To have something to write about this month, I had to buy a new printer. Times are tough when you have to spend money to get a newsletter topic. I am sure that writers for more prestigious publications have such items showered upon them for reviews. As far as I can tell, that is not the case for the writers at the *Bits of Blue*. Perhaps that is the reason for our lack of writers.

Anyway, I had been eying this printer for some time. In house before buying the 2200, if I wanted something done in color I would have had to use my old Alps dye sublimation printer (bought 12/1998) or a slightly newer HP 832C (bought 12/1999). The Alps gives quite good results, but I am running out of the cartridges that make the color and of the paper--and there will be no more since this printer is no longer supported. The HP, being a fairly cheap printer, while fine for text, has never produced top quality photo images. And that is what I wanted the new printer for--photos.

For the past couple of years, when I wanted good quality prints, 4 x 6, 5 x 7 or 8 x 10, I would simply put the files on a CD and take it to the local drugstore's one hour photo department. And for the most part the results have been quite good, better than I could have produced on the Alps, and certainly better than I could have produced on the old HP inkjet. Furthermore, the price just keeps getting better. The last 8 x 10s I had made were right at $3.50 each.

This new printer produces prints of comparable quality to the one hour photo places. Now I need to figure out if it does them for a comparable price. More about that later.

I purchased the printer here in Tampa from North Tampa Photography for $679, about $20 less than at the major stores selling computer equipment. I have purchased a fair amount of photography equipment from them--not for the lowest price, but for the very good advice available from their salesmen.

Along with the printer, I also purchased packages of 4 x 6, 8.5 x 11 and 11 x 17 paper at what appeared to me to be quite good prices compared to what I used to pay for the Alps paper. The 4 x 6 was $.25/sheet, the 8.5 x 11 was $.52/sheet and the 11 x 17 was $1.05/sheet. This paper was made by Ilford, a well known manufacturer of photographic paper--not by Epson.

What the final cost of a print will be is still to be determined since I have yet to know how much ink is needed to print the different sized photos. I note that at CompUSA, the ink cartridges cost $13 each. Since there are seven of them required, we are talking about $91 to replace all seven of them. I am trying to keep track of what I print to get a rough estimate of the ink required for photo printing.

Epson gives an estimate of 440 pages with 5% coverage per color. If this means what I think it does, then with seven colors, you have 35% coverage of 440 8.5 x 11 pages, or equivalently, 180 completely covered 8 x 10 images. At $91 per set of cartridges, this would yield a price per 8 x 10 of just over $.50. If that is true, then based on the paper cost above, I could print an 8 x 10 for just over one dollar--not counting tax and the cost of the printer. That is probably too good to be true. If you read the review to which there is a link later in this article, it appears that the reviewer printed the equivalent of about 62 8 x 10 photos before the first cartridge ran out of ink. So $91/62 equals about $1.50 should be the upper bound on ink cost. So we are looking at around $2.00 total cost for each 8 x 10. Of course, the Epson paper costs more than the Ilford and some Epson paper costs more than others.

Now to the printer. This is not a small printer. It is 25" wide, 13" deep and 8" high without any paper supports. With the paper supports extended, the depth and the height are increased by about a factor of two. It will handle paper up to 13" x 44" in either sheet or roll form. As said before, it has seven individually replaceable ink cartridges. Additionally it has two ver-

(Epson ……..Continued on page 4)

(Epson……..Continued from page 3)
sions of black depending on whether you are printing on matte stock or not.

One important marketing feature is the durability of the prints produced when printed on the Epson paper. I am not sure of this for the Ilford paper, but I think it is the same since, I believe, the durability comes mainly from the inks. Depending on the paper used, Epson claims that color prints will last from 71 to 108 years and black and white will last from 95 to 140 years. That is far superior to standard inkjets.

Other specifications are:

- 2880 x 1440 dpi
- USB 2.0, Firewire & parallel ports
- Borderless printing with some paper sizes and types
- 7-Color UltraChrome™ archival inks in individual ink cartridge
- Fast print times

The speed of printing is determined by the print quality selected and whether or not you wish to print borderless. I have not printed anything in less than Best quality, so I can't speak to that. But for a 4 x 6 printed with borders it takes about 3 min, 45 sec. To print the same image borderless is right under seven minutes. The author of the review at one of the links below stated that he could tell very little difference between the best and other quality prints except a much longer print time.

All inkjets I have dealt with left a fairly wide non-printable margin on the trailing edge to leave the printer. This printer is no exception, leaving one of 14 mm. However, there is the option to Minimize Margins which will allow you to print within 3 mm of all sides. This slows the printing only slightly, adding about 15 seconds for a total of 4 minutes. Of course, printing borderless removes all four margins.

I highly recommend this printer.

For a very detailed review of this printer, go to http://www.steves-digicams.com/2002_reviews/epson_2200.html. Another review is at http://www.luminous-landscape.com/reviews/printers/Epson2200.shtml ◆

(Minutes……..Continued from page 2)
for you to take.

Finally, there is a feature which lists all registered PC user groups and how to contact them. If you make purchases, you should have your group credited toward future promos and discounts.

After a short break, the following door prizes were awarded by Smart Computing:

- Don Patzsch -A Smart Computing Reference Library
- John Witmer - A fancy binder containing the 2004 issues of Smart Computing
- Doug Mullis - A One Year Gift Certificate for Smart Computing Magazine.

Next were drawings for Club prizes, the winners of which were too numerous to record.

No official business was conducted due to the party atmosphere and the changed venue. Meeting adjourned about 8:40 PM. See you all next year. Have a Happy New Year !!!! ◆

site using either a PayPal account or a credit card. Click on the "Join our Group or Pay Dues" link on our main page. Since PayPal is the processor of your credit card if you use one, they take every opportunity to give you a chance to set up a PayPal account. If, like me, you don't want one, make sure you follow the instructions at our site carefully. I have renewed my membership this way; now it is your turn.

Adware My daughter just returned to college, and I spent a few hours before she left checking out her laptop to make sure it was virus/adware free with all its Windows updates installed and in good working order.

The first thing that needed attention was the freezing of the computer when you inserted a blank CD in the drive. I noticed a shortcut to some sort of DVD player

(Continued on page 5)

(Comments……..Continued from page 4)

on the desktop. She said that she had installed it because she couldn't get Windows Media Player to play a DVD. I suspected that DVD player from PC Friendly as the freezing culprit and uninstalled it. Immediately I could now burn CDs--both audio and data. Furthermore, I could find nothing wrong with Windows Media Player.

Next, I ran Norton Antivirus' full scan. It discovered 34 files that it termed adware. They all had to do with a WebSearch Toolbar or WebSearch Tools. I found the associated programs and uninstalled them. Then I let Norton delete any remaining files on its list. After a reboot and opening of Internet Explorer I received a message from some program to the effect that the computer was in danger. A little sleuthing revealed the program as Solid Peer--itself an adware program. Somehow Norton had missed this one. It was listed in the Add/Remove section of Control Panel. On initiating its removal, I received the message that it would search for adware; however, it actually did remove itself. I suppose it was sort of like the message you get from the Windows Installer that it is installing a program when, if fact, you are uninstalling the program.

My daughter said that she was aware she had such problems but couldn't figure how to remove them.

After all of that, I rebooted and ran a full scan in Norton one more time, producing no problems. To finish I created a new restore point for the computer. ◆

Looking Back to 1995

From the January, 2005 Newsletter

Secretary's Report
MINUTES OF 12/14/94 MEETING
and Personal Comments by Jim Clark,
Tampa PC Users Group

Another important meeting for the TPCUG, with elections taking place for the five elected positions on the Board of Directors. And there was a good turnout for this important event, as well as for a fine presentation by a very popular software vendor, Broderbund.

USER GROUP NEWS — A foul-up by the Ybor Campus staff, who had just closed the campus that day for the holiday season and hadn't made arrangements for our use of the facility, caused a delay in the start of our meeting, cutting down the time available for user group and industry news.

SECOND BBS PHONE LINE IN OPERATION: Thanks to the donations received so far in the Adopt the BBS campaign, the generosity of an anonymous donor of a 14.4 modem, and an offer by REALTRON (the host site of our BBS) who is allowing use of an existing phone line for the BBS, paying only the monthly phone bill, our second line to the BBS has been put into operation and is now available for all members. This line, 237-4997, is reserved exclusively for members in good standing. Harvey also called attention to the how-goes-it chart in the newsletter which shows the generation of funds still far below that needed to upgrade the BBS with more file space and other improvements. He emphasized the importance of supporting the ADOPTBBS fund-raiser if we are to realize these improvements in the BBS.

NEW SIGs BEGINNING: Harvey announced the offer of one of our members to host two SIGs at his business facility near the intersection of Anderson and Waters. Mr. Hodges [Mike Hodges] is also making available for these SIGs his computer equipment. Plans are already under way to begin an Internet SIG in February; final plans will be announced at the January general meeting; reservations will also be open at that time. Space will be limited to 20 people for each class. Harvey also solicited people to lead other SIGs, such as but not limited to Windows, DOS, communications, or any of the many popular software applications, to name but a few. One need not be an expert in the SIG subject, but need only have an interest in it and be able to guide the learning experience for all. If you have an interest or would like to discuss the matter further, please contact Harvey.

ELECTIONS: Harvey announced the names of the members nominated for the five elected positions on the Board of Directors and opened the meeting to additional nominations from the floor. Receiving none, Harvey proceeded with the election and issued guidance on completing the ballots which had been provided. The ballots were collected and counted, producing the following elected BOD officers who will take office in January:

President:	Harvey Bruneau (incumbent)
Vice President:	William LaMartin
Treasurer:	Tom Cone (Incumbent)
Secretary:	Bruce Register
Member At Large:	Connie Kincaid

Congratulations to you all. We are confident that you will do an excellent job for the TPCUG.

INDUSTRY NEWS:

INTEL PENTIUM CHIP: The bug in Intel's Pentium chip has received a good bit of publicity lately. Intel says the bug has been fixed and all of their new chips do not have the flaw. They also say there has been a big to-do about nothing, that the probability of anyone having trouble with the chip is negligible, that there is no need to replace them, and they have no plans to do so. They will, however, replace the chips for anyone having trouble. Informally, word is that they will replace the chip for anyone requesting same, but it may take a while since they are well behind the demand for their Pentium chip.

PRESENTATION — BRODERBUND Tad Brickson, Southeast Sales Representative for Broderbund Software, Inc., was kind enough to make a presentation for us on some of the Broderbund software. Tad noted that Broderbund had some 147 software titles, categorized into three broad categories — productivity, education and entertainment. However, he wisely chose to limit his discussion to an overview of the company and a brief review of 4 of those titles. Sitting here writing about Tad's presentation, one thing seems to dominate my thoughts — consistent with all four programs is that they seem to be very easy to use; a bit like a multiple choice test where all the answers really are good answers and you can't go wrong.

Print Shop 2.0 for Windows: This is probably the best known and most popular Broderbund title, and it is a really good one. I have used Print Shop Deluxe for DOS

Special Interest Groups

Microsoft Access SIG

This SIG meets the **first Tuesday** of the month at 6:30 PM. The meeting location varies. For information contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merlenic@tampabay.rr.com.*

Digital Imaging SIG

This new SIG meets the **fourth Monday** of the month at Pepin Distributors at 6:30 PM. For information contact Mary Sheridan at *mcpease@mindspring.com.*

Visual Basic for Applications SIG

This SIG meets the **third Wednesday** of the month at 6:30 PM. The meeting location varies. For information contact William LaMartin at *lamartin@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Kevan Sheridan moderates the discussion.

(1995…….Continued from page 6)

and Windows, both of which are fine programs. But, Print Shop 2.0 makes major improvements, adding labels and business cards to the list of things one can create in the other programs - greeting cards, signs, banners, letterheads and calendars. Even more emphasis has been placed on user friendly - and it is truly easy to use - while adding significantly to the text, graphic and layout template options available, and including the capability for almost unlimited user control of all of these. It would be tough to dream up a creation in any one of the categories of documents that Ver. 2 is designed for that one couldn't produce in minutes, selecting only from included layout options; the toughest part would be your determining what words you wanted to say in the document. Ver. 2 will handle a variety of graphic formats, and it provides the capability to print out in any density now available in popular printers or expected to be available in the foreseeable future.

Print Shop 2.0 for Windows is available on floppy disks and CD-ROM. Both have the same program, but the CD-ROM version includes more goodies than the floppy version - 73 versus 30 TrueType fonts, for example, and some 1600 pieces of clipart and 25 PCD photos. The floppy version has a good supply of clipart, though well short of the CD-ROM, and no PCD photos. The CD-ROM version also includes Print Shop Companion. Originally conceived as a program for youngsters, Print Shop has evolved into a powerful, very flexible program suitable for all ages and purposes, including business.

Math Workshop: An example of the education category. Math Workshop is a program designed for younger kids. It does an excellent job of teaching in an entertaining way. Like Print Shop, this program is very easy to use, yet contains a wide variety of options. The graphics are well done and entertaining, even for adults. It provides a number of different levels of difficulty and several different approaches to the learning of math.

3-D Home Architecture: Another example of a productivity program, 3-D Home Architecture shines above the other programs in its category that I have seen for its power, speed and ease of use. Home Architecture is very easy to use, almost intuitive. It is well laid out, fast and very powerful, allowing switching between 3-D and 2-D views and between 3-D views quickly and easily with a click or two of the mouse button. Imagine a house suspended in air, for example, giving one the ability to view the structure for any angle, including from underneath - that is the kind of capability built into Home Architecture. Unlike other programs I have seen, this program will create a useful list of construction materials. Tad was using a 486/33, with a mathco [math coprocessor], for the demo. As fast as the program operated on that machine, I would judge that it would operate fine on a 386/25 or better with mathco, but may be a bit tedious with lesser capabilities. A mathco is not a criteria, but because of the very large amount of complex calculations that take place, it makes a big difference in how fast the program operates.

Myst: Tad informed that this is the best selling entertainment software in the industry today. It is an impressive program, for sure, with stunning graphics. Tad was able to do little more than demo the graphics in the program, however, but reported that it could be addictive in that once you get started it may be difficult to stop. One of our members who had tried the game confirmed that it is very

fascinating and hard to quit.

Tad, thanks very much to you and Broderbund for an excellent presentation and the opportunity to view some of your great software programs. We will look forward to seeing your updates to these programs, and perhaps an introduction into some of your other programs.

AND THE WINNER IS
Thanks to the generosity of Brainchild Computer Distributions, who donated Fox Pro 2.6 for Windows, and Broderbund who donated the rest of the door prizes, there were several very nice door prizes. Those among us to have the good fortune to win are:

William LaMartin	Garden Plant Selector
Kelly Saunders	CNN Time Capsule
John Whitmer	New Car Buyers Guide
Merle Nicholson	Plumbing Essentials
Jenny Lind Olin	Royal Flush
George Jurado	FoxPro 2.6 for Windows

The meeting adjourned at about 8:40 PM. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

As usual, Gene Barlow's yearly presentation should reacquaint us with our hard drives. He is a font of knowledge on the subject, and one of his topics is the different scenarios of backing up your entire hard drive. It is a subject to which we should all pay more attention.

I have my usual problem this month--a lack of articles. Except this is the first month that I have no article, except the minutes, from a member or from myself, and I am not going out and purchase a new program or piece of hardware just to be able to write about it. So, I need to fill up this space with something else. Let's see what I can produce.

Minutes of the February Meeting

By Doug Mullis, Secretary, Tampa PC Users Group
dmullis@tampabay.rr.com

Mary Sheridan, Member at Large, started the SIG portion of our meeting promptly at 6:30 pm. She announced that President Kevan Sheridan was out of town (in snow country) and would not be conducting tonight's meeting. As Mary spoke, a PowerPoint presentation of past meetings and conventions was shown courtesy of William LaMartin. We were reminded of the Spring FACUG Conference in Kissimmee Mar 4th through the 6th. Those planning to attend were announced. Mary also encouraged members to attend TPCUG Board Meetings the first Thursday of each month starting at 6:30 pm at this site.

Discussion on Microsoft's Service Pack 2 carried over from last month. There have been eleven security updates to XP since Service Pack 1.

We discussed Windows Messenger and whether we need it. If you use Internet Explorer, you are probably stuck with it unless you do a registry modification.

Bruce Register brought up a problem he was having sending JPEG photo files over Outlook Express. The solution was to send the photos in a zipped folder.

It was announced that Peggy Pulliam, our immediate past Secretary, died on Feb 3, 2005. There was to be a memorial picnic for her at MacFarland Park on Feb 13th starting at 2:00 pm. William LaMartin passed around an excellent picture of Peggy taken at one of our events.

At 7:00 pm our regular meeting commenced under Mary Sheridan's leadership. Mary introduced our presenter for the evening, Bob LaFave. Bob's main

Free Online Tax Filing. If you go to the IRS site http://www.irs.gov/app/freeFile/jsp/index.jsp? and link from that page to one of the vendors listed there, you may just get your taxes figured and filed for free. Some of the vendors listed have restrictions on who may use the free service, others don't. TurboTax, for example, claims that everyone qualifies. I assume that for complicated returns, this service probably lacks the additional forms needed. So Donald Trump need not attempt it.

Treasury Bills Online While we are on the topic of money, have you thought of investing in Treasury Bills instead of CDs at your local bank? http://www.treasurydirect.gov/ is the site to get you started. As I write this, the return on a six month T-Bill is right at 3%, far better than any short term instrument your bank is offering. To get started, you need to download the "New Account Request" Adobe Acrobat file, print it out, fill in the information, sign it and mail it in. Two of the items to be entered on the form are a bank account number and bank routing number for the bank account from which money to buy the T-Bills is deducted and into which proceeds are to be paid. Once your account is set up, then everything else can be done online. T-Bills can be purchased for as little as $1,000 and in increments of $1,000. You can view your account at any time online. Additionally, periodic printed statements are mailed to you.

HP Scanner Redux I recently received an email requesting help with a scanner problem from someone out there on the web. They had done a search and come up with an article I wrote in the newsletter in January of 2003. They said their HP ScanJet 5370C was exhibiting the same problem as I had described. What I outlined in the article that got my scanner working again did not solve their problem, nor did my further suggestions.

My last suggestion to them was to junk the HP Scanner and buy an Epson one, which is what I did when my HP scanner died a year later (http://www.tpcug.org/newsletter/nl_2004/march2004/epson_scanner.htm). HP has produced some quality products for me over the years (e.g., my still working LaserJet 4 Plus printer bought in 1995), but it is my belief that they have let their quality control lapse and have farmed out most of their manufacturing. I'll give Epson a try for a few years. I also recently bought an Epson Stylus Photo 2200 for my photo printing and am very happy with it.

Perhaps with the departure of Ms. Fiorina HP will regain their focus on quality products and figure out there are other ways to create a profitable company than firing a lot of people. I could never figure why HP brought her on in the first place, since I think she presided over the near demise of Lucent, a once-great company. Now I see that after five years of decline at HP under her tenure she is being touted as a candidate for the president of the World Bank. I didn't know she knew anything about banking. But, then, she didn't know anything about computers, and she was hired to run a computer company and kept on for five or so years.

I see that I have over a page left to fill. What can I present? How about how I use my computer? That was the title of a talk I gave to another user group a few years back.

Like most of you, I use my computer to deal with **email** and browse the **World Wide Web**. Also like most of you, I have to delete more than 100 unwanted emails every day. At least, very few of them have viruses attached anymore. It seems that the Internet service providers are getting quite good at stripping the viruses from emails.

As far as web browsing goes, I find that I no longer go to all sorts of strange and new sites as in the past when all of this was new. The past few years most of my WWW time is spent at just a few sites--The New York Times, The Wall Street Journal, and Google. The Internet is no longer a novelty.

In addition, I write computer programs and create and manage web sites. I use **Microsoft's Visual Studio .Net** to write the programs and to create some of the pages at web sites. I use **Microsoft's FrontPage** to manage the web sites.

(Comments…….Continued on page 4)

(Comments……..Continued from page 3)

Visual Studio .Net has several languages within it that you can use to write programs. My choice is **Visual Basic .Net**. Some of the programs I write are presented in our VB SIG. At the last VB SIG meeting we looked at a simple program that allows you to send text messages from your computer to anyone with a number with one of the major cell phone carriers like T-Mobile, Verizon and Alltel.

After I had demonstrated the program, I noted one thing that bothered me--with a slight modification and a database of cellular phone numbers, you could spam all those phones with text messages quite easily. Possibly the providers have a method of detecting such an onslaught and stopping it, but I doubt it, since I just read an article in *InfoWorld* about a vulnerability at the T-Mobile web site that would allow anyone to gain access to a T-Mobile account from the T-mobile.com web site, as long as they knew the account holder's T-Mobile phone number. Of course you had to know a bit more than that, but not much, since even I could understand it.

For many years I used **Borland's Delphi** program for programming, but I have not used it much since the advent of Visual Studio .Net.

Photography Another use I make of my computer is to use it as my digital darkroom with the help of **Adobe PhotoShop CS**. I have been interested in photography since I was a teenager. In the 1970s and 1980s, I took that interest a step further and processed all of my black and white film and prints. In the 1990s I sort of lost interest in photography, except for starting to scan in photos and then negatives in the mid 1990s. However, with the advent of digital cameras and much-improved inkjet printers, I am back into photography.

Now I have total control. I can take a photo with my Nikon D100 SLR style digital camera and instantly see if it is worth saving. Later I can bring it into my computer, adjust the lighting and color balance, and crop it as desired. Then I can store it both on the computer and on a CD, send a lower resolution version in an email message or print the original image on my Epson 2200 in a size anywhere from 4 x 6 to 11 x 17. 11 x 17 is the largest photo paper I at present have, not the largest size the printer will print.

That is total control. My darkroom equipment is stored away in the garage, and all my chemicals and empty chemical bottles have been thrown away.

I have also found a use for my programming in photography by writing a program that will automatically take all the files in a folder and stuff their names and locations into a database. Later when I click on one of the records in the database, the program will display a thumbnail of the photo and allow me to enter data about the photo, such as a description and date. It is a great timesaver, and I eventually hope to realize my dream of having all my photos from the past scanned in and stored on hard drives with CD or DVD backups and catalogued in the program just mentioned. Additionally I will do the same for all of the new photo files from my digital photography. They, of course, don't need to be scanned, but they do need to be catalogued.

Other programs I use are **Quicken** for all my financial records and **Outlook** to keep my calendar and address book. I do not use full Outlook for my email, using Outlook Express for that, except when I want to do an email merge. Of course I use **Word** and **Excel**. Excel was particularly useful recently when I needed a set of financial calculations to determine the best of several scenarios. And I use **Access** to keep and analyze all sorts of data, not the least of which is our TPCUG membership data.

I use **Adobe Illustrator** to create simple graphic designs and greeting cards. All of the genealogy information gathered by me and several relatives is stored in **FamilyTree Maker**. **Microsoft Publisher** is used in creating this newsletter and other desktop publishing projects such as the directory for my neighborhood organizations.

I suppose there are at least a half-dozen other programs that I use from time to time: Adobe Acrobat, Adobe Streamline, PowerPoint, Art Icons Pro, Delorme's Street Atlas, Easy CD Creator and WS FTP come to mind.

Next month, someone please send me an article. ◆

(Minutes……..Continued from page 2)
topic was Google's Gmail.

Bob started by suggesting we subscribe to Staples' discount coupons email notification. They also have an online rebate system that speeds up the rebate turnaround. CompUSA gives TPCUG members a 5% discount if you go to their special checkout desk (on the left as you face the front of the store). You must show your membership card, and that brought us to the realization that most of us have expired cards. Mary will get new cards issued.

Bob now explained Gmail is a web based mail service. It is separate from your current Outlook Express, but can be forwarded by you to your email account. You can only get a Gmail account by invitation from a current user. Bob says there are advantages to having more than one mail service. He then demonstrated the ease of setting up a Gmail web page and some neat features it claims. Get in touch with Mr. LaFave if you want Gmail.

At some point during our meeting, Mary asked if the members were interested in a presentation on Linux. By a show of hands, many present did want a presentation.

No door prizes were available at this meeting so we concluded at 8:15 pm. ◆

Internet Picture of the Month

Mardi Gras Dog

One of the many photos taken in New Orleans this Mardi Gras was of "Baby Dog" at the Krewe of Grela parade in Gretna by a New Orleans Times-Picayune photographer.

Looking Back to 1995

From the March, 1995 Newsletter

SECRETARY'S REPORT
TPCUG MEETING 2/8/95, 6 PM
Ybor Room, Hillsborough Community College,
Ybor Campus

Minutes and Comments by Bruce Register

President Harvey Bruneau called the meeting to order. Comments and information were given regarding SIGs, miscellaneous topics and vendors.

SIGS
Microsoft Access - February 16,1995, 6 PM Promptly, 3903 Northdale Boulevard, northeast corner of Mapledale and Northdale. Reservations are closed due to limited seating. Next SIG-Microsoft Access is same place, March 16, 1995, 6 PM (sharp-Security Officer must permit entrance at the rear entrance of the building). Sign up early.

OS/2 - February 28, Contact John Lucas for time, place and openings/sign-up.

Internet - February 28, 1995, 6 PM, promptly. Contact Charles Howe. As of February 8,1995, seven seats were available. You can use BBS to sign up. Promptness is required because security at Reflectone is tight and required. From North Dale Mabry, go west on Waters to TAMPA WEST sign on the south (left) side of the street (if you pass Anderson Road, you have gone too far), turn south at TAMPA WEST sign, go one block to dead end, turn right one block and take a "forced" left turn, go south about a half block to north entrance of Reflectone building. You must enter the north end and be prompt at 6 PM because security will unlock the door and escort us to the meeting room. It reminds me of the Pentagon; you don't stray or wander around.

ANOTHER SIG is under consideration. Let Harvey know your interest. A tax SIG was mentioned as a possibility. It is timely. Harvey wants your opinion. He reads BBS regularly. Send him a message.

MISCELLANEOUS
Harvey reported a monetary gift from GTE to TPCUG. GTE has a program for recognizing their employees who make a contribution of time and effort to community and educational activities. In recognition of Roger Waters' many hours of devotion to TPCUG, GTE donated some $430 to TPCUG. Thank you, Roger! Thank you, GTE!

Harvey reiterated the goal of every member in 1995 is to bring in at least one new member.

VENDORS
IBM has recalled power adapters for IBM ThinkPad 360 & 375. If you have one, contact IBM for a replacement part.

HP DeskJet 500, 550 and 560C have glitches in rollers. Call HP for replacement parts.

Pentium prices have dropped and are expect to drop some more before the end of March.

Some surprises have been received by Pentium users who have replaced the old chip with the new chip. Spreadsheets run and calculated under the old chip will carry the same chip errors along with the spreadsheet under the new chip. Solution: when you load the spreadsheet, recalculate the entire spreadsheet under the new chip. Easy solution!

Many companies are tied so completely to Microsoft that they feel that they cannot change software when errors and software problems occur. Some feel that Microsoft, unintentionally, releases software with problems. When this occurs, serious difficulties could occur. Some companies (end users) are so critically dependent upon Microsoft's various packages that they feet it is better to suffer than to try to change it all.

Hardware vendors and software vendors are planning on the future world of Microsoft Windows 95, whenever it is released. IBM OS/2 Warp is the competition. Some feel that sufficient market acceptance of OS/2 would result in a much more healthy competitive market—one without monopoly.

Some feel that Microsoft Windows 3.1 will not only lose its state of the art position but will also become extinct to OS/2 and Windows 95-relatively soon after release.

PS2 mouse ports make your life easier.

Don't use Windows 3.11 32 bit File Access on Gateway, Compaq or Notebook computers. Problems may occur!

SOFTWARE VENDOR DEMONSTRATION
Mr. Robert Morgan of Gold Disk, presented two software products-ASTOUND AND VIDEO DIRECTOR. His general comments during the demonstration ran along these lines: **ASTOUND** was developed originally on a MAC

(1995……..Continued on page 7)

Special Interest Groups

Microsoft Access SIG

This SIG meets the **first Tuesday** of the month at 6:30 PM. The meeting location varies. For information contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merlenic@tampabay.rr.com.*

Digital Imaging SIG

This new SIG meets the **fourth Monday** of the month at Pepin Distributors at 6:30 PM. For information contact Mary Sheridan at *mcpease@mindspring.com.*

Visual Basic for Applications SIG

This SIG meets the **third Wednesday** of the month at 6:30 PM. The meeting location varies. For information contact William LaMartin at *lamartin@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Kevan Sheridan moderates the discussion.

(1995…….Continued from page 6)

platform. Since then, they have developed it on the Windows platform. Their market demand has been pleasing.

ASTOUND is chasing the PowerPoint (by Microsoft) presentation market. ASTOUND loves multimedia machines. ASTOUND is a presentation package. One can create/use handouts, slides and video clips. A cable connects the computer with video, camcorder and stereo for use in creating presentations. The process was demonstrated to be very fast. We watched a presentation being developed before our eyes!

ASTOUND for Windows allows one to integrate the power of multimedia. sound, animated texts and graphs, and digital video appeared to be easy to add into presentations. Import of files from other presentation packages and from other sources such as clip art, etc., are an emphasized feature.

"No special training is needed—just a few clicks", according to Mr. Morgan. Any object may be animated; you can add digital video animation, sound and synchronized narration. You can save to disk(s) and send or hand to your clients with a full demonstration of what service or product you offer. A user can even add interactivity by making any object button control your presentation. Slides, overhead projections and video tapes are computer based. On-screen presentations appear to be most welcome as tools for instructors and public speakers. The sophisticated production that we have seen on television news, TV advertising, etc., appears to be available now to anyone with inexpensive equipment. The cost of the software is unbelievably low.

ASTOUND has menu bars, and pull-down and pop-up menus. Robert Morgan feels that all the help that you need is on the screen available "for the clicking." ASTOUND can perform 3-D presentations (like you see with CAD). "The time-line is the heart of the presentation. Much time is saved compared to other programs." Voice-over editing is permitted. Mr. Morgan demonstrated by placing a graphics voice track on the screen. The "uhs" and "ahs" can be erased right on the graphics screen. Animation and graphics are very easy to do. One can put together a demo presentation disk to market your product or service and give out the disks. Minimum Requirement: ASTOUND; 486, 4MB (8 MB is better), 66 MHZ. Cost: ASTOUND: Retail, $399; Computer City $129. Gold Disk SPECIAL OFFER TO TPCUG $79.00 ASTOUND/Video Director bundle SPECIAL OFFER TO TPCUG $150.00

VIDEO DIRECTOR software. Plug your computer into your camcorder or VCR. Video Director has three modes: Icon, Text and Graphics. A tape library is nice to work with. The video clip that you developed with ASTOUND can be selected to be saved on tape (you have already saved it to disk in the ASTOUND software). Pull in the clips that you want. Click to make tapes. One can create the video clip, click the camcorder to make a video tape for replay on the VCR and go have a cup of coffee while your take is being recorded. Minimum Requirement: VIDEO DIRECTOR: 386, 2MB. VIDEO DIRECTOR: Retail, $199; CompUSA, $119, SPECIAL OFFER TO TPCUG $89.00.

Editorial Comment: See Kathrine Powell's excellent review article on Video Director, Ver. 2.0, in Bits of Blue.

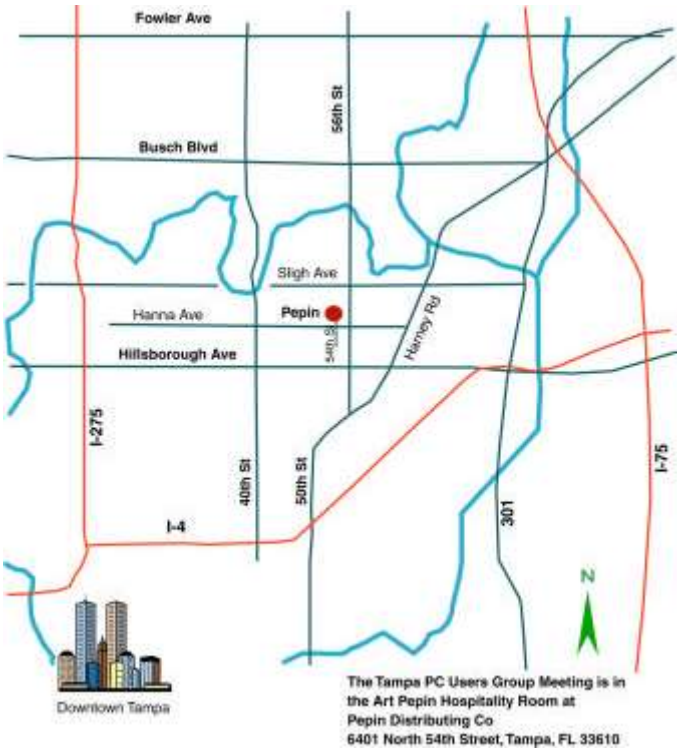
First Class Mail

☐ *Member: Your membership is up for renewal*
☐ *Vendor: Your product was reviewed on page ___*



(1995…….Continued from page 7)
Jan., 1995 on Page 5. Yep! The prices are a correct quote of the Special Offer from Gold Disk.

Robert Morgan gave an excellent presentation of these two software programs. Comments were concise, understandable and meaningful. His demonstration was well planned. He is GOOD!

Robert Morgan and GOLD DISK donated the door prizes. We all appreciate this generosity. The following door prize winners appreciate them even more than the rest of us!

Jay Reese	Multimedia Magic
M. N. Marteny	Multimedia Magic
John Lucas	ASTOUND
M. N. Marteny	VIDEO DIRECTOR

Harvey thanked all for coming. He reminded all to return here (Ybor Room at HCC YBOR Campus, adjacent to the Administration Building) March 8, 1995, 6 PM. Bring a friend. Sign up a new member. Use the BBS. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

I only have room for two short items.

APC Backup update The battery backup unit I wrote about in the November newsletter malfunctioned recently by continuously displaying the overload warning. I called APC, and they gave me a RMA number to send it back to them at my expense (about $20) for a replacement, which I received in an approximate 10 day turn around. The fellow at APC suggested that I may have caused the problem by having a power strip and surge suppressor in line in between the APC unit and the devices. I have removed them since receiving the new unit.

Street Atlas USA If after the New Year you receive an error message in Street Atlas USA when doing a search, you need the Magnetic Declination Update from Delorme. ◆

Minutes of the January Meeting

By Doug Mullis, Secretary, Tampa PC Users Group
dmullis@tampabay.rr.com

Mary Sheridan started the SIG portion of our meeting promptly at 6:30 pm. It seems Microsoft is pressing for users to install Service Pack 2. Most responded that they have, with few problems. Some discussion followed as to Microsoft's concern/motivation and the type problems/experiences that were encountered by some. After installing SP 2, you must identify programs you use to your Firewall.

Mary called attention to the need to formally elect officers for Year 2005. Slate presented:

President	Kevan Sheridan
Vice President	John Witmer
Treasurer	Mike Hodges
Secretary	Doug Mullis
Member-at-large	Mary Sheridan

By a show of hands, the nominees were unanimously elected/installed, and a "Thank You" was extended.

Mary announced that the Spring Conference of the Florida Association of Computer User Groups, Inc. is coming March 4, 5 & 6, to be held at the Kissimmee Civic Center. Advance registration for the Conference is $40 (before Feb 10) or $60 at the door. TPCUG will pay advance registration of members involved in running our organization. Let a Board member know if you want to attend. Check out the program at: http://www.facug.org/05springconf.htm.

Mary introduced Jane Jukes who has moved to San Antonio, Florida and is considering joining our PC users group. Jane has been associated with another group for twelve years. We would be pleased to have her as a member.

(Minutes……..Continued on page 8)

apcug Member of The Association of Personal Computer User Groups

Dell Axim X50v Pocket PC

By Merle Nicholson, Tampa PC Users Group
merle@merlenicholson.com

Pocket PC's are pretty much alike once you get beyond the basic features. There are some new options available now that are very interesting and maybe just the thing you need to push you over the fence, like it did me.

The newest developments in Pocket PC's are: camera (naturally), cell phone, faster processors, WiFi, Bluetooth and VGA screens. There are a lot of models to look at with some or all of these features. I can't keep track of all of the HP iPAQ models, but I'd thought I'd pretty much narrowed my choice down to the HP iPAQ HX4705 ($617.50!) as my base unit of choice. It had all the latest stuff I "need". I could also look some more and maybe even wait six months.

I wasn't about to spend $617.50 on a pocket PC! But it intrigued me enough (actually, I REALLY wanted one!) to look around to see who else is making a PDA with the newest Intel 624MHz processor and who else has VGA. I'd read one reviewer article that said that VGA on a small screen like this is useless except in viewing pictures because the small screen dictates that all the elements — buttons, text, borders etc. — must be oversize anyway. Now that I've experienced the difference, the VGA has so much obviously superior screen clarity that it has to be the way they'll all go eventually.

The usual Pocket PC screen size is QVGA (Quarter VGA) at 240x 320 pixels. VGA quadruples that at 640x480 (Actually 480x640 when viewed in normal portrait mode). There is a modification of the Microsoft Pocket PC OS, called 2003 Second Edition, written to accommodate switching between Portrait and Landscape modes.

And, of course, I wanted WiFi, so I can sit in Barnes and Noble and check on the latest HP and Dell stock quotes, and maybe check out my email. Last, why not Bluetooth in case I want a GPS, wireless keyboard or a wireless headset? I definitely do not need a camera or cell phone on my PDA.

I have a Cassiopeia E-125 that I've been using continuously since I got it three years ago. A Pocket PC syncs up Office Outlook automatically to Pocket Mail, Calendar, contacts, tasks and notes. I depend on it for appointments and all my personal and business contacts. Drop it in the cradle and the Pocket PC to Outlook starts automatically, and in a few seconds it's done. I have Pocket Streets and Trips 2002 with a half dozen or more city maps, and I also use it as a personal picture viewer to dazzle people with pictures of my grandchildren.

The OS on my Casio is not upgradeable. And I thought I would use the MS Money that came with it as my checkbook except that I found that it sync'd up only with MS Money 2002 on the PC. I couldn't buy MS Money 2002 for the PC – no longer available in 2003, and I couldn't upgrade the version on the Pocket PC with the existing OS, and I couldn't upgrade the OS. So eventually I abandoned using Money. I have the same problem with MS Reader. I want to buy books online and most books now are protected, so you're allowed one download each to two registered devices. Guess what. My OS is too old for the new MS Reader. Do I need a new Pocket PC? You betcha!

Dell Axim X50v! It has what I want, and by December 2004, Dell had put a sizeable discount on the price down to $419, and it's still available as of this writing – 1/30/05. That's a clear $200 less than the HP – 32% in fact, so there's no contest for me.

So I figured out how to get it delivered on my birthday and feign surprise that someone mailed me a gift. The UPS guy wasn't impressed. I think he always gets birthday gifts.

The photo below is of the old Casio next to the new little rocket. The physical screen sizes are almost identical. The Casio's is perhaps .1" taller.

(Axim ……..Continued on page 4)

(Axim…….Continued from page 3)

The specs on the new little rocket (copied and modified from the Dell website) are:

- Microsoft® Windows Mobile™ 2003 Second Edition operating system with Windows Media Player 10 Mobile
- Powered by the Intel® XScale™ PXA270 Processor at 624MHz Microsoft® Windows Mobile™ 2003 Second Edition operating system with Windows Media Player 10 Mobile
- Brilliant 3.7" color TFT VGA display with 640x480 resolution
- Integrated Intel® 2700G multimedia accelerator with 16MB video memory
- Integrated 802.11b and Bluetooth™ Wireless Technologies
- Packed with 64MB SDRAM and 128MB Intel StrataFlash® ROM
- Integrated CompactFlash Type II and Secure Digital / SDIO Now! / MMC card slots provide flexible expansion
- VGA-Out Support with optional VGA Presentation Bundle
- Removable Primary Battery with optional High Capacity Battery
- 3.5mm Headphone / Headset Jack for Headsets to support VoIP and voice recognition applications
- Built-in microphone and speaker for easy recording on the go
- USB Cradle including Battery Charging Slot
- Standard v1.2 (115 kbps) Infrared Port
- 3.5mm Headphone/Headset Jack
- 36-pin Cradle/Sync Connector
- Length 119 mm (4.7 inches)
- Width 73 mm (2.9 inches)
- Height 16.9 mm (0.7 inches)
- Weight 175 grams (6.2 oz)

I know I'll get asked about how hard it is to get connected to the nearest wireless router, so I'll relate my first connection. I accidentally bumped the WiFi button, a box popped up asking for the WEP security for the network it detected, I typed it in the five characters I use for the WEP and then opened Internet Explorer to the default home page. That was it. After that all I ever had to do is accidentally bump the WiFi button, and it automatically connected. I did go into the setup and turn off the Bluetooth radio for now.

The things I don't like about it are few. The biggest is the location of the two buttons on the left side; the recorder button and the WiFi connection. I ***cannot*** pick the PDA up without touching one of those buttons. They're not recessed, and they're sensitive. I don't need a recorder button. So I have reprogrammed the two buttons to do nothing, and programmed the WiFi button on the front. Now no button does anything if it accidentally gets pressed. My Casio has similar buttons in the same location and they never got pressed because they are properly recessed.

So how good is the new Dell? Fast? As an example, to load my 2MB Hillsborough County Street and Trips map – less than a second. On my old one, I could have completely driven out of the county while it loaded. Actually just fifteen seconds on the old Casio, but it always ***seemed*** longer. And clicking through pictures goes as fast as I can go, no delay. I'm extremely happy with the quality of the screen.

During my research into current Pocket PC's, I'd read more than one warning that some older applications that you may be using may not migrate to the new PDA, either because of operating system differences, or, in this case, screen display conflicts. And particularly if you want to use the landscape feature of the new screen.

My one fear was that my Pocket PC Streets and Trips

(Axim…….Continued on page 5)

(Axim……..Continued from page 4)

2002 that came with the desktop copy of Streets and Trips 2004 would not work on the VGA screen, but it's great. It's still QVGA resolution, but I can live with that. MS is selling a revised Streets and Trips For Pocket PC 2005 as a separate product now. I'm considering it, but I'll more likely go to the Delorme Street Atlas USA 2005 Handheld for $39.95. It's not clear if it will work on this PDA from their website, but I've emailed their support site to find out.

And the last thing I'll mention is not specifically about the Dell. All Pocket PC's are not necessarily the same. Because of the variety of processors used, there are differences in the operating systems that will prevent you from migrating from one Pocket PC to another the software you have purchased. Usually on an installation CD you will see three .CAB files, only one of which will be used because that is the one specifically written for your processor. In my case, I purchased a couple of applications for my Casio that has only one setup, just for a MIPS processor. So I've abandoned the applications, and in one case I may try to replace it. The best news is that there are literally thousands of high quality programs written for the Pocket PC, and all are pretty cheap, just $5-$15.

The user interface has been improved in appearance, but functionally hasn't changed at all since Pocket PC 2002. On the new VGA screen, the text is very clear and much easier on the eyes. ◆

Looking Back to 1995

From the February, 2005 Newsletter

SECRETARY'S REPORT

Meeting 1/11/95. Minutes and comments (as I understood them)

Bruce Register, Sec'y

The meeting was called to order by President Harvey Bruneau. Some 53, MOL, attendees.

Elected Officers are:

President: Harvey Bruneau
Vice President: William LaMartin
Treasurer: Tom Cone
Secretary: Bruce Register
Member-at-Large: Connie Kincaid

Appointed Positions are:

Education Officer
Newsletter Editor
Bulletin Board System Operator
Librarian

President Harvey reported many bits of interesting information. He asked that the members let him know what subject matter that the members would like at the meetings and SIG meetings.

President Harvey reported that SIGs (Special Interest Groups) are scheduled.

Internet SIG...January 24, 1995, 6 PM, Reflectone Corporation, Tampa West Boulevard. The building is located south of Waters near Anderson Road. Security is tight; entrance is through the north entrance for only persons on the advance cleared list. If you signed up before the class maxed out, your name will be on the security list for entry. Charles Howe is the leader. We thank Mike Hodges and Reflectone Corporation for making this possible.

Microsoft Access. February 16, 1995, 6 PM, 3903 North Dale Mabry. Mark Saunders is the SIG leader; Sergio Mendez, Connie Kincaid are among the assistants. SIG enrollments can be made on the Bulletin Board; however, you should report your name exactly as it appears on the TPCUG membership list. Look at your membership card or the address label on the BITS OF BLUE.

SIG sessions are open to TPCUG members only. Have you renewed yet? President Harvey asked that everyone submit topics that we would like to experience, not only in SIG, but also in discussions at regular meetings. He also asked for SIG leader volunteers. Please make a note of your comments and hand them to President Harvey. Written comments are less likely to be forgotten or misunderstood. Lets help our long-serving President by putting them in writing.

President Harvey announced an upcoming SIG on OS/ 2. Come, listen and watch BITS OF BLUE for details at the appropriate time. Caere Corporation will present our program March 8,1995. Delrina will present April 12, 1995.

MISCELLANEOUS COMMENTS:

(As I understood them, factual or not)

- Brainchild offers discounts on products and labor to TPCUG, membership card showing, members. One store is in St. Pete; the other is at 1910 W. Busch Boulevard.
- President Harvey stressed the request that each of us bring in one new member in 1995...early in 1995.He also stressed the need for receiving renewal membership dues for 1995. Please encourage your fellow member friends to renew. Do not let member friends fall by the wayside.
- The TPCUG Board is considering all aspects, known, or made known, to them regarding a more suitable meeting place. Please jot down your comments, however you feel regarding a change or not to change. Give your thoughts to President Harvey.

INDUSTRY NEWS:

- Windows 95 will not run OS/2.
- Lotus is developing an application to run on OS/2 under contract with IBM.
- Notebook with Windows 95 must have a "plug and play" docking station which recognizes notebook Windows 95.
- Some people, today, are spending more on speakers for computer systems than they spent on their stereo systems. Why not just hook up to the stereo; save money; spend the savings on computer needs.
- Gold Disk will make a multi-media presentation at the TPCUG meeting February 8, 1995. Meeting starts at 6 PM, Auditorium, Administrative Building, HCC, Ybor City. Security guards are positioned in the parking lots.

PRESENTATION:

A speech by Bill Gates at Fall Comdex '94 was presented

(1995……..Continued on page 7)

Special Interest Groups

Microsoft Access SIG

This SIG meets the **first Tuesday** of the month at 6:30 PM. The meeting location varies. For information contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merlenic@tampabay.rr.com.*

Digital Imaging SIG

This new SIG meets the **fourth Monday** of the month at Pepin Distributors at 6:30 PM. For information contact Mary Sheridan at *mcpease@mindspring.com.*

Visual Basic for Applications SIG

This SIG meets the **third Wednesday** of the month at 6:30 PM. The meeting location varies. For information contact William LaMartin at *lamartin@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Kevan Sheridan moderates the discussion.

(1995…….Continued from page 6)

by President Harvey with equipment provided by Will Goble.

President Harvey announced that the manner of this presentation is a FIRST for TPCUG. A machine (computer) with a video card in it that allows one to hook up a VCR to the machine that has a video and sound card. The computer connects to a display panel positioned on the top of an overhead projector. The display is then viewed on the "movie" screen. The sound card in the machine permitted plugging into the external speakers.

On with Mr. Gates'…..Microsoft is presenting (The following are excerpts from Mr. Gates' speech.)

- "Microsoft Tech Net to help software users, like replacing Intel chips and how to cure Intel Chip problems."
- "40 million PCs are out there and will double in the next ten years."
- "...online service will be improved...Windows 95 will assist online services through innovative ideas."
- "Stereo vision (3-D) is being developed to provide ....viewing...(we) will not see this as mainstream for 3 or 4 years."
- "Internet can be accessed from computers of all types."
- "Information Highway with all types of information by anyone will be available to anyone who wants it."
- "Video is down the highway (Information Highway) at a future time."
- "Fox Pro is to be released in January 1995 at a Fox Pro meeting."
- "Microsoft Access is becoming the common tool."
- "E-Mail is in major use in business. Our E-Mail is our primary application in our company (Microsoft). Our E-Mail includes spreadsheets....(other documents)."
- "Beta use (Beta Windows 95) allows you to use all the connectivity to any number of machines without license problems...this is to allow a user to test applications and get ready for the release of Windows 95."
- "The real question is 'Will the industry run Windows 95 or OS/2' (and) is a dead-end (discussion). OS/2 and Windows 95 are just competition."
- "All new machines that you buy after Windows 95 will come with Windows 95 already installed."
- "In three or four years, the high end users and low end will operate from one platform instead of two as they come together in the future."
- "Bus will become standard...VL....people will likely move to a 64 bit bus level."

After the Bill Gates video presentation, the door prizes were given away.

(Minutes……..Continued from page 2)

At 7:00 pm, President Kevan Sheridan took control of our regular meeting. As our presenter for the evening, he told us about Web logs or Blogs. Blogging in general started in 2002.

What is a Blog site? It is an online publishing site, and Kevan has had one since last May. What is it for, you ask. Anything (within reason) you want it for. It can be a diary or newsletter. Blogging gives you as much presence on the Net as you want. An individual or a designated group can post multiple daily entries to the site. You can receive comments from visitors to your site and a tally of "hits". You will have a worldwide audience. You can publish a profile of yourself and create hyperlinks to other Bloggers who share your interests. Best of all Blogging is free through Google. Anyone can establish a Blog site for sharing information with others. Many Bloggers are women.

After a short break, winning numbers were drawn for a dozen door prizes, ten of which were CD's entitled Bob's Computer Goodies, courtesy of our own Mr. Lafave. Meeting adjourned at 8:40 pm. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

I am happy to report that this month we have a description of the FACUG meeting in Kissimmee by Mike Hodges and a short article on Digital Print Order Form by Ron Weinberg. That, along with the Looking Back article, pretty much fills the newsletter. So I am grateful for this respite from producing an article for another month, plus it is nice to have variety.

I hear that our web site received a third place award for user group web sites at the FACUG meeting. I didn't enter this newsletter in the newsletter competition, since I didn't see much chance for an eight page publication against all those 20 and 30 page professionally printed offerings by other groups. To see a list of web sites and online newsletters of other groups, go to the FACUG site at http://www.facug.org/ and click on the members link. ◆

Minutes of the March Meeting

By Doug Mullis, Secretary, Tampa PC Users Group
dmullis@tampabay.rr.com

Kevan Sheridan, President, opened the SIG portion of our meeting at 6:30 pm by pointing out the different ways (web sites) we have for communicating with our members. We have our main web page http://www.tpcug.org, where you can find current club information and links. One link is to Amazon.com where your purchases made through the link benefit our group

Next we have our main e-group site http://groups.yahoo.com/group/TPCUG we use for communication.

Then we have our Web Log, where past and current information about group activities can be found. To participate in the web log, first join BLOGGER (http://www.blogger.com), then ask the page administrator for access to the Team Membership.

Finally, we have our MSN Groups pages: http://groups.msn.com/TampaPCUsersGroup; http://groups.msn/TPCUG; and http://groups.msn.com/BoardofTPCUG. The first two are where the public can find information and links to our group. The last msn group is for Board members and is where online Board meetings are conducted.

Group meeting time and location can also be found at the sites of local newspapers and community web sites http://www.tbo.com and http://www.saintpetersburgtimes.com/.

At this point we began our regular meeting, as it was 7:00 pm. Kevan introduced our speaker, Gene Barlow of User Group Relations now in St George, UT. Gene informed us that their web site, http://

apcug Member of The Association of Personal Computer User Groups

FACUG Spring Conference

By Mike Hodges, Treasurer, Tampa PC Users Group
mphs@aol.com

Bob LaFave and I attended the Florida Association of Computer User Groups, FACUG, conference on Saturday only. We left North Tampa at 7:30 am and we arrived at the conference at 8:45 am, in good time to enjoy breakfast if not being able to concentrate on what Marcy Gunn had to tell us about Smart Computing. Since we have heard her presentations before, I do not believe we missed anything that was new or significant. Bob kept up a continuous dialog in both directions on the journey, and so our time spent driving I-4 seemed to take just minutes. We left Kissimmee at 8:30 pm, and I was home by 9:45 pm, having had a most enjoyable and full day. The breakfast, lunch and dinner were superb, and we as individual attendee members certainly received good value for our $40 each registration fee, even if we only attended for the one day.

The three most significant things I gained from the days event were:

- Our group could save $120 per year if we availed ourselves of the APCUG's (Association of Personal Computer User Groups) free web-start hosting service.
- It was recommended that groups retain paper mail-outs of their newsletters, so that members could use the hardcopy to best remind themselves of upcoming events. I wholeheartedly agree with this premise.
- Florida has a continuing growth in the number of user groups enrolled as members of FACUG. Most of the growth occurs as new gated communities, particularly in the Broward County area, set up computer clubs for their residents. I would surmise that most large urban areas, however, are experiencing a decline in individual memberships from area-wide groups as compared to gated-community groups. The only states in which APCUG noted overall membership growth were in the retirement states of Florida and Arizona.

The sessions I attended were:

- Cyber Mentoring, presented by Dave Dockery
- APCUG Membership Objectives, Vision & Strategy, by Peggy Ireland and Suzy Ball
- Lunch Presentation on Intel's Presentation in a Back Pack, by Dave Whittle
- Building and Maintaining Attendance, by Bob Schneider
- How to increase membership, by Sam Wexler of the Valencia Falls Computer Club in South Florida
- Vendor Panel, moderated by Larry Tyler
- Dinner Presentation, by Microsoft's Richard Katz & Matt McCann.

The presentation skills exhibited by each presenter were outstanding. This made it a pleasure to be in the audience for all the breakout sessions that I attended. Obviously, I was most happy with my selections.

Although I had attended Dave Dockery's session in October on NetMeeting as a means to help members resolve their PC problems remotely, I gained a far better insight at the Spring Conference thanks to the live demonstration in Cyber Mentoring. This was a back-up demo as the Conference Center did not radiate wifi for the initially planned presentation. Unfortunately, NetMeeting is about to become not supportable by Microsoft as they convert us all to Live Meeting for an additional fee. NetMeeting can truly help a coach or an instructor help individuals, including novices, with their problems remotely from the instructor if a broadband internet connection is available and active.

Peggy Ireland's Q&A format was also most informative relating to the benefits afforded APCUG members. Again, a well prepared presentation kept us all most interested in what the APCUG is all about.

Bob Schneider gave us valuable tips on how to ensure our SIG leaders gain the respect of their audience. Prior inspection of the leader's agenda or outline is the key, along with clear diction that keeps material from becoming too dry or archaic. Minimizing technical jargon and detail are critical aspects of a good presentation. Bob himself was dynamic.

The way to membership growth as presented by Sam Wexler was also outstanding. His advice was similar to

(FACUG…….Continued on page 4)

(FACUG…….Continued from page 3)

Bob's. Do not be overly technical if you are to maintain your member's interest at most sessions. It is the novice who will make up about two thirds of the membership. The techies will continue to attend in any event. Limiting the audience to one question per member per meeting was also advised. I am not sure that I can agree with this, however, since some people are much better at asking questions than others.

Gee as to the vendor presentations, I am sorry that I could not experience the Corel girls' presentation at breakfast on Sunday morning, but I have seen enough Digital Studio presentations as demonstrated by Microsoft, even with the lively duo of Dave and Matt at the helm. These products, be they Pinnacle, MS or Corel, keep getting better with each new product.

The vendor handouts or door prizes are generally very useful. Unfortunately, all I got from Microsoft was a free music download. My musical interest is nil; I really had hoped to get a coffee mug as everyone knows that I do drink coffee. Unfortunately although my ticket entitled me to a mug, I dallied towards the end of the line only to find all the mugs were taken already. I got another blue key light from Intel, and this is always useful to have, even if I rarely use it.

As for the Vendor Panel, as last year but even worse this year, there was little value to be gained. These sessions were far better when technical questions filled the forum. As I recall from last year, I was embarrassed to keep hearing the same begging by the audience for vendor freebies, particularly requesting free software. I think this begging does us harm and recommend that the session be limited in the future to truly technical questions or product announcement plans. Dave Whittle was between a rock and a hard place as he was attempting to tell the audience to understand the predicament of the vendors in today's marketplace. His business is User Group Relations. Unfortunately, the retirees cannot change their spots. They do not appreciate that the marketplace is now highly competitive and that unit software prices are these days in the tens of dollars, whereas yesteryear they were in the hundreds of dollars.

Larry, my congratulations to you and your staff for another great conference.◆

Digital Print Order Form

By Ron Weinberg, Tampa PC Users Group
rswjbr@verizon.net

Despite the prevalence of home PC photo printers, many digital camera owners choose to have prints made at a commercial photo lab for several reasons. They may not have a home photo printer. Commercial quality is better than that of inexpensive home printers. Commercial prints may be more permanent. Last but not least, commercial prints are generally far less expensive per print, often in the range of 17 to 20 cents each for high quality 4x6 prints. Even the common 29-cent price often compares favorably to the per print cost of paper and ink at home. As for convenience, one hour commercial service is often available.

In order to facilitate ordering digital prints in a standard easy to use manner, a consortium of leading camera makers–Canon, Kodak, Fuji and Matsushita (Panasonic)–developed the DPOF (Digital Print Order Form) Standard in 1999. In 2000, version 1.10 was released and has been licensed to more than 80 companies, including most other camera makers, commercial photo finishers, and for use in other digital imaging devices. Many PC photo printers also accept the standard information automatically.

The key features of DPOF are as follows:
Settings are made on your camera and DPOF information is stored on your memory chip (digital media) attached to the image and is downloaded with the photo for processing. Some software will allow you to edit or add DPOF settings to photos residing on your PC.

For DPOF-enabled labs and printers you can specify:

- Number of prints desired
- Print date on photo
- Multiple Image Print (multiple pictures can be printed on the same sheet)
- Specific Size Print (different sizes for printed images).

For DPOF-enabled cell phones, projectors, or other

(DPOF…….Continued on page 8)

(Minutes……..Continued from page 2)

www.usergroupstore.com, is organized into six divisions:

The first division is Organization Products, which includes Acronis Disk Director Suite 9.0, Discovering Your Hard Drive Educational CD, Optimal Desktop Pro 4.0 and Spearit Move Me 2.5.

The second division, Backup Products, includes Acronis True Image 8.0 and Backing Up Your Hard Drive Educational CD.

The third division, Security Products, includes WhiteCanyon Secure Clean 4.0, WhiteCanyon Wipe Drive 3.0/Media Wiper, WhiteCanyon My Password Vault, Acronis Privacy Expert Suite 8.0 and Spearit Associate This.

The remaining divisions–Photo/Video Products, Text/Office Products, and Accessories–were not covered this evening. Gene demonstrated the products in the first three divisions, stressing the importance of backing up your hard drive weekly using incremental backups that use relatively little disk space and can be done very quickly. He recommends hard drive backup be done on an external hard drive using a USB 2 connection.

Gene then answered questions and offered the demonstrated software to our group at a discount from list prices. ◆

Looking Back to 1995

From the April, 1995 Newsletter

SECRETARY'S REPORT
TPCUG MEETING 3/8/95, 6 PM
Ybor Room, Hillsborough Community College, Ybor Campus
Minutes and Comments by Bruce Register

Harvey, our president, called the meeting to order. Comments and information were given regarding SIGs, vendors and miscellaneous.

SIG: March 16,1995, 6 PM Promptly. Microsoft Access. 3903 Northdale Boulevard, northeast corner of Mapledale and Northdale Boulevards. Reservations are closed due to limited seating. First signup first served! Next SIG--Microsoft Access is same place, April 20, 1995, 6 PM (sharp--Security Officer must permit entrance at the rear entrance of the building). Sign up early. Use Bulletin Board.

March 28, 1995. OS/2. Contact John Lucas for time, place and openings/signup.

March 28, 1995, 6 PM, Promptly, SIG Internet. Contact Charles Howe. Seats are available. You can use the BBS to sign up. Promptness is required because security at Reflectone is tight and required. From North Dale Mabry, go west on Waters to TAMPA WEST sign on the south (left) side of the street (if you pass Anderson Road, you have gone too far), turn south at TAMPA WEST sign, go one block to dead end, turn right one block and take a "forced" left turn, go south about a half block to north entrance of Reflectone Building. You must enter north end and be prompt at 6 PM because security will unlock door and escort us to the meeting room.

If you would like to have a particular SIG, let President Bruneau know your interest. President Bruneau wants your opinion. He reads the BBS regularly. Send him a message.

A two-day SIG regarding basics and BBS, etc., is in the talking stages. Connie Kincaid is thinking that the interest in overviews of PCs, DOS, hardware, etc., is strong enough to warrant the effort to bring us this educational and functional SIG. What a treat for us neophytes and for the more advanced. Let Connie and Harvey know of your interest.

Harvey asked for VOLUNTEERS to call non-renewal members to encourage them to continue being a member by paying the low, low dues.

Harvey strengthened the reminder that the goal in 1995 is for every member to bring in at least one new member.

There is a new store in town. CompuAmerica. See the *USER FRIENDLY* newspaper for more information.

Harvey presented Adobe Acrobat. He demonstrated how to download the ACROREAD file and how to read the BITS OF BLUE newsletter through the BBS. He says the software download will take about 15 minutes. You can click anything in BITS OF BLUE; you can go right to the article and then you can print it, even in color if you like. You can click on an article and move it around. Harvey has put in tabs for "hot links". If you want to download BITS OF BLUE instead of receiving it in the mail, notify the Editor. You can use the TPCUG Bulletin Board (BBS) to access it.

TPCUG paid for ADOBE ACROBAT but you can download ACROREAD without license/registration problems.

Harvey plans to put BITS OF BLUE on PRODIGY and AMERICA ONLINE.

Contributions to the Bulletin Board will continue to be accepted.

The Editor of BITS OF BLUE will surely appreciate receiving quality fillers for BITS OF BLUE.

SOFTWARE VENDOR DEMONSTRATION

Mr. Andrew Domnauer, District Sales Manager, CAERE CORPORATION, Atlanta, demonstrated OMNI PAGE AND PAGEKEEPER. CAERE has five OCR products. He stated that OMNI PAGE PROFESSIONAL is a high end product. WORD SCAN and OMNI PAGE are middle line; others are OMNI

(1995……..Continued on page 7)

Special Interest Groups

Microsoft Access SIG

This SIG meets the **first Tuesday** of the month at 6:30 PM. The meeting location varies. For information contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merlenic@tampabay.rr.com.*

Digital Imaging SIG

This new SIG meets the **fourth Monday** of the month at Pepin Distributors at 6:30 PM. For information contact Mary Sheridan at *mcpease@mindspring.com.*

Visual Basic for Applications SIG

This SIG meets the **third Wednesday** of the month at 6:30 PM. The meeting location varies. For information contact William LaMartin at *lamartin@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Kevan Sheridan moderates the discussion.

(1995…….Continued from page 6)

PAGE DIRECT and WORD SCAN.

He demonstrated scanning a page with graphics, using different sizes of text and also multiple columns. He emphasized and showed the ease of doing this. He said, "This OCR product holds the format in place" You tell OMNI PAGE the scanner product that you are using and OMNI PAGE recognizes text in 6 to 72 points.

When you bring in text, apply text editor to spell check. OMNI PAGE even reports the "success of the scan accuracy." Graphics sharpen images in an easy format. You can add special effects to your work. The program has the ability to retain or hold the "look and appeal" of the original document. You can save the document in your word processor application such as WordPerfect 6.0. You can fax the image. You can scan and use DEFER OCR to edit at a later time. A feature called 3DOCR helps clarify when the original document is "not too good." PAGEKEEPER requires 7 MB to install and is a database program with OMNI PAGE built in. You can retrieve information from virtually any source. Special dealer price is available to TPCUG members. We are very grateful to Mr. Domnauer and CAERE CORPORATION for the demonstration and for the software that they contributed for door prizes.

COMMENTS by various members for our benefit and edification:

THE TPCUG BARGAIN TABLE will be presented at the MAY meeting. That particular meeting will be across the street from our regular meeting place in the auditorium due to the need HCC has for our May meeting night. Harvey asked us ALL to look around for LEGAL software, hardware, connections, etc., that you might like to contribute. Please look around now! Everybody gains. TPCUG gains!

TURBOTAX and TAXCUT have been reported to have some problems.

MICROSOFT Resource Guide at a cost of $19 is a good source for help with unique problems.

Winners of the door prizes were:

Merle Nicholson	Pen Set
D. A. Clary	T-Shirt
Larry Anders	T-Shirt
Margaret Petros	WINSENS
Sec'y didn't get name	PAGEKEEPER 2.0

Remember our long time friend and contributor to TPCUG Ed Buzza. He has been ill. We have missed Ed's presence.

President Bruneau thanked all for coming. He reminded all to return here (HCC YBOR Campus, ADM Auditorium) April 12, 1995, 6 PM. You will not want to miss DELRINA's presentation. Who knows what great door prizes await TPCUG members. Only members are eligible for opportunities of receiving door prizes. Bring a friend. Sign up a new member. Use the BBS. ◆

lamartin@tampabay.rr.com

We have no contributions from the membership this month for the newsletter other than the minutes from our secretary and the 2004 financial summary from our treasurer. The financial report should have been in last month's newsletter, except that I forgot to include it.

I have several things that I have been looking into in the computer world, but none is at the point of a full article yet. As I mentioned last month, our web site, http://www.tpcug.org, place third in the web site competition at the recent Florida Association of Computer User Groups meeting. That resulted in a copy of **Adobe GoLive CS** for the webmaster--yours truly. I had hoped to get deeply enough into it to be able to write an

Minutes of the April Meeting

By Doug Mullis, Secretary, Tampa PC Users Group
dmullis@tampabay.rr.com

Mary Sheridan, Member at Large, started the Windows SIG portion of our meeting at 6:40 pm. President Kevan Sheridan was not present. Mary raised a recent experience she had with her Toshiba laptop. The cooling fan failed, and she was unable to find a local parts house or dealer who stocked the part. She had to order the part from New York at a cost of $44 plus $36 for shipping. She asked why this is? Merle Nicholson explained that laptops and notebooks are comprised of proprietary components to minimize space and are sold in a very competitive market. These components are not interchangeable and the situation is not likely to change in the foreseeable future.

Several questions were asked about printing out system information, however your Secretary was distracted by the arrival of the evening's presenters and did not comprehend the questions.

At 7:20 pm our program presenters, Kelly Whitelock and Tony Hills were introduced. Kelly and Tony are affiliated with the Mormon Church, and their topic was entitled "Bringing Genealogy To Life". Packets were handed out, which included Pedigree Charts, Family Group Record forms, a Research Log, a list of items to consider in writing your personal history, and a Five-step Procedure for researching your ancestry.

Step One of the procedure was to record what you already know about your family. Step Two was to decide what you want to learn about your family. Step Three was to select the records you will search. It was suggested you first search compiled records (previous research by others), then search original

(Comments……..Continued from page 1)
article for this newsletter, but it is so different from Microsoft FrontPage, which I have used for years for web work, that I would have had to drop everything else to find enough time. Perhaps by the next newsletter I will have had time to learn it better.

However, right off the bat, I can tell you that it will not be easy for someone who has not used Adobe products before and is familiar with the FrontPage way of doing things. I have used many Adobe products, but I am having a bit of trouble with it. It appears geared to those who are versed in Adobe's graphical programs. My hope is not to master it so as to use it to manage web sites, but to use it to create graphically rich web pages, since graphics is what Adobe is all about. Then I can bring those pages into my already existent sites.

Two things of note are that GoLive CS2 is now out, so I no longer have the latest version, and in doing a little research on the product I discovered some discontent among users that database connectivity was dropped from the product starting with the CS version. For me that is no problem since I have never used the database connectivity wizards in FrontPage, preferring to roll my own by using Visual Basic script and Active Server Pages, or by using ASP.Net to interface with a database. So, stay tuned to see if I learn enough about the program to write a review. However, that may be a waste of time, since I recently read that Adobe is to purchase Macromedia, the developer of the Dreamweaver web development program, and that may portend a dropping of GoLive in favor of Dreamweaver.

In a different direction, I have also presented two of my **Visual Basic.Net** programs at recent SIGs: One written for the Pocket PC which performs a simple slide show; the other written as a desktop application which allows you to add a time stamp on any photo taken with a digital camera, so that when printed the date and/or time would be visible on the print in whatever position you selected. I could go into a bit of detail about how one does such things. In particular, in the time stamp application I needed to retrieve the date and time a digital photo was taken from what is know as the **EXIF information** in the header of the jpeg file for the photo. By the way, member Merle Nicholson requested the Pocket PC program and member Ron Weinberg requested the time stamp program.

To finish, .I will write briefly about what sort of information goes into the EXIF section of the header. You have camera information, such as Make & Model; you have exposure information, such as Aperture and Shutter speed (listed as Exposure below); and certainly you have the date, which started this programming effort.

Below are the data that I extracted from a photo I took recently. The only thing not put there by the camera when the photo was taken is the Title, which I added using Adobe Photoshop's File Browser feature.

Title	Lizard on cactus in Bayshore yard
Make	NIKON CORPORATION
Model	NIKON D100
Exposure	0.001sec
Aperture	f/7
Program	program normal
Date	2005:05:02 12:16:30
Bias	0.00
Meter	unknown
Light	unknown
Flash	no flash
Focal length	120.00

My Nikon D100 actually creates 59 fields in the header of the image file where for this photo it recorded data in 50 of them. As you can count above, I searched for and extracted only 12 such fields.

VB.Net has methods for extracting this information. However, once it is extracted you then need to know the data type of a particular field to be able to use its information. It turns out that the type could be ASCI, short, rational, long or undefined. To find the data type of a particular field, you need to consult the Exchangeable Image File Format (EXIF 2.2) for digital still cameras of the Japan Electronics and Information Technologies Industries Association (JEITA), which I found in English through a Google search at the Kodak site. Isn't programming useful?◆

Looking Back to 1995

From the May 1995 *Bits of Blue* newsletter

Editor's note: Although not mentioned in the minutes, based on the President's Column from the same newsletter, this was one of those meetings where certain attendees wanted to argue the superior merits of OS/2 over Windows during the presentation, causing a bit of a stir with the presenter caught in the middle. As I recall, there was more than one meeting where the OS/2 vs. Windows argument got a bit heated.

SECRETARY'S REPORT
TPCUG MEETING 4/12/95
Minutes and Comments by Bruce Register

President Bruneau called the meeting to order. Comments and information were given regarding SIGs, vendors and miscellaneous. Some members have downloaded BITS OF BLUE. You must have Windows and download Adobe Acrobat Reader to download the BITS OF BLUE. The April issue contained 300 KB. First, you download the reader, then use it to download the BITS OF BLUE NEWSLETTER.

The MAY MEETING will be across the street (north side of street from regular meeting place) in the Performing Arts Building. The bargain table and an excellent program composed of demonstrations, questions and answers regarding many of your concerns, including working through the bulletin board (RBBS) and using the Adobe Acrobat Reader, is planned. Bring your individual questions for which YOU need answers. Come prepared to get those answers to the questions that "you never asked but wished that you had asked." Be prepared to sigh, "I did not know that!" One of the joys of TPCUG is that members are always ready and willing to help each other.

THE TPCUG BARGAIN TABLE will be presented at the MAY meeting. That particular meeting will be across the street from our regular meeting place in the auditorium due to the need HCC has for our May meeting night.

Contribute to the BARGAIN table. Harvey asked us ALL to look around for LEGAL software, hardware, connections, etc. that you might like to contribute. Please look around now! Everybody gains. TPCUG gains!

MICROSOFT Resource Guide at a cost of $19 is a good source for help with unique problems.

May 18,1995, 6 PM, promptly is next Microsoft Access SIG; 3903 Northdale Boulevard, northeast comer of Mapledale and Northdale Boulevards. One or two may be squeezed in due to limited seating. Be there at door at 6 PM, a few minutes before 6 PM is better. A Security Officer must permit entrance at the rear entrance of the building. Sign up early. Use Bulletin Board. Meeting is the 3rd Tuesday of each month. Instructors and SIG leaders are superb!

April 23, 1995, OS/2 SIG. (Always 4th Tuesday of Month) Contact John Lucas for time, place and openings/ signup.

June 6, 1995, 6 PM, promptly, is next Internet SIG. Contact Charles Howe. Seats are available. You can use BBS to sign up. Promptness is required because security at Reflectone is tight and required. From North Dale Mabry, go west on Waters to TAMPA WEST sign on the south (left) side of street (if you pass Anderson Road, you have gone too far), turn south at TAMPA WEST sign, go one block to dead end, turn right one block and take a "forced" left turn, go south about a half block to north entrance of Reflectone Building on left. You must enter north end and be prompt at 6 PM because security will unlock door and escort us to the meeting room. There will be no Internet SIG in May due to scheduling of OS/ 2 on the same 4th date. The next Internet SIG meeting will be the first Tuesday of the Month.

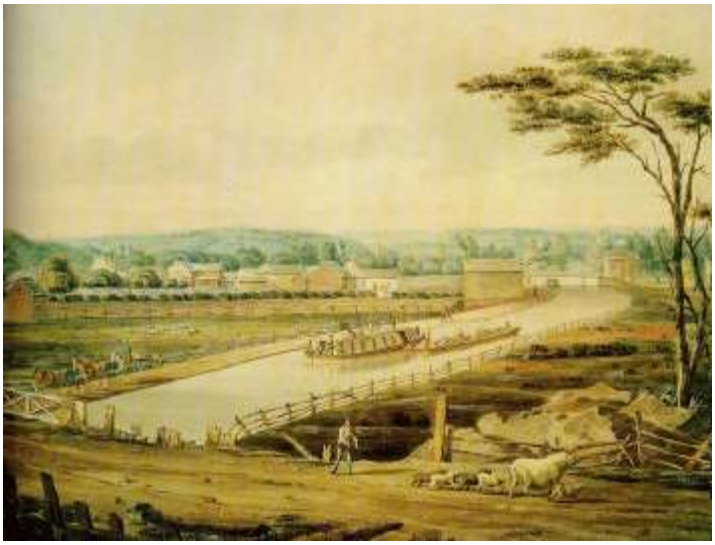
If you would like to have a particular SIG, let President Bruneau know your interest. President Bruneau wants your opinion. He reads BBS regularly. Send him a message. Many have not tried to use the Bulletin Board. Use it, you can't hurt it.

SOFTWARE & HARDWARE SIG. Connie Kincaid has the two day SIG regarding basics and BBS: Hardware, June 27, 1995, 6:30 PM. Software, July 25, 1995 6:30 PM. Place: Reflectone Building. See Internet SIG above for directions, security, etc.

Harvey asked for VOLUNTEERS to call non-renewal members to encourage them to continue being a member by paying the low, low dues. Various reasons were given to the VOLUNTEERS by non-renewals. From "I forgot" to "I lost my interest" and all kinds of good responses in between. Most non-renewals appreciated the call. The responses were helpful.

EACH ONE SIGN ONE. Harvey strengthened the re-

(1995…….Continued on page 6)



(Minutes……..Continued from page 2)

records (birth, marriage, death and census records). Step Four, you should obtain a copy of the records you find and look for facts and clues, recording the results in a log. Finally, Step Five, use and share information you find. When you reach this point, select a new objective based upon what you now know about your family.

Kelly Whitelock instructed us on the use of records at public libraries and outlined the information contained on a page of a census survey. Don't expect to see a census record done within the last 76 years, as, to protect the privacy of the living, this information is not made available. I guess after age 70 you should have nothing to hide, or, having burned the candle at both ends, you are expected to have "kicked the bucket" by then.

Kelly invited members of our group to visit her web site at http://www.tampabayroots.com or to attend future classes on genealogy and family history at The Church of Jesus Christ of Latter Day Saints at 2120 W. Fletcher Ave. Other web sites referred to were Ancestry.com, HeritageQuest, Cyndi'sList, Roots.com, immigration web sites and the genealogy section of our local public library's web site, http://www.thpl.org/, at http://www.hcplc.org/hcplc/ig/genealogy_frame.html. ◆

Internet Picture of the Month

View on the Erie Canal
by John William Hill

This painting is from the site http://www.eriecanal.org/. The Erie Canal was the engineering marvel of its day. It was completed in 1825 and linked the waters of Lake Erie in the west to the Hudson River in the east and hence to the Port of New York and the Atlantic Ocean.

(1995.....Continued from page 4)
minder that the goal in 1995 is for every member to bring in at least one new member. Some have already exceeded this goal. Where do you stand? You will be surprised how many people are unaware of how easy it is to get such excellent help. Ask those browsers in the computer store check out line; even your Pastor will want to know. They will not know if you don't ask. Please do; better, bring them.

Harvey reported that you should download the Adobe Acrobat ACROREAD file to be able to download the BITS OF BLUE newsletter through RBBS. ACROREAD download will take about 15 minutes. You can click anything in BITS OF BLUE; you can go right to the article and then you can print it, even in color if you like. You can click on an article and move it around. Harvey has put in tabs for "hot links". If you want to download BITS OF BLUE instead of receiving it in the mail, notify the Editor. You can use TPCUG Bulletin Board (RBBS) to access it.

Financial contributions to Bulletin Board will continue to be accepted, needed, desired and appreciated..

The Editor of BITS OF BLUE will surely appreciate receiving quality fillers for BITS OF BLUE. Some of members have insertions already. Put in your sharing of knowledge, hints, help, etc.

Some members reported receiving BETA WINDOWS 95 ($39). One member reported "running 16 bit and will not change to 32 bit until the final release of WINDOWS 95 comes out."

Tampa College on West Hillsborough is looking for speakers for their PC Users groups. They meet on Saturdays. If you feel that you have something to offer and want to be helpful, give them a call.

SOFTWARE VENDOR DEMONSTRATION-Comments and statements are:

Mr. Hartley Macklin, Manager of User Group Relations, Delrina Corporation, presented Delrina' s several existing and new to-be-released programs. He made an excellent "discount offering" to TPCUG members. "Delrina is the leader in communication and forms products. Delrina has 650 employees in five countries and will be hiring an additional 150 within the next 60 days. Delrina can send out 10,000 faxes for you anywhere in the country. WinFaxPro can be used to download a fax that is awaiting you in your FaxMailBox. This is a Delrina service."

Delrina has Communications Suite "Strategy" (WinFaxPro and WinComPro) for stand alone applications. They are for the mainstream market, i. e., Windows 95 & Macintosh. Applications for OS/2 will be in the future as OS/2 users increase to 20,000,000. WinComPro is for Bulletin Boards. Delrina "is getting a toehold on the Internet." They have Internet Messenger. WinComPro provides for Internet E-Mail. Echo Lake is soon to be released for consumer programs. It is a Scrapbook application for biography, photos, etc.

Hartley gave a BETA copy of Echo Lake to the TPCUG Editor for review. He donated several software products to the TPCUG door prize program. He said, "If you can print it in Windows, you can fax it with WinFaxPro. There are no exceptions regardless of the application. Faxing from DOS will not work. It must be a Windows application that will print in Windows. He demonstrated the ease of use with Microsoft Word, whether faxing to one or to several recipients. You can select style and other features. You can "grab, drag and drop" from one phone book to another. In addition, mail can be sent to those in the address book who are selected to receive mail.

WinFaxPro has menu and tool bars. The "item log" manages the folders with choices and icons. Right mouse button capabilities speeds use. WinFaxPro "Viewer" cleans up fax "dirt" from faxes; it will even add your signature. You can doodle on your fax or draw on it, etc. He demonstrated using OCR. He took Microsoft Word, created a fax and turned the fax back to Microsoft Word. You can hook up any TWAIN scanner and scan a printed document and fax it from WinFaxPro. He says the current WinFaxPro is a tremendous improvement over WinFaxPro 3.0.

Delrina PerForm Designer for Windows was released in December 1994. "It is so easy to use; it is a 'form for idiots' ". It shows you what you see before you get it. It is easy to put in your logo just like you did your signature. The special to TPCUG members present that night only was $39; not the suggested retail price of $129. He presented several other special "one night only" offerings. Several of us took advantage of them.

Many COMMENTS by various members for our benefit and edification were shared.

Winners of the door prizes were:

WinSense	Gary Peterson
Bag	Gary Ennis
Corell CD	Gary Ennis

(1995.....Continued on page 8)

Special Interest Groups

Microsoft Access SIG

This SIG meets the **first Tuesday** of the month at 6:30 PM. The meeting location varies. For information contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merlenic@tampabay.rr.com.*

Digital Imaging SIG

This new SIG meets the **fourth Monday** of the month at Pepin Distributors at 6:30 PM. For information contact Mary Sheridan at *mcpease@mindspring.com.*

Visual Basic for Applications SIG

This SIG meets the **third Wednesday** of the month at 6:30 PM. The meeting location varies. For information contact William LaMartin at *lamartin@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Kevan Sheridan moderates the discussion.

June in Tampa

A Monthly Publication of the Tampa PC Users Group, Inc.

Vol. 18 No. 6 June 2005

Meeting

Serre Murphy
Net Fulfillment Technologies

Wednesday, June 8, 2005
6:30 PM
Art Pepin Hospitality Room
Pepin Distributing Co.
6401 N 54th St
Tampa, Florida

Meeting Preview: Serre Murphy from Net Fulfillment Technologies will tells us about creating web sites. We will also have the usual half-hour Windows SIG.

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

I was promised a couple of articles for this month's newsletter, and one was actually delivered thanks to Jenny Lind Olin. I think the other one will be here for a later newsletter. So I am going to still have to write a bit myself this month. It won't be more detail about Adobe GoLive, which I wrote briefly about last month, since I didn't find time to look further into it. Instead, I will cover a USB video capture device and its accompanying software.

We should thank Doug Mullis for handling the job of securing speakers for us. It is good to have new people taking up such roles in the group. And we certainly need to thank Bob LaFave for helping Doug by contacting the Microsoft people who gave last month's presentation. ◆

Minutes of the May Meeting

By Doug Mullis, Secretary, Tampa PC Users Group
dmullis@tampabay.rr.com

We skipped the usual SIG portion of our meeting due to Microsoft being our presenter for the evening. Pepin turned on the beer taps and our guests brought the pizza. A meeting not soon to be forgotten! John Witmer, our Vice President, served as Sgt-at-Arms to make sure no one over-indulged. Actually John pulled double duty and conducted the meeting as our President, Kevan Sheridan, was without a speaking voice.

Mr. Jerry Harris was introduced as a visitor. We hope Jerry will be back. William LaMartin asked members to please submit articles for the newsletter. None has been received in some time. Certainly things are happening out there that our members would like to read about. Please make the Editor's job easier by sending articles.

Our much-missed treasurer, Mike Hodges, was present and plans to be at our meetings until fall classes resume. John Witmer introduced the group officers. Doug Mullis asked that members wear their name tags at the meetings to help him put faces to names.

Normal business being concluded, John Witmer introduced the Microsoft representatives, Greg Boyd and Blain Barton. A little later in the evening, Russ Fustino from Microsoft also joined us.

Topics focused on Internet security and new software coming out in the next couple of months. Business Contact Manager, Version II will be available in June. Security cannot be overemphasized, as there are lots of nasty things out there. It is hoped everyone has Service Pack 2 installed by now on XP. Updates are released the second Tuesday of each month. SP 2 has a removal tool for malicious software that scans your computer every time you download updates.

A good firewall and anti-spy ware are also important to protect your PC. Without anti-spy ware, your computer

Dazzle DVC 90 and Pinnacle Studio QuickStart

By William LaMartin, Editor,
Tampa PC Users Group
lamartin@tampabay.rr.com

The Dazzle DVC 90 is a USB 2.0 Video capture device. It imports video from an analog source (camcorder, VCR, DVD or TV). To additionally import from a digital source (and have the video encoding done by hardware instead of software), you need to spend more and purchase the DVC 150. The accompanying software that allows you to turn your captured video into a "movie" is Pinnacle's Studio QuickStart, a scaled-back version of their Studio Version 9.

Creating a "movie" is a three step process: Capturing, Editing and Generating the Movie. I will only describe using an analog source, since I do not have a digital source or the digital capture hardware.

To capture, you select the Dazzle DVC as the source, select the capture quality, frame aspect ratio (4:3 or wide screen) and the name of the file to which the capture is saved. You may also indicate how frequently a thumbnail of the current scene is created and added to the ever growing filmstrip of such thumbnails. If you choose automatic scene detection, the software will create a new thumbnail whenever it detects a change in scene. In my first project, described below, I found that the automatic scene detection produced very few such thumbnails, so I switched to having thumbnails created at intervals of every five seconds. If I had desired I could have set it to create a new scene thumbnail whenever I clicked the mouse. Once all settings are made, you start the source running and click the capture button of the software.

One other setting that I did not mention allows you to view a preview screen of the actual video as it is being captured. The recommendation is not to do this, since it may interfere with the capture, so that was my choice. And having a thumbnail created every five seconds lets you know very well what is happening.

When you have captured your video material, it is then time to edit it. This is where all those thumbnails come in. In editing mode, you have the thumbnails laid out in the video scenes section of the Album window in the top half of the screen and in the story board below that in the bottom part of the screen called the Movie Window. To include any scene in the final movie, you simply drag a copy of the scene from the top window to the bottom story board. If all you want is to make a movie of everything you captured with no modifications, you would simply drag all the scenes to the bottom and then go the final step of generating the movie.

Since my project was to port two 21-minute videos professionally created for our neighborhood to the neighborhood web site, I wanted to break each into either three or four separate parts and then save them as Windows Media Player files that could then be streamed to the site visitor's browser. File size was the reason for breaking each video up into several parts: I didn't want the files to be much more than 10 MB each. As it turned out, one video broke down into four wmv files totaling 39 MB and the other video was broken down into three wmv files totaling 34.5 MB.

To create one of the short video segments, I selected the collection of thumbnails that contained the portion of the video that I wanted. I could then view this in the preview screen, with my primary concern being to start it and stop it exactly where that should occur. To do this, I switched the view of the bottom half of the screen from story board to time-line view. To get the exact ending of this segment of the video, I started it a little before the end, and, while viewing it in the preview window, noted the exact time that it ended. I then split that five-second long scene there and deleted the remaining portion of it. Similarly I got the exact starting point.

Once I had the collection of scenes that I wanted, I moved on to the generation of the movie and chose to create a file that could be streamed from the Internet and viewed with

(Video ……..Continued on page 4)

(Video……..Continued from page 3)
Windows Media Player. The program then works away for some time and produces the file in wmv format. Other output formats are rm, Real Video for the web and avi and mpeg for playing on computers. You may also save it to a CD as DVC, or to a DVD in the DVD format.

In the above, I added nothing to the video. I simply captured it and then used the software to turn it into Windows Media files that could be viewed on the Internet. They were also sized so as not to take up excessive bandwidth, with a screen size of 320 x 240. If I had been capturing and editing a home video or collection of such videos, I would probably have wanted to add background sound clips, transitions between scenes and titles. All of this is possible with the software and the included transitions. For sounds, some effects are included, or you may use your own sound files. You may also include still images. In addition to the included transitions, you may purchase additional ones. For my next project, I will see if I can use all these features.

InstantDVD Recorder software that allows you to capture video and write it to a DVD as it is being captured was also included, but I chose not to install it. It is something I am not at this time interested in, and the requirements for the computer involved – 2.2 GHz Pentium 4 – exceeded my laptop's capabilities.

To see the videos I captured, go to http://www.oldhydeparkfl.org, click the HPPI button and then the Hyde Park History link. Pinnacle systems is found at http://www.pinnaclesys.com. ◆

(Minutes……..Continued from page 2)
will run slower and slower as spy ware accumulates. You can install multiple anti-spy ware tools, as one will catch things another misses; however, multiple firewalls will conflict with each other. Microsoft offers a free anti-spy ware, or you can also get Ad-aware or Spybot. Microsoft is also coming out with a new anti-virus.

Greg Boyd demonstrated some small business software, such as Business Contact Manager. Russ Fustino distributed a DVD entitled *MSDN Events DVD-ROM* and indicated he was available to make presentations to user groups and even SIG's. Greg is moving on to a new assignment, so we may not see him for a while.

(Minutes……..Continued on page 7)

Being Frugal with Google

By Jenny Lind Olin, Tampa PC Users Group
jlolin@tampabay.rr.com

Do you know all there is to know about the world's #1 search engine? Probably not! However, of the people questioned in a recent survey, 92% said they knew and understood the capabilities of all the search engines. Which group are you in?

Did you know you can enter your telephone number, and your name and address will be the result or whatever is in the phone book directory? Try it. Interesting? Cell phone number--not yet!

On Friday, May 5th, I attended a presentation given by Golden Compass, Inc., http://www.Goldencompass.com, titled "Hidden Google Treasurers of the Internet" at the University of South Florida Learning in Retirement (LIR) Lunch and Learn. They listed eight hints of more effective use of Google in the home and/or office. They were:

1. Quotations / Everybody Knows Bartlett was Right!

Use quotation marks around phrases that belong together. For example, to search for Jenny Lind and not get every Jenny and every Lind but only "Jenny Lind" you use quotation marks. Swedish Nightingale or Baby Furniture? You will find this hint important when doing searches other than just search engines. This is not the best example, but I still reduced the number of choices by 80% when I used quotation marks.

Results 1 - 10 of about 751,000 for Jenny Lind [definition]. (0.11 seconds)
Results 1 - 10 of about 149,000 for "Jenny Lind" [definition]. (0.35 seconds)

2. Google Tabs / Everybody knows about Google Tabs

Right above the Google search box you will find the Google Tabs: Web Images Groups News Froogle Local

If you just want a photo of Anna Kournikova, be sure to use the "Images" Tab on Google. If you just want the latest news stories on Anna use the "News" Tab.

Froogle is the shoppers tab: **Results 1 - 10 of about 98,600 for Replacement Cover Canvas for Directors**

(Google……..Continued on page 5)

(Google…….Continued from page 4)

Chair. (0.22 seconds) This is what I wanted: Replacement Cover Canvas for Directors Chair (ROUND STICK)

3. Preferences / Have it Your Way – Sit, Speak, Roll Over

Click the Preferences tab to make Google behave – or misbehave! Get your results in English or Chinese, or maybe your "other" language is Pig Latin. If you have children using the computer or you are just prudish, you can use strict filtering to filter both explicit text and explicit images. You can also choose to not filter your search results.

4. Alerts / All the News that's Fit To Get

Click the "More" tab to go to "Alerts" under "Google Services." Create a Google Alert. Select HTML or text e-mails. Select the type and how often you want to receive the alerts.

5. New Meaning to Modern Math / It's A Bird, It's a Plane, It's a Calculator!

No need for a disguise, Google is Super (number) man. Now you can help your third grader with math homework.
Try this equation: 8 * 4789 =

Looking Back to 1995

From the June 1995 *Bits of Blue* newsletter

SECRETARY'S REPORT
TPCUG MEETING 5/10/95, 6 PM
Minutes and Comments by Brace Register, Secretary

Many of our members and visitors enjoyed the TPCUG Bargain Table. The efforts of the donors and purchasers are much appreciated by all the members The President thanked all for contributions of items and contributions from your purchases. He stated that we might do the TPCUG BARGAIN TABLE again in December 1995.

After considerable and adequate time, President Bruneau called the meeting to order. Comments and information were given regarding SIGs, vendors and miscellaneous. Several comments and questions were raised and answered. Harvey asked for comments from those who have downloaded BITS OF BLUE. (FYI: You must have Windows and download Adobe Acrobat Reader to download the BITS OF BLUE. The April issue contained 300 KB. First, you download the reader, then use it to download the BITS OF BLUE Newsletter.)

The JUNE MEETING TPCUG will be back at our regular meeting place, the HCC Auditorium - Ybor Room.

SIGS: MICROSOFT ACCESS: June 15 (3rd Thursday), 1995, 6 PM, promptly, at 3903 Northdale Boulevard, northeast corner of Mapledale and Northdale Boulevards. One or two may be squeezed in due to limited seating. Be there at door at 6 PM, a few minutes before 6 PM is better. A Security Officer must permit entrance at the rear entrance of the building. Sign up early. Use Bulletin Board. Meeting is the 3rd Tuesday of each month. Instructors and SIG leaders are superb!

OS/2: (Always 4th Tuesday of Month) Contact John Lucas for time, place and openings/sign-up. (Read the SIG information page.)

INTERNET: June 6, 1995, 6 PM Contact Charles Howe. Seats are available. You can use BBS to sign up. Promptness is required because security at Reflectone is tight and required. From North Dale Mabry, go west on Waters to TAMPA WEST sign on the south (left) side of the street (if you pass Anderson Road, you have gone too far), turn south at TAMPA WEST sign, go one block to dead end, turn right one block and take a "forced" left turn, go south about a half block to north entrance of Reflectone building on left. You must enter north end of the building and be prompt at 6 PM because security will unlock door and escort us to the meeting room. The next, and thereafter, SIG Internet meeting will be the first Tuesday of the Month.

President Bruneau wants your opinion. If you would like to have a particular SIG, let him know your interest. He reads BBS regularly. Send him a message.

The Bulletin Board is easy to use. You cannot mess it up. Try it whether member or non-member of TPCUG. Many have not tried to use the Bulletin Board. Use It, you can't hurt it. Check out the HUMOR Board, also while you are on.

SOFTWARE & HARDWARE: Connie Kincaid has the two day SIGs regarding basics and BBS: Hardware, June 27, 1995, 6:30 PM. Software, July 25, 1995 6:30 PM. Place: Reflectone Building. See SIG Internet above for directions, security, etc. Check with Connie for reservations. If it is filled, ask her about a repeat.

DESKTOP SIG is in the planning stage for August.

EACH ONE SIGN ONE goal in 1995. Harvey reminded us that the goal is for every member to bring at least one new member. Just ask whom you casually meet in places of business. If someone asks you a question while you are browsing the computer store, acquaint them with the benefits of TPCUG. What did your neighbor say when you invited them? You didn't. Well bring them next time on June 14, 1995. Bring a whole carload; they will thank you for being a good neighbor.

Use of the Bulletin Board and a demonstration of Adobe Acrobat were presented. A Q & A session was lively and helpful, even for those of us who did not ask questions. We learned also. Kevin Sheridan, SYSOP, showed a tree of files on the RBBS. He noted the new EXPRESS mail file. Over 144 files related to messages are available. He accessed the RBBS so that we could follow the steps on the overhead screen as he walked through the prompts and responses. Mail door is working perfectly, but 255 lines continued to lock up the system. Kevin installed SILVER EXPRESS to solve the problem so that messages of 255 or more can be handled.

Some comments on this and that were given. The RBBS Menu has a different color combination than previously. Al Poole, Asst. SYSOP, has done an excellent job on the system. Kevin walked through BULLETINS Menu. We watched bulletins retrieval. Files have been categorized. You can change your color setting by using Utilities Menu on the RBBS (Bulletin Board main menu). Kevin recommended that we use Z-MODEM Protocol for download. Upload will ask you for that information each time. You can use numbers rather than names of "doors", i.e., TQM door is the 1st. Type in the number of mail conference to turn on that conference. RIPTERM.4 is RIPTERM communication program to download; go to files. RIPTERM iallows the use of a mouse. All uploads on RBBS are scanned for virus before accepting upload. “Express System” explains the RBBS and how it works. When TQM or EXPRESS are packing mail, your screen may look as if nothing is happening but the RBBS is packing the mail. Just wait it out. Downloading messages shows a spinning propeller as it packages messages. Message numbers in series should be separated by a comma or a space in between. Sending a message to (ALL) exposes the messages or questions to everyone. The phone numbers to the Bits of Blue BBS are (813) 239-3704 and (813) 237-4997. In uploading, give one filename and

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

This month I am the presenter, and I will talk on two topics that consume a good bit of my time--programming in Visual Basic .Net and Digital Photography with Photoshop.

In the VB.Net section, I hope to give examples of how to program for the Web, the Windows desktop and the Pocket PC. VB .Net is a far more powerful programming language than the old Visual Basic, the howls of protest from a segment of VB users notwithstanding.

In the digital photography section I will give examples of photos I have taken with my digital cameras and how you may modify or improve them in Adobe Photoshop. ◆

Minutes of the June Meeting

By Doug Mullis, Secretary, Tampa PC Users Group
dmullis@tampabay.rr.com

Bob LaFave started the SIG portion of our meeting at 6:45 in the absence of Member at Large Mary Sheridan who had injured her foot in a kitchen mishap.

Bob recommended we try the Google Picasa photo-handling program that can be downloaded from the Internet. It is not a full photo editor, but is easy to use, to download and to organize your images.

Bob announced the upcoming AMD Road Show being presented June 14th at the local Hard Rock hotel. This is a free presentation if you can make it starting at 3:00pm.

Our regular meeting commenced at 7:05 pm presided over by our President Kevan Sheridan. Kevan called attention to the fact our treasurer Mike Hodges was at our meeting this evening and that members should see him for nametags, also for dues and membership renewal. Mike said that during the summer he would be able to be at our meetings.

Kevan advised the group that Intel offers a canned program for building your own state-of-the art computer for a price of $999. They supply the components (less the monitor). Phase I is a seminar done at a regular meeting (tentatively our November meeting) at which the program is presented and final orders placed. Phase II is the assembly workshop scheduled by us (not a regular meeting). To start this process, we need at least one person to place an order and the other members to express a desire to attend the sessions. Ed White said he was interested in the program and would place the initiating order. Members said they would support the program.

New Keyboards And Notebooks as a Desktop Replacement

By Merle Nicholson, Tampa PC Users Group
merle@merlenicholson.com

This should be a short article on two keyboards I've purchased, both fairly different from the normal, and also some advice on the use of notebooks as a primary PC and the hazards.

Microsoft Keyboard Elite for Bluetooth
This is a fairly new keyboard, and somewhat hard to find in a retail store. It follows the most recent pattern of layout as Microsoft's other "Elite" keyboards. It's wireless and uses Bluetooth for communicating to the PC. It comes with a Bluetooth USB plug-in, which is about 1-1/2 inches in length.

The USB device can plug into the back of your PC and still communicate just fine with the keyboard and mouse in the front. There is a very small instruction sheet that comes with it that works perfectly if you follow it exactly.

The key layout differs quite a lot from normal. For instance the "Home, End, Page Up, Page Down" cluster of keys is entirely different. It has buttons for multimedia devices, sound - mute and volume, buttons to launch My Documents, My Pictures, your Mail Client, the Internet Browser, Calculator, Sleep, My Favorites, and more. The row of keys that is normally F1 - F12 is also a variety of functions within Windows programs, such as Reply, Forward, Send, New, Open and Close. There is an "F Lock" button to make those keys F1 - F12 when you need that. Notice on the left is a wheel that duplicates the mouse wheel. Both this wheel and the mouse wheel do horizontal scrolling by moving it side-to-side.

All this is surprisingly easy to get used to. I thought that the "home-end, PageUp, PageDown" cluster would throw me for sure, but it really did not. I like this keyboard so much I bought a second one. The large palm rest is a thin rubber. It's comfortable and not removable. I especially like the freedom that wireless gives me, and removing some of the wire clutter from the PC is a bonus, too. It would make a perfect keyboard and mouse for a Notebook Desktop replacement. Never mind that it's larger than a notebook.

Now the downside. First, it's big – really big. It measures 19-3/4 x 10-1/2 x 2-1/2 inches thick. It really needs some desk space. The other disadvantage is that it works in Windows, Period. If you have a more recent motherboard that gives you "Legacy USB Keyboard Support," that's fine, just don't expect this keyboard to work until Windows is active. So it's useless for the F8 menu to get Safe mode, and you have no keyboard to change the BIOS. Just don't throw your old PS/2 keyboard away, because you'll eventually need it.

Microsoft Keyboard Elite for Bluetooth and Microsoft IntelliMouse Explorer for Bluetooth. $150 retail, $130 mail order (Try http://www.NewEgg.com)

Adesso Wireless SlimTouch Keyboard Wireless WKB-4000
This is another wireless keyboard, and it's tiny. It's just 8 1/2" x 12", and 3/4" thick. It has a touchpad instead of a mouse. My wife uses it for her desk. The desk is in the living room, and she doesn't want a keyboard sitting out, so she puts this in the desk drawer to hide it. We had a nice – but very old – similar infrared keyboard that was going flaky on us, so this was a perfect replacement.

This is a really beautifully made, unusual looking key-

(Keyboard & Notebooks…….Continued on page 4)

(Keyboard & Notebooks…….Continued from page 3)
board.

It is wireless, runs at 2.4GHz and communicates with its own proprietary USB transmitter. There is a vertical area on the right side of the touchpad that functions the same as a scroll mouse. It really works great. The layout is about the same as a notebook keyboard. If you need a keypad, and lots of keys, don't look here. It does have Windows keys and a Function key, similar to notebooks.

If you search for Adesso products, you'll find various Adesso computer peripheral devices for sale on the internet (for instance CompUSA and Amazon), but not this keyboard. I ordered it directly from them at http://www.adesso.com. And if you're used to the fine Internet shopping, feedback, tracking and emails that, say, Buy.com, Amazon.com and NewEgg.com all give you, you'll be disappointed with Adesso. After I ordered, I wanted the tracking number so we'd be home to receive it, and they wouldn't answer my email. The website has a place for it when you look up your account, but it wasn't there. My wife called them; they didn't have it and said they'd get it and call back. They didn't call back, and it was delivered the next day via FedEx. Actually it was shipped and delivered pretty fast, but you're in the dark all the way.

And then we had trouble with it. It has a sleep mode where it goes to battery savings mode after 10 minutes. And it would rarely wake up. Usually I had to pop a battery out of it to reset it, and it'd be fine until it went into sleep mode again. So I sent an email to Adesso's support the same day we received it, and I sent another two days later; no reply; ever.

I did phone them just before their closing at 5PM PST, and got through to them fairly quickly. The support person said they have gotten several reports of the problem and if I'd look at their online FAQ, there's a solution. I said I didn't see any, but he explained he had just posted it 45 minutes earlier. OK. What it needs is NiMH batteries – four AAA nickel-metal hydride rechargeable batteries of at least 750MAH capacity. And he said he'd send me some when they get some in, maybe two weeks. Give him my address, because he couldn't look up my account, even though I had the Adesso customer number.

We didn't want to wait two weeks, so we went to Radio Shack, which I knew handled them, and bought four and a charger. Hold onto your hats here - $20 for four batteries and $13 for a charger.

But it works just fine. We're absolutely delighted with it, in spite of the problems.

Adesso Wireless SlimTouch Keyboard Wireless WKB-4000

$129.99 – keyboard
$12.32 – S&H
$33 + tax – Batteries and chargers

You add it up, I don't want to.

Notebooks as a desktop replacement

You may be aware that notebook sales in the US have exceeded sales for desktops. Notebooks are increasingly replacing desktop PC's as a person's primary computer. It's partly a result of the changing business climate where people are spending more of their personal time working at home. A notebook makes some sense; it can travel back and forth to work, and it can also float around the house wirelessly connected so you don't have to be isolated from other family members.

But the notebook is not designed to be a desktop replacement. The physical layout is really unsuitable for extended periods of time. Think about it. The keyboard and screen are attached. Something has to give. Either the screen is in a really bad place or the keyboard is or both are, and it's causing repetitive stress injuries to the hands and wrists, and neck, back

(Keyboard & Notebooks…….Continued on page 5)

(Keyboard & Notebooks…….Continued from page 4)

and spinal injuries due to improper posture. It can't be helped; the design is fixed, at least until the system unit can communicate with a detachable screen. That's coming, but that's years away.

There are a couple of ways to improve the situation if you must use a notebook for extended periods. First, get a couple of sets of keyboards and mice for all the locations you may land; home and work. Then get a stand for the notebook that gets the screen higher up so the top of the screen is just below eye level. A very good alternative is to buy LCD monitors, and just pretend it's not a notebook at all. It's an expense, that's for sure, but you really don't want an operation on hands and wrists for carpal tunnel, either!

HP has a couple of interesting solutions, one shown here. It's a stand, and wireless keyboard and mouse. ◆

Internet Picture of the Month

Looking Back to 1995

From the July 1995 *Bits of Blue* newsletter

PRESIDENT'S COLUMN
By Harvey Bruneau

June Presentation - I was disappointed when Landmark notified me that they were not going to be able to present at our June meeting. With only a short notice before the meeting, it was not possible to schedule another vendor. Although he never got a chance to do his presentation, I want to thank our own Tom Cone for volunteering to do a presentation. As usual I got carried away with myself and dominated the meeting with my Win95 presentation. I can't stop myself sometimes. I certainly hope that those of you in attendance got as much out of the presentation as I did.

Help Needed - In my column last month I mentioned that we were looking for a replacement newsletter editor. This individual will take over the duties from Marylee for the 1996 year. However, we would like to get someone on-board as soon as possible so that we can begin a smooth transition into the 96 year. To date there has been no response.

We are also looking for early candidates to fulfill officer positions. Look at page 2 for the positions in question While I am not sure which current officers will volunteer again next year or in what capacity, lets not wait until our elections in December to realize that we have no volunteers to run the business of the Tampa PC Users Group in 96. In next months newsletter I'll post job titles and descriptions.

If you are interested in helping and are willing to volunteer your time and effort for a good cause then please call me at 985-3338 or 962-2554 ext. 715.

SIGs -I can't express enough thanks to Reflectone and Michael Hodges for providing the facilities and resources to hold two of our SIG meetings. Similarly, I thank Dun & Bradstreet Software and IBM for providing their facilities and resources to the MS Access and OS/2 SIG groups. Without the contributions of these companies there would be no SIGs.

The 1st meeting of the hardware SIG, led by Connie Kincaid, was an enormous success. Connie mentioned that those in attendance were grateful yet thirsty for more at the end. A reminder: Connie will be presenting her software SIG on July 25th. Both of these SIG meetings will be repeated later this year by Connie. Thanks Connie for a job well done and your unselfish dedication to furthering the education of our fellow PC users.

Items Wanted - A reminder that we are collecting equipment and software for the December bargain table and special community projects yet to be announced. Donations are eligible as a tax donation since we are a designated 501 (c)3 non-profit group. If you have any computer related items to donate Please bring them to any of the following; general meeting, SIG meeting or contact Harvey Bruneau at 962-2554 ext. 715 for pick-up.

A 28.8 modem for the BBS would also be appreciated. Don't forget that we are still taking donations for the BBS.

Win95 - It wasn't that long ago that my belief was WHEN95? However after conversations with many software vendors and using the Beta version, I do believe Microsoft will ship the long awaited Win95 this August.

I am sure many PC users are wondering if Win95 is going to affect them and if they should bother upgrading to it. The answer for both is a resounding YES. Of course there are those who will say NO. Well those are the individuals that still use old 57 Chevys and VWs to get around and THAT'S OK. However, I think most of us would rather have the new models with A/C, stereo, airbags, power steering, and if cruise control and power windows come with it that's even better. Keeping up with PC hardware alone has not been pleasant for most of us. It seems that the state of the art hardware technology we buy gets outdated faster and faster every year. This new release of Windows will not only speed up the outdating of hardware but will now begin to outdate existing software at a fast pace.

Despite all of the hoopla and hype or how many bugs it has when released, Win95 will be the next major dominating operating system for the masses. No, I don't have stock in Microsoft. My experience and common sense tells me that, for now, Microsoft is the undisputed front runner in the OS and GUI world. In the year 2000 Packard Bell may replace Microsoft, but that's a column for another day.

Some things to consider: Win95 will be preinstalled on most new PCs; at best there will we one last release of MS DOS before Microsoft puts it to rest; software vendors will eventually stop developing 16bit Windows apps and de-

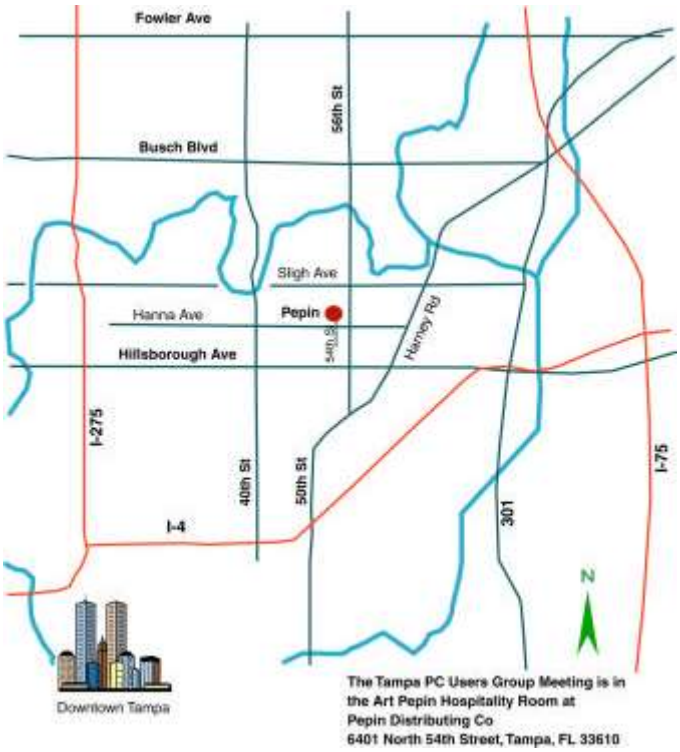
(1995…….Continued from page 6)

velop 32bit apps for Win95 and Windows NT, the same will be true for drivers; hardware vendors will develop plug and play products. When will all this happen you might ask? I anticipate that this shift will be completed by the end of 1996. Of course by then we will have updated Win95 twice.

How would I prepare and implement Win95 and its technology if I could? If you are not in a hurry and you don't need the immediate benefits of Win95, wait till the 1st update. It should be out in the Q4 of 95 and include some worthwhile patches to the original release. The minimum computer sys-tem should be a 486/66, 16MB RAM, 300MB HD, 14" 28 dot pitch VGA monitor. Of course if you are planning on buying a new system, then go for at least a 90Mhz Pentium with 16MB RAM, 1GB HD, 4X CD ROM and a 17" VGA monitor with 28 dot pitch. Don't skimp on the monitor. Also, take into consideration that a 90 MHz Pentium is already outdated in today's PC world. As far as software applications, I would stick with whatever existing 16bit Windows apps I had for at least a year. There are enough benefits in Win95 alone without the need for new 32bit apps. Secondly, Win95 is a brand new operating system and will surely have some bugs. The same holds true for all the 1st generation versions of Win95 3rd party software that will be released after Win95. Unless you feel lucky or have a dedicated IS staff, then wait for these new products to be tested and proven by others ◆

(Minutes…….Continued from page 2)

At this point Kevan introduced our presenter for the evening, Serre Murphy, president of Net Fulfillment Technologies, Inc. of Melbourne, Fl., which offers a range of services, including web applications, anti-spam services, and consulting. Tonight Serre told us about WebBuild Express, an easy to use and inexpensive web design tool. You may have considered building a website but thought the technology too difficult and the costs too high. No longer! WebBuild Express is a powerful, easy to use program that gives you unlimited freedom to manage web page content and appearance, and you do not need to know how to program or write HTML code.



Why should you create a website? You can use it to share information or promote a product or cause. Costs associated with a website can be kept to a minimum and include: Design - using WebBuild Express, as low as $22.50; Domain Name - $10 to $30 per year; Host (ISP) - average $150 per year and may be included as part of your provider's basic service; and finally Maintenance - $30 to $50 per year.

Serre gave each attendee a CD-ROM containing a 30-day evaluation of WebBuild Express to take home to try. He also provided a complimentary CD of WebBuild Express to the group for our raffle. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

This will probably be our last meeting at the present location. If things go according to plan, in September we will be meeting at the new Pepin location a few miles south of the current location. As soon as we know for sure, a new map will be posted at our web site, and a notice and map will appear in the next newsletter. That's if everything goes according to plan.

I just downloaded my email that had arrived since I turned off my computer nine hours ago. There were 94 messages--and every one of them was SPAM. I will receive an equal number of messages during the day, and probably only five or ten will be legitimate email. I am sure with deleting about 200 messages a day some legitimate email gets included. So if you send me an email and don't get a response, send it again because your first one may have been deleted in error. ◆

Sunbelt Software from Clearwater will enlighten us concerning their latest products

Minutes of the July Meeting

By Doug Mullis, Secretary, Tampa PC Users Group
dmullis@tampabay.rr.com

Vice President John Witmer started the SIG portion of our meeting at 6:35 p.m. in the absence of both Mary Sheridan, Member at Large, and President Kevan Sheridan. Kevan's absence was because he had to work late.

John announced that the Intel Build Your Own Computer presentation has been moved from August to our November 9th meeting as the program is being revised to permit more flexibility on the participants' part in deciding what they want. John also said that Pepin is moving right after our August meeting. The new location will be south of the existing, on 50th Street at the northeast corner of Martin Luther King Blvd. We will have to get instructions out in the newsletter for getting into the site and finding the meeting place for our September meeting.

Mike Hodges, Treasurer, distributed membership cards and nametags. The cards were very professionally done and waterproofed and the nametags now all match. We can thank Mary Sheridan for such a great job.

Bruce Register reminded us that Comp USA honors our Group with discounts in the range of 12%, so use those membership cards to get your discounts by going to the commercial or service checkout, not the front registers.

At 7:00, the regular meeting began with John introducing our presenter of the evening, William LaMartin, distinguished member and editor of our newsletter. William's demo this evening focused on two areas of interest, examples of Visual Basic .Net Programming and some aspects of digital photography, two areas that consume much of his time. We also got to see part of his collection of "Old Florida" photographs.

According to William, VB.Net is a far more powerful programming language than the old Visual Basic. William gave examples of how to program for the Web, the Windows desktop and the Pocket PC using Visual Ba-

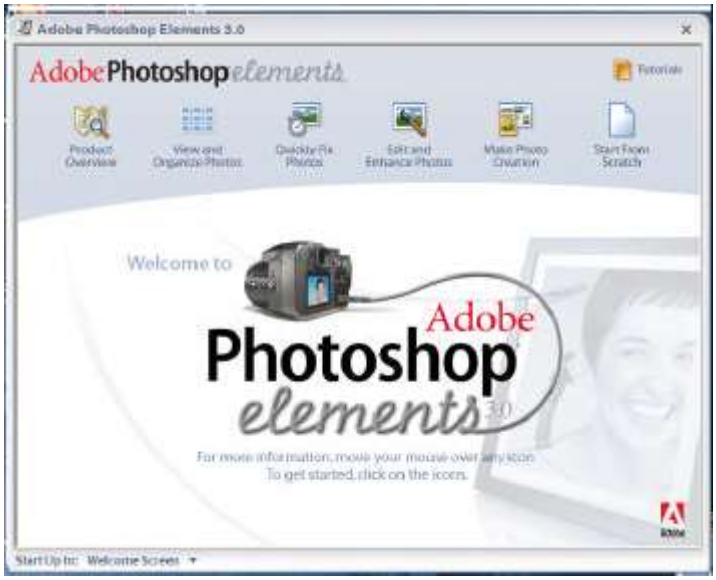
Photoshop Elements 3

By Jim Purcell, Tampa PC Users Group
edward_j_p@msn.com

BACKGROUND

Adobe Photoshop has long been the industry standard for editing photos. A high percentage of all of the photographs that have been published in the past decade have been edited in some way by Photoshop. This excellent program, however, is quite expensive ($599.00 list price), very difficult to learn and has many features that only a professional photographer will use.



Adobe has worked for sometime to develop a program for the everyday photographer. They started with PhotoDeluxe then Photoshop LE but didn't seem to get the mix of low cost, ease of use and a sufficient number of tools until they developed Photoshop Elements 1. The program was improved with the issue of Photoshop Elements 2. Both of these programs were still a little difficult to learn. With the release of version 3, they have not only greatly expanded the capabilities of the program but also have made it much easier to use and understand.

Adobe has improved Elements as it improved Photoshop. Photoshop Elements 1 was based on Photoshop 6, Elements 2 was based on Photoshop 7 and Elements 3 was based on Photoshop CS, which means that you can use some plug-ins and brushes that were designed for Photoshop CS that weren't compatible in previous versions of Elements.

The Windows version of Elements 3 requires Windows XP with Service Pack 1 or Windows 2000 with Service Pack 4.

The Elements 3 Welcome screen is at the top of the page. The choices across the top of the screen show the new organization of Photoshop Elements 3**.**

All of the Elements programs are loaded with the tools to edit your digital images and create an unimaginable variety of special effects and projects, especially using the Adobe system of layering. Another thing that is special about Photoshop and all of the Elements programs is that practically everything you do has a keyboard shortcut that is identified on the mouse command. As you learn these shortcuts, your speed and ease in operating the program increases greatly. There is no way that this article can begin to cover all of these capabilities. The O'Reilly book *Photoshop Elements 3: The Missing Manual* devotes

more than 500 pages to the subject. I will try to cover "What's new in Elements 3" and discuss some of the program's highlights that I think by themselves make the program worth the purchase price (List Price $99.99, but often on sale for less than $60). You can get additional information and see some graphic illustrations of the program's capabilities at http://www.adobe.com/digitalimag/main.html. You can also download a demo of the program at that site.

SOME OF WHAT'S NEW IN ELEMENTS 3

- **Organizer**: Adobe has merged their previous program, Adobe Photoshop Album, with Elements 3. You can use it to collect your photos, store them and search for them using a sophisticated system of tags. You can also set up many different ways of viewing your files. The Create section provides the ability to make Slide Shows, Cards, Postcards, Wall Calendars and other projects.
- **Photo Review**: Allows you to show acquired photos in full screen in slide show format.
- **Version Sets:** Keep track of multiple versions of edited or shared photos by automatically creating a stacked "history" of the multiple copies.
- **Creations Wizard:** Simplifies the tasks performed by the Creation command such as the slide show, calendar and post cards.
- **Stacks:** Save space in the catalog by stacking less than perfect photo shots behind your favorite of the group.
- **Photo Compare:** Allows you to show acquired photos side-by-side in slide show format
- **Quick Fix:** The Quick Fix window has been redesigned. The new tools and commands often create dramatic results, and with the before-and-after display of

(Photoshop Elements……..Continued on page 4)

(Photoshop Elements…….Continued from page 3)

your photos, you can see and evaluate the changes as they take place.

- **16-bit Image Support:** The more technically proficient can work with 16 bit images. There is a limit to the kinds of edits that you can make using this extra color information but you can make these changes and save your photo in the extra detail.
- **Noise removal capability:** If you are using a digital camera, you probably have seen noise in some of your photos. The noise reduction filter should help correct the grainy areas.
- **Shadows/Highlights adjustment:** This tool allows you to correct exposure errors by adjusting shadows, highlights and mid-tones quickly and easily.
- **Styles and Effects palette:** This palette now contains over 100 customizable filters, effects and layer styles.
- **Spot Healing Brush:** This tool allows you to brush away blemishes.
- **Red Eye Tool:** This tool has been redesigned to allow you to correct red eyes more effectively than before and with just one click.
- **Cookie Cutter tool:** This tool crops your photos in a predetermined shape of your choosing.
- **Photo Bin:** The bin displays all photos that you have open so that you can juggle multiple photos. It can be reduced or enlarged, or it can be eliminated to enlarge your workspace or restored with a single click
- **Scan Multiple Photos:** You can scan multiple photos on your flat bed scanner, and the program will separate the photos and let you save them as individual files.

PROGRAM HIGHLIGHTS:

Organizer:

The Photo Browser is the main workspace for organizing your photos. The terms "browser," which is one of the three windows in the Organizer, and "organizer" are sometimes used interchangeably, which may at first be a little confusing. The Organizer shows thumbnails of all of the photos that you acquire from various sources. The slider at the bottom of the screen allows you to adjust the thumbnails from very small images approximately nine across to a large single thumbnail on the screen. You can acquire photos from files or folders, cameras, scanners and other sources listed under the Get Photos command button. Your files remain where you want them or have stored them. The Organizer merely contains thumbnails that point to the file. If you plan to use Organizer, you need to add, delete and move your files through Organizer to insure that the thumbnails remain connected. Some of the features of the Organizer are a bit aggressive. The Photo Downloader may jump ahead of your camera's software, moving photos from your camera to your computer, so be aware that you may have to make choices on how you perform some of the tasks.

The Organizer automatically assigns a timeline to your photos, so you can search in the point in time in which the photos were taken or in which they were brought into your computer if there is no time otherwise attached to the file. There is a system of tagging that allows you to search in as much or as little detail as you desire.

Organizer also has a very versatile and elaborate built-in backup system for your photos. It's easy to backup to a hard drive, a CD or a DVD. You can choose to backup your catalog only or include your files. If you choose to move your files to a CD, the program will name the CD so that when you at some future date click on a thumbnail of an archived file it will tell you the name of the CD that you have to load in order to retrieve the file.

In summary, the Organizer is a very powerful tool that you will probably love or hate, but even if you hate it, you'll probably find some of the features quite useful.

Quick Fix Window: The Quick Fix Window is probably the most significant feature that has been added to Elements. For the first time user of Elements, it allows correction and enhancement of photos by pressing a button and, with the pictures placed side-by-side, it greatly eases the job of fine-tuning the photo. You are able to make significant improvements to your pictures while knowing little or nothing about the process. It allows you to do some positive work while learning the system. I'm sure longtime users will often start at this page to adjust things like shadows and highlights to take advantage of the side-by-side feature.

(Photoshop Elements…….Continued on page 5)

(Photoshop Elements……..Continued from page 4)

This window contains a group of four tools from the Standard Edit screen. They operate the same in both edit windows and have the same keyboard shortcuts. The Zoom and Hand Tools are the same tools found in many programs that allow you to enlarge and shrink the image and to move it about the work space. The Cropping Tool allows you to crop a rectangle or an ellipse. You can set the exact size or the proportions of the sides of the rectangle. The Red Eye tool works better than any I've used in removing the pesky red eye from your photos and normally requires only one click per eye. If you don't like the results, you can undo, then adjust the darkness and pupil size and click again and continue until you have the results you want.

The Quick Fix Control Panel below is where most of the editing adjustment takes place. The Smart Fix command is what most of the excitement concerning this window is all about. With one click, the command automatically adjusts the picture's lighting, color and contrast. If you are happy with the results, you can move on to the next photo. If it needs sharpening, you can move that tool first. If you are not happy with the Smart Fix command results, you can undo it and try using the Smart Fix slider by gradually changing the amount. Sometimes Smart Fix will not be smart enough to satisfy you and you can undo the results and work through each of the Levels, Contrast and Color Auto buttons, or the slides for each, to satisfy your eye. Of course, you still have the option of moving to the Standard Edit window, where you can take advantage of the wealth of tools and even the famous layer system with all of the selection tools to "fine tune" your job.

Looking Back to 1995

From the August 1995 *Bits of Blue* newsletter

President's Column
By Harvey Bruneau

I certainly hope that each of you weathered hurricane Erin without any major problems. In the aftermath of this storm, it's easy to for many individuals in the Tampa Bay area to say the storm was a wimp. Nevertheless, the center of the storm came less than forty miles from Tampa. It certainly could have been worse. Personally, I thought it was going to be, based on information coming across from the news media. We should all be prepared for these storms and not chance a disaster. Ask the people in the Florida panhandle how they liked Erin. I am sure they have a story that is 180° different from ours.

After the storm, the story, *The Little Engine That Could*, came to mind. Two events happened that caused me to think of this. One was the backups I created for our small data center the night before the storm was to hit, and the second was Erin itself. My nightly backups are usually performed on a 4Gig Mountain tape drive. Unfortunately, it had failed the week before, and I was waiting for a replacement from Mountain. While waiting for the replacement drive, I purchased a 4Gig Conner tape drive from Computer City to ensure that I would have daily backups. At this point Erin was not even a tropical storm. After conversations with tech support from Arcada and Conner it was determined that limitations of the Arcada software that was included with the Conner drive was not going to allow me to properly backup my Novell server. By now Erin was a hurricane and bearing down on Florida and still no replacement drive. Well on Tuesday it was finally time to put plan C and D into action. Plan C was the use of Colorado Trakker 250Mb tape drives. Fortunately I had two. It took a lot of tapes and some time to backup four gigabytes, but it worked. This was a case of the little tape drives that could.

The second reminder is to look at the damage caused in the Pensacola area. Who thought that Erin, that little bitty storm could do over $200,000,000 worth of damage. I guess it was the little storm that could.

I mentioned in my column last month, we are looking for early candidates to fulfill officer positions of the Tampa PC Users Group for the 1996 year. Elections will be held in December. Let’s not wait until the elections to realize that we have no volunteers to run the business of the Tampa PC Users Group in '96. Following is a list of officers needed to run a PC user group and their associated brief job descriptions. I have added some positions which do not currently exist but are important. Additionally, I have placed the names of those individuals currently assuming, in whole or part, the responsibility of each position.

- President (Officer) Harvey Bruneau Duties: Ensure the delivery of the group's mission to its members. Lead meetings and provide overall direction. Serve as overall representative of the user group to the public.
- Vice President (Officer) William LaMartin Duties: Act as president during president's unavailability and chair key committees. Fill other key roles as determined by group needs.
- Secretary (Officer) Bruce Register Duties: Manage correspondence and records. Records minutes from group's general and board meetings.
- Treasurer (Officer) Tom Cone Duties: Oversee financial resources, recording, and reporting.
- Director/Chairperson/Committee Head/Task Leader Tom Cone Committee/Task: Membership Duties: Coordinate new member recruitment and existing member retention. Manage database and membership communication.
- Committee/Task: Program Director Harvey Bruneau Duties: Handle planning and direction of speakers, presentations, demos, special events, and other programs. Periodically query members to identify speakers and programs of interest, satisfaction, and dissatisfaction.
- Committee/Task: Vendor Relations Harvey Bruneau Duties: Responsible for communication with vendors (hard-ware and software; local, regional, and national) regarding working with the group, special events, obtaining review products and door prizes, and other activities.
- Committee/Task: Volunteer Coordinator All officers Duties: Coordinate volunteer recruitment, management, and recognition.
- Committee/Task: Equipment Manager Bruce Register, All officers Duties: Manage inventory, transportation, availability, and storage of equipment owned by group or used by group.
- Committee/Task: Marketing/Public Relations Connie Kincaid, All members Duties: Direct publicity, including media relations, community relations, and special event promotion.
- Committee/Task: Advertising Marylee Bruneau Duties: Manage advertising sales in user group newsletter and advertising placements for group activities. Committee/Task: SIG Director William LaMartin Duties: Assist special interest groups with program development, publicity, membership, meeting arrangements, and other tasks.
- Committee/Task: Newsletter/Magazine Editor Marylee & Harvey Bruneau Duties: Oversee editorial development and submissions, design, production, and distribution of newsletter. Prepares and sorts mail according to bulk mail postal regulations. Creates electronic version, Adobe Acrobat, of newsletter. Selects and distributes

Special Interest Groups

Microsoft Access SIG

This SIG meets the **first Tuesday** of the month at 6:30 PM. The meeting location varies. For information contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merlenic@tampabay.rr.com.*

Digital Imaging SIG

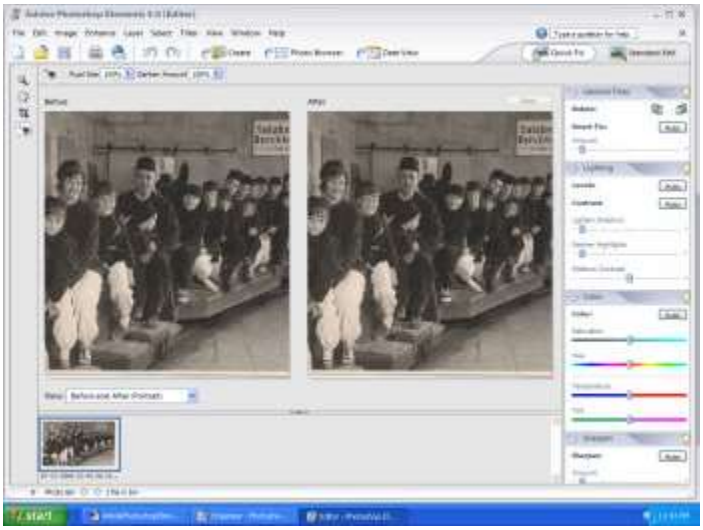
This new SIG meets the **fourth Monday** of the month at Pepin Distributors at 6:30 PM. For information contact Mary Sheridan at *mcpease@mindspring.com.*

Visual Basic for Applications SIG

This SIG meets the **third Wednesday** of the month at 6:30 PM. The meeting location varies. For information contact William LaMartin at *lamartin@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Mary Sheridan moderates the discussion.



(1995…….Continued from page 6)

articles to be published in Tampa Bay Online via Prodigy.

- Committee/Task; Bulletin Board Sysop Kevin Sheridan/Al Poole Duties: Maintain and operate group bulletin board system.
- Committee/Task: Librarian/Resource Center Coordinator Larry Anders Duties: Coordinate shareware, public domain software, and other resources for group.
- Committee/Task: Software Review Editor/Coordinator Harvey & Marylee Bruneau Duties: Get review software from vendors, coordinate getting software to review writers, and follow up on reviews.
- Committee/Task: Legal Counsel Tom Cone Duties: Advise group on legal issues.
- Committee/Task: Finance Tom Cone/William LaMartin Duties: Advise and oversee financial management. Committee/Task: Development/Fund-raising All officers Duties: Plan and oversee fund-raising events and activities.
- Committee/Task: Community Relations/Outreach Harvey & Marylee Bruneau Duties: Manage community services activities and serve as contact person with community at large.

In conclusion, if you are interested in serving your group in any one or more of the above positions, share those thoughts with the officers in person at the monthly meeting on the BBS or by phone. The future and the success of the Tampa PC Users Group depends on volunteers committed to leading the group. ◆

(Photoshop Elements…….Continued from page 5)

Summary: I've tried to cover the significant changes that have been included in Photoshop Elements 3. As I've mentioned, this article doesn't begin to touch on the total capabilities of Photoshop Elements 1, 2 or 3. There is massive help and an extensive tutorial system available in Elements to help you utilize its many capabilities. There are also many publications that provide even more insight into the use of all of the available tools. I purchased the O'Reilly book *Photoshop Elements 3: The Missing Manual* by Barbara Brundage. It is an excellent and well organized manual for Photoshop Elements 3. It's available on Amazon.com for about $13 below list price. (If you purchase any books from Amazon.com, don't forget to go through the TPCUG web site.) ◆

sic .Net.

In the digital photography section, William showed us photos he has taken with his digital camera and demonstrated how you can modify or improve them using Adobe Photoshop. We had fun making him and other subjects look better (or in some cases worse) than they are in real life. It was lots of fun, but time consuming. It was 9:00 p.m. before we knew it. Thanks William for an entertaining evening.

We had no door prizes to give at this meeting, so we adjourned at about 9:00 p.m. ◆

New Meeting Site Be sure to look on page eight for a map of our new meeting location at Pepin Distributing Co., 4121 N 50th Street. We certainly appreciate Pepin for making this room available to us and for John Witmer for organizing everything. John says that if anyone gets lost, please call him at 404-4655 for directions.

Hurricanes We thought last year was bad with four major hurricanes striking Florida. This year we have had two lesser ones strike Florida. However, one of those lesser ones, Katrina, after passing over Florida grew into the monster that totally destroyed the Mississippi Gulf Coast and left most of New Orleans under water. As I write this, after a week of ter-

Minutes of the August Meeting

By Doug Mullis, Secretary, Tampa PC Users Group
dmullis@tampabay.rr.com

Vice President John Witmer started the SIG portion of our meeting at 6:35 pm. John reminded us that Pepin is moving on Aug 12th to their new location at 4121 N. 50th Street. We have directions in this newsletter. Also let John know if you are interested in used 17-inch and maybe some 19-inch monitors that Pepin no longer wants.

John announced the Fall Conference of FACUG to be held Oct. 22, 2005 at the Sahib Shrine Temple, 600 N. Beneva Road in Sarasota. Go to their website for details.

Mary Sheridan, Member at Large, reminded us that election of officers for 2006 will be upon us soon. We will seek nominations in November with elections at our December meeting. We really need to get fresh blood as some of our officers need relief. Please think about serving.

Bob LaFave fielded several questions that members raised about programs available and updates to Microsoft's Windows XP.

At 7:00 pm John introduced our speaker for the evening, our very own Merle Nicholson. Merle told us about Linspire, a Linux based operating system previously known as Lindows. For an annual fee of $49.95, you can subscribe to a website called Click & Run which allows you to download thousands of Linux based programs. PC club members can get a nice deal from Steve Singer of RDI, which includes an installation CD, a Linspire "Extras" disk AND the "Gold Membership" allowing access to their warehouse of programs. Such a deal!

apcug Member of The Association of Personal Computer User Groups

Wireless Internet Access on Two Fronts

By Larry Anders, Librarian, Tampa PC Users Group
Larry@AndersNet.com

I've been away from writing articles for the newsletter for a while because of my busy work schedule, but I've recently had some experiences with some stuff I wanted to pass along.

I've had wireless Internet access at home now for a couple of years but was never really impressed with it. Anytime I was close enough to the router I always plugged in my notebook with a cable and my desktop stays plugged-in all of the time. If it was absolutely necessary I would unplug and go into other rooms of the house with my notebook or PocketPC. My connection would always seem to go in and out. I typically also had the same type of problem when I traveled. But recently my daughter convinced me to upgrade to a Belkin F5D8230-4 wireless Pre-N broadband router and wireless Pre-N notebook network card. Pre-N is the latest wireless technology preceded by wireless b and g.

Since installing the Belkin, my connection has never been so strong or steady. It is at least as good as or better than my direct cable connection. I can now walk out in my yard or next door and still have a very good connection. I'm not sure if it is the addition of the wireless network card, instead of using the internal adapter, or if it is the three antennas on the router, or a combination of both. Belkin's ad says it's both. A new smart antenna technology that boosts wireless network speed and range far beyond that of a 802.11b or g router, and they claim the wireless network card will increase performance another 20% over the built-in internal card. All I know is that my daughter was correct. This is the fastest and most reliable wireless connection I have ever experienced. If you're looking for a reliable, fast, wireless Internet connection, I highly recommend looking into this dynamic pair. Below is a link to a recent test done on both. http://www.pcworld.com/reviews/chart_test_report/0,chid,6089,prodid,25740,00.asp.

I'm on vacation this week as I write this, and there is something else I wanted to tell you about that has made my vacation more enjoyable. We typically go to Indian Rocks Beach in Pinellas County during the summer for a week or two. We stay at some very good friends' condo with no broadband service. I usually just fire up my old AOL account and use it to check my email. After being on cable at home and DSL at work, dial-up is better than nothing, but in my opinion, not much. My daughter came through for me on this, too.

If you're like me, and have not already signed up for the service, you've probably seen or heard the commercials about Verizon's new wireless broadband service. Having used a cell phone in the past to access the Internet and not liked the results, I had not really paid much attention to the advertisements. Well, my daughter loaned me her Verizon wireless broadband NationalAccess PC card to use while I was here at the beach, and it is really terrific.

If you're not familiar with it, anywhere there is cell phone access, you will be able to access the Internet at speeds typically between 400-700 kbps up to 2 Mbps. In a taxi, airport, or at a park, one click and you are connected. I will admit I was truly surprised at the ability of the service. And, if you are on a VPN at work, all of the security is included in the service to connect to that also. The card snapped into the PCMCIA slot, a setup CD was included, and after a few clicks I was connected. The charge is $79 per month for unlimited connection time. It's a little costly when compared to other normal services, but you can't beat the freedom of accessing the Internet anytime, anywhere. ◆

(Comments……Continued from page 1)

ror, almost all those who stayed in New Orleans and survived have been evacuated. The thousands of dead are yet to be counted.

I lived in New Orleans for eight years in the 1970s and drove along the Gulf Coast many times. So I have been mesmerized by the TV and computer images of destruction and despair, so much so that I have had difficulty finding time to put this newslet-

(Continued on page 8)

Good Service on OfficeJet 4215

By Merle Nicholson
merle@merlenicholson.com

I bought a new HP OfficeJet 4215 all-in-one from NewEgg.com – a low end one at $80 plus $6.50 shipping. It's a FAX, copier, scanner and inkjet printer. I ordered it online and received it via FedEx five days later. As I unpacked it, it didn't take long to find out the "front panel overlay" that snaps around the keyboard was missing from the box.

It wouldn't work at all without the cover. There are four switches that have to get depressed by this cover for the machine's own setup to work. It would power up, but I got messages that the panel overlay wasn't installed, and it went no further.

This printer has an LCD screen that enables all sorts of setup options for all of its functions, including prompts for cartridge replacement. There's no guessing here; this little baby tells you what to do. It said to install the overlay.

So I called HP's 1-800 support number about 4:00 PM the same day, talked to a pretty good customer service lady presumably in India; it took her several minutes to find out she could FedEx me one, and a follow-up email gave me an expected delivery for four days later. The next morning at 9:00 AM the FedEx guy was at the door with box in hand, say about 16 hours after I called tech support. Installed and working in 16 hours. It'd be hard to complain about HP's service.

The machine works pretty well. I haven't found anything I haven't liked so far. My research finding reviews haven't anything bad to say except for printing speed, but the cost was more important to me than speed. You can't say that it's slow, anyway, just not fast, about the same as my other printers. I have an old HP 722C I have set on draft black and white (the color cartridge emptied years ago) for very fast b&w copies, and a nice but rarely used Canon 850i for excellent color prints. All three are attached to the same PC, one parallel and two USB.

This OfficeJet has USB connection only. Other, more expensive models have Ethernet and even Bluetooth. The power cord is a simple small cord, no power cube – the way it should be. There are the incoming telephone line connector and an outgoing one if you want to connect a phone instrument.

My spouse wanted a copier that is easier than using the utility and scanner on my PC, and I've been exchanging FAXes with some business associates lately. I'd been connecting and powering up my notebook to receive FAXes, and I'd grown pretty tired of it. My past experience with multi-function devices wasn't too good, and I never recommended one to anyone unless they owned nothing – no printer, scanner or FAX machine. Then you could justify the cost. But all that's in the past. This does a good job of all of these functions for the price of an inexpensive printer. I'm keeping my flatbed scanner though; obviously you can't slide a book into the OfficeJet.

For FAX there are plenty of options for telephone line situations. You can set it up for a dedicated line, share it with a telephone using distinctive ring detection (an option from your telephone utility); share with a telephone and/or answer machine and receive only when you press a button. The instructions even go into sharing it on a line with DSL.

For copying, you just stack the paper in the scanner input tray, press Copy, quickly set the number of

(OfficeJet……..Continued on page 5)

(OfficeJet……..Continued from page 4)

copies if you want more than one, then press the Black or Color buttons.

If you're attached to a PC by USB cable, you can send scans to the PC – you set the default directory and it's automatic. Just load the paper and press Scan. It couldn't be easier. There is a scanner utility installed on the PC that detects the scan. It includes OCR if you receive the scan as Text. There is also photo organizer and photo printing software and more – see the list below.

You can FAX from the PC – and if you've shared the FAX on the network – from any networked PC. When you FAX from a PC, you select the OfficeJet FAX printer. A panel pops up on the attached PC with boxes for destination telephone, cover page fill-ins, the works. In my own case, the OfficeJet is attached to a PC I use for networked backups along with two other printers. If I FAX from my networked personal PC, I then have to go to the backups PC to fill in the FAX destination information.

And of course this is a FAX machine that stands alone; it doesn't have to be connected to a PC at all to FAX or to copy.

And obviously it's a standard color inkjet printer, too. If the printer is shared on the network, you can add that printer to any other PC and the printer driver automatically installs over the network, a feature of

Looking Back to 1995

From the September 1995 *Bits of Blue* newsletter

SECRETARY'S REPORT
TPCUG MEETING 8/9/95, 6 PM
HCC Ybor Room Auditorium
Minutes and Comments by Bruce Register, Secretary

President Bruneau (Harvey) called the meeting to order. Miscellaneous comments and information were given: Harvey Bruneau shared Hurricane Erin preparedness. He stressed the importance of being serious about equipment and data. Losses can occur from wind, storm, rain, or sprinkler systems; or maybe even static electricity in the building through the metal superstructure or conduits. He emphasized backup systems. UPS and dedicated plugs are just some of the terms that have familiarity.

Planning is required for most ongoing systems before making a cold splash into W95. Some of your previous applications may not run in W95 without adding this or that software that you previously had within your software system. Some may elect to increase hard drive capacity so as to accommodate a dual boot, W95 and Windows 3.11. W95 will only run on Intel or clones. Other platforms give one an opportunity for other considerations. Many interesting opinions were expressed regarding many applications. (Secretary's opinion— Some people seemed to be polarized toward W95 or OS/2 Warp. Sometimes these strong opinions become almost argumentive as emotional preference is aggressively manifested. Our president, Harvey, seems to be exceptional at keeping peace while allowing everyone their say. One of the many benefits of TPCUG is the openness of the expressions by the members. We are exposed to other viewpoints. We are then able to have better understanding before making decisions). Much open and frank dialogue permeated the meeting. Several members stated that they thoroughly enjoyed and appreciated the broad participation. Several expressed opinions regarding the future of the computer world. All comments were enlightening and confidence builders. Someone suggested that TPCUG could set up a 286 in a retirement facility to fulfill the desire to provide community service. Volunteers are needed to do it; suggestions such as this are great and hopeful but "we need doers" according to one opinion. The conversation by individual members reflected enthusiasm during the break. One member stated the "refreshing sight to see pairs, threes, etc., groups exchanging information, assistance and fellowship." Sharing info and ideas are just one of the great benefits of TPCUG, Harvey stated.

Harvey reported that GTE has offered to present ISDN at their downtown GTE building. More later as plans develop. Several members responded with delight. Look for messages on the bulletin board. Some members have avoided using the TPCUG BBS. Do not hesitate to try it. You cannot break it. You cannot hurt it. You will enjoy the experience. If you have stage fright, just call one of those most willing helpers listed in the back of the BITS OF BLUE. Any of them will be glad to talk you through the access. In helping me, they have even "fired up" their own computer while talking to me over the phone. They would ask "Do you see....."? etc. They really like to assist you. Do not hesitate! Miscellaneous comments were "stay away from 5 volts and 60 Pentium", "Lotus Approach is better than ACCESS", "Be prepared to upgrade; but you may continue with your present system and may not need to go to the latest technology. If you need it; do it. If you do not need it; you might want to consult your pocketbook before jumping in." Other comments were also appreciated.

PRESENTATION: Tom Cone, Treasurer, shared a tool that he finds useful. Creator, V6.0, writes programs. It is a "code generator". It is not particularly sophisticated and is very easy to use. Tom presented highlights of the program rather than giving detailed training. He likes the program and uses it in building report programs. You tell it what kind of information you want to track and the type of screen you want. Creator then builds the program. You add fields as you desire. Creator is a commercial program that sells for $99 MOL (More or Less).

CONGRATULATIONS TO DOOR PRIZE WINNERS:

Pagekeeper	Steve Schoeneck
CD Murder Mystery	Wil Goble

The next regular meeting of TPCUG will be Wednesday, September 13, 1995, 6 PM at Ybor Room, Administrative Building, Ybor City HCC. Come and bring someone, your spouse, pharmacist, neighbor or friend, etc. ◆

Special Interest Groups

Microsoft Access SIG

This SIG meets the **first Tuesday** of the month at 6:30 PM. The meeting location varies. For information contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merlenic@tampabay.rr.com.*

Digital Imaging SIG

This SIG meets the **fourth Monday** of the month at Pepin Distributors at 6:30 PM. For information contact Mary Sheridan at *mcpease@mindspring.com*.

Visual Basic for Applications SIG

This SIG meets the **third Wednesday** of the month at 6:30 PM. The meeting location varies. For information contact William LaMartin at *lamartin@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Mary Sheridan moderates the discussion.

(Minutes…….Continued from page 2)

Merle suggested you set up your system to operate bothWindows and Linspire in a dual-boot setup. In fact he offered a used computer for $150 already programmed with Linspire. This system has an AMD 1300+ MHz chip, 40 Gig hard drive, 256 MB RAM, speakers and keyboard.

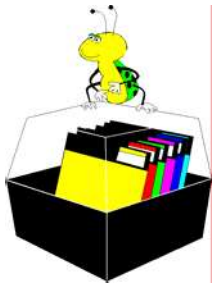
Someone asked if Linspire would be compatible with his or her existing devices, printers, etc. Merle said in most cases they probably are but printer settings must be changed. USB connected devices work best.

Merle demonstrated how easy it was to use Linspire and showed us some applications. As usual, the hour and a half zipped by. If you are interested in trying Linspire, remember Merle's pre-programmed computer, or get in touch with Steve Singer. Thanks Merle for an interesting evening.

After a short break during which Mary sold raffle tickets, we had a drawing for a year's subscription to Smart Computing Magazine. Jim Purcell was the lucky ticket holder.

The meeting concluded about 9:00 pm. ◆

(OfficeJet…….Continued from page 5)



Windows XP. It has two ink cartridges – a three-color and a black. You can convert the printer to a 7-color photo printer by removing the black and snapping in a photo cartridge. I haven't tried this out, but there's no reason to expect anything but good results; all the reviews I've read praise the photo quality. After all, it's an HP.

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

Wireless Camera Those who attended our last meeting, which was our first meeting at the new Pepin location, saw my new Motorola Home Monitoring wireless camera at work. It allowed me to view on my laptop the entrance to the building, which was a little over 120 feet away with an office and lobby area in between it and our meeting room. This was desired since, being after hours, the doors either needed to be locked or someone would have to stay at them to give late arrivals entry. The system worked fine. I think we only had two late arrivals, and the rest of the activity was the cleaning crew working around the entrance.

The setup consisted of a wireless camera positioned on a stool

Minutes of the September Meeting

By Doug Mullis, Secretary, Tampa PC Users Group
dmullis@tampabay.rr.com

Vice President John Witmer started our meeting at about 6:55 pm. We did not have the usual SIG portion of our meeting as we were setting up our new location, including a wireless closed circuit monitor at the front door.

John described the Pepin layout and where the restrooms and break room are. We plan a tour at our next meeting as construction is still in progress. We expressed our appreciation to Pepin for the fine facilities with a heartfelt round of applause.

John Witmer introduced our presenters for the evening, Phil Owens and Dave Bove of Sunbelt Software with US offices in Clearwater, Florida. Their parent company is France-based Sunbelt International Group, a leading provider of enterprise system infrastructure software, including anti-spyware, security, anti-spam and systems management tools.

Phil started with, "Tonight we are going to talk about spyware" and then asked ,"Is your computer spying on you?" If your computer is slowing down, crashes frequently, you're getting more popups when you go from site to site and you suddenly have a new browser home page, then you're probably suffering from spyware. Spyware is installed for commercial gain and to learn your interests.

To protect yourself, you first need a good firewall. Zone Alarm and Microsoft SP 2 were recommended. Next you need to install reputable anti-spyware. Sunbelt offers Counter Spy for detecting and eliminating spyware at a modest price of $19.95 for the first year and then for $9.00 a year you can keep it current. You can install multiple anti-spyware programs if

apcug Member of The Association of Personal Computer User Groups

New Trends in PCs

By Merle Nicholson, Tampa PC Users Group
merle@merlenicholson.com

The latest kinds of PCs aren't made by HP and Dell. If you want to really find out what's going on you can look at Alienware and VoodooPC, smaller computer makers that do direct internet sales. Here's what's going on in the PC industry. All I describe is commonly available, but just not necessarily mainstream.

Dual-Core Processors: Both AMD and Intel are producing CPUs with two processors. Intel's workstation CPUs are not available yet, but will be soon. I'm much more familiar with the AMD product, but suffice it to say that Intel's claims are just as emphatic as AMD's that their design is best. Of course, you can go to various - usually gamers' - websites and read extensive performance comparison tests. The gamers tend toward the AMD products because they are fairly easy to "overclock" - that is, run at higher speeds than they were designed for. The ultimate gamers' CPUs, however, seem to be the AMD 64 FX single core CPUs. There are two available; the most powerful (FX57) runs at 2.8GHz, has 2x64 and 1x1MB cache at $1,100 or so, including just CPU and fan. Games are rarely multi-tasking just yet, and gamers tend to do only one thing at a time.

Dual-Core processors seem mostly to have an advantage in multi-tasking environments where other things are going on in the background. You know how it is. You get something started on the computer and then just relax and fold your hands because trying to do anything else is useless or will even jeopardize your project. With dual processors, well, you have another processor! Go ahead, do more stuff. AMD's processor is called Athlon 64 X2 Dual-Core, and ranges in performance ratings from 3800+ to 4800+. The prices range from about $430 to $1100. That's processor and fan only. Intel's prices are supposed to be lower when they're available. Offsetting some of the processor cost for AMD is built-in support for common and cheaper DDR 400 memory. The on-chip memory cache on X2 processors is very large. L1 Cache on some models is 128KB, L2 is 1MB, but then multiply those times two!

PCI-E (PCI Express): This is a new version of PCI device expansion slots that greatly improves on the standard old PCI expansion slots. They come in flavors of PCI-E x1, PCI-E x2, PCI-E x4, PCI-E x8, and PCI-E x16, with bandwidths of 512MB/s to 8GB/s. The PCI-E x16 is used for video cards and is now common enough that the price differential over AGP is negligible. This interface provides 3-1/2 to 4 times the speed of AGP. In addition to that, many boards have SLI support that takes two PCI-E x16 slots for two video cards sharing the graphics load at a ludicrous graphics speed. So this is the latest in fast 3D video. ATI and NVIDIA are the major players here so far. Many of the GPU (Graphics Processors) on these cards are overclocked, so all of them have fans and large fan shrouds on the card. You should research these thoroughly to make sure the fan noise is acceptable. Some expensive notebooks are using PCI Express graphics. There are a few add-on cards, drive controllers, network interface cards and firewire cards using PCI Express.

Serial ATA (SATA I & II): This is a method of connecting hard drives to your system. The past method (now called PATA-Parallel ATA) is limited to 133Gb/s burst rate. This is the highest momentary burst it will take and in reality is not achieved very often. The sustained rate is more important, but the burst rate is an indication of the ultimate transfer rate. SATA-I will do 150Gb/s, comparable to SCSI, and the SATA-II specification provides for 300Gb/s. Many older PATA systems are 33Gb/s and 66 and 100 are most common.

SATA drives are common enough now that there is little or no price differential. They are physically distinguished by the small diameter red data cable that replaces the wide flat cable. Most new ones also use a different power cable. Many SATA drives on the market are just PATA drives with some conversion interface to SATA built in. One indication of that is that many will also have a 4-pin power connector. The best drives are those designed as SATA from the start. The most famous and the oldest is the Western Digital 36GB, 10,000RPM Raptor, but its newer 74GB counterpart is the fastest of all SATA drives. They're both relatively expensive on a dollar per byte basis.

(Trends……Continued on page 4)

(Trends…….Continued from page 3)

Maxtor has two new drives designed from the ground up, called MaxLine III, in 250 and 300GB, 7200RPM, but with 16MB cache. They have NCQ (Native Command Queuing) capability. And Hitachi is doing new things using SATA-II.

NCQ: Native Command Queuing is simply the capability of a disk storage system to re-order each request for efficiency, instead of supplying data in the order requested. The idea is to minimize the disk head movement, saving time. In a single-user, single-threaded environment, NCQ doesn't supply too much advantage because the requests for data are mostly sequential. But with servers – and multiple core processors, there's a very real advantage. The hard drive controller must be designed for NCQ as well, and so far that's harder to find. Look for NVIDIA motherboard chipsets using RAID that may have support for NCQ. Also some hard drive controller cards have it.

RAID: RAID has been around in the SCSI world forever, nothing new here. But RAID has finally made it mainstream because of the availability of SATA on common motherboards. So you can expect many new motherboards to have SATA RAID support in RAID configurations of 0-Striping, 1-Mirroring, 0+1-Striping+Mirroring and JOBD (Just a bunch of disks). Some new motherboards provide RAID support for PATA.

For pure speed, RAID 0 is used with two new identical hard drives. The two drives become one logical drive, and the files (and the load) are divided between the two. It's very fast. RAID 1 mirrors all the data on one to the other also, providing redundancy. And that's not fast – or slow for that matter. But for pure speed, RAID 0 uses two separate cables and doubles the bandwidth to the drives.

Dual Channel Architecture Memory: This speeds up data flow in and out of memory. The motherboard will have two independent channels to memory in hardware. This is the format of NVIDIA's nForce chipsets for AMD Athlon XP systems and Intel's i850E, where each memory bank has its own memory channel and an arbiter distributes the load between them and plays traffic cop for incoming data. You must have two compatible (identical) memory sticks. It's best to buy them packaged as a pair. The memory controller recognizes them on boot-up.

Motherboards: There are a surprising number of motherboard manufacturers that are trying to supply the needs of hobbyists and of computer companies like Alienware and VoodooPC. Many appeal to gamers, who apparently are willing to spend the extra to have leading-edge fast computers. There are four or five chipset makers for these; ATI and NVIDIA seem to have gotten the jump on everyone. VIA and SIS are there too. ATI and NVIDIA are of interest to gamers because they're familiar with the brands through their leading-edge video cards, and the hope that some compatibility will exist between the motherboard and video card. So the things to look for are the subjects in this article: Dual-Core, SATA, NCQ, RAID, PCI-E and SLI.

Cooling Systems: The new larger processors do generate more heat. AMD and Intel both are developing manufacturing methods to reduce the thickness of the wafer (the new ones are 90 nanometers), which reduces heat requirements. And you may have noticed that notebooks get special attention with slower processors (less computing power) and sophisticated CPU speed controls.

The idea in cooling systems is three-fold. One, it's a good goal to reduce the fan noise as much as possible; two, some people overclock their systems to the point where ordinary fans can't keep up with the increased heat and risk burnout; three, it's neat and clever.

The high capacity cooling systems center around liquid cooling, where, in the places you would have fans and/or heat sinks, you mount a "water block" - just a little box the right size clamped down with two pipes to attach plumbing. They don't really use water but instead use some kind of coolant whose heat retention properties exceed that of water. In any case, these water blocks are interconnected with plastic pipes and finally wind up connected to some radiator device that also contains a pump.

(Trends…….Continued on page 5)

(Trends……..Continued from page 4)

The radiators are mostly external to the PC. Not all though. One mounts inside, where the normal air exhaust fan would be. Most radiators have a large diameter fan that moves slowly with as little noise as possible. And, of course, it can get more sophisticated, with temperature controls, readouts and variable fan speeds, depending on how much cooling is actually required.

There are other things in the cooling arena. The most interesting is CPU cooling, where the radiator can be of immense size, accommodating a large slower-moving fan. Also of interest is the use of "heat pipes," which are liquid-filled metal piping that moves the heat out to larger-finned radiator devices. These work well and are in the neighborhood of $50-$70. There are case fans designed to be quieter.

Building your own system: You need to do quite a bit of research. Start with the processor and then the motherboard to support it, then look at the features you want on the motherboard. Then go to the motherboard website and research the compatibility lists. You'll want to select the video cards and memory from their approved compatibility lists. They're available on the manufacturers' websites. Mostly. If you deviate, there's some risk that it won't work, or worse yet, have problems where you can't identify the source.

The major manufacturers maintain extensive documentation, FAQs, and even model-specific forums for users to exchange information. ◆

Internet Picture of the Month

Other Evacuees from New Orleans
Photo by Susan Poag

From page B4 of the September 30, 2005, New Orleans *Times-Picayune's* online version at http://www.nola.com/. If you are interested in the story of the "Big Flood," then go there and read all the archived editions of the paper. The story is far from over, and many of the articles are quite detailed with good photographs.

near the entrance. It was provided electricity by plugging its transformer into a nearby outlet. However, it could also have been run off batteries. The base station was connected to my laptop by a short USB cable. I emphasize short USB cable since at home I had tried to use a USB extension cable to move the base station to a location further from my laptop, but I lost the camera's image. I know there is a limit on how long USB cables can be, so perhaps this was past the distance for this particular application. Anyway, everything worked fine with the USB cable provided by Motorola. The base unit and wireless camera are pictured on the right. The base station looks a lot like a cable modem.

To set things up, you first install the monitoring software and USB driver. You then connect the base station to your computer. Finally, you activate your remote camera. The camera has an infrared motion sensor that you can set to save the current color image to a file. This feature can be adjusted so that it will then wait a specified number of seconds before a motion will again cause it to save an image. One limitation I found is that the motion sensor will not work through glass due to its being infrared. However, at any time while you are monitoring the action, you can click the mouse on a button to save the current image. Supposedly, you can also capture short color videos with sound, but I haven't tried that. Another yet untested feature is an email notification of an event, which, of course, requires that your computer be connected to the Internet and be able to connect to your email server.

What I purchased from CompUSA was called the Motorola Easy Start Kit Home Monitoring and Control System, Model HMEZ1000, consisting of the base station and one wireless camera for $149. The system supports up to six wireless cameras, three wired cameras and eight sensors (wireless door/window, wireless temperature and wireless water).

Now to the odd thing about all this - it is not easy to purchase the starter kit or an additional wireless camera, which I think I might want. There is no longer any in the two local CompUSA stores I use, Amazon.com has only one available, and so on. Possibly this is because they have a new version out, the HMEZ2000. And the prices really vary - all well in excess of $200 when I paid only $149.

Speaking of new versions, I went to the Motorola site and downloaded a new version of the software, which is nicer and I think is really the software that ships with the newer hardware since the software is now called Motorola Homesight software.

The Motolola site for all of this is http://broadband.motorola.com/consumers/home_monitoring.asp.

For those of you who want a standalone wireless camera and are not interested in all the monitoring stuff, you can purchase just a camera that has its own server and will appear as another object on your wireless network with its own IP address and which can then be accessed via a browser. Linksys makes one for $180, and there are other brands for around $100.

Network Stumbler In setting up the above wireless home monitoring, you need to know what wireless channel your home wireless network is operating on. There are 12 channels, 1 - 12. However, I believe that for wireless-g there are actually only three that don't

overlap: 1, 6 and 11. You can get that information from the configuration setup for your wireless router, or you can download the shareware program, Network Stumbler, that will tell you about all the wireless networks available. Once you know the channel your wireless network is using (6 is the default for most home routers), then you can put this into the configuration of the Motorola Home Monitoring setup and it will choose a different channel for itself. I had to use this program to find out what channel was being used at Pepin. You may obtain the program from http://www.netstumbler.com/.

The image below right is what Network Stumbler is currently showing for the wireless networks available near my home. I have selected the Encryption On filter (none are broadcasting without encryption). As you can see, there are three wireless networks available--one mine and the two others apparently from neighbors.

There is also a Pocket PC version of Net Stumbler that you can download for your mobile device.

I will have the Motorola Home Monitoring camera at the next meeting if you missed seeing it last meeting. ◆

Tampa, Florida

Meeting Preview: This month D. J. Elliott, the Clone Evangelist, will give us an amusing fractured history of the IBM compatible PC. We will also have the usual half-hour Windows SIG.

What To Do About This Newsletter?

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

This month the newsletter well went dry. Well, almost dry. Doug Mullis sent in his usual minutes, and on a second request for material, Mary Sheridan sent me an article. But that leaves a whole lot of space to fill. And since I long ago instituted a policy of using only material from our group, I have a problem. I could reduce the newsletter to four pages this month, or I could try to fill up about three pages myself. Some months when I have purchased a new computer item or had some interesting computer experiences, I could easily do that. But this month there is no new item, and my computer experiences have been mostly redoing web sites and writing computer code in Visual Basic .Net.

Minutes of the September Meeting

By Doug Mullis, Secretary, Tampa PC Users Group
dmullis@tampabay.rr.com

Mary Sheridan, member at large, started the SIG portion of our meeting at 6:40 pm. We welcomed Mary back from her vacation to Maine.

As our first item of business, Don Patzsch reported that he was being cut off when doing wireless downloading from the Internet on his new laptop. After several suggestions as to why this may be happening, Don decided he would contact the dealer for a solution.

Mary advised the group that during our Nov. meeting we would submit nominees for next year's officers. So far she has John Witmer accepting the nomination for president, Kevan Sheridan agreeing to accept vice-president, Mike Hodges and Doug Mullis agreeing to continue as treasurer and secretary respectively. Any of these nominees would welcome others volunteering or being nominated, also we need a nominee for member at large. Please express your interest in serving as an officer or submit nominees at the Nov. meeting. Fresh blood is healthy for the organization. Your group needs your service, and those who have served for more than a year need the break.

Mike Hodges, our treasurer, expressed appreciation for the fine job William LaMartin is doing with our newsletter and added that our financial situation is stable for the remainder of the year. Of concern, however, is the fact that we are losing members and therein revenue. Mike made a call for dues payments and suggested we try to attract new members.

Mary reminded the group of the upcoming Fall Conference of the Florida Association of Computer User

(Minutes……..Continued on page 3)

apcug Member of The Association of Personal Computer User Groups

FACUG Conference and Other Things

By Mary Sheridan, Member at Large,
Tampa PC users Group
mcpease@mindspring.com

Despite the threat of Wilma heading for the west coast of Florida, the FACUG fall conference was a huge success. We only had half of the people that registered for the conference in attendance. This was not a problem. The conference was well-organized, and the food was very good.

This is the second event that I have attended at the Shrine Temple in Sarasota. It's a very nice place and less than an hour's drive from home.

Because of my required attendance at the board meeting, I was not able to sit in on all of the sessions that were offered. There were round tables on how to get grant money, how to get programs, how to grow membership and many more. I heard many people discussing that eBay has become a "hot" topic for meeting presentations. I'm working on trying to get an eBay pro to give us a presentation at one of our future meetings.

Dave Gerber (past vice-president of the FACUG) has an online web site, http://www.bitsandbytesradio.com. I tuned in on Sunday and it was quite interesting. His guest was the creator of an anti-spam program. He has a variety of guests and takes call-ins. You could even win software. Check it out.

At our November meeting, I will call for nominations from the floor and present the candidates for the December election. I encourage anyone who wants to help make our user group better and more interesting to consider being an officer. The tentative slate is president, John Witmer; vice-president, Kevan Sheridan; secretary, Doug Mullis; treasurer, Mike Hodges; and member at large, Mary Sheridan. If you have a nomination and are unable to attend the meeting, please email me at mcpease@mindspring.com.

The December meeting is Smart Computing and our annual Christmas Party. Everyone who has a special dish that they like either to make or buy, please bring it to the party. The club will provide something from Publix, probably finger sandwiches, and plates, forks and cups. Be creative and prepare to have a great time.

Happy Computing! ◆

(Minutes……..Continued from page 2)

Groups on Oct. 22, 2005 in Sarasota. This is a one-day meeting, with continental breakfast and lunch included, for $20. Learning how to maintain an active club and what others are doing will be beneficial to our members.

We are still settling into our new meeting place, and it was decided to delay a tour of the Pepin site until construction is completed toward the end of the year.

At 7:00 pm, Mary started the regular portion of our meeting by introducing Steve Singer of RDI-Tampa. Steve started by telling us some history of his involvement in supplying computer hardware beginning in 1978 when Apple ruled.

Steve displayed three Jetway motherboards and reflected he prefers AMD hardware to Intel. AMD uses two buses to divide the routing of tasks. Their chips utilize a dual core, which take advantage of the motherboard's split bus for greater speed. The dual core CPU requires a 939 Chip socket and RAM must be filled in pairs, but SDRAM PC 100 and 133 can be utilized. Steve pointed out that the emphasis on chip speed has been redirected toward the dual core chips, as faster and faster chips were generating too much heat.

Steve offered an external disk drive case for housing a notebook hard drive for $35. He also demonstrated a portable two channel USB speaker system by Encore Electronics, featuring a 2" subwoofer and two 1" satellite speakers with self contained amplifier, for $29.95.

Steve invited us to visit his website,

(Minutes……..Continued on page 8)

(Newsletter…….Continued from page 1)

The Newsletter and Me I have been doing the newsletter one month short of 10 years. That makes 119 issues of the newsletter, all, if I am not mistaken, produced on time (arriving in your mail before the monthly meeting). And for every one of those newsletters, there is an Adobe Acrobat version. In December of 1995, I took over the job from someone who was burned out, and I would not be adverse to now yielding the job to someone else. I have been thinking of creating a CD with all the Adobe Acrobat files along with a searchable index. It would be sort of a history of what we were doing in computing for the past 10 years. To fill up all that empty space I mentioned, let's look inside some of those issues.

Ten years of the *Bits of Blue*

In that December 1995 issue, Larry Anders had a review of *Street Atlas USA 3.0* . I assume if they were still numbering the product in that manner we would now be on version 13 since they put out a new version each year. However, I note that the product is now called Street Atlas USA 2006. Also in that issue the president of the group, Harvey Bruneau, described his recent trip to COMDEX in Las Vegas. Changing times killed that event, which used to be enormous. There were also reviews of *Adobe Photoshop 3.0* and *Lotus SmartSuite for OS/2* copied from other user group newsletters. I don't think there are any new OS/2 programs out there at the moment. The newsletter, as it was until recently, was 12 pages, and our meetings were on the Hillsborough Community College campus in Ybor City.

The January 1996 issue had a column from our new president, Connie Kincaid. There were also reviews of *Syncware Fill* by William LaMartin, Seattle Film Works (a business) by Bruce Register, *Zip Explorer* by Larry Anders and *Partition Magic* by Don Patzsch. That was version 1 of Partition Magic. I note that *Zip Explorer* is now on version 7 and *PartitionMagic* is at version 8. Remember, you probably heard about them first via the TPCUG.

In the March 1996 issue, I wrote an article about *Microsoft Publisher for Win 95*, as that version was called. That was the first issue I had used *Publisher* to do the newsletter, the previous three issues having been done in *Microsoft Word*. Let me tell you, I found out quickly that a word processor is not the ideal vehicle in which to create a newsletter. I have been using *Publisher* ever since. My current version is *Publisher 2003.* In that issue, Larry Anders wrote about an early version of *PaintShop Pro*. There was an OS/2 article from outside the group. (At that time, I struggled to secure articles about OS/2 since there was a small but active part of the group using OS/2 as their operating system.)

Do you remember *Microsoft Bob*? If not, you can read about him (it?) in the May 1996 article by Tim Condon. The June 1996 issue had a very long article about *OS/2 Merlin*. In the July 1996 issue, we announced our first web site which was hosted by member John Meroth as a subdirectory of his site. It would be a few more months before we got our own domain name of tpcug.org. Remember the Zip Drive from Iomega? Larry Anders wrote about an early one in the August 1996 issue. Iomega is still making Zip Drives but no longer appears to make the parallel interface ones of that era.

In the September 1996 newsletter, I wrote about PC Hell--a topic I would return to not infrequently over the years. The October 1996 issue inaugurated a short-lived column by Will Goble titled *Ask PC Willy.* And again since OS/2 was of interest, Charles Howe had an article on *OS/2 Warp*.

The November 1996 issue has articles about *Delrina CommSuite 95,* of which *WinFax Pro* was one of the components. Faxing from your computer was a big deal back then. There was mention of Internet Explorer 3.0, and it was noted that Netscape was the runaway preference for most of the Internet world. Mention was also made of a beta version of *Microsoft Net Meeting.*

In December 1996, Larry Anders had a review of *Street Atlas 4.0*. (See they had put out their yearly update from 3.0 to 4.0.) And there was mention of our move in February 1997 to a new location for the general meetings to MOSI, the Museum of Science and Industry.

Those are some highlights of my first year of newsletters. And there are nine more years to go, but I will spare you that for now. If you go to our web site, http://www.tpcug.org, you will find Adobe Acrobat

(Newsletter…….Continued on page 5)

Good Hard Drives Needed

Bring them to the meeting!

Do you have an unused hard drive lying around?

Merle Nicholson and Bob LaFave will clean it of data for you, test and recertify it and donate it to Metropolitan Ministries. They can use anything 10G or larger. Nothing smaller, please!

They'll also accept systems that can be refurbished with processors 1G and higher, and also CRT monitors in good condition 17" and up. Bring them to the meeting this month or contact Bob LaFave at boblafave@verizon.net or Merle Nicholson at merle@merlenicholson.com.

(Newsletter…….Continued from page 4)

versions of the newsletter for the past 12 months. There are HTML versions of the newsletter going back to 1998, and a list of articles going back to March of 1996. There are opinions, hardware reviews and software reviews. All that should give you an idea of the members' interests over the past years.

Anyone interested in manufacturing those CDs I mentioned? ◆

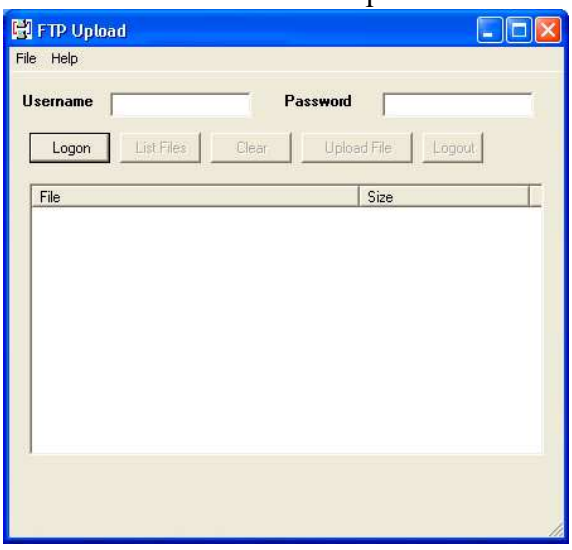
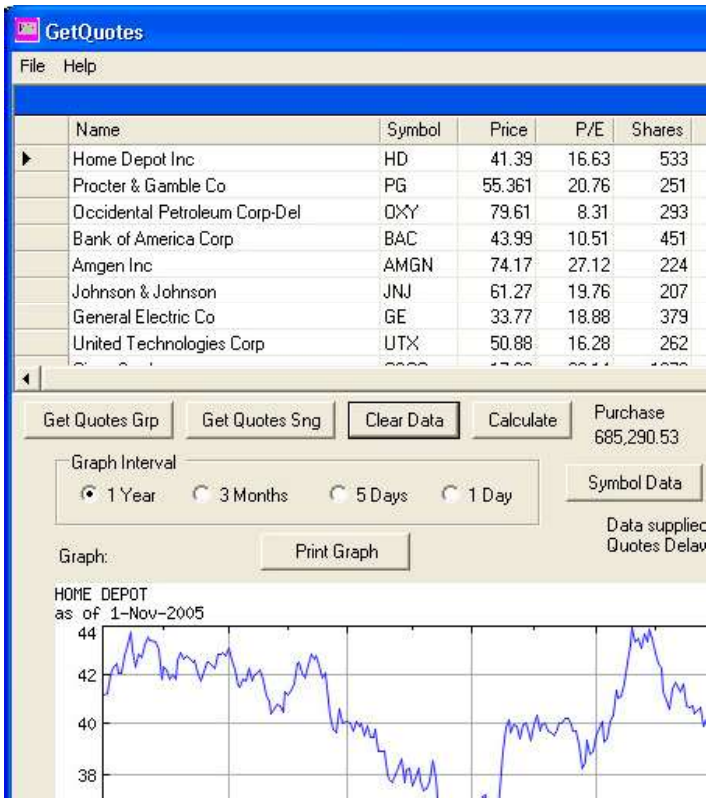
Some Visual Basic .Net Programming

By William LaMartin, Editor,
Tampa PC Users Group
lamartin@tampabay.rr.com



I spend a good bit of my time writing programs using Visual Basic .Net. In past years I used Delphi and Visual Basic. The more I use it, the more I appreciate VB .Net.

In the past month or so, I have written



- A bare-bones FTP program
- A Zip and UnZip file program
- A program to parse data from a Telnet session dump and then display it and post it to an online database
- A stock portfolio that retrieves time-delayed quotes and displays the portfolio's current status with individual stock details and graphs.

I am also in the process of using VB .Net in the redo of a web site using ASP.Net technology.

The FTP program was written to satisfy a request from a friend who wanted a simple way for his clients to send files periodically to his server. The clients needed an "idiot-proof" way of doing the file uploads, and telling them to download a shareware FTP program, install it and figure out how to use it was clearly not "idiot-proof." Here is the simple interface of the program. All they need do is supply a username and password, then log on. Once logged on, they then click the Upload File button and select the file to be uploaded from the directory tree. The file is then automatically sent via FTP to the server and put in the folder associated with that username.

There is no

installation of the program; you simply place the executable on the desktop of any computer that has the .Net Framework installed (if not installed, the .Net Framework can be downloaded from Microsoft and easily installed).

The picture above is the upper left hand portion of the stock portfolio program, displaying the status of a hypothetical portfolio and the one year graph of a selected stock, in this case Home Depot. The stock data is supplied by a free web service that has a 20-minute delay. The graphs are gotten from the Yahoo financial site.

For any stock you select, you can display both a graph for varying lengths of time and its statistical details. This program also needs no installation.

In general, a program will need no installation program if it does not reference any external dlls. To write the Zip and UnZip program, I had to use the SharpZipLib from http://www.icsharpcode.net. So this program required an installation program. But the installation program was small and no big deal. At present the program will unzip an archive of zipped

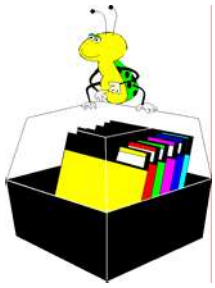
(Programming…….Continued from page 6)

folders within zipped folders to any depth, but will only zip a collection of folders with folders to a depth of 2. I need to come back at some time and write a recursive function to handle that process.

You might rightly ask, why write a program to do something that you can already get done for free. For example, Windows XP will zip and unzip things for you. Well, here is one reason. Say, I wrote a program that as output creates a large file and sends it somewhere using either FTP (as in the earlier example) or HTTP post to put it at a web site. I would like the file to be as small as possible. I could accomplish that by including the zip code within that program so that I zipped the file from within the program before sending it off. The Zip and UnZip interface is at the top of the next column.



Finally, I'll write briefly about the inventory program. The problem basically was that I needed a way to get data out of a proprietary system that you could only access via a vendor-supplied Windows program which was basically just a wrapper for Telnet. (Remember Telnet, the way you communicated with another computer and viewed the session on a "DOS" screen for which you had to keep pressing Enter to see more data?) About the only thing the program will allow is for you to export the display memory to a text file.

So I wrote a program that opens this text file, parses

out the desired information and displays it in table form. You can then sort based on each column or filter on the values in as many as three columns. You can then save the data as a text file or as an xml file. Finally, the most important thing is that you can press a button and the data will be uploaded to a web service which will then save it to the web site where you want to display the inventory information. The idea is that someone at the business will run this program once a day to update the web site information. And that is the end of my story. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

Jim Purcell and Merle Nicholson heeded the call for articles and made this newsletter much easier to produce than was last month's. For next month, it's someone else's turn. So….get to work!

Speaking of Merle, I had him build me a new computer. The four year old desktop from Gateway was getting a bit old and cluttered. This one is has an AMD Athon 64 4400+ dual core processor, two GB of memory, two 250 GB serial ATA hard drives configured in as Raid 0, two DVD/CD Read/Write drives, and a very nice Samsung 20-inch LCD monitor.

Perhaps next month I will give a complete description of the

Minutes of the November Meeting

By Doug Mullis, Secretary, Tampa PC Users Group
dmullis@tampabay.rr.com

Member at Large, Mary Sheridan, started the SIG portion of our meeting at 6:30 pm. We discussed whether or not you should defrag your PC's hard drive. The consensus was that, although defragging does cause wear, if you first delete programs/files you no longer use and run Disc Clean-up before defragging, you minimize the wear and improve the efficiency of your machine. Always analyze your system to see that defragging is recommended. Also remember to run Disc Check after defragging. The entire discussion was humorously highlighted by a dialog between Merle Nicholson and Bob LaFave over what you should and should not delete from your computer.

Bob LaFave announced he is willing to present a session on Windows Restore Console during the SIG portion at an upcoming meeting after the first of the year.

At 7:00 we launched the new "Business" portion of our meeting. Mary announced the nominees for office for next year as follows; John Witmer for President; Kevan Sheridan for Vice President; Mike Hodges for Treasurer; Doug Mullis for Secretary; and Mary Sheridan for Member at Large. Mary asked for nominations from the floor; none was offered. The election will be at our Dec.14th meeting. We will also have our Christmas Party, and Smart Computing Magazine will be our presenter. Bring finger food or dessert if you wish for our party.

At 7:10 our Program Director, Doug Mullis, introduced our speaker for the evening, Mr. Dennis Elliott, who lectures primarily on PC technology to computer clubs in western Florida. He calls himself the Clone Evangelist and presented a 45-minute presentation with sound and graphics tracing the amusing evolution of the PC over a 25-year period.

According to D. J. Elliott, it all started at Xerox Corporation with a research project at Xerox Parc, CA, where they invented the mouse, the graphic user interface, the laser jet printer and the Ethernet. Xerox mothballed these new inventions, as they were not interested in expanding their product line beyond copy machines. Steve Jobs and Steve Wozniak of Apple Computer and upper management of IBM saw the potential for PC's, pirated these ideas and ran with them.

Adobe Photoshop Elements 4

By Jim Purcell, Tampa PC Users Group
Edward_J_P@MSN.com

This is an update to the article on Adobe Photoshop Elements 3 that appeared in the August Bits of Blue Newsletter. That article focused on the new features that were available in Photoshop Elements 3, with some background information on the overall capabilities of the product. The focus of this article is to cover the new features in Elements 4 and the enhancements to the features in Elements 3.

