What it really costs, now that the bills have come in. Well, as everyone knows, your Verizon bills are almost impossible to figure out. What I really would like to see is:
Your bill for this service is normally: $__.__ and it's been adjusted $__.__ for this reason _____.
Not to be, at least in the version of reality I live in.

Phone.....Continued on page 4

Phone.....Continued from page 3

But here's what I've seen so far:

First time installation costs, Verizon wireless:
$53.49 for equipment.
$39.33 Activation and fees.
$8.75 Taxes for equipment and Activation
$9.99 Payment in advance for first months service.
$111.56

Monthly charges added to Verizon Wireless bill:
$9.99 Basic
$4.45 Taxes and surcharges
$14.44

Reduced monthly charges on Verizon FIOS bill:
$-5.99 Inside wiring maintenance
$-30.00 Essentials Freedom
$-14.35 various incomprehensible Florida and Federal taxes
$-50.34 Savings monthly

To summarize, there is a net monthly savings of $35.90 ($50.34 - $14.44), starting in three months after offsetting the one-time charges.

The downside:
We have a 700 minute wireless family plan. We added this phone to the plan, and it is working out, but we have to be careful. We've run our minutes up to 500 of our allotted 700 minutes, a substantial change. We do a fair amount of talking to our sons in Seattle and an occasional sibling out of state. We do this off-peak, evenings or weekends.

When I have business calls, or have to call some kind of lengthy support line, I use my Google phone. It's free to anywhere in the US, even to non-Internet connected numbers. My Google phone runs from my browser or from my Google Talk App on my desktop or my Android Phone. Sometime I have a call come in and anticipating a lengthy conversation, I'll ask to call them back and I use my Google phone. My favorite place for Google Phone is at my desktop machine because I have an excellent USB Plantronics noise cancelling headset. Did I mention the quality is excellent and it's free?

I can look at my daily minutes usage online, and also from my smartphone and I keep a close eye on it. I can change the plan any time I want by breaking out this phone from my family plan and go to an unlimited local and long distance plan for $20/month vs. the $10/month I'm paying now. We'll see, but so far, so good.

Summary:
The Katrina experience has taught us that the communication service that is restored fastest is the cellular systems. The biggest reason I think is that emergency services are dependent on them now. Also Verizon and other services have purchased emergency trucks that have a cellular tower on them to spot them where needed in emergencies.

I'm happy with the service. The quality of the calls is excellent, and otherwise, well, you know, it's a phone. ◆

Comments.....Continued from page 1

another company called Google that would allow us to search for information on anything but which also would cause us to worry about all sorts of information being stockpiled about us. All of this done on the Internet, which began as a military project but now had been taken over by companies like Google and another named Facebook, and where people played games like Farmville where they bought and sold virtual things such as pigs and hay. Much of this being done on, of all things, telephones, but not the phones of old, but these are actually small computers that you can hold in the palm of your hand with more processing power and memory than anyone dreamed of for even a desktop computer back in 1987.

So let's talk a bit about Apple, Google, smartphones and even that old fuddy-duddy Microsoft. First, I want to thank everyone who made an Amazon purchase through the link on our home page. We collected $41.22 for purchases made in December. And this I must remind all was at no extra charge to the

Comments.....Continued on page 5

Internet Picture of the Month

The Ascent of Apple This is a ten year chart from Feb 2002 to Feb 2012 demonstrating how dumb we all were not to purchase Apple stock in 2002 and hold on to it until now. Of course, ten years from now there may be a similar chart demonstrating how dumb we were not to have sold the same stock in 2012.

Comments.....Continued from page 4

purchaser.

Apple is now the darling of the stock-following crowd, closing at around $544 per share on March 2. That seems mighty expensive, but what do I know. I have made very few decisions in my stock trading life about which I can brag. Many stock analysts that I hear or read say that, based on fundamentals, $544 is low, and, say, $750 is a more reasonable price. But perhaps they should note that as recently as 2009 it was below $100 and recall that what goes up can come down--and usually does. Anyway we are not so interested in the price of a company's stock here but in what products that company makes. And Apple has certainly made some popular items. In our house, my wife has an iPad, and I must say that it is a pleasure to use to browse the World Wide Web and to have video talks with our son on Skype. Then there is the ubiquitious iPhone. Everywhere I go, I see people using them. And it is not just the young crowd. People in their 60s and older are walking around poking at them. Almost no one is using the things for a phone conversation since they do not have them near their ear. They are holding them in one hand and manipulating them with the other. Who knows? Perhaps they are viewing their brokerage account with the desire to purchase Apple stock. More likely, they are checking

their data usage so as not to run into trouble with their service provider since recently several companies, AT&T being the most prominent, have said that they will throttle usage (slow down service) for accounts that exceed a certain amount of data usage in the current month. The surprising thing about this is that this throttling is going to occur on accounts with data plans that were purchased as unlimited data usage. As expected, some heavy data users have cried foul only to be told that they still have an unlimited data plan – they are just going to get that unlimited data at a slower speed once they exceed a, say, 2 GB or 3 GB monthly non-throttled limit. This definition of unlimited reminds me of our former president's statement that "it all depends on what the meaning of is is." (http://www.youtube.com/watch?v=j4XT-l-_3y0).

Google has been in the news recently regarding their tracking of your online computer use. They seem to be doing things that they said they wouldn't do. In fact, they are accused of actively bypassing the Apple browser's built-in setting that is supposed to keep such tracking from occurring. How could that be possible from a company whose motto is "Do no evil?"

What to do about this? Well, many people obviously don't care since they have already turned their life over to Google by having a Gmail account, using the Chrome browser, being a member of Google+, etc. And turning your life over to Google is probably no worse than giving it to Facebook, which half the world seems to have done. But call me an old fogy because I really dislike having done a search for something like water softeners and then, within an hour, while reading the New York Times online, seeing an ad on the right side of the screen for the very same water softener that I just spent some time considering. And those ads were not just at the NY Times site; they were on other sites, and they appeared for days, and anyone else using my computer would have also seen them. Ads for water softeners, or course, should be of no embarrassment to anyone. But what about ads for things you had rather others not know about?

There may be no real solution since Google seems to be able to figure out a way to circumvent anything that is tried, as they did with the Apple Safari browser. But we who do not want to be followed (and also have everything we do stuffed in a database) must try.

InPrivate Browsing My current solution is to use the InPrivate Browsing feature of Internet Explorer (under the Tools menu item) when I am doing certain browsing activities. You should realize that you do not have to be using an obvious Google application to be giving them your data. This is because many websites use something called Google Analytics to analyze their web traffic, and the information collected goes straight to a Google server.

To use InPrivate Browsing in IE, click on the Tools menu item and then select InPrivate Browsing. A new browser window will open and you can go to work. To learn about what InPrivate Browsing blocks and what it doesn't, look up InPrivate Browsing in IE's help.

Microsoft's Windows 8 is coming. Microsoft just released the Consumer Preview of Windows 8. They are not calling it beta software, but I would think that is what it is. You may download and install it from this link: http://windows.microsoft.com/en-US/windows-8/download. But I would think that you would want to do it in some sort of Virtual PC setup and not overwrite your current Windows OS – unless you have a fairly new PC to spare on which to install it.

Based on advice in our meetings from Merle Nicholson, I went to https://www.virtualbox.org/ and downloaded and installed VirtualBox. I then downloaded the Win 8 iso file from the above Microsoft address and had VirtualBox add it as a new virtual machine. Surprisingly there was a choice of Windows 8 as the guest operating system.

After that I was up and running with the Windows 8 desktop with Metro icons for a few apps. There were Internet Explorer, mail, SkyDrive, Maps, Weather, a few games and the ability to acquire more from the Store. At the moment, there are just a few and they are all free. With Win 8 running in a virtual machine, to be able to actually install programs as in Win 7,

Verizon FiOS TV Listings Problem

By Ron Weinberg, Member at Large,
Tampa PC Users Group
rswjbr@verizon.net

Verizon TV Listings had been working and suddenly changed several weeks ago. Instead of the spreadsheet format grid of channels and time, all you saw was the channel name or number and a blank sheet. If you click on a channel number you get a horizontal listing of the day for that channel only. I use this to see program listings as well as to set DVR recordings remotely.

I tried to contact Verizon via telephone. After being transferred from one department to another, each saying it was not their problem, and interminable waits on the phone, I hung up in frustration while waiting for the next department (whichever it might have been.).

A day or so later I decided to try again using Live Chat with a Verizon tech. He suggested I try another browser (Firefox) and it worked. However, he could not help correct the issue on my IE 8 in Windows XP. That identified the problem as being from my installation of IE 8, as it also worked on my Laptop which runs Windows 7 IE 9.

How to fix IE 8:

- Backed up my favorites and did a Reset within IE 8.
  Problem not corrected.
- Googled "Repair IE 8" and found repair script "ie8-rereg" and ran it.
  Problem not corrected.
- Removed and Replaced IE 8 with new copy downloaded from Microsoft.
  Problem not corrected.
- Posted request on Verizon forum.
  To date only 2 replies:
  1 Upgrade to IE 9 (but that's not available for XP).
  2. They are using IE 8 with no problem.

I could not find any other information on this even through the Verizon forums.

Not willing to give up, I resorted to trying "trial and error".

- Perhaps it was a security error related to .aspx files so I turned off my AV to no avail.
- I tried various Internet Explorer security settings to no avail.
- Downloaded and installed all Optional Windows updates, and it still did not work.

Then almost by accident I right clicked on the page and tried Print Preview. Lo and behold the missing text appeared in the preview window. That alerted me that it might be something related to the display that I had not tried.

I changed the zoom level to 125% and a large detailed spreadsheet appeared. After experimenting, I found that any Zoom Level less than 99% caused the detail to be missing.

100% looks as well as I could expect.

Problem solved, although I do not really know how it started as I didn't previously alter the Zoom Level. ◆

you need to add some shared folders from the host computer. I added the My Documents folder and the CD drive. Adding the CD drive, allowed me to install Office 2007 in Win 8 using the CD drive of my main computer. I also copied over some documents from the host computers My Documents folder to use in my newly-installed Office 2007 in Win 8.

Next month, I will probably delve deeper into all of this. But for the time being, if you are interested, I think I have given you enough info to get started with Win 8 Consumer Preview on VirtualBox. ◆

william@lamartin.com

The big news this past month was the iPad3, although it was stilled officially still named just iPad. In the Picture of the Month, we have one of the usual lines that form for such events outside Apple stores before opening time. This one was in London. People who could just as well order the devices to be delivered to their home that day still get in line. Perhaps they just enjoy the camaraderie, like Apple cofounder, Steve Wozniak, whom you can view being interviewed while waiting in line in Los Angeles in this YouTube video, http://www.youtube.com/watch?v=PXaJ7TxkfCI, or in the longer one at http://www.youtube.com/watch?feature=player_embedded&v=ATfqKRZ0z-4#!. Then there is this guy offering to sell his place in line in Seattle on craigslist, giving his cell phone number and saying "625am right now. U have till 8 to get here.", http://seattle.craigslist.org/est/ele/2905058385.html. Steve Jobs' dream has certainly come a long way from when he offered to sell his and Wozniak's just born Apple Computer to

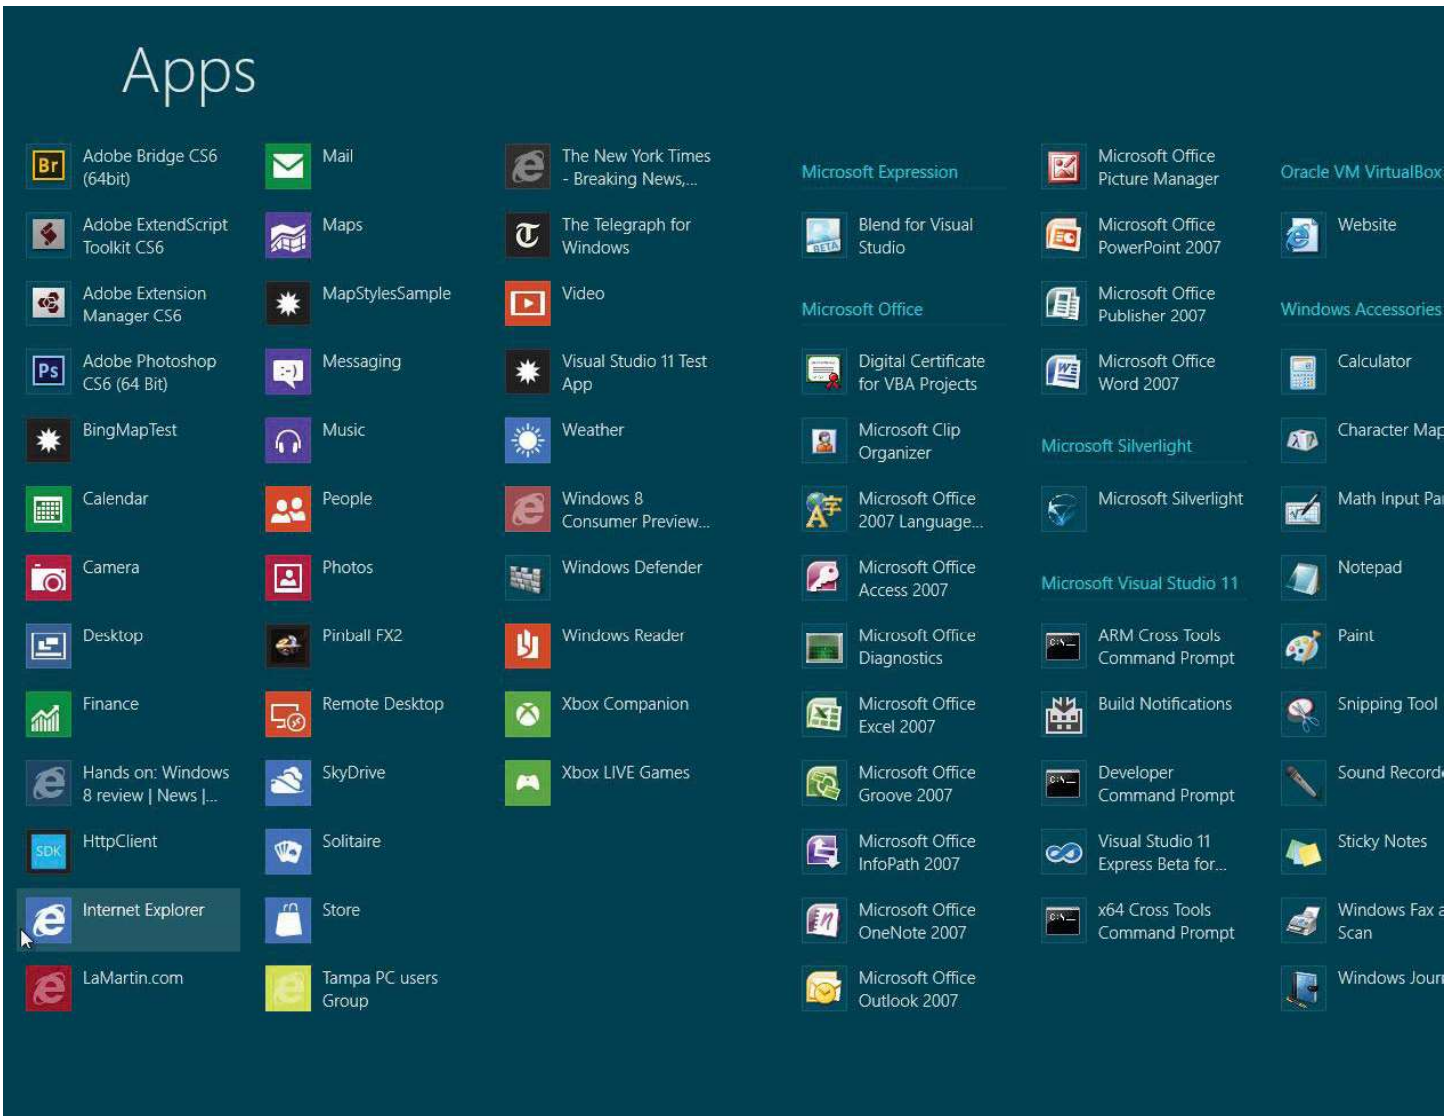
Minutes of the March Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

Our meeting was six days earlier than normally scheduled to accommodate our speaker, Gene Barlow.

The Windows Special Interest Group (SIG) opens our monthly meeting. The meeting began as usual at 6:30 PM. The SIG is devoted to a discussion of all aspects of the Windows Operating Systems and of computer-related subjects in general. The SIG moderator, Bob LaFave, introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees.



This month Bob showed us Personal Software Inspector and the Western Digital Media Player. WD Media Player is a hardware device with TV output and USB input to play movies and Internet on a TV screen from an attached flashdrive or USB hard drive. It has a remote control and is very inexpensive.

Bod fielded a round of questions on several subjects: Corel PDF Fusion – demo'ing editing a Hillsborough County form; also AVS Document Converter to convert PDF to Docx; and finally an offer of extra copies of BitDefender.

This month our guest speaker was Gene Barlow, a very long term speaker of ours who tours to Computer user groups. He and Linda Barlow run a business – http://www.ugr.com. He has an interesting talk on backups of your computers with a very well-developed powerpoint show. He fielded questions and demonstrated his in-depth knowledge of this very valuable subject.

Gene and Linda offer several well known products: Acronis Disk Director 11, Acronis True Image Home 2012 and Invisus PC Security Solution. Changes to Acronis are a Drive Monitor, and it also has new disk synchronization capability. For the first time, the software installation is monitored, preventing one license

Windows 8 Consumer Preview & Virtualbox

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

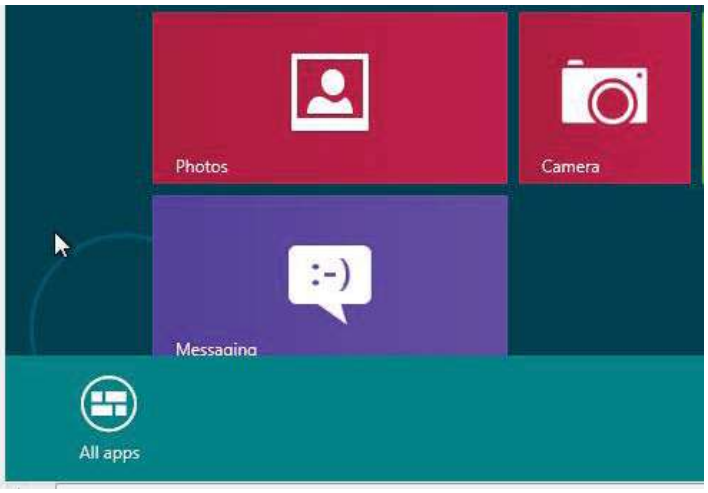
Microsoft has released the Consumer Preview of Windows 8. You may download and install it from this link: http://windows.microsoft.com/en-US/windows-8/download. However, I would think that you would want to do it in some sort of Virtual PC setup and not overwrite your current Windows OS.

Based on advice in our meetings from Merle Nicholson, I went to https://www.virtualbox.org/ and downloaded and installed VirtualBox. I then downloaded the Win 8 iso file from the above Microsoft address and had VirtualBox add it as a new virtual machine, with Windows 8 as the guest operating system.

As for the settings I chose:

- a Base Memory of 2,048 MB
- a dynamically allocated hard disk of 20 GB
- a Network attached to a Bridged Adapter

You want the hard disk to be dynamically allocated so that it will actually consume only as much as needed of your actual hard drive and then expand as needed up to the maximum you have indicated, 20 MB in my case. Unfortunately, it turned out that 20 MB was not enough when I wanted to install such programs as MS Office, Visual Studio and Photoshop. More on how I



Windows 8.....Continued on page 4

Windows 8.....Continued from page 3

solved that problem later. Using the Bridged Adapter instead of the default NAT, gave the virtual drive easy access to my local area network. This is important if you want to exchange files between the rest of your network and the virtual operating system. Once you have your Virtual Machine up and running, you may also use the option under Devices to "Install Guest Additions." This will allow you to create some shared folders on the host computer. You may also use the CD/DVD drive of the host computer and, in theory, use the USB connected devices of the host computer.

Once you have the new VM created, you use the Win 8 Consumer Preview iso file that you downloaded from Microsoft to install the Windows 8 operating system on it. You will need a Product Key, which is available under "Need help?" in the FAQ where you got the iso file. To save you the trouble, it is: DNJXJ-7XBW8-2378T-X22TX-BKG7J.

On booting into Win 8, you are presented with a window with a bunch of fairly large icons representing some of the apps available. This is certainly not the Windows 7 desktop. And there is no Start button, a major complaint. So how do you get a list of all your apps and programs? Take your mouse down to the bottom of the screen and right-click, and you will be presented with an All apps icon as pictured below. Simply click on it to get a list of everything, pictured in the large screen capture at the beginning of this article, where you see the left-hand side of the listing of all the apps and programs installed in my Win 8 setup. The ones like Calendar, Camera, Finance, Messaging, Music, etc. are Win 8 apps. Anything to do with Adobe, Microsoft Office and Visual Studio are programs (not apps) that I installed.

The Photoshop program is actually Adobe Photoshop CS6 Beta. Visual Studio is Visual Studio 11 Express Beta and Microsoft Office is the Microsoft Office 2007 Ultimate. Photoshop CS 6 Beta and Office do not need Win 8; however, Visual Studio 11 Express Beta does (full Visual Studio 11 Beta does not need Win 8; however, it will run on Win 8).

At some point, when installing Photoshop I think it was, the installation failed, and it traced it to not having a large enough hard drive for the Virtual Machine. 20 GB was just not large enough to hold everything I wanted. A search on the Internet, revealed that I needed to do two things. First, on the host computer I should run at the command line an executable for Virtualbox that would allocate whatever size drive I desired to the Virtual Machine. I wanted to double it to 40 GB. The actual command (executed from the directory where VBoxManage.exe was located) is:

VBoxManage modifyhd "D:\VirtualBox VMs\Windows8Preview\Windows8Preview.vdi" --resize 40000

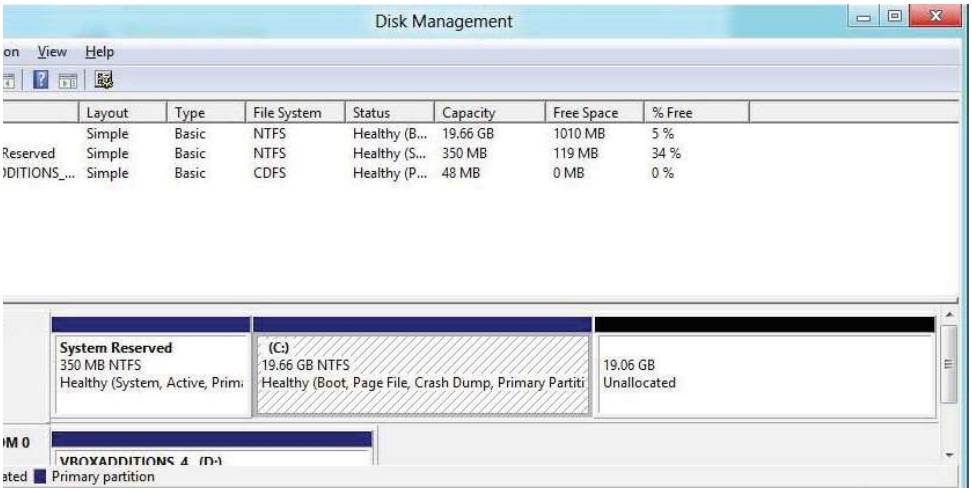
D:\VirtualBox VMs\Windows8Preview\Windows8Preview.vdi" is the path to my vdi file and 40000 indicating that I wanted a 40 GB drive.

After that was accomplished, I needed to go into Disk Management in Control Panel in Win 8 (just like you would do in Win 7) and expand the current drive, which was still 20 GB, to take up the entire 40 GB now available, as indicated in the screen capture on page 5. The next screen capture at the top of page 6 displays the result of expanding drive C to use the extra space. After that, the installation of Photoshop CS6 Beta went forward flawlessly. As with each iteration of Photoshop, new features are added. To give a brief idea of the more eye-catching type of stuff, have a look at this YouTube video: http://www.youtube.com/watch?v=UrlsnQ32YhY&feature=youtu.be.

Once I had about all the programs loaded that I wanted

Windows 8.....Continued on page 5

Internet Picture of the Month



Waiting for the latest iPad

Windows 8.....Continued from page 4

to use to test Win 8, what next? Well, the first thing one needs to learn is how to navigate. Recall there is no Start button (at least at this time). First, if you are on the Start Menu, there is a Desktop icon with a fish on it (I think it is the Beta fish). Clicking on that will produce the Desktop, which, if you have not added any icons to it, is pretty bare. I have now added a number of icons to my desktop, but, as I recall, it started out with an Internet Explorer (IE) icon and

- WINKEY + E – Switch to the (classic) Windows desktop and launch Windows Explorer with Computer view displayed.
- WINKEY + F – Display File Search pane

To see a complete list of such shortcuts, go to http://www.winsupersite.com/article/windows8/windows-8-consumer-preview-windows-key-keyboard-shortcuts-142358.

a Files icon in what I would call the task bar at the bottom. Note that you actually have two versions of IE, IE 10 in the apps Start Menu and IE 9 on the Desktop. The apps version does not support Flash or Silverlight.

The best method I have found for navigation is using the Windows key in combination with another key; for example, WINKEY alone toggles you between the apps Start page and the Desktop. Here are a few I use:

- WINKEY + D – Switch to the (classic) Windows desktop and toggle Show Desktop (hides/shows any applications and other windows).

My Win 8 desktop looks like the screen capture to the left. If I want to view the files, I simply use WINKEY + E if I am in the Start Menu or Desktop. Additionally in the Desktop, I have a Files icon on which to click. In the screen capture above, you see a Windows Explorer screen that looks very much like Windows 7. Even though I am running Win 8 in a Virtual Machine, I have had no trouble installing any program that I have tried. I have been able to see my local network, use the printers on the network and use the Internet connection. The

Meeting Preview: William LaMartin will describe installing Windows 8 on a virtual machine using Oracle's VirtualBox. He will then take us on a tour of Windows 8. As usual for the first 30 minutes, Bob LaFave will conduct our Windows SIG.

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Thanks to newsletter contributors Ron Weinberg for his article on resurrecting his Win XP computer, Jim Purcell for the database article and Merle Nicholson for the minutes and all the QR codes. Somehow, we always manage to put out our small newsletter with our own original content.

In last month's newsletter I wrote about installing a preview version of Microsoft Windows 8 on a Virtual Machine using Oracle's VirtualBox. That saved me from having to dedicate an actual computer to the installation. There I gave links to all the pertinent web pages you would need to repeat the process yourself. Possibly some of you actually tried it.

This month I will demonstrate all of this at our monthly meeting and lead you through a tour of using the new operating system that should be coming out in the Fall.

Merle has included QR codes at the end of the minutes which,

Minutes of the April Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

Our meeting was six days earlier than scheduled to accommodate our speaker, Gene Barlow.

The Windows Special Interest Group (SIG) opens our monthly meeting. The meeting began as usual at 6:30 PM. The SIG is devoted to a discussion of all aspects of the Windows Operating Systems and of computer-related subjects in general. The SIG moderator, Bob LaFave, introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees.

This month Bob showed us quick demos on drive utilities Acronis, Seagate and Western Digital WD Support; also, Easeus To-Do Backup, Easeus Partition Manager and Drive ImageXML, most of which are free as downloads.

- **EaseUS:**
  http://www.todo-Backup.com,
  http://www.partition-tool.com
- **Seagate:**
  http://www.seagate.com/support/downloads/
- **Western Digital:**
  http://www.wdc.com/wdproducts/acronis/um.asp,
  http://support.wdc.com/product/downloaddetail.asp?swid=119&wdc_lang=en
  http://support.wdc.com/product/download.asp

And finally, Bob showed a Microsoft SyncToy demonstration. Bob then led discussions on extending a TV signal and on the Microsoft Security monthly newsletter at http://www.microsoft.com/security/resources/newsletter.aspx

Kevan Sheridan, vice-president of TPCUG and a very long term member, gave a slideshow-augmented presentation on Google Voice, where he routinely

SAVING AN OLD PC ON THE THIRD TRY

By Ron Weinberg, Member at Large,
Tampa PC Users Group
rswjbr@verizon.net

My desktop system is a seven-year-old Dell Dimension system which was well-equipped and not inexpensive for its time. It still has all original components. The operating system is Windows XP Professional, originally SP2 but now SP3. Naturally, age takes its toll, and I have had several system problems in the last few months, all of which I have recovered from.

1. System Failure Feb 6, 2012.

Error Message:
"Windows could not start because the following file is missing or corrupt:
\Windows\System32\Config\System

You can attempt to repair this file by starting Windows Setup using the original Setup CD-ROM
Select 'r' at the first screen to start repair."

I loaded the disk and carefully proceeded to use the System Repair option. However, it appeared that instead it was reinstalling most of the entire system.

When that completed, I repeatedly got as far as the sign-on screen, which did have my user name and did accept my password. But it kept looping back to loading and would not completely boot. I got some fatal system errors which went by so fast I could not record them. It was logging the errors, but because I could not boot I never got to read them.

I repeated the Repair with much the same result, whereupon I ran hardware diagnostics on the memory and hard drive. All passed successfully with zero errors noted.

I concluded that despite my efforts the operating system was corrupted beyond repair.

I then used Acronis to completely restore everything from my last entire system backup. After a few updates were installed I ran a complete AV scan and was fully operational. Unfortunately, the backup was one month old so I lost my January and early February work.

I reinstalled a program which I had recently installed and was now missing. Next, I rechecked for additional updates and there were quite a few, including 11 optional ones, and I installed them all. Lastly, I created a new Restore Point.

At that point my comments were that a seven-year-old system is obviously prone to problems but it has served me well. Reluctantly, if problems continue a new system may be the only answer. Meanwhile I'll be backing up work files weekly.

2. Problem reoccurred on Feb 9.
This time I pressed 'R' at the first screen and got in the Recovery Console wherein a number of DOS commands were available. I copied Config.Sys from the CD and rebooted. Problem appeared corrected.

3. Not long after, my system crashed again, and I was just about to purchase a new hard drive, but, stubborn as I am, and because the hard drive seemed to pass all diagnostics, I decided for one more try at resurrection.

This time, instead of using the Microsoft Repair or Recovery Console, I tried a method published online by Charlie White, http://webcast.broadcastnewsroom.com/articles/viewarticle.jsp?id=8658, which seems to be similar to "How to recover from a corrupted registry that prevents Windows XP from starting." (Microsoft Article 307545)

This process involves copying critical Registry entries from an original XP disk and then replacing those entries in the Registry. There are a number of important steps that must be followed in sequence, but the result for me was excellent.

Upon completion, my system booted perfectly, and I had no loss of program data, personal documents, or

B-FOLDER 3

By Jim Purcell, Tampa PC Users Group
Edward_J_P@MSN.com

The reason that I had an immediate interest in "B-Folders 3" software was that it seemed to provide the versatility to create and securely store data in a format similar to what I had used with a Palm Pilot. It also appeared to be capable of importing about 15 years of data that I had accumulated on my Palm Pilot.

I started using a Day-Timer in the early 70s while I was working as a Budget Officer in the Air Force, and I continued to use it until I switched to an almost identical product offered by Franklin Covey. Both companies had developed a computer program that mimicked their notebooks and both programs would print pages for all sizes of their notebooks, either as blank pages or pages containing the content of your program. The Franklin Covey program was frankly one of the best computer programs that I have ever owned. It was simple, powerful and was based on Microsoft Access. When all else failed, you could open your database in Access and correct or repair it. Then in the late nineties, Franklin Covey announced that their program would Sync with Palm Pilot. So "SHAZAM", prior to 2000 I had a smart phone (Sans phone of course but also Sans quagmire and Sans $60 a month). The B-Folder 3 program instructions indicate that you can not only sync your desktop with all of your devices but also you can sync using USB, Wi-Fi, 3G or your LAN, and they provide a tutorial for each method. Sync sessions are always encrypted so you can use whatever network is available - Wi-Fi, Ethernet or even public hotspots. They also have a free stand-alone app for Android for Smartphones and tablets.

About three days before I found the B-FOLDER 3 program, my Palm Pilot died. If I can revive the Palm Pilot, I hope that I can export the data, otherwise I'm going to be doing a lot of cutting and pasting.

You are probably wondering why I am writing about the program since I just downloaded it and have no words of wisdom about how well it has done the job for which it was acquired. There are two reasons, the first of which is the structure of the program itself. It is an encrypted database that allows you to structure it according to your needs. The database is created by establishing a structure of folders that you name and connect. Usually it is by "type" of entry or by "topic/subject". Unstructured data can be stored and found, as can structured data and "managers". Predesigned forms are available for notepad, contact manager, task manager, password manager, bookmark manager, credit card and journal. These forms give you even more flexibility; for example, you can use the password manager simply as an encrypted storage place for your passwords, or you can enter the appropriate instructions on individual or all passwords to allow you to launch a program requiring a username and password with one click from within the database. The forms can also be customized in a variety of ways. The customizable cards format can be used for bank accounts, frequent flyer accounts, insurance and other similarly structured data.

The second reason that I am writing now is that the software is marketed in such a way that you can explore it completely at no cost. You can download the complete and fully-operating program for a 30 day trial period with no charge. At the end of the 30-day period, if you wish to continue, you pay $29.00 for the program. One license covers all your personal computers and devices. If you choose not to buy, editing and creating new items will be disabled. However, you will still be able to read and search your data. The free Android app is fully operational with or without the desktop program.

In summary, when you start B-Folders for the first time, there is no database and you need to create one. You must provide a strong password since the strength of the database is that it remains encrypted when you sync it and when you back it up and that it is constructed to minimize exposure. Another example of the nature of the database is that B-Folders cannot recover lost passwords and, without the password, all of your data will be permanently lost, and since backups require the password in effect at the time of backup, they too are lost. In managing backups, you must retain all passwords and relate them to the appropriate

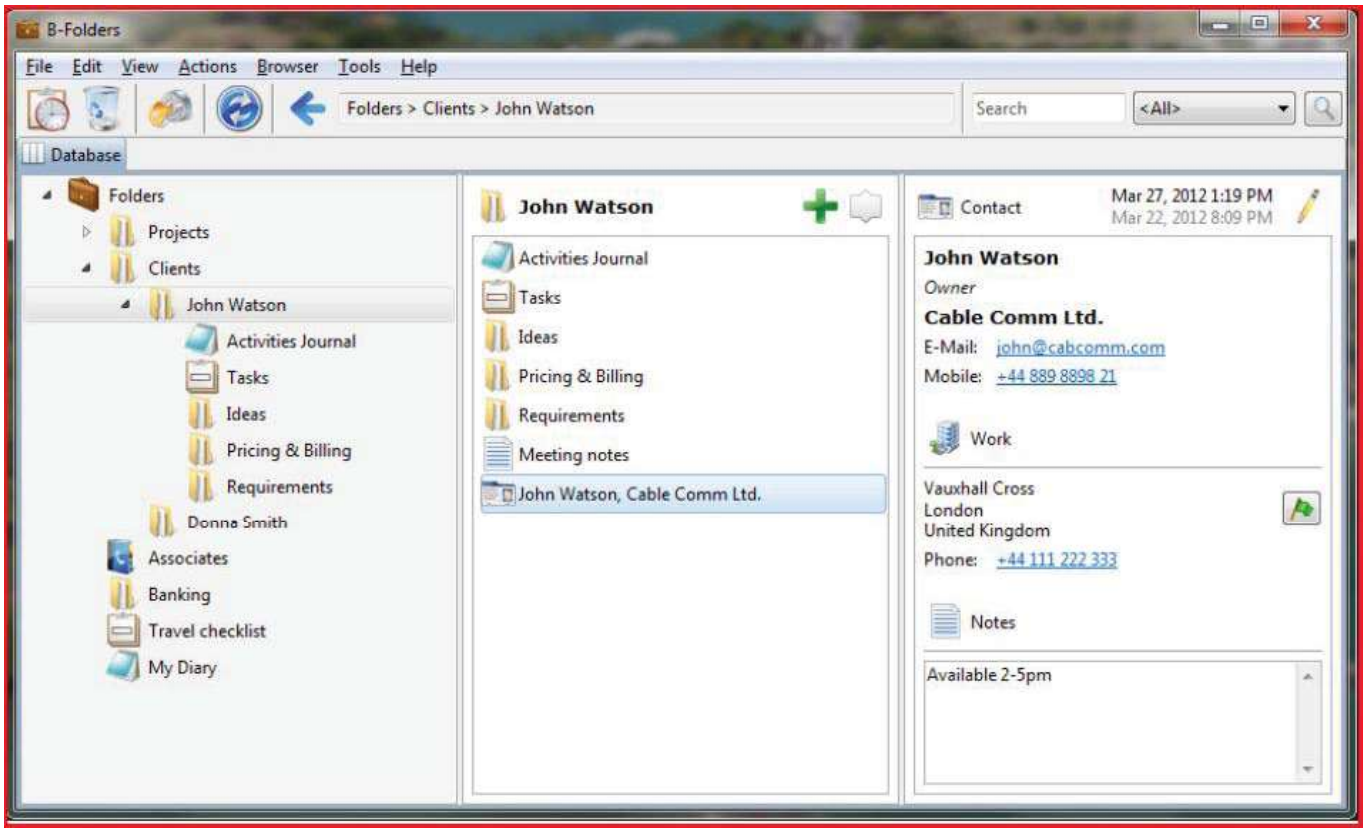
May Day Occupy Oakland

May 1 is a big day for protest parades. The photo above is of one such in Oakland, CA. The photo can be found posted on flickr at http://www.flickr.com/photos/bonjourjanel/7134888859/ by a user named jsruby22.

Saving.....Continued from page 3

photos.

I had been using Windows Live Mail, and that disappeared requiring a new install. Accordingly, I lost a few days of email and my old deleted items, but nothing that I had saved in previously created Storage folders.



After checking for updates and backing up, I did notice several programs which I had added over the years did not work. It seemed as if they were not recognized by the Registry and did not even show in Control Panel Add and Remove Programs. Rather than try to re-register them, I reinstalled them.

I can now report that my system is working better than ever, response is fast and errors nil.

Just I case, I did install Acronis Drive Monitor to watch my old hard drive. ◆

backup in order to access the data.

This main application window has three vertical panes (see image above). The left pane displays the hierarchy of folders as a tree structure, the middle pane shows the contents of the current folder as a list of items, and the right pane shows the current item. The B-Folders site at http://jointlogic.com/b-folders/ will provide all of the needed information, including online help, illustrations, support and download of the desktop and Android edition for smartphones and tablets.

The Home screen of B-Folders Android edition (see image to the right) is the first screen displayed when you start the application. It acts like a menu and allows you to easily access the most common features of the application. As in the desktop edition, there is initially no database so you will be required to create a new one. After the database is created, you will see the Folders screen. ◆

william@lamartin.com

Windows 8 replay with a virtual drive

Last month I did the presentation on using Oracle's VirtualBox software to install Windows 8 Consumer Preview in a Virtual Machine. I spent a good bit of time on laying out how to set all of this up in Virtual Box. I then began the part of demonstrating Windows 8 and after a few minutes discovered that I did not have the Win 8 Virtual Machine connected to the Internet, something that had never given me a problem at home. A check that the host computer, my laptop, for the Win 8 Virtual Machine was itself connected to the Internet came back positive. A bit of playing with various settings got us nowhere, and the presentation had to proceed and end without actually demonstrating anything in Win 8 that had to use the Internet.

When I returned home, I started up VirtualBox on my laptop and opened the Win 8 Virtual Machine--and, as it had never done at home before, it would not connect to the Internet. I don't recall what actually got the Internet working, but I did get the Win 8

Minutes of the May Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

Our meeting was held in one of the large conference rooms at the Pepin facility since our regular smaller room was booked. A special thanks must go to our president, John Witmer, and the Pepin organization for making our meeting facilities possible.

The Windows Special Interest Group (SIG) opens our monthly meeting. The meeting began as usual at 6:30 PM. The SIG is devoted to a discussion of all aspects of the Windows Operating Systems and of computer-related subjects in general. The SIG moderator, Bob LaFave, introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees.

This month Bob touched on a variety of subjects: A discussion on the Path environment variable, the use and editing of it. Finding Windows mail when you have lost it. Roadrunner email help, Set Defaults program and its use. Publishing pictures. Creating a document from a Gmail PDF. A quick look at Skydrive and Hotmail; printing PDF and Google Docs. Whew – it ran a bit over, but we covered a lot of ground.

William LaMartin, a very long term member of TPCUG and our newsletter editor and webmaster, gave a Windows 8 demo and overview and a tutorial on how to set it up on a notebook computer. The Windows 8 Consumer Preview was available for those with the interest and technical skills to load it safely on a computer, and William took advantage of that because of his interest in developing commercial applications. The Consumer Preview is a pre-release version. (Note: By now, an even newer preview is available – called "Windows 8 Release Preview," and usually there will be a "Release Candidate" before the final release version.) William installed this version as a Virtual Machine in the VirtualBox software. We're very glad we

ObiHai Obi 110 VoIP Telephone Adapter

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

To tie all this together – what I've been up to for several months - you may want to look at my January and March articles on "Wireless Home Connect". And if you've been to the meetings lately you've seen a presentation on Google Voice that Kevan Sheridan did and how he's managing multiple phone locations through Google Voice. I've used Google Voice for some time now for free calls – but not to any great extent.

To summarize Google Voice, it's a Voice Over IP (VoIP) telephone service that you can use from your computer or a mobile smartphone device (because it's a computer). It's like Skype, except that it's voice only and well - it's free and entirely web-enabled and web-trackable. Google has extended the service for the second year free through 2012, after which they may charge if they decide to. What you get with Google Voice is a real telephone number attached to your Google account. You get voice mail as a playable media file and also a text version of the voice message to your Google mail inbox. It calls and receives calls from all other telephones, wireless, landline and VoIP.

To summarize my "Verizon Home Connect," it's a stationary cell phone. I abandoned the landline phone to my house and gave up the interior wire maintenance, the telephone charges, the fee for not having a long distance carrier (!), and plenty of federal taxes. I added the new "Verizon Home Connect" device to my wireless plan and connected it to my four-station cordless phone. Kept the old landline number, thank-you-very-much.

Ok – well, where are the pitfalls in this scenario? There's only one that I have encountered so far – I have to track my cell phone minutes pretty closely. The danger is getting in long conversations on the home phone, because it's very easy to forget it's on our shared cell phone minutes. As it turns out, talking to friends and relatives – we're all pretty much in the same boat so we use weekend minutes because they don't count.

Looking at our habits, there are a couple of dangers. The first was unexpected – getting into discussions with service people – say the alarm service, or insurance companies – medical providers, my coffee machine repair service. Oh man, they just don't care that it takes an hour just to go through their automated menus, only to get cut off. Verizon has the most broken menu system – oh, don't get me started.

Then I have an occasional business conference call. What a waste of time and never less than an hour.

I can't tell you how I decided to look for a VoIP device. I use Google Voice, but I got tired of fussing with the sound and microphone settings on my computer. The computer has to be on – naturally, and it's difficult to switch from speakers to headset on an incoming call. So I never did reveal the Voice phone number to business clients and coworkers. I wanted an office business phone that I could sit on for hours talking to service providers because I have nothing else to do.

I did some real searching for VoIP alternatives, and if you do this you come up with some real confusing things that look like they must be for commercial use for a lot or money. I ran across a forum about Google Voice and saw this thing and then found its website, http://www.OBiHai.com. I then found the devices on Amazon and NewEgg. There are other more recognizable brands I discovered, but I'm a great reader of reviews and got the impression that you can configure the Obi devices expressly for Google Voice. Out of three devices I picked the Obi110. There's a comparison chart of features on the website to help. So I ordered from Amazon – Obi110 Voice Service Bridge and VoIP Telephone Adapter $50.47 (Do you see why it was difficult to text search to find the products?) and a Uniden DECT1363 cordless phone, $17.69

The Uniden is a standard cordless phone. I could have gotten something for five bucks. I liked this one; I've had this brand before and they seem to last forever.

Telephone.....Continued on page 4

Telephone.....Continued from page 3

I didn't want an answering machine, just one single wireless handset.

Ok so what does this guy do? Here's what it looks like:

It's less than five inches on a side and 1-1/2 inches tall. On the back it has two telephone jacks, One Ethernet jack and a power supply socket for the power cube. So you cable it to your router, plug your telephone in the correct jack and power it up. You configure it – more about that in a moment – and it becomes a telephone. And you did it without even discussing it with Verizon.

I guess here's the place to say again. It's free. There are no monthly charges because Google Voice is free, the device setup with OBiHai is free, and there are no monthly charges from OBiHai. It's free.

For configuring it, first – get a Google Voice account. Before that – get a Gmail account in case you're the last person on earth without one. From your Google account just sign up for Google Voice and get the telephone number. You select the telephone number from the available telephone numbers in the country. So you can have an area code anywhere you want. Give that some thought. It shows up on caller id displays wherever you call unless you block it. If you block your caller id, don't bother calling ME, because I won't answer. I hope that when President Obama calls me to ask for advice on the economy, he's using caller id. To get the Google Voice number assignment you have to establish an account so they can charge you if they ever get around to doing that. I have had an account because I have an Android phone and I purchase Mobile Phone Apps from their app store. (Now called "Play Store"). So it was easy to get the Google Voice account set up. That – for me – was more than a year ago.

With the Gmail account and Google Voice account set up and the OBi110 connected – you need to get your IP address handy and also know your Gmail email account name and password. To get your IP address, you use a website like http://whatsmyip.com. At the top of their page is your IP address at the time you queried it. It's a four-number group separated by dots like 12.12.123.12. You can also get this address by logging into your router. It's usually displayed prominently.

To configure the Obi110, you go to their website and click on the image at the left. All the steps are there, including a video, a step-by-step tutorial and trouble-shooting guides. But basically, you go to http://www.OBiTalk.com and register. You'll need to fill in your Gmail username and password and your IP address. You'll need to have logged into Gmail and do a couple of Google Voice settings. I'd say I spent a half hour getting the phone configured. Instructions come with the device; it's pretty easy.

This device can be configured to work with many other services. It can serve as a bridge from any phone device you can call in on, and it will complete the call to your POTS line. There are apps for iPhone and Android to make it easy to call into your system and use it to forward your calls. It has all the Star Code features that all phones should have – redial, block caller id, call forward, block anonymous calls, call waiting.

In use, it's pretty simple – frankly I don't think about it. There are some green lights on the device; two must be solid green and one is flashing. As long as this happens, it's active and I don't concern myself. It's worked flawlessly since the day I activated it. ◆

Comments.....Continued from page 1

Virtual Machine connecting to the Internet. The only thing that I can come up with that would be the cause is that the Virtual Machine does not like being moved from one IP address to another. I am sure there is a way to quickly fix this problem in the future, but I no longer need one. I have changed how I run Win 8 from running in a Virtual Machine inside VirtualBox to residing on a Virtual Hard Drive.

Without getting technical, a Virtual Hard Drive (VHD) is just a file (see the file WIN8.VHD in the screen capture later) on your computer's hard drive that has been configured so that when the computer boots it is recognized by the Windows Boot Manager as a separate hard drive containing an operating system if additionally an operating system has been installed on it. You will then be given the option of choosing which operating system to boot. In my case it was Windows 7 or Windows 8.

This sounds a lot like a dual boot system, but it differs in that in a true dual boot scenario your hard drive is partitioned into more than one partition with different operating systems installed on the different partitions.

Comments.....Continued on page 6

D-Day, June 6 1944	http://www.history.army.mil/brochures/normandy/nor-pam.htm
Dual Boot Windows 8 from VHD	http://blog.concurrency.com/infrastructure/dual-boot-windows-8-from-vhd-using-windows-setup/

Comments.....Continued from page 5

Here we have the VHD file playing the role of the extra partition.

The advantage of running Win 8 on a VHD instead of on a Virtual Machine inside VirtualBox is that there is no virtualization, and that means fewer problems (such as not getting on the Internet at User Group meetings and not having access to the computer's camera) and, in general, having full access to all the computer's peripherals.

There is, however, a catch: It is much easier to set up a Virtual Machine and install an operating system on it in VirtualBox than it is to create a VHD and install an operating system on the VHD. At least this will be true the first few times you try the process, since it is

done from the command prompt. Then there is this small item: If things are not done properly, you may destroy your current operating system by overwriting it with the new operating system you think you are putting on the VHD. I know because I did it.

I was lucky on my first attempt at creating a VHD and installing the Windows 8 Consumer Preview. I used that setup for a few days and found it much nicer than working with the Virtual Machine in VirtualBox. Then Microsoft pushed out a newer version of Win 8 termed Windows 8 Release Preview. So I went to the Microsoft site and downloaded the iso file for it, burned the iso file to a DVD, booted the laptop from it and was quite quickly presented with the message: "You can't upgrade Windows on a virtual drive." That meant that I needed to create a second VHD on my laptop and install the new Win 8 version there.

As to what went wrong during the installation of a second VHD, the best I can figure is that, when I was given the opportunity to install Win 8, I chose the drive my Win 7 was on. It was late at night, I was tired, and the process was a bit complicated. Anyway, the result was that when the new version of Win 8 installed on what I thought was the VHD and I rebooted, I had only one operating system: Windows 8. Windows 7, along with all my programs and data on the laptop, was gone, as was the VHD file containing Win 8 Consumer Preview. Quite a disaster.

But that is why you have backups. I knew I was a bit in over my head, so before doing any of the above, I cleaned up the laptop's hard drive to give me plenty of space for the first VHD file I was going to create (it was to be made expandable up to 60 GB). I then used our old friend Acronis True Image Home 2010 to do the backup. I had not gotten around to installing the newer version, Acronis True Image Home 2012, that I had purchased when Gene Barlow visited a few meetings back.

When I realized I had destroyed my Windows 7, I booted the laptop from an Acronis bootable disk, set it to restore the laptop to the way it was a few days back and went to bed. The next morning I booted the laptop and checked on my main programs and files, and everything seemed to be in good form. Now to create a new VHD and install Windows 8 Release Preview and to not make a mistake.

If you would like to possibly destroy your current operating systems, here is a link to the steps to create a VHD and install Win 8 on it. There are a number of other such links. Just do a search for install Windows 8 on virtual hard drive.

http://blog.concurrency.com/infrastructure/dual-boot-windows-8-from-vhd-using-windows-setup/#Beta.

Acronis Tip

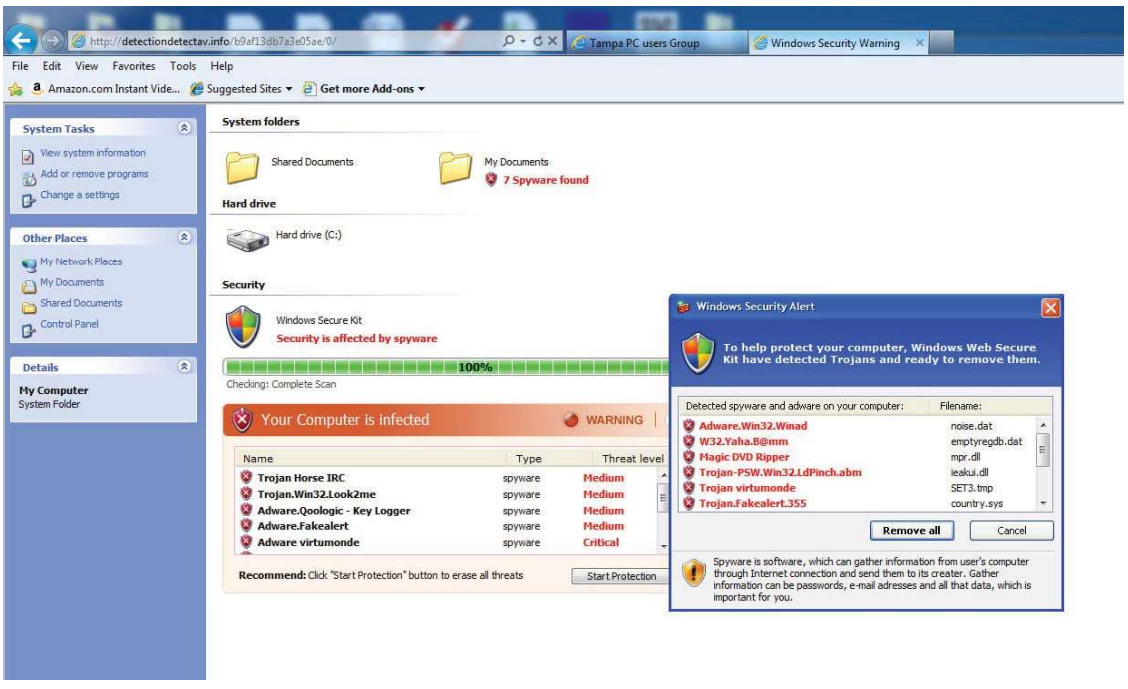
Earlier I mentioned how backing up with Acronis True Image Home had saved me from a very serious loss. Now let me give you a tip on how to save a bit of typing. One reason I was still using an older version of Acronis was that in order to install the new

Comments.....Continued on page 7

Comments.....Continued from page 6

version I purchased from Gene Barlow at our meeting was it required you to type in a serial number of 64 characters plus five hyphens. That was a bit much. I sent an email to Gene and presented my problem. He said to email him the first eight characters for each of the CDs I had purchased. He then emailed me back the complete 69 character serial number for each, so that I could then just copy and paste in the serial number to do the installation.

Eye-Fi



My son likes to carry a very small digital point-and-shoot digital camera with him. The one he had was a number of years old, so for his birthday we decided to give him a new one. I wanted one slightly larger than the smallest you could buy because it had more of the features I would like, such as WiFi, a larger optical zoom and most importantly a GPS My wife assured me that he wanted something really small, and she ferreted out that it was indeed the case. So the camera we purchased was a Canon Powershot Elph 110 HS. This is a 16 megapixel camera, and its dimensions are only 0.8 x 3.7 x 2.2 inches; 4.8 ounces. Now that is a small camera. And it takes quite good photos; much better than you will get with your phone camera. But this is not really about that camera. It is about what came next.

When my son visited Tampa a few days later, we were talking about the lack of a GPS and why that was the main reason I thought the other camera would have been better (at least for my taste). I don't recall how, possibly due to an Internet search about GPS and cameras, possibly because my son had heard about such, we came up with a product named Eye-Fi that is a SDHC memory card that has WiFi built in. How they get all that in a tiny SD card is a mystery to me, but they do and it works.

At first I thought the card also had a GPS receiver, which really astounded me, but later had it pointed out to me that the GPS data the card recorded for each photo was based on WiFi location data. Better than throwing a dart at a map but not as accurate as a real GPS receiver. However, in the test we did at my house, the latitude and longitude were right on the money. How did it know that? Is my wireless router one of the ones for which Google recorded the position?

The setup is as follows: The card comes with a USB card reader in which you put the card and then insert it into your computer that is connected to your wireless network. Once your computer has recognized the card, select the Open Folder to View Files option, navigate to the Start Here Folder and then click on the Setup.Exe file. That will install the required software on your computer. After that you are set to go. Put the card back in your camera. Then, when you take a photo, it will automatically insert the GPS info into the file's EXIF header information when it is saved by the camera to the SD card. Later, when you have the camera near your wireless network, the photo files will be automatically download to your computer.

You may read about this item at http://www.eye.fi/. It comes in different versions: four or eight GB, with or without geo-tagging My son's is the 8 GB with geo-tagging.

Beware of fake security warnings. While trying to move from viewing Nola.com in IE to Bloomberg.com, I saw some sort of message flash up and then disappear from the notification part of the task bar. Then what appears to the left filled up my monitor screen (I have cropped out the right-hand side and bottom

have William to go out there and then show us what we can look forward to.

William showed us the process to get this installed, and he then went into the Win 8 desktop and also showed the new Metro interface to see what that is going to look like. After passing through the Metro interface, the underlying settings pages show little change from Windows 7. But the demo should not be taken to represent the final configuration. The final features are still to be decided.

Our thanks go to William and the preparation he took to show us Windows 8. ◆

Comments.....Continued from page 7

where there was nothing).

The effect was to make you think you had a Microsoft Security warning on your computer. But, if you look closely at the image, you realize that what you are seeing is actually a graphic in a web browser page with a popup in front that has a button they expect you to click on. I am sure that a click on that button would have caused all sorts of bad things.

I suspect the Nola.com page was infected. So, when in doubt, don't click. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

It appears that we have a photography newsletter this month. Jim Purcell tells you about a handy type of lens if you are tired of carrying around a camera with a long protruding lens. Then I relate my experiences with a piece of photography software that I didn't think I needed until I purchased it. Lightroom 4 is probably not for the casual photo snapper, but if you take a lot of photos or just have a collection of photos that you have digitized some other way, then you should consider putting some order in your collection. Lightroom will help you do that.

It has been truly amazing how so many of my interests have been enhanced by what we could now loosely call computing. Photography has been an interest since I was a teenager. Now cameras are lenses with computers attached and the darkroom has no chemicals, only software and a printer.

I am not sure when we first began to mention digital cameras

Minutes of the June Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) normally opens our monthly meeting but was deferred so our speaker, Blain Barton of Microsoft, could conclude early and get back to Tech-Ed in Orlando. The meeting began as usual at 6:30 PM. Blain very graciously has given a talk for us on Microsoft matters for many years. We specifically asked about Windows 8, and Blain came prepared to do that, although he admitted to not spending much time with Windows 8 prior to the meeting.

Blain had a pre-release copy on his notebook. Since it was not touch-enabled he was restricted to mouse movements. The subjects he explained were the tiles interface, Metro UI, Charm Bar, Settings and how it's been somewhat consolidated, single sign-on and federated passwords.

He explained some of the integration with Windows Skydrive, a very large and interesting subject in itself. Also Hyper-V, a virtualization technology that requires specific 64-bit hardware. He also touched on Internet Explorer 10, which is available only for Windows 8.

Our thanks go to Blain Barton and the preparation he took to show us Windows 8. We truly look forward to Blain's annual presentation. ◆

What is a Pancake Lens and Why Should I Want One

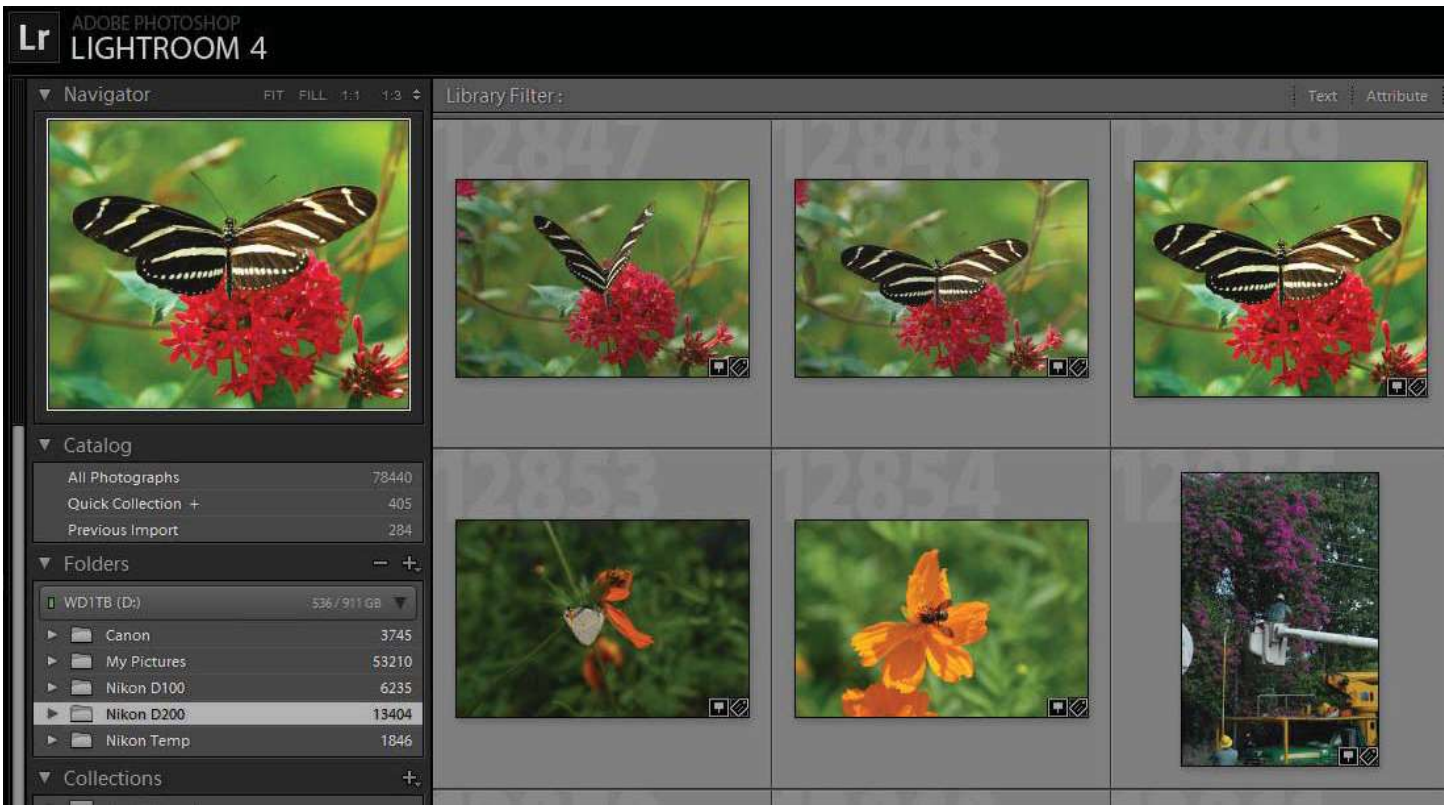
By Jim Purcell, Tampa PC Users Group
Edward_J_P@msn.com

What is a Pancake Lens:

I received a newsletter from B&H Photography announcing that Canon had developed a new "pancake lens." This was the first that I had heard of the Pancake type lens, and I assumed that it was a recently-developed concept or technology. When I started doing some research for this article, I discovered that the first Pancake lens design was developed by Zeiss Tessar in 1902 and that a "Pancake Lens" is a descriptive name for a group of flat, thin or short barrel lenses. These lenses are generally in the 50mm focal length range, or slightly wide-angled, with a fixed focal length. In the seventies and early eighties a variety of manufacturers offered these lenses in their compact Single Lens Reflex (SLR) camera kits. In that era, Pop Photo declared the Konica 45 mm 2.8 the sharpest lens they had ever tested. Pancake lenses are primarily valued for providing quality optics in a compact package. The Canon lens uses linear stepping motors for autofocus and therefore gains an "STM" designation. This type of motor is commonly used in lenses for Compact System Cameras (CSC) as it offers fast, silent focusing during video recording. This system uses a "focus by wire" manual focus technology. The focus ring on the lens is not manually connected to the focusing mechanism but rotating the ring sends an electronic signal to the focusing mechanism.

Why Would You Want One:

First of all I'll state the obvious. To want a Pancake lens, you would need to own or plan to own an SLR or CSC camera since a lens is of no use to you unless your camera has an interchangeable lens capability. I will use the specifications of the Canon EF 40mm lens for this discussion because you should find similar features in other Pancake lenses. I caution you, however, to carefully check the features of any lens that you plan to buy. If you shoot video, the STM technology provides smooth, quiet and continuous auto focus while shooting. The feature that probably is most attractive to anyone who has carried a heavy and bulky SLR to an occasion where there is absolutely no place to put it is its size (less than 1") and weight (4.6 oz). It is the smallest lens that Canon makes. This size tends to make any camera to which you attach it less obtrusive. The lens has a bright F/2.8 aperture giving the capability to shoot under nearly any light conditions. It provides high image quality from the center to the periphery due to its advanced lens configuration, including an aspherical lens element. A circular aperture (7 blades) allows beautiful soft focus backgrounds. The lens also has optimized coatings that minimize ghosting and flare while providing exceptional color balance.



As I mentioned above, I used the new Canon lens features to illustrate the reasons for purchasing a Pancake lens. I again caution you to check the features of any lens that you are planning to purchase. Until I opened the box, I thought that this lens had Image Stabilization. I normally would not purchase a lens without that feature but luckily I believe that the other features override the absence of Image Stabilization. I did not discuss how the crop factor of your camera affects the 35mm equivalent of the focal length of the lens, but it is another thing that you should consider in determining if the stated focal length actually fits your needs. ◆

Camera with 40mm Pancake Lens

Camera with 17-135mm lens

Adobe Photoshop Lightroom 4

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

I had held off purchasing this program for a number of years because I didn't think I needed it. To me it was just another program for organizing your photos, and Adobe Photoshop already came with a program called Adobe Bridge which seemed to do that. It allowed you to add things such as a title, keywords and a description to the photo header information. While in Bridge, if you wanted to edit the image it was trivial to bring up Photoshop. What more could you want?

Well, you might want to geotag the photo – that is, add the longitude and latitude of where the photo was taken. I still don't have a camera with a built-in GPS unit. And, of course, any photos that I have scanned from negatives, slides or prints will not have that information. I do have a free program, Microsoft Pro Photo Tools, which I have mentioned in the newsletter, that allows you to geotag photos, but that was a separate program. So I would use Bridge to enter descriptions and keywords and then have to use Pro Photo Tools to do the GPS info. All this was a bit tedious and time consuming. Hence, my decision to purchase Lightroom since it would do all of this and much more in one software package. And Adobe would let me have it for $100 instead of the usual $150.

The first and an important thing you should know is that when you import your images into Lightroom, it does not move their location on your hard drive. This is important since some cataloging programs apparently do this, which, I think, is a bad idea. Importing will be the first thing you do when beginning to work with Lightroom. I did this in batches, not all at once, partly because I don't have all my images in one place like My Pictures and also because I have so many of them. If you look closely at the screen capture above you will note that I have brought a total of 78,440 photos into Lightroom from various places on my hard drive. You wouldn't want to do all that at once even if they were inside the same big folder. I actually have only about 68,000 unique photos on my computer since I have two folders each containing around 10,000 images that are almost the same but not quite the same, so I need to sort out how they are different before making one folder of the distinct images in each of the two.

Lightroom.....Continued on page 6

Comments.....Continued from page 1

in our newsletter, but I am pretty sure that one of the first articles, if not the first, was by Larry Anders about his Sony Mavica digital camera. It was a camera that stored its images on a 3.5 inch floppy. Larry's article was in our October 1997 newsletter, where he noted that the Mavica could store up to 20 high-resolution images or 40 standard-resolution images in 24-bit 640 x 480 (VGA) JPEG format. Well, we have come a long way since then. I am having a hard time recalling, but I think a 3.5 floppy stored about 1.4 MB of data. That wouldn't even hold one cell phone photo now.

Speaking of cell phone cameras, that is about all I see in use any more. I see basically no point-and-shoot cameras, although I am sure the new ones produce much better images than the best cell phone camera. And as for digital SLRs, sometime I feel I am the only person using one, at least for casual photography. Obviously professional images for magazines, newspapers and weddings require the digital SLR.

Next month, something more than photography, I hope. ◆

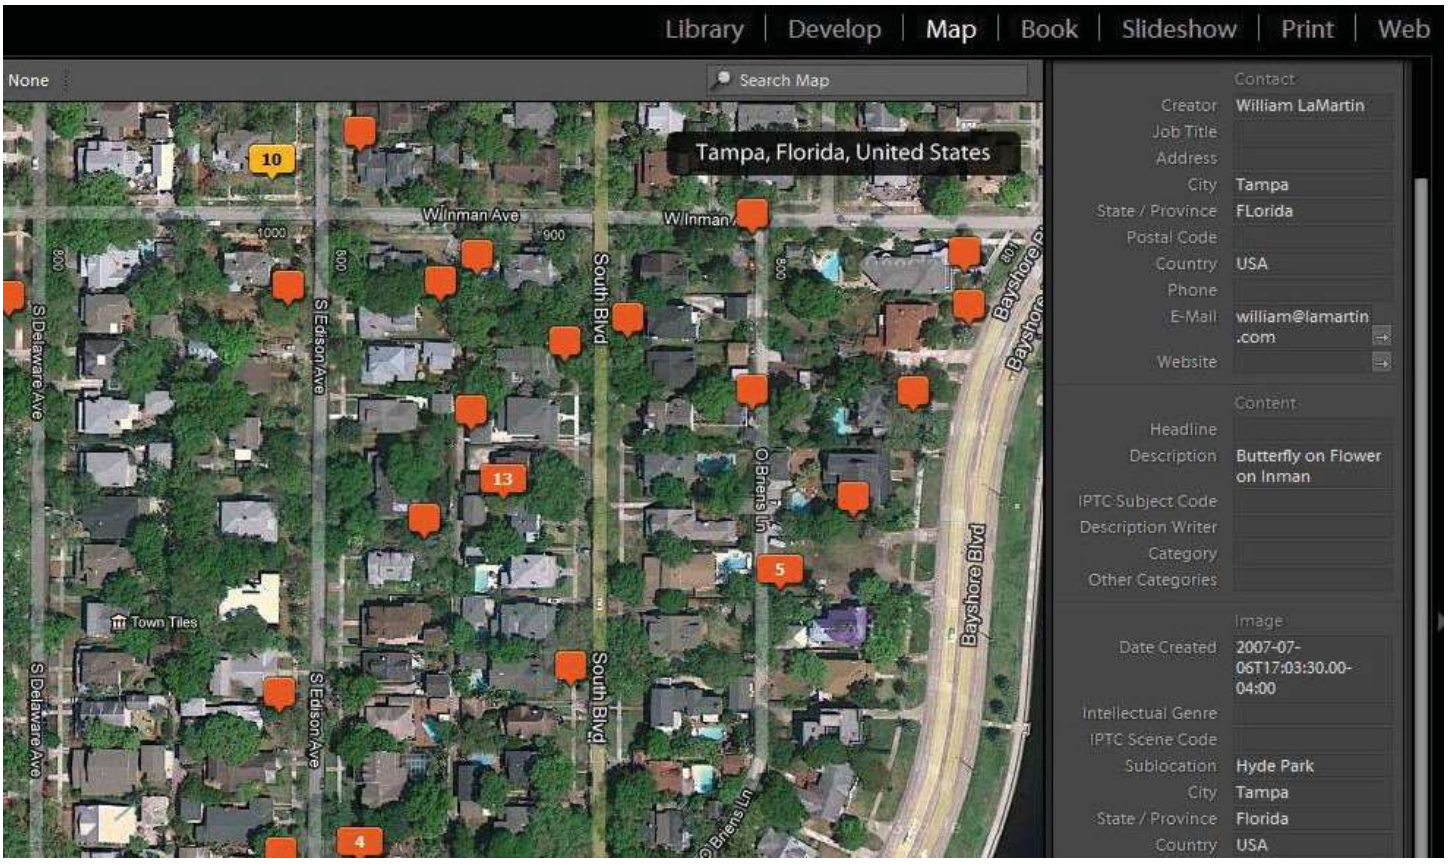
Lightroom.....Continued from page 4

Lightroom has seven modules: Library, Develop, Book, Map, Slideshow, Print and Web. The image on the previous page is a crop of a screen capture of the Library Module where you do your importing and file management.



The next Module is the Develop Module where you can modify various items, such as exposure, white balance, contrast, saturation and more, for individual images. At present, I have not used this Module since I have in the past done such things in Photoshop. The third Module is the one that I really like, the Map Module. A cropped screen capture below shows the locations of photos in a folder of images from my neighborhood taken with my Nikon D200 camera. The yellow [view the newsletter at our web site to see color] tag with the numeral 10 is the location of the butterfly image on page 4 and nine other images.

To locate an image, you simply drag it and possibly others from the thumbnail collection (not shown) onto the map. On the right you can see the data I entered about the image. The maps used are by Google. On the right also is a panel containing data entered by the camera, such as when the photo was taken.

If you are in the Library Module, this panel on the right gives you the opportunity to enter keywords. If you then assign keywords to your images, such as dog, cat, tree, water, Tampa,John, etc., in the Library Module, you may filter by keywords to display only those photos in your collection that have, for example, the keyword John. This filtering may be done on any one or any combination of file name, keyword, title, description or any searchable field. Quite a useful feature.

The only problem with the filter feature is that to use it you need to have entered such information in your photos. I have only been doing this since I purchased my third digital camera, the Nikon D200, and there still is a folder named Nikon Temp (1,846 photos) where some of my more recent photographs await geotagging and keywording. I believe most of the photos in Nikon D200 (13,404 photos) have been geotagged and given descriptions and keywords. If

Lightroom.....Continued on page 7

Lightroom.....Continued from page 6

you do it right after you take the photos, then it is not too bad. But who does things when they are supposed to. You put it off, take more photos, put off cataloging them, and before you know it you have 1,846 photos sitting in Nikon Temp that you haven't done.

Then there is the elephant in the Lightroom: 53,210 photos in MyPictures that were not taken with a digital camera. I have already said that I need to get rid of around 10,000 of them that are duplicates, but that leaves around 43,000. Now in that collection are many thousand from the Burgert Tampa Photo Collection and the Historic New Orleans Collection and smaller numbers from other historic collections I have downloaded from the web. There are about 25,000 such images, so I won't be geotagging them. But it is conceivable that if I can figure out how to automate the process via programming, I can add with little effort a description to many of these photos since I have many of the descriptions in a database along with the corresponding photo's file name. Subtracting these 25,000 leaves 18,000. Oh, and there are the 3,475 photos taken with my first digital camera, a small Canon, plus the already mentioned 6,235 taken with the Nikon D100. I should live so long as to get all this done!

But that is not all. I also have about 10,500 images that I have scanned in over many years from negatives, slides and prints, using at least four different scanners. I have added descriptions and keywords to almost none of these (although I know the subject matter since I took the slides and most of the negatives and the other items mostly have some family connection). For many of them I don't know the exact location, so there is no geotagging to be done. However, there are images I took more than 40 years ago that I can tell you the exact locations they were taken. Of course, it is easy if it is in your boyhood home's back yard or some well-known public location.

What else can you do in Lightroom? After the Map Module, there are four more Modules.

Book This Module allows you to create a book in Blurb, PDF or JPG format in four different sizes using a collection of your photographs, You may choose front and back covers, the particular layout of each page regarding the number of photos and text. And if you use the Blurb format, it will tell you the cost of an actual printing and binding of the book. Now you ask, what is Blurb? Blurb.com is a printing service that prints a bound book based on the layout and photos you select. I did a quick test of setting up such a book with some 62 family photos in the 8 x 10 format just to get an idea about pricing. The quoted price (from inside Lightroom) was $78.65.

Lightroom.....Continued from page 7

Slideshow The cropped screen capture below is of the right-hand side of the panel used to create a slide show. The thumbnails running across the bottom are the ones that I have flagged for use from the larger collection. On the right is the panel for choosing the setting for the show. Once I choose the settings, add a little text and preview the show, all I have to do is press the Export to Video button (out of the cropped view) and the program will create a mp4 video.

The remaining Modules are **Print** and **Web**. Print just facilitates printing with a few features like watermarking (for proofs, I suppose). The Web Module is more interesting in that it lets you create what I would call a slideshow for the web as opposed to the mpr4 video mentioned earlier which Lightroom terms a slideshow. These Web shows are termed Web Galleries, and there are a number of different formats from which to choose. Some use Flash and some appear not to, but I haven't had time to really look into them.

If you are serious about cataloging your photos, Lightroom 4 is the program. My question: Will I ever get mine done? ◆

william@lamartin.com

Well, no phone or camera article this month. Ron Weinberg tells us how to more easily connect to streaming content (movies) on the web, and Merle Nicholson tells us how to protect our computers from weather hazards. So that leaves me a bit of space to write about some computer odds and ends.

Apple vs. Samsung Apple is suing Samsung claiming that Samsung copied the iPhone's look and feel, i.e., the rectangular shape and rounded corners. Also there is something about the Android operating system stealing from Apple's iOS. Apple says that receiving 2.5 billion dollars from Samsung will make them feel better about the alleged theft. Samsung, I think, has a countersuit against Apple. What appalls me about all this is the sort of things that are claimed to be patentable: rectangular shape, rounded corners, certain types of swipes and taps on the phone screen. These companies try to patent variations of

Minutes of the July Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. The meeting began as usual at 6:30 PM. The SIG is devoted to a discussion of all aspects of the Windows Operating Systems and of computer-related subjects in general. The SIG moderator, Bob LaFave, introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees.

This month Bob touched on a variety of subjects asked by members in attendence: DLL error messages – he demonstrated Autoruns from SysInternals as a good tool to track down errant DLLs. He also discussed a "Take Ownership" menu change program, a quick way to resolve security file ownership problems with files that refuse to be deleted. Further information on this is posted on our TPCUG Forum. See General TPCUG topics for the July 11 entry by Bob LaFave.

Bob LaFave was our presenter for the July meeting, so he continued from where he was. The subjects he presented were Torrent, Portable Apps and ISO files.

Torrent – Bob demonstrated uTorrent – a peer-to-peer file sharing application. He showed how to install the free version, peer ratings on movies, and quite a lot of security cautions. Bob spent quite a bit of time showing various locations and what to do and not to do. All very valuable information.

Portable Apps – a free application and menu system that is to be installed on a flash drive and transported so that a very large collection of good quality applications are available on any computer from the flash-drive. All of these programs are specifically configured to be run from the portable apps application. This is an excellent way to have familiar software on any computer. Nothing is installed on the host.

Another Way to Connect

By Ron Weinberg, Member at Large,
Tampa PC Users Group
rswjbr@verizon.net

Do you want or need an Internet connection at or near your TV? Easy, just run a Cat 5e or Cat 6 cable though your walls, ceiling, etc. for the best hard-wired connection. Too difficult? Buy a pair of powerline adapters and connect through them. Not as efficient or fast as wired, but it works. Don't want to spend the money and already have wireless router and receiving equipment? Just set up your slower wireless connection.

Wait! Now there may be a better alternative for you. Here is my story.

As avid movie fans, we have been streaming movies, primarily from Netflix, using a wireless G connection from our ISP router to and through our Blu-ray Player. The quality of the picture has been excellent, but the initial connection has been slow. From time to time we could not connect and received a "Network Interference" message, which seemed to be coming from the Blu-ray Player or an intermediate Samsung server. To resolve each instance we had to turn the Blu-ray Player off and on, sometimes several times, in order to connect to the Internet and on to Netflix. A Google search showed this was a common problem but a specific remedy was not available.

It occurred to me that perhaps a faster, better connection might correct the problem. Hard-wiring is the preferred method for the best signal. Running a physical Ethernet cable was not practical for this location. Budget would not allow powerline adapters. Next best, I thought, would be to try wireless N, which the player was capable of receiving.

A wireless N router was not readily available at no charge from Verizon, my ISP, but I did have the option of buying my own directly, which could be easily connected to my network.

After a discussion of the problem with a Verizon support specialist, it was decided to send a service technician to investigate.

When I explained the problem to the technician he immediately came up with a solution and installed a Coaxial Network adapter, which required a splitter, two short coax cables, one Ethernet cable and one power adapter.

The main coax cable carrying the TV signal is connected to the input of the splitter. The splitter outputs from one port to the adapter and another to the Verizon DVR/Set Top Box. The Ethernet cable is connected from the adapter to the Ethernet port in the Blu-ray Player. Powering off the router does not kill the coax signals to the TV, only the Ethernet connectivity.

We reset the Blu-ray Player to use a wired connection and the router automatically assigned it an address and incorporated it into the network.

After testing it, the tech was on his way.

The adapter shows as a MoCA device in the router. Difficult hard-wiring or other adapters were not needed.

MoCA is the home entertainment networking standard, from the Multimedia over Coax Alliance, used for delivery of cable, satellite, and IPTV signals. Main features are: Supports full Ethernet speed, uses existing coax cabling, and coexists with cable TV services.

The new adapter is Verizon Coaxial Network Adapter, Model ECB2200V, manufactured by Actiontec. You can see details on the Actiontec website, http://www.actiontec.com/. If your ISP can not provide this or an equal device, Amazon sells them without the Verizon brand for about $83.

I can now report that connection times are faster and the "Network Interference" error message has not reoccurred. I have all the benefits of a high speed wired connection. ◆

Hurricane Season – Are You Ready?

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

Ok, as we all know – we've at least been reminded – the 2012 hurricane season is upon us. It arrived in late June with a tropical storm that hung around a long time. Some of us in Tampa experienced some real outages that lasted a couple of days. I was fortunate to have just a couple of brief outages over three days; just some blink-outs. Those brief interruptions can cause some real damage if you're not set up correctly. If you're interested in preserving your electronic equipment, I have some ideas and some solutions.

First, I'd like to categorize the types of events:

1. Direct Lightning Strike – fuggetaboudit. The outcome is just dumb luck. Obviously it can burn your house down and/or destroy all or anything attached electrically. In Tampa, the TECO Zap Cap program is the best protection. Outside of the equipment, Zap Cap provides you with a policy against damages.
2. Nearby Lightning Strike – this is the temporary full outage you get from a nearby strike. It's characterized by a single full outage typically lasting for one second.
3. Tree strike – this is when a tree blows into a line. It's pretty common. It's characterized by as many as three successive blink-outs. The fourth usually results in a complete outage lasting for a minute to days, depending on the storm and the demand placed on the restoration crews. Most of the time it's a single blink, but wait a few minutes – it may happen again when the wind gusts again.

It is number three that I want to discuss, because it's what we need to address using UPS equipment. I call it a tree strike, but it could be other things that blow into the overhead lines. An electric company spends a lot of time and resources on tree trimming. The problem is – deciding how much to trim, because they can't afford to over-trim. It's very costly and those costs are passed on to you because they are operating costs.

When a tree branch is whipped into an overhead line, it causes a short that is detected by equipment back at the substation. That equipment opens the line – drops power within milliseconds – waits for a timed interval and then closes; reenergizing the line. If the branch is still touching the line, it will interrupt again. It has a timer so that it counts the number of closings and after that number, it stays out. It can be reenergized from the control center, but to prevent permanent damage someone must be sent out to investigate. An outage may last an hour to days.

Trees are a difficult subject. After all, trees belong to people who are also customers. There is very little regulation concerning the placement of trees. Trees sprout on their own, right? Little trees grow up to be big trees. Some trees grow fast, some slow. And municipalities are very much interested in preserving trees. It's very difficult-to-impossible to cut them down, and there are regulations on the percentage of a tree that may be trimmed.

So what can we do to minimize damage to the home? There are two things we must look out for. One is low (or high) voltage, and the other is electrical and thermal shock to equipment that turned off and back on repeatedly. Our best protection is UPS – Uninterruptable Power Supplies. Now, I'm not ignoring "surges" – that rare event that causes a stray high voltage to surge in and destroy equipment. Surge protection is basic – also covered in the Zap Cap program, but it's an integral part of any UPS. Those surges are a brief high voltage caused by a nearby lightning strike that lasts just milliseconds (that's event #2).

Let's check on one thing. Did you know your computer can be set to turn back on when power is restored? Do you want it to be? Well, I guess that would be a NO! I don't want it turned off and then on .. then off. Right? It must be set so when it goes off, it stays off. If yours does not stay off, you can set that in BIOS. My setting is "Restore on Power Loss" and the choices are "Power Off" and "Power On". This is important. Set it

Comments.....Continued from page 1

searching on the Internet, clicking on the computer screen and all sorts of obvious ideas (at least to me they are obvious) that really should not be patentable. Since Google makes the Android operating system that the Samsung devices use, I suppose that the lawsuits are also a shot across the bow of Google, which is probably more of a threat to Apple than is Samsung.

Social Media Stocks Apparently someone has unfriended the stock of Facebook and Zynga in recent weeks. As I write this, both companies' stock prices have plummeted since their IPOs, with Facebook down around 45% since its IPO in May and Zynga down a whopping 70% since its IPO last year. Since Zynga's games, like Farmville, run on Facebook, the two companies affect each other. All you Farmville players need to get out there and purchase more virtual tractors and cows to help these two companies. Facebook is now selling at only $21/share instead of the IPO price of $38.23.

Time will tell if the current collection of social media stocks, which also includes Groupon, Yelp, Pandora

to "Power Off".

OK now UPS. It's a battery backup that keeps power on your equipment so it doesn't blink out for those one second intervals. It's to extend the life of your computer or equipment. How long can it power your computer? I don't know for sure, but I certainly hope they stay powered up long enough for me to shut them down manually or the UPS software to do that for me. That's the objective; to carry you through those blinkouts. The type of UPS we're considering is a "standby UPS". This type of UPS powers your equipment with the line voltage and then switches to battery/inverter power very quickly. They are available in sizes from 200 to 1200VA. I have two 200VA, a 550VA and three 750VA in my house.

A UPS has these components:

- Outlets for equipment to have battery backup; they also have surge protection.
- Outlets that have no backup, but they do have surge protection.
- An inverter to supply 115V AC to supply the outlets that have backup.
- A battery – Sealed Lead Acid type to power the inverter.
- An AVR – Automatic Voltage Regulator. This is optional – more about that later.
- Electronics to control all this stuff, power switch and circuit breaker.

When we buy a UPS, there are just a few things to consider: Capacity, runtime, AVR, battery and price.

Capacity This is measured in VA – that's Volt-Amps. Useful, right? Not Watts like you'd expect. Here's what I do.

For a full-blown desktop computer with LCD monitor, I use 750VA. A small computer, small processor, one hard drive and an LCD monitor. I use a 550VA, and for the Verizon router, wireless and network switches I use a couple of 220VA. The Verizon FIOS device has its own battery. I have four monitors, so I have just the one primary on the UPS; the others are plugged into the non-battery outlets. I have the DVR, a small media PC and an LED clock on one 750VA.

All the major UPS manufacturers have calculators to help you with this. In my opinion, they all lean toward selling you more capacity that you may be interested in, but they are very useful. Just Google search "Uninterruptable power supply size", and you'll get several sites. Don't Google "UPS" because .. well, you know.

Runtime I'm sized to get about six to ten minutes on computers. That's enough time to ride out all the blinkouts. If the power goes dead altogether, I have no interest in keeping power on computers. We shut them down properly. All the large capacity UPS have USB cables and software to shut them down gracefully. The small devices like the router will probably run for a couple of days. But – you know why – being in Tampa, I'm not interested as much in runtime as I am interested in having the ability to ride out the blinkouts.

AVR I consider AVR where I live pretty essential. It definitely raises the cost and weight of the UPS significantly. The AVR is a heavy transformer that adjusts the output voltage on low and high incoming voltages. It's available in the larger sizes – 500VA and up. Those UPS that have AVR have it labeled very plainly on the box and in advertising.

Battery UPS uses SLA – Sealed Lead Acid batteries. Batteries should be replaced every two years. You can go longer, but you're at risk, and I would never go more than three years. I have the battery sizes, dimensions and an industry size in a document that I keep up when they are replaced. I also (now) label both the battery and the outside of the UPS with the date of last replacement. You'd think I do a good job on this? Wrong. I just installed four replacements – all have the same size batteries. One I took out had bulges on the sides! And one was dated in 2008 – four years. What prompted me to order those replacement batteries? The hard way of course. When the June storm came in, one UPS battery was so low that it just shut off and didn't come back on. Not that this was a bad thing; it just wasn't what I expected.

Battery replacements are easy to get. I order all mine

Hurricane.....Continued on page 7

Hurricane.....Continued from page 6

from an online battery sales company at half the price of retail. Yes, the shipping is a bit high, but all those batteries are an industry standard size. You don't have to buy from the UPS manufacturer unless you really want to spend three times the generic brand price.

Rules Never plug a power strip in a UPS unless you absolutely know for sure that the outlet strip has no surge protection built in. No surge-protected power strips. Never plug a laser printer in a UPS. There's no reason to plug any printer in a UPS; use a surge protector instead. It's as important to figure out what you don't need backup for as what you do. Don't plug in any charger, cell phones or wireless telephones. If your house phone has a base station with no battery in it, that would be a good thing for a UPS. If your alarm system uses an Internet connection to call in the alarm, the Internet router is a good one for the UPS.

Last advice Don't wait until replacement time to find out what kind of battery your UPS uses. The time to do that is when you buy it. Sure, write down the manufacturer battery replacement number, but pull the battery out and measure the battery and photograph it while you're at it. Generic battery sizes designate dimensions, Voltage, Ampere Hours and terminal size. Save the information and make a Google appointment in two years. My battery guys: http://www.batterymart.com. ◆

Comments.....Continued from page 5

and Linkedin (the only one doing well) turn out to be like Pets.com of the .com era (do you remember them?) or like Google.

Searching Flickr There are many ways to search for photos on the Internet, and there are a fair number of photo sites. One of the oldest and best, but of less interest to the general public now, is Flickr, owned by Yahoo. You can simply go to the Flickr site at http://www.flickr.com and search for any photos you would like from among the over five billion they say they have. Or just click on one of the photos you like that they are featuring at the moment. That will lead you to all the collections of that particular photographer. When I do this, I realize two things: There is a large and diverse world out there, and there are some very good non-professional photographers. In fact, sites like Flickr make things hard for the professionals who used to be able to charge several hundred dollars for a particular photo sold to a magazine. Now the magazines whenever they want a particular type of photo, check the photo sites like Flickr, and, if they find what they want, they offer the amateur a fraction of what they would have had to pay the professional for the photo. And, with these modern high-end digital cameras, the amateurs can produce, when they are lucky, something as good as a professional.

So, why mention Flickr? After all, it is old news. Well, I decided sometime back to write a program that would allow me to more easily search the Flickr database of photos for ones that interest me. Flickr makes this possible by providing an API for doing this. You can find the API at http://www.flickr.com/services/api/. To use the API you need to request an API Key from Yahoo, which is easy and, as far as I can tell, automatically granted on request. And, of course, you need to be able to program in some programming language.

Perhaps six months back, I did all of the above and wrote such a program for a Windows desktop computer and for a Windows 7 phone. As of yet, however, I haven't bothered to put the WP7 app at the phone marketplace since I have made so little on the apps I have previously put there. However, with the arrival of Window 8 for tablets and the desktop, I think I might do better on that platform and have been working on modifying the Windows application for Windows 8.

As an example of using the program, you can put in a search term like Manhattan or New Orleans, set the most recent date to consider, such as today, select how many thumbnails to retrieve at a time, say, 25, and press the Search button. You then receive a collection of 25 thumbnails, where clicking on one will display a larger version of the image along with pertinent facts like: Title, Description, Owner, Longitude & Latitude, Posting Date, Camera and Host Computer. You may also download the largest version of the photo permitted. The Picture of the Month was retrieved in this manner. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Thanks to our contributors, Merle Nicholson, Robert Davis and Ron Weinberg, I have very little empty space to fill.

The big news, I suppose, is that Apple was successful in its lawsuit against Samsung for patent infringement, and they will now try to block the sale of a number of Samsung Android phones in the US. I don't know if Kevan will be using one of these phones in his presentation or not.

In other news, Microsoft will be releasing Windows 8 to the general public in October. People who have certain Microsoft subscriptions, as does Merle Nicholson, were able to download it a couple of weeks back. Today, August 29, Samsung announced that they would have both an ARM processor and an Intel Core i5 processor version of their Windows 8 slate computers that will be available in Europe on October 25. I am sure other manufactures will soon follow suit. There was no mention of the US date. Finally, Windows Phone 8 and Visual Studio 2012 are also due very soon. ◆

Minutes of the July Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. The meeting began as usual at 6:30 PM. The SIG is devoted to a discussion of all aspects of the Windows Operating Systems and of computer-related subjects in general. The SIG moderator, Bob LaFave, introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees.

This month Bob touched on a variety of subjects – the main subjects were ISO files, and their use, ISO Buster to view the contents of ISO files, ImgBurn to create and to burn ISO files to CD/DVD; there was also a brief mention of Portable Apps and running from the hard drive, and Roboform. As usual, an excellent and informative SIG session.

The presentation this month was given by myself, Merle Nicholson, on the subject of passwords and the necessity of having a system to manage them, the importance of not re-using passwords, and the advantages of a program like Keepass or KeepassX to store them. I mentioned what I thought is the best method of remembering the Keepass lock password and how the brain stores and retains this type of thing.

Also shown was the online e-edition of the Tampa Bay Times, and some directions on how to navigate this and what it has to offer. There seemed to be plenty of interest in this, partly from its convenience, but also the cost savings.

Also demonstrated was inSSIDder, a free program to capture and analyze local WiFi signals when you need to locate a suitable WiFi connection, and incidental to that a quick demo on WiFi sharing from a smartphone, for which, in my case, having an Android phone, I have an app called FoxFi.

Windows 8 – first three hours

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

I guess after saying I didn't have time to look at the Win 8 release, I was lying. My plan was to eventually build a computer with parts I have around here and install it, but I went ahead and installed a Virtual Machine (VM)in VirtualBox. My curiosity just got the best of me.

Eventually I'll have to test my commercial applications because a customer will buy a new notebook with Windows 8 installed and then call me to ask if that's ok. I can't really say no, because sooner or later no one will have a choice. And that time is coming in October.

I tried to upgrade a Windows 7 Virtual Machine. The Upgrade failed, with the error below, so I created a new virtual machine and then making a new machine failed.

Research on the Internet came up with a BIOS setting in the motherboard that fixed it. "No-Execute Memory Protection" needs to be enabled, as found at:

http://www.tech-recipes.com/rx/26800/windows-8-on-virtualbox-and-vmware-your-pc-needs-to-restart-fix/

I don't know why. There are a lot of incidents on the Internet with this error; some were fixed by this, and some by other things. This was after the third attempt to install.

All went well after that. I did some settings and realized that I was really tired of getting to "Apps" from the desktop with no Start Menu. Apps are there, but you have to leave the desktop to get to this tiled-list. I knew about this because everyone writes about it, but it's just tiresome.

Ed Bott on ZD Net has some good Win 8 articles, http://www.zdnet.com/eight-things-to-do-right-away-after-you-set-up-windows-8-7000002693/. One thing he points out is strange. You have to set your time zone. It used to come up automatically on installation, but it does no longer. So you start out with Pacific time. When you realize this, you have to wade through settings to change it. I think they intend for "Location Services" to catch up and change it, but I don't know when that is, and I turned that off anyway. William LaMartin is pretty sure it's a bug. On the other hand, I have a desktop unit with no GPS.

I took Ed's advice and added several items on the Taskbar by right-clicking on the Metro Tile and selecting to add to the Taskbar. Otherwise I may have never found them. (Maybe not "NEVER.") Notably "Run," "Help" and "Cmd."

I relied on Ed's articles when I switched to Windows 7, and he's holding true to form now. These articles are very useful: http://www.zdnet.com/blog/bott/.

Your default logon account seems to be your Windows Live account. You can change that to a Local account – and I did this and entered a new password for that, and it created an administrative account with that name and password. You really aren't aware you need to do that until you realize that your login password is the same as your Live account. And you just THOUGHT you were entering the Live account and password so they could send you a message in case you've forgotten your account information. Yep, maybe, but that became your account login also. Until you figure it out and change it. They SHOULD be different. Your Live account is probably all over the place; it's not suitable for locking your PC.

Win 8.....Continued on page 4

Win 8.....Continued from page 3

Also, there's no obvious way to Shut Down, Restart, Sleep or Hibernate. Believe it or not, it's in Settings from the Metro screen. I had to find Help first so I could find that out, and – I may be wrong here – I had to go to Charms, Search, type Help. I eventually was able to get a Help icon on the Taskbar. Then I made a Shutdown and a Restart shortcut on the desktop.

Windows 8 doesn't have a Start Menu. If you put the cursor at the bottom left corner, you get a little pop-up that when clicked goes to the Start screen [below]:

And when you right-click the Start screen, you can get to the Apps screen, as captured at the bottom of the left column:

The Apps screen is difficult for me to grasp because all the Start Menu programs are here, and when I'm done installing all my applications, I'll have five times this many tiles. It reminds me of people who have their

desktop covered in icons and haven't discovered menus.

To solve the Start Menu problem I added a ToolBar on the Taskbar and used the "Start Menu" folder as the Toolbar source directory. With some fiddling – this isn't easy, I moved the ToolBar on the left. And I now have a Start Menu. I manually added just a couple of items – the Shutdown and Restart shortcuts. It isn't pretty, but it's cascading. Yay [see screen capture immediately above]. Current score: Merle 3 and Microsoft 300,000.

I am used to having Windows Security Essentials installed for anti-virus, and at first

Win 8.....Continued on page 5

Internet Picture of the Month

Goats in a Tree

From the Wall Street Journal online, http/www.onlinewsj.com, in the photo section for August 27. The caption read: Goats climbed an Argan tree to get to its fruit near Essaouira, Morocco, Sunday.

Win 8.....Continued from page 4

look, it seems there is no anti-virus. Except while I was in Control Panel, Windows Defender was there, I opened it and found Windows Security Essentials inside there already running. It isn't in the system tray. This is interesting. I like it.

Since my Windows 8 foray is in a virtual machine it's hard to measure performance, but I can say this; I'm not disappointed by how well – and how fast – it runs. It isn't slow.

I'm still working with this, obviously. My immediate objective is to get Office 2010 and Access 2003 installed and some other programs I need and to try everything out so I'll be prepared to help my customers. I'm trying to keep an open mind and to keep from sounding curmudgeonly; maybe I'll find some advantage and grow to love it. ◆

Donating or Transferring a Clean PC

By Ron Weinberg, Tampa PC Users Group
rswjbr@verizon.net

Getting a system ready for donation or transfer to another individual is distinctly different from adding another user to the system.

The objective is to remove all personal information including: data, passwords, financial information, emails, photos, videos, etc.

The most common way is to completely wipe the hard drive, which will make the information unrecoverable. Mere deletion allows most data to be easily recovered by using readily available tools. Repetitive overwriting with 0 or 1 or other character will make the data unrecoverable. There are many different standards for overwriting. The common tools offer various options. The more overwrite passes, the longer the process takes.

If you merely want to junk the PC and kill the hard drive there are various programs sold or available free to wipe the drive. Some of them are: CCleaner, Darik's Boot and Nuke ("DBAN"), Eraser, DP Wiper, WipeDrive, etc.

If you completely wipe the drive, you are left with an unusable piece of hardware because the operating system and all programs will have been destroyed. This would be of little use to someone else unless they had their own software or just wanted parts.

You can resolve that issue if you have the OS and Program disks but reinstallation takes time and thereafter updates must be installed, often years worth. Nevertheless, those truly concerned with removing highly sensitive classified Government Security or extreme personal or business data and who fear their hard drive may be searched should only do a complete drive wipe.

Otherwise, you can remove only sensitive and personal data and leave the OS and programs intact using file wipe rather than disk wipe programs. This will take considerably more time than just wiping the whole drive.

Here is the procedure I recently used to clean a Windows XP laptop.

1. First I removed junk, unused, questionable, and trial programs that may have come originally with the new system. Of course, you could omit this step and dispose of the PC with those programs still intact. I used "PC Decrapifier." CCleaner would also work. The Control Panel's Add/Remove Programs may be sufficient.

Use care if the system has any programs that use sensitive material such as Quick Books or a Password Storage Program such as Roboform, Keypass, or similar. Remove the program but be sure to determine the location wherein it stores data so that data is not omitted during the cleaning process.

2. Clear the browser cookies, temporary Internet files, passwords, and history using delete in Internet Explorer's Internet Options. Users of other browsers such as Firefox or Chrome would need to take appropriate action.

3. Locate and delete all the .dbx Outlook Express files (for Windows Mail .eml or for Outlook .pst) and the email account itself.

To perform the clean itself I used a combination of CCleaner and Eraser. It is possible to do the entire clean using Eraser alone. Both offer file wipe options.

4. Using Eraser, clean the My Documents folder and any customized folders. Repeat this for any additional users of the PC you are preparing.

Steps 5,6,7 are easy to perform. A Google search will provide easy to follow instructions.

5. Change the Owner on the General Page of System Properties to remove the name. This created a set of folders as if there were a new user.

6. Change the Computer Name if had been personal-

Donating.....Continued on page 7

The Unknown Problem

By Robert Davis, Tampa PC Users Group
RobD234@gmail.com

Ever have one of those weird days where something goes wrong and you just don't know what it is or what caused it? Well, Friday the 17th was like a Friday the 13th for me. I logged onto my Google email and wanted to send a PDF file I had just scanned to my nephew's email. After attaching the file, I tried to open it to be sure it was the right thing. When I selected Open from the Google Open or Save options, my laptop went into mumble mode. McAfee virus software reported it stopped a program from creating a "Buffer Overload." Nothing worked after that except the mouse. I couldn't even get the Toolbar to come up. I did a Control-Alt-Delete and was able to shut down OK.

I started up the PC again and all looked well. I tried to open the PDF file again and zap – same thing. McAfee again claimed it stopped a program from creating a "Buffer Overload." Then nothing worked.

The technical area of PCs got away from me about when Windows replaced DOS, a long time ago. I called one of our club's technical gurus, Bob La Fave. With his assistance, I tried a Restore, but I didn't realize how long it takes to do a Restore and thought the PC was stuck again. I had to pull the battery to kill the restore. Bob suggested I bring it up in Safe Mode and do a Check Disk. The Check Disk ran and ran and ran, but I could see it was actually doing something. I told Bob I would call him if I needed more help. It checked out over 214,000 files and over 16 million clusters. It took over an hour to complete. Next per suggestion from Bob, I started a Restore again. I waited and waited for over an hour. Finally, I decided to just let it run until it busted or finished. I took my wife out to dinner leaving the Restore running. When we got home, to my surprise it had finished the Restore, and it came up normal. It was late in the evening so I decided to just shut down and do more checking tomorrow.

Saturday morning the PC came up normal again, and I was able to open the PDF file with no problem. However, there was one final problem. McAfee Virus Software claimed I was unprotected and needed to run a full scan. But every time I started the scan, it would stop, claiming it had errors and to try again. I logged on to McAfee website. I selected their FIX option. It ran and fixed 2 of 3 problems. I tried to use the Chat mode but after waiting for about 20 minutes, decided to just download the whole thing and reinstall it. I guess they don't have free Chat on Saturday. Anyway, reinstalling the whole package fixed everything. The laptop is running fine again, thanks mostly to some great help from Bob. But what caused the problem in the first place is unknown. I just hope I don't have an unknown problem lurking in there that will come back a kill a tranquil day again. ◆

Donating.....Continued from page 6

ized.

7. Remove the former user's Profile or Profiles. Repeat for additional users..

8. Clean the Recycle Bin with CCleaner and perform a defrag.

9. Use Eraser on the free space to remove remnants of previously deleted files. Defrag and Erase of unused disk space can be run unattended.

10. (Optional) Clean the Registry with CCleaner or other Registry Cleaner.

There is one limitation to using these methods rather than a complete removal of the operating system. Once Windows establishes a User it can never be completely removed. You can remove that user's data and profile but a folder with that user's name can never be removed because it is a System folder. Although empty, it will forever show in Documents and Settings. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Thanks to Robert Davis for sending an article for the newsletter this month. Since there were no others, I was forced to purchase parts for a new computer so that I would have something to write about. Well, that is not exactly the whole story, since I wanted to be able to use Windows 8 on a desktop computer that was not simply a virtual machine or a dual-boot operating system. And I didn't want to sacrifice my Windows 7 desktop to an installation of Windows 8 over it, so it seemed the only option was to get a new computer. Plus, isn't that what we are supposed to do to get the economy going? However, I think all the parts were made in Asia. so I don't know how much they help our economy. Of course, Amazon and newegg did get something out of the deal, as did UPS and FedEx.

As I have mentioned before, Apple has not only surpassed Microsoft in its market capitalization (value of its stock), it is the most valuable company in the US. What is new this past week is that Google for a few days had a larger market capitalization than Microsoft. As I write this on Oct. 2, a share of Apple stock

Minutes of the September Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. The meeting began as usual at 6:30 PM. The SIG is devoted to a discussion of all aspects of the Windows Operating Systems and of computer-related subjects in general. The SIG moderator, Bob LaFave, introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees.

This month Bob touched on a variety of subjects – the main subjects were Windows 8, Media Center, Start Menus, TV tuner hardware, Kaspersky Anti-Virus. As usual, an excellent and informative SIG session.

The presentation this month was given by Kevan Sheridan, our vice president and one of our longest-term members. The subject was Smartphones and everything you can do with them. Kevan is most familiar with Android, but gave as much of a brand-neutral presentation as possible. He talked about the OS, Apps (applications), Web Access messaging. He made a comparison of Android vs ios, numbers of applications and what that really means.

He spent a great deal of time describing how to enhance the experience with GPS, tracking athletic progress, watching videos, sharing photos, social experiences and much more. Applications he touched on were WiFi Analyzer, HotSpot, Join.me, View Docs, Remote Desktop, Pandora, YouTube and Navigation. YouWave for Android, and Mint – a Quicken emulation were also talked about, as were GasBuddy – a gas station locator that uses your current GPS location and finds the best price on gas. Shazam – a music recognizer, Disney Parks, Weather and fitness workout software.

Kevan is always well-prepared with his slides (on Google Docs of course) and is an entertaining and

Building A New Computer

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

If you will look back at the November 2010 newsletter, you will see that I wrote about Merle Nicholson building a quite nice Windows 7 desktop computer for me. You can read the article at our web site and have a look at the specs and the prices of the components. It will be interesting to compare then and now.

Why do I need another new desktop computer so soon? Normally I wouldn't even think about a new desktop computer now. The one I have is still functioning just fine. It is fast, the C drive has sufficient room for more programs and the D drive is not even half full of data. The problem is that I need to be able to work in Windows 8, and I don't want to load Win 8 over Win 7 on my very nice desktop. I am not sure I really trust Win 8 to do all the things I do as conveniently as I do them in Win 7.

I need Windows 8 so as to be able to program in the new Visual Studio 2012 for the new Windows 8 tablets and phones that are soon to appear. You will not be able to do this in Win 7. Right now I have Windows 8 Consumer Preview in a Virtual Hard Disk on my laptop so that I can dual boot to either Windows 7 or Windows 8. Why not just put the final version of Win 8 on the laptop the same way? Well, because I find it difficult to use a laptop to write programs. Thus the desire (I suppose not really a need) for a new Windows 8 desktop. And, I may eventually put Win 8 in a dual-boot situation on the laptop (replacing the Consumer Preview) so as to be able to demonstrate the new programming environment in our programming SIG.

Oh, you say, why not do a Virtual Hard Drive and dual- boot for Win 8 on the existing Windows 7 desktop? Unfortunately, the desktop's C drive is a solid state drive that is 128 GB, of which only 30 GB is free. Having the operating system and programs on a solid state drive is one of the things that make that computer so fast. I am not going the solid state drive route with the new computer since it will have a still faster processor than the current desktop's processor. The processor in my current desktop is an Intel I7-875K and in the new computer the processor will be an Intel I7-3770K, which is about 66% faster.

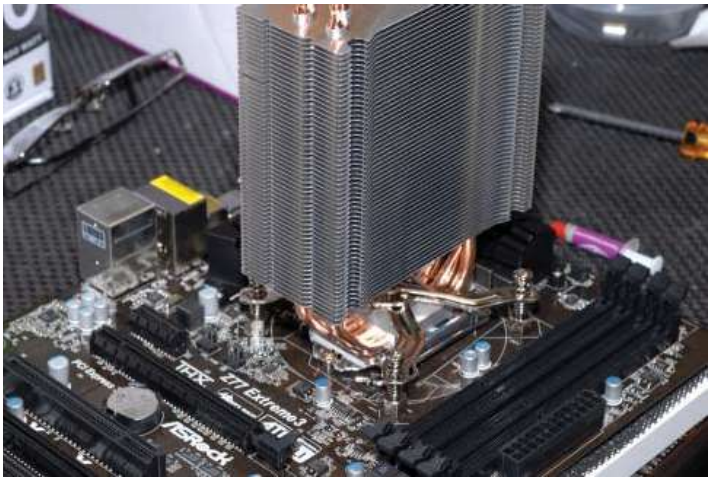
New Computer.....Continued on page 4

New Computer.....Continued from page 3

The parts list for the new computer is above. Merle, who is an experienced and knowledgeable computer builder, made the list with a few minor modifications by me. You will note that there is no keyboard or mouse. I am gong to use what I have around the house until I settle on something better.



The monitor is special for this computer. It is a multi-touchscreen monitor. That is to allow me to use hand gestures on the monitor when working with Win 8 apps. This monitor is like the screen of a smartphone or a tablet in that not only can you use your finger to select items, you may also do swipes and pinches with your fingers just like you do on your smartphone. This will allow me more easily to see how the phone and tablet apps I am working on creating perform. Visual Studio, where I will be doing the work, provides emulators for the phone and the tablets where you can use the mouse to simulate such actions, but it will be much nicer to actually be able to do them by touching a screen. The only thing that I will not be able to do with the screen is to rotate it from landscape to portrait and have what is on the screen rotate as it does in a phone or tablet.

The afternoon the last of the parts arrived, and they arrived quite quickly from both Amazon and newegg, I took them to Merle's and watched him put everything together. I should note that the reason for buying some things from Amazon and others from newegg was that either the Amazon price was cheaper than newegg, or the total cost was less because I receive free two-day shipping from Amazon because of Amazon Prime.

Merle estimated a two-hour job, but it turned into four because of a few complications. The basic process is to first unpack everything, then put the motherboard on the workbench and expose its CPU socket for installation of the CPU as indicated in the photo on

the bottom left. In the photo at the top, the CPU has been installed, and in the next photo, we see the CPU cooler installed on top of the CPU. In the photo with the cooler, on the lower right is where the memory modules will go and to the left is the slot where we will install the video card. I should note that the moth-

New Computer.....Continued on page 6

Internet Picture of the Month

Hurricane Isaac

Perhaps you have already forgotten, but there was a hurricane in late August that caused a lot of flooding in southern Louisiana, just not in New Orleans this time, where it only knocked out the power for a few days. Since it didn't really damage New Orleans it won't be remembered like Katrina – except by those unfortunate, very flooded people in several parishes, Plaquemines being one of the worst. The photo to the left from the online New Orleans *Times-Picayune* pretty much tells the story.

As a side note, the *Times-Picayune* after 175 years as a printed daily paper is now going to be printed only three days per week (another casulty of the Internet), with the online version having to be sufficient for the other days. http://www.nola.com

Comments.....Continued from page 1

will put you back $661.31 and a share of Google goes for $756.99 (obviously there are more shares out there for Apple than for Google since Apple has the larger total value). Oh, the current value of a Microsoft share is $29.66. For the record the market capitalizations today are APPL: $619,915,940; GOOG: $248,360,580; MSFT: $248,651,550. So Google, while it temporarily surpassed Microsoft, today has dropped back below. But just look at Apple. The parts for the computer I just built could be purchased for a little more than two shares of Apple stock. But enough on stocks. Unfortunately I was never smart enough to purchase Apple or Google when they were cheap – only Microsoft and it is still cheap, but at least it pays dividends, which is better than having money in a CD at essentially 0%.

erboard comes with a built-in video. However, Merle said that it was awfully slow, so we will be installing a stand-alone video card, as will be seen in subsequent photos.

The top photo shows the cooler fan installed and in front of the fan are the two 8 GB memory modules which give this computer 16 GB of RAM. In the next photo the video card has been installed, and the colorful (if viewed on the web) bundles of wires you see are one of the connections of the power supply to the motherboard. With this motherboard, Merle advised, there is also a smaller secondary connection of the power supply to the motherboard. In the next to last photo we see the motherboard from the opposite side from which we have been viewing. Here you can see the connections we used to test the setup. The far left

black plug is the power cord to the house power. The second from the left (blue if you are viewing this on the web) is the video connection. Note at this point we are using the built-in video to do the test instead of the separate video card. The white rectangular object that is next is a USB thumb drive with Ubuntu loaded so that when booted the computer loads and runs Ubuntu for our testing (at this point I still don't have a final version of Win 8 to load into the hard drive). To the right of the thumb drive is a LAN cable. What you don't see connected above is the hard drive, a DVD/CD drive and an internal FAX modem. The final installation looks like the last photo, except that the FAX

modem had not yet been installed. As you can see there are plenty of slots and bays available if things need to be added in the future.

New Computer.....Continued on page 8

McAfee Problem Resolved

By Robert Davis, Tampa PC Users Group
RobD234@gmail.com

I had another one of those weird days where something goes wrong, but this time I think I found the problem. McAfee Anti-Virus software! It was right at a week after a weird problem I think was also with McAfee – seeming to stop "Buffer Overloads" – that I had another more damaging and time-consuming problem. Friday afternoon I tried to log onto my email as usual only to see the message "Internet Explorer cannot display the webpage." Thinking I had messed up something, I rebooted the laptop, but I had the same problem. It appeared the PC was not connected to the Internet anymore! I called Bright House tech support, tried plugging their modem directly into the laptop – no good. The laptop was still unable to connect to the Internet. It appeared the modem was broken. I had just had it replaced a couple weeks ago due to the phone line section being zapped by lightening. So I was suspicious of the modem anyway. Bright House agreed to come out Friday night between 6 and 8 PM after I twisted their arm a little. Unknown to me, my mother's Bright House is somehow connected to my account, and, even though my complaint was for my 655 phone number, they called my mother's 653 phone number about 6:30. Of course she told them she had not put in a service request, so I lost the hands-on tech Friday night. She did call me and asked if I had ordered the service – too late.

About 8:30 or so, after I raised a fit with Bright House, their supervisor said he could not send a tech out Friday night anymore, he rescheduled a tech for 12 to 2 PM Saturday, and he wasn't sure they had even diagnosed the right modem! My mom has a similar setup with Bright House. So reluctantly I agreed to talk with their tech support again. After going through the same diagnostics again, the tech thought the modem seemed to be OK, and he asked me what anti-virus I was running. I told him McAfee - for 10 years or so. "That is probably the problem," he said. I thought he was joking, but he wasn't. It seems McAfee has done an automatic update with apparently bad code which causes many PCs to lose their Internet connection! He said he thought the fix was to merely uninstall McAfee and reinstall it. I did uninstall McAfee and after reinstalling the D-Link router (I had reset it for 10 seconds which sets it back to factory default) I was able to access the Internet again. But none of the other PCs could use the router. I did ask why the first tech hadn't asked me about my anti-virus type that afternoon. He said they should have. What happened next is in my opinion an unconscionable act by McAfee! I logged on to McAfee and downloaded what I thought would be a cleaned version of their software. Why would McAfee leave a known problem available for their customers or anyone to download? Anyway, I reinstalled McAfee from the new downloaded file and all seemed well with the laptop and the Internet the rest of the evening. I finally shut down the laptop about 11 PM. I figured I could fix the other PCs' accesses Saturday.

The next morning to my amazement the laptop would not connect to the Internet again! And of course none of my other PCs could access the Internet through the wireless router either! After reconfiguring and messing around for an hour or so, I finally deinstalled McAfee and again the laptop could access the Internet. I cancelled the Bright House call. But the other PCs still could not connect through the router. They all saw it with excellent signal strength but would not connect. I was using the same key word, same password, and I thought the same encryption type, but still no connecting.

It is now Monday night. This afternoon I went into the modem itself and set the passkey, password, and noted the encryption type was different from what I thought. After I used the correct encryption type, everything started working again. All the other PCs and my MAC can access the Internet normally again. So because of what I consider an unforgivable act on the part of McAfee, I cancelled my account. Bad enough to put out a bad upgrade – but to leave it available for downloading by their customers in my opinion is unforgivable! I am now using AVG until I find something better. Just another three days of trouble-shooting so I can save time by using PCs! ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

This is pretty much a Merle Nicholson newsletter, for which I am extremely grateful, but he did leave me a little space to fill. I hope those of you who don't have Windows 8 installed on anything will not tire of all the Win 8 coverage. But that is mostly what is happening at the moment, and the material can also serve as a guide and reference for the future. So with that hope I will write here about installing Win 8 and other software on the new computer I wrote about in the previous newsletter.

Microsoft finally got my MSDN subscription straightened out, and I was able to download Windows 8 Professional and install it on both my new desktop computer and on a virtual hard disk on my main laptop. Both installations went quickly and flawlessly. However, the virtual hard disk setup on the laptop is always a scary situation for me in that once while doing such I wiped out my Win 7 installation and had to use Acronis to bring it back. I will be using the laptop to do the Windows 8 presentation to the group this month.

Minutes of the October Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. The meeting began as usual at 6:30 PM. The SIG is devoted to a discussion of all aspects of the Windows Operating Systems and of computer-related subjects in general. The SIG moderator, Bob LaFave, introduces new or little-known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees.

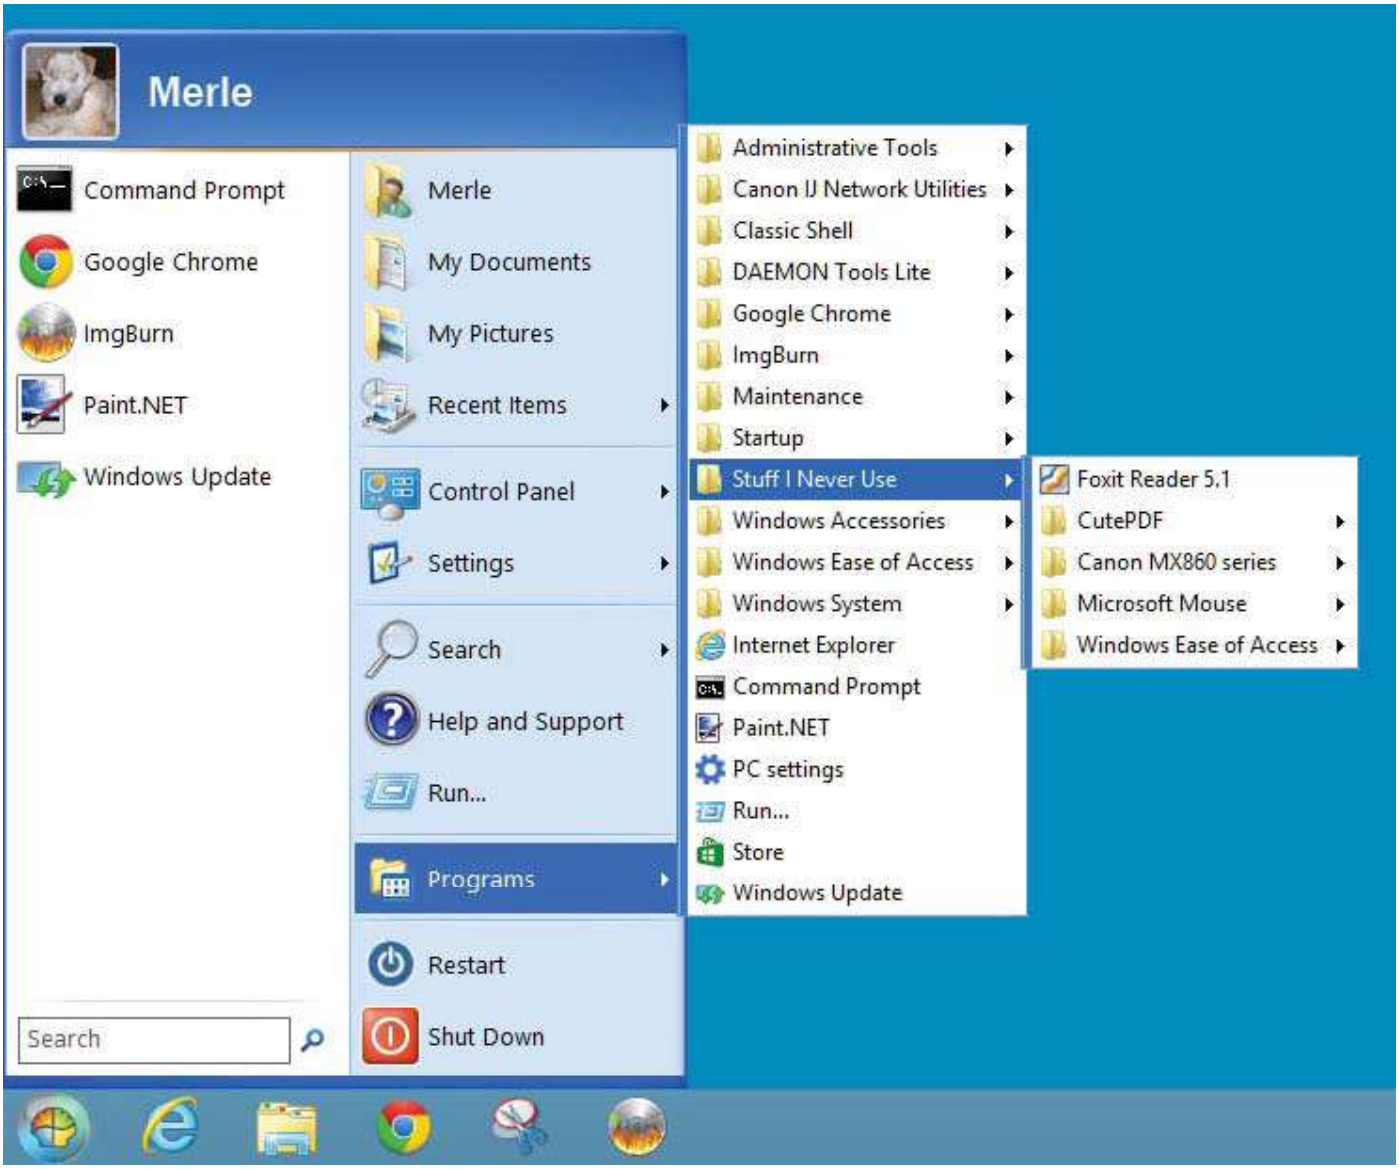
This month Bob touched on a variety of subjects – the main discussion was about Windows 8 and performance, Windows 8 Recovery and partitions. Then Bob touched on the subject of the GoFlex external hard drive, which connects to a router.

John Witmer, President, led a discussion on the December annual dinner/meeting and food. Then he brought up the question about meeting locations after March 31, 2013; asked for volunteers for officer positions for 2013; and noted the need for a program topic for November.

The presentation this month was given by Steven Singer, who did his annual hardware presentation. He brought in a large variety of interesting gadgets and computer components. He started with USB fast-charging devices that will output more than the standard USB 500mA for faster charging. Bluetooth was the next subject with Bluetooth speakers, headphones and headsets and also Bluetooth handsfree.

Steve also brought in some mini-computer components in the way of mini-ITX motherboards, ITX computers and USB WiFi dongle. He then spoke of a passion of his – movies, and talked about the website moviesneaks.com. He suggested software called JV16 Powertools, which claims to fix a variety of computer problems with cleanup software. ◆

Windows 8 Start Menu



By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The picture with this article is a screen capture of my Windows 8 computer with the Start Menu expanded. We've all been reading about the loss of the Windows 8 Start Menu and having to return to the Tiled Interface to select a program. That switching between the desktop and the tiled interface (* – see footnote, page 4) to me is confusing and will take a lot of learning because the actions are designed for a touchscreen(# – see footnote, page 4). There are keyboard and mouse equivalents, and they are being well-documented now in blogs, but I don't see a Win+h key combination as being intuitive; it's something that must be learned instead.

The alternative is to change the interface so that you deal with the AUFL (*) as little as possible, and I've been working off and on to make it so. My objective is to use the improvements inherent in Win 8 and keep it Win 7 as much as suits me. Also I must test my Windows 7 applications in Windows 8 because one of my customers will surely buy a Windows 8 computer and THEN ask me if my application will work.

There are a surprising number of replacement Start Menu systems that work in varying degrees on Win-

Start Menu.....Continued on page 4

Start Menu.....Continued from page 3

dows 8. The one I have chosen for now has existed since before anyone ever heard of Windows 8. I looked at this several years ago as I was trying to get used to the Vista menu. I found it wanting and went on to other things, but they obviously have been developing and improving this product and I'm very pleased with it now. It's called Classic Shell, available for free at http://classicshell.sourceforge.net/

The interesting thing about Classic Shell is that they have "skins" – that is ways to customize the appearance. They have three basic styles, called "Windows Classic", "Windows XP", and "Windows Vista/Windows 7." It has a basic settings mode and a HUGE amount of customization in "All Settings".

The "Windows Vista/Windows 7" version lacks what the real thing lacks – a cascading menu system. Instead it uses the Windows 7 tree view, where the menu items keep getting taller, to see everything instead of branching (cascading) to the right. It has everything I have always hated AND liked about the Windows 7 menu.

The Windows Classic is what you get on Windows XP as an alternative "classic" menu; it's minimalist and doesn't have the column for "most used shortcuts." It's ok, but needs more.

The Windows XP version is – for me – almost perfect. It has cascading menus and a column for displaying most recently used shortcuts and a way to pin those permanently. To my great surprise, it is customizable to fix the most annoying thing about the original – the location of the Programs button. In the picture on page 3, I have moved it to the right-hand column. It traditionally is at bottom left, and when you expand from there – the left – the menu expands and hides other items on the menu. I have made other changes – like Shutdown; it did have a menu with – you know – Reset, Sleep, Hibernate; I don't need that. Everything I wanted to improve is improvable. I love this product.

There are several Windows 8-specific changes to make, like disabling the hotspot corners and changing it to go directly to the desktop instead of the AUFL when booting.

I like it so much I'm going to use it on my Windows 7 computers.

Classic Shell, available for free at http://classicshell.sourceforge.net/

Footnote:
(*) the tiled interface doesn't have a name – we need to invent one. I tend to think of it as "Annoying Useless Fluff, Lite" (AUFL, pronounced AUFL).

(#) To be fair, it seems to work well on a touch-enabled device if you don't mind going back to doing one thing at a time. I already have a touchscreen – a 7" tablet, and I don't mind doing one thing at a time on it, but it isn't my primary computer. ◆

Comments.....Continued from page 1

Once Win 8 was installed on the new computer, I had to then install whatever programs I wanted to use. That included Microsoft Office 2007 Ultimate, Adobe Design Standard CS6, Microsoft Expression Studio, and Visual Studio 2012 as the main programs, along with less important ones like the FTP program FilZilla, the mapping program ArcGisExplorer and another mapping program Microsoft MapCruncher, Firefox and Google Chrome.

Of the programs, I tried to install, only one gave me trouble: Family Tree Maker 2010. The installation started and got a long way into the process and then just stopped progressing at the point where it was installing some background image named Arch de Triomphe.jpg. Later I decided to do a search on that file and Family Tree Maker and found all sorts of people with the same problem going back long before Win 8. But while I was searching I was also trying to do the installation again, and all of a sudden the installation started moving forward and did indeed finally complete. However, the first time I tried to open a Family Tree Maker file, it crashed. But on my second try everything worked fine and has continued to work

Comments.....Continued from page 4

the few times I have tried the program. Based on the Internet search information, this is not a Win 8 problem but a Family Tree Maker problem, which I have luckily surmounted without doing anything other than waiting a little longer for the installation. I am sure there will be a number of additional programs that I will still load, but these are the ones I use most often.

The next job was to load all of my data: Word files, Excel files, etc. I did that over several days, along with copying all of my photos. When finished, I had moved a lot of data: 117 GB of files in My Documents and 183 GB of files in My Pictures. With that, the new computer was ready to be used, which I have been doing for the past month. ◆

Saving FIOS DVR Recordings

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

Saving FIOS DVR recordings: We've had two one-hour DVR recordings on the FIOS Set Top DVR device for more than a year that we – my wife Val and I – want to save. Two reasons – one – we now use a Media computer running Windows 7 and Windows Media Center, along with a cable tuner card for all our TV, and no longer use any Verizon FIOS Set Top Box (STB). Second – I have friends who have had the hard drive in the STB go bad. That's not a problem to Verizon, they will willingly replace it, but, of course, anything you want to save is lost.

Our DVR STB is still in place and connected but rarely gets used because the Windows Media Center (WMC) is far superior to any STB available. I have 2 TB of recording space, and that allows us to never watch live television. Honestly, we never do. We record everything we want and watch it when we want and just fast forward through commercials, pledge drives and anything else unpleasant.

Microsoft WMC is a jewel of a computer program. The remote control is well designed (and inexpensive), the menus are well organized; the advanced scheduling for recordings is a pleasure to use, and guess what – it's free in Windows 7, but uncertain in Windows 8.

The advantages of WMC over the FIOS DVR are apparent from the beginning. The FIOS STB is just painfully slow to respond to anything. Press a button and wait, press a button and wait. And there is so little real information on the screen. They keep changing the menus, improving the appearance, I'll admit, but slowing it down to just painfully slow.

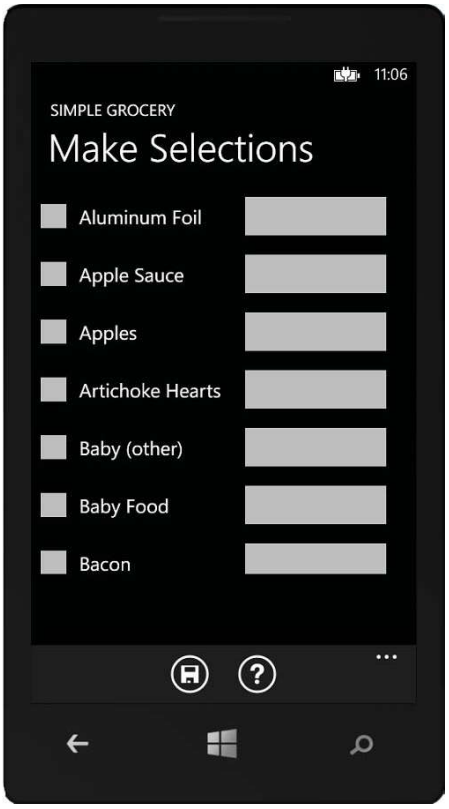
Back on subject now. We wanted to get two Discovery Channel Sunrise Earths off of the DVR and saved. Lots of research had led us to one fact; there are a lot of excellent Sunrise Earth programs that Discovery has not made available on DVD; the two that we like the most are not. We have bought one 3-set DVD collection from them and will buy more if they made them available. The STB is just a black box – no way to read anything from it. But we can play those programs for as long as we want until the hard drive fails.

I've had a solution sitting and collecting dust for some time now in a Samsung VCR-to-DVD recorder. It's a model DVD-VR335. It's designed to make VCR to DVD conversion easy, and it does a pretty good job of that. What I realized was that it also has a video input and can record anything from a video source to either DVD or tape. I don't want to make it sound too easy; I made a half dozen DVD coasters in the process, but it does work. The video input is composite or S-Video. Composite takes three RCA connectors: one Video and two for Stereo. For DVD output I used Component – the best choice for my older 19" flatscreen Monitor/TV. So I had three devices sitting on my workbench; a DVR, VCR to DVD recorder and the monitor/TV. So after recording I had a playable DVD. The recording program ALWAYS puts a menu at the beginning, so when you load the DVD, you must select the only menu item and it starts playing.

OK so far. But I want the videos on the WMC hard drive in the video library.

I now have a DVD with some kind of movie with a .VOB file type. WMC will play it as a DVD, but it will not appear in the WMC video library. I have a large set of media programs by a company called NCH Software Suite. There's a module called "Prism Video File Converter Plus" at www.nchsoftware.com. I'm certain there are other video format converter programs. This one works, but you purchase the modules a la carte, and it can get expensive if you want many of the 17 modules available. In addition it wants to install a crapware toolbar. Fortunately it's optional, but you have to be careful. It created a .wmv file in short order, but for the two large videos, they play in a smaller window with the black bands where the DVDs do not project. So I'm still looking for the solution to that. In any case I have the DVDs and they play fine in WMC as long as I drop the DVD in the PC. If anyone knows of a good conversion program from .VOB to .wmv let me know. Update – well, I should have thought

Saving.....Continued on page 8



Writing Win 8 Applications

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

I have been writing Windows desktop applications for years, Windows Phone 7 applications for a little over a year and now Windows 8 applications for a few months. And with the launch of the Windows Phone 8 SDK, I plan on looking at Windows Phone 8 applications. I will be using the recently released Visual Studio 2102, but you can download the free Visual Studio 2012 Express and do the same thing.

In the presentation at our monthly meeting this month, I hope to give you a taste of what programming for a Win 8 phone application and a Win 8 desktop or tablet application is like.

Below you see a phone app for creating a grocery list, where you check the items wanted and enter any additional text. On other pages in the app, you can add extra items to the list and put the list in walking order of a particular store (assuming you have previously ordered the categories of items in that store: for example, bakery, deli, dairy, cereal,...).

Of course, all of this requires coding both for the interface you see here and for the code underneath that carries out whatever is necessary to record your choices and to then put them in order.

A small selection of the code, called xaml, that creates the visual part of the page is listed next. You don't need to understand it. Just believe that Visual Studio turns the xaml containing that text into the screen you see in the previous column.

```
<StackPanel x:Name="TitlePanel" Grid.Row="0" Mar-
gin="12,13,0,12">
  <StackPanel Orientation="Horizontal">
   <TextBlock x:Name="ApplicationTitle" Text="SIMPLE
GROCERY" Style="{StaticResource PhoneTextNormalStyle}"
HorizontalAlignment="Left"/>
   </StackPanel>
<TextBlock x:Name="PageTitle" Text="Make Selections"
Margin="9,0,0,0" Style="{StaticResource PhoneTextTitle-
1Style}" FontSize="48" />
..............
```

Then there is the C# code that runs behind the scenes and does all the heavy lifting. A small sample:

```
StreamReader readFile = null;
if (myStore.FileExists("ItemAndCategory.xml") == true)
//this will not be true on first use
 {
   try
   {  //Retrieve Category info

    readFile = new StreamReader(new IsolatedStorageFile
Stream("ItemAndCategory.xml", FileMode.Open, myStore));
string fileText = readFile.ReadToEnd();
doc = System.Xml.Linq.XDocument.Parse(fileText);
readFile.Close();
...................
```

My goal is to show you how to create a very simple Windows Phone 8 app (the grocery shopping one is not simple) and a very simple Windows 8 tablet app. After that, I will simply demonstrate several of my phone apps and Windows tablet apps using the emulators provided by Visual Studio. It would be a bit difficult to give a good demonstration on an actual phone or tablet.

If there is any time left, we can talk about what sort of devices have just hit the market for Windows 8 and what is planned. The Windows Phone 8 is scheduled to be released very soon with all major carriers having a couple different types. As you should have seen, Microsoft for the first time has manufactured its own computing device called a Surface. It is a tablet running Window 8 RT that can also have an attached keyboard. A second Surface running Windows 8 Professional is due in several months. We can also discuss the differences between Windows 8 RT and Windows 8. Come out and learn something new. I will try to make it understandable. And if you have a Surface, please bring it. ◆

of this, but the Windows Live Movie Maker will read multiple .VOB files. That also eliminated the menu and it allows you to clip any ends that need it. Then you can save it as .WMV video file.

I had another, similar project – I have a VCR tape of my youngest son in a TV commercial from when he was professionally modeling when he was seven. I was able to apply what I'd learned and record from tape to DVD, convert to .WMV and then I converted that to .MP4 so it could be published on our family Google+ site. What fun. Now he can impress girls in bars with it. 30 seconds of … Awwww. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Last month was pretty much a Merle Nicholson newsletter, for which I was extremely grateful, but he said he couldn't do it two months in a row. And since no one else has come forward at this late date, it appears that this month it will be pretty much a William LaMartin newsletter.

I am going to give you an overview of my latest Windows 8 application, which has a lot to do with our club. Its sole purpose is to allow you to read and search all of our newsletters back to 1988. I don't think more than a small handful of our members have yet installed Windows 8 or purchased a new device with Windows 8, but as time goes by many of you probably will. And when you finally do, the Computer Group Newsletters app will be there at the Windows Marketplace waiting for you. It will cost you nothing, since it is free. Merle Nicholson has previewed it for me and even made two suggestions to make it more user friendly. And just before I started this newsletter, I submitted Release 2 of the app containing those improve-

Minutes of the December Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The December meeting was our annual dinner meeting held at Pepin; catered, organized and hosted by John Witmer. The dinner as always was excellent and well-attended. There was no formal program, just plenty of conversation and good food.

A special thanks must go to John for his hard work in making this a special evening.

Our slate of TPCUG Officers remain unchanged for 2013.

Comments.....Continued from page 1

ments to Microsoft with the hope that they would pass scrutiny and the new version will be available by the time this article reaches you. But you can't tell. Sometimes the submission process takes just a couple of days and sometimes it can take over a week. In this case, it took less than a day and the new version is now in the Windows Store.

I know that some of the TPCUG members received some sort of technical gadget for Christmas about which they could write an article for the newsletter. It would interest your fellow members and help the editor.

