A case can and should be made in the national public forum that even if servo-bots can be contrived to achieve the implementation of mundane, non-virtual tasks (driving nails, street sweeping, maintenance of drainage ditches, etc.) planned by AI computers, this is not a desirable goal. Ample evidence is already before us about the validity of the old adage which talks about idle hands. Computers are here for the long haul; just as certainly there are many practical justifications for this state of affairs to continue. However, trying to shoehorn every child in this, or any, nation into learning via the CRT before they have a base of reading (so they can read the screen and manuals) and math (so they can do the math needed to write a program to solve the area of a triangle) just so that every hardware and software drummer has a full order pad is not justifiable. Therefore we should watch with a jaundiced eye any and all persons who advocate that every child should have a computer on their desk at school, whether or not they are up to the curve in the traditional skills which would give them the wherewithal to fully utilize the newer educational tools. The current holders of the land's two highest offices have demonstrated precious little compunction about turning a buck in contexts which, while tried and true with respect to return, are dwarfed by the payoff that would be awarded the front man who institutionalizes unbridled, saturated computer installation in all of the public edifices of the nation.

Many accomplished computer users exhibit an intolerance for anyone who shows the least reluctance to be pulled into the cyber-arena. They cannot stand to

(Vision.....Continued on page 5)

(Vision……..Continued from page 4)

see people doing anything on an old DOS machine. "Why, you could write a macro in Access to do that, do a mail merge and dump it over a network right to the mail room with the postage already metered on the envelopes!" Doubtless true, but to such folk it never seems to occur that some individuals genuinely do not have the time to learn the software involved, funds to purchase the hardware needed, and lastly and perhaps most importantly, the desire to do so. There is a strong element of denial in the viewpoint of hyperbolically enthusiastic cyber-people. Perhaps seeing others whose entire world does not seem to revolve around a keyboard, mouse and monitor reveals a flaw (however small) in their attempt to validate their own obsession; nevertheless, there are still those of us who just want to complete an assigned task or plunk out some invoices and get back to ***doing*** something in the wide world outside of the computer room.

Another form in which the elitist stance manifests itself is the prejudice in the graphic arts industry against the PC. At one time, the Mac may have been a better platform from which to run graphics software. That time has long since passed, but the bias

(Vision……..Continued from page 5)
remains. If one wishes to pay a premium to buy a machine whose maker at times seems to be on the verge of extinction, that's all well and good. It is not logical to expect all concerned to make the same choice. This situation is akin to the contentious posturing which seems to quickly attach itself to discussions about the relative merits of the various operating systems. While personally I have never owned or used a Mac, I reserve the right to investigate Linux because I am interested in greater stability than Windows affords on a consistent basis. To those of the PC purists who loudly testify to the stability of the Windows, I must reply: Why all of the patches, bug fixes, updates, and new major versions each touting greater ease of operation, more features and a more robust nature? These marketing ploys by Microsoft and others remind me of television ads by auto makers which stated our new models are (insert some impressive percentage figure) safer, more ergonomically designed, fuel efficient or whatever than last year's model. All they have accomplished in either case is to point out what a piece of junk they were foisting on the public only a year ago.

To listen to Microsoft loyalists go through the litany of their machinations to keep Windows on the beam in effect puts the lie to the claims from Microsoft about ease of use and stability. I'm no guru, but it is my contention that one should be able to get a scanner which worked well on Win 3.1 to work on the same system after an upgrade to Win 98. As it turned out, the scanner does work on 98; but not before I was forced to:

1) purchase new scanner software which did not include the OCR capability my old setup had;
2) reinstall Windows 98 once or twice;
3) spend a lot of time with tech support whose sum total of wisdom seemed to be: Format the Hard Drive;
4) pay a consultant to bail me out (which he did; but sans any definitive answer as to what the root cause of all this was. Thus, nothing concrete can be extracted from this experience to ward off recurrence. Nonetheless, a conviction on my part exists that this sort of difficulty is part and parcel of the marketing roll-out plan for these new operating systems. They know that you will end up having to upgrade some thing or other as a result of the latest Windows version; if it is one of their apps then it's gravy. If not, well, a rising tide floats all boats.)

The point here is that although no bona fide geek, I have done some programming in a couple of different languages, spent the last 6 years immersed in study and use of Windows computers, and have installed and configured (for the most part) my own network. Still, I get into problems that pop out of the clear blue. Point is only a dilettante can afford to be abstractly immersed in the complexities of the "problem" for the "diversion" it affords when paper is not coming out of the printer. When nothing usable is emerging from the output end of the system, one does not want to hear pontificating about how well Microsoft's products *can* work with each other across the platform. This is especially true when one has made a point of not installing a raft of games, not visiting or downloading from sites known to be risky, not involving my system with chats, discussion groups, etc. Certainly when Windows is working properly it is a powerful tool. If it takes a black-belt power user to keep it working then Microsoft's Plug-and-Works-Better-Plays-Better pitch kind of loses its luster. Point is, given the above, opinion here is that intransigence in the stead of Windows and against any and all other operating systems is short-sighted, counterproductive and probably, at the bottom of it, just a self-aggrandizing move designed to establish how clearly superior the cyber-snob's knowledge and abilities are. Further, when these sorts of forensic histrionics are engaged in the presence of the uninitiated, the most likely end result is bemused disaffection on the part of the neophyte (translate potential user group member). ◆

The Best of….

By Larry Anders, Librarian, Tampa PC Users Group
larryanders@msn.com

This time of year most of your computer magazines start coming out with the best of the best awards such as best scanners, digital cameras, printers, monitors, PCs… well, you get the picture. For many years in the past I subscribed to several computer-related magazines to get my fix of technology information. Today I'm down to one magazine in hard print and most all my other techy-type reading material is now in the form of e-Mail dispatches, brought right to my desktop, free of charge (and if you know me you know I like free stuff).

One of my favorite sources for obtaining information on the Internet is ZDNet.com at http://www.zdnet.com/. My good friend Bruce Register turned me onto this several years ago, and I have been an avid user every since. ZDNet has been around for a long time, and they also publish many of your major computer magazines in print.

ZDNet gives you a whole host of information to have "pushed" to you on a regular basis. One of my favorites is ZDNet's Software Express download picks of the day. Along with the Hot File of the day, they are also currently providing a links to a Free File, Game File, Screen Saver File, Utility File and Internet File, and many, many more. When you're a file-hound like I am, this couldn't get much better! I'll admit that I don't always have the time to follow all of the links but I do try to read the descriptions and if they sound interesting, I'll click through.

One thing I do is read my email both at work and at home. I typically have more time at home than at work to digest what I am reading so by choosing to leave my email on the server when I read it at work I can also read it at home. But I have gotten a lot of good free utility programs from ZDNet that also come in handy at work. That's why I try to read my email at both places.

My most recent *push* from ZDNet had a special link to a featured collection of their top 100 recent downloads, and finally, that's what this article is about…

At the top of their list, with nearly 4 million downloads, and probably at the top of every other software site like C|Net's http://download.cnet.com/ or http://www.tucows.com/ is **WinZip (32-bit) version 8**. Although I don't use it personally, WinZip has been the most widely used compression tool since Windows based compression began. (I use a program that I reviewed and beta-tested for the software's author many years ago. Some other larger software maker purchased the rights to the program I use and discontinued it - I guess that's how they wipe out the competition in this business - but it does what I need so I continue to use it. Hey, why fix it if it ain't broken?) WinZip has built-in support for .zip, .tar, gzip, UUencode, XXencode, BinHex, and MIME formats (plus support for .arj, .lzh, and .arc files through external programs). The new Zip and Email feature compresses documents and folders and attaches the zip file to an email message without leaving Explorer. The program I use doesn't handle all this but I have other utilities that do. Maybe it's time I looked into changing to one program that can handle it all. For $29 it's well worth the price and it's free to try!

Rated number two and one of my all time favorite programs ever is **Paint Shop Pro version 7**. I was surprised to see it had nearly 2.2 million downloads because PSP7 has only just recently been released. I guess that shows the popularity of this fine graphics program. If you want most of the capabilities of a high-end program like Adobe's PhotoShop without the high cost (free to try, $99 to keep) and without the long learning curve, then you should try the shareware version of PSP7. With version 7 all of the old stuff was left intact but a lot of new features were added like additional and improved photo-enhancement capabilities, along with Web, vector/drawing, and productivity tools. There are way too many new features to list here but if you'll download the readme file at the download site you can read all

(Best……Continued on page 8)

(Best……..Continued from page 7)
about the many other features and effects like Aged Newspaper, Sunburst, and Soft Plastic. There are also new tools for getting rid of red-eye and removing scratches too. Version 3.0 of Animation Shop is included as well. Like PSP7, it offers several additional features and improvements, including integration of the Paint Shop Pro browser and the ability to open MPEG files now.

Next on ZDNet's list at third is **SolSuite 2000 version 5.6,** which is a collection of 250 solitaire games like Diplomat, Easthaven, Equinox, Fifteens, Four Seasons, Fourteen Out, FreeCell, Golf, Klondike, Pyramid, and 235 more. I play Klondike solitaire all of the time and I'm not sure what most of the other games are but at over 1.2 million downloads I must be in the minority. It's free to try and $29 to keep.

Following SolSuite at fourth was **StayOn Pro version 3.24** with nearly 1.1 million downloads. I used StayOn Pro for quite some time before going to broadband Internet connection at both home and at the office. It keeps your Internet connection alive by simulating activity when you're away from your computer and keeps your ISP from kicking you offline. It's free to try and only $19.95 to keep. And it really does work.

Now, I'm not going to go down all one hundred of the top downloads. I just wanted to make you aware that the list is there at http://www.zdnet.com/downloads/hotfiles/shareware100.html. I haven't gone through all 100 yet myself, but so far all the ones I've looked at or tried have been shareware, meaning they are free to try and you pay only if you decide to keep them. As far as I'm concerned there is no better deal on the planet. Stop by and check them out. And while you're at ZDNet check out all the other neat stuff they have to offer. It's well worth your time. **Happy downloading!** ◆

Editor's Comments

By William LaMartin, Editor,
Tampa PC Users Group
lamartin@tampabay.rr.com

Well, I was just sitting here late in the afternoon the day before the newsletter needed to be printed looking at around two and a half blank pages. What to do? I just did it. I reformatted all the articles from 10 point type to 12 point type. That added a little over a page—and made it easier for you to read. Now I will attempt to fill that remaining empty space with something of interest.

I have no new software or hardware to write about this month. Neither do I have any terrible computer problems to relate. But I have done a few things worth noting.

First let me say that **Windows Millennium** for which I did a clean installation on my Compaq 333 with 128 MB of Ram and a 20 GB hard drive is running well with no problems. I have found no problems with it. I also purchased the upgrade from Windows 98 version to install on my Gateway 600, but I have held off on that since I think I need to uninstall GoBack on that computer before installing Windows Millennium, and I haven't had the inclination to do it. I read somewhere older versions of GoBack were not compatible with this new version of Windows.

As mentioned in the minutes of our last meeting, as a brief fill-in, I demonstrated the **WebCam** I have been working on. I have one of these small Intel video cameras that connects to the computer via a USB connection. I wrote some Delphi software (with a lot of help from examples in the Delphi online help) that captures a picture of my pet cockatiel at fixed intervals. It then changes the captured BMP file into a JPG file, which it then saves to the computer's hard drive. Another Delphi program I wrote (again with considerable help from Delphi examples) takes this file at fixed intervals and sends it via an FTP connection to one of the web sites I have. On

(Comments……..Continued on page 9)

(Comments……..Continued from page 8)
that site is a page which displays the picture. This page automatically updates itself every three minutes. As with a lot of the things I do, this was more of an exercise in programming than a desire to have my bird on the Internet. I think there is still a little problem with the FTP software, but when I get it totally debugged, I will be happy to share it with anyone who might be interested.

AOL Mail Contacts Online This past month I have had several people tell me that after sending an email to someone who was on AOL, the AOL person would then reply to them, saying something like "I see that you are still online, so I will reply to you." They mentioned it to me, and I said that I didn't see how anyone could know whether you were online or not unless you had signed up with one of those instant messaging services—which these people hadn't. Then I had the same experience, and that led to the following investigation.

Knowing that I hadn't signed up for any instant messaging, I came to the conclusion that the email messages I send apparently transmit more than just my email address, since no one could tell whether I was connected to the Internet using just that. I then sent myself a message from my RoadRunner account to my NetCom account, opened up the message after receiving it, and looked at the "message source". To my surprise, right there in the message source was the line: "Received: from rome (242848hfc60. tampabay.rr.com [24.28.48.60])". Well, "rome" is the network name of my computer and "24.28.48.60" was the current IP address of my RoadRunner connection. So a lot more than my email address was being sent with the message.

Now, how could I use this information to see if "rome" at 24.28.48.60 was still online. Well, there is a program called Ping. All computers running Win 95 and above have it. You can run it from the Start | Run text box, but it is better to drop to the DOS prompt to run it, since then the Window will not disappear when it is finished, and you can then read the results. I ran "Ping 24.28.48.60" from the DOS prompt on the computer connected to NetCom and it indicated that it had indeed sent and received responses from 24.28.48.60. That told me that there was a computer at the address 24.28.48.60.

But how do I know that the person who sent me the email from a computer at IP 24.28.48.60 is still the same person using that IP address? I don't. It is possible that he sent the message then disconnected and RoadRunner then assigned someone else to that IP address. But if, when I pinged the address 24.28.48.60, I could also ascertain that the computer name was still "rome", then I would be pretty sure that I had the same person.

I have not had time yet to figure if and how this last item can be done, but I believe that it can—unless the person is using a firewall.

Anyway, I have basically figured out how AOL knows whether the person who sent you an email is still online or not. And I have learned that when you send an email, much more identifying information than just your email address goes along with it.

I have also been doing a bit of Visual Basic programming involving **Microsoft Access databases**, and I find that I have almost as much of a problem getting the database to behave correctly—which really should be the easy part of the effort— as I do writing the VB code. And it turns out that these database problems are the same ones I have run into in our Microsoft Access SIG. So come out to the SIG and help me solve them. ◆

(President……..Continued from page 3)
The October general meeting will include a list of candidates for next year's officers. I'm hoping for lots of nominations and to really have an election. My experience as President has been entirely positive. It's not nearly as time consuming as being the Program Director…wait, I'm doing both jobs. Well, if you only want to run for President, then hopefully we can find some-

Unwanted Programs

By Merrill Friend, Tampa PC Users Group
mfriendtampa@worldnet.att.net

Over a year ago I downloaded a trial version of PKZip from the PKWare website. I was told to try it and if I didn't choose to pay for it to simply uninstall it. That seemed fair enough. So I downloaded it. I have always respected this product and its creator's genius but I was drawn between two choices, whether to use PKWare's PKZip products or to download Winzip, which may be written by the same people. Winzip, however, is marketed by a different organization.

I chose Winzip and currently have a registered copy of that product on my unit. I uninstalled the PKWare product, and in checking to see that everything had been removed I found that I now had a new program on my computer, added at the exact date and time that the now uninstalled PKWare product had been added. Apparently piggybacked on the trial version of the PKWare product was this Timesink program which is somehow involved with a firm known as ADGateway. I don't know how this program works, but I am under the impression that every time I use the Internet it somehow reads into my computer and I know it stores ads of some sort onto my hard drive. I recently found that these ads were taking up about 5,900,000 bytes of disk space and this was from a program I never wanted on my computer.

Since I didn't want this product I contacted PKWare to find out how to get rid of it since they are the ones who caused it to be there. I received what was to me a rather complicated response about how I could make changes in Registry which would take it away but the writer recommended that I not do so unless I was a very skilled computer guru or I might render my computer unusable. So not being a real expert I left well enough alone, fearing that I might cause worse problems which I might not be able to correct.

I am disappointed with the PKWare Company for deceptively putting this unwanted program on my computer. I feel that their uninstall program should have removed everything that their trial program added to my hard drive.

This, however, is no longer a problem for me since I recently replaced my hard drive and I do not intend to ever again download any trial programs from

Meeting Preview: At the November meeting we will have a rescheduled presentation by John Locke from our local Gateway store. Mary Sheridan, as usual, will conduct a 30-minute Windows discussion at the beginning of the meeting.

President's Message

By Mary Sheridan, President, Tampa PC Users Group
mcpease@mindspring.com

I thought Marty Fries gave a great presentation at the October meeting. We heard before the meeting that an announcement was airing on the radio that Napster would be discussed at our meeting. Not knowing what kind of crowd to expect, I went to MOSI early and tried to get a better-bigger room, wasn't able to, panicked, then found out it wasn't necessary. We had our usual attendance at the meeting. So all was well.

I attended the Computer and Technology Showcase last month at the Convention Center. I was there representing the user group and handing out our trifolds. I also had a hand out from the Greater Tampa Bay PC User Group. I was asking people where they lived and would give them a brochure from whichever group was closest to their home or office. It seemed more of a business-to-business kind of convention, and, to date, I haven't gotten any feedback about the success of the event. I haven't received any phone calls.

Windows ME isn't installed on my PC yet. I just haven't had the time. If anyone has experience with it, please send William an article.

The FACUG fall conference was a big success. There were 54 paid attendees. The most interesting people were the Macintosh group. They came in a huge

The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

apcug Member of The Association of Personal Computer User Groups

Minutes of the October Meeting

By Mike Hodges, Vice-President, Tampa PC Users Group
mike.hodges@baesystems.com

Mary Sheridan, our stalwart president and ace presenter, kept us entertained as usual by responding to "how to" questions relating to MS Windows for the first 30 minutes of the evening's meeting.

Next, the standard announcements and official organizational business were addressed for five minutes including the announcement of the slate of TPCUG officers for 2001 to be elected at the November meeting. See the President's message in this newsletter for the list.

Then Mary introduced the author of *The MP3 and Internet Audio Handbook*, Marty Fries, who co-authored the book with his brother Bruce Fries.