What's New in Elements 4:

1) Magic Selection Brush: Using this tool, you select an item by using the Magic Selection brush to draw a few lines or place a few dots on the item. It's not necessary to trace the outline of the item; just try to cover the range of colors. Elements then calculates the outline of the item and selects it. The tools required to "fine tune" the selection, when necessary, are exceptionally easy to use. You simply paint in the area to be added with the plus brush or in the area to be deleted with the minus brush.

2) Magic Extractor: This tool is used in a way similar to the Magic Selection Brush in that the areas that you want selected are marked in the same way. After selecting the photo from which you want to extract an image, you select the tool and your photo appears in the preview area of the Magic Extractor. The Magic Extractor provides an array of tools to help you make a perfect selection.
   a. Foreground Brush. This brush is used to mark the area that you want to extract.
   b. Background Brush. You use this brush to mark the area that you want to exclude from your selection.
   c. Point Eraser Tool. This tool is used to remove areas marked by mistake by either the Foreground or the Background brush.
   d. Add to Selection Tool. Use this to add to your selection.
   e. Remove from Selection Tool. Paint over areas that you want removed from the selection.
   f. Smoothing Tool. Use this tool after previewing to smooth ragged edges that aren't connected by the touch up commands that are also provided (Feather, Defringe and Fill Holes).

3) Adjust Color of Skin Tone. Call up this command and click on an area of skin in the photo. The skin tone and all colors in the photo will be adjusted. Tan and blush sliders are provided to fine tune your photo.

4) Red Eye Removal. A new completely automatic Red Eye Removal Tool is one of the neatest additions to Photoshop Elements. You can even select to have red eyes corrected automatically as you bring your photos into the program from your camera, scanner or file folders.
   You'll probably be happier with the results, however, if you wait until the photos are imported and then select the photos with a red eye problem. Once you've selected the photos to be corrected, you merely need to execute the tool from the organizer or the editor and the job is done. If you are not satisfied with the results on any of the photos, you can undo the action and use the regular Red Eye Removal tool in the Quick Fix or Standard Editor, which is more accurate and provides more flexibility (and is also a quick and easy tool to use). The strength of this program is that you also have tools like the clone stamp to use in particularly difficult situations where the "automatic" tools don't work as expected.

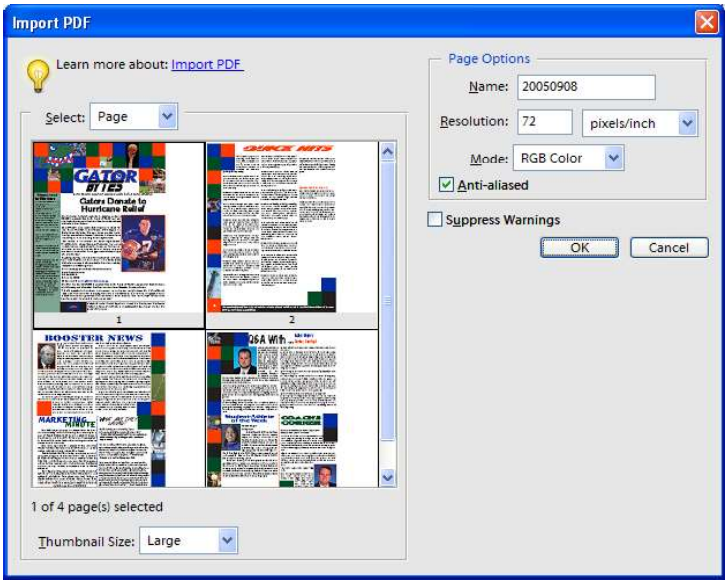
5) Defringe Command: When a selection is moved or copied a portion of the former background is often transported with it. This command will remove that fringe to better allow it to blend into the new background.

6) Straighten Tool: If you have a picture that is crooked, you merely need to select the photo, activate the Straighten Tool, and choose from three options: 1. Grow Canvas to Fit. 2. Crop to Remove Background. 3. Crop to Original Size. Then use your cursor to draw a line that identifies the part that should be level (such as the horizon) or perpendicular (such as a flag pole), and Elements straightens the photo.

7) WYSIWYG: The font menu identifies what each font actually looks like.

8) One Click Printing: Prints or Professional Hardbound Books from Photoshop Elements can be ordered by dragging the items to the "Order Prints" palette.

9) Slide Shows on TV: If you have Windows XP Media Center 2005 installed on your computer, you can view Photoshop Element slide shows on your TV and navigate using your TV remote.



10) Face Tagging: Elements will search a group of selected photos and isolate and display the faces on the photos with a thumbnail so that you can easily tag the photos in your organizer. The photos can be tagged by simply dragging the tag and dropping it on a face or by dragging a face and dropping it on a tag (you can tag multiple selected photos at once).

(Elements…….Continued on page 4)

(Newsletter…….Continued from page 3)

11) Search by Metadata: In addition to the previous methods available to search for your photos you can now search by such items as file type, shutter speed, f stop, iso speed, camera name and camera model. This new feature also allows you to search using multiple criteria.
12) PDF Support: You can open a PDF document in Elements, which produces an Import PDF dialog box. With the Import PDF dialog box, you can preview the pages and images in a multi-page PDF file, then decide if you want to open them in the Editor. You can choose to import individual full pages (including text and graphics), or you can import just the images from a PDF file. If you import only the images, the resolution, size and color mode of the images remains unchanged. If you import pages, you can change the resolution and color mode.

What Has Changed in Elements 4

In addition to the new features, there are numerous enhancements to the previous features. Some of the significant changes in four functional areas are:

Editing and Selecting

- The Crop Tool has been enhanced. The "accept" and "reject" buttons have been moved to a more convenient location at the bottom corner of the item being cropped. New preset sizes have been added and a quick change control for the aspect ratio (switch from portrait to landscape, or landscape to portrait).
- Text handling has been improved. Paragraphs can be formatted and contained by the use of a text box.
- The Quick Fix automatic correction functions have been enhanced. New options and embedded profile support provide easier color management. These changes promise to make it easier to get the color you expect when printing.
- Raw data files from your camera can now be saved in the new Digital Negative format. The Digital Negative (DNG) format is Adobe's proposed standard format for camera raw files. DNG files are useful for archiving camera raw images because they contain the raw camera sensor data and data specifying how the image should look. Camera Raw image settings can be stored in DNG files instead of in sidecar XMP files or the Camera Raw database.
- The Noise filter, used to remove noise resulting from shooting in low light and with the ISO camera settings, has been improved by adding the Remove JPEG Artifact function.

Sharing and Printing

- The slide show editor has been completely redesigned. Many new features have been added, including the ability to pan and zoom and to add clip art to your show. You can make final adjustments or complete enhancements to any photo, even in the middle of the slide show creation process. There are over 50 transitions included in the program. You have the ability to add text, graphics, narration and music (add multiple songs with precise start and end points). Edit and enhance photos from any point in the slide show creation process. Your work can be saved as a slide show, and you can go back and edit it at anytime.
- Create cards, calendars and photo albums, and send them to your printer. There are formats to personalize your email for various occasions and add your photos. You can also create your own wallpaper.

Viewing Tagging and Organizing

- The enhanced Photo Downloader is faster and can be used even when Photoshop Elements isn't running. You can view your photos in full screen without the clutter of menus, or you can view two photos in the same mode either side by side or above and below.
- The Organizer allows you to view photos in four different ways. **Date (Newest First)** shows the most recently taken or imported photos first. (Within a given day, the photos are shown in the order they were taken, oldest-first, unless otherwise specified in the General Preferences dialog box). Newest-first order is convenient

(Elements…….Continued on page 5)

(Elements……..Continued from page 4)

when you need to attach tags to the photos you imported most recently**. Date (Oldest First)** shows all the photos in chronological order. **Import Batch** displays photos in the batches in which they were imported and shows how the photos were imported. **Folder Location** view in the Organizer splits the Photo Browser into three sections: a folder hierarchy panel on the left, an image thumbnail panel in the center, and the Palette Bin on the right. From this view you can manage your folders, add files to your catalog, automatically tag files using their folder names as the tags, and add or remove folders from Watched Folder status.

- Adding a caption is one more way of identifying your photo. The captions can be added in several ways, depending on the view you are using. Like almost everything else in this program, Adobe has made it as convenient as possible for the user. Captions can be used in Creations, printed in contact sheets, and viewed in a web photo gallery. If you have a microphone, you can even add an audio caption to your photo.

Summary: I've tried to cover the significant changes that have been included in Photoshop Elements 4. In addition to the extensive help and tutorial system available in Elements 4 to help you utilize its many capabilities, the changes to the Organizer provide you with an all-embracing search capability for your photos. There are also many publications that provide even more insight into the use of all of the available tools. I purchased the O'Reilly book, *Photoshop Elements 4: The Missing Manual* by Barbara Brundage, as I did her book for Elements 3. It is an excellent and well-organized manual for Photoshop Elements 4. It's available on Amazon.com. (If you purchase any books from Amazon.com, don't forget to go through the TPCUG web site.) ◆

Internet Picture of the Month

Bill Gates
Playing with an Xbox

With the introduction of the new Xbox, I wanted to use a photo of Mr. Gates with it, but all I could find were of poor quality. So here is one of him with the old toy from in January 2005.

Photo Story 3 for Windows

By Merle Nicholson, Tampa PC Users Group
merle@merlenicholson.com

Photo Story 3 is a program that creates movies from your collections of digital photos. It's kind of a slideshow, like Ken Burns does for PBS. If your target platform is a PC, Pocket PC or a new Palm, it creates a Windows Media Video file (.wmv). It also will create DVD's to be played on a TV and for Windows Media PC. And the results are nothing short of spectacular.

Photo Story 3 is a free download from Microsoft. Yes, it's free. The previous version, Photo Story 2, is still distributed on the Windows Plus! CD, along with other things, and of, course, that's not free at all.

There's only one catch. It's a $20 catch, and one that I bumped into early: If you want to make a DVD that will play in a standard DVD player, you need your own software for the creation of the DVD. I was unable to get my copy of Nero OEM to do that, but I did purchase a plug-in for PS3 that did all I needed. More about that later.

There are excellent tutorials on the Microsoft website, with more information than you'll ever need. I highly recommend looking at those. It's where I found the reference to the Sonic site where I bought the plug-in. All these are in the links section of this article.

Now for the program. If you do these following simple steps and did nothing else, you'll just love the results.

Collect all the pictures you want in your slideshow, preferably in a single folder, but if they are scattered around, you can deal with that inside the program, too. Step two, open the program and read in the pictures. Step three, move the pictures along the picture strip to get them in the order you want. Step four, pull in some music you've ripped from an audio CD, point the start of the music to the first picture, then look down the pictures to see where the music ends, and repeat the same music, or point to another. Step five, save the project in a file because you'll want to come back later. And last, step six, create the movie. For the first save, I'd create a movie file to be run on a PC at, say, 1024x768. When it's done, run the movie.

Everyone knows about Ken Burns' wonderful series on the Civil War for PBS, in which he used a technique on all the still photos where he panned through the picture and zoomed in or out of the photo to a point of interest to create a sense of motion. He may not have invented the idea, but his name became synonymous with the technique. I can remember being entranced with the impact of this when it came out.

Photo Story 3 does this pan and zoom on every picture by default. It's wonderful. And the funny thing is, it must be done randomly. It certainly can't know of the content of the picture to do it intelligently. So after you've created your first show and maybe looked at it twice, then is the time to go back into the saved project and go to each slide and change the motion so that the motion fits into the context of the picture. Some pictures you'll want to have no motion at all, and perhaps some you may want to repeat the picture so that you can zoom out after zooming in.

I told a friend about this program, and he put together a movie of about six pictures and one song. He said he did it in about five minutes. Just did pretty much what I described above. He emailed it to me, and it was just excellent. And he was extremely happy with it.

For my own 20 minute project with 165 photos, it took three minutes to create a file for my pocket PC. For a file to be played at 1024x768, it took seven minutes. It surprised me how long it took since I have a very powerful dual-core processor. So if you have an older computer, I'd be prepared for a long final creation time.

The program has a very wide range of options that I'll try to summarize: You can crop the pictures, rotate, color correct, remove red eye, annotate with titles on each, record voice for each, create music and edit each photo with 10 effects like sepia color, black and white, watercolor and negative.

Now for the rest of the stuff. The program is written to be a kind of a wizard with five panels. The panels' functions are:

1. Import and arrange your pictures (color correction, red eye, rotate, crop, add 10 effects)
2. Add a title to your pictures (Add text and arrange on the photo)
3. Narrate your pictures and customize motion (Yes, add voice annotations or narrations)
4. Add background music (Select music, create music)
5. Save your story
    - Save your story for playback on your computer
    - Send the story in an e-mail message
    - Save your story for Pocket PC
    - Save your story for playback on a Smartphone with Windows media player
    - Save your story for playback on a Portable Media Center
    - Optionally, with the Sonic Plug-in,
    - Save your story to a DVD for playback on your home DVD player

On "Save your story for playback on your computer," you have a very wide range of options. You have file, DVD and CD (VCD) formats and a variety of screen resolutions for each.

For creating DVDs to play on a home DVD player, I can recommend the plug-in from Sonic. There's a link to it from the Micro-

(Minutes…….Continued from page 2)
Don Estridge of IBM's Small Systems Group went off looking for an operating system for their new small computer that they had spent a year secretly building. After failing to connect with Gary Kildall, who had an operating system called CPM, they sought out Bill Gates, whom they knew but who had never created an operating system. Bill assured IBM that he was up to the task. To his good fortune, his partner Paul Allen stumbled onto a real deal and purchased an operating system from Tim Peterson for $50 thousand. They then entered into an endless contract with IBM wherein they got a royalty for each computer IBM produced using their newly acquired software. We all know where it went from there.

Not only did Bill Gates take IBM for a ride, but also because of the open architecture of the IBM personal computer, anyone eventually could clone their machines. Compaq Computer was the first with a suitcase sized 50-pound portable and then Michael Dell did his thing to capture a part of the personal computer market. Few realized at the time how popular the personal computer would become at its inception. So here we are today, each of us with our own home computers.

Mr. Elliott ended by saying if we wanted him back, he has an equally interesting presentation on the Internet.

Following our speaker, we took a 10-minute break during which tickets were sold for our five door prizes. The winners were:

Photo Shop CS2 Manual	Ed White
Flight Simulator Software	Bruce Register
Laptop Ventilated Platform	Mary Sheridan
Tech Smith T-Shirt	John Witmer
I Hate Spam Software	Ed White

They're being no further business or entertainment, the meeting adjourned at 8:15pm. ◆

Meeting Preview: This month Bob LaFave will show us how to build a computer. We will also have the usual half-hour Windows SIG.

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

This seems to be hardware month, with Bob Lafave doing a presentation on building a computer and me writing about my new
"Merle built" computer. There is really no need to buy from one of the major computer vendors. Have either Merle, Bob, or one of the local businesses like Steve Singer's put you one together--or do it yourself. You will probably have to buy your own CD/DVD burning software, but that is about the only "free" thing usually provided by major computer assemblers that you will need. The virus scanning software, etc. provided by them is good for only a few months, so you would need to purchase your own copy anyway.

Minutes of the December Meeting

By Doug Mullis, Secretary, Tampa PC Users Group
dmullis@tampabay.rr.com

We did not have our usual SIG portion of our meeting as we were partaking of the Holiday Party Buffet. The spread was fantastic as usual. Thanks to all who brought goodies.

At 6:55 PM, Vice President John Witmer started the business portion of our meeting. After thanking all who brought items for the buffet, John asked Member at Large Mary Sheridan to present the slate of nominees for the coming year's officers. Mary presented:

For President	John Witmer
For Vice President	Kevan Sheridan
For Treasurer	Mike Hodges
For Secretary	Doug Mullis
For Member at Large	Mary Sheridan

The election was held and the above were elected unanimously. Terms of office begin January 1, 2006. To those who agreed to serve as officers, a special thanks.

John expressed appreciation to William LaMartin for continuing in the volunteer position of Newsletter Editor. He then welcomed our guests and acknowledged one new member, Robbie Randall. Robbie is Doug Mullis's son-in-law and has attended a couple of meetings in the past. Unfortunately Robbie's job requires he be in the Atlanta area much of the time. Welcome, Robbie!

William announced that he now owns his first non-Gateway desktop computer in many years. Merle Nicholson set it up for him, and he is initially happy although there was a problem getting some missing

Making My First Music CD

By Ron Weinberg, Tampa PC Users Group
rswjbr@verizon.net

Although a former computer professional, I had remained a more traditional consumer of music, i.e., purchasing records, tapes, or CD's as technology changed. I don't own an iPod or an MP3 player. My first attempt to download so called "free" music resulted in a virus infection that took hours to eliminate.

Lesson 1, "free" can mean including pop-ups, adware, spyware, and virus infections.

Therefore, it was with great trepidation that I attempted to create a special birthday gift by downloading music. Being a neophyte in this area, I resorted to the old trial and error method.

The Web led me to try Rhapsody, one of several prominent services, as they were offering a free trial with 5 free downloads. This worked pretty well after leaving credit card information as collateral. Rhapsody from Realnetworks.com, owner and supplier of RealPlayer, allows you to legally share or burn CD's of purchased selections. Rhapsody downloads were in the restrictive .rax format but Rhapsody burns CDs in CD Digital Audio (.cda) format. This is the format used in music CDs you buy.

Now that I had the free selections, I removed Rhapsody from my computer. This was a mistake! I could no longer play or burn the titles to a CD, and I lost license rights. Rax format could not even be played by most other players. I had to download and reinstall Rhapsody to regain control.

However, Rhapsody did not have several of the older songs I was seeking. Again, research was my guide, and I tried Wal-Mart's Music Service. There I found the songs, at a cost of 88¢ each, which download in WMA format. You can legally burn them to a CD up to 10 times and are allowed unlimited transfers to a portable device, but have restrictions on sharing or attaching to emails, etc. Note that a WMA file is similar to an MP3 file, but the WMA can be programmed to limit copying.

There are many music playing and/or recording programs available such as: RealPlayer, Musicmatch Jukebox, Creative Mediasource and Windows Media Player. My default player is the latter, but I needed Rhapsody to burn all my selections, including those from Wal-Mart. None of the others (except RealPlayer) can handle the rax format.

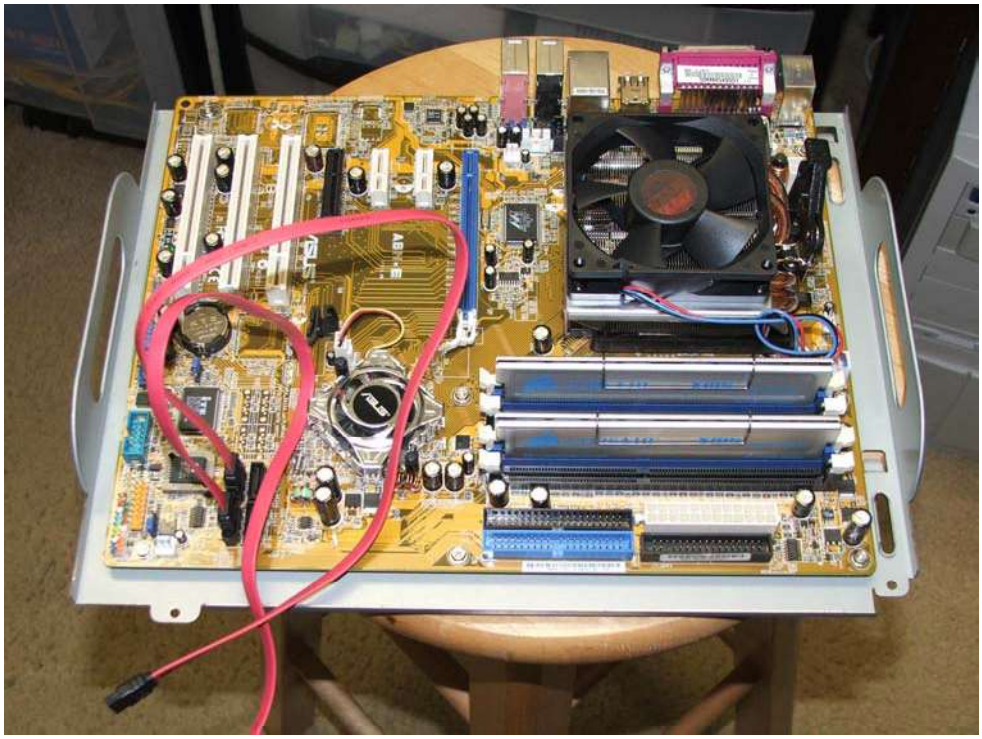
The final result was a homemade CD that actually played perfectly.

A word of WARNING is in order. It has been well publicized that a number of lawsuits have been filed against PC users for illegally sharing or otherwise misusing downloaded music. The law issues are many and complicated. Conflicting claims abound. This is serious business, and readers are cautioned to exercise great care in their use of downloaded music, particularly with regard to sharing music directly or indirectly with others. ◆

(Minutes……..Continued from page 2)

parts.

At 7:15 PM our regular meeting began with the introduction of Marcy Gunn and Vince Cogley with *Smart Computing* magazine. Its being winter in Nebraska, Marcy assured us they were pleased to be making the Florida circuit in December for the second year.



Marcy handed out packets containing the January 2006 *Smart Computing* magazine, the October 2005 *Your Guide To The Ultimate Computing Resource*, a mouse pad with calendar year 2006 printed on it and a ball point pen.

Smart Computing is a monthly publication for computer users of all skill levels. It features easy to follow tutorials, new product evaluations, troubleshooting guides for operating systems and everything in

There it is at the right, my new computer, minus a case, hard drives, CD/DVD drives, floppy drive, video card and power supply, perched on Merle's work stool. Now, he doesn't assemble computers on a stool; that positioning was just to make taking the photograph easier. So what you are seeing here is really only the motherboard, memory and processor fan.

After 14 years of Gateway desktop computers, I finally made the break to a "home built" one (in Merle's home). And I feel I got a better machine than if I had purchased a Gateway, HP or Dell. As I see it, these companies make computers cheap to sell cheap since that is what most people want. My new computer has a large, roomy case, one where you actually have space to put your hand into and do some work. It has an AMD Athelon 64 Dual Core processor, two GB of Ram, two 250 GB Serial ATA hard drives configured as Raid 0, two CD/DVD burners, a multi function floppy, 20-inch monitor, standard keyboard and wireless mouse. Total cost for the parts was $2,365 (including Windows XP Professional). A breakdown of the pricing is on the following page. Oh, there is a card with extra USB ports and firewire ports.

So, how was all this done? The first step was for Merle to go to http://www.newegg.com and select the components for me to approve. The choice of a case turned out to be the most difficult. I did not want a black case or a poorly-constructed case. I would have preferred a mid tower one but had to settle for the larger tower to get what I wanted. I trusted Merle on the memory, hard drives and power supply. He gave me several choices for the monitor. He did this by setting up a wish list that I could go study at the site. Once we had agreed on what I needed, I placed the order.

All the packages arrived within a week. Unfortunately, the box containing most of the small items was missing one hard drive and all the memory. That one box was very poorly taped, so I don't know if Newegg didn't put the parts in the box, they fell out or they were stolen during shipment. Now here is the bad part. Newegg has to "investigate" such occurrences, and this takes at least two weeks before they will either ship you replacements or refund your money. So if you want your parts now, you have to reorder (and repay). That is what I did. However, I had to go to another online company, PCMall.com, to get the hard drive, since Newegg was out of them.

Newegg definitely has low prices, and several members of our group recommend them highly and have never had problems, but dealing with them is entirely different from dealing with someone like Amazon.com. Recently I ordered from Amazon the upgrade for Visual Studio, Visual Studio 2005. This is an expensive program with the upgrade costing just under $500. When my copy did not arrive when the tracking said that it should, I went to the UPS site to check, and much to my surprise it said that the package had been delivered earlier at 5:30 PM and that

(Computer……..Continued on page 5)

(Computer…….Continued from page 4)

LaMartin had signed for it. Well, my wife and I were both home then, saw no UPS driver and certainly signed nothing.

A call to UPS produced sympathy but the information that I had to contact the shipping party, Amazon.com and have them put in a trace. Well, as you might know, there is no phone number for such at the Amazon site. But I had run into this problem before, and went straight to Google, which produced the secret customer support number. Once connected to

Internet Picture of the Month

Squirrel Problem

You might well ask why such a photo for Internet Picture of the Month. Well, I am desperate. Additionally my neighbor at present has a family of squirrels living in his attic, and I have photos of them entering the attic soffit to prove it, but that wouldn't be an Internet picture, would it—unless I put it at my web site. There are all sorts of sites dedicated to removing squirrels from one's house. The one where this photo came from is http://unexco.com/SQ1.html.

Amazon, they immediately offered to ship me via next day air the missing software at no cost. Now I call that service (that we have bought so much through Amazon may have had something to do with it). My Newegg refund was credited to my credit card in about two weeks.

Back to the computer. It took Merle a couple of hours to put it together and check that it didn't explode when booted. Next it was up to me to configure the Raid setup of the drives using a floppy and instructions Merle provided. (If you did not want to do a Raid stripe of the two drives (for faster hard drive access), then this step wouldn't be necessary.) After that I installed the operating system. Following that, again using Merle's instructions, I updated the motherboard chipset driver, sound driver and LAN driver. By the way, Merle normally does all of the above when he builds you a computer, but since he figured that I could manage myself using his instructions, he left that to me and saved himself, perhaps, an hour of work.

Once all that was done, it was time to go to Microsoft and do the Windows updates, of which there were quite a few.

Next came the time-consuming part—installing all my programs. Let's see, there was Microsoft Office 2003 Professional, Microsoft FrontPage 2002, Microsoft Visual Basic 2006, and Microsoft Visual Studio 2003 for the Microsoft ones. Then from Adobe I had PhotoShop CS, Illustrator CS, Acrobat 7.0 Professional and Streamline. For second tier programs, there were Family Tree Maker, WinZip, Stuffit, Nikon View and others.

Now it was time to retrieve all my data from the Gateway. I could have simply copied and pasted folders over the network connection between the two computers, but at Merle's suggestion I decided to use the Microsoft File and Settings Transfer Wizard to accomplish the task, with the additional benefit that most of my program settings for the programs I had just installed would also be transferred. Additionally, all my email folders, address book and Internet favorites would be transferred with no work on my part.

The Wizard is found under System Tools in the Accessories folder of the Start menu. If you have a lot to transfer, it can take several hours to create the package to be transferred (the packaged file was named IMG00001.DAT and was about 2.1 GB in size) and then an equally long time to place everything in the proper place on the new computer. I have lost my notes on all of this, but I think it took a bit more than four hours for each of the two steps.

The one thing I did not include in the transfer was the collection of local copies of websites I maintain, which, I had on the Gateway. For those who know about FrontPage, I chose to use it to "publish" each of those webs separately from the old computer to the new computer over the LAN. As a final note, I should mention that Merle said for some strange reason the Wizard did not automatically include the file type jpg in the collection of file types it would transfer, so I had to add that—don't want to leave all the jpegs behind.

between, all in plain English. They also keep advertising to less than 20% of the publication.

Marcy used the Table of Contents of the distributed issue as an outline for the presentation. First was "Troubleshooting Your Software," then "Reviews of New Software and Hardware Products", next "Windows Tips and Tricks", then the "Plugged In" section, followed by "Tech Support," with questions and answers, "PC Projects", "Quick Studies" and, finally, "Tidbits".

Next we logged onto the website, http://www.smartcomputing.com so Marcy could demonstrate the ease of use and familiarize us with their homepage. She referred to the second handout, *Your Guide To The Ultimate Computing Resource,* as an outline. Marcy told us of My Personal Library and Browse All Issues & Articles features which allow subscribers to read past and current issues of all four publications they produce online and store articles of interest for quick future reference. The four publications are *PC Today*, *Computer Power User*, *PC Builder* and *Smart Computing*. Subject searches using key words can be done for all publications. There also is tech support available through a question and answer board, or through an 800 number you can call for free assistance in resolving problems.

Heck, for just $17 a year you could subscribe to the website only and access articles from all four publications, printing them, or storing them in your personal library. At any rate, the magazines, web site and free 800 number should cover any PC problems you encounter and keep you current with what's available in the marketplace.

Thank you, Marcy and Vince, for an excellent presentation. We can get *Smart Computing* for just $29 per year.

Smart Computing provided two door prizes for meeting attendees. The numbers drawn were 792690, held by Ed Snow, who won the *Smart Computing* Reference Set, and 792691, held by Richard Brooks who won a year's subscription to *Smart Computing* magazine.

The meeting adjourned at 8:20 PM. Happy Holidays and a Happy New Year to all! ◆

(Computer…….Continued from page 6)

But one thing remained to be done—and a very important one—install antivirus protection and spyware protection. For me this meant installing a new copy of Norton Antivirus 2006 and of Spy Sweeper. Oh, I almost forgot—my scanner's software and two printers also had to be installed.

It is nice to have a new desktop computer with a monitor larger than I have ever had before. It really

does make working at the computer easier. I have a laptop computer but only use it for travel and presentations. How so many people now use laptops as their main computers is something I cannot understand unless it is just a matter of not paying for two computers. ◆

(Comments…….Continued from page 1)
Make sure that you use virus and adware/spyware scanning software. It is very necessary. I hadn't had the new computer running for more than a week before it was attacked. All I did was go to Google, do a search on a problem my sister was having with a program, then view one of the pages provided by the search. All hell broke loose with windows popping up everywhere, Norton Antivirus popping up messages, etc. To make the story short—three spyware programs had been installed and it took both Norton and Spy Sweeper two runs each to remove them. ◆

lamartin@tampabay.rr.com

Gasparilla has come and gone in Tampa. That is the reason for the pirate image above. He really should have adorned the January newsletter since Gasparilla was on January 28 this year. But that is only because the powers-that-be didn't want to have a conflict with some other important event like the Super Bowl. So we had Gasparilla in Tampa on the last Saturday of January instead of the first Saturday of February.

Since I live a block off the parade route, I sort of have to stick around to make sure my home is not part of the invasion. And it is also a good time to take a few photos with the digital camera. Gasparilla, however, is one of those things to which I can find no computer angle. I suppose I could upload my photos of

Minutes of the January Meeting

By Doug Mullis, Secretary, Tampa PC Users Group
dmullis@tampabay.rr.com

Vice President John Witmer called the meeting to order at 6:40 pm. He welcomed a visitor, Dora Jones. Dora read about our group in the Temple Terrace paper, and we hope she joins our group. We need to get the Tampa Tribune to announce our meetings again.

Bruce Register performed the duties of our vacant Membership Chairperson this evening, greeting guests and members and distributing nametags. We need volunteers to perform these important duties at every meeting. Please step forward to make our meetings more memorable to our attendees.

John announced the Spring Convention of FACUG March 3rd thru the 5th in Kissimmee. The Board is sending five members and others are encouraged to attend. Registration is $40 until Feb. 1st and then jumps to $55. Mary Sheridan is the FACUG President this year and can use help putting this conference on.

At this point John turned the meeting over to Bob LaFave for a shortened Windows SIG meeting. After some discussion of a problem Google is having, Bob handed out a paper listing several web sites he thought we would find interesting. He also announced that Microsoft is continuing to offer Baseline Security Analyzer and Windows OneCare Live anti virus and firewall in a free Baea version. Check this out.

At 7:05 we began the business portion of our meeting. First item was the installation of officers for 2006. They are: John Witmer, President; Kevan Sheridan, Vice President; Mike Hodges, Treasurer;

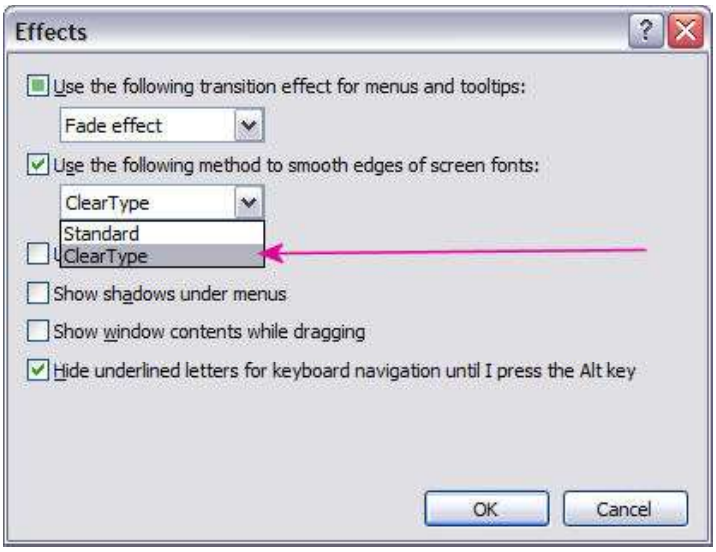
Fonts and LCD Screens and ClearType

By Merle Nicholson, Tampa PC Users Group
merle@merlenicholson.com

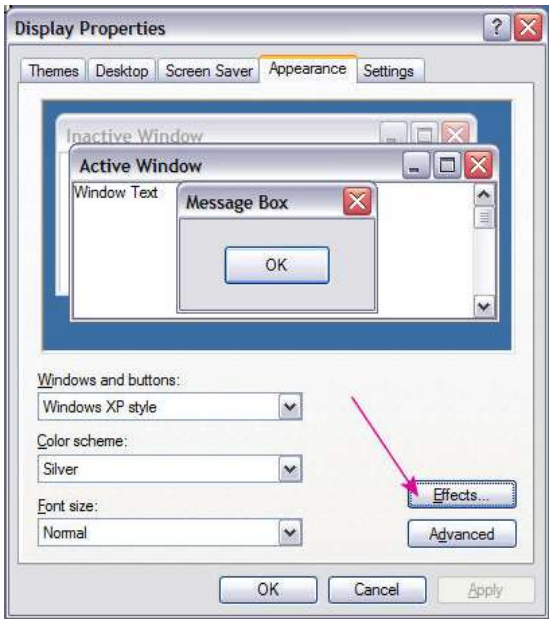


If you have an LCD screen – and you should! – there is a font technology that you should know about. It's called ClearType; it's made expressly for LCDs, and it's already on your computer if you have Windows XP.

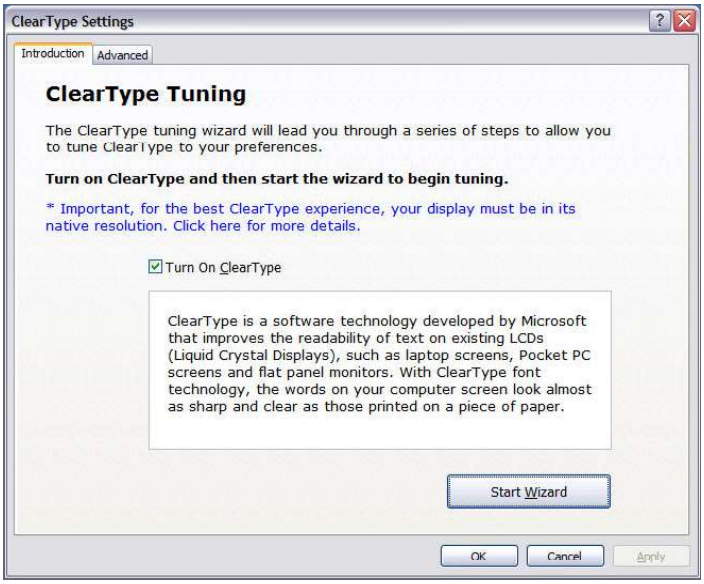
You can read about ClearType at:
http://www.microsoft.com/typography/WhatIsClearType.mspx

The following is taken from the web page:

"ClearType is a software technology developed by Microsoft that improves the readability of text on existing LCDs (Liquid Crystal Displays), such as laptop screens, Pocket PC screens and flat panel monitors. With ClearType font technology, the words on your computer screen look almost as sharp and clear as those printed on a piece of paper."



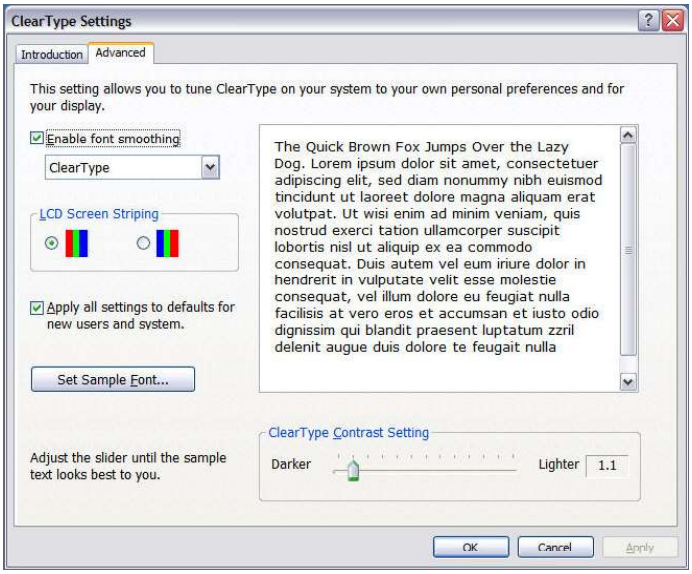
"ClearType font technology works with current displays. Readability on CRT monitors will be improved somewhat, but it will be dramatically improved on color LCD monitors, such as those found in laptops and high-quality flat desktop displays."



So we know what it's for, how do we use it? Go to Control Panel, Display Properties, Appearance tab, Effects and choose ClearType.

Then click OK, OK. But we're not done yet. We need the Cleartype PowerToy Wizard. It's a free download from Microsoft. You can find it at:
http://www.microsoft.com/windowsxp/downloads/powertoys/xppowertoys.mspx

On the right of the page, the "ClearType Tuner PowerToy" Setup.exe is what you want. Save it to a folder on your computer and run it to install. It'll put an item in Control Panel called "ClearType Tuning." Run that, and here's what we get:



(ClearType……Continued on page 4)

(ClerarType…….Continued from page 3)

And on the Advanced tab :

You can make adjustments to pick the clearest looking font with this wizard.

One thing I should mention. On your LCD screen, you have an "Auto" button. This runs a program in the monitor to optimize the screen for your PC's video signal. Be sure to use that, and then perhaps go back to the ClearType PowerToy and re-run it.

You can make a dramatic difference in the appearance and usability of your screen in just a few minutes. Don't forget it's available on Windows Pocket PCs, too! Give it a try! ◆

(Comments…….Continued from page 1)

the event to the Internet. But by that standard, anything that you can photograph or write about and then upload to a web site would become computer-related. So let's drop the pirate discussion and move on to some computer-related items.

Google is certainly computer-related and much in the news lately, the current topic being the federal

FACUG Spring Conference 2006

By Mary Sheridan, Member at Large, Tampa PC Users Group
mcpease@mindspring.com

The twelfth annual FACUG spring conference is scheduled for March 3rd, 4th and 5th at the Kissimmee Civic Center in Kissimmee, Florida. As President of FACUG, I will have the responsibility of coordinating many of the activities for the conference. I've been amazed at all that needs to be done.

The roundtables are held in meeting rooms at the convention center, and each room needs to have whatever equipment that the roundtable facilitator might need for the session. Last year there were several tech sessions, and I'm hoping to have some this year as well.

The caterer last year was Golden Corral, and I hope I will be able to have them again this year. It's a bit of a Catch 22 because some of the vendors pay for meals or pay for part of a meal and this means that the caterer can't just be contracted by one person. It becomes a ballet of getting all the parties moving in the same direction. The FACUG will pay for anything that the vendors do not sponsor, but the conference should be at least a "break even" proposition and that means the more FACUG funds, the less money there is for future conferences.

The vendors change from year to year, so it's hard to say what products will be represented. I have contacted all the vendors from last year and others are working on getting donated door prizes.

We will have a newsletter contest and a home page contest again this year. Letters in the form of emails have gone out to the user groups.

I have contacted the people responsible for working last year's registration for the conference, and I'm hoping to be able to count on them again. Some of the volunteers have done the registrations for many years, and they know much more than I do about

(FACUG…….Continued on page 7)

(Comments……..Continued from page 4)

government's request for search information from Google. Even though the request does not ask what IP addresses originated the searches in question, all of this has gotten people to worrying that at some time in the future, such information may be requested.

This may be an eye-opener to most of us in the US, but to people in places like China, it is an old story. There you can get into serious trouble for writing about certain forbidden topics; possibly you can get into trouble for just searching the Internet for these things. Recently, at the Chinese government's request, Google removed from the Chinese version of its site the ability to return meaningful links to certain search phrases. In other words, if you search (in Chinese or in English) for Tiananmen Square in the Chinese version, Google.cn, you will get very few links as compared with the version of Google we use, Google.com. I can't read or write Chinese, but I can view photos in Chinese, so I put in the query *tiananmen square* in English into both the Google.com site and the Google.cn site with the second search option selected (the image search). Very different photos were produced by the two sites. I will leave it to you to guess which search produced the photos of police battling students or the famous photo of one lone individual standing in front of a tank.

So how do English-speaking Chinese do a Google search at Google.com so as to see "all" the results? Well, they don't do it by typing http://www.google.com into their browser, since no Chinese Internet provider is going to allow them to get to that site. What they need to do is point their browser to one of the many proxy server sites on the Internet (and necessarily ever changing since once they are known, they can be blocked). The point of these proxy server sites is to serve as "pass-throughs" for web page requests so as to mask the true destination of your browsing.

You can find sites on the World Wide Web that will do this for you, or you can download software that does this. Of course, without recommendations, you don't know the safety of such sites; they may be nothing but conduits of spyware. For example the site http://proxify.com/ is a proxy site that promises anonymous surfing without having to download any software. However, I am uncomfortable with it since it does have links at the top for casinos (and how to cheat casinos) and such. Perhaps someone can do some research on this topic and write a full article for the newsletter.

What I did some time back before all the current fuss about Google erupted was to make my own special sort of pseudo proxy server setup for doing Google searches. I did it as a programming exercise, but now it looks as if it might be useful. I created a web service that, when provided with a phrase, would return the html code to the Google search results for that phrase. I then put this service at one of the web sites I have. Next, I wrote a Windows desktop program that would pass such search phrases to this web service and then take the returned html code and place it in a web browser control inside the program so that I could view it. I had to add some code to allow for looking at additional links in addition to those on the first page, etc. What this did was make it look to Google as if the search request was coming from the IP address of wherever the web service was installed—not from my local computer where the Windows program was running.

Of course, to make this of any real use in hiding my Google searching from inquiring eyes, I would need two more things: allow a lot of people to use this program so that I would be just one among many and—very importantly—delete or don't let the web server keep a log of activity. This second item is probably only truly possible if either you do your own web hosting or your web host deletes the server logs after downloading each hosted site's part of the log to the individual site. Otherwise, if Google released the IP address of the requestor for a particular search to anyone with a court order, the people with the court order could then go to the hosting company who owned the IP address Google gave them. They, in turn, would say at the time and date that you are interested in, only one individual who was using the IP address of such-and-such accessed the page in question. Then onto whatever Internet Service provider to which that IP address belonged to find out which of their users had the IP address at that time. And I would be nabbed—for searching for something that the government was interested in knowing about.

So given all that, I believe that if I were truly interested in being anonymous on the Internet, I should use one of the proxy services set up to do just that. But not so fast. What if many of these proxy services are really actually controlled by those people who want to find out where I am surfing? Sort of like one of those police sting operations set up to purchase stolen goods and then eventually arrest all their customers. Think about it. The more you think about it, the more complicated it gets.

On a different sort of Google topic, recall that in the previous newsletter I mentioned that two times I had gotten spyware put on my computer by simply clicking on links provided by a Google search. Of course, being a reasonable person, I did not hold Google responsible in that it had cataloged a web page that contained my search text but also contained some code that provided me with an additional hour of work removing spyware from my computer. Now, many lawyers do not appear to be reasonable people in the way you and I may think of the word reasonable (recall your former lawyer president: "It depends on what you mean by the word is"). So I suppose it is only a matter of time before Google gets sued for not provid-

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Mary Sheridan moderates the discussion.

(Minutes…….Continued from page 2)

Doug Mullis, Secretary; and Mary Sheridan, Member at Large.

John continued the meeting in his new capacity as President by thanking William LaMartin for continuing as our Newsletter Editor. Next he announced that Pepin would be installing gates at entrances and exits. We are to continue using the main gate. Promptly at 7:15 John introduced our presenter of the evening, member Bob LaFave, whose topic was Intel's power point program "Build Your Own Computer".

Bob presented Part I of an intended two-part series specially developed by Intel for computer user groups. The seminar portion presented tonight addressed "Why Build Your Own Computer" and "Where To Buy The Components". Three processors and motherboards were offered with various combinations of video cards, etc. available. PC Club prices were presented which included shipping and Windows XP Home Edition software. Prices ranged from $572 for the "Silver" system to $1947 and up for the "Platinum" system. The intermediate "Gold" system started at $915.

The PC Club web site listed all the options with price increments for your selection to match your needs regardless of chip/motherboard selection. The array is impressive.

At our next meeting we will see who wants to take advantage of this program. Once all components are received, we need to set up Phase II, a supervised 3-hour workshop to assemble our computers. This would be scheduled for other than a regular group meeting.

At this point we took a break for cookies and the sale of door prize tickets for Roxio software to burn CDs and DVDs. Income on ticket sales was $39. The lucky winner was Todd Grubbs with #792714.

After some intermingling, the meeting adjourned at 8:35 pm. Remember to turn in your name tags and tell Bruce what a great job he did. Thank you, Bruce. ◆

what needs to be done.

This is just a tiny slice of what goes into the FACUG spring conference, and from what I've heard in the past, it is well worth the effort. Groups are able to leave the conference with a renewed sense of direction for the individual groups. Better ways to manage each organization, increase membership and please the existing membership are found at the conference and returned to the user groups by the attendees.

Let's make 2006 the best conference ever! Further information can be found at http://www.facug.org ◆

ing a safe computing experience. It certainly didn't provide me one.

To try to keep that from happening again, I download FireFox and now use it for all my Google searches since possibly (I do not know this for a fact) it is not prone to the same sort of spyware attack. I still use Internet Explorer for much of my browsing, though.

Amazon.Com has apparently slipped your mind. Almost no one is using the link at http://www.tpcug.org to do their Amazon purchases—and depriving us of that 5% commission that costs you nothing. Possibly I am wrong: It has not slipped your mind. You are not ordering anything from Amazon, only buying used stuff on eBay. But be warned. Tiffany is suing eBay for promoting fraud. Tiffany ordered 200 supposedly Tiffany items from eBay vendors—three-fourths of them were fake. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

Thanks to Merle Nicholson and Jim Purcell, I have only this small amount of space to fill this month. Keep those articles coming. Mary Sheridan also sent in a short comment about preparing for the recent FACUG meeting for which I had no room. Perhaps she can expand it to include a description of what happened at the meeting for the next newsletter.

It will be nice to hear from Microsoft about the future of Windows. Much of my time at the computer is spent using Microsoft products—mainly Visual Studio 2005 and Office Professional 2003. Most of the rest is devoted to digital photography and Adobe Photoshop CS and Illustrator CS. And when in the future there is space needing to be filled in the newsletter, I will probably be writing about these products. ◆

Minutes of the February Meeting

By Doug Mullis, Secretary, Tampa PC Users Group
dmullis@tampabay.rr.com

Vice President Kevan Sheridan called the meeting to order at 6:35 pm, in the absence of President John Witmer. We had two guests, Rex Miller and Sam Christy, who were welcomed to our meeting. Bruce Register once again assumed the duties of our vacant Membership Chairperson position, handing out name badges and greeting members and guests. Again, we need someone to formally step forward to fill this voluntary position.

Kevan familiarized everyone with the Art Pepin facilities. William LaMartin announced that D. J. Elliott, who spoke to us last October, had passed away. We had planned to have him back to do a follow-up presentation about the history of the Internet. Kevan then turned the meeting over to Member at Large Mary Sheridan to conduct the Windows SIG portion of our meeting.

Mary brought up her desktop on her laptop computer, which she had in tow this evening. Icons filled the screen to Merle's chagrin; however, Mary uses all these programs. Mary's wallpaper, a scene of Mystic, Connecticut, taken by her while on vacation last fall, impressed us, as well as the choice of programs.

Mary went on to call attention to Microsoft's Power Toys for Windows XP, SyncToy and Image Resizer to name a few, and then demonstrated programs. Kevan commented on the value of Google's Gmail, which can only be had by invitation, an offer he extended to members. Kevan would be willing to do another presentation on Gmail at a future meeting.

At 7:05 pm, Kevan started the business portion of

TRAVEL PHOTOGRAPHY IN THE DIGITAL WORLD

By Jim Purcell, Tampa PC Users Group
edward_j_p@msn.com

The *National Geographic Traveler Magazine* scheduled one-day seminars in ten locations in the United States. The seminars are designed to help attendees improve their "travel digital photographs". I attended the first seminar, conducted in the Grosvener Auditorium next to National Geographic Museum in Washington, DC. Dan Westergen[1], the Senior Photo Editor for the *National Geographic Traveler Magazine*, and Ralph Lee Hopkins[2], a contributing photographer, conducted the seminar.

The following are some of the topics that were covered:

WELCOME TO THE DIGITAL WORLD

There was a discussion of the advantages and disadvantages of switching to digital photography. Among the advantages is the ability to have instant feedback instead of waiting for film to be developed. The ability to change the ISO[3] gives you the ability to, in effect, change film at any time you choose. It is easier and more practical to experiment since you can snap as many pictures as you choose with little or no additional expense. The digital darkroom and digital printing offer even more opportunities for experimentation after the picture is taken.

The disadvantages are the cords, cables, memory cards, chargers and batteries that you have to have available. Also there is the need to download your images to a computer or other memory device. Since you normally snap more photos than you did on film, there is the requirement to review and decide whether to print, store or delete. You must decide the resolution needed to meet the requirements of your intended use of the photo. There is a big difference in the resolution and file size required to display on a monitor or TV and that required for prints and enlargements.

CHOOSING AND USING YOUR NEW DIGITAL CAMERA

In their discussion of choosing a digital camera, they divided the selection into luxury point and shoot cameras, compact cameras, bridge cameras and digital single lens reflex cameras.

The luxury point and shoot cameras do have many of the advantages of digital over film but they also have their limitations. Most have a slow lens and limited zoom capability. The slow lens necessitates high ISO, which can create "noise" in the pictures. In summary, the cameras in this category are convenient but limit the capabilities of a serious photographer.

The obvious advantage of the compact camera is that you can easily carry it in a shirt pocket or purse. It provides the ability to always have an affordable camera capable of taking quality photos with you. These cameras, however, have a limited zoom power and small sensing chips. The small chip provides poor high ISO performance.

The bridge camera is more expensive. It can be as expensive as some of the lower end SLR cameras. They have lots of shooting modes, manual overrides, quality lenses; they are easy to carry and have a better zoom capability than the lower cost cameras. Unlike the SLR, the lens is permanently attached so there is no sensor dust. The disadvantages are that the zoom range is limited to the attached lens and the small sensing chip means poor high ISO performance. There was some discussion that Sony has made progress in improving this performance with its new chip.

The digital SLR has all of the advantages of the bridge camera except small size and absence of dust on the sensor. In addition, you can use any lens that you want, which gives you the capability of greater zoom and faster lenses. The larger sensing chip means great high ISO performance. The interchangeable lenses do create a dust problem on the sensor so it does require cleaning. It was clear that, in spite of any disadvantages, the SLR provides far

(Photography…….Continued on page 4)

(Photography……..Continued from page 3)
more capabilities than any of the other type cameras.

CREATIVE TIPS TO IMPROVE YOUR TRAVEL IMAGES

The following tips were given. You might agree or disagree because we all have our own opinions, but I think that they are all worth thinking about:

- Use program icons instead of AUTO for exposure. Use Aperture priority to control depth-of-field. Go deep (F/11 or higher) for depth in landscapes and shallow (F/5.6 or lower) to isolate subjects. Use Shutter priority to control motion blur.
- Switch the ISO setting "Auto" off and preset ISO to 100 or 200. Push to 400 or higher only in low light.
- Preset White Balance to Daylight most of the time. Change to Cloudy for warmer scenes. Experiment with other settings.
- Use the largest JPEG file setting (FINE – LARGE – BEST) with the lowest compression rate, or medium if you don't need the resolution. Use the RAW format for your highest quality projects.
- RAW will not erase your mistakes and is not for everybody (it takes more computer time). JPEG is best for most photographers.
- A good size for a memory card is 512 since all images will fit on a CD. Use multiple cards and protect cards in a protective case or wallet.
- Downloading direct from camera to computer is the slowest. Downloading from a card reader to computer is the fastest.
- To minimize sensor dust when changing lenses, turn the camera power off, point camera body down, avoid windy or dusty conditions and keep caps and camera bag clean.

Workflow, sharing digital travel images, and the digital photographer's camera bag were also covered. Additional information on these seminars can be found at http://www.nationalgeographic.com/traveler/photos/photosem0509/ps.html .

Additional Santa Fe Workshops in photography are conducted at Santa Fe, New Mexico; Tuscany; and San Miguel de Allende, Mexico. Details can be found at http://www.santafeworkshops.com/ .

Footnotes:

1 Dan Westergren
As Senior Photo Editor for *National Geographic Traveler Magazine*, Dan Westergren is responsible for the magazine's photographic vision, which has claimed numerous awards for photography. Dan has also photographed a variety of stories for the magazine. He particularly enjoys cold, high places, having photographed the summits of Mt. Kilimanjaro, Mt. Blanc and the Matterhorn for the pages of *Traveler*. He is also an experienced teacher, having led workshops for National Geographic Expeditions workshops in both Santa Fe and Tuscany. As editorial magazine photography rapidly converts from film-based to digital, Dan is amused to realize that he can edit twice as fast with a computer. But since the photographers tend to shoot twice as many images digitally it all evens out in the end.

2 Ralph Lee Hopkins
Ralph Lee Hopkins travels to the world's wild places as photographer and expedition leader with Lindblad Expeditions, which operates six ships worldwide, including the *National Geographic Endeavour*. He is also the Director of Photo Expeditions for the Lindblad Expeditions/National Geographic alliance. His images are represented by the National Geographic Image Collection and have been published in numerous National Geographic books and special publications. Ralph teaches photography workshops for National Geographic Expeditions, Arizona Highways, and the Santa Fe Workshops. He is also author of the popular guidebooks *Hiking the Southwest's Geology* and *Hiking Colorado's Geology*.

3 The international standard to identify film speed. It has been carried over to digital photography.◆

(minutes……..Continued from page 2)

our meeting by reminding us of the FACUG Spring Conference in Kissimmee Mar 3rd thru 5th. At our last meeting, Bob LaFave presented Intel's "Build Your Own Computer" and offered his assistance to anyone interested in doing so. Bob suggested we check component prices at a couple of Internet sites and determine what we want in a system. P C Club brochures were handed out advertising the packages they offer. Please let us know what you want to do.

At 7:15 pm, Kevan asked Program Director Doug Mullis to introduce our speaker for the evening, Gary Robertson with Metro Crime Prevention of Florida. Gary is a retired police officer from the City of Tampa. He first made us aware that we live in a high crime area and presented some startling statistics to attest to this. The purpose of his talk was to tell us what we can do to avoid being victimized.

Gary addressed three areas for us to take safeguards in, and I have organized them as follows:

Home Security: Make it look like you're home. Use 7-day timers to control lights, radio or TV. Make it difficult for a burglar to get in. Lock windows and doors even when home. Use double deadbolt locks on doors and secondary locks to limit how far a window can be opened. Most break-ins occur during work hours. Post "Beware of Dog" signs even if you don't have a dog. A large water bowl and a conspicu-

Plantronics DSP-400 Foldable PC Headset DSP-400

By Merle Nicholson, Tampa PC Users Group
merle@merlenicholson.com

The Plantronics DSP-400 is a digitally-enhanced foldable stereo headset with microphone with a USB connection for your PC. I bought it to replace two headsets that I was using because the idea of a USB connected headset kind of intrigued me. So I bought one for my son in Colorado, following Doctor Furst's theory of scientific testing. (His full name was Yugo Furst). After a period of testing, I then bought one for myself.

My son and I have been using Gizmo Project for a couple of months to talk over the Internet. Gizmo Project is a VOIP (Voice over IP) all-software telephone using PCs, and a comfortable microphone and headset are needed for extended conversations. I was using an inexpensive mono headset/microphone that connected to the audio in-outs on the PC, and I was also using a good stereo headphone when I wanted to listen to music at my PC without disturbing my spouse. This turned out to be an excellent choice for both purposes.

FIRST, THE CONS: Well, look at the picture. There is an unbelievable amount of cord attached to this thing. About a half meter down from the headset is the volume control, then the USB connector is 2-1/2 meters from the control. You'll notice that there are two bundles of cord where I've used the cable twists (supplied) to gather the excess. The only other improvement I would make is to have the cord come out one side instead of both in the "Y" iPod-style. That may not be possible with a folding set, but with all this cord bulk, and no way to detach any of it, I'm not sure why it's foldable in the first place.

Everything else is good. The aforementioned control down from the headset contains a volume rocker switch and also a very useful microphone mute button. The control has a neat clothing clip and also tends to keep the weight of the rest of the cord off your head.

The sound quality is simply excellent. You have two software controls – an Automatic Gain Control (AGC) and a Bass Boost with Windows XP. The microphone is lightweight and unobtrusive. My son says he talks with the microphone pointing straight up, and I didn't know the difference on my end. I can see why he does this because it gets the microphone completely out of his vision.

Windows doesn't know if you've plugged in a normal headset or speakers to audio connectors, right? It would be nice if it did, but audio is just, well, audio! A USB connected device is automatically detected, and the Operating System should know what your intentions are. This is the case with this headset.

To install this in Windows XP, just plug it in. Win XP (SP2) detects it and, while it's plugged in, kills your normal speaker output and sets your input to this microphone. So there's no software needed. There are no installation instructions – or instructions of any kind that come with this. For the adventuresome or the completely ignorant, no instruction is needed. The rest of us would like to have a one line instruction: "On Windows XP, no installation is needed."

There is an application available from the Plantronics website called "PerSono". It's a small download (5MB) and is yet another system tray application. With it, you can control volume, bass, treble and balance, and it has a speaker test and a button to switch from headset to speakers. For the microphone, it has a mute and a volume control. I've removed the program from the system tray and left the program installed. The user interface is too fussy to suit me. I'd rather have a straight, easy to

understand Windows application. I really don't intend to use it. I found the application while browsing their website for information on this article. Otherwise I'd never known of it.

CONCLUSION: I'm glad I bought it. It combines excellent stereo sound with a quality microphone in a lightweight unit. It connects using USB, a far more convenient connection, and one that is detectable by Windows.

Plantronics DSP-400. $40 from BUY.COM, $79 from Plantronics. ◆

(Minutes…….Continued from page 5)

ous heavy leash hanging nearby add to the illusion. Never hide a key anywhere near your door. Secure sliding doors so they cannot be lifted from their track. Use pin locks that cannot be jarred out. Install a security system with an audible alarm on all windows and doors. The alarm needs to be loud enough to wake you and be heard by your neighbors. Interact with your neighbors so you watch each other's house and call the police when suspicious activity is observed.

Personal Safety: We are most vulnerable when on foot in public parking areas. Be observant but display an air of confidence. Take precautions if things look suspicious to you. "N'er-do-goods" don't like anything that draws attention. Have keys ready before reaching your car. Carry valuables on your person, not in a handbag. This will make it easier to give up a handbag without a struggle if confronted. Carry pepper spray and be ready to use it. Forget mace or stun guns.

Automobile: Never leave your keys in the car even to gas up. Always engage your alarm system. Even if you have an alarm, use "The Club" as the second deterrent. Consider buying an automobile with a manual transmission. Besides getting better gas mileage, most teenagers can't drive them.

Gary concluded his presentation by displaying locks

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

Thanks to Merle Nicholson, I have very little space to fill this month. From his article, it appears that almost free phone service is here. Thanks also to our ever-reliable secretary, Doug Mullis, for this month's minutes and to Mike Hodges, our treasurer, for the yearly financial report we are required by our bylaws to put in the newsletter once a year.

For the second time, I have left an old computer sit unused for some time, only to find that when I did boot it, the hard drive had gone bad. This first happened quite a few years ago when I moved on from a Gateway 166 to a newer computer and put the old Gateway in another room and after some time did nothing with it. I thought I had copied everything I might want from it to the new computer but discovered one day that there was this particular very old Visual Basic project that I didn't

Minutes of the March Meeting

By Doug Mullis, Secretary, Tampa PC Users Group
dmullis@tampabay.rr.com

Member at Large Mary Sheridan started the SIG portion of our meeting at 6:40pm. Mary showed us how to make desktop icons transparent and demonstrated Yahoo's see-thru calendar. Get with Mary if you are interested in installing these features on your PC.

Ed White asked why he has lost Calculator and Notepad from his Accessories menu. No one had an immediate answer.

At about 6:55 pm, Mary launched into the business portion of our meeting as President John Witmer was out of the room. Mike Hodges summarized the FACUG Spring Conference held the weekend before (Mar. 4 & 5). TPCUG had six representatives in attendance. Mary got a round of applause for guiding the FACUG over the past year as President. Vendors were few this year but included Microsoft, Smart Computing, Panda Software and Corel, who all sponsored meals. Lapworks provided carry bags and general sponsors were Chronicles Software, Linspire and User Group Relations.

At the conference, Mike headed up a roundtable on "How Friendly Is Your User Group?" The number one suggestion for making your meetings friendlier was to have nametags. The conference spans a two-day period and many sessions are designed to help the officers run their group.

At this point Mary introduced the TPCUG officers. Merle Nicholson asked that we mention the providers of door prizes at each meeting, as vendors do not provide all. We have some generous members and want to recognize them for providing the interest that door prizes add to our meetings. Mike and I will

(Minutes…….Continued on page 3)

apcug Member of The Association of Personal Computer User Groups

(Minutes……..Continued from page 2)
make sure this is done.

At 7:10 pm, our speaker for the evening, Blain Barton of Microsoft, was introduced. His topics were Windows Vista and Office 12; however, he first told us about Microsoft's Campus Connection program. This is a pilot program for going around to Florida colleges to educate students on current computer technologies. It started at USF and quickly caught on at Miami-Dade. Blain is quite excited about this program that has been in existence for about 18 months.

So, why change to Vista? XP has been around for five years, and many improvements have been incorporated into Windows Vista including better performance and security, improved email service, speech recognition, visual folder stacks, full index searches, fewer reboots and "hangs," and the ability to communicate with "smart phones."

Hardware requirements include a 32 or 64 bit processor with a speed of 3 GHz or better, 1 Gig or more of RAM recommended and a PCI Express or equivalent video card for starters. Recently acquired PCs will most likely be compatible with and upgradeable to Vista.

Blain indicated Windows Vista would hit the market around Thanksgiving of this year (Microsoft has since changed the release to early 2007). Two versions will initially be offered: the Basic Edition for budget users not requiring advanced media support (AERO Glass will not be included in this version); and the Ultimate Edition that will include AERO Glass, pod-casting support renamed by Microsoft as "blogcasting", a game performance tweaker, DVD ripping capabilities and possibly online services for downloadable media. This edition is designed for the high end PC user, gamers, multimedia professionals and PC enthusiasts.

Blain then demonstrated Vista so that we could see the improvements and features of Vista turning Glass on and off. Movie Maker was very impressive. Next he demonstrated the voice recognition capabilities of Office 12 by issuing a variety of commands, which were properly interpreted after several repeats. Then Power Point 2007 was plugged, obviously due for release next year.

Tomorrow's technologies - such as facial recognition, central communications panels, information clustering, collaborative workspaces and radio frequency identification - were mentioned as sneak previews. We watched a short video demonstrating how video conferencing technology of the future could be utilized.

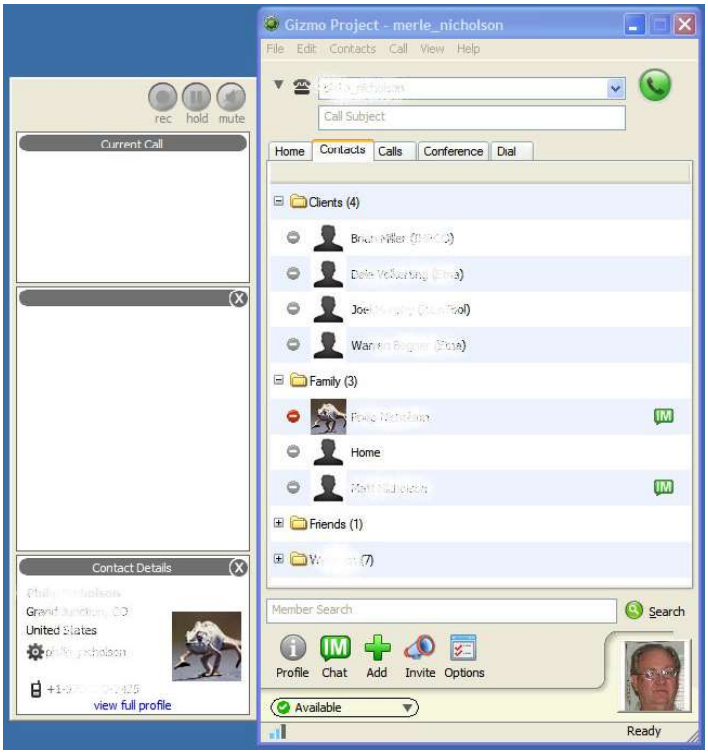
Blain says he will be back in September if we will have him to take up where he left off tonight. Microsoft provided eight door prizes to be raffled off. The winners were:

Adobe Photoshop	won by Gary Ennis
Optical Mouse	won by Todd Grubb
Game Pack	won by Robbie Randall
Game Pack	won by Jim Purcell
X P Book	won by Doug Mullis
Microsoft T Shirt	won by ?
X P Book	won by Bruce Register
Microsoft T Shirt	won by Jim Purcell

We took in $82 on the sale of raffle tickets. Thank you, Microsoft.

The meeting adjourned at 8:40 pm ◆

(Comments……..Continued from page 1)
have. Unfortunately I received some sort of message indicating that the C drive was bad when I booted it, and no amount of Scandisk, etc. would revive it. It turned out that the D drive was also bad.



Well, it has happened to another one of my older computers — a Compaq 333. I bet you thought no none used such things still. I had only used it for two things in the past four or five years: to keep my contacts in Outlook and my finances in Quicken. It was one of my quirks that I liked to keep those two things on a different computer (to my left in my L-shaped desk setup) from my main computer. Also, this com-

(Continued on page 8)

Gizmo Project
VoIP Internet Telephone That Works

By Merle Nicholson, Tampa PC Users Group
merle@merlenicholson.com

Gizmo is a software-only device that allows you to make telephone calls at low cost – or free – from

your PC. You need a computer, broadband internet connection and a headset and microphone. The software is a free download from http://www.gizmoproject.com.

Calls to and from other gizmo users are free. That's free as in unlimited, talk all you want. You can call out from Gizmo to land or mobile phones for $0.01 per minute. That's one cent per minute. You can purchase a local area telephone number for a renewable fee so that land or mobile-based telephones can call your PC as if the PC were just another land phone.

The last two options are fee-based and are called "Call In" and "Call Out". There's a new program similar to "Call In" called "Area775"

I've been using Gizmo since November, 2005, just five months now, and have gotten a lot of very good use from it. One of my sons and I collaborate on software design. We use Windows Remote Assistance to control from my PC in Tampa to his PC in Colorado and connect voice through Gizmo at no cost for hours at a time, a few days every week.

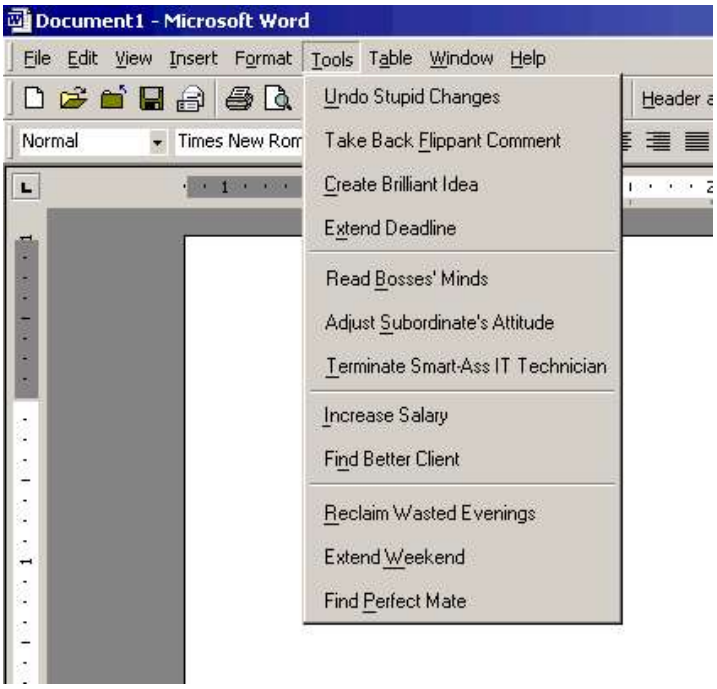
We both use USB-connected Plantronics DSP-400 headsets with boom microphones. This has been our only expense so far at $40 each. I've averaged $1/month in "call-out" fees because I use it to call my clients' land-based phones around the country. That's 100 minutes a month, being all short business-related calls. I sometimes call my sons' cell phones briefly if they're away from their offices and I don't want to tie up our land phone.

The application is a 10MB download from the website. It's well-designed and intuitive to use. It works

(Gizmo……..Continued on page 5)

(Gizmo……..Continued from page 4)

very much like an Instant Messenger (IM) application, except without the advertising. You set up a contact list by either manually entering callout numbers or doing a search for Gizmo users. You can also import contacts from your Outlook or Outlook Express. You can attach an Avatar (it's just a picture) to each if you like, and also set up expandable groups of users.



When you click on a name, a side window pops up with contact information, and you can then click on which number for that person to dial if that person has more than one. There is also a dial pad to just make manual calling. Just as in IM, you can choose to hide your identity and block users. When someone calls, you get a ring and a pop-up that tells you who is calling, and an "answer" button.

Just as in IM, you can set your availability as available, away, do not disturb, and your contacts will see that flagged against your name in their own list. The contact list and options are saved on the Gizmo server. That wasn't obvious until I installed it also on my notebook. After logging in with my user name and password, all my contacts appeared from the server, a very pleasant surprise.

When you dial and it goes unanswered, Gizmo will take a voice message, which is emailed to that person as an attached .wav sound file. You can also record

(Gizmo.....Continued from page 5)

both sides of a conversation, which is saved as a .wav file. Be careful here; the file can get large in a hurry!

There are options to designate ringtones and all the various sounds it uses and a very effective way to designate the sound device. This is handy for me, because I need to switch from speakers to the headset when I use Gizmo. The whole application is nicely configurable. It's one of the best-designed little programs I've seen.

For calling out – that is to a non-Gizmo phone – you draw from a prepaid account. You prepay through a credit card or PayPal. As you use your minutes, the account balance is continuously updated on the home page. If you purchase a Call In number, the cost is $12 for 3 months or $35 per year.

The Gizmo Project website is pretty complete and easy to navigate through. I was disappointed only once, when I was looking for the reason it permanently installed a service called Bonjour Service. There are references to this to be found on the website, and I've been able to determine that it's owned by Apple, and it helps when networking – as on a network, but it presented no compelling reason to have it. I've disabled Bonjour Service in Control Panel, Administrative Tools, Services, to no detriment that I can perceive. I'd prefer that if a program like this installs a service that it start the service and then stop it when not needed instead of running it continuously, just to help manage the "startup bloat" that plagues everyone.

My youngest son in Seattle set up Gizmo to use while he is in India. He bought a "Call In" Seattle area code number to use so he can be called from within the US. But so far it hasn't worked out. His hotel and workplace are apparently blocking the IP Port it uses. He'll try it other places while he's there. We did try it all out before he left Seattle; I called him by Gizmo, and also his "Call In" number and it worked just fine. He uses a notebook computer, with just some lightweight ear plug speakers, and the notebook has a built-in microphone. I had to remind him not to swivel his head while talking to the fixed-location microphone, but otherwise it worked just fine. As an aside, there is a similar, competing VoIP service called Skype, and he

has called us using it from India from his computer. The results are excellent.

The connection almost all the time is as clear as land-based telephones, and although it does drop out on us sometimes, I consider it more reliable than cell phones. In any case, when a dropout does occur, we disconnect and reestablish in just seconds. As far as communicating, there is somewhat of a lack of "full duplex" where if you both talk at the same time, something is lost. But I think it's still superior to cell phones in that regard, although somewhat less in quality compared to land-based telephones.

All-in-all, I've been very pleased with this and plan to continue to use it. It does save me money, but I think most importantly it provides free voice communication to other people while I'm on my computer. I've never thought of using it for normal conversations, but I can see how it would be especially useful to someone who has "gone mobile" – given up their landlines for exclusive mobile phone use. ◆

puter had windows Me on it, and that allowed me to use it to answer questions about that operating system when someone occasionally asked.

When I got my recent Merle-built computer, I started using Quicken on it, and several weeks ago I moved all my Outlook data to the new computer, too, and didn't try to start the old Compaq again until yesterday.

Somehow sitting idle for several weeks seems to have trashed the C drive such that there appears to be nothing in the System32 folder of Windows and nothing will repair the problem. I can boot with a startup disk and view all the drive except that directory. The D drive, where I kept my data, is still good so that I can remove it and put it in another computer if needed. Or I can buy one of those USB drive enclosures and put it in there. But I think I had already copied all of the data to two of my other computers long ago. So it appears to be the old story of use it or lose it. ◆

lamartin@tampabay.rr.com

As mentioned last month, I had an old computer's main hard drive fail on me and thought I might buy a USB drive enclosure, put the drive in it and see what data I could rescue. Well, I did just that, buying one for $29 with in-store rebate at COMPUSA. The case was real flimsy (what do you expect for $29), but it worked flawlessly.

I have a Netcom (now owned by EarthLink) email account that I have had for many years. I don't get rid of it because it is a dial-up account and handy for travel—but less handy now that so many hotels provide free—or cheap—wireless connections. Also, it is the account I used when I set up all my early Internet domains and web hosting accounts. Anyway, recently it started asking me for my username and password. That happens occasionally with all my accounts. Normally you just

Minutes of the April Meeting

By Doug Mullis, Secretary, Tampa PC Users Group
dmullis@tampabay.rr.com

Member at Large Mary Sheridan started the SIG portion of our meeting at 6:40 pm. She announced that Nancy Cottrell's mother passed away on Apr. 11th at the age of 94. Nancy and her brother are making funeral arrangements at this time. We offer our condolences to Nancy and family.

Mary served as our "Greeter" this evening as Bruce Register and his wife are celebrating their 48th wedding anniversary with a night on the town. We wish you two many more! Guests this evening included Joseph and Ewana Weaver, Debbie Whittaker and Tim Kearns. Please return and join our group.

Mary asked who needed membership cards, as it has been several months since new ones were distributed. Also, if you need a nametag, email Mary at mcpeace@mindspring.com. If you have taken your name tag home, please remember to bring it back.

Mary announced that Microsoft is releasing Office 2007 in several suites, but that the prices are high. Office Basic only comes as an OEM and includes Word, Excel and Outlook. Office Home & Student will sell for $149 and includes Word, Excel, OneNote and PowerPoint. Office Standard will include Word, Excel, Outlook and PowerPoint, selling for $399, or $239 as an upgrade. Office Small Business is offered for $449, or $279 as an upgrade and includes Word, Excel, OneNote, PowerPoint, Outlook w/Business Contact Manager and Publisher. Office Professional Plus will only be available through multiple licensing.

Mary turned the meeting over to our president, John Witmer, who gave a PowerPoint presentation

Presenting Genealogy on an Autorun CD

By Merrill Friend, Tampa PC Users Group
mpf1719@verizon.net

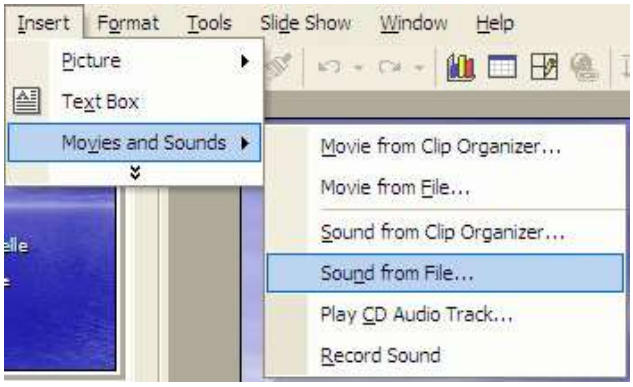
There are many ways of presenting genealogy information to family members, and I wanted to give them all a CD which would automatically run in their individual computers. I wanted a CD which would provide a copy of the family tree as well as comments about individual idiosyncrasies and well-known quotations of some family members no longer with us. It would be a lot of information. So much so that I decided to break the information down into four separate presentations. This helped separate subject material and the smaller presentations loaded more rapidly than one large presentation.

These presentations are listed below:

- Family Genealogy
- Family Photographs
- More Family Photographs
- Supporting Genealogy

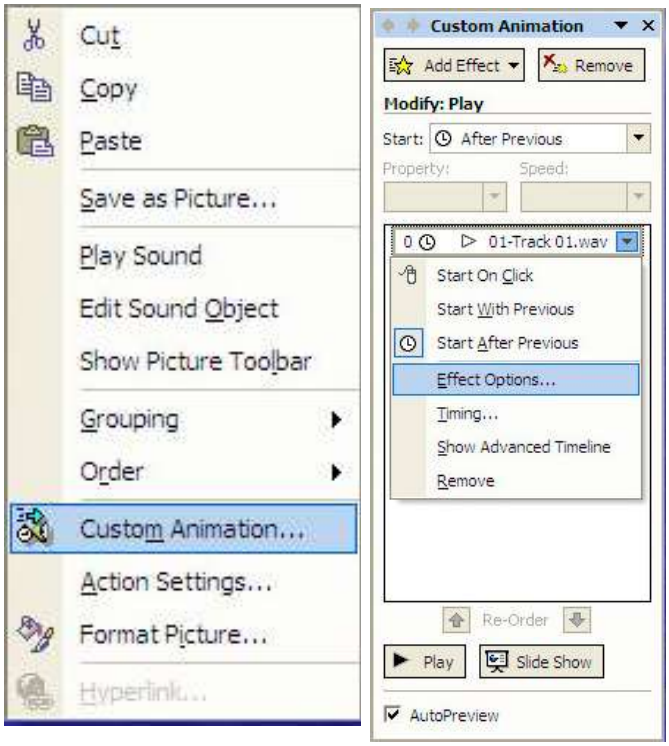
The Supporting Genealogy contains copies of census forms, book pages, letters, genealogy notes written by long-deceased ancestors about family and the politics of the day, and similar data.

I also wanted to do this in plain English that all could easily read and understand without the need for special genealogy software, which ordinary word processing programs cannot understand. The specialized programs are very valuable when assembling information and understanding our relationships with each other but this wasn't what I had in mind for my CD.



I decided to see what could be accomplished using Microsoft's PowerPoint software since later versions make it possible for this program to be prepared with a PowerPoint viewer, allowing users to run the CD even if they do not have the PowerPoint program on their computer.

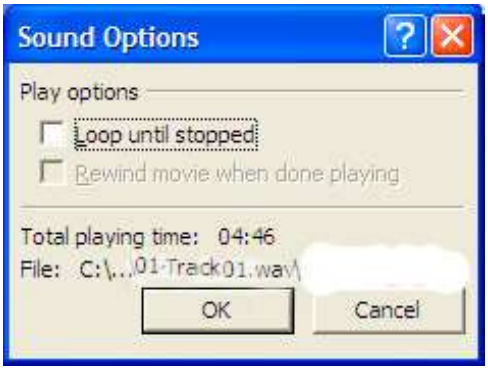
Finally, I wanted appropriate music to play automatically through all four presentations, with different music for each presentation. I did not want anyone to have to click on a music icon to accomplish this. I wanted the music to change as each presentation was pulled up. I found that all this could be accomplished with PowerPoint.



I began my project research on the internet, where I found information on preparing a *PowerPoint Autorun CD* by Echo Swinford, which was exactly what I wanted. That website is found at http://www.indezine.com/products/powerpoint/ppautorunviewer.html. They also have information on *Sound Across Slides* which was most helpful. I also found a similar Microsoft article entitled, *How to play music or sounds across multiple slides in PowerPoint 2002,* which, along with the Indezine article, put everything in perspective.

At this point I had already done all the heavy genealogical research. Also, the PowerPoint slides were ready. Now I needed to make it all work as desired.

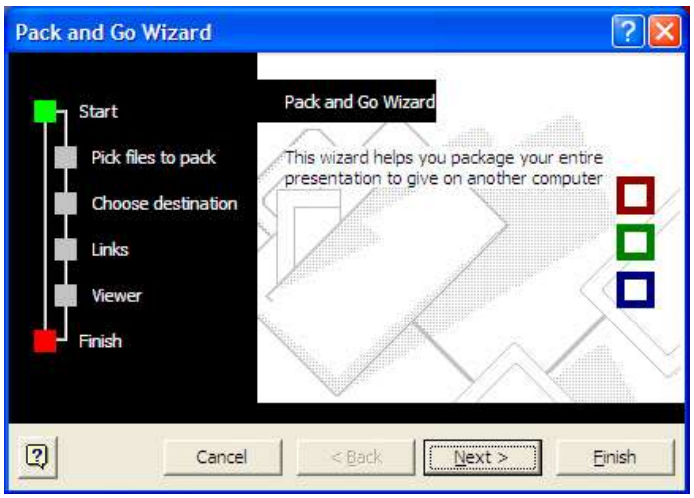
The first item was to set up my music files for each presentation. Select Insert, Movies and Sounds, then Sound from File. When "Sound from File" is selected, your sound files will appear. When one is selected, you will be asked if you want that file to run automatically. Select "yes." Then right click on the sound icon on your screen and the options, including "Custom Animation," will appear. Select "Custom Animation," and the Custom Animation screen will appear. Select the track you want to play, and the next menu contains "Effect Options" as an available choice. Select "Effect Options" and the Play Sound screen appears. The Stop Playing option will be open. Change it to stop playing after 999 slides.



(Genealogy……..Continued on page 4)

(Genealogy……Continued from page 3)

Now close the Custom Animation window and right click on the sound icon again, and the resulting menu will offer the option of playing the music in a loop until stopped. Check the "Loop until stopped" option. It will then restart as often as needed. On my machine there is about a seven second delay when a song ends before it restarts.

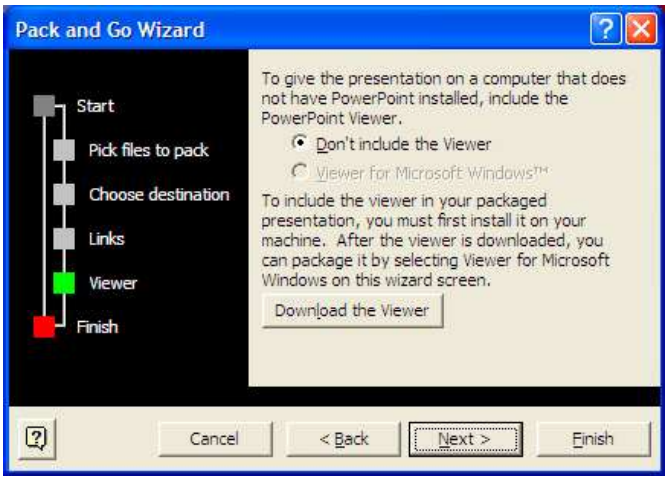


If the sound icon disturbs you, it can be moved out of the way to the side, and the sound will play just the same. Save a copy of the file and run it to be certain it works properly. If the copy works fine, the original can now be saved. This illustration shows the procedure with a single presentation. If there are several presentations, the sound will have to be set up separately in each, and each will have a separate music track. When all are done, we can proceed to packaging all presentations together.

Packaging the Presentation(s) and Preparing the Autorun CD.

I am working with PowerPoint's 2002 version. The 2003 version is less work since the old "Pack and Go" product is eliminated and replaced by a "Package for CD" product. To make the 2002 product do the job, I needed to download from Microsoft the 2003 "viewer" for the 2002 product. With that viewer in my possession I was able proceed as follows:

With PowerPoint on the first slide of the first presentation, click on "File" and "Pack and Go" and the following image will appear.



You will pick the files to pack, choose a destination folder to keep them in, and link all the music together. **If there are 3 or more presentations with separate music for each, you must highlight all linked presentations other than the first presentation and make only one selection**. If all are highlighted, it will work. It will not work if they are selected individually. The software allows only one selection of ALL presentations to be linked. You will be given an opportunity to use the "Pack and Go" viewer. Do not download this viewer. Select the option "Don't include the viewer" and proceed to finish the package.

(Genealogy……Continued on page 5)

(Genealogy…….Continued from page 4)

See image below:

Pack and Go will give you two files, PNGSETUP.EXE and Prez0.ppz. Double click PNGSETUP and unpack the Pack and Go files.

There are seven files in the 2003 viewer you downloaded which you now need to copy and place in the folder with the unpacked Pack and Go files. I had mine in C:\Program\Microsoft Office\Powerpoint viewer.

These files are: gdiplus.dll, intidate.dll, ppview.exe, ppvwintl.dll, pvreadme.htm, saext.dll, and unicows.dll.

My packaged product ended up looking like this:

(Genealogy…….Continued on page 6)

Internet Picture of the Month

Price of Gasoline in NYC July 2, 1936

From the New York Public Library site at http://www.nypl.org/. The specific page for this photo is http://www.nypl.org/research/chss/spe/art/photo/abbottex/cny0840.html. By the way, $.11 gas + $.04 Tax = $.15/gal in 1936 is roughly equal to $2.10/gal now.

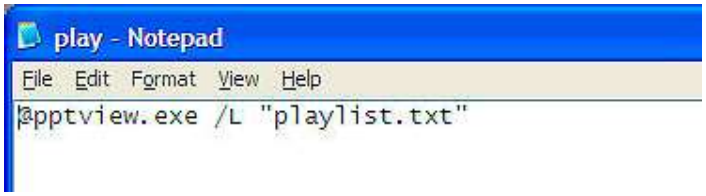
Some of these links will join the many already on the Links page at our web site, where you need only click on the name.

(Genealogy.....Continued from page 5)



There are three additional files which must be created or modified. They are Autorun.inf, playlist.txt and Play.bat. Pack and Go creates a file called playlist.LST. That file must be changed to a text file in Notepad. When opened the LST file will look similar to this: /s "SamplePresentation.ppt." The Indezine material explained that the "s" indicated the presentation would begin with a splash screen and the /s should be removed. They also indicated the name or names of the presentations should not be in quotation marks. The final playlist.txt file, the Autorun.inf file, and the play.bat files are shown below after their creation in the Notepad.

I learned that the /L tells the new viewer to read the playlist which is in playlist.txt. The file is saved as Autorun.inf. Finally, a batch file was created to start the whole thing and it was also created in Notepad and looks as follows:

To test the work click on the Play (batch) file. If all was done correctly it should work. Then this folder of files may be burned to a CD. They should be loose on

the CD and not inside a folder.

I was pleased with the results. It suited my purposes and I have enjoyed sharing this material with my relatives and I like to think they enjoyed it also. Geneaology is an ongoing process. I have since learned of additional information which should be added to my family tree so future revisions of this CD are planned.

The final face pages of two of the four presentations are illustrated. ◆

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Mary Sheridan moderates the discussion.

(Minutes…….Continued from page 2)

brought back from the FACUG Spring Conference. The title is "Power Zappers," originally given by Carl Lofstrom, which suggests ways to troubleshoot and speed up your PC. John went through the presentation. We have seen many of the suggestions before, and a number of comments were offered by Bob LaFave and other members. Let John know if you would like a copy of this package. You can reach John at president@tpcug.org

At this point we went into an abbreviated business meeting. Mary introduced the officers and suggested dues payments to Treasurer Mike Hodges. Copies of the newsletter were distributed to guests. Next month's speaker will be our vice-president, Kevan Sheridan, on Airset online calendar. John reminded attendees to register/check info on the sign in sheet.

At 7:10 pm, Mary introduced our speaker for the evening, her daughter, Michelle Holminsky, and her husband, Jay, to tell us all about eBay. Michelle said first bring up the eBay home page and register. This sets up your account with a user name and password. Next peruse the site and determine what you want to do. Choices include Buy, Sell, My eBay, Community and Help. My eBay is my favorite. Specialty sites include eBay Express, eBay Motors, eBay Stores, Live Auctions, Reviews and Guides, Want it Now and eBay Business.

There are some charges for listing items for sale. There is an Insertion Fee, which ranges from $.20 for items under $1 to $4.80 for items valued over $500. There is a Picture Fee of $.15 per picture; however, the first is free. And then there is the Final Value Fee, which is 5.25% of the selling price. You need also to figure what it is going to cost you to ship the item. I usually use $ 4.00 to cover anywhere within the U.S. But you can get actual postal fees, which you include in your asking price. You also need to set a cut off date/time for your item. You also will want to set a minimum bid amount, state the condition of the item and include a picture.

Michelle showed us an ad for a pair of children's play shoes she had placed with a cut-off time during her presentation at the meeting. She had hoped to show the flurry of last minute bidding that usually occurs, but alas, there were no bidders. Apparently all children are well-heeled at this time. She said that around Christmas things are a lot more active and bid prices rise.

Michelle and Jay answered many questions our members had about payment methods, seller ratings and experiences with eBay. We all learned how to get rid of our treasures and make a little money without leaving home. Thank you, Michelle and Jay.

We took a short break for refreshments and then concluded the meeting at about 8:30 pm. There were no door prizes this evening. Members were reminded to leave their nametags and to return any they have at the next meeting. ◆

wait a few minutes—or hours—and then everything will be OK. Not so this time.

I finally contacted EarthLink via an online chat. To make a fairly long story short, my password had been changed from one I had used since 1995 to the word "petlura." I didn't make the change, although Earthlink assured me that it had to be me or someone to whom I had given my information.

I know a bit about email servers, databases and programming, and I am pretty sure that the change was made by something EarthLink did. However, we will never know. I suspect they were making a password change for another client of Ukrainian heritage, and it got applied to my account instead. Why Ukrainian? Do a Google search on the word petlura. It is not exactly a random collection of letters.

I purchased the latest version of Street Atlas USA and, for our web site placing second in the FACUG contest, received a copy of Streets and Trips. I'll perhaps compare the two next month. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

With the arrival of hurricane season this month, I have some thoughts prompted by a recent trip to New Orleans and the Mississippi Gulf Coast. In 2004, each of four hurricanes at one time was predicted to pass right over Tampa. Our luck was that two missed us completely and the other two only slightly brushed Tampa. Even though our house is less than two blocks from Hillsborough Bay, we did not evacuate for any of the storms. After seeing the Mississippi Gulf Coast, if anything approaching the size of Katrina heads this way, you will probably find us heading for the hills, wherever that is in Florida.

I drove about 35 miles along the coast, from a dot on the map called Lakeshore to Biloxi—a distance of about 35 miles, not counting the detour to the interstate and back to the coast road

Member at Large, Mary Sheridan started the Windows SIG portion of our meeting at 6:35 p.m. in the Pepin Training Room. Mary asked how she could stop Corel from auto playing pictures when she loads her CD ROM? Merle suggested she go to My Computer, click CD ROM drive, then right click Properties, then reset Auto Play.

Mary went on to tell us if you ever have to reinstall Windows XP, you normally have to reactivate Service Pack 2. Now you can just copy WPA.dbl in Windows System 32. Also you can get a screen keyboard by clicking START, RUN and type OSK. Both are useful little things to know.

Mary introduced our guests, Sam Christy and Deborah Whittaker, then our group officers. She turned the meeting over to our president, John Witmer, for the business portion.

John announced that the Digital Imaging SIG would be taking a break for the summer and will reconvene in September. We still have openings for presenters at our July and October meetings. John asked the audience what they would be interested in having presented. Two suggestions were Macromedia Flash and Power Point. We will attempt to find presenters for these programs.

Programs already set up for presentation this year include: In June Merle Nicholson will present "The Anatomy of a Modern Computer". In August Liz Mueller will tell us what is available at the Public Library System. In September Blain Barton will be back to tell us more about Windows Vista. In November Steve Singer of RDI will tell us about the latest computer hardware to hit the market. December will be our Christmas party AND Marcy Gunn of Smart Computing will be back.

John announced that our web master, William LaMartin, distinguished himself and our group by placing second with our website in the FACUG competition this year.

Mapping Programs: Street Atlas 2006 and Streets & Trips 2006

By William LaMartin, Editor,
Tampa PC Users Group
lamartin@tampabay.rr.com

I recently purchased Delorme's Street Atlas USA 2006. And I recently received a free copy of Microsoft Streets & Trips 2006 with GPS Locator. I want to compare the programs as best I can. It will be a bit hard to do a fair comparison, since I have owned Street Atlas USA since version 1, which, I think, was before 1993. I wrote an article for the newsletter about version 5 in 1998 (http://www.tpcug.org/newsletter/nl_1998/January1998/street_atlas_5.html). And this is my first use of Streets and Trips.

As to prices, Street Atlas USA 2006 is $34.99 from Amazon, and Streets & Trips is $35.99 from Amazon. If you want a GPS unit with your program, Microsoft Streets and Trips 2006 with GPS locator is $99.99 from Amazon, and Delorme is selling its Earthmate GPS LT-20 with Street Atlas USA 2006 for $99.95. The Delorme products used to be more expensive, but now appear to be about equal in price to those from Microsoft. However, I have seen the Streets & Trips with GPS locator on sale for as low as $79.99.

I think this sort of software serves three purposes:

- Planning a trip by finding the best route before you ever leave the house
- With the use of a GPS unit, tracking your route in real time accompanied by directional instructions ("turn left at the next intersection")
- Just simple browsing of maps to familiarize yourself with an area.

Both programs do these things quite well. The differences are in the interfaces and the depth and accuracy of the information provided — for example, businesses, points of interest, etc. along a route or on a street.

As to the mapping data, I personally found no streets I looked for missing in either program. I have read where other individuals found things missing and had routes planned that sent them along dirt roads out West for parts of their trips when they asked for the shortest route. I am sure with all the roads in the US that things like that will occasionally happen. In fact, I am amazed at how well all of this mapping stuff works—especially the routing part along with the GPS.

What I did find lacking was up-to-date construction information. Streets & Trips has a feature under Routing that allows you to download the latest road construction information. Street Atlas used to have this feature, but I can no longer find it in the program or mention of it in their product description. They do provide phone numbers and websites for the various individual state sources of such information, which is not all that useful.

To check out the accuracy of the construction information I had just downloaded from Streets & Trips, I asked for a route between Bay St. Louis and Pass Christian, Mississippi, two towns just across a Hwy 90 bridge from each other. The bridge has not been there since Katrina. But, as I suspected, Streets & Trips routed me right across the missing bridge. Of course, Street Atlas did the same since it didn't have any possibility of incorporating up-to-date information.

Then there are the points of interest (POI). Both programs give you the ability to display certain types of POIs: restaurants, lodging, landmarks, parks, various businesses, etc. If you zoom in close enough, they will automatically display on each program's maps. Or if you select a location, you can find all of such a type within a certain distance of some central point. Streets & Trips gives you more choice in the type of things to display, even going so far as to break the restaurants down as to type—seafood, Chinese, etc. What I did find strange, though, was that in Streets & Trips, there were no churches displayed on the map and no POI item to check to put them there. They do have an item to show all casinos. In Street Atlas, under minor POI, you get the churches displayed. Neither of the items are usually important to me, since I don't attend church or gamble, but in recording the

(Mapping…….Continued on page 4)

(Mapping……..Continued from page 3)
location of my photos on the Gulf Coast recently, it was important to know the location of certain churches I had photographed.

Street Atlas and Streets & Trips both marked restaurants and lodgings well, but only Streets & Trips marked the gas stations.

In starting off, Street Atlas had the edge in ease of use since I had used it for so many years. I might add that I have never liked its interface. For example, if I want to copy a map to the clipboard, I have to click on the Print tab and then click on an icon in the lower right-hand corner of that window at the bottom of the screen. In contrast, the Street & Trips interface is like a usual Microsoft Windows program. To copy the map to the clipboard, you click on the Edit menu item and then click on Copy Map—just as in any other Windows program.

However, for scrolling the map, I prefer Street Atlas, where to move to the right you simply click near the right-hand edge, the cursor turns into a hand and you pull the map to the left. In Streets & Trips, you again position your cursor close to the right edge, the cursor turns into an arrow, and when you click, your position moves to the right. Not difficult but allowing less control than the hand method of Street Atlas.

Another feature I like in Street Atlas is that when you hover the cursor over a map item, you get a description in a status bar near the bottom. To get the same sort of information in Streets & trips, you need to actually click on the spot.

As a test of routing, I had both programs create a route from my home in Tampa to my hotel in New Orleans, and both came up with the same route and the same length within four tenths of a mile at around 657 miles. As to driving times, that all depends on what preferences you have set in each program. It was 11 hours and 18 minutes using the default settings for Street Atlas and 11 hours and 4 minutes using the default settings for Streets & Trips.

Both programs allow you to create maps for the Pocket PC. But here is where the Microsoft program I have, Streets & Trips 2006 with GPS Locator, comes out ahead. The PDA version of the program, Pocket Streets, is provided free with it. As best I can tell, to get the Delorme PDA program, Street Atlas USA Handheld, you have to purchase it separately for $39.00.

Needless to say, I am using Pocket Streets on my HP iPaq Pocket PC. In addition to creating maps in the regular version of the program for the Pocket PC, you can go to a Microsoft website for such and download maps of popular areas, e.g., Manhattan. But if you want one of Manhattan above 79th St., the Bronx or Queens, you will have to create it in the regular version of the program and export it to your handheld device. However, this is very easy to do.

So now I have a map of any part of the USA I choose on my Pocket PC. I can browse the map, zoom out or zoom into street level. I can also search for places or by address. But what if I want to use that GPS unit that also came with the program. It came only with a USB cable, and that won't connect to a Pocket PC. The solution—spend $99 for what is called a Bluetooth cradle for the GPS unit. It increases the total size of the unit very little and has a battery life of about six hours. The GPS partially inserted into the Bluetooth cradle is pictured below.

The programs are basically equivalent, unless you also need the Pocket PC version. ◆

(Comments……..Continued from page 1)

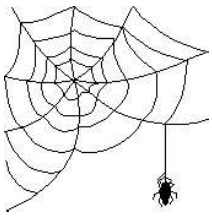
because of a missing bridge at Bay St Louis. And there was essentially nothing two to three blocks in from the Gulf—nothing. The slate had been wiped clean except for the remaining trees, a few foundations, steel or concrete frames of buildings, and less than a dozen heavily damaged structures. No homes, restaurants, gas stations, or hotels. Near Biloxi there was a bit more to see. The large casino hotels (in various states of repair) were still standing, along with the heavily damaged Jefferson Davis home and a few other structures. That is what 30 feet of tidal waves will do.

New Orleans is a different matter. In general, anything in the city within a mile or so of the river was OK for this was naturally "high" land. But the rest of the city up to within a few blocks of Lake Ponchatrain (again "high" land) flooded anywhere from one foot to 15 feet. Being fairly familiar with the city, I drove around for quite a few hours over a couple of days and saw mile upon mile of deserted houses. The houses were still standing but abandoned, with dead shrubbery and waist-high weeds in the yards. This could be anywhere from 25% to 50% of the city.

What does this have to do with computers? Well, if your computer data was within a few blocks of the Gulf and you didn't take it with you—it is gone. Similarly for much of New Orleans, if it was on the first floor of your house, it is also gone.

I took 600 digital photos with my Nikon D100 on this trip, and, since there were no other contributions to the newsletter this month besides the minutes, in another article in this newsletter I will describe how I used mapping with GPS and some programming to record the positions of the photographs. ◆

Internet Picture of the Month



Florida Airplant

Tillandsia x floridana, commonly known as the Florida Airplant, from the Institute of Systematic Botany at USF's site, http://www.plantatlas.usf.edu., A wonderful site if you are interested in Florida plants. I grew up with this plant, as it was all over the property my family owned in South Central Florida.

Photography, GPS Mapping and Programming

By William LaMartin, Editor,
Tampa PC Users Group
lamartin@tampabay.rr.com

I have longed wished for an easy way to record data about a photo when I take it. Digital cameras now record all the technical stuff—shutter speed, f/stop, lens focal length, the date and time and much more. But they do not tell you the location. With Pocket Streets on my Pocket PC and my Bluetooth enabled GPS unit, I could sort of do this. Every time I took a photo, I could then pause and put a push pin where the GPS indicated I was on the map. I could even enter in text for the pin. This would create a map with a collection of push pins at the photo locations with perhaps numbers associated with each pin to tell the order of their creation. In practice, this can be quite challenging with the sun shining on the screen and the general difficulty of writing anything on the Pocket PC under less than perfect conditions.

What I really wanted was a program that would, with the push of a button on the Pocket PC, record the current Date/Time, latitude and longitude to a file. How to get such a program? Write one, of course, using Visual Studio 2005. I had already written a number of programs for this device, so this shouldn't be too big of a problem once I figured out how to communicate with the Bluetooth GPS from my program.

Well, it turns out that the Bluetooth connection between the Pocket PC and a Bluetooth device is made via a pseudo serial port on the Pocket PC. In the case of my GPS unit, it was comm 6. After determining that, things got a bit more difficult since Visual Basic for the compact framework (what you use to program for things like the Pocket PC or smart phones) has no built –in ability to program against serial ports, unlike Visual Basic for the .Net framework used for writing programs for regular Windows devices such as your desktop computer. Not desiring to try to figure out serial communication, I did a search on Google and found one fellow who had written a component (a DLL) that I could drop into my program for free that would do the serial communication for me. With that component, I could now access the stream of data the GPS unit was receiving from the satellites.

The data coming in over the port looks like this:

,87,0*4F
$GPGSV,3,3,10,1,23,276,0,135,26,248,25*41
$GPRMC,205054.672,A,2756.1063,N,08228.1373,W,0.073
604,64.79,100506,,*28
$GPGGA,205055.672,2756.1061,N,08228.1371,W,2,04,2.1,
-21.1,M,-29.7,M,2.3,0000*5B
$GPGLL,2756.1061,N,08228.1371,W,205055.672,A*26

If you look at the GPS specification, all those "sentences" that begin with $ signs have a meaning. You can get various GPS information from different ones with an overlap in the information. In particular I am interested in either the $GPGGA sentence or the $GPGLL sentence. In our particular example, the $GPGLL sentence yields: 2756.1061,N,08228.1371,W,205055.672,A*26, which parses out as 27 degrees, 56.1016 minutes N Latitude, 82 degrees, 28.1371 minutes W Longitude and 20 hours, 50 minutes and 55.672 seconds UTC time

My program stores this sort of information in a text file each time I press a button on the Pocket PC. When I get back to my computer, I can retrieve the file from the Pocket PC and then import the latitude and longitude part of the information into either Street Atlas or Streets & Trips to produce a map like the one here.

I also note that the time information in the file can be correlated with time information recorded by the camera for

Special Interest Groups

Microsoft Access SIG

This SIG meets the **first Tuesday** of the month at 6:30 PM. The meeting location varies. For information contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merle@merlenicholson.com.*

Digital Imaging SIG—Cancelled until the Fall

This SIG meets the **fourth Monday** of the month at Pepin Distributors at 6:30 PM. For information contact Mary Sheridan at *mcpease@mindspring.com*.

Visual Basic for Applications SIG

This SIG meets the **third Wednesday** of the month at 6:30 PM. The meeting location varies. For information contact William LaMartin at *lamartin@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Mary Sheridan moderates the discussion.

(Minutes……..Continued from page 2)

The prize was Microsoft Streets and Trips software that can interface with a GPS system through a USB or Blue tooth connection to your laptop. The unit works well, giving a location update every second or so.

Longstanding member Bruce Register announced that on May 22nd, he and his wife, Marie, would relocate to Dothan, Alabama. The Group offers our best wishes to them in their new home, and thanks Bruce for 15 years of service and support to our group. I remember the warm reception you gave me at my first meeting three years ago. Thanks for being our "Greeter" at recent meetings. We will surely miss your presence at our meetings, and we look forward to future visits when you are back in the Tampa area.

At the inquiry of a member regarding computer security, Merle recommended that we protect our PC's with a single good firewall and anti virus program, but supplement them with other types of "free ware" offered (Ad aware, spybot, windows Defender).

Next month your secretary will be in Lido Beach at meeting time. We need someone to take meeting minutes for the record.

At 7:30 p.m., John introduced our own Kevan Sheridan to tell us about the benefits of using a shareable online calendar to keep our busy schedules organized and available to those who need to know. There are several online calendars, including Google and Yahoo Group but Kevan prefers Air Set at http://www.AirSet.com/public/ calendars.

It is free, and there is no advertising. Air Set also has an "announcements" feature and can "sync" with other public calendar events. For $5 per month you can "browse" online calendars with your Bluetooth cell phone.

Kevan demonstrated his office calendar and the SWAMP (Southwestern Association of Mountain Bike Peddlers) calendar. At the office you can coordinate vacation schedules in conjunction with important meetings/events, limiting access as needed. Events are blocked in half-hour intervals. Public calendars are excellent where the general public would be welcomed to association events.

Kevan went on to answer many attendee questions about administering/using shared calendars. Thank you, Kevan, for the informative presentation.

At 8:35 p.m., we broke for cookies and the distribution of door prize tickets. Group member subscriptions to Smart Computing Magazine had earned the prizes. William LaMartin also donated a copy of Drive Image and eight CD's as "giveaways".

Door Prize winners were:

- John Witmer — A Smart Computing Magazine subscription
- Bob Davis — A publication from Smart Computing
- Jim Purcell — A publication from Smart Computing
- Ron Weinburg — A publication from Smart Computing

We thank Smart Computing for the prizes; the Group earned $19 as a result of the prizes.

The meeting concluded at 8:45pm. ◆

each photo—if you think ahead and synchronize your camera's and your Pocket PC's time.

The previous map is of one of my photo-taking walks around the French Quarter in New Orleans.

Once I have the location information, I can then use the File Browser feature of Adobe Photoshop to enter a description into the metadata of the file such as "balcony in the 1100 block of Decatur." This information is now part of the jpeg file.

Suppose I now want to create a slide show of a selection of these photos. To accomplish that, I wrote another Visual Basic .Net program to extract this description metadata from each file and then place each file name, description, and data/time in a database. Next the photo files and the database (really an XML file) are uploaded to my web site, where previously developed ASP.Net code is used to display the photos in a slide show with a description under each photo.

To see the results of all this, go to http://www.lamartin.com/katrina.htm. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

Thanks to Doug, Merle and Larry, I have only a little space to fill this month.

Bad Mouse For the past two months, my computer has been freezing occasionally, and recently it got much more frequent. Except for one time, it would freeze when I was doing something with the mouse like resizing a window. When that happened three times in one day, I had had enough. I replaced the Microsoft Wireless IntelliMouse with an old Logitech TrackMan Marble that connects via a PS/2 socket. It has now been three days with no lockup. So I believe the mouse was the problem. It is nice to have a simple solution.

Printing Panoramas As you know, I have an interest in photography and also old photographs. In the past year, I was able

Minutes of the June Meeting

By Doug Mullis, Secretary, Tampa PC Users Group
dmullis@tampabay.rr.com

Bob LaFave started the Windows SIG portion of our meeting at 6:35 pm. A member asked why he was unable to retrieve email that had attachments. Bob said they are normally stored in a master email file or possibly are going to the Recycle Bin. William LaMartin suggested checking the MSN email settings for the handling of email.

Another member asked why he should have a UPS protecting his computer. Ed White pointed out that TECO is notorious for short power interruptions. Bob added that our lightning season is just beginning. Power-conditioning to smooth voltage variations and eliminating other "noise" is another reason. Bob suggested not putting a power strip between your UPS and your protected devices. Merle added that if you must use a power strip, use one that does not have a surge suppressor. Bob also said to connect your Internet modem but not your printer to the UPS and to make sure there is good air circulation around all electronic devices.

Bob asked if anyone was interested in a session on backing up the hard drive on their system. A couple of members had indicated they wanted this; so let Bob know if you are interested.

Next someone asked what anti-virus and anti-spyware will work on 64-bit systems. Bob responded that all major brand software and most others should work, but that if he were talking about Windows Vista, nothing is available at this time. Windows Defender will be included as part of the Vista operating system for protection.

At 7:00 pm, Bob turned the meeting over to presi-

Canon Selphy CP510 Photo Printer

By Merle Nicholson, Tampa PC Users Group
merle@merlenicholson.com

This is a little photo printer that just does small 4x6 photos – that's it, and it does it well and relatively inexpensively. It uses dye sublimation to lay down the image, and it's virtually indistinguishable from commercial printing.

Dye sublimation is the process of choice for high-end color printing in the commercial world, especially for glossy magazine work. In the case of this little printer, it has a wide semi-transparent spool of film that is laid down on the paper in three passes and then lays down a gloss coat as the last layer. So a color is created by layering (mixing) the colored dyes one on top of another.

An inkjet process lays down dots next to each other, creating the illusion of different colors. They obviously do a good job, but if you compare the two side-by-side, both will be very good, but the dye-sub process will have a better professional look. All that is fine if you value glossy prints. If you don't, then this is not for you.

I have a Canon i850 photo printer as well that I use for regular color printing and for other full-size printing like labels. Although it will do borderless small cut-sheet printing, I think it's a pain to pull the regular paper out, adjust the paper feeder to 4x6, load paper, then put it all back afterward. I really wanted something better for photos. I also want to contain the cost; at least know what I'm paying for paper and ink.

I wouldn't have considered a printer dedicated to 4x6 except for three new developments. First and foremost, I got this little puppy for 50 bucks at Staples. Second, I bought supplies for 105 prints for $29, and last was that I realized how the supplies are packaged.

The supplies for this little guy are complete with a single cartridge of film and 35 pieces of 4x6 photo paper. So when you run through 35 photos, you pull the cartridge out, throw it away and unwrap a new supply of 35 pages and a new cartridge. There's no more guessing about cost, or worrying or tracking when the ink will run out and if it will ruin a photo when one runs out and guessing if you should replace all four (or seven) cartridges at once. I hate that.

On the final (fourth) pass of a finished print

As you can see, the printer is small. It includes the body, a paper tray, a power cube with cord, and a six foot removable power cord for the cube. On the left side is a standard USB "B" printer port for connecting to a PC; next to it is a USB port to connect to a camera in case the camera uses a non-standard USB cable. On the front is a clever retractable cord with a standard mini-A connector that plugs into a camera.

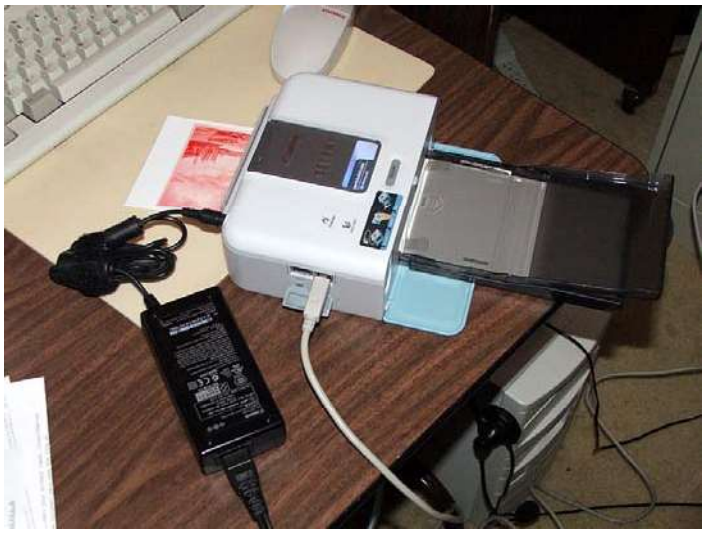
The back has the power connection and a cover that can be replaced with a battery to make the printer a portable. The right side has a door to access and replace the color cartridge.

There are two ways to print to this. One is a direct connection to the camera, the other from a PC.

To print from a non-Canon camera, the camera needs to have "PictBridge" capability. PictBridge is a printing program in the camera. My FujiFilm S5100 camera has that, and I did some printing. And I'd say that while it's OK, I wouldn't want to do a lot of it. It's mainly because it requires a lot of tedious navigation through the menu system on the camera. Otherwise it

(Printer……..Continued on page 4)

(Printer…….Continued from page 3)



gives satisfactory results, and perhaps there are better implementations of PictBridge on other cameras. My camera has the standard USB mini-A connection compatible with the retractable cord. My older camera – a FujiFilm 2650 – has a non-standard connection at the camera, but I could use the USB cable that came with the 2650 and plug it into the USB connection on the side.

This is a good time to mention that another model of Selphy printer – the CP710 – has an LCD screen on the printer and a printing menu system. I would expect that this would be a better solution to printing directly from a camera, but I have not tried it out.

Frankly, connecting the printer and printing images from a PC is pretty much dead simple, and I'd print directly from a camera only under conditions where I had no other choice. The printer comes with good software: Easy-PhotoPrint, PhotoStitch and PhotoRecord. Photo Record is for creating albums, PhotoStitch stitches photos together, does a good job and is easy to use. Easy-PhotoPrint makes printing photos about as simple as you can make it. I'm experienced with Easy-PhotoPrint and PhotoStitch because they came with my older Canon i850 printer. I expected that Easy-PhotoPrint would recognize the new Selphy printer and the particular paper it uses, but it wasn't to be. I installed the new Easy-PhotoPrint software, and it still did not pick up the printer until I uninstalled it and reinstalled the new one. Fortunately, it recognized both Canon printers.

The printer will print to a couple of smaller size papers that I have not tried out because you have to buy different paper cassettes. The sample paper that comes with it and the paper that I bought is actually a 4x7 "postcard" size with perforations to break ½" borders from each end. The break is clean and invisible even if you choose to leave it at 7". Interestingly, there's light postcard printing on the back in case you want to mail it as a postcard.

This second picture shows the only real surprise of the printing process. As it prints, the paper slides out the back, and retracts four times. You must be careful to make sure the printer is on a flat surface, and that

the power cord doesn't interfere with the slot at the bottom.

PROS: Excellent quality, convenient, 4x6 glossy photos at reasonable cost, in a small size.

CONS: The large power cube and a total of 11 feet of cord! Also, why does the cord plug into the back where you have to be careful to make sure it doesn't interfere with the paper slot? And how hard would it be to supply a wire or plastic guard to protect the back paper slot from interference?

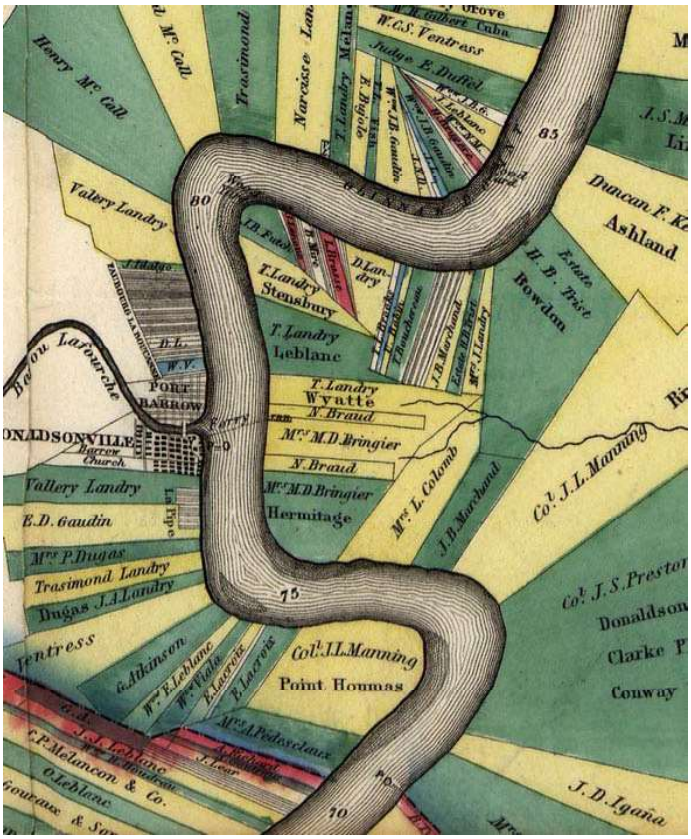
FINALLY: I think it's a good deal. The quality is excellent; the cost is reasonable in quantities of 105 (at 35 it is too expensive) and nearly competitive to commercial printing ◆

(Comments…….Continued from page 1)

to locate and scan a panoramic photo of downtown Fort Pierce Florida from 1926. As I recall, it took about five scans on a flatbed scanner. I then pieced the scans together in Photoshop. The result was quite good. I then needed a way to print it. Well, it was about 7.5 inches by 41 inches, and paper that size does not exist. However, for my Epson Stylus Photo 2200 printer you can purchase rolls of paper 32 feet in length and either 8.3 inches or 13 inches in width. Just what I needed.

(Comments…….Continued on page 5)

(Comments……..Continued from page 4)



Below is a photo of my printer producing the Fort Pierce panorama. It took it about 32 minutes to do the job.

Where does one get panoramas? One source is your digital camera. Preferably with a tripod, take a number of overlapping photos (overlap about 20%). Then

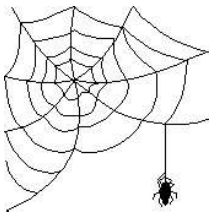
Internet Picture of the Month



Norman's chart of the lower Mississippi River — A very small section —

The full map displays the landowners along the Mississippi between Natchez and New Orleans in 1858. This was where much of the wealth of the country was located at that time. The MrSID version is 16.2 MB, which if you expand it 1:1 yields a TIF file of 542 MB. A 2:1 expansion yields a file of a mere 135 MB. This would make a beautiful print. From the site http://memory.loc.gov/ammem/index.html .

Roku: SoundBridge Network Music Player

By Larry Anders, Librarian, Tampa PC Users Group
Larry@AndersNet.com

It's been while since I've written an article for the newsletter, so I thought I was due. It's not that I haven't had anything to write about; it's just that I haven't had the time to write it. But I told William I would

take a little time to write about something, so here goes…

One of the fortunate occurrences in my life is to have a daughter who has grown up to be a first-class techie-geek. Better yet, she married a first-class techie-geek. (And I now have a beautiful 8-month-old granddaughter whom I am sure will grow up to be a techie-geek, too.) My daughter is an IT Director for a firm here in Tampa and my son-in-law is a manager and project leader specializing in medical databases and software also here locally.

What does all this have to do with my article? Well…, having two first-class techie-geeks in the family means that I have stopped getting neckties and socks for Father's Day and other special occasions, and now I get some really neat gifts!

My last two gifts have been great! The first, which I'll talk about this month, was a Roku M1000 SoundBridge. Other than just being a very attractive addition to your stereo gear, if you have a wired or wireless network in your home, the SoundBridge can play your collection of MP3, WMA or WAV files stored on your computer (PC or Mac) directly through any powered speakers, stereo or boom box within range of your network.

SoundBridge is only a networked music player. What I mean by that is, it doesn't store any music, but it is capable of playing music files stored on a computer connected to your home network. It can also play Internet radio without connecting to your computer, using a direct connection to the Internet. But to be able to play the music files stored on your computer, SoundBridge needs to receive data from software installed on your computer—that is, a "music server". This music server streams the music to the SoundBridge, sends the list of music that is available to the SoundBridge (when asked), and performs searches of the music library at your request. There is no standard for music servers, but there are several, and you may already have one on your computer. The most popular ones are iTunes, Windows Media Connect, and Rhapsody. But there are others. I had heard a lot about iTunes from friends who use it with their iPods, so I downloaded the latest version of iTunes, which is free, and went with that as my music server. I am extremely impressed with iTunes so far. The installation was simple and straightforward.

After that, you just connect the SoundBridge unit to your powered speakers or stereo and connect the Cat 5 cable to the SoundBridge if it's a wired network, but it is not needed if wireless. If your network is wireless, the SoundBridge will find your network automatically. Then answer a few prompts on the large and readable front panel of the SoundBridge, and you are ready to listen to your music by song, artist, genre, album or even composer, where you please.

Like most electronic devices today, the SoundBridge comes with a convenient remote control device that allows you to control all of its capabilities from across the room. You can also use your computer and a web-interface to customize your musical streams.

The SoundBridge lists for about $200 locally, but I recently purchased one online as a gift for someone for less than that. Now, if they'd make one I can install in my new car, that would be great!

More to follow on another neat gift soon. ◆

dent John Witmer for the normal business portion. John introduced the elected officers and William LaMartin, our newsletter editor and webmaster. John announced that our speaker next month would be Merrill Friend with a Digital Photography presentation. In August, Liz Mueller from the Hillsborough Public Library System will tell us what they have to offer. Liz lives in Temple Terrace and will need a ride to and from our meeting.

In the absence of our treasurer this evening, John took dues payments. John then introduced our speaker for the evening, distinguished and long-standing member Merle Nicholson, to tell us about "The Anatomy of a Modern Computer."

Merle told us of and demonstrated the latest success in electronic "cloaking" devices, apparently being funded by DARPA. The idea being to see through or around things. The displays showed the differences between day- and night-cloaking, although, frankly, I saw nothing, So it must be successful.

Merle started by saying most video cards now are capable of driving two monitors. And the latest CPUs are dual core processors. Speed is everything, and with speed comes heat generation. Cooling is therefore a major concern, and Merle is interested in case-modification for coiled and piped cooling of critical heat generators.

Merle took pictures as he built his current computer. Of course, he modified the case, rearranged the hard drives and piped cool air from three, perhaps four, fans to cool critical components. He showed us a $400 cooling system and referred to a Peltier website for information and pricing. He also showed a video of an oil-cooled PC, which may be the coming thing, and a variety of amusing household-appliance housings used to serve as PC enclosures.

John Witmer and those present thanked Merle for the very informative and entertaining presentation. John is considering whether it's time to redo his system. William LaMartin said now he understands the piping in his new computer.

We had no door prizes this evening so instead of the normal break, Bob LaFave told us about an online evaluation by Microsoft to advise if our current computers are compatible with Windows Vista. To do this, go to Windows Vista Upgrade Advisor. Bob also warned about downloading Windows Vista Beta and Office 2007 as they require a lot of disc space and there are still problems with device drivers.

The meeting adjourned at 8:25 pm ◆

locate some photo-stitching software and stitch the photos together. I believe many of today's digital cameras come with such software. Photoshop also has this ability. I don't know about Photoshop Elements.

If you would like to see some panoramas from the past, go the Library of Congress site, http://memory.loc.gov/ammem/collections/panoramic_photo/. There you can search for what may interest you. I searched for New Orleans and Florida. I didn't find my Fort Pierce panorama but did find several nice ones of Tampa in the early part of the 20th century.

Another interest of mine is maps, and the Library of Congress site also has many old maps for download (however not in the panorama section). Here you will have to learn how to use the MrSID viewer to view them full-size and to export them to TIF format for your use. The Picture of the Month on page 5 is a very small section of one such map.◆

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

Printing Much of my computer time the past month has been spent printing out large images. In last month's newsletter I mentioned the panoramas that I had been printing. Well, I don't have many panoramas to print, but I have many, many other photos that I would like to view as large prints. By large here, I mean mostly 11" x 17" images. That is a convenient size since the aspect ratio of the images produced by my digital camera is approximately 2 to 3, and this fits nicely with almost no cropping on the 11" x 17" paper. The printer used is an Epson Stylus Photo 2200 (2400 is the latest version).

If the largest images you have printed are 8.5" x 11" ones, then you are in for either a pleasant or an unpleasant surprise with the 11" x 17" ones. It will be a pleasant surprise if your

Minutes of the July Meeting

By Doug Mullis, Secretary, Tampa PC Users Group
dmullis@tampabay.rr.com

Bob LaFave started the Windows SIG portion of our meeting at about 6:35 pm in the Pepin Training room by telling us that Windows XP has a program for transferring files from your old computer to a new computer. It is the Files & Settings Transfer Wizard. You must have the Windows XP operating system on both computers to use it.

Bob then demonstrated the Windows Vista Upgrade Advisor, a service available online to scan your computer and determine what upgrades it needs to be compatible with Windows Vista.

Nancy Cottrell asked about adding USB ports to her computer. Bob suggested she get a four-port powered hub at a computer store. When Nancy said she has been camping on her neighbor's wireless network, she was advised her neighbor, by having an unsecured network, is exposed to hackers. Wireless networks should be secured and only authorized access permitted.

Another member was having trouble with his cable provider's Internet access. Several suggestions were offered, all of which had been tried except "change your provider because they are a bunch of dummies".

At 7:00 pm, Bob turned the meeting over to president John Witmer for the business portion. John thanked Bob for conducting the SIG portion of the meeting and introduced the officers present, stating that our vice president and our member at large are vacationing. Joseph Weaver, Richard Brooks and Dirk Vallo were introduced as guests and welcomed to our group. Two new members were introduced and also welcomed, Sam Christy and Jean Gillespie.

Sling Media's Slingbox™

By Larry Anders, Librarian, Tampa PC Users Group
Larry@AndersNet.com

Last month I alluded to some really neat presents I have been receiving from my techie-geek daughter and son-in-law. Last month I told you about the Roku Soundbridge. This month I want to tell you about how I can now watch the TV in my family room anywhere I have a connection to the Internet; at work, in another state, or even in another country. Well, not actually watch that specific TV, but rather whatever can be viewed on that TV, and not only just viewed but controlled as if I were sitting there in my living room. Sling Media calls it "placeshifting" your TV to your PC, no matter where you are.

The **Slingbox** is a mechanical device that looks like a large silver chocolate bar that connects between the TV and a router, either by cable or wirelessly. The **Slingbox** is compatible with thousands of devices like TiVo, Comcast's and Bright House's DVRs, Dish TV, Direct TV and many, many more. The initial automatic device setup asks you specifics about your equipment so that when you go to control your TV at another location you practically have the same ability as if you were home.

You can receive TV on an unlimited number of PCs without the hassle and cost of adding new hardware (i.e. TV tuner cards) and software drivers to every computer — and with no additional service fees. The only catch here is that only one connection to the **Slingbox** can take place at a time, kind of like AOL.

The setup really is painless — just follow the instructions. They provide a CD with the client software, or you can download the latest version from their website. Once the client software was installed on my notebook I started the program, opened up the remote that looks remarkably like the one I got from Bright House, turned on my TV at home and watched a program that I had recorded earlier, and it really was just that simple. And all the time I was in my hotel room in Houston, Texas.

I travel a lot with my job and this new accessory I have added to my notebook sure makes my travels a little more enjoyable now. As with all good things, there is typically a downside. If there is one with this, it's that you have to have an Internet connection, the faster the better. It has built-in optimization that will automatically adjust to the speed of the connection to give you the best picture. I don't always carry my notebook, but I always have my PocketPC, which will access my TV also. Again, you need an Internet connection with that. This past week I upgraded my cell phone to a new Motorola Q, which runs on a Windows Mobile Smartphone platform, and you guessed it, it accesses my TV, too. But with my Moto-Q, I carry my broadband Internet connection in the phone. So now, anyplace I can make a cell phone call, I can access my TV at home. The picture is obviously smaller, but the new Q has a high-resolution screen and the picture from the TV is remarkably clear.

The Slingbox sells for about $200, and if you're a TV aficionado like I am, this is the best deal on the planet. Go here to see what you must have, what the minimum requirements are and other facts about the Slingbox: http://www.slingmedia.com/us/slingbox/.

Next month, more on my Motorola Q. By then I may have learned all it can do. ◆

(Comments……..Continued from page 1)
image file has enough information (pixels) to produce the large print. It will be unpleasant if your file does not have the pixels or is of poor quality. All of the files produced by my camera have enough pixels. However, very few—possibly one in 50—are of the quality that I want to print them as 11" x 17" . So far, I have only printed 20.

Just as an 8.5" x 11" is more impressive than a 4" x 6" photo, an 11" x 17" completely outclasses an 8.5" x 11". Some photos that are nice as 8.5" x 11"s are stunning in the larger format. Of course, there is no way of demonstrating that in this article. Perhaps I can bring a portfolio of them to the next meeting.

Of course, there is one drawback to the 11" x 17" s or the even larger 13" x 19"s that I can print—the price of paper and ink. Based on what paper and ink cost me and using Epson's estimate of square inches printed per ink cartridge, I come up with about $8.00 per 11" x 17" . Of course, that doesn't include the wear and tear on my $725 printer.

And if the print comes out a little too dark, you have just thrown $8 in the trash can. So it is important to know how the print will compare to what you see on your monitor. Supposedly you can calibrate your monitor using Adobe Gamma. I have tried it with so-so results. And I am not going to pay $300 plus to buy a device to do it.

Actually, I get a fairly good match between what I see on the monitor and what I print. I accomplish this by knowing the image will always print a bit darker than the monitor shows it, and I adjust the file's brightness accordingly just to do the print. Additionally, I have downloaded the ICC profiles of the types of paper I use made by Epson and Ilford for my printer. I then set the print driver settings to use the proper profile with no color correction.

For anyone who might actually be doing this, a note of warning: When you do a print with preview on this particular printer using the ICC profiles and no color correction, the print preview will appear very red in tone. Epson says to ignore this and proceed, as the print will be fine. And it will. When I first started using the printer and profiles and saw the reddish preview, I would cancel and simply print with no profiles and hope for the best. But reading at the Epson site that the print preview did not give an accurate rendition when using the profiles with no color correction gave me courage to proceed with first printing 4" x 6"s and then moving up to the larger formats using the profiles.

From what I have read, getting a reddish tone to prints from inkjet prints is not all that uncommon—and I produced my share when I was trying to learn how to use the different profiles and print driver settings for this printer. But once I learned what the correct combination of settings were, I have been able to produce results superior to just simply using the default settings.

Until we meet again was the subject of an email I just received from friend and club member Wade Herman. Normally that would not be out of the ordinary except that Wade died of a heart attack July 27th in Asheville, NC.

The email was listed as from "Wade" with subject "Until we meet again" and began with the salutation "Dear family and friends." I forwarded the message to club members for whom I have addresses, so I won't repeat the details of the message here other than to say that it touched on the past, the present and the future. At this point I do not know if Wade wrote it earlier and set it aside to be used at the appropriate time, or if some family member or friend penned the message. Of course, if you are of a Spiritualist bent, then there is the possibility that Wade did actually send it himself. Regardless, it was well done and much in line with the way Wade did things.

The computer connection My acquaintance with Wade actually coincides with my involvement with the personal computer, which for me began when our family bought an Apple IIe in 1983 from Florida Computing in downtown Tampa. After having the computer for a few months, I learned from another neighbor that there was the fellow living a couple blocks away who also had an Apple. That was Wade. He actually had a slightly earlier version of

(Comments……..Continued on page 5)

(Comments……..Continued from page 4)

the Apple—an Apple II. Our main interaction at that time was simply sharing information on the various software programs available for the Apple.

For those who never had one of those early Apples, let me remind you of the specifications of the Apple IIe (I think the Apple ii may have been more minimal). The Apple IIe came with 64 KB (that is KB not MB) of RAM with an external floppy drive with a capacity of 135 KB. All programs were run from floppy disks inserted into this drive. I think, the computer and a green screen monitor cost around $1,650. If you wanted to buy a second disk drive to write out data to, for example, that would cost you another $350 (I think, as stated, the price of the IIe included a floppy, but it may have been extra). If you wanted an additional color monitor (the Apple produced color), that would be around $400. An Apple dot matrix printer went for around $500. Compare those prices in 1983 dollars to what you can get now for just a few hundred dollars.

I stuck with the Apple, writing my little programs for it using the built-in Applesoft programming language, until we purchased our first PC from Gateway in 1991. That was by far much longer than I have ever subsequently gone without purchasing a new computer. Wade moved on to the PC format much sooner. So, after he purchased an IBM compatible, with no computer problems in common we had very little contact until sometime after 1991.

At some point in the mid-1990's we began communicating regularly on computer problems, and that developed to discussions of life, in general: politics,

Internet Picture of the Month

Ottoman Empire 1481—1683
— A small section —

For the second month in a row, the Internet Picture of the Month selection is a map. This map is from the University of Texas's Historical Map Collection for the Middle East at http://www.lib.utexas.edu/maps/historical/history_middle_east.html. The different colors indicate when the regions became part of the empire. What is of interest is that on this map there is no Iraq, no Lebanon, no Israel. These countries came into existence after WWI.

automobiles, the stock market, etc. But no sports. Neither of us cared a whit about that.

The last phone call I received from Wade was about a week before he died. He was in Asheville, where he had a second home. He wanted to relate all his tribulations in finally getting his dial-up Internet connection there to work. In Tampa he had a RoadRunner (Bright House) cable connection for the Internet; they also apparently have a feature where you can connect to the Internet through a dial-up account when you are away from your main cable connection (Tampa in this case). I think you possibly have to pay extra for this and it is really through the AOL dial-up numbers. Whatever the case, Wade had signed up for it and used it on previous trips to Asheville.

This trip he had occasionally been able to share (with permission) a neighbor's unencrypted wireless connection, but that would often drop out after only a very brief time. So he needed to try his dial-up. That is where the fun began. An attempt to connect via his modem to the local phone number produced the common error message that says in effect that your username or password is incorrect. I have seen that many times over the years, and it is usually solved by simply waiting a few minutes and then trying again when everything will be OK, since the problem was really a temporary problem on the ISP's end. No such luck for Wade.

I wish my memory were better on this, but here is the outline of what happened as I can best recall it. In all, Wade spent over five hours that day with various phone-help people scattered all over the world. First he contacted RR help. I don't recall the sequence of events here, but I believe they led him through all sorts of setting checks to see if that could be the problem. When that didn't work, at some point they found out his operating system was XP and asked him if he had SP2 installed. On an affirmative answer to that, he was told that was the problem and he needed to contact Microsoft.

I think this took well over an hour, and he then moved on to Microsoft, where after a long wait on hold, he was informed that there was no way that SP2 would cause a problem with dial-up networking—which Wade said that he figured was the case all along. But he was just following up all possibilities since he had not been able to get things to work otherwise.

There are many details of all this that I cannot remember, but I know he again contacted RR in North Carolina with the Microsoft answer, and they tried more finagling to no effect.

Before I reveal the solution to the problem, a little history: Wade a couple of years back had RR as his Internet provider in Tampa, as many of us do. He had a username and password for that account. He then changed to Verizon DSL when that became available in the neighborhood and cancelled the RR (now Bright House) account. Then, sometime in the past year, he decided to change back to Bright House because of an attractive package deal for both cable TV and the Internet. When he did this, he created a new username and new password different from what he had before with RR.

Now back to North Carolina. After five hours of frustration, he decided to try the old RR username and password—you guessed it, the dial-up connection in Asheville now worked. Somehow, even though he had cancelled his RR account in Tampa and then created a new RR account, approximately a year later when he went back to RR, the Asheville account was apparently not cancelled or if it was, it was reinstated with the old information.

Of all the problems we discussed in recent years, keeping his two computers on a network was the most persistent. We always got the problem fixed, but sometimes it would take several days before whatever caused the problem was reversed. Some of Wade's other problems were because he always wanted the latest and greatest in video cards and other hardware devices—many of which did not perform as advertised because they were slightly beyond the cutting edge. As for myself, I was happy to wait until others had tried out such stuff and the kinks had been worked out. But waiting was not for Wade when it came to the latest gadgets. And I will miss him. ◆

(Minutes…….Continued from page 2)

John announced next month's speaker would be Elizabeth Mueller from the Hillsborough Public Library System. Don Patzsch had suggested this presentation as he heard it at the Brandon Group. A member also asked that she tell us about their e-book service.

Jim Purcell reminded us of our arrangement with Amazon.com wherein books and other computer supplies are not only discounted, but also the group gets a percentage of the sale. You have to access Amazon from our home page for us to get the credit. Bob LaFave said that newegg.com is also an online site with good prices.

Doug Mullis recalled that, at last month's meeting, Bob LaFave asked if anyone was interested in a session on backing up their hard drive. It seems before a response was heard another question was presented. Except for Doug, no one spoke up this time either.

Another member asked about replacing her printer with an "all in one" device (printer, scanner and copier) costing around $100. Merle Nicholson responded that he bought one several months ago and is happy with the performance. Bob made a pitch for the new low-priced laser printers. Although not color, they are fast and you get many, many more copies before having to replace the cartridge.

At 7:15 pm, John introduced our speaker for the evening, one of our own members, Merrill Friend, to show us what he has been doing with Adobe Photoshop Elements 4.0.

Because of his investment in camera and lenses, Merrill uses his Minolta X 700 film camera for taking color slides. He then scans the slides into digital format and is pleased with picture quality.

Merrill says it is important to first adjust dimensions of your images, maximizing resolution rather than simply cropping. After that, there are all kinds of things you can do. Editing your images is fun, but time-consuming.

Merrill showed us things he has learned, such as doing panoramic views, adding or removing people or items, enhancing sky color, clouds and lighting. One particularly nice image was a Rocky Point causeway scene where he had created a mosaic on white foam board, leaving a grid between each picture element with the effect that the scene was viewed through a multi paneled window. A panoramic riverside view with majestic oaks was also beautifully backlit and refreshing. You could feel the shaded air cooling with the retreating summer sun.

Merrill did admit to having the expert assistance of Creative Color Inc., located on E. Cypress St., with

(Minutes……..Continued from page 7)

some of his work. They don't come cheaply, however. He showed us price comparisons of photo services for varying sizes and numbers of printed pictures. Shipping usually is additional, so use a local service. To have anything framed, you'd better carry a sack of money, or learn how to do your own.

John thanked Merrill for the interesting presentation. We did not have any door prizes to raffle off this evening; however, attendees were reminded we had chocolate chip and Oreo cookies, Starbucks coffee and bottled water.

The meeting adjourned about 8:20 pm. ◆

Meeting Preview: This month Brian Blair from Microsoft will enlighten us with the latest from one of our favorite software companies. We will also have the usual half-hour Windows SIG.

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

I hope all of you had fun on Labor Day. I did not. My Road-Runner cable connection was down, and no repairman was available until 4.5 days after the problem started. As I write this, I have two more days to wait. I do have Internet connectivity through a dial-up connection with EarthLink that I have kept for travel and to maintain my old Netcom email account.

The dial-up connection I receive is 50.6 kbps. In the olden days of simple web pages and mostly text based email with no graphics that was pretty good. Today with many emails having pictures and web pages loaded with the same, you wait forever to view anything. In such situations, Macromedia Flash is your enemy. I did speed things up a bit by disabling Windows automatic update once I realized that it was running. I suppose I could walk the neighborhood with my laptop looking for an unencrypted wireless connection! ◆

October Meeting: To be announced

* * OFFICERS * *
President: John Witmer (president@tpcug.org) 949-8007
Vice President : Kevan Sheridan (kevan@tpcug.org) 988-6480
Treasurer: Mike Hodges (mphs@aol.com) 962-2114
Secretary: Doug Mullis (dmullis@tampabay.rr.com) 234-9343
Member at Large: Mary Sheridan (mcpease@mindspring.com) 988-6480

APPOINTED (Volunteers)

Editor: William LaMartin (lamartin@tampabay.rr.com) 251-3817
Librarian: Larry Anders (Larry@AndersNet.com) 989-9119

Minutes of the August Meeting

By Doug Mullis, Secretary, Tampa PC Users Group
dmullis@tampabay.rr.com

Bob LaFave started the Windows SIG portion of our meeting at about 6:35 pm by suggesting we install test versions of Windows Vista 1.1 or 2.0 to see if we like it.

Two members were having problems, one with MSN and the other shutting down Windows XP. Members offered suggestions for resolving these problems. Another member had changed out a memory card and was getting a driver error message that was unclear. Bob suggested he review the Event Viewer under Administrative Tools for a better explanation.

Ed White had two problems; having installed Windows Vista, he now gets a message there is no driver for a piece of hardware, but the device is not identified. Bob said with Vista, dial-up modems and video cards are notorious for driver problems. Ed was referred to the Event Viewer for identification of the device. Ed's second problem was with Verizon DSL. His computer works fine, but friends tell him they cannot get through on his phone. He has tested all his phone instruments and did not find the problem. Bob suggested he report this to the phone company and have them check his service connection.

At 6:55 pm, Bob relinquished control of the meeting to President John Witmer for the business portion. William LaMartin distributed hard copies of the newsletter to those who wanted them. John recognized a standing room crowd this evening. Richard Brooks joined our group last month so we welcomed him. Richard's dues check is apparently in our mail box, which William said needs to be emptied twice a month. We need name tags and membership cards for a number of new and renewing members. John

Wacom Graphics Tablet

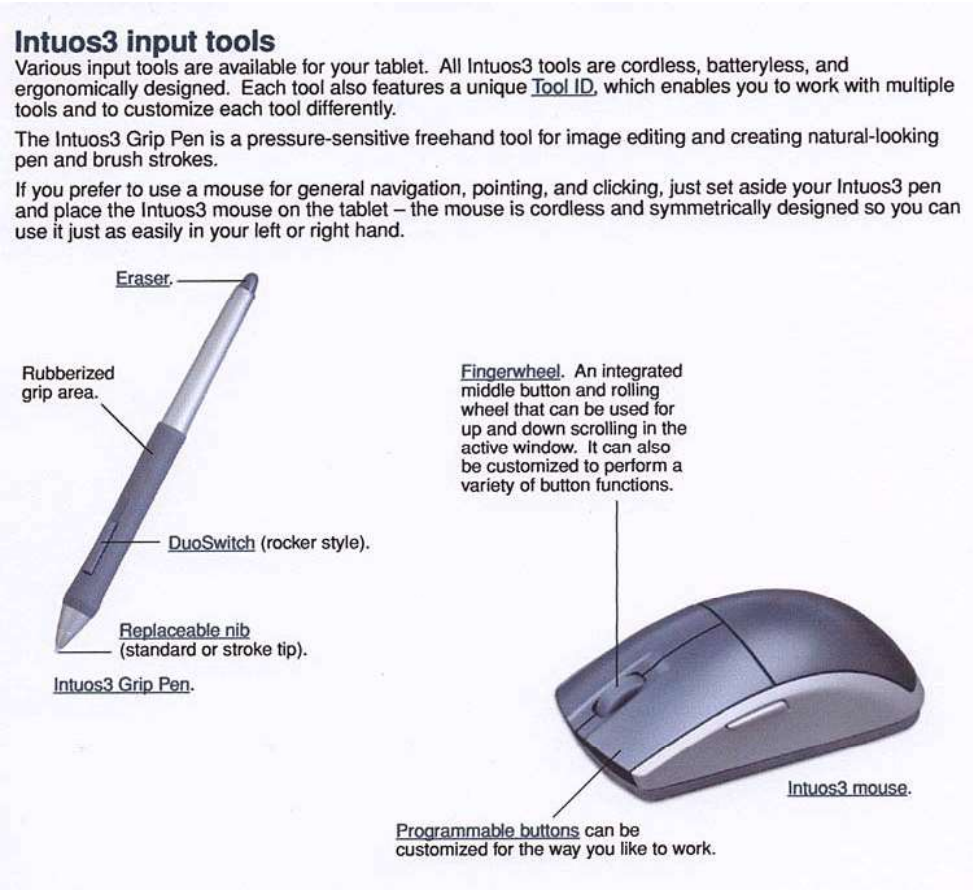
By Ed Purcell, Tampa PC Users Group
Edward_J_P@MSN.com

I am working on an ambitious project to put about 55 years of photography on DVD's. I am also restoring some black and white photos taken in the early 1950's to be included in the University of Florida archives. Some of the photos require extensive restoration, and a large number of the older slides require at least minor restoration. As I started to perform the work, it quickly became apparent that I needed help. I dug deeper into my favorite Photoshop Elements book by Barbara Brundage. She covered the subject well but recommended that anyone who was going to do much restoration and retouching should look at the books by Katrin Eismann. I bought Eismann's book, "Photoshop Restoration and Retouching". In the book she states that a pressure sensitive tablet is essential. It, of course, is not essential for infrequent or small jobs, but I read a separate paper that she wrote on the subject and she convinced me that not only can you do a better job with a tablet but also you can do it much faster. She also thinks that "mousing" causes repetitive motion injury and that a pen does not. If you are interested in the subject, there is a study of mice versus pens at http://www.wacom.com/comfort/ErgonomicStudy.pdf .

I started looking at graphic tablets and didn't get beyond Wacom. It seems that Wacom is to graphic tablets what Photoshop is to photo editing. Wacom has also evidently spent a great deal of time including features that increase the Photoshop user's efficiency and versatility while editing and enhancing photos. The tablets list from $99.99 (4x5 Graphire entry level tablet) to well over $2,000 (An LCD monitor on which you can work directly). Details and pricing can be found on http://www.wacom.com. The Intous line of tablets is recommended for the serious photographer or artist. Since my project is serious, at least to me, I bought a WACOM Intous3 6X8 model at CompUSA and received a substantial TPCUG discount. Although I plan to use the tablet primarily as an aid to editing and restoring photos and I will only discuss that part of its utility, the tablet has a wide range of applications. Wacom describes the capabilities of the Intous 3 as follows: "Intuos3 gives you the power to quickly and professionally edit photos and create digital artwork by turning on the full power of Adobe® Photoshop®, Corel® Painter™, and over 100 other leading software applications". Among the accessories available are a pen with an air brush effect and an ink pen that allows you to write or draw on paper placed on the work area and have the identical drawing or written words appear on the screen. Business applications of the tablet are discussed at: http://www.wacom.com/businessapplications/index.cfm

(Tablet……..Continued on page 4)

(Tablet……..Continued from page 3)



As seen in the illustration, the INTOUS3 6x8 has 4 customizable keys and touch strip controls on each side of the work surface. It came bundled with a grip pen with 4 tips, a pen stand, a five button mouse, tablet driver software with user manual and bundled software. The bundled software includes Adobe Photoshop Elements 4 for Windows, Adobe Photoshop Elements3 for the Macintosh, Corel Painter Essentials 3, nik Color Efex Pro 2 IE and Wacom Brushes 2. The keys are preprogrammed as Control, Shift, Alt, Space, and the touch strip will scroll up and down or zoom in and out. All keys and the touch strip are reprogrammable quite easily with a utility provided with the driver file. One of the things that also set the tablet apart from the standard mouse is that the work surface of the tablet is mapped to the monitor. If you want to go to the upper left corner of the monitor, you merely place the pen (or tablet mouse) in the upper left corner of the work surface. The mapping can also be customized if you need to change it.

The four keys and a touch strip on each side don't sound like much but they become extremely valuable with an application like Photoshop or Photoshop Elements, which have keyboard shortcuts for practically every operation they perform. For instance the brushes that are used for the three tools used most in restoration are enlarged by the "]" key and made smaller with the "[" key. Your finger on the touch strip allows you to zoom in and out instantly while you are editing. The space bar turns any tool you are using into the hand tool, allowing you to grab the area that you are editing and move it to the center of the screen as you zoom. Having these keys on the tablet is a significant time saver. It is so easy to customize the keys that it may be practical to change them for specific projects.

The pen and the mouse are wireless, require no batteries and, like the tablet, can be customized. The only power to the tablet and the tools is through the USB connection. The tip of the pen is set to click, the top of the rocker switch is set to double click and the bottom of the rocker switch is set to right click. All of these and the eraser can be customized to other functions. The pen can use pressure sensitive tools from the application to vary width and opacity with pressure. With some applications, the pen is also sensitive to tilt.

The 5-button mouse is ready to use on the tablet if the project you are working with is better handled with a mouse. The customizable preset functions are as follows: The side buttons are programmed for back and forward movement within an internet browser. The right button is set to right click and the left button to click. The finger wheel when rolled will scroll up or down and when pressed it is a middle click.

There are many more uses of the Wacom Graphic Tablet. The web sites above should answer practically all of your questions. ◆

(Minutes……..Continued from page 2)

will get with Mary Sheridan on this need.

Next month's speaker will be Blain Barton of Microsoft who will update us on the release of Windows Vista and Office 2007. The month of October is still without a presenter, so if anyone has a subject they would like to present, let John or Doug know.

Members were advised that Wade Herman recently passed away. He had been a member of TPCUG for the past five years or so. There is a nice article on Wade and computing in the August Newsletter done by his friend William LaMartin. All of us in TPCUG are going to miss his humor and contributions to our organization. Rest in peace, Wade.

At 7:05 John Witmer introduced our speaker for the evening, Elizabeth Mueller. One of our members, Don Patzsch had heard a library presentation at the Brandon computer group and was impressed. Liz is with the Hillsborough Public Library System and told us what their modern library system has to offer us.

Liz took us to the library home page at http://www.hcplc.org and clicked on the **Catalog** link. Using **Catalog** you can search for items by exact title, title keywords, author or subject. The searched item could be a publication, video, CD, DVD or audio book. Once you find the item, you can place a **hold** on it but have your library card handy. Once you choose the library where you wish to pick up the item, you'll be placed on a list and contacted when the item is available for pick-up.

Motorola Q

By: Larry Anders, Librarian, Tampa PC Users Group
Larry@AndersNet.com

In last month's article, I finished telling you about a couple of neat gifts I had received lately. One was the Roku Soundbridge for listening to tunes stored on my PC via my wireless network on my stereo system throughout my house. The other was the Slingbox, which allows me to watch what is playing on my own personal TV in my home anywhere I could connect my notebook computer to an Internet connection. I also told you that the only thing negative I found with the Slingbox was that it required an Internet connection. I travel for a living and having that Slingbox makes traveling a lot more enjoyable because I can watch my own TV. But if I was delayed in some airport that did not have an Internet hotspot like our Tampa International Airport does here in Tampa, I was basically out of luck. Not any more. Enter my latest Smartphone.

The new Motorola Q Smartphone has many features that I will list down below, but one of the abilities that attracted me to it was having a broadband Internet connection anywhere I had telephone service. By broadband I mean it typically has an access rate of approximately 500 kb/s. More than adequate for most things you'd want to do on the Internet and plenty fast enough to access my TV at home and play it any where I chose.

The Motorola Q is a Windows Mobile® 5.0-based mobile phone and email device that is small enough to easily fit in your pocket. It only weighs 4 ounces and is less than ½" thick, and with its QWERTY keyboard you can do many of the functions of a larger computer, like reading Word and Excel files, viewing presentations and PDF files, handling business (VPN) and personal email, accessing the Internet, playing music, stream videos, etc. Personally, I think of the Moto Q as being a Blackberry on steroids. Whereas the Blackberry is primarily for email you can do so much more with the Moto Q.

Some of the features are as follows:

- Dual stereo speakers

- Windows Media Mobile Player
- 1.3 Mega pixel-camera with flash and digital zoom
- Video capture and playback with sound
- Supports and plays back most popular audio and video formats
- 64MB RAM/128 MB Flash memory built in
- Removable Mini SD card slot for extended storage of documents and multimedia files
- Send and receive photos, video clips, text and sound
- Browse the web with Internet Explorer Mobile
- Built in Instant Messaging
- View email and attachments (documents, spreadsheets, presentations and PDFs)
- Supports multiple email (inboxes): POP3/IMAP4, Microsoft® Exchange and GoodLink
- Manage personal information with Outlook Mobile (Inbox, Contacts, Calendar and Tasks)
- SMS, Group SMS (Short Message Service) and Multi-media Messaging (MMS)
- Calculator and Alarm Clock
- Photo ID Caller
- Built-in hands-free speakerphone with calling contacts or opening of applications with advanced speech recognition
- Virtually unlimited address book (dependent on

Special Interest Groups

Microsoft Access SIG

This SIG meets the **first Tuesday** of the month at 6:30 PM. The meeting location varies. For information contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merle@merlenicholson.com.*

Digital Imaging SIG—Cancelled until the Fall

This SIG meets the **fourth Monday** of the month at Pepin Distributors at 6:30 PM. For information contact Mary Sheridan at *mcpease@mindspring.com*.

Visual Basic for Applications SIG

This SIG meets the **third Wednesday** of the month at 6:30 PM. The meeting location varies. For information contact William LaMartin at *lamartin@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Mary Sheridan moderates the discussion.

(Motorola…….Continued from page 6)

available memory)

- Weight: 4.1 ounces; Dimensions (H x W x D): 4.33 x 2.52 x 0.45 inches; Display: 2.4-inch 320x240 65K TFT; Color: Silver
- Talk Time: Up to approximately 4 hours (voice and data), Standby Time: Up to approximately 212 hours
- Bluetooth®: Supports Bluetooth® Headset/ Hands-free
- Synchronization: ActiveSync® and AirSync® with Microsoft® Exchange Server 2003, IrDa (infrared), Motorola mini USB connector
- On-device security features include keyboard lock, device lock and password authentication to prevent unauthorized use

The Pocket PC (formerly Windows CE) has been around for a few years, and I have had a Pocket PC (and still do) for most of that time. Windows Mobile is slightly different, was created specifically for cellular phones and allows you to be able to navigate around the operating system without the need for a stylus as used with a Pocket PC. The QWERTY keyboard makes it much easier to send emails and text messages, which I rarely did on my previous phones because of the cumbersome fumbling with the keys to create the words. I've only had the Moto Q for a couple of months, but it has been well used. The standard battery lasts about two days under heavy use. If I watch much TV on it, I pop in my extended-use battery which is good for a few hours of TV watching. In case you are wondering, I pay $30 a month for unlimited access to the Internet and all the Internet services, over and above the calling plan I chose. My hat is off to Motorola and Microsoft for making a very useful tool that fits into my pocket. ◆

(Minutes…….Continued from page 5)

From the home page, you can also select **Information Gateway** to access subscription services and librarian-selected web sites. Included are 30 subject pages and each links to premium databases, which include Tampa history and genealogy links.

You may choose to click on **Library Locations** for a complete listing of the HCPL branches and partner sites in adjacent cities and counties. Find the branch where the hours, size, services and location meet your needs. Maps are available to help you find the location. Enter your zip code to find the nearest library.

Or you may want to check **Happenings & Events,** which is a newsletter and program guide full of information about free library resources, programs and events listed in two-month increments. All is available in PDF format for downloading.

☐ *Vendor: Your product was reviewed on page ___*

(Minutes……..Continued from page 7)

Liz said there was an interest expressed in eBooks. If you wish to access the library eBooks, you will need to establish a NetLibrary account. Ask your librarian how to access the web page with the account creation function. In most cases, you can enter http://www.NetLibrary.org and use the *Create a Free Account Here* link. Once you have clicked on *Create a Free Account* you will be prompted to provide user information for your account. Page prints can be made of PFD formatted eBooks if you desire.

Liz answered many questions about library services and distributed a handful of written materials telling how to use their system. Many services can be obtained online from your home PC. John thanked Elizabeth Mueller for a most informative presentation, and the members expressed their appreciation.

We did not have door prizes to raffle, so the meeting was concluded at about 8:05 pm. The group socialized and shared cookies, coffee and bottled water provided by John Witmer and Pepin. ◆

Mouse problems. At least I think that is what I have, as my computer will occasionally freeze when I am using the mouse to resize a window or click on something. Some days it doesn't happen, and other days it will happen several times. When it does, there is only one solution: Press the start button on the computer until the computer turns off; then reboot. It has been with me for over a month. I have thought that I have found the answer only to be proven wrong several times.

I don't even know if it is a hardware problem or a software problem. At times, I was sure it was hardware, then software, then hardware. Usually I solve such problems within a few days, but this one has persisted.

The obvious thing to check was the mouse and its driver. I

Minutes of the September Meeting

By Doug Mullis, Secretary, Tampa PC Users Group
dmullis@tampabay.rr.com

Due to our speaker needing extra time, we skipped the Windows SIG portion of our meeting and launched into the business meeting at 6:40 pm. President John Witmer began by announcing that we need members to step forward and serve in elected and appointed offices of our group for calendar year 2007. Next month we will be seeking nominees for Member at Large, Secretary and Treasurer as the existing officers heed the call to other challenges. Also anyone interested in serving as President or Vice President should let it be known as the incumbents would welcome the direction of newer members. We also need to fill the appointed position of Official Greeter to greet and distribute nametags at our meetings. Bruce Register did a fine job but has moved to Alabama.

John said he is preparing a presentation for our October meeting and asked whether the members prefer Excel or Power Point. Or possibly someone has a topic they would like to present? Hearing no volunteer, John asked for a show of hands between his two topics. The group was divided, showing an interest in both, so John will do a presentation on Excel, and, if time permits, touch lightly on Power Point.

John next announced the upcoming Fall FACUG Conference in Orlando on Sunday, October 29th. Registration is $15 before Sept. 29th or $20 thereafter and includes breakfast and lunch in addition to interesting lectures and door prizes. What a deal! For details go to the FACUG website.

Our Digital Imaging SIG has been on hold for the summer, and the Board believes regular monthly meetings will be hard to support without a new leader, or possibly a new topic. Does anyone have ideas for this group? Special meetings could be called as the situation warrants. Jim Purcell said he had a new program he would like to present and will get with Doug or John when ready.

Programs through the end of the year include John Witmer

Best Tech Support Website at Techsupportalert.com

By Merle Nicholson, Tampa PC Users Group
merle@merlenicholson.com

I wouldn't ordinarily write about a website, but this one grabbed me and has kept me entranced, so I thought others in the club may find it useful. It's a website apparently by one man, Ian "gizmo" Richards, and it's a huge undertaking for one person.

The web page is: Gizmo Richards' Tech support Alert and has headings for "Gizmo's Top Picks of the Best Utilities and Tech Resources", "Gizmo's Top Picks" and "The 46 Best Freeware Utilities".

There was a mention in the St Pete Times about this website that was very flattering so I thought I'd check it out.

Most of the website is directly viewable without subscribing, but there is a monthly newsletter called "Gizmo Richards' Support Alert Newsletter", and the last one posted was 14th September, 2006. If you subscribe - free, he sends out an email about mid-month with the latest newsletter. In addition there is a Premium SE (Support Edition) for $10/year.

The September newsletter is very long, with categories like "Top Tech Sites and Resources", "Top freeware and shareware utilities", "Security patches, service releases and updates", "Other useful stuff", "Tip of the month" and "Freebie of the month".

I'm in the middle of troubleshooting a software problem of my own where my Webroot SpySweeper scan is crashing my computer (a real BSOD), and so I first delved into this website because he has very extensive testing and comparisons on antivirus and spyware software. His emphasis is on finding freeware and shareware, and he seems to spend the most space on those, but he also includes commercial products. His sections on Internet Security, Virus and Spyware is very extensive and highly educational. Ultimately, I have turned off my daily scheduled scan in SpySweeper and installed ewido, a free spyware program for which he has some recommendations, and I am doing manually-initiated scans with ewido for now.

I've been through some of his "Best Free Utilities", and I am amazed at how much time this must take one person to maintain! There is plenty of free software that he says he's tested in categories that you've never thought possible. And usually he'll list two or three in that category and give you a summary of the differences. This list is very worthwhile going through.

When you subscribe, your email address is simply registered. There is no password. There is a subscription administration page where you can change your email address and also to un-subscribe and to look at back issues. When you register, you get an email that you must reply to and then wait for a second one saying your email address has been registered.

In addition to his own written material, there is plenty of lists of other websites under the categories of "Best Free Support Sites", "Best Paid Support Sites", "Best Shareware and Freeware Sites", "Best Troubleshooting Sites", "Best Sites for Tips, Tricks and Tweaking" and several others.

Take a few minutes and look at this website; you'll be glad you did. http://www.techsupportalert.com. ◆

(Comments…….. Continued from page 1)

have reinstalled the Microsoft IntelliPoint driver and tried different mice. I even tried old PS/2 mice and bought a new Logitech mouse and installed it. All was to no avail; the computer would still freeze at times—always when using the mouse. Sometimes it would even reboot itself.

Almost all of the freezes were while resizing a control in Visual Studio 2005, so I even began to suspect that program. However, since I was spending most of my time with Visual Studio, it was reasonable to assume that most of the freezes would occur there.

I also suspected USB as being the problem, and there was good reason for this since the additional card I had in the computer that supplied extra USB sockets, along with Firewire sockets, all of a sudden went bad.

(Comments……..Continued on page 6)

UTStarcom PPC 6700

By William LaMartin, Editor,
Tampa PC Users Group
lamartin@tampabay.rr.com

In last month's newsletter, Larry Anders wrote about his new Motorola Q Pocket PC and mobile phone. Well, I can't let Larry get too far ahead of me. I have been following him hardware-wise for many years. He had a scanner before I did back when scanners cost around $1,000. We both ended up with an HP IIcx, I think it was called. Then he had RoadRunner cable for the Internet before I did, and a digital camera before I got mine. Then there was the Pocket PC and now the Pocket PC cell phone with an Internet phone service. And, I imagine, there have been many other computer doodads that he has beat me to the draw on—probably some of which I will never buy.

Larry's article was not really the impetus for me to buy a fancy new phone—although once I decided to get one, it did point me in the direction of a Pocket PC phone. What pushed me toward the phone store was actually a cut thumb. That may sound a bit odd, but there is logic in it—my old phone put a nice deep gash in my right thumb.

Perhaps that last line needs a bit of explaining. I wear my phone in a holder on my belt and not infrequently hit it on things like car doors and door frames in houses. Well, this last item, a door frame in an office I was visiting, apparently lifted the decorative aluminum on my old phone up so that a very sharp triangular point of the metal was pointing at a 90 degree angle from the phone. I noticed it and, not realizing the danger, pushed on it with my thumb, resulting in a surprisingly large amount of blood gushing out, and my thumb is still sore five days later. The piece of aluminum could not be bent into its former position satisfactorily. Thus, a new phone.

Buying this phone was a bit of a stretch. It lists for more than $600. However, by taking a plan with Alltel for two years, I got it for a net of $199 after instant and mail-in rebates. I had better remember to do those two mail-in rebates since they total $150. I am sure Alltel is hoping that I forget; isn't that the purpose of mail-in rebates—hope that the buyer doesn't follow through. And if you have a phone that can connect to the Internet via a cell tower, you just additionally have to also buy the Internet plan for $29.95.

That is one thing my previous Pocket PC could not do. It could connect to any available wireless connection, but it had no ability to connect to cell phone networks. Now while we are driving in the car, my wife can order things online instead of being restricted to ordering from the computer at home. At least that is in theory, since she should be able to get some benefit from my fancy new phone.

Of course, you can set up your email accounts on the device so as to send and receive your email. There is one caveat here. Receiving email on your accounts is no problem. However, if you want to be able to send, you most likely will need an email account other than your usual ISP-provided one. For example, RoadRunner will not allow me to send email using that account when I am connected to the Internet via a provider other than RoadRunner. I solve this problem by using an account I set up with my lamar-

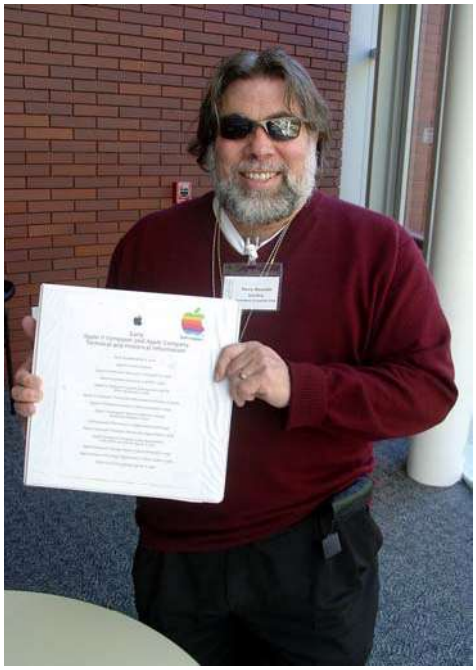
presenting Excel in October, Steve Singer on new hardware in November and Smart Computing Magazine in December at our annual Christmas party.

William LaMartin suggested members pay their dues through the link at our web site. This gives us an electronic path for quicker record keeping and eliminates physically going to the bank and P O Box. Kevan has told us this works well for his bike club. You can use your credit card, but go through Pay Pal. You do not have to join Pay Pal to do this. Try it at the site and see how it works. We may even have nametags and names of new members on our roster at the next meeting.



At 6:55 pm, President Witmer concluded business and introduced our speaker for the evening, Blain Barton of Microsoft, to tell us the latest on Windows Vista and Office 2007. Blain thanked us for having him back, introducing himself as the IT-Pro Evangelist representing Microsoft in Alabama, Mississippi and Florida. He specializes in client service and is part of a team making presentations across the nation, with sessions planned in the near future for Orlando and Ft Lauderdale.

Blain has been with Microsoft for 13 years and has seen operating systems evolve from Windows 3.0 to Windows XP, with vast improvements overall. Today Microsoft is fine-tuning Windows Vista with a release date before the end of the year. This will be the biggest release in the history of Microsoft! Two hundred and fifty million currently use Windows XP worldwide.

Blain said use the Windows Vista Upgrade Advisor to assess your present computer's compatibility with Vista. It not only tells you what upgrades to make, but also which edition best suits your present system. Almost any computer will run Vista; you just won't get all the features or the best performance possible without the recommended upgrades.

Suspend your hard drive in rubber bands

By Merle Nicholson, Tampa PC Users Group
merle@merlenicholson.com

Just this last July, I built a new server for my office. I like a particular black Enlight case that – at least from the factory – will only mount one hard drive, and I needed three. I also want to keep fan noise at a minimum in my office and also cool the hard drives. So I bought a very quiet power supply for the new machine and then developed a variation on something I saw in a magazine where they mounted hard drives using stock heavy rubber bands. I was a little alarmed at the use of gum rubber bands though so I bought ten feet of 1/8" nylon-covered bungee cord from a marine supply store at $.50/ft.

You lightly burn the nylon cover after cutting, knot it properly and it should outlast the PC for quite a few years. I then mounted a 120mm Silverstone quiet fan using the remainder of my cord, and, along with two 80mm Silverstone quiet fans in the back and the stock cpu fan for the AMD-64 3500+, the PC is virtually silent from two feet away. Note too, I used two long screws in the bottom of each drive to act as stops to keep the drives in place even if you tip the unit violently on its back.

I had to cut a hole in the front for the large fan, and was amazed just how quiet the unit is. Doing some subsequent experimenting, I've discovered that a great deal of fan noise is the air itself whistling through restrictive openings, and just opening up the passages reduces the noise dramatically.

Since that time, I've built two more similar computers using the same method and even cutting two holes in the front for fans on a PC I sent my oldest son. That one moves a very large volume of air over four hard drives, video card and a very hot CPU. In spite of the amount of air flowing through the case, it's virtually silent. ◆

(Comments……..Continued from page 3)

No device plugged into it would work, and it displayed as defective in Device Manager. So I removed it, and things seemed to improve. However, in a couple of days the freezes returned.

I have searched through Google and the Microsoft Knowledgebase, finding no solution. I have unplugged all USB devices while using a PS/2 mouse.

This SIG meets the **fourth Monday** of the month at Pepin Distributors at 6:30 PM. For information contact Mary Sheridan at *mcpease@mindspring.com*.

Visual Basic for Applications SIG

This SIG meets the **third Wednesday** of the month at 6:30 PM. The meeting location varies. For information contact William LaMartin at *lamartin@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Mary Sheridan moderates the discussion.

(PPC Phone…….Continued from page 4)

tin.com domain. The hosting company for that domain allows me something like 25 or more email accounts. If you can't do something like that, you will have to use web mail to do any sending from such a device, or, for that matter, to send email anytime you are using a computer not connected to the Internet via your ISP.

This device will do all the things Larry listed in his article. To highlight a few:

- Function as a small computer (Pocket PC) so that you can run programs like Pocket Word, Excel, PowerPoint, Outlook, Pocket Adobe Acrobat, Pocket Streets and a thousand more written especially for the Pocket PC.
- Is a full-featured cell phone
- Has a 1.3 MP camera with flash
- Built in Wi-Fi and Bluetooth
- Mini SD card slot for extra file storage
- Windows Media Player 10 Mobile to play video and audio files (thus an MP3 player)
- Can be used as a modem for a laptop
- Slide out keyboard (large letters for a PDA)

The only problem I have encountered so far is forgetting to disable the Internet and enable Bluetooth on the phone before starting my car. If these two things are not done, I cannot get the phone and the car to connect via Bluetooth. ◆

(Minutes…….Continued from page 5)

Mr. Barton told us there are four editions of Windows Vista: Business, Home Basic, Home Premium and Ultimate. The Ultimate Edition, of course, has the most features, and Blain demonstrated many of its bells and whistles.

Ultimate included Windows Photo Gallery, Windows Aero with Flip 3 D (really neat), Windows Media Center, Windows Tablet and Touch Technology, Windows BitLocker Drive Encryption, Windows Ultimate Extras and Business Networking. Our virtual tour started in the Welcome Center and ended in the Media Center.

Blain then demonstrated the improved search features of Vista. This really makes finding photos easy if you label them distinctly. He also demonstrated DVD Maker, Gadgets and Microsoft Word.

Windows Vista and Office 12 (aka Office 2007) are planned to be released simultaneously around Thanksgiving and will be on store shelves for Christmas. Why upgrade to Windows Vista you ask? For improved performance, increased reliability and the latest in security.

Blain answered many questions, reflected on where we are headed with PCs and distributed DVDs of Windows Vista Beta 2 for us to preview. He also left a copy of Microsoft OneNote, which we will raffle off at a future meeting.

Thank you for demonstrating Windows Vista, Blain, and for updating us on its release. The meeting adjourned at about 8:40 pm. ◆

(Comments…….Continued from page 6)

I have asked Merle Nicholson. Still no solution. Obviously I have checked for viruses and spyware.

Possibly it is some software addition or update. Microsoft, Symantec and SpySweeper are always updating themselves. I have installed a couple of new programs, I think. It is difficult to recall exactly when the problem began and what I might have installed or changed in the days preceding the first occurrence.

There is really nothing in the Event Viewer that I can pinpoint as being the problem. There are always warnings there and an occasional error recorded. But none seem to be a cause of a freeze. In fact, when the computer freezes I don't think it will be writing much to the log.

I think the next step is to totally stop SpySweeper, see if that helps, and if not, additionally stop Norton Antivirus except for email. I'll keep you posted. ◆

Meeting

Hardware Presentation
By Steve Singer

Wednesday, November 8, 2006
6:30 PM
Art Pepin Hospitality Room
Pepin Distributing Co.
4121 N 50th St
Tampa, Florida

Meeting Preview: This month Steve Singer from RDI@TampaBay will give us his annual rundown on new hardware. We will also have the usual half-hour Windows SIG.

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

Mouse problems solved Last month I described the problem I was having with my computer freezing occasionally when I moved my mouse or clicked on something with it. I had tried all sorts of things—using different mice, getting new mouse drivers, getting new video drivers, changing the hardware acceleration settings for the video drivers and stopping some software programs that run all the time, like Spysweeper. None of this solved the problem.

Well, one obvious thing remained to be done—try a different video card. Most of us don't have extra video cards just lying around, but Merle Nicholson does, and he loaned me a relatively high-end one from Matrox to try. I took out my NVIDIA card, installed the Matrox one and booted the computer. When the new hardware was found by Windows, I

Minutes of the October Meeting

By Doug Mullis, Secretary, Tampa PC Users Group
dmullis@tampabay.rr.com

Bob LaFave started the Windows SIG portion of our meeting at 6:35 pm. Several members were having problems with their computer's startup routine. Merle Nicholson suggested removing programs from your startup that you normally do not use. Bob referred us to a program by Mike Lin called Startup Control Panel that allows you to configure programs to run when your computer starts. You can get to Mike Lin's Home Page at http://www.mlin.net. William LaMartin cautioned those planning to disable programs, as you may cause more problems if you don't know what you are doing.

One member was having a problem with Windows Vista Analyzer due to his wireless network. Bob said not to worry about it.

At 7:05 pm, Bob turned the meeting over to President John Witmer to conduct the business portion of our meeting. John thanked Bob for doing the SIG meeting and then introduced three guests: Marva Christy and Harry Lockabay from Lakeland and Robin Fortner from Bartow. The guests were welcomed, and Harry Lockabay has become the newest person to join our Group. Debbie Whittaker joined at our September meeting.

William LaMartin called attention to the revised TPCUG website. Some complimentary comments were made, and William asked for suggestions and reports of any problems with access to the site. John said he plans to demonstrate using PayPal on the site to renew and pay his dues at the November meeting.

Elections are to be held at the December meeting for next year's officers. Mary Sheridan wants to relinquish

(Comments……..Continued from page 1)
pointed it to the Matrox CD to install the new driver. After the new driver was installed and I changed the screen resolution to my preference, I went into Add/ Remove to see about uninstalling the NVIDIA driver. It was already gone. Apparently the installation of the Matrox driver also removed the NVIDIA driver.

After three days of being freeze free, I purchased a new video card for my computer and gave Merle his loaned one back. The new card is made by ATI and, importantly, is Windows Vista ready. Merle reminded me that I wanted to be sure to get a card that would support the new features in Vista, like Aero with Flip3D.

Windows Vista After seeing Microsoft's presentation of Vista at our meeting, and given the fact that I had a fairly high-end computer only one year old, I just assumed that I would be upgrading to Vista when it was available. After running the Windows Vista Upgrade Advisor, I am not so sure. The problem is not with my computer—although there were several potential problems, such as no compatibility data for the NVIDIA nForce Networking Controller and the NVIDIA nForce RAID Class Device.

The problem is with my scanner and my photo printer, both by Epson. The advisor said that the Epson Perfection 3200 Photo scanner would not run in Vista and that it had no compatibility data for my Epson Stylus 2200 Photo printer. Well, the scanner was purchased January 16 of 2004 for a bit over $400, and the printer was purchased December 29, 2004 for $780. Not exactly old items and not exactly cheap items.

I searched the Epson site to find something about Vista drivers but found nothing. So who is to blame here, Microsoft or Epson? Perhaps by the time Vista comes out, there will be a change. If not, Vista will not be installed on this computer. I have too much invested in the printer, plus several hundred dollars worth of ink and paper on hand. And the printer is working well. The scanner is also working fine except for the item below.

Scanner Catch-22 Since my HP Photo scanner died a few years back, I have been scanning negatives on flatbed scanners. The Epson I am currently using, the 3200 Photo, was purchased specifically because it was said to do a reasonably good job on both 35-mm negatives and larger-format negatives, of which I have a few hundred. I have scanned in more than 8,000 negatives frames and slides using the HP PhotoSmart film scanner, an HP flatbed scanner (also now dead) and the current Epson flatbed scanner. I am basically finished with my black and white negatives, the large format negatives and my slides but have a couple of thousand color negatives yet to go. I do them when I have time, or the mood hits me!

About a month back, though, I encountered a problem. For the 35 mm negative holder (or mask, or whatever it is called), the piece of plastic that holds one of the strips of negatives in place on the bottom part of the holder broke. I still had one good top piece, but that meant I could only scan one strip at a time instead of two.

I contacted Epson via email and they supplied the names of three suppliers who should be able to sell me the part. I looked at their web sites and purchased a 35-mm holder from one. In fact, I purchased two 35-mm holders, along with one larger format holder, since there was a minimum purchase of $10, and these holders only cost about $4 each.

There was no joy when the package arrived, though, since I had received three negative holders with no top hold-down pieces. Unbeknown to me, a negative holder consists of a top part and a bottom part. In ordering the holders I saw at the site, I thought you got both pieces. Upon contacting the online supplier, I was told that the top piece was separate and that they did not carry it. Neither did the other two dealers. However, one supplier did give me the part number that was needed. I contacted Epson parts with a "secret" phone number one of the suppliers gave me and asked for the part by number.

In a nice way, the person who answered at Epson said that he could only sell parts to retailers and that I couldn't buy the part from him. He wouldn't even tell me if he had the part or not. So there is the Catch-22. My solution: Krazy Glue, and the repaired piece is still holding together.

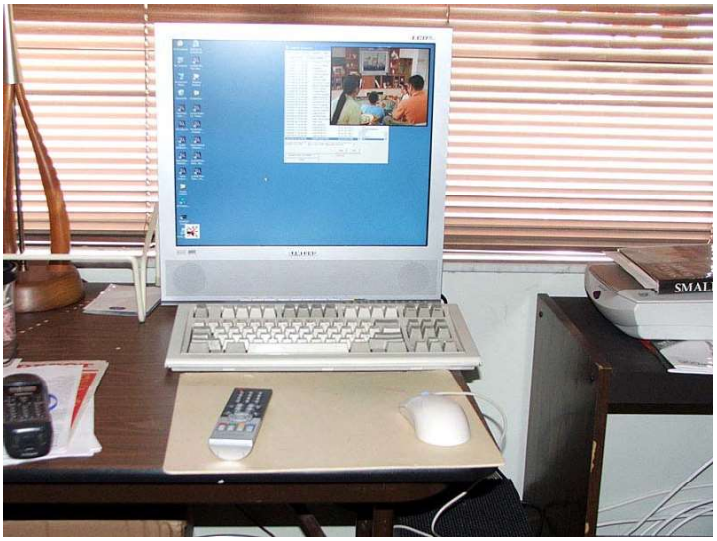
iWoz That is the name of the recently published book

(Comments……..Continued on page 8)

Monitor/TV and TV/Monitor Samsung models 910MP and 940MW

By Merle Nicholson, Tampa PC Users Group
merle@merlenicholson.com

910MP Monitor/TV:
The 910MP monitor is a strange animal, but it may suit you as well as it does me. In short, it's a 19-inch standard LCD monitor, but it's also a TV. It's primarily a monitor, because it's shaped like one. It's a standard 4:3 ratio with a native resolution of 1280x1024. So if it's sitting next to a standard 19" LCD monitor, it's the same screen size and resolution.