As usual, the images in this newsletter appear much nicer and in color in the Acrobat version at our website.

Happy New Year! ◆

TPCUG Newsletter App

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

We are quite possibly the only computer club with its own Windows 8 app, although I must confess that I haven't done a search. It just sounds like the sort of thing no one else would think worth doing. But I wanted to do a couple of free Windows 8 apps before submitting some of my ideas for paid apps to get some practice with the Windows 8 app submission process, it being a bit different from the Windows Phone app submissions. My first such app was one that allowed to you view both private and public cell tower locations on a map of the United States. As I recall there were around 600,000 private ones and perhaps 60,000 public ones. I collected that data from the Federal Communications Commission site, put it in a database and wrote the mapping application. I like working with data and maps, and that application used both.

But what to do next? Then, on a visit to the local Microsoft office for a monthly meeting on programming, I saw an app where there was a grid of images (Boy Scout merit badges, I think) that you could click on to learn about a particular one. And I had a vision: A scrollable grid of TPCUG newsletter first pages that when you tapped on a particular one, the first page of the newsletter was produced such that you could read it and also move through the rest of the newsleter. But what I really wanted to do was to allow you to search the newsletter collection for any combination of words. In this article I will tell you how I did that.

Before going further, lets note that although the Tampa PC Users Group has been in existence since sometime in 1984, the earliest newsletter is from 1988. And for the first several years, our collection of existing ones has holes, but beginning with 1991 the collection is pretty much complete. Since I was the newsletter editor, a job I inherited in December of 1995, former member Edward Buzza gave me a box of newsletters when he was going to move from Tampa to Pennsylvania. I don't recall the year. Later current and longtime member Roger Waters gave me his collection.

Over time, I scanned those paper newsletters into Adobe Acrobat and performed Optical Character Recognition on them. That is the source of the newsletters from 1988 up to December 1995.

From December 1995 onward, whenever I created a newsletter in, first, Microsoft Word, then later in Microsoft Publisher, and still later in Adobe InDesign, I would also have the program create an Adobe Acrobat version. I was able to do this since I had a copy of the full version of Adobe Acrobat thanks to Adobe providing for the small charge of $25 a copy of Acrobat to computer club newsletter editors. They no longer do that, and I have been paying full price for any updates for many years.

Thus, I have all the club's newsletters as Adobe Acrobat files, and you can actually view them at our website at http://www.tpcug.org. And, I also made available a CD or DVD containing all the newsletters through, I think, last July, along with an index that could be used in Acrobat to search the entire collection. And that was what I wanted to be able to do in my newsletter app. And that is where a good bit of the work in the project resided.

At first, my plan was to somehow display the Acrobat files, or possibly the individual Acrobat pages, within the Windows 8 app, but I found that was not possible. So the next best thing would be to display an image of each page. Thus, the first thing I needed to do was to create from each page of the 281 newsletters a corresponding image. That would be 2,924 pages, so we are not going to be taking individual screen shots of the pages while being viewed in Acrobat.

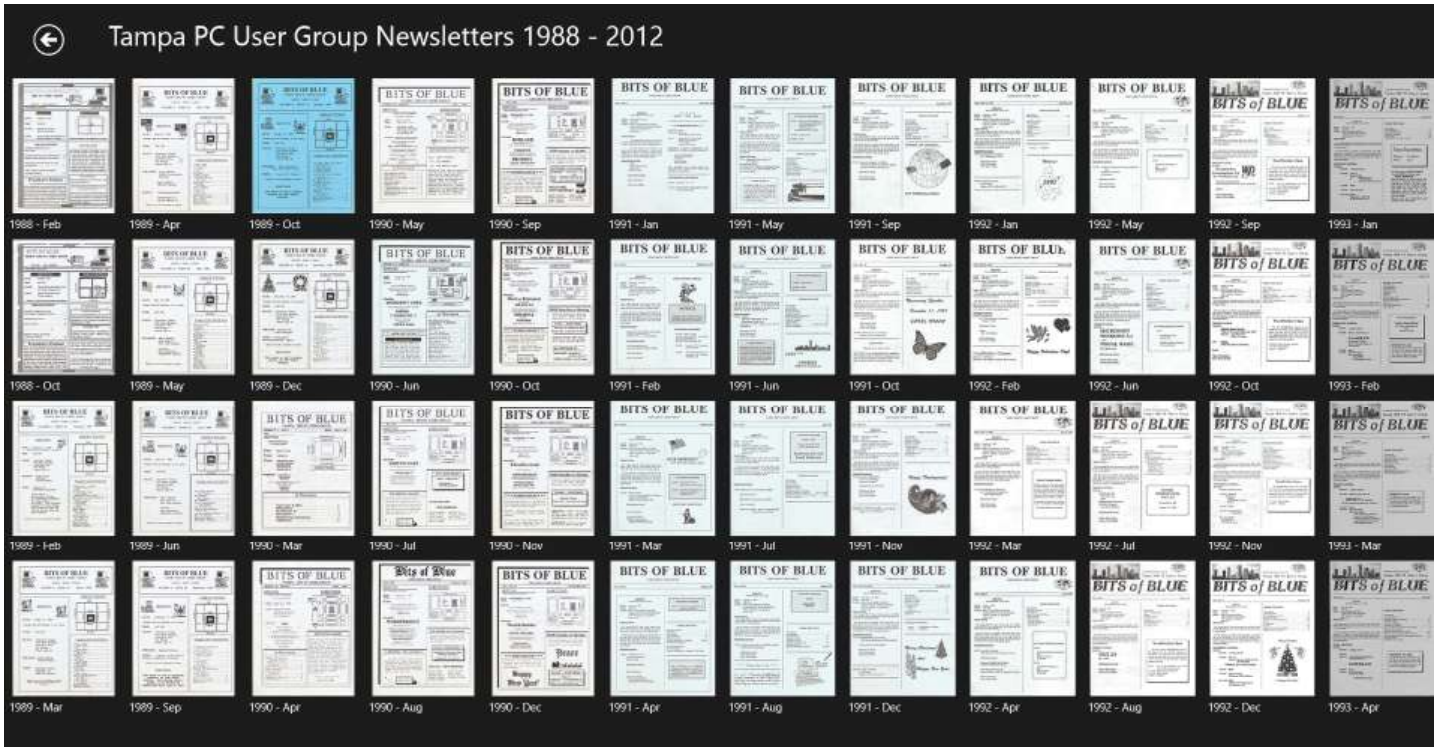
Fortunately Acrobat full version has all sorts of tools. I am using Acrobat X Pro. Here is the sequence of things I needed to do using the tools available in Acrobat:

1. Remove the password for each newsletter
2. Split each newsletter into its individual pages
3. Produce a jpeg image of each page
4. Produce a text file for each page

Newsletters.....Continued on page 4

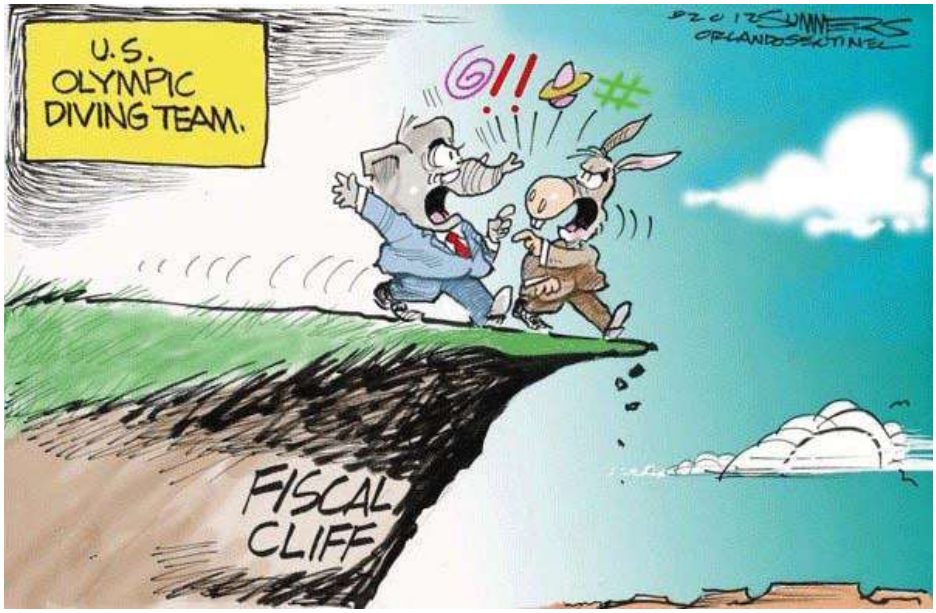
Newsletters.....Continued from page 3

1. Each of the newsletters is password-protected as to making changes (not to opening to read), and I needed to remove the password from each newsletter so as to do any work on it. Removing the password from each newsletter by first opening it, removing the editing password and then saving the newsletter would be a bit tedious if done for 281 newsletters. However, it can be accomplished quickly and easily by creating an action that first asks for the password and then simply opens each newsletter that is in a folder you select and subsequently saves the newsletter without any password protection to another folder.



2. Acrobat has a tool that allows you to split an Acrobat document into its individual pages. All I need to do is have it do this process on all the 281 files I have in a folder that I point it to. It will split each file into its individual pages and output them to a second folder I point it to. A typical name for one of the resulting pages would be pcnl2005-01_Page6, which is page 6 from the January 2005 newsletter. When finished, we have 2,924 individual Acrobat pages.

3. The next step is to create an image file from each of these 2,924 pages. Again this is accomplished via an Acrobat tool. You create an action that opens each of the individual Acrobat page files created above that are all in the same folder and simply choose the option to export the file to an alternate format. In this case it will be as a jpeg file. When finished, you will have 2,924 jpeg images of the individual pages in a separate folder.



Now to get the images of just the first page of each newsletter, I could go and select each of the 281 first pages from the above, or I could again do a batch type process to extract only the first page of each newsletter and then, as in 3 above, create an image file from each such page. It has been awhile since I did this; however, I think I approached it a bit differently in that I created a batch process in Adobe Photoshop where it would open an Acrobat file, select the first page and save it as a jpeg image. Anyway, it got done and I had a folder with 281 first pages as jpeg images, which I also batch-reduced in size since I wanted small versions of them.

4. To get a text version of each of the 2,924 pages, I

Newsletters.....Continued on page 5

Internet Picture of the Month

The Fiscal Cliff

Continuously in the news for the past month or more, the so-called Fiscal Cliff has finally come and gone with the country going over the cliff for one day. We are all still here and will have to live with the patchwork solution our representatives have worked out. So I thought a cartoon about the cliff would be appropriate for this month's Picture of the Month. And I found one close by from the Orlando Sentinel. It is a cartoon by their cartoonist Dana Summers. The cartoon actually appeared July 26, 2012. http://www.orlandosentinel.com/news/opinion/dana-summers/os-summersfiscal-cliff-20120726,0,5208460.photo.

Newsletters.....Continued from page 4

follow the same method as in 3. with the alternate format of the export being a text file instead of jpeg file.

I want a text version of each page so that when you search for Bill Gates, I will have some text to search. In my app, I am going to use the 281 first page images as a sort of list that you can choose from if you just want to browse the newsletters. When you choose one, say the June 1995 newsletter, you will be presented with the first page of that newsletter as an image you can read and additionally that you can enlarge with your finger gestures if you have a touch screen. But how to enable a search of all the newsletters for a collection of words like Bill Gates?

Newsletters.....Continued from page 5

My solution was to create a database of 2,924 records that had fields representing the year, month, page number and a final field holding all of the text on that particular page. The database I chose to use was SQLite, a database that works with Windows 8 applications. To get the data into the database, I first had to create an empty SQLite database with the requisite fields mentioned above. I then had to write a Windows desktop application using C#(I could have used VB) to fill the database with the 2,924 records containing the newsletter page data. Once I had my database, which turned out to be 10 MB in size, I was ready to create the Windows 8 app that would allow you to read and search all the TPCUG newsletters since 1988 through November of 2012.

The image you see on page 4 is the main window of the app. It displays all 281 newsletter front pages in a scrollable grid. What is visible are the newsletters through April 1993. You simply tap on a newsletter to bring it up for reading. The image to the top right is a screen capture of the result of selecting the June 2012 newsletter. You move through the newsletter by tapping the Next Page or the Prev Page button. You will notice an ad for bing in the upper right corner. Sometimes there are different ads. However, Microsoft has not gotten its advertising for Win 8 apps in full swing yet. That is why you see bing a lot. As you might guess, this is not a real popular app, so there is very little advertising income--almost none at the moment.

The second image to the right is a screen capture of invoking what is known as the Search Charm and then entering it as a search term os/2. If have sharp eyes and can read the text, you will see that it says there are 243 pages containing os/2. The first time it was mentioned was on page 3 of the February 1993 newsletter and the last time was on page 5 of the August 2011 newsletter (you would have to scroll the list on the left far down to see that). Of course, you can search for multiple words, such as for the two words os/2 microsoft, and you would get 151 pages containing those two words. If you add my last name of lamartin to the list, the result is 37 pages. You could spend hours doing such search combinations and relive a bit of

computing history. Let's finish this search stuff with a more recent one: android iphone. The result of that is there are 13 such pages, and if you select the June 2011 page 6 one, you will see what is displayed on page 7 of this article.

Of course it takes a fair amount of code behind the

Newsletters.....Continued on page 7

Newsletters.....Continued from page 6

scene to make all of this happen. For example here is the code to do the search

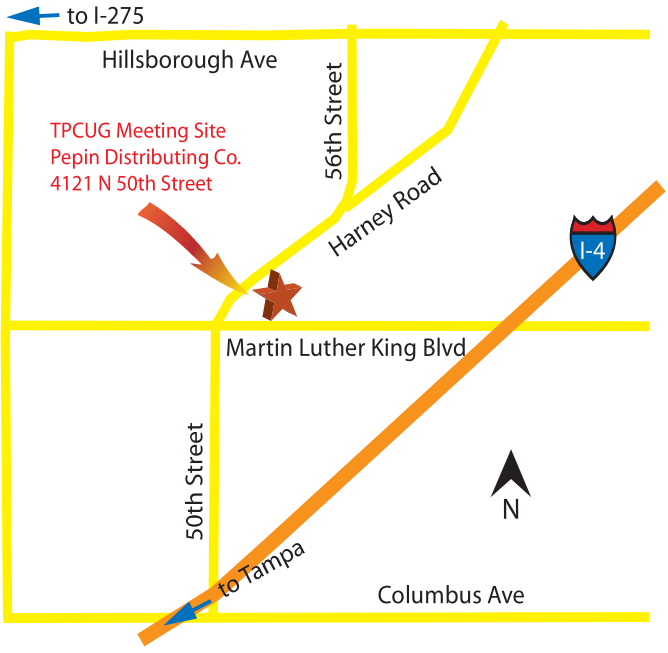
```
string[] A = SearchText.Split(' ');
     string[] B = new string[A.Length];
     for (int i = 0;i<A.Length;i++)
     {
         B[i] = "PageText like '%" + A[i] + "%'";
     }
     string Query1 = "";

     if (A.Length == 1)
     {
Query1 = "SELECT * from NewsletterPages Where " + B[0];
     }
     else
     {
Query1 = "SELECT * from NewsletterPages Where " + B[0];

         for (int i = 1; i < A.Length; i++)
         {
             Query1 = Query1 + " And " + B[i];
         }
     }

     string strSQL = Query1;
     cmd.CommandText = strSQL;

resultSearch = cmd.ExecuteQuery<NewsletterPages>();
```



If you are running Windows 8 on a desktop machine, laptop or tablet, I certainly encourage you to give the app a try. It will obviously work best on a multi-touch screen monitor because then you can make the pages as large or as small as you like. In general, if you need to resize them it will be to make them larger so as to be more easily read.

To install the app in Windows 8, simply go to the marketplace and search for Computer Group Newsletters. If you don't have Windows 8, then you can't install the application, but there are a number of ways to get with the program. For example, when Microsoft introduces its new Intel CPU based Surface tablet later this month, you can purchase one. I think that might put you back a bit over $1,000. Alternatively, you might prefer the current ARM processor version of the Surface that is already out. It will also run the newsletter app. However, the ARM versions will not run regular Windows desktop programs like the soon-to-be-released Surface Pro will. Then there are all the other Win 8 devices that are out there or soon to be out there from Acer, Dell and the other usual suspects. Or you may do what I did and contact Merle Nicholson about building your own Windows 8 desktop computer with a multi-touch screen monitor, as I described in the October newsletter ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Now everyone can afford the full version of Microsoft Office, the version with not just Word, Excel and PowerPoint, but additionally with Access, Outlook and Publisher. And you can have it for mere $99.99. My that is cheap, you say. What is the catch? The catch is that amount is thea-subscription price for one year (28 cents per day). It is really a rental, and there are other restrictions, such as it is not supposed to be used commercially. Lawyers, doctors and, I assume, writers who earn money from their writing are not supposed to use this version. Neither are nonprofit organizations.

So if you make money from using Microsoft Office (or maybe even if you lose money) in a commercial endeavor, then you need to look at the other options. They are not as cheap, and if you want Access and Outlook, you pay a pretty high price for the purchased version. Additionally those versions can only be installed on one computer. With the subscription version, you can install on up to five computers. See page 3 for details.

Minutes of the January Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. The meeting began as usual at 6:30PM. The SIG is devoted to a discussion of all aspects of the Windows Operating Systems and of computer-related subjects in general. The SIG moderator, Bob LaFave, introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees.

This month during the SIG, topics were: A new member's Asus notebook, USB failure with Citrix – many suggestions there, accessing a 3TB (that's a 3 terrabyte drive, or 3,000 Gigabytes). That's often beyond the capability of a computer system's BIOS. A quick look at malwarebytes.org and Teamviewer remote desktop.

The program this month was a return of Patrick T. Courteny of the Brandon users group, Greater Tampa Bay Users Group, http://www.gtbpcug.org. Patrick demonstrated his use of Dragon Naturally Speaking. He uses version 9.10 SP1. The current version is 12. He demonstrated dictating into any Windows software as an alternative to using the keyboard and mouse. He demonstrated the four input modes (normal, spell mode, command …) and very effectively controlled the Windows session using a headset and his voice. He did a variety of demonstrations to show the versatility of the software.

There was a lively discussion on the differences in the current versions, the basic version being the $100 Dragon NaturallySpeaking Home, and also the $199 Dragon NaturallySpeaking Premium version.

Our thanks to Patrick for a lively and informative program.

Our club President, John Witmer, led a discussion about the latest developments on his impending retirement from Pepin and the future of our meeting place. The decision was made that we haven't enough information yet to take serious action, and we tabled it for now. ◆

Office 2013 & 365 Home Premium

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Office 2013 is now for sale or rent. That is correct. You can rent Office now by the year or by the month.. As I write this, it only came available two days ago, and I decided to rent on the second day. In what follows, as I write this over the next few days, I will try to explain the different options on purchasing and renting and give some general comments on the installation and changes I have observed.

I have never rented a piece of software before in my life. But the software landscape is changing. Adobe, for example, started offering subscription versions of their software this past year. They call it the Creative Cloud. You can have a single application such as Adobe Photoshop or Illustrator for $20/month or you can have a full version of all their applications for $50/month. So for $600/year you get all Adobe has. People who have the regular versions receive a $20 discount per month off the $50/month price for the first year. You can have it installed and activated on two computers, as is the case for the standard versions like I have. I have no plan for joining the Creative Cloud in the near future. My Adobe software is the latest version.

Microsoft is going in the same direction. And after you look at the options, there really is only one clear option for you if you are an individual and not a business – and don't use the software for commercial purposes. That is, you will rent the entire Office Suite for $100/year, which will give you the ability to install it on five computers. There is also the option for $10/month. To see the other options for Office 2013, go to http://office.microsoft.com/en-us/buy/.

At the link above, you will note that Office Professional 2013 is $400, and that is the version I would want if I were purchasing the product since it contains Microsoft Access. The other two suites displayed there don't. However Office 365 Home Premium (the $100/year subscription version of 2013) does contain Access. It has everything, and very importantly you can install it on up to five computers. Those other versions may be installed on only one computer.

With Office 365 Home Premium, you also receive 20 GB of extra SkyDrive Storage and 60 minutes of Skype calls per month. I didn't check the details on that.

But I must emphasize again: Office 365 Home Premium is not for business or non-profit origination use. For those purposes, check out http://office.microsoft.com/en-us/business/. However, I think those products will only become available later in February.

Don't be afraid of all the Cloud talk. You do not have to do anything with the Cloud if you choose not to when using Office 365 Home Premium other than to do the original download of the software and for any subsequent updates. You can keep all of your data files right on your computer's hard drive. And if you discontinue your subscription, they do not take your data away. The files are still on your computer, and they may be opened by any other software you have that will open them.

Of course, you may do both: Have your data files on your computer's hard drive and also in the Cloud. That way you have a safe backup of your files, and you can access them from other computers on which you have installed Office 365 Home Premium.

You may try it for free or you may purchase a subscription. Here are the steps I followed to purchase a one-year subscription.

I went to http://www.microsoft.com, selected Office, then Buy Now. It already knew who I was and asked me to login with my Live ID (your experience may differ here). I logged in, and I made the $99.99 + any applicable taxes, which I am pretty sure will be 7%, payment with a credit card. I was informed that my subscription would renew automatically and that I could cancel at any time to stop the renewals.

Then at the bottom of the monitor screen was the message: "Do you want to run or save setup?" I chose

Office 2013.....Continued on page 4

Office 2013.....Continued from page 3

Run. Once it begins to install, you are presented with a short cartoon-like video about the new Office, and at the end you are presented with a sign-in button. A click on that brings up a place to enter an email address for you to use. It can be any email address. I used my Microsoft Live ID one. It then asked me for the password for that. I don't know what would be the option if you used a different sort of email address.

After that, a click on the Next button gives you the choice of a background for Office or no background. I chose no background. The installation then begins and they give you some information while this is occurring, such as you can sync all your data files in the Cloud with the SkyDrive folder on each computer. "You can invite people to read or edit document in the Cloud right from Office. Then everyone can review and work on the same document. They do not even have to have Office. They can use their browser and Office Web apps."

The installation went fairly quickly. I think it was around 12 minutes; I suspect that later it downloads more as you use different parts of Office. The installation took up about 3.5 GB on the hard drive.

You can install Office 365 alongside any existing version of Office you may already have on the computer. In my case it was Office 2007 Ultimate. In the past, you could also do that with the exception of not being able to have two different versions of Outlook.

I first opened Word, and everything was OK with it. I will cover later the appearance of the 2013 version as compared to the older versions.

My next trial was to open Outlook 2013 to see if it picked up all my email folders and accounts. Opening Outlook, it says, "Preparing Outlook for first use. It may take a few minutes." It took about four minutes. Then I get the message that my mailbox is currently being optimized.

In a moment another message that it could not locate the server for lamartin.com (this turned out to have to do with the Outlook Connector that was installed for Outlook 2007 that allowed me to sync myWindows. Live calendar and Contacts with those in Outlook. More on that later.). It took about six minutes to do the optimizing. Then I tried to send an email, and it worked fine. So OK so far. Now to the problems.

I should say that what I am describing here was done on my Windows 7 desktop computer. A similar installation on my Windows 8 desktop computer had no problems with Outlook because there was no Outlook Connector there. However there was Office 2007 installed on that computer, too.

Somehow switching back an forth later between Outlook 2007 and Outlook 2013, things went awry. At one point, I could not open the Access pst file in Outlook 2013 since it had supposedly not been closed properly (it contains all your messages, contacts and calendar). Well, I would open it with no problem in Outlook 2007 and then close Outlook, 2007 then try with Outlook 2013 and receive the same error. I then decided to remove the MAPI email account that the Outlook connector creates, since I knew that I did have problems with Outlook not closing properly with it sometimes in the past. But that didn't help. I think I even rebooted the computer and tried to open Outlook 2013, and that wouldn't work. Finally I tried an Inbox repair of the pst file (look up how to do this on the Internet). That took quite a long time because the file is 9 GB, but it solved the problem. Outlook 2013 would now load all the messages, contacts and calendars that were originally used by Access 2007. And to avoid further problems, I deleted all the links on the desktop and Start Menu to Outlook 2007 so as not to be using it again; although it is still installed on the computer.

One final thing on Outlook. To be able to sync Outlook 2013 with your Windows Live calendar and contacts, all you need to do is add your Windows Live or Outlook.com email account as an email account in Outlook 2013. No Outlook Connector needed. I am sure that you can also sync your email messages, but I didn't look into that since I don't keep my messages in the Cloud as I do with copies of my Calendar and Contacts. Enough Outlook.

Office 365.....Continued on page 5

Internet Picture of the Month

Mardi Gras

Above a masked reveller poses in Saint Mark's Square during the Carnival in Venice in 2012. This year it began on January 26 and, presumably, will end on Fat Tuesday, February 12. To find similar photos, simply do an image search for Carnival Venice. The costumes here are a good bit different from the costumes, or lack thereof, you will see at Carnival in New Orleans.

Office 365.....Continued from page 4

If you have used Microsoft Office 2007 or 2010, you will be right at home as far as the layout of things goes. At least that is true for Word, Excel, Access and Outlook. I have not yet looked at Publisher (in fact I have not used Publisher in years) and PowerPoint.

On the next page I have a screen capture of the menu ribbons of a document in Word 2007 from my laptop and the same document in Word 2013 from my Windows 7 desktop. You will note the menu and ribbon items appear very similar but that the 2013 version is less colorful, very flat and monochrome. This is the new look at Microsoft which I had already noted in

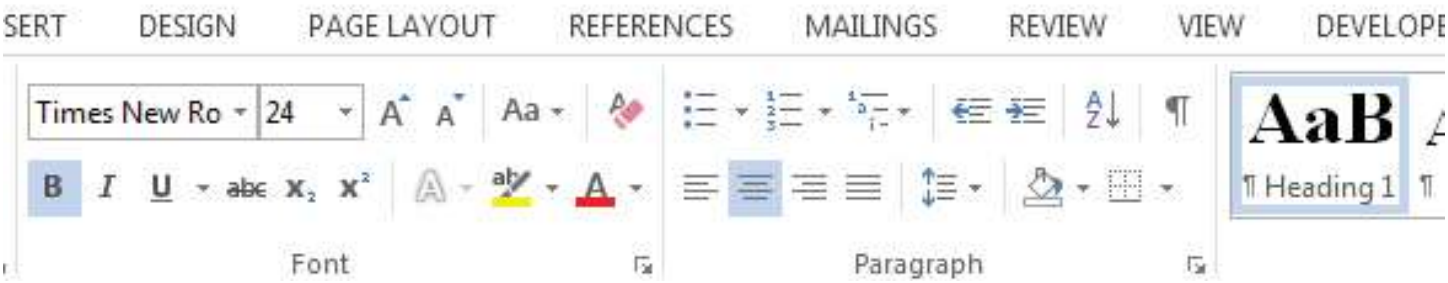
Office 2013.....Continued from page 5

Windows 8. This new look is going to take some getting used to. At the bottom of the page, the top image is a screen capture of a portion of the Ribbon in Word 2007. Below that is a screen capture of roughly the same portion of the ribbon in Word 2013. Items are basically in the same location, but the 2013 is more flat and certainly less colorful.

A few words about SkyDrive are probably in order since you get 20 GB of free space on it to store any files you want. In your My Documents folder you should now have a folder named SkyDrive (if you didn't already have it before). Anything you put in that folder is propagated not only to your SkyDrive account at Live.com but also to any other computers you have that also have a SkyDrive folder that syncs with SkyDrive at Live.com created by the installation of Office 2013 or in some other manner.

Thus, if you have, for example a Word document, Excel file, or just an image file and they are in that SkyDrive folder, any changes you make to them on one computer will be propagated to the same files at SkyDrive and the other computers. But be warned that if you delete such a file, it will then be deleted at all the other SkyDrive locations. So I would also keep a copy of it somewhere else outside a SkyDrive folder.



Certainly this is a very handy feature in that you can have access to your files anywhere you have an Internet connection. Lose your computer on a trip or have it destroyed, simply purchase or borrow one, and if you remember your SkyDrive login, then you are good to go.

I am still a bit reluctant to put what I consider sensitive data there, but it is probably pretty safe if I put it in an Access database that then can be password-protected and encrypted.

Well, I have worked with a few documents in Word, in Excel and Access with no problems of any significance. I even did an email merge in Word using a Query in Access. So everything seems a go. I have yet to look at Power Point but don't expect that would be any problem since it is the simplest of all. And Publisher is of no interest to me since I use Adobe's inDesign for such purposes as I am doing at present in creating this newsletter.

This subscription for $100/year (although the price could increase) seems a good deal to me when you consider all the programs you are able to use. I think using Outlook for email would be an eye-opener for many. It is much more complicated than web-based email, but it is far more powerful. To use Office 2013 you will need to be running Windows 7 or higher. ◆

Review - CPU Magazine and Smart Computing Magazine

By Merle Nicholson, Secretary,
Tampa PC Users Group.
merle@merlenicholson.com

CPU (Computer Power User) magazine has been around for a long time, and the publishing company sent someone to give us a talk on Smart Computing magazine some years ago. Anyway, Smart Computing and CPU are two magazines published by Sandhills Publishing in Lincoln, Nebraska. I think they mentioned "Processor" also.

I subscribed for many years, and finally maybe two years ago I found I couldn't renew without calling them and discovered they publish the magazine but no longer sell it, and would I like to receive a copy? Well, yes, since it's free, I would.

So I got free copies for a year and then that stopped on its own. They had been sending me emails about the online edition for a while, and I would look at it; but frankly – it was terrible. There were rectangular blocks on the screen that were flashing, and parts just weren't working.

But look at it now. Everything works, and in my opinion, it's just excellent. I've used it for several months now and have adapted to the format pretty easily. You have to ask why it's presented just exactly like the (formerly) printed version, down to turning pages if you wish. But I've grown to like it better than the print. I think it's because I can flip through the stuff I'm not interested in much faster than print.

CPU is mostly very technical, but with a fair amount of gaming weirdness and LAN party (gaming meets) that I skip over. It's mostly geared toward people who build their own computers from components with reviews on internal computer parts. If you want to know the latest developments in CPU's, motherboards, power supplies and video card benchmarks, this magazine is well worth it. http://www.computerpoweruser.com

I just looked at Smart Computing for the first time in many years, and I'm intrigued now. The current issue has excellent articles on setting an office up with Ethernet and router, and how to install an SSD. The articles look very thorough to me. It appears to be targeted to small businesses and home offices, but that just makes the appeal even broader. It's pretty obvious it uses the same magazine viewer as CPU. I'll register for this, too. The worst they send out to a registered user is a monthly reminder that a new issue is available. http://www.smartcomputing.com

Sandhills Publishing list of publications is at http://www.sandhills.com/pubs-trade.aspx. ◆

Merle Nicholson again came through with an interesting article to help fill the newsletter. I encourage others to do the same.

We have been receiving a decent amount from Amazon most months by your clicking on the Amazon link on the home page at http://www.tpcug.org. We received $82 for October and $29 for November. Keep it up.

And when you get Windows 8 on any device, don't forget to install the free Computer Group Newsletters app that I wrote that allows you to read any TPCUG newsletter from 1984 through 2012. ◆

Meeting Preview: Working with Excel for home and personal applications by John Witmer. Bob La Fave as usual will conduct the Windows SIG.

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

First off, we had a great December with our Amazon link at our home page. The referral fee for December was $169. Keep up the good work and tell your friends about using the link.

Merle Nicholson writes about what to look for in buying a new notebook computer in this month's newsletter. I would like to have such a thing with a touchscreen monitor, but there have been too many such nice things to have lately, including a new desktop Windows 8 computer built by Merle, a subscription to Office 365 and a new Windows Phone 8, so that device will have to wait.

Regarding Office 365, which I wrote about in the previous newsletter, the change from using Office 2007 has been real easy. The menus are slightly different, but mostly everything is the same. One big improvement for me was how Outlook now much more easily syncs its contacts and calendar with the

Minutes of the February Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. The meeting began as usual at 6:30 PM. The SIG is devoted to a discussion of all aspects of the Windows Operating Systems and of computer-related subjects in general. The SIG moderator, Bob LaFave, introduces new or little-known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees.

This month during the SIG topics were: Backup methods, what computer stuff to keep in a safety deposit box, types of backup drives, cloud storage Acronis and Windows backup methods.

For the business meeting, President John Witmer announced a lot of surplus computer components, especially three printers – available for raffle after the presentation. He again went over the arrangements with Pepin to continue the meeting room and a brief review of those meetings that will be held without his presence.

The monthly presentation was conducted by our own Bob LaFave, Windows SIG moderator, the subject being "Clean up your computer." He started out with the physical cleaning and brought in a dirty computer that needed cleaning – it was full of dirt and dust - and the reasons that it must be done to ensure correct cooling of the components. We had some up-close views, and also some pictures of the dirt accumulation that can occur. He showed us computer cases, fans and vents, power supplies and CPU coolers. Methods include vacuum cleaners, brushes and compressed air cans. He cautioned us against turning a compressed air can upside down, and showed the propellant going out the nozzle. One member suggested taking the computer outside and using a leaf blower to move the dust out.

Minutes.....Continued on page 8

New Notebook Computers

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

I always have a notebook computer that I use in my business, mostly at home. I'd guess that I replace them every two years. I was originally buying 15" screen devices and more powerful processors that smoked through the battery; units with DVD players; perhaps eight pounds and had chargers plugged into them always. I guess I've evolved some in my thinking.

There are some transitions going on in the notebook arena right now, and some are pretty complicated. So the subjects I want to address are: Windows 8, DVD, SSD, Screen size and resolution, Ultrabooks, Batteries and Upgrade/Repairability.

With my current one and the previous one, I opted more for lightweight, less processing power, longer lasting battery and smaller (14") screen size. It seems to fit my needs better. It's perhaps because I'm using them more as a communications device and I rarely need a powerful processor. I've come to value the portability of lightweight and the ability to go longer without a power cord. The designs have been changing; the choices are better than ever

Windows 8 Most new notebooks have Windows 8. That's not necessarily a bad thing as long as you have a notebook with a touch screen. DO NOT buy a Windows 8 machine without a touchscreen. Many are out there without touchscreens, and, believe me, you will not like it. For experts or those willing to pay an expert, there are changes and software additions you can make to bring back the Windows 7 style menus to Windows 8, and this is pretty foolproof and well tested. I use them myself on a desktop machine, and it appears that all problems are solvable. This means abandoning the Windows 8 tiled Start screen, and that's appropriate for a computer without a touchscreen.

One additional warning. Office 2003 cannot run on Windows 8 (according to Microsoft), so it's time for an Office upgrade if you're depending on Office 2003. I recommend LibreOffice as an excellent quality replacement. It's free. Unless you need Access, Publisher or Outlook, you don't need the expense of MS Office.

You can have someone install Windows 7 on a Windows 8 computer (at extra cost of course), provided the drivers are available. The troublesome drivers for Windows 7 are for touchscreens, touchpads, cameras, fingerprint readers, proximity sensors, LAN and WAN card drivers. This takes a lot of research and is not for the faint-of-heart. There are still Windows 7 computers out there for now if that's what you want, and the pricing is very good. I got a Windows 7 $1,400 HP Ultrabook for $1,000 with free shipping.

DVD players You can probably do without one. You'll have noticed that starting with netbooks a couple of years back more notebooks are available without DVD players. DVD players seem to be common in 15" and up sizes, optional in 14" sizes and nonexistent in anything below 14". DVD players just aren't installed in anything considered thin or light. On my last 14" you could unseat the DVD player, leave it at home and use a plastic snap-in cover over the slot in the side. In the last year or so that I had that laptop, the more I used the laptop, the more I realized I didn't need a DVD. Several reasons; the largest one being flashdrives. A DVD is good for 4.8GB, and a 32GB flashdrive is about 11 bucks and it's rewritable. My latest laptop is an ultrabook, and it's too thin for a DVD drive.

Almost all software installations are downloads now. Downloads come in executables (.exe and .ISO files). Both formats are easily moved over your home network, downloaded directly or put on a flashdrive. I use .ISO files a lot. So when I get the occasional DVD or CD – the only one comes to mind is Delorme Street Atlas, which I buy yearly – I simply mount it in my desktop computer and create an .ISO using ImgBurn. An .ISO file is simply an image of a CD, DVD or BD disk. (BD is Blu-ray Drive) I use a free product called DAEMON Tools Lite that mounts a BD-ROM player on boot that is used to mount an .ISO file in memory.

Notebooks.....Continued on page 4

Notebooks.....Continued from page 3

It's very fast and reliable.

I do have a portable USB DVD player, a gift which I have never used – still in the box. And obviously I never play a movie DVD on my notebook. I do stream from Netflix and Amazon Prime Movies.

For very large notebooks – 16" and 17" – you'll have a DVD or BD player; why not? You've already given up portability and lightweight anyway.

Screen size and resolution This is a complicated subject, but an important one. If you see a very, very good price on a 13" to 15" notebook, always check out the screen resolution. I'll bet it's 1366x768. That's because it's the cheapest display made. To me, it is terrible unless it's an inexpensive 11" to 13" machine. You can say: Well, it's a crappy display but I only paid $400 for it. Obviously it's a compromise. But don't buy an $800 notebook thinking you have a quality machine if it's only 1366x768. It's not.

With screen resolution, you're mostly concerned with the vertical resolution as in Something x 768, or something x 1080. That's because screens are designed with the Width to Height ratio in mind. The ratio is typically 16x9 – a "Widescreen." So if the vertical resolution is 1080, the width will be at least 1920. That's the resolution standard of TV now: 1920x1080. Sometimes you will find 1920x1200 or even 2650x1600.

Except for the inexpensive compromises, the goal should be a vertical of 1080 for displays 15" and up. 13" and 14" the goal should be 900, unless you're buying an Apple MacBook with Retina display costing $1500 and up.

SSDs and other Hard Drives The price of SSDs are dropping like a rock. This fact, and the realization that you may not need all the hard drive space you thought you did, make SSD's the best choice for notebooks. An SSD makes all the difference in the world in creating a fast notebook. You can even compromise in processor speed and graphics GPU as long as you have a fast SSD and plenty of installed memory.

You will see now that many SSDs are not a conventional-looking 2.5" SATA drive at all. Instead the SSD is on an mSATA card. My own has one mSATA card and a socket for a second. Below is an image of an mSATA on top of a 2.5" SATA.

As for size, it made sense to have a 500GB hard drive when it was about $15 more than a 250GB drive. But the operating system needs only 50GB to 65GB. Especially if this is not your primary computer, a 128 GB hard drive may be more than enough. It is for me, but I do not keep many years' worth of pictures, and no video at all. Besides, your pictures probably do not take as much space as you think. A friend's collection of five years' worth of photos for her family was but 16GB, and it was a LOT of pictures. You can make up the difference in external drives or a card slot that the new computer will have anyway.

Remember that all flashdrives and SD cards have minimum speed ratings, commonly 6MB/Sec to 10MB/Sec, and the price goes up slightly – but not much - the faster the speed. Buy as fast a card as you can.

On Intel notebooks, look for Intel SRT (Smart Re-

Ghost Cities

As you have mostly likely read or viewed, China is full of ghost towns built in the past for years because of the rampant real estate speculation there. Most of the new cities consist of high-rise apartment buildings, but the one pictured above is a meant to resemble an English Village. The photo came from http://www.businessinsider.com/china-ghost-city-english-town-2011-6#.

Notebooks.....Continued from page 4

sponse Technology). This is a hybrid system utilizing a 20GB to 32GB SSD and a separate conventional hard drive working together. It results in nearly-SSD speed, but with the large lower-priced, conventional 5400RPM mechanical drive. As I understand it, you must use the system a bit before the extra speed is apparent.

Looking at new notebooks at NewEgg, I found hybrid systems priced from $500 and up. They weren't that easy to spot because there wasn't any emphasis or special mention. I found typically "500GB HDD + 32GB SSD."

Notebooks.....Continued from page 5

Be careful if the SSD is 128GB in concert with a hard drive; it probably isn't a hybrid. Instead you should expect to see the entire OS on the 128GB, and the conventional drive a data drive, just as you would see on a desktop machine. That's better than a hybrid anyway.

I've had quite a few notebooks go through my hands recently for repairs, and it's always puzzling at first when I start it up. I say "Why is this thing so slow? There's nothing much going on and no viruses. Oh, it's got a 4500RPM conventional hard drive. What a piece of crap." It's fixable! Look at installed memory, and for Windows 7, 64 bit, it should have 4GB and a reasonably good SSD, and we'll have a new machine!

If all you can afford is an inexpensive machine with a conventional drive, at least look for the hard drive speed. They come in 4500, 5400 and 7200 RPM. Higher is better. 4500 is unacceptably slow. A hybrid system is better, and a SSD is best by far.

Finally, the manufacturers are doing some creative hard drive partitioning, especially on Windows 8. But my Windows 7 machine had two partitions for recovery and emergency install that totaled 16GB, and that's out of about 120GB available. I created the recovery disks using the supplied HP program. It allowed me to make DVDs or boot flash drive, and since it doesn't have a DVD drive the choice was easy. Then I used some Windows utilities to deallocate those two partitions and then extend the C: drive into that space. The result is the full 120G useable.

Ultrabooks First an explanation about the term. The term "Ultrabook" is a word copyrighted by Intel. They have a certain set of rules that, if adopted into the design of the notebook, grants the manufacturer rights to call it an Ultrabook. And obviously the numero uno is that it have an Intel processor. So just because it has an AMD processor and is called a "Speediebook" or something like that, does not mean that it's no good. As a matter of fact, AMD has some excellent APU's – that's the GPU, a graphics processor built into the CPU – that are very much more powerful than Intel's built-in GPU. The Intel graphics are numbered 2000, 3000 and 4000, and are notoriously slow – especially for games. If you're just processing words, who cares?

An Ultrabook has some characteristics though; slim, light, no DVD, reasonably long battery time. So how do they accomplish this? They sometimes do it by making the battery non-replaceable! Not exactly, you can have it replaced, but if it involves taking the whole thing apart, you may not want to do that yourself, and believe me, if the battery has soldered leads and a glued-in soft pack battery, this is not a DIY project.

Many, including my own, require a complete disassembly to add more memory. In my case I can access the hard drive and easily replace the battery, but only after completely removing the back cover. Some cannot have the memory even replaced at all because they're soldered in. An Ultrabook is a compromise, like anything else.

So how do we make sure we're getting the best system? One way is to discover how well designed it is for repairs. The website http://www.iFixIt.com tears notebooks – actually all kinds of devices – apart and makes a video of it and gives it a repairability index number. Many, many other people put tear down videos on YouTube. Just search for your model number. Do this BEFORE you buy. This is primarily the reason I bought mine, because of the reduced price and because it had a good repairability index.

Batteries, as you may be aware, last for just a couple of years, depending on how they are used. Battery life is rated basically on how many times it's recharged. If it's already charged and you're connected to it with the charge cube, it doesn't count. If it's 50% down when you start charging, that counts as 1/2, not 1.

The newest processors are so much better than previous years as far as battery usage is concerned. They've gone to smaller and smaller die size – Intel Ivy Bridge is now at 22 nm, with every generation getting better. You can research all this ahead of time on the Internet given the manufacturer's model number. Look at the number of hours of operation that they claim. You should expect much better than four hours, but typically five or six.

Notebooks.....Continued on page 7

Notebooks.....Continued from page 6

Look into the cost of battery replacement. Replacement batteries are very typically $150, but sometimes much more. Think about that. When it's two years old and costs $200 to replace the battery it'll be worthless as a used computer if the battery is gone completely. Perhaps it doesn't matter to you, or perhaps it can continue as a useful computer plugged in for a couple more years. The cost of battery replacement should be included as the basic cost of owning the notebook in the first place, and to not know the battery cost is the same as not knowing the cost of the notebook.

Upgrade/Repairability I've pretty much covered this where batteries are concerned. Batteries are the #1 repair concern. When buying new, be sure to research all the reviews out there on that model number. It may surprise you with some things you have not considered. Like a really huge clunky charging cube, or screen hinges that are too stiff, or funky keyboard layouts.

The last thing to consider is installed memory. For Windows 7 and 8 with x64 Operating System, 4GB is the minimum. But subtracted from that is memory that video needs, and it could be substantial. My Intel 4000 graphics can use up to 1.6GB of my 4G memory. Mine is upgradable to 8G, but many are not. You can offset this by buying a notebook with "Dedicated Graphics." This is a graphics module that is installed in addition to the built-in graphics on the CPU. Intel machines have switches so that you can switch from one to the other, with the CPU unit using less battery. So it's a battery vs graphics performance trade-off.

Finally – I can't emphasize this enough, don't buy one without doing your research. Read the reviews first, and then see if there's a repair video. If it's too new to have these things, then it's too new to buy that model. Look for another. ◆

Comments.....Continued from page 1

contacts and calendar at Windows Live, or as they now call it, Live.com. All you need do is add your Outlook.com (Live.com) email address as an email account in Outlook.

I have had one problem, though. Twice on trying to open an Office program, possibly Outlook or Word, I don't recall which, the program would appear to begin opening but never finish. To fix this, I simply went into Programs and Features in Control Panel and did a repair of Office 365 (right-click on the program and choose Change). The first time it happened, I did the online repair, which takes longer but is guaranteed to fix any problem. The second time I chose the Quick Repair, and that also fixed the problem.

I mentioned earlier that I now have a new Windows Phone 8. That replaces a Windows phone 7, I have had for about a year-and-a-half. My contract with Verizon was a two year one and not due to be over until either May or June, but I noticed in January that they were allowing me to purchase a new phone at the usual reduced price so I began thinking about what to get. However, there really wasn't too much of a choice, since Verizon only offered two Windows Phone 8s. I chose the HTC 8x. It had a larger screen with more pixels and a better processor than my previous phone, and it was thinner – and it cost $100. However, at Amazon Wireless, I could get the same phone in their Verizon substore for $50. So I made the purchase there, where they have access to whatever setup you have at Verizon so that I maintained the same plan I had before with one exception: I no longer had unlimited data. But that is the case now at Verizon whenever you purchase a new phone and had nothing to do with me purchasing through Amazon- you can no longer have an unlimited plan and must chose from various metered plans. I chose the 2 GB plan and don't really expect to use more than that based on my past usage.

Now here is the really good part. Since I had clicked on the Amazon link at our website, the purchase of that phone was credited to us, and we received the entire $50 as a referral fee, not just 5%. I don't know how Amazon makes money on this deal. ◆

Meeting Preview: Since cars are now computers, Merle Nicholson is going to tell us about his new iCar. Bob La Fave as usual will conduct the Windows SIG.

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Thanks to Merle for his iCar article. It made me pause and think of all the things around my house that are run by computers. There is certainly the central intrusion and fire alarm system. It is obvious that it is a really a special purpose computer when you open its metal box and see a motherboard with chips just like a desktop computer. I suppose even my coffee maker is sort of a computer since you can program it to grind coffee beans and brew coffee at a certain time in the future. Unfortunately it has no feature that will automatically dispose of the used coffee grounds.

Then there is the more obvious example of my HTC 8x Windows Phone 8. As does Merle's Android phone, my phone connects to my car via Bluetooth, where I can communicate with it manually or with voice commands and view its address book on the car's display screen. I don't know if it can play its music through the car's audio system since my phone doesn't have any music files installed. It is odd that as a teenager I

Minutes of the March Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. The meeting began as usual at 6:30 PM. The SIG is devoted to a discussion of all aspects of the Windows Operating Systems and of computer-related subjects in general. The SIG moderator, Bob LaFave, introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees. This month Bob discussed antivirus options on Windows 8. Windows 8 comes with a new version of Windows Defender – formerly called Windows Security Essentials.

President John Witmer introduced the raffling of hardware we missed last month. He noted the passing of former member Richard Brooks, and we welcomed new member Frank Weitzman. The raffle then was held with Eddie Rodriguez drawing an ink jet printer, Nancy Norton a security camera package, Jeannie Gillespie a printer and iPad cover, Gary Ennis a Bocce Ball set, and additional articles to Merrill Friend and Doug Mullis.

This month the presentation was given by our president, John Witmer, who showed his interest and skills with Microsoft Excel. Starting with a blank spreadsheet, he presented call basics, cell format and custom format, cell math and conditional formatting all using several examples.

John then demonstrated the kinds of activities useful for private use: Check register, filter by category, checking recap and forecasting. John demonstrated an Excel sheet for personal finances including credit card accounts, amortization schedules and net worth. All of these are available as Office templates.

We were shown working copies of spreadsheets for TPCUG; a password keeper file; a graphics demo showing drawing elements and pictures: crop, rotate,

iCar Tech

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

William LaMartin, our newsletter editor, suggested I buy an iThing this month so I'd have something to write about, and I guess I already did without thinking about it. I bought a new Honda Accord, and it certainly qualifies as an iThing as much as a new phone or tablet qualifies. So this month it's about my iCar.

The technology advances that are being made and the progression of that technology downward in price make it available to everyone. Much of the really useful computer technology has been moved to affordable cars. The Honda Accord I bought is just one step above the base model. For those who are not car-aware, the Accord has been a top selling mid-sized sedan in the US for many, many years. Most years it has ranked no lower than third. And Consumers Union has always recommended it. In short, it's a mainstream sedan. Mine is an EX, one up from the bottom of their offerings. No Navigation option, no Leather.

This thing runs on computers. The car won't start, and certainly won't run anywhere, without them. The fuel, air and ignition to the engine are all completely automated by computer. The gas pedal is an input device to a computer. The doors unlock and lock, the daytime lights and headlights come on and off, all by computers. It has an 8-inch LCD screen in the center of the dash, just larger than my Android tablet. The car has two cameras. It has a Near Field Device (a radio), which I keep in my pocket. To open the door, I simply touch the door handle. (You cannot lock yourself out of the car.) To start the car, I push the start button. There is no physical key needed to unlock a door or to start the car.

The LCD screen is used for a variety of functions, all of it real-time. Current music information (track and title, album, sound volume etc.), time of day, current instantaneous miles per gallon, overall mpg since last fill up, last four trips mpg, miles to empty, trip odometer and, of course, the two camera displays, and much more. You pick the music source, AM, FM, CD, Bluetooth and USB. There are a variety of display configurations and options to set for each display. These are pretty much selected by one turn knob with a push select in the center. Many of these functions are duplicated as dedicated buttons on the dash, but, as far as I can see, not used very much after you've settled on your main display. You can even upload a JPG to be used as a desktop background.

Smartphones communicate with the car using Bluetooth in very important ways, and it's this telephone capability that is the focus of this article: CELLPHONE, MUSIC and MAPPING

CELLPHONE

The cellphone connection is truly a marvel. There are controls on the steering wheel to initiate calls, receive and hang up. The microphone is built into the car (somewhere), and the sound comes from the car's speakers. It's always clear sounding, and the person you're talking to will not be aware you're in a car as long as the windows are up. Any good cellphone will have active background noise cancelation, and the interior of this car has noise cancellation, too. When you first "pair" the telephone to the car, it will download the entire phone's contact list to the car. There is a manual process to pick the number for dialing on the screen from the contact list if the car is not moving. It can be done by voice command any time.

Most of this takes some practice to get proficient. If you expect to put the practicing off until you need it, you'll be disappointed. But there's a pretty good built-in solution for that too. It has a shortcut list of twenty telephone numbers that you attach voice commands to, and connect those to the contact list. I have a contact called "Home". But it turns out that a single word like "Home" isn't distinctive enough to voice-recognize reliably, so the voice command I use is "My House." That voice command calls the "Home" contact in the list. You can set up smartphone connections for more than one person.

While driving you press the call button on the steering

iCar.....Continued on page 4

iCar.....Continued from page 3

wheel, the Car Phone Lady says "Say a command," you say "My House." She says "Calling. Press hang up to cancel." You get a recording of the voice command as you made it and hear the dial tone. We're good.

Now you don't want to get me started on using a phone in the car. If I ever die from apoplexy it'll be from seeing a person holding a long conversation on his hand-held with small children in the van. My goal is to keep conversations to less than 15 seconds. I'm convinced that hands-free devices in the car are a tremendous step up in convenience and safety, but having a telephone conversation is a serious distraction.

Still, for convenience and safety, it can't be equaled. I once called 911 to get an ambulance for a motorcycle driver who went down in the street, and it makes you think back to pre-cellphone days and the thousands of lives it has saved by now.

For those interested, there are good add-on hands-free devices that you can carry in the car and clip on the visor. I had a couple of those for many years. Look for "Motorola hands free" in an Amazon search. The current ones look a lot better than the early ones I used. They have much the same capability as my car, with buttons to pick up, hang up and initiate voice commands. They are only $60. There are also a couple of "Speaker Phones" that will pair to your phone and act as just speaker and microphone. When I was using these I wasn't enthusiastic about them, but the button arrangement was complicated and the battery life short. I think the new ones look pretty good.

MUSIC

The next Bluetooth feature I like in the car is playing music from my phone. It's always playing my album collection when I'm in the car. It comes on when it connects – gets within Bluetooth range – and starts playing from where I left off. There are extensive controls for radio, CD, flashdrive and iPod playing options that I'm not very familiar with, since I never listen to a radio or CD in the car. There are controls on the steering wheel for sound volume, track and album forward and back, pause/play; all the controls you need to manage music, and it's all controlled through the Bluetooth connection to the smartphone. You have the same capability using a flashdrive – the car has a USB connection. Unless I have the smartphone mounted on the dash for navigation, it can stay in my pocket for both music and cellphone calling. There's just no need to ever look at the smartphone. All the music information is displayed on the screen. Current track and album name – all that music stuff.

GPS MAPPING

We've used GPS mapping software in the car for many years. I'd guess 2001 is our first long trip with a computer and an attached GPS. The notebook navigation is perfect for long distance planning and turn-by-turn assistance, but requires an operator (In My Opinion); Google Navigation does not. When I got our first Android phone and started using Google Navigation, it gave us local, full time navigation in the car unassisted by a passenger. We have car mounts for our phones (both cars) so they're in sight and always on charge.

Google Navigation gives you turn-by-turn navigation and presents itself on the screen as a (optionally) satellite view. It looks like you're viewing your progress and having a long view ahead from a camera a hundred feet above the car. It's all from composite recording from satellites. The advantage of this is so you can look ahead and anticipate turns ahead and see what it looks like before you get there. Google Street View is there, too and it pops up unexpectedly. I can navigate to Pepin for a meeting, and when I get there, it presents me with a camera street view of the Pepin main gate. You just need an active Smartphone connection with data capability. Also, you can use Google Maps that shows you a continuous street map and positions your car in the center of the screen. There's just no reason to not know where you are. Best thing - it's free. And it comes on Android Smartphones.

OTHER TECHNOLOGY TO LOOK FOR IN A NEW CAR

Some of these items are available as standard or optional on a variety of cars. It's difficult to predict, however. For instance there is no rear camera on a VW Jetta. Even on models that would greatly benefit. It's

just not available. But its sister company, Audi, heaps technology in their cars. It's pretty much expected in high-end cars, but you'll be surprised to see what is available in lower-priced cars.

Lane departure warnings: This is implemented in several ways depending on the maker, from just a light that comes on in the corner of the outside mirror and audible warning, to a vibrating warning in the steering wheel, and in high-end cars, some form of active steering.

iCar.....Continued on page 6

iCar.....Continued from page 5

Forward collision warnings: Sometimes this is just a warning sound or voice warning, to (Volvo) actively braking for you.

Cameras: Rear cameras are available both as standard and as options in most cars now. Some will have multiple views that can be switched and most, if not all, have distance markers overlaid. There are cameras that look at the lanes on either side, emulating outside mirrors.

For more expensive makes, the list goes on and on, like driver dozing detection, heads-up displays on the windshield and night vision augmentation.

Satellite Radio, gas station, ATM and business searches and communications to subscription roadside assistance are common. ◆

Comments.....Continued from page 1

thought I would like to be a musician and as a young adult I listened to much jazz and classical music. Now in my old age I hardly ever turn to music on the radio and have no collection of music on either my phone or computer. One's interests change. As to talking on the phone while driving, I think using a hands-free setup as Merle and I have is just about as dangerous as holding the phone in your hand while driving because the problem is not where your hand is but where your mind is.

Finally, as to computers in the house, there is my Nikon D800 camera. Now that is a computer. If you want some optics, then you have to buy a lens. I have had three Nikon digital cameras, a D100 and a D200 being the previous ones. This new camera stands apart in its use of computerization. There are just so many features. The printed manual that comes with it is approximately 5 in x 7 in x 1 in. I should probably read it. One jpeg image producerd by this camera ranges between 12 and 15 MB; a raw image is 35 MB. I think my first IBM compatible had only a 120 MB hard drive, and before that my Apple IIe didn't even have a hard drive, so you could not store very many

Comments.....Continued on page 8

THANK YOU

JOHN WITMER & PEPIN DISTRIBUTING

Thank you for giving us such a wonderful place to hold our computer meetings every month.

1. It's a beautiful building, landscaping and area impeccably clean and orderly.
2. Very spacious, fenced for safety and security
3. A specially designated room for us
4. Complimentary hot and cold beverages (even Starbucks Coffee)
5. Great video and audio capabilities

It's so unusual to see a company treating their employees with Massage Chairs, Billiards, Foosball, and a Big Screen T.V., complimentary Beverages and attractive surroundings like the serene and scenic Aquarium.

All this you have shared with us and you don't even charge us. You have given us your time, patience and kindness as you set the meeting room up for us, bring beverages and Cookies in and set up the screen and plugs, and probably other activities that we aren't even aware of.

Every year you and your wife go to a lot of trouble creating a warm and welcoming Christmas Party for us. Whenever the time comes that we must go, you and Pepin will be missed ever so much. I and I'm sure many others feel the same way about you, John and Pepin Distributing. You are truly a Class Act.

— Debbie Whittaker

photos from this camera on that. Luckily my present computer has a 2 TB hard drive. The D800 has two memory card slots, a SD card slot that will take up to a 64 GB card and a Compact Flash Card slot that will take up to a 128 GB Card. I have 32 GB cards in them now. I use the SD for storing still images and the Compact Flash for movies. Yes, this camera also takes movies (1080p Full HD movie mode at 24/25/30 fps, 720p at 24/25/30/50/60 fps). My point is that we have gone from a personal computer in 1983 that had only 64 KB of memory (could be increased to 128, which I did) with no hard drive to a camera in 2013 that takes images 35 MB in size (which can actually be 74 MB if you use the RAW uncompressed 14 -bit mode). Wow! It would take a lot of Apple IIes to hold that one image. ◆

Meeting Preview: Blain Barton from the local Microsoft office will demonstrate how to set up a WordPress site at Microsoft Azure. Bob Lafave will have the usual Windows Q & A for the first 30 minutes.

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

I have had two problems recently that involved computers with two monitors. One was on my Windows 7 desktop, the other on my Windows 8 desktop. It took a while to figure out the cause of the problems, with the solutions coming from the Internet and Merle Nicholson (who, I believe, got his solution from the Internet).

On the Win 7 computer, the problem was that the computer started booting with the right-hand monitor as the main monitor with all the desktop icons etc. I would then set the left-hand monitor as the main monitor in the place where you do that, and everything would be as I wanted. Unfortunately, on a subsequent boot the main monitor had again moved to the right-hand one. This is not supposed to happen. I tried all sorts of solutions, such as switching which port the monitors were connected to, but the problem persisted. Then Merle did some research and came up with the possibility that an installation of Micro-

Minutes of the May Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. The SIG moderator, Bob LaFave, introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees. This month Bob extended this time to cover the month's presentation.

Bob covered a wide variety of PC subjects, starting with a walkthrough of Windows 8. Bob's version of Windows 8 on his notebook has Start8 installed to restore the missing Start menu of Windows 7. He demonstrated several browsers, Windows 8 new Performance monitor and Performance Index.

He then showed ATTO disk benchmarks and talked about the advantages of SSD, and then explained IDE, SATA I, II and III. He moderated a discussion of wireless networking, private and public and those settings. He had brought in a show-and-tell directional wireless antenna.

Then he went on to a variety of other subjects: Windows step recording, NTI Echo disk cloner, Windows System Image software and Windows 8 Restore to remove everything and reinstall Windows 8. There were several other subjects of wide interest. Bob conducted a very interesting and entertaining session with good group participation. ◆

Buying a New PC?

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

This month, I'd like to talk about Operating Systems. We'll start with XP.

XP Maybe you're not too concerned, but there's one upcoming event that you should be watching. It's the end of support for Windows XP. That's April 8, 2014, less than a year from now. That's the day that Microsoft stops patching the OS for updates and security improvements.

Why should that concern you? Well, Windows XP is vulnerable enough now, but I am advising you now that without security patches your computer is more vulnerable to outside attacks than ever. Another problem is that as time marches on your chances of buying compatible devices lessen. In April basically all manufacturers' new device drivers will stop as well. Most have stopped long ago anyway.

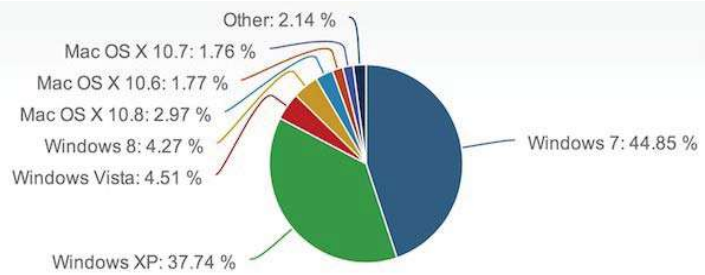
What to do? Well, you can buy a new computer or install a new operating system on your old computer. The operating systems available to you are (in my own order of preference) Windows 7, Ubuntu, Chromium and a dead doubtful last – Windows 8. More on Windows 8 later. If your hard drive is more than three years old, I advise replacing it and keeping your old one as a backup to avoid putting your XP system at risk. If you have a slow or weak computer, Ubuntu may be the very best option.

XP - Installing Windows 7 on an old computer: Fortunately there is some help here. There's a Windows 7 compatibility survey program available from Microsoft. (There's one for Windows 8, too.) This program scans your hardware and software and tells you in some detail what will work and what will not. The #1 thing to look at is if you can run the x64 bit version or the x32 bit version. They are sold separately, so you buy the 64 bit version if the system is compatible, the 32 if not. Start with the Windows 7 upgrade advisor download at http://windows.microsoft.com/en-US/windows/downloads/upgrade-advisor and http://windows.microsoft.com/en-us/windows7/help/upgrading-from-windows-xp-to-windows-7#T1=tab01

XP – Installing Ubuntu, a version of Linux: This can be a breeze or it can be hard, depending on what you do with your computer. The mostly easy part is that you can install the Ubuntu OS onto a flash drive and resolve any compatibility problems without putting your current system at risk. If you use your computer for mainly Internet use or Google apps and email, Skype and IM, Chrome, photos and movies, Netflix and Amazon Prime, then Ubuntu is an excellent choice. All these things are dead easy, as well as LibreOffice, an excellent MS Office-compatible word processor, spreadsheet and presentation editor. All of these things I mention are free. No cost whatsoever. Now if you already do more than the above with your computer, there are endless varieties of programs available, and if it's critical for you, start your research on available software. There's a very surprising amount of commercial and free software that will run on Ubuntu. There are thousands available for free. And the Chrome browser may solve many of these software needs. See Chrome Browser below.

XP **– Installing Chromium OS**. This OS and it's sibling Ubuntu are becoming more and more viable for the average user. The reason is the suddenly popular migration to cloud computing. As you find yourself using cloud services and storage more, Ubuntu and Chromium and Chrome are leveling the environment. With these OSes, all you need is a very good web browser not named Internet Explorer. Chromium is a variation of Ubuntu, modified to load a slightly different package of programs by default and to emphasize Chrome as the browser of choice. (See the paragraph on Chrome Browser below.) The idea is to emulate the Chrome OS installed on computers sold by Google, Samsung, HP and Acer Chromebooks. The Chromebooks OS itself is a variation of Ubuntu. You can't buy the Google Chromebook OS, but the next best thing is Ubuntu with Chrome installed or Chromuim OS.

XP – Installing Windows 8. Well maybe, I doubt it,



New PC.....Continued on page 4

New PC.....Continued from page 3

but you need to read a later section on Windows 8. The Windows 8 Upgrade Advisor is at http://windows.microsoft.com/en-us/windows-8/upgrade-to-windows-8

Buying a New Computer
Buying a new computer, the OS choices are for a computer without an Apple logo on it: Windows 7, Windows 8 and Chromebook. With an Apple logo: Mac OS X.

Let's start with a little graphic of computers in current use in the US (about 300 million) and 1 billion worldwide: This is a graph of the currently installed operating systems. Surprised? Windows XP is still

pretty huge, and the combined Mac OS X at 6.5% is pretty stable over many years and not growing. Ubuntu, Chromium and Chromebook OS, by the way, are imbedded in that 2.14% "Other," along with others.

What the graphic does not tell you is that the Windows 8 slice is slowly growing, as is the Windows 7 share. The Windows XP share is dropping as corporations migrate in favor of Windows 7. Remember that the retail sales of computer OSs (XP, 7 and now Windows 8) is a very small part of Microsoft's income. The Windows 8 slice is small, but that's expected.

Before the Windows 8 share gets bigger, it has to become what Windows 7 is now to XP. That's a very long way off, and it may never make it at all. That's because Windows 8 has no appeal to any corporation trying to manage thousands of personal computers. The transition to touchscreen is just prohibitively expensive with no established productivity improvement.

New computer - Windows 7 Buying a computer with Windows 7 x64 is risk free. If you can find one. New computers with Windows 7 are out there, but you have to look. My guess is that Microsoft is providing Windows 8 software to manufacturers at a lower price than Windows 7. You can downgrade Windows 8 to Windows 7 only on the Windows 8 Pro version, using the Windows 8 Pro license. Check on that first to make sure it's still available.

New computer – Windows 8 Windows 8 uses a tiled interface designed for touchscreens. All your old and new programs – menu selections and icons now are on tiles on the Start Screen(s) that slide right and left. You can group these tiles in categories and name the categories. You cannot create a folder and drop tiles into them to hide them. For instance I have a menu selection I call "Stuff I never look at." It's one item on a Windows 7 menu, but in Windows 8 it's 40 tiles in a group. I move past that 40-tile group all the time.

Staying in the tiled interface there are apps designed to work well. At the moment you can view but two of the Win 8 apps at a time, and one is always larger than the other. Windows 8.1 will improve that some, perhaps to 4 equally-sized apps. All others must drop to the desktop where they work normally, but there is no menu there. You must switch back to the tiled Start screens, temporarily abandoning all that you're doing on the desktop. Yes, you can use a mouse. Many people really like the tiled interface. **BUT. If you don't have a touchscreen, you're going to have a very hard time using Windows 8.**

As an alternative to the tiled interface, you can get one of a couple of Start Menu programs that do an excellent job of adding a traditional menu system to Windows 8. The ones I've used are excellent, and mostly free or inexpensive. Here's the catch. They're somewhat technical. So you may need help getting it set up and configured so it's working satisfactorily.

I've read recently that only 20% of new computers have touchscreens. I really am sympathetic to those thousands of new computer buyers who have expectations that Windows 8 will work well out of the box only to discover the interface needs a touchscreen to

An Old Plantation Home

The above is one of many thousands of photos by Jeff Lamb at Flikr. You may view many of his New Orleans area photos at http://www.flickr.com/photos/fej/with/388214062/. Jeff died in 2011, so Flikr makes it possible for one's work to live on after them. My interest in the photo was because I photographed the house in the mid-1970s. You might also note that Flikr has a new look.

New PC.....Continued from page 4

work well.

When I'm asked about a new computer, I always say to make sure you're willing to pay the extra cost of a touchscreen, or you're not going to be happy. Adding a menu program is somewhat technical and you may need help setting it up. On my own version of Windows 8, you may not be able to tell that it's not Windows 7. But is it worth the trouble over a real Windows 7? No. Definitely not.

Chrome Browser

Ok, I know the Chrome Browser isn't an operating system. This browser, available on a number of op-

Gaming and You

By Brian Lance,
Tampa PC Users Group
master.pc.tech@gmail.com

Games. They serve as a way to blow off steam, unwind, compete or even show an extreme level of unsportsmanlike conduct. Games can do all this and more! But this can get expensive. Here's how to get the games you want for PCs, and get them on the cheap.

We start with the major platforms for PC: Steam (http://store.steampowered.com/) and Desura (http://www.desura.com/). Both allow you to search for games by various criteria such as genre, price, or popularity, download and automatically update, interact socially with other gamers, host a server where others can connect to your game, get modifications to games ("mods") and much more.

One of the handy features of both is the ability to sign in to your account on another computer, download a copy of purchased (or free or gifted games) and play them. On Steam, many games support SteamCloud, which allows saved games and settings to follow your login wherever you are. Currently, this is 100MB per game, which should cover multiple save states for most games. This also means less annoyance in avoiding having to "back up" or otherwise find a way to rescue your game saves, as there is no unified way to do this with regular retail boxed games.

Steam also allows you to do a full backup of your games, should you find the need. If you have a lot of backup space, this can be a time saver vs. re-downloading the games. This can also be useful when migrating to a new PC or one that will not have net access.

Some First-Person Shooters (FPS) can be upwards of 8GB in size, so you might not want to simply add those to every computer you own, but it can be nice to have a casual game and its current state be available on all your PCs.... well, maybe not the office computer!

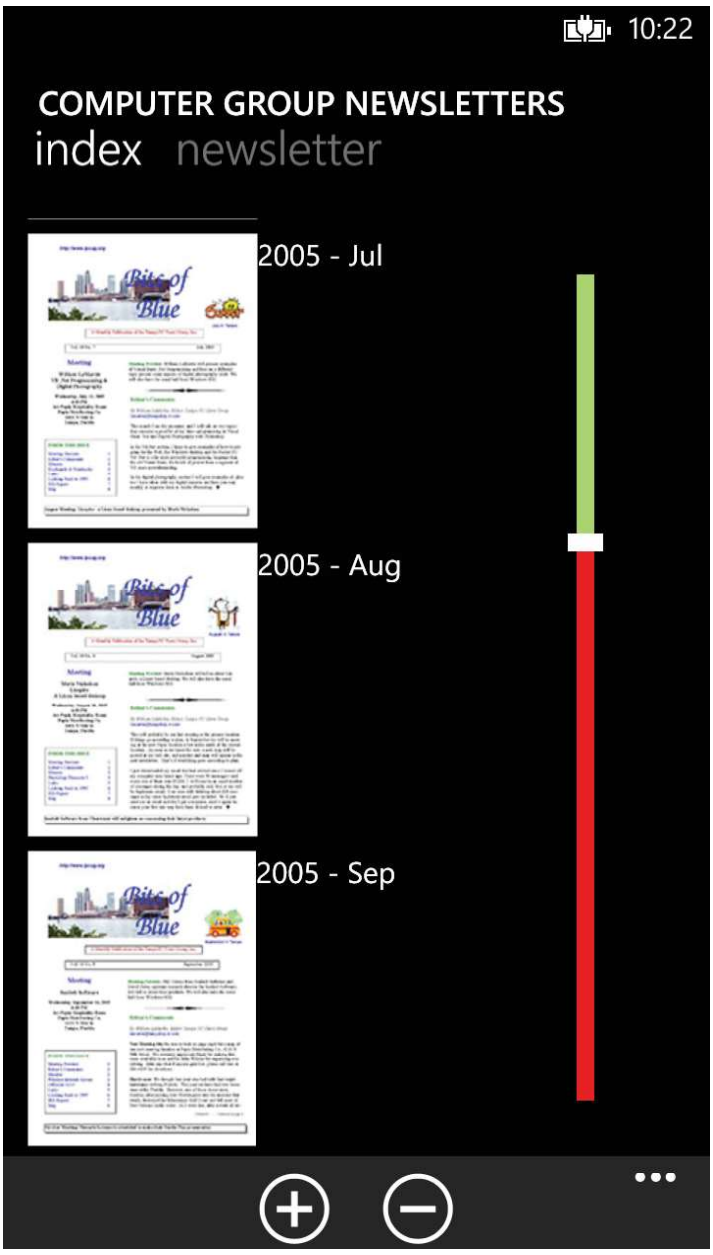
Some social features include your own nym (pseudonym) and homepage, joining groups, and in-game chat with friends. Access to game guides and blogs while a game is in progress has been useful to me. Big Picture is a feature that's handy if you have a large monitor or are using a TV. It even allows a game controller to navigate the interface, making Steam more like a jukebox of games.

The Steam Store page even has categories for under $10 & $5. Some top titles go from $50 to $10 and under in a year or two – see below. There are a bunch of completely free-to-play titles on Steam; many of these are MMORPG (Massive Multiplayer Online Role-Playing Game) or FPS titles. With most (all?) of these you can purchase extras, but basic gameplay is still worth trying out. Some will limit the player to a certain level of advancement without paying, but nowhere near the underhanded and avaricious tactics of game monetization with mobile gaming. This will be covered in an upcoming article!

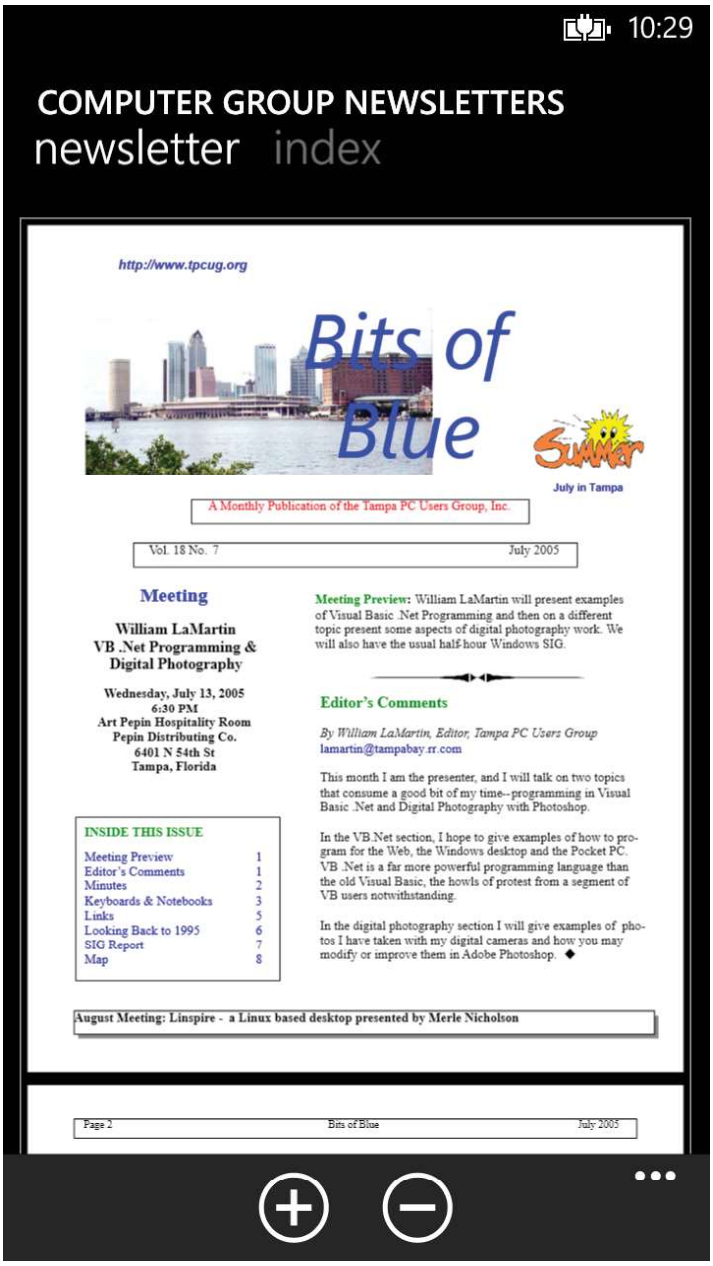
Desura's interface is a bit less polished, but still makes it easy to acquire and play games. One of its unique features is that is can scan and add games to your account if they are already installed elsewhere on your PC. Desura seems to center more around inexpensive and indie games. Don't let the indie appellation fool you - I found some of my favorite games and developers this way.

Best to get both Desura and Steam. Search for major or new games on their interfaces, but use various sites like these to get games on the cheap (and support charities!): indiegala.com, humblebundle.com, indieroyale.com, indiegamebundles.com, bundlestars.com

With these, you typically get a mix of indie and commercial games as direct downloads on PC, Mac, Linux and Android, as well as having them attached to your Steam or Desura accounts. They have a low starting price and most bundles of games give you extras (music, artwork) if you beat the average. Bundles will typically be available for one day to a week. And the average is typically less than $6, so it's easy to give freely to charity, developers, or the hosting site. You can pay with diverse methods such as PayPal, Amazon, Google Wallet or even BitCoin. ◆



Comments.....Continued from page 2



uninstall the Live Mesh feature from Windows Live Essentials 2011, Live Mesh was truly removed, and I could get my monitor changes to work.

The Win 8 problem was that often when I booted the computer both monitors would display the blue Windows logo as if everything was fine, but after I was presented with the login screen on my main monitor and I had logged in, the right-hand monitor became dark. My temporary solution was to simply restart the computer, and then miraculously everything worked as expected. Again an Internet search indicated that when I shut down the computer I was not getting a true shutdown and this caused a problem on the next boot. The solution was to turn off the option of Fast Startup in Control Panel | Power Options | Choose what the Power button does. After that I got true shutdowns and had no more problems with the monitors.

TPCUG Windows Phone 8 app

Below are two screen captures of my Computer Group Newsletters app in Win Phone 8, which I am porting from my Windows Store app of the same name. So soon (after I publish it) you may read all the old TPCUG newsletters on your Windows 8 Phone. (You do have one don't you?) I don't think I will include the feature to search all the newsletters in the phone version as is in the Windows 8 Store version since that would entail packaging up the fairly large database (10.4 MB) necessary to do that with the phone app. ◆

erating systems, kind of levels the field. It has a wide variety of programs that run inside of the browser. So if you have Chrome on a Windows machine, you have the same Chrome in Ubuntu and other Linux, Android telephones and tablets, the Chromebooks and Chromium OS. In my own Chrome I have: Netflix and the usual Google stuff (Calendar, Maps, Gmail, Drive, YouTube and Books). But I also have apps: TwistedWave (Sound editor), Write Space (Text Editor), Pixlr Editor (Graphics editor), Drive Notepad (Text again), draw.io (org charts .. excellent!) Google Docs (Word Processor), Sheets (spreadsheet), Drawings, Slides, Remote Desktop and Angry Birds. But guess what … there are thousands more and mostly free. Many have "Pro" versions with a small cost. Need a financial organizer? Try Mint or Cash Organizer. These are not amateur applications. Most that I've looked at are professionally written by established software companies. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

I have several topics I can write about this month, and that will give Merle Nicholson a rest after he basically filled the newsletter for the past two months. Ron Weinberg has also helped by contributing an article this month.

I have three topics I would like to cover this month:

- The Tampa PC Users Group Windows 8 Store application I wrote, named *Computer Group Newsletters.*
- Removing a hard drive from a laptop
- The Microsoft Surface Pro

I will deal with the first item here. If you have Windows 8 on a computer, go to the Store and search for *Computer Group Newsletters* and install it. Then you will have access to all of our newsletters from 1988 through 2012. You will be able to search the entire collection, and in the update I recently made you will now be viewing the newsletters as PDF files instead of just images, and you will be able to print the newsletters from inside the app. ◆

Minutes of the April Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. The meeting began as usual at 6:30PM. The SIG is devoted to a discussion of all aspects of the Windows Operating Systems and of computer-related subjects in general. The SIG moderator, Bob LaFave, introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees. This month topics covered by Bob included wireless access options and setting up an access point from a distance.

This month the presentation was given by myself, Merle Nicholson. The subject was GPS, but first a presentation on the world coordinate system and some history behind it was necessary. The presentation was on time measurements and the nature of time related to longitude, the locations of the Equator, equinoxes, Arctic and Antarctic circles, Tropic of Cancer and Capricorn. The presentation went into GPS and the satellites in orbit, altitude and period, number of satellites to obtain a good fix, a description of WAAS, the difference between celestial time used for GPS and terrestrial time. There were some questions asked and some lively discussions and all in all a success thanks to a great audience and their expressed interest. ◆

GPS Satellites

vCard

By Ron Weinberg, Member at Large,
Tampa PC Uswers Group
rswjbr@verizon.net

We installed a new telephone and needed to add our contacts. This was not a smartphone or cell that could retrieve contacts from the Cloud or the Telco website. However, it did have an Internet connection, and we wondered if we could enter the contacts automatically from a file rather than hand-entering each record individually. A check with the phone's website indicated that it could be downloaded from there into the phone if we first uploaded our own vCard file to their website.

But, what is a vCard?

A vCard is often referred to as a virtual business card. It is defined in Wikipedia as follows:

> *"vCard is a file format standard for electronic business cards. vCards are often attached to e-mail messages, but can be exchanged in other ways, such as on the World Wide Web or instant messaging. They can contain name and address information, phone numbers, e-mail addresses, URLs, logos, photographs, and audio clips."*