Marty entertained the group with his excellent presentation on the ins and outs of the audio compression technology known as MP3 that has recently opened up the music delivery marketplace and provided a new medium of personal listening opportunities. Marty was definitely in command of his topic and came across as a cool devotee of his passion for music in general and the enhancements provided by MP3 technology in particular. The presentation was like "easy listening" but contained an enormous wealth of technical information relating to MP3. What now follows is my attempt to capture a number of technical nuggets of information recorded as best I could from Marty's excellent presentation. For those anxious for more technical definition, Marty's book has just gone through a reprint and should again be readily available at all the major booksellers.

Marty, a long time band musician by his own admission, also confessed that his interest in things digital commenced with the Commodore 64 and Apple PC's. Marty started out by passing around the group a small compact electronic device known as an MP3 Player. Portable MP3 players range up to 64 MB's of memory. The MP3 compression technology is perfectly legal, notwithstanding the raging Napster legal controversy pitting the recording industry against independent musicians. Typical compression factors achieved by MP3 approach 1 to 10 and can be compared loosely to zip compression that eliminates space and zeros.

The technical discussion started with the factoid that a standard audio CD contains 760MB of data and provides 74 minutes of audio. The laser CD path covers 1.6 kilometers of recording. This equates to 1.1 MB per minute. The Nyquist

Kyocera-Qualcomm Phone

By Mary Sheridan, President,
Tampa PC Users Group
mcpease@mindspring.com

I recently wanted to get new cell phone service—one of the new plans that include both local and long distance calls for one price per month. I called around and found out that I would need to get a new phone to qualify for the plan. Since the Internet is so much fun, I figured I might as well get a phone that also accesses the Internet.

I stopped at the Verizon kiosk in the mall and got talked into a Qualcomm QCP 2035a. Kyocera has recently bought the cell phone division of Qualcomm. So, I guess it's really a Kyocera QCP 2035. The phone was selling for $99.00, and the guy sold it to me for $49.99. He said that it was a one-day only thing. I half expected him to open his jacket and reveal a bunch of wristwatches, but he didn't. It came with a regular charger. I bought a car charger ($29.99) and a belt chip ($24.99). The salesman threw in a hands-free headset and my total with tax for the phone was $112.06

Next I had to contract a year for the service. It's $40.00 a month and includes 400 anytime minutes and 500 night and weekend minutes. I have no more roaming charges or long distance charges. Features that come with the phone are call forwarding, 3-way calling, voice mail, caller ID, call waiting, check billing, #Pay.

So far I'm having a great time with the phone. Verizon's Mobile Web provides you with your own personalized web site that you can access from your handset. An email account is provided, or you can access other POP3 email accounts. Also available is a personal organizer for scheduling, addresses, important events, etc. I was able to sync my Outlook with the web site, and I now have all of my information available from my cell phone.

The web sites that are available are separate from regular web sites, but there is a world of interesting data. You can make stock trades, shop, and check sporting events, weather, and lots more.

When I cancelled my Alltel (GTE) service, the girl was very nice but told me that I was probably making a mistake because Alltel's signals were stronger than Verizon's. I'll keep everyone posted if I have any signal problems.

If anyone is interested, I have a LGC-300W ($126.87) phone for sale. I have a leather case ($21.34), charger and car charger. I'll take $25.00 for everything.

Ebooks and File-Sharing on the Internet

By Tim Condon, Tampa PC Users Group
tim@free-market.net

When you say "file-sharing on the Internet," everyone thinks "Napster" or "Gnutella" or "Freeinet." Viz. swapping music files, usually in the MP3 format. But there's a potentially more important form of file-swapping "piracy" (which you call it if you're on a certain side of the debate) that's so far received little attention. And that form of swapping really, reeeeellly needs wider discussion...and **your** attention....

But first, a late report from the Napster legal battlefield. When last we checked in, it looked like the Napsterites were going to go down for the count. In August both the RIAA (Recording Industry Association of America) and a bunch of pile-on musicians went before the Federal District Court in California asking for an injunction to shut the Napster Internet site down for copyright infringement (uh, music piracy to the rest of us).

At a hearing, held on July 26, 2000, the Napster lawyers were stunned (and the RIAA suits elated) by the open hostility shown by Federal Judge Marilyn Hall Patel toward the Napsterites. That first hearing was only an opening barrage by the music industry plaintiffs, asking for a preliminary injunction to shut down the Napster web site while the litigation proceeded. Well.

To the surprise of everyone—not least of all the music industry lawyers—the judge proceeded to enter an immediate injunction ordering the Napster web site to shut down within 48 hours (thus causing a stampede from the 60 million or so users who wanted to stock up before the party was over).

But wait! The Napster lawyers instantly filed an emergency appeal to the Federal 9th Circuit Court of Appeals (which is the level directly below the U.S. Supreme Court), and **that** court overturned the injunction and ruled that the Napster site could remain open and operating until the court case was finally decided. Whew!

Which is where things stand today as scores of millions of music lovers merrily share and download free copies of just about any music you can imagine...ahem...royalty-free. Observers of the legal dust-up predict it won't be surprising if the matter ends up before the Supreme Court. And for those of us who can't see how the Napsterites can survive, take a look at the arguments of their renowned lawyer, David Boies, interviewed in the October 2000 issue of Wired magazine at http://www.wirednews.com/wired/archive/8.10/boies.html. His arguments, even in the face of what "appears" to be music piracy by many millions of people, actually appear quite powerful.

From eOne to Dialpad.com through DSL

By James Kalshoven, Tampa PC Users Group
nasajk@hotmail.com

Having a high speed link to the Internet at work made using my neat little eOne computer at home for surfing more and more tiring with its dial-up connection, especially with time limited by the attention needs of two little girls clamoring to play. The eOne from eMachines is the iMac lookalike with a PC soul that is great because it is an integrated unit (15" monitor with a 466 MHz Celeron) which makes up for its lack of normal expansion slots by including two Type II PC Card inputs, three USB ports, high resolution video capture, modem and Ethernet all built in. And all for only $799 from Circuit City last year. I got a three year warranty for $89 considering the unique nature of the machine. But a lawsuit from Apple has crimped the distribution of faster models and it is no longer listed at the http://www.e4me.com web site.

This machine is cute and beckons you to use it. Josie, my three year old, already can change CD's and start up the games she wants, thanks to its kid friendly feel with the CD player directly under the monitor. It was kind of weird when I first heard the music of a game I had not loaded for her coming from the living room where we keep the computer.

All this was fine, but the Internet at home beckoned. The ads for DSL were tempting. We were using two phone lines since, when we did get on the computer to check email and such and wait for the slow downloads, it made sense to have the extra phone line. Dropping that line and using that cost savings as more justification for a DSL line made sense. The result, with the local DSL competition here in the Washington, D.C. area, was only a bit over $20 a month more for a line ten times faster than a 56K modem! And this was SDSL, not ADSL. Which means up and down links are the same speed. By the way, a great site to check your Internet speed is at http://www.computingcentral.com/topics/bandwidth/speedtest.asp.

Given the always on nature of DSL, and I did keep the computer always on, I installed the free ZoneAlarm software from http://www.zonelabs.com/ and checked my security and web presence using the http://www.grc.com site. I was well hidden.

Now I paid attention to all those neat things I was reading about new web sites – and began to check them out. The payoff came soon: Such a site is http://www.dialpad.com which offers free PC-to-phone calls anywhere in the U.S. I do not know what business model can pay for a company offering this service using just a few banner ads and a shop for PC phone accessories, but more power to them because the site works almost perfectly! Setup is easy, and the information I filled out several months ago has resulted in no unsolicited email or snail mail. My favorite use for the site was when I was on vacation to visit the Expo 2000 World's Fair in Hanover, Germany. I kept in touch with the States using dialpad.com on friends' systems using only modems! The biggest thing to be aware of is that the ringing you hear simulates the real ringing of the party you are calling. There is about 3 seconds of delay from the time they actually answer until you hear the ringing stop and you can hear them. But they can hear you, so now I hum or mumble something nonsensical when calling someone who does not know I am using it until I hear them so they do not hang up. My mom now knows and is very patient with the initial silence!

For the last couple of months, our phone bills have been at least $20 less due to the use of dialpad.com for long distance, so now the DSL is "free"—and that was with a long distance service that gave five cents a minute all the time with no fee!

But with over ten million users, dialpad.com is sometimes down and sometimes choppy. Try again right away for the times it is busy and wait awhile if you can for the less clear times. I found that my computer was introducing most of the noise at first -- it took a lot of testing using Windows' sound recorder. But now I have had calls where the other party does not even know I am using it! The best comparison is a digital cell phone. If you can live with those, you'll have no problem with dialpad.com! ◆

(Minutes……..Continued from page 2)

theorem, sometimes known as the Shannon theorem, states that the sampling rate must be at least two times the highest natural frequency, which for human audio perception equates to 1.4 MB per second, or 44.1 kilohertz. A typical five-minute song, therefore, requires 50 MB. Also, typically 5 MB is about the maximum practicable amount of data that can be downloaded over a 56 KB per second modem.

MP3 technology mostly overcomes this problem by virtue of the compression achieved. The human frequency range of hearing is from 20 Hz to 20 kHz. The compression algorithm divides this range into 30 bands and eliminates the definition of those bands with a volume level lower in dynamic range than the brain's detection level. Sixteen bit encoding provides a dynamic range up to 90 dB. This equates to 6 dB per bit or voltages ranging from one milli-volt to one volt. Other types of compression have been developed and are also known by their acronyms, such as WMA, AAC and AZT3. However, MP3 has now permeated the marketplace. With a 128 KB per second bit rate, MP3 is found to have a most acceptable audio quality. A full orchestral recording is by far the most musically complex collection of sounds and, even so, a compression ratio of 7 to 8 is readily achievable.

A standard MP3 player with 64 MB of memory can play back over one hour's worth of high quality music. Memory itself has

(Minutes……..Continued on page 5)

(Minutes…….Continued from page 4)

taken on a number of highly compact forms such as flash memory, the Sony stick, or the smart media chip. With any of these memory forms the MP3 players tend to be extremely light and, therefore, very portable.

Marty then conducted a live test for our captive audience, who were asked to distinguish between uncompressed audio, as from a CD, and the MP3 recordings. MP3 recordings were demonstrated at a number of recorded bit rates, and we were asked to determine from the audio quality rendered if they were compressed or not. These tests were conducted using a Ricky Lee Jones song that contained a significant level of musical complexity. This demonstration was conducted using the Win Amp MP3 player software. The test was repeated for a number of variable bit sampling rates that automatically varied according to the musical complexity. Bit rates of 80 to 200 kilohertz were witnessed. The streaming Internet "Real Audio" uses a 32-kilohertz bit rate, by way of comparison. At the lower bit rates a loss of sharpness or muddiness of sounds was detectable when compared to the audio CD rendition of the same song. The use of a variable bit rate further improves the compression ratio by 2:1 compared to the fixed bit rate sampling rates.

The presentation now proceeded into a less technical realm of MP3 recorded music. "Music Match Juke Box" was touted as the equivalent of a 300 CD disc changer! The software not only catalogs and allows the user to pre-select a large number of songs to be downloaded to a MP3 player but also stores information for readout on the player display, such as the song title and artist and any other information so desired.

Drive Image 4

By Don Patzsch, Tampa PC Users Group
patzsch@acomp.usf.edu

When I receive a copy of a new computer program, I read the manual through three times. It took several years for me to recognize the importance of doing that. Drive Image 4 tells you to disable your anti-virus program and close any programs you may have running before you attempt to use Drive Image 4.

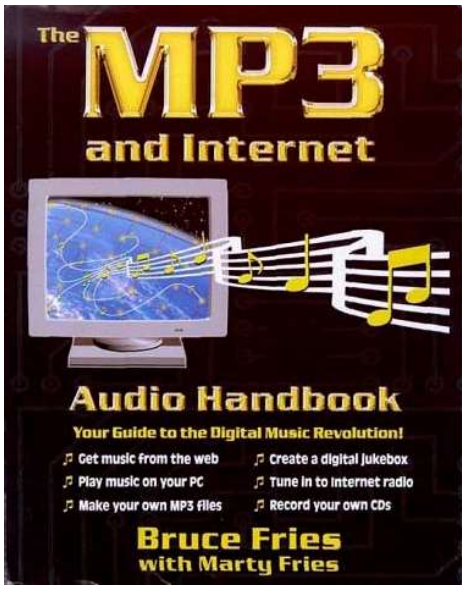
With this program you may

1. Set scheduled backups.
2. Drive Image will create image files on floppies, hard disks, CDR drives, and other removable drives.
3. Interestingly enough, you may image more than one hard drive at once, if you have several hard disks in your computer.
4. You may save an image to a hidden partition.
5. In advanced options, you may split an image file to cover more than one removable drive, such as floppy disks.
6. You may make an image copy of one or all the partitions on your disk. This means you may have an exact copy of your partition or partitions transferred to a CD - R or a CD-RW drive. Now if you need to replace a file or two, you may do so from the CD ROM or another partition on your hard disk.
7. Datakeeper 4.1 is included with the Drive Image 4 program. It continuously monitors your system for changes. You specify which files or folders to monitor and then selectively they can be restored.
8. Drive Image 4 will create images on hidden FAT, FAT32, and NTFS partitions. You can check the integrity of the Image files. It works with Windows ME.

PowerQuest Corporation P.O. Box 1911 Orem, Utah 84059-1911. Phone 801-226-8941. http://www.powerquest.com.

When I buy a new computer, I add a second hard drive right away. I also split up my main disk into partitions. Splitting your main disk allows you to set up your programs so that your spreadsheets, letters and databases are all "saved" to one partition. This allows for easy backups, not for the main programs but just for your work. Other people prefer to have one large C drive.

After I set up the new computer and load all my programs, I image copy to the second hard drive. This means that if I make a mistake or if a file is corrupted, I can simply switch over to the second hard drive and go right on with my work. Then, at my leisure, I can image copy from my stored hard disk back to my original disk and be right back where we were when we set up the new computer: with my regular work on my original disk, and with the image backup copy to go to any time trouble develops. This is neat for another reason.



Sometimes, we use a lot of programs and erase them, we think. However, Windows keeps some of the snippets and so the whole computer slows down after a time. Formatting the c:\ drive and image copying it back will close out all those snippets, and I believe my computer runs faster.

I have used PartitionMagic for a long time and Drive Image since Version 1. I am impressed with the people at PowerQuest because the programs work as advertised, and they are not user unfriendly as some programs are. Using DriveImage you can restore your hard disk programs if you accidentally erase some or all. Using Lost and Found, another PowerQuest program, I have gone into hard disks we thought were beyond further use and I have taken off programs and whole sections of data and then deep fixed the bad hard disk.

If you get the latest copy of PartitionMagic, and also DriveImage, you have the manuals that you need to easily understand how hard drives work, and how you can best use them. ◆

(Minutes……..Continued from page 5)

A number of MP3 player models were presented and included the Genica, the Nomad and the JB Works. Prices range from $150 to $900. Excellent 64 MB MP3 players were obtainable by means of Internet sales for $250.

For further details on all of the above and for technical validation, the reader is directed to the web site, http://www.MP3handbook.com. Overall this session was one of the best and most enjoyable presentations ever made at our monthly TPCUG meetings. Thanks again to our presenter, Bruce Fries, who signed copies for us of his book, available for $20. Two copies were donated for our door prize that netted $46 for our general fund. ◆

Do you know what your invisible ink says?

By Larry Anders, Librarian, Tampa PC Users Group
larryanders@msn.com

As usual, when our newsletter editor started asking for articles for this month's newsletter, I went blank. I usually do better under pressure so… I waited. While I was waiting… and waiting…I came across an article about invisible ink at work in the Wall Street Journal that caught my attention. I remember being the sly one when I was much younger using a mixture of white grapefruit and lemon juice to write secret messages to my friends, but this article was talking about a much more serious situation. So, after reading the article, which I will refer to from time to time (***The Wall Street Journal – Friday, October 20, 2000***), I decided to do a little more research on this matter.

Another name for today's high-tech invisible ink is "*Metadata*." It seems that software makers such as Microsoft created programs like Word (among others in the Office product line) that just happen to leave behind a lot of information that doesn't appear on your screen, such as the author's name and/or initials, company name, computer name, the name of the network server or hard drive where the file was saved, non-visible portions of embedded OLE objects, other file properties and information, the name of each subsequent person who has worked on the file and sometimes, if the correct options are not selected, deleted text and various other revisions and versions. And, you know the old saying, "out of sight – out of mind." Well, maybe you should mind this!

Microsoft says Metadata is used for a variety of purposes to enhance the editing, viewing, filing, and retrieval of Office documents. But, this just may be something you don't want to share. Because Metadata is created in a variety of ways within Word documents, there is currently no single method that you can use to eliminate all such content from your documents. Microsoft says it hasn't had many complaints about this problem in the past but… in late spring of next year, when the next version of Office is due to hit the shelves, there will be a "privacy option" that will allow a Word document author to "remove all personal information with the click of one button and also be warned if you're saving tracked changes and comments." (…and they haven't had many complaints.)

Some Metadata is readily accessible through the Microsoft Word user interface; other Metadata is only accessible through extraordinary means, such as opening a document in a low-level binary file editor. But sometimes even a simple text editor like Notepad can be very revealing. Personally, I can't wait till someone sends me an email with a Word document attached. I'm nosy by nature!

The Wall Street Journal article talked about someone on the Democratic campaign trail continually receiving slamming emails with Word documents attached and signed by someone that evidentially didn't exist. After three months of this finally some techy aide decided to do a little mouse-clicking investigating and uncovered hidden text that seemed to link the email to the campaign of the Republican incumbent. Fancy that! High-tech politics as usual? (And I'm not hitting on the Republicans. The roles could have just as easily been reversed.)

So, what can you do in the meantime, before Office 10 hits the stores, to make sure your invisible ink stays invisible? First of all, check your setting under Tools | Options and see what you allowed to go out in your last Word document. Then go to Microsoft's web site and search for the word *Metadata*. You should find article Q223790 in Microsoft's Product Support Services database entitled "How to Minimize Metadata in Microsoft Word Documents." I won't try to go into the fixes here. The document is quite lengthy so I'll leave that part to you. Also, notice that this problem isn't new to the latest version of Office. This document was published back in the Word 97 days.