Over the years I've had TV cards in my primary computer from time to time — three different ones that I can recall for sure — all of them ultimately unsatisfactory. In my own experience, TV as a secondary function on your PC is helpful but fraught with occasional PC lockups. I always felt I couldn't push the limits of my computer when the TV card was running and I had to be especially careful not to move or resize the TV window too aggressively to prevent lockups. Maybe it was just bad luck, but it was bad luck with three different cards!

But I do want a TV in my work office. I don't find it especially distracting because I can tune it in and out in my head when I need to. Hence the 910MP. It's attached to my server on a table to the side, and I switch between Monitor and TV sources using the supplied remote. While it's in Monitor source, I can also bring up the TV in a PIP window, something in which I have no particular interest. And — to me — the best thing about all this is that the PC has no knowledge of the TV at all. No lockups.

This device does not have a lot of input/output choices, just the essential ones: Cable Coax, a not-too-accessible headphone jack, AV In (a three jack set - stereo and composite), PC In (15-pin D-Sub VGA and Stereo 3.5mm jack). It has no DVI or HDMI inputs. It has a very good remote with all functions. It has a row of nine buttons at the bottom of the unit, but the labeling is hard to read, and I've never attempted to use them. The speakers are fairly large and adequate.

As for using it as a PC monitor, it works very well. The display is clear and crisp, with no dead pixels. The contrast ratio is an excellent 700:1. My oldest son is using a standard 19-inch LCD Samsung monitor and also had a TV failure and was looking for a replacement TV. He also wanted a dual monitor setup for his primary PC, so I ordered one of these for him too. So his 910MP and his 19-inch LCD monitor are sitting side-by-side. He claims the new 910MP is somewhat crisper with better contrast than his LCD, probably due to the high contrast ratio.

The current price for the 910MP is $410 at NewEgg, but I paid about $350 for mine after a sizeable rebate from Samsung. Search around for deals, and be patient.

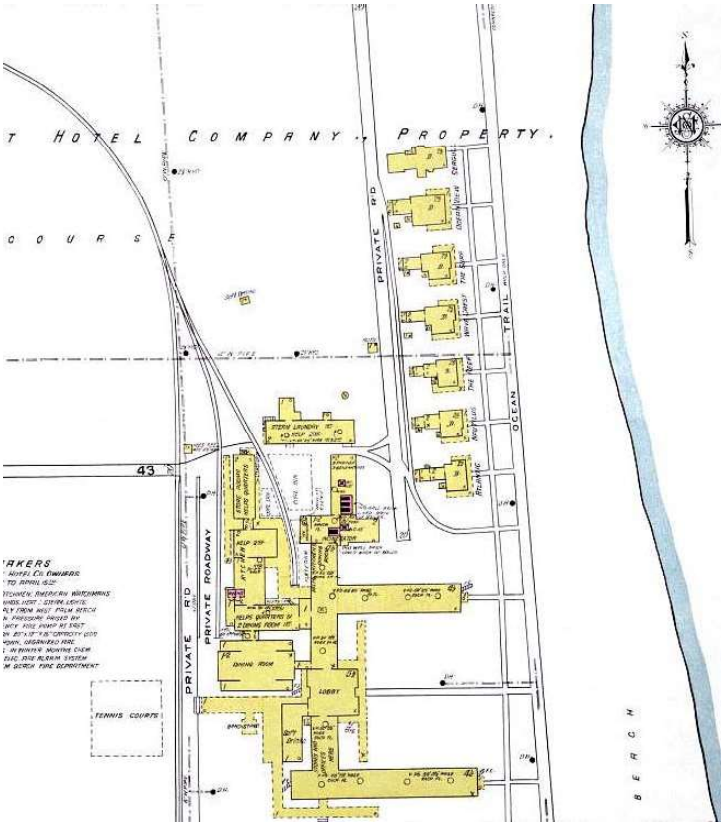
940MW TV/Monitor:
I won't go into as much detail as this is an LCD TV, but after buying the one Monitor/TV Samsung 910MP, I went out a month later and bought two TV/Monitor Samsung Model 940MWs to replace two aging tube type bedroom TV's. It has a wide screen with native resolution of 1440x900. At that resolution it's more a TV that also serves as a monitor, but perhaps it could be used functionally as a primary monitor if the vertical resolution is adequate for your own needs. On reflection, it's the same resolution as my notebook, and I certainly find that adequate as long as it's not my primary PC. Functionally, the two — 910MP and 940MW — are the same, except for the shape and the in/out ports. The controls are the

(Monitors……..Continued on page 6)

(Minutes……..Continued from page 2)

her role as the Member at Large; Doug Mullis would like to turn over the Secretary duties to another member, and Mike Hodges has a work conflict that makes it prudent that he give up the Treasurer's duties. We also have an important appointed position left vacant when Bruce Register moved from the area, that of "Official Greeter." This person greets members and guests at the beginning of each meeting and sees that nametags are worn and then collected at the meeting's conclusion. We need a slate of nominees at our November meeting, so let Mary, John or Kevan know of your interest to help lead our Group in the coming year. We will have the duties of the various offices put into the next newsletter. [See page 6.]

The Fall Conference of the FACUG is on Sunday, October 29th in Orlando. Please visit the FACUG website for particulars. Registration is $20 for this one-day conference.



November's program will feature Steve Singer from the RDI distributorship. Steve will tell us of the latest computer hardware, as he does each year. This presentation is always an interesting program to kick off the holiday buying season.

Ed White has suggested a PC Building SIG. Ed recently had fun building two computers and wants to share his experience. Let Ed or John know of your interest in doing this. We will need to find a suitable meeting place for this SIG group.

At 7:05 pm, John Witmer changed hats and became our speaker for the evening. His topic was Excel and

(Monitors.....Continued from page 4)
same, and the remote may be identical.

I bought these two at the same time at Staples because they were offering a $50 rebate after a $350 store price. One I use attached to a Windows Media Center PC I built to use as a PVR (Personal Video Recorder), with a Bluetooth keyboard and mouse. The other LCD TV uses one external input, a combo DVD/VCR, besides the TV. I'm using an HDMI-to-DVI cable, with excellent results at 720p resolution.

The 940MW has a wider range of input/output ports, comparable to what you'd expect on an LCD TV. Accessible on the left side is a headphone jack and AV input connectors with composite and stereo and also S-Video.

Less accessible underneath in the back is the TV cable connector and component In, audio and video. For PC connection, there's both a 15-pin D-Sub VGA and a DVI video connector and a 3.5mm stereo jack.

The current price at NewEgg is $339.

Incidentally, when you delve into LCD or plasma screens you'll be needing some very expensive cabling, HDMI-to-HDMI, HDMI-to-DVI, S-Video and others. Do NOT buy this cabling at retail stores. It is available online at a fraction of the cost. I bought two Phillips brand HDMI-to-HDMI cables at Sam's Club for $26 each. The cheapest at Circuit City is $85. Best Buy is $120, although they do have a 3-foot cable for $50. ◆

Election of TPCUG Officers is soon
The duties of the officers are:

1. President: The president shall foster and promote direction, leadership, education, and organizational goals. The president shall act as the legal head and chief administrative officer; exercise supervision of the corporation and its activities; represent and speak for the organization; preside at meetings of the members; appoint and discharge committees; sign letters or documents necessary to carry out the mission of the organization; and preside as the Chair of the Board of Directors.

2. Vice President: The vice president shall assume the duties of the president in the event the president is absent or incapacitated, or at the request of the president, and becomes president on the death, resignation, or permanent incapacity of the president.

3. Secretary: The secretary shall serve as the chief recording and correspondence officer and the custodian of the records of the corporation. The secretary shall take such steps as necessary to prepare and certify the correctness of member and Board of Directors meeting minutes; preserve all records, reports, and official documents of the corporation except for those specifically assigned to the custody of others; sign official documents to attest to their authenticity; and carry on the official correspondence of the corporation as directed, except for those matters assigned to other officers. The secretary shall assume the duties of the president and/or vice-president in the event the president and vice-president are absent or incapacitated and shall become president on the death, resignation or permanent incapacity of both the president and the vice-president.

4. Treasurer: The treasurer is responsible for the collection of funds, their safe deposit, and the expenditure of all funds for the organization; and for keeping an accurate record of the collections and expenditures. The treasurer shall submit a report at the Board of Directors meeting and prepare an annual report to the members. The treasurer shall issue payments for bills submitted to the corporation as approved by the Board

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Bob LaFave moderates the discussion.

(Minutes…….Continued from page 5)

its many applications at home and at the office. John said about 85% of his work on his computer is with Excel. He asked how many use Excel and to do what? Several responded they use it to make lists, keep financial records, to record genealogy information and to keep home business records.

John said Excel is a spreadsheet with cells that can contain a value, a formula, text or even pictures. It does functions invaluable for financial and statistical analysis. The power of Excel is in knowing how to use the many tools built into it. You can quickly set up payment schedules, inventories, payment records and plot histories.

John's company uses Excel to track sales activities and expenses, maintain personnel records, track monthly inventories, schedule events and track equipment usage and billing records. John showed us examples of these applications.

At home, John uses Excel for payment records, recording trip logs, cataloging and calendars. John catalogs photos and even did floor plan layouts of his home. Again, he walked us through his efforts and answered many questions.

John offered to help anyone apply Excel to projects they may be contemplating. Based on the interest shown during his presentation (which made us run overtime) and the group gathered around him afterward, John should be busy for a while. Thanks for presenting such an interesting topic, John.

Due to the lateness of the hour, we did not have a raffle for the Microsoft OneNote software door prize left by Blain Barton of Microsoft at our last meeting. If time permits at the November meeting, we will have a raffle at the end of the presentation.

The meeting adjourned at 9:10 pm. ◆

(Duties…….Continued from page 6)

of Directors or the membership, as per standing policy or special consideration by the Board of Directors.

5. Member at Large: The member at large shall serve in the capacity of an ombudsman for the members of the organization; propose a slate of candidates for the offices of president, vice president, secretary, treasurer and member at large, and perform such other duties as requested by the president and/or the Board of Directors. The member at large shall, to the best of one's ability, be accessible to the members and to bring to the attention of the Board of Directors those matters that the members, for whatever reason, wish to be brought to the Board of Directors rather than have those matters brought to the floor of the regular meeting. ◆

by Steve Wozniak, creator of the Apple I and Apple II personal computers and the co-founder, with Steve Jobs, of Apple. If there had been a lot of space to fill in the newsletter, I was going to do a full review of this book ($15 from Amazon), but the space is mostly filled, so here are just a few observations:

- Wozniak, tutored by his engineer father, started learning about electronic devices and transistors in grade school.
- As a pastime, he redesigned on paper the mini computers of the time so as to make them more efficient and to use fewer chips.
- He basically made the Apple I and II by himself.
- He was the first person to type input at a keyboard and to see it appear on a monitor.
- He loves to play pranks on people.
- He is not an ambitious person—and was happy to give the plans for the precursor of the Apple I to anyone (this is where Steve Jobs' business sense became important to the creation of Apple).
- Being shy, he thought he might never have a girl-friend. He is now on his third marriage.
- Finally, Woz is a nice guy. ◆

Bits of Blue

December in Tampa

A Monthly Publication of the Tampa PC Users Group, Inc.

Vol. 19 No. 12 December 2006

Meeting

Smart Computing

Wednesday, December 13, 2006
6:30 PM
Art Pepin Hospitality Room
Pepin Distributing Co.
4121 N 50th St
Tampa, Florida

Meeting Preview: Jen Clausen will speak about Sandhills Publishing's magazines and the Smart Computing User Group program. Jen will step us through an issue of Smart Computing, convey the value of SmartComputing.com through a live demonstration and introduce attendees to Smart Computing's sister publications - PC Today, Computer Power User, and the Reference Series.

We will also have the usual half-hour Windows SIG.

lamartin@tampabay.rr.com

Scanner solution Recently I wrote about not being able to purchase a replacement negative holder for my Epson scanner. Well, I have found a solution. It's an 8"x 10" piece of clear glass. I simply put the negatives on the scanner bed aligned parallel to the side of the scanner and then place the piece of glass over them to hold them in position. It works for all negative sizes. The only difficulty is getting the negative aligned properly.

IE 7 I have installed IE 7 on my laptop and my desktop with

Minutes of the November Meeting

By Doug Mullis, Secretary, Tampa PC Users Group
dmullis@tampabay.rr.com

Bob LaFave started the Windows SIG portion of our meeting at 6:35 pm. A member stated he had bought a music CD in Europe and could not get it to play. Steve Singer (our speaker for the evening) said that foreign CDs and DVDs are encrypted to play only in the zone intended. There are programs for decrypting CDs and DVDs so this is what will be necessary.

Bob showed us a device that accepts standard Stereo cable inputs and sends the signal to your PC through a USB connection. This allows you to store music on your hard drive or make CDs. There also is a turntable available with a USB connection.

At 6:50 pm, Bob turned the meeting over to Member at Large Mary Sheridan to conduct the business of presenting names of nominees for next year's group officers. John Witmer has agreed to continue as President. Jim Purcell has agreed to be nominated for Member at Large. We need members to step forward to serve as Vice President, Secretary and/or Treasurer. Doug Mullis is willing to be nominated for Treasurer if someone else will be Secretary. Eddie Rodriquez has agreed to be our new "Greeter" at our meetings. Way to go, Eddie and Jim! Elections will be conducted at our December meeting.

Mary asked if we want to party at our December meeting. Smart Computing Magazine will make their annual presentation after our election of officers. If you want to party, please bring finger food or holiday desserts to share at our December 12th meeting. We will set up a table as was done in the past.

At 7:05 pm, Mary introduced our speakers, Steve and Pam Singer with RDI-Tampa. Steve is our local dis-

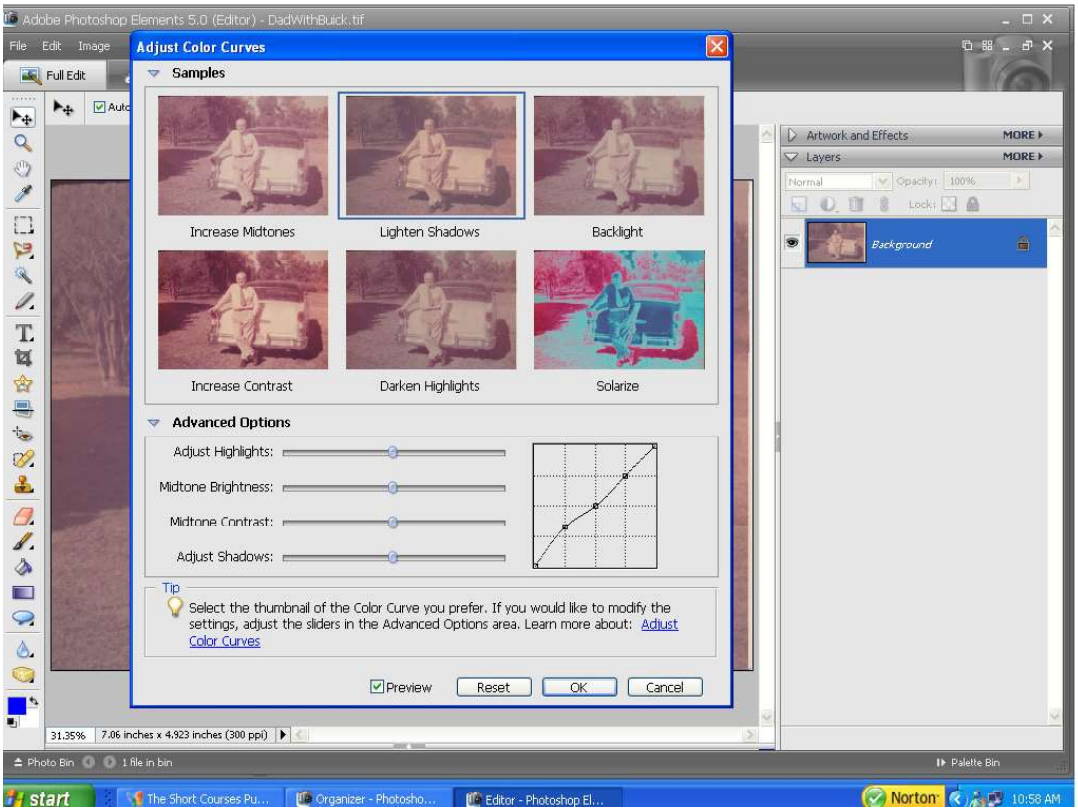
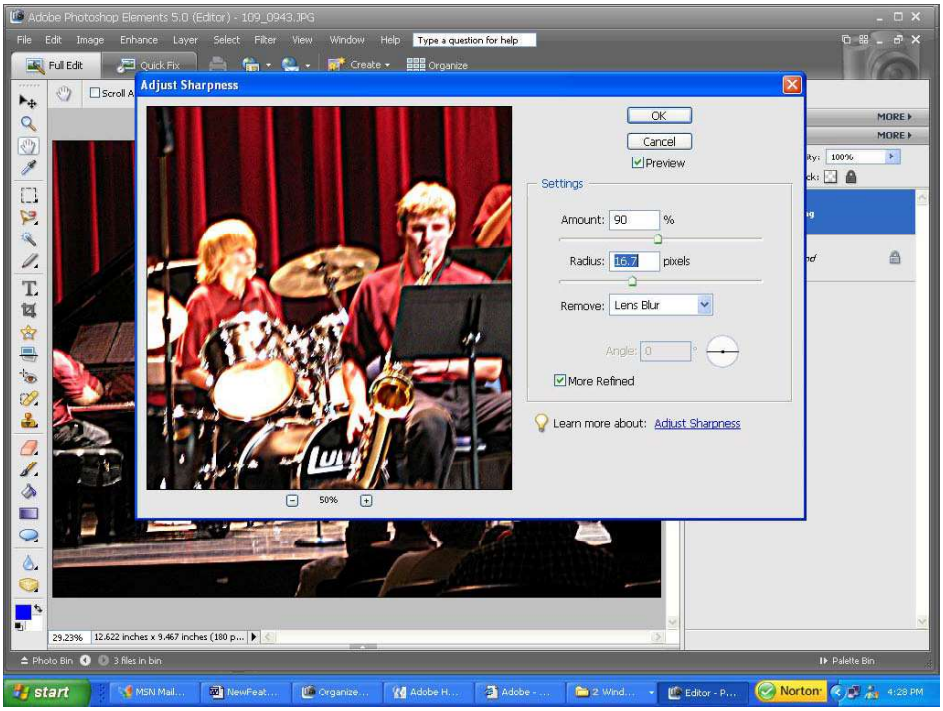
Photoshop Elements 5 — New Features



By Jim Purcell, Tampa PC Users Group
Edward_J_P@MSN.com

Overview There are many online references in this article, so you might want to download the HTML version of this article from the TPCUG web site, http://www.tpcug.org, so that you can merely click on the URL. The basic structure and functions of Photoshop Elements were broadly covered in the article on Photoshop Elements 3.0 published in the August 2005 Bits of Blue, which can be viewed and downloaded at the TPCUG web site. Photoshop Elements is made up of three parts. The first is the Organizer that is used to gather the photos and provide a sophisticated system for organizing them with a user-designed tag system, by time or by the Windows folders to which you have assigned them. The Organizer also provides a system of backup and archiving your photographs. The second is the Editor, which is divided into two parts, the Quick Fix Edit and the Full Edit. The Quick Fix is largely a set of one-button fixes to the most common problems with photographs. The Full Edit is a set of commands using sophisticated commands, filters and layering to correct or improve almost any problem you might encounter in improving the quality of your photographs. The Editor also provides a large number of tools to create special effects. The third is the Creator, made up of Photo Creations and Digital Creations. Photo Creations are print-oriented projects. The Digital Creations are primarily computer or web-oriented. As you can imagine, there is also crossover between these two categorizations. The commentaries I have read indicate that Photoshop Elements has practically everything that is included in Photoshop that the average amateur photographer requires and that many of the Photoshop features been included in Photoshop Elements have been powerful features that have been modified to make them easier to use. To get a thorough look at the entire program, you can download a full-featured copy of the latest version (5.0) for a free thirty-day trial at http://www.adobe.com. The new features in Version 4.0 were reviewed in the December 2005 Bits of Blue newsletter, which is also available for view and download at the TPCUG website.

Some of the more significant new features appearing in Version 5.0 of Photoshop Elements are:



Correct Camera Distortion: The "Correct Camera Distortion Filter" is a popular Photoshop filter that has been transferred to Photoshop Elements minus some of the advanced options. Adobe has made this tool very easy to use in Photoshop Elements. This one filter allows correction of distortions caused by being too close to your subject, by having been forced to take the picture at an odd angle, or by shadows caused by the lens hood. These photos are most often of buildings which are obviously out of perspective, or of faces that look like balloons. The filter can also be used creatively to purposely create some of these distortions.

(Elements……..Continued on page 4)

(Elements……..Continued from page 3)

Sharpen Blurred Edges: The new "Adjust Sharpness Tool" goes beyond the Unsharp Mask that has been probably the most used method of sharpening photos. The Unsharp Mask tool reduces Gaussian blurring, which often is not the cause of the blurring. This new tool, which is quite easy to use, is capable of reducing Gaussian Blur, Lens Blur and Motion Blur. You are given a dialog box (*See Below)* that contains the image you are sharpening so that you can see the results of your changes in real time.

Fine Tune Exposure: The "Color Curves Tool" is introduced in Version 5.0. It is the feature that evidently was the one most requested by Elements users. It is similar to "Levels" but gives many more points of correction. It is not quite as powerful as the Curves Tool in Photoshop, from which it was adapted, but is much easier to use. A short video tutorial that explains the details of its use can be seen at: http://www.adobe.com/special/photoshopel/pse5_help_cc_26.html .

Enhanced Support For Raw Files: Raw files can be likened to a digital "negative," in that they contain the raw data of your picture before your camera makes the changes needed to produce a JPEG, TIFF, or other file format. The Raw format is most used by advanced photographers and sparingly if at all by the amateurs. No matter which you are, it is nice to have this capability if you have a very special subject that you want captured in all of its detail. You can process and edit the raw files of most cameras within Elements 5.0. This is apparently a great time saver. The Adobe Camera Raw Converter allows you to make sophisticated corrections to your photos even before you open them, and you can further edit the file once it is opened.

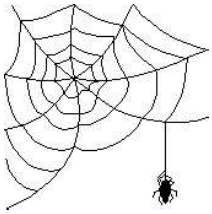
Create Dramatic Black and White Photos: Previous versions allowed you to remove the color from a photograph. The process is described by Adobe as follows: "The Remove Color command converts the colors in the image to gray values by removing all the saturation from the image. It assigns equal red, green, and blue values to each pixel in an RGB image, so the image is still in RGB mode. The lightness value of each pixel does not change". The "Convert to Black and White" command gives you the ability to make the conversion decisions that are decided for you by the software in the Remove Color Command. This may not seem like much to those of you who lost interest in black and white when color photography became available, but to someone like my daughter it is a terrific feature. She seems to have inherited all of the creative genes that both my mother and her mother possessed. She has done some neat things with black and white photography. I know that she and those of you who are convinced that the birth of color photography spoiled your chances to become the next Ansel Adams will enjoy this new command. Click on the URL below to view a short video tutorial that does a good job in explaining just how simply this command works. http://www.adobe.com/special/photoshopel/pse5_help_cc_27.html

(Elements……..Continued on page 5)

(Elements……..Continued from page 4)

Creations, New Ways to Show Your Photos: Photo Creations includes such things as photo layouts, album pages, DVD or CD labels and greeting cards. They can be single pages or, thanks to a new feature in Elements 5.0, up to thirty pages in one file. The new photo layout feature provides many formats but allows all to be customized. Another new feature allows you to size and resize the photos and artwork that you bring into the layout with no loss of quality, and you can still edit the photos after they are brought into the layout. You can print or email these projects or burn them to a CD or DVD. If you are interested in scrapbooking, the tools and artwork provided within this program will boggle your mind (Check the commercial website at http://www.scrappersguide.com). Digital Creations enables you to make flipbooks and three types of photo galleries that are web-oriented and animated. These can be burned to a CD or uploaded to your website or to a free service provided by Adobe. The wizard does all things necessary to allow you to send the folder, which it creates, containing your project via FTP to your web server. To get an idea of the magnitude of this section of Photoshop Elements 5.0, you can click on the URL below, which will bring up the "Idea Gallery" from Adobe. There are six colored boxes at the bottom of the page. The first contains the two tutorials referenced above. The last five contain examples of what you can do and a section in each that tells you how to do it. There is also a fifteen-minute overview of Photoshop Elements 5 and a shorter one on using the program in conjunction with Premier Elements 3.0. http://www.adobe.com/digitalimag/ideagallery/ ◆

Internet Picture of the Month



Three test mice

This was in most news outlets on the web in early November. The description below is from the Wall Street Journal (http://online.wsj.com). The exact link is http://online.wsj.com/article/SB116239800769710272.html?mod=mostpop. However, you will need a subscription to view it.

In a Harvard Medical School and the National Institute on Aging study, "three 15-month-old mice from the study were fed, from left to right, a standard diet, a high-calorie diet and a high-calorie diet plus resveratrol. Although it still got fat, the mouse on the right had a 31% lower chance of dying as it aged than the control mouse next to it."

Before you run out and buy some red wine (which contains resveratrol), note that the article also said: "A person would need to drink more than 300 glasses of wine a day to get the amount of resveratrol the mice got."

Replacing that old cassette

By Ron Weinberg, Tampa PC Users Group
rswjbr@verizon.net

Music CDs have virtually replaced cassette tapes. Many new cars have no cassette slots. CDs are relatively inexpensive and of higher audio quality than most tapes. Converting from tape to CD is probably not worthwhile in most cases. But then again, there are old favorites that may be hard to find in CD format.

Since I had a good sound card (Sound Blaster Audio 2 ZS) with a line-in jack, accompanying software, a CD Burner, and RCA Audio Cables left over from some old equipment, I decided to try. There may be more sophisticated and fully-automated programs, but I decided to work with what I had available.

None of my in-home cassette players or radios however, had proper output ports. Earphone ports were not recommended. This was corrected by borrowing an old Technics cassette tape deck.

To connect the deck to the jack with the cable, I needed to purchase an inexpensive Y-adapter at Radio Shack that accepts two RCA phono plugs and fits a 1/8" stereo phone jack.

The Sound Blaster Card came with a complement of 13 programs from Creative, which allow great flexibility in creating and editing audio. Not being a music guru, I selected the basic Creative Media Source Player, which has a record feature. It creates MP3 files. It was necessary to select the input or Recording Source as Line/CD/AUX/TAD/PC.

Examining the various options of the Creative Media Source Player software, I found an EAX advanced HD Console that has an option to automatically remove unwanted noises in audio, such as hisses, clicks and pops from external sources. I set this option ON using its default settings.

I started the tape deck playing, clicked on Record in the software panel, and the work was in progress. At the end of the first side, I stopped recording and saved the file so as not to have blank space while the tape was reversing or switching to side 2. I manually reversed the tape and repeated the process for side 2. When complete, I saved the second file.

My CD-DVD writer came with Sonic's *Record Now Plus,* which has an option to create an Audio CD for Car or Home Player. Using that, I burned both files onto the CD and tested it in a boom box. The result was a CD with two audio tracks, fair sound, and poor volume.

Unsatisfied, I rechecked the recording software and found a Surround Mixer Panel that had a Master Control, which allowed me to increase the volume setting. Note that the volume dial on the tape deck had no effect on the resulting volume.

After setting the Master Volume to high, I repeated the copy and burn processes, and the result was a success. ◆

(Minutes……..Continued from page 2)
tributor of computer related devices and tells us the latest and what is coming. Pam keeps Steve on course and brings him back to earth when his enthusiasm gets him talking too fast.

Steve first reflected on statements made during the Windows SIG meeting relative to encrypted foreign media devices. There are several programs available for decrypting material from other countries. Some may already be on your computer. Find someone who knows how to use them.

Next, Steve told us about the BitTorrent's web site for downloading audio, video, images, ebooks, games and software for FREE. You do have to become a member by paying either a flat or annual fee. According to Steve, you can earn credits by sharing materials you download with other members. Try http://www.BitTorrents.com for particulars.

Steve says there are wireless video extenders, which

(Minutes……..Continued on page 7)

Special Interest Groups

Microsoft Access SIG

This SIG meets the **first Tuesday** of the month at 6:30 PM. The meeting location varies. For information contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merle@merlenicholson.com.*

Digital Imaging SIG—Cancelled until further notice

Visual Basic for Applications SIG

This SIG meets the **third Wednesday** of the month at 6:30 PM. The meeting location varies. For information contact William LaMartin at *lamartin@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Bob LaFave moderates the discussion.

(Minutes…….Continued from page 6)

will connect your TVs or music system to your PC using Windows Media Center or D Links software. Antenna extenders can be attached to your wireless router and network cards to improve signal strength. New routers now come with multiple antennas for greater performance. Signal strength is increased by up to three times. The new 802.11n (NIMO) wireless performance standard will be out next year. Speeds and distance will increase substantially. This standard will apply to multiple antennae devices.

Wireless USB is coming, similar to Bluetooth but probably faster. Voice-over IP is an inexpensive way to talk by telephone over the Internet. Voice-over IP can save you lots of money in long distance charges. For $35 a year, you can get a local phone number for receiving incoming calls over the Internet. Or you can have Sip Phone (Gizmo Project) installed, which will give you multiple phone lines using the Internet. Steve can set you up if you are interested.

We now have a choice of Verizon FiOS or Bright House (Time Warner). FiOS is all digital and cheaper for the time being, but negotiate the best deal you can, as Verizon will deal to get your business. Make sure you don't get short-changed on the number of TV channels you desire. FiOS does require a battery backup that you will be required to maintain.

Finally, Steve told us of motherboards he has to offer and distributed price sheets that not all got to see. Also Steve has rebuilt some past generation computers starting around $50. They may be as slow as 133 KHz, but they're great for your Mom to surf the Internet.

Steve answered members' questions and gave information on how to get free passes to new release movies and how to get cheap popcorn to boot.

No door prizes were raffled at this meeting because of the time. The meeting ended informally at about 8:40 pm. ◆

(Comments……ontinued from page 1)

no real problems other than getting used to the new interface. I did notice an increase in security settings when I open web sites on my computer for editing with FrontPage and other programs. But others I know have not bee so lucky.

One person noticed that immediately after the installation, if she left her computer unused for any length of time, when she returned to try to open a web page or send an email, nothing would happen—neither IE nor Outlook Express would respond. The solution to this problem was to change the power settings for her computer from an energy-saving mode to one that only shut off the monitor after a certain length of time. The energy-saving mode was putting the computer in standby, which had caused no problem previously.

Another person could not open any message in Outlook Express after installing IE7. If she clicked on a mes-

sage, she would get an error message to the effect that there was something wrong with the address book and it could not be loaded. If you looked up the exact wording of the error message, there was a solution at Microsoft.com that supposedly provided a solution. It basically involved finding your address book, copying it to the desktop, then deleting all address books under your profile (which had somehow become corrupted). That should allow you to then open Outlook Express and to import the information in the old address book, and everything should be OK.

However, that did not work. As soon as she would touch the address book in OE, the same error message appeared. After some thought, I think I know the problem. What she thought was her profile was probably not her profile. So, since she is the only user of her computer, she should delete all the address books (.wab files) on her computer except the one she put on the desktop. Then OE would create a new blank one into which she could import the data from the one on the desktop. But she has not tried this yet.◆

Meeting Preview: William LaMartin will demonstrate how to create and manage a web site using Microsoft Expression Web and Visual Studio. Expression Web is just now available and is the replacement for FrontPage.

We will also have the usual half-hour Windows SIG.

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

As noted above, I will be doing the presentation this month. It will be an introduction to Microsoft's new web site creation and management program, Expression Web. I have just used it to give my personal site, http://www.lamartin.com, a new look and will use that as a basis to demonstrate how to create pages with a consistent look and feel, where this look and feel can be easily changed by changing the layout of one master page.

Additionally, I will show how Visual Studio can be used to make the sites much more powerful, with interactivity, programming and database connectivity. Also, we will see what needs to be implemented to make the pages render properly in different browsers and even in hand-held devices. ◆

Minutes of the December Meeting

By Doug Mullis, Secretary, Tampa PC Users Group
dmullis@tampabay.rr.com

President John Witmer opened the meeting at 6:40 pm by welcoming Mike Hodges, who has served as our Treasurer for several years. Due to his work schedule, Mike is unable to attend many of our meetings and has announced a desire to turn over his duties at year's end. John then introduced a visitor, Nancy Norton.

President Witmer then turned the meeting over to Bob LaFave to conduct the Windows SIG portion of our meeting. Bob asked if anyone had computer problems to present. Ed Snow wanted to know how to enlarge the screen print on his laptop. Bob explained how to change screen resolution.

Another member wanted to know how to eliminate paragraph symbols that popped up on her email this afternoon. Mary Sheridan suggested going to Outlook Tools, then Views and uncheck Paragraphs. Someone else asked which file format he should use. Merle Nicholson said NTFS wins "Hands Down" over FAT32.

Some discussion followed on security settings. Bob LaFave said the security programs are now so complex he recommends selecting the manufacturer's default settings in most cases. On the question on how to convert VHS material to DVD, Bob suggested using the $30 DVD Santa program. William LaMartin said he connects his VCR to his PC via three wires (left and right audio and yellow video) and a Dazzle adapter and captures the content. Bob said if you are having problems playing DVDs you've created, get a new inexpensive DVD player, as they are now compatible with many formats.

At 7:10 pm, Member at Large Mary Sheridan took control of the meeting for the election of officers for calendar year 2007. The slate is as follows: John Witmer has agreed to continue as President. Kevan Sheridan agreed to continue as Vice President. Doug Mullis agreed to assume the duties of Treasurer. Jim Purcell agreed to become our Member at Large. The votes in favor of all were unanimous

Buying a Notebook Computer & Other Stuff

By Merle Nicholson, Tampa PC Users Group
merle@merlenicholson.com

Notebook sales have exceeded desktops this year, and they've been very close for several years. Part of the reason for this is that notebooks have become very competitively priced and, also at least technically, as capable as desktops. Also, I think that most universities have completely embraced the technology, and high schools and grade schools have followed, and notebooks make sense in those environments.

In this article, I want to offer what I've observed in the notebook market that may help in deciding what to buy.

The big compromise. Keep in mind that a notebook is a very severe compromise, balancing energy use (battery), weight, computing power and file storage. You can't have a very large, powerful desktop replacement and expect it to run more than an hour and a half on the battery! You can however have a small lightweight notebook that will run five hours!

All things are affected by this compromise: Screen size, battery capacity, hard drive speed and overall dimensions and weight. Every element that goes into the notebook is affected. It's up to you to find the balance of these elements consistent with your intended use. If I make it sound hard; that's intentional. It isn't a decision that you can make in a half hour of looking at notebooks at a store. Do your homework first.

Do not consider any notebook without finding good, up-to-date product reviews. They test things like how long the battery really took to run down. That's so very important. Just Google the model number and add "review".

First you must try to classify how you intend to use your computer 90% of the time. Classifications that I can think of are:

1. Desktop replacement next to a power outlet
2. Powerful computer most always in range of an outlet (business presentations)
3. Carry around all day (to classes)
4. Outdoors at Starbucks and occasional outlets
5. Entertainment (Play an entire DVD movie or play games for hours on a plane on battery)
6. Ultra light portable
7. Ruggedized (See Panasonic)

Most of these classifications are mutually exclusive. My own powerful notebook will just barely play a short DVD movie all the way through. I knew that when I bought it, knowing that I am almost always near an outlet. Remember that a battery six months old does not have the same capacity as new, and, if you use it a lot, may be ready for replacement after a year. Replacement batteries are typically $150. Sometimes they cost much more.

Next is screen size. If you're near an outlet 90% of the time, and you don't carry it a lot, you can go for both size and power. You can pick a 15.4" widescreen or 17" screen. With a mostly portable notebook with some outlet availability, you can pick a 14" or 15" screen and, if portability is paramount, pick a 12" to 14" screen.

So here's Merle's notebook rule one: Analyze your intended use (size and capacity vs. portability) and then pick a screen size consistent with that use. Remember that the big compromise prevents you from having both. Go to a big box store and look at screen sizes and the relationship to physical size and ignore the details until you have that down pat. Write down the model numbers, then find Internet product reviews to see what expert testers think of it.

Screen resolution. Find out what it is, not always an easy task. Let's say you pick the very popular 15.4" widescreen. Look at the vertical resolution. I've found five different sizes: 768, 800, 900, 1024 and 1080. In my opinion, a 15.4 vertical resolution should be at least 900. Anything less and you're looking at a cheap computer. A 768 is acceptable for a 12 to 14" standard screen on a lightweight notebook, but not 15".

Operating System. The choices right now will be XP Home, XP Pro and Windows Media Edition (WME). Also they're usually bundling a later Vista upgrade,

(Notebook……..Continued on page 4)

(Notebook……..Continued from page 3)
and, believe it or not, there are options to get an operating system CD for $10 or so (TAKE IT!).

I cannot think of one reason to buy a computer with Windows Media Edition that doesn't also have a TV tuner built in, but so far I've not found one with a tuner, and who'd want one anyway? And external USB tuners are poor. What are they thinking? Enough said about that.

The only real debate is between Home and Pro. If you connect in any way to a corporate system domain server (either locally or remotely through VPN), or wish to control the notebook with Windows Remote Desktop, you need Pro. Otherwise Home has everything you'll need. If you want to control another computer using Windows Remote Desktop from this notebook, Home is fine for this. The software is available for download even for Win 98.

Hard Drive. Be realistic. Look at your needs now, and determine if those needs are going to change. If you need to save the money, don't be afraid to get a standard 60G hard drive and supplement it with an external USB backup drive for your archived stuff or pictures that you don't need online. I'm using about 90G on my desktop right now, but my 60G notebook computer has only 40G used and I can easily clean some of that off. In the notebook world, the price per megabyte is much higher than for desktops.

Hard Drive speed is important. They come in 4500, 5400 and 7200 RPM. Believe me, the notebook takes quite a hit in performance if you have 4500 RPM drive and you are trying to do something intensive that requires a lot of pagefile activity. If you're doing just Internet, email and word processing, the standard drive is fine. Stray out of that arena, and you'll appreciate the faster drives. What's the downside? Battery life.

Battery. There are choices here, too. The standard Lithium-Ion battery has six cells. But most makers also offer 9- and 12-cell batteries for very little more, and they offer significant run time improvements, as much as a 50% increase. Be careful if you're ordering online, and don't mistakenly order a second battery instead of a replacement. I've never seen this option in a store, only online.

Wireless. All notebooks have Ethernet and Wireless/g built in. Do not be tempted to buy "pre-N". It'll be years until that becomes useful. An additional choice is built-in Bluetooth. After using a Bluetooth "dongle" sticking out the side of my notebook and worrying about breaking it off in there, I'd buy the internal Bluetooth in a heartbeat. I've bent the dongle so badly that I'm just amazed that it's still functional. I use Bluetooth for GPS, external keyboard and mouse, and, when I find a good Bluetooth headset, I'll use that for my Gizmo VoIP use and leave my large USB unit at home.

USB. My notebook has only three USB ports, and I wish it had more. I carry a tiny powered hub on the road, but it's just adding more to my collection of power cubes. I have finally resorted to applying labels on every cube I have, so I can't mix them up. That's pathetic.

Processors: There's too much on this subject to write about, so I'll try you give you my own summary.

Forget these: Duron, Sempron, Celeron, Pentium 4, Pentium D, AMD XP.

Celerons and Semprons are still being sold. Pass them by unless you need a really cheap, slow computer. These are the $600 computers you see advertised.

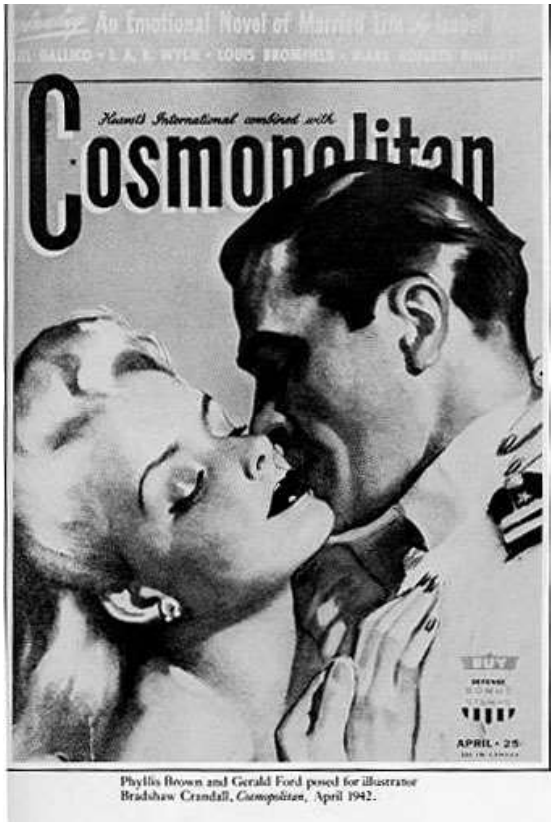
You'll especially find a lot of Core Duo (not to be confused with Core 2 Duo which is an entirely different CPU). Dell is selling systems with a 1.66GHz Core 2 Duo for only $108 more than a 1.6GHz Core Duo. Pass the Core Duo by if you can.

Look for these: Pentium M (older, but with Centrino, very good on battery life), Turion and Turion X2, and Core Solo, Core Duo and Core 2 Duo. The Turion X2 and Core 2 Duo are dual processor low power CPU's. Dual processor CPUs are a very good idea for extending battery life. It's a way to get very good powerful CPU's when needed but be able to partially shut down when not needed.

If you play games or use some specialized intensive

(Notebook……..Continued on page 5)

(Notebook……..Continued from page 4)



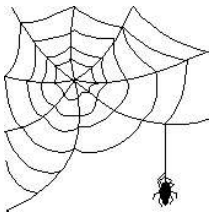
software, and it's very important to you, consider Turion and Core Solo, but at higher speeds (above 2GHz) than is available with 2 cores. The 2-core processors are faster overall, but almost all games and many graphic and movie editors and renderers are optimized for single-core. That's changing, but not very fast, and notebooks tend to have a shorter useful life.

Memory: Windows XP runs best with 512MB and up. It's a real mistake to cut corners here, because the lack of memory forces the OS to swap to the pagefile, and on a notebook with a slow hard drive, you take a real performance hit. To make matters worse, most notebooks' videos use a part of system memory. 1 GB memory, is best. You may also find that, if you want 1GB memory, it's cheaper to get it at the onset. Many 512MB systems use two 256 chips that fill all possible slots, so there's no way to just add 512!

Windows Vista: I would never, ever never upgrade an XP computer to Vista. That's my opinion. Notice I say "upgrade". That means that I'd expect all my installed applications to stay installed and all my data to be intact. Fat chance. BUT .. Replacing the entire system, maybe I'd do. I've read the offers that Dell and HP make which include a Vista coupon. It isn't clear whether the disk they will send you is a system restore or an upgrade. If it was a complete system restore (which effectively reformats your drive), and I was willing to reinstall all applications and data after the replacement, I might do it. … but it wouldn't be worth it. If I just *had* to have Vista on a notebook,

(Notebook……..Continued on page 6)

Internet Picture of the Month



Phyllis Brown and Gerald Ford posed for illustrator Bradshaw Crandall, *Cosmopolitan*, April 1942.

Gerald Ford?

From the site http://www.tommcmahon.net at http://www.tommcmahon.net/2005/05/world_premiere_.html we have what is possibly our 38th president working as a model.

From the site: "According to Carole Conover, in her book Cover Girls, President Ford also posed with Ms. Brown for a Cosmopolitan cover, issued in April 1942." And from the Ford Library: "…., we at the [Ford] Library cannot confirm or deny that it is President Ford in that cover."

(Notebook.....Continued from page 5)

I'd wait until it was available, and even … I doubt. Give it a year first.

Accessories: One thing I hate about my HP is a monster charger cube that is about 1/3 the weight of the notebook! What are they thinking? Targus and others make smaller replacements. I have several "notebook mouses," two of them with ZipLinq retractors. Also I have a good collection of other ZipLinq cables (try Amazon and TigerDirect). Targus makes an astonishing number of notebook cases, briefcases and backpacks. Go to Targus online for these; you'll find just exactly what you're looking for, and the prices have become reasonable. They used to have a very high retail markup, but that seems to be no longer the case (pun intended).

For home use, I use a Microsoft Bluetooth keyboard and mouse. I put the notebook on an old printer stand to get the screen up high enough for my eyes, and then I place the keyboard and mouse comfortably where my hands land. Remember that on a notebook the screen is located at a fixed distance from the keyboard. Obvious, I know. Consider, though, that your eyes' requirements are in conflict with your typing comfort. Ok, I guess, if you're under 25 and you're oblivious to the eyestrain and haven't experienced repetitive motion pain.

Warranty: The more I look at notebooks the more alike they are. For me, there are only six or seven variables, and I can get what I want from three or four manufacturers with very little difference between them. So I do some research on service and warranty and give the top-rated manufacturer the edge. I want to speak to someone I can understand on the phone when I call; I want extended hours for help; and I want to be able to send my computer out for repair and have it come back with all my software intact on the hard drive.

My brother-in-law needed a keyboard repaired on his Toshiba, and it came back with the hard drive in the same state as new out of the box. They'd done a system restore since it was their policy. Everything was gone. I think that's just inconceivably poor customer relations. The good news is that he called me first, and I convinced him to back everything up before he sent it in.

The major manufacturers are: HP, Dell and Lenovo (A Republic of China company; 20% is owned by IBM). Other name manufactures are Sony, Toshiba, Panasonic (which builds ruggedized ToughBooks), ASUS and Gateway. There are many others, and some build very good quality specialized notebooks like AlienWare (now owned by Dell) and Voodoo. Pick your manufacturer by their service ratings!

In-Store or Online: Consider this. Except for maybe adding memory, you're pretty much stuck with what you buy. And there are hundreds of configurations possible for each model. Stores carry what moves. That's obvious. What are the chances that you can get the exact configuration you want? Well, maybe they have something close that you're willing to compromise on. I did that, and I wished I'd realized that I could have gotten the internal Bluetooth online for the extra cost of the Bluetooth alone. Except for store clearances, I've never found a store to have lower prices than you can get online.

Finally, after you've bought: You still have a lot of work to do. First thing, before installing anything and before connecting to the Internet, you need to remove all the crap software (crapware). I'm serious. Go to Add/Remove Programs and remove all AOL, Yahoo, Google, Real, anything with the word "toolbar" or Screen Saver. Reboot, then uninstall all trial versions of Norton and McAfee, Trend and whatever the current favorites are. Reboot, then open Internet Explorer, click Tools, Manage Add-ons, Enable or Disable Add-ons. Disable all Add-ons except Sun Java and the Microsoft XML thing.

If you're fond of say Norton anti-virus, go to CompUSA and get a highly discounted anti-virus and anti-spyware program. It's usually much cheaper than an online subscription. They also sell 3-packs at a discount. Also consider some good alternative like free.grisoft.com, free AVG and Spyware or perhaps Kaspersky (not free, but highly rated). Install those and then attach your broadband. DO NOT use the Verizon or Roadrunner (Brighthouse) install CDs. You don't need them to attach to DSL or Cable, and you run the very real risk of adding more crapware. After connecting to the Internet, go to Windows Updates, and get

Special Interest Groups

Microsoft Access SIG

This SIG meets the **first Tuesday** of the month at 6:30 PM. The meeting location varies. For information contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merle@merlenicholson.com.*

Digital Imaging SIG—Cancelled until further notice

Visual Basic for Applications SIG

This SIG meets the **third Wednesday** of the month at 6:30 PM. The meeting location varies. For information contact William LaMartin at *lamartin@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Bob LaFave moderates the discussion.

(Minutes……..Continued from page 2)

Elections were concluded with terms to begin January 1, 2007. Doug will continue to serve as Secretary until a member accepts nomination and is elected to this office. Please step forward as Doug also serves as our Program Director and now Treasurer.

John Witmer announced we need a speaker for our January 10th meeting as Microsoft has requested to be rescheduled to March. Presentations on Outlook or Scanners were suggested. Vendor presentations are scarce so we will need members to take up the slack. Volunteers? Get with John or Doug.

At 7:20 pm, President Witmer introduced our speaker for the evening, Jen Clausen, to tell us about Smart Computing magazine and the related website. Jen reminded us that Sandhills Publishing produces not only Smart Computing, but also PC Today, CE Lifestyles, Reference Series and Computer Power User.

Jen started by telling us she is from a small town in the middle of Nebraska and that her office is in Lincoln, which is notoriously cold in winter. Tours of Florida are envied assignments at this time of year, so she is pleased to be here. Packets were handed out containing the January 2007 issue of Smart Computing, a ball point pen with logo, a published guide for using the Smart Computing website and a mouse pad with 2007 calendar, email address and toll free phone number for technical support. Smart Computing boasts being written in plain English for computer users of all skill levels with acronyms explained the first time used in an article. The purpose of the magazine is to improve the computer skills and productivity of its readers.

We then scanned the issue distributed, starting with the Cover Story, which may be several articles. The cover subject is always something of a timely interest. Jen next reviewed the Software and Hardware Reviews section. These reviews are actually done by the writers based on their hands-on experience, and the programs are scored based upon performance, ease of use, (ease of) installation, support/documents provided and price.

We then looked at the Windows Tips & Tricks section, which deals with Windows 98 through XP and will include Vista once released. Articles offer operating system information to make these systems perform at maximum efficiency. Jen then showed us Quick Tips, that is in a question and answer format explaining how to accomplish many tasks covering a number of applications. Next was the Plugged In or Web Tips section, which is all about the Internet and designed to enhance our online experiences.

Mr. Modem's Desktop is a lighthearted series about computers and interesting websites. And finally, Jen covered the Tech Support section, which explains error messages and offers fast fixes to problems you may encounter.

Leaving the magazine, Jen told us about the Smart Computing website, where you can seek support through the Q&A Board, Chat Rooms or Forums, read articles from Smart Computing, Computer Power User or PC Today and create a library of your favorite articles. Articles are PDF and printer friendly. Jen gave us a tour of the website, showing us the many ways we can get support/answers to computer problems or simply improve our efficiency in our applications.

Smart Computing provided door prizes, with the three winners being drawn by Jen Clausen. Prizes and winners were:

- Smart Computing for one year—Nancy Norton
- Smart Computing Reference Library—Merle Nicholson
- Smart Computing Tee Shirt—Ed Purcell

Lucky winners! Thank you, Jen, for the nice door prizes.

The meeting adjourned at 8:25 pm. Attendees partook of the Holiday buffet. See you next year! ◆

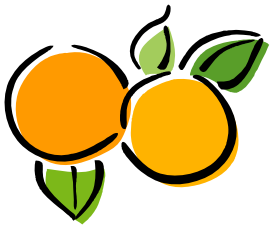
First Class Mail

☐ *Member: Your membership is up for renewal*
☐ *Vendor: Your product was reviewed on page ___*

(Notebook……..Continued from page 6)
your computer up to date.

Look at your MSCONFIG startup list and also your System Tray. See if there's any crapware you can remove or disable. You don't need Adobe Reader to "call home" through the Internet every time you start your computer to see if there's an update. Note what's on your system tray; write it down before you install any more software so you'll know what came with it and what you've added since then.



So why do Dell, HP and all the rest put crapware on all new computers? They're paid to. It's income for them. Think of it this way. Yahoo makes money how? From targeted advertising. Advertisers pay them, right? The more advertising they get out there, the more they collect, so paying Dell to install the crapware on YOUR NEW COMPUTER makes sense to them. It's easiest to remove this stuff when the computer is new. If you need help with this, just take advantage of being in TPCUG and call a knowledgeable member. ◆

Bits of Blue

February in Tampa
Oranges

A Monthly Publication of the Tampa PC Users Group, Inc.

Vol. 20 No. 2 February 2007

Meeting

Digital Photography

With Keith Bunch
of
North Tampa Photography
Wednesday, February 14, 2007
6:30 PM
Art Pepin Hospitality Room
Pepin Distributing Co.
4121 N 50th St
Tampa, Florida

Meeting Preview: With so many of our members interested in digital photography, it will be a treat to hear the presentation from Keith Bunch from our premier photo store in Tampa, North Tampa Photography.

We will also have the usual half-hour Windows SIG.

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

As is not unusual for me, I did not get to the end of my planned presentation at last month's meeting on building web sites with Microsoft's Expression Web and Visual Studio. The Expression Web part was fairly well covered, but the Visual Studio part wasn't. Partly this was because our Windows discussion went a good bit over time. But such discussions are what the group is all about, so I was reluctant to suggest that we close it down. Anyway, the Visual Studio part you missed would have been more technical and would have given you some insight into what goes on behind the scenes on the server to create more functionality than could be obtained by the standard static web page. Perhaps that can be covered at some future meeting when a presenter is hard to come by.◆

Minutes of the January Meeting

By Doug Mullis, Secretary, Tampa PC Users Group
dmullis@tampabay.rr.com

President John Witmer called the meeting to order promptly at 6:30 pm and then turned control over to Bob LaFave to conduct the Windows SIG session. Bob showed us the Microsoft SyncToy 1.4 program for copying, moving or renaming files between folders or even computers quickly and easily. This program can be gotten from Microsoft.com's download center free of cost. Bob demonstrated the ease of using this program to make backup files on Flash or other external storage devices.

Nancy Cottrell asked about installing a program for making backups. It was generally thought the feature could be gotten from the Windows installation CD. Discussion followed on backing up your hard drive and the making of music CDs.

Another member was having user sign-on problems. Bob told him about TweakUI, another free, useful program from Microsoft, which gives access to system settings not revealed by Windows XP and allows changes to default settings including automatic logon and privacy settings.

Expanding on a discussion started last meeting, Merle Nicholson gave us a little history on FAT 32 and NTFS file systems and recommended converting to NTFS.

At 7:15 pm, President Witmer ended the very lively SIG session for group business. A record number of guests this evening included Nancy Norton, Brooks Rimes, Roy DeArmond, Eric Goldstein, Emily McGee and Tim Condon. This was Nancy's second visit, and Tim previously was a member. A welcome was extended to all with the hope our guests will join

apcug Member of The Association of Personal Computer User Groups

Bits of Blue—10 Years Ago

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

My main impetus for writing this article is that, beginning last month, the newsletter is being printed at Pepin Distributors by John Witmer. Prior to that, since October 1997, Larry Anders of Marshall and Stevens allowed me to use their copy machine to print the newsletter. All we provided was the paper. That is almost 10 years of basically free printing. Thank you, Larry and Marshall and Stevens!!

I think that during that time I used three different copy machines, each one superior to the previous one. In that time, we have gone from printing around 220 copies of a 12-page newsletter of mostly 10-point type to printing 75 copies of an 8-page newsletter of mostly 12-point type.

We did not actually have around 200 members then. It was probably more like 150 members. But to take advantage of the bulk mail rate, we had to mail at least 200 copies. So I would mail around 204 copies each month, with the extras going to vendors and friends of the group. As our membership shrank, I started mailing more than one copy to some of the membership to make the 200 quota. Then one day, I ran a spread sheet analysis that demonstrated that, instead of mailing 200 newsletters by bulk mail, it would be cheaper to mail only to our membership and a few vendors and friends and pay first class postage.

A few years later, due to the difficulty of getting content from our members for the newsletter, we reduced the length from 12 pages to eight. However, the reduction in content was not all that much, since some of what was lost was just boilerplate that appeared unchanged in each newsletter. Still later, most often we printed the newsletter in a 12-point font due to less original content being available from the membership. Occasionally, the membership comes to life and provides enough articles so that I need to reduce the font to 10-point type to make everything fit. However, this month is not turning out to be one of those times. To fill up any remaining space in this newsletter, I would like to look back and see what sort of articles we had in the newsletter when Larry first started letting us use his office machine.

In that October 1997 newsletter, Larry Anders wrote about his new digital camera, a Sony Digital Mavica, which stored its images on a 1.5 MB floppy disk. Boy, how things have changed - a camera that took a full-sized floppy for storage! Don Patzach had an article about the DriveCopy program from PowerQuest. Of course, PowerQuest was subsumed by Symantec a few years back.

In the same newsletter, Larry Anders also had an article about a new type of 3.5 floppy drive and disk, called the SuperDisk LS-120, that would hold 120 MB of data . Its price was from $175 to $200 and was competition for the Zip drive. Like Larry, I also had two articles. One was on the software called Microsoft Dictation and Voice, which was really a work in progress that could be downloaded from Microsoft and was not really a commercial product. The other review was of a video capture card called Computer-Eyes/RT Video Capture. It was used to capture a single frame and not a continuous video. As an example, I used it not to capture a frame from a TV program but to capture a frame from a video that my daughter took of me with a video camera. You cannot see how young I looked back then, since the online newsletters only go back to January 1998. You will just have to take my word for it that there is a difference between then and now.

As a point of interest, in that October 1997 newsletter is says that the current officers were:

- PRESIDENT.—.Connie Kincaid
- VICE PRES.—.Mike Hodges
- TREASURER—Wil Goble
- MEMBER AT LARGE — Bruce Register
- SECRETARY.—.Merle Nicholson

It also notes that we had a BBS with Mary Sheridan as SYSOP.

In the November 1997 newsletter, Larry Anders had an article about the Power Cat Touchpad, which he had begun using for computer input at the suggestion

(Bits of Blue……..Continued on page 6)

Targeted Advertising and Crapware on New Computers

By Merle Nicholson, Tampa PC Users Group
merle@merlenicholson.com

Undesirable software is being installed at the manufacturer on all new computers meant for the consumer market. The results are new computers that, at worst, are running badly right out of the box, and, at minimum, need some expert attention to remove software so that the computer is running optimally.

Taken one at a time, they don't sound too bad. For instance, right now you may really like the Google Toolbar and you'd say that if I bought a computer with it preinstalled, that it'd be easier than installing myself. But here's the catch: Do I need fifteen programs preinstalled on my new computer? How do I know which ones I want to keep and how do I get rid of the ones I don't want? The most dangerous thing is how do I distinguish a really bad program from a program that the computer really needs to run? How do I get rid of a browser add-in when it does not have an uninstall? How do I find out what each one does?

I've looked at a half-dozen brand new computers regarding this problem over just the last year, and I can conclude a couple of things. One, the situation is getting worse, and, two, if you clean up your new computer it will run significantly faster and the power-up time will be reduced an amazing amount.

So why do they do that? I'm talking about Dell, HP and Gateway. I haven't looked closely at other brands, but I don't see any indication that all of them are not doing this to some extent. If there's a brand out there that refuses to load their computers up, they should be advertising: "NO CRAP SOFTWARE".

Back to why they're doing this. It's … you guessed it … money. What is Google's interest in this, for instance? Where does Google's income come from? Targeted advertising. The more advertising that gets pushed out to the consumer, the more money they make. So they pay Dell to preinstall it. That isn't saying that Dell thinks the Google Toolbar or Google Desktop is a good or a bad thing. It's saying that with the extra income from Google, Dell can either sell the computer just a little cheaper or can return more to their stockholders.

Let's explore an analogy. What if you bought a new refrigerator, and when you opened the door each time, a window shade popped down that said: "Wal-Mart Daily Specials on Ladies Undies"? You have to roll the thing up every time you want a jar of mayonnaise. How do you get rid of it? It's tied in such that if you rip it out, it appears that the door seal will be damaged. What do you do? The answer: hire a guy skilled in removing refrigerator advertising shades to come out at $60/hr to remove it. Here's the catch. They didn't say anything about this advertising gadget in the literature when you ordered your refrigerator, and the one you looked at in the store must have had it removed, and you looked at the warranty fine print and did not see a warning: *"Caution. This computer...oops...refrigerator may or may not have removable or non-removable crapware. We are not responsible for expenses incurred in removing said crapware. Your warranty may be voided if damages are incurred in the removal of such crapware."*

The same goes for the car dealer's name permanently mounted on the back of your new car. You can bet they don't do that until after the car is sold! Would you buy a new couch if they mounted a "Monaghan's Fine Furniture" plaque on it?

Back to crapware. First, I'll mention one thing. You can find out about all the crapware by Googling the executable name. Someone has written something about it, you can count on that. There are some specific websites that specialize in describing the programs by name, and, for the most part, you can get an assessment of their relative usefulness or dangerousness. But many of these sites are also trying to sell you something, usually a program that will remove the offending program. I've never purchased these because it's just too self-serving. Usually I can glean the manufacturer's name out of this and then go to that site to see what it is. I disabled a service called Bonjour Service from my computer when I investigated enough to find that it had been installed by the "Gizmo Project" software I use. It was written by Apple Computer of all things, and it's a "network

(Crapware…….Continued on page 5)

(Crapware…….Continued from page 4)

helper" that, when removed, has no effect on the use of Gizmo Project. Since then, Gizmo Project has included information about it in their FAQ's.

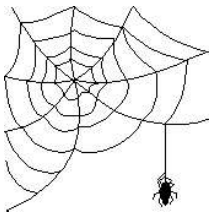
I'll classify some of the crapware programs into a few categories: 1) the "Call Home" programs, 2) the "Internet Access Sales", 3) the "Toolbar and Desktop programs", 4) the "Anti-Virus crowd" and 5) the "Really Useless Stuff."

1) "Call Home". The first things that come to mind are Adobe Update Manager, Dell Update Manager, and Windows Update Manager. You'll find the Adobe manager in the Startup manager, MSCONFIG. Do you want Adobe to call home to see if there are any updates ready for Adobe Reader, every time you boot the computer? Has any Adobe Reader update affected your life in any way? How many of these are installed on your computer, and how much time does it add to your boot time? Can you remember to manually look for Windows updates, instead of having Windows do it for you? At least that's configurable in XP. Incidentally, HP printer software is the worst! I've never had any consequences from removing HP software from the Startup in MSCONFIG. The last computerI looked at had four HP items.

2) "Internet Access Sales". The last Dell Notebook I worked on had an AOL icon in the Start tray, that, when clicked, gave you an opportunity to subscribe to AOL. This means that this program is running on your computer all the time it's on, for the life of the computer. To its credit, there was an uninstall in Control Panel, Add/Remove programs. But Wait! I

(Crapware…….Continued on page 6)

Internet Picture of the Month



The first hard drive

The photo is from http://www.intelligentmind.co.uk/moc_IBMRAMAC50th.htm. There we learn that (mostly quoting) The introduction of the 350 Disk Storage Unit made it possible for the first time to file, retrieve and manipulate information from database records in "real-time".

With the cabinet covers on, it measured 5' 8" tall, 5' wide and 2' 5" deep, and weighed in at over a ton. The unit comprised fifty 24" platters, one pair of read/write heads and a pulley system that provided both the vertical and horizontal head movement. Furthermore, the native storage capacity of the disk drive was 5MB.

Jenny Lind Olin alerted me to this monster. The photo she sent is similar to the one at http://www.elektriq.com/articles/technology-history-a-hard-disk-in-1956 which shows the drive being loaded onto a plane.

(Crapware…….Continued from page 5)
found two more internet services' advertising to remove while I was at it! Give me a break!

3) "Toolbar and Desktop programs." The worst offenders are (currently) Yahoo and Google, which have desktop managers and browser toolbars and IM (Instant Messaging) clients. Again, to their credit, there are uninstall programs. But, in addition, you have to go to your internet browser's Manage Add-Ons to make sure the toolbars are not running, and, if they are running and you have also done all the Add/Remove stuff, that you disable all the add-ons. Remember – the reason they are there is to provide you with some usefulness, but at the cost of targeting advertising directly to you. If you like Google, for instance, put a link on your browser toolbar to www.google.com to click on, and make your default search box in Internet Explorer for Google, all at no cost to you in computer resources.

4) The "Anti-Virus crowd". Every time I look at a new computer there's somebody's three-month trial anti-virus installed. Why do they do that? Well, obviously the anti-virus company is hoping you'll just click on a link and give them your credit card number; you'll get a year's subscription, and then next year they'll charge the same account for another year and send you an email that they've done that, that hopefully your spam filter doesn't catch first. What's going on here? The software company paid Dell to preinstall it, hoping that you'll not give it too much thought. And they installed the highest bidder's software. It has nothing to do with what's good, what's bad or the best software for the money.

Look, you've bought a new computer. New computers need anti-virus and anti-spyware. You know that. You probably know which ones you like, so consider them a part of the original purchase cost and have them ready when you fire the new computer up for the first time.

5) The "Really Useless Stuff". Let's start with Wild-Tangent Online Game network. It's installed. Do you need it? Do you know what it is? Let's look at QuickTime and RealPlayer. Do you need three media players? Really? You have Windows Media player already, and at least it isn't running until you need it and it goes away when you don't. So you run into a site that has a warning that to present some little video it needs Apple QuickTime. Do you really need to look at whatever it is enough to install QuickTime and have it running all the time? You can't turn it off! Yes, you can configure it so that it doesn't start at boot. But ... when it is used in any way, it doesn't shut off after you're done. When I discovered that, I sent Steve a personal note about it. That was two years ago, and I'm expecting any time now he'll apologize ….

Have you realized that your computer is getting slower over time, and you may as well go make a pot of coffee while it boots? Everything you load has a cost in boot time and in processing cpu cycles. So start while the computer is new, buy the anti-virus you need first, clean out the crapware, and then be diligent from then on. You'll be glad you did. ◆

(Bits of Blue……. from page 3)
of his doctor to help alleviate pain from a developing wrist problem. Don Patzsch wrote about the recent FACUG meeting in Sarasota, Merle Nicholson wrote about hardware gifts for Christmas. In the next newsletter, Larry Anders wrote about his new HP DeskJet 1000 printer and his carpal tunnel surgery (of interest to people who type at computer keyboards). Don Patzsch reviewed PowerQuest's Drive Image, and I reviewed the Encyclopedia Britannica '97 CD, where I noted how the once mighty Britannica had gone from being able to charge near $2,000 for a set of printed encyclopedias to selling the equivalent CD for around $100. Like many companies, they were too slow in adjusting their business plan to accommodate the computer. Time Warner's RoadRunner was to give the presentation that month.

Starting with 1998, you can view the HTML versions of the newsletter at our web site. In the January issue, Larry had an article about the Grolier Encyclopedia CD. (Boy, did he write a lot of articles back then. That was nice!) I wrote about Street Atlas USA 5 and also Quicken Delux 1998, and Merle Nicholson had a hardware article about a Umax scanner.

Special Interest Groups

Microsoft Access SIG

This SIG meets the **first Tuesday** of the month at 6:30 PM. The meeting location varies. For information contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merle@merlenicholson.com.*

Digital Imaging SIG—Cancelled until further notice

Visual Basic for Applications SIG

This SIG meets the **third Wednesday** of the month at 6:30 PM. The meeting location varies. For information contact William LaMartin at *lamartin@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Bob LaFave moderates the discussion.

(Minutes……..Continued from page 2)
our group.

John announced the Spring Conference of the Florida Association of Computer User Groups in Kissimee, Florida, March 2,3 and 4, 2007. This is always an interesting affair and a chance to see what other groups are doing and what is successful in regard to programs and speakers. Registration is $40 until Feb 10th, then jumps to $55, and $60 at the door. Five meals are included in the registration and the door prizes are worthwhile. Check their website at http://www.facug.org

At 7:20 pm, President Witmer introduced our speaker for the evening, William LaMartin, our award winning webmaster and newsletter editor. His topic was How to Create and Manage a Website.

William started by giving us a little history lesson. He said that the Internet was actually started as a military project and that Tim Berners-Lee created the World Wide Web in Switzerland in 1990. TPCUG has had a website since 1996, and you can view it by going to http://web.archives.org and then entering tpcug.org and clicking on Take Me Back. Be patient because it takes time to pull up your selections, just as it did back then.

William said the original TPCUG site was created using NotePad. He then moved to FrontPage, and he recently redid the site using Microsoft's Expression Web and Visual Studio. Web pages are much more complicated today.

William then demonstrated the features of the recently updated http://www.tpcug.org site, his neighborhood site, http://www.oldhydeparkfl.org, and his personal site, http://www.lamartin.com. All three of these sites have been updated in the past year to give them a more modern look.

One of the more interesting things was the Useful Things link at lamartin.com, where he had some examples of using Visual Studio programming in creating pages that "do something." Here is where you will find the Web Psychiatrist and a cost of living calculator.

The main part of the presentation involved using Expression Web to create an example site about New Orleans. Actually, he had already created the site and went through some explanations of how you use master pages or Dynamic Web Templates to give your site a consistent look. Also, there was mention of how to separate content from presentation by the use of Cascading Style Sheets (CSS), which are nothing but text files that tell a browser how to display web pages. He gave some examples of how by changing one CSS file, he could change the appearance of text on one page or throughout the whole site.

He didn't have time to go more deeply into the Visual Studio material or the database connectivity material.

The meeting adjourned at 8:55 pm. No door prizes were raffled at this meeting due to the late hour. ◆

(Bits of Blue……..Continued from page 6)

In the minutes that month, it was noted that the new officers were:

- Merle Nicholson, President
- Mike Hodges, Vice President
- Kevan Sheridan, Secretary
- Jenny Lind Olin, Treasurer

In the February 1998 issue, I wrote one of my Comments columns where I basically just go through all of the computer problems I have had during the past month. Some months the list was quite lengthy. Usually, though, I was also able to provide the solutions. I also had a review of FamilyTreeMaker 4.0, Larry Anders provided one of his many Shareware articles, and the Internet Picture of the Month was none other than Monica Lewinsky. Just looking at all the Internet Pictures of the Month over time is interesting to me.

In the March 1998 issue, we noted the closing of our BBS with two articles by Kevan Sheridan, the person who devoted so much time over the years to that endeavor.

So take a tour of the past by looking over all of the old HTML newsletters at our web site. ◆

We will also have the usual half-hour Windows SIG.

Editor's Comments: Vista and Other Things

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

Vista is now upon us, and, like all PC users, I need to decide if I am going to upgrade to it and, if so, upgrade how many of my computers. Of the three computers that are used regularly in this house, my main desktop machine is the only one I am considering upgrading. It is the newest of the group at just a little over one year old, having been built for me by Merle Nicholson (see the newsletter article http://www.tpcug.org/newsletter/nl_2006/january2006/new_computer.htm).

As everyone who is thinking of upgrading should do, I have gone to the Microsoft site several times to get the latest Upgrade Advisor for Vista to run on my main computer to see

Minutes of the February Meeting

By Doug Mullis, Secretary, Tampa PC Users Group
dmullis@tampabay.rr.com

Bob LaFave called the Windows SIG portion of our meeting to order at 6:35 pm. He suggested we check to see that the latest Windows updates had been received, as there were several this month.

Nancy Cottrell asked whether Microsoft Windows Defender or WebRoot Spy Sweeper was better. Windows Defender is free and is included in the new Windows Vista operating system. Spy Sweeper will cost you for the license each year, but they both do the job of protecting your PC from spyware.

Bob then told us some ways to monitor what's going on with our current programs. He also mentioned Windows One Care and some of the things it does. At present there is a $20 discount offered. He also is impressed with the service packages and prices offered by Internet Junction. NewEgg is still one of Bob's favored software and hardware providers. Check out their prices on whatever your computer needs are.

At 7:05 pm, President John Witmer began the business portion of our meeting by welcoming our attendees and guest speaker. We did not have any guests, but we had a fine turnout. With our new members, we are going to have to turn attention to issuing membership cards. Some computer stores like Comp USA give discounts to our members if you go to the commercial sales counter.

The FACUG Spring Conference will be Mar. 2 through Mar. 4 in Kissimmee, Florida. This is always the big meeting of the year, but the $40 discounted registration is now past. Still, you get several meals with a number of workshops offered along with im-

apcug Member of The Association of Personal Computer User Groups

Buying a Second Digital Camera

By Jim Purcell, Tampa PC Users Group
Edward_J_P@MSN.com

I recently purchased a second digital camera. Digital cameras have become so versatile that it's pretty hard to justify having two, but there are a couple of things I used to convince myself that it was a good idea. First, when I upgraded from my Canon PowerShot G3 about a year ago I gave the G3 to my grandson and instead of going for a Single Lens Reflex (SLR) Camera I purchased a Canon PowerShot Pro1, a high level point and shoot camera, sometimes referred to as a hybrid. It was less expensive than the SLR's, has Canon's best quality lens and many more features that combined to convince me that it had the capabilities that I needed and would in no way interfere with the full expression of my skills (of course, neither did the G3, but that's another matter). For a lot of reasons, the SLR is the way to go in order to get high quality photos, but SLR's are larger, generally more expensive and there are additional lenses to buy and carry around when you are shooting. So I saved quite a few bucks by not buying a camera system that I didn't need and probably couldn't fully make the most of.

The second reason for getting a second camera was born from my reluctance to take my new camera out in the boat on a fishing trip in the Everglades. There was a fairly safe place in the boat and l had taken other cameras when fishing that area and gotten some excellent pictures. While searching for bait we happened on an island with approximately forty white pelicans just standing on the beach in a semicircle. I missed a picture of one of the most beautiful scenes that I have witnessed. I could have been a contender! I reasoned that if I could find a quality camera small enough to easily fit in a pocket so that I could safely take it places like the Everglades then it was unlikely that I would miss the picture of the century if it popped up in front of me. There would also be many other places where I would take a camera in my pocket that I would not be comfortable taking one strapped around my neck, no matter how safe the conditions.

The first thing I did was to consider how to settle on which of the many small cameras available best fit my needs. I wanted a camera capable of taking a picture that could be printed at least 8x10 or larger in size; I don't print many pictures 8x10 or 11x14, but I often crop my pictures and a severe crop can require a photo with a very high resolution to provide a sharp print. I wanted to be able to take group pictures indoors, outdoors and under limited lighting conditions. There are many small cameras that meet these criteria, so I decided that the best way to narrow the field was to decide what was the largest size I would consider portable enough to comfortably carry it practically anywhere.

I had pretty much decided to stay with Canon unless one of the other camera brands had some overwhelming features. I looked but didn't find any. I have been pleased with the Canons that I have owned, and by staying with Canon I greatly reduce

A710 Back, In Hand

the learning curve. I began my search of the 2 smallest versions of Canon—the A series and the SD (Elph) series.

I was quite impressed with the A series. They are easy to hold steady, even with my large arthritic hands. One of the reviewers stated that he was able to easily shoot steady shots with one hand. They are pretty much full-featured cameras with impressive specifications. The A710 IS has 7.1 megapixels of resolution, 6X optical zoom, ISO settings up to 800

(Camera…….Continued on page 4)

SD800 IS Front In Hand

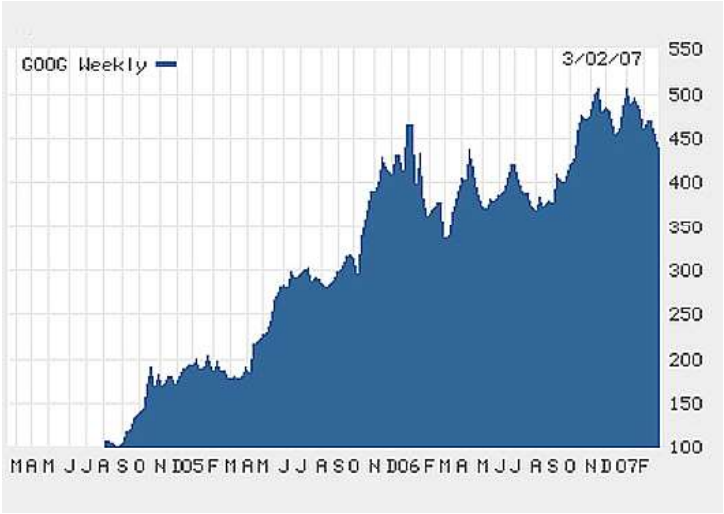
SD800 IS Rear

(Camera…….Continued from page 3)

and Image Stabilization. The reviews that I read were quite impressive. The camera is small but is a little large for a shirt pocket, and, if it is placed in a suit coat or blazer pocket, it will cause a noticeable bulge that might cause the more suspicious to think you are "packing". I decided that, in spite of how impressed I was with the specifications and quality of the camera, it was not quite small enough. The Elph series are small enough for a pocket or purse, even a shirt pocket (approximately 0.6 inches thinner than the A series). The camera is definitely harder for me to hold steady but is manageable. It takes some discipline to prevent placing a finger over the flash or a sensor. I looked at three of the top Canon Elphs—the PowerShot SD700 IS, PowerShot SD800 IS and PowerShot SD900. My decision was made easier when I looked at the features that Canon has included in the SD800 IS to compensate for these problems. I chose the PowerShot SD800 IS based on these features:

SD800 IS Front

- **7.1 Megapixel Resolution:** This provides a level of resolution that I felt would cover my needs with pixels to spare.
- **Wide Angle 3.8x Optical Zoom:** The wide-angle lens (28mm-105mm, equivalent of a 35mm film camera) allows me to get closer to the subject, especially for group photos. This helps compensate for a relatively low-powered flash capability, which is one of the main difficulties with small cameras.
- **Image Stabilizer Technology (IS):** This feature somehow compensates for shake and reduces or eliminates blur when you shoot at slow shutter speeds and at long zoom settings. It's especially important in a small camera, such as the SD800 IS, because it is more difficult to hold steady than most of the larger cameras.
- **High ISO (Equivalent to Film Speed):** The SD800 IS has an ISO rating of up to 1600 and a High ISO Auto setting that also reduces the effects of camera shake and can sharpen subjects in low light situations. As with film, however, the higher the number the grainer the image and, with digital cameras, the more digital "noise". The ability to get acceptable quality at the higher ISO level with the small processors in point and shoot digital cameras is certainly less than with the larger processors found in SLR's.



(Camera…….Continued on page 5)

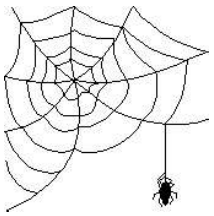
(Camera……..Continued from page 4)

- **High Resolution 2.5 LCD:** The large high-resolution display makes it much easier to frame your picture and judge the quality that you can expect. It is also large enough to see the effects when you adjust the Exposure Compensation. I think this ability to make plus or minus adjustments to the exposure and see the effects of the adjustment on the LCD screen before you snap the picture is one of the greatest features of digital photography. There is also an optical viewfinder, which is often not included in this size camera. I think that an optical viewfinder is essential for bright sunlight and action photos.

Shopping for a digital camera is not easy unless you know exactly what you want and how you will use the camera. The bright side is that there are several sources of information that will give exhaustive detail on almost any camera on the market. If you haven't visited any of the digital camera review sites, it would be worth your time to look at least two. The first is Steves Digicams http://www.steves-digicams.com/, which has extensive technical and shopping information on practically any camera. It is the source of the SD800 IS front and back photos. The other is linked to the TPCUG site and has even more information and some of the neatest photographic tests that show you how the new features work (or don't work). The Link is "Digital Cameras Digital Photography Review News," http://www.dpreview.com/. That site is the source of the two "In Hand" pictures of the A710 IS and the SD800 IS. I think that when you are trying to select a camera, it is a good idea to look at two or more reviews because sometimes opinions (and tests) do differ. ◆

Internet Picture of the Month

The Rise of Google



From time-to-time, I like to include a chart of a high-flying computer/Internet stock or, as the case may be, a once high-flying computer/Internet stock.

This month we have Google (symbol goog) for which the chart has been mostly up for the past two-and-a-half years. The chart above is from the March 5, 2007 online Wall Street Journal at http://online.wsj.com/. You have to pay to use this site, but a similar chart can also be had for free at Yahoo Finance, http://finance.yahoo.com/.

You might want to compare the chart above to the one of Amazon.com we featured in the newsletter at http://www.tpcug.org/newsletter/nl_1999/january1999/picutre_of_the_month.htm in January of 1999. Remember that once high-flying stock?

What goes up usually comes down. So is Google the next Amazon.com? Take a look at another chart we featured http://www.tpcug.org/newsletter/nl_2001/april2001/picutre_of_the_month.htm.

(Comments…….Continued from page 1)
how well its hardware and software will work with Vista. The two major problems to upgrading that are still listed by the Upgrade Advisor are the lack of drivers for my Epson Perfection 3200 Photo scanner and my Epson Stylus Photo 2200 printer. However, I checked the Epson site and discovered that they now have a new driver for my scanner. Furthermore, an email to them produced a response that a driver for the printer would be available within the month. So the two Epson problems will soon no longer exist.

As to other hardware, everything is basically OK. After the installation, I will need to go to the Realtek site and get an updated sound driver. Also, there are a couple of NVIDIA motherboard drivers that appear to need new versions—but apparently not enough so that the computer will not run after the upgrade.

For software, the few problems indicated were almost always for minor Microsoft products. And most of them carried the message: "This program might have minor compatibility issues after upgrading to Windows Vista," followed by either a link to click for an update or a message to go to the Microsoft site for more information. There were two items that needed to be uninstalled before doing the upgrade: Microsoft FrontPage Server Extensions and Microsoft Backup MyPC. So it is goodbye to the FP Server Extensions. I can still run FrontPage. The FP Server Extensions just can no longer be installed to Microsoft IIS running as a web server on the computer. This is really of no consequence for me, since I have moved away from using FrontPage components that depend on the extensions. Web hosting companies will still support them for those people who have sites developed with FrontPage that need the extensions.

So it looks like Vista will be happy with all my major programs, but will it really? Although I use Visual Studio 2005 now, I still have Visual Studio 2003 on my computer for maintenance of web sites and applications created with it and not yet migrated to VS 2005. The Upgrade Adviser did not flag VS 2003 as a problem, but I have read on the web that there is a problem. Some research is needed here.

Other things Speaking of Visual Studio, here is a list of some of the recent programs I have been working on that we have looked at or will soon look at in the VB SIG.

- SQL Compact Database. Using it with desktop applications as well as mobile device applications. A program to convert an Access database to a SQL Compact database.
- A program to retrieve time from a time server and set your computer's clock more accurately than does Windows.
- A program to wipe (not just delete) files from your computer.
- A program to reveal an Access database password
- A simple FTP program

The SQL Compact database originally meant for only mobile devices (in fact, it used to be called SQL Mobile) has been adapted now by Microsoft to be used as a small footprint database for desktop applications. That should make it easier to distribute desktop database applications. As for its mobile usage, I wrote a program for the Windows Pocket PC mobile device that allows you to view such a database's various tables. So, using the other program I wrote to transform an Access database into a SQL Compact one, I can now take important information I have on my main computer in Access and have it on my mobile device in a secure form since the SQL Compact database can be encrypted and password-protected.

At least I hope it is secure, since I am assuming that Microsoft has improved the security in SQL Compact over what it had in Access. A bit of web searching reveals VB code which is fairly trivial and works to retrieve an Access 97 password. I have also seen code to do the same for Access 2000 and 2003 databases, but, based on my playing around with trying to crack the password on the 2000 and 2003 databases, I found that code did not work. I then managed to crack the database code for a database that I created and gave a password to. I was quite proud of myself until the next day when I created a new database and gave it a password and tried out my program to get the password. It only produced every other character of the password. Not bad, but no cigar, as they say. I think this is probably what happened to the people who proudly posted their code. It was only good for databases created on a certain day.

Special Interest Groups

Microsoft Access SIG

This SIG meets the **first Tuesday** of the month at 6:30 PM. The meeting location varies. For information contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merle@merlenicholson.com.*

Digital Imaging SIG—Cancelled until further notice

Visual Basic for Applications SIG

This SIG meets the **third Wednesday** of the month at 6:30 PM. The meeting location varies. For information contact William LaMartin at *lamartin@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Bob LaFave moderates the discussion.

(Minutes……..Continued from page 2)

pressive door prizes. Also, find out what the other groups are doing to draw members and generate interest at their meetings.

Blain Barton with Microsoft will be our speaker next month to tell us about Virtual, so don't miss that meeting. Bob LaFave will entertain us in April.

At 7:15 pm, President Witmer introduced our speaker, Mr. Keith Bunch, owner of North Tampa Photography, Inc. North Tampa Photo has been in business for 36 years. They are at 1020 W Busch Boulevard.

Mr. Bunch told us that digital is taking over from film and that small format film (35mm) cameras are almost a thing of the past. They haven't sold them for two years. In another two years, you may have to mail order film since it is hard for the retailer to make any money on it. To Hell I say!

To add to this, the number of camera manufacturers is declining. Kodak and Sony are the strong runners based on sales, although Kodak doesn't make their own digital cameras for the most part. Minolta has dropped out, and Nikon and Olympus are trying to find their niche in the digital revolution, with Canon a bit better positioned.

Keith said it's his opinion a small-format digital camera of more than 6 mega pixels is more than adequate for the nonprofessional photographer. Secure Digital is the most popular memory card today. The highest ISO is 3200, with 400 being the norm.

He went on to say that DVDs are quickly replacing CDs for external image storage/transfer due to higher capacity and their ability to store moving images. Kodak is offering a printer that uses $10 black ink cartridges and $20 color cartridges. Also, the new ICS (Image Correction Scanners) do a fantastic job copying images. Canon and Sony are my choices.

Keith concluded by saying he recognized faces of customers in the audience. He took questions and invited anyone to their store on W. Busch Blvd. Feel free to come by and they will address your concerns about photography equipment.

The meeting adjourned at 8:30 pm. ◆

(Comments……..Continued from page 6)

But one cannot give up. Especially since I was once turned down for a job at the National Security Agency. And a few more days of work on and off did indeed produce a program that, as far as I and a few testers can tell, reveals an Access 2000 to 2003 database password of up to 14 characters.

I don't plan on making this program available, since it sort of defeats the purpose of such a password. But if you should ever forget your password, ask me, and if I trust you, I will open your database. Additionally, you can pay around $40 on the web to purchase a program that supposedly does the same thing (and if I can figure it out, certainly many other people can too). I assume that in Access 2007 Microsoft will remedy this and my program will not work on 2007 databases.

(Comments……..Continued from page 7)

The file-wiping program is designed to write random data over a file to obscure what was there before, since a simple delete only marks the file name as deleted in the disk directory. In fact, the program writes over the file several times because one or two times is not enough to keep really sophisticated snoops from detecting the magnetic residue on the disk. It is not a hard program to write and will save me from having to purchase such. If I needed a more advanced program to write over the "empty" space once occupied by deleted emails, etc., I will go with a commercial product. Like much of what I write, I mainly wrote the program to see if I could.

I have actually written an FTP (File Transfer Protocol) program twice—once with VS 2003 and again using a different approach with VS 2005. Then, at the request of Merle Nicholson, I expanded it a little and made it more user-friendly, since he wanted a simple FTP program that required no installation (if you already have the .Net framework 2.0 installed) that he could give to his clients instead of more complicated many-featured FTP programs requiring an installation.

That's all for this month. ◆

Editor's Comments: Linux on a Virtual PC

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

Immediately upon arriving home after watching Blain Barton demonstrate Virtual PC 2007 from Microsoft at our March meeting, I went to Microsoft (http://www.microsoft.com/windows/products/winfamily/virtualpc/default.mspx) and did the free 30 MB download and installed it. I had already thought about what operating system I wanted to install as my first VPC. I really didn't care to revisit DOS, Win 3.1, or Win95. What I thought would be interesting was to see if I could load some version of Linux. I suspected that this was not exactly what Microsoft had in mind, and, after struggling with various versions of Linux (Debian, SUSE, and Ubuntu) and the need to occasionally drop to a command prompt to issue commands to make things work properly, I thought perhaps that was part of their plan—To whit: Let people see that installing Linux and using it with various programs is no cakewalk. And, indeed, it is not. But I persevered, and I now have the Ubuntu 6.10 flavor of Linux running as a Virtual PC (VPC). Additionally, I in-

Minutes of the March Meeting

By Doug Mullis, Secretary, Tampa PC Users Group
dmullis@tampabay.rr.com

The Windows SIG portion of the meeting commenced at 6:35 pm. Bob LaFave turned the meeting over to Kevan Sheridan to present the concept of portable applications. Kevan said a portable application is a computer program that you can carry with you on a portable memory device such as a 2 Gig flash drive, which he then demonstrated. When plugged into any Windows computer, you can access your software and personal data just as you would on your own PC. You can load your passwords, antivirus program, utilities, or the whole Open Office suite with documents and prepared presentations and use them on the host computer. Each of the applications you load on the flash drive has either been modified to run from the flash drive or run in an environment controlled by the flash software that allows it to run from the USB device. And to add to this wonder, when you unplug your flash drive, portable hard drive, or iPod/MP3 player, none of your personal data is left behind.

You can download or purchase flash drives with portable applications programs from a number of sources. Kevan mentioned U3.com and PortableApps.com as two he was familiar with. Then just add your programs and data. Really interesting stuff, Kevan. Thanks!

At 7:05 pm, President John Witmer took control for the business segment of our meeting. John asked that we indicate our presence and verify the information on the sign-in sheets so that our records are accurate. Two or three of our members went to the spring FACUG conference in Kissimmee, and John asked for a report at our next meeting as to what went on at the conference that would be of interest to the Group.

Next month, Bob LaFave will be our presenter, so he asked what topics the Group wants covered. In May we will have Drew Smith, president of the Florida Genealogy Society as our speaker. Some of you missed our genealogy program two years ago, so plan to make this one and see what the local society has to offer.

(Comments……..Continued from page 1)

stalled the Apache web server and the MySQL database. Along the way, I removed the version of Open Office that comes with Ubuntu and installed the latest version from Sun along with the latest Java runtime environment.

From my Linux VPC, I can use the Open Office word processor, spreadsheet, database, and presentation programs to do things similar to what I would do with Microsoft Word, Excel, Access and PowerPoint. I can send and receive email using the Evolution email program and browse the WWW with the Firefox browser. I can see and access the shared files on any of my Windows Network computers. However, the reverse is not true. My Linux VPC has an IP address on my LAN (I think you need to be using a router for this) just like my Windows PCs, e.g., 192.168.0.15. If I put web pages into the www folder of my Linux VPC that was created by the installation of Apache, with the Apache web server running I can view them from any of my Windows computers on the LAN by an address like http://192.168.0.15. Furthermore, if I edit the configuration file for my router to point port 80 (used for HTTP) to the IP address above, then anyone in the world can access those web pages on my Linux VPC by going to the IP address of my router (which, of course, I would have to tell them).

The final thing I did was to learn enough php coding to use the php language (server-side HTML embedded scripting language) to be able to insert data from an input form on a web page (at my virtual Apache site) into a database table on the virtual MySQL database server and to be able to also retrieve such data on another web page on my virtual site using php code.

In the space remaining is a very abbreviated sequence of things I did and some problems I encountered. Please excuse the gory details. I have included them as a guide to anyone wanting to do the same thing,

First, I should say, I chose the Ubuntu flavor of Linux since member Tom Cone said that he had installed it on an old PC he had but had done nothing with it yet (a very common Linux situation I have noticed). To get it you can go to http://www.ubuntu.com and click on the download button. Choose the United States as your location, then choose Columbia University as the mirror site. Or just go to http://mirror.cc.columbia.edu/pub/linux/ubuntu/releases/edgy/ubuntu-6.10-desktop-i386.iso. This will get you the iso CD file to use in Virtual PC.

Once you have the approximately 700 MB file, you will need to start Microsoft Virtual PC 2007 that you have previously downloaded and create a new virtual PC. Give it a name and set the operating system to other; next, adjust the RAM to 512 MB, and tell it to use a new virtual hard disk. Finally, look at its settings and set the Undo Disks to Enabled.

Now you have a new empty Linux VPC. Select it and click the start button in the VPC Console.

Note that in all of this you can recapture the mouse cursor from the VPC by pressing the right alt key. Once the process starts and you get a "DOS styled" window, choose “capture iso image” from the CD menu item. Then click on the action menu item and select ctrl-alt-delete. This reboots the VPC, and the Ubuntu installaton will appear. Press F6, then use the backspace key to delete everything from the end of the line through the word splash and press enter. The install will start and the output will be very limited, so be patient.

You will eventually see a screen that has gotten wide and begins to fill with colored squiggly lines. Let this continue for a minute or so until things settle down. Then press ctrl-alt-F1, followed by enter. If you are lucky, another DOS type window will occur with a prompt. If so, type or paste in the following text and press enter: sudo sed -e 's/DefaultDepth.*24/DefaultDepth 16/g' -i /etc/X11/xorg.conf (you are changing Ubuntu’s color depth setting from 24 bit color to 16—with which Virtual PC will be happy). Note this problem would not occur on a non-virtual installation. Now enter ctrl-alt-F7 and press enter. This should give a slightly fuzzy screen. Then press ctrl-Alt-backspace and press enter. In a moment things should clear up. Once you are able to see the Ubuntu screen, just let the Ubuntu user log in itself. Once you see the desktop, double click on the Install icon to start the actual installation to the virtual hard drive. Answer questions about language, location, time, keyboard, etc. Once the install starts, accept the defaults for hard drive and partitioning. (I found the workaround at https://help.ubuntu.com/community/HowToConfigureUbuntuForMicrosoftVirtualPC2004.)

The installation of the operating system took a little less than 20 minutes on my computer. You are asked to reboot the virtual computer. The reboot from the installation may hang. Use the right alt key to get your mouse back and then, in the VPC window, click on Action menu item and choose close. When finished, all of this will close, and you will be left with the Virtual PC Consul. You are now ready to use your newly-created virtual Ubuntu PC.

First-Time Vista

Windows Vista Business Upgrade

By Merle Nicholson, Tampa PC Users Group
merle@merlenicholson.com

On previous OS upgrades you could provide proof of a previous OS by inserting a CD. With Vista, this is no longer true. I installed Vista on an older machine with very limited Vista graphics capability.

I'd just acquired a used AMD XP processor, and, with an older motherboard and various parts lying around, I set up a "test bench" computer to run Windows XP for a software job for a client. The client needs networking software I was reluctant to risk on my main computer. So it was taking up space on my bench, and I realized that with another old hard drive from a junk drawer, I could try out my new Vista with no risk.

I do have to say that I have no intention to upgrade my current primary machine to Vista – or any of the computers in my household. Instead, when I do migrate to Vista, it will be using a new computer I've set up from scratch, and on which, over perhaps a couple of weeks, installed all the software I need.

So I have this Windows XP computer sitting there running a legally-activated XP Professional OS. I disconnected the hard drive, connected a new junk hard drive – it probably has remnants of an XP OS from my spouse's computer when I replaced it a month ago. I booted from the Vista DVD and went through some of the process – entered the CD key, only to be told that I must run the DVD from a system that is being replaced and please exit. I can upgrade only from a working system.

Ok, I guess I knew that. Remember on previous OS upgrades, you booted from the CD and eventually you would be asked to insert the media from the previous system you were replacing.

With Vista, this has changed. You must run the DVD from a working system. If you have a broken computer with no CD to repair the OS and decide that, as long as you're at it, you just migrate to Vista, chances are you're out of luck. You may have to buy the full version. Many millions of computers have no operating system CD. Some computers had the only backup of the OS on a partition on the hard drive. That's a disaster waiting to happen. Bad hard drive = no operating system. Others have "restore" CD's. So if you have one of these, that's good. If it works.

Ultimately, I reformatted the drive and then backed up my good working XP system to it using my trusty old Powerquest Drive Image Disk-to-Disk copy, then booted to the hard drive. I inserted the Vista DVD and proceeded with the install.

At the onset, you're provided with two choices: One is to replace the XP system leaving the documents and programs intact, and Two is to put a scratch-new OS on the drive after moving all files to a "Windows.old" folder.

Notice there was no option to reformat or partition the drive. This is an upgrade, and I guess if it has to behave as an upgrade, it offered only those two choices. I don't know what choices you'd have if your drive was formatted FAT32. If you have an XP system with a FAT32 drive, it would take some cautious investigation and some reliable backing up.

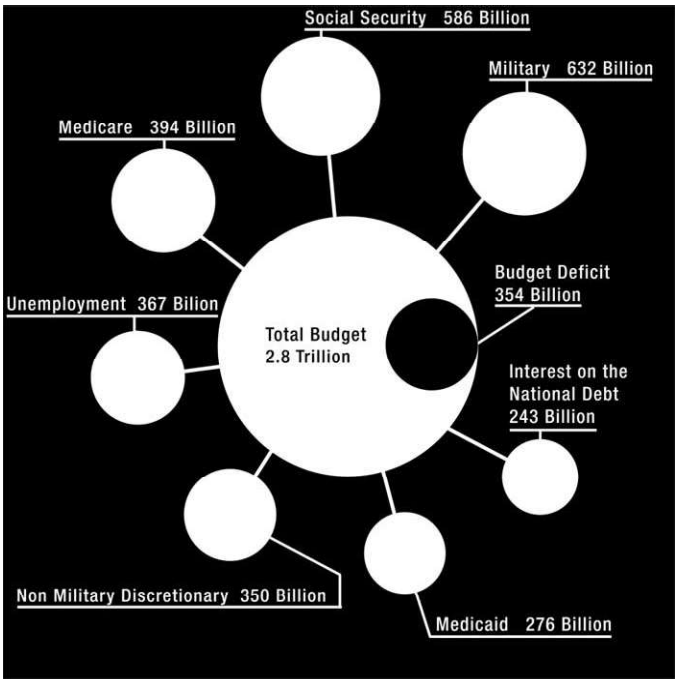
In my own case, the system I am replacing had no applications worth preserving. It is a very clean basic XP system, so I picked the second option and put a scratch-new OS on the drive after moving all files to a "Windows.old" folder.

The install options were setting time zone and language options and the option to validate the OS on the Internet. There was one thing to pick to allow it to get its own OS updates from the Internet, which I did allow.

After the setup and learning how to set the screen back-

(Vista……Continued on page 5)

(Vista…….Continued from page 4)



ground to get rid of all the pretty things, I went to the hardware manager and found no issues. It had picked generic video and monitor drivers. After poking around, I found the "Windows Experience Index" with a rating of 1.0 out of 5. It picked the lowest number of all the categories – two were "graphics" and "gaming graphics," both with 1.0. This reflects the age of the system and the fact that it has on-the-motherboard video. Now, this is an AMD XP 2200+, and although it isn't in production, it still – in my opinion – makes a more than adequate computer, and the experience index of 3.1 for processing power bears this out. The Graphics Index of 1.0 is defined as suitability to run "Aero" – the Vista transparent overlapping Windows. I could not find the Windows Aero interface in the list of desktop interfaces, so I assume that I am blocked from using it because of the low rating.

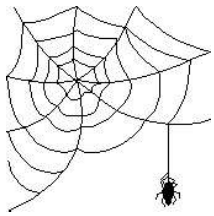
Even with generic video and monitor drivers, I was able to set the screen to the maximum of 1280x1024, 32-bit color depth. I'm not 100% happy with the response of Windows when opening and moving. Perhaps some fine tuning would produce better results, like not showing a window's contents while moving. I have looked for a Vista–capable video card online to help improve the response and can find some in the $68-$75 range.

I did find that the install did some unexpected things, like retaining the data folders in the root of the drive. I'd expected everything to be in the Windows.old directory. There are but three folders in Windows.old: Program Files, Windows and Documents and Settings.

The Control Panel is very much larger, with more of all the various settings concentrated here, which is a very good thing in my opinion. Aside from that – and the time I've spent figuring out where everything is – it's been a positive experience. I'll keep it and use it to test software developed on my primary XP machine and perhaps start installing software to see what works and what doesn't. ◆

Internet Picture of the Month

The 2007 Federal Budget



Since April is tax month and I need an Internet picture of the month, here is graphical representation of where those taxes go. As you can see, you are not paying enough since there is a projected $354 billion budget deficit.

The URL of the image is http://www.kaushik.net/avinash/2006/09/the-awesome-power-of-visualization-2-death-and-taxes-2007.htmlprint/, which I really think they could have made shorter.

On that page there is a link to the "Death and Taxes" home page, which you may also find instructive. The link is http://thebudgetgraph.com/index.html.

Happy Tax Month.

(Minutes…….Continued from page 2)

Jim Purcell asked for a show of hands of those interested in attending monthly meetings of the Digital Imaging SIG. Seven or eight expressed an interest so Jim will try to arrange a meeting place and meeting schedule.

At 7:10 pm, John introduced our speaker of the evening, Blain Barton with Microsoft. The Group expressed their appreciation to Blain for the great pizza. Blain said that it was his pleasure and tonight he was going to tell us about Microsoft Virtual PC 2007.

Blain said that Microsoft has recently released Virtual PC 2007 and that free downloads are available. The host PC can be any x86-based or x64-based computer running at 400 MHz or faster, although a 1 GHz processor with L2 cache is recommended. Virtual PC supports the use of AMD, Athlon/ Duron, Intel Celeron, Pentium II, III and 4, Core Duo and Core2 Duo processors. You must have a CD ROM or DVD drive, a super VGA (800x600) or higher resolution monitor, keyboard and Microsoft mouse or compatible pointing device.

The host operating system can be Windows Vista Business, Enterprise or Ultimate, Windows XP Professional or XP Tablet PC Edition. Host memory and disk space needed range between 64 MB and 500 MB to 512 MB and 15 GB respectively, depending on the guest operating system selected.

Blain then demonstrated setting up several virtual machines that ran concurrently on the same physical computer. This is particularly useful for running test applications under differing operating systems. Available RAM is the limiting factor for the number of virtual machines you can run simultaneously.

During the demonstration a number of interesting questions were answered. As you might expect, Blain kept us entertained until 9:00 pm. No one dozed off even with tummies full of pizza. Several nice door prizes supplied by Microsoft were then raffled off. The prizes and lucky winners were:

Windows Vista Ultimate	Ron Weinberger
Microsoft Light Pen	Roy DeArmond
X-Box Headset	Jim Purcell
X-Box Headset	John Witmer

Seventy-four dollars were collected in raffle ticket sales. Thank you, Blain and Microsoft!

The meeting adjourned at 9:10 pm. ◆

(Comments.....Continued from page 3)

After all that, I was up and running Linux as a VPC. I could browse the WWW and see my Windows Network computers. What I couldn't do was add any new applications. A search of Google for the error message told me to get a command prompt (using the Terminal program) and execute the command "sudo dpkg --configure -a". This apparently reset something, and I was able to use the Synaptic Package Manager, the advanced form of Add/Remove. I then was advised that five packages were corrupted. So I downloaded and installed new versions of them. Then I tried a test of adding some little educational piece of software, and that worked.

Now that I had the Add/Remove working, when I closed down the session (saving the changes) and started up again, I received a notice of all the many updates available--253 MB worth. So I let Ubuntu update itself.

I played with Open Office for a bit and found one problem in that I couldn't create a form using the wizard in its database program (I find the database program to be the least fleshed out when compared to Microsoft Office's programs). So I used the Synaptic Package Manager to remove the main packages of Open Office and then went to the Sun Microsystems site and downloaded the latest version of Open Office and installed it, which was an adventure in itself since the packages were meant for the RedHat flavor of Linux. That meant I had to use the Synaptic Package Manager to download a program called Alien that would convert these packages into the Debian flavor of Linux packages (which Unbuntu belongs to) so as to be able to install them. Alien runs from the command prompt, so you see this is a bit more complicated than installing things in Windows.

To test everything, I exported some name and email data from Access as a DBF file (I could not import the Access file directly into Open Office), imported the DBF file into the Open Office database, then did an email merge from the Open Office word processor to send emails to the people in the file—and it worked. I also imported Microsoft Office Word documents, Excel spreadsheets and PowerPoint presentations into the corresponding Open Office programs.

My next step was to install the Apache web server software into my Ubuntu Linux setup. I then copied a folder from my main Windows computer containing a small web site and put it in the appropriate place in my Linux VPC for Apache and, voila, I had a website up and running that could be seen by anyone to whom I gave the IP address of my router once I allowed port 80 to map to the Linux VPC.

There was only one thing left that I wished to immediately

try—install the MySQL database server on my Linux VPC. Again, I used the Synaptic Package Manager in Ubuntu to do this. I also installed a visual interface for managing MySQL: MySQL Administrator. I could find no way to create a database using this interface, so after consulting Google, I used the proper command at the command line prompt to create a database. I also created a user who could access the database. Once created, I could then use the nice graphical interface to create tables for this database and add columns to the tables.

Having a MySQL database meant that I could, by using the php programming language, communicate with it from web pages. To test this, I created an input form on a web page where one enters their first name, last name and email address. I gave Merle Nicholson the URL to this page, and he went and tested it for me. It worked, and now the main table of the membership database in MySQL has an entry for a David Slartybartfase, apparently one of Merle's aliases.

This has all been very interesting—and it costs nothing in dollars, only in time. But for me and my house, Windows is still the operating system of choice. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

Thanks to our contributors, I have little need to write anything this month. And since the past month has been a month without much computer-wise to write about for me, that is good.

I did very little more on the Linux Virtual PC setup I wrote about in last month's newsletter. I did print up a number of 11" x 17" black and white prints from copies of early 1920s photos of my hometown for a friend who is moving his real estate business into a freshly-renovated early 1900s building in that town. This involved using Photoshop to remove blemishes and adjust brightness and contrast on most of the images, which I had copied with a camera years ago, or, in more recent years, scanned as I discovered the old photos. I have

Minutes of the April Meeting

By Doug Mullis, Secretary, Tampa PC Users Group
dmullis@tampabay.rr.com

President John Witmer called us to order at 6:30 pm and turned the meeting over to Bob LaFave to begin the Windows SIG portion. Bob was also to be our presenter to tell us about Acronis True Image and Beyond TV.

Bob asked for items the members were having problems with. Doug Mullis began by telling us he has been refilling black printer cartridges from refill kits sold by Office Depot. Office Depot has stopped selling the refill kits and now offers a refill service at about 30% less than new but considerably more than the kits sold for. Another cost-conscious PC user told Doug to try Walgreen's Drug Store or Wal-Mart for ink refill kits. Low and behold, Doug got the black refill kit at Walgreen's for under $10 and it had twice the amount of ink as he had been getting. So far he is pleased with the change. Color refill kits are offered for under $15. Bob says Staples issues coupons worth $3 each for used ink cartridges.

One member was having problems with his Firefox browser. While many like the increased security provided by Firefox, the down side, according to Bob, is that you cannot get Windows updates.

Another member just bought a new Acer desktop computer that is about the size of an encyclopedia. He peeked inside to see how they reduced the size. It's like the inside of a laptop. This is probably the coming thing and good if available space is a problem.

Someone asked if Windows XP Media Center was based on the XP Home Edition. It is based on XP Professional, but you cannot join a server-based do-

First-Time Vista — Part II
Wood PC
Acronis True Image

By Merle Nicholson, Tampa PC Users Group
merle@merlenicholson.com

First Time Vista – Part II
I've only just begun to configure my copy of Vista, and I'm still struggling with configuring it. It's not at all useful yet because of the drivers. So I'm still working on it.

The performance with the video remains less of a problem – See the article last month, April 2007 – and I've decided that I must buy a new video card to completely solve it. The video driver that is installed now for the on-board system is just too generic, making Windows slow to appear and move. The problem is finding a video card that is 1) cheap enough, 2) will work with Vista and 3) will run on my motherboard. It's a process of finding the video card that satisfies 1) and 3) and then going to the supporting website to find if the manufacturer supplies the Vista driver and then finding reviews to see if it's proven to be satisfactory to other users.

To be fair to Vista, though, there is a list of performance options having to do with how Vista treats window behaviors. All are turned on if you tune for appearance, and all are off if you tune for performance. I've turned off nearly all; the most notable for me is "Show Contents of windows while moving". I've kept the "Use Windows Themes" because that makes Vista look like Vista. With it off, it looks like Windows 2000. Turning those off did make a noticeable difference.

The second hardware problem popped up because I'd decided to install a wireless card in the PC. This will help in finding a location in my office for my newest Wood PC, where the Vista hard drive is located. I've run out of wired connections to my router. I have a couple of "new" wireless/G PCI cards in my inventory. I say "new" because they've never been installed, and I'd estimate they're less than a year old. I decided to configure the card for Vista first (before my Win XP) for the obvious reason. After a thorough Internet search, there's no driver for the Netgear WG311 v2 wireless card to be found, and I'm guessing there won't ever be. There's a WG311 v3 that's being sold now that does have Vista support, but it doesn't work on the v2. There are all kinds of user complaints on the Internet and on the Netgear comment board. So much for that. So I must either buy a new router or a new switch or a new card. The new card makes more sense because it's the cheapest at about $20.

After working with Vista for awhile and discovering one program that wouldn't work with the User Access Control (UAC) turned on, I turned it off. You just configure it off in the Control Panel, User Accounts. The UAC is a pop-up (that pops up ALL the time) when anything is being run or changed. I quickly discovered the disadvantage of having it off. The Security Alert now pops up, warning you that the UAC is off. It's almost as annoying as the UAC. The Security Center (Alert) can be switched off easily, which I'm hesitant to do. I'm sure there's an ideal solution. Someplace.

Wood PC
I've designed and built a computer built of wood to use as a test bench to make it easy to change out components. The main feature is that nothing except the motherboard is actually fastened down. Everything else just sits in place. Some things that vibrate are sitting on a rubber pad, like the power supply and CDROM. There are six slots for 3-1/2 inch devices like hard drives. I attached three fans to it, one each to cool the hard drive bays, and one for the center. I have two active hard drives right now, one Vista and the other XP Pro. I use these to test software. Each drive has a partition where a clean image of the boot drive is backed up. I used Acronis True Image 9.0 to back them up.

I'm currently working on a new version of Wood PC in an attempt to make it easier to build. The parts themselves just took an afternoon to cut, but the trim work and finishing were time-consuming. I sketched out several ideas until I'd developed the simplest scheme, and now that it's built and working I can see that I can simplify it even more. It's narrow enough to sit on a 10" bookshelf, but it works well as a

(Vista……..Continued on page 4)

(Vista……..Continued from page 3)

bench computer for testing components and software.

Wood PC Front View

Wood PC Back View

Acronis True Image 9.0

This backup software has been written about several times. We have a nearly annual visit from Gene Barlow, who also sells it on his website. Bob LaFave emailed me a few weeks ago that he'd found version 9.0 at http://www.nothingbutsoftware.com for only $26.95 plus shipping, so I bought one for myself, used it and immediately ordered one to be shipped to my son in Colorado. I used it again to clone a damaged drive to a new one with success. This old drive had a bad Master Boot Record (MBR) which I fixed with XP Recovery Console, but then it failed a diagnostic. It would boot into XP, and I successfully backed up all the pictures and documents to an external drive, so it was worth saving.

I used this software - booting from the CD - to copy the old drive to a new one. The copy process stopped three times, saying that it had encountered a bad unreadable sector. But there was an option to ignore the problem and continue. It did and successfully created a new, usable drive. Presumably there are now a couple of bad files on the disk, but that's usually insignificant. I did find that it was missing one essential file, but I identified that and replaced it easily.

Errors like this are fatal on other drive copy programs, but Acronis saved our bacon. It also says that it will clone to a drive that is smaller, if possible. I haven't tried this, but if it works it solves several problems I've had in the past.

Acronis True Image v9 $26.95 at http://www.nothingbutsoftware.com.
Acronis True Image v10 Home User Group Price $29 download at http://www.usergroupstore.com. ◆

(Minutes…….Continued from page 2)

main.

John Witmer recently installed PC-cillin on his computer. He asked why it tries to update frequently. Bob said the update might not have installed successfully but look at the program User Options to see what the update interval is. Maybe this needs adjusting.

Another member desired to install a wireless router and wanted to know where he could find the best deal. Bob suggested he check Newegg.com. One can be gotten for around $40.

Ed White has gotten Verizon DSL and wants to disable the wireless feature for security purposes. Bob said he needs to find the wireless address and turn it off. Hard wire connections should still work.

At 7:00 pm, Bob closed the Windows SIG format and launched into his prepared program. He began with a backup program he finds better and cheaper than Norton's (Symantec) Ghost. The utility program is Acronis' True Image (remember presenter Gene Barlow) for backing up an entire system or just selected files. While Version 10 is available, Bob got Version 9 as part of a package with a $70 rebate. NothingButSoftware.com is offering True Image Version 9 for $26.95. This program is really fast and is completely automatic. Bob demonstrated a system incremental backup and highlighted features offered by the program.

Next, Bob showed us Beyond TV, which, with a TV tuner card, allows you to use your PC to receive and record TV programs as long as you have ample RAM

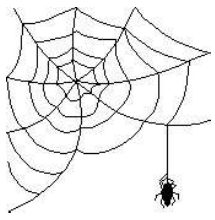
Internet Picture of the Month

FSU Stadium Stained Glass Window



From the site http://sports.webshots.com, we have a photo of the 30 ft. by 20 ft stained glass windows depicting coach Bobby Bowden looking over the field at FSU. I took the liberty of cropping the photo to just display the window. The precise URL is http://sports.webshots.com/photo/2332296220027668403kUZidx.

I was unable to find a photo of the window at night when it is most impressive.

According to http://www.fsu.com/pages/2004/11/22/bowden_window.html, the window "created by FSU artist Robert Bischoff, his wife, JoAnn, and 12 FSU students in the Master Craftsman Program, … is among the five largest stained glass windows in America. It is composed of 112 individual panels and 8,500 pieces of glass."

SilverFast Scanning Software

By Jim Purcell, Tampa PC Users Group
edward_j_p@msn.com

My neighbor asked if I could scan some "old slides" so that she could make prints for framing. Since I have a film scanner and a flatbed scanner capable of scanning prints, negatives and positive slides, I told her that it would be no problem. I was wrong; there was a problem. The slides were not 35mm slides but Kodak Ektachrome slides taken on 120 film, which produced a 40x40mm image instead of the 24x36mm image produced by 135 (35mm) film. I knew that I could not use my Minolta film scanner because it can only handle the standard images from 35mm positive and negative film and Advanced Photo System (APS) positive and negative film with an adapter. I thought that there would still be no problem using my "Epson Perfection 3200 Photo" flatbed scanner since it handled images from film much larger than 35mm. I was even more certain that there was no problem when I compared her slides to 35mm slides. The "mounted" sizes of the 40x40mm slide and a 35mm slide were identical (2x2 inches). As you can see in the photo, both slides fit in the Epson holder for 35mm slides, so the problem was solved? Wrong again. When I scanned the film, the scanner recognized only 24x36mm of the 40x40mm image. The software had a setup display that allowed adjustment of both input and output dimensions of the image. However, when I attempted to change the input dimensions they returned to their original settings, reflecting the 2x3 aspect ration of the 35mm slide.

I called William La Martin, who also owns an Epson 3200 Photo scanner. As usual, he had a solution. He said that the SilverFast software included with the scanner (which I had ignored), was much more versatile than the Epson software. I loaded the software and finally the problem was solved; I scanned the slides and printed the pictures.

I was obviously pleased with the results so I decided to further research the product because I plan to scan a large number of both slides and prints in the next few months. I'm writing this article because perhaps some of you are not completely happy with the software that was supplied with your scanner. LaserSoft Imaging's headquarters is located in Kiel, Germany; they also have an office in Sarasota, FL and will answer sales and pre-sales questions at (941) 921-4815. I have talked to them twice at this number and found them to be very helpful. They have an exceptionally informative web site at: http://www.silverfast.com/ . There is a variety of software from which to choose and you can find detailed descriptions of each at the site. There are also movies and testimonials on the site. The software is priced from $49.00 to $332.00. The product is available to support a long list of flatbed and film scanners. You can easily determine at the web site whether or not your scanner is supported. SilverFast can be launched as a stand-alone, an Adobe Photoshop (5.5 or later) or PhotoShop Elements plug-in, or as a Twain driver. Once you've decided the version in which you are interested, you can either purchase a download or a CD from the web site or by phone. If you want a CD and purchase by phone before 3:00 pm, they say that they can have it in the mail by that evening. If you still have questions or want to see the software in action, you can download a fully operating demo but it will place a watermark on your final scan. ◆

Special Interest Groups

Microsoft Access SIG

This SIG meets the **first Tuesday** of the month at 6:30 PM. The meeting location varies. For information contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merle@merlenicholson.com.*

Digital Imaging SIG—Cancelled until further notice

Visual Basic for Applications SIG

This SIG meets the **third Wednesday** of the month at 6:30 PM. The meeting location varies. For information contact William LaMartin at *lamartin@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Bob LaFave moderates the discussion.

(Minutes…….Continued from page 5)

and hard disk space. We went to the SnapStream Beyond TV web site. Bob showed us product bundles that are available to get us operational. His recommended bundle was $69.95. This does not include the TV tuner card, which runs about $120 for a good one.

Beyond TV has an Internet guide listing US and Canadian programming. You tell them what kind of broadcast source you have, and they provide a personalized guide. Also, if you turn on the Smart Skip Feature, Beyond TV automatically inserts markers at major scene changes, AND you can skip commercial breaks. Bob prefers to edit out commercials before recording to DVD. Bob then demonstrated features of the program that impressed him.

Bob went on to tell us about DVD Encryptor and DVD Shrink for copying DVDs. Just remember, movies are copyright protected, and, although programs for breaking the encryption can be purchased, there is a continual effort by the recording studios to render these programs ineffective.

President Witmer took control of the meeting at 8:25 pm for the business segment. He thanked Bob for an excellent meeting and announced that our planned speaker for May would be Drew Smith from the University of South Florida, President of the Florida Genealogy Society. His topic will, of course, be genealogy. Also, North Tampa Photography is putting on a Tamron workshop on April 20 & 21, which should be interesting. Cost per person is $119 but you get to use equipment (lenses and tripods) being featured, with discount coupons to be issued. Check the Yahoo Group announcement for particulars.

Visitors tonight included Nancy and Bruce Norton and James Kalshoven. James was William LaMartin's guest.

Members were encouraged to join the Yahoo Group to see announcements such as the Tamron workshop. Also, Bob LaFave's haircut was noted, as he looked great! Bob donated his hair to Locks of Love, a worthy charity.

The meeting was adjourned at 8:30 pm. ◆

(Comments…….Continued from page 1)

been very pleased with how my Epson Stylus Photo 2200 produces quite good results at this large size from images that were originally smaller than 8 x 10 and in most cases smaller than 5 x 7. Either Photoshop or the printer or both are filling in extra pixels very nicely.

I have moved away from using Microsoft FrontPage in the past few months to using Microsoft Expression Web. It has forced me to learn about Cascading Style Sheets (CSS) so as to better format the look of pages. I touched on this in the presentation I gave to our group a few months back.

On a recent trip to Tallahassee, I had a bit of trouble sending one of the mass emails I am often requested to send to all those in my neighborhood organization. Of the 400 households, 267 have provided us with an email address. I send the messages as individual messages using a mail-merge from a Microsoft Word

document based on information in an Access database table. I always have my laptop with me and used the hotel's wireless network to send the 267 messages from Microsoft Outlook (you cannot use Outlook Express with a mail merge). When I later went to check my email messages, I had 75 messages kicked back to me, and all except five were from a Road Runner (RR) address. RR considered the hotel's Internet provider to be a source of spam. So I needed a way to send out the message to only RR recipients. The solution was to use my dial-up Netcom (EarthLink) account over a phone line for a new mail merge based on an Access query of only the 70 or so RR addresses. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

Merle Nicholson has rescued me from having to write much this month. But I do have a bit to say and, I believe, just enough room to write it.

Rescued laptop I use my laptop only for travel and presentations, much preferring to work with a desktop computer whenever possible. The laptop is a three year old Gateway with a 1.7 GHz Centrino processor, one GB of RAM and a 120 GB hard drive. Three months back it had only 512 MB of RAM and a 60 GB hard drive.

I increased the RAM because, as you might recall from my programming presentation for the group in January, when I

Minutes of the June Meeting

By Doug Mullis, Secretary, Tampa PC Users Group
dmullis@tampabay.rr.com

The meeting started at 6:30 pm, with Bob LaFave conducting the Windows SIG portion. Bob asked, "What do you do when you don't want to keep loading a program you have on CD?" You download Microsoft's free Virtual CD-ROM Control Panel for Windows XP. You can then use a program like Nero to make an image of the program onto your hard drive. This allows you to copy the entire contents of a CD-ROM to your hard disk and run the programs or access the files without the need for the original CD. One thing though, it only works on ISO images. Bob demonstrated how this can be accomplished.

Bob went on to tell us about TechRepublic (http://techrepublic.com/) as a source of information and eEye Digital Security. He recommends AVG as the best anti virus protection; however, BitDefender for $29 per year is also good.

At 7:05pm, President John Witmer began the business segment of our meeting, telling us that next month William LaMartin will be our speaker to tell us of his success installing Linux on a virtual PC. We are looking for members to make presentations during the summer months.

Jim Purcell is trying to reestablish meetings of the Digital Imaging SIG. He asked for a show of hands of those who are interested. Several indicated they would attend. Where and when to meet is another issue for the group. Possibly the SIG could meet before or after the regular monthly meeting at Pepin. Jim indicated that he would conduct an email survey of the members as to what they want to do.

At this point, John turned attention to our speaker for the evening, Mr. Andrew "Drew" Smith, President of the Florida Genealogical Society. Mr. Smith is also the Information Literacy Librarian, Tampa Library at the University of South Florida, and was at our meeting to tell us about genealogical research online.

apcug Member of The Association of Personal Computer User Groups

First-Time Vista — Part III

By Merle Nicholson, Tampa PC Users Group
merle@merlenicholson.com

Vista failed a major hardware replacement, and XP adapted pretty well.

To help you follow this, I'll summarize from the last articles. I have what I call my "Wood PC" that has an open rack to place as many as six hard drives to experiment with and test software on. So far, I have one system each for Windows XP Professional, Windows Vista Business Upgrade, Windows Small Business Server 2003 and Ubuntu. I've now made a major hardware replacement, and Vista didn't survive.

The machine was a very nice AMD 2200+ processor and 1GB of memory with an on-board S3 graphics adapter. The processor is no longer made, and the motherboard was a bit difficult to get. Steve Singer at RDI came through for me on that one, so the motherboard is pretty new. All the systems but Vista worked very well. To be fair, except for a Vista 1.0 Experience Rating on graphics, Vista ran satisfactorily. But not having anything but a generic video driver, all the Vista graphic effects were missing. And it was apparent that the video was slowing down my interaction with the computer. My most apparent solution was to buy a new video card.

But then I had a chance to combine some parts I have and sell them, so I put the AMD 2200+, motherboard and memory in a nice old case I have and out the door it went, and with the proceeds I ordered the newest ASUS nVidia motherboard, memory and an inexpensive AMD AM2 X2 3800+ processor. To say that it's inexpensive doesn't mean that it's not powerful; it has two cores running at 2.0GHz, more than most new notebooks.

VISTA: When you make a hardware change as drastic as this, changing a motherboard with a different chipset, and especially a new chipset manufacturer, you expect an existing operating system to fail, and both XP and Vista did fail to boot. Drawing on my XP experience, though, I expected to repair the Vista OS, maybe with some difficulties. I wasn't prepared for what I did find.

In cases like this, the standard procedure is to first try Safe Mode. No chance there, but not surprising. So it's boot time from the Vista Business Upgrade OS CD. Like XP, you can try installing new, and then when it discovers that there's already an OS on the hard drive, it gives you a chance to repair the existing OS. I selected that, and sat down to watch. I should have timed it but didn't. It ran a long time, and it finally told me that the OS couldn't be repaired. Now that's a surprise. On XP, you could always repair. That repair sometimes replaced so many OS files that the system was put back to Service Pack 1, but it would be successful, and once completed you can expect that all your applications will operate as before, and all your data would be intact. Vista failed, and it knew it failed enough to tell me so. So, not being too trustful, I booted from the hard drive again, and it rebooted itself, and rebooted itself.

Here's what's surprising. The repair facility should have the capability to repair an OS all the way back to the point that it would have been, as if it were a first time installation. Does this mean that it'll fail if I do an original install? The motherboard is advertised as "Vista Premium Ready" and the graphics card – a Gigabyte X1650 (it is an ATI Radeon X1650 licensee) – disclaims the Vista-specific drivers, but that's common to most (maybe all) Vista video drivers.

So the obvious next step is to do an original install over the existing OS. I have not too much to lose: some customization, a Windows Office 2007 installation, anti-virus, spyware and DVD-writing software. I'll have to do those all over unless I abandon the idea of having Vista, and, after all, this is why I sold the old one and bought the parts in the first place—to have Vista. What a mess.

So I went ahead to do an install, and it took me just a couple of minutes to discover that Vista Upgrade will not install over a broken Vista OS. The Upgrade runs from a previous version of Windows. It does not recognize that there's a broken copy of Vista already on the hard drive. It refuses to install. It still angers me right now as I'm writing this. Man, what a mess.

What I need now is a running XP system to run my Vista Upgrade from, and, well, I have to do that anyway because on the same machine I have XP Pro, Windows Small Business Server and Ubuntu. So it's time to fix XP Pro. This runs smoothly but takes a very long time. Again, I was forced to do a system repair. In this case, it replaced all my system files back to the state of the XP Pro CD. On startup it asked to validate the operating system license. I accom-

(Vista…….Continued on page 4)

(Vista……..Continued from page 3)
plished that over the phone to Microsoft without talking to a person. Thanks, MS; this is a first for me; I used the touch key pad on the phone to key in the 6,379 numbers you wanted. I'm curious; why doesn't one number, say, less than 50 million, work as well?

After successfully starting the system, it's at a level of Service Pack 1. I installed Service Pack 2, then I installed 75 updates from the Microsoft Update site. Then I have motherboard chipset, sound, LAN, network and graphics cards updates to do. This is an all-day job in itself. In this case all my other programs worked fine: Office 2007, Nero, Windows Defender. The only non-survivor was AVG Free Anti-Virus. It couldn't find its license number, and I didn't write it down.

Now I'm really able to start – whoops, first I have to clone the drive to the Vista drive. To allay any sharp-eyed lawyers out there, I have XP licenses out the gazoo, don't worry. I'm paranoidly cautious about licensing. Now I can boot into XP and run the Vista DVD. To try to save some work here, maybe I'll actually do a Vista upgrade from XP. This is something I have not done before. This will preserve some of the programs already installed.

The first choices are to either upgrade the XP system or to install a new system. The first choice attempts to preserve any programs and data from the XP system, and the second option puts the old Windows files in a new directory but keeps other root directories in the root. I picked the first one, although it took a long time (and it does warn you that it takes a long time) – hours – I don't know - I finally dozed off for a while and then went to bed. After completing the next day – it was waiting for an answer as to the type of network I have – it was ready, and I'd say working well except for just a few things: It didn't have any animated windows as I expected, it has a Vista Experience rating of 1.0, it blue-screens for a second while shutting down, AVG Anti-Virus couldn't find its license again, and it warned me that two programs, PowerToys Tweak UI and Windows Messenger, did not work on Vista.

I installed all the updates—five, I think, then I downloaded and installed new ATI video drivers. This fixed the blue screen on shutdown, but the Vista Experience rating screen warned me that I should rescan for a new rating and it's now 4.5 out of 5, and, when that happened, the Vista graphics started working on their own. Hooray. This was the reason for buying new hardware and spending three long days of working on software.

I installed more new drivers from ASUS, then I uninstalled some junk that shouldn't be there, like the original S3 video software and PowerToys, and replaced AVG and Windows Defender with a trial version of MS OneCare. Office 2007 survived the transition, as did some custom software that I wrote and some that William LaMartin wrote. I have a ways to go to see if Nero still works and to try to see if I'll ever get used to the new Windows Explorer. We'll see on that one.

Now then what else? Did you guess? I have to quickly make a full system backup. This is to restore to where I am now in case of a full failure. Because remember – **The Vista Upgrade DVD WILL NOT INSTALL over a broken Vista Operating System**. ◆

(Minutes…….Continued from page 2)
Drew started by saying that the PC has transformed how we do genealogy. With a public library card number, or through a home subscription with data providers, you can have access to many genealogy research sites on the Internet. You can access all types of records, create a website, use bulletin boards to inquire about ancestors, exchange information through chat rooms, or even create your family tree or write a book online.

Mr. Smith distributed a handout showing many online research sites. They included Family Tree Maker, Legacy Family Tree, Roots Magic (which he recommended) and The Master Genealogist. You can reach many of these research sites at your public library without charge to see what is available and then subscribe for direct access from home for more convenient research.

With a current library card and using a library computer, you can also access Heritage Quest, America's Genealogical Bank, many newspapers and Ancestry Library Edition. You may also want to check out the Social Security Death Index, World Connect or Find a Grave. If your ancestors immigrated before 1924, the Ellis Island records are available online at a charge. You can also access naturalization papers. Drew also told us about a weekly pod cast that he and George G. Morgan produce. Check it out at http://www.genealogyguys.com.

(Minutes…….Continued on page 5)

(Minutes…….Continued from page 4)

There are also genealogical mailing lists and message board sites that you can register on and hope for "hits" from other researchers. Ask some leading questions and then be ready to exchange information.

Drew said that while online research capabilities have hurt genealogical societies, there are still reasons to join one. They have interesting speakers to tell of their experiences and to give helpful advice, and there is the camaraderie. You will hear interesting and helpful things at the meetings to help you in your research.

Mr. Smith answered a number of questions the attendees had on genealogical research. We thank you, Drew, for an interesting evening.

The meeting adjourned at about 8:30 pm. ◆

(Comments…….Continued from page 1)

had Visual Studio, Photoshop, PowerPoint and possibly some other programs going at the same time, things would occasionally get quite slow. The extra memory solved that problem, and it cost around $100 to replace two 256 MB memory modules with two 512 MB memory modules.

As to the hard drive replacement, that was an absolute necessity since I started occasionally getting read errors for the old hard drive when I would boot the computer. When that would occur, you couldn't get the computer to work for several hours. After the several hours, it would boot and run fine.

When I consulted Merle on the problem, he was sur-

More Crapware Part II

By Merle Nicholson, Tampa PC Users Group
merle@merlenicholson.com

An old friend came to me with a non-functioning Dell desktop that's not far out of warranty. It wouldn't boot at all, and I was able to fix it for her.

Somehow, some of the file system became corrupted. It just wouldn't boot. It did have a white-on-black text message that a system file was missing that, frankly, I didn't believe. But first I needed her operating system CD. Remember dude, it's a Dell, dude. She had no CD. She was aware that she should have one, but she was also very aware that it didn't come with the machine. She thought she could get it from the Dell website. Nope.

First thing was to run a diagnostic on the hard drive. These come free from the drive manufacturer's websites and run from a floppy. The result was that there was no physical damage to the hard drive. Interestingly, the machine had a floppy drive (remember this for later) but was built without keyboard and mouse ports. The machine came with USB keyboard and mouse instead, using two of the four available USB ports. Why would Dell make a machine with a floppy? Now it's time to boot and repair the file system.

I was hopeful that one of my own personal copies of XP Professional OS CD's would boot the machine. All I want to do is repair the existing OS using the repair facility that is built into the CD. So I booted on one of mine after correcting the boot order in the BIOS. So after a few minutes, the OS installation repair said that there was no operating system to be found, and, indeed, there was no hard drive. Well, Duh, Merle. The machine has a Serial ATA hard drive (the little red cable instead of the wide, grey cable), and like some – not all – computers with SATA, it needs a RAID driver despite the fact that it does not use RAID. RAID is a method of combining multiple hard drives to operate as one drive for either speed or data redundancy. AND Windows XP requires that the RAID driver be loaded from a floppy drive mounted as the A: drive with the SATA/RAID files on it.

Ok, here we are with no OS CD and obviously no floppy, but at least there's a drive. So investigations on Dell's website say that I can make a recovery CD by running a program located in Start, Dell Utilities. Ok, but I can't do that until I get the computer to run. No mention of a floppy.

At least the website is organized so that I can select the model number and find all the downloadable drivers, and, yes, there is a RAID driver zip file. So I downloaded that and made a floppy, and, yes, I repaired the OS using my CD and the floppy. Near the beginning of the boot on the CD, you have a chance to press F6 to load any SCSI drivers, and, despite the fact that this is not SCSI, do it anyway. It continues, and later on it asks for the floppy containing the drivers.

The OS repair took a very quick look at the files and obviously decided not to replace all the files, and in just a short minute required a reboot of the machine, and yes, we have a repaired system.

First thing in, I did the (allowed one-time) creation of the recovery CD. Then I ran CHKDSK that cleaned up some file errors, and we're good to go, except that this machine is the slowest powerful machine I've seen. It's a 3 GHz Pentium D, and a MB of memory. It should be very fast, but it takes forever to boot and it's pretty much sluggish all the time. So a quick look at the software, and, no big surprise, it's a Dell. It's loaded with crapware. And to top that off, it's also a Verizon/Yahoo machine. That more than doubles the crapware.

Ok – Dell crapware first. There are several programs running – starting at bootup – that Dell put there to "enhance the Dell experience" that do nothing except to make it easier for the unwitting user to contact Dell, or get some online help from Dell. Then there are two AOL programs running. The owner doesn't use AOL and doesn't want to (she has Yahoo!). Dell has sold out some of your computer. Then Verizon did the same thing by selling their customers' time and part of the computer to Yahoo!. Verizon gives the customer a CD with their DSL modem to install. And the customer really thinks that they must have a "provider", MSN, AOL or Yahoo, for the DSL to work, and it doesn't cost any more.

It cost my customer two hours of work to clean this computer up. Get this – she actually thought she had to sign on to Yahoo just to get her mail. She wasn't using Yahoo mail, she was using Verizon mail! She was thoroughly discouraged in using her computer, and I fully understand what she was going through. If you're going to buy a Dell (HP, Compaq, Gateway, Sony) meant for the consumer market, add a hundred fifty bucks or so to the price; you're going to spend it getting the crapware cleaned off.

A message to new Verizon users: When you get the modem, throw the CD away. You don't need it, and worse, it'll con-

Visual Basic for Applications SIG

This SIG meets the **third Wednesday** of the month at 6:30 PM. The meeting location varies. For information contact William LaMartin at *lamartin@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Bob LaFave moderates the discussion.

(Crapware…….Continued from page 6)
taminate the computer. Is there a market for a CD crusher?

So here's Merle's **Crapware Rant #1**. It's first about MSN, Google, Yahoo! and AOL. Remember, now, even AOL is no longer a service provider. AOL cannot run a DSL cable to your house. AOL is now providing free "connections" to broadband customers.

These companies are not even Search engines or content providers. What are they? **They're Advertising Providers**. That's how they make their money. They're in business to direct advertising to you. That's what they get paid for doing. Why do you think they're aggressively pushing toolbars to you? To easily push targeted advertising directly to your computer.

Ok, maybe they have a right to exist. It certainly isn't illegal, and if the computer manufacturers and broadband providers didn't sell you out to the crapware providers, there wouldn't be a problem in the first place. They actually are paid by the crapware providers. Why are they selling out? To be as competitive as they can. The crapware provider is offsetting some of their cost.

Crapware Rant #2 This is about RealPlayer. Not that they don't have a right to exist, but RealPlayer has evolved into the same as other crapware; they're in business to push advertising to your computer. They – and QuickTime – put themselves on your task tray when installed. RealPlayer has changed now so that a "message center" pops up much like an instant messenger with "messages" that are just advertising. Now I don't know about you, but what I want to do is play video presentations from a website. My spouse loves Jack Horkheimer's astronomy website. He used to have a 10-minute TV program on PBS. He presents current astronomy events in an informative and entertaining manner. But they've changed the website so that it plays only through RealPlayer. Even if you use msconfig and block the startup item, all you have to do is use the website again, and it re-installs as a startup item without your even knowing about it. The same happens with QuickTime (qttask.exe). Shame – and double shame on the websites that use them. ◆

(Comments…….Continued from page 5)
prised to hear that I had no backup for the laptop's drive. I never considered needing one since there was no data or program on the laptop that was not also on my desktop. But then I thought about the problem of having to replace the hard drive and then having to reinstall all the programs on it, and I had an epiphany. I went to Gene Barlow's site, http://ugr.com/, and purchased for $29 (the user group price) Acronis True Image 10.0 Home to use to create an image of my laptop's hard drive to an external USB drive. Bob LaFave has mentioned this program in the Windows SIG, and Merle has written about it in the newsletter.

I installed the program on the laptop and had it create an image of the hard drive on the external USB drive. The process took about 50 minutes for the 53 GB of data on my 60 GB drive. The resulting compressed image was 37 GB. During the process, Acronis twice stopped to warn of sector read errors that had to be ignored.

At Newegg, I found a 120 GB Toshiba laptop drive

(Comments……..Continued from page 7)

for around $70, ordered it and had it the next day (for an extra $8). I don't have room here for much detail, but suffice to say that all that was needed was a small Philips head screwdriver and some care to get the drive installed.

I then booted the laptop from the bootable CD that I had Acronis make earlier—and found that it couldn't see my external USB drive. No problem, though. Just install Acronis on the desktop computer, connect the new laptop drive to the desktop via a special adapter, connect the external USB drive to the desktop and have Acronis transfer the image from the USB drive to the laptop drive. That took a bit less than 50 minutes. Finally, I put the new drive back in the laptop and booted the laptop. And the laptop has been working fine and much faster (thanks to the new, larger hard drive) than before.

To avoid having a similar problem with the desktop drive, I later made an image of its drive to a different USB external drive. ◆

Meeting Preview: Jim Purcell is to present various aspects of digital imaging—for example, scanning negatives and using Photoshop Elements to modify images. As usual, the meeting will begin with our Windows SIG led by Bob LaFave.

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

Again, there is not much room for comments since our contributors have come through again, and I thank them for that.

As a follow up to my presentation on Linux on a Virtual PC last month, I would like to add that I began wondering, what next? And the answer was: "Can I find a program that runs in Linux and allows me to write programs that run in Linux under a graphical environment?" Somewhat to my surprise, the answer was, "Yes."

The program is named monodevelop and can be found at http://www.monodevelop.com. What is nice is that it allows me to write the programs using the C# programming language

Minutes of the June Meeting

By John Witmer, President, substituting for
Doug Mullis, Secretary, Tampa PC Users Group
dmullis@tampabay.rr.com

Bob LaFave opened the meeting with the usual Windows SIG. Bob spoke to the importance of backing up your system regularly, including backing up your data and Outlook Express files. To that end, he presented information on a program he uses that is in the $20 price range for file backup and creating a startup disc. This program is called "DriveClone," from a company named Farstone (http://www.farstone.com). You can find details of the program on the company's website.

As to backing up your Outlook Express files, Bob told us about a free program he uses for this purpose. This program is "Outlook Express Freebie Backup", and it can be downloaded from http://www.oehelp.com/oebackup. Upon checking this website, I noticed a message that said this particular program was undergoing revisions and was not available; however, the site has another program that accomplishes the same purpose, and that is "Outlook Express Quick Backup", also free to download and use.

After discussing several additional items with the audience, Bob turned the meeting over to the group's president, John Witmer. John had Jim Purcell give the group a preview of what he was planning on presenting at the July meeting, which all pertained to digital-imaging-related items that would also serve as a basis for future programs at the Digital Imaging SIG that Jim wants to reinstate. John also received checks from four members who were renewing memberships with the group.

John then turned the meeting over to William LaMartin for his presentation on Ubuntu Linux on a Virtual PC. In order to do this presentation, William first created an environment to run the program, using Microsoft Virtual PC 2007. William demonstrated the steps required to install and utilize this virtual pc application, after which he discussed how he came to the decision of selecting the Ubuntu 6.06.1 version of Linux.

He chose Ubuntu over several Linux flavors because, when he tried the installation of the different Linux distributions on

apcug Member of The Association of Personal Computer User Groups

Are CD's and DVD's A Reliable Place To Store Your Data?

By Jim Purcell, Tampa PC Users Group
Edward_J_P@MSN.com

In January of 2006, I attended a digital photography seminar conducted by staff members of the National Geographic Traveler magazine. They had recently published the first issue of their magazine in which every picture was taken with a digital camera. They instructed all of their photographers submitting pictures to use only digital cameras even if it meant buying a camera. They said that even a "point and shoot" was acceptable if they didn't already own a digital camera. It was interesting to hear of all of the procedural changes that were forced upon them as a result of going completely digital. One of the problems was settling on the most practical way to store and transmit all of their pictures. In addition to backing up on portable hard drives, they used a large number of CD's. They mentioned that people were becoming more concerned about the shelf life of CD's and indicated that MAM-A Inc. produced high quality CD's. I didn't pursue it at the time because I had my desktop with a large hard drive and my laptop had duplicates of my pictures and important files on its hard drive. Then a couple of things happened that brought data storage and in particular the storage of digital photos to the forefront. First, William LaMartin almost lost all of the data on his laptop (twice). He had his data and photo files backed-up on other devices, but the point is no matter how much you know about computers or how good your equipment is, you can very quickly find yourself staring at a blank screen. Next, two of my daughters and my granddaughter are taking a Photoshop course in St. Petersburg. Their instructor, who is a professional photographer, told them that he tried to retrieve some photos that he had recorded on a CD only five years earlier and he was unable to recover a single photo. He emphasized the importance of getting quality CD's and also recommended MAM-A Inc.

After hearing MAM-A Inc. mentioned again, I decided to check their web site. Their organization is described there as follows:

"MAM-A Inc. was founded in March 1996 for the production and sales of recordable compact discs. Its 50,000 sq. ft. plant is located in Colorado Springs, Colorado where the CD-R media is manufactured in a state-of-the-art clean room environment. The MAM GOLD discs use Mitsui Chemical's patented dye and have a characteristic gold color. This combination of dye and pure gold provide superior longevity, high-speed writing and quality recording up to 52X. MAM-A has earned a reputation in North America for producing the highest quality (professional grade) recordable media available. MAM manufactures CD-R media in 650 MB and 700 MB capacities, with reflective surfaces of silver or gold. DVD-R media is manufactured in 4.7 GB capacities. MAM operates two manufacturing facilities worldwide for the production of CD-R and DVD-R media. Facilities are located in Colorado, USA, and in Alsace France".

All of the media that we are discussing in this article is recordable media (CD-R's and DVD-R's). When we get to the discussion of DVD's, we'll briefly discuss the two DVD formats (DVD-R and DVD+R), but the quality is the same for both. MAM-A does not make rewritable CD's or DVD's (CD-RW, DVD-RW or DVD+RW).

Gold CD-R's: There is an Archive and a Standard Gold CD-R. They both come from the same production line. The product is closely monitored during production and those of the highest quality are pulled and identified as having archival quality. Both the Archival and Standard version are tested to have an estimated storage life in excess of 300 years and are available in 74 and 80 minutes.

MAM guarantees compatibility. "MAM Gold CD-R's guarantee a perfect recording compatibility up to 52X, allowing an additional time saving for all users, while preserving an absolute reliability in storage and retrieval of data. MAM CD-R's media are compatible with all recorders and readers."

You can review specifications, as well as labeling and packaging alternatives, for the Gold CD-R at: http://www.mam-a.com/products/gold/Gold%20CD-R%2010_10_03.pdf.

Silver CD-R's: The Silver CD-R's have basically the same qualities as the Gold CD-R's except for the storage life. The Silver CD-R's estimated storage life is in excess of 100 years, and they are available in 74- and 80-minute format.

You can review specifications, as well as labeling and packaging alternatives, for the Silver CD-R at: http://www.mam-a.com/products/silver/Silver%20CDR%2010_10_03.pdf.

A list of the Gold and Silver CD-R's made by MAM-A can be found at: http://www.mam-a.com/products/cd_product_list.htm.

Gold and Silver DVD-R's: The recordable DVD Discs are recordable General Purpose DVD-R media. As mentioned earlier, none of MAM-A's products are "rewritable". They can be used in any format (DV-Video, DVD-Audio etc). Although MAM-A recommends the MAM Gold DVD-R for archiving, both the Gold and Silver DVD-R's have an expected storage life of more than 100 years. When you write your data to a

(Data……..Continued on page 4)

(Data……..Continued from page 3)
MAM-A DVD-R disc, it adapts the same playback characteristics as a DVD-ROM disc. This makes it compatible with the world-wide base of both DVD video players and DVD-ROM drives that support DVD-R media.

The DVD's are available in both formats, the dash R (DVD-R) and the plus R(DVD+R).

MAM-A recommends that CD-R media be handled and stored as follows:

Precautions Before Recording

- Handle the disc only by the outer edge to prevent fingerprints and smears on the surface.
- Never touch the recording surface (unlabeled side) or set it down on a hard surface.
- Store the disc in its protective case. Proper storage helps protect the data from damage due to scratches on the disc surface.
- If dirty, clean the surface with canned air. Cleaning by wiping the surface is not recommended

General Handling Precautions After Writing

- Never use a ballpoint pen or any other sharp object to label your discs. Using a felt tip pen is the easiest and fastest way to label a CD-R. Note, however, a few caution items. Some chemical properties of the ink can actually permeate the disc surface and cause damage to either the reflective layer or dye layer below the surface. Never use a solvent-based permanent marking pen on the top surface in the data area**.** The absolute safest area to label your CD-R is in the clear center near the center hole (any marker can be used here). A water-based, permanent marker is recommended when labeling the top surface.
- Do not attempt to erase anything that has been written on the surface of the disc.
- If you will be using any adhesive labels or stickers, some precautions should be taken:
- Labels must be perfectly adhered to the disc surface. Any bubbling or creasing can imbalance the disc, which can cause tracking errors or noisy spin-ups. Never attempt to remove an adhered label. This can damage the protective layer or the reflective layer, causing permanent damage to the disc. In addition, as with writing pens, insure that your labels' adhesive does not contain any chemical solvents that can become absorbed into the top layer. The adhesive on some labels has been known to damage discs. Labels can also become loose with age. Adhesive labels are not recommended for discs being used for archival purposes. (See list below)
- If you need to remove dirt or fingerprints from the read side of the disc, please follow these guidelines:

Use a CD-cleaner cloth if available and wipe the disc from the inside to the outside, perpendicular to the tracks. (Lens cleaning cloths work well, or a clean cotton cloth. The cloth should be a "non-wood product," i.e., not a facial tissue or paper towel). Do not wipe in a circular motion around the disc, as this may scratch the disc ALONG the track if dirt is on the cloth. (Scratches ACROSS the disc are easier to correct than ones that follow the track) Commercially available CD cleaning liquid, ethyl or isopropyl alcohol, clear or soapy water can also be used. Do not use gasoline, kerosene, benzene, acetone, lacquer thinner, anti-static agents, or LP record cleaners, as they may damage the recording surface.

Quick List for Archiving:

- Use gold CD-R or DVD-R media for the best longevity
- Never touch the recording side
- Do not use adhesive labels
- Store vertically in a protective case
- Protective cases should be rigid and contact the disc at the center hub only
- Store at room temperature at moderate humidity (below 50%)
- For labeling, use a water-based, permanent, felt-tipped marker for writing on the top (write area) of the disc, or mark in clear center hub with any marker, or, ideally, write only on protective case
- Do not subject CDs to rapid changes in temperature or humidity
- Protect from light
- Never flex a recordable disc
- Store one copy offsite if possible.

Firmware: They also point out that if the firmware for your CD or DVD drive is not up to date, it might not record at the top-rated speed and may not produce acceptable recording quality even on the best media. All CD and DVD writers have firmware that contains basic operating instructions that allow them to write to the wide range of disc types in the market place. Drive manufacturers test recordable CD's and DVD's from all major disc manufacturers. These samples are used to find a "writing strategy" that is best suited for each media type. MAM-A has provided the following "pdf" document on their site that will provide even more information and has links to all of the major manufacturers of drives so you can just click to find the most recent firmware upgrades: http://www.mam-a.com/upgrade/default.htm.

(Data……..Continued on page 5)

(Data…….Continued from page 4)

Where to Buy: The product is available at Amazon.com. Just go to our web site (TPCUG.com) and click on the Amazon.com link on the home page, which, at no cost to you, will give our user group a commission. When you reach Amazon just search Electronics for "MAM-A". Depending on the quantity and label or no label, the prices I saw were in the range of $0.47 for a silver CD to $1.99 for a gold DVD. A solvent free pen is $1.90. MAM-A has a web store that didn't have quite the selection that I found at Amazon.com. I'm sure that if you contacted them for a particular item that they would either get it for you or tell you where you can find it. This store has closeout items at excellent prices so it would be worth your time to check there before you buy. Their site is: http://www.mam-a-store.com/.

Summary: I confined my discussion of CD's and DVD's to one company. There are a couple reasons for not covering several manufacturers. One, MAM-A is the name that kept coming up when people talked about CD or DVD quality. Once I visited their web site and encountered the wealth of information available on the site and answers to my questions provided by their Sales & Marketing and International Inquiries representatives, I decided to limit my presentation to the MAM-A product. I hope that this and the links from their site provide information that will help you select the media to fit your needs.

I've include an unusual number of links because I felt that further information would be of interest to some but not all. I am also adding more links at the end of the article because they are quite informative but are not essential to the purpose of the article. As you know, we have the luxury of having all of our newsletter articles available on our web site in "html" and "pdf" format shortly after publication. They can be downloaded, so that you can click on the links to view them.

iPhone Cutout

From almost anywhere on the Internet, you can find an image of the new iPhone. An unbelievable amount of free advertising was given Apple for the introduction of their entry into the cell phone market. Price $499 or $599.

If you don't want to spend that much and already have a phone, then why not go to the link below and download the full-size version of the image above so that you can make your own iPhone.

FACUG Spring Conference at Kissimmee

By Bruce Register, Tampa PC Users Group
bregist3@sw.rr.com

Editor's Note: *Bruce submitted this several months back, and I misplaced it and forgot about it. So the delayed publication date is my fault, and the information is just as good now as it would have been earlier—just not as timely.*

Gene and Linda Barlow (http://www.usergroupstore.com) have been regulars at FACUG for several years. They have been visiting the Florida PC user groups, making presentations and giving door prizes. This year Gene says that he will cut down on his traveling. He will "focus on tutorials instead." Visit his website for tutorials. He will provide groups with review software.

He publishes a technical newsletter that is free to members and friends. Contact Gene/Linda to sign up for it. Go to their website shown above. I made notes to the best of my ability to understand and follow his presentation.

Gene said, "Now is the time to go Vista." He said, I think I understood it correctly, for us to go the MS Product website and view Vista, 300 pages. That must be some review or discussion. I have not been there yet. He says Vista will require "more memory and contains upgraded graphics."

He recommended purchasing the Vista Home Premium edition, $159. Business users may want Windows Vista Business. Current Windows users could upgrade to Windows Vista Ultimate, $259 upgrade price.

He said to avoid replacing XP; buy a new computer and install Vista to avoid problems. He suggested other ways. The new computer route seemed to be his recommendation. He suggested one could make a clean install. In other words, start new with Vista to avoid upgrade over XP problems. Or, partition your drive for both systems.

Gene mentioned software that will transfer applications from one computer to your new PC, named PCMove, which is $49 in store. He also mentioned partitioning your computer with a an extra D drive for your data. Keep your applications on the C drive. One example he gave was C:\XP, C:\Vista and D:\Data. That way you get a clean install. You can expand or reduce space in the partitions. Acronis Disk Director Suite assists with partitions. Vista can do partitions, but it cannot expand or reduce without wiping out all applications and data. Gene has many software programs. User group members get discounts.

Smart Computing with Jen Clausen and Marcy (Gunn) Kremer ("Yep! She got married.") provided the buffet and a great program. The program was filled with good information and a lot of fun games. Prizes were awarded. All agreed that there was no better money spent than on a subscription to Smart Computing. The support, research and all the other features and help are fantastic. You can even get Smart Computing Magazine and articles from their website. They can and will assist you with tech support via an 800 number. This is a subscriber-only feature. Much information, research and support is free to non-subscribers. Going to buy something new, go to Smart Computing product research. Among many, many services that they provide is your own research library maintained on their system available to you 24/7, as are their other services. Quick Studies is another service. Phone contact is 800-368-8304. A user group member who subscribes should subscribe through their system as they have it set for PCUG members so that your group can get credits. Credits are used for freebies to your group. Go to http://www.smartcomputing.com.

As usual, **Corel** presented an excellent program and a buffet meal. They presented Paint Shop Pro XI. They also presented several other software programs. The new Word Perfect program is available. I decided to replace my Paint Shop Pro 8 with this newer fantastic application.

The presentation was made using their "Learning Center." That is also available to you. Go to http://www.corel.com and click on the Community link. Then select Tutorials.

Scott Moore of **Ai Squared** presented Zoom Text 9.0 by Scott Moore. Zoom Text is a most unusual magnifier. It is billed as the world's best magnification and reading software for the vision impaired. It does so much in so many ways that it is far ahead of other magnifier programs. You will be amazed at the features. It was designed for handicapped, but its usage goes far beyond. Close work can be viewed, manipulated and presented in "Wow!" ways. It has a hefty price tag. One version is $395, another is $595. Upgrades are much cheaper. Ai Squared, http://www.aisquared.com, (800)859-0270, will provide you with a trial version which is a really good presentation of the program. Scott was asked if his company will provide a group with a copy of the program for review and group presentation and the reviewer can keep it. He said that he would take the idea back to his company. Give the trial presentation to your group. I think that I remember reading on my copy of the software they gave everyone that it was a free 60-day trial.

Carl Lofstrom presented **"Trouble Shooting"** using PowerPoint. He kept everyone attentive to hear and see all that he presented. One cure for troubles is, "Every 30 minutes, get up from the computer and walk around." I seem to remember him saying that his presentation is available at http://polk-pcug.org. Always carry USB memory sticks to the meetings. The pre-

Special Interest Groups

Microsoft Access SIG

This SIG meets the **first Tuesday** of the month at 6:30 PM. The meeting location varies. For information contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merle@merlenicholson.com.*

Digital Imaging SIG—Cancelled until further notice

Visual Basic for Applications SIG

This SIG meets the **third Wednesday** of the month at 6:30 PM. The meeting location varies. For information contact William LaMartin at *lamartin@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Bob LaFave moderates the discussion.

(FACUG…….Continued from page 6)
senter will frequently download the presentation for you on site. Carl mentioned so many websites for free help that I could not write them fast enough. He will answer your emails. A program chairperson could do no better than to get Carl to come over and do a demo. He is most courteous, is very qualified in all aspects and wants to be helpful. One can find him in the list of PC user groups on the FACUG website. I lost a UPS from plain overuse and old age. I followed his advice when I replaced it and "did not skimp on money when buying an uninterruptible backup power supply." Low voltage and power surges can be very damaging if not protected.

Microsoft made presentations of several applications. Mindshare was the main focus. Microsoft donated the meal, as did the other presenters. We are lucky and grateful.

New officers were elected. Meritorious Awards were given. Door prizes have become leaner and leaner each year for the last several years. Vendors have had to cut back on budgets, staff, travel and prizes. We appreciated everything donated. Exhibitors were very few. Attendance was way down this year. Numbers were smaller but QUALITY was still very good. Everyone would be rewarded by attending the Fall Conference for one day in October 2007 and attending the Spring Conference the first or second weekend of March 2008. Much, much more was presented. You cannot attend every session as three different ones are going on at the same time. You will just pick one of interest. The breakout session are all day. Breakfast, lunch and dinner buffets are in the main auditorium of the Kissimmee Convention Center. Everyone attends those. ◆

Editor's Note #2: *Bruce, a longtime member of the TPCUG and still a member has moved to Dothan, Alabama and is in the process of starting a computer users group there.*

(Minutes…….Continued from page 2)
VPC 2007, Ubuntu worked by far the best with no modifications. For example, connecting to the Windows network and the Internet worked from the beginning. He said that there were two newer versions of Ubuntu, 6.10 and 7.04, but both had problems with the installation (which, however, could be overcome with a bit of command prompt work). Since version 6.06.1 gave you the same basic functionality, why bother with the extra effort to install the others.

He showed how to begin the installation of Ubuntu on a VPC and, since that would have taken some time, switched to a VPC on which he had already installed Ubuntu. From there he demonstrated working within Linux using the Open Office Suite of programs: word processor, spreadsheet, presentation program and database. We saw how to install new programs by installing a game and trying it out. A brief look at the Apache web server and the MySQL database ended the presentation.

At the conclusion of William's presentation, John Witmer reminded the group of Jim Purcell's digital presentation at the July meeting and thanked everyone for coming. We had approximately 25 attendees at the meeting, including four visitors. The meeting concluded at 8:40 pm. ◆

with which I have some familiarity. At this point I have only tried to do simple things, like display message boxes, display images, change the image based on a file that is selected from a directory, do simple calculations and connect to a MySQL database. As time permits, I hope to do more.

Programming in monodevelop is somewhat similar to programming for Windows in Visual Studio using C#—except that Visual Studio is light years more advanced than is mondevelop.

I hope my presentation might have tempted a few of you to try out Linux in the VPC environment. If you do, you will probably find what I found: You can do most everything many people want and need to do from within the Linux environment. But for me, there are many things I cannot do in Linux that are important to me, so it will remain just a novelty to investigate while I continue with Windows for my main endeavors. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

What to write about? I have had the new Adobe Photoshop CS3 for several months. I have had the new Microsoft Office 2007 Ultimate for less than a month. Photoshop CS3 was a two version upgrade from my previous Photoshop CS. Office 2007 is the next upgrade from my previous Office 2003. However, the Ultimate version has several more programs than did Office 2003 Professional: OneNote, InfoPath and Groove. I won't be using Groove since is for collaborative work among a group of people, but InfoPath and OneNote might be of some interest. Then there are the usual suspects of Microsoft Word, Excel, Outlook, PowerPoint, Publisher and Access, all of which I use. The problem of doing a re-

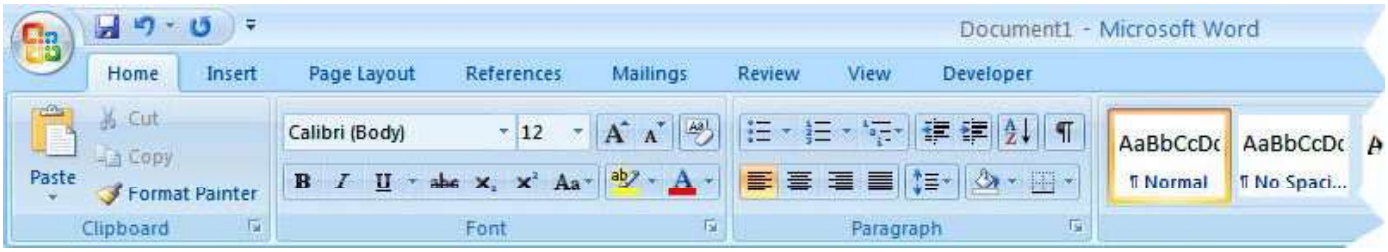
Minutes of the July Meeting

By John Witmer, President, substituting for Doug Mullis, Secretary, Tampa PC Users Group
dmullis@tampabay.rr.com



The meeting began with the Windows SIG led by Bob LaFave. Bob stressed the importance of periodically doing a Disk Cleanup. This utility can be found by clicking on Start, | select All Programs | Accessories | System Tools. Both Disk Cleanup and Disk Defragmenter can be found there. On the More Options tab of Disk Cleanup, there are several additional options that can be selected to free up additional disk space. Disk Defragmenter is another utility found there that should be periodically used to help speed up your system accessing the files and data stored on your hard drive.

Bob next took us on a trip down memory lane, bringing up Windows 3.1 in a Virtual PC environment, giving us a flashback to how the old days looked and functioned, including use of the old File Manager, etc. Following this flashback, discussion took place on the benefit of disabling and getting rid of the Language Toolbar, if you don't need it for any reason. This program uses resources to monitor for microphone input and is not necessary if you don't have or use a microphone to capture speech.

A question was asked about monitor resolutions. The response was that your video card and video memory determine what resolutions are available to you; you must also have the correct drivers installed to match the video card. A comment on a different topic had to do with removal of old security programs before installing new ones. If you are unable to uninstall a Symantec problem application that does not respond when you use the add/remove programs approach, you can find a Removal Tool that removes everything that Symantec ever created. This tool is available on their website. This concluded the Windows SIG portion of the meeting.

apcug Member of The Association of Personal Computer User Groups

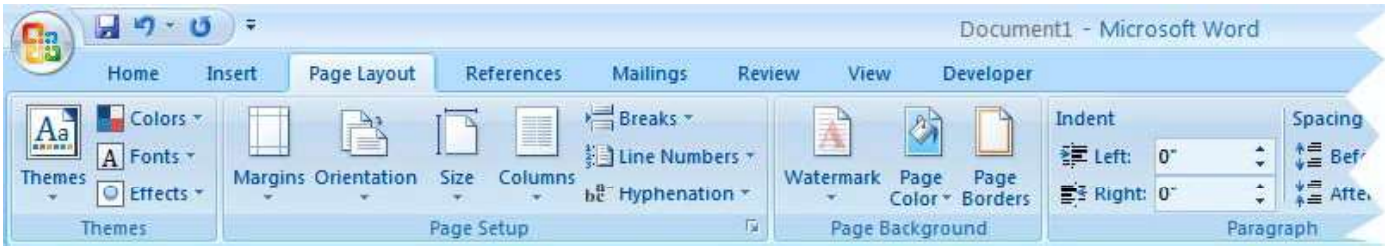
Microsoft Office 2007: My First Impressions

By William LaMartin, Editor,
Tampa PC Users Group
lamartin@tampabay.rr.com

The first thing I noticed when saving this document I am writing in Word 2007 is that there is now a new Word document type. It has a suffix of docx instead of doc. Docx is the extension of the new file format based on XML. Microsoft lists several benefits of this format over the old format:

- More compact files: It uses zip compression to compress and decompress on the fly.
- Improved damaged-file recovery: The modular construction of the file allows it to be opened if one component of the file is damaged but others are OK.
- Better privacy: You can use "Document Inspector" to remove hidden data and personal information.
- Easier detection of documents containing macros: Office 2007 Word (.docx), Excel (.xlsx) and PowerPoint (.pptx) files cannot contain macros or VBA code. Only files ending in m like .docm, .xlsm, and .pptm can contain such code.

Of course, you can still save documents in the formats of earlier versions of Office. Additionally, someone using an earlier version of Office, e.g., Office 2003, can open, edit some items, and save Office 2007 Word, Excel and PowerPoint documents by using the Compatibility Pack for the 2007 Office system, from Office 2003. The Office Compatibility Pack for Office 2007 is available at the Microsoft Download Center.



Access has a new file format, also. The suffix for that is accdb. As above, you can convert the new file format to the earlier mdb file format if your Access 2007 database does not use any of the new features in Access 2007. Things get quite technical when discussing the reasons to use or not use the new Access file format, so I will not venture there.

I had no trouble installing the full version (not an upgrade) of Office 2007 on both my desktop computer and my laptop, both of which had Windows XP as the operating system and also had Office 2003 Professional installed. I chose to leave Office 2003 Professional installed and to install Office 2007 Ultimate in a separate folder. The reason for doing this is that two individuals had warned me that I might find a time when I needed to use the older version for something. So far that need has not occurred, but, of course, I have done very little with the new product so far. I should note that you are allowed to install the product on a desktop computer and a laptop computer simultaneously.

Word was the first program I started after the installation, and I was a bit disorientated by what I saw at the top of the screen. Things are not where they used to be. As you will note, there are no File or Edit menu items in the image above. Instead, what you see is called a Ribbon, with different tabs and each tab divided into separate sections.

To get to your file options, you need to click on that large round button in the upper left-hand corner. The usual Edit options of Copy, Paste, etc. are right in front of you on the Clipboard section of the Home tab. If you need to insert something such as a picture, you would click on the Insert tab, where you would be presented with a Ribbon containing a Pages section, a Tables section, an Illustrations section, etc. The Illustrations section is the one containing a picture icon to be clicked on to start the inser-

(Office……Continued on page 4)

(Office…….Continued from page 3)

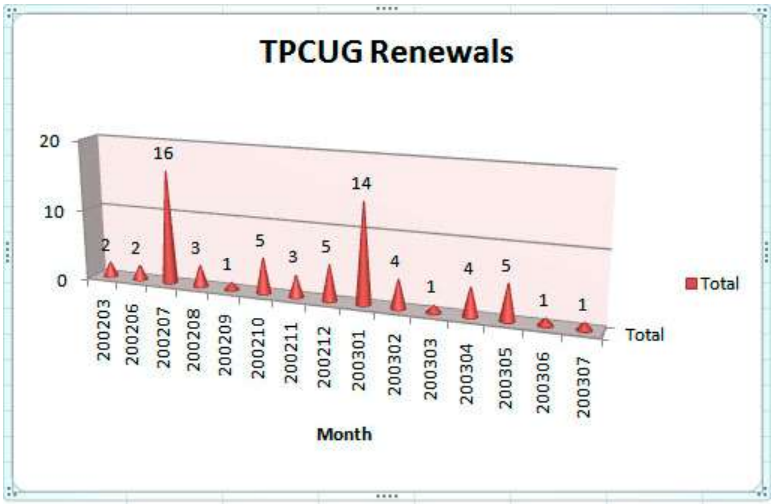
tion of an image.

The Page Layout ribbon tab looks like the second image, above.

I think the Themes section is something that is new with 2007 (I never saw it in 2003). Of course, the other settings for Margins, Orientation, etc. are the same as before. A check shows me that I am using what is termed the Office Theme in writing this in Word. There is a selection of 20 different themes available, and, as I hover my mouse over any one, my document immediately displays according to that theme's colors, fonts and effects.

Times New Roman is no longer the default font for body text. It is now Calibri if I am using the Office Theme, as you can see in the first graphic for this article.

I suspect the new interface might actually be easier for a novice user since they would not have to search for features hidden in the old labyrinth of menus. For me, though, it has taken a little time to get used to it since, it is so different from the old interface, but I am getting comfortable with it quite quickly.



One neat new feature is the zoom slider bar in the lower right-hand corner of the Word screen, as shown directly above. This makes it real easy to zoom the document in or out.

Excel also has a new interface with a Ribbon, like Word. In fact, the home tab ribbon in Excel looks much like the one in Word for the first few sections. So, to show something a bit different, I have displayed the Formulas tab Ribbon from Excel at the bottom of this page.

As in Word, if you hover your cursor over one of the icons in the ribbon, a small window pops up to describe the functionality of the item and also to give you a keyboard shortcut, if such exists and if you should want to learn that.

Also, just as I found with Word, all the documents created with previous versions of the program opened in the 2007 program without problems. I was able to save the document in its "old" format, or I could choose to convert it to an Office 2007 XML format.

(Office…….Continued on page 5)

(Office……..Continued from page 4)

In my brief look at Excel, I could find nothing different about the functionality other than a larger and more colorful selection of charts. The chart on the previous page is an example of that. It is a Columnar 3-D Cone chart based on a pivot table created from the membership renewal data for the club in 2002 and 2003. You might rightly ask why such old data. Well, I keep the membership data for newsletter mailings in Access—not Excel. But, for some reason, in looking for some Excel files with data to graph, I found this old membership data already there in Excel and thus used it to create the graph.

Excel 2003 does have a cone graph style; however, in 2007 there are many more variations that can be applied to it, one of which I used, so the workbook containing the chart has to be saved in the Excel 2007 format.

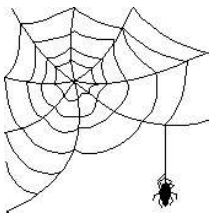
Merle Nicholson alerted me to one improvement in the new Excel—no limit of 65,535 rows in an Excel sheet. Now you can have million-row sheets.

Outlook in appearance looks basically the same to me as did the 2003 version. I see no Ribbon across the top like the ones in Word and Excel. What I do notice is that Outlook is now fully indexed so that you get quick results for any text search of the messages. To get this going, Outlook first has to index all your messages, which may take some time. But after this, it indexes each new message that comes in, and I gather that when a message is permanently deleted its index information is also removed.

One thing to note is that, as mentioned earlier, I have both Office 2003 and Office 2007 installed on my

(Office……..Continued on page 6)

Internet Picture of the Month



Postcard of old federal building in Tampa

From the Jacksonville Florida Public Library's site, http://jpl.coj.net/, we have one of the postcards from their postcard collection. Their postcard collection at http://jpl.coj.net/dlc/florida/postcards.html is divided into Jacksonville cards and cards from the rest of Florida.

This card depicts the federal building and post office on Florida Avenue in Tampa. It must be fairly old since it shows a horse carriage and no cars. The card's URL is http://jpl.coj.net/dlc/florida/pc/PCJPG/PCJAX211-008.html.

(Office……..Continued from page 5)

computer. However, that is not totally true since I no longer have Outlook 2003 installed—only Outlook 2007. You can have only one version of Outlook installed.

PowerPoint has the ribbon interface, and after getting used to it in the previously-mentioned Office applications, it is straightforward and easy to use. Of course, there are new templates for presentations, but, since I do fairly unadorned presentations, it is hard for me to tell what new or improved features this new version has. One exception to that is something called Smart Art on the Insert tab or the ribbon.

The types of Smart Art fall into the categories of Lists, Processes, Cycles, Hierarchies, Relationships, etc. The image above is a Cycle example.

Access is probably the least used Office application and is, in fact, not even available in some of the distributions of Office. It is, however, the most powerful and also most difficult to master of the applications. You can make a good living programming Access applications. Of course, the same could be said for Word if you used it to write Harry Potter books.

Much of my Visual Basic programming involves dealing with data stored in Access databases. I would say that Access is Merle Nicholson's primary area of work at present. He sometimes presents some of what he has been working on at our Access Special Interest Group.

It was Merle mainly who caused me not to install Office 2007 over 2003 since he had found that some of his applications created in Access 2003 did not port to Access 2007. He uses custom tool bars in his applications, and the new Access Ribbon is not compatible with them. Such things would not be a problem for Access users who do not create custom applications.

At present, I have found none of my Access databases that didn't open and display properly in Access 2007. I did, however, encounter one problem that was easily fixed.

Many of my Access databases have Visual Basic code modules in them. I found that when I tried to open such databases and then do something like a query or report that used this code, I would receive an error message like *Undefined Function Trim in Expression……..* In this instance, it was telling me it did not know what the Trim function was (the VB function that removes spaces before and after text). A check of Google told me that it was a reference problem that could be easily fixed by opening any code module, displaying the references, adding any new reference at random, closing the reference dialog and then reopening it and removing the recently added reference. And, you know, I think I had this same problem when I installed Access 2003 and used the same technique to fix it.

One new feature I noticed in Access and have tested is the ability to create an email message in Outlook that contains a form to collect information corresponding to certain fields of an Access table. When I receive a recipient's reply to the email, what they entered in the form's fields is automatically inserted into a new record in the database table. This has possibilities for questionnaires within our group.

I just about forgot to mention the program with which I am creating the newsletter.

Publisher 2007 appears the same to me as Publisher

Microsoft Access SIG

This SIG meets the **first Tuesday** of the month at 6:30 PM. The meeting location varies. For information, contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merle@merlenicholson.com.*

Digital Imaging SIG—Cancelled until further notice

Visual Basic for Applications SIG

This SIG meets the **third Wednesday** of the month at 6:30 PM. The meeting location varies. For information, contact William LaMartin at *lamartin@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Bob LaFave moderates the discussion.

(Minutes……..Continued from page 2)

Our presentation by Jim Purcell covered a multitude of things related to digital imaging. Jim started off his presentation by showing us a collection of film and digital cameras that he has collected since the late 1940's and early 50's, giving us a little background on why each particular camera was selected to be used by him. For a little show and tell, Jim was able to connect one of his digital cameras thru the room's VCR to the overhead projector, and, thus, we were able to see on the screen what he could see when taking a picture, including some of the settings and the changes made to them. Jim demonstrated the differences in results by varying the white balance settings. He also showed us the differences obtained when choosing the bracket shooting mode, whereby each of three pictures taken sequentially have slightly different exposure settings, allowing you to choose the best one. There was also a discussion on the benefit of getting a digital camera that had Image Stabilization capability, which can eliminate photos that are slightly blurred due to movement in your hands and arm when taking a picture.

Jim next moved on to demonstrating photo corrections that could be achieved using Photoshop Elements 4.0. Through his familiarity with using this program, he made it seem fairly simple to correct blemishes, coloring, red-eye, etc. in your pictures. This is a program that he would like to demonstrate further in a future Digital Imaging SIG, once that group's meetings are reinstated.

Jim brought to the meeting two different scanners that he uses, and he demonstrated use of the Minolta film scanner. He also had a flatbed scanner set up, but, due to the lateness of the hour, he only mentioned some of the ways he uses it. Jim concluded his presentation by reeling off a list of books and publications that he recommended for a more in-depth understanding of the world of digital photography and imaging. Unfortunately, I was not able to get that information written down to include in these minutes, so I would recommend anyone interested in which books Jim has suggested to contact him directly to discuss the particular topics that interest you.

The meeting concluded at the end of Jim's presentation. We had a total of 26 members and guests present at this meeting ◆

This is a correction to my article "**Are CD's and DVD's A Reliable Place To Store Your Data?**", that appeared in the July issue of our newsletter. Lora Swenson, Sales Manager of MAM-A Inc., graciously agreed to review the article to make sure that I had reported their product information correctly. I know that all of you are indeed shocked to learn that I did make an error. She provided the following correction to my article:

"The only correction that should be mentioned is that MAM-A's Silver CD-Rs are estimated to last conservatively 50+years under proper storage conditions, but Silver DVD-Rs are rated only for 20+ years. This is because DVD recordable discs have two bonded plastic layers, which will allow oxidation to occur for the silver metal layer over time, compared to CD-Rs that have only one plastic layer. DVD-R dye is also not as UV resistant compared to Mitsui's CD-R dye.

True archival discs should be 24K Gold, with accelerated aging tests for Gold CD-Rs rated at 300 years, and Gold DVD+/-Rs at 100+ years."

— Jim Purcell

view of them so soon after getting the 2007 versions is that I really don't have time to see what is new in each program in any detail. However, I think there is probably more interest in Office than in Photoshop. Certainly more people have some version of Office than they do of Photoshop (not to be confused with Photoshop Elements). So that is what I will write about this month and save anything concerning Photoshop for the future. ◆

(Office…….Continued from page 6)

2003. It does not have the Ribbon across the top, but it has the usual menu bar and tool bars. I really see nothing new, although I am sure that is not the case and that there is at least a larger collection of publication templates than before, if nothing else.

Groove, InfoPath and OneNote are the minor components of Office 2007 Ultimate. I have some interest in InfoPath and One Note and will possibly write about them later. ◆

Meeting

Microsoft Publisher 2007

Wednesday, September 12, 2007
6:30 PM
Art Pepin Hospitality Room
Pepin Distributing Co.
4121 N 50th St
Tampa, Florida

Meeting Preview: John Witmer will do a presentation on Microsoft Publisher 2007. William LaMartin will assist by showing how he uses Publisher to put the newsletter together. As usual, the meeting will begin with our Windows SIG led by Bob LaFave.

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

Office 2007 Article In my Microsoft Office 2007 article in last month's newsletter, I inadvertently omitted a recommendation as to whether or not you should rush out and buy it. If you use your current version of Office rarely and it does everything you want, then you probably shouldn't. If you use its programs every day and have some money burning a hole in your pocket, then you should. It does offer more functionality and a slicker interface

iPhone Unlocking As you knew would happen, a month or so after the introduction of Apple's iPhone that uses the AT&T network exclusively, various individuals have found

Minutes of the August Meeting

By Doug Mullis, Secretary, Tampa PC Users Group
dmullis@tampabay.rr.com

We first watched the flawless launching of Orbiter Endeavour (STS 118) from Cape Kennedy. At 6:47 pm, Bob LaFave began our Windows SIG session by asking if any members were having computer problems they wished to discuss.

Ed Cohen said he recently installed Norton Internet Securities on his three PCs and is unhappy with the four minutes each takes to boot up and then everything seems to run in slow motion. Bob said to see what effect removing unused programs from the startup routine has.

Ed then asked how to remove programs from the startup routine. Bob reflected back on his earlier recommendation for us to download Mike Lin's Startup Control Panel. It is free, although a donation is suggested. It will show what programs are loading at startup, and you simply check off those not needed. It is much easier to use than Microsoft's MSConfig. Merle said his policy, using MSConfig, is to remove from Startup: Adobe Update Manager, QuickTime, and anything starting with HP.

Nancy Cottrell asked about installing a wireless router. She uses Bright House Roadrunner as her Internet provider. Bob told her to call Bright House, as they will install and program a wireless router at a nominal charge. Might as well let them make it work.

Another member wanted to know if he could install a second router. Bob said to try it. He thought it should work.

After some general discussion, the SIG meeting con-

Surge Suppressors

By Ron Weinberg, Tampa PC Users Group
rswjbr@verizon.net

It was evident at the August group meeting that there was significant interest in this issue, so I am writing this to contribute a little knowledge of the subject gleaned from my professional experience, although I am not an electrical engineer and do not claim to be an expert on this subject.