The following, also from Wikipedia, is an example of a vCard file containing information for one person: There are several versions, with 2.1 being the primary and higher versions adding additional fields or properties.

```

Business Card (vCard) or Business Card (.vcf) records can be sent or imported by Outlook and many email programs into their respective address list (Contacts). They can also be used by other devices such as cell phones, PDA's, laptops, etc., as well as various software programs. In short, they are the electronic digital method of transferring business cards via Infrared, Bluetooth or Internet.

Each vCard record has the .vcf file name extension. and is equal to one business card.

Again, my object was only to transfer my contacts but in the process I learned how valuable vCards can be. Today's business person should consider having their own vCard.

A little research revealed many software programs and websites which are available that could create and/or read vCards. There were others that could translate to or from Excel, Comma Delimited, or other formats. Most were offered as "free" shareware but in reality they would allow a short trial with very limited capability and then a purchase to fully function. Prices ranged from $39 to $69.

Since the format is standard, it would not be too difficult to write an input program to create vCards individually or in a batch from a file containing the needed information. The Contact List for this phone would only contain 25 records, so I decided to forego any purchase or programming and try to make do with what tools I already had available.

vCard.....Continued on page 4

vCard.....Continued from page 3

I have a fast i7 Windows 7 laptop, but my primary system is an 8-year-old Dell desktop with Windows XP Professional and Microsoft Office 2003. I plan on keeping it, barring catastrophic hardware failure, until at least April of 2014, when support for XP ceases. Although well-equipped at the time, the software in particular is generations behind and obviously lacks the more recently added features.

The challenge was to finding a way to create the vCard file with available resources. I enjoy this kind of challenge. Here is what I found:

As a backup I already had an Excel file with the needed data (25 essential records) in .xls format. I used Excel 2003 to save the .xls file as a comma delimited file. Then I imported the comma delimited file into the Outlook Contacts.

Outlook 2003 and Outlook Express can save each individual contact as a vCard but only one at a time, not as a batch. Note that Outlook Express uses an Address list; it does not use a Contacts list, but the function is the same. Windows Live Mail would only create a vCard for every corresponding item in its Contacts list (my 177 records), many more than needed here.

For only 25 records, I quickly saved each record individually as a vCard using Outlook 2003. Now I had 25 individual business card records but they needed to be in one file to be quickly moved into the database.

To bring them into one file, a simple old-fashioned DOS command did the job.

I used the name AllVCF1.vcf.for the file. Then from a Command Line, I went to the Folder containing the vCards and entered COPY *.vcf AllVCF1.vcf .

Mission accomplished! AllVCF1 uploaded successfully and contacts were downloaded to the phone. ◆

Removing a Laptop Hard Drive

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

My daughter's almost five-year old Sony Vaio laptop just quit working. The first indication anything was wrong was that it produced a white screen while she was using it. She did manage to get it to reboot and retrieved the PowerPoint presentation she was working on and needed the next day. However, after shutting down, the laptop would never again produce an image on the screen or on an attached external monitor. But you could hear and feel that the fan was working.

I contacted Merle Nicholson. He offered several possibilities, but nothing worked to revive the laptop. So we pronounced it dead. My immediate goal was to remove the hard drive so that I could see if I was going to be able to extract her data, as she, like so many others I know, had not done a full backup in over a year.

As they say, I had been to this rodeo before and knew what I needed to do. Since opening up a laptop and extracting a hard drive is usually a multi-step and sometimes very tedious process, I wanted a YouTube Video that detailed the process.

If you have my Windows 8 Computer Group Newsletters app and you search for Sony Vaio, it will produce the June 2008 newsletter where I describe the same exact problem I was confronting: removing the hard drive from a Sony laptop. For that laptop, I had found an online video that demonstrated step-by-step the process of removing the hard drive. Unfortunately, the innards of that laptop were nowhere near the same as the one I now had in front of me. And still more unfortunately, I could find no video that detailed the disassembly of a what was supposed to be a model pcg-6w1l, according to the bottom of the laptop. I then had the idea to check back on my Quicken expense file for when I purchased that laptop. It was in May of 2008, and in the memo the laptop was described as a Sony VGN-SZ770N/C laptop. I passed that info on to Merle, and he found, not a video, but a web page with

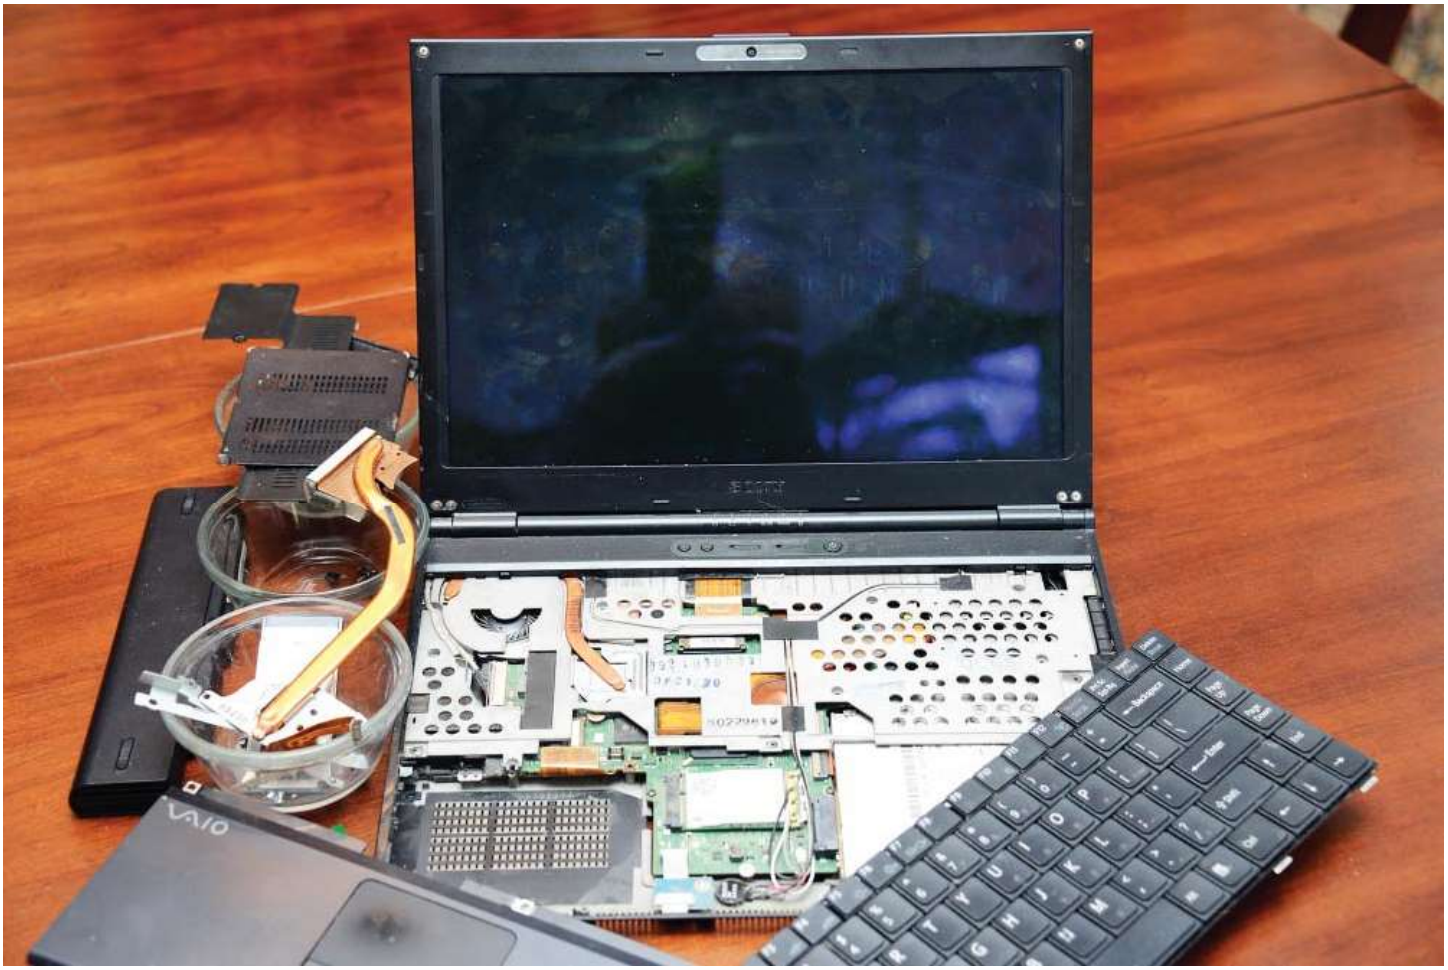
Hard Drive.....Continued on page 5

Internet Picture of the Month

Visiting Alligator

The alligator pictured above has become a regular visitor to a golf course in Avondale, LA. Having just three legs, he has been nicknamed Tripod. The photo above came from the *Wall Street Journal* at a mile long URL. A search of the Internet for the words alligator golf course Zurich Classic will produce other links.

Hard Drive.....Continued from page 4



photos that detailed such an action, not on my model, but on one that was close enough that it got me three quarters of the way through, so that I could figure out the rest on my own. The link Merle found is http://laptoprepair.ca/news/11449.html. What would we do without the Internet and the ability to search it?

The question in my mind, though, is why is there one model number on the bottom of the laptop and a different one that I entered in Quicken, probably from the box the laptop came in? Anyway, with the help of the Internet and Merle, I eventually extracted the hard drive in a way that the laptop could have been reassembled if that had been desired. And to make this

Hard Drive.....Continued from page 5

all complete, the data on the hard drive was intact and readable.

Above is a photo of the disassembled laptop displaying every component that was removed except the hard drive. The hard drive is shown at right connected to my Windows 7 desktop computer via a SATA hard drive dock on top of the case. That dock is a very handy feature for temporarily connecting hard drives to a computer.

With the laptop's hard drive connected this way, my desktop computer recognized it as just another local disk, and I easily copied the folders and files wanted to my desktop computer. I then copied them from my computer to my daughter's external USB drive. Eventually they will end up on whatever new computer she gets. And this will be the topic of another article in this newsletter. ◆

Microsoft Surface Pro

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

If you read the previous article, you know that my daughter's laptop died. What to get her for a replacement? She could use a tablet in her work, but a tablet is not a computer. A Surface Pro is definitely a computer, having a 3rd generation Intel i5 processor with Intel HD graphics, a 64 or 128 GB solid state drive along with a USB 3.0 port and a mini Display Port and running on Windows 8 Professional, but it has a slim profile and with its keyboard detached looks like a tablet. It also has a pen, with which you can write on its capacitive touch screen, and front-facing and rear-facing 720p HD cameras.

My son already had a 128 GB Surface Pro and was happy with it. So, we went with the same thing, purchasing it from the Microsoft kiosk right near the food court of International Mall in Tampa. One thing you note right away is that the Microsoft kiosk at International is a lot less busy than is the Apple store in the same mall. (There is a full-size Microsoft store in Orlando.) However, the Apple store has nothing like the Surface, and that is what we wanted.

In the photo below you can see the Surface Pro with its real keyboard in front of my 23-inch touch screen monitor for my Windows 8 desktop computer, and over on the right in front of my second monitor is my Windows Phone 8. That is an image that should make Microsoft happy.

The Surface is a bit pricey, but recall that it is a real computer that can function as a tablet and run tablet type apps. However, you can also run any program on it that you can run on Windows 7. Right now the only thing installed other than the tablet type apps that come with it for Weather, etc. is Microsoft Office 365 (also known as Office 2013).

Surface.....Continued on page 8

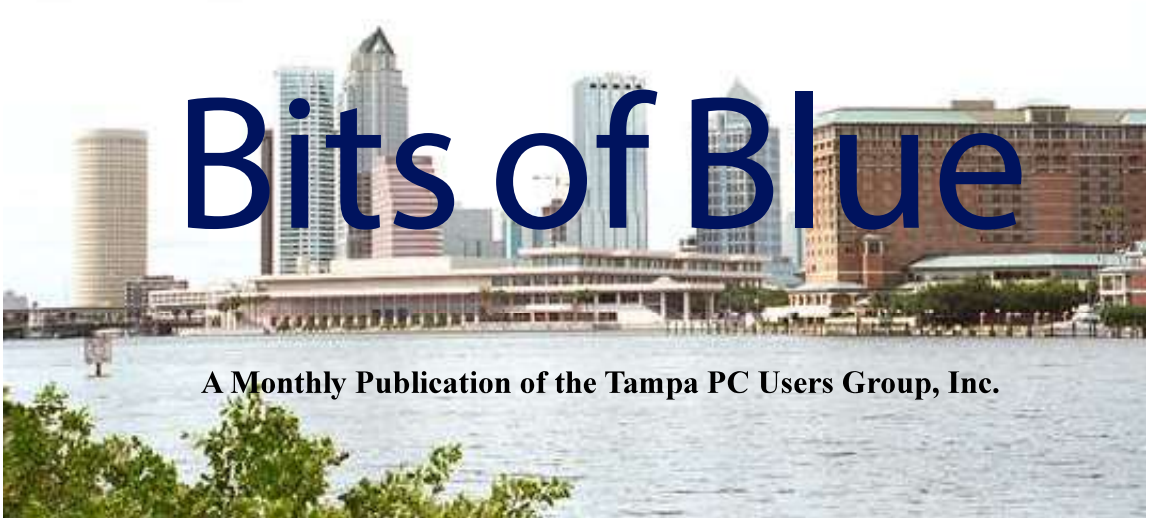
Surface.....Continued from page 7

If you have a student ID, Microsoft will give you a student discount of around $100 on the Surface Pro. Still the price is going to come in a bit over $1,000. Also, the Type Cover ($129) is much better than the slightly cheaper Touch Cover.



You may read about the Surface Pro at http://www.microsoft.com/Surface/en-US/surface-with-windows-8-pro/home.

I think it is quite possible that late this year in time for the holidays there will be a slightly improved and possibly less expensive version of the device available. .

Minutes of the June Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. The SIG moderator, Bob LaFave, introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees.

Bob covered a wide variety of PC subjects, starting with a review of search providers. Then he demonstrated the setting that turns off the system restart and presents a bluescreen instead. This is a very desirable setting for everyone, as Windows Install defaults to Restart.

Bob then demonstrated Windows Download Center, and Knowledge Base and how to look up the KB (number) updates, as well as how to check updates for install errors. Bob then mentioned InTune, an update manager application, then EMET v4.0 Beta (Enhanced Mitigation Experience Toolkit). Bob conducted a very interesting and entertaining session with good group participation.

Blain Barton from Microsoft was again with us for the meeting presentation. Blain has been doing an annual presentation for us for several years and he's always entertaining and informative.

This session, Blain demonstrated Windows Azure, the cloud-based software service. This is a storage service but includes many valuable software packages that run on the user's behalf. He demonstrated creating an SQL database and also how easy it is to set up a WordPress web site. He did a quick starter website for us.

As always, interesting and informative. ◆

Comments.....Continued from page 1

programs such as Windows 8, Azure (the Microsoft Cloud), Windows Phone, Bing and more. The 6,000 attendees (who either paid or their employer paid $2,000) were treated to three days of major and minor presentations and as a bonus given free items, such as a Microsoft Surface Pro and an Acer Iconia W3 Windows 8 tablet. They also were given some lesser items like 100 GB of storage on SkyDrive, a one-year subscription to Office 365 Home Premium and a one-year subscription to Adobe Creative Cloud. So the attendees got back most of their registration money in the form of gifts.

You can watch the Day One Keynote address at http://channel9.msdn.com/Events/Build/2013/1-001. Some of the highlights are:

- Windows 8.1 Preview now available
- Visual Studio 2013 Preview now available
- Two new Nokia phones, the 928 and the 925, thin and light with the best cameras on the market
- The Nokia 521 for third world markets at $150
- Also HTC 8XT and Samsung ATIV S Neo phones going to Sprint this summer
- Many new small and larger tablets, some combo type with detachable keyboards
- New small and larger laptops, all with touch screens
- Windows 8.1 will have built-in support for printing to 3D printers (if you can afford one)

Microsoft CEO Steve Balmer admitted that most of the first Win 8 devices did not have touch, but that will not be the case going forward. There is now a large collection of different Windows 8 touch tablets, laptops and combo devices. The small 8.1 inch Acer Iconia W3 Windows 8 tablet comes in at around $400. The Lenova Helix can go over $2,000 depending on RAM and hard drive size. And Dell has an all-in-one with a 27" screen, an i5 or i7 processor, up to 16 GB of RAM and a hard drive up to 2 TB, starting around $1,600.

Balmer paid particular attention to the Lenova Helix device with an all-day battery because it has a detachable keyboard with an additional battery. It weighs only 2 lbs., has an i7 processor, 8 GB RAM and a 180 GB solid state drive. "Is that a PC or a tablet," Balmer asks. It is not cheap. Have a look at http://shop.lenovo.com/us/en/tablets/thinkpad/thinkpad-helix/index.html/.

Win 8 has been out seven months and has 100,000 applications (seven of which are by William LaMartin). Additionally, you have the millions on regular Windows desktop applications.

He said that there were 800 updates to Win 8 coming in 8.1. Bing will be part of the operating system instead of just a search engine, whatever that means. You watch the video and see if you understand it. Free music streaming is built into Win 8, streaming what was a bit unclear to me – all songs or a select collection. When in the Win 8 app mode instead of the desktop mode, Snap (displaying two Windows Store apps on the same screen) is no longer constrained to the 1/3

Comments.....Continued on page 4

Comments.....Continued from page 3

- 2/3 part of the screen. You can now snap two applications to any ratio. In fact, you can now snap more than two applications. And the upgrade of Windows 8 to 8.1 will be free.

Now to the big thing, at least for some people. The Windows Start button is back. Here is how I understand that. You will be able to configure Win 8.1 to boot directly to the desktop (as seen in the previous image), not the Win Store apps Start screen. And once on the desktop, you can tap the small icon in the bottom left corner of the desktop to bring up a Start screen on top of the desktop. Based on what I saw, that results in a collection of tiles representing both Windows Store apps and desktop applications. You can also go further and have the Start screen display all applications sorted in different ways, alphabetically being one choice, as shown in the screen capture on this page. However, it is still not the same as what you had in Windows 7. I think the reason Microsoft will not go back to that is that it would be quite difficult to tap on those entries on a small screen with your finger. With a mouse, you could but not with your finger.

Personally, I am not going to jump in and install the 8.1 preview since I have Windows 8 on two computers, and I don't want to do anything that might cause problems for my current perfectly-functioning Windows 8. If I had been one of those attendees at Build 2013 in San Francisco and had thus been the recipient of a new Surface Pro tablet, then I might have installed 8.1 on that.

I learned many years back the dangers of installing trial software when I installed some beta version of Internet Explorer (probably as far back as IE 4) and it caused spell check to disappear from Outlook Express, which was my email program at the time. There was no way of fixing the problem until the final release of that version of Internet Explorer was available to install. And if anyone needs a spell checker, I do.

There is also a preview version of Visual Studio 2013 available, and I just might try that out since I don't believe it will cause any problems with my currently-installed Visual Studio 2012. As I understand it, VS 2012 and VS 2013 exist happily side-by-side on the same computer. However, I am going to do a full Acronis backup of my Windows 8 computer before installing Visual Studio 2013 Preview so that I can restore things if that is not the case. And it is time to do such a backup anyway. Have you backed up your computer – or at least your data files – recently?

A few extra items:

Recycling Staples will accept many computer items for recycling at their store: Desktop computers, laptops, monitors, printers, UPS battery backups and much more. Here is a link to their info: http://www.staples.com/sbd/cre/marketing/easy-on-the-planet/re-

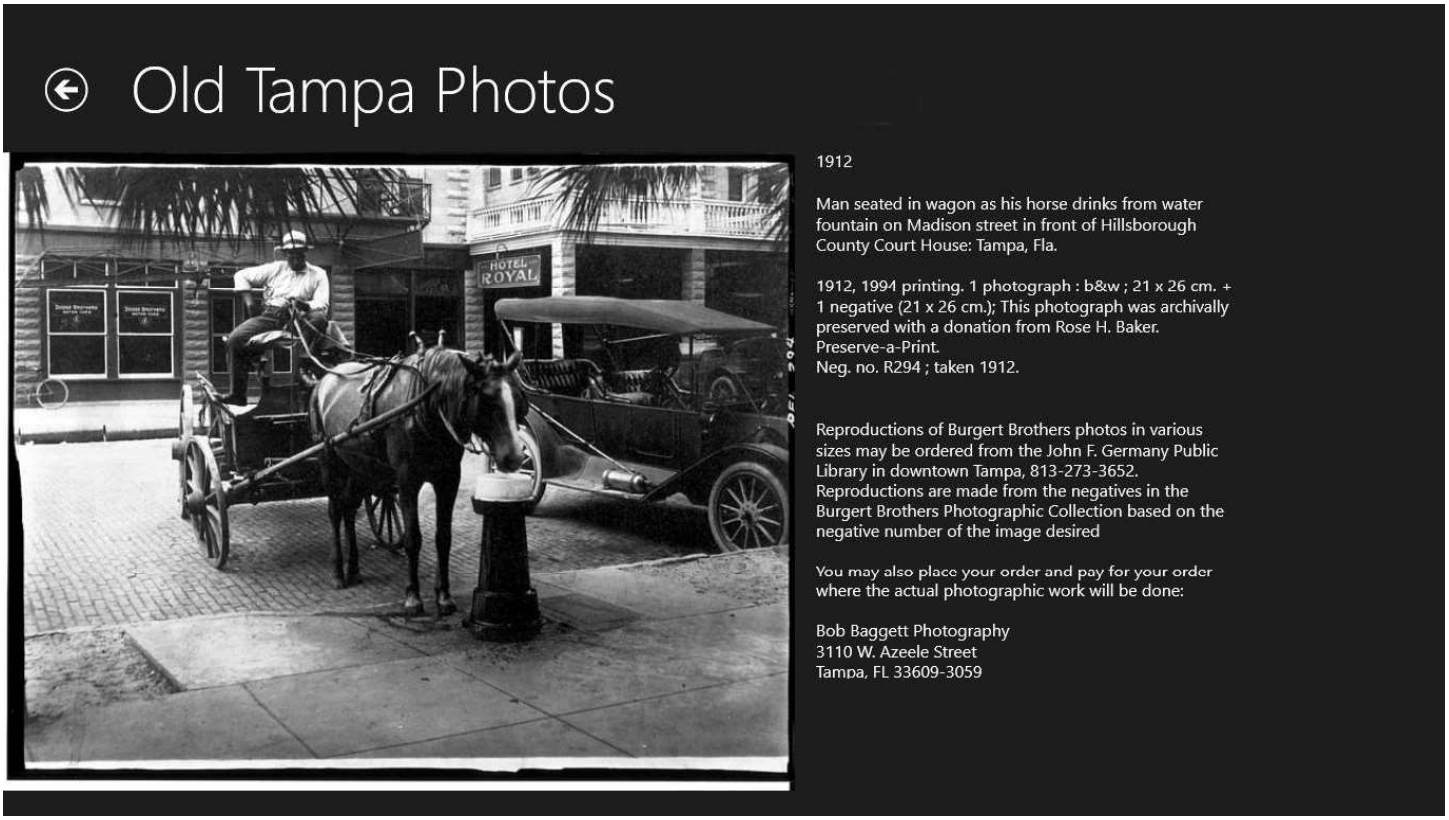
Old Tampa Photos

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

I have been dealing with the Burgert Brothers photographs of the Tampa Bay area for many years. A lot of people use my two search methods at http://www.lamartin.com/burgert/index.htm, which the library is well aware of and quite happy with. I particularly like the version which requires Silverlight in the browser.



But now, according to Microsoft, we are moving away from such things and focusing on apps, so I have created an app that does that, as they say, named Old Tampa Photos. The link to the app is http://apps.microsoft.com/windows/en-us/app/old-tampa-photos/73777782-b140-41bd-acfe-0676ae1be3ee. If you go to that link, you will see seven screen captures of the app, considerably more than space here allows. And if you have Windows 8, you might also install it and take a tour of this area in a time that for the most part was before any us had arrived on the scene. I find the photos interesting and think that I have probably viewed all 14,000 plus of them over the years.

What you see above is the opening screen displaying the images in the collection dated before 1920. There are 625 of them, which you may view the thumbnails of as you scroll to the right. In the app, if you were to tap on the thumbnail in the lower right corner of the image displayed above, you would bring up a page with a larger image and information about the image as seen in the screen capture on the next page. That photo is from 1912. I don't think there are any water fountains for horses left in downtown Tampa.

The screen capture below the latter one shows the Windows 8 Share charm being displayed, which allows one to send an email to someone with the photo and its accompanying information.

Windows 8 also has a Search charm, which, when invoked in this app, will allow you to search the entire Burgert collection for a single word or phrase. As an example, a search for "hurricane" will display 34 images. A search for computer will display zero. However, one for "IBM" or "International Business Machines" will yield several. There is also another Windows 8 charm, the Devices charm. Bringing that

Burgert.....Continued on page 7

Burgert.....Continued from page 7

up will allow you to print the photo in question to your local printer. Since most of the images are no more than 750 pixels wide, the image produced will not be of top quality or size. If you should want a very high quality and even a very large reproduction of the photo, you will want to follow the instructions

Burgert.....Continued on page 8

Tampa PC Users Group, Inc.
P. O. Box 3492
Tampa, FL 33601-3492

First Class Mail

☐ *Member: Your membership is up for renewal*

Burgert.....Continued from page 7

provided with each photo to contact the library or their assigned photo studio to have that reproduction made for you.

There is one last feature of the app, a slide show. Pick the time period in which you are interested and simply move through the images using your finger (on a touch monitor) or the mouse. If you wish to skip ahead, there is a slider that allows you to do that. And, as before, if you find one you would like to share, bring up the Share charm and send it to a friend.

I don't expect this app to have much appeal outside this part of Florida. However, I suspect that more people will be interested in it than in the Computer Group Newsletters app covered in last month's newsletter comments; that app featured all the TPCUG newsletters, and the Windows Phone version is now published at http://www.windowsphone.com/en-us/store/app/computer-newsletters/dd35c8f2-8d5e-4c5b-84de-e24d1204f2ac. I am also curious to see if Old Tampa Photos increases the requests to the library for reprints of the images. I will check with Bob Baggett Photography in a few months on that. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Merle Nicholson and Brian Lance have come through for us again with interesting articles. Otherwise, you would have been left with my ramblings. Those would probably have been about my newest Windows Store application, Drug Data, where I provide easily accessible information about the drugs in the FDA's list of prescription and nonprescription drugs.

Then there is the site I discovered with old newspapers. A number of years back I found a Google site for searching old newspapers and retrieved quite a few articles about the land boom of the 1920s in my home town area of south Florida. But for some reason Google disbanded the site, as they are wont to do with some of their projects. The articles I collected are at http://www.lamartin.com/OldNewspaperArticles.aspx.

The new site I have found, http://www.genealogybank.com, is not free, but has, I think, a much wider selection of papers

The Windows Special Interest Group (SIG) opens our monthly meeting. The SIG moderator, Bob LaFave, introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees. This month Bob covered a wide variety of PC subjects.

This month the program was presented by myself, Merle Nicholson. It was a continuation of the April 10 meeting where I started a discussion of GPS, the use of time to determine a person's longitude on the planet. This month I expanded the notion of time zones, and how to determine where you are in the time zone, some history of timekeeping. Also throwing in some examples of timepieces, American space travel and animal training.

Our gratitude is extended to Pepin for providing the room, projector and the presentation materials for the meeting. There were no announcements made due to president John Witmer's absence. ◆

Comments.....Continued from page 1

than did the Google archive. Importantly to me in my searching, it has the *Miami Herald*, the *Tampa Tribune*, the New Orleans *Times-Picayune* and the Baton Rouge *Advocate*. And the dates covered go quite far back, in some cases, from the 1800s up to the 1980s. The site has all *Tampa Tribune* issues, I think, from 1895 to 1959. The *Times-Picayune* runs from 1837 through 1988.

All of this is a phenomenal resource, and it is at your fingertips for $70/year. I think there is also a free trial offer. ◆

Building a Portable Office

By Brian Lance, Tampa PC Users Group
master.pc.tech@gmail.com

Have a spare USB drive? Of course you do. Even a 2GB drive can be a useful tool if you ever need to run a program on another computer. This simple guide can show you how. The first place to start is one of the most popular sites for portable applications:

www.portableapps.com The PortableApps platform can get you a fine list of portable applications. You can select all the programs you want upon installation, or add/remove at any time. I list the programs' home pages so you can check what you might want and get more info about them.

www.winpenpack.com Gives three pre-selected lists of applications to install portably.

www.portablefreeware.com Another, more extensive list of portable applications. Portablefreeware even has a complete list of Program Launchers for launching your own list of applications.

There can be the temptation to install every application you find. I don't recommend this. Your list should have two or three of any one type, at most. You'll want your menus simple so you can quickly find just the application you need and get to work.

Some of the more useful applications I've used:

TrueCrypt, www.truecrypt.org In my opinion, the best encryption software available. Its many advantages include open source code, speed optimizations, portability, hidden volume and even hidden operating system capabilities. You can use files or executables from an encrypted volume with almost no lag on modern systems, and the volumes can be located on any writable device.

There is some learning curve to proper use of encryption software, and the site has solid direction on this. It's very important to get an idea of how large a storage area you will need per volume ahead of time, I recommend no more than half of the drive or partition the volume will be stored on. Dynamic ("sparse") volumes that grow as you use them are not recommended.

KeePass, www.keepass.info For password storage (vs. file storage), I recommend KeePass. Also a very solid, open source program. It was recently updated with browser integration and many other improvements.

IrfanView, www.irfanview.com "...one of the most popular viewers worldwide!" There is no doubt about this! Very easy to use, just jump right in and browse a list of your favorite images. Offers many options for file-handling and thumbnail-previewing. Supports dozens of formats. Note there is a separate plug-ins pack if you need the more esoteric camera formats. If you have different types of non-image files in the same folders, I recommend you disable Irfan from previewing audio/video formats. Use MPC for those.

MPC-HC (formerly Media Player Classic), www.mpc-hc.org For all your video and audio needs. Plays back all major formats and will run on anything built in the last decade.

Greenshot, www.getgreenshot.org Better than many commercial programs for screen shots, I found new features while researching this article.

AbiWord, **OpenOffice**, http://abisource.com/ and http://www.openoffice.org Both useful, but keep in mind that if you import MS Office documents, the format may change on import even if you just enter data into a form. This is especially true for office documents edited in Google Drive.

So, jump on the Microsoft bandwagon, get a Live address at **www.live.com** and edit Word like a pro. One useful Live feature is the ability to log in with a one-time password sent to your cell, avoiding the need to expose your password while on an unknown network or device.

Your own browser can be one of the most useful items

Random Computer Ramblings

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

I'll summarize my ramblings first, and you can use them to decide if you want to read further:

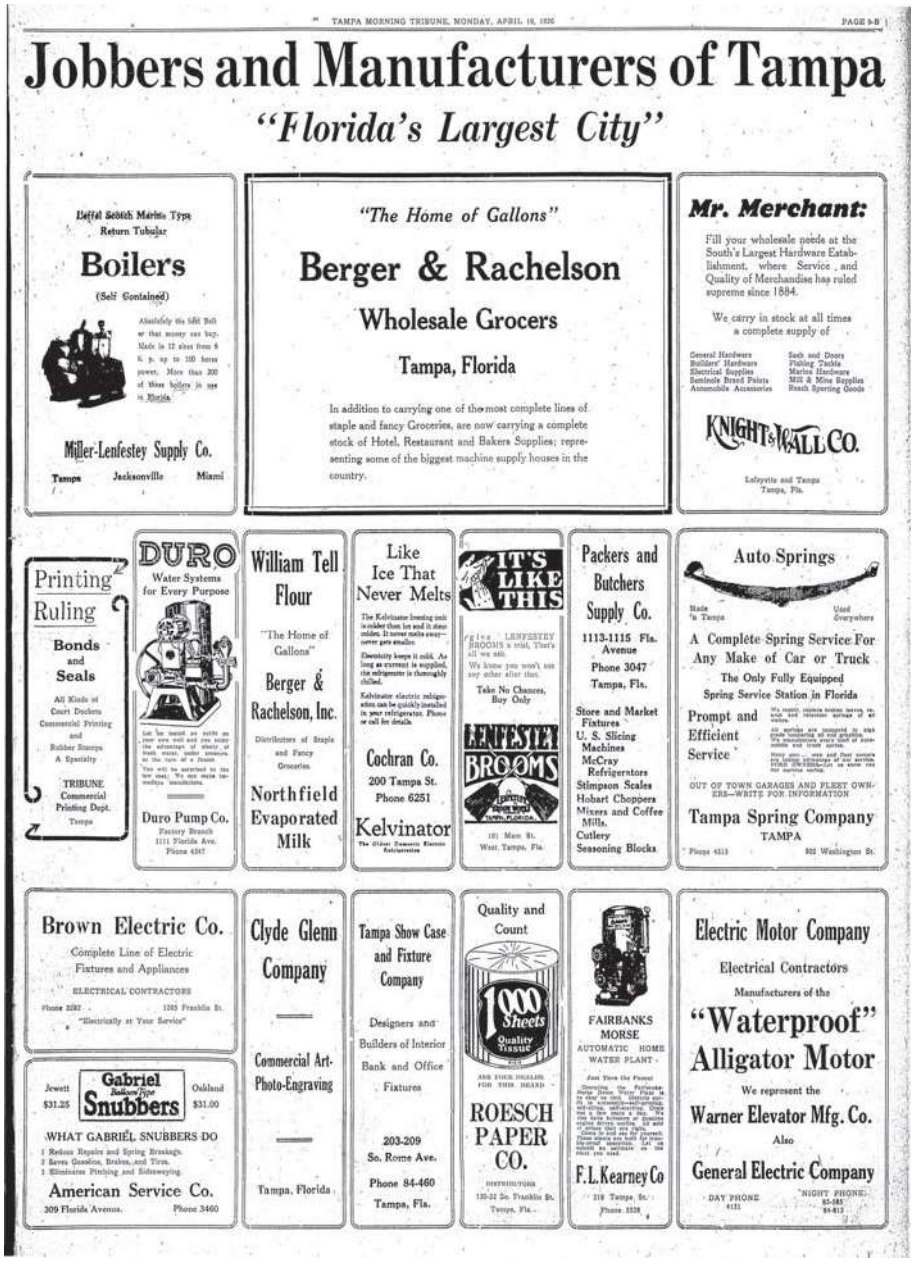
Windows 8 and Touchscreens
Windows 8.1 Preview
Multi-Tasking – the computer kind
A new notebook checklist
Notes on Operating Systems

Windows 8 and Touchscreens
I know, you have heard this before from me, probably monthly. There are many, many new computers on the market without touchscreens. Virtually all have Windows 8. This is a big mistake. I had a call from a friend who bought a new Acer notebook in Indianapolis and had to return it. She said she "hated Windows 8," and "hated Acer notebooks." Well, yeah. No touchscreen. She trusted Microsoft, Office Depot and Acer to sell her a functional notebook and found that they have violated her trust. I've noticed even Office Depot, whom I generally trust, is listing some of their notebook models as having "Windows." Not Windows 7 or Windows 8. That's deceptive. Yes, you can run Windows 8 with a mouse only, but it's so much trouble you'll be looking for a solution. There are free good quality products out there designed to make Windows 8 operate like Windows 7, but it's some work and a lot of experimentation. You'll be looking for an experienced friend to help you. I have done it, I think, pretty satisfactorily, but it was a lot of work and research.

You can order new computers online with Windows 7 for some time to come – directly from the manufacturers. They are usually "Business Computers" or "Home/office". This is because the corporate world is not about to switch to Windows 8 for many years. They have just barely transitioned from XP to Windows 7.

An alternative is to install Windows 7 over the Windows 8 operating system. This is generally a $140 "downgrade," but there's a lot of technical work to be done if you have the ability. The Windows 8 Pro version license can be converted to Windows 7 Pro version at no cost. But you cannot upgrade a Windows 8 Home version to Windows 8 Pro to make that work. Personally, I would not hesitate to downgrade, but first you must find out if all necessary hardware-specific drivers are available from the manufacturer's website and download them.

Last, there are always people speculating that Microsoft will "fix" Windows 8. But I think most professional industry writers are saying that it won't happen. They may make some improvements over time, but they will stick to the current theme. I think they see themselves as social innovators and are willing to bet that computers will follow the trend of tablets and go to touch and also that users are interested in running only one program at a time. At the same time, their Microsoft Phone, Microsoft Surface and Surface RT devices are just not selling well. Microsoft has the resources to stick it out, and probably will.



Windows 8.1 Preview
If you have Windows 8, you'll want to install 8.1 when it comes out, NOT the 8.1 preview. There are some good reviews out there to read in advance. If you're hoping for a return of the menu system though, it isn't going to happen. There are some important changes like allowing you to window four running applications on each screen at a time, sizeable. The current Version 8 is limited to two apps and is not sizeable. There is a new option to boot to the desktop, but the menu is still the "modern" tile screen. That screen has some real improvements in organization, but if you're like me, you will find it wanting.

Multi-Tasking of the computer kind
It's a popular idea now that a person can claim to be multi-tasking, and of course it's completely delusional if you give it some serious thought. If a human brain can multi-task there wouldn't be vehicle collisions while using a cellphone, or stubbing your toe on the table leg. It isn't lack of attention, it's just more things than you can process. The human brain can, however, TASK-SWITCH fairly well. That is – when the demand appears (an "interrupt" in computer terms), the brain can put the current task aside and switch to one being held in near-term memory. Like remembering to put gas in the car while putting on your pants to go to work. Or watching tennis while writing a newsletter article.

It is interesting, though, that there is a set of redundant pathways from your eye receptors to your brain. The more primitive pathway bypasses that part of the brain that processes images and instead provides a survival alarm. Every driver has been amazed that he had the ability to slam on the brakes to just avoid a collision at the same time knowing his eyes (and his brain) were focused elsewhere.

Random.....Continued from page 4

It wasn't luck and it wasn't experience. It is a primitive physical survival ability. In computer terms, it's task-switching.

A computer has hundreds of processes going on simultaneously. You can find out how many in Windows Task Manager. Look at the number of "threads." A thread is a part of a process, and each is independent. A process can have one or hundreds of threads. A process typically launches threads and allows each either to complete independently or to wait until each is finished because it needs to aggregate the results of many threads. Multi-threaded applications are written so that the operating system decides what processor runs each thread so that the threads can be run simultaneously on several processors.

So if you have one processor in your computer's CPU, it has to do a lot of task-switching because it does only one thing at a time, very fast. Each Task, Process and Thread is held in memory and is serviced in its turn. Obviously if you have more than one processor in your CPU, it can, overall, complete more threads simultaneously. That's mostly true. So if you're comparing computers you would conclude that a quad-core computer is better than a dual-core (probably, maybe), and an Octal-core is better than a Hex-core (possibly, probably not). And an Intel i7 is better than an Intel i5 (probably not). So here's the CPU skinny according

to Merle.

A dual-core or quad-core processor is about right for most everyone. A single-core CPU may be disappointing because it has to do a few hundred tasks (like antivirus and firewall) while simultaneously paying attention to your needs. Let's throw the single-core processor out.

There are a lot of new computers out there with old processor technology, and those are to be avoided. Specifically Pentium, Duo Core, Core 2 Duo, Athlon, Athlon II, Sempron, Celeron should not be on the market at all, but they are.

An Intel i7, by the way, demands a price premium because it's "hyperthread" capable. A hyperthread in this case means that each processor can do two threads at the same time. So if you have a quad-core i7, look at the Task Manager performance tab and you'll see eight "CPUs." For the most part, as you monitor it, whenever anything significant happens on your computer, you'll see that most of the processors are idle. Worse, if you have an intensive application like Access you'll see only one of the eight processors servicing that demand and the remainder will be idle. This is because Access, like most applications, is "single threaded." So trying to get the maximum performance out of a quad-core i7 CPU, you'll be disappointed to learn that you're restricted to one-eighth of the CPU. That's 12.5%. Yes, antivirus and firewall, keyboard, display and USB devices; all that are running, taking another 4%. In my opinion, skip the i7 and get an i5, save the money. What's more, unless you have software that demands multi-threading (high-end graphics rendering, motion picture processing), let's throw out hex and eight-core processors. I was surprised to find out that AutoCad, a very expensive, high-end 3D complex drawing program that has no peer, costs thousands, is single threaded. I disabled hyperthreading on that client's computer. I'm now expecting my client's AutoCad to use 25% of the computer instead of 12.5%.

Don't be afraid of AMD processors. The "A" series, A4, A6, A8 and A10 all have the GPU (graphics processor) built in (as do Intel I3 and i5), integrated in the CPU – called APU. AMD's APUs though, have superior graphics. In general, if you're looking at notebooks, the Intel processors have better (lower) power requirements, and AMD's better graphics. That's not to say AMD's APUs are especially bad, power usage wise, unless a notebook's battery life is important to you.

When you're considering a computer, get the CPU model number from the specifications and look it up on the Internet. I use a website called Passmark Benchmark. http://www.cpubenchmark.net/ . It gives you a relative performance number (Passmark) and gives you a cost/performance graph and a comparison to currently popular CPUs. For a notebook computer with normal low demand (Internet, word processing, email) and no need for demanding graphics (games), look for a CPU with two or four processors and an operating frequency of 2.2GHz and higher, not less than 1.8GHz. For Intel that will be an i3 or i5. A desktop processor is different. You can get more processing power for less money. Look for a quad processor with at least 2.5GHz, and compare to those with 3.2GHz. You may find more power for very little extra cost. Why is there a difference between Desktop and Notebook processors? CPU cooling and battery drain. Notebooks are a necessary compromise especially in cooling systems, so they tend to have lower power CPUs. Less cooling and less battery demand.

You have to be careful in comparing benchmark numbers. Usually sites like CNET Reviews will do a series of different benchmarks that may or may be relevant to your own usage. So pick and choose the performance benchmark that aligns to your own usage. The Passmark mentioned above is a good indicator of relative total power. But that benchmark powers all available processors 100% at the same time. This never happens in real life. I use these numbers to determine cost to performance. To decide if the cost of a processor is worth the money or not.

Buying a new notebook – a checklist

If you're in the market for a new notebook and want to make the right selection, you have some real work ahead of you. I hope the checklist I use will be some help to you. In any case, when you have a candidate, be sure to get on the Internet and read all reviews available for that model. Read both the professional reviews and the actual purchaser reviews. I use mostly CNET professional reviews and then the user reviews on Amazon and NewEgg. If there are some low-rated user reviews, be sure to read those. You may find out that it's rated low because it did not meet the user's expectations for delivery or something that does not pertain to you. On the other hand, low ratings sometimes make you consider something important that had not occurred to you.

Here – in my opinion –is the only way to make a well-considered decision when you're buying a new notebook computer. The ORDER of decisions is very important

Random.....Continued on page 7

Random.....Continued from page 6

because it will save you time.

1) Operating system Choices are - Windows 8, Windows 7, OSX (Apple), ChromeBook and Linux (Ubuntu and Chromium OS). Windows 8 REQUIRES a touchscreen. Chromebook is a very viable option because of its low cost and low power requirements.

2) Screen size 11, 13, 14, 15.3, 16 (rare) and 17 sizes are normal. The screen size is very important. It's a deciding factor in portability, weight and battery life. You should go to a store like Best Buy, ignore the prices and brands and look only at screen size, try out each one and make this decision number 2.

3) Battery rundown time This is at the top because it's so closely tied to the screen size. Generally, the smaller the size, the longer the battery run time. This is because the screen is the biggest power consumer. If it never leaves the desktop or is always near a plug, the decision is easier. Look at the specs on all notebooks under consideration and go to professional reviews.

4) Hard drive Choices are – SSD, SSD/HD combo, Hybrid and HD. Fortunately, traditional mechanical drives are becoming rare except in the cheapest notebooks. SSDs are affordable, especially in the small 128/256GB size. Hybrid SSD/Disk are common now as is the SSD and HD combination that Intel is building into Intel chipsets. Make SURE you know what your actual hard drive size requirements are. It's probably much lower than you think. The Windows 7 notebook computer I'm typing on now uses 53GB out of 119GB SSD total. Obviously I wouldn't spend a dime on a 500GB hard drive. The consumer of hard drive space is music and videos and game software. I have no need for storing videos, and my whole collection of music CD's will fit on a 4G flashdrive. Consider flashdrives. You will never regret buying an SSD system.

5) Features:

Bluetooth There is NO excuse for building a computer with no Bluetooth. It's cheap and makes connections to your phone, cameras, speakers, headsets and remote controls. Yet you'll see many on the market without.

Backlit keyboard This is a very valuable feature unless you're an accomplished touch typist. If you need to watch your fingers, you'll love backlit keys.

Camera Skype & Google hangouts.

Fingerprint reader This technology seems to be not fully developed yet. I've never heard anyone say "I LOVE my fingerprint reader."

CD/DVD/BD This is becoming less common. My current notebook has none, and I haven't missed it one bit. I still have my household network and flashdrives. But I don't play games and I don't play DVD movies. I did (Once) make an ISO file of a software DVD and put it on a flash drive.

USB 3 The combination of a USB 3 port and a USB 3-speed flashdrive is just amazing. It's faster than a mechanical hard drive and an order of magnitude faster than USB 2.

USB ports I look for at least one USB port on the right hand edge for a USB mouse. My personal preference would be three total including at least one USB 3. The thinner, lighter notebooks may not have three.

SD card port With WiFi and Bluetooth available for camera and phone connections, I've lost interest in card ports. For your particular camera it may be a necessity. But don't forget $8 USB adapters.

Notes on Operating Systems

By that I mean Windows, MAC or Chromebook. This decision is pretty much independent of the hardware. It's based though on your personal experience with the kind of software you use. If you find you're doing Internet browser, email, IM and word processing, you may want to consider Chromebook for its simplicity and low cost. If you have specific applications in Windows right now, the decision is already made.

I have a relative who became entranced with a MacBook Air, an expensive, beautifully made slim notebook. He took the salesperson's word that his Windows-only case management software will run just fine, and two years later it still would not work and he finally gave it up. He had better than $2,000 in it by then. A seriously technical person probably could have managed it. The upshot of this was that he had to own two notebooks. This is a good example of a compromise computer that uses a very weak processor because of the room for a CPU cooling system and limited battery space. The battery is actually glued in place and is not owner serviceable. But it's a gorgeous little computer.

Once the OS is selected, and if that OS is Windows, and it is for 91% of all computer users, then you have to decide if it's Windows 7 or Windows 8. ◆

to take on the road with you, with your own bookmarks, preferences, and saved passwords.

Chrome, Firefox, Opera - whichever browser you like, all portable. There are also more minor variants that are portable, but I recommend you use major recognized ones. Many, but not all of these have been tested under Windows 8.

I recommend grabbing a **Program Launcher** and just having fun with it. Try it out on your own PCs first. I think you'll find many uses for these utilities, some being lighter and more configurable than their standard installed, licensed counterparts.

One last note: The launchers and many of the utilities are open source projects and can certainly use any financial help you care to give. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Thanks to Merle Nicholson and Ron Weinberg for providing articles this month, but they came short of filling the newsletter, so I suppose I will have to write something. Merle sometimes writes quite long articles, but we can't expect that on a regular basis.

Since no outside speakers were found this month despite the best efforts of Doug Mullis, our program coordinator, I volunteered to talk on Windows 8 and the applications I have written for it. I gave a similar talk to the group in November of 2012. I know a lot more about Windows 8 now than I did then and have more applications, and, besides, you have probably forgotten what I said then anyway.

Windows 8 has turned out to be a controversial operating system with many detractors and few supporters in the computing press. Let me declare myself to be a supporter, but one who understands much of why there are so many detractors.

When I learned I was to do this presentation, I thought there was a good chance that Windows 8.1, the reworked version of Windows 8, would be available to me. But that is not the case. There is a Beta

Minutes of the August Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. The SIG moderator, Bob LaFave, introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees. This month Bob covered a wide variety of PC subjects and handled member questions, IE not playing video and ActiveX filtering in IE Tools and compatibility mode. Ransomware and NSA phone monitoring were discussed as well.

This month's program was presented by Microsoft's Blain Barton. Blain is continuing his presentation of Microsoft Azure. The subjects were very wide ranging: Azure recovery services, Certificates, private and public. A private certificate in this case is a pairing of you and Azure and a public certificate is you, Azure and the Internet. Backup Vault was shown. Blain went into "Blain Barton Blogs" using certificate. For Backup there are menu items: Server backup and local backup to server, register server and schedule the backup. There is an Azure simple store for simple file storage.

His advice, when starting up your new account, be sure to create the storage using a friendly name yourself first. It apparently cannot be corrected after storing a file. Blain then showed us Windows Azure Backup, creating a new website and creating a WordPress website. Blain is an entertaining and informative speaker. Our thanks to Blain for a very good presentation.

Our gratitude goes to Pepin Distributors, Inc. for providing the meeting room, projector, coffee and water for the meeting. ◆

Comments.....Continued from page 1

version of Windows 8.1 out there, but not the final release to manufacturing version (RTM) that I would feel comfortable in installing. The RTM version has been given to the hardware makers but not to developers such as myself, unlike when previous new versions of an operating system were made available. So the developers will have to wait until sometime in October just like the general public. But the original release of Windows 8 that I have will prove quite sufficient for me to explain the operating system to you, pointing out why so many tech writers hate it and why I and other users don't really have a problem with it. ◆

Preserve Those Vital Contacts

By Ron Weinberg, Member at Large,
Tampa PC Users Group
rswjbr@verizon.net

Those of us who are serious computer users well know the necessity and value of adequate backups. Some of the most common, valuable and essential data we have is our Email Address Book or Contact List.

I often assist others who have malfunctions or other computer problems. Far too many do not have adequate backups. Most do not even know how to backup properly.

Regardless of the complete backups you may have, I recommend that everyone keep a separate backup copy of their contacts by exporting them to a .csv file. However, Microsoft has not provided any way to export email contact Groups (categories). If you export all contacts, Groups are always lost.

Recently, I aided someone whose Vista system was completely dead without any power. Due to the age and quality of the system, over 5 years and only a basic model, they decided to purchase a new computer (iMac) rather than repair the source of the problem, which was probably the power supply. Their backup included only a few personal documents on a flash drive.

I removed the hard drive and was able to reclaim all of their data and photos using my Sabrent USB to SATA/IDE Hard Drive Adapter. I recovered a Contacts file containing email addresses wherein each record has the .contact extension.

A file with the .contact file extension is a Windows Vista or Windows 7 Contact file. These files are not readily utilized by other programs. Unless you have the same program on the new systems as the old (e.g. Vista to Vista or to Windows 7) or you use Windows Easy Transfer Wizard or an equivalent, .contact records are useless. How these were translated is described later in this article.

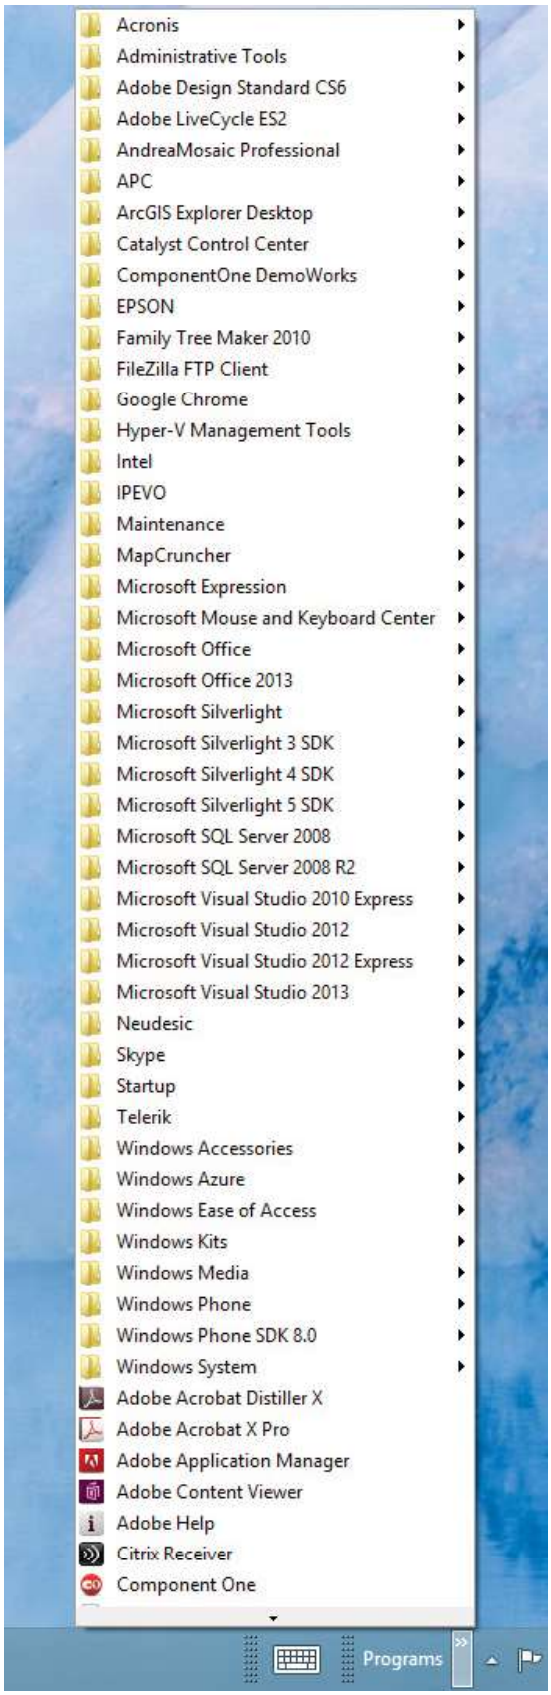
Of many available formats, the standard for transferring address files or contacts in all email programs is universally to import .csv. Restoring even from the best of backups to a different email program or operating system may present problems if you do not have a copy of your file in .csv format.

It should be noted that online programs like Outlook (Hotmail), Gmail, Yahoo, etc. may also have copies of your addresses which could be recovered only if the addresses have been properly transferred in.

Here is how I made the recovered file of contacts usable in any email program by using Windows Live Mail, without purchasing a third party converter.

1. Save your personal original contacts by exporting to a .csv file.
2. a. Delete all contacts in your Windows Live Mail (must be online to Hotmail online account).
   b. Highlight the first record of the .contacts file and press shift and highlight the last record.
   c. This will select all. Use the delete option from top or by right click. This removes all existing records.
3. Check the properties of the folder containing new contact records for number of records.
4. Open that folder containing the .contact records
5. Highlight the first record, press shift and highlight the last record. This will select all.
6. a. Use Open With command to open Windows Live Mail.
   b. A box will appear with one record. Click OK and box will appear for next record
7. Add one click for each record and the result will be a complete new file with the correct number of records.
8. When complete, export this new file in .csv format.
9. Delete this new file retaining the exported file.
10. Import to reinstall your original saved contacts.

The exported file is now available for any email program. ◆



Windows 8 Is Not That Bad

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

I have written about Windows 8 in previous editions of this newsletter. Even though I had not used it, I also wrote about Windows 8.1 in the July 2013 newsletter based on what I had viewed online of the presentations regarding it at Microsoft Build. And there have been various Windows 8 items inside other articles going back into 2012. Since you will be hard pressed to find another positive article on Windows 8 (or Microsoft for that matter), let me have a try at it.

First off, you should realize that professional writers have to write something to make a living – even if they don't really have a firm grasp on the subject at hand. I think that is why there are so many negative articles out there about Windows 8. They take a quick tour of Windows 8, they read other negative articles that resulted from a quick tour, and then they produce their variation on the "Why Windows 8 is a Disaster" theme.

I have used Windows 8 since it first came out, first on my main laptop in a Virtual Machine setup, then in a much better dual boot setup. The laptop does not have a touch screen. I also had Merle Nicholson build me a new desktop computer with a touch screen monitor specifically for Windows 8. I use both my Windows 7 desktop and Windows 8 desktop computer almost every day. I have essentially every program of importance to me that is installed on my Windows 7 desktop computer also installed on my Windows 8 desktop computer. I do not find it any more difficult to use Microsoft Word, Excel or Access in Windows 8 than in Windows 7. The same is true for all my Adobe products: Photoshop, Illustrator, InDesign and Acrobat. And I could go down the list of Windows Desktop programs that are installed on both my desktop computers. But there is no need. To the right is a screen capture of the program list on my Windows 8 desktop computer. Looks like a pretty good Start Button-produced list to me, the Start Button being that small rectangle at the bottom to the right of "Programs." It is nothing other than an added Toolbar. Such a Toolbar is easily added, and if that is not enough for you there are all sorts of other ways to add a Start Button for Windows 8 out there. Merle has written about them in previous newsletters.

So what is the problem with Windows 8? I think that fact that

Windows.....Continued from page 4

it is really two operating systems in one. What I have just shown a Start Button list for is the Desktop part which, I believe, is essentially Windows 7. It is where you go to run the traditional Windows Desktop applications like Word, Excel, Photoshop, Quicken and Family Tree Maker. This is not the app world. It is the world for what we call programs. And most programs there still function better with a mouse and keyboard and have no real need for touch. Of course, you can use touch to manipulate them. It may just be difficult sometimes if the thing you want to touch is not all that large.

Windows.....Continued from page 5

Then there is the other part of the operating system – the app world, or whatever you want to call it. It is the world of colorful tiles that you are supposed to touch with your fingers and which when touched will start a program that does something just as a traditional Windows program would do; however, all aspects of the program can be manipulated by touch. In reality these apps are more appropriate to a tablet situation than a desktop computer or even a laptop with only a keyboard. Think playing games, browsing the web and doing simple email. I cannot imagine composing this newsletter in a Windows Store application (that is what programs than run in the tiled part of Windows 8 are called at present, or simply apps). Or doing anything serious with Excel or even Word.

So, what is so hard about all this. You start up your new Windows 8 device, and you are presented with a Start Screen of tiles representing many of the apps or programs on your device. And to the lower left is a tile that when tapped will bring up the standard Windows desktop (without the beloved Start Button). On the Start Screen, by the appropriate finger gesture, you may also display smaller tiles in alphabetical order for all the apps on your device - including any Windows desktop programs. Apparently in Windows 8.1 this is all going to be made easier. However, from what I have read no one thinks it will be easy enough, and nothing will suffice until Microsoft gives us back our Start Button.

Well, I have news for you. I don't think you are going to see a Start Button any more than you are going to see a DOS prompt when your computer boots. Times change, and if a company does not adapt, they may be left behind. In recent years, Blackberry failed to notice that smart phone users preferred a touch screen phone to one with a keyboard. Blackberry, once the most popular such phone is now an also ran. Going further back, the number one word processing program, WordPerfect, was slow to move from a DOS version to a Windows version. They subsequently essentially disappeared. Microsoft does not have to worry about disappearing from its enterprise products like SQLServer and Azure, but for its consumer products like Windows on desktop computers, where are they if people continue to migrate to tablets such as the iPad, not using Windows to do their email, web browsing and social media? That is why they need a tablet-oriented operating system. And, fortunately or unfortunately, they chose to offer it in conjunction with a new version of their desktop operating system. Having said what I have, I will concede that Microsoft probably should have made a built-in way for people who cannot tolerate too much change to have a Microsoft-supplied Start Button. I earlier displayed one I made for the Windows desktop programs, but I think the desire is for one that would have both desktop programs and the new apps in one vertical popup list – not the alphabetical collection of small tiles as now exists.

There is also a method in the supposed madness for a tiled interface for everything except the traditional desktop applications. It is to have a standard interface across three types of devices: Windows phones, Windows tablets and Window 8 on a desktop computer (the tiled Windows Store part - not the standard desktop applications part). With this common interface, the programmer can write code that will work on all three platforms by creating something called a Portable Class Library. That does not mean that the programmer can write a Windows Phone app and immediately turn it into an app for a Windows tablet, but it does mean that he or she may create a block of code that does something in a phone application that is easily reused in a Windows tablet or Windows store application by simply importing the code library (DLL) that contains that code. It can be a great time saver.

In summation, I suggest that change is often difficult. I recall many years ago the difficulty for myself in changing from programming in Basic to programming in Visual Basic, then the change to also programming in Delphi, since the syntax was so different. Then I made the change to Visual Basic.Net and finally to C#.Net. All of these changes required an adjustment but all had rewards.

But we must change. Or we would still be using DOS without even a mouse. Of course, there are people who would be completely happy with that. ◆

ChromeCast by Google

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

ChromeCast by Google is a little device that allows you to play Netflix video streaming, YouTube and "Google Play Movies" on your TV. It must use a remote control device; there are no on-screen controls. That remote device, however, is a PC, Phone or Tablet.

The list of video sources is limited. But it's only $35. Google promises to expand the offerings. I'm happy with the limited functions, because it's only $35. My wishlist would be Amazon Prime Movies and ESPN3.

Did I mention that it's only $35, and for what it does, it works very well? In the first picture, it's not real clear, but on the business end there's a standard HDMI connector, and on the other, a power port. You must have a wireless network in range and an outlet for the power cube. It has a built-in wireless network receiver.

TV – must have an unused HDMI input and a means of quickly switching between them. Most flat screen TVs have two or more, but be careful that you have one unused. In my case I use only one, and I have four on my receiver. One is unused, so I am in business. I use a programmable remote, so I added a control item that will switch to that HDMI port.

Wireless Network. The Chromecast has a wireless receiver for 802.11g/n. My Verizon router recently expired, and the replacement router has Wireless-n instead of g. If I had known that, it may have expired sooner.

Power. You must have an available outlet for the power cube. The ChromeCast device does not have a battery, so it works only when powered. There is no on/off switch. I have a UPS next to my media center for things I don't want to drop out, like the set-top box and the media center computer.

Unboxing. So first, unbox it - In the photo on the left, working from left to right; the power cord; an HDMI M/F extension cable; the small power cube and on the right – the ChromeCast.

Connecting is simple. Thanks to the included extension cable I just plugged the ChromeCast into the extension cable, and the cable into the HDMI port on the receiver. Note that the base of the ChromeCast is wide and probably won't insert without the extension cable if there is another port next to it. Then the power cable and the power cube. That's it. Switch on the TV and select that port. There's a screen on the TV that prompts you to use the ChromeCast app to make the wireless connection work. It displays a temporary name for itself. Install the ChromeCast app on your control device. I have only Android devices and Windows PCs in my house, so I can't comment on anything Apple-wise, sorry.

The ChromeCast app is quick and easy and free at the Google Play app store. When you run it, it searches your own network for the ChromeCast device. When found, the same device name as on the screen will appear and ask for the wireless network security password. It remembers this. It also suggests you supply a name that may describe its location in case you want to buy one of these for each room in your house. At pressure times like this my creativity goes away, so I named it "Main". Looking at the picture on page 8, that name is on the screen, as is the SSID of the wireless router.

Now, it's "ready to cast". That symbol before "ready" on the screen is the symbol of the button that appears on some (in my case – my Nexus 7 tablet) apps. When I open the regular Netflix app on my tablet, I can pick a movie or TV episode to play, press that symbol at the top of the Netflix screen on the tablet, and it automatically plays on the TV. It does not play to the tablet and then the TV. It bypasses the tablet and streams directly through the Internet to the ChromeCast device. So far it's that easy, but just for Netflix, YouTube and Google Play Movies. But that's a lot.

ChromeCast.....Continued from page 7

Experimentally (it's beta) for the PC and Mac, there is an app that is a plug-in to the Chrome browser. You can easily display the browser window through ChromeCast on the TV. I have done this a few times, and it's useful to get an Internet browser to display. But it's laggy, and a little frustrating. It certainly will not play video in any useful manner. But if for some reason you want to display a browser window and it's fairly static so you don't induce vertigo for the viewers, it works. And it's $35. Available at Google - https://play.google.com/store/devices/details?id=chromecast (You do have a Google Login, don't you?) $35.

It is also at Amazon.com. Search for ChromeCast – temporarily out of stock, but when it's available it's $35. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Thanks to Merle Nicholson and Robert Davis for providing articles this month. The article by Robert reminded me of how much old software and hardware is residing in the room above our garage. The hardware starts with an Apple IIe followed by computers with almost every subsequent processor available in an IBM compatible PC starting with a Gateway 386. Since a lot of the monitors went bad and were discarded, there are many fewer monitors than PCs. I think there is only one printer up there, the one used with the original Apple. All other printers were either given away when no longer wanted or recycled if defective. There are even two Apple plotters that I purchased at give-away prices. Of course, you can no longer get the pens for them. And there are several scanners there, too. Then there is the software. I don't believe I ever threw away more than a few items of software. I am sure that room contains large floppy disks with games and applications for the Apple. And there have to literally be hundreds of large and small floppies for all the Microsoft DOS and Windows programs purchased over the years. The question is will any or all of those old PCs boot and run the programs on their hard drives, since I suspect the hard drives go bad just sitting there. ◆

Minutes of the September Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. The SIG moderator, Bob LaFave, introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees.

Bob covered a wide variety of PC subjects, starting with a discussion of a members' broken computer and steps to take to revive it. Then he demonstrated the features of Kaspersky Anti-Virus.

William LaMartin, our volunteer newsletter editor, provided our presentation this month on a couple of subjects surrounding Windows 8, which he has experience with both as a user and an application developer.

The first subject he addressed is that "Windows 8 Is Not That Bad," with a comparison and use of the two user interfaces, Tiled Screens vs. the desktop. William emphasized that the Windows 7 interface is still there, with the exception of the Start Menu. He did demonstrate the "Programs Toolbar" that Merle Nicholson has written about and that they use. This allows a very useful cascading program menu with very little effort to implement.

William went on to mention Office 365 and how it differs from the traditional sales model. Office 365 is a subscription-based (SAS-Software as a Service) for $100/year. Also he mentioned Adobe CS 6.0 Suite for $600/year.

William continued with a PowerPoint-led presentation of his Windows 8 metro-interface applications. These are applications that he has published in the Windows Store. Following this, he ran several of the apps including"Computer Group Newsletters." This is a way to search for all past articles in *Bits of Blue,* our own club newsletter, from 1988 through November of 2012. It's free in the MS Windows 8 App store. It's very well presented, and very easy to use in Windows 8.

William then discussed how the Microsoft App store payments are made, both advertising and direct sales, and how his are doing. As always, interesting and informative. ◆

The Box of Stuff

By Robert Davis, Tampa PC Users Group
robd234@gmail.com

Have you ever cleaned out your software closet? I hate to admit it, but I guess I am an old pack rat at heart. I'm one of the few people who still have a 3.5" disk reader on my desktop PC. I even copied some old 3.5" disks onto CD's for a friend last month. He had some perhaps priceless pictures on the disks and no longer had a disk drive to display them with. Modern technology bulldozed the 3.5" and 5-1/4" disks. Even the old spinning hard drives I believe will be replaced with solid-state disks. What comes next?

Today I took a mental trip back to the past. My wife Marty gave me an old big box full of "stuff" she dug up from a closet and said, "See if there is anything worth keeping in it." The stuff must have been packed into that box back in 1997 when we moved to Seffner, Florida. Nothing had been touched for over 16 years! The box literally contained hundreds of old 3.5" and 5-1/4" disks and floppies. There were old back-ups and perhaps bandit/backup copies of some old outdated software as well. It had all kinds of original software packages from the past in there, too. Most of the software stuff I probably have never used, nor will I ever use in the future anyhow. I can't remember where I even got some of it. You know how stuff just seems to accumulate? I used to work for StorageTek Corporation, and I suppose some of it was for the old laptops we used.

I thought I would list the major stuff to see if anyone remembers any of these priceless gems…. But don't expect to acquire any of this stuff from me. I may actually just blatantly toss this stuff out! Here's some of the software that was in that big box. Think back – what were you doing when these programs were hot stuff?

- Business Works integrated accounting system v7.0 on a 5-1/4" Floppy disk
- CA-Textor for Windows on a 3.5" Disk (says it Requires a VGA monitor!)
- NmbrCrunchr version 1.5 on a 3.5" disk C 1991 (with registration card)
- NmbrCrunchr Beta test version 1.3 on 3.5"
- Frontline Demo 5-1/4" Disk
- Doom - The Ultimate 3-D Virtual Reality Game on 3.5" Disks
- Online for Windows version 3.0 on 3.5" disk
- WinFax Lite v 3.0 for DOS on 3.5" disk
- LePrint 3.1A Manual dated May 8, 1989
- Cc:Mail for Windows Version 1.1 C1991 on 3.5" disk
- Kiplinger's CA-Simply Money Version 1.0 on 3.5" disk
- Prodigy (requires DOS version 2.0 or higher)
- Crosstalk Communicator - still in sealed package
- Online Library Omnibus Edition VM Collection dated September 1993 (use with IBM Library Reader/DOS included in the sealed package)
- Online Library Omnibus Edition MVS Collection dated September 1993 (use with IBM Library Reader/DOS included in the sealed package)
- Lotus Works Pro Visionary CD June 1995
- Compuserve version 1.4

Box Stuff.....Continued on page 8

Don't forget to Google it first!

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

I know, Google isn't a verb, or it isn't supposed to be. I think using it as a verb is not a social shortcoming but an English Language shortcoming. So the title of this article should be "Don't forget to use your favorite search engine first."

My latest success with search was "Windows Live Mail offline." I just resolved my brother-in-law's computer problem in Louisville. We talked for two hours trying to figure out why his gmail wouldn't pull in his Windows Live Mail. Here's a case where I could have resolved it in five minutes with a specific search in Google. So this is a reminder to me as well as for you. Search first before launching into fire walls and email settings.

This turned out to be a setting in Internet Explorer that Windows Live Mail uses: "Work Offline." Even though IE is not his default browser and the IE browser setting was "Online," setting it to "Work Offline" and then back to "Work Online" fixed his email client.

The discussion thread had some misinformation, so it paid to continue reading the discussion posts until I got to someone who had symptoms identical to ours. One red herring was to first make IE the default browser. Next one was to look at the IE setting to see if "Work Offline" is checked – it wasn't – but piecing it all together said to first enable the IE Menu Bar and under File check or uncheck "Work Offline," then uncheck it if you just checked it. The Windows Live Mail worked immediately, and it downloaded all of the old mail as duplicates, so when I hung up he was looking at 425 emails to sort out. ◆

What is this?

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

I'm a fan of PBS's "This Old House" and "Ask This Old House." On "Ask" they do a "What is it?" segment for quirky gadgets and they goof off awhile with funny uses for odd plastic things. So I have my own "What is it?"

The photo above is a Sony DSC-QX100, and it's obvious it's a lens because it says "Carl Zeiss" on it. Other fact is that it's $500. What is it? No, it's not what you would think.

It's a camera. A fully functioning still and HD movie

What is this.....Continued on page 5

Internet Picture of the Month

The Rabbit Hop

From http://www.theatlantic.com/infocus/2013/09/animals-in-the-news-with-a-vladimir-putin-cameo/100598/. "A rabbit hops to avoid a five-month-old leopard cub in a test of the cub's wild natural instincts at a wildlife park in China."

What is this.....Continued from page 4

camera with 3.6x optical zoom, image stabilization, a 20M pixel 1-inch sensor, HD video, battery, WiFi and NFC communications.

It clips to the back of your smartphone, as shown in the second photo and communicates with NFC radio so that you can then control the camera on the smartphone screen using software for either IOS (iPhone) or Android.

I'm still incredulous. Maybe someone needs to tell me where this fits within the categories of human endeavor. It's a camera. Buy a camera if you need a camera. ◆

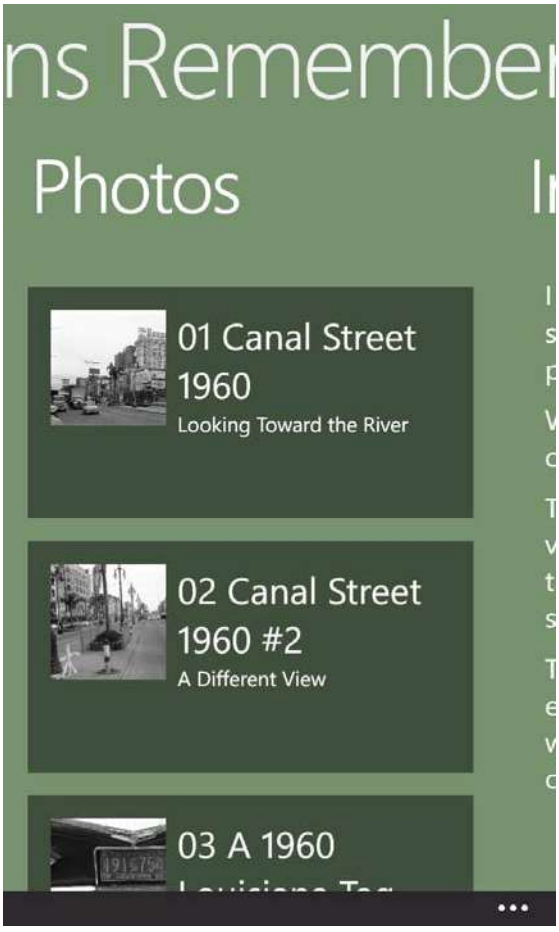
App Studio

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

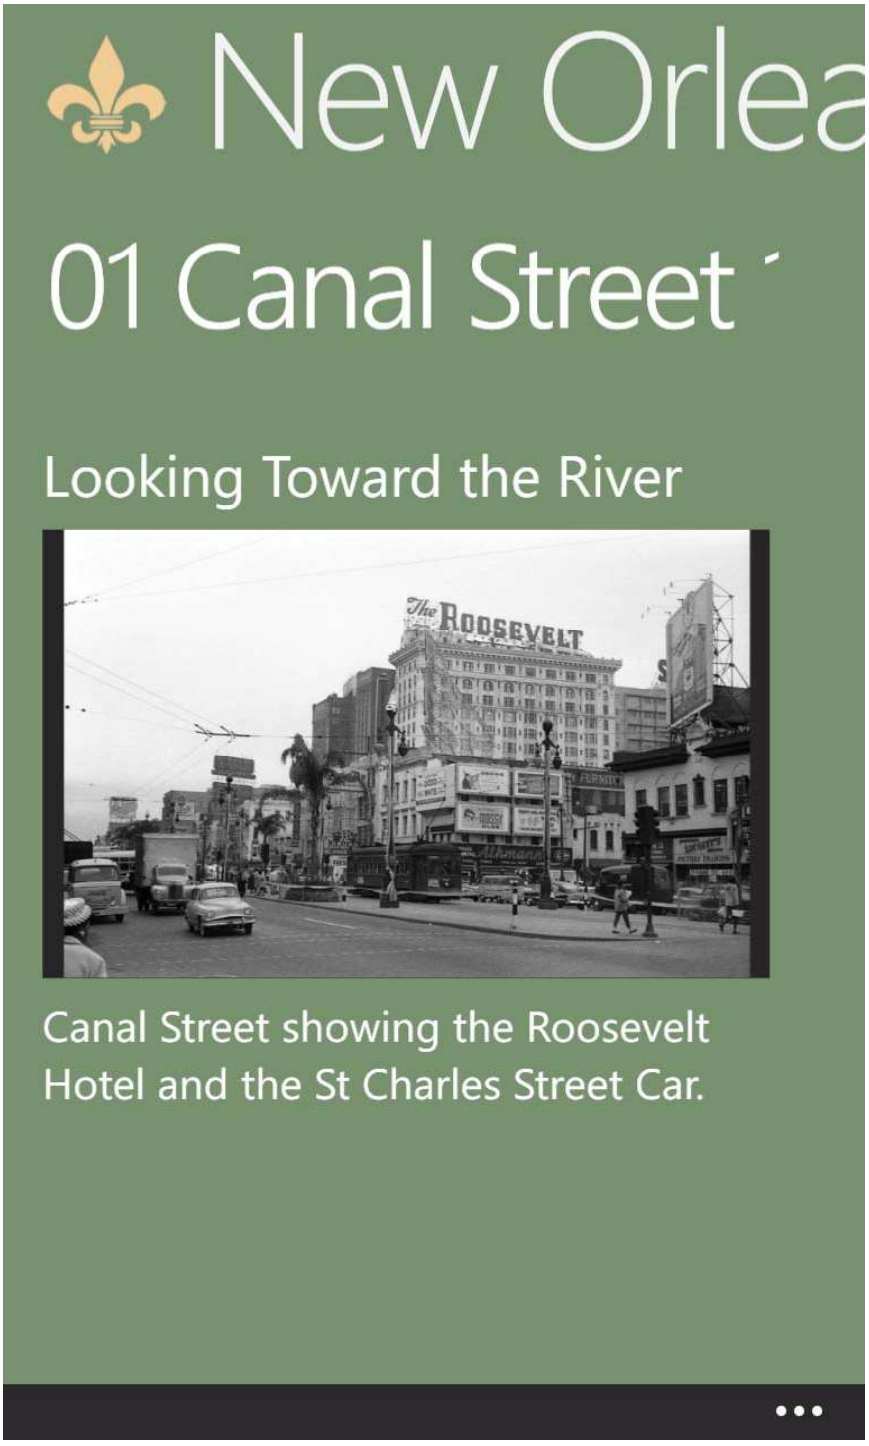
You too can build a Windows Phone app without having to do any coding. All you need is a Windows Live account, which Microsoft is now calling a Microsoft Account, You don't even need a Windows phone, but having one would be nice so that you can see your app run on the phone. To get started, go to http://apps.windowsstore.com.

The first thing you should do is to open the tutorial, which is a pdf file, under the Resources heading on the page. Ignore the information about installing a certificate since that really comes later when you want to install and test the app on a Windows Phone. At that time you will need to install the certificate on your phone, but to create an app just follow the tutorial.

To begin, click the Create link on the web page. That will produce a web page where you have the option to create an empty app or an app from a template. I chose the empty app option. After that, you give your app a title, description and select an image for a logo. Then you are at a point where you can begin adding things to the app. Clicking the + button on the then-current web page, you have the choice of adding a Menu, which I didn't, or a Section which consists of a group of pages. I chose to add two sections: An Introduction section and a Photo section. For the Introduction section, I gave it and its data source names and chose HTML as the type of source, which simply means that it is going to be text. That text is seen in the top left image on page 7, where the Introduction section is displayed. I then added another section, the Photo section. The Photo section will use a local collection as the data source for my photos, but they could be pulled from the Internet. To populate the Photo section I need to add photos while supplying them with Titles, Subtitles and Descriptions. I will add a total of 30 such photos to create my app.



There is more to be done. I need to select a theme for the app as regards background color, etc. Also needed is a layout for the photo thumbnails and the photo details page.



On page 7 are three screen captures of the finished app, including the Introduction and photos in the theme I chose, the third made larger for better viewing. The photos shown are black and white, but of the 30 included, perhaps half are in color.

Once you have completed the design of the app, you click a button on the web page to generate the app. And after a very short time when the app has been generated you are presented with a web page with the options to 1. download the source code, 2. download the publishing package or 3. to share the app by email (with someone else using app studio). But the neatest thing is the display of a QR code which you can use to install the app on your phone simply by capturing the QR code with your Windows Phone's camera.

I have submitted the app to the Windows Phone Store under the title *New Orleans Remembered*. After it is in the store and accessible to the public, I am going to need to do an update since by not first reading the tutorial I missed the part about creating a Splash Screen (a minor item). ◆

New Orlea
Introduction
I have been visiting New Orleans since I was a teenager and taking photos on those visits.
What follows is a tiny part of that collection.
Tap a thumbnail to see a larger version with a description, then tap the larger version to see it full screen.
This app was created as an experiment using App Studio without writing a single line of code.

Box Stuff.....Continued from page 3

- MS-DOS Version 6.22 still in a sealed package! The best DOS version ever!

It is truly amazing how different the PC world is today compared to just ten or fifteen years ago. I even wrote my own amortization program for DOS back then using MS QuickBasic 4.0. Actually, I still use that Amortization program today to calculate payments, etc. It just won't print to a USB port. But it's like an old friend you hate to see go. I am getting into the modern Windows programs, though. Why just this year I converted from Quicken version 8.0 for DOS to Quicken for Windows. The reason why, you ask? I use Quicken to print reports for our tax returns. Quicken for DOS wouldn't print to a USB port and my old parallel port printer died! Alas, the old printer went to the recycle dump on SR 579 along with some other broken electronics.

Today the software is mega better than the old DOS programs were. It's a challenge to keep up with changes in the PC's and the software that runs on them. After going through that big box, I'm thinking I need to take a look at the old stuff in my software cabinet, too. Have you cleaned out your old out-of-date stuff lately, or are you a pack rat like me? ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

It's been a bit exciting here with all the projects I have been working on. And it got even more exciting when I pressed the power button on my Windows 7 desktop computer that I use for most of my work and nothing happened. I will write about that later in the newsletter.

Don't you find it interesting that Google is upset because it has been disclosed that the National Security Agency is intercepting much of their data when Google's whole business plan is to intercept your data so as to better aim ads at you from which they make no small amount of money. Anyone who uses Gmail has to know that every word they write is picked over and analyzed by the Google software to see if they are a good candidate for a camera, long underwear, health food, unhealthy food or whatever else is mentioned in the emails. The same goes for

Minutes of the October Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. The SIG moderator, Bob LaFave, introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees.

Bob covered a variety of PC subjects, a member's lost user account and password, using the administrator account to recover it, and a tool from Farstone.com Total Recovery Tools v10. He touched on WEP/WPA router settings and answered questions from other users.

Steven Singer was with us to present his annual hardware talk with trends and new stuff. The subjects he talked on were phones – mostly the Android kind – and ebooks. WiFi, Smart TV, Windows Media Center, TPLink Router, 1TB 2-1/2" drives and Powerline Networking were discussed. Other hardware mentioned were: a discussion of AMD and APU, new AMD A10, ITX motherboards, USB 3 adapters and 64GB SDHC storage. As always, interesting and informative. ◆

Comments.....Continued from page 1

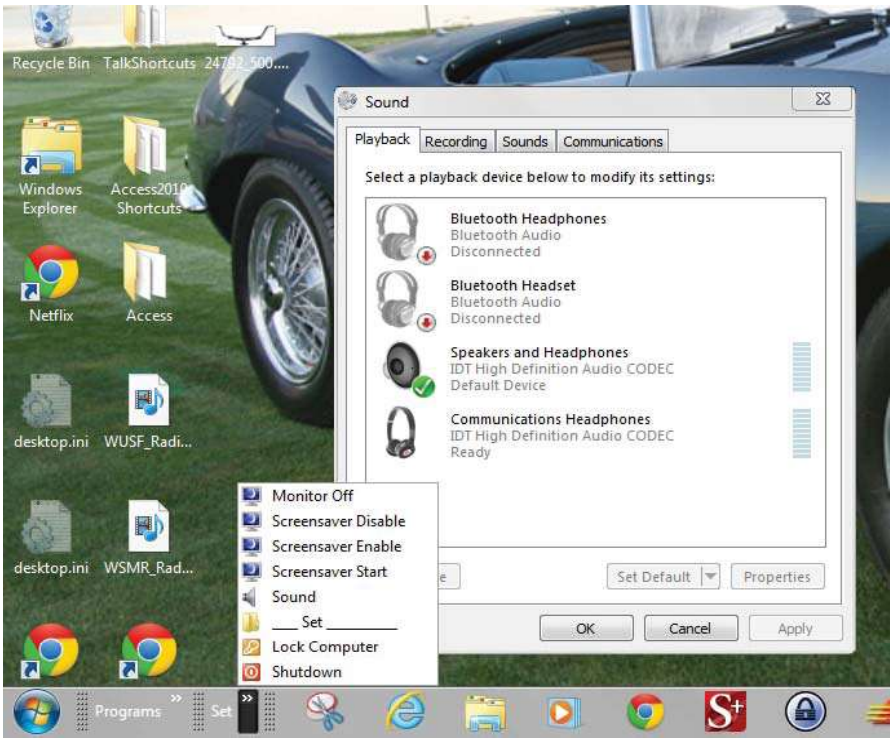
the Google search engine. If you use Gmail, then I assume Google knows who you are and which computers you use, so it is then easy to conclude that the searches coming from your computer you also use for Gmail are associated with you.

Since I use an email server at the company which hosts my website, I at least don't have Google pawing through all my emails. However, I am sure that doesn't stop the NSA from seeing my requests to you each month for articles for the newsletter. ◆

A SET Menu for Windows 7/8.1

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

I'll say it right off the bat, I love Android. Even on my not so new v2.3 Droid phone, but my tablet and my spouse's phone have v4.2, where a swipe down from the top will get all your system settings. Maybe kind of like Windows 8/8.1 Charms menu may be one day years from now when they fix it. By the way, the "Charms" name doesn't set too well because I'm not an eight-year old girl. I'm a grumpy old man, and "Settings" would pretty much suit me.



The Android feature I'm referring to is "Settings." That's a convenient way to get all your settings quickly in one place (it's an expandable drill-down menu). In Windows 7 and 8 they're scattered all over the place, sometimes where you can never find them without some kind of a desktop word search. Why can't we do that on Windows 7?

So I decided to track the things I do on my notebook and see if I can make it easier. I can't duplicate the Android look without programming something, but the Taskbar Toolbar feature will do the job. I've written before about my "Programs" menu, and William LaMartin has shown it in the Windows 8 environment. You'll see it below just to the left of my "Set" menu.

My "Set" toolbar is constructed exactly like the "Programs" toolbar. You simply add a toolbar to the taskbar by pointing to a folder you create. Then you add items in the folder, and they become the menu items. The items are all in the form of a Windows shortcut. In this picture, I had just clicked on the "Set," "Sound" shortcut to get the sound settings. These are all I have for now, but it takes care of 90% of my day-to-day annoyances. I have no intention to put all settings there, just my favorites. An explanation for each:

Monitor Off. Sometimes I want to walk away from the notebook. The screen is a major user of the battery. Setting the Windows Power Options to a short time creates annoying behaviors in other circumstances. You certainly do not want to make a Power Option change knowing you will set it back in a couple of hours. The method I used to turn it off uses a mouse movement to wake it.

I NEVER use Sleep or Hibernate on this notebook. It has an SSD and boots in about 20 seconds. It would take another long article to give all the reasons.

Screensaver Disable and Screensaver Enable. First, let's call a screensaver what it really is: entertainment. Pictures on a wall; I see value in that. I use photos I've taken – the ones I'm most proud of. It's a lot of trouble to turn off your screensaver and back on. You have to change the screensaver program to "none" then later select the one you usually use. I turn the screensaver off when I want to put an instructional PDF on the screen to refer to and sometimes to monitor the progress of a major backup or disk clone. These are circumstances where the screensaver interferes with something that is being displayed. Then if I turn it off, I'll need to turn it back on.

Menu.....Continued on page 4

Menu.....Continued from page 3

Screensaver Start. Start it NOW.

Sound. I don't mean change the volume. I mean change the sound device to another. For me that usually means change it from internal speakers/headphone to Bluetooth or USB and back. Windows should have a better way to do this, but it doesn't.

____ Set ____. This is a Windows Explorer shortcut to the folder where the Toolbar's Set shortcuts are. So I don't have to remember where to look if I need to make a change.

Lock Computer and Shutdown. These are the standard system functions except that it's immediate – for people who accept the consequences of their rash behavior. These items, along with "Restart" will be invaluable in Windows 8/8.1 desktop mode, since the Start menu has been eliminated. As it is, you have to go to Charms, Settings and Shutdown to turn the computer off.

That's it. I'm sure I will be adding more items over time, and if you're interested in doing this and you have some other ideas, be sure to email me. The following is a technical description. It involves downloading a free utility program for some functions.

Technical Part.

First, create a folder for the shortcuts. Mine is called "Set", and I put it in "My Documents". "C:\Users\Merle\Documents\Set". Then in "My Documents" create a shortcut to the folder, and move the shortcut into the folder. Rename the shortcut to "____ Set ____" or just "_____" so it will resemble a menu divider. Then right-click on the Taskbar, Toolbar, New Toolbar, and select the "My Documents\Set" folder as a new toolbar. The toolbar will appear on the right, next to the System Tray, and I moved mine to the left. Sometimes that's tricky to do, but be persistent. You'll see that then locking the taskbar messes up the appearance. I just leave it unlocked.

OK, so now it's a toolbar and it has one item in it: The folder to conveniently open Windows Explorer to drop shortcuts into it. You can drop any kind of shortcut there, copies of ones you already have or shortcuts to other useful folders, or create new ones. Here are the details of mine.

I use a tiny utility called Nircmd.exe from http://www.nirsoft.net/utils/nircmd.html . DO NOT do the download at the top of the web page. Go to the bottom of the page where it says "Download NirCmd 64-Bit". If you happen to have Windows XP or the rare Windows 7 32-bit, download the other one, "Download NirCmd". You get a zip file. Unzip the files into a folder. I put mine in a convenient place by creating a folder in "Downloads" called "nircmd-x64", so the path to this executable is now C:\Users\Orion\Downloads\nircmd-x64\nircmd.exe, Orion being the administrator logon name. When you go to that NirCmd web page you'll see the pages of stuff this little executable will do. You can even create scripts, so that it will execute a series of steps.

Usually I create a shortcut on the desktop with a Right-Click , New, Shortcut. The dialog box Opens and in this case I paste in the location of the NirCmd. Exe, Ok and then the name of the shortcut "Monitor Off". Then I go to properties of the shortcut and edit it. In this case I add a space and "monitor off" to the target. Then I change the icon with the "Change Icon" button. You get a warning that NirCmd.exe has no icons, but it should open up a chance to select an icon from the library: %SystemRoot%\system32\SHELL32.dll.

Here's the list of shortcuts, the shortcut name and the target field.

- **"Monitor Off"**, C:\Users\Orion\Downloads\nircmd-x64\nircmd.exe monitor off
- **"ScreenSaver Disable"**, C:\Users\Orion\Downloads\nircmd-x64\nircmd.exe regsetval sz "HKCU\control panel\desktop" "ScreenSaveActive" 0
- **"ScreenSaver Enable"**, C:\Users\Orion\Downloads\nircmd-x64\nircmd.exe regsetval sz "HKCU\control panel\desktop" "ScreenSaveActive" 1

Internet Picture of the Month

Looted Art

From the National Archives, http://www.archives.gov/. I thought with the current interest in the 1,000 plus trove of paintings recently discovered in Munich that were most likely looted by the Nazis it would be appropriate to view one of the most famous photos of such a discovery. Here we have: "General Dwight D Eisenhower, Supreme Allied commander, inspects art treasures looted by the Germans and stored away in the Merkers salt mine. Behind GEN Eisenhower are General Omar N. Bradley (left), CG of the 12th Army Group, and (right) LT Gen George S. Patton, Jr, CG, 3rd U.S. Army. 4/12/45".

What do you do when the power button doesn't work?

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

As I mentioned in my introductory comments on page 1, things around my house got a bit bothersome when I pressed the power button on my Windows 7 desktop computer that I use for most of my work and nothing happened. My first thought was that something might have gone wrong with the computer's power supply. But a quick check showed that the computer was getting power since several LEDs inside the case were lit. The first thing to do was open the case and look for loose connections. I saw none and did nothing.

My work was backed up on external drives and at live.com but no more recently than several days back. So if I wanted to be able to use that data, the thing to do was remove the drive in the computer that had my data on it and attach it to a convenient drive port that exists on my newer Windows 8 desktop. I did that and copied all the important files to that computer.

Then I sent an email to Merle Nicholson. His response was: The power button cable is disconnected. Well, I had already looked at all connections to the motherboard, and everything appeared to be connected. But to make sure I grasped what I thought to be the power button cables, along with the other cables they were bound together with (in the center of the photo to the left), and moved them in and out and then tried to boot the computer by pressing the power button. And everything was fine. Merle was correct – sort of. To paraphrase one of our former presidents: It all depends on what you mean by connected. The cables were plugged in, but the connection was not good, and by my moving the plug in and out I apparently cleaned off whatever minor corrosion had occurred.

So I learned something, and all that was lost was the time I spent removing the data hard drive (there is another drive that contains the operating system and the installed programs) and connecting it to the Windows 8 computer so as to copy the files of interest. And what is the answer to my question in the title? You call Merle. ◆

Menu.....Continued from page 4

- **"ScreenSaver Start"**, C:\Users\Orion\Downloads\nircmd-x64\nircmd.exe screensaver
- **"Sound"**, Go to "Control Panel", "All Control Panel Items", Right-click on "Sound", and select "Create Shortcut". The shortcut should appear on your desktop labeled "Sound – Shortcut". Edit the name to "Sound" and then drag (move) it to the Set folder.
- **"Lock Computer"** C:\Windows\System32\rundll32.exe user32.dll,LockWorkStation
- **"Shutdown"**, C:\Windows\System32\shutdown.exe /s /f /t 000

Cloning a replacement drive

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

In the previous article, I indicated that my Windows 7 desktop computer had two drives. There is a Solid State Drive (SSD) that is reserved for the operating system and for the programs there is the C drive The second drive is a much larger capacity standard hard drive that is for all other files such as files in My Documents, My Pictures, the Desktop, and more.

When I had Merle Nicholson build me that computer in 2010 (see the November 2010 newsletter for the building of this computer), the price of SSD drives was quite high, so I chose the smallest size I thought I could live with, a 128 MB one for $270, which was still larger than Merle thought I needed. He just didn't realize how many programs I have - and I have acquired more since then. Hence the need now for a larger SSD drive. This time I purchased a 240 GB SSD drive from Newegg for $170. Quite a price reduction from three years back.

Once I received the drive, I needed to install it. But before doing that I needed to transfer everything that was on the original SSD to the new one. And before doing that, I decided to back up my entire system to an external drive using Acronis True Image Home. Once that was done and the backup was verified, the next day I again used Acronis True Image Home to do a Clone Disk of the SSD drive in the computer to the new SSD drive that I had installed into the drive dock in the top of the computer, as indicated in the photo to the left. If I had not had that convenient setup, I could have used an inexpensive USB device that connects a drive to your computer.

I recall that at first neither Acronis nor Windows Explorer saw the new drive I had put in the dock. I had to go into Control Panel | Administrative Tools | Computer Management | Storage | Disk Management where I could then see the new drive listed. Here I am a little vague in my remembrances, but I think I right-clicked the new disk and chose the Initialize Disk option. After that when I restarted Acronis, the new disk was visible, and I could proceed with the cloning.

The cloning of the disk took less than 10 minutes. To install the new drive, I had to take off both sides of the computer case so as to be able to first get at the back of the drive to be removed and disconnect the two cables connected to it. Then I needed to open the front cover and remove the old SSD drive itself. Actually I removed the tray containing the drive and then unscrewed four small screws that attached the drive to the tray. Reversing this procedure, I installed the newly cloned drive and everything was good to go. So I stupidly put both covers back on the computer case and booted the computer.

But everything was not OK. The computer produced a message to the effect that something was missing that Windows would like to have. I don't recall the particular item, but it was one of those things that is normally on the C drive but that I have relocated to the larger D drive to save room on C. And I, in fact, no longer had a D drive. Without taking much time to think about the situation, I simply phoned Merle Nicholson who told me that I had somehow disconnected a cable

Cloning.....Continued from page 7

to the D drive while I was working on the computer.

So the back cover had to come off, and indeed the cable was hanging loose. After connecting it, this time I did not put back the cover until I had booted the computer and noted that everything was OK.

Merle knows about such problems since he works on computer hardware all the time. For me, it is an occasional thing, so sometimes I just don't see the obvious, and having Merle's assistance has been an enormous time-saver . ◆

Menu.....Continued from page 6

I obtained the information to create these from sources on the web just by Googling the objective. One of the treasures I got was the NirCmd. It's been invaluable. I also get very worthwhile information from HowToGeek.com. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Since the monthly meeting is occurring a week earlier than usual, this newsletter may well not reach you before the meeting. But if it should, don't forget that our meeting is is on the first Wednesday of the month this one time.

As usual, Merle Nicholson came through with an article this month. However, for myself, I had to purchase a new program to have something about which to write. It is a program that I had previously thought I didn't need but now realize is very crucial if I want to do anything with the movies my digital single lens reflex camera can take.

As to newsletter articles, Merle and I need some help. We receive the occasional one from others, but what is needed is an article or two from the rest of the group each month. Otherwise, we may have to rethink the purpose and format of the newsletter. I cannot purchase a new program or piece of hardware to have something about which to write each month.

Merry Christmas and Happy New Year! ◆

Minutes of the November Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. The SIG moderator, Bob LaFave, introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees.

Bob covered a variety of PC subjects: A member's Java Script error and how to verify that the Java you have installed is the latest from the Java website; updating Flash; protecting your computer from infection with some common sense rules of conduct; and some discussions about tablets.

Bob was also the speaker for this meeting and gave several tutorials and ideas on a variety of subjects. Playing movies and storing large volumes of media were discussed.

Bob went on with some screen captures taken during the installation of Windows 8.1 over an existing Windows 8 machine. Some interesting new information was revealed: The new dependence on a Microsoft online account and the need to receive a code by email while your computer is tied up on the upgrade. Bob investigated the means to retain your 8.0 user account password and avoid creating a new account and displayed slides for that. Bob demonstrated several good tips to make the upgrade go smoothly.

Next was the subject of the Ceton Infinity4 TV tuner for PCs to allow Windows Media Center (WMC) to receive and record standard and HD television. The Ceton is available as a USB connection and also as a PCIe card. Bob showed us the Ceton Diagnostics Tool to look at the settings available on the card. There was some discussion of the abilities of the card and program and the advantages in cost and function over a standard FIOS or Brighthouse DVR, explaining the card and the Cablecard that must be purchased from

Adobe Premier Elements 12

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

I have always been a still photographer, never having owned a movie camera until recently. And that camera is not a dedicated movie camera but is a digital SLR camera with the ability to take movies. Of course, over the years I have used others' video cameras to take short videos at their request. So I have a little experience with movies – enough to know that it is not easy to take decent movies. My main problems are holding the camera steady, zooming without shaking the camera, and focus.

Oh, you say, "Why do you have a problem with zoom and focus? My video camera has a power zoom and automatic focus. It also has image stabilization to minimize shaking." Well, my Nikon D800 is not a dedicated video camera. It produces excellent quality videos, but it is up to the user to hold the camera steady, use the zoom ring to zoom in or out and refocus the lens when the subject to camera distance changes very much. If you do a good job at all this, you will have nice video with good sound. Finally there is no stopping and restarting a video. If you stop a video and then restart, you create two separate video files. And that brings me to why I purchased Adobe Premier Elements 12. At the least, I needed something to allow me to combine several videos. Microsoft Live Movie Maker was a possibility, but I found it lacking (possibly my fault).

Anyway, I had heard about Adobe Premier, so I went to the Adobe site to have a look. Well, things have changed. You can no longer buy the Adobe professional products as separate downloadable or DVD based products. Now you have to purchase a subscription. And to get Premier, you either purchase it as part of a one-year subscription to the Adobe Creative Cloud, which contains many of the Adobe programs such as Photoshop, Illustrator, etc., for $60/month ($720/year), or as a standalone subscription for $20/month ($240/year). That is a bit much for an amateur movie maker such as myself – and I already owned Adobe Creative Suite 6, which includes Photoshop, Illustrator, InDesign and Acrobat.

There was, however, another option, the baby version

Premier.....Continued on page 4

Premier.....Continued from page 3

of Adobe Premier, Adobe Premier Elements 12. I suppose it is sort of like their Photoshop Elements. In fact, they offer the combination of Adobe Photoshop Elements 12 and Adobe Premier Elements 12 for $150 as a download. Having the full Photoshop, I had no need of that, so I sprung for Premier Elements 12 for $100 as a download. I figured that should do all that I needed. And it has.

With this program, I have been able to

- Combine several videos
- Cut out selected segments
- Insert still images and textual screens (titles for example)
- Apply transitions
- Adjust the brightness, contrast and color of a video
- Add a sound track and adjust the volume at different locations
- Save the video as an MP4 file and upload to the Internet
- Burn the video to a DVD or BluRay disk

Then there are the things I have not yet tried:

- Add a narration
- Install a graphic or other video over the main video and animate it
- Add photos or other videos on top of the main video to create a composition
- Adjust the speed of segments of a video
- Pan and Zoom an image (the Ken Burns effect)
- Mix the audio
- Export the video to a site like YouTube or Facebook with the built-in export presets.

The program has three editing modes: Quick, Guided and Expert. The screen capture on the previous page displays the Quick mode, which has a simplified timeline. I find that good for combining videos, deleting segments, and inserting textual frames. When I want to add a music track and adjust the volume of different portions of the music, or if I want many more options for adding audio, graphics or effects, I use the Expert mode.

The first thing you do when beginning a new project is to import the media you will use: Existing digital video, photos, audio and graphic files on your computer's hard drive. Or you may import from DVDs camcorder, camera or webcam. I have only used video, photos and audio that I already have on my computer. Premier Elements has a companion application called Organizer whose sole purpose is organizing and indexing all the photos, movies, etc on your computer. I don't use it, since I have the much more powerful Adobe Photoshop Lightroom that serves the same purpose. However, it is not integrated with Premier Elements as is Organizer, and Organizer has some interesting features such as the ability to identify people in images.

The basic idea is simple: Add media, edit and add special effects and then output the result to whatever media format you desire. But to do this, you really should first watch some instructional videos. Guided mode is somewhat helpful to teach you; however, what is really better is to find instructional videos on the web. I subscribe to lynda.com which has training videos on almost all popular software, Premier Elements 11 (but not 12 yet) included. For free, Adobe provides help and tutorials here: https://helpx.adobe.com/premiere-elements.html.

All my videos so far were made from material I already had on my computer, where the videos originally came from my Nikon DSLR. But you may import directly for all sorts of devices, including tape-based camcorders as long as you can connect the device to the computer.

I am just a beginner at this movie stuff, but here are some of my first attempts:

- http://www.lamartin.com/Videos/ChristmasDinosaurs1280x720.mp4
- http://www.lamartin.com/Videos/JansonChristmasOnBoulevard1280x720.mp4
- http://www.lamartin.com/Videos/CookingASteakHD1280x720.mp4

The Christmas ones were made almost a year ago, but put together only recently with Premier Elements. ◆

Internet Picture of the Month

Macy's Duck

From http://www.flickr.com, a large balloon duck from this year's Thanksgiving Day Parade in New York City. The photographer is listed as david.gardiner1. His photostream at flickr is at http://www.flickr.com/photos/15022466@N03/, where he has 3,608 photos, some very good. The duck is not one of his better ones, but it is the appropriate one for this time frame. Anytime I think that I take good photos, all I need to do is go to flickr and view some of the work there. It makes me humble.

Windows 8.1 Upgrade – quick notes

By Merle Nicholson, Secretary, TPCUG
merle@merlenicholson.com

I finally felt it was time to do the upgrade. Bob LaFave gave us some tips at the last meeting, so I felt I was fairly well-prepared. And it went almost-smoothly.

Two things are important. One is that in the middle of the installation, Microsoft wants to send you an email with a code you'll need to type in to continue. They don't have any suggestions (that I can see) on what to do if the only means to receive email is the device you are upgrading, and therefore you can't receive it, but I had another device. Two, the other thing is that it asks for a Microsoft online password to set for the login password. It does give you a chance to create a new one, use one you have and use your local login that you have for Windows 8. Even though Bob found it, and demonstrated it, I failed to find it, so I approached the problem later; details below.

There are several legitimate authorized Microsoft logins: Passport, Windows Live and Hotmail will all work. I suspect that the login is needed because for 8.1 your SkyDrive account is an integral part of all your drives. It even appears as a folder in Windows Explorer. More on SkyDrive later.

At first, the install stopped because it needed me to uninstall my Vipre Internet 2013 antivirus. I researched that a bit (on another computer obviously) and found surprising little on that subject, and the Vipre phone service was after hours. So I uninstalled it and let Defender and Windows Firewall activate. I reinstalled Vipre later, and everything works fine. The little I did find on the Internet suggested that Vipre will work fine after reinstalling, and they were right. It even upgraded to Vipre Internet 2014. Remember that Windows Defender is an integral part of Windows now, so it will be sitting there not running if you have installed another antivirus product. When I reinstalled Vipre later, it turned off Defender and the Windows firewall.

Back to the login problem, I think I followed Bob's instructions wrongly because I had to sign in with my online account and password every time, and even though I unchecked the "must sign in" with netplwiz Network Wizard, I still had to sign in. In Control Panel, User accounts, I was able to switch the login account from the online account to my local account. Then had to do the netplwiz again because it was checked again! Under Win 8, it was unchecked before I even began, so the installation messes with it. All is well now; it logs in automatically on the local machine account. That makes sure that it's on the Internet when I want it to be. I almost believe that.

Last thing, I wanted to get rid of the SkyDrive and eliminate the item in Windows Explorer. A quick group policy GPEDIT fixes that. I found the instructions in HowToGeek. For those not familiar, SkyDrive is an on-line storage drive that anyone with a Microsoft account can get; I think it is 5GB. I'm much more familiar with Google's similar Google Drive. I use Google Drive to sync files to all my – and my spouse's - computers; four Windows 7 computers, a Windows 8.1, a Windows 7 laptop, an Android tablet and two Android phones. Basically, you drop any file in any of the local designated folders and it's available on all the devices within a minute. Skydrive works identically, although it looks like it may be more tightly integrated with Microsoft file types. SkyDrive has an Android App, and Google Drive has a Windows App, so there does not seem to be a conflict or compatibility problem. http://www.howtogeek.com/167058/how-to-disable-skydrive-integration-in-windows-8.1/

More on SkyDrive at http://www.howtogeek.com/166996/how-windows-8.1-integrates-skydrive-everywhere/

It looks like the 8.1 install does not affect the Classic Start Menu I have on this machine to give me a good menu system. The Classic Menu System recognizes that it's on 8.1 immediately. Perhaps through an update that I was not aware of.

Upgrade.....Continued on page 7

Upgrade.....Continued from page 6

This from Bob LaFave:

You can set to go to the desktop without signing into your MS passport account. Type in netplwiz into search and open netplwiz.exe as seen in the top image below.

Uncheck the box "Users must enter a user name and password to use this computer." Hit the "Apply" button. Enter the current password and confirm and you will GO TO DESKTOP when starting. ◆

Hazardous Waste Reminder

By Merle Nicholson
merle@merlenicholson.com

This is a very valuable (and free!) resource for disposing of your old computer parts, household chemicals, paint, oil, lead acid batteries, fluorescent bulbs and more. I use this a couple of times a year and have found it easy and quick. The staff are very helpful, and they do all the heavy lifting once you get there.

Hillsborough County Household Chemical & Electronics Collection Center
9805 Sheldon Road
Tampa, FL 33635
Hillsborough County
Phone: (813) 272-5900
Facility Contact: Household Hazardous Waste Coordinator
GPS: 28.038283, -82.579087
Facility Type: Household Hazardous Waste

Household Chemical & Electronics Collection
Household chemicals and electronics are accepted from 8AM to 2PM at the Northwest facility (9805 Sheldon Rd.) on the 1st Saturday of the month, the South County facility (Powell Rd., east off US 41, ¼ mile north of Big Bend Rd.) on the 2nd Saturday of the month, and the East County facility (Thonotosassa, CR 579, ¼ mile north of I-4, Exit 10) on the 3rd Saturday of the month. Materials accepted include paint, solvents, pool chemicals, hobby and craft supplies, lawn and garden chemicals, computers, stereos, televisions, etc. Collections are for residents only - NO chemicals or electronics will be accepted from commercial interests. Call (813) 272-5680 or click on the link below for more information and maps to the collections.

Verizon or Brighthouse. He passed a card around the audience.

Bob went on to talk about the format of programs recorded in WMC and converting and the problems occurring when DRM (Digital Rights Management) is applied to the recorded media. He demonstrated the AVS Video editor ($59 Lifetime License), converting .WTV to .DVR-MS.

Last Bob went on to the universal person-to-person method of file (movie) sharing – uTorrent, and some brief discussion of the risks.

Our thanks go out to Bob for a well-prepared and interesting talk on some timely subjects. ◆

Meeting Preview: This month's meeting topic is Ubuntu Linux presented by TPCUG secretary Merle Nicholson. Bob LaFave will conduct the usual Windows SIG for the first 30 minutes of the meeting.

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

This month Merle Nicholson covers working with Windows 8.1 and modifying it to suit his needs, even though he is to give a presentation on Ubuntu Linux at our next meeting. Ron Weinberg tells us why he no longer feels the need for a desktop computer and has purchased a Windows 8.1 touch-screen laptop as his main computer. And Doug Mullis has provided us with the 2013 financial report. In the remaining space allotted to me, I will write about various problems I have encountered.

In January, I wrote about a problem with my new Microsoft Surface Pro 2 computer that was caused by an update in mid-December. The problem was a UEFI boot screen loop when you pressed the power button to boot the device. UEFI stands for Unified Extensible Firmware Interface, which is meant to replace the BIOS. It has been around for some time, but the Surface Pro 2 is the first computer I have had that uses it. If you would like to learn about UEFI, simply do a search. Personally, I have suffered enough with it where, when booting my Surface,

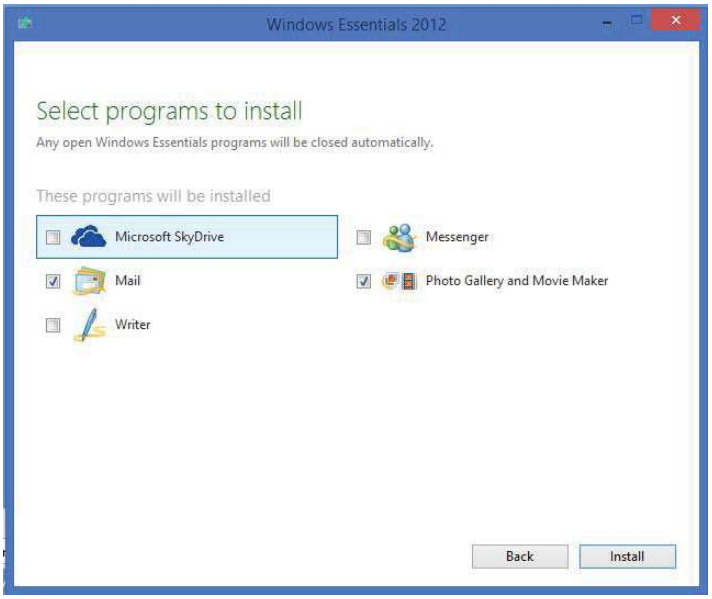
Minutes of the January Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. The SIG moderator, Bob LaFave, introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees.

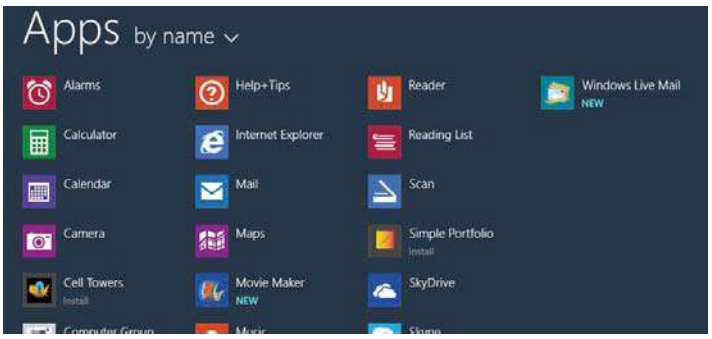
Bob covered a variety of PC subjects: Service Pack 8.1; his personal computer software PaperPort and Power2Go; how Mozilla Backup for Firefox and Thunderbird recovered both his Windows 8 desktop and notebook; and a comparison of Windows 7 Virtual Machine running XP on VirtualPC vs Virtualbox. Our thanks to Bob for a well-prepared and interesting discussion.

Our presenter this month was our own long-time vice-president, Kevan Sheridan, who demonstrated Google Chromebook and the features available from Google. He started out with the communications features: Google Voice, Hangouts, Snapchat and Pinterest. He then showed us calls using Voice from/to three cellphones and two PCs using Windows 7 and his Chromebook. Mary Sheridan participated from home, Bob LaFave, Brian Lance and myself participated using a combination of cell phones and PCs with cameras. It was an interesting and informative session.



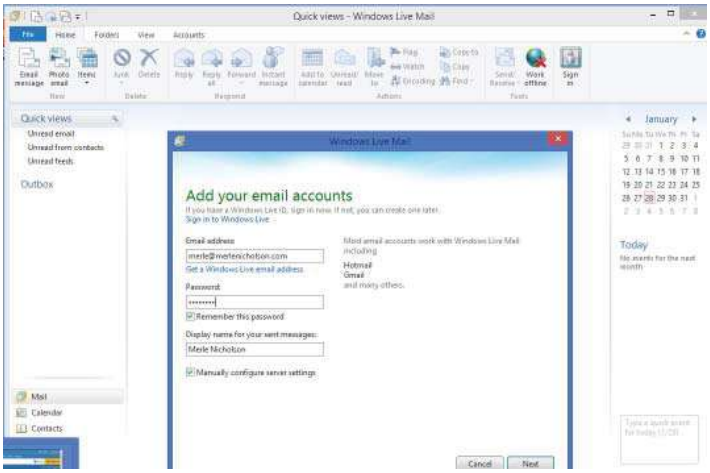
John Witmer, our president, then reviewed the O'Reilly book offers and how to download e-versions in mobi, PDF and other formats and encouraged the membership to participate. John concluded with describing the next FACUG Technology Conference. ◆

Windows 8.1 Adventures



By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

Mail: I just want a mail client in Windows 8.1. I don't want yet another online account, and Microsoft is making this hard for me. I don't want yet another email account, thank you. If I type in "MAIL" in the Search box, I'm led through a path that leads to Outlook.com, which insists that I establish an account at Microsoft. (Here's where I disclose that I already have one, many years old that I do use often, but not for mail, not for cloud, just some professional software accounts.) And I do not want to tie my PC activity to an online account … anyone's. Apparently Outlook.com will handle ("Import") POP accounts, but not until I enter my Microsoft account.



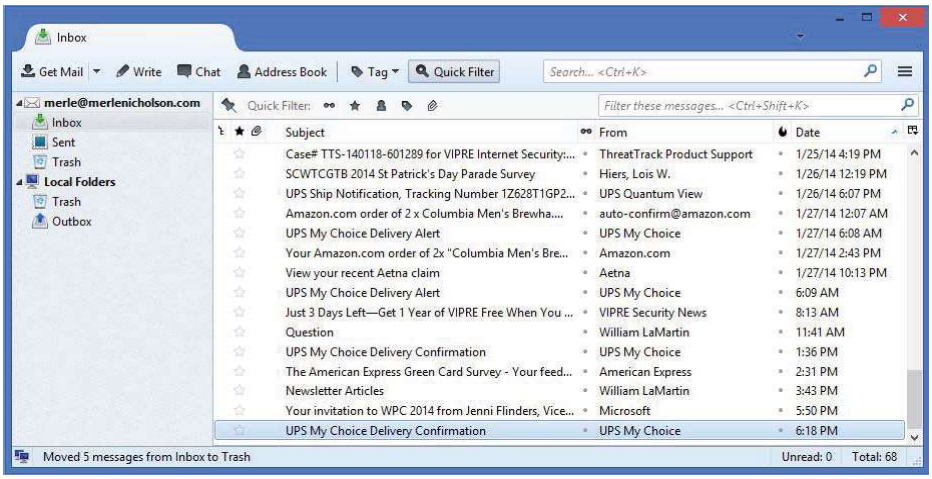
Ok, here's where my guys would say "Thunderbird, Duh!", and I'll go there but first I'll search for my old Windows 7 solution and see if it works. http://windows.microsoft.com/en-us/windows-live/download-windows-essentials is where I can get Windows Essentials 2012. It's SO 2012! It first installed a .NET 3.5 package before downloading this installer:

While I'm at it, I'll get Photo Gallery and Movie Maker.

We're off and running. Wasn't hard was it? While Windows Live mail is running and waiting for

your POP account settings, just go to the item on the taskbar, right-click and select "Pin to Taskbar". While we're at it let's turn the Reading Pane off. Under the tab "View", select the drop-down little arrow next to "Reading Pane", and select "Off". You should NEVER have a reading pane on. That's because you can't delete a harmful email without opening it. If the reading pane is on, it will open when you click on that email to delete it. That's what you don't want.

I realize this email client runs from the 8.1 desktop and not from Tile World, but you can have email without a Microsoft account if that's what you desire. I've never been a big fan of Windows Live Mail because they "flattened" out the appearance – eliminating color – and for me making it hard to read from.



A good alternative is Mozilla Thunderbird at http://www.mozilla.org/en-US/thunderbird. After installing, it will make an offer to you for a new email service. Click on the "Skip this and use my existing email".

Adventures.....Continued on page 4

Adventures.....Continued from page 3

When you put your email address in, it does a credible job of finding the account settings. It found all mine, and I didn't have to change anything except "Leave messages on Server". F8 will turn the reading pane on/off. I like a couple of features in Thunderbird. One is that it makes use of tabs to read messages. Even in Windows 8.1, it doesn't have the flat, hard-to-read appearance you find in Windows Live mail. As I did with Live Mail, while it was open I pinned it to the taskbar. When you right-click on the taskbar, there are two tasks: "Write New Message" and "Open Address Book". Live Mail has four similar tasks.

Mozilla Thunderbird

Having both email clients on the PC is interesting. Both want to be the default, so I guess I'll let them fight it out.

ISO FILES: I recently built a new Windows 8.1 computer for my younger son. He bought some new parts; case, motherboard and CPU, and I pulled other parts out of bins in my closet, built it and shipped it to him. It was my second 8.1 computer built recently, so I was able to configure the software pretty quickly. I had to resist the temptation to "customize" it the way I would do one of my own. This case is but 4-1/8 inches tall, the size of a stereo receiver. It has no optical drive, which posed some interesting installation problems. One was creating a Windows 8.1 installation onto a bootable USB drive, and the other was providing him with two other DVDs needed when he had no drive. He isn't remotely challenged by this but I thought I would resolve it before it got to him. The answer really lies in .iso files.

.iso files are simply images of optical disks. You can increasingly buy downloadable software in this form. If you start with the physical CD/DVD/BD media, making an .iso file is easy with little utility programs like ImgBurn (at http://www.imgburn.com). And with ImgBurn you can recreate the physical media from the .iso file.

If you have the .iso it makes sense that you could skip the physical media entirely and "mount" the .iso file directly into a "virtual" drive (a software simulation of a physical drive), and indeed you can.

As it turns out, Windows 8.1 will mount .iso files automatically without any software. From what I read, it will not do audio or video format files; I have not tested that. If you want to mount video or audio disks, see the following paragraph for the Windows 7 solution. In any case the 8.1 problem is solved with no effort on my part other than some research time. I included the .iso images of the two DVD's on the flash drive.

For Windows 7, I have been using a nice little product called "Daemon Tools Lite" for many years – a nice, free program from http://www.daemon-tools.cc/products/dtLite (see screen capture on page 6). It acts like a CD/DVD/BD player. The file extension .iso (and optionally many other types) is associated to the player, so a double-click on the .iso file auto loads it into the drive. You can configure the drive to auto-load on Windows startup. You can configure it to auto-load the same .iso file on startup. A word of caution; there are imbedded links to game sites in this app. I was first aware of it when my antivirus blocked the installer as an advertising application. Looking at it, I think it's benign; at least my Vipre antivirus doesn't protest when I went to one of the links. You can collapse the pane where the game site links are shown. The paid versions of this app are too steep in my opinion. I'll

Comments.....Continued from page 1

it would produce the UEFI screen (which looks like an old DOS screen and is not supposed to appear), I would have the option to save any of the two possible changes having to do with Secure Boot and then continue. No matter what I did, the computer would most often come back to the same screen. If I did that enough, five or six times, then possibly I would see Windows 8. Or if I pressed the power button until the computer shut down and then restarted, I may be lucky and have Windows 8 appear--or I may not.

I tried all solutions suggested on the Internet (I was not the only person experiencing the problem), but none fixed anything. I contacted Microsoft technical support, and in a week's time they did not produce a solution. There were several other problems caused by the update that I had been able to fix, but this one seemed intractable. So my solution was to phone Microsoft customer service and request a return. The lady who answered cheerfully said she would put that through and I would receive a return label within 48 to 72 hours via email. When the label did not arrive, I phoned again and spoke with someone who sounded like the same cheerful lady; she made the same promise – with the same result: no label in 72 hours. A third try produced the same result. Enough. I contacted someone I knew at the local Microsoft office, and he said he would escalate my request. Within two

Goodbye Desktop Towers

By Ron Weinberg, Member-At-Large
rswjbr@verizon.net

The April 8, 2014 support deadline for XP fast approaching and my old reliable and powerful custom Dell desktop's hard drive showing signs of wear, time to consider a replacement. Holiday season specials were overflowing.

Dell no longer seems to offer the wide customization options with which they formerly excelled. HP still offers some, and there is a vast array of ready built systems from Lenovo, ASUS, and Acer, etc. Of course, complete custom built or build your own are still available.

Times have changed. The explosion of tablets with thousands of apps has made the PC less important for many. But those of us who are a little bit more involved in computing still need the PC over a tablet.

The days of the big box tower with large power supplies, extra card slots and massive memory are past – such items no longer needed except by a few gamers, professionals, and serious enthusiasts. I have no need for heavy-duty graphic cards for heavy gaming, art or photo/movie editing.

Today's mid- and high-range laptops easily outperform our best older desktops. Their graphics are more than adequate for most tasks.

After due consideration, I decided I could best be served by a Windows 8 Touch Laptop that offers portability and compactness, rather than a big screen All-In-One desk model.

Microsoft Office, Adobe Photoshop Elements and Premier Elements are the only programs I must purchase. The latter two will satisfy most of my editing needs. Mine are old (Office 2003, Photoshop Elements 5.0, Premier Elements 3.0) and needed to be upgraded in any case.

Goodbye.....Continued on page 7

TPCUG FINANCIAL REPORT

(No Bank Account Reconciling Items for Beginning or End of Year)

Goodbye.....Continued from page 6

My reliable B&W LaserJet 2100 Printer is compatible and already networked. My old Color DeskJet 895CXi will work via USB.

There is no Windows 7 or 8 driver for my old Canon LiDE 50 Desktop Scanner. Like other devices no longer supported after XP, they have mostly been replaced by newer models and, although they still perform, must be sacrificed to so called progress (i.e. planned obsolescence).

While I have already purchased a new laptop, it has not been my intention to extol the virtues of one or another, but rather to comment on desktops' demise as they slowly fade away. ◆

hours I had been emailed a label. Was it his request or just a coincidence or both? Anyway, I had the label, and the next day the defective Surface was on the way back to Microsoft. About a week later, I had a credit for that Surface Pro 2 in my credit card account, which was nice since, when the first lady said I would be receiving a return label, I immediately purchased a replacement at the online Microsoft Store because I knew the devices were in short supply. In fact, the one I wanted, the 512 GB version, was the only one not out of stock, and as I write this the 128 GB version is the only one in stock. So for a little over two weeks I had two Surface Pro 2 512 GB devices on my credit card.

Now all is well, the new device is fine (please, no bad updates) and is a pleasure to use. It is a real computer with a detachable keyboard in the footprint of a tablet. It has great battery life, seven or eight hours in use, and runs all my Windows desktop programs in addition to the Win 8 apps. One of those apps is Computer Group Newsletters, the updated version of which allows you to view all our newsletters from 1984 to 2014. And there is no room to relate other problems.

william@lamartin.com

Microsoft Surface

Before receiving Merle Nicholson's article on Windows and Alternatives, I was afraid I was going to have to fill the newsletter by myself except for the possibility that Ron Weinberg would be sending me something. So I had started on what would be a fairly long article on the Microsoft Surface Pro 2. But seeing Merle's article, I think I need to change course and write a shorter article explaining what the Surface is, why you might want one and why you might not want one. And Ron's article is being saved for next month.

The Surface and its newer version Surface 2 are tablet computers and run only apps, not Windows desktop programs. They are similar to the iPad with a few additional features such as a full-size USB 3.0 port and an HD video out port. But tablets are not my interest. I want a full-featured Windows computer in a tablet format. The Surface Pro 2 is such a device.

Minutes of the December Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

In December of each year, TPCUG members dispense with the usual meeting and hold a banquet. This year it was a week early, December 4th for scheduling reasons, held at Pepin in the open conference table. It was well attended; we ate well and got a chance to talk in a social setting with other members. Thanks to John Witmer for arranging the food and meeting location, and our thanks also to Pepin Distributing for providing the venue. ◆

Comments.....Continued from page 1

The Surface Pro 2 is not simply a tablet; it is a real Windows 8.1 computer. In addition to the Windows 8.1 apps, it will run any Windows desktop program, such as Adobe Photoshop and Illustrator, Family Tree Maker, Quicken and TurboTax, and Microsoft Office programs such as Word, Excel, and Visual Studio. In short, it will run any program that will run on a Windows 7 desktop computer. Additionally, you have all the tablet-style Windows Store apps that come with Window 8.1, plus the ones that people such as myself write.

My wife and I had gifted both our adult children with the earlier Surface Pro 128 GB devices shortly after Microsoft introduced them. However, I waited and recently purchased the new Surface Pro 2. It has several important advantages over the original. Briefly, it has two additional storage sizes: 256 GB and 512 GB, with 8 GB RAM instead of the original 4. Also, very importantly, it has a much better battery life than did the original Surface Pro because of the new Intel Core i5 Haswell processor it uses. The time that the original Surface Pro would run on the battery was the primary complaint people had, including my son. With the Surface Pro 2, battery run-time is no longer a problem. To see the specifications and pricing on the Surface Pro 2, go to http://www.microsoft.com/store and select Surface as the shopping category.

Comments.....Continued on page 3

Comments.....Continued from page 2

I like the Surface Pro 2. It is a very compact and powerful computer, but it is not for everyone for several reasons, the first being price. I haven't done much research, but I am sure you can purchase a quite adequate Windows 8.1 laptop with a touch screen for a good bit less than a mid-priced Surface Pro 2 with a detachable keyboard. Then there is the problem of your vision with the small screen. The display on the Surface is superior for a tablet and when running apps, viewing web pages or reading documents you can enlarge what you are viewing by the usual finger gestures. However, if you are running a desktop program such as Photoshop on the Surface screen you are going to have a hard time identifying the small tool icons in the tool box. If I didn't already know where the clone tool or the paint bucket tools were, I would have a difficult time identifying them without using a magnifying glass. Now if you are using the Surface at home, you could just connect a larger monitor. That would give you two monitors, and you could use the larger one for working with programs such as Photoshop. Problem solved, but on the road it is a different matter.

And that brings up another advantage of the Surface over most tablets: It has a full-sized USB 3.0 port, a mini Display port and a Micro SD card reader. You may purchase all sorts of adapters to use with these ports. There is a VGA adapter and an HDMI adapter that you may use to connect the second monitor. There is also an Ethernet adapter you may use to connect to your local LAN to get a faster connection that is available through a wireless connection.

The Surface Pro is really not much different in size from the Apple iPad, being shorter in one dimension, longer in another dimension and slightly thicker and weighing a bit more. But the big difference is that the iPad is a tablet; the Surface Pro 2 is a real computer. If all you need are email, web browsing and apps, then there is no need to pay for the Surface Pro 2. Buy an iPad or Android tablet – or the Surface 2 tablet. But for me, I want a real computer as my portable device, just as I used laptops for portable devices in the past. But now I can get the same functionality in a much lighter and smaller package with the Surface Pro 2.

So the good is that it is a very compact real computer with a wonderful screen, good front-facing and rear-facing cameras with ports to connect peripherals that will do anything your desktop Windows computer will do.

The main downside is the cost, ranging from around bit over $1,000 with a detachable keyboard and a 64 GB SSD drive to almost $2,000 with a 512 GB SSD drive. Not cheap. If you want cheap, do what Merle did with his old desktop machine. But instead find an old laptop and put Ubuntu on it. That will give you a cheap portable device – but it won't be touch enabled, it won't weigh only two pounds, it won't run for eight or so hours on one charge and, if you carry around a normal size lady's purse, it won't fit in that.

And at present there is one other downside to the Surface in addition to the cost. In mid-December, Microsoft issued an update for the Surface that caused many Surface owners' machines to experience various problems, a fix for which has not yet been issued. The update was removed from the Microsoft site, but the damage was done. My Surface Pro 2 was one of the affected computers.

For some, the problem was the battery draining even when the Surface was supposedly sleeping, others had different problems after the update. My problem is termed, I think, the Secure Boot Loader Loop where on some boots of the Surface instead of going to a login screen, you are presented with what appears as a very abbreviated BIOS screen with four choices. And no matter what choice you make and then tap Exit, you are brought right back to the same screen. In my case, I can eventually escape. I have spoken with Microsoft, and they are researching my problem. In the interim, I rarely shut down the Surface Pro 2 and instead just let it go to sleep by closing the keyboard cover. ◆

Windows and Alternatives

By Merle Nicholson, Secretary TPCUG
merle@merlenicholson.com

A startling idea: Chromebook sales were 20% of total notebook sales in 2013. I'm sure even Google – the "owner" of Chrome – is surprised. So I thought it's time to have a look at what is available – kind of a reflection of my own recent activities.

Windows, the one we're all familiar with. I can safely say that until Windows 8, Windows had not changed much in functions or in user interface since Windows 95. It has steadily gotten better; that's obvious. The change to Windows XP and then Windows 7 x64 was dramatic in reliability and in minimizing driver issues and making new devices self-installing. But usability – the day to day launch of an application, using it and going on to the business of what you own one for – had remained the same since 1995. There is a good reason for this I think. It was well-thought-out in the first place, and the 1995 version was a result of a development process – as a graphical user interface – that began, say, 12 or 14 years earlier with Atari, Amiga, Lisa, Macintosh, Xerox Star and of course Xerox PARC.

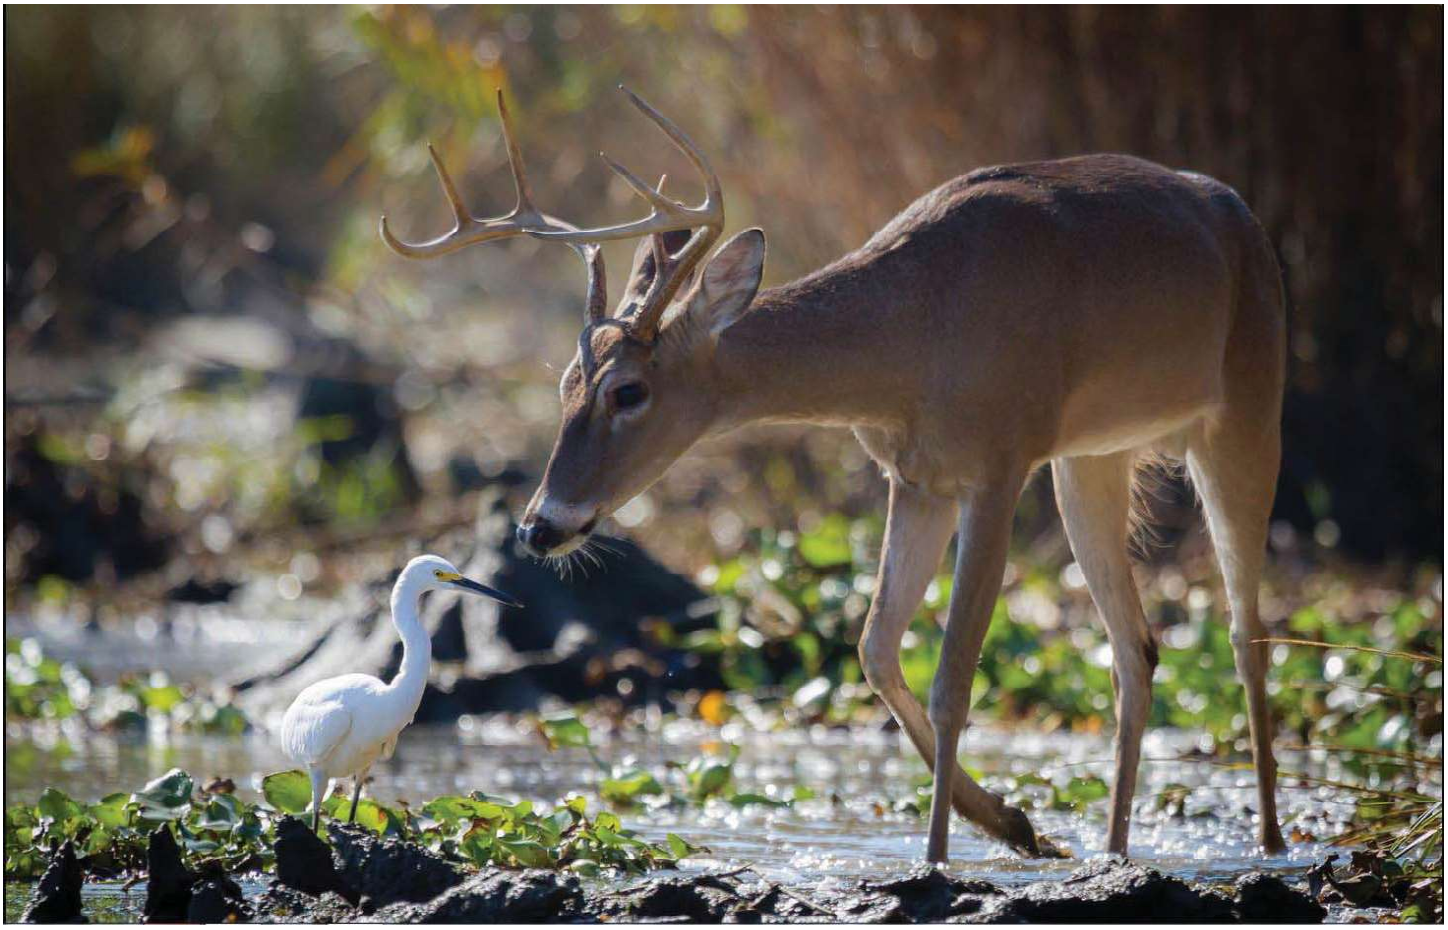
The details of how to operate application Windows right now is the result of nearly 30 years of minor changes. So we can look at this as "well-developed and mature" rather than "old in the tooth".

I can personally attest to this since I'm using Google Docs for the first time right now to compose this article, and there is nothing that is unfamiliar. It is a better, more developed version of Word Perfect 6 that I used in 1989.

The point I'm trying to make is that ALL of the alternative computers are alike in all important usable ways.

Windows 8.1 Is the first real change Microsoft has made to the user interface with a tiled screen designed for touchscreens. We're calling it "Tile World" – I think first suggested by David Pogue of the New York Times. His YouTube videos on the subject are worth watching. This OS is not being adopted by businesses. The loss of XP support by Microsoft this coming April is forcing businesses to replace their old XP OS in favor of Windows 7. It's an expensive migration.

Computers using Windows operating systems have an overwhelming share of the market (new sales) and the existing base. Its nearest competitor is the Apple Mac computer, constituting just 6% and dropping slowly. I'm referring to the personal and business computer market excluding servers.



There is no lack of personal and business software for Windows OS. With a little research you can do very well with no-cost software. Business software is plentiful but more expensive. The virus problem is overwhelming for the non-technical user. I advise non-technical users to bite the bullet and purchase good quality self-maintaining antivirus. Too much of the day-to-day of Windows computers use is technical and a "Social Media" user would be better served with ChromeBook, Linux or Mac.

Apple Mac This uses an OS called OSX (X as in ten). They are available in both desktop, all-in-one and notebooks. They use essentially the same components as Windows machines, but the choices are relatively limited. (Basically they make one model of anything. I say this because if you look at HP, you should find a dozen different 15" notebooks, all configurable, and it's the same for all screen sizes. Then there's a business class . . .)

This limited choice – one model for each size – is a strength because it's not confusing you with choices, and a weakness because there are no choices. No one else makes Macs, and it's difficult to get the Mac OS to work on other hardware (called Hackintosh). Apple enjoys very high profitability because they have a high margin and high retail prices. Since they don't compete and another company cannot compete with them; they're unique. Their investment in software is much less because they support far fewer hardware choices. They enjoy a reliability that's hard to beat for the same

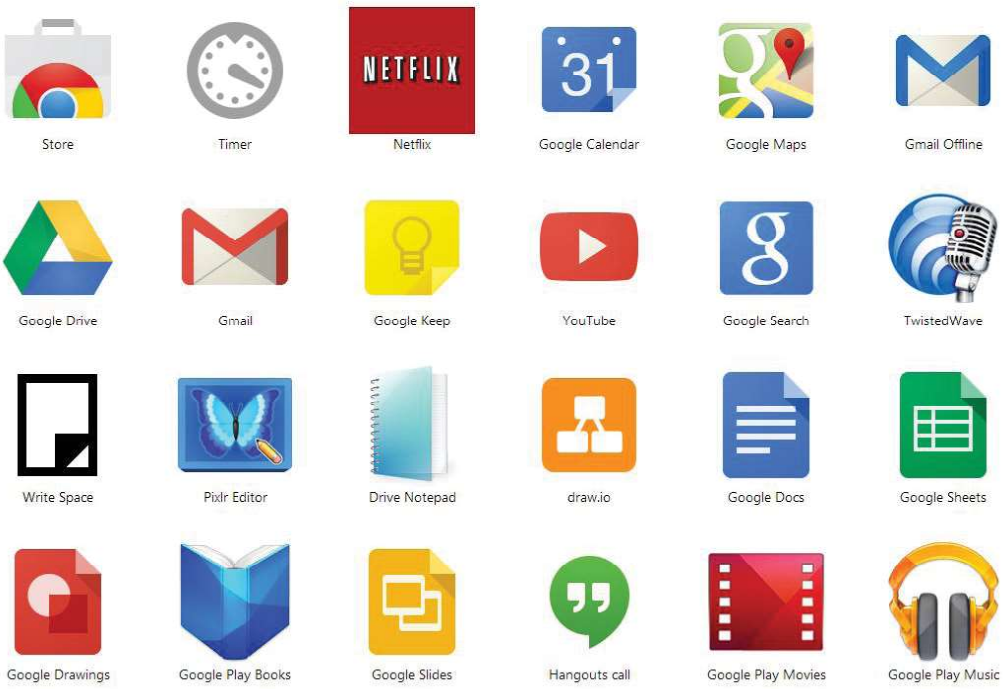
Windows & Alternatives.....Continued from page 4



reason – limited hardware choices.

As far as usability – running applications from the desktop, they're the same. I'll disclose that I used one only for a few weeks earlier this year but study the subject often. It takes a bit of learning to find everything, but in the end I can do all of the essentials: web, email, photos, documents. But I found if I want to do real work – publishing, movie and photo editing, programming, database development, commercial applications, the number of applications is extremely limited and what is available is expensive. I found printer (and other non-Apple devices) setup problematic. This is my own opinion; I think Apple Mac usability is lightweight but it would suit 90% of the "Social Media" users and none of the people wanting to derive income or use in business. You CAN run Windows software in a Virtual Machine, but I found it slow and difficult (impossible for the non-technical). The Apple hardware is first class; they lag behind the current Intel hardware offerings, not necessarily a bad thing, but if you need real processing power or reasonable pricing, look elsewhere.

ChromeBook (and ChromeBox). A ChromeBook is a thin, lightweight notebook that uses the Chrome browser as the user interface. There are eight ChromeBook models on the market and one ChromeBox. The prices top out at $320 for seven of the eight and the one exception can run up to $1800. All of these are very attractive; slim and light. The largest is 14", the smallest is 11". I took a serious look at the HP 14", and, honestly, until that time I thought the most attractive notebook I've handled was the Apple Air, but this is better. Most – not all – have a limited size SSD 16G hard drive. One Acer has a conventional 320G HD. The SSD and the lightweight operating system allow them to boot in about 10 seconds, and shut down in two.

Models are available with built-in cellular for portable web browsing, email and data. The extra cost is low, but of course you'll be paying the blood-sucking-phone-provider-of-choice more money every month.

Since the Chrome browser is always on, it does all the Googley things well. All Google accounts have a 5G "Google Drive" where you store most things you need. Obviously you can't store a music library on that drive. But Google+, Picasa, Google Keep are all a part of this automatically. Google Play Music is available if you need storage for music. The ChromeBooks I've looked at have USB ports and SD card readers for more storage, and of course because they're networked you can transfer pictures from your phone or tablet. If you're an Android user, phone or tablet, most of this will come naturally. You can purchase more storage for a monthly fee.

If you have Chrome on your Windows PC you can preview what is available on ChromeBook by installing the Chrome Apps in your browser.. I'm using "Docs" right now, and I just completed a fairly large

Windows & Alternatives.....Continued on page 7

Windows & Alternatives.....Continued from page 6

spreadsheet project using "Sheets". On page 6 is an image of what I have installed in Chrome right now on my Windows 7 PC Not shown is Angry Birds and Google Play.

As you can see in the image on the previous page, all the "Social Media" requirements are being met by a standard collection of applications. There are much more available (thousands) than what I have, such as Kindle Reader, Outlook.com, Remote Desktop . . . . Google takes a pretty low key approach to announcing new applications.

ChromeBooks are technically Linux (Ubuntu) computers but the base operating system is hidden, just like it is on your phone or tablet. It means that updates are done automatically. If an update requires a reboot it will tell you so just like it does on your smartphone. There is no antivirus available nor is it necessary. The base OS being Ubuntu means that it's fundamentally secure from viruses, probably not forever.

I have recently looked into a ChromeBook as an alternative for my wife's desktop. She is getting tired of contending with Adobe flash player updates, Windows updates and pop-ups and warnings of impending doom and threats of viruses. The ChromeBook is as close to meeting all her requirements as anything I can find except for her Quicken application, and there doesn't seem to be a way to solve that so I'm writing a "Google Sheets" spreadsheet. The big advantage to this is that it is shareable with her Android phone, albeit hard to read.

ChromeBook will probably satisfy all your "Social Media" needs and do it well and quickly in an attractive lightweight notebook with no update and no virus hassles. In a way it's because it does just the necessary fundamental things very well.

Linux (Ubuntu) I haven't looked at any distro except Ubuntu, but there are dozens of distributions (called distros) available, all of high quality and most requiring a fair amount of technical skill. The exception seems to be Ubuntu. Their obvious goal is to try to make the OS foolproof to install. As far as I'm concerned Ubuntu has accomplished that. It's free, as in $0.00 for an unsupported version.

I think my own situation can be typical. I have an older PC, still running OK that I would ordinarily scrap or give away. It was running – for several years – as a media PC running Windows Media Center and a TV card. Basically it was my TV/DVR. I did have a failure on it that I later identified and fixed. But because it was my TV/DVR I needed to get something running and picked another good PC in my house. So I was left with this thing. By then it had no hard drives, but that was all it was missing.

It happens to everyone, say when your old laptop just isn't hacking it any more. Ubuntu is a good solution to a weak PC or laptop. It runs on virtually anything. And it runs well with very little memory and very little hard drive space.

I picked a 60G SSD relatively low performing HD that I had in a Windows 8.1 machine. It's perfect. It's slow for a SSD, but still five times faster than a conventional drive. I created a startup "Live CD" on a flash drive from the Ubuntu website, and booted from that; I picked the first of two choices – (1) install on hard drive or (2) run from flash drive without installing, and in 30 minutes had a running system. It's fast – boots from scratch in ten seconds. So far it's taken all the devices I've attached to it: wireless USB WiFi, wireless keyboard and mouse, speakers, monitors. I plug this stuff in; it does a software update and we're good. It takes all of 5.6G on that 60G drive. The rest is unused.

I look at Ubuntu kind of like I do a Mac. They're really similar in appearance and usability, and I would rate them fairly equal. Ubuntu does have some advantages in the availability of free high-power, high-quality software. That's because Linux has a very long history and culture of being open and free. Ubuntu has three things going for it. "Ubuntu One" is a 10G storage "cloud" like Windows Skydrive and Google Drive. Next is the Ubuntu Store where all the free software is. It's well organized, easy to find by searching and all start installing quickly and with virtually no interaction. Third is a really huge forum and help community

so that you can get virtually any problem solved. Just use the web; ask the question. It never failed me.

Some TPCUG person whom I will not mention by name, asked how I would run Microsoft Access if I went to Ubuntu – just as a challenge, I expect. I installed a Linux Oracle VirtualBox and a virtual machine manager, then copied a Windows 7 virtual hard drive from my Windows server over to Ubuntu unchanged and ran it. It took two hours to get it right, but I now have Windows 7 running in a Ubuntu window on an old computer, and it does very well. It runs MS Access flawlessly. I did decide to add a second hard drive to accommodate the very large VirtualBox files.

Last thing to mention. I installed the Google Chrome browser in Ubuntu and now I have all the Googley functions that I would have in a ChromeBook as well.

Finally, I think Linux Ubuntu is just as functional as a Mac for everyday "Social Media" functions and has additional advantages of free major applications like LibreOffice. It accepts a wide variety of hardware and is a very viable solution to reviving old hardware that doesn't run that well under Windows. ◆

In this month's newsletter, Merle Nicholson educates us about a new plan from Verizon Wireless that can possibly provide you with a better package than you now have. I know that I am going to look into it. Then Merrill Friend tells us how to monitor our heart with a personal EKG device. However, you will need to have an iPhone to use it.

Dell All-in-One

I was in Microsoft's local office this past week for a programmer's meeting and saw a very interesting new Windows 8.1 portable computer brought in by one of the attendees. It was an XPS 18 Touch All-in-One made by Dell. It was an 18.5 inch tablet with separate keyboard and mouse. It had an Intel i5 processor, 500 GB hard drive, 8 GB of memory and Windows 8.1. According to the Dell site, the cost for this configuration is $1,300. Different options are available. With an i3 processor and 4 GB of memory, 500 GB hard drive, and Windows 8 (freely upgradable to 8.1), the cost is $1,000. With an i7 processor,

Minutes of the February Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. The SIG moderator, Bob LaFave, normally introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees. Merle Nicholson, Secretary TPCUG, was moderator in Bob's absence.

Merle introduced the newer line of Logitech keyboard and mouse using the "unified transmitter" used across a wide variety of Logitech input devices. The features are much longer battery life and the ability to wake from sleep so fast that you're not aware of the sleep state.

Merle then went on to describe the method to get a toolbar menu added to Windows 7, 8 and 8.1 by utilizing the existing Start Menu folders. This is especially helpful in Windows 8, where there is no menu at all, and is highly recommended for those who value a cascading menu system that even Windows 7 does not have.

The meeting presentation was also given by Merle Nicholson on the subjects of the Ubuntu and Kubuntu, two of the many Linux operating systems. He brought a desktop computer with a single hard drive set up to dual boot to either OS. The two OS have very different appearances, despite both being based on Ubuntu 13.10. This OS is an interim release between the fully supported 12.04 LTS and the next fully supported LTS of 14.04 Trusty Tahr. The LTS designations are milestone releases that have five-year support by Ubuntu.

The Ubuntu release is similar in appearance to the MAC OS X, with an animated app dock on the left side that is included in a desktop product called Unity. It is easy to install from a bootable flash drive. When running from the flashdrive the user has a choice to

Verizon Wireless Revisited

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

Switching over to the Verizon "More Everything" plan has been interesting. It's not necessarily the best thing to do, depending on the equipment you have and how much you value some features. I sprung for it, and I think I will benefit from it.

I have my wireless account with Verizon. Verizon has the best national coverage and the best reputation of all carriers. Their recent 4G outbuild into the US has been outstanding. Basically if you can't get at least 3G cell phone coverage with them wherever you are in the US, you probably shouldn't be there. Of all US carriers, Verizon is the most expensive.

That they have the best reputation isn't saying too much, because it's compared to the other carriers. As a group, Cable TV operators are the most reviled businesses in the country, and a very large part of Verizon is FIOS. I'm not even remotely fond of phoning them. In making my recent changes, their website failed three times over two days, completely, saying that the service I was using was not available. I had to phone to make the changes only to discover that the changes had been applied on one of my three previous website attempts. I think the Verizon Wireless website has improved over time.

A large part of my own dissatisfaction is the virtually unreadable bills, and the dearth of vital information. I am finally getting used to the bill to the point where if nothing has changed – no adjustments, credits or new equipment – I can compare it to previous months and decide if it's a valid bill.

I wanted to determine how much data my family's phones use before I was ready to make my most recent changes. The new plan has shared buckets of data, and it's important that I pick the best one. 2GB is $50, 3GB is $60. We have three Smartphones. My own is on a "grandfathered" unlimited data plan.