There is also something else you can do. The kind people at Payne Consulting Group, after discovering some hidden text in some of their legal documents, devised security procedures for removing hidden text from its files. They developed a program called Metadata Assistant to purge any unseen or unwanted information from documents. The program can be downloaded free of charge at http://www.payneconsulting.com/MetaDataAssistant/. It's free because they can't guarantee that everything will be stripped out. But hey, it's a lot better than the alternatives… and it's free!

Oh, by the way, the Democrat lost the election anyway, but the investigation into the email continues. He just may win after all. Don't forget to vote November 7th so we can get rid of these ads on television! ◆

Easy CD Creator Version 4.0

By Tom Goff, Tampa PC Users Group
tgoff1@tampabay.rr.com

How would you like one CD software package that could reliably duplicate both audio and data CDs or rearrange and record to CD the content from a number of sources including MP3? Any analog audio source like tapes and albums can be "cleaned up" and equalized. Your CD RW can be used as an additional drive letter using the DirectCD part of the package. Also included is a simple backup program that I've used but not needed to restore from. And last is a very complex audio and video editing program that works with WAV and MPEG files respectively or other files you can manage to convert to these formats. The package also comes with a really helpful 120 page instruction book and four bonus programs. List cost $100 (what I paid); street cost $69, and occasionally $59 with a rebate at CompUSA. This software package meshes nicely with the subject of our last meeting on MP3 files and other forms of audio.

First a little history. Back in 1998 I became acquainted with Adaptec by buying a 2940 host adapter and a Ricoh 6200s 2x2x6 CD writer. Adaptec's Easy Creator 3.0 was bundled. It only copied CD's in total or let you rearrange the cuts to make a custom CD. CD-R's were very difficult to find and RW disks were 3 for $25 dollars. No analog audio could be transferred unless you bought their Deluxe Version with Spin Doctor. All these programs survive in the new 4.0 version. All of my comments pertain to version 4.0 purchased software only. I don't know what's being bundled with CD writers at present. They do support patches for bundled software.

The opening sections of CD Copier and CD Creator closely resemble the 3.5 versions. One advantage offered by Adaptec is the vast database they maintain on CD-Rs and CD-RWs that will work with the program, not to mention CD-ROM players from which you might or might not be able to copy data. Many are actually tested. My favorite is the category of CD R/RWs that will **never** ever work with their software. Newer equipment will most likely meet their specs. If you're buying, check their web site: http://www.adaptec.com. Just because your CD-ROM player plays music through your speakers is no guarantee it will transfer to your recorder. However, the first thing the copy program does is run tests on your equipment. Back in the dark ages I had to buy a new SCSI CD-ROM player. I flunked. I still prefer SCSI for this task, the Plexor 12X unit mentioned in the MP3 group meeting would be fine.

Again, always check their web site before you buy or need firmware updates for older equipment. Creator 4.0 required a firmware way beyond my CD writer's 2.03 and directed me to a site that got me up to 2.40. I like that kind of support. I was having periodic problems with the 80 minute CD-Rs if the master were nearly full. This upgrade solved it. They also give unbelievable support to Adaptec's own equipment at this web site. Periodic patches accommodate new equipment and software released. Another interesting note: MS ME requires a special patch for Easy CD Creator 4.0 to work with my CD writer, but there is a bold note saying "You don't want to load this driver!" They have sense humor! I wish Office Depot had had a similar message warning me not to load the Windows Me that I purchased from them in the first place.

Also included in the package but not used by the author is "Video CD Creator" which is new to ver. 4.0. I didn't own any video equipment at the time but have just bought an Intel USB camera, so I'll be trying it. Creator 4.0 does not say exactly how much video will fit on a CD, but for tracks the data rate is 1,151,929 bits per second with some overhead and maximum track length restrictions. Again, not tried.

My only real criticism of the program is superficial— the graphics are young and hip and are just plain juvenile, which doesn't fit their market, as I see it. They have an excellent newsletter explaining many of the inner workings in the CD business.

Finally, a warning: order over the Internet at your own risk, Digital River handles Adaptec's shipping, and I was literally 3 months getting a 2 meter SCSI cable instead of the 1 meter one they sent. This was with high level help. It reminded me of the Capital One Credit Card TV ad running now, where you're dropped into a basement after you order! ◆

(EBooks……..Continued from page 3)
All of which is a digression. What could be more powerful and more interesting than the Napster vs. Music Industry struggle? Just this: A more important industry than the crooners and rock 'n rollers, even if the absolute dollar-numbers aren't as large. I speak of course of the mother of all information tsunamis, the publishing industry itself.

Consider. Each year anywhere from 40,000 to 50,000 books are published in an industry that generates about $20 billion per year, while the music racket generates approximately double that, weighing in at about $40 billion per year. But when you talk about book publishing, you're not talking about screaming adolescents who occasionally smash up defenseless hotel rooms. You're talking about the successors to Johannes Gutenberg, the foundation upon which civilization itself rests. (I

(Ebooks……..Continued on page 9)

(EBookss……..Continued from page 8)
mean, how do you train architects and astronauts and doctors and lawyers and physicists and scientists and teachers and entrepreneurs and all manner of other Indian chiefs without...books? Compare and contrast those societies today which have plentiful books with those, rare though they may be, that don't.)

So what's going on? Just this: The battle over music file-sharing isn't just a fight over who's going to be able to control and distribute the artistic creations of musicians. It's the opening salvo in a struggle over the "unauthorized" sharing of **all** kinds of information files over the Internet. Including music, books, magazines, graphics and pictures of all types of artwork (including photography, painting, sculpture, poetry, you-name-it), and all other possible forms of "information." After all, this is what the Internet ultimately excels in more than anything else does: The quick, universal, virtually costless distribution of information.

Thus, the desperate attempts by some in the music industry to maintain a monopoly in distribution are mirrored in the publishing industry...but with a twist.

In the publishing industry there's no easy way to get best-selling books into digital, and thus downloadable/tradable, format. I mean, it's not like a music file where you play it one time with a ripper running, and then it's on your hard drive for sharing forevermore. To get a book into digital format on your hard drive, you'd either have to digitize it by scanning or otherwise copying it, or you'd have to do it the old-fashioned way, by bribing someone at the publishing house to give you a copy of the book on a disk, which hasn't seemed to happen...yet.

Nevertheless, the writing is on the digital wall: The days of the tree-killing, codex book are numbered, and those numbers are small. Does it make any sense to keep chopping down trees to fuel the cumbersome process of creating paper, then printing on the paper with ink, then putting all the pages together and then binding and gluing them with cardboard covers in the form of a book? Let's face it, whether hardback or paperback, books are heavy, expensive, and cumbersome. In a word, "wasteful" (with apologies to all you bibliophiles out there).

What's the alternative? Why, the "ebook" of course! Everyone's heard about them, few have seen one so far, and almost no one has purchased one. Why? A number of reasons: The first widely available electronic book, the "Rocket Ebook," was guilty of poor execution and high pricing. It had a dull monochrome screen and was priced at several hundred dollars (for the early-adopters). Now the Rocket Ebook has been discontinued when two ebook manufacturers, SoftBook Press (maker of the Softbook Reader) and NuvoMedia (maker of the Rocket eBook), were purchased by a company named Gemstar. As a result, both the Softbook Reader and the Rocket eBook were discontinued, to be replaced by two new offerings by Gemstar, manufactured by Thomson Multimedia and sold in the U.S. under the RCA brand.

The new ebooks, the REB1100 and REB1200, are currently priced $300 and $700 respectively. The 1100 has a monochrome screen and weighs 18 ounces with batteries that last 20 to 40 hours between recharges, while the 1200 is larger, weighing 33 ounces, with a color screen and batteries that last from 5 to 10 hours.

While the pricing is a problem for many of us, that's not the real show-stopper. The problem is that Gemstar is trying the same old trick seen repeatedly in the computer industry: It is attempting to lock REB 1100 and 1200 purchasers into a proprietary, closed merchandising system whereby content can only be purchased through Gemstar or Gemstar-approved content providers. That is, you may generally only purchase your reading matter from RCA or approved publishing houses working with them...and guess what that does to the pricing structure?

Some of the big publishing houses, in their desperate scramble to co-opt the nascent electronic publishing industry, have seen to it that an electronic text downloaded to an ebook reader generally costs either the same or—get this—even MORE than a hardback edition of the same book you can buy in a store. Incredible? The publishers have all **kinds** of arguments as to why ebook texts—with no paper, no ink, no weight, no distribution costs, etc.—should cost the same as tons of books printed the old way.

When it became clear that Gemstar was going to try to pull the closed-system switcheroo on its ebook purchasers, observers immediately raised objections. Ebook crusader and columnist Kelly Ford, upon learning of Gemstar's plans, wrote, "I love eBooks. I love the Rocket eBook. I'm anxious to buy the RCA eBook. But, even I am not willing to spend $300 (or $700 for the REB1200) for a device that locks me into buying content from a single company. This is a recipe for disaster. From the consumer's perspective, it reeks of corporate arrogance and will ensure that their collective wallet remains shut." Amen to that.

So electronic book publishing isn't going to happen any minute now, at least not in a huge way. Let's give it, oh, say two years before open standards are put into place and the entire paper-based publishing industry starts to crumble and reconstitute itself. The ebook industry awaits a light, low-cost, reasonably-priced device with a high-resolution color screen and reasonable battery life. Not to mention the easy availability of books from many origins, priced in a way that reflects the reality of the savings to the publisher (which may in time become the author personally, thus cutting out the middleman publishers and their current distribution monopoly entirely).

Fortunately, the RCA e-readers are only the tip of an emerging iceberg of electronic reading devices. Sony and other Japanese

(EBooks……..Continued from page 9)
companies are said to be looking at producing low-cost e-readers (can you say "Playstation II"?). Xerox is said to be looking at the possibility of producing one. A company named Everybook, Inc. has developed expertise in both ebook software and producing an electronic reader that was to have been called the "Everybook Reader." Shaped and read like a regular book, it was to have had a very high resolution color screen and open-standards software so that content could be obtained from myriad locations. Now Everybook, Inc. has spun off its hardware division, resulting in a new company named N-Vision Technologies (http://www.nvisiontek.com/) which will manufacture and sell the codex-type e-reader.

The N-Vision e-reader looks so good, in fact, that I wrote them a few weeks ago asking when their product would be available. This is what I got back: **"***Thank you for your interest in our product. We are currently trying to raise capital to bring this product to market. Once funded, we are about 10 months away from production. We are about 3 months away from having alpha units to demo to the world, and 5-6 months away from Beta/test units. We appreciate your support of this product..... it's been a tough road, but our team is dedicated to bringing this product to market. I will try to keep you posted on our progress. Cheryl, EVP Operations and Sales, N-Vision Technologies, Inc.*"

Oh boy. Personally, I can't wait. I think the age of the paper book is about to come to a quick end. Electronic e-book readers will be better, lighter, cheaper, more convenient, more versatile, and perhaps most of all, more fun to read (the advent of devices that can talk to you and play music while you're reading; allow marginal notes, underlining and other marking; automatically bookmark pages; etc. is almost upon us). It'll save a lot of trees, too.

What do the rest of you think? ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group

motor home that was decorated with colorful signs and banners. I spend the entire day taking notes, so I'll have to write them up to find out what happened. I'll write an article about the event for the next newsletter.

The list of candidates presented at the last meeting are: Mary Sheridan – President, Mike Hodges – Vice-President, Jenny Olin – Treasurer, James Weber – Secretary, and Kevan Sheridan – Member-at-Large. Anyone can be added and presented at the November meeting, so please let an officer know if you're interested in seeking office. At the November meeting, we'll announce the complete roster.

On a very sad note, another one of our members has passed away. Don Sebrell died at home from the cancer that had plagued him for so long. He was also dealing with a ruptured disk that was so painful that he hadn't been able to attend our meetings. I talked to Don often and will miss him very much. ◆

Meeting Preview: A Christmas party and election of officers are the only items on the December agenda .

President's Message

By Mary Sheridan, President, Tampa PC Users Group
mcpease@mindspring.com

As another Christmas approaches. I feel privileged to be writing this column. I've so enjoyed being your president. I look forward to a successful 2001. The election will be held at our Christmas Party/December meeting, but since we only have one person running for each office, I'm hoping the voting goes smoother than the national election went. I welcome any suggestions that will make the club better. I also encourage everyone to attend the meeting and let your vote count.

I will be starting classes on November 30th. It's important for the group that things continue to run smoothly. I will be asking for help as my available time reaches the breaking point. Don't hesitate to tell me no if you feel unable to help and please don't commit to anything you're unable to accomplish.

Recently I went to William LaMartin's house to help with the newsletter. Later on his way to the post office, William was involved in a car accident. Luckily he wasn't injured. I was amazed to find out that a couple of hours later he had driven to the post office to mail the newsletters. That's certainly above and beyond, and I want to thank him for his continued excellence and dedication.

We sometimes fail to acknowledge what we appreciate and just assume that others know how we feel. I am so thankful that Merle Nicholson is doing so

(President.....Continued on page 12)

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

apcug Member of The Association of Personal Computer User Groups

Minutes of the November Meeting

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

Our secretary was absent and the member who volunteered to take notes took them, but unfortunately the notes have not made their way to the newsletter, so I will relate what I recall.

As best I can remember, we had our usual Windows SIG for the first 30 minutes of the meeting. We then were presented with the slate of officers to be voted on at the December meeting. An opportunity was given to add names to the slate, but none was added.

Since Gateway backed out of their scheduled presentation earlier in the week, Ford Bond, a local photographer and computer person, agreed to fill in. And fill in he did, giving us a very good presentation on digital photography.

He brought with him two of his cameras, both Nikon digital cameras. One was a high end consumer model (a little over $1,000) and the other was a professional model. If I remember correctly, he described this professional model as being on the low end of such cameras, costing slightly less than $5,000 for the back alone, although it did have the advantage of using all of the regular Nikon SLR lenses.

He provided a run down on the advantages and disadvantages of both cameras—the only disadvantage of the more expensive model being its price. Along with this, we learned a bit about digital photography in general. For example, you can do more with an underexposed photo than with an overexposed one.

To display the quality of results that can be achieved with a professional digital camera, he passed around a number of prints made from his digital images. At this point he described the various printers he used to produce the photos which he had printed himself.

The next topic was a discussion of how he modifies digital photos by opening the digital file in Adobe PhotoShop, where he can “fine tune” the photos.

Finally, he took us to his web site where he has, among other things, examples of his panoramic photography. Actually we only visited a duplicate of his web site that was on his laptop. However, you can visit the real site at http://www.computer-doc.net.

As an amateur photographer, I found the presentation very valuable. ◆

The Canon G-1 Digital Camera

By Wade Herman, Tampa PC Users Group
wherman1@tampabay.rr.com

Ever since I became interested in Adobe PhotoShop, I have had an increasing itch between the eyes for a high quality Digital Still Camera. I have been able to repress that urge because I have a Digital Video Camera that does an excellent job at TV resolution (640/480). Recently a close friend began seriously considering the purchase of a Digital Camera, with the excuse that he had to replace his Nikon film camera lost in a recent move, so he could take pictures of his granddaughter. So in keeping with current mindset that every dumb thing we do is someone else's fault, it is his fault that I purchased this object. My law firm, Dewy Cheatham and Howe, says I should sue.

This is not a camera that should be considered by everyone. If you have been pleased with the results of your Instamatic, read no further. The G-1 is Canon's latest 3.3 Mega Pixel Camera under $1,000, yes a whole $1.00 under.

Now for some of the justifications and excuses for the purchase:

I WANT IT, not withstanding that I know next year an equivalent object will be cheaper and maybe even better. I may have a heart attack and die without one, so what the H---. My friend bought one, keeping up with the Joneses. Look at all the money I will save on film; after all I took two rolls last year. Holiday photo opportunities are coming, so buy now or wait until next year to buy.

Now for some real reasons for a Digital Camera:

I can snap away without consideration of the cost of each picture. The main difference between snap-shooters and professional photographers is the number of pictures they take. It is easier to throw away all the bad ones, as they did not cost anything. With a program such as PhotoShop, I can do everything that formerly required an expensive dark room and all of those costly and smelly chemicals. If I make a mistake it is only my time that is lost. What you can do is limited only by your creative ability. I can save the good ones to CD ROM and preserve them for future generations. I currently have thousands of pictures that have suffered greatly from deterioration with time. No more box upon box of pictures and slides. I can easily share those special moments with family and friends via the Web. With high quality Digital Pictures I can make high quality enlargements of those occasional outstanding shots. This is the main reason for having an expensive SLR instead of an Instamatic.

Now my reasons for purchasing the Canon G-1:

It was the first camera I have seen that meets most of my desires for features. Its 3.3 Mega Pixels produces an image that is photo quality at 8" by 10". It will accept both standard compact Flash Card and the IBM 340 MB postage stamp size hard drive. Each image in highest quality uncompressed is over 2 MB. It has a 3 to 1 zoom ratio, wish it were greater. In addition to the standard Point & Shoot Mode it has all of the creative Modes one could wish for, including Shutter Speed and Aperture Priority, settable exposure compensation, 3 shot programmable bracketing and much more. In spite of the plethora of features it is quite user friendly with a little practice and careful reading of the manual. It has both an optical and LCD View Finder. I especially like the fact that the LCD normally rests screen side against the camera to protect it and folds out and rotates for creative low and high shots. I am getting too old to flop down on the floor to get kids or animals at their eye level. I still gag at most of the baby, look down, shots. The LCD View Finder also rotates 180 degrees and, with the wireless remote control, allows the photographer to compose and take the family photo and be included in it. I was impressed by the almost unanimous rave reviews, and so far the camera lives up to those accolades.