Tampa Bay is known as the lightning capital of the nation. Computers and other electronic equipment are sensitive to electrical variations. Nothing can guarantee protection against a direct lightning strike, but lesser spikes and power surges can be severely damaging. Therefore, we locals should have a means of protecting our equipment.

Electric utilities may offer full home protection (TECO offers Zap Cap). This may be an ideal solution. For most of us, protecting individual equipment may be an acceptable compromise.

The saying "You Get What You Pay for "applies to the purchase of a surge protector. Those cheap strips claiming protection offer minimal protection at best, and are almost nothing more than extension cords.

Most good protectors use MOV (metal oxide varistor) as part of their circuitry. MOV based designs are subject to gradual deterioration, i.e., the MOV wears out a little with each surge it suppresses. This means that old units may have lost some or all of their ability to protect.

You can judge a Surge Protector by its UL rating, Joule Rating, and of course you should select one offering enough wattage for all your connected devices. UL Rating must be 1449 for Surge Protection and 1778 for UPS. Joule ratings vary, generally higher is better, but unscrupulous companies may quote unrealistic or fake ratings. It is best to buy from a reliable maker.

You can Google "Joule rating" for more detailed information.

Many reliable brands are available. Two prominent ones are APC (American Power Conversion), http://www.APC.com, and Tripp-Lite, http://www.tripplite.com. These companies include insurance for your devices against loss of the type they are designed to protect, such as a power surge.

You will be able to find protection for all kinds of devices and many multiple purpose units. Protection is offered for computers, printers, LCDs, HDTVs, etc. Some units include protection for telephone (modem), cable, and DSL connections as well. Some units have indicator lights for status and even wire faults. You may select a combination UPS unit offering Surge Protection or a Surge Protector only.

Check out what you want online and you will find most popular models available at leading suppliers. A favorite of mine is the Tripp Lite ISOTEL8ULTRA. It has:

8 outlets / 12-ft. cord
2850 joule rating
All metal housing with LEDs
Isolated filter banks
Modem/fax surge protection
$50,000 Ultimate Lifetime Insurance (USA, Puerto Rico & Canada only)
Price around $60.00 ◆

Traveling with a Laptop

By Jim Purcell, Member at Large,
Tampa PC users Group
Edward_J_P@MSN.com

I spent a week, along with other family members, visiting my daughter's father-in-law in Madison, a small town in central Maine. When I had gone several days without checking my email, I started looking for a Starbucks or a Panera Bread Store and found that there was a Starbucks about 22 miles away in Waterville, ME. I hadn't used Starbucks in about three years, and at that time it was free so I assumed that there was no change. After getting my computer set up, buying a cup of coffee and spending a good bit of time trying to log onto the Internet, I finally asked for help. They told me that all Starbucks stores are connected to "T-Mobile Hot Spot" and that I needed either an account or a daily pass. When I declined, they suggested parking close to a motel that was next door or going to Downtown Central Waterville, which they said was "wired". I had tried two or three locations downtown with no success when I spotted the Waterville library and decided to ask them for further instructions. The librarian told me to bring my laptop into the library and find a place that was comfortable. I found a spacious desk with an electrical outlet nearby and was able to quickly connect to the internet and check my email. All of this ate up about three and a half hours, just to check my email.

When I got back to Florida, I decided to see if I could find a way to make things easier on my next trip. Much to my dismay, I found that had I spent about 20 minutes of research before my trip to Maine, I would have easily found access to the internet throughout my trip. I located "The Wi-Fi-FreeSpot Directory" at: http://www.wififreespot.com/index.html. The well-designed index at this site allows you to search by facility or by state and town. I learned from this site that the library in Waterville, ME is one of 57 libraries in Maine that offer a free Wi-Fi connection and one of the 57 libraries is located in Madison, about 4 blocks from where I was staying. I also learned that "First Watch", one of my favorite restaurants, offers free Wi-Fi and now has78 daytime cafes in 11 states. I emailed First Watch to confirm that all locations offer Wi-Fi and received a prompt reply from their marketing manager advising that all 78 locations offer free Wi-Fi. I took my laptop to breakfast at the First Watch just off of Fowler Avenue this weekend and was able to connect to the internet quickly with no hassle. If you are not familiar with First Watch, you need to be aware that they are a daytime café and are open year-round from 7:00 AM to 2:30 PM, excluding Thanksgiving and Christmas Day. Their web site links to their menu for breakfast, brunch and

(Wi-Fi……Continued on page 5)

(Wi-Fi……Continued from page 4)

lunch and you can click on the menu items for the nutritional information of each item. http://www.firstwatch.com/article.cgi?file=2007.02.20.9 . Panera Bread is another of my favorite places to eat or to get a cup of coffee. Their menu also provides nutritional information by clicking on the menu item. If you are a serious pastry, sandwich, salad and soup person they also have a downloadable seven page PDF document that lists the nutritional information on all of the items they sell (down to the individual bagel or scone). They offer free Wi-Fi at more than 1,100 Bakery Cafes in 38 states. http://www.panerabread.com/cafes/wifi.php .

If you are a serious traveler, you might be interested in T-Mobile HotSpot. There are 8,288 T-Mobile Hot-Spot locations in the U.S. T-Mobile HotSpot sub-scription customers can stay connected in 712 addi-tional U.S. roaming locations and in thousands of locations worldwide. There is a schedule of rates and services at: http://hotspot.t-mobile.com/services_plans.htm . ◆

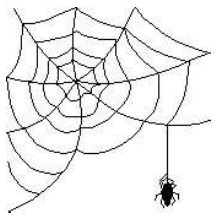
Internet Picture of the Month



Farm Foreclosure Sale in Iowa

With all the attention being directed to home fore-closures at present, most due to subprime loan problems, it is instructive to look back to the 1930's with its many farm foreclosures.

Many farm debts were incurred when prices for farm commodities were relatively high, in the late teens or early 1920s. However, by the mid-1920s, it cost more to produce the crops than they brought at market, and the situation only worsened into the 1930s. The result--foreclosure by the banks that had made the loans.

(Comments……..Continued from page 1)

ways around using AT&T. The first solution out of the starting blocks was a hardware solution, which, while ingenious, involves work beyond the abilities, I am sure, of 99.9% of iPhone users. More promising to those interested in the iPhone is a software solution that has been announced and demonstrated in a video on the Internet. How anyone can implement the software solution is still a mystery, though, since the developer of the solution is afraid to post the method on the Internet for fear of being sued by either Apple or AT&T.

Burgert Brothers' Tampa Photos I am sure many of you in the group are familiar with the collection of more than 13,000 photos of Tampa from a little before 1900 until in the 1960s taken by the Burgert Brothers' photo shop and now residing in the Tampa/ Hillsborough County Library and accessible from their online card catalog, http://www.hcplc.org/. You may even recall that I created an index of these photos (when the search abilities of the library's online catalog were much more primitive than at present) at my personal site, http://www.lamartin.com. I receive emails occasionally from individuals who thank me for this since they find it easier to either browse the photos or do searches at my site than at the library's.

Although I have an index of them in a database at my site, the photos are at the library's site, and this past month I received an email from a user of my index informing me that my index was of no more use since the library had removed the photos. Now, I knew that the library hadn't removed the photos; they had just most likely changed their location on a server. So I went to the library's site, did a search for Burgert Brothers and found the new base URL for the photos. I just needed to change 13,214 addresses in my database by replacing http://zerver.thpl.lib.fl.us/ with http://burgertimages.hcplc.org/. Computers are good at doing things like that. So go to http://www.lamartin.com, click on the Photos button and then the Burgert link.

Automated Slide Show Staying on the subject of photos for the moment gives me a chance to write a few lines about my programming. Over the years, I have come up with various methods of presenting a slideshow of photos on web pages. Most of my slideshows at various sites were not automated—that is, you had to press a button to go forward or backward within the show. There is a good reason for this—if you want automation of the display of images on a web page, you need to use JavaScript. You can do a search and find such code on the Internet and include it in the HTML of your page to do the show, and I have done this a couple of times in the past. But most of my slide shows contain many photos and this makes the JavaScript method cumbersome since you have to include all the photo links in the code of the page.

Since I use VB.Net (part of Visual Studio) for my web programming, I have stuck with a manual type slide show until recently, when Microsoft added a new tool for web programming—the AJAX Tool Kit. This allows me to do things with web pages that require Java but have the Java aspect of it hidden from me. Thus, I can now do things like automated slide shows from within BV.Net. To see both types, again go to http://www.lamartin.com, click on the Photos button and click on the Hurricane Katrina link. Which do you prefer, the manual show or the automated show? If you prefer flowers to hurricane damage, go to the neighborhood site I maintain at http://www.oldhydeparkfl.org/, click on the Hyde Park | Photos buttons. Here you also have a choice of automated or manual shows. Oh, and there is one hurricane show here, too.

As the tools available change, I try to change with them. We have certainly come a long way from when I used Notepad to create the HTML code for the first TPCUG web site.

Comparing folders Another programming project this past month was to write a program for Windows Desktop computers that would compare the subfolders and files in one folder with those in another folder and then allow you to copy files and subfolders that are different between the folders . You might think that this ability was already a utility in Windows, but it isn't. Of course, you can purchase programs that will do this. However, I wanted to roll my own. Merle Nicholson was my beta tester on this project, and it surprised me how many bugs he could uncover that I hadn't caught. This is what I will talk about at the

electronic devices.

Mr. Brooke confirmed that TPCUG members are generally entitled to a discount at the business counter on items not already discounted. Locally, Comp USA has stores in Brandon, Clearwater and two locations in Tampa. They have served the Tampa Bay area for more than twenty years.

One member asked if there was a way for us to check the availability of items online before coming to the store? Dana said there was, and Mytu took us to their business web site for a demonstration.

What are the hottest-selling items at Comp USA? Digital cameras, MP 3 players and iPods with video. People now want a super-compact camera for travel and another with all the features for home use. You might have noticed that electronics prices change very little but that the features increase with each year's models. Dana says most people no longer do major upgrades to their PCs. Now, every three or four years they buy a new computer, usually a laptop for portability. The industry is pricing PC's to encourage this, as obsolescence is assured within four years. Also, Dana recommended not upgrading an older computer to Windows Vista; buy a new one with Vista already installed. You'll save money and avoid headaches.

Here in Florida you should protect all expensive electronic equipment from power surges. Protective devices should be rated to absorb at least 1200 joules of surge energy. Power conditioning and battery backup are also important to prevent crashes of your PC. Soft shutdown preserves your data and is easier on the electronics. Comp USA donated such a protective device at the meeting for the group's benefit. Ed White says TECO will provide something they call Zap Cap for a few dollars a month to protect all your electronics against power surges.

Mr. Brooke said backing up your system is cheap today, so Do It! Thumb drives, external hard drives and DVDs are recommended based upon the capacity needed. Save important data using these backup devices.

Bob LaFave suggested that Comp USA do away with mail-in rebates. Why not instant rebates? Dana said he would pass this along to upper management.

In closing, Mr. Brooke said anyone wanting to log in to the Comp USA business web site should email him at dana_brooke@compusa.com and he will see to it.

John Witmer thanked Dana Brooke and Mytu Tran for the insight into the computer sales world. And for the APC power backup device which will be raffled off as a door prize. Raffle tickets were sold during a short break. Winners of prizes were as follows:

Harry Lochaby	$40 Comp USA Gift Certificate
Roy Drew	$20 Comp USA Gift
Bob LaFave	APC 350 Battery Backup Device

Guests this evening were Hardy Tuegel and Roy Drew.

The meeting adjourned at 8:40 pm.

(Regular Secretary Doug Mullis thanks John Witmer for carrying these duties for the past two months in addition to being our president.) ◆

next VB SIG.

Newspapers Are you noticing that not only are the printed versions of our local newspapers, *The Tampa Tribune* and *The St. Petersburg Times*, shrinking, but also their online sites seem to have less news than before, or it may just be that in their reorganization of their sites, they have put the news in locations where I am not used to finding it. It appears that they want their main page to be mainly local news and sports. You have to dig to get the state and national news from the sites. The Tribune is also pushing a subscription to some sort of digital version where you can read the entire paper with your browser or an offline reader. There is only one catch—it is about $90 per year. This is a service from http://www.newsstand.com/. For comparison, it appears that to read *The New York Times* in its original format digitally will cost you about $180 per year.

Perhaps this is the future: It is cheaper than a subscription to the printed version, and it saves the trees (which are grown for the sole purpose of being made into paper). But it is going to be hard to get people to pay for something that they have been getting a scaled-down version of online for free. ◆

Minutes of the September Meeting

By Doug Mullis, Secretary, Tampa PC Users Group
dmullis@tampabay.rr.com

Before the meeting began, we watched a video of one of our members, Eddie Rodriquez, do his first tandem skydive at Zephyrhills, Florida. Eddie went with a group of students from USF and hired a cinematographer to record the event. We're not sure why Eddie jumped out of a perfectly good airplane, but he did live to show and tell us about it. Thanks for sharing your experience (and your dark side) with us, Eddie.

At 6:45 pm Bob LaFave brought us back to earth with our Windows SIG portion of our meeting by revisiting a program called PC Decrapifier for removing trial software that comes on new computers. It's free, but use at your own risk. You can download it at www.pcdecrapifier.com/download .

A member told us of a program for removing temporary files from your computer. Bob said this could also be done using Disk Cleanup. Getting rid of unused files will make virus scans quicker, as well as free up disk space.

A member asked how difficult it was to replace a wireless router. William LaMartin suggested trying it following instructions that come with the new router. The wiring is simple, and, if the encrypting is beyond you, just reinstall what you had and call for help. Bob warned that you want to encrypt to prevent unauthorized access to your system.

Another member had a problem with files on her hard drive being converted from Word 2003 format when she went from Office 2003 to Office 2007. William suggested opening each document and resaving it in Word 2000 or 2003 format. Much dis-

First Time Vista – Part IV

By Merle Nicholson, Tampa PC Users Group
merle@merlenicholson.com

I'm still occasionally using my Vista machine, but not for my regular business activities. I am getting used to it, including the User Access Control (UAC) pop-ups, which I have not disabled. I'd decided to install Microsoft One-Care on this machine and two other machines, so the following will be on two subjects: Microsoft One-Care and Vista File Manager.

One-Care. Microsoft One-Care is a subscription-based anti-virus, spyware, firewall and backup product. It costs $50/year, but it allows three machines on the one subscription, which makes it pretty cheap. So I installed it on the Vista machine, on my peer-to-peer Win XP Pro server and on my Win XP Home notebook computer. You can install it on a trial basis, and it'll remind you when it's expired and also make it pretty easy to pay up.

My original thinking was that I wouldn't mind having an all-in-one product to simplify administration, and in that respect it works very well. There's a bubble in the system tray to click on, and all functions are accessible in a well-organized panel, including virus and other malware scanning, firewall and also file backup.

Firewall The firewall is two-way, a real improvement over the native XP/Vista one-way firewall. A one-way firewall is always looking at incoming internet traffic, hides your own computer from sight and blocks illegal intrusions from the outside.

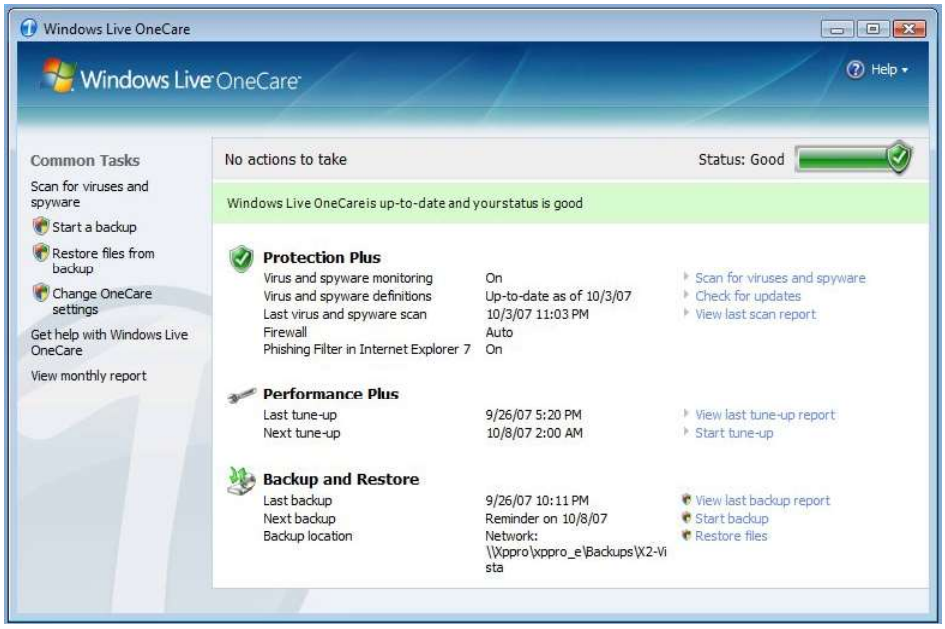
A two-way firewall also looks at your own programs when they request internet services, checks against a list of permissions and then asks you in a pop-up if you want to allow some activity that is not authorized. I've used Webroot Desktop Firewall for three years on my business/personal computer, and it works in the same manner, and One-Care seems comparable. With Webroot, you can go into its database of programs and alter those settings, but it's something I rarely do.

Anti-Virus & Anti-SpyWare. What can I say about this? It scans reliably and when it's supposed to. It updates daily and notifies me that it has done so. It doesn't seem like it's a resource hog, but that's a pretty subjective thing. It even runs almost unnoticed on my notebook, a 1.8GHz Athlon single processor, and it's completely unnoticed on my Vista machine, which has a high-end AMD dual-core processor. I must say that both machines have more than adequate memory installed, which is usually a factor.

Now, on the XP machine, One-Care did once find a Trojan downloader virus that caused me some trouble. It was clear it did find the Trojan, but it failed to quarantine it. But – and this is important – it did not identify the file. In One-Care help, it said that the cause of failing to quarantine is based on the file being a system file that was loaded. So I did the pretty standard things. I disabled System Restore. That's because often System Restore will have a copy of the virus and it will return to you. Then I tried to run One-Care in Safe Mode, and it refused to run. So then I loaded and ran a single copy of AVG Anti-Virus, and Spybot Search & Destroy and maybe some others. And these others did not identify any virus.

So I went back to normal and went on with life, and daily, when it ran it found the same virus just like the first time. I looked for other sites that had tools that would remove that virus with no luck, so I submitted a report to Microsoft. And, I think, within two days I got a call from a person about it and also exchanged some email over the course of about four more days. One of the things he wanted to do was to remote control into my machine, and I must say that he accepted the fact that I was probably as capable as he to operate my computer.

To my surprise, he did finally tell me that there is a virus scanner that can be run in safe mode. Later I did find mention of it in the Microsoft Knowledge Base. In any case, it runs on the command line box and is strictly text-based, like an old DOS program. He said it took a long time to run, and he was right. After about four hours, it displayed the name of the offending file that contained the virus, and also said that it failed to quarantine the file! It was in a zip file



(First Time……..Continued on page 4)

(First Time…….Continued from page 3)

that I'd archived to my file server and had erased from my personal computer. So I just deleted the file. In retrospect I should have "wiped" the file first before erasing, but I did not do that. It didn't go to the recycle bin though. After it was all over, I enabled System Restore. I do think it wasn't really a virus, but I didn't need the file anyway, and I had to stop One-Care from detecting it every day.

Back to the subject of Vista/One-Care. Perhaps you've been reading about this lately. The complaint is that Windows Update will reboot your computer after doing updates. This is causing a flurry among those who believe that it is they – not Microsoft – who should decide when the computer is to be rebooted. The claim of course is that they may lose some important work that hasn't been saved, especially if they are not sitting at the computer when all this happens.

On most of my own computers, I've set the Update Options to download but not install automatically. Now add Windows One-Care on top of this in Vista. The problem is that One-Care has two status levels, "Good" and "At Risk". If it's "Good", there is a pop-up when the program updates and sometimes some other warm fuzzies. If you have a virus or have something that must be attended to, you're in the red zone and "At Risk". And then you're fairly frequently reminded that you must take some action.

But … here's the problem … if you have Windows Updates set to any of the options except "Automatically Update", ol' One-Care goes red on you. And you're reminded pretty frequently that you must do something about it.

Well jeez, give me a break. My own fear was that I'd get so used to the pop-ups that I'd miss something important. So I spent some research time to see if there was something I could do and ultimately submitted a problem ticket to Microsoft.

I got a pretty positive response that they could help, and the guy would phone me once a day, Saturdays and Sundays included; offered a registry edit fix that even I could tell changed the behavior of Windows Update (Not!); wanted to take remote control of my computer (Not!); and then ultimately admitted that it was a feature of One-Care and they couldn't change it. I really did waste a lot of time with a Microsoft person who took many days of back and forth only to realize that he didn't have a grasp on my problem. He would repeatedly ask questions that I had covered in my problem description.

I finally did change my Windows Update to Automatic for two reasons: 1) I thought it's more important to have One-Care show a red at-risk status only when it was important and 2) It's my Vista machine and I don't do my real business there.

Vista Windows Explorer: I've been using Windows Explorer in Vista quite a lot. I do a great deal of file work: moving, copying and organizing. I'll say now that Vista Windows Explorer makes handling files very difficult. It's a complete redesign and bears no resemblance to the XP version or any other version. It appears that the objective was to make casual searches easy, and they may have done a good job at that. But if you're a serious, professional computer user and have a lot of files to manage using even a simple file structure, you're going

(First Time……..Continued on page 6)

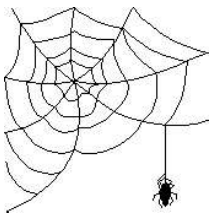
(Comments…….Continued from page 1)

still more astronomical number. (It is at $582 as I write this and was as high as $595 a few days back.) Oh, if we had only had the foresight to have purchased a few shares when it first went public about three years ago at around $85. Google now has a market capitalization of $182 billion, as compared to Exxon with $521 billion, Boeing, $83 billion, GM, $20.4 billion, GE, $430 billion, and Hewlett-Packard, $131 billion. Is Google really worth more than twice Boeing or more than Hewett-Packard? I don't think so. They don't sell anything but search services (other companies use their search) and click advertising. How often do you click on a paid ad when you do a Google search?

As a computer club, we are not really interested in stock prices, but we are interested in keeping our personal information safe when we use our computers. That is why I cannot understand why many people I know use Google's Gmail. As I understand it, every Gmail message you send is scanned by Google so they can direct advertizing to you, and all this information is saved in a database. I personally don't want anyone scanning my email.

What about web searches using Google? They know everything in which you have an interest--that is, they know everything that the person with, say, current IP address 22.156.184.104 is interested in. And then, if that is matched up with the person using Gmail whose messages come from IP address 22.156.184.104, well, they then know that Mary Smith writes letters to her congressman decrying the decline in morality of the country while at the same time she is searching the web for you know what. Think about it. ◆

Internet Picture of the Month



Soldiers of the 55th Armored Infantry Battalion and tank of the 22nd Tank Battalion move through smoke-filled street. Wernberg, Germany

With the Ken Burns WWII epic documentary on PBS TV recently, it is appropriate to use a WWII photo for our Picture of the Month. In looking for such images, I came across the sub-site of the National Archives that features a few select photos from all segments of the war. The URL is http://archives.gov/research/ww2/photos/

The pictures at this site are from the holdings of the Still Picture Branch (NNSP) of the National Archives and Records Administration.

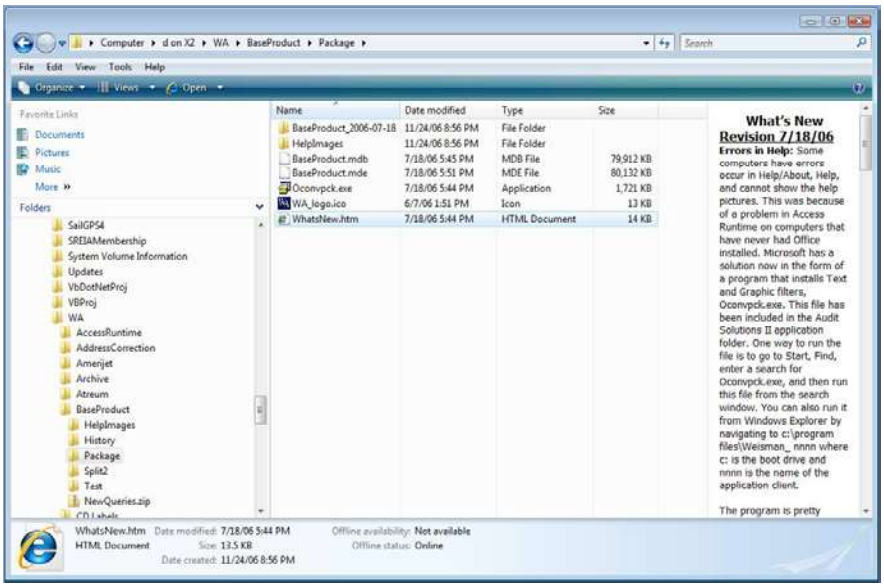
FIOS World

By Robert Davis, Tampa PC Users Group
robdavis7@verizon.net

Did you ever have one of those days when you got 150 emails waiting to download and you're logged on your landline at 37.2KB? Maybe none of you have that problem like I did. So, while spending a lot of time one day downloading email with a phone line, I decided it was time to change to the 21st century! I had tried to switch to DSL, but that is not available at my house. However, Verizon had recently installed their FIOS cable up to my house. I had to twist my own arm to spend extra money just for a quicker internet, but I did call Verizon. I'm getting close to the age where you only buy ripe bananas, and I was tired of spending so much time on downloading email.

Verizon set up a time to install FIOS for 10 am on Wednesday, September 19th. At about 9:50 am that day, the guy was there to install. They had said it would take about 4 hours. He was done in about 3 and a half hours. Very courteous and informative. I also had my old landline (that had zero enhancements and cost me over $40 per month) put on FIOS for an additional $25 per month. The FIOS phone service now includes caller ID, call waiting, voice mail, etc., as well as free long distance for USA and Canada anytime of day or night. The voice quality on the phone is at least as good as it was on the landline. When I added up the bills, I think I am paying less than $20 more per month and I have a lot better phone and internet access. Life is good.



What a difference there is on the internet now! The installer's tests showed the download speed at about 10MB and upload at just under 2MB. Both ways are extremely faster than 32KB! A couple days ago I had 125 emails. With the old landline it would have taken me maybe an hour to download them all. With FIOS, it took about 30 seconds. Quite an improvement. So now I am hooked. Like the ads on TV claim, I will never go back to a landline, ever! The transition has been virtually seamless, so my hat's off to Verizon for a fine group of products. ◆

(First Time.....Continued from page 4)
to be unhappy.

My two largest complaints are that: 1) There is no way to show a complex directory tree structure that you can quickly absorb. Part of that is because the pale yellow folder icons are not distinct and the old + and – distinct boxes are no longer used. Instead, there is a tiny colorless triangle that denotes that there are folders below it. And 2) There is so much wasted space with three non-configurable toolbars and very little left for the tree and file details. You can, however, remove the only really useful menu bar. You can hide the details at the bottom; that does help, and you can remove the file viewer; all useful actions to take.

As a remedy, I have been looking for a Vista-compatible old-fashioned file manager. I'll pay money for it if I can find one. I have reviewed a couple of pretty good ones, but I reject even good ones if they stay resident after closing and if they have a huge amount of features that I have no interest in. I guess a lot of features aren't a really bad thing as long as you can turn them off or hide them. But I don't need to browse the internet with a file manager, I don't need to FTP, I don't need to publish to the internet, I don't need to sync between folders and I really don't need to view files.

It's too bad. I thought that the XP file manager was pretty good and would have been ideal if it had a file filter. There was a Windows 3.1 file manager called Norton Commander that had that feature, and it worked wonderfully. Maybe I'll get what I want eventually. If you find one, let me know, will you? ◆

Special Interest Groups

Microsoft Access SIG

This SIG meets the **first Tuesday** of the month at 6:30 PM. The meeting location varies. For information, contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merle@merlenicholson.com.*

Digital Imaging SIG—Cancelled until further notice

Visual Basic for Applications SIG

This SIG meets the **third Wednesday** of the month at 6:30 PM. The meeting location varies. For information, contact William LaMartin at *lamartin@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Bob LaFave moderates the discussion.

(Minutes…….Continued from page 2)

cussion followed.

At 7:16 pm, President John Witmer took control of the meeting to conduct group business. He announced that the Fall Conference of FACUG would be a one-day event in Orlando on October 6th. Go to their website for full details. John also asked members to add their names to a list being circulated if they want a TPCUG membership card.

Next month's speaker will be Ken Scott from Media Concepts Inc. of Gulfport. They provide a service converting whatever imaging you have to CD's or DVD. Jim Purcell's daughter had them transfer videotape to DVD, and she was very impressed with their service and product quality. In November, we will have Steve Singer back to tell us about the latest in computer hardware.

At 7:25 pm, John Witmer and William LaMartin became our featured speakers for the evening. Their topic was Microsoft Publisher 2007. John presented a Power Point presentation supplied by Microsoft and William showed us how he utilizes this software in doing our newsletter and other things.

John asked how many here tonight have used Microsoft's Publisher software? Four members stated they have used it for newsletters and to produce signs. John said Publisher could also be used to make business and membership cards, calendars with personalized pictures, greeting cards, brochures and even postcards. John had done newsletters in the past using Microsoft Word. Publisher 2007, however, has much more capability. John then ran the Microsoft Publisher demonstration showing its vast possibilities.

John then asked William LaMartin to show the group how he uses Publisher 2007 to do our monthly newsletter. William said he would do that, as well as other applications.

William said he has been doing the newsletter since December 1996 and originally used Word but found it difficult to insert pictures and to flow articles from page to page. He then opened Publisher 2007 to show features offered and generally what it looks like.

Our newsletter page layout is tricky because it is assembled as a booklet printed on both sides of 11"x17" sheets. Publisher allows you to preview the page layout of the entire booklet. Placing images is easy as text will wrap around pictures. You "make things fit" by trying different font sizes and adjusting the margins. William then showed us how he deletes material from last month's newsletter to turn it into this month's issue, leaving things that don't change as is. He then replaces the deleted material with the new articles and images. Talk about minimizing work! Good show, William!

Next, William showed how to make a tri-fold brochure. Again, both sides of the paper are printed on and properly arranged to be right when folded. Font size, image or logo placement and color selection are important in creating an attractive brochure.

Finally, William showed us the Hyde Park Direc-

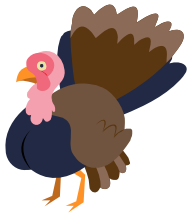
tory, which he composed and keeps current for his neighborhood. It is published in booklet form and uses data from a Microsoft database for the membership information. He creates reports in Access for the membership information and then saves the reports as Rich Text Files, which are then pasted into Publisher.

Very impressive, but, alas, the clock approached the 9 o'clock hour, and William ended it. Thanks, John and William and Bob, for such an informative evening.

As we adjourned, John Witmer told us of a Publisher 2003 tutorial available for about $30 if anyone is interested in trying Publisher.



The meeting adjourned at 9:01 pm. ◆

LP to CD Following last month's presentation on Audio Visual duplication, I decided to restart my long-lapsed program of transferring some of my LPs to digital files which could then be put on CDs. I had done this for a few LPs many years back and recalled it was a bit tedious, so I asked Merle Nicholson if he had any suggestions. He said, "Do you have Easy CD Creator?" Well, yes, I have Roxio Easy Media Creator. He said to check and see if they didn't have some software for working with LPs. And they did. It is Roxio LP and Tape Assistant.

After that, everything was fairly easy. I simply connected two RC cables from the output of my very old (1968) KLH stereo system with an integrated turntable to an adapter that plugged into the stereo line-in jack of my computer's sound card. Next I started the Roxio software, started the LP playing and let the software determine the proper recording levels. Next, I restarted the LP and let

Minutes of the October Meeting

By Doug Mullis, Secretary, Tampa PC Users Group
dmullis@tampabay.rr.com

Bob LaFave started the Windows SIG portion of our meeting at 6:30pm.

Eddie Rodriquez asked which is the fastest web search engine. Bob responded that Google is fast and will find almost anything. William LaMartin thought Microsoft had a good engine and didn't like the fact that if Google combined information from your Gmail account and your searches they could track your activity. William suggested we also check out Scroogle.org, which does not retain a history of your activities beyond 48 hours.

Bob said Office 2003 SP3 is now out but don't download it if you downloaded SP2. You should go instead to the Microsoft update site on the Internet for updates. Windows Vista SP 1 and 2 are coming, as well as Windows XP SP 3.

Harry Lochabay was at the recent FACUG seminar in Orlando and found the program interesting. At the concurrent computer trade fair, the vendors were mostly pushing notebook computers. Both XP and Vista operating systems were offered, however, XP seemed predominant. Microsoft is already hinting at the replacement of Vista as early as 2009.

The 2008 anti-virus software is constantly improving and is checking for newer forms of viruses. Depending on whom you are with, updates are downloaded anywhere from daily to monthly. Make sure you stay current with the updates.

At 7:05 pm, President John Witmer started the business portion of our meeting. John acknowledged the larger than usual attendance, then reminded everyone that we need a slate of officer nominees to serve the group in calendar year 2008. The elected offices are President, Vice President, Treasurer, Secretary and Member at Large. We need members who have not led the group to step up to

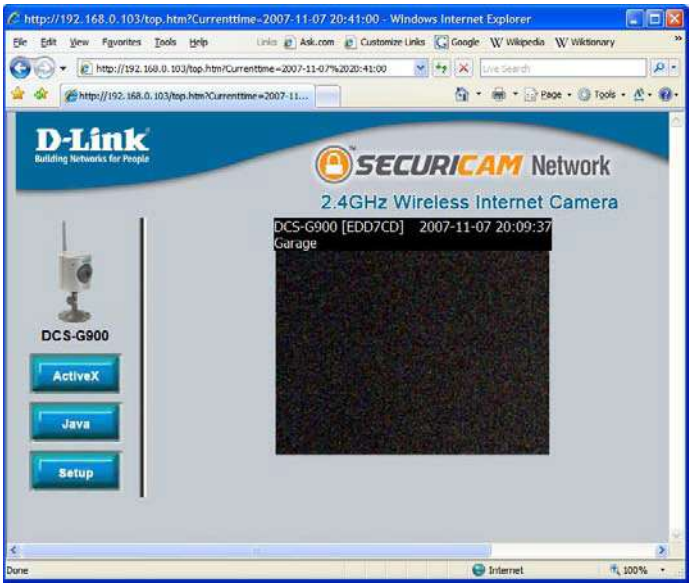
apcug Member of The Association of Personal Computer User Groups

D-Link Wireless-G Internet Camera Model DCS-G900

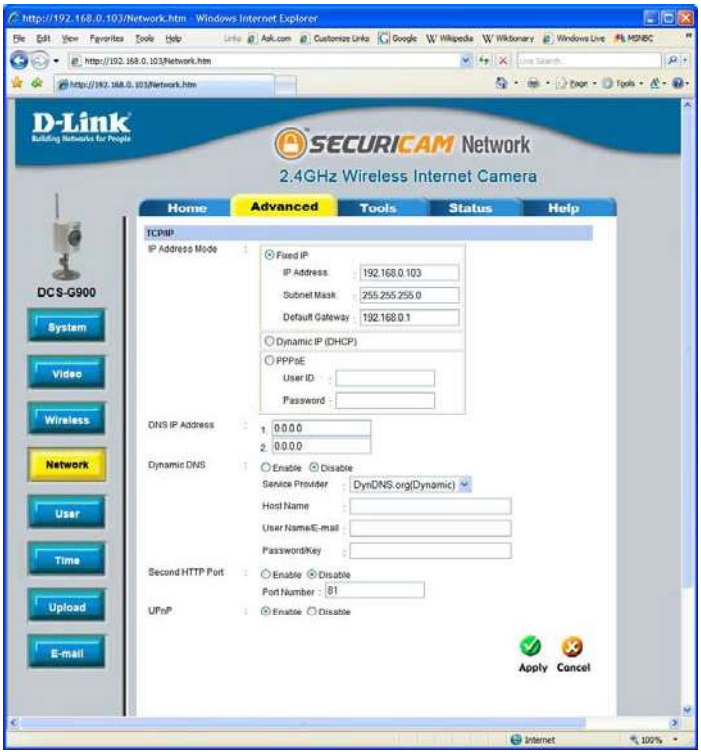
By Merle Nicholson,
Tampa PC Users Group
merle@merlenicholson.com



This is a camera you can place anywhere in range of your wireless router. You can then monitor the picture from any computer on your network. It's very easy to set up, and, other than the power cube, there are no wires to run.

My wife, Valerie, and I have wanted some way to monitor our detached garage for many years, and this appeared on sale at NewEgg, so I looked into it. I rely very heavily on the user reviews there in making my buying decisions. I looked at others, more expensive and cheaper, too. This one had very good reviews.

To understand how this guy works, you have to understand that it has a web server built in. It generates its own web pages, and all you do is connect to it with a browser – I use IE 7. It couldn't be simpler.



Some people program their router to expose the camera to the Internet, and, as long as you know your router's IP address, you can watch the cat tear up the couch from work! Or see that your hamster really sleeps all day.

I haven't any reason to watch it away from home. But if I did -- what I really like about it is that it isn't connected to a computer. You need the router and the webcam on, and that's it.

To set it up, you just plug it in and run the installation program. You'll connect to the camera's home page and select the setup, then you need to program the webcam with the router's SSID and whatever encryption key you use. Your wireless router DOES have encryption, doesn't it? You don't want your neighbor kid camping on your router to do his BitTorrent download of the latest Spiderman movie, do you?

When the SSID and encryption are set, the picture will start up using its default resolution and frame rate. You can set the resolution to 160x120, 320x240 or 640x480. You can set a data compression rate and frame rates in Frames/Sec of 1, 5, 7, 15, 20 and 30. There are brightness, contrast and saturation controls.

Other settings are available to FTP a picture to an FTP site at scheduled intervals, and there are email settings where you can set your SMTP server address and email address, and it will email a snapshot to you at intervals that you choose.

To view the picture in the browser, it will download an activex plug-in for your browser. There's an alternative Java plug-in, too. These install from the camera web server.

(D-link……..Continued on page 4)

(D-Link……Continued from page 3)

There is a stand-alone program, IPVIEW, that installs from the CD which takes up less screen real estate than a browser. This camera viewer can zoom in and out and also capture snapshots to a JPG file. Its main attraction is that you can view multiple cameras – up to four – in split screen. You don't need this program to view the camera, but it does have some real functions that compelled me to install it on one computer in my house. The others just use Internet Explorer.

With IPVIEW, there's a control panel that will scan your network for the cameras, so you don't need to assign a fixed IP address. From this control panel there are numerous setup options, including an alarm based on motion that will send an email, and there's a recording option.

View of my garage with door open

I've had it running for a month now. I have the application running continuously on my server machine that runs continuously anyway, and I'll set up an email or FTP to my website based on motion when we are out of town. In the meantime, it's there to check if the garage door is down, the garage lights off and the cars are there with their interior lights off. And that the bicycle hasn't yet fallen on my Honda. We like it; it's inexpensive, has a minimal footprint on the computers and easy to set up.

D-Link Wireless-G Internet Camera Model DCS-G900
$104.99 at NewEgg ◆

FACUG Fall Meeting

By Doug Mullis, Tampa P C Users Group
dmullis@tampabay.rr.com

Jane Jukes, Harry Lochabay and I attended the Fall conference of the Florida Association of Computer User Groups last month in Orlando. This group meets in the Spring and Fall each year in convenient central Florida locations. The purpose of the Association is to coordinate activities of statewide PC user groups and to exchange ideas for assuring the success of those groups. .

While few of us would attend a national conference in Las Vegas (the Association of Personal Computer Groups), why not go to the Florida association conferences? If you want to take an active role in leading our group (and you should) to assure its continuance with interesting programs, I encourage you to become an officer and attend FACUG conferences. Of course, you don't have to be an officer to attend. Registration fees are reasonable and include meals and many door prizes. Find out what common problems we have with other PC groups and share ideas on how to deal with them. FACUG programs are also educational, based upon current trends in our area of interest. Let me outline the most recent Fall program:

9:00 – 10:00
Room A: How Does A Web Site Help Me Build Membership?
Room C: How To Do A Pod Cast
Room D: Networking
Room E: The Ins And Outs Of Blogging

10:15 - 11:15
Room A: Double Your Membership
Room C: Bridging Mac And PC Users
Room D: Microsoft Vista
Room E: What FACUG Can Do For You

11:15 – 12:15
Dining Hall: Catered Lunch

12:15 – 1:15
Exposition Hall: Vendor Fair

1:15 – 2:15
Room A: Group Treasury/ 501c Information
Room C: Web 2.0 Technologies
Room D: Newsletters And Editing
Room E: Using Education To Expand Membership

2:30 – 3:30
Room A: Working With Digital Video
Room C: User Group Insurance
Room D: Success Of The Small User Group
Room E: Importance Of Software Reviews

(FACUG……Continued on page 8)

(Minutes……..Continued from page 2)

the plate in at least two critical positions, Vice President and Secretary. Kevan Sheridan no longer can serve as Vice President due to work commitments, and Doug Mullis has served as Secretary for three years and holds two offices. Please offer your name to any of the current officers for any office so we can benefit from fresh leadership. Jim Purcell, our current Member at Large, must present a slate of officers at the November meeting, so act now.

Steve Singer from RDI will be our speaker in November to tell us the latest in computer hardware. In December, we will have our Christmas party, with no speaker planned. We will provide finger food and drinks paid from our treasury. Members may bring their favorite dessert or whatever they desire. We will need to take a head count of those planning to come for the party so we can order enough food and drink.

John indicated that the Digital SIG would be reactivated after the first of the year. Jim Purcell is planning materials for two sessions, and with sufficient interest, meetings will continue. John said these meetings could take place at the Pepin facility.

It was pointed out that some members are in arrears in their dues. Please check to see when your renewal month is and use our web site to make a payment or get a check or cash to our Treasurer.

At this point, John introduced our speaker for the evening, Mr. Ken Sparks with Media Concepts, Inc. of Gulfport, FL. Ken said he has been with Media Concepts for about five years. The company which is owned by Bob Skidmore and John Gallagher, both previously with RKO in New York, started in 1974 as a video equipment rental agency. They branched into video-library sharing (VHS tapes) in 1978. They predated Blockbuster and their first

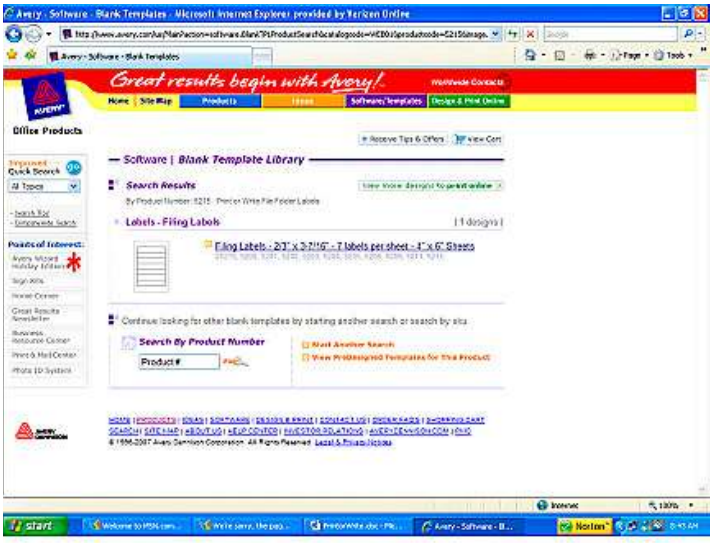
Print or Write Labels

By Jim Purcell, Member at Large,
Tampa PC Users Group
Edward_J_P@MSN.com

I was late in recognizing the utility of Avery's "Print or Write" labels. There are approximately 60 varieties of these labels. Some of the 60 labels represent a different color of the same label, plus you can get permanent or removable versions of some labels, and they even have a gold notarial seal to certify awards. They come in 4x6 sheets and usually cost between $3.00 and $6.00 per package. There is one 3x5 label per page (40 per package) and twenty-seven 1/2″x 7/8″ labels per page (945 per package). This format is an excellent alternative to buying packages costing $15.00 - $30.00 when you only need a few labels of a particular size.

They are also handy if you only need to write or print one or two labels when you add a folder to your filing system or you want to label a magazine case or the AC adapter to your latest toy.



Avery offers some excellent free software that you can use with these and all other Avery products. You can pick from six options offered by Avery. One option allows you to edit on the web and print from there. A table to assist you in picking the product that best fits your needs is found at:
http://www.avery.com/us/software/avery_software_guide.html

Page to Assist in Selection of Software

The "Avery Wizard for Microsoft Word" is probably the most versatile and easiest to use if you have Microsoft Office (or only Microsoft Word) and you print a fair amount of labels. The Wizard will appear in the Tools menu of Microsoft Word, Excel, Access and Outlook. I have only merged from Access. The merge with Access was easy to set up, and I imagine that merging with Excel would be even simpler. The Wizard software currently available for download contains Christmas designs that you can use to embellish your labels and cards. I also merged with an Access data base using the "Avery DesignPro Software" to print name tags on the normal format label. Again it was easy to setup, and it printed just as designed.

At the other end of the spectrum are the blank and predesigned templates that you can download for the products that you are using. You can print single- or full-page labels, and it is easy to print additional labels at a later time on the page if you are printing less than a full page.

Example of Blank Template Page

You can use the labels and other products for many different purposes; I've included just a few examples below. To explore all of the products visit; http://www.avery.com. ◆

The following image is an example of some of the different labels you can have.

(Comments…….Continued from page 1)

Roxio record the first side of the LP. That done, I stopped the software, flipped the LP and repeated the process. That resulted in an approximately 40-minute sound file.

The next thing to be done was to use the software to examine the resulting waveform and select where the track breaks occurred if the software hadn't already found them. I then entered names for each track along with an album name, musicians and date. The final step was burning everything to CD. I can now listen to music recorded by Louis Armstrong in the 1950s and '60s in my car and see the name of the song displayed in the car's information window. I have done about six albums so far. It really is quite easy after you have done one.

Census by Zip My latest programming project was to find a source of 2000 census data and build an application that will provide that data for whatever zip code you enter. You can see it at http://www.lamartin.com under the Useful Things link. I got the idea from http://www.zipskinny.com.◆

(Minutes……..Continued from page 5)

shop in this area was Video Corner in Tyrone Mall.

They started doing DVD duplication in 2001/2002 and currently have 64 DVD drive towers and 152 VHS duplicating machines. They also transfer video from mini DVD tapes, 8 mm and Super 8 mm movie film and 35 mm slides. Video can be put on VHS or DVD. For example, at funeral services they do memorial video shows from photographs. They also provide a service for recovering images from digital memory cards. Finally, they do web site design and sell or rent all types of video products. Ken handed out packets on equipment they provide.

Someone asked the price for converting color slides to DVD. Setup is $25 and $1 per slide, or $2 per slide if color correction is desired. On movie film conversion, every foot is monitored to assure the best quality possible. They do lots of movie film.

Ken then answered a few questions and offered opinions on plasma and LCD televisions. His preference is still rear projection for large screen television.

John thanked Ken for his presentation and noted our sizeable audience as an indication of the interest in the program. He then called attention to free trade magazines Ken had brought in and free used P C cabling and devices being offered by William LaMartin.

The meeting adjourned at 8:37pm. ◆

Dining Hall: Wrap Up Session/Door Prizes

You can see that many of the presentations are directed toward the successful operation of the user group, but these are balanced with current topics of general member interest. In the past, I attended sessions on "how to run a group," but this time focused on current trends and general interest sessions. Many of the sessions are posted on the FACUG web site at http://www.facug.org. Click on Fall Conference and then Roundtable and Panel Descriptions. You will find the presenter, a brief description of the presentation, and, in some cases, the entire outline used in the presentation.

Did I mention the camaraderie of PC users from across the state? Notice that this Fall even a computer trade show was held concurrently at the same site. While only an hour was allotted out of the program to attend the trade show, there were other opportunities to browse and to take advantage of "special show offers." Also, some of the contacts made for presentations to our group were made at these conferences. I hope you are inclined to attend a FACUG conference and that you come back with some exciting ideas to apply in your PC endeavors and at our group meetings. Won't you join Jane, Harry and me at the next FACUG conference? ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

At our last meeting, Steve Singer, president of RDI (http://morevalu.net/), as he does once a year, introduced us to many new things in computer hardware of which we were unaware. I hope to do the same for you in this month's newsletter with what I write about my new phone, which is more computer than phone and runs a mobile version of Windows.

It is truly a remarkable package about the size of, and thinner than, a pack of cigarettes. The iPhone cannot even dream of doing what this phone can. And, in addition to all of the built-in functionality that comes with this phone, I can add as much as my abilities at programming allow. It is the HTC PPC 6800, which I review on page 3.

Agreed, for those of you who are not computer programmers, what appeals to me about the phone may not be so compel-

Minutes of the November Meeting

By Doug Mullis, Secretary, Tampa PC Users Group
dmullis@tampabay.rr.com

Bob LaFave began the Windows SIG portion at 6:30pm by asking for questions or computer problems we may have. A member was having problems with pop up ads. Bob suggested running Ad-Aware, Windows Defender or SpyBot Search & Destroy. Web Root is also good, but will cost you $40.

Bob went on to say Microsoft now offers online file storage for no charge at a site called Windows Live SkyDrive Beta. It's 1 or 2 GBs of storage available to any computer with Internet access.

Bob suggested we look at Picasa Wed Albums that can be downloaded free from Google to find, view, edit and share digital pictures on our computers. Kodak has a similar web service.

At 7:00pm President John Witmer started the business portion of our meeting by thanking the large number of attendees for coming to hear our featured speaker, Steve Singer of RDI. John also introduced our newest members, Nancy and Bruce Norton.

The first order of business was the announcement that officers for 2008 will be elected at the December meeting so we need members to step forward. John introduced the current officers: Jim Purcell, Member at Large; Doug Mullis, Treasurer and Secretary; Kevan Sheridan, Vice President; and John Witmer, President. William LaMartin is our voluntary Webmaster and Newsletter Editor. Having our officers serving double duty reduces the size of our Board, so John asked that members please let Member at Large, Jim Purcell, know what position they would be willing to serve in so that we may finalize the slate of officers.

apcug Member of The Association of Personal Computer User Groups

HTC Pocket PC 6800

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

Why am I writing about a phone in a computer newsletter? Because it is really more of a computer than it is a phone. A search of the Internet reveals that "HTC is a Taiwanese designer and manufacturer of PDAs and smart phones, particularly Windows Mobile devices. HTC re-brands and sells its devices to other vendors and carriers around the globe, including UTStarcom."

Some History My Pocket PC 6700, which I wrote about in the newsletter about one year ago (http://www.tpcug.org/newsletter/nl_2006/october2006/phone.htm), began to be flaky. You would be, too, if you had been dropped as many times as I had let this phone hit the concrete. Of course, it was really not my fault but the fault of the person who designed its case so that it was removed from my belt by my car's seat belt almost every time I exited my car. The problem was so bad that I eventually quit using the supplied case and bought a clunky replacement case that would not come off my belt. But this case was bulky, so I settled on just putting the phone in my pant's pocket with my loose change.

More importantly, though, that phone's Bluetooth never functioned properly. The way Bluetooth is supposed to work between a phone and a car is that, once the phone and car are "paired" (introduced to each other), the next time you get in the car with the phone, the two connect up again and you can then do all your dialing and talking through the car instead of the phone. However, the 6700 didn't seem to understand that, and almost every time I returned to the car, the phone and the car had to be reintroduced. I know it was the phone's fault because my previous phone did not exhibit that problem, nor does the current phone. This had nothing to do with dropping the phone since the Bluetooth never worked properly even before the phone's first fall.

In addition, though, possibly the outlet plug's not producing any sound to the plug-in ear pieces could be blamed on all the falls, but, whatever the reason, starting several months back I could no longer listen to my

favorite Internet radio stations, as I used to be able to do on walks.

The final thing that caused me to look for a new phone was the 6700's habit of locking up while it was running one of the programs I had written for it (recall, it is more of a computer than it is a phone), and, also, the screen sometimes just stayed very dark when I turned the phone on. But when I went looking for a new phone I ran into several problems: Specifically, I was on my 13th month of a 24-month contract, the one-year warranty had expired one month in the past, and I had no insurance on the phone. Thus, according to the Alltel fellow in the store, I was out of luck in that a new replacement phone--the HTC 6800--would cost me around $600. And this was even though the "advanced" tech fellow that he connected me with to see if he could help with the current problems admitted that they had numerous complaints about the screen going dark and not coming back. My screen wouldn't even come back with a soft reset and a new battery installed while in the store. Everybody was very nice--but no new phone without $600. It was enough to make you want to change to another carrier. However, there are only a few carriers that carry the type of Pocket PC phone I wanted. And I was joined to Alltel at the hip, having three phones under contract with them. So time for Plan Two.

Plan Two was my wife's calling Alltel's 800 number and speaking with a representative; it turns out they can do things the store can't. The result was the deletion of the current contract and the start of another two

(HTC 6800……..Continued on page 4)

(HTC 6800…….Continued from page 3)

-year contract on a new HTC 6800 phone with the same $30/month data service that allows you to connect to the Internet (the real Internet, not some hokey phone Internet). The cost was around $250, including an instant discount and a $100 mail-in rebate. I received the phone in two days and activated it with no problems. And, for all car trips, the phone's Bluetooth has connected every time to the car.

Let's talk a bit about this phone's features. Here is the list of things from Alltel's site.

- Windows Mobile 6.0 OS
- Windows Media player
- 2 MP camera with picture and video messaging
- Wi-Fi-capable
- Voice activated dialing
- Infrared (IR) communications
- Bluetooth® wireless technology
- Use your device as a modem for your laptop while traveling
- Expandable memory slot
- Speakerphone
- Mobile Office includes Word, Excel, PowerPoint, and Outlook, which includes calendar, notes, tasks and integrated address book

These are basically the same features as my previous phone even though the new phone is slightly smaller and more compact-appearing than the older one. It has a 2 MP camera with auto focus instead of the 1.3 MP camera of the older phone. The expandable memory slot takes a micro SD card instead of a mini SD card. It also has much more storage memory, around 160 MB, than did the 6700, so you may not even need to use an expandable memory card.

The specifications may be found at http://www.america.htc.com/products/ppc6800/default.html. They are incorrect in that they list the OS as Windows Mobile 5.0 instead of 6.0.

By the way, the Windows Mobile home page is http://www.microsoft.com/windowsmobile/default.mspx. Watch the Flash demo while you are there.

Observations I find this device responds quicker than the previous one. As mentioned, the Bluetooth works flawlessly with my car. It also connects fine with a Bluetoooth GPS unit I have.

Live Search I can run Live Search to return valuable information centered on a city I choose, a position on a map, my GPS position (if connected to the GPS), or someone's address from my contacts. To demonstrate this, I just selected a person I know in New Orleans, and Live Search downloaded a map centered on the address where he lives. This is the sort of map you can click with your cursor and move in any direction you wish. You can also zoom in or out. I can then search for all sorts of things close by--restaurants, nightlife, government, shopping, hotels, etc. I just did a search for Banks and produced quite a list ordered by distance from the map's center. And, since we are in New Orleans, my second search was for restaurants. It will let you choose a category, or you may select All Restaurants. With that, it will return the 25 closest.

Another useful category of information is Gas Prices. Here a search will produce a collection of service stations ordered by the price of regular gasoline, with the date of the price and the distance from you. It turned out that the closest station was next to last--that is, highest--in price. The oldest price I saw was only three days old.

For movies, it presents an alphabetical list of movies. Clicking on a title presents you with a running time, rating, etc.. For a specific movie, you can get detailed information and a list of theaters where it is playing, with start times, the closest theater at the top.

You can also get a traffic map for major cities. Tampa is included, but New Orleans isn't. The availability of all of this information, of course, is predicated on your having a live Internet connection to your device. For that I pay Alltel $30 per month for their data wireless cell phone service, on top of the monthly charge for regular cell phone service.

Mobile Office, included in Win Mobile 6, is mobile versions of Word, Excel, PowerPoint and Outlook. With these programs, you can open and do basic ed-

(HTC 6800…….Continued on page 8)

(Minutes……..Continued from page 2)

John next announced that our December meeting will also be our Christmas party and intentionally no speaker is scheduled. The Group treasury will cover the purchase of food and drink this year; however, if there is something you want to bring, you may do so. John also asked that if you have ideas for the catered food, let John hear them.

If you have music CDs or DVD's appropriate for the occasion, bring them. We will give door prizes away at no charge. You don't want to miss this meeting. A show of hands indicated about 30 will attend.

You may have noticed this month our newsletter is in color. William was curious what color would cost, as our usual printer (Pepin) was not available. Kinko's wanted $800 for 60 copies in color and $90 in black and white. Having his heart set on color, but without approval or the desire to spend $800, William ran color using his home printer and three and one-half hours of his time. Cost was about $40 for ink, wear and tear on his printer and his time. I already mentioned that his duties as Newsletter Editor are voluntary (no compensation). What a deal we get! Enjoy--I doubt it will happen again. Thanks, William.

It now being 7:15pm, John introduced Steve Singer and his wife Pam to tell us what is now available in computer hardware. Steve started by saying computers are continuing to get smaller and smaller. He showed us a fully loaded motherboard that was 10 inches square made by JetWay and selling for $170. He also told us about Thin Client, a mini computer now used in many offices connected to a server. It

Programming for a Windows Mobile Device

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

The real reason I wanted the type of phone I described in the previous article was that I want to be able to write programs that will run on its Windows Mobile 6 operating system, as I have done for the Pocket PC 2003 and Windows Mobile 5 devices I have owned.

Some programs I have written for these devises are:

- A viewer for photos
- An FTP program
- A database program for compact SQL databases
- A GPS program that will post your positions to a text file or to a database on the Internet

The database program is particularly useful and works as follows. First I run a program I wrote (using VB.Net in Visual Studio) for a Windows desktop computer that will turn any Microsoft Access database into a compact SQL database. These are the types of databases for which Windows Mobile 6 has built-in support. In Windows Mobile 5, you had to install a number of additional files to attain such support. Second, I copy the compact SQL databases to my mobile device, where I can then use the mobile database program (also written using Visual Studio) to open the database on the mobile device.

The mobile database program allows me to carry around in a secure manner data for our computer club, my neighborhood association and much of my personal information. It is secured by the data being encrypted in the compact SQL database and the database itself being password protected.

The image at the top of the next column, is from the web page http://www.lamartinsoftware.com/GPS/GPSExample.aspx at one of my web sites, the one used mainly for testing. What we have are 10 markers on a Google map that indicate the points at which I paused on a walk around my neighborhood and took readings from the Bluetooth-connected GPS with my

new Pocket PC phone. What is interesting is how these markers then got on this map on this web page.

Here is what is going on behind the scene that creates this map.

1. First, a program I wrote for the mobile device continuously displays my latitude, longitude and universal time that the device is receiving from the GPS every second.
2. When I click the screen, I am given the opportunity to send this data to a text file on the device--or, more importantly, if I have a connection to the Internet with the cell phone, to send it to a web service (a program I also wrote) running at lamartinsoftware.com, which will, in turn, insert the new position data into a table in a MySQL database at lamartinsoftware.com.
3. When someone asks for their web browser to display the URL, http://www.lamartinsoftware.com/GPS/GPSExample.aspx, the hidden VB.Net code for that page (not the source HTML) connects to the MySQL database, downloads the data that I earlier put there and creates the source HTML that puts the Google map on the page with the 10 markers you see and with the text you will see if you click on a marker.

What you see on that page will not change. It always draws on the same data, but I have other pages for my own use that display the last 10 or 20 or whatever number I desire of the most recent positions I have had

(Programming……..Continued on page 7)

Special Interest Groups

(Programming…….Continued from page 6)

my device send to the database. I suppose this is the sort of technology that the phone companies provide parents who pay for a service to track the positions of their kids who have GPS-enabled phones. It is also the same technology that allows trucking companies to keep track of their trucks.

With my previous phone, I created a similar application that only logged the positions to a text file and had no Internet connectivity. I used that application to record to a file the locations where I took photos. I wrote about that in the June 2006 newsletter, http://www.tpcug.org/newsletter/nl_2006/june2006/photography_GPS_programming.htm. I still have that feature in my new application, where the positions are recorded to a file on the device instead of to the Internet.

If anyone has an idea for another program for this phone, let me know. ◆

(Comments…….Continued from page 1)

ling. And such a phone is not totally trouble-free. It takes a certain amount of "geekiness" to be able to keep it running smoothly.

I have met quite a few people who had my previous phone, the PPC 6700, who basically never used it for anything other than just a telephone. I suppose they did use the contact manager, the calendar and the camera. So I don't think the phone was really meant for them, since it is not really the best device to have if you only want a phone with a few features and a camera. ◆

(Minutes……..Continued from page 5)

comes with a keyboard and mouse for about $350.

AMD and Intel are still the big competitors producing CPUs. Steve leans toward AMD due to lower prices and proven reliability. The latest push in processors is the quad core. AMD is releasing a three core CPU at a lower price, which essentially is a quad that (maybe intentionally) didn't quite make the grade.

Steve said now is the time to upgrade RAM on your existing computer, as prices are at an all time low. Examples: 512 MB DDR2-667 sticks are selling for $25.00, 1 GB for $34.50 and 2 GB for $74.50. SATA 1 & 2 hard drives are now also at very reasonable prices.

Steve went on to tell us about Photo JoJo, TV Torrents.com, VideoLand.org and MovieSneaks.com, to be checked out as we please. Steve always tells us about many interesting sites.

John Witmer thanked Steve and Pam for the informative evening. Pam periodically makes Steve slow down so that we can comprehend what he's presenting.

The meeting adjourned at 8:45pm. ◆

Please don't forget to use the link at our site, http://www.tpcug.org if you are going to order from Amazon.com. We get a commission, and it costs you nothing extra.

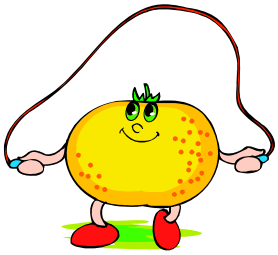
(HTC 6800……..Continued from page 4)

iting of the desktop versions of the documents. Although a check showed that the new Word 2007 document format is not supported, there is a free upgrade available that will correct this. Outlook will usually be the most used of these programs, and an improvement over Windows Mobile 5 is the addition of HTML email. Now if you receive an HTML email, you first see the text of the message, and, if you so choose, you may download it again and include all the HTML formatting, including images. There is also a mobile version of Windows Media Player 10 to view videos--including those you may take with the camera since it has that functionality.

About the only problem I have encountered is erratic syncing of the device to my computer, and I have not got the problem entirely solved. The first problem was that apparently the USB cable I was using wasn't reliable, and, when I changed to the new one that came with the phone, things worked better--but not perfectly since sometimes I get the message, "USB device not recognized." Trying several times more usually solves this problem, but obviously something is not right here.



All considered, it is a great phone. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

It's a new year, and thanks to my contributors I have only this small area on the front page to fill. That should give me just enough room to properly put CompUSA to rest. As you probably know by now, CompUSA has sold itself to a liquidation firm and is in the process of disposing of its inventory and will then close its doors.

CompUSA opened their first store in Tampa on Hillsborough Avenue near Dale Mabry in December 1991. I know that because in the November 1991 Bits of Blue, then-TPCUG president Harvey Bruneau noted that they would be open for the holidays. This was a very exciting event for all of us local PC users, and many of us spent a lot of time and money there. Apparently we didn't spend enough in recent years.

I was curious what I had contributed over those 16 years, having bought only one computer from them. So I checked Quicken, and it revealed I spent $25,743.02--not including the few items I purchased in December. So I feel that I still did my share. ◆

Minutes of the December Meeting

By Doug Mullis, Secretary, Tampa PC Users Group
dmullis@tampabay.rr.com

Due to this being our annual Holiday party meeting, we did not have our usual Windows SIG meeting preceding the business session or a guest speaker. President John Witmer began the business meeting at about 7:00 pm. The important item this evening was the election of officers for calendar year 2008. Two members did step forward this year offering to serve the group. They were Ron Weinberg for member at large and Roy Dearmond for Treasurer. Jim Purcell acknowledged his willingness to give up his member at large position and serve as secretary, which would create an opening for a new member at large. Additionally, Roy agreed to withdraw as a candidate for treasurer to allow Doug Mullis an opportunity to serve a second year in this position.

Current member at large Jim Purcell then asked for further nominations from the floor before presenting the slate for a vote. Hearing none, the following slate of officers was presented:

For President	John Witmer
For Vice President	Kevan Sheridan
For Treasurer	Doug Mullis
For Secretary	Jim Purcell
For Member at Large	Ron Weinberg

A motion was made to accept this slate and to vote. All members present voted in favor. Terms of office begin January 1, 2008.

John then thanked those willing to serve the group as officers and acknowledged some past officers present at the meeting, including Merle Nicholson, Mary Sheridan, Jenny Lind Olin and Roger Waters. Appreciation was also extended for the years of ser-

Bluetooth

By Merle Nicholson, TPCUG
merle@merlenicholson.com

I've just installed a new Bluetooth device on my brother's new Vista notebook, and while it's fresh in my mind, I think Bluetooth may be a topic of interest to those who haven't seen the full potential of this very fine device.

Most people think of Bluetooth as being the means for the geeks you see walking around with a blue blinking thing stuck in their ear, and talking to no one in particular. Yep, that's Bluetooth, and it's communicating over a short distance to their cell phone in a pocket or purse. And, obviously, it's a short-range communications protocol that allows multiple simultaneous devices to attach to a computer, cell phone or car; wirelessly. The maximum range is 10 meters.

Bluetooth devices include headsets and headphones, keyboards and mice, PDA's and cell phones, GPS, ultra-mobile PCs, Playstation 3, Barcode scanners, in-dash radio/mp3 players, navigation devices, drawing tablets, cameras, printers, speakerphones and hands-free car kits.

My interest, of course, is in its use on a computer. I have three computers with Bluetooth. My main PC that I'm writing this with uses a "Microsoft Desktop Elite for Bluetooth" keyboard and mouse, and my Media PC in the next room is set up the same, with its own identical keyboard and mouse. The third computer is my notebook.

The notebook is a little different. I use Bluetooth on the notebook to communicate with a GPS device sitting under my windshield in the car, and occasionally with a Bluetooth mouse and keyboard when I borrow one from one of the desktops. I do have a Logitech headset (earbud) that I was going to use for IP telephone (Gizmo Project), but I wasted my money on that one--too early, too cheap.

When buying the notebook, I made a mistake in not getting Bluetooth built in. I'd picked up this HP at CompUSA about two and a half years ago, and, as was typical then, computers that were in stock didn't have that option. It's fairly common to have Bluetooth installed internally now, but you really can't count on it unless you research it thoroughly or order it installed as a custom order. As you'll see further down, having it built in is a real advantage.

It was apparent from the start using my notebook in the car that I was on dangerous ground. It sits in the passenger/navigator's lap and gets folded up and put on the floor sometimes or maybe put on a back seat. And I'm always aware of that damn Bluetooth "dongle" sticking out the side of the computer. Once when it was to be passed from the front passenger to the backseat passenger, I remember saying, "Be careful and don't bend the Bluetooth". "Be careful", "Be careful". When it got back to the front seat, it was bent severely.

So, as you can see in the second photo, I've largely

(Bluetooth…….Continued on page 4)

(Bluetooth…….Continued from page 3)
resolved that problem by replacing the Microsoft device on the left with a Cirago BTA-3210 EDR, shown on the right. Note that you normally would only have one of the devices plugged into the USB ports. Both are shown here to compare sizes.

Bluetooth "dongles" vary in price from about $7 to $35. On my desktop, I attached a USB cable, installed it internally to the motherboard and snaked the cable and dongle so that it's under the front plastic cover of the PC. On the Media PC, the dongle is just plugged into a USB port on the back.

When you install the dongle, most times the PC will ask for the Bluetooth drivers. Not always, though. My brother's Toshiba has the drivers already installed, presumably for the models they sell with Bluetooth built in. So the best thing to do is be patient for a half minute to see what happens. Also, you can look in Control Panel to see if there's a Bluetooth icon already there, or one appears after the dongle has been plugged in.

After the Bluetooth driver is installed, there will be a "Bluetooth Devices" icon in Control Panel. Most often the icon will be the official Bluetooth symbol.

To make it start talking to a device – let's take a keyboard for instance, open "Bluetooth Devices" in Control Panel and select "Add". Turn on the device (a keyboard is sometimes "always on"; sometimes it has a power switch). Make it "discoverable" by pressing on the small round button on the bottom and holding while the computer goes into "discovery mode" and the keyboard is found.

Select the keyboard from a list of devices found and then select "Select a new passkey". The computer will generate a passkey of numbers that you then key into the keyboard and press Enter.

The keyboard should be ready to use and will "pair" the keyboard to the computer automatically when the operating system boots. So this passkey business and identifying the device to the computer should happen only once.

So far, in my experience, mice don't use a passkey. My GPS does require one, but it's fixed at "0000".

One downside exists to Bluetooth that I can think of, and that's a Bluetooth device like a keyboard will not work when the operating system is not running, like setting BIOS, or utilities like a DOS-based disk copy of disk diagnostics. I keep a USB keyboard and mouse around for that purpose.

You also may ask why not just buy a standard wireless mouse and keyboard and save some money? Standard wireless mice and keyboards are somewhat cheaper. Remember though that Bluetooth uses a dedicated dongle that takes a USB slot all its' own; and that dongle cannot communicate with other devices.

My next notebook will have the Bluetooth built inside.

Cirago BTA-3210 EDR Bluetooth adapter http://www.eXtremePCgear.com. It was $22.99 but had a $8.34 shipping charge.

Also available now at Amazon.com and Tigerdirect.com. ◆

vice William LaMartin has volunteered to our group as newsletter editor and webmaster. His fine work is evident to us all. John also introduced his wife, Donna, who had assembled our party buffet for the night. We appreciate her hard work in preparing and presenting such an outstanding offering of food and desserts. Our thanks are also extended to John and Pepin Distributing for accommodating us and providing the array of beverages. The applause of those present attested to the above. For this year's Holiday party, the TPCUG Board Members decided that the party food should be paid for out of the Group's funds, thus alleviateing those attending of having to deal with trying to bring anything other than themselves to have a good time.

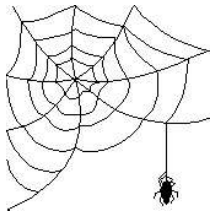
John reminded those whose dues are due to forward payment. William reminded us of the ease in using our web site with your credit card electronically for dues payment.

Next month we have asked Office Depot to do a presentation. We are also seeking topics for member presentation. Merle Nicholson offered to have a Windows Vista session ready if a fill-in is needed.

The business meeting adjourned about 7:30 pm. The party continued till approx 8:45 pm. ◆

Please don't forget to use the link at our site, http://www.tpcug.org if you are going to order from Amazon.com. We get a commission, and it costs you nothing extra.

Internet Picture of the Month



CompUSA Tombstone

This image is located at the URL http://www.counteragent.com/wp-content/uploads/2007/12/compusa-here-lies-gravestone.jpg. The very short story is at http://www.counteragent.com/2007/12/13/here-lies-compusa-beloved-father-lousy-customer-service-rip/.

It is not much of a website, but it had the best image I could find on the web of the demise of CompUSA. Most places I went said that the company died because of poor service and bad pricing. One such article is the PC World blog at http://blogs.pcworld.com/staffblog/archives/004100.html.

eBook Readers
Using E-Ink Technology

By Jim Purcell, Secretary, Tampa PC Users Group
Edward_J_P@MSN.com

My only hands-on experience with eBooks so far has been with my Palm Pilot. I downloaded my first eBook about three years ago. The Palm Pilot leaves a lot to be desired as an eBook reader but it does have the advantages of portability and instant access to a reasonably large dictionary while reading another book. By purchasing and installing the Merriam-Webster Collegiate dictionary, it became directly linked to any other book that I installed on my Palm Pilot. When reading a book on the Palm Pilot, I merely had to tap on any word and the definition popped up. It didn't clear up what the real definition of "is" is, but about every thing else was covered.

I enjoyed the portability, convenience and the luxury of finding the meaning of a word I didn't know before I'd even left the sentence I was reading. I was on the lookout for a better reader that would provide a page that would compete with that of a book but would provide portability and take advantage of the things that a digital electronic device can provide. I saw the Sony Reader advertised about six to nine months ago. Detailed information was difficult to obtain, but as I read reviews and was able to find a demo at a local Borders store I found that there were desired features that were not provided. The new Kindle Reader has several new attractions, but it also is lacking in some features. Both readers use the e-ink technology mentioned by Steve Singer at our November meeting. This technology paints each new page to the screen, which results in a page that closely resembles a printed page. You really need to see one of these readers to fully appreciate the quality of the page. Borders bookstores have demos displayed. The only time there is any appreciable battery use during the process is when the page is actually being painted. Unlike most digital screens, there is no backlighting so the page is clearly visible in sunlight or normal reading light but is not visible in the dark.

I'm only looking at two of the readers using this e-ink technology developed by the Massachusetts Institute of Technology's Media Lab, but there is a lot of competition from a lot of locations. A list of some of the competitors is at: http://blog.wired.com/gadgets/2007/11/e-book-readers.html (the chart is included below if you prefer using it rather than the link). I won't go into all of the specifications and all of the details of the features of these two readers, but I will discuss what I consider important pros and cons.

Sony reader Digital Book PRS 505
Sony just upgraded their reader from Model 500 to Model 505. They made several improvements and reduced the list price to $299.99. As mentioned earlier, it uses the e-ink technology that produces a page that is easy to read. You can switch to and from small, medium or large print on your books. The number of pages are increased or decreased accordingly. In spite of these changes, your bookmarks remain in the proper place, no matter which font you select. You can store approximately 160 average size books in internal memory and hundreds more with the optional removable Memory Stick Duo or llSD memory cards. The unit weighs about 9 ounces, is about the size of a paperback book and is only 0.3 inches thick. They claim about 7500 page turns on a single battery charge. There are about 20,000 titles in the CONNECT eBooks Store. You can view and access Native-RTF, TXT, BBeB and Adobe PDF, BBeB Book, Microsoft Word, plain text and RSS internal content. Supplied accessories include soft cover, USB cable, CD-ROM EbOOK Library Software. The AC charger is extra. There is no keyboard. You can buy a dictionary but it is not linked to your books, you must exit your book to search the dictionary.

Kindle Wireless Reading Device
Amazon recently released their e-Ink Kindle Wireless Reading Device with many new and convenient features. The convenience that they built into their system certainly "kindles" interest, but the price is $399.00. You need to look closely at these new features to insure that they provide every thing that they appear to provide. The unit is lighter and thinner than a typical paperback, weighs only 10.3 ounces and holds over 200 titles. More than 90,000 books are available, including more than 95 of 112 current New York Times Best Sellers. You can download and read first chapters for free before you decide to buy. New York Times Best Sellers and all New Releases are $9.99, unless

Special Interest Groups

Microsoft Access SIG

This SIG meets the **first Tuesday** of the month at 6:30 PM. The meeting location varies. For information, contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merle@merlenicholson.com.*

Digital Imaging SIG—Cancelled until further notice

Visual Basic for Applications SIG

This SIG meets the **third Wednesday** of the month at 6:30 PM. The meeting location varies. For information, contact William LaMartin at *lamartin@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Bob LaFave moderates the discussion.

(Readers…….Continued from page 6)

otherwise marked. You can subscribe to top U.S. and International newspapers, including The New York Times, Wall Street Journal and Washington Post, and top magazines, including TIME, Atlantic Monthly and Forbes, and they will all be auto-delivered wirelessly. Unlike WiFi, Kindle utilizes the same high-speed data network (EVDO) as advanced cell phones, so you never have to locate a hotspot. There are no monthly wireless bills, service plans, or commitments, so you can simply click, buy, and read. Wireless connectivity enables you to shop the Kindle Store directly from your Kindle, whether you're in the back of a taxi, at the airport, or in bed. When you buy a book, it is auto-delivered wirelessly in less than one minute. You have long battery life. If you leave the wireless on, you will need to recharge approximately every other day. If you turn wireless off, you can read for a week or more before recharging. The unit fully recharges in 2 hours. You must email your Word documents and pictures (.JPG, .GIF, .BMP, .PNG) and pay a small fee to have them formatted for Kindle for easy on-the-go viewing. Supplied accessories are a book cover, power adapter and USB 2.0 cable

Comments about Both Readers

I've described the features of both readers in general terms and did not go into a detailed listing of the specifications because I believe that if you are going

☐ *Vendor: Your product was reviewed on page ___*

(Readers……..Continued from page 7)

to spend $300 or $400 for an eBook reader, you need to look closely at the features and specification to see if they satisfy your individual requirements. For instance, the literature on PDF documents is confusing for both readers. The Sony Reader literature says that PDF is supported. You have to dig to find that a PDF document formatted 8½ x 11 shows up too small to be read and the format cannot be adjusted by the reader (small, medium, or large) as it can for the books. You need Adobe Acrobat software or its equivalent to reformat the document. The Kindle literature says that PDF document compatibility is in the experimental phase. It seems that the requirement to email your documents to Amazon for formatting for a fee also needs some further clarification. The operating manuals and startup sheets for both readers can be downloaded in PDF format, and there are numerous reviews that you can consult online. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

As you can see from my article on page 4, I am back into Linux again. Using Fedora on an actual computer is certainly more interesting and rewarding than my earlier installation of Ubuntu on a Virtual PC.

Of course, I spend most of my computer time working on my Windows desktop computer. But this recent installation has convinced me that for people with a very limited amount to spend and needing only to browse the web and send and receive email, along with doing an occasional word processing document, spreadsheet, presentation or even editing images, a fairly robust version of Linux like Fedora is a wonderful, free solution. All they need is an older, used PC and the technical expertise to install Fedora. Most of the things that gave me some trouble, like integrating the Linux computer into a LAN or configuring MySQL, would not be of interest to them. So go for it! It's free. ◆

Minutes of the JanuaryMeeting

By Jim Purcell, Secretary, Tampa PC Users Group
Edward_J_P@MSN.com

The meeting started at approximately 6:40.pm with the opening of the Windows SIG portion of our meeting led by Bob LaFave. Eric Goldstein asked Bob to explain the safety concerns of wireless connection to the Internet. Both Bob and Merle Nicholson emphasized that it is very difficult to hack into your router and therefore unlikely that anyone would even try. Merle suggested that if you have concerns for some reason, you can turn off file and peripheral sharing on your computer and this would prevent anyone from looking at your files even if they are successful in hacking into your system.

Another member asked Bob to explain the meaning of "ActiveX". Bob said that it is a program running on your computer that is activated on your browser. He stated that "Windows Update" is an example of an Active X program. He advised that you should set your preferences to require that you be asked before starting an ActiveX program. There was a follow-up question concerning how sites initiating ActiveX programs know which browser to use when more than one browser is in use. Merle suggested that the solution to having three browsers is to delete two of them. Bob cited some features on Firefox that he preferred, particularly the ability to download anything on the screen without purchasing additional programs. William LaMartin said that Windows Media Encoder, a free download from Microsoft, would also allow you to capture anything on the screen.

A member asked the meaning of the message on your computer stating that you do not have sufficient memory and that Windows is getting more memory. Bob stated that the notice is referring to "Virtual Memory" and that Windows automatically designates a certain amount of your RAM as virtual memory. Depending on what you are running, this may be too little or too much. He showed how to adjust the total. William suggested that he shuts down his computer each evening in order to release memory that had been set aside for reasons that were no longer

apcug Member of The Association of Personal Computer User Groups

An Infection Repair Case

By Ron Weinberg, Member at Large,
Tampa PC Users Group
rswjbr@verizon.net

A friend complained his system was very slow. This is an XP Home PC rarely used that, upon investigation, had somehow become severely infected, possibly with an infection that reinstalls itself if not completely cleaned.

McAfee Internet Security Center and Ad Aware, which were already installed had cleaned multiple items but kept missing something. The addition of Webroot Spy Sweeper cleaned more, but still failed to complete the job. Windows Defender was also added.

Just a few of the bad items encountered were:

- Adware SearchSquire
- Adware Ad Destroyer
- Adware eBay Moe Money Maker
- Roings Search Browser Modifier
- Spyware Shop At Home
- Adware Memory Watch
- Adware AZE Search
- Adware180 Search Assistant
- Adware Easy Search Bar
- Many more were buried deep and remained hidden.

But the most noticeable problem was the redirection of any Google search to a legitimate looking page of links, each of which really took you to an undesirable (porn) site, always at 85.255.120.26/feed/search.

A search for this problem revealed that this was a hijack from a server in the Ukraine, and help was available from the Tech Support Forum (http://www/techsupportforum.com).

My request for assistance was responded to by "Pancake," a Security Team Analyst in Australia, who guided me step by step through the issue. Various tools were required to find the malware, Trojans and any Root Kit infections. The steps were:

- Downloaded Fixwareout. It failed.
- Next, SDFIX to remove Trojan Services and repair Registry
- Next, ComboFix, which aborted because it found the system did not have a Recovery Console. It was necessary to download an installation package from Microsoft, which ComboFix used to install the Recovery Console.
- Next, ComboFix ran successfully.

With each of the above repair programs, a log was produced which, together with a new HijackThis log each time, was forwarded to the Security Team Analyst.

Finally, the system was clean, and I removed the repair programs and logs. But in the process I had discovered that the System Restore function was inoperative, and it was necessary to reinstall System Restore.

This whole process was laborious and time-consuming. It took several days because it was necessary to wait for the analyst's response to each log.

For those of you unfamiliar with HijackThis, it is the premier tool used to document system problems of this type. It creates logs of everything related on your system and is available free from Trend Micro. I urge you to download a copy and have it on hand should it ever be needed.

The logs can be analyzed by Trend Micro or any of several free volunteer forums.

It is amazing that this level of expert free help is available from such highly competent volunteers.

Finally, I installed free Spyware Blaster and ThreatFire as further prevention measures. ◆

(Minutes……..Continued from page 2)

valid. Bob explained how to use the task manager to determine which programs are running and what resources they are using. He warned to not to modify the registry unless you are sure of what you are doing.

A member stated that the computer manufacturer had set up half of his drive to be a backup drive; he wanted to know how to have the space available for regular storage. Bob and Merle explained that it was unlikely that it was consuming a significant amount of his storage. There was confusion as to whether the partition was for recovery or for backup. If it is for backup, it was suggested that there is probably a program like "Ghost" installed on his computer to perform this function. Bob explained the procedure for making the conversion in either case but cau-

(Minutes……..Continued on page 7)

Linux One More Time

By William LaMartin, Editor,
Tampa PC Users Group
lamartin@tampabay.rr.com

In the April 2007 newsletter (http://www.tpcug.org/newsletter/nl_2007/april2007/comments.htm), I wrote about installing Linux on a Virtual PC -- specifically the Ubuntu flavor of Linux. At the May 2007 general meeting, I did a presentation on that. And then I forgot about Linux. I had seen what it was like to install, update, configure and use it. Of course, this was in a virtual setting with its attendant shortcomings, such as not being able to see the Linux computer from the Windows computers on the network, not being able to print or have sound, and being limited to an 800 x 600 pixel display. There were probably more things missing, but that is what I recall at this time.

Recently, though, someone told me they needed to install Linux somewhere so as to be able to use a program written for Linux. Of course, I sent them my notes on installing Ubuntu on the Microsoft Virtual PC, along with the PowerPoint presentation I had used in my presentation to the group. They said that was helpful, but they had to install Fedora instead of Ubuntu since that was the version of Linux the program in question ran under. Using some of the workarounds for installing Fedora on a VPC that I had to use to install Ubuntu, they were able to get Fedora 8 successfully installed on a VPC. Additionally, the program in question ran in that environment.

That prompted me to download the Fedora 8 iso file and get it running on a Microsoft Virtual PC. But there were a number of problems, such as the display size being too small and its not always booting on the first try. Problems enough for me to eye that unused Gateway 450X laptop that had been my daughter's first computer in college. It got replaced after a couple years of use because of, based on what could best be diagnosed over the phone, a failing hard drive. Additionally, the lid had a crack on the back caused by the binding of the left hinge. Could I bring this machine back to life? It hadn't been booted in a year. I decided to give it a try with the thought of installing Linux on it. It would be nice to give Linux a try on a real computer (with a sticking hinge and a suspect hard drive) instead of in a virtual setting.

I connected it to its AC adapter, let the battery charge for a little, then pressed the power button, and it came to life with Windows XP. I then cleaned up the files on the hard drive a bit and copied any documents and pictures on it to a folder on one of my USB external hard drives. Then I went a step further and installed Acronis True Image on it and did a complete backup of the entire C drive, again to one of my USB external hard drives. That was just is case I wanted to restore Windows XP with Microsoft Office, etc. to the computer at some future date.

Now I was ready to give Fedora a try on the laptop. First, on my desktop computer, I took the 3.18 GB Fedora 8 i386 iso file I had downloaded from one of the Linux mirror sites and made a DVD from it. By the way, I used a mirror site (the one at Georgia Tech) instead of the Fedora site, http://fedoraproject.org/, to get the iso file since the Georgia Tech site was feeding the file to me about 10 times faster than was the Fedora site -- 380 KB/sec vs. 38 KB/sec, as I recall. The URL for the Georgia Tech download is http://www.gtlib.gatech.edu/pub/fedora.redhat/linux/releases/8/Fedora/i386/iso/.

Once I had the Fedora DVD made, I checked in the laptop's BIOS to confirm that it would boot from a disc in the CD/DVD drive, put the DVD in the drive and then rebooted the laptop. The Fedora installation took over from there. It was all very familiar since this was the same sequence of steps I had already been through in installing Fedora on the Virtual PC. I chose to install everything available -- Office, software development (whatever that might be) and web server (Apache). That entailed the installation of 1106 packages.

Unfortunately, I did not take detailed notes, so I cannot tell you how long it all took. I do know that it was less than one hour. And I cannot be sure that upon installation I had immediate Internet connectivity through my LAN, but I think I did.

During the installation, you have to pick a root password, which is required for system modifications, and then a username and password for you as an individual user.

Once Fedora is installed and you have Internet connectivity, a check of available updates will produce quite a large number -- again I didn't take notes. In fact, almost every time you boot Fedora it will check and tell you that there are updates available. Here is a crop of what such a

(Fedora……..Continued on page 5)

(Fedora…….Continued from page 4)
screen looks like.

You can view the updates and then tell Fedora to download and install them. It is just like in Windows -- except a lot more frequent.

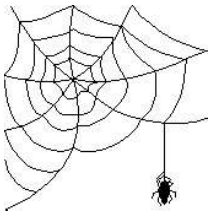
With the Firefox browser working, the next thing to do is to set up some email accounts in the Evolution email program, This process is similar to what you would do in Outlook or Outlook Express in Windows, and I had no trouble setting up my Road Runner and Netcom email accounts.

The next thing on my schedule was to check out the Open Office word processor, spreadsheet and presentation programs. I was familiar from these from my work in Ubuntu. They function much as their counterparts -- Word, Excel and PowerPoint -- do in Windows.

To test for the Open Office programs ability to also open these Microsoft-created documents, I needed to get a Word document, an Excel sheet and a PowerPoint presentation on the Fedora computer. Well, it was connected to the network through my router since it was accessing the Internet. But I, as yet, had not been able to see the Windows network from the Linux computer or see the Linux computer from the Windows computers. That was a problem to be tackled later. For the moment, to get some Windows files to work with, I simply emailed them to myself from my Windows computer, shut down the email program on the Windows machine so as not to inadvertently receive them there, and went to the Linux computer and did a send and receive with its email program.

Open Office opened all three documents fine. The only problem I saw was that, in some of the slides in the presentation program, the text was a little large and overwrote some images. I think this may have been caused by the

(Fedora…….Continued on page 6)



Internet Picture of the Month

Rex, Mardi Gras 2008
New Orleans

February 5 was Mardi Gras this year in New Orleans. And since I am a former resident of that old city and attended many parades and always tried to get to the French Quarter on the big day, I like to check on the Internet to view some photos of the various parades and costumed people. One of the first places to check is the site of the New Orleans *Times-Picayune*. This photo of Rex, King of Carnival, came from that site's photo pages. The link to the site is http://www.nola.com/.

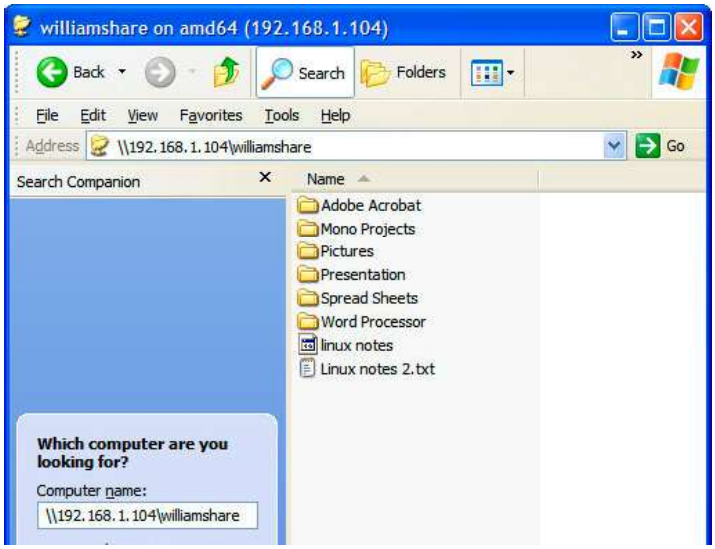
(Fedora…….Continued from page 5)

required font not being on the Linux computer. And that gives me something else to look into -- importing fonts from the Windows computer into the Linux computer, since I recall reading somewhere that Linux could use True Type fonts.



Now to the networking problem. To be able to see my main desktop computer, named AMD64, from the Linux computer, I had to manually set up a host setting in the Linux Networking dialog for AMD64, with the IP address of AMD64. That Fedora provided a Windows style dialog from which to do this, and I did not have to drop to a command prompt, which shows how far some versions (Fedora here) of Linux have come.

I also finally got the Windows computer to see the Linux computer by setting up a share on the Fedora computer in Samba (Unix networking protocol), with System | Administration | Samba named williamshare for the folder I wanted to share. Then I could see it in Windows when I searched for the share with \\192.168.1.104\williamshare. Next, my problem was to get a password and username to work since it asks for them. To do this, I needed to add my Windows username and password to those accepted by Samba, using the Samba server configuration and the samba user configuration, as explained in the Help at System | Administration | Samba. I had a little trouble with the user name when logging on from the Windows computer. I had set up a Samba user with Unix user name william, Windows user name William LaMartin and the Windows password. It turned out that I needed to log on from the Windows machine using the Unix user name of william and the Windows password for William LaMartin -- a bit confusing. Additionally, Samba needed to be enabled in the Firewall settings of Fedora.

The screen capture above is of my shared folder on the Fedora computer as seen from my Windows computer. I have only gone into the details of setting all this up since, if you should decide to install Fedora on a computer where there is a LAN, seeing and being seen by the Windows computers on the network will probably be one of your major problems.

I think most Windows users who install Linux on a computer really do not go much past simply browsing the Internet and using the Open Office programs. My goal is to see how much I can actually do with this Fedora setup. So what more have I done so far?

Since the Fedora setup allows you to include the Apache web server in its installation, I did that, and to get it to work was as simple as starting the httpd service in System |

Administration | Services. I could then place the files for web sites I had already created in the appropriate folder on the Fedora computer and view them with a browser from anywhere on my network -- or, if I had configured my router to allow such, from anywhere on the Internet.

I next downloaded the free MySQL database and installed it and started the MySQL service. After a bit of configuration of the database from the command prompt, I then put the same web pages I had created for the Ubuntu VPC setup on the Fedora computer so that a user from a web browser could view and insert new data into the database. Just the sort of things I do in the Windows server and web programming environment.

To enable the Firefox browser to be able to render some of the "fancy" pages on the web, I downloaded and installed the Adobe Flash and Acrobat plug-ins. I also downloaded Real Player, since obviously Windows Media Player is not available. What I couldn't find is something to Play QuickTime movies.

Now, I do a lot of work with photos, and Linux has a pretty good image editor named GIMP (GNU Image Manipulation Program). While not as powerful as Photoshop, it will probably do more than most users need. I haven't done much with it but hope to investigate it more in the future. What really surprised me, though, was that you can open and edit Photoshop files with it. In the screen capture below, you have the GIMP toolbox on the left, a Photoshop file (.PSD) open in the middle and a GIMP Layers Dialog open on the right that displays the different layers in the image. I was quite impressed with GIMP's ability to do that.

The two printers shared from my main Windows computer,

an Epson 2200 and an HP 4 Plus, were also easy to set up in Fedora using installed drivers for the Unix printing system copyrighted by Apple. The only thing that I have tried but failed at is getting the laptop's wireless card working with Fedora.

So, if you have an unused computer, give Fedora a try. It is free; all it will cost is your time. ◆

(Minutes…….Continued from page 3)

tioned that the member be sure of what he was doing before taking any action.

A member asked about a backup program. Bob recommended Acronis and cited Newegg as an economical source. He said that there are a variety of programs that will fit various needs. He also mentioned several programs that allow you to easily clone a computer drive. He identified Sync Toy as a free program from Microsoft. It is an easy to use, customizable application that helps you copy, move, rename, and delete files between folders and computers. Bob recommended using external hard drives for backup of files (as opposed to your entire hard drive); they are inexpensive and small so can easily be moved to external locations for storage. William suggested that storage on any media should not be left dormant, especially CD's and DVD's. Jim Purcell reminded members to consider CD's and DVD's from MAM-A Inc. as discussed in the July 2007 TPCUG Newsletter (http://www.tpcug.org/newsletter/nl_2007/July2007/cd-dvd.htm).

President John Witmer opened the business portion of our meeting at 7:40 pm with a discussion of the upcoming FACUG meeting. The meeting will be held in Zephyrhills on March 7th, 8th and 9th at the Zephyrhills High School. The early registration deadline is February 9th. All of the pertinent information can be found at http://www.facug.org.

John mentioned that next month's program would be a demonstration of TurboTax. He advised that the demonstration was not intended to provide tax advice but to show how the software can be used to prepare a return and find answers to your tax questions.

John introduced the speakers for the evening: Dave Aponte, Assistant Manager, and Ryan Pulliam, Tech Specialist, from the Brandon Office Depot store at 10057 E. Adamo Drive. Dave started with a summary of their services. He explained their ink refill program, which they began in 2007. They can only refill cartridges that have the print head attached to the cartridge, which excludes, among others, Epson and Brother. The pricing recently changed to

$10 per cartridge. The machine that they use requires 15 to 20 minutes to fill one cartridge. They usually have about 90 cartridges in their processing queue. William asked about their policy to carry or not to carry a printer cartridge. The only thing that they could identify was whether the store carried the printer.

Office Depot recently entered the HDTV market. They explained the requirements to get an HDTV configured and operating. On February 17, 2009, all analog TV broadcasts will cease. There was also a discussion of their rewards program and their product protection plans.

Bryan mentioned the trend in small laptops. He described the features of the new 8-inch laptop, which weighs about 2 lbs. and uses flash memory with no hard drive. The models have from 2 to 8 gigabytes of flash memory. Doug Mullis asked if there was anything new in wireless routers. Ryan said that the wireless N system is faster and more expensive but there is no advantage unless you convert your whole system. The question and answer session ended at approximately 8:30pm.

John thanked Dave and Ryan and asked the members to confirm that the TurboTax demo is something in which they are interested. The answer was yes. The meeting closed at approximately 8:45pm. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

I have a bit of space to fill in this month's newsletter, so I suppose I should write something. Many years back we decided to only use articles from our members, and that makes it difficult to fill the newsletter some months. Many groups use articles that appear in other clubs' newsletters, but I feel that if you want to read those you can go to the various clubs' online newsletters, as follows: Go to our web site, http://www.tpcug.org, and click on the Affiliations button and then select APCUG. Once at the APCUG site, click on User Groups at the top of the site and then "Find a UG near you." That will produce a list of states and even countries.

As an example, selecting FL and then looking down the resulting list until you get to Tampa, you might want to look at our sister group, the Greater Tampa Bay PC Users Group. Once on their site, you could then select the Newsletters link

Minutes of the February Meeting

By Jim Purcell, Secretary, Tampa PC Users Group
Edward_J_P@MSN.com

The meeting started at approximately 6:35pm with the opening of the Windows SIG portion of our meeting, led by Bob LaFave. Bob introduced a product called Autoruns, which is one of many utilities originally from the site Sysinternals by a company called Winternals Software that was recently acquired by Microsoft. The program shows what is running on your computer. He recommended going to Microsoft TechNet on the web and reviewing the utilities provided by this recently-acquired company. One utility that is no longer sold is Erd Commander, a program that allowed compromising passwords on personal computers.

As a lead-in to John Witmer's presentation on Turbo Tax, Bob reviewed several alternatives that offered free tax preparation on the web. John Walden and Merle Nicholson asked about the security and storage of the data that was provided to Turbo Tax when filing online. Bob indicated that it was stored with Intuit and is available to you by password for comparison purposes the following year. Bob was asked about his comfort in using "registry cleaners". He said that he was not comfortable using a registry cleaner because the registry has become so complex that he would rather find the problems himself. William LaMartin and Merle Nicholson questioned the need to clean the register unless there is a specific problem. They stated that they felt it involved a miniscule amount of space and you are taking the chance of causing major harm. William, Merle and Bob agreed that "registry cleaners" are dangerous. Bob discussed the need to monitor your cache settings for temporary Internet files and to set a level that is appropriate for you. Multiple users generate their own sets of data, including temporary Internet files.

apcug Member of The Association of Personal Computer User Groups

Virtual Vista

By Ron Weinberg, Member at Large,
Tampa PC Users Group
rswjbr@verizon.net

Like most other users, I am well satisfied with XP. The Microsoft Vista Upgrade Advisor reported that most of my hardware was acceptable except for my old scanner. However, my software required numerous patches or upgrades. Accordingly, I saw no compelling reason to upgrade to Vista at this time.

I still do some limited consulting work and am beginning to encounter Vista systems.

In an attempt to become more familiar with Vista and avoid all the required changes to my system, I decided to try installing Vista in a virtual PC. Using Microsoft Virtual PC 2007, I installed my Vista Ultimate Edition with the New Virtual Machine Wizard.

The installation was simple and my Internet connection was immediately available. A large number of Vista updates were then downloaded and installed.

Next, I installed "Virtual PC Additions", which help tie the host and guest (virtual PC) together, such as Drag and Drop, Mouse Control, and Folder Sharing. Then I added a compatible anti-virus program for safety.

I have not actually used the new Windows Mail but was able to explore it and it seems to be operational. Network Printing and File Sharing worked, and I could access files on my host PC and see the Virtual PC as part of my network from my XP host.

Overall this experiment was worthwhile for me but should not be confused with a full non-virtual installation. I have not tried every available feature but can return to the virtual machine to test something else at any time with just a few clicks.

However, there are limitations of Vista with Microsoft's Virtual PC product.
There is no support for the Aero Glass graphics. Devices are all emulated so the actual drivers are neither needed nor available. I could not directly print from the Virtual PC until I discovered that direct printing works if you turn on LPT1 in Settings of the Virtual PC 2007 Console. Virtual PC is by nature somewhat slower than the host PC.

Support for Virtual PC2007 is at Microsoft's Virtual PC Support 2004 Center. Forums, Blogs and Newsgroups already exist. These include step-by-step installation instructions.

Anyone who hesitates to try this because they fear compromising their host pc should remember that the great feature of this type of virtualization is that it can be deleted with ease, and no harm done.

It should be noted that Microsoft has only recently increased its virtualization technology effort. Several other companies specialize in this technology. VMware makes a free Virtualization Server available. Anyone seriously interested in virtualization is well-advised to check out competitive products. ◆

(Minutes……..Continued from page 2)

One of the members asked if there were tutorials for the use of "Recovery Console". Merle indicated that Microsoft has some very good tutorials on the details of its use. Bob gave an overview of "Recovery Console" and the many facets of its capabilities.

President John Witmer opened the business portion of our meeting at approximately 7:25pm with a discussion of next month's program. Doug advised that Blain Barton from Microsoft will be the presenter for the March meeting. John reminded the group that the Florida Association of Computer User Groups is having their spring meeting in Zephyrhills on March 7, 8 and 9. John announced that we have three new members: Eric Goldstein, Mark O'Leary and Arthur C. Williams. John mentioned that we have no one scheduled to present a program in April and that if

(Minutes……..Continued on page 7)

(Comments…….Continued from page 1)
to view one of a list of newsletters going back to 2006. So, if you have a lot of free time, there should be plenty of articles you can read for free when you consider just a few groups for each state plus the foreign ones.

What to write about this month? I can't write more about my Linux adventure, as I did in last month's newsletter, since I haven't even booted that computer in the past several weeks. But I will probably have some more to say later in the year when I have tried to do a few things still undone, like figuring out how to back up the entire setup to a USB hard drive, as I do my Windows computers.

I can't write about programming with Visual Studio for my Windows Mobile phone, since I have done nothing new in the past couple of months. The same is almost but not quite true for my Windows desktop programming.

Statistics for the TPCUG web site haven't been mentioned in a very long time so there is a topic. A look at the February server log shows we had an average of 463 unique visitors per day with an average of 1.6 pages viewed per visitor. All days of the week seemed to receive about the same amount of traffic, as, surprisingly, did the hours of the day. Traffic was a bit heavier around 4 and 5 in the afternoon, Eastern time zone.

As expected, the home page of the site was by far the most visited. The next most visited page was an article I wrote in 2004 about my new Epson Perfection 3200 Photo scanner (284 visits). Most of these visits were obviously the result of a search engine search. I don't know if they were searching for Epson or for my comments on my previous HP scanners. The next most visited page was our Links page (195 visits) and the third one was an article by Bob LaFave in 2003 on IsoBuster (184 visits), obviously also found via a search engine in most cases.

Google sent 800 people to the site, followed by Yahoo with 442, AskJeeves with 95 and MSN with 56. Of the Spiders that indexed the site, the largest by far was the Inktomi Slurp with 7,784 hits, then the Googlebot with 2,547 and then the MSN Robot with 2,184. There were some 30 more spiders (or crawlers) that indexed the site to a lesser degree.

What computer things this past month might be of interest? I have certainly used my computer to watch my small **investment portfolio decline** in value, along with the interest we receive on our T-Bills, CDs and other such instruments. I am sure many of you are in the same boat, which seems to be leaking. Just this hour I received an email from the Bureau of Public Debt stating that the investment rate on a 182 T-Bill in today's auction was 1.852%. It was above 5% this past summer. I receive most of my financial news from the online Wall Street Journal (there is a yearly charge), the online New York Times Business section or Bloomberg.com. And if I read all that was available in just those three sources, it could take up a good part of the day, which I obviously don't want to do. So I usually just read the more negative articles, since the positive ones will just turn into negative ones in a day or two. However, I need to read something during breakfast, so I scan the printed version of the Tampa Tribune, where it seems most of the articles are ones I have read either at the WSJ or the NYT the day before, unless it is some article about our local government or other local interest. That brings up the question, why do newspapers still carry stock quotes in the business section? Do not 99% of the people interested in such now have computers where they can get this information for free and in large enough type for old eyes to read?

Photography is something that I usually do each month, and the computer and an array of USB external hard drives is where all those digital images are stored and sometimes manipulated. This past month was no exception. There was the annual Gasparilla parade that runs one block from my house, but I believe that was actually at the end of January. However, there were the Gasparilla distance races that also go down Bayshore Boulevard that I can walk down to and photograph. I took photos of this year's parade, selected ones I would like to put at our neighborhood website, used Photoshop to do a bulk resizing of then to a maximum dimension of 800 pixels and then inserted my name in the lower left-hand corner. I started putting my name on photos

(Comments…….Continued on page 5)

(Comments……..Continued from page 4)

that I put on the web a few years back after I found some of them showing up on other sites with no attribution. An automated batch resize and name imprint is not what usually comes to mind for Photoshop but it is a very useful and fast feature. Oh, and I also had it rename the files as 1.jpg, 2.jpg,… for an online slide show.

You can see the Gasparalla parade photos at the site http://www.oldhydeparkfl.org under the Hyde Park | Photos link. You will also see some photos of parades in 1962 and 1969. It is interesting to compare these older parades with our modern, more rambunctious ones. Those earlier parades were photographed by TPCUG member Gary Ennis, who loaned me the Kodak slides to be scanned. I did have to do a little Photoshop work on them to remove, as best I could, the effects of aging, e.g., color shift and small spots.

As for the Gasparilla races, I took a few photos, but they were not all that interesting—just people run-

New $450 Notebook: Compaq F750US

By Merle Nicholson, Tampa PC Users Group
merle@merlenicholson.com

Well, I didn't know you could get a full-size notebook for $450, but Staples has them, at least for now. The Staples off of Dale Mabry and Spruce was temporarily out, but we got one of nine left at the store on Dale Mabry and Ehrlich Road. It's a good PC for $450 ($480 in the store and a $30 on-line rebate), but some things are lacking. More about that below.

From the Sunday ad, I was able to look up the specs at the HP/Compaq site, and determined that this was an exceptional deal. It's a Compaq model F750US.

Ok, here's what it has and doesn't have:

WHAT IT HAS:

- AMD Athlon X2 1.9GHz processor
- 1G memory, shared with Video
- 120G Hard Drive, some of which is reserved for system recovery
- Windows Vista Home Premium
- CD/DVD Writer
- WiFi 802.11g
- Card Reader
- 15 inch Bright LCD screen
- Ethernet, modem, 3 USB, AC Charger

WHAT IT DOESN'T HAVE:

- A card slot of any kind – that is, a PCMCIA or Cardslot
- 2G Memory to run Vista really well
- Bluetooth Transmitter/Receiver
- A case of any kind

The attractive part of the deal is the processor. This is a very powerful CPU. Other inexpensive computers in the $500-$700 range will have AMD Semprons or Intel Celerons. I imagine there will be a trade-off in battery life using this processor, but that is not a big concern for me.

The biggest disadvantage for me is the 1G memory and Vista in combination. HP/Compaq does not supply XP drivers for this notebook. This isn't keeping me from trying, but that's another article for next month.

In my opinion, a $450 notebook computer should stand as is. I would not buy one with the intention of upgrading it, and the reason for that is, in the $500-$700 range you can get everything you need, including 2MB or even 3MB RAM. And you also have to resist the hard sell for a $150 extended warranty.

As a final warning, this computer has a lot of crapware, some of it HP branded, and it's a lot of work to get rid of it. Then, in consideration of the 1G RAM, I started "De-Vista-izing". That is, I've disabled great amounts of graphics and flash and gegaw stuff that slows it down, and the results are pretty striking. A good start is "Tune for Performance", and then restore a few things like ClearType that you will certainly miss. It now certainly behaves no worse than XP, and performs pretty well. More next month.

The laptop is pictured below.◆

(Comments…….Continued from page 5)

ning (or walking). I am not much of a sports photographer. What was interesting, though, was the fellow who, along with several others, was taking photos of all the runners he could capture. He said that he worked for a company whose sole purpose was to photograph runners and then to sell them the shots online. He said during that one day alone he would

(Minutes…….Continued from page 3)

any of the members can make a presentation, they should come forth.

John began his presentation of "Turbo Tax" at approximately 7:30pm with an overview of tax preparation software. He discussed some of the more popular tax preparation packages currently available. Tax Cut and Turbo Tax are the two with which most people are familiar. He selected Turbo Tax because he has used it for several years and it is probably the one that is most popular today. He reviewed the four different versions of Turbo Tax and the features of each. Some versions include the ability to prepare your state income tax but of course it is not needed if your state does not have a state income tax. He and William discussed the ability of Turbo Tax to import financial and investment information from Quicken and even import investment information directly from some brokerage accounts. Bob indicated that the online version has the same capability. There was a discussion about the wisdom of placing so much of your personal financial information in one place on an online server. They pointed out the convenience of having all of your information automatically imported versus the inherent dangers of placing all of this information in the hands of a third party over which you have little or no control, or even any knowledge of the measures taken to keep it secure.

John explained the help that is available to you and also the forms that are readily available to you. He showed how easily information could be imported from last year's return if it had been prepared with Turbo Tax (or TaxCut), so that the information could be used for certain calculations or for comparison purposes. He also showed how the return could be prepared from scratch if this is your first time using a tax preparation package. He pointed out that if you have a simple return, the free online version is easy to use and permits e-filing. If you are receiving a refund, it can be in your bank in 7 to 24 days. Another advantage of the packages is that Intuit provides prompt updates that make changes to keep up with the many revisions to tax laws that are made after the period for filing began. The software provides easy access to all IRS publications that you need. You can view them online or print them. He pointed out that the program will calculate your depreciation of things like rental property. It will allow you to add the cost of things like additions to the property and the program will then recalculate your depreciation.

Help even includes videos to explain topics that are not clear to you. Changes in filing required by new statutes or IRS rulings are usually highlighted and explained in detail.

John worked through returns having different types of circumstances, showing how the software handled the input. He went through numerous transactions and answered questions as they were entered to illustrate the versatility of the software. There is also a feature that calculates your probability of an audit. In addition, they provide audit experts, for a fee, to assist in your audit should one occur. When you have completed the return, you are provided a printed copy of the return to file with the IRS and a PDF document that not only duplicates the return but also provides all of the worksheets that the program generated to calculate your return. The program also generates tax reports provid-

Spanish and French Newsletter

As many members surely know, member Ed White is a big proponent of Spanish, and he has mentioned to me several times about the possibility of a Spanish version of the newsletter. Well, my foreign language abilities are severely limited to one year of Spanish in high school, one or two (I can't recall which) years of French in college and one semester of German in college. I was not a very good student in any of these courses, and they were a long time ago. But time has produced progress, and we can now let Google or Microsoft do our translations for us. These computer translations are not always that accurate—based on what people proficient in the two languages in question have remarked to me about such translations in the past. However, they seem to do a pretty good job on our usually simple and straightforward newsletter articles.

Minutes of the April Meeting

By Jim Purcell, Secretary, Tampa PC Users Group
Edward_J_P@MSN.com

Bob LaFave opened the Windows SIG at 6:40 pm. Ed Cohen asked how he can change the default view of his file folders. Bob showed the different ways to set the default to have the folders displayed as he desired. Rick Goldstein and John Waldon both reported that they recently began receiving a message to put the "Sonic" CD into the computer so that the program could be installed. Neither knew of having a "Sonic" program on their computer. Bob stated that Dell used "Sonic" software as utilities or drivers for different devices. The consensus was that their problem was the result of a Dell update. He showed different solutions that might solve the problem. There was a discussion of virus programs and their characteristics and costs. There was also an extended discussion of how to troubleshoot wireless connections. Bob advised that there is a bug in the software "Diskeeper" that can cause loss of data when used with the Vista SP1 operating system.

John Witmer began the business part of the meeting at 7:00 pm. He announced that we would have a raffle after the presentation of Voice Recognition software by Patrick T. Courtney. John mentioned that we are revising our method of notifying members their annual renewal date had passed. He said our financial status is good. Our expenses are relatively low because our newsletter printing expenses have been reduced to the cost of the paper and postage and we do not have to pay for a place to meet. He then turned the meeting over to Patrick Courtney.

Patrick advised us that he is a registered Professional Guardian. He explained the requirements to become a Professional Guardian and the services that they perform. He noted that the very sensitive nature of

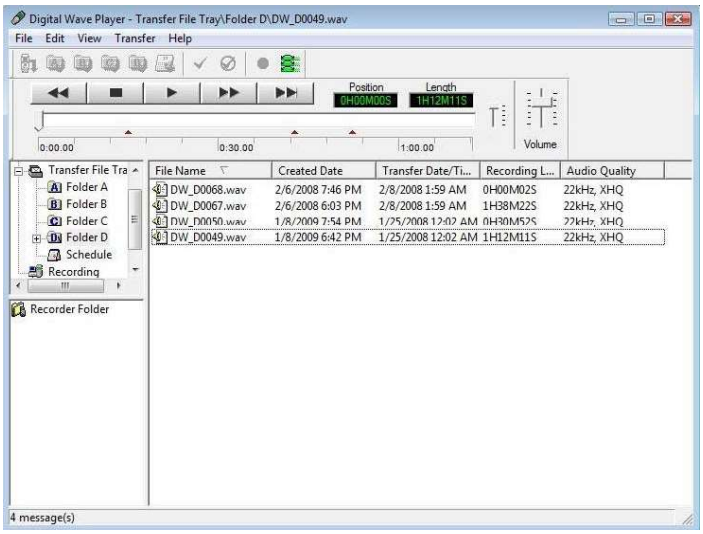
Olympus Digital Voice Recorder

By Jim Purcell, Secretary, Tampa PC Users Group
Edward_J_P@MSN.com

After being elected secretary (by a landside), I felt an obligation to my constituents to report the minutes in the same accurate detail as Doug Mullis, my predecessor, had recorded them. He captured the details of each meeting with a small voice recorder. I had toyed with purchasing a voice recorder for quite some time to record memos and passing thoughts when it wasn't possible or was inconvenient to write them down. It seemed that a digital voice recorder would accomplish both tasks.



I started looking at Olympus recorders and went no further, because I quickly found what I was looking for at a reasonable price. I purchased the Olympus VN4100PC (list price $59.99, currently available at Amazon.com for about $45.00 plus shipping). This recorder is 4 inches long and weighs a little over 2 ounces. It operates on 2 AAA batteries. It is rated to provide approximately 25 hours of operation with alkaline batteries or approximately 15 hours using NiMH rechargeable batteries. It has four recording modes that allow a remarkable maximum recording capacity of over 144 hours (XHQ mode: Approx. 11 hours & 40 minutes; HQ mode: Approx. 23 hours & 40 minutes; SP mode: Approx. 47 hours & 20 minutes; and LP mode: Approx. 144 hours, 20 minutes). It has four folders built into the recorder, each of which will hold up to 100 files. A digital wave player and USB cord are included with the recorder, which allows you to easily transfer your recorded files to your computer (the model VN4100 does NOT have these features). The digital wave player includes a "Device Detector" which recognizes the recorder when it is connected to your computer and automatically opens the Olympus Digital Wave Player. You have several options in transferring your files but the folders (A, B, C &D) are already set up to correspond to those on your recorder. The included wave player is the only way files can be extracted from the recorder and transferred to the computer. Once the file is transferred to your computer, of course, it can be transferred internally or to another computer, copied and renamed, or played on other digital players that accept a "WAV" format

file. The Olympus Digital Wave Player is not supported for 64-bit operating systems. I have the 64-bit Vista Ultimate operating system on my laptop. Although the Olympus Digital Wave Player runs the same as it does on my Windows XP computer, the "Device Detector" does not work so I can't extract the files to my 64-bit computer. I extract the files on my XP computer and then transfer any files that I need on my laptop by copying them like any other file. (See the second image in this article.) There are at least two Olympus recorders that are 64-bit compatible, the WS-210 (only available at Radio Shack) and the WS-110. These two recorders plug directly into your USB port and come without the wave player software. The WS-110 has 256mb of internal memory and the WS-210 has 512mb of memory. Both of these recorders function as a flash drive and can be used to store files other than those you have recorded.

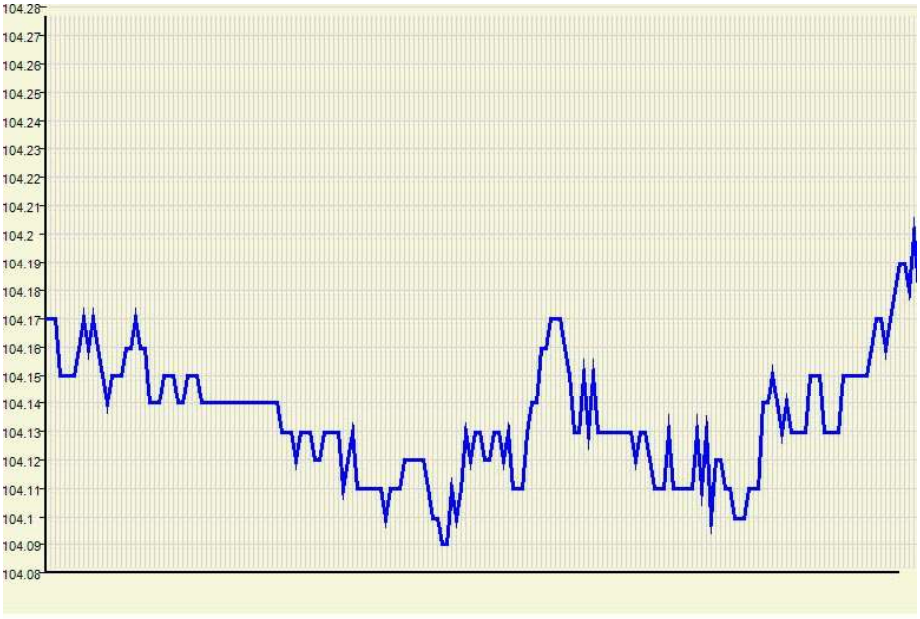
I've been pleased with the performance of the recorder. I try to sit near the center of the room when I'm recording meetings. I just put the recorder on the

(Recorder…….Continued on page 4)

(Recorder…….Continued from page 3)

table and turn it on at the beginning and let it run until there is a break or the meeting is over. Surprisingly, it picks up practically everything that is said. There are problems sometimes if someone near the microphone is talking rather loudly at the same time as someone else is talking. I've been able to sort these things out by using the wave player's playback feature and the cryptic notes that I've taken during the meeting. This ability might be a disadvantage for some projects. I purchased a "Noise-Canceling Microphone" from Olympus, and even when I reduce the sensitivity of the microphone it still seems to pick up some background noise. The instruction sheet has specific directions on how to use the microphone with voice recognition software. If you are purchasing the recorder for this purpose, I'm sure you can get more precise information from Olympus.

The built-in folder organization has proven to be handy. By dividing my recordings into four categories, it has been quite easy to locate files. I put notes that I want to keep when I'm reading technical books and magazines in one folder. I use one folder exclusively for TPCUG meetings. I put all of my reminders, passing thoughts and things I want to do that that I think of when it is not possible to write on a pad or in my Palm Pilot in another folder. I can quickly review them at the end of the day and take whatever action is necessary. The last folder is my miscellaneous folder for things like odd facts, unusual experiences, or thoughts that I don't know how to spell.



I found the Olympus Digital Wave Player useful in managing and playing my recordings. It is organized like the recorder, so it is easy to extract and organize your recordings. It has an indexing capability that allows you to insert and delete index marks while you are reviewing the recording, and you can also insert a limited number of indexes while recording. It does not allow you to edit the content of the recording or to run it fast or slow, although the recorder itself has a fast or slow mode when you're using it to listen to the recording. As mentioned above, the recordings are in the "wav" format so you can use a player that has the functions that you need. ◆

(Comments…….Continued from page 1)

So, for the April HTML version of the newsletter, I added links to each article that provide either a Spanish or French translation. I may or may not continue this into the future, since all a person desiring such a translation need do is go to http://www.windowslivetranslator.com/ and enter the URL of the web page they want translated.

Graphing

(Comments…….Continued on page 5)

(Comments……..Continued from page 4)

I was looking for something for which I could write a program to do real-time graphing. Since foreign exchange trading seems to be all the rage now, taking the place of the day trading of stocks that proved unprofitable to most people who engaged in it during the dotcom bubble, I settled on plotting various currency trading pairs — for example, the Japanese Yen (JPY) against the US dollar (USD)

I retrieved the data for these trades from Yahoo in real-time by writing code to "scrape" such information from the Yahoo pages which display that financial data . The graph above is such a graph showing the USD to JPY conversion.

With all my programming, I had never done much graphing. So, with my interest in graphing growing, I then thought about three-dimensional graphing. This involved plotting on a two-dimensional computer screen an object that would appear to the viewer's eyes to be three dimensional. The first image below is an example of such using, Cartesian coordinates (x,y,z) in three-dimensional space and projecting the image on the y-z two-dimensional plane so as to produce a 3D-appearing image.

The second image is an example of doing a similar thing but using polar coordinates (φ,θ,r), where the Greek letters φ and θ are angle and r is a distance from the origin. If you have had some geometry in the past, this probably makes sense. If not, then just look at the images. If you find such images interesting, I have a collection of 3D images I have generated with my 3D graphing program at http://www.lamartin.com/ComputerGraphing.aspx. There

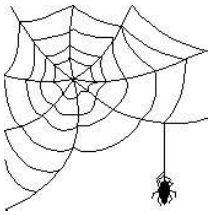
Internet Picture of the Month



Microsoft & Yahoo

The image is from the site http://sarahmeyers.wordpress.com.

Well, for now the Microsoft purchase of Yahoo is off. They couldn't agree on the value of Yahoo. Microsoft was willing to pay around $43 billion; Yahoo thought they were worth over $50 billion. Today's stock market price says Yahoo is worth $34 billion. Marketwatch.com says that Yahoo had a net income of $660 million in 2007. To my uneducated eye, any of those numbers seems like a lot to pay to make $660 million a year. By the way, Google had a net income of $4.2 billion in 2007, and Microsoft had a net income of $14 billion.

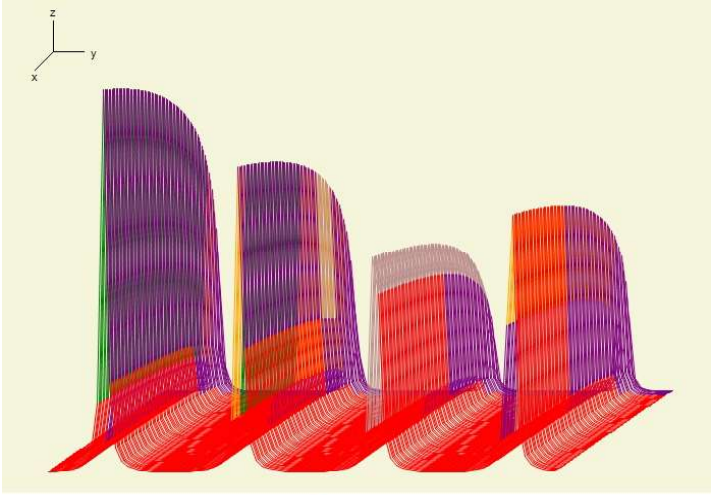
these services, legal requirements and the complete vulnerability of some of his clients required that his actions be completely documented. Many professions have similar requirements; for example, he related the story of a friend of his who was a social worker and was also required to document her actions. He said that while he was talking to her he noticed a sign on the inside of her door which read, "In God We Trust, the Rest of Us Must Document". Voice Recognition software helps him to comply with the requirements that his documentation meets the criteria of being factual, thorough, accurate, clear, brief, timely and well-organized.

He then gave an excellent demonstration of how he used "Voice Recognition" software to perform his duties. He showed how the software recognized his vocal documentary and transformed it into a written record of his comments and also how effectively he could use his voice to punctuate and move through the document.

Patrick was very careful to relate that he did not represent nor was he reimbursed by the software company. He was using Dragon Naturally Speaking Version 7 Preferred and recommends Dragon Naturally Speaking Version 9 Preferred, which is the latest version of the software. Merle Nicholson found that the software was available from NewEgg for $69.99 after a $50.00 rebate (includes a wired headset). It's $199.99 from the publisher, Nuance.

Patrick's presentation convincingly illustrated that the software that most had considered a toy or a curiosity has been developed into a valuable tool that can effectively perform a very difficult and exacting function. The presentation ended at approximately 8:30 pm. The raffle winners were as follows:

Sam Christy	Subscription to Smart Computing
Harry Lochabay	TPCUG T-Shirt
Jim Purcell	TPCUG T-Shirt
Dennis Neal	TPCUG T-Shirt
Merle Nicholson	TPCUG T-Shirt
Linda Neal	TPCUG T-Shirt
Todd Grubb	TPCUG T-Shirt
Ron Weinberg	TPCUG T-Shirt
Kevan Sheridan	Trend Micro Software
Eddie Rodriguez	TPCUG T-Shirt
Ed Cohen	TPCUG T-Shirt



The meeting ended at approximately 9:00 pm. . ◆

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Bob LaFave moderates the discussion.

ELEVATE MIAMI / ELEVATE TAMPA BAY

By Ed White, TPCUG
cwhite1@mail.usf.edu

To understand this idea, you have to know that it all starts with Jim Osteen. He is James E. Osteen, Jr., Assistant Director - Information Technology, City of Miami.

In conversations in his office, I asked him to explain to me a little more about what he wanted to accomplish.

To understand his answer, you need a little background. Jim Osteen will be retiring from the City of Miami in two years. He wants to leave behind "something really good."

He got his big chance when Manny Diaz was elected Mayor on a platform of improving the schools in the City of Miami. Jim is a very modest guy and will not say, "This is my idea", but I am certain that it really is his baby. Instead, he says: "The IT Department got together to see how they could make the Mayor's plan become a reality." And it is probably true that the mayor jumped on the idea and pushed everybody who works for the city to support it. You have to see this thing in action to believe it. I think that Jim personally is probably spending at least 50% of his time on this project and he seems to get anything he wants from city employees – from printing jobs to city cars for his people.

His original thought was this: The City of Miami, like most big operations, replaces 25% of its computers every year. They had been selling them at auction and getting about $5 apiece for machines with a lot of life left in them. He said: "Why don't we put them in government buildings open to the public? We have lots of them in parks, beaches and other public areas." And the Mayor said: "DO IT!!!" And they did it.

Then they found out that the public did not use the machines because they did not know how to use the machines. So they saw the need for a basic training program in email and web-surfing. The City got AT&T and the other supplier (I forget the name) to provide free DSL service at these locations. Of course the City of Miami spends lots of money with these outfits, and I can see that I really need to get the City of Tampa and/or Hillsborough County to sponsor/support/take credit for, or whatever, and then I can get just about anything.

About this time along comes the priest in charge of Gesu, which is a very large, old and beautiful Roman Catholic Church in the heart of downtown Miami. This priest is technologically-oriented and he tells the mayor: "I have this giant basement below the church. We call it the Gesu Senior Citizens Center. It has a big kitchen with lots of nuns to do all the work, and we serve free breakfast and lunch to the many poverty-stricken senior citizens living in the downtown area. I want computers and training for these people." And the mayor said: "DO IT!!!".

They installed four computers in a little room in the basement, brought in the City's one and only teacher, AND WERE OVERWHELMED WITH DEMAND, especially since the teacher, Maria Martorell, is from Puerto Rico, and teaches beautifully in Spanish, as do the other teachers she has now recruited. I did not see any classes in any of their locations in English.

So the priest built a bigger room, Maria got the old one for her office, the "school" now has twenty computers and is still overwhelmed. Quite a few of the students have purchased computers for home use. And AT&T and the other outfit give them a year of DSL at $10 per month.

They have plans to expand this way beyond senior citizens. The other "legs" of the program are: small businesses, parents and after-school. So the possibilities are infinite. And Microsoft damn well knows it.

Jim Osteen's personal goal is to expand this throughout the

(Elevate…….Continued from page 7)
state, eventually making Florida another "Silicon Valley." So far, I am the only "civic leader" to bite on this idea, and they are leaning over backwards to help me. I asked him if it would be all right to use "ELEVATE TAMPA BAY" as our name in Tampa and he said: "Yes, do it".

BUT, in May or June or July (I forget a lot), Miami is hosting a big convention for Florida municipalities and naturally Mayor Manny Diaz will make a speech. He will say that ELEVATE MIAMI is the greatest thing since sliced bread and recommend it to all the other city mayors who will be present. They already have posters printed, and leaflets, etc. on the way.

So we think this idea is a winner and we want to pursue it. ◆

Minutes of the March Meeting

By Jim Purcell, Secretary, Tampa PC Users Group
Edward_J_P@MSN.com

President John Witmer opened the business portion of our meeting at approximately 6:30pm with a discussion of a possible presentation on identity theft by Hewie Poplock. The presentation, "Identity Theft – Protect Yourself", was delivered by Mr. Poplock at the recent FACUG meeting in Zephyrhills. There seemed to be interest in the topic but most of the discussion surrounded Mr. Poplock's request for some assurance that there is interest in purchasing "LifeLock Insurance" from him after the presentation. Interested members were asked to contact Doug Mullis, and, if he is satisfied that there is sufficient interest in the topic and the insurance, he can schedule the presentation. If not, it will be discussed and a decision can be reached at the April meeting.

Microsoft was present to provide another of their interesting and informative presentations. John introduced Blain Barton and Yung Chou of Microsoft. Blain said that their theme for the evening was "New Products". He said that Yung would talk to us about the Windows Server 2008 and that he would talk about Windows Home Server.

Yung stated that his objective was to inform us of the trend of new developments in the Information Technology industry. He also wanted us to better understand the reasons that Microsoft is proceeding in the direction that it is with their new developments. He said that Microsoft has found that IT professionals are spending about 70% of their time on maintenance (putting out fires). This prevents these professionals from using their skills to take advantage of the technological capabilities of the server. He gave a detailed explanation of how Microsoft has included changes in Server 2008 to lessen the maintenance

Faster Hard Drives

SAS, SATA and 15K drive installation

By Merle Nicholson, Tampa PC Users Group
merle@merlenicholson.com

I've installed a new type of hard drive – SAS, or Serial Attached SCSI – that has dramatically improved the performance of a new PC. I have a pair of Seagate Cheetah 74GB drives running in RAID 0. They run at 15,000 RPM, and I'm pretty sure they're the fastest available.

I've been building a new PC for a couple of months now for my business use because I do a lot of pretty intensive database work. The faster the machine, the more work I get done. Also my current PC is getting to be about three years old, so I need at the minimum to replace all four hard drives. I don't wait for hard drives to fail, I replace all hard drives as they approach three years.

PROCESSORS

I started with an average-speed processor while I experimented, and have since upgraded to the fastest dual processor AMD makes – an X2 6400+ running at 3.2GHz. The motherboard isn't optimally set up for Phenom (four cores), so I'm waiting for a while on that and for AMD to raise the Phenom processing speed beyond the current 2.3GHz.

SSD

I've been looking for an affordable hard drive that will match the performance of the rest of the system. I was very interested in SSDs – Solid State Drives – and found that the fast ones that are large enough for a full Microsoft Operating System, plus Office and a dozen other programs, are simply prohibitively expensive. I think they will get there, but not just yet. I found also that just because they're solid state doesn't mean they're fast. Besides, a couple of recent innovations with hard drives have lowered the prices on all the parts I needed to stick with regular hard drives. More about that further on.

VISTA

The reason I put two months in the project was because I wanted to experiment with Vista and see if I can make it suitable for my business. I thought I was close after I obtained Vista Service Pack 1, but I now have a regular service program failure that I haven't solved. So I give up for now; I'll stick with XP for the foreseeable future. It's too bad, because, except for just a few things I didn't like, Vista was looking pretty good. I managed to find all the Vista device drivers I needed, with the exception of my old scanner.

PATA and SATA INTERFACES

The conventional hard drive interface has, for a good many years, been IDE ATA, sometimes now called PATA, or Parallel ATA. The connection from the motherboard to the hard drive or CD/DVD drive is a 40-wire cable – and now commonly an 80-wire cable of the same width. This is very quickly being replaced with SATA – Serial ATA that uses a narrow cable about 5/16" wide. They have even become predominant in notebooks. There is no longer a price differential in hard drives or motherboards between PATA and SATA. SATA will handle data faster, are easier to route cabling and don't restrict airflow the way PATA cables do. Even CD/DVDs are using SATA now. Virtually all motherboards now have at least four SATA ports. The software that controls the data is largely powered by the CPU. RAID support is also implemented in virtually all these motherboards, and, if you set up a RAID array, the software that runs the RAID also depends on the CPU to handle the data stream. The fastest and most common SATA interfaces run at 3GB/Sec. (Called SATA II). Desktop hard drives are always 7200 RPM. Notebook drives are usually 4500 RPM or 5400 RPM and, rarely, 7200 RPM. The faster they spin, the faster the data goes out.

SCSI and SAS INTERFACES

Until pretty recently, if you wanted a really fast hard drive you had to look at the server world and get a SCSI drive. SCSI drives have always been small – typically 36GB, 74GB and 147GB. And they're expensive – in the neighborhood of $600 apiece. The cable is very wide – 50 wires – and the connector is a monster, and you really have to know a lot of stuff to make it work. You also need a SCSI controller card at a minimum of $150 and up, more typically in the $800-$900 range. Many of these drives, however,

(Hard Drives……..Continued on page 4)

(Hard Drives…….Continued from page 3)
run at 15,000 RPM or, just as often, 10,000 RPM and deliver up data at one-half and two-thirds the time, respectively. There's more to it than that, but that's close enough. But some things have recently changed. Two things, really: One is the PCI Express bus and the other is the adoption of a serial interface to SCSI called SAS – Serial Attached SCSI.

PCI EXPRESS
All new motherboards have adopted PCI Express – a scheme that allows bus cards – and especially video cards – to connect to the main data bus at a much faster rate. They use different connectors, and, indeed, there are several different connectors that may appear on a given motherboard. Mine has two 1x, one 4x and one 16x – the last for video. Each is a different length. But suffice to say that it makes the old PCI bus look pretty slow.

SAS
SAS is to SCSI as SATA is to PATA. It's the implementation of a serial data stream from the old SCSI parallel scheme. It's cheaper and uses small cables that don't restrict air flow. The connectors on SAS drives are very similar to SATA. Actually, they're designed so that you can connect a SAS cable to a SATA drive. But you cannot connect a SATA connector to a SAS drive. This is because the SAS controller cards will also support SATA drives but not vice versa.

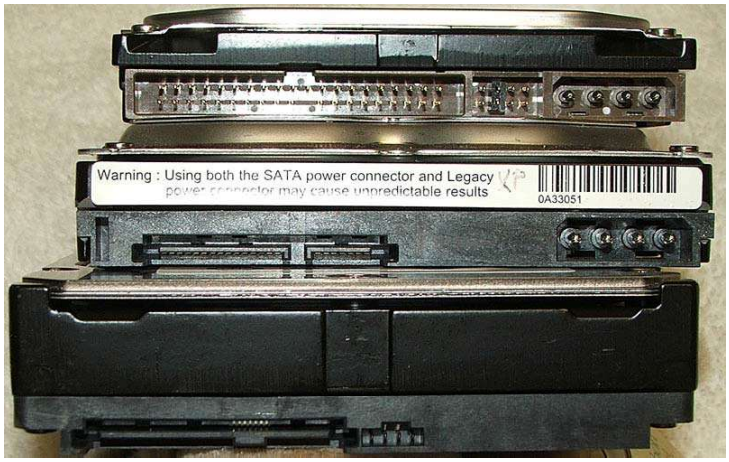
THE REASON to use SAS is because SAS interfaces are available on 15K and 10K hard drives at a reasonable cost. Mine were just under $200 each – I needed two for RAID 0, and the controller card was $315 and a $40 cable was necessary. Two 36GB drives would work well for me, but the 74GB drives were cheaper.

SAS CONTROLLER CARDS
These run between $175 and, well, you don't want to know. The inexpensive ones handle four drives and depend on the computer's CPU to move the data, just as board-implemented SATA does. As the price goes up, they add on-board processors and memory, and they support more drives – typically eight. The one I got after much research does four drives, has an on-board PowerPC processor (remember those?) and 128MB DDR2 memory. So it's a computer on a card for $315. It comes with a cable for SATA drives for some reason, so I bought a SAS cable for $40. Researching the cable to buy was harder than all the other components put together.

THE RESULTS
To briefly describe what I have: Two Seagate Cheetah 74GB, 15,000 RPM hard drives that are controlled by the card with its own computer on board. It's configured for RAID 0, meaning that it combines the two drives to look as one, adds the capacity for 147 GB and divides the workload between two interfaces. A failure of one drive disables data in both; there is no data redundancy. Believe me, I have backups and can recover data to a spare hard drive in fifteen minutes.

I did some subjective testing, comparing some common things I do using a standard 80GB SATA drive compared to the new SAS setup. It turns out that starting up the PC from cold is about the same as it

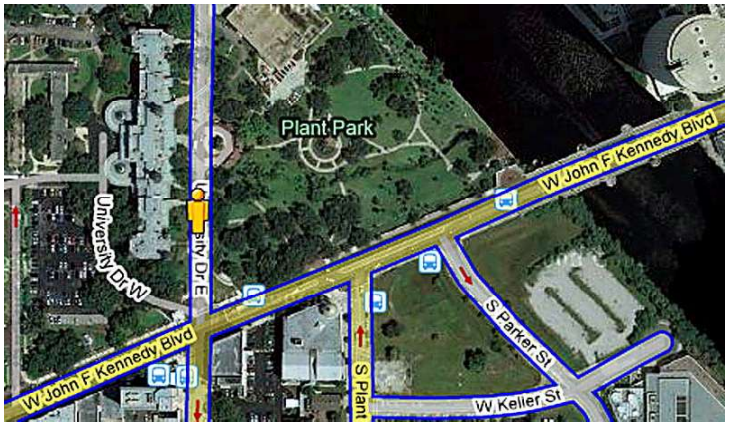
(Hard Drives……..Continued on page 5)



To the right of the controller card is the new 15K Seagate Cheetah, a Hitachi 80G SATA drive and a new Seagate 160G ATA (or PATA).

(Hard Drives……..Continued from page 4)

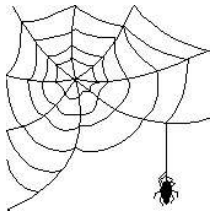
was before. That's because adding in the controller card itself slows the system boot by about 15 seconds. The controller card has a boot of its own to perform. That it doesn't take longer overall to boot is satisfactory, since we're talking about one minute, 15 seconds. Starting up Word 2003 takes about 3.5 seconds vs 6.5 seconds before. This document, now on its third page, loading from a drive on the LAN, is virtually instantaneous. Shutdown remains the same at about 17 seconds.



Compared to my previous machine, which has a couple of 10K drives in RAID 0 and a similar processor, but at a 25% reduction in processor speed, the Access database queries round off at about a 20% improvement. Not a great deal, but every bit counts, and I certainly learned a lot in the process. ◆

Looking at the ends from the bottom are the SAS drive, a SATA drive and the top one is the PATA drive. There is a considerable difference in the thickness of each drive, considering the capacity at 74GB, 80GB and 160GB. The SAS 74GB is thickest and heaviest by far – I suppose to handle the stress of the high speed.

Internet Picture of the Month



Tampa has been Googled

Google Maps has now added Tampa to the cities where its maps and aerial images have a street level view, in which you can travel along any city street and view both sides of the street as if you were in a car.

Above is the street level view of the Tampa Bay Hotel, now the main building of the University of Tampa, and below it the aerial view, with the yellow man you click on to go to street level.

demands and to thus greatly improve the ability to utilize both the old and the vastly-improved new technology.

Blain began his presentation by telling us that, within about five hours after he contacted Microsoft corporate to gather information for his presentation on Microsoft Home Server, they had shipped him a 500 GB HP MediaSmart Home Server, pictured below. He said that he was able to hook it up and have it running within about 20 minutes after taking it out of the box. He emphasized the increasing need for a home server based on the number of computers that we own, the value of the data stored and the ever-present possibility of equipment failure. He explained that this would not be a domain controller, so it would not violate the rules normally established by a provider like Verizon. The server provides backup across all home PCs, password synchronization, health details and notification on all connected PCs and also provides better security. You can have 10 user accounts and one guest account. It is also easy to add and remove drives, and the system sees all drives on the server as one space. The server adds and decreases this total space as drives are added and removed. It also allows remote access to all PCs and allows media sharing. Blain followed with a detailed demonstration and a question and answer session to demonstrate the functions.

There was no Windows SIG, so John asked for any questions. Merle Nicholson reminded everyone that their UPS batteries should be replaced if they are more than two years old. John announced that there will be a raffle at the April meeting. The items will include two evaluation copies of Microsoft Home Server software thanks to Blain and Yung, and several other items.

The meeting ended at 8:10pm. ◆

(Comments.....Continued from page 1)

Marylee Bruneau gave me a box of old newsletters. Later, member Ed Buzza gave me another box when he was cleaning out his home. From those two collections I have a pretty complete collection from March of 1990 on and spotty for 1988 and 1989. An email routed to me by Kevan from a daughter, living in Houston, of a former member in the early days of the group revived my interest in those old newsletters. She had found references to her now-deceased father, Vern Semrad, and his interest in BBSs which also mentioned Kevan Sheridan. She wrote to Kevan: "*I found your name on an article posted about BBS, and it mentioned my father, Vern Semrad. I was wondering if you were still around, and if you remember anything about my father. He passed away many years ago, and I have so few memories of him.*"

Well, she can now read several years' worth of newsletters (Feb. 1989 - March 1991) where her father was a considerable contributor to the content of the newsletter and was also listed as the membership officer for the group in 1989 and 1990. She can do this online at our site because her query prompted me to restart a long-stalled project of scanning in these old newsletters. Quite a few years back, I had scanned in about ten of them but had done no Optical Character Recognition (OCR) on them. So I went back and did the OCR on those already scanned and then scanned in some additional ones and did the OCR. All of this was done using Adobe Acrobat 8 Professional and my Epson Perfection 3200 Photo scanner, scanning at 150 dpi resolution, best quality and 8-bit gray-scale.

The files produced above are considerably larger than those you get when the Acrobat document is created directly from the program used to create the newsletter, Microsoft Publisher. An additional problem was that these old newsletters were all printed entirely on blue paper (think *Bits of Blue*). That adds a complication to the scanning. The files can be accessed at our site under the Newsletter link or directly at http://www.tpcug.org/OldAcrobatNewsletter.aspx. The articles in these old publications will probably bring back memories of computer things that you have probably forgotten.

Silverlight is Microsoft's answer to Adobe Flash. It is a method of supplying a richer visual experience to web pages (and capturing some of the money now going to Adobe for displaying such content).

Silverlight 1 is now out, version 2 is in Beta. To view the Silverlight content on a web page, you will be prompted to download the Silverlight browser plug-in when you visit that page – just like you were asked to download the Flash browser plug-in many years in the past.

What I like about Silverlight is that it is programmable with Microsoft Visual Studio 2008. You can view my first attempts with it at http://www.lamartin.com/Silverlight/. I am using Silverlight 2.0 Beta. To see more impressive examples than mine, go to http://silverlight.net/Showcase/ and when you receive the browser notification about pop-ups, allow them. ◆

Elevate Tampa Bay Have you noticed your house rising? I had hoped to get my first floor above its present 11 feet above sea level, since 11 feet wouldn't be very nice if a 20-foot high storm surge were to come in from the bay. But that is not to be, Ed White and his cohorts are only interested in elevating the computer literacy of Tampa Bay. They, all members of the TPCUG, gave us a presentation of the program and goals at the last meeting and have followed up with progress reports via email.

Parts online I had recourse to order repair parts for a dish-washer and lawnmower in the past several weeks. At http://www.partselect.com, I was able to view a schematic of my GE dishwasher to get the part and had it within two days by ordinary delivery since it was coming from Jacksonville. The mower part was for a 19-year-old Toro and is coming from

Minutes of the May Meeting

By Jim Purcell, Secretary, Tampa PC Users Group
Edward_J_P@MSN.com

Bob LaFave opened the Windows SIG at 6:40 pm. In response to a question on how to identify unknown or unusual sounds that you are getting from your computer, Bob explained how to identify the commands that generate sounds. He said that the only way that he knew to identify a sound was to go through each command that is marked to emit a sound until you hear the sound that you are trying to identify. Ed Cohen said that he was periodically having very poor performance and he could see that his hard drive was running constantly. Bob indicated that this was often caused by poorly-written software that does not release resources when you exit the program. If this is the case, it can usually be rectified by rebooting your machine. The Windows Task Manager provides some information on what is using the resources, but some of the things, such as updates running in the background, cannot be detected.

Todd Grubb mentioned getting a popup telling him that they had detected a Trojan on his computer with a message to click on a URL to have it removed. He learned that they want to sell a program that will remove the Trojan. This initiated a discussion of various scams involving certified checks passed to you to pay for merchandise that you are selling online. Even though the bank is perfectly willing to cash the check, you are liable when the bank may later find (after you have delivered the merchandise) that it is a bogus check.

William LaMartin relayed a problem with electronic picture frames. Sometimes the individual pictures loaded in the frame become distorted. The problem is usually solved by erasing and reloading the pictures. Bob suggested that you keep the pictures in a group

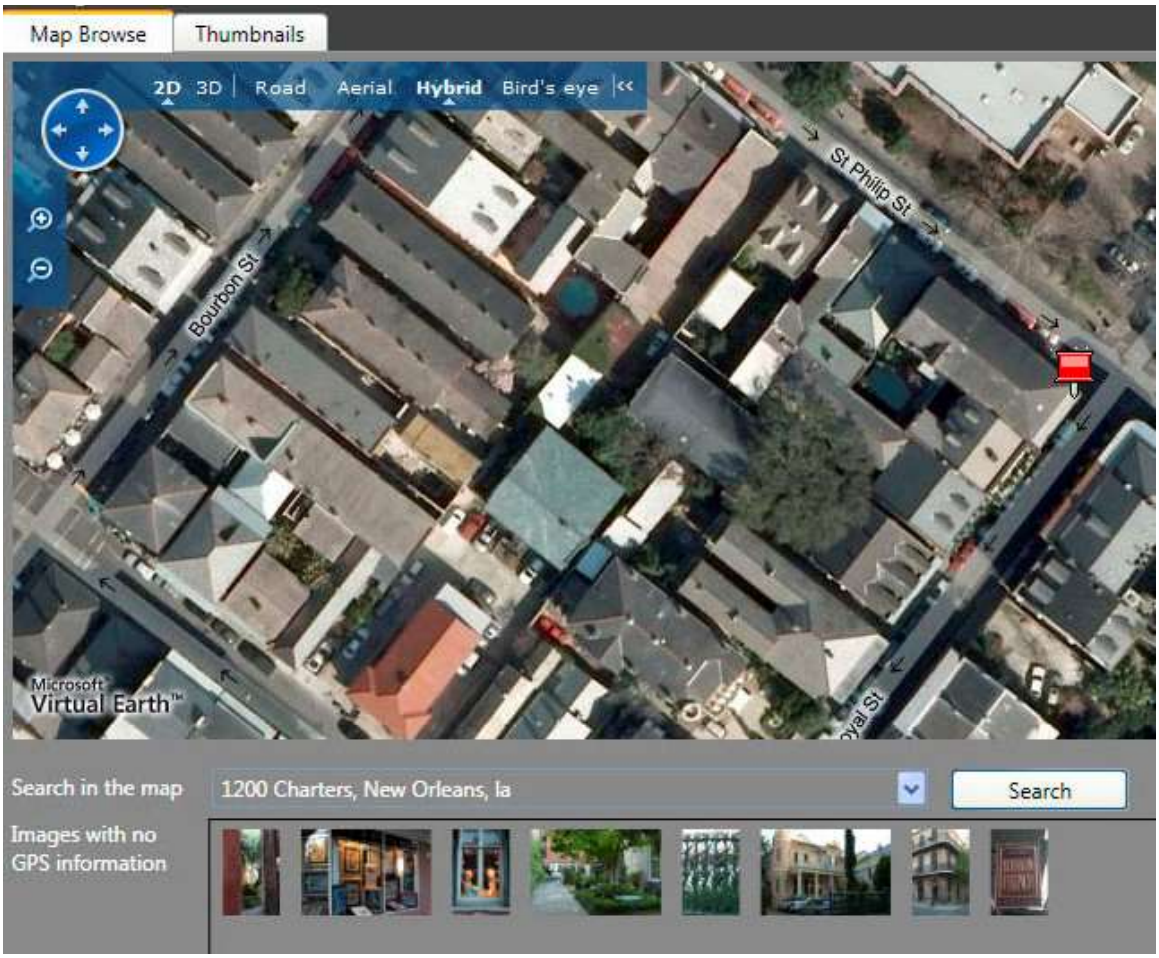
Microsoft Pro Photo Tools



By William LaMartin, Editor,
Tampa PC Users Group
lamartin@tampabay.rr.com

You can now record the exact location of those photos you took yesterday with your digital camera or even years ago with your film camera (and scanned into a digital file). That is, you can if you can pinpoint the location on an aerial photo. Microsoft has a new free tool named Pro Photo Tools that lets you enter meta data about an image, such as location, description, etc., in addition to any camera data that your digital camera automatically recorded, like the date and time and the camera settings. The big feature, though, is being able to write the longitude and latitude to the photo file's header of whatever point you indicate on an online aerial or map in the program, as seen in the screen capture on this page.

For those of you who work only with JPEG (.jpg) files, certainly the tool works with these files. I did a test and found that it also works with TIFF (.tif) files. Such information is stored in what is known as the header of the file, and writing this sort of information to the file does not affect the image portion of the file in any way.

The program can be downloaded at this very long URL: http://www.microsoft.com/downloads/details.aspx?FamilyID=3acbe51c-9d63-48ff-9614-5f30d76061b4&DisplayLang=en. And I thank Merle Nicholson for alerting me to it.

In the screen capture below, I am adding longitude and latitude information to each of the thumbnails at the bottom. This is accomplished by first finding the general location of your images on a map by zooming in from a world map or by putting an approximate address in the search box. Since I started by geotagging (as this is termed) on Charters St. in New Orleans, that is the address you see there. Once in the general area of the photo site, you zoom in until you can find the exact location you want. Sometimes switching to "Bird's eye" view will help in locating a particular building. Once you have the location for a particular thumbnail image, you right-click on the image and tell the program to set the GPS location for that image. It will put the red pushpin in the center of the map, and you can then

(Photo Tools……Continued on page 4)

(Photo Tools…….Continued from page 3)

position it more exactly where you want. Do this for each of the thumbnails (if you can find their locations) and then save the results and you are ready to geo-tag another batch of images.

The image I have tagged above is of the C C Coffee Shop at the intersection of Royal and St. Phillip in the French Quarter, New Orleans, La.

You might recall that I did something similar a couple of years back when I wrote an article about using a program I created for my PocketPC to record the longitude and latitude each time I took a photo. I then used that data to create a map in Microsoft Streets and Trips. The article with an accompanying map is at http://www.tpcug.org/acrobat_files/pcnl2006-06.pdf. Unfortunately I have misplaced the data used to do that, since it would be a great aid in finding map locations if I want to geo-tag those images.

What we are doing with Pro Photo Tools is different. The photos have already been taken, and we are then finding their position on a map and having the Pro Photo Tools program write that information to the files header.

So, what can we do with information? Well, we can create a map with a bunch of pushpins on it that records the locations of certain photos. I have done that for about 50 of the photos I have taken around my neighborhood in Tampa. The result is at http://www.oldhydeparkfl.org/HydeParkVirtualEarth/HPVEMap.htm. If you hover your mouse over a pin, it will provide you with information about the photo (just a description, time and date of the photograph, along with a little blue link to click on to see the image). A small section of that aerial is shown on this page.

This sort of aerial map is not part of Pro Photo Tools. To create such a map, you need to use Microsoft's Virtual Earth Map Control 6.1 (http://msdn.microsoft.com/en-us/library/bb429619.aspx). And, here comes the big thing—you need to be able to retrieve the GPS information from each of the photos you want to use. Of course, you could use the Pro Photo Tools to open each image and copy its longitude and latitude and, if you wanted them, the date and time. This could get old fast. So, I wrote a program to extract such information for all such images in a folder and put the information into an xml file in the form that Virtual Earth likes to find it. Below is what the entry for one particular image would look like:

```
<item>
    <link>http://www.oldhydeparkfl.org/
    HydeParkVirtualEarth/images/DSC_0567.jpg</
    link>
    <title>Spiral stairs on Inman</title>

    08T15:34:21.80-04:00</description>
    <geo:long>-82.4719673395157</geo:long>
    <geo:lat>27.9360691931094</geo:lat>
</item>
```

If you view the source code for the page in question, you can see the JavaScript that produces the map. This uses Microsoft's map control. A similar thing

(Photo Tools…….Continued on page 6)

(Comments……..Continued from page 1)

http://www.partstree.com in Austin, Texas. I was not so lucky with a Stihl brush cutter since they do not allow their parts to be sold online, as best I can tell. Additionally, I also ordered a toner cartridge for my 13-year-old HP LaserJet 4 Plus printer from HP with free next day FEDX shipping (of course, at $104 they can throw in free shipping). And it is not as if I am taking business away from local stores. Home Depot has about run out of business all the small, independent places that used to sell lawn mowers and their associated parts. And good luck finding a toner cartridge for a 13-year-old printer locally. I suppose, though, with a bit of phoning around, I could have gotten the dishwasher part.

The Internet is a real handy thing, isn't it?

Geo-tagging In another article in this newsletter, I write about adding longitude and latitude information to photos you have taken. Microsoft has supplied the free program, Pro Photo Tools, to do this. You can even geo-tag a photo taken many years ago if you scan it into a digital file. I am sure if you have a photo of your parents standing in front of the Empire State Building, you will have no trouble finding it on the map in Pro Photo Tools and thus be able to tag the image.

In fact, you would be doing a great service to anyone to whom you might be passing these photos in the future if you provided, in addition to a geo-tag if such is possible, a description and other information using this program. That information will then stay in the header of the image file—unless deleted by some renegade image-editing program—for future generations to view. ◆

(Minutes……..Continued from page 2)
on a flash drive so they can be quickly reloaded. He mentioned that there is a free Microsoft Flash Drive manager that helps manage various types of backups with flash drives.

Bob and Merle Nicholson discussed using PDF writers to copy web pages. The Scansoft program was mentioned as a reasonably-priced program that will do most of the things that the Adobe program will do. There are also several, with less features, that are free. They mentioned pdf 995 and .PrimoPDF.

John Witmer began the business part of the meeting at approximately 7:05 pm. He introduced the night's presentation by TPCUG members Ed White, Ed Neugaard and Juan Romero. As covered below, they described a corporation that they have formed, "Elevate Tampa Bay Inc". It is modeled on a similar program successfully implemented in Miami, FL, and was explained by Ed in an article in last month's newsletter.

John advised that the program for June will be a presentation by the Verbatim company representative, featuring various Verbatim products. [Now moved to a later date]. The July program will be a presentation by Kevan Sheridan. The subject will be announced later. The August through October presentations will also be conducted by TPCUG members. John mentioned that some of the members' dues are in arrears. He reminded everyone to look to see if the box is checked on their newsletters indicating that their dues have not been paid.

William LaMartin reported that the HTML online TPCUG Newsletters are now available in English, Spanish and French. He requested that members fluent in the French and Spanish languages review them for accuracy since they were translated by a computer program.

Ed White began his presentation with a discussion of the history of the Elevate Miami program. He said that he was first alerted to the Elevate Miami program while reading Microsoft web pages. He ran across a Microsoft press release from both Microsoft and the City of Miami as partners in the program. He was impressed with the extent of the program, which he said was probably one of the greatest training programs that he has ever seen. It is available in many languages, including English, Spanish, German, French and Japanese. In addition to the two TPCUG members mentioned above, Ed was accompanied by USF Professor Emeritus William Blount and by Ray Burris, who is a resident of the University Village retirement community and is active in current training programs at that facility.

Ed contacted Microsoft's head of their Department of State and Local Governments, who spent a great deal of time discussing the program and then directed him to James E Osteen Jr., Assistant Director of Information Technology for the City of Miami. Ed contacted Mr. Osteen and then traveled to Miami. He got a royal welcome from Mr. Osteen and the City of Miami officials during his two-and-a-half-day visit. The program is off to a roaring start, as Ed and his crew already have 40 loaned laptop computers to start the program.

The meeting closed at 8:23 pm. ◆

(Photo Tools……..Continued from page 4)
could be done using the mapping ability provided by Google. Google and Microsoft are competing in mapping. I like the Street View that Google has for some cities like Tampa, and I like the Bird's Eye View that Microsoft has for even more cities. And both allow you to customize their maps that you put at your web sites.

Get Microsoft's Pro Photo Tools and start geo-tagging.

Using this program got me to thinking. Possibly I could create a web-based application that would allow you to locate a place on a Microsoft Virtual Earth map, select it, say, with a double-click, so that its latitude and longitude are recorded, enter some sort of description in a text box, and, at the press of a button, store this data in a database. Then I would create a companion program to open the database and put pushpins at all the locations you had geo-tagged such that when you hovered over a pin with your mouse, the description would be displayed. Think of it sort of as a display of all the places in the world of special interest to you for some reason. ◆

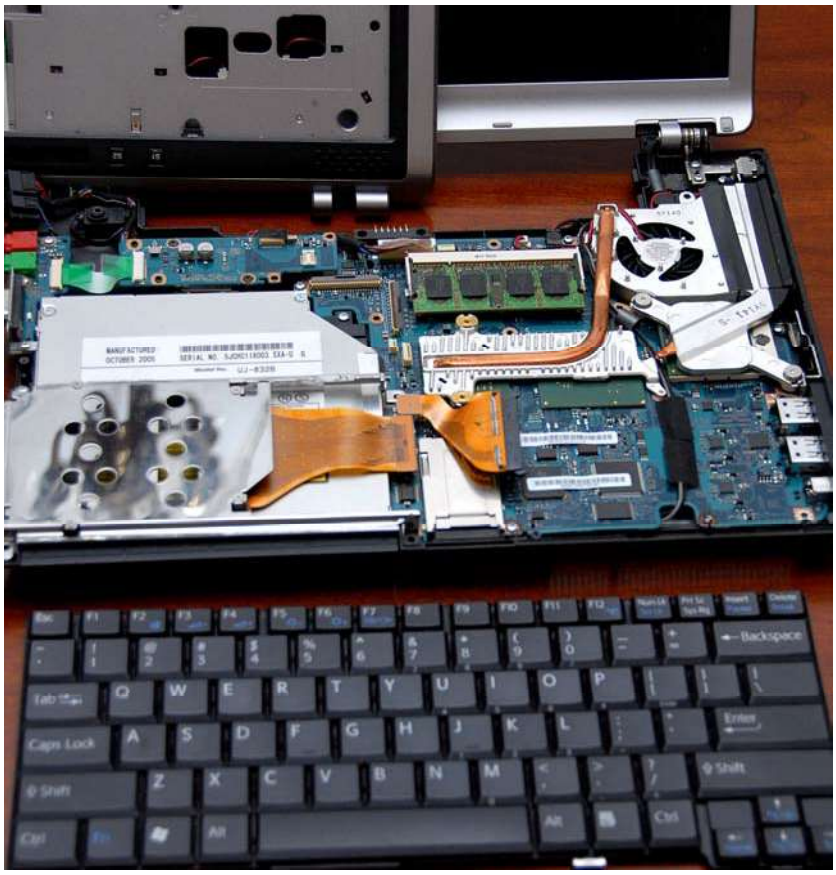
Do It Yourself Hell

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

A very nice two-and-one-half-year old Sony VGN-S560P laptop was destroyed recently by an improperly-performed memory upgrade. So let this story be a warning to all you amateur computer technicians.



The owner of the laptop complained about the increasingly slower performance of the machine, so a friend suggested adding to its memory. Now there are really only two things that the non-technician can do to a laptop—add memory and sometimes replace the hard drive depending on how accessible the drive is. In the case of this particular laptop, the drive is not easily reached. But the friend was only going to add memory, and the slot for that was easily accessed from the bottom of the computer.

Compatible memory was kindly purchased by the friend, who easily installed it, replaced the cover of the memory compartment on the bottom of the computer, and reinserted and tightened the securing screw. Then the repairman and the owner watched expectantly as the power button was pressed, but nothing happened. After several more tries to boot the computer with the power adapter attached and unattached, it was decided to remove the new additional memory. Perhaps it really was not compatible. After the removal, still no boot. The computer appeared to be dead.

Well, it was time to go to a computer shop where, after several days, the report came back—a fried motherboard, probably caused by overheating caused by a dust ball in the computer's fan. And it would cost $500 or $600 to replace the motherboard.

Now, I suspect the computer store was just trying to make the customers feel good, since I am 90% sure the reason the motherboard got fried is that proper procedure was not followed in installing the additional memory. You must remove the battery from the laptop before working on it. That was not done, and, in my opinion, was the cause of the problem. And, at

least as regards the Sony, you are told to do this if you read the owner's manual supplied as an Acrobat file. Of course, no one reads such things.

So, the laptop ended up with me, to get the data off the hard drive. I got the laptop halfway apart, but there were two or three screws in the middle that I couldn't get to. They were under the keyboard, and I needed an online video to show me how—Sony certainly provides no information on this. For my Gateway laptop, it was easy to remove the hard drive. This one was quite complicated. The video link, provided by a very helpful person, is http://www.metacafe.com/watch/377396/how_to_replace_hard_drive_on_sony_vaio_vgn_s260/.

The photo above is the disassembled Sony VGN-S560P (PCG-6H4L) laptop minus the hard drive, which at that time was having its data transferred to one of my USB external drives using an USB hard drive adapter. The drive normally attaches to the right-most ribbon cable in the picture. RIP. ◆

Minutes of the June Meeting

By Jim Purcell, Secretary, Tampa PC Users Group
Edward_J_P@MSN.com

The windows SIG began at approximately 6:30 pm. Bob LaFave discussed the various options available when you run more than one monitor from your graphics card. He also discussed the options available in Windows XP versus Vista.

There was a question concerning the management of updates. One member reported that Microsoft attempted to download an update that was already installed on his computer each time he booted the computer. Bob said that he should first look for the update in "Add or Remove Programs" in the Control Panel and, if this is not successful, check the knowledge base to see what other people are doing under the same or similar circumstances. Bob mentioned that he liked to remove the updates from his hard drive once they were installed. This reduces unnecessary files on your hard drive but also removes the records that would easily identify which updates were installed. Bob detailed his reasons for deleting these files and any others on his hard drive as soon as he finds that they are not needed. He felt that the benefits were worth the risk but some members were not eager to take the risk. William LaMartin indicated that he was having trouble with a browser window opened as a link and resized. When he closed and later reopened the link, the window it appeared in was its original size rather the size that he had created. Bob detailed the process necessary to have the window reopen in the newly created size.

John Witmer opened the business portion of the meeting at 7:40 pm. He introduced the visitors and mentioned that Steve Singer, a yearly presenter to our group each fall, was present.

John asked Ed White to provide an update on his program. Ed advised that they had met with members of Mayor Iorio's staff and that it appears the City of Tampa is going to actively support the program. They are scheduled to have future meetings at the Barksdale Senior Citi-

Vista – I don't hate it

By Merle Nicholson, Tampa PC Users Group
merle@merlenicholson.com

I have some observations on the usability of Vista, and a few recommendations. You may find this useful if you've found yourself in the position of needing a new PC and are hesitating because of all the bad press – and Apple commercials. I think the dust has settled; the drivers we need are there now; SP1 is out and we're ready to go.

First – the bad press about Vista. We have to keep in mind that readership is kept higher on bad news instead of good. Some of the bad news was based on pre-release copies of Vista; also on pre-version SP1. The Vista SP1 release, I think has changed Vista substantially. Also, remember that many, many newspaper and magazine writers use Macs and really spend a lot of time just repeating other writers' bad news. As for Apple, remember that they have about 4% of the embedded market of one billion PCs. Apple's PC sales have gone way up since the iPod and iPhone, but that's relative to where they were, and it's still insignificant compared to the numbers of PCs.

Apple makes a high quality, high profit PC with a variation of Unix for an operating system. But it's not faultless at all. Yes, there are fewer viruses and malware, but the OS is constantly being patched with security updates. Apple does, however, bundle fixes together in single releases less often, making it hard to make comparisons.

For the manufacturers of PCs and peripherals, and for the entire software industry and for Microsoft, the real problem is that there are tens of thousands of PC components that can be used and there's no way to predict what combinations will be used in any given PC. Every piece of hardware must have a driver, and, in the case of the motherboard, six or so drivers. The "standards" that every component must comply with are decided by groups of people who are also competitors – with each other. It's a total wonder that anything at all gets decided. Hence the Blu-Ray/HD fight; and the Wireless-N standards debacle. Wireless pre-N devices have been available about two years, and the standard itself is still a year away from ratification. Man, what a mess.

With Vista, MS decided that they would make some major changes to the OS fundamentals to address security, in addition to adding features. That decision necessitated a new driver programming model. It obviously was a huge problem for Microsoft. After all, they had to track 12,000 new drivers and incorporate them into the DVD distributions. The documentation alone must have been a nightmare. But they have done this before; more than once.

One of the "bad" things that the press is repeating over and over again is that Vista will not work with older machines. And that's certainly sometimes true, but completely irrelevant. After all, my old machines (and I have four of those) already have a perfectly good operating systems in XP SP3. Why would I want to change operating systems now? XP will certainly outlast the hardware.

The next common complaint is that you need a very good graphics subsystem to run Windows Aero. Also irrelevant, in my opinion. Aero is one thing I tired of quickly, and, for the sake of performance, I have turned Aero off, along with the taskbar thumbnails, Sidebar and transparent windows. I want to maximize my efficiency and get rid of unnecessary distractions. I rarely have more than a couple of links on my desktop, and no wallpaper. It certainly was not a hard decision to do this on my notebook, because my notebook, like most, has a tendency to have weak graphics systems.

So far, I've purchased one PC – an HP/Compaq Presario notebook, and then I configured my personal/business computer with Vista three times. The final configuration that I'm now using exclusively is Vista Business 64.

I'll lead you through a few details on my progression through installing Vista. I certainly learned a few things along the way.

My PC now has the most powerful two-core CPU that AMD makes. It's also inexpensive. It has a decent but inexpensive ATI x1650 graphics card. It has a SAS hard drive controller and two disk systems; one is the fastest on the planet. And after installing the 64-bit OS, I increased memory to 6GB. I built the PC case myself so that most of the components are readily accessible without de-cabling or even moving it.

I started with a working Windows XP Professional OS on the fast drives, completely configured, that I used for my essential office PC. I then cabled up one or two of three 80G hard drives I have to build my new Vista OS. I used the BIOS Boot menu to select the drive to boot from, so that I could continue my business on XP, and, when I had time to work on Vista, all it took was a reboot. All my data and documents, including My Documents and the

(Vista……..Continued on page 4)

(Vista…..Continued from page 3)
Outlook data, are on a larger, second set of hard drives and then backed up daily across my network.

The 32-bit Vista I have is Business Upgrade. On Vista Upgrade DVD's, it must be run from an existing qualifying WORKING system. Remember that on earlier systems you could insert a qualifying CD to continue and install the update on a blank hard drive. You can no longer do this. On one of my 80G hard drives I had a backup copy of my main XP system, so I duplicated it to another drive, booted that and then ran the Vista DVD. But first I uninstalled a lot of software and drivers from XP.

The install went very easily and quickly without any issues, taking less than an hour. You do not have an option to reformat the drive, obviously. And you have plenty of time to activate the copy before it goes into a "reduced functionality" mode. It's important in case you have network adapter problems and can't get to the Internet to register.

I had no real driver issues, much to my surprise. I did this before SP1, so I had better than ninety updates to do. The big surprise was that Vista recognized my LSI Logic SAS hard drive card, identified it perfectly, and both sets of hard drives were accessible. I kind of slowly installed software and experimented with it over about a month, migrating the installation toward using it as my primary system. Then I started finding discouraging not-good things. There was just too much junk left in the way of XP programs and drivers that just did not work. Some were impossible to get rid of, like my old scanner software. I was not happy with it, so I needed a better approach.

The second time around, I used another unused XP CD and license and wiped out the previous attempt. Then I validated and registered the XP software with Microsoft. I did no driver updates, and even deleted some drivers like the video, then rebooted back in, canceled out any attempts to install drivers, put the Vista Business (32) DVD in and started the Vista installation again. This time the results were very much cleaner. I had no driver issues, although I did not install all my printers or my old Canon USB scanner. I did discover newer versions on manufacturers' websites, like the ATI video card. All in all it was very satisfactory. I did some tuning on the system for performance. Over some time, I slowly installed software from scratch, with the idea that I would switch over permanently sooner or later. I would go back to booting my XP system whenever I wanted to do my real work until Vista SP1 was released.

To me, SP1 changed everything. It installed in about twenty minutes and with no problems. For some reason, the computer seemed to run a bit more quickly. They added about 2,000 drivers to the update. So that encouraged me to try out Vista Business 64, as did the positive experience with Vista 32.

The main reason I wanted to try Business 64 was because of a Vista feature called SuperFetch. SuperFetch loads – and keeps – portions of your most commonly used programs in memory for re-use. It collects your program usage frequency to decide what to keep. With Windows 32 of any kind, there is an upper limit on how much memory is recognized; about 3.5 GB. With 64 bit, usually the limit is what your motherboard will allow. In my case that is 8GB. I increased the memory to 6GB, and I'll probably eventually go to 8. So, with more memory, there's more SuperFetch, and it seems to make a difference.

My copy of Vista Business 64 is a full version, so I didn't have to install over a copy of XP this time. I did install to one of the 80 GB extra drives though, so I could continue to boot into XP. After installing SP1 for Vista 64, I updated just a few drivers, ones for the ATI video card and the motherboard chipset. Three of my four networked printers installed from the Vista disk. For the third, a Canon i850 I bought in 2003, I obtained a 64-bit driver from Canon. I did have problems getting a PDF printer installed. When you're looking for software, very often the OS support includes Vista. But that doesn't mean it will work under Vista 64. I installed three of these before I settled on CutePDF. The installation failed, and I went to the website FAQ and got a manual installation instruction which worked well.

The next hurdle was for a DVD package. I've tried to stay away from the later copies of CD Creator and Nero because the installations have gotten so big with attempts to supply everything, including search and cataloging databases, video editing and even browser toolbars. I was pretty discouraged trying to find a Vista 64 package, until I finally decided to install the latest copy of Nero. They offer a trial-period free version, so I downloaded and installed it, being very careful to un-check as much crap as I could. And – drum roll – it wouldn't even start. Just an error message. Bob LaFave had suggested a free program called StarBurn. I had downloaded it a month before and then forgot it. Once found and installed, it's perfect. It has a simple one-window interface for all CD & DVD

(Vista……..Continued on page 5)

(Vista…….Continued from page 4)
creation.

About three weeks ago I had enough software installed that I could function pretty well in Vista 64, so I backed up the XP SP3 on my main boot drive and cloned the 80G Vista drive to it. I've been very slowly installing more software as I need it. The performance is excellent. My most used software just pops up to the desktop instantly. Internet Explorer, any Office product and my various data/text editors all are at least as fast as my XP, if not faster.

All of my other hardware is working well; the only exception is the Canon USB scanner that I have no hope for. I've simply moved it to another computer. I have a multi-function HP FAX/Scan/Print/Copy device that just installed transparently, as did the networked Brother Laser printer. My old (2005) Dell PDA x50V was recognized instantly and the driver installed automatically. I had sporadic problems with the Vista Sync Center's understanding that the PDA needed to be automatically sync'd until I found a later version of "Windows Mobile Device Center" to download and install. Sync'ing to devices is very much improved over XP.

I think I can attribute the very good performance of the system to having plenty of memory. I bumped my Vista 32 notebook memory to 2.5 GB from 1 GB and the program loads were very noticeably faster.

Now the two things I don't like. I dislike Windows Explorer (File Manager), and I LOATHE the Start Menu. I've used Windows Explorer enough that I can use it when necessary, but I don't like to. I think the Windows XP Windows Explorer had the right idea; it just needed better file search and filtering. I've installed a copy of FreeComander and use that whenever I get serious about finding, copying and moving files.

(Vista…….Continued from page 5)
The Start Menu just sucks and there just doesn't seem to be anything I can do about it. The problem is that the organization of the menu utilizes a tree structure, and the menu has no tree structure. There is a "Classic" menu that I could switch to, but why does the "Classic" version have to look like Windows 3.1? To counter the Start Menu, I've created a pop-out Toolbar on the left screen edge with all my installed program icons on it. This, along with the Quick Launch toolbar, meets my needs very well. I only rarely use the Start Menu.

Overall, my transition to Vista has been worth the effort. I do not have any problem with it that I'd consider a handicap. The response is excellent when tuned for performance and memory is installed to the maximum. I would not recommend buying any computer with less than 2GB installed or upgraded. Fortunately, even inexpensive notebooks commonly have 2 and 3 GB memory. I do not recommend upgrading any PC from XP to Vista.

and look to the right side where you'll see other subjects in the series on Windows Vista. ◆

(Minutes…….Continued from page 2)
zen Center. This is the place that the city parks department wants to use for training Tampa students.

John mentioned an exchange of emails with Parker Monroe from the Greater Tampa Bay PC User Group in Brandon. Doug Mullis initiated the exchange, hoping to work out some program to share or exchange speakers between our organizations in view of the increasing difficulty in getting significant or meaningful vendors to provide speakers to PC user groups of our size. John asked for members who are willing to make presentations to our group and speak at Brandon to contact him so that we can accumulate a list of volunteers. He said that the Brandon group normally had about the same number of attendees as we have but will sometimes have as many as 70 members show up for high interest presentations. This will probably be pursued after the end of the year since we seem to have our presentations lined up through the end of this year. The July presentation will be on Trend Micro.

John began his presentation on PowerPoint with an overview of the types of things that he would cover and a discussion of the information presented in some of the available training programs. He also provided a training outline that lists commands and the instructions on how to access them, as well as operational and navigational shortcuts.

He had numerous examples of presentations, some provided by the presentation experts from Anheuser-Busch and some smaller presentations prepared for a single subject. He demonstrated the different ways to review or examine the content and organization of the presentations. The lesson learned is that PowerPoint is an extremely versatile program. It provides a simple way for the amateur, without an unreasonable amount of effort, to put together a professional presentation which clearly portrays the points that he wants to convey. John played a presentation prepared on PowerPoint by his 11-year-old grandson which clearly emphasized this point. On the other end of the spectrum, he illustrated how the issues, data and graphic information already produced (in Access, Excel and Word) can be easily reformatted and molded into an elaborate presentation and accentuated in many different ways to best present and emphasize the details that you are trying to convey. The data in these Microsoft documents can be linked to the PowerPoint presentation so that, when the data is updated in the documents, the PowerPoint presentation will be automatically updated. John also showed an example of PowerPoint being used to document personal belongings to assist in preparing an insurance claim in the event of a catastrophic loss.

PowerPoint is a very versatile program that meets the needs of the most casual or the most demanding user.

The meeting ended at approximately 8:40 pm. ◆

Are CD's and DVD's A Reliable Place To Store Your Data? – Revisited

By Jim Purcell, Secretary, Tampa PC Users Group
Edward_J_P@MSN.com

About a year ago, I wrote an article on the reliability of CD's and DVD's for medium or long term storage of data. There seemed to be no real way of predicting whether the discs would store data that could be accurately retrieved a

LinkSys Wireless-G Game adapter WGA54G

By Merle Nicholson, TPCUG
merle@merlenicholson.com

This wireless game adapter proves to be useful as a PC wireless device. It's really intended to connect Playstation 2, Xbox and GameCube game consoles to a wireless network, or alternately using two units between two game consoles. Its main claim to fame is that it requires no additional network drivers.

I used it to connect my spouse's PC to the household wireless network. That PC has been connected satisfactorily for many years, but something has been going amiss; probably dropping in and out, causing her web browser to fail to produce web pages. I was never able to nail down the real problem. It was using a NetGear USB wireless unit on a three-foot USB extension. This is just a small "dongle" that I have used many times before. I had some evidence that the problem may go away if I moved the dongle to another location about three feet away. But I really needed to solve the problem conclusively.

This unit, as you can see, is small; less than seven inches in length. It has two ports, power and Ethernet. The power cube is very small, and it comes with a generous Ethernet cable. So all you do is power it up and connect the adapter's Ethernet port to the Ethernet port on the computer.

To configure this adapter, you run a program from the included CD. This does not install anything on the PC. It does allow you to set a few things necessary to connect to your secured network. You set the SSID and security code of the router you're connecting to using the CD's software. I also set the unit to utilize DHCP instead of having a fixed IP address so that it obtains an address from the router. All this takes about three minutes. After that – it just works.

This is a very good alternative to the usual solutions to connect a PC to a network. It assumes that your PC has a working network connection, of course. But you don't need to install a card in the PC, and it doesn't need a USB port that may be in short supply on a notebook, and it doesn't need a driver. At $70 it's the most expensive. But on the other hand, it's the least technical solution. It works, and works well, and is easy to set up. ◆

(CDs…….Continued from page 6)

few months or years in the future. I focused on the MAM-A Corporation for several reasons. I attended a digital photography seminar conducted by staff members of the National Geographic Traveler magazine and they indicated that MAM-A Inc. produced high quality CD's. Next, a Photoshop instructor, who is a professional photographer in St. Petersburg, stated that he tried to retrieve some photos that he had recorded on a CD only five years earlier and he was unable to recover a single photo. He emphasized the importance of getting quality CD's and also recommended MAM-A Inc.