The bill summarizes the amount of data used in KB. Last month mine was 13,000KB. That's 13MB, and .013GB. Considering the use I make of my phone as a GPS (and Google Navigation) while in the car and using the browser while I'm away from my home WiFi, it's surprisingly low. Just about nothing.

The other two phones are each on $30/mo 2G data plans. How much does Verizon report? 1G for each. Not some fraction of a gigabyte, no … just round it up to the nearest gigabyte. I'm certain that my spouse uses no more than I, so if it were the same amount as mine, how do you round up from .013GB to 1GB?

On Verizon's website they have a calculator that takes your devices in account and recommended … wait for it … 6GB for $80! By the way, 10GB is $100. 250MB is $15. So it's priced on a slope. At $15 for 250MB, 2G would be $120, not $50.

There is a very good Verizon Android app to monitor your usage. Now that my plan has been changed, it is reporting my plan data usage in KB. Excellent. Also I set alerts to message me when my usage hits 50%, 75%, and 90%, so I'll get plenty of warning if I need to increase it.

Copied from their website: "Data overage for plans with 1 GB or more is $15 per 1 GB. Need more than 10 GB of data. Add 2 GB for $10 by logging into My Verizon". So if I'm in danger of exceeding my shared data limit, I can jump in there with the mobile app and increase it for $15, or wait for them to charge me that $15 overage.

To change everything over to the new plan, you are charged a monthly "access" fee for each device: Smartphone $40/mo; Basic phones $30, Jetpack, USB devices and Home Connect $20; Tablets $10 and Connected Devices $5. For my three smartphones ($40ea) and Home Connect ($20 for one) plus one $50 2GB data plan for a total of $190. Plus fees and taxes. The fees have been running just over $2 each, and taxes are taxes.

This is just shy of a $9 increase over my base charges

Verizon.....Continued on page 4

Verizon.....Continued from page 3

significantly. I now have unlimited phone minutes and unlimited messaging. Messaging for me has ranged from $6 to $22/mo. That sneaked up on me, and it was when I was doing 2013 taxes that I realized the reason for this: I was enjoying the message alerts from Amazon, UPS and FedEx on purchases and shipments. I like those, but I was paying for each one. Duh. December was $22! To be fair, I could have added coverage for messaging, but I mistakenly never thought it was worth it.

The final improvement is that the smartphones are now unlocked for mobile hotspot. Hotspot uses cellular Internet data and transmits it – makes it available to connect to like any other WiFi.

My Verizon hotspot app now works, where before it asked if I were ready to pay the $20/mo hotspot fee. For me, this is an optional activity to get Internet access for my notebook or tablet when a WiFi is not available. I have tested it; you just set up the SSID name and the security password and it's ready to go. The notebook and tablet detect the SSID and remember the security code. William LaMartin reports that the Windows Phone hotspot is in settings > Internet Sharing. iPhone is settings > general > cellular. Android has one of those Verizon apps that you can't delete, along with CityID and Madden football crapware.

A word of warning about hotspot. You can't take it for granted that your smartphone is hotspot capable. Almost all are, but there are exceptions. Second, when it's on, it's a significant power drain, so turn it off when not needed; watch your battery usage.

Here's why I think "More Everything" will work for me. I have multiple devices that are already in the system, paid for or under contract. At worst, it's a wash, moneywise. But let's say I want a new Nexus 7 tablet with LTE (that's 4G) cellular capability. It's $10 a month. A bargain. Add to that the occasional use of hotspot, eliminating my variable messaging fees, and eliminating the worry that our shared 700 minutes would get crunched, it looks good for me, and I really want a new Nexus 7. ◆

Minutes.....Continued from page 2

a full installation (very fast, especially from an SSD). After installation, the OS boots from scratch in 10 seconds and shuts down in less than two. There are thousands of good quality applications available, almost all are at no cost. For those who have a Windows application that can't be duplicated there is a Windows emulator called WINE that does an excellent job of running many Windows binaries. It does some Windows applications very well and very many not at all. For ultimate Windows support, the Oracle Virtualbox is the answer. There, it runs an entire Windows OS and then the applications you want can run in the VM. This option is pretty much flawless, although somewhat more resource intensive.

Ubuntu desktop is available from http://www.ubuntu.com/desktop. It comes in LTS or the current release in either 32bit or 64bit. If your computer will run 64 bit, and most do, be sure to get that one.

The second OS Merle demonstrated is Kubuntu, which is a Ubuntu OS, but with a desktop called KDE. KDE replaces the Unity desktop that Ubuntu uses. Otherwise, the capability and availability of applications is the same as Ubuntu. There's a KDE organization that administers the product and one that has some corporate support to help sustain their efforts. The key feature of KDE is the Windows-like appearance, but it is very highly configurable. The look and feel appearance can be radically changed depending on how much time you want to devote to it. It's the version that Merle has adopted and uses often. http://www.kubuntu.org. ◆

Comments.....Continued from page 1

8 GB of memory, a 500 GB hard drive, and Windows 8.1, the price is $1,400. All have an additional 32 GB solid state drive for quick startups, two USB 3.0 ports and a camera.

This is a real computer and tablet with a full-size screen that has all the power you will need with a size of 11.17"x18.25"x.7" (HxWxD). It weighs about five

A Heart Monitor For Your iPhone

By Merrill Friend, Tampa PC Users Group
absecon1933@gmail.com

My wife's doctor recently recommended that she obtain a medical app for her iPhone-4. The app operates a Heart Monitor which sells for $199. I was surprised to see such a device available through an iPhone app, but I suppose it is just a sign of our highly technological times. I thought others might find the concept as fascinating as I did, so here is what I have learned about it so far.

The monitor is sold by AliveCor and is a mobile, clinical-quality electrocardiogram (ECG) recorder for use by both physicians and patients. The duration of the recording is customizable from 30 seconds to continuous. The software can store thousands of recordings on your iPhone 4,4s or 5, and these recordings are accessible to you on the AliveCor, Inc. (AliveCor) server.

- The Heart Monitor, which snaps onto the iPhone, contains sensors and electronics used to collect ECG rhythms and transmit them to the iPhone.
- The AliveECG mobile application (AliveECG App) is used to collect, view, save and wirelessly transmit ECG recordings to the AliveCor Server. A user supplied Apple iPhone 4, 4S or 5 operating with iOS 5.1 or greater is required. Note: The iPhone must be purchased separately.

This Heart Monitor enables the physician or patient to:

- Collect and view single-channel ECG rhythms using the iPhone. (As I understand it, a full ECG in a physicians office involves 12 leads – the iPhone is a single lead recording only.)
- Store ECG recordings on the iPhone.
- Wirelessly transmit ECG recordings to the AliveCor server.
- Access ECG recordings stored on the AliveCor server from anywhere in the world, and print the recording or save it to a hard drive.

INDICATIONS FOR USE

The Heart Monitor is intended for use by licensed

medical professionals or patients to record, display, store and transfer single-channel electrocardiogram (ECG) rhythms.

The literature furnished by AliveCor indicates there are no known contraindications for the Heart Monitor.

Until mid-February 2014, Federal law (USA) restricted the sale of this device to or on the order of a physician. Over the counter clearance has now been given for the AliveCor Heart Monitor.

WHAT DOES THIS MEAN FOR THE USER?

The device is intended to be used by licensed medical professionals or by a patient under the care and supervision of a physician. Previously, AliveCor would sell the product only to patients who provided them a prescription for the device signed by a licensed physician who is also a user of this product.

Recently that changed when over-the-counter clearance was granted under Federal law. Now the device can be ordered without a prescription. Expert analysis of ECG recordings can still be shared with a user's physician, or sent to a board-certified cardiologist or a U.S. based cardiac technician through AliveInsights.

Users without prescriptions can pre-order the device with shipments beginning in March 2014.

The device measures heart rate and heart rhythm only. This device is not designed or intended for complete diagnosis of cardiac conditions.

Monitor.....Continued on page 7

Monitor.....Continued from page 6

The Monitor does contain its own separate 3-volt replaceable battery power source.

Below are two photos. One shows the face of the Heart Monitor held in the patients hands with the screen facing the patient. His fingers make contact with two finger contact points in each end of the Monitor. Once the patient has signed in with name and password to the AliveCor website, simply making contact with these contact points starts the recording.

The second photo shows the iPhone 4 Heart Monitor itself and its storage container, which has rubberized

edges enabling the patient to slip it over the rear of the iPhone for operating the Monitor.

The Patient can email a copy of the ECG to her physician for discussion and may also send it as a PDF file.

The list of smartphones usable with this device is expanding. For more information, http://www.alivecor.com/. Follow them on Twitter @ AliveCor, Facebook at Facebook.com/aliveCor, and see the videos at YouTube.com/aliveCor

One of the best of these videos in my view is the interview on NBC News with Dr. Nancy Sniderman, along with a former physician from the Cleveland Heart Clinic. This video includes a demo of the product.

AliveCor, Inc is a privately-held company headquartered in San Francisco. Company literature indicates the company is dedicated to enabling individuals to participate in their heart health through the use of the AliveCor Heart Monitor, an innovative mobile healthcare solution. ◆

pounds, and the battery should last around five hours before you need to use the A/C adapter.

I was impressed. I personally never had a good opinion of Dell computers, but this looks like a game changer. HP has a competitor named the HP Envy Rove, but I think it falls short.

Although this is a large tablet which is portable, it is not as portable as a laptop since you have to worry about protecting the screen. And it is certainly not as portable as my Microsoft Surface Pro 2, which has similar specs (i5 processor, 8 GB of memory and a 500 GB solid state drive) but which is much smaller at 6.81”x10.81x.5”(HxWxD), weighs only two pounds and has a battery life during use of around seven hours. But for that solid state drive, small size and weight you pay an extra $500 over the Dell. Even though the Dell screen is much larger, it has the same resolution as the Surface.

I would include a link to the Dell device, but it is way too long. Just go to the Dell site and look in All-in-Ones for the XPS 18 Touch with stand.

Looking Back

I just consulted my Win 8 app, Computer Group Newsletters and note that in March of 1994 the TPCUG was meeting on the Ybor campus of HCC and the presentation was going to be a demo of Corel Draw. For April, the presentation was going to be Photoshop presented by Adobe, and for May, Microsoft was going to demo Office, which, according to the May newsletter, turned out to be a demo of Access 2.0. Those were the days: Big name vendors doing our presentations.

For March of 2004, the presentation was about PowerQuest products like Partition Magic, and the presentation was given by our friend Gene Barlow. I think by 2004 we were mostly doing our own presentations with an occasional visit by someone like Gene Barlow. No more Adobe, Corel, Symantec, etc. Times had changed – as they always will. ◆

Meeting Preview: On Thursday, not Wednesday, Doc Dockerty from the user group across the bay will give us his take on the future of user groups. Bob LaFave will conduct the usual Windows SIG for the first 30 minutes of the meeting.

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

The perennial question: What to write about this month to fill the newsletter with something that might be of interest. Merle Nicholson's and Bob Davis' articles are greatly appreciated. My first thought for the space remaining was to write about the difficulties I had in getting a wireless connection in the hotel in which we were staying while our house was fumigated for drywood termites, along with the attendant problem of sending a mass email merge to 400 residents of my neighborhood concerning some neighborhood matters that it is my responsibility to publicize as the neighborhood webmaster.

To make a long story short, for two days in the hotel I could not connect to their wireless network with my Microsoft Surface Pro 2 running Win 8.1, my HP laptop that has both Win 8 and Win 7, or my Windows Phone (the phone does have a cellular connection and I could use the Internet that way, but I do not have the ability to use the phone as a wireless hot spot). To add insult to injury, my wife could connect fine with her iPad. Now

Minutes of the March Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. The SIG moderator, Bob LaFave, introduces new or little-known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees.

Bob covered a variety of PC subjects in answering questions from the members: IP address conflict, USB disconnecting problem, and an Internet camera access.

Bob LaFave also gave the monthly presentation, "A little bit of this and a little bit of that". He showed a new revision of Sysinternals Process Explorer, which many of us are familiar with. They have added a feature that allows an Internet lookup of any process to get a new "virus total". This can be very helpful in chasing down an infected computer.

The next subject was SkyDrive, the MS cloud file storage service, and how to increase available storage space. Bob gave a demo of TrueCrypt, which encrypts files and folders, and 7-zip, a popular zip utility that also has the ability to encrypt and add a password, which is required to open the file. Last was DockLock, another interface to encrypt files. ◆

Comments.....Continued from page 1

that was bad. A check with the desk informed me that they had many complaints other than mine, but nothing seemed to be getting done, and the poor beleaguered desk person could only pass on the complaints to management. Apparently management did not realize that to many people nowadays a wireless connection is as important as having hot water. I thought about going to a local Panera Bread or some other such location to get a connection but opted instead to go to my own backyard, sit at a lawn table and do my mass mail merge from there using my own wireless Internet connection. The only problem I had was convincing my Surface Pro that it indeed had an Internet

Last Chance For Windows XP

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

April 8, 2014, about the same date you get this newsletter, is the date your computer explodes. No, not really, but, if you're one of the millions of XP users, you can get a step ahead to protect yourself. And I'm here with some suggestions that may keep you out of trouble.

The event really affects three Microsoft products: the OS - **Windows XP, Microsoft Security Essentials and Office 2003**.

Windows XP. As of April 8, there will be no updates issued for the operating system. If you've been watching your updates as they come in, there are always changes to the operating system that are issued for security improvements. That's because the bad guys out there are always finding new ways to exploit your system, and finding and attacking the operating system itself pays off for them. So Microsoft has been keeping up with this and rewriting the code to block attacks. So it's never only been about improving your antivirus software, it's patching the OS as well.

Outside of replacing your OS altogether, which I will address here, there are a few things you can do to keep it safer. **1) Get up to date now, today.** Install all Windows updates. **2) Get the machine running well and virus-free.** You may have to get an expert to do a tune-up. That means removing startup items, uninstalling services you don't need and optimizing the hard drive, replacing the hard drive or installing more memory. Do not buy or use any "tune-up" software. There is no such thing. The solution to a badly running computer is less software, NEVER more software. **3) BUY A QUALITY ANTI-VIRUS**. You can no longer use Microsoft Security Essentials, and I'll go into that later. Buy a well supported, full-featured "Internet" version of a quality product. The "Internet" versions will have a good firewall, and Windows XP's native firewall is primitive, to say the least. Look at antivirus reviews - PC Mag does a good job on reviews. If you have a weak machine with only 1G memory, you may want to focus on those that have a lightweight footprint. Look at the major brands first. You'll have to spend some money here. 4) BACK UP. Make a good, and I mean good, full image backup of your system. I recommend an Acronis Recovery CD, even an old version. This has both backup and recovery capability. Make the boot CD (or USB flash drive) from the Acronis software. Then use that bootable backup CD (USB) to actually do a new full disk backup to a suitable external storage device. I usually use an internal hard drive and SATA Enclosure Docking Station, because I have them, but any external USB or eSATA hard drive backup will do fine. They have become very inexpensive, and you really don't have an excuse.

Microsoft Security Essentials on Windows XP. On April 8, 2014, you will no longer be getting new virus signatures for this. It will continue to run, but an antivirus that is not being updated regularly is no antivirus at all. Time to step up with the big boys. Spend a little money and get the best because you're out there all by yourself and security patches to the OS have been discontinued.

Just yesterday, I had to do a refurb of a friends laptop with XP. I had just done a thorough tuneup on it last September - six months ago, and I had replaced his hard drive because it was old, with a 60G SSD and had made a full image backup to that old drive that I had removed. He had acquired some ransomware that had hijacked his whole system. His fault - the ransomware mimicked Microsoft Security Essentials saying he had a virus and to install a PC Repair program to fix it. He did that and then it asked for $30 to do the "final" repair. Since he had the backup I made, along with an Acronis boot disk, we were golden.

Then I had to install the 37 MS updates for the last six months. There were two security updates installed that interested me. One is a notification that runs with every startup of the computer that warns of the impending loss of support; the other is a similar warning that Microsoft Security Essentials will no longer be updated. I also installed a trial version of Vipre Internet Security and made him promise to pay for register-

XP.....Continued on page 4

XP.....Continued from page 3

ing it. I selected this one because it does a good job of real-time protection and scanning your Internet pages prior to opening; it has a very lightweight footprint for his 2GB machine and a very aggressive and sometimes annoying firewall. It isn't rated very high for removal of virus that has already infected a machine. Reviews seem to rate antivirus for the capability to detect and remove virus from a test computer, and I'm not too sure that's right. Virus removal software is pretty much free. I'm not sure I value a product that will remove a virus after allowing it to get on the machine to begin with.

Office 2003. Same problem. They have been providing security updates all along and it's ending now. They have replaced this product three times over, in 2007, 2010 and 2013. This is a shame because millions of people consider Office 2003 to be the best and most usable version of all, and the installed user base is enormous, especially in the workplace. Remember that for 2007 they introduced the ribbon interface. That seems to work fine for inexperienced users to find the most commonly used controls, but for an advanced user and for program developers it just gets in the way (perhaps except for Word). They could have retained support for standard menus without its getting in the way for ribbon users. Kind of the way Windows 8.1 does with crippling parts of the desktop. On the Microsoft sites, they state clearly that Office 2003 will not run on Windows 8.1. I have found that to be not true, at least with Access. There certainly is nothing stopping you from installing it fully. There are plenty of excellent alternatives for Office, and I don't intend to worry about loss of support for this.

What are the alternatives? There are Microsoft sites dedicated to helping you upgrade your old computer to Windows 8.1 for $199 retail. ($102.21 at Amazon). They suggest that for the x86 version (32-bit) the minimum memory required is only 1G, and it is 2G for the 64-bit version. You have to find out what the installed memory is, whether the system will support 64 bit, otherwise use 32 bit. There is a compatibility program for XP that is designed to determine what hardware and software will not make the transition. Their website, http://www.microsoft.com/windows/en-us/xp/end-of-xp-support.aspx, states: "Keep the familiar desktop you love."

Another alternative is to install Ubuntu or one of its many relatives: Mint, Kubuntu, Lubuntu. Chances are very good that your old laptop will be supported very well and will boot up and run faster than it ever did in Windows. I have configured my spouse's computer with Ubuntu very successfully. Everything she needs or could ever want is available, all at no cost. I have configured a spare computer with Kubuntu for my own use. Again, I want for nothing (except live sync with Google Drive, but that's not a deal killer). Both machines work well on my network along with several printers and Windows computers. Ubuntu's desktop is very Apple Mac-like, and Kubuntu (Ubuntu + KDE desktop) is very Windows-like. The Ubuntu interface has become very graphical, and you can probably get everything you want without ever using the command line interface. And it's free, attractive and easy to use and free.

Buy a new computer. Yes, and this should be seriously considered. Interesting thing right now is that Windows 7 computers are plentiful after 18 months of Windows 8.1 on the market. The manufacturers have bitterly complained that the business sales are depressed because businesses will not buy Windows 8.1. So there is a new agreement made. Computers will be available for another month or so with Windows 7 Home and also Windows 7 Pro, after which the Home version will be discontinued. Windows 7 Professional will be available for another year until March or April 2015. Speculation is that this may be extended if the sales are good. You'll see that especially Dell flyers are offering Windows 7 machines for business use. The downside is that these business computers' prices are pretty high.

Most people I've talked to that have transitioned to Windows 8.1 say they have adapted to it pretty well. I think that having a touchscreen is needed for a frustration free experience. The premium you pay for touchscreen on new computers is pretty much gone now.

There is a Windows 8.1 revision 1 coming out soon

The PC That Wasn't Broken

By Robert Davis, Tampa PC Users Group
robd234@gmail.com

It was a cold morning in February. I went into my office, turned on the window shaker heater, and hit the power on for my PC. After I hit the power on button, I sipped some coffee and waited, and waited, and waited. My menu program never came on the screen. Nothing came on the screen. I thought about the last time I backed up my data - probably weeks ago. About five minutes later, I hit the reset button hoping maybe there was a glitch in the startup. To my amazement, the screen lit up. The PC booted up but it just did not bring up my main menu as it usually does. After the PC booted up, I tested every program I could think of. Everything worked fine.

My PC has a digital thermometer on the front panel. I noticed it was reading about 76 degrees. I thought maybe now something had to warm up before it would boot up. So I tested my theory. At first, I found if when I powered up the temperature was less than 72 degrees, the PC would not start up. If I let it sit and warm up to 73 degrees or so, it would boot up but still would not come up with my menu program like before. A few days later, I noticed it had to be up to 75 degrees or so to make the reboot work. I was getting desperate.

After doing some listening and watching, I suspected the monitor. The PC always sounded like it was booting up normally. I could hear the hard drive clicking, and I could see the access light flashing for a while and then go quiet - just like a normal boot up. The PC was coming up normal every time. It was the monitor that was failing! I replaced the old 17" LCD monitor with a new 23" LCD Acer monitor. Presto everything is back to normal! Apparently, my old monitor had to warm up to work. That's about an eight on the 0-10 weirdo scale. ◆

Comments.....Continued from page 2

connection since I had tried so often in the hotel and received the message of there being no connection. It seems the device has some sort of memory of such things. But I finally got the job done.

What else has been happening? I have essentially brought a long term project to completion. The project was gathering historical information about my Tampa neighborhood. Using Census data, old Tampa City directories, historical maps and photos, as well as old Tampa Tribunes, I have been able to piece together a history of the neighborhood that includes a pretty precise estimate of when each of the 394 houses were built ranging from 1880 up until 2012. We refer to our neighborhood as Hyde Park, which is actually two subdivisions, West Hyde Park (1906) and Morrison Grove (1910), situated in South Tampa and bounded by Swann Avenue on the north, Brevard Avenue on the east, Bayshore Boulevard on the south and Rome Avenue on the west. In addition, Hyde Park is the name of a pre-1900 subdivision immediately south of the University of Tampa, and people for years have referred to the area west of the Hillsborough River, south of Kennedy Boulevard and east of Howard Avenue as Hyde Park. So that name means different things to different people.

Anyway, our neighborhood decided that this year would be a good year to celebrate 100 years of existence, and that prompted me to try to bring my research to a close and post all my findings at our neighborhood website, http://www.oldhydeparkfl.org. The specific page that is the window to this information is http://www.oldhydeparkfl.org/HouseDates.aspx. At this page you will find links to much of the data I have collected. To the casual observer, I suppose the maps will be of most interest and possibly also the old Tampa Tribune articles.

One of the maps is reproduced on page 7. It displays the date ranges for the build dates of all the houses in our neighborhood. To see the different colors, you really need to view this newsletter online, or better yet, view it via the neighborhood website link above. By the way, this is quite a large map, 4464 x 3586 pixels.

Comments.....Continued on page 7

Comments.....Continued from page 6

There is a companion map at the site that instead of a colored circle actually lists the address and build date of each house. How I created these maps is a story in itself. Many years ago, I used a Microsoft mapping program and Visual Studio to do a geocoding of each address to get its exact latitude and longitude. I then stored that in an Access database along with all the historical information I subsequently gathered on each address. The final step was to write another program in Visual Studio to place a color-coded circle on each house in the map indicating in which date range it fell and put all this on a map at a web page. At full resolution, the map covered more than one computer screen, and to capture it I had to do around 10 separate screen captures and then piece them together in Photoshop to produce the map you see. A similar process was used to produce the map that lists each address and its estimated build date.

As to the old Tampa Tribune articles, I made a mockup of 15 pages of an old Tampa Tribune with 17 inch x 22 inch pages in Adobe InDesign using articles I had discovered about our neighborhood – hundreds of them – and then saved it as a PDF file. I first tried putting that at the neighborhood site, but the downloading from there was just too slow. So I moved it, and the link on the house date page at the neighborhood site actually points you to a file at my Microsoft Azure cloud storage account. ◆

that will appear in the Windows 8.1 update that makes more small changes to the user interface. It's mostly changes to help make mouse users find things easier. I'm sure there will be more changes coming, but slowly.

Endnote: I'm using Google Docs to write this article, and the file is being saved to my Google Drive. To send it out to William LaMartin, our newsletter editor, I download it from Google Drive to the download folder. Google Drive makes the conversion from Google Docs format to Office .docx for William. There are a half dozen different formats, including PDF. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

I am sorry that I was unable to attend last month's meeting and hear what Dave Dockery from the Pinellas club had to say about the future of user groups. Obviously that group is much larger than the TPCUG and provides many more services for its members. Nonetheless, based on Merle Nicholson's minutes of the meeting and a conversation I had with Merle about the meeting, that group has had a severe loss of membership. Surprisingly to me, it was attributed to the iPad. You don't need much help for an iPad. It either works or it doesn't. If it doesn't, you either send it to Apple, take it to the Apple Store or throw it away. I sort of like the last option. Then you could purchase a Windows-based tablet that has a USB port and a few other handy things that an iPad doesn't. After that, most importantly, you could download all those Windows Store apps that I have been writing, including the TPCUG's own *Computer Group Newsletters* app.

I was only half serious about your discarding your iPad, since

Minutes of the April Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. The SIG moderator, Bob LaFave, introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees.

Bob covered a variety of PC subjects in answering questions from the members and also demonstrated DocLock file and folder encryption software.

This month's presentation was a talk by Dave Dockery, the multi-year president of the large computer club in Clearwater - Tampa Bay Computer Society. The subjects were on the state of club membership and where they believe it's going. This computer club has been in operation for 30 years and hosts fifty training events a year, including a monthly computer repair clinic.

There has been a downturn in membership in the Tampa Bay Computer Society from a high of 1300 members to just 600 today. Dave attributes this to the advent and popularity of the iPad. Dave then went on to describe his vision of the future use of personal computing in a well-rounded and well-prepared talk. We are very grateful to Dave for his time, and thoroughly enjoyed his presentation.

The Tampa Bay Computer Society can be found at http://tampa-bay.org/. Be sure to check out the club calendar at http://tampa-bay.org/calendar. ◆

Exchanging Large Files

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

Sometimes you need to send someone a large file - too large to email. Even harder is receiving a large file from a non-technical friend or associate. What is the best way for them? Over the years I've done this various ways. I've most recently settled on the quickest and easiest, using a web-based service http://www.WeTransfer.com.

MAIL: All the traditional ways to send files are still available. In operating my software business I have resorted to Priority USPS mailing or FedEx CDs, and some high-security conscious federal agencies insist on this. It seems strange at first, but I think it's a proven reliable safe method. The information just does not hit the Internet. Since we're discussing large files, a CD is good for .7GB and a DVD normally is 4.7GB. There are variations of DVD capacity like DL, but sender and recipient must both have that capability in hardware.

WEB: To distribute software, I maintain a website on a server where I create a webpage with a download link for just one file. Then I email the recipient a password and a download link. It's really pretty easy and economical when you have direct access to the web server file structure as I do. I have a script that I copy to the web folder that presents a listing of all the files as a live download link. The web server software is free. I've used this for many years. To clarify, I require three passwords. The web folder, the zip file password and finally the application password. It's obviously not for receiving a file from someone else.

FTP: For close business associates and my technically inclined sons I maintain an FTP server with password-ed folders. FTP is well known and relatively easy to use but it is technical. It requires a client FTP application, but these are free and of high quality. Look for Filezilla on Windows. There are equivalent applications available for all platforms from a smartphone to mainframes. Windows Explorer will do FTP natively, but in my opinion is very difficult to set up. FTP is an excellent way to store and distribute collections of large files as well as one-off exchanges. I sometimes use this just for myself to distribute large files to my own computers instead of using a flash drive.

Flash Drives and cards: Speaking of flash drives, they have become cheap. Remember you can get a name brand 8GB flash drive easily for $4.50, and you can get them for much less if you look for promotions. A microSD card can easily be purchased for $5 and is a little more mailable perhaps. Most everyone with a notebook has a reader built in, and a USB connected card reader is less than $5. If waiting for snailmail is OK, it's a good solution for a non-technical person or for a high-security application.

Online Storage: My experience with this is limited to Google Drive, but many others are available, most notably Microsoft OneDrive (formally SkyDrive) and the many services like DropBox. I'm using Google Drive now as I write this article on Google Docs on my Ubuntu computer. I share common ongoing files with my family through this, but have only once used it to "send" a file. They are encouraging me to use this and Google+, but so far I restrict access to my immediate family and I'll keep it that way, thanks. Keeping the (free) limited storage amount in mind, and to me, the tenuous legal obligation to provide permanent reliable access, it isn't for me. The subject at hand is exchanging large files, and I don't think this qualifies for me.

Large File Services: WeTransfer at http://www.WeTransfer.com is the only service like this I have used. This is a quick and easy method of sending a large file to anyone with an email address. It's easy. You supply your email address and the recipient's email address, an optional note to the recipient, then use the upload button to select your file up to 10GB. The service sends the recipient an email with the download link and your note and sends you a copy of that note. Then when (if) the recipient downloads the file you are notified by email. The file is available for a week, then removed permanently. You do not create an account. I have zipped all files I have sent so far; with a password that I send by separate email.

Large Files.....Continued on page 6

New Ubuntu Release

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

Ubuntu has just released a new version of the popular operating system. This is release 14.04 LTS (Trusty Tahr) April 17, 2014. The previous LTS release was two years ago - version 12.04 LTS (Precise Pangolin) April 26, 2012.

This takes a little explanation. LTS - or Long Term Support are the main releases of the OS, and are milestones in the direction of the continuous development of the OS. The LTS indicates that they are supported and receive updates for five years, with paid technical support also available from Canonical Ltd. Since the last LTS release - 12.04, there have been three interim versions 12.10, 13.04 and 13.10. I demonstrated two variations of 13.10 a few months ago at a TPCUG meeting, and I have since upgraded to 14.04 LTS on my own machine, but not my wife's.

This time I selected the Gnome variation called Ubuntu Gnome - an official flavor of Ubuntu. If you're interested, the Ubuntu Gnome official release notes can be found at https://wiki.ubuntu.com/Trusty-Tahr/ReleaseNotes/UbuntuGNOME. I am especially pleased with this variation because of its excellent use of multiple monitors and multiple simultaneous desktops (workspaces in Ubuntu-speak). It's a little more technical, but it's highly configurable.

This version features enhanced capability for multiple users. Of particular interest for me is the optional smooth integration of Google services - and other services like FaceBook and Yahoo. I have been using my Google account and by setting up an account found that the email, calendar, reminders, contacts, IM and tasks appear in the native Gnome applications and sync and update automatically. So it's automatically in sync with my phone and tablet.

For the average user, I recommend the primary release of Ubuntu at https://help.ubuntu.com/community/Installation. This is a Wiki page that provides excellent, detailed instructions for everything you need and has links for special installs from live CD/DVD and bootable flash drives.

The maturity of this OS is very evident. It is well organized, with everything you need cataloged and easy to find. All of the configuration is done in graphical interfaces in a System Settings panel, much like Windows Control Panel, but simpler - more akin to Android settings. The native web browser is Firefox, but of course Chrome installation is just a couple of clicks away. Obviously Internet Explorer is not available, but Chrome surpasses this in every way. I'm not a user of Firefox, but I have no doubt that it's fully capable.

LibreOffice is included, so you have a full Office suite with full file compatibility with Microsoft Office files . . . except for a database application compatible with Microsoft Access. This shouldn't be a concern for most users. This is not to say that very fine full featured technical databases are not available - they are.

There is a huge software catalog with virtually everything you will ever think of - almost all of it free and of high quality and with user ratings. The library is very easy to use; everything is cataloged and searchable. Most applications give thorough descriptions and screenshots. There's an "Install" button and it's installed very quickly with plenty of progress information. The catalog knows what you have already installed, and of course you can get a listing of all that and uninstall anything very quickly. This all works so much faster and easier than in Windows. For instance in Windows you may see software in "Programs and Features", but you don't necessarily know what it does, remember why it's installed or even if you need it. With this Software Catalog it doesn't come up as an issue. It's all there.

So far in my year or so of using this and previous versions, I am missing only one thing. There isn't a Netflix application available in any Linux release. That's just amazing. I manage without it because I have multiple computers and a tablet, but jeez. My son's solution is to run Windows 7 as a virtual machine in VirtualBox so he can have Netflix. But he would have

Ubuntu.....Continued from page 4

that VM in any case - as would I. I run Windows XP, Windows 7 and Windows 8.1 virtual machines in Ubuntu VirtualBox with no issues at all except for the time it takes to keep them updated.

I'll say that I don't read Kindle books on any PC; I prefer my 7" Android tablet. For those who need it, there is no stand-alone Kindle application. However, your Kindle book library is completely available in the Chrome browser as the "Kindle Cloud Reader" (see the screen capture below). I just used it for the first time for this article; it's excellent. My entire Kindle library is available immediately, and if I wish, I can download any for offline reading, as in the picture.

As for updates, there is a non-intrusive notification of updates that always goes smoothly and much more quickly than in Windows. This installs updates for ALL of your installed applications, not just Windows, just as we come to expect with Android.

Dogwise Solutions
Mind Games for Dogs

As for performance, it's very fast even on older computers with limited memory. I have installed quite a bit of software and so far I haven't gotten to 6GB of disk usage. It's a perfect situation to replace your notebook drive with a small SSD. My older AMD 2-core computer with an SSD boots in twenty seconds and shuts down in less than five.

For my day-to-day computer use, this release of Ubuntu suits me very well. It literally covers all my needs exceedingly well (except Netflix support). I continue to advocate for this OS as a perfect replacement for Windows XP computers and any other computer that has limited resources; memory or hard drive, so if you have an older notebook that needs new life, you won't be disappointed. Remember that you can run the OS from either a live CD or better still, a bootable flash drive, eliminating the risk; it does not touch your existing system and will identify any hardware incompatibilities before you commit to the changeover. It will also install as a second bootable operating system, leaving your existing OS intact. This requires though that you have sufficient space on the hard drive. ◆

Large Files.....Continued from page 3

What impressed me most besides its doing precisely what I needed at the time was the website's professional layout, help and the FAQ, which left me with no unanswered questions. The advertising is even tasteful (and large) and never got in the way. They say on the site that they do not use your email in any way except for this file transfer, and so far I have not experienced otherwise. The fact that they do not require you to create an account is outstanding.

I was introduced to this by another company that requested a large file from me. As it turns out that company had purchased an account at WeTransfer that provides some visual enhancements, so I didn't realize at the time I was looking at a useful tool for everyone. For $120/yr the advertisements are removed, an optional custom background picture can be uploaded for the screen, the storage expands to 50GB and the files are not erased. It will zip the files for you if requested.

Large Files.....Continued on page 7

Large Files.....Continued from page 6

There are many services available, just a quick search found these - please beware - I have used NONE of these so I am not recommending them: SendThisFile, Files2U, SendUit, TransferBigFiles, BigUpload. Some of these I see are restricted unless you create an account. ◆

Comments.....Continued from page 1

my wife has one which has really been a boon to her. However, it sometimes seems to not hold a charge as well as in the past, so a battery replacement may be needed in the future, and the cost is around $100 with the possibility that you may receive a replacement device and not your original device when the iPad with a new battery is returned to you by Apple. So what happens to all your emails and pictures? Well, they say to back them up. I suppose that means you have to put them in the iCloud or whatever (I must confess that I have learned no more about the iPad than is necessary to help my wife set up her email accounts, which are POP 3 accounts that are not web based). But we will cross that bridge if we come to it.

In the past month I have learned of the deaths of two TPCUG members who were in the club when I joined in the fall of 1991: Larry Anders and Parker Monroe. A little searching in my *Computer Group Newsletters* app tells me that Larry joined the group in June of 1989 and Parker in May of 1991. Because of his illness, multiple myeloma, Larry stopped attending meetings perhaps seven years ago but maintained his interest in the group. He was a good friend, and I saw him occasionally and often exchanged calls and emails with him. You may read the last of many, many articles he wrote for the newsletter in the March 2011 newsletter. When I joined the group and for many years after that, Larry was the Librarian, which included doing research on software and keeping a box of floppies that had programs and utilities we could borrow to install on our computers. There was no downloading such from the Internet then. You could, however, get them from Bulletin Board Services (BBS) via a modem and phone connection. Larry was always the guy who got the hardware first. He purchased an HP

flatbed scanner at least six months before I got mine. You can read about that on page 6 of the August 1994 newsletter. (All newsletters are available at our website.) That was when such an item cost a little over $1,000. He had the first digital camera in the club, a Sony Mavica that used a 3.5 floppy as its storage media. You can read about that on page 3 of the October 1997 newsletter. He was one of the first in the club to move from a dialup Internet connection to a broadband connection. Besides being a main contributor to the newsletter from October 1997 through December 2006 he provided free printing of the newsletter, on paper we provided, at his place of business. Larry, pictured above in August of 1996 helping assemble the newsletter, died April 5.

Parker Monroe I recall from the TPCUG meetings at IBM in 1991 when the membership was probably around 150 or so. At that point, I was new to the PC

world, having just decided to move over from Apple, and Parker seemed to know a good bit more than I. So when he said in a meeting that he had purchased a Gateway computer via a phone call, I did the same and continued purchasing Gateways for many years. Parker at some point discontinued attending our meetings and became an active participant in the Brandon club's meetings and was their president at one time. He, however, continued his membership in our club up until sometime around the beginning of 2013. Over the years we had phone conversations about computer topics, and from time-to-time he would compliment me on articles in the newsletter, articles not necessarily written by me. The photo of him on the previous page was taken at the one TPCUG meeting he did attend in recent years. It was the June 2011 meeting, where I did the presentation on a history of the PC based on articles in our newsletters. I had specifically invited him and several other long-time members who did not attend our meetings anymore. Parker died November 10, 2013, although I did not hear about it until shortly after Larry's death. They both will be missed. ◆

Meeting

Cyber Crime as an Industry
by
Dave Palmer

Wednesday, June 11, 2014

6:30 PM

Pepin Distributing Co.
4121 N 50th Street
Tampa, Florida

Meeting Preview: Dave Palmer will present an overview of the cyber crime industry and how it has evolved over the last 10-15 years. The presentation includes a look at current business practices, the role and importance of malware, the structure of the industry, and at the flourishing underground market that serves the industry. Bob LaFave will conduct the usual Windows SIG for the first 30 minutes of the meeting.

Last month it pretty much fell to Merle Nicholson to fill the newsletter. He also contributed a major part of the previous month. So we'll give him a rest this month, and I will write a bit. Ron Weinberg has helped out with an article on using Win 8 with a mouse since it is not exclusively a touch operating system.

I have two items: My new eight-inch Dell Venue Windows 8.1 tablet and a new Windows Store app I have written to view photos of Florida in the early 1900s. That app allows me to combine my interest in old photos of places I am familiar with and the creation of mosaics made up of thousands of photos .

Again I invite all members to write articles for the newsletter. I am sure your unique contributions would be appreciated. ◆

July Meeting: To be announced

* * OFFICERS * *
President: John Witmer (president@tpcug.org) 949-8007

Minutes of the May Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. The SIG moderator, Bob LaFave, introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees.

Bob covered a variety of PC subjects in answering questions from the members. He talked about the reasons to abandon XP operating system computers, being that support has been discontinued. Discussion ensued about getting rid of the pop-up reminders about loss of support; perhaps restoring to an earlier restore point or checking the "Do not show again" box. Some discussion went on about the "missing mbr" on a desktop machine when a USB external drive is plugged in. The solution is to change the boot order in BIOS. The problem of managing pop-ups in IE was discussed by using "managing add-ins". Bob mentioned the increasing difficulty of machine-guessing passwords as the length of the password increases.

The April, 2014 meeting presentation was given by Blain Barton from Microsoft. Blain has done a presentation for us yearly for a number of years now, and we always welcome him. He's entertaining and a very accomplished speaker. He is one of the "Microsoft Evangelist" employees.

His presentation was roughly entitled "1-2 years of future stuff" and encompassed Cloud computing, mentioning the new Microsoft CEO who came from the Microsoft Azure open platform. He talked mainly about transitioning from the "private cloud" (local area network) to the "public cloud" (Azure).

One brief subject was the product Intune Manager, which configures and manages computer configurations (mobile device management from the cloud).

Minutes.....Continued on page 8

Dell Venue Pro 8

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

May was a good month for me. I wrote a Windows Store app titled *Manhattan Then and Now*, the purpose of which is to allow you to overlay any of six historical maps of Manhattan over the current map. In doing that, you can see what was at any current location in 1905, 1879, 1865, 1852, 1836 or 1807. For example, at 42nd Street and Fifth Avenue, instead of the current New York Public Library there was a reservoir in 1905, as there was in 1836. But in 1807 there was no reservoir. You can see where there were ponds now filled and hills now leveled on one of the maps. I find it very interesting. Unfortunately, not many others do because the app's sales have been minimal, as have the downloads of the trial version. Of all my phone apps and Windows store apps, this is only my second attempt at a paid version ($1.49), and in both cases the results have been very poor as compared to the free apps, some of which have ads and a few with no ads. It seems that if the subject is not compelling, the paid label deters people from even downloading and trying the app.

But all is not in vain. Microsoft is currently running a contest named Best App of the Month (BAM), where in different regions of the country they give a prize to the "best app of the month" submitted that month by a developer from each region. For April, *Manhattan Then and Now* won for the Central and North Florida region. And the prize was a 32 GB Dell Venue Pro 8, along with a Nokia Lumia 925 Windows 8 phone. I have received the Venue and have been using it, and the phone just arrived but is still in its box.

The Venue Pro comes as a 32 GB or 64 GB Windows 8.1 8-inch tablet. The 32 GB version sells for $299.99, the 64 GB version is 349.99. You may also purchase a wireless keyboard and a stylus and a few other items. I have an order in for a stylus. Now to the specifications:

Processor: Intel Atom Z3740 1.8GHz Quad Core
Operating system: Windows 8.1

Memory: 2 GB
Hard Drive: 32 GB or 64 GB Solid State Drive
Screen: 8-inch 1280x800 HD 800p display
Front camera: 1.2 MP
Rear Camera: 5.0 MP
Port: Micro USB
Extra storage: MicroSD, SDHC or SDXC
Battery: up to 9.9 hours of use; 3 hours of video

Venue.....Continued on page 4

Venue.....Continued from page 3

Extra Software: Office Home & Student 2013

This Tablet is running a full version of Windows 8.1 which, if you wish and are willing to pay, may be updated to Windows 8.1 Pro. But I see no need for that since it will run any Windows desktop program you may want to install. I installed Office 365, which I rent from Microsoft for $99/year and am allowed to install on up to five machines. This is a full version of Office 2013 and hence includes Outlook, which I very much wanted to install so as not to have to use the email client that comes Windows 8.1. I am not saying that there is anything particularly wrong with the email client in Win 8.1. It's just that I prefer Outlook. Office 365 also gave me Access which I like to have installed since there are several Access databases that I like to be able to consult from time-to-time (one is the TPCUG membership). I should note that there is a free instance of Office Home and Student that Dell will provide for the Venue Pro 8. That would have given me Word, Excel, PowerPoint and OneNote – but no Outlook or Access.

Now to the usability of the device. It is a small tablet with an 8-inch diagonally measured screen. Since it is just 5.25 inches wide you could put it in a large pocket, possibly in a jacket or cargo pants. It is very thin and light, so you will not tire holding it. For browsing the web it is quite good. However, in using it in my home I have found that its wireless range is a bit less than that of my wife's iPad or my Surface Pro 2.

The small screen works fine for web browsing since if the text or images are too small, you can simply enlarge them using the usual pinch and zoom finger gestures. What does not work so well on such a small screen is a standard Windows program. For example in using Word, the text you are typing can easily be sized with the pinch and zoom finger gestures. What you cannot do is enlarge things on the Ribbon such as the menu items so that they are easier to read and select with a finger tap. My solution is to use a Bluetooth mouse with the device whenever my location makes it feasible (you need a location to place on which to place and move the mouse). Possibly the stylus I have on order will obviate the need for the mouse.

Just because you may install any Windows desktop program on the Venue doesn't mean you should. I have no intention of installing Visual Studio or any of the Adobe Creative Suite programs such as Photoshop. The device has only 2 GB of RAM so that will slow such programs down, plus the difficulty with seeing the controls and menus in such programs will be a problem as I mentioned for Word. Of course with a magnifying glass you will do just fine. Don't laugh at that. I had to resort to a magnifying glass when I wanted to use the Command Prompt to run a Windows PowerShell script to install my latest Windows Store app on the Dell to see how it would work on a small tablet. I could read the text, but it was difficult. So once I typed in the command, I wanted to check if it was correct and resorted to the magnifying glass to make sure. Possibly younger eyes would have had no problem.

Why do I need to use Windows PowerShell to install an app on the Venue? If the app were already in the Windows Store, I wouldn't; I would just go to the store and install the app from there. But to install an app under development, you need to either have Visual Studio 2013 on the device and then open the project in Visual Studio, or you need to (through your wireless network) place an installation package for the app on the Venue and then run the Windows PowerShell script in that package to install the app. Oh, and one more thing, you need to have previously installed your Microsoft Developer's License on the Venue. And that is, I am sure, more than you wanted to know.

I can recommend this device if you want a small portable tablet to browse the web, check your email, take notes and keep up with your calendar and contacts or even to watch videos. I do not recommend it as a tablet that you would use as your sole Internet device. I think a larger tablet would be more appropriate for that (and cost twice as much, at least). And Dell has one named the Dell Venue Pro 11, I believe. That would be a a Windows 8.1 tablet with an 10.8-inch diagonally measured screen. It will cost more, be heavier but give you a much larger screen. ◆

Internet Picture of the Month

Steve Ballmer in 2010

Mr. Ballmer made, perhaps, 20 Billion dollars selling you Windows, Word and a few other Microsoft products over the years. And he just offered two billion of that for a basketball team. I think this photo captures his personality, more of a salesman than a technical guy. He was Bill Gates' roommate at Harvard and actually graduated from there, unlike Bill, and was Microsoft's 30th employee. So that is probably why he was eventually given the job of running Microsoft, from which he has now retired. The photo is from http://commons.wikimedia.org/wiki/File:Steve_Ballmer_at_CES_2010.jpg,

Why You Need a Windows 8 Device

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Simply stated, you need a Windows 8 device, actually 8.1 now, device so that you can use all the apps I have written for that operating system, almost all of which are free. I think you would really find useful the *Computer Group Newsletters* app that has all of our newsletters from the earliest days through just a few months back and which is searchable. Then there is the *Old Tampa Photos* app which allows you to view, search and share any of the 13,000 plus historic photos of Tampa that are in the Tampa/Hillsborough County Public Library's collection of Burgert Brothers photos. And there are many other apps I won't mention, but which you may find by searching the Windows Store for LaMartin Software.

Now I have a new app that I am just finishing and will put in the Windows app store soon. It will be titled Old Florida Mosaic. The mosaic pictured to the right is on the opening screen of the app. That mosaic is made up of about 900 images repeated enough times to total approximately 5,100. The base image is the Jupiter lighthouse, photographed around 1897.

This will be my first app that Microsoft terms a Universal App. What this means is that in Visual Studio 2013 I create both a Windows 8.1 Store app and a Windows phone 8.1 app in the same project where they share much of the same code and assets. This is possible since Microsoft has rewritten the code base for Windows Phone 8.1 so that there is a major overlap with its code base and that of Windows 8.1. The two operating systems do not share everything, but they share a lot. And this should make creating both Store apps and Phone apps much easier.

I created the Store version of the app first, that is the app that will run on a Windows 8.1 operating system. Then I let Visual Studio create the 8.1 phone app for me based on that. The result was that almost none of the underlying C# code had to be modified; however, the layout for the phone had to undergo a bit of re-jiggering since fitting things on a phone screen is not the same as placing them on a larger tablet or desktop computer screen. But in theory, if you can use the same layout on the phone as on larger screens, then such a Universal App could run on a phone with a four inch screen or on a 40 inch wall display with no adjustments necessary.

When I get my app in the Windows Store you will be able to run it on any Windows 8.1 desktop, laptop or tablet. You will not be able to run the phone version yet since Microsoft has not yet released Windows phone 8.1 to the general public, only to developers. However, it should not be long before anyone with a Windows 8 phone receives the 8.1 update.

Eventually I will create a second app using these same Florida photos that is similar to what I did with the Burgert Tampa photos. In that app besides viewing the individual images and downloading them, you may also view a slide show or search the collection. ◆

How-To Tips for Windows 8.1 without a Touch Screen

By Ron Weinberg, Member At Large,
Tampa PC Users Group
rswjbr@verizon.net

Important Parts of Windows 8 or 8.1

The **START Screen** shows all the Programs on the System in Tile form which was originally called the Metro style.

- Left clicking on any Tile will start the associated program.
- While in START, clicking on the Desktop icon or pressing the Windows key and the letter D at the same time will switch to the Desktop.

The **DESKTOP** is the screen used for daily use and, if used, rarely requires use of the START screen.

- Pressing the Windows key in a program or when in the Desktop mode switches to the Start screen.
- To return to the program switch to the Desktop or Press the Esc (Escape) key.

The **CHARM Bar** is a toolbar which appears on the right side of the screen when you place your mouse at the top right or lower right of your screen. It quickly disappears if no action on it is selected.

- The top Charm is Search, used to search the computer for words or programs.
- Other Charms are: Share, Start, Devices, and Settings. Share allows the user to share files or photos with other users.
- Start brings up the Start Menu.

You can learn more about Charms by clicking on this link.

http://windows.microsoft.com/en-us/windows-8/charms-tutorial

Alternatively, you can enter that address in a Browser's address bar.

Common Browsers are: Internet Explorer, Chrome and Firefox, which are programs that allow you to access the Internet.

The **TASKBAR** is the ribbon at the bottom of the Desktop which shows which programs are active. It also displays Icons for a few often used programs which can be clicked on to start the program.

Selecting Records

To add a Sender to your Contacts automatically in Windows Live Mail:

- Highlight the Message in your Inbox with one left click of the mouse.
- Right click on the Message.
- Select Add Sender to contacts and press Enter.

To select a group of records or email messages,

- Highlight the first message or record
- Move down to the last message in the group and hold down the Shift key while left-clicking on this last item.

To select multiple individual records or messages,

- Highlight the first record
- then hold down the Ctrl (Control) key and left click on each additional desired record or message.

Ways to shut down or exit a program

To exit a program such as Live Mail, left-click on the Red X at the upper right corner.

To turn the computer off use any of the power symbols.

- In the START menu a Power symbol is displayed in the upper right corner of the screen.
- Using the Charm Bar, the lowest charm called Settings will offer a power key with the Shut down option or in some cases Update and Shut down.
- In the Desktop, right click on the Windows icon at the lower left corner of the Task bar and an option to shut down will appear. ◆

Minutes.....Continued from page 2

Most of Blain's talk involved Azure, the Microsoft cloud computing platform. Azure runs multiple virtual computers, handles most other OS clients like Ubuntu, Oracle Linux and other Linux clients, and has data center security, Global Foundation Services, Active Directory services and manages remote desktop and telecomputing. OneDrive (formerly SkyDrive) synchronizes local folders to cloud drive folders.

Blain then demonstrated the newest preview of Azure portal for websites; SQL database and MySQL; and the ability to create a complete website from a gallery of website elements.

Once again, our heartfelt thanks to Blain for his entertaining and current technology presentation. ◆

Meeting Preview: Merle Nicholson will give an overview of the new version of Ubuntu - 14.04 LTS "Trusty Tahr". Bob LaFave will conduct the usual Windows SIG for the first 30 minutes of the meeting.

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Thanks to Merle Nicholson and Kevan Sheridan for providing content this month and to Merrill Friend for sending in something that will go in next month's newsletter.

I filled the remaining pages with a description of my latest Windows 8 app. It is a display of photos I have taken of the flowers in my neighborhood over the past 10 years. It is amazing how many different blooming things there are in our 400-house neighborhood. I included around 170 photos but could have added more. If you have Windows 8.1, I invite you to download *Hyde Park Flowers* from the Windows Store. I have not published it yet, but it should be there by the time you receive this newsletter.

Last month the presentation was on cyber crime, and a number of recommendations on avoiding being a victim were given. I have to disagree with the one about avoiding Internet Explorer. My best advice is to avoid clicking on anything you receive in an email that did not come from me – all others are suspect. ◆

August Meeting: To be announced

Minutes of the June Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. The SIG moderator introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees. Bob LaFave was not in attendance this meeting, so I (Merle Nicholson) substituted for Bob.

The first subject covered in the SIG was a demonstration of WeTransfer, a free or optionally paid website for the purpose of sending large files to other people over the Internet. This was a subject covered in the previous newsletter, but the demonstrations seemed of interest. Basically you upload a large file to the site along with necessary instructions for the website to send the recipient an email with a download link. http://www.WeTransfer.com. The second demo was a brief overview of sending money to another person via Amazon Payments at https://payments.amazon.com/home. This is an easy way to send or receive money using a credit card. It's an interesting alternative to PayPal for those people with Amazon accounts who deal with Amazon anyway. Despite several requests I did not want to send a club member any money, so the demo was limited.

The June 11, 2014 meeting presentation was given by Dave Palmer. Dave is a TPCUG club member. He gave a similar presentation some time back and he has obviously kept current on the subject. His presentation used slides extensively and was well-organized and interesting. The subject this month was "Cybercrime Goes Professional" and outlined how the virus business has become professionally organized into a very big business. Dave quoted one source that estimated the loss at $500B/year, with 84% of all businesses infected with some form of malware aimed at stealing financial information, account passwords, intellectual property or competitive business strategy.

The DVR is Dead

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

We're reading a lot about "cutting the cable" lately. This is about people who have decided they no longer want cable TV and have opted for Internet streaming from Netflix, Amazon Instant Video, Google play, Hulu plus and others to provide entertainment content. There are several reasons for this, the one most obvious is that the content people want is now available from streaming services. Usually the episodes of a TV program will be made at the end of a season, and there are some more expensive subscription services that have TV content that is just a few days old. Of course if you don't care about being current, there is more content available than you can possibly watch for eight bucks a month from Netflix. The major networks have their own websites where many TV series episodes are available just days or weeks old.

All this isn't the same as having an active live TV, of course, but it's suiting millions of people, and if you're willing to work at it a bit, you can keep the cost to a minimum, maybe $20/mo – an insignificant amount compared to the cost of cable TV.

The other motivating factors are a little more subjective. One of my own pet peeves is the poor quality of the TV controls and on-screen menus on the set-top boxes I have had. The controls I had were close to being unusable they were so slow and unresponsive. It took forever to look ahead at future programming, and the number of channels you can view are very limited. Further, the storage capability in my DVR was tiny compared to my needs, and being limited to two simultaneous recording channels just wasn't working. Further, there was the $32/month being charged for two unsatisfactory devices; an HD set-top box and an HD DVR. I needed to do something. I seriously considered cutting the cable altogether as my adult sons had done. I decided instead to improve my equipment.

First – the direction my sons have taken. I built both their computers. One has his attached to a standard monitor, the other to a TV screen. Part of their motivation is that their only provider is Comcast, repeatedly surveyed as one of the most hated corporations in the US.

The monitor is a 1080p 23" widescreen with just two input connectors, VGA and DVI, and must use external speakers. It's a quad-core AMD A8 with a mATX motherboard in a conventional PC. This means that the GPU (graphics processor) is built into the CPU and the motherboard handles the output connections to the speakers and monitor. AMD calls this processor an APU – Accelerated Processing Unit – because it has combined a very powerful GPU and CPU all in one. The operating system he uses is Ubuntu-Gnome 14.04. The Chrome browser handles most of his video needs, the exception being Netflix, which requires a Firefox browser at the current time (long technical story). He uses Netflix and Hulu Plus.

The TV installation (other son) is different. He uses a computer with an Intel processor that, while powerful, is somewhat weak in graphics capability, so this one uses a low-profile graphics card with DVI and HDMI connectors. The HDMI cable carries stereo sound as well as digital video. We installed Windows 8.1 and a nice wireless compact keyboard. The compact case he wanted can be mistaken for a piece of stereo equipment; it's about five inches tall and the same width as a stereo. The TV he uses, like all TV's, has a TV tuner for OTA (Over The Air) broadcasts (Who does this?) but also has a few HDMI inputs for Set-Top boxes and in this case the computer. That computer is inconspicuously stashed on a shelf along with other stereo equipment.

My own setup is quite different. I have not cut the cable, but at least have minimized the requirements from Verizon FIOS. I no longer have any Set-Top boxes or DVRs in the house. My TV channel lineup has no premium channel content, but isn't just basic. I have one "M-Card", the only rental equipment at $5/mo. It's the size of a credit card and slips into a slot in the back of a dedicated computer I have named "Media-PC". The computer serves no other purpose except

DVR.....Continued on page 4

DVR.....Continued from page 3

as a PVR (Personal Video Recorder).

It has three large hard drives totaling about 3TB. The AMD CPU is far more powerful than needed; it's an older style quad CPU without graphics. This particular one was simply made up of parts I had on hand when the previous very old one died mysteriously. It has a very powerful dedicated graphics card, plenty of memory and runs continuously (it's never been turned off) plugged into a large UPS. I replace the UPS battery every two years.

I use a TV cable adapter made by Ceton and exposed in the back of the computer. The Verizon M-Card is inserted into this and has a connector for the incoming TV cable. So this combination of the Ceton card, Verizon M-Card and the incoming TV coax cable substitutes for what you would use a Set-Top box for.

The Ceton card – along with a couple of other brands – now comes in a couple of configurations; as an internal card, an external USB connected device, and models that will give you six channels for recording instead of the original four like I have. There is no reason you can't have more than one device in a computer. I'm happy with my one card and four recorders. For software, there is a downloadable package that installs software that communicates with the TV card and also – in my case – Windows Media Center, free with Windows 7. It's $40 with Windows 8.1. All of this – software and hardware has proven to be nearly trouble free.

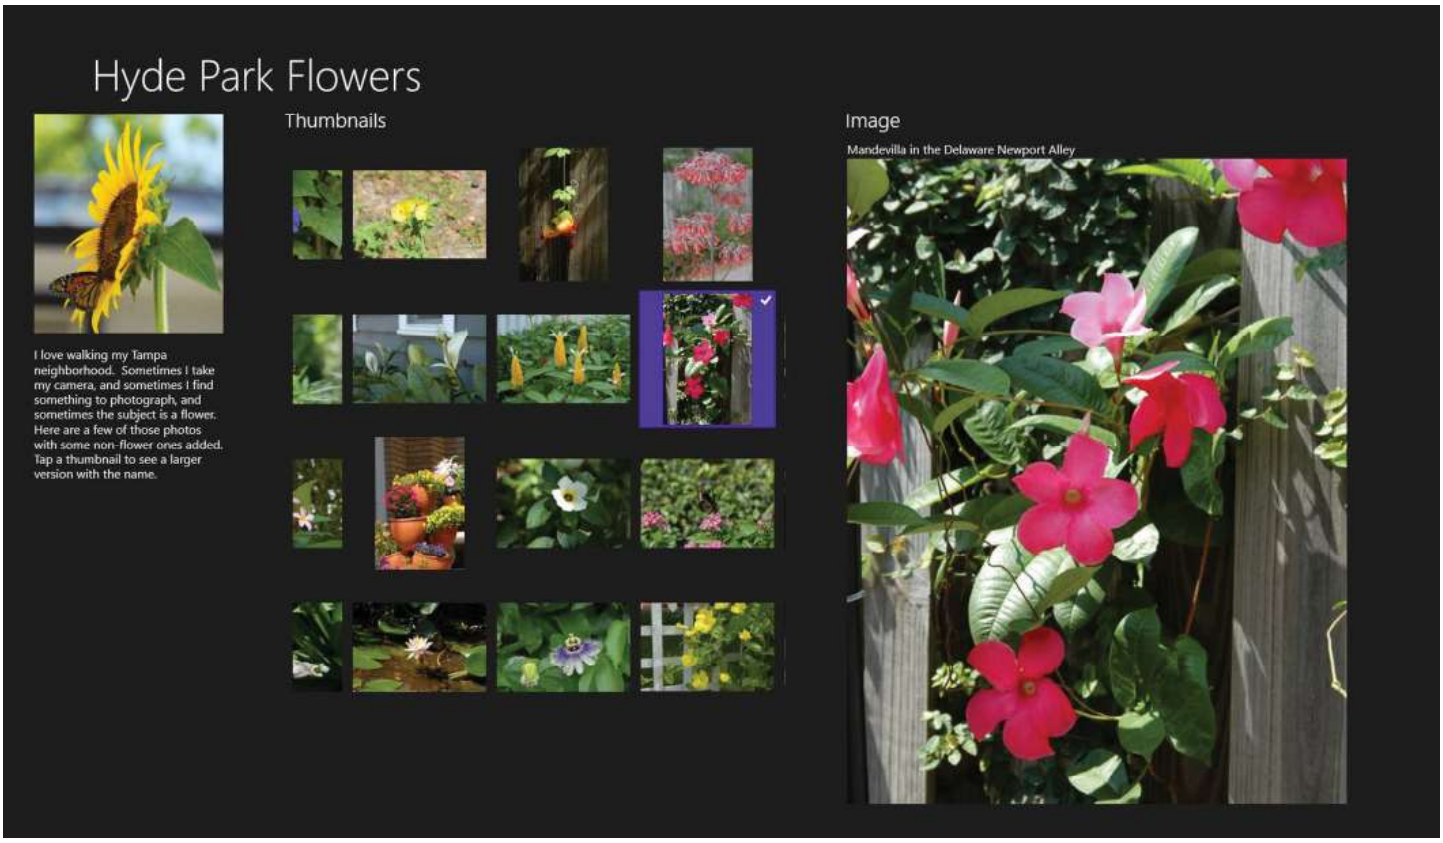
Windows Media Center handles all your TV recording, storage and playback easily and fast. You can scroll forward in the TV guide for a couple of weeks faster than you can read them. You have lists of programs you are set to record in the future, and settings to establish what you intend to record. You can edit the list of channels that appear in the guide. Search by keyword or wildcards is excellent. Try as I can, I find very little to fault in this software. I did have a confusing couple of hours once when my Vipre Internet software got updated and blocked the Ceton card. One thing Vipre has – good responsive phone help. I would rate both Windows Media Center 7 and Vipre Internet 2014 software 4.9 out of 5.

The software also handles your DVD player and music and picture libraries. It's network aware so that it can use the libraries of other computers on your network, and if you have WMC on other computers, you can play or store recorded content on those as well, without a cable card.

Other equipment needed is a WMC remote, a keyboard/mouse device and perhaps a universal remote. The Windows Media Center remote is found on Amazon and is less than $20 by several manufacturers. It is similar in appearance to the DVR remote that you're familiar with. It's IR (Infra Red), and comes with an IR receiver that you attach to the PC by USB. It gives you on-screen control over WMC. You can do the same control by other methods like the PC mouse or even with network software that you can control with your Android or IOS phone or tablet. I have a tiny Logitech Bluetooth DiNovo keyboard/mouse that is about the size of my hand to use when I'm using the browser, or have dropped to Windows out of WMC. The DiNovo is fairly expensive, but has a replaceable, rechargeable battery, and had proven to be ultra reliable. I shouldn't have to say this but you also need the best Anti-virus/Internet software you can afford. I also paid $50 too much for software to play Blu-ray disks because WMC does not do it natively. I say $50 too much because it should integrate seamlessly – as advertised – into WMC but does not.

The last item is a programmable remote. I control a stereo receiver for 5.1 channel sound, minimal TV set control functions and even most of the WMC functions, although I never use that. The programmable part turns the TV and receiver power on and off together. I purchased this remote while I was using set-top boxes, and I probably will not replace it if it dies. ◆

Internet Picture of the Month



Detroit 2014: 43,634 Properties on the Brink of Foreclosure

From the New York Times, http://www.nytimes.com/interactive/2014/06/27/us/detroit-foreclosure-photo-mosaic.html. "This mosaic, created with images from Google Maps Street View, shows one of the many enormous challenges facing Detroit as it tries to climb out of debt. As of January, the owners of these properties collectively owed the county more than $328 million in unpaid taxes and fees. Since then, some have paid their debts, entered in payment plans or qualified for assistance. But 26,038 properties, shown with a yellow triangle, remain in jeopardy, and many are headed for public auction."

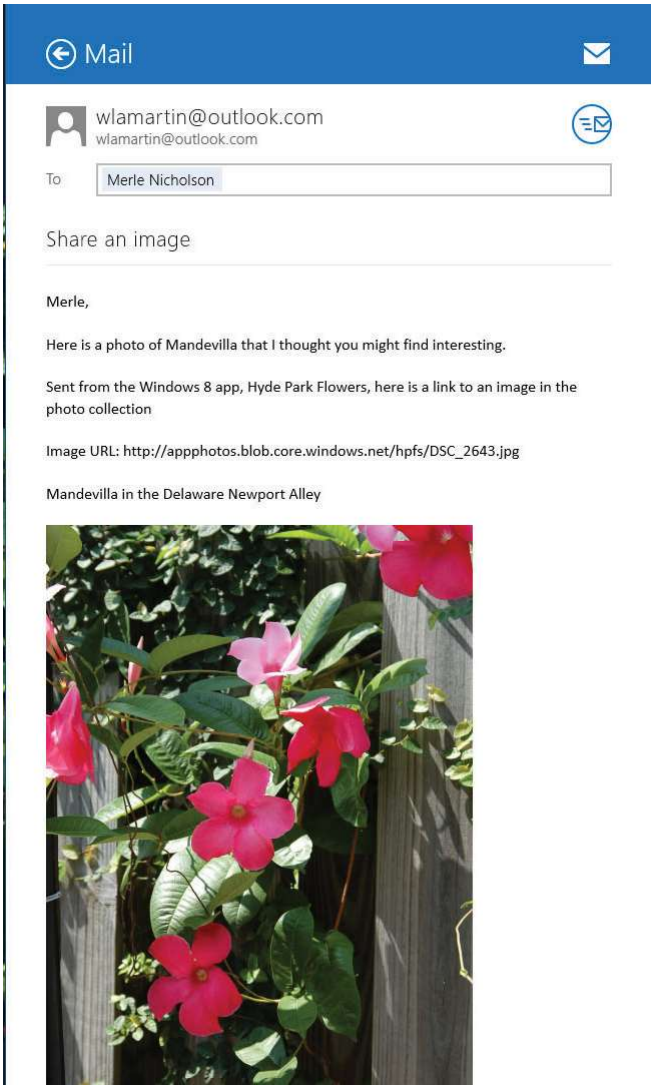
Hyde Park Flowers

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

What do flowers have to do with computers? This is a personal computer club that is morphing into a personal computer club and all things digital. First off, that is the main page of my newest Windows 8.1 app. That means you have to have a Windows 8.1 computer or tablet to use it, which I hope you will download and do (it's free). There is also a companion Windows 8.1 Phone app. Next, all the photos were taken with a succession of digital cameras over the years: A Nikon D100, a Nikon D200 and a Nikon D800. So that is something digital. And all the photos have been resized in Adobe Photoshop, and that is software. So there are a lot of computer and digital things going on here. Oh, there is one more thing: All the photos for the app are stored in Microsoft Azure, which, as Blain Barton has told us is in the Cloud, one of the latest buzz words in computing.

Now that I have established that Hyde Park Flowers has something to do with computing, let me describe a little of what goes into making such an app. By the way, this app is what Microsoft terms a Universal App, where in the Save Visual Studio project you create two apps at once, a Windows Store app and a Windows Phone app. The theory is that this will involve less work than creating each app separately. Not all apps are amenable to this, but what I am doing here is.



The first thing I did was select out around 170 photos of flowers and a few other photos that had images of various fruits in them from the much larger collection of photos I have taken around my neighborhood. I then made two folders of the photos that contained resized versions of the photos. The first folder contained photos with a maximum height or width of 200 pixels. These would be the thumbnail photos you see in the middle of the image above. The second folder contained photos with a maximum width or height of 1200 pixels. These would be the photos you see on the far right above when you have tapped a thumbnail. Once I have all the photos resized, I upload them to Azure to be accessed by the app.

Flowers.....Continued on page 7

Flowers.....Continued from page 6

Next I import all the photos' file names into an Access data table (this took a bit of programming which we will skip). After that, there is the tedious work of supplying each photo with a description in the table. For flowers, I do not know, I did a lot of searching in Bing for Florida flowers in image searches. When the table is complete, I note that I have 173 photos, and I export this table to an XML file which will be the data source for the app: You tap a thumbnail, the app looks up that flower in the XML file and provides the description.

The real work begins with writing code to make all this work. I certainly won't go into that. Perhaps we can close with one of the features that I coded in: The ability to send via email the photo you are viewing. Below is a screen capture of such a message being sent to Merle Nicholson. ◆

Yahoo! eGroup

By Kevan Sheridan, Vice President ,
Tampa PC Users Group
kevan57@gmail.com

The purpose of the TPCUG Yahoo! eGroup is to inform, promote and encourage communication among members of the Tampa PC Users Group. This is a great member benefit and the easiest way to stay in touch with other members during non-meeting days.

Joining the eGroup is simple: Use your preferred email address to send an email join request to TPCUG-subscribe@yahoogroups.com. Include your full name in the text section of this email. You will then receive a verification request that you reply to, then you are up and running.

Note: if you join with a Yahoo! email address you get full access to the group site at http://groups.yahoo.com/group/tpcug

To send email messages to the group, address it to: tpcug@yahoogroups.com Your message will be broadcast to everyone in the eGroup.

Use of the eGroup would include, but is not limited to:

1. TPCUG leadership
   - Posting announcements of general interest to the members
   - Notifying members of recent changes or additions to meetings or special interest groups
   - Requesting feedback from members
2. The Members
   - Further discussing topics presented in meetings
   - Follow up to previous requests or links from presentations
   - Asking questions that were not answered during the Q/A portion of the meeting
   - Posting announcements of general interest to membership or leadership
   - Listing equipment either for sale or wanted
   - Holding discussions of consumer electronics or related topics and issues ◆

Minutes.....Continued from page 2

Dave outlined the business of creating malware itself where people develop inexpensive kits to sell to people who want to customize their own malware. The variety and volume of new malware has made the Antivirus industry lag 24-48 hours behind in the creation of detection software, which is always too late for some.

Dave went on to outline the steps that the regular user should take to be protected from malware as much as possible: 1) Create and use a standard user account, with logins for each user. 2) Games are dangerous because the gaming websites are targets for malware. (I may add that goes for music download sites, movies and torrents.) 3) Download only from known sources. 4) Disable script processing in your browsers. 5) Don't use Internet Explorer because that's the browser that receives the most hacking attention and 6) Disable Java.

These minutes cannot do justice to Dave's presentation; it covered so much valuable information. It was well-presented, interesting and informative. Our thanks go to Dave for his time and effort. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Thanks to Merle Nicholson and Merrill Friend for providing content this month. Let's see what I can do to fill the rest.

I have been doing my usual: Writing apps for Windows 8.1 and the Windows Phone. That is something I enjoy. I write the sort of apps in which I am interested. Unfortunately, not many others have the same interest. Or, perhaps, they cannot find my apps in the Windows Store. Most of my Win 8 apps have over 1,000 downloads with several having much more, and the best one, my Drug Data app, having around 17,000 downloads at present. But having downloads does not make any money on ad-supported apps unless the users not only use the app but spend time on a page that has an ad. For apps such as the Drug Data app, if someone uses it, they most likely simply look up information on one drug, and then they are gone. That sort of use produces very little income. My Simple Portfolio showing selected stock listings produces the most income because people

Minutes of the July Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. The SIG moderator introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees.

The subjects covered in the SIG by moderator Bob LaFave were notebook overheating problems and known solutions; a KickStarter powered module Bob brought for powering a paper airplane and controlled by smartphone; Mac Drive, software to access Mac Drives from Windows, free and pro versions from http://www.mediafour.com

The monthly program presentation this month was given by myself, Merle Nicholson, on the subject of Ubuntu 14.04 LTS, the newest iteration of Ubuntu and the first in a year to have the LTS – Long Term Support – designation. The Ubuntu organization has commited to making every fourth release of the OS as LTS; the last being 12.04 LTS. The website – the place to begin if you are interested in the desktop version of this free OS – is http://www.ubuntu.com/download/desktop. Ubuntu is especially attractive as a replacement for older Windows XP systems, for those who want to avoid the current virus and malware nightmare, or for those disenchanted with Windows 8.1. It has fairly low processor and memory requirements. It's available in both 32 and 64 bit versions. I demonstrated software availability – office suite, image editing, software catalog and software updates.

The presentation was well attended; fairly lively with plenty of questions and discussions. ◆

Oracle VirtualBox Introduction

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

If you have an interest in using a different operating system temporarily for any reason, the risk-free approach is to use a Virtual Machine (VM). There are several VM programs available; my favorite, the one I now use exclusively, is Oracle VirtualBox. Other systems are described with less detail below.

VirtualBox is a free software product that allows you to run more than one operating system (OS). As an example: You have a Windows 7 computer and you have an interest in trying out Windows 8.1 without putting your computer at risk. Or you really can't find a replacement for your old 1982 SuperCalc spreadsheet and it hasn't run since Vista. You need either a DOS computer or maybe Windows 98SE.

Perhaps you have a Windows XP computer to do certain things but you know it's not safe anymore or perhaps it's dying. (Microsoft recommends you disconnect your XP computer from the Internet – even if it's running in a virtual machine.)

A virtual machine extends the capabilities of your existing computer so that it can run multiple operating systems (inside multiple virtual machines) at the same time. So, for example, you can run Windows and Linux on your Mac, run Windows Server 2008 on your Linux server, run Linux on your Windows PC, and so on, all alongside your existing applications. You can install and run as many virtual machines as you like -- the only practical limits are disk space and memory.

VirtualBox runs on Windows, Linux, Macintosh, and Solaris. It hosts and supports a large number of guest operating systems including Windows NT 4.0, 2000, XP, Server 2003 and 2008, Vista, Windows 7, Windows 8 and 8.1, DOS/Windows 3.x, Linux, Solaris, OS/2, OpenBSD and others.

If you are going to run an operating system, you must own it. A pirated OS won't work any better in a VM than in a real computer. So before you devote any time with this; be sure to get your license key if it's necessary (Windows, OS X). Obviously you can run any OS free when the OS is free, as in most Linux. A Windows OS that comes installed on a commercially made computer is usually licensed for that computer only (called an OEM version), and is not normally transferable to another.

The computer that you have running, the computer where you install the VirtualBox software, is called the "Host" computer, and the virtual machines are called "Clients", or "VMs".

So what do we need to host VMs, and where do we get it? For software, we need the OS that we're going to run, and the VirtualBox software from the VirtualBox.org download link below. As for hardware, well that's a bit more complicated. First, let's say you have Windows 7 and you want to experiment with Windows 8.1. It takes 4GB of real memory to run both of these products really well (although 8GB each would be better). The Windows 7 VM software dedicates real memory to the VM, so we're talking 8GB to run well. If you want them to just run, and are willing to wait while your PC chunks around swapping memory out to the swap file, you can actually do it on 2GB each. Obviously if you want to run Ubuntu, Lubuntu or Eubuntu (that's (L)ight and (E)ducation versions) which will run on as little as 1GB, 3 or 4GB of real memory, will do not too badly. There are numerous other Linux that are specifically designed to be small - "Tiny Core Linux" and "Damn Small Linux" and others. Those small Linux machines have greatly reduced memory requirements as well.

Now we need to talk about disk space. A VM simulates a disk (Virtual Drive) for your new VM computer, in the form of a disk file. That disk file obviously needs to be as big as if it were on a real computer, so if you need a large computer disk, that space is going to be allocated on your host computer. But there's some good news here, too. One is that VirtualBox supports dynamically allocated drives. This is where you set an initial and an upper limit for the size and allow it to

VirtualBox.....Continued on page 4

VirtualBox.....Continued from page 3

grow. This is well documented, so be sure to research it. The other good news is that you probably don't need nearly as much disk space as you think you do. Look at the actual amount used on the host machine or look at folders on other computers like notebooks. You can get folder properties to see how much of your disk is taken up by Downloads, documents, music and pictures. I allocated 25GB for my Windows 8.1 Virtual Drive. I use the VHD (Virtual Hard Drive) file type because that type is recognized and is readable by other VM's, and is transferable to a real hard drive. The basic OS takes only about 9GB, but more gets eaten up as you install software. You have to get serious about this if you intend to load music, video or pictures.

After doing some reading, open VirtualBox. This is just a manager of virtual machines. You create new VM.s and manage existing ones here. Each VM has a handful of settings such as number of processors, memory allocated, number of monitors, virtual and real CD/DVD and even floppys. You can set the guest VM to share the Host DVD to load software or USB devices. There are sound settings and Network devices, microphones and camera support. Virtually anything a "real" computer needs can be connected to the VM. You think of the VM as a real computer and the procedures for installing software and hardware are the same process, except for one thing: Your risk is just lost time. You can't harm your real computer unless you access (share) your real computer hard drive, which is something a novice should not do. Restrict your activities to your "local" machine and you can't go wrong.

Once you get your new computer going, it should easily start any time from the VirtualBox manager. Then it's time to look at modes. There are three. One is a full screen mode where it uses all your monitor(s) and hides your host from view. Here you are simulating what your new computer would look like and behave as if it were booted up. Another useful mode is windowed so that the machine looks like any other window with the whole screen scaled down in size. There are setting and procedures to transfer clipboard and files between the host and the client.

If you have plenty of memory and processing power you cannot tell it's in a VM. It's that good.

Other features of interest; if the VM is running and you have shared it to your network, it's accessible through the network and even controllable using remote access software. It's a good option for running a SQL Server or MySQL. There are command line calls so that you can set up a desktop shortcut and bypass opening the VirtualBox manager, or startup with the Task Scheduler or command line. All of this is well documented. See the links to the manual and also for a very useful forum where other users will answer your concern if it has not already been addressed.

Other stuff on VM:
One very useful VM product is "XP Mode" in Windows 7. It's included in all copies of Windows 7 Professional, Enterprise or Ultimate. It's a free licensed version of Windows XP. It is very easy to set up. Microsoft recommends you disconnect your XP Mode computer from the Internet. XP Mode was not implemented in Windows 8. See the XP Mode link below. It's very well documented.

There are other Virtual Machine products besides VirtualBox. Windows Virtual PC is one I have successfully used. If you have a MAC and need to run Windows products, Parallels is the most common choice at $50. My personal experience with Parallels did not go well. We found that the computer was brought to its knees for lack of memory and slow hard drive. See this somewhat older article in Lifehacker: http://lifehacker.com/5714966/five-best-virtual-machine-applications

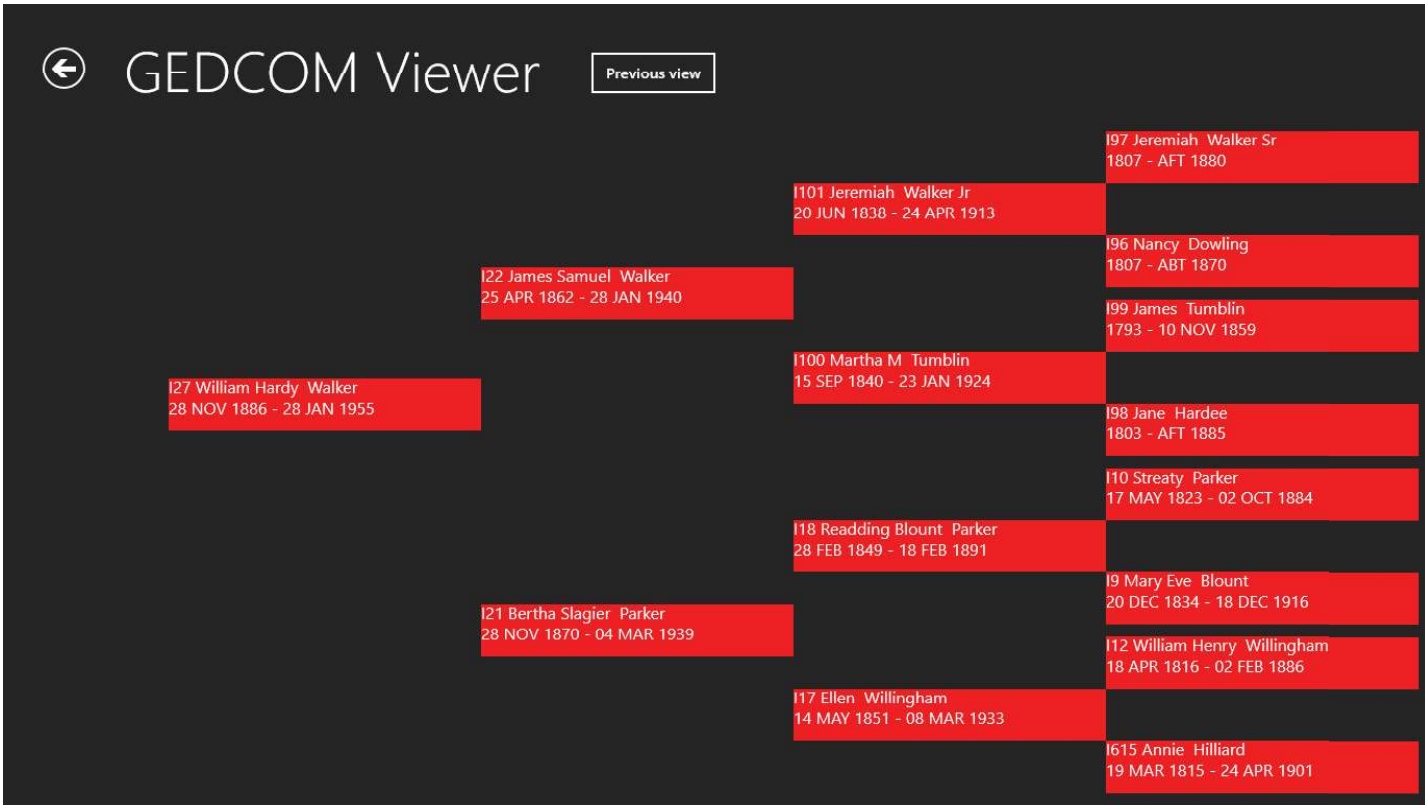
tend to leave it running for some length of time. But it has been out there a while and I haven't updated it (not that it needs updating), and that tends to cut down on new downloads. But you can have quite large downloads and make no money if you don't update your app, particularly for a game. I know one fellow who wrote a game for the Win Phone that has garnered over 300,000 downloads and produced some noticeable ad income at first. Now he says he receives almost nothing since he has not updated the game and people have apparently lost interest. It also helps to promote your app through various means such as on

Windows 8.1 running in VirtualBox

Facebook and Twitter. I don't do that, but the developers who are working at making a living writing apps very much do that. I don't even have a Facebook or Twitter account. Well, I will just have to suffer the consequences of not being on social media. But then I have the benifits of not being on social media – I am not inundated with trivia.



I am about ready to add to my app list with a Windows 8 and Windows Phone app that allows you to view, search and download the Civil War photos by Mathew Brady in the Library of Congress – all 8,000 plus of them. It will be simply titled Civil War Photos and should be out sometime this month.

And while finishing that up, I have also started on an app that will allow you to view all the geneaological data in a GEDCOM file with the usual ancestor and descendant reports. So I am keeping busy. Here is a

screen capture of one of the ancestor reports. ◆

WiFi Problem

By Merrill Friend, Tampa PC Users Group
absecon1933@gmail.com

One of my wife's relatives recently gave her a brand new iPad. Neither my wife nor I have ever owned an iPad and learning to use the thing involves a convoluted learning curve for us both. In our case that learning curve was more difficult than we expected.

We took the thing out of the box and found that the battery was fully charged but we couldn't do a darn thing with it. There were some interesting Apps available for downloading, many for free but we could not get any of them to work. So I made an appointment with the geniuses at the Apple Store in International Plaza where everything worked beautifully. Those genius types made it look so easy I really felt kind of stupid. So I thanked them for their kindness and took the iPad home and tried again. Once again it would not do the easy things at home that it had no difficulty doing at the Apple Store in International Plaza. My pride now almost destroyed, I decided I would have to figure this out by myself. I just couldn't face all those smiling Apple Geniuses another time.

I began to suspect that my Bright House Wifi was not working properly but that made no sense because my laptop which operated off my Bright House router was working just fine. I looked at the Wifi settings on my iPhone. When I first checked, the iPhone indicated Wifi was on and then it suddenly said it was Not on. That made no sense. But it did suggest that perhaps I had a weak Wifi signal. Why then was my laptop still working so well. Years ago I hooked my laptop up to the router using a cable, thinking I might improve the connection and speed. So, now I disconnected the cable and found that I could no longer get the Internet.

I phoned Bright House who seemed to immediately know what the problem was. I was asked to reboot the modem, which failed to make any difference. Then

WiFi.....Continued from page 7

the Tech guy on the phone made more changes at his end and my Wifi reception gradually improved until it was up where the Tech guy said it should be. Since my computer was close to the modem and router, the Techie suggested I discontinue using the cable to connect to the router. My wife is using her iPad a couple of rooms away, and it now seems to be working fine and the roughly 50-foot distance from the router and modem doesn't seem to be a problem.

I have not heard of this type problem before and wonder if it is specific to Bright House or is it more commonplace than that. It would be interesting to me to know if anyone else in our group has experienced this type problem with their Wifi connection. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Since it is less than one week before we usually mail the newsletter and since no one has sent me anything, I suppose I should see what I can come up with to entertain you.

First off, I can tell you that our newsletter and our website did not place in the yearly APCUG newsletter contest or the website contest. Most years we place somewhere in one of those. I suppose our offerings may have become dated and do not fit what is expected of a modern newsletter or website. Have a look, for example, at the winning websites listed below and you will see that they all have a similar look that is quite different from the TPCUG website. Anyway, our site serves its purpose. But I do need to do a bit of updating to some of the information there. Kevan Sheridan has made a few suggestions which I will look into. If anyone else has any ideas, send me a note.

Regarding the newsletter, I think we are one of a very small number of groups that still put out a printed version of the

Minutes of the August Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. The SIG moderator introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees. The discussions about members' questions were lively and interesting.

The presentation this month was given by Judy Woster of the Hillsborough County Sheriff's Office. The topics were Personal Safety and Internet Safety. She emphasized that, for children, no child should have a Facebook social media account, and they should have their computer in an open area in where their activity can be monitored. She described the huge numbers of sexual predators and active pedophiles. She emphasized that hundreds of pedophiles are active in Hillsborough County every day. Children have no defense against these people, and their online activity must be closely monitored.

Judy also mentioned specifically those people who roam neighborhoods in vans and sell steaks; their procedure is to ring the doorbell and immediately try the knob, looking for immediate entry. Your defense is to lock your doors, and if you hear the knob being tried, call 911 immediately. The Sheriff Department's dispatcher number is 813 247-8200, and the dispatcher supervisor number is 813 247-8240.

Judy spent some time addressing purses and billfolds. She recommends trimming billfolds down to the essentials; one credit card, drivers license, cash. Do not carry insurance cards, Medicare and above all never carry your Social Security card. If you trim the billfold down to the minimum, put it in a front pocket, not the back. The backside is just not sensitive enough to detect someone pulling it. Women should do the same. Women should never let a purse out of their grip. Never put it in a shopping cart. Take it to the restroom and carry it over a shoulder. Never put it on a hook, shelf or on the floor. If you can, wear clothing with a pocket to carry the slim billfold, not in the

newsletter that is mailed to each member in addition to posting an Adobe Acrobat version at the website. I think we are almost unique among user groups, too, in that all the content in the newsletter comes from our members. It would certainly make my job easier if I just copied articles from other computer club newsletters. That was what we did for some of our content when I took over as editor many years ago. Perhaps the matter should be revisited, though when members contribute it is always very well-received.

I don't know what the future of the newsletter, the website, or even the TPCUG is since we are all getting older and no one younger seems to be coming along to replace us.

Below are the winners of the APCUG contest. When the online version of our newsletter is published, the links below will be live.

The Internet of Things

I imagine you have read a lot recently about the Internet of Things, where everything is connected to the Internet: Your refrigerator, your A/C, the lights in your house, even you possibly. Of course, a good portion of this is hype. But some of it is already here and, I am sure, more is to come. For the most part, whether you participate is up to you. However, there may be some things that you will not have a say about. For example, your future car may be connected and be reporting on your driving with nothing you can do about it, certainly not if you want to have insurance coverage. I don't think, though, that you will be required to wear some sort of monitor that keeps track of your body temperature, pulse rate, etc and sends it into the cloud. However, I have already seen a fellow termed "the most connected man," I think, who has such a setup in place. Here is the link http://www.businessweek.com/videos/2014-06-04/meet-the-worlds-most-connected-man.

That fellow is a bit more connected than most of us would like to be. Possibly more acceptable is the person who can control the lighting and A/C in his house from his cell phone. I know such a person, and he did it all himself, which would be easier for him than for the average person since he is an electrical engineer by training and a software programmer by occupation. He installed all the sensors and controllers necessary for this to work himself. So he can remotely monitor and change the lighting and A/C in the house. And he also can view remotely most of the rooms of his house, along with the pool, on his cell phone because he has a web camera installed in many rooms.

If he is away, he can set the A/C warmer, then an hour before he returns home, have the A/C begin to cool the part of the house he plans on using first and later have the bedroom area cooled. I don't think he has set up his lawn sprinkler system for remote control yet, but I have seen such setups demonstrated by others. Right now, such things are for the geeky among us, but in 10 years, you may be able to have your refrigerator talk to you regarding the freezer compartment temperature while you are away.

My only contribution to the Internet of Things so far is to be able to view a webcam video of the front and rear of my house via an app I wrote for my Windows Phone. Perhaps I will come up with something additional in the future. ◆

Intel Galileo

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

If you would like to create your own connection to the Internet of Things, then you will need a micro computer board such as the new Intel Galileo, now in Version 2. It is a microcontroller board based on the Intel® Quark SoC X1000 Application Processor, a 32-bit Intel Pentium®-class system on a chip (SoC). Version 1 will cost you $50 and Version 2 will be $75, and they may be purchased from Amazon. The dimensions are: 4.2 x 2.8 inches (not sure of the height). Interesting, but I don't think the average person should be purchasing one since to make them useful, you are going to need to understand some basic electronics and some basic programming.

There are other such boards, the Raspberry Pi and the Netduino. I have worked a little with the Netduino but gave it up for lack of time. The most I got done was to make various LEDs flash when I pushed a button and to make an electric servo turn x number of degrees. All of these boards are available from Amazon.com (don't forget to go through the link at our site) along with all sorts of other electronic items that you will need to actually accomplish anything: LCD, motor, thermoresistor, and temperature sensor are examples of that.

What interests me about the Intel Galileo is that you can actually install a version of Windows on the board and then program it in C++ using Visual Studio. At present you can only do this with Version 1 of the board, but such support will be coming to Version 2. I will wait until the Version 2 board supports this before even considering looking into it. But it has prompted me to do something I have avoided doing for many years: Learn C++ programming. I know Visual Basic and C# but never learned C++. I should be able to learn enough to do the simple programming required for this board. And since I have a subscription to lynda.com and they have several courses in C++, I have already made my start on that. Once I learn a bit of C++ and have written some simple programs using Visual Studio, I will no longer feel inferior as a programmer. The lack of C++ programming ability has always bothered me. Although I cannot think of anything at the moment that I wanted to do but was not able to accomplish in VB or C#, I think there were such things in the past that I just can't recall.

To see a schematic and the accompanying code in C++ for what Intel calls a Smart Fan have a look at https://ms-iot.github.io/content/SmartFan.htm.

When I was working with the Netduino board, I saw a video where a fellow had modified the lock on his apartment door so that in addition to a key he could use his phone to connect via the Internet to the Netduino board in his house that somehow communicated with the lock and with the correct password could have the lock to unlock (or lock) itself. I can't find the video now, but if you just go to YouTube.com and search for Netduino you will produce videos of all sorts of projects people have done with the board. ◆

Some Thoughts on the Internet

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

I don't recall exactly when Al Gore invented the Internet (joke) or exactly when I first got on it. I do know that my first foray was with Prodigy, followed by AOL and then via a dialup on Netcom. As I recall, Prodigy and AOL did not provide what we now think of as the World Wide Web but rather a collection of places under their control that we could visit using their software. But I may be wrong about that; it has been a long time since.

My website, lamartin.com, was started in 1998, as was the club website tpcug.org (see the September 1998 newsletter). I actually created a website for the club a bit earlier that went live in July of 1996 as a sub-site of member John Meroth's business site. The address then was http://www.tbos2cla.com/tpcug. However, John had an untimely death in August of 1997 and member Larry Anders then offered us a sub-location at a site he owned. The URL for that was http://www.canx.com/tpcug, where we stayed until we got our own domain name as mentioned above. The point of all that is to indicate that I have been creating web content for the past 18 years and have witnessed a lot of changes.

When I started, there was no Amazon.com or Google and certainly no FaceBook, companies that now dominate the Internet. I think the first time I entered Amazon.com in the newsletter's Interesting World Wide Web Locations page, as our Links page was then termed, it was as a sub-site of some other site, but I can't verify that and find no information on the Internet to back that up. So most probably I am thinking of some other well-known site. I first entered Google on the Links page in July of 1999 describing it as "A different search engine." Google was founded in 1998.

There was actually very little selling back then. The commercialization of the World Wide Web came later. Newspapers were all free when they created their sites. And if a paper tried to charge, very few people were willing to pay and the paper soon rescinded the pay model. The only paper back then that made it stick was the Wall Street Journal. It was all so new and so exciting. So many new sites popping up. Now, I am a bit jaded with it all. Perhaps you are too.

I now visit very few sites on a daily basis: *The New York Times*, *The Wall Street Journal* and *Bloomberg*. I follow links I receive in emails to sites that have computer news and visit Microsoft for updates to my programming software that are not fed automatically to me as are Windows updates. Usually if I end up at a new site or viewing a YouTube video, it is because I followed a link in an article in one of my news sites. Or it is the result of a Bing or Google search for something.

There is so much useful information out there – some of it accurate. In the beginning of the World Wide Web, there was no online encyclopedia as we have with Wikipedia now. If you wanted an encyclopedia you purchased a CD. Well, that may not be exactly true, since I think Prodigy had what they claimed was an encyclopedia. However, I suspect that it provided a very limited bit of information. In 1992 Microsoft had something called Bookshelf for Word which was a 16-book encyclopedia costing several hundred dollars. In the July 1994 newsletter, Larry Anders wrote a review of the *Grollier Multimedia Encyclopedia* that sold for under $100 and which he described as by far the best of all the CD based encyclopaedias that he owned, and he owned four. I think I purchased this encyclopedia based on his recommendation. About the same time Microsoft came out with a similar product called *Encarta*. And that is what killed the printed encyclopedia business of which *Encyclopedia Britannica* was the king. They tried an expensive CD version but were too late to the game. CD Encyclopedias are not on the Internet, and when Wikipeida came along, the CD encyclopedia business also disappeared. The first mention of Wikipedia in our newsletter was in the Links page of the April 2005 newsletter. It was founded in 2001, so there should be an earlier reference in the newsletter, but I didn't see one. CD based encyclopedias replaced printed book versions and Wikipedia replaced the CD versions. I cannot imagine what will replace Wikipedia. Perhaps the Wikipeida app for Win 8 could be considered a replace-

Thoughts.....Continued on page 7

Thoughts.....Continued from page 6

ment for the method of accessing Wikipedia using a browser.

Forget Wikipedia, though. When most people want to know anything, even the web URL of a business, they simply type it in to Google. Want to know about high blood pressure, water filters or laserjet printers, type that into Google and you will find an answer. But you will get more than an answer. For when you go anywhere else on the web in your browser, for example the New York Times site, you will most likely see an ad on the right side of the screen for whatever you recently searched for in Google. So don't search in Google for anything that might embarrass you if someone else using your computer saw an ad for it at another site.

The club receives $30 - $70 each month from the Amazon link on our home page. And I personally make several purchases each month from the link, but my purchases are not credited to the TPCUG since I am the one who set up the account. Almost anything you can think of may be purchased from Amazon. It has sort of turned into America's store and undoubtably has hurt many other businesses. But not everything I want may be gotten from Amazon.com. I recently needed to replace my lawn mower. I wanted a quality one, and Amazon's offerings just did not meet what I wanted. So I went to the Home Depot site and found numerous mowers that were of the quality I wanted and ordered one. It arrived about five days later fully assembled in a large box at my front door with no shipping charge. In the past I would have gone into several different stores in Tampa to see what was available. Another advantage of the online site at Home Depot, as well as Amazon.com, is that you may read numerous reviews about the item of interest written by people who have previously purchased the item (and possibly returned it if they were not satisfied).

For entertainment, the Internet provides us with movies and TV shows on demand. That was certainly not the case in the beginning. There just wasn't enough bandwidth on a dialup modem connection. There are also things such Kindle books that I find particularly valuable. In my house I have two walls and more of bookcases filled with books I have purchased since my early twenties. On my Kindle I now have a collection of ebooks purchased in recent years. If they should want them, my descendants will have easy access to the printed ones in the bookcases. As to the ebooks, I don't know how one can pass them down. They are, however, very convenient to purchase and read, with the price generally being less than a printed book. In fact, I think they could be even cheaper than they are, but Amazon seems to be having trouble convincing the book publishers of that. Of course, this has greatly diminished the quantity of books sold in real bookstores. But it is just the way the Internet affects almost everything it touches.

Lastly, the Internet allows us to express our opinions, share what we are doing and keep in contact with friends and "friends." The latest manifestation, I suppose, is sites such as FaceBook, Twitter, Pinterest and Instagram, where you can basically post your interests to be shared with others who do the same. It sometimes seems that everyone except me and a few like-minded people I know is doing this. Additionally it seems that every criminal or terrorist in the world is also using these service, for when such a person makes the news it is inevitable that they have a FaceBook page or Twitter account where their warped ideas may be viewed.

But enough of the Internet. The question is what comes next? I suppose some would say that mobile is already here and is the next great thing. To me, mobile is simply a different way of accessing the Internet and its World Wide Web instead of using a computer and a browser.

In closing, which I am doing since I have now filled the newsletter, here is what I have done recently:

1. A list of my Windows 8 apps is posted on my website at http://www.lamartin.com/Win8Apps.aspx

2. Using my Nikon D800 DSLR in video mode, I captured a movie of a brown anole showing off in my back yard, http://www.lamartin.com/Videos/The-BrownAnole.mp4, which I edited with Adobe Premier

Minutes.....Continued from page 2

purse, and, better yet, don't carry a purse.

Regarding the credit card, make arrangements with your bank to limit the amount that can be withdrawn to limit how much a thief can withdraw. Never carry a checkbook. Checkbooks are of no real value now. The trick that a thief uses is to pull one check out of the middle of your book where you will never miss it and use the numbers to cash checks against the account. Never shop at night, and under no circumstances go to an ATM at night. Use your car alarm fob to set off your car alarm as you approach. This is to help bring out someone hiding behind and also to verify the alarm is still working.

For alarm systems, test your alarm system by notifying the police dispatcher that it will go off, and set it off.

Allow the alarm company to do their regular procedure and time them to see how long it takes for them to phone your house and to call it in to the dispatcher. Judy addressed some items about gun safety, the procedure to certify the owners competency, and license it. The presentation was well practiced, very informative and never for a moment lacked for subject matter. Our thanks go to Judy Woster and to the Hillsborough Sheriff office for a very valuable presentation. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Another month, another newsletter. Many thanks to Merle Nicholson for his article on how to protect your computer by setting up a non-administrative account as your main account. That way, malware will not be able to install itself.

What's new in computing and technology? The first things that come to mind are the new versions of iPhone. As usual, people lined up for what seemed blocks at Apple stores to purchase the latest version in addition to all that were sold online. Apple claimed 10 million were sold during the first weekend. Apple also released a new version of its mobile operating system. However, apparently everything did not go all that well with the release of the new operating system, with people saying that it trashed their iPads and iPhones, and Apple pulled it very quickly. I think the moral of that story is to not install any update the first day that it is available. Let others be the guinea pigs.

Minutes of the September Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. Bob LaFave, the SIG moderator introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees. This month the SIG subjects were laptop overheating problems and possible solutions, Windows Compatibility Mode, and Merle passed around a mSATA SSD (solid state drive). The discussions about members' questions were lively and interesting.

The presentation this month was given by our own Dave Palmer, who had a well-prepared PowerPoint-based presentation on "How to use Google like an Expert".

The overall subjects were History, Search Engine, Search Basics and Google Beyond Search. Dave discussed Google Toolbar, Search Operations, Google Alerts, Google Images, Sports Scores, Movies, Flight Information, Google Translate, Google Finance, Google Now, Google Maps, Google Earth, Moon and Mars, Google Voice and Google Plus. There is no way to make these minutes describe the breadth of Dave's presentation. It was well organized, well practiced and interesting to the end. Our thanks to Dave for another excellent presentation. ◆

Windows 9 is coming

Create a Standard Account

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

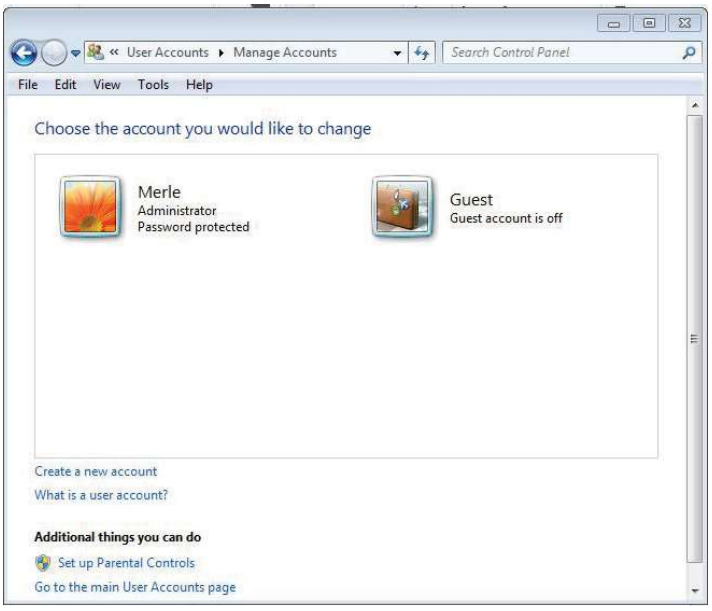
We all need to be using a standard account for our daily use and reserve an administrator account for installing software. This gives us added protection against viruses and especially hijackers. I'll explain how to do this safely.

This setup is an absolute necessity if you have children using the computer, and also unsophisticated adults as well. The first time you pay someone a hundred bucks to get rid of a hijacker because a 6-year-old clicked on something, think back and find this article. Make one new standard account for each user.

First, I'll excerpt from Windows 7 Control Panel, User Account Help for definitions. I begin quoting here.

Standard account
The type of user account that allows users to install software and change system settings that do not affect other users or the security of the computer. This account type is recommended for daily use.

Administrator account
The type of user account that allows complete access to the computer. Administrators can make any desired changes. This account type is not recommended for daily use and should only be used when necessary.



Why use a standard user account instead of an administrator account?
The standard account can help protect your computer by preventing users from making changes that affect everyone who uses the computer, such as deleting files that are required for the computer to work. We recommend creating a standard account for each user.

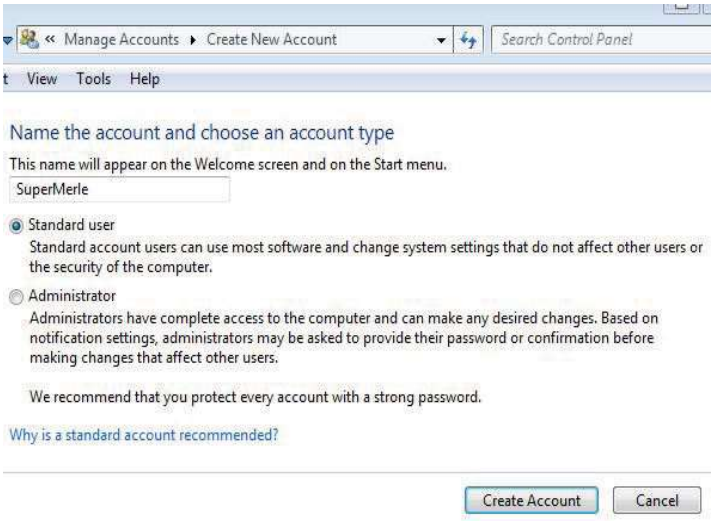
When you are logged on to Windows with a standard account, you can do almost anything that you can do with an administrator account, but if you want to do something that affects other users of the computer, such as installing software or changing security settings, Windows might ask you to provide a password for an administrator account.

That is the end of quoting.

Whoa. Wait a minute. My computer came with two accounts. The Administrator and a disabled Guest account. Since when are they saying I need a standard account? Well, the answer is - That's the way it's always been (maybe since XP and Windows 2000)

I'll predict that all of us use an administrator account all the time. That's because that's the way our computers come to us by default, and we just go with it because there's nothing special to deal with. But if you go looking for it, Microsoft has always recommended using a standard account and then just made it hard to find. In my opinion, setting up two accounts should be a part of the Windows setup procedure.

So we'll begin. We'll assume that you have the usual: Two accounts – Administrator and Guest. Go to Control Panel, User Accounts, and click on Manage Accounts.



In the following, I'll put names specific to my installation in parentheses. Passwords will be (xxxxxxxx). That's at least eight alpha/numeric/upper/lower case. The procedure we'll use is this:

Standard Account.....Continued on page 4

Standard Account.....Continued from page 3

1. Create a new administrator user account. (Super-Merle).
2. And create a password for (SuperMerle) in a separate step.
3. Test the accounts - Restart Windows, select a user.
4. Share (Merle) user document folder to (Super-Merle).
5. Change the old administrator account (Merle) to standard.
6. Change the User Account Control Settings to Default or to Always Notify.
7. Test that we can still do administrative stuff.

As an aside, if you look at the bottom of the next picture, there's a link that says "Why is a standard account recommended?"

I entered (SuperMerle) in the New Account Name. You cannot use any special characters. When you click on "Create Account", you then have to change (Super-Merle) to add a password. Strange, huh?

Click on "Create a Password" [screen capture of this step omitted due to space limitations].

Fill out the password, confirm the password, fill out a hint and click on "Create password" button. And we're mostly done with (SuperMerle).

OK, we are done with creating the new account. Notice (SuperMerle) is now password protected. Just close the panel window. Notice we haven't touched the original account, and we're still in the (Merle) account.

Time to restart. Start, click Restart. When you get to the account sign-in you'll see both users. The first time you select the new administrator account (Super-Merle), after typing the password, you'll have an extra delay because it has to create the new desktop and set up the new account directories. Restart again and this time select the original account (Merle).

Now that we're back in the original (Merle) account, we'll share the user directory with (SuperMerle). This is really not completely necessary, but it saves time later when in the Super Account and you're trying to find files.

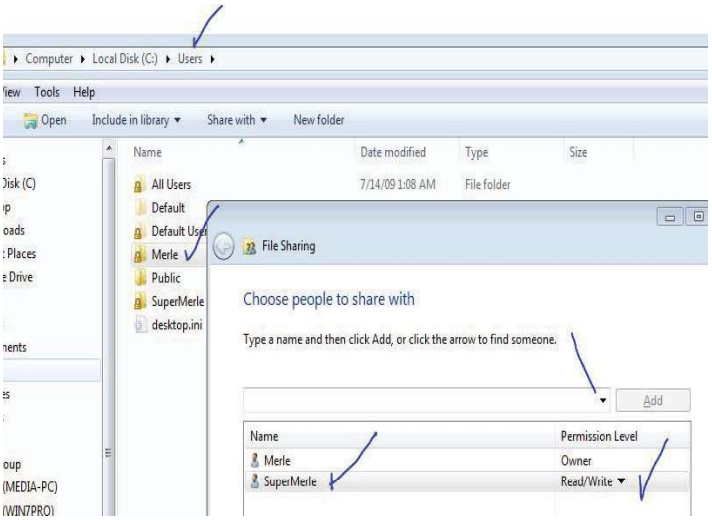
Standard Account.....Continued on page 6

Internet Picture of the Month

iPhone 6 Line in New York

From http://www.pcmag.com/at the slide show at this very long URL: http://www.pcmag.com/slideshow_viewer/0,3253,l=327592&a=327592&po=20,00.asp, we can see part of the 12-block long line along 5th Avenue heading to the Apple Store. Don't they know there is such a thing as online ordering? Perhaps there is the cult of standing in long lines.

TPCUG Yahoo! eGroup Joining the eGroup is simple: Use your preferred email address to send an email join request to TPCUG-subscribe@yahoogroups.com. Include your full name in the text section of this email. You will then receive a verification request that you reply to, then you are up and running. To send email messages to the group, address them to: tpcug@yahoogroups.com. Your message will be broadcast to everyone in the eGroup.



Note: if you join with a Yahoo! email address you get full access to the group site at http://groups.yahoo.com/group/tpcug.

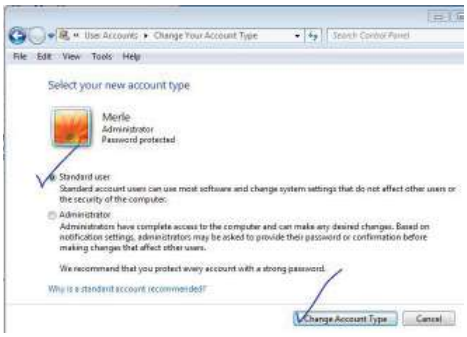
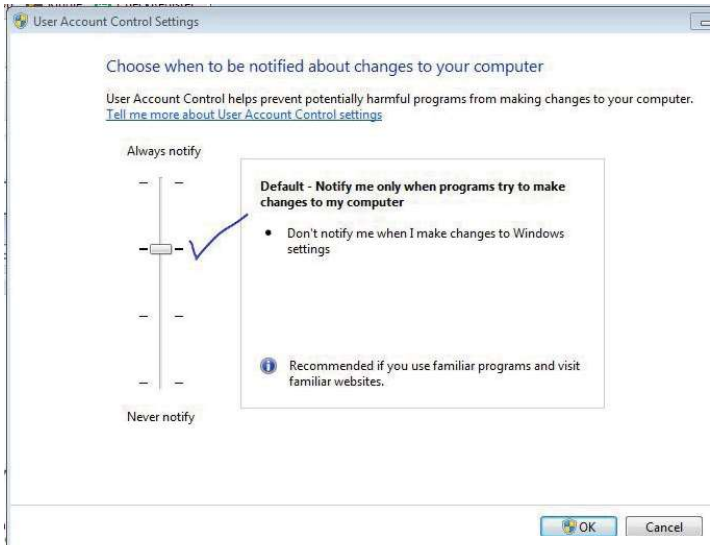
Standard Account.....Continued from page 4

Open Windows Explorer, click on Computer, then open the Users directory, then right-click on (Merle) and select Share With … and then on Specific People .



Click the Arrow to find and select (SuperMerle), and then click on Add button. When the (SuperMerle) user is in the list, change the permission level to Read/Write and then OK.

Just to check, let's log into (SuperMerle) and make sure we're accessing all of (Merle) files. Go to Start, ShutDownArrow, Switch User. Select (SuperMerle) from the Login Screen, enter password and we're at the new (SuperMerle) desktop. Open Windows Explorer from the taskbar, Computer, Drive C, Users directory, open (Merle). As a test, open (Merle)'s desktop directory, right-click and New, Text Document, and create a new document on (Merle), Open and type something, and file. This time you'll notice in the Start, Shutdown menu, there's a Log off. Do that. Then Log back into (Merle); we're going to change



(Merle) to a Standard User.

Control Panel, User Accounts, Select Change your account type. [Image at bottom of previous column]

Notice at left the Standard User is already selected. While we are here, you'll see another item in User Accounts . . . Change User Account Control settings. This is "UAC". Click that and you'll see the image below.

Make sure the slider is set to either Default or to Always Notify. The Always Notify is best, of course, and if you haven't tried it, you should for a while at least. You can always go back to Default later. Some people find it annoying, and it was an original default feature in Vista. Remember we're doing this mainly to keep hijacker software

from installing, and especially to protect your computer from unsuspecting or unsophisticated users. You'll need to reboot to put the new UAC into effect.

Finally, to test, Let's try something. Go to Start, click on Run and type in msconfig and OK. Here's something new. It's asking for the password for the administrator account (SuperMerle). It's working. So if that's the kid in the house, he'll have to ask you to type it in. And if you're the Super, it's a minor inconvenience. Think of that last hundred bucks you spent. ◆

Comments.....Continued from page 1

Then there was the IPO of the giant Chinese e-commerce business named Alibaba. All the excitement around it reminded me of the Internet bubble of 1999, although Alibaba is supposedly quite profitable, as compared to the startups of that bubble What was a bit odd to me is what you are actually buying. Because Chinese law prohibits foreigners from owning assets of a Chinese company, to get around this buying shares in the IPO "will buy you a stake in a Cayman Islands-registered entity which is under contract to receive the profit from Alibaba's lucrative Chinese assets but will not actually own them" (from *MarketWatch*). Well, put down your money and take your chances. I don't do that; possibly it is why I am not rich.

Hacked again My computer has not been hacked, but my personal website, lamartin.com, was hacked back in July, and now all the sites that I have at a particular web hosting company, including the TPCUG site, are suffering from the effects of a hack on the hosting company that hosts them. First, let me explain what happened to my site in July.

On July 7, I noticed that lamartin.com was inaccessible up until the web hosting company reset things. And it had been that way since the 4th, although I did not discover it until the evening of the 7th. I contacted the web hosting company about it. Based on what I found below, it appears that some Chinese site caused the problem.

In using FTP to look at my most recent log file for the site, which was on 7/4/2014, I noted that under cs-uri-query (the query that sent them to the site), around 2:55 AM I begin to see nothing but items such as

http://fashionandnewest.com/www.lamartin.com/fake-michael-kors-clutch-bag-c-1.php&inurl=http://www.discountbagsshopping.com

I would appear that my site was bombarded by hits from http://fashionandnewest.com/ every few seconds from 2:55 AM to around 3:30 AM and then nothing. Perhaps my web hosting company shut my site down; I do not know. Anyway, I got them to reset it and get it up and running again, but the "attacks" just kept coming. I then noted what the originating IP addresses were and blocked access to entire blocks of IP address that included those. Things got better, and only a few such visitors were getting access to the site (although they were still trying).

I then took a close look at what was at my site. I found a folder named file that I did not put there. It contained 1,019 files and was 22 MB in size. All the files were php files. I deleted all of that and reset the site's password. I don't think my password was the problem. I believed then and am now sure that they got to my site through hacking into the web hosting company. So what was the purpose of all of this? They were using my site to direct people to their site. My site's IP address would be one whose IP address would not be blocked as their IP address probably would.

With that fixed, I forgot about things until around September 26, when I needed to send up new version of some files to my site. That is done using FTP. But the FTP process would time out with no connection. I then went to the hosting company's site and logged into my account and found a message that read "We are currently completing a necessary upgrade which required FTP services to be disabled. Please use File Manager instead." Well, for lamartin.com their online File Manager application will not work because the site is too large – almost 9 GB with 718,187 files. So I could not make any changes. I had quite a few discussions with people of varying expertise, and I discovered that it may take over a month before I could again have FTP access. I also discovered the reason for what was termed an upgrade. All of their servers for my type of account had been hacked, and they needed to clean up and transfer to new servers all of the many thousands of such accounts one-by-one.

The only solution to regain FTP access sooner was to change my account to what is termed an OnCloud account. They would migrate all my data and email settings to the new account in several days, and I should be good to go. That has not happened yet, and my fingers are crossed. As for my other sites, which are much smaller, such as the TPCUG site, since I can make changes using the hosting company's File

Comments.....Continued from page 7

Manager application online, I will hold off on converting them to OnCoud. But I may eventually migrate all my sites to the OnCloud type since that is what they really want people to do. The main reason I have held off is that if you do that for email for the site's domain name, you have to use Exchange Server which has one feature I do not like: In the mail server setup, you cannot forward an email received by one person to two additional people. You may only forward to one additional person. That is of no concern to me on my personal site, but it is something I use at the neighborhood site I maintain, http://oldhydeparkfl.org, and it may also be something used for the TPCUG site (but I would have to check on that to make sure).

Anyway, the only constant is change. So I have to bend to the prevailing winds and move to the Cloud.

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Thanks very much to Merle Nicholson for almost everything in the newsletter this month. I will add a few comments to fill in the space that is left. As you will note on this page, I am the speaker this month. A lot of computing news seems to involve the Cloud, so I have decided to demonstrate how I use the Cloud in my computer life.

The Cloud is really nothing more than servers connected to the Internet. The main providers are Amazon, Google and Microsoft. In the most basic sense, our TPCUG site is in the Cloud, as are all websites. But people mean much more now than websites when they speak of the Cloud. We now have Cloud Storage, Cloud Computing and more. I found Cloud Computing of special interest since I can create at Microsoft Azure a Virtual Machine running Windows 8 that already has Microsoft Visual Studio 13 installed. I can then upload any of the programs I have written for Visual Studio to that Virtual Machine and then run

Minutes of the October Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. Bob LaFave, the SIG moderator introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees. This month Bob was absent and Merle Nicholson filled in.

The presentation this month was given by Steven Singer from RDI and http://www.morevalu.com. Steve has given us a quality hardware presentation every year for many years. He has always entertained us and filled us in on the latest in hardware and what the manufacturers are doing. This year he brought in several routers and cable modems and gave us some interesting insights on what the TV and Internet providers in our area are doing. We expect a quality presentation and once again we were not disappointed. Our thanks go to Steven for taking the time for us. ◆

Comments.....Continued from page 1

it. I recently did that with an application I had written that captured images and their descriptions. There were many thousands of images that I wanted to download along with their descriptions. I was running the application on one of my desktop computers. To speed up the process, I began doing the same with my application running at Azure. Using both together cut the time involved in half. Now my job is to go through the large collection of images, selecting the approximate 10% that I want to use in a Windows 8 app. And there is no Cloud item that will help me speed up that.

My main use of Azure is to store photos for use in my Win 8 applications. such as *Old Tampa Photos*, *Old Florida Photos*, *Currier & Ives* and my most recent one, *5 Southern Cities*. If I wanted, I could also create websites there. In addition, I will demonstrate how I use Microsoft OneDrive to backup my files. ◆

Windows 8.1 First Startup

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

We'll attempt to cover all the "first things" you need to do with a new Windows 8.1 computer. We won't necessarily cover all the details; it would take too much space in this newsletter, but hopefully we have sources for you to read. In the following, I'll revert to calling the Desktop interface "desktop", and the tiled interface "tile"

The main thing to keep in mind is that eventually you'll decide if the Windows Desktop is your primary workspace, or the tiled interface is where you do your stuff. Or perhaps you may be comfortable switching back and forth. Having a touchscreen will certainly influence your decision, because the tiled interface is awkward without a touchscreen. Some people get along just fine with tiles and no touchscreen. Others get tired of leaving the keyboard and touching the screen. Realize now, even MS Office 2013 works in desktop only and most important settings are in tile. You'll need to work with it for a while; just give it a chance. Here's why it's important, but not necessarily urgent:

Windows 8.1 has many dual applications: desktop AND tile, and many important functions are available in tile only or in desktop only. Let's take a PDF reader. If you've been using other versions of Windows, you have installed and used Adobe Reader, and for quite a few years its competitors like Foxit Reader. If you open a .pdf file, the "default file association" determines which reader is used, and in the case of 8.1, it's a built-in reader in tile. But here's the thing. The 8.1 reader is just lame. There's no other way to describe it. It's limited and awkward to use. Like all 8.1 apps, it comes up full screen, and the only option is half screen something, and you can't share the screen with a desktop app .. you get the picture. So for PDF files, you have no choice, just install Foxit or Adobe Reader, make it the default, and .. at least for now, you're in desktop. By the way, in Windows 10, you'll be able to run a tile app in a desktop window.

And one of the last items on the "First Startup" list is installation of "Classic Shell" that restores a very fine menu system and has options that pushes the tile interface in the background so it mainly goes away except to annoy you.

Here's the "First Startup" list in pretty much useful order. Check further under References and Resources to see if I have elaborated on the item or referred to an Internet link.

- Check the time zone. Yep, Windows will be reporting the time zone as Pacific, and you're three hours off. This is important.
- "Trust this PC". Look in Actions in the notifications tray. This is important.
- Decide if you would rather log onto your PC with a local account or a Microsoft online account. If you are already set up with an online account, you can switch to a local account. This is important. There is much written about this, and I'll add my two cents below.
- Create standard login accounts for each user of the PC, including one for yourself, and "share" the Documents folder to the administrative account. This is especially important for protecting children and to protect your PC from visitors' good intentions, and from Viruses and Hijackers. This is important.
- Create a Windows rescue disk. On CD if you have one or on a small, cheap USB flashdrive. No excuses; it must be done.
- Create a password recovery on a small, cheap USB flashdrive. No excuses; it must be done.
- Configure Windows Update, then install all MS updates. Do it now and when it says "no updates to install", force a new update again and repeat. The only time you can believe there are no updates is immediately after you force a scan for new updates. It isn't lying, it just isn't telling you the whole truth.
- Remove all crapware; anything that has the word "toolbar", and any online gaming. Disable all unnecessary startup items. Uninstall any trial versions, usually anti-virus and Office.
- Decide on a good anti-virus, firewall and Internet scanner product. Visit PC Magazine recommended products. Right now, McAfee, Webroot, Norton, Panda Free, BitDefender. Install it from the Administrator account. No excuses; it must be done.
- Configure your backup scheme. Buy an external USB drive and do a full backup now that your updates and anti-virus have been installed. No excuses; it must be done.
- Install essential software:

1. Email. The standard Windows email is designed to make you want to purchase Outlook or Microsoft Office. I recommend Mozilla Thunderbird. It's free, well supported, has plenty of add-ons, and is a very mature,

Windows 8.1.....Continued on page 4

Windows 8.1.....Continued from page 3

easy to use full featured product. There are no compromises made because it's free. It's fully compatible and has importers for transferring accounts and mail from your old email.

2. Office. At http://www.LibreOffice.org. Like Thunderbird, it's a mature up-to-date full-featured product. Unless you need, need, need MS Access and/or Outlook there is no reason to buy MS Office. LibreOffice uses the same formats as MS Office, or the other way around; MS adopted Open Document Standards to comply with the inevitable. LibreOffice has Word Processor, Spreadsheet, Database, Presentation Manager, Drawing and Math editor.

3. Browser. This is one of those dual 8.1 apps – different versions for desktop and tile. You seem to get the version in the same environment that you are in. The tile version seems to be limited in some areas of graphics and of course runs first full screen and then can be reduced to a part-screen. I prefer Google Chrome, and then make it the default browser for both situations. Chrome has this wonderful list of apps that run as add-ons, matching the list on Android, Ubuntu and OSX: Calendar, Clock, Drawings, Docs, Sheet, Hangouts, Kindle, Keep, Google+, Remote, Timer, Gmail, Google Drive and more. Another browser alternative is Firefox.

4. PDF Reader – Foxit or Adobe Reader.

5. Instant Messenger, Skype, Google Voice, Google Talk.

6. Printers, camera, webcam, scanners, microphones, speakers.

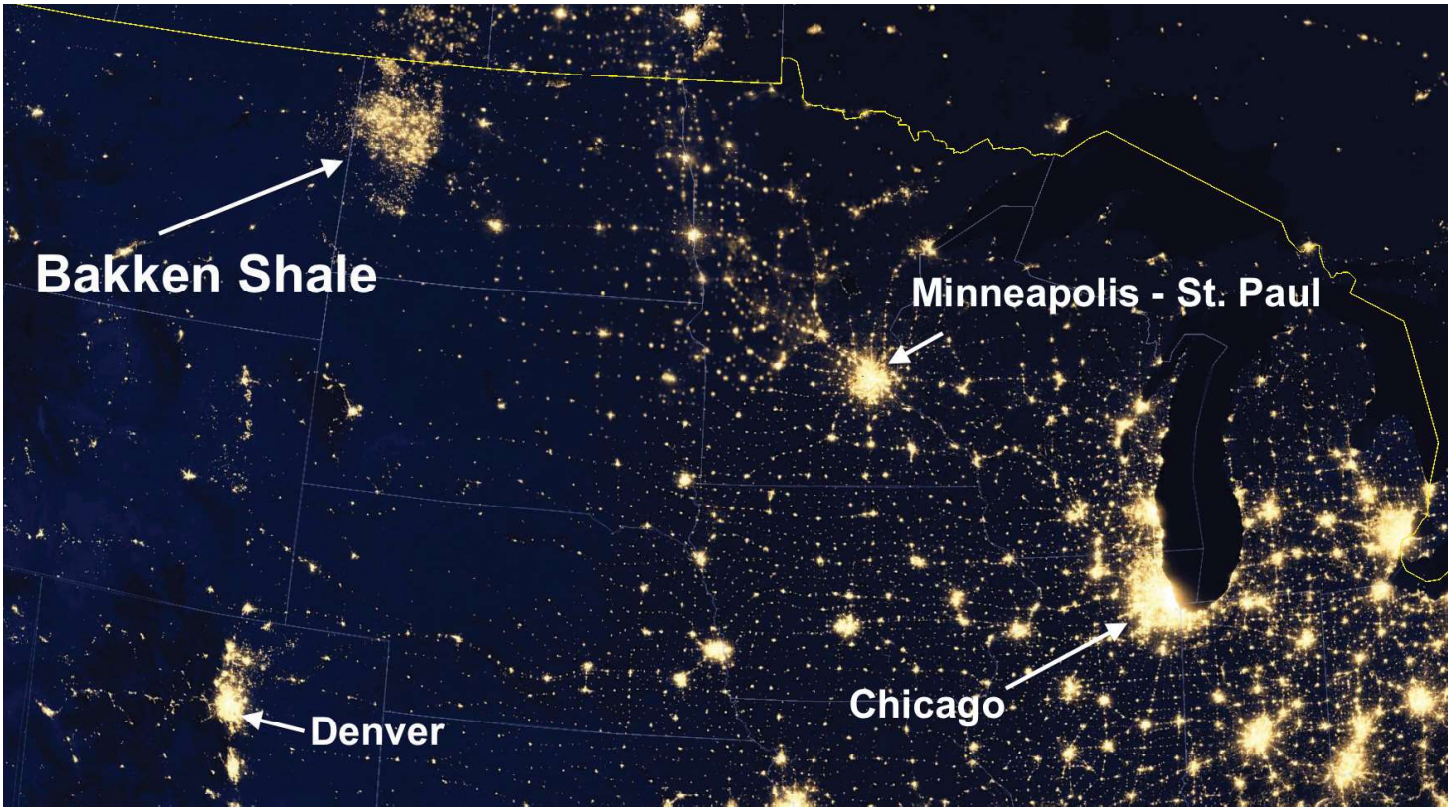
- Classic Shell. This is a sophisticated, well developed application that puts a menu back where it was in Windows 7. It's what you want if you want to push the Windows 8.1 tile world a little further in the background. You can use it to disable many of the mouse actions in desktop that shove you unwillingly into tile. If you do not disable hot corners and charms, there is nothing lost by using this program. There are three styles of menus to pick from. I chose the 2-column menu style, and clicked an option to start when Windows starts, and left the rest as default. This has the minimal impact on the operation of the 8.1 tile features.

  I have been following the development of this from their earliest version, and have complete trust in this. It's free, but please consider a donation.

References and resources:

"**Trust this PC**": http://www.howtogeek.com/121875/htg-explains-why-does-windows-8-want-me-to-trust-this-pc/
Decide on a good antivirus: http://www.pcmag.com/products/1594?Editor+Ratings%3d4.5

Decide if you would rather log onto your PC with a local account or a Microsoft online account. When your PC is first set up, it's apparent that they want you to log onto your PC with a Microsoft online account. Indeed, they don't really make it easy to avoid that. They make it tempting, because they set up a OneDrive "cloud" storage for you, free, and make it clear that this is the way you get Windows 8 Apps from the store, free email and settings synchronizing between your computers if you have more than one. If you are already set up with an online account, you can switch.



Microsoft is just jumping on the bandwagon now that its competitors, Apple and Google, developed this relationship with its customers that guarantees a steady revenue stream* (see note 1 at the end of this article). If you have Apple and iTunes, you already know that you can't get anything, even music without that iTunes account. If you have an Android phone or tablet you'll have a Gmail account and probably a credit card attached to buy apps, books, magazines, music and movies. This relationship with Google is much more open than iTunes, because you can get most anything from other sources, even applications. Amazon is a good Android resource for apps, movies and music.

What Microsoft is not telling you is that it's only barely more trouble to use a local account. Obviously, if you want to buy a $4.00 app from the Microsoft Store, you just order it and authenticate the purchase with your Microsoft account. In my opinion, my relationship with Google and with Microsoft are very much different. I carry my phone in my pocket, and being an adult, never carelessly expose it to theft. The phone has very limited monetary exposure, and I can track it and disable it if stolen – if it's on. My computer(s) are very much different. They are exposed to the Internet (and open in my home and vehicles), malware and hijackers, keyloggers and children inclined to click on things. http://www.howtogeek.com/121975/htg-explains-microsoft-accounts-vs.-local-accounts-in-windows-8/

merle@merlenicholson.com

Catastrophe planning – Here's your checklist

- Have you made your Windows Recovery disk?
- Do you have a password recovery USB?
- Are you doing backups to an external drive?
- Do you use a good quality anti-virus and keep it up to date?
- Is your computer up to date? Is your computer updating automatically, or do you initiate it manually and forget?
- If you have children or unsophisticated users on your computer, have you made a separate standard login account for them?
- Are you still using Windows XP connected to the Internet? You could be in trouble and your computer is in jeopardy. Worse, you may be in a position to lose all your family pictures and documents. They may not be recoverable. Scary, right?
- How old is your hard drive? Is it more than three years old? You're at risk of losing everything unless it's backed up to an external drive.

Windows XP – if you insist on continuing with Windows XP, you must have a very good anti-virus and Firewall. The Windows firewall for XP is very weak. Windows Defender and Microsoft Essentials anti-virus will no longer update, so you must buy a good quality product. Look at WebRoot, Kaspersky, Norton. Check with PC Magazine to see their ratings on both paid and free products.