Naturally there are a few things I wish it had:

A larger zoom ratio, with a little more on the wide end would be nice, as would image stabilization. A faster lens for better low light performance without flash. But then would I want to tote around all that extra glass. One of my Nikon Zoom lenses weighs several times the whole G-1 and is several times larger. Zebra Stripe, which puts stripes in the LCD viewfinder areas that are over exposed. This is a cool feature of my Camcorder, as correct exposure using the LCD View Finder is almost impossible. The G-1 however includes programmable exposure compensation for bright or dark backgrounds and a 3 shot bracket mode. Remember the 2 extra shots cost nothing. The battery pack is a proprietary Li-Ion, so if the battery is dead you must wait for it to recharge instead of slipping in some Al-K-Line batteries, to catch the kid's first poop in the potty.

If you are in the market for a camera of this class, the Canon G-1 is a MUST CONSIDER.

I was fortunate to have missed Ford Bond's excellent demonstration of the Nikon professional Digital Camera at the last meeting. As a long time lover of Nikon cameras, I am afraid that the drool on my chin would have been mistaken for senility. ◆

Another Digital Camera: AOL DIGICAM

By Clark Evans, Tampa PC Users Group
CETrain320@aol.com

I have been wondering about digital cameras and how they work, and I have seen them in the price range of $200.00 up to $900.00. But I said to myself, you have two good regular cameras, a Canon EXEE SLR and a new Olympus Accura XB700 ZOOM. So I have been holding off getting a digital camera till the price comes down.

When AOL offered a digital camera for $59.95, I said here is a way to find out what digital cameras are all about without the wife getting mad at me. I ordered it, and it came in five days. I took some pictures around the house and at the ham radio station at the museum. On the front of the camera it says 320 x 240. What does this mean? If you make the pictures bigger than 2 inches by 3 inches, they start getting to look terrible. My son blew up a picture of him to an 8 by 10, and it was really bad looking.

My wife and I had a picture taken at EPCOT by a digital camera. It was a 5 by 8 that came out great. So the AOL DigiCam 320 x 240 is good if you want to send E-mail pictures and print pictures that are only 2 inches by 3 inches. If you want big pictures, you need to get the digital cameras that cost the big money. So you get what you pay for. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

Recording a RealAudio Stream I was sent a link to a RealAudio file the other day, and after playing it I decided I would like to have a "copy" of it. Well, when you play one of these streaming audio files, there is no copy of it left on your computer as there is for graphic images you view on the Internet. So what to do?

My first attempt was to start up the extend length sound recording I had written in Visual Basic, a download of which is available at http://lamartin.com. This differs from the Windows Sound Recorder in that the Windows Sound Recorder will only record for 60 seconds; my version will record for as long as you want. Unfortunately playing the RealAudio file on the Internet while running the sound recorder produced nothing. Next I tried a program I have called Acid Music from Sonic Music Foundry which not only allows you to record sound input to wave files, it also allows you to edit the files. Well, it also produced nothing.

Time to get inventive. I next connected the computer sound card's line-out plug to a cable running to the line-in plug of a tape recorder. I then started the tape machine recording and again played the RealAudio file on the internet. That produced a 7.5 minute audio tape that sounded as good as the broadcast.

To get the file back to my computer, I connected the cable from the line-out plug of the tape recorder to the line-in plug of the computer's sound card. Then I ran the Acid Music program and captured the tape output to a wave file on the computer. Since there had been approximately 20 seconds of dead air in the tape where the Internet transmission had to re-buffer (no data was lost, though), I used Acid Music to delete this dead air. The result was a 76 MB wave file that sounded just like the broadcast. Success!

But remembering our most recent meeting's presentation by Bruce Fries on MP3 files and how they were approximately one tenth the size of the equivalent wave file, I went on the Internet and got a freeware program called Simple MP3 from the ZDNet download center. I used it to convert this large wave file to a 2.6 MB MP3 file using a bit sampling rate or 96, which is listed as near CD quality. I then did the conversion again using a sampling rate of 64 (FM radio quality) and found this just as good as the broadcast quality with a file of only 1.7 MB.

The simple MP3 program is really two programs—a MP3 player and an encoder which will make MP3 files out of wave files and vice-versa.

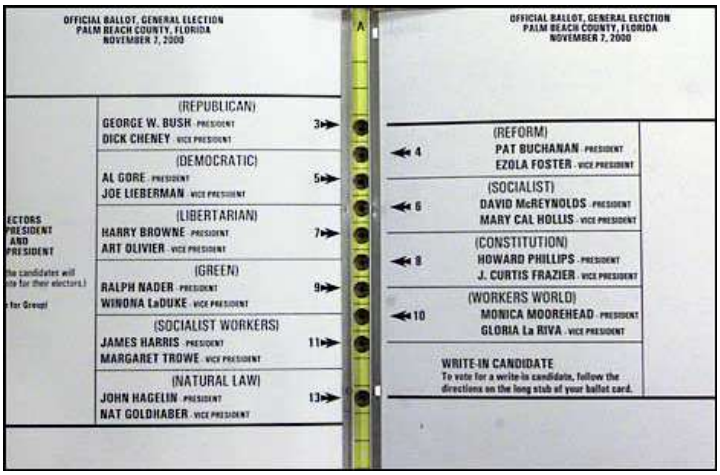
If anyone has a better or alternate way of capturing RealAudio audio broadcasts, I would be interested in hearing about it.

Invalid procedure call or argument is a message you don't want to see--especially if it occurs when you run some code that is the main component in a presentation you are to give in a couple of hours. But that is the way it is with computers.

The day before, I had prepared a presentation for our Visual Basic for Applications (VBA) SIG on my desktop computer. The next day I polished the code a little and then transferred the folder containing all the presentation material to my laptop. It is always a good idea to try such things out on the laptop to see if everything is OK. Well, this time it wasn't, and it was only two hours until meeting time. The VBA code would hang at a certain point and freeze Microsoft Access. Later I modified the code slightly and managed to avoid the freezing and instead got the above error, which was really no better in getting the presentation done. So at the presentation we worked around the problem by talking about it, trying to change the code to correct the problem, and running other code to fill out the meeting. The next day I reinstalled Office 97 on the laptop, and Access ap-

(Comments.....Continued on page 5)

(Comments……..Continued from page 4)



pears to be functioning properly there now. But for how long? How do these applications get corrupted?

VBA SIG What we do in this SIG is study code that allows us to automate processes in any of the Microsoft Office applications. What I wanted to display in the SIG was as follows. At any web site the server software keeps a record of everything that happens and stores it in a log file. There is specialized software that will download and analyze that log file, then present you with tables and graphs to help you see where the visitors to your site come from and what they are interested in--or not interested in. I own one such program called Virtual WebTrends, which cost around $80 as an Internet download. Its big brother WebTrends probably costs at least $400. It serves its purpose with nice tables and pretty graphs, but unfortunately it only displays the top 10 in each category--the top 10 visited pages at the site for instance. But I want to know what is going on with the other pages. So I really need to download the log file and analyze it myself.

The log file for the TPCUG site for September is around 4.5 MB. I have created a database to bring it into as a table containing the requisite fields and also the queries I need for the analysis--how many different user sessions each day, the number of visits to each page for the month, etc. There is only one problem. The log file contains what I would call page header lines all throughout the document. They need to be removed before I can import it into an Access table as a space delimited text file. To remove these unwanted lines throughout the document, I bring the document into Microsoft Word and run some VBA code I wrote that deletes these unwanted lines. I then have a space delimited file that can be imported into the data-

TPCUG Supports Microsoft Event

By Mike Hodges, Vice President, Tampa PC Users Group
mike.hodges@baesystems.com

On Saturday, November 4th, a live telecast from Microsoft's World Headquarters in Redmond, Washington was simultaneously screened at thirty locations, including the AMC Veterans 24 Movie Complex located on Anderson Road just north of Waters Avenue in the Town and Country area of Tampa. The occasion was the release of Microsoft's latest product, "Money 2001". This product is an updated release of Microsoft's personal finance management program that can help one track spending, make a personal budget, plan investment strategies and generally manage one's finances. Details on this product can be obtained at http://www.microsoft.com/money.

A number of Tampa Bay area PC user groups were invited to support the local screening and to promote their groups at each screening. Three local groups participated: the Clearwater based Tampa Bay PC users group, the Brandon based Greater Tampa PC users group and our own Tampa based TPCUG. The TPCUG was represented by Mary Sheridan and her daughter Michelle, Jenny Lind Olin, Bob LaFave, Bruce Register and myself. The local coordinator for Microsoft, working out of her Orlando office, was Mary Sue Cameron. Some 214 attendees were present to view the local screening. The majority came predominantly from Pinellas, but many had traveled from Manatee, Pasco, Polk and Hernando counties. We hope a number of new members will join our group from Hillsborough and surrounding counties.

Microsoft touted this as a "Microsoft Extreme Event" and had previously staged at least four other product releases in this manner, although never before in Tampa. The Clearwater PC users group had previously supported an event in Clearwater. I inspected the Microsoft web page devoted to the event on Friday November 2nd and saw that New York had over 900 people pre-registered for the New York screening. Most locations had one to five hundred pre-registered attendees. Each attendee received information concerning our group, a T-shirt and a CD providing a sixty day trial of the "Money 2001" program.

What was interesting to me was the technology involved to simultaneously telecast the promotion to 30 sites nationwide. The broadcast commenced locally at 1 PM, or 10 AM on the west coast. Is this the wave of the future? For two whole hours the local captive audience was mesmerized for a single commercial. I for one will want to do this again and I hate to watch regular network TV because of all those annoying commercial breaks, not that the PBS stations are much better with their sponsor promotions between programs. I for one have not jumped on the Time Warner bandwagon to get a cable modem as I find my $77 cable TV bill exorbitant already and do not wish to pay an extra $39 to receive RoadRunner Service. Yes, I have deluxe service with beautifully clear reception and the multimedia-streaming video-on-demand. At any time I can watch any one of a hundred just released movies, pause the transmission for a meal and resume watching exactly as if I was controlling a VCR. This article will reach our editor by means of my $21.95 AOL service, which it has recently bid to tie up with the Australian news group magnate owner of Time Warner, Rupert Murdoch.

What also struck me was that none of the Microsoft presenters appeared to be over 25. Everything was cool! Is this the wave of the future! The two hour tele-broadcast lost a little in resolution on the really big screen. To me the white noise was a little disconcerting. As my main function was to be the door greeter, I missed the introductions and started in twenty minutes after the start, but caught the full commercial impact of the "Extreme Event." I took a vacant seat on the front row of the upper tier next to the technician who was in control of the projector and the external feed. The theater I estimated could readily seat up to 300 attendees. The first up for me live from Redmond, who also had a local live audience, was an Austrian born Microsoft employee named Claudia Andrea or was it Andrea Claudia. Everything was cool and Andrea had a charming accent and a wonderful command of the English language and could really command her keyboard and mouse drags and clicks beautifully. In short order we witnessed "Encarta", "Encarta.com", a true reference resource, "Mid Town Madness II", a video driving game, and the video golf game, "Links 2001". Andrea then passed over the presentation to Microsoft's MSN Explorer product manager, Mike Nichols, who demonstrated many of the latest Explorer features, such as how to filter out SPAM, obtain free long distance voice phone calls, get MSN news for up to date election coverage and the good life in general.

Next up was Bill Nye who demonstrated Windows ME and how this product allowed one to snap save the entire operating system such that retrieval of a system status to a prior date and time of saving was readily possible. This is something I hope I will not need to do too often, but it is good to know that as a resort to sanity one can always go back in time. Since I had changed screen resolutions and switched between large and small fonts, I would have enjoyed this new operating system's save feature. Next up before the real finale came the Dutch born gamester, that is gamester, not gangster, John Degleman. John gets paid by Microsoft to play games all day and possibly all night! The products introduced included "About Games", "Sidewinder" and the really exciting features available utilizing "Voice Command and Control." With the "Game Voice" product, true gamesmanship can be enhanced by simultaneously chatting to your opponents as one plays over the Internet with a possible 64 simultaneous channels of communication. Finally some precious few remaining min-

FACUG Fall Conference 2000

By Mary Sheridan, President, TPCUG
mcpease@mindspring.com

The fall meeting of the Florida Association of Computer Users was held at the Sunlight Community Church, 477 SW Cashmere Blvd, Port St. Lucie, FL on October 14, 2000. The Tri-County Computer User Group sponsored the meeting. As usual, it was informative, well planned and a great benefit to user group leaders.

Registration and check in for the event began at 8:30 AM. A continental breakfast was available until 10:30. Larry Tyler welcomed us at 9:00 AM, and then everyone went to the round table session of his or her choice.

During the morning sessions, the Board of Directors met and discussed the past and future business of the organization. Lunch was Italian and just wonderful. There was tray after tray of lasagna, ziti, spaghetti and meatballs, plenty of fresh salad and loads of garlic bread. After the meal, I realized how reasonable the conference fee had been.

A short general meeting was held at 1:00 PM. Larry Tyler introduced the Board of Directors: himself as President; Hilda Frederico, vice president; Betty Shearer, Treasurer; Mary Sheridan, Secretary; Web Austin, Newsletter Editor, Murray Tiano, Dave Gerber and Bill McCabe. Bart Koslow has moved to California and will have to be replaced as the ninth board member for the upcoming year. Larry introduced Sharon Rump of the Venice Area UG. Sharon will replace Bart as the Webmaster. Larry also mentioned the importance of keeping all user group data current at the web site.

A Logo Contest will be held, chaired by Murray Tiano. There are hopes that Corel will sponsor the contest. The FACUG will also institute a Community Service Award. Betty Shearer will chair the award committee. The details of both these projects will be available on the web site.

Rose Lynn of the Gold Coast Mac UG announced that the APCUG membership dues were being waived if the user groups joined the APCUG through Rose. For further information you can contact Rose Lynn at roselynn@mac.com.

The Spring Conference 2001 of the FACUG will be held at the Kissimmee Civic Center in Kissimmee Florida. Larry has commitments from eight vendors. A new feature this spring will be Technical Sessions sponsored by Gene Barlow, Microsoft and Adobe. Larry explained that the Spring Conference is a big undertaking. He asked for help so the next conference can be as successful as the last spring conference was. Some of the needs are: panel leaders, round table leaders, and many volunteers. A task list will be posted on the FACUG web site.

The Polk UG in Lakeland will host the Fall Conference 2001. Bob Read, the President of the Polk UG asked the attendance at the current conference. There were 62 attendees representing 18 User Groups.

Larry Tyler introduced Betty Shearer and Tom Chambery as the coordinators of the Fall Conference 2000. Betty then introduces Bob Leonard, CEO of **www.out2.com**, the conference guest speaker. Bob's company is Florida's online Community Newspaper. Bob advises businesses to provide local information as well as advertising. To learn more check out the web site. Bob concluded his talk at 2:05 PM.

The afternoon round tables were followed by a panel discussion in the Sanctuary of the church at 2:50 PM The panelists were Bob Read, Rose Lynn, Betty Shearer and Larry Tyler. The topic was Community Service and Your Group. Items discussed were What is Community Service, How Can My Group Get Involved and the APCUG Jerry Awards. ◆

(Microsoft…….Continued from page 6)
utes were devoted to "Money 2001" and the improved import and archival features available. For these features and others the Microsoft web site tells all and sells this essential product at http://www.microsoft.com/money. If all this information was not enough for those present, our local Microsoft coordinator then introduced each of the local user group presidents and awarded 14 door prizes, including copies of many Microsoft products and three additional T-shirts. For me this was a most worthwhile products demonstration, and I hope to attend future "Microsoft Extreme Events"….. ◆

(Comments……Continued from page 5)
base.

I note that it is quite humbling to see after the analysis of the log file that the Editor's Comments are usually quite far down the list of pages ordered by the number of visits.

If you are really interested in Microsoft Office, you should consider learning Visual Basic for Applications. ◆

Run, Run DLL...

By Michael Hutchison, Tampa PC Users Group
myankee@ij.net

First, I will try to reconstruct the chronology of my problems with Win 98 SE shutdowns. This has proven to be a fairly persistent malady. I am hopeful that it has finally been corrected; however, there have been at least two such hopes already dashed on the rocks of computing reality.

This all started more or less out of the blue. I can't recall any installations or major crashes prior to the first time that an older machine just froze up after clicking on OK in the shutdown Dialog Box. The box would go away and the computer would thrash a little, all of the icons would leave the desktop and there we would sit just looking at the bare wallpaper. When you did a Ctrl-Alt-Del one culprit appeared in running programs/ files list box: RunDLL32. The only way out of this which I found effective was a touch of the Reset Button on the tower's case. After a reboot and the obligatory Scandisk tour ("because Windows was not properly shut down….."), the machine was typically good to go for 5-6 sessions before this occurred again. Since RunDLL32.exe kept turning up as the file that was not responding, I kept thinking that it was corrupted or had been switched for a newer or older version, etc. After predictable reading and webbing, I invoked the System File Checker. SFC said I had numerous files which had been changed or updated including more than one DLL; none of them were RunDLL32. Other trails of possible solutions which were run across on the Web included:

- disabling the assignment of IRQ/s for USB.
- go to C:\Windows\System\MSCONFIG.exe and select the Advanced button and then disable the quick power down option.
- disable power management .
- right-click on My Computer, open Device Manager, click on the plus sign next to System Devices,double-click PCI Bus, select the IRQ Steering tab and remove the check mark beside "Get IRQ Table from Real Mode PCI BIOS 2.1 Call" Then restart the PC and have your Win 98 installation CD handy.
- in CMOS BIOS enable IRQ for VGA

Well, either I was in compliance with these suggestions or my gut told me that I was heading down a dead end on each of the preceding. Basically, I was still looking at RunDll32 as my prime suspect. So thought I, if the file is corrupted just pull a fresh copy of it off of the Win 98 CD. So I hit the Windows Key, Find, entered the file name and hit Enter. Nada. After some more research, a lucky stumble revealed that the file resides in Cabinet 46. More specifically the path to the file is: Win98_se\Win98\Win98_46. Having ascertained the location of the file, I then tried to extract it per the information in Microsoft Knowledge Base articles and got some sort of error message which eludes my memory at the moment. But I soon found that once you dig down to the file itself in Windows Explorer and select it, you then have in the File menu drop down an option to Extract right there. This being done, the machine was restarted and work proceeded. Before going any further I will list some Microsoft KB article numbers/titles which surfaced during this overall process.To Wit:

- Q129605 How to Extract Original Compressed Windows Files
- Q180465 Error Message: The File was Not Found. Verify…..
- Q231793 Corrupted Setupx.dll After Installing Windows 98 Second Edition
- Q192926 How to Perform Clean Boot Troubleshooting for Win 98
- Q239887 Availability of Windows 98 Second Edition Shutdown Supplement

In truth, Microsoft does put out a lot of information about their product even if much of the info needs the three letter prefix "mis" attached. At this point I thought I had accomplished something and maybe this little fracus was over. This proved to be False Hope #1. After following the pattern that had been established in terms of number of normal work sessions, the machine again froze and named RunDll32 as No-Respondent. I then turned my attention to the last of the Knowledge Base articles listed above. Following the directions, I downloaded and installed the Shutdown Supplement as outlined in Q239887. It prompted me to do a restart so that the changes could take effect. OK, let it rip. The machine froze on the restart. False Hope #2. What followed was a lot of frenetic and extremely feral casting of allegations about the lineage of various industry personalities and a forced landing of the system for additional musing. However, at the next opportunity (translate: at the next juncture where I had time *and* had just done the manual Reset), I downloaded the supplement again, installed it again and was prepared for a prompt to Restart the computer. This was not forthcoming. So I then went in through the Start-Shut Down route and restarted the machine and so far so good. On the second or third shutdown after this last attempted fix I noticed a hesitation but after some more churning, it did go ahead and perform the ShutDown normally.