I'm doing this follow-up article because of information that I received when I attended a presentation by Bill Baillie, the representative for Verbatim, at the recent FACUG meeting. Bill stated that the life expectancy of Verbatim CD's and DVD's is in the 200 to 300-year range. I visited their web site to get the details of the warranty and was surprised that I found no mention of the 200 to 300 years that Bill reported. I had Bill's phone number so I called him. He stated that they do not put

those numbers in writing because there is obviously no way to prove them. Bill said that the figure is the result of their testing and a projection of the results and is their best estimate. While on the phone, I discovered that Bill makes presentations to PC user groups so I passed his name to Doug Mullis. Doug then made arrangements for Bill to make a presentation to our group. Bill has had to postpone several times but we hope that he will be able to visit late this year. Although CD's and DVD's are only a part of the many Verbatim products that Bill will discuss, I thought that a review of the information might bring to mind some questions to which Bill can give us educated answers. Their informative web site is at: www.**verbatim**.com/

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

Most of you probably have a digital camera, and a few have moved up to the SLR-type digital. I am also sure almost everyone has boxes of photos and the attendant negatives you have taken over your lifetime. What to do with these new digital photos and the old film ones?

In my presentation at this month's meeting, I am going to try to answer that question and along the way introduce you to a couple of new programs that are currently free from Microsoft. Of course, any discussion of digital photography has to also include Adobe's Photoshop. Then there are the programs from Microsoft that I have used for years that are not free. I have enough material on this to do several presentation, and the job for me is going to be winnowing it down to the allotted time and presenting it in a nontechnical way.

Minutes of the July Meeting

By Jim Purcell, Secretary, Tampa PC Users Group
Edward_J_P@MSN.com

Bob LaFave opened the meeting by starting the Windows SIG at 6:35 pm.

A member had a problem with his wireless connection. Bob went through all of the things that might possibly be causing his problem.

Another member had lost use of Office 2007. After a discussion of the conditions that she has encountered, Bob determined that the program had not been installed after she purchased the program and received the key to convert the trial version that came on her computer. He also mentioned that she might use the Microsoft Complete Uninstall routine if the normal installation procedure does not work after a normal uninstall. He recommends a complete uninstall of the trial version if you buy a new package that may or may not be the same version as the trial version.

Bob mentioned that the "Lost.FM" site was a good source to find music and artists. It has an easy to use and versatile search program that allows you to quickly find practically any artist or song. Bob also recommended "Total Recorder", a program that he has used for several years, that allows you to record practically anything that is playing on your computer.

There was an extended discussion about the provision of free antivirus programs by Verizon and Roadrunner compared to the antivirus programs available commercially from a variety of vendors.

John Witmer, our president, opened the business portion of the program at 7:20 pm. He mentioned that

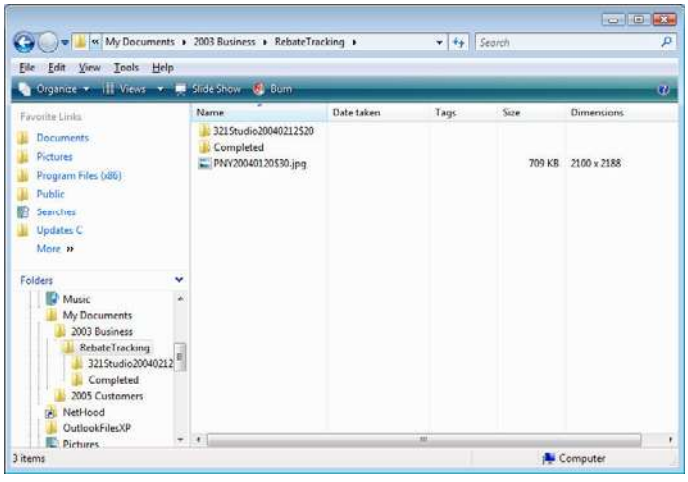
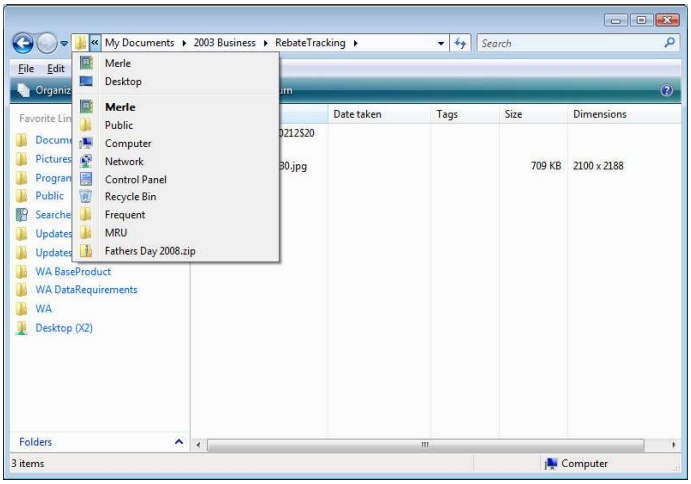
Vista – It's Growing on Me

By Merle Nicholson, Tampa PC Users Group
merle@merlenicholson.com

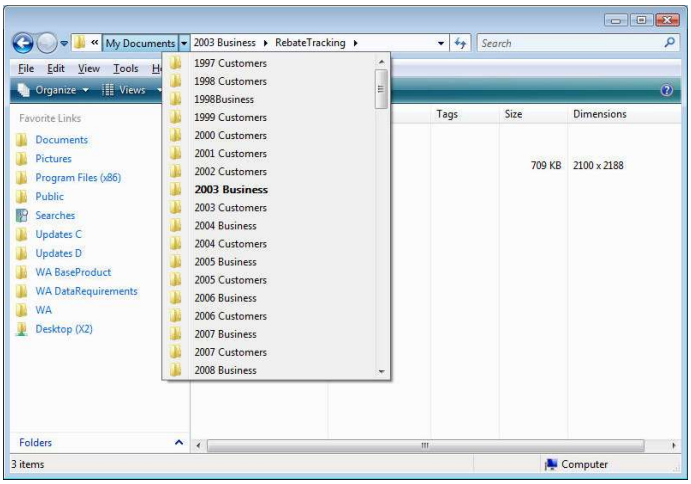


OK, I'm beginning to like this Vista thing. For the record, I have Vista 64 Business installed, tuned for performance. That turns off most of the gee-whiz graphics, including Aero, the taskbar thumbnails and the gadgets/widgets.

Last month I declared that I disliked the Start menu and Windows Explorer. I haven't changed my mind about the Start Menu, but I have mitigated it some.



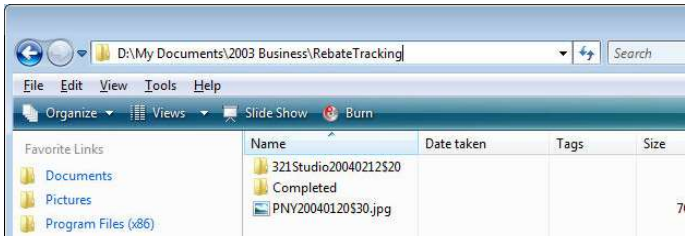
Windows Explorer
I have, however, changed my mind about Windows Explorer. I now think it's an improvement over the traditional old tree structure that goes back to Windows 95 and Norton Commander for Windows 3.1.



I may keep the Free Commander file manager (http://www.FreeCommander.com and no relation to the old Norton Commander), but I find I'm using it less as I gain experience with Vista's Windows Explorer.

With Vista's Windows Explorer, I was trying to make it fit into my old XP paradigm instead of looking at it as a new approach, starting with the Navigation Pane on the left, having two sections, "Favorite Links" and "Folders".

Where I made my mistake: I was depending on navigating the Folders and hating it – for good reason. So I've stopped using that and closed it so I have more room for Favorite Links, and I'm using the drop-down folder listings in the Address Bar to move around instead.



You can see the result above. I've added useful Favorite Links that satisfy my needs about half the time, and I then navigate using the drop-down folder lists from there. Unfortunately, you cannot eliminate the Folders section altogether, but at least you can shove it to the bottom.

For the times I need to copy and paste a path, I just click in the Address Bar and it automatically turns into something you can cut and paste. See below. Also, the in-context menu that you get when you right-click a file changes by holding down Shift. It adds a few items. One is "Copy As Path." Right-click on a file holding shift down, select "Copy As

(Vista……Continued on page 4)

(Vista…….Continued from page 3)
Path," and the entire pathname is sent to the clipboard.

The right-click+Shift also adds "Pin to Start Menu" and "Add to Quick Launch". You get different in-context menus, depending on the file type. For picture files, "Rotate Clockwise" and "Rotate Counter-clockwise" and "Set as Background" are on the menu.

There's a Search Bar at the top right that filters, showing only the file names that fit the search. It looks inside all files for the text, the filename, tags and file properties. The search is limited to the current folder and all its subfolders. You can search only the filenames by typing "Name:" as a prefix as in Name:flower. There are a great many advanced queries available, such as date range or size range (size:>=50 <= 70). There's too much to cover on this subject, but the built-in help is extensive and well-written. Once you're used to it, it works very well, and is exceptionally fast.

There are a couple of other features, like the File Viewer, which I find pretty useless, since, as far as I can tell, it works only with Text files. Office files launch the full Office application anyway, as well as Adobe Reader for PDFs and Windows Photo Gallery for pictures.

In Detail view, there are other ways to organize the files in addition to sorting by columns. You can Sort By, Group By and Stack By. If you Stack by Modified Date, you get all the files stacked in time categories like "Today," "Earlier This Week," "Last Week," "Earlier This Month," "Earlier This Year" and "A Long Time Ago." Each stack contains the files fitting that stack criteria.

Start Menu
We'll cover this next month.

Other Subjects
Vista Screen fonts: Screen fonts are handled differently in Vista, apparently. They are crisper and easier to read than XP. Cleartype is a part of the installed features. It was an add-in in XP. But even considering Cleartype, Vista fonts are even better. It's an unexpected bonus.

Networking and accessing network files
This is a subject for another article, but I've found attaching to shared folders on my network from Vista is very much quicker and more responsive to navigating. It's pretty easy. And I have not found locating Vista shared folders from XP machines any different. If anything it's faster. There were a lot of complaints prior to Service Pack 1. I experienced some frustrations myself. It seems to have gone away.

Windows Live One-Care
I have this on three machines, one XP, one Vista and my Vista 64. It's antivirus, anti-spyware, an improved firewall, automatic backup, scheduled tune-up and phishing filter. It's a bargain at $50 for three machines, in my opinion. I started the subscription eleven months ago, and I'll renew.

It's the most unobtrusive of any antivirus software I've seen. If it wasn't for my noisy hard drives I wouldn't know it's scanning. It detects that you have your machine in use and will slow down to make sure it doesn't interfere. There's a single interface program to pop up from the taskbar, and everything is located there in a well-organized manner. It will pop up and tell you when something isn't done on time. Otherwise it leaves you alone.

More next month. ◆

(Minutes……..Continued from page 2)

Kevin Sheridan, our vice president, would give a presentation on the Trend Micro Internet Security programs shortly. John also reminded the members of the importance of going through our web site for all of their Amazon.com purchases. The purchase is handled the same for your purposes as it would be if you went directly to Amazon.com. The price is the same and you take full advantage of any special prices or discounts that Amazon is offering, and your user group receives a percentage of the sale price.

Kevin opened his presentation by explaining the role of firewalls and of antivirus programs. He discussed the differences among malware (malicious software), viruses and spyware. The stated purpose of his talk was to make sure that everybody has something on their machine to provide protection.

Trend Micro's web site has information on each type of coverage that they provide. The three programs that Kevin discussed are: Trend Micro Antivirus Plus 2008, Trend Micro Internet Security Suite 2008 and Trend Micro Internet Security Pro 2008. Kevin covered the features and pricing of each of these products. He demonstrated and gave numerous examples of how the features of each worked. He concentrated on the details and features of the Trend Micro Internet Security Suite 2008. He ended his presentation with a discussion of the added security provided by "OpenDNS", which will stop your computer from going to unidentified sites. Members were also advised that when they use unsecured or public wireless "hotspots" that they should turn off file- and printer-sharing options on their laptop.

Vista Experiences – Summary

By Merle Nicholson, Tampa PC Users Group
merle@merlenicholson.com

If you'll remember from last month, I purchased an inexpensive middle-of-the-road notebook with Vista Home Premium and increased the memory to 2.5GB. Then, after trying out Vista 32 Business (while also using XP) on my main fast desktop computer, I finally settled on a Vista 64 SP1 Business version.

On both Vista systems, I tuned the system for performance, disabling all of the new graphics capabilities.

I haven't experienced any of the "bad stuff" that the press is writing about. The system I built for myself had no real driver issues. In fact, except for the not-surprising non-support of my old scanner and having to visit Canon for a printer driver for a 2003 inkjet, Vista 64 SP1 supplied all of the drivers needed off the installation DVD, including ones for a USB headset, a drive controller card, a Bluetooth Dongle and my old PDA.

On the purchased notebook, since it was delivered with Vista installed, it had no problems for me to inherit. I did remove quite a lot of HP CrapWare, almost none of which was actively bad, just slowing the computer down. It did have WildTangent, which, depending on your point of view, is malware in the wrong hands.

I found Vista networking very easy. I can share folders to other Vista and non-Vista computers and vice-versa. It works as well or better than XP. It's certainly more responsive.

Setup for Mail and Internet is routine; no real difference from XP. All my data is on a separate hard drive, so I didn't have to move much from my XP drive to Vista 64.

I've had no "Blue Screen" events or any unexplained program failures. The system is very "tunable", allowing me to turn off a lot of annoying (to me) graphics. But I was able to leave a few features that I enjoy, like ClearType, "smooth edges of screen fonts" and "use visual styles."

Aside from my personal dislike of Start Menu and Windows Explorer, I can find nothing much to fault. I do find file copying from one location to another using Windows Explorer disappointingly slow, but that's not a real impact on me. The automatic backups I do to a networked PC are very fast, as is Acronis 11.0.

You'll need to upgrade to Acronis 11 for Vista support. A very surprising amount of 32-bit software all runs transparently. I did obtain a couple of replacement programs for Vista 64, but all were free anyway. So far, except for the Acronis 11 upgrade, I've not spent any money for software.

One peculiar thing is that Vista 64 has two IE 7 browsers, one is 32 bit and the other 64. Of course, no ActiveX or any other browser add-in will work on the 64-bit version, even Adobe Reader. I haven't yet found out how I get to one or the other.

I find the system very fast, fairly quick to load (58 sec after POST) and to shut down (28 sec). Applications like MS Office, IE 7, FTP, Acronis and Delorme Street Atlas all load pretty much instantly, somewhat faster than XP. I attribute this to a large amount of installed memory and Vista SuperFetch. I haven't timed the notebook, but I do know it's acceptable. Naturally, I set my expectations low when it comes to an inexpensive notebook.

I do have a wish list for Vista, but it's not large. I would like to see file copying improved. I would like some alternative desktop themes. Mainly I'd like to get rid of the black Start Bar, and I'd prefer the cascading Start menu of XP. The "classic" desktop theme should not be Windows 3.1. The Vista file Dialog box has some interesting features, and there's more there than meets the eye, but I think it operates on a pretty superficial level, aimed at novices. I'd pay money – today – for an improved desktop theme that does not call for replacing a DLL with one from XP. ◆

This SIG meets the **third Wednesday** of the month at 6:30 PM. The meeting location varies. For information, contact William LaMartin at *lamartin@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Bob LaFave moderates the discussion.

(Comments……..Continued from page 1)

The programs that I will feature are

- Adobe Photoshop
- Adobe Illustrator (only a brief mention)\
- Microsoft Pro Photo Tools (free)
- Microsoft Deep Zoom Composer (free)
- Microsoft Visual Studio 2008
- Microsoft Access

Somewhat of a strange collection, you might think. What do Microsoft Access and Microsoft Visual Studio have to do with photography? The Access answer is easy: I created an Access database to record the file name, date, location, etc. of each of the images I have scanned in from either a negative or slide. I am probably halfway through scanning in all my negatives and slides. I have scanned almost all of the oldest ones (that is important since they are losing quality). That amounts to 8,585 scans; however, of that total, I have only catalogued 5,137 in Access.

Then there are all the digital photos: 3,890 taken with my first digital, the Canon G1; 6,482 taken with my Nikon D100 digital SLR; and 2,315 taken with my newer Nikon, the D200 digital SLR. With the digital files, I can use either Photoshop or Microsoft Pro Photo Tools to add a description and location to the EXIF information in the header of the file. And I have been doing this for my more recent photos. With Pro Photo Tools, if you can find the location on a Virtual Earth map, then you can include the latitude and longitude of the location in the image file simply by clicking on the map at the location.

But what to do with this information in the header of the image file? There are programs that let you view it, Photoshop being one, but how can you make use of it? That is where the programming comes in. I have written various VB.Net programs to extract this EXIF data from the image files so as to retrieve the title and description (which I put there, usually with Photoshop), the date (which the camera put there) and the latitude and longitude (which I put there using Pro Photo Tools). I can then either add this information to my Access database of photographs or I can use it to create pushpins on a Virtual Earth map, where for each pin there is an associated photo.

I have touched on these ideas before in the newsletter. In the presentation, I am going to go a step further and show you (leaving out some detail) how this is done. You will be able to do the geo-tagging of your photos, that is adding latitude and longitude with the free Pro Photo Tools using no skill other than being able to find on a map where you took a photo. You can also use this program to add a title, description and much more. So, unless you use some renegade program (one that destroys the EXIF header info) to edit the image files in the future, all that information will stay with the file indefinitely.

In closing, I believe some thought should be given to how you preserve your images. In theory, digital files should last forever. However, that does not take into consideration failing hard drives, lightening strikes, gamma rays and people who don't care.

You can protect your files against failing hard drives by saving copies of the image files to more than one hard drive. You can protect against lightening by making sure the other hard drive is an external one and

The raffle conducted at the end of the meeting earned $24 for the group. Jenny Lind Olin and Jeanne Gillespie each won software, and Merle Nicholson and Ed Cohen each won a T-Shirt.

The meeting ended at approximately 8:35 pm. ◆

(Comments……..Continued from page 7)

that it is kept totally unplugged from anything when not in use. Of course, you can also save copies to CDs and DVDs. As to the gamma rays, I don't know about that, but we are bombarded with them all the time and we are still alive.

The people who don't care are a harder problem. It is quite possible that when you pass from this earth, your descendants will simply throw everything, including your 10,000 digital photos, in the trash. However, based on my experience with my father-in-law's photos, including those from his father, it is more likely that someone will keep, treasure and make use of at least part of your collection. ◆

Editor's Comments: Fan Problems

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

My current computer was built in November of 2005. Beginning in July of 2007, I started to have problems with some of its fans. The first fan to cause a problem was the CPU fan, pictured as the first image below in the continuation of the article. It is a fairly large fan positioned on top of the processor and secured with four screws.. It began to make a noise when the computer was started, and the noise would come back later as the computer ran.

I ordered a replacement fan of the same size, except that it was slightly thicker, from Newegg. That solved that problem.

July seems to be a bad month for computer fans because, this July, I began receiving a message that the Chip Fan, as shown in the photo below, had either failed or was not rotating fast enough when I would boot the computer. Simply turning off the computer and then starting it again solved this occasional problem (about one out of four or five startups). Finally the problem got to the point that turning the computer off and then on did not solve it. And when you get that message from the BIOS that a fan is malfunctioning, if you want to use the computer you have to go into the BIOS and

Minutes of the September Meeting

By Jim Purcell, Secretary, Tampa PC Users Group
Edward_J_P@MSN.com

The meeting opened at 6:40 pm. Bob LaFave started the meeting by opening the Windows SIG. He announced that he had changed the format for this meeting because there had been so many questions about "wireless technology". He said that he thought the best way to satisfy these questions in a way that would be most fully understood by all members was to present a demonstration in which he would methodically go through the steps of setting up a wireless router he had brought to the meeting. He discussed in detail the requirements for security and invited comments and questions from the members on a number of approaches to securing wireless connections. There was a discussion of the consequences of not taking the time to make the setup properly secure. He demonstrated how to disable and reactivate the wireless connection. Bob also discussed the advantages and disadvantages of using "MAC addresses" to further enhance security. He pointed out the need to keep up with both firmware and software updates of your router.

Additionally, he cautioned to be aware of the baggage that comes with some free software and updates to third-party software. At the end of the presentation, a member mentioned having trouble connecting her printer to her new computer. Bob believed that it was a driver problem and showed her how to locate and download the latest driver for her printer. He also mentioned the advantages of setting up the printer as a network printer if it has either an Ethernet or a wireless connection.

John Witmer opened the business portion of the meeting at 7:12 pm. He reminded the members of the importance to our group for all members and guests to log in at each meeting. Jenny Lind Olin had volunteered to bring in software and hardware that she is no longer using to see if any of the members could make use of either. John urged her to bring it to the next meeting and also encouraged other members who had similar items to bring them in for members to examine. Doug Mullis mentioned that several members were behind in their dues. He also reminded us that we have not finalized the agreement with the Brandon User Group to swap presenters. Doug will reopen the discussion with the Brandon group. Doug said that our current schedule is filled through December. Merle Ni-

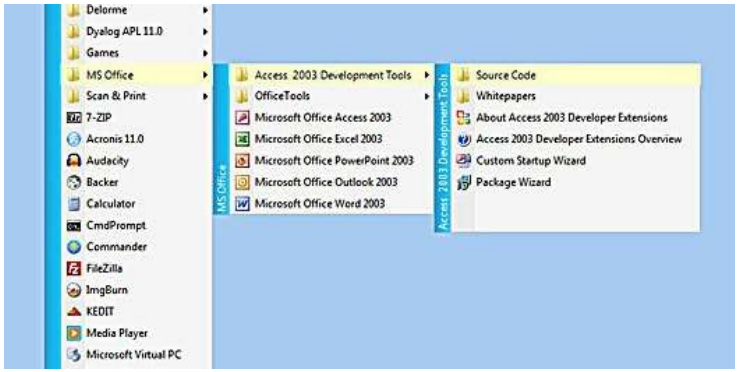
left).



It's hard for me to see any advantages over the XP menu. I find it slow and tedious to get where I want. When you exit from the menu and then later go back, you'll find any folder expansions you've done are gone. And all-in-all, the whole menu is impossibly tall if you have any collection of programs.

You can switch to "Classic" menu just as you could in XP, but guess what – it's the same Windows 3.1 classic menu.

I have to say I do use the Vista Start Menu, but rarely. My personal solution to this is a product called True Launch Bar at http://www.truelaunchbar.com. It's very highly configurable, and you can construct a very efficient menu. But I'd say it is a lot of work. A cropped image of my True Launch bar is the last clip on page 7. You can see a larger picture of my True Launch Bar in the HTML versions of the newsletter that will appear online. ◆

(Vista… … …Continued on page 8)

ual "loose" program icons are sorted above the folders and there are many more folders not shown. You must use the slider to see the remainder of the folders. Further, the way folders expand is vertically, not to a submenu on the right as in XP. This has the effect of making the All Programs list very tall (picture to the

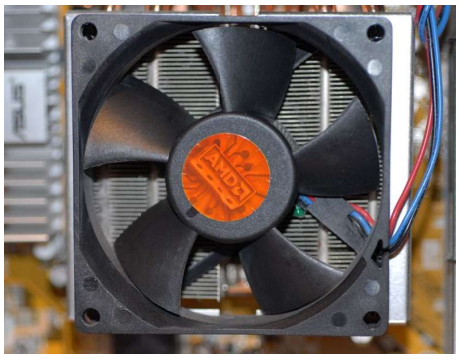
Vista – It's growing on me, Part II

By Merle Nicholson, Tampa PC Users Group
merle@merlenicholson.com

Last month, I wrote an article mostly about Vista Windows Explorer and what I discovered after forcing myself to use it. I've abandoned the use of FreeCommander, a freeware alternative to Windows Explorer.

This month, I'd like to explain what I've found using the Vista Start Menu—some positive features, and negative ones, too.

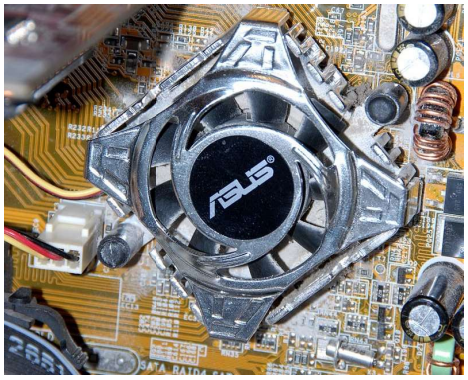
The first image on the left below is my own Start Menu, with minimal customization. The area marked "1" is the list of most-recently-used programs. It's configurable in two ways: The number of entries in the list – maximum of 30, and the icon size, large and small. I'm using the small icon size, but the large has an advantage in that it makes the menu much taller. That's an advantage when we discuss "All Programs" later.



The "Power Button" (2) is configurable if you open Control Panel, Power Options. You can set this to "Shut Down", "Sleep", "Hibernate" and "Do Nothing". When you press this button, it acts immediately with no further interaction or confirmation. I have mine set to "Shut Down" and it simply starts shutting down. I like this a lot: No further questions, no more menus.

Here would be a good place to discuss Sleep and Hibernate. They haven't changed from XP. But one big change is that it's become acceptable to use either one regularly, especially on notebooks. I think it all got started when Vista was new and everyone was looking for a way to speed up the boot and shutdown process. What I would do, I think, would be to use Shut Down for a long while and then try Sleep a few times and then Hibernate to see if it's worth the trouble. If you settle on Sleep, just remember to shut down every couple of days to clear out memory.

The padlock (3) is "Lock This Computer". You do remember the password, right? And last; the Power Menu (4) is a small menu list with Shutdown, Restart, Sleep, Lock, Log Off and Switch User. Some of the items on the right panel under the picture and User Name are optional, just as they are in XP: Printers, Run, Control Panel, Network and others.

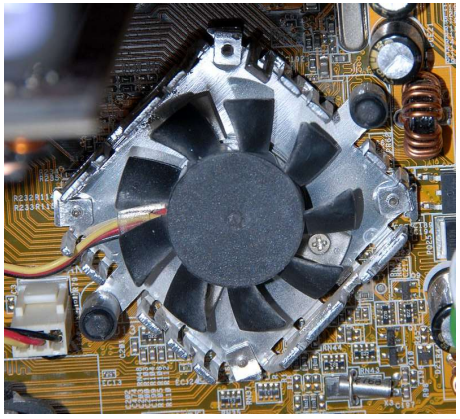


Pressing on "All Programs" (or hovering over it for a few seconds) will switch to the programs menu. It may be hard to see in this second picture (to the right of the first picture), but the individ-

(Vista… … ….Continued on page 7)

(Comments… … ….Continued from page 1)

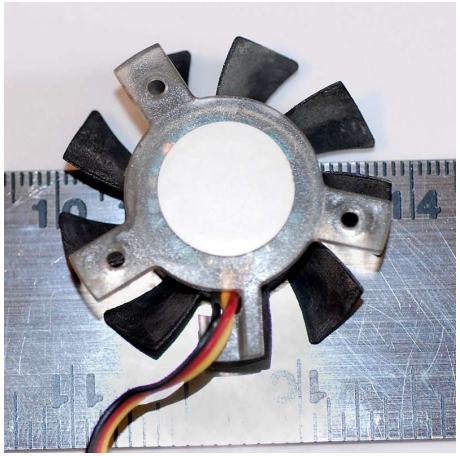
change the fan settings in the Power sub-menu. For the Chip Fan, which is more accurately called the Northbridge Chip Fan, there are only two options—Enable Fan Monitoring or Disable it. So I disabled it and was, thus, able to use my computer. I used it this way for several days but then began to worry about what would eventually happen. Since I had removed the cover to the computer, I could touch the combination fan/heat sink for the Northbridge Chip and tell that it was hot. In fact, I noted that I could almost get the fan revolving if I tried to spin it with my little finger. So, using a small pair of side cutters, I cut away the metal that held the fan cover to the heat sink to totally expose all of the fan's blades as shown below. This allowed me to spin the fan counterclockwise, which started the fan revolving and made me and the computer happy. Unfortunately this required me to leave the cover off the computer so as to be able to rotate the fan each time I started the computer. Not good, and possibly not safe.



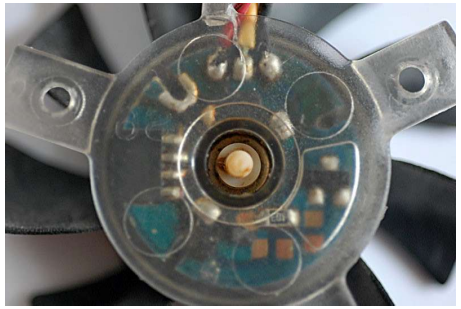
I ran all of these problems by member Merle Nicholson, my hardware expert. He offered three solutions. Buy a replacement fan, buy a replacement heat sink that was larger and, hence, did not need a fan, or take the current fan out and try to oil it and get it spinning smoothly.

A replacement heat sink without a fan or a replacement of exactly the same thing I had (assuming that could even be gotten from the motherboard manufacturer, Asus) would entail taking the motherboard out of the computer to do the installation. Here is a link to how to do that.: http://euroalps.eu/technology/Computing/Chipset_Cooling/Remove_existing_fan/remove_existing_fan.html You will note that the fan looks a bit different from mine, but the removal process would be the same.

I opted for trying to remove the fan from the heat sink and then oiling it. In the previous image you can clearly see one Phillips-head screw attaching the fan to the heat sink. There are actually two more such screws, and, with a small Phillips-head screwdriver, I was able to remove the fan. The removed fan is shown in the first photo below. Unfortunately, I could see no place to oil it, since Merle did not tell me the whole story. You need to remove that white circular adhesive paper cover, seen in the next photo, to see the bearing of the fan. Not knowing this, I simply hit the fan with a fair amount of compressed air and reinstalled it, with the result that it now would not even start when I rotated it with my finger. A call to Merle informed me about the paper cover over the bearing, and I then knew that I would have to remove the fan again (a magnetized screwdriver is a big help here, so as



(Comments… … ….Continued on page 4)



(Comments… …..Continued from page 3)
to not drop any screws).

The second image shows the now exposed ceramic (or plastic) bearing in the center. Applying a few drops of oil to the bearing and working the fan at first produced nothing. But finally, with more oil and more rotating and then turning the fan vertical from horizontal, the fan spun very easily. I reinstalled the fan and watched it with the computer cover off for a few days. Everything seemed fine. So I went back into the BIOS and reset the Chip Fan to be monitored. I also set the CPU fan to give me a warning if it went below 800 RPM and the Chassis fan to do the same. However, on startup, I received a CPU fan warning. And looking at the information about the fans in the BIOS showed that the fan was rotating at 795 RPM, occasionally reading above 800. The fan seemed fine, so, in order to be able to use the computer, I disabled the CPU fan monitoring since 800 rpm was the lowest available setting.

And that is where I am in my fan saga—waiting to see if my oiling of the Chip fan is a long term solution. ◆

(Minutes… … ….Continued from page 2)
cholson will give a presentation on Vista in September, Steve Singer will give a presentation in October and Jim Purcell will give a presentation in November. Our annual Christmas party will be in December.

William LaMartin began his presentation on Digital Photography and Programming. William gave a history of his experience with cameras that began with a Brownie camera when he was nine years old on a visit to California. That experience led to his acquisition of increasingly sophisticated film cameras and a broadening interest in photography. He showed pictures which depicted the improvements in the tools of photography, his methods of using the technology and a pictorial history of the changes in our society that were taking place at the same time. He purchased a Canon G1 in 2000 as his first digital camera followed by a Nikon D100, then a Nikon D200. He talked about scanning his negatives and slides in order to preserve their quality in digital format. He has so far scanned approximately 8,600 negatives and slides (approximately 30 gigabytes). He estimates that this is about half of his collection of negatives and slides. The negatives and slides are scanned to allow a 12-inch wide print at approximately150 dpi. He stressed the need to organize your photos in some logical order and to backup your collection on a regular basis. William discussed the various ways to scan photos and slides using both dedicated film scanners and flatbed scanners.

The digital pictures are, of course, already in digital format and he shoots his pictures at the maximum size his camera will produce, which is approximately 3000 pixels x 2000 pixels as jpeg files with minimal compression. He occasionally uses the camera raw setting, which produces a very large file and marginally better results.

He mentioned that the quality of digital pictures has progressed to the point where it has surpassed those produced by film in the 35mm format. Even the relatively

(Minutes… … ….Continued on page 5)

(Minutes… … ….Continued from page 4)
inexpensive point and shoot digital cameras produce decent pictures that rarely require any post-exposure correction (unless you are a perfectionist; in which case you probably should be using a SLR). He said that Photoshop is his photo editor of choice. He listed eight tools of the many available in Photoshop that will make practically any correction that you want to make. He demonstrated how each of the tools is used.

Next, William spoke on mapping. He showed several maps that were created long before there was a digital capability. He demonstrated some of the things that can be done with Microsoft Deep Zoom Composer to view these maps at various levels of detail. This actually had nothing to do with photography, but allowed him to demonstrate Deep Zoom Composer, which can also be used to view photos or collections of photos at different levels of detail. He then showed us one of his multi-level photo collections created with Deep Zoom Composer.

After that, he demonstrated using Microsoft Pro Photo Tools to geo-tag photos, which inserts latitude and longitude data into the header of the photo file. This position data is, thus, added to the camera data that are already there, such as f/stop, shutter speed, ISO setting, date and time taken, etc. . Both Deep Zoom Composer and Pro Photo Tools may be downloaded free from Microsoft.

William ended the presentation with a demonstration of a web site he is creating that allows you to upload your photos and place pushpins on a map of the world at the exact location at which the photos were taken, such that when you hover your mouse over a pushpin you see a thumbnail of the photo, along with a description, and, if you click on the thumbnail, you view the photo full size.

Since time ran short, he omitted some additional programming examples.

The meeting ended at 9:05 pm. ◆

Internet Picture of the Month

High Water

This photo from http://www.huffingtonpost.com shows the localized flooding in New Orleans adjacent to the Industrial Canal caused by rising water in the canal as the result of Hurricane Gustav to the west. The canal reached a level that was within one foot of the top of the floodwall. It is not clear from this photo whether this was inside or outside the floodwall. What do you think would have happened if Hurricane Gustav had actually hit New Orleans?

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

Thanks to Jim Purcell and Ron Weinberg, we have a newsletter this month. They each simply wrote about a program they are using on their computer—Ubuntu and Microsoft Virtual PC for Ron and Adobe Photoshop Elements for Jim. Almost any member could do the same thing—if you would.

As for me, it has been a slow computing month. I have done a little VB.Net programming, provided descriptions and location information for recent digital photos and created web pages so that I could simultaneously watch several local TV stations in both New Orleans and Houston as the recent hurricanes approached those cities.

For the digital photos, I use Adobe Photoshop CS3 to add my own name, email, etc. to the creator Metadata item. Then I add a description and key words. Later, using Microsoft Pro

Minutes of the October Meeting

By Jim Purcell, Secretary, Tampa PC Users Group
Edward_J_P@MSN.com

The meeting began at 6:35 pm. Bob LaFave began the Windows SIG with a demonstration of how to track a problem. Bob discussed the use of a print server and the increased flexibility that it provides, in that it is not necessary to have a host computer running in order for other computers to access the printer. He also discussed the ways to recognize printers on a network. He mentioned that Office can cause problems when it becomes necessary to uninstall the program. Bob said that the best way to uninstall Office is to start the installation disk, go to repair – uninstall, and uninstall the program. A member asked how to use "Aero" capability with Vista. Bob gave a brief description of how to take advantage of the things available in the "Aero" program.

He mentioned CPU-Z (a hardware monitor). Bob said that he has found the program useful in monitoring the performance of his computers, especially to insure that the computers are not overheating.

There was an expanded discussion of the pros and cons of Google's new browser. Some members liked the new features and some thought that you paid a price for using them.

Bob discussed anti-virus programs and the ones that are his current favorites. A member asked Bob to identify the free anti-virus programs that he prefers. He explained how to find the one that best serves the individual's needs by determining the one with which they are most comfortable. Member Merle Nicholson mentioned that most programs have a 30- or 60-day trial period, which allows users to make sure they understand the features and peculiarities of the program. There was a discussion of working

apcug Member of The Association of Personal Computer User Groups

Upgrading Ubuntu in a Virtual PC

By Ron Weinberg, Member at Large,
Tampa PC Users Group
rswjbr@verizon.net

Like some other group members, I have been experimenting with Ubuntu Linux using Microsoft Virtual PC 2007. I do this out of professional curiosity and for the challenge. With a Virtual PC, I don't have to dual boot or compromise my host XP Pro system in any way.

Day to day use of a computer running Ubuntu is relatively easy. You get a free open source operating system that will run, even on some old underpowered hardware, and programs that provide all your basic needs and features and a lot more. For example, the free Open Office Suite has all the essential functionality of Microsoft Office and good interoperability with it. Each new release of Ubuntu brings added improvements.

However, there are still some rough spots that might intimidate the ordinary PC user. I am reminded of the old days of DOS and early Windows when you had to learn by trial and error and often use a command line. As then, time and patience are required here.

I selected Ubuntu because it seems to be one of the most popular distributions with great potential and it is improving rapidly. Frankly, the Virtual PC aspect does complicate and somewhat compromise the features of Ubuntu.

My original install was version 6.10, so I tried to use the automatic upgrade offered by the built in Update Manager to move to a newer version, 7.04.

Before proceeding, I found out that there was a new Service Pack1 for Virtual PC which supports XP Professional SP3 and Vista, and I installed it.

Using the built-in Update Manager, I started the upgrade to version 7.04 and failed, receiving multiple error code 404 errors (failed to fetch). I retried several times and got the same errors. It was time to get help.

There were so many proposed fixes for these errors posted in search results that it was impossible to determine which would be correct to use in this case.

One of the great assets of Ubuntu is the myriad of online help resources, including the large and very helpful user community easily reached at https://launchpad.net/ubuntu.

I posted a question there, giving the exact problem, and included all the error messages. Suggestions began arriving the same day, but the solution came after 10 days. Remember, patience is needed as respondents are volunteers.

The answer was that Version 6.10 is no longer being supported and there was a link to confirm it at https://launchpad.net/ubuntu. It was suggested I upgrade offline using the 7.04 Alternate install CD, which could be downloaded as an ISO file at http://releases.ubuntu.com/7.04/. Then I was instructed to make a CD from the ISO image. (This requires a free program, such as Infra Recorder or ISO Recorder.) Using Ubuntu 6.10, you then insert the CD into your drive and you get a request to upgrade.

When the upgrade was completed, there was no mouse function.

Searching Google, I found that the problem was that Ubuntu did not recognize the mouse within a Virtual PC. Google provided a makeshift fix, turning the numeric keypad into a pseudo mouse, which was very inefficient. Further research located a permanent fix by editing the Grub Boot Parameters. This sounds difficult, but exact and easy instructions were provided.

After this fix, and the upgrade to 7.04 having succeeded, the Update Manager now offered an upgrade to 7.10. I wanted to move up to this release. Of course, I could have just installed a new Virtual PC with each later version, but I wanted to proceed as if I were actually using the product.

I started the upgrade from 7.04 to 7.10 and left it un-

(Ubuntu……..Continued on page 4)

(Ubuntu…….Continued from page 3)

attended overnight. My PC rebooted due to a Microsoft auto update so any messages were lost. I could not determine how far the upgrade got, but I still had 7.04, and, when I clicked on the Update Manager, nothing happened.

I posted another question on launchpad and got the solution the same day. It told me to try to update in a terminal window. You open a terminal in Applications > Accessories > Terminal. Then type: sudo aptitude update && sudo aptitude upgrade. This command line restored the Update Manager. Once it was restored, I was able to run the upgrade to 7.10. It started over from step 1, "Preparing the Upgrade," and completed successfully.

The upgrades themselves, while automated, do take several hours. In going from 7.04 to 7.10, a time remaining bar appeared showing 13 hours, but the actual time was much less.

Finally, I tested the installation, and everything worked. I could use the Internet, found my local Network Places, and could even share between Virtual Ubuntu and the host computer running XP Pro.

But again I discovered another limitation of the Virtual PC. You can share files, see and use them, but you cannot cut and paste between Virtual and Host. There is a trick found with Google, which I have not tried, that tells you how to do it using Remote Desktop.

Next, upgrade to 8.04, maybe? ◆

(Comments…….Continued from page 1)

Photo Tools, I add the longitude and latitude of the photo (if I can remember exactly where I took it). So, now I am considering this as computing and not just photography since I am using the two computer programs to accomplish this task.

For any who have created web pages, you may know that you can insert as many Windows Media Player

(Comments…….Continued on page 8)

(Minutes……..Continued from page 2)

online or offline and how it is that you find yourself offline when you had not specifically requested the option. There seemed to be no answer to the problem, in that there are several things that might have been the cause. The Windows SIG ended at 7:14 pm.

John Witmer, our president, opened the business portion of the meeting at 7:15 pm. He mentioned that, in October, Steve Singer will discuss new developments in hardware with his usual insights on all of the technical details. In November, Jim Purcell will discuss digital storage, editing, scanning and sharing. John mentioned the FACUG meeting to be held in Clearwater on Saturday, October 25. The details of the registration requirements and program content can be found at FACUG.org, He also stressed the need for members to furnish newsletter articles. John reminded the members that there were computer related items on the back table that Jennie Lind Olin brought in for any of the members who might have a need for them.

Merle began his presentation on the Vista operating system at 7:20 pm. He explained that the computer in a box that he was using for his presentation was built and designed by him to make it easier to change hard drives and to update and repair the computer. He detailed many of the changes and improvement that he has made since its original construction. He has several SATA ports built into the box so that he can easily use different hard drives for special requirements. He brought three versions of Vista so that he could illustrate his responses to member questions about the various versions. He talked about Vista requirements and why you might go to 64 bit and why you might not go to 64-bit. A primary reason to select the 64-bit version is the ability to address more memory. The additional memory, in addition to the obvious advantages, makes “Super Fetch” even more efficient than it is with only the usual 3GB or less of memory. Merle said that he has found very few programs that would not run with the 64-bit version of Vista. One of the exceptions is Nero, He said that there are a lot of differences between Vista and XP. For instance, the Vista control panel is more complete than in XP, and some of the changes are helpful, but there are many of the fea-

(Minutes……..Continued on page 5)

(Minutes……..Continued from page 4)

tures that seem to have been changed for no apparent reason.

He demonstrated some of the many features of Aero. One that he showed was a very good calendar that is available from Vista. He commented that Vista help is very good. He thinks that Vista Windows Explorer is poorly designed, very confusing and difficult to use. He has made extensive changes to the structure, but there are some things that you cannot change. Networking with Vista is much faster and much simpler. He recommends that you uncheck Automatic Restart on System Failure in the control panel's System & Maintenance link. so that you will get a blue screen and see what is causing a problem. Merle warned to not turn off your User Access Warnings (UAC's). Although UAC's may be bothersome, they help prevent viruses from doing their work.. He also warned not to use the hibernate or sleep modes. Merle has taken all of the frills off of his computer in order to make it operate as efficiently as possible. Merle emphasized how important it is to read the instructions on how to use the Search function. There is valuable information in "Help," particularly on the use of prefixes, which will dramatically improve your efficiency in the execution of searches. He says that Vista fonts are superior to XP fonts. Merle said that he does not believe that anyone should upgrade to Vista, His recommendation is that Vista should only be installed on a new machine that meets the requirements for Vista. The meeting ended at 8:55 pm. ◆

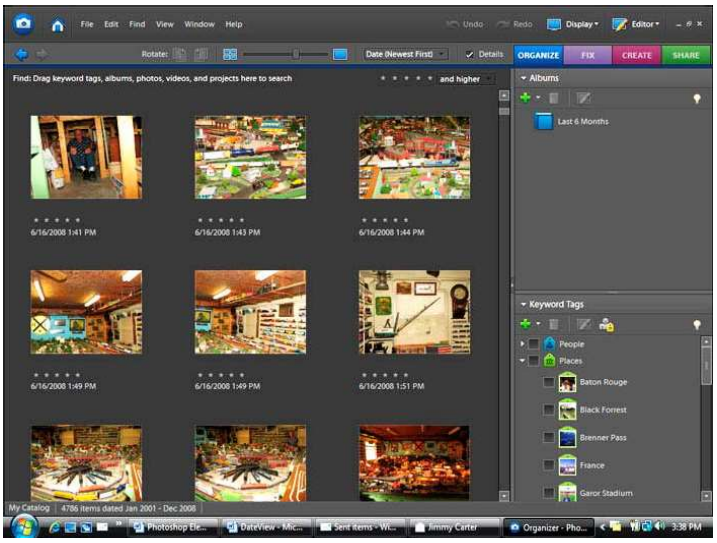
Photoshop Elements 6 Organizer

By Jim Purcell, Secretary, Tampa PC Users Group
Edward_J_P@MSN.com



I know that those of you who saw William LaMartin's presentation on digital photography were impressed with the program that he has created in Access to organize his photo collection. Not everyone has the skills to put together such a program. There is an excellent alternative that is not as flexible but is relatively inexpensive.

Photoshop Elements, which is an offshoot of Photoshop, is an extremely powerful program for amateur photographers. Some of the professionals admit to having a copy running on their machine because some of the Photoshop tools that have been modified to make them easier to use often work as effectively as the Photoshop version. There is normally a new version of Elements when there is a new version of Photoshop. Most of the downloads and plug-ins for the new version of Photoshop will work in the new version of Elements. A new version of Photoshop Elements has just been released (Version 7) to coincide with the new release of the newest version of Photoshop, but I will discuss the Organizer in Version 6.

Before I start, I feel that I should give you a broad overview of the software. The list price is $99, but it is often on sale in the $50 -$60 range and will possibly go lower since a new version has been announced. You can have more than one version of Elements on your computer at a time, but Adobe recommends that you have only one version open at a time. There are four main sections: 1. the Organizer, which I will discuss in more detail; 2. the Editor, which is divided into Full Edit, Quick Fix (similar to point and shoot with your camera) and Guided Edit, which takes you through a number of editing tasks a step at a time; 3. Create, which contains several programs to help you do such things as Photo Books, Photo Calendars, Collages, Slide Shows and many more; 4. Share, which allows you to share photos using Online Galleries, Photo Mail, Email, CD\DVDs and more. I know that all of this looks like a lot of complicated stuff with a rather steep learning curve, but the beauty of the program is that you can use as much or as little as you like and the Help system is extensive. There are also many books available if you get interested in really pushing the program. I'm going to discuss a summary of the features of Organizer with just enough detail that you can see how easy it is to store your photos and find the ones that you are trying to locate.

The Display Menu is probably the first place to start in showing how the Organizer helps you keep track of your photos. The basic way that you get your photos into the Organizer is to identify which of your folders that you want included. Once this is done, any additional photos that you add to these folders will be added to the Organizer. Once in the Organizer, there are five different ways to look at your photos:

1. The **Thumbnail View** displays your photos as thumbnails, with or without the detail that you have identified in your options. They are normally sorted by the date in your metadata, either oldest or newest first. You can adjust the thumbnails larger or smaller, which will increase or decrease the number on screen.

Thumbnail View

2, **Import Batch** displays the thumbnails into the same batch configuration (by date) in which they were loaded into the Organizer.

3. The **Folder Location** places the thumbnails in the order in which they appear in your Windows Explorer folder tree and places the tree to the left of your thumbnail collection. You only need to click a

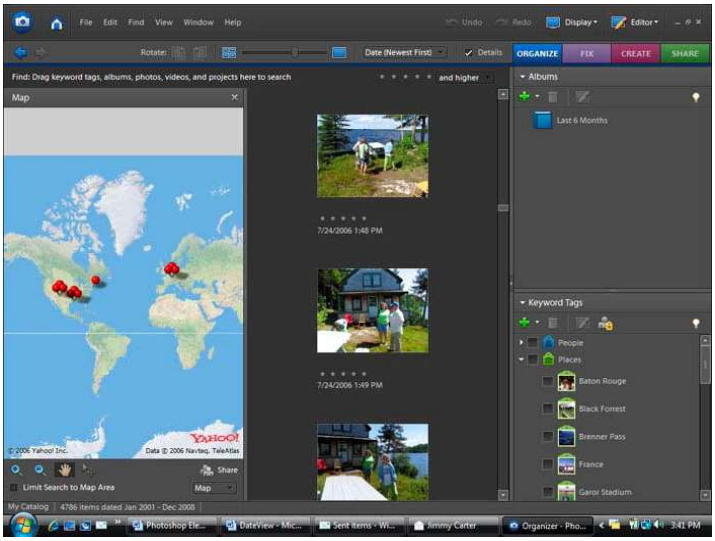
Special Interest Groups

Visual Basic .Net SIG (and sometimes Access SIG)

This SIG meets the **third Wednesday** of the month at 6:30 PM. The meeting location varies. For information, contact William LaMartin at *lamartin@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Bob LaFave moderates the discussion.



Digital Imaging SIG—Cancelled until further notice

(Organizer……..Continued from page 6)

folder and the thumbnails that are in that folder appear.

4. **Date View** displays your photos on a calendar either by the date assigned to the photo by your digital camera, or the date it was loaded into the organizer, or a date that you have assigned to the photo.

5. **Show Map View** allows you to place your photos on a Yahoo map to show where they were taken, The map has a satellite view that allows you to zoom in and out so you can, in many cases, place the photo in almost the exact spot that it was taken. Once you have processed these pictures at their locations into an online gallery, you can send the gallery to an Adobe web site or your own web site. You can also save the gallery to a CD/DVD, which can be displayed with Flash Player. The tagging system, which I will discuss later, allows you to put a location tag that you have created on several pictures from the same location and move them all at once by dragging the tag to the location. There will be one pin on the map for each location. When you click the pin, it sets up a slide show for the pictures at that location.

Map View

The View Menu allows you to modify the way your thumbnails are displayed and the type of descriptive details that are visible.

Keyword Tags is a system that lets you further identify your photo in as much or as little detail as you wish. You determine the hierarchy for people, places, events, or whatever you like. For instance, you can have only one tag for family, or you can have sub tags for children, or the children by name, or name tags for each member of the family. You can add several tags to the same photo. You could, for instance, have a tag for every name in a group picture if you desired. You can do the same sort of thing for places, events or points in time. When you click on a tag, every thumbnail in your collection with that tag is placed in a group. When you unclick the tag, the thumbnails return to their normal order.

The Find Menu is quite versatile; some of the ways you can search are: The program allows you to group your photos into various Collections and you can search for the individual Collections. You can search by Caption, or Note, or File Name. You can also search by Metadata. You can search for up to seven different historical events. You can search for photos that have a visual similarity to a selected photo(s). You can select a group of photos and have them scanned to find faces for tagging. You can look for

lamartin@tampabay.rr.com

I will give the usual contributors a rest this month (other than our hard working secretary, who provides the minutes each month) and write about a new software suite that I have been working with. It is Microsoft Expression Studio 2. As noted in the article, the average computer user will probably only find one of the programs useful and, if they additionally maintain a web site, two programs. The other three programs are more specialized.

It would be much appreciated by me—and the other regular contributors and the readers, I am sure—if more members contributed articles. An article doesn't have to be long or technical. One page about something of interest in your computing life would be fine. ◆

Minutes of the November Meeting

By Jim Purcell, Secretary, Tampa PC Users Group
Edward_J_P@MSN.com

Bob LaFave started the meeting by opening the Windows SIG at approximately 6:30 pm. He discussed several sources which he had researched concerning antivirus programs . He had discovered several that were available at bargain rates. He also covered several sites that offered a variety of "Freeware" for practically anything that you want to do with a computer. One of the members asked about whether Microsoft would make its Publisher program available to a nonprofit group. Bob suggested that they contact the local Microsoft Office since they often provide some of their products to nonprofit groups, and they have a person especially designated to handle nonprofit relations. There was a question about links from places like Walgreens not working properly. Bob explained how to follow the information contained in emails concerning links to obtain coupons or other offers. He cautioned that you should be sure of the reliability of the information you are receiving from vendors because you can possibly install a virus by opening a link. He advised to be aware of phishing, especially on emails referencing bank accounts.

A member asked for instructions on creating a virtual PC. Bob gave the information on how to set up a virtual PC. He and Merle explained the operating system licensing requirements for legally installing operating systems on a Virtual PC. Bob mentioned that if you add a digital tuner card to your computer, Vista allows you to record the programs that you are watching to a DVD.

Steve Singer of RDI, Inc., gave a detailed discussion of the capability to view TV programs and movies on your computer. He discussed Media Center and its capabilities and limitations. He also mentioned that

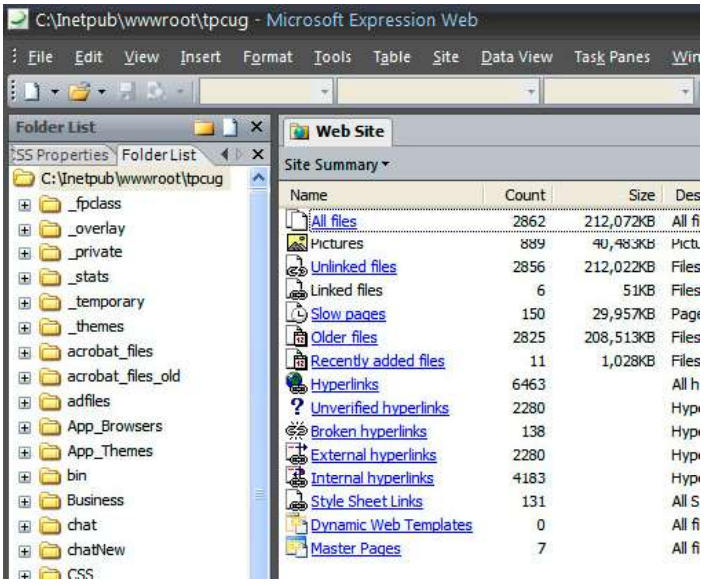
Microsoft Expression Studio 2

By William LaMartin, Editor,
Tampa PC Users Group
lamartin@tampabay.rr.com

Expression Studio 2 consists of five programs: Expression Web, Expression Design, Expression Blend, Expression Media and Expression Encoder. Expression Web was the first on the scene a few years back as the replacement for the HTML editor and web site management program FrontPage.

I switched from FrontPage to Expression Web 1 in December of 2006 (and gave a presentation on it to the group at the January 2007 meeting). For me, the transition was fairly easy, since I was already using Visual Studio to do a lot of my web work that required server programming and Expression Web was designed to work well with web pages that used Visual Studio's VB or C-sharp code. I would use Expression Web to edit the visual aspects of the page and use Visual Studio to edit the code behind.



Also, moving to Expression Web encouraged me to start using Cascading Style Sheets (CSS) to control the appearance of pages. What one lost by leaving FrontPage were all the "web bots" that did things for you, such as a search bot, a discussion-web bot, a feedback forms bot, etc., which all require FrontPage Extensions. Losing the ability to include such bots in new web pages created using Expression Web produced a good bit of angst among FrontPage users. However, for me, I really didn't need these bots since I could program such things using Visual Studio. Furthermore, Expression Web created pages that met web standards much better than did FrontPage.

Now there is a new version of Expression Web out as one of the programs in Expression Studio 2. Of course, you may purchase it or update it separately from the entire suite. I chose the option to purchase the Expression Studio 2 Upgrade since I was allowed to do this by already having Expression Web 1 (which was itself an upgrade from FrontPage). Additionally, I had been working with Expression Blend in a free preview version so as to be able to visually edit my Microsoft Silverlight pages. As you may recall, Silverlight is Microsoft's answer to Adobe Flash, and I mentioned it in the April newsletter, http://www.tpcug.org/newsletter/nl_2008/april2008/comments.htm, with a link to some simple Silverlight examples I had put on the web.

If I wanted to work with Silverlight, I needed to move from the preview version of Blend to the new Expression Blend 2, and purchasing Expression Studio 2 seemed the best solution. The web site for Expression Studio is http://expression.microsoft.com/ with a link there to all the different products included. For me the tutorials and forums are of particular interest.

Clicking on the Products tab at the Expression Studio site will give you a brief description of each component. Below is my brief take on each product based on my use to datre.

Expression Web I have already mentioned this program. I should add that new to version 2 is that those who use PHP code can now edit it from inside Expression Web with IntelliSense, which helps you with coding options. You can easily insert Flash or Windows Media files and edit their properties. You can insert Photoshop files and Expression Web will automatically convert them to png, jpg or gif files appropriate for the web. However, I saw no option to resize the converted files while this was being done. Since I typically want to make my Photoshop

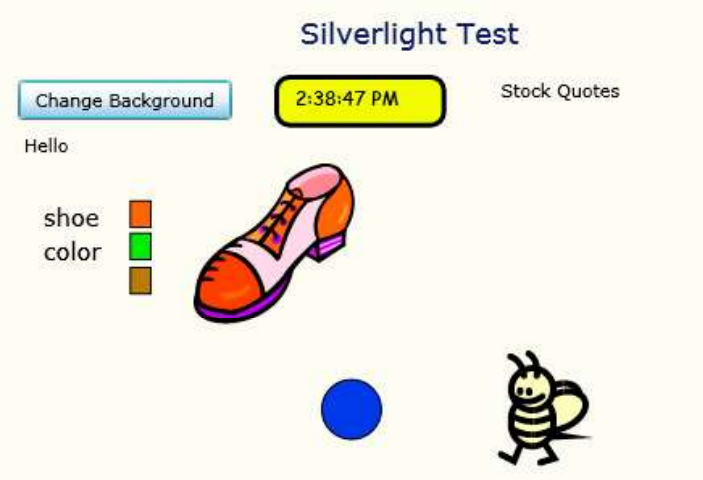
(Expression……..Continued on page 4)

(Expression…….Continued from page 3)

images much smaller for web work, this feature is not of much use to me. I will still need to resize the images in Photoshop, save them as jpgs and then import them into Expression Web.

The screen capture on the previous page is of one of the many reports that you may view in Expression Web. This one is the Site Summary for our TPCUG site, which lists information about files, hyperlinks, and other items at the site. You might note that there are 2,862 files at the site.

Expression Design is a vector graphics creation program. In that regard it is the same as Adobe Illustrator. The latter, though, is a much more powerful program (and more expensive). Recall vector graphic images can be made as large as you want without destroying quality. Raster graphics images (like those used in photo editing programs, such as Adobe Photoshop) lose quality as you enlarge them.



I think Expression Design was not meant to compete with Illustrator (whose files it can open) but rather was to be a simple tool to create images for use in the Expression Blend program that I describe below.

In Expression Design, you create your graphic objects using the brush, pen, rectangle, ellipse, polygon and line tools. You apply colors to the interior of the objects or their borders. You add text with the text tool, selecting a font, size and color. All of these types of objects are then combined to form your graphic. Your resulting graphic may be made up of one layer or many layers of such objects.

If you wish to use your new creation in Expression Blend, you then export it as a xmal (pronounced zammel) file, which is really just a text file.

Expression Blend is used to create the visual effects of a Silverlight application. Visual Studio 2008 is used to create the code behind, for example, what happens when a button is pressed.

In the screen capture at the top of the next column, you see one of my Silverlight Test programs from http://www.lamartin.com/Silverlight/. It has a continuously running clock, a button to change the color

of the background, boxes to click on that change the color of the shoe, a bouncing ball and moving bee. There are some stock quotes that are supposed to appear, but in moving from the beta version of the software to the new version, something went wrong with the code for that and I need to look at it.

All of the visual components of this were created in Blend. The shoe and bee were wmf files from Microsoft clipart that I brought into Adobe Illustrator and then exported as xmal files (there is a xmal export plug-in available). Since Expression Design was meant to create files to use in Expression Blend, it is strange that Microsoft does not seem to support the opening of wmf files in Design since wmf is a Microsoft format.

The bouncing ball and moving bee are examples of animations using Blend. The button click that changes the background is done from code created with Visual Studio. You can also start and stop the animations from code in Visual Studio if you wish.

Slide Shows I am always looking for new ways to create my own slide shows to display photos. I know that you can download such things from the web that use JavaScript to make the show run, and Adobe Photoshop will create several different types of slide shows which you can modify slightly to suit your purposes. But I prefer to be able to create my own. Using Blend and Visual Studio, I created a Silverlight slide show that you can view at http://www.lamartin.com/Silverlight/ by selecting the Slide Show link.

(Expression…….Continued on page 5)

(Expression…….Continued from page 4)

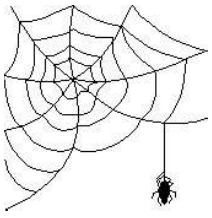
In the past I have used just Visual Studio to create slide shows. However, if I use it to create a Silverlight project instead of just a standard ASP.Net web project, I get the ability to be a little more creative with the appearance of the show. The see-through photo information box that can be displayed in the slide show is one such item.

Now, where does all the information that is displayed about each photo come from. As you may know, when you take a photo with a digital camera and save it as a jpg, all sorts of information is saved to the header of the jpg file. There are free programs available, as well as programs like Photoshop, that will display this sort of information for you—when the photos were taken, shutter speed, f/stop, and much, much more. Additionally these programs will allow you to enter extra information, such as a caption, author, keywords, etc. Recently, I wrote about a free Microsoft program, Pro Photo Tools, that allows you to also add longitude and latitude information to this header information if you can find the location of the photo on a map. But one can also do that with the following Expression Studio program

Expression Media is a program that allows you to create catalogs of all your digital media files. For me that means mainly digital images. In addition, you can view all of the files' header information, such as date taken, flash status, shutter speed, etc., along with things that you can edit yourself, like author, key words, latitude and longitude, etc. It allows you to filter your photos based on such things as a key word. For example, if you filtered on the keyword flower, you would see thumbnails of images where you had previously entered flowers as a key-

(Expression…….Continued on page 6)

Internet Picture of the Month



Physicians Recommend Cigarettes

Those were the days—when doctors recommended cigarettes. This image is from a slide show of such images at the New York Times site at http://www.nytimes.com/slideshow/2008/10/06/business/media/20081006_CigaretteAd_Slideshow_ready_index.html. Another ad says that "More Doctors smoke Camels." There also you will see Mickey Mantel endorsing Viceroys but then later switching to Camels in another ad.

(Expression……..Continued from page 5)

word. This is pictured in the partial screen capture above, where all photos in the slide show with the keyword flower are shown.

In Expression Media you can do a number of time-saving tasks for any collection of files:

- Batch rename
- Batch convert to a different format, e.g., jpg to tiff
- Batch change certain information, such as author, or clear such information
- Make an HTML Gallery
- Make a contact sheet
- Make a tab or comma-separated data file containing all the information for each image
- Make an xml data file containing all the information for each image (of particular use to me for my slide show)
- Display a Virtual Earth map so that you can drop an image on the map to set the location's latitude and longitude where you took the photo.

Expression Encoder According to Microsoft, "Expression Encoder is an advanced video encoding and live broadcasting application especially suited for generating content that takes full advantage of the rich graphic and interactive capability of Microsoft Silverlight playback scenarios."

Expression Encoder is the one program in Expression Studio that I have done very little with—not that I didn't try. I wanted to see if I could use it to capture a DVD made about my neighborhood and then convert it into some sort of file that could be played in Windows Media Player. Expression Encoder seems to want either a live feed from a camera or a media file on your computer, not a video on a DVD. The problem possibly could be due to my lack of knowledge in dealing with video as compared to still photography.

I wrote about one of the few things I have done with video in an article on the Dazzle video capture USB device in the June 2005 newsletter in the article at the link http://www.tpcug.org/newsletter/nl_2005/june2005/dazzle.htm. That gave me the idea of connecting the Dazzle device between a DVD player and my laptop computer, which could be easily taken to the room with the DVD player. Since I had Expression Suite installed on the laptop, as well as the main computer, I was ready to see if I could do a DVD video capture this way using the Dazzle device as the live input and Expression Encoder as the software. A good sign was that Expression Encoder recognized the Dazzle device, but it was downhill from there, and I won't go into the details.

But that gave me another idea. The idea was to use the Dazzle device and the Dazzle software to first capture the DVD's 21-minute video. I then used the Dazzle software to create a MPEG-2 640x480 MPG file of the video, which came to about 400 MB. That

Special Interest Groups

Visual Basic .Net SIG (and sometimes Access SIG)

This SIG meets the **third Wednesday** of the month at 6:30 PM. The meeting location varies. For information, contact William LaMartin at *lamartin@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Bob LaFave moderates the discussion.

Digital Imaging SIG—Cancelled until further notice

(Minutes…….Continued from page 2)

Verizon's conversion to 100% digital format practically eliminates the ability to record and burn any of their programming.

Steve believes that Cloudmark makes the very best spam program available. It does not work on the 64-bit Vista operating systems, He says that Cloudmark also checks email for viruses Steve recommends using the 64-bit edition of Vista if you are upgrading. The reason he gave is that the 64-bit version is required to access 4 gigabits of memory or more. He mentioned that he has a motherboard that will hold up to 16 gigabytes. He described the many features of the new motherboards and said that they are continuing to increase capacity. The board he showed had heat pipe technology and the highest quality capacitors that they could find. He explained that the importance of the capacitors was due to the fact that they are what "blows" if you have overheating. He also discussed the new developments in small computer cases for automobiles and other uses that have limited space available. He mentioned that he sells high-end cell phones. Displays are nearly all going to LCD's. OLED's are the replacement display that is just coming on the market, but they are very expensive and Steve believes that it will be 10 years before they are priced reasonably. There is a program called Vista Antivirus that is not associated with Microsoft. Steve says that you should not even click on the product's ad or even the button to get rid of it. Once you get it on your computer, it is almost impossible to uninstall. He recommends a free program called Magic Disc, which allows you to create virtual CD drives and CD/DVD discs on your computer that can be played at anytime without inserting the disc. Steve explained the concept of connecting to a server with a "Thin Client." This is a small box with a VGA plug, a USB keyboard plug, a USB mouse plug, a network plug and an amplified sound plug. Steve ended his presentation with a question and answer session, Steve provided a 802.11n wireless pci adapter for the raffle.

John Witmer began the business portion of our meeting at approximately 8:45 pm. John announced that Jim Purcell would give the presentation for November. The subject of the presentation will be "Scanning, Editing and Sharing Your Slides, Negatives and Digital Photos". He reminded members of the FACUG Fall Conference at Clearwater on October 25th. He also mentioned that we would have our annual holiday party at the December meeting. The meeting ended at approximately 9:00 pm.

The wireless card donated by Steve Singer was won by Jim Purcell. ◆

(Expression…….Continued from page 6)

finally gave me something I could import into Expression Encoder. I then transferred this file to my desktop machine, where I set Expression Encoder to work encoding the file as a Windows Media Video (WMV) file, which after much, much work ending up being about 175 MB—still a pretty large file for the web. But at least I finally managed to find a use for Expression Encoder.

Perhaps I should try to do a shorter video as above so that I could then have a much smaller example to put on the web.

First Class Mail

☐ *Member: Your membership is up for renewal*
☐ *Vendor: Your product was reviewed on page ___*

(Expression…….Continued from page 7)

That's it for Expression Studio's five programs. For most computer users, Expression Media which allows you do all sorts of things with your media files, will probably be the only one of interest. For those few who do web work, you will find Expression Web quite valuable. And for anyone who wants to take their web work one step further and create Silverlight applications, Expression Blend, along with Visual Studio 2008, are the tools to use. I should note that Visual Studio can be quite expensive, but, to work with Silverlight in Visual Studio, Visual Studio 2008 Standard for under $300 is sufficient. The free Visual Studio Express does not support Silverlight. As for Expression Design, the vector graphics program, it could certainly be a standalone program for anyone who desires to create vector graphics. I am just not sure of the audience for it. ◆

Meeting Preview: Holiday Party. Bob LaFave, however, will conduct the Windows SIG at the beginning of the meeting as usual.

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

We set some sort of record this month with articles from four members. Of course this is much appreciated by the editor. Now that these four have done it, perhaps others will see that you don't have to write a book to make a contribution—just a one page article is fine. That way the readers will see more than just what the editor is doing with his computer, which was the case in last month's newsletter.

I have been wanting to mention two neat things I have discovered in recent months. The first is a feature of Internet Explorer. If, while using the latest version of Internet Explorer, you come across a word for which you do not know the definition or the pronunciation, you can simply highlight it, right-

Minutes of the November Meeting

By Jim Purcell, Secretary, Tampa PC Users Group
Edward_J_P@MSN.com

Bob LaFave started the meeting by opening the Windows SIG at approximately 6:30 pm. There was a question on how to properly delete temporary files. The member said that when she last deleted temporary files, she also deleted useful cookie files. Bob stated that there is a free download called "CCleaner" that does a good job of selectively deleting temporary files. A member asked if he should leave Windows Defender turned on when he adds a new antivirus program. Bob explained that Windows Defender is an antispyware program and should be left on unless it conflicts with a new antispyware program that you are adding. A member asked which antispyware program used fewer resources. The problem seemed to be the frequency with which the program runs. Bob advised that the program that he uses allows him to determine how often he wants the program to run. He suggested that the member check his program to see if his program has a similar setting. William LaMartin complained about a Norton popup offering an update that is almost impossible to cancel. Bob's advice was to keep clicking until you find a way to permanently cancel the popup. Most members seemed to think that an offer to make your computer run faster for $29.95 was not really from Norton.

John Witmer, our president, opened the business portion of the meeting at approximately 6:45 pm. He discussed the candidates for election at our December meeting. He introduced Andy Phillips, a visitor at the meeting. John discussed possible presentations in the first months of next year. He asked members to submit topics for presentations during the next year. He announced that there would be no presentations for December. The whole evening at the December meeting will be devoted to a Christmas party and election of officers.

Jim Purcell began his presentation of "Scanning, Editing and Sharing Your Photos" at approximately 7:20 pm. He began with a discussion of the announcement by LaserSoft Imaging AG, a software developer designing soft-

apcug Member of The Association of Personal Computer User Groups

By Ron Weinberg, Member at Large,
Tampa PC Users Group
rswjbr@verizon.net

After a recent vacation, I created a photo slide show with Photoshop Elements and emailed it to some traveling companions. I was quickly reminded that the file was too big for email because my ISP rejected it. ISP's have file size limits, mine was 20MB. The attachment slide show was over 32MB.

The question was how to distribute this file.

1. Create and send individual CD's by US Mail; not a practical solution.
2. Upload to my own web site and then send out links? That would work, but, although I have the allocated space, I have not seen the need for my own site so far.
3. Use a free photo service such as Google Picasa? No, I already had created the show.
4. Share through Windows Live Spaces, new SkyDrive or some other password-protected online storage? No, because I would have to set up permissions and defaults. For SkyDrive, each access would require the person to have either a Live ID, Hotmail, Messenger or an MSN account.
5. Find or create some other FTP server to host the file. This may require hardware and/or software.
6. Use a service that specializes in this issue.

It seems that there are an abundance of ways to tackle this issue.

I did not want to make it too complicated for the recipients with passwords and URL's since some are reluctant PC beginners. I seldom need to send out large files so a simple quick way would be preferable.

A search using the phrase "sending large email files" returned a large number of hits, mostly referring to the service method (#6 above). I checked out several that looked promising. There were too many to check them all.

Most of the larger, more reputable services cater to business accounts and have many attractive features. Some of these features are automatic notification of recipients, delivery tracking, delivery certification, delivery receipts, plug-ins to send directly from popular programs and high levels of security to protect your files. These services require paid contracts for different levels of service. Many have free trial periods, which have various restrictions.

I chose YouSendit.com, which offers a free level rather than a free trial. No credit card was required. This free level, called Lite, has limited functionality compared to the paid versions but was more than adequate for my needs. It allowed a 100MB maximum file size, 100 downloads per file and a seven-day expiration of the file. After a quick initial registration, I uploaded the slide show, entered the email addresses of the recipients and some comments, and that was about all there was to it. Lite does not access any address book. You have to manually enter a list of contacts' email addresses.

The recipients quickly got an email containing the link and telling them I had sent the link. They clicked on the link and received the download. They required no link addresses or passwords.

If you have the need to email large files, you should choose a service or method that fully satisfies your particular requirements.

A good starting point would be a search, as indicated above, and the excellent article, **Top 9 Services to Send Big Files via Email by** Heinz Tschabitscher, About.com, which can be found at:
http://email.about.com/od/sendbigfilesviaemail/tp/send_big_files.htm ◆

(Minutes……..Continued from page 2)

ware such as Silverfast for scanners and digital cameras, that they can now remove dust and scratch marks while scanning Kodachrome film. Jim explained that he had not been able to test the process, so that part of the presentation will be given at a later date. He said that he would generalize the discussion of Photo Editors because there are several on the market and practically everyone prefers the editor that they are using. He discussed flatbed scanners and film scanners. He also talked about the growing use of digital cameras to scan large objects that conventional scanners cannot handle and to expedite time-consuming projects, such as large numbers of slides that can be captured by a digital camera in a fraction of the time required by a scanner. He used a picture that William LaMartin produced using a quickly-assembled setup with his digital camera. William pointed out that this sys-

(Minutes……..Continued on page 4)

Quicken Legal Business Pro 2008

By Robert Davis, Tampa PC Users Group
robdavis7@verizon.net

Quicken Legal Business Pro is a program designed to help you start and run a small business. The version I bought is compatible with Windows 2000, XP and Vista. The installation was quick and easy. It has a button for checking for updates via the Internet and offered free legal updates throughout 2008. Well, there's not much left of 2008, so I thought I'd better get what updates I could. Since I installed this on a PC that is never allowed on the Internet, and I wanted any updates they had, I had to do some finagling. I decided to load it on an Internet PC, get the upgrades downloaded to a file and then put that on the non-Internet machine. This would have worked, except Quicken doesn't give you that option. It downloaded the upgrade and installed it on the Internet machine. So the next thing I did was email Quicken tech support and asked them how to upgrade the non-Internet PC. Within a day, they answered via an email and gave me a link to download the upgrade files. I did that and was able to upgrade the program on the non-Internet machine with no problems.

Why did I want this program? Well, I have a small corporation, and I have been filling out corporate minutes in longhand writing, which is OK, but lacked some professionalism, as well as some information that should be in all meeting minutes. Additionally, folks with a one- or two-person corporation may be lax in doing a corporate annual meeting, or the organizational meeting, or directors' meetings. QLBP makes it easy to keep these minutes and other stuff up-to-date. My main reason for purchasing this was to use it for corporate minutes. It has a really good wizard-type approach that guides you through filling out every line for corporate minutes for directors' meetings, organizational meetings and stockholders' meetings. But that is just part of the over 140 contracts and documents in QLBP, along with a lot of guidance on how to fill out any form. Some of the things it has are forms for buying and selling a business, corporate minutes and consents, forming and running a business, hiring workers, leasing space, managing finances, buying and selling real estate, and taxes. It also has contracts for goods and services, as well as some sample letters to use.

I have seen this product advertised for anywhere from $12 to $59.95. I bought mine brand-new in a sealed package through the Internet on eBay for under $20, including shipping. It did not come with a big user's manual. In fact, there was no user's manual at all. All I got was a box with 2 CD's in it, one of which was the QLBP CD. But I usually judge how good a program is by how little one needs to consult a user's manual. So far, there has not been any need to have one. The program explains everything and has references we can go to if we need more information on a subject.

Included in the program are things called "Nolo books." Some of the titles are Starting and Running a Business, Tax Savvy for Small Business, Manager's Legal Handbook, and many others available with just a mouse click. There are additional references and products available online via http://www.nolo.com. QLBP also includes a second CD, called "Carbonite," which is a program for online PC backup. I probably will never use that though.

I highly recommend this product for anyone who is running a small business or thinking of starting one. The price is very reasonable for such a powerful and intuitive business tool. ◆

(Minutes……..Continued from page 3)

tem, when properly assembled, is quite expensive. Jim demonstrated how the film scanner works using a roll of Advanced Photo System film. He also demonstrated how the image was loaded into the Photoshop Elements Organizer and showed the features of the Organizer. He discussed the vast improvements and versatility of the new flatbed scanners which, in spite of the quality improvements, are available at much lower prices than just a few years ago. Jim highly recommended a visit to Wayne Fulton's web site for information on practically any aspect of scanning. The site is exceptionally well organized and is written in a style that is easy to understand. Fulton also responded to an email on the same day that it was submitted. http://www.scantips.com.

In showing the Organizer in Photoshop Elements Jim demonstrated how images are added by downloading them from the camera and how they can be viewed by folder, date, or geographical location. Jim demonstrated a feature that allows you to switch good heads for bad between common group pictures, thereby eliminating closed eyes, turned heads and funny expressions. Jim also had scrapbooks available as examples of how to share your photos. The presentation ended with a discussion of scanners and how to look for the features that take care of your specific needs. The meeting ended at approximately 9:30 pm. ◆

InSight

By Jenny Lind Olin, Tampa PC Users Group
jlolin@tampabay.rr.com

Some of you may think that I was kidding when I told you I was in a brain training program. It has been fun to tell people: "I had brain training this morning" and see their reaction.

I have recently taken part in a study using InSight by the Aging Department at the University of South Florida. InSight is an expensive **($395 for the single user)** program which you can purchase online. I participated free because I volunteered to participate and do a follow-up program in five years. After completing the course, I took the assessment test, which was similar to the pre-assessment test I took before starting the program. In five years I will go back to be reevaluated. The study has shown that your assessment score after a 5-year lapse will be very similar to the assessment score that you obtain after completing the InSight program.

InSight features five engaging exercises. These exercises adapt to individual performance, so you're always working at the right level for your brain.

This scientific program has been designed to improve your memory, your reaction time and your life. Check it out at http://www.PositScience.org.

Change the way you see the world. See more, react faster, drive better. Get more out of viewing a movie. InSight features five engaging exercises for visual precision, useful field of view, visual processing speed, and divided attention, found in these exercises: Bird Safari, Jewel Diver, Master Gardener, Road Tour, and Sweep Seeker. Although it was offered, I never did do the Master Gardener. After an hour session, I felt as though I had worked out in the gym except it was my brain that was stimulated

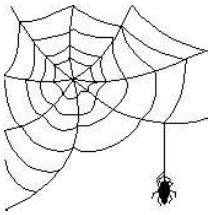
Venice Floods



It is nothing new for Venice to flood. This image (cropped to better fit our page) is from the New York Times at http://www.nytimes.com/aponline/world/AP-EU-Italy-Venice-High-Water.html?hp

"The worst flooding in Venice in more than 20 years forced residents and tourists to wade through knee-high water Monday.

City officials said the sea level topped 61 inches (156 centimeters) on Monday, well past the 40-inch (110-centimeter) flood mark, following heavy rains."

Viewing Your Photos In Vista

By Jim Purcell, Secretary, Tampa PC Users Group
Edward_J_P@MSN.com

At the August meeting, William LaMartin showed us the program that he created in Access to organize his photos. In addition, there was an article in the September Newsletter about another method, the Photoshop Elements (PE) Organizer, and a demonstration of it at the November meeting.

This should be the last article on organizing and viewing your photos, but I think that it's important to point out the features of the Vista Photo Gallery because I don't think most people are aware of what an outstanding program it is. I believe that this is true regardless of what your definition of is is. Another important point is that, if you have Vista, Photo Gallery is free. Not only is it one of the most powerful and flexible organizers that I have seen but it is also one of the easiest to use. Further, Vista Photo Gallery has a built-in editing program that allows you to correct some of the most common photo problems, such as red eye, dark photos, or faded color. The included cropping program provides a simple way to crop your pictures to standard print sizes. You can also turn your color photo into a black-and-white or sepia photo. Although I'm not actively using Gallery, it automatically picked up all of my photos stored in the Pictures folder. I tested the Red Eye tool on one of my pictures that I had a little trouble with in PE, and it worked like a charm the first time. The program also provides a quick and easy way to assemble a fairly sophisticated slide show or movie and burn it to a DVD. Your photos will be automatically brought into the Pictures folder when you plug your camera or card reader into the USB port of your computer. You have the ability to control the automatic feature, as well as the destination

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Bob LaFave moderates the discussion.

Digital Imaging SIG—Cancelled until further notice

(Photos…….Continued from page 6)

folder. The program is available in all versions of Vista, but there are less theme options in the home basic version.

The illustration above shows you the general layout of Vista Photo Gallery which I hope will help you visualize the options that I will describe. The folders on the left in the illustration are your folders in your Windows Explorer just as you have constructed it. When you click on a folder, the photos in that folder will appear in Gallery. If you click on date taken, you get a list of folders by year, each of which can be expanded to the 12 months in the year and then to days. By using Ctrl Click, you can include as many options as you wish. Gallery has a ranking system consisting of one to five stars to allow you to rank your pictures in any way you choose. You can select any group or groups that you desire by just clicking on them in the same way.

There is also a system of tagging where you create the tags (Names, Locations, Dates, Events, etc). Tags are properties that will be attached to your files to help you to find and organize them by clicking on the tag and dragging it over the photo. They are not a part of the actual contents of a file but become a part of the file's properties. You can change the size of the thumbnails in the gallery from too small to recognize to large enough to clearly recognize. When the thumbnails are small to very small, you can get a popup of a large picture with its basic data by pausing your cursor over the thumbnail. You can change the appearance of the thumbnails to include captions or basic data. The way your files are indexed in Vista allows almost instant response to your searches, permitting you to take full advantage of the many ways that your photos can be displayed.

The beauty of this program is that it contains practically every function to store, edit and print your photos. It also gives you the capability to create both slide shows and movies. I would consider the organizer in Photo Gallery a full function program. The editing program is certainly not Photoshop, but it contains most of the features that a casual photographer requires. Both the slide- and the movie-producing programs are short of what's available in the specialized programs for those functions, but they allow you to do things like adding music and they have a generous assortment of themes and slide transitions. These may be all that you need, but, if not, they should be big help in selecting a more sophisticated program. For more information you might look at the "Windows Vista Book" by Matt Klosklowski and Kleber Stephenson. ◆

(Comments…….Continued from page 1)

click on it and then choose "Lookup on Merriam Webster" from the several options given. You will be provided with a definition, as well as a speaker symbol, which, if clicked on, will produce the pronunciation through the computer's speakers.

The second item is a web site called theRadio.com at http://www.theradio.com. So far I have found only one song that it couldn't play for me. It seems to know popular songs from many years back, as well as current ones.

Since the stock market has been doing so badly lately, let's end with a look at some technology stocks. The figures are adjusted for stock splits.

Company	1/3/2000	1/2/2008	12/1/2008

Minutes of the December Meeting

By Jim Purcell, Secretary, Tampa PC Users Group
Edward_J_P@MSN.com

Since this was our annual holiday party meeting, no guest speaker was scheduled. Bob LaFave did conduct a short Windows SIG meeting preceding the business session to cover any holiday related or urgent questions. President John Witmer began the business meeting at about 6:45 pm. The only item on the agenda was the election of officers for calendar year 2009. No new members offered to serve as officers for 2009. Current members all agreed to serve one more year if there were no further nominations from the floor. John then asked for further nominations from the floor before presenting the slate for a vote. Hearing none, the following slate of officers was presented:

- For President: John Witmer
- For Vice President: Kevan Sheridan
- For Treasurer: Doug Mullis
- For Secretary: Jim Purcell
- For Member at Large: Ron Weinberg

A motion was made to accept this slate and to vote. All members present voted in favor. Terms of office begin January 1, 2009.

John then thanked those willing to serve the group as officers. The TPCUG board members decided that the party food should be paid for from the group's funds. Our thanks are also extended to John and Pepin Distributing for accommodating us and providing beverages for the party. John reminded members to make an extra effort to pay their annual dues on time. William LaMartin reminded us of the ease of using PayPal on our web site.

ASUS Eee PC Netbook

By Merle Nicholson, Tampa PC Users Group
merle@merlenicholson.com

I recently purchased two ASUS Eee PC Netbooks for my grandchildren (ages 9 and 11) as portable computers to take to school. I was attracted by their very small size, relatively long battery life and wide range of built-in features. So far it has been a success, since the children took them on a Christmas trip and connected wirelessly to the Internet unaided in a hotel.

So what is a netbook? It seems to be a small notebook with a screen size of 10 inches or less and a slightly reduced-in-size keyboard. ASUS looks to be the pioneer in this class of notebooks, but there are competitors now in HP, Dell and MSI. As far as I can tell, though, ASUS still enjoys the highest sales in this category, no doubt attributable to the very wide range of models. I read a sales report that a substantial amount of Christmas notebook sales were in this category.

The ASUS line begins with a model 4G with a 7-inch 800 x 480 screen display, Linux OS, Intel Mobile CPU, 512 MB memory and a 4 GB solid-state hard drive (SSD). It has a LAN (wired) port and wireless b/g, stereo sound, and a 0.3 Megapixel camera. The size is 8.9"x 6.3"x 1.26", it weighs just 2 pounds, and it has a 4-cell battery for 3.5 hours of operation. It comes with a cloth/neoprene slipcase and charger. All for $220 at NewEgg.com.

There's an XP Home version, believe it or not, using the same 4G SSD, and depending on a (user-supplied) SD or SDHC card for storage. The Linux OS is a modified Xandros distribution. Some users are installing a version of Ubuntu called Eeebuntu. Many buy the Linux version because it's cheaper and then install their own copy of Windows XP.

By the way, the Eee comes from "Easy to Learn, Easy to Work, Easy to Play".

What these netbooks are (not surprisingly) missing are a CD drive, a floppy drive, serial and parallel ports and keyboard/mouse ports.

They DO have three USB ports and an external VGA port, an SD/SDHC reader slot, a touchpad, camera, LAN-wired and wireless. Starting with the larger models, 8.9" and 10" screens, wireless N and Bluetooth are added, the camera jumps to 1.3 Megapixels, the battery goes to a 6 cell and the processor changes to the Intel Atom. They're also slightly lar-

ger and heavier, but with a much longer battery life.

The ones I purchased are the Eee PC 901. And let me say right here, I want one for myself. I have absolutely no use for it, but after using them myself for a couple of days, I really like them, and if I could find even a small excuse, I'd buy one for myself.

The Eee PC 901s that I bought are black. They look really well-built and rugged. The black gloss finish collects fingerprints like nobody's business. There's no indication that it's not suitable for a six- or seven-year-old who is already used to using a computer. The screen hinge is especially rugged. There's no latch to hold it closed, but there's plenty of friction

(Netbook……Continued on page 4)

(Netbook…….Continued from page 3)
there and it's not really effortless to open.

The features of the 901 (actually there's a 900 series) are a 8.9" 1024 x 600 screen, slightly larger (not much) at 8.9" x 6.9" x 1.5", 2.43 pounds. It has a 1.3 Megapixel camera, 1G of memory, an Intel Atom (1.6 GHz), low-power CPU and 12G SSD storage. The storage is divided into two drives: one 4G and one 8G. It has wireless b/g/n, Ethernet and Bluetooth. The SSD storage and compact design makes it pretty much shock-proof . When you use the SD slot, the card does not project out at all, and, frankly, on a black case it's a little difficult to find. They advertize a 7.8-hour battery life. I paid $600 each for them in early August, 2008. The current (Jan 2009) price is $450 with about $11 shipping.

As for software, it's surprisingly (almost) crap free. They have Windows XP Home installed on the 4G "C" drive. Besides what comes with XP, they include MS Works, OpenOffice and Skype. There was – I've forgotten now – some kind of antivirus that needed a subscription and no anti-spyware. Windows XP firewall was enabled. I installed AVG Free, hoping that it wouldn't bog the CPU down too much (it doesn't). I uninstalled Skype, and went through all installed programs, looking for their usefulness, and uninstalling anything that I felt my grandchildren would not use – like Skype, which is Internet phone and video. I did check out Windows Moviemaker to make sure it would use the camera – it does. I uninstalled Adobe Reader and installed a PDF reader from Haihaisoft, because it is much, much smaller. I felt that the children must have a good photo editor, so I installed Paint.NET, a very good image and photo-editing program. I looked at GIMP (cloned from the Linux world) also, and I think it was a toss-up. I used a good (free) PDF printer, PrimoPDF.

I wound up leaving MS Works on the machine because there was room, but removed OpenOffice. I found an Office 2007 Student, three-license version, for only $90. I custom-installed Word and PowerPoint, both of which the children have used before.

I even went through the Services list to see if there was anything running that was not necessary, stopped any I found not worth running, and set them

to manual start.

Then I did a CCleaner, and created a paging file (it had none; a mystery to me) on the D drive, defragged and wiped my handprints off. As an aside, I have since learned that there is no need to defrag an SSD and that doing so regularly may be detrimental to its life.

I was impressed with the power of the computer. I did some Internet surfing, edited a photo, printed and made a short movie of myself. Now, it's not fast, but I really did not expect it to be as fast as it is. My grandson has played a DVD movie from an external CD/DVD drive and he says it played perfectly. It's comfortable, and I'd say I've certainly owned slower notebooks (a last generation, maybe a Pentium III). This particular PC boots very quickly because of the SSD. I have disabled Hibernation because of the SSD also, there being no gain in boot time.

You should expect the models with an SSD to be somewhat faster, and they should boot much quicker. They're obviously much more expensive.

Looking at other models, there are versions that use conventional hard drives to save money. For instance, there's a model 904HA, which is essentially like the 901 except it has a 160G hard drive, for $350, a full $100 cheaper. Strangely, it does not have Bluetooth or wireless N. I think Bluetooth should be considered as an essential part of all notebooks.

Looking on, there's a 10" model (1024 x 600) with a

(Netbook…….Continued on page 8)

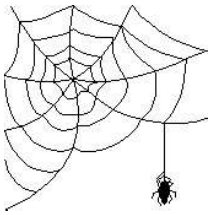
(Comments…….Continued from page 4)

new hard drives also fail, or perhaps a virus will destroy some of your files. A year or so back, my laptop's hard drive began to exhibit signs of failure. I didn't have an Acronis backup of the laptop, since I didn't consider it important, my real work being done on the desktop computer. However, when I thought of the work involved in installing the operating system, all the programs and all the updates for everything on the laptop after a new hard drive was installed, I saw that I really needed a backup of the current drive if I could still get it. And, luckily, the old hard drive cooperated long enough for me to make a backup of it, using Acronis True Image Home.

So I recommend the Acronis True Image Home program to you. I use it about every two weeks to back up my main computer to an external hard drive. I verify that the backup is valid using the program, and I alternate between two different external drives in doing the backups. Additionally, I disconnect all cables from the external drives when they are not in use. It does no good to backup to external drives, leave them connected and then have lightening strike your computer and possibly also damage the external drive. I backup up the laptop less frequently.

I should comment that I also back up the data for programs such as Word, Excel and my Visual Studio programming, as well as photos downloaded from my digital camera, to a third external hard drive as I make changes to the files. I do this simply by copying the new version to the external drive. So these files are saved in four places—on the computer, on two external drives as part of the Acronis backup and on the third external drive as separate files. You cannot backup enough. ◆

Internet Picture of the Month



Snow in New Orleans

On December 11, 2008, a rare snowfall occurred in New Orleans. And the amount was enough for a fairly good blanket of snow on the grass. Above is a photo of the St. Charles Avenue street car traveling through the falling flakes. The image came from http://www.nola.com/, the site of the Times-Picayune.

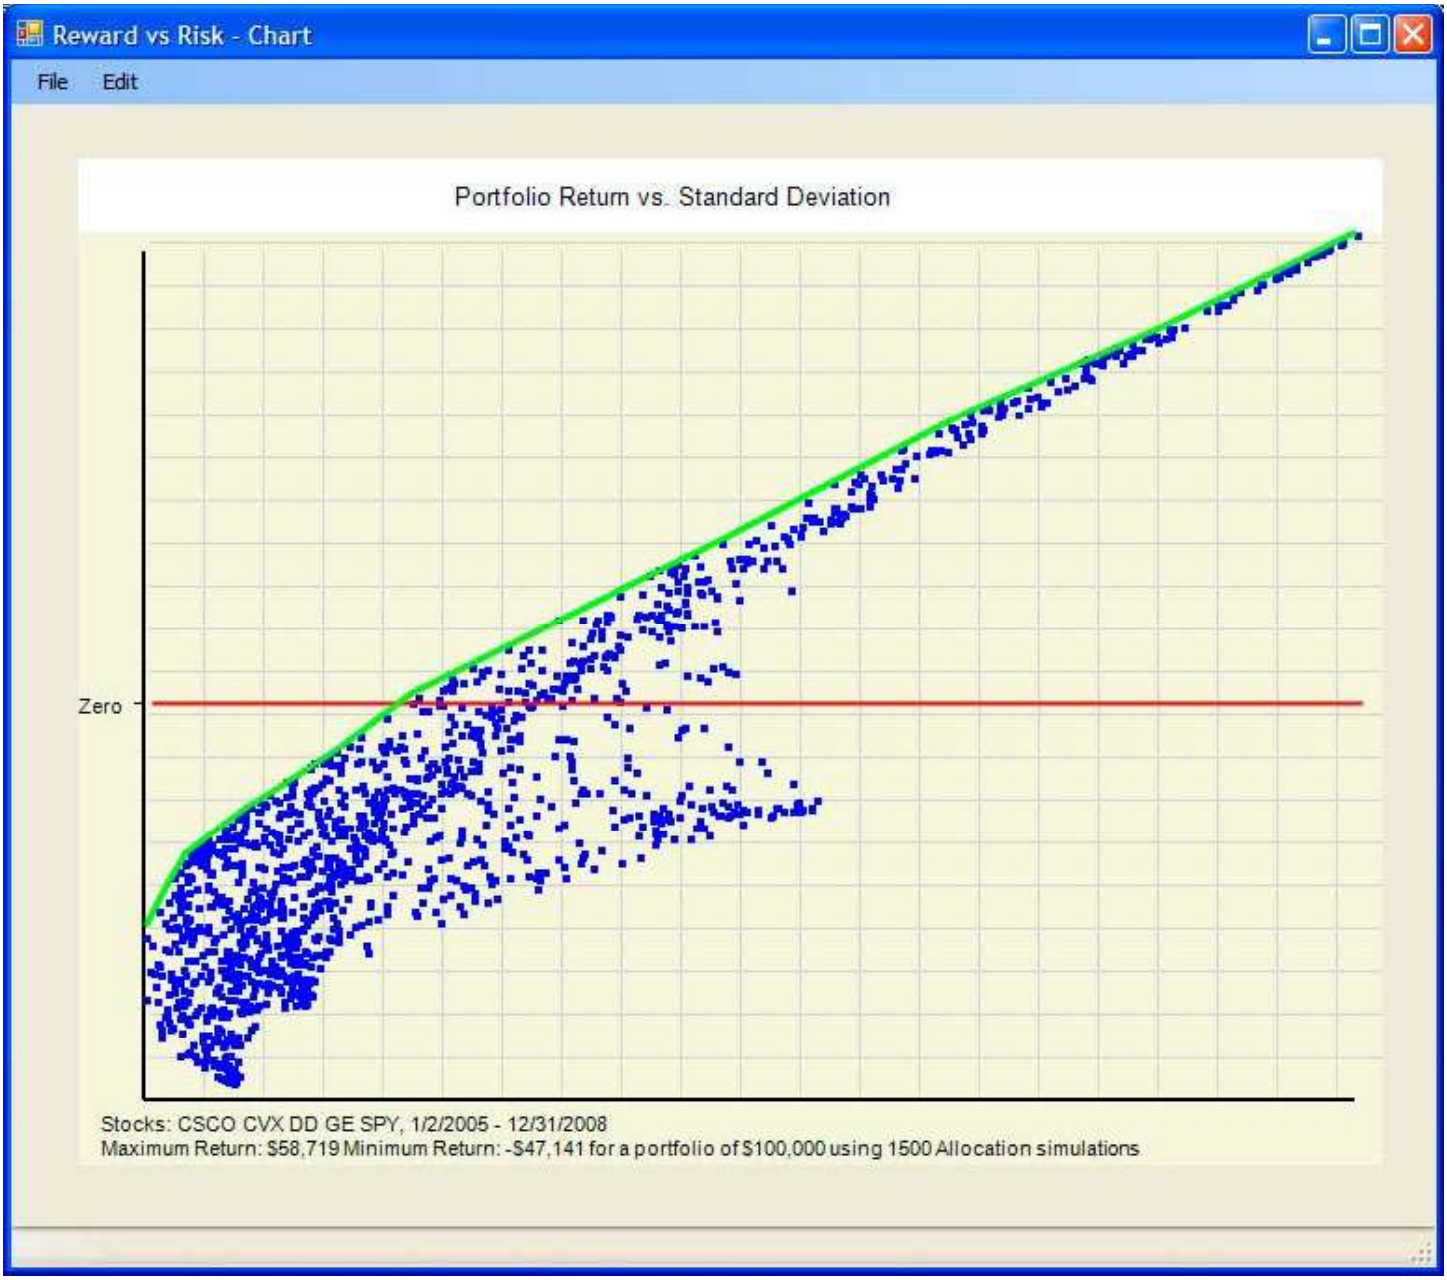
Stock Allocation with Visual Basic (.Net)



By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

I always love a programming challenge. So when I came across the idea of "The Optimal Portfolio" for a collection of stocks, I set to work to see if I could represent the idea in code. Harry M. Markowitz (who, along with William F. Sharpe and Merton Miller, received the Nobel Prize in 1990) first developed the ideas on which all this "Portfolio Selection" is based. The idea is that each collection of stocks would have a level of risk and reward, but that for any given level of risk, there was only one allocation of those stocks that would return an optimum reward. And, for any given reward, there would be only one allocation of stocks that would minimize the risk.

If you want to read about all this, just do an Internet search for optimal portfolio and Markowitz. The Wikipedia reference is http://en.wikipedia.org/wiki/Modern_portfolio_theory.

The graph below is the visual representation of the results of my code for five stocks over a four-year period. The blue dots represent the results of a Monte

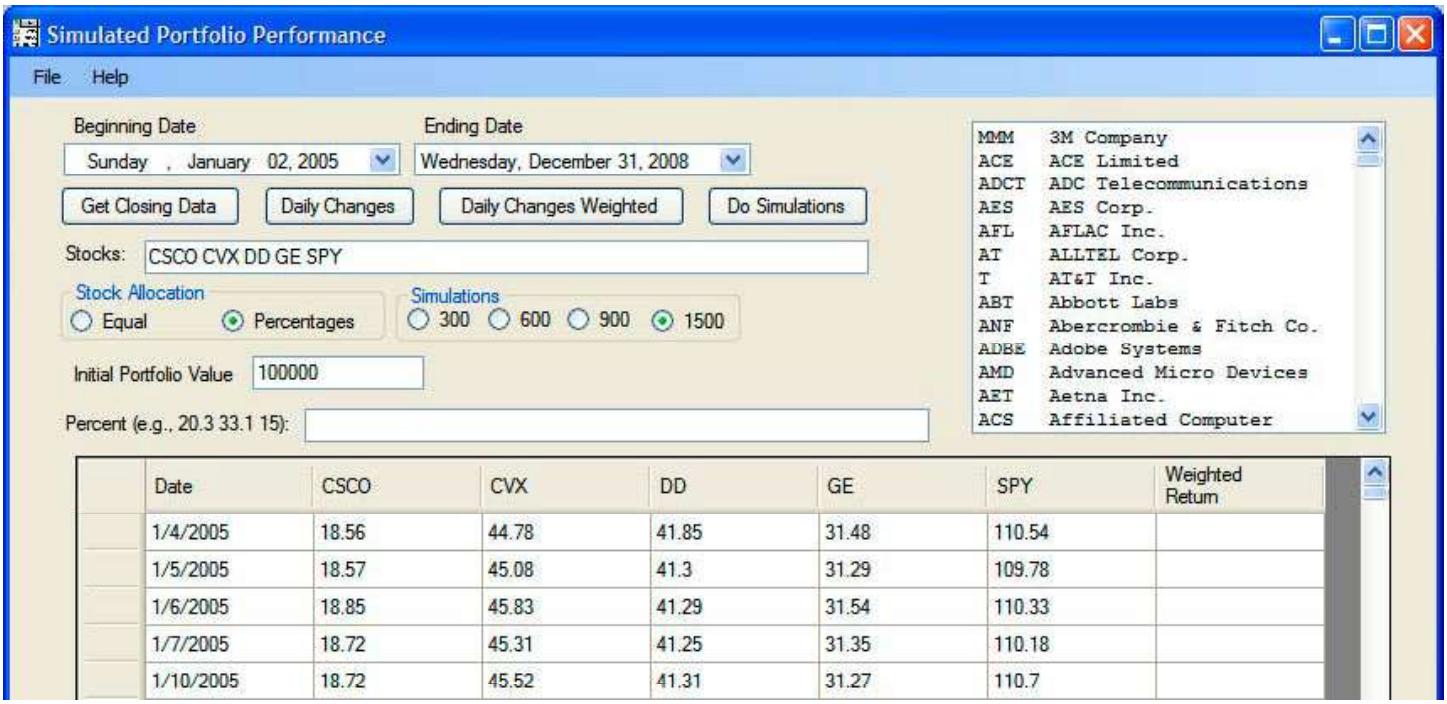
(Stocks……Continued from page 6)



Carlo simulation of different allocation percentages of the five stocks followed for four years. Obviously, we prefer to have the result with the greatest return. That would appear to be the one represented by the blue dot in the upper right-hand corner (when you view the numerical results of the simulation, you see that it is the one with 95% of the portfolio in CVX). But wait a minute, that result carries a high risk (risk increases to the right along the horizontal axis).

There are really two questions:

1. For a particular risk (a point on the horizontal axis), what is the best return we can expect (a point on the vertical axis)?
2. For a particular return (a point on the vertical axis), what is the result with the least risk (a point on the horizontal axis) that produces it?

An inspection of the graph, shows that the points along the green curve are the results that satisfy our conditions. This set of results is called the efficient frontier.

So how is all this accomplished? Obviously there is not room here to explain that except to say that my program retrieves the historical stock data from Yahoo, as displayed in the screen capture below of the program's main interface. Once the Closing Data is received, I click the Do Simulations button, which performs 1500 simulations. For each simulation, a random assignment of percentages of the portfolio is assigned to each of the five stocks. Then, for each assignment, the program uses the historical data to calculate the return for that assignment. After the 1500 simulations, then means and standard deviations are calculated, and a graph is drawn. And I am out of space, which was the point of this article—to fill up space. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

Several of our members now have Kindles. In this issue, member Jim Purcell tells us about his. And I continue the saga of my computer's chip fan that was begun in the September 2008 newsletter. The moral of that story is that, if possible, purchase a computer with a heat sink instead of a fan for the chip's cooling. That way the fan will never need replacing.

For those of you with smart phones, you might improve their functioning by downloading and installing the latest software updates for your particular phone. My one-year-old HTC Windows Mobile PPC 6800 phone (http://www.tpcug.org/newsletter/nl_2007/December2007/htc_pocketpc_6800.htm) had been giving me more and more trouble, the main problem being that it would quite frequently need to be rebooted. As I was almost at the pont of junking this very expensive phone, I decided to call Alltel and see what could be done. They directed me to a web site from which I could download the newest software that would install ROM updates, etc. And, a bit to my surprise, after the update the phone has worked flawlessly for the past three weeks. ◆

Minutes of the January Meeting

By Jim Purcell, Secretary, Tampa PC Users Group
Edward_J_P@MSN.com

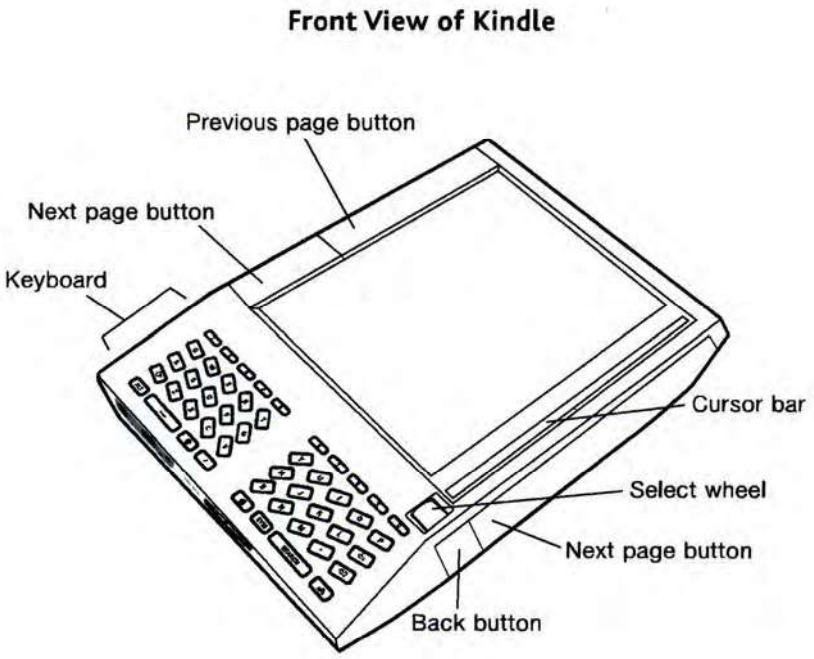
Bob LaFave started the windows SIG at about 6:35 PM. He discussed disk burning software, both free and commercial. He discussed the merits and capabilities of software like ImgBurn, which allows you to read a disk to an image file, create an image file from files on your computer, write an image file to a disk and verify the readability of a disk. Bob pointed out that if you were interested in more sophisticated projects like slide shows or video editing, you would need a program like those offered by Roxio and Nero. There was also a discussion about the viability of upgrading the firmware on your CD or DVD drive. Both Bob and Merle Nicholson cautioned that it is not always a simple download and that it is not advisable to do the upgrade unless either you are having trouble with the drive or the upgrade offers additional capabilities that you need. They also noted that new drives with the latest features are relatively inexpensive. Bob also discussed "Network Magic," offered by Cisco, as an excellent program to help you set up and manage your network. It also includes a network scanner to help you understand and secure your network.

John started the business portion of the meeting at approximately 7:00 PM. He welcomed and introduced a new member, Jim Sides, and acknowledged another new member, Bernard Wesner, who was not present. John gave the details of the upcoming Spring FACUG meeting in Zephyrhills on March 13th, 14th and 15th. This will be a combined meeting with the APCUG, so it will probably address more subjects than normal. More details should be available soon. He welcomed Gene Barlow of User Group Relations and thanked him for working us into his schedule. Gene and his wife Linda last visited our group about four years ago.

Gene started his presentation at about 7:10 PM. He was a part of the IBM team that put the IBM PC together, and he worked for IBM with user groups for about 14 years before he retired. He decided to continue working with user groups after he retired and has represented various software groups. His topic was all about backing up your hard drive. He stressed the importance of doing this on a regular basis. If you have performed your backups, it can not only save you a lot of time if your hard drive crashes, it can also probably save you a great deal of money. But, most importantly, it will prevent the possible permanent loss of valuable information, such as financial records, family or busi-

Minutes .....Continued on page 4

Amazon Kindle eBook reader



By Jim Purcell, Secretary, Tampa PC Users Group
Edward_j_p@msn.com

A year ago I wrote an article on eBook readers that focused on the Sony and Amazon Kindle readers and covered what I believed to be the advantages and disadvantages of the two. I've been watching both and have been trying to decide whether to buy or wait. The decision was made for me when Amazon couldn't keep up with demand and developed a six-month backlog sometime in November of 2008. I think this was due to the fact that Oprah came into possession of a Kindle, devoted one of her shows to it and proclaimed to the world that it was her "favorite new gadget," and Amazon reported that she even said that it was "life-changing for me." We all know that an endorsement of that kind from Oprah could probably immediately sell all of those buggy whips sitting in warehouses waiting for us to run out of fossil fuel. The reason that my children were able to purchase a Kindle before Christmas is that my oldest daughter was watching the Oprah Winfrey Show and ordered the reader before the big rush (and, thanks to Oprah, got a $50 discount that Amazon offered to celebrate Oprah's endorsement).

In this article, I will discuss only the Kindle eBook reader. There is a great deal of progress that has been made in both the Sony reader and the Kindle. If you are interested in the Sony reader, you probably should visit Sony Style in International Plaza. They have a full display of the two models that are currently active; one is about $50 less than the Kindle and one is about $50 more. They also have knowledgeable personnel who can discuss the intricate features of each or can quickly obtain the answers to any questions that they cannot answer.

To fully appreciate the capabilities of the Kindle, it is important that you understand how the Kindle reader functions. The diagram to the right shows the page turning controls down each side of the reader. For some unknown reason, the main page-turning control is about two-thirds the length of the unit and is very easy to hit accidently. I know that they have received complaints; I've seen them in the reviews. The "Back" control works the same way the back arrow works on your browser. The keys on the keyboard require a firm click so they do not pose the same problem as the page controls. The keyboard has special keys to assist in entering data and navigating the system. The "Select wheel" runs the cursor up and down the "Cursor bar", to select items from the pop-up menus that appear along the right side of the screen. You make your selection by simply pressing the Select wheel. The Kindle comes equipped with a wireless capability called Amazon Whispernet, which allows you to download books, magazines, Audiobooks, and your personal papers that have been formatted by Amazon to be read by your Kindle. Whispernet is free, extremely fast and works practically anywhere that you are in range of a cellular tower.

BOOKS, NEWSPAPERS AND MAGAZINES: When I wrote my article a year ago, Amazon had approximately 90,000 books in Kindle format for sale at their site. Amazon now has approximately 220,000. The books vary in price but most "best sellers" sell for $9.99. There is some indication that this price is beginning to creep to $14.82. (One Kindle owner suggested in a recent Amazon forum that all owners boycott new books offered at $14.82.) You can search the Amazon Kindle store from your Kindle and order and download from the items available. As discussed

above, books range in price, as do the magazines and newspapers. You can download and read a sample of most books for free. Most all of the newspapers from large U.S. cities, China, France, Germany, Ireland and the International Herald Tribune are available for subscription or an individual copy. The Financial Times, Wall Street Journal, Investor's Business Daily and USA Today are also available. Most of the newspapers that I checked were $9.99 a month or 75 cents per issue.. There are 21 magazines available ranging

Kindle.....Continued on page 4

Kindle.....Continued from page 3

from Technology (MIT publications since 1899 @ $1.25 per month or $2.99 per single issue) to the *Reader's Digest* @ $1.25 per month or @ $1.49 per single issue. *Time* and *Newsweek* are both $1.49 per month or 49 cents per single issue. There are also about 1200 blogs that you can search by category. The few that I scanned ran from 99 Cents to $1.99 a month. I'm sure that the range is larger. All newspapers, magazines and blogs offer a 14-day free trial. You simply need to cancel before the end of the period or the subscription will continue until canceled.

PERSONAL DOCUMENTS: In addition to the items that you purchase, you can also read several formats of your personal documents that you may wish to transfer to the Kindle. Some can be transferred directly to your reader from your computer using the USB connection. Some formats must be converted, which is quickly accomplished by Amazon. The formats are identified in the tables below. You have two choices for the documents that must be reformatted. You email the document to Amazon as an attachment and they email it back to your computer as an attachment for free. You then transfer the document to your reader via USB. For a small fee (currently 10 cents per document), they will send it directly to your reader. I've processed two documents, one to my computer and one to the reader. One took less than two minutes from the time I sent my email, and the other took less than 10 minutes.

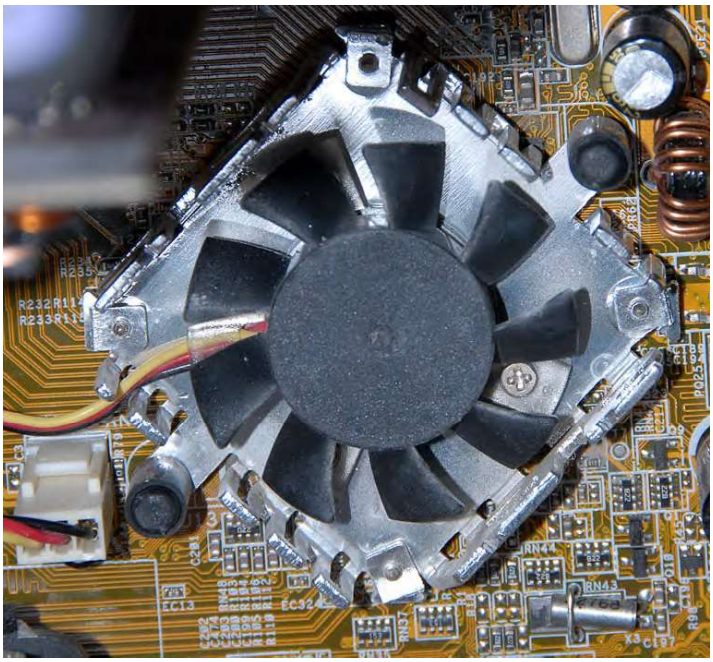
Reader Folders	**File Types That Can be Moved Directly by USB**
Documents Mobi (.mobi*, .prc*)	Kindle (.azw), text (.txt),
Music	MP3 music format (.mp3)
Audible	Audible.com (.aa)

* Files containing digital rights management software will not be readable.

The following file formats can be converted via e-mail for viewing on Kindle:

- Microsoft Word (.DOC)
- Structured HTML (.HTML, .HTM)
- JPEG (.JPEG, .JPG)
- GIF (.GIF)
- PNG (.PNG)
- BMP (.BMP)

USING THE KINDLE: Like anything new, it takes a little time to get used to reading an eBook. The adjustment came very quickly for me. It is so much more comfortable reading from the Kindle. The disadvantages of the Kindle eBook are the lack of color and, in some instances, the lack of illustrations and diagrams. I think that a newspaper is a newspaper and it is almost impossible to create a small screen format that competes with it. Some of the mechanics, such as the accidental page turning, need tweaking. Some will probably not like the screen compared to a page, but I find it easier to read. Being able to easily turn pages forward and backward is certainly a plus. The things that I really enjoy the most are the conveniences resulting from the electronic format. When you place a bookmark, it appears in a chronological list at the front of the book in which you placed it. A single click on one of these bookmarks takes you instantly to that location. You can highlight text in a book and it remains until you erase it. You can write notes as you read (via a small keyboard), and they are stored on a page that you can transfer to your computer. A built-in dictionary allows you to quickly find the meaning of words that have more than two syllables. When you conduct a search, it almost instantly searches the content of the reader (every book, newspaper, magazine, etc., that you bring into the Kindle is indexed). Once the internal search is completed, the "hits" are listed and a search document is prepared for you to search the Amazon library or the Internet. The mere fact that you can have 200 books in a unit smaller than a paperback is also very difficult to fully comprehend. ◆



Minutes.....Continued from page 2

ness historical files and pictures that can never be recreated. He identified the two stages involved. First, you back up your data to some other device, such as another hard drive, a CD or a DVD. If something happens to your data due to a hard drive crash or corruption of data, then you restore your data to a functioning hard drive. If backup has been done properly, you should be back and running in a matter of minutes. He covered, in detail, the various options for backing up data and also the details and options for restoring data, as to both the entire hard drive and individual files. His presentation detailed what he considered the best hardware and the best software to create an ideal backup program. Of the options available as a destination to backup your data, such as the Internet, DVDs or CDs, tape cartridges, or another hard drive, he believes that the best thing to which you should back up a large hard drive is to another large external hard drive. He talked about both laptop-size hard drives and the normal large hard drives. These drives have become relatively inexpensive. You should have at least one external hard drive that is dedi-

Replacing a Fan with a Heat Sink

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

In the September 2008 newsletter, http://www.tpcug.org/newsletter/nl_2008/september2008/comments.htm, I described how I removed the malfunctioning chip fan from the motherboard of my desktop computer and oiled it so that it would again turn and do its job of cooling the chip. To the right is a photo of the original chip fan with the top of its heat sink removed so that I could get at its attaching screws to remove it when I did the oiling. I knew that this probably was not a long-term solution — and it wasn't since I now have had to go and do what I didn't want to do. That is, I had to remove the motherboard from the computer and replace the chip fan and its small heat sink with a much larger heat sink.

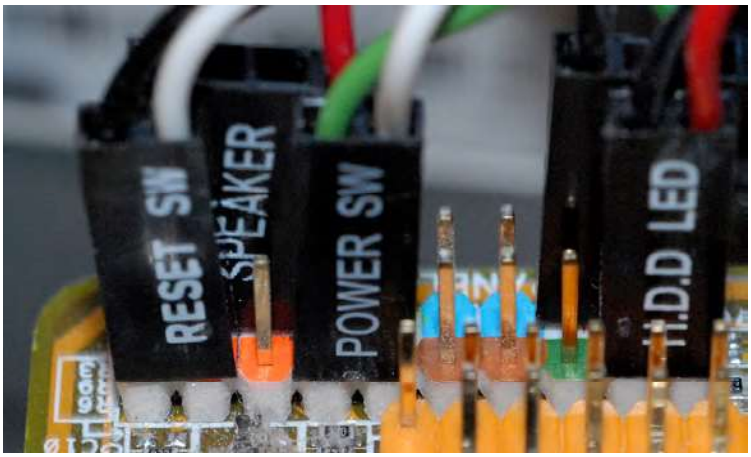
Heat Sink.....Continued from page 5



Merle Nicholson directed me to several suitable replacement heat sinks at the newegg.com site. The one I chose was a little under $10, including shipping. The replacement heat sink and its associated parts are pictured at right.

To remove the motherboard from the computer, you first disconnect the power from the computer and then unplug everything that is external to the computer: Keyboard, network cable, etc. Then you have to open up the computer and remove all its cards. But you are still not finished. You then need to disconnect the hard drive, CD and floppy drive cables. And that is not the end of it since there are various other cables that need to be disconnected depending on your particular configuration. The image below is of some of those other cables. And I confess that on my first try I reconnected them improperly since I misinterpreted the position indications on the motherboard. But no harm was done.

But before you do all of this disconnecting and removal, a word of warning. You are going to have to put everything back the way it was. This is where some mailing labels used as tags can be attached to cables indicating where they should be reattached. And a very big help is a collection of images taken with your digital camera of how things were before the big disconnect. Ideally you would have a laptop computer to which you would download these images so as to have them readily available when reassembling the desktop computer. If you don't have another computer to use, I suppose you could print them out.

Once you have tagged and photographed everything you think is necessary, you simply unplug all connections, remove the cards and then unscrew all the screws holding the motherboard in place. I think there were around nine of these screws. Be careful with the video card removal since it does not just pull out like the other cards.

Once you have the motherboard out of the computer, the next thing to do is to remove the chip fan/heat sink. This is held in place with two pins similar to the two pictured in the replacement heat sink image above. To remove one, you first use a pair of pliers to squeeze its expandable tip while pulling with another pair of pliers to remove it. Be gentle since you may need this pin if the replacement ones do not work well (as was the case for me).

Once you have removed the fan/heat sink, your motherboard should look like the image on the next page. There was a sort of paper spacer with a hole cut out for the chip that was between the motherboard and the fan/heat sink that the instructions said you could throw away, which

Special Interest Groups

Visual Basic .Net SIG (and sometimes Access SIG)

This SIG meets the third Wednesday of the month at 6:30 PM. The meeting location varies. For information, contact William LaMartin at lamartin@tampabay.rr.com.

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Bob LaFave moderates the discussion.

Heat Sink.....Continued from page 6

I did. You then assemble the screws, nuts and flanges and slide them into position in the replacement heat sink grooves. This is somewhat difficult since the screws and nuts are so small. With the flanges roughly positioned in the right locations and the nuts fairly tight, line up the holes in the flanges with the two holes in the motherboard. Then tighten the nuts all you can and recheck the alignment. The next step is to put onto the chip — the silver rectangular object in the center of the image above — a thin film of thermal grease from the supplied tube. The final step is to attach the new heat sink to the chip by pressing the replacement pins until they click in place.

This is where things got a bit dicey for me. The replacement pins just wouldn't make a tight connection. After two tries ended in failure, with the flanges becoming lose and needing retightening, I decided to try the old pins. The old pins worked beautifully. They appear to be a bit longer and heavier duty than the replacement ones, so perhaps that is the reason they worked better.

Once the new heat sink is attached, you are ready to reinstall the motherboard into the computer with the nine screws. When doing this, make sure no cables get trapped underneath the motherboard. This happened to me, and I didn't catch it until I had reinstalled the motherboard, reconnected a number of cables and reinstalled all the cards. I noticed I had a problem when one cable that was shown in my before photo appeared missing. To get at the cable I had to remove most of the cards and screws so that I could gently lift one end of the motherboard and extract the trapped cable.

With the motherboard reinstalled and all internal cables reconnected, you then connect your monitor, keyboard, mouse, etc. to the back of the computer and fire it up. If something is not right, nothing will happen. If everything is correctly connected, Windows will boot as usual.

All of this is obviously not for the faint of heart. Merle's advice was a big help, as was the web site I found with instructions for doing all this on a motherboard similar to mine. The link to it is http://euroalps.eu/technology/Computing/Chipset_Cooling/Remove_existing_fan/remove_existing_fan.html. This was helpful since the instructions that come with the replacement heat sink are minimal. ◆

Minutes.....Continued from page 4

cated to an organized backup program. He owns several brands of hard drives but prefers either the basic Seagate (without software) or an Hitachi. You should get a backup hard drive about the same size as the hard drive on your computer. You can back up more than one computer on a single hard drive, but the rule of thumb is to get an external drive that equals the sum of the size of the drives that you are backing up. There are two basic types of software available: The "basic file backup software," and the newer "image backup technology," of which he believes Acronis True Image software is one of the best. The image software creates a copy of your entire hard drive and saves it as an image. This image includes your operating system, your

Minutes.....Continued from page 4

software, your drivers and everything else, just as it appears on your computer. Acronis also allows you access to all of the individual files on the backup hard drive. The three types of backup are full, incremental and differential. Gene recommends a combination of the full and the incremental. He estimates that the backup takes about one minute to backup one gigabyte. He provided a demonstration of all of the recommended procedures. The required products were offered to our members at reduced rates.

The details of this process are generously provided in the form of a tutorial at Gene's web site at http://www.user-groupstore.com. You will also find tutorials and technical papers on other subjects and the details and prices of all of the products that he distributes. The presentation ended at about 8:35 PM. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

Thanks to Merle Nicholson and Jim Purcell, I don't have much space to fill this month. That is good since I have not really been doing much that I could write about, especially along the programming line. However, I have been using a program new to me — Adobe InDesign CS4, part of the Adobe Creative Suite 4 Design Standard upgrade which I purchased in January. And although I used it to create the February newsletter, I don't feel proficient enough to write about it yet.

For many years, I have had Adobe's Photoshop, Illustrator and Acrobat Pro, which I would upgrade individually every other year. However, I noticed that I was paying more for these three upgrades than the price of an upgrade from, say, Adobe Creative Suite 3 Design Standard to CS4 Design Standard (which contains these three programs and additionally InDesign). There was an upgrade path from either Photoshop or Illustrator to CS4 which was somewhat expensive, but there was no upgrade path

Minutes of the February Meeting

By Jim Purcell, Secretary, Tampa PC Users Group
Edward_J_P@MSN.com

Bob LaFave started the Windows SIG at about 6:30 PM. There was a question about the use of special programs for moving to a new computer from an old one. Bob does not recommend using PC Mover to move applications. Bob stated that the best way to put your applications on a new computer is to use the original CD and install the program on the new computer, just as you did on the old one. He recommended that you use the Windows Transfer Wizard or Windows Easy Transfer to move files and settings from one computer to the other. The transfer can be done in a number of ways, including a "Windows Easy Transfer Cable". There was also a discussion of the problems encountered in installing and uninstalling some antivirus programs. A member asked about dual layer DVD's. Bob discussed the various formats, their capacities and their relative costs.

John Witmer started the business portion of the meeting at approximately 7:15 PM. He purposely kept the discussion short to leave plenty of time for the Creative Memories presentation. He mentioned the need for members to pay their dues on time and suggested some methods that might be used to help members keep up with the expiration dates. He reminded members of the FACUG conference in Zephyrhills. John introduced Kathy Eustis and covered her experience and expertise with the Creative Memories programs. Kathy Eustis started her presentation at about 7:20 PM. She began with an open discussion with the members on how we use and store our pictures once they are taken. She stressed the importance of storing them in such a way that we can easily find them and of having an adequate backup system to preserve the pictures. She pointed out that pictures do not normally stand alone, that we need to record and preserve the story as well as the pictures. Kathy described the "Memory Manager" program as a complete system for storing your digital photos, clippings, children's art, as well as video and audio clips. The program allows you to record the story of the picture in as much detail as you wish. You can easily print, email or create a slide

Minutes .....Continued on page 5

New PC Setup

By Merle Nicholson, Tampa PC Users Group
merle@merlenicholson.com

For some reason, I've been setting up new computers the last few months – mostly notebooks. Offhand I'd say six since Christmas, just ten weeks ago. I thought I'd go through what I do to these machines and recommend software to add that will make them a "complete" PC. That would be just those mostly free software applications that should be of interest to everyone. To those, you'll have to add your own software that follows your own interests.

To get started, the first thing I do to a new computer is make operating system backup disks. Sometimes it's not necessary when disks are included in the package. However it's handled, it's the number one priority. Do it first. Also, later that day after removing crapware, it is necessary to make some Acronis image backup CDs and then a bootable Acronis CD for recovery and put all these CDs away for WHEN (not IF) you need them. I don't consider a recovery partition a valid option because it's useless in the case of a hard drive failure.

I'll continue to use the new $550 HP/Compaq as my example. There is an HP program that you can only run once that will make recovery CDs. It is not an Operating System CD, so it will put the PC back to its delivery state. Do it now, not later.

The second in priority is to clean the crapware from the new PC. The last notebook I bought for myself at Office Depot, the sales guy offered a $15 program on CD that will clean up my computer! Later I found it on the HP site as an ordering option. I was just a bit indignant, and my wife said to him "That's why I have him to do that!" meaning me. It's true I'll do a much more thorough job because I have a very well-defined crapware definition. "If I don't know what it is, uninstall it!"

I uninstall everything I do not need from the "Programs and Features" in Control Panel. On an HP consumer PC, there's a lot to do, almost all of them identified as HP. They have even rebranded Wild Tangent as "HP Games". That was the first to go. The problem in uninstalling is the risk of losing something essential, but I've never really encountered that. If I were to accidently delete a hardware driver, I can get that driver back from their web site. I always uninstall any "trial" software. That will include copies of Office and Norton AntiVirus. Also, I uninstall anything that has the word "toolbar", "MSN" or "AOL". Now reboot one last time, and install an antivirus. Then start doing Microsoft Updates. All this will take quite a while.

Antivirus:
At this point I usually install AVG Free 8.5 (http://www.download.com). There are a couple of reasons. First, it's free. Second, it's reasonably unobtrusive even on a netbook PC like ASUS EeePC. It includes anti-spyware, and it has a very understandable user interface. If I put footprint size as most important, I'd use Sunbelt Software VIPRE ($29.95) at http://www.sunbeltsecuritynews.com/LYFUQ0/090218-VIPRE-for-Netbooks. They have specifically tested on netbooks. Remember also that Vista has Windows Defender installed by default, and it probably was installed in some Windows XP update. It's just an anti-spyware program. So if you install a fully integrated anti-malware program, you can disable Defender if you wish. It's in your startup list in msconfig, labeled "MSASCui.exe. It's also installed as a Service in Computer Management, Services. Find it, right-click for Properties, stop and disable it.

I also use Microsoft Windows Live One-Care, http://onecare.live.com/standard/en-us/3/default.htm, on three of my computers. It's very easy to install and use. It's $50 for three PC's for one year. It's very unobtrusive and has the best reporting system and user interface I've seen. It includes an enhanced two-way firewall, schedules tune-ups, checks for updates and schedules automatic backups. By the end of 2009, Microsoft is supposed to rename it and make it free.

Firewall:
If you don't want to depend on the Windows Firewall, and your antivirus package does not include one, there are several free ones available. My favorite free one is

New PC.....Continued on page 4

New PC.....Continued from page 3

Webroot Desktop Firewall, free at: http://www.webroot.com/En_US/consumer-products-desktopfirewall.html

Updates:
After the antivirus and firewall programs are running, it's time to install all updates. First make sure XP is at Service Pack 3, and Vista is at Service Pack 1. If not, install those first, then do the remaining updates. After you have the updates installed, do it again until there are no more updates available. The reason is that updates need updates, and you'll get the first one, and when Update rescans, it'll find more.

In Windows Updates, there are usually "optional" hardware driver updates. I always, always skip those, and also I'll mark them as hidden so I won't be bothered with them again. Then I'll go to the manufacturers' website to see if there are later drivers there. My philosophy on hardware drivers is: Don't fix it if it ain't broke.

Back Up:
Ok, here's a very good time to back up the system. All the crapware is off, and it's up-to-date and an anti-virus is installed. Also, the backup will not be large because I haven't begun to move data files, and I haven't installed any software. I usually do an Acronis full backup. I really don't want to use a file backup here now because I want to have a fast recovery method. So I use either an external hard drive or DVDs – or both. Then I make sure I have a CD that will recover the image.

Essential Software:
PDF Writer: Every PC needs a PDF printer installed. It appears in your printer list, along with all other printers. The difference is that the resulting print is a PDF file. You should never send someone a word document or a text file just to have them read it. Everyone has a PDF reader.

There are many PDF printers. I use PrimoPDF. Other popular freebies are CutePDF Writer and PDF995, all from http://www.downloads.com.

PDF Reader:
Well, everyone has Adobe Reader. http://www.abobe.com/reader, and you probably need it for the add-in for Internet Explorer, but it's gotten so very large it takes forever to load. For a while the install included an IE toolbar which you had to uncheck. And now it installs Adobe Air, and you don't have any choice. However, you can go to Add/Remove and uninstall just Adobe Air. Also, you must (should) remove Adobe Reader from Startup in msconfig. I hate programs that are always "calling home." I would never install Adobe Reader on a netbook.

A very good solution to Adobe Bloat is to install a lightweight reader. Foxit Reader (http://www.download.com/windows/) is very popular. My personal favorite is Haihaisoft PDF Reader. http://www.drm-x.com/PDF_Reader.aspx. It's very small sized at 1.7 MB.

Office Software:
Everyone needs word processing. Most students need a presentation program and a spreadsheet. You can't go wrong with Microsoft Office. The current price for Office Home and Student is $100. I purchased one in December 2008 that is licensed for three computers for $90 at http://www.NewEgg.com. But there are some competitors, and they're very good. OpenOffice is free at http://www.openoffice.org. Its close cousin, Sun StarOffice, is $34.95 at http://globalspecials.sun.com/. You should not have file compatibility problems sharing with Word documents. But check the compatibility out first before committing a lot of work.

Photos:
My favorite free photo searcher/viewer/slideshow/cataloger/photo editor is WildBit Viewer 5.3 at http://www.wildbit-soft.fi The photo-editing capability is not complete like you'd expect of a commercial package, but it does a lot. I found it because I was looking for a program that would sequentially rename all of the photos in a folder. This does that, and much, much more.

More Photos and Paint:
Two very good free Paint Shop substitutes are Paint.NET and GIMP. GIMP is a Linux derivative and is the standard photo and paint program in Linux. Also there

New PC .....Continued on page 6

Minutes.....Continued from page 2

show with your photos and keep up with the status of each item in storage. The program also includes four pages of editing tools. The editing program is quite comprehensive, is very easy to use, and most scrap bookers will find the tools intuitive. Kathy then described the capabilities and versatility of Story-book Creator Plus, the Creative Memories software program that allows you to create a digital scrapbook. To start a project, you choose from a list of sizes and themes. You begin with the templates provided (or you can start with a blank page). The program populates the first 20 pages with the photos or digital articles that you have selected. You have complete freedom to move or change the photos and rearrange them as you desire. You can also create text boxes where you

is a smaller version of GIMP called GIMP Portable. All are available at http://www.download.com/windows/

Media Player:
It's hard to beat the free VLC Media Player from VideoLAN Project. I always get frustrated with the Windows Media Player because I can't seem to remember what file types it WON'T play. With VLC you don't have to worry about that for audio and video files. It also has a simpler user interface than WMP. Any program that offers "skins" isn't for me. Hell, I don't know what a "skin" is.

Backup:
It's hard to beat the free Microsoft SyncToy 2.0. But if you use Vista, don't forget that a built-in "Backup Status and Configuration" (Orb, All Programs, Accessories, System Tools) is very good and easily scheduled. SyncToy 3 is available at the Microsoft Download Center: http://www.microsoft.com/downloads/en/default.aspx.

Disk Defrag:
The built-in Windows defrag is pretty boring. I use the highly rated Auslogics Disk Defrag 1.5.23.350. from Download.com: http://www.download.com/Auslogics-Disk-Defrag/3000-2094_4-10567503.html?tag=mncol

Outlook Email Organizer:
xobni (all in lower case – inbox spelled backwards) indexes and searches all your outlook emails and attachments. It's a plug-in for Outlook 2003 and 2007. Once you see what it can do, you'd actually pay money for it. Thankfully it's free. http://www.xobni.com/

Three Windows XP Specific MUST HAVES:
Microsoft ClearType Tuner http://www.download.com/ClearType-Tuner/3000-2094_4-10628947.html?tag=mncol

Comments.....Continued from page 1

that would be cheaper for those like me with both Photoshop and Illustrator, not to mention Acrobat. So I phoned Adobe about this and laid out my case and did receive a better price for the upgrade to CS4 Design Standard which was cheaper than an upgrade from either Illustrator or Photoshop but more expensive than an upgrade from CS3 Design Standard.

By the way, Adobe InDesign is for desktop publishing and will replace Microsoft Publisher for me in creating newsletters, booklets, brochures, etc. Now I had a new program I needed to learn, and Adobe had just the thing to teach me — a one-month free subscription to lynda.com, where I could watch all the training videos I wanted. In the past, I had temporary access to some of these on a CD for learning Photoshop and knew how good they were. Now I would have access to the entire catalog of training videos.

I highly recommend that you go to http://www.lynda.com and look around. You can sign up for as little as $25 for one month. And a few of the videos may be viewed for free. For example, I think Photoshop CS4 Essential Training has about six that may be viewed for free. Additionally, as is true for all versions of other programs, there is training for all versions of Photoshop.

A list of the programs — some of which I didn't know existed — for which there are videos is below. ◆

want. There are a large variety of pre-designed pages that you can customize with the software program. Once you have created your book you have a variety of ways to show your photos. You can upload the information to Creative Memories and have them published in a beautiful bound book of 20 to 100 pages. The books are available in sizes of 12x12, 11x8.5, 8x8 and 7x5 inches. You can also have individual pages printed or you can print your own pages to be framed or placed in an album. Creative Memories has a wide variety of optional packages that you can purchase to embellish your pages or you can use your imagination and create your own.

The meeting ended at 8:40 PM. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

A number of members attended the FACUG Spring Conference this past month in Zephyrhills, and attendee Ron Wienberg tells us some of the highlights of the meeting in his article on page three of this newsletter. Our secretary, Jim Purcell, ever conscientious, while traveling emailed the minutes from a Panera Bread location in New York. However, someone else must have forgotten to send in his/her article, so you will be stuck with what I have this month. Actually, I think my topic is fairly interesting. It is a web application that for any state, displays the location of each city with an National Public Radio station. Further, if you hover your mouse over the pin at a city, a fly-out lists the call letters of all stations in the city, and, if the stations have a live audio feed, a link to that is provided. Additionally, the pins are color-coded so as to indicate multiple stations in a city and whether or not they have live feeds. I hope you find my description of creating it interesting. ◆

Minutes of the March Meeting

By Jim Purcell, Secretary, Tampa PC Users Group
Edward_J_P@MSN.com

Bob LaFave started the Windows SIG at 6:35 PM. He began by demonstrating how to reach Amazon.com through our web site in order for our user group to receive a commission on a purchase. Bob also answered a question on exporting cookies from one computer to another. He described the features of "LightScribe," a labeling program for specially treated DVD/CD's. He advised that sometimes the colors you choose will affect the quality of your label on some LightScribe blanks. He demonstrated the repair and restore functions available in Vista. Bob discussed CD/DVD capacities as a follow-up to a question at last month's meeting. He mentioned Nero Info Tool, a program that will give you all of the information on your CD/DVD players and an inserted disk. Bob discussed the details of how you can watch TV and listen to the radio on your computer. He took a minute to explain the mechanics of backing up computers with the Vista operating system. You can easily backup several Vista computers on the same hard drive. The backup system is very simple, with few or no choices. Almost everything is decided for you. Bob led an extensive discussion of TV tuners and how they can be used. In response to a question on how to record "You Tube" programs, he also mentioned that "Total Recorder" is a program that will record almost any form of audio.

The Windows SIG ended at approximately 8:00 PM. The last part of the Windows SIG led into the presentation for March, "Microsoft Moviemaker," which was also presented by Bob. The Microsoft Moviemaker program is included in the Windows Vista Ultimate operating system. Bob's presentation contained numerous tips and procedures to help the user get the most from this program. Bob stressed the ease with which you can complete complicated and impressive functions which in the past were diff cult to learn and to execute. He demonstrated the ways that you can build your video and enhance it by importing audio and video supplements from various sources. The program also provides numerous special effects. The

FACUG Conference Highlights

By Ron Weinberg, Member at Large, Tampa PC Users Group
rswjbr@verizon.net

The Florida Association of Computer User Groups, or FACUG, held its Spring Conference in Zephyrhills on March 14 and 15. These events consist of a number of separate sessions in which various topics of interest to Florida group members and other guests are discussed. Each topic is led by an expert on the subject. Some presentations are made by representatives of software or hardware companies to explain their products or to introduce new ones. Each presenter tries to answer related questions.

Several sessions were devoted to topics related to the administration of User Groups such as: Increasing Membership, Remote Presentations, Microsoft Live Meeting, Group Communications and Online Newsletters.

More of interest to general members were sessions which covered some of the most timely subjects and technology issues of today. A brief comment on several follows.

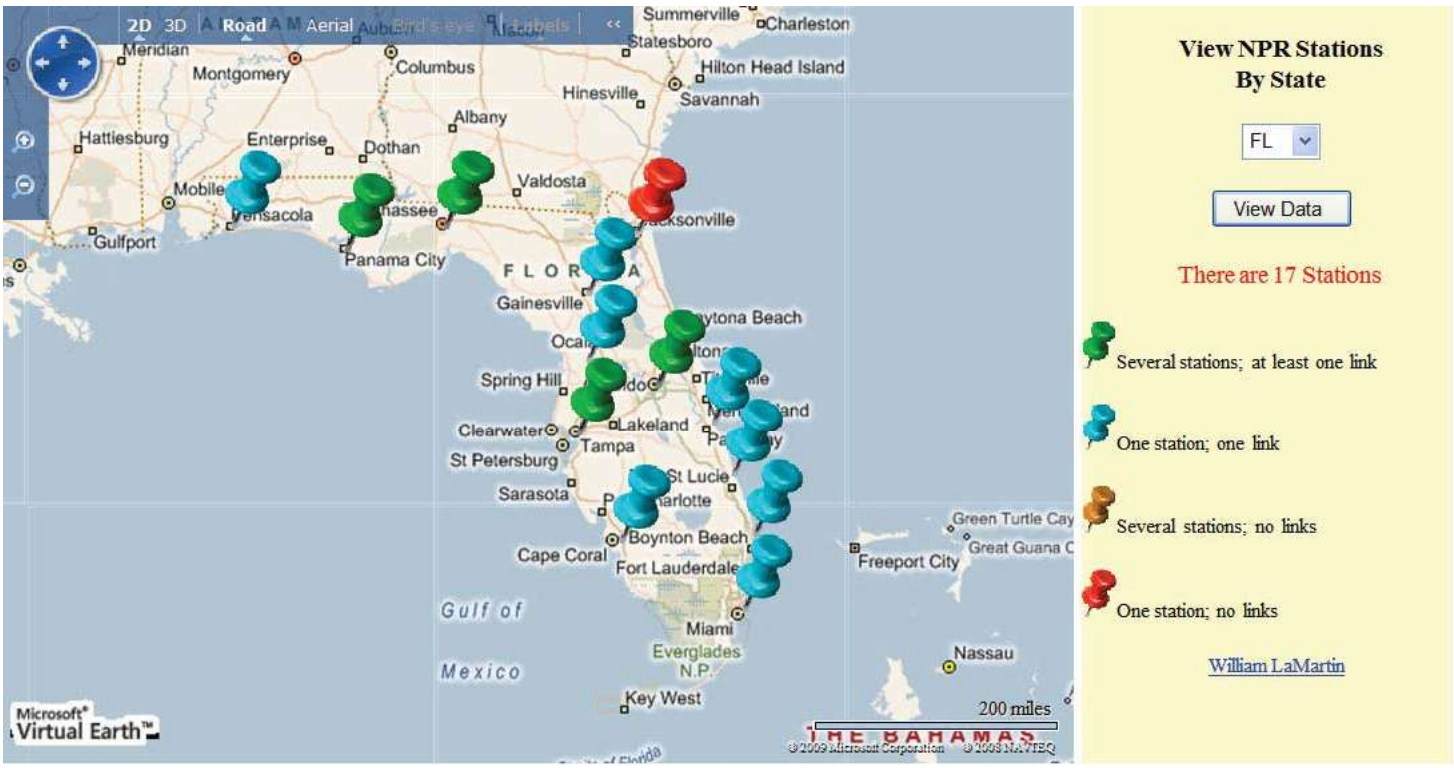
Smart Computing Magazine had staff members present to explain in detail the workings of their superb free tech support program, now only available to subscribers. It was noted by several attendees' experiences that this is a very valuable service. The support team will go to great lengths and spend much time resolving user issues.

Virtual Worlds and Second Life. As def ned by Wikipedia, a virtual world is a computer-based simulated environment intended for its users to inhabit and interact via avatars. Second Life is a popular virtual world. Secondlife.com explains that Second Life is a free 3D virtual world where users can socialize, connect and create using voice and text chat. Virtual worlds are predicted to be future locations of many interpersonal relationships, some of which can involve the transfer of genuine actual currency. They can be an excellent educational tool also.

Cloud Computing, one of the new techniques taking over computing was explained. Essentially, banks of gigantic servers replace users' own hardware and software. Access to everything is online. Local PCs or large corporations do not require powerful processors, large memory or storage devices. There is no need to know where the processing and storage is. "It is in the cloud."

Wikis (quoting from the presenter, Dave Dockery). "A Wiki is a web page that can be edited by its creator, and also by visitors. Wikis may be used as an excellent group planning tool. They are easy to create and edit." Two sites to work with wikis are http://www.wikispaces.com and http://www.pbwiki.com.

Ning is an interactive web site with which users can create their own customized social networking site. Go to http://www.aboutning.com for more information.



Twitter. Sending tweets with Twitter is the current rage. Tweets are merely short messages (140 character maximum). They are a written Internet version of instant messages. Go to http://www.twitter.com to use it.

Drupal is a very popular complete web design tool, free and open source. It can be learned for individual use or you can contract with consultants to use it for you.

Microsoft Windows 7. Conference attendees received a copy of the beta release and a demonstration by Jay Ferron. Discussion of Windows 7 is best left to the myriad of other articles now appearing everywhere. There seems to be agreement that this will be the answer to complaints about Vista.

This article is not all inclusive. Several of the other valuable sessions were not mentioned here such as: Bar Camp Unconference, Doterati, Magix Multimedia Audio Video Software, offering free Widgets at magixwidgets.com, Photoshop.com for online sharing and editing, and ZoomWare screen magnif cation for everyone. More information on each of these is available through Google. There was also a superb f ll-in

FACUG.....Continued on page 8

Creating Interactive Maps

By William LaMartin, Editor, Tampa PC users Group
lamartin@tampabay.rr.com

In past articles, I have described how to geo-tag your photos—that is, add latitude and longitude information to the image f le using the free Microsoft Pro Photo Tools. And once you have your photos geo-tagged, you can then identify the locations on a map with a bit of programming. As a f nal touch, you can have a thumbnail of the image display, along with some text, when someone hovers their mouse over the location indicator pin and then, if they actually click on the thumbnail, have a larger version of the image display.

This sort of process opens up all sorts of possibilities for using maps for displaying data other than images. Within the last year, I created an example using the 2000 United States census which, I believe, I mentioned in the newsletter. I will brief y describe that application a little later in this article and give a link to it. My main interest here, though, is to give a non-technical description of how I created my National Public Radio (NPR) stations interactive map shown above in a screen capture of its display of cities in Florida with NPR stations.

First off, I should say that someone did a similar application before me, for when I did a search for a list of all NPR stations, among the hits was the site http://www.broofa.com/Toys/NPRStations/, which had an interactive map based on Google mapping. The creator was also nice enough to have a link to a f le containing the data on which his map was based. He got his data from a stations list, http://www.npr.org/stations/pdf/nprstations.pdf, at National Public Radio, which I, too, had found.

The NPR list had given me a list of stations, their call letters and the cities they were in. What it didn't give me were the latitude and longitude of the cities where the stations were—and, more importantly, what the online audio live feed URL for the stations was. Now I could have used the US Gazetter site, http://www.census.gov/cgi-bin/gazetteer, to retrieve the latitude and longitude of each city. I wouldn't do this by going to the page and individually entering the city name and state for each city and then retrieving the result. I am a programmer, so I would write a program that would run down the list of cities and retrieve this information for all the cities on the list without my having to

Internet Picture of the Month

William C Durant Mausoleum

With General Motors about to go bankrupt, it might be of interest to consider its founder, William Durant, who, after founding GM, lost the company. He then founded Chevrolet and regained control of GM, only to lose it again. He started Durant Motors and was a major player on Wall Street in the 1920s. The failure of Durant Motors and the crash of the market ruined him f nancially. The photo is from http://en.wikipedia.org/wiki/William_C._Durant.

Mapping.....Continued from page 4

do anything. However, this was not necessary since the other fellow's data f le provided the latitude and longitude information for each of the cities. So that is the f rst of two things with which he provided me.

His site does not provide a URL for a station's audio live feed, but he did provide a link to a site named radio-locator, http://www.radio-locator.com/, which did provide this information. This was the second thing he provided that was useful. Now all I would need to do was to again use my programming ability to write a program that would, for each station, go to the radio-locator site, provide it with the call letters for the station and be presented with a page of information about the station. The program would then analyze the page to see if there was an audio feed URL listed for the station. If so, it would save it and then move on to the next station on the list.

Well, I wrote my program, tested it on a few stations to work out the bugs, and then set it to retrieve the information on the f rst 100 stations. However, it wasn't long before things stopped. In examining the text on the last page returned, I found "You have exceeded your allotted usage." Next day, I could again retrieve information from the radio-locator site. This time I did it in small bits so as to see at what point I would again get cut off. That happened a little past 60 requests.

You may wonder how did the web site know that the same computer was making those requests. The simple answer is that when my program made what is known as an http request, the same as when your browser make a request for a web page, it sends along the IP address of the requesting computer. How else would the web server know where to send the page. And it would do no good to move to a different computer in the house, since the IP address sent is that of the router to which all the computers are connected.

How to speed up the process a bit? I could have taken my program to some of my friends homes, installed it on their computers and then got another 60 each day. What I actually did was write another type of program, called a web service, that did the same thing and placed it on two of my web sites. Then I modif ed my program to also use these remote web services to request pages. Since these requests would be coming from two new IP addresses, I could get 60 more results from each of them for a total of 180 each day. That made it a bit easier to get the 800 or so responses I needed.

Now I had a list of NPR stations in each state, the latitude and longitude of the cities where they were and an URL of their live audio feed if one existed. The next thing to do was check out the data on the audio URLs. That check revealed a not-insignif cant number did not provide any audio. One problem was that, in cases of what turned out to be long URLs, the radio-locator data was truncated. However, the most common problem was that the URL was now different from what was listed by the radio-locator site. My solution for getting a correct URL for a station was to do a search in Google with terms being the station's call letters plus the text "audio live feed". This was a process that I did one station at a time. Most of the problems stations were resolved, but there are still a few, and I invite you to try my application and send me any stations that don't work properly. Also, enjoy listening to stations all over the country. Right now I am listening to KWED in San Francisco. The current program is Morning Edition, which airs much earlier here in Tampa due to the time difference.

The link to my NPR Stations interactive map is http://www.lamartin.com/VENPRStations/ in the Useful Things section of http://www.lamartin.com.

Brief y, the 2000 Census Interactive Map at http://www.lamartin.com/VECensus/ uses the same technology to plot pins at each zip code in a state. When you hover your mouse over any pin, you are provided with the most important census data for that zip code. For example, if I zoom in the map for Florida to Tampa and then to the 33606 zip, hovering the mouse over the 33606 pin reveals, among many other pieces of information, that in 2000 the population was 14,960. The data for this application is obviously US Census data. ◆

Meeting Preview: Patrick Courtney, a member of the Brandon group, will give us an Optical Character Recognition presentation that begins with a Power Point show about OCR followed by a demonstration of some practical applications of OCR using OmniPage Pro 14. Bob LaFave will also conduct the Windows SIG at the beginning of the meeting as usual.

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

Thanks to Jim Purcell we have some content for the newsletter this month. And since I made a small computer related purchase, I wrote about that.

Last month, right at the end of the meeting, Bob LaFave took us to a site of interest to him--Live Ships Map, in the links this month. That got me to thinking that I might be able to do something similar. Recall that I have mapped census data and NPR stations, among other things. After a good bit of work, I have things the way I want, and you can view the results at http://www.lamartin.com/ShipLocations/. There was a fair bit of programming involved with this: Getting the marine traffic data as a zipped file, unzipping the data, supplying country names and flags for the ships, and, lastly, displaying the data on a map. All done when you select a location to view.

In the continuation of this article, is a view of the program dis-

Minutes of the March Meeting

By Jim Purcell, Secretary, Tampa PC Users Group
Edward_J_P@MSN.com

Bob LaFave started the Windows SIG at approximately 6:30 p.m. He explained the use of TV and FM tuners. He also discussed the use of programs that let you record any sound coming into your computer. He demonstrated the use of these programs. Bob explained the things which you can listen to and record with "Download Helper." Bob outlined a procedure to play ASF files in Windows Vista, since there is a bug in Windows Media Player in Vista that will not allow ASF files to play. William LaMartin discussed problems he experienced when Norton installed a new version of the anti-virus program he was using. He felt that the problems were serious enough to cause him to switch to another anti-virus program despite several years of satisfactory service from Norton. Bob ended the session at approximately 6:55 p.m.

William LaMartin started his presentation, "Online Program Training Videos at lynda.com and More" at approximately 7:00 p.m. William discussed his use of the online training program at lynda.com. He began with a discussion of his experiences over the years with many copies of a wide variety of software and their updates. He said that he installed and learned these programs "by the seat of his pants," or searched the Internet when he was unable to work out a solution. He said that had he found training videos that were as effective and easy to use as these, he would not have wasted so many years of his life learning the programs and also would have discovered capabilities of the software that he never realized existed. He said that the videos were very efficient and reasonably priced and that, in fact, many are free. William described how he used Adobe Illustrator to plan his installation of a water sprinkler system, which served as an example of the complexity of many software programs.

William went to the lynda.com web site to show the large variety of subjects available and the flexibility of the subscription program. He played programs that showed the quality and versatility of the training. The

Monitor Calibration

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

For several years, ever since purchasing an Epson Stylus Photo 2200 printer, I have never been sure that what is printed will appear the same as what I see on my computer monitor. This is not really a complaint about the printer; I have printed many stunning images using it. Yet I have also had to reprint images several times to get the proper degree of lightness and, more rarely, the correct color cast.

The most persistent problem has been that the printed images appear a good bit darker than what I see on my monitor from Photoshop. My solution to this has been to simply make the image about +25 brighter in Photoshop when I want to print it. Additionally, a small reduction of the saturation for red is often needed if I want the printed result to be the same as seen on the monitor.

Now, you might ask: How do you know that what you see on the monitor is correct? Good question, and that is where a monitor calibrator comes in. There are several such devices on the market. The one I chose is the one I was shown at North Tampa Photography, the huey by Pantone. It is a small USB device about 4 inches long and a little over one half-inch wide and about one-half inch thick. The cropped photo, Image A, shows it dangling from the top of my monitor over the blue color portion of Image A during a calibration, with its progress display and cancel button to the left.

It is quite simple to use. First, you install the software from a CD. (By the way, the huey pro is the same hardware item--it just has more advanced software.) Next, you run that software, where the first screen tells you to click the start button. After that you see the second screen, shown at the bottom left of this page, Image B, which tells you to attach the sensor, which has suction cups, to your monitor. Then you simply follow the on-screen instructions. A number of different colors will appear on screen under the device, as photographed above with a blue light on the screen.

When the calibration is finished, you will be able to see the results of before and after and will also be given the opportunity to place the device in a cradle

Improving Your Workspace

By Jim Purcell, Secretary, Tampa PC Users Group
Edward_J_P@msn.com

Our workspace requirements are sometimes obvious because we have been using the same space, furniture and equipment for years and are perfectly happy with what we have. This is probably not completely true for most of us because it's rare that there is no change in all of these factors for any of us.

There is an awful lot of assistance out there to help you decide how to approach and accomplish your goal. I won't attempt to discuss all of these possibilities, if for no other reason than the fact that the article would consume more than one newsletter and still wouldn't answer all of your questions. I have just been through this process so I'll give you a quick summary of what I considered, the sources of information I used in reaching a decision and the resulting workspace.

Goal: About five and a half years ago my wife and I began a project, which I have used to identify my workspace requirements. We started by cataloging our estimated 1800 35 mm slides taken between 1953 and 1985. We also began accumulating and arranging any pictures of our family history, both slides and black and white prints and negatives, up to the time we met in high school. We already had begun to accumulate pictures after that time, once we were married. I became interested in photography at an early age. My next door neighbor and best friend since we were 4 years old had our first photo lab in his mother's wash shed in 1947. I got my first 35mm camera in 1953, after college graduation and marriage. My wife also became interested in photography as the number of our children increased at a steady pace from zero to five. When the three grandchildren started arriving, the previous numbers were quickly eclipsed. As a result, in addition to the slides, we have about twelve hundred color negatives in APS format and hundreds of black and white and color photos and negatives to scan. The goal is to create a searchable cross referenced library of all of the images on DVD and on external hard drives. The second part would be to produce DVD slide shows which depict our family and show how our lives evolved in these areas, to give our children and grandchildren a good view of the conditions that existed when and where they were born in the United States and in Germany.

Required conditions: I have long been a fan of Katrin Eismann, an internationally recognized artist, author and educator. She seems to be most proud of her role as educator. In a book that she coauthored with Sean Duggan, they devoted four-and-a-half pages to "Building a Digital Darkroom." It covers practically everything you consider in building a workspace to fit your needs. I discussed their recommendations with some of the many knowledgeable members that we have in our group to try to fit their recommendations to my needs and to update equipment changes since the book was published in 2008.

Equipment: After my information gathering, I decided to, at least initially, keep all of the equipment that I had: (1.) A Dell Laptop Inspiron 9100 with Windows XP that I have had for several years, (2.) A Dell Desktop Dimension 8300 with Windows XP that I have also had for several years, (3.) An HP Pavilion dv6675us laptop with Vista Ultimate 64 bit (4gb of memory) that I purchased about a year and a half ago to replace the Dell laptop, (4.) A Minolta Dimage Scan Dual III film scanner that was purchased several years ago and (5.) An Epson Perfection 3200 Photo scanner that I have had for over four years. I also plan to keep all of my printers, which will not have much effect on the project, with the exception of an all-in-one that could provide limited scanning of photos and documents. I added a new scanner, the Epson Perfection V700 Photo. This dual lens scanner will provide increased quality and speed. It can batch scan 12 slides or negatives, as opposed to four with my other scanners. I may be able to quickly pass my other Epson scanner on to one of my children, but I wanted to try a few weeks of production to see whether it is needed. The last thing that I added and the pride of my stable is a new desktop. Merle Nicholson provided me with a parts list to order and allowed me to help him put it together (I held the flashlight and gritted my teeth). I never saw so many pipes and towers. It looked like it

Workspace .....Continued on page 5

Workspace.....Continued from page 4

had been designed in Los Alamos. Briefly, it has Vista Ultimate 64 bit, 8GB of memory, an AMD Phenom II X4 940 Deneb 3.0GHz Quad-Core Black Edition Processor, 2 Sata 150GB 10,000 RPM drives combined into one drive using RAID technology for program files and a 750GB 7200 RPM Sata drive for data files and two Samsung 22" monitors. There should be no doubt that this configuration will provide rapid processing of photos in Photoshop or Lightroom.

Furniture:

Once I decided on the equipment, I started searching for additional furniture. I decided to get all of the additional furniture from IKEA, Their furniture is modular and can be easily shaped to use the available space. You can add to the furniture if you need to do so at a later date. Their design is innovative and easy to modify. There is an assembly requirement so don't buy it on Christmas Eve. It is sturdy as a rock but also just as heavy. IKEA has a program that you can download that allows you enter your dimensions and window and door placements to create a scale model of your room to which you can add the exact furniture that you wish to buy and it is loaded into your room to scale. The program allows you to move the furniture around to fit the model. I was also able to insert a model of my old non-IKEA desk to make sure that it all fit. Once you are satisfied, you close out and print. You get a layout of your room and a list of the parts you need to assemble the furniture. You take them both to IKEA, and their representative in the show room that has assembled models of your furniture

will review the list with you to make sure that it's accurate. He or she will then print a new list which identifies the bin number where each part is located. The special tools such as allen wrenches are provided, but if you're doing much, you'll be much happier if you have a power screwdriver and a ratchet socket wrench. This is also a two person job although I did assemble a mobile drawer unit by myself.

Workflow: I'll give a short summary of my thoughts on workflow. First you probably wonder why I'm clinging to all of this old equipment. The oldest of my equipment is the Dell laptop and the Minolta film scanner. I plan to use them together for one purpose only, to scan the APS film cartridges. The Minolta

scanner is old but it is the only scanner that can process this film and, though it's slow, it can batch process a whole roll (25 negatives). The Dell laptop is slow but this is the only use I intend to make of the computer and it can scan practically unattended. The older of my Epson flatbed scanners I plan to use with my Dell desktop for digitizing photos of high-quality and medium-size black-and-white negatives. The new laptop will be used as a new laptop but is capable of running the new high-quality scanner. The new desktop with the dual monitors will be used editing, organizing and creating slide shows and, hopefully, intelligent archives that will be useful to my children and grandchildren. ◆

huey.....Continued from page 3

on your computer desk next to the monitor so that it can re-calibrate your monitor periodically as the room lighting changes.

So, how has this helped my photo-printing problem since I have done nothing to calibrate my printer?

The answer is that, in using a calibrated monitor, you know that what you saw yesterday and see today and will see tomorrow and also see under different room lighting conditions will be the same. That gives you a base from which to make further adjustments. Those adjustments and settings will be made in Photoshop and in the printer dialog settings when you actually print from Photoshop.

All modern photo printers should have an ICC profile for each paper. For example my Epson 2200 printer has a profile named SP2200 Premium Glossy_PK to use when printing using the Epson glossy paper, and it has similar profiles for each of the other papers. So, when printing my image from Photoshop, I select this profile in the print dialog, along with other settings, which I will omit here but which you can read about in the Matching Prints to Screen link and the huey & huey Pro User Guide link below.

This is supposed to give me a printed result that matches what I see on the monitor. But not quite. It seems that for many photos, I need to increase the brightness in Photoshop to get a printed result matching the monitor.

I purchased my huey locally at North Tampa Photography for $77. I have seen it on the web anywhere from $65 to $90. The huey pro costs around $30 or $40 more, and there is also an upgrade from Pantone from the huey to the huey pro. The Pantone site is http://www.pantone.com

Color is a much more complicated subject than you might think. Just do a Google search for things like "monitor calibration" or "printer calibration".

The first three links below are articles by a professional photographer named Keith Cooper, whose knowledge about color far exceeds anything I could write. So, if you are interested in better printed photos, read his three articles.

If you are interested in purchasing a Pantone huey color meter, then read the pdf user guide at the link below. This document also has good information on printing from Photoshop, in its last section titled "Printing after the monitor is calibrated."

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

The TPCUG has been around about 24 years, having started sometime in 1984. Since I knew that I would be short on material for this month, I checked out the June 1989 newsletter to see what I might reproduce as a bit of history. Unfortunately the minutes for that month were quite short, so I am going to have to write more than I wish. I am appreciative, however, for Merle's and Jim's contributions; otherwise, there would be even more space to be filled. The 20-year-old minutes are on page 7.

Speaking of old newsletters, may I remind you that there are several years of them at the web site in Acrobat format starting in 1988. A little reading of them will show you how far computing has come.

This month I will describe a slide show program and a panorama viewer program that I have written, which I hope you will find interesting. ◆

Minutes of the May Meeting

By Jim Purcell, Secretary, Tampa PC Users Group
Edward_J_P@MSN.com

The meeting began late, at approximately 7:45 PM, due to a heavy rainstorm. Bob LaFave opened the SIG meeting with a discussion of a member's email problem. This led to other email problems that members were having and how problems are affected by the type of email account that is being used. The Windows SIG ended at approximately 8:00 PM.

Doug Mullis, our treasurer, commented on the importance of paying dues on time. A review at the last board meeting revealed that there are about 15 members whose dues are outstanding. John Witmer, our president, discussed the door prize procedures that the board recommended at the May board meeting. There will be two groups of prizes; one group will consist of the better prizes, from which the grand prize winner can select his prize; the unselected items will be available the following month, along with any new things of value that we receive. The other winners that evening can select from a group of lesser prizes in group two. John will provide the details in the newsletter or in an email, as well as a list of items in each group. John introduced Patrick Courtney of the Greater Tampa Bay PC User Group, Inc., and advised that Patrick had donated the grand prize for the night's raffle, a 1,200,000 clip arts software program.

Patrick began his presentation on Optical Character Recognition (OCR) software at approximately 8:05 PM. He started by defining OCR as the transformation of alphabetic and numerical images into editable text. There are many versions of OCR software available, some of which are free. One version, called Instant OCR, advertises that you can upload an image and they will instantly download an editable text document. He pointed out the numerous challenges to OCR software that are posed by the enormous number of fonts that are available and the minor differences in many of the characters in some of these fonts. The software overcomes some of these difficulties by actually learning from the mistakes that it makes in recognizing these minor differences. He demonstrated the actual use of the software and showed how the features can be used to get the best translation of the images to editable text. Patrick also demonstrated how to transform a JPEG image into a text document.

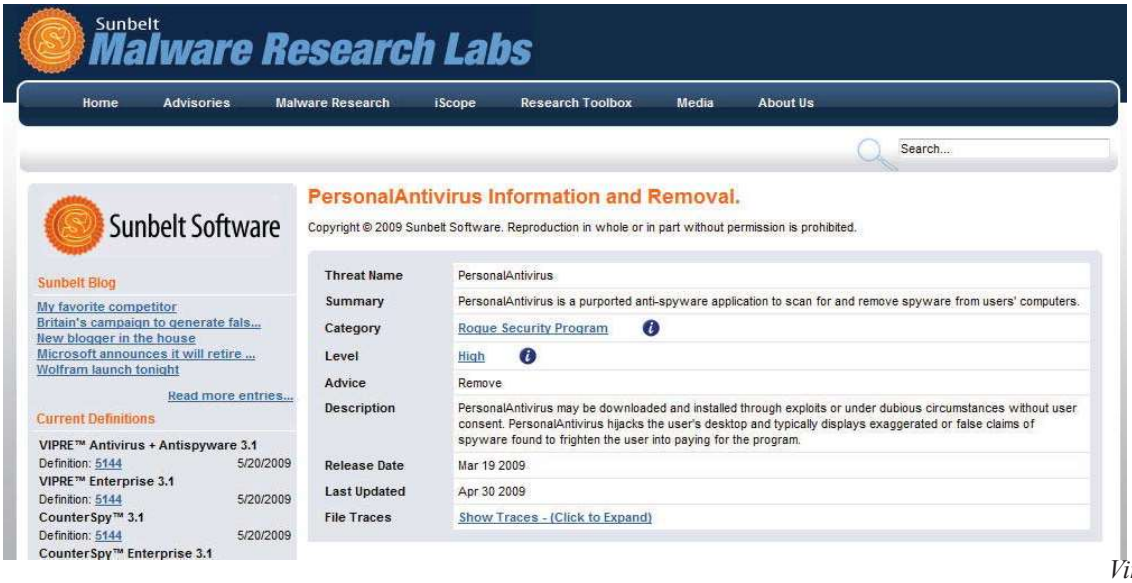
Virus encounter – Sunbelt Software Vipre

By Merle Nicholson, Tampa PC Users Group
merle@merlenicholson.com



This month I had an interesting virus experience, fortunately not on any of my own computers. This was an older Dell desktop machine, and the owner had given up trying to cope with it. It had a frequent popup virus alert. The home page on the browser looked to me like it had a highjacker on it. The owner was trying to remove the virus the anti-virus software was reporting, which, as far as I can tell, did not even exist on the computer.

The virus was the anti-virus software! I found several descriptions calling it a "Rogue Security Program." It was named "Personal Antivirus," and it would constantly pop up and report a virus. It really looked legitimate – the user interface looked very much like AVG – the colors appeared identical and the icons and text looked very convincing. Looking in the Add/Remove Programs produced nothing. Nosing around in the program just told me two things: One was there wasn't a way to uninstall it, and, two, it was apparent that it intended to make trouble until the user purchased it. So it was definitely a scam for money.

Given all that, it was easy to track down on the Internet. There was a removal program available that I found mentioned on several forums. I failed to find the program in the first couple of locations, and, when I finally found it, I had lost my enthusiasm for it. I certainly did not want to infect one of my own with a virus, and the computer I was trying to fix wasn't in any shape for downloading anything. So I looked at a few other web sites; Symantec had a reference to it as did another site – AVG, I think. The problem was that even though the rogue software was mentioned, nothing there would tell me that their free or trial download antivirus would actually fix the problem. Until I looked at Sunbelt Software's Vipre antivirus. Sunbelt had all the information I needed to assure me that the trial download would remove it. I downloaded the trial, installed it on the bad machine, got the virus updates and had it cleaned up in a half hour. In addition to removing the "Personal Antivirus," it also found a couple of trojans and cleaned up the browser hijacker.

I think that someone in that household responded to a fake virus warning, thinking that it was legitimate, and clicked on it. So be warned.

I did learn some things about Sunbelt Software Vipre in the process. Members may recall that, some years ago, a couple of Sunbelt employees gave a very good talk at one of our regular meetings. They're headquartered in Clearwater. I did buy one of their products not too long ago and since moved on to something else. The Vipre antivirus/antispyware is a fairly new product. Its main claim is its "lightweight" footprint, meaning that it uses a reduced amount of resources, memory and CPU. Their website indicates that it's small enough to make it a good choice for netbooks. Netbooks are especially constrained in memory and CPU size, and many have very small storage using even 4G solid-state drives. I just installed Vipre on another client's older notebook. Even though it has a small Pentium M processor and 512MB memory, the first scan didn't kill the note-

Slide Shows and Panoramas

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

A Random Slide Show

In the past I have mentioned the Burgert Collection of photographs in the Tampa-Hillsborough County Library. It is quite a collection from the late 1890s into the 1960s. At present there are over 14,000 of them digitized and viewable online. My project over the years has been updating my database of the photo information as they added images. The original reason for this was to be able to do searches for images with my software when all the library offered was a Telnet connection on which to do this. The days of the Telnet connection are long gone, but I have continued to update the database every few years as they added more images.

You can go to http://www.lamartin.com/burgert/ at my site and do a couple different types of searches of these old Tampa photos. I find these searches more convenient than using the library's online catalog, and apparently others like to use them, too, since I get emails about the page.

I have now added a slide show to the site that picks an image at random from the 14,000 plus images and displays it along with its description. So, if you have nothing better to do, you may sit and view randomly displayed images of Tampa over a 60-plus-years span. I find the older images the most interesting.

The slide show can be accessed from the link above, or you can access it directly at http://www.lamartin.com/burgert/SlideShow/.

The show was created using Microsoft Visual studio 2008, along with Microsoft Expression Blend 2, and posted to the web with Microsoft Expression Web 2. The slide show is a Silverlight application, Microsoft's answer to Adobe Flash.

The visual aspects of the page on which the show is displayed are created in Blend. The logic and programming are done in Visual Studio. In theory, all the work done in Blend could also be done in Visual Studio. But it is much easier done in Blend.

The data about the photos is stored in an xml database at the site--specifically, the description and notes for each image and, importantly, the URL to the image file on the server at the library. So all these images are being pulled from the library site--not my web site server--just like they would be if you were viewing them at the library site with your browser.

Panoramas

To display a panorama you need two things. First, you need a photograph that can be viewed as a panorama, and, second, you need a program that will display it for you in a manner that simulates viewing the scene in 360 degrees.

I first made a few panoramas after purchasing a couple of pieces of software form one of our presenters quite a few years back. As I recall, one piece of software was used to create the image that was the result of stitching together the individual images that made up the panorama. The other piece of software was the Java Script viewer to be put on a web page to display the panorama. These first attempts can be viewed at http://www.lamartin.com/virtual_tours/virtual.htm. The software was PhotoVista Virtual Tour Maker from iSeeMedia and was mentioned in the newsletter in 2003, http://www.tpcug.org/newsletter/nl_2003/May2003/comments.htm. So that was six years ago.

Well, a lot has happened since 2003. I now have Adobe Photoshop CS4, which will make a panorama for you from a collection of images you have taken as you pan the camera; the images should have about a 40% overlap. Of course, it is best to use a tripod-mounted camera.

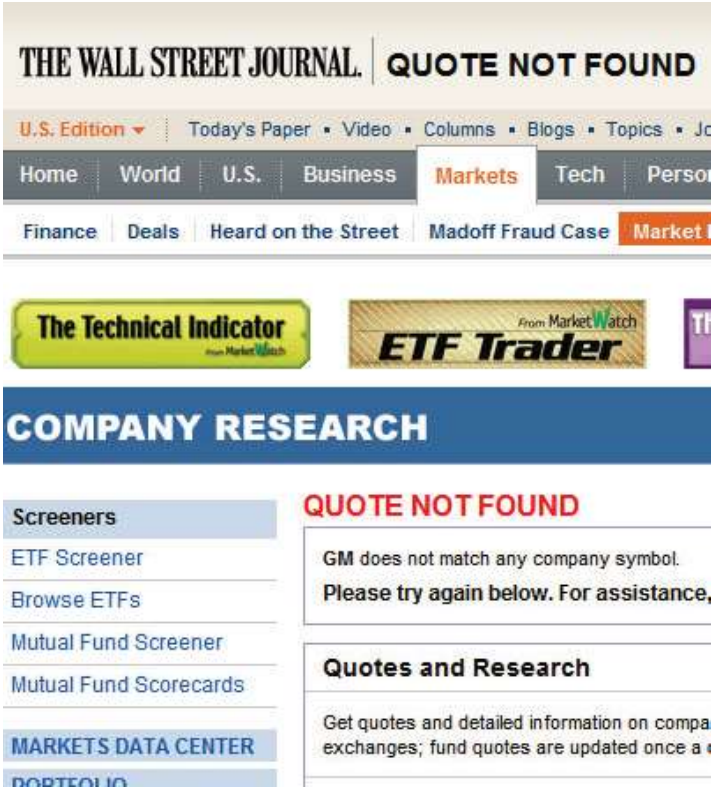
The panoramas I am interested in at present are the 360-degree ones. They are a bit more difficult than the ones that don't make a full circle in that, after Photoshop or whatever stitching software you use to assemble the panorama is finished, you are left with cropping the image so that one end stops exactly

Slide Shows .....Continued on page 5

Slide Shows.....Continued from page 4

where the other end ends.

At the Adobe site, in the comparison of Photoshop CS4 and Photoshop CS4 Extended (I bet you didn't even know there was such a thing as Photoshop extended), the claim is that they both do 360-degree panoramas. But this just isn't the case, as I had pretty much decided for myself and which was confirmed in the Photoshop forum at Adobe.



To make a 360-degree panorama, I take my Nikon 200D digital camera with its 18 mm x 200 mm zoom lens and mount it on a tripod in a vertical position. I make sure the tripod is level with all its fittings tight--except the one that allows the camera to rotate around 360 degrees. Using a cable shutter-release also makes life easier but certainly isn't necessary. It is also helpful when setting up to try to minimize having to shoot directly into the sun during the rotation. I prefer to use a zoom of closer to 50 mm if possible, but often, to get the view I want, I am forced to use something closer to 24 mm or 18 mm. This was certainly true for the back yard panorama and the house construction panorama that I will mention later.

Once set up, all you need to do it take a photo, rotate the camera, take another photo, etc., until you have gone a bit more than a complete revolution, overlapping each successive photo about 40%. I found that this will involve snapping 22 to 28 photos.

The next step is to download the images to your com-

puter and setup Photoshop to turn the collection into a panorama. There are several different choices available in Photoshop CS4 for this (with older versions, you have different choices). I got the best results using the cylindrical projection--although the recommended one for 360-degree panoramas is spherical.

Warning--do not try to make a panorama out of 25 full-size images taken with a Nikon D200. These images are about 6 or 7 MB each as jpegs, and you will be at it for a very long time. Besides you don't want to put such a large file on the Internet. I did this once, and the resulting image was several hundred megabytes, I think. What you want to do is to first downsize each of the images to something like 400 x 600. Then, when you have Photoshop "photomerge" the images into a panorama, things will go fairly rapidly.

The top image below is Photoshop's created panorama. Notice the differences between it and the image below that has been taken one step further. The bottom

image has been cropped so that the curved edges at the top and bottom produced by the merging are removed. Furthermore, it has been cropped so that the end of the right edge is the beginning of the left edge. I realize that may be hard to see since, for the newsletter page, the images need to be quite small considering that this is a panorama.

The image, perhaps, looks a bit strange, especially in the way the roads run. But when viewed in the panorama viewer, you will only see a small portion at a time, and the effect will be what is desired.

You can view several panoramas I recently created by the above method at http://www.lamartin.com/HP-Panoramas. The bottom image on this page is used in the second panorama. One person has informed me that he had to change his browser security setting before the show could be run.

The Panorama Viewer

More interesting to me than creating the images for the panorama was creating the viewer. I had thought about such a piece of software over the years, and I just didn't see any easy way to do it--until Silverlight. Making an image scroll across the screen is not the problem. Making it scroll so that it appears to never end is.

The basic idea is to have three copies of the image lined up horizontally, with one in the middle and the other two on either side positioned the appropriate distance from the middle and overlapping the middle one a bit but underneath it. You also restrict what the viewer can see to, say, 500 pixels in the center of the viewer screen.

If we start with the middle image moving to the right, at some point the left image will start following it so

Slide Shows .....Continued on page 7

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Bob LaFave moderates the discussion.

Slide Shows.....Continued from page 6

that there is no break in what is seen. Then when the images have gone what amounts to one full image, everything is reset so that we are really starting over, but, to the person viewing, it appears that we are just continuing to rotate around. Going the opposite way, the right image would start moving at the appropriate time so as to follow the middle one and keep things looking continuous.

The viewer is basically finished. All I need to do now is make it look a little more polished and possibly allow for panning the image up or down, along with a possible zoom.

I think the main problem remaining is figuring out how to take better photos. I still don't know what causes some shows at the link, like the back yard one, to have distorted sections while other shows have no distortion. It is obviously caused by the stitching. But possibly this can be mitigated by changing the focal length at which the photos are taken. The back yard one was the first one I did. Possibly I could retake the images and improve the result.

When I started computer programming many years back, I certainly never dreamed that it would tie in so strongly in later years with my interest in photography.

I wish I had time to research some free software to do this sort of stitching so that I could have included it in this article. But I am lucky to even get the newsletter out (the panoramas were photographed today with the exception of the back yard). I know such software comes with many of the digital cameras. Also, there are possibly free panorama viewers to be had on the web. But, again, time is short; the newsletter should have been printed yesterday. ◆

20 Years Ago in Bits of Blue

Minutes from the June 1989 newsletter

MAY MINUTES
By Russ Merritt

The planned presentation by Steve Spears was delayed for another session due to lack of the overhead projector. A general discussion about various aspects of computers was led by Harvey Bruno.

The beginning DOS session by Bill Fuller did take place, using an easel and paper pad to describe the events to be expected when copying files. Another beginner's session will be given next month.

Bill Fuller also announced an apparent bug in WordPerfect 5.0. If a space is included in the naming of a file, the document will be saved but cannot be retrieved or renamed using WordPerfect. The solution is to use a file manager program or DOS to rename the file. If DOS is used, the question mark needs to be inserted in place of the space.

EXAMPLE: If the file name is MY FILE.DOC, the DOS rename command will be REN MY?FILE.DOC MY_FILE.DOC, and now the file can be retrieved in WordPerfect. This was confirmed by your secretary. When I called WordPerfect, they said this was corrected in the version issued as of April 12, 1989.

Meeting Preview: For the July monthly meeting, Bob LaFave and Merle Nicholson will demonstrate Windows 7, the newest version that will be in stores on October 22, 2009. They'll be using the Windows 7 Release Candidate that was recently released for testing. It should be interesting, so bring your questions with you, and Bob and Merle will try to answer or find the resource needed.

More on panoramas

Last month I wrote about a panorama viewer program I had written. I have made some changes since then--not in the viewier but in the panorama images themselves. When I first created the panoramas, I used Photoshop CS4 to do the stitching of the collection of images, and I mentioned at the time that it was left to me to crop the resulting image so that the beginning of the left side matched the end of the right side as to content. Furthermore, often the far left side would be exposed differently from the far right side due to Photoshop's blending, which apparently didn't take into consideration what would happen if the two ends were juxtaposed.