Linux Desktop – For my day-to-day computer, I have switched away from Windows and adopted a Linux OS for my notebook. I added a second hard drive, so one drive is dedicated to Windows 7, and it default boots to the other – Linux. To me, the Ubuntu family of OSs makes sense because Ubuntu (through the company Canonical) continuously updates to keep up with the latest hardware. And so far I have not had to go looking for drivers except for one of my two printers. The "flavor" of Ubuntu 14.04 LTS I've chosen is Gnome Desktop. There are five or more flavors available. I'd recommend, in order, Ubuntu/Unity (the one supplied by Ubuntu), Gnome or KDE. Pick the latest LTS version, 14.04. There is a new version 14.10 (October), but the LTS is like it says – Long Term Support(ed). Start at http://www.ubuntu.org.

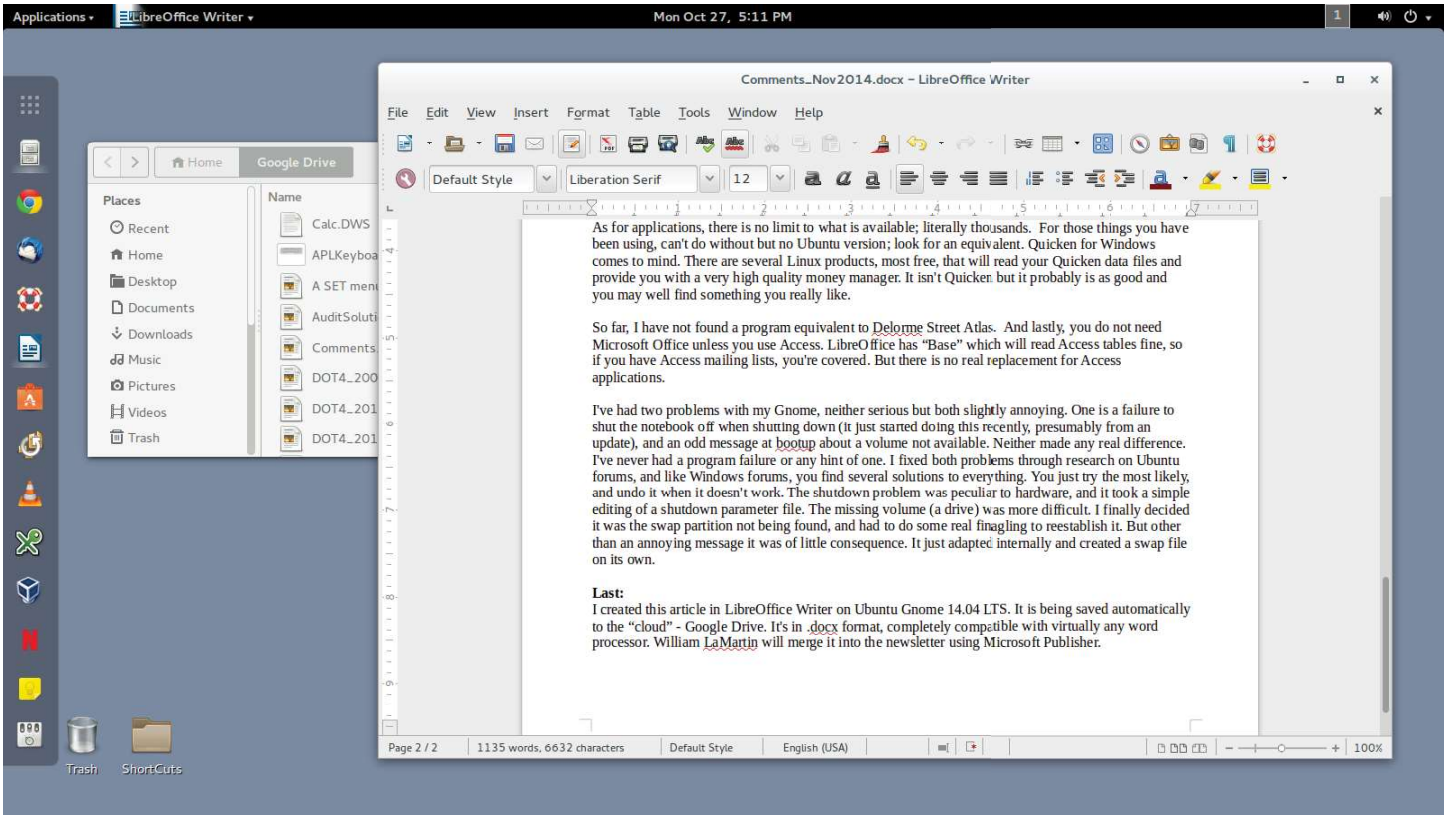
For those of you who have a Windows XP computer that is otherwise running well, this is an easy and inexpensive replacement. It needs very little computer capacity and memory to run. It installs easily and quickly. The instructions to create a boot USB flashdrive or CD/DVD are well-written and easy to follow and assume you are making it from a Windows computer. If you wish, you can boot and run the OS from the flashdrive itself (slower) or DVD (v.slower) without installing it to the hard drive. Then if you like what you see and haven't any serious hardware problems, go ahead and install. You have the option of keeping your Windows and dual-booting to your old Windows OS or Ubuntu, or completely replacing everything on the hard drive.

I have not spent a penny other than the hard drive cost. I installed some excellent quality free software. All of the following have a Windows equivalent version:
Chrome Browser - with apps Hangout and Keep and everything Google; Docs, Drive, contacts, Gmail.
Mozilla Thunderbird – Email. I choose this because it runs in Windows as well, and is excellent quality
VLC – Music/Media player. WUSF and WSMR PBS radio anywhere!

Comments And Notes.....Continued on page 7

Comments and Notes .....*Continued from page 7*

LibreOffice – Word Processing, Spreadsheet and presentation manager, Database, Draw, Math all compatible with MS Windows formats. This was pre-installed on my Gnome version.
KeepPassX – Password manager compatible with all my devices; Phone, Tablet, Windows and Google Drive.
Oracle VirtualBox – Virtual Machine manager, completely interchangeable with the Windows version.



There is a program called WINE, which can make some Windows programs run natively in Ubuntu. I used it to install my 1996 version of Microsoft Return of Arcade. So I still have my old 16-bit PacMan. I have used it for others, like my copy of Windows KEDIT, probably the best text file editor ever made. The results are varying; you should go into this with low expectations, but be persistent and be prepared for pleasant surprises.

In Gnome, you can set up your online accounts for integration to the desktop. I have only one, Google. After setting it up, it automatically integrates my Google calendar to the built-in calendar, IM program and Google Keep. Not having a Facebook or Twitter account, I can't comment on those. There is an app called Grive that will automatically synchronize a folder with your Google Drive. It's unofficial, but it works well. Google does this in Windows, OSX and Android but has not yet done an official Ubuntu synchronization app.

As for applications, there is no limit to what is available; literally thousands. For those things you have been using, can't do without but no Ubuntu version; look for an equivalent. Quicken for Windows comes to mind. There are several Linux products, most free, that will read your Quicken data files and provide you with a very high quality money manager. It isn't Quicken but it probably is as good and you may well find something you really like.

So far, I have not found a program equivalent to Delorme Street Atlas. And lastly, you do not need Microsoft Office unless you use Access. LibreOffice has "Base" which will read Access tables fine, so if you have Access mailing lists, you're covered. But there is

no real replacement for Access applications.

I've had two problems with my Gnome, neither serious, but both slightly annoying. One is a failure to shut the notebook off when shutting down (it just started doing this recently, presumably from an update), and an odd message at bootup about a volume not available. Neither made any real difference. I've never had a program failure or any hint of one. I fixed both problems through research on Ubuntu forums, and like Windows forums, you find several solutions to everything. You just try the most likely and undo it when it doesn't work. The shutdown problem was peculiar to hardware, and it took a simple editing of a shutdown parameter file. The missing volume (a drive) was more difficult. I finally decided it was the swap partition not being found and had to do some real finagling to reestablish it. But other than an annoying message it was of little consequence. It just adapted internally and created a swap file on its own.

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

I had a very rough day this past week. Shortly after booting my Windows 7 desktop computer and checking my email, I was reading an article in the New York Times about a Russian programmer when a small window popped up with a message to the effect that something bad had happened and, here I don't recall exactly, that Internet Explorer or the computer needed to be restarted. I tried to use the Snipping tool to capture the message, but it wouldn't work. I then immediately stopped Internet Explorer from Task Manager. I next tried to open Windows Defender, where I was informed that it was not set as the default for whatever it does and hence was not running. There was a place to click to make it the default for protection, but a click on that started OK and then just disappeared. I could not run Windows Defender.

Sensing that I had a serious problem, I immediately uploaded the important files I had been working on, including this newsletter, to OneDrive. I then shut down the computer and restarted only to find that I now had no network connection and no ability to

Minutes of the November Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. Bob LaFave, the SIG moderator, introduces new or little-known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees. This month the SIG subject was a member's system backup problem. The discussion created some lively comments and further questions from the group.

The presentation this month was given by our own William LaMartin, who had a well-prepared presentation on "Computing in the Cloud". The presentation was done completely on a Microsoft Surface Pro 2 with the detachable keyboard. He began by showing Live.com; Contacts, Calendar, Office Online (cloud versions of Word and Excel) and OneDrive.

He showed examples of the online versions of Word and Excel at OneDrive (formerly named SkyDrive). He then compared these online versions to Office 365, a subscription version ($100/yr) of Office. The Office 365 product is a full-featured copy of Office installed on your computer (actually up to five computers). It includes Publisher, Access and OneNote, as well as Word, Excel and PowerPoint.

William continued with Azure, a Microsoft Cloud service that provides: Storage, virtual machines, SQL databases and Cloud Services (worker computers). As a subscriber, you are able to connect from any of your computers from anywhere on the Internet. William used a Remote Desktop connection to connect to a Virtual Machine running Azure from his Surface. Then he even did the same thing from his Windows Phone.

Our thanks to William for another quality presentation.

Securifi Almond

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

My wife had been complaining about the wireless connection in our downstairs back room where she spends much of her time. To get a good connection on her iPad she often would have to move closer to the Verizon Fios router, which is in my computer room at the opposite end of the house. At one time I had used an old router as an extender, but that did not improve things much. So, with her birthday imminent, I went to Amazon (through the link on our home page), did a bit of searching for "wireless extender" and produced the Securifi Almond, a strangely named and somewhat expensive device that can function as either a router or just an extender.

Since I could have purchased a wireless extender for around $20, why did I spend $90 on this device? There were several reasons, the first being that my brother-in-law had just purchased a cheap wireless extender that he could never get set up to extend anything. Second, I had similarly purchased a cheap wireless extender many years back which worked but didn't really do much extending. Third, this device had a touch screen and received many rave reviews. And last but not the least, a $90 gift seemed better than a $20 gift.

There is a manual as a PDF file that you may view or download at http://firmware.securifi.com/AL1/AlmondQuickGuide.pdf, which will tell you all you need to know about the device. It has nice pictures that explain everything about the setup as either a router or an extender.

It is quite easy to set up, and I had it up and running in no time. I placed it about 33 feet further toward the interior of my downstairs from where my router is. It obviously requires an electrical connection. I followed the on-screen menu to set up everything. You are asked to select a language (English), then the region (North America) and next whether you want to use the device as a router or a range extender (I chose extender). It then searched for nearby wireless routers, giving me a list from which I chose my Verizon FIOS router. The only real work came next when I was asked to enter the very long password to connect to the router. This was made easy, though, by the virtual keyboard that pops up on the Almond's screen. If you find the letters on the keyboard a bit too small for comfort, a small stylus is also provided.

I did have one small problem when I was attempting to look at all the different screens that provide various sorts of information about the connection and the device. On the main screen there are five small square boxes near the top, and only the first box was always checked on the main screen. To me this meant that I had a connection with very poor wireless strength. So I phoned the support line, which was answered quite quickly by a fellow who not only resolved my question but also wanted to have me run through several things just to make sure I had the device set up properly. Oh, the answer to my question was that the small squares did not indicate signal strength but rather the screen you were on.

How does work? It seems to do quite well. Now there is a strong wireless signal in all parts of the house, downstairs and upstairs. http://www.securifi.com/ ◆

32 Gigabytes Is Not Enough

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

There are now a lot of new Windows 8.1 tables out there at prices as low as $99. But buyer beware, they may work fine for your web browsing and even email, but should you ever need to do a Restore to the tablet and it is a tablet with only 32 GB of drive space instead of 64 GB, then you most likely will experience the problem that I relate below of not being to do a simple Restore (with files and apps you have added retained) but instead having to return the tablet to its original state

My tablet is a Dell Venue Pro 8 with a 32 GB hard drive and 2 GB of RAM which currently costs around $200. Another warning: those $99 tablets have only 1 GB of RAM.

The first indication of a problem was that when I tried to do a Windows Update on the tablet it would never finish looking for updates; just a busy indicator forever. I finally figured out that this was probably caused by so little free space remaining on the hard drive, a little over 3 GB. I hadn't used the device in several weeks, when I had no trouble in doing an update. What had changed?

What had changed was that now the OneDrive folder on the device was taking up 3.5 GB. And the shocking thing about that was that there was no data or photos in that 3.5 GB. All that was there were the names of my folders and files that were at OneDrive at Live.com. How did this happen? Well, it is all Microsoft's fault. They gave me unlimited storage at OneDrive. I can put as much data and images there as I desire. So I had gotten to work in earnest copying everything I have there so that I would have a backup in case of a disaster. I back up all my computers to external drives using Acronis, but what if my home burned, then those external drives would also be gone. So everything was headed to OneDrive, which would take a long time to finish since you have to create a folder at OneDrive before you can upload something to it. It is not as simple as right-clicking on MyPictures and saying copy and then paste into OneDrive at Live.Com. It would be that simple if I did that to the OneDrive folder on my computer.

But I don't want everything I have on my computer to also be its OneDrive folder. To make a long story short, I had already placed 167 GB of files at OneDrive online made up of 1,075 folders and 82,163 files. It was simply the cataloging of all of that and not its content that created the 3.5 GB folder on my tablet. The solution to my problem was to purchase a micro SD card for the tablet (make sure your tablet has a slot for one) and move the tablet's OneDrive folder there. I did that.

I purchased a 64 GB Micro SD card, and I moved all the OneDrive files to the Micro SD card (3.5 GB), but that did not solve my problem with being able to do a Windows Update on the device. I then uninstalled all my installed apps, and that didn't help either. I only had less than 20 MB of other files, but I got rid of those also. That gave me 7.2 GB free according to File Manager (what was taking up the difference between the 20 GB supposedly available of the 32 GB drive and the 7.2 GB free since I had uninstalled everything I could possibly uninstall?). Still I could not do a Windows Update.

I then tried a Restore of the device. However I received the message that there was not enough free disk space and 2.71 GB more was needed. Now after I did all the uninstalling and moving of OneDrive, there was 7.2 GB free of the 20 or so gigabytes available. Hard to believe that it needs 9.791 GB to do the Restore. That is almost half the 20 GB on the drive that is usable. So there was nothing left do to but to return the device to its original state.

I did the total Restore by taking it back to its original state, and once everything was set up I made sure that I moved the location of OneDrive (called SkyDrive at the moment before any updates) to the Micro SD card location so that wouldn't cause a problem again. I was then able to initiate a Windows Update. It also took over 20 minutes to check on available updates. Once I started the Update process, there were numerous downloads, restarts and surprisingly some roll-

32 Gigabytes.....Continued on page 5

32 Gigabytes.....Continued from page 4

backs with the message that not all updates could be installed. But finally after many, many hours, 101 updates were done.

And the little device seems to be functioning fine. From all of this my conclusion is that 32 GB is not a large enough drive for such a device if you want to do a Restore instead of wiping the drive clean and starting over, at least that was my situation.

Some people recommend removing the Restore partition and that will free up six gigabytes. Don't do that because then you can not do a full restore as I had to do because you cannot connect a thumb drive containing the Restore and have power at the same time. ◆

4K TV with Media Center

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

As a last ditch subject for the newsletter, we can always fall back on "what technology stuff did I buy this month?" So for me, it was all started with a new TV. But this isn't all about TV, it's about the computer connected to it.

Much is made of "Smart TVs" now. A new "Smart TV" has programs built in so that with an Internet connection you can connect to various streaming and internet sources. The newest ones will have Skype (yes, a built-in camera), Netflix, Hulu, a browser (mine is Opera), several social Internet services.

By personal preference, I don't use any of the smart features, and I have never used the TV tuner. That's because, since 2006, I've used a smart computer instead. I use the TV as a monitor for the computer, which has a TV tuner card and runs Windows Media Center software. Like any window, I can minimize or restore the size and use the Windows 7 desktop and anything else a Windows 7 computer can do. So there is no limit to the available entertainment and social media sources. But it's on a big screen TV that I want to watch it. Until now, I used a 2006 42" TV at a resolution of 1920x1080p at 60Hz. That's a ratio of 16:9.

1920x1080 has -unfortunately- become the standard for computer screens, and in sizes of 14- or 15-inch screens has an acceptable pixel density for a pleasant reading experience. In sizes larger than that, like the very popular 21- and 23-inch desktop monitors, the pixels are just too far apart for close-in desktop computing. The 1080 standard has accomplished one great thing though; monitors have become inexpensive at 1080 because the same technology is applied to TV devices. There was years-long debate over the latest TV standard when it became obvious that we had to adopt a new standard to replace the old 4:3 TV. There were many people involved that rightly claimed that the new TV standard was wide-reaching into other industries – especially computers.

There's one thing to be taken from this: The resolution (pixel density) should be increased as the screen gets larger. That was the case for my old 42" sammi. While playing movies and TV were acceptable, the desktop was very difficult to work with. It didn't detract from the entertainment experience, but researching and setting up – for instance Amazon Watchlist, mostly reading text, or a quick research into Imdb.com or Wikipedia – was difficult.

Now enter the new 4K TV "standard." It's double the dimension in pixels – 3840x2160. That's four times the total number of pixels. With the approach of Christmas 2014, the prices are getting reasonable, somewhat less than the 2006 cost of the old 42. And with a new home established for the old TV, we jumped on it. But that's not the real story. The story is: will the old equipment handle the new monitor? (I'm referring to the new TV as a 3840x2160 monitor now). The answer is obvious – not by a long shot. Starting with the video card. And guess what. There is very little support for that resolution.

I use NewEgg.com as a research tool because of the thoughtful selection criteria; looking for 4K support, I found the Nvidia 700 series card. I settled on the 750, partly on cost (it was getting expensive – more later) and it met the resolution criteria. There are more models: 760, 770, 780 ranging in price for my 750 at $150, to nearly $600. In comparing specs, the larger, higher priced have more cores (processors) and memory. They also have much higher power and cooling requirements, with fan noise a consideration. All these have at least two fans, some have three. And the higher models have power requirements that exceed the capability of my power supply.

The one I picked was probably too low-end. I didn't know it when I ordered, but at max resolution the output frequency is but 30Hz, not the standard of 60Hz and a long way from the 120Hz that the monitor is capable of. What scared me downwards in selection was the power requirements. I am considering buying a higher-end one, but I'm taking my time and have quite a bit of research to do. For one thing, the

TV.....Continued on page 7

TV .....*Continued from page 6*

higher end ones are "overclocked" - that is, the GPU is running at a higher clock rate than the original design calls for, and the cooling and power requirements are higher as a result. I think I should be looking for one that has the larger number of cores – 640 to 2880 ($575) cores running at 1176MHz to 7000MHz is typical, but clocked normally. I can replace the power supply, but at some cost – say $80-$100. I'm not in a hurry though, because the display I have now is truly outstanding regardless of the technical shortcomings.

Earlier I mentioned it was getting expensive. I knew going in that I had to replace the systems receiver. The receiver – better known perhaps as a "Stereo". It's the sound system, and after spending the money for a new monitor, it makes no sense to use the crappy TV speakers. The receiver handles all the sound – the output from the computer – 5.1 speakers, and is also an AM/FM radio. But here's the problem.

The output of the TV is one HDMI cable. It has both the digital video, and also the digital sound. This is no different than if you were just using a Verizon or Brighthouse Set-top box. If you want better sound than those TV speakers, you have to route the HDMI to a receiver which intercepts the sound and handles your six speakers and then passes the signals through to the monitor. You then disable the TV sound in the TV setup.

So will your 2006 receiver handle 4K? Certainly not. Need a new one. So now we have a project. Replace the video card, get that set up and running, replace the receiver – no small thing – it has 12 speaker wires – inside a cabinet, and several more cables, a manual to look and about a hundred possible on-screen settings. Then finally replace the monitor and send the old one to a new home.

The results are just spectacular. I was concerned that the low technical specs on the video card would be a limitation, but I think it's just technical. That means that I can take my time toward improving that and only me (and you) know about that. I also was worried that the quality of TV and streaming services would be a limitation; that is, the new higher screen resolution would be wasted, and that's completely, totally unfounded. Even on live TV broadcasting the detail is just outstanding. The real improvement is using it as a monitor – going to the desktop. All text is clear; using the mouse and typing and reading the browser are easy now; remember it's a Windows 7 computer so backups and updates are no different from any other. And -wow – what a screen. It will just bowl you over.

REMINDER: Remember to use the Amazon link on the TPCUG website for your Amazon purchases. My TV purchase got TPCUG a $100 commission! ◆

Comments.....Continued from page 1

use System Restore, in addition to no Windows Defender.

Time to call Merle. He suggested that I download several virus scanners: Microsoft Security Scanner, a Vipre product and a couple of others. I ran Security Scanner, and it found no problems. I then ran Vipre all night, and it produced quote a few things that it cleaned. But much of what it found did not seem legitimate to me since it involved programs I had written in Visual Studio 2005. Anyway, after running Vipre I still had no network connection, could not use System Restore and Windows just looked funny.

The next morning I totally crashed the computer by using System Configuration to change from a Selective Startup to a Normal Startup, which seem like a good thing to do since I was having problems. When I then rebooted I had nothing but a screen telling me that Windows failed to start and that I should insert a Windows installation disc, restart the computer and then choose the option to repair. I did that. It then said that Windows had found problems with the computer's startup options and asked me to choose to repair and restart. I did that and then like a miracle I had my Windows 7 computer back.

My Windows 7 computer was not the only thing causing problems that day. I had started up my Surface Pro 2 and it had no wireless network connection. I

tried all sorts of things to get one and then decided to turn the modem/router off and back on, since that usually fixed such problems.

But that introduced another problem. The modem would not turn back on. A lot of checking finally determined that the AC adapter had gone bad and was not producing any power. Verizon said they would send me a new modem/router in two days (it actually arrived in one), but I couldn't wait that long with no Internet. So I scrounged around and found an AC adapter with the same size plug and about the same output in amps. That got me back on the Internet, but the Surface still had no connection.

I then went into Device Manager and saw that the wireless adapter for the Surface had a yellow tag. I checked and found the error message, searched the Internet for that and produced a page at Microsoft with a Fixit button on the page. I clicked on the button, and much to my astonishment that got me back the ability to do a wireless connection on the Surface How do these things happen? What else can go wrong? Well, something, for sure. My wife told me the washing machine was on but it was not doing anything. I told her to be patient, then she tried to get some water in the kitchen and there was no water. A check outside produced a city employee replacing our water meter without having warned us. Now if we had had the Internet of Things, our washing machine would have told us what was wrong. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Much thanks to Merle Nicholson for providing a long article with several screen captures. I really needed help in getting the newsletter filled.

Last month I laid out all the problems I had on my Windows 7 computer caused by some sort of malware that, as best I could tell, I received while viewing a page at the New York Times on-line. You can never be totally sure about such things, but while viewing that page was the time I received the message about bad things happening on my computer. As noted there, within 24 hours I had everything fixed with no sign of any damage. I also mentioned that while coping with my computer problems, our washing machine appeared to malfunction; however, the cause was simply the city replacing our water meter without giving us any warning.

More about the washing machine in a moment. But first I want to announce that I will soon have a new version of my Windows

Minutes of the December Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

Our December meeting has been for several years an occasion to socialize without the usual program. Our president, John Witmer, catered a dinner for the club members and guests for an evening's enjoyment. As in the past, John reserved a nice corner at Pepin Distributors for the more than 20 attendees. John obviously works hard to set this up for us and the spread was up to his usual standards. It was a very enjoyable evening.

Our thanks to John for a job well done and to Pepin Distributors for providing the place. ◆

8 app, *Computer Group Newsletters*, that displays all of the TPCUG newsletters going back to 1988 in searchable form updated to include the 2014 newsletters. The new version should be in the Windows Store as a free app by next week. I will also publish an update to the companion Windows Phone app which is titled *Computer Newsletters.*

Now back to my appliance problems since that is about all I have to write about this month because of the many problems, some more serious than the appliance problems, that have kept me from getting any serious computer work done other than the updating of the newsletter apps.

The good luck with the washing machine did not hold since a few days later it began to malfunction and we had a repairman out who said that it needed a new water valve, which he would order. It appeared that our appliances were rebelling since less than a month before the same repairman had replaced water valves in the refrigerator and the dishwasher. The dishwasher malfunction was particularly bad since if I had not

Hard Drive System Using RAID 10

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

This is about the hard drive I put on my home computer, a Windows 7 desktop. It may be too technical for everyone, but please, give it a try .. I'll give some background and definitions for you. Overall, it should be of interest at least to those who are really concerned with backups and performance.

I have written before on the idea of separating your boot drive from the data drive, so that you have two: One small, fast one that will contain the operating system and your programs that you keep a backup system image of, typically not more than 60GB, and the other for all the data, settings, pictures, desktop folders, and documents. I partition this data drive into two drives, one large, one small and relocate all the stuff that doesn't need backups: Swap file, temporary Internet files and TEMP files to the small drive and then put all my data files on the large drive. So in total there are two physical drives and three drive letters. The boot drive is occasionally cloned to a spare or just an image copy that goes on a spare drive or even on a flash drive as a backup. A Windows 7 OS is just 6 – 15GB, and even as the system ages, it should not go over 30 or 40GB. I use SSDs for boot drives now, usually either 60 or 64GB. The data drive needs a backup system, either online or more practically using external portable drives. There's too much risk not having a good reliable backup, yet I talk to people who have no backup and try to help when they have lost valuable pictures and documents.

The computer I'm working with now is a very powerful machine. People are not really aware that $5,000 (or more) computers are available from "boutique" system builders, and even from major manufacturers. My computer – at least in performance – matches those boutique computers easily except in graphics performance. But mine can be easily duplicated for about $2,000 in parts, since I assemble my own.

I really do use the power of the computer for database development, and I've been very happy with it for some years now; it's powerful enough that I don't see replacing it for years to come. I mention cost to illustrate that the cost of installing five hard drives isn't inconsistent with the overall cost of the computer. More on that following.

In order to balance the hard drive performance with the processor power, one hard drive for data will not do the job. It's easy to tell with the performance tools available that even the best hard drive doesn't have the speed – throughput – that keeps up with the rest of the system's CPU and memory. So I bought two very good Western Digital High performance drives and installed them as RAID 0 and used that as my only drive, boot and data. Later I acquired a very fast 128GB SSD. It was time then to split my system up into boot (SSD) and data. So now is the time to explain RAID. We'll start with RAID 0, then RAID 1 and finally RAID 10 (Or alternately RAID 1+0).

Quoting from Wikipedia, RAID is "originally called redundant array of inexpensive disks; now commonly redundant array of independent disks. It is a data storage virtualization technology that combines multiple disk drive components into a logical unit for the purposes of data redundancy or performance improvement."

Physically, the work of operating RAID systems is built into virtually all motherboards. There's a system chip that manages this. It uses the power of the CPU to drive it, but it works independently from the operating system. That allows the operating system to load as if the RAID array were one drive. There are other means to do this; some are built into the operating system (but can't boot), and the ultimate is a RAID add-in card that has the RAID system chip and also a dedicated CPU. This card starts at about $400 and goes up.

In the case of my RAID 0, it combined two identical hard drives and makes it look like one to the operating system. This is also called "Striping" or "Stripe". The RAID 0 scheme divides the workload of reading and writing data into the two. Since the system is capable of operating several hard drives at once, by divid-

RAID.....Continued on page 4

RAID.....Continued from page 3

ing the work up, the throughput is doubled (for two drives). So Windows 7 thinks it has but one really fast drive. Believe me, doubling the throughput is noticeably faster. Here's the downside. If a failure occurs on one of the two, the data on both are lost. Most times that does not happen though. Usually some sectors are lost, and some files, but sometimes the whole drive will fail, and you've lost everything. This isn't entirely different than having one drive, but you have statistically increased the chances of this happening by having two drives. The hard drive space is the sum of both. To summarize, RAID 0 makes the hard drive significantly faster but reduces reliability. So something further is needed. So we look at RAID 1.

RAID 1 is for reliability only. It takes two drives minimum, reads and writes all data to both. RAID 1 is easiest to implement. This is also called "mirroring" or "mirrored". Most operating systems have this built in software, but it's easiest to set up on the motherboard to move the workload off the software. It has the advantage of very high reliability. If a file on one drive is damaged, the data will come from the other undamaged. If one drive fails altogether, you just unplug the failed drive and plug the new one in its place. The RAID system then rebuilds the new automatically in the background. It takes quite a while, but for the most part there's no impact on the system. As in RAID 0, the ideal is for the two drives to be physically identical. They must be at least the same size. Obviously, since the data is mirrored, you lose half the capacity. So a RAID 1 array of two 1TB drives yields 1TB, not 2. There is also a slight, perhaps unnoticeable penalty in performance. The main advantage is reliability. You have an automatic backup running in the background with no effort on your part.

RAID 10 (Or sometimes called RAID 1+0) is a combination of RAID 1 and RAID 0. It is two sets of mirrored drives (RAID 1) that is striped (RAID 0). It takes a minimum of four drives. The advantage is that it provides the reliability of RAID 1 with almost the speed of RAID 0. The total capacity is halved, just as in RAID 1. But it is nearly as fast as RAID 0 – not quite – because of the overhead of mirroring. But the result is that it can withstand the total loss of one drive and continue to use the system. Any one of the drives can be replaced and the RAID utility will rebuild the array. The system can even withstand the failure of two drives as long as it's the right two. If the two are in different RAID 1 groups it will continue with what it's got.

Remember I had a set of drives originally set up as a boot and data in RAID 0. Then I did an inventory and discovered that among my computers I had two more drives with identical manufacturer's part numbers. They are WD1002FAEX in case you want to look at them. They are pretty unique with two processors built in and a 64MB cache. They are about as fast as you can buy for a consumer drive and also have five year warranties. They are somewhat more expensive – and still are – but the newest replacement drive is affordable at $75 each for 1TB. Anyway I had four of them and did some swapping around and reconfigured my system to accept my newest SSD for boot (operating system and program files) and four 1TB drives for data. The ages of the drives start in early 2011, now nearly four years old.

Since I configured the system a few years ago, I have had two in-warranty failures, one very recently (prompting this article). The first indication something is wrong is that it tells you so! When the computer goes through its boot process, there is a program built into the motherboard that checks the availability and then the condition of the RAID array. It reports the status of all four and also the health of the array as a whole. If one drive does not check out, it reports that a member of the array has failed or has problems, and displays the manufacturers part and serial number. The computer boots normally, and in my case there is an Intel utility that can manage all this from Windows. That will reaffirm which drive it is and will also run some integrity utilities and attempt to relocate the data if possible. In this last incident, it reported the problem was not repairable. Guess what? I have a spare! Next I shut the system down and had to identify which drive it was. I had to dismount each one and read the serial number. So this time I got out my handy label maker and put the a serial number label on the end where I could see it. (Proving even old geezers can learn new

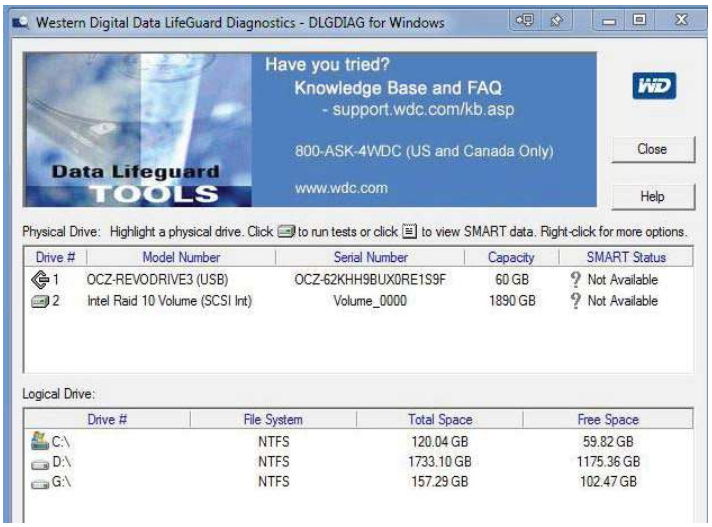
RAID.....Continued from page 4

things.) Back into Windows and the Intel utility, I found that the drivers have already discovered the new drive and was rebuilding. It took three or four hours, but the computer was operable if I chose to keep working.

Now the only thing left is to mount the failed drive in a dock and run the Western Digital (WD) diagnostic, obtain the error number and do an online RMA, pack it up, print the UPS label and run it over to Staples. I had the new replacement in 10 days. The cost to me was the UPS shipping one way. But I have a new drive with a 5 year warranty.

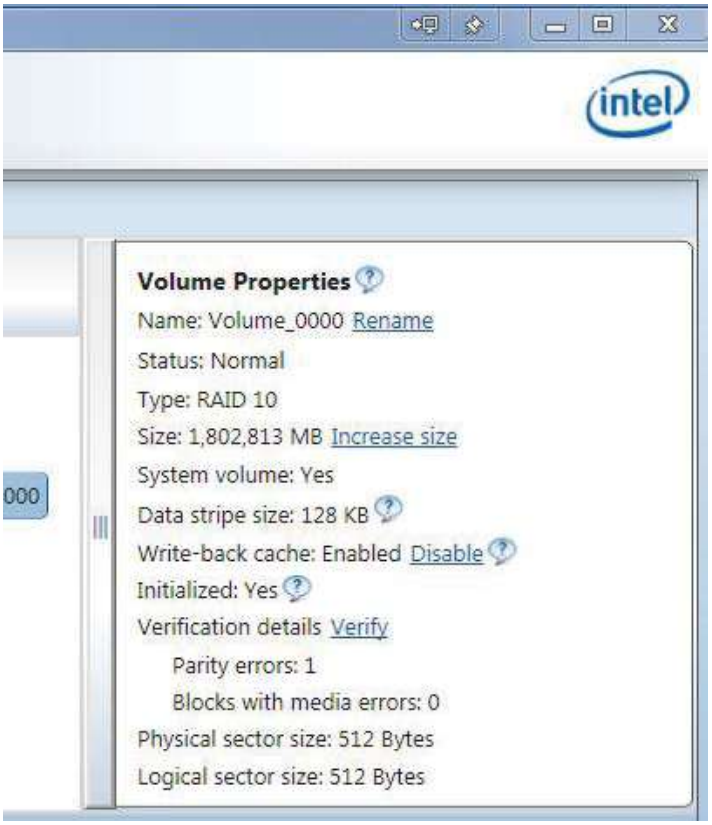


This was my first – and only – implementation of RAID 10, and it has worked out well for me. I have had four years without a single loss of any data. It's a bit more expensive – about $325 for a 2TB array, but remember this also includes a backup drive. That backup drive is alive and copying all files in real time with no intervention at all. Additionally, it is performing at a throughput level unobtainable in anything but an SSD. You can reduce the cost slightly by using four 500GB drives, yielding 1TB, but the cost differential is small.

RAID is used routinely in business systems. No one would consider a server that doesn't have RAID of some kind, and it has been in constant use in millions of computers for many years, so there just isn't anything new or unknown. But it's rarely used in desktop systems, even though on a well designed system there has to be a backup system in place that requires some intervention and attention.

Below are some screen captures of the RAID setup. ◆

Screen shot of the RAID utility initializing during POST. The first item is the full RAID10 array, then the four member disks. Instead of green "Member Disk(0)" you may get red notices like "Fail" or "Rebuild". There is a part number "WDC WD-1002FAEX" and serial number "WD-WCATR5485298" to help you identify the bad drive. Notice you can enter a configuration utility. It's very complete, but difficult to use. Fortunately you can wipe the configuration and start over again.



The Western Digital Data LifeGuard Diagnostics utility. If you have a suspect disk you want to return, run this utility and WD accepts an error code as proof for issuing an RMA. Note there are two physical drives. One is the SSD boot disk, 60G capacity and the RAID 10 1890GB virtualized drive. So you cannot test a single drive from a RAID array without dismounting it from the array. But good thing here – the program runs from the SSD boot drive.

RAID.....Continued on page 7

RAID.....Continued from page 6

Left half of the Intel Rapid Storage Technology application. This originally came from the motherboard manufacturer driver disk, but it's easily downloaded from Intel. Notice the SATA_Array_0000 volume_0000 and its member disks consisting of four SATA disk (932 GB). You usually use this application to initially set up the array and test it – unless it's also a boot drive of course. The alternative is a text-based complete RAID utility whose program is built into the BIOS. You punch the right key(s) at the right time during POST, much like you do for BIOS settings. In this case it's a Ctrl-I (that's an i).

Right half of the Intel Rapid Storage Technology application showing characteristics of the RAID array. Notice you can do several settings, and I also see I have one parity error; a possible bad file, but it's self-correcting.

The end of screen captures and comments.

Comments.....Continued from page 2

caught it before going to bed, when we awoke in the morning we would have awakened to a flooded house since the valve stopped working in the open position. But that was not the end of it. When the repairman came to replace the washing machine's water valve he told my wife that she had a leaking hot water heater and should call a plumber. I was not home at the time, spending a few days in the hospital to get a minor problem corrected. She contacted me, and I called our plumbers, who determined it was just a malfunctioning pressure valve, which they replaced.

And it is not over. A couple of days after writing the above, we noticed that the thermostat control panel for our downstairs A/C was totally blank as if it had no power. A check of the pertinent circuit breakers came back OK. So the problem must be in the air handler which sends power to the control panel. Of course it was the weekend and no repair person could be called. This unit is only two-and-one-half years old.

On Monday, the A/C repairman came out, found a clogged condensation drain line, fixed it and gave us a bill for $179, which I was glad to pay and have the downstairs A/C back running.

And there is more. Feeling neglected, I suppose, the Win 7 computer decided that it needed to complain again. After opening an article in the New Orleans Newspaper, http//www.nola.com, Windows Security Essentials warned me about a dangerous item and directed me to go to my home page instead. I forget the name of the item other than it ended in .pl indicating it was a Perl Script, since when I looked at it in Security Essentials history, I saw that it was quarantined, checked its box and then said remove, thinking that would remove it from the computer, but it appears that it removed also all the listings of things that had been quarantined.

Anyway, this time Security Essentials appeared to have caught the malware as compared to my earlier problem. However, I immediately did a full scan of the computer with Security Essentials. And that evening, I did the same on my Windows 8 computer

Minutes of the February Meeting

By Merle Nicholson, Secretary, Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. Bob LaFave, the SIG moderator introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees. This month in Bob's absence, I was the substitute moderator. The subjects covered were mostly about passwords and the best practices for storing them. Also discussed were the available email clients - particularly Mozilla Thunderbird. The discussion created some lively comments and further questions from the group.

The presentation this month was given by myself, Merle Nicholson, on the subject of Ubuntu Gnome desktop - a variation (officially a "Flavor") of Ubuntu. The demonstration computer is a dual-boot Windows 7 and Ubuntu Gnome, defaulting the boot to Gnome. Navigating around the desktop was demonstrated, as was the menu system, the cataloged download library, updates and utilities.
An overview was given of the installed programs and a discussion of WINE, the method to run many of the Windows programs.

I demonstrated and talked a bit about LibreOffice and the reason to never buy Microsoft again for most people. The latest update of LibreOffice has a slightly new look. It is available for Windows users as well. I also displayed the list of useful apps in Google Chrome, all of which are available in Windows, too.

The level of participation during the demonstration was gratifying as was the later feedback from a few members in attendance. ◆

Comments.....Continued from page 1

Okeechobee produces, discarding the vast majority which actually have nothing to do with Okeechobee City and the happenings there. So far I am up to 1926 and have selected around 667 articles. You may view the results at http://www.lamartin.com/OldNewspapersOkeechobeeInfo.aspx. I will mention the second project at the meeting. ◆

Malvertising

By Dave Palmer, Tampa PC Users Group
dkp205@hotmail.com

Just as 'malware' is short for malicious software, 'malvertising' is short for malicious advertising. Like many services on the Internet, online advertising has become highly automated. And like nearly everywhere else on the Internet, cyber criminals have found ways to corrupt that automation to turn a profit.

Have you noticed that after you do some online research for a specific purchase that you soon see online ads for similar products on different websites? That's a result of websites leaving 'cookies' on your computer. Cookies don't identify you personally but they can identify you as having an interest in a category of products. In addition, the IP address of your computer provides a general geographic location. When you visit other websites, they read your IP address and any cookies left recently. They also provide this information to an ad network which quickly adds interest-based or location-based ads to the websites you visit. Now advertisers and ad networks know your approximate location and the categories of products you're interested in.

How online advertising works
Ad networks consist of publishers, advertisers and the middlemen who connect the two. Publishers are the owners of the websites you visit. They sell advertising space on their websites. Then there's the advertiser, the individual or business that has a product or service they want to advertise. They buy advertising space on websites.

The sites you visit usually do not play a direct role in choosing the ads you see. Instead, a middleman, a third-party advertising company, manages the ad selection and placement for both the publisher and advertiser. This makes the process more efficient for everyone. The process is highly automated – humans are only rarely involved – usually only at the beginning for initial approval. This business model, advertising supported by ad networks, supports a large portion of the Internet, providing the 'free' information and websites we have come to rely on.

Online advertising can come in many forms. Ads can be a single static image without animation, ads can be animated in one of several different ways, or ads can be video-based. There are pop-up ads, pop-under ads, banner ads and a dizzying array of shapes sizes, styles, formats and technologies involved.

As this advertising business model has developed, ad networks have spread across the Internet. Over time the sheer volume of ads has given rise to a massive and tangled conglomeration of ad networks, ad exchanges and other related businesses that buy, sell, trade and swap ads and ad space constantly as the tides of supply and demand shift constantly. Of course, opportunistic cyber criminals weren't far behind. They soon found many ways to abuse the system for profit.

Delivering the payload
Bad guys may scam the system by posing as legitimate advertisers. They may hack into legitimate but dormant accounts. Either way they gain access to the ad networks. They then create legitimate-looking ads to disguise malware to either deliver malware directly from booby-trapped ads, or to redirect viewers to a poisoned website that delivers the malware payload. In most cases neither the publisher (the website displaying the ad) nor the ad network providing the ad knows the ad is booby-trapped.

One major obstacle to detection of malicious ads is that they are not persistent. Once the user leaves a website or closes the browser, all traces of the ad disappear. In addition attackers take great pains to make their ads hard to detect. They may enable their malicious payloads only after their ads have been approved. They may set the malicious ads to only attack every 10th user. They may set up many different domains and redirect victims many times before the victims reach the poisoned website. These and other practices make detection quite difficult.

Once installed on the victim's computer, malware may look for login information for e-mail, social media, and bank accounts, as well as for identity information.

Malvertising.....Continued on page 4

Malvertising.....Continued from page 3

In some cases the malware can lock the user's computer and demand a ransom.

Click fraud

Another way the bad guys corrupt legitimate advertising is to commit 'click fraud.' Click fraud occurs in pay per click (PPC) online advertising when machines or programs imitate a legitimate user and click on an ad to generate a charge per click without having any interest in the ad itself.

Hackers may use the malware installed by ads to commandeer the victim's computer and add it to the hacker's botnet – a network of hijacked computers used for criminal activities. Botnets (bots) are often used for click fraud. Click fraud sometimes begins when unscrupulous publishers or ad networks hire hackers to boost their numbers or to generate income. Computers in the botnet are instructed to visit various websites and click on specific ads.

Here are a few eye-opening stats from an adweek.com article (http://goo.gl/9zrH7X). Up to 50% of publisher activity is from botnets - automated click fraud. Bots account for 11% of display ad views and 23% of video ads. Of the $43.8 billion in ad revenue, fraudulent activity accounts for $6.3 billion. More than half of traffic from 3rd parties claiming to lift publisher's traffic numbers comes from bots. Click fraud is a major problem in that it raises costs for legitimate publishers, advertisers and ad networks. Click fraud can also be used indirectly to attack legitimate competitors and force them to pay higher advertising costs.

What can be done?

Unfortunately there's little agreement on who is responsible for addressing these threats. Both publishers and advertisers need to take action to limit malvertising on their networks. In addition a number of companies now exist to validate that ads are being seen by humans. They include WhiteOps, ComScore, Integral Ad Science, The Media Trust and Double Verify, among others. But since consumers are under a serious and direct threat, we must do what we can to protect ourselves.

How to protect yourself

In some cases the bad guys are hoping they can redirect your browser from your intended website to a poisoned website so they can download malware into your computer. For that scenario to work your browser has to: 1) allow the redirect and 2) contain a vulnerability that allows malware to be installed and 3) operate in administrative mode to allow the installation. I've included some instructions below on how to set up the Big 3 browsers to prevent redirects*. In case you still operate daily in administrative mode, Merle wrote an excellent explanation of how to create a standard user account in the Oct 2014 edition of the TPCUG newsletter.

In some cases the ad is booby-trapped with some executable script, often Flash, Javascript, etc. Your protection is to use script-blocking software – NoScript for Firefox and ScriptSafe or Script Blocker for Chrome. Things are a bit more complicated with Internet Explorer. Don't use Internet Explorer unless absolutely necessary. If you're an IE diehard check out the instructions here: http://goo.gl/YTcQpK. Although script blockers are not terribly convenient, removing malware is way beyond inconvenient.

In the end, the threats from malvertising are really no different than other malware threats across the Internet. So the protection advice is no different either.

To reduce the threat from vulnerabilities, first minimize your 'attack surface,' that is, remove programs you're not using. The next step towards minimizing your vulnerability is to keep everything updated – your operating system, browsers, programs, add-ons, plug-ins, etc. Backup your data and system regularly. Use a password manager and strong passwords.

Preventing redirects*

Chrome

To prevent Chrome from being redirected to another site without your knowledge, click the "Customize and Control Google Chrome" button. The button has three horizontal lines on it. Click "Settings." Click the "Show Advanced Settings" link to display more setting options. In the Privacy section, click "Enable Phishing and Malware Protection." Close the browser

Malvertising.....Continued from page 4

window. Google now displays a warning if the browser is trying to redirect you.

Mozilla Firefox

In Firefox, click the "Open Menu" button, which has three horizontal lines. Click the "Options" button in the panel that opens. Click the "Advanced" button and then the "General" tab. In the Accessibility section, check the "Warn Me When Websites Try to Redirect or Reload the Page" box. Click "OK."

Internet Explorer

Internet Explorer doesn't have a way to expressly stop redirects. Instead, you have to limit the whole Internet. Click the "Tools" button, which looks like a gear. Click "Internet Options." Click the "Security" tab. In the Security Levels for This Zone pane, set the slider to "High." This prevents IE from running ActiveX controls, which is how many browser redirects are carried out. However, this might prevent some safe sites from loading correctly. Click "OK."

These steps work for Google Chrome 40, Internet Explorer 11 and Mozilla Firefox 35. Other versions might use different steps.

*The above instructions were taken from: https://www.ehow.com/how_8744477_do-links-redirecting-different-sites.html ◆

Reminder To Use Our Amazon Link; New Board Members

By John Witmer, President, TPCUG
jwitmer@outlook.com

TPCUG has a link to web shopping giant, Amazon, on our website (http://www.tpcug.org) for which the Group receives a small referral commission for all purchases made through this link. It costs you nothing extra to make your purchases by accessing Amazon through this link. Amazon commissions are a valuable source of income to our Group, as seen in the annual Financial Report for 2014, which is included in this March 2015 newsletter. We received income of $427 in 2014, and $688 in 2013. Without this fee income we would have had a $369 operating loss in 2013, and our small 2014 loss would have grown to be $479. Please remember us when you do your shopping on Amazon. We all benefit by keeping our Group's membership fee low as a result of this needed extra income from Amazon.

Update On Officers And Board Members For 2015

I was pleasantly surprised that my annual plea for other Group members to become involved in the leadership of this Group actually produced results for this new year we just began. I am pleased to report that Dave Palmer and Ed Cohen both volunteered their services to be on the Board of Directors for TPCUG, and to add their input and insight into the discussions and decisions affecting the operations and direction this Group faces in the coming year(s). Thanks to you both for stepping up and lending us your help. As most of you know, Dave has also done several great presentations to our Group in the past, including the January presentation on Passwords. ◆

Commentary On 2014 Financial Report

By John Witmer, President, TPCUG
jwitmer@outlook.com

Included in this month's newsletter is the 2014 TPCUG Financial Report prepared by our Treasurer, Doug Mullis. As I looked it over, I was struck by the fact the expenses were greater than the income for the first time ever that I can recall. We spent $55.88 more than we received in income from membership dues and Amazon Commissions. Dues income was in line with past years, and reasonable in amounts, so why the loss this year? It appears the culprit is a combination of lower Amazon Commissions in 2014, and our Newsletter printing costs rising substantially as a result of having to pay a vendor to print all 12 monthly issues this year.

Commentary.....Continued on page 7

TPCUG FINANCIAL REPORT FOR 2014
Submitted by Doug Mullis, Treasurer

TPCUG STATEMENT OF INCOME AND EXPENSES AND BANK BALANCE

2014 INCOME	
Membership Dues (22 Single + 4 Family)	$815.00
Door Prize/Auction Receipts	0.00
Amazon Link Commissions	427.14
TOTAL INCOME	$1,242.14
2014 EXPENSES	
Newsletter Postage	$196.00
Newsletter Printing (12 Mos in 2014)	468.60
FACUG Dues	25.00
APCUG Dues	50.00
Florida Annual Corporate Fee	61.25
Web Site Hosting Fee (12 Months)	181.08
P O Box Rental (fee increase)	78.00
December Holiday Party Costs	204.00
Refreshments (Cookies)	24.99
PayPal Usage Fee (6 Paymts @ $0.85 ea)	5.10
TOTAL EXPENSES	$1,294.02
NET LOSS FOR 2014	$51.88
CASH BALANCE PER BOOKS – START OF 2014	$7,560.86
CASH BALANCE PER BOOKS – END OF 2014	$7,508.98

(No Bank Account Reconciling Items for Beginning or End of Year)

Commentary.....Continued from page 6

Let's consider the newsletter printing cost increase. The Group was fortunate during my employment years with Pepin Distributing that William created the newsletter each month and sent it to me to print on the Pepin copier at no cost other than the cost of a few 8.5x17 reams of paper each year. I was able to print three months of newsletters in 2013 before retirement, so we had to pay for 9 issues to be printed in 2013 using a local printing vendor. In 2014, the Group paid for all 12 months of newsletters to be printed, at a cost of $469. This cost used to be less than $75 a year when I was able to do it at Pepin.

The second item concerning Amazon Commissions is not within the control of the Group, other than reminding the membership to please remember to use the Amazon link on our website before you purchase on Amazon. There is a separate article related to this reminder in this month's newsletter. We do count on these commissions to help offset costs, and it is even more important given the rise in costs of getting the newsletter to our members.

I think we are one of only a few Groups left that still print and mail Newsletters to members, and I know that the members generally prefer to have it that way, like reading a newspaper in hand is preferable to reading it online. So we are not going to propose

Commentary.....Continued from page 7

any changes to how you get your newsletter in the mail. The good news is that we have a reasonably comfortable bank balance that can afford to absorb small losses each year for a long time without affecting the financial health of the Group, even in light of declining Amazon commissions if that should happen. And we do not need to raise our dues for membership either as long as the level of membership stays fairly consistent year after year. There are measures that can be taken should our financial situation begin to decline significantly, but I see no indication this is going to happen in the next few years. So sit back and enjoy this newsletter, do your entire Amazon purchasing through our website link, and keep your membership dues paid timely. Your TPCUG should live happily ever after as a result, at least financially. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

It is nice to be able to welcome Dave Palmer as a contributor to the newsletter. He certainly knows a lot more about passwords than I. And I look forward to more articles in the future. Merle Nicholson has also been helpful in providing an article to fill out the newsletter so that all I need do is make a few comments.

Compared with last month, I have no problems to report. But I do have a complaint about what is happening at major and not so major websites. When I go to websites such as the New York Times and The Wall Street Journal, quite reputable organizations, I am amazed at all the processing my computer is doing. You can monitor this in the Task Manager's Performance tab. To see the actual traffic between your computer and the website, you can install the free program Fiddler and run it while visiting websites. You will be shocked at the volume.

In the first 15 seconds, the NY Times site's server had sent out

Minutes of the January Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. The SIG moderator, Bob LaFave, introduces new or little-known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees. Bob covered a wide variety of PC subjects, starting with his new notebook computer with Windows 8.1 and touchscreen. He talked about an external USB FAX modem and the software "Windows FAX and Scan," reassuring us that Windows 8.1 still has it included as standard.

He showed us what the Start-8 menu system for Windows 8.1 looks like and how to get it as a download. Last he led a discussion on a member's problem with lack of sound while using Firefox.

Dave Palmer gave us a very comprehensive presentation on passwords and what criminals do to attack users and best practices on prevention. Since the presentation is included in this newsletter, we'll just thank Dave for an excellent program, well-organized and thoughtful. It's clear that Dave worked very hard and long putting this together and we're the grateful recipients. ◆

Comments.....Continued from page 1

just over 200 http requests to various places, probably a little over 50%, of course, to the NY Times site itself. But the rest are to places such as ad.doubleclick.net, ckm-m.xp1.ru4.com, beacon.krxd.net, r.flite.com, b.scorecardresearch.com. And the list goes on. The Wall Street Journal is just as bad. The site of the New Orleans newspaper, the Times Picayune, produced over 1,000 http requests in the first 15 seconds. And it didn't stop once the page was loaded. Periodically, another large batch would arrive. It is no wonder that,

Taming the Password Beast

By Dave Palmer, Tampa PC Users Group
dkp205@hotmail.com

In recent years cybercrime has become a growth industry. The tech-savvy criminals began developing and selling crimeware tools. Now it seems anyone who can operate a keyboard can buy a do-it-yourself malware kit for less than $100. Hacking into websites and stealing data has become a favorite, and lucrative, pastime.

But some of the data stolen was encrypted - usually passwords. How to decrypt, or "crack'"it? Cybercrime newbies found the necessary tools and how-to help forums on the web. Now they're off to the races.

Once a database of passwords is stolen, the criminals need to operate quickly – before the breached website discovers the data has been stolen and notifies users to change their passwords.

What do the hackers need?
Above all they need to work fast, and that means working smart. They need big lists of commonly used passwords like "LetMeIn" or "Password1" or "12345678." They need lists of words (called wordlists) commonly used in passwords. And they need to understand common password patterns. No problem, all those items are available online – usually for free. Did you know entire forums exist online to share stolen passwords and to assist in cracking them? In addition YouTube has many self-help videos aimed at new criminals and "password recovery specialists."

Wordlists exist in many places on the Internet. Wordlists exist in multiple languages and can contain every word in Wikipedia, every word in Webster's dictionary, first names, last names, sports teams, pet names and much more. Check out openwall.com/wordlists/. This paid wordlist has 40 million entries and contains commonly used passwords from 20+ languages. This database is 500MB in size. Another wordlist available at Crackstation.com contains nearly 1.5 billion words and is available for free or for a small donation.

RockYou changed everything
In late 2009 a gaming website called RockYou was hacked. It contained 14 million unique passwords. Unfortunately they were not encrypted; they were in plain text. Both legitimate security specialists and criminals quickly analyzed this treasure trove. Many common password patterns were discovered. This analysis changed password cracking forever.

Analysis of the RockYou passwords confirmed that nearly all capital letters come at the beginning of a password and almost all (90%) numbers and punctuation come at the end. Many other common patterns were revealed.

Password-cracking software is surprisingly easy to find, and often free. Several popular titles include John the Ripper, Cain & Able, Brutus, and oclHashcat. Most come with "rules" to test various patterns against a password database.

Rule-based attacks always begin with a wordlist. They can combine words, append endings, prepend beginnings and test common substitutions – like substituting 3 for E, 5 for S, 1 for L, etc. A rule, known as a "combinator" attack, runs two or more words together and either strips out all the spaces or leaves them intact. Other "mangling" and "hybrid" rules account for variations in capitalization, character substitutions, and other tweaks.

The cracking process
Experienced password crackers will begin by testing the database against a large list of common passwords (12345678, or Password1). Often that process alone will crack 15% – 20% of the passwords. The next step is to use a comprehensive wordlist to test dozens of password patterns (rules). Again a 15% – 20% success rate is possible. The last resort is to use a "brute force attack" to test every possible password combination for a specific number of characters: aaaaaaaa, aaaaaaab, aaaaaaac to zzzzzzzz.

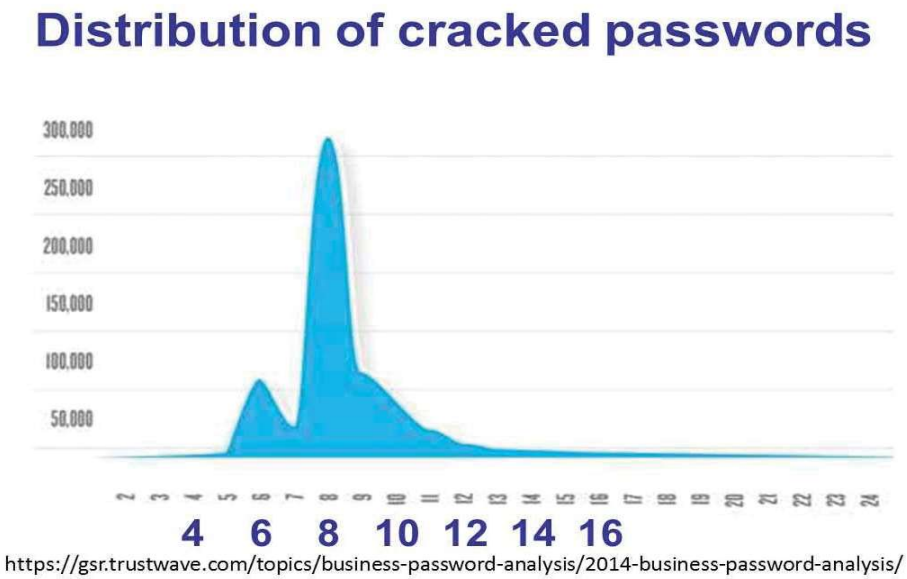
Following Moore's Law, the power of computers is increasing quickly. In fact, performance of computers roughly doubles every 2 years. (www.mooreslaw.org/) Along with it, the ability of bad guys to "guess" or "crack" passwords is increasing too. (http://ow.ly/pkgvW) Expert crackers have learned to utilize the power of graphics cards, also known as GPUs, such as the AMD Radeon 7970 to boost the performance of their computers. During the recent presentation Merle added that this particular card has a total of 2048 processors on each card (!) and can run at the blazing speed of 6,000 GHz! It is capable of running billions of calculations (not guesses) per second. I believe that translates to around 8 million password guesses per second.

Why are longer passwords better?
Without getting too deep into the math, let me explain briefly why longer passwords are better. Imagine a 2-char-

Password.....Continued on page 4

Password.....Continued from page 3

acter password that is limited to numbers. Since each character can be any one of 10 possibilities (0-9), the number of combinations for a 2 character password is 102 or 10 x 10 = 100.



If we have another 2-character password that can include upper case letters (26), lower case letters (26) and numbers (10), the number of possibilities for each character jumps to 62 (26+26+10). The number of possible combinations is now 622, or 62 x 62 = 3844.

Let's try a 12-character password that uses upper case (26), lower case (26) and numbers (10). The number of possible combinations is 62 x 62 x 62 x 62 x 62 x 62 x 62 x 62 x 62 x 62 x 62 x 62 = 6212 or 312,000,000,000,000,000,000,000 possible combinations. In spite of the number of combinations, these passwords can still be cracked by a determined but patient criminal using brute force.

Password best practices

Passwords MUST be random – hackers are experts at testing for ANY pattern. The longer the password the better! The more complex the better! Passwords should include upper and lower case letters, numbers and, if possible, special characters. You absolutely MUST use different passwords for each account. Hackers have created software that can automatically check multiple accounts (banks, retailers, social media) for a single password.

The graph below shows a distribution of cracked passwords according the Internet security company Trustwave. It show that few people use passwords less than 5 characters or more than 12 characters. It also shows that passwords between 6 and 10 characters are often cracked.

https://gsr.trustwave.com/topics/business-password-analysis/2014-business-password-analysis/

Given that computing power doubles every 2 years, I would contend that 12 and even 14 character passwords are not currently safe. To secure sensitive accounts such as bank accounts or investment accounts, or even e-mail accounts, I would suggest using 18+ character passwords. 10, 12, or 14 character passwords could be used for less sensitive accounts such as the New York Times, etc. Given the state of password pattern analysis, I don't believe that passwords created by humans are safe even if they're longer than 12 characters.

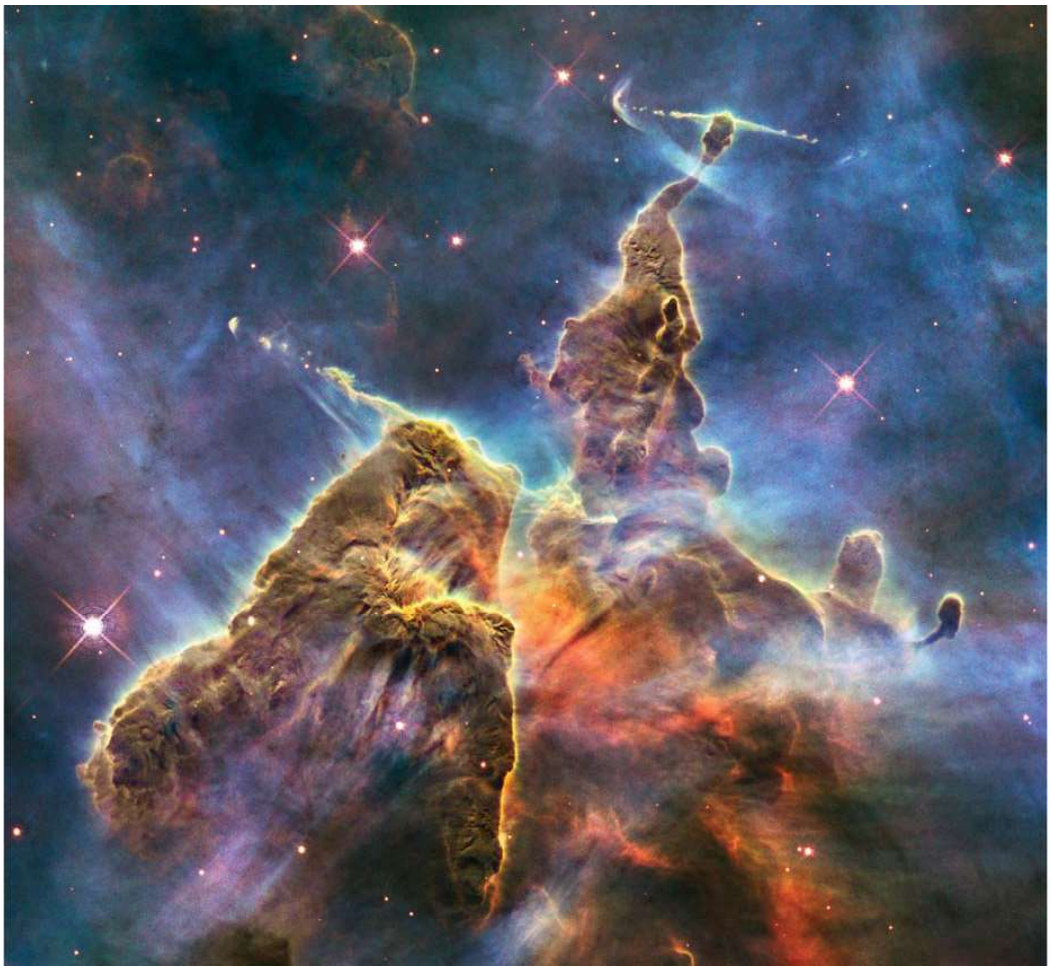
Do not use whole words

Hackers are getting wise to people using whole word phrases for their passwords. They are starting to include multi-word phrases in wordlists like givemelibertyorgivemedeath(1). [(*) indicates a footnote at the end of the article.]

Are security questions a weak link?

If your security questions are more easily guessed than your password, you have a problem. If the website allows it, make up your own questions. If not, either make up your answers, use someone else's information, such as a spouse or simply use the correct answers but spell them backwards.

If you can create your own questions consider making them 1) safe so they cannot be guessed or researched, 2) stable so they do not change over time, 3) memorable so you can remember them, 4) simple so they are precise, simple, consistent, and 5) have many possible answers.



Consider using a password manager

A password manager can remember all your passwords for you except your master password. It can generate long random passwords. Most can auto-fill username and password boxes. Many can even log you in automatically. Most password managers are cross-platform – Windows, iOS, Linux, and mobile cross-platform. Some can also save other data beyond passwords. The basic version of most password managers is free. I suggest that you not use browser password managers as most are insecure to some degree.

A word about master passwords

Password.....Continued on page 6

Internet Picture of the Month

Images of outer space from the Hubble Space Telescope

From http://www.wsj.com/articles/star-studded-images-from-the-hubble-space-telescope-1422658561?mod=WSJ_article_EditorsPicks_6. "It may look like a fantasy film still, but this image is actually the top of a pillar of gas and dust. Located 7500 light years away, the pillar is three light-years tall." Note that these are not the colors you would see with the naked eye. They are due to enhancements by NASA to emphasize certain features. The Hubble telescope has been in orbit for 25 years.

Password.....Continued from page 4

If you can create a completely random password that you can remember, use it. If not consider this system. Find a quote, a song lyric, a line from a poem, the Bible or a movie that you can repeat almost without hesitation. Use the first letter of each word and include all punctuation. The password will be much stronger if it includes numbers, punctuation and/or capital letters in the middle. If it doesn't contain them, figure out how to add them or find another phrase.

Here are a couple of examples to lead you in the right direction. I increased the font size so the characters underlined would show up better.

Ifi2abrof,Iwdddatfwh. – 21 characters – Johnny Cash
I fell into a burning ring of fire, I went down down down and the flames went higher.

Y,Amtssfa,Nilatth2s. – 20 characters – Beatles
Yesterday, All my troubles seemed so far away,
Now it looks as though they're here to stay.

Fascinating articles

In 2013, a tech-savvy journalist with no hacking experience attempted to "crack" a database of over 16,000 encrypted passwords. His editor gave him one day to find the resources, learn the tools and "crack" as many passwords as possible. The rules were he could use only consumer-level computers and free tools from the Internet. After some initial struggles Nate Anderson cracked over 8,000 passwords (47%) in one day.(2)

Not long afterward, Wired magazine asked 3 expert crackers to attack the same database. One spent only one hour and cracked 62% while using a single GPU card. One used a bit more than an hour and cracked 82% while using two GPU cards. The last cracker spent 20 hours and cracked 90% using a single GPU card.(3)

What I've learned

- Cracking tools are quite sophisticated and mostly free.
- Wordlists, online help,and other resources are easily available and mostly free.
- Computing power doubles roughly every two years.
- Cracking passwords is all too easy even for relative beginners.
- Human generated passwords (HGP) invariably have patterns embedded in them.
- Humans are not usually capable of generating completely random passwords.
- Wordlists, pattern analysis, and pattern-generating software can defeat HGP.
- Shorter passwords, whether created by humans or completely random, are simply not secure.
- The degree of difficulty in cracking passwords increases exponentially with the number of characters.

Conclusion

The only way to generate and remember long, completely random passwords for every account is to use a password manager.

Where is the Linux Desktop?

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

We all know by now that Linux is in wide use all over the world, just not on the desktop. It dominates phones (Android) and servers and even supercomputers. The top 20 supercomputers worldwide almost all use Linux. The one supercomputer exception uses Unix – an earlier version. And the millions of internet servers? Almost all Linux.

Chromebooks outsold laptops last Christmas season, and the year before. Linux is a dominating force in connected devices. So it's all around us, except for the desktop and for notebook computers – Chromebooks being the exception. Chromebooks are making great inroads in schools where the ability to control what gets installed ranks high, as does the relative resistance to malware and viruses, and obviously cost.

Computers with Linux OS pre-installed just aren't gener-

Lilnux.....Continued on page 7

Linux.....Continued from page 6

ally available. Dell and HP have always sold them, but you won't find them in stores. With Dell, the cost differential with Windows OS is small, just $50; although if it were on a $500 computer that's 10%. And I suspect that the margin will be even smaller because Microsoft is now giving the OS software to manufacturers at a price close to zero. Look for an operating system called "Windows 8.1 with Bing."

First, let's state that there are no file or networking incompatibilities between Linux and Windows. Common files are fully interchangeable between the systems: Documents, spreadsheets, pictures, movies. This concern is even less important now that users' computer needs are evolving toward Internet-centric applications. The Internet browser is a great equalizer. You can even install some Windows programs in Linux using an emulator called WINE. For the technical-minded you can run excellent Virtual Machine software and then run any and all Windows software.

But there are some needs that have so far been unmet. The first that comes to mind is Intuit's TurboTax. If your tax needs are simple enough to use the online TurboTax, problem solved. Otherwise, there's no Linux solution. The second thing is a major trip planning and navigation software like Delorme Street Atlas. But most everything else is available in first-class applications like Office Suite, financial systems, photo and movie editing, publishing, CAD drawing and thousands of games. And to top it all off, nearly all these are available at no charge. There is a built-in software catalog program that helps you find and install everything.

I have yet to install Linux only to find I have a driver problem. The device drivers – except for some printers – are built in. And they work well.

Finally, let's address malware and viruses. There are some few known viruses that affect Linux. But the OS itself is constantly being updated to plug those exploits. Linux users don't use virus scanner software because the chances of getting one is much smaller than a Windows computer with the very best virus software installed. Statistically speaking, no one gets a virus with Linux.

So why would you consider a Linux desktop? What circumstances make it a viable option?

If you are currently running an old Windows OS. XP or earlier, you need to replace it now. Right now unless you are not connected to the Internet. Linux will run on an old system easily and much faster than Windows ever did. For free.

If you have a computer where you're up to your eyeballs in malware and can't fix it yourself, you're looking at a $100 professional repair. Save the bucks and give Linux a try first. If you can back up your data you have nothing to lose.

If you're just plain tired of fighting off malware and viruses or you feel you don't have the skills to do it, Linux is a good way to go. No yearly fees for virus scanners that work about 95% of the time anyway.

If you're looking for a simpler system with good protection for the kids in the house, you can't do better than Linux. You can control everything that gets installed and also know it's virus-free. Nothing gets installed without the administrator password. Just don't tell the kids what it is. The desktop and application launcher is actually closer in operation to an Apple iMac than it is Windows. It's simple and easy.

What are the issues?

Probably the biggest issue is deciding which of the many versions to install. If you count all the variations and branches, there are probably 250 or so choices to make. The most popular by far is Canonical Ubuntu with the standard "Unity" style desktop. This is a very good way to start because the base OS is being maintained by a large multi-national company. Alternately, there are some "flavors" of Ubuntu that replace the desktop appearance and controls, menus, settings and a unique selection of standard software. These all have the blessing and cooperation of Canonical. Each has a target audience like Eubuntu which is designed for children and schools. The website https://wiki.ubuntu.com/UbuntuFlavors details the differences of the nine flavors.

There are good instructions on how to make a bootable CD or flash drive with Linux and then run it on your computer without installing any software. This is a very good way to try it out to see if there are any hardware incompatibilities and to see if you really like it. You have nothing but a little time to lose.

There is a wealth of friendly web pages to help with all this. Start at http://www.ubuntu.com/ or https://wiki.ubuntu.com/ and proceed to http://www.ubuntu.com/download, a very good place to get installation guides and instructions; also "Ask Ubuntu" and "Ubuntu Forums." ◆

for sites such as these, our browsers are unresponsive at times. And it is getting irritating.

I am sure you have probably noticed at many sites now when you start viewing at the main page and then click on a link to go to another page at the site and then click the return button to return to the main page nothing happens. To get back to the main page (using IE), you have to either hold your cursor down on the back button to see a list of previous page and choose the main page or you have to find a link to the main page and click on that. I am convinced this is because of all the activity that is going on in the background.

What would be nice is a new browser that stripped out all that advertising and tracking stuff and just presented you with a web page containing text, images and whatever links were appropriate. Think we will see anything like that anytime soon? ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Dave Palmer and Merle Nicholson are back with articles for the newsletter, for which I am very appreciative. At present, I do not have time to think about articles, so it is nice to have others step in.

I have been thinking, though, about our website, http://www.tpcug.org, and how it is a bit dated. It still works fine when viewed in a browser on a desktop or laptop. However, there is a problem with viewing it on all the new smartphones and tablets. Problem one is that the navigation menu is built on the assumption that you will be using a mouse and, hence, can hover over a menu item to pop out a sub menu. Touch devices do not allow that. Also many of the pages do not display well on the smaller screens.

To fix this problem, I looked into what are know as responsive

Minutes of the March Meeting

By Merle Nicholson, Secretary, Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. Bob LaFave, the SIG moderator, introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees. This month, in Bobs absence, Merle Nicholson was the substitute moderator. The discussion created some lively comments and further questions from the group.

The presentation this month was given by myself, Merle Nicholson, on the subject of creating a new spreadsheet in Google Docs. The subject at hand was a need for a monthly money manager for my spouse. She has been hand writing one every month for many years. It consists of all regular monthly bills and payments and estimates of expenses. That is balanced against the monthly income, and should give a difference of an amount that can come from or go to savings. This interested the members, and they became very engaged in the finished product. Many questions, suggestions and comments were made, and the result was a collaborative effort. The meeting was adjourned at the spreadsheet's completion.

The level of participation during the demonstration was gratifying, as was the later feedback from members in attendance. ◆

Comments.....Continued from page 1

websites, did a bit of research for tutorials on how to create such sites and have produced a new test version of our website. I learned how to accomplish mostly from tutorial videos at http://www.lynda.com, to which I subscribe

The test version of our website is at http://tpcugtest.azurewebsites.net. It should work well on your phone. Eventually I will move that content to our site at http://www.tpcug.org. ◆

What Would a Digital Society Look Like?

By Dave Palmer, Tampa PC Users Group
dkp205@hotmail.com

I read an article recently about the tiny but highly wired Baltic country of Estonia. While Europe and the United States debate the role of technology in people's daily lives, Estonia has welcomed it as a fact of life.

Estonia gained its independence in 1991 after the fall of the Soviet Union. At the time, Estonia had few financial resources and a small population to jump-start its economy. Local policy makers soon realized that they could not offer Western-style services without using new technology, including the Internet, to keep government costs to a bare minimum.

When the Iron Curtain fell, less than half the population had a telephone. In the last 20+ years, Estonia has transformed itself from being a member of the Soviet bloc to being one of the most connected countries on earth, using technology built primarily within its borders.

Estonians, using a national identity card embedded with a microchip, have access to thousands of services, including banking, business registration and even fishing licenses. They can review medical records and order prescriptions on smartphones. Almost everyone files taxes on the web within minutes, and about a third of voters now cast their ballots online. By law, the state may not ask for any piece of information more than once, and people have the right to know what data the government holds on them.

When Estonian political and technical leadership began laying the foundation for e-Estonia, it decided on the following principles:

1. Decentralization. There's no central database, and every stakeholder, be it a government department, a ministry or a business, gets to choose its own system in its own time.
2. Interconnectivity. All the elements in the system have to be able to work together smoothly.
3. Open platform. Any institution can use the public key infrastructure.
4. Open-ended process. E-Estonia was conceived as a continuous project to keep growing and improving organically.

E-services available to citizens and businesses in Estonia include the X-Road, I-voting, e-Identification, e-Residency, and e-Tax among others. The two key ingredients in the infrastructure are the X-Road and e-Identity or e-ID.

X-Road – X-Road is the backbone of e-Estonia. It's the invisible yet critical environment that allows the nation's various e-services databases, both in the public and private sector, to link up and operate in harmony. One of the key elements of e-Estonia is that its databases are decentralized, which means:

- There's no single owner or controller.
- Every government agency or business can choose the product that's right for them.
- Services can be added one at a time, as they're ready.

X-Road is the all-important connection between these databases, the tool that allows them to work together for maximum impact. All of the Estonian e-solutions that use multiple databases use X-Road. Originally X-Road was a system used for making queries to the different databases. Now it has developed into a tool that can also write to multiple databases, transmit large data sets and perform searches across several databases.

X-Road was designed with growth in mind, so can be scaled up as new e-services, with their various platforms, come online.

In 2013

- Over 287 million queries were done over X-road.
- Over 170 databases offer their services over X-Road in Estonia.
- Over 900 organizations use X-Road daily in Estonia.

More than 50% of the inhabitants of Estonia use X-Road through the information portal eesti.ee.

All outgoing data from the X-road is digitally signed and encrypted. All incoming data is authenticated and logged. X-road allows databases to interact, making

Digital Society.....Continued on page 4

Digital Society.....Continued from page 3

integrated e-services possible. Institutions are not locked into any one type of database or software provider.

Struck by the X-road's scalability and security, and the fact that it has already worked well for over a decade, Finland and other countries are adopting the Estonian system in whole or in part.

e-Identification –Estonia has by far the most highly-developed national ID card system in the world. Introduced in 2002, the e-ID is the nationally standardized system for verifying a person's identity in an online environment. Much more than simply a legal picture ID, the mandatory national card serves as the digital access card for all of Estonia's secure e-services. All Estonian citizens and permanent residents are legally obligated to possess this ID card from the age of 15. There are more than 1.1 million active e-ID cards in Estonia. That's nearly 90% of Estonia's 1.3 million residents.

A chip on the card stores digitized data about the authorized user: the user's full name, gender, national identification number, and cryptographic keys and public key certificates. Only a minimum of private data is kept on the ID card itself. Lost cards can simply be cancelled. The embedded files use 2048-bit public key encryption, which enables it to be used as definitive proof of ID in an electronic environment. And in over a decade, no security breaches have been reported. Also issued are two PIN codes, one for authentication (proving who the holder is) and one for authorization (signing documents or making payments). Asked to authenticate a user, the service concerned queries a central database to check that the card and relevant code match. It also asks for only the minimum information needed: To check a customer's age, for example, it does not ask, "How old is this person?" but merely, "Is this person over 18?"

Here are some examples of how the ID Card is regularly used in Estonia:

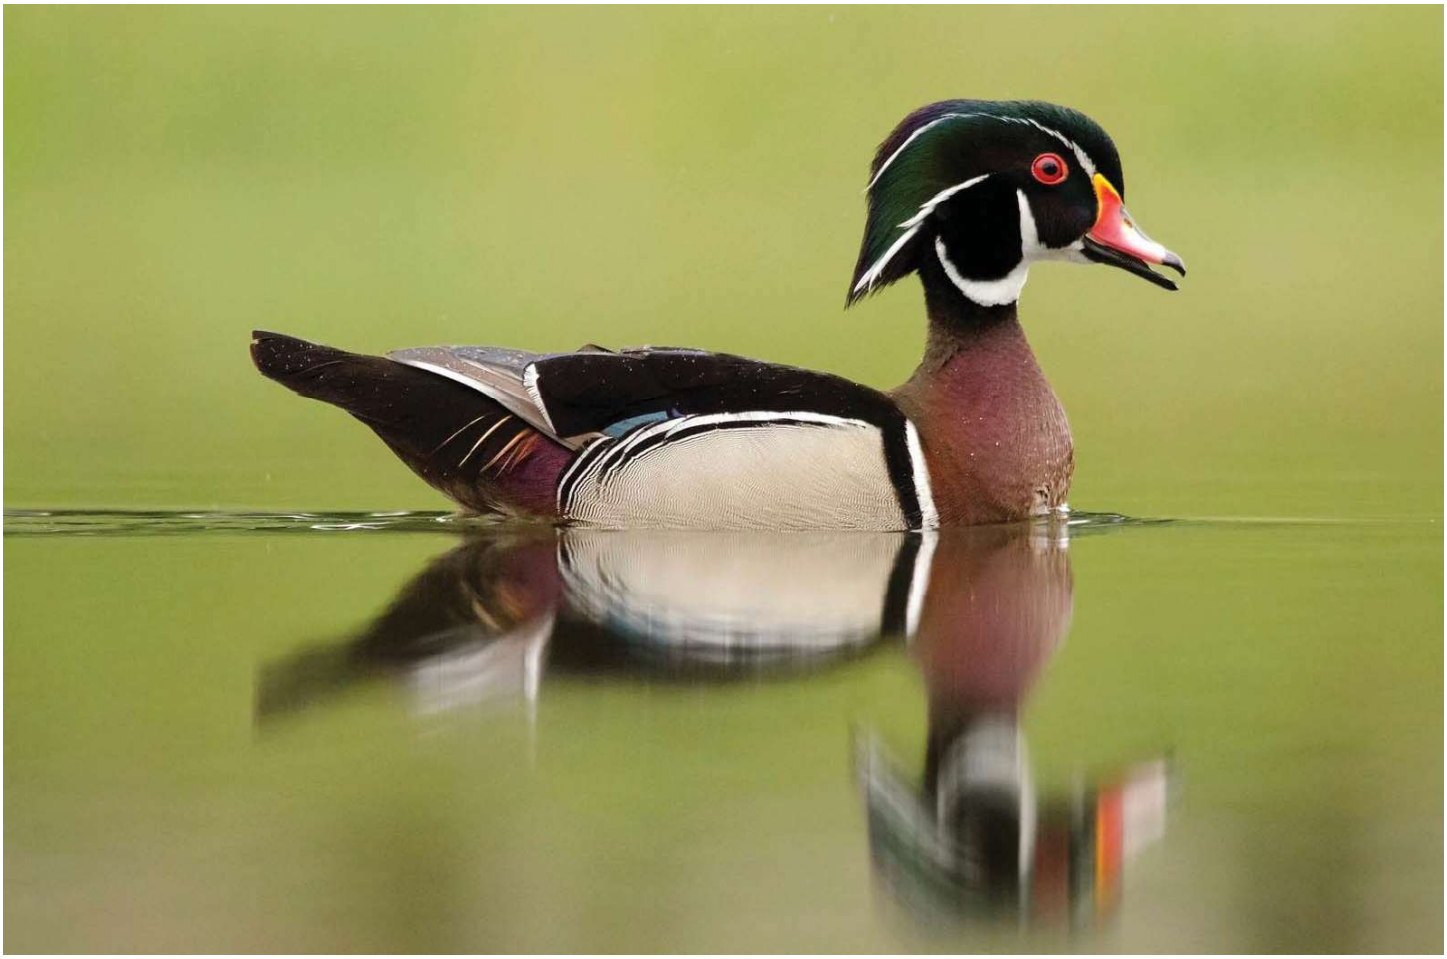
- As a national ID card for legal travel within the EU for Estonian citizens
- As the national health insurance card
- As proof of identification when logging into bank accounts from a home computer
- As a pre-paid public transport ticket in the cities of Tallinn and Tartu
- For digital signatures (Under Estonian law the cryptographic signature is legally equivalent to a manual signature.)
- For i-voting
- For accessing government databases to check one's medical records, file taxes, etc.
- For picking up e-Prescriptions

Public transportation

Larger cities in Estonia have made arrangements for residents to purchase "virtual" transportation tickets linked to their ID cards. Period tickets can be bought online via electronic bank transfer, by SMS, or at public kiosks. This process usually takes only a few minutes and the ticket is active instantly from the moment of purchase. To use the virtual ticket, customers must carry their ID card with them whenever they use public transport.

Customers also have the option of requesting e-mail or SMS notification alerting them when the ticket is about to expire, or of setting up automatic renewal through internet banking services.

During a routine ticket check, users are asked to present their ID card, which is then inserted into a special device. This device then confirms that the user holds a valid ticket, and also warns if the ticket is about to expire. The ticket check usually takes less than a second.



Ticket information is stored in a central database, not on the ID card itself. Thus, to order a ticket, it is not necessary to have an ID-card reader. Ticket controllers have access to a local archive of the master database. If the ticket was purchased after the local archive was updated, the ticket device is able to confirm the ticket from the master database over a GSM (cell phone) data link.

I-voting – Internet voting, or 'i-voting', is a system that allows voters to cast their ballots from any internet-connected computer, anywhere in the world. Unrelated to the electronic voting systems used elsewhere, which involve costly and problematic machinery, the Estonian solution is simple, elegant and secure.

During a designated pre-voting period, the voter logs onto the system using an ID card or Mobile ID, and casts a ballot. The voter's identity is removed from the ballot before it reaches the National Electoral Commission for counting, thereby ensuring anonymity.

Digital Society.....Continued from page 4

With any method of remote voting, including traditional mail-in ballots, the possibility of votes being forced or bought is a concern. Estonia's solution was to allow voters to log on and vote as many times as they want during the pre-voting period. Since each vote cancels the last, a voter always has the option of changing his or her vote later.

In 2005, Estonia became the first country in the world to hold nation-wide elections using this method, and in 2007, it made headlines as the first country to use i-voting in parliamentary elections.

The cumulative time savings in the Estonian parliamentary elections of 2011 were 11,000 working days, which would amount to around 504,000 euros in average wages.

e-Residency – By 2015 Estonia is planning to issue e-ID cards to non-resident 'satellite Estonians', thereby creating a global, government-standard digital identity. Applicants pay a small fee, 50 euros or about $55 at this writing, and provide the same biometric data and documents as Estonian residents. If all is in order, a e-ID card will be issued, or its virtual equivalent on a smartphone (held on a special secure module in the SIM card). Estonia hopes to add 10 million 'satellite' Estonians over the next decade. What may help provide the necessary scale is a European Union rule soon to come into force that will require member states to accept each other's digital IDs. That means non-resident holders of Estonian IDs, wherever they are, will be able not only to send each other encrypted e-mail and to prove their identity to web-service providers who accept government-issued identities, but also to do business with governments anywhere in the EU.

e-Tax – e-Tax is the electronic tax filing system set up by the Estonian Tax and Customs Board. Since its introduction in 2000, it has drastically reduced the time spent by individuals and entrepreneurs on filing taxes. In 2002 the system matured tremendously with automated tax declaration forms. In 2013, 95 percent of tax declarations in Estonia were filed electronically. Using a secure ID, a taxpayer logs onto the system, reviews their data in pre-filled forms, makes any necessary changes, and approves the document with a digital signature. The process

Keep Your PC Clean

By Merle Nicholson, Secretary, Tampa PC Users Group
merle@merlenicholson.com

You're going to say, "Here's Merle again, preaching on the same ol," but keeping your computer fully functional goes further than just buying antivirus and doing backups. Here's my take on what we have to look out for.

Emails: We're getting emails – it seems constantly – with requests to straighten out your credit rating, fix an error on the mortgage, a report on someone logging into a credit card account that you don't even own. Or worse, one that you do own. Scams – all of them. Any legitimate concern – they'll NEVER send you an email. It's a scam to get you to reveal something that will harm you. They need to be deleted immediately. You'll soon be able to recognize each one because they're persistent, and you'll delete without opening. Better still, mark the email as spam, and the next time you get one from them hopefully your email client will recognize it and put it in your spam folder for later deletion.

The objective is to never open the spam email in the first place. Sometimes you have to. But first, let's make a small change to your email client. If there is a pane (a section of the email window) that automatically shows the content of the email; turn that off. If it's on – guess what: You have already opened that spam. That's not good. You want to be able to select it and hit delete without reading it. If the reading pane is showing, it's too late.

No legitimate business will ask you to click on something in an email unless you're expecting it. For instance, I buy something from Amazon, and they send me a link to get a tracking number. There's something there that I recognize: The previous transaction. But if I get something from Amazon that doesn't contain a known previous transaction, just urging me to click on a link, forget it. I may open the browser independently of the email and log into my account to check, but probably not.

Incidentally, there's a system of second level login security on some websites. One of my sons told me about it

Clean.....Continued on page 7

Clean.....Continued from page 6

when he knew I was using PayPal, and he directed me where to set it up. I associated my mobile phone number to my PayPal account and checked one option. Now when I log in, I'm stopped asking for a six digit number to type in to continue. There's a "Send SMS" button to click and when I do, they immediately send a message to my mobile phone with the number to type in. You have five minutes before the number expires. I really like this. I can glance at a six digit number and remember it long enough to type it in, so I don't see that I've lost a thing. I'd like to see more of this – my banking site first comes to mind.

Finally on this subject, guess how many unopened emails you should have. If you guessed none, you're managing your mail effectively. If you have hundreds, you're not managing at all. How can you find the important emails if you have hundreds of unopened ones?

To get on the right track, sort all your current email by sender, start at the top and block delete the entire senders mail if it's not of interest. But just before that, right-click on the first one in the group and mark it as Spam. If your email doesn't have a Spam filter, it's time to change email clients.

Downloads: One very disconcerting trend on websites is the appearance of multiple "Download" buttons on a page where you expect a singe download of a product. I do have several products, some paid and some free that require new versions. I'm directed to the site and I see a confusing number of Download buttons. What is happening is that the owners of the site have sold a section of their page to a service that provides content. That content is then sold to advertisers, and I'd guess there is very little oversight of the content. In any case those things with Download buttons can't be to your benefit. Be alert, cancel this quickly if you can; if there's a file being downloaded, there's a notification on the lower left of your browser; it can be canceled if you're quick. If you don't catch it, there's a menu item to "Show in Folder", go to that file and delete. Hold Shift, hit Delete or Shift, right-click Delete. Be careful! The next thing you have to look out for are downloads of things you don't want that are attached to things you do need. When you want to update Flash, or PDF readers, and get the update, very frequently you'll see a popup that has a toolbar or something else already checked for installation. UnCheck those first. Do it slowly and make sure you understand everything that is happening.

Phone Calls from Microsoft Support: You have to believe me. Microsoft does not know what PC you have, cannot tell you have a problem, and certainly will never call you! There is no mechanism existing that can do that to benefit you. None. That the speaker is saying something in a language vaguely resembling English has to be the first clue.

Offers to "Fix" your PC: Merle's Rule Number 1 is worth repeating. No software can "Fix" your computer. It doesn't exist. If you're having problems it's because you have software installed causing it. That's Too Much Software, don't add more! First uninstall all software you don't need. You don't need anything that has the word "Toolbar" in it. You don't need "Repair My PC" software. You don't need "PC Cleanup" software and you certainly do not need someone to log into your computer remotely to repair it, even if they say they are "Microsoft Support." Even benign PC repair software stands on its ability to clean up the registry. Guess what? No one needs that. Ever. You also don't need but one antivirus software installed and running. Then look at all your browser add-ons. Anything with the word "toolbar," disable it.

Actually there is plenty of software that will fix specific problems. But first you must identify the problem in detail first. Frankly, if you have the knowledge to do that you probably wouldn't have the problem in the first place.

Last, make sure you are completely up to date on all Windows Updates. Don't just assume that it's being done automatically. Check on that first. One of the tricks malware pulls is to block or turn off automatic updates. Microsoft creates and sends you a "Malicious Software Removal Tool" on the second Tuesday of each month. Currently it detects and removes the top 264 malware. It runs automatically. The tool is a part of the Windows Update process.

There are lots of things you can do to be safe, and operate your computer with a minimum of fuss, but if you're having problems with your computer that you can't handle, get some help. This is one reason you are a mem-

william@lamartin.com

Dave Palmer and Merle Nicholson are back joined by Ron Weinberg with articles for the newsletter, for which I am very appreciative since, as you know, I do not have time to think about articles, at the present time.

Last month I mentioned a test version of our website at http://tpcugtest.azurewebsites.net. It is what is know as a responsive site that should work well on your phone. I said that I would move that content to our site at http://www.tpcug.org. I haven't done that yet, but I have made a similar responsive version of my personal site, http://www.lamartin.com which may be viewed at http://lamartincomtest.azurewebsites.net. That, being a much larger site, required more work. And there are pages there , mostly in the Large Images/Maps section, that you will not be able to view with any phone or non-windows tablet since they depend on the browser plug-in Silverlight. ◆

Minutes of the April Meeting

By Merle Nicholson, Secretary, Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. Bob LaFave, the SIG moderator introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees. This month in Bob's absence, Merle Nicholson was the substitute moderator. The discussion covered exporting Thunderbird mail, a demonstration of WinDirStat – a mostly file-size utility analysis of your hard drive, A discussion of SSD and (not) defragging.

This month we were very fortunate to have Andrew Sekela from the FBI White Collar Crime/Public Corruption section. Andrew is a very accomplished speaker, and he covered subjects that we're all interested in; cyber security, phone high pressure sales, phishing and "social engineering" via email and websites.

His section investigates white collar crime when the loss exceeds the threshold of $1 million. There is no minimum threshold for public official corruption. Andrew strongly advises reviewing activity reports from the three credit bureaus for unusual activity and filling a police report for any fraud loss, even small. He says that while small losses do not get investigated that your loss may fit into a larger pattern that may exceed the threshold. Also, to use the US government website http://www.ic3.gov. It's the "Internet Crime Complaint Center". "The IC3 serves as a clearinghouse and repository of cyber crime complaints from private citizens and industry. The IC3 refers complaints to law enforcement agencies for investigation and prosecution and provides analytical support for cyber crime investigations and prosecution." Looking at the site there is a lot educational materials on cyber crime and fraud to be read.

The presentation was excellent, well-prepared and fascinating. Our heartfelt thanks go to Andew Sekela for taking the time to speak to us. And to Doug for finding him! ◆

Recent Cybercrime News Highlights

By Dave Palmer, Tampa PC Users Group
dkp205@hotmail.com

A Clever Criminal
Back in 2014, Neil Moore, a 28 year old man awaiting trial in London's Wadsworth Prison, found a creative way to be set free. He used an illicit mobile phone to create a fake email account. Using that account, he then set up a fake web domain which closely resembled that of the court service's official web address. Moore registered the bogus website in the name of investigating officer Detective Inspector Chris Soole, giving the address and contact details for the Royal Courts of Justice. Posing as a senior court clerk, he then sent bail instructions to prison staff, who released him. Moore had previously used four different aliases to commit fraud worth £1,819,000 ($2,700.000). http://goo.gl/XoTfmy

Clear Evidence That Running in Admin Mode is a Threat
An analysis of Microsoft Patch Tuesday bulletins suggests that 97 percent of all 'critical' security vulnerabilities reported by Microsoft could have been mitigated simply by removing administrator rights. The figures are from the 2014 Microsoft Vulnerabilities Report by UK- based security firm Avecto, in which the company pulled data from every patch issued by Microsoft in 2014 - 240 in total. In 2013, the same report found that 92 percent of 147 total vulnerabilities with a critical rating could have been prevented via the same admin rights removal. The report goes on to say that user accounts with admin privileges are the primary targets for exploitation by malware, as they provide unrestricted access to a computer. http://goo.gl/vcpa8T

Energy Sector Targeted
Researchers have uncovered an ongoing espionage campaign that uses custom-developed malware to siphon confidential data out of energy companies around the world. The majority of the targets were linked to the petroleum, gas and helium industries. The United Arab Emirates was the country most targeted by the attackers, followed by Saudi Arabia, Pakistan, and Kuwait.

Computers are initially infected through spam e-mails. The e-mails contain a malicious attachment that exploits a Microsoft Windows vulnerability. The vulnerability was patched in 2012. The malware, called Trojan.Laziok, acts as a reconnaissance tool that scours infected computers for data including machine name, installed software, RAM size, hard disk size, GPU details, CPU details, and installed antivirus software. The attackers use the acquired data to decide how to further infect the computer, using malware tailored for a specific compromised computer. http://goo.gl/lE0DX7

Did Elaborate Scheme Lead to Winning the Lottery?
Prosecutors say an Iowa man, Eddie Raymond Tipton 51, the information security director of the Multi-State Lottery Association, entered a locked computer room in 2010. They say he infected the computers with software to make sure the Random Number Generator picked his number in the December 2010 lottery. Although the room was monitored by a video camera, the cameras on that date recorded only one second per minute rather than running continuously like normal.

A little more than a month later Tipton was videotaped buying a Hot Lotto ticket that later won the $14.3 million payout. As an employee of the association, he was barred by law from buying lotto tickets or claiming lottery prizes. The winning ticket went unclaimed for almost a year. Hours before it was scheduled to expire, a company incorporated in Belize tried to claim the prize through a New York attorney. Weeks later Tipton was charged with two counts of fraud.

According to the prosecutor, the former security director "was 'obsessed' with root kits, a type of computer program that can be installed quickly, set to do just about anything, and then self-destruct without a trace." http://goo.gl/CaGU27

Dyre Wolf – a Sophisticated and Targeted Attack
The heist starts with highly targeted phishing email (called spear phishing) that attempt to trick people into

Recent.....Continued on page 4

Recent.....Continued from page 3

installing a strain of malware called Dyre. Researchers say this malware was undetected by the majority of antivirus products.

Once the infected victim tries to log in to one of the hundreds of bank websites for which Dyre is programmed to monitor, a new screen will appear instead of the corporate banking site. The page will explain the site is experiencing issues and that the victim should call the number provided to get help logging in.

One of the many interesting things with this campaign is that the attackers are bold enough to use the same phone number for each website and know when victims will call and which bank to answer as. This results in successfully duping their victims into providing their organizations banking credentials.

As soon as the victim hangs up the phone, the wire transfer is complete. The money starts its journey and bounces from foreign bank to foreign bank to circumvent detection by the bank and law enforcement. One organization targeted with the campaign also experienced a DDoS. IBM assumes this was to distract it from finding the wire transfer until it was too late. http://goo.gl/cxZlsb

Elusive Botnet Takedowns

Beebone – A small but highly elusive botnet called Beebone was taken down recently. It was a bit of a feat as the underlying malware, a worm, is extremely resistant to detection. Polymorphic downloader software at the heart of this malware updated itself many times a day. Beebone also relied on a pair of programs that re-download each other, acting as an insurance policy should one of them be removed.

Identifying a unique malware 'signature' is one of the oldest and most common methods of combating malware. This method is the standard among big-name anti-virus (AV) software such as Trend Micro, Norton, etc. The malware behind Beebone tries to overcome signature-based detection by changing its form every time it moves to a new system. It can also detect sandboxes and antivirus software, block connections AV websites, disable tools that try to terminate it, leverage encryption techniques, and dynamically change control server addresses and domain names. As a result, it has remained a threat since it was first discovered almost six years ago. The worm has been responsible for infecting tens of thousands of systems, and initial estimates from the sinkhole operation suggest that the botnet is considerably larger than our original estimates (more details to follow).

The takedown was carried out by "sinkholing" the Beebone command-and-control network. Sinkholing is the process of seizing all domain names and IP addresses used to communicate and update the infected machines. The whitehats performing the takedown set up their own command channel that prevented the computers from downloading malware updates or participating in any other botnet activities. http://goo.gl/tXnaOn

Simda – A week after the Beebone takedown, law enforcement groups and private security companies around the world said they have taken down a botnet that enslaved more than 770,000 computers in 190 countries. Simda, as the botnet was known, infected an additional 128,000 new computers each month over the past half year, a testament to the stealth of the underlying backdoor Trojan and the organization of its creators. The backdoor morphed into a new, undetectable form every few hours, allowing it to stay one step ahead of many antivirus programs.

Botnet operators used a variety of methods to infect targets, including exploiting known vulnerabilities in software such as Oracle Java, Adobe Flash, and Microsoft Silverlight. The takedown involved the seizing of 14 command-and-control servers that were located in the Netherlands, US, Luxembourg, Poland, and Russia

The malware modified the HOSTS file Microsoft Windows machines use to map specific domain names to specific IP addresses. As a result, infected computers that attempted to visit addresses such as connect.facebook.net or google-analytics.com were surreptitiously diverted to servers under the control of the attackers. Often the booby-trapped HOSTS file remains even after the Simda backdoor has been removed. Secu-

Recent.....Continued from page 4

rity researchers advised anyone who may have been infected to inspect their HOSTS file, which is typically located in the directory %SYSTEM32%\drivers\etc\hosts. People who want to discover if they have been infected by Simda can check this page (https://check-ip.kaspersky.com/) provided by AV provider Kaspersky Lab. The page is effective as long as a person's IP address hasn't changed from when the infection was detected.

Taking down a botnet however, does not clean the infected machines. To be fully free infected computers still must be disinfected using AV software or, better yet, by having their hard drives wiped and operating systems reinstalled.

These takedowns are just the latest internationally coordinated botnet takedowns. They are encouraging because they demonstrate the growing ability of police and private industry to launch highly coordinated operations that can sever large, international criminal operations from the Internet in a single stroke. On the other hand, the need for a steady stream of takedowns demonstrates the persistence of the botnet problem. http://goo.gl/57zMIE ◆

Verizon FIOS Router Security

By Ron Weinberg, Member-At-Large, PC Users Group
rswjbr@verizon.net

Many of us who reside in the Tampa Bay area rely on Verizon as their ISP. We benefit from their fiber optic service FIOS. In most such cases, a router is supplied by Verizon to support home wired and wireless networks. The latter being essential for linking tablets, laptops, and smart phones.

TPCUG members well know the importance of Security in everyday electronic transactions. Your router is the door to all your connections and transactions. Is it secure?

I recently helped install a replacement Actiontec M1424 supplied by Verizon. The Wireless Password (WPA2), The router's controlling software (User Name: admin) and its password, are printed on the label permanently affixed to the Router. This is like leaving the key to your house in the lock.

The average customer, even if given instruction by Verizon on how to install this product, is unlikely to change these defaults. If you have an older Verizon Router you may wish to check it's settings. Bright House customers may wish to check their Routers also.

WPA2 is the highest level of security available on the Router. Verizon recommends using the default Pre-Shared key printed on the label rather than a Custom Pre-Shared key.

One might say that an intruder or hacker might have to come into your home to see these settings. Personally, I prefer to err on the side of more security, not less.

Changing the settings is simple, just log in to 192.168.1.1 through your browser. Sign in using the admin and provided password combination. The software is straightforward. ◆

Monthly Rambling

By Merle Nicholson, Secretary, Tampa PC Users Group
merle@merlenicholson.com

I want to mention three things this month: the availability of inexpensive printers with full features; inexpensive laptop and computers-on-a-stick; and Google Fi.

Google Fi

First, Google Fi is a new phone carrier, in competition with Sprint, Verizon, AT&T and T-Mobile. It's unique though. They don't own any infrastructure, but instead purchase coverage from Sprint and T-Mobile. In addition to cell coverage it switches to WiFi as if it were a cell whenever it can. So if you happen to be in an

Rambling.....Continued on page 7

Rambling.....Continued from page 6

area with no cell coverage, head for the nearest library, or bus. It's inexpensive as a result; unlimited phone and text coverage is just $20/mo, plus data at $10 per gigabyte per month.

There are a few catches (of course), but maybe it will suit you. Personally, I come close to liking all this but not 100%. First, the phone has to have the capability to do all this and there's but one expensive phone that works; a Phablet called Nexus 6, and, yes, it's a 6 inch phone and a superb phone/tablet at that if you have big enough hands and pockets. I'm considering one myself as a replacement for my current phone and Nexus 7 2012 tablet combined. The big downside is the $650 price. Wow. It's made by my favorite Motorola. But it's made to do all the carriers and WiFi calling too if you have the right SIM card. You can get the phone right now from carriers like Verizon and from Google, Amazon and others. Google Fi will be selling this phone for $27/mo on a two year contract.

You buy into the data plan in 1GB chunks, but unlike Verizon the cost per GB is linear and unlike everyone else they credit you for unused data! Even data overages cost the same as the plan!

This is where Verizon really stinks. You don't want to go over your data plan with Verizon, the cost is 50% more. There's no real reason to do that since you can monitor your usage and buy a higher plan at any time over your Verizon app, but still, you have to monitor it; especially if you share the plan with family members as I do.

So Google Fi isn't for everyone, for sure. Right now it's by invitation only, and I haven't been invited yet. Because of my shared plan, I'm paying $63/mo each at Vz, and if I broke away I'd be paying $75/mo each for the two, plus . . . man, my head hurts. I think this would be a no-brainer if I were on an individual Vz account and my trusty Nexus 7 tablet stopped holding battery charges.

Still, it's good for all of us to have this kind of competition. Verizon needs to dump their tiered data pricing. It makes no sense at all, and is not fair to anyone. Secondly, they need to lower the monthly charge when a phone goes off contract. In Verizon's defense, they provide the best coverage and reliable service. They have also finally gotten the billing statements so they're understandable.

Inexpensive notebook computers

ASUS notebook for $179 at Staples. It's Windows 8.1 and just 11" screen, 2GB memory and 32G SSD. Looking at the Staples and Office Depot ads, it looks like small Windows 8.1 notebooks are common at $250 and less. Maybe I don't want one, but it's intriguing. I certainly don't want a Windows 8.1 computer without a touchscreen, but I see a $250 one that is. What's happening? Well one thing is that Microsoft has essentially stopped charging manufacturers for the "Windows 8 with Bing" operating system. The other thing Intel is working hard on processors that compete with the ARM processors going into tablets and phones. They are years behind in this market. They have always made something, but the new requirements are stringent. Battery life and heat are the big problems that are solved only by smaller, more efficient cpu designs. And then Intel processors mean that Windows 8.1 is possible in small devices since the price for small memory storage modules has gotten reasonable.

So this $179 notebook has some serious limitations, but it's a good alternative to a tablet and keyboard combo, mostly cheaper, and if Windows 8 without touchscreen it doesn't suit you, installing a good Linux OS is just perfect. Using Chrome and Chrome Apps will get you pretty much everything and you can add Linux programs like LibreOffice and Netflix. I like it. If I drove away with it sitting on the roof of my car, I'd only be out the $179 bucks.

Quick review – new inkjet all-in-one – HP Deskjet 2540 - $59.

I was looking for a compact inkjet for my spouse' computer in our living room. "Compact" is a tough one. I gave up when all I can find are portables costing $300-$500. Not for me. But I did find that all the makers now have small inexpensive all-in-ones (Epson's is "Small-In-One"). In this case All-In-One means

Rambling.....Continued from page 7

printer/copier/scanner, not FAX, and no scanner sheet feeder. Prints on one side, but is wireless! After checking prices thoroughly, Valerie bought this HP Deskjet 2540 wireless model in a retail store, a rarity for us. Several things are surprising. It was very easy to set up from a Windows machine since they provide software for Windows and Mac and no other; via a USB cable (supplied). Then the USB cable is no longer needed. The wireless connection needs to be set up, and from there on, printing is from anything. I can print anything directly from my Android phone or tablet. Scan, too! After setting it up, our computers and phones and tablets were easy. Two Linux computers, two phones, one tablet and one more Windows 7 computer found the printer and scanner and installed drivers. It isn't compact, but it isn't big either. After all, it has a flatbed scanner lid that determines the footprint. $59, one color, not pretty. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Dave Palmer and Merle Nicholson are back joined by Roger Waters with articles for the newsletter, for which I am very appreciative. It means that I have to write less myself.

I don't usually mention such things in the newsletter, but since my wife, Karen, was my proofreader for all the years that I have edited the newsletter I feel it appropriate to mention that she died in the middle of May. Her cancer took a turn for the worse, and she was not able to do either the April or May newsletters. I think she had probably proofread every issue I have put out since I began in December of 1995, even doing that job while in the hospital at times. What that means is that now you most likely will find some missing or misplaced commas, some misspellings, occasional bad grammar and whatever else goes along

Minutes of the May Meeting

By Merle Nicholson, Secretary, Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. Bob LaFave, the SIG moderator introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees. This month in Bob's absence, Merle Nicholson was the substitute moderator. The discussion covered a demo of Portable Apps – a Windows program that packages and presents a menu of important and useful Windows application, all on a USB drive.

Our guest speaker was Blain Barton. We are very fortunate that Blain is willing to do a presentation to us yearly. Blain is a Microsoft Senior Technical Evangelist who focuses on cloud technologies. He has just completed a book entitled: *Microsoft Public Cloud Services: Setting up your business in the cloud*. A Paperback will be available June 27, 2015 at Amazon.

- Blain gave us an outline of the first chapter of his book Azure platform as a service
- SaS Software as a Service
- IAAS – Infrastructure as a service, licensing and delivering
- PAAS – Platform - web apps in a ready made cloud based environment

Finally, Blain gave us a pretty quick view of Windows 10, especially the menu system which looks to be a blend of Windows 8.1 and Windows 7. ◆

Robocall Help

By Roger Waters, Tampa PC Users Group
rvwaters@hotmail.com

During several past meetings comments were made about robocalls. This discussion will be for those that still have land lines. The frequent calls at supper and later can be disruptive. Many sign up for the Do Not Call list. I signed up for both the national (https://www.donotcall.gov/) and state (https://www.fldnc.com/) do not call list. It did not seem to help. I was still getting calls.

To understand why they keep coming is to understand the predictive dialers that are used. Some of these dialers run through area codes and office codes and then dial number 0000-9999. As an example my area code is 813 and the office code is 949. The dialer will dial 813-949-0000 through 813-949-9999. As you can tell, it will eventually hit my number. These dialers can dial every area code and office code. Most of them are set to target a specific area. The dialers can tell if they get an answer so an agent can be engaged for the sale. It can also tell if they have a dead number or intercept. Suggestions I have seen to reduce robocalls include putting a SIT tone at the beginning of your voicemail. The SIT (Special Information Tone) triggers the auto dialer to think the number is disconnected. The tone can be found on many sites. You just need to Google Special Information Tone. One example can be found here:
http://home.comcast.net/~mcbrides9/sit.html. I believe that it could also be useful for cell phone calls if placed before a voicemail message.

In April 2013, the Federal Trade Commission issued a Robocall Challenge. The FTC declared two winners. I believe one system was for a hardware device for your phone. The other solution was the one I am using. Aaron Foss was awarded $25,000 for his Nomorobo. This works with Voice Over Internet Protocol lines. This would be the phone service through the cable companies. I have Verizon FIOS. As part of the phone service you can put numbers on a list to block the call. To stop some of the calls I could set up a list of numbers to block. This helped with the fake calls from Windows about my computer having issues. As you can imagine, I would be all day blocking all numbers that call. That is why I signed up for Nomorobo. It stops most of the calls.

Nomorobo uses a service called "simultaneous ring" that is provided by most VoIP phone companies. This feature allows customers to have numerous phone lines ring at the same time. When a call comes in it also rings a number Nomorobo provides. The company uses caller ID and call frequency information to screen calls. When Nomorobo decides a call is a robocall, it hangs up after the first ring. That's how you know a call was blocked. You don't need to have caller ID on your phone for this to work and Nomorobo promises the information they collect is anonymous to protect subscribers' privacy. There are currently millions of phone numbers in the company's database of blacklisted phone numbers. These known robocallers come from complaints filed with state and federal regulators. The system isn't perfect. Robocalls do slip through. Nomorobo encourages users to report robocall numbers that are not in their database. It will not block schools, political campaigns or any emergency numbers. It works well for us. Since all calls are checked, you may not want to use the service. Their system will know all of your incoming calls. I don't worry about the privacy issues using the service. I just enjoy not having sales calls. If you are interested in using Nomorobo here is the link for them http://www.nomorobo.com The site has a video explaining the service and how to sign up. ◆

Creating a Windows Standard Account

By Merle Nicholson, Secretary, Tampa PC Users Group
merle@merlenicholson.com

Last month, Dave Palmer wrote an article "Recent Cybercrime News Highlights" in the May 2015 newsletter on page 3. One part stood out for me, and I'm reprinting it here:

> **Clear Evidence That Running in Admin Mode is a Threat** An analysis of Microsoft Patch Tuesday bulletins suggests that 97 percent of all 'critical' security vulnerabilities reported by Microsoft could have been mitigated simply by removing administrator rights. The figures are from the 2014 Microsoft Vulnerabilities
>
> Report by UK- based security firm Avecto, in which the company pulled data from every patch issued by Microsoft in 2014 - 240 in total. In 2013, the same report found that 92 percent of 147 total vulnerabilities with a critical rating could have been prevented via the same admin rights removal. The report goes on to say that user accounts with admin privileges are the primary targets for exploitation by malware, as they provide unrestricted access to a computer. http://goo.gl/vcpa8T

The solution is to create a standard user account for your normal everyday use and reserve the use of an Administrative account for the times you need to install software. The problem is that you don't want to disrupt your or your family's own use of your computer. That is solved by creating a user account with administrative rights and then change your existing account to standard. That way you won't have to rebuild the new account by copying documents and files. It's all here in a TPCUG newsletter article *Create a Standard Account*" in the October 2014 newsletter on page 3 at our website.◆

What is an Exploit Kit?

By Dave Palmer, Tampa P C Users Group
dkp205@hotmail.com

You may have heard the term 'exploit kit.' Maybe not. The term has become more prominent over the last decade as Internet crime has become more sophisticated. A few definitions will be helpful in explaining what an exploit kit is and how it's used.

A vulnerability is a weakness in a system that can be directly used by a hacker to gain access to a browser, a router, a system or a network. Vulnerabilities can result from mistakes in software, weak passwords or infected software. The vulnerabilities mentioned here are the software variety and require updates, patches, or fixes in order to prevent compromise by hackers or malware.

A zero-day vulnerability is a newly discovered vulnerability. It is completely unknown to the security community. It has not been recognized, analyzed or patched. Signature-based anti-virus software will not recognize it and cannot defend against it.

To take advantage of a specific vulnerability, hackers create software, called an exploit, specifically designed to take advantage it.

An exploit kit is a malicious software toolkit that automates the exploitation of browser and computer vulnerabilities for the purpose of spreading malware. I'm beginning to believe that 'tookit' is too soft a term. 'Attack platform' is more accurate. The goal of an exploit kit is to automate the infection of computers or other systems.

Exploit kit basics
The earliest exploit kit was developed in Russia and was first seen in mid-2006. It was called WebAttacker, and it sold for $20 US and included tech support. Researchers and security analysts are currently tracking over 70 exploit kits around the world. Together they

Exploit Kit.....Continued from page 4

take advantage of more than 100 different vulnerabilities. While they can, and sometimes do take advantage of zero-day vulnerabilities, the vast majority of the time they attack vulnerabilities that have already been patched. Those computer users who are slow to patch their systems are therefore at highest risk.

Advantages of Exploit Kits

Easy to use - Exploit kits are designed from the beginning to be easy to use. Their target market includes criminals with only low-level tech skills. They also provide a console or dashboard to help attackers track the performance of the infection campaign and provide information about the victims system. Did I mention tech support is included?

Flexible – Most exploit kits probe for multiple vulnerabilities. Their initial payload can include multiple exploits, or they may download exploits to match the victim's vulnerabilities. Customers can often customize specific features to fit their business model such as ransomware, bank heists, botnet building, etc.

Evasive – Some exploit kits can probe for anti-virus programs and virtual machines. If found, these exploit kits may stop themselves from running to avoid being found and analyzed. Some exploit kits don't write their payload to disk but run directly in the memory instead to prevent detection by anti-virus programs. They are called 'fileless infections.' Exploit kits also use a number of other evasive techniques.

Continuously updated – Subscribers are continuously updated with the latest exploits against such software as Java, Adobe Flash Player, Adobe Reader, Microsoft Data Access Components (MDAC), and other programs and browser plug-ins.

Good Communications – Once an exploit kit is discovered and analyzed, authorities and security firms can usually block communication URLs (web addresses) within 24-48 hours. To counter this, authors of some exploit kits provide fresh communication URLs every hour plus an automated process to update the URL to stay one step ahead.

How an exploit attack works

The hacker builds one or more websites that contain a 'landing page' and adds an exploit kit. To drive traffic to the exploit kit, the hacker has many options:

- Email spam - Spam campaigns using content such as warnings from the IRS, banks, and even police seem to work well. Fake alerts from legitimate companies that contain poisoned links are also popular. Unlike traditional phishing spam, the victim of these spam campaigns isn't taken to a look-alike site and asked for credentials. Instead they are directed towards a landing page that hosts an exploit kit.
- Purchased traffic – Underground markets have 'traffic providers' where traffic can be bought and sold.
- Compromised websites – When hackers compromise a website it's trivial to add a redirect. To slow down security analysts and authorities hackers typically add multiple redirects that change frequently.
- Malvertising – Malicious advertising is a relatively new and rapidly growing tool hackers have added to their arsenal. Hackers create fake companies and legitimate looking ads on existing online advertising systems to redirect victims toward exploit kits.

Just prior to connecting to the exploit kit, potential victims are screened by automated traffic direction systems (TDS). Hackers can filter out unwanted IP addresses (like security companies) or target specific countries or companies.

Once a potential victim encounters the poisoned landing page, the kit quickly (in fractions of a second) analyzes the browser and its components to see what's out of date. If there is a usable vulnerability, the correct exploit is loaded and executed. The hacker is then notified which exploit was used as well as the victim's country, operating system, browser and which piece of software on the victim's computer was exploited.

As a result, and without your knowledge, the hacker now owns your computer. Additional malware will

Exploit Kit.....Continued on page 7

Exploit Kit.....Continued from page 6

added to prepare it to become a vehicle for further crime. Just as smart street criminals don't use their own vehicles for street crimes, cybercriminals don't use their own computers for Internet crime. They will either use it to commit crimes or rent it out to other criminals as part of a botnet.

Exploit kits facilitate the addition of most other types of malware such as backdoors, droppers, banking Trojans, spyware, ransomware, botnet malware, scareware, keyloggers, rootkits, viruses, worms, adware, remote access tools, and ad fraud malware.

Earlier I mentioned that exploit kits could and probably should be considered attack platforms. A comparison could be made between exploit kits and unmanned military drones. Both carry sensors. Both carry weapons. Both can be programmed to operate with little or no human oversight. Both can be assigned a variety of missions.

Exploit kits are commercial products developed by teams of specialists. A recent example is the Blackhole exploit kit developed by Dmitry Fedotov (aka Paunch) and his team. Blackhole was one of the most notorious exploit kits of the last decade. Popular and quite profitable, it was first offered in 2010 and lasted through the arrest of the Paunch and 12 others in late 2013.

The Blackhole product itself and the service and management of the business was quite sophisticated and business-savvy. The scripts that made the software work were protected by a commercial coder to prevent other criminals from lifting & reusing the code. Blackhole was reported to have had thousands of customers and making $50,000 a month. Paunch was the first to use a 'rental' business model for exploit kits. Other licensing agreements were also available, all of which included tech support.

How to protect yourself

The standard excellent advice you've heard dozens of times before still applies. Run in Standard User Mode, NOT Administrative Mode. Stay patched & updated. Don't click on links in e-mail. And I'll add one item not typically mentioned: Configure your browser(s) to deny redirects without permission.

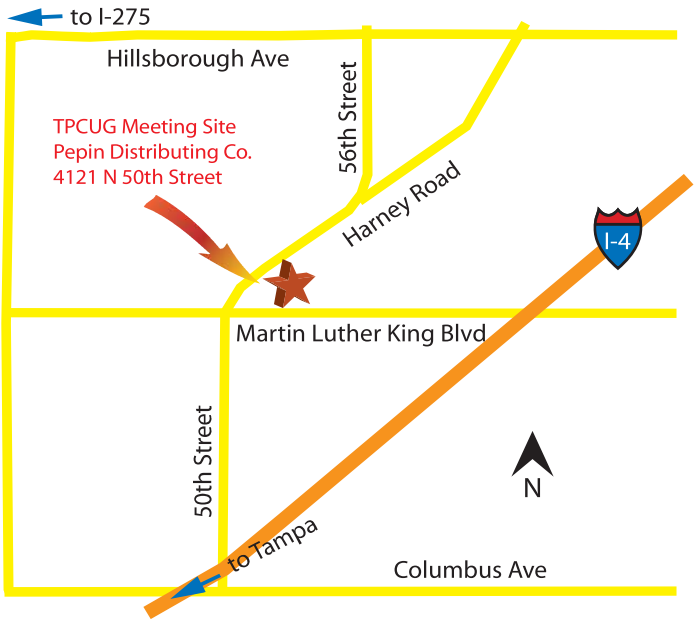
Comments.....Continued from page 1

with not being an expert in such things entails.



Windows 10 will be here on July 29. And if you are running Windows 7 or Windows 8.1, you are eligible for a free upgrade. The Windows 8.0 people are eligible too, but, I believe, they have to first upgrade from 8.0 to 8.1. If you are running Win 7 or 8.1, you should now see a small new icon in your system tray that looks like a window. Clicking on that will begin the process of reserving a free copy for you when the upgrade dat arrives.

A friend asked me to work with him on apps for the Microsoft Band. But, I don't have a Band, I said. I don't need to know how many steps I have taken today. Yes but it does much more and will do more in the future. So I went to the Microsoft Store at International Mall and purchased one. And it does do a good bit more than I thought. The most interesting thing is the report on my sleep last evening: I had 2 hours 43 minutes of restful sleep and 3 hours 53 minutes of light sleep and woke up five times, etc. There is a lot more, but let's save that for the next newsletter. I have only had the item for 24 hours. ◆

william@lamartin.com

Last month, I mentioned that a friend asked me to purchase a Microsoft Band so that I could work with him on writing phone apps for it. I did that and have been working on such an app. For now let's ignore my app and see what the Microsoft Health app provides.

Of the many reports that it gives, I find the Sleep Report displayed on the right the

Minutes of the June Meeting

By Merle Nicholson, Secretary, Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. Bob LaFave, the SIG moderator, introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees.

This month in Bob's absence Merle Nicholson was the substitute moderator. The session was a discussion of Ninite.com's Ninite program installation/updater, where you can select Windows programs that packages important and useful Windows applications for installation on your computer. This is in contrast to a trend of otherwise clean downloading websites allowing advertisements for downloads for malicious and/or unwanted software. A discussion of that problem ensued with dire warnings to check the download source before installing anything.

Our guest speaker was Laurie O'Hall, a Board Certified Elder Law Attorney, with the subject of "What Happens to your files when you die." Obviously she is an advocate of elder estate planning and addressed the questions "What is a will?", "What is Probate?", "Durable Power of Attorney," "Health Care Surrogate," "Living Will," "Living Trust," and "Asset Protection planning." She also covered the law on digital assets and offered advice on the value and the circumstances where you may want to control the disposition of the assets.

Our thanks go to Laurie O'Hall for her excellent and well prepared presentation. ◆

ISO Disk Image Is Your Friend

By Merle Nicholson, Secretary, Tampa PC Users Group
merle@merlenicholson.com

Yes, it is. ISO images solve some problems for you that you may not have known you had. I'm here to explain. But to make an early point, it has mostly to do with your new slim notebook or Chromebook that has no optical drive. It's slim and lightweight for a reason. No CD, DVD or Blu-ray drives. Things still come on these CD/DVD, so how do we adapt? There are a couple of ways.

Microsoft has said (maybe unconfirmed at this point) that Windows 10 installation distribution will be available on a flashdrive. It's not unprecedented; Linux OS distributions have been available on flashdrives for years now. There are utility programs available (even in Windows!) that prepare flashdrives for Linux installations. One difference is that the OS can run completely on the flashdrive without writing anything to the system drive. To me, an SD card would make more sense because systems having no optical drive always have some kind of card slot for cards. Flashdrives can be somewhat faster, especially if they are designed for USB3.

You can buy other operating systems on flashdrive (all Linux of course) like for the Raspberry PI. Most software now comes as a download. I've bought Microsoft Office software and Intuit Turbotax from Amazon, Acronis from UGR.com, and Street Atlas from Delorme all as downloads. I can't remember the last time I purchased software on DVD. Despite this, downloading software has become more difficult because of the failure of reputable sites to keep the sites safe.

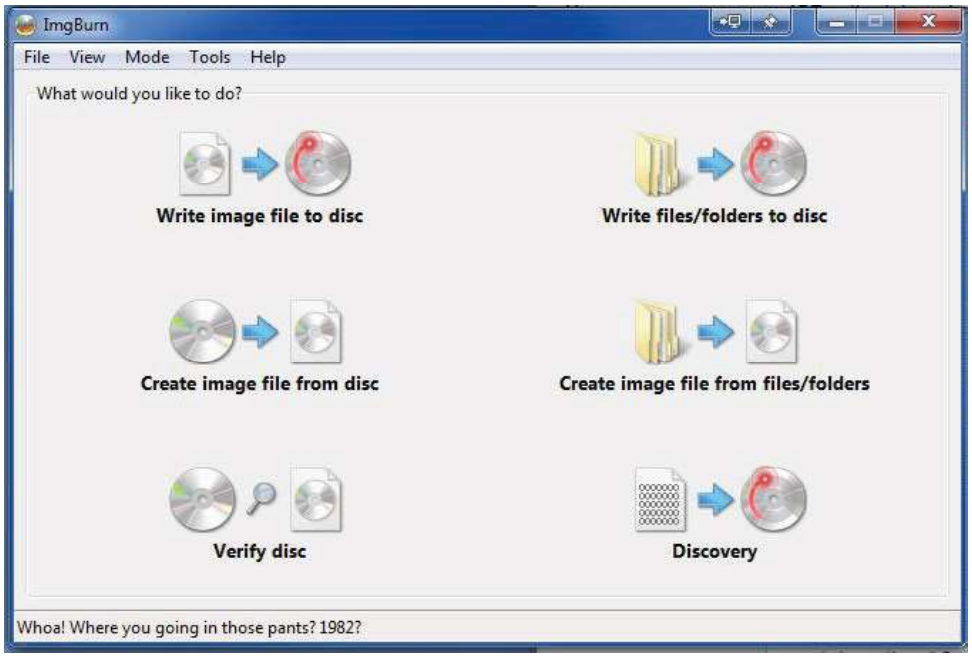
An ISO image is an archive file of an optical disk, a type of disk image composed of the data contents from every written sector of an optical disk, including the optical disk file system. On the hard drive of your computer, it usually has an extension of .iso, but sometimes .img is used. The name is taken from the ISO 9660 file system (one of many ISO standards) that is used on optical drives. ISO is the International Organization for Standardization.

We're used to software installation distributions coming to us as an .exe, but we're increasingly seeing .iso and .img. What do we do with a file with an .iso extension? Two things: 1) burn it to optical disk then put it back in and use it as a real DVD; and 2) Mount it as a logical drive on your computer and then just pretend it's a real CD/DVD/Blu-ray drive and run whatever's on it. For your no-optical-drive-notebook, you can buy or borrow an external USB optical drive – that's for option 1.

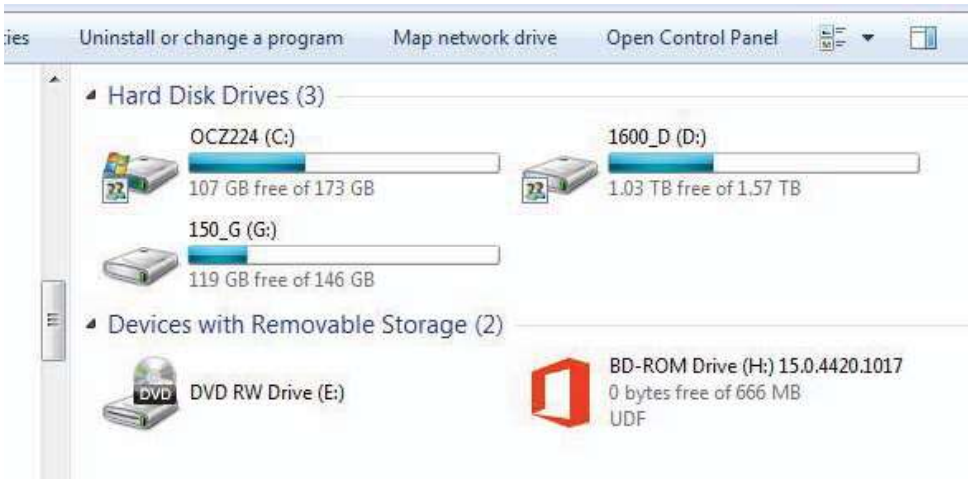
For option 2, it's easier than you may think. For Windows 7, you get a nice piece of free software called Daemon tools Lite from http://www.daemon-tools.cc/home and install it permanently on your system. Configure it so that it creates a virtual DVD/Blu-ray drive on bootup. Then you just either double-click on an .iso file or right-click and select Open. If the drive has an autostart, Windows will ask to run it. To remove the iso, just go to that drive in Computer, right-click and select eject. It works identically to having a real optical drive.

For Windows 8, 8.1, and (presumably) Windows 10, and Linux operating systems, it's built in. Just right-click and select "mount."

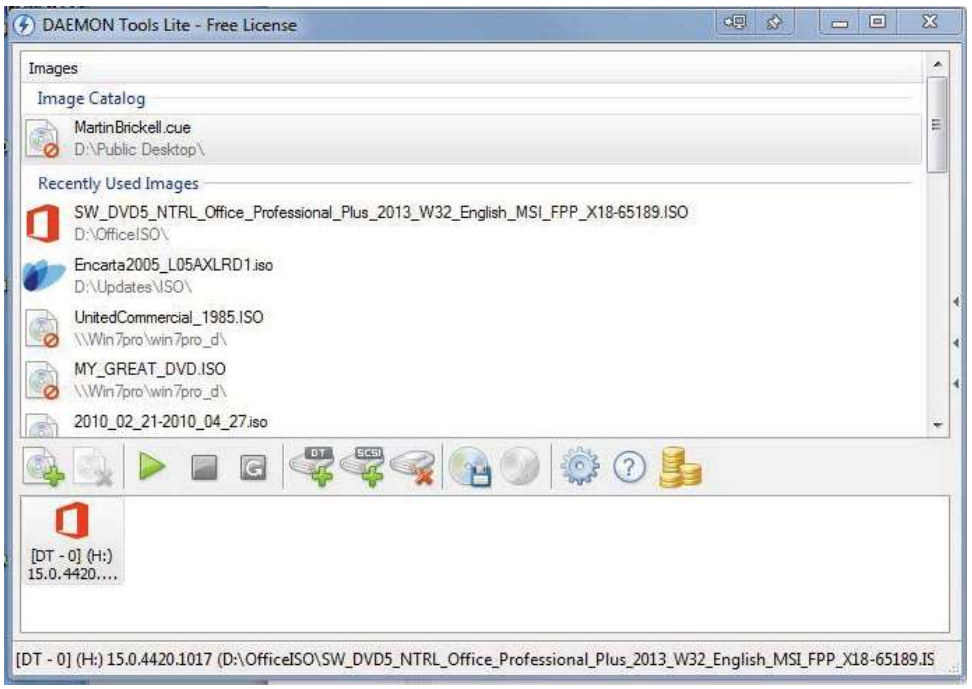
BUT Wait! There's More! What if you want to do more? Let's put your favorite CD music albums online. Instead of "ripping" music to the mercy of player software, just make your own ISO file from the CD or DVD. My spouse's daily exercise DVD is a good example. We have Windows Media Center playing to the big screen that plays DVDs. Inserting the (expensive!) DVD in daily and running it that often; it will certainly eventually fail from handling, so let's make our own .iso, put it on that system that has 3 or 4 TB, and it won't even be noticed hidden in 10 hours a day of Wimbledon Tennis recordings. We have a computer and a brand new workout DVD, how do we get it there? Free software of course. Here's ImgBurn in the screen capture at the top of page 4.



ISO.....Continued on page 4



ISO.....Continued from page 3



The website is http://www.img-burn.com/, but I wouldn't get it from them. It's another risky website. Instead get it from ninite.com at https://ninite.com/ Too bad ninite doesn't have Daemon Tools Lite, too.

Select "Create Image file from disc" and insert the DVD, let ImgBurn find it, then select the installation path and name. When it's done, it plays a happy little tune to let you know. Then just mount the .iso in a virtual optical drive, and you have the video on line all the time.

In Daemon Tools Lite, you can configure a maximum of four drives, allowing you to have four Virtual drives, and you can autoload the .iso for each on boot-up. ◆

Old But Better

By Ron Weinberg, Member-At-Large,
Tampa PC Users Group
rswjbr@verizon.net

They don't make them like they used to. My HP LaserJet 2100xi black and white Printer is 16 years old, still running perfectly, now on Windows 8.1, and has produced thousands of perfect crisp clear pages at a very low cost per page.

It has never required a repair or an adjustment. The only problem, very occasionally encountered, is an easily cleared paper jam. Long-lasting toner cartridges, yielding approximately 5000 pages, are still available online at prices well below HP's list.

Purchased in June of 1999 for $649, a time when cheap throw away inkjets were unknown, it was inherited when my company went out of business. This printer was intended for individuals and small work groups. It has 4MB of memory, a parallel port, and now obsolete infrared wireless capability. Additional memory and Postscript emulation cards were available, included in other similar 2100 models, as well as individually. It prints 10 pages per minute with a resolution of 1200x1200 dpi and projected monthly volume of up to 15,000 pages.

With the increasing disappearance of parallel ports, in July of 2009, I had the foresight to purchase a HP Jetdirect 600N J3113A Print Server which is actually an internal 10/100 Ethernet network card. It cost $22.50, well less than the original list price. This was the same card which was standard in the 2100TN network ready model. It allowed me to abandon parallel and connect as well as share it on my home network. Although my printer lacks 802.11a/b/g/n wireless connectivity, which became popular much later, I can still connect wireless devices to it via the network.

The first HP Laser Printer 2680A appeared in 1980. It was large, cumbersome, and very expensive at $108,500. Newer designs followed, and in 1984 the original desktop LaserJet Model, at $3,495, was introduced with great success. Those early models were substantial, high-quality pieces of equipment, manufactured with heavy metal cases, built for volume output and durability, mostly for business use. My LaserJet 2100, a much later model still weighed 31.7 pounds. Improvements continued and prices dropped as ever newer models became available.

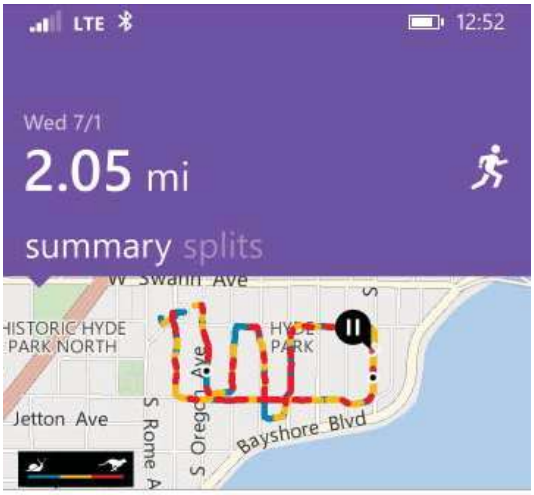
Inkjets ultimately took over the consumer market because of price and color printing capability. Multifunction printers (MFP's) also called All-in Ones that print, copy, scan, and fax entered the market. Additional manufactures such as Epson, Canon, Lexmark, and many others mass produced printers and competition drove prices down.