Bottom Line: What I "learned"was more or less corollary to the circumstances at hand, but if it holds up we'll take it.

Onward through the Fog. ◆

Free for the Holidays

By Larry Anders, Librarian, Tampa PC Users Group
larryanders@msn.com

Well, it's that time of the year again when we've probably spent more than we should (or soon will have) on Christmas gifts, so I thought it was time for one of my "freebie" articles. One of the only computer magazines I still subscribe to is PCMagazine, published by Ziff Davis. It is still dedicated to the PC user and hasn't converted to some type of business magazine that deals primarily with e-commerce. PCMagazine is still about computing and it is published about every two weeks so it's very current with what's going on in the industry.

But, enough about PCMagazine, that's not what this article is about. When I got my most recent issue it reminded me that I hadn't been to http://www.pcmag.com lately, so off I went. I clicked a few links and wound up in the software section and **voilà!**, there was this list of a bunch of free downloads… and you know how I like free stuff!
http://www.zdnet.com/pcmag/filters/downloads/

A little ways down the page there is a link to ***Ten cool -- free! -- tools for your system tray***. Here's what I found:

Tray Command Line - Tray Command Line is a free tool that gives you instant access to a small command-line window, just by clicking on its system tray icon. The utility keeps a history list of past commands, can be loaded automatically each time Windows starts, and can be hidden whenever a command is executed. You can assign program/edit aliases and easily insert file arguments into a command line. With the AutoComplete option turned on, Tray Command Line auto-guesses the commands you try to enter, plus you can specify a hotkey to execute the last program entered in the dialog window. Tray Command Line doesn't quite give you all the freedom of working at an MS-DOS prompt, but its benefits more than make up for its minor shortcomings.

FastOpen - FastOpen is a free, tray-based menu system that's incredibly easy to use and offers a great alternative to the Windows Start Menu. Use it to launch your favorite programs, documents, Web sites, and folders from its left-click menu. Arrange your menu entries in any order you wish and add separators to organize items into logical groups. You can even play a different sound when each item is launched.

Wallpaper Changer - Staring at the same desktop background everyday because it's too much of a bother to change it? Wallpaper Changer will add variety to your screen with virtually no fuss. This versatile tray-based freebie supports . bmp, .gif, and .jpg images from any combination of folders, random wallpaper selection, and automated changing of wallpaper on every startup, once a day, or at regular intervals -- even as often as once a minute. Have it tile, center, or resize background graphics to full-screen. Plus, you can build, save, and reload multiple sets of wallpaper images. Another nice feature: Wallpaper Changer can give the captions of your desktop icons a transparent background so that more of your wallpaper shows through. The program automatically analyzes wallpaper images and determines the best matching background and the most readable icon caption color.

Free Disk Space - Free Disk Space resides in your system tray and monitors the amount of free disk space on all of your hard drives. Double-click the icon to invoke an attractive dialog that graphically displays total and free space for each drive. You can also set an alarm that provides notification when free space falls below a certain level. Just set the available slider control to determine the alarm level. Other features include configurable display and refresh times, and historical data display. This utility is easy to use and best of all -- it's free!

TclockEx - TClockEx is an excellent utility that hooks into the system tray clock to let you see a lot more than just the current time. You can display the date and/or the time -- with seconds -- in variety of formats and in the order you wish. Customize the colors, font used, tooltip format, mouse actions, and more. Other neat features include memory/CPU usage monitoring, a pop-up calendar, and a copy-to-Clipboard option. Until Microsoft wises up and makes the tray clock in Windows this versatile, we're glad TClockEx is around -- and we're especially thankful that it's freeware.

Exits 95/98 - Exits 95/98 is a free system tray-based utility that gives you several ways to get out of Windows 95 or 98 quickly. Its options are accessed through its icon's right-click menu. You can elect to shut down, reboot, restart, exit to DOS, log off, activate your screen saver, standby, power-off, force exit, eject removable media, use hotkey, use three types of timed exits, and/or exit on single click. The selected method is displayed in the icon's tool tip. Exits 95/98 also supports several command-line switches. It's very small and doesn't require MFC, VB, or any other runtime library -- just the executable and a tiny included .dll file. A Windows NT version is also available here.

Push The Freakin' Button! - Pesky dialog boxes giving you trouble? Check out Push The Freakin' Button (PTFB)! This free tray-based utility waits for specified dialog boxes to pop up, then automatically presses the button you've configured. So when a dialog causes irritation, you simply tell PTFB which button should be pressed, and it will handle the dialog in the future. Although it doesn't work with all dialog box buttons (we had problems with apps written in Visual Basic and Delphi), PTFB should work with most programs programmed

(Free…….Continued from page 9)
in C++ (such as Windows and its applets) and America Online. It offers a clean, drag-and-drop interface for adding buttons to the "hit-list," with plenty of options provided. Buttons are pushed only once per appearance, so you don't have to worry about a pressing frenzy if the button doesn't dismiss the dialog for some reason. One thing's for sure: PTFB can make life in Windows a lot easier.

Yankee Clipper Plus - Yankee Clipper Plus saves and can even print the past text contents of your Windows Clipboard as you routinely replace it. It stays minimized as an icon in your system tray. A click brings a listing, starting with the most recent clip, of the first line of past Clipboard content. A double click returns any entry to the Clipboard for your repeat use. A second window shows the current contents of the Clipboard and can be scrolled for a complete review. The system can store multiple sets of text collections and retain Clipboard history between sessions. It's a convenient way to retrieve text clips that have been overwritten and can handle text clips too large for even the program to display. Unfortunately, it's not particularly intuitive in use (and the help isn't of much assistance), but it's free and certain to add flexibility to your Clipboard.

WinSpace Light - WinSpace Light lets you create numerous virtual desktops, which give you the effect of having several monitors working at once. (The program does support multiple "real" monitors under Windows 98, though.) This lets you have more applications open at once, with the windows on each program larger than you'd normally run them. You can easily switch between desktops (or "panes") using the system tray-based window manager. We really liked the Elephant Windows feature, which lets you make individual windows larger than your computer's monitor, which gives you unlimited space to display information in one window. Using the Free-Scroll function, you'll be able to scroll inside of one application just by moving the mouse to the edge of your screen. This Light version of WinSpace is free but has a handful of minor limitations. A Professional version with more features is available from the developer.

Hotkeys (Broeze) - Give your poor mouse a break with Hotkeys. This excellent -- and free -- system tray-based utility is similar to the Microsoft Intellitype software, in that it gives you fast and easy access to a lot of common Windows 95 elements through keyboard shortcuts. Hotkeys does this and a lot more. Use it to define hotkeys to launch applications such as Control Panel applets or frequently used programs; send keystrokes to other applications; exit Windows, log off Windows, or reboot your computer; and quickly access some of Hotkeys' internal functions such as its editor or list. Hotkeys also has multiple hotkey commands (useful for scripting actions) and virtual clipboards that allows you to use a virtually unlimited amount of clipboards. Hotkeys works with nearly every key on your keyboard, including that seldom-used Windows key. Delphi 3.0 source code is included.

Some of these could even make a good gift for your fellow computer user buddy who's not geekish enough to know you downloaded these programs for free. But hey! It's the thought that counts, right? Or, just get these utilities for yourself. You deserve a break for all the shopping you've done for everyone else.

President's Message

By Mary Sheridan, President, Tampa PC Users Group
mcpease@mindspring.com

At the close of the year 2000, having survived all of the "disasters", we can approach 2001 with a greater sense of security. I haven't heard any reports that the world will end in 2001, but I guess you never know.

My run for president was a tough battle, but having been re-elected, it was worth it. Wouldn't it be fun to have two people running for the same office?

I'm having a wonderful time as your president but I fully intend to find some capable person to replace me for 2002. I think the group needs fresh ideas and fresh faces. Anyone who has been toying with the idea of getting more involved, PLEASE, let me know.

Our Christmas party was a success. Due to the generosity of those attending, we had plenty of great food and thousands of calories for those of us trying to "bulk up" (giggle). I hope no one thinks the annual party is a waste of time. Everyone who attends acts like they are happy for the chance to just talk to each other and exchange ideas. If you'd rather we didn't have the party, I do care about the feelings of everyone in the group. Email me (mcpease@mindspring.com) and tell me what you think.

(President.....Continued on page 2)

Minutes of the December Meeting

By Jim Weber, Tampa PC Users Group
jlweber9@mindspring.com

This month we had our annual Christmas Party in lieu of a full meeting. The only business conducted was an election of officers. Since we all ran unopposed, election was unanimous. (No need for a recount.)

Merry Christmas and Happy Holidays to all of you.

Jim Weber ◆

(President……..Continued from page 1)

My focus for the upcoming year will be to try to have more interesting topics at our meetings. I could use suggestions on the programs you use and what kinds of things you'd be interested in hearing about. I'm in a rut at home because today my computer is working fine. That makes me want to leave it alone and not add or subtract any programs. And we all know, that's no fun.

By the way, I finally upgraded to Windows Millennium. It's not much of a change. The "find" feature is now the "search" feature. Some change, huh? I was hoping for a faster boot, but I upgraded instead of doing a 'clean' install and it boots as slow as ever. I'm not unhappy with it; I just don't really see the point of the upgrade.

I hope everyone had a very nice holiday and I wish you all great prosperity in the New Year. ◆

For the month of December 2000, our site http://www/tpcug.org had:

- An average of 209 user sessions per day
- An average user session length of almost 17 minutes
- An average of 439 page views per day
- 5 PM EST the most active and 7 AM EST the least active

The HP ScanJet5370 Cse

By William LaMartin, Editor,
Tampa PC Users Group
lamartin@tampabay.rr.com

There is a new scanner in our house—thanks to my mother-in-law. Why might she be interested in my having a third scanner? Well, she just happens to have a lot of old, very large negatives floating around her house, and the HP 5370C series flatbed scanners come with a transparency adapter good for scanning in transparencies, photographic negatives or photographic slides up to 5" x 5" in size.

I have had an HP IIcx flatbed scanner for many years. And it has really been a workhorse for me. I think I have had it for at least seven years. It has been extremely reliable and does fast scans of standard pages of up to 14" in length. It does a good job on photographs, and, coupled with TextBridge Pro's OCR software, I have converted a lot of printed text to digital text. It has a 400 dpi optical resolution and does its scans quite fast with no warm up of the light.

HP ScanJet 5370 Cse Scanner with transparency adapter and large template

But the IIcx cannot scan negatives. That is why my son added an HP PhotoSmart photo scanner to my collection several years back. It will scan 35 mm negatives and slides at an optical resolution of 2400 ppi (pixels per inch), and the results are quite good. It also scans regular photographs up to 5" x 7" at an optical resolution of 300 ppi. I think here we can equate ppi with dpi. So it would be better to scan a photograph using the IIcx; however, if you have a negative for the photo available, the results of using the negative scanner instead of scanning the photo itself in either scanner is superior. So I always scan a negative instead of a photo when I can.

Unfortunately the HP PhotoSmart scanner will not scan negatives larger than 35 mm, and I have a lot of 6 cm x 7 cm and larger negatives. That is where the new scanner comes in. Using the transparency adapter displayed in the photo above, I can scan these negatives at 1200 dpi (I don't know why HP keeps going back and forth between dpi and ppi in their specifications). It would be nice to be able to scan them at 2400 dpi, but since they are so large, the 1200 dpi scan of one of them contains more information than would a 2400 dpi scan of a 35 mm negative of the same subject.

But what about a comparison of using the PhotoSmart photographic scanner versus the 5370C with transparency adapter for either 35 mm slides or negatives? I did the comparison, and the PhotoSmart scanner is superior. I assume for the simple reason that scanning at 2400 dpi will give sharper results than will scanning at 1200 dpi. The color balance also seemed better with the HP PhotoSmart scanner.

But for an all in one scanner, I think the HP 5370 Cse is a real good buy. You get 1200 dpi flatbed scanning for documents and photos with the addition of respectable—although not top notch—scanning of slides and negatives. I think, however, that the average individual will be quite content with the quality of the negative and slide scans that it produces.

The HP 5370 also provides for one button scanning by allowing you to scan by simply pressing one of four buttons on the front of the scanner. There is a button to scan directly to your email program, your printer, your fax program or to your scanning software. A warning, though: If you are installing the scanner on a Windows Me computer, you will need to go to the HP site and download a small patch to make the buttons work.

Personally, I prefer to scan from the HP ScanJet software. And if you are going to use the transparency adapter you will have to use the software. Additional features include the ability to scan a document to text, which means that the HP software contains an optical character recognition (OCR) module. If the document is of good quality, like a page printed by a laser printer, then I found the text was recognized fairly well but not as well as by my standalone OCR program TextBridge Pro. However, for a small amount of OCR work on good quality documents, the included option should be sufficient. I acquired the article from the 1989 Bits of Blue reproduced in this issue using Text capture of the 5370 scanner.

The scanner costs $300 at the local CompUSA store, and for an additional $200 list you can get an automatic document feeder. The scanner can be connected to the computer with either a parallel printer port connection or by a USB connection. I like the USB connection. Additionally with the USB connection it should be easy to move the scanner between different computers.

In addition to the HP PrecisionScan Pro software, you also get

- Corel Print Office 2000
- Boomerang Internet Design Shop Gold
- eFax Messenger Plus
- Caere PageKeeper Standard

New Optical Mouse

By Tim Condon, Tampa PC Users Group
tim@free-market.net

Okay, I have to admit it: My main home computer sits in a Very Dirty Room. Sure, I've got a way-cool cable Internet connection. And I'm thinking of adding a home local area network so the rest of us can log on to the Internet with our laptops. But guess who shares the room, our sun room out back, with the computer? Buddy, our 5-year-old Corgi. And, what's worse, he's got his own doggie-door so he can go out, roll in the dirt, bark at the squirrels, roll in the dirt some more, and then come back in and roll around on the furniture to get rid of all that dirt. Not to mention shedding, shedding, shedding from his thick doggie fur coat.

All of which has no doubt got you wondering…what does all this have to do with computers, software, and the TPCUG Newsletter? Good question, and here's the answer. Think one word: Computer mouse. Then think two words: Little rolling ball. Then let's make a stretch and think **three** words: Try cleaning that thing!

Yes, this article, such as it is, is all about my new computer mouse. Specifically, my new computer mouse with "no moving parts." You know those little spinning rods and that little Teflon roller inside your mouse? The ones that get "coated" (heh) with dog hair, dust motes, little pieces of string, and JPD ("just plain dirt")? Well if you think **you** have periodic problems cleaning the things…think of what kind of problem I have, sharing that room with Buddy!

So…let's look for a solution. A trackball! **Not!** Why? Because the way those things work, using your **thumb** instead of your **wrist**, and then trying to twiddle your fingers this way and that while spinning that ball with your thumb…is just plain **perverse**, if not awfully confusing (it is to me, at least, but then it may be that I'm just not all that well coordinated).

So what to do. Over the last few years I've always wondered why they couldn't take that great trackball-optical-thingie-with-no-moving-parts technology, and apply it to a good old-fashioned, normal mouse, one that slides around on a mouse pad and works the way the almighty intended it to…only with no moving parts.

Well, **viola** (not "voila," we're in America now). What do my wondering, wandering eyes see during an entertainment outing last week at CompUSA? Why, none other than a Kensington Mouse-in-a-Box Optical Pro with no mouseball, and no moving parts to clean. Say Halleujah! Not only that, but the furry little sucker was only $20. Well, hell; I said to myself right then and there: "Self, for that amount I'll take a flyer and see if it really works as advertised."

It's a pretty little thing. Butttons all over. And no big ball rolling and grinding around on the bottom. Actually, it's true like they say, "no moving parts." Got a pretty red light coming out of the bottom, aka an optical laser. And to make it more stylish, the same pretty red laser light comes out of the back on top of the mouse too, so you can roll it around and see the red light moving around in the dark (at least that's what I figure they had in mind).

Now, the propaganda that comes with the mouse says that it "will glide easily over almost any surface." I tried that out on a table-top with no mouse pad. And it's true, it did "glide easily." However, the pointer on the computer screen didn't glide so easily around on the monitor. No problemo. Just stick with a mouse pad, and all is/was well.