Well, all those problems are in the past. I have discovered a free program created by Microsoft Research that surmounts the two problems I encountered with Photoshop mentioned above. The

Minutes of the June Meeting

By Jim Purcell, Secretary, Tampa PC Users Group
Edward_J_P@MSN.com

Bob LaFave started the Windows SIG at 6:35 PM. He began by demonstrating how to open PDF files if you are having trouble opening them in Windows Vista. He explained the use of the "Windows Key" on the keyboard and diagnosed a problem that a member was having in the use of the key. Merle Nicholson reported a problem with his cursor jumping forward or backward or even to the next line. Bob believed that it was a bad driver or perhaps the sensitivity adjustment. Bob demonstrated the use of the trouble-shooting wizard.

There was a discussion of several operating system improvements that are being offered in the soon-to-be-released Windows 7. Bob explained how graphic systems can be configured to allow additional monitors to be run from one computer. There was a discussion of the capabilities of cell services' connections to the web. William LaMartin noted that the speed of the service varied greatly with your proximity to large metropolitan locations. John Witmer reported that Internet service on cruise ships is not only very slow, it is very expensive.

John opened the business portion at approximately 7:10 PM. He briefly discussed the problems opening the gate during the severe thunderstorm that struck just before the prior month's meeting. John said he would put instructions in the newsletter (see page 7) to outline the procedures to gain entrance when the gate has been disabled through power outages. John described how the raffle procedures will be altered to, hopefully, allow members a chance to select prizes that are useful to them and advised that this information would be in the next newsletter (see page 5).

He stressed the need for articles for the newsletter. John introduced Marty and Michelle Burgess, the local representatives for "SendOutCards," whose presentation was titled "Creating Cards Online to send by mail." Marty began by describing the operation and services provided by SendOutCards. It is a

Vado - Creative Labs' Pocket Video Cam HD

by Larry Anders, Librarian, Tampa PC Users Group
larry@anders.net

I have written many reviews for Bits of Blue in the past, but it has been a while since I have written anything due to an illness I have. However, I am feeling more like my old self right now and bought something I had wanted for a while. The price was too good to resist, so I bit, and I am really glad I did. I thought I would tell you about it.

I have a superb Sony video camera from about three years back that was just below a professional model, one of the first to use the mini video tapes. With the video tapes, as many of you probably know, you have to take the video off the tape and convert it to digital in whatever format the program you use to make a movie recognizes. This is not only time-consuming but also cumbersome. My wife is a teacher of adult students, and she takes a lot of videos of her students, which I turn into DVDs for her. She has a later, smaller version HD camcorder, but, like mine, it still has to be taken off a tape and converted to digital on the computer. Enter the Vado…

When I first read the ad, I thought it was too good to be true, but it was an ad from CompUSA.com, which I have purchased several items from, and I knew I could return the article if I was unhappy with it without too much of a hassle. I have purchased several digital cameras in the past and always made sure the lens was of good quality, feeling that a good lens can make a not-so-good camera better. When I saw the picture of the Vado, the lens was this itty bitty thing that didn't look too much bigger than the lens on my last cell phone that had a camera. Plus, as the name infers, it was HD. Maybe I was more curious than anything to see how something that small could be high definition. Well, I am happy to say, "It is."

The Vado records in an HD video resolution of up to 1280x720p. The lens is a wide-angle precision-engineered glass lens, and, believe it or not, it produces near professional-looking videos in a 16:9 aspect ratio.

There is also a 2x digital zoom, which doesn't seem like much, but with a lens that small it does a decent job. There is no flash or light with the camera, but I have used it in pretty dim light, and it adjusts quite well.

The recording starts with a touch of a button and records 8 hours in VGA mode 640x480 (old analog TV), 4 hours in HD mode 1080x720i (interlaced mode) or 2 hours in HD+ 1280x720p (progressive mode) onto 8GB internal memory, progressive mode being the best and the largest file. I could not tell much difference between HD and HD+ picture-wise except for size.

After the video is taken, simply connect the Vado to your PC with the built-in USB connector and a program called Creative Vado Central will run (from the Vado) that does everything to the recording that you will need to do: View the video, copy it to your PC (in .AVI format), delete it, create a movie and/or edit it, send it to YouTube™, PhotoBucket or Box.net, create a single picture (.jpg) out of one frame or capture a burst of 25 frames. Playback your video on any HDTV by connecting the Vado camcorder to the TV with the included HDMI cable in 1080 quality.

As near as I can figure, the picture is so good because of the H.264 compression technology that provides efficient files sizes for the best possible viewing experience. You can record up to 4 times more videos compared to MPEG-4 encoded ones.

There is a 2" antiglare screen for viewing the videos while you take them and reviewing clips onscreen. Keep the videos you like; delete the ones you don't. It comes with a removable, rechargeable Lithium-ion battery that recharges via USB. An extra battery can

Video.....Continued on page 8

Minutes.....Continued from page 2

website which provides a choice of approximately 15,000 cards that can be selected and customized. When you have finished with the design, you email it to SendOutCards and they will print it, address it, stuff the envelope, place a stamp (not a postal meter strip) and mail it. The card is normally mailed the next day, and you can expect it to be delivered within 3 to 7 days. The card looks just like one that you would mail yourself . The one difference is that all cards will have a Salt Lake City postmark. Cards can be sent for a price of about 62 cents and up depending on the complexity and quality of the card. The system starts with the establishment of a prepaid account. The balance of your account is shown in points. The value of the points varies by type of account. There are a variety of business and personal accounts available. They are structured to allow extensive management of your contacts. You can add pictures on the front or inside the card and can even purchase a font of your own handwriting and up to 4 signatures. Gifts or gift cards can be included. There are many ways to personalize the cards that you choose in that you can write your own message and choose the size, color and type of font. The details and answers to frequently asked questions are provided on the Burgess web site, http://www.MandMCards.com (case sensitive). They have invited everyone in the group to send two free cards by clicking on the red banner on the web site that says "Click here to send two free cards".

You can also call Marty (813-927-5916) or Michelle (813-310-9518) anytime for more details and instructions on how to set up an account. The presentation ended at approximately 8:50 PM.

The raffle winners were Michelle Burgess, who won a copy of Norton Internet Security; Richard Brooks, who won a screen saver; and Ron Weinberg, who won a TPCUG T-shirt.

The meeting ended at approximately 9:05 PM. ◆

Comments.....Continued from page 1

program is called Image Composition Editor (ICE). You may download the program from http://research.microsoft.com/en-us/um/redmond/groups/ivm/ICE/.

Revisit my 360-degree panoramas at http://www.lamartin.com/HPPanoramas/index.htm. I challenge you to find the place where the join is made. In the earlier examples, the join was easily found in several of the panoramas if you were looking for it.

What you see there is a jpeg image created by ICE that my software rotates. But you can also make less than 360-degree panoramas with ICE. And, here is what I like, you can make them with a zoom functionality. Go to http://www.lamartin.com/ZoomImages.aspx and under Planar Panoramas click on Davis Islands from the West. As usual, you will need the free Microsoft Silverlight browser plug-in installed to view this.

The image was made from 50 photos of the west shore of Davis Islands shot from the Bayshore Boulevard seawall in Tampa with about a six-power telephoto lens (300 mm). Then I let Microsoft ICE do its work of stitching them together and creating a Deep Zoom image that you can zoom in and out and move around.

The closest distance was around 2,000 ft.; the farthest distance was around 1.85 miles. To take the images, I used a tripod to hold a Nikon D200 digital camera with a 400 mm zoom lens set at 300 mm positioned on the Bayshore Boulevard seawall facing Davis Islands. My main problem was focusing. I had made an earlier version where I let the camera do an automatic focus for each image. Unfortunately, since the point of focus sometimes was on the sky, the results were not as sharp as I wanted. So this time I set the camera and lens to manual focus and did a manual focus for the images. I give the Microsoft ICE program most of the credit for the result; I only took the images; it did the magnificent job of stitching them together and creating the ability to zoom.

As a side note, the width of the image saved as one file and not the multiple number that make up the zoom is 67,218 pixels wide by 1431 pixels high. If saved as Tiff file, it is 376 MB. That is quite an image. ◆

TPCUG Meeting Raffle Prizes Update

By john Witmer, President,Tampa PC Users Group
jwitmer@pepindist.com

At the May TPCUG Board Meeting, we discussed our inventory of raffle prizes and what would be the best method to make them available to the attendees at our monthly meetings. We have been lax in the past regarding having raffles at each meeting, and yet we have included this raffle income as part of our budget needs during the year. The raffle income helps offset some of our operating expenses, with the membership dues and Amazon commissions comprising the balance of our income source.

Part of the raffle discussion was devoted to a perceived problem of getting a prize that was useful to the raffle ticket winner. So many times the winner of a nice prize finds it is not something they can or would use, while there may be others in the raffle pot who would have loved to have won and could use the item. One suggestion entertained was to perhaps put the significant items up for auction within the group, thereby assuring that the high bidder/acquirer of the item would put it to good use (no one would bid much for something they did not have a use for). It was felt that, although this may make sense, it would have the potential of cleaning out the prizes in a relatively short time and perhaps take away a part of the meetings that some members enjoy. Another proposal was to only raffle off one item of significant value each meeting, but to let the winning raffle ticket holder select his

Active Desktop Problem

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

The image above is a crop of a screen capture of what I saw on a reboot after my computer froze and I had to manually shut it off. That is not really what I saw. What I really saw was all of that writing with a lot of icons covering up much of the text. So what you see now is the appearance after I moved all of the obscuring icons out of the way.

I had this problem once before, certainly over a year back, but could not remember what I needed to do. A click on the Restore my Active Desktop button shown in the picture (I didn't even know that I had an active desktop) produced an error, so that was out. I opted for the option to turn off my active desktop that I didn't even know I had. But when I got to the web tab mentioned, none of the check boxes were checked. I just clicked OK anyway and things went back to normal. But not quite normal since I didn't have my background back yet—and the background change options were grayed out in the desktop tab of the Display Settings.

A search of the Internet (using Bing for a change) produced:

Open Regedit and navigate to the following two items: HKEY_CURRENT_USER\Software\Microsoft\Windows\CurrentVersion\Policies\System

HKEY_LOCAL_MACHINE\Software\Microsoft\Windows\CurrentVersion\Policies\System

Delete the values "Wallpaper" and "WallPaperStyle" in the right-pane.

I only had the one entry, "Wallpaper," in the first item. But deleting it solved the problem of being able to choose a background. But one problem remained: I did not have transparent backgrounds for the desktop icon text, and that is really ugly.

Unfortunately none of the solutions I could find (for example those at http://www.entity.cc/icon-label-transparent.php) solved my problem. But researching and talking with Merle Nicholson helped me zero in on the Windows XP Group Policy Editor, which you can bring up by running gpedit.msc. There under User Configuration | Administrative Templates | Desktop Active Desktop, I set Enable Active Desktop to Not Configured and Disable Active Desktop to Enabled. Do you think you can remember all that if you have this problem. I don't think I can.

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Bob LaFave moderates the discussion.

Raffle.....Continued from page 5

choice from all the available prizes. We could then add a couple of consolation type prizes into the raffle so that we would have multiple tickets/chances available for those entering the raffle process but only one grand prize winner.

The Board elected to go with the latter method to see how this is received by the members. We first implemented this system at the June 10th meeting, and it was very successful for the club as there were many who participated. The winning ticket holder was able to choose from a group of items and was happy to be able to choose the prize she wanted from the available selection.

A list of the remaining prizes to choose from will be available at each meeting, and you can decide if there is something on the list that might make it worthwhile for you to enter the raffle. I am going to list below the main items we still have on hand for a winner to choose from beginning with the July meeting, as well as what we are calling consolation prizes:

◊ **Software Items:** Norton Internet Security 2008; Trend Micro Internet Security 2008; System Mechanic PC Tuneup (XP & Vista); Magix Audio Cleaning 12 Lab; Acronis True Image Home 2009; Acronis Disk Director Suite 10.
◊ **Hardware item:** Video Xpress from ADS (USB Easy Capture & Movie Creation Device, previously used, but still in good condition).
◊ **Subscription:** Smart Computing annual subscription to magazine (4 of these are available for prizes).
◊ Co**nsolation prizes of minimal value:** 4 Large TPCUG T-shirts (size 42-44); 2 Black Norton T-shirts, size large, in shrink wrap cube; twin pack of HP45 Black OEM ink cartridges; miscellaneous older software programs from 2007 or prior; Monitor dust sweep; and mouse pads. ◆

Important Info About Meeting Access At Pepin

By John Witmer, President, Tampa PC Users Group
jwitmer@pepindist.com

As a result of a bout of really bad weather on our scheduled meeting night at Pepin Distributing Company back in May, I wanted to make sure those of you attending our meetings have information on what to do if this scenario happens again. I have the front gate (on 50th St) programmed to stay open from 5:30 pm until 7:15 pm on TPCUG meeting nights. Unfortunately, the lightning killed the computer-controlled connection to the gate and caused the gate to close in the middle of a horrendous downpour. Fortunately, the hard-wired phone connection to the gate was still operational, but the only way it could be activated was by using a call button device on the block wall as you enter the gate area (the call button device is on the driver's side of the entrance wall to the left of a grey scan pad).

So, if you arrive for our meeting (rain or shine) and find the gate closed, press the lighted button on the bottom of the call box and you will reach the warehouse office. Identify yourself as attending the Computer Club meeting hosted by John Witmer, and the gate should be opened for you to enter the parking area. I usually have the building front door open until approx 7:15 pm also, so if you should arrive later than this time for our 6:30 pm meeting, you may have to call my cell number to gain access to the building. My cell number is 813-404-4655. I hope this information helps in the unlikely event you should ever run into a problem attending one of our TPCUG Wednesday night meetings. ◆

be purchased online for less than $15.

If you're looking for something that is easy to use, provides excellent quality for $150+/-, you can't go wrong with the Vado Pocket Video Cam. ◆

Desktop.....Continued from page 6

Somehow in my having to hold in the power button to shut down the computer after it froze, something must have gotten corrupted in the Windows settings. And what worked for some people in getting back the transparency of the desktop icon text background would not work for me.

Of course, I could have tried the solution of setting back my computer to an earlier date, but there is satisfaction is solving a problem. Now if I can just remember the solution if it is needed again—or remember to look up this article. ◆

Meeting Preview: For the August monthly meeting, Kevan Sheridan will tell us about Cloud computing with Google Apps. As usual, Bob LaFave will conduct the Windows SIG during the first part of the meeting.

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

Web site change This month I sent out a message that the TPCUG site would be down from several hours to a day. I had asked the web hosting company to move us from a Windows 2003 server to a Windows 2008 server. To do that they apparently couldn't just transfer all the files involved. Instead they had to terminate the old account and create a new account (all free), and then, after this was completed, I had to upload all the files for the site to the new server. That consisted of 194 MB containing 5,870 files in 352 folders. Our site does not have all that many images. If it did have a proportionate number of images to the number of files, the size would have been several times larger.

The reason for making the move was to get the additional functionality that the Win 2008 server provides. The particular thing I was interested in was the new interactive map to our meeting location. I wanted to replace the old static map with one that would create a route for you from whatever location you wished

Minutes of the July Meeting

By Jim Purcell, Secretary, Tampa PC Users Group
Edward_J_P@MSN.com

Bob LaFave started the Windows SIG at 6:30 PM. He began with a discussion of his early review of some of the features of Windows 7. There was a discussion of Internet Explorer (IE) 7 and 8. Bob mentioned that some people have had trouble installing IE 8. Ed White was having some troubles with IE 7 that Bob believed were a Vista problem. Bob said that he has used the Vista Repair Function eight or ten times and said that it has worked for him every time. He explained the different ways to activate the repair function. There was a question from a member about the magnifier. It did not operate properly when it was opened for the demonstration. Merle pointed out a possible solution to the screen magnification problem by using the magnifier in the Accessories section of the operating system. In response to a question about which computers would and which would not run Windows 7, Bob showed how to run the upgrade advisor to see whether your computer can run Windows 7. Bob mentioned that everyone should be very cautious about using registry cleaners. He recommended that you use Windows Live OneCare. There is a Microsoft free tune-up that includes a registry cleaner at www.Onecare.live.com/site/en-us/center/tuneup.htf that Bob recommends.

John started the business portion of the meeting at approximately 7:15 PM. He passed out a list of the prizes available under the new raffle procedures. He announced that Kevan would deliver the presentation at the next meeting, where he will discuss "Cloud Computing with Google Applications." John announced that we tentatively have Blaine Barton from Microsoft scheduled for September. Steve Singer will probably be scheduled for October. Doug Mullis also believes he has a commitment for November but the details have not been finalized. John reminded everyone that we get a commission from Amazon.com on your purchases if you connect to Amazon.com through the link on our web site.

Bob LaFave and Merle Nicholson opened the presen-

Minutes .....Continued on page 5

Favorite, (mostly) free software

By Merle Nicholson, Tampa PC Users Group
merle@merlenicholson.com

Keep in mind as you go through this list that I'm primarily interested in 64-bit software because my primary computer has Vista Business x64. This means that if I list it here, there should be either 1) a 32-bit version that runs with no issues on Vista 64 or 2) it is 64-bit, but also has a 32-bit version. OK in random order:

Microsoft Windows Live OneCare
If you have OneCare (Anti-Virus, Anti-Spyware, Advanced Firewall, Backup & Restore, Tune-up, Printer Sharing), you'll know that it's being dropped and replaced with Microsoft Security Essentials this year, perhaps along with the release of Windows 7 in October. So what happens if your current subscription runs out? Well, I found out because mine is about ready to run out. It's free! Microsoft will renew your current subscription for $0.00, which will keep it operational past the release date. The new free version will not do some of the goodies that OneCare will do, like Backup and Tune-up, but .. it's free, and the early reports say that it's very unobtrusive and easy on your computer resources.

DataRam RAMDisk VE
As you may expect from the title, it creates a RAM-DISK, just like back in DOS or Windows 3.1. I use it all the time. It automatically configures a 2GB drive for me and also restores all the files that were there the last time the computer was on. It will do a timed backup to its storage/backup file, and it uses that file when booting from scratch. It adds a significant time to bootup and shutdown.

I put my current Access project there, and also sometimes data files it has to read. It makes Access fly!

http://www.dataram.com/products-and-services/ramdisk. Up to 4GB on the freeware version. I've yet to lose a file. Just in case though, I have my own timed backup set to run every 15 minutes. It's not for everyone, but if you have a use for fast disk space, this is a great, quality product. It was made to order for database work.

Remote Desktop Connection
This is software that allows you to log onto another computer, either on your own network or through the Internet.

I use it for two things: 1. When I need two computers running (It happens!), since my primary has two monitors, I remote into one of my other computers and configure Remote Desktop to run full screen on one of the monitors. 2. I use it from one of my notebooks when I'm on the first floor (usually watching TV) and need something on my primary computer. I sometimes do real work in that manner. It's completely reliable and easy to use.

There are two components, server and client. The server software is on the computer you're logging into. It comes with the operating system, but not all Windows Systems: XP Professional, Vista Business and Vista Ultimate & Enterprise, NOT Vista Home Premium or XP Home. The client is available for all Windows operating systems. If it doesn't come with it, it's downloadable from Microsoft. If you want to use it, there are very good tutorials. Try this first from Microsoft: http://windowshelp.microsoft.com/Windows/en-US/Help/02ddfbec-7a97-4788-9d54-86f174a95f841033.mspx .

FileZilla
FileZilla is a Free Open Software FTP product especially suitable for easy drag-and-drop FTP file operations. It's free, reliable and easy to use. http://download.cdnet.com/windows. It's popular and well-reviewed.

7-Zip
7-Zip is a free zip program. Obviously, it handles zip files. But it also does RAR, TAR, LZH, ISO, CAB, RPM and its' own 7z format, that is claimed to have the very latest compression (2-10% better) and encryption algorithms. It's very easy to use because it has a very understandable user interface. http://www.7-zip.org. There are 32- and 64-bit versions.

Software.....Continued on page 4

Software.....Continued from page 3

Foxit Reader
I had been increasingly bothered by the size of Adobe Reader, its taking so long to load and always calling home for more updates. So I got Foxit Reader, and then removed Adobe Reader, eventually on all my computers. I'm certain that this doesn't do everything Adobe does, but I'm also certain that it does 100% of what I need it to do. It's small and loads fast, and doesn't leave anything running on your PC. http://www.foxitsoftware.com/.

Xobni
To quote Xobni: "Xobni is the Outlook plug-in that saves you time finding email conversations, contacts and attachments. After a quick install, you'll see the new Xobni toolbar appear in Outlook - and suddenly information will become much easier to find. When a new email arrives, the sender's full communication history appears in the Xobni sidebar, including past conversations, attachments and contact details. Xobni also includes a blazing fast email search tool."
Mine is in constant use. It's difficult to imagine any email indexing tool that presents as much relevant information so quickly. Now in version 1.8, there's a for-money "Pro" version. http://www.xobni.com/ or http://download.cdnet.com/windows. "Xobni" is "Inbox" spelled backwords.

Here's others I use. All free except:
Ultramon – multiple monitor tools $40 http://www.realtimesoft.com/ultramon

VLC Media Player – Media Player
Starburn – Burn stuff to CD/DVD
Imgburn – ISO to disk, disk to ISO
Avery DesignPro Labels – Everything Avery has and more. Word Templates, free DesignPro. http://www.avery.com
Paint.Net – Excellent Paint and Photo tools.
Audacity – Record and edit sound
SyncToy 2.0 – Microsoft Backup
Windows Fax and Scan – Scanner control and FAX. Microsoft.
WildBit Viewer 5.3 – Edit pictures, slideshow, organize search and tag pictures. http://www.wildbit-soft.fi/software.html ◆

Comments.....Continued from page 1

to start to our Pepin location. That uses the Microsoft Live server control for Virtual Earth, which would work on the 2003 server but only under special permissions that the hosting company would not grant for security reasons. Under the 2008 server, the security setup is different and the Virtual Earth DLL needs no special permission.

So, now you can go to our site, under the menu item About Us | Meetings | map, and create your route. The direct link is http://www.tpcug.org/Routing.aspx.

More Mapping I continue to find things to do using Microsoft Virtual Earth (VE) to map data. In previous newsletters, I wrote about creating such maps for the 2000 US Census data, current worldwide shipping information and National Public Radio station locations. Now I have found another use--cell phone tower locations in the US. You can find that application at http://www.lamartin.com/CellTowers/. I have written more about my motivation for creating such an application in a short article which is on page 7 in this newsletter.

Bing I am sure you have heard of Microsoft's new search engine. Perhaps you have even tried it. I know that Google is so entrenched in people's minds when it comes to search that they wouldn't use anything else. I gave bing a try and like it. It gives much better results that the previous MSN search. Possibly not as many results as Google, but possibly more focused results than Google returns.

Internet Explorer 8 problem Since being upgraded to IE 8 from IE 7, I have rarely been able to use that browser to connect to my Linksys WRT54G router successfully. I can log in with my user name and password, and the configuration page sort of appears, but it is missing all the links I need to do the administration. Sometime if I try to log on several times, it is successful in displaying the configuration page correctly. However, a sure-fire way of getting to the configuration page is to use Firefox instead of IE 8. After writing this I solved the problem: I updated the router's firmware from v8.00.2 to v8.00.6, and IE 8 now accesses the router's configuration pages in a flash. ◆

Minutes.....Continued from page 2

tation on "Windows 7" at approximately 7:30 PM. Bob started the presentation by polling the members on the time it has taken them in the past to install a new operating system. The general consensus was about one-and-a-half hours. Bob stated that he had loaded the Windows 7 system in 27 minutes and it took only 7 minutes for Microsoft to find, download and install drivers not found in the first 27 minutes. He said that this was by far the easiest installation that he has ever performed. The local network setup was also very easy. He was impressed with the way it handled a wide variety of programs. He liked a feature called "Action Center," which warns you of problems and helps you solve them. Bob discussed how well the Vista system repair disk performed. The repair disk on his version of Windows 7 did not work so he was unable to test it. He did find bugs but was impressed with the software. There was an extended discussion of the "BitLocker" encryption system, but it was concluded that anyone using the encryption system should be thoroughly familiar with the options available to them before they encrypted their data. Bob then turned the demonstration over to Merle.

Merle stated that anyone familiar with Vista will be able to move into Windows 7 quite easily. He views Windows 7 as an improved version of Vista. Microsoft has again rearranged things, but the arrangement seems to be much more logically constructed. The organization of the operating system is greatly improved. Merle installed Windows 7 on a computer approximately 7 years old. He had an initial driver problem for his video card, for which the manufacturer

Remote Desktop on a Pocket PC

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

Remote desktop allows person A using computer A to take control of another computer, Computer B, if B has been configured to allow person A to connect via the Internet with a certain password. The usual scenario is for someone traveling to use their laptop to log into their home or office computer. Merle mentions this in his article, Free Software, on page 3 of this newsletter.

If you own a Windows Mobile phone, like the one pictured on the right, you may be able to set up a remote desktop connection between the phone and another computer. It will depend on whether your wireless provider has enabled this feature or not. Apparently T-Mobile does not install Remote Desktop on their Win Mobile 6 phones (my son has one). But Verizon does, as did Alltel, my provider, which is now owned by Verizon.

What you see on the right is a small portion of Microsoft Outlook running on my home computer as seen from my phone. It is not at all easy to navigate the desktop applications from the small screen of the phone, so I am not sure how useful this will be.

To set things up on your computer, go to Control Panel |System | Remote Users and set yourself as allowed to connect remotely. If you have a router you will need to additionally enter its setup and forward port 3389 to the local computer you will be connecting to as shown in the screen capture below, where in this instance the local IP address for the computer is 192.168.1.101. You will also need the non-local IP address of your router, which can only be gotten from a web page set up to return that information. I have one at my site at http://www.lamartin.com/ASP/ip.asp. If you are not using a router, this can be gotten by running ipconfig.exe on the computer.

When you are ready to connect from the phone, start Remote Desktop on the phone and enter the remote computer's IP along with your user name and password. That should connect you. In the picture you can see that the phone is connected to the remote computer at IP address 173.171.200.200.◆

Port Range

Special Interest Groups

Visual Basic .Net SIG (and sometimes Access SIG)

This SIG meets the third Wednesday of the month at 6:30 PM. For information, contact William LaMartin at lamartin@tampabay.rr.com.

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Bob LaFave moderates the discussion.

Mapping Cell Tower Locations

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

The image above is a screen capture of the collection of cell towers in Hillsborough County zoomed to the maximum so that only one tower, represented by the blue pushpin, is shown. It is located in South Tampa in the small area bounded by S Dale Mabry Hwy, W. Inman Ave. and Henderson Blvd. The actual tower is just to the upper left a little from the pin. I chose this tower because they have attempted to disguise it as a large tree, as you can see in the image.

I originally became interested in cell tower information when I thought I would be able to write a program for my Win Mobile phone to display the location of the tower being used at any time. But after a bit of work and research, I found that apparently

Towers.....Continued on page 8

Minutes.....Continued from page 5

had no solution. He turned the computer off and later turned it back on, and Microsoft fixed the problem. The computer, however, is running slower than a netbook. Merle demonstrated many of the new features offered by Windows 7. He discussed which of the new and the old features are available in each of the versions of Windows 7. Merle explained the concept of the file manager, which is an expanded version of the manager that was introduced in Vista. He covered the limitations and showed that it is very much different from the file manager in Windows XP. He also discussed how he had modified the Vista version to better fit his needs. He ended the presentation at approximately 8:40 PM.

The raffle was held immediately after the presentation. The winners were: John Waldon, who won a copy of

The meeting ended at approximately 9:00 PM. ◆

Towers.....Continued from page 7

either the manufacturer, HTC, or my wireless carrier, Alltel, had disabled that feature so that the information could not be acquired by a program running on the phone. Thus, that idea was out, but then what to do with the database of cell towers I had found at the Federal Communications Commission site? Make a map of course. So go to http://www.lamartin.com/CellTowers/ and find a cell tower near you. There are at least 300 in Hillsborough County and 92,537 plus in the USA. Not all commercial towers are necessarily in the database, and none of the private ones is. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

The auto cash for clunkers program gave me an idea. What about a cash for clunkers program for computers? Perhaps $500 for your old computer when you buy a new computer for more than, say, $1,500. I bet that would bring out a lot of old electricity-guzzling, CRT-equipped, Win 95-running desktops. That would stimulate the economy, by having us buy more imported computers, just like the clunker car program sold more imported cars than domestic ones. If that didn't provide enough stimulus, then we could have a cash for clunker software program, where you would get cash for your old Word Perfect software toward the purchase of something new. This would actually help American workers since most software is still made in the US, I believe.

I occasionally look at old newsletters. In the September 1989 issue (that's 20 years ago), current member Merrill Friend is listed as a new member. Also, current member Roger Waters was apparently a member then since he won a door prize at the previous meeting. The minutes of the August meeting tell that Microsoft was the presenter, with a presentation about Word 5,

Minutes of the August Meeting

By Jim Purcell, Secretary, Tampa PC Users Group
Edward_J_P@MSN.com

Bob LaFave started the Windows SIG at 6:35 PM. Ed White was having a problem with Flash Player. Bob discussed the problem and suggested that it was probably related to his cache settings. Rick Goldstein reported that he was receiving a request at startup to insert the Scan Soft uninstall disk. He said he doesn't have a disk since he has never owned the program. He can't uninstall because the program is not listed as installed. Bob believed that it was due to an entry created in his registry by some software, probably provided with hardware detected by his computer. Bob led a discussion that produced several possible solutions.

The question of register cleaning arose again. Bob indicated, as he had in previous meetings, that he thought it was dangerous to try to clean your registry manually or to randomly select one of the many "Registry Cleaner" software programs available. He again suggested that you use the free registry cleaner offered by Microsoft at http://onecare.live.com/site/en-Us/article/registry_cleaner_why.htm . The site gives you detailed instructions and also explains what a registry is and why it should be periodically cleaned. The site also provides the procedures to follow if you are using the Foxfire browser.

Bob discussed the methods of identifying unknown programs that are running on your computer. William LaMartin mentioned that, when you are unable to shutdown such programs and "popups," ALT-F4 immediately closes the open window. In closing, Bob recommended the "HWINFO32" freeware if you want to learn about the system details of your computer.

John Witmer started the business portion of the meeting at approximately 7:25 PM. He confirmed that Blain Barton will provide the presentation in September. Blain will discuss "Migrating from Windows XP to Windows 7." Doug Mullis reported that Steve Singer is scheduled to give his annual presentation to the group at the October meeting. Doug also believes that he has a speaker for November which he should be able to confirm shortly. John welcomed Mike Hodges and Eric Goldstein, two members who have been absent for awhile. He

Creating Mapping Overlays

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

I hope you are not tiring of my articles about mapping; I just keep discovering different things that can be done with the Microsoft Virtual Earth maps, which are now termed Microsoft bing maps due to Microsoft's rebranding of such things.

Let's see what I have written about so far and the links to the applications. August was cell tower locations in the US, http://www.lamartin.com/CellTowers/.
May was ship locations around the world, http://www.lamartin.com/ShipLocations/.
And in April I wrote about mapping NPR stations, http://www.lamartin.com/VENPRStations/.

Further in the past, I have written about mapping in real time your recent and current locations using a Windows Mobile phone with GPS. I also recall creating an application that would map where photos were taken so that when you clicked on a pushpin on the map, the image taken there would be displayed. All of this is just another way of visualizing data.

This month, I will tell you how to put one map on top of another. More specifically, I will overlay a current map of the US with a 1915 and a 1922 map of a specific part of Tampa, FL. The area in question is made up of a subdivision platted on the east side in 1911 and on the west by part of another subdivision platted in 1914. This area of Tampa is currently known as Hyde Park, although that is not the subdivision name.

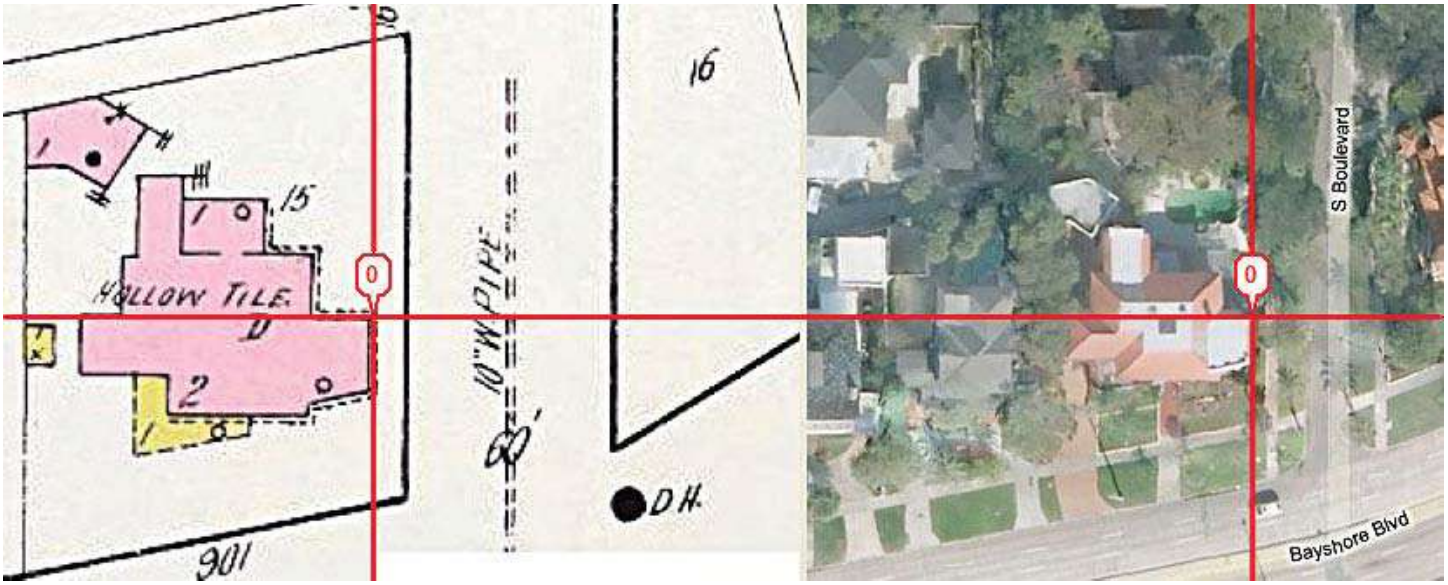
The 1915 map consists of two sheets from the Sanborn Insurance map collection. As best I can tell, the Library of Congress in the 1990s planned to scan in these maps and make them digitally available, but that never happened. However, the various state universities have done this, and luckily the University of Florida allows anonymous viewing of its Florida maps. I would love to view the maps for New Orleans,

Map.....Continued on page 4

Map.....Continued from page 3

but, like most such sites you need a library card for the library hosting the online maps. So I am grateful to UF. To read about the maps in the UF collection, go to http://www.uflib.ufl.edu/ufdc/?c=sanborn&m=hhh.

I used the 1915 and 1922 insurance maps of Tampa. I will describe the process for the 1915 map. For the 1915 map, I used sheets 95 and 97 and viewed them as "zoomable" at the next to highest resolution and largest screen display settings at the UF site. With a good bit of sleuthing, I discovered how to download the image of the entire map sheet and not just the small portion being viewed. I then used Photoshop to remove some of the writing and features that I didn't want to appear when the image was going to be used as an overlay to the Microsoft map.



Now what to do with the image I had created from the two 1915 Sanborn sheets? You can't just plop such a static image on a Microsoft bing map, since the bing map is dynamic. Enter a free program from Microsoft Research named MapCruncher that will take any image and allow you to match positions on the image with locations on the Microsoft bing map. In the screen capture below, you can see where I have matched the corner of a house in the Sanborn map on the left with the same house corner in the Microsoft map on the right. (The red color, as seen on the web version of the newsletter, of the cross hair lines was added for emphasis; the lines are actually dotted in the program.)

Once you have created enough corresponding locations--say, 20 in my case--you select the colors you want to be transparent. In my case, I wanted the background color of the Sanborn map to be transparent. That way only the colored drawings of the footprints of the 1915 houses would be seen along with whatever other items the draftsmen had put on the map, such as water lines, etc. The next step is to let MapCruncher create a collection of map tiles (images) for all different zoom levels. In this instance, 297 map tiles were created, totaling about 9 MB. To read about and download MapCruncher, go to http://www.microsoft.com/maps/product/mapcruncher.aspx.

At this point, if you take all the tile images plus all the other files MapCruncher has created for this map and put the entire collection on a web server, you will have a zoomable Microsoft bing map with the Sanborn map overlaid. But, since I wanted a more custom setup, I chose a slightly different route. What I chose to do was use Microsoft Visual Studio 8 to create a Silverlight project, add a bing map to it and then add a tile layer to the map based on the tiles created by MapCruncher for the 1915 Sanborn map of Hyde Park.

I did the same thing as described above for the 1922 Map.

You can see the results for both at http://www.lamartin.com/HPSanborn1915. ◆

Minutes.....Continued from page 2

expressed his appreciation to the members for the large turnout (28 members). He again reminded members of the benefits that the group receives when they go through our web site to place their order with Amazon.com. The raffle was not held because the normal program ran late.

Kevan Sheridan opened the presentation of "Cloud Computing with Google Apps" at approximately 7:30 PM. In his overview of the program, he noted that Email, Calendar, Tasks, Contacts, Spreadsheets, Documents, Chat and more are in one virtual location. The primary advantages of using these apps are that there is no software to purchase or upgrade, there is no fee for individuals using the apps, the programs are available from any web browser, data is stored on Google servers and does not occupy your storage capacity, and you have live collaboration with multiple users that is very easy to learn and use. The primary disadvantages are that there are fewer software tools and features, you have no control of the location or backup schedule of your data, your data, although protected, may be less secure than with your desktop applications, and the Google apps are slower and less stable than those on your computer.

Kevan explained how easily data could be shared between applications. Finally, the amount of free storage space appears to be generous; however, it is not a simple number of gigabytes but is defined by the number and the size limitations for the type of document. These limitations are described at http://docs.google.com/support/bin/answer.py?hl=en&answer=37603.

The meeting ended at approximately 9:00 PM. ◆

Internet Picture of the Month

Foreclosure Tours

From the NY Times site, http://www.nytimes.com/2009/08/16/weekinreview/16cave.html, we get the photo from above and the quote below:

"Ever since the 1920s Florida has been cast as the place people go to escape contemplation, not to indulge in it. But in the past year, from Pensacola to Miami Beach, Floridians have been soul searching. And for good reason. The state's decades-long binge on real estate has given way to empty homes in rich and poor neighborhoods alike. Hundreds of thousands of jobs have vanished, empty stores are everywhere and even golf courses are shutting down."

The Confusing and Ever-growing Array of Microsoft Email

By Jim Purcell, Secretary, Tampa PC Users Group
Edward_J_P@MSN.com

The current list of Microsoft email services other than full Outlook includes Outlet Express, Hotmail, Windows Mail, Windows Live Mail, Windows Live Hotmail and Windows Live Hotmail Plus. If this confuses you, don't be ashamed, it also confuses Microsoft Customer Support. I had a problem with Windows Live Mail, which I clearly identified as a Windows Live Mail problem, and they referred me to the "Windows Live Hotmail Support Team." My problem had nothing to do with Hotmail but with my inability to change the color of the Windows Live Mail font (a very light blue) to a darker color. Even though my monitors are almost as large as a movie drive-in screen, it is very difficult to read. Their final answer, though disappointing, assured me that I might have a part in the future development of the product: "Jim, we currently do not offer the feature that will allow you to adjust the color of your fonts and folders in Windows Live Mail interface. What we can do for you right now is to personally submit this item to the Windows Live Mail Product Development Team as a feature request for evaluation, as I see the usefulness of this capability. We appreciate your interest and will consider your suggestion as we plan for future product improvements."

Outlook Express, the first on the list has, at one time or another, been used by practically everyone. It was bundled with several versions of Internet Explorer beginning with version 4 and with several versions of Microsoft Windows from Windows 98 to Windows XP and was available in Windows 95. Over the course of its life, it has experienced some problems with email standards, database corruption and security issues. http://en.wikipedia.org/wiki/Outlook_Express

Hotmail was one of the first web-based email services. It was launched in July 1996 as "HoTMaiL"; its name and capitalization refers to HTML. It was one of the first free email providers. It was acquired by Microsoft in 1997 for an estimated $400 million and renamed "MSN Hotmail." It quickly became the world's largest webmail service and reported more than 30 million active members. During the period 2000/2001, a security issue appeared in Hotmail that permitted anybody to log into any Hotmail account using the password "eh;" it was at the time called "the most widespread security incident in the history of the Web." In 2001, the Hotmail service was compromised again by computer hackers, who discovered that anyone could log into their Hotmail account and then access messages from any other Hotmail account by using an easily crafted URL. http://en.wikipedia.org/wiki/Hotmail.

Windows Mail was included in Windows Vista to replace Outlook Express. It addressed concerns about email, junk mail and phishing attacks. It also added features to search large volumes of email messages. It was not made available for earlier versions of the Windows operating systems. It has been replaced by "Windows Live Mail," which is also available for Windows XP as a replacement for Outlook Express.

Windows Live Mail is a free email program with many of the same features as Outlook Express, such as synchronizing your email messages, folders, contacts, and more. It also includes junk mail filtering and a built-in calendar that works with your Windows Live Calendar. It also offers:

- Offline mail
- Send/receive mail from multiple accounts in one place - Hotmail accounts or POP and EVLAP mail accounts (like Gmail or Yahoo! Plus)
- Rich photo-sharing capabilities
- Integration with Desktop Search
- Safety tools (anti-phishing, anti-spam features)
- Integration with Windows Live services, including Windows Live Spaces
- RSS feed aggregation
- Built-in calendar view that can access your Windows Live Calendar

Windows Live Hotmail is the free upgrade of MSN Hotmail. It includes the following features:

Email.....Continued on page 7

Special Interest Groups

Visual Basic .Net SIG (and sometimes Access SIG)

This SIG meets the third Wednesday of the month at 6:30 PM. For information, contact William LaMartin at lamartin@tampabay.rr.com.

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Bob LaFave moderates the discussion.

Email.....Continued from page 6

- Improved spam protection — safety bar plus one-click spam tools
- 5 GB of storage —five times as much as MSN Hotmail
- Faster than ever — read mail without reloading the page
- Customizable design — use themes to customize your interface

Windows Live Hotmail Plus has all the benefits of Hotmail—ease of use, strong spam protection, fast performance—but with lots of extras. The cost for this service is $19.95 annually. What more do you get with Hotmail Plus compared to regular Hotmail:

More storage Get 10 GB of storage that automatically grows with your needs.

Larger attachments Send files up to 20 MB, twice that of regular Hotmail.

More custom filters Sort and organize your incoming mail the way you want.

Bigger distribution lists Send emails to a much larger group of recipients than with regular Hotmail.

No account expiration You don't need to log in to keep your account active as long as your Hotmail Plus subscription is current.

More "Safe Addresses" 500 versus 250 with regular-Hotmail. Tell Hotmail which senders' emails should not land in the junk folder.

Forwarding Have your Hotmail sent to accounts not hosted by Microsoft.

No graphical ads Just your e-mail.

Finally, Microsoft has announced that they are retiring the DAV protocol September 1, 2009, which will prevent you from connecting with Hotmail from within Outlook 2003 and 2007 unless you download the Microsoft Office Outlook Connector. http://office.microsoft.com/en-us/outlook/HA102225181033.aspx. ◆

Comments.....Continued from page 1

which, I think, was a DOS program. The minutes also say that Microsoft gave the group a free working copy of their Excel program. So we have had Word and Excel around for 20 years. It is hard to believe. And it is interesting that we will be having a presentation at this month's meeting given by Microsoft 20 years and one month after that meeting in August 1989.

The minutes also say the club president, Harvey Bruneau, had two 10 MB hard drives for sale for $100 each. Wow! How the price of hard drives has changed. That is $10/MB, and there is no mention whether they are new or not. I remember buying hard drives in the early 1990s for around $1/MB. Today Newegg will sell you a 2 TB, that's 2 terabytres or 1,000,000 MB, Western Digital internal hard drive for $219. If my mathematics is correct, that is $ 0.000219/MB. Twenty years does make a difference. Automobiles get more expensive, computers cost less.

At that time, the club met downtown in the GTE building that was located in the block bounded by Zack, Morgan, Twiggs and Marion streets. The speaker for the September meeting was to be Egghead Software. The topic was "The Latest and Greatest in Hardware and Software." Sounds almost like the presentation that Steve Singer will give us next month, doesn't it? ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

September was a very busy computer month for me. I solved a couple of problems, installed a major update for one of my program suites (which caused the problems), installed the Powerline Ethernet adapters that I write about in this newsletter and wrote several useful little computer programs.

The alternating current power line adapters from Netgear in the article on page 3 were not really purchased to solve a computer problem. The wireless connection to the computer in our back room, while not 100% reliable, was functioning well enough. What really pushed me to find a better LAN connection for that room was the purchase of a new TV which would reside there, replacing a large TV that served us well for 15 years. The replacement, a Sony 40-inch LCD Bravia, had a socket to connect a LAN cable. Thus, the new Ethernet adapters mentioned above. Instead of simply connecting the computer in that room to the adapter, I connected an Ethernet switch I had just sitting unused to the adapter, and, from the switch,

Minutes of the September Meeting

By Jim Purcell, Secretary, Tampa PC Users Group
Edward_J_P@MSN.com

The meeting began at approximately 6:35 PM. Bob LaFave opened the SIG meeting with a discussion about the ways that programs can be adapted to the different operating systems. One of the members had a problem with a computer that was taken to Staples for a cleanup. The computer was working fine except that it did not automatically log on to the Internet when the computer was booted, as it had done before the cleanup. He had to turn on the wireless card each time he booted the machine. Bob discussed several possible causes and explained how to go through each to locate the source of the problem. Bob discussed some of the problems in upgrading to Windows 7 from both Windows XP and Vista. Bob again mentioned the full-service cleaner that can be downloaded from Microsoft. He said that it will take a couple of hours to run but that he had gotten substantially improved performance every time that he used it. Bob said that the quickest way to determine your IP address is by using the site http://whatismyip.com/. The site also provides other interesting information. Members using Windows XP stated that they are getting a message advising that "Outlook Express needs to compress its folders to save space." Bob says that you can set an option in Outlook Express and Windows Mail to determine how often the message appears. The Windows SIG ended at approximately 7:15 PM.

John Witmer, our president, opened the business portion of the meeting. He mentioned that we had recently received $50.00 from Amazon.com as a result of routing our purchases from them through our web site. John mentioned that election of Board members will be held in December and the slate will be created in November. He stressed the need for volunteers. John announced that Steve Singer will give the presentation at the October meeting. There was a discussion about the cruise sponsored by FACUG.Our treasurer, Doug Mullis, reminded members to be sure to submit their dues before their membership expires. John welcomed Blain Barton and thanked him for again provid-

Powerline Ethernet Adapter

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

Are there places in your home where you would like to have a LAN connection but running a LAN cable is too difficult and a wireless connection is of poor quality? Do you have $120 to spare? That is what the NETGEAR XAVB101 Powerline AV Ethernet Adapter Kit will cost you (at Amazon.com, including shipping). It consist of two modules, one of which is pictured to the right. They also supply you with two short LAN cables.
Installation is easy. Simply plug one of the modules into an electrical wall outlet near where you receive your Internet. For most of us, that would be near our router. Next, connect one of the provided LAN cables from a socket on the router to the one on the module. Take the other module to where you want the remote connection, plug it into an electrical wall outlet there and, similarly, connect a LAN cable from it to the device you want to add to your local area network. It takes about a minute for each of the adapters to be recognized by the network. At that point, you should be up and running--except for the important item of security.

Security for the adapters can be enabled in either of two ways: Either with the security button on each adapter, or by running the configuration software provided on the CD that comes with the adapters. I chose the latter method, where the first step is to install the configuration utility on your computer. Once the utility is installed, follow the instructions in the user guide (also on the CD)

A word of warning: You will need the MAC address of the remote adapter when using the configuration utility, so copy this from the back of the adapter before plugging it into the wall socket.

Below is a screen shot of the configuration utility, showing my two adapters. You would select the Security tab to do the security configuration.

The configuration utility installation also installs a firmware upgrade tool. So, at some point after the network is functional, you will want to run this to upgrade the devices' firmware to the latest versions.

It is a bit expensive but sure beats crawling under the house, or putting up with erratic wireless connections. Now, in a far room of our house, the computer is connected to the local area network at 100 mbps, the same as for a wired LAN connection. By the way, pay no attention to the claim in the specifications that it is a 200 Mbps connection. From what I read, that is gotten by adding 100 Mbs for both receive and send.

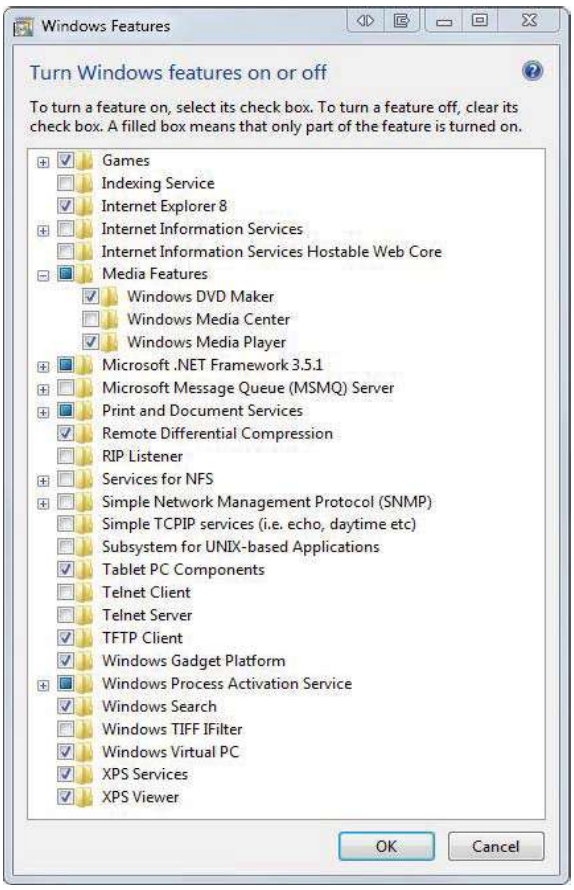
If you have another room you want to add to the Powerline network, simply order a single adapter. I think the price from Amazon for one is around $62. Again, this is not as cheap as installing a wireless Ethernet adapter in the remote computer--but it is a whole lot faster and more reliable. ◆

More Windows 7

By Merle Nicholson, Tampa PC Users Group
merle@merlenicholson.com

I've been messing around off and on with the last free version of Windows 7 and then built a new fast computer just in time for the real thing almost a month ago. I couldn't go too far with the testing versions, knowing that whatever work I put in was going to be lost when the final release came out. It helps to keep reading the press and blogs on this subject, so I had been forewarned.

In any case I've had a system going for a bit less than four weeks, and I switched over to it as my primary computer just over a week ago. After installing Windows 7 Ultimate x64, I attached a copy of my data disk and have spent the last week installing software and configuring the system. My personal preference is to never install any software that I could do without. Fortunately, my previous system was Vista Business x64, so I've invested a lot of time in researching software.



Windows Ultimate has a few things I don't need, so to save computer memory and cpu cycles, I used the "Windows Features" and made sure I didn't have "Windows Media Center" and a couple of other things. While doing that, I actually added a couple of features, and it installed those without asking for the installation DVD.

There's no reason to think that software that works on Vista 64 wouldn't work on Win 7 x64, but I have run into a problem with my old PaintShop Pro 9. When it loads, the screen blinks and a flag goes up to say that the color scheme has been changed to Windows 7 Basic, which I think just eliminates Aero Peek. When I close PaintShop, it reverts back to an Aero theme.

There are quite a few additions that I find very useful. Some were added for Vista.

Virtual PC XP Mode - New

This is a Windows Virtual PC application. Windows Virtual PC 2007 was a free downloadable product, but Windows Virtual PC is now included in Windows 7 Professional, Enterprise, and Ultimate editions. One requirement is a processor capable of hardware virtualization with Intel VT or AMD-V enabled and at least 2GB memory. You configure each machine with a fixed amount of real memory.

With Virtual PC, you can install and configure other operating systems and have them running in a window or full screen. You normally set it up so the virtual machine is connected to your network. One catch, of course, is that you must own a license to that operating system. And just because you have a notebook with XP on it doesn't mean you can use that install CD. The Virtual PC is considered a real machine for licensing purposes.

Now, all this is background. I was getting to XP mode software. It's a free download from MS to a valid legal Windows computer. It contains a free version of Windows XP, so there's no license to purchase. When you have it set up and configured, you can use it like any XP machine. The intention is to have an environment where you can run old software that may not be able to run in Windows 7 (or Vista for that matter). So if you have an old Quicken for Windows 95

Windows 7 .....Continued on page 6

Comments.....Continued from page 1

connected cables to the computer and to the TV, with two additional sockets remaining on the switch for other possible connections.

So, with a TV connected to the Internet what can you do? There is no built-in browser in our Sony TV, so no wandering around the Internet. With this LAN connection (and without any cable or FIOS connection), you can:

- Use Widgets provided by Yahoo to check the weather, the news and stock quotes.
- Use Amazon's Video on Demand to rent or buy movies or old TV programs and watch them as they download.
- Watch You-Tube
- Use Netflix when it will be available later this year
- Watch an assortment of videos from different sources like blip.tv, Wired, Epicurious.com and Concierge.com.

If I had a DLNA Certified Media Server, I could connect that to my network, and the TV could access that also to view the images, videos or music there. Although you cannot access anything on the hard drives of computers on the network, the TV has a USB port, so you can plug in a thumb drive containing this type of media, and the TV can access it.

That is all from me for this month. Happily, other contributors have filled the rest of the newsletter. ◆

Internet Picture of the Month

Spider Fun

WSJ Photos of the Week, October 2, from http://online.wsj.com.

A large Golden Orb Spider on the face of Wildlife World keeper Borisat in Sydney, Australia. The wildlife park was holding a survey to establish which of two types of animals the public finds more creepy: Snakes or spiders.

I am personally familiar with these large, harmless spiders since they were in an orange grove I owned. They would build their webs across the grove middles, perfectly situated to catch you on the head when driving a tractor down the middles.

Windows 7.....Continued from page 4

with invaluable 1989 expenses, or in my case – Microsoft Arcade – on diskette for 16-bit systems, you're a happy camper. Yes, I did miss my old original Dig Dug and PacMan, but no longer.

There are a few downsides to this, however. One is the real memory requirement, a minimum of 512M. To run well, it needs at least 1GB. Another is that it's slooow to load and start up. That's 1-1/2 minutes slow on my own, very powerful computer (8GB, Quad processor at 3.6GHz). But it does work well. I just realized that it would have been a good solution to running my old trusty USB scanner, instead of throwing it away and getting a new one. Naw, I wanted a new one.

Backup and Restore – improved
The Windows 7 Backup and Restore is finally worthy of using. There are two versions; The version that comes with Professional and Ultimate will back up through your network; Starter and Home Premium will back up, but just to a local or USB drive.

Editions
In case you're confused about the various editions, here's a summary:
Windows 7 Starter – To be pre-installed on new computers by computer manufacturers. The Aero theme is not included, and it's 32-bit only.
Windows 7 Home Basic – For emerging markets, not available in developed countries like the US, Canada, France, Germany etc.
Windows 7 Home Premium – Aimed at the home market, it includes Aero and Windows Media Center. It does lack some features you may want, like logging into a Domain (server) at your business and Remote Desktop Connection.
Windows 7 Professioal – Adds Domain, Remote Desktop Connection, Location Aware Printing, Encrypting File System, Presentation Mode and Windows XP Mode.
Windows 7 Enterprise – Volume licensing to large businesses.
Windows 7 Ultimate – All the features of Professional and Enterprise, and adds Bitlocker drive encryption and multi-language support.

Remote Desktop Connection – Has been improved with multi-monitor support. So, if you log into any computer that supports Remote Desktop (Professional and up) from a Win 7 PC with two monitors, that desktop will show up on both your monitors. I like this very much, and I've configured a Remote Desktop for three other computers in the house. Very handy. I also sit at a (slow) laptop in the living room and log into my main (fast) computer, located upstairs.

Upgrading – There are upgrade versions at better pricing for Home Premium, Professional and Ultimate. You can't upgrade from XP to Win 7. You can, however, use the File and Settings Wizard to create a file that copies essential settings and email, favorites and more from your XP machine to Windows 7. But you'll have to reinstall all your applications. Also, you can't upgrade a Vista x32 to Win 7 x64, or a Vista 64 to Win 7 x86 (32-bit).

I can see a reason to upgrade your Vista machine to Windows 7. And if you HAVE to upgrade your XP machine (I wouldn't) there is a pretty good chance it will work. If I just HAD to upgrade an XP machine, I'd disconnect the existing hard drive and put a new one in to install to. You can then just swap back if it all goes badly.

Windows 7 x86 (the 32-bit version) vs. Windows 7 x64:
I've gone through Vista x64, and then Windows 7 x32 Beta, and now Windows 7 x64. I haven't found any disadvantage to using the 64-bit versions. I did lose an old USB scanner, but the new one I got uses LEDs light source and is lightning fast. Two of the four printers date to 2005, and the other two to 2007. No driver problems. The x64 has some advantages, the main one being that it will see all of the memory you can install. In my case I have 8G (4 x 2G), and the motherboard would take 16G (4 x 4G) modules, which are cost prohibitive. If I had used x86 (the 32-bit version), the most memory it could see is under 3G.

The x64 Version is more efficient handling memory, but, most importantly, you have the ability to run Virtual PC and dedicate 2G to it and, also, use a 2G Virtual drive. I use the Virtual Drive for my database

Special Interest Groups

Visual Basic .Net SIG (and sometimes Access SIG)

This SIG meets the third Wednesday of the month at 6:30 PM. For information, contact William LaMartin at lamartin@tampabay.rr.com.

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Bob LaFave moderates the discussion.

A Message from your Board of Directors

We are fast approaching the time for election of the Board for the year 2010.

The Board is responsible for all aspects and activities of the Group and provides leadership and for the continued existence of the Group.

We are a relatively small group, one of the smaller groups in the area, perhaps because of geography, but as such, we have the advantage of a more intimate type of meeting.

There is a core group of members who take a more active part.

They all have lives and outside interests, as do all members.

Each of the members of the current Board has served at least two terms.

We urgently need other members to volunteer for the Board.

No positions should require more than a few hours each month.

New members can provide new ideas and a fresh look at things, as well as relieving current members.

Elected Officers are: President, Vice President, Treasurer, Secretary and Member at Large

Editor, Librarian and Program Chairman are appointed volunteers.

Please consider this request carefully.

Applicants should notify John Witmer our current President by email immediately so as to be included in the forthcom-

Elections.....Continued on page 8

Minutes.....Continued from page 2

ing the latest information from Microsoft.

Blain began his presentation, "Migrating from Windows XP to Windows 7," at approximately 7:30 PM. He divided his presentation into two parts. In the first part, he explained virtualization, hypervisor and the tools that he uses to do his presentations. He explained that he uses a server environment that can actually be run in production. He mentioned that the Windows 7 "official street date" is October 22. There is an upgrade Windows 7 version for Vista but not for Windows XP. He explained how he uses snapshots in virtualization to quickly demonstrate various phases of the upgrade. In the second part of his presentation, he covered the many facets of migrating from Windows XP to Windows 7. He talked about using the Easy Transfer Wizard and cable to make transfers needed during the migration. Blain mentioned that you can also use a USB external drive (or a thumb drive) or your network to make these transfers. Blain covered the ways to deal with the many problems arising during the activation of software from the old to the new operating system. He reemphasized that there is not an upgrade version of Windows 7 for Windows XP so the process is a complete replacement of Windows XP and that the transfer of settings and reinstallation of applications is more of an involved process than you would experience with an upgrade. The presentation was followed by a lengthy question-and-answer session.

The meeting ended at approximately 8:35 PM. ◆

work, and it's well worth the trouble.

Installing: If there's a device that can't be installed, just wait. At the next reboot, it'll find the right driver on its own. I've seen this many times. Remarkable.

Networking: Easiest I've ever seen.

Windows 7 Ultimate: I don't see any reason for a home or home business to pay the difference. I think the Professional version is a good buy for an experienced user. ◆

Meeting Preview: William LaMartin will demonstrate how to combine mapping, photography and computer programming. As usual, Bob Lafave will conduct the Windows SIG at the beginning of the meeting.

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

Since neither Bill Gates, Steve Wosniak or Larry Ellison were available for our November meeting, you are stuck with me. Don't blame Doug; speakers are hard to come by. However, I think I have some interesting things to show and hope you will find them interesting, too. In the past, I have given programs on computer programming and programs on digital photography. In this presentation, I will combine these with mapping. Thanks to all the developments in recent years, we can do amazing things with maps.

To get an idea of my subject, go to my web site, http://www.lamartin.com and click on the Large Maps/Images button. The programs used in creating these interactive maps and images were almost exclusively Microsoft products. I did use Adobe Photoshop to edit some of the individual images that went into the large compositions.

Microsoft Deep Zoom Composer was used to create the zoom-

Minutes of the October Meeting

By Jim Purcell, Secretary, Tampa PC Users Group
Edward_J_P@MSN.com

The meeting started at 6:35 PM. There was no Windows SIG since Bob LaFave was ill and unable to attend. Steve Singer, who was our speaker for the evening, filled in with a question and answer session before his presentation on new hardware.

Steve began with a broad discussion of Windows 7 changes. He showed a small "Complete Computer" that he said was about as small as you can go at this time. He outlined an impressive list of features and specifications that were available in the small unit. The motherboard is 17 cm by 17 cm. In response to a members request for contact information, Steve provided his phone number, 813-600-1901, and web site, http://www.morevalu.com. He indicated that you can contact him at practically any day or time that there is not a free movie playing in Tampa or its suburbs.

Steve gave a detailed explanation of the various computer-based telephone systems and the cost and limitations of each.

He returned to Windows 7 and discussed in detail the various virtual PCs that are available in Windows 7. He mentioned that his word for updates is "bug-fix." So, if you do not get the updates, you put your system at risk. He brought motherboards and cases for the members to examine and showed the members several unusual products that perform a variety of functions and that he has for sale at bargain prices. Steve's presentation ended at 8:30 PM.

John Witmer, our president, opened the business portion of our meeting at approximately 8:35 PM. He reminded the members of the importance of keeping their dues current. Newsletters are marked when dues are delinquent to help everyone remember. John also mentioned that the election of officers will take place in December and the slate of candidates will be presented by Member-At-Large Ron Weinberg at the November meeting. John expressed his hope that addi-

Continuous Inking System Eliminates the Need to Buy Ink Cartridges

By Ed Cohen, Tampa PC Users Group
condovacations@earthlink.net

There are many inkjet printers selling for less than $100.00 retail. After the first month or two, you could have spent as much for replacement ink cartridges as for the printer.

Using the web, I had found third party suppliers for cartridges at less than half the price compared to OEM's prices. I also tried refilling cartridges using third party inking kits. This worked well except some OEMs date the cartridges and they will not work after the cartridge is "too old". Of course, you do not discover this until you refill the cartridge and attempt to use it.

Another solution is Continuous Inking System (CIS) from http://www.cisinks.com. They have kits that convert most printers into CIS. The startup kits cost between $25.00 and $60.00, depending on the printer. Bulk ink supplies range from $15.00 to $30.00 for a set of inks to match your startup kit.

The startup kit consists of replacement "cartridges" for your printer, bulk ink supply and a ribbon hose attached from the bulk ink supply to the ink cartridges, and strapping to hold the ribbon in place.

Installation is easy:

1. Remove all cartridges
2. Remove cartridge cover if need be
3. Insert CIS cartridges
4. Tape down the ribbon hose using clips supplied, and you are done

My son has used the system for about one year on three different printers. He prints hundreds of pages each month.

I had two minor problems:

1. Make sure all replacement cartridges snap into position. This is slightly difficult since the individual cartridges are bundled together.
2. I did not have enough space for the ribbon cable to swing back and forth when the printer was closed. It worked perfectly when the printer was open. I taped two spacers to the frame which raised the top another ¼ inch and all was well. ◆

Microsoft Virtual PC Hardware Requirements

By Merle Nicholson, Tampa PC Users Group
merle@merlenicholson.com

The newest versions of Virtual PC (VPC) are designed to use "Hardware-assisted Virtualization." It seems to have become a requirement to have this native to your motherboard and processor for VPC to work.

This has come to the forefront since the release of Windows 7. If you have one of the right versions– Professional, Enterprise and Ultimate, then you automatically have VPC. You also have available as a download what's called "Windows XP Mode." This is a licensed version of Windows XP that runs in VPC. When you configure this virtual machine, you set an option to "Auto Publish."

Auto Publish means that, when you install a program in that virtual machine, it places a program shortcut in your host Windows 7 Start menu. So, after I installed my 1995 16-bit "Microsoft Return of Arcade," my Pac-Man icon appears in Windows 7! (Current price for "Return of Arcade: 20th Anniversary Edition": $113.99)

When you launch the Pac-Man program from Windows 7, it appears that Pac-Man was installed directly on Win 7, and the only sense that you get that it's in a VPC is that it takes longer to load. The long load time is from my habit of always shutting down a VPC session, instead of using Sleep Mode.

So, back to the subject of hardware. Windows Virtual PC requires processors capable of hardware-assisted virtualization with AMD-V™, Intel® VT or VIA® VT turned on in the BIOS. If you have a computer and the desire, you still need to know if you have the RIGHT hardware, if it is supported on the motherboard and that it's enabled.

Microsoft thought of everything. There's a free "Microsoft Hardware-Assisted Virtualization Detection

Linksys Wireless Internet Camera

By William LaMartin, Editor, Tampa PC Users Goup
lamartin@tampabay.rr.com

The Linksys WVC54GCA wireless camera, pictured on the right without its power module, is my latest purchase and something I have been interested in for some time. In the November 2007 newsletter, Merle Nicholson wrote about such a device made by D-Link that he had mounted inside his garage and pointed at the garage door to monitor if the garage door was open or closed. That article can be read at http://www.tpcug.org/newsletter/nl_2007/november2007/wirless_camera.htm. He advises me that, after two years, the camera is still working well and only occasionally requires a reset because of a lost wireless connection.

This Linksys camera functions much the same as Merle's D-Link one. They both have built-in web servers which create their own web pages that you may view if you know their web address. They both can be hard-wired with a LAN cable to a router, or can work as a wireless device off a wireless router. But in two years the technology for these home wireless cameras (as opposed to commercial ones that cost many times more) has advanced a bit. The Linksys camera can produce an image as large as 640 x 480 pixels, and, instead of producing a static image file every few seconds as does the D-Link, it actually produces streaming video, which you may stream at any bit rate you desire. The larger the image and the faster the bit rate, the more bandwidth you use. Such an image is below. It was

taken through the window of my computer room across the edge of my front porch and shows a parked work truck at the house to the left, a man mowing a yard across the street and a black car parked in front.

Additionally, you may also enable mobile streaming so that the stream may be viewed on your mobile device using the Real Time Streaming Protocol (RTSP), if your mobile device supports this, which my Windows Mobile 6.1 Pocket PC phone does. The camera's web server also creates an .asf file, which may be viewed remotely with Windows Media Player.

So, how do you view the videos produced by these cameras? There are several ways. You can use the Linksys utility that allows you to both configure the cameras and to view all the videos

Camera.....Continued on page 7

Special Interest Groups

Visual Basic .Net SIG (and sometimes Access SIG)

This SIG meets the third Wednesday of the month at 6:30 PM. For information, contact William LaMartin at lamartin@tampabay.rr.com.

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Bob LaFave moderates the discussion.

---

for all the cameras you have. I used the utility to do the original setup of my camera. I set it up to be wireless with a fixed local IP address of 192.168.1.120, since I had read on the Internet that using a fixed IP address provided better results. You have to use a LAN cable to do the original setup; then you can move the camera wherever you want that has a good wireless signal. My way of viewing the video is to open a web browser and point it to the assigned IP address for the camera, http://192.168.1.120 in my case. Or, finally, you can use Windows Media Player to play the video at http://192.168.1.120/img/video.asf

What if you want to view the video from Paris? It can be done. Go to the camera's setup, either from within the utility or using a web browser, enable HTTP web connections and assign the camera a port, say 1050. You may also require a user name and password, if desired. Then go to your router's setup and forward port 1050 to 192.168.1.120, the camera's local address. Now, if you know the IP address of your router (which you can find at http://www.lamartin.com/aspx/IPAddress/IPAddress.aspx or at other such services), which, by way of example, we will say is 108.444.200.333, then pointing your Parisian browser to http://108.444.200.333:1050 will produce the streaming video of your camera. That is, it will do that if the IP address of your router hasn't changed since you last checked. In my experience, if you are on broadband, your IP address can stay the same for weeks or more--but there is no guarantee. That is all there is to it. Setting up the Real Time Streaming Protocol (RTSP) is a bit more complicated.

I should also mention that the camera allows you to stream whatever audio that it picks up along with the video. And there is a built-in motion sensor that will record a video clip of the action and send it to you via email if you wish.

I find the camera produces quite good video and have only one complaint. It doesn't seem able to keep a wireless connection for more than two days. However, this may not be the fault of the camera entirely (or it may be). I am using a standard wireless router (WRT54G V8) and Linksys recommends a WRT350N wireless-N gigabit router with storagelink. So the router may be the problem. My solution was to run a LAN cable to the camera since it was convenient to do that. Now I know I will have a connection.

Cost: $90 from Amazon.com ◆

Comments.....Continued from page 1

able versions of the maps. The maps themselves were mostly downloaded from the Library of Congress. The "Additional Maps" were created with Microsoft Map Cruncher which allowed me to overlay an old map on the current map. The "Photos" were also created with Microsoft Deep Zoom Composer, and the "Planar Panoramas" were stitched together with another Microsoft product named Microsoft Image Composition Editor (ICE). Finally, when I wanted to tag a particular photo with a latitude and a longitude, I used Microsoft Pro Photo Tools. All these programs are free, though ICE is officially listed only as a research project.

One final program that I used was Microsoft Visual Studio 2008. While many of the programs listed above produce web-ready results, most still needed some tweaking to make them work the way I wanted. For example, if I want to show or hide an overlay on a map, this sort of thing was done with Visual Studio.

I hope to have a new laptop by the time the meeting rolls around. Some may recall how, during my last presentation, we had to wait while my laptop did a bit

tional members will volunteer to run for each position. He indicated that the presentation by Dave Roberts for November was being deferred as the planned topic on "POS software" was of little interest to the group; however, Dave may be called on after the start of the New Year for a presentation on something of broader interest to the group. John thanked the members for our increase in income as a result of their participation in the group's Amazon.com program. The meeting ended at 8:45 PM. ◆

Comments.....Continued from page 7

of "thinking." I probably had Adobe Photoshop and Illustrator open, along with Microsoft Visual Studio, and tried to do something that required a lot of processing. And maybe Microsoft or Adobe decided to do an update right then. Anyway, five years seemed about the right time for a new one, and it should probably stop that from happening this time. At least it will if it gets built and shipped on schedule. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

This is Merle Nicholson's newsletter by the fact that his article on Windows 7 tips takes up most of the space remaining after the minutes and my brief comments here. And for that I am very thankful. Also, Ed Cohen's unsolicited article on *Continuous Inking Systems* last month was a nice surprise. I could use more surprises like that. Less than two weeks before our monthly meeting, I am usually looking at a newsletter with no content. Then, somehow miraculously we get a newsletter made up of member content. The miracle usually consists of my calling several members and pleading for an article, or my figuring out something to write. Happily, that wasn't necessary this month.

I hope my presentation last month on mapping, photography and computer programming was somewhat enlightening. It amazes me how much we have advanced in these things in the last few years, thanks to the increases in computing power and sophistication of the software. As usual, I had more to present than time, and I thank you for your patience since the meeting ended a bit late.

Finally, don't forget to use the amazon.com link at http://www.tpcug.org for your shopping. ◆

Minutes of the November Meeting

By Jim Purcell, Secretary, Tampa PC Users Group
Edward_J_P@MSN.com

Bob LaFave started the Windows SIG at approximately 6:30 PM. Bob showed how the DVD that you use to install Vista or Windows 7 allows you to install a hard drive in the computer as a hidden partition on your current hard drive. He mentioned that with Vista and Windows 7, Microsoft provides you a lot of options to fix your own computer. He stressed the importance of making a recovery disk as soon as you have installed the operating system and your software, because the information will be lost if your hard drive crashes before you have created the recovery disk. Bob mentioned that Belarc Advisor, a free download, builds a detailed profile of your installed software and hardware, a list of missing Microsoft hot fixes, anti-virus status and also provides the serial numbers of your software DVDs. (http://www.belarc.com/free_download.html) In response to a member's question about updating "drivers," Bob discussed the various ways to update and obtain drivers. Merle Nicholson mentioned how easy it has become with the new operating systems to find the drivers that you need. Bob explained how to add a switch to your router in order to provide additional outlets. The Windows SIG ended at approximately 6:55 PM.

William LaMartin began his presentation of "Mapping, Photography & Computer Programming" at approximately 7:00 PM. William opened with an explanation of how and why he spends so much of his time with maps, photography and programming, He has had an interest in maps since he was a young boy, he has a deep interest in programming, and photography is one of his favorite hobbies. The huge technological changes in all three of these areas have allowed him to explore digital maps and show them with amazing clarity and detail that could not have been imagined a few years ago. William showed the members several examples of what he has been able to produce. He started with several maps on which he had used Microsoft Deep Zoom Composer to develop a zoom capability: (1) 1858 Map of the Lower Mississippi River indicating plantation owners; (2) 1798 Map Of New

Minutes .....Continued on page 7

Windows 7 Installation Tips

By Merle Nicholson, Tampa PC Users Group
merle@merlenicholson.com

By now, I've accomplished three successful from-scratch Win 7 64-bit installations and one failed upgrade from Vista BE 64-bit. This isn't counting a couple of Beta installations. Everything I know is a lesson learned by doing it wrong the first time. So I, of course, can call myself ¾ pretty good at it by now.

In two cases, I've run the free Win 7 Compatibility program to anticipate what I may be missing or may have trouble with. The program gives you a pretty informative list. It warns you if there may be some initial problem with a device driver and may say that it should be fixed after a reboot. It will list all the devices it found and whether or not there's a driver for each. It also lists any software that may have problems if you're interested in upgrading from Vista.

If you're upgrading from XP (and I would only if it's a new PC), there is some very good help on this on the Microsoft Windows 7 page (the link is below). You can get all your mail, documents, favorites, address book and more by using the "Windows Easy Transfer" program. It's on the Win 7 Install DVD and is also downloadable for XP and Vista – both 32-bit and 64-bit.

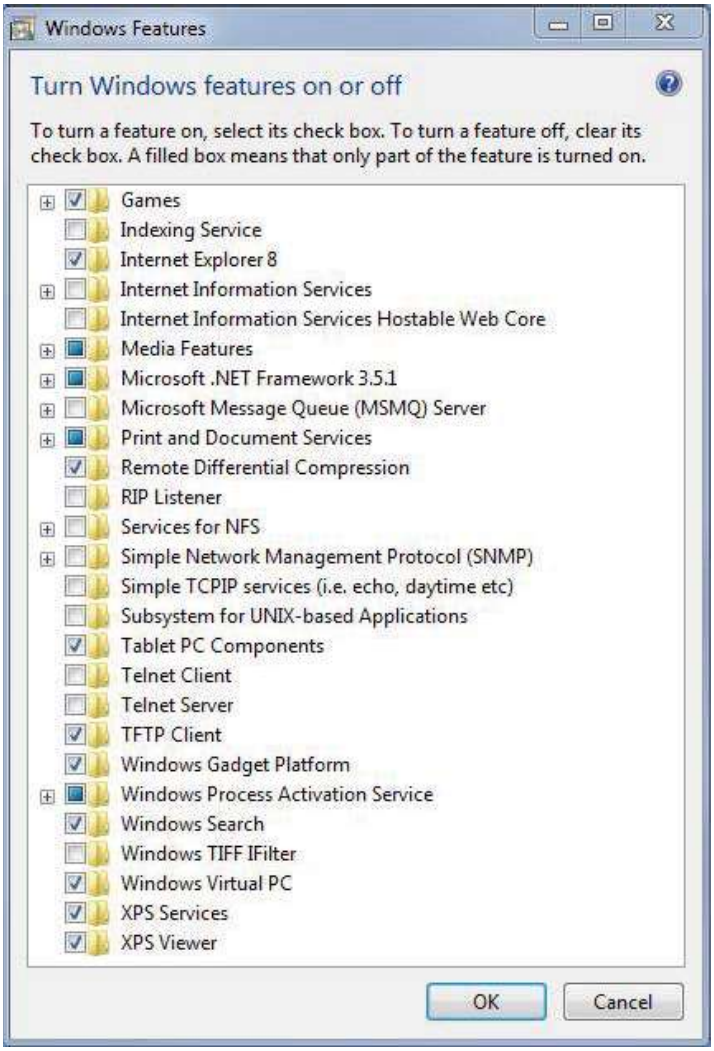
http://windows.microsoft.com/en-us/windows7/products/features/windows-easy-transfer

So here's more or less what I do now for a Win 7 installation from scratch, whether it's for myself or for a friend or customer.

Install the software and get the computer running. This is really the easy part. There are very few decisions to make, limited to entering your product key, logon name, password and computer name, selecting a public or private network and your time zone. Later if it detects other Windows 7 computers with a Home group name, it will ask for the Home group password. You'll need your network name, too.

Use Help. Now would be the time to say that the Windows 7 on-line help, tutorials and articles are endless and of excellent quality. So, if you don't know what a Home group is, there should be a link on the page to pull up the Help. To get started, you may want to go to http://www.microsoft.com/windows/windows-7/. Don't forget about Wikipedia, either. There's a mountain of information available there, too.

Refine the OS. The first thing is to see what issues must be addressed. There is an "Action Center." It's a flag in the System Tray and in Control Panel. It lists all current issues, including that you're missing antivirus programs. The Action Center will have suggestions as to how to fix each issue. Hopefully, most will just require a reboot to allow the OS to find a driver on its own.



In the case of printer driver problems, you should know that there are many, many supported printers that are not listed in the driver selection where you pick out the model number. In my case I looked under Canon for my i850 inkjet, and it wasn't there. But there's a link you can click on that will update the list, and it goes to the Internet and downloads lots more. I've always resolved all my printer driver problems in this manner. You should know, though, that when I went out to update the printers, it was just the Canon printers because that's where I was in the list. I discovered that I couldn't find my Brother laser printer, until I updated that, too. That was certainly contrary to my expectations.

Look at the Device Manager to give you information about a device if you need more. You can always go out to the manufacturer to get drivers if necessary, but I've rarely needed to do that. Remember that if there's no Win 7 driver, then a Vista driver should work, and a Win XP driver will not. Go to the Windows 7 Solution Center for even more help: http://support.microsoft.com/gp/windows7#tab0

After you've resolved all the hardware problems – and obviously some could wait – you need to look at the OS. Go to Control Panel, Programs and Features, "Turn Windows features on or off." There you will

Windows 7.....Continued on page 4

get a pretty comprehensive list of everything available that it may have installed (checked) or not (unchecked). It depends on the version you have. My Win-7 Professional does not install any games by default, so I have to check that box. And I've been unchecking "Windows Media Center" (go figure). Be sure that you read the info flag that pops up on each one before changing a check box. For instance the one after Games is "Indexing Service," and maybe you want indexing, but this one is the service that was in the previous versions of Windows, and you don't want this one. The "Windows Search" near the bottom is what you need, and it is probably already checked. If you're planning to use Virtual PC XP Mode, you'll want the "Windows Virtual PC" checked. You'll need to look at all of it.

A final OK will configure the features, and pretty quickly, too.

Install AntiVirus. Get this done now. I've been using the free Microsoft Security Essentials, and I see that AVG has a major update –Rev.4- to AVG Free. I installed one of these just yesterday to try it out.

And if you've bought a new PC with Windows 7 – or Vista – it's time to make the recovery CDs or DVDs. Many new PCs have this in the Start Menu, and it should be done immediately.

More Windows components. OK it's time to get the missing programs like Outlook Express (actually now Windows Mail) that you may have discovered are missing. What you're looking for is "Windows Live Essentials." Each program is available individually or all together:

Messenger, Mail, Writer (a blog editor), Photo Gallery, Movie Maker, Family Safety (Internet site blocker for kids), Toolbar (I think this is MSN Toolbar).

Additionally these are available: Microsoft Office Outlook Connector, Office Live Add-in (this is "Cloud Computing" add-ins for IE) and Microsoft Silverlight (you need this one). All are available from http://download.live.com/, or from the Windows 7 page above.

More programs you'll need: I have kind of a minimum list of programs that I download and install, usually from http://download.cnet.com/windows/.
Imgburn – free dvd/cd/blu-ray read & write, ISO creator/burner. DVD support is built into Win-7, so do not spend money on CD Creator or Nero yet--until you see the need. There are many free products that may satisfy your needs.

1. **Foxit Reade**r – Free PDF reader. I use this as an alternative to Adobe Reader because it's faster and smaller. Adobe Reader does a lot of things I don't need.
2. **CutePDF** – A free printer driver that makes PDF files. Again, it doesn't have the capability of the Adobe products, but it does 100% of what I need.
3. **Paint.NET** – A free Paint & Photo program. I used

Windows 7.....Continued on page 5

Windows 7.....Continued from page 4

to use Paintshop Pro 9, but it's a little hard to deal with in 64-bit, and I really don't see the need to buy a new Corel Paintshop. Paint.NET is a very good substitute for these for the limited photo editing that I do.

4. **VLC** – Multimedia player from VideoLan. This doesn't have any codec problems, seems to play anything and it's small and fast to load, and it's free.
5. **7Zip** – This is a zip program that you can drag and drop from/to, kind of like a better WinZip. It has a very nice user interface. I'll admit that I use it rarely, only when I want to do RAR format or some of the more esoteric types. Zip file support is built into Windows Explorer and does a very good job.
6. **Dataram RAMDisk**. I use this RAMDisk because an Access database is blindingly fast when dropped in a 2 GB ramdisk. Having the extra memory is possible because I use the 64-bit version of Windows.
7. **Virtual Clonedrive** – Allows you to put an ISO file online so you can emulate reading from a CD or DVD. It's way faster than a CD/DVD drive.

And last, there's Virtual PC XP Mode. There are two downloads you must make. One is "WindowsXP-Mode_en-us.exe" at http://www.microsoft.com/windows/virtual-pc/download.aspx. This page has advice that should be carefully considered. The first step is to decide if you really need XP mode.

Now Tweak the System. Go to Control Panel, Sys-

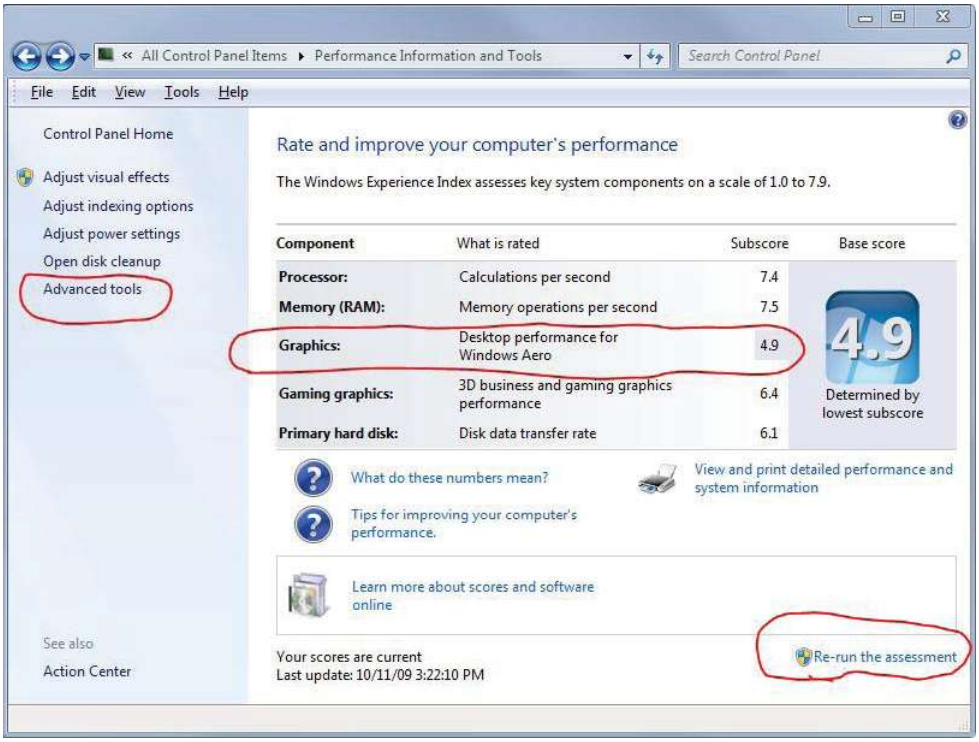
Internet Picture of the Month



Dubailand

From the New York Times Lens section at http://lens.blogs.nytimes.com/2009/11/30/showcase-85/, we see what will probably be a failed real estate development. According to the Times, "Dubailand (is) a complex of theme parks and residential, retail and industrial centers to be completed in 2020" in the desert emirate of Dubai. It is a place that has hit a rough spot lately--not unlike some real estate developments in Florida. In fact, that arch looks a lot like the entrances to some "ranchet" projects I have seen in South Florida. This is a crop of the original photographed by Lauren Greenfield.

tem, and see if there is a System Rating for Windows Experience Index. If it hasn't been done – there is no Base Score – then click on "Windows Experience Index" and find "Re-run the assessment." You're looking at a Settings page called "Performance Information and Tools"

It takes awhile to run but then gives you five subscores and a base score. You're interested in the Graphics Component. If that score is too low, it will restrict you from running Windows Aero and Aero Peek.

Now, make sure Aero is on. Click on "Advanced Tools." Unless the Graphics rating limits using Aero, check "Let Windows choose …" or "Adjust for Best Appearance." Then, as you work with Windows 7 for awhile, you may want to tune for performance a bit by unchecking some of the graphics features, as I have done. I look for those things that I don't care about anyway. I really don't care if menus fade or slide into view. Just remember how you got to this panel.

Now, just a couple more things to do.

Right-click on the Taskbar, select Properties, and look at the customization you can do to the Start Menu and the Taskbar. Be sure to look at Advanced Settings. There's a lot you can do that you'll like. I add "Computer as a menu," Network, Run Command, "Devices and Printers" and "Documents as a link." You can also regulate what items go into the "Notification Area;" the name was System Tray in XP. While you're here, be sure to check "Use Aero Peek to preview the desktop," and set "Power button Action." I have it as "Shut Down" because that's what I use it for 90% of the time.

Default Logon. If you want to turn on your machine and have it go to your desktop without halting for a password, you can easily do that, but it's hard to find. In Windows Explorer, go to c:\Windows\system32 folder and look for netplwiz.exe. Create a shortcut to this .exe and save it. I put it in the Start Menu under Accessories, System Tools. It should be named "Advanced User Accounts Control Panel." On the Users Tab, select your login name and uncheck the box "Users must enter a user name and password to use this computer".

Set Clear Type. It doesn't

Special Interest Groups

Visual Basic .Net SIG (and sometimes Access SIG)

This SIG meets the third Wednesday of the month at 6:30 PM. For information, contact William LaMartin at lamartin@tampabay.rr.com.

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Bob LaFave moderates the discussion.

Minutes.....Continued from page 2

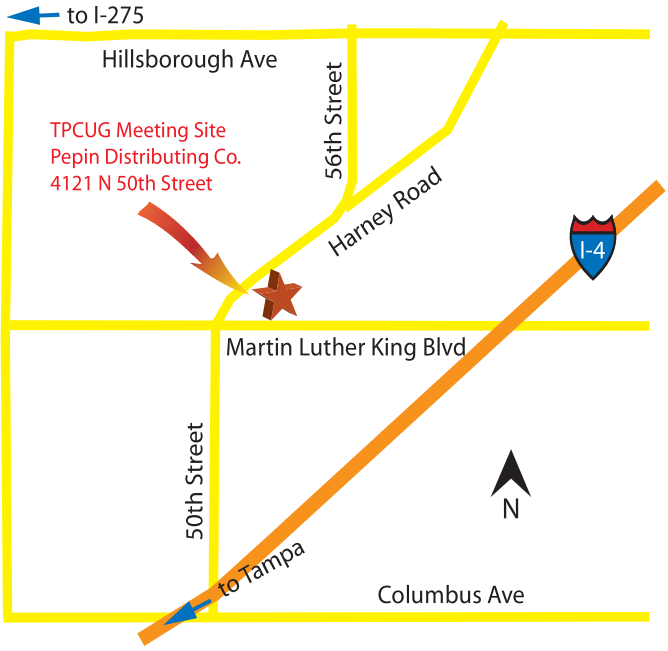
Orleans (1875 copy and translation of original);(3) 1900-1910 (date unsure) "Aerial View" of Manhattan; (4) 1884 Birds Eye View of Deland Florida.

He showed a group of COMDEX buttons that he had scanned and converted to PNG files and made the backgrounds transparent. The detailed background information of the button is revealed when you hover over the button. You can zoom in and out on each of the buttons to get a clear view of all of the fine points of the button itself. William showed an aerial view of a ranch that he and his sister had once owned. He used about 40 screen captures in Google Maps to construct an aerial view map of the property by piecing them together in Photoshop. He used Microsoft's Deep Zoom Composer to place 137 photos that had been taken on the property at the approximate locations where they were taken. He demonstrated how older maps can be overlaid on current maps to show the historical changes in locations. Two of the maps that he used were a current Hyde Park map, overlaid with 1915 and 1922 historic maps, and a map of Hillsborough County, overlaid with an 1882 historic map. He also showed three interactive maps that he had developed that showed cell tower locations, National Public Radio station locations and ship locations. William demonstrated how to construct a panorama using individual photographs. He showed a striking panorama of Davis Islands viewed from the west that he had composed. You can zoom in to a sharp picture of each house, including the famous Derek Jeter home currently under construction. All of the above projects and many more interesting ones that he has developed can be viewed on his web site, http://www.lamartin.com. The presentation ended at approximately 8:50 PM

John Witmer, our president, opened the business portion of the meeting at approximately 9:00 PM. John announced that the meeting room will not be available on January 13th. The members agreed that **January 20th will be an acceptable alternate date. John said that we would again discuss and confirm the date at the December meeting.**

John discussed the proposed menu for the December meeting. The members confirmed that they had enjoyed last years dinner and that a menu similar to the one from last year would be desirable.

He reminded the members of the elections at the December meeting and again asked that anyone interested in any of the offices step forward. The meeting ended at approximately 9:10 PM. ◆



Windows 7.....Continued from page 6

seem possible that Clear Type is set off by default. Anyone with an LCD screen (all of us, right?) needs to use Clear Type and adjust its properties. Go to Control Panel, Fonts. On the left pane, select "Adjust Clear Type text." Select "Turn on Clear Type" and then Next. A step-by-step procedure comes up. It's easy and quick to do and can make all text on the screen dramatically clearer. The name of the Clear Type program is "C :\Windows\System32\cttune.exe." You can make a shortcut to that as well and keep it. Windows XP and Vista have this feature, too. XP is done through a "Powertoy" download program. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

Happy New Year to everyone! I hope included in your New Year's resolutions was one to send the editor at least one article for the newsletter this year. Eddie Rodriguez has already followed through on that this month by telling us in an article how much he likes his new iPhone. Have you ever met anyone who didn't like their iPhone?

Tax time is coming, and I just downloaded TurboTax Premier 2009 from Amazon. Last year I downloaded it from Newegg because they were cheaper; this year Amazon had the best price. Of course, I went through the Amazon link on our home page. Oddly at Intuit, the home of TurboTax, there doesn't seem to be an option to download a stand-alone version – only the ability to pay them to let you prepare your taxes online at their site. Anyway, the price of the program seems to go up a few dollars each year.

You never know when you will need something from an old computer. I have always brought over all my data files from a previous desktop computer to my new desktop computer. I

Minutes of the December Meeting

By Jim Purcell, Secretary, Tampa PC Users Group
Edward_J_P@MSN.com

John Witmer, our president, opened with a few remarks during the Christmas Party which began at 6:30. He gave a short summary of the December Board meeting and discussed the decision of the Board to auction all prizes of value at the end of the December Group meeting.

John turned the meeting over to Ron Weinberg, our member at large, who announced that the slate of candidates consisted of only the officers from 2009 since no one else had volunteered. He advised that anyone who desired to run for any of the offices could still be considered. When no one stepped forward, the following slate of officers was presented:

- For President: John Witmer
- For Vice President: Kevan Sheridan
- For Treasurer: Doug Mullis
- For Secretary: Jim Purcell
- For Member at Large: Ron Weinberg

A motion was made to accept this slate and to vote. All members present voted in favor. Terms of office begin January 1, 2010.

The results of the auction were as follows: Michele Burgess got the VIDEO EXPRESS (easy capture and movie creator) for $15; she also got the MAGIX Audio Cleaning 12 Lab (software) for $9; John Witmer got the ACRONIS Disk Director Suite 10 for $2; the following got TPCUG Tee Shirts – Doug Mullis, $5, Bruce Norton, $4, Michele Burgess, $5 and Debbie Whittaker, $4; Michele Burgess got the Norton Internet Security 2008 software for $1; Bruce and Nancy Norton each got the NORTON Tee Shirts for $3 each; David Gillespie got the SYSTEM MECHANIC PC Tune-up Software for $5 and TREND MICRO Internet Security 2008 also for $5. A total of $61 was received. ◆

New HP Laptop

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

It has been a long time since I wrote about a new laptop. My former one with Windows XP Professional served me well for 5.5 years, with an addition of memory and a new, larger hard drive along the way. It was the last of many Gateway computers I bought over the years and the only laptop I bought from Gateway. However, for the past year, it had become apparent that it was not up to handling all I was asking it to do involving Adobe Design Standard CS4 (Photoshop, Illustrator, InDesign and Acrobat Professional), along with Microsoft Office 2007 and Visual Studio 2008. Having several of these programs running simultaneously was just too much, as you probably noticed in my past presentations. I did use the new laptop in my presentation at the November meeting, having gotten it just a few days before. I was not fully familiar with Windows 7, but the laptop had no trouble handling all I threw at it.

Well, the new dv6t laptop from HP with Windows 7 Professional 64-bit and a very fast Quad Core i7 processor with six GB of RAM is really a change.

The specifications are:

Operating system	Genuine Windows 7 Professional 64-bit
Processor	Intel(R) Core(TM) i7-720QM Processor (1.6GHz, 6MB L2 Cache, 1333MHz FSB)
Memory	6GB DDR3 System Memory (2 Dimm)
Hard drive	500GB 7200RPM SATA Hard Drive with HP ProtectSmart Hard Drive Protection
Graphics card	1GB Nvidia GeForce GT 230M
Display	15.6” diagonal High Definition LED HP Brightview Widescreen Display (1366x768)
Optical drive	Lightscribe Blu-Ray ROM with SuperMulti DVD+/-R/RW Double Layer
Personalization	Webcam + Fingerprint Reader
Networking	Intel Wireless-N Mini-card with Bluetooth
Modem Port	Integrated 56K Modem

Additionally there are the following: External monitor port; Docking device port; RJ-45 network jack; HDMI port; 3 USB ports; 1394 (Firewire) port; eSATA/USB port; Express Card slot; Digital Media slot.

These specifications are considerably better than my desktop computer. The only thing I do not like is the wide screen display. That may be great for people who like to watch movies on their computer, but, for the type of work I do, it would be better to have a few more pixels in the vertical direction. All of the nice features come at a price, too: $1,608 plus tax, which, however, is about $900 less than I paid for that Gateway 450 XL laptop in February of 2004. So, this is hardly the $500 laptop many people are buying now. However, I do not run the same types of programs on my laptop that most people do.

When one gets a new computer, what should really be done first is to make the recovery CDs/DVDs so that you can recover the original setup in case of some catastrophe. Many people don’t do it and have to pay the manufacturer to provide such if they need them. I didn’t make them the first day I had the laptop, but I did the second.

The first day was devoted to getting acquainted with Windows 7 and installing the main programs I use. First on the list was to go on the Internet to Microsoft and download their free security software called Microsoft Security Essentials. It may be found at http://www.microsoft.com/security_essentials/. The second thing done was the installation of Microsoft Office Ultimate 2007. This went without a hitch, with only the product key needed. Microsoft didn’t seem to care that I already had it installed on my desktop computer and my previous laptop (I will probably never use it again on the old laptop). Either next or a bit later I exported my Outlook contacts list on my desktop computer, brought it over to the new laptop via the Wireless LAN and imported it into Outlook on the laptop. I didn’t want to bring over all the email messages or the calendar. To finish with Outlook on the laptop, I set up the three email accounts I use.

What to install next? I think my next installation was the Adobe Design Standard CS4 suite of programs (Acrobat, Photoshop, Illustrator and InDesign). Here is where you see the difference between Adobe and Microsoft. Unlike Microsoft, which seems to only ask you not to install their programs on more than two computers, a desktop and a laptop, Adobe enforces it.

Laptop.....Continued on page 4

Laptop.....Continued from page 3

You can install the Adobe products on as many computers as you like, it appears, but you can only have a product activated on two computers at the same time. So, here is a warning: If you are going to uninstall one of these programs from a computer, first deactivate it from the Help tab of the program. For if you do not and then uninstall the program, you have no way of deactivating it on the computer without contacting Adobe. I didn't want to uninstall all the programs in the CS4 suite from the old laptop, but I did need to deactivate all of them. So I did that, and then I was able to activate them on the new laptop. For this installation, I also had to supply an earlier disk of one of the programs since what I was installing was an upgrade version. As an aside, the installation installs both a 32-bit and a 64-bit version of Photoshop.

Next on the list was the installation of the Microsoft Expression Studio 3 Suite, consisting of Expression Blend, Expression Design, Expression Web and Expression Encoder. Again, all that was required here was a product key, although the suite was installed on both my desktop computer and the old laptop. And I don't think I was asked for an old disk even though what I was installing was, again, an upgrade version. But I am not positive about that.

The final one of my main programs to be installed was Microsoft Visual Studio 2008, in which I do all of my programming and some of my web work. That would also have been an upgrade version, and I don't' recall whether or not I had to provide a previous disk, which would have been interesting since 2008 is at least the third upgrade I have in the Visual Studio series.

With the major programs installed, I then created the recovery disks mentioned earlier. This may vary by computer manufacturer, but, on the HP laptop, I went to Start | All Programs | Recovery Manager | Recovery Disk Creation. It took Three DVDs. If you use CDs, it would be a lot more, so I recommend the DVD route. You only get one chance to do this, and the program will verify each DVD after it is created. In my case, the third DVD was found defective and had to be made again.

At some point in all of this, I let the computer do a Windows update to receive all the changes since the operating system was installed by HP. I also did updates for all the programs installed so far.

Next on the list was the installation of the minor programs I use. Several of these programs I demonstrated at the presentation I gave to the Group at our November meeting. The programs are:

Microsoft Deep Zoom Composer
Microsoft Image Composition Editor
Microsoft MapCruncher
The Firefox browser
Microsoft Pro Photo Tools
Acronis True Image Home
Drivers for my Canon portable scanner
Drivers for the two printers I use
Drivers for my Wacom Tablet
Microsoft SQL Server 2008 and its management tools

Finally, I installed Microsoft Internet Information Servicer (IIS). Actually, from Control Panel | Programs and Features, I turned it on in the "Turn Windows features on or off" option. IIS is a web server running on your computer. Most people have no use for it; the same for Microsoft SQL server. I use IIS to test web sites locally. SQL Server is a server-based database that I also use in web work (as well as locally sometimes) that I can access via my Visual Studio-created programs or web sites. All this is certainly stuff of no interest to the average user.

For the few who are interested in this, there are some gotchas in setting up IIS. You really need to create the virtual directories, set them as applications and set permissions for the IIS_IUSR account and the NETWORK SERVICE account properly before importing any web sites into them. If you do it in reverse order – that is, import the site and then try to set the properties – you will have to set all the sub folders individually, which is quite a pain.

About all that now remained was to import any data files I wanted: Word documents, Excel sheets, Access databases, InDesign publications, Photoshop files, etc.

Laptop.....Continued on page 5

Laptop.....Continued from page 4

This was done via the Wireless LAN, which Windows 7 had set up automatically. I think the only thing I did was give the new laptop a name, create a login name and password for myself and set the computer to be in the same workgroup as the other computers in the house. Oh, I did one more thing: I set up the fingerprint reader so as not to have to type in a password at login.

Merle gave me a Bluetooth mouse to use with the laptop, and it is nice not to have cables attached for a mouse. So if you can, make sure you have Bluetooth on your next computer. The laptop also has a built-in webcam, and I figured out how to use that with the HP software. However, I am not sure I want to use it since it does nothing for my appearance. To get a decent image, you really need to position the laptop and yourself so that the lighting is optimal. ◆

Comments.....Continued from page 1

don't worry about that with laptops, since I don't keep a lot of data files on them, and, in any case, they are just duplicates of what I have on my current desktop computer. What these old computers have, however, that is not on a newer computer is old versions of programs. And it just so happened I needed an old version of either Microsoft Word or Publisher. Let me explain why.

My sister had corresponded with a lady, perhaps ten years back, who sent her some images of old wills, promissory notes, etc., that were of interest to her genealogical research. These files had a suffix of .mix, apparently a file type for which both ladies at the time had programs that would create and open these files. However, none of the computers I currently use contained any program that would open them. So I did a bing search to find out about this file type. What I found was "Microsoft Image extension (.mix) is

The iPhone – A Wonderful Smartphone

By Eddie Rodriguez, Tampa PC Users Group
Eddie2020@gmail.com

During the holiday season – my wife gave me a wonderful gift, the Apple iPhone. I am thrilled to have this phone, and I'm still learning all the features that it has. The newest iPhone comes in two standards – a 16 GB memory or a 32 GB memory. The price difference between the phones is $100. The 16 GB can be purchased from AT&T for $199, or the 32 GB can be purchased for $299; both require a two year contract. I think that 16 GB is plenty of memory for what most people want to do. I have the 16 GB phone that runs on the 3GS network from AT&T.

The phone comes with a number of free and fee-based applications. The fee-based applications can be purchased at a nominal cost. For example, the prices can range from $0.99 to 12.99.

I always wanted a phone that would do everything – including unlimited access to the Internet. Additionally, you have access to thousands of applications that increase the productivity of the phone. For example, the phone comes with a 3-megapixels camera and also a video camera. However, you can download applications for a 5-megapixels camera and also an application that gives you a black-and-white camera. Besides the 3-megapixels camera, other standard features include: "You Tube," "iTunes," Calculator," "Voice Memos," "Weather," "Clock," "Google Maps," "Stocks Tracker," "Notes," and a GPS. The phone also has an applications store where you can review and download free or fee-based applications. Some fee based applications include CNN, a 5-megapixels camera and Time magazine for $0.99. Free applications include "Skype," "New York Times," "Gas Buy," etc. "Gas Buy" shows you where you can buy gas at the lowest price and the distance to the gas station.

The best thing that I like about the iPhone is its simplicity. All applications are integrated, so navigating though the applications is very easy. Also you can take a picture or video and immediately e-mail it.

The total cost of owning an iPhone is the discounted purchase price of the phone with a 2-year contract ($200 or $300) and the monthly fee to have unlimited access to the Internet. The cost for the access is $30.00 a month in addition to the cost of your plan with AT&T. You can also purchase the iPhone from the Apple store or AT&T without a 2-year contract for $400 (16 GB) or $600 (32 GB).

Another interesting feature of the iPhone is its iPod. You can upload (from a computer) songs from CDs or purchase them from the iTunes store. And you can sort the songs by artist or by song title. With the 16 GB version of the iPhone, you can upload hundreds of songs. ◆

Comments.....Continued from page 5

a closed proprietary (non-standard) format used by Microsoft's PictureIt! and PhotoDraw." Furthermore, I found that it had not been supported since around 2001 or 2002. So, how to open such a file? The only method I found was that I should open Word and insert the image into a Word Document. On my Windows 7 laptop with Word 2007, that produced an error message. On my XP desktop computer with both Word 2007 and Word 2003, Word 2007 said in order to do the insert I needed to install a certain graphic filter that could be obtained from the Microsoft Publisher 2002 CD. Unfortunately, I couldn't find that CD. It is probably packed away in my garage where I put software I don't want to throw away but will probably never use again. Then I thought of the old laptops I had around.

I selected one that was a couple laptops back. When I booted it, I first had to set the system date and time. After that, it booted into windows 98 just fine. I opened what turned out to be Word 2000. Previously I had transferred one of the .mix files to the old laptop via a floppy disk, since I couldn't find the dongle that attached to the PCMCIA network card that used to connect this laptop to the LAN. I then tried to insert the file into a Word document and again received a notice that a graphic filter was needed, but this time it said to insert the Microsoft Office 2000 Premium CD.

Special Interest Groups

Visual Basic .Net SIG (and sometimes Access SIG)

This SIG meets the third Wednesday of the month at 6:30 PM. For information, contact William LaMartin at lamartin@tampabay.rr.com.

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Bob LaFave moderates the discussion.

SMART COMPUTING SUBSCRIPTION DEAL

By John Witmer, President, Tampa PC Users Group
JWITMER@Pepindist.com

Smart Computing Magazine has notified TPCUG (and all other participating user groups) that they are terminating the "Buy 5, Get 1 Free" incentive that has been available to us for the past six plus years. The magazine will continue to be published, but the company apparently needs to cut back on some of its expenses/programs.

Smart Computing has provided TPCUG with three free subscriptions to thank us for our past participation in their program. In addition, we have five free subscriptions remaining that have been earned and accumulated over the past couple of years. As part of the termination process, Smart Computing has set a deadline of April 1st to redeem all these eight subscriptions.

As you know, TPCUG has used these free subscriptions in the past as part of our fund-raising activities via door prizes. At the December holiday party meeting, we disposed of all our other door prize items by auctioning off the ones with value and giving away those that couldn't be sold. The Smart Computing subscriptions were not included in this process at the party, as we were planning to utilize them for additional fund-raising purposes. Now that the Smart Computing incentive program has ended, and we face a deadline to utilize the eight subscriptions that we have, we are proposing the following incentive deal to our members, which will benefit both the Group and the member who is interested in saving on his or her subscription.

We are offering to our dues-paid membership, on a first-come, first-served basis, the opportunity to buy one of the available 1-year subscriptions at a price of $15.00, which is 50% off the regular renewal rate. This offer is limited to one subscription per member/household; if we are not able to have all eight subscriptions sold under these terms, we will open the process to allow multiple subscriptions closer to the deadline.

If you already have an existing subscription, you should be able to extend it an additional 12 months with the purchase of one of these subscriptions under this offer. You also have the option to use your purchased subscription for a gift to a friend or family member if you choose.

If you are interested in purchasing one of these eight subscriptions for $15.00, please send an email to confirm your intention to: President@tpcug.org. As was mentioned above, they will be sold on a first-come, first-served basis, based on receipt of your email request. Thanks for supporting your Tampa PC Users Group. ◆

Comments.....Continued from page 6

I had that one, so I did that and was able to insert the image into a Word document.

Success, but now I had to do this for about 20 files. I first burned all the files to a CD on my desktop computer, then inserted this disk into the CD drive of the Win 98 laptop and went about the process of inserting each of them into a new Word document and saving it.

Comments.....Continued from page 7

Now I had the problem of getting them off the Win 98 laptop without a CD burner or a network connection. The only thing I could think of was putting two at a time onto a floppy and then inserting that floppy into my desktop computer to copy the files. For 20 files, this took a bit more than 10 repeats of the process since sometimes only one file would fit on a floppy. As a footnote to this, I found the dongle a few days later so that the old laptop could connect to the LAN.

What you should learn from this is that, if you have any files in strange formats, save them in a format that you think will be around in years to come. If my sister had saved all of these .mix files as either .jpg or .tif file types, then there would not have been a problem.

Comparing that old laptop to my current laptop is like comparing a Model T to a new BMW. The Win 98 laptop was a ThinkPad 385XD-LEU with a 233 MHz processor, 3.2 GB hard drive, 64 MB RAM and a 12.1" screen. It had a USB port (which wouldn't recognize a Thumb drive) and a CD ROM drive. The new Win 7 laptop specifications are listed in the article on page 3 of this newsletter. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

In my article in this newsletter, I describe two problems with my desktop computer I had this past month that took about four days of my life to solve. The first involved an Acronis full system backup that would freeze the computer, although such a backup worked fine several weeks previous.

The second problem was that I discovered any email sent from my computer or any other computer on the LAN in my house was being labeled as spam by at least two important Internet Service Providers (ISPs) and deposited in the recipients SPAM folder, which they never saw. The ISPs were EarthLink and Verizon. I was particular galled by Earthlink's labeling me as a spammer since I have had an EarthLink email account for 15 years – before there even was an EarthLink. It was with Net-Com, which was absorbed by EarthLink many years back.

My only guess as to how I got labeled a spammer is that several times a week I send about 300 emails to residents of my neighborhood who have provided their emails for that purpose. Read the article for details. ◆

Minutes of the February Meeting

By Jim Purcell, Secretary, Tampa PC Users Group
Edward_J_P@MSN.com

John Witmer, our president, opened the meeting at 6:40 PM. He reported on a discussion that we had at our last Board meeting concerning the content of presentations at our monthly meetings. It remains difficult to attract outside presentations on subjects that are of interest, or that we think are of interest, to our members. He said that our Board members' discussion led us to believe that it would be productive to learn members' exact interests so that we can better concentrate our efforts. He asked the members to complete a survey that Member-at-Large Ron Weinberg had designed to gather their interests. John announced that we had no presentation at present for March but Blain Barton from Microsoft is scheduled to be at the April meeting and a genealogy expert will discuss the latest available genealogy software at the May meeting. He announced that the rest of the February meeting would be devoted to the Windows SIG and a follow-on discussion led by Bob LaFave, Merle Nicholson and Steve Singer.

Bob LaFave opened the Windows SIG at 6:45 PM. A member began the discussion with a remote mouse problem. The discussion included possible cause of the problem, such as a need for a line of sight between the mouse and the wireless or Bluetooth source on the computer, the class of the Bluetooth device and also the number of devices that are competing for space on the channel. There was an extended discussion of problems with sound on video recordings, and their solutions. Ron Weinberg had a problem with MSN Mail's not allowing attachments with pictures to be opened. The problem was suspected of being related to the selection of security options, but no one was able to locate the specific setting. There was a discussion of crashed external drives and how to check the various conditions that may have caused the problem. One member asked for advice on reformatting her "C" drive. The discussion of methods included advice on the use of SATA drives. Merle Nicholson suggested that she should buy a new hard drive and use it as the "C" drive. The advantages and disadvantages of "Solid

Minutes.....Continued on page 8

SSDs – Solid State Drives

By Merle Nicholson, Tampa PC Users Group
merle@merlenicholson.com

Newer and faster hard drives are developing rapidly with the use of Solid State Drives (SSD) in various forms for the end consumer. You may find it worthwhile to investigate these for your own use.

SSDs use a technology similar to memory in flash drives. The on-board program is different, however, to allow for faster, larger and more efficient storage of data.

There are notebooks and high-end desktop computers available right now with SSDs already installed. The most prominent ones are the Eee PCs from ASUS. Most of the early ones have drives mounted on an internal card and are very small, sometimes only 8 GB, just barely enough space to install an operating system. They've gotten larger, of course, as the cost/size ratio gets smaller.

There are several reasons to consider SSDs. First, they are fast. Very fast - like Spaceball One's ludicrous speed in the movie Spaceball. I've seen some claims that have OS load times down to ten or twenty seconds. Second, they use very little power, an important feature for notebooks, and, third, they're shock resistant, in case you're prone to dropping your notebook.

SSDs are sold in several forms. The most common by far is a device that is exactly the size of a notebook SATA drive (2-1/2" size). If you want to install this in a desktop machine, there are several adapters that will allow inexpensive mounting in a 3-1/2" standard mounting bay. The connectors and placement of the connectors are identical to notebook hard drives, so installing them in a docking station or enclosure made for notebook drives is no problem.

Forms and typical prices (2010) are:

- Mini PCIe – For netbooks, mostly, like Eee PC, 64 GB $165
- ZIF Socket – a 1" notebook drive (I'd never heard of this myself) 16 GB $55
- PCIe - For internal desktop systems. 250G $1,275, 512 GB $2,000, 1 TB $4,000. This type is by far the fastest – more than four times faster than notebook drives.
- USB and SATA – 120 GB $350
- Express Card (Notebook Slot) – 16 GB $65 (relatively very slow)
- SATA II Notebook internal drive – 30 GB $130, 120 GB $365, 250 GB $700, 500 GB 3-1/2" $1700.
- PATA – For older notebooks made before SATA became widespread. 64 GB $195, 128 GB $400. Again – relatively slow.

Except for the price, there really is no downside to these devices. Even the slowest of these – and there's quite a range of data speeds – are faster than mechanical drives. There were some initial problems when they first came out: a "stuttering" problem and a dwindling available space. There were (are) some problems with earlier operating systems. All of these have been fixed now for Windows 7. Windows 7 came out recognizing SSDs and utilizing them optimally. There are solutions to problems with XP and Vista on manufacturers' forums, but they should probably be left to experts – if you can find one. Best thing is to simply use Windows 7.

Interestingly, you should never defrag an SSD. I've read that Windows 7 turns off defragging for SSDs, but there's probably nothing keeping you from using other defraggers. But if you do, you'll shorten the life of the drive. Basically, there is no such thing as a fragmented SSD. It's all equally fast all across the drive, and defragging just moves the data back over the most-used part, the very last thing you want in an SSD. Its total life depends on spreading the data out and using the unused parts as much as possible.

And while we're at it, let's address lifespan. I've looked at many of these to see what the MTBF rating is. (Mean Time Between Failures – See Wikipedia for MTBF). A few are rated for greater than 500,000 hours, but many – or most – are rated greater than 1,000,000 to greater than 1,500,000 hours. Well, that's

SSDs.....Continued on page 7

Two Computer Problems and Four Days

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

The last week of February was a real rough computer week for me. First, it appeared that my desktop computer's hard drive was going bad. Then, after that was sorted out, I discovered that email I sent to people using Verizon and EarthLink was being labeled as SPAM. It basically took two days to solve each problem. Of course, every cloud has a silver lining in that I learned a bit and I have something to write about in this newsletter.

That something might be amiss with my computer's hard drive surfaced when I went to bed with the computer doing an Acronis True Image backup and woke the next morning to find my computer frozen with a blank desktop. I rebooted the computer and checked the external drive where the backup was to be and noted it was only 39 GB instead of the usual 300 GB. Oddly, Acronis had marked it as a successful backup on its calendar but did not recognize it when I tried to open the file. So I deleted that file and that evening ran the backup process again. Next morning, the result was the same.

To try to isolate the problem, I then had Acronis do a backup of just my data files. Now, this is not a simple copy and paste but rather the creation of the type of image that Acronis does. I kept an eye on what Acronis was doing. After less than an hour, when I tried to move the mouse, it wouldn't move and the computer was again frozen although everything looked OK on the screen.

Time to see if a little housekeeping on the computer would fix things. On the computer's C drive and the external drive, I did both a chkdsk /f and a defrag. While good things to do, they didn't solve the problem. I then began to worry about my data. Although I had been copying the most recent versions of many of the data files I used to a different external drive, the computer had not had an Acronis image made of the entire C drive in almost a month. That meant there were a fair number of photos from my camera on the hard drive and in my email correspondence for the past month that hadn't been backed up. Then there were the changes I had made to the local versions of my web sites. So I needed to get these things on some of my external drives if my hard drive was going bad, as it seemed to be. What other reason for all of a sudden not being able to do an Acronis image.

My first action was to find the location of my Outlook folder containing the pst file and copy that folder to an external drive. That meant that I had all my emails, contacts and calendar saved. Then I copied my Nikon temp folder to the external drive. The Nikon temp folder is where I accumulate the most recent images I have downloaded from my camera. Finally, I decided to just copy all of the My Documents folder to the external drive since I was not really sure what files in it had not been backed up recently.

Well, the copying process started and went along for less than an hour and then came to a halt. I don't recall the exact error message other than it could not continue the copy. To get to the root of the problem, I deleted all the files on the external drive that it had copied there and then started the copying over. This time I copied just a few sub folders of My Documents at a time so as to get my data copied and to catch where the problem occurred. Eventually I reproduced the error message. I then found that one particular folder couldn't be copied. I discovered I could copy everything in that folder to another folder on the C drive, or to the external drive, so I got all of its data copied. I then deleted the folder on the C drive and proceeded to copy everything else in My Documents to the external drive with no problem. As best I could figure, something must have been wrong with the drive's file allocation table information for that folder.

That discovery opened the possibility that, with the bad folder removed, I could now do an Acronis backup. And that was the case. I ran Acronis and after 4.5 hours I had a completed Acronis backup. My hard drive is apparently fine, and the computer was working well except for the Acronis backup problem. It would be nice if Acronis had some way to indicate at exactly what point a backup goes wrong and then gracefully exit the backup process instead of freezing

Internet Picture of the Month

Kluge House

From the Wall Street Journal's online real estate section at http://www.online.wsj.com, we have a nice home owned by a lady named Kluge with 300 acres near Charlottesville, Virginia, that has been reduced 52% in price to 48 million dollars from the original asking price of 100 million dollars. It is 23,500 sq. feet with eight bedrooms and 13 baths. Now is the time to buy while prices are low.

Problems.....Continued from page 4
the computer.

Now to my second problem of the month – disappearing emails. I am sure all of us have been told that emails we were sure we had sent were not received by the intended recipient, so we just resend the email, they receive it and all is fine. Or we tell the person to look in their junk email folder, and it is found there because we put some combination of words in the email that turned it to junk. Recently though things got a bit more serious with email at our house.

My wife mentioned to our son an email she had sent him, and he said he had not received it. She sent a couple more, and he didn't receive them. A little investigation showed that the emails from my main Road Runner (RR) account to his MindSpring account, which is now part of EarthLink, were being put in his known SPAM folder at EarthLink webmail and being immediately deleted since that is the default setting. As soon as he changed the setting, emails from our house started accumulating in the known SPAM folder and were not deleted.

Although my wife was using my main RR account, what was especially interesting was that I couldn't even send him an email using my NetCom account, which I have had for 15 years and which is now part of EarthLink. In fact, I couldn't even send from my NetCom account to itself without the message being deposited in my EarthLink known SPAM folder. EarthLink suggested that my son mark my emails to him as not SPAM and this should clear up the problem – which it didn't. Neither did my so marking my emails allow me to send a message to myself.

I also found that any messages from my computer to anyone on Verizon would not appear in their Inbox. I had a serious problem. Over two days, I spoke on the phone with EarthLink and my ISP, RR. I also corresponded with them via online chats. In addition, I corresponded with the web-hosting company for my neighborhood's web site, which I manage and through which I send email messages to all in the neighborhood for whom we have emails (around 300), since I also discovered I couldn't use the email account I had through their email server to send messages. It was even worse at the neighborhood's webmail site. Any message I sent simply disappeared – not even ending up in anyone's known SPAM folder. None of these providers had a solution. I asked them if they were blocking my messages, and the answer was no, if messages were blocked, I'd receive a bounce-back message to that effect. So some of my messages were being treated as SPAM and some just disappeared.

I decided that the IP address that RR provided to me, just like your ISP provides you when you connect to the Internet, was on some SPAM list. I had the same IP address for as long as I can recall. Years back, when I first used RR, I would keep the same address for just a few days and then receive a new one. That apparently changed at some point. More than a year ago, to send a message to a friend at a German university I had to switch to sending his mail through the email server at one of my web sites. Thus, I could have had the same address for well over a year, and that could have been when the problem really began.

What I needed was a new IP assigned to me by RR. Of course, the RR help fellow was not sure how to make that happen. He did suggest that I take power away from the cable modem and then repower it. But I knew that wouldn't work, since I had done that many times to reset the modem when there had been problems. It always came back with the same IP. Then I got an idea – I disconnected the cable modem from the router and connected it directly to my computer. I then checked to see what my wan IP address was – and it was a new one – and I could send emails to EarthLink and they arrived correctly. Unfortunately, when I reconnected my computer to the router and the router to the cable modem, I had that old problem IP address back. The cable modem had a memory.

Thanks to a web search, I found that I should go into the router's setup and change the MAC number by one digit while the cable modem was powered down and then to power the cable modem back up. The modem would think a new device was attached and assign a new IP, which it did. And I could again send emails. Problem solved!

Now that the problem is solved for me, what about anyone who might be assigned my old IP address by RR. Perhaps they will do an Internet search and find this article. ◆

SSDs.....Continued from page 3

not forever. But mechanical hard drives are good for about three years, and there's no reason to think SSDs have a shorter life. Indeed, think of this: When your computer is on, that mechanical drive is probably spinning when idle, wearing out the motor and bearings. There's no equivalent to that in SSDs.

One more observation. An SSD mostly reads blazingly fast. So you should expect dramatic changes in the time it takes to read in the Operating System on startup, or read a large video for editing, or pull from a large database, or edit JPEGs. But the write times are usually much less, especially in small writes. So, while loading programs and data is fast, it may not be so noticeable while you're working with your software. It probably will not do a thing for cruising the Internet or editing a document. Overriding that, though, is a longer battery operation for notebooks, but not a dramatic improvement because the hard drive is only one of the heavy use components in a notebook.

And please, do not consider an SSD for a system with limited RAM installed. Address the RAM problem first – at least 2 GB, but 4 GB or 6 GB is even better, depending on where your interest lies regarding software. ◆

Minutes.....Continued from page 2

State" hard drives were discussed. The deliberation on Windows 7's advantages and disadvantages began at 7:50 PM. Bob opened the session by showing some of the features that he has gained by installing Windows 7. Steve Singer recommends installing one of the 64-bit versions if your PC supports a virtual installation. The Virtual XP Mode that you can download at no cost is very flexible and will probably allow you to use older versions of software and older peripherals that won't work on a 64-bit system. You also must have either Windows 7 Professional or Ultimate to use the Virtual XP Mode. There is a procedure called "God Mode" that makes most features accessible in one folder. There are many features in Windows 7 that have not been publicized by Microsoft. Bob closed the Windows 7 session at 8:45 PM.

John Witmer, in closing, mentioned that some of the Smart Computing subscriptions are still available for half price ($15.00). The meeting ended at 8:50 PM. ◆

Meeting Preview: Bring your Windows questions for Merle and Bob in this extended Windows SIG meeting.

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

Another month, another newsletter. And thanks to Ed Purcell, we have some content this month. Additionally, I did a review of the latest version of Family Tree Maker. I know several members of the TPCUG use this program. If space had permitted, I would have gone more deeply into using the online resources that come with the program. The US Federal Censuses are available through 1930 and searchable, where you can download an image of any page in which you have an interest. The same is true for many city directories. I have found useful information in the directories for New York City, New Orleans and Baton Rouge. Unfortunately, there is no city directory for Tampa in their collection. In addition, it appears that most of the directories included for Florida cities are only for the 1940s. I think the reason for this is that they are using these directories as a substitute for the 1940 Federal Census, which is not yet available to the public. In time, I am sure, many more cities and dates will be added. There is so much more genealogical available online now than just a few years back. If there is interest, perhaps we can have a future meeting on using Family Tree Maker. ◆

Minutes of the January Meeting

By Jim Purcell, Secretary, Tampa PC Users Group
Edward_J_P@MSN.com

The meeting began at approximately 6:35 PM. Bob LaFave opened the SIG meeting with a discussion of problems that a member was having connecting to a router. Several possibilities were discussed, and Bob suggested a solution for the member to try. Merle recommended that he not add any utilities such as Network Magic. Another member was having trouble dragging with her mouse. Bob recommended that she adjust the options for her mouse in Control Panel and to uninstall and reinstall her mouse if that didn't work. There were no more questions so Bob closed the Windows SIG.

Merle Nicholson started his presentation on "Windows 7 Installation Tips" at 7:00 PM. He began by showing a list of the things that he would want to do during a new Windows 7 installation. He stated that he has been using Windows 7 for about three-and-a-half months and has found that it has dramatically changed the way he manages multiple windows, runs multiple tasks and switches between the tasks. He has found that Microsoft has finally come up with a system that helps you to manage multiple windows and has provided a useful task bar. He demonstrated several ways of moving, shaping and finding multiple windows. Merle also discussed the new Windows virus and spyware program, Windows Security Essentials, that is replacing Windows One Care. Like One Care, it also has a versatile backup program. He stated that it has a much improved firewall over that furnished in Windows XP. The program is still free, and Merle has seen very favorable reviews of the program. He discussed the various options available in backing up data. He feels that the program covers all of the needs of most users. The two types of back-up provided are an image of your hard drive and several managed folders containing zip files. The email program that is available in Windows 7 is Windows Live Mail. Windows 7 also comes with voice recognition software. Merle went through the many options that are available when you set up your computer and gave advice about the settings and the possible consequences of some of the

The Kindle DX

By Jim Purcell, Secretary, Tampa PC Users Group
Edward_J_P@MSN.com

This is my third article on e-readers, and they have been within a month of being exactly a year apart. The first article compared several e-readers to the first generation Kindle Wireless Reading Device. The second article was right after my children surprised me with a Kindle for Christmas. I was amazed at how well it performed. Being first generation, it had a few flaws but they were far outweighed by the advantages that the Kindle provided.

The second generation Kindle fixed most of the first generation problems. I didn't upgrade because I didn't think it was practical to spend $259 to get the improvements (improved cursor control, correction of a clumsy and irritating page turning system, much better resolution and improved PDF capability). The new generation Kindle has a 6-inch screen like the original.

Amazon recently announced the Kindle DX with a few more improvements and a 9.7 inch screen. This immediately caught my attention. The large screen, coupled with the other current generation improvements, made it a much more functional reader. Illustrations become more legible, especially since you can just turn the reader sideways and it automatically switches to landscape mode. It should be mentioned that the one big shortcoming in all of the Kindles and most of the e-readers on the market is the absence of color. The reason that there is no color yet is that most of the readers use the e-ink technology that mimics a sheet of paper so closely that, in my mind, it is as easy, if not easier, to read than a printed page. The Amazon CEO recently stated that color for the e-ink product is already available in the laboratory, and he believes that it will be available commercially in four to five years. There is no backlighting, so there is little eye strain. The same as is needed for reading the printed page, you need an external source of light where lighting is poor. Several styles of small clip-on LED lamps are available for e-readers, and they work well. I was immediately ready to buy the DX until I saw the price ($489), which, I believed then and now, is too high, so I decided to wait until they lowered the price. My

children surprised me again and gave me a Kindle DX for Christmas. I have been extremely pleased with the Kindle DX and amazed at some of the things it does. I will recommend it highly to anyone when the price goes down to a reasonable amount.

Before I describe some of the more important features of the DX, I would like to discuss one of the reasons, perhaps the primary reason, that the DX was developed, and that is textbooks. If and when the concept is widely accepted, the publisher does not have to worry about how many books to print or the cost of paper, printing or shipping. In addition, no matter how many textbooks the student has, he or she only has to carry one weighing 18.9 ounces. The student always has all the books together and can study any one desired between classes. The student can highlight passages or attach notes, all of which are accumulated in order (page order by book) in a file called "My clips." "My clips" can be downloaded into the student's computer, where it can be reassembled and printed, or imported back into the Kindle as a text or PDF file. (Everything that goes into the Kindle is indexed, so it can be quickly searched.) For this to be effective, the publishers have to make charts and graphs that are not color-coded (at least until color is available) and have to make illustrations large enough to be viewable on the Kindle. Amazon has to create a keyboard on which the student can quickly type notes.

The illustration above shows the new and improved controls: **Keyboard:** One of the worst features, they've made it too small in my opinion to do any-

Kindle.....Continued on page 4

Kindle.....Continued from page 3

thing but type with your thumbs. Use it to enter search terms, notes and URLs for web sites. **Alt Key:** Provides a way to enter numbers. **Text Key:** Adjusts font size and words per line. Turns off/on the function which allows the book to be read to you (unless the publisher disables the function) and lets you choose the speed and choose male or female voice. **Symbol Key:** Presents a menu of punctuation marks and symbols. **Back button:** Like the back button or arrow on a web browser. **5-Way controller:** Moves cursor 4 directions, selects item when pressed. Can also accelerate cursor. **Menu button:** Displays application and navigation choices related to the screen that you are viewing. **Next Page button:** Takes you to the next page. **Previous Page button:** Takes you to the previous page. **Home button:** Shows content stored on your Kindle and content archived at Amazon. **Volume Controls:** Controls the two speakers at the top of the Kindle, or the headphones' volume, for audiobooks, background music and text-to-speech.

Some of the More Important Features:

- **Large Display:** 9.7 inches e-ink display with 16 shades of gray. Auto rotates to portrait or landscape view. Provides magnification in landscape view.
- **3G Wireless:** Books delivered in less than 60 seconds with no monthly fees and no annual contract. Coverage throughout US and more than 100 countries abroad. U.S. customers will be charged a fee of $1.99 for international downloads.
- **Carry Your Library:** Holds up to 3,500 books, periodicals and documents.
- **Long Battery Life:** Read up to a week on one charge with the wireless, or up to two weeks with the wireless off. Charge time approximately four hours. Can charge with USB.
- **USB Port:** USB 2.0 (micro-USB connector) for connection to the Kindle DX power adapter, or optionally to connect to a PC or Macintosh computer.
- **Read-to-Me:** With the text-to-speech feature, Kindle DX can read newspapers, magazines, blogs and books out loud to you, unless the book's rights holder made the feature unavailable.
- **Low Book Prices:** *New York Times* Best Sellers and New Releases are $9.99, unless marked otherwise. Some books are free and some at very low prices. Reference books are often more costly but usually less than hardcover price.
- **Content Formats Supported:** Kindle (AZW), PDF, TXT, Audible Enhanced (AAX), MP3, unprotected MOBI, PRC natively and HTML, DOC, RTF, JPEG, GIF, PNG, BMP through conversion. Built-in PDF reader. Some features such as annotations and read-to-me are not currently supported for PDF. You can magnify PDFs by viewing them in landscape mode. You also have the option to have your PDF document converted to the Kindle format.
- **Large Selection:** Over 400,000 books, including 101 of 112 *New York Times* Best Sellers, plus U.S. and international newspapers, magazines and blogs.
- **Sync with Other Devices:** You can sync your Kindle books and view them on your computer or iPhone and soon on your BlackBerry.
- **Built-in Dictionary With Instant Lookup:** Kindle DX includes The New Oxford American Dictionary with over 250,000 entries and definitions. Simply move the cursor to the word, and the definition will automatically display at the bottom of the screen.
- **Basic Web Browser:** Kindle DX's basic web browser works well to read simple, text-centric web sites, such as Google and Wikipedia. The web browser is still in the experimental stage.
- **Search:** To use the Search feature, simply type in a word or phrase you're looking for, and Kindle finds every instance in your book or across your Kindle library.
- **Magazine and Newspaper Subscriptions:** Your Kindle magazine is auto-delivered wirelessly when the physical issue hits the newsstand, and all subscriptions start with a 14-day free trial. Your Kindle newspaper is delivered automatically and wirelessly to your Kindle, so it's waiting for you to read first thing in the morning.

A comparison of the $259 Kindle and the $489 Kindle DX is shown below.

choices available to you. He went into the details of how and why to set up Administrator and User accounts. He advised users to turn off the automatic restart function so that it will not restart from a "Blue Screen"

The presentation ended at 9:30 PM. John Witmer, our president, opened the business portion of the meeting at 9:35 PM. He stated that a raffle had been planned and asked if the members wanted to stay for a few minutes and have the raffle, or did they want to postpone it. The members chose to stay and have the raffle. He advised that in the last newsletter it was announced that we are offering to our dues-paid membership, on a first-come, first-served basis, the opportunity to buy one of the available *Smart Computing* one-year subscriptions at a price of $15.00, which is 50% off the regular renewal rate. The subscriptions have to be redeemed by April 1st. The raffle winners were: John Witmer, who won the Wireless Mouse; Doug Mullis, who won the Card Reader; and Ed White, who won the Air Net USB wireless network adapter.

The meeting ended at approximately 9:45 PM. ◆

Toyota Problems

In Toyota's drive to surpass General Motors in sales, it appears that they might have also taken on some of GM's bad habits as regards quality. If you haven't been on an extended camping trip, you know about their sticking accelerator pedal problem for eight of their models, for which they have temporarily stopped sales. They now claim to have a fix. The above image of the fix is from Toyota's site at http://pressroom.toyota.com/pr/tms/toyota/toyota-announces-comprehensive-153311.aspx.

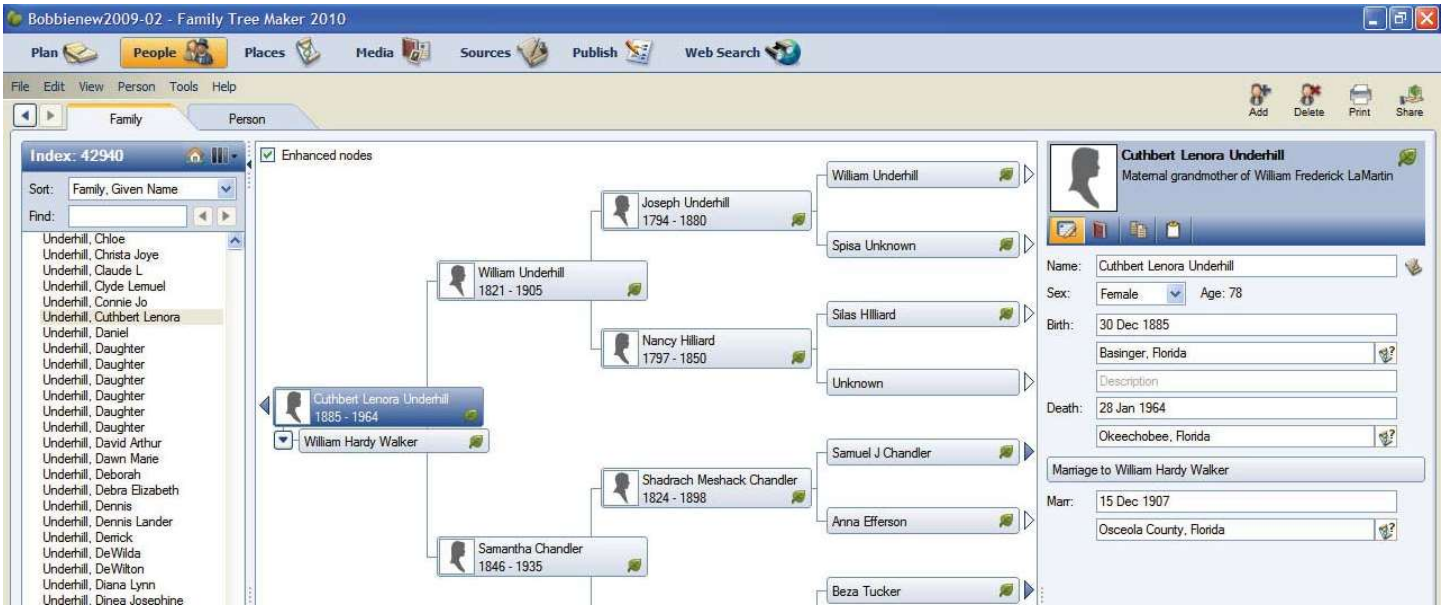
Family Tree Maker 2010

By William LaMartin, Editor Tampa PC users Group
lamartin@tampabay.rr.com

I have been using Family Tree Maker since it was a DOS program produced by a company called Banner Blue, I wrote about version 4, which was a Windows version, in the 1998 newsletter, http://www.tpcug.org/newsletter/nl_1998/february1998/family_tree_maker_4.html. I don't recall how many versions I have purchased over the years. However, the version I was using until recently was version 10, purchased in 2003. That was seven years ago.



I would probably still be using that version if I hadn't bought a new laptop. I mainly use the program on my desktop computer, and occasionally, on starting the program, it would crash the computer. I decided I didn't want that old crash-prone program on the new laptop. The program is now the property of Ancestory.com and may be purchased from them. Basically how much you pay depends on how much online access to genealogical information and databases you want in addition to the actual program. Ancestory will sell you the program CD (called Family Tree Maker 2010 Essentials) for $39.95, plus shipping. There is no downloadable version. Or you can save money by going to Amazon.com (through the link on our home page) and purchasing the same CD for $27.98, plus shipping.

The interface for the 2010 version is totally different from the version I purchased in 2003, which is certainly to be expected. But, like the change in Microsoft Office from Office 2003 to Office 2008, the changes do take some getting used to, and familiar items are sometimes hard to find. The major change apparently arrived with the 2008 version, which also was apparently a bit buggy. That was supposedly fixed in the subsequent versions in 2009 and 2010.

When I started with my first version of Family Tree Maker, I entered the little information I had and then the information I gathered from others. At some point my sister, much more interested in genealogy than I, got a computer, and I turned over to her the task of making changes and additions to the shared Family Tree Maker file. Now, years later, that file has over 40,000 individuals, entered along with thousands of notes and research references. This is a file you don't want to lose. She has a copy on her computer, as do I, on both my laptop and desktop. We both also have copies on external hard drives.

Below is a screen capture of the top portion of the program displaying what I would call the People view. For the selected individual, you see four generations. The screen is divided into three frames horizontally. There is also a frame at the bottom (not shown), where the selected individual's children are shown. As you

Special Interest Groups

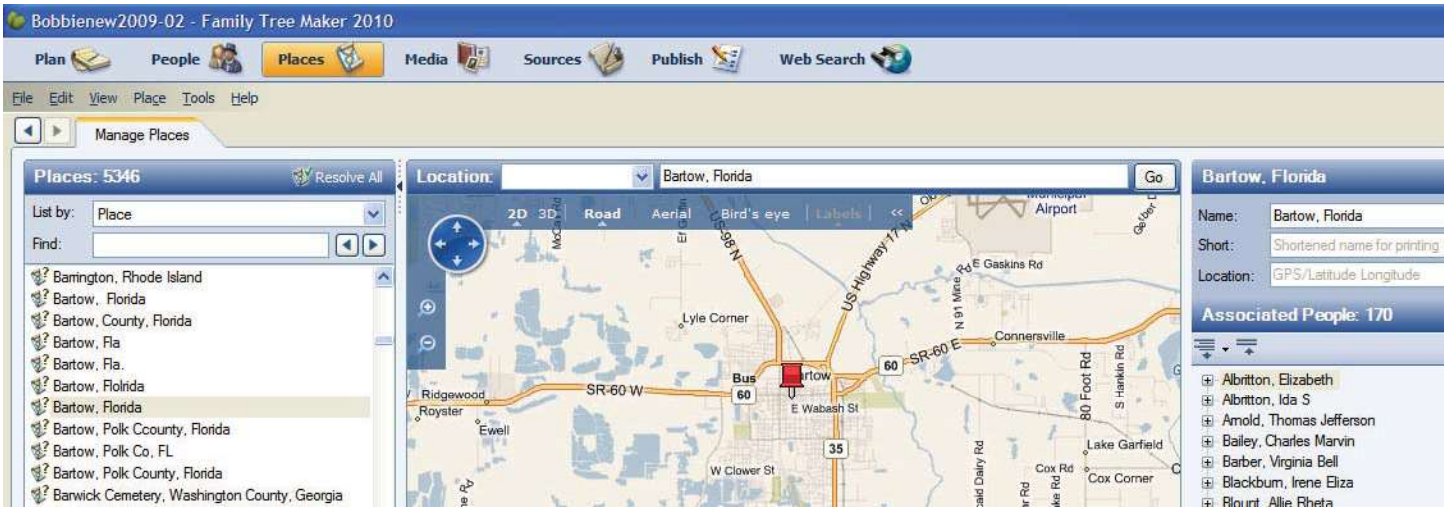
Visual Basic .Net SIG (and sometimes Access SIG)

This SIG meets the third Wednesday of the month at 6:30 PM. For information, contact William LaMartin at lamartin@tampabay.rr.com.

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Bob LaFave moderates the discussion.

Family Tree.....Continued from page 6



can see, the leftmost frame is an index of all individuals in the database, the center is the immediate tree, and the right frame is where you edit the individual's information, called the detail panel. If you want to add a source for any information you enter about an individual (birth, death, marriage, notes or facts), you simply click on the Edit menu item, choose Manage Sources and go from there. There is also an alternate way of doing this: For the person selected, if you hover your mouse over an item like Birth in the detail panel on the right, a button appears to the right of the text box that, if clicked on, will open the Source Dialog window. This was one thing I was confused about before consulting Help. I first thought to click on the Source view and try to do it from there. Be warned, even if you are not new to Family Tree Maker, this new interface will probably present a few problems at first. But you have four resources: Built in Help, online Help, the Adobe Flash training tutorials that install with the program and the two little books that shipped with the software.

The image below is the top portion of a screen capture of the Places view. The left pane is an index of all the places listed in your data. The center pane is a bing map displaying the location of the selected index location, Bartow, Florida. The right pane lists all the individuals associated with that location. Note in the index pane there are nine variations on the spelling of Bartow, Florida. This indicates that some work needs to be done to settle on one spelling and to modify the data accordingly.

I don't have room to display a screen capture of the Publish view. There you are provided all sorts of ways to display, print and export your data. The broad categories are: Charts, Genealogy Reports, Person Reports, Place Reports, Source Reports and Books. Within each category are the specific reports. What is new to me in all of this is that you can now export reports to PDF, RTF, CSV and HTML. Both the PDF and HTML results are quite nice and, if I remember correctly, were not available in my old version. I recall having to use RTF in the past. Right now, I can't think of a use for a CSV export for the type of reports I have used.

A big part of Family Tree Maker is access to the online

Family Tree.....Continued from page 7

data. In the People view image earlier, you will notice a little leaf (green in color) in the lower right hand corner of a person's box in the middle pane. That indicates that there is information about this person at the Ancestry.com site. With the purchase of the program, you are entitled to one month free access to this information. If you want more, you may purchase access by the month, or, more economically, by the year.

The data consists of documents such as census records, marriage records, Social Security death records, ship manifests, city directories and many other things. Additionally, you have access to all the family data uploaded to Ancestry by other users. Be forewarned, some of this user uploaded information is good and some of it is totally inaccurate. You may find that the great-grandmother whom you know was born in Louisiana is listed by some submitters as being born in Florida; others may have her as born in Louisiana but with an incorrect date. I have actually seen instances where submitters have a father and son switched. And once an error is made, it gets copied by others over and over. Verify your data. ◆

Editor's Comments: A New, Small Laptop

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

In the January 2010 newsletter, I wrote about my new HP Pavilion dv6 laptop. It had a quad core Intel i7 processor with six GB of RAM and a 500 GB hard drive. It ran Windows 7 professional 64-bit and had a 15.6 inch diagonal display with a resolution of 1366 x 768. I described how I loaded all the programs onto it that I had on my desktop computer: Adobe Creative Suite 4, Microsoft Office 2007 Ultimate, Microsoft Expression Studio 3 and Visual Studio 2008. Then there were all the minor programs, along with Microsoft IIS7 and Microsoft SQL Server. The idea was that I could do anything with it that I could do with my desktop computer. It would be my new computer for demonstrations and for travel.

Demonstrations turned out fine. Travel turned out to be a problem. Although the new laptop was a bit thinner than the old one, it was also a good bit wider. It was fine to put in the trunk of a car and take out when you got to your destination; however, carrying it on a plane didn't appeal to me – especially when I

Minutes of the April Meeting

By Jim Purcell, Secretary, Tampa PC Users Group
Edward_J_P@MSN.com

Bob LaFave started the Windows SIG at 6:30 PM. There was a discussion about routers and the availability of security cameras that can be linked to a computer. Merle Nicholson and Bob responded to questions concerning the capabilities of these cameras and the hardware and software required to install them. The SIG ended at approximately 6:45 PM.

John Witmer, our president, started the business portion of the meeting at 6:45 PM. He introduced the guests who were attending the meeting. He announced that we have programs lined up for May and June. Drew Smith of the Florida Genealogical Society will do a genealogy presentation in May, and Blain Barton from Microsoft will appear in June to discuss a topic yet to be announced (after the meeting, Blain Barton's presentation was rescheduled to July). John mentioned that we were still receiving funds from Amazon.com for purchases through our site. He introduced Dave Palmer, the Instructional Media Agent for the University of Florida South Central Extension District, who was delivering the evening's presentation on "Internet Security".

Dave described his job with the extension service and gave an overview of their many services. He emphasized several times that he believes most people are not aware of the many services that are available to them through the extension program. He discussed existing threats on the internet, which include Phishing, Trojans, Spyware, Rootkits and Botnets. He defined each of the threats and described the precautions that can be taken by an individual or an organization. He also described a list of best practices which he had provided in his handout. Dave discussed social networking threats on sites such as MySpace and Facebook. He emphasized that he believed that the primary threat with these networking sites is the type and amount of information that is being disclosed by the individuals using them.

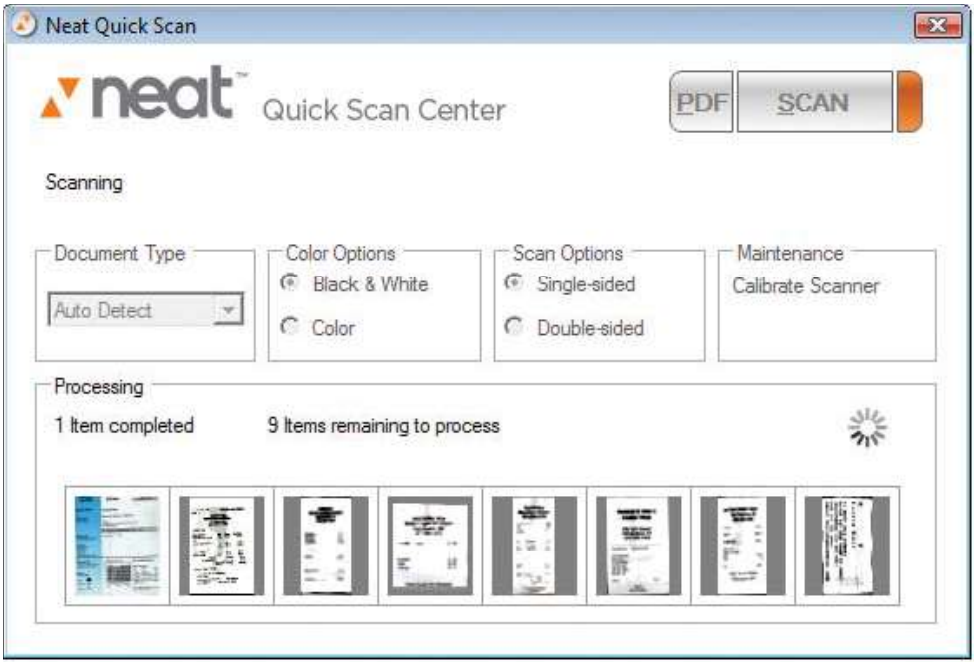
Neat Desk

By Jim Purcell, Secretary, Tampa PC Users Group
Edward_J_P@MSN.com

I have been interested in a product of the Neat Company, called Neat Receipts for some time. I learned of the product when COMPUSA went out of business. They had several for sale at reduced prices. It looked like a good deal at the time, but reviews were mixed and I couldn't find anyone I knew who had owned or used one. Neat Receipts consisted of a slim, portable, USB-powered scanner and powerful, specialized software whose primary purpose is to allow you to scan bills and business cards which the software will recognize to the extent that it is able to extract the pertinent information on each bill or business card and place it in a database where it can be used in a variety of ways. The reason that I was so interested was because I have for years matched receipts to credit card bills and retained them for warranty and tax purposes. Not only is it cumbersome to maintain the files but also the bills that we receive today quickly become illegible. All things considered, I decided to not buy at the time but kept checking the product for improvements. About eight months ago, a couple of our members talked about unsuccessfully using the product. A few months later I saw an advertisement featuring their new scanner, a small desktop scanner that is both flexible and fast. I checked locally about return policies. They were too restrictive to make it really practical to buy the product and return it if it didn't do the job. I decided to call the Neat Company to ask some questions and mention the local return policies. Their representative suggested that I buy directly from the company and said they would allow me 30 days to try the program. When I asked about shipping costs, he said that they would pay for the shipping and that they were currently having a sale, which in effect made their total price about $70 or $80; this was less than what I could purchase it for locally, and he said that they would pay for the return shipping if I wasn't satisfied with the product. It thus became a no-brainer to try the product. I was happy with what I saw of the product and kept it. Anyone who is interested should probably visit their site and watch the video tutorials. They will give you much more detail that what I am able to give in the general descriptions than I can provide in this article. Go to http://www.neatco.com/products

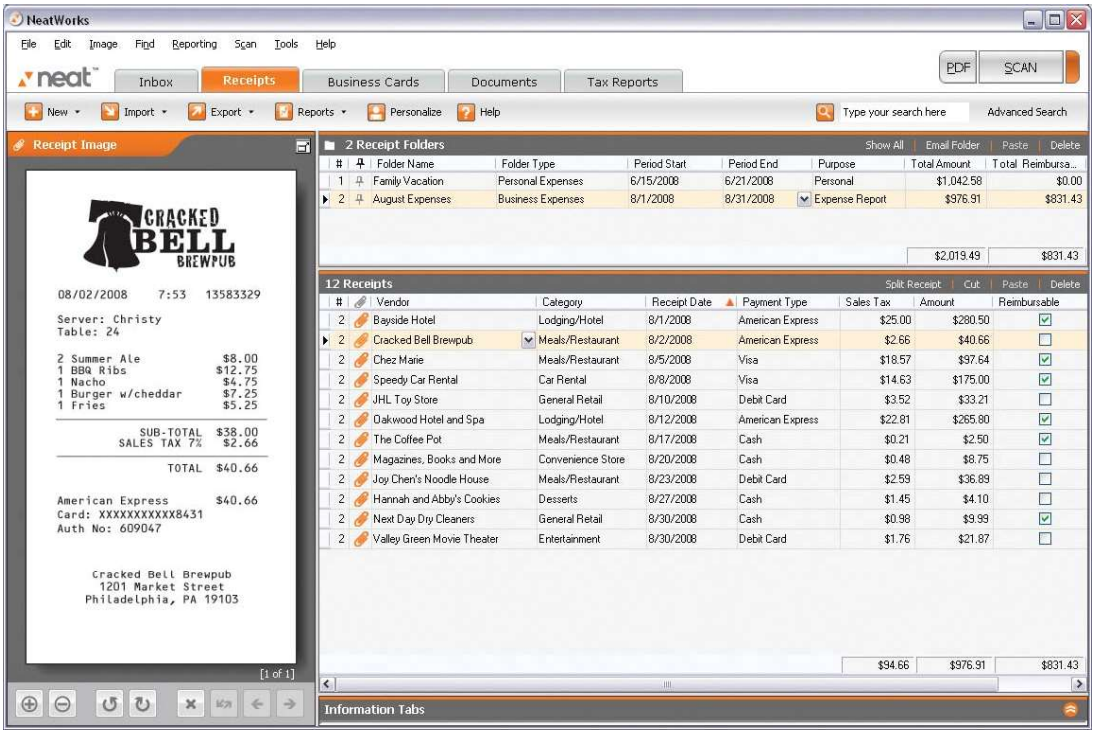
They still sell the portable scanner (bottom photo), and it works with the same software as the desktop scanner (top photo). Frequent travelers can own and use either or both.



The Neat Desk has an unusual document feeder that allows you to scan up to 15 business cards, receipts and documents (single or both sides) in one pass. If you remove the divided paper input tray, you can scan up to 50 documents (single or both sides). I think that you'll be surprised at the speed. Documents can be scanned directly as a PDF file to a folder of your choice, or they can be filed as a document in the document organizer. Once in the organizer, the document can be exported as a "searchable" or "report" PDF file. The searchable PDF file is selectable, which means that you can select, copy and paste text from the PDF document into a text editor such as Microsoft Word or Notepad; it also is searchable, which means you can

Neat Desk.....Continued on page 4

Neat Desk.....Continued from page 3



search anywhere within the text of the PDF document, and you can save the PDF document as other document types. You would use the "report" PDF file when you don't need the above features or when you want a document that can't be easily altered, such as a report, invoice or contract.

The scanning process begins with the Neat Quick Scan Center (adjacent image) and is well-organized, fast and convenient.

The Quick Scan Center processes receipts, business cards and documents as you scan them and automatically sends them to the proper Inbox as it completes processing them. The Inbox is where your scanned items display so that you can verify their accuracy, make edits or add notes before filing them in the appropriate organizer.

The Inbox consists of three bins: Receipts, Business Cards and Documents. A scanned item displays in the appropriate bin for editing and filing (see image below). If they should go to the wrong bin, they can be easily dragged to the proper bin. Your edit of the documents allows you to add data not picked up automatically or add additional information that you want included in the file. Individually-scanned documents can be combined into one document file. You can do such things as assigning a tax category so you can prepare a report at tax time that includes your deductible items and a copy of each deductible receipt. You also have both keyword and advance search capabilities. NeatWorks allows receipts to be exported in a variety of formats: PDF, Excel, Word, HTML, QuickBooks, Quicken, MS Money, OFX, and CSV (comma separated values). Your business cards can be synced with Microsoft Outlook or Plaxo and can be exported to PDF or RTF. ◆

Comments.....Continued from page 1

also wanted to take a digital SLR camera along. That meant two bags: a camera bag and a computer bag. And with all the fuss by the airlines now about extra carryon items, I wanted to get down to one bag that would hold both the camera and the laptop.

The idea of a netbook first came to mind, but the limited memory and processing power, along with the less robust operating systems that came with them, got me away from that idea pretty quickly since I wanted to do more than just check email and browse the web. In my looking, I came across the category of small laptops. I looked at such computers from HP, Acer and Toshiba and settled on a Toshiba Satellite T115D-S1125 LED TruBrite 11.6-Inch Laptop.

The dimensions of the Toshiba laptop are 8.3 x 11.3 x 1.4 inches and 3.5 pounds. My HP laptop weighs 6.34 pounds, and its dimensions are 10.15 x 14.9 x (1.33 at front-1.61 at back) inches. So the Toshiba is a much smaller package, but, surprisingly, its display has the same resolution of 1366 x 768 pixels. So what is missing? Well, the main component not in the Toshiba is a CD/DVD drive. When I bought the larger laptop, I said that I would never buy a laptop without a CD/DVD drive. However, when it came down to how to get the smallest real computer I could get (without paying a really large amount of money), I had to give up the internal CD/DVD drive. Instead I ordered an additional external USB drive to use for making those recovery disks that we all are supposed to make and use to install programs (although you could install programs from the drive on another computer on your

Internet Picture of the Month

Icelandic Volcano

From the site http://www.boston.com, we have a pretty amazing collection of 35 photos of the recent volcanic activity in Iceland. The exact link to the photos is http://www.boston.com/bigpicture/2010/04/more_from_eyjafjallajokull.html.

The description given for the photo above is: "The volcano in southern Iceland's Eyjafjallajokull glacier sends ash into the air just prior to sunset on Friday, April 16, 2010. Thick drifts of volcanic ash blanketed parts of rural Iceland on Friday as a vast, invisible plume of grit drifted over Europe, emptying the skies of planes and sending hundreds of thousands in search of hotel rooms, train tickets or rental cars. (AP Photo/Brynjar Gauti)"

Comments.....Continued from page 5

home network). The external Toshiba drive costs $64.

The Toshiba also came with two GB of Ram, which for $55 I upgraded to four GB by adding a two GB memory module. So my little laptop which started off at $493 was up to $612. Then to finish things off, for $15 I added a little USB Bluetooth radio (there was no way to purchase the laptop with Bluetooth) so that I could use a Bluetooth mouse I already had with the laptop, since I really don't like to use those laptop touch pads. Thus, the final price was $627. I see that the price of only the laptop at Amazon has now dropped $20 to $473.

This laptop has:

- 1.5 GHz AMD Athlon NeoX2 L325 Processor
- 4 GB 200-Pin DDR2 SO-DIMM Memory
- 320 GB Serial ATA Hard Disk Drive (5400 RPM)
- 802.11b/g wireless LAN
- 11.6" LED (16:9) 1366 x 768 Display; ATI Radeon HD 3200 Graphics
- Windows 7 Home Premium 64-bit

Getting Windows 7 Home Premium 64-bit was very important to me, since so many of these small computers and netbooks come with much less robust operating systems. I am sure there are more differences, but the only thing I have found so far that Windows 7 Professional has that Home Premium doesn't is Remote Desktop connection – important to some people but used very rarely by me.

On this little laptop, I have loaded almost all the same programs I use with regularity on my desktop computer and had also loaded onto the larger laptop, with the exception of Adobe Creative Suite 4. Adobe really enforces that "install only on two computers" limit for its programs. I could have gone to the trouble of installing the Adobe stuff on the small computer and just leaving it deactivated. Then, if I wanted to use it on a trip, I would have had to deactivate it on either my desktop computer or the other laptop so that I could activate it on the small laptop. But I chose not to do so. Instead, I use the free Adobe Reader to read pdfs and use the free CutePdf to create pdfs. To edit images, since I don't have Photoshop on the small computer, I use the free Paint.Net (probably all the average user would need). Both of these two free programs were recommended to me by Merle Nicholson. He also recommended the free FTP program FileZilla. All three of these free programs are excellent. Since I use Adobe InDesign to create this newsletter, I will not be working on the newsletter when traveling with the Toshiba. However, I still have Microsoft Publisher as part of Microsoft Office 2007, so I do have a desktop publishing program available.

This little computer is really a wonderful thing. The display is so sharp and crisp. And the dual core processor with 4 GB of RAM makes for really fast processing. With all my programs loaded and a modest amount of data brought over from the desktop computer, I still have 217 GB of free space on the hard drive.

Some other features I should mention include three USB ports, an HDMI output port, a five-in-one-card reader and a standard VGA video output port. In addition, there is a built-in webcam that supposedly has facial recognition; however, I cannot get it to recognize my face Finally, the computer supposedly has six hours of battery life, whatever that actually means. Does it mean that I can work on the laptop for six hours before the battery is discharged? If so, that would be very nice.

I suppose the only negative of this machine for most people is the lack of an internal CD/DVD drive since so many people like to pop in a movie on DVD and watch it as they fly through the sky. And I wouldn't really want to lug the external drive along because that would defeat the reason for purchasing a small laptop.

I purchased the Toshiba and all of its additional items from Amazon. Unfortunately, since I set up the Amazon account for the TPCUG, the group is not allowed to get credit for anything I purchase. However, everything anyone not at my address purchases from Amazon by going through the Amazon link at our site, http://www.tpcug.org, will contribute an average of 4% of the purchase price to the club. And for the past several months, people have been doing just that. So keep it up! ◆

Special Interest Groups

Visual Basic .Net SIG (and sometimes Access SIG)

This SIG meets the third Wednesday of the month at 6:30 PM. For information, contact Editor William LaMartin at lamartin@tampabay.rr.com.

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Member Bob LaFave moderates the discussion.

Microsoft Launch 2010 in Tampa
Tuesday, June 29, 2010

5426 Bay Center Dr

Suite 700 Tampa Florida 33609

Launch 2010 Highlights

The Next Wave of Business Productivity

See what Microsoft Office 2010 and SharePoint 2010 mean for the productivity of you and your people—across PC, phone, and browser*. Find out firsthand how to plan for, implement, and deploy the new wave in business productivity at this free, half-day event. There's a lot that's new—here's what you can expect:

- Come and see first-hand how the new wave of products like Office 2010, SharePoint Server 2010, Exchange Server 2010, Visio 2010, and SQL Server 2008 R2 can optimize the way you work every day.
- Learn about tools and resources that'll help you plan by evaluating your current infrastructure
- Explore tools that'll help you optimize desktop deployment.

Launch 2010 Highlights

Life Runs on Code

Learn about the rich application platforms that Microsoft Visual Studio 2010 supports, including Windows® 7, the Web, SharePoint, Windows Azure™ and Windows® Phone 7 Series. From tighter development and test team integration to new ALM tools, there's a lot that's new. Here's what you can expect:

- See how to move your existing skills forward with Visual Studio 2010 both for in-house ASP.NET development and the new frontier of the Cloud.
- Build rich Windows applications with Silverlight 4 using trusted application features including out-of-browser execution and saving to the file system.
- Learn about the powerful capabilities of the Window Phone platform and the developer tools experience.

Minutes.....Continued from page 2

He explained the construction of a URL and stressed that this knowledge is one of the most valuable tools that you can use to recognize phony URL's. He provided examples of the damages caused and the extent to which the criminals both local and foreign will go to steal money and information from you. What is even more distressing is the extent to which some individuals will go to destroy your files and equipment just to satisfy their ego.

Dave also discussed in detail the protection that is available to all of us. He covered layered security, best practices, security software and suites, backups and various types of support available from many sources.

In addition to the presentation, Dave provided everyone attending with a very impressive handout that contained a wealth of information to provide a better understanding of not only the security problems encountered on the internet but also how to improve the security of your files and hardware. The meeting ended at approximately 8:30 PM. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

I suppose this newsletter might not be considered a true computer publication if it didn't have a mention of the iPad this month. There I have mentioned it. Should I say more? Well, I have a bit of space to fill, so I will.

I haven't actually touched one, so I'll just comment on a few things I read on the web using my un-hip desktop Windows PC, or heard on the TV or radio.

While driving, I heard one of the ladies on CNBC predict that the iPad would be a Dell killer. By this she meant that people would no longer need to purchase the type of things Dell Computer sold since they could now turn their computing life over to the iPad. Her logic was that she had typically purchased a couple of Dell computers every year until she got an iPhone. Since the iPhone now did everything thing she needed done computerwise, there was no need to buy anything from Dell. The iPad would just make the case against Dell stronger.

Minutes of the March Meeting

By Jim Purcell, Secretary, Tampa PC Users Group
Edward_J_P@MSN.com

Bob LaFave opened the meeting with his Windows SIG presentation at approximately 6:35 PM. In response to a member's question about problems with his router, Bob suggested that it might be a firmware problem. He expanded the discussion of firmware for other components. He cautioned anyone having problems with their hardware to explore firmware updates to determine specifically what they will correct or improve and to avoid downloads that are of no benefit to you. He cautioned that some firmware installations can be difficult to execute and can cause serious problems if they are improperly installed. In discussing virus and malware problems, he covered a variety of "uninstall programs" and several free "repair programs" that can be used when problems occur. Bob also covered the process of restoring your computer and went into the details of the process.

President John Witmer opened the business portion of the meeting at approximately 7:10 PM. He announced that all of the Smart Computing subscriptions had been purchased by members and that he has received confirmation that all have been processed by Smart Computing. Blain Barton of Microsoft was scheduled for April but he had to cancel. John announced that the May program will be Genealogy by Drew Smith, and Blain Barton has committed to June. Dave Palmer a member of The Greater Tampa Bay Computer User Group emailed John announcing a presentation on an Internet Computer Security Program. He is giving a presentation at the Hillsborough County Extension Office in Seffner on March 18th. It is a free presentation offered by the county, and John had brochures for anyone desiring to attend. The presentation is the product of a partnership between Hillsborough County and the University of Florida. John announced that we had gotten a large check from Amazon.com ($200). He encouraged members to continue to go through our website when they purchase merchandise and gift certificates.

John introduced a member, Michelle Burgess, who had volunteered to give a presentation on FaceBook and Twitter. Michelle began with an explanation

Uniting The Internet and Your TV

By Ron Weinberg, Member-At-Large, TPCUG
rswjbr@verizon.net

The era of obtaining VHS tapes or DVD discs from retail or rental store or by mail is ending. Media will be dispensed by pay-per-view or on demand from cable providers, or via streaming or downloading directly to you via the Internet.

This article involves connecting television sets to the Internet to receive media for viewing with or without a PC. It is not concerned with any methodology for directly viewing television on the personal computer.

There are several distinct ways to connect the Internet to your TV, either with or without using your PC. The benefits of connecting via PC are that, once connected, various types of software will allow functions beyond obtaining and viewing movies and TV shows, such as: Saving downloaded material, displaying photos, listening to music, or merely using the TV as a large display screen. Some devices which do not rely on your PC may still require one for initial installation.

Connecting a Computer to a TV

Connecting a computer to a TV requires establishing some form of physical or wireless connection between the two devices. Possible methods are:

1. Use direct cables such as DVI, S-Video, VGA, HDMI, USB, or Firewire. The available ports on both the TV and the computer will determine which methods are practical. These cables may be costly and may depend upon proper video cards or require some sort of converter. The PC and the TV must be located within cable distance.

2. A new hardware approach has been developed. The NETGEAR Push2TV adapter requires an Intel® Wireless Display software enabled laptop powered by the Intel® Core™ Processor Family.

3. Via your home network, (wired or wireless). This is the more common and perhaps the easiest method. An Ethernet or Wi-Fi port is required. Some new TV sets have a built in Ethernet port, or can support Wi-Fi. If no port is available, web-enabled consumer electronics (CE) devices described below provide indirect connectivity.

Connecting TV to the Internet without a PC via your home network (wired or wireless)

Of course, a home network will include at least one PC, but it is the router connection to the Internet rather than the PC's hardware that is usually utilized.

Direct connections through your home network

Some new TV sets have a built-in Ethernet port to access the Internet. More new models are expected to include this port. Any required software will either be provided by the media supplier or the TV maker.

Indirect connections through your home network

Through Blu-ray:

Many Blu–ray players have a built in Ethernet port; some have built in Wi-Fi and can support Internet video directly. The connection between the player and the TV delivers the media to the TV.

Through CE Devices:

Web-enabled consumer electronics (CE) are devices which deliver streamed content. to TV, Blu-ray, or standard DVD players that have no Ethernet or Wi-Fi ports. They are usually wired to the TV with component vfideo or HDMI cables.

There are many different and competing devices already available. Prices range from $100 or less and up. Some have unique features which justify higher costs. Better models should provide perfect 1080p HD and digital surround sound. In time, some will become obsolete as a standard method develops.

Examples of CE media players that relay Internet video to TV are:

- Roku Digital Video Player (requires no PC)
- VUDU - 1080p HD Internet movie player (requires PC for activation only)
- Also may be built into some new TVs
- Apple TV (requires PC or MAC)

Internet and TV.....Continued on page 4

Internet and TV.....Continued from page 3

- WD TV Live HD Media Player (requires no PC).
- D-Link Media Center Extender DSM-750 (requires PC).

Downloading vs. Streaming

Downloading and streaming are the prevalent methods used to move media from the Internet to your PC and TV.

Downloading: The file is copied from the web server to your computer.

Progressive Download allows users to watch or listen to media as it is being downloaded from a web server to the hard drive.

The progressive download feature in most media players allows them to begin playing the file as soon as enough data has been downloaded. The playing file will stutter or stop if the rate of play is greater than the rate at which the file is downloaded. The file will begin to play again as the download improves.

Streaming: The media is played but not stored on the computer or TV. The file is played as it downloads, without having to wait for the download to finish.

Streams can come from a live video camera, webcasts, audio radio feed, or a movie on the server. To achieve highest quality a broadband connection is needed. Streaming has advantages. It allows you to skip ahead in a video, or begin playback somewhere in the middle. Video playlists and Search may be options.

Obtaining Media

There are technical differences in the actual transmission methods used for progressive downloads and streaming. However, the method used is usually determined by the source rather than the client end user.

Streaming content comes from special streaming servers. Netflix, Amazon, iTunes, and Blockbuster offer streamed movies. Prices vary. Other online TV programming portals, such as Hulu and YouTube are free. If the content does not come from a streaming server it will most commonly be a progressive download.

Moving Media from PC to TV

Most streaming would be direct to the TV through one of the connection methods. Media which has been downloaded or otherwise entered into the PC can be transferred from PC to TV by CE media players, DLNA, Media Manager or various other programs which are not in the scope of this article.

CE media player boxes supply their own software.

DLNA is explained by Wikipedia as follows:

> DLNA (Digital Living Network Alliance) is a standard used by manufacturers of consumer electronics to allow entertainment devices within the home to share their content with each other across a home network.
>
> DLNA intends to solve the problems inherent in using digital media between different consumer electronic devices. For example, a DLNA-compliant TV will interoperate with a DLNA-compliant PC to play music or videos and display photos. The specification also includes digital rights management (DRM), a technology to ensure that the "content must be protected from unauthorized copying and use."

Verizon Media Manager

Media Manager is free PC software available to FIOS TV customers which transmits personal media such as photos, music and videos from your PC over the Internet to the FIOS server, which then forwards it to your FIOS TV. You can connect from cell phone, thumb drive, or portable media player, and even go from camera to TV. A DVR set-top box is required.

Conclusion

The technology and equipment for delivering media is improving and changing constantly. No doubt, in time the process will be simplified.

However, it must be noted that most broadband providers already offer on-demand or pay-per-view ser-

Internet and TV.....Continued on page 8

Minutes.....Continued from page 2

of Twitter. She went to http://www.twitter.com and began tracking people and things. She explained how to sign in and establish an account and demonstrated the various ways you can use Twitter to track both subjects and people. Twitter is a free service that lets you keep in touch with people and subjects through the exchange of quick, frequent input. Entries are limited to 140 characters. The format of the application allows extremely rapid access to information and to the activities of people. Michelle described the various ways the program could be used and the versatility of the structure, such as the ability to attach links.

Michelle demonstrated how to create a FaceBook account and how to locate friends to add to your account. She suggested that when you create the account that you indicate networking when asked what you are looking for. She described some of the reasons that you might want to establish a FaceBook account. Michelle explained uploading and downloading photos, audio, video and events to FaceBook. Her demonstration included many of the applications that can be initiated in FaceBook and she showed the versatility of these applications in response to questions and suggestions from the audience. In both the Twitter and the FaceBook presentations, Michelle used audience participation not only to provide the members with an understanding of how the programs operate but also to make them aware of many of the finite details that allow the user to take advantage of the various tools provided by Twitter and FaceBook.

John closed the meeting at approximately 8:45 PM. ◆

Internet Picture of the Month

HDR Sunset

This sunset photo from http://www.flickr.com/photos/murtasma/730847627/ is an example of an High Dynamic Range (HDR) photo. I first saw it at the HDR Pictures link in the Interesting Links section below. HDR images are composed of several images of the subject taken at different exposures and then combined in software and further manipulated by adjusting, among other things, the resulting image's tone curve. Adobe Photoshop will do this for you, or there are more specialized programs available.

Go to flickr at http://www.flickr.com and do a search for HDR. I just did, and they list 430,938 such photos. Now tell me how flickr makes money off all of this; I see very little advertising.

Verizon FIOS Battery Backup System

By John Witmer, President, Tampa PC Users Group
jwitmer@pepindist.com

I recently had a situation come up with my FIOS battery backup device, and I thought I would share the experience and information with our Group since I know many of you also have this same service. My system was installed in July 2007 by Verizon and has worked flawlessly since that time. The battery backup system is installed in the garage, close to my electrical panel and the exit door to the outside, so I couldn't help but notice it when the red, replace battery light came on during this past Christmas holiday. After ignoring it for a few days, I was treated to an intermittent beeping alarm also calling my attention to the device and its red light notice to replace the battery.

Being somewhat naive, I thought perhaps this was something that Verizon would take care of, considering I pay them more than $200 a month, so I called Customer Service inquiring about the battery and the replacement warning I was getting. I learned it obviously was not their problem, and they suggested I go to Batteries Plus to obtain the replacement battery I needed. So on December 31st, during a day off from work, I removed the battery from the device and hauled it down to Batteries Plus for replacement. The employee behind the counter took my old battery and hooked it up to a test unit as the first step. To my surprise, he said the battery was in excellent condition and should last me another few years at least. He then let me know that this problem was common with the Verizon battery backup devices, and although he did not know for sure why the problem existed, he thought it had something to do with the Verizon backup box it was installed in. He said he has had the same experience at three different times so far with his FIOS system.

The solution to determine if the battery truly needs replacing (if you don't want to remove it and have it tested as Batteries Plus would do) is to unplug the battery backup device from the electrical outlet it is plugged into, disconnect one of the wires going to one of the terminals (I chose the negative black connection) and leave it unplugged for ten minutes or so. Then reconnect the internal wire to the terminal and plug the device back into the electrical outlet. Chances are you will get a green light showing the System Status to be ok and no red light showing at all.

Interestingly enough, two more people showed up at Batteries Plus with Verizon backup batteries in hand while I was there. I know the elderly lady who was waited on next to me was told the same solution I was told. If by chance you do have to replace the battery, the cost with tax is about $35 at Batteries Plus, or someone said you can get them online for less money (I don't know the web site). There is also the convenience of disposing of the old battery if you go the store route. By the way, my battery and backup system has worked just fine since then, and I have no replace battery warning light coming on at all. In case you wondered, Verizon Customer Service does not furnish this information as a solution, or even alert you to the possibility that the battery is OK. It might lead you to infer that they could have a defect of some sort in their piece of equipment, which would not be good considering the number of units installed in the market. ◆

FIOS Battery and control showing everything is OK

Special Interest Groups

Visual Basic .Net SIG (and sometimes Access SIG)

This SIG meets the third Wednesday of the month at 6:30 PM. For information, contact William LaMartin at lamartin@tampabay.rr.com.

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Bob LaFave moderates the discussion.

Comments.....Continued from page 1

What can I say? If the iPhone satisfied all of her computing needs, she didn't really do much with all those Dells she had been stockpiling. And that is fine. Many people really don't do much with their desktop and laptop computers other than browsing the web, using email, taking part in social networking sites like FaceBook and searching for information. And the iPad will give such people a larger screen than the iPhone on which to do all of this.

I will close out this iStuff with the observation that Apple has done a lot of things right. They are also great at marketing their products. And the press gives them so much free coverage. I can't count the number of articles about the iPad that I have seen in *The Wall Street Journal* and *The New York Times* in the past couple of months. I particularly like articles in the *Journal*, since they always allow comments; sometimes the *Times* does also. It becomes apparent quite soon, as you read the comments, that the audience breaks down into pro-Apple and anti-Apple camps. One of my favorite comments was from the obviously pro side, in which the comment was something to the effect that the individual was so into everything Apple that he would even buy an Apple toilet if they were to produce one.

As for me, though, I will never buy an iPhone because I can't program it as I do my Windows Mobile phone. As I am sure you have read, the iPhone is really locked down in that, even if you have the ability to write a program for it, you cannot install that program on the phone without Apple giving its official seal of approval to the program, which takes time and is not guaranteed to occur. With a Windows Mobile phone, I can write a program and then install it on the phone one minute later. I can even send it to others who have such phones, and they can install the program.

In fact, I am working on a new program for the phone right now that, at the press of a button, will open the phone's camera so that I can take a photo. Once the photo is taken, if I like what I see and press the OK button, it is automatically uploaded to a folder at my web site. At the same time, data about the photo (its file name, time taken, and longitude and latitude of the location if I have the bluetooth GPS running) are uploaded to a Microsoft SQL database at the site.

For display purposes, the images can then be displayed in two ways. For all the photos, there is a page where thumbnails of the photos are automatically generated and displayed, and a click on the thumbnail displays a full version of the image. For photos with GPS data, a map is displayed with a pushpin at each photo location. A hover of the mouse over a pushpin displays a thumbnail of the image, and a click on the thumbnail displays a full version of the image. This is sort of my own flickr for phone photos application.

You will note that I mentioned a Bluetooth GPS for my phone. My HTC Windows Mobile 6.1 phone is approaching 2.5 years in age and does not have a built -in GPS, hence the need for an external GPS. I thought about replacing it when Windows Mobile 6.5 came out, but decided to not do that, and now I am glad I didn't since Microsoft is supposed to have Windows Mobile 7, also known as Windows Phone 7, available by the end of the year.

I hope the Windows Phone 7 works for Microsoft. They have dropped the ball a bit in the phones and let others like Apple move ahead. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

It is less than one week and a day before our June meeting as I sit down and try to think of something to fill the June newsletter. My monthly request for articles turned up only one possibility. And even if that had come through, it takes more than one article to fill the newsletter. So what to write about?

I have done a number of things this past month and even upgraded a software package, but, as you may have already noticed, much of what I do is not of interest to the general computer user. That is another reason we need articles from the group as a whole, since we have diverse computing interests.