Quality and durability declined as cheaper designs and plastics were used to reduce costs. Inkjets dropped so low as to make repairs more costly than replacement, while ink prices remained the cash cow for the makers.

Lower priced laser printers, claiming a lower cost per page than inkjets, are now competing with better laser models. Conversely, some new better inkjets are now claiming a lower cost per page than lasers. You can choose Print only or Multi-Function (MFP) models, most are wireless. Beware of advertising claims. The old adage "you get what you pay for" applies here.

Heavier, solid, durable laser printers including color capable models remain available for heavy duty or commercial use, but, as expected, are priced accordingly. ◆

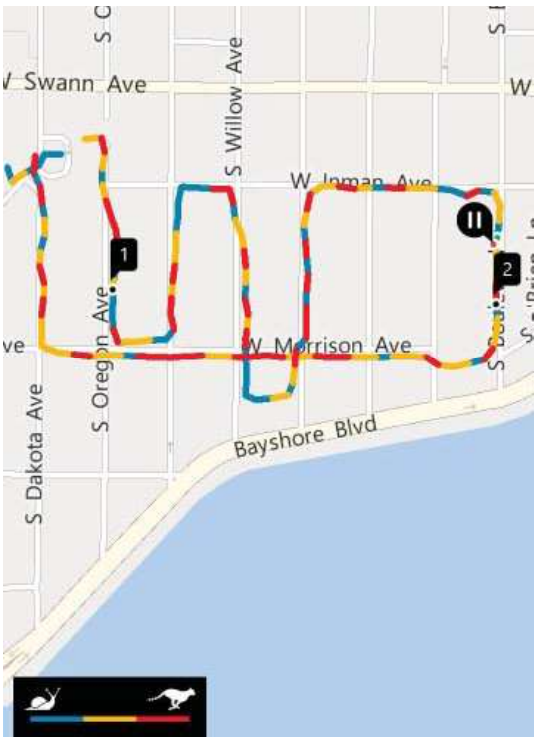
Comments.....Continued from page 1



most interesting. In addition to what you see in the screen capture, if I scroll the screen down, I would also see the following items: Efficiency 87%, Duration 8h 30m, Resting HR 54, Calories Burned 626 and that my Sleep Restoration was Good. How the band knows when I am sleeping or awake is beyond me.

There are many other things the Band will monitor such as a run or walk, a bike ride, a workout and how many steps you have taken during the day; also how many calories burned.

Comments.....Continued on page 7



Comments.....Continued from page 6

On the right, you see the summary of a recent walk of 2.05 miles. On most of my walks, I pause to talk to people and pet cats that may appear, so this will not be the fastest walk possible.

The phone screen capture at the bottom right is just a larger version of the map in the top image. Red segments are faster and blue one are slower.

You do not need a Windows Phone to use a Microsoft Band. There is a Microsoft Health app for both the Android phone and the iPhone. ◆

Found Treasure

By Eddie Rodrigues, Tampa PC Users Group
eddie2020@gmail.com

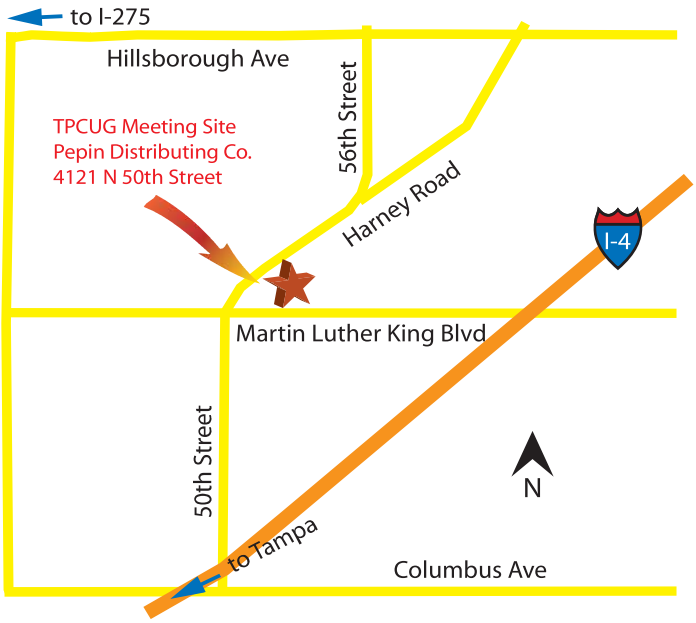
Have you ever wondered, do I have money due to me that I need to claim? Well, the good news is that there is a web site for the State of Florida where you can look to see if there is money due to you personally or to a business that you have or once owned.

The website is at the following link:
https://www.fltreasurehunt.org/

The following statement is on the website: Currently, the Chief Financial Officer holds unclaimed property accounts valued at more than $1 billion, mostly from dormant accounts in financial institutions, insurance and utility companies, securities and trust holdings.

In addition to money and securities, unclaimed property includes tangible property such as watches, jewelry, coins, currency, stamps, historical items and other miscellaneous articles from abandoned safe deposit boxes. Unclaimed money is deposited into the state school fund, where it is used for public education. There is, however, no statute of limitations, and citizens have the right to claim their property any time at no cost.

It's important to note that claiming your "lost' property is at no cost to you. Also, be aware that you indeed need to have an undisputed claim to the property.



On the website, please read "Frequently Ask Questions" about your claim and identification. Also note that every state in the nation has a similar website, and you can make similar claims. ◆

Meeting Preview: Windows SIG for the full meeting using Windows 10. Merle Nicholson will set up an administrators account and standard account and some initial settings that should be done with any new installation. Subject to having remaining time, Merle and William LaMartin will answer any Windows 10 installation questions.

Editor's Comments – Windows 10

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Have you upgraded your computers to Windows 10? I have done that for five of the six devices I have that are eligible: A win 8.1 desktop, a Win 8.1 Surface Pro 2, a Win 7 desktop, and two Win 7 laptops. The remaining device is a Win 8.1 tablet with minimal memory. It has the small white window in the System Tray that indicates that an update is coming, so I will just wait and see what happens.

As for waiting, all my computers had the little white window in the System Tray indicating they were eligible, and on June 29, the first day of the update, two of them actually already had the folder $Windows.-BT in the C:\ directory which is an indication that something should be happening soon. So I waited, and on June 30 my Surface Pro 2 said it was ready to do the update

Minutes of the July Meeting

By Merle Nicholson, Secretary, Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. Bob LaFave, the SIG moderator introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees. This month in Bob's absence, Merle Nicholson was the substitute moderator.

Our guest speaker was TPUG's own Dave Palmer, giving us one of his well-prepared cyber security presentations. This month's topics were Identity Theft and Fraud, both Identity Fraud and Consumer Fraud. How a company website is targeted with an overview of the 2014 large target data breaches, and the world's largest data breaches. He showed a fascinating video on how fake credit cards are made. Finally, he told us what we can do to deter identity theft. Our thanks go to Dave for his excellent and well prepared presentation. ◆

Comments.....Continued from page 1

when I clicked on the little white window. And I did the update. The update on it took about one hour and 12 minutes. That is pretty fast, but that computer does not have a lot of files or programs on it. That installation went fine as far as I can tell, with all my programs, files and settings preserved.

Now to wait on the update for my other computers. I particularly wanted the update on the Win 8.1 desktop, since that is where I do all my programming in Visual Studio 2013 for Win 8.1 apps. I had recently installed Visual Studio 2015 on it and was looking forwarded to working with Windows 10 Universal apps as soon as Win 10 got installed. But the little white window kept telling me that Win 10 was coming and that I would be notified when the installation was ready. I waited two days and decided to take things in hand. There is another way to do the upgrade. Simply go to the URL

What is Yubikey

By Dave Palmer, Tampa PC Users Group
DKP205@HOTMAIL.com

As Internet threats have grown over the years, and as my understanding of them has grown, I've tried to keep pace and become more secure. About five years ago I adopted Lastpass, the password manager. Afterwards I slowly switched my all my accounts to long, randomly generated passwords. Usually extra security means less convenience. But the change to Lastpass actually made my life both easier and more secure.

Two-factor authentication.
Last year I tried two-factor authentication (2FA) for the first time. Wikipedia says 2FA "… provides identification of users by means of the combination of two different components. These components may be something that the user knows, something that the user possesses or something that is inseparable from the user. A good example from everyday life is the withdrawing of money from a cash machine. Only the correct combination of a bank card (something that the user possesses) and a PIN (personal identification number, i.e. something that the user knows) allows the transaction to be carried out."[(1)] In other words 2FA adds another layer of protection by requiring a second login step. 2FA can keep the bad guys out of my Lastpass account even if they steal my username and password through malicious software.

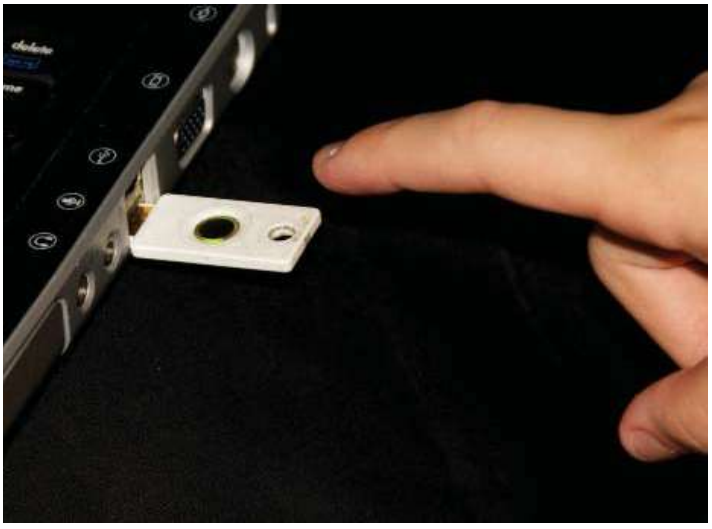
Lastpass supports several 2FA options, a number of which I had never heard of. I first tried Duo Security, a third-party service that can either generate one-time verification codes or send push notifications (texts) to my phone. Setting up and configuring the account turned out to a bit complicated. But eventually I got it set up and began using it. Whenever I logged in to Lastpass, Duo Security would send a code in a text message to my smart phone, which I would enter as the last login step. It turned out to be less convenient than I thought. Maybe I expected too much.

Having listened to Steve Gibson's podcasts[(2)] for many years, I knew that several years ago, he had dug deep into the security behind the Yubikey and the company behind it as well, Yubico[(3)]. He liked what he found and, like Lastpass, decided to use a Yubikey himself.

What exactly is a Yubikey?

As you can see in the accompanying photo, the Yubikey is a small thin device, smaller than most flash drives. It plugs into a computer's USB port. When I tap on the metal circle, the device generates a password and enters it into whatever text box or web form my curser is in. This password is authenticated against my account, and can be implemented by a website either in place of a text password you know or as an additional login requirement (2FA). For Yubikey to work on a website, that website must add the Yubikey code and implement the Yubikey process.

Here's how it works.
In Lastpass, I first enter my password, then Lastpass shows me a dialogue box (see photo) that needs input from the Yubikey. When I touch the metal surface the Yubikey provides the password and - I'm in. It's far easier than waiting for a text message and typing it in manually.



Yubikey.....Continued on page 4

Yubikey.....Continued from page 3

YubiKey does not require software installation or a battery; just plug it into a USB port, and touch the button. A Yubikey is something I have that provides security protection beyond something I know (my username/password). So, even if someone steals my username and password they can't get into my Lastpass account without my Yubikey. To use a Yubikey on Lastpass however, you do have to be a Premium User, which costs $12 per year. Speaking of costs, a Yubikey costs $25 – a one-time fee. Yubikey is also available on Amazon.

Yubico products work on Windows, Mac OS X, and Linux. Yubico currently has several versions of the Yubikey available,[4] in addition to hardware and software for business.[5] I'm using the Yubikey pictured. Yubico has complete and relatively easy instructions to set up and activate the Yubikey. Lastpass and other websites have instructions on connecting Yubikey to their websites. Yubikey works on Gmail and Google Accounts, WordPress websites and the following password managers: Keepass, Password Safe, Password Tote, pwSafe, and PassPack, and of course Lastpass.[6]

Who else is using Yubico technology?
According to the Yubico website these companies have purchased Yubico products for their employees: Google, Facebook, Salesforce, Novartis, Microsoft, and many others. There's a long list on the site.[7]

1. https://en.wikipedia.org/wiki/Two-factor_authentication
2. https://www.grc.com/sn/sn-143.pdf - the Yubikey discussion starts on page 7.

http://www.microsoft.com/en-US/software-download/windows10?OCID=reserve_r_PostReserve_MediaCreationTool and follow instructions. I used this for four out of five computers I upgraded.

The process was problem free except for one computer, the small Toshiba Win 7 Home Premium laptop. Everything seemed to be going fine and almost finished. I walked away and came back to a blank screen and after a few minutes wait with no activity decided the laptop was off. I pressed the power button and the laptop booted to the message that my previous operating system was being restored. After that was done, and I was in Win 7 again, I read a message that said: "0xc1900101-0x30018 The installation failed in FIRST_BOOT phase with an error during SYSPREP operation."

I had a thought. I had let the laptop run on battery power alone since it had a full charge. Was it possible that the charge ran out just before everything was finished properly? I tried the installation again and this time received an error message which I don't recall exactly other than it did not like the Windows product key and quit at some early point in the process. A look at the product key on the label on the back of the laptop told me that the original product key for the laptop did not match what was currently in the registry. I suppose the Win 10 update had given the device a new product key. How to get around this? How about a reboot first off since I had neglected to do that after the previous failure before trying again.

Internet Picture of the Month

Too Much Rain

The picture this month is a bit a cheat since it is actually at one of the websites I manage, http://www.oldhydeparkfl.org, my neighborhood's website in Tampa. It is one of the photos used in the video at http://www.oldhydeparkfl.org/Videos/TooMuchRain.mp4 that demonstrates just how much rain fell in my neighborhood on August 1.

August's Links

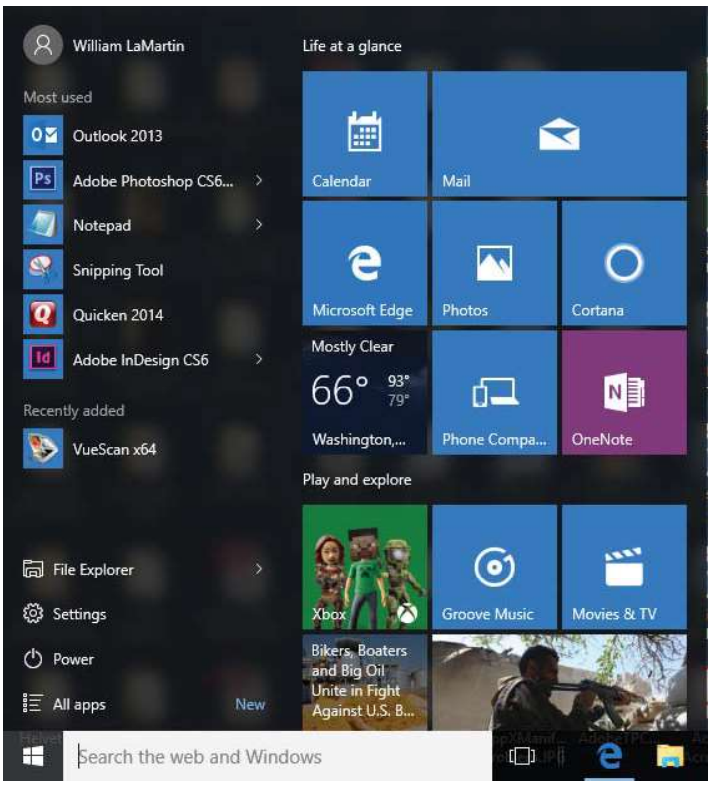
Comments.....Continued from page 4

So a reboot to Win 7 and a retry at the installation. Thank goodness this is not an important computer to me. However, in somewhat of a surprise to me, everything went smoothly this time, and I had my fifth computer running Windows 10. I will wait and see if Microsoft eventually does the update to the tablet.

The moral of the above is: Try again on the Windows 10 upgrade using the link I provided if you experience problems. My sister found when she checked the little white window that Microsoft had tried three times to upgrade her Win 7 desktop only to encounter problems. I gave her the above link, she used it and got Win 10 installed successfully.

Now the question is: What do I think of Windows 10? Well, I had actually been using the Technical Preview version on a Virtual Machine at Azure for some time. And to be honest, I really didn't poke around much to see what was new and different since my main reason for working with it was to be able to use Visual Studio 2015 to modify my Windows 8 and 8.1 apps to be Windows 10 Universal apps.

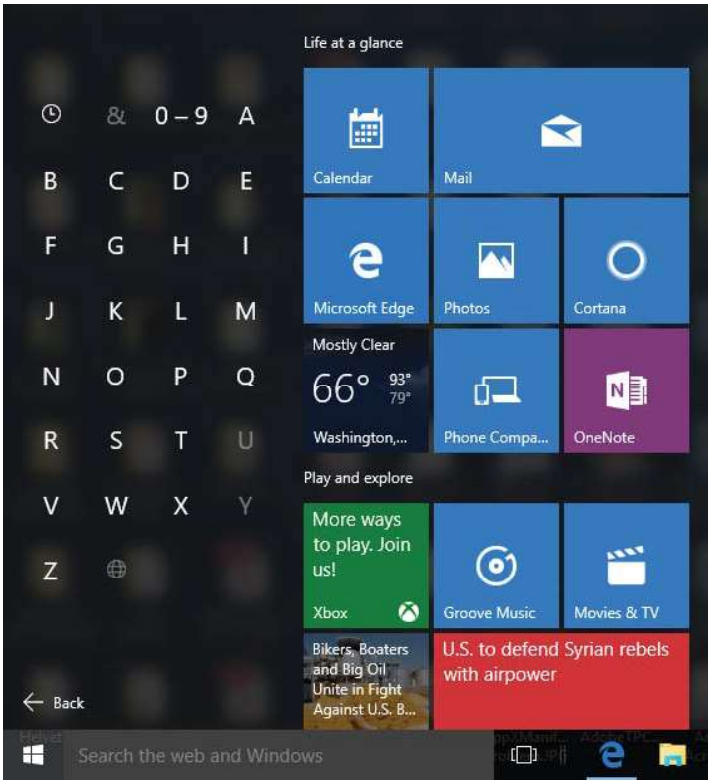


First, I should note that when I boot any of my Win 10 computers they all go to the desktop where I see my desktop with all the many icons for folders, files and shortcuts that I have put there – just as in Win 7. If I press the Windows key or click the Windows icon at the extreme lower left of the screen I am presented with what you see in the image to the right overlaid over the left side of the desktop. If I click (or tap for a touch screen) on the All Apps item, then I am presented with an alphabetical list of my applications as you seen in the top left image on page 7. Note, however, that I can only see the first part of the list of applications beginning with A. Of course I can scroll down as far as I want. However, if I tap on the A or any other letter heading, I am presented with the image at the bottom left on page 7 displaying the alphabet. If I click on any letter in that I am taken to that section of the alphabetical listing beginning with that letter. Not exactly the start menu from Win 7, but still quite functional. You may also search for an application by name simply by typing it into the search box you see at the bottom left of the first image.

Some problems that Windows 10 may present are: It will uninstall Windows Media Center if installed; Older versions of Acronis True Image are not supported, the 2012 version, for example; Your printer may need a new driver; And your scanner may need a new driver. Also, provided by Merle Nicholson: Since Microsoft no longer supports Office 2003 (no new updates), Windows 10 (and 8/8.1) will not provide any old updates if needed. There are no Windows 10 Drivers for the Ceton InfiniTV cablecard devices, USB and PCIe

I lost Acronis True Image 2012 on the upgrade of my Windows 7 desktop, and I needed to download from Epson a new Windows 10 driver for my Epson Stylus Photo 2200 wide carriage printer. That is the printer I use for all my photography work. It produces excellent prints, and I didn't want to lose it, not in the least because I have well over $100 worth of extra ink cartridges on hand. Epson had the Win 10 driver.

My Epson Perfection 3200 photo scanner was another matter. There is at this time, at least, no Windows 10 software available. And even though there is now a



Comments.....Continued on page 7

Comments.....Continued from page 7

Windows 7 driver, as I recall when Windows 7 first came out there was no Win 7 driver either. So you see this scanner is a bit old; however, it still produces excellent results. What to do?

When I could not find a Win 7 driver when Win 7 first came out, I discovered a program named VueScan by Hamrick Software (http://www.hamrick.com/) that would work with any scanner and any operating system. Too good to be true? It is true – believe it! I still had that software on my former Win 7 desktop, and before upgrading that device to Windows 10, I found the installation for it and installed in on my recently upgraded to Win 10 Windows 8.1 desktop. The software would not work. So I went to Hamrick Software and downloaded and installed the new Window 10 version of VueScan. It worked with the scanner in Win 10. But to remove watermarking on the scans, it required a product serial number, a customer ID and a customer email. I had all these items from the old version, and after entering them into the new version, I had a fully registered and functioning new version of VueScan and a working scanner in Win 10. Now that is quality software support, not having to pay for new versions. So I had no fear of upgrading my Win 7 desktop to Win 10.

My recommendation is that if you have Windows 7 or later on your computer and don't have any printer or scanner driver problems (check this out ahead of time regarding drivers), then do the upgrade. You will have problems at first adapting to something new, but the new start menu is fairly straight forward, and you should have easy access to all your applications. Also, we will be discussing and demonstrating Windows 10 in future meetings if you want to wait and see those demonstrations before plunging ahead.

I am sure you can find on the Internet many people saying don't upgrade. A few of them may provide valid reasons concerning old applications and old hardware. But most of the naysayers really don't know what they are talking about and basically are simply Microsoft haters.

Before you upgrade to Windows 10, make sure your Windows updates are 100% current. If incompatible programs do need to be uninstalled, the upgrade will tell you. With the exception of Windows Media Center, it helps the process by uninstalling in advance any

Meeting Preview: Windows 10 will be displayed running on devices of various sizes: A laptop computer, a Windows 10 phone, and a credit card sized computer running windows 10 IoT, where IoT means Internet of Things. There will be the usual windows SIG preceding the presentation.

Editor's Comments – Raspberry Pi 2 and Windows 10 IoT

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

The entire newsletter is one long comment this month. It is a comment instead of an article since it started on the first page. Last month I wrote that I had installed Windows 10 on six devices: Two desktop computers, two laptops, a Surface Pro 2 and a seven-inch tablet. Now I can say that I have added one more device to the list. It is a credit card sized computer named the Raspberry Pi 2. It is simply a tiny motherboard with all the necessary items to make it a real computer. It has four USB 2 ports, and I have connected a keyboard and a mouse to two of then. It has an HDMI port, and I have attached a 23-inch monitor to that. There is port for a LAN cable, and that is how I first connected the Pi to the Internet and the Local Area Network. Finally there is an RCA port to connect a cable

Minutes of the August Meeting

By Merle Nicholson, Secretary, Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. Bob LaFave, the SIG moderator introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees. This month in Bob's absence Merle Nicholson was the substitute moderator and also the presenter for the months presentation. The SIG was brief, and the topic was, of course, the new Windows 10, which brought us to the presentation, done on a Windows 10 computer.

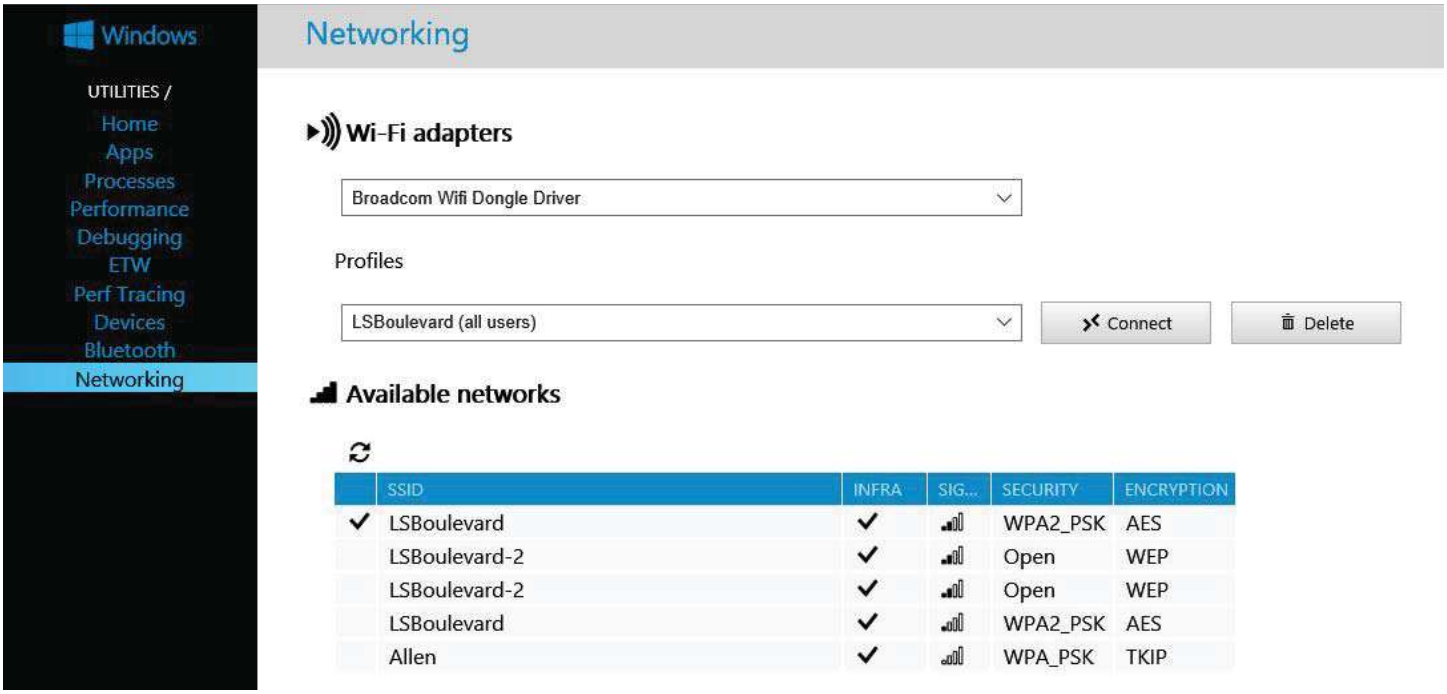
The subject of the presentation was "Windows: Use a Standard Account for security and other good reasons." I presented all the reasons that it is a bad idea to do your daily work on an Administrative account. It means that as long as you're logged on, any malware or electronic intruder can execute and install using the authentication level of the current user. 90% of all virus infections and other malware could be prevented by simply using a standard account. A standard account user is prevented from installing software and making configuration changes and settings. The system must ask for an administrator password.

Using Windows 10, the demonstration activated the administrator user account, created a password for the account, tested the accounts, changed the original account to standard and changed the User Account Control Settings.

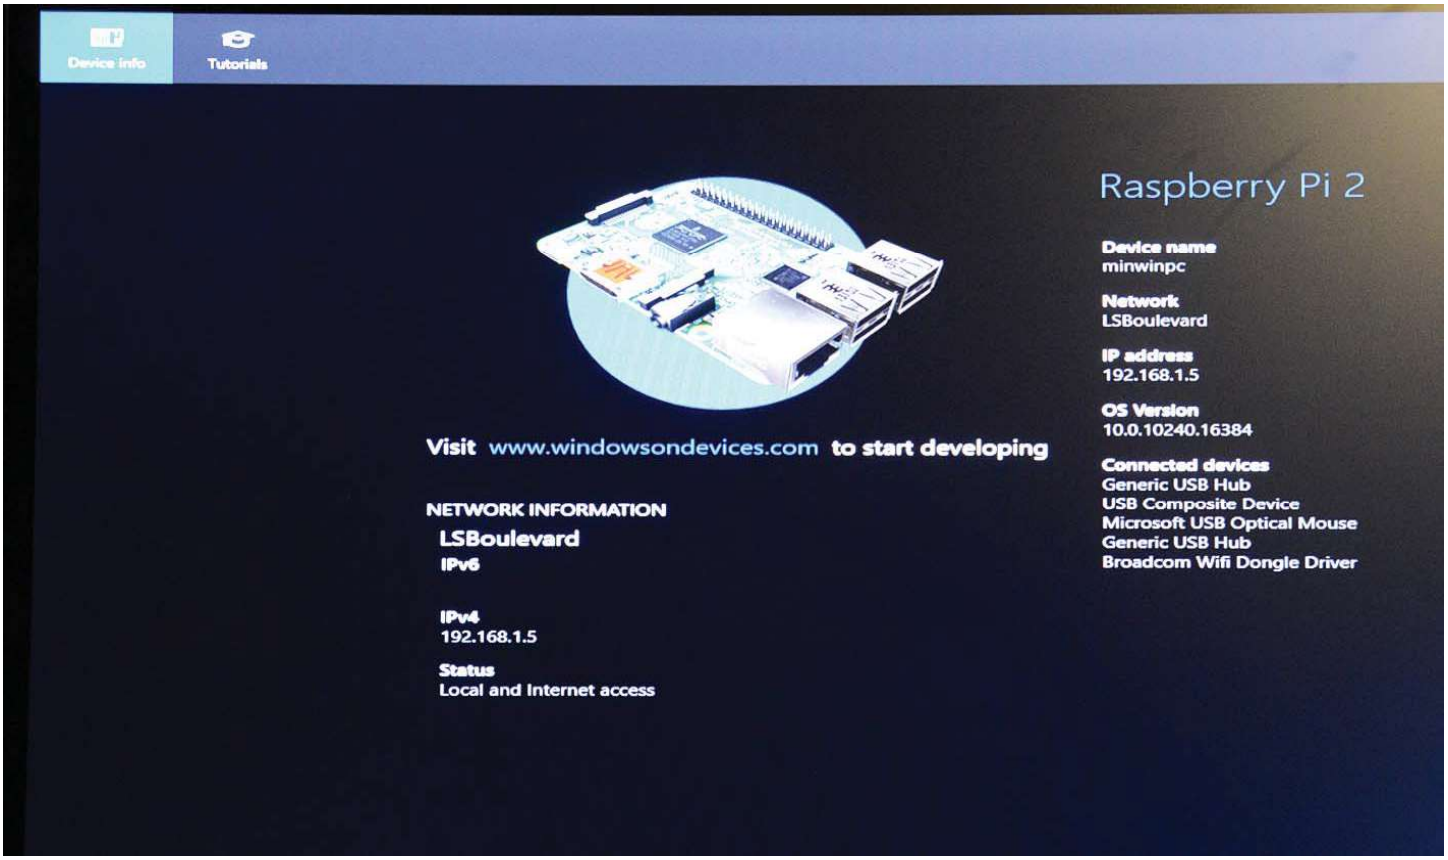
As was expected, there were continuous discussions surrounding the operation and appearance of Windows 10 and questions about installing it. Windows 10 final release was just a few days before, and most members had not upgraded.

All in all, we had a successful and lively presentation.

◆



Comments.....Continued from page 1



to the speakers on the monitor. The price of the Raspberry Pi 2 is around $45. A mouse and small keyboard are around $10 to $12 each. The most expensive item is the 23-inch monitor at around $130, as I recall. Of course, you could use a spare monitor you already had. To the left, there is a photo of the Pi with nothing attached. Then following that is a photo the Pi enclosed in a clear plastic case with the mouse, network cable and monitor attached. At the time I took that photo, my keyboard for the Pi had not arrived.

But before you can use the Pi you will need to give it an operating system . My choice is obviously Windows 10 IoT (Internet of Things). I won't go into how you put that on a micro SD card that you then insert into a slot in the Pi. But if you are interested you can get detailed instructions from http://www.Windowsondevices.com.

All the hardware items mentioned above were purchased through Amazon (using the link on our home page). What I

Comments.....Continued on page 4

Comments.....Continued from page 3

couldn't get from Amazon was a USB wireless dongle. Actually I could get one. In fact, I own one already. However, I have been told that the only such dongle that will work with the Raspberry Pi 2 is the official one from Raspberry Pi – if you plan on putting Windows 10 IoT on it as the operating system. Apparently there are many such wireless USB dongles that will work if you are running whatever is the appropriate version of Linux on the Pi, but only this one for the time being if you are running Win 10 on the Pi. I ordered an official such item from the only place you can purchase one, England (the home of the Raspberry Pi), and it is coming via Royal Mail. However, since it has been shipped over a week ago at the time of this writing and I have not received it, I believe the Royal Mail is a bit slow. And 30 minutes after typing that, the Royal Mail package arrived in my mail box after a nine day journey. I inserted the dongle into one of the two empty USB ports in the Pi, and the Pi immediately saw that it had some wireless networks available.

Now, you might ask how I knew the Pi had recognized the new Wifi dongle. That information was arrived at as follows: When I connect the Pi to a power source, it boots its operating system, which is Win 10 IoT. When the boot is finished, on the monitor is a screen that lists information about the Pi including the device name, OS Version, as in the image above with the exception that in the original image there was no IP address listed (this photo was taken after everything was set up). What you see above is a photo of the monitor after I have set up the wireless connection using the list of Wireless sources as shown in the photo at the bottom of page 3, where I have selected LSBoulevard and have put in the required password. I cannot explain why each of the two inhouse sources is listed twice.

I hope to demonstrate this little computer to you at the meeting, and having the wireless USB dongle should make things easier since to do some of the things I want to do requires that the Surface Pro 2 that I will be using as my computer at the meeting be on the same network as the PI. I am not sure that connecting the Pi to the LAN connection at Pepin will put it on the same network as the Guest Wireless network there that the

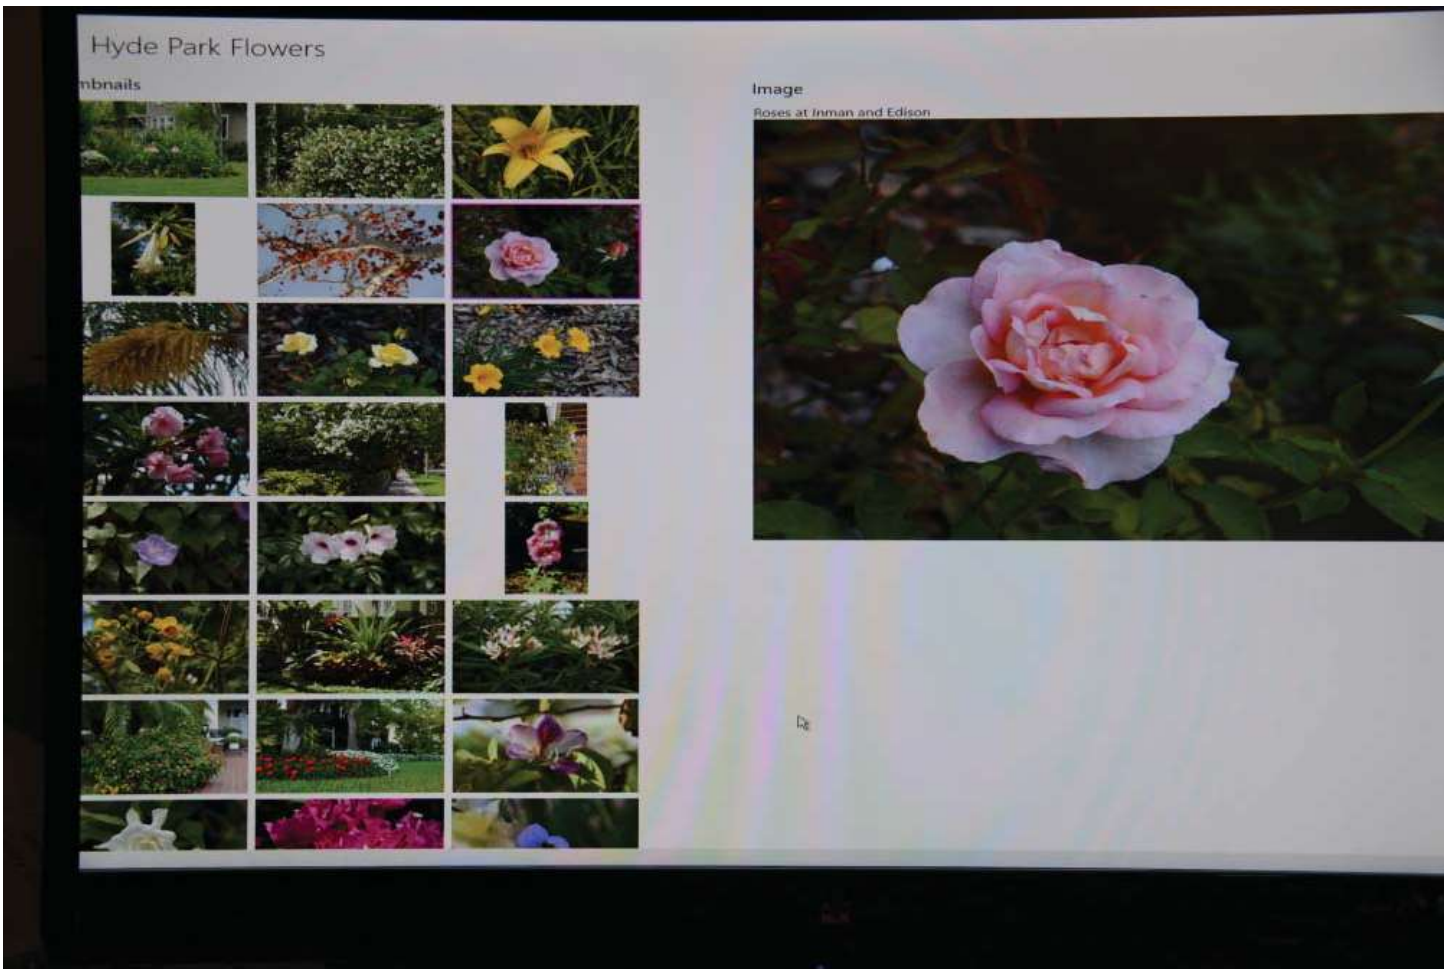
Surface Pro 2 will be connected to.



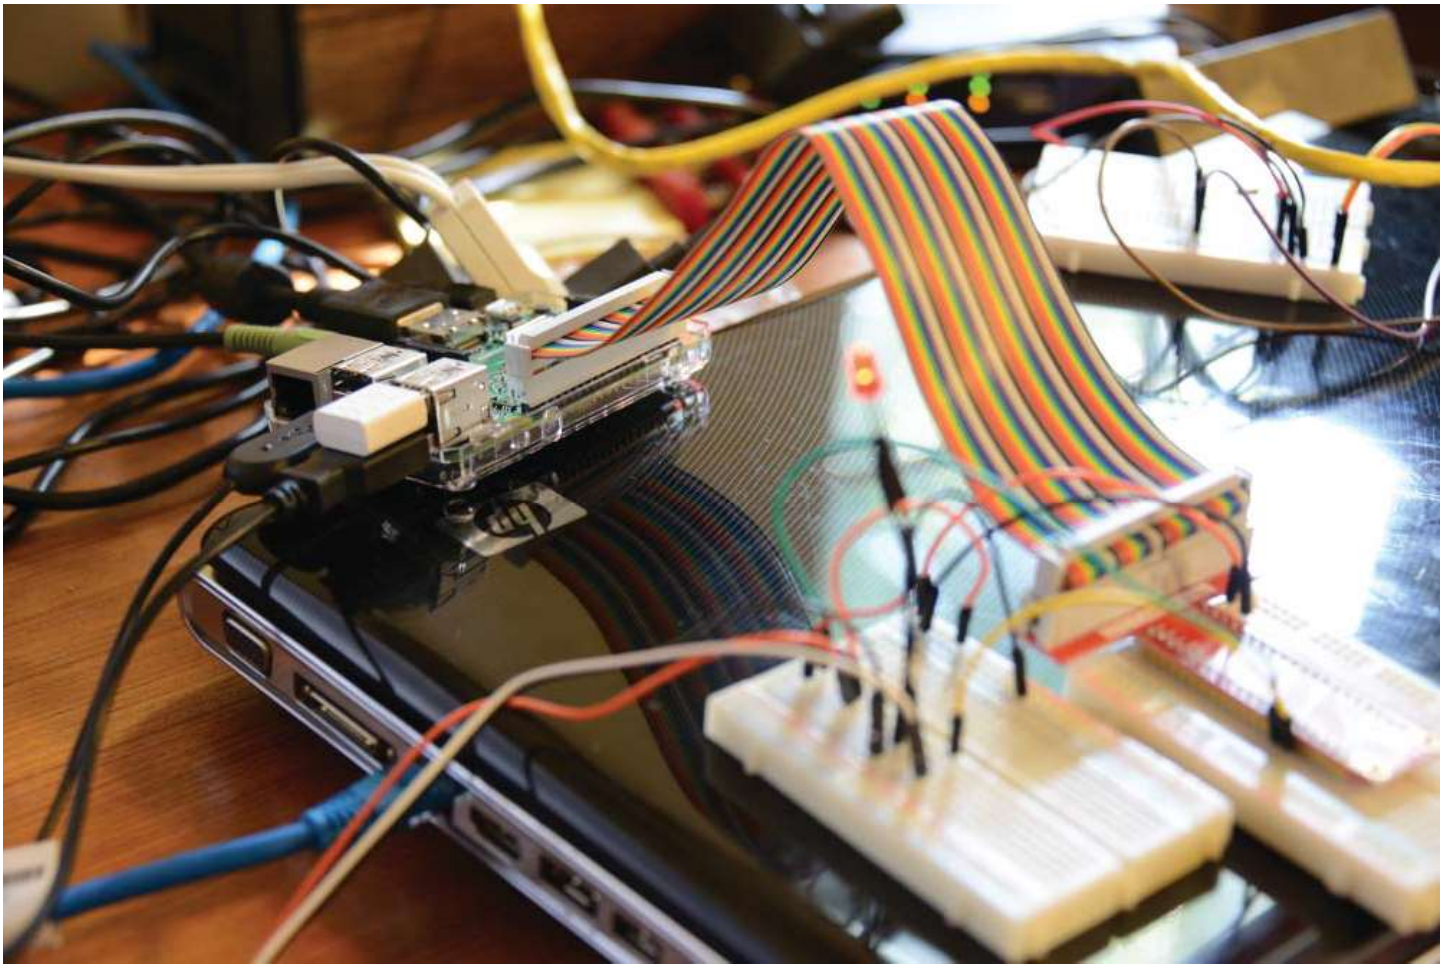
I think that the Pi is not really meant to mostly be used with a monitor. It is meant to control electronic devices by a program that you write and install on the Pi. There are all sorts of examples of such out there on the Internet. Some examples are: Opening the dead bolt on your apartment door via your cell phone, controlling a small robot, and the simplest of all – making a LED blink at various rates.

So far, not being much with electronics, I have only done two simple projects of that nature. The first is to make a LED blink at varying rates. The second uses a proximity sensor connected to the Pi to indicate when something is moved close to the sensor. Both of these apps will work without the monitor since they indicate what is happening by the use of LEDs. However, the program that controls then (written with Visual Studio) can also put output to a monitor such that the rate of the blinking LED is controlled by a slider on the monitor and we have a red dot on the screen that blinks on and off in unison with the actual blinking LED. And for the proximity sensor, we can also have our program output information to the monitor where it displays Close when something moves close to the sensor and Far when the sensor detects nothing.

So much for blinking LEDs. I am not really an electronics person. Although I am going to try to learn how to do more with sensors and the Raspberry Pi 2. To that end, I have bought quite a collection of sensors sold by SunFounder and available at Amazon. What I want to discuss last is what makes Windows 10 so special as an operating system.

If I write what is called a Windows 10 Universal app, and if I take care to consider the different screen sizes that are available in my layout part of the app, that app will run and display properly on all Windows 10

Comments.....Continued on page 7



Comments.....Continued from page 6

devices: A Microsoft Surface Hub (http://www.microsoft.com/microsoft-surface-hub/en-us), a Windows 10 desktop computer, a Windows 10 laptop computer, a Windows 10 tablet, a Windows 10 phone, and – here is the surprise – a Windows 10 IoT device's monitor. And I have done it, since my Window 8 Store app Hyde Park Flowers, which I have ported to Windows 10, runs perfectly all the devices listed. The photo at the bottom of page 6 is the Hyde Park Flowers app running on a Raspberry Pi 2 and displaying on the connected monitor. Admittedly it runs a lot slower on the Pi than on any other of the devices since the Pi's processing power is much less. But it runs with only one thing missing: I cannot share a selected image via email since the Pi has no email program.

In the meeting this month, I hope to demonstrate Windows 10 running on all the above mentioned devices except the Surface Hub which is not yet available and which I will not own when it becomes available due to its high price and a desktop computer since I don't want to bring one to the meeting. But I will bring a laptop, my phone and the Raspberry Pi 2 with a monitor for it.

We can talk about Windows 10, in general, and compare our experiences with it since it has now been available for about one month. I know some of you may be holding back on installing Win 10, so perhaps this will give you a bit more information and make you more comfortable with installing and using it. My sister solved a lot of the problems she was having with her five year old Windows 7 computer by moving up to win 10. And she is nine years older than I. So you know that makes her somewhat advanced in years. As I said in last month's newsletter, the only problems you may encounter would be drivers for old scanners and printers. And I gave you the solution for scanners: View Scan by Hamrick software.

Comments.....Continued from page 7

To finish, the photo on page 7 lets look at a completely decked out Raspberry Pi. Everything is sitting on top my old HP laptop computer. The Pi is to the left, and you can see the empty top left USB port where a LAN cable was connected but which was disconnected when I added the wireless USB dongle that you see in the top right USB port. In the bottom two USB ports,the two black cables connect to the mouse and the keyboard. The sound connection is the green item plugged into the Pi on the far left, and beside it is the HDMI cable to the monitor.

The colorful ribbon cable contains 40 wires that connect to the 40 pins on the Pi and which then terminate in a 40 pin connection to the breadboard on the lower right corner. That bread board is then connected to another breadboard to its left and then jumpers connect it to the proximity sensor out of sight, and the blinking red LED is connected to it and is standing upright to the left of the ribbon cable.

It will all be much clearer when you see all this in person at the meeting.

To end this, here is a video of my proximity app in action: http://www.lamartin.com/Videos/RaspberryPi2AvoidanceSensor.mp4. ◆

Meeting Preview: Steve Singer will tells us about the latest in computer hardware. There will be the usual Windows SIG preceding the presentation.

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Last month I wrote about in the newsletter and did a presentation at our monthly meeting on Windows 10 On Many Devices. A part of the meeting focused on my running Windows 10 programs I had written on the credit card-sized computer know as the Raspberry Pi 2. Some of the programs were standard Win 10 programs that displayed photos, etc. on the attached monitor. But a couple of the programs were meant only for the Pi and not other Windows 10 devices. They were simple programs that used sensors to make LEDs connected to the Raspberry Pi blink when the sensor detected something.

But the Raspberry Pi and Windows 10 IoT (Internet of Things) can do much more than that in the hands of programmer who is also an electrical engineer. In short, in the hands of someone much more talented than I. And I have an example for you created by one of the area's Microsoft developers. If you go to the link, https://microsoft.hackster.io/en-US/cyborg-gibson-11/ultimate-kegerator, you will see how to control all the various

ATM Cashout Fraud
Highly Coordinated, Highly Profitable

By Dave Palmer, Tampa PC Users Group
DKP205@HOTMAIL.com

ATM fraud has been growing steadily over the past decade. There are many varieties of ATM fraud, from simply stealing a PIN and withdrawing money illegally, to reprogramming an ATM machine to spit cash out on demand, to installing skimmers to steal customer data for later use. But the type of operation called 'Unlimited Operations' by both the criminal underground and the U.S. Secret Service takes ATM fraud to a new level.

The cyber crime groups attempting these crimes combine two different types of criminals. On one side are the highly skilled masterminds and technicians. They formulate the plan and break into the bank networks using combinations of social engineering, malware and technical skill. They recruit and coordinate the other team, the street criminals, and carefully monitor the withdrawals and flow of cash. The street team consists of multiple 'cashout crews,' or cashers, those who withdraw and forward the money to the money launderers. The laundering crew purchases expensive items then liquefy them to erase any connection to the cyber crime group.

Let's look at several of these crimes in some detail.

2008 attack against RBS WorldPay - $9 million
The group used sophisticated hacking techniques to compromise the data encryption that was used by RBS WorldPay to protect customer data on payroll debit cards. Payroll debit cards are used by various companies to pay their employees. By using a payroll debit card, employees are able to withdraw their regular salaries from an ATM.

Once the encryption on the card processing system was compromised, the hacking ring raised the account limits on compromised accounts, and then provided 44 counterfeit payroll debit cards to several cashout crews.

The hackers then sought to destroy data stored on the card processing network in order to conceal their hacking activity. The cashers were allowed to keep 30 to 50 percent of the stolen funds. They then transmitted the bulk of those funds back to the ringleaders.

Within a span of 12 hours the cards were used to withdraw more than $9 million from over 2,100 ATMs in at least 280 cities worldwide, including cities in the United States, Russia, Ukraine, Estonia, Italy, Hong Kong, Japan and Canada.

Federal prosecutors in the U.S. alleged that the 2008 RBS theft was orchestrated by at least eight men from Estonia and Russia — the alleged ringleader, Sergei Tsurikov, was extradited to face charges in the United States. In October of 2014 Sergei Tšurikov was sentenced to eleven years in prison for conspiracy to commit wire fraud and computer intrusion for his involvement in an elaborate scheme.

Another key figure in that case was Viktor Pleschuk of St. Petersburg, Russia, who monitored the fraudulent ATM withdrawals remotely and in real-time using compromised systems within the payment card network. Pleschuk and Russian accomplice Eugene Anikin were arrested and charged in Russia. Prosecutors asked the court for five- and six-year sentences, but those requests were ignored. Pleschuk and Anikin agreed to plead guilty for their roles in the RBS heist in exchange for suspended sentences (probation, but no jail time!!).

ATM Fraud.....Continued on page 4

"You know, you can do this just as easily online."

ATM Fraud.....Continued from page 3

2011 attack against Fidelity National Information Services (FIS) - $13 million

In May 2011, Fidelity National Information Services (FIS) said it had incurred a loss of approximately $13 million related to unauthorized activities involving one client and 22 prepaid cards on its Sunrise, Fla. based eFunds Prepaid Solutions, which was acquired by FIS in 2007.

Jacksonville, Fla. based FIS is one of the largest information processors for the banking industry today, handling a range of services from check and credit card processing to core banking functions for more than 14,000 financial institutions in over 100 countries. Cyber thieves broke into the FIS network and targeted the Sunrise platform's "open-loop" prepaid debit cards. The balances on these prepaid cards aren't stored on the cards themselves; rather, the card numbers correspond to records in a central database, where the balances are recorded. Some prepaid cards cannot be used once their balance has been exhausted, but the prepaid cards used in this attack can be replenished by adding funds. Prepaid cards usually limit the amounts that cardholders can withdraw from a cash machine within a 24 hour period.

The crooks were able to drastically increase or eliminate the withdrawal limits for 22 prepaid cards that they had obtained. The fraudsters then cloned the prepaid cards, and distributed them to co-conspirators.

The thieves then waited until the close of business in the U.S. on Saturday, March 5, 2011, to launch their attack. Working into Sunday evening, conspirators in Greece, Russia, Spain, Sweden, Ukraine and the United Kingdom used the cloned cards to withdraw cash from dozens of ATMs. Armed with unauthorized access to FIS's card platform, the crooks were able to reload the cards remotely when the cash withdrawals brought their balances close to zero. The heist netted around $13 million in cash.

As a result FIS came under heavy scrutiny from banking industry regulators in the first quarter of 2011. The Federal Deposit Insurance Corporation (FDIC) found the company failed to enact some very basic security mechanisms. For example, the FDIC noted that FIS routinely use blank or default passwords on numerous production systems and network devices. Analysts say FIS's problems almost certainly stem from having to cobble together various networks and systems that it inherited from a long series of corporate acquisitions over the past few years.

Feb 2013 - $45 million cashout attack across 24 countries

In two precision operations that involved criminals across two dozen countries acting in close coordination and with surgical precision, thieves stole $45 million from thousands of ATM's in a matter of hours. In the first operation, hackers infiltrated the system of an unnamed Indian credit-card processing company that handles Visa and MasterCard prepaid debit cards. Such companies are attractive to cybercriminals because they are considered less secure than financial institutions, say computer security experts.

The hackers, who are not named in the indictment, then raised the withdrawal limits on prepaid MasterCard debit accounts issued by the National Bank of Ras Al-Khaimah, also known as RakBank, which is in United Arab Emirates.

With five account numbers in hand, the hackers distributed the information to individuals in 20 countries

ATM Fraud.....Continued from page 4

who then encoded the information on magnetic-stripe cards. On Dec. 21, 2012, the cashing crews made 4,500 ATM. transactions worldwide, stealing $5 million.

In the second operation, 12 account numbers were secured for cards issued by the Bank of Muscat in Oman and raising the withdrawal limits, the cashing crews were set in motion. The crews made 36,000 transactions and withdrew about $40 million from machines in the various countries in about 10 hours. In New York City alone, the thieves responsible for ATM. withdrawals struck 2,904 machines over 10 hours starting on Feb. 19, 2013, withdrawing $2.4 million. This New York street crew however, was the first to be caught, their pictures captured as they traveled the city withdrawing money and stuffing backpacks with cash.

In May 2013, eight defendants were charged with stealing $2.8 million from New York banks in the 2 separate attacks. The indictment and criminal complaints in the case offer a glimpse into what the authorities said was one of the most sophisticated and effective cybercrime attacks ever uncovered. Prosecutors said it was one of the largest heists in New York City history. Alberto Yusi Lajud-Peña, the leader of the New York cashing crew, was later found murdered in the Dominican Republic on April 27.

In June 2015, Ercan "Segate" Findikoglu, a 33-year-old Turkish man who investigators say was the mastermind behind several of these ATM cashout crimes appeared in the U.S. court system for the first time. The investigation is ongoing.

Comments.....Continued from page 2

the Microsoft Devices Briefing may be viewed at http://www.microsoft.com/october2015event/en-us/live-event. I found it quite interesting. Here is a list of the items discussed:

- HoloLens
- Microsoft Band
- Lumia Phones
- Surface Pro 4
- Surface Book laptop

The **HoloLens** virtual reality thing will not be available until 2016 even for developers, who have to pay $3,000 for a development kit. The other items will be available later in October or in November.

There is a new version of the **Microsoft Band** that is more aesthetically pleasing with its curved design and which also has several new health features. It is available for pre-order at $250, $50 more than the original Band, which I have and find useful for monitoring my sleep, calories burned and my walks, just some of the features it has. This should be available by the end of the month.

I am particularly interested in the new **940 and 940 XL Lumia phones** since my current Windows phone is over two years old. Unfortunately for me, at least at first, the phones will only be GMS type phones available from the Windows Store and from AT&T. I saw no mention of CDMA phones that would work on

Comments.....Continued on page 7

Comments.....Continued from page 6

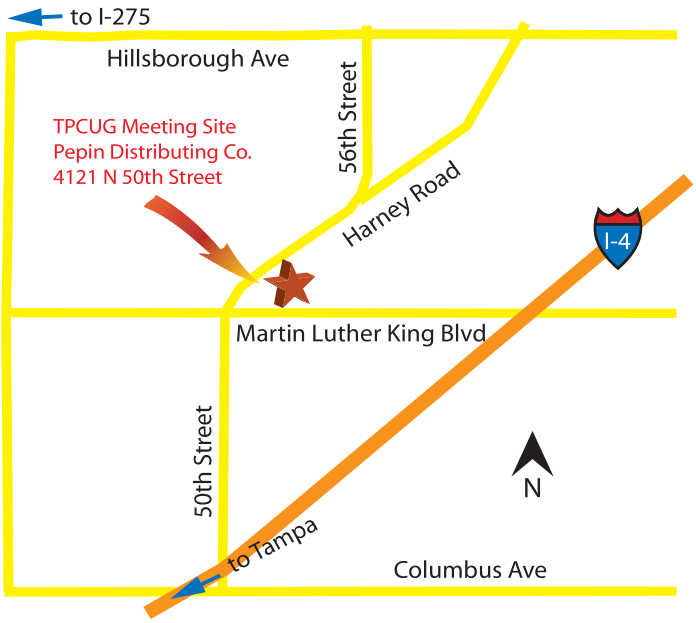
the Verizon network where my account is. The same goes for Sprint customers. However, since T-Mobile is a GSM carrier, one of these phones purchased from the Microsoft Store will probably work there. At the Microsoft Store, their prices will be $549 and $649, respectively, definitely high-end phones.

The **Surface Pro 4** looks fantastic, thinner with a slightly larger screen, faster processor and up to 16 GB of RAM and one terra byte of storage. You may pre-order the Surface Pro 4 now for delivery by October 26. The base model with an Intel Cor M processor, 4 GB of RAM and 128 GB of Storage will run you $899. The top of the line Intel Cor i7 with 16 GB of RAM and 1 TB of storage will run you $2,699. Oh, and don't forget the detachable keyboard is extra at around $130. These are not cheap devices. But they are well-made and cutting-edge.

And to the big surprise, a Microsoft laptop named the **Surface Book**. It has a 13.5-inch PixelSense™ touchscreen display with (3000 x 2000) resolution. It weighs only 1.6 lbs. The base version has an Intel Core i5 processor, 8 GB of RAM and 128 GB of storage and will cost you $1,499. Not cheap because you are paying for the slim packaging and quality construction and the superb screen. The top version has an Intel i7 processor, 16 GB RAM and 512 GB of storage and will cost you $2,699. This is a very high end machine, twice as fast as the Mac Book Pro, as I recall, and intended for power users. And after seeing the screen moved to all sorts of different positions as is normal with a laptop, the surprise in the presentation came when the presenter simply detached the screen and turned the screen into a tablet, which he preferred to term clipboard mode, as you can do with the Surface Pro.

All of these devices may be viewed online at the Microsoft Store http://www.microsoftstore.com/store/msusa/en_US/home. And, I am sure they will soon have them at the Microsoft kiosk at International Plaza and then when it opens sometime in November, as I have been told, at the full Microsoft Store at International Plaza.

One of the most amazing things demonstrated was using your new Windows 10 phone as a computer via a small Display Dock pictured below connected wirelessly to a mouse and keyboard and to a monitor.



I am excited about all this new Microsoft hardware. I know it is expensive, and if you want to get a new touch enabled laptop running Windows 10 there are many options out there from other vendors that will suit almost any budget. However, I doubt any will match these new microsoft products in performance and styling. Personally I am content with my Surface Pro 2 since I do most of my work on one of my two desktop Win 10 computers. But I would really like one of those new phones. Unfortunately Microsoft and Verizon do not seem to be on the same page at the moment. ◆

This newsletter belongs to Merle with his two articles, one long and one short. It is good to not have to write anything other than this brief paragraph or two here on the front page.

The big news for me is that Microsoft is opening a full-scale store on the Second level of International Mall on November 5. As everyone knows, Apple has had a store there for several years, and all Microsoft had was a kiosk. Now it appears that Microsoft is getting serious about becoming a hardware vendor with their new laptop, the Surface Book, in addition to their Surface Pro 4. They will also have Windows computers from vendors such as Dell, Lenova and Acer on sale.

I was in Manhattan recently and saw the large presence Apple has there in retail with their flagship store at Fifth Avenue and 59th Street. But I also saw, about five blocks to the south on Fifth Avenue a five story Microsoft Store scheduled to open two days after I left. It will be interesting to see how this plays out. ◆

Minutes of the October Meeting

By Ron Weinberg, Member at Large
Tampa PC Users Group
rswjbr@verizon.net

We welcomed back old member William McKenney who had been absent for several years. He suggested using Beezix cards cheat sheet and tips to learn Windows 10.

William LaMartin advised that TPCUG Newsletters are indexed and can be searched using the App "Computer Group Newsletters" available from the Windows store.

Tonight's presenter, Steve Singer, showed a selection of the latest tech products and discussed several items of interest.

According to Steve, Windows 10 has security holes for use by Microsoft which are still open at this time. Steve suggested "JV16 Power Tools," free for 60 days, to fix this and it will also do a good system cleanup.

The program "Calibre" is an excellent manager of E-Book collections.

Steve showed the latest Netis Routers which could be used with FIOS. Cat 5 wiring can be used instead of Coax. There is an Ethernet Port in the FIOS in-box.

You can eliminate your land line and connect wired phones to your Router by using Google Voice and the OBIHAI black box which Steve showed.

Charging speeds are affected by the quality of charging cables. Two apps for Android measure the speed: "Read Charging" or "Galaxy Charging Current." A number of new universal smart chargers were shown. They can handle Apple and Android phones as well as tablets.

Steve also displayed a new improved Bluetooth headset and several of the latest system boards in small format using AMD processors and featuring APU

Travelling With Tech

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

We just completed a 7,500 mile cross country road trip by car. We equipped ourselves to use the Internet as much as we could for the route planning, reservations and scouting for resources – food, lodging, supplies and all the necessities of a month long trip. By "we", I mean my spouse Valerie, our dog Guinness and me traveling in a recent Honda CR-V. Our farthest stop was Seattle from Tampa FL.

The technology devices we used were: 1) The car, 2) two Android smartphones, 3) an Android tablet, 4) a Windows 7 notebook, 5) a GPS tracker on Guinness' collar and 6) an Aircard/wifi router combination. Plus software and apps for all of these.

We started out with no idea of what our physical capabilities were going to be – how many miles we could manage in a day and sustain that for a month. That complicated things making it impossible to make hotel reservations more than a day in advance. That and the desire to avoid being tied down to a schedule. In the "old" days we would land in a city and start looking for a place to stay, then look for meals. That's hugely time wasting, making it necessary to depend on fast food. The further complication is Guinness and needing a dog-friendly hotel and dog-friendly places to eat, being determined to eat well and not in the car.

It took about three days to determine a daily distance goal. That number ranged from 350 miles to 450. We accomplished that with one exception – extending the distance for an additional two hours of night driving just once – and had some serious consequences.

We needed a flexible range because when you get into low-population western states, there just may not be a town with dog-friendly hotels at the distance we wanted. So we tried to use the technology at hand to make the best choices we could.

The Car – 2013 Honda CRV. How is the technology in a car a factor? We used my smartphone on a car mount with Google Navigation and voice commands. The microphone and speakers connected via Bluetooth and Honda "Hands-FreeLink". It handles phone calls hands-free while navigating. While driving, Google Nav gives you continuous distance to destination remaining and estimated arrival time of day. The car displays miles of fuel remaining and can be compared to the navigation distance from destination, making fuel stop decisions easy. It has two trip odometers and an average MPG for the current tank since filling. The Google navigation app uses voice for turns and directions through the car speakers, temporarily killing any music playing.

Smartphones. We used one of the two phones continuously for navigation, telephone and information from the Internet. In addition to Google Nav, we used Google Now, Google Maps, and voice communications ("Ok Google, distance Denver to Hays, Kansas"). I set the Nav app to the next city's hotel's exact address, just a finger poke on a Google map. Once the route was selected and saved, I could then ("Ok Google, navigate to Starbucks nearest me"), get coffees on the way out of town and return to the original navigation route while we were waiting in the drive-thru. The Nav adjusts to the current location and gives us miles remaining and estimated arrival time. I found the estimated arrival time to be extremely accurate, and we came to depend on it. It told us how much time we could afford at rest stops and breaks and puppy-walking time. We tried to arrive as close to 5:30PM as we could, and we were very successful.

The other telephone was used intermittently through the day. Valerie had an app called "rest stops" which gave us the location and minimal informations about all the interstate rest stops. It was current location-based, but needed manual input for direction (southbound lane). It gave the location in mile-markers so it was easy to do the distance math. We do not recommend the app because it was ad-supported and had really vicious ads ("Your phone is infected …"). Val would use the phone occasionally - once to cancel a reservation. It was used mainly for Internet information. ("Ok Google, distance current location to Mobile Alabama").

Data Plan. Ok, time to talk Verizon data plan. My standard plan provided 2GB/month of data, plenty for our family's three phones. We do not **ever** stream video, music or internet radio to our phones. Our intention was to use the phone data as necessary to make life easier on the road, but never use it for entertainment. This fits in with our normal lifestyle in any case.

I was certain that 2GB would be inadequate for the trip. We

Travelling.....Continued on page 4

Travelling.....Continued from page 3

were to leave two days before the turnover of my account, so to avoid 2-day prorating we took off with somewhat less than 2GB with intent to raise the plan in a couple of days. With Verizon of course if you exceed the allotment, they automatically start charging overages at 1.5 times the normal data rate. Not really a disaster, but something easily avoided, since you can monitor the data usage real-time on a Verizon phone app. But surprise, I blew through nearly all the 2GB in the first two days, and we had another 28 days to go. After getting over the shock I realized that without thinking I had included the "satellite" layer on Google Nav. This is the way I normally use it, and I didn't think about it. So of course there was a constant stream of data for perhaps 10 hours. I simply turned that off. It certainly is not needed.

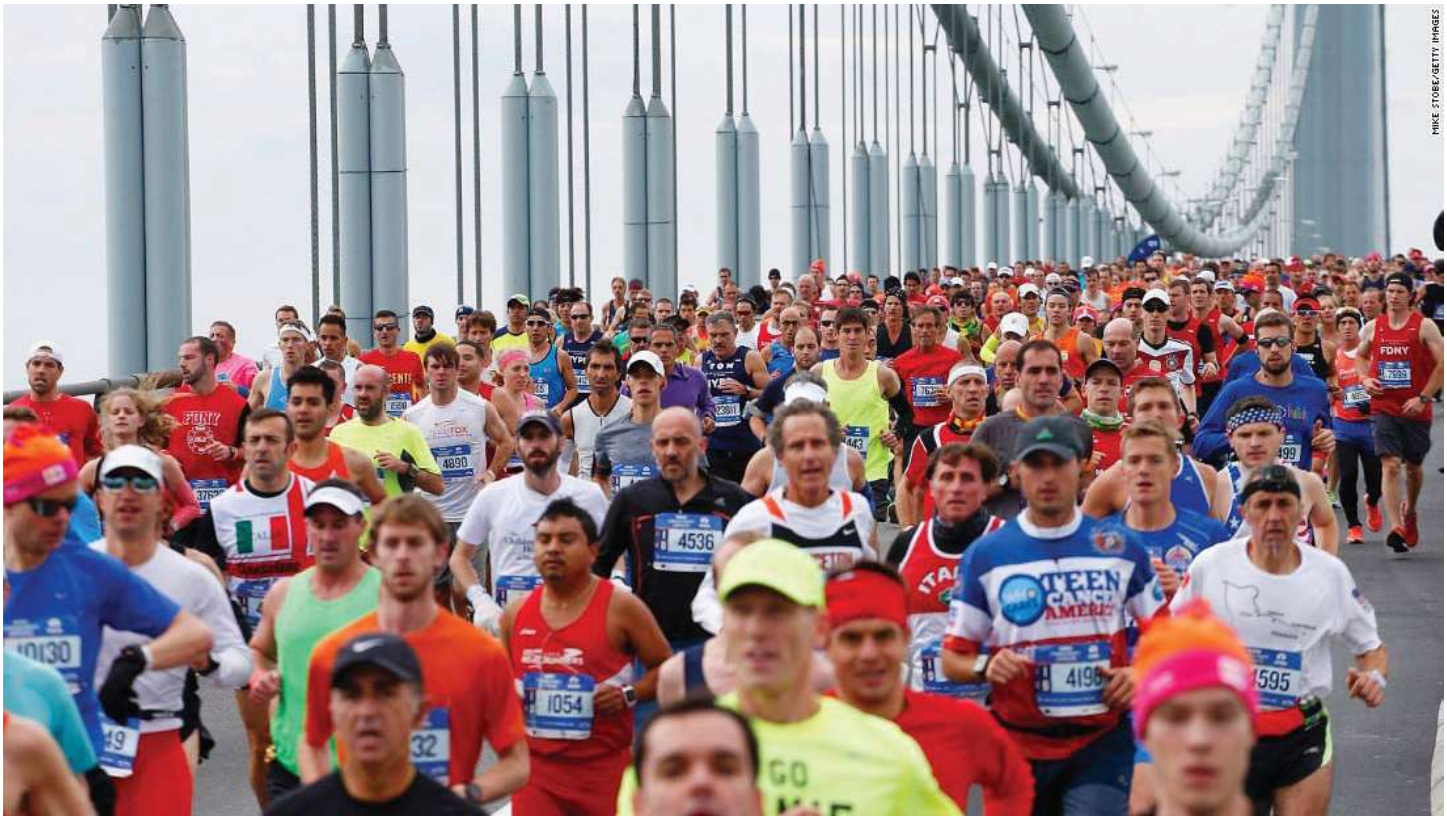
In my panic I upped the plan to 4GB using my phones app, and a couple of days later as I monitored the usage I was fairly confident I needed 12GB. They had just revised the rate schedule and the current cost for 12GB was $80. I raised it to 12GB and found that it did not show as increased on my account so I called them. The on-line system assumed that I was changing it for the following month instead of immediately, and they fixed that by backdating it to the time I changed it to 4GB, all fine with me. $80 seems quite a lot, but I looked at it as a one-time vacation expense. I changed it down to 3GB as we were returning to Tampa, effective the following month. The 2GB plan I was on had disappeared from their offerings, but the cost differential was minimal. I had about 3GB unused at the end of the month when we returned.

Android Tablet: A new Google Nexus 9, 32GB WiFi only. I used a couple of very valuable apps on the tablet in hotels and sometimes at rest stops. Use of the tablet grew during the trip, and the use of the notebook decreased. This Nexus tablet has a large enough screen with a very high resolution that made it a pleasure to use. The apps we used made it invaluable for the trip. The first being AAA travel. We used it exclusively to search for and book hotels. There is a complete map of the US to zoom into and out and a (difficult to use) trip route system where you can highlight your entire highway route. Then zooming in on an area of interest, we used a search criteria for hotels included pet-friendly, our #1 concern. Once we selected a city (or town) suitable for one day travel distance, then windowing on a map area, selecting hotels produces a list of all AAA-rated hotels and their location on the street map. The information gives pictures, ratings, facilities, reviews and booking details down to the type of room, a typical picture of that room, smoking or non. This data is real-time so you can book right from the app, and we did this most of the time. We did find an advantage to phoning the booking directly to discuss the dog and the resultant extra fee, and we did that in a few cases while using the information from the app.

The AAA app has the capability to transfer the hotel address and phone number directly to Google Maps. When Google Maps appears, I only had to "save" it as a favorite location. Since all the Google data is saved to my Google account, that location appeared on my phone as well. So Google Nav used in the car has the next day's destination. This reduces time for setting the days destination to just seconds, and you never have to use the keyboard.

The tablet was used for many searches for eating establishments, self-serve dog washing facilities, the Seattle bus system and ferry (both are dog friendly). The tablet was used for other Internet things such as handling my email and for the Kindle reader. It has the apps needed for the GPS dog tracker, and we even ordered an item from Amazon and tracked delivery to our son's house.

Obviously, we needed WiFi to do all this. All activity except for the Kindle needed an Internet connection.



During the trip, all hotels had free WiFi access, and in Seattle, WiFi was abundant. As a rule, we never connected the tablet or PC to public WiFi, preferring our own aircard system for security. The aircard uses Verizon data, but we had planned on that as a vacation expense. More about the aircard later.

Notebook. I have a three-year old HP 14 inch Ultrabook that has served me well. It's small and fairly thin, about the size of a 13" notebook because of the very thin screen bezels. In retrospect, we could have left it home, but we did make use of it. It has Delorme Street Atlas 2015 (SA) software which we have used for real-time navigation in the past, using a small USB-attached GPS.

One of SA's real strengths, besides being completely offline, is its trip planning capability. During our planning stages we established routes out and back based on where our family lives but also to make the route as interesting as possible and sometimes routing to areas we have not seen (Western Montana, wow!). With SA you can set daily mileage or driving time goals, your expected speeds for the various types of highway, fuel capacity, miles per gallon, starting days tank level and the level that you expect to fill your tank. The software then puts symbols on the route and

Travelling.....Continued from page 4

the routing instructions to designate overnight stops and fueling positions. This was uniquely valuable in the early stages. We were prepared to use the notebook full time for navigation in case the phone's Google Nav did not work out, but we were happy with the Google Nav capability right away.

We did use the notebook for our online banking. We paid several recurring bills as we always do when home, moved money and constantly checked our credit card accounts for current charges, making sure the charges corresponded to the receipts we accumulated. While some of this could have been done on the phone or tablet, we are most comfortable doing these with a full size computer, screen and mouse. We used the aircard for this exclusively. The notebook was never connected to a public WiFi.

Google Navigate (Google Nav): It needs to be pointed out that while Google Nav is truly excellent for point-to-point navigation over even long distances, it can't program a mid-route side stop. It isn't designed for handling multiple routes or multiple stops, something I suspect would be easy for Google to do. The current route must be interrupted, the route to the stop selected and then after that stop, restart the original route. So it was used for one day at a time; point-to-point with interruptions.

It was sometimes interesting when we didn't like the route it selected. The route is always based on the expected minimum driving time. So you may find yourself on a non-interstate road to save four minutes (or an hour) driving time over a five hour trip. This happened only a couple of times, but we were alert to that and just kept going on the interstate and let the Nav eventually adjust to our new location. It was always spot on to point out slow or stopped traffic, and in a couple of cases an estimate of the delay time and the cause (accident). It adjusted the ETA accordingly.

The destination locations failed us three times. Twice in towns in Colorado it routed us to Walmarts that had moved locations. Valerie went into an existing business to ask and found that it had moved ten years earlier. Once, in Hays Kansas (pop. 20,000) it routed us to a Starbucks that did not exist. We suspected it was there once. My advice, if you find yourself in Hays Kansas, forget your latte', but it has a truly remarkable brewery/restaurant downtown, found by an online search.

Tagg dog collar GPS attachment (now "Whistle"): The Tagg company produced an attachment for an animal collar with a battery-powered GPS receiver and cellular phone-based communications device for $80 (now $60) and $10/month. It has an Android or iPhone app that allows you to query the current location on a map (Google-based), and also a system that activates a map based report every 30 seconds in case the animal needs retrieving immediately. It has several features such as monitoring the battery, notifying you when the tracker is out of range of the base charger and also if the device gets detached from the collar.

It was the availability of this device that made it possible to have our dog travel with us. Guinness was in and out of the car many times every day in areas that we were experiencing for the first time ourselves. We simply considered it a necessary one-time travel expense. We have no intentions of keeping the service now that we're home. During our trip, another company, "Whistle", bought Tagg and issued new tracking software. Although they did provide the same basic service as Tagg their "social media" approach on their app was disturbing to us; we lost some email notifications and multiple phone SMS notifications, the basic usefulness did not change. We still recommend this product. http://www.whistle.com. The only dislike is a battery that we felt needed charging every other day.

Aircard/WiFi: We needed to take the Internet with us and provide WiFi service for the tablet and PC. With Verizon policy no longer restricting hotspot use, my current phone, a 2013 Moto X with Android OS 5.1 Lollipop has a "Tethering and Mobile Hotspot" switch in settings and a "Verizon Hotspot" app. This turns the WiFi receiver off and uses it as a WiFi receiver/transmitter using data from the cellular network. You configure it with an SSID and a WPA2 security password. There are a few disadvantages in using my phone for this; the most important is that it's a huge battery drainer. If the screen is on because you're using it for full time navigation, the battery charger will not keep up, and obviously if the battery is low to begin with you're risking use of the phone as a phone. With the right careful planning you can get around this by making sure you start the day out with a full battery charge, keep it on charge while in the car and limiting the time hotspot is actually on. The other disadvantage is that obviously you can't fiddle with turning it on and off hands-free while driving.

An alternative is to purchase a portable hotspot or USB device from Verizon and add it to your account. Currently, they offer four devices, three WiFi hotspot units and one USB receiver. The pricing is simple; $200 each, plus tax and $10/month, and the one-time activation fee for the de-

Travelling.....Continued on page 7

Travelling.....Continued from page 6

vice on your account has risen to $40. So no, it's not for me when it's really a luxury item to be used because the phone hotspot is not ideal.

Spending enough time researching, I found an affordable solution. First, a USB Modem/Aircard for $50. It's a Verizon-branded 4G USB device LG VL600. After I activated it ($40!) at a Verizon store, I am able to plug it into a USB port on the PC and have 4G data networking. The Verizon guy just shook his head when I told him where I got it for 50 bucks. At the same time I bought a TP-Link 4G Wireless portable router (battery powered model) for $30. This is an amazing little device that has a USB port to attach a USB Modem, a 10/100Mbps WAN/LAN port and a micro-USB charging port with a power adapter, USB cable and an Ethernet cable. Configured for 3G/4G, I have a choice of an Ethernet connection or WiFi. It can also be used as a portable Access Point.

After setting it up, I carried it in the car (charging) and also in my day-pack when on foot or in a hotel room. It was simple to just flip the switch on and have internet service within about 30 seconds. The battery is good for just a couple of hours, but I had it on only when needed and never ran it down. On Amazon: TP-LINK TL-MR3040

A side note: Somewhere above I mentioned some night driving with consequences. We went over a deer carcass on the interstate at about 70 mph. We assume it was killed by a truck that continued on because there was no car wreckage nearby. The car seemed OK so we continued. This was in South Dakota, and even in daytime you can drive for a while and see no cars in either direction. Three days later in Seattle I took it to a Honda dealer and had some deer meat removed, a missing undercarriage panel and some fasteners, a leaking drive seal and drive shaft replaced. Close call.

Microsoft Update KB3035583 Problems

By Merle Nicholson, Secretary, TPCUG
merle@merlenicholson.com

On 5/29/15, my computer became unresponsive for a while. I tracked the problem down to a new Microsoft Update, uninstalled the update and got my system back. Some research turned up some interesting things about the update that applies to all Windows 7, 8 and 8.1. Update 10/19/15: It also provides the "Install Windows 10" nag in the system tray, and it acts as the conduit to signal MS to download the Windows 10 update to your PC.

Windows 10 is not for everyone. If you use Windows Media Center software, Windows 10 will uninstall it. If you are using WMC as your DVR, Do not install Windows 10. The Windows 10 Start Menu really can't be called a menu without a lot of work or by installing a third party menu program. Office 2003 is disabled, and can be revived only with a lot of technical work.

The offending task that was killing my computer is GWX-ConfigManager.exe. It was trying to send data to the Internet, and my Vipre Firewall was blocking it causing the computer to bog down. It's located in the Windows\System32\GWX folder. I had never heard of that so I did some research on the Internet. It's a program that is installed on your computer relating to upgrading to Windows 10. You can find it in Windows Update>Installed Updates.

I looked at my other Windows 7 computers and it was installed there too. Microsoft wasn't being very forthcoming about what it was for at the time. Going to Windows Update > Installed Updates (click on the text near the bottom left of the Windows Update). If you sort by category, under Windows System updates it should be in order of most recent, so it should be near or at the top. Look for KB3035583, right-click and select Uninstall. But there's a catch.

On the next Windows Update, it will appear again and if you have automatic install set, it will just install again. Here's how to fix that. You have to set that particular update as hidden. Just "Check for Updates" and you'll get at least one "Important" update KB3035583. On that update, right-click and hide. If you do another "Check for Updates", you'll see that it does not appear. If you later "Restore Hidden Updates" for any reason, it will appear again.

Here's all the information available from Microsoft:
Update for Windows 7 for x64-based Systems (KB3035583)
Download size: 517 KB - 601 KB
You may need to restart your computer for this update to take effect.
Update type: Recommended
Install this update to resolve issues in Windows. For a com-

design. An APU is a combination of a CPU and GPU wherein the GPU provides the greater power needed for graphics.

More information is available at Steve's website: Http://moreValu.com. ◆

Problems.....Continued from page 7

plete listing of the issues that are included in this update, see the associated Microsoft Knowledge Base article for more information. After you install this item, you may have to restart your computer.
More information:
http://support.microsoft.com/kb/3035583
Help and Support:
http://support.microsoft.com

Update 10/19/15: Even though I marked the update on my computers as "Hidden", I found it installed on my four Windows 7 computers all over again. Microsoft made a change so that the Hidden status will be ignored. I have repeated the uninstall and hidden process once again. This is very disconcerting to me. It appears that Microsoft views my personal computers as their property to install anything they want. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Thanks to Merle Nicholson and Dave Palmer for articles this month. Dave's article on tracking ship locations was of particular interest to me since I created a web app that did exactly that at one time. I pulled the worldwide shipping data from some Greek university. However, after a couple of years, the source of that data disappeared, and I was forced to remove that app from my website.

The Microsoft Store is now open at International Mall, just in time for your Christmas shopping. It is in the Nordstrom wing of the Mall on the upper level. Have a look at the Surface Book. It is expensive but very nice. If that item is a budget buster, there are many other devices at all price levels.

Just the other day, someone told me that they had totally wiped all the files from their data hard drive. And they couldn't really give a clear explanation of how they did it other than it happened while trying to move the data to One Drive. They had been told it would cost $99 to examin the drive and considerably more to recover any data. I said to bring the drive to me, and I would have a look. That look verified that the drive did appear to have nothing on it.

Time to ask Merle Nicholson, who told me that he had an ancient DOS

Minutes of the November Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. Merle Nicholson, the SIG moderator, introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees. This month, Windows 10 installation problems were discussed, and Merle gave a quick demo on Windows 10 keyboard shortcuts.

Our guest speaker was TPUG's own Dave Palmer, giving us one of his well-prepared cyber security presentations. This month was Exploit Kits, software designed to take advantage of software flaws; the flawed software most exploited is Java, Silverlight and Flash. Flash accounts for 80% of all exploits. Server-based exploits target built-in browser applications. Besides disabling Flash and Silverlight, another suggestion is to use an alternative PDF reader other than Adobe Reader. Also it's very important to keep all operating system updates current at all times. Our thanks go to Dave for his excellent and well prepared presentation. ◆

Comments.....Continued from page 1

program named Uneraser, which he sent it to me. That program showed me that there were a lot of files still on the disk (when you delete a file it is not really gone; the operating system just can't find it). However, I couldn't figure out how to use the program to unerase the files. So I went to the program's website, http://www.uneraser.com, and downloaded a free trial Windows version of the program. It displayed many folders full of files on the disk and would allow me to unerase one file at a time. To be able to completely restore all the files, I purchased a registered version for $39. And I was then able to restore around 33 GB of data consisting of aproximately 19,000 files in 14,000 folders. Success! ◆

More windows 10

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

Now that Windows 10 has seen some improvements, I've revisited it and installed it on my notebook.

Back in July, Windows 10 came out, and I thought at the time it was suitable for my notebook, replacing Windows 7 Home Premium. I kept it a couple of weeks and even showed a couple of things at a TPCUG meeting. As I got into it and trying to do my day-to-day stuff, I became somewhat discouraged with the inefficiency of the menu and the old/new schizophrenic settings. Then I got an ad for something on my desktop in a live tile. That did it for me. I recovered my Windows 7 from a backup and went back to where I was three or four weeks before.

Some things have been happening since that time. There is a revision 1511 that came out early November that makes important changes to the licensing and to make it possible to install Windows 10 from scratch easily. Sometimes that's a very handy thing especially if you have some persistent virus or malware. Just as importantly, now you can use Cortana with just a local login. You do miss some advantages because you are not sending your personal information back to Microsoft so Cortana doesn't have the benefit of knowing your habits.

In the meantime I have been running a Windows 10 Virtual Machine that I revisit occasionally to try to learn how to live with it and to see if there are any compelling reasons to switch. I have found nothing in the area of "compelling", but I finally concluded that with the 1511 revision I can configure Windows 10 to be as efficient as 7. By efficient I mean the time and trouble it takes to find stuff and run applications.

A few days ago I felt I was finally there and tackled it. I have to say that once you have Windows 7 (or 8.1) configured, the upgrade goes quickly and smoothly. For this particular notebook I have a "Dual Boot" setup that complicated things for me, but once I learned how to deal with that, the Windows 10 installation was mostly uneventful.

Preparation: Number 1: Make certain your Windows 7/8.1 is up to date. All Windows updates must be installed. **Number 2**: Now is the time to uninstall all the applications you no longer need. Go to Control Panel, Programs and Features and go down through the list, find all the stuff you have never needed. Also uninstall anything with the word "toolbar" or "fix my pc" or "repair". Uninstall WInZip while you're at it. **Number 3**: Do a "Disk Cleanup". That's on the properties of your C: drive, including clearing your Recycle bin. **Number 4** do a complete system Image backup or clone of the drive(s). If you cannot make a system backup or clone the drive DO NOT PROCEED. If you don't have the technical skills to do a full backup, you need help with Windows 10 upgrade anyway.

I do have a suggestion for you. If you have a hard drive over three years old, buy a replacement for it. Clone the boot drive to the new drive and swap them, keeping the old drive as a backup. If the Windows 10 upgrade destroys your system just swap them back. Another good reason to buy a new drive is if you can afford an SSD for your boot drive. There are some bargains out there especially for last year's slower SSDs. Believe me, last year's slow SSD is still five times faster than a conventional drive and far more reliable.

A couple of important changes to Windows 10 installation have been made. First, the upgrade no longer insists that you install your system with a Microsoft login. Previously it did that, but if you knew what to click on you could set up a local account. Now, it assumes a local account. Later on, when I wanted to get something from the MS Store, it tricked me into signing in with my MS account and changed my login to that account, wiping out my local account. I suspect that I wasn't being attentive enough and could have avoided it. But it did not give me a warning that my local account would be wiped. The first I knew of it was when I booted the system and the login screen appeared, and it would not take my account and password. So I tried my MS account name and password, and it logged me in. It's easy to switch back in Control panel, Accounts, but you can't just say "use the local account", you have to create the account over again.

Why is this important to me? I feel that I will not get advertising "pushed" to my desktop with a local account. There are a couple of other settings to make in that regard; more later. Also I don't want to search the internet for items. It's too time consuming. There are obscure settings for that now, too.

Back to the installation. One of the early things it does is scan your PC for incompatible software. It will give you a list of suggested programs to uninstall. In my case there was one; Daemon Tools Lite. This software allows you to mount .ISO files as a drive. That's built into Windows 10 and is not needed. One other item is a clear warning that it is going to uninstall Windows Media Center. I've written on this subject before; if you depend on WMC, Windows 10 is not for you. If you're using it for your DVR, there is no suitable replacement. But the Windows 10 installation makes the removal very clear. I suspect that if you choose to not uninstall the incompatible software it will proceed anyway. As for the WMC removal, it's not optional. It's just there as a warning that it will be removed. Even if you'd paid for it.

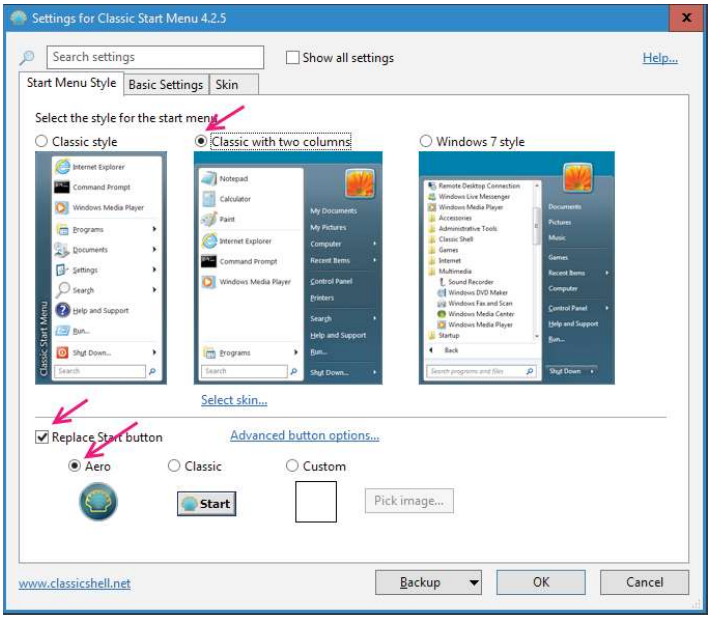
It takes quite a while to go through the installation. I used a USB3 flashdrive with all the needed files. This is easy to get from the Microsoft website. You download a tool called "Media Creation Tool", have a USB flashdrive available and run it. Get it from https://www.microsoft.com/en-us/software-download/

More.....Continued on page 4

More.....Continued from page 3

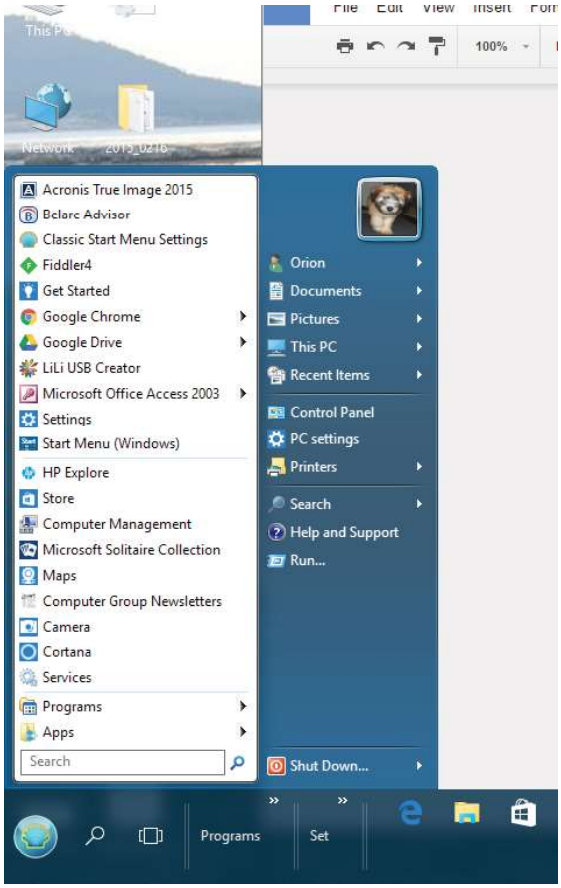
windows10. If you go this way, you may want to hang around 20 minutes or more and when it does the first reboot, pull the flash-drive out so it doesn't attempt to reboot to the flashdrive. I use the USB route so I don't worry about an internet interruption while installing. Also it's much faster if you have two or more computers to upgrade. The website has very accurate instructions.

Once it's done all the reboots, you're ready to configure it. All your files should be where you left them, and all your programs should still be working. In particular, check your printers and any other external devices. Also look at Computer Management, Device Manager. (or right-click on the start button, select Device Manager) Look for any system device with a warning flag on it.



Look at the screen resolution, make sure it's where it was and that you like it. Mine had all desktop icons much larger, a sure indication that my screen resolution is not set to my full native screen size, and that was the case. Right-click on the desktop, select "Display Settings", then pick the "Advanced Display Settings" link at the bottom, then look at the "Screen Resolution" drop-down, make sure it's set on the "recommended", which should be the highest (top) one.

In my case, I had to deal with a disabled Vipre Internet antivirus. The standard Defender was running, and Vipre did get an automatic update for Windows 10 and reinstalled itself. Defender complained on each boot until I disabled it in Startup apps.



Here's a list of all the things I found necessary to change. You may agree with them or not. First thing I did was to unpin all live tiles. They're interesting for the first 10 seconds, but then you have to ask; "do I want to expend system resources just for this?" Right-click on each and select "UnPin".

I would state right now that I have no intention of making Windows 10 look like Windows 7. But, I do feel that Windows 10 is a step forward with two or three things deficient. The main one being the menu. Frankly, it isn't a menu at all, it's just an alphabetical list of all applications, giving important programs equal weight with the stuff you'll never use. Second, it lacks visual style. The white titlebars are a real pain trying to find the top of anything for windows controls. And last, that you must go to quite a bit of trouble to protect your privacy. Fortunately, using a local account disables much of the information being sent to Microsoft. There is much written about this.

Next I downloaded and installed "Classic Shell" from http://www.classicshell.net. Do NOT download from any other site. While you're there, donate 10 or 20 bucks via PayPal Guest. It's a quick install. When you run it, there's a list of items to include. You do not need anything but Classic Shell and Classic Shell Update, and you do not need Classic Explorer or Classic IE. These make changes to Explorer and Internet Explorer. Windows 10 has changed both of these, and I think it's a good idea to get used to them before making changes.

When you look at the setup for classic shell, the "advanced settings" should be off, leaving three tabs of settings. First tab, I selected "Classic with two columns" and "Replace Start button" with "Aero". Under "Skins", I selected "Windows Aero" skin, and in "Basic Settings" , I did not change anything. Please don't blame me if you're not happy; just pick something else. Classic Shell is very highly configurable under "Show All Settings".

More.....Continued from page 6

"The Classic with two columns" has the two column layout of Windows 7, combined with the cascading menus of Windows XP. In my mind, it's perfection.

Configuring further, I installed a theme exported from Windows 7. That put color in the title bars, a badly needed improvement. With the new 1511 update, you can add color to the titlebars, taskbar and action center in settings, personalization, colors. Last, I changed some registry settings that changed all window border widths to the narrowest possible. Contact me if you are interested in doing that; I can send a registry file to you.

Concluding: Do a full system backup of your new Windows 10 now. Don't wait. Later, when you have full confidence in your system and have it backed up, clean up the boot drive. In "Disk Cleanup" there is a button labeled "Clean up system files". This will reclaim a very large chunk of disk because the Windows 10 upgrade stored all the Windows 7 or 8.1 files on a Windows.old folder. When you do this, you will no longer be able to revert back to the previous version. But we don't care because we have a full system backup that we can use anytime we want.

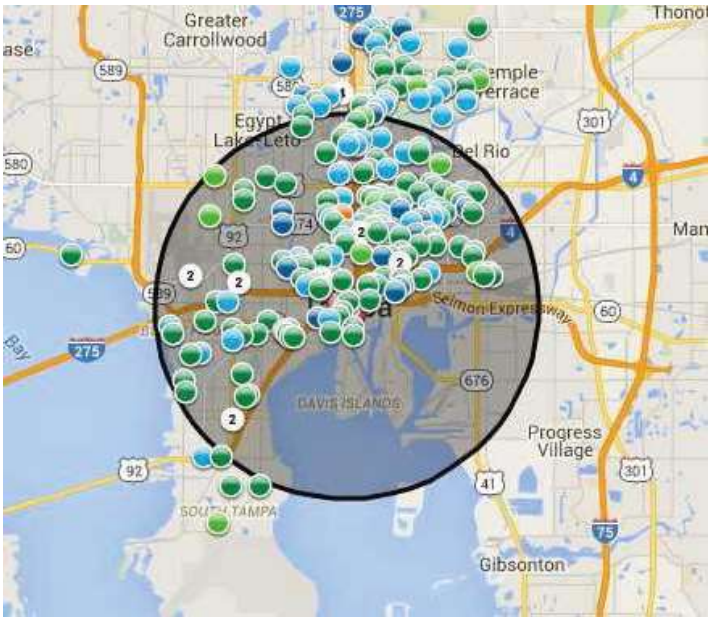
Interactive Tracking Websites

By Doug Palmer, Tampa PC Users Group
dkp205@hotmail.com

I have an extensive list of weird, odd and interesting websites that I've run across over the years. Here are two that might qualify as tracking maps as they track something. Most also qualify as interactive as the user has some control over the data seen.



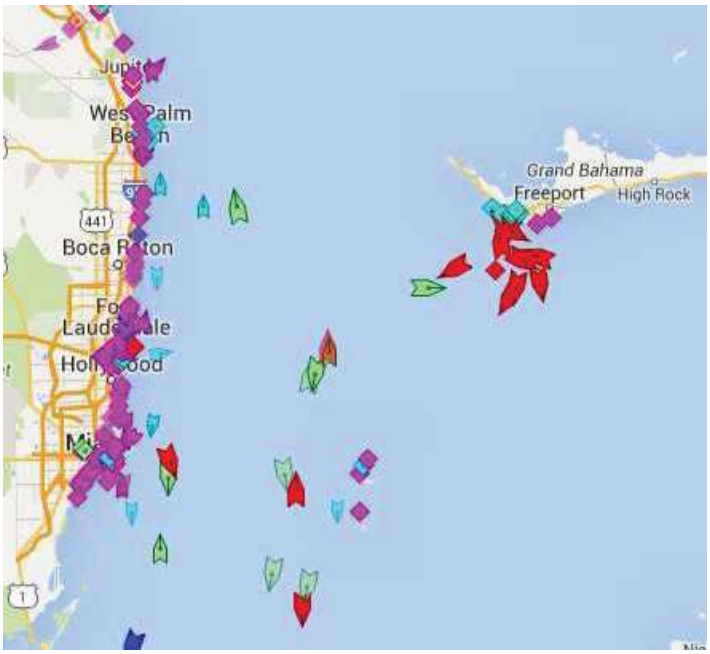
http://raidsonline.com/
RAIDS Online is a free public crime map developed by BAIR Analytics. Crime mapping takes data available from law enforcement sources and makes it available to the public in a visual format. This is just one of several such websites available. Raids Online also has mobile apps available for Android and iPhones.

This map works much like Google Maps or other such maps on the Internet. A toolbar is on the left side of the screen that contains controls to specify multiple layers of data. At the top of the toolbar type in a city name, an address or even a zip code. The map will adjust accordingly. The Buffer section of the toolbar allows you to adjust the size of the area you wish to pinpoint. Below that are several filters that you can use to specify a date range, a long list of various events and crime to either include

Interactive.....Continued on page 6

Interactive.....Continued from page 6

or exclude. Tabs on top allow you to view the data on the map, in charts or in a spreadsheet format. Once you have adjusted the area and events to your liking, you can create a daily or weekly email alert notification of crimes within a certain distance of your home or business



http://www.marinetraffic.com/

The Worldwide Marine Traffic interactive map is serious fun for those who love to explore and tinker and learn. This site and several other similar websites are free Internet-based vessel tracking services. They do not require any user registration. They list the position of thousands of ships around the world. On occasion it's interesting to look specifically at the waters around Tampa Bay to see how many ships are out there, where they're from, where they're going, which are underway and which are anchored. Other times I'll pick out a really busy port somewhere in the world – there are many. Those ports make Tampa Bay look like a backwater! Here are a few basics from the FAQs.

Vessels over 299GT (Gross Tonnage) are required to have an AIS transponder on board, which transmits their position, speed and course, among some other static information, such as vessel's name, dimensions and voyage details.

Data received are uploaded in the database in real time and are immediately available on the map and on other pages. However, several positions shown on map may not be continuously refreshed (e.g. when a ship goes out of range). Vessel positions shown on the map may be up to one hour old. Please note also that map web page is only periodically refreshed or whenever the 'Refresh now' link is pressed manually.

There are numerous filters and controls. The shape of the icons tell you whether the ship in in underway or anchored. The color of the icon tells you what type of ship it is. Running your cursor over the icons will give you the name

of the ship, the heading, speed, destination and age of the data. Left click on the icon to see bring up a information box with basic details of the ship along with a small image. Inside that box is a button called 'Vessel Details' which will provide extensive information as well as one or more images of the ship.

Editor's Note: Dave provided a couple more such examples of tracking websites, but we have run out of space. Perhaps they will find a place in the next newsletter. ◆

Meeting Preview: John Witmer's description of this month's speaker: "I attended his presentation at the APCUG Conference last September in Las Vegas, and from his years of experience representing Avast software and doing presentations, he has gained a very good understanding of virus, malware and other internet threats to users of computers, tablets and smartphones."

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Thanks to Merle Nicholson, Dave Palmer, Bob Davis and Ron Weinberg for articles this month. I continue Dave's article on Interactive Tracking Websites from last month since we ran out of space to include all his examples in the December newsletter.

We are starting a new year, and you will note above that this newsletter is Number 1 of Volume 29. So this group has been around for a long time, and we have the newsletters to prove it. You may view newsletters from 1988 through the present at our website, or you may use the Windows 8/10 app I wrote, *Computer Group Newsletters*, to do the same. However, that application only does the newsletters through 2014. I am preparing a new version, a Windows 10 Universal version, that will include the 2015 newsletters. And, since it is a Universal version, it will also be available on the Windows 10 Phone.

Minutes of the December Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The December meeting is reserved for a dinner to celebrate the holidays and allow the time to socialize and eat. As in past years, John Witmer catered the event and Pepin distributing provided the space. It was well attended, and some old friends who have been unable to attend regular meeting were able to make it. It was a success; that was certainly agreed upon. Our special thanks go to John for acquiring, toting and hosting the food and goodies for the event. Good job as usual. And thanks to Pepin for having us. ◆

Comments.....Continued from page 1

Speaking of Windows Phone, I am probably the only one in the group with a Windows Phone, and that has gotten me to thinking. I suspect most of you have now or will eventually have Windows 10 on your desktop and laptop computers, but I am far less sure that any of you will purchase a Windows Phone. So how do I reach you and all the other iPhone and Android phone users out there with the apps I write for the Windows Phone, including the newsletter app? There is a solution, but it is not cheap.

The solution is a program named Xamarin which you can run independently or integrate with Microsoft Visual Studio that allows for the creation of Windows Phone, iPhone and Android apps using the C# programming language where much of the code is shared among the three different platforms and what is not shared you have to write for each platform. In simple apps, you have to write almost nothing extra for each separate platform.

I have begun working with Xamarin for Android only, not iOS, and will probbly write about that in next month's newsletter. ◆

Operator Error
(How to spend more time fixing things)

By Bobert Davis, Tampa PC Users Group
robd234@gmail.com

Back a few months ago, Merle suggested we change our normal login from administrator to guest mode. A guest login has limited power to do things. In guest mode, if something tries to stick in a malware or virus, a screen pops up asking for the administrator login password. This is a way to keep unwanted stuff from knowingly or unknowingly getting on to the PC. I changed both desktop PCs (an old XP and a Vista machine) to boot up with two options, guest or administrator mode. To do this I went into my normal login and took away administrative powers. Then I created another login with full powers. Now it's a bit of a nuisance having to tell it which login to use every time I power up the PC. Also if I want to install anything or change some things I must switch to administrative mode. However, I think the benefits of using guest login are greater than the inconvenience of having to click on the guest mode when I power up.

After a couple months, I realized the old XP PC literally has no internet access. It has no modem or LAN, so it can never be exposed to malware unless I load something on it myself. In a weak brainstorming moment, I decided to delete the guest login for the XP PC and only use the new login with full powers. Thus I wouldn't have to click on the guest icon every time I powered on the PC. I did select to not delete the files associated with the old login. I realize now I should have just turned on the administrative powers on the old login and deleted the new one. When I deleted the old login, even directing it to save the associated files, my folder with all my shortcuts went away! Even worse than that, when I found the Address Book program and ran it, it had no contact phone numbers and addresses (I use the MS Address book program). The data file seems to have disappeared. I looked at what file the program would import, but nothing I found contained the information I wanted.

The only thing I found was a comma delimited file called address book.txt, last modified July 26 of 2013. I imported that and have most of my addresses and phone numbers back. But I'm pretty sure I've made new entries since July of 2013. The imported folder has no subfolders like the old one had. So the original file is probably lurking somewhere on the PC but I haven't found it yet. If anyone knows where that file may be, please let me know! In the mean time, I keep adding shortcuts back as the days go by and I find something else I need. ◆

Mirroring to TV

By Ron Weinberg Member at Large,
Tampa PC Users Group
rswjbr@verizon.net

Download a film to your PC but watch it on a large screen. Show a slide show or photographs to a large group. Demonstrate or teach PC applications. View the web on a big screen. These are just some of the reasons to use mirroring.

Mirroring is viewing your PC or Smartphone's screen on a TV. It can be done using any of several methods or devices. Hard wired using an HDMI Cable (which requires some proximity between devices) or through physical devices such as: Google's Chromecast, Apple's AirPlay, Samsung All Share Cast Hub, Microsoft Wireless Display Adapter, and many others.

MIRACAST, a wireless screen mirroring protocol solution created by the Wi-Fi Alliance, has emerged as the leading contender which requires no additional hardware. Miracast has experienced some technical problems (reliability and connection failures) but is emerging as the dominant standard. It has been described as wireless HDMI. Although wireless, it does not rely on your existing Wi-Fi network but rather Wi-Fi Direct. As more and more new devices contain built in Miracast capability, problems should diminish.

Miracast has been included in Windows 8.1, Windows 10, Android 4.2 and newer releases. Note that if you upgrade from Windows 7 to 10 and your system does not include Intel WiDi or equivalent support, Miracast will not work. Each Miracast connected device must have mirroring capability. Search the Wi-Fi Alliance web site for compatible devices.

Many new Smart TV's have mirroring capability built in, and the ubiquitous Roku now has the feature but not on all older models. Miracast can also connect to enabled Projectors.

I have successfully and easily used both Windows 8.1 and 10 to mirror my laptop to both an older TV with Roku and a newer Smart TV that has mirroring capability.

Here are the steps for Windows 10 which are slightly simpler than those for Windows 8.1.

Mirroring.....Continued on page 8

More windows 10

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

I've submitted a couple of Windows 10 articles in past months. I'll continue to write about 10 in the coming months. The last article, and the largest to date, was about my experience upgrading Windows 7 to Windows 10. I was never a fan of 8 and 8.1, so my experience with that is limited.

There's an additional advantage to upgrading from 7, and that is, if you're the owner of (or a fan of) Office 2003 even though it is no longer supported. The best way to get it running in 8/8.1/10 is to have it already installed and up-to-date before upgrading. It's difficult to install Office 2003 after. But unlike a couple of other Microsoft products it will survive the upgrade.

Windows 10 got several important upgrades with the November 15 update. The most notable is that now you can install Windows 10 from scratch using a qualified Windows 7, 8 and 8.1 license, so if you are interested in a fresh build with nothing left over from the previous version you can do that now. Don't make an assumption that it's easy, though. You have to be careful and get the specific instructions.

There are new upgrades coming in 2016, reportedly in the spring and fall, and it seems that Microsoft intends to continuously improve Windows 10.

What you lose: For Windows 7 users going to 10 you will lose a few things you may be fond of: Windows Media Center, The Windows games collection (Solitaire, Spider Solitaire, Minesweeper, Mahjong Titans, checkers and more ..), Windows XP Mode, and the Windows Mail client (which wasn't much anyway). The Windows 10 games being ad supported, browser-based and pretty much crappy graphics are a real disappointment.

For a mail client, I recommend the free Mozilla Thunderbird. There are published ways to restore the Windows 7 games and Windows Media Center to 10, which I have done successfully, and a way to install Windows XP mode which I have not tested. These three products are documented on reputable internet sites, just Google them.

Of course you also lose the Windows 7 Start menu. There is a very good article on getting the most out of the existing start menu at

http://www.pcworld.com/article/2960788/windows/how-to-customize-windows-10s-start-menu.html and http://www.howtogeek.com/223412/getting-to-know-the-new-start-menu-in-windows-10/

But there are several first class complete replacements: Start10, IoBit Start 8, StartIsBack++, and my personal favorite Classic Shell. There are 10 replacements out there, half of them free.

What you gain: Not too much, but some are interesting. For those of you that have a Windows touchscreen tablet – the Windows 10 tablet interface is there, just turn it on. The new browser Edge has many limitations, but it is safe and attractive. Fortunately the older Internet Explorer is installed as well. The Notifications are a step up from previous Windows, but still need some refinements. Virtual Desktops work really well, but with not quite the convenience you'll find in any Linux OS where it has been around for a long time. And of course you have Live Tiles, which may interest you. Mounting ISO files as a CD drive is now native. Windows 7 needed an add-in like Daemon Tools, and the upgrade will force you to uninstall it.

For my own part, I'm not a heavy user of Windows 10; my daily business/productivity/programming computer is still Windows 7, and my internet cruising/entertainment computer is Linux Mate'. I especially like Linux (and Android tablet) because of its internet safety and easy maintenance. No virus worries. ◆

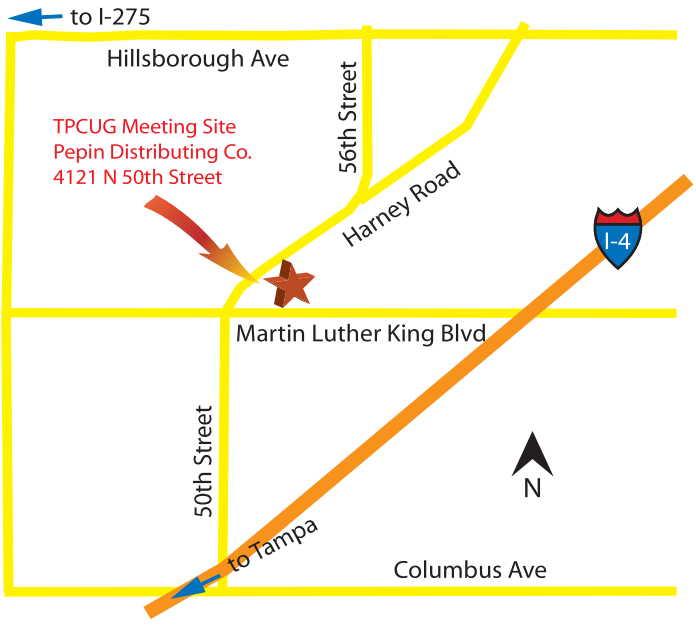
Mirroring.....Continued from page 3



Mirroring Windows 10 PC to Samsung TV

1. Change Input Source on TV To PC Mirroring
2. Select Connect Option from Action Center of PC
3. Select [TV] Samsung XXX to connect
4. Change projection mode to Duplicate if necessary Step 5 below
5. Projection Mode
   Select method: PC Screen only; Duplicate; Extend; Second screen only
   Press or click "Connect to a wireless display"
   If needed, press Connect Option again to display the connection so it can be disconnected.

Mirroring Windows 10 PC to TV through Roku 3

1. In Roku Settings, Screen Mirroring should be checked Enabled.
2. Select Connect Option from Action Center of PC
3. Select Roku 3 to connect
4. Follow steps 4 and 5 above as needed.
5.

Connection automatically connects with the Roku connected TV. There is no need to manually change the Input Source. When the PC disconnects, the Roku the TV resumes what was playing before the connection. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Thanks to Merle Nicholson and Ron Weinberg for their contribution this month. Thanks also to John Witmer for a detailed description of this month's presentation on page three.

Last month I wrote about using Xamarin to port some of my Windows 8.1 and Windows 10 Universal apps to the Android platform. I had finished converting several apps but had not as yet published them to the Google Play Store. Well, as I write this, three of them are now in the Store for you to install on your Android device, phone or tablet. The apps are Hyde Park Flowers, Civil War Photos and Computer Group Newsletters. That last app should be of interest to the group since it provides access on an Android device to all the group's newsletters from 1988 through December 2015. Install them and give me a decent rating. Who knows, you may be the only people who do that, since I have read that there are many apps in both the Apple and the Google stores that never get downloaded.

Minutes of the February Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. Merle Nicholson, the SIG moderator, introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees. This month Merle Showed several items of interest in Windows 10.

The February presentation was given by myself, Merle Nicholson, on Windows 10 in two parts. First was a Pros and cons of doing the upgrade and the circumstances where upgrading may not be the best thing. Next was steps to prepare for the upgrade. Get your system healthy, do a chkdsk and make a good backup or clone of the existing drive.

The second part was Windows 10 essential customizations. A description of Windows 10 Build 1511 and what it means, and finally 11 things to do after installation. The three page slide show is available - just email the presenter at merle@merlenicholson.com. ◆

Comments.....Continued from page 1

In the news toward the end of February was that Microsoft bought Xamarin. I had to pay Xamarin $800 to use Xamarin in conjunction with Microsoft Visual Studio to create my Android apps. Perhaps with that purchase Microsoft will now offer the use of Xamarin with Visual Studio as cheaper or possibly even free. I know a lot of independent developers found the $800 per year for Android too high. And if you wanted to develop for iOS along with Android with Visual Studio, add another $800/year. The development for Microsoft Windows was free. Perhaps they will make an announcement about all of this in April at the Mi-

March 9th Meeting Presentation

By John Witmer, President Tampa PC Users Group
tpcugpres@gmail.com

We are privileged to have Abby Stokes present to us this month. The topic selected last month by our members was for her to give us a presentation on "How to be Smart with your Smartphone and Tablet." Abby is an entertaining and very knowledgeable speaker who gets great reviews from the numerous groups she presents to. She targets her presentation to the older generation, especially those who did not get on board the digital revolution thru work experience or other means before retirement. She also has knowledge and tips to share with the more experienced technology users.

She is the author of the newly revised book "Is This Thing On?" She will have copies of the paperback version (496 pages) of her book available for purchase at the meeting. The cost is $18.00 and can be paid with cash, check, or credit card. I encourage you to consider purchasing a copy for personal use, or as a gift to someone you know who would benefit from having access to this friendly guide to everything digital.

I would also suggest you check out Abby's website to review the video tutorials, helpful guides, and other resources she provides to supplement the book content. Go to http://www.AskAbbyStokes.com to access her web content and further information on her book.

I am also encouraging our members to invite their spouse or a friend to hear Abby's presentation. I don't want anyone who attends our meeting to feel any obligation to buy her book – I just think whoever does attend this meeting will find it entertaining and enjoyable to hear Abby speak. Hope to see you at our monthly meeting on March 9th at Pepin Distributing Co. ◆

Comments.....Continued from page 2

crosoft Build conference in San Francisco.

Developing for a platform really requires that you have different devices to check how your app appears on them. For windows, I have several Windows phones, tablets, laptops and desktop computers. For Android, I had only one phone. And when I found in using an Android tablet emulator that the buttons on some pages of an app did not look good, even though they looked perfect in an Android phone emulator and an actual phone, I decided it was time to purchase an actual tablet. I settled on an ASUS ZenPad S 8 Z580CA-C1-BK 8" 64 GB Tablet from Amazon.com. The tablet received good reviews, and I have found only one thing that is less than optimal. When I want to watch some of the videos I have made and placed at http://www.lamartin.com/Videos.aspx, they are jerky. At this point, I am not 100 percent sure of the cause, but I think it is that the tablet does not get a good connection to the wireless router. The same videos run

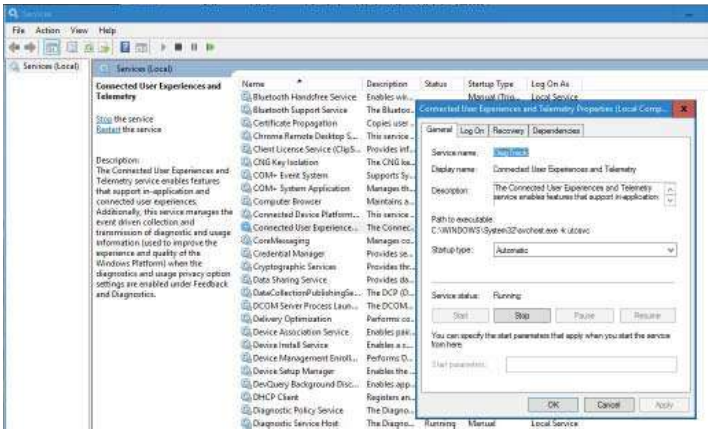
Windows 10 tips - March 2016

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

This month I have some beginning tips to improve the Windows 10 experience: Playing DVD movies, reducing the amount of "telemetry" data going back to Microsoft and eliminating advertizing on the lock screen.

DVD: Windows 10 will not play a DVD movie as delivered, although DVD devices are supported otherwise. Windows 7 did movies through the Windows Media Center and Windows Media Center was available for Windows 8.1. But Windows Media Center is uninstalled by the Windows 10 Upgrade. Please don't mistake what I've said here; Windows 10 handles DVDs fine, but not DVD movies.



There are several solutions to this. You can overcome the loss of WMC by reinstalling it through an unofficial source (See my previous articles on Windows 10). Second option is to install VLC from VideoLAN, a free and open source media player. Be sure to get VLC from the official website http://www.videolan.org. DO NOT download from one of the many locations that a Google/Bing search produces. Last option is the best but costly, PowerDVD from CyberLink at http://www.cyberlink.com. PowerDVD is a good option if you have a Blu-ray drive. PowerDVD also extends Blu-ray support to WMC.

Telemetry: The bloggers (and Microsoft) are now calling the usage data being sent from your computer back to Microsoft "telemetry". Not a bad word I guess if you're trying to downplay the importance of this data. (I worked on space programs at Cape Canaveral for 10 years and I'm pretty sure I know what telemetry is.) There is a long technical Microsoft TechNet article that explains the general content of this data, and describes four levels of settings available to some versions of Windows 10. Windows 10 is always set to the highest (least private) "Full" setting by default. As it turns out, the settings are accessible. A very trustworthy technical writer, Ed Bott, writes about this pretty comprehensively. See http://www.zdnet.com/article/windows-10-telemetry-secrets/. He references that TechNet article, and if you have access to it, it's pretty interesting technically.

Further searches produce instructions on how to make the setting as low as possible. In addition there is a background service that handles some or all of the "telemetry", and everyone is saying that it's safe to disable this service. I have done so on my four Windows computers.

One last thing about Telemetry. Recent updates to Windows 7 and 8.1 have installed the "Diagnostic Tracking Service" to your PC if that's what you are using. The Service name is "DiagTrack". I have now disabled that service on my Windows 7 computers. I have read the claim that DiagTrack was installed by an optional update, suggesting that it's your own fault that it's installed. I think that's valid only if there's a thorough description of the update in Updates. I look at the Microsoft articles on all optional updates for my computers, and I guess I just missed this . . three times. My fault obviously. Disabling it in Windows 7 and 8.1 is the same as in Windows 10.

To kill the DiagTrack service in Windows 7, 8.1 and 10, go to Control Panel, Administrative tools, Services. Scroll down and find "Connected User Experience" service, right-click and select "Properties".

Then Use the "Stop" button to stop the service – it takes a moment – and then change the "Startup type" to Disabled as indicated in the screen capture on page six.

Tips.....Continued from page 4

In Settings, Privacy, Feedback and Diagnostics, Set "Windows should ask for my feedback" to "Never", and set "Send your device data to Microsoft" to "Basic".

Advertising on the Windows 10 lock screen. Yes, that's right. Microsoft has been pretty discrete about this. Some advertizing for a couple of games and for Minions has appeared. It was planned all along to use this for push advertising to you; they finally did and got a lot of flack about it. I probably wouldn't notice it for a long time because I bypass the lock screen, but sooner or later I would want to login as Administrator and maybe see this. As it turns out, there's a setting to turn it off, but like a lot of Windows 10 settings, you wouldn't have guessed it.

In Settings, Personalization, Lock screen, set the Background to anything but "Windows Spotlight", the installation default. I've set mine to Slideshow. Then switch "Get fun facts, tips, tricks and more on your lock screen" to Off. ◆

Verizon.net Mail Moves to AOL

By Ron Weinberg, Member-at-Large,
Tampa PC Users Group
rswjbr@verizon.net

The many Verizon subscribers in Florida, California, and Texas who use Verizon.net email at home or when traveling have already been notified in an email proclaiming new benefits.

You should have also received a separate activation notification message wherein the necessary conversion could be completed. If you use Verizon for email you must take prompt action.

Here are a few important points to be aware of.

We quote from AOL Help. "Your verizon.net email must be moved to AOL before March 15, 2016. If you do not complete the basic AOL registration to move your verizon.net email to AOL by this date, your email will be deleted and you will not be able to use it in the future."

"If you use your verizon.net account to access Flickr, you must update your login ID to another Yahoo account. This action MUST be taken BEFORE you receive the notification that it is time to make the move to AOL Mail or you will lose access to your Flickr account and stored photos/videos. You can complete this process at http://aol.it/flickr."

"If you use your verizon.net account to access other Yahoo services, such as Yahoo Finance or Groups, you will no longer have access to those accounts. You must use an existing or new Yahoo account to use those services in the future. It is a good idea to take a screen shot or print out any information you want to retain before you migrate your verizon.net account to AOL Mail. Then you can mirror that information within your new Yahoo account."

By using the method in the notification you will be able to retain your Verizon.net address. Folders and Contacts and sub accounts will be moved for you. If you attempt to sign up to AOL Mail directly, the connection to Verizon will not be available. Therefore, if you have lost the notification email you may have to call Verizon or AOL for assistance.

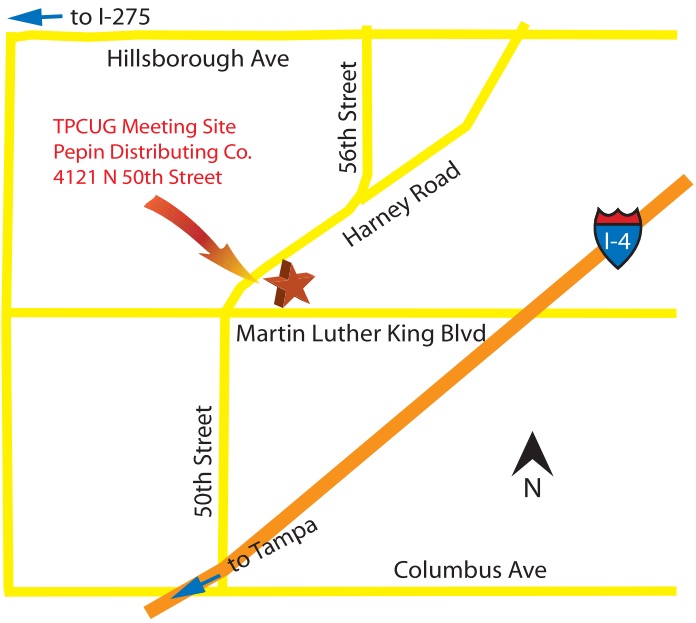
If you receive your Verizon email on your local PC through Outlook, Thunderbird, Live Mail, Incredi-Mail, Apple Mail, etc., you will not have to change your POP or SMTP server but you must replace your Verizon email password with the AOL Mail password. Verizon passwords will still be valid for non-email entry to your Verizon account.

Android or iOS users need add AOL to their native email app or download "Alto" or the "AOL Mail News Weather and Video" app.

Additional information is available at: https://help.aol.com/products/aol-mail-verizon. ◆

Comments.....Continued from page 3

fine on my desktop computers and also on my Surface Pro 2 that is using the same wireless. The tablet works fine for regular web pages. There is just a problem with my videos (which are quite large).



My videos are of three types. Videos that are made of a collection of still photos joined together using Adobe Premier Elements. Then there are ones made up of still photos interspersed within actual movie clips, and finally ones that are exclusively movies. Having taken only still photographs since I was in junior high, I only started taking movies when I purchased a Nikon D800 DSLR that had movie capabilities in addition to still photography two year ago. I never thought I would enjoy making movies but am finding it interesting.

While the Nikon D800 gives excellent results when you have managed to get it correctly focused and held steady, it is not the ideal piece of equipment for making moves. Hence, a Sony HDR-CX900 Full HD Handycam Camcorder is on order from B & H Photo. I am spending my children's inheritance. ◆

Meeting Preview: Merle Nicholson will present Windows 10 Essential Customizations. Merle will also lead the Windows SIG for the first 30 minutes of the meeting.

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Thanks to Merle Nicholson for his contribution this month, including the Picture of the Month. And Doug Mullis has provided our financial report for 2015.

Speaking of the financial report, we missed renewing with the Florida Department of Corporations for our nonprofit TPCUG, so to renew we also had to pay a penalty of $175, then $65 for the missed 2015 renewal and $65 for 2016. I suppose it was my fault since I am the one who usually does that. However, the state is supposed to send out an email reminding you to renew. I have no record of receiving such an email but do have a record of having received such for the previous three years. In the distant past, they used to send me a postcard. Now I have put the renewal on my Outlook calendar.

There is not a lot of text in this newsletter since I used the space for screen captures of my apps running side-by-side in an Android and a Windows 10 Phone in my Xamarin article.

Minutes of the January Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. Merle Nicholson, the SIG moderator introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees. This month Merle showed several items of interest in Windows 10; Windows Media Center from Windows 7 and Gadgets restoration from Vista.

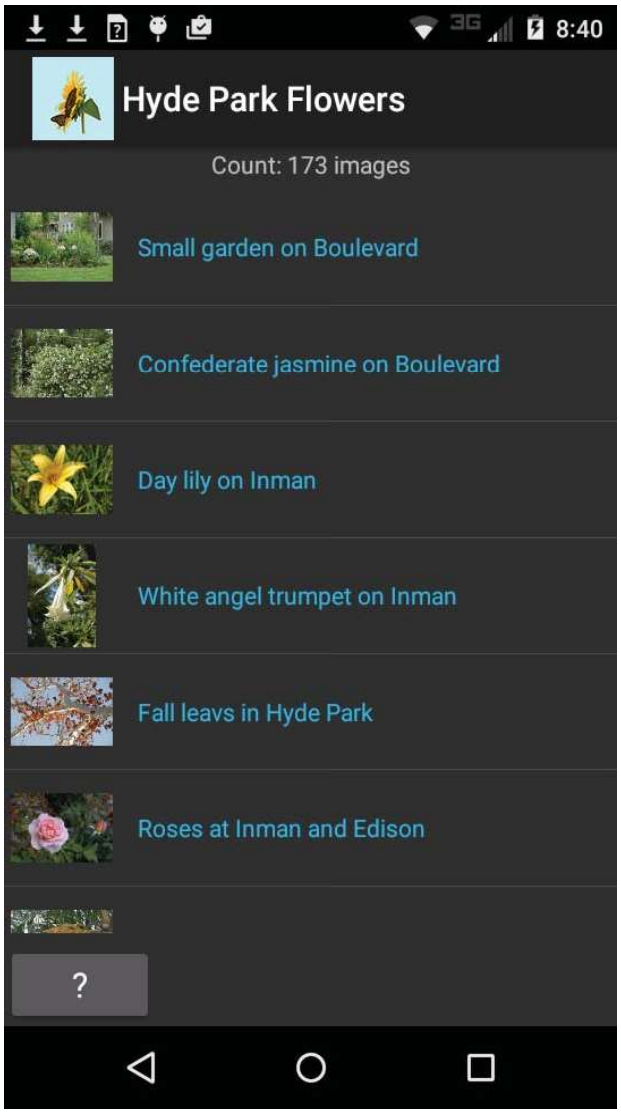
The January presentation was given by Bob Gostischa, an independent presenter of Avast!, a free Antivirus for PC, Mac, iPhone and Android. The Avast! "Free Antivirus" gives essential protection from viruses and malware and also "strengthens your home network." There are other paid versions with more features that Bob did not discuss. Bob presents a well-prepared talk on the essentials of Antivirus and was very willing to give advice to the members in a relaxed and informal atmosphere. It was an enjoyable hour and very informative. Thanks go to Bob Gostischa and to Avast! for sponsoring him. ◆

Comments.....Continued from page 1

Ancestry.com created quite a furor a month or so back by announcing it would discontinue its support for Family Tree Maker. There would be no new versions and no maintenance after 2016. They want everyone to move to their cloud app and store all their genealogical data at the Ancestry.com site. That did not go over very well with the many thousands of Family Tree Maker users, many who don't want to trust their data to the cloud and who found the web-based app lacking when compared to the desktop version.

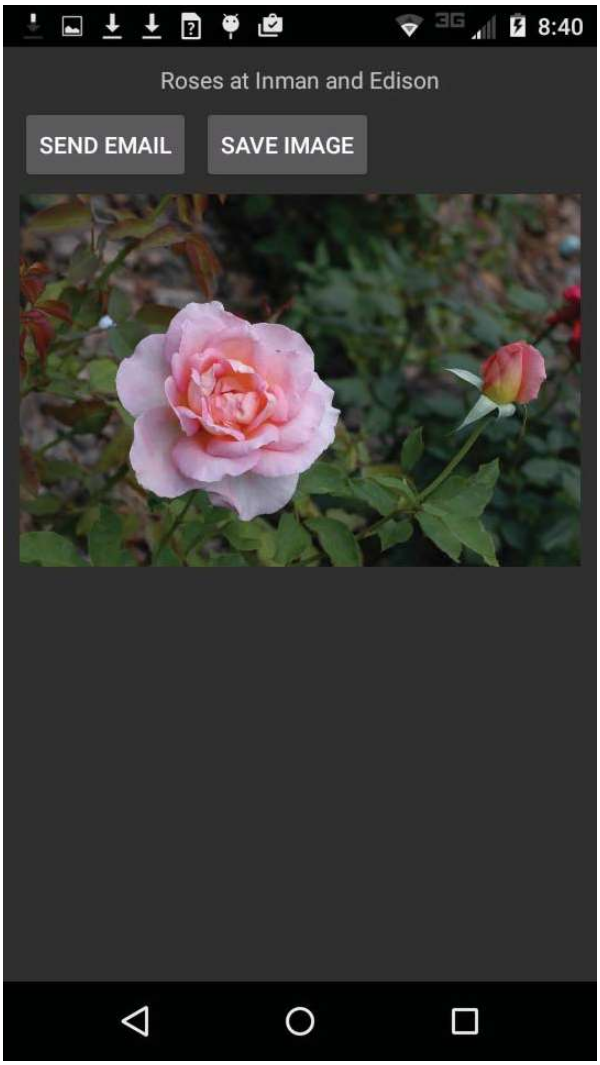
Well, just yesterday Ancestry.com relented a bit to say that they will sell the Windows version to a company that already makes an Apple version of Family Tree Maker and they will also enable the desktop Windows program genealogical RootsMagic to be able to sync with Ancestry.com. ◆

Xamarin

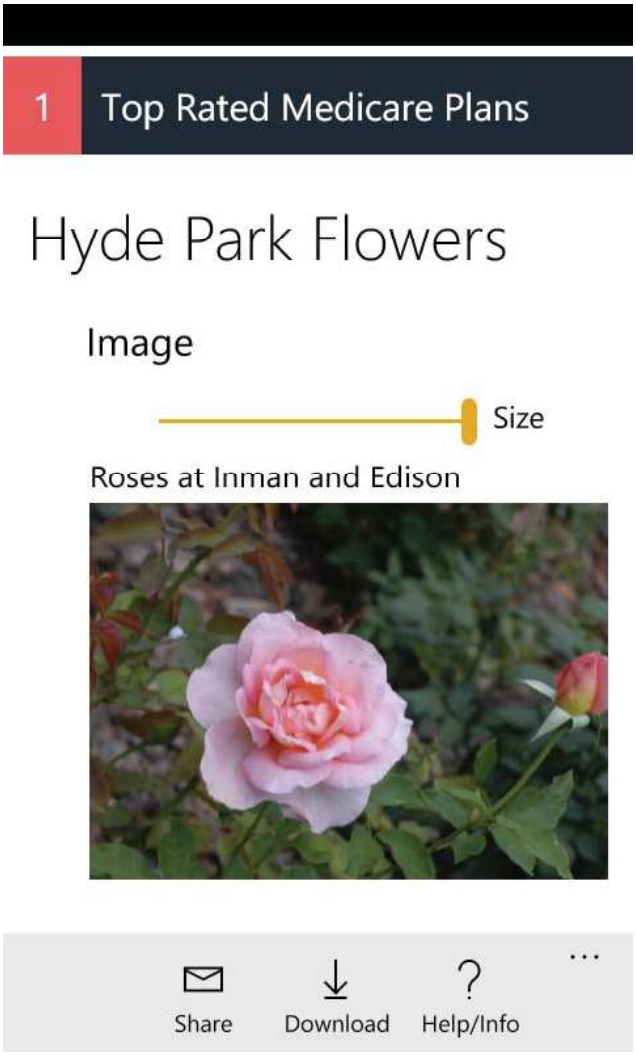


By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

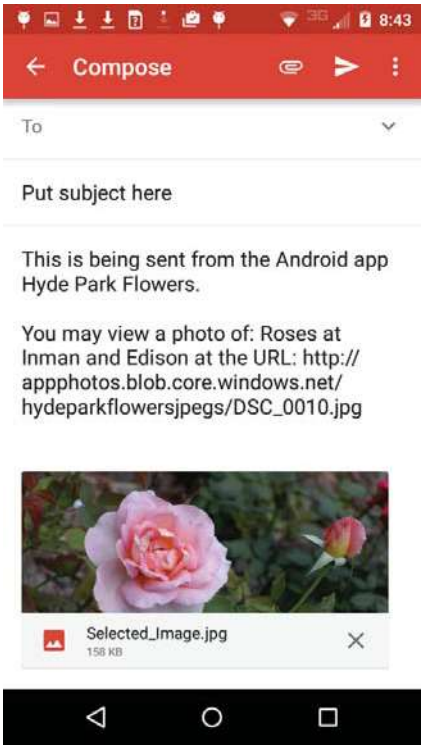
As I mentioned in my comments last month, Xamarin is a software development tool that allows you to develop simultaneously (up to a point) for the three main mobile platforms: Android, iOS and Windows. Also as you probably know, I have been a Windows developer for many years, recently working with Windows Phone and then more recently with Windows 10 Universal apps. The Win 10 Universal apps have the nice feature in that you write one code base and you have an app both for Windows 10 on the desktop/laptop and you have a Win 10 phone app also.



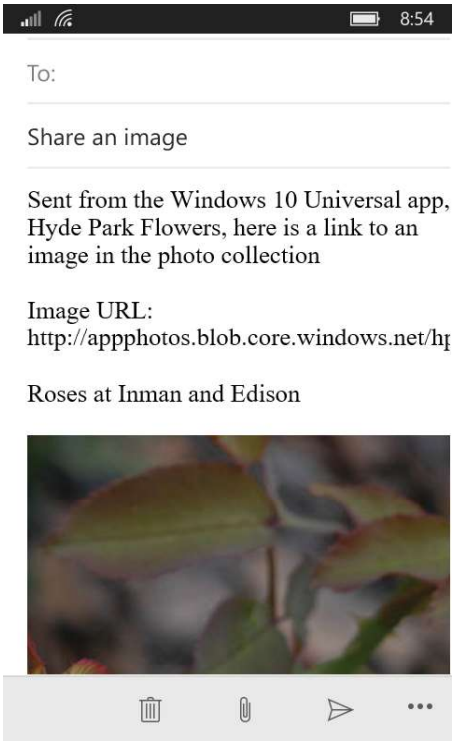
When I heard about Xamarin, I thought, hey, that will allow me to easily port my Windows phone apps over to Android. I didn't include iOS since that would require an Apple computer to compile the code for iOS and twice the cost for Xamarin. What cost, you ask? Well, Xamarin is not free. To use it with Visual Studio you need to pay $1000 per platform per year, discounted to $800 per platform for independent developers such as I. That also helped me omit iOS.

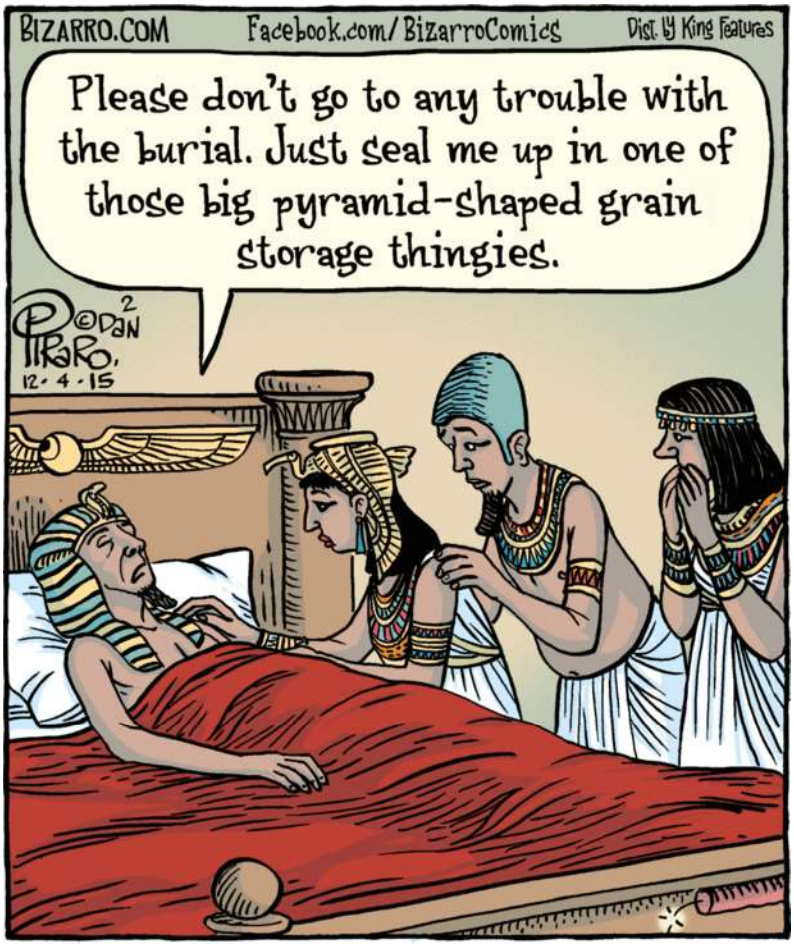


Before going further, note that on this page and the next, there are screen captures of the same app running on an Android phone on the left and a Win 10 phone on the right. The Win 10 version has ads. If the Android app and the Win 10 app are using the same code base, you are justified in asking why the difference in appearance. The reason is that I didn't use Xamarin as it is meant to be used in developing the



Xamarin.....Continued on page 4



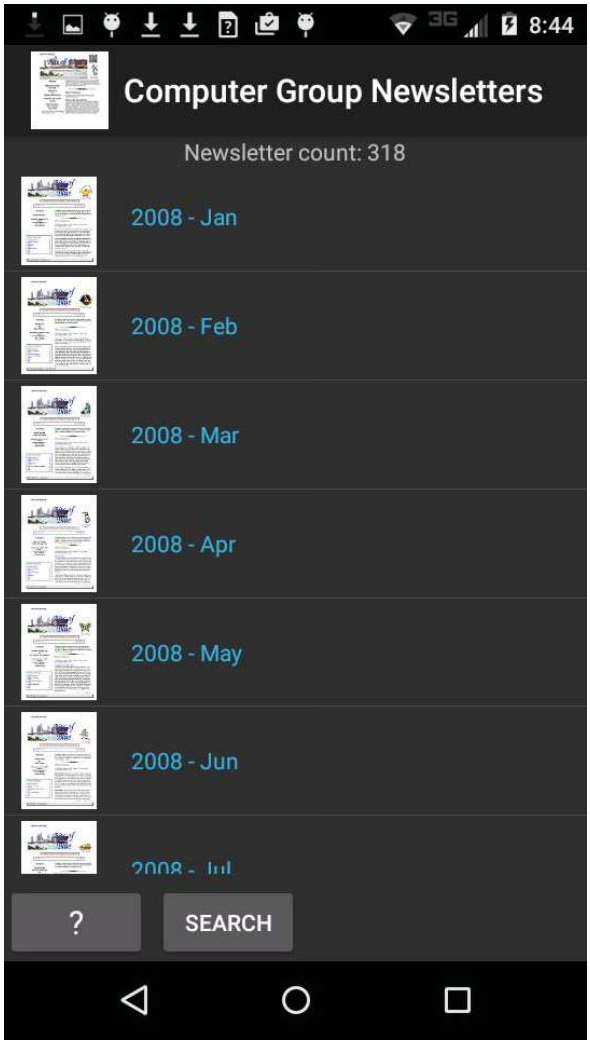


Xamarin.....Continued from page 3

app for both platforms simultaneously. I already had the Win 10 apps, and I only wanted to port the apps to Android – and not use the usual Android development tools. So I simply dropped my C# code for the Win 10 app into the shared part of Xamarin, made a few changes in component names to satisfy Xamarin, such as changing <StackPanel> to <StackLayout>. That got me the Android app up and running with its basic features. To enable features such as sending email and saving an image to the Pictures folder, I had to move to the Android only part of the Xamarin and do what was needed

Xamarin.....Continued on page 6

Internet Picture of the Month



Apparently Ben Carson was correct

From the site http://bizarro.com/ at http://bizarro.com/comics/december-4-2015/. Obviously inspired by Ben Carson's comment that the pyramids were built to hold grain.

there to be able to send an email with an image attached and also to be able to save an image to the Pictures folder in Android.

A Xamarin Solution in Visual Studio has four projects: A shared code project, then three separate projects for the three platforms. In my work, since I already have a Windows app and am not interested in an iOS app, I only deal with the shared project and the Android project. So far I have ported the Computer Group Newsletter app you see on this page, the previous Hyde Park Flowers app, my Civil War Photos app and my Old Florida Photos app. However, none of the Android apps have yet been published. That is my next project. ◆

Yahoo Groups email group

By Merle Nicholson, Secretary, Tampa PC Users Group
merle@merlenicholson.com

We have had a Yahoo group for broadcasting emails to members TPCUG@YahooGroups.com for many years, and although there are messages coming out of the group every month, it seems to me the participation is lower than it could be. Will you please consider joining?

The concept and use of the group is pretty straightforward. If you send an email to the YahooGroup, that email gets sent to all subscribers. So you can ask a question, make announcements, send items of interest or ask for help from the entire membership just by sending your email to TPCUG@YahooGroups.com. At least to those members who have subscribed.

Yahoo.....Continued from page 7

To subscribe, send an email to tpcug-subscribe@yahoogroups.com. It will add the email address that you sent it from. If you're not sure if you're already on the list, just send it anyway, and you'll get a message back to that effect.

We are not getting any spam or anything unwanted from this so far – and it's many years old. There is a monthly reminder to contribute an article to the newsletter and a reminder for the monthly meeting, and an occasional ask for help on one thing or another. It's always had the potential to be truly useful as a way to ask questions of the membership. Will you join? ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Thanks to Brian Lance, Ron Weinberg and Merle Nicholson for their contributions this month and again to Merle for the Minutes of that very well-presented presentation last month.

Last month I wrote: "In the news toward the end of February was that Microsoft bought Xamarin. I had to pay Xamarin $800 to use Xamarin in conjunction with Microsoft Visual Studio to create my Android apps. Perhaps with that purchase Microsoft will now offer the use of Xamarin with Visual Studio as cheaper or possibly even free..... Perhaps they will make an announcement about all of this in April at the Microsoft Build conference in San Francisco." Well, they did, and they made it free, just as is Visual Studio. Now I can hope that they will refund the $800 that I paid on December 28 to be able to use Xamarin with Visual Studio to create Android apps.

Speaking of my Android apps, the downloads of them have

Minutes of the March Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. Merle Nicholson, the SIG moderator introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees. This month Merle Showed several items of interest in Windows 10.

The February presentation was given by Abby Stokes, a technology author who concentrates on the basics of technology: computers, phones and tablets (http://askabbystokes.com). The title of the talk was "Is this thing on?" Abby talked on a very wide range of subjects: WiFi, Cellular, hands free driving, passcodes and how to protect your smartphone and battery savings. Abby gave a very informative talk; well prepared and entertaining throughout.

Our heartfelt thanks to Abby for an interesting and informative presentation. ◆

Comments.....Continued from page 1

been minimal. The three of them, *Civil War Photos*, *Computer Group Newsletters,* and *Hyde Park Flowers* have received a total of less than 50 downloads over the past month, with Civil War Photos receiving the most. I didn't expect much because of their content, but I expected more than that since there are supposedly a massive amount of Android devices out there. Well, nothing ventured, nothing gained. And I have just added to the list by publishing *Old Florida Photos* to the Google Play Store. So it gives me something to do and keeps me occupied.

At the end of March, I watched the Microsoft Build conference via a live stream from San Francisco, and I saw a few truly amazing things. The app that left the

Comments.....Continued on page 4

Fixing Bad Menus in Windows 10

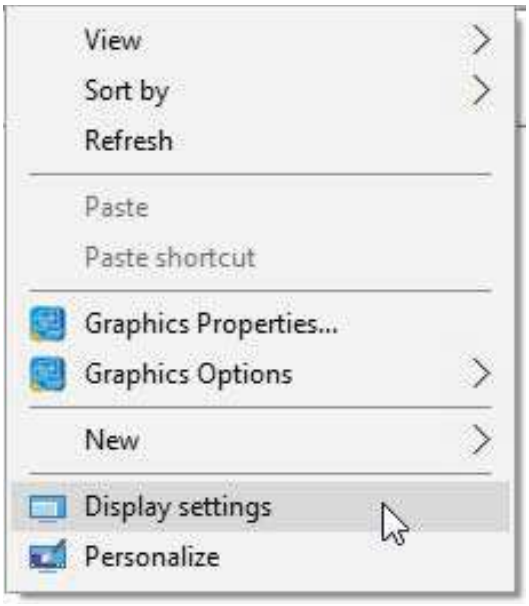
By Brian Lance, Tampa PC Users Group
master.pc.tech@gmail.com

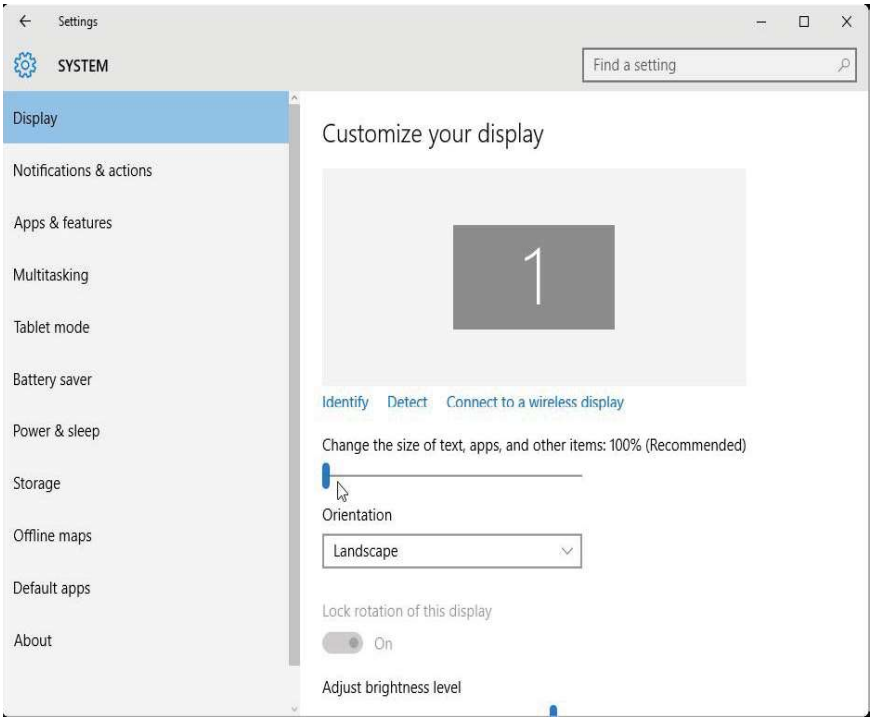
I had this happen to a Lenovo Yoga laptop that was upgraded from Windows 8.1. I do not have a screen capture of the original issue, but I can describe it as all menus that had underlined shortcuts, such as Word and Notepad, were bold and misaligned and not the standard font.

I remembered a similar situation had occurred with Windows 7 years ago and tried my usual trick to restart the Themes service. Anyone who knows me knows I typically run with this service off. In this case, I elevated a command prompt to toggle the service to no effect. Rebooting and power cycling also had no effect.

Looking further, I went to the display settings, which, in the 'new' Windows manner, hides many customizations from the user.

Fig 1: Right-click on desktop and select Display settings.





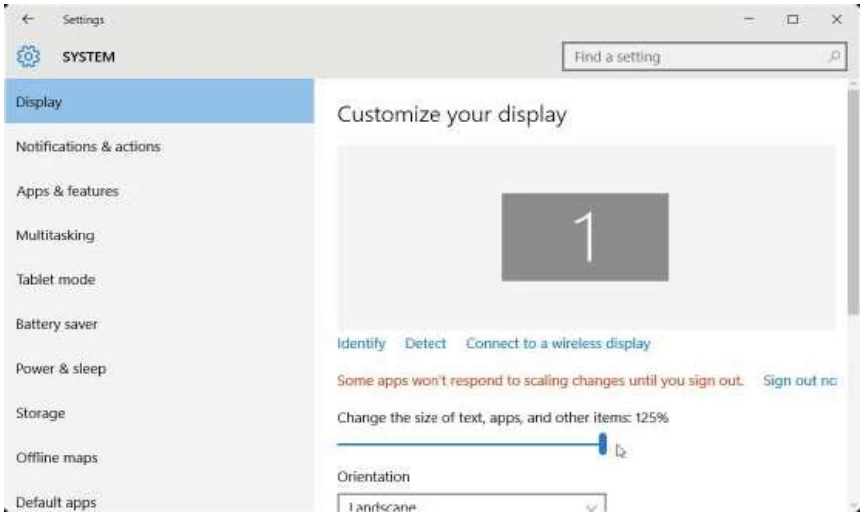


Fig 2: System, Display, Change the size of text, apps, and other items

You'll see the setting here at its default, 100%. My display is slightly crowded, 1366 * 768.

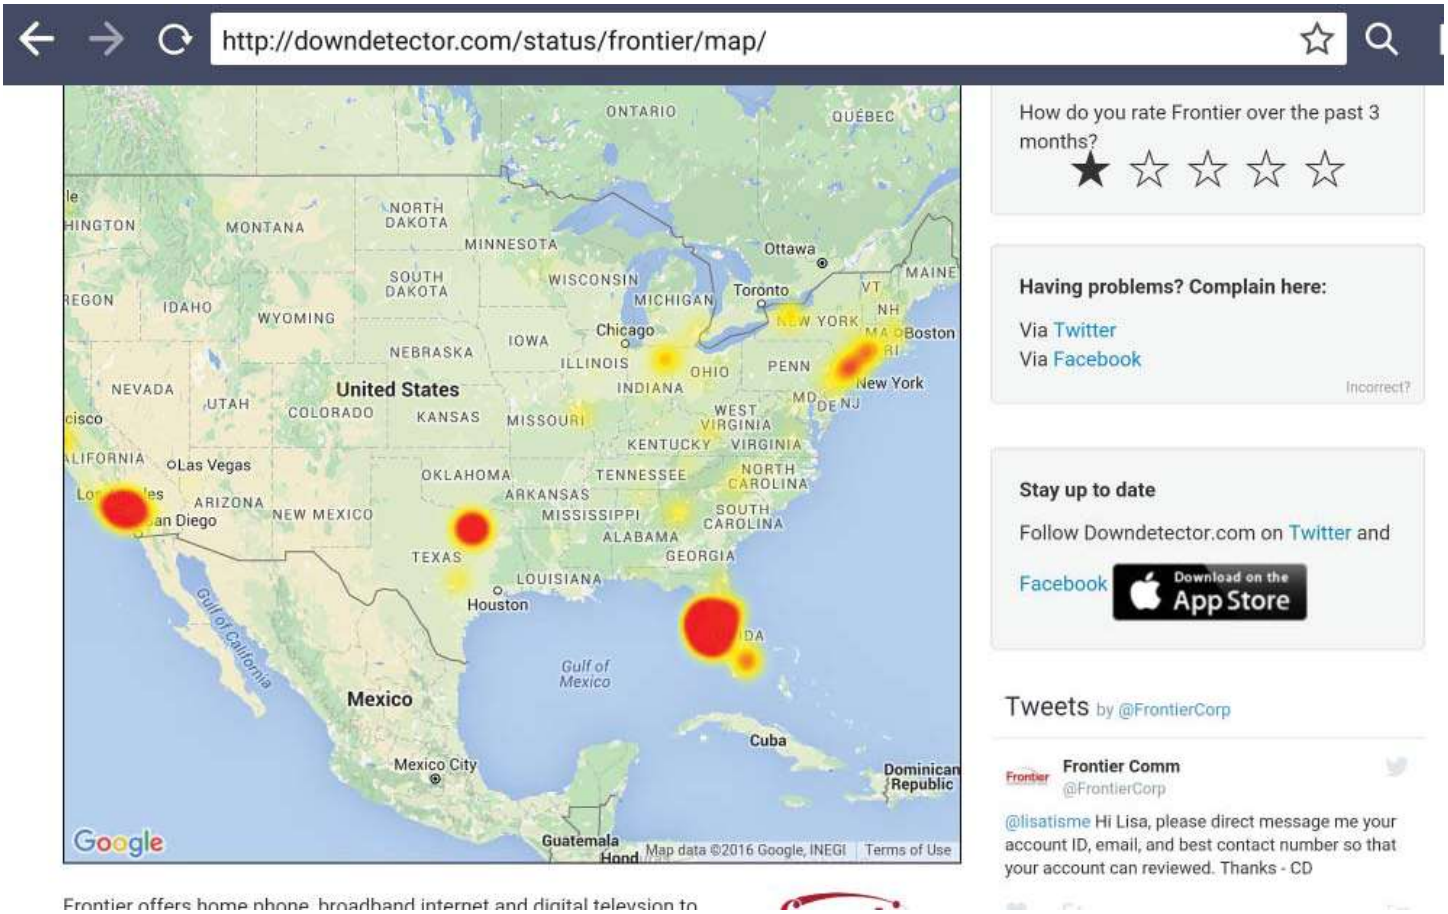
Fig 3: Here is the display at 125% of normal, the only other option for this notebook display. Note that changes are processed immediately, and all was back to normal when toggled back to 100% default. Verified OK after reboot. ◆

Comments.....Continued from page 2

most lasting impression was one created by a Brazilian developer named Flavio Almedia. It was named Pro-Deaf and used the Microsoft Translation API to convert spoken Portuguese into English, which was then converted to American sign language instructions that were then acted out by an Avatar. It could also convert English directly to American sign language instructions sent to the Avatar that went though the motions of displaying the spoken words with American Sign Language.

Below you see the Avatar saying part of "Hello, how are you today?" I don't know what word the screen capture is depicting. So, with this app you can now speak to a deaf person.

Then there was Saqib Shaikh, blind since seven and a software engineer at Microsoft. He created an app that



helps you know what is going on around you, based on the Microsoft intelligence APIs. The app runs on smart phones and also the Pivothead smartglasses, pictured above on Saquib. When he swipes the side of these glasses while facing a man on a skateboard as pictured below, it gives him its best guess as to what is happening. In this case it says, "I think it's a man jumping in the air." Of course, the blind person does not see the image below; he only hears the spoken description.

When used on a Smartphone and a restaurant menu is presented to it, it will guide you to position the menu so as to be better viewed by the phone. Then it will read the menu and allow you to request things such as "read me the entries." All of this is truly amazing, and there was much more. I have put a link to the Keynote Address at Microsoft Build Day 1 in the "April's Links" list on page 5 ◆

Internet Picture of the Month

Frontier Communications Outage

From the site http://downdetector.com, we have a screen capture of a heat map of the Internet outages on the day of the transfer from Verizon to Frontier of the land lines and FIOS services. This screen capture is from my Asus Android tablet that was receiving a wireless connection shared from my Windows phone (which had a cellular connection) since I lost my Internet all my waking hours on the day of the transfer. This screen capture was made around 10 PM on Friday, April 1. Some of my neighbors never lost service that they noticed, some lost it briefly, and I and others were out all day. Area wide there were many outages as evidenced by the 6,000 plus messages posted to a site I viewed following the problem. Frontier has said the problems were minimal.

Windows 10 for April 2016

By Merle Nicholson, Secretary,
Tampa Pc Users Group
merle@merlenicholson.com

Here is an interesting factoid I wasn't aware of. Windows folders are optimized for the type of files in them, and sometimes they're done non-optimally. A case in point is that your Downloads folder is optimized for Pictures, and since folders for pictures generate thumbnails of each one, this slows the opening and scanning of all the files. Instead, change the optimization to "General Items", and opening the folder will be much faster. Here's how.

To do the above, open the Downloads folder and right-click on an empty spot, select "Properties", tab to "Customize", and change the "Optimize this folder for:", and select "General Items" instead of "Pictures". There is a check box just below for "Also apply this template to all subfolders", select OK or Apply. Note, too, that you can change the icon that the shortcut uses, and even use a picture in its place. This works in Windows 7 as well,

and I'd assume Windows 8 if you haven't upgraded to Windows 10, but I've not verified that one.

I've been upgrading a friend's/customer's PC the last couple of days. It was necessary because the motherboard blew out on an electrical fault that left a burn on the board. So the motherboard and processor needed replacing. The new motherboard required new memory, and the drive was four years old. So I added a 1TB Samsung SSD, and just to be safe a new power supply. So there's very little left of the original PC. I first built it in 2004 with Windows XP, then rebuilt in 2009 with Windows 7, so this is the third time around with Windows 10.

The Windows 10 upgrade for Windows 7 is evolving. The screen prompts are very much different than they were a couple of months ago. There was no mention of using a Microsoft online account for the user account. There were three pages of options, mostly concerning choosing your preferred level of information ("telemetry") sent to Microsoft. You have to read the prompts carefully, but as it says on the page, you can opt to make changes to the settings after installation.

For the upgrade media choice, I use the Windows 10 media creation tool, which will download the latest software and either write the software to a USB flashdrive or to disk in ISO form. If you choose ISO, then you can easily write the ISO to a DVD disk using ImgBurn. Installing from a USB3 flashdrive is easy as long as you pay attention. For me, it took an hour installing on that new SSD.

There are still settings left that you must change to minimize Microsoft's involvement. I've covered them in previous articles, and there are surely more to come.

And finally I installed some software over the top of Windows 10 to improve the experience. I installed "Classic Shell" – a menu system, 8Gadgets – to restore desktop gadgets introduced in Vista, Windows Media Center, and Microsoft Games to replace the crappy games collection that Windows 10 provides. I like 7-Zip and FoxIt PDF reader.

One new discovery is that the "Windows Live Family Safety" from Windows 7 no longer works, producing errors in Windows 10. Signing into any account gives a

Windows 10.....Continued on page 7

Save on Ink

By Ron Weinberg, Member-at-Large,
Tampa PC Users Group
rswjbr@verizon.net

Inkjet printer users know that no matter how inexpensive an inkjet printer may be, the cost of cartridges to run them is steep. According to *Consumer Reports,* ink costs from $13 TO $75 per ounce or $9,600 per gallon, one of the most costly liquids known, far exceeding the finest aged wine. There have been two recent developments addressing this problem: Epson's new tank printers and HP's Instant Ink.

Epson's Tank Printers
Epson has introduced four new ecotank Supertank Printers. These are equipped with refillable tanks instead of cartridges. Each new printer comes with up to two years' worth of ink, enough for 4,000 to 11,000 B&W or 6,500 to 8,500 color pages depending on model. Prices range from $279 to $499. There is also a new business professional heavy duty model which uses ink packs.

These are full featured all-in-one and wireless capable printers, two of which include FAX and Ethernet.
With prices starting around $279, these do not compete with the $99 and less than $99 type printers and likely would not really be cost effective for users of those basic printers.

HP's Instant Ink
HP's Instant Ink is a service available for only certain eligible HP printer models. Current HP Instant Ink eligible printers are the HP ENVY 4500 series, HP ENVY 5530, 5660, 7640 series, HP Officejet 4630 and 5740 series and HP Officejet Pro 6830 and 8610/8620/8630 series, and Officejet 8040 Series with NEAT®.

- 2.99 per month provides ink for 50 pages, ($1 for each additional 15 pages.)
- You can rollover 50 unused pages.
- $4.99 per month for 100 Pages, ($1 for each additional 20 pages.) You can rollover 100 unused pages.
- $9.99 per month for 300 pages, ($1 for each additional 25 pages.) You can rollover 300 unused pages.

Ink usage is monitored on connected printers automatically via Internet. You never run out of ink. Free shipping for cartridges and return of the used ones is included. You get genuine HP ink cartridges. All calculations confirm this will produce substantial savings. HP owners who have an eligible model would likely benefit from the Instant Ink plan.

Neither of these two options is the perfect or complete solution to high ink costs. Other attempts to reduce costs have been made, notably by Kodak who later abandoned the printer business.

For those considering a new printer, if an ecotank or eligible HP is not for you, check reviews and do some online research. It should help determine printer models which are likely to be more economical than others. Also, consider Laser printers, more costly to buy, cheaper per page, especially for high volume printing. ◆

Windows 10.....Continued from page 6

notification flag that it failed to run. Looking it up using an internet search gives plenty of information on what Microsoft expects you to do to replace it. If you go to the Microsoft Family Safety website, it's clear that you must sign in with a Microsoft account, and identify the family structure. There is no mention of how to clear the startup error messages. Research into that just brought up that you go to Control Panel, Programs and Features, Windows Essentials, select uninstall and then select the family safety item for removal. But that family safety item is not on this panel, and it is nowhere to be found. Not Essentials or Windows Live. Eventually the startup error stopped on its own.

Last, I must mention that you must make a full system backup before upgrading, and I've been taking my own advice, and it really saved me this time once again. Actually it saved my customers data and all her pictures going back 10 years. In my complacence, I put her pictures at risk without thinking about it, and I had an unexplained failure of a disk clone (Acronis DiskDirector) that wiped out both the old disk and the new. I was absolutely distraught, kicking myself for putting both disks at risk at the same time.

I'd started the clone and headed for bed and within five

Windows 10.....Continued from page 7

minutes I realized that both drives were attached and running at the same time, and slept knowing that the likelihood of something happening to them was slim. When I got up I attached the new one to the new system and it failed to boot, and the Windows 10 installation drive failed to repair it. I found the same result with the old drive. I was so distraught I wasn't thinking clearly, and when I calmed down I realized that of course I had done a complete system backup to a portable drive that I could recover from. If the recovery worked, that is. But it worked. I used the Windows 10 installation flash-drive and selected "repair this computer", then "Restore System Image". I did this on both the old drive and the new. The old drive is mounted inside the case, but not hooked up as an emergency full system recovery. It was replaced because of its age and was working fine. Sitting unplugged it should outlast the computer itself.

The new Windows 10 backup program is called "File-History," not "Backup and Restore". FileHistory is a scheduled backup system that backs up just personal files. But "Backup and Restore" is still on the system renamed to "Backup and Restore (for Windows 7)". "Backup and Restore (for Windows 7)" seems to be fully functional. It clearly says it's to recover backups made with "Backup and Restore" made from Windows 7. It can be used however on Windows 10, and that's how I made the System Image Backup. So I'm mentally kicking myself for doing a dumb thing, but congratulating myself for being in the habit of doing backups. ◆

May in Tampa

Meeting

Windows Backups

by

Dave Palmer

Wednesday, May 11, 2016

6:30 PM

Pepin Distributing Co.
4121 N 50th Street
Tampa, Florida

Meeting Preview: Dave Palmer will be moderating an interactive session on windows backups, and we need your help.

The idea is to present the schemes that our members use for backups and discuss them. So in preparation for this, if you will put your thoughts down: Computer type, software used, backup hardware (external drives etc), backup frequency and bring that with you. Or better still:

If you feel that a presentation slide would be interesting, email it to Dave and Merle and we'll put it on the screen. We can handle Google Slides, Microsoft .PPT and LibreOffice Impress formats. Or any document type for that matter.

Merle Nicholson will lead the Windows SIG for the first 30 minutes of the meeting.

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Thanks to Merle Nicholson and Dave Palmer for their contributions this month. The newsletter sort of snuck on me this month, and if not for Merle asking me about its status, it would probably have been late. And it still might be a little late since I am struggling to get it finished and to the printer with the hope that they will print it immediately.

Minutes of the April Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. Merle Nicholson, the SIG moderator, introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees. This month Merle demonstrated several Windows 10 Tips and settings items.

The presentation was given by a TPCUG member, Michelle Burgess, on her favorite applications. It turned pretty interactive with lots of suggestions and quick demonstrations. It was a lively and interesting session.

Favorite apps: Keyring, Google Maps, Bubble Levels, Google Goggles. Michelle opened the Windows 10 store and we looked at Fresh Paint (Interesting!), USA Today, iHeart Radio, TuneIn, Allrecipes Video cookbook, PicSketch (turns your photos into pencil sketches) and My Radar (available for Android as well)..

Our heartfelt thanks go to Michelle for an interesting and informative presentation. ◆

Comments.....Continued from page 1

I have taken a slight break from programming and have been using my new Sony Video Handycam to take videos and then edit and piece them together in Adobe Premier Elements 14. You may have a look at my amateur attempts at my website http://www.lamartin.com by selecting the Videos menu item.

In closing, I note that Microsoft, after purchasing Xamarin and then making it free to developers, refunded anyone who purchased the program after February 1 their purchase price. I paid $800 on December 28, 2015, so I missed out on the refund by 34 days. That's $23/day to use the program. I am not happy. ◆

What Interesting Phone Apps!

By Dave Palmer, Baord Member,
Tampa PC Users Group
dkp205@hotmail.com

At last month's TPCUG meeting, Michelle Burgess demonstrated a wide variety of highly-rated smartphone apps. I'll attempt to recap the presentation. Michelle began the presentation by recognizing our own William LaMartin's apps, Computer Group Newsletters, Hyde Park Flowers, Civil War Photos and Old Florida Photos. They are free, and I understand they are available for Microsoft and Android but not iPhones. I especially like the fact that the newsletter app is searchable.

First Aid, an app by the American Red Cross looks especially useful. They advertise it as "…expert advice for everyday emergencies in your hand." The app features videos, interactive quizzes and simple step-by-step advice.

Are you tired of carrying around all those loyalty cards? Key Ring might be a solution to consider. One of many such solutions, the app offers the benefits of carrying not only your loyalty cards, but also the stores' weekly ads, coupons, and your shopping lists – all in one app.

One app that woke up my normally dormant inner-handyman was the Bubble Level app. My understanding is that this and similar apps use the accelerometer in the phone (the chip that allows your phone display to move when it's tilted) to help create a digital image of a working spirit level. Some apps also display the angle in tenths of a degree. Looking at the range of similar apps, I'm drawn to the 'tool kits' that contain a range of useful tools. One that caught my eye is the Army Knife for Android. It contains a flashlight, a unit converter, a timer, a stop watch, a compass a bubble level, a calculator, a magnifying glass, a mirror and a ruler, depending on the hardware/software combination. For us primitive Homo habilis (handy man) types a tool kit like that is nearly irresistible. The permissions on that app are quite benign. No forays into my phone looking for my location or contact list.

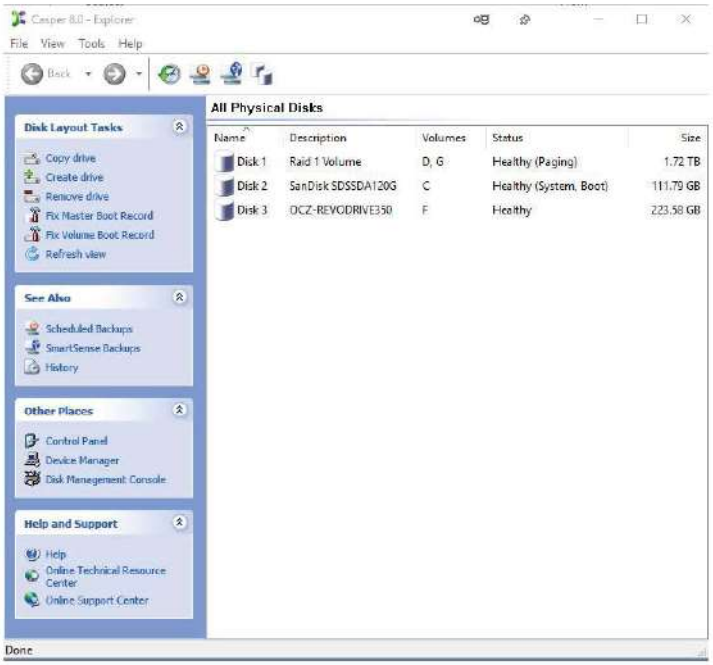
Frank Weitzman mentioned a highly-rated app called Like That Garden - Flower Search. This and similar apps take image recognition and attempt to extend it into the garden. As Frank mentioned it's a work in progress, but is improving by leaps and bounds, much to the delight of tech-savvy gardeners.

Google's app Goggles was discussed as well. This highly interesting app is a combination of tools - image recognition, optical character recognition (it 'reads' print), translator (Goggles can read text in English, French, Italian, German, Spanish, Portuguese, Russian, and Turkish, and translate it into other languages), as well as a barcode & QR code reader. The app works by taking a picture - a landmark, a famous painting, a barcode or QR code and Goggles will bring you information on the image. If you take a picture of text in a foreign language, Goggles will provide a translation.

The bottom line is that there are many (many) potentially useful and interesting apps available. Thanks for the interesting meeting Michelle ◆

Casper 8.0 Disk backup/utilities by Future Systems Solutions, Inc.

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com



I've been using Acronis for many, many years, through our long term relationship with Gene and Linda Barlow at http://ugr.com/, and I expect that to continue. But I recently ran into something that Acronis was failing at. I needed to make a clone disk of my primary boot drive for the transition from Windows 7 to Windows 10, and Acronis failed with an error message that it failed to read from sector yada, yada. I wasted quite a bit of time trying to find out what was going on, because I had a good working boot drive with no errors … and well, it's not a mainstream disk product. It's an OCZ (Now Toshiba) RevoDrive, an SSD that is plugged into a PCIe video slot and is about three times faster than a conventional SSD. So I contacted OCZ and they acknowledged that they know of the problem and it isn't their fault, and they are having good service from Casper. So I downloaded a 30-day trial version from Future Systems Solutions, and cloned the drive. Since then I have purchased a standard one-user version for $50. Yep, a bit expensive if you have more than one computer as I do, but I can stick with Acronis for my other three Windows machines (Server, notebook and Media Video machine). Gene and Linda have attractive multi-computer license prices.

I like to use Casper. It's a simpler user interface compared to Acronis, and it covers everything I want to do, which includes making full image backups using wizards, and creating a boot disk on USB. I do full image backups to the server, and I also clone all the boot drives to separate drives so they can be connected in seconds and get a machine running quickly without software. You just mount the cloned drive physically, and boot to that. The prices for good quality drives are now so low that I value my time much higher than the $60 it takes for an alternate boot device.

Casper makes that clone process fast and easy, and I do mean fast. I cloned my primary drive on my desktop to an SSD in minutes. I don't know how long it takes, but it's not more than 10 minutes.

There are three entry points to launch Casper: Wizard, Explorer and SmartStart. SmartStart figures out for you which drive it thinks you need to back up and pre-configures the settings. If it guesses wrong, it's no harder to change to what you want than any other backup method.

Explorer interface shown below.

Explorer has a good collection of utilities like the "Fix Master Boot Record", create a startup disk and Schedule a Backup.

Launching Casper into Wizard gives you the basics. Copy Drive, Create Image, Restore Image. All other actions are on the menu, or you can jump to Explore. See the screen capture on page 6.

The current version (8.0) is not yet optimized for Windows 10. I asked their support about Windows 10 before I purchased, and here's their reply.

"We are currently preparing a new version of Casper specifically for Windows 10. That said, there are no known issues with creating or restoring a backup

Casper.....Continued on page 6

Internet Picture of the Month

The Tampa Tribune is No More

The Tampa Tribune was purchased by its local rival, The Tampa Bay Times, on Tuesday, May 3, 2016. The image above is from a video at the Tampa Bay Times website, http://www.tampabay.com with an actual link of http://www.tampabay.com/news/business/tampa-bay-times-purchases-tampa-tribune/2275765?platform=hootsuite. The announcement is being made by the Times CEO, Paul Tash.

From the accompanying article: "The purchase marks the end of the 121-year-old Tampa Tribune as a daily newspaper. It was started in 1893 when Wallace Stovall moved his existing news operations to Tampa from Bartow, according to Tribune files. Stovall's first Tampa Morning Tribune debuted on March 27, 1893, and became a daily in 1895."

Casper.....Continued from page 4

of Windows 10 using Casper 8.0. (NOTE: Due to a driver change in Windows 10 support for booting directly to a USB backup is not currently supported, but booting from an internal backup or alternate external connection (e.g.,eSATA) is fully functional.) Please let me know if I can be of any further assistance. Thank you."

I can recommend this product; having a simpler user interface may justify its higher price, but keep in mind you may want to delay if you're using Windows 10. Also you can contact them and ask them to waive the charge for the upgraded version when it becomes available as I did. The normal upgrade price is $25, and in my opinion it should have been ready for Windows 10 a year ago. https://www.fssdev.com/

In my opinion Acronis has been trying to add some minor functionality every year and changing the look without actually justifying a new product every year. I'm happier with my Acronis 2009 than my Acronis 2015 because the new user interface is messier. It has that flat, colorless "material" design with no borders. Still, the price for multiple computers is much more attractive, and Gene and Linda make it easy. ◆

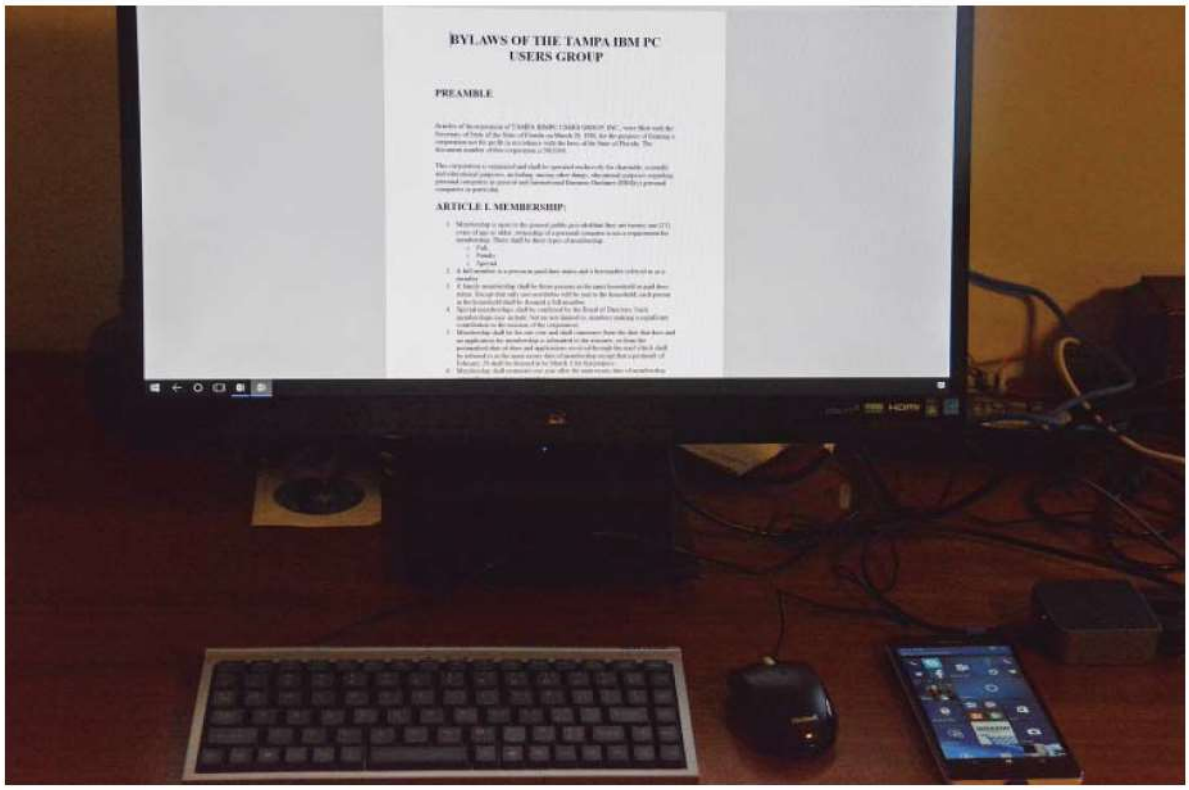
Continuum

By William LaMartin, Editor,
Tampa PC Users Group
william@lamartin.com

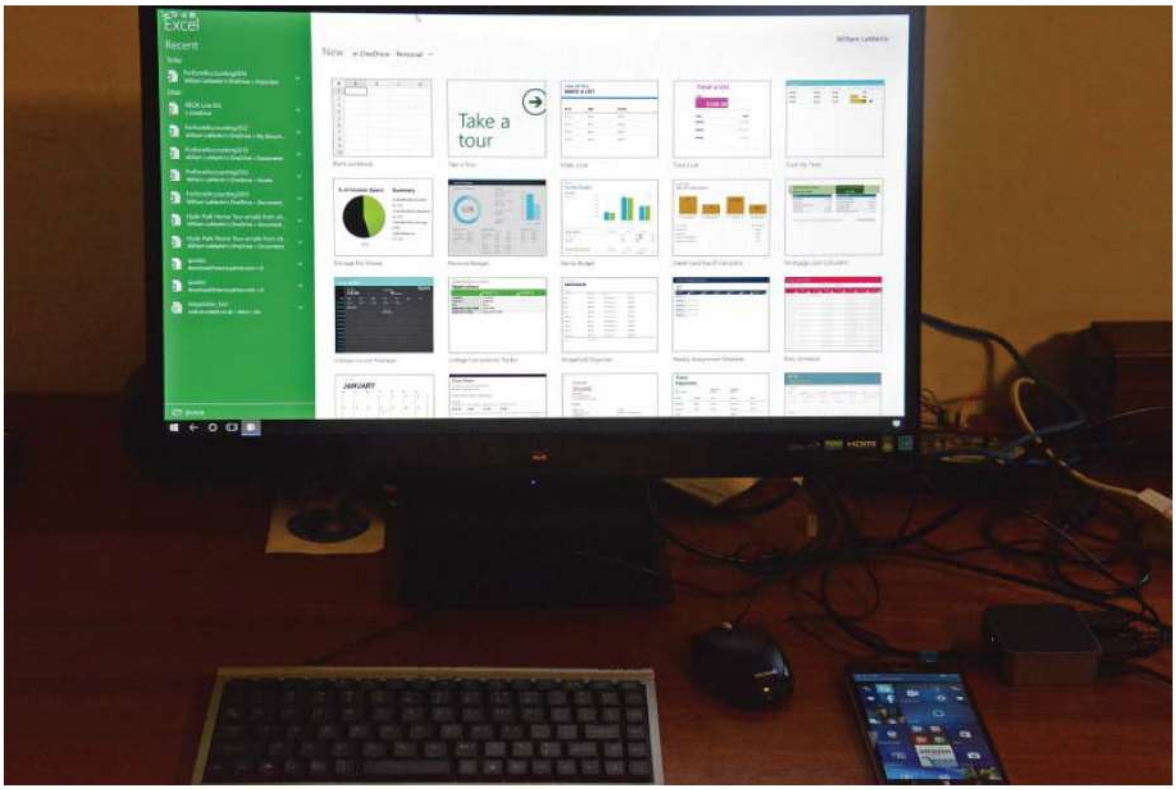
It is a pity all of you don't have a Microsoft Windows 10 phone, either a 950 or a 950 XL. Since if you did then you wouldn't need a regular computer for most of what you do. I think most people only surf the web, use email and possibly work with Microsoft Word or Excel. With certain Windows 10 phones, you can do all of this on a screen of any size and also do it with a mouse and keyboard--but without a laptop or desktop or tablet device.

What you need in addition to the phone, is a Microsoft Display dock ($99), pictured above as the small cube looking device with all the cables emanating from it. In that photo there is a power cable, a USB cable to the phone, an HDMI cable to the monitor, USB cable to the mouse and also one to the keyboard.

What apps can you use? Anything that will run on the Windows 10 phone. That includes the usual phone apps plus the Edge browser, Outlook email, Microsoft Word, Excel, Powerpoint and OneNote. And these last Microsoft items are quite full-featured.



And if your monitor has wireless connectivity, then you can connect the phone to it in that manner with no cables. I have no such monitor or TV, so I cannot test that feature. However, you can view it in use in the



Continuum.....Continued on page 7

Continuum.....Continued from page 6

demonstration video at this link: https://www.microsoft.com/en-us/windows/Continuum.

I don't have much to say about Continuum at the moment other than I have used it, and it works. I have created and/or edited both Excel and Word documents using it, as pictured below. I also have opened and viewed PowerPoint presentationes but have not done any editing in PowerPoint on the phone using Continuum. ◆