And if you're in to cheap entertainment, you can spend some time gazing into the innards of the Optical Pro mouse, because the bottom of the thing is translucent plastic. As Kensington says in the instructions: "Take another look: you can see right into the mouse interior through the cool blue translucent bottom." Oooookay…if they say so. Fact is, it works perfectly, and I haven't had a speck of trouble from it in the, oh, two weeks I've been using it. Also, getting set up is nothing: The Kensington MouseWorks software that comes with the thing installs off of either a CD-ROM or a 3 ½ inch floppy (both are supplied) in a snap.

One other thing, however. While I do believe that optical mice are going to totally wipe out the old roller-ball things, I don't unreservedly recommend this particular mouse. Kensington is to be congratulated for being the firstest and cheapest with the mostest. However, there are other optical mice out there (go look, you'll see 'em); the problem is that they're more expensive, starting out at $30 or $35 or more, and heading north.

So why not just stick with Kensington? I probably will, but you need to know about a small irritation: The mouse has a thumb-button on the left side, and a button over on the right side that I guess you're supposed to stab at with your right ring-finger, along with the regular two mouse buttons on the top bracketing a scroll wheel. The problem is that button over on the right. I'm used to picking the mouse up and moving it because of limited desk space. You know, to get the cursor to go here or there on the screen. The problem on the Kensington is that I keep accidentally hitting those side buttons as I

(Mouse.....Continued on page 5)

(Mouse…….Continued from page 4)

grasp and pick the mouse up to move it. Irritation, yes. Disqualifying? Not at all. I'll keep it.

So for those of you who want to stop wrestling periodically with those little spinning rods and that big ball on the bottom of your mouses…it's time to Go Optical. Check out the Kensington Mouse-in-a-Box Optical Pro.

For only $20 you can't beat it with a stick. Why you'd **want** to hit it with a stick is beyond me. Heck, I can see beating the old **roller-ball** mouses with a stick, they get so gummed and messed up inside. But the Opti Pro? **Not!** Try it! You may like it! And if not…you can feed it to the cat.

Maxtor DiamondMax™ ATA/100 Hard Drive — As good as it gets

By Fredrick Rea O'Keefe
fredrick@tech-center.com

UP FRONT SUMMARY:

- Product – DiamondMax™ Plus 45 GB hard drive kit, Model #54610H6
- Manufacturer – Maxtor®
- Website: http://www.maxtor.com/Maxtorhome.htm
- Class – Hardware, part
- PC requirements – Available PCI slot, Ultra-DMA capable system, Pentium-class processor. MaxBlast™ Plus software comes on 1 diskette. If HD capacity is < 32 GB, requires a full installation of Windows 95 or higher; >32 GB requires full installation of Windows 98 or higher.
- Cable Requirements: An 80-Wire UDMA Interface Cable is required for all UDMA/100 & UDMA/66 hard drives. (Recommended for UDMA/33, too.) Cable comes with both the drive and the card.
- Used with Maxtor Ultra ATA/100 PCI Adapter Card for UDMA 100/66/33 devices.
- Street price – varies, if you can find it in stock. I paid $180 at Staples, $50 for the card.
- Rating (0-10) - 10

Recommendation – This makes a big difference in performance and the price is most reasonable – if you need a hard drive and your PC meets the requirements, a lesser drive would not be the thrifty choice..

KEY FEATURES:

- Fast ATA/Enhanced IDE compatible
- Digital Signal Processor (DSP)-Based Architecture
- Ultra ATA/100 Data Transfer Rate
- 2 MB SDRAM Cache Buffer
- 7200 RPM
- DualWave™ twin processors
- <8.7 ms average seek time
- Up to 100 MB/sec data flow rate

(To skip the verbiage, jump to the table at the end.)

All right, that kind of detail appeals to techies. It even appeals to me, when comparing products into which to sink my hard-earned dollars. 45 GB in a 3 ½", 1.3 lb. package. Remarkable how technology developed by hard drive manufacturers packs more, more reliably, into ever smaller packages. Happily, the marriage of Maxtor and Quantum has brought the fastest drives to market at a reasonable price. I am impressed with the performance.

Usually I review books and software, so why hardware? Despite partitioning my old hard drive, using Microsoft's DriveSpace 3 compression, I ran out of room. Believe me, you don't want to run short of hard drive space. When Windows doesn't have enough resources, including room for data, temp files and swap space, disaster awaits.

My ordeal began when Windows 98 Explorer got bollixed up. Windows refused to boot, and Windows wouldn't reinstall. DOS was useless, although I did manage to delete enough files to give me back enough room on the HD to supposedly be able to reinstall Win98. Nope. After several attempts to repair or re-load, the SR-1 upgrade CDs refused to try again. (Why did I donate my original Windows software?) None of my local suppliers had or could get the Maxtor ULTRA ATA/100 drives. Mail order vendors either never heard of them, or couldn't get them. Maxtor's regional rep couldn't help other than to suggest that the drives weren't released yet, but "try Tech Data". No luck.

My aggravation and lost time depleted my patience. Off to the new, nearby Staples. They didn't have the hard drives in stock or in their catalog, and couldn't help, even through their regional Staples Direct® sales rep. But, the store had Windows ME ($180 full version) and Norton SystemWorks™ 2001. (Seems that Windows 98 is an antique, no longer stocked.) Hating to shell out the money, I was in need. How could I function without the damned computer?! So, maybe a miracle could occur.

Forget it. Regardless of DOS-deleting much more data and programs from the HD, WinME refused to recognize that there was valid Windows somewhere, somehow on the old drive. Nor could I free up quite enough space for an install. The old Windows was causing problems. Time to buy some kind of hard drive to get me through. Back to Staples – convenience was the goal. I was getting worn down.

At the sales counter, what did my eyes focus on? Eureka!!! Both the Maxtor hard drive of my dreams, and the PCI adapter card to go with it! Perhaps I had paid enough for my sins? $180 for the hard drive kit, complete with software and the required 80-wire UDMA cable, and $50 for the Ultra ATA/100 adapter card. Paying, with relief, despite the sales people having their own involved and lengthy PC/cash register problems, I rushed home (never exceeding the speed limit, naturally). I knew my troubles (might be) were over.

My fine, 5 year old ASUS mother board supports a PCI Bus Master EIDE controller with PIO Mode 3 & 4, and DMA Mode 2, with an Award BIOS (Does that sound promising? What the heck – at this point, it's gonna work or I'll have a new PC!).

Installing the drive and the controller was very easy. My PC has a full tower case. I decided to set the old drive as the slave on the new controller, and for once there was enough cable length

(Maxtor……Continued on page 7)

(Maxtor…….Continued from page 6)

for attaching readily to both drives. What could I lose?

A delay - back on the road to buy a "Y" connector for the power leads. (I am now well known at Staples. In this case, familiarity bred contentment.)

Now I was ready to finish the mechanical part of the installation. But here I had a “confusement.” The HD instructions say to install the controller software first. Unfortunately, the controller's instructions indicate installing the hard drive software first. The latter "automatically" (I know you've heard that before) formats the HD and gets it ready for recognition. I chose trying the HD software first. A few choices to configure the system, including drive recognition (perfect), which drives were to be assigned as master and slave, and how to partition the Maxtor were clearly presented. (I didn't need Windows for this.) The software ran so fast that I thought nothing useful had happened. A lengthy scrubbing, partitioning and formatting of the drive were what I expected, as always in the past. I twiddled around a bit, but was left wondering. At least the software offered to transfer any or all data from the old drive to the new one. Great – everything went except the compressed partition data.

So, the card software was next. Again, fast setup seemed too speedy and effortless. Nothing works that well for me. Apparently the drive was preformatted, and because I accepted the recommended FAT 32, single 46 GB partition, little needed doing. Wondrous, as I later discovered.

Straight away, the real test – would Windows ME install? Would my data be recoverable on the slave drive?

Windows installed effortlessly, recognizing all the attached hardware. However, a message let me know the bad news. Something like, "It appears you have a compressed partition - Drive D. Tough luck, WME doesn't support or recognize DriveSpace compression." Searching the CD shows a DriveSpace.exe program, but that works only for floppy diskettes. Drat! Nowhere on the Internet or on the old Win98 CDs could I find DriveSpace. (After a couple of days, I decided to jettison all the data not already backed up, and FDISKed D:. Anything not on the back up tape is tough luck for me, legal records and all.). Enough with frustration.

I lost all of the data in the compressed partition, and much of my Outlook/Outlook Express data, and the Address Book got scrambled. But I am in operation again, and satisfied, even delighted with the new hardware. Here's why.

Comparing the performance of the original Western Digital Caviar™ 32500 2.5 GB HD, plugged into the motherboard controller, with the same drive plugged into the ATA/100 controller, versus the new Maxtor HD on the ATA/100 controller shows these results from SpinRite 5 benchmarking: (7.542 microsecond. is the measured system overhead)

Test	WD direct to motherboard	WD through Maxtor® card	% improvement	Maxtor HD & card	% improvement
random sector access (msec)	17.678	18.079	-2.27	12.412	29.79
sector velocity (MB/sec)	41,068	40,157	-2.22	989,223	2,308.74
burst tx rate (b/sec)	714,418	9,952,183	1,293.05	12,613,525	1,665.57
sustained tx rate (b/sec)	2,203,056	7,333,709	322.89	30,675,957	1,292.43

Burst transfer rate measures transfer of data already in the HD buffer out to the system. This is the maximum rate that data can flow from the HD buffer.

Sustained transfer rate measures transfer of data from the disk surfaces through the buffer out to the system. This is the maximum rate that data can flow from the physical platters.

Summary: This super quiet HD with the ATA/100 card shows an easily observable increase in throughput (i.e., a much shorter time for accessing data). Hard drive operations which previously took a minute or so now take less than 5 seconds. Nowadays, the big slow down on my machine is the motherboard and the bus. The 200 MHz Pentium® II is holding me back!

As ever, wishing you safe and enjoyable computing. Rick O’Keefe ◆ *Copyright © 2000 by the author, all rights reserved*

Canon Power Shot G1 Digital Camera — A Second Opinion

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

Last month TPCUG member Wade Herman wrote about his new Canon G1 digital camera. He had a lot of nice things to say and only a few small items that he wished Canon had included but didn't. The main thing he would have liked would be more zoom in the zoom lens. The G1 has an optical 3 power zoom.

Now that we have a G1 in our family, I, too, would like a larger zoom ratio. I would also like to be able to focus closer in macro mode for better close up photography—but perhaps we are asking too much of one lens and should be happy with the quite good quality of photos produced by this camera.

I can thank my wife for the camera, since after reading Wade's article she suggested that instead of separate gifts we get the G1 for both of us. I certainly couldn't turn down an offer like that. Wade brought his camera over, and I tried out about 20 shots with it, he downloaded them to his computer and sent them to me via email (for which a cable modem is handy). Using a setting of medium resolution and medium quality compression, the images were quite good. So then it was only a matter of how to get the camera before Christmas.

With less than a week to go, since Amazon is supposed to give us 5% on orders through the TPCUG web site, I checked Amazon and they had the camera for $900 (a bit less than when Wade bought his from a camera store), shipping in 2 to 3 days. Since the camera comes with only a 16 MB compact flash memory card, we also ordered a 48 MB memory card at the good price of $93. Then the wait began. The flash memory came in two days, but the Amazon site kept saying the camera was in stock and usually ships in 2 – 3 days. It finally did ship and arrived the Friday before Christmas. The only let down was that Amazon restricts its "commissions" on orders to a maximum of $10 except on books. So the TPCUG got $10 for the camera instead of the expected $45.

Horse at Three D Farm in Riverview, Florida

Of course, the camera couldn't be opened until Christmas. Since then we have taken over 160 photos in five days. As Wade pointed out, one advantage of a digital camera is that you can simply delete the photos that you don't like. At present I have deleted 70 of the 160 and will undoubtedly delete many more.

(Canon G1……..Continued on page 9)

Panorama stitched together using PhotoStitch from five photos shot using the G1's stitch assist mode

(Canon G1……..Continued from page 8)

Now a word about the photos accompanying this article. The horse and holiday lights were taken at an image resolution of 2048 x 1536 pixels and saved as JPEG files with what Canon calls fine compression (In descending order there is RAW, i. e., no compression, superfine, fine and normal compression). The rabbit was taken at a resolution of 1024 x 768 and saved with fine compression. The panorama was taken at 2048 x 1563 resolution and saved with super fine compression. All except the holiday lights were taken in the auto mode, with the horse photo using the built in flash.

The holiday lights were taken in manual mode with an ISO setting of 100 (think film speed), a shutter speed of 1.6 seconds and an aperture of 3.5. All of this information and more being available to you when you view a photo in the Canon supplied ZoomBrowser EX. This camera is particularly handy for available light photos, since you can immediately see your potential shot in the LCD display and adjust the exposure time until you get the results you want. And then if you do take several shots at different exposures, you can discard the unwanted shots. I found an exposure time of from one second to 2.5 seconds with the ISO setting of 100 provided the exposure I wanted. Of course, a tripod was used for the nighttime shots.

I am particularly intrigued by the camera's ability when coupled with the supplied PhotoStitch software to make quite good panoramic photographs. If you carefully overlap your separate shots about 30%, then the PhotoStitch program does a fairly good job of automatically merging them into the panorama. However, for the best results you should use the manual align mode of the program, which is the method I employed for the backyard panorama. I used a tripod to do this

When viewed in color, this bunny look as if he needs a little red eye reduction, but what you see is his natural eye color

Holiday lights on S Boulevard, Tampa

panoramic shot. That is the reason for the uneven top and bottom borders—what should be a curved image is being projected onto a flat page. I could have cropped the final image, but I prefer to show more of the combined images.

In addition to the PhotoStitch software for making panoramic photos and the ZoomBrowser software that allows you to view the photos while they are in the camera, download them to computer, then organize and view them in the computer, Adobe PhotoShop LE is also supplied. Since I already have PhotoShop I didn't install this and can't detail the capabilities of the program.

The photos accompanying this article were brought into PhotoShop and reduced to a 1024 x 768 pixel size, then they were saved as JPEG images at what Adobe calls a level 3 (medium) quality file on a scale of 0 – 10. When I publish the HTML version of this newsletter at the TPCUG web site I will probably reduce the files even further to facilitate downloading. As an example of compression, the holiday lights 2048 x 1536 JPEG image as saved by the camera was 1,334 KB, which PhotoShop claims is equivalent to a 9 MB uncompressed file. But after reducing it to 1024 x 768 and saving it with level 3 compression, the resulting JPEG is only 162 KB This is possibly still a bit large for an image on an Internet page, and I will probably reduce it further for the HTML version of the article.

And that brings me to suggest that you go to http://www.tpcug.org and check out this article in the HTML version of the newsletter to be posted there. That way you will be able to better judge the camera's capabilities by viewing the photos in color.

For an excellent review of the camera with probably more de-

A Look Back In Time

From the September 1989 Bits of Blue

President's Podium

By Harvey Bruneau, President

EARLY RELEASE. WHO WINS.

Ever wonder why some companies seem to announce a product shipping date before it's completed. Generally it's to stay ahead or even with their competition. Whether it's hardware or software these vendors are hoping that their announcement will make you reconsider or postpone a decision to leave their product or purchase another vendor's similar product. This is called the freeze factor. They are betting that you will purchase their product sight unseen. Ever buy a house that way? Did you pick your spouse or significant other with a blindfold on? I didn't think so.

Software vendors are notorious for asking you to send in your upgrade money or purchase their current product now in order that you may be among the first to receive the new product when it ships. JUST SAY NO. Ask a dBase IV purchaser if he got his money's worth either by upgrading or 1st time purchase.

Many of the big boys COMPAQ, IBM, WORDPERFECT, MICROSOFT , LOTUS, BORLAND, ASHTON- TATE, FOX, 3COM and NOVELL, to mention a few, play the game. Unfortunately bigger does not mean better. For instance, ASHTON-TATE decided to ship a bug infested incomplete dBase IV 1.0 after missing more than one delivery date. This early product release has allowed ASHTON-TATE competitors to be winners at the expense of users. Of course now that word-of-mouth has gotten around, ASHTON-TATE is in deep trouble. A $19 million loss and over 200 employees terminated with no better outlook on the horizon.

WORDPERFECT has been dominant in word-processing for some time. MICROSOFT, in order to keep up, released its answer, WORD 5.0, in hope of surpassing WORDPERFECT. While WORD has some nice new features, the product has glitches. It has problems converting documents from the previous release of WORD. There are other problems related to hardware which have also surfaced. Once again the winner is the competition and the loser is the user. These bugs aren't as serious as ASHTON-TATE's but the product shouldn't have been released until corrected.

LOTUS did the right thing. Although around two years late and a loss in market share, Lotus 3.0 has hit the streets with favorable reviews. The jury is still out, but so far it looks like a good clean product. Users and LOTUS win.

There are many more stories like the ones above. The point is that the user generally gets the short end of the stick on early released products. The Japanese are getting more involved in software and hardware development. If our current vendors don't get their act together they could go the way of the American automobile industry by the year 2000. ◆

Friends of the User Group

Meeting

Digital Photography And Your Computer

February 14, 2001
6:00 PM
Museum of Science and Industry
4801 E Fowler Ave.

Meeting Preview: William LaMartin will give a presentation on Digital photography and the digital darkroom. As usual Mary Sheridan will conduct a computing and Windows discussion for the first 30 minutes of the meeting. Finally, we will raffle off a copy of QuickBooks Pro 2000 Accounting software.

President's Message

By Mary Sheridan, President, Tampa PC Users Group
mcpease@mindspring.com

It's 2001, and we find the Tampa PC Users Group doing extremely well. We have a solid member base. We have a wonderful projector and screen that's paid for. Our bills are paid, and we have Bruce Register working on some exciting presentations for the upcoming year. It just "doesn't get any better than this." Sure, we could use a little more income so we could provide better door prizes. I guess you all realize that our vendors, as a rule, are not providing us with product to use for our raffles. We are to the point of needing to buy software to raffle off. We need the raffle money to make our income equal our expenses. The board decided that raising dues would be a bad idea. So we're left with the need for some creative solutions to our raffle issue. William LaMartin, Bruce Register, Bill DeLucia and many others have donated some wonderful things for us to raffle, so that's one solution. Any other ideas will be greatly appreciated. It's not a crisis, but a small problem that needs fixing.