One of the items I will write about is Microsoft Pivot Collections, which are a new way of visually organizing data. And since, unfortunately, a computer crash prevented the promised article from getting to me, I will also write about Microsoft Live Mesh, introduced to me by Merle Nicholson at a recent VB SIG ◆

Minutes of the May Meeting

By Jim Purcell, Secretary, Tampa PC Users Group
Edward_J_P@MSN.com

Bob LaFave started the Windows SIG at 6:30 pm. He began with a discussion of various things available to assist you in backing up the contents of your computer. He mentioned that many of the hard drive manufacturers include a program to allow you to easily perform a complete PC backup. These programs are normally an abbreviated version of popular programs like Acronis. Although they are not full-featured programs, they do the job. Bob discussed some of the full-featured programs available. He favors using more than one program and setting a schedule for making multiple backups with each version of software that you own. Bob also discussed the features that are available to you in Windows Vista and Windows 7 to backup and restore your computer. The SIG program ended at approximately 6:50 pm.

John Witmer, our president, started the business portion of the meeting at approximately 6:50 pm. He mentioned that Doug Mullis is always available to accept annual dues payments. John also mentioned the Microsoft meetings on June 29th (see page 7 of this newsletter). There is a change in our June meeting. Blain Barton had to postpone his Microsoft presentation until July, and Marty Burgess has agreed to demonstrate a computer-assisted drawing program during the June meeting. Steve Singer volunteered to give his annual presentation in October. John introduced Drew Smith, president of the Florida Genealogical Society of Tampa, who was scheduled to give a presentation on Genealogy.

Drew's presentation began at approximately 6:55 pm. He stated that his presentation was aimed at bringing us up-to-date on what's going on and where things are in the world of genealogy. He described many of the websites that are available, as well as various versions of software. He covered Ancestry.com and how it interacts with Family Tree Maker software. He talked about the many sources of genealogical data available to the individual and how they can be accessed. Drew recommended a book "How To Do Everything Gene-

Microsoft Live Mesh

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

The image you see above is a screen capture of my Live Mesh Desktop as viewed on my desktop computer. The image shows my three main computers in the Live Mesh network along with an Add Device icon and a Live Mesh Desktop icon. Live Mesh is in beta and is free from Microsoft at http://www.mesh.com. All you need to sign up is a Microsoft Passport account or a Windows Live account.

Merle Nicholson introduced this to me, and I was a bit hesitant at first because of security concerns. However, after some thought, I decided to give it a try since, first, to use Live Mesh, I had to enter my Microsoft Passport user name and password. Then, second, the only real sensitive data I might want to put in a Live Mesh folder would be in a database that I could both encrypt and password protect. And, finally, if I wanted to actually remotely log in and use one of my computers via Live Mesh Remote Desktop (which is quite powerful), I would have to enter my login password for that particular computer. Thus, I felt comfortable with the setup.

The first thing I did was to go to the Live Mesh site and click on the Sign In button using my Microsoft Passport user name and password (if you don't have such, you are given the opportunity to acquire a Windows Live ID). I then clicked on the Add Device icon and was prompted to download the required software and install Live Mesh on my computer. That done, I was ready choose any folders (or just files) on the current computer I wanted to sync with any other computers in my Live Mesh network.

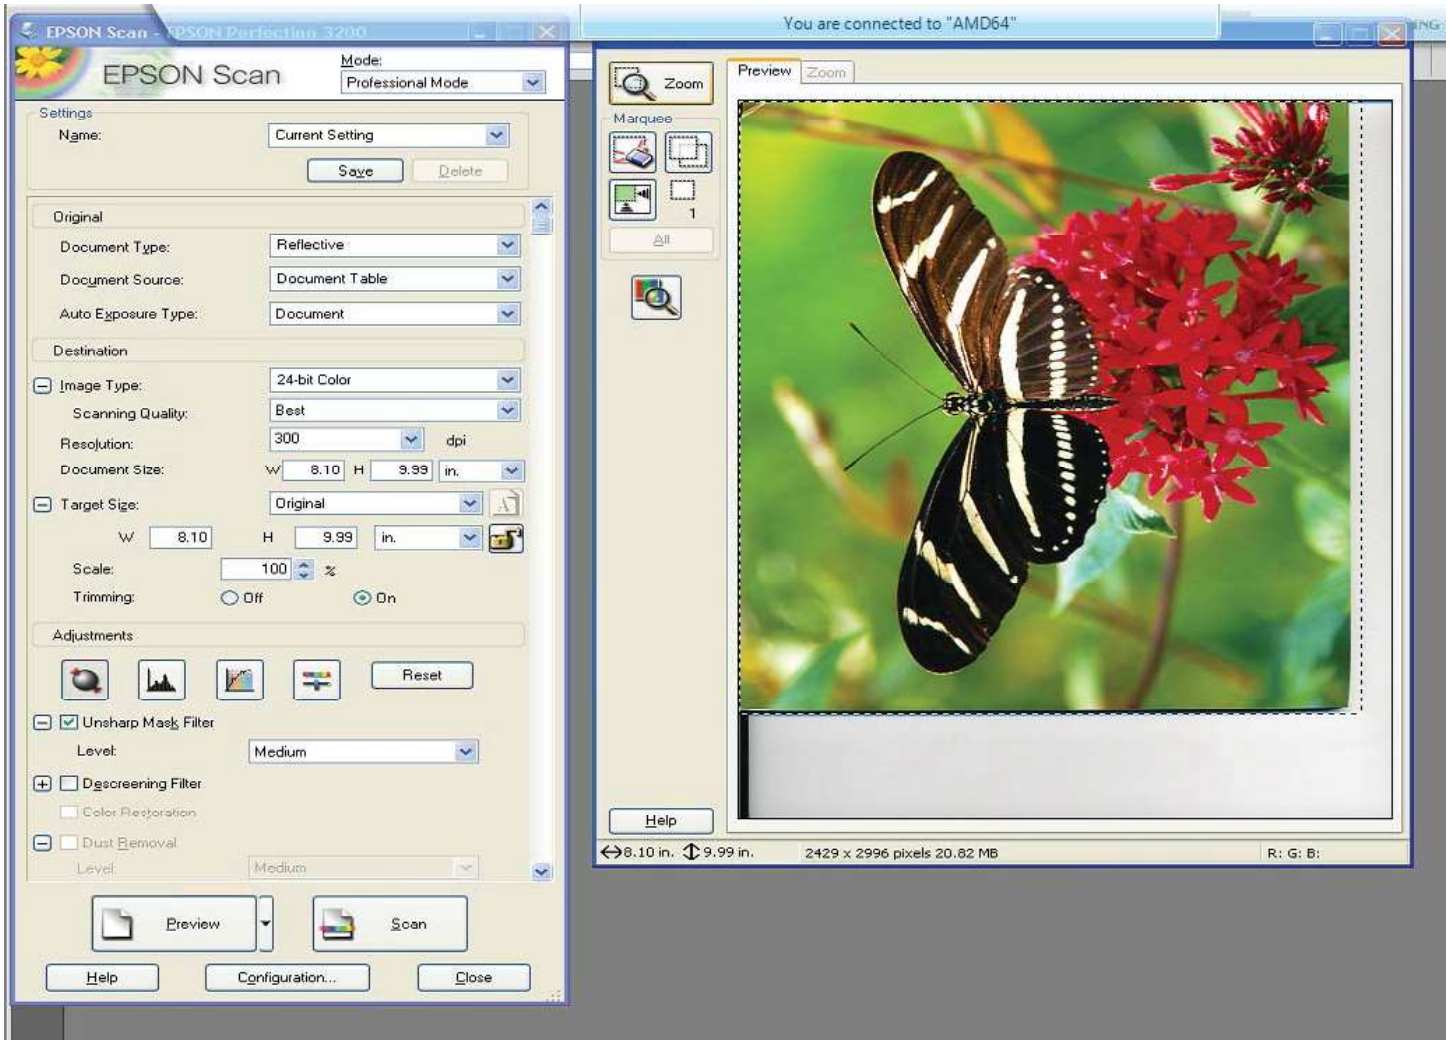
The way you add a folder or file to sync in Live Mesh is to right-click on it in Windows Explorer and, depending on whether it is a file or folder, select the Add File to Live Mesh option or the Add Folder to Live Mesh option. The file or folder will then change appearance and appear blue instead of yellow. If you now go to your Live Mesh Desktop, your just-added item will now appear there.

The next thing to do is go to each additional computer you wish to be in your Live Mesh network and proceed as above to install the Live Mesh software on that computer. And, as before, if you have any files or folders on one of these computers you want to share via Live Mesh, you can add them.

For any files or folders that have been added to the Live Mesh Desktop, on each of the computers you have these options for syncing:

- When files are added or modified
- When files are opened
- Only files smaller than 500 KB
- Only files modified in the past 30 days
- Never with this device

All of this works for computers in the same room, the same house, or anywhere in the world as long as they are connected to the Internet. With Live Mesh, you no longer need to email files between computers. To make a file on computer A available to computer B, you simply need to log in to your Live Mesh account and add the file on computer A to the Live Mesh desktop. Then on computer B, someone logged in using the same Live Mesh account will see it available to them momentarily (not instantly). They can then make changes to the file and save it, and in a few moments the modified file will be available to any of the other computers on the same Live Mesh account.



Live Mesh.....Continued on page 4

Live Mesh.....Continued from page 3

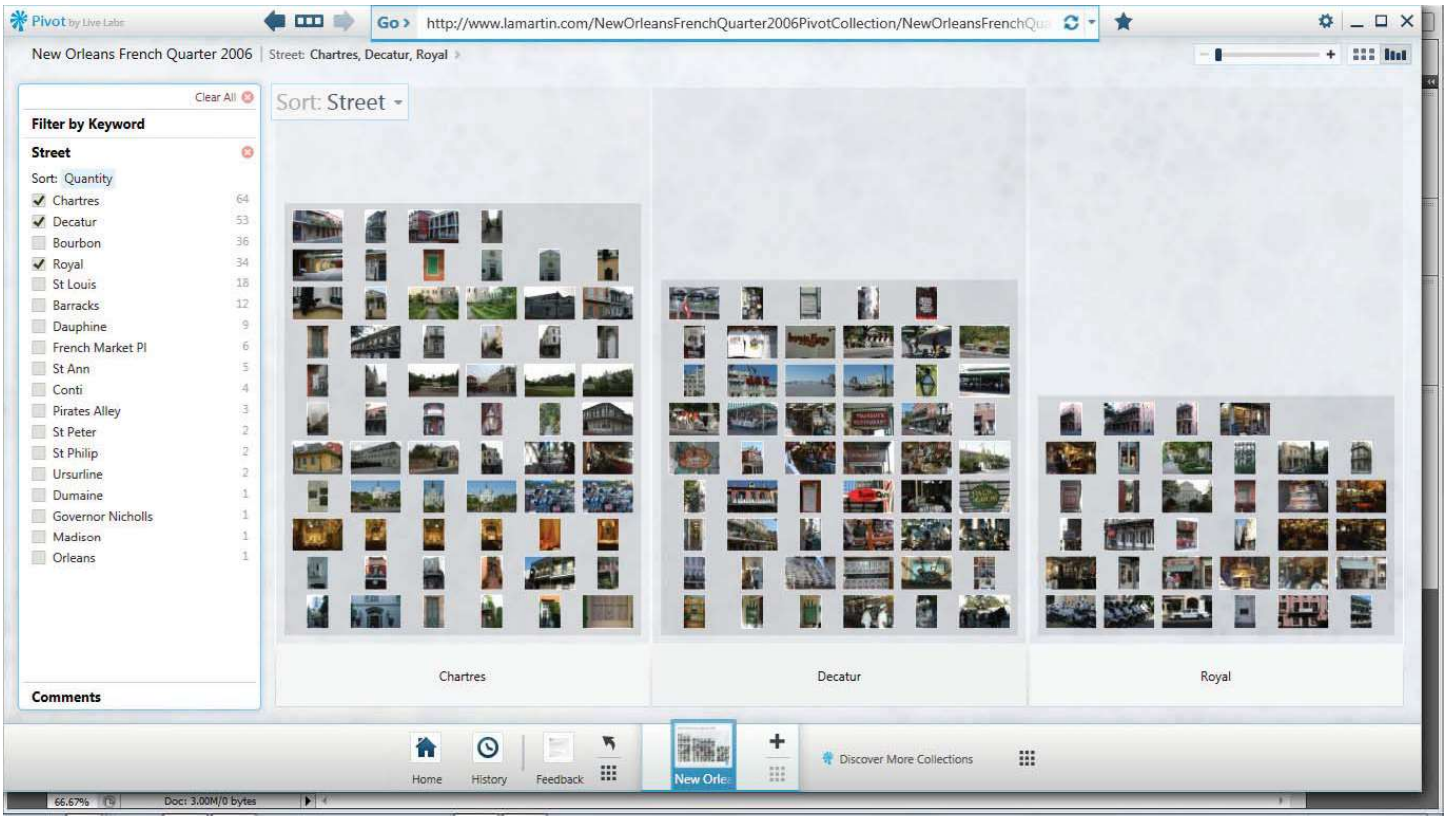
There is, of course, a slight problem with this scenario in that if someone on computer A and someone else on computer B decided to edit the document at the same time, there would be an obvious issue. At the top of the Live Mesh screen, one of the menu items is News, which will give you a list of what has been done in Live Mesh recently – for example, files added or files modified.

Now, we come to what I think is the most powerful feature of Live Mesh, the Remote Desktop feature. For at least as far back as Windows XP, possibly further back, Windows has had a Remote Desktop feature where, with permission, you can take over a remote computer over the Internet and work with it as if you were sitting at that computer. This Live Mesh feature is similar but much easier to set up.

To use the Remote Desktop on computer B from computer A, I double-click on computer B in the Live Mesh Desktop Devices view, as shown in the previous screen capture, and wait a moment while a message is displayed on computer B saying that access was being requested. If the acceptance is given or denial is not given within 30 seconds, the remote desktop connect is completed, and I see B's login screen on A, where (if B requires a password) I enter B's password. From then on, I have control of computer B just as if I were there. In fact, I have just connected my HP laptop to my desktop, where I have InDesign open and working on this article. This paragraph has been typed in its entirety on the laptop computer inside the InDesign program running on the desktop computer. But I can do one better than that. The screen capture below is of my HP laptop screen while remotely connected to the desktop computer, where I just scanned a photo on the Epson scanner connected to the desktop computer via Photoshop running on the desktop computer – all controlled from the HP laptop. Quite amazing. ◆

Internet Picture of the Month

AAPL vs MSFT



I am sure almost everyone is aware that Apple surpassed Microsoft in market capitalization last week. That is, the number of shares of Apple Computer outstanding times the value of each share was greater than the same number calculated for Microsoft. That does not take into account the profit of each company or the sales of each company--just how investors value each company.

The chart is from Big Charts, a service of MarketWatch at http://bigcharts.marketwatch.com/, and displays not the value of the shares but rather the percent increase of the value of a share of stock in each company over the past 10 years. If you bought a share of Apple 10 years ago and held it until now, it would have increased in value over 1,000%. If you had done the same for Microsoft, you would be down a few percentage points.

I am not sure what is to be learned from this. Apparently a lot of people are purchasing Apple things, but not I. In 2002, my wife and I purchased an iPod for our daughter; in 2004, we bought one for our son; and, in 2008, another iPod was purchased to replace the no-longer functioning first one. And that is it for Apple purchases in the past 10 years. As for Microsoft, there have been thousands of dollars in Windows, Office, Visual Studio and now Expression Studio purchases in that time.

A New Way of Viewing Data

By William LaMartin, Editor tampa PC Users Group
lamartin@tapabay.rr.com

The screen capture above is an example of what Microsoft calls a Pivot Collection, a new way of organizing data of any type so as to better see relationships among the data. I made this Pivot Collection out of 255 digital photos I took in the New Orleans French Quarter on a visit in 2006. The data includes each photo image, along with a description of the image, the street name where the image was taken and the latitude and longitude of the image (added by geo-tagging). I could have included the time, camera's f/stop, shutter speed, etc. but chose not to do that.

What you are seeing is the data for three of the streets in the French quarter – Chartres, Decatur and Royal – being displayed in a bar-graph format. If you click on an image, you can then zoom in to see the details of the image, while on the right-hand side of the screen will appear the description of the image and the street name. A double-click on the image will produce a Microsoft bing map of the location of the image in birds-eye aerial view (using the longitude and latitude).

You can sort the images in as many different ways as you have provided data. For example, I could display only images that had the word restaurant (17 such images) in the description. If I had included the camera f/stop, I could have displayed all images at, say, an f/stop of 5.6.

Pivot is a product of Microsoft Research and as yet is not intended for general use. To view a Pivot Collection, you have to use the special Pivot browser. However, later this summer Microsoft plans to release a Silverlight control that will allow the creation of Pivot Collections inside Visual Studio such that they can then be viewed with an ordinary web browser, such as Internet Explorer or Firefox.

If you would like to investigate Pivot, the link is http://www.getpivot.com. There you can read about Pivot and download the Pivot Browser to view the existing collections, which right now seem to lean toward sports databases. To see my New Orleans collection, download the Pivot browser and put http://www.lamartin.com/NewOrleansFrenchQuarter2006PivotCollection/NewOrleansFrenchQuarter2006.cxml into the URL text box (not in the regular browser). ◆

Special Interest Groups

Visual Basic .Net SIG (and sometimes Access SIG)

This SIG meets the third Wednesday of the month at 6:30 PM. For information, contact Editor William LaMartin at lamartin@tampabay.rr.com.

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Member Bob LaFave moderates the discussion.

Microsoft Launch 2010 in Tampa
Tuesday, June 29, 2010

5426 Bay Center Dr, Suite 700

Tampa Florida 33609

IT Pros | 8am - Noon — Microsoft TechNet

Launch 2010 Highlights

The Next Wave of Business Productivity

See what Microsoft Office 2010 and SharePoint 2010 mean for the productivity of you and your people—across PC, phone, and browser*. Find out firsthand how to plan for, implement, and deploy the new wave in business productivity at this free, half-day event. There's a lot that's new—here's what you can expect:

- Come and see first-hand how the new wave of products like Office 2010, SharePoint Server 2010, Exchange Server 2010, Visio 2010, and SQL Server 2008 R2 can optimize the way you work every day.
- Learn about tools and resources that'll help you plan by evaluating your current infrastructure
- Explore tools that'll help you optimize desktop deployment.

Developers | 1pm - 5pm — msdn

Launch 2010 Highlights

Life Runs on Code

Learn about the rich application platforms that Microsoft Visual Studio 2010 supports, including Windows® 7, the Web, SharePoint, Windows Azure™ and Windows® Phone 7 Series. From tighter development and test team integration to new ALM tools, there's a lot that's new. Here's what you can expect:

- See how to move your existing skills forward with Visual Studio 2010 both for in-house ASP.NET development and the new frontier of the Cloud.
- Build rich Windows applications with Silverlight 4 using trusted application features including out-of-browser execution and saving to the file system.
- Learn about the powerful capabilities of the Window Phone platform and the developer tools experience.

Meeting Preview: Blain Barton from Microsoft, speaking on Office 2010, will be our presenter this month. Member Bob LaFave will lead the usual Windows SIG meeting.

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

First I want to thank all of you who have been doing your purchasing from Amazon by starting with the Amazon link on our home page. Each month recently we have been receiving a deposit from them for the purchases made a couple of months previously. The latest check was for around $36.

Microsoft Events I saw one of our members at the Microsoft event location on June 29. Possibly more of you attended since the morning event had been over for at least 30 minutes when I arrived for the afternoon event. The morning session was geared toward Office 2010 and its deployment on the desktop and in the cloud. The afternoon event was aimed at programmers and developers using Visual Studio 2010.

The afternoon session was broken down into three parts: What's new in Visual Studio 2010, Web Development and the new Windows Phone7. It also turned out that there was going to be an additional meeting of developers/programmers in the area inter-

Minutes of the July Meeting

By Jim Purcell, Secretary, Tampa PC Users Group
Edward_J_P@MSN.com

Bob LaFave opened the meeting with the Windows SIG at 6:35 PM. Bob discussed failed mice and problems with dual-layer discs. He suggested that you first check the battery in your mouse, if your mouse has a battery. If that is not successful, then check the drivers for the mouse.

For your dual-layer DVD player, you should see if a firmware update is available. He advised members to check the description of the update to insure that it contains changes that are beneficial. He cautioned members to be sure to follow the update instructions precisely because a botched update can cause very serious problems.

A member asked how to best increase the speed of his computer. Bob recommended that he download the "Windows Live One Care Scanner" (http://onecare.live.com/site/en-us/default.htm) . Bob and the members discussed various ways to save money on software and computer accessories. There was also an extended discussion on how to solve problems that are encountered when upgrading your operating system. The Windows SIG closed and John Witmer opened the business portion of the meeting at 7:10 PM.

John discussed the problems encountered in publishing the June newsletter and emphasized the need for all members to contribute any information they have that might be of interest to the group. He suggested that members might begin preparing profiles of their life experiences to allow us to know more about each other. He pointed out that it is not only very difficult for a few members to carry the load but also that we believe that publication of more diverse subject matter would improve the quality of the newsletter and of its interest to our members.

John announced that Blain Barton from Microsoft will be the speaker for the July meeting and that our only solid prospect for the rest of the year is Steve Singer's yearly hardware presentation. Members suggested several topics. William LaMartin offered to give a presentation on a variety of subjects. John introduced Marty

Home Network Improvements

By Merle Nicholson, Tampa PC Users Group
merle@merlenicholson.com

Costs for network devices are dropping pretty dramatically. After some slow backups across my little network, I decided to look into improving its speed from the standard 100Mb/sec to "gigabit" – 1000Mb/sec, (or 1Gb/s), a factor of 10.

There were other reasons to revamp my system that you may relate to: I ran out of places to connect new devices for lack of ports.

I'd replaced two of my older USB printers with one new all-in-one, and it has a network connection, far more desirable than a USB port, but I needed to find an Ethernet port.

I discovered that, when upgraded to Windows 7, the notebook I'd recently bought with wireless-g (with the Vista driver) became wireless-n. WooHoo.

The modem/router installed by the ISP has four 100Mb/s ports and wireless-g. Not nearly enough for my needs.

Two of my four desktop computers (three for me, one for Valerie) have 1Gb/s ports built in and were connected to older 100Gb/s equipment. Valerie's was one of the 100Mb/s; I added a wireless game adapter some time back so it was connected wirelessly as Wireless-g. I really needed to improve that since I wanted to look at streaming movies from Netflix – since proven successful.

OK. We need to stop and present some definitions:

Wireless-g works generally up to 54Mb/s, some at 108Mb/s, depending on distance and interference from other things like walls and portable phones.
Wireless-n works generally variably at a raw data rate of 54-600Mb/s. depending on a lot of stuff mostly having to do with money.

Wired Ethernet is reliable, 10/100/1000Mb/s, depending on distance, quality of the cable and the relative positions of Mars and Saturn.

Router is a small ugly box that usually your ISP installs. It may be just downstream of a modem. Most times it has four Ethernet ports and a wireless antenna, typically wireless-g. Or it may combine a modem, router and wireless. Or maybe no wireless. The one necessary requirement to be a router is to have DHCP in the built-in program.

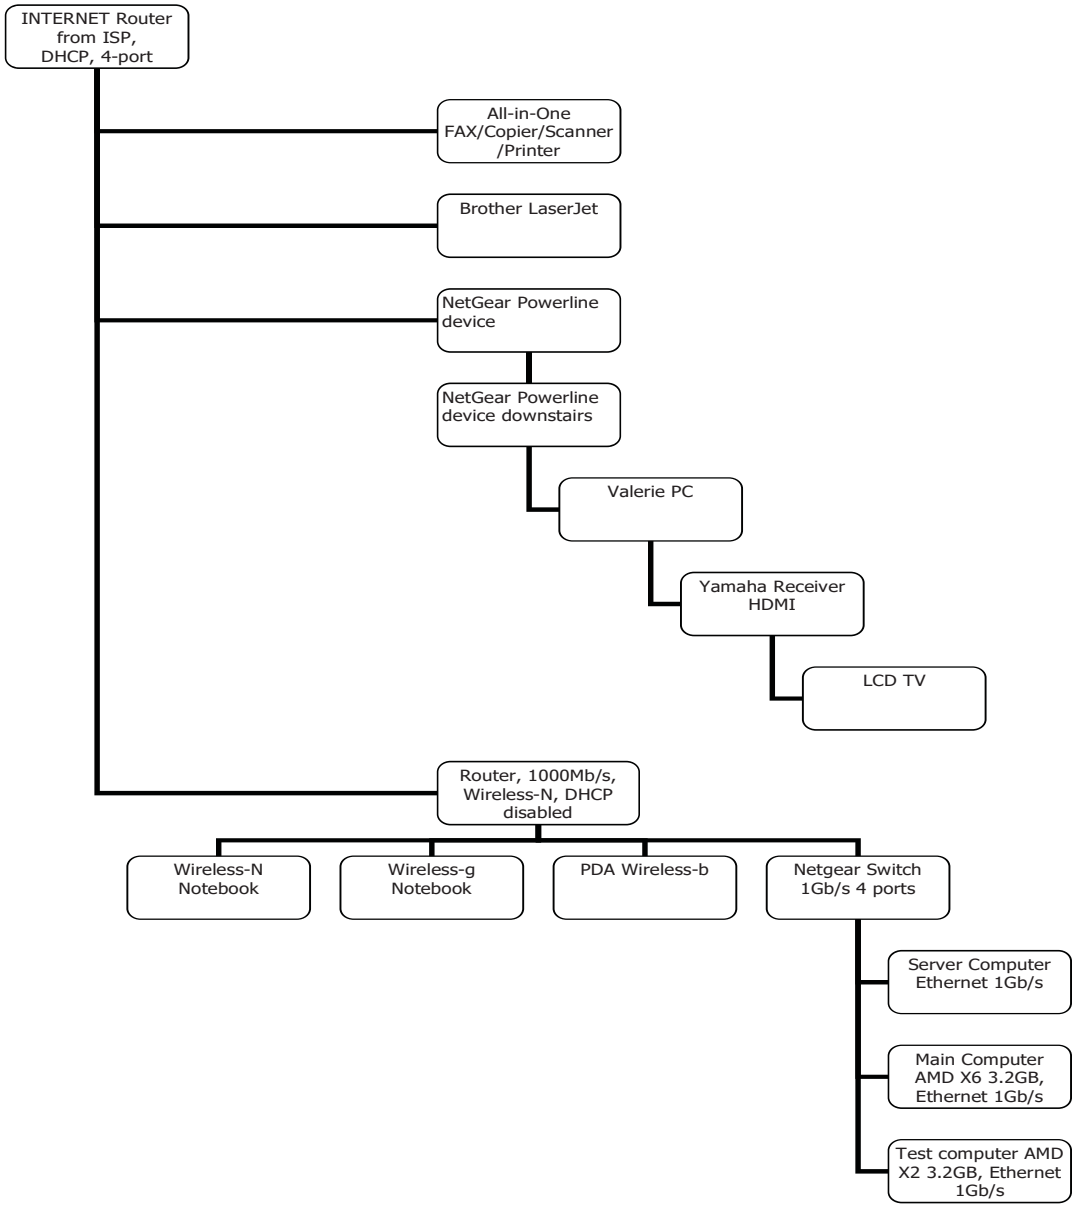
DHCP Dynamic Host Configuration Protocol. Yada-Yada for "IP address traffic assigner" for all the devices on your network needing an IP address. There can be only one of these on your network because they're poor at playing with others.

ISP Internet Service Provider – The large corporate entity seemingly based somewhere in Asia that bills about $300 a month, including TV but not mobile phone.

Ethernet Adapter card A card that you can install inside a computer to a PCI or PCIe socket. The adapters now come in 10/100 and 10/100/1000 speeds. Most computers have Ethernet built in, and this Ethernet can be just ignored or disabled in software. Computers handle more than one Ethernet port easily, but not simultaneously.

Switch This is kind of a small port multiplier with one Ethernet port In and four Out, maybe eight or sixteen Out. It's relatively inexpensive, probably has nothing to set and definitely does not have DHCP. It routes Ethernet signals and can multi-task – that is, handle multiple channels at the same time. If you were to add DHCP, it would be a router. Indeed, if you have a router and disable DHCP in software, you have a switch. If that's not confusing enough, it's similar to a Hhb.

Hub A single-route-at-a-time version of a switch. You don't want one unless you have low expectations and it's offered free of charge.



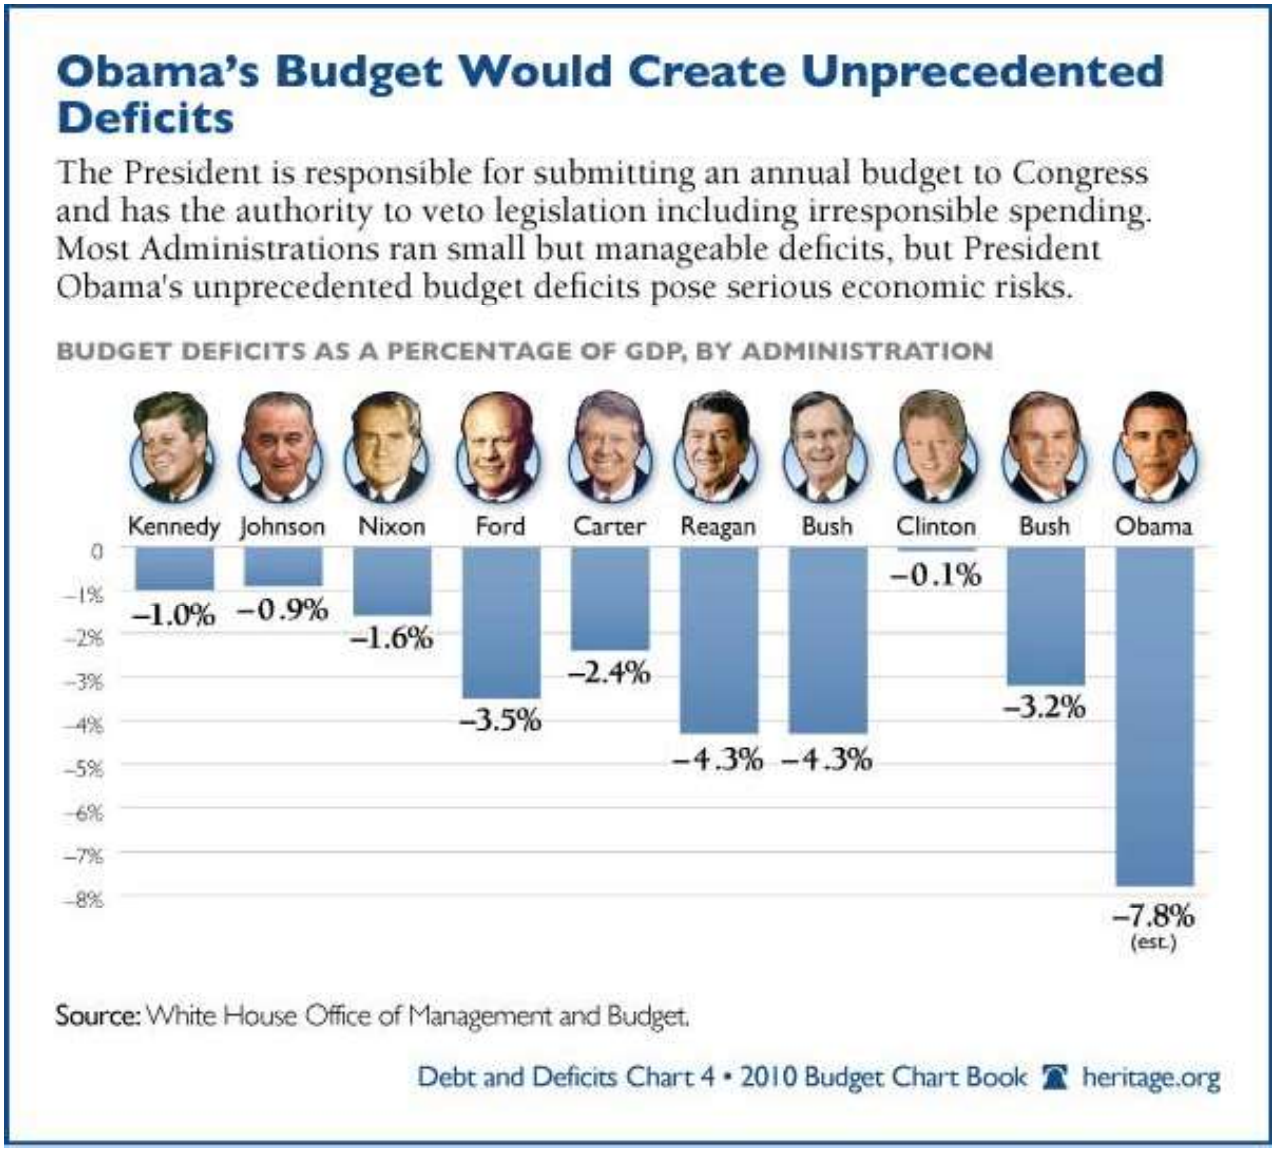
Improving my system a bit at a time.
First thing I had to do was get some more ports available and to improve my backup speed. I had two long

Network.....Continued on page 4

Network.....Continued from page 3

Ethernet cables running to my computer corner where I have my server and main desktop. I abandoned one of the cables and installed a 1Gb/s switch to the end of the other, then two short cables to the two computers. I used CAT5e or CAT6 cables for that. Then I installed a new Ethernet Adapter card in the server. So the rest of the system was slow, but the backups moving files from the desktop unit to the server were fast, and it was obvious it was fast. And it opened up a port on the router for the new printer.

Later, when I was contemplating Netflix streaming, I bought a new Rosewill brand wireless-n router. This was inexpensive, has four 1Gb/s Ethernet ports and wireless-n. I ran the configuration program for this device to set the wireless parameters, set a password, added an encryption code for the wireless, and last thing was to disable DHCP. You do this last because you will lose the configuration program at this point and the only way to go back is to do a hard reset, which blows everything and you have to start the configuration all over. This is because it will lose its IP address. That's OK though. Remember I said they don't play well with others. I placed it next to the ISP's router and cabled it to one of the router's 100Mb/s ports. Then I used the cable from my office corner to the little 1Gb/s switch to the new router, so everything that could use 1Gb/s would. Next steps were to reconfigure my notebook to use wireless-n. Yaaaa cheers. It doubled the speed from 54Mb/s to about 108Mb/s. It's very noticeably faster.



I then installed a pair of NetGear powerline devices to route Ethernet downstairs over the house wiring to Valerie's PC. I'd removed the wireless-g game adapter and cabled it directly to the Ethernet port on her computer. Now that's a 100Mb/s port, but the powerline won't do much better than that. It's more than enough for streaming movies though. I got a long HDMI cable from the PC to my receiver/amplifier which routes video to the big LCD TV. William LaMartin and I have both written about the powerline devices in previous articles. It's a very good way to get good (not great) Ethernet across your house without running wires.

It's complete now, and

ested in Microsoft Silverlight beginning at 6:30. This is something I am very much interested in, so I had to stay for that. The result was that I acquired some very helpful new ideas between 1:00 PM and 9:15 PM, which is a fairly long day. But iff I had attended the morning session, it would have started at 8:00 AM.

Speaking of Silverlight, I have recreated the Pivot Collection of New Orleans French Quarter photos that I wrote about in last month's newsletter ("A New Way of Viewing Data") as a Silverlight application which can now be viewed in any web browser. You may recall that last month you had to download the special Pivot Browser if you wanted to view the collection. Now to view the collection, just point your browser to the link http://www.lamartin.com/NewOrleansFrenchQuarter2006PivotCollection/. Another such collection, which Microsoft created as an example, is the NetFlix Instant View Movies collection at http://netflixpivot.cloudapp.net.

Live Mesh While on a recent trip to Boston and Maine, I had occasion to use Microsoft Live Mesh, which I also wrote about in the June newsletter. I left my desktop computer running and logged onto Live Mesh while away (something I have not done in the past) on the chance that I might want to access it via Live Mesh. And I did. I needed an email address I was recently given and had not yet added to the Outlook contacts on my travel laptop. So I simply logged onto Live Mesh on the laptop, connected to the desktop computer via a Live Mesh Remote Desktop and opened Outlook on the desktop computer and retrieved the new contact information.

Tethering is the term used for connecting a Windows Mobile phone via Bluetooth to your laptop computer and then using the phone as a modem to connect the laptop to the Internet. Not all service providers allow this feature to be enabled in the phone's operating system. However, my provider, Verizon, does, and I used this feature several days while on my recent trip. The hotel in Boston had a note on the room desk saying that a high-speed Internet connection was available and would cost $10/day. Next to the note was a LAN cable. So I concluded that there was no wireless connection available, and if I wanted to use the Internet, I had to use their cable – or I could tether my phone to the laptop and go that route, which I did.

At the Inn where we stayed in Maine, there was a free wireless connection that worked fine with one exception: It would not allow you to send email. You could browse the Internet and download all the email you wanted using your email client. You just couldn't send any email unless you used a web-based mail setup, such as webmail. Again, I connected my laptop to the Internet via my phone and sent email when any needed to be sent. Arriving back in Boston for a couple more days at the same hotel, it occurred to me that the hotel might have a free wireless connection even though it was not advertised. And they did. It was free, fast and allowed the sending of email. so I didn't need to tether.

I have had a data plan with my phone for many years, and I am one of the lucky ones with an unlimited bandwidth quota. I will probably buy a new phone when the Windows Phone7 comes out in late fall. What I hope is that I will not have to change plans to do it. For, if I have to change, I think the new plan will most likely not offer unlimited data use. Verizon will probably have something like the recently-introduced AT&T plan, with the first 200 MB free and you either pay more for a larger amount or get charged a certain amount for each extra MB. I checked my usage for the trip, and it came to around 125 MB, which was mostly racked up during three days. So, if one did much tethering, it wouldn't take long to go above a 200 MB limit.

Computer Assisted Design (CAD) Member Marty Burgess introduced us to CAD with a very interesting program at the last meeting, where he mentioned a free program called ProgeCad.

I had to do a bit of looking to find the free version of the CAD program he mentioned. It is called ProgeCAD 2009 Smart and can be found at the link http://www.progesoft.com/en/smart-2009.

There does not appear to be a free version of the

This SIG meets the third Wednesday of the month at 6:30 PM. For information, contact Editor William LaMartin at lamartin@tampabay.rr.com.

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Member Bob LaFave moderates the discussion.

Comments.....Continued from page 6

ProgeCAD 2010 program – only the paid-for professional version. The 2010 version says it is for Windows 7; the 2009 version doesn't mention that. And, in fact, if you download the free version and try to install it on a Win 7 computer, you will get an incompatibility error and the installation will not complete. To get around this, I just right-clicked on the installation exe and had it run in Win XP SP2 compatibility mode, and it installed fine – that is, right up to the end when I received errors about the PDF and JPF print drivers. The problem there is that you need to do them separately as administrator. It tells you where to go look for the appropriate executables. However, I didn't worry about that, since I can print to PDF without their driver.

After all that, the program worked fine in Windows 7 on my laptop. For Windows XP, as I have on my desktop computer, there was no problem at all with the installation, and the programs runs fine.

I found a very good tutorial/instruction PDF for the program at http://www.progesoft.com/skins/progeSOFT/upl/Inside-progeCAD-2009.pdf And I would be lost without it. Using it, I was able to produce a simple drawing of a bathroom floor plan. Unfortunately, my recent trip interrupted my learning of the program, and I have not been able to get back to it since returning. So I will probably have to start almost from scratch whenever I do find time.

My main frustration was in how using CAD differs from the drawing done in a program such as Adobe Illustrator, with which I am familiar. I think we have at least three CAD users in the group. So be warned that I may be asking you a few questions as I progress. ◆

Minutes.....Continued from page 2

Burgess, a member, who had volunteered to give the June presentation on Computer Aided Drafting software.

Marty began his presentation at 7:30 PM. He opened the presentation with a discussion of the advantages of utilizing CAD software, which he began using in 1989. He talked about the capabilities of the various software packages. In discussing the advantages of using a CAD program, he cited accuracy as number one. He stressed that you easily have precise accuracy, whether you need it or not. You simply request a length or width, and you get exactly what you requested. The ease of making revisions was his second most important advantage. The ability to change the error only and not the entire drawing saves countless hours. His third most important advantage was three dimensional modeling, which cannot be drawn manually. Marty talked about various software programs and their cost and capabilities. He showed many examples of how he uses CAD software at his job and described how, in addition to the other advantages of using CAD software, it makes it easier and more practical to share data with other contractors on a project.

Marty noted that one of our members, Wayne Lawrence, has been a Computer Aided Design instructor for 20 years. Marty stated that he only recently became aware of this fact, in spite of his interest in CAD software. He said that it made him think that publishing members' profiles might be helpful to the group.

Marty identified a free basic CAD program that he and Wayne think has all of the features that most people need. It can be downloaded using the link: http://www.progesoft.com/en/smart-2009

The meeting ended at 8:50 PM ◆

worked perfectly until the inexpensive Rosewill router failed after just a few months. I had to replace it and went a big step up in price for a Netgear router. I lost several hours because the new router needed reprogramming. I have to send the Rosewill back for warranty repair and I really didn't want to wait, so I bought the new Netgear.

The diagram on page 4 is what the network looks like now. ◆

Meeting Preview: William LaMartin will demonstrate the many things you can do with collections of digital images using software – much of it free. Member Bob LaFave will lead the usual Windows SIG meeting.

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

This month I was very happy to get three members' articles in addition to the minutes, so this is a diverse newsletter. Also, this month I get to do the presentation, and I think I have a topic you will find interesting. I will demonstrate the use of software, some of which is free, in the creating of very large images, panoramas and mosaics.

I have touched on these topics before but have done much more since then. The final results of some of this work may be viewed at my website, http://www.lamartin.com. Go there and click on the Large Maps/Images button. On the Large Images and Mulit-Level Maps page, my most recent work starts with the "180 Degree Panorama of Lake Okeechobee..."

I am most pleased with the Burgert Brothers Tampa Photos Pivot Collection and the New Orleans French Quarter Mosaic. Go to the site and browse around; then come to the meeting with your questions.

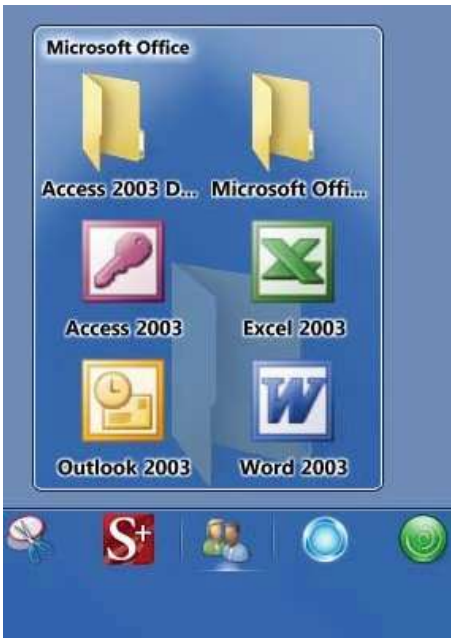
Minutes of the July Meeting

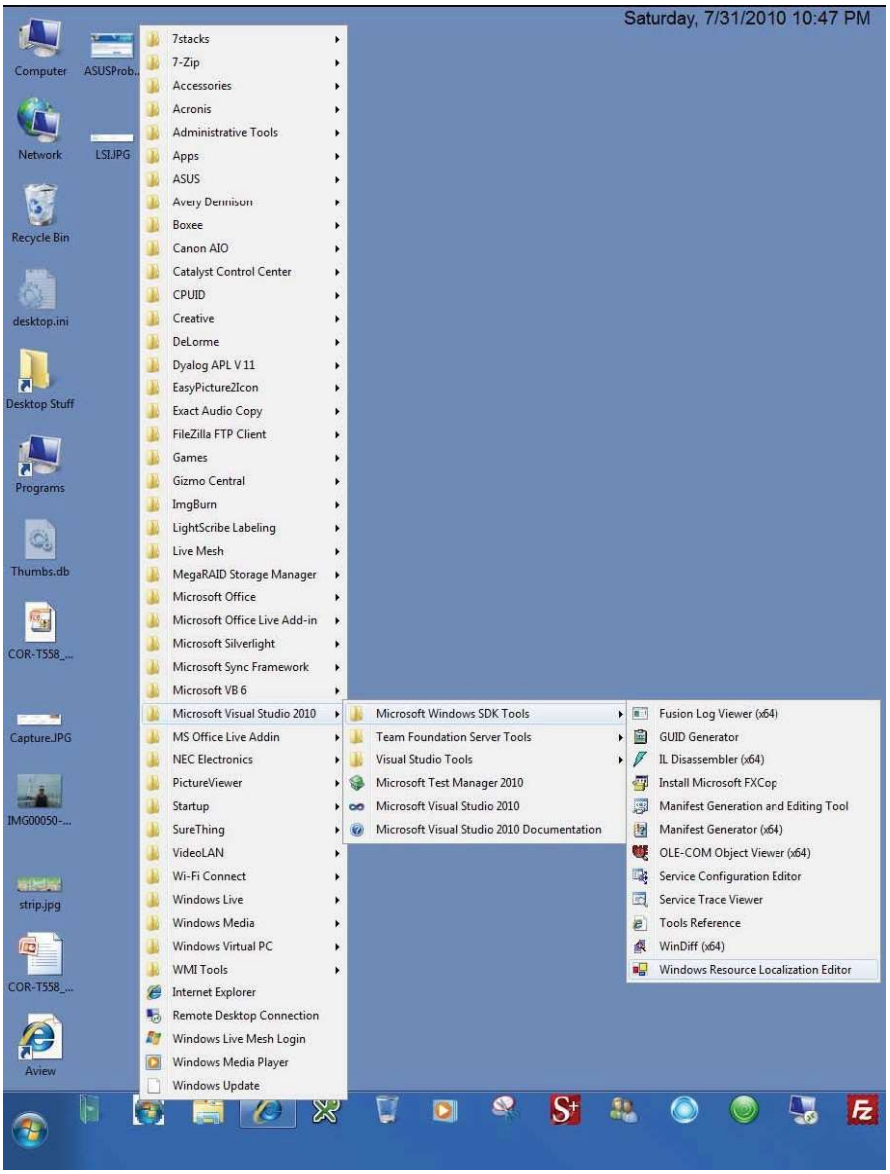
By Jim Purcell, Secretary, Tampa PC Users Group
Edward_J_P@MSN.com

Bob LaFave started the Windows SIG Meeting at 6:30 PM. He discussed a small company, Centralists, that was purchased by Microsoft. The company has produced a suite of utilities that are useful and easy to use. Bob has discussed some of these utilities at previous meetings. At this meeting, he discussed "Disk2vhd 1.61," a utility that creates VHD (Virtual Hard Disk, Microsoft's Virtual Machine disk format.) It can be downloaded at: http://technet.microsoft.com/en-us/sysinternals/ee656415.aspx He demonstrated how easily a Virtual Hard Drive can be created by the program. He covered uses of the program in connection with virtual PC programs that are available to you within Vista and Windows 7. Bob mentioned that there is a new free download from Acronis called Drive Monitor that has several useful functions. The SIG program ended at 7:00 PM.

Blain Barton of Microsoft began his presentation began at 7:05 PM. He mentioned that he had favorable results with the Microsoft antivirus program, "Microsoft Security Essentials," which is a free download. He discussed the things that you should consider when loading a new antivirus program. Blain suggested that you use the Microsoft Fix it Solution Center, http://support.microsoft.com/fixit#tab0, if you are having problems with one of their products. Blain discussed the differences, features, costs and functionality of Microsoft Office XP, 2003, 2007 and 2010. He explained how to best use the trial versions of Office to get the product that you really need. There was a discussion of the "Cloud" versions of Office and the components and capabilities of the programs that are currently included in the Cloud version. Blain explained some of the advantages of using the cloud programs and how you should weigh these against the power and versatility of the traditional Office programs. He installed Office 2010 and explained the choices that you encounter during the installation. He discussed "PC Decrapifier," a free program that removes unwanted preinstalled software from Windows XP and Vista machines. He recommended that you use the tools that he discussed



Minutes.....Continued on page 7



Alastra Software

By Merle Nicholson, Tampa PC Users Group
merle@merlenicholson.com

7stacks is just what I was looking for. It's a program that gives me Start Menus just like I want them for Windows 7 and Vista. I'm not running a copy of Vista any more, thanks very much, but it was in Vista that Microsoft decided to change the way the Start Menu "All Programs" items display. It used to be "horizontally cascading." Each level of menu depth appeared to the right, so you could never lose sight of the whole menu or how you got there.

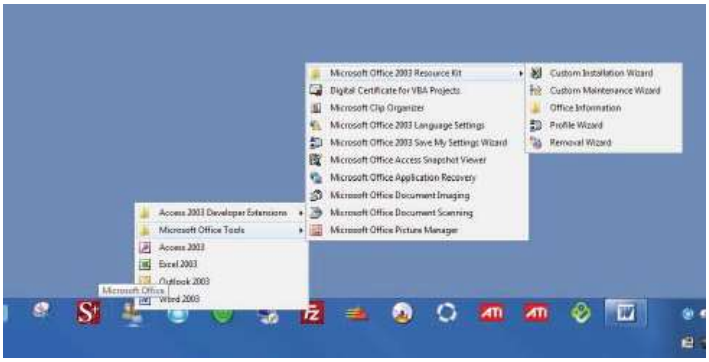
Now, Vista and Windows 7 expand the menu vertically. When it is expanded, it stays expanded, so to navigate to another part of the menu you have to close out the last expansion. (Or let go and start all over again). Then you have to be concerned with the menu growing vertically beyond its capability to show the whole menu. As each level gets a little wider, often important items are pushed off the menu. What were they thinking?

I've been looking for more than a year for the right kind of modification from someone who will agree with me that Win 7 "Start Menu," "All Programs" just sucks. Finally it's happened in the form of 7stacks, and I couldn't be more pleased with the outcome.

Now this program is far from perfect. It's actually flawed pretty badly. But, for the specific purpose of providing horizontally cascading menus, it works perfectly as long as you do it right. The Alastra website does make one mention of cascading menus and shows two screenshots. But I think their real emphasis on its use is "The Stack" (left) and "The Grid" (above), each with titles or not.

At http://www.alastria.com/index.php?p=software-7s, the website points out that it's filling a need to have a menu like the Mac provides called the Stack. While I'm not really disagreeing on the need for Mac-like stacks, their implementation of this is well … ugly. The text can be white (on a border of black) or

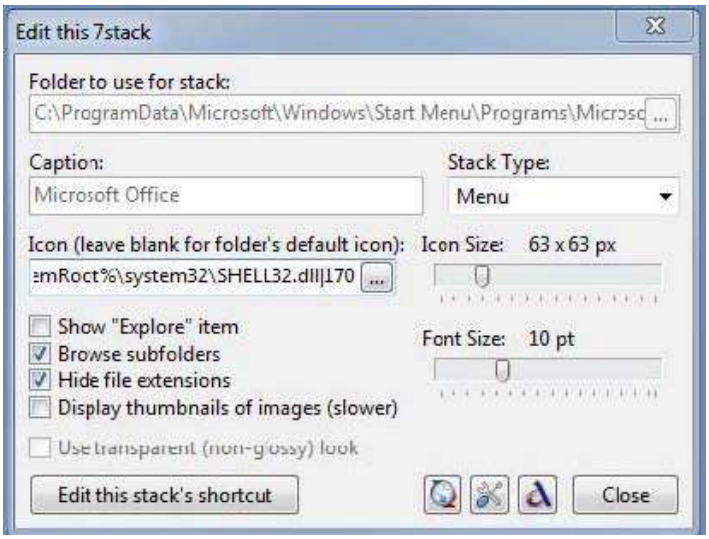
Alastra.....Continued on page 4



Alastra.....Continued from page 3

black (on a border of white). There are no other choices. The text is hard to read. And, most importantly, if there is more than one level, they don't cascade. Also, they don't adjust to accommodate the length of the icon's name. I almost uninstalled it within 10 minutes of installing. I'll concede there may be a use for this, but not for me.

I now have three different menus that have the content and behavior I'm looking for. Each of them is an icon on the taskbar. The first two are the first two items (icons) on the taskbar containing programs, and the third is the collection of Office programs (on previous page).



The second icon on the taskbar points to the system "Start Menu" directory. This is so that, as I install new programs or uninstall, this cascading menu needs no maintenance. It directly mimics the system Start Menu, except, as you can see, it is horizontally cascading. There's a technical tip at the end of the article if you decide to try it out.

The next menu (below) is my Office applications. Here, I've set its shortcut to a folder inside the system "Start Menu" to "Microsoft Office," and it gives me Office in a three-tier cascading menu. Notice it arranges a total of 21 items.

The third stack I created is the first icon on my taskbar. I created this one from scratch by creating a folder in My Documents and dropping a shortcut to all the programs I use the most. I tried to minimize the subfolders, but to get everything I needed I had to put ten folders. The folders, of course, just create a cascading menu. This menu is a little harder to maintain because I have to remember to add and delete shortcuts in the folders as I install/uninstall programs. But for finding a program quickly, I haven't found a better way.

Shown in the last picture is the 7stack editor. It's pretty simple. Notice that there is a button, "Edit this stack's shortcut." You MUST use this button to save your work, or you can't recover any previous work. Then you have to start all over again.

One thing that does not show up on the editor is a button next to the text bar, "Folder to use for stack." There is a button that normally shows up labeled "SF" for "Special Folder." A Special Folder can be a folder that has its contents in more than one location. The "Start Menu" is one of those. There is the Start Menu folder stored under the User Name directory, but there is also one under the All Users directory. What you see in the actual Start Menu is a combination of all of them, with any duplications eliminated. Before I discovered what that button was for, I'd already unnecessarily moved all the shortcuts in my User Name folder to the All Users folder.

One disadvantage to using this as a substitute for the standard menu is that you lose the Recent Documents that is provided you in native Win 7. For myself I rarely use them, but, when I do, it's because I've failed to find the file, making the Recent Documents (to me) very important a very few times.

All-in-all, despite the flaws, I really like this little program. And the price is right – free or a donation. ◆

What is Google Voice?

By Roger Waters, Tampa PC Users Group
rvwaters@hotmail.com

I was curious about Google Voice, so I signed up for it when it became available. Google Voice allows you to choose an available number that can be tied to any phone. Calls to the Google number can be used to ring one or more phones. This allows you control over your phone calls. It offers a host of features at no charge.

Let's start at the beginning. Google Voice was originally called GrandCentral and was established in 2005. Google bought GrandCentral for $95 million on July 2, 2007. Google launched Google Voice on March 11, 2009. Google then acquired Gizmo for $30 million on November 12, 2009. Google Voice was only available by invitation when it was first launched. It then moved to being available to anyone with a Gmail account.

Google Voice allows you to pick a number in your, or a different, area code. Depending on available numbers, you can choose vanity numbers (ones that spell names). If you own a business and wanted a number within another area code, you could look like you were in another city. I chose a number within 813-421 and matched the last four of my home number. This made it easy for me to remember.

Google allows you to set up different greetings for voice mail based on who is calling you. You can set up one voice mail for business and another for friends and family. You can review your messages with your phone, or they are translated as an e-mail and sent to your Gmail account. It will try to convert the message to text for reading or allow you to play the message from Gmail. You can send voice mails to others via Gmail.

Google Voice allows you to designate how a call is handled at different times of the day or on different days of the week.

Google Voice allows you to block calls or do call screening. You can request callers to say their name, and the call will come to you as a call from the name given. You can elect to answer the call, or let the call go to voice mail. You can also elect to have it go to voice mail and listen to the message being left. If you want to take the call, you can barge in on voice mail and take the call.

Google Voice allows for conference calling by having people call you and then you add them one at a time to a conference.

Google Voice allows you to make free calls to anyone in the US and Canada. You dial your Google Voice number from your phone and then dial 2 to input the number you want to call. International calling is available with charges from $.02 to $.06 per minute.
I personally do not text, but Google Voice allows you to text message anyone. You can receive Short Message Service (SMS) text messages on your Google number when it is sent to your cell phone.

Google Voice can be a useful tool to screen calls but may come at a price for privacy. I know William LaMartin is concerned about Google and the data they collect. Using this service would allow them to know whom you call and who is calling you.

As a postscript, I believe that Verizon FIOS will offer what they are calling Digital Voice, which will offer some of the same features as Google Voice. I think others might also offer some of these features in the future. ◆

Comments.....Continued from page 1

And don't forget to do your Amazon.com ordering from the link on the TPCUG web site. We receive our payment two months after the month in question. We did quite will for April but received only a few dollars for May purchases. ◆

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Member Bob LaFave moderates the discussion.

Sound Forge Audio Studio

By Robert Davis, Tampa PC Users Group
RobDavis7@verizon.net

Last month I decided to buy a program that would record music that I create. As a third career, I am performing Early Country Western music at various places and writing songs as well. I used to use a hand-held digital recorder to record tunes I would come up with, as well as songs I wanted to learn to play. This worked fine until I got a lot of stuff on the recorder. I had a hard time finding those tunes and songs mixed in with everything else. Even when I put them in separate folders (the recorder has four different folders), it was hard finding a particular tune or song. Additionally, if I wanted to repeat just a certain part of a song for some reason, I would have to go back to the beginning and start over.

Both my desktop PCs are still running XP, and the recorder program that comes with XP only records for a max of one minute. My laptop with VISTA came with something that will record OK, but I wanted to record stuff on the desktop. And so the adventure began. At first I bought something called Pro Tools from Best Buy's music center. It came with a little box to plug in a mike and/or a guitar to record via USB port. It costs about $100. This seemed to be a good solution since I already have a good microphone. However, the program was not user friendly at all in my opinion. It had no level indicators that I could find to monitor the sound level, and I was unable to change the way it saved stuff to a file. It always would create a new subdirectory for each file. After two frustrating days with this, I returned it and got my money back.

Next I went to CompUSA and bought a program called Sound Forge Audio Studio. It was just over $50, so for another $20 I bought a USB mike, too. The total investment was about $30 less than the supposedly better program. After getting through the LONG activation code, the stuff performed just fine. I was able to record, see the sound levels and save the tunes or songs where I wanted without a problem. There are also several file types you can use when saving, and I chose .wav for my files. The good part is that when I play back the tunes with MS Media Player, I can slide back to any point and replay just what I want. Additionally, all the songs and tunes now have individual names, so it is easy to find what I look for. The Audio Studio is a relatively simple program in that it only has two tracks as far as I can determine, so you couldn't have multiple tracks like a real studio would. It does have many complex features for editing and mixing stuff; however, for just getting the basic songs recorded and keeping track of them, it is very easy to understand and operate. ◆

Minutes.....Continued from page 2

to determine if the increased capabilities provided in the Office upgrade that you are considering will be worth the price of the upgrade to you. Blain's presentation ended at 8:25 PM.

John Witmer, our president, began the business portion of the meeting at 8:30 PM. He thanked Blain Barton for supporting our group by providing us relevant and timely presentations on new Microsoft products. Discussion of future programs for August and beyond was had with the members. It was agreed with William LaMartin that he would be our presenter for the month of August, with

Meeting Preview: Learn how to manage all of your social media applications from Charles John. Member Bob LaFave will lead the usual Windows SIG before the meeting.

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

I am looking forward to Jim Purcell's Part Two of his Sony camera article. I am real curious how well some of the mentioned technologies worked for him, in particular the Blink and Smile features; also, the panoramas which, as you saw from my presentation last month, are an interest of mine. Thanks to Jim, Ron Weinberg and John Witmer for helping me fill the newsletter this month.

I recently attended a full-day presentation on programming for the Microsoft Windows Phone 7 that is to be released sometime before the holidays. It will be a total departure from their previous Windows Mobile devices that I use and for which I have written programs. Those phones were aimed at the enterprise and geek segments of the market. This new phone is aimed squarely at the same consumer segment as the iPhone. Microsoft has learned that there is more money to be made from people who want to use their phone for social media type interactions than from people like me who want their phones to be mini computers that can handle databases, run Windows Remote Desktop and function as a modem for their laptops when traveling. ◆

Association of Personal Computer User Groups

Minutes of the August Meeting

By John Witmer, President, Tampa PC Users Group
jhwitmer@verizon.net

The meeting opened at 6:30 PM with Bob LaFave conducting the Windows SIG portion of the meeting. Bob opened by asking if there were any questions, and one audience member brought up issues he was having creating a wireless connection from his laptop to the router at home. Various suggestions were offered by Bob and others in the group to resolve the issue. Another member was having power problems with his computer. After back and forth discussion of this issue, it was felt that the power issue probably originated with a problem on the motherboard. This concluded the Windows SIG portion of the meeting, and John Witmer then opened the regular meeting at 6:50 PM with a few comments.

John introduced our newest member of the group, Margo Maseman, to the members. Margo joined TPCUG after visiting with us last month. Also in attendance tonight was former long-time member Brian Lance, who continues to work at Computer Corner on Fowler Ave. Next, John outlined the remaining programs for the year. Charles John, an occasional visitor to our meetings, will give us a presentation on software for management of social media at our September meeting. Steve Singer will provide us the October program with his customary update on hardware and gadgets, along with his insight into current hardware trends. For the November meeting, we have contacted a representative of the Hillsborough County Public Library who will present a program on Internet resources available through the library; and our December meeting will be our usual Holiday Party gathering. John then mentioned that Blain Barton had given the group a book on Configuring Windows 7 and that, instead of trying to raffle it off as our only prize, we would auction the book off to members via an email auction. John will email current members with details of the book, and anyone interested in making an offer will need to respond by email to John. After the first go around, a second email will go out to the bidders from the first round with information on the highest bid and giving one more opportunity to raise the bid

Sony Cyber-shot DSC-HX5V Part One

By Jim Purcell, Secretary, Tampa PC Users Group
Edward_J_P@MSN.com

In Part One, I'll discuss why I bought a new ultra-compact point-and-shoot camera and chat about the replacement that I selected. In Part Two, I'll report on how well the many features of the new camera work.

In addition to a Canon 40D Single Lens Reflex camera, I own a Canon SD800 IS ultra-compact point-and-shoot camera. I used the small point-and-shoot camera when it was not convenient to use or carry around the 40D. Although the SD800 IS had its limitations, it was ideal for indoor snapshots. The telephoto lens was only 3x, but it was a wide-angle lens, equivalent to 28 - 105 mm, and the 7.1 megapixel CCD was adequate resolution for my purposes.

I started looking for a replacement because the newer cameras can take quality low-light pictures with no flash and I felt that I needed a camera that would give me a better capability of taking outdoor pictures at greater distances than the SD800 could cover. I like to have a camera with me in the car whenever possible, and, since that would normally be the small carry-around, I felt that it needed to be more capable of both close-up and distance shots. I was also hoping to find a camera with GPS capability.

After a long search and a lot of reading, I bought the Sony DSC-HX5V Digital Camera. The features that most influenced my decision were: (1.) The 10.2 megapixel Exmor R CMOS image sensor, which is reported to have exceptional low-light sensitivity with improved image clarity and drastically reduced grain. (2.) A 10x (equivalent to a 25-250mm 35mm film camera lens) professional-quality optical zoom G-Lens (which is used in Sony's top-of-the-line SLR cameras). (3.) It had an integrated GPS receiver and compass to record the location and direction of every shot you take, and it lets you view your images on a map. These features convinced me to ignore two of my long-standing criteria. I have previously stated that I would not buy a camera without a viewfinder. The Sony list of features stated that this bright LCD with special anti-reflective coating would provide sharp visibility, even in bright sunlight. It evidently was not tested at the top of Pikes Peak at noon on a summer day since three of my shots of the beautiful scenery there included shots of my fingers. I also have tried to stay with Canon products, which sharply reduces the

learning curve.
The camera is loaded with additional features, most of which I will discuss below. Some of these helped sway me, and some are almost too "whiz bang" to be believable. In the coming weeks, I'll be testing them and will report the results in Part Two.

Intelligent Auto Focus: Allows you to instantly take snapshots by focusing in as little as 0.3 seconds. The camera can also capture 10 frames per second,

Camera.....Continued on page 4

Camera.....Continued from page 3

Optical SteadyShot Image Stabilization: The camera uses a built-in gyro sensor to detect camera shake and automatically shifts the lens to help prevent blur without sacrificing image quality.

Anti-Motion Blur Mode: Captures cleaner and sharper images in low light for non-landscape shots. When set in Anti-Motion Blur mode, the camera captures six images in a fraction of a second with a higher shutter speed. It then combines the data from all six to create a single image of extraordinary detail and clarity.

Handheld Twilight: You can capture cleaner and sharper night shots without using a tripod. When set to Handheld Twilight Mode, the DSC-HX5V captures six images in a fraction of a second with one press of the shutter and processes them in the same manner in which they are processed in the Anti-Motion Blur Mode.

High Sensitivity Mode (ISO 3200): High ISO allows for faster shutter speed, so you can take photos indoors or in low light without the need for a flash. In addition to High Sensitivity Mode (ISO), you can select up to seven ISO settings (Auto, 125, 200, 400, 800, 1600, 3200) when shooting in Program Auto Mode to adjust sensitivity to your shooting conditions.

Backlight Correction HDR: Shooting high-contrast scenes can often lead to washed-out backgrounds and/or details lost in shadow. Backlight Correction HDR helps correct for this by taking two pictures at different exposure settings and processing the best elements of both into a single image for more natural looking shots.

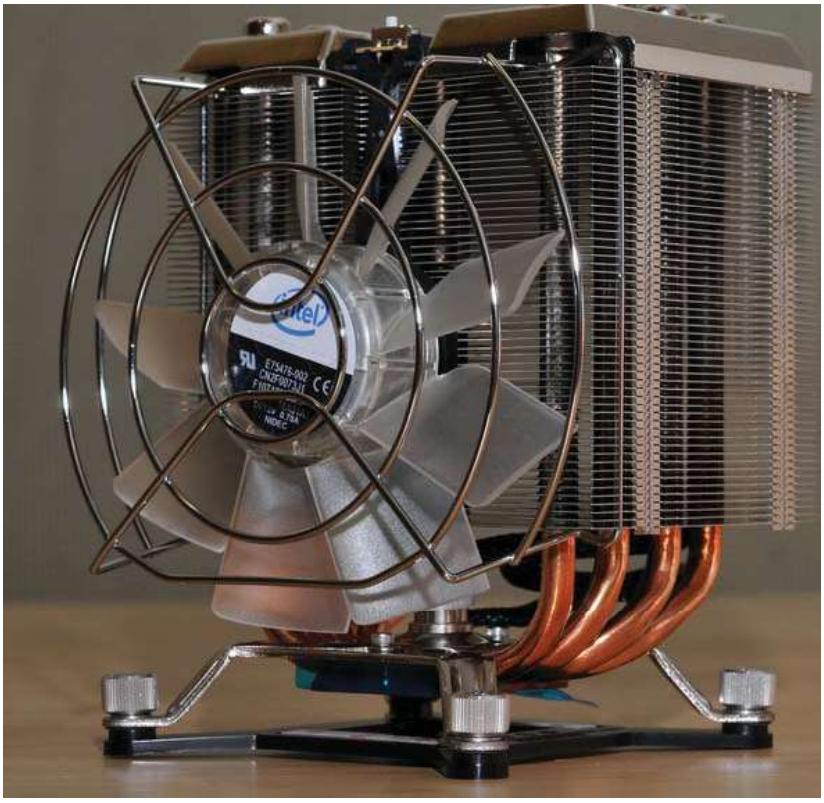
Easy Shooting Mode: With Easy Shooting Mode, beginners can take great photos and experienced photographers, not familiar with Sony controls can take pictures while they are learning the system. In Easy Shooting Mode, easy-to-understand basic instructions are displayed on the LCD screen and the camera switches to all automatic settings, removing several function choices and allowing you to focus on just your subject. Since this mode works together with Intelligent Scene Recognition (Scene Modes), the camera selects the optimum setting for each scene.

Intelligent (iAuto) Auto Mode: This is a step up from the "Easy Shooting Mode." Unlike traditional auto mode, Intelligent Auto (iAuto) mode thinks for you by recognizing scenes, lighting conditions and faces, and it adjusts the settings to produce clear images and faces with natural skin tone and less blur. It allows you to take advantage of all the technology without leaving Auto mode.

Intelligent Sweep Panorama Mode: You can capture expansive landscapes with Intelligent Sweep Panorama Mode. Press the shutter and sweep, and the camera does the rest, continuously shooting images and stitching them together almost immediately, creating a single image over 7,000 pixels wide. This model even detects faces and moving subjects and stitches different widths intelligently to help avoid subject distortion.

Smile Shutter Technology: Smile Shutter technology captures a smile the moment it happens. Simply press the Smile Shutter button, and the camera does the rest.

Anti-Blink Function: When the camera is set to Soft Snap, the Anti-Blink function captures two images, recording only the photo with less squinting or blinking. If a blink is detected in other shooting modes, a warning will be displayed after you take the shot.



Video Capability: The camera can shoot 1080i AVCHD HD movies. You can shoot a movie continuously for approximately 29 minutes. Both stills and videos are composed and viewed on the 3" Xtra Fine LCD display. HDMI (High-Definition Multimedia Interface) connectivity is also available, as is the MP4 format.

In-Camera Retouching Tools: You can retouch and enhance your photos on the go with in-camera trimming and Red-Eye Correction functions.

Sony PMBP (Picture Motion Browser) Software: A portable version of the Sony Browser program is installed in the camera which makes it easy to pre-se-

Internet Picture of the Month

Intel's Fastest Processor with Cooling Fan

The Intel Core i7-980X 6-Core CPU is Intel's fastest. And it can be yours for $999 with the additional expense of a more expensive motherboard yet to be added in. That is more than most people nowadays pay for their entire computer system, including monitor and printer.

http://forumas.modding.lt/viewtopic.php?f=11&p=67248 is the link for the images. However, I cannot read the language. So, for a very detailed review of the new processor go to the link http://benchmarkreviews.com/index.php?option=com_content&task=view&id=475&Itemid=63.

amount. The highest bidder and bid amount will be awarded the book and the rest of the bidders will be provided information on the winning amount. This method seems reasonable in that someone truly interested in having the item will be able to obtain it if their bid wins.

A final comment was made by William LaMartin that he is planning to discontinue creating the HTML-formatted version of the newsletter available for viewing on the group's website and will produce only the Adobe Acrobat version of the newsletter The existing HTML newsletters would remain on the website as they currently exist, and future newsletters would be available only in Adobe Acrobat format. John then introduced William LaMartin as presenter of the evening's program on "Panoramas, Mosaics, and More," using digital images and software that is mostly free as downloads.

William's presentation began at 7:00 PM with the showing of a picture he had printed on paper. He asked the audience if anyone recognized it (no one did), and he went on to say it was composed of over 4,000 pictures put into a mosaic that was created as a picture of the St. Louis Cathedral at Jackson Square, New Orleans. With this revelation, William began the mosaic portion of his presentation. He said the creation of a mosaic required a software program, and he utilized the free program AndreaMosaic that can be downloaded from the following website: www.andreaplanet.com/andreamosaic . This is a very interesting website worth your time to visit and to see what this individual has to offer and say about things. In a demonstration of how to create a Mosaic, William used this free program and selected 372 photos on his computer, specifying that each could be used up to 20 times, and gave a limitation on the maximum size of the mosaic to be created. He selected an existing picture image that served as the base image for the mosaic. From there, the program acquired and used the 372 photos to arrange them as minuscule images that formed a mosaic picture of his selected image. This program is very powerful, yet seems easy enough for us to use.

The program then moved on to Panoramas. William spoke of a Microsoft program that is very useful in creating a panorama, and it is a free download for all to use. Microsoft ICE (Image Composite Editor) is an advanced panoramic image stitcher. You can find out more about it and download it from the following link: http://research.microsoft.com/en-us/um/redmond/groups/ivm/ICE/ . William demonstrated the abilities of the program using pictures he had taken in downtown Arcadia. He had previously used his camera to take numerous shots around a 360-degree circle of where he was standing in Arcadia. Then, using the ICE program during the meeting, William was able to have them stitched together to create the panorama. He also commented to the audience that if you are taking camera shots to be used in a panorama, it is best to lock the aperture setting, to get a consistent depth of field in all the pictures, and let the shutter speed and auto focus adjust as needed. He also noted that for larger sized panoramas, it is better to have it as a TIFF format image due to the limitation in size found with JEPG formats. In conjunction with a panoramic picture of Davis Islands that William had taken from Bayshore Blvd., he showed us the capabilities of using Deep Zoom Composer to view detail of the homes on Davis Island that were too small to see in the panorama. For more information on Deep Zoom Composer, check out the following Microsoft website: http://msdn.microsoft.com/en-us/library/cc645050(VS.95).aspx . Additionally, you can see most of the pictures, panoramas, etc., used in Willam's presentation by visiting his website at http://www.lamartin.com . There is a wealth of great stuff to see on his site that William has created and arranged into various categories.

The More portion of Willam's presentation involved two items not yet addressed. The first is Pivot Collections, for which there are several examples on his website. Pivot Collections allows you to view images grouped by a similar characteristic, such as the year in which they were taken. For the Burgert Brothers collection of old photos of Tampa on William's website, they can be viewed by year. For the New Orleans collection, they can be viewed by the street they were taken on. The last thing that William demonstrated was the use of Microsoft Pro Photo Tools, which is a free program that allows you to gather information about your pictures if your camera records this info as

Visual Basic .Net SIG (and sometimes Access SIG)

This SIG meets the third Wednesday of the month at 6:30 PM. For information, contact Editor William LaMartin at lamartin@tampabay.rr.com.

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Member Bob LaFave moderates the discussion.

Laptop Keyboard Issues

By Ron Weinberg, Member At Large, Tampa PC Users Group
rswjbr@verizon.net

The design of laptops precludes the use of the full-size standard keyboards used on larger desktop systems. Of course, quality and design varies among brands and models, but it is not uncommon for some laptop users to have difficulties with their keyboards: Jumping cursors, missing key strokes, keys which may be either too sensitive or which have to be stroked too hard, etc. Users usually adapt and accept these shortcomings.

If the problem is a jumping cursor it may be that the typist is unknowingly rubbing or grazing the touchpad. Touchfreeze is a free program which can be downloaded from http://www.pcworld.com and which automatically disables the touchpad when typing and enables it when typing stops. If that does not solve the problem or the other key problems mentioned are too annoying, the only true solution is to use an external keyboard. Wireless keyboards are widely available. USB keyboards will also work.

My wife is an experienced professional typist trained at 100 wpm. She is an avid fan of the Facebook games, Farmville and Farmtown, and communicates with other users throughout the world. Our laptop keyboard was, because of the issues mentioned, unsatisfactory for her.

We had a small but full-featured Dell PS/2 keyboard which was ideal for use in this situation. However, laptops have no PS/2 ports. I purchased a PS/2 to USB adapter, connected the keyboard and it was dead, completely unresponsive. It seems that these small adapters merely try to match the wiring of one side to the other. They will only work with keyboards and mice that were originally designed to work with either PS/2 or USB connections. Old style devices will not work. These adapters are called Passive. Many are sold without any indication that they are merely Passive.

Luckily, there is another type PS/2 to USB adapter, which is called Active. The Active adapter contains a chip that converts the actual signal from one type to the other. Often it is a splitter which will allow the optional connection of a Mouse. I purchased an Active adapter and it worked perfectly the first time I plugged it in.

The solution mentioned should also work for an old laptop that may have a worn-out or defective keyboard or touchpad. ◆

Minutes.....Continued from page 6

part of each picture (shutter speed, f-stop, date taken, camera type, lens used, etc.). You can also use Pro Photo Tools to geo-code your pictures by identifying the place they were taken on a bing map within the program. William demonstrated this with pictures taken from a recent trip to Boston.

The meeting concluded at approximately 8:40 PM. ◆

Meeting Preview: Learn about new computer hardware from Steve Singer of RDI @ TampaBay, Inc. Member Bob LaFave will lead the usual Windows SIG before the meeting.

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

Many thanks to Merle Nicholson and Jim Purcell for helping me fill this newsletter. I know we all are looking forward to hearing what Steve Singer has to tell us about computing and computer hardware at the coming meeting. His annual presentations, which we have had for quite a few years now, are always interesting.

As for my computing, I have been involved with two projects this past month. The main one was setting up the new computer Merle built for me. Possibly next month I will write about it in more detail. But for now here is the bare minimum of facts. First, it is very fast since it has as a C drive a solid state drive and one of Intel's faster processors, the Core i7 875K 2.93 GHz,(the fastest was featured in last month's Picture of the Month). The computer also has 8 GB of Ram and a very fast video card with 1 GB onboard memory. The C drive is only 128 GB and meant exclusively for the operating system and the program files. The data files, temporary folders, etc., reside on a 1 terabyte drive. There is the usual DVD/CD drive, which

Minutes of the August Meeting

By Jim Purcell, Secretary, Tampa PC Users Group
Edward_J_P@MSN.com

Bob LaFave opened the meeting with his Windows SIG presentation at approximately 6:40 pm. The session was short due to the late start and to allow Charles John time for his presentation. There was a brief discussion of rootkits and rootkit scanners. Bob mentioned a few rootkit scanners that have proven to be effective. Bob described a custom method of upgrading from Vista to Windows 7 that will insure that you do not lose your data. Your programs, of course, must be reinstalled, but this custom method will insure that your data is transferred. The Windows SIG ended at 6:50 pm.

John Witmer, our President, began the business portion of our meeting at 6:55 pm with a discussion of the method that was used to auction the Microsoft book donated by Blain Barton. Arthur Williams bought the book with his bid of $18.00. At our October meeting, Steve Singer will give a presentation featuring the latest developments in computer hardware. A librarian from the Hillsborough County Public Library will give a presentation at our November meeting. We will have our holiday party at the December meeting, so there will be no presentation at that meeting. The slate of officers will be determined at our October meeting, and the vote will be taken at the December meeting. John encouraged members to volunteer. He reminded the members that most of the current officers have served for several years. The speaker for the night, Charles John, was introduced by our Program Chair, Doug Mullis. The business portion of the meeting ended at 7:00 pm, and Charles John immediately began his Social Media Management presentation.

He discussed the development of Social Media Management beginning with development of television in the early 50's. The progression continued into the 60's where more sophisticated presentations began to be a prominent part of television programming. The TV began to take more and more of our time but then began to decline because of the development of Internet and computer-based social media. He mentioned that

Minutes.....Continued on page 7

A Quick Look at Internet Explorer 9 Beta and Office 2010

By Merle Nicholson,Tampa PC Users Group
merle@merlenicholson.com

The first beta version of Internet Explorer 9 is available for download now. There are a hundred opinions out there every day about how well (or not-so-well) it works, so I thought I'd throw my quick two cents worth in, making it number 101 just for today.

The top image is it in its basic form, showing the first page of the TPCUG site.

It's a shock at first to see it's missing all its STUFF. Where's the STUFF? OK, right-click on the tab area and then select Favorites and Command bar, as shown in the second image. You get this along with one or two more which I have combined, Favorites on the left and Command bar on the right as seen in the first screen capture on page 4.

After using IE9 for a while, I finally decided I couldn't do without these. But it's still a far cry from the old one where the toolbars took up a substantial part of the window. So where's the rest? Obviously I can select the Status bar. But the Search entry box has been combined with the URL box. Smart move, I think, and reportedly "stolen" from Google Chrome.

One last thing – the menu bar! I didn't find it at all until today when I had to read about it. Press Alt Key, then let it up. It appears long enough to use it, then it

IE & Office.....Continued on page 4

IE & Office.....Continued from page 3

disappears. The image above is what it looks like. Its contents are pretty much IE8, which is fine with me because I like the old Favorites menu much better than the new, and it's still there.

The Command bar is showing clearly now – in my case consisting of five icons (on the right just above the page), which is customizable.

If you notice there are three icons to the right of the tabs (and above the five just mentioned): Home, Favorites and Settings. These, as far as I can see, are not configurable. The Favorites is really Favorites, Feeds and History. They look like IE8's Favorites, Feeds and History and can be placed so they appear either on the left or right. If it's on the right, the window will disappear automatically, but on the left, just as in IE8, it has to be closed with a mouse-click.

On the list of objectives for IE9 is: Support for HTML-5, simplify the user interface and make it faster. Oh yes, I forgot that. It's faster. In my opinion, noticeably so.

HTML-5 is supposed to be of interest because it has the elements built in for playing media, audio and video – without plug-ins. That would be a wonderful thing.

One catch – if you're hanging onto your old Windows XP, forget this. It runs on Vista and Windows 7 only. There are 32- and 64-bit versions.

A couple of quick words about Office 2010. First, they finally reworked Outlook to use the ribbon bar, and they've done a very nice job of it. I don't think there's any area of Outlook that didn't go untouched, and the improvements are all worthwhile. It's just full of good ideas, and yet the basic stuff works with no learning effort at all.

Second is about Access. Here again, it has the same ribbon interface, but – along with PowerPoint, Excel

IE & Office.....Continued on page 5

IE & Office.....Continued from page 4

and Word – the ribbons are all very configurable, so if you find yourself constantly digging for something, you can move it – or copy it – where you can get at it.

Access 2010 will not coexist with earlier versions of Access, and, even worse, now it won't coexist with an earlier runtime version of Access. You can install them, but each time any Access is used, it has to go through some part of a reinstallation – every time. I have, however, configured my own machine with Access 2003 and Word, Excel and Outlook 2010.

I don't remember Word 2007; perhaps it did have the change preview feature, I don't know. But I can tell you I think it's the best thing to happen to word processing. On page 8 is a screen capture of what looks like. It's showing a preview of changing five words from 11 points to 16 points.

The point is that it's just a preview, and it takes another click to commit to it. Otherwise it stays the same as it was. On top of that you get this little formatting menu whenever you highlight any text. Wonderful stuff.

Disable your Caps Lock and other things, too

IE & Office.....Continued on page 6

Internet Picture of the Month

Baby Alligators Hatch

From the Naples News web site, http://naplesnews.com, with the exact link being http://www.naplesnews.com/photos/galleries/2009/aug/17/baby-gators/. The location was the Marbella at Pelican Bay, a Naples Florida retirement community that backs up onto a nature preserve. Let's hope that all those small dogs that are probably also living at the retirement community don't become evening meals for these little reptiles when they become large reptiles.

October's Interesting World Wide Web Locations

Tampa PC Users Group (that's us)	http://www.tpcug.org/

PublicRadioFan.com	http://www.publicradiofan.com/
CPU Benchmarks	http://www.cpubenchmark.net/

IE & Office.....Continued from page 5

Awhile back I'd read something about how to disable Caps Lock, and there was something intriguing about the idea. It took the realization that the only time I ever use the Caps Lock is to release it after I've turned it on by bumping it by mistake. I NEVER type with the Caps Lock on. After all, we used to say to people to stop shouting at me in your emails! It's a carryover from the old data-input days where punch cards could handle only upper-case letters.

Knowing it is possible to disable Caps Lock, I found the best source at How-To Geek; they not only explain how to do it manually with Regedit, but they also supply some Registry merge files for downloading. They are reported to work on Win XP, Vista and 7. I have several of these, and I can vouch for Win 7 64-bit myself. I used the one that simply disables the key. There are others. http://www.howtogeek.com/howto/windows-vista/disable-caps-lock-key-in-windows-vista/

Now, the next thing I need is to disable NumLock for my notebooks and for a couple of other keyboards that do not have a numeric keypad. I've had a couple of situations recently on other peoples' notebooks where, no matter how careful I'm being, the logon password wouldn't work. I've since learned that I must check the state of the NumLock if there is no numeric keypad. There is usually a group of keys that substitutes U, I and O, for instance, for 4, 5 and 6. So if there's an O in the password, you are actually typing 6. It's surprising how many keyboards I have like this in my house. I have a small one on my workbench, two notebooks, and my spouse has a very small Adesso keyboard on her desk that's thin and small enough to slip in her desk drawer. And I just bought a new Logitech diNovo Mini Bluetooth keyboard for my NetFlix streaming PC that I'll look at. ◆

Comments.....Continued from page 1

is a Blu-ray one, and, for the first time, I now have a 2-monitor setup with two 23-inch Samsung monitors. After installing my programs, the C drive now has 68 GB free, and, after installing most of my data files, the D drive has 652 GB free.

How fast is the computer? Well, from the time I press the power button until my logon screen appears is 37 seconds. After I enter my password, it is only about five seconds until I can run a program. It is like night and day when compared to my almost 5-year-old Windows XP computer, which I then thought was so fast compared to the 4- or 5-year-old computer that preceded it.

Microsoft Phone 7 The new Microsoft Phone 7 is due in November, but, for anyone who wants to develop programs (or just play at that), the software has been available for some time in beta form. However, in September Microsoft released the software in final form, and I have been trying my hand at programming the phone and then testing the code on the supplied Phone 7 Emulator.

On the next page you can view a screen capture of one of my test programs running on the emulator. It is a mapping program that displays my neighborhood with a red square pushpin over each house (the pushpins are not very visible in the printed newsletter), where if you click on a pushpin the address and resident's name is displayed. Of course, this wouldn't be the data I would use in an actual application; it is just for testing. What this demonstrated was that I could display such a map, populate it with many pushpins at locations for which I had the latitude and longitude and then display any other information that I had associated with that location. Additionally, to use such maps, you need a developer's account for the bing maps (which I have), unless you want a message splayed across the map to the effect that you need to get such an account.

Microsoft just announced that they will unveil the actual phone on October 11, and it will go on sale on November 8. The first phone available will be

Visual Basic .Net SIG (and sometimes Access SIG)

This SIG meets the third Wednesday of the month at 6:30 PM. For information, contact Editor William LaMartin at lamartin@tampabay.rr.com.

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Member Bob LaFave moderates the discussion.

only GMS (see Wikipedia for this and CDMA), with AT&T being the primary carrier. CDMA phones will follow sometime after the first of the year. The carriers supporting CDMA will include Verizon, my provider. So, it looks as if I won't be getting an actual phone until after the New Year, which is a bit of a letdown because testing programs on an emulator is not as good as being able to deploy them to an actual phone. I have read that there are ways of simulating the acquisition of GPS data for the emulator, and probably there is a way to simulate taking photos with the phone camera in the emulator, although I haven't looked into that.

Microsoft is providing actual phones for testing to many developers, but I am too far down the pecking order to receive one of them, I believe.

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Thanks to Roger Waters for his telephone article, which was especially timely considering what I write about below, and also to Jim Purcell for the minutes.

The past month has been quite busy with computer things: The continuing fine-tuning of my new computer; the learning how to program the new Windows Phone 7, even though I don't yet have a physical one to practice with; the updating the membership database for the yearly membership drive for our three neighborhood organizations; and, finally, making the many changes necessary to switch from Bright House (the old Time Warner Road Runner) to Version Fios for my Internet connection. The change to Verizon has caused me much work in notifying many people and businesses about the change in my main email address, which I have had for the past 11 years.

Regarding the neighborhood membership, I am the keeper of the membership database, which I do in Microsoft Access. I am also the producer of the yearly membership directory. For all those

Minutes of the October Meeting

By Jim Purcell, Secretary, Tampa PC Users Group
Edward_J_P@MSN.com

The Windows Special Interest Group (SIG) normally opens our monthly meeting. The meeting began at 6:40 PM. The SIG is devoted to a discussion of all aspects of the Windows operating systems and of computer-related subjects in general. The moderator, Bob LaFave, introduces new or little-known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees. Bob leads the group in finding answers to questions and solutions to problems. This month's SIG ended at 7:00 PM.

The business portion of the meeting was opened at 7:05 PM by John Witmer, the Tampa PC Users Group President. John discussed the Holiday Party in December and asked for input from the membership. The majority of the suggestions were to "do it like it was done the past two years." John asked members to submit any new menu items that they would like to see added, so that they could be considered by the Board when the menu is finalized. He reminded the members that we will also vote on officers during the December meeting. He said that all of the officers except the Secretary were willing to continue for one more year, so there is a need for at least one volunteer. John described the job requirements for Secretary and advised that there is a proposal to change the structure of the minutes to make them less time-consuming. He also mentioned the limited amount of time required to participate in the monthly Board meeting. John advised that, although the other Board members had agreed to serve, they would step aside if someone else wants the job. Next month's presentation will be delivered by Mary Jo Combs of the Hillsborough County Public Library system. She will discuss the many services available to the public. John ended the business portion of the meeting with a request to the members to come forward with any suggestions that they might have for speakers in the next year. He introduced Steve Singer, of RDI of TampaBay, Inc., who began his "New Computer Hardware" presentation at 7:16 PM.

Minutes.....Continued on page 5

The Evolution of the Telephone

By Roger Waters, Tampa PC Users Group
rvwaters@hotmail.com

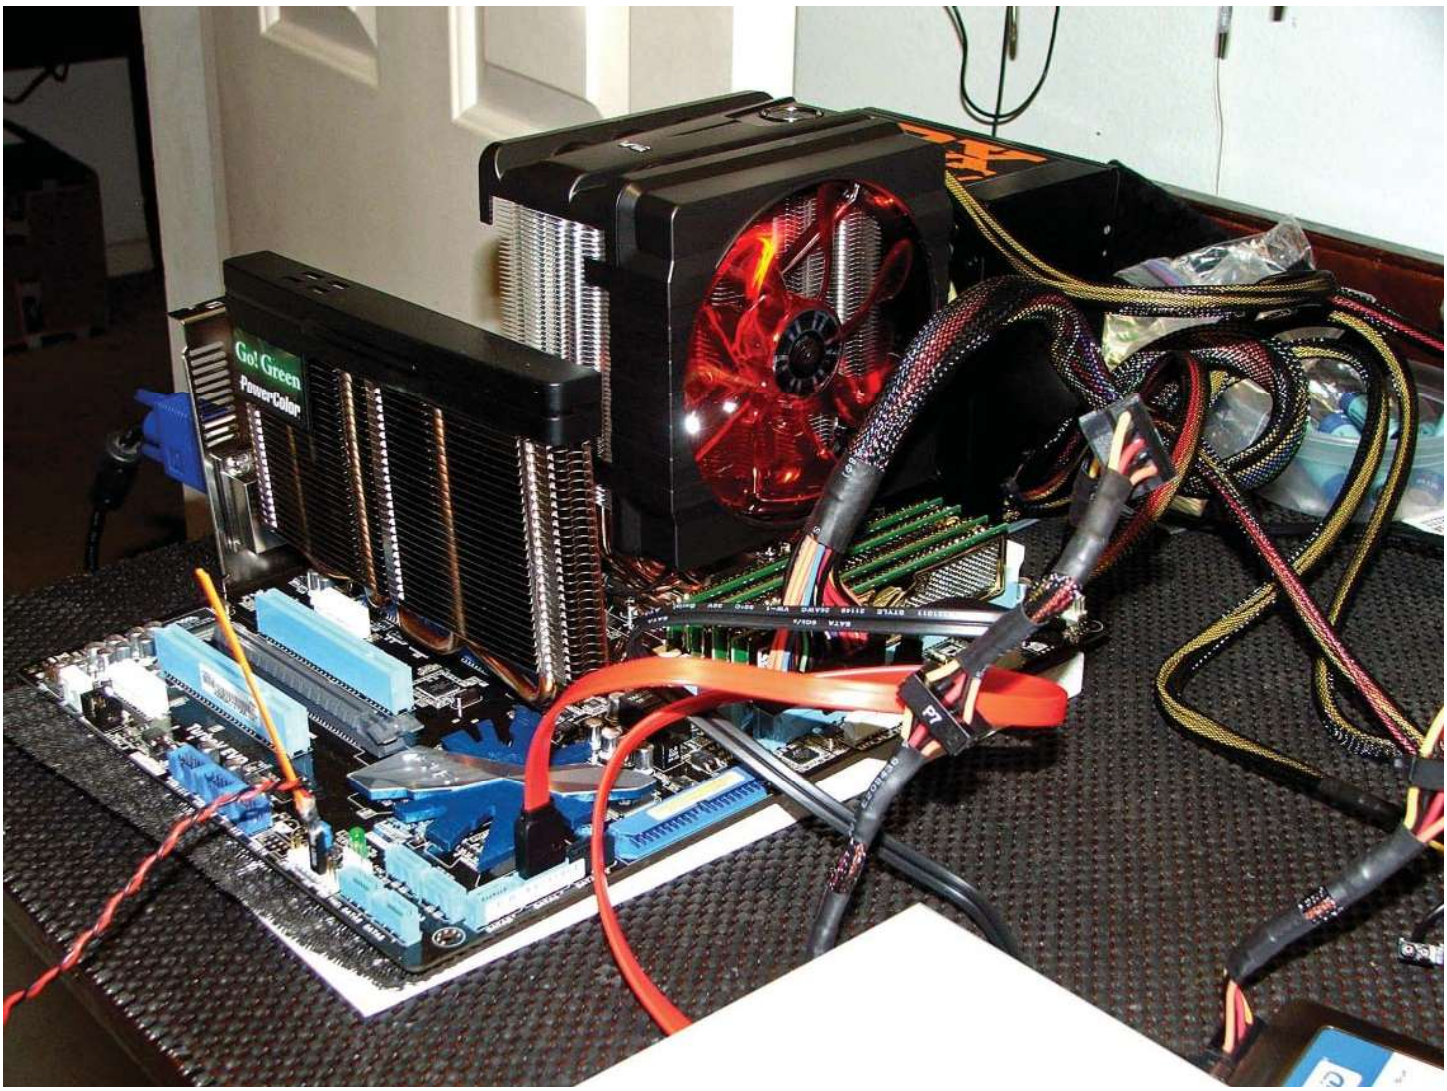
We have come a long way from "Watson, come here, I need you" to today's telephone. When I started in the telephone industry in 1966, it was an electromechanical system. It was known as step-by-step since each rotation of the dial (you do remember that telephones had dials) stepped you to the next level until you got to a point that you rang a phone. This system had been around since the early 1900s.

The next system that evolved was known as crossbar. It was still electromechanical, but I viewed it as a relay-controlled computer. It did have some logic to it and allowed for more control, as well as allowing features like call transfer, three-way calling, auto number identification and conferencing. After crossbar came electronic switching, which was computer controlled. This allowed for even more features that consumers loved.

The company that supplied the Central Office equipment was originally known as Western Electric, which later became Lucent. The Canadian company was Northern Electric, which became Nortel Networks. Lucent was bought by Alcatel and is now known as Alcatel\Lucent. Nortel sold some of their Central Office business to a startup company known as Genband.

The telephone now is going to VOIP or Voice over Internet Protocol. I first got involved with VOIP after Steve Singer told the group about Gizmo Project. I bought a Linksys PAP2 ATA (analog terminal adapter) and signed on with Gizmo. The ATA is used to hook up the phone to the Internet. The calls were priced at 2 cents a minute anywhere in the US. My wife used it to call relatives and said the voice quality was like a cell phone. I was able to tweak it to improve some of the voice quality but it was not the same as calls over Verizon.

My sons signed up with Vonage for their phone service. With Vonage you can take the ATA with you anyplace that has internet access. When one son was sent to Hong Kong for six months he used it in his extended-stay hotel. Since he lives in Orlando, his number was assigned for that area. When he called us, the caller ID came up as his Orlando number. We were able to dial his Orlando number and he answered in Hong Kong. Having this ability, however, presents a problem with 911 calls.



Since VOIP is cheaper to provide, the service is cheap, and free in some cases. I am sure everyone has seen the Magic Jack commercial. For $20 a year you can make unlimited calls in the US and Canada. You can call for free over the Internet with Skype, Gmail, Google Voice and other free services.

I have a FIOS bundle and my home phone is practically free. I am sure that the bundles from Bright House also include phone service at low cost. My home service is not VOIP but is fiber to the home. Verizon offers what they are calling FIOS Digital Voice, which is a VOIP service. With their Digital Voice you get additional features and more control over your phone service. They allow you block calls, get voice mail via e-mail and have your calls follow you. You can program your phone number to ring up to three phones (cell, business, etc). This service is like Google Voice I wrote about in a previous article.

With VOIP being cheaper to provide, I believe that Verizon will stop providing the current analog service. In the Mid-West, Verizon sold their outside facilities to Frontier Communications to provide local phone service. Verizon sold its Maine, New Hampshire and Vermont wireline business to FairPoint Communications. My feeling is that Verizon will sell all of its cable and will become a fiber company and deliver phone service via FIOS. Maintaining fiber is less expensive for them. Verizon reports a 10.9% decline in home phones. Many people are using cell phones for all calls, or using some type of VOIP service and disconnecting their traditional phone. I have heard that Verizon is removing some of the equipment that they use for analog phone service.

Among the current disadvantages to VOIP provided by Skype and Vonage would be loss of power means

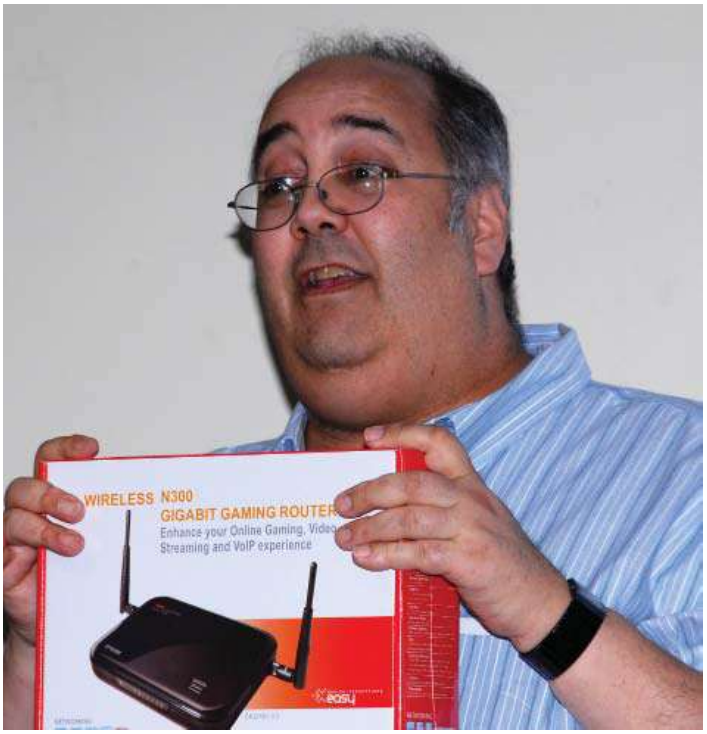
Telephone.....Continued on page 8

New Computer

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

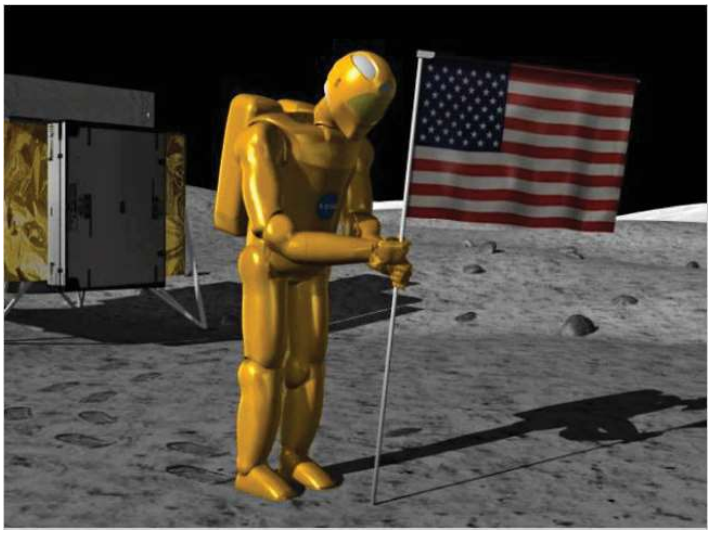
Above is my new computer under construction on Merle Nicholson's workbench. At this point, on the motherboard is installed, from left to right, the video card, processor with cooling fan and heat sink, and the power supply, along with some cabling. In comparing this to my previous computer, the thing most striking is the size of the processor's heat sink and fan, along with the heat sink for the video card.

The philosophy was to build something that was very fast but affordable (a relative term), so we went for components one step back from the bleeding edge. We were helped in that by Intel's having made available the i7 875K processor at a very reasonable price. In the future, since it is unlocked, I might try to overclock it a bit, but right now I see no need for that. Since we are a computer club and many years back a great deal of attention was devoted to the components it took to build a computer, I have included the component list on the following page, just as it came from Newegg.



Merle picked out everything except the monitors, keyboard, mouse and speakers. I appreciate that since I know little about motherboards and processors. I do know that the processor you pick will determine the collection from which you may choose a motherboard, and it will further restrict which memory configurations you may have (mine has four 2 GB modules).

New Computer.....Continued on page 6



Minutes.....Continued from page 2

Steve Singer (photo below) has, for several years, given the group an annual presentation which highlights the latest changes and improvements to computer hardware. Steve explains in detail the advantages and disadvantages of these changes and explains to our members how to select the hardware that provides the results that they need at the most affordable price. He uses his extensive knowledge of computer hardware and software to answer across the spectrum questions on their use and to provide advice on how to solve problems that users have encountered.

The meeting ended 9:20 PM. ◆

Internet Picture of the Month

Robonaut 2

For less than $200 million, along with about $250 million for a rocket, NASA engineers at the Johnson Space Center in Houston say they can safely send a humanoid robot to the Moon. And they say they could accomplish that in a thousand days.

That is a bit cheaper than the price tag of sending astronauts back to the moon at a cost of around $150 billion.

New Computer.....Continued from page 4

What makes this computer boot fast is the solid state C drive. From the time I press the power button until my logon screen appears is 37 seconds. After I enter my password, it is only about five seconds until I can run a program. This drive is 128 GB, which was quite expensive at $270 (current price is $215) when you note that my 1 TB second hard drive cost only $90. I recall that the choices for solid state drives seem to range between 50 GB up to 500 GB. I don't think you want the 500 GB one since its price is right at $1,600.

The purpose of the solid state drive is to hold only the operating system and the program files that I install. Everything else goes on the 1 TB Western Digital hard drive that is itself very fast when compared to other similar drives because it has a dual processor and 64 MB of cache onboard. I preferred getting a 2 TB drive but could not find one that matched this one in speed. By "everything else" above, I mean all my data files, most of which are in My Documents, the operating system's temporary files, My Pictures, Desktop, Downloads and probably several more of the Windows 7 special folders that I have now forgotten. All of this goes on the regular drive. That way the computer is not always writing to and deleting things from the solid state drive.

I suppose I should mention that the computer has a Blu-Ray DVD/CD drive that supports LightScribe. However, I did not spring for the extra money to get a Blu-Ray writer since I have not as yet had such a need. The keyboard and mouse are wireless, and the keyboard is the only part of the computer that has given me any trouble in the two months that I have been using the computer. For some yet unknown reason, occasionally I lose the ability to enter text from the keyboard, and I have yet to find a solution to the problem other than closing out what I can with the mouse and then rebooting the computer. I tend to think that it is some key combination I have inadvertently pressed but have no idea what that is.

Merle installed the operating system, Windows 7 64-bit, and, over several days, I installed all of my programs and brought over via the local area network my data and pictures. The main program suites included Microsoft Office 2007, Adobe Creative Suite Standard CS5, Microsoft Expression Studio 4 and Visual Studio 2010.

Then there were the minor programs like Family Tree

New Computer.....Continued on page 8

Special Interest Groups

Visual Basic .Net SIG (and sometimes Access SIG)

This SIG meets the third Wednesday of the month at 6:30 PM. For information, contact Editor William LaMartin at william@lamartin.com.

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Member Bob LaFave moderates the discussion.

Comments.....Continued from page 1

people who purchase Office without Access, I don't see how they get by, but obviously they do, just as many people around the world get by with no computer. Access produces the mailing labels we use to occasionally send snail mail, since not all of our residents have email addresses. I use it in combination with Word to do email merges for the many email messages we send the residents concerning everything from membership to parties, from City of Tampa announcements to lost or found cats, dogs, tortoises and parakeets messages. Then, using Access along with Adobe InDesign and a bit of Visual Basic programming, I produce the membership directory and send it to the printer for printing. And, because of the complications of all this, I am not sanguine of being able to find anyone to take over the job.

Now to the Internet provider change. I did not make the change because I was unhappy with the Bright House service, although I do like the faster speed of the Verizon Internet connection I now have. My reason for changing was that Verizon failed over a year-long period to fix our regular telephone service where we could be sure that we, not just the caller, would hear our phones ring when they were dialed. My wife and I had agreed that, if the most recent fix failed (as had the half dozen or more previous ones), we would switch to Fios. It failed, so we changed.

Our setup is probably different from most local households in that we do not receive TV over a service; we get it the old-fashioned way via an antenna on our chimney that is two stories high and provides excellent reception of all the local area channels. TV is not a big thing in our house. I probably watch less than seven hours a week. What we do have is two phone lines and an Internet connection. The package deal offered for two phone lines and Internet was pretty good. What was even better was to have the phone service changed from regular Fios to what they call Digital Voice. In addition to the lower price, with Digital Voice you receive a number of extra features more than regular Fios provides (see the Evolution of the Telephone article by Roger Waters on page 3).

So what is Digital Voice? The Verizon representative was a bit cagey about that and would only say that it was crystal clear and had many more options than regular Fios. "It was digital." Well, I had my suspicions, and they were confirmed by our local phone expert, Roger Waters. Digital Voice is Verizon's version of VOIP. Yikes! Was this to be something like Vonage or Skype, and might the quality be less than desired? Roger said that he was sure it would be better since it was over Verizon's dedicated lines. And I read on the Internet that, yes, it uses the Voice Over Internet Protocol, but the voice packets do not travel on the Internet (good). I checked with a few others whom I knew to have Verizon Fios, but none had the Digital Voice version. We were on our own. But I was willing to gamble since it wasn't really a gamble in that this was a no-contract deal and, if things didn't work out, we could always move to the regular Fios phone service for the two lines and pay the extra $40 or so a month.

So far the quality has been fine, and, as with regular Fios, it is nice to have free calling anywhere in the US or Canada. There is one small downside you should know: All calls, including local ones, require 10-digit dialing. I supposedly have 25 MBps up and 25 MBps down for the Internet. In practice, my preliminary tests show slower speeds than that, but what I am getting is much, much faster than with Bright House, especially for uploads. On one test I had a download speed of 13 MBps and an upload speed of 10 MBps. But I need to do more testing.

With Digital Voice, you have 911 dialing and an 8-hour battery backup, just like with regular Fios. ◆

New Computer.....Continued from page 6

Maker and Quicken. Since my copy of Family Tree Maker was a bit old, I decided to purchase Family Tree Maker 2010 to install. If I had trouble with the installation of anything, it might have been with Family Tree Maker. I recall that it wouldn't install properly from the CD, so, as I have discovered in the past in similar situations, I copied all the installation files to a folder on my desktop and installed from there.

Finally, Windows 7 64-bit had drivers for my two printers, so there was no problem with that. However, my Epson Perfection 3200 scanner does not have a Win 7 driver and thus cannot be attached to the new computer. So my old desktop is still sitting under my desk with that scanner attached. ◆

Telephone.....Continued from page 3

a loss of phone service. If your Internet service is out, so is your phone system. Calls to 911 are hard to handle since the number could ID for your area and you could be in another city, state, or country. The call quality is dependent in part on the available bandwidth.

We are seeing a shift to all-digital telephone networks. I believe that progress will be made to continually improve voice quality with VOIP. ◆

william@lamartin.com

Thanks to the ThinkPoint virus for giving Merle Nicholson something to write about in this month's newsletter. And thanks to Merle for taking the time to fill us in on this particular nasty problem. Also, thanks to Jim Purcell for the monthly meeting minutes.

Later in the newsletter, I tell you a bit about my Cloud Computing experience. And by that I don't mean using Google Apps or Microsoft Docs. What I am talking about is actually installing a Windows application in Windows Azure, Microsoft's version of the Cloud, and setting 15 instances to run simultaneously. The program could have been something I wrote, but in this case it was a program from Stanford University that does one computing task at a time of tasks assigned to it as its part in a very large distributed computing project involving 400,000 plus CPUs around the world.

I wonder if anyone in the group has purchased a Windows Phone 7. They have been out now for a couple of weeks at those providers like AT&T which use the GMS phone systems.

Minutes of the November Meeting

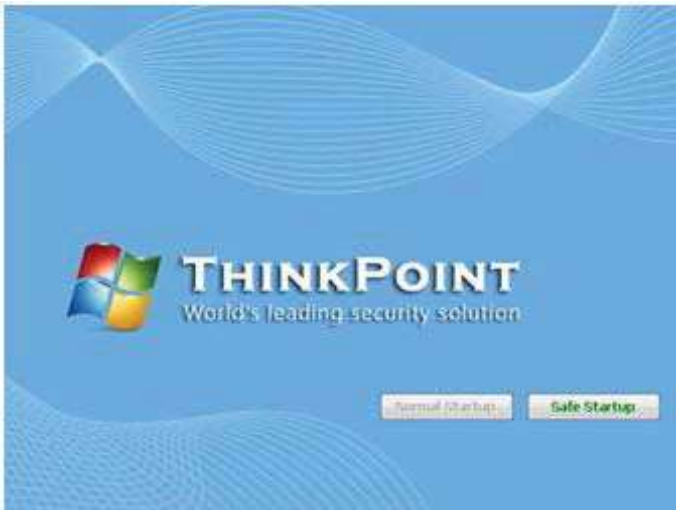
By Jim Purcell, Secretary, Tampa PC Users Group
Edward_J_P@MSN.com

The Windows Special Interest Group (SIG) normally opens our monthly meeting. The meeting began at 6:30 PM. The SIG is devoted to a discussion of all aspects of the Windows operating systems and of computer-related subjects in general. The moderator, Bob LaFave, introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees. Bob leads the group in finding answers to questions and solutions to problems. This month's SIG ended at 7:00 PM.

The business portion of the meeting was opened at 7:05 PM by John Witmer, the Tampa PC Users Group President. John gave a brief summary of the plans for the Christmas party. He reported that the menu would be basically the same as last year with a few additions. He added that members could bring food if they desired, but there is certainly no obligation to do so.

John reviewed the procedures for electing officers that will take place during the December meeting. He noted that all current board members except the Secretary have agreed to serve another term if no one steps forwarded. He encouraged members to volunteer to fill all positions, but he emphasized that there was an absolute need for someone to volunteer to fill the Secretary's position.

John appealed to the members to volunteer to deliver the presentation at one of our monthly meetings. He noted that we do not have a presentation scheduled for January which certainly highlights the importance of their participation. [Editor's Note: Member Merle Nicholson has agreed to do the January presentation.]



Mary Jo Combs of the Hillsborough County Public Library System opened her presentation of Library databases at 7:10 PM. Ms. Combs discussed databases that are free to the public and several additional databases that are subscribed to and paid for by the

What a nasty virus can do to your computer

By Merle Nicholson, TPCUG
merle@merlenicholson.com

I recently was asked to remove a virus from a friend/client's notebook. For all intents and purposes, it rendered the computer completely inoperative. The virus was in a virus category of "Rogue antivirus software". There are many of them out there for the unwary to catch, and this one, called "ThinkPoint," even has the Windows flag on it to further fool you into thinking it is legitimate. The only option you can see is "Safe Startup," and that takes you to a virus scanner and a way to purchase the product. If you close it out, it shows you a blank desktop, no icons, no menus. You can turn the machine off, that's about it. Turn it back on, same situation. I did figure out a way to kill it through the Task Manager's Run command, and then run the desktop. I also found some things written up on the Internet to do something similar, but no help in removing it. I did remove it using some very clever, obscure skills, several virus scanners, then finding and removing twenty or so copies of it. But the computer really didn't work well enough to use. What I found surprised me, and this is what the article is about and what you can do.

Here's a list of what I found. Some things are by deduction and may not be 100% accurate. But I am 100% certain that these problems existed. All of the things fit into a strategy that prevents you from fixing the computer.

1. The worst thing: The computer will not boot into safe mode. It bluescreens every time. I'm speculating that ThinkPoint either corrupted an existing driver or put a new one in that loads and then fails. The way to fix this is to do a system repair or a complete reformat and installation. I did not want to impose that cost on my customer, and she agreed (it's not a primary computer, and it's rather old). So I left it that way.
2. All the system restore points were unusable. Refused to restore to any point.
3. To run most anything, an official-looking popup would ask to confirm the logon user and give a box for an alternative user account that did not work. This is to make sure that everything you try is run under the current user account which has been modified to prevent circumventing the virus. What you want to run is Explorer.exe giving you your desktop, and every effort is made to prevent you from doing this.
4. Most – perhaps all – items in Control panel will not run. It gave a warning that the administrator account has restricted its use. I did manage to get into the power configuration, but it would not accept any change. The computer would go into sleep mode after about 20 minutes, keeping me from running a full system scan from any antivirus software unless I sat there and wiggled the mouse occasionally for four hours.
5. The Internet articles say that even if you purchase the software to fix a bogus virus, ThinkPoint stays on the computer. The uninstall just errors out.
6. The Internet articles say that it installs other viruses, and I did find a half dozen other viruses, mostly downloaders.
7. It leaves about 20 copies of itself under various random names, and places items in the registry to run each of them. So removing the active virus is just the beginning. I also found a couple of viruses in the System Restore files.
8. It apparently makes changes to the current user account profile that look like group policy changes, even though this was Windows XP Home, which

Virus.....Continued on page 4

Virus.....Continued from page 3

doesn't have group policy capability.

9. Only after all the bad software is cleared from the machine can you then get rid of the modified account by creating a new administrative account, copying all of the user files from the old to the new – except for the profile files, then deleting the old account after locating the email files.

Isn't this scary? It is to me, and I (95%) fixed this one with a lot of work. The idea of having to fix my own machine after something like this gives me nightmares.

What you can do to prevent this: A sizable number of virus infections now are rogue anti-virus. There's an understandable reason for this. It creates revenue. Old-fashioned viruses are malicious, but have no revenue-producing strategy. In other words, it's now about money. Most all viruses are sent to you via web pages, and most of those are porn sites, either designed that way or hacked from outside. Porn sites are visited so often, they are a very good candidate for this kind of thing. Also, presumably the porn site owners don't have the skill to remove sophisticated hacks. But most any web site is vulnerable. In any case, you must select something on the site – click on it – to give the browser a chance to violate security rules.

The next common ways to get a virus is with downloads. And that means just about any download or file transfer. So you have to get any and all files from reputable sites like iTunes or Downloads.com, Amazon etc., which have the resources to check their own content.

But that leaves any and all file-sharing sites absolutely and definitely off the list. So if you're downloading songs for free, you're in trouble. Any file-sharing site's software must be uninstalled from your computer. And that also goes for any peer-to-peer gaming sites, LimeWire, Kazaa, and any and all IM programs that allow peer-to-peer file exchanges.

And while we're at it remove – uninstall – anything that says "Toolbar." Right now. Want to know why toolbars are free? Because they're a conduit for pushing advertising to you; and they're easily exploited. Besides you don't need them. They want you to believe you do, of course! But the browser itself and a couple of favorites will do anything a toolbar will do.

An alternative is giving up gaming and IM and to start purchasing songs. So if you have kids who will just die without peer-to-peer gaming or IM and stealing songs, the answer is to live with it with some intelligent prevention.

First, if at all possible, put the kids (and maybe grandpa) on a Windows 7 machine. If you have some internal networking and file sharing, Windows 7 Pro is better because it will back up to a network drive. But so will Acronis Home, or 2010 or 2011, running under Win 7 Home Premium.

Make sure you have a full system backup, and replace it monthly. Use Windows 7 Backup or Acronis. Believe me, restoring the entire system hard drive is way, way better than any alternative that I can think of. Look at what I had to do with ThinkPoint. Want to try it?

I guess it's obvious, but a strong anti-virus program running on your machine is essential. BUT – this is important – make sure you look at the scheduling part of it and make sure it will automatically download new definitions and also run a full system scan at a time of day that the machine will most likely be turned on. Same for Windows Updates. Make certain that all important updates are installed as soon as they are available.

Password protect your main administrative account (this is the one that comes first with the computer) and bury the password paper in the back yard and leave the location with your attorney. Better yet, Win 7 allows you to create a flash drive that will unlock the computer. Hide it under some rubber fake dog poop someplace.

THEN: Create a non-administrative account for yourself – a regular non-privileged account, and a separate one – or one for each kid. A regular account cannot

Virus.....Continued on page 5

Virus.....Continued from page 4

install software. But most importantly, SOFTWARE that is run under this account can't install software. Ah HA!

Then one more step. Set the screen savers to require a sign-in on wake-up, and ALWAYS log off when you leave the computer. That's especially essential when leaving the administrative account.

Skills: There are a few things that would be very helpful to learn. The big one is navigating the computer file system using Windows Explorer. Find out how your files are organized, and more importantly, how to change what files you can view. That's in Windows Explorer, Tools, Folder Options, View tab. Second Important Skill – learn to use the Add, Remove Programs. That's "Programs and Features" in Vista and Win 7. When you find an installed program that you are not using (say, anything with the word Apple or toolbar), just uninstall it, see how it goes. ◆

Comments.....Continued from page 1

Or have all our members who want smart phones already purchased an iPhone or an Android one? I plan on acquiring a Windows Phone 7 but will have to wait until my provider, Verizon, has the CDMA version of the phone. As of now, all I know is that is supposed to occur in early 2011. Perhaps there is even an advantage in having to wait in that some of the early bugs will be removed by then.

I have already written a program for the Windows Phone 7 and tested it on the Phone 7 Emulator in Visual Studio, but I have to wait for an actual device to really know how well the program works. ◆

Cloud Computing and Alzheimer's

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

You certainly may be forgiven for wondering what Cloud computing has to do with Alzsheimer's disease, and then to further question what the above map would have to do with either of these items and why is my name on the map. Well, it all started with my attendance at a one day session at the Microsoft Tampa office on Windows Azure, Microsoft's Cloud computing platform.

Don't make a big deal of the Cloud. It is just computing on the Internet of interest mainly to large scale users and not to most of us. Windows Azure is a Windows environment for running applications and storing data on computers in Microsoft data centers (the Cloud). A number of other large companies offer competing platforms. The advantage of putting your applications in the Cloud is that you don't have to worry about infrastructure; you spend your time on writing code and, if there is to be a public-facing interface (web page), developing that. If demand for your service is small, you only pay for the computing resources and storage needed for that. If the demand increases, you then pay for the extra servers, storage and transaction time needed for that increased traffic.

Cloud.....Continued on page 7

Special Interest Groups

Visual Basic .Net SIG (and sometimes Access SIG)

This SIG meets the third Wednesday of the month at 6:30 PM. For information, contact Editor William LaMartin at william@lamartin.com.

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Member Bob LaFave moderates the discussion.

Cloud.....Continued from page 6

At the Microsoft session, they first gave us their presentation on the Azure platform, provided lunch, talked a bit more and then provided each of us with a user name and password that would allow us to use our own computers to access a temporary Azure account good for one month. They then led us through downloading several files from the Internet that would allow those who brought their laptops (as had been suggested) to use Visual Studio to create a Cloud application on the laptop, then test it on the laptop in a "Cloud simulator," and actually deploy it to the Cloud and make it active.

I would say only a hand-full of attendees managed to accomplish the above. One big problem was that the guest wireless network withered under the assault of over 50 people trying to download all the files required. I managed to get all the files via a neighbor's thumb drive after he had downloaded them via his laptop's wireless card and not the guest network. However, that is where things stopped for me since I could not get Visual studio to run the Cloud application that we were supposed to modify and then deploy to Azure.

Later at home I did get everything to work on my desktop computer and was able to deploy the application that I describe below to the Cloud. I also eventually solved the laptop problem by moving the downloaded Cloud application to a different location on the hard drive. Strange, but sometimes Visual Studio objects to running programs created on other computers at certain locations on a different computer's hard drive. However, I didn't look any further into the laptop problem since I had everything working correctly on the desktop computer.

So what was this application? Recall SETI, the search for extraterrestrial intelligence, where they used thousands of people's home computers to run a program that did small bits of the processing required to do the search? This program was similar, and you can download a version to run on your home computer if you want to participate.

The program is called Folding@home with the goal: "to understand protein folding, misfolding, and related diseases." It is run out of Stanford University, and the web site is http://folding.stanford.edu/. Go there and read about the project and how it relates to such diseases as Alzheimer's, ALS, Huntington's, Parkinson's and many cancers. Then if you are interested in participating, download the executable and run it on your computer.

Now back to the map. The map at the beginning of the article is a screen capture of the Tampa area of a world map showing the Microsoft Azure teams efforts in the Folding@home project. There are about a dozen of us in the greater Tampa area with about nine in this map area. Orange indicates active, red inactive. There is a fly-out from my pin noting that I have 15 instances of the folding program running in Azure. The fly-out covers another orange pin with the name of Jeff Odell. Sorry about that, Jeff. I assume most of the orange pins in the Tampa area will turn red in another week or so since we were only given a month of free time on Azure. Once this newsleter is at our web site, the online Adobe Acrobat version will show the map in color.

If you go to http://wfltampa.Cloudapp.net/, you can see the list of work units I have completed on the project – 220 as of November 30. There is also a link to the Microsoft Azure team's results and the map there.

Microsoft gave us the ability to test out other programs (worker roles) at the site. I originally used only 10 of the 20 instances allotted for the Folding@home program, then increased it to 15 with the thought that I still might try something else with the remaining 5, but so far I have not had time to do anything else. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

The Microsoft Windows Phone 7 is out but not yet available from Verizon, my cell phone provider. So my interest in programming for it has waned a bit. Then Merle purchased an Android phone about which he writes in this newsletter. And that gave me an idea: See if I could write some simple programs for that phone. This would require a new language, Java, and a new programming environment, Eclipse.

I have never really programmed with Java other than to do a few things for web sites with Java Script. And I would have to switch from using Visual Studio as a programming environment to a free program called Eclipse. The screen shot you see on page 6 in this article is of a simple program I wrote (with much help from the Internet) that uses the Google Maps Application Programming Interface (API) to display a pushpin where you click and to also display the coordinates of the point. The program is running in the Android Emulator, which is a software-

Minutes of the December Meeting

By Jim Purcell, Secretary, Tampa PC Users Group
Edward_J_P@MSN.com

John Witmer, our president, opened the business portion of the meeting with a few remarks during the annual Christmas party which began at 6:30 PM. He gave a short summary of the December Board meeting and indicated that he would present the slate of candidates since Ron Weinberg, our member at large, who normally announces the slate of candidates, was unable to attend the meeting. He advised that anyone who desired to run for any of the offices could still be considered. When no one stepped forward , the following slate of officers was presented:

- For President: John Witmer
- For Vice President: Kevan Sheridan
- For Treasurer: Doug Mullis
- For Secretary: Merle Nicholson
- For Member at Large: Ron Weinberg

A motion was made to accept this slate and to vote. All members present voted in favor of the slate of officers as presented. Terms of office begin January 1, 2010.

The party continued until approximately 9:30 PM ◆

Comments.....Continued from page 1

created version of the Android phone that Eclipse uses to debug the phone programs. In case you don't recognize the location, it is of our meeting site at Pepin. By the way, Eclipse can be used for any Java Programming, not just for the Android phone.

One advantage, I think, of the Android phone is that you can side-load applications onto it (not have to get them from the Google app store), whereas for the Windows Phone 7 (and the iPhone) you have to go through the Microsoft Phone 7(or iPhone) app store. This, however, may change in the future. Of course, if you sign up as a developer for either the Windows Phone 7 or the iPhone, you get the ability to side-load

Comments.....Continued on page 6

New handheld computer that also phones (Smartphone)

(Verizon Motorola Droid X – Android OS 2.2 Froyo)

By Merle Nicholson, Tampa PC Users Group
merle@merlenicholson.com

OK – this is an article about an Android phone by a guy who is three times older than the demographic that normally buys these things. So I'm going to say "Facebook" here and now, the first and last time because I'd don't have a Facebook account; I haven't "friended" anyone, so I certainly don't care where they are. And I haven't gone hunting for dates for 47 years. Just so you know who I am.

I've replaced two pocket devices with one Android smartphone two weeks ago. I had a tiny wireless telephone that I used for, well, telephoning, and a five year old PDA – a Dell Axim x50v.

The old Dell is still functioning almost as well as it did when it was new. Its connectivity options are limited to wireless/b and Bluetooth. I used it mostly to sync with my Outlook calendar and contacts and keep family pictures to bore people with. The charging/sync connector is getting flaky, and I bought a new part to replace it, but the tiny soldering required put me off some and also prompted me to look elsewhere. Don't get me wrong, I can solder. NASA taught me how a lifetime ago. But this is tiny, close together and there are about twenty things to be soldered.

The phone I've had for two years has been just a telephone to me; it connects to a hands-free device I bought for the car, but it will also take pictures and do messaging, in which I had no interest. I discovered that the process to keep the camera from taking pictures of the inside of my pocket made it hard to take any kind of pictures at all and that Verizon was going to charge me to get them off my phone after I did take some. I have a good camera anyway.

Verizon is making it pretty easy to get a new phone and a data/mail plan to go along with it. But Amazon is doing it better by reducing the price of this model (Droid X) down to $120, $50 cheaper than buying direct from Verizon. That's after a $30 credit accumulated at Verizon for having fulfilled my last 2-year contract. That's $120, no tax, no shipping, no activation fee, plus, I later discovered that, because I went to Amazon through the TPCUG link, $65 was credited to the TPCUG. I activated the phone with Verizon within a few minutes of delivery to my house but after the online activation failed. Apparently Amazon and Verizon work it all out because the Amazon price is reduced by Verizon's $30, and Amazon checks while you wait online to verify the Verizon eligibility if you've told Amazon that you're an existing Verizon customer and have given the phone number you want to use.

OK, now about Android phones – or rather what I've learned so far. There seems to be a consensus that the latest version of the OS, version 2.2, is the best so far, and 2.2 apparently has some much-needed new features. Being a Google product – you guessed it – it had a lot of features imbedded in it that depend on Google. I'm not especially fond of going to one source for everything, but Google has not eliminated all your choices, and, with time, now I'm completely comfortable with it.

Email would be a good example. I'm using my own email server account for email, not my Gmail account. My mail is still managed on my home PC because I run a business and my Outlook is essential. My Outlook 2010 isn't just an email/contact list/calendar; it truly categorizes and manages that searchable client data going back several years. So the phone brings in all my incoming mail from my private server, and I can send replies or initiate new mail through my server.

The web-based Gmail/Contacts manages your contact list on your Android phone pretty much seamlessly. I export files (calendar by broad date range and contacts one at a time) from Outlook and then log into my Google email account and import each of those files. I really don't know if the data is on the phone or in the "cloud," but I've decided I don't care. The contacts and calendar data appear in my phone not instantly but within maybe an hour; I'm not sure.

Droid.....Continued on page 4

Droid.....Continued from page 3

So far no one has discovered my Gmail account and that's just fine. On the phone, I pretty much just read any incoming email that I'm especially interested in, reply if required and then just erase all the phone's email. There are programs (purchased and free) that improve the Outlook to Android transfer process, but I haven't yet seen any need to fully automate the exchange.

Here's a list of most of the functions and programs I'm actively using. Most are free and already installed. A few were free from the Android Market, and just two were purchased.

Browser – The Internet browser is surprisingly good considering the screen size. It responds to 2-finger zoom and pan rapidly, so, with a small amount of manipulation, you can see any part of even a large page in all detail. A very large number of websites have pages optimized for mobiles. Wikipedia is one excellent example.

Navigation – Google navigation is just amazing, and it's free, unlike the optional VZNavigator, which has a $10 monthly fee from Verizon. Type in or speak a destination, and Google looks up and presents all the possibilities; select the one you want and the route is presented with voice directions as you drive. When you reach the destination, it presents a Google Street view. This really surprised me when I stopped and it showed a photo of the front of my house.

Maps – Google maps, satellite view and Street View, just like on the PC. Nothing seems to be missing.

Car Locator – This is a small GPS program that lets you quickly set the location of your car and then find it later using a directional arrow as you walk with the distance in feet or meters. $3.

Kindle – This is a Kindle book reader; there are versions available for many other devices including PC's. The library of digital books you own here are identical to your Kindle. If you stay connected on both, it tracks your last read page so you can switch devices and not lose your place. It's wonderfully readable. It's not a substitute for the Kindle if you own one, but it's handy, and if you happen to own a mobile phone, there's no real need to buy a Kindle if you don't want to.

Alarm Clock – You simply add alarms; each has its own settings for sound, snooze and vibrate and appearance.

Kitchen Timer – A free app to track three time settings with alarm at the end. I'm using this every day.

Contacts – An excellent contacts database that is integrated with the Phone, email and IM. You can search and select favorites and list of last calls. It's fully synchronized with Google Calendar.

Weather - AccuWeather.com real-time continuous weather at any multiple locations you select, with 5-day forecasts. Drill deeper and you can get animated radar.

FTP – A free app that is an FTP file server. When turned on, it exposes the entire phone file system to my network wirelessly. A few shortcuts placed in my Windows Explorer and file transfers are trivial. I find this to be the fastest way to drag and drop pictures on and off the camera.

Tether – Provides pretty fast Internet service to my notebook via USB cable anywhere I have 3G telephone service. With Verizon, that's pretty much anywhere I'd go. Purchased for $16 and worth every penny. PDANet at http://www.junefabrics.com.

Dock – I bought a Motorola desk docking station for charging, but it also automatically displays an attractive digital clock and responds to alarms and dimming, the music player and just about anything else you can think of.

Voice Commands – An app with a library of voice commands that you can use to control the device. It makes dialing by voice easy. I may give up the hands-free device I have in my car.

Google Talk – This is Google's version of Instant Messaging. It works great, and transferring files is quick and easy. You can use voice to text if you wish, eliminating typing altogether. The Voice to Text is very good, accurate enough for IM and then some.

Google Voice – VOIP – This is real Voice-over-IP, but wherever your phone is, without eating into your minutes. It's integrated into Contacts as well. It's well thought out and easy to use. My sons and I are using it regularly for long distance.

Droid.....Continued on page 5

Internet Picture of the Month

Text To Movie

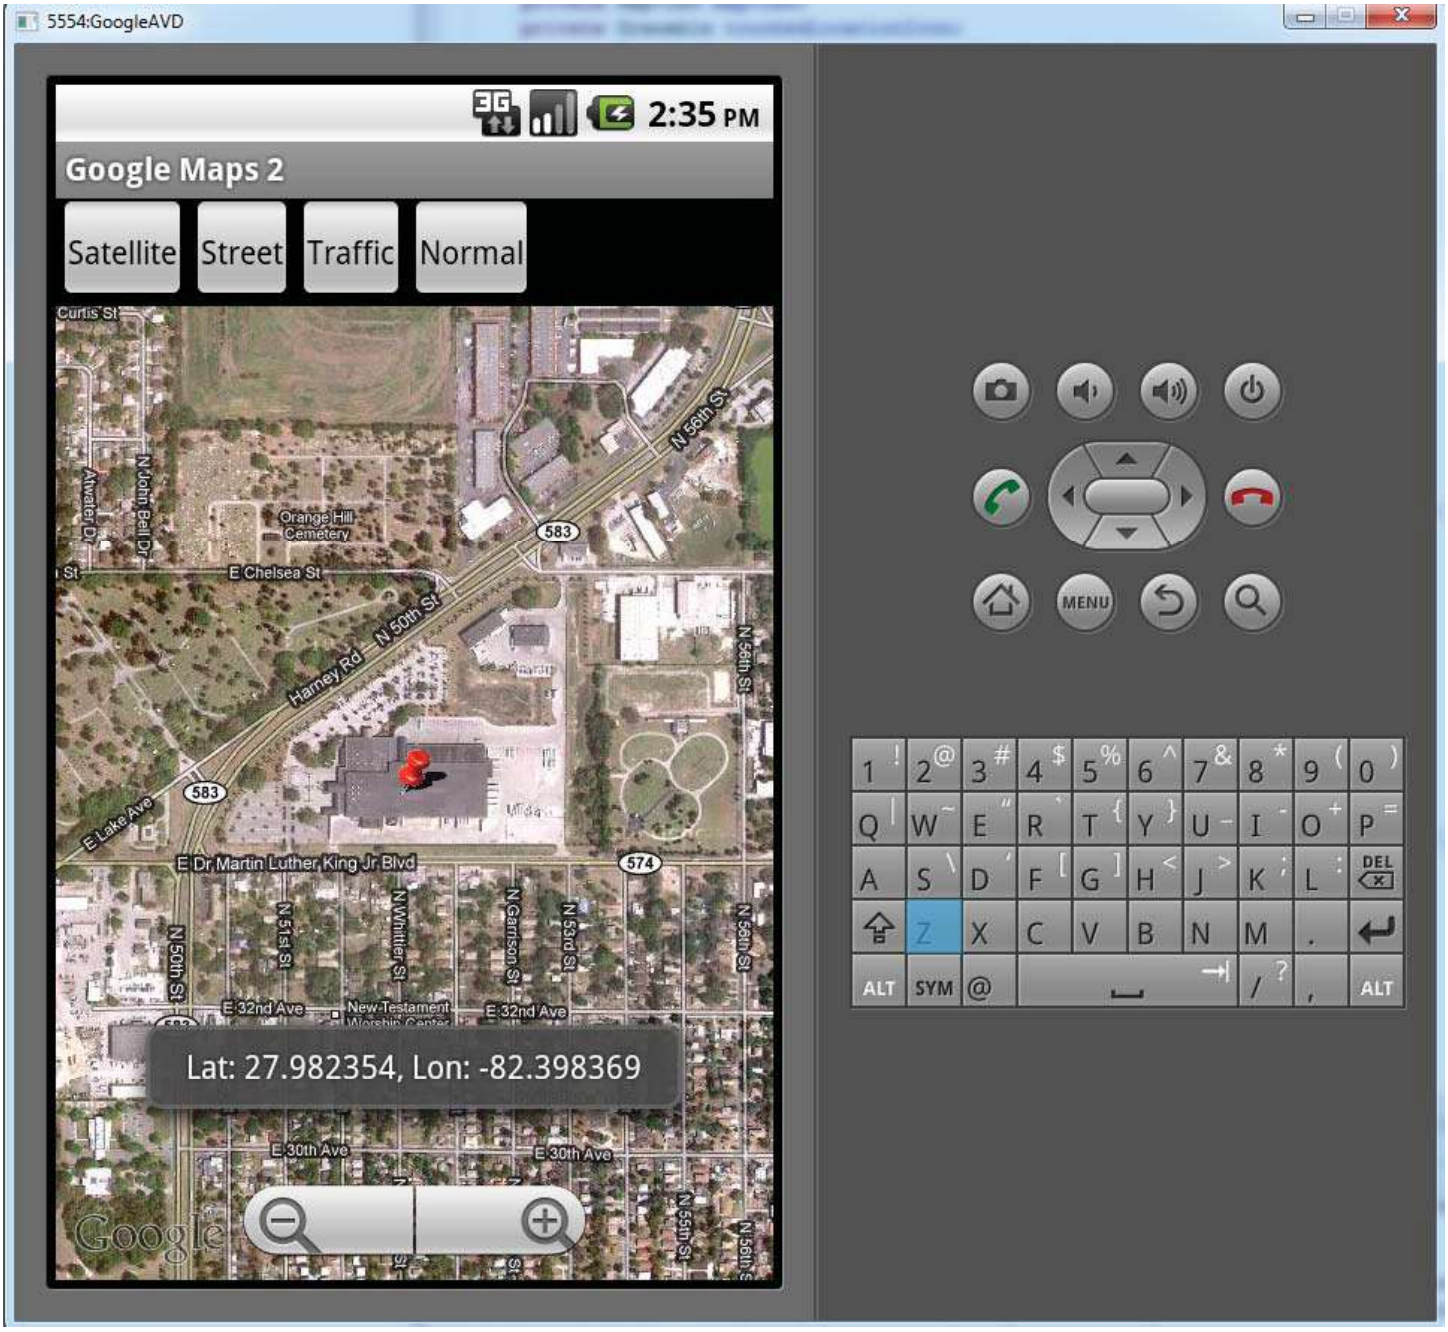
The image above is a screen capture of a YouTube video produced using xtranormal's text to movie program. This particular one at http://www.youtube.com/watch?v=FL7yD-0pqZg shows the female bear (in blue) telling the male bear how much she wants an iPhone, and he is telling her it is not as good as the HTC EVO. There are many such movies out there made by people using the xtranormal software. I found some of the ones about Ben Bernanke and the economy particularly amusing. Go make your own movies (http://www.xtranormal.com/).

Droid.....Continued from page 4

Email – Well, it's email. It's the mail that I get from my mail server. I do reply to email from the phone when I feel I have to, and, since the voice-to-text feature works here as well, it's pretty easy.

Calendar – It's pretty good, completely integrated with Google Calendar.

Voicemail – Google voicemail takes your voicemail messages, translates them to text and places a message on your phone to read or play – your option.



Music player – There's a sync app that detects when you're plugged into a PC and syncs your PC music to the device. There's also a DLNA app that plays media from a network with a media server. Otherwise it's a decent MP3/WMA player that also does videos.

Camera – An 8 Megapixel camera with face detection and panorama stitching. It has two fairly bright LEDs for

your apps onto a phone you own so as to be able to test them on an actual device and not just on an emulator. But, at present, I cannot write a Windows Phone 7 application and give it to you so that you would be able to install it on your Windows Phone 7. The same is true for the iPhone. Supposedly this is to save you from rogue applications, but it obviously also makes money for the app store.

What I would like to do in the remaining space is outline the process I went through to be able to write programs for the Android phone. What is needed are several downloads and some configuring. First you need to get the Java runtime (the thing that many of you are probably always being reminded to update when you start your computer--at least that is the case for me) and the Java SDK. The next piece of software is the Eclipse program. Then the fun begins in trying to configure everything.

Here are the steps I followed in setting up everything.

Comments.....Continued on page 7

Special Interest Groups

Visual Basic .Net SIG (and sometimes Access SIG)

This SIG meets the third Wednesday of the month at 6:30 PM. For information, contact Editor William LaMartin at william@lamartin.com.

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Member Bob LaFave moderates the discussion.

Comments.....Continued from page 6

That will be followed by links that were very useful.

Steps

1. Install Java runtime and Java SDK. If you are getting them for a 64-bit system, then you need to do the downloads using a 64-bit browser.
2. Install Android SDK: just put the folder in the C:\ directory
3. Add the Tools directory of the Android SDK to the system path variable
4. Install Eclipse: Just put the folder in the C:\ directory
5. To be able to run Eclipse, make a shortcut on your desktop with the property C:\eclipse\eclipse.exe -vm "C:\Program Files\Java\jdk1.6.0_23\jre\bin\java.exe"
6. Install the ADT plug-in in Eclipse: From Help, select install new software, then select the ADT plug-in (https://dl-ssl.google.com/android/eclipse/)
7. Modify Eclipse preferences (Window | preferences) to point to the Android SDK directory
8. Create an AVD (an emulator with the properties of a particular phone)
9. You are ready to start programming.

A good walkthrough: http://android.marvinlee.net/2009/07/start-development-android-sd/

If you are going to use the Google maps, then you will need a Google account, which is free, and then a Map API key, also free. There are tutorials on how to do all of this – just do an Internet search.

Anyone can be a programmer (with a lot of work). ◆

Droid.....Continued from page 5

flash and plenty of manual settings. Very good zooming, as you'd expect with 8MPixels to work with.

Camcorder – The camera also functions as a 720p HD video recorder. The device also has a mini HDMI port for playing to an external device such as a wide screen TV. It comes with a 16GB SDHC card.

Slideshow and picture management – naturally.

Password management I use the PC version of KeePassX, and I was delighted to find they make an Android version. Free.

Swype - I saved this for last. It's an alternative screen keyboard that allows you to enter a word by sliding a finger from letter to letter. It uses error-correcting algorithms to guess the word and presents alternatives. A world record was set on a touchscreen and Swype using a Samsung Galaxy S. The world record text message consists of 26 words and was typed in 25.94 seconds, which corresponds to a speed of 60 words per minute.

Droid.....Continued from page 7

The few things I don't like It's a mystery to me that Android applications don't have an exit or close. Instead, they stay running until you either shut down each service manually or turn off the phone. I'd guess the up side to this is that everything launches very quickly. It's so fast in fact that you take it all for granted. I haven't found a disadvantage to this, although I've read complaints that it must be taking up cpu cycles and therefore must be draining the battery and contributing heat to global warming. I guess I doubt all that, but what I really don't understand is why I find apps such as Skype running when I've never used them. There are programs you can purchase to help you manage these, but it's also widely held that you'd live a calmer life if you just ignored it all. Finally I did read a built-in tutorial recommending that you turn the phone off once a day to clear out unused programs in memory.

Second, in spite of the claim of 220 hours of standby and 480 minutes of talk time, this thing eats battery. I'll admit I pretty much actively used it all one day for 10 hours and ran the battery down. I used it for phone calls very little. The display, when on, eats most of the battery, so a continuous charge is necessary if you're going to use it for navigation. There's an extended battery for $50, which is way too much. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

This is turning out to be a particularly tough newsletter since, as I sat at the computer just four days before we usually print and assemble the newsletter, I had no articles. My usual handful of contributors seemed to have run out of ideas (or time) and the rest of the club is in a prolonged dry spell. Then Ron Weinberg came through for me, for which I am very appreciative.

The past and the present

The *Bits of Blue* used to be 12 pages instead of the current eight, and the print was 10 point instead of 12. However, we did use articles from other groups and there was a boilerplate page at the back with a list of members and the software items they were willing to give assistance on. We also had free software given to us by vendors that we could provide to members in exchange for reviews to appear in the newsletter. But that was then, and things are different now: There is no free software, we have many fewer members, and the excitement and newness of

Minutes of the January Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) normally opens our monthly meeting. The meeting began at 6:30 PM. The SIG is devoted to a discussion of all aspects of the Windows Operating Systems and of computer-related subjects in general. The SIG moderator, Bob LaFave, introduces new or little-known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees. Bob leads the group in finding answers to questions and solutions to problems. This month's SIG concluded at 7:00 PM.

The very brief business portion of the meeting was opened by John Witmer, Tampa PC Users Group President.

The presentation was "More Windows 7," a second attempt at showing the unique features of the newest Microsoft Operating System. It was conducted by myself, Merle Nicholson, and went from approximately 7:10 to 8:40 PM.

During the course of the presentation, there were many questions from the membership relative to computers in general, including an endorsement of the Amazon Kindle. All attempts to structure the material and keep on the agenda failed, but it was deemed an overall success by many attendees.

Subjects covered included a newly-installed user account intended for my dog and the limitations a dog has in using a computer. We migrated through the default Start Menu and some of the adjustments you can make to customize the desktop. An emphasis was put on the real necessity to learn the basics of the file structure of a computer to help you find files when they're "missing." A brief mention was made on the subject of passwords and the necessity of having a password database of some kind. Bob LaFave had touched on RoboForm earlier and Merle endorsed

Minutes.....Continued on page 8

How we got to watch our first streamed movie

By Ron Weinberg, Member-At-Large,
Tampa PC Users Group
rswjbr@verizon.net

Since my earlier article "Uniting The Internet and Your TV" (April 2010), the use of rented DVDs to watch movies continues to rapidly decline and streaming will likely become the standard method, leaving rentals for occasional users and those who may lack proper equipment.

In that article, I enumerated many devices and methods for the task, a list which now includes game consoles, iPhone, Windows Phone, and iPad. Expect other tablets to be included soon. Availability notwithstanding, most people prefer to watch movies on big screens rather than small.

As avid movie fans, my wife and I watch several films each week. We are Blockbuster members, Redbox users, and theatre goers, generally avoiding Video on Demand. I have been anxious to try streaming to simplify things, no disc to mail or take from or to a store or vending machine and no bad weather issues. I chose Netflix because of reputation, availability, and price. Unlimited streaming is 7.99 per month, and currently there is a one-month free trial.

Alas, my new HDTV purchased in 2009, which has an Ethernet port, was supposed to have an app making it easy to connect to Netflix directly using only my router. This would require connecting the TV to the router by Ethernet cable or wirelessly. Running an Ethernet cable would have been awkward. An alternative would have been to purchase a pair of relatively expensive Power Line Ethernet adapters, or a less expensive $69 wireless adapter, to plug into the TV's USB port.

I waited for the Netflix app for the TV, but it never became available for my model TV, so I had to consider one of the other options. We had been considering a Blu-ray player, so we killed two birds with

one stone by buying a Samsung Blu-ray player with a built-in wireless connection. This player includes the Netflix app, as well as other apps.

Our ISP is Verizon FIOS, and there was one issue concerning streaming with wireless that could present a problem.

We are using a Verizon-supplied FIOS 9100EM Router. This is a Wired and Wireless G Router. Reading blogs and reviews, there was a question as to whether or not Wireless G was adequate for faultless streaming.

Some said yes, some said no, but those who said no recommended Wireless N.

Verizon has been promising to offer Wireless N capability but so far has not delivered. Several alternative methods for using Wireless N with FIOS are available, such as connecting a second router as primary, secondary, or bridge. Instructions for this are readily available from the Verizon FIOS site, router manufacturers and independent sources.

I took my wireless laptop close to the Blu-ray player and determined that I was receiving a strong wireless signal there. So, I decided to take a chance and try using the existing Wireless G connection. If that was unsatisfactory, I could then pursue one of the other options.

I opened a Netflix account and selected the equipment I was using (Samsung Blu-ray Player). The first time I

Streaming.....Continued on page 4

Streaming.....Continued from page 3

started the Netflix app on the TV, I was asked if I had an account. When I replied yes, a code number was generated. This code had to be entered into my Netflix account to activate the device. Once activated, I have unlimited access to the library of films. No code entry is required for normal use. The process is simple. It may vary slightly on other configurations.

Turn on Blu-ray player, which is connected via HDMI to the TV. This automatically powers on the TV. Select Internet from Blu-ray Options, and then select the Netflix app.

That evening we watched our first streamed movie. Results were excellent. After a short wait for loading, the film came on. Sound and color was the equal of DVD quality. The film can be paused and restarted and, if turned off, can be restarted from where it left off. So far, we are highly satisfied with streaming, and it is easy to see why this delivery method is predicted to be a winner. ◆

Comments.....Continued from page 1

computing has long ago worn off. For most, I think, computing has turned into entertainment and something called social networking.

A look back over our old newsletters easily demonstrates the changes. We have newsletters in Acrobat format at our web site starting in 1988. There are two from 1988, eight from 1989 (we do not have newsletters for the missing months) and the complete years up through 1993. These were scanned in from printed versions and then had optical character recognition performed. The years 1994 and 1995 remain to be scanned. Starting in 1996 through last month's January 2011 newsletter, we have Acrobat versions that were made directly from the creating program: Microsoft Word for a few newsletters, then Microsoft Publisher for many years and, finally, Adobe InDesign for the past couple of years. That is more than 20 years of personal computing history. Perhaps when I manage to scan in the 1994 and 1995 issues, I can put them all on a CD, 1988 - 2011 and have Acrobat (full version) index the collection so that the entire group is searchable and not just each individual issue. That might be something of interest to the group. Right now, those issues make up around 271 MB of data.

Instead of updating your Facebook page, you could then read all the articles about Word Perfect, Corel Draw, Hayes modems, Windows 3.0, OS/2, 486 computers and 500 MB hard drives. All these items were very exciting to the club at one time. Then there was the beginning of the Internet for the group, with Prodigy and AOL. And there was President Harvey Bruneau reporting to us each year on the excitement of his visit to COMDEX in Las Vegas.

But all this is past, and time marches on. Apple, a company almost unworthy of mention in those years, is now threatening to take over the consumer computing world with, of all things, a computer masquerading as a telephone called the iPhone. Right now these iThings seem to be proliferating like rabbits. There is the iMac, iPod, iPhone, iPad, and suggested by some wags, the soon-to-be iToilet, since it appears that anything with an i in front of it and sold by Apple will produce a line of people wrapping around a city block in all sorts of weather so as to be among the first adopters.

Microsoft, which has provided so much joy (and pain) to us PC users over the past 30 years, has now been pushed aside and relegated to the trash heap of old ideas by a good portion of the computing press, to be replaced by Google and the aforementioned iThing company, Apple. Google, an advertising company that dabbles in computer software so as to create other platforms for its advertising, is supposedly to soon one-up Microsoft by allowing us to do everything we need computer-wise using only a browser and storing all of our data in the Cloud. They are even working on their own operating system that will support this browser-for-everything paradigm and thus free us from the terrible burden of needing Windows or Microsoft. No more need for software, and, hence, no more need for Microsoft. All software will now be free. All you need do is allow Google to watch everything you do so as to better target you with advertising.

Comments.....Continued on page 5

Comments.....Continued from page 4

Apple, which also sells regular computers that surprisingly allow Windows to be installed, has created a tablet, the iTab, that, according to some in the press, will, once it is refined in later versions, allow its users to do all the computing that the average person (read social media type) will need without a keyboard or mouse. You will just move your fingers around and get things done. Sort of like finger painting, I suppose.

But enough of this. Otherwise you will think that I am not a progressive person, willing to accept change and all the good things it brings. But you would be wrong; I applaud Google for what they have done with their search engine and Apple for their improvements in the smart phone interface. I was using a search engine (recall AltaVista) and a smart phone (recall Windows Mobile) long before Google and Apple introduced their versions of these items. So they weren't the first. But they did introduce a better product. However, I now think Bing (from Microsoft) produces nearly as good search results as Google. And from what I have been told the new Android phones (using the Google Android operating system) are as good as, or better than, the iPhone. So time marches on. Today's winners may be tomorrow's also-rans.

We are running out of more than money

We are running out of web addresses. In a recent article in the Wall Street Journal, I read that there are now only 117 million left of the original 4.3 billion. What is an IP address? It is a number, such as 168.144.211.61, which is the IP address of the tpcug.org web site on the Internet. If you put http://168.144.211.61 in your browser you will get our site just the same as if you used http://www.tpcug.org. The TPCUG does not own that numeric adddress. It is part of a block of

Internet Picture of the Month

Year of the Rabbit in Gold

From the China Daily site at http://www.chinadaily.com.cn/china/2010-11/12/content_11541201.htm, we have: ".... a 1000g Year-of-Rabbit gold bar at a jewelry store in Suzhou, East of China's Jiangsu province on Nov 11, 2010. To seize the market share, many jewelry stores start to sell new designs for the upcoming 2011, the Year of the Rabbit in Chinese lunar calendar."

At around $42,000, I will take that over a real rabbit.

Comments.....Continued from page 5

IP addresses allocated to our web hosting company, myHosting.com, and they assigned it to us when I first set up the web site many years back. We do, however, own the domain name tpcug.org.

The system now used is called IP version four, or IPV4. The new system created to fix the problem is named IPV6 and has 4.3 x 10^{28} possible addresses. That is a very large number. To read more about IPV6, check the Wikipedia article at http://en.wikipedia.org/wiki/

According to the WSJ article, "....the transition – likely to happen gradually over a number of years – won't have a big impact on consumers. Some older operating systems and home routers won't work with the new addresses, but ones bought in the last couple of years should, according to networking experts."

You can test your IPV6 connectivity by pointing your browser to http://www.test-ipv6.com/. My computer failed; probably because Verizon does not support such yet.

Another very good article on all of this is at http://news.cnet.com/8301-30685_3-20029721-264.html.

Well, enough on the new IP address setup. It may not occur for a long time. However, one does wonder why 4.3 billion IP addresses is not enough. And there are actually many millions of those that, I suppose, have been allocated to hosting companies in large blocks but not yet used.

Photography

One of the primary uses of the computer for me is working with images taken with my digital camera or with images derived by scanning old negatives, slides or printed photos. The image below was taken just a few days ago at the annual Gasparilla Pirate Invasion. It was captured with a Nikon D200 digital camera using a 24 mm to 200 mm zoom lens. Very little work was needed to move this image from the camera to this newsletter.

I snapped around 385 photos on Gasparilla Day – people and floats. The floats are pretty much the same from year to year, but the people vary. And it is a great day for people photos since many of those there are there to see and be seen. Also having a good zoom lens helps. Of the many thousands of people at the parade, I only saw three other people with digital SLR cameras (one was a *St. Pete Times* photographer). All other photos were being taken with phone cameras. I have yet to figure out how such cameras, with lenses the size of the tip of my little finger, can provide enough information to fill five or eight megapixel images, as these cameras supposedly do.

What to do with all these Gasparilla photos? First you select a collection of the better ones; then you make a slide show; and then you put that on the Internet for everyone to see. I selected 163, reduced each to a maximum dimension of 1000 pixels and then used Adobe Bridge (part of Adobe Creative Suite 4) to create a Flash slide show that you may view at http://www.lamartin.com/Gasparilla2011SlideShow/.

Special Interest Groups

Visual Basic .Net SIG (and sometimes Access SIG)

This SIG meets the third Wednesday of the month at 6:30 PM. For information, contact Editor William LaMartin at william@lamartin.com.

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Member Bob LaFave moderates the discussion.

Comments.....Continued from page 6

While watching the slide show, you are supposed to be able to pause the show, then right-click on it and select Zoom In and then be able to left-click and move the larger image around your screen. This works on my laptop, and, for several people I asked to try it, on their computers. However, on both my desktop computers, when I zoom in, I lose part of the image off to one side and am only able to left-click and move the image just a tiny amount. Perhaps someone can figure out why this is happening. Is it because of a setting, a mouse driver, a video card, or a video driver?

The black-and-white photo on this page is from another era, and a lot of work was done before that image appeared here. First of all, that image is from 1946, probably taken with a press camera, and what I had to work with was the negative – a 64-year-old 4" x 5" negative. The photo was taken by my father-in-law when he was living in New Orleans, as part of an article about Mississippi River pilots for the *Saturday Evening Post*. I had earlier scanned this negative, along with many others, from that era using my Epson Perfection 3200 Photo scanner. Unfortunately, I cannot use this scanner with my new Windows 7 desktop computer since Epson has made no drivers for Win 7. Eventually I will need to get a new scanner to use with what is now my main computer.

A few weeks back, I decided to find the old *Saturday Evening Post* that contained the article and do something with it and the photos of the river pilots at Pilottown, Louisiana. What I did was use Adobe Acrobat Professional to scan in the magazine article, with its color photos, as a number of different Acrobat files. I then used Adobe InDesign to create a 5-page article from these separate Acrobat files, which I then made into one final Acrobat file.

For the 21 black-and-white photos, I used Photoshop to clean them up a bit since they had a few scratches and dust spots. I also adjusted the brightness and a few other things, depending on the particular photo, and added my father-in-law's last name to the corner of each image. After all, these were 64 old negatives that hadn't been kept in archival conditions, so a little work was expected. Finally, I used Adobe Bridge to create a slide show of the 21 photos.

Comments.....Continued from page 7

You may view the *Post* article and the slide show at the Photos section of my website, lamartin.com, at http://www.lamartin.com/Pilottown.aspx.

These 4" x 5" negatives have lasted in fairly good condition for 64 years. How long are my digital files of the Gasparilla photos going to last? I will continue to copy them to new computers as I get such, along with copying them to external drives and then to newer external drives. But are any of those drives going to be around and usable 64 years from now? I know I won't be here. How long will data persist on a flash drive? Do we yet have the equivalent of a film negative for digital data? ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

We have three contributors this month from whom we haven't seen anything is some time. Welcome back to Larry Anders, Bob Davis and Doug Mullis. More will be expected from you in the future.

Old Newsletters Last month I mentioned that we have newsletters at our web site running from 1988 through the present. The ones before 1995 are in the Old Newsletter section and were scanned into Adobe Acrobat from the paper newsletters instead of being created as Acrobat documents by the original desktop publishing software. I also mentioned that the issues from 1994 and 1995 had not yet been scanned. Well, that is now done, and they are at the web site. You can now view and search these old newsletters.

Actually, I am not happy with the quality of some of the earlier newsletter scans. I have redone some of them, but some of the

I had been highly opposed to Apple products for years because of what I feel to be the small-mindedness of Steve Jobs and the Apple management by not making their code available to developers, which would allow software to be developed so there would be more choice at reasonable prices. If so, I'm sure there would be a Mac in my house instead of just seven PCs running various Windows operating systems.

Above, you'll notice I said "had" been. Then I purchased my first iPod, and I was hooked! I did not get the first version iPhone, but I have had the 3GS now for almost two years. It is about the 10th cell phone I've owned and by far the very best. I have been tempted to try an Android phone but so far have had no reason to give up the iPhone. The Apps for the iPhone make it an everyday challenge to find something useful, and typically for free. Why Mr. Jobs can't see that allowing all these people to develop software for the iPod/iPhone/iPad has made his products extremely successful is beyond my understanding. He has still kept control by not allowing anything to be installed except through the iTunes App Store store. Even the free Apps. If something similar was allowed for the Mac, I think he would see the popularity of the Mac increase also. I just can't validate paying twice the price for software just because it's a Mac. It's good, but not that good.

For Christmas I was given an iPad by my wife and kids. Now, you want to talk about what I think is the best invention of the 21st century. Since December, I use my PCs at least 50% less. My iPad sits next to me on the couch when it is not in my hand. Email, Messenger and text messaging is with me now whereever I am, between the iPad and iPhone. The two are very similar, but the 9" screen on the iPad is much easier to read and work with.

The iPad comes with several built-in Apps, such as Calendar (to track your appointments), Notes (to keep lists of things), Maps (complete Google maps), Videos (to watch your favorite videos), YouTube, iTunes, App Store and Games. They also include Safari (Apple's Internet browser), Email, Photos (access to your photos, graphics and screen captures), iPod (for music) and Contacts. That's plenty to keep you going until you learn how to start downloading some of the thousands of Apps available, with more coming every day. If you're into anything, there is probably an App for it. Also, there are free Internet music-streaming sites that will allow you to listen to any kind of music whenever you want, with no hiccups.

The battery is excellent. With my constant use, I still get two to three days between charges, and the recharge is very fast.

Apple has also released iBooks, which will probably be a permanent fixture in the next iOS upgrade. In my opinion, it's one of the better (free) eBooks reader programs. If you're used to using Kindle, Google or any of the other readers, there is an App out there for that, too. I downloaded a free App the other day that makes 23,469 classic books available at your tap. And I did say free.

One App I especially like is the Dragon Speaking App, for both the iPhone and the iPad. There is no need to type. Just start the App, push Record and start talking. It recognizes when you stop, allows you to insert commas, periods and new paragraphs. When you're done with the dictation, tap Copy, then paste it wherever you want, or tap Email and it will send it directly into your email. Oh yeah, did I mention it was free?!

iPad.....Continued on page 4

iPad.....Continued from page 3

The iPad does not come with a text program, like the iPhone, but there are several free Apps that will take care of this problem. I use one that I am more than happy to pay for but see no reason to do so as the developers do not ask me to. There is a small unobtrusive ad area in the lower left corner and that's it. The same with Messenger.

I am currently using Dragon Speaking with a free App called Documents to create this article. Documents allows you to review and edit Word and Excel documents. I wouldn't expect to be able to work on some gigantic files. I expect a version of Word and Excel to be out soon, assuming Apple will allow a Microsoft App to infiltrate their domain.

Another thing I am really pleased with are Apps available for our younger computer users. My daughter and son-in-law both have iPads, so my 5-year-old granddaughter is well-versed on using the iPad. I typically get her to teach me some secret thing when she comes over on the weekends. I spent a lot of money for the overhead movie system in my Tahoe for her to be able to watch movies, etc., when we are in the car. Lately, though, she would rather have my iPad while we are driving around. There are some excellent educational Apps (free, of course) that help teach her to read, do math, draw and all sorts of other things.

As some of you know, I am a cancer patient. I spend hours at a time at Moffitt Cancer Center waiting between treatments. The WiFi connection at Moffitt is excellent, and, with the iPad in hand, cancer treatment is so much more pleasurable (if that's really possible).

In any case, as I have thanked Bill Gates and the team at Microsoft in the past for making computing enjoyable with Windows, I now need to thank Steve Jobs and the gang at Apple for heading in a new direction and once again making computing enjoyable. I can't wait for the 22nd century to get here!

Reviving My Apevia PC

By Robert Davis, Tampa PC Users Group
RobDavis7@verizon.net

Last Sunday afternoon I powered up my financial PC, got a cup of coffee, and returned to find it wasn't powered up anymore. I hit the power on button, the lights flashed and went out again. It also had a bad smell to it. Not the best way to start the afternoon! This is a PC that has all our financial records on it, and I hadn't backed up the data for a couple weeks. When I opened the box, the smell appeared to be from the power supply. I called Bob LaFave who said if the power supply stinks it's probably bad. I thanked him for calling back and said I would call if replacing the power supply didn't fix the problem. I have an old dead PC lying around with a good power supply in it. So I pulled both power supplies but found the old one didn't have a four-pin plug added on the motherboard power socket. Not being sure what that meant at the time, I went to CompUSA and was fumbling through the many power supply selections. Another guy who was gathering stuff to build a PC came over and explained about the power supplies. My new PC has a P4 motherboard, which requires the extra plug. My old PC was not a P4 type, so the power supply was not right for my newer Apevia PC. Of course, all the new power supplies are equipped to handle the P4 and more.

Unfortunately, the guy took the last of the 600-watt power supplies that were on sale, so I had to settle for a 550-watt unit for about $10 more. But I figured the $10 extra I paid by fumbling around there was the price I paid to find out what to buy. My original Apevia system came with a 350-watt power supply. I had talked the salesman I bought it from a couple years ago into adding a CD ROM drive, and a 3.5" disk drive. They also had added a second hard drive. So I think what happened is the 350-watt power supply was straining all the time to handle all the extra load and finally died. So a 550-watt power supply should be able to handle the extra load without a problem.

I installed the new power supply, even though it had

Reviving.....Continued on page 5

Reviving.....Continued from page 4

several extra cables with odd connectors that I had no idea what they were used for. I bundled them up out of the way. Then came the challenging smoke test. The system came up without a hitch. You know, the first thing I did was back up that data! It may be my imagination, but it seems the PC is running better now than before. Anyway, I'm a happy camper again. ◆

Comments.....Continued from page 1

1991 and all of the 1992 and 1993 ones would be improved by a rescanning. The software I am using now for scanning does a much better job on the old newsletters than whatever software I had used before (I can't recall if I did them with HP or with Epson programs). And that brings me to the next topic.

VueScan, which is a scanning program from http://www.hamrick.com/. I have mentioned that I could not use my Epson Perfection 3200 Photo scanner with my Windows 7 desktop computer since Epson has not provided any Windows 7 64-bit drivers. So I was still doing all my scanning using my Windows XP desktop computer. I had thought about purchasing a new scanner, possibly the Epson V600 Photo scanner, which has a 6400 x 9600 dpi hardware resolution, while my older scanner has a 3200 x 6400 dpi hardware resolution. The 600 costs $200. I think my Epson 3200 scanner was around $330 and, to my surprise on checking just now, is seven years old. Perhaps I did need a new scanner. However, the old scanner produced document scans that were more than satisfactory, and, in performing negative or slide scans, I noted that my negatives and slides did not benefit from using the highest resolutions the 3200

Internet Picture of the Month

McDonald's at
98 Boulevard Saint Germain, Paris

This photo is from http://www.flickr.com at the link http://www.flickr.com/photos/mckroes/242517306/. The person who placed it there has a collection at flickr devoted to photos of McDonald's locations from around the world. If he took all the photos listed there, he is quite a traveler. The link to that collection is http://www.flickr.com/photos/mckroes/sets/72057594069544156/with/242517306/.

My interest in the photo was because of the address, which was the address for a restaurant on a business card my father-in-law brought back from Paris in the 1930s. The restaurant was the Grand Restaurant Des Écoles Réunies. Now it is the Grand McDonald's, I suppose. Time marches on.

The 2011 FACUG Technology Conference at Sea

By Doug Mullis, Treasurer, Tampa PC Users Group
dmullis@tampabay.rr.com

Well, you really missed a good experience at the end of January. The Florida Association of Computer Users (of which our group is a member) had their second annual conference at sea, sailing from Tampa while going to and from Cozumel, Mexico. Harry Lockabay and I did our best to represent our group. We even took our wives. Harry is an old hand at cruising, but this was my first cruise. Bruce Register (a former member) now residing in Dothan, AL and his daughter were also along. I can tell you the seas were calm and the weather perfect.

This was FACUG's second such event, as last year they sailed to the Bahamas for their conference. Bruce also went on that one. The only down side of this cruise was that we did not leave Tampa until 3 AM Friday due to repair to one of the propeller pods. No rudder on this ship; in fact, you couldn't tell when it was moving. We ran on both gas-turbine engines, making up all but two hours of our 10-hour delay.

The FACUG sessions were held between 2 PM and 5 PM on Thursday (while still in port) and from 8 AM to 5 PM the two days we were at sea. I attended about half in order to spend time with my wife, who didn't want to attend the conference. Neither one of us had sailed before, so there was a lot to see and experience. The conference welcoming speaker was Dave Dockery of the Clearwater/Largo group followed, by the FACUG general meeting led by President Sam Wexler. The next speaker was Abby Stokes, encouraging people over 39 not be intimidated and to get with current technology. She addressed seniors the next day, encouraging them to buy a computer (and her book on how to use it). Abby is a good motivational speaker, as is Dave Dockery.

As I have been to several FACUG conferences, I can tell you this was the typical conference, with a number of vendors pushing their products (Adobe, Tech Smith, Corel, Zoom Text, Microsoft, Smart Computing and User Group Relations). Not all vendors were presenters but all contributed door prizes. The door prizes and the food have always made these conferences worthwhile. The prizes are not as large as they used to be but there are many.

Other presentations dealt with user group problems and presentation ideas. I enjoyed Abby Stokes' presentations, two by Bill Campbell on taking and making the most of your photographs, and how to get the most (ink mileage) out of your printer by Jere Minich. There were several sessions by Evelyn Watts on Corel VideoStudios Pro X3 and Corel PaintShop Pro. Two or three sessions often were scheduled at the same time in adjacent rooms so you could choose which was of most interest to you. I missed the sessions on how to sell on ebay and shop online. There also was a session by Carey Holzman on security, passwords and backups. Overall we heard that smart phones are taking over the technology world.

Would I do it again? I've always enjoyed the FACUG 2-day spring seminars. Registration is usually $50 including meals. The cruise adds more. Would I go on a cruise again? I enjoyed it but the big draw was sailing out of Tampa. I was really impressed with The Radiance of the Seas. Next year they are back to sailing from Miami. I've seen Cozumel but not Bermuda. I haven't made up my mind yet. Anyone want to go? ◆

Comments.....Continued from page 5

scanner offered. So a new scanner would possibly not improve my results. Nonetheless, I still couldn't use the old scanner with my new desktop computer. That is, I couldn't until I recalled the Hamrick scanning software which I had purchased many years ago. It was VueScan 7.6. If I could have found my information on that order, I could have possibly have gotten a free upgrade to the new 9.017 version. But I could find no documentation of that purchase.

The VueScan site offers two versions: Standard and Pro. The Pro version has several extra features; the only one probably of interest to most users would be

the free upgrade to newer versions. You can check if your scanner is supported. And I bet it is, since they claim to support 1,100 scanners. My Epson Perfection 3200 Photo scanner was there, along with my small Canon scanner I use if I want to take a scanner on a trip. There is no charge to download the software and try it (it puts a watermark on your scans). Once you know that it works you can make the purchase. It supposedly runs on 32-bit and 64-bit versions of Windows XP, Vista and 7. It certainly works well for me on Windows 7 64-bit for both the Epson scanner mentioned above and the smaller Canon CanoScan Lide 500F, which scans a standard letter-sized sheet but is very small and light and gets all its power from the USB connection. ◆

Meeting Preview: Steve Singer of RDI@TampaBay returns. This presentation will focus on phones and tablets using the Android operating system. As usual, Bob Lafave will conduct the Windows SIG for the first half-hour of the meeting..

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Android phones, part of the topic for this month's presentation, are giving the iPhone and Blackberry pretty good competition. According to Merle Nicholson, his Android is just great. I suppose the only thing missing from an Android phone is the ability to end each email sent with the tag line *sent from my iphone*. I see a lot of those, but for some fortunate reason the Android people don't add *sent from my Android*.

Regarding the picture of the month photo in the March newsletter, member Larry Andrers wrote: *Hey, I liked your picture this month. I've eaten at that restaurant several times. The hotel I stayed in the last couple times I was in Paris is right down the street from that McDonald's so I am quite familiar with it. Thanks for the memories.*

Nancy Cottrell The TPCUG lost long-time member Nancy Cottrell last month. She died March 27 at age 72. I have no idea of when she first joined our group. I have photos taken

Minutes of the March Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) normally opens our monthly meeting. The meeting began as usual at 6:30 PM. The SIG is devoted to a discussion of all aspects of the Windows Operating Systems and of computer-related subjects in general. The SIG moderator, Bob LaFave, introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees. Bob leads the group in finding answers to questions and solutions to problems. Discussed during the March SIG were questions about monitoring network resources in Windows 7, Backup and Restore and creating restore disks for both Acronis and Windows 7 Backup and Restore. Also, the IEEE 1394 Firewire was discussed, and Bob did a quick mention of Google Cloud Printing. This month's SIG concluded at 7:05 PM.

John Witmer conducted a brief business meeting and mentioned his election as the treasurer for FACUG, the Florida Association of Computer User Groups. John noted the next January "2012 FACUG Technology Bahamas Cruise" is January 23rd through January 27, 2012. See registration details at http://www.facug.org/Conference/2012/2012conference-Reg2.asp

Our speaker for March was Bob Gostischa, a volunteer speaker for Avast! Anti-virus software. Bob displayed a detailed slide show about the present state of virus infections, who is doing it and why. For instance, 85% are through web pages and 15% through infected devices. Surprisingly, 6 out of 10 legitimate websites are infected in some way. He detailed the various ways anti-virus software detects viruses and recommended some free scanners to help clean up your infected PC. Thanks for an excellent program, Bob. ◆

Keyboards and Stuff

By Merle Nicholson, Secretary, Tampa PC Users Group
merle@merlenicholson.com

I've modified and programmed keyboards, trying my best to optimize my time at the computer. Not that I don't enjoy my computer and the things I can accomplish, but, first, I'm a lousy typist, despite having practiced continuously since 1976, and, second, I hate messing with things that are obviously flawed. Keyboards are all flawed, that's a given. Here's how I'm coping.

I pretty much settled, a couple of years ago, on a Logitech Gaming Keyboard model G11. It's been succeeded by a model G510 ($106 at NewEgg), which is only slightly improved from the G11. I'm always on the lookout for new keyboards, but so far I haven't found anything else to excite me. The G11 is distinguished by 18 programmable keys, key backlighting and multimedia controls. The G510 is the same except the backlighting is probably better and it has a small multipurpose LCD screen. It's the backlighting and programmable keys that make it worth it to me. The picture to the right is the left side, showing the key arrangement and my labels.

You can use these 18 keys in 18 times three ways (54) because there are three buttons at the top of the array – M1, M2 and M3 – that will switch the whole bank of 18 to three sets. So far I haven't found a use for switching the banks. Eighteen seems to be enough, so it stays on M1. Programming is pretty versatile. It accepts macros, shortcuts, functions, text and a scripting language, so I'd guess that you'd be hard pressed to find anything you couldn't program.

The bottom three keys in the picture are pretty obvious: They're a replacement for Ctl+X, C and V. I use these three constantly, since I'm a real believer in cut, copy and paste because I make a lot of mistakes and need to avoid typing as much as possible. The next set up is new for me, marked 1 2 3. They (and cut, copy, paste) don't need labels; I marked them for this article. 1 2 3 run a little program I wrote in VB.NET that will pop the mouse cursor to the center of my monitors 1, 2 and 3 and blip some eye-catching circles. The only disadvantage in using three monitors is finding the

Keyboards.....Continued on page 4

Keyboards.....Continued from page 3

mouse and how to get it where you want it. Problem solved: The buttons “Computer”, “F:”, “G:”, ”C:” and “D:” all just open Windows Explorer to those drive letters. “UP” moves Windows Explorer up one level in the directory tree, “close” closes the current window (it’s really Alt+F4, and a bit hazardous to use). “KP”, “outlook”, “IE” and “WAtracker” all launch programs and are used perhaps once a day. I’ll ditch any of these if I find any other use for the keys. “Date” runs another program I wrote to push the time and date into the clipboard ready for pasting. I use this, well,...sometimes.

There are several other ways to alter keyboards. I’ve disabled the “Caps Lock” key. It has no effect when pressed. It takes a complicated little registry change to do that, but just think about it; the only time I EVER use the Caps Lock is to switch it off after accidently switching it on. What a waste of keyboard space. Likewise “Scroll Lock.” I’ll bet not one in ten thousand keyboard users know what Scroll Lock is, and it’s on every keyboard waiting for an accidental bump. How about the “Ins” key? Although I probably would not disable it as I did Caps Lock, I’d like to at least disable it from an accidental bump almost all the time.

Now that I’m started on this – let’s look at Num Lock. Ok, I’ll concede that some people use it. But I do own three keyboards (two on notebooks) that have no numeric keypad. But Num Lock switches an array of character keys to numbers if you don’t have a keypad. More than once I’ve gone crazy knowing that I know the logon password on a computer that wouldn’t take. Guess what. The num lock was on, the password used characters U,I,O,J,K,L or M, and being a password wouldn’t show up on the screen. Man, I hate that.

What I really want is a 100% fully programmable keyboard program built into Windows. How hard could it be? There are programmable keyboards. One or two really are 100% programmable. Even some that you just place the key switches wherever you want on a slate. But I don’t want it bad enough to pay them $1500!

Pictured above: Logitech G510, NewEgg Item#: N82E16823126100 $106.

Also nice in my living room (think NetFlix): Logitech diNovo Mini Black 63 Normal Keys Bluetooth Wireless Mini keyboard Item#: N82E16823126039 $120, pictured to the right. ◆

copies of my computer backups.

While having a new storage cabinet delivered, I was asked to move one of the monitors on my computer desk just a little so as to avoid the possibility of the delivery people hitting it while placing the new piece of furniture. I complied and in the process knocked to the floor one of the external hard drives that was sitting behind the monitor. The floor is made of unforgiving quarry tile, and the drive no longer works. When connected to the computer, the drive has a light on it that lights and the computer beeps as it always should when a USB device is connected. But the drive is listed as an unknown device with no way to access the data on it. I downloaded the Western Digital Diagnostic program from their site, but it didn't detect the drive, so that was of no help.

What was on the drive? I know that there were several Acronis full-system backups of my main desktop computer, along with possible Acronis backups of my main laptop. I think there were also a lot of other data and image files that had been copied there, too. Of course, I have other Acronis backups of those computers on different external drives, but I was not sure about the data files and image files since I don't know what they were. I am 95% certain that I should have them on my main computer and thus also on any other Acronis backups of it. So nothing is really lost.

I ordered a replacement drive from Amazon with the new one being 2 TB, whereas the old one was 1 TB. The new one probably didn't cost any more than the smaller old one. The first thing I did was perform a complete backup of the desktop computer with Acronis, followed by Acronis backups of my two laptops. I then verified the Acronis backups. And I have also placed this new drive in a less vulnerable location.

The moral of the story? Look before you move something and have multiple backups.

New York Times Digital has moved to a pay-to-read format – that is, after you have read your 20 free articles per month. I have been reading *The New York Times* online for years; the same for *The Wall Street Journal*, except the *WSJ* has been charging me for years, with $155/year being the most recent fee. And, to me, the *Times* was the more important source of information, so I was ready to pay up if that is what it took to continue. However, I received an email from the *Times* saying that Lincoln was going to cover my subscription until the end of 2011. I suppose Ford hopes to sell me a Lincoln. My daughter received the same offer; however, my son in Manhattan did not. I suspect the offers went to longtime readers who were potential Lincoln purchasers, possibly based on zip code information. My son, living in Manhattan is not a very good candidate since almost no one there has a car. My daughter is certainly not a candidate for a Lincoln, but her zip code, the same as mine, may indicate otherwise.

Years ago when the newspapers began putting their publications online, they seemed to compete as to how much material they could put there and how well and timely they presented it. You could go to any of the major US dailies and see great news sites online. Locally *The Tampa Tribune* site was up there with the best in the nation. Then some papers thought about charging for access. I recall *The Miami Herald* tried that and *The New York Times* tried it for their premium content, whatever that is. The *Herald* soon dropped the pay plan since it had resulted in very few paid subscriptions. After a longer try, the *Times* dropped their premium plan. *The Wall Street Journal* is the only major publication I know of that instituted a pay plan and made a success of it.

Then everything fell apart. The papers' advertising revenues plummeted along with their readership, and the nice online versions were scaled back. *The Tampa Tribune* site is a mere shell of its past, at least in my opinion. *The New York Times* and *The Wall Street Journal* bucked the trend, their online versions improving, if anything. But all that takes money. So if you really care about in-depth news and not just a headline and a couple of paragraphs, you need to subscribe.

Your email, my email, everybody's email has been compromised. That is basically the message

Special Interest Groups

Visual Basic .Net SIG (and sometimes Access SIG)

This SIG meets the third Wednesday of the month at 6:30 PM. For information, contact Editor William LaMartin at william@lamartin.com.

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Member Bob LaFave moderates the discussion.

Yahoo! eGroup

By Kevan Sheridan, Vice President, Tampa PC Users Group
kevan@tpcug.org

The purpose of the TPCUG Yahoo! eGroup is to inform and promote communication among members of the Tampa PC Users Group. This is a great member benefit and the easiest way to stay in touch with other members during non-meeting days.