Meeting Preview: Brian Lance will give us the details on Google Maps and Google Earth. There is probably a lot more to these two items than you would think.

Merle Nicholson will lead the Windows SIG for the first 30 minutes of the meeting.

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Thanks to Dave Palmer and Ron Weinberg for their contributions this month. Now this is important:

The July meeting, not the current meeting, is moved up one week from the usual second Wednesday to the first Wednesday of July 6

I have for the past few months been receiving a tremendous amount of email that have attachments on which I know I do not want to click. I send all of them to the Deleted folder. I have heard from others who are experiencing the same problem. Typical subjects are:

Photos; attachment Photos
New Invoice; attachment INVOICE_editor.zip

Minutes of the May Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. Merle Nicholson, the SIG moderator, introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees. This month Merle demonstrated the change on the TPCUG website that launches the latest newsletter in PDF. Thanks go to our webmaster, William LaMartin.

The presentation was a discussion of members' data backup methods moderated by Merle and Dave Palmer. The subjects were wide-ranging from online backups, file transfer methods, Acronis, Casper, Truecrypt at grc.com, and RAID drives. Also discussed were file backup and imaging and duplicate boot drives as were files that don't need backing up. It was a good and lively discussion for the entire membership present. ◆

A Difficult Windows 10 Upgrade

By Ron Weinberg, Member-At-Large,
Tampa PC Users Group
rswjbr@verizon.net

We are nearing the end of the time frame (July 29, 2016) wherein the Windows 10 free and automatic upgrade is available. Those who have not so far proceeded and wish to do so should not wait until the last minute as problems may occur. After completing this upgrade and before you read about the difficulties encountered, I would like to offer a recommendation.

For the average person the choice should be: If the automatic upgrade works, fine. If not, unless there is a need for Windows 10 features, which is doubtful, my suggestion would be leave well enough alone and stay with Windows 7 or 8.1. Of course, if there is a known quick fix or minor tweak a competent user could proceed.

The first of the attempts to upgrade the ASUS N61Jq laptop (Windows 7), began in late 2015. Completion took over six months of intermittent work. One must ask why put so much effort into a 6-year-old Laptop? In truth, the average non-technical layman would have been unlikely to complete the task and would have experienced a series of frustrations leading, and properly so, to the abandonment of the project.

I am very experienced, stubborn, and was challenged by the failures involved. The laptop is a full featured i7 model, definitely worthwhile. It was my choice to upgrade mainly to keep it current.

Documenting this upgrade and its failures in detail took over four pages. The following is a summary.

The process was complicated because of the absence of a Windows 10 Compatibility Checker and the presumption that all Windows 7 systems could be easily upgraded.

Microsoft was of little help in dealing with the many issues that occurred, nor was the PC's manufacturer.

All solutions were obtained from Google research of similar issues, User's forums, my own experience, and some luck too.

As I researched each problem, I found that others had encountered the same or similar problems. Many suggestions were offered, some worked, and some did not. In some cases multiple solutions were offered for a problem. It was necessary to guess which might be the best or to try them by elimination.

My first try in late 2015 failed, presumably due to defective Windows Update Utility and numerous hard drive problems. The hard drive was subsequently replaced with a new SSD (purchased Jan. 3, 2016). Windows 7 was completely reinstalled from a clean copy and programs reinstalled.

The second attempt also failed for reasons unknown. I was able to access the recovery menu and return to Windows 7.

For the third try after which, if it failed, I did consider keeping Win 7. I decided to try the Media Creation tool. It appeared to be installing well and then it stopped leaving a blank black screen. I tried to reboot several times, to no avail. I couldn't get to the recovery menu to recover Win 7 nor could I get into Safe Mode no matter how many times I tried. Google revealed blank black screen was a frequent issue, generally device related. It was suggested there might be a new second video driver that should be removed with Device Manager (which was inaccessible). My only hope was to restore Windows 7 with the backup image and Win 7 recovery disk.

This Laptop always operates on AC as the battery is worn out. In order to move it to the location of my backup external hard drive, I unplugged the AC adapter. And the screen came alive and said "Hello Ron" indicating the upgrade was almost complete. I plugged the power back in and the screen went black. I repeated this several times realizing that it was a power issue. I ruled out connection or power supply problems since the disconnect worked. I took a chance, and went into Control Panel Power Options

Windows 10.....Continued on page 4

Windows 10.....Continued from page 3

and switched from High Performance to the "Recommended" selection. This mysteriously woke the system. Still, the upgrade did not work properly. The next day there were many "Machine Check Exceptions". These were supposed to cause a restart but didn't. No error numbers were indicated.

A "Machine Check Exception" is accompanied by the blue screen (BSOD) and indicates some kind of hardware error but is not very specific. It can result from Device drivers, Registry corruption, or damaged system files.

I had to manually restart. I also encountered locked up conditions where mouse and keys did not function. Finally restored again to Widows 7 from disk image backup.

Later, I found that the black screen problem was caused by the upgrade's change to generic AMD-ATI driver instead of a customized ASUS driver. Pressing (FN+F6) turns the screen back on. Several failures occurred because when the screen went black I assumed it was processing but when after a prolonged period it did not come back I rebooted, thus aborting the upgrade.

The next try encountered Windows Update Error 0x80070057. I ran Windows Update Troubleshooter, Windows Update Diagnostics.diagcab, Fix Windows Update-setup.exe, and Microsoft Fixit 50123.msi. After which there were "Machine Check Exceptions". Again, they were supposed to cause a restart but never did. Reboot was required. Thereafter, locked up conditions occurred where mouse and keys did not function. Each time I had to manually restart. Reluctantly I restored again to Windows 7 from disk image backup.

Drivers are most frequently the cause of failures in the upgrade and I located an independent European site that listed all the Windows 10 drivers for my model. Not every driver listed was needed.

April 26, after several weeks passed, I Installed most optional Windows 7 Updates, Created Windows 7 Image Backup, Uninstalled ASUS Control Deck, Performed Disk Clean and updated Drivers for: ATK Package (which controls function keys), Realtek Audio, (LAN) Atheros AR8131 Gigabit Ethernet, and Elan Touchpad. Next I disabled Avira Antivirus Program during the upgrade and upgraded via Media Creation Tool. When the black screen appeared, FN+F6 immediately turned it back on. The Upgrade completed successfully. Avira AV required an update. Then I ran Windows Update too.

The next day there were continual lock ups; the System froze completely. Research found a fix that seems to have corrected the issue: Control Panel-Power Options-PCI Express-Turn Link State Power Options OFF

Day 3, Start menu stopped working and Search box frozen. This too was a known problem, fixed using Windows PowerShell and it reinstalled Windows Apps quickly and automatically after entering the proper command line.

April 31, (Next day) Start Menu and Search box stopped working again. I performed a system reset which supposedly kept files but removed many programs including all the vital ones needed. System Reset produced a report "Apps removed while refreshing your PC." After reset completed, I ran Windows Update again.

May 1, I was preparing to reinstall missing programs but system failed again "Machine Check Exception" with BSOD. Completely unusable. Suggestion was to disconnect hard drive. So I opened the case and disconnected the Hard Drive and reconnected. This seemed to alleviate the lock up. Then I installed the missing programs: Avast AV (replacing AVIRA), Acrobat Reader DC, Chrome, IncrediMail and Contact List, LastPass Chrome Extension, Skype Desktop, LibreOffice. The Ethernet controller was missing so I downloaded and installed Qualcomm Atheros AR9285 Gigabit Ethernet Driver.

Many items, particularly bloatware ASUS proprietary programs, were left uninstalled as some may have contributed to the earlier problems. I decided to wait and see, watching carefully for the next few days.

Windows 10.....Continued on page 6

Internet Picture of the Month

Beaches

From the Wall Street Journal, http://www.wsj.com/articles/beach-party-1464359770, we have a selection of photographs of beaches from Gray Malin's new book *Beaches* that he took from a helicopter.

"Flying over this beach in Barcelona, Mr. Malin directed the helicopter toward a cluster of bright umbrellas, only to discover there were no people there. It turned out to be a film set." That is the photo pictured above.

June's Links

The Links item is being discontinued, as discussed in the Comments section. It has run for 20 years and four months. Look back on some of the old newsletters starting in January of 1996 to relive the past by seeing the 20 or so new links listed each month. Do many of those sites still exist? I don't know because I have not checked. But I think that would be an interesting historical exercise to check. Goodbye Links!

Windows 10.....Continued from page 4

May 2, System won't Wake from sleep mode. Tried changing power settings, but before I could complete them the system began freezing completely.

It will freeze as soon as you reboot, even in sleep mode. No way to add drivers or any other repair without reset or retuning back to Windows 7. System seems to be running hot. Shut down and allowed to cool. Problem continued when cold. Had to perform another reset. Created Restore Point before adding back programs. Added ATK Package, Intel Driver Update Installer, which I ran, and the appropriate AMD VGA Windows Driver.

May 3, Removed Sleep Button from Start Menu Power section and through all settings of the active power plan. Reinstalled Avast, IncrediMail, Chrome, and ran Windows Update. Created another Restore Point and reinstalled LibreOffice and Skype Desktop.

May 5, Chrome would not connect. There have been some reported problems with Chrome and Windows 10. I considered uninstalling Chrome and using Microsoft Edge but before I could on **May 6**, the System completely froze again with "Machine Check Exception" as on May 1. Both times the exception was to restart after collecting some information but did not. I had decided enough was enough.

In a last and final effort? on **May 7** I re-flashed the system BIOS. Voila! Everything worked! But, on May 19 the system froze again.

I restored it to **May 12** (Restore Point) and installed Chrome again making sure it was the 32 bit version as the 64 bit had been reported troublesome. Everything now seems to be working properly.

After all of the above I cannot claim complete success, but I am cautiously optimistic. It has truly been a learning experience. ◆

Cleaning, Scanning & Backing Up Your Computer

By Dave Palmer, Baord Member,
Tampa PC Users Group
dkp205@hotmail.com

Like many others, the process of backing up my data didn't interest me greatly until I lost a lot of data. It was a traumatic experience. I found my religion pretty quickly after that. That was nearly 20 years ago. Since then I've been on a quest to create a backup system that would protect me from such losses ever again.

Over the years, I've been part of a number of discussions on the topic. Many have been one-on-one and some have been in small groups, like the one at the TPCUG meeting in May. It turns out many others have been through traumatic experiences similar to mine. Some of them are on a similar quest.

Many people don't back up their data at all. I can understand that. They may have never lost valuable data. Or they may have looked into backing up their data, and found that it can be difficult, as well as complicated, to do it well.

I found Merle's backup system quite interesting. He's applied a lot of thought, and a lot of technology, to the problem and come up with a system that works well for him. His backup system is based on the configuration of his computer system which is a bit unconventional. That's worth an article all on its own.

William has a system too, quite different from Merle's but it works for him. I've spoken to people who are minimalists – they use the online Carbonite system, and nothing else. While it seems a bit inadequate to me, it works for them. That may be the key, to find a backup system that works for you.

I think there are several basic principles involved in any backup system.

1. **Only backup data that has significant value**. If losing last year's episodes of the Walking Dead wouldn't shake your world, why spend the time and effort to back them up?
2. **Don't backup data that doesn't need to be backed**

Backing up.....Continued on page 7

Backing up.....Continued from page 6

up. This is Rule 1 from a different perspective. Computers accumulate a lot of temporary files and other useless data. Why spend time and energy backing that data up?

3. **Don't backup the same data again and again.** Data that changes frequently needs to be backed up frequently. Data that does not change ('static' data - like last year's tax returns) should be put in an archive and only backed up infrequently.
4. **Don't back up any data that you aren't sure is 'clean'** (uninfected).
5. **When you do backup, make multiple copies.** The general rule is 3-2-1, make 3 different copies, in 2 different formats, and keep 1 copy off site. Redundancy is the key to successful backups.
6. **Verify that your backup copy is good, or that it can be restored.** In an emergency you need to have confidence your data still exists and can be restored. A backup that cannot be restored is worthless.
7. **Automate the backup process wherever possible.**

Here's a brief explanation of my backup process. At the end of the article I've listed some resources to help you find and download these programs safely.

I start with preparation. I like a clean house so I dump the trash and uninstall programs I'm not using. If I have accumulated any 'static' data, I move it to my archive. I then use **Ninite** to update all my major programs - why backup an out-of-date program? Next I run the free version of **CCleaner** to clean out temporary files both in Windows and in various applications. Now, with some confidence that I've minimized the amount of data to backup, I use multiple scanning programs to search out any malware and PUPs (potentially unwanted programs). I currently use the free version of **Avast!**, a paid version of **SuperAntiSpyware,** and a paid version of **Malwarebytes**. These choices change occasionally. Once I have some confidence the computer is relatively clean, I create a restore point and run **MozBackup** which backs up my data and configuration of both FireFox and Thunderbird. To back up data I currently use **FreeFileSync**, to sync 2 copies of my current data. My last step is to use **Acronis** to create multiple images of my system. Luckily I still run the 2014 version so I haven't run into the problems Merle and William have. I don't run validation on these images as it would take twice as long. To compensate, I keep the 3 latest past versions of the image. This is certainly not ideal, but then my backup system is a work in progress. I think the next step in the evolution of my backup system will be to clone my hard drive rather than use Acronis. I may also try to emulate some features of Merle's backup system.

While many people use online or 'cloud' services as backups, I share William's concerns about corrupted data. I use Dropbox and once saved a file that somehow got corrupted. When I went to my other devices and the cloud to retrieve an uncorrupted version, it turns out all of the current copies of that file were corrupted. That surprised me for a moment. But then I realized that the purpose of Dropbox, and other similar cloud services is to 'sync' files, not to serve as a backup system. While Dropbox keeps 'previous versions' of files, the previous version of my corrupted didn't contain the most current data.

As for an offsite copy of my data I currently use an encrypted 4TB SSD. On it I keep a current copy of my data and a current copy of my system image. I keep that drive in a backpack in my truck.

Resources

Proceed cautiously when downloading programs. Read everything. Watch for checkboxes associated with unwanted toolbars and other programs. Unless downloading programs from major, reputable websites, check the website or .exe file through VirusTotal.com

Ninite - An easy way to install and/or update multiple programs all at once. https://ninite.com/

CCleaner - Utility that can delete temporary or potentially unwanted files like browsing history, cookies, recycle bin, memory dumps, file fragments, log files, system caches, application data, autocomplete form history, and various other data. Unless you are an experienced user, use with caution, especially with registry files. https://www.piriform.com/ccleaner

Avast - An anti-virus, anti-malware program. It can be set for 'silent mode' to show no ads. Although it comes with many features, I have not used any of them. https://www.avast.com/en-us/index

SuperAntiSpyware - An anti-virus, anti-malware program. I use the Professional (paid) version and keep it running in the background. http://www.superantispyware.com/

Malwarebytes - A highly recommended anti-virus, anti-malware program. I use the paid version and keep it running in the background. https://www.malwarebytes.org/

around the world wide web as much as I used to. I basically read three news sites, the *New York Times*, *Wall Street Journal* and *Bloomberg News* and go wherever they may take me I do no Social Media.

Furthermore, when I started the Links item, there was no Google, which was founded in 1998. There were search engines, but they were manually updated and not all that helpful. Now if you want to find a site for a particular topic, you simply do a Google or Bing search for it. So I think it the Links item has served its purpose and needs to be retired. ◆

Meeting Preview: Blain Barton from Microsoft will give us a look at the newest technologies for building infrastructure in the cloud from a Developer and Operations perspective.

Merle Nicholson will lead the Windows SIG for the first 30 minutes of the meeting.

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Thanks to Merle Nicholson's article on Windows 10, there is very little room for anything else in the newsletter this month. And that is fine with me, since it is usually, but not always, a struggle to find enough material each month.

This July meeting is moved up one week from the usual second Wednesday to the first Wednesday of July 6

In the small amount of space Merle has left me, let me say I have done the unthinkable: Purchased an Apple iMac. Now, don't get the idea that I am going over to the dark side. This iMac is to serve a special purpose. I have decided to extend my app publishing to include iOS devices in addition to my

Minutes of the June Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. Merle Nicholson, the SIG moderator introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees. This month Merle demonstrated using the Windows Store and how to keep Microsoft from hijacking your local account.

The presentation was given by a long-time member, Brian Lance, on Google Maps and Google Earth. He demonstrated a lot of useful capability that just isn't obvious. Cameo by Google Earth searches businesses and routes, drag and drop way points on route, a menu to embed and share map boundaries and custom saved maps.

He demonstrated fine measurement of closed polygons in a Google map to get area in acres. Draftlogic.com has plugins: Google Maps Area Calculator tool, Send a position, and Maps Guestbook. Staticmapmaker.com is a service that generates HTML to display an imbedded map on your website. All in all, this was a very interesting and useful demonstration of the uses for Google Maps. Thanks must go to Brian for an entertaining and useful presentation. ◆

Comments.....Continued from page 1

Windows and Android apps. And to do that I needed an Apple computer on which to compile the code that is created in Visual Studio using Xamarin. That was not necessary when I wanted to use Xamarin to create Android apps from my already existent Windows 10 Universal apps. Android was happy to be compiled on a windows computer. But Apple is special in this regard. Thus, I made my first Apple purchase since the mid-1980s when I would have been purchasing items for the Apple IIe I had back then. ◆

Windows 10 Priority One For New Installations

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

I'm using Windows 10 successfully, but only after being satisfied that I've done all I can to change some of the behaviors through policies and settings. Let's face it, it's rough around the edges. The start menu and PC settings are a work in progress, as is Edge. Some Windows 10 settings are just strange and inexplicable, and then some policies and settings just are not in your best interest. Fortunately, there are legions of technical people out there looking for solutions for us. Here's a compilation of what I've found and implemented myself. I consider every one of these mandatory for all computers. I have implemented all of these on my own computers and others as well.

Note to readers: Instead of typing the URLs referenced in this article, go to the TPCUG.org website, and on the first web page, open this current newsletter. There you'll find that all the links in this article are live. Just click on them.

Below is a link to an article that got me inspired to write this. I don't agree with the priority, and it's not complete, but it's worth a read, and it has some excellent instructions. But be sure to read my own advice below on some of these same subjects.
http://www.itpro.co.uk/operating-systems/25802/fourteen-windows-10-problems-and-how-to-fix-them-3
and this article is similar with a different set of issues.
http://www.howtogeek.com/227827/windows-10-is-great-except-for-the-parts-that-are-terrible/

The following is in my own priority order, with a quick explanation and the best solution I've found.

Convert to Local Account from a Microsoft online account Some will certainly disagree, but I believe that setting your login account and password on your computer and then giving it to Microsoft over the Internet (daily) is an unconscionable risk. Yes there are advantages to do that, but every reason is contrived to encourage you to violate a basic security principal. If you look at what every corporation does - many hundreds of millions of secure computers, you won't find one that does this because it's automatically turned off for Windows domain users. The initial Windows 10 installation setup assumes you want a Microsoft account, and actually obscures local account setup. Also, the Windows Store will hijack your local account if you're not careful. More on that later. Here's a good article to convert back to a local account.
http://www.howtogeek.com/230543/how-to-revert-your-windows-10-account-to-a-local-one-after-the-windows-store-hijacks-it/

I used the word "contrived" reasons to discourage local accounts. For instance, the Family Safety feature, which was a part of the "Windows Live" set of software is still there but now requires it be managed from on-line accounts and even requires an email address for each child. That's shameful and unnecessary. This was a very valuable tool to protect vulnerable children from predatory websites. PC Magazine now rates it at a very poor 2. Instead, Google search for "Best Family safety software". It appears that Net Nanny and Norton Family Premier is still prominent. In any case Microsoft is encouraging you to convert to Microsoft accounts to get something that they used to offer for free. That's a contrived reason. It's the same for Microsoft Games.

If you elect to stay with Microsoft Account sign-in, all the changes below apply, but there's more security and privacy setting that need to be done than is covered here. Start with "Settings", "Accounts", "Sync your settings". And a lot more.

Administrator Accounts If you follow my articles over several years, you will know that I advocate setting up a local Standard account for daily use and activating the Administrator account, invoking the Administrator name and password only when needed to install or make changes to the computer. Microsoft actually advocates this as well, but you have to deliberately go looking for it.

Windows 10.....Continued on page 4

Windows 10.....Continued from page 3

Using your computer in a Standard account blocks any outside influences - ransomware, viruses, malware from installing anything on your computer. Or maybe 95% of it. Microsoft should have a wizard that helps you set up accounts and encourage every new installation to use it. Instead, they are actually making it more difficult. After years of doing this pretty much in my sleep, when it came to Windows 10 I gave up and started looking for a tutorial.

Activate the Administrator Account. Every Windows OS has a hidden Administrator account. Activate this account - it puts the name on the login screen - and give it a very good strong password. Using that account, convert your regular account to "Standard". Create separate Standard accounts for children or anyone else using the computer.

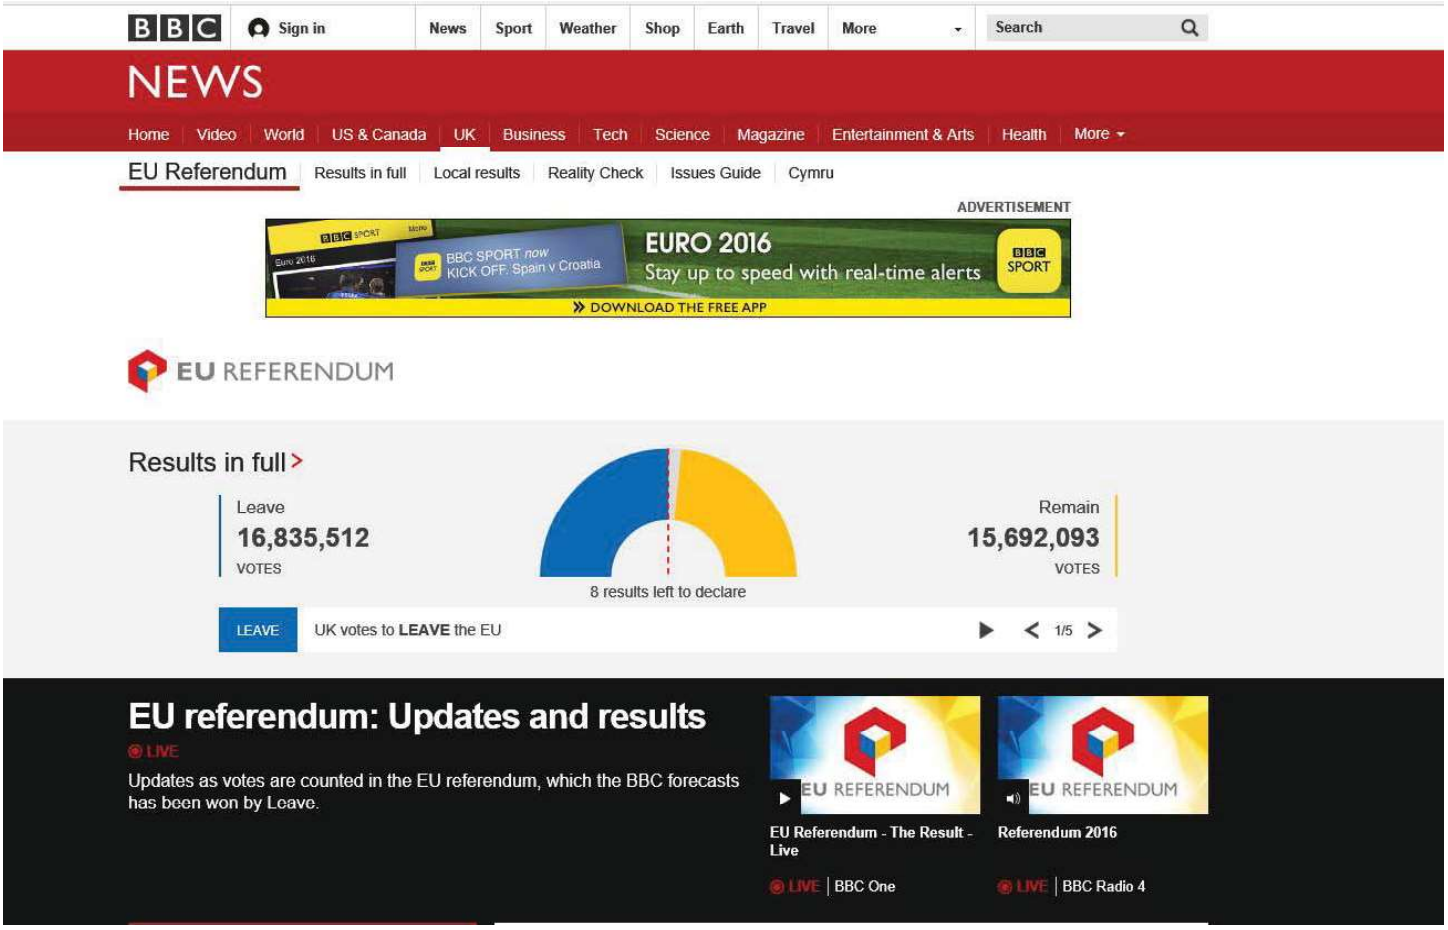
In Win 10, right click on the Start icon, select Command Prompt (admin). Enter: net user administrator /active:yes . Then set the password with: net user administrator . enter the password and then again to confirm. Here's a good article.
http://www.ghacks.net/2014/11/12/how-to-enable-the-hidden-windows-10-administrator-account/

Create a new local user account. If you try to add a new local account in Windows 10, you find as I did, it's incredibly difficult. A tip: when asked for the online Windows account name, click on the item that says you don't know it. That moves you forward, otherwise you'll never find it.
http://www.howtogeek.com/226540/how-to-create-a-new-local-user-account-in-windows-10/

System Protection, System Restore. This is the system that manages restore points so you can revert to the last good system or undo damage that an update or driver installation has caused. It's just as important now as it was in 2002 with XP. But in Windows 10 it's disabled by default. That's just astounding. But it's still there; it needs to be turned on.
http://www.howtogeek.com/237230/how-to-enable-system-restore-and-repair-system-problems-on-windows-10/

Boot into safe mode. If you think you can boot into Safe Mode using F8 early enough - just after POST, think again. It's gone. But we can get it back. Actually you can go into safe mode in several ways but all of those ways require you to boot into Windows first, and I don't know about you, but every time I needed Safe Mode is because I can't boot into Windows. Or you can use a Rescue Disk or a Windows installation disk. Here's what it looks like.
http://www.howtogeek.com/107511/how-to-boot-into-safe-mode-on-windows-8-the-easy-way/

Add Safe Mode to the boot menu. This really works; I've done it, but I consider it technically challenging. Look at this first, but the best way is the subject after this - activating F8.
http://www.howtogeek.com/245175/how-to-add-safe-mode-to-the-windows-8-and-10-boot-menu/



Add F8 Safe mode on boot. This article was written for Windows 8, but Windows 10 is the same. This option gives you the white text menu on black screen with a lot of options. It looks identical to Windows 7. You press F8 repeatedly very early in the boot sequence. I do have one computer where this does not work, I suspect because of a dual boot system in place. So I implemented the option above this one.
http://www.howtogeek.com/164001/how-to-make-the-f8-key-work-for-safe-mode-in-windows-8/

Restart to BlueScreen. This appears on systems back to XP. If you have a serious enough hardware problem you get BSOD, Blue Screen of Death. But sometimes not. You can actually set it to automatically restart! after a System Failure and as a result, boot right back into the failure, and leave yourself confused as to the reason. This is supposed to be Unchecked, but I find it time and again on computers as checked, don't know why. I check for this on every computer I set on my workbench, perhaps 20 a year, and I always find some to change to unchecked. The setting is called "Startup and Recovery, System failure, Automatically restart"

Control Panel, System, Advanced system settings, Advanced tab, Startup and recovery is seen in the leftmost screen capture at the top of page 6. Then click the Settings button there and get what is shown in the

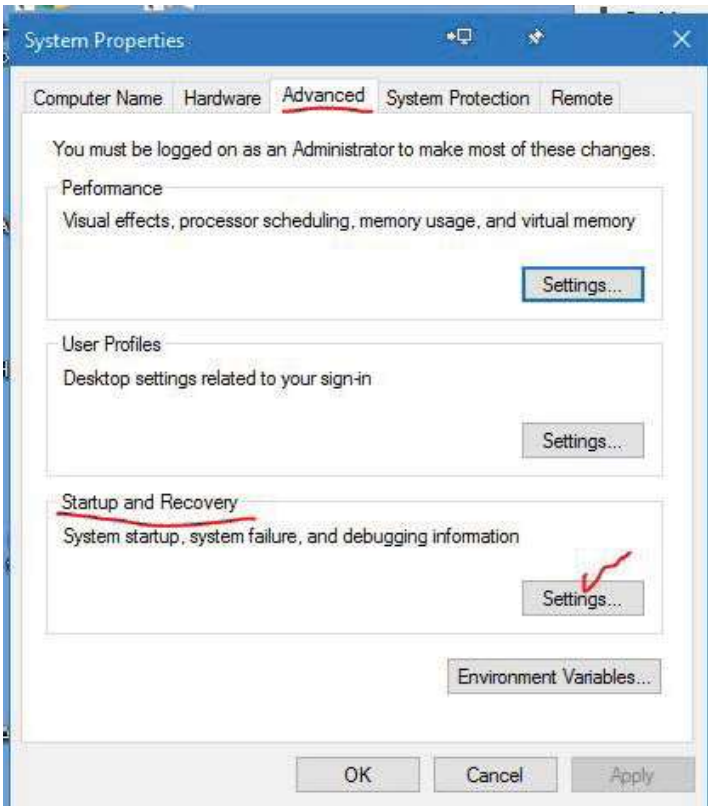
Windows 10.....Continued on page 5

Internet Picture of the Month

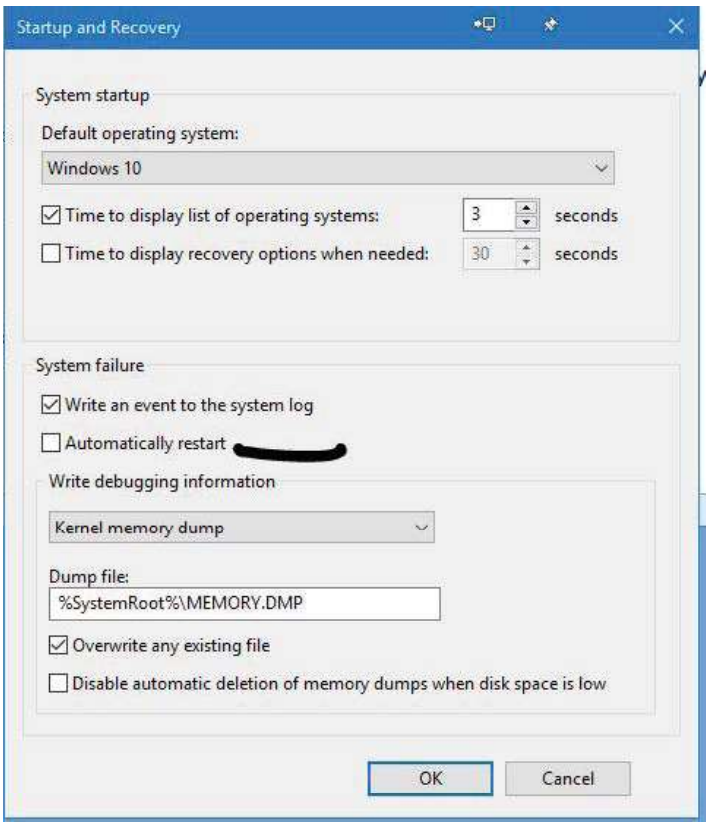
Brexit

A screen capture from http://www.bbc.com taken at 12:59 AM Eastern Time of the page at the BBC's website displaying the current status of the British vote to leave the European Union. At that moment the exit side had prevailed. On another page at the site, they were running a live broadcast of talking heads giving their opinions on this, the majority saying that it would have dire economic consequences.

Windows 10.....Continued from page 4



right-most screen capture at the top of page 6.



Control Updates and turn off forced updates. Windows 10 is set by default to automatically download and install all updates, then reboot. There are changes you can do that will mitigate some of this like notifying you first to reschedule a reboot.

Windows 10 Pro versions have an option to take total control of this. It's intended to be used by corporations who want to test all updates before deployment to thousands of their computers.

This following link is pretty comprehensive. It was here that I found a solution for a problem on my main

Windows 10.....Continued on page 6

Windows 10.....Continued from page 5

desktop machine: An update that appeared every day - a printer driver - that installs fine, but doesn't go away. It installed daily for a couple of weeks. There's a downloadable Microsoft tool that troubleshoots update problems called wushowhide.diagcab. It's at https://support.microsoft.com/en-us/kb/3073930 . Look at http://www.howtogeek.com/223864/how-to-uninstall-and-block-updates-and-drivers-on-windows-10/ first. This worked for me. Standard (home) users don't have this beyond setting the reboot policy.

Prevent automatic downloading Updates For comprehensive help on controlling what you can, see: http://www.howtogeek.com/224471/how-to-prevent-windows-10-from-automatically-downloading-updates/ . OK, you may not want to mess with this and I can't blame you. But when you're in trouble, there's a way back.

Choose how updates are delivered. Incredible as it sounds, Windows 10 will use your internet connection to send updates to other PCs on your network and to PCs on the Internet to "save on bandwidth". By default, you give them permission to do so. You can change that in settings. The quickest way to get there is type "advanced update" and click on "advanced windows update options" in the search list, then click "Choose how updates are delivered". There's an on-off button that is on by default.

Privacy There's a ton of privacy settings in PC Settings. There's the obvious "Privacy" category with 15 tabs on the left. But first go to the taskbar and click the Cortana window, then the settings in Cortana. "Search online and include web results" needs to be turned off, no question. This limits searches to your own PC, and there's no reason at all to wait until a Bing search covers the entire internet to find Windows FAX. I turn off the "suggestions, ideas, reminders, alerts" as well.

Then go to PC Settings, Personalization, tab Lock screen. Under Lock screen, change the Background dropdown to Picture or Slideshow. Windows spotlight allows advertising to your lock screen, along with "Get fun facts, tips, tricks and more … ". Turn that off too. See:

http://www.howtogeek.com/243263/how-to-disable-

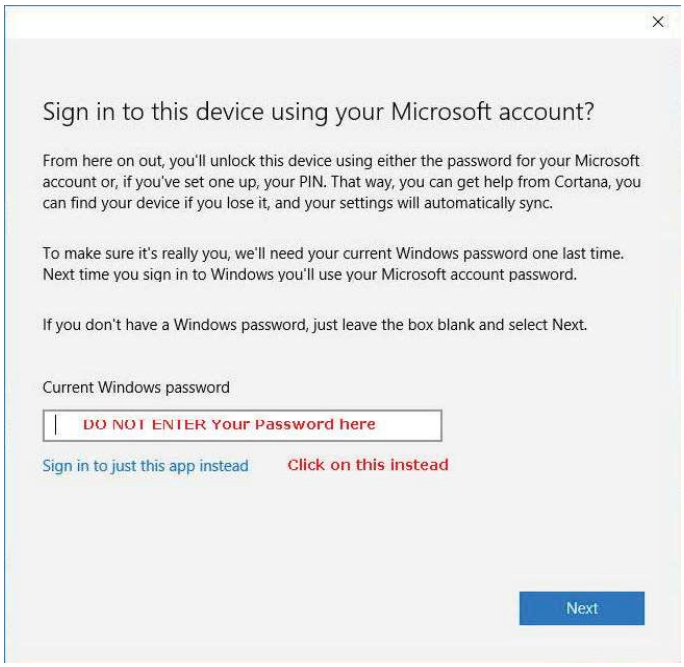
Windows 10.....Continued on page 7

Windows 10.....Continued from page 6

ads-on-your-windows-10-lock-screen/

Then go through all of the privacy settings. Frankly, I don't see any of this is to my advantage. I just turn it all off. I'm happier.

Then while we're at it, if you're a Chrome browser user, you can set the default search engine to Google with the Chrometana extension. If you're also an Android phone or tablet user, you have about a hundred reasons to switch to Chrome. I find Edge to be a work in progress, and have seen no reason to use it. Indeed, there's one website that I use often for a client that doesn't even appear in Edge. I understand that the late June Windows 10 "Anniversary" update will improve Edge. Most of all, I can't see me using and maintaining more than one browser, so goodbye IE and Edge.



WiFi Sense If you're using a computer with wireless like all notebooks and tablets do, WiFi Sense connects you to suggested WiFi hotspots that your contacts share with you. And you with them. You must be signed in to a Microsoft account. Of course there's very little you can do in the way of security, and that makes just no sense at all. I've read an article lately that the Windows 10 Anniversary update to Window 10 is going to remove this "feature". In the meantime it needs to be disabled. I have read that it is enabled by default. In PC Settings, Network and Internet, WiFi tab, select "Manage WiFi settings", "Connect to suggested open hotspots" and "Connect to networks shared by my contacts". In "Advanced Options", turn "Metered Connections" off as well. This probably has no real impact, but it should not download updates to your notebook when your Wireless is 3G/4G.

And speaking of 3G/4G, instead of connecting to unknown WiFi networks in public places, learn to use your cellphone's hotspot feature and connect to that for your travelling notebook needs. Obviously it should be used for essential purposes only, but if you have purchased a data plan that will allow streaming video to your phone, it may as well be on a notebook screen.

Windows Store You can log in to your Microsoft account for just the Microsoft Store without having your local login account hijacked (converted to a Microsoft account). If you're careful.

While you're logged onto your computer using your local account and you want to install your first app from the store, your local account is in jeopardy of being hijacked and converted to a Microsoft account. When you use the store for the first time on your computer and for your first app download, it asks for your Microsoft login and password and even offers to create an account. It offers a confusing explanation as to why it needs your Microsoft account password a second time, but believe me, this is where you can go wrong. Underneath that password box is a text **"Sign in to just this app instead"** click this; do not enter your password. You'll find you can use the Microsoft Store with no more nags for account and password, and your local login account will stay intact. The request for the second password says that the next time you log onto your computer you will need this password. And they're right. The login will be changed as well. Bad Microsoft.

Windows 10.....Continued from page 7

Lock Screen I'm not sure why they call it the "Lock Screen", when you first power Windows 10 up, the first screen is just a picture that you have to click through to log on. This is a just a nuisance in my opinion. If you're interested in eliminating this and booting to the login screen it takes some skill editing the registry: http://www.howtogeek.com/134620/how-to-disable-the-lock-screen-on-windows-8-without-using-group-policy/

Meeting Preview: William LaMartin will discuss several topics: Publishing apps to Windows 10, Android and iOS; What is Windows Continuum; and creating videos from your photos.

Merle Nicholson will lead the Windows SIG for the first 30 minutes of the meeting.

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Last month I mentioned purchasing an iMac to enable me to create iPhone and iPad apps similar to my Windows 10 apps, some of which I had already extended to Android. Well, I now have two iOS apps in the Apple App Store: *Newspapers of the World* and *Computer Group Newsletters*. As time permits, I will add to that collection. Without a doubt, there are more hoops to jump through to create an iOS app than for Windows or Android. On Android and Windows, the first app is titled News of the World. The second app has all the TPCUG newsletters through 2015.

I had an iPad 2 around the house so as to be able to check the functionality of my iOS apps on a real device but thought that I also needed a small form-factor device. I purchased a used iPhone 5s for that purpose. It was an expensive month, especially considering that I make no money from these apps, considering it just a hobby. ◆

Minutes of the July Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

For July, we had a scheduling conflict for the meeting room and scheduled it a week early from July 13 to July 6. As a result, the meeting was poorly attended, quite a shame since our speaker was the ever-entertaining and informative Blain Barton, an employee of Microsoft. Blain has been there for us every year for quite a few years. Our gratitude goes to Blain for his continued support.

The Windows Special Interest Group (SIG) opens our monthly meeting. Merle Nicholson, the SIG moderator, introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees. This month Merle demonstrated more Windows 10 settings challenges, including how to prevent Windows Store from hijacking your local account.

Our presenter, Blain Barton, was the July presenter. He always has something interesting to talk about on projects he's engaged in at Microsoft. His main topic was about DevOps, a combination of the words Developer and Operations. It's for "orchestration and automation technologies needed in the world of big data analysis, cloud and Agile rapid application development." Blain is now engaged in the development and deployment of small applications. He explained his interaction with a business customer and modeling applications for them.

Thanks to Blain for an entertaining and useful presentation. ◆

Rethinking 2-Factor Authentication

By Dave Palmer, Tampa PC users Group
dkp205@hotmail.com

I've taught various aspects of Internet Security for many years. I subscribe to many newsletters and newsfeeds. I have a number of Google Alerts to bring me information on a variety of related topics. As a result, I do a lot of reading. Like any good cub reporter, I like to confirm information I've read from one source with similar information from other sources, usually a number of other sources. In other words, I don't like to get fooled.

But I recently I got fooled. Or maybe lulled to sleep is a more accurate description.

Let me start at the beginning. 2-Factor Authentication (2FA) isn't new, but it's become a lot more popular over the last few years as hackers have more gotten more sophisticated and better at what they do.

Wikipedia (https://goo.gl/5QkXD) says 2FA is "… a method of confirming a user's claimed identity by utilizing a combination of two different components. These components may be something that the user knows, something that the user possesses, or something that is inseparable from the user." The standard example is the combination of an ATM(automatic teller machine) PIN (personal identification number) and a debit card. Something I know, the PIN, is combined with something I have, the card.

One popular method of 2FA is to use mobile phone-based two-factor authentication. This method of 2FA relies on the user inputting their user name and password (1st factor) into a website. The website responds by sending a one-time-valid, dynamic passcode via SMS (text) to the user's phone. Inputting the code (2nd factor) into the website authenticates the user and allows use of the website.

Many security-sensitive websites now have the ability to be configured to accept various forms of 2FA, including mobile/text 2FA. These websites include the Who's Who of technology: Google, Apple, Facebook, Yahoo, Amazon, Twitter and dozens, if not hundreds, more. All include mobile/text 2FA as well as other methods of 2FA. At least one site I'm aware of (https://www.turnon2fa.com/) offers specific instructions on setting up 2FA, including mobile/text, on many of these websites.

In addition, hundreds of articles have been published in the last few years touting the benefits of mobile/text- based 2FA. I'm sorry to say that the constant drone of this input put me to sleep.

Recently, while watching Steve Gibson's 'Security Now' broadcast on Twit.tv, I was jolted awake when Steve proclaimed that, in fact, mobile/text- based 2FA was INSECURE!

'What?' I thought. That seems to go against the advice of the entire technology ecosystem. His point, perfectly valid once I was roused from my comfortable acceptance, was that the phone system itself is not secure! But of course! My reading on privacy, tracking

Rethinking.....Continued on page 4

Rethinking.....Continued from page 3

and the shenanigans of the NSA and similar organizations around the word came racing back. Of course cell phones are not secure. I, like so many others, had not put the puzzle pieces together. That realization triggered another round of online research.

The information I ran across completely contradicts any thought that mobile/text 2FA could possibly be secure. Here are a couple of articles demonstrating that sophisticated hackers, as usual, are well ahead of us.

http://goo.gl/cNMrcq - 'Malware Bypasses 2-Factor Authentication' (2014) - "Criminals have been bypassing the Android-based two-factor authentication systems in use at 34 banks across four different countries, as part of a sophisticated spear-phishing and malware campaign…"

http://goo.gl/hAEERv - 'Two-Factor Authentication Bypassed in Simple Attacks' (2016) - This article concerns recent research that demonstrates "…practical attacks against both Android and iOS devices, showing how a Man-in-the-Browser attack can be elevated to bypass 2FA."

https://goo.gl/yr40pw - 'So Hey You Should Stop Using Texts for Two-Factor

Authentication' (2016) - This article points out several ways messages to mobile phones can get hijacked.

https://goo.gl/2mpUHk - In this recent (7/27/16) article the U.S. National Institute for Standards and Technology (NIST) says the SMS-based two-factor authentication would soon be discouraged citing a lack of security.

I also found the following academic paper. Dr. Wolfe should have added 'Let Me Count the Ways' to the title. This is an interesting read, 6 pages, and a bit scary.

http://goo.gl/SQ04ln - "The Insecurity of Mobil Phones" by Dr Henry Wolfe, a PhD specialist in computer security.

Rethinking.....Continued on page 8

Windows 10 Priority One for new installations Continued

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

This month, I'm adding a few more items to the changes that should be made to all Windows 10 installations. The main article is in last month's issue of Bits of Blue July 2016.

Note to readers: Instead of typing the URLs referenced in this article, go to the TPCUG.org website, and on the first webpage, open this current newsletter. There you'll find that all the links in this article are live. Just click on them.

But first, let's discuss the security of your computer. I've heard the argument many times that your computer is in your house and isn't accessible, so having a no password login or setting it to log into a default user account is acceptable. I'll disagree, and here's the reason why.

User Accounts

By default, on installation, the main user account has "administrative rights" which means that any user of this account can install and run any software unimpeded, including undesirable software as well as useful, intended software. All that needs to happen is to log into that account. The problem with this is software that comes into your computer from the Internet or software that has been piggybacked onto some other process that may or may not be initiated by yourself. Email attachments, hacked websites, software that you acquire thinking it's useful, PC help phone calls from people representing themselves as Microsoft employees .. all this is dangerous.

OK, well, what do you have to lose? Let's look at some worst cases; the situation where some ransomware changes the operating system to encode all useful files. Or gets your Amazon account or Visa card info. Or just wipes out the hard drive. Do you have a

Windows 10.....Continued from page 4

complete image backup stored where you can just re-image the hard drive using a boot CD or flash drive? Are your two- thousand photos backed up? Important documentation? Perhaps you can reinstall Windows and all your software from scratch. Do you have the original installation media? Do you have the CD installation keys? If you have Windows 7, do you want to then install the drivers for all your devices and also 260 updates?

If you believe you are fine with reinstalling Windows 10 after a disaster; you have documents and pictures in Google Drive, Dropbox or OneDrive; use a browser email implementation and do mostly internet, I'd sug-

Windows 10.....Continued on page 6

Windows 10.....Continued from page 5

gest you're not well served by Windows and should look at ChromeBox, ChromeBook, Linux (Ubuntu) or even MacBook. They're all much more secure, way cheaper (except Apple, which is much more expensive) far less trouble, and you can stop worrying about viruses and malware. My spouse and I both use Linux and Android for much of our everyday needs.

Compounding the user account situation on Windows 10 is that Microsoft obscures the route needed to create local accounts. All the buttons are there to route you to a Microsoft online user account and password. Yes local account links are there, and if you are not forewarned or are not using a well written tutorial, you'll miss them because they are just text, not a button, sometimes a different font color, sometimes not.

So what's wrong with using an online account? Wait a minute .. what? This is a login entry into your computer that malware, virus and ransomware can use to install on your computer, and you want to send it over the internet to Microsoft? Why would you do that? There is no other operating system that allows this. I can use my Android phone and tablet without logging into my Google Account, can't you? Yes, I do log into that gmail account, but it's not a condition of turning on the device. And obviously I don't have the level of concern about viruses.

If you like (insist on) an online Microsoft account to log into your computer, please change the security level to "standard". That's the only way there is to protect yourself. First, create an administrative level local account or activate the "Administrator" account. Use a good password, memorize it and use a password database like LastPass or Keepass. Don't tell anyone what that password is. Log into it once, then out, you may not need it again. Log into the main (MS online) account and change the security level to "standard". You may never use the administrator account again, but you'll use its password many, many times whenever a setting or a software installation requires it. You'll get to recognize the password prompt and it'll become routine. This will block out 95% of all viruses as well. All the details are covered in last month's article.

Number One problems with Windows 10 that you should fix right now.
See last months article for details.

1. Fix your login accounts. Activate or create a local Administrator account
2. Activate System Protection, System Restore
3. Fix the Boot into Safe Mode, activate the F8 on boot up.
4. Fix restart to BlueScreen
5. Manage Microsoft Updates (Win 10 Pro)
6. Disable as much Microsoft telemetry and forced advertizing as possible.

Turn off or uninstall OneDrive
In last month's article, I included one link to turn off OneDrive, the file storage and sync supplied for Microsoft users, and built into Windows 10. I personally don't use OneDrive, not that there's anything especially wrong with it. I have been using Google Drive for many years, and I really don't want to manage two cloud drives. There are three concerns associated with OneDrive. One is the System Tray icon, second the service itself is running in the background even though it's not being used, and third is the OneDrive drive shortcut in the left pane of all Windows Explorer windows.

This link from last month doesn't address the main problem - disabling the OneDrive service, but it is the least technical. https://support.office.com/en-US/article/Turn-off-or-uninstall-OneDrive-f32a17ce-3336-40fe-9c38-6efb09f944b0

This following link does everything, but by necessity is more complicated because Microsoft chose to not provide an accessible uninstallation or even an optional Windows Component for OneDrive. In fact, I've seen claims from Microsoft that it's a built in feature of Windows 10 and cannot be uninstalled. Bad Microsoft.
http://lifehacker.com/how-to-completely-uninstall-onedrive-in-windows-10-1725363532

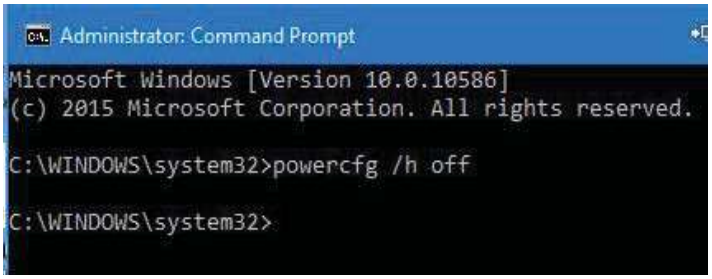
More on Managing Updates
If you need a better reason to manage Microsoft Updates I have one you maybe haven't guessed.

If you can delay the installation of updates you can

Windows 10.....Continued on page 7

Windows 10.....Continued from page 6

have a chance to create a new restore point. This is important because every now and then there will be an update that cause enough havoc on boot up to keep you from using your computer. I'd wager this has happened to you at least once. Fortunately with Windows 10 Pro you can get notification that updates are available, you can then create a new restore point manually (if you have activated it), then allow the installation to proceed. Then, on a bad update you can use Safe Mode to restore the last good restore point.



Fast Startup Power Option

It's a variation of the long standing Hibernate system available mostly for notebooks where the entire content of memory is saved to disk to be reactivated on next boot. But it went through some changes with Windows 10, became faster because it's been modified to save just the kernel (essential part) of memory. And it may be causing some problems on your computer. It may or may not be turned on. I would make sure it's turned off for several reasons. First, if you are booting from an SSD drive, it really has very little advantage and no further discussion is necessary because you're already enjoying fast boot up; make sure it's off. Problems it may cause are with USB devices not activating after boot because they haven't been awakened or updates becoming out of sync.

Turning Fast Startup off (or on) is available through the Settings: Settings, System, Power & Sleep, Additional Power Settings, Choose what the power buttons do, Change settings that are currently unavailable, Turn on fast startup (recommended). That's six steps, uncheck the box.

This link, http://www.howtogeek.com/243901/the-pros-and-cons-of-windows-10s-fast-startup-mode/, pretty much covers the subject except for one thing, and this is what I do to disable hibernate entirely which also erases the hibernate file from disk (hiberfil.sys). I would rather my computer do a complete reload at boot and not carry anything loaded in memory from the last session. I've encountered USB devices not working too many times, requiring that you first figure it out then unplug and reattach the device. My old USB scanner comes to mind. I boot from an SSD, in any case. I have tested this to see if there's any discernible difference and have found none.

In an elevated Command Prompt (Admin), enter: powercfg /h off

Lightning Strikes Again

By Bob Davis, Tampa PC Users Group
rob234@gmail.com

Lightning makes no sense some times. Although my computers and all the peripherals are on an uninterrupted power source, the other day a lightning strike killed my 4-port USB unit plugged into my laptop. Fortunately the laptop has 3 USB ports so I was able to hook all three important things back into it like the wireless mouse, the keyboard, and the printer. Next I went on to Amazon and ordered a replacement 4-port in case I need it.

I tried to print the invoice. That's when I found out the printer no longer communicated with the laptop. After testing all the USB ports on the laptop, I concluded the USB port on the printer was fried too. I thought about using the wireless feature but you have to use the USB port to set up the wireless feature. Go figure… End result, I needed to buy another All-in-One printer. I hate to throw the old 915 away. It still copies okay. I even think it will send and receive a FAX okay. It just won't talk to a computer so what would you do with it? I found it very inconvenient to dump a file to a thumb drive and take it to the desk top computer to print something. The work horse printer has always been the one hooked to the laptop.

Another problem is I just purchased a pile of spare cartridges for the fried Pro 915 printer. Contrary to what

Rethinking.....Continued from page 4

In spite of the information above, I believe that if you're using texted codes on your cell phone as 2FA, the risk is relatively small. This is not (yet) a wide-spread threat. But if you're relying on mobile/text 2FA to secure your valuable accounts (banking, e-mail, etc.), it might be time to consider other options. The fact is, it's not secure. ◆

Lightning.....Continued from page 7

a professional printer user might say, I liked my little Lexmark Pro 915 All-in-One printer. (And what can I say – sometimes I go cheap.) Of course the Pro 915 printer is out of production and not available at a price I want to pay. I did some research and found the Pro 715 printer uses the same ink cartridges, and I was able to buy a barely used Pro 715. After updating the drivers, etc. I have a working printer again. The front panel is not as nice as the 915 but other than that, it's hard to tell any difference between the two.

I always say enjoy the journey, but some days are more enjoyable than others. Like the days when you don't have to buy another All-in-One printer. So now I am enjoying the journey again. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

In this newsletter, Merle Nicholson tells us about new phone trends. And then he stops way too soon. Doesn't he realize we have a newsletter to fill, and no one has sent me anything, and that I really have nothing to contribute since I put all that in last month's newsletter. But necessity is the mother of insertion, as they say. And, thus, I have pieced together a few things that I observed or did this month that are computer related.

First I tell you about the amazing new computer that Microsoft will bring forth in the first part of 2017. It is named the Surface Studio, and it is a beauty with a beauty of a price. It is aimed at the creative crowd according to the video I watched. So it is obviously not meant for me

Minutes of the October Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. Merle Nicholson, the SIG moderator, introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees.

In October, Merle did the presentation as well as the SIG, and since they were the same subject, Windows 10 Tips, the SIG simply continued. Of the attendees, only two people did not have or use Windows 10. Merle demonstrated how to tell the update level of your Windows 10 OS, and explained the history of the two: 1511 and 1607. Next were complete instructions on the System restore points, how to check if Microsoft update had turned it off and how to reinitialize System Restore. Then new changes to how system updates are handled. The next subject was drivers, their importance and how to manage drivers; more specifically how to turn driver updates off without affecting security updates. Finally with William LaMartin's help a demonstration of Windows 10 Quick Access, yet another remote control, windows third remote control program. William controlled Merle's computer after receiving an invitation. Lastly, Merle shared some pictures and narrative about Cape Canaveral in the early 60s. ◆

Comments.....Continued from page 1

Another new item is the quite remarkable Windows phone from HP named the Elite X3. At least that is the opinion of the writer who reviewed it for PC World. I provide a link to the review, which will be more easily followed in the online version of the newsletter.

With all these new devices from Microsoft and such things as the HP phone, it would appear that things are looking in the Microsoft World. I certainly hope so since I am a stock holder in the company. ◆

New Phone Trends – what you may not know

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

It's common to buy your smartphone from your carrier, and while in the past, some carriers discounted the price, they are now charging full retail; having "unbundled" the phone payment from the monthly service. Some may give other incentives if you ask. There are advantages to buying from sources other than the carrier, not the least of which is a much lower price.

I had decided to replace my (only) three year old Android phone and then I monitored prices for several months until I found what I wanted at a good price. I pretty much met my goals with last year's Moto X Pure. It's a 2015 model by Motorola (now owned by Lenovo) and was highly praised as a "flagship" smartphone when it came out. FedEx delivered it Oct 3; the tracking info originating in Wuhan, China. I paid $289 + tax, shipping included. This is for a phone that cost $600 last year.

Lenovo has replaced this model Moto X Pure with the 2016 Moto Z, a modular smartphone that comes in several varieties, including the Droid Z phones that are sold by Verizon. But they're still selling the X Pure and others (Moto G and Play) from the Motorola website.

I moved my VZ (Verizon) SIM card from the old phone to the new, waited for Google to transfer data and install apps, then waited for an OS upgrade to 6.0, installed the 64G micro SDXC card ($20 at amazon), then to formatted it as internal storage, and I was in business with a new 80G top-of-the-line (in 2015) smartphone. Motorola will upgrade it to the very latest OS (7.0 or 7.1) in December, but 6.0 is excellent. The VZ cloud restore from backup failed as expected, but all I lost was some old text messages that I was saving. No big loss, and Google had saved the rest. Motorola has a data transfer app, and even has a transfer program using NFC radio holding the two phones back-to-back if you want to wait 6 hours to do it.

Most of my search was based on a goal to release myself of Verizon's unhealthy need to control what devices are available to their customers. Specifically, they demand that they determine the apps that are installed (we call it bloatware), and their insistence that they control updates to the OS – late or not at all. The other goals I have is to never go on contract and to never pay full retail price, all of which means that although I love being on their network, I will never again be buying a phone from Verizon. There are excellent alternatives – more on that later.

The only manufacturer that is refusing to supply Verizon branded phones is Apple. If you will recall, Apple phones were not available from Verizon for perhaps a year later than AT&T because of Apple's refusal to allow Verizon to control updates. Obviously Verizon relented.

What makes it possible to buy a phone that works on Verizon but not supplied by them is a class of phone called "unlocked" and in addition one that is built to work on any carrier called "Universally Compatible". I mean any carrier; Verizon, T-mo, Sprint, AT&T and European carriers as well. That means that the phone must have two kinds of cellular receiver/transmitters - GSM and CDMA, so that the carrier's SIM card determines the type of radio that is in use. The Google flagship phones - Nexus 5X and 6P, new Pixel and Pixel XL, The Moto G, the Moto X Pure, and a new one from LG the V20, all are "unlocked", and multi-carrier and also international. Amazon calls these phones "Universally Compatible". See Amazon https://www.amazon.com/unlocked-cell-phones/b?ie=UTF8&node=2407749011 for lots of good information.

These phone's updates are controlled by the manufacturer the same way Apple has all along. You can count on the Nexus/Pixel getting the first releases when Google makes a major change to the OS. The advantage is that Verizon does elect to freeze your phone's OS at an older level. It's understandable because it's a lot of work. But it's unnecessary in the first place if they would leave their bloatware off. Really, who would pay a monthly subscription price for Verizon Navigator and be unremovable from the phone? John

Trends.....Continued on page 4

Trends.....Continued from page 3

Madden NFL .. Really?

Since I started this article, VZ has started selling the Pixel and Pixel XL, "exclusively" from Verizon. But don't be fooled by that; Google also sells the same model that is unlocked and "universally compatible" and works on VZ. No one has figured out the "exclusive" tag Verizon uses.

You do have to be careful when selecting an unlocked phone. There are models that are not universally compatible, almost always GSM-only (not Verizon) and there are "International, no warranty" versions made for Europe. You want to look for "US Warranty" and check out the published carrier compatibility. You can get one of these phones for as little as $150*, and it will work on any US carrier. You can travel to Europe and pick up a prepaid SIM at the destination airport and use it during your European trip. Watch for models that are compatible with VZ except that it may not work on 4G. Not a deal-breaker for me.

* This $150 phone is an excellent Moto G. It has ads on the lockscreen. The no-ads version is $200. It may not handle VZ 4G. 4G US coverage isn't 100% anyway and I don't stream movie content.

If you travel to Europe and back, you may want to look for a phone that has two SIM slots, US and Europe. They're available. ◆

Two Miscellaneous Items

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

On the left is a phone photo that was taken an a meeting at the Iron Yard in St. Petersburg last week showing me trying out a Microsoft HoloLens. I was able to view a shark, a hamster, a ballerina and an object that I can't recall that floated in space and which with finger movements I was able to move to different places in the room. Quite interesting. At present the devices are $3,000 and still under development. The hope is to be able to sell them at under $1,000 and possibly as low as $700.

The fellow doing the demonstration was working on an app for the device. This is one thing I have no interest in working with at the present, the steep price being one of the determining factors.

Miscellaneous.....Continued on page 5

Internet Picture of the Month

Halloween

It is Halloween around the world. This photo is from the photos section of the Wall Street Journal, http://wsj.com. The caption reads: "Dublin hosts the Bram Stoker Festival on Halloween. Mr. Stoker was an Irish author who wrote the novel 'Dracula' in 1897. Niall Carson/Zuma Press"

Miscellaneous.....Continued from page 4

The image at the top of page four is a screen capture from an Android phone of an app that Merle Nicholson requested I develop for him. He wanted a bicycle riding app that would display the instantaneous speed in big digits at the top and then two separate leg displays below that which would keep track of elapsed time, distance and average speed over the leg. The two leg displays needed to be able to be reset, frozen (not paused but just have the display frozen) and paused. You also would be able to unfreeze and un pause.

In the image, the data is from a short test walk I did where both leg displays are showing the same information. When finished, the leg displays would normally be used to display data from different legs. The app could also record walk data. ◆

Microsoft's New Hardware

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

On October 26, Microsoft did a presentation in New York City showcasing their new hardware products. That's correct; hardware products and not software. That would be the Surface Pro 4, the new version of the Surface Book, and a new and exciting item: The Surface Studio. Warning: You are not going to like the price, but you would love to have one. At least, I would love to have one. But, beside the high price, I am not sure where I would place it. I am already overloaded with two desktop Win 10 machines, a monitor for working both with my Win 10 phone using Continuum and with the Rasperberry PI 2 (I think there is a 3 out now) and an iMac. All of which take up desk space around the house. However, the main thing that stops me from ordering one is the price, which starts at $2,999. However, by the time I configured it as I would like, it would balloon to $4,199.

To learn about the Surface Studio and the other items, you can view the presentation at https://www.microsoft.com/en-us/octoberevent/microsoft-live-event. This is a two-hour presentation. The Surface Book and Surface Studio starts at time point 1:11.

You may view the Surface Studio at the Microsoft site at https://www.microsoft.com/en-us/surface/devices/surface-studio/overview. And you may even preorder it for early 2017 delivery

It comes with either an it5 or and i7 processor with up to 32 GB Ram. It has a stunning 28-inch, 192 PPI, 4,500 x 3,000 pixel multi-touch display. The hard drive can go up to two terabytes. How they get all of that into what you see in the photo above is a mystery to me.

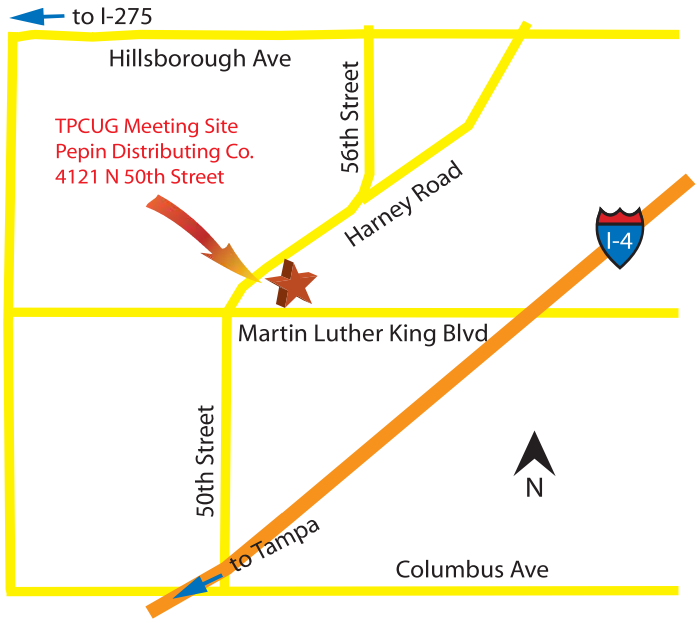
The presentation indicated it was aimed at the creative class, so I suppose that leaves me out. ◆

HP Elite X3 Windows Phone

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Just when you thought Windows Phone was dead, HP has revived it with the new HP Elite X3, a smartphone aimed not at the consumer but at the business world. You will not find it at the Verizon store since it is a GSM phone and not a CDMA one as Verizon would require. But that is not the only reason. The real reason is that it is not at present sold in any of the telecom phone stores. You may at present only purchase it from HP, starting at $799 (and possibly ending at $799) which, I will bet, is more than you want to pay for a phone.

To read about this phone at HP, go to http://www8.hp.com/us/en/products/tablets/product-detail.html?oid=12740553#!tab=features.



To read about it at the more informative PC World site, go to http://www.pcworld.com/article/3129416/phones/hp-elite-x3-review-this-could-be-the-last-great-windows-phone.html.

This phone seems like a slight notch up from my Microsoft 750 XL Windows 10 Phone, both of which allow you to use it as a PC running Windows Universal apps by way of Microsoft Continuum as demonstrated in the photo above. And, this is the big one: If you are willing to pay more to use the HP Workspace in a virtualized cloud environment, the HP phone will even run Win32 apps – for $579/year or $939/year. Obviously this phone is meant for business, not the rest of us. But it points the way to what will be common in the future. ◆

Merle will also lead the Windows SIG for the first 30 minutes of the meeting.

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Last month I wrote about upgrading the C drive in one of my desktops from a 240 GB SSD to a 512 GB SSD. That was needed since my free space was getting pretty low. I thought that was what kept me from being able to install the Windows 10 Anniversary update on the computer, but that was not the case. Even after the upgrade to the twice-as-large SSD drive, I still had problems installing the upgrade. I eventually did get the update, as described in that newsletter. I also wrote about my smartphone programming.

This month, I do not have too much to relate computer-wise other than I have replaced the 1 TB data drive with a 2 TB one on that same computer. So I will relay what problems I encountered in doing that. I also took a a trip to London and Paris and, as always, took many photos. I think describing how I deal with those photos also may be of interest. ◆

Minutes of the September Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. Merle Nicholson, the SIG moderator, introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees. This month Merle discussed the necessity of restoring System Protection back on after the Anniversary 1607 update. Then a demo of Google Photos, the replacement for Picasa, and finally some discussions on "cloud" storage.

Our presenter was William LaMartin, TPCUG member, newsletter publisher and web administrator, who demonstrated methods Microsoft has developed for a programmer to develop applications for Windows 10, including Windows Phone 10. He started by displaying Windows 10 on his phone using Continuum through a Microsoft device, a display dock, that presented the display on the Pepin large wall screen. It also provided a connection for a keyboard and mouse effectively turning the phone into a computer. After exploring a bit, he then started a PowerPoint presentation he prepared for this session. Finally he switched to a Windows 10 Surface Pro 2 where he brought up the programming environment he uses to program apps for Windows, iOS and Android. He demonstrated three apps that are in the respective app stores and shared some insights on the difficulties presented by the very different environments.

Thanks to William for an excellent and entertaining program. ◆

Replacing a Data Drive

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Last month I wrote about replacing my 240 GB SSD C drive on a desktop computer with one twice as large. That went fairly smoothly. Unfortunately I did not recall the one problem I had and repeated it when attempting to clone the 1 TB data drive on that computer to one also twice as large.

What I forgot was that when doing a Clone Disk from Acronis you do not, I repeat, do not want to do it from inside Windows. I tried that first from the Clone Disk item in the Acronis folder in my Windows 10 Start Menu. After several hours with the progress indicator showing no progress and Time Remaining indicating nothing, I abandoned that and thought that starting Acronis True Image 2016, selecting Tools and the Clone Disk from within Tools might work better. After letting that run overnight, the result was the same: No indication of progress.

Now, Merle Nicholson had always told me that I really should run Clone Disk after booting the PC using an Acronis Recovery CD or USB thumb drive. So I proceeded to do that. First, I had to figure out how to set my computer to boot from the thumb drive I had made. I have two desktop machines, and on the one that has a standard SATA C drive, things go by slowly enough that you see a message about how to change the boot device. On that computer you press F11. Unfortunately on the computer on which I was working, because it had a SSD C drive, things happen so fast that you never see such a message. So I started guessing what F key to press to get the boot menu. F11 did not work; however, F8 did, and I was able to set the computer to boot to the Acronis Recover Thumb drive.

Once the program, which I think is running on Linux, starts, you choose Clone Disk from the Tools & Utilities menu. You then select a Source Disk (my D Drive) and a Destination Disk. It may take it a little time to find your new destination disk. Mine was mounted in the nice drive port on top of my computer case as indicated in the top photo. It assigned it a drive letter M (it can't use the already used D and

CD drive E and also several small USB drive letters assigned to a card reader that the computer has). That letter M will cause us trouble later. In the second photo, you see the program running with a nice indication of progress. The total time to clone a 1 TB drive was around two hours and 40 minutes.

It then took me around ten minutes to replace the D Drive in the computer with the new drive. I started the computer and got all sorts of error message that I don't recall along with no desktop and Taskbar icons – and no D drive. Possibly the message said something about Page Files. Anyway, the problem became obvious when I used File Explorer to see the drives on my computer. No D drive – but there was a M drive that was around 2 TB and which contained all my data files. So all I needed to do was change the drive letter

Clone Disk.....Continued on page 4

Clone Disk.....Continued from page 3

for that Drive from M to D. A phone call to Merle Nicholson informed me that I needed to go into Control Panel > Disk Management to do that. Once that was done, I had my desktop and Taskbar icons back. The reason: When I set up this computer originally, I moved My Documents, My Pictures, Desktop, Temp, etc to the D drive. So, once I changed the drive letter from M to D, the computer then knew where to find things.

But the computer was still not happy, and I am not sure it occurred at the same time as the missing desktop items or just after when I tried to do something else. Anyway the problem was that the new D drive did not have a Page File. Merle to the rescue again telling me to go to Control Panel > System > Advanced System Settings > Performance > Settings > Advanced, where you can create a Page File for that Drive.

The next problem: Now that I was up and running, I needed to start this newsletter. Merle had sent me the minutes as an attached Word document in an email. I opened that email and double-clicked on the attachment and received an error. A little analysis of the error message showed that it was looking for a temp folder in a drive K. There was no drive K. However, there was a partition on the new drive that was listed as L. I suppose that was where the temp file for that drive was. Problem solved – No! I was not allowed to change the drive letter.

A bit of Internet research told be that I needed to set that drive as having no Page File before I could change the drive letter. I did that, and after the required reboot, I could then open the attachment by double-clicking.

I had none of these problems when cloning the C drive because none of the standard folders such as My Documents, etc. were on the C drive.

Why do I need so much space on my data drive? Well, the My Pictures by itself requires 539 GB. I have taken a lot of photos over time, and not just digital. I have scanned in most of the photos I took with my film cameras over the years. Then there is My Documents folder which has 297 GB of data. And I am already up to 834 GB. Additionally there are My Videos and some more that add up to an amount that leaves only 14 GB on the 1 TB drive I replaced. With an extra terra byte on the new drive, it should take some time before I fill that. ◆

Photographing London and Pairs

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

There is a lot of newsletter left to fill, and no one else at the moment has come up with an article. So I will continue by describing the process I use to photograph places I visit and how I manage the photos using Adobe Lightroom with modifications to the photos using Adobe Photoshop, which are part of the Adobe Creative Suite. I will also discuss how I use Adobe Premier Elements to make videos of the still image or simply edit the movies I can also make. So this will also be about software and not just photography.

For travel, my photography equipment consists of only one camera, a Nikon D800 DSLR with a 28 mm to 300 mm zoom lens. That is a heavy and obtrusive piece of equipment, especially when everyone else is using a phone to take their photos. I do use my Microsoft 950 XL phone to take photos sometimes, especially in restaurants, and it does quite good job on both photos an videos. Additionally the Nikon camera has an attachable GPS unit. Why Nikon cannot put a GPS inside the camera baffles me since the much smaller phones seem to include one. For storage in the camera, I use a 32 GB extremely fast Compact Flash card to store the still images. And since the camera will also take movies, I store them on a very fast 32 GB Micro SD card in a second camera slot. Finally I carry along and leave in the hotel room an extra of these cards in case one gets full, as did the compact flash one on this trip. I also include a battery charger and extra battery

Photography.....Continued on page 5

Internet Picture of the Month

Paris Fashion Week

From the NY Times site, with a URL of http://www.nytimes.com/2016/10/04/fashion/paris-fashion-week-day-8-no-one-goes-bigger-than-chanel.html, is this photo from an article on Fashion Week in Paris. The model is wearing something from Vanessa Seward. Photo by Bertrand Buay/Agence France-Presse. I missed the opportunity of seeing any of this since it occurred right after I returned to Tampa. However, I doubt they would have let me into the shows anyway. Why do fashion models always have a bored look?

Photography.....Continued from page 4

for the camera. I own a Sony HDR movie camera and would love to be able to use it, but that would simply be too much equipment to take on a trip.

For camera settings, I usually used the program mode and let the camera select the aperture and shutter speed. I do adjust the ISO based on the lighting conditions. For example, inside museums I will set the ISO quite high to be able to get decent photos with no flash. I also moved it very high so as to force a very fast shutter speed when attempting to take photos out the window of the Eurostar train traveling at 180 plus miles/hour between London and Paris. There is a feature to increase or decrease the aperture from the programmed selected one. I usually use this to increase one f-stop when taking a photo facing into the sun of

Photography.....Continued on page 6

Photography.....Continued from page 5

something. That's it. I am not a professional photographer; just a fairly advanced amateur. Most times, I spend no more than two seconds on composing and snapping a photo. That is why I think of myself as a snapshot photographer. However, I do manage to get some fairly decent pictures

Of the 1,721 photos I took over eight days, I selected 491 to use plus several of the short movies I took with my camera along with a few of the restaurant photos I took with the phone.

My method is as follows. While on the trip, each evening I would copy the day's photos from the camera to a folder on my Surface Pro 2. That way, I had two copies of the images: One on the camera and one on my laptop. On the laptop I had a folder for each day of the trip. When I arrived back in Tampa, I opened Adobe Lightroom on my desktop computer and imported all the 1,721 photos. In Lightroom, I then go through and delete any that are quite bad, such as badly out of focus or something that is totally of no interest. Next in the Library menu item displayed below, I add my name as creator and the location as London or Paris to the metadata of all the photos.

If I really wanted to spend a lot of time, I could identify photos as being buildings, gardens, statues, paintings, etc. in the metadata in the Library portion of Lightroom. But that was a bit too much for me.

I next look at the GPS tags in the metadata of each photo. Most have it, but there will be some without. For example, those taken inside a museum will not have this information. But it is easy to add in the Map menu item of Lightroom. I simply select all the photos taken inside the museum and then use my mouse to move them to the museum's location on the map. For other photos where the GPS did not fire, I can, with a bit of work, use Microsoft Bing's street view to trace my route, identify the building in question and then place the photo at that location on the map. That is a bit of work, and I don't do it for all photos for which the GPS did not fire. The map at the top of page 7 is a screen capture from Lightroom showing all the locations of my photos in Paris on a Saturday.

The final step is to do a presentation of the photos. I have two methods. One is to simply upload them to my OneDrive account, reduced in size from 7360 x 4912 pixels to 2400 x 1602 pixels, which is done in

Photography.....Continued on page 7

Photography.....Continued from page 7

Photoshop, and share them. The second is to make a video of the still images using Adobe Premier Elements as displayed in the screen capture at the bottom of this page. I add some text at the beginning and select a music track to add and have the program create the mp4 file. The higher the quality of video, the larger the size of the resulting file. For these images, I used 1920 x 1080 HD, a better quality video than the 1280 x 720 HD that I usually use. The resultant file is considerably larger but the resulting video

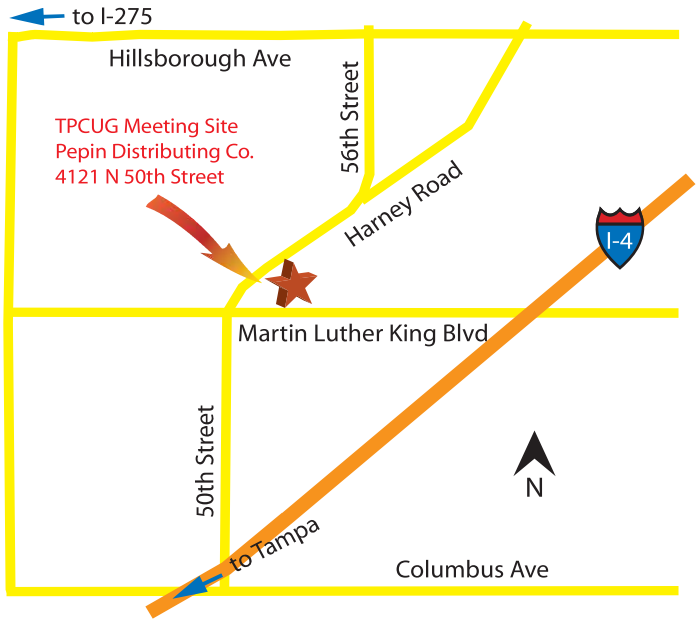
☐ *Member: Your membership is up for renewal*



Photography.....Continued from page 7

is noticeably better. I would like to share these images with you if you have an interest. I have two ways of viewing them. You can watch the videos by going to my website http://www.lamartin.com and selecting the Videos menu item. The items of interest are the ones at the top. The second method is to view the London and Paris photos as individual images at these shared links at my OneDrive account

London:
https://1drv.ms/f/
s!AjI1fQgXBbBGloNgQXEkwn3y2kUfHg

Paris:
https://1drv.ms/f/
s!AjI1fQgXBbBGloVv6Fi87GjYdJ16nw

Of course, for the second method, it will be easier to go to the TPCUG website and view the current October newsletter where the above links will be live. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

In this newsletter, Merle Nicholson tells us about new phone trends. And then he stops way too soon. Doesn't he realize we have a newsletter to fill, and no one has sent me anything, and that I really have nothing to contribute since I put all that in last month's newsletter. But necessity is the mother of insertion, as they say. And, thus, I have pieced together a few things that I observed or did this month that are computer related.

First I tell you about the amazing new computer that Microsoft will bring forth in the first part of 2017. It is named the Surface Studio, and it is a beauty with a beauty of a price. It is aimed at the creative crowd according to the video I watched. So it is obviously not meant for me

Minutes of the October Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. Merle Nicholson, the SIG moderator, introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees.

In October, Merle did the presentation as well as the SIG, and since they were the same subject, Windows 10 Tips, the SIG simply continued. Of the attendees, only two people did not have or use Windows 10. Merle demonstrated how to tell the update level of your Windows 10 OS, and explained the history of the two: 1511 and 1607. Next were complete instructions on the System restore points, how to check if Microsoft update had turned it off and how to reinitialize System Restore. Then new changes to how system updates are handled. The next subject was drivers, their importance and how to manage drivers; more specifically how to turn driver updates off without affecting security updates. Finally with William LaMartin's help a demonstration of Windows 10 Quick Access, yet another remote control, windows third remote control program. William controlled Merle's computer after receiving an invitation. Lastly, Merle shared some pictures and narrative about Cape Canaveral in the early 60s. ◆

Comments.....Continued from page 1

Another new item is the quite remarkable Windows phone from HP named the Elite X3. At least that is the opinion of the writer who reviewed it for PC World. I provide a link to the review, which will be more easily followed in the online version of the newsletter.

With all these new devices from Microsoft and such things as the HP phone, it would appear that things are looking in the Microsoft World. I certainly hope so since I am a stock holder in the company. ◆

New Phone Trends – what you may not know

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

It's common to buy your smartphone from your carrier, and while in the past, some carriers discounted the price, they are now charging full retail; having "unbundled" the phone payment from the monthly service. Some may give other incentives if you ask. There are advantages to buying from sources other than the carrier, not the least of which is a much lower price.

I had decided to replace my (only) three year old Android phone and then I monitored prices for several months until I found what I wanted at a good price. I pretty much met my goals with last year's Moto X Pure. It's a 2015 model by Motorola (now owned by Lenovo) and was highly praised as a "flagship" smartphone when it came out. FedEx delivered it Oct 3; the tracking info originating in Wuhan, China. I paid $289 + tax, shipping included. This is for a phone that cost $600 last year.

Lenovo has replaced this model Moto X Pure with the 2016 Moto Z, a modular smartphone that comes in several varieties, including the Droid Z phones that are sold by Verizon. But they're still selling the X Pure and others (Moto G and Play) from the Motorola website.

I moved my VZ (Verizon) SIM card from the old phone to the new, waited for Google to transfer data and install apps, then waited for an OS upgrade to 6.0, installed the 64G micro SDXC card ($20 at amazon), then to formatted it as internal storage, and I was in business with a new 80G top-of-the-line (in 2015) smartphone. Motorola will upgrade it to the very latest OS (7.0 or 7.1) in December, but 6.0 is excellent. The VZ cloud restore from backup failed as expected, but all I lost was some old text messages that I was saving. No big loss, and Google had saved the rest. Motorola has a data transfer app, and even has a transfer program using NFC radio holding the two phones back-to-back if you want to wait 6 hours to do it.

Most of my search was based on a goal to release myself of Verizon's unhealthy need to control what devices are available to their customers. Specifically, they demand that they determine the apps that are installed (we call it bloatware), and their insistence that they control updates to the OS – late or not at all. The other goals I have is to never go on contract and to never pay full retail price, all of which means that although I love being on their network, I will never again be buying a phone from Verizon. There are excellent alternatives – more on that later.

The only manufacturer that is refusing to supply Verizon branded phones is Apple. If you will recall, Apple phones were not available from Verizon for perhaps a year later than AT&T because of Apple's refusal to allow Verizon to control updates. Obviously Verizon relented.

What makes it possible to buy a phone that works on Verizon but not supplied by them is a class of phone called "unlocked" and in addition one that is built to work on any carrier called "Universally Compatible". I mean any carrier; Verizon, T-mo, Sprint, AT&T and European carriers as well. That means that the phone must have two kinds of cellular receiver/transmitters - GSM and CDMA, so that the carrier's SIM card determines the type of radio that is in use. The Google flagship phones - Nexus 5X and 6P, new Pixel and Pixel XL, The Moto G, the Moto X Pure, and a new one from LG the V20, all are "unlocked", and multi-carrier and also international. Amazon calls these phones "Universally Compatible". See Amazon https://www.amazon.com/unlocked-cell-phones/b?ie=UTF8&node=2407749011 for lots of good information.

These phone's updates are controlled by the manufacturer the same way Apple has all along. You can count on the Nexus/Pixel getting the first releases when Google makes a major change to the OS. The advantage is that Verizon does elect to freeze your phone's OS at an older level. It's understandable because it's a lot of work. But it's unnecessary in the first place if they would leave their bloatware off. Really, who would pay a monthly subscription price for Verizon Navigator and be unremovable from the phone? John

Trends.....Continued on page 4

Trends.....Continued from page 3

Madden NFL .. Really?

Since I started this article, VZ has started selling the Pixel and Pixel XL, "exclusively" from Verizon. But don't be fooled by that; Google also sells the same model that is unlocked and "universally compatible" and works on VZ. No one has figured out the "exclusive" tag Verizon uses.

You do have to be careful when selecting an unlocked phone. There are models that are not universally compatible, almost always GSM-only (not Verizon) and there are "International, no warranty" versions made for Europe. You want to look for "US Warranty" and check out the published carrier compatibility. You can get one of these phones for as little as $150*, and it will work on any US carrier. You can travel to Europe and pick up a prepaid SIM at the destination airport and use it during your European trip. Watch for models that are compatible with VZ except that it may not work on 4G. Not a deal-breaker for me.

* This $150 phone is an excellent Moto G. It has ads on the lockscreen. The no-ads version is $200. It may not handle VZ 4G. 4G US coverage isn't 100% anyway and I don't stream movie content.

If you travel to Europe and back, you may want to look for a phone that has two SIM slots, US and Europe. They're available. ◆

Two Miscellaneous Items

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

On the left is a phone photo that was taken an a meeting at the Iron Yard in St. Petersburg last week showing me trying out a Microsoft HoloLens. I was able to view a shark, a hamster, a ballerina and an object that I can't recall that floated in space and which with finger movements I was able to move to different places in the room. Quite interesting. At present the devices are $3,000 and still under development. The hope is to be able to sell them at under $1,000 and possibly as low as $700.

The fellow doing the demonstration was working on an app for the device. This is one thing I have no interest in working with at the present, the steep price being one of the determining factors.

Miscellaneous.....Continued on page 5

Internet Picture of the Month

Halloween

It is Halloween around the world. This photo is from the photos section of the Wall Street Journal, http://wsj.com. The caption reads: "Dublin hosts the Bram Stoker Festival on Halloween. Mr. Stoker was an Irish author who wrote the novel 'Dracula' in 1897. Niall Carson/Zuma Press"

Miscellaneous.....Continued from page 4

The image at the top of page four is a screen capture from an Android phone of an app that Merle Nicholson requested I develop for him. He wanted a bicycle riding app that would display the instantaneous speed in big digits at the top and then two separate leg displays below that which would keep track of elapsed time, distance and average speed over the leg. The two leg displays needed to be able to be reset, frozen (not paused but just have the display frozen) and paused. You also would be able to unfreeze and un pause.

In the image, the data is from a short test walk I did where both leg displays are showing the same information. When finished, the leg displays would normally be used to display data from different legs. The app could also record walk data. ◆

Microsoft's New Hardware

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

On October 26, Microsoft did a presentation in New York City showcasing their new hardware products. That's correct; hardware products and not software. That would be the Surface Pro 4, the new version of the Surface Book, and a new and exciting item: The Surface Studio. Warning: You are not going to like the price, but you would love to have one. At least, I would love to have one. But, beside the high price, I am not sure where I would place it. I am already overloaded with two desktop Win 10 machines, a monitor for working both with my Win 10 phone using Continuum and with the Rasperberry PI 2 (I think there is a 3 out now) and an iMac. All of which take up desk space around the house. However, the main thing that stops me from ordering one is the price, which starts at $2,999. However, by the time I configured it as I would like, it would balloon to $4,199.

To learn about the Surface Studio and the other items, you can view the presentation at https://www.microsoft.com/en-us/octoberevent/microsoft-live-event. This is a two-hour presentation. The Surface Book and Surface Studio starts at time point 1:11.

You may view the Surface Studio at the Microsoft site at https://www.microsoft.com/en-us/surface/devices/surface-studio/overview. And you may even preorder it for early 2017 delivery

It comes with either an it5 or and i7 processor with up to 32 GB Ram. It has a stunning 28-inch, 192 PPI, 4,500 x 3,000 pixel multi-touch display. The hard drive can go up to two terabytes. How they get all of that into what you see in the photo above is a mystery to me.

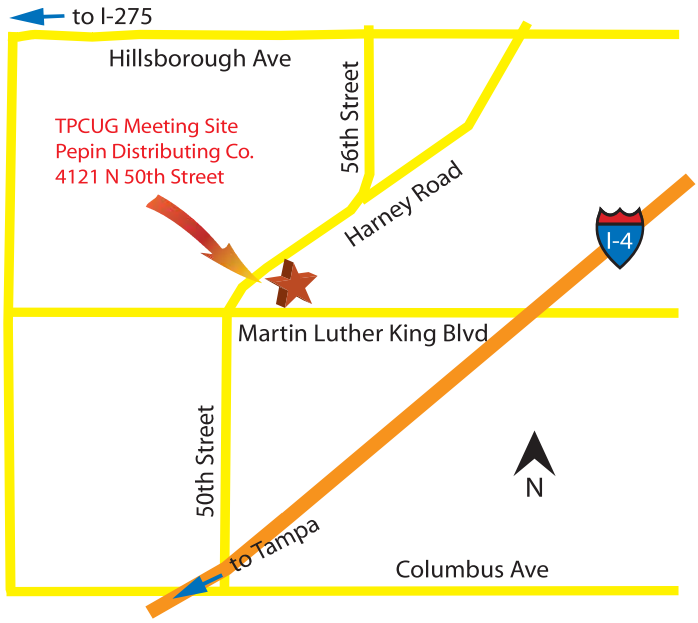
The presentation indicated it was aimed at the creative class, so I suppose that leaves me out. ◆

HP Elite X3 Windows Phone

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Just when you thought Windows Phone was dead, HP has revived it with the new HP Elite X3, a smartphone aimed not at the consumer but at the business world. You will not find it at the Verizon store since it is a GSM phone and not a CDMA one as Verizon would require. But that is not the only reason. The real reason is that it is not at present sold in any of the telecom phone stores. You may at present only purchase it from HP, starting at $799 (and possibly ending at $799) which, I will bet, is more than you want to pay for a phone.

To read about this phone at HP, go to http://www8.hp.com/us/en/products/tablets/product-detail.html?oid=12740553#!tab=features.



To read about it at the more informative PC World site, go to http://www.pcworld.com/article/3129416/phones/hp-elite-x3-review-this-could-be-the-last-great-windows-phone.html.

This phone seems like a slight notch up from my Microsoft 750 XL Windows 10 Phone, both of which allow you to use it as a PC running Windows Universal apps by way of Microsoft Continuum as demonstrated in the photo above. And, this is the big one: If you are willing to pay more to use the HP Workspace in a virtualized cloud environment, the HP phone will even run Win32 apps – for $579/year or $939/year. Obviously this phone is meant for business, not the rest of us. But it points the way to what will be common in the future. ◆

Meeting Preview: Annual Holiday Party.

Merle Nicholson may or may not lead the Windows SIG for the first 30 minutes of the meeting. It will depend on whether there are any questions.

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Thankfully Merle Nicholson and Ron Weinberg have something to contribute this month, for I have very little to write about. I have been keeping busy, just not doing things that would provide much material for a newsletter.

I continue to refine the Android phone app that I am working on for Merle to keep track of his bike riding. However, I can't seem to finish because of all the other projects that pop up--some that have to be taken care of immediately and some that are all of a sudden new and interesting.

One of those that has to be taken care of immediately is handling the data that comes into PayPal from our annual home tour in my neighborhood of Hyde Park. Each year we have a home tour of six or seven houses on one of the streets in the neighbor-

Minutes of the November Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. Merle Nicholson, the SIG moderator introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees.

For the November meeting, Steven Singer of RDI did his regular hardware presentation after introducing his brother, Scott. Scott brought a very high-end, powerful Windows 10 desktop machine. The computer was specially designed for Scott for editing video – one of Scott's businesses is recording live music bands and putting out a professional product. Scott demonstrated and discussed Adobe Premier for Video rendering, a product that a couple of our members have interest in. Steven went on to discuss some of the computer components he had brought with him: Computer cases, cell phone chargers, mini-ITX motherboards and also some AMD processors, one with a larger but flat fan for low profile cases. All-in-all once again Steven has done an entertaining and informative presentation. We always look forward to his annual visit. Our thanks go to Steven and Scott Singer. ◆

hood. My job is to take photos of the exteriors of the houses for the brochure and then to return the day of the tour and take interior photos right before the tour begins. You may view a video of this year's houses at my website, http://www.lamartin.com, in the Hyde Park menu item. The alternate link usually works better than the first one for most videos.

The most tiresome job is keeping track of all the PayPal payments for the tour when people make online purchases. It is not difficult to view the data. The problem comes when the organizers want a

Have a Spare Smartphone?

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

I recall TPCUG member Michele Burgess asking if I had ideas for uses for good older smartphones, and somehow the conversation was interrupted and I didn't have a chance to answer. I've been using an old smartphone in my car for much more than a year. It's not on a cellular account; it's an older Moto X2 that's working fine as a GPS device. As it turns out, I own four surplus working smartphones that are not in use. I've checked on their market value which range from zero to $10. I think it's interesting that it's pretty normal (and strange) to replace a device like this every two or three years in full working condition. I think two are going to be donated to The Spring, and two are re-purposed as GPS readouts.

One device, I'm referring to the phone on the left of the steering wheel above, is an older model that uses a replaceable battery that's especially cheap. I've actually replaced it as my primary phone twice now, the latest is on the right - a Moto X Pure. But it's a good functional smartphone that still has the Verizon SIM installed. As long as the SIM is there it can be used for emergency 911 calls. It's always plugged into a USB charging device, never unplugged. But I do shut off the smartphone itself because I really don't drive the car enough to keep it sleeping and charged.

Its only function is information the app can get from GPS. Primarily speed, and you can observe my speed was zero when the photo was taken, not 0.3, more on that later. I prefer a digital speed indicator, which this current car does not have. I've had a couple of predecessors (2009 and 2012 Civics) that had a digital speed readout and I find it's less distracting than an analog speedometer. In any case this GPS app provides compass direction, a couple of trip odometers and several speed settings you can set to give warning that you're exceeding speeds, and a bunch of other functions. I use the digital speed and trip odometers, and ignore the rest. If you look at available GPS apps for smartphones the only problem is selecting among the hundreds available, including some that are in reverse so that they'll reflect on your windshield as a heads-up-display. I actually have three GPS apps on this phone and have settled on this one for now, but I'm always looking for "the right one".

The phone on the right of the steering wheel is my newest primary smartphone, a large 5.7" Moto X Pure. Normally it's rotated landscape and running Google Navigate (Maps). It's connected via BlueTooth to the car for hands-free telephone and for music to the car speakers. For this photo however, I was testing an app that William LaMartin is developing that I asked for. I want a GPS app that has just the functions I use and no more. Speed and two trip registers for my bicycle. Here's that phone with William's app mounted in my bicycle phone bag.

That bag is good for a billfold, keys and has the win-

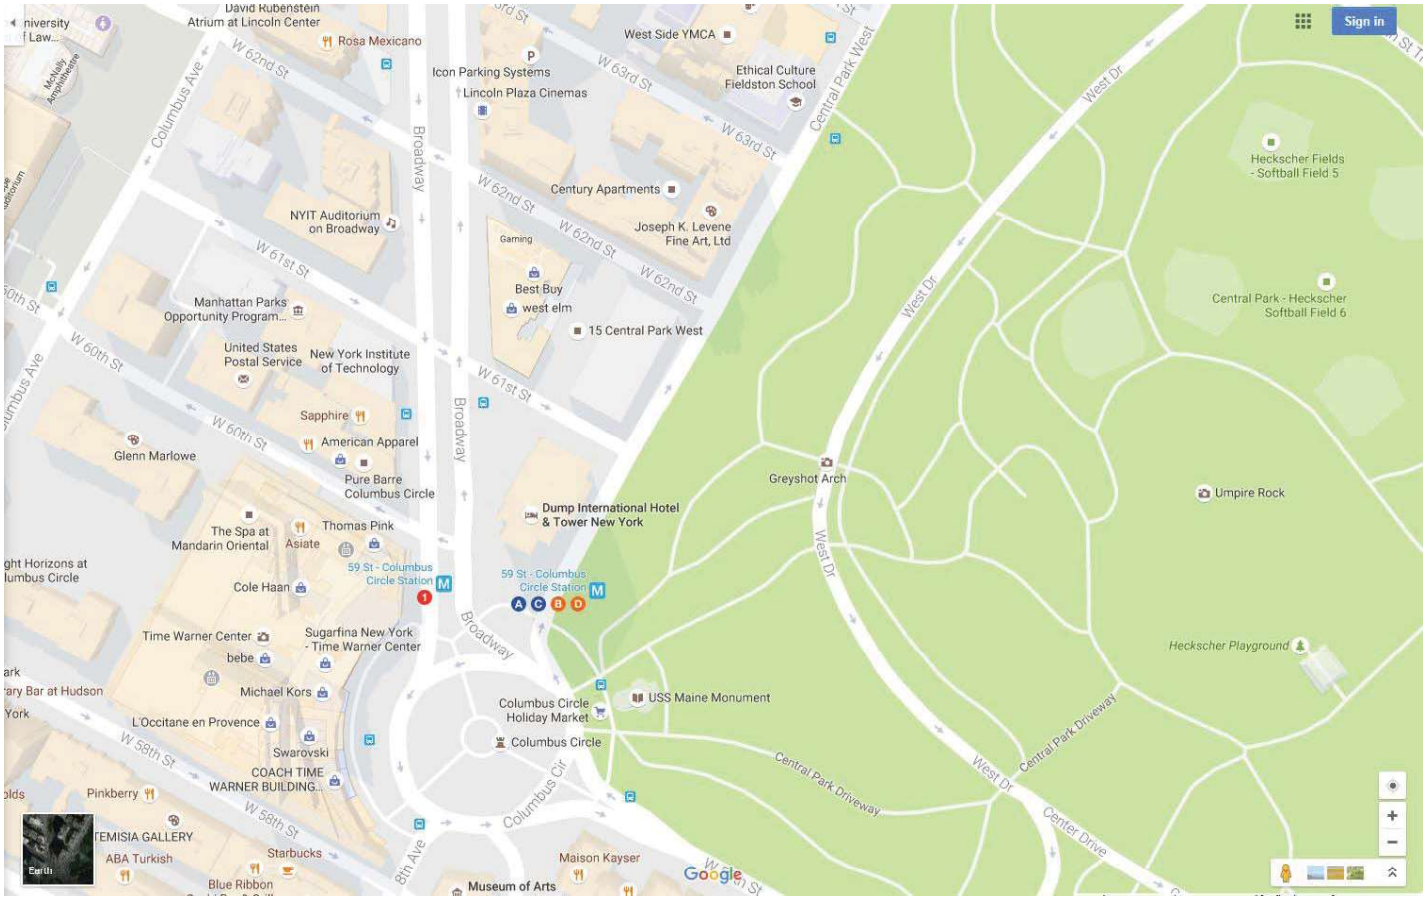
Smartphone.....Continued on page 4

Smartphone.....Continued from page 3

dow for a phone. The plastic window does not inhibit touching the screen. It's hard to see in the photo, but it's very readable in direct sunlight because the digits are large and William's app has very little to interact with. If William's app turns out as I expect, I'll use it in the car as well, replacing the current app. Then I'll dedicate one of my surplus phones just for this bicycle bag.

The other uses for surplus working smartphones are car and bicycle GPS, donating to The Spring, and for remote control of household devices. We were using one of these phones to run a Honeywell app that remote controls our air conditioner thermostat. The only thermostat is on the second floor of our townhouse. We try to keep it as warm as we can comfortably most of the time, but several times during the day set it a couple of degrees lower for kitchen activity, vacuuming and cleaning. It has an internet connection for remote control and it works surprisingly well. We have no interest in controlling it when away from the house, but it did allow for us to use a smartphone dedicated to the app – always on – to pick up and make quick adjustments. We have since abandoned that when we set up our Amazon Echo to do the same thing by voice command: "Alexa, set thermostat to 78".

Other notes:



1. I think a digital speed works best for me because that speed I read goes directly to my brain. An analog speedometer must be interpreted – translated to digital before it's useful.
2. You can buy a semi-clear reflective film to adhere to the inside of your windshield so that a phone used as a heads-up-display will be readable in daylight. It's reflective enough to read the phone sitting on the dash. See next note.
3. You have to be careful to make sure your phone does not get fried in sunlight. The interior of your car can easily reach 150 deg f, and the phone will get much hotter than that being directly behind the windshield. I use a white terry facecloth to drape over the phone if it's parked in the sun, and if I think it's especially intense while I'm away from the car, I'll dismount it, wrap it and put it in the glove box. This is a precaution for any similar device left in the car. I let it overheat one time and it shut down, did not power back up until it cooled down. It even notified me why it shut down. It obviously monitors its internal temperature.
4. You also have to be concerned that a phone may be a temptation to steal because it's in plain sight. Not that you lose much, but you'll have car damage to deal with.
5. Smartphone-controllable devices are commonplace now. Especially remote controlled wall outlets and switches and internet-connected light bulbs. ◆

Comments.....Continued from page 2

listing every few days of who has purchased tickets so as to be able to make up a wrist band package for them. They do not want to wait until the last day or two to do this, so it falls to me, the person who set up the Pay Pal account, to supply them frequent updates. No good deed goes unpunished. Next up for the neighborhood is the creation of the directory of residents which I do each year. To do that, I receive the data in an Excel file from the membership person. I then transfer it to Microsoft Access and then use that along with some Visual Basic programming to arrange the data, which I then transfer to Adobe inDesign for the final product. I am trying to shed some of the

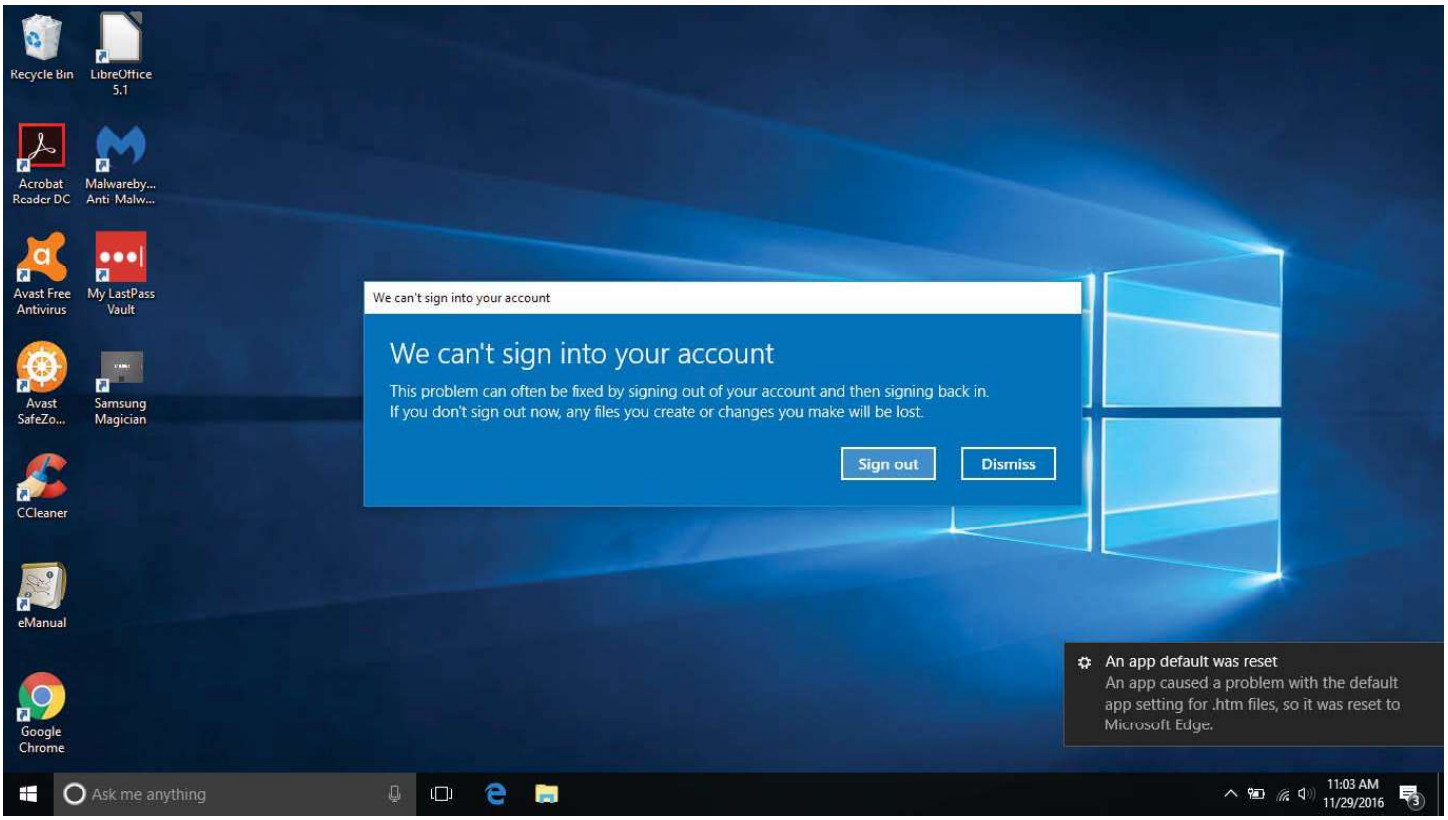
Internet Picture of the Month

Dump International Hotel & Tower



As seen in the screen capture above, on November 26 Trump International Hotel & Tower on Central Park West just north of Columbus Circle in Manhattan was temporarily renamed to Dump International Hotel & Tower New York on Google maps (https://www.google.com/maps). Additionally, Trump Tower in Manhattan was renamed Dump Tower (If you don't know the location, it is just to the east of 5th Avenue and in between 56th and 57th streets). It is unclear who was responsible: Google programmers, hackers inside of Google, hackers outside of Google, or the Democrats' favorite suspects: Russian hackers. Anyway, the renaming remained for a number of hours.

Comments.....Continued from page 4

many "jobs" I have, but the only one I have managed to drop is doing the neighborhood website, as I still have the the neighborhood database, emails and directory--not to mention this TPCUG newsletter.

Microsoft has also been causing me problems. A number of years back, when the Windows Phone 7 came out, I began writing phone apps for it. One of them was a database named My Data Tables. The way it functioned was that you exported xml files from Microsoft Access tables or queries or text files from Microsoft Excel and placed them at your One-Drive account (then called SkyDrive). From the app, you then downloaded these files from your OneDrive (SkyDrive) account. In the app, the data was encrypted and the app password protected. Everything was fine until a month back when Microsoft decided to recertify apps. They noticed that this app did not have an

Back from the Dead

By Ron Weinberg, Member-At-Large
Tampa PC Users Group
rswjbr@verizon.net

Our six year old i7 Asus laptop, which I had previously written about, describing the difficult upgrade to Windows 10 had, after a few minor tweaks, been working perfectly. It is primarily used by my wife, an experienced touch typist. As such, she prefers to use a heavier external USB keyboard laid on top of the laptop keyboard.

We know food and especially drink should not be placed near a laptop. There was a glass of unsweetened iced tea on a nearby table, a relatively safe place, or so we thought. An accidental bump caused the tea to be thrown onto the laptop.

We immediately shut off via the power button and tried blotting up the tea. The external keyboard did not shield the laptop very well and it was very wet. We grabbed a hair dryer to help.

Later, we found what we should have done: Immediately disconnect the power cord and the battery. Do not use a hair dryer, it forces the liquid further in. Our first step after power off probably should have been to turn the laptop over to let gravity remove the liquid as much as possible.

After allowing everything to dry we tried many times to restart the laptop and all failed. The system was presumed dead. A call to the manufacturer's service department indicated that the system board had probably been ruined and it was not cost effective to replace.

I removed the SSD hard drive and tested it. It, as well as the external keyboard, was not damaged. All the files were easily recoverable. I stored it in a static free bag and stored the laptop in a vertical position like a book intending to scrap and replace it when the forthcoming holiday sale season began.

Fast forward four or more weeks. Black Friday is approaching, the time to buy. I decided to make one more effort, reinstalled the hard drive and switched it on. The screen appeared, wildly flickering, a sign

Back From The Dead.....Continued on page 7

Back From The Dead.....Continued from page 6

of life. I could not sign in as the "s" on the laptop keyboard was inoperative. Adding back the external keyboard I was able to sign in and adjust the display setting to eliminate the flicker. When my wife tried to sign in we got the message "We can't sign into your account."

The suggested fixes for this condition are to try to sign in and out multiple times. If that fails you need to edit the registry from the safe mode and change the Ref Count to 0 in the ProfileimagePath and then install any Windows updates. Neither method worked. We could sign into the other user but not the principal user. The main user's profile was corrupted and had to be replaced.

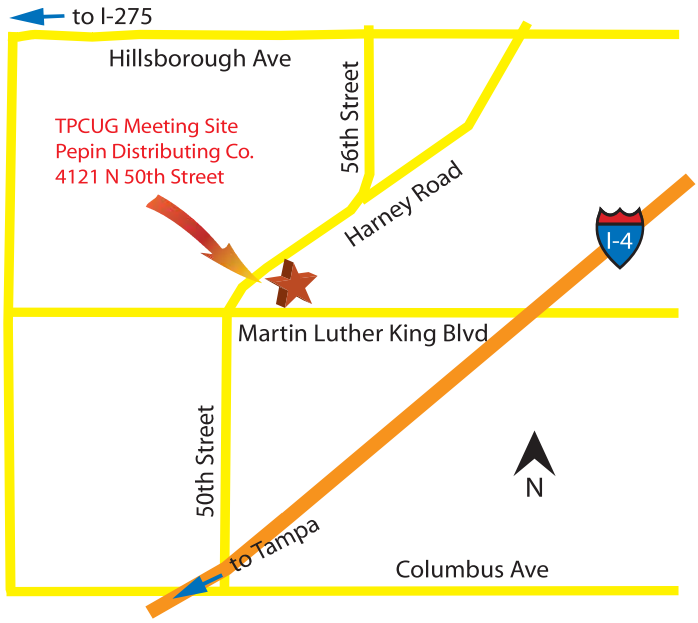
By activating and using the Administrator account we saw that all the original files were intact. We created a new user, copied the old files into it and renamed the old user. Then we were able to rename the new user to the original name. The sign in problem was corrected. It was necessary to reenter the email program's settings and everything was back to normal.

Upon further examination it was determined that many of the built in keyboard keys would not work including all of the FN keys. Using the external keyboard was a satisfactory work around. However, the external keyboard lacks a Fn key so all of the functions controlled by key are disabled. ◆

Comments.....Continued from page 5

age rating, which was not in existence at the time it was published. So they re-tested it and discovered that they needed to access the OneDrive test account I had provided and for which there was a provided user name and password. When they tried to access the account, Microsoft now required (but not in the past) that they retrieve a verification code that was being sent to the email associated with the account--which was sent to the owner of the account – me! so there was no way for the tester to actually test the app. I discussed this with Microsoft for over a week and finally gave up on the idea of keeping the app in the store, since they had no solution and simply said that there was no way for them to certify apps that require access to a OneDrive account. So, since some fights are not worth fighting, I gave up on that.

I am now toying with the idea of redoing the app so as not to need OneDrive and redoing it as a Win 10 Universal app with possible Android and iOS versions. In this version, to get the data on your phone, you will connect it via a USB cable to your computer, copy the xml or txt files desired to a folder on the phone, import them into the app where they will be encrypted, and finally delete them from the folder on the phone. That way you will only have encrypted versions of the data on the phone. Working on that has also taken up some time.



Now there is one final thing that I recall as taking up a bit of my time: Building a robot (pictured above fully assembled). This robot is really meant for children. It includes a small arduino computer on it that can be programmed. One way for children to program it is using the simple SCRATCH language. However, a collection of adults, of which I am a member, is going to attach a Raspberry Pi 3 that is running Windows 10 IOT to the robot, and we are going to write programs to control the device using the C# programming language. The group meets monthly at the local Microsoft office. You may view a video of my robot running around the house on its own at https://1drv.ms/v/s!AjI1fQgXBbBGlsIbKUbpZnOrPrknuw (wait for the online version of the newsletter to more easily use the link). ◆

Meeting Preview: Extended Windows SIG and a Business Meeting.

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

There almost wasn't a newsletter this month. But here it is again. However, you may not have received it in the usual timely manner before the monthly meeting. It may have arrived a few days later. I am pretty sure it will be finished a couple days before the meeting, but that does not allow enough time for having it printed and then mailed. However, it should have been posted online a couple days before the meeting

The main reason it is late this month is that I received no articles. As should be obvious, in recent years only a handful of members submit anything, and that handful consists mainly of Merle Nicholson and myself with occasional help from about four other members. And this month the handful was an empty hand. In years past, members would provide articles. Sadly some of those members have died, some have left the group and some are just getting old and tired. I am a bit old and tired myself. I have been newsletter editor since December 1995. That is 20 years. I have managed to put out a newsletter on time for those 20 years despite going on vacations, being in the

Minutes of the December Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. Merle Nicholson, the SIG moderator introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees.

The December meeting is a social meal held at Pepin Distributors. John Witmer did all the hard catering work with help from his wife. John has done this for enough years that he's found the winning formula, and it was a resounding success. The members took the opportunity to socialize, something that's difficult to do during regular meetings.

Our heartfelt thanks to John and Donna Witmer for the food and to Pepin Distributors for providing the venue. ◆

Comments.....Continued from page 1

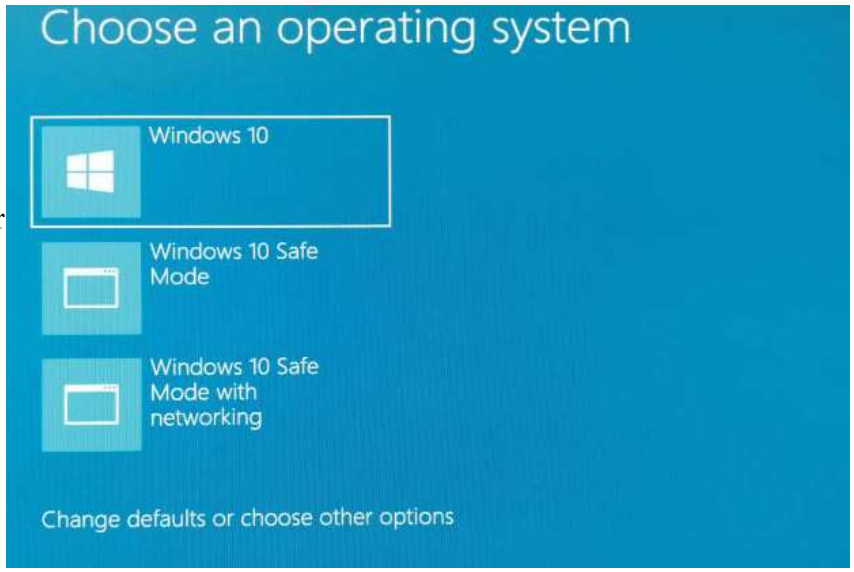
hospital and worse. I have enjoyed it and learned a lot in the process. But I need some help with articles if I am to continue.

At the last minute, I told Merle that we had nothing. He said that he had no ideas, and I had only the thinnest of an idea. But we decided to put ourselves to the task, and this newsletter is what we came up with.

As I have mentioned before, I have written a Windows 10 Universal app that you can download from the Windows Store, either for your Win 10 computer or your Windows 10 Phone (I think I am probably the only one in the group that has such a phone) that will allow you to read and search all our newsletters back to 1988. I have also ported that app to Android, so it is available in the Google Play Store for your Android phone or tablet. Well, you know what comes next: An iOS version.

Comments.....Continued on page 5

Where did Safe Mode go?



By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

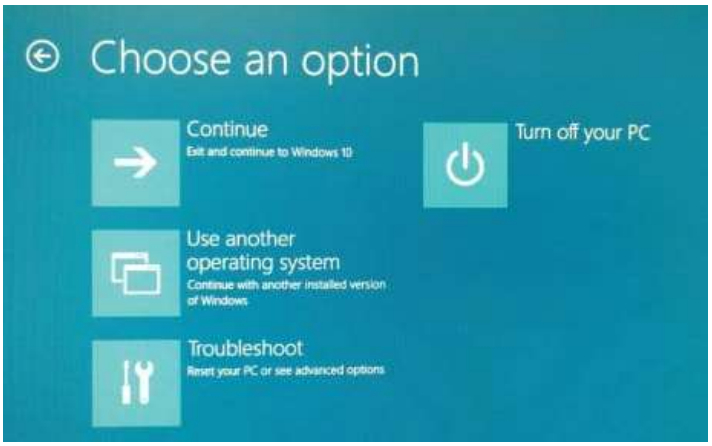
Those of us that have been Windows users for a while have certainly used Safe Mode, and on an OS before Windows 8, it was extremely useful to recover a broken OS without going to extreme measures like reinstalling. Safe mode loaded a minimal OS without many hardware drivers. It was useful because if you got a driver that was incompatible with say a network card, you could boot without drivers and remove the offending one. Most times it is useful to run a virus scan when you have an infection that is persistent. Chances are that the virus is not running in Safe Mode, so it can be removed more easily.

In Windows 7, for instance you must press F8 after the hardware is booted but before the OS is loaded and you got a menu that included Safe Mode. Sometimes the timing was difficult and it took several tries. Another way to get there is through a setting in System Configuration, on the boot tab, set a temporary boot into Safe Mode and then restart. But that presupposes that you can get into Windows in the first place.

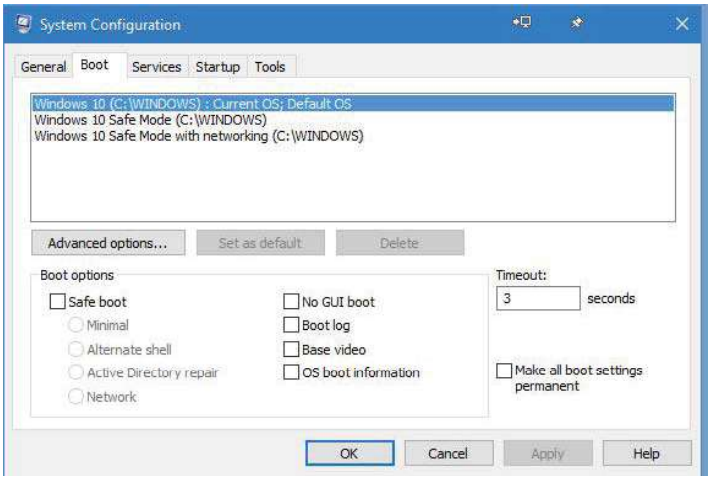
Windows 10 has changed it all around. The F8 option is no longer there. If you can run Windows you can get into safe mode, but frankly if I can get into Windows, I don't need Safe Mode. It isn't even available in the repair options. And to my mind, Windows 10 needs it more than ever because of the way updates are forced. You can avoid driver updates somewhat with Windows 10 Pro, but it's a lot of work and only temporary so you have to re-do a lot of work because the driver updates will keep popping up.

There's an interesting change you can make in Windows 10 to get a boot menu with Safe mode on the menu. It is not a secret especially, and apparently it's been there a long time. Anyone can do the changes, but it is technical in nature. Here's the final result. Just read on if you think it's worth it.

After making the change, the screen above appears just before a normal boot. I've made sure the default choice is Windows 10, and if no action is taken, it will boot into Windows 10 after a three second wait. The time-out is adjustable. I have three seconds to press a down arrow, and regardless what I do after that, there is no time-out. The truly interesting thing is that if the "Change defaults or choose other options" is clicked on you get the full system repair and troubleshooting. These options are normally accessed through a recovery flash drive or installation media.

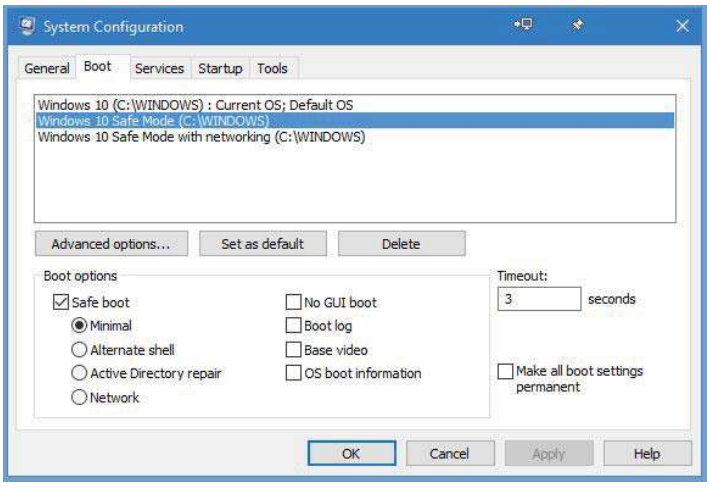


I've clicked around on the options and made some screenshots:



Safe Mode.....Continued on page 4

Safe Mode.....Continued from page 3



Here's how you add this menu:
Go into "System Configuration". This can be done several ways, you can search for "system configuration" or in the start menu type "msconfig" or right-click the start button, select "Command Prompt (admin)", and in the command line type "msconfig.exe" (all without the quotes). Click the "Boot" tab and here's what you get, except that you have only one entry, "Windows 10 (...) … Default OS" We're going to add the other two. Notice that the first, default Windows 10 entry is selected and that there are no Boot Options and that "Set as default" is greyed out because it's already the default and we want to keep it that way.

To add the second option, we need to go back to the "Command Prompt (admin)" and type the following: bcdedit /copy {current} /d "Windows 10 Safe Mode" and press Enter. Close out System Configuration and open it again to the Boot tab and you'll see the second "Windows 10 Safe Mode" entry. Select that and click the "Safe boot" option and then the "Minimal" button. Click on "Make all boot settings permanent" and click Apply. There's a lengthy message box with dire warnings, so just read, worry a bit and click.

Now we need to add the third menu item. Repeat the last steps except you want a different description in the command prompt line: bcdedit /copy {current} /d "Windows 10 Safe Mode with networking". Then close and open System Configuration, select "Windows 10 Safe Mode with networking" and click "Safe boot" under "Boot options" and click the "Network" button. You can change the time out from 3 seconds to something longer, but not shorter. Again, click on

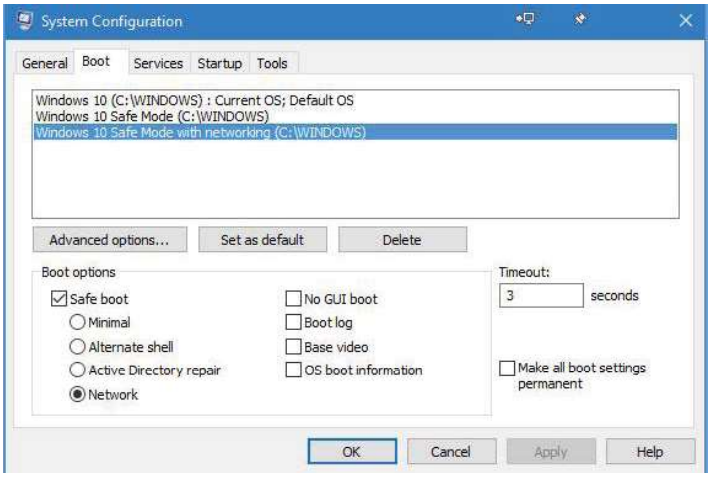
Safe Mode.....Continued on page 6

Internet Picture of the Month

How to get hummingbirds in your garden

From the Old Farmer's almanac, founded in 1792, at the link: http://www.almanac.com/content/plants-attract-hummingbirds They tell you what plants attract hummingbirds and provide facts about hummingbirds, such as: "They are the tiniest of all birds, weighing less than an ounce and measuring only 3 inches long.

Comments.....Continued from page 2



Porting an app or writing one from scratch for iOS (iPhone and iPad) is more difficult, at least for me, than for Windows or Android. And once you have it written and working with no obvious bugs, having tested it on the various OS simulators, an actual iPhone and an actual iPad, there is the problem of jumping through all the hoops necessary to finally get it in the Apple App Store.

As I write this, I have the newsletter app, *Computer Group Newsletters*, running on my iPhone and iPad. The most difficult thing was figuring out how to display a pdf file on an iDevice so that you could pinch and zoom it. But with the help of the Internet, I got that done. It was considerably easier on Windows and Android. I will test the app on my iPhone and iPad for several days before submitting the app to the store.

Comments.....Continued on page 6

Safe Mode.....Continued from page 4

"Make all boot settings permanent" and click Apply.

Be sure to use the Command Prompt (Admin), because the changes won't work otherwise. Be sure to select each option in turn to make sure the options are correct and make doubly sure the Windows 10 first entry is the default. It says so and also the "Set as Default" is greyed out and when you click on each of the others it isn't greyed.

I really like this. I'm not sure why it hasn't been talked about or even considered common knowledge. At worst, it's a three second delay on bootup and that may annoy some, but I don't notice it. The access to the system recovery and troubleshooting was a complete surprise to me and I'm really pleased to have it.

I discovered it quite by accident when I was researching a problem with a friends computer. The article I found has several very useful tips including "Enable System Restore", something I have written about myself. Enabling system restore should be number uno on all new installations. I think this boot menu should be on the top 5 at least.

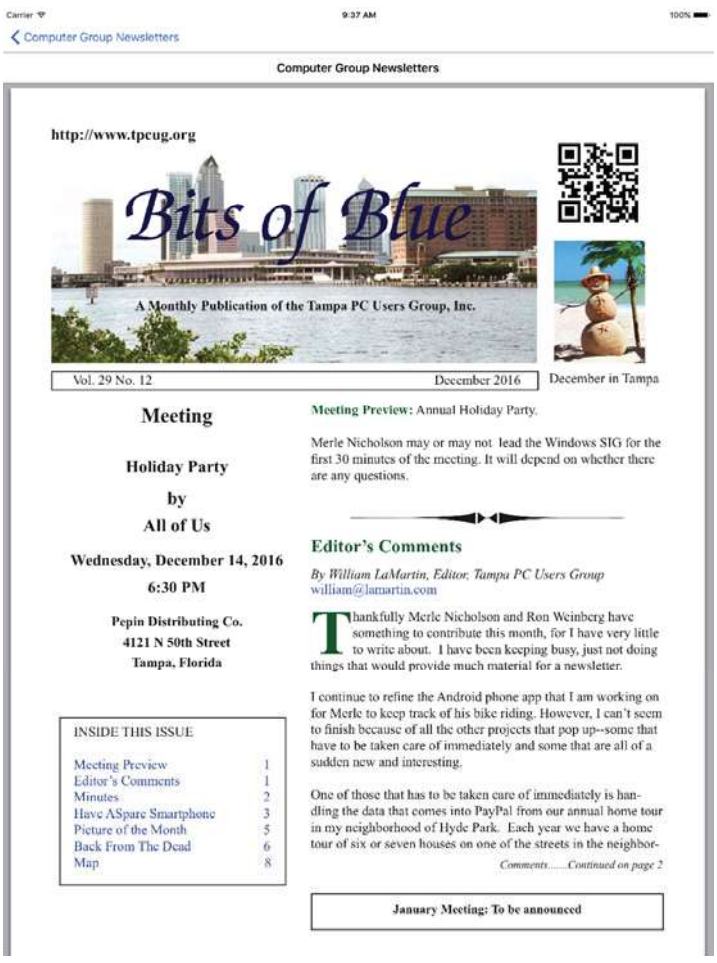
See
http://www.itpro.co.uk/operating-systems/25802/15-windows-10-problems-and-how-to-fix-them-5 ◆

Comments.....Continued from page 5

The following screen captures from the iPad Pro simulator will demonstrate the appearance of the app.

What you see in the first image below is the app's opening page scrolled down through 330 newsletters to the latest one, December of 2016.

Perhaps I should have ordered the newsletters in descending order by date so that the most recent newsletters were at the top. However, the current order may be the best if you are interested in reading about the early days of the group. And I think that is one of the main values of the app. It allows you to read and recall what was happening in the PC world in the late 1980s and early 1990 when so many exciting things were occurring. At least they were exciting for me, having purchased an Apple IIe in 1984 and a Gateway 2000 IBM close in 1991, after which I soon joined the Tampa IBM PC Users Group, as we were then named.



Comments.....Continued on page 7

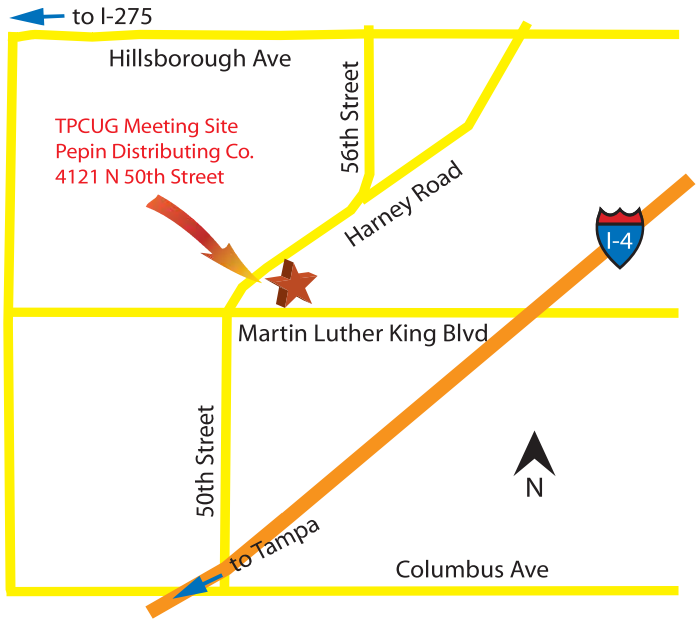
Comments.....Continued from page 6

When I read one of the old newsletters, I am amazed at how much I have forgotten. Just choosing the December 1995 newsletter, the first one with which I had anything to do, the article titles are fairly familiar, being Street Atlas USA, Adobe Photo Shop and Lotus Smart Suit for OS/2. That last one may be a problem for some. Do you recall Lotus? Do you recall OS/2?

Go to the next newsletter, the January 1996 issue. Do you recall Syncware Fill, Photo Works from Seattle Film Works, Zip Explorer., Partition Magic or Impos/2. The only one you probably recall is Partition Magic. And a reading of the many more old and older newsletters will show you how much you have forgotten. Just try to recall how many personal computers you have owned in the past 20 or more years; how many different operating systems; how many peripheral devices, etc.

The image below is of our most recent newsletter being displayed in the iOS version of the app that I hope to have in the Apple App Store within a week.

The final image below is of the search page of the app, where it is displaying the results of a search for the word Microsoft and claims to have found 1394 instances of it. The first instance found was on page four of the March 1989 newsletter. The results for the newsletters before December 1995 will not be as complete as those after since for those early newsletters. I scanned them into Adobe Acrobat from paper copies and then ran optical character recognition on them. I next used a feature of Acrobat to extract the text from each page of those newsletters and used that to build the searchable index. Since the OCR was not 100% accurate, the index for those early newsletters will not be 100% accurate. For newsletters from December 1995 onward, the searchable index should be totally accurate with the exception of hyphenated words in the articles.



Once I get the iOS version finished, there will be a version for all three different platforms. Go get one. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Thanks to Merle Nicholson and Ron Weinberg, I do not need to write much this month, which is good since I don't have much about which to write. The TPCUG newsletter app, *Computer Group Newsletters*, was accepted by Apple, so now you may view it on your Windows 10 device, your Android device and your Apple iPhone or iPad.

At first it was rejected (Apple is always looking for something to use to reject an app, it seems). Their reason was that an app was not needed to view the newsletters; All that was needed was a browser. That would lead you to think that they had gone to our website and noted that all the newsletters back to 1988 were there to view. Given that, in their opinion, my app added nothing of value.

I thought about that for a few minutes, a bit hurt since no one likes to be rejected (Google and Microsoft didn't reject the app). Then I formulated a response, which basically pointed out

Minutes of the January Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. Merle Nicholson, the SIG moderator introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees.

For the first meeting of 2017, the agenda was a business meeting and Windows SIG. John Witmer, president, led the meeting, and he and the members present discussed a variety of subjects mostly having to do with the future of the club and its newsletter. The slate of officers was informally discussed and opened to new officer volunteers. None forthcoming, it is assumed that the current slate will continue for 2017. The officer list is published in this newsletter on this page. Doug Mullis, treasurer, supplied a financial sheet and the 2017 budget was discussed.

After some discussion, it was resolved that members in good standing as of December 31, 2016 will have their membership dues waived when they renew in 2017.

Some other observations were discussed: The current location and accessibility of the club PO box; obtaining speakers monthly; the difficulty of obtaining original newsletter articles, and the somewhat unlikely possibility of reducing the newsletter to four pages. ◆

Comments.....Continued from page 1

that the app did provide one very import thing that a browser could not do: Using the app, you may search for a word or phrase over the entire collection of newsletters from 1988 through 2016. And I provided a couple of examples of doing such a search. Apparently that impressed the reviewer since in less than an hour, I had a message indicating that the app was on its way to the Apple App Store. ◆

Changing Providers

By Ron Weinberg, Member-At-Large,
Tampa PC Users Group
rswjbr@verizon.net

Since December 2009, when I switched From Bright House Networks for TV and Internet services to the newly introduced Verizon FIOS fiber service, at their attractive introductory price, I had been satisfied with the products and service, but not customer service which was at times problematical.

I had a bundled package deal which included my long time Verizon land telephone line.

Over the intervening eight years cost of the services had been inching up to becoming burdensome,
too costly for the value received. My obligatory signing contract had long since expired.

It was time to try and do better. Actually, I attempted to negotiate with Verizon just at the time they were selling to Frontier and timing was poor. After the transition was completed and several months had passed to allow the new company to formulate their own prices and policies, I began again to request a price reduction.

I have been receiving excellent introductory offers in the mail from Dish Network for TV, Bright House offers and more recently a complete package from AT&T Direct TV, including Phone and Internet. Dish and Direct TV are satellite systems, and I prefer to keep a wired system.

I had been warned by the experiences of others that switching from Verizon to Bright House for whatever reason was difficult and troublesome. Recently, Bright House was purchased by Spectrum, a much larger company.

Spectrum, new to the area, obviously wishes to increase their customer base and has offered a very attractive introductory one year new customer plan for full-featured TV, Internet, and Voice (Phone) service. At the time this article was created, Spectrum's introductory offer was valid until Feb. 2, 2017. It may be extended or other offers may be available.

Armed with the competitive information, and not limited by a contract, I contacted Frontier several times and threatened to cancel their services unless they could offer me a substantial price reduction. I was transferred to their "Retention Dept." to negotiate. Their initial quotes were not sufficiently improved. Each time I called I had to deal with a different person. The third or fourth call which I had hoped to be my last and final was handled by a person that seemed new to the job and quoted me higher than the previous despite the fact that the earlier quote was supposed to be in my record.

At that point, I concluded it was time for a change, and decide to take a chance and signed up with Spectrum. I had to pay the first month in advance but there was no contract and a 30-day money-back guarantee. Installation was scheduled for the following week with telephone number porting expected to take several additional days.

It should be noted that Frontier, as did Verizon, continues to have an excellent new customer offer which they refuse to give to existing customers. Also, Spectrum has a conditional limited offer to buy out your existing contract.

Specific costs for Frontier and Spectrum bundles are not listed as each subscriber may require different equipment such as number of set top boxes, etc. Taxes and fees are much lower on Spectrum since Frontier is taxed as a traditional land line carrier.

Since Verizon had transferred email address routing to AOL it does not appear that it will be necessary to replace the Verizon.net address.

FIOS Internet Speed was billed as 15/15. Speed tests showed approximately 25/16 Mbps. Spectrum quoted 100/10 and after the installation various tests showed speeds from 71 to 94 download and 12 upload using wireless, a distinct improvement.

On Friday Jan. 13, I prepaid for the month through Feb. 18. The installation was scheduled for Wednesday Jan 18. Since there was no access to the connection box in a neighbor's yard, installation was delayed to Jan 19. Completion took about 1½ hours. The Installers were subcontractors, not Brighthouse workers.

The Installers left leaving only the Router's SSD and WEP Password. They provided no setup or instructions other than making sure all TVs were operational.

After the installation was completed I observed that contrary to my expectations, external wiring was run along

Changing.....Continued on page 4

Changing.....Continued from page 3

a neighbor's fence for expediency rather than buried for protection and security. I have requested that this be corrected. A service call to bury the cable has been scheduled.

As of the first evening, outgoing calls could be made; incoming failed while waiting completion of porting from Frontier. Porting was completed by late afternoon Jan 20, restoring incoming phone service. At that time, I called Frontier to cancel their services. The representative offered additional inducements to stay, but it was too late. Those inducements should have been offered by the retention department.

Here are the pros and cons of this changeover.

Con:

- Phone, TV, and Internet are all passed through the telephony gateway (router). If it fails or loses signal, all is lost.
- There is no power backup for the telephone line. (Charged cellphones serve as our emergency backup.)
- A battery backup for telephone while not supplied, is available at extra cost.
- There was no customer service follow up after the physical installation.
- Little information was provided as to features making it necessary to call support for every question. MoCA is not supported by Spectrum at this time and is deactivated in the Router. I was able to substitute a wireless connection for the one location it was used.

Pro:

- Phone, Internet, and TV are performing well. TV picture quality is excellent.
- Telephone service is full featured, unlimited, and includes US, Canada, Mexico, and Puerto Rico.
- Digital adapters on two TV sets were replaced by full featured set top boxes, at lower cost.
- Installation was on schedule and brief with minimal inconvenience.
- Internet speed was greatly increased. Total cost is significantly lower.

My years of IT experience reduced any difficulties caused by the lack of customer service to fully complete the installation by providing guidance to the new customer. A layman or average customer would have had greater difficulty. The changeover appears to have been worthwhile for our household. ◆

Windows 10 essentials

By Merle Nicholson, secretary, Tampa PC Users Group
merle@merlenicholson.com

If you're not aware, Windows 10 is evolving. Two major "updates" have been issued – 1511 and 1607. I've seen several major changes to the installation procedure; not just cosmetic changes like to the Start Menu. With some updates, you'll find that some of the settings changes you have made have not been honored and have been set back to the default, all without notification. Another large change ("Creators Update") is essentially completed and due this spring.

I've had several Win 10 computers come to me that were essentially broken – unusable (unbootable) after updates were made. I've spent two to four hours getting them restored to working condition. In one case, the system restore could not repair without wiping out the disk so I had to remove the hard drive, mount it on one of my own systems and copy all the user files I could find, then let the system replacement work and return the files. Looking at internet forums for solutions to the problems I've found, I see that the same problems are not uncommon. None of the repairs I've done could be explained and are certainly not the result of owner mishandling.

One thing all these broken computers have in common is inadequate backup. No repair flashdrive, no image backup, no file backup, no accessible Safe Mode. The fault really falls on Microsoft because they do not even attempt to inform the user of the essential steps to be safe. I'm particularly apprehensive for the millions of casual users who really need an internet/mail/messaging/streaming/word processing appliance and have no interest in learning settings and fixes, antivirus and more software. Most would be much better served with Chromebook, Ubuntu, Android tablet and even maybe iMac, in that order.

To Microsoft's credit though they have made restoring the operating system back to "factory" condition fast and pretty easy. There are but two options, one pre-

Windows.....Continued on page 5

Internet Picture of the Month

Robotic Barista

From the Wall Street Journal, http://wsj.com, at http://www.wsj.com/articles/robot-baristas-serve-up-the-future-of-coffee-at-cafe-x-1485781201, we have : "Cafe X's [which is in San Francisco] barista robot uses a six-axis Mitsubishi arm to grab cups, get them filled at an espresso station, then serve them to customer." It appears that one more job for college graduates without a marketable degree is about to be eliminated.

Windows.....Continued from page 4

serves your user files and the other does not. Neither though preserves any programs you have installed and of course all the settings will be at default, your accounts lost, all your email to set up all over again. For a "mature" installation it may be a week to get back where you were or maybe never. All this can be largely avoided by making an image backup. Image backup is not a part of Windows 10 backup, but it's there left over from Windows 7. It's left to the user to find it provided he knows it even exists.

To have direct access to the system repair programs you need one of two things - a system repair flashdrive or access to Safe Mode. Actually you need both. I wrote about how to revive Safe Mode in last months Bits of Blue January 2017 issue. I used it to reinstall Win 10 from scratch on one of my own systems, and it works quickly and it even did the major updates. But to use Safe Mode for repairs means that your hard drive boot record is not damaged. So Windows can be broken but not 100% broken. For 100% broken you need a repair flashdrive.

I said that I recently did a complete system replacement. It was to a Virtual Machine that I had nothing invested in. It was an upgrade from Windows 7, then

Windows.....Continued on page 6

Windows.....Continued from page 5

8.1 and then 10, and I had some confusing software testing to do and decided I needed a clean Windows 10 machine. It was surprisingly quick and it installed the latest version – 1607 and it powered up with the original licensing activated intact.

Windows 10 installation is somewhat different now. Early on, be sure to select "customized" settings so you can turn all the security and telemetry settings off manually. And I do mean ALL OFF. I have found no advantage – absolutely none – in allowing any of the security and telemetry to go through. If you find something you need later, they're easy to find in "Settings," "Update and security."

The installation or repair process still makes it difficult to recognize where to create a local login account. It really looks like you must create an on-line Microsoft account to continue. There is no need to and no advantage to do that. Just don't enter an existing account or create an account – click on the other things and you'll find a panel that asks who will be logging on, two password fields and a password hint field. This isn't an extreme or angry response. It's simple. If you were on Windows 7 and you had a pop-up from Microsoft asking for the login and password to your computer, would you give it to them? I Don't Think So! Will they promise to keep the private login to your computer safe from Russian hackers forever? Don't think so, Dude.

So, it seems appropriate right now to again publish a list of essential settings to improve your odds of surviving a broken OS. For instructions on each, you'll have to read my previous TPCUG articles, July through September, 2016. If you want to download them, just go to http://www.TPCUG.org, look in the menu for past newsletters. Also you should get LaMartin's *Computer Group Newsletters* in the Microsoft App Store. The articles are in PDF form so all the links are live, making it fast to go to instructions. You will need a Microsoft account to get William's app, but you do not need your computer to be logged into a Microsoft account. Be very careful though, it's easy to be fooled into allowing the store to hijack your local account and replace it with a Microsoft account. I've written about that in July newsletter, page 7.

Essentials:

1. Fix your login accounts. Activate or create a local Administrator account and for daily use, employ a standard local account. There's no real disadvantage in doing this. The worst case is if you install something using a standard account it will ask for the administrator's password. This will prevent most malware from installing on your system without your permission. Under no circumstances should a Microsoft on-line account be an administrator account. That would be crazy.
2. Activate System Protection, System Restore, create a new restore point.
3. Fix the Boot into Safe Mode. See January, 2017 newsletter article.
4. Fix restart to BlueScreen
5. Manage Microsoft Updates (Win 10 Pro). Do your best with Windows 10 if you don't have Pro.
6. Disable as much Microsoft telemetry and forced advertizing as possible.
7. Disable Remote Assistance. Search for "Allow Remote Access", and if you have Windows 10 Pro, disable Remote Desktop.
8. Create a Recovery Drive. Use a USB flashdrive; 8GB will allow system files to be written to it.
9. Create a Backup Image. Search: "Backup and Restore (Windows 7)". Use an external USB backup drive for this. Look at how much disk is used. Get USB3 if your computer has USB3 ports. For myself, I use Acronis, Tools, Clone drive to an external SSD for each of my computers. This gives me a complete alternative drive to boot from with no image restoration to go through.
10. Make a new Image backup regularly, replacing the old. How often you do this depends on how much your system has changed. Keep a log so you can look up the last backup date.
11. Use backup software to back up data. The Windows 7 backup program is still as good as it always was. Others: Acronis and Caspar. Windows 10 has "File History"
12. Check your network connections. My last new installation defaulted my network profile to "Public" which prevented file and printer sharing. It

really confused me how to change it to "Private". I wound up just joining my HomeGroup, something I usually don't think of doing. That freed up whatever was stuck.

Options:

- Disable One-Drive if you're not using it. The latest updates make One-Drive real nagware. By default it's running all the time and synchronizing files on your computer. Unfortunately the fix is pretty technical. Chances are if you're an Android Phone user you're using Google Drive which works excellently with Windows 10. See http://lifehacker.com/how-to-completely-uninstall-onedrive-in-windows-10-1725363532
- Install Google Chrome browser especially if you're also an Android Phone or tablet user or Linux for that matter. May as well, it's become the most used browser in the world anyway. Google Earth and Google Maps are unparalleled. I share

documents and spreadsheets among all my devices and spouse's Ubuntu computer and Android phone. My documents and spreadsheets are edited in Google Docs in Chrome browser.

- Get LibreOffice. You don't need Microsoft Office unless you have a free copy or need MS Access or Publisher. Don't be fooled into believing the old term "compatibility" which disappeared with the term "IBM Clone". LibreOffice reads and produces all file formats and it's free. It's much easier to use than Office for the casual user and yet does all the esoteric stuff that mostly never gets used. http://www.libreoffice.org/ Microsoft themselves have had to make the most changes to make Office files compatible with Open Standards, so there's just no issue anymore and hasn't been any for many years. ◆

Thanks to Merle Nicholson and my purchase of a little camera, there is something to fill the newsletter this month. But I can't purchase a new item each month to have something about which to write. So, some of you need to step forward with your computing experiences.

You might ask, what has a camera to do with computing. Well, a modern digital camera, just like your modern car has a lot of computing going on inside. You cannot begin to imagine all the things that happen when you press the button to take a photo. Then, when you download the digital images to your computer, you typically use a program such as Adobe Lightroom or Sony's Play Memories Home to both download the images and to also organize them. Next, your modern darkroom is software such as Adobe Photoshop or the simpler Adobe Photoshop Elements. Finally, in my case, I use Adobe Premier Elements to either edit and combine the movies from my movie cameras or to turn my still images into videos for easier viewing. It is so nice to not have to purchase film and mess with photographic chemicals. Don't forget to view the newsletter online to better see the photos. ◆

merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. Merle Nicholson, the SIG moderator introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees. This month, there were questions about Outlook.com, losing contacts in Windows Mail, Facebook security and a discussion about the current on-line live session on the APCUG website.

Our own longtime member Brian Lance gave an interesting talk and demonstration on video conferencing using Google Hangouts with some discussions on Verizon services, set top boxes and DVR. Brian used a prepared slide show and demonstrated a Brian-to-Brian conference from the outside hall. It was an informative and interesting demonstration after which we discussed if there was a better way to do Android connections to the big presentation screen. ◆

Me vs. The Computer

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

My first personal computer encounter was in 1976, five years before the release of the IBM PC model 5150 in 1981. It too was an IBM, but the model was 5100. Mine (I'm calling it mine) was bought by my company for the engineering department, and the director of my department at the time really did not know exactly what it was to be used for. He just hoped that it would be useful – and eventually it was. How he was able to sell his own management on a $20,000 machine he really couldn't

Amazon Echo

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

My birthday was in February, and my son thought I needed a new toy. He gave me an Amazon Echo. The Echo is a voice-enabled device that connects to the Alexa voice service via a wireless connection. Merle Nicholson tells me he has had an Echo since 2015, but I don't recall an article.

The voice service Alexa is similar to Microsoft Cortana and Apple Siri. It is a personal digital assistant. The Echo simply sits on your desk, or wherever you wish to place it, and responds to your commands. You bring it to life by saying "Alexa." When it hears that word, a thin blue ring with greenish trim lights around its top, as pictured on the right, and it awaits your request.

Once you bring Echo to life, you may ask it the local weather, or you may ask for the weather in any other city. It does a good job at that. But when I ask about nearby Chinese restaurants or about nearby Italian restaurants, the results are not so good. It provided non-Chinese and non-Italian restaurants and some of the addresses were many miles away.

It does better with playing music. It knows who Chopin is; also knows Rachmaninoff. So it is up on the Classics. It even suggested another classical music station after hearing my two previous classical requests. However, asking it to play some Dixieland music produced the response. "I can't find Dixieland songs." But it knows Louis Armstrong and Scot Joplin. Merle Nicholson tells me that Alexa knows performers better than composers or musical genres.

It will also read you a book – if it is in your Amazon library. I asked it to read to me from the *Sound and Fury* by William Faulkner. The response was, "I can't find the *Sound and Fury* in your library." However, when I ask it to read from a book that I have in my Kindle library, it gets right to the task, beginning at the start of the book. I am not sure at this point if you can make it move to a different place in the book.

If you ask for the latest news, you get the news from National Public Radio from tunein. Alexa also knows that Bob Buckhorn is the mayor of Tampa, and it knows what the current time is. I had no luck in asking it for recipes for various dishes. But it knows how many kilometers are in a mile. It doesn't understand the question: "What Florida county is Tampa in?". Perhaps I needed to rephrase it.

It supposedly can access your calendar and contacts, but not my Microsoft Outlook calendar and contact info. I believe it has to be Google's gMail and Calendar.

There is an Alexa app for both Android and iOS. If you go to that app and set up your commute, then Alexa can tell you about traffic conditions for that commute. A handy feature for me is setting up alarms and timers.

If you have the appropriate interfaces for your lights, appliances, etc. in your house, you may use Alexa to control them via voice commands.

In theory, the Echo could record everything you say, but Amazon says it only pays attention to what is prefaced with Alexa. ◆

Sony RX100 V

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Obviously the Sony Cyber-shot RX100 Mark V is not a computer in the normal sense of the work, but it is really a computer, as are all modern digital cameras. If you know me you might ask, "Why do you want such a 'toy' camera when you have a very serious Nikon D800 Digital Single Lens camera?" The Nikon does indeed take very good photos (when I don't muck things up). But it is large, heavy and intrusive. I wanted something that I could slip in my coat pocket, or even in a shirt pocket.

Of course, everyone now uses their phone as their camera of choice. And a modern smart phone takes quite good images, my Microsoft Lumia 950 XL included. I imagine that most of the photos you see on the Internet are now taken with either iPhones or top-end Android phones. But that is not good enough for me. One thing phones fail at is low-light photography, and this camera does quite well at that. You can take the ISO up to 12,800. However, I recall reading that the quality of the image is degraded (noise) a good bit after you go over 6,400, I would never use such a high ISO except in essentially nighttime conditions.

The camera takes 20 mega pixel images and has a one-inch sensor (13.2 x 8.8 mm). The images are 5472 x 3648 pixels. Your most recent iPhone is, I believe, 8 mega pixels with a 1/3 inch sensor (4.8 x 3.6 mm). Quite a difference. Just for comparison, my Nikon D800 has a full frame sensor at 36 x 24 mm and creates 30 mega pixel images of 7360 x 4192 pixels. The Sony also has a 35 mm equivalent 24mm to 70mm optical zoom of 2.9 times. Not a big zoom but OK (I have read that the larger sensor makes it more difficult to have a large zoom).

Oh, I almost forgot my main reason for purchasing. The dimensions are 102 x 58 x 41 mm (4.02 x 2.28 x 1.61 inches). That is width, height and depth. The second image on the right displays its width and depth with the lens retracted. It will fit easily in your shirt pocket. The weight is 10.99 oz. For its safety, I use it with the included wrist strap.

In the top photo above, you see the camera with the lens in shooting mode and the built-in flash and the built-in electronic viewfinder extended. There is an LCD screen on the back that can be put in various positions, but when you have bright sun, the viewfinder is a real plus.

Ever tried to catch an action photo at just the right moment? I have when trying to catch the small cannons being fired and thus emitting smoke. The only sure way to do it is with having your camera fire multiple shots. I believe the Nikon D800 will do 10. The Sony

Internet Picture of the Month

The Jose Gasparilla

From TBO.com at http://www.tbo.com/events-tampa-bay/gasparilla-parade-an-expensive-affair-but-not-for-taxpayers-20160128/. Described as a Tribune File Photo with the description "The Jose Gasparilla approaches the Tampa Convention Center during The Gasparilla Invasion". It happens every year on the last Saturday in January.

Camera.....Continued from page 4

RX100 V will do 24/second until its buffer is full, which will last several several seconds.

There is a good and detailed written review of the camera at https://www.dpreview.com/reviews/sony-cybershot-dsc-rx100-v-review

For a video review of the camera on YouTube, that has many details, go to https://www.youtube.com/watch?v=GcNa_eFTzkk

For a video review without all the small details, go to https://www.youtube.com/watch?v=oPKF_DAdsgU

I am finding it a great camera. There is so much photographic power packed into the very small package, not much larger than a pack of cigarettes (recall those things?) when the lens is retracted.

The Rx100 V, where the V stands for the fifth iteration of this camera, can also take videos and stitch together short panoramas. On page 7, the large photo of bread and wine was taken using available light in a restaurant, a task that was previously assigned to my phone. The camera works extremely well in low-light

Camera.....Continued on page 6

Camera.....Continued from page 5

situations where a flash might be considered intrusive. And, I actually prefer the no-flash available light photos to those taken with a flash most of the time.

The photo at the bottom of this page is a stitch done by the camera as I panned it around my living room; it is 8192 x 1856 pixels in dimension.

On page 7, the flower photo was taken in bright sunlight from just a few inches. The camera will focus down to around two inches. The image below that is another of my restaurant photos taken in available light.

I have yet to mention videos, and the RX100 V does a very nice job on those also. In fact, I have a hard time differentiating videos made with it and those made with my much larger Sony HDR-CX900 HandyCam video camera. I recently took still images with my Nikon D800 DSLR and video images with the Sony HandyCam and the new Sony RX100 V. Go to my website, http://www.lamartin.com, select the Video menu item and then scroll down to the Gasparilla in

Camera .....Continued on page 7

Camera.....Continued from page 6

Hyde Park subheading. There you will see four Gasparilla 2007 videos, two each for the races on day one and day two. For each day there are two videos: One video is made of still images taken with the Nikon; the other video is actually made from movies taken both with the Sony HDR-CX900 HandyCam and the new Sony RX100 V. First off, all the slow motion segments interspersed through the movie video were made with the RX100 using the High Frame Rate movie setting. But I challenge you to identify which camera was used to take the other normal speed video segments.

My only complaint about the camera is that it has a very extensive and complicated menu system you need to master if you want to use any but the most basic settings. Oh, the price? You won't like it: $1,000. And you really need to purchase an extra battery since it literally eats batteries. But, it fits in a shirt pocket and gives far superior photos to any phone. ◆

Computer.....Continued from page 2

justify is beyond me. That's $86,000 in 2017 dollars for a computer that couldn't do one hundreth of the calculations of a new smart watch today.

If you want to know more, Wikipedia has good articles on both the 5100 and of course the 5150 with pictures. It makes good reading.

Below is what it looked like. On the left is a 5-inch screen and on the right is a precision tape drive. It was called a "Portable Computer" even though it weighed 50 pounds, and you could even buy a fabric case for it.

We also had a robust dot matrix printer, and eventually we bought a second external tape drive and a small B&W monitor to ease the eyestrain from that 5-inch monitor. Other than that, it had no connection to the outside world. If you had external data you typed it in.

This was a 64K machine, and it was very much more powerful than the typical IBM PC of five years later. It had ROM with the language interpreters on it – mine had two languages, BASIC and APL.

Employees of the department were invited to look at it, time permitting, and to try it out and then go through very long and tedious programmed instruction tapes that taught the programming languages step by step. I started them as did others. Most of the interest was in APL programming, and I believe that the

Computer.....Continued from page 7

instructions were very thorough. Some people made it all the way through the tapes, some even quickly, but most were ultimately unable to convert that to a real program that did something useful and gave up. I was slow at it and sometimes frustrated, and I thought I had failed, which at the time put me in a sweat. I was 35 at that time and I couldn't admit to anyone that I couldn't do it. Finally, well before I could finish the tapes, something just clicked in my brain – I got it – and from that point on I just looked up things I needed in the excellent programming manual. And, from that point on for another six or seven years, that computer was mine.

As an aside, the APL language is still very much in use. I have a 2017 version of it, completely modernized and it's available on virtually any computing device including Raspberry PI. ◆

Minutes of the March Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. Merle Nicholson, the SIG moderator introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees. This month, there were questions about network sharing and browser details.

Our own TPCUG member Michelle Burgess gave an interesting talk and demonstration on video conferencing using Apple Facetime. Harry Lockaby was attending with his Apple Mac Air notebook and served as a conferencing partner. Michelle was using a Mac mini and the room big screen as the only monitor. After the demo, Michelle went on to describe her attendance at a General Motors Hackathon and showed some of the possibilities of connected apps being considered for autos. Our thanks go to Michelle for an informative and interesting demonstration. ◆

Comments.....Continued from page 1

Windows 10 will get the Update first." Personally I am in no rush since much of what I do on a computer does not involve what all the new features address. But there are some interesting things there regarding inking, for example. One of the more impressive things I saw in the demonstration of inking was: You draw a route on a map, and then Microsoft will tun your drawn route into an actual route with all the information usually associated with a route. The Edge browser will now be able to read your eBooks and display YouTube videos in 4K. I expect everyone to have the Creators update by our May meeting and for someone to give a demonstration of using the new features. Any volunteers?

Comments.....Continued on page 6

New 4K Computer Monitor, Three Weeks Later

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

A new 27" computer monitor has been a big change for me. It's been mostly a good experience, but there are some considerations that suggest that it may not be an entirely wise move. I'll try to explain.

For those not familiar with the term "4K", it's a very high resolution monitor that's four times the resolution of a "standard" 1080 monitor. That is, vertically and horizontally it's doubled. A 1080 monitor is 1920x1080, and a 4K is 3840x2160. Pixels, that is, dots on the screen.

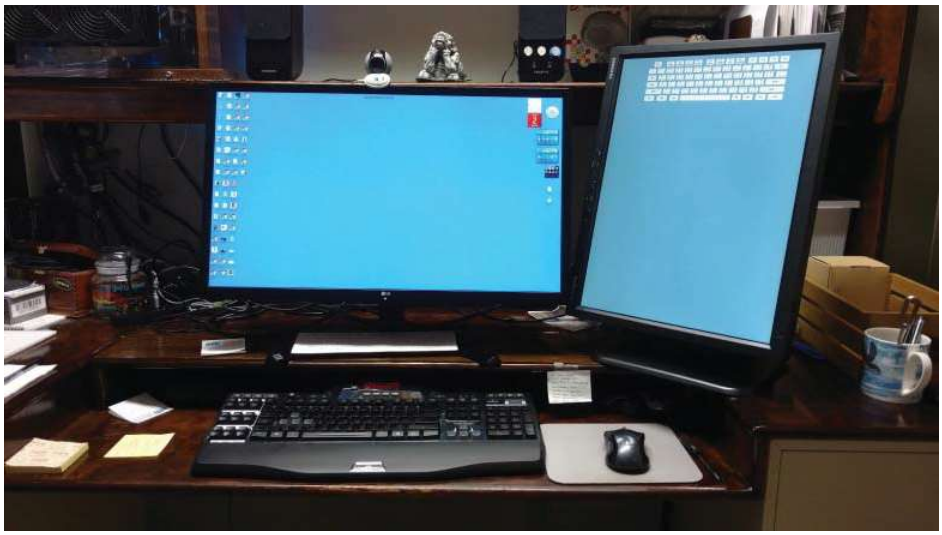
A little background about the 1080 standard first. We have television to blame for 1080. We needed a digital flat screen for television use for years and years, and we just had to put up with CRTs long after digital was technically possible – we had digital monitors in all sorts of sizes until the (mostly TV) industry decided on a standard. The standard was necessary to move on and scrap the 1930s CRT technology. It stood to reason that the TV standard would be duplicated in other products, not the least for computers, and that happened without question. If you'll look at good quality monitors right now, the 1080 is by far the least expensive and, because of the sheer numbers sold, is pretty much the standard consumer monitor.

In the meantime, computer technology has bypassed the need for standardized monitor sizes and resolutions; the 1080 remains on the least expensive computers. But there are a dozen or more resolutions that are common.

We bought a 55" 4K TV more than 2 years ago for use as our only TV in the household. Its TV comes from a cable tuner in a computer that serves as a large capacity DVR. So we have a lot of experience with the standard. In our minds, we knew the clarity of the 4K screen will be so dramatically improved that I would thoroughly enjoy the change on my desktop computer, and that is mostly true.

The tipping point on the decision to replace my perfectly good flat screen monitors was price. Amazon hit a low of $330 one night as I was checking almost daily and clicked on it. It's at $428 today and $377 yesterday. That night, I bought an LG 27UD58-B 27-Inch 4K UHD IPS Monitor. It replaces two 1600x1200 21" monitors that I bought in 2005 for about $550 each. That's $1,372 in today's money for both.

Surprisingly, there are very few suitable 4K monitors made. Amazon has just eight, and half of those are in the $600 range.



First, though, the hardware. To use this you need a video system that will handle 4K, and very few do. Mine did not. The newest, higher end computers largely do, but you can't count on it, check the specs. Look for 4K at 60Hz. I built my own system – you could say it evolved over many years, and I knew it wouldn't do 4K. I had two video cards that were just a few years old; I replaced one and kept the other only to discover that AMD video software wouldn't allow an old card to coexist with a new one, so back off the shelf it came and torn apart the second time to remove the second. The new card, a Radeon RX470 was $175. A DisplayPort cable (and an HDMI) came with the monitor.

OK, so let's see what I did. I replaced two 21" monitors placed side by side for a combined 442 square inches (17"x 13" x 2) with a single 4K screen 305 Square inches (23.5"x13"). And increased the pixels from 3,840,000 to 8,294,400. Oh oh, what have I done? Well, I made those 8.3 million pixels a LOT tinier.

I find it strange to look at Windows elements that small. All this detail is crystal clear and very sharp, but very tiny. Remember I have 8.3 million pixels. Now, Windows 7, 8.1 and 10 all have the capability to scale windows elements larger. If you look at Windows Display Settings, there is a slider that allows you to enlarge everything. Windows 10 offers to set scaling at

Monitor.....Continued on page 4

Monitor.....Continued from page 3

150% right off the bat. But think about it. My 8.3 million Pixels will then become an equivalent of 5.5 million. Well, that's one way to look at it, but remember those very, very sharp pixels are still there doing their job, and it's just spectacular. If you want to really get blown away, look at a high rez movie on Amazon, or even a relatively low resolution YouTube video . . well it's hard to describe. And worth it.

I finally settled for 125% scaling. In terms of how many useful, readable, windows of information I can get on the screen all at the same, it's a tremendous improvement. If you're just a one-application-at-a-time person, you'll still like it because of the clarity. If you're a programmer who needs four or five windows up at a time because you're referencing information between, it's a godsend. Sometimes I'll need to set the scaling back to 100%, and at least Windows makes that easy to do. I have a problem with a 14-year old Microsoft Office product Access 2003 that cuts off 25% of user windows when scaled. I attribute that to fate and the computer gods messing with me. Bill didn't know that would happen back in 2003. But my support for Access 2003 applications is slowly going away.

Now the downside(s). I have to be fairly close to the screen because of the size of screen elements, and that's ok for my eyes; I have computer glasses selected for that distance. But I really can't relax and tip back in the chair unless I'm watching a YouTube video. The previous arrangement with two 21" screens (18.5" x 2 full width) worked well, because I had both turned inward, each facing me. A 23.5" wide screen really needs to be curved, and I'd guess by the time I'm ready to replace this one they'll be readily available. Curved 4K TV screens are available, expensively, but none small enough for computer use.

Sometimes when I have a lot of detail on the screen I feel I must shift my body right or left to get the detail right in front of my eyes. I'm trying to not do that now that I'm aware of it. As I said, the previous arrangement had both monitors turned inward.

I've been discussing my primary monitors' replacement, but I really had four. There is one 1080x1920 monitor on my right, turned in portrait. I use this for help screens and PDF references. It's turned inward to face me. The fourth was a low resolution screen that I used rarely for spillover when I wanted my email and calendar up. I have abandoned use of that one now that I've increased my window area so much.

The side portrait monitor is invaluable, and I've been considering replacing that one with a 24" 4K monitor. The one I'm using now is one of the old ones of course and it has its problems that I've been struggling with. I finally convinced myself that the text is fuzzy and everything is scaled larger even though it should be at 100%. I have just done some research and finally found some Microsoft descriptions of my problems. It seems that even Windows 10 can't handle mixed resolutions well. That is, if you have a new high resolution monitor it works well but any second or third monitor that is older, lower resolution, you can expect that the display isn't sharp like it was (yep), and the scaling may be off (check!). And although Windows 10 handles multiple monitors much better than Windows 7 or 8.1, they acknowledge these problems and offer some suggestions that may mitigate, but not cure them.

Microsoft also mentions that some of the scaling problems have to do with the capability of the applications, and that those applications assembled as a Universal

Monitor.....Continued on page 5

Internet Picture of the Month

The island Hotel

In Cedar Key, Florida, a bit of old Florida. From Flickr.com, taken by Faye, whose photstream is at https://www.flickr.com/photos/sheffe73/. She has lots of interesting photos, but you will need a Yahoo account to be able to see more than just a few. My interest in the photo was that I stayed in that hotel just a few months ago and also many years ago. Go to Cedar Key. It is very relaxing and off the beaten track.

Monitor.....Continued from page 4

App (from the Windows Store) will scale fine and there's no guarantee that others will work. It's also a plug for Office 360 or Office 2016. But that jibes perfectly with my problems with Access 2003. One suggestion on older apps is to change the apps compatibility property. There's a setting "Disable display scaling on high DPI settings". I've changed my MSACCESS.EXE settings, and I'm still assessing the effect.

The only definitive solution is to use secondary monitors of the same resolution. Hence supporting my "need" to buy another new monitor.

Considering how relatively inexpensive they are and how much benefit, the only remaining problem is finding a home for my old ones. ◆

HDMI Cables with Ethernet

By Ron Weinberg, Member At Large,
Tampa PC Users Group
rswjbr@verizon.net

At our last meeting there was a dearth of information on the new HDMI with Ethernet cables that are now widely sold in anticipation of devices that have not yet appeared in common use. Here is a simple explanation of these cables.

In short, this feature reduces the number of Ethernet cables required in some networks, primarily home entertainment networks.

Both standard and high speed HDMI cables are available with Ethernet. These cables are backward compatible and serve as regular HDMI cables if the Ethernet channel is not used. Both ends of the cable must be used in enabled ports for the Ethernet channel to work.

Ports which utilize the Ethernet feature may be marked HEC (HDMI Ethernet Channel enabled). The use of that mark is optional to the manufacturer of the device. When purchasing new devices, as with any new feature, it would be advisable to check product specifications and or user manual to determine if the feature is included.

Here is the basic information and diagrams obtained from the HDMI.org website.

HDMI Ethernet Channel

HDMI Ethernet Channel technology consolidates video, audio, and data streams into a single HDMI cable, combining the unmatched signal quality and convenience of HDMI connectivity with the power and flexibility of home entertainment networking. It incorporates a dedicated data channel into the HDMI link, enabling high-speed, bidirectional networking at up to 100 Mb/sec. ◆

Comments.....Continued from page 2

Hijacked

Read this closely so that you won't fall for the same trick. Although I am not at all sure that I fell for any trick. But here is what happed to me just a few hours before I sat down to write this.

I was using my other desktop computer to work with Visual Studio 2017. I was working on what is known as a cross platform app, that is one that uses Xamarin from within Visual Studio to create a solution that has four projects: A shared project, an Android project, an iOS project and a Windows Universal project. The idea is to put as much of your code as is possible into the shared project and then for anything that has to be dealt with specifically for the separate operating

Comments.....Continued on page 7

Comments.....Continued from page 6

systems, such as saving images to the device or sending email, you put the code required by the separate operating systems into the three separate projects

Well, Xamarin is still a bit new to me, even though I have been using it for over a year. So I have to search for how to do certain things using Bing or Google. In this case I was using Bing and had put in a search regarding tapping on images.

And here is where my memory is not perfect. I recall there were a number of links returned as results. I then clicked on one, and I don't recall if it was the first link I tried or the third. Anyway, I clicked on one of the links provided by Bing and was presented with a web page in Edge that had what appeared to be a large yellow popup saying that FLASH was required to view the page. And here is where my memory fails me. I don't recall if I clicked on the x in the upper right corner of the popup to close it or it closed automatically. Anyway, all Hell broke lose with loud audio telling me not to close the web page or I would lose all access to my data; that all my contacts were being sent to some site along with my Facebook contacts (none of which I have); and some other threats that I don't recall. I was supposed to follow the instructions on the screen to make a payment to be able to access my data again.

I stopped paying attention to the verbal instructions since I felt that I really needed to get Edge closed and was pretty sure that the problem was restricted to Edge and not the entire computer. Edge could not be closed except via the Task Manager, which I did. Foolishly I then reopened Edge with the result that all of that talking and threatening was presented again. So I again used Task Manager to close Edge.

What to do? I opened a different browser, FireFox and did a bit of searching and came up with a page about the Edge browser being hijacked. I had not used the word hijacked, but that is exactly what had happened to me. And the solution was quite simple. All that was necessary was to disconnect from the Internet. With that done, if you started Edge again it could not load the offending web page. You see, Edge keeps track of what web pages were open when you close it and then reopens them again when you start up Edge I don't particularly like this feature and now see a real problem with it.

Anyway, when I restarted edge with no Internet connection, the offending web page informed me that I had no Internet connection. And I was able to close all of Edge's tabs and then Edge. On restarting Edge, I noticed no problems. I did a quick Windows Defender scan that produced no problems and will do a thorough scan soon.

Did I click on that web page? Had the web page been infected with code that redirected me to a malicious site? I don't know, but I do know that many years ago, I followed a link to a page and had something similar happen, and I did not click on anything. It would seem that you should not be harmed by simply viewing a web page after all these years of technological improvement – but I just don't know.

Networking Problems

At least I thought my problem was a networking problem for several weeks. About four months back, I lost my network connection to my TV. The TV is in a room some distance from the router which connects to the TV room via a power-line Internet adapter; the TV connects to a switch which connects to the power-line adapter. Disconnecting the Ethernet cable from the switch connected to the power-line adapter, I easily discovered that the switch was the problem and ordered a new one. In that room connected to the switch I also had an iMac and an older HP laptop, my main computers being in the room with the router. Everything worked fine for several months, then I noticed that the iMac, which I leave running since I use it to compile iOS apps from Visual Studio running on a Windows computer in the other room, had a problem. The iMac started to often lose its network connection while the TV an the HP most of the times still had a connection. I thought the new switch might be going bad because if I rebooted the switch, the iMac reconnected to the network. So I ordered another new switch, but the problem persisted. I tried all sorts of connections, through the switch, directly to the power-line adapter, and even ran a 50 feet plus Ethernet

cable on the floor through the house to connect things. Sometimes I had a connection for over 24 hours, sometimes not. None of the combinations produced an uninterrupted connection for more than two days. I even set the iMac to not go to sleep. But nothing would give me the weeks-long uninterrupted connection that I had experienced in the past.

I then hit upon an idea. The iMac had its operating system updated to Sierra sometime in the recent past. Could that have anything to do with it? An Internet search for "iMac, Sierra and Network" produced many people experiencing the same loss of network connectivity. Many solutions were proposed, but none seemed to fix things for people. Then I found one fellow who had the answer that he had received from Apple: The article said that I should try going to the iMac's Sys Preferences>Energy Saver and untick Wake for Network Access. I already had it set to not go to sleep (which did not fix things). But de-selecting the Wake for Network Access seems to have fixed the iMac losing its network connection.

What would we do without Google and Bing? However, in all my searching, I only found one person with the correct answer. ◆

william@lamartin.com

Thanks to Merle Nicholson I have to write very little this month, and that is good, since I have not had much happening this month that would be of interest to a general audience. I have spent a lot of that time updating my Windows 8 app, Cell Towers, to be a Windows 10 Universal app and then to porting it to Android. I also managed, much to my surprise, to install the Windows 10 Creators Update on my minimal Dell Venue 8 Pro Windows tablet.

Windows 10 Creators Update

The Dell Venue 8 Pro tablet, which I won as a prize, has only two GB of RAM and a 32 GB of hard drive, and I thought it was a miracle that I managed to update it to Windows 10 when I did that. I tried to install the next Win 10 update and could not do it for lack of disk space. The update required eight GB, and I only had five free on the drive, no matter how much stuff I deleted.

Minutes of the April Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. Merle Nicholson, the SIG moderator introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees.

Our own TPCUG member, William LaMartin, reflecting a current interest in 3D printers showed several pictures and videos of a Microsoft meeting he attended that demonstrated 3D printers. He then showed several YouTube videos of a few in action creating useful plastic objects. William went on with a powerpoint show discussing the upcoming Windows 10 Creators update. William at that point had done updates on three of his computers and was able to describe the slight differences it makes. He went on to show Microsoft Edge and the enhancements that were included: 3D Cities, Loss of the Control Panel in the shortcut menu (right-click on the start menu or Win+x), and how to find it. He went on to show changes to Edge, Search Box new things and a quick demo of Paint 3D. Our thanks go to William for an informative and interesting program. ◆

Comments.....Continued from page 1

What I did not realize at the time was that there was a Windows.old folder that contained the previous operating system that could be deleted (if you let Windows do it via Start > System > Storage > This PC > Temporary Files > Previous version of Windows and do not try to do it yourself).

After not being able to install the next update (for lack of disk space and not knowing the above at the time), I got a notice on the tablet that an update for Windows was available, and much to my surprise, after a couple of tries that was accomplished. That left me with version 1607. And I am not at all sure how that was done

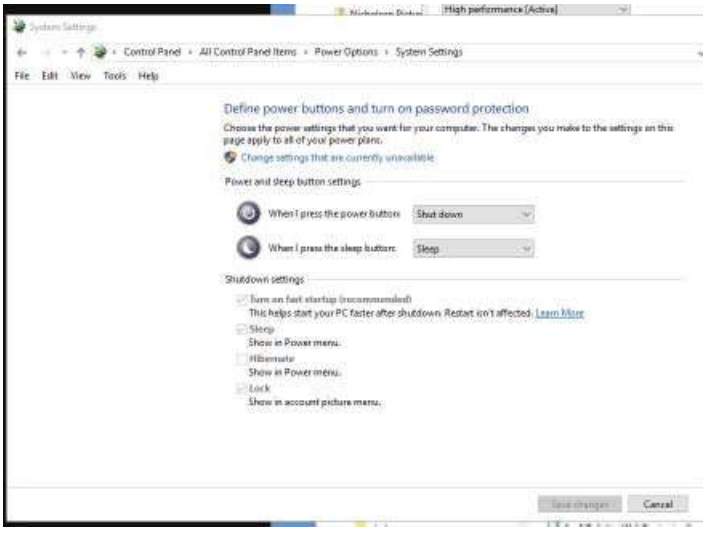
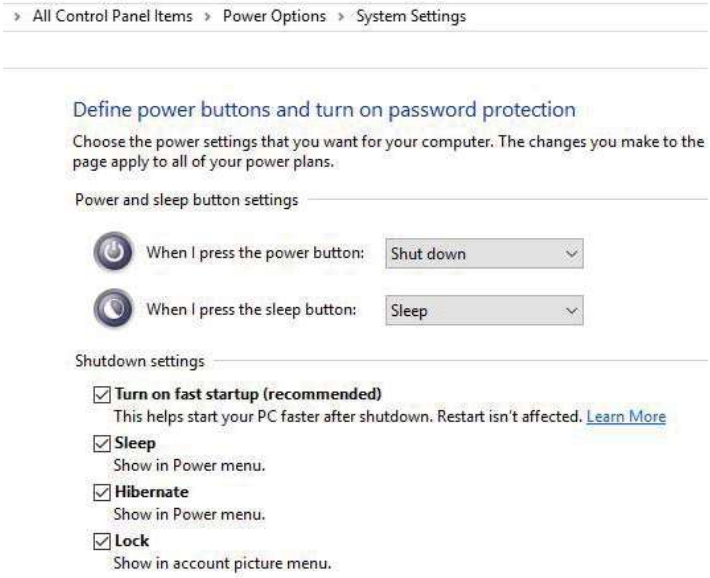
Windows 10 Sleep/ Hibernate/Shutdown



By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com



Windows 10 has a boot scheme called "Fast Startup". There's a remote possibility of it causing problems with some hardware. Here's a breakdown of all the schemes and the settings and options you have.

Shutting down - and then rebooting - a Windows computer is more complicated than you would guess. There are options to choose the shutdown and restart methods, and in Windows 10, you may not care for the defaults that are set for you, and in some cases have caused some unresolved problems.

Windows 10, if you accept the defaults preset for you, really does shut down OK, it's the restart that will surprise you. By default, a new method called "Fast Startup" is enabled. It really does dramatically reduce the Windows start time if you boot from a conventional hard drive. That goes double for a typical slow notebook mechanical hard drive. But if you're booting from an SSD, there's not much advantage. In any case, regardless of the boot drive, there are some potential annoyances. Hopefully I can tell you what you need to know about this new "feature".

In Control Panel, Power Options, System Settings, you

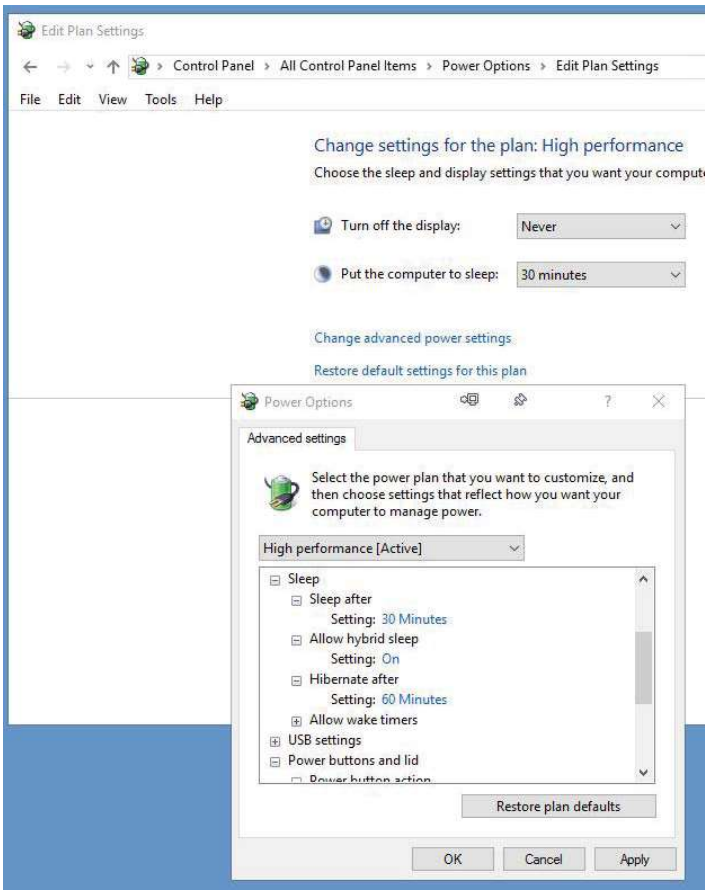
want to look at the – Shutdown settings – Notice that in order to change any of these settings you first have to click on the blue "Change settings that are currently unavailable", and that to do so, you have to be in an administrator account (that's the blue and yellow shield). After you click on it, it disappears – as in the second picture. You will probably find the "Turn on fast startup (recommended)" already checked.

If that "fast startup" is checked, when you shut down it actually will do a hybrid Hibernate. It's also referred to as "Hybrid Sleep". It's the old style hibernate available in previous Windows editions, with some changes. The old conventional hibernate copies the entire contents of memory to a disk file C:\hiberfil.sys. On the next startup, instead of a traditional boot, that is loading the OS kernel and then loading each of all the drivers and services, it simply restores the contents of that file into memory and resumes where you left off. Fast (or at least faster). For conventional hard drives it saves a lot of time. For SSDs it's technically faster. In notebooks it is useful to overcome the cheap, slow mechanical 5400 RPM hard drives.

I've observed a lot of people using notebooks where when they are finished, they typically just close the lid, putting it to sleep. Sleep is an entirely different thing. The computer – when in sleep mode is still powered up – at least the screen is shut down, and probably the

Sleep.....Continued on page 4

Sleep.....Continued from page 3



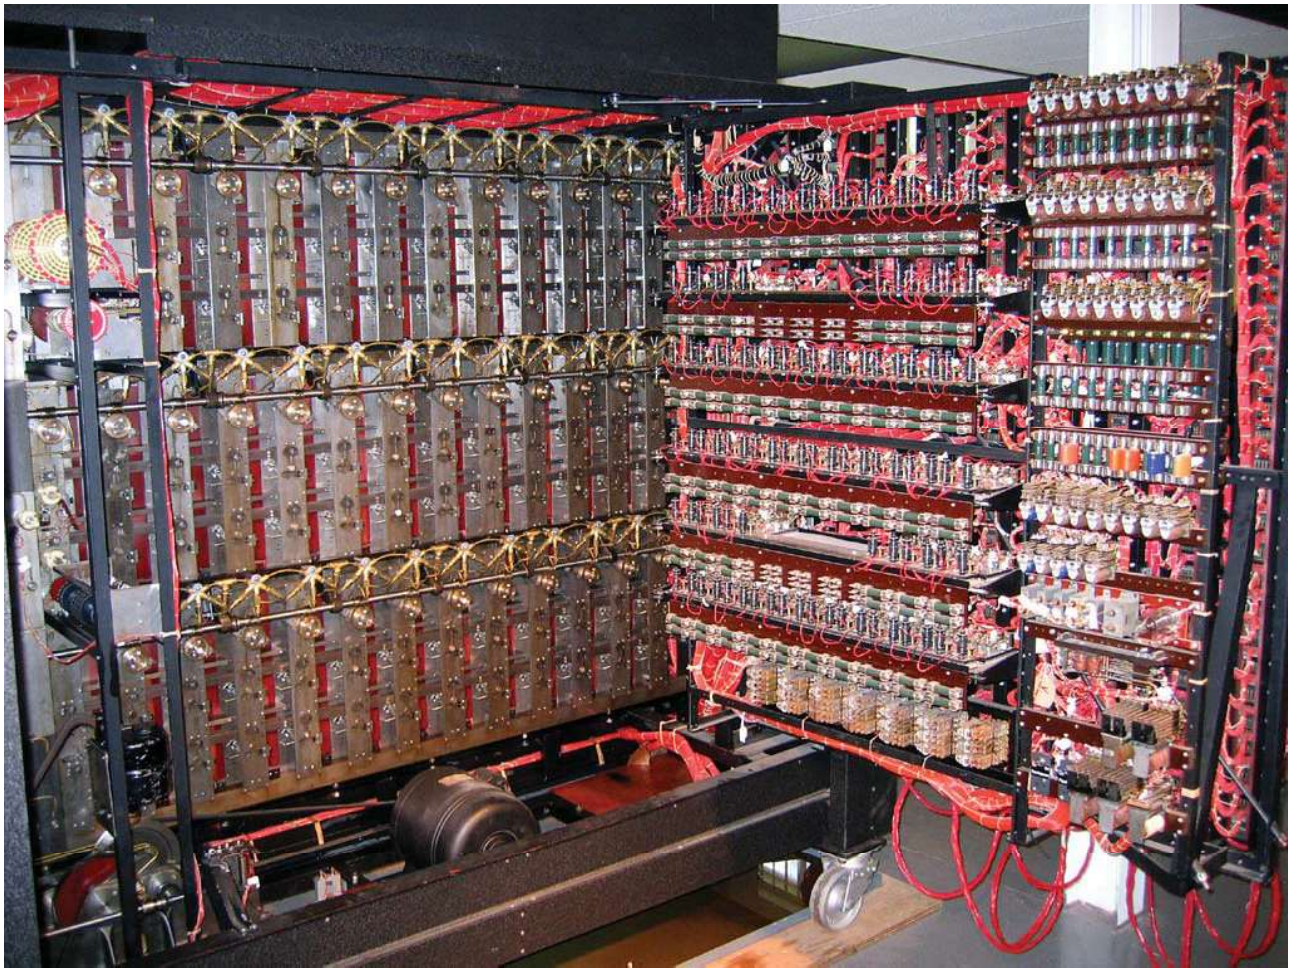
hard drive too, saving power on the battery, and the wake-up is instantaneous as long as you do that before the battery runs down (a month?). In sleep mode the contents of memory is maintained in memory – just where it was. But it will eventually die when the battery is depleted.

So far you're saying "So What?" Right? The Sleep and (old, conventional) Hibernate restore everything just as it was. If there was an open application it reappears just as you left it. Your keyboard and mouse, touchscreen .. wait a minute, my old printer isn't communicating or my external touchscreen monitor doesn't work unless I unplug it and plug it back in. Maybe you haven't seen any problems and are OK, but maybe you're looking for a reason that your scanner doesn't resume as it should. My own single problem is my new 4K monitor doesn't come back from "fast startup" (Hybrid Sleep). It's black. Not off .. that would be white in this case .. but black, and fortunately I have a second monitor so that I can do a Reset. That fixes it, but not permanently. I have a permanent solution for this if you can bear with me.

To be honest with you, since I have a very fast SSD boot drive, I have had all forms of Hibernate turned off for years. For this article, I turned it back on so I could do the screen captures, and serendipitously had the monitor problem within minutes of doing so. I have no desire to fix it other than to disable Hibernate again. But it was a big Ah Ha moment.

I said I did a Reset to temporarily fix the fast startup problem. This is because Reset is designed to do a real 100% power down and restart from scratch. It is done this way because Windows updates and application installs just couldn't work correctly if it did a sleep, hibernate or "Fast Startup".

In Control Panel, Power Options, there is a "Change advanced power settings". Click that and the Advanced settings panel comes up. Here, you can find several thing of interest on this subject: "Sleep after Setting", "Allow hybrid sleep", "Hibernate after". The "Power buttons and lid" settings determine what happens when you close the lid. Mine is set to "Shut



Down". But my notebook uses an SSD. It boots just fast enough, thank you.

"Hybrid Sleep" means hybrid Hibernate. This means that instead of saving the full memory contents to disk, it saves just the operating system kernel and drivers. It closes all applications first before saving, thus greatly reducing the size of the file and the time it takes to restart. The regular Hibernate saves everything, the intention being to restore the desktop just as you left it. Note that you can enable Hibernate and disable Hybrid Hibernate. I wouldn't, but hey – have fun.

Here's one of the big things I don't like about Hybrid Hibernate. It's indistinguishable from a real shutdown and start. You can easily think you have been doing a full shutdown all along and even wasted time trying to figure out why your mouse sometimes doesn't work. How can you tell? Well, you have to look at the settings. See if "Allow hybrid sleep" is on and "Turn on fast startup" is checked. Or maybe you don't experience any problems at all. In my own opinion, though,

Sleep.....Continued on page 5

Internet Picture of the Month

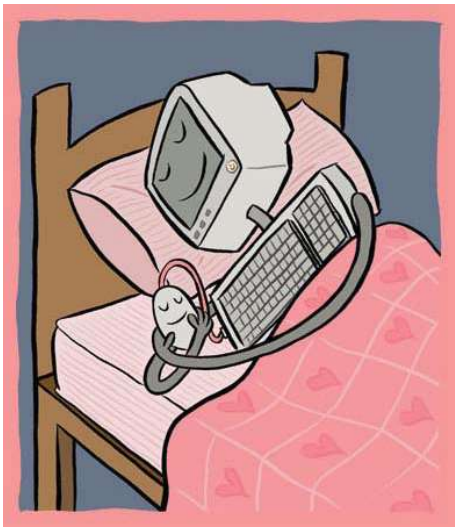
The Bombe

The first "computer" that was used to crack the German's Enigma code. The photo is of the back of the re-built machine from the site http://www.benryves.com/gallery/bletchley. There is also a good write-up there. This is the machine at the center of the recent movie, *The Imitation Game*.

Sleep.....Continued from page 4

it is peripherals – especially older USB devices that may sometimes have a problem, but maybe you don't have any of these.

On my own systems, I simply disable Hibernate using the powercfg.exe application. This has the advantage of automatically erasing the c:\hiberfil.sys file, freeing up – in my case – 12GB of file space. To do this, open a command prompt for admin. The easiest way for me is to right-click on the start menu, select "Command Prompt (Admin)". This gives you the command prompt box and command line. Here, type: powercfg /h off. There is no message that it's completed, but it should not report an error. Before doing this you can check what you're about to do by typing "powercfg /h /?". This will give you the help topic on what you're about to do. Another effect is that Hibernate no longer appears in the shutdown options. You reinstate it easily with an ON.



For myself, I use different settings between my desktop unit and my notebook. On my desktop, I set the

Sleep.....Continued on page 6

Sleep.....Continued from page 5

power setting for Sleep to "Never", Allow Hybrid Sleep setting Off – not that it would work without a Hibernate file – it can't, and Hibernate After is "Never". Obviously "fast startup" is not enabled. I do leave "Sleep – show in Power menu" enabled, but I have never used it. I just don't see any advantage in Sleep or Hibernate on the desktop. I do have a slideshow screen saver, but it's set for a very long time and it's for entertainment – pictures I especially like.

On the notebook, I have the lid set to "Shutdown", not sleep. On this computer, a quick blip of the power button will put it into sleep. It's like that because if I want it to sleep, I want it to go there deliberately. I'll admit I have used it in the car while travelling. We could make a lunch stop, and I want to leave the laptop in the car but not with an obvious screen on. I put it in sleep and then close the lid, put it out of sight but with the power cube and GPS still plugged in – it does not do a shutdown in that case, and it resumes when we return. Apparently the GPS does some sort of handshake periodically because it has always resumed. But this is rare, maybe two or three times in the five years I've had it. The other thing different is I set is the Display timer. "Turn off the display" "Never" for when it's on external power, and 30 minutes for "on Battery". The desktop doesn't have that option. The display is by far the biggest battery drainer component on the laptop. If I had a mechanical hard drive (I don't) I would set "Turn off hard disk after Setting (minutes)" to the same as the display. ◆

Preparing for Creators Update

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

I'm not sure why I was so fortunate, but one of my two Windows 10 computers was selected for the latest big update a week ago. No, this is not a sad tale, it went fine. In anticipation of that event, I had done some prep work to make sure I could recover in case of a disaster.

My objective is to get an external USB3 hard drive cloned to be exactly like the computer drive and to test it by booting from it. This makes sure you have not lost anything and can get running in minutes in case the update hoses the system. Second objective is to set a restore point. More on that later.

To create the external boot drive there is some prep work to be done in the way of disk cleanup. There is no need to move files over to the external that you don't use, that should be obvious. Cleaning up has the secondary advantage of removing unneeded files from the computer hard drive before the big update gets run. On systems with little unused space it may be critical to clean up first. Even if it's some time to wait until the update and you need to do it again, it's good practice. Besides, all computers need to be cleaned up occasionally to get rid of the accumulated crap.

The first thing to look at is your Downloads directory. This is where I accumulate the most unneeded files. Usually it's an installation exe. It's been installed, and I can replace it online, so I may as well delete it. PDF bank statements that we printed and filed – that kind of stuff. Also it goes without saying, documents and pictures, sometimes just duplicates. Excel files always have backup versions. Then it's time to do the Windows Cleanup. Open "This PC", right-click on the C: drive and select Properties, then a button called "Disk Cleanup". It goes through a system scan. You want to pick out most if not all of these categories. Notice that it includes "Delivery Optimization files", "Recycle Bin" and "Temporary Files". These weren't checked in

Creators.....Continued on page 7

Creators.....Continued from page 6

my case, so I checked them. When completed, it sends you back to the drive properties. But there's more. Click again on Disk Cleanup button, then click on "Clean up system files". There is another system scan, and if you look at categories, you'll see that some new categories have been added, the most important are the Windows backup installations files.

If you look at your C: drive – as long as you have not hidden system files – you'll may see a Windows.old directory and a couple of folders starting with $windows. In all, as I write this article, I gained 10.3GB of disk space. I also lost the ability to restore to the previous large update. But remember, you were going to lose that ability when the Creators update comes out for you anyway. And that 10.3GB may be just the critical space needed to do the update in the first place.

Next thing to look at are emails. Emails really don't take up much room unless you just don't pay attention to them, but attachments to emails do. Usually if someone sends a picture or two or ten, you copy them somewhere, and it's ok to either delete the email or delete the attachments. Some email systems allow easy sorting. The Outlook I was using and Thunderbird I now use has a column where you can click the header and sort by attachment. That gets all emails with attachments together so you can block delete them all, or open each and delete the attachment itself. When you're done restore the sort you like and then force the email client to compress its file.

Next is the system restore point. To go "System Properties", "System Protection" tab, you can do a search on "create a restore point" or right-click on "This PC", properties, and click on "system protection". You should see your hard drives, and the C: drive protection should be "On". If not, select "Configure" button and configure it on. Windows System updates have a tendency to set this off, which means you have lost the ability to set restore points. When all that is done, click on "Create" button and give it a name. I usually name it something like "before creators update" or something like that. The restore point always carries the date created regardless.

Now we're ready to clone the drive. I usually use an Acronis rescue disk that has a utility 'tools' category with a "clone" function. I've transferred this to a bootable flash drive. Usually if you buy an SSD it comes with a clone drive program that can be used, and of course you can buy one if you don't otherwise have it. You may have a good use for Acronis backup, but if not Acronis has an excellent "Disk Director" program . See our friends Gene and Linda Barlow at http://www.UGR7.com, and be sure tell them how you heard of them and whether or not you're a TPCUG member..

For my PCIE SSD boot drive, Acronis clone will not work so I use Casper at http://www.fssdev.com. It's similar to Acronis, but more expensive than the Barlow's UGR Acronis.

After the Creators update, be sure to look at System Protection to make sure the update did not disable restore points. If it did, the previous restore points have been deleted, and it's time to make one more new one. ◆

Comments.....Continued from page 2

other than Windows on its own deleted the Windows.old files.

That got me to thinking that maybe I could also get the Creators Update, and I went to the System Update and asked for new updates and was given a link to tap on to receive the Creators Update. I was informed that I was again short on disk space, and would I like to delete the files in Windows.old to acquire more space. A yes answer to that did not delete the Windows.old folder, but it did remove essentially all the files, giving me more than enough free space on the C drive to do the installation. Thus, I now have the Creators Update on my minimal Windows Tablet. Remarkable.

Cell Towers

This is an app I wrote about five years ago, and which someone asked me to update, that will display on a map all the cell towers in a selected county of a se-

Comments.....Continued from page 7

lected state. Actually it is not all the cell towers; rather, all that are in the database I found at the FCC. For example, I know a rancher who leases a plot of land to a tower owner, and that tower is not in the database. Anyway, in the latest information I could find at the FCC, there are a lot of towers in the current database – 240,401 nationally, 882 in Hillsborough County, FL and 4,757 om Los Angeles County, CA. At first, I didn't want to bother updating the app; then, I thought, why not?

I will be updating the app to have that new data along with a new interface where it will run on a Win 10 desktop, Win 10 tablet, a Win 10 phone and hopefully an Android phone and tablet and eventually an iPhone and an iPad. The Windows 10 work and the Android work are close to completion; the iOS work, yet to be started. I make no money on such apps. It's a hobby.

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Thanks to Merle Nicholson and Ron Weinberg for their articles. And to fill out the newsletter, I have a couple recent problems that you may find of interest. One of the problems might well happen to you.

Windows 10 Creators Update

Before getting into problems, let me remind you that a new windows 10 update is coming available on April 11. It is going to be pushed out in waves, so not everyone will receive it on that date. And for those few who have windows phones, it will be available on April 25.

A brief video about the new features may be found at: http://www.pcworld.com/article/3185431/windows/how-to-get-windows-10-creators-update-the-release-date-and-more.html. *PC World* says that "Newer PCs that have the optimal specs for

merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. Merle Nicholson, the SIG moderator introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees. This month, there were questions about network sharing and browser details.

Our own TPCUG member Michelle Burgess gave an interesting talk and demonstration on video conferencing using Apple Facetime. Harry Lockaby was attending with his Apple Mac Air notebook and served as a conferencing partner. Michelle was using a Mac mini and the room big screen as the only monitor. After the demo, Michelle went on to describe her attendance at a General Motors Hackathon and showed some of the possibilities of connected apps being considered for autos. Our thanks go to Michelle for an informative and interesting demonstration. ◆

Comments.....Continued from page 1

Windows 10 will get the Update first." Personally I am in no rush since much of what I do on a computer does not involve what all the new features address. But there are some interesting things there regarding inking, for example. One of the more impressive things I saw in the demonstration of inking was: You draw a route on a map, and then Microsoft will tun your drawn route into an actual route with all the information usually associated with a route. The Edge browser will now be able to read your eBooks and display YouTube videos in 4K. I expect everyone to have the Creators update by our May meeting and for someone to give a demonstration of using the new features. Any volunteers?

Comments.....Continued on page 6

New 4K Computer Monitor, Three Weeks Later

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

A new 27" computer monitor has been a big change for me. It's been mostly a good experience, but there are some considerations that suggest that it may not be an entirely wise move. I'll try to explain.

For those not familiar with the term "4K", it's a very high resolution monitor that's four times the resolution of a "standard" 1080 monitor. That is, vertically and horizontally it's doubled. A 1080 monitor is 1920x1080, and a 4K is 3840x2160. Pixels, that is, dots on the screen.

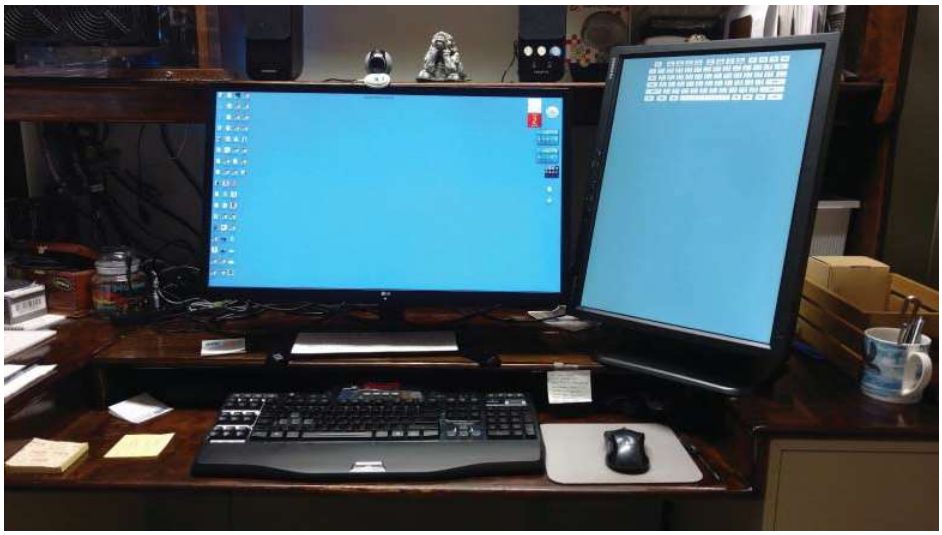
A little background about the 1080 standard first. We have television to blame for 1080. We needed a digital flat screen for television use for years and years, and we just had to put up with CRTs long after digital was technically possible – we had digital monitors in all sorts of sizes until the (mostly TV) industry decided on a standard. The standard was necessary to move on and scrap the 1930s CRT technology. It stood to reason that the TV standard would be duplicated in other products, not the least for computers, and that happened without question. If you'll look at good quality monitors right now, the 1080 is by far the least expensive and, because of the sheer numbers sold, is pretty much the standard consumer monitor.

In the meantime, computer technology has bypassed the need for standardized monitor sizes and resolutions; the 1080 remains on the least expensive computers. But there are a dozen or more resolutions that are common.

We bought a 55" 4K TV more than 2 years ago for use as our only TV in the household. Its TV comes from a cable tuner in a computer that serves as a large capacity DVR. So we have a lot of experience with the standard. In our minds, we knew the clarity of the 4K screen will be so dramatically improved that I would thoroughly enjoy the change on my desktop computer, and that is mostly true.

The tipping point on the decision to replace my perfectly good flat screen monitors was price. Amazon hit a low of $330 one night as I was checking almost daily and clicked on it. It's at $428 today and $377 yesterday. That night, I bought an LG 27UD58-B 27-Inch 4K UHD IPS Monitor. It replaces two 1600x1200 21" monitors that I bought in 2005 for about $550 each. That's $1,372 in today's money for both.

Surprisingly, there are very few suitable 4K monitors made. Amazon has just eight, and half of those are in the $600 range.



First, though, the hardware. To use this you need a video system that will handle 4K, and very few do. Mine did not. The newest, higher end computers largely do, but you can't count on it, check the specs. Look for 4K at 60Hz. I built my own system – you could say it evolved over many years, and I knew it wouldn't do 4K. I had two video cards that were just a few years old; I replaced one and kept the other only to discover that AMD video software wouldn't allow an old card to coexist with a new one, so back off the shelf it came and torn apart the second time to remove the second. The new card, a Radeon RX470 was $175. A DisplayPort cable (and an HDMI) came with the monitor.

OK, so let's see what I did. I replaced two 21" monitors placed side by side for a combined 442 square inches (17"x 13" x 2) with a single 4K screen 305 Square inches (23.5"x13"). And increased the pixels from 3,840,000 to 8,294,400. Oh oh, what have I done? Well, I made those 8.3 million pixels a LOT tinier.

I find it strange to look at Windows elements that small. All this detail is crystal clear and very sharp, but very tiny. Remember I have 8.3 million pixels. Now, Windows 7, 8.1 and 10 all have the capability to scale windows elements larger. If you look at Windows Display Settings, there is a slider that allows you to enlarge everything. Windows 10 offers to set scaling at

Monitor.....Continued on page 4

Monitor.....Continued from page 3

150% right off the bat. But think about it. My 8.3 million Pixels will then become an equivalent of 5.5 million. Well, that's one way to look at it, but remember those very, very sharp pixels are still there doing their job, and it's just spectacular. If you want to really get blown away, look at a high rez movie on Amazon, or even a relatively low resolution YouTube video . . well it's hard to describe. And worth it.

I finally settled for 125% scaling. In terms of how many useful, readable, windows of information I can get on the screen all at the same, it's a tremendous improvement. If you're just a one-application-at-a-time person, you'll still like it because of the clarity. If you're a programmer who needs four or five windows up at a time because you're referencing information between, it's a godsend. Sometimes I'll need to set the scaling back to 100%, and at least Windows makes that easy to do. I have a problem with a 14-year old Microsoft Office product Access 2003 that cuts off 25% of user windows when scaled. I attribute that to fate and the computer gods messing with me. Bill didn't know that would happen back in 2003. But my support for Access 2003 applications is slowly going away.

Now the downside(s). I have to be fairly close to the screen because of the size of screen elements, and that's ok for my eyes; I have computer glasses selected for that distance. But I really can't relax and tip back in the chair unless I'm watching a YouTube video. The previous arrangement with two 21" screens (18.5" x 2 full width) worked well, because I had both turned inward, each facing me. A 23.5" wide screen really needs to be curved, and I'd guess by the time I'm ready to replace this one they'll be readily available. Curved 4K TV screens are available, expensively, but none small enough for computer use.

Sometimes when I have a lot of detail on the screen I feel I must shift my body right or left to get the detail right in front of my eyes. I'm trying to not do that now that I'm aware of it. As I said, the previous arrangement had both monitors turned inward.

I've been discussing my primary monitors' replacement, but I really had four. There is one 1080x1920 monitor on my right, turned in portrait. I use this for help screens and PDF references. It's turned inward to face me. The fourth was a low resolution screen that I used rarely for spillover when I wanted my email and calendar up. I have abandoned use of that one now that I've increased my window area so much.

The side portrait monitor is invaluable, and I've been considering replacing that one with a 24" 4K monitor. The one I'm using now is one of the old ones of course and it has its problems that I've been struggling with. I finally convinced myself that the text is fuzzy and everything is scaled larger even though it should be at 100%. I have just done some research and finally found some Microsoft descriptions of my problems. It seems that even Windows 10 can't handle mixed resolutions well. That is, if you have a new high resolution monitor it works well but any second or third monitor that is older, lower resolution, you can expect that the display isn't sharp like it was (yep), and the scaling may be off (check!). And although Windows 10 handles multiple monitors much better than Windows 7 or 8.1, they acknowledge these problems and offer some suggestions that may mitigate, but not cure them.

Microsoft also mentions that some of the scaling problems have to do with the capability of the applications, and that those applications assembled as a Universal

Internet Picture of the Month

The island Hotel

In Cedar Key, Florida, a bit of old Florida. From Flickr.com, taken by Faye, whose photstream is at https://www.flickr.com/photos/sheffe73/. She has lots of interesting photos, but you will need a Yahoo account to be able to see more than just a few. My interest in the photo was that I stayed in that hotel just a few months ago and also many years ago. Go to Cedar Key. It is very relaxing and off the beaten track.

Monitor.....Continued from page 4

App (from the Windows Store) will scale fine and there's no guarantee that others will work. It's also a plug for Office 360 or Office 2016. But that jibes perfectly with my problems with Access 2003. One suggestion on older apps is to change the apps compatibility property. There's a setting "Disable display scaling on high DPI settings". I've changed my MSACCESS.EXE settings, and I'm still assessing the effect.

The only definitive solution is to use secondary monitors of the same resolution. Hence supporting my "need" to buy another new monitor.

Considering how relatively inexpensive they are and how much benefit, the only remaining problem is finding a home for my old ones. ◆

HDMI Cables with Ethernet

By Ron Weinberg, Member At Large,
Tampa PC Users Group
rswjbr@verizon.net

At our last meeting there was a dearth of information on the new HDMI with Ethernet cables that are now widely sold in anticipation of devices that have not yet appeared in common use. Here is a simple explanation of these cables.

In short, this feature reduces the number of Ethernet cables required in some networks, primarily home entertainment networks.

Both standard and high speed HDMI cables are available with Ethernet. These cables are backward compatible and serve as regular HDMI cables if the Ethernet channel is not used. Both ends of the cable must be used in enabled ports for the Ethernet channel to work.

Ports which utilize the Ethernet feature may be marked HEC (HDMI Ethernet Channel enabled). The use of that mark is optional to the manufacturer of the device. When purchasing new devices, as with any new feature, it would be advisable to check product specifications and or user manual to determine if the feature is included.

Here is the basic information and diagrams obtained from the HDMI.org website.

HDMI Ethernet Channel

HDMI Ethernet Channel technology consolidates video, audio, and data streams into a single HDMI cable, combining the unmatched signal quality and convenience of HDMI connectivity with the power and flexibility of home entertainment networking. It incorporates a dedicated data channel into the HDMI link, enabling high-speed, bidirectional networking at up to 100 Mb/sec. ◆

Comments.....Continued from page 2

Hijacked

Read this closely so that you won't fall for the same trick. Although I am not at all sure that I fell for any trick. But here is what happed to me just a few hours before I sat down to write this.

I was using my other desktop computer to work with Visual Studio 2017. I was working on what is known as a cross platform app, that is one that uses Xamarin from within Visual Studio to create a solution that has four projects: A shared project, an Android project, an iOS project and a Windows Universal project. The idea is to put as much of your code as is possible into the shared project and then for anything that has to be dealt with specifically for the separate operating

Comments.....Continued on page 7

Comments.....Continued from page 6

systems, such as saving images to the device or sending email, you put the code required by the separate operating systems into the three separate projects

Well, Xamarin is still a bit new to me, even though I have been using it for over a year. So I have to search for how to do certain things using Bing or Google. In this case I was using Bing and had put in a search regarding tapping on images.

And here is where my memory is not perfect. I recall there were a number of links returned as results. I then clicked on one, and I don't recall if it was the first link I tried or the third. Anyway, I clicked on one of the links provided by Bing and was presented with a web page in Edge that had what appeared to be a large yellow popup saying that FLASH was required to view the page. And here is where my memory fails me. I don't recall if I clicked on the x in the upper right corner of the popup to close it or it closed automatically. Anyway, all Hell broke lose with loud audio telling me not to close the web page or I would lose all access to my data; that all my contacts were being sent to some site along with my Facebook contacts (none of which I have); and some other threats that I don't recall. I was supposed to follow the instructions on the screen to make a payment to be able to access my data again.

I stopped paying attention to the verbal instructions since I felt that I really needed to get Edge closed and was pretty sure that the problem was restricted to Edge and not the entire computer. Edge could not be closed except via the Task Manager, which I did. Foolishly I then reopened Edge with the result that all of that talking and threatening was presented again. So I again used Task Manager to close Edge.

What to do? I opened a different browser, FireFox and did a bit of searching and came up with a page about the Edge browser being hijacked. I had not used the word hijacked, but that is exactly what had happened to me. And the solution was quite simple. All that was necessary was to disconnect from the Internet. With that done, if you started Edge again it could not load the offending web page. You see, Edge keeps track of what web pages were open when you close it and then reopens them again when you start up Edge I don't particularly like this feature and now see a real problem with it.

Anyway, when I restarted edge with no Internet connection, the offending web page informed me that I had no Internet connection. And I was able to close all of Edge's tabs and then Edge. On restarting Edge, I noticed no problems. I did a quick Windows Defender scan that produced no problems and will do a thorough scan soon.

Did I click on that web page? Had the web page been infected with code that redirected me to a malicious site? I don't know, but I do know that many years ago, I followed a link to a page and had something similar happen, and I did not click on anything. It would seem that you should not be harmed by simply viewing a web page after all these years of technological improvement – but I just don't know.

Networking Problems

At least I thought my problem was a networking problem for several weeks. About four months back, I lost my network connection to my TV. The TV is in a room some distance from the router which connects to the TV room via a power-line Internet adapter; the TV connects to a switch which connects to the power-line adapter. Disconnecting the Ethernet cable from the switch connected to the power-line adapter, I easily discovered that the switch was the problem and ordered a new one. In that room connected to the switch I also had an iMac and an older HP laptop, my main computers being in the room with the router. Everything worked fine for several months, then I noticed that the iMac, which I leave running since I use it to compile iOS apps from Visual Studio running on a Windows computer in the other room, had a problem. The iMac started to often lose its network connection while the TV an the HP most of the times still had a connection. I thought the new switch might be going bad because if I rebooted the switch, the iMac reconnected to the network. So I ordered another new switch, but the problem persisted. I tried all sorts of connections, through the switch, directly to the power-line adapter, and even ran a 50 feet plus Ethernet

cable on the floor through the house to connect things. Sometimes I had a connection for over 24 hours, sometimes not. None of the combinations produced an uninterrupted connection for more than two days. I even set the iMac to not go to sleep. But nothing would give me the weeks-long uninterrupted connection that I had experienced in the past.

I then hit upon an idea. The iMac had its operating system updated to Sierra sometime in the recent past. Could that have anything to do with it? An Internet search for "iMac, Sierra and Network" produced many people experiencing the same loss of network connectivity. Many solutions were proposed, but none seemed to fix things for people. Then I found one fellow who had the answer that he had received from Apple: The article said that I should try going to the iMac's Sys Preferences>Energy Saver and untick Wake for Network Access. I already had it set to not go to sleep (which did not fix things). But de-selecting the Wake for Network Access seems to have fixed the iMac losing its network connection.

What would we do without Google and Bing? However, in all my searching, I only found one person with the correct answer. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Thanks to Merle Nicholson I have to write very little this month, and that is good, since I have not had much happening this month that would be of interest to a general audience. I have spent a lot of that time updating my Windows 8 app, Cell Towers, to be a Windows 10 Universal app and then to porting it to Android. I also managed, much to my surprise, to install the Windows 10 Creators Update on my minimal Dell Venue 8 Pro Windows tablet.

Windows 10 Creators Update

The Dell Venue 8 Pro tablet, which I won as a prize, has only two GB of RAM and a 32 GB of hard drive, and I thought it was a miracle that I managed to update it to Windows 10 when I did that. I tried to install the next Win 10 update and could not do it for lack of disk space. The update required eight GB, and I only had five free on the drive, no matter how much stuff I deleted.

Minutes of the April Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. Merle Nicholson, the SIG moderator introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees.

Our own TPCUG member, William LaMartin, reflecting a current interest in 3D printers showed several pictures and videos of a Microsoft meeting he attended that demonstrated 3D printers. He then showed several YouTube videos of a few in action creating useful plastic objects. William went on with a powerpoint show discussing the upcoming Windows 10 Creators update. William at that point had done updates on three of his computers and was able to describe the slight differences it makes. He went on to show Microsoft Edge and the enhancements that were included: 3D Cities, Loss of the Control Panel in the shortcut menu (right-click on the start menu or Win+x), and how to find it. He went on to show changes to Edge, Search Box new things and a quick demo of Paint 3D. Our thanks go to William for an informative and interesting program. ◆

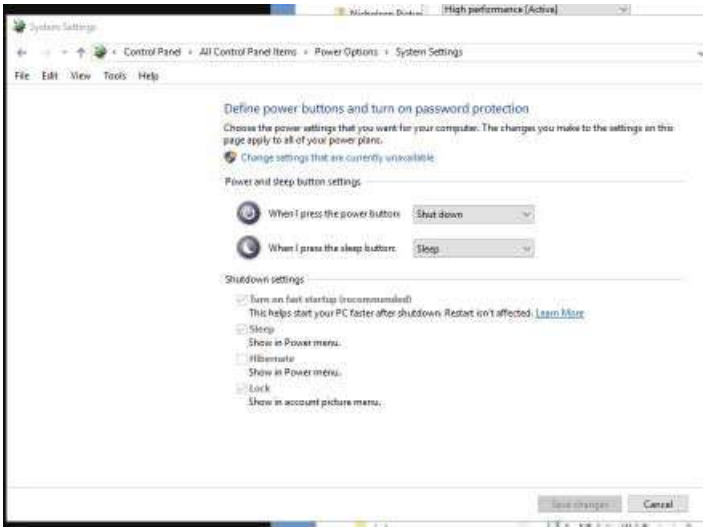
Comments.....Continued from page 1

What I did not realize at the time was that there was a Windows.old folder that contained the previous operating system that could be deleted (if you let Windows do it via Start > System > Storage > This PC > Temporary Files > Previous version of Windows and do not try to do it yourself).

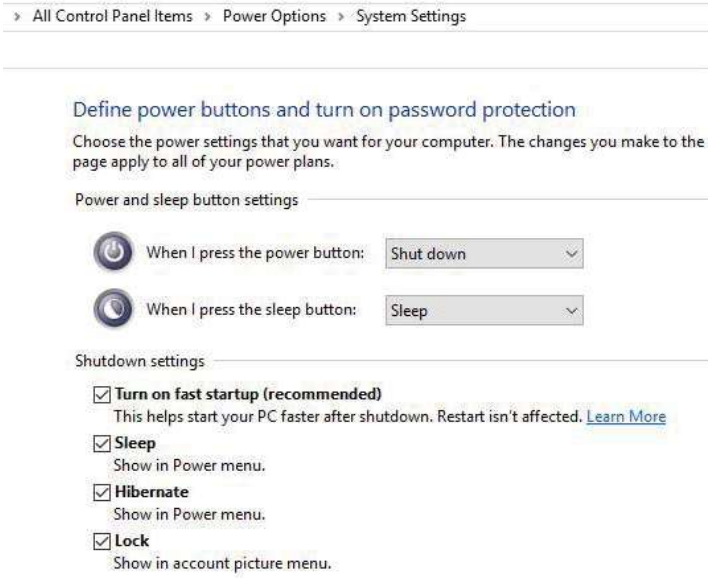
After not being able to install the next update (for lack of disk space and not knowing the above at the time), I got a notice on the tablet that an update for Windows was available, and much to my surprise, after a couple of tries that was accomplished. That left me with version 1607. And I am not at all sure how that was done

Comments.....Continued on page 7

Windows 10 Sleep/ Hibernate/Shutdown



By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com



Windows 10 has a boot scheme called "Fast Startup". There's a remote possibility of it causing problems with some hardware. Here's a breakdown of all the schemes and the settings and options you have.

Shutting down - and then rebooting - a Windows computer is more complicated than you would guess. There are options to choose the shutdown and restart methods, and in Windows 10, you may not care for the defaults that are set for you, and in some cases have caused some unresolved problems.

Windows 10, if you accept the defaults preset for you, really does shut down OK, it's the restart that will surprise you. By default, a new method called "Fast Startup" is enabled. It really does dramatically reduce the Windows start time if you boot from a conventional hard drive. That goes double for a typical slow notebook mechanical hard drive. But if you're booting from an SSD, there's not much advantage. In any case, regardless of the boot drive, there are some potential annoyances. Hopefully I can tell you what you need to know about this new "feature".

In Control Panel, Power Options, System Settings, you

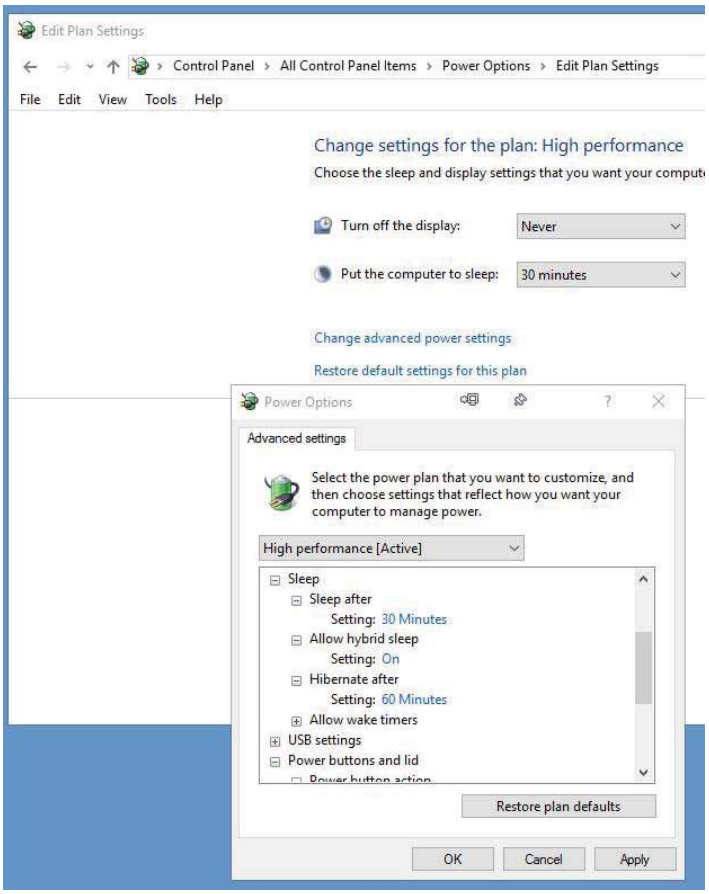
want to look at the – Shutdown settings – Notice that in order to change any of these settings you first have to click on the blue "Change settings that are currently unavailable", and that to do so, you have to be in an administrator account (that's the blue and yellow shield). After you click on it, it disappears – as in the second picture. You will probably find the "Turn on fast startup (recommended)" already checked.

If that "fast startup" is checked, when you shut down it actually will do a hybrid Hibernate. It's also referred to as "Hybrid Sleep". It's the old style hibernate available in previous Windows editions, with some changes. The old conventional hibernate copies the entire contents of memory to a disk file C:\hiberfil.sys. On the next startup, instead of a traditional boot, that is loading the OS kernel and then loading each of all the drivers and services, it simply restores the contents of that file into memory and resumes where you left off. Fast (or at least faster). For conventional hard drives it saves a lot of time. For SSDs it's technically faster. In notebooks it is useful to overcome the cheap, slow mechanical 5400 RPM hard drives.

I've observed a lot of people using notebooks where when they are finished, they typically just close the lid, putting it to sleep. Sleep is an entirely different thing. The computer – when in sleep mode is still powered up – at least the screen is shut down, and probably the

Sleep.....Continued on page 4

Sleep.....Continued from page 3



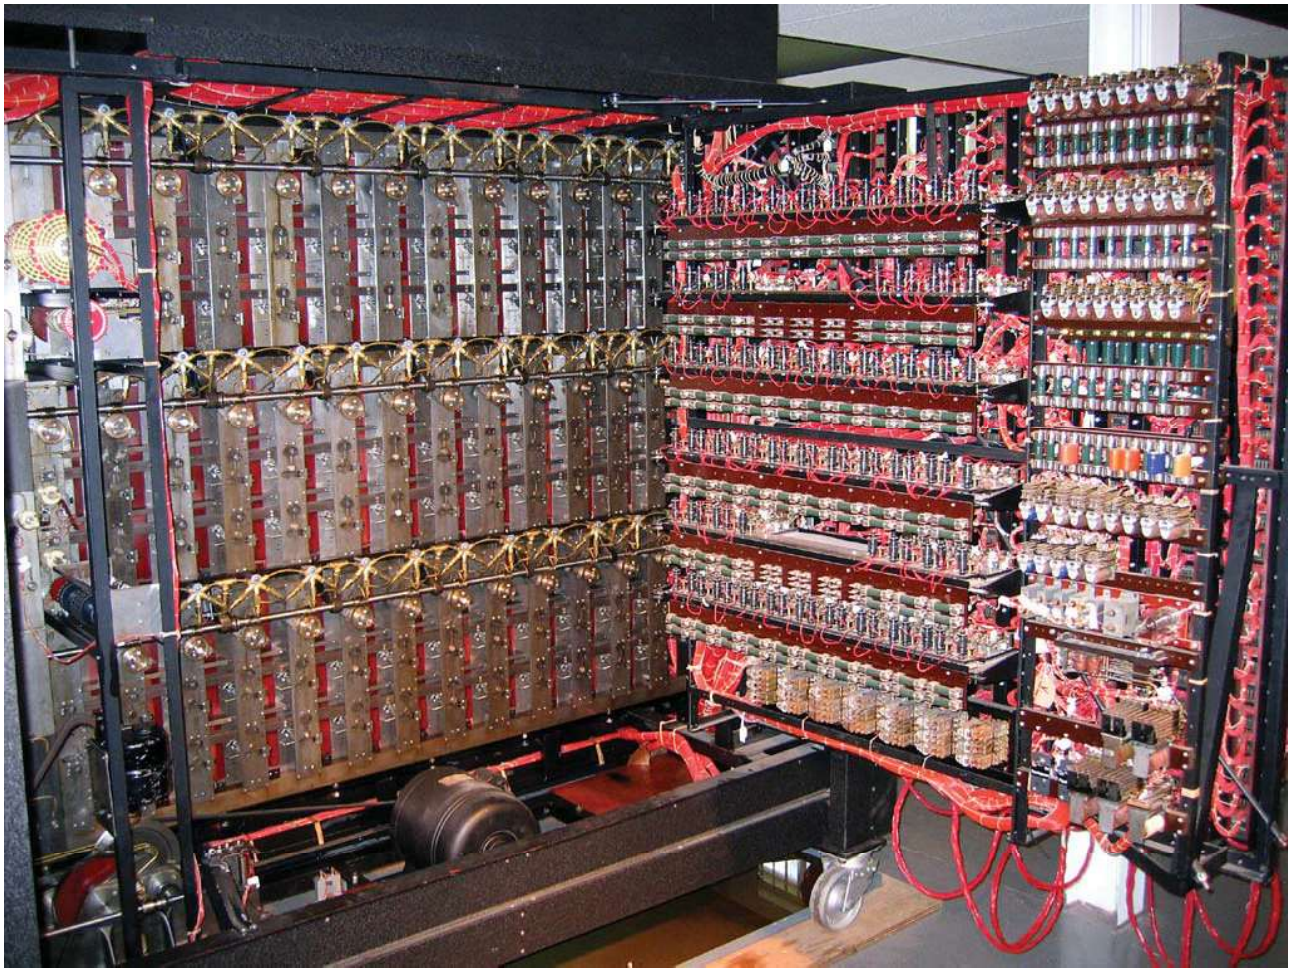
hard drive too, saving power on the battery, and the wake-up is instantaneous as long as you do that before the battery runs down (a month?). In sleep mode the contents of memory is maintained in memory – just where it was. But it will eventually die when the battery is depleted.

So far you're saying "So What?" Right? The Sleep and (old, conventional) Hibernate restore everything just as it was. If there was an open application it reappears just as you left it. Your keyboard and mouse, touchscreen .. wait a minute, my old printer isn't communicating or my external touchscreen monitor doesn't work unless I unplug it and plug it back in. Maybe you haven't seen any problems and are OK, but maybe you're looking for a reason that your scanner doesn't resume as it should. My own single problem is my new 4K monitor doesn't come back from "fast startup" (Hybrid Sleep). It's black. Not off .. that would be white in this case .. but black, and fortunately I have a second monitor so that I can do a Reset. That fixes it, but not permanently. I have a permanent solution for this if you can bear with me.

To be honest with you, since I have a very fast SSD boot drive, I have had all forms of Hibernate turned off for years. For this article, I turned it back on so I could do the screen captures, and serendipitously had the monitor problem within minutes of doing so. I have no desire to fix it other than to disable Hibernate again. But it was a big Ah Ha moment.

I said I did a Reset to temporarily fix the fast startup problem. This is because Reset is designed to do a real 100% power down and restart from scratch. It is done this way because Windows updates and application installs just couldn't work correctly if it did a sleep, hibernate or "Fast Startup".

In Control Panel, Power Options, there is a "Change advanced power settings". Click that and the Advanced settings panel comes up. Here, you can find several thing of interest on this subject: "Sleep after Setting", "Allow hybrid sleep", "Hibernate after". The "Power buttons and lid" settings determine what happens when you close the lid. Mine is set to "Shut



Down". But my notebook uses an SSD. It boots just fast enough, thank you.

"Hybrid Sleep" means hybrid Hibernate. This means that instead of saving the full memory contents to disk, it saves just the operating system kernel and drivers. It closes all applications first before saving, thus greatly reducing the size of the file and the time it takes to restart. The regular Hibernate saves everything, the intention being to restore the desktop just as you left it. Note that you can enable Hibernate and disable Hybrid Hibernate. I wouldn't, but hey – have fun.

Here's one of the big things I don't like about Hybrid Hibernate. It's indistinguishable from a real shutdown and start. You can easily think you have been doing a full shutdown all along and even wasted time trying to figure out why your mouse sometimes doesn't work. How can you tell? Well, you have to look at the settings. See if "Allow hybrid sleep" is on and "Turn on fast startup" is checked. Or maybe you don't experience any problems at all. In my own opinion, though,

Sleep.....Continued on page 5

Internet Picture of the Month

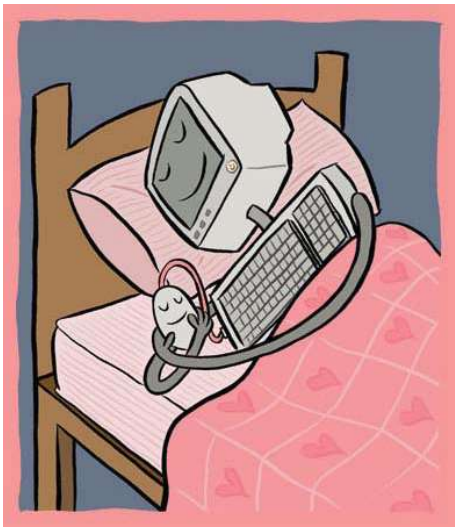
The Bombe

The first "computer" that was used to crack the German's Enigma code. The photo is of the back of the re-built machine from the site http://www.benryves.com/gallery/bletchley. There is also a good write-up there. This is the machine at the center of the recent movie, *The Imitation Game*.

Sleep.....Continued from page 4

it is peripherals – especially older USB devices that may sometimes have a problem, but maybe you don't have any of these.

On my own systems, I simply disable Hibernate using the powercfg.exe application. This has the advantage of automatically erasing the c:\hiberfil.sys file, freeing up – in my case – 12GB of file space. To do this, open a command prompt for admin. The easiest way for me is to right-click on the start menu, select "Command Prompt (Admin)". This gives you the command prompt box and command line. Here, type: powercfg /h off. There is no message that it's completed, but it should not report an error. Before doing this you can check what you're about to do by typing "powercfg /h /?". This will give you the help topic on what you're about to do. Another effect is that Hibernate no longer appears in the shutdown options. You reinstate it easily with an ON.



For myself, I use different settings between my desktop unit and my notebook. On my desktop, I set the

Sleep.....Continued on page 6

Sleep.....Continued from page 5

power setting for Sleep to "Never", Allow Hybrid Sleep setting Off – not that it would work without a Hibernate file – it can't, and Hibernate After is "Never". Obviously "fast startup" is not enabled. I do leave "Sleep – show in Power menu" enabled, but I have never used it. I just don't see any advantage in Sleep or Hibernate on the desktop. I do have a slideshow screen saver, but it's set for a very long time and it's for entertainment – pictures I especially like.

On the notebook, I have the lid set to "Shutdown", not sleep. On this computer, a quick blip of the power button will put it into sleep. It's like that because if I want it to sleep, I want it to go there deliberately. I'll admit I have used it in the car while travelling. We could make a lunch stop, and I want to leave the laptop in the car but not with an obvious screen on. I put it in sleep and then close the lid, put it out of sight but with the power cube and GPS still plugged in – it does not do a shutdown in that case, and it resumes when we return. Apparently the GPS does some sort of handshake periodically because it has always resumed. But this is rare, maybe two or three times in the five years I've had it. The other thing different is I set is the Display timer. "Turn off the display" "Never" for when it's on external power, and 30 minutes for "on Battery". The desktop doesn't have that option. The display is by far the biggest battery drainer component on the laptop. If I had a mechanical hard drive (I don't) I would set "Turn off hard disk after Setting (minutes)" to the same as the display. ◆

Preparing for Creators Update

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

I'm not sure why I was so fortunate, but one of my two Windows 10 computers was selected for the latest big update a week ago. No, this is not a sad tale, it went fine. In anticipation of that event, I had done some prep work to make sure I could recover in case of a disaster.

My objective is to get an external USB3 hard drive cloned to be exactly like the computer drive and to test it by booting from it. This makes sure you have not lost anything and can get running in minutes in case the update hoses the system. Second objective is to set a restore point. More on that later.

To create the external boot drive there is some prep work to be done in the way of disk cleanup. There is no need to move files over to the external that you don't use, that should be obvious. Cleaning up has the secondary advantage of removing unneeded files from the computer hard drive before the big update gets run. On systems with little unused space it may be critical to clean up first. Even if it's some time to wait until the update and you need to do it again, it's good practice. Besides, all computers need to be cleaned up occasionally to get rid of the accumulated crap.

The first thing to look at is your Downloads directory. This is where I accumulate the most unneeded files. Usually it's an installation exe. It's been installed, and I can replace it online, so I may as well delete it. PDF bank statements that we printed and filed – that kind of stuff. Also it goes without saying, documents and pictures, sometimes just duplicates. Excel files always have backup versions. Then it's time to do the Windows Cleanup. Open "This PC", right-click on the C: drive and select Properties, then a button called "Disk Cleanup". It goes through a system scan. You want to pick out most if not all of these categories. Notice that it includes "Delivery Optimization files", "Recycle Bin" and "Temporary Files". These weren't checked in

Creators.....Continued on page 7

Creators.....Continued from page 6

my case, so I checked them. When completed, it sends you back to the drive properties. But there's more. Click again on Disk Cleanup button, then click on "Clean up system files". There is another system scan, and if you look at categories, you'll see that some new categories have been added, the most important are the Windows backup installations files.

If you look at your C: drive – as long as you have not hidden system files – you'll may see a Windows.old directory and a couple of folders starting with $windows. In all, as I write this article, I gained 10.3GB of disk space. I also lost the ability to restore to the previous large update. But remember, you were going to lose that ability when the Creators update comes out for you anyway. And that 10.3GB may be just the critical space needed to do the update in the first place.

Next thing to look at are emails. Emails really don't take up much room unless you just don't pay attention to them, but attachments to emails do. Usually if someone sends a picture or two or ten, you copy them somewhere, and it's ok to either delete the email or delete the attachments. Some email systems allow easy sorting. The Outlook I was using and Thunderbird I now use has a column where you can click the header and sort by attachment. That gets all emails with attachments together so you can block delete them all, or open each and delete the attachment itself. When you're done restore the sort you like and then force the email client to compress its file.

Next is the system restore point. To go "System Properties", "System Protection" tab, you can do a search on "create a restore point" or right-click on "This PC", properties, and click on "system protection". You should see your hard drives, and the C: drive protection should be "On". If not, select "Configure" button and configure it on. Windows System updates have a tendency to set this off, which means you have lost the ability to set restore points. When all that is done, click on "Create" button and give it a name. I usually name it something like "before creators update" or something like that. The restore point always carries the date created regardless.

Now we're ready to clone the drive. I usually use an Acronis rescue disk that has a utility 'tools' category with a "clone" function. I've transferred this to a bootable flash drive. Usually if you buy an SSD it comes with a clone drive program that can be used, and of course you can buy one if you don't otherwise have it. You may have a good use for Acronis backup, but if not Acronis has an excellent "Disk Director" program . See our friends Gene and Linda Barlow at http://www.UGR7.com, and be sure tell them how you heard of them and whether or not you're a TPCUG member..

For my PCIE SSD boot drive, Acronis clone will not work so I use Casper at http://www.fssdev.com. It's similar to Acronis, but more expensive than the Barlow's UGR Acronis.

After the Creators update, be sure to look at System Protection to make sure the update did not disable restore points. If it did, the previous restore points have been deleted, and it's time to make one more new one. ◆

Comments.....Continued from page 2

other than Windows on its own deleted the Windows.old files.

That got me to thinking that maybe I could also get the Creators Update, and I went to the System Update and asked for new updates and was given a link to tap on to receive the Creators Update. I was informed that I was again short on disk space, and would I like to delete the files in Windows.old to acquire more space. A yes answer to that did not delete the Windows.old folder, but it did remove essentially all the files, giving me more than enough free space on the C drive to do the installation. Thus, I now have the Creators Update on my minimal Windows Tablet. Remarkable.

Cell Towers

This is an app I wrote about five years ago, and which someone asked me to update, that will display on a map all the cell towers in a selected county of a se-

lected state. Actually it is not all the cell towers; rather, all that are in the database I found at the FCC. For example, I know a rancher who leases a plot of land to a tower owner, and that tower is not in the database. Anyway, in the latest information I could find at the FCC, there are a lot of towers in the current database – 240,401 nationally, 882 in Hillsborough County, FL and 4,757 om Los Angeles County, CA. At first, I didn't want to bother updating the app; then, I thought, why not?

I will be updating the app to have that new data along with a new interface where it will run on a Win 10 desktop, Win 10 tablet, a Win 10 phone and hopefully an Android phone and tablet and eventually an iPhone and an iPad. The Windows 10 work and the Android work are close to completion; the iOS work, yet to be started. I make no money on such apps. It's a hobby.

June in Tampa

Meeting

No Meeting in June

Meeting Preview: The June 14th meeting is cancelled and will not take place. As noted in the article on Page 3 by the President of TPCUG, we are considering not having any meetings over the four summer months of June thru September. No final decision on this summer hiatus for meetings has been made, so you are encouraged to check in on the TPCUG website to confirm when the next meeting will be held, which could possibly not happen until October 2017. Read President, John Witmer's article regarding this on page 3.

To *be, or not to be, that is the question* is a famous quotation from Shakespeare's *Hamlet*. It is also the quandary that now faces our club. We have existed since 1984. I joined in 1991 and have been doing the newsletter since December of 1995. Some of you have been in the club almost from the beginning. At one time we had in excess of 200 members. Now it is around 30 with sometimes as few as a dozen attending the monthly meeting. At one time we had national presenters such as Microsoft, IBM, Corel Draw, Harvard Graphics, Delrina, and Word Perfect – many of which no longer exist. Perhaps the TPCUG should no longer exist; perhaps it has served its purpose of educating person computer users. I know I have benefited much by being a member and contributor. But now we have the Internet, which seems to be enough for most people. Read John Witmer's letter on page 3, think about the situation and let's come to decision over the summer. ◆

Minutes of the May Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. Merle Nicholson, the SIG moderator introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees.

Merle Nicholson (myself) moderated the Windows SIG portion of the meeting and then moved on for the rest of the evening with "A Sticky Math Problem". I had an ulterior motive in that I wanted to introduce my favorite computer language to the group, hoping that perhaps someone may be interested in it. But what intended to accomplish was resolving a way to express the gearing on my 21-speed bicycle in terms that are easily understood, and to be able to introduce the variables (variables are cadence and physical gear set replacements) to demonstrate my current dislike of my gear ratios. I used APL, (A Programming Language) one of the oldest computer languages and fairly unique in that you can use the full capability interactively. That is, see immediate results and then choose if you want to include it as a program so you can introduce variables to see what different results may be obtained. In my case I wanted to show the entire 21 speed range expressed in Miles Per Hour and to recalculate it with different cadence (cadence being how fast you are pedaling) and a different cogset (the rear set of 7 gears) that are commercially available. Some of the members had useful suggestions along the way, and perhaps some interest in APL. The program content was a bit unusual for our group, but I think pretty successful. See http://www.dyalog.com for free software, tutorials, books and other documentation, be sure to look at years of annual symposium presentations available online at http://video.dyalog.com , and http://tryapl.org. ◆

Message Regarding the Current Status of the TPCUG

By John Witmer, President, Tampa PC Users Group
jwitmer@outlook.com

Fellow Members of the Tampa PC Users Group: The June meeting scheduled for June 14th is being cancelled at this time and will not be held. We have at least three Board members who will not be able to attend, including Merle Nicholson, our SIG moderator and one of our main presenters. Doug Mullis will also be out of town, and he has not been able to secure any presentation for June. Additionally I am gone for the rest of the summer and early fall. I also know of several regular attendees who cannot be there in June, so it makes the decision to cancel the June meeting as the only reasonable course of action.

I think this is the first time I can remember that a meeting had to be cancelled entirely. With our dwindling attendance at the monthly meetings, it is time to address the question of how much longer will we continue to be a viable computer club, and what, if any, action needs to be taken to keep the club open for meetings and a source for information to be shared among the members. TPCUG also serves as an opportunity to meet periodically with fellow members sharing the same interests and insights into the world of computing. We have been very fortunate to be able to continue to meet at the Pepin facility long after I retired from there. I do not see that changing in the foreseeable future, so a place to hold meetings is not a consideration in the discussions about our future, unless there is a feeling the Pepin location is not suitable for some reason.

This year we suspended the collection of dues from those members who were paid up and current as of 12/31/16. Our bank balance indicates we do not need to continue collecting dues for the foreseeable future. I think this makes sense, and yet allows us the ability to continue having a newsletter printed and mailed to each of us, and pays for the Holiday Party we have each December.

The factors affecting our TPCUG are no different than those affecting other computer clubs and organizations across the country, including the Florida Association of Computer User Groups, and the APCUG national organization. As Treasurer for the FACUG, I can see firsthand that membership by clubs in the state continues to drop, from over forty clubs 5-6 years ago to less than 20 this year. Some clubs are disbanding or dissolving, and others exist solely within the residential community they draw membership from and are a quasi-social club in addition to being a computer club. Outside speakers and presentations are virtually non-existent, and all clubs have this same problem. With our ever smaller group, we rely on just a couple of members for providing each month's program, and so far, it has worked pretty well for us. But even these presenters grow tired of the monthly obligation to provide a meeting topic and presentation. So, what are our options? Listed below are a few that come to mind, and you may have some of your own to contribute to the discussion. We need to begin having this discussion to determine where we go from here. I have been asked to get the discussion started.

The obvious solution would be to join the many other clubs that have dissolved and no longer exist or meet. It might be the easiest answer; however, I personally would prefer to not go this route if at all possible. I would like us as a group to come up with a workable answer that takes some of the huge burden off of certain members, and gives them a periodic rest from the monthly obligations of a newsletter and program.

My initial thought would be to do like many of the computer clubs in South Florida, and suspend activities over the summer months when members are traveling and returning to other places they have back up north. We could make the months of June thru September as non-meeting months with no newsletter created or provided, and then resume monthly meetings in October until the following May, after which we would again take the summer months off.

Members would be able to reach out to each other during the summer to get questions answered, or problems resolved, but just not in a formal meeting setting. I would think and hope that those technical savvy members who provide assistance would be willing to do so over the course of the summer, and that this would not be an inconvenience for the limited investment of their time and talent. Perhaps website content or a different form of communication could be provided for any member wishing to communicate an event or story they want to share

with the group or perhaps some other form of staying in contact.

There are other options that can be considered, and I leave it to you, our members and officers, to offer what else you would like to be considered. I hope you will respond to the email sent out to you and all the other members and reply to all, so that your comments and suggestions can be shared within our group, and help foster a dialogue as we move forward on what course of action the group members would like to see.

Sincerely,
John Witmer

December Meeting: Wednesday, December 13 6:30PM
Annual Holiday Party for members and guests at Pepin
January Meeting: Wednesday, January 10 6:30PM
Bob Gostischa from Avast Software
"If it's Connected it Needs to be Protected"

December 13th Annual Holiday Party

The December TPCUG Meeting is this Wednesday, and it will be our Annual Holiday Party for the Group. It starts at 6:30pm at our regular meeting place at Pepin Distributing Co. The menu of items will be similar to past years, including chicken nuggets from Chick-Fil-A, shrimp with cocktail sauce, other hot hor d'oeuvres, cheese and crackers, miscellaneous other snacks items, and chocolate & various other desserts. We will have soft drinks available along with water, but no alcoholic beverages. We hope you are able to attend, and look forward to seeing you at the party. You only need to bring yourself to this event, as our Group treasury provides for all the food and beverage.

January 10th Upcoming Meeting Presentation

We are scheduled to have Bob Gostischa from Avast Software present his new program “If It’s Connected, It Needs to be Protected”. His presentation will cover computers, tablets, phones and the Internet of Things (IoT) devices, and will discuss the current dangers that face us on a daily basis, and how to secure and protect those same devices. It is not often we are able to have outside presentations made to our group, so please plan on attending this informative January meeting and help our group show support and appreciation for Bob making us one of his stops on this winter’s Florida tour of user groups. Mark your calendars or reminder list now for the Jan 10th date of this meeting.

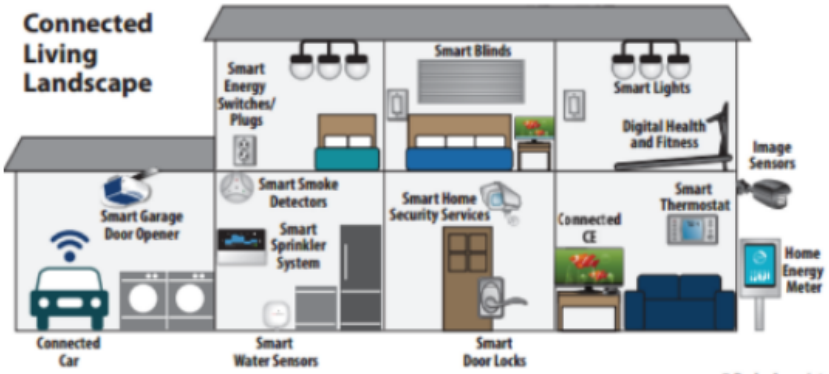
Upcoming Meetings:

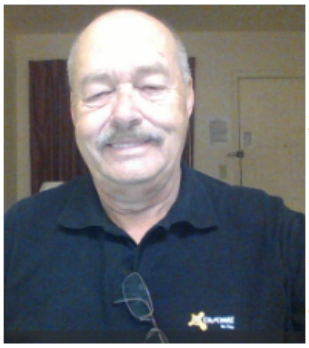
January Meeting: Wednesday, January 10 6:30PM
Bob Gostischa from Avast Software
"If it's Connected it Needs to be Protected"



January 10th Upcoming Meeting Presentation

Our Presentation for the Jan 10th meeting at Pepin Distributing Company will be done by Bob Gostischa who represents AVAST security products to the PC groups across the country who are members of APCUG. It is not often we have a presentation available to us from someone outside of our User Group, so I encourage you to make plans to come out this Wednesday to hear Bob's presentation. I would love to see a full house in attendance if you can possibly be there. - John Witmer

Here is some information about Bob and his presentation:



Bob Gostischa's 2018 Presentation

If it's Connected, It needs to be Protected

Updated information on why and how things that connect to the internet need to be secured and protected.
This presentation will cover: Computers (Windows and Mac), Tablets, Phones and the IoT (Internet of Things.

Join presenter Bob Gostischa, as he explains the current dangers that face us on a daily basis. He'll also share what he uses to keep his computers, smart devices and other connected things that are a part of the IoT.

About the Presenter:
Norbert "Bob" Gostischa, after a successful career in banking, enjoys his retirement as an enthusiast IT security expert, most notably for **Avast Software**.
Avast is the creator of avast! antivirus software.
The Avast website has a discussion and help forum, where Bob has been helping with security-related and general computer issues since 2004.
He has contributed over 35,000 forum interactions. Avast Antivirus s.r.o. is currently the most used antivirus software in the world.
Avast has been making security software for over 25 years and has more than 400 million users worldwide.
Although Bob's presentation is not a sales pitch for Avast, mentioning Avast and their Software in your announcements, would still be appreciated since they pay all the bills. **There is no charge to the Club, Usergroup or, Organization for Bob's services.** You can also learn a little more about Bob's presentations and passions in his Blog and YouTube Channel. BobG. is also a proud member of the APCUG Speakers Bureau.

The following is an excerpt from an email from the APCUG that should be of interest to us all. - JW

UPDATE YOUR IPHONE AND MAC NOW: APPLE CONFIRMS VULNERABILITIES- iPhone and Mac owners, you're not escaping unscathed from the flaws affecting the processors inside laptops, PCs and smartphones. Apple confirmed tonight (Jan. 4) that the security issues known as Meltdown and Spectre also affect Mac and iOS devices. Read more at this Tom's Guide article: http://bit.ly/2m0oJVR

HOW WILL THE MELTDOWN AND SPECTRE FLAWS AFFECT MY PC? - What Are Meltdown and Spectre? -Spectre is a "fundamental design flaw" that exists in every CPU on the market—including those from AMD and ARM as well as Intel. There is currently no software fix, and it will likely require a complete hardware redesign for CPUs across the board—though thankfully it is fairly difficult to exploit, according to security researchers. It's possible to protect against specific Spectre attacks, and developers are working on it, but the best solution will be a CPU hardware redesign for all future chip Read more of this How-To Geek article at: http://bit.ly/2qshuf6

Windows 10 recovery (from disaster).

by Merle Nicholson, Secretary TPCUG

In case you've missed this along the way, every Windows 10 computer needs a recovery USB drive in case of a software failure. This allows you to start the repair process when something goes bad. Believe me, eventually something will go bad, and when it does, you'll be prepared.

The process of recovery has been steadily improving with each new major update, and it's within most users ability to do this successfully, provided you have set things up right. So do this while you can – the preparation obviously needs to be done *before* the disaster – right now.

First a setting needs to be made – or at least checked to make sure it's been done. In Search, type "create a restore point", and select "Create a restore point". That should get you to the System Protection settings.

Notice that the (System) drive (C:) is On, others are off. If you have found that the system drive was off, there are no system restore points. Enable it, then create a new restore point right now. On the Configure page, you can control the amount of storage allocated for this function. Mine is about 2.5G.

After doing two major OS upgrades, I have found that the Microsoft update had set protection Off, much to my annoyance, so it's best to check on it.

The restore point is used for the recovery process. If a software update or failure (virus, malware) happens, you can revert back to a time when it was working well. Most major updates automatically do a new restore point prior to installing, and of course you can initiate it yourself. I usually do this just before installing any major software.

Now for the recovery process. You need to make the bootable recovery drive USB. You boot from the drive in case Windows is broken and cannot start. It needs to be at least 8GB. Put a label on it and save it somewhere obvious, like taped to the PC or hanging from a cord attached to the ceiling.

To create the drive, find “Create a recovery drive” in Search. Be sure to check “Back up system files to the recovery drive”. It will tell you to insert a USB drive.

I've had to rescue a user twice now because Windows would not boot. Fortunately, I had been asked to set up his computer when it was new and I had turned System Protection on then. There is much less risk to personal files if a restore point is available. That's it. You can save yourself a couple hundred bucks when your system goes bad and won't start on it's own because you can maybe fix it yourself.

"Display media content on another screen"

February 14th Upcoming Meeting Presentation

After the Windows SIG and short business, Merle will connect a Chromecast device and display content from an Android device and Windows 10 to the screen wirelessly. This is a very inexpensive way to get content such as Netflix, YouTube, HBO, Hulu, ESPN, internet browser and more to a large screen, TV or anything with an HDMI input.

Before the meeting, you can preview the Chromecast device capability at:

https://store.google.com/product/chromecast_2015 and

An Easier Way to Find Netflix Movies

By Ron Weinberg, TPCUG

The vastly popular and almost universally used streaming service stocks a myriad of movies, numbering in the thousands. The Netflix program itself offers a search tool and displays choices somewhat tailored to your previous viewing.

If you know the name of the Movie or Performer you wish to see, the built is search is adequate.

However, if you have trouble deciding or the choices offered don't seem to fit the bill there are some other excellent tools to help. Most require you to already be a Netflix Member in order to

Immediately transfer your selection to Netflix.

Netflix Streaming by Alternate Genres (Extended List) is a list of all categories from Action and Adventure to TV shows. It includes everything: Children's, Action, Sports, Drama, Romance, Multiple Foreign, Documentaries, Thrillers, Horror, Independent Films, Musicals, Sci-Fi. Comedies, etc. It runs on line in your Browser. Simply clicking on a line item brings you directly into Netflix and displays a selection of films to watch on your PC or to allow you to add to your queue (List) for future viewing on PC or TV. This is the link to it.

http://ogres-crypt.com/public/NetFlix-Streaming-Genres2.html

There are quite a few other index/search programs available, some more sophisticated, allowing particularly tailored searches to satisfy your requirements. Here are some which you can review if you need more than the Streaming Genres of Netflix.

Lifechecker's Flix Plus Extension for Chrome (Customizes the Netflix Interface.)
http://instantwatcher.com/ (For both Netflix and Amazon)
http://fixable.com/
http://flicksurfer.com/

If you stream from other sources such as Amazon, hulu, VUDU, Crackle, epix, HBO, STARZ, Acorn, etc., try search programs that include many or all available streaming apps, including Netflix.

Some provide access to foreign or worldwide content.
Here are a few examples:
http://justwatch.com/
http://canistream.it/
http://allflicks.net (a gateway to reelgood.com)

Remember that these are only search/index aids and do not avoid the need for any required paid memberships.

COAX A WEAK LINK?

Prepare Now! You may not be as safe as you think!
By Ron Weinberg, TPCUG, March 2018

We all know about Tampa's notorious May to October Lightning season, (not to be confused with our Hockey team) which has been known to last over 80 days. Electronic equipment is dependent on the smooth and regulated flow of electricity. Uncontrolled variations from whatever cause can inflict serious damage. Nothing can protect you from the power of a direct lightning strike. The best protection you can take is to unplug everything which is totally impractical.

For many years my equipment (power plugs) have been protected by high quality surge protectors from Tripp Lite and APC which had high joule ratings. I thought I was safe.

Last June, an expensive High Definition television set suddenly failed for no apparent reason. At the time of the TV failure there was no discernable lightning. House lights did not drop or even flicker and no other TV, electrical device, or equipment seemed to experience any difficulty.

The HDMI port and the circuit board of the TV was damaged beyond repair. The TV repair technician said the fault was caused by Brighthouse equipment and that they would compensate me, which I doubted. A claim was filed with Spectrum-Brighthouse. An inspector came and made a report but was not optimistic. I replaced the TV at my expense. While trying to set up the new TV it was determined that the set top box and my HDMI connected ROKU Box also had failed, and had to be replaced. Not surprisingly, Spectrum declined my claim for responsibility.

It is possible that the Roku failed as it was connected to the damaged circuit board of the TV.

The likely path of the destruction was ISP's COAX to set top box and HDMI from box to TV. The problem may have been caused by an electrical issue on the COAX or the failure of the set top box, which itself could have been caused by the COAX line.

What can be said for certain is that some surge or power variation entered my system. Damage was limited to the one area. Since all wiring is vulnerable, the least protected closest to the damage was the COAX.

COAX (Coaxial Cable)

Coaxial cable is a type of electrical cable that has an inner conductor surrounded by a tubular insulating layer, surrounded by a tubular conducting shield.

COAX is omnipresent, a basic part of every installation. You are connected by COAX cable at your ISP's input to the structure and by COAX to Modem or Router and set top boxes. A Satellite Dish also enters through a COAX cable. Antennas too, generally have adapters to connect to the COAX port.

Modern television sets receive input through COAX via set top box to HDMI or to an out COAX cable.

Even old component video or RCA type stereo/composite cables, if still used, can originate from your set top box. In some cases, where there is no set top box, COAX cable is directly connected to the TV.

The ISP reportedly protects the COAX by grounding but is that sufficient? Some surges can even bypass ISP equipment and directly affect electronics. Any type of wire or cable in the home or office,

including COAX is susceptible.

I am not an Electrical Engineer. Research indicates this subject is controversial, pro and con. Some articles say that it is not necessary to further protect COAX beyond the ISP's grounding or even not to. When protectors are used some signal degradation can result but if the signal is strong would be minor. This should not be an issue with better quality protectors. Were it not that we are in such a lightning prone area and that I have already sustained a loss I would tend to heed that advice, but we are. Brighthouse does not encourage or discourage use but rather indicates specific specs required for the device. The fact remains that we are in an extremely vulnerable area.

Expensive stereo equipment and Televisions are better protected when COAX is monitored. This extra protection, a belt and suspenders approach, is readily available at a reasonable cost. I am in the process of replacing the surge protector at each television, closest to the endangered device rather than at the incoming modem router, with a more adequate model containing coaxial protection.

There are many choices of protective devices with various numbers of ports, most available from Amazon. Here are just two examples: Tripp Lite Isobar 10 HT10DBS and APC 11 PV11VNT3. Both include Equipment Protection Insurance which pays if they fail to protect and you sustain a loss. If specific specifications are required check before purchase. Bear in mind that you must pay more for quality and reliability. Very low priced items from lesser known manufacturers may not do the job.

Pg 2-4 Amazon Echo and Google Home Mini by Merle Nicholson

Pg 5-7 FREE 2018 SPRING VIRTUAL TECHNOLOGY CONFERENCE (VTC)

Amazon Echo & Google Home Mini
By Merle Nicholson, secretary TPCUG

Four days ago we received a Google Home Mini and have it installed just about three feet from our Amazon Echo. We're using both Mini and Echo even though they do largely do the same things. There are definite differences though and as we're learning each strengths and weaknesses, we're currently planning to leave them where they are and use them both. We'll see.

In case you're living in an off-the-grid cabin in Montana, both devices are voice-command connections to the internet and have a lot of built-in functions that serve as a personal assistant and access to vast amounts of information. You interact with them by voice, but they require an Android or IOS application for setup, and you can further interact through that app on your phone or tablet, even remotely. Everything you do on either the device or on the phone is recording a history that is a part of the app. Both products' capabilities are evolving and since the firmware is updated remotely, we are expecting them to last a long time.

We have plenty of experience with the Echo. Ours is three years old this month. We pre-ordered it in January, 2015 and it was delivered in May. It is used every day. It's located in our media area above the TV on a shelf. If you look it up on Amazon, there's a later - second generation version now at $100. By the time it was delivered to us the price was $200, and we got a pre-order discount at $105. This model is tall and has an excellent speaker system worthy of listening to good music.

For the Google Home device, we opted for the mini at $50. It's hockey puck size, attractive and unobtrusive. The speaker is very good for voice and is pretty much worthless for music. There are three models; Mini at $50, Home for $130 and Max for $400. They are available in a variety of stores or directly from Google - everywhere but Amazon.

Both products have an app for Android and IOS. My experience is completely about Android. I'm assuming IOS functions are identical, but I have zero experience with that. The Amazon Alexa app is specifically for Amazon, and there are required setups and for interconnecting devices that must be done within the app. Then the Alexa app can also be used just as if you're interacting with the Echo device either by voice or keyboard.

The Google Home app is more tightly integrated within an android phone or tablet. That's because the Home device and Google Assistant are one and the same. When you speak to the Home device, you're interacting with Google Assistant and obviously, Google Search because Google has integrated the two for Android 6 and up. The Google Assistant integration is what triggered our purchase of the mini, along with the realization that it can control our Chromecast device on the TV as well. More about Chromecast further on. Our interest really peaked when Google Assistant recently became the search engine for Android Auto.

Music
We almost never play music even though the Echo has plenty available. Being an Amazon product, my Amazon personal music library includes all the music CD's I've ever bought from them going back many years, and of course they're all my personal choices. This is in addition to the huge Amazon Prime library. It's interesting to be able to choose music by voice command, but after the initial amazement, it's just too tedious. A better choice is to set up Amazon Music on a tablet, and command the Amazon Alexa app from there. Echo knows all about Amazon Prime Music Playlists. Now I would never have a playlist otherwise since I play albums, not songs. So to abbreviate the process of identifying an album, I can create a playlist that contains just one album. This works because I can just say "Alexa, playlist Rare Bird" and get a specific Steve Martin album, instead of some random

accidental pick. But it's just too tedious, and there's no way to track fifty playlist names. And by the way you would NEVER ask for anything random, because you'll probably get some loud four-letter rap song. That happened once to me in the car and I could have had an accident in scrambling to turn it off.

Google has "Google Play Music" and "Google Movies and TV", "YouTube", "YouTube Music" and "Youtube TV", all of which you can direct to a Chromecast device. I don't use any of these services except YouTube, which I use a lot on either my tablet or notebook. When on the tablet, I can direct any content to the TV using the Chromecast. Experimentally after discovering the Home Mini speaker is unsuitable for music, I directed a 70's song Valerie wanted to the Chromecast using voice command on the Home Mini. It was simple to do, and doing so turned on the TV and started playing through the stereo system speakers attached to the TV speaker output. By default, apparently it uses "Google Play Music" which we do not subscribe to, but nevertheless has an extensive library of free music.

Devices
We control our house thermostat a couple of times a day especially when we're baking in the kitchen - we lower it a couple of degrees then set it back to normal when we're away from the oven. The Echo is within voice range of the open kitchen downstairs. The house thermostat is on the second floor saving a trip up and down, although we do have specific Android apps for the thermostat, but this is really easy and fast. We have daytime and nighttime temperatures, and since we are night owls setting by voice is better for us than setting rigid schedules.

Our security system can be queried, armed and disarmed through Echo voice command, but although we test it, it's never been used. A more useful feature is querying the status of the garage door. It's a detached garage and we're very cautious about leaving it open accidently. The door could be opened and closed by Echo voice, passing the command onto the security system. It works, it's never been used, but comforting because of its remote capability. I'm sure that we could also send a voice panic command to the alarm company. That would be useful. I just thought of it.

Last, we have one controlled outlet (so far). I found one at Amazon for $13 that needs no hub for controlling by both Echo and Home. It works really well, it's fast, and we're delighted with it. Looking at these devices, many are in the $40-$50 range and need some kind of controller hub. I gave it a name "Living room light" and we can say "Alexa .. living room light off" or "OK Google living room light off"

On the Home Mini ,we have connected just the outlet. I did that just for the experience to see how difficult it is (about 1 minute). It isn't set up for security or thermostat, and there's no reason to.

Day to Day use
We use both Echo and Mini many times a day. Since we bake (mill flour, bake bread, cake, pies, scones) , cook and Green Egg Grill, we get a lot of use out of timers. "OK Google set timer for five and a half minutes" or "Alexa set timer for one hour", "Alexa time remaining?", "Alexa cancel timer", "Alexa Stop". They handle multiple timers - I don't know how many. This is an excellent, capable way to set cooking timers. We have abandoned use of our kitchen timers.

Weather reports - "Alexa .. is there rain nearby?", "Alexa what is tomorrow's forecast for Seattle?", "Alexa, seven day forecast", "Alexa is there rain today?"

Much other stuff. Just today - "How old was Chief Dan George?" (119 years this July), "When was Little Big Man made?", "what time is it in Barcelona?" - (Tennis match). "Hours difference in Barcelona?", "How many days since February second 2018?" (answer 83 days to mark in the log for changing the water filter).

We do lots of conversions like “convert 23.4 degrees centigrade”.
“Distance Paducah, Kentucky to Kansas City” (ans - 419.8 miles, 6 hours and 23 minutes via I-70 . . trip planning .. remember paper maps?)

Differences Echo vs Home
We have had the Home Mini just for a few days, but a few things stood out from the beginning. The Mini is way faster. When you want to say something to Echo, you say “Alexa” .. hesitate .. look at the blue listening light and the listening sound then say what you want. It’s fairly fast, but you can’t just command it. You have to use the “wake” command, then say what you want. With Home Mini, you just say “OK Google living room light on”. It gives the impression that it’s always listening. I can see that it may put you off, but it’s doing it the only way it can to accomplish the task really quickly.

We’re both convinced that the response in looking things up on the internet is much more powerful on Home. It has really impressed us several times with its responsive speed. Valerie asked for some sports score the other day kind of vaguely and Home had a surprising fast answer. She immediately asked the same of Alexa, and got a “Sorry I don’t know the answer to that one.” Sports scores aren’t something we’re interested in, except rarely for major tennis tournaments. The Echo has never satisfied us in any case, but today the Home came up with a detail score at the Barcelona match quite by accident when we were trying to find the home country of a player. (Tunisia). We have the impression that Echo knows American football scores really well though.

Valerie and I set up our Android Google Home apps on our respective phones and linked them to the Home Mini. The app wants to do a voice recognition process and link it to our respective Google mail accounts, which also links to Google Calendar and Contacts. It’s easy to set up, just do what it says. Then I ask “OK Google who am I?” it says “You are Merle”, and for Valerie it says “You are Valerie”. So if I ask for my next calendar appointment it recognises my voice and uses the appropriate calendar.

I’m assuming I can send SMS and email by voice command and for the two of us use the correct address book and sending email account. I’ll try that.

The Echo does have multiple accounts. I had to research for the instructions to set them up, and it did not seem trivial to me, and as far as I know you have to name the account to switch it to. I saw no indication that it recognizes the voice to decide who you are. We would leave it on my account in any case because we use Echo for information on shipments from Amazon which it does really well. Valerie and I use one Amazon account (mine).

You can make internet telephone calls from either device. I have not done that yet, but I’m especially intrigued by the Google setting where you set the caller ID that you want to appear on the callee’s screen. It defaults I think to the number on the phone you set it up on. The Echo will make Echo to Echo calls, if that is of interest. Google has always had “Google Voice” available as an Internet-caller-to-POTS bridge, and I noticed when I looked at it that it knows my one Google Voice telephone number and offered that number to use for Home device internet calls. In my case it’s attached to a FAX machine so perhaps it’s not suitable.

Being an android user I’m delighted to have the same Google Assistant on my phone, car and living room voice commands.

We are very happy to have these in our home. They’re unbelievably useful. At only $50 I’m looking at someday getting enough use to have one in every major room in the house. It could happen if it keeps evolving at the current pace.

FREE 2018 SPRING VIRTUAL TECHNOLOGY CONFERENCE (VTC)
SATURDAY, MAY 5
1:00 pm – 4:00 pm ET / 12:00 – 3:00 CT
11:00 – 2:00 MT / 10:00 – 1:00 PT

Thank you for forwarding this message to your members.

Attend APCUG's May 5, 2018 Virtual Technology Conference (VTC) from your own home, invite some of your members to join you, or have a Technology Tailgate Party with your club members!

You only need to register once; you do not need an Eventbrite account to attend the conference. Before the VTC, you will receive an email with directions and links for attending both conference tracks.

You can attend using your computer or tablet with Zoom software. The sessions are 50 minutes in length and offer attendees the opportunity to ask questions via a chat window.

Make sure you have the latest version of Zoom for your device. "Zoom Client for Meetings - The web browser client will download automatically when you start or join your first Zoom meeting and is also available for manual download here."

https://zoom.us/download

When you attend the conference, please sign in with the user name and e-mail address you used to register for the VTC.

Register at Eventbrite

TRACK 1

1:00 PM ET

AI Assistants / Smart Homes
Joe Melfi, Mobile Road Warrior and Die-Hard Tech Enthusiast

Description TBD

2:00 PM ET

What's new in the Spring Windows 10 update
Jere Minich, Program Chair, Lake-Sumter Computer Society

Microsoft is readying the release of its semi-annual update to Windows 10. The upcoming update is expected to be called Spring Creators Update - Windows 10, version 1803. There are several new and useful features coming your way with Spring Creators Update. Here are the headlines, they will all be covered:

- **Timeline**
- **Nearby sharing**
- **Focus assist**
- **Password recovery for local accounts**
- **Choose your GPU (graphics processing)**
- **Windows Diagnostic Data Viewer**
- **Mute tabs in Edge**
- **Swift Pair**
- **Better privacy**
- **A better Microsoft Store**

3:00 PM ET

Teaching Computer Skills to Seniors
Ray Baxter, Payson Computer Meet-Up Club, APCUG Treasurer

As we know, Seniors are special; some are up-to-date with technology and some are still learning about it. Ray's presentation will give us tips on how to open the world of technology to seniors as well as enhance the skills of others.

TRACK 2

1:00 PM ET

Synchronizing Your PC, a Guide to…..
Bill James, VP, Computer Club of Oklahoma City; APCUG Advisor, Region 8

There are numerous ways to sync desktops, laptops, tablets and phones.
From the complex to relatively simple solutions, this presentation will cover sharing over a

network, local file sync programs, LANs, Cloud services and more.

2:00 PM ET

What's new with Ubuntu?
Orv Beach, Training Chair, Southern California Linux expo – SCALE

Named "Bionic Beaver," it is a Long-Term Support release with 5 years of support for both the desktop and server version. What's new?

- **Minimal install option**
- **Faster boot speed**
- **Easier live patching**
- **New Linux Kernel**
- **GNOME desktop environment**
- **New default apps**
- **New way to install apps**

3:00 PM ET

Write and Publish Your eBook on Amazon Kindle… for Free
Bill Neves, Member, Silvercom Computer and Technology Club

In this session you'll learn how to easily and quickly do the following:
- **Research your book**
- **Write your book**
- **Name your book**
- **Format your book**
- **Set up your Amazon Kindle account**
- **Upload your book**
- **Offer your book for sale, or free**
- **Rinse and Repeat**

Vol. 31 No.9 September, 2018

September 12, 2018, 6:30PM meeting at Pepin

Upcoming meeting presentation

Dave Palmer, TPCUG member

'How the Russians Hacked the 2016 Election'

The presentation will include discussion of the techniques & tools the Russians used to plan, research, gain & maintain access, and cover their tracks. Also included are techniques you can use to stay safe from the bad guys, whether state-sponsored, or cybercriminals. The presentation is based on the 2018 Mueller indictment.

Dangerous invasive species

by Merle Nicholson, secretary TPCUG

I'll admit, this is far from a technology issue, I hope for forgiveness but I'm in the middle of a cane toad crisis and I'm constantly surprised that it isn't well known. I've shown my neighbors one and they always say "oh - a Frog".

We – my spouse and I - have killed several cane toads in our back yard recently – yes you got that right, killed. They are an invasive species not native to the US. The Tampa area used to be at the northern edge of their range, but I'm sure that's creeping northward with global warming, and we're certainly seeing an increasing number at our home. This happens yearly during our summer rains.

Cane toads were introduced to the south florida sugar cane fields to control insects and is one of those great ideas gone wrong. They're dangerous because they exude a toxin that's deadly to other animals. If a dog or cat gets his mouth on one, the dog has about 15 minutes to live suffering a horrible, painful death usually of a heart attack. A bite on the toad isn't necessary, the toxin invades through the mucus membranes in the mouth and eyes.

The size of the toad – another name is "Giant Bufo" - doesn't matter. They are just as poisionous when tadpoles. They are laid as eggs – about 25,000 in one clutch, and I guess fortunately, are cannibals so they feed on each other and only a few survive. But given time and a food supply they can grow quite large – 6 to 9 inches. The ones we have been seeing are about five inches long, but I'm assuming these are fairly young.

The prescribed method of humainly killing them is to put them in a zip-lock bag and freeze them for a couple of days. The State of Florida says that they are to be killed when found. They are easily identified – cannot be mistaken for a friendly frog. They are mottled brownish and are extermely well hidden in soil or vegetation or mulch until they feed just after dark. We have found just a couple in daylight, but usually find them from their motion from a flashlight. They are relatively easy to catch, but if they detect pursuit they'll move faster than you could pursue. We use a frog gig on a 5' pole. We keep a "toad kit" at our back door consisting of the frog gig, gallon ziplock bag and plastic disposable gloves.

The State of Florida website states that if you have what looks like a toad that is 4 inches in length, it's definitely a toad. Their legs are shorter in proportion to their bodies than a frog, and if you're interested, the Wikipedia site has a recording of their sound. They're quite noisy after a rain, and the sound is distinctive.

Our main concern is our dog. For many years we cannot turn the dog out for his final poop, we have to walk him on a leash in our own back yard, scanning with a flashlight, and it's that walk that we invariably find a toad, sometimes a close call.

They are capable of limited climbing a tree, maybe a couple of feet to escape but I don't think that's a regular activity.

There are pictures available on the internet, just Google "cane toad". I have taken some pictures myself, but not suitable for publication here. We found a dead toad just two days ago laying on our potting bench top outside. We cannot imagine in any way how it got there except perhaps from a screech owl dropping it there.

There are huge areas of Australia that have been invaded and there are some interesting YouTube videos where people are attempting to deal with them including grinding them up to manufacture fertilizer.

Vol. 31 No.10 October, 2018

October 10, 2018, 6:30PM meeting at Pepin

Upcoming meeting presentation

"Chromebooks 2018"

Merle Nicholson, TPCUG member

There have been some major changes in Chromebook product lines; availability, cost and capabilities. If you're planning to buy a new laptop, it makes sense to consider Chromebooks as an alternative to Mac or Windows 10. They're available everywhere now.

There are opportunities to re-use older Windows notebooks by installing a Chromebook OS called "Neverware CloudReady" at https://www.neverware.com

We'll be using a presentation from the 2018 collection of APCUG Virtual Tech Conferences.

Upcoming meetings

<u>November 14, 2018, 6:30PM</u> at Pepin: CRIME PREVENTION TASK FORCE

Crime Prevention Task Force is a community service organization developed by former law enforcement officers. Our mission is to achieve more awareness by the public of the criminal threat facing everyone in today's society and show effective measures to counter that threat.

We support the community, businesses, groups and organizations by providing free crime awareness programs. Our speakers offer current information on all aspects of the crime problem, and recommended tested procedures to enhance personal safety.

The Program requires only 30 minutes, although 40 minutes are recommended to accommodate questions and answers.

Topics discussed are:

*** Identity Theft * Fraud and Scams**

*** Purse Snatching * Guns and Alternative Weapons**

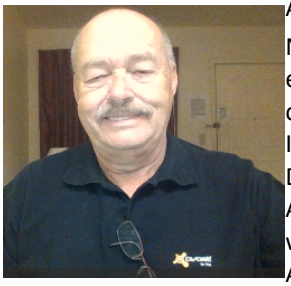
*** Hurricane Safety * Carjacking and Much More**

We appreciate the opportunity to discuss a program with your group. We have the flexibility in crafting a program that will minimize disruption at your scheduled event, while significantly enhancing the personal safety of those in attendance. You will find our program to be both informative and interesting.
Saving lives, preventing personal injury and, or property loss are our goals.

We will discuss the plans for the annual December dinner and social meeting. Please plan to attend on Wednesday and contribute your ideas

<u>December 12, 2018, 6:30PM</u> Dinner & social meeting, details to be determined

<u>January 3, 2018, 6:30PM</u> "Protecting Your Digital Life" by Bob Gostischa



Protecting Your Digital Life

Between ransomware, data breaches, cryptojacking,
supply chain attacks, and mobile malware,
it's never been more important to protect your
digital life.

avast

Our security and privacy are constantly in danger of being attacked from many sources. Staying secure and guarding as much of our privacy as possible is a constant challenge.
This presentation will cover how we can protect our computers (Windows and Mac), tablets, smartphones and other smart devices.
Join presenter Bob Gostischa as he explains the importance of guarding our online presence. He'll also share what he uses to keep his computers, smart devices as well as connected Internet of Things devices secure.

About the Presenter:

Norbert "Bob" Gostischa, after a successful career in banking, enjoys his retirement as an enthusiastic IT security expert, most notably for Avast Software s.r.o., the global leader in cybersecurity products. The most known product is Avast Antivirus.
In 2016, Avast purchased AVG Technologies and in 2017 Avast bought Piriform (Ccleaner, Defraggler, Recuva and Speccy).
Avast has been making security software for over 30 years and has more than 400 million users worldwide. Avast prevents 2 billion malware attacks every month.
Avast Antivirus is the most used antivirus software in the world.

The Avast website has a discussion and help forum, where Bob has been helping with security-related and general computer issues since 2004. He has contributed over 38,000 forum interactions. Bob's presentations are free-of-charge and are not a sales pitch for Avast, although mentioning Avast and their software in your announcements is appreciated. You can learn more about Bob's presentations and passions in his Blog and YouTube Channel. Bob is a proud member of the APCUG Speakers Bureau.

A Year-End 2018 Message
John Witmer, President, TPCUG

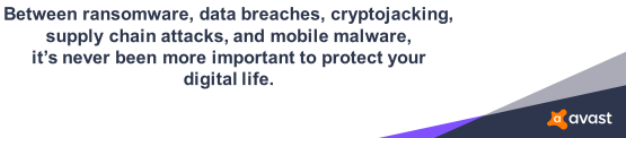
As this year draws to a close, I wanted to take this opportunity to thank all of you who were able to come out on December 12th for the Holiday Party. This event was well attended by our members and in addition we had some spouses who also joined us this year. I think all who came out had a good time enjoying each other's company and meeting some spouses for the first time in quite a while. The menu this year was also influenced by several requests made by members, and I hope you enjoyed the food selection for this year's party. As usual, there was food available to be taken home afterwards, and I'm thankful to those who did so. I also want to thank my wife Donna in assisting me with the food preparation and setup at Pepin.

As computer clubs are becoming dinosaurs on the landscape of this country, our Club has managed to hang in there with 8-9 meetings held each of the last few years – taking the summer months off, and by having a few members who willingly step up to give us presentations each month. Occasionally, we are able to get an outside presentation such as the one held in November. Doug Mullis, in addition to being our Treasurer, is constantly looking for outside speakers of interest to our group. They are becoming very rare to find, but we do have such a speaker lined up for our January meeting that had to be moved to this coming Thursday evening, Jan 3rd. See the following article on who and what is in store for us this Thursday.

Our Club is in great shape financially with about $6,000 still in the bank. We have suspended dues collection, and the monthly income from our affiliation with Amazon on our website has generated a nice stream of commission payments that help offset the minimal expenses we have each year.

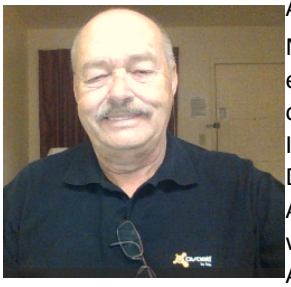
Our membership unfortunately mirrors many of the other clubs across the country, as new members seldom join, and existing members for numerous reasons fall by the wayside. I was reminded of this situation while reading a Dec 14th article in the Lakeland Ledger about Polk County's last public computer group shutting its doors for the last time this month. As noted in the article, teens and young adults know more about technology than we in the older age category ever hope to learn. So I mention this demise of computer clubs because I think we may also have to address our being a viable computer group in the not too distant future. But it is not a topic to deal with for the present time.

If you are able, I hope to see you come out to Pepin for the Jan 3rd presentation by Avast.



Finally, on behalf of your Board of Directors for TPCUG, I wish you all a healthy, prosperous, safe, and fun filled New Year.

Warmest regards,



John Witmer, President

April Meeting at Pepin

Wednesday, April 10, 2019, 6:30PM

"Google Hardware Part 2"

Google has integrated Google Home devices, Home automation, Security, Google Assistant, Android Auto and Nest Cameras all into one (mostly) linked system. Here's what it can do for you.

Due to technical difficulties at the March meeting, Merle was unable to cast the phone screen to the big screen. That's fixed now (dead power cube of all things) and hopefully demo some of the things we talked about last month.

Please plan to attend!

Do you know any good presenters? We need to fill the May meeting. Volunteers from the membership? Then June, July and August we suspend meetings for the summer.

Vol. 32 No.2 February, 2019

February Meeting at Pepin

Wednesday, February 13, 2018, 6:30PM

"VPN – virtual private Networks"

by John Witmer

Please plan to attend!

February 13th TPCUG Meeting Presentation

The presentation for Wednesday's meeting will deal with VPNs, with a review of some popular VPN service providers. John Witmer will utilize an APCUG VTC presentation on VPNs from the fall of 2017 that was presented by Joe Melfi, as well as some articles and current reviews found online. He hopes to demo a service he has selected and implemented on his laptop.

There will also be a discussion about the possibility of using an online presentation/meeting service that is used by the APCUG for their Virtual Technology Conferences. This service is Zoom, and has the ability for us at times to do online meetings and not have to drive to Pepin for a meeting. Additionally, the APCUG has a speaker's bureau of presenters that can present to us online in real time, and allows for Q&A during the presentation. As most of you know, the ability to have speakers come to our small group is almost non-existent. We should explore if this is a viable option for us.

Come share your thoughts and opinions.

Vol. 32 No.6 November, 2019

Wednesday, November 13, 2019, 6:30PM

November meeting

Wednesday, November 13, 2019, 6:30PM at Pepin

Do you know any good presenters? We need to fill future meetings.

Volunteers from the membership?

For November, we'll take a quick look at the APCUG Free presentations and select one. You may want to review the presentations before the meeting, just search YouTube for "APCUG" or "APCUG Technology conferences". There are plenty of good subjects to choose from. Also we'll discuss the December holiday get-together, currently scheduled for December 11, 2019

Vol. 32 No.7 December, 2019

Wednesday, December 11, 2019, 6:30PM

December Holiday Dinner

Wednesday, December 11, 2019, 6:30PM at Pepin

December holiday get-together, December 11, 2019. For anyone not attending for the last couple of years, John and Donna Witmer cater a dinner spread for members, past members and spouses.

John has promised more of the same for this year and past years dinnes have turned out especially enjoyable. Pepin has an area to the left of the entrance suitable for a gathering of this kind, so it will be worth your while. Please come, and if you know of a recent past member not on our current mailing list, please pass it on.

Vol. 33 No.1 January, 2020

Wednesday, January 8 2020 - 6:30PM

Speaker Jere Minich Presentation

Wednesday, January 8 2020 - 6:30PM at Pepin

Jere Minich is our District Representative from the APCUG. (https://apcug2.org/) In addition to being Advisor, Region 5 (AL, FL, GA, SC), Jere is on the APCUG Speakers Bureau and writes "Jere's Tech Tips". Go to the APCUG website, his Tech Tips are on the APCUG Home page.

Jere's presentation subjects: "Configure Storage Sense to free up space", "Keep your Windows 10 PC clean and running at top performance" and "Create a Restore Point on Windows 10"

His presentation should be of interest to everyone, We hope for a good turnout. See you there on Wednesday.

Windows 7 to 10 upgrade

By Merle Nicholson, Secretary, TPCUG

I've recently seen several web articles warning you that you may need to buy a copy of Windows 10 and get your old Windows 7 machine upgraded now.

It's not exactly correct.

This is the month that support ends from Microsoft. And while it's true that your risk of new hijackers, ransomware and viruses increases, it will continue to otherwise work as well. I wouldn't exactly advocate that, but it's prudent that you get the best rated security package you can afford. You especially need a strong website scanner.

I've very recently (Dec 2019) upgraded two of my Windows 7 computers and upgraded a couple of friends computers with no trouble, even on my two ancient AMD computers. Free.

I've seen no indication that you cannot upgrade for free.

I've upgraded by using the Microsoft Windows 10 "MediaCreationTool1909.exe", and create the installation on a USB flashdrive. You then run the setup from the flashdrive in Windows 7. In the event that the Windows 7 OS is broken, hopefully you'll have the Windows 7 License Key. Before I do any upgrade I make sure I have that key documented. If you don't have it, the easiest way to get it is by using "Belarc Advisor Free edition". That tool gives you a comprehensive configuration of the entire PC, hardware and software. Obviously if Win 7 is broken, you're not going to use the software, but it's a good idea to get this documentation ahead of time on a working machine because it's not unknown for the upgrades to completely brick your computer.

The media creation tool will give you a choice of "Upgrade this PC Now", or "Create Installation Media (USB, DVD ....)", and I have always created to a USB drive.

This newest installation (1909) forces you to install with a Microsoft account, and then after installing you must know to create a local account.

Media Creation tool: (https://www.microsoft.com/en-us/software-download/windows10)

I'm going to admit that I've adapted to Windows 10. I certainly do not recommend a new Windows computer (or upgrade) to anyone who is not technically inclined.

My daily use computer is a Chromebook that suits me perfectly 95% of the time. But when I need to do photo or video editing, complicated printing, database or programming I go to a windows machine. But the Chromebook suits me for any web browser work, word processing, spreadsheet, email, messaging, communications and streaming, TV programming, movies. It syncs to my cell phone in all ways, something that Windows does only uselessly.

But back to Windows 10.

There are a few things I intensely dislike, one being the Start Menu. I think it's absolutely useless. I've mitigated the annoyance by installing "Classic Shell" and have a lot of experience with it. It's highly configurable if you feel the need, but it defaults to a useful configuration. You do not lose the Windows 10 menu, it's still available by holding Shift while clicking Start. I highly recommend it if you find the start menu difficult. It's not your fault, it's designed to be difficult.

The second intense dislike is the default privacy settings along with annoying tips and disguised advertising, and the constant hijacking of your local sign-in account.

The newest installation (1909) forces you to install with a Microsoft account, and then after installing you must know to create a local account.

If you then try to use MS OneDrive or obtain any app from the MS Store, your local account will be hijacked again and you PC will revert to the MS account again. If you've used different passwords (AND YOU SHOULD !), you may be surprised that your account has been hijacked again. You can fix all this if you are really careful to click on a cleverly worded opt-out to the left of the Accept button when it asks for your MS account. Be careful.

There is absolutely no reason to sign in to your computer with a Microsoft Account. Everything works keeping them separate. The MS Store and OneDrive will sign in separately with your MS Account even though you sign in with a local account. There are dire warnings that your personal information will not sync to other sessions if you use another computer, but that's what we're trying to prevent in the first place - saving your personal information.

I've documented a 42 item checklist to configure a new or upgraded Windows 10 installation to satisfy myself that the system is safe to use. Most that must be changed are settings and accounts setup, but many items are in the old Control Panel, restore points and activation of the Administrator account (a command line!). Some of the changes that must be made are pretty daunting and I could not recommend doing this without some skill, patience and experience or help.