I want to once again thank everyone who contributed to the projector fund. A very special thanks to Merle Nicholson for thinking the whole thing up. The fund was a great idea and a huge success.

(President.....Continued on page 2)

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members. Our mailing address is P. O. Box 3492, Tampa, FL 33601-3492.

However, for business concerning this newsletter, Bits of Blue, please contact the Editor, William LaMartin, at 821 S. Boulevard, Tampa, FL 33606-2904; 813-251-3817; lamartin@tampabay.rr.com.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII, Microsoft Write, Microsoft Word, or Word Perfect file to the editor at 821 South Blvd., Tampa, Florida 33606-2904 or to lamartin@tampabay.rr.com.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

The use of trademarked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

apcug Member of The Association of Personal Computer User Groups

Minutes of the January Meeting

The first part of the meeting Bob LaFave demonstrated how to copy the files from one computer to another by removing the hard drive from Jenny Lind Olin's old computer and installing it in her new computer as a second hard drive. He then simply used Windows Explorer to copy files from the old drive to the new drive.

With the file transfer still continuing we conducted a brief business meeting, which included the installation of the new officers for 2001. We then started our main presentation.

This was given by Chris Morris (in the photo) and Joey Richardson of Verison DSL service, which is no longer officially part of the Verison telephone service. The presenter pictured below gave a brief description of DSL in general and Versison DSL in particular. He then fielded a good number of questions from the group. It appeared that there was considerable interest in DSL.

As usual, the meeting ended with a drawing for prizes—Verison shirts among them. ◆

(President……..Continued from page 1)

The Spring Conference for FACUG will be the first weekend in March. As always, any who may be interested in attending can contact me or another board member for information. It's in Kissimmee, it's fun and you get to meet some really nice people.

I sure hope this year is as successful as last year. ◆

Digital Photography and Your Computer

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

In the January newsletter I wrote about the new Canon PowerShot G1 digital camera and included some photos taken with it. The photo above was also taken with the camera at our January meeting. The goal of this article, though, is not to write about the camera again, but, rather, to give an introduction to my presentation at our February meeting.

I started snapping photographs when I was around 10 years old—1956—and had a 35 mm camera by the time I was in the eighth grade. I wrote my first computer program (to run on the only thing there was then—a mainframe) around 1967. I developed my first strip of film around 1973, when I also printed my first photo in a darkroom. I didn't get a PC until 1983, and that Apple II really had no way to deal with photographs. Why, it only had 65 KB of memory and 65 KB of what was called auxiliary memory. It had two floppy drives, each able to hold 135 KB of data. And I didn't have a way to get a photograph I had taken into a computer until I got my first scanner, a HP IICX flatbed scanner, in 1994. That $1,100 scanner allowed me to scan photographs—not negatives—into my PC, a Gateway 33 MHz with, I think 16 MB (4 originally) of RAM. So, you see, I had moved up a bit from the Apple.

But that old Gateway would be hard pressed to handle the large graphics files I use now. The file of our meeting above is a 1,855 KB JPEG file, and that is not at all large by today's standards. Of course, anything for the web has to be much smaller to facilitate a relatively quick download.

The next step in my photography/computer journey was getting a scanner that would scan 35 mm slides and negatives. This was the HP PhotoSmart photo scanner. Then came faster computers with more memory and finally a new HP flatbed 5370Cse scanner and the Canon G1 digital camera.

New Computer

By Jenny Lind Olin, Treasurer, Tampa PC Users Group
jlolin@tampabay.rr.com

I didn't have enough memory -- Computer RAM Memory. Somewhere in the back of my mind I remembered that "You can't be too thin, too rich, too pretty, or have too much memory [RAM]." I had tried twice to upgrade the old computer with more memory, and both times the old computer didn't recognize the new chips. Never mind that when I ordered the computer, I asked for a computer that was upgradeable. Is that word, "upgradeable" an oxymoron?

What would buying a new computer mean? I could get the latest version of Windows Millennium (ME), thus no need to clean up the previous version. Two Pluses. I could get a cable Internet connection (Local Road Runner), so no more AOL taking over my machine. Two more Pluses. I could upgrade my word processor, spreadsheet, (Office 2000) which would have Microsoft Access so I could catch up in the Access SIG. Another Plus. I would have the latest version of Internet Explorer and could learn how to use Outlook Express. Is that a Plus or a Minus?

The downside was the cost, just about the same as the three-year-old computer cost. But it is just money.

I got interested in my old jazz records and wanted to play them and save the recordings on CDs. (I am way in over my head here.) I had also seen my brother using Napster to play around with his musical downloads and that looked really neat. With a new computer, I would download Napster, and when around him I would just pretend I had been using Napster all my life and what was the big deal. But I would need some spiffy speakers and the best sound cards (Sound Blaster Live) I could afford. No problem, it was just money.

I would need a CD reader and burner. Then I would need CD blanks and covers. And maybe labels. This is what brought up the question about the life-span of a CD (see our Tampa PC User Group's Online Discussion Group).

I now own an AMD 700 Duron Processor, 30 Gigabyte hard drive, 128 MB SDRAM. With this system I got Corel's WordPerfect Suite 8 which includes their QuattroPro spreadsheet program. This will work, and I can convert all my Word documents and Excel spreadsheets to this new format. I can save my worksheets to Excel format when I want to send them to others as an attachment on my E-mail. Still no database program, but there is time for that later.

I loaded my genealogy program, Family Tree Maker 6.0, without a problem, but I wasn't expecting one. The real problem was getting the large genealogy databases from the old computer to the new one. Most of my data files I could copy on floppies and then copy from floppies to the new computer, but my genealogy databases were too large to do that easily. So the Windows SIG at the last Tampa PC Users Group came into play.

I took both my old computer and my new computer and monitor to the meeting. Bob LaFave was arriving about the same time I got there, so he helped transport the components upstairs to the lab.

Before anybody else arrived Bob had both computers opened up and had removed the hard drive from the old computer (see photo in the Digital Photography article in this newsletter). Bob connected that drive to the new computer as a slave drive. He showed us how he looked at the diagram on the side of the hard drive and then changed the setting to match. After his demonstration of how to do the setup, it was time to transfer the data. The old drive was then considered the D-drive. He made a folder in the new computer called "Old Drive" and then we copied all the files from the D-drive (the slave) to the C-drive in the new computer. My antiviral program was working and did find a downloaded file from some e-mail that had a virus. PC-cillin 98 paid for itself that night. This process took awhile, so we went on with the regular program while files literally flew from one computer to the other.

With that process done, it was time to learn what I had to know to use Outlook Express for my email. I was not so lucky as to be able to transfer my email addresses and my favorite places from AOL to Outlook Express and Internet Explorer. I can't read them unless I am using the AOL program. I had to do them a few at a time. Still doing that to tell the truth.

To finish a message later, I have learned I can copy the message to the draft folder or I can save the file and the default is the draft folder. I can move a message to the draft folder by right clicking on the file listed and then select "move to folder."

I usually send a joke to several people on my list. I like to send them as blind carbon copies (bcc) so that the recipient doesn't have to go through line after line of addresses in the header before they get to the message. I know how I feel after scrolling down line after line after line only to find a joke that I have read so many times that I have memorized it. The other day I sent the joke off in a rush and forgot to put an address in the TO: box. AOL would not send a message without a TO: recepient. But since I had used bcc, the message went out as "Undisclosed Recepient." Neat. My name was in the FROM: box, so it wasn't as though the message seemed to come out of nowhere. AOL will not let you send a message without an address in the TO: box.

(Computer……..Continued on page 5)

Donations	$3,195.00
Outflow	$2,011.56
Balance	$1,183.44
Total Assets	$4,233.38

(Computer……..Continued from page 4)

I have noticed that if somebody sends me a forwarded message it comes as a blank message, and there is an attachment. That makes it very easy to just delete (no guilt involved) the message as I have no idea what and from whom I am receiving (probably) junk. I also received a GEDCOM for my genealogy program and it came as an attachment, and the text was also in the body of the message. Every message is now a surprise as far as format is concerned.

As soon as I forget how to use AOL and I learn how to use Outlook Express, I will be looking for some other problem to cope with. ◆

Internet Site Review

By Larry Anders, Librarian, Tampa PC Users Group
larryanders@msn.com

I recently got my reminder email from William that the articles for this month's newsletter were due, so the pressure was on. While I was pondering just what to write about this month my email notification chimed-up and there it was, ***DOWNLOAD.COM.***

As Librarian for the TPCUG in years past (before the popularity of the Internet), my job was to collect, categorize and have available to our members all the software I could acquire, and it was a chore to haul that collection to each general meeting. Then the Internet came along and made my collection obsolete. But I'm not complaining because the quality and quantity of software out on the World Wide Web is excellent and so much easier to access now for everyone.

One of my favorite sites for software is http://download.com, a part of CNET, which is a major force on the Internet today. It doesn't matter if you use a PC or MAC, Windows or Linux, or even a handheld computer; it's all there for you. It's a software geek's paradise. (Now you know why I like it.) You can download to your heart's content, and a lot of the software is actually free (another reason I like it), or Shareware, in which case you can download for free, try it for a period of time and if you like or need it, you can buy it. Now, you can't get a guarantee like that off the shelf. And the price is fair. You don't pay for all the fancy packaging or advertisements that the "big boys" do.

When you log-on to ***DOWNLOAD.COM,*** one of the first things you see is **this week's top picks**. As I was writing this article the top picks were:

- **ICQ** – the popular instant-messaging program that lets you communicate with friends and colleagues in real time. **FREE**
- **Napster** – the controversial search engine that allows you to find and download MP3 audio files. **FREE**
- **Diablo II** – the classic dark fantasy game. **DEMO**
- **Opera 5** – a versatile Internet/intranet browser that also includes a newsreader. **FREE to try, $39 to register**
- **WindowBlinds** - a utility designed to change the way you look at Windows by allowing you to completely customize your desktop by changing the style of title bars, buttons, toolbars and many other choices. **FREE to try, $20 to register**
- **Internet Explorer** – get the latest version of IE 5.5 SP1 here. **FREE**
- **TaxACT 2000** – one of the competitors to the commercially popular TurboTax TaxACT 2000 helps you complete your tax return. It features more than 80 forms, schedules, and worksheets, plus an interview process to guide you through completing your return. You can also directly enter your information onto the tax forms. TaxACT calculates your return for you, then reviews your return and alerts you of possible errors. **FREE to try, $20 to register.**

The software for the PC compatible is divided into 11 categories, which are:

- **MP3 & Audio**
- **Games**
- **Desktop Enhancements**
- **Business & Finance**
- **Home & Education**
- **Drivers & System Files**
- **Internet**
- **Utilities**
- **Multimedia & Design**
- **Software Development**
- **Web Authoring**

Each category is broken down into several sections and each category lists its most popular download, new releases and ***DOWNLOAD.COM's*** own picks. So if you want to take the time to go through all the thousands of programs or just look at the most popular titles, it's your choice. And you don't have to download every program to find out what it's all about. There are thorough descriptions and product specs on all of the programs with links back to their home sites if what you find on ***DOWNLOAD.COM*** is not enough for you.

I could go on and on but I think if you will just take a few minutes to go to http://download.com you'll see what I'm talking about. If you haven't been there, you owe it to yourself to see what's available for the download at ***DOWNLOAD.COM***, but be careful… it's addictive! ◆

(Photography……Continued from page 3)

One tool is still to be mentioned—Software. There are the cameras to take my pictures. They are the new digital Canon G1, the relatively new Nikon 35 mm single lens reflex camera, and an assortment of older 35 mm cameras and one large format camera. Then there are the scanners to input the images from the film cameras into the computers. But what do you do with the images once you have the files in your computer? That is where software comes in.

I purchased my first serious graphics and photo editing program in 1994. It was Corel Draw 3, an older—and hence cheaper—version than whatever the current version was at the time. I didn't upgrade to Corel Draw 8 until 1998. In 1999/2000 I added Adobe PhotoShop and Adobe Illustrator, two products that I am still trying to master. So much for history.

With either Corel Draw's Photo-Paint or Adobe's PhotoShop, you have one component of a digital darkroom. Your printer, of course, is the other component. However, most of my digital photographs are never printed. They are either viewed on the computer or optimized for the web and included as parts of web pages.

Let's talk a bit now about how I use all this digital photographic equipment. One obvious use is in the production of this newsletter—although we often have too much content to leave room for much graphical filler. The photo below was a quick snap of Bob LaFave at our January meeting working on Jenny Lind Olin's computer preparatory to transferring data from her old computer's hard drive to her new computer's hard drive. No editing of any kind has been done on this image. Below pirate Wade Herman has had a Hyde Park squirrel added to his shoulder. Since the squirrel was not situated in a uniform background, it did take a bit of work in PhotoShop to cut him out of his photo so as to paste him in with Wade. I assume this is the sort of thing the *National Inquirer* does all the time so as to juxtapose celebrities.

Member Bob LaFave works on Jenny Lind Olin's computer

Member Wade Herman and friends at Gasparilla

PhotoShop, Corel Photo-Paint and lesser such photo editing programs allow you to do much more than cut out squirrels and place them on pirates' shoulders. You can "repair" damage, change the color balance, contrast and brightness, and do so much more that I am convinced you could spend a lifetime learning all the ins and outs of these programs. For an amateur, I am not bad, but compared to the professionals, I know nothing about PhotoShop—but I have from now on to learn. And each time I use the program, I learn a bit more.

What I will be discussing at our next meeting are the various ways I use all of these digital photography tools. The newsletter I already mentioned. Then there are the various web sites I maintain which need photographic content. Of course, there are all those family photos—both current and some well over 100 years old—of which I have made copies. Finally, there are those projects I think of from time to time. My most recent project consists of taking a digital photo of each house in my neighborhood and writing a Visual Basic program which will list all the addresses such that when you select an address, the picture of the house for that address will be displayed. Here I am combining photography, an Access database and VB programming. Hope to see you at the meeting. ◆

A Horror Story

By Wade Herman, Tampa PC Users Group
wherman1@tampabay.rr.com

About a year ago I upgraded my computer to a new motherboard with a 500Mhz Athalon but kept my old ATI All-In-Wonder Video Card and an even older Creative Sound Blaster AWE32 sound card. I had been reading about the new ATI All-In-Wonder Radion, which promised greatly improved performance for Video Editing. It also turns your computer into a TIVO like system; more about that at another time. There was also the Sound Blaster Live Platinum card which touted a host of cool features. The front panel analog and digital I/O connectors were especially appealing to me.

During a trip to the local Comp USA, I discovered they had just received the new ATI Radion card. So I yielded to the temptation; after all it was only 2 ½ months until Santa Day. While I was at the cashier, I asked about the Sound Blaster card and learned that they had just received, not even on the shelf yet, Sound Blaster Live Platinum 5.1. Having never had any Platinum, I decided to go all the way. Being from Creative Labs and one of the most expensive cards at $199, it must be great.

With great anticipation I dashed home and installed the new Gems. The installation of the ATI card went without a hitch. Now to install the Platinum. I had no concerns as their previous Sound Cards and DVD players installed without a hitch. **WRONG!**

Try as I might the software would not install. I am not exactly new to this procedure, having done it since the first Apple II. Being male, I take it as a challenge to solve problems on my own. I checked Creative's web site—no help there. After several hours of getting nowhere, it was time to call their Tech Support Line. The call is on your nickel, which irritates me, but I am sure it eliminates a lot of calls from people who otherwise would make no effort to read the book. Within 10 or so minutes a very pleasant tech support person answered. It took almost 2 hours but finally everything seemed to be working OK, so I hung up. **WRONG!**

The second or third time I re-booted the system I received one of those dreaded fatal error messages, as the desktop was starting to load. MSGSRV32 has caused a fatal error in Devcon32.dll. This is particularly frightening since, as most people are aware, Devcon5 denotes an impending Nuclear Attack. From a computer standpoint it is almost as bad, as the computer is totally locked. Forget CTRL-ALT-DEL, the only option is to say a prayer and turn off the power. Now the only way to boot the machine is to boot in Safe Mode and disable the sound card. Then the computer will boot normally but naturally with no sound support. More hours of tinkering and un-installing, re-installing and it is obvious that I need help from a higher power, and, since God's line was busy, I again called Creative. A very nice young lady listened to my tale of woe and spent almost two hours trying to solve the problem. She acknowledged that the problem is with their Devcon32.dll file and is probably related to my video card. She will send the problem to engineering and will personally call me back with the fix, which may take as much a two weeks. Naturally I am not a happy camper, but I have the feeling that it will be resolved. Over six weeks later I still had not received the promised call. So I called again, on my nickel, and went through their automated telephone support, and there was a solution—Joy of Joys. But the elation was short lived as the fix did not work for me. Now yet another call to Tech Support, with elevated blood pressure, to let them know how I felt about the company, but no point to take it out on the Tech because those above are not doing their job. The Tech was aware of the problem and said they knew that the posted fix only worked in some instances, which was why I had not receive the promised call—sure.

After trying a few things and getting nowhere I demanded to speak to a supervisor. He told me that he was pretty sure they would eventually have a solution, but it might be a month or two. At this point I requested that they take back their Sound Blaster Platinum Live 5.1 and refund what I had paid. Honest, I did not tell them where I thought they should stick it. They informed me that they do not take merchandise back. I would have to take it up with the Dealer. I reminded him that due to the time that had expired since the promised two week fix that was not possible. He was sorry, but my only other option was to take it up with Customer Service. Great I thought, bring on the SOBs (Sweet Old Boys). He even gave me the number and then added that it was a fax only number; they will not talk to people directly! How about that for Cus-to-mer Service! I am sure I would hear back in about the same time frame as the original promise and with as much satisfaction as I have received to date. I am sending them a copy of this article as my submission.