Joining the eGroup is simple: Use the e-mail address with which you wish to join the group to send an e-mail to: TPCUG-subscribe@yahoogroups.com. Include your full name in the text section of this e-mail. You will receive a verification request that you reply to, then you are up and running.

Note: if you join with a Yahoo! email address you get full access to the group site at http://groups.yahoo.com/group/tpcug

To post messages to the group, create an e-mail and address it to: tpcug@yahoogroups.com. Your message will be broadcast to everyone in the eGroup.

Use of the eGroup would include, but is not limited to:

1. TPCUG leadership

- Posting announcements of general interest to the members
- Notifying members of recent changes or additions to meetings or special interest groups
- Requesting feedback from members

2. The Members

- Further discussing topics presented in meetings
- Asking questions that were not answered during the Q/A portion of the meeting
- Posting announcements of general interest to membership or leadership
- Listing equipment, either for sale or wanted
- Holding discussions on consumer electronics or related topics and issues

You may also sign up for and access the Yahoo! eGroup from the link on the tpcug.org main page. ◆

Comments.....Continued from page 6

many of us have been receiving from businesses such as Verizon, Walgreens, Best Buy and many other companies that have farmed out to a company called Epsilon the sending of those annoying emails we don't want to receive anyway.

The message I received from Verizon says:

"*We have been informed by Epsilon, a provider of Verizon's email marketing services, that your email address was exposed due to unauthorized access to its systems. Verizon uses Epsilon to send marketing communications on our behalf.*

Epsilon has assured us that the information exposed was limited to email addresses, and that no other information about you or your account was exposed. "

Comments.....Continued from page 7

I wonder what other information about my account Verizon provided to Epsilon. Personally, I don't like the idea of a company I deal with farming out the data I provide them to anyone else. I bet they provided them with such info as my zip code and what sorts of phones I own. And since I have an account with Walgreens, what sort of information of mine did they give Epsilon? My address, my age, what medications I take? Who knows. So far I have not heard anything from my bank, but it was also on the list of companies using Epsilon to send what I consider junk email.

So, you can practice all the safe computing you want, but that will not stop some company you have a relationship with possibly doing you in. The people who stole all this info, by combining all they got from different sources about you, will now probably know almost as much about you as Google does. Happy computing. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Thanks to Merle Nicholson for filling up the newsletter this month. He writes about free programs and the Windows 7 Explorer.

I suppose many of you went out and purchased Android phones following last month's presentation by Steve Singer. I am still waiting for the Microsoft Windows Phone 7 to appear at Verizon. The latest guess now for that is the middle of May. However, my daughter has her eyes on an Android.

Another TPGUG member has left us. Don Patzsch died at age 91 on April 24. He was one of the longest continuing members of our group. A search of the old newsletters for the word Patzsch has him attending a meeting in May of 1990, where he won a door prize. According to the Adobe index for all our newsletters, the word Patzsch appears in 120 newsletters with 200 instances. However, since the early newsletters were scanned into Acrobat and then OCRed, the indexing for them may omit some instances. I then did a search for the word Don

Minutes of the April Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) normally opens our monthly meeting and began as usual at 6:30 PM. The SIG is devoted to a discussion of all aspects of the Windows operating systems and of computer-related subjects in general. The SIG moderator introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees. Bob LaFave, the designated moderator could not attend, so the April SIG was conducted by myself, Merle Nicholson. It concluded at 7:00 PM, and the regular meeting began.

Our April speaker was Steven Singer CEO of RDI, Inc., a wholesale computer hardware distributor. Steven has been a valuable presenter to TPCUG for many years. His presentation was on Android phones, being an Android user himself for several years. He mentioned several products available and software availability, tethering and "rooting". He answered many questions from the audience on a variety of subjects.

As always, a big thanks goes to Steven (pictured below) and to his wife Pam for a valuable and informative presentation. ◆

A dozen free PC applications everyone needs on a new computer

By Merle Nicholson, Secretary,
Tampa PC Users Group.
merle@merlenicholson.com

All of these are excellent quality free software. Most do not even have a paid version and are maintained by professional organizations. All are available from http://download.cnet.com/windows/, but I've included the source websites. I recommend downloads from cnet. The files are tested spyware free, and it's easy to use. http://download.cnet.com/windows/

VLC Media Player At the top of this list is the VLC media player from Video LAN Organization. It's an all-purpose audio player, which also plays all video formats. There's no need to go looking for codecs, as in Windows Media Player. http://www.videolan.org/vlc/

Irfanview Everyone's favorite picture viewer. It will also play most movie formats, as well as audio files. The program has a lot of features and is a great photo manager, but it only does minor photo editing. http://irfanview.com/

ImgBurn For those of you who like to work with ISO images and need reliable ways to create and burn ISO images on and off discs effortlessly, ImgBurn is the CD/DVD burner utility you want. I'm using ISO CD/DVD images more and more as hard drives become cheaper. http://www.imgburn.com

Open Office/LibreOffice If you can't afford Microsoft Office, then Open Office or LibreOffice will do the job for 95% of what you need . The newest open-source version of this is called LibreOffice at http://www.libreoffice.org/

This version comes about because Oracle, the current owner of OpenOffice (acquired from their acquisition of Sun), is making some content and distribution decisions outside of the Open Source community (according to the Open Source maintainers). So they've broken away and have reversed some of those decisions. There are Linux and Mac OSX versions, too.

Audacity is a sound editor. For someone who likes to work with sound files but doesn't want to buy professional systems, this program is a gem. I use it to clean up recordings from vinyl records. Available for Linux and Mac, too. http://audacity.sourceforge.net/

Paint.NET It isn't PhotoShop, but it's at least Paint-Shop Pro quality, and it's free. You'd be surprised at how much photo work this will do. It's available in 64-bit version. http://www.getpaint.net/download.html

Daemon Tools Lite gives you a virtual Blu-Ray/DVD/CD player so you can quickly mount and play .IMG and .ISO files. It's a nice complement to Img-Burn. There's a paid version, too, but my needs are pretty simple, and the free version is excellent and non-obtrusive. http://www.daemon-tools.cc

KeePassX is a login/password encrypted database that works across most all platforms, including MacOS X, Linux, Windows, iPhone, PocketPC, Blackberry and Android. http://www.keepassx.org/

FileZilla is a first class FTP client. There's a FTP server version, too. http://filezilla-project.org/

By the way, Windows does FTP from Windows Explorer, but it's difficult to set up, in my opinion. But if you have an FTP site that you send and pull from regularly, set it up and save it as a shortcut in Windows Explorer. Once set up, it's fine.

Oracle VM VirtualBox – An excellent virtual machine, far superior to Windows Virtual PC. It's much faster, the screen fonts are as good as your screen can get, and it has a snapshot system for experimenting with software scenarios. With a Windows XP machine loaded, it runs 16-bit programs. Think Microsoft Arcade. Pac-Man and Dig-Dug!

You can use a VM to test software, to see how it works before you commit it to your main machine, or to maintain old systems if you have a favorite program that won't run on your current system. I run virtual machines for Windows 7 64 and 32 bit, XP SP3, and

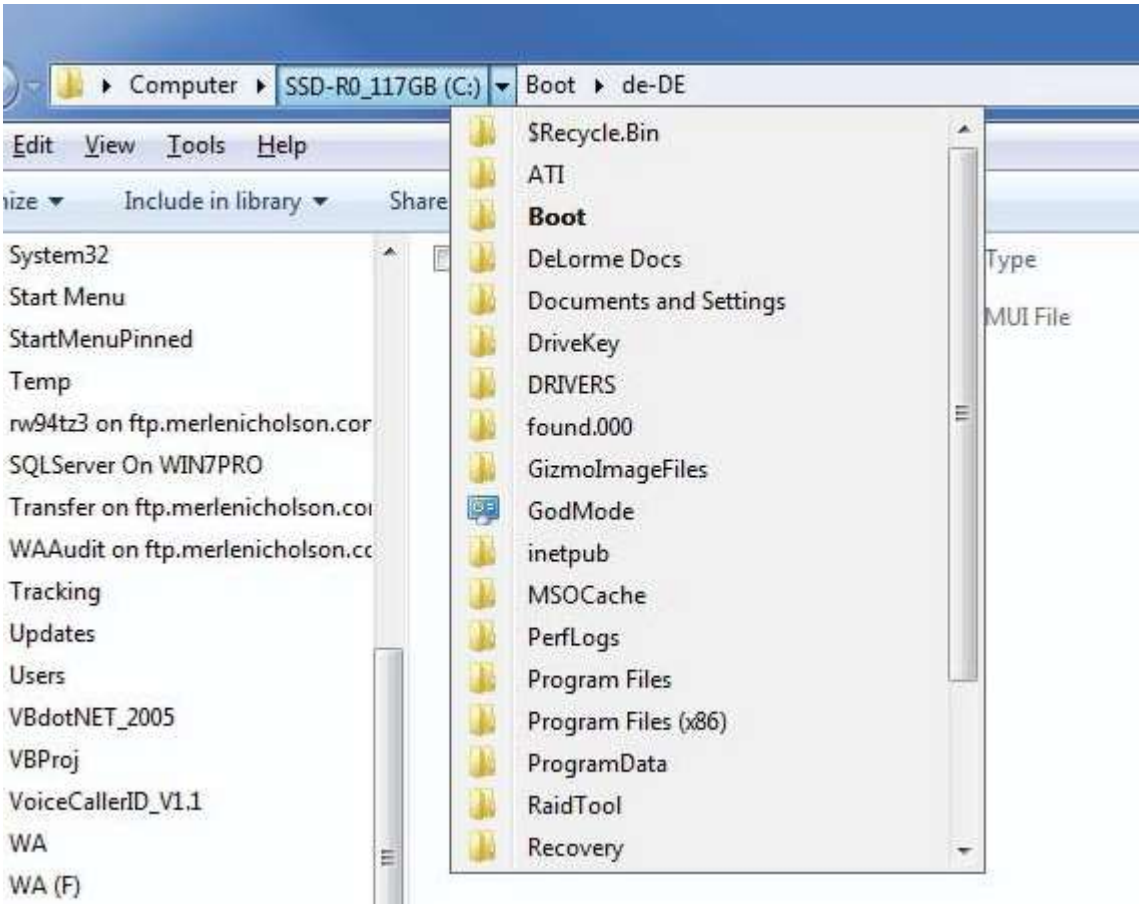
Windows Explorer in Windows 7 (Vista, too)



By Merle Nicholson, Secretary Tampa PC Users Group
merle@merlenicholson.com

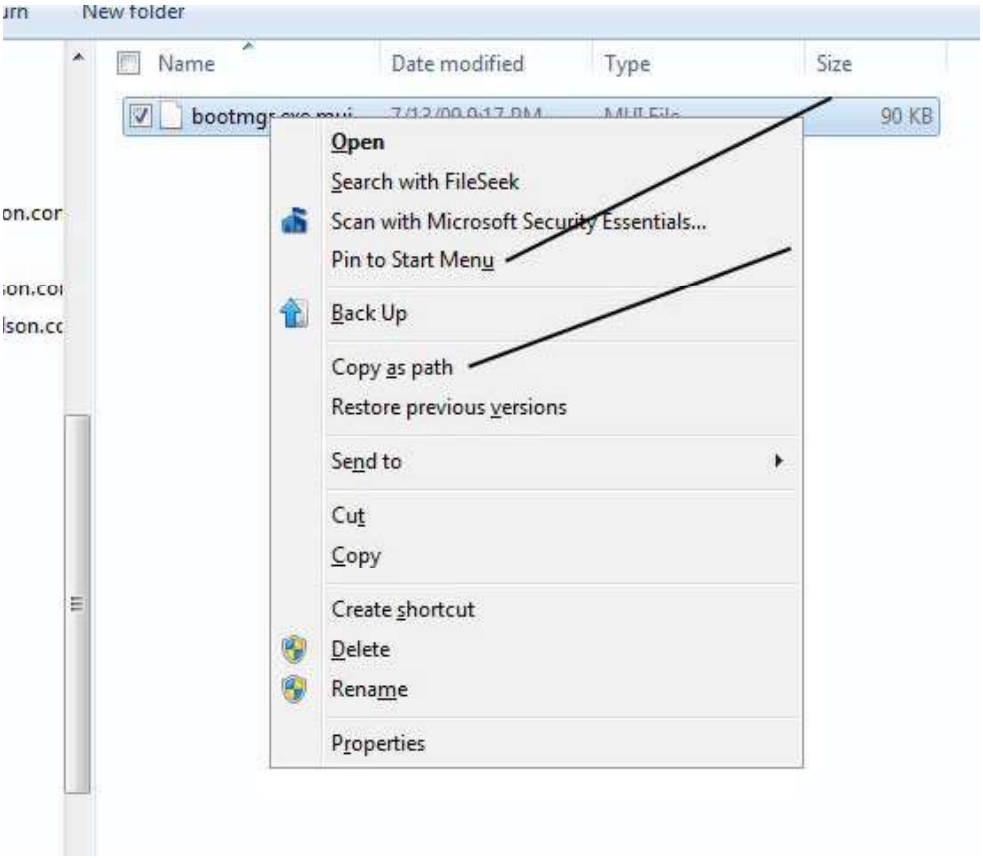
Here are some tips on using Windows Explorer in Windows 7 (Vista, too). The old "Up one directory" button that we all loved is gone in Win 7. It is now (always was) the keystroke Alt+Up (arrow). Although it's not hard to remember, I have it on a programmable key. I guess there's no point in making it a hotkey, since it IS a hotkey. Anyway, use Alt+Up for "Up one directory."

Also, you can traverse up with the mouse. In the image below, you can click once on the text between the right arrows. In this case I can click on "Boot," "SSD-R0_117GB (C:)" or "Computer,", and the Explorer will move to those locations.

Also you can click on the arrows themselves and get this, dropdown list of file directories:

Explorer.....Continued on page 6

Internet Picture of the Month



A Reminder

With all the excitement over the death of Osama bin Laden, I thought it appropriate to remind ourselves of why he was hunted down.

The image above is from a PowerPoint presentation found at the financial advice website http://www.cumber.com/ with exact URL http://www.cumber.com/content/special/aerial_photos.pps. When I did a search on both Bing and Google, I thought it would be trivial to produce many good images. That was not the case. There was much junk, little quality and more than one site attempting to induce me to click on a popup window to clean a supposed virus from my computer.

Explorer.....Continued from page 4

And while I'm at it, the in-context menu in Windows Explorer is slightly different when you hold down the shift key and right-click on a file: Two items are added as indicated in the image on the left. The Copy as path is really useful. It puts the entire drive, path and file name as text onto the clipboard.

And if you Shift+right-click on a blank area in Windows Explorer, you get one with "Open Command Window Here". Less useful, but kind of interesting. See the image on the left on page 7.

You may get other variations on a

Comments.....Continued from page 1

and found a fellow named Don Patszch (obviously a misspelling) mentioned in the May 1989 newsletter who had four short articles in that issue. So he was a very active member.

When I joined in 1991, I recall his being interested in hardware items such as modems, on which he gave several SIGs and wrote several articles. Later he took a great interest in different operating systems, seeming to prefer anything other than Microsoft. First there was OS/2, and, when that disappeared, Apple, to be followed by Linux. At one time he appeared to have an in with IBM, managing to get a couple of free computers from them, possibly also the jacket he is wearing in the photo at the left. The photo was taken at the February 1996 meeting. I think the last meeting Don attended was the 2009 Holiday Party. He particularly enjoyed a meeting where there was food and wrote at least two articles about FACUG yearly meetings where he lauded the free meals.

As an aside, current Vice President Kevan Sheridan was mentioned in the 1990 issue and again in the 1981 issue, along with current members Merrill Friend and Roger Waters. ◆

right-click, depending on the file type.

I also added a lot of items under Favorites (see image on far right), because I find the tree menu inadequate. It's not the entire tree, but it's 99% of all the places I go. This really works.

Also there are the Back and Forward buttons and the "Recent pages" button (see image below). The forward and back buttons do not traverse up and down the directory tree, but they have the history of the views of where you've been. As does the Recent pages button. You'll have to try the Recent pages button. It can be very useful. ◆

Ubuntu 11.04. They run flawlessly. http://www.virtualbox.org/. There are versions for Linux and others, even "DOS/Windows 3.x".

7-Zip I guess you could argue (and I have many times) that Windows doesn't need a zip file manager. If you do need something for 7z, cab, gzip, gz, rar and many others, you can't go wrong with this. I prefer this over WinZip. It has a newer interface, and it's free, open source besides. http://7-zip.org/

CutePDF Writer All computer users need to save lots of printed stuff, especially invoices and receipts. There's no better way to do this than with a PDF printer. There are several free ones out there. I've settled on CutePDF Writer. http://www.cutepdf.com/Products/CutePDF/writer.asp ◆

Meeting Preview: William LaMartin will lead a presentation on the past two decades of personal computing as seen through our club's newsletters. As usual, Bob LaFave will conduct the Windows SIG for the first half-hour of the meeting.

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

This month I am scheduled to do the presentation, and I thought a retrospective of the past 20 plus years of our user group and the PC industry from the perspective of our collection of newsletters would be of interest. I also hope to include some of our long-time members in the presentation and, if possible, have people who devoted a lot of time to the group but no longer attend meetings attend just this one to help us remember.

Our club was founded in 1984 as the Tampa IBM PC Users Group, which was later changed to the Tampa PC Users Group since there were then a lot more personal computers than just those made by IBM. The first formal newsletter, as best I can tell, was published in January of 1988. The earliest copy we have is from February 1988, where there is a misprint identifying it as Volume II, Issue 2. The volume number was corrected in subsequent months.

I have started going through the old newsletters looking for

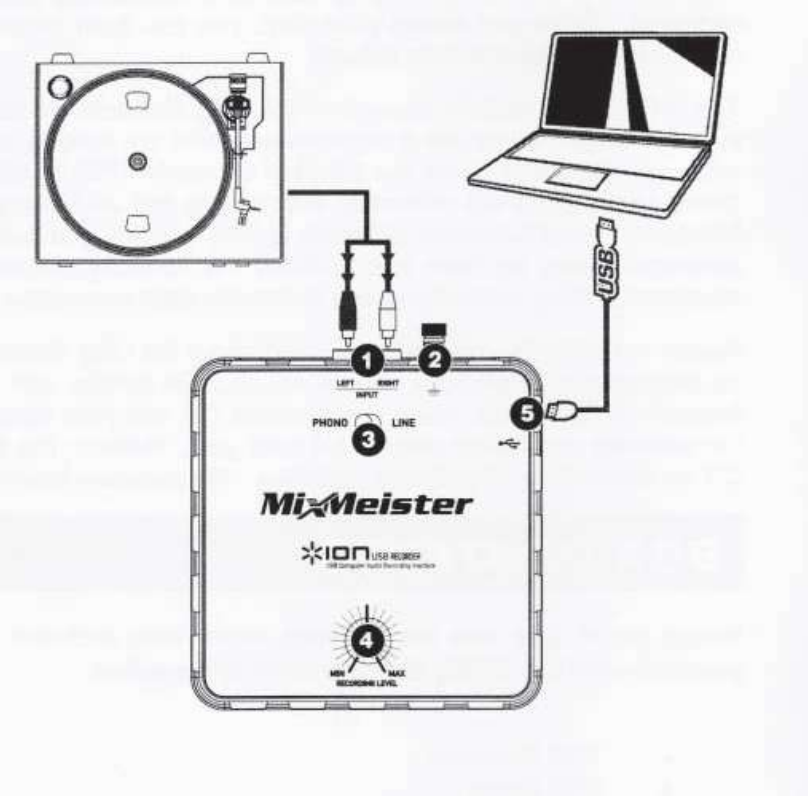
Minutes of the May Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) normally opens our monthly meeting. The meeting began as usual at 6:30 PM. The SIG is devoted to a discussion of all aspects of the Windows operating systems and of computer-related subjects in general. The SIG moderator, Bob LaFave, introduces new or little-known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees. Bob discussed several items: MSI i-Speeder, a simple network information tool; IE-9 installation; Microsoft Knowledge Base; and Microsoft Fix-it. He touched briefly on SlimDrivers, a product to scan your PC for missing, broken or out-of-date drivers.

This month's SIG concluded at 7:00 PM. TPCUG President John Witmer mentioned the FACUG Cruise, a reminder of membership dues and upcoming programs and asked for suggestions.

Our speaker this month was long-time member and current TPCUG Vice President, Kevan Sheridan. His topic was "Google Applications." Kevan is an experienced Google Docs and Google Applications user, having implemented "cloud computing" and cloud-shared documentation at his workplace.



Kevan gave a quick demo on many things Google – as much as time would allow. He touched on email, calendars, documents and slideshow presentations. In Calendar, tabs, tasks, sign in and out of accounts. Google Apps for Business ($50/user/year), Google Apps Free and Enterprise Resource Planning. He touched briefly on creating a Google personal website.

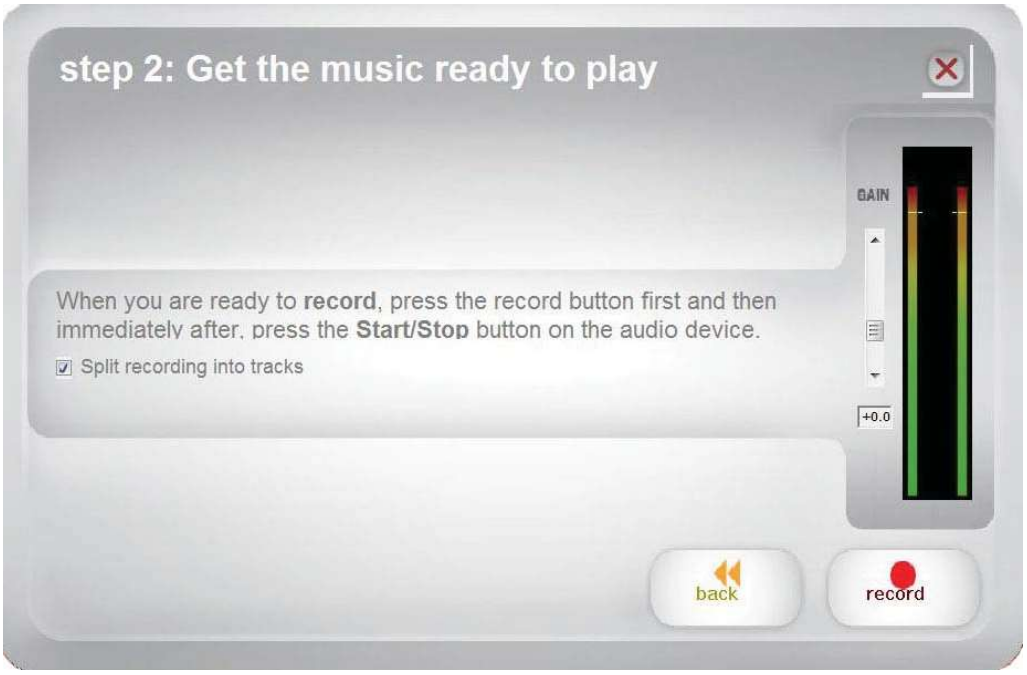
Kevan gave a very enthusiastic and dynamic presentation that barely covered the many features of Google Applications. It was interesting and made the audience want more detail. The presentation concluded at 8:40 PM. ◆

ION Audio U Record USB Music Archive System

By Jim Purcell, Tampa PC Users Group
Edward_J_P@MSN.com

I have a large collection of records that dates back to the late 1940s. They consist mostly of "Big Band," Jazz, Country Western and Classical, with a sprinkling of other stuff that was popular from about 1940 forward. I have been thinking for some time about digitizing some of my favorites and some that might make good background music for my slide shows. I have a high quality turntable that is still in good condition, but I had heard several discussions about USB turntables and their ease of use so I took a look on Google. Much to my surprise, the first link at the top of the page was: "Don't Buy A USB Turntable - 8 Reasons against USB at dak.com. Use your PC Soundcard. Your turntable or ours." It opened with a beautiful ad and an audio that came on immediately explaining all of the many features, including the ability to copy from tape recorders and CD players. I was impressed and ready to order since the price ($77) was less than I had expected to pay for just the USB turntable. Thankfully, I realized that I didn't understand most of the miraculous things that could be accomplished by the Mixer Interface System, so I asked Merle Nicholson to look at it. In summary, he thought that the price was too high and that the system fixed some things that did not need fixing. If you buy their turntable, the price of the package is $237. He forwarded some options that he believed would do the job. I decided to purchase one of his recommendations, the ION Audio U Record USB Music Archive System, that costs just $40 and has the following features: http://www.ionaudio.com/products/details/u-record

- **Phono/line input records from a turntable, tape deck or CD player** As you can see from the illustration on the left, the recorder is simple to hookup and can accommodate practically all turntables, tape decks and CD players. You plug the RCA output plugs into the clearly-marked input RCA plugs on the recorder (1). If your turntable or tape deck has a ground wire, you attach it to the ground connection on the recorder (2). The Phono/Line switch (3) is set, depending on the output signal from your turntable or tape deck. Most old turntables output a weak signal known as a Phono-level, which needs to be amplified in order to be heard. In this case you set the toggle to "Phono." If your device outputs an audible signal, you toggle to "Line." The Recording Level Knob (4) is used to adjust the volume of the recording so that the audio level meters in the recording application screen shown below never hit the red. The "Plug and play USB connection" (5) gives you a quick connection with no drivers required
- **EZ Vinyl Converter software (PC) and EZ Audio Converter software (MAC)** I'll discuss only the PC version, but both versions are on the disc that is included. The software was easily and quickly installed. You are instructed to install "iTunes" before you start recording. The software will not work without iTunes. This worried me at first, but so far it has worked exceptionally well. You can move quickly and conveniently between iTunes and Windows. While installing iTunes, I got a pop-up recommending that I use the 64-bit version, and it furnished me the link, which installed the



Recorder.....Continued on page 4

Recorder.....Continued from page 3

program without a problem. I found that the iTunes software makes it simple to burn music and MP3 CD's.

- **Audacity software records, edits and corrects** I haven't used the Audacity software, a freeware editor that is included on the installation disk. Merle indicated that he has used it for quite awhile, and he recommends it highly. There are many editors that are available, many of which are freeware, if you need more features.

As I mentioned, I've only used the system for a short time, but I have been impressed with the simplicity and convenience of recording from a turntable and a reel-to-reel tape deck. The ability to record from a tape deck has been especially rewarding. My family was stationed in Germany from 1961 – 1965. We had four children, aged from three to eleven, and two sets of grandparents back in Florida. The cost of long-distance calls between Germany and Mulberry was enough to make it impractical to use with any frequency. Both sets of grandparents bought small reel-to-reel tape recorders. The three-inch reels came in a mailing box, so we exchanged them frequently, and I have a pile of these tapes. The first that I recorded was Christmas of 1964 in Wiesbaden, and it came through crystal clear. That alone has been worth the price of the unit. ◆

Comments.....Continued from page 1

things of interest for the presentation. For 1988, there are two newsletters; 1989 has eight; and in 1990 there are 10. After that, there is pretty much one for every month with a few missing issues. All the newsletters from 1988 through November of 1995 had to be scanned. Subsequent ones were created as Acrobat documents from the originating programs, either Word, Publisher or InDesign. Obviously the scanned ones had to have OCR preformed on them to make them searchable. This allowed me to create an index in Acrobat that lets one search the entire collection of 262 newsletters for words or phrases.

As examples of using the index for searching, searches for the words below produced the results shown with the year indicating the earliest year of mention. With each search, you also get a list of newsletters containing the searched for word or phrase and the ability to click on the link and go to the location in the newsletter.

Pentium: 80 documents, 203 instances; 1992
OS/2: 111 documents, 679 instances; 1988
Windows: 250 documents, 5801 instances; 1989
Apple: 64 documents, 159 instances: 1989
IBM: 165 documents, 976 instances; 1988
Microsoft: 246 documents, 3148 instances; 1989

The early newsletters came mostly from a collection of Ed Buzza with the help of a collection from Roger Waters. All of these newsletters are at our web site. Additionally I plan to put them on a CD, along with the Acrobat-created index, so that you may search for interesting topics, or just browse them at your leisure. You will be surprised how far we have come since 1988.

In the early newsletters there was a lot of emphasis on the AUTOEXE.BAT file and other

Internet Picture of the Month

High Water

This photo was taken on May 13, 2011, a few days before the Mississippi River crested in New Orleans. It looks as if an average wave would put the river over the top of the levee. You have Jackson Square in the background, with the St. Louis Cathedral behind that. Possibly the river is only three or four feet from over-topping here. However, the high crest predicted did not occur due to the opening of two spillways above New Orleans, which diverted a lot of the flow to the Gulf by various other routes.

things which modern computer users do not even know existed (a good thing, I think). Then there was all that time spent on getting our modems to connect to other computers over the phone lines. We needed a certain connection string to connect to one computer, say, at the library and another to connect to our own BBS. You will see Kevan Sheridan's name all over those early newsletters since he was the club's SYSOP – that is, the person who ran the club's Bulletin Board Service (BBS). Yes, at one time personal computer users did not have the Internet and instead relied on BBSs to communicate with other computer users and to post and receive information on topics of interest.

And do you know how much memory those early PCs had? Or the size of the early hard drives? What about the costs of the first flat-screen 15-inch monitors? The answers are all in those newsletters.

Then there are all the programs we used, first in DOS, then Windows 3.0, 3.1, Millennium, 95, etc. that we no longer use, or which no longer exist. You probably recall names such as WordPerfect and Lotus 1-2-3, but do you also recall vendor or program names such as Procomm Plus, Quarterdeck, Delrina, XTreeProGold, Ashton-Tate, Applause, Borland, Paradox. And the list could go on for quite some length. They are all mentioned in the old newsletters, along with information about how important these programs were and their somewhat expensive prices.

If you go to the display of COMDEX buttons at http://www.lamartin.com/ComdexButtons/index.htm, you will get a flavor of some of the vendors and software that were current then. Then-president Harvey Bruneau would attend COMDEX each year and bring back news, software and these buttons, which I have made into a display using Silverlight. For more, come to the meeting. ◆

My Windows Phone 7

By William LaMartin,Editor, Tampa PC UsersGroup
william@lamartin.com

I was beginning to feel like a dinosaur carrying around my almost three-year-old Windows Mobile 6.1 phone with everyone else sporting iPhones or the Android equivalent. I was waiting for a Win phone because that is the operating system I can most easily program. I had looked at programming the Android phones, but that was an alien environment. The Windows 7 phone became available at other carriers last Fall but didn't show up at Verizon, my carrier, until the end of May. It is supposedly a $200 phone, discounted by $50. However, on ordering online from the Verizon site, there was an additional $50 off with free overnight shipping. So I ordered before the required 4:30 in the afternoon for delivery the next day and received the phone via FedEx the next day.

Above is a photo I took of the phone showing about a third of the tiles on the main screen. The phone is an HTC Trophy, hence the large htc tile showing the current Tampa temperature. The flower photo on the Pictures tile is one of the photos I took with the phone's camera. I added a tile for each of my three email accounts. Most of the programs, however, are accessed via what appears in the photo to be the small white disk in the upper right. It is actually a white circle with an arrow inside.

Activating the phone was trivial. I dialed the required number and had only to input my Verizon Wireless account password, and I was finished in a couple of

Special Interest Groups

Visual Basic .Net SIG (and sometimes Access SIG)

This SIG meets the third Wednesday of the month at 6:30 PM. For information, contact Editor William LaMartin at william@lamartin.com.

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Member Bob LaFave moderates the discussion.

Yahoo! eGroup Reminder

By Kevan Sheridan, Vice President, Tampa PC Users Group
kevan@tpcug.org

The purpose of the TPCUG Yahoo! eGroup is to inform and promote communication among members of the Tampa PC Users Group. This is a great member benefit and the easiest way to stay in touch with other members during non-meeting days.

Joining the eGroup is simple: Use the e-mail address with which you wish to join the group to send an e-mail to: TPCUG-subscribe@yahoogroups.com. Include your full name in the text section of this e-mail. You will receive a verification request that you reply to, then you are up and running.

Note: if you join with a Yahoo! email address, you get full access to the group site at http://groups.yahoo.com/group/tpcug.

To post messages to the group, create an e-mail and address it to: tpcug@yahoogroups.com. Your message will be broadcast to everyone in the eGroup. ◆

Phone.....Continued from page 6

minutes. The phone was now ready to make calls, surf the web or download Apps to run. What it was not ready to do was email. Setting up my several email accounts was not problem. All that is needed is a user name, password and incoming and outgoing mail server addresses. But after that you would like to have your contacts and possibily your calendar, as you have in Outlook, on your computer. For Windows Mobile, I simply connected my the phone to my computer and the contacts and calendar were automatically synced. Not anymore.

Now for Win Phone 7 (and the Droid and iPhone) you have to sync with some online account. For my phone, I need to sync with Windows Live, which has both a contacts list and a calendar. But then the problem becomes: How to get my contacts and calendar in Outlook up to Windows Live. To do this, Microsoft has created a program called Outlook Companion. When you download and run it, a menu item appears in Outlook named Outlook Companion, along with an additional contact folder named “contacts in <your Windows Live user name>.” You then simply select all the contacts in your regular contacts folder, copy them and then past them into this newly-created contacts folder. Then by some miracle, these contacts will appear at Windows Live and, when your phone syncs with it, the same contacts will arrive in the People Hub of the phone. Your Outlook calendar is imported into the phone is a similar manner.

The only disadvantage of this method is that, if you add a new contact to your regular contact’s folder in Outlook, you then have to copy it and paste it into the Win Live one in Outlook so that it will eventually move up to Windows Live and then to your phone. Also, it appears that I now receive two notifications of the same calendar event in Outlook on my computer, since there are now two identical calendars there. Possibly there is a solution for this.

If you think the above is cumbersome and would not buy this phone for that reason, think on. For the situation is the same if you have an iPhone or a Droid.

Phone.....Continued from page 7

For the iPhone, you have to sync through iTunes, and, for the Droid, you have to do something similar using Gmail. The web is full of people having problems doing this. So it is probably equally a pain to do it with any one of these three phones.

I like the phone's interface, with my only complaint being that, on some built-in screens, some of the text is quite small. Right now, both the iPhone and the Droid have a few features that this phone doesn't have. However, a major operating system update will be rolled out in the Fall that should make them more equal. And I particularly like it because I already have installed three of the programs I have written, one of which I am thinking of placing on the Windows Phone Marketplace. Possibly I will even make enough to pay for the phone. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Last month's presentation was mine, and I hope the group enjoyed our trip down memory lane where we revisited the group and personal computing's history through our newsletters since 1988.

I was surprised to learn that a few members had been in the group from the very first days of 1984 and 1985. I knew that Kevan Sheridan and Roger Waters had been there from the earliest days, but Ed Cowen and Gary Ennis also volunteered that they were in the group when it met downtown. In general, some members recalled items from the past that others of us had forgotten.

Those newsletters are online at our website as Adobe Acrobat documents. At future meeting, I will also be happy to provide to anyone interested, for the agreed-upon $5 donation to the group, a CD or DVD containing them that additionally has an index that may be searched using the free Adobe Acrobat reader.

Minutes of the June Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. The meeting began as usual at 6:30 PM. The SIG is devoted to a discussion of all aspects of the Windows Operating Systems and of computer-related subjects in general. The SIG moderator, Bob LaFave, introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees. Bob talked about Prey software.

Prey is a free, open source laptop-tracking software developed by Fork Ltd, that helps recover computers by tracing their location through the remote retrieval of information. The software is activated from the outside by using a URL as a checking method and phones home by sending a detailed report either to a centralized control panel or directly to the computer owner's mailbox. It's available for Windows, Linux, Mac OS X and Android. http://preyproject.com. This month's SIG concluded at 7:00 PM.

Our speaker this month was long-time member and newsletter editor, William LaMartin. William has spent a huge amount of his own time scanning all the back newsletters he has been able to find and publishing them to PDF files. He has compiled them and produced a CD that is available to anyone for a $5 donation to the group. Each newsletter can be downloaded from the website, but obtaining the CD from him is well worth it to avoid the time of downloading more than 200 files if you're inclined to have all of them. Additionally, the CD is searchable, of course.

William must have read an impressive number of newsletters to prepare for the presentation. He gave a timeline of events of the club and invited members present to recall details, people and locations. Several people were able to contribute memories and facts not otherwise known.

QR Codes

By Ron Weinberg, Member At Large,
Tampa PC Users Group
rswjbr@verizon.net

Recently, I have been noticing small high density code squares appearing in magazine articles and catalogs. I found that they are QR Codes intended to be scanned by smart cell phones which then automatically insert a specific URL in your phone's browser. The related web page gives more detailed information about a particular product or subject.

QR codes (QR meaning Quick Response) were developed and widely adopted in Japan, spread to Europe and are now being found in the US and elsewhere. These two dimensional bar codes have multiple uses, but the most common is to store URLs and addresses.

I have had more than a passing interest in bar codes since my days in the retail industry when I was developing coded labels for small jewelry items. Some time ago, I wrote an article for the newsletter explaining and extolling bar codes for personal and business recordkeeping.

Since I knew little about these squares, I wanted to learn more, see what they were, and what they did.

BUT, I do not have a smart phone, neither iPhone, nor Android, not even a new Windows phone. I thought there must be a way to do this using a computer. The problem was how to get the code into the computer. Conventional bar code scanners are expensive and many cannot read QR code.

Fortunately, a method had already been found, using a web cam. I have an early generation Logitech VCAM-U1. This is a simple low resolution camera, but I thought I might see if it would work.

Many programs were available, but professional programs which had to be purchased seemed in excess of my requirements. Several free programs were found, and, after looking at three, I determined two to test.

1. The first was QRreader from densl.net. This required my computer to have Adobe Air as a prerequisite, which I did have.

2. The second was bcWebCam from QS QualitySoft GmbH in Germany.

Both work in a similar way in that a box appears on your screen into which you move the focused image of the QR code from the web cam, whereupon the program reads the code.

After several attempts to use QRreader trying different code squares, all attempts failed, none were read. Since I had to believe that the program probably did work or would not have been made available, I had to attribute the failure to my poor quality web cam.

bcWebCam worked perfectly every time! It had more features than QRreader. It can also read many additional types of bar codes. Although I mainly used the defaults, I did choose two options: To automatically save to the clipboard, and audible beep for successful scan.

The first screen that appears when you begin the program is an illustrated instruction set showing the few steps required to insert the scan result directly into a target document or browser. Since I chose to save the scan to the clipboard, I did not have to choose a target.

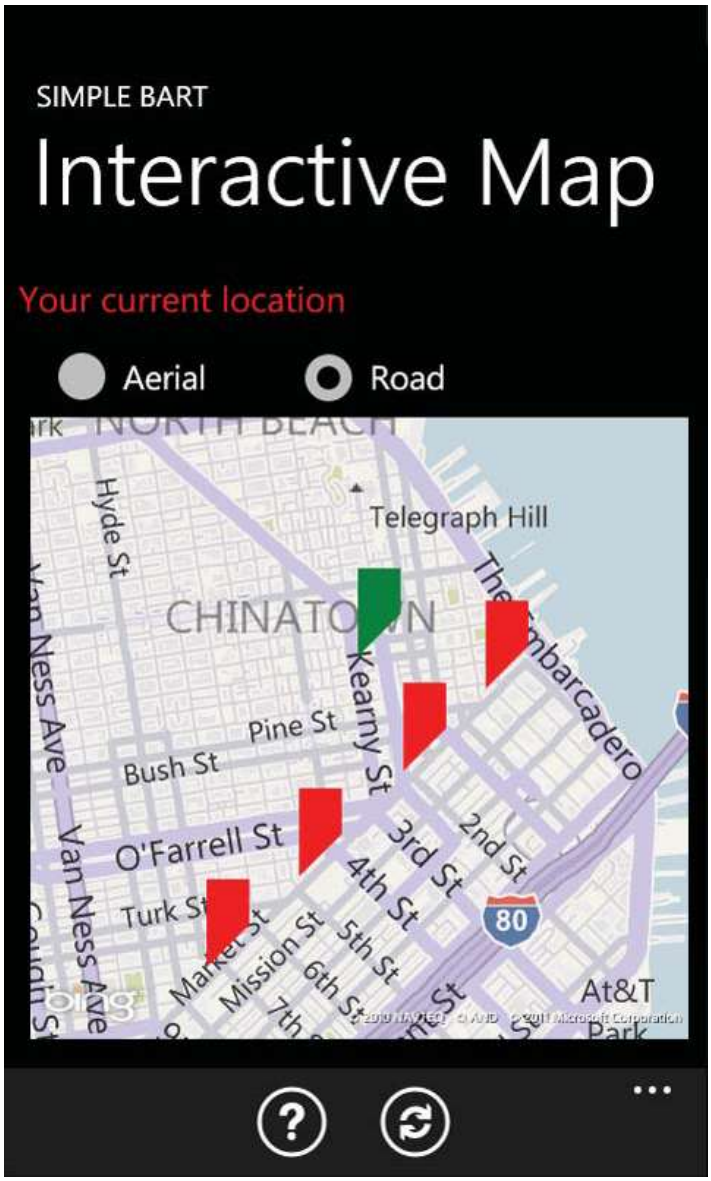
When you press START, a box appears into which you scan. bcWebCam remains in the foreground and the target, if you choose one, shows in the background. The resulting text from the read appears at the top of the box and is automatically inserted in the target wherever you have placed the cursor.

If you press STOP after the successful scan, the first instruction screen returns in German. You can close and restart the program to return to English

There are simple ways that anyone can generate and print their own QR codes but that is beyond the scope of this article.

QR Codes.....Continued on page 4

QR Codes.....Continued from page 3



The example code shown here is actual code, created with "Qurify!" (qurify.com). Newsletter readers with appropriate phones should scan it in. ◆

Comments.....Continued from page 1

This month, thanks to Ron Weinberg for his article about those new types of barcodes that appear almost to resemble a square containing lines making up a maze. Recently a friend at a car dealership gave me her business card that had one such code on it. One of the free apps I downloaded for my new Windows Phone 7 was supposed to decipher such codes. And it did, with the result being that it displayed her name, title, business address, phone number and email address. My question, then, is why do people write such applications for free. One possibility is that they make money from advertising that they display during the app, or they collect your location information (supposedly with your permission) to send off to a database for payment. Or they could actually just create such an app for practice or because they enjoy programming. I would love to find out how they get from a camera shot of the code to the deciphered content of the code. Perhaps I will look into it in the future.

Practice and love of programming are the reasons for the creation of two free apps that I have published to the Microsoft Windows Phone 7 Marketplace. Microsoft has strict guidelines that must be followed for apps to be placed at the marketplace. And it takes a bit of study to master the process. I write about this in an article in the newsletter beginning in the next column.

Hope to see you at the next meeting. ◆

Programming a Windows Phone 7

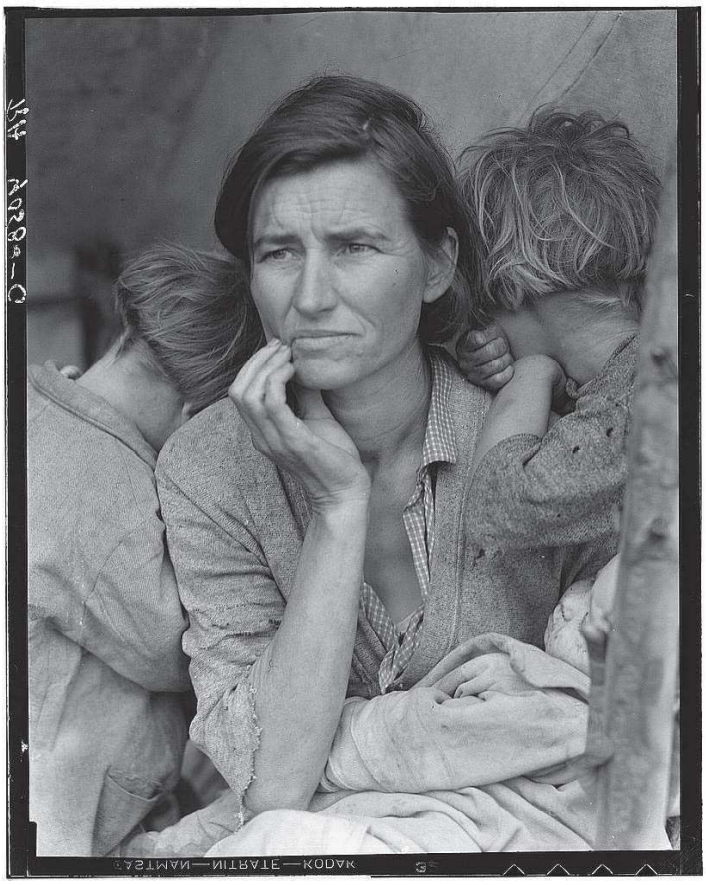
By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

I received my HTC Trophy Windows Phone 7 (WP7) around the first of June, when it became available at Verizon. Before that, I had already been working on programs for it, termed apps I suppose, using the phone emulator in Visual Studio 2010. The image above is a screen capture of the emulator running my application named Simple BART. What you see is a bing map centered on downtown San Francisco, with the nearby BART subway stations

Phone.....Continued on page 5

Phone.....Continued from page 4

indicated in red and my (supposed) location in green. I temporarily modified the code to put my location in San Francisco for the sake of getting a realistic image to use at the Microsoft Phone Marketplace. With the correct code, the program would put the green marker at my house in Tampa, thousands of miles from San Francisco.



The BART System provides an open live feed of information about the 43 stations in the system: Their arrival times, destinations, direction of travel, track, etc. All the programmer has to do is to sign up with them and figure out the relatively easy SDK for retrieving the information. About the only restrictions I found were the prohibitions against using the BART logo and the official map. So I had to go out and find another map of the stations and the different colored tracks on the Internet. Wikipedia had one, and it was free to use. Isn't the Internet wonderful?!

So how does the app work? When you run it, you are first presented with a page stating that the application uses a data connection to retrieve the BART data and location services for receiving your map position. It is a Microsoft requirement that you notify the user of such things. You can choose to use or not use these features. If you don't use a data connection, the program is of no value since there will be no BART info; if you choose not to use location services, all you lose is your present location marked on the interactive bing map.

When you click the Continue button on the opening page, you are presented with a scrollable list of all 43 stations in the system. A click on any one will then provide you with either a detailed or brief (your

Phone.....Continued from page 5

choice) list of incoming trains and details about them and their destinations.

There are probably at least half-a-dozen BART apps at the Marketplace, most free, but a couple for pay. I wrote a preliminary version of mine long before I had an actual phone in hand or had even looked at the Marketplace. It was just something I could program as practice for retrieving data from the Internet, and I could test the program on the emulator until I actually got a phone. There are a number of things, though, that cannot be tested on the emulator. One is changing the size of what you are viewing by using finger gestures. That is something I wanted to do for the system map pictured below. Another is programming and testing that had to wait until I had a physical phone.

For those going to San Francisco who have a WP7, you may download the program from the Marketplace at the link: http://social.zune.net/redirect?type=phoneApp&id=6f2c84ed-7a98-e011-986b-78e7d1fa76f8. Or go to the Marketplace and search for Simple BART.

Around June 20, I was told that if I had two apps registered with the Marketplace by June 30 I would receive a refund on the $99 I paid to register as a WP7 developer. The question then was, could I, in a little more than a week, prepare an app and get it published to the Marketplace. Based on my first submission, at present it takes three to four business days for an app to go through testing at the Marketplace, and then it may well be rejected for not meeting all of Microsoft's guidelines. My BART app was initially rejected because I failed two requirements on my first submission.

I looked over the apps I had already written and saw none that I wanted to submit; some because I thought they would be of no interest and others because I hoped to eventually submit them as paid apps. I decided to write something fairly simple that had been of use to me in the past: Calculating the volume of liquid in a cylindrical tank lying horizontally, based on the depth of the liquid in the tank. If you have ever owned a fuel tank of any kind, then you know the value of such information. To make the app more interesting, I added three more tank configurations as pictured on page 7. Since all these images are in color, you will have a much better experience if you look at them in the newsletter on the website.

A click on a tank type takes to you to another screen where you then enter the appropriate dimensions of the tank along with the depth of the liquid, click on the Calculate button, and a scrollable list of volumes is returned for the various possible depths. You may use either US or metric measurements.

Luckily, this app, Simple Volume, was published to the Marketplace on my first submission. The URL to the free download is http://social.zune.net/redire

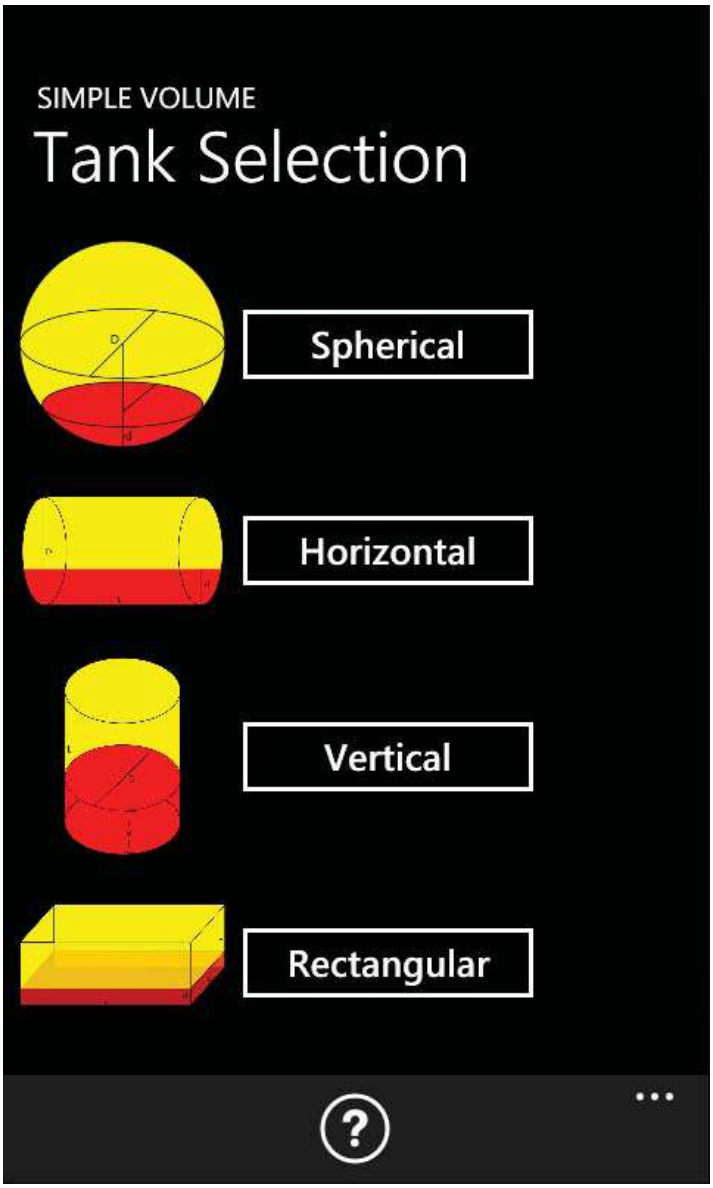
This SIG meets the third Wednesday of the month at 6:30 PM. For information, contact Editor William LaMartin at william@lamartin.com.

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Member Bob LaFave moderates the discussion.



Phone.....Continued from page 6

ct?type=phoneApp&id=1a6c32e7-459c-e011-986b-78e7d1fa76f8. Or you may search for Simple Volume at the Marketplace.

Now, with two practice apps under my belt, I am ready to see if I can create a paid one that will get some attention. I have an idea and have it far enough along that I find it useful to have on my phone. In looking at the Marketplace, I see that there are other apps that supposedly do the same sort of thing. But looking at the descriptions and screen shots, I see that they don't really do what mine does. So I think there is an opening for mine. My problem will be in getting people to notice it and then to think it is worth paying $.99 for instead of using one of the free ones that purport to do the same thing but which really are very limited.

It is clear that I will need to offer a free or trial version with somewhat limited functionality to make people want the very expensive $.99 version. However, it is not clear to me if there is much money to be made with these phone apps due to your app getting lost in all the clutter at the Marketplace,

I recall one fellow in an online forum for WP7 app developers who also developed iPhone apps. He said that in the beginning of the iPhone his first paid app garnered thousands of dollars, and he thought he was on the way to something. So he spent more than 500 hours developing a second iPhone app, which he thought much better than the first. But after he put it at the marketplace, almost no one bought it--not even the free trial version--most probably because they didn't notice it among the, at that time, more than 200,000 competing apps (now more than 500,000). I suppose the secret is getting Apple to feature the app for a few

days. But how does one do that?

I have met one fellow who has a golfing app at all three marketplaces: Apple, Android and Windows, and he seems to be making a success of it. However, it is a full time job for him. I don't know if he was doing

William showed a brief history of personal computers, Apple II and Mac, Commodore and IBM PC, and recalled the meaning and origin of "PC clone."

William gave a very interesting and dynamic presentation that only partly covered the subjects of the history of the club and the relationship to earlier computing. For complete coverage, we would need several meetings. ◆

Phone.....Continued from page 7

any marketing, but I would guess so. Such success stories notwithstanding, my guess is that less than one percent of app developers are actually making any income of consequence from their apps. Of course, that doesn't include programmers who are paid by major corporations such as Bank America to create apps for their businesses. So, go out and create apps because you enjoy it, but don't expect to get rich. ◆

TPCUG Forum

We have a new forum at the TPCUG site, http://www.linux.tpcug.org/forums/, where you may post or answer questions. Being the webmaster, I set up the forum at the site and then turned it over to Merle Nicholson to configure and manage, since he had volunteered to be the forum manager. Merle has an article in this month's newsletter going into detail on how to use the forum. I encourage the members to sign up and use this new item.

Our web site is hosted on a Windows 2008 server. Additionally the hosting company also provides for free an additional Linux sub-site hosted on an Apache server, with whatever space it uses being subtracted from the space available on the Windows server, of which we have more than we could ever use. I had never been interested in the Linux sub-site until I looked into finding free forum (also called bulletin board) software. There didn't seem to be any for a Windows server. Although I could have written a very basic program myself, I wasn't about to take on that project. I did a bit of research and found that there were nu-

Minutes of the July Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. The meeting began as usual at 6:30 PM. The SIG is devoted to a discussion of all aspects of the Windows Operating Systems and of computer-related subjects in general. The SIG moderator, Bob LaFave, introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees. Bob briefly mentioned Prey software, one of the subjects of last month's meeting.

Arthur Williams described a problem with his PC sound; it was discussed for a while and not resolved. Bob introduced the TPCUG Forum to the membership at http://www.tpcug.org. This month's SIG concluded at 7:00 PM.

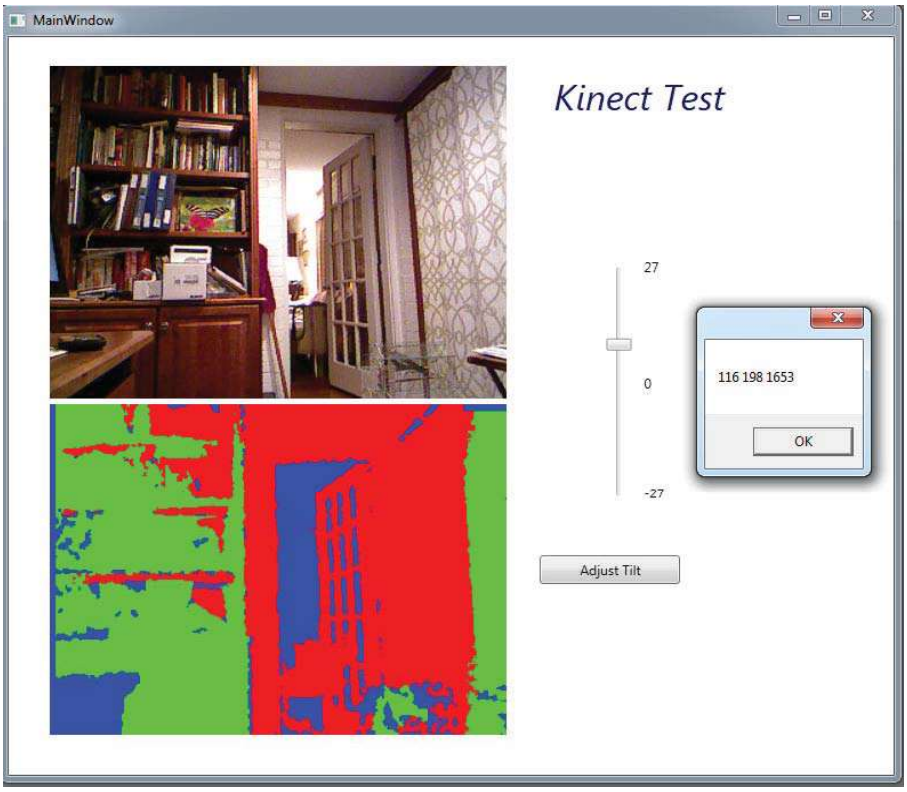
Our speaker this month was member Michele Burgess, who gave a very interesting talk and demonstration on wordpress.com and wordpress.org, the open source blog and website creation organizations.

Michele demonstrated the building of a web-based, template-driven website builder and blog site, all supplied free (the .org site is self-hosted). She demonstrated and addressed security concerns and how to protect against spam and keep bots off your site.

WordPress is software you download to your PC to create a website or blog. It claims to have thousands of plugins and themes available to transform your site into anything you can imagine. WordPress started out as a blogging system but has since evolved into a full content management system. As much information as you can possibly need is available at the website: http://www.wordpress.org.

Michele's presentation was well organized and very comprehensive. Since Michele is an active user, she was able to give us very helpful instructions based on her experience. She gave an interesting and useful look into a world of quality web and blog publishing. ◆

Kinect without the XBOX



By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

I don't own an XBOX and have only seen a Kinect device connected to an XBOX on the Internet. The Kinect allows someone playing a game on the XBOX to interface with it by using body motions, such as hand or leg movements. I am not a game player, so I had no interest in the Kinect – until recently when I heard that Microsoft had released a beta version of the Kinect for Windows SDK. That meant that a programmer could now program the Kinect using Visual Studio.

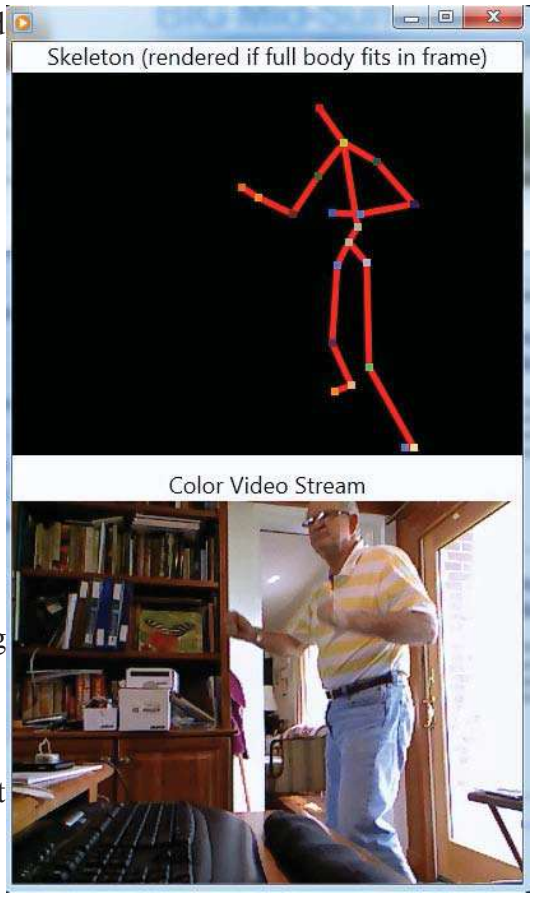
Was I interested in writing a game? No, at least not at the moment. My interest came from the Kinect being a stereo camera that can provide depth and other spatial information. I have worked with a stereo camera that costs around $3,000, using its programming interface to find three dimensional information about objects in its view. The Kinect, at $150, offered a much cheaper alternative.

The image below is a screen capture of a program I wrote for the Kinect that displays an RBG image in the top frame, a color-coded distance image in the lower frame and a slider to adjust the camera's tilt. The message box that is displayed in the image below is showing the results of a mouse click on the box sitting on the bookcase. The first two numbers are the pixel coordinates of the point clicked; the last number, 1653, is the distance from the Kinect to the box, 1653 millimeters. And when measured with a tape, that distance proved to be right on the money. However, clicking the mouse in other locations sometimes produced distances that were obviously quite a bit off. By the way, the working range for the device to determine distances is from around four to 11.5 feet. This is not a very wide range; the expensive stereo camera I dealt with had a range of more than 30 feet.

The Kinect SDK was released in the middle of June. I started working with it a week or so later but then stopped to return to programming the Windows 7 phone. So I didn't get all that much done. In the project I mentioned, where you see the pixel location at 116,198 of a 320 x 240 pixel image in the message box in the screen capture on this page, I would like to replace the pixel coordinates with actual distance coordinates in millimeters measured from the center of the image. That way, I could use the camera to do such things as remotely measure the area of objects, or even estimate volumes if the object was positioned properly. This was the sort of things I was dong with the more expensive camera.

In looking at the data I receive using the camera, it appears that as you increase the size of the image, say, from 320 x

Kinect.....Continued on page 4



Kinect.....Continued from page 3

240 pixels to 640 x 480 pixels, more of the points do not have valid distance data. And I assume that this would also be the case for spatial data in the other two planes (the x-y coordinates if z is the distance coordinates).

This SDK is beta, and I believe when the release version is available, more features will be available, but I doubt the range will be increased past 11.5 feet, which is a bit of a downer for me.

With the SDK they provide some examples of what can be done. As opposed to my interest in finding distances, what is of most interest to Microsoft and other programmers is leveraging the Kinect's ability to recognize the human body and follow its movements. In one example, they have a game called the shape game, where you stand before the Kinect and look at a skeletal version of yourself on the computer screen with all sorts of shapes (balls, triangles, etc.) falling around you. The object of the game is for you to use your hands, feet, head or any part of your body to make contact with and deflect these virtual shapes. The image above is a screen capture of me playing this game. In the upper right-hand corner is an actual image of me and below that is my skeletal representation. You will note that the skeleton is positioned exactly the same as the person in the actual image. I think I have just gotten five points from bouncing something off my head. The game is actually a bit of fun and not bad exercise. You do have to be careful kicking at the virtual objects since there are actually real objects in the room you can come into contact with.

Another sample allows you to make all sorts of movements and see them instantly displayed as a skeletal view. A screen capture of that is in the upper right of this page. Note how the software picked up my arm positions perfectly.

I should comment that these are not actually screen captures in the usual sense. Think about it. How could I do a screen capture by pressing the PrtScn key while I was a distance from the computer? What actually occurred was that I had running on the computer a program called Microsoft Expression Encoder Screen Capture, part of the Microsoft Expression 4 suite, that will record whatever activity is occurring on a selected portion of your screen and create a video file of it. That gave me a video file which, while being played, I could do a PrtScn for to capture a single image to use in the newsletter.

merous ones written for Linux. With this knowledge, I took a close look at what was available at our hosting company for the Linux sub-sites and found that there was a bulletin board called phpBB 3 available.

To add the bulletin board, all I had to do was click on a link, and the installation process began. When it was finished, I marveled at the complexity of what had been created. I could never have created something like this. For example, it created a MySQL database with 62 tables to manage all aspects of the content and appearance of the forum. Once the forum was created, I did a little configuration, such as adding the world famous TPCUG dancing palm tree as a logo, and set up the ability of the forum to send email messages for whatever purpose the forum administrator, Merle Nicholson, should desire. Merle then took over and has been further configuring things and adding features, as described in his article on page 6.

Apple beats USA

As we all know, our federal government recently had a bit of a to do about being allowed to borrow more money. And if Congress didn't OK raising the limit on how much the government could borrow, the country would run out of money to spend (or give away) on around August 2. Well, someone sent me a link to a CNN article, http://www.cnn.com/2011/

New TPCUG web site feature: TPCUG Forum

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

We have added a forum for the membership to post questions and answers, tips and just to document interesting resources and other things. It's free, it's open to everyone to read and post most anything computer-related that interests you. Take a look at it right away and see what ideas pop into your mind. It's at our club website, http://www.tpcug.org. Look at the menu on the left, and you'll see "TPCUG Forum." When you get there, make a shortcut, or add it to your favorites.

The purpose is limited to the mission of the club. We have deleted several posts that are not on subjects related to the club, and we will continue to do so. It's surprising to me that the forum has been found by foreign commercial interests, and I've had to delete a half dozen posts and deleted the users' accounts. At least it's not difficult.

To post subjects, you must first join the forum - "Register". You declare a username and password and supply a valid email address. Also, there is a code to type in that is a random character and number combination. But – you're not a forum member yet. You must then wait for just a few seconds for the arrival of an email from the forum. In the email is a link that you select to confirm the registration. More about this process later.

So far, there are four "boards" or forums. Under each board are topics, and under each topic are posts, or "replies" to each topic.

A forum is an overall collection of topics. You, as a registered forum member, can create new topics under any of the existing forums. So far, the three existing forums are "General TPCUG topics," "Windows 7 and Vista (64- and 32-bit versions)" and "Windows XP". I'll add new forums when it's apparent that they're needed. Feel free to post suggestions.

There's a top level forum, "Guidelines and Suggestions," that is there just to provide brief instructions, and the other three are open to new topics and replies to those topics.

So say you are having a problem with a rogue antivirus and need some help with it. Go to the forum "General TPCUG topics" and create a new topic. This is a one-liner where you state the topic of discussion. Name it, say, "Need help with malware." After it's created, post the first reply, and give it a full description of what you're experiencing, with screen capture or camera pictures, if you have them, and details about the computer system. The more descriptive you can get the easier it is to help you. There are several people who are currently monitoring the posts, and, hopefully, you'll get some help from some club member. You will be notified by email when other replies are posted to this topic. There is a check box that determines this. It's checked by default to get the email notice, and you have to clear it if you don't want to be notified.

The registered user can:

- Post new topics
- Reply to topics
- Edit your posts
- Delete your posts
- Post attachments

So far, under General TPCUG topics, we have:

- Best Software I'm using and recommend
- Hack Cell Phone
- Microsoft now has a bootable antivirus
- Best free software list

There are three topics under Windows 7 & Vista

- Create a bootable flashdrive for WIndows 7 installation disk
- IE 9 and Helvetica
- Set my computer to auto log on to my account

When you get used to the forum, it's really easy to jump around to areas of interest. There's a good text search and controls to display and sort topics, for

Special Interest Groups

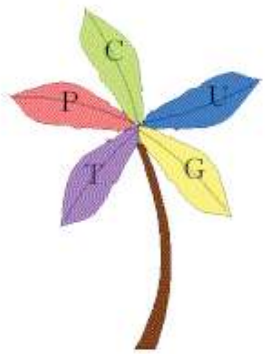
Visual Basic .Net SIG (and sometimes Access SIG)

This SIG meets the third Wednesday of the month at 6:30 PM. For information, contact Editor William LaMartin at william@lamartin.com.

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Member Bob LaFave moderates the discussion.

Forum.....Continued from page 6



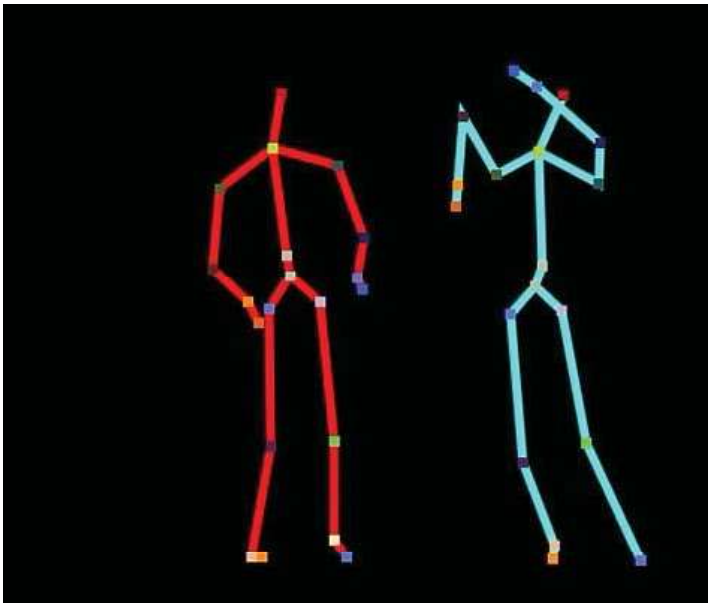
when it gets large enough. So far it's pretty small, but we have hopes that it will become second nature for the club members to log on and see what's new.

About the registration process

The username and password are necessary to be able to identify you and to keep track of your own posts. You have the right to edit or delete your own posts, and the registration process is the only way to do that.

When you register, you need an email address. This is pretty much necessary to determine that you are a real person – not a computer – and are willing to give out the address and have a sufficient level of interest in the forum to return to post your first topic. Many do not click on the link in the email – and they are deleted.

It's about the same situation as when you have to type in a code at registration that is presented to you as a graphic. The idea is that a machine is unlikely to be able to figure out the code, requiring a real person. This is expected to filter out the automated systems that post advertising, or that use the forum to post links to malware. ◆



Kinect.....Continued from page 4

The skeletal stuff works with more than one person. The example provided will track up to two people moving about in front of the Kinect, and I believe that it is possible to actually track several more. Below is a screen capture on the computer of two people dancing in front of the Kinect.

After doing only a little work with this, I can see how one could write a game, say a handball game, where a single player would hit a ball that was bounced off a wall. All of this following the applicable laws of physics. And I believe that it would be possible to present your skeletal figure with some clothing. But all of that is for the future when I have time. Right now, I have other things that need my attention.

If anyone is interested, the SDK may be downloaded

Comments.....Continued from page 5

TECH/innovation/07/29/apple.cash.government/index.html?hpt=te_bn1, the headline of which was: *Apple now has more cash than the U. S. government*. On that day, the government had an operating cash balance of $73.8 billion; Apple had a total of $76.2 billion in cash and marketable securities. And I suspect that, if Congress hadn't raised the limit, on or around August 3 the TPCUG would have had more cash on hand than our federal government. Now that is a scary thought. ◆

TPCUG Forum

As mentioned in last month's newsletter, we have a new forum at the TPCUG site where you may post or answer questions. The forum has received little use, with only a handful of members logging on and posting or answering messages. However, a number of the existing posts have been viewed more than 50 times. Unfortunately, we are having a problem with SPAM. Before writing this, I checked the forum, and there were four such postings arriving on Sept. 5 and Sept. 6 with the following titles:

- download comedy movies
- Htc touch pro 2
- karen millen dresses
- Quick question about number one treatment for acne

It is difficult to understand anyone going to the trouble that you have to go through to be able to post to the forum. To be able to post, they would have to: Press the register button; give a user name, email address, password; then read and type in the

Minutes of the August Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. The meeting began as usual at 6:30 PM. The SIG is devoted to a discussion of all aspects of the Windows Operating Systems and of computer-related subjects in general. The SIG moderator, Bob LaFave, introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees. During this session, a member's printing problems were discussed, as well as expiration dates of files, and Bob discussed video file conversion.

This month's SIG concluded at 7:00 PM.

Our speaker this month was Blain Barton, Microsoft Evangelist, who kindly has given us an interesting and informative presentation each year for several years now. This presentation was on Microsoft Cloud Computing, coinciding with the introduction of Microsoft's Office 365, and touched upon the corporate data center needs first, then the consumer side with SkyDrive, Office Web Apps and Microsoft Live Essentials. Blain was well-prepared with an extensive slideshow – stored in the cloud, of course, and using web editing tools – and explained what needs to be in the cloud and what does not. Many thanks go to Blain for his usual excellent presentation. ◆

Sony Cyber-shot DSC-HX5V Part Two

By Jim Purcell, Tampa PC Users Group
Edward_J_P@msn.com

In the September 2010 newsletter, I wrote an article describing the many features of the Sony DSC-HX5V Digital Camera that I had recently purchased. I ignored the fact that there is no viewfinder and that the camera probably would have a high learning curve due to its many features and the fact that the rest of my digital cameras have all been Canons. I reported that I had quickly learned that even a high-tech screen is no substitute for a good viewfinder. I have also since learned that, for me at least, the camera does have a high learning curve.

The features that most influenced me to purchase the camera were:

1. The 10.2 megapixel Exmor R CMOS image sensor, which was reported to have exceptional low-light sensitivity with improved image clarity and drastically reduced grain.
2. A 10x (equivalent to a 25-250mm lens for a35mm film camera) professional-quality optical zoom G-Lens (the G lens is used in Sony's top-of-the-line SLR cameras).
3. An integrated GPS receiver and compass to record the location and direction of every shot you take, and it lets you view your images on a map. I will try to demonstrate the success or lack of success that I have had with some of the more futuristic features.

Intelligent Sweep Panorama Mode for taking panoramas: Most high-end cameras now have the ability to produce a panorama. It usually involves using a series of pictures that you take of the area that you want to be included in your panorama. It is necessary that you take the pictures with sufficient overlap so that a "stitching program" can recognize common points on the photos where they can be joined. It is also best if you use a tripod in order to prevent straying from the track of the panorama. You cannot be sure that your subject will allow stitching until you try it with the program because some subjects don't work (such as all trees or similar backgrounds). These stitching programs are on your computer, not contained in the camera. They are often a part of software programs included with your camera or as a part of image-editing programs.

The big differences between the above procedures and with the Intelligent Sweep Panorama Mode in this camera are: (1.) You don't have to take 3, 4, 7 or more photos, you only take one. You depress the shutter and sweep the area to be included in the panorama. There is a limit to the maximum length of the track, but I believe that it is generous enough for most occasions and you have a choice of two sizes: The Standard size, Horizontal: 4912×1080, or the Wide Size, Horizontal: 7152×1080. (2.) You probably will be happy with the results from a hand-held sweep. (3.) All of the stitching is done within the camera. (4.) Processing is rapid and provides you with an image for review. It takes less than 15 seconds from the time you press the shutter button until you see the completed panorama on your screen. (5.) Your first view of the shot is a narrow strip across the LCD screen, but one touch of the control button switches to an image that fills the screen and automatically pans the full length of the panorama, giving you the same quality review that you get with your other pictures. (6) You know within 15

Camera .....Continued on page 4

Camera.....Continued from page 3

seconds whether or not the scene is a good candidate for a panorama shot. An example of a panorama taken with this camera is shown at the bottom of page 3.

Anti-Motion Blur Mode: This is suitable for indoor shots, without using the flash, to reduce the subject blur. A burst of six shots are taken (the camera is capable of up to 10 frames per second), and image processing is applied to reduce subject blur and noise. The pictures below were taken in a darkened scene. The top one (extremely dark) was taken with a Canon SLR camera at ISO 800, 1/50TH of a second and a lens aperture of f4.5. This picture is an attempt to capture the scene as it would appear to the naked eye in order to provide some comparison to the bottom picture produced by the Sony camera shooting in the Anti-Motion Blur Mode. The Sony camera has a range of seven ISO settings from 125 to 3200, including "Auto ISO."

Backlight Correction HDR: Shooting high-contrast scenes can often lead to washed-out backgrounds and/or details lost in shadow. Backlight Correction HDR is supposed to help correct for this by taking two pictures at different exposure settings and processing the best elements of both into a single image for more natural-looking shots. This, so far, has been my most disappointing feature of the camera. HDR technology has allowed the production of some remarkable photos. I had hoped that, when I was shooting a picture in which background lighting washed out a background which I wanted included in detail, I could merely turn the Mode Dial and fire away. To this point, I have not been able to make that happen. I plan to work on finding out why I can't make it work and then consult Sony if I have no success.

In-Camera Retouching Tools: This function allows you to perform Trimming, Red Eye Correction and Unsharp Masking functions on the playback image of your photo. Trimming was the only function that I actually tried, and it was frustrating and unreliable. My experience with automatic Red Eye Correction within a program is that it seems to work more often than it doesn't but, when it doesn't work, it can create a real mess. The owner's manual, in discussing the Unsharp masking function, states, "Depending on the image, sufficient correction may not be applied and the image quality may deteriorate."

Summary: In spite of the shortcomings, I am happy with the camera. It is very small, so it can easily be carried almost anywhere (almost too small for my large arthritic hands). The most serious shortcoming, in my opinion, is the lack of a quality viewfinder. There are also many features that appear to be quite useful but that I have not had occasion to use. Smart phones have provided many with all that they need in an easily portable camera, but these phones don't provide the capability to capture the high-quality photos and the extra features that others desire and that this and similar cameras do provide. The camera is still available on Amazon and the price has been reduced from $349.00 to $205.99. Its apparent successor is

Password tracking – Windows and Mobiles

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

Tracking passwords has always been a problem for me. Years ago I started a password document to track everything, and, while it worked, it left a great deal to be desired. The problem was much larger than just username and password. I needed to save the URL to log in to websites. I needed to track expiration dates for subscriptions. I needed key codes for software. I have five different logins with Microsoft. Yes, I could reuse some of those, using the same login and password, but not always. For instance, sometimes your login is the same as your email address, but most times not. Making it more complicated, different sites have different login and password requirements.

And Verizon! I have SIX different logins with Verizon: Call Assistant, Verizon Central, Verizon FIOS, Verizon Mail Account, Verizon Mail and Verizon Wireless.

So I developed some "password rules" for myself. I decided that if I could remember more than just a couple of passwords, it was because 1) I had to reuse them (a bad thing) and 2) they were too simple. So something had to go. I decided I need really good passwords and I couldn't handle it in my head.

One of my sons suggested the KeePassX database he'd been using for a while, and I started using it sparingly, slowly embracing its features as I got used to it. The program is maintained professionally and is available free of charge. You can look at the program at http://www.keepassx.org/ to see if this will suit your own needs. Of particular interest is the variety of devices that it works on. You won't see any mobile versions at the website, but each of the mobile devices has a version available from its own app store. I use the Android version on my Motorola Droid X.

The program uses an encrypted database, and I guess ideally there should be a way to automatically update or synchronize between devices. I own several computers and my Droid, and I need the database on all of them. I could use Microsoft Live Mesh or Dropbox or something like that for synchronization, but I dislike the idea of my password database being in the "cloud." So for now I use a flash drive to copy the database file to my computers, and I connect my Droid to my base computer via USB and drag and drop the file. I've found that, in practice, I don't have to refresh the files very often. None but the one on my main computer is up to date at any one time, but it never seems to matter.

What is so useful about this program is that I can store any useful information along with the URL and the logon and the password. For instance, my Amazon/Kindle account logon has the names and Kindle email addresses of two Kindles, two Droids (smart phones) and two PCs. It's a logical place to keep all this stuff. Right now I count 82 database entries, and I'm very careful to keep it trimmed of anything not useful. It has a configurable password generator and the ability to look at the password when you want to instead of a line of *******.

I got an email to my Droid with a notification of an event on the TPCUG forum before I would even think of firing up my main computer. I needed to log on using a regular account on the forum. The peculiarities of a smart phone with just an on-screen keyboard that needed a complex login and password should have been just too daunting. But on the Android version of KeePassX, when you select the group (TPCUG) and title (User Logon), the database puts two little buttons in the notification strip at the top of the screen. So when you open the browser to the site, you just poke the login notifier, then poke and hold on the login box and a paste menu appears that you poke and it's pasted in place. Then the same for the password and I was in and out in seconds.

What a deal, and it's free. There are versions for Linux, Mac OSX, Windows, iPhone, PocketPC, Blackberry and Android. Http://www.keepassx.org. And if you think you don't need one, your passwords are too simple and you're using the same one for everything. ◆

Special Interest Groups

Visual Basic .Net SIG (and sometimes Access SIG)

This SIG meets the third Wednesday of the month at 6:30 PM. For information, contact Editor William LaMartin at william@lamartin.com.

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Member Bob LaFave moderates the discussion.

Comments.....Continued from page 5

many by Apple, regarding various computer and phone devices, or the software than runs them. It seems as if everyone is suing everyone else; and sometimes it is for things that seem so obvious you wouldn't think they could be patented. Such a suit by Apple has caused Samsung to have to stop selling its tablet computer in Germany. But everyone seems to be involved: Apple suing Samsung, Samsung suing Apple, Google suing everyone and everyone suing Google. Microsoft and Oracle are also taking part in all the fun. Google recently paid $12.5 billion for Motorola Mobility for their patent portfolio, not for their phones. There is, however, speculation that they actually want the phones too since several years down the road they may be producing their own Android phone for worldwide distribution and at that time making the Android system proprietary and tough luck to all the phone manufacturers who have jumped on the Android bandwagon.

Then there are companies who really have no product and whose sole value consists of the patents they have acquired and with which they essentially try to extort money from companies that do have products by claiming that these products are infringing on some patent the patent-aggregating company possesses. Many of these dubious patent suits are filed in some small East Texas county where the judicial system seems predisposed to favorable rulings to the plaintiffs in such cases.

Mark Cuban, a successful entrepreneur (Broadcast.com of the DotCom bubble era), said in a *Wall Street Journal* interview that he would do away with the patent system entirely for technology It was stifling any innovation because any time you come up with an idea and try to implement it some patent troll is going to sue you for infringement of their supposed patent. He went further to say that if patent litigation had been at the same level in the 1980s as it is today, there would be no Microsoft. His reasoning was that Digital Research would have taken out all sorts of patents on CP/M and then submerged Microsoft in litigation before they even got started. Now companies buy up troves of patents so that if a company sues them, then can then probably find some patent in that trove that can be used to sue the company. It is sort of like mutually assured destruction.

Data Breaches I just read where Stanford University Hospital has exposed emergency room care patient records online for a year. It seems that we have a new story like that every week. In my small world, I have received Visa cards with new account numbers for two different cards this year because at least two vendors exposed account information for many accounts, apparently including my two cards.

In the Stanford instance, a spreadsheet that was provided to a billing contractor ended up on a website called "Student of Fortune," where students can solicit paid help with schoolwork. The article I read in the *New York Times* said that it appeared "as an attachment to a question about how to convert the data into a bar graph." This is just another example of why such data should, in my opinion, never leave such places as the hospital and why such material should never be on any network connected to the Internet. Of course, there is still the old-fashioned way of losing data. The same article mentions that an employee of Massachusetts General Hospital "left paper medical records on a subway train while commuting to work." That cost the hospital a $1 million federal fine. Perhaps the time of confidential information has passed and everything will eventually be public. ◆

Meeting Preview: Our October presenter is Steve Singer of RDI@TampaBay who will present his annual hardware review. Also, as usual, Bob LaFave will conduct the Windows SIG for the first half-hour of the meeting.

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Steve Jobs We should note Steve Jobs' passing since he was one of those who helped create our personal computer world by teaming with Steve Wozniak to produce the Apple I, the success of which, along with that of the Apple II, motivated IBM to develop the first IBM PC, which, in turn, led to the creation of the Tampa IBM PC Users Group, renamed at a later date the Tampa PC Users Group. So I can blame Steve Jobs for possibly being a partial cause, along with Steve Wozniak and Bill Gates, among others, for my working on this issue of the Tampa PC Users Group newsletter.

News I am sure we all have heard that HP may exit the computer hardware market. Apparently selling desktop and laptop computers is a low margin business. HP's new CEO, Meg Whitman, says she will tell us their decision by the end of the year. That is if she is still CEO then, since HP has had three CEOs in what, I think, is less than a year's time. It is amazing how disorganized HP has appeared to be in the past year. I certainly hope

Minutes of the September Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. The meeting began as usual at 6:30 PM. The SIG is devoted to a discussion of all aspects of the Windows Operating Systems and of computer-related subjects in general. The SIG moderator, Bob LaFave, introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees. This session, Bob LaFave could not attend, so Merle Nicholson stood in his place. One subject explored was a question about what computer to get for a person who was not interested in the computer at all and couldn't be bothered. A possible solution was suggested by Kevan Sheridan, who happened to have a Chromebook sitting in front of him in the meeting. (See related article on page 3.)

This month's SIG concluded at 7:00 PM.

Our speaker this month was myself, Merle Nicholson. Merle talked about Windows 7 Backup, why you must do backups, what the consequences of not doing backups are and suggestions on the possible equipment available to do it inexpensively using Windows 7 Backup as software.

The thrust of the presentation was that your computer's storage is based on a hard drive and that hard drives have a lifetime, after which they die and take everything to the grave with them, leaving you with no choice but to replace the hard drive, recover the operating system and lament losing all your email, documents and valuable pictures.

Windows 7 Backup and Restore is a good software solution, because it's there and it's good and reliable, even if it does not have any useful extras that you get with purchased packages such as Acronis.

The session was lively and some good related discussions occurred during the presentation. ◆

Chrome OS Linux

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

This is about an alternative to a Microsoft Windows computer – Chrome OS. It's for people who want to keep things simple and are willing to do most everything on the web – but, specifically, the Google family of applications. It's similar to a Google Chromebook, but with some additional advantages and disadvantages. And it's kind of free.

By comparison, the Google Chromebook is a Netbook computer with an Atom processor running the Google Chrome operating system. The price at Best Buy today is $429 wifi, and 3G Cellular for $499. That's with a 12.1 inch screen, wireless Internet, no DVD, 16 GB solid state hard drive. It's not cheap, but it does have some advantages. It is lightweight at 3.3 lbs., it boots up very rapidly and you're on the Internet in a minute, where you can do email and web, calendar, messaging, Picasa, Google+ and dozens more applications, all web-based and cloud services that Google offers. And other services, too, if you wish.

What you don't have is access to your own computer in the traditional manner of thinking. For instance, you can't worry about computer viruses and antivirus because, so far, there aren't any (maybe). You don't worry about updates to the computer because that's done for you. And you can't manage your own files. That's all a good thing and a bad thing, depending on your point of view.

This operating system is built around a product – Chrome Browser – that you can install on any computer. I have it myself on my personal computer. It's simple and seems to do everything you need in a browser after you get past its very simple user interface. It's fast; I like it.

So the Chromebook is a very attractive idea and probably works very well if you're happy with everything Google – or at least everything web, because there is nothing keeping you from using Hotmail or Verizon mail or maybe the Windows Live products for that matter. Don't hold me to the Windows Live thing, I'm guessing.

Ok – onward. Did you know you can buy a Dell Mini notebook at Best Buy for $200? Wifi, 10.1 inch screen, a 160 GB hard drive, 1 GB memory and 3.1 lbs! It has the useless Windows 7 starter OS, so why not put Chrome OS on this? $230 cheaper than the Chromebook!

And Hey! A Lenovo notebook, 15.6 inch display – a full sized notebook computer with 4 GB of RAM for $299.99. It's called an ultraportable because it's only 5.2 lbs, and 1.3 inches thick.

Here's what I'm leading up to. The Chrome OS Linux. Now, the Chrome OS is built on a distribution of SUSE (pronounced soo-sa) Linux. SUSE Linux is a German-origin open source Linux project. It has evolved over time, having been acquired by Novell, and then by Attachmate. So SUSE lives on both as a commercial enterprise and as an open source, meaning there are free distributions. Make no mistake, Chrome OS Linux is not a Google product. Instead, it is a free operating system built around the Google Chrome browser. The website to get this operating system starts at http://getchrome.eu.

Copying from their website, we have:

Featured software in Chrome OS Linux:

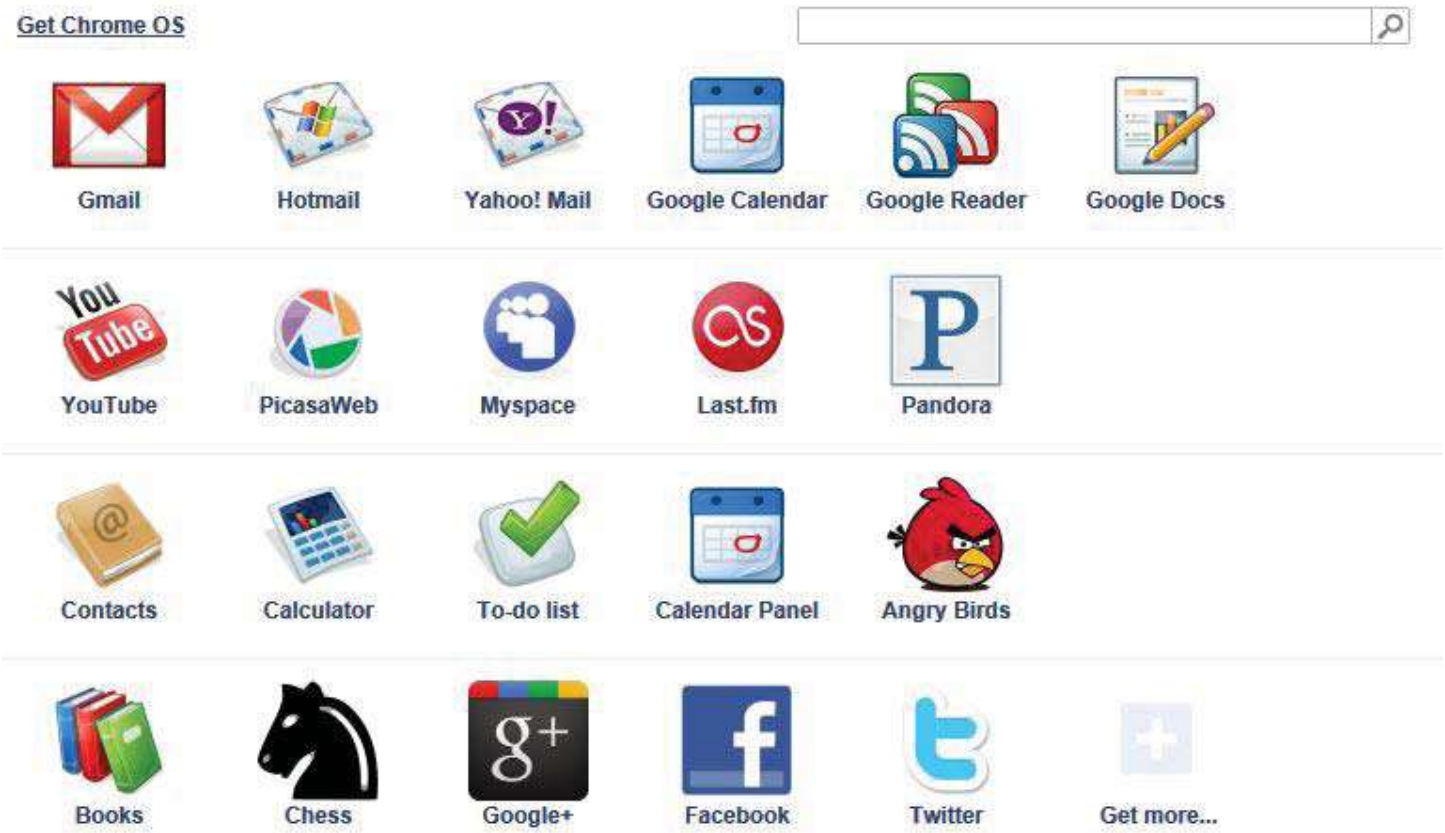
- Linux kernel 2.6.37
- GNOME 2.32 desktop environment
- Experimental GNOME Shell desktop environment
- Google Chrome 15.0.874 web browser New!
- Google Picasa 3.0 photo manager
- LibreOffice 3.3 office suite
- GIMP 2.6 image editor
- Wine 1.3 Windows emulator
- Cheese 2.32 webcam app New!
- Pidgin 2.7 instant messenger
- Dashboard with social toolbar
- Control Center
- revamped new tab page New!

Chrome.....Continued on page 4

Chrome.....Continued from page 3

- and much more!

I have downloaded this operating system and installed it on a notebook with the idea in mind of duplicating a Chromebook in functionality as much as possible, and it looks as if I'll succeed in doing that. I have set the Chrome browser to load at Start and to load the getchrome home page. It happens in about 75 seconds from the notebook power on. And to give you an idea, this page is pretty much the beginning. If you have the Chrome browser and a gmail logon, you can go to the chrome web store at: https://chrome.google.com/webstore and get a few hundred more apps.



The notebook I installed this on is pretty old as notebooks go – 2005. It's large and heavy but still works well. I pulled the hard drive out and installed an older one that I didn't care about. It's plenty fast enough for this very fast operating system.

I won't go into the technical details of downloading and installing the OS in this article. I will say this: If you're not particularly technical and experienced at this, you'll need some help. But once I had the CD created it was pretty easy from there. First, I did try an alternate – installed to a 4G flash drive and booted from that, and failed with early lockups. My son in Seattle experienced the same thing. So I created the live CD and went forward. It's made to run "Live CD" - so it will run from the CD without installing to the hard drive, and I did that a couple of times. I don't recommend doing this as long as there is a valuable hard drive installed because, just momentarily, I came within an inch of destroying my Windows installation. That's when I decided to replace the hard drive and go on with a regular installation.

My installation isn't 100% complete. I don't have my Bluetooth mouse or WiFi running yet. When I'm 100% done – that's another article.

My thanks to Kevan Sheridan for the introduction to the Chromebook and the time he took to explain it to me.

Below is the Chrome OS home page. ◆

Internet Picture of the Month

A small plane crashes into a Ferris wheel in Sydney, Australia and dangles there with two people inside the plane and a pair of children on the Ferris wheel trapped there for 90 minutes. Comments.....Continued from page 1

they decide to continue producing computers because that gives us one more source when we want to purchase a new one. I think the problem is, once you buy a computer from them, that is all they get until you may want an additional computer. However, if you purchase a printer from them, then it is more toner or ink until the printer is no longer used. The same for all the consulting services they supply.

IBM has done quite well since they discontinued selling desktop and laptop computers and sold that business to Lenova. Apparently they are surviving quite well with their mainframe business and computer services. So well, that I recently read where IBM has now, as Apple did some time back, passed Microsoft in the value of their stock. For tech companies, we have the most valuable is Apple followed by IBM and then Microsoft.

Kodak As noted above, being on top does not guarantee that you will stay on top – or even be anywhere near the top. At one time, Kodak dominated photography and was one of the 30 companies in the Dow Jones Industrial Average. Now, they are almost bankrupt, with a stock value of under one dollar per share. You will say, but their mistake was not getting into

Update on FIOS Battery Backup

By John Witmer, President, Tampa PC Users Group
jhwitmer@verizon.net

I previously wrote of my experience with my FIOS backup battery causing both an audible alarm and a red-light replace battery warning signal. The events occurred over the Christmas holidays in 2009, and the article appeared in our newsletter in April 2010. I thought I would update you on that situation. The very same battery is still alive and well in my FIOS backup system box, some 21 months later. So much for its needing to be replaced! I will have to admit that I have had several more instances in those 21 months where the audible and red-light alarms occurred in the unit, but by following the instructions I put in that old article, the battery alarms were silenced, and the system continues to function perfectly. I have had that battery for more than four years now and expect it to last another couple more. I base this guesstimate on having to recently replace the backup battery in my home alarm system after getting seven-plus years out of it. Here's hoping anyway that the FIOS battery lasts as anticipated.

One of the surprises that came out of that article was receiving emails from a couple of individuals who had come across the article in our TPCUG newsletter while searching the web for a similar problem they were having. They were appreciative of finding a solution to their problem without having to replace the battery and were thoughtful enough to let me know it benefited them. I was curious back when the emails were received as to what was out there when doing a Google search for the topic of "FIOS Battery Backup." I came across a Verizon website forum on the subject. The solution that was contained in my article was not mentioned on this Forum, so I decided to add it as a posting under that topic, hoping that not only would many people benefit from it, but also that perhaps a Verizon representative might see it and offer a comment. I posted my comments and a link to the TPCUG newsletter article on the Verizon Forum in early Feb 2011, and within a month or so, there were favorable comments from a couple of other posters. What really surprised me is that they show the number of views the post has had, and, as shown in the screen clip below for this article, it has had 6,315 views so far. I feel somewhat elated that perhaps a great many of those viewers were able to resolve their problem without the expense of a new replacement battery. I even noted that a later poster to this Forum in July 2011 indicated that he received essentially the same information as in my article from a Verizon FIOS representative when he called about his battery problem, so maybe Verizon has seen the article and is now offering it as a possible solution to customers calling in with this type of battery backup problem. For me, this is another example of what a great resource the web is, with people sharing information and solutions to problems. ◆

Special Interest Groups

Visual Basic .Net SIG (and sometimes Access SIG)

This SIG meets the third Wednesday of the month at 6:30 PM. For information, contact Editor William LaMartin at william@lamartin.com.

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Member Bob LaFave moderates the discussion.

Comments.....Continued from page 5

digital photography soon enough. Well, I have news for you. They invented the digital camera in 1975. I am not sure, but that may have even been before Al Gore invented the Internet. Anyway, it is obvious that they did not properly capitalize on their invention. Possibly because it would have cut into the cash cow of film photography where they were dominant. Now with what remains of their business, Kodak is trying to become a printer company, I think.

WP7 Mango Update I was one of the lucky ones who got the Windows Phone 7 Mango update pushed to me on the first day it was available. It is being deployed in stages to a percentage of users on different phones from different vendors in different sections of the country, as I understand it. That way they can monitor the process for problems instead of pushing it out to everyone at once.

There are supposedly 500 improvements. I assume most of those will be invisible to the user. The ones I have noticed that are quite nice are

- Holding down the back button displays all the running apps.
- You can now aggregate all your email accounts into one super account for ease of use (the all accounts inbox).
- When you click on the Bing search button and then the eye button, the camera activates, and, if you point it at a barcode, it will provide you information on the product. Similarly it will copy and translate text for you.
- That is all that I have noticed of use to me so far. However, for those who use facebook and twitter there are all sorts of features that will make your life easier. For example, you can put your friends into different groups and then send messages or tweets to everyone in a particular group.

I am sure there are a lot more, but I haven't really been interested in looking for them. My main interest is writing programs for the phone. On the same day the update was released, the final version of the programming tools for the phone using Visual Studio were released. Before I could install the new tools, though, I needed to download and install Service Pack 1 for Visual Studio 2010. I only mention that because the size of the download amazed me. It was 600 MB plus. I think the Apple IIe that Steve Wozniak and Steve Jobs designed for me only had 64 KB of memory plus an additional 64 MB I purchased (that extra 64 was really not easily addressable at the time). We have come a long way memory-wise.

Of course, not much attention was paid to the Mango update for the WP7 by the press since it had been devoting its space for a couple of weeks to hyping the upcoming (and now done) release of a new version of the iPhone. It was the iPhone 4S with the iPhone 5 expected sometime in the Spring of 2012.

Are you being tracked? Are you worried about Google, Facebook and other social media following you on the web and storing all sorts of the information about you that you divulge on such sites, which they can then combine with subsequent searching and browsing activity? If so, why don't you use two different browsers. Use one, say Firefox or Chrome, for the social media stuff and use Internet Explorer for your web searches and browsing, or vice-versa. Or make it even more restrictive and use, for example, Chrome for social media, Firefox for web search and IE for general browsing. Then, when you research

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

What to write about this month? Well, it is supposed to be something at least loosely associated with computing. So that leaves out the two hot topics of today as I write this: The Greek debt crisis and the MF Global meltdown, the f rst having to do with spending more than you have, the second with betting more than you have. Then there is Bank America and other big banks backing down on charging $5 per month to use their debit cards. Anyone with any sense knew that would happen, but the banks had to run the idea up the f ag pole and see if anyone would salute before giving up.

I think most members of our group will be happy to know that HP has decided to stay in the PC business. I certainly am, although I don't plan on purchasing a new PC or laptop in the immediate future.

The Steve Jobs biography is out, I see. Perhaps someone in the group will read it and be kind enough to write a review of it for

Minutes of the October Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. The meeting began as usual at 6:30 PM. The SIG is devoted to a discussion of all aspects of the Windows operating systems and of computer-related subjects in general. The SIG moderator, Bob LaFave, introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees. This session, Bob LaFave was could not attend, so Merle Nicholson stood in his place. This month's SIG concluded at 7:00 PM.

Our speaker this month was Steven Singer, CEO of RDI Distribution Corp, a wholesale computer hardware distributor at http://www.rdi.us, and at http://www.morevalu.com, the end-user division.

Steven and his spouse, Pam, have for many years done our October or November presentation, bringing with them a variety of hardware from their business to show us and talk about each. Steven is very knowledgeable about all things computer-related and is an entertaining speaker, with hardware examples that are passed around for all of us to handle.

One item was a USB adapter that bypasses the 500 mA charging throttle that USB imposes for charging devices. This sounds very useful for devices that don't adequately charge from your computer.

Steve and Pam passed around the $100 HP tablet that went on the market when HP decided to abandon their production. Steven seems knowledgeable about Android and "rooting" Android devices. He brought – and talked about – a mini ITX computer motherboard with an imbedded processor that seemed very inexpensive and capable of building into a very tiny computer.

The discussions sometimes run far af eld and get pretty lively. It was a thoroughly entertaining session. Our heartfelt thanks to Steven and Pam. ◆

Office Products & Multiple Monitors

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

Office products: LibreOffice is my #1 choice for a full-featured Office suite. The suite consists of Writer, Calc, Draw, Impress and Base. If you can't justify Microsoft Office in price or sheer size, LibreOffice will do the job for 99% of what you need. And it's FREE. You should not encounter file compatibility problems. I have switched between MS Word and LibreOffice Writer with the same document and so far have not encountered any page formatting problems. I haven't done much swapping between MS Excel and LO Calc since my spreadsheet needs are pretty simple, but I've never failed to do what I need in Calc. It can use .xls and .xlxs formats as well.

The newest open-source version of this is called LibreOffice 3.4 at http://www.libreoffice.org/. This version comes about because Oracle, the current owner of OpenOffice (acquired from their acquisition of Sun) is making some content and distribution decisions outside of the Open Source community (according to the Open Source maintainers). So they've broken away and have reversed some of those decisions. Even though I spend good money for Office for every version, I still use LibreOffice for Word Processing and spreadsheets. They have Linux and Mac OSX versions, too.

Another thing about Microsoft Word, Outlook and Excel is that I've given the "ribbon bars" several years of my attention, and I just prefer the simple toolbars of LibreOffice. It isn't that I can't get used to the ribbon; I can and do. I use the Outlook ribbon constantly throughout my day (but normally hidden). In my opinion, as long as the "old style" toolbar is customizable it's superior. The ribbon takes just too much screen room and too much searching. The versions of ribbons have greatly improved between Office 2007 and 2010. The ribbons are now customizable, so I use one of my own ribbons almost exclusively, with all my most-used functions.

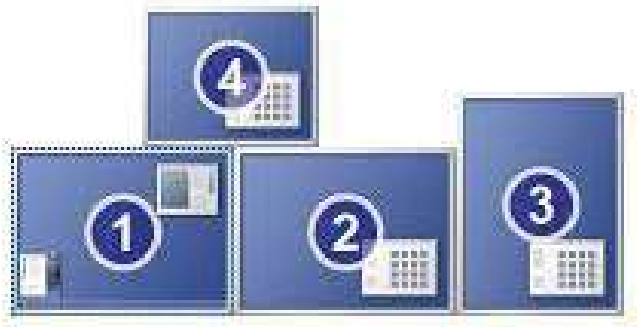
I'm currently using: LibreOffice Writer, LibreOffice Calc, occasionally Excel 2010 for clients, Outlook 2010 and Access 2003. I've been experimenting with Access 2010. I don't use presentations, so I can't advise on either Impress or PowerPoint.

With Access 2010, I haven't gotten a handle on customizable menus yet, and so far I'm pretty much headed for failure. I have a commercial menu-driven application that just can't be duplicated with ribbon bars. It's very much a shame; I've been a firm advocate of Access for many years. I'll use Access 2003 as long as the latest operating system will allow.

I very highly recommend LibreOffice. You can't beat the quality and price, and, with the exceptions of Outlook and Access, there just is no reason to use Microsoft Office.

Multiple Monitors: Multiple monitors can offer some unique challenges, many of which I hadn't anticipated at first, but I can easily say that they make my life on the computer much more manageable and efficient when I need several programs and windows at the same time. I run a successful software business from them, and I just can't imagine doing this on one monitor.

I last wrote about using multiple monitors with Windows in 2004, when I had just gotten a second mismatched monitor and was making pretty effective use of them. I was using Windows XP, of course, and I talked of getting a bargain in a 15" Samsung LCD for $369. Right now I can get a 27" LCD screen for $300!

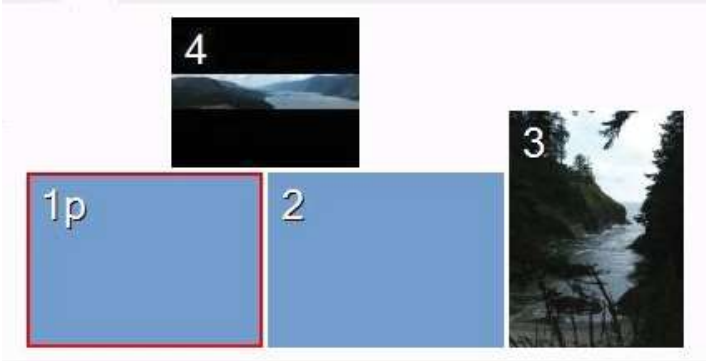


In 2005, I bought a pair of matched 21" LCD screens, very expensive at nearly $600 each, which I am still using, and I still consider them essential. I purchased a very nice multiple-monitor software program called UltraMon, which I can still recommend, but I bought another program called DisplayFusion Pro a year ago that I am extremely happy with.

My current configuration is four monitors with two video adapters. The Video cards are both ATI HD 4650 that are adequate but not especially fast under these

Office.....Continued on page 4

Office.....Continued from page 3



circumstances. I added a 21" monitor to my right (a gift from a friend who had it surplus) and swiveled it to portrait for viewing help and reading PDF f les, and recently I put an old 17" on the shelf above me to display my web cameras, weather gadget and to park Outlook for monitoring incoming emails. Here's what they look like in Windows 7:

Windows 7 handles multiple monitors much better than all previous versions, but the customizing choices are still pretty limited. The options are to decide which is your primary monitor, and, for the remaining monitors, whether you want to duplicate another monitor, or extend the desktop to that monitor; the second choice is the only one you'd want, of course. And you can rearrange the relative positioning with the mouse after identifying which monitor is assigned what number. The positioning is critical because you have to move the cursor from one to another, and you can't go outside a monitor. For instance if my cursor is in Monitor three, I can't get to Monitor one or four without going through two.

The primary monitor has the Start Menu and the taskbar; the others have nothing. The wallpaper, and screen saver choices are pretty limited to one, a less than satisfactory situation. I can't speak too much about screen savers, because I don't use them. They're misnamed in any case. They're for entertainment, and perhaps as a rotating picture frame when not in use, and can't really be effective in a multiple monitor situation. Unless you buy good software. Instead of Screen Saver, I set a Windows Power Prof le to turn the monitors off after 20 minutes of non-use. My wallpaper is plain light blue-grey.

I depend on the program DisplayFusion Pro 3.4 by Binary Fortress at http://www.DisplayFusion.com. This program does a great deal to help you manage your desktop, but, for me, the #1 feature is its ability to add additional taskbars on each of the monitors. Mine is conf gured to have a Windows Start Menu and the "Show Desktop" panel each. Additionally, I have some duplicate shortcuts on each and, when a program is minimized to the taskbar, its task icon goes to its respective taskbar. That is, on the monitor where it was minimized from. This is all unique. Native Windows 7 can do none of these. Below is the DisplayFusion rotating wallpaper setup.

The scope of the things this program will do is just too large for an article to cover well; I'd suggest a visit to the website, but I'll try to summarize: Wallpaper Management, Hotkeys, Titlebar Buttons, Monitor Conf guration, Window Snapping, Window Management, Logon Screen and Multi-monitor Screensavers. For one computer, the Pro version is $25, and $35 for all computers in your household. I highly recommend this; I think it's very inexpensive considering its wide-ranging capabilities.

One other thing that I need to do with multiple monitors is to f nd my cursor! I have to admit that sometimes I don't know where it is. I have the standard Windows setting that pops large circles around the cursor, in Control Panel, Mouse, Pointers, "Show Location of pointer when I press the CTRL key", and that does help, but not quite enough. So I wrote my own program that will move the cursor to whatever monitor I want by a hotkey action. When I press the hotkey for Monitor 4, the cursor pops to the center of Monitor 4

Internet Picture of the Month

Kudzu Bugs. From the site http://naturecloseups.com/posts/globular-stink-bug-invasive. Apparently the invasive vine kudzu now has a bug that loves to eat it. Unfortunately this bug, the Megacopta Cribraria, is also an invasive species, recently arrived in Georgia. The bad thing is the bug also likes other plants, including soybeans. And it stinks.

Comments.....Continued from page 1

the newsletter. We haven't had a book review in a very long time.

Apparently not all laptop batteries are made the same. My daughter's Sony laptop purchased in 2008 needed a new battery recently. The message she was receiving was, I think, "battery not detected." So the question was: Is it a bad battery or is it something else. If you purchase a battery and that does not f x the problem, can you return the battery for a refund or are you stuck with it? After I decided to purchase a replacement battery, do I go with ones found at sites on the Internet for $40 to $50, or do I purchase a Sony exact replacement, which I could not readily f nd by searching the Web? My f rst impulse was to go with one of the $45 aftermarket batteries, but the more I read, the more worried I became about doing that. Here is the rub. The replacement batteries also come with a CD that you are supposed to run on the laptop (connected to its AC power adapter) that will change something in the BIOS or somewhere that will reprogram how the computer interacts with the battery so that the aftermarket battery will be recognized and function properly. In my reading, I found people for whom this worked successfully and others for whom it did not. There were also a fair number of individuals

My Phone Apps

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

I now have f ve apps at the Microsoft Marketplace for Windows 7 Phones. The f rst two I did back in June as sort of practice apps when the WP7 f rst became available from Verizon. One was a tank volume program which calculated for different types of tanks the volume of liquid in the tank at different levels from the bottom. The other was a real-time scheduling app for the San Francisco Bay Area Transit System (BART). These were free apps with no advertising.

With the introduction of Mango, the large update of the WP7 operating system, I decided to get more serious. The last week in October, I put three more apps at the Marketplace, a walking app, a grocery shopping app and a stock market app, hopefully all to bring in a little money via advertising appearing in the bottom 80 pixels of the screen. The little fellow above is the program icon for the walking app, and the screen capture on the right displays the selecting of items for a grocery shopping trip captured from the phone emulator (simulates the phone) running on my computer. This image was done before I added the advertising banner to the program.

Based on what I have seen so far, I don't think I am going to make much from this endeavor. My f rst two apps have been at the Marketplace about three months. The volume app has been download a little more than 200 times, the Bart app, a little under 100 times. As I write this, the walking app has been at the Marketplace for f ve days and been downloaded f ve times.

Here is what I have seen about ad revenue so far. Of course, I don't really have much data, but, with the ads running while I was testing my three new programs over a bit more than a week, I did generate some money. According to the stats, while I was testing the three apps, 1,600 impressions of various ads were displayed (sounds like a lot to me) at the bottom of the screens. And for that impressive total, my estimated revenue is $.30 (that is cents, not dollars). Viewed another way, it amounts to $.18 per 1000 impressions of an ad.

The message here is pretty obvious. If you want to make any money from apps by displaying advertising, then you need to have your apps running on thousands of phones. I know of at least two people, working as a team, who are supporting themselves entirely with WP7 apps that display advertising. So it can be done. They, the last I heard, had 25 apps, and some had been downloaded thousands of times. They at f rst tried to put, say, $.99 or $1.29 as a price for downloading an

Visual Basic .Net SIG (and sometimes Access SIG)

This SIG meets the third Wednesday of the month at 6:30 PM. For information, contact Editor William LaMartin at william@lamartin.com.

Windows SIG

This SIG occupies the f rst 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Member Bob LaFave moderates the discussion.

My Apps.....Continued from page 6

app but discovered that almost no one would do that – too much free stuff out there. So they went to the display advertising route. And I took their hard-learned advice and did the same thing. But it appears that my results are gong to fall a good bit short of theirs.

Part of my problem, I think, is going to be that I just don't have the same interests as 95-plus percent of the smart phone users. One way to get a lot of attention is for Microsoft to select one of your apps as a featured app. Perhaps I will get lucky and hit on something that Microsoft will select as a featured app and things will look up. But with so many other apps out there and more coming online everyday, there is little chance of that. I will just keep writing the sort of things that interest me and see if I am fortunate enough to hit on something that is also of interest to others. ◆

Comments.....Continued from page 5

who had purchased such a battery which did not work even after the individuals had run the CD. I cannot imagine them running the CD, though, after they had been warned that doing so might damage their computer. Some people, after reading the warning, examined their CDs and could f nd no f les on them. So it seems that many of these batteries are being produced and shipped with essentially no quality control. Additionally, not a small number of the people who had left messages about their experience with the batteries were still waiting for refunds. You pay your money and take your chances.

After thinking about this for a short time, I went to the Sony site to search for their battery but couldn't f nd it. Amazingly, when I entered the model number for the battery into their parts search, it produced other batteries (not listed as replacements for my battery) and non-battery items such as keyboards. So much for Sony's parts site. A call to the local Sony store informed me that they did not have the battery in stock, but I was given the 800 number to call. I did that, and the lady who answered found the battery I needed for a price of $139 + tax + shipping. I ordered the battery, and when it came the laptop was happy and, thus, I was happy. But that $45 price certainly sounded a lot better than the $139 plus price. And, who knows, the supposedly replacement $45 battery may have worked. I just wasn't willing to take the gamble that using the CD would not damage the laptop, as it had done for others.

Finally, on this battery issue you may ask why spend more than $150 when you can buy a new laptop for under $400. Well, this laptop cost more than $2,000 in 2008, and I am sure that you couldn't f nd an equivalent one now for under $1,000. And if the laptop with the new battery lasts two more years, then I will be happy.

The **Amazon.com link** on our home page has been producing results. We received $27, $15 and $32 for the months of June, July and August; the payments are made each month for the month that was two months previous. Keep up the good work and tell your friends to use the link at http://www.tpcug.org for their Amazon.com holiday shopping.

Looking back at our newsletter for November, 1992 (that is 19 years ago, if you can believe it), I see in the President's column where he is looking forward to the opening of Tampa's f rst CompUSA on Hillsborough at Dale Mabry. Well, a lot has changed in the ensuing

Meeting Preview: Holiday Party

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Thanks to Mike Hutchison, Jim Purcell and Merle Nicholson for providing content. Jim sent along some images to accompany his article, but there just wasn't any extra room. Usually that is not the case, and, in fact, I often use images to take up space. Of course, such images also provide us with valuable information about the topic of the article. You know, "a picture is worth a thousand words." Well, you will only get words in this edition.

I write about tablet computers this month, when a month ago I had not really used one. Now we have two in the family, and I have played with them enough to write a comparison piece about the iPad and the Kindle Fire. At a Microsoft meeting last month, I also saw a tablet, the brand of which I didn't take note, that was running a pre-alpha version of Windows 8. Windows 8 is supposedly going to be both a tablet operating system and a desktop operating system.

The tablets are in many ways a pleasure to use, but don't throw away that desktop or laptop if you really want to do anything productive. In my opinion, tablets are for web browsing, emailing and entertainment. ◆

Minutes of the November Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. The meeting began as usual at 6:30 PM. The SIG is devoted to a discussion of all aspects of the Windows operating systems and of computer-related subjects in general. The SIG moderator, Bob LaFave, introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees. This session Bob gave a PogoPlug demo. It is a device for file sharing that connects to your internal network. He also mentioned his purchase of the Ceton Windows TV/DVR card – or USB device. He made a quick mention of Live Movie Maker for editing commercials out of recorded TV, Media Sharing and the Microsoft Stand-alone System Sweeper which is a recovery tool that can help you start an infected PC and perform an offline scan to detect rootkits and other advanced malware. The URL is http://connect.microsoft.com/systemsweeper.

Our speakers this month were Kevan Sheridan and Merle Nicholson, both long-term TPCUG members. The subjects were ChromeBook (Kevan) and Chrome OS (Merle).

Kevan brought in his ChromeBook – a slim 12.1" laptop-like device with a closed operating system, but optimized to operate in the Chrome browser and interact with all things Google. Google, as we know, is now providing most everything a more-than-casual user may want in "the Cloud" - Gmail, Calendar, Contacts, (Book)Reader, Google Docs (where you can store all your docs online), Picasa (storage and sharing pictures), Google Books, Google Music, Google+ and a wide variety of non-Google apps like MySpace, Facebook and Twitter.

Kevan demonstrated some of this from his own Chrome-Book connected to the projector. There were quite a few questions about this lightweight, slim and fast notebook.

Merle had the Chrome Browser installed on his notebook running under Windows 7, but mostly talked about Linux/Chrome. He explained his process of attempting to install the Chrome Operating System for PCs. That is an open, free Linux variation from SUSE. It's built to be minimal with the Chrome browser as its centerpiece. It also includes non-chromey things like Libre Office Suite, Gimp, and

Purchasing a Camera

By Jim Purcell, Tampa PC Users Group
Edward_J_P@msn.com

[To more easily access the links in this article, view it at our site, http://www.tpcug.org]

My first real interest in photography began in 1946 when I started using my Dad's post-card size Kodak bellows camera and set up a darkroom with a friend of mine in his mother's wash shed. I have bought several cameras before and since the digital revolution. I purchased my first Kodak 35mm camera in 1952. My first high-quality cameras were a Rolleicord ($25) and a Leica IIIF ($165) that I purchased in 1955 while stationed in Germany during the Occupation. Both are still in operating condition. I have had some repair work done on the Leica, but the Rolleicord has required none. I won't go through the list of cameras that I owned since then, but I now own a Cannon 40D single lens reflex camera and a very small but full-featured pocket megazoom Sony DSC-HX5V camera which I use as a "carry around" camera.

Cameras to Consider

Digital Single-Lens Reflex (DSLR) This is the group of cameras most preferred by professionals and serious amateurs. The cameras use a mechanical mirror system and pentaprism to direct light from the lens to an optical viewfinder on the back of the camera. DSLRs allow an accurate preview of framing close to the moment of exposure, and allow the user to choose from a variety of interchangeable lenses. They also have larger sensors compared to most other digital cameras. The sensors are generally the same as, or closer in size to, the traditional 35mm film format that many photographers started out using. These large sensors allow for similar depths of field and picture angle to that of film formats. In general, a larger sensor provides lower noise, higher sensitivity and increased latitude and dynamic range. The downside is that camera bodies and the lenses of DSLRs are very expensive. The bodies and lenses are also large, heavy and cumbersome. For complete information go to: http://en.wikipedia.org/wiki/Digital_single-lens_reflex_camera#Comparison_with_digital_point-and-shoot_camera Examples can be found at: http://cameras.bestcovery.com/best-digital-slr-camera-overall?sem=3884548238y&gclid=CPeKsZem7qwCFY1W7AoduGzTIQ

Interchangeable-lens Digital Cameras This group of cameras tries to bring together some of the best features of the DSLRs and those of the compact point-and-shoot cameras. They offer the advantages of an interchangeable-lens system with strong user control features and generally have better than point-and-shoot performance. The absence of the mirror system found in the DSLRs allows a smaller, lighter and less cumbersome design. If you decide to invest in this group of cameras, you should carefully review the specs and determine if the camera in which you are interested fulfills your needs in such areas as video, and the availability, type and cost of interchangeable lenses. Go to review sites such as the link listed below and check reviews by both the site staff and those by individual users. Examples can be found at: http://reviews.cnet.com/best-interchangeable-lens-cameras/

Point-and-Shoot Cameras It is easier to discuss the point-and-shoot cameras if they are divided into four groups.

1. The Megazoom or Pocket Megazoom (compact and pocket high-zoom camera): The Megazoom cameras in some cases are as large as the DSLRs but are the most versatile fixed lens cameras you can find. They offer as much as 20x to 30x optical zoom lenses and usually have impressive wide-angle lens capability. They have manual controls, usually excellent stabilization and a choice of excellent lenses. Examples can be found at: http://www.pcworld.com/reviews/collection/1685/top_rated_megazoom_cameras.html . The pocket megazoom cameras are much smaller than the megazooms discussed above but they have optical zoom ranges from about 10X to 16X. They normally have excellent stabilization features. Examples can be found at: http://www.dpreview.com/reviews/q311travelzoomgrouptest/.

2. Advanced Point-and-Shoot (compact camera with manual controls): The strong point of these cameras is that they have manual controls for shutter speed, aper-

Camera.....Continued on page 4

Camera.....Continued from page 3

ture and ISO settings, giving you control of the quality of the picture. They are a good "carry around" camera for DSLR owners and a good learning tool for novice shooters. Examples can be found at: http://www.pcworld.com/reviews/collection/5586/top_point_and_shoots_with_manual_controls.html

3. Basic Point-and-Shoot: These are the real point-and-shoot cameras because you literally point and shoot since you depend on the automatic adjustment capabilities of the camera, which have improved greatly over the years. They have small sensors, so don't pay extra money for a very high megapixel rating since it will probably lead to higher image noise. Many have good wide-angle capability (28mm or less), which is handy for group shots, arms-length self-portraits and landscape shots. They are inexpensive, so it's important to read the reviews to insure that you get what is needed to give you satisfactory results. Examples can be found at: http://reviews.cnet.com/digital-cameras/canon-powershot-a1200-silver/4505-6501_7-34468799.html?tag=rb_content;contentBody.

4. Rugged Point-and-Shoot: These cameras are for the mountaineers, the divers, the hikers, the extreme sports enthusiasts and the clumsy. They are rugged and can be waterproof, freeze proof, drop proof or dustproof but they are not known for their optics or sensors. It is therefore important that you pay as much attention to the quality of the optics and sensor as to the durability of the camera. If it doesn't take a good picture before you drop it off of the Empire State Building, it probably won't take a good picture after you drop it. Examples can be found at: http://www.bhphotovideo.com/indepth/photography/hands-reviews/rugged-point-and-shoot-cameras

Conclusion

I hope that the category discussion above helps you narrow your search. The example links at the end of each section are just samples to give you a visual picture and specifications of some of the best cameras in the categories. There are many more reviews and,

Camera.....Continued on page 8

Two Tablets

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Tablets are all the rage now, and we went from having none in the family to having two, both belonging to my wife. She is now the owner of an Apple iPad 2 and a Kindle Fire. The Fire is quite new, the iPad has been out for some time. There has been some press where the two are compared, usually to the detriment of the Fire. But, in my opinion, comparing the two as if they were meant to do the same thing and for the same audience is not appropriate.

First off, this particular iPad, the less expensive one with the smallest amount of memory, costs $499. The Kindle Fire comes in only one version at $199. You wouldn't expect a $20,000 car to be a good as a $50,000 car, would you? So you shouldn't expect a $200 tablet to perform on the same level as a $500 one. Both cars will get you where you are going, and both of these tablets will perform most of your desired functions, just not with the same ease or speed. The cheaper one will actually do a few things the more expensive one won't. And, as expected, the more expensive one will do some things that the cheaper one won't.

iPad advantages are

- Larger screen
- Faster processor
- Front and back cameras
- Large collection of iPad apps

Kindle Fire adavantages are

- Direct access to all of Amazon Prime video content, movies & TV
- Ability to connect via a USB cable to your Windows computer to load music and image files
- The web browser supports Flash
- Native Kindle book reader

Web and email

Both of these devices require a WiFi connection to access web content. Once on the web, you can do your

Internet Picture of the Month

Prince of Tampa Cigar Box Label From the site http://www.cigarboxlabels.com/. This site has much more than cigar box labels to view and purchase. How about an old oil company stock certificate? But since we are in Tampa, I thought it appropriate to use a Tampa-themed cigar box label.

Tablets.....Continued from page 4

browsing and email just as you would on a computer. Well, the email is not exactly the same, since you don't seem to have the option of HTML-style email, only text based. Both allow you to send images you may have on the device as attachments. The iPad appears to insert the image inside the message, but when it arrives at my computer it is as an attachment. And oddly, in my two tests, it arrived upside down.

Of course you use finger gestures on the screen to navigate instead of using a mouse. And once you master that, you will probably find it preferable. I have noticed that in watching movies with either device or on the iPad using Skype that the closer you are to your WiFi transmitter, the better the quality.

Skype

Since I just mentioned Skype, let's discuss that for a moment. Of course, you know that Skype allows you to use your computer to make phone calls, and, if you and/or the other party has a video camera, to actually do a video call. Since the Fire does not have a camera, you will not be using it to make a video call. The Fire also does not have a built-in microphone.

During a video call on Skype, you use the front fac-

Tablets.....Continued from page 5

ing camera on the iPad to transmit your image to the other party. While in the call, your screen fills with the image of the person being called. There is also a small insert of your image so you can adjust the camera's position to produce the appearance you wish of yourself for the other party to see. You wouldn't want them to see only your belt buckle or the ceiling of the room.

In the several calls made to our son in New York, the quality of both voice and image was excellent. He says that calls between him and others have not been so good. The obvious culprit for that poor quality is a less than optimal wireless connection. Finally, you don't have to use the iPad's front camera during such calls. You can switch to the back camera. Then you could walk around wherever you are showing your phone partner what your surroundings look like. It is really quite powerful technology and doesn't bode well for the phone companies' bottom line. Of course, my phone company is the one providing the broadband connection, so they are still not locked out of the income picture.

Screen

The screen on the iPad is beautiful and measures 19.7 cm x 14.8 cm. That is an area of 291.56 sq cm. The screen on the Fire, is adequate and measures 15.4 cm x 9.0 cm, equaling an area of 138.6 sq cm. So, the iPad2 has a screen area more than twice that of the Fire. But it costs 2.5 times as much as the Fire, and most of that extra cost is probably tied up in the screenF

Web Browsing

Both devices allow you to browse the web as you would on your computer. However, both have some shortcomings. For the iPad, it is the inability to display Flash. The Fire will display flash content, but it and the iPad both will not display Silverlight content (of which I have made extensive use at my personal web site). The iPad reacts more quickly to your finger taps on buttons or links on web pages. In fact, I have found the Fire to sometimes not respond or respond sluggishly to taps not only on buttons or links on web pages but also to buttons on the screen in general. Particularly bad for me is the fact that the Fire does not like the way I stream the PDF versions of our newsletters at the TPCUG web site. The document is downloaded, but when you try to open it with the Adobe Reader provided with the Fire, you get an error message to the effect that it is not a valid PDF file. On the iPad 2, our PDF newsletters open beautifully inside the Safari browser. Perhaps I need to change the streaming method to simple links to be clicked on, since the Fire downloads the PDF files fine from such a link. Note, however, that the Fire does not display the PDF file from within the browser. It downloads it, and after the download you need to start the Adobe Reader app yourself to view the downloaded file.

Connecting to your computer

For a Windows computer, forget connecting the iPad. It doesn't work. I suppose Windows knows nothing about the file system on the device. When you connect the Fire to your computer using the USB cable that is also used to charge the Fire, you can view a collection a of folders on the Fire with names that include Download, Music and Pictures. To copy some photos from your computer to the Fire, you simply drag them from wherever they are on your Windows computer to the Pictures folder on the Fire. The Fire has an app named Gallery for viewing photos.

For music, or sound, in general, on both devices you can listen through the built-in speakers or through a headset.

Movies

The largest plus for the Fire to me is that viewing movies and TV shows available on Amazon Prime or Amazon Video on Demand is built into the device where you simply click on the Video button. To the best of my knowledge, you cannot access Amazon media from the iPad. Both the iPad and the Fire have Netflix apps.

Apps

No doubt, the iPad has far more apps available. (Of course, the Fire was just released.) So if you want to play games, then I suppose the Fire is not your best choice.

Tablets.....Continued on page 8

WIDE OPEN SPACES

By Michael Hutchison, Tampa PC Users Group
LPshop@tampabay.rr.com

Many years ago at a TPCUG meeting held at the old Pepin Hospitality Room (56th St.), I purchased SecureClean put out by White Canyon Software. One of their reps came and gave a presentation and then offered their software to the members at a user group rate. SecureClean came with two other apps on separate CDs. One was WipeDrive, which was to be used to completely erase/clean a drive for situations when you are discarding a computer or donating one to some charity or person. The other was MediaWiper for cleaning floppies, I think. I never used either of these two programs. However, I have gotten a lot of use out of SecureClean.

In recent time, I used SecureClean in a sort of ad hoc conjunction with Windows Disk Cleaner. Whenever I noticed that my hard disk space on the C: drive was getting low, I would run one or the other, Disk Cleaner or SecureClean, first and then the second application, and in a couple of iterations my hard disk space would be back at a reasonable percentage. That worked well enough so that no future problem was on the radar. As time passed, though, it seemed to take more cycles of the two programs to achieve the desired result. Of course, during this time, anti-virus programs were changed from Kaspersky to AVG and back to Kaspersky. Endless updates of virus definitions were done, and digital photos piled up somewhat. Finally it got to a point where my hard disk space was going down, and no amount of running the two programs, Disk Cleaner and SecureClean, in either Quick Clean or Thorough mode, was helping. I called White Canyon and the rep said he would email a coupon for a 50% discount on an update to SecureClean5. I received two emails from them and there was indeed a "coupon" and a link to their support center - http://support.whitecanyon.com/

I figured it was time to update. However, while doing some research online, a Google search came up with Sdelete, which does the same job for free and was released in September of this year. I downloaded the Zip file, scanned it for virus, unzipped the program and ran it. First run retrieved about half a GB.

A couple words about the Sdelete file or utility that I downloaded: It is v1.6 and written by Mark Russinovich from SysIntervals, which is a wholly owned subsidiary of Microsoft. Sdelete is a command line utility which takes several options. I used the -c switch on the first run, which is supposed to clean free space. I noticed that, as I got near to 100%, I started getting a little pop-up from the SysTray area telling me that I was getting very low on hard disk space. Well, that's how we got here in the first place. I also thought it was interesting that I got to 106% disk-space cleaning before it quit.

According to the utility documentation supplied at http://technet.microsoft.com/en us/sysinternals/bb897443, the utility indirectly overwrites free space. This is as opposed to opening the disk for raw access and overwriting files, which runs the risk of collision with other applications' active file operations. I take this to mean Windows internal system operations.

In short, I was pleased to be able to reclaim some of my hard drive space and will now consider uninstalling SecureClean rather than update it. I will also run the little command line Sdelete utility (download was 81 kb) with more passes and different switches to see if it will get me any more room back. ◆

Minutes....Continued from page 2

other things on a regular laptop in which a user might be interested. Unfortunately, that installation was having problems identifying some of the hardware components such as the touchpad and networking, so he abandoned that and installed the latest Ubuntu Linux OS and Chrome, and this was a resounding success. He proved that, if you had an older notebook and an old Windows operating system, the Ubuntu/Chrome combination might be a good way to put some life back into the old notebook. It's fast, operates on very little installed memory – unlike Win 7 – boots quickly and has very few updates/virus problems.

Ultimately it made sense in his case to try doing Chromey things on Windows 7. His notebook runs Windows 7 well, and it proves that the Chrome experience can be about the same. The Chromebook has some advantages like light weight and a simplified experience from a maintenance standpoint and boots very fast.

The Linux/Chrome notebook option might be good if it's something you already own, needs a new life, and the Windows 7/Chrome version has the advantage of versatility along with much more complexity. ◆

of course, many vendors. Amazon and B&H Photo Video are two that I have used often. (If you buy from Amazon, don't forget to go through our site.) We have many local vendors, including North Tampa Photograph who can provide expert advice. I've included one more link below that I think you will find extremely helpful. It explains things about memory cards, sensors, LCD quality and lots more that you may have not considered. Look in the "Point-and-shoot camera features" paragraph: http://www.macworld.com/article/137117/2011/11/buyingguide_cameras.html. ◆

Tablets.....Continued from page 6

Conclusion

If money is a concern and if you want Amazon Video, then the Fire is obviously for you. It also has a built-in Kindle reader. However, you can read Kindle content on the iPad, and the iPad has a nicer screen and a better user experience in general, so if you have $500 or more, go for the iPad 2. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

This is again pretty much a Merle Nicholson newsletter, for which I am again extremely grateful, but he did leave me a little space to fill.

This month he tells us how to set up a new computer with two hard drives: A solid state drive for your operating system and programs and a regular hard drive for your data, temporary files, email files, your desktop, pictures, etc. The process is a bit complicated and certainly time consuming. But if you want a computer than boots fast and runs at optimum speed, this is the setup you want. I went through this process two years ago when I set up Windows 7 on a new desktop machine that Merle built for me then.

This past month I came up with another idea for a Windows 8 application that will make me no money but that should be of interest to a few old-time PC people along with the members of this group. It will allow you to read all of our newsletters beginning in 1988 up through 2012 with the ability to search the entire collection for any word or group of words. I almost

Minutes of the November Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. The meeting began as usual at 6:30 PM. The SIG is devoted to a discussion of all aspects of the Windows Operating Systems and of computer-related subjects in general. The SIG moderator, Bob LaFave, introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees.

This month Bob touched on a variety of subjects – the main discussion was about Windows Surface, IE9 on Windows XP and Chrome. Ways to send anyone money was a good topic that brought some discussion. And last, Office 13 on Windows 7 and 8; Bob gave a quick demo of Word and Outlook and the difference of the Pro version.

The presentation this month was given by William LaMartin, of LaMartin Software (and the Tampa PC Users Group). LaMartin Software (that's William) has a large collection of programs available for Windows Phone and two apps for the Windows 8 PC platform. There are too many to devote much time here to, but his collection of Windows Phone programs – available on the Microsoft App site: Manhattan 1905, Simple BART, Simple Grocery, Simple Volume, Boston Mosaic, Simple Stocks, Simple Walk and several others.

William started up Visual Studio 2012, the programming development platform used for all these programs. In there are environments called emulators that simulate the target device, so he could demonstrate several – just as you would see them on the device it was intended for. So he gave us some live demos of just a few of his applications. Cell Towers, Manhattan 1905, World News (one of my favorites) and BART on the telephone – that's the Bay Area Transit subway system in San Francisco. For Windows 8 Phone, we saw a speech test of a program William is currently

Optimizing Windows 7 and 8 for a Solid State Drive

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

We're going to set up a computer with a solid state drive (SSD) primary boot disk and a second conventional data drive. It makes sense; we want an SSD for fast boot and for fast program startup. For that, an SSD is the way to go. We need more storage for documents, email and contacts, appointments, music, pictures, downloads, image files and data. A conventional mechanical drive is the answer for this. SSDs are relatively expensive and mechanical hard drives are inexpensive. The current technology is merging the two products and reducing the price, but we have a way to go. In the meantime, you can get a 64GB SSD for under a hundred bucks if you're patient.

There are a couple of other considerations, ones that influence the design of our system.

Backups We must do backups, and we may as well optimize our system with this in mind. We want a "system image" backup to quickly restore our boot drive. System Image backup is a backup file of the entire drive. When your system has failed and you need to restore from backup, you don't need a system image that has your entire music collection! All you need is a small, clean boot drive. Your backup should go to a drive that is externally connected. Win 7 Home and Home Premium OS will not back up to a networked drive. A USB or eSATA drive is fine. USB 3 is even better. You cannot retrieve an individual file from a system image.

A data drive is different though. Here you want a file system backup where you can find individual files and even look for earlier versions of a file. A regularly scheduled backup of just the files that have changed is ideal. You don't need a system image of this drive; they're just files.

There are files though that you don't need in a backup at all. TEMP directories, Temporary Internet files, Pagefile, Hibernate file, Search Index Files. I have 52GB of such files. I have a third drive for this purpose, and my automatic backups don't touch these. No need.

Ideally, you would follow the practices I'll be describing on a new computer, or at least a new Windows installation on an old computer. It CAN be done on an existing system but it's just more work.

SSDs The thing to consider is that SSDs have special needs. One, you don't schedule chkdsk and repair and you don't optimize (defrag) SSD's. Why? They are already optimized. If you move files around to shove them together they don't retrieve files any faster and you're hastening the eventual failure (a little) every time they get rewritten. You don't want files that are being constantly rewritten, like pagefiles or search indexes and temporary Internet files on your nice SSD. Your system won't run any faster anyway with these on the SSD. Running faster is the reason you invested in an SSD in the first place. Look at the maintenance schedule in Start, Run, Disk Defragmenter. Make sure there is no scheduled defragmentation on your SSD. Windows should have turned it off for all SSDs, but it needs checking.

My System The arrangement I have put into practice on my Windows 8 computer is as follows:
C: drive – Windows boot installation, a 64GB SSD. 38GB is used out of 59GB formatted. On my primary Windows 7 computer I'm using 43.8 GB. I have moved as many data directories to the data drive as possible. This is backed up irregularly to a system image on a portable drive using Windows Backup and Restore. Note: If you're thinking I don't have much software installed on this computer and you'll have more, you'd be wrong. It IS well organized and maintained, though irregularly. Irregularly means I make a new system image whenever I think I've made enough changes to software or installed or uninstalled something.

D: drive The D drive, the data drive, is 1 TB partitioned into two parts – D: and G:. This has all the

Optimizing.....Continued on page 4

Optimizing.....Continued from page 3

above mentioned files: documents, email and contacts, appointments, music, pictures, downloads, image files and client data. It is file-backed-up on a regular schedule to a portable drive using Windows Backup and Restore.

G: Drive This is formatted to about 73 GB with 52 GB used. It has SearchIndex Files, TEMP, TMP, Temporary Internet Files and Pagefile.sys and is never backed up. It's a partition on the same physical drive as D:. I could just as easily have used an old drive from a previous system, but not a slow clunker.

How it's accomplished: When Windows is installed, it creates directories and libraries for all your stuff. And all these directories are on the C: drive. So you have to do two things. **One** – either move the directory and its contents to the data drive and tell Windows where it is now, OR recreate the directory in a new location and tell Windows where it is. **Two** – A bunch of other stuff, such as making a setting in Control Panel, Internet Options, General, Browsing history, Settings, and use the Move button to move the Temporary Internet Files directory. Do something similar for Outlook, Windows Mail … etc. – you get the idea.

The following is a pretty formidable list of things to do. There's no need to read on unless you're truly interested in doing this or don't have anything better to do. Although I've done this several times there will be something I've left out, so if you think of something useful – send me an email and I'll add it and update this documentation.

How to move data to the TEMP drive G:

Notation convention: I'm trying to use the underline to denote a specific label or object like a button. If I have Enter the amount of space to shrink, this means there really are those words to look for on the setting panel.

Folder Options: You'll have a very frustrating time following the steps I have here without changing Folder Options first. Go to Control Panel, Folder Options, View tab. Select (enable) Show hidden files, folders and drives and then uncheck Hide extensions for known file types and uncheck Hide protected operating system files. You may want to re-check Hide protected operating system files later when we're done.

Temp Drive Creation: I created my G: drive using Start, Administrative tools, Computer Management, Storage, Disk Management, Right-Click D: drive, Shrink Volume, Entered 75,000 MB in Enter the amount of space to shrink, and clicked Shrink. That left a 75GB unlocated drive, from which I created a Simple volume, Label TEMP, Mount as Drive G and formatted as NTFS. If you uncheck the Quick Format the disk will format in 20 minutes or less. The result is a data drive D and a TEMP drive G on the same physical drive.

TEMP, TMP and Windows\TEMP: In the G drive I created the folders TEMP, TMP and Windows. In the Windows folder, I created two folders TEMP and TMP.

In Control Panel, System, Advanced system settings. In Performance, select the Settings button, then Advanced tab, and Virtual memory, Change button. You're now looking at a settings panel called Virtual Memory. Clear the check box Automatically manage paging file size…., Select C drive, then No paging file, and press Set button. Do the same for the D: drive. For the G: drive you can either click on System Managed file or set a Custom size. I set a Custom size equal to my installed memory. In my case, 8,000 for Initial size and for Maximum size. Click Set button here. Don't forget that. This will require a reboot to take effect, but we're returning to setting TEMP variables. So an OK on Virtual Memory. OK on the warning about rebooting. OK on Performance Options, and we're back to System Properties, Advanced tab.

In the System Properties, Advanced tab, click the Environment Variables button. Edit the User variables for {loginName}. Click on the TEMP line, click Edit button, edit to G:\TEMP. Then edit the TMP line to G:\TMP. Under System Variables, scroll down to TEMP and Edit the line to G:\Windows\TEMP. For TMP, I used G:\Windows\TMP. OK on Environment Vari-

Optimizing.....Continued from page 4

ables. While we're here, I always go to Startup and Recovery, Settings button, and under System Failure, I clear Automatically Restart check box. If I have a failure, I want to see what the error is, and I certainly don't want it to automatically restart. I can't believe this is checked by default for the last 10 years.

Temporary Internet Files: Control Panel, Internet Options, General tab, Browsing history, Settings button. Tab Temporary Internet Files. There's a button Move folder . . . Select the G drive. It will create a new location G:\Temporary Internet Files. Wasn't that easy? In Windows 8, the system logs you off after asking permission.

Indexing location: This relocates the index files created for fast file searches. If you have a lot of files, and you also want everything indexed as I do, the index files can be large. I don't see the point in backing them up because they're constantly changing, and the indexing service will reproduce them whenever needed. Whether it is moved to the D data drive or the G TEMP drive is up to you. For me, they must be removed from the SSD because they're so volatile. Control Panel, Indexing Options. Select Advanced, and Index Setting tab, Select new button. Click on G and Make New Folder. I named the folder SearchIndex. Select the new folder and OK.

While you're here, you may want to review the file indexing drives and folders. I tend to check everything in C: and D: except for the Recycle Bins, and obviously do not include anything on the G TEMP drive. Ok and Close. You'll see that the indexing service will be hard at work for a while.

After a reboot is the time to manually delete all the files in the old TEMP, TMP and Temporary Internet files. I would not delete these old directories. There will always be some errant program that will look for a TEMP directory in the old location.

Miscellaneous tuning and improvements

Hibernate: Before we go on to the Document directories, let's get rid of the file hiberfil.sys in the root directory. This is used to Hibernate, and has no place on a desktop machine with an SSD boot drive. It's a significant amount of file space. (Mine was 23GB!) Open a Command Prompt from its shortcut by right-clicking and Run as administrator. Enter powercfg –h off. This also eliminates the Hibernate choice in Start, Shutdown and also in power settings. If you change your mind about this later on, you can change it back using on in the command line.

Logon: Next, let's make it so that when you power on your machine, you go right to the desktop without logging on. In Start, Run, enter netplwiz. This is the advanced User Account Setting. On the Users tab, clear the checkmark next to Users must enter a user name and password . . . .. Doing this is NOT appropriate unless you have every expectation that you can maintain who can access your computer. You would NEVER do this on a notebook that ever left your household. Otherwise, keep the logon and password. While you're here, the Advanced tab is where you can manage passwords and secure logon settings

Performance Tuning: Last, let's do some performance tuning. Control Panel, System, Advanced system settings. In Performance Settings button, then Visual Effects tab. If you experiment here, you'll see that if you have a reasonably powerful machine that if you choose Let Windows choose or Adjust for best appearance it will check on all options, and Adjust for best performance will uncheck all options. A little experimentation will help you make a compromise between the appearance and performance. For myself there are some appearances that I consider the mainstay of Windows 7; Enable Aero Peek, Enable desktop composition, Show thumbnails instead of icons, Show window contents while dragging (I would not select this on a weak machine or weak graphics), Smooth edges of screen fonts, Use visual styles on windows and buttons. I just don't notice the difference if I check anything else. I also uncheck (clear) the box Enable transparency in Control Panel, Personalization, Window Color. That's a personal preference of course, but I think it's significant that it isn't an option on a system with a weak graphics adapter. I also Adjust the ClearType in Control Panel, Appearance and Person-

Optimizing.....Continued on page 7

Optimizing.....Continued from page 6

alization, Adjust ClearType text, and of course make sure ClearType is enabled.

Later, you will want to look at all your startup items and eliminate all the junk. And after you install programs, it will be loaded with even more. In Start, Run, enter msconfig and then the Startup tab. Here you will find that there will be a Google Update, and Google Chrome, iTunes and Adobe updates; lots of HP items that makes your printer and scanner look at you 24/7. Uncheck all that crap and see how things go; you can always restore the check later if something doesn't work right. You'll need your Security Client (anti-virus) intact, but you definitely do not need your Java platform and Adobe calling home every time you boot. Believe me, your iTunes will work just fine without the startup item. There is a lot written on this subject, and if you are on the fence about something just ask Google about it.

Relocate Data to the D: drive.

If you look at the properties of some folders, you'll see an extra tab called Location. Right-click and get Properties of the folder C:\Users\{AccountName}\Desktop and you'll see one of these. On this tab you'll find a quick explanation and the means to move any existing files to a new preexisting folder. We'll use this to move much of the default data locations to drive D. When we're done, when you open Word or Documents or Pictures, you'll go to the files stored on your data drive D:. One caution; if you have multiple logins – Administrator and user accounts for other people; this procedure must be repeated for each account.

Create a new Users folder in the D: Drive. That's D:\Users. Inside of Users, create a user account named folder. Mine is named D:\Users\Merle. Don't use mine unless your name is Merle. Under D:\Users\Merle create 10 new folders named Contacts, Desktop, Downloads, Favorites, Links, My Documents, My Music, My Pictures, My Videos and Searches. These are the folders we're going to use the move functions on the Location tabs. I'm not aware of any others. After creating these folders, use the properties of each in their original locations to move them. As you do these, the old folders themselves will disappear by the process. I know; it makes no sense; if the folders are deleted automatically, why are the new ones are not created automatically, too? Remember to do this for every user name that logs onto the computer. That was easy. It's the heart of this article, and it was the easiest to describe.

Mail: If you are using Microsoft Windows Mail, add a folder D:\Users\Merle\Windows Mail, and if you're using Office Outlook, add a folder D:\Users\Merle\Outlook. These locations are optional of course. Sometime I put the mail directories under My Documents, but usually under D:\Users\Merle. If you have started using either Outlook or Windows Mail, it's fairly easy to go into the setting of these and change the file locations, carefully recording the original location, copying the contents or moving the entire folder to the new location, change the mail setting. Microsoft Outlook is much more complicated than this. While it's easy to relocate the main mail .pst file, there are other files to consider; contacts, address book, calendar and mail account settings, and categories. They are NOT in the same folder. Crazy, huh? The locations of these are well documented on Microsoft Office help sites. It's easiest if you do not have mail accounts set up yet, so there is no risk.

Finally: You have to be diligent, at least for a while, and every time you install and use a new program. A new program will have its preprogrammed location to store your newly made file, and that location may not be My Documents and especially maybe not on the D: drive where you want everything kept. So in saving a file, pay particular attention to where it initially wants to save and change that to an existing or new directory on D:. Then look at the programs settings and see if there's a default directory you can set yourself. The object of course is to keep the amount of disk used on your SSD to a minimum, but more importantly to locate all files in a common location for your scheduled backups. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

This has been a rough month to get out the newsletter, but we again made it with the help of Merle Nicholson, John Witmer and Rob Davis as contributors. It really is not difficult to write an article for the newsletter. Just describe some problem you solved or some new item you purchased that is computer, smart phone, digital camera, etc. related. I know you can do it, and it would greatly be appreciated.

Most of my computer activity in the past month has been writing apps for the Windows Phone 7. I did manage to complete the yearly directory for our Hyde Park neighborhood. It is a booklet of 44 five inch by eight inch pages. The layout is done in Adobe InDesign. The neighborhood data is maintained in Microsoft Access, and I use a Microsoft Visual Studio program I wrote to extract the data from Access in a format that I can then use in InDesign. So it is a bit complicated and almost assures that I will never find anyone else in the neighborhood who will be willing to take over the project.

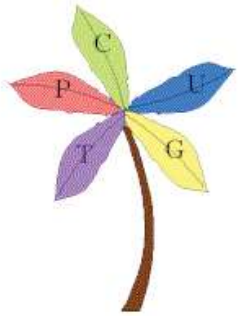
Minutes of the December Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

Our usual meeting was suspended in favor of our annual club dinner at Pepin Distributors, hosted by our TPCUG President, John Witmer. This year the dinner was held in one of the Pepin meeting rooms. John did his usual fine job of ordering food and getting it set up for our little group. This year, large round tables were set up encouraging conversation. It was a very nice addition. As usual, the food was excellent, and John was a great host. Thanks for the hard work, John and for the whole year as well. Our thanks and best wishes go to Pepin Distributors also.



Our slate of TPCUG Officers remains unchanged for 2012.

John Witmer, President
Kevan Sheridan, Vice President
Doug Mullis, Treasurer
Merle Nicholson, Secretary
Ron Weinberg, Member at Large

Appointed positions:
Doug Mullis, Program Coordinator
William LaMartin, Editor and Webmaster
Bob LaFave, Windows SIG

Happy New Year.

Merle Nicholson, Secretary ◆

What Are You Doing Feb 25-28, 2013? Need A Getaway?

By John Witmer, FACUG Treasurer
president@tpcug.org

Most of us don't plan that far in advance, but the Florida Association of Computer User Groups is, and they have a very unique opportunity being pursued currently to obtain the buyout of a luxury resort for exclusive use in holding the 2013 FACUG Technology Symposium. The 2012 Technology Conference cruise is about to depart Miami on January 23rd of this year, and it is too late for you to reconsider attending it. But, that doesn't mean you should be left out of the 2013 conference. At the request of many attendees to these last couple of cruises, the FACUG will move to a land-based Conference in 2013 provided we can get the initial support to make the financial commitment to the resort.

So, what resort are we talking about? It is the only all-inclusive CLUB MED location in these United States, and it is located in Port St. Lucie, FL on the east coast of our fair state. Only a couple of hours away by car, if you are thinking of a great vacation getaway in early 2013, this is something you should seriously consider. There are huge advantages to being able to buy out the resort for our exclusive use and pleasure, and I would like you to check it all out by logging into the http://www.facug.org website, and selecting the 2013 Conference from the menu on the left. Here is where you can read all about the plans, dates, cost, and get a look at what awaits you if you should decide to join the FACUG in this once in a lifetime opportunity for learning and playing all at the same time.

Why am I promoting this event that is 14 months away? First, I signed on to be the Treasurer for the FACUG early last year and have become acutely aware of what FACUG is doing and offering to Florida PC User Groups, as well as groups outside the state. I will be participating in the 2012 Conference in a couple of weeks and look forward to the whole experience. I am a supporter for the 2013 Conference that will happen provided that we can get enough participants to register and put up a deposit by February 14th next month that will ensure the financial viability of FACUG putting down a non-refundable deposit to buyout the resort for its use in February 2013. So, I am asking if you have the desire and means to participate in the 2013 Technology Symposium, check it out on the website and make a commitment to attend. Let me know if you have any questions, and I will get you the answers. I am getting the impression that those land-based conferences that we attended in Kissimmee and Zephyrhills a few years ago for FACUG are no longer viable, and participants want a much bigger experience to draw their interest. The FACUG is trying to provide such an opportunity, and it is working as we have over 400 participants from across the country on the Norwegian Sky attending the 2012 Conference/ Cruise. Give it some thought! ◆

2012 Election of Officers

By John Witmer,President,
Tampa PC Users Group
president@tpcug.org

At our Holiday Party meeting on Dec. 14th, the following slate of candidates for the officer positions shown was presented and unanimously approved for the coming year 2012. These candidates are presently holding the same position in 2011 and had previously agreed to continue in that same responsibility for the New Year 2012. There were no other candidates that volunteered for a position or came forth for consideration. Elected to represent the TPCUG in 2012 were:

President: John Witmer
Vice-President: Kevan Sheridan
Secretary: Merle Nicholson
Treasurer: Doug Mullis
Member-at-Large: Ron Weinberg

Also appointed and continuing in their same position with the Group for 2012 are Doug Mullis as Program Chair, and William LaMartin as our Newsletter Editor and Webmaster.

Verizon Wireless Home Connect

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

I switched my home phone land line to wireless. It's still a home phone, is on the cellular network, but uses no wires. (Actually, there are about ten feet of wires involved).

For background, like many of our members, I have FiOS. FiOS is fibre-optical cabling to the house. It was supplying TV, Internet (25/25) and house phone. I had traditional copper wire until FiOS was installed, and to my surprise they insisted my house phone be switched over to FiOS. I said no, they said yes. It was a package deal, and I agreed to it, so I would have known the details if I'd only read the fine print. So the line was physically patched into the FiOS box, and the copper to my house has been abandoned. Actually that's good. Fibre-optic is much more rugged and reliable than old copper.

The FiOS-supported phone was still a "traditional" phone line in that the calls went to the local switching station that is a part of the local phone network. The next step up is to convert this line to "Digital". This is something that is done remotely – my impression is that it's a computer thing, there are no physical changes – that takes you off the local network. There are two apparent changes when going digital. One is that you must start using the area code even when calling inside your own area. OK. The other change is that your bill will be reduced – my reduction will be about $6.50 because it will no longer be subject to a federal tax. Actually I have mixed feelings about this. I think when government spending and indebtedness increases, reducing government income isn't the best idea. Duh.

Verizon people on a couple of occasions have "offered" to convert us to a digital home phone, but aside from the $6.50 monthly reduction, they couldn't present a case for it. I think the advantage is all theirs, and I knew I would lose a couple hours on the phone either getting it to work or getting the billing right. Kind of like living with the devil. But one person told me that I was going to be switched over to digital within a month or so with or without my participation. I figured if I am going to change, and my billing is going to change, I may as well look at all the options. So I looked at wireless.

Wireless using a cell phone:
Scouring Amazon got me very quickly to a Wireless cellphone/Bluetooth option. There are two types of devices. Both require you to buy a new – or use an old – cellphone with Bluetooth. You add this phone to your cellphone account (everyone has one), and ask that they use your land line number. You put the cellphone down, turn it on, attach a charger to it, leave it on a table and never turn it off. It communicates using Bluetooth with the new device Amazon shipped you . Of the two types of devices, one device is just a black box and has a telephone jack on it. You plug your house phone to that jack. You don't even have to tell your family what you've done, because everything works the same way. The house phone just isn't plugged into the wall anymore. The other option works exactly the same way except that it includes new house phones, and is all in one. It communicates via Bluetooth, has an answer machine built into the base station and one wireless phone. Then – depending on the model, you have one or more – maybe six – handsets placed all over your house that communicate wirelessly to the base station. Mine are made by Panasonic. I've used these for many years with a conventional plug; I'm on my second set that has a base station and three handsets for total of four. I'd have seven except for my policy of never answering the phone from a bathroom. I let it ring until the "survey" company gives up.

OK, so you've just added a cell phone to your family plan, discontinued the land line, reused the home phone number and plugged in your current telephone, and your family doesn't know the difference because you pay the bills – which have gone down because you no longer have the $30 land line. You've discontinued the inside wire maintenance fee, and lost a federal tax. Your wireless family plan has gone up only $10/month, and you got a new free flip phone with no features except Bluetooth for free; it can't even take

Verizon.....Continued from page 4

pictures. Oh, and there is no longer a monthly access fee because you don't need a long distance carrier. That's gone, too.

Here's the bad:
Your new house phone now uses your wireless family minutes. Better keep an eye on that! More on that below.

Last Option – the one I picked.
I'm not sure how I found this. I was looking at the Verizon Wireless phones and plans and stumbled on a tab for "Home Phone Connect." It is shown in the picture on the following page.

It's a variation of the other devices I was considering. It has the cell phone built in, hence the antenna. It has a power cube that also charges a battery and two telephone jacks. One of these goes to the Panasonic base station – the same one I've had for many years and like very much. I tried to order this on the Verizon website and gave up, then talked to a couple of Verizon people. It took about an hour-and-a-half on the phone. And that was without talking to the non-wireless people. They FedEx'd the device to me, and since Christmas Day and the day after intervened, it took two FedEx days to get it to me.

Verizon.....Continued from page 5

We have been using 1/10 of our 700 minutes on three family phones every month. We're not chatty Cathys. But the land line is going to be a different story. I can look at my daily usage online, and also from my smart phone, and I'll be keeping a close eye on it. I can change the plan any time I want by breaking out this phone from my family plan and go to an unlimited local and long distance plan for $20/month vs. the $10/month I'm paying now. We'll see. ◆

I plugged it in, attached an old spare wired phone to it and immediately called the number indicated to activate it. The instructions were clear. I could phone out on this, but incoming calls would continue on my land line until Verizon/wired released the land line number. That took three non-holiday/non-weekend days, actually shorter than they warned. Wednesday morning, the regular phone was dead – no dial tone, so I transferred the base station to the Home Connect. It's been working(almost) perfectly since. The cost? The $129.95 cost was $49.95 with a two year contract, and a $35 one-time connect fee. And $10/month.

One problem – the day after – we determined the Call Waiting wasn't working, and that is important to us. I called *611, got transferred to the Home Connect technician. He reprogrammed it remotely. I assisted by pulling the battery to get it to reboot, and I reactivated it. Then he tested it by calling that number on two phones. Excellent and efficient.

Watching the minutes:

Comments.....Continued from page 1

As for my phone apps, I now have eight in the Windows Phone Marketplace. They are making me very little money, but I am enjoying doing them. The main reason for the small return is that I chose to have them display small ads for the ad income and make them free instead of making them paid apps. Now I realize that for ad supported apps, the apps need to be things like games where people stick with them for an extended time. My apps are not "sticky." You use them for a few minutes and then move to something else.

I entered one of the apps in a contest run by New York City, http://2011.nycbigapps.com/. New York City has made much of their data available online and has asked developers to write apps that use it. I chose to use nine of their datasets, such as WiFi locations, parking garage locations and museum locations in my app that places the items on maps with the associated information. The link to my submission is

This SIG meets the third Wednesday of the month at 6:30 PM. For information, contact Editor William LaMartin at william@lamartin.com.

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Member Bob LaFave moderates the discussion.

Wireless Fun & Games

By Robert Davis, Tampa PC Users Group
robd234@gmail.com

Back in November, I got cross-threaded with Verizon and changed to bright house for the Internet. I pretty well got everyone changed over to my Gmail address from the Verizon one. However, bright house didn't offer a free wireless router. Someone said if I had asked they would have provided one. But this seemed OK since I wanted to have my own wireless router. That way I wouldn't have to change things if I switched ISPs again. I have a wireless laser printer, which worked fine on a USB cable, but I wanted it to go wireless as before so my other computers could use it. So I bought a D-Link wireless router model DIR 615. That's when the chaos started.

The router comes with very little documentation, but has a CD with a Wizard program to install it. The Wizard is maybe for more advanced users than I because I could never get the router properly installed using it. Finally, after contacting their technical support, we resolved the problem. I was letting the computer generate a security key. I would copy it to a thumb drive, paste it in the net card on the other computer and it would not work. Finally, the tech guy said to put in a manual key, and that worked. Now I could talk to the Internet from every computer – great!

The next project was to make the laser printer wireless and accessible from all computers. I went through the wireless set-up Wizard with no luck. I called for Samsung tech support and was walked through the set-up by addressing the printer via its network address. The Samsung tech support is great! All went well. I was able to access the printer from all computers that day. However, the next day the printer was no longer available! After much fiddling I discovered it had changed its network address all by itself! So I reinstalled it again with the new address. After that didn't work, I called tech support again. The change that fixed the problem was changing the TCP/IP type from DHCP to STATIC. If I understood him correctly, he said every time the printer is turned off and on again, it would use a different network address. Why would anyone do that? Anyhow, after much de-installing and reinstalling, we got it working from all computers again. So far I have powered off and on the printer and computers several times and everything still works. So I told myself welcome to the wireless world. Another way to spend hours fixing things to save time using computers. ◆

Comments.....Continued from page 6

http://2011.nycbigapps.com/submissions/5695-nyc-data.

In doing the submission, I had to make my first YouTube video since the submission required a Video hosted at YouTube demonstrating the use of the app. The link to the YouTube video is http://youtu.be/OYkj7CHK7CI. Now that I have done one, I might make such a video for my other apps.

Happy New Year to all! ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Please note for now and in your calendar/schedule that the March meeting (not this meeting) date has been moved forward to a Thursday evening at 6:30 PM (March 8th). We have made this one-time change in order to allow the Group to receive a presentation from Gene Barlow, who will be in our area for a limited time, but not on the usual March 14th meeting date. It has been a couple of years since we last heard from Gene, and we wanted to allow our members to hear from him again, and to have a chance to see and purchase his latest offering of software for the hard drive and backups. Please make sure you have this Thursday date in March set aside to attend our meeting in lieu of the normal 2nd Wednesday.

Merle has put some interesting graphics in the minutes. They are QR codes, and there are three of them. If you have a smartphone that will read such codes (I think most do), then by reading the code with the phone, you can go to the web site it represents using the phone. Give it a try. It worked for me. ◆

Minutes of the January Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. The meeting began as usual at 6:30PM. The SIG is devoted to a discussion of all aspects of the Windows Operating Systems and of computer-related subjects in general. The SIG moderator, Bob LaFave, introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees.

This month Bob had a very successful session demonstrating desktop search, starting with the Windows Explorer Search. Since Windows Explorer Search will index and search the contents of documents, the question was asked about searching PDF files. A member had a collection of PDF that needed searching, and she asked about what was on the market. Bob showed the third-party search program Copernic Desktop Search, but also did some searching on the subject in Winsows Search and found the Adobe Registered iFilter 9 for Windows Explorer. This is added as an Explorer add-in. After installation, it indexed quickly. Bob tested it on a couple of documents in the meeting, and it worked amazingly fast. It's bundled with Adobe Reader 9 for Windows 32-bit and for 64-bit platforms. Go to http://www.adobe.com/support/downloads/detail.jsp?ftpID=4025

Important announcement – March meeting date change: John Witmer announced a change in the March meeting date. It has moved to the second Thursday, March 8, to accommodate the presentation speaker, Gene Barlow. Please note that this is 6 days before the regular meeting date. Gene has been a regular speaker at the TPCUG meetings for many, many years and always has an interesting presentation. Gene and Linda Barlow live in St. George, Utah and run a business User Group Store, http://www.ugr.com. They market Acronis Backup Utility, True Image Home 2012, Partitioning Utility Acronis Disk Direc-

Phoneography

By Jim Purcell, Tampa PC Users Group
Edward_J_P@msn.com

I've had a cell phone for many years. It was just a phone with no frills because all I had ever needed was a portable phone. I retired in 1997, so the phone, a laptop and a Palm Pilot continued to provide all of the "mobile" services that I needed at a very reasonable cost. They provided the information that I required and an understandable and easily accessible database of information that had grown from the time that I began using a (manual) Daytimer back in the early 1970's while working in the Pentagon for six years and then for the next eight years as I worked as a budget officer in Washington D.C.

The Franklin Day Planner was first produced in 1984. Somewhere in the late 1990s, I switched to the Franklin Planner when they developed a Windows software program based on Microsoft Access that allowed me to accumulate all of the information on a computer. Going to cut and paste from erase and rewrite was a huge step. You could also print Planner pages in the size and format of the blank Planner pages. The really great thing that they did was sync the program with the Palm Pilot. When I got the ad from Franklin Covey hyping the Palm Pilot I looked at the picture of this little rectangular box with no keyboard and hardly even any buttons, I was certainly not impressed.

I finally let curiosity take over, and my wife and I drove over to Orlando to the Franklin Covey store one evening and the saleswoman very quickly and skillfully showed me why I was living in the dark ages without one. The software and the Palm were probably the best PDP system that I have experienced. Instead of trying to refine it Franklin Covey decided to replace it. To make a very long story short, the replacement program was a mess, and the Palm product died not long after I purchased the Palm that I am now using. It is over 10 years old and is still working, but barely.

I explored many options and spent endless hours trying to find a suitable replacement. I finally decided to buy a Droid X2 smart phone and find the apps to build a system that would satisfy my needs. I'm making a little headway, but it is still a work in progress to say the least.

When I purchased the Droid X2, I inherited what I assumed was a pretty good simple but very portable 8 megapixel "snapshot" camera. The capability of the camera, the scores of apps that have been written and the unbelievable accessories that are being developed sold to enhance this "snapshot" camera is why I decided to write this article.

The first real eye opener that I had in seeing the obsessive way that people are using these cameras and the pictures that they produce was an article in an email photography newsletter called *Photojojo*. The articles in this newsletter are unusual in nature, as is the equipment and novelties that they sell in their Photojojo Store. This article had *10 Tips to make your Phone Photos Amazing.* I'll summarize the article, and I won't list the many apps that are identified to perform the functions discussed, but if you are interested in the detail and a look at the many apps that they reference, you can find the article at: http://content.photojojo.com/tips/improve-your-phoneography/?utm_source=Photojojo+Newsletter&utm_campaign=b710638d0d-10_Phone_Photo_Tips01_02_2012&utm_medium=email . You might want to wait for the online version of the newsletter to be able to use the link. You can also subscribe to the free newsletter at this site.

The first tip is on controlling the exposure of your picture and taking advantage of the extremes to produce your desired effect. They mention the built in features of the camera on some phones and apps that give you a wide capability of options. There are apps that give you control over your phone's flash to the extent that you can leave the flash on continuously while you set up your shot, insuring that you get the exposure that you want. You can purchase eight vibrant, pocket-sized color filters on a handy ring, ready to hold over your lens or flash ($15.00). See the first photo on next page.

Phoneography.....Continued on page 4

Color Filters

holga iphone lens

Phoneography.....Continued from page 3

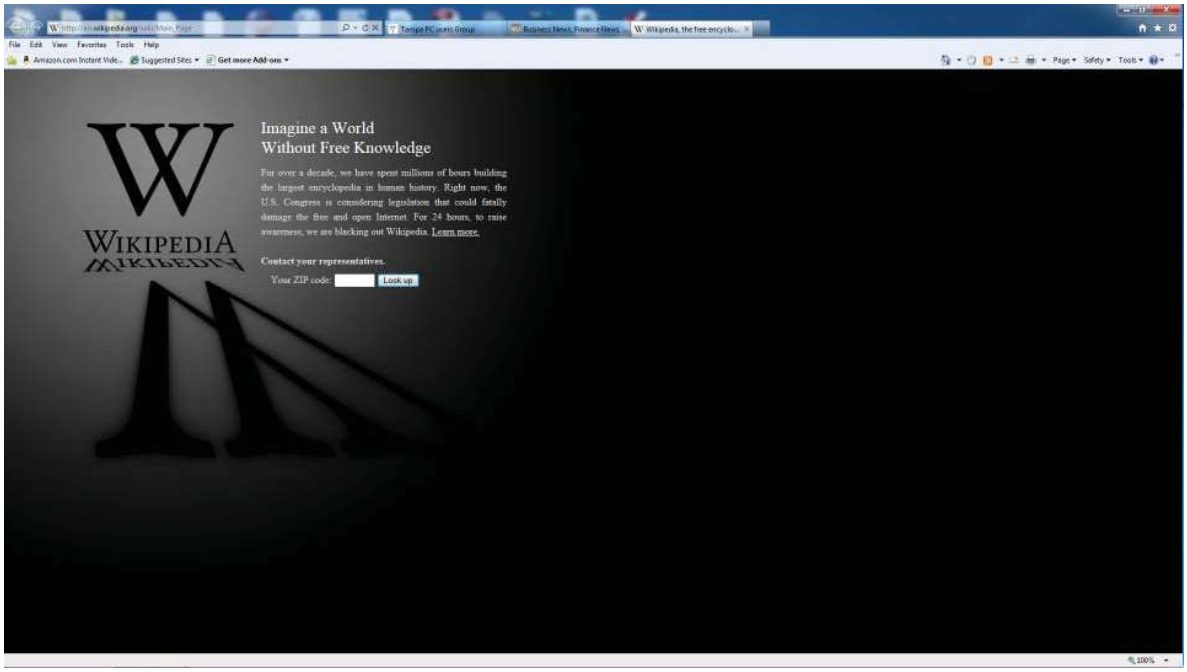
They also sell a lens dial that mounts 9 special effects on your phone. See the second photo.

There are several apps available that help you combine and split pictures in creative ways just as you would with prints in a frame (see the third photo). There are several examples in the article and at the instagram blog: http://blog.instagram.com/post/12302863597/combiningphotos.

You have a choice of several apps that allow you to add a blurring effect on your photo (Tilt/Shift). The thing that has most astounded me is the fact that supplemental lenses are sold for smart phones and what is even more puzzling is that there is such a wide range in the type and price for these lenses. You can buy a set of lenses that attach magnetically to your phone. The set includes a wide angle – macro lens, a

Separate photos combined

Set of lenses



fisheye lens and a 2X telephoto lens for $49.00 . You can buy an 8X telephoto lens that includes a case that is the mount for the lens, a tripod, and a cleaning cloth for $35.00. You can buy both kits and a handy carrying case for $79.00.

There is a mount for either a Canon or Nikon SLR lenses for $249.00 each. Who would want to do this? See the last photo.

Apps are available to shoot your smart phone in the HDR mode in which several photos are taken and

Phoneography.....Continued on page 5

Internet Picture of the Month

Wikipedia went dark for a day On January 18, 2012, a series of coordinated protests occurred against two proposed laws in the United States Congress—the Stop Online Piracy Act (SOPA) and the PROTECT IP Act (PIPA). The main such site was Wikipedia, http://en.wikipedia.org/.

Phoneography.....Continued from page 4

averaged to produce a more perfect picture. The article suggests that the process creates all sorts of special effects if you shoot fast moving objects, shake or toss the camera during the process. The article covered apps that allow the photographer to combine photographs. These apps will probably excite the photographers that experimented with double and triple exposure photos with conventional cameras.

As you can see the capability of the apps and the smart phones range from simple, affordable and helpful to complicated, expensive and experimental. The newsletters are loaded with information and links to blogs that have even more information. ◆

Mapping with Arc GIS Explorer

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Last month a friend asked me if there was a way I could calculate the latitude and longitude of several lots in Polk County he had bought in a bankruptcy auction. He could look at the Polk County Property Appraiser's web site and locate the eight one acre parcels and roughly see they were a bit north of Highway 60, but the map was not all that good, and it didn't supply any latitude and longitude. He needed the coordinates of the lots if he wanted to stand on his land. Now, mind you, he was going to have to walk over several lots owned by others to actually get to his lots since he had bought lots with no road access. He had bought into a classic Florida land scam. But he was lucky, having only paid $1,000 per lot. The original buyers supposedly paid much more for each lot. However, it is basically worthless land. Land that you have no access to is not worth all that much unless you can sell it to a neighboring owner who does have road access or he will sell to you.

So, why is an article about real estate in a computer newsletter? Because I am going to introduce you to a free computer program that will give the latitude and longitude for the above mentioned lots but also do much more. It is also free. The program is Arc GIS Explorer, and it is a large download. You may download it at http://www.esri.com/software/arcgis/explorer/download.html.

GIS stands for Graphic Information System, which, quoting the web site, "lets us visualize, question, analyze, interpret, and understand data in many ways that reveal relationships, patterns, and trends in the form of maps, globes, reports, and charts." Once you have the program, you need something to display. You can import various kinds of data into the program. I imported what are known as shape files which I acquired from various public entities that were nice enough to make them available, Hillsborough County, Tampa, and the above mentioned Polk County to name a few. The screen capture above is of the program displaying for part of Davis Islands the Hillsborough County real estate parcel boundaries in blue (for color see this newsletter at our web site) along with the historic lot

Mapping.....Continued on page 7

Mapping.....Continued from page 6

boundaries (when the subdivisions were originally platted) in yellow. Additionally, there are two roughly vertical purple lines on the left that delineate the flood zones. The westernmost few yards of the island are in the worst zone, and the remaining entire island is in the next zone. So it is not where you want to be in a Cat 4 or 5 hurricane. You are seeing the results of three shape files. Note that a shape file is no more than a collection of coordinates (latitude and longitude) along with the information on which points are connected to other points by lines.

Other shape files provided are Tampa storm water pipes, neighborhoods, historic districts, Hillsborough County subdivisions and section lines. Additionally, for the parcels, if you click on any parcel – for example, the lot where your house is – you will be provided with the same information as at the property appraiser's site: information like lot size, house heated square feet, etc. You will even be provided with your own name.

As I said, Polk County provides similar information, just not as much. But many other counties in Florida provided nothing in my brief searching. I was interested in both New Orleans and New York City, and they provided varying amounts of information in the form of shape files. The Federal Government also is a source of information from the Census and other agencies. There are also other types of files you can download. One such is called a kml file. From FEMA I downloaded a shape file that showed how far inland Hurricane Katrina pushed water over the Mississippi coast.

It is quite interesting if you love data and maps. Just last evening I found a kml file of all the locations in the US of places in the Trust for Historic Preservation and a shape file of all know bald eagle nesting sites in Florida. And as I have time, I am sure I will be adding to my collection of interesting data overlays to put on the map. By the way, the map is of the world, so you can look for data from anywhere. Perhaps there is a file for WWII battles. Who knows? ◆

tor 11 Home and Internet Security Invivus Protection Services. You can obtain these products from Gene and Linda on CD at the meeting, or download at the same price.

John Witmer also recognized our long-term member Bob Davis, President of the Society for the Preservation of Early Country and Western Music, Inc. http://mysite.verizon.net/res77qfb/societyforthepreservationofearlycountrywesternmusicinc/id14.html. The QR code for the site is:

SPECWM is a non-profit educational organization dedicated to the promotion and preservation of the traditional sound of country and western music through various programs and projects. See the Tampa Bay Online article at http://www2.tbo.com/news/brandon/2011/nov/21/twangin-and-toe-tappin-old-country-on-tuesdays-ar-325444/. The QR code for the site is:

The program was presented by Bob LaFave – Windows Media Center. Also Windows Live Movie Maker for video editing. Since Bob didn't have a TV connection, his presentation centered on movie captures, editing and transferring to DVD for long term storage. He talked about the Ceton TV cablecard, both the PCIe internal card and the external USB version. These two devices bring TV into your house and present it on a computer and, optionally, your WideScreen

TV and can record and offer it for editing and long term storage like no other known device on the market.

Also in the presentation Bob answered some questions about Windows Safety Scanner at http://www.microsoft.com/security/scanner/en-us/default.aspx, a live antivirus scanner (QR to the left), and Windows Defender Offline Beta, for creating a CD, DVD or USB flash drive for machines that won't boot otherwise because of a virus. At http://windows.microsoft.com/en-US/windows/what-is-windows-defender-offline

Thanks, Bob from all of us for a fine and interesting presentation. ◆

Meeting Preview: Our old friend Gene Barlow will present the software programs he represents. As usual for the first 30 minutes, Bob LaFave will conduct our Windows SIG.

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
william@lamartin.com

Please note that the March meeting date has been moved forward to a Thursday evening at 6:30 PM (March 8th). We have made this one-time change in order to allow the Group to receive a presentation from Gene Barlow, who will be in our area for a limited time. It has been a couple of years since we last heard from Gene, and we wanted our members to hear from him again and to have a chance to see and purchase his latest offering of software for the hard drive and backups.

I thank Merle Nicholson and Ron Weinberg for their contributions this month. And I will see what I can do to fill out the newsletter with a few things of interest.

So much is changing. Merle's article on his home phone, a follow-up on an earlier article, is such an example. You will note that our group was founded 25 years ago in 1987. Apple existed as a company then, but who at that time would have guessed that 25 years later it would be the most valuable company in the world based on the value of its stock. And that there would be

Minutes of the February Meeting

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

The Windows Special Interest Group (SIG) opens our monthly meeting. The meeting began as usual at 6:30 PM. The SIG is devoted to a discussion of all aspects of the Windows Operating Systems and of computer-related subjects in general. The SIG moderator, Bob LaFave, introduces new or little known products and technological developments for discussion by the group. He accepts questions and requests for help in solving problems from attendees.

This month Bob showed us Log Me In Free, a remote control software that allows you to control your PC from a remote location. It's available to run on a PC, iPad, or iPhone and Android.

Bob talked about a Mini Media Player from Western Digital. This tiny device allows you to attach a USB hard drive or flash drive with media files to it and play the files on your TV or as input to your home theater device. It has a small remote control and is very inexpensive.

This month our guest speaker was Stephen Blalock of Barnes & Noble. Steven brought a Nook Tablet – the newest eReader device from Barnes & Noble for $250. It is able to operate as a book reader that uses epub and pdf formats and is networkable to browse the B & N bookstore and purchase online.

The Nook Tablet is a new device that complements two other B & N devices – Nook Simple Touch, an E Ink device, and the Nook Color.

Stephen gave a very good talk on the availability of media files and ebooks, including mention of the public libraries' ecollections and what was available and how it worked – the rules, and how it relates to a real book. He talked about the entertainment aspects – movies and TV shows, newspapers and magazines.

Verizon Wireless Home Connect, II

By Merle Nicholson, Secretary,
Tampa PC Users Group
merle@merlenicholson.com

I switched my home phone landline a wireless system. It's still a Home Phone, is on the cellular network, but uses no wires. (Actually, there are about ten feet of wires involved). I wrote about this two months ago in our January 2012 newsletter and, now that the bills have come in, this is a quick update.

From the January Newsletter
I was looking at the Verizon Wireless phones and plans and stumbled on a tab for "Home Phone Connect," and it looks like the device in the photo above: It has the cell phone built in, hence the antenna. It has a power cube that also charges a battery, and two telephone jacks. One of these goes to my household Panasonic base station (on the left) – the same one I've had for many years and like very much.

The advertised Cost? The $129.95 cost was $49.95 with a two-year contract, and a $35 one-time connect fee. And $10/month.