In one final attempt to get help, a friend suggested I see if they had a News Group listing, and boy do they. I strongly suggest anyone thinking of buying a Sound Blaster or other product read the postings. To be sure you see all of the postings, read them daily as very critical ones tend to be deleted in short order, as mine was when I outlined the problems described above and requested help. I did find out that I am not Home Alone! With all of the other problems users are experiencing, I may be lucky mine was not solved. One critical posting, which did not seem terribly strong to me, was responded to by Creative's Ambassador of Goodwill, Harvey Fong, stating that he was going to block all postings from her ISP until they canceled her account. There may been justification from other postings to ban an individual, but trying to coerce an ISP into canceling someone's account by punishing all of their subscribers, really. Later that day he made a half hearted apology, undoubtedly after taking his dose of Lithium. It is their news group so it is their right to control it as they see fit.

I am sure that most people who purchase a Sound Blaster Live are very satisfied. But from my experience and research I would strongly recommend that you be sure that if it does not function

(Horror…..Continued on page 12)

RunRun DLL Reprise

By Michael Hutchison, Tampa PC Users Group
myankee@ij.net

About three more normal work sessions with my machine after I sent in an article to this publication for December dealing with my problems getting Windows 98 to shut down (and what was hoped was a solution had been arrived at), it froze again. It named the same old suspect, but as time went on RunDLL began to get some company in the Programs not Responding dialog/list box. Among these "norespondents" were:

mprexe.exe and msqsrv32. The first file accepts network requests from the API and sends them to the correct network provider. The second file handles Plug-and-Play messages between various parts of the operating system, coordinates automatic responses to setup programs, plays the system startup and shutdown sounds, runs the shell program. As things now seemed to be on the old computer, these two files were moving up fast on the suspect list, particularly msqsrv32.

But I'm getting ahead of an accurate recap of the situation with respect to chronology. In the parade of events, guesses and angst, I also took a minor excursion through the land of Bootlog.txt and BIOS. This was due to a helpful tip from one of our members, Brian Lance—or was it Jim Weber? I was telling him that as a result of my reading an article or a web page which talked about a file called Bootlog.txt, I suspected that I had a problem with either the mouse driver or an old sound card.

Bootlog.txt resides in the root directory. It is plain old text file so it can be examined with any text editor. Towards the bottom of the file there is a group of lines which should look something like the lines below:

Terminate=User
Terminate=Query Drivers
End Terminate=Query Drivers
Terminate=KERNEL
Terminate=RIT
EndTerminate=RIT
EndTerminate=KERNEL

From Windows Help we have the following:

To pinpoint the problem in the Bootlog.txt file

1. Use any text editor, such as Notepad, to examine the Bootlog.txt file for Terminate= entries. These entries are located at the end of the file and may provide clues to the cause of the problem.

2. For each Terminate=entry, find a matching EndTerminate=entry.
If the last line in the Bootlog.txt file is EndTerminate=KERNEL, Windows 98 shut down successfully.

If the last line in the Bootlog.txt file is one of the following entries, check the listed possible cause:

Last line — Possible cause
Terminate=Query Drivers — Memory manager problem.
Terminate=Unload Network — Conflict with real-mode network driver in the Config.sys file.
Terminate=Reset Display — Video shadowing may need to be disabled. May also need an updated video driver.
Terminate=RIT — Timer-related problems with the sound card or an old mouse driver.
Terminate=Win32 — Problem with a 32-bit program blocking a thread.

After examining this information, I noticed that in the instances when the machine did freeze on shutdown, the computer did not play the new wave file which I had created and then gone into Control Panel and made the new system shutdown sound. At that time I thought that perhaps I had installed something which was periodically asking my old sound card to do things it wasn't capable of and this was causing errors. I did not give enough consideration to the phrase *Timer-related problems with sound card or…*in the Possible Cause column after Terminate=RIT.

I did not know what was wrong, and I was ready to try a little trial and error replacement cloaked in upgrades clothing after getting as close to the problem as was possible. This lead to consideration of updating my BIOS to facilitate various minor hardware improvements either just completed or proposed. Some of these additions or upgrades had no bearing on the shutdown issue. Therefore, I was inclined to think a BIOS upgrade was not a bad idea on a couple of levels. However, other club members didn't feel the BIOS was the culprit in my shutdown woes. So I abandoned this tack. I also tried changing the mouse driver (again grasping at the straws in the wind provided by the Terminate=RIT *Timer* related…) and managed to effectively KO the hapless little rodent temporarily.

Seeing some of my options in the form of throwing small to medium amounts of money at the problem/s thus thwarted, I turned my attention again to the last part of the Bootlog.txt file. At length (fairly great length), I decided to change the system shutdown sound back to the default Windows sound file. It can not be claimed that there was any great thunderclap of sudden understanding behind this move. Rather, this was one of a short list of things to try just prior to formatting the poor old machine's hard drive and putting Linux on it to experiment with.

The computer has now performed a shutdown quite a few times in a row and in a reasonably normal fashion. I say quite a few; don't know how many times exactly, but it's more than the computer has done in a long time. It was the length of the shutoff sound file in terms of time it took to play which was doing the dirty deed. ◆

Special Interest Groups

Microsoft Access SIG

This SIG meets the first Monday of the month at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6:30 PM. For information contact either William LaMartin at *lamartin@tampabay.rr.com* or Merle Nicholson at *merlenic@tampabay.rr.com.*

Genealogy SIG

To be included on the TPCUG genealogy mailing list, contact Jenny Lind Olin at 960-5723 or jlolin@tampabay.rr.com

Visual Basic for Applications SIG

This SIG meets the third Tuesday of the month, at the Gateway 2000 Store on North Dale Mabry at 6:30 PM. For information, *contact Merle Nicholson at merlenic@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting at MOSI and is devoted to a general Windows and computing discussion. Mary Sheridan moderates the discussion.

A Personal View of Technology 2000

By Mary Sheridan, President, Tampa PC Users Group
mcpease@mindspring.com

It hasn't been a very exciting year for technology. I can't think of even one new innovation.

I want an MP3 player, but I'm hoping the price will drop below $100.00 and I'd also like for the play time to be longer than one hour.

The Ebook I have is still a great idea, but the books sold for it cost the same price as the hardbound versions. It seems that it is much less expensive to produce an electronic version, so I resent the cost.

The Virgin Connect Web Player has been shut down. It was a neat idea, but I couldn't figure out how they could make money, and I guess they didn't.

My web-enabled cell phone is amazingly slow when accessing the Internet. The phone itself works fine, but that's hardly "new technology."

Digital cameras are becoming more affordable so more people are able to use them. I'm still trying to figure out my Instamatic, so photography isn't for me.

I use my Palm Pilot, but only as an address book. The other functions are just easier and faster on the PC. I'm getting better at note taking with graffiti, but it's still more efficient to take notes on a piece of paper.

I'm taking college courses with the University of Phoenix Online. My schedule would never allow me to physically attend courses on a regular basic, so this is wonderful for me. Online learning has been around for quite some time, but it's just now becoming accepted and accredited.

The upgrade to Windows Millennium hasn't made any difference. I'm just glad I only paid $49.00 for it.

So, here's hoping 2001 will be a banner year for technology and the cushy lifestyle said technology will bring. ◆

Finally, My Solution Since there was no assurance of an early resolution to my problem and others may follow, I decided to take my loss and research other possibilities. Naturally Creative Sound Blaster is the card that immediately comes to mind because of the tremendous amount of money they spend on glitzy advertising. What a shame they don't spend a little of it elsewhere. There are several other possible choices. After reading several rave reviews of the Turtle Beach, Santa Cruz, I decided to investigate further. I called their Technical Staff to ask if there were any known issues that might cause me problems. It was worth it to me to spend a few bucks to try and avoid a repeat of the expense, time, anguish and aggravation with Creative. I was assured me that they knew of none of the problems I had experienced and in fact the Tech personally was using the previous version of my ATI All-In-Wonder card. Then he cinched the choice by telling me that if I bought the Santa Cruz directly from them it carries a 30day unconditional return warranty. It is half the price of the Sound Blaster, but it does not have the cool front panel connectors and teaser software. All I can say is the Santa Cruz installed without a curse word, works and sounds great. Once again it appears Avis tries harder. ◆

Bits of Blue

March in Tampa

A Monthly Publication of the Tampa PC Users Group, Inc.

Vol. 14 No. 3 March 2001

Meeting

JR Inkjet

March 14, 2001
6:00 PM
Museum of Science and Industry
4801 E Fowler Ave.

Meeting Preview: JR Inkjet will give the main presentation. As usual, Mary Sheridan will conduct a computing and Windows discussion for the first 30 minutes of the meeting.

President's Message

By Mary Sheridan, President, Tampa PC Users Group
mcpease@mindspring.com

It feels like summer already and it isn't even spring. Oh well, that's Florida. We had a great meeting last month with a full house, and that's always exciting. William LaMartin did a presentation on using a digital camera. The pictures he's taken are simply beautiful. I keep waiting for the cameras to fall into my price range, but they aren't there yet.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

Minutes of the February Meeting

By Merle Nicholson, Member at Large, Tampa PC Users Group
merlenic@tampabay.rr.com

WINDOWS SIG The Windows SIG got underway at 6:15, led by Mary Sheridan, President.

Bob LaFave suggested that installing Internet Explorer 5.5 slowed his computer down by a significant amount and that he found a solution to it by deleting EMM386 in CONFIG.SYS.

There was a discussion and speculation on the forthcoming operating systems from Microsoft. One thing that was agreed on was it's confusing.

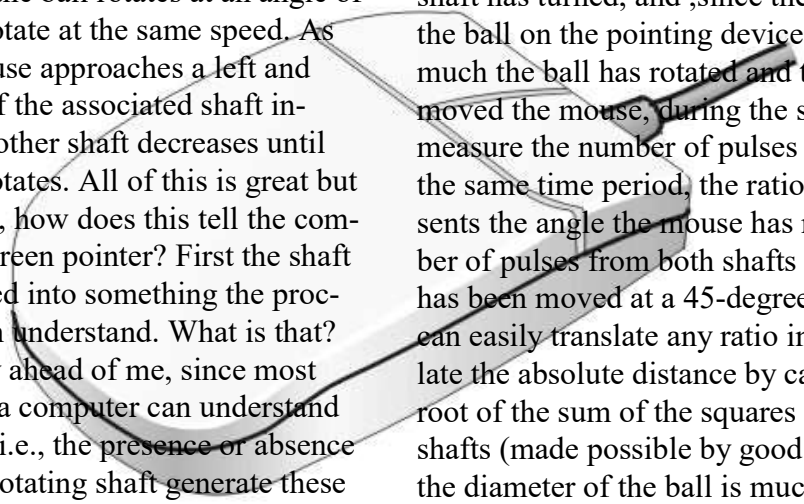
Bruce Register put in a plug for the help list in the back of each newsletter to encourage members to call for help and to participate if possible.

Mary mentioned the ITEC trade show coming up in May. We – TPCUG – will have a booth there. ITEC is also looking for volunteers.

Other news: http://www.bigzoo.com is offering long distance service for 2.9 cents per minute. It's a $20 pre-paid service. An announcement was made that memory prices are at rock bottom right now, and there's not a better time to upgrade the memory on your computer.

PRESENTATION William LaMartin gave an excellent presentation on digital photography. He brought some of his equipment with him and had prepared a terrific PowerPoint presentation.

William began by relating his long history in amateur photography using film and his transition to digital using film to digital equipment and scanning to the present where he's relying more on direct digital photography and using his computers.



In the presentation he showed 35 mm photos that

(Minutes.....Continued on page 10)

How Mice Work

By Wade Herman, Tampa PC Users Group
wherman1@tampaby.rr.com

Most mice and track balls are controlled by the ball on the device contacting two shafts placed orthogonal (perpendicular) to each other. One shaft will rotate when the ball is rotated left and right and the other shaft when the ball is rotated up and down. When the pointing device, and consequently the ball, is moved at some other angle, both shafts will rotate simultaneously and their relative speeds will be proportional to the angle. If the ball rotates at an angle of 45 degrees, both shafts rotate at the same speed. As the movement of the mouse approaches a left and right motion, the speed of the associated shaft increases while that of the other shaft decreases until only the left right shaft rotates. All of this is great but the question still remains, how does this tell the computer how to move the screen pointer? First the shaft rotation must be converted into something the processor in the computer can understand. What is that? You are probably already ahead of me, since most know that the only thing a computer can understand is strings of 1's and 0's, i.e., the presence or absence of a voltage. How can a rotating shaft generate these 1's and 0's? The most obvious way is to put a wheel on the shaft that has a group of equally spaced bumps on it that turn a switch on and off as the shaft rotates. When the switch is on it connects to a voltage source (representing a "1"); when the switch is off the voltage is disconnected (representing a "0"). This was in fact the way some of the earliest mice generated the signal for the computer. The problem is that mechanical switches wear out very quickly, as they may be turned off and on thousands of times a second and undergo millions of operations in a few hours or days. To be practical we must generate the pulses without mechanical contacts. There are several possibilities, but the easiest to implement uses light. How can light do that? Remember when you walk in some small stores there is a bell that rings to alert the clerk. You may already know that this is usually accomplished by projecting a beam of light across the doorway onto a photocell. When the light beam is interrupted by your body, the photocell acts like a switch, generating a pulse of electricity that rings an alarm. So we miniaturize that system thousands of times and put a wheel with many slots or holes in it that break the beam as the wheel and shaft rotates. The light source is an IR (infared) LED (Light Emitting Diode) with almost unlimited life, like the photo diode or photo transistor used as the detector. The light sensitive device generates the pulses without any mechanical contact. These devices can operate much faster than mechanical switches. If we measure the number of 1's and 0's over a short period of time, a few thousandths of a second, it tells us how much the shaft has turned, and ,since the shaft is connected to the ball on the pointing device, we can calculate how much the ball has rotated and thus how far we have moved the mouse, during the sampling period. If we measure the number of pulses from both shafts over the same time period, the ratio (sine function) represents the angle the mouse has moved, i.e., if the number of pulses from both shafts are equal, the mouse has been moved at a 45-degree angle. The computer can easily translate any ratio into an angle and calculate the absolute distance by calculating the square root of the sum of the squares of the pulses from both shafts (made possible by good old Pythagoras). Since the diameter of the ball is much larger than the diameter of the contact point on the shaft and, further, the encoder wheel on the shaft has many holes, every rotation of the ball can produce several thousand pulses, which allows very accurate positioning information, called resolution. The raw data generated in the mouse is encoded by a special processor in the mouse before being sent to the computer to make the operation more efficient.

I have outlined most of the principles of mouse operation; however, I have left out one very important principle. If anyone knows what this is and would like an explanation, I will be happy to include it in an article next month. No techies please. ◆

Roundup Time, March 4, 2001

By Tim Condon, Tampa PC Users Group
tim@free-market.net

Okay, okay, here's the deal: I was originally going to talk about my recent adventures with a program named "Time Matters." It's what's generically called "case management software" and can be used by various professionals, including lawyers (like moi), accountants, architects, financial planners, etc. Pretty cool program. I'm running much of my law practice with it now. Big and complex, but not all that expensive ($500 for two users)...but.…

But I can't talk about that. It's those damn Napster guys. There's just too much going on, even as I hunt-&-peck here. So Napster and file-sharing it's going to have to be, once again.

Well. Napster. Play taps. It's wide-open file-sharing system is being reined in as I speak. The Nap-guys are instituting a filtering system as I write this on March 4, 2001 that will prevent copyrighted material from being shared over the Internet if the copyright holders don't give permission. This is a preemptive strike by the Napster guys, as the ruling from the federal district court in California is expected shortly.

Oh. You don't know the latest? Background: The Recording Industry Association of America (RIAA) along with some rockers (e.g. "Dr. Dre" and the heavy-metal band Metallica) sued in federal court in California some months ago to shut the Napster online music-file-sharing phenomenon down, citing wholesale, worldwide copyright law violation. The federal judge who heard the case, Marilyn Patel, evidenced quite a strong hostility toward the Napster defendants, and in July 2000 entered an immediate injunction saying that Napster had the responsibility to block all sharing of all copyrighted works. Napster responded that they didn't have that ability, and such a ruling was tantamount to shutting down the service.

So...Napster took an instantaneous appeal to the 9th Circuit Court of Appeals, also in California, and they entered what's called a "stay," stopping the lower court injunction from going into effect. Then the Napster guys hired some very heavy-hitting legal talent to argue the case in front of the 9th Circuit (and ultimately possibly the U.S. Supreme Court), David Boies (last seen arguing in front of the Florida Supreme Court and the Supremes in Washington in favor of Presidential candidate Al Gore).

Bottom line? On February 12, 2001 the 9th Circuit ruled that the original injunctive ruling was unfair to Napster, and that the **record** companies had to specifically identify the copyrighted material they wanted blocked. Result: the case went back to the lower court for further proceedings and to fashion another injunction. Which gave rise to further flailing around by all the parties in the lower court. (However, the appellate court did decide that if it looks like copyright infringement, quacks like copyright infringement, and waddles like copyright infringement, then it must be copyright infringement under the law as it presently exists.)

That further injunction from the federal district court is expected any day now, with the RIAA and their rocker-backers asking the court to enter an order that would make it necessary to shut down the Napster service **entirely**. Well. Seeing as how Napster doesn't only help its 64 million registered users to copy zillions of **copyrighted** songs, but **also** assists people in copying music which (a) has an expired copyright, (b) is uncopyrighted (often by struggling starving artists trying to make a name for themselves), or (c) is copyrighted but the owners of the copyright(s) have decided to give permission for everyone to share...well, shutting the Nap-thing down entirely might seem a bit **extreme** to many people.

But wait! Judge Patel **this** time isn't showing the same hostility toward Napster that she did in the hearings last year. "We're here to find out what the parties can live with, something that will work for

(Roundup.....Continued on page 8)

(President……..Continued from page 1)

Groups is the weekend of March 2nd. Since the newsletter goes out around the first Wednesday of the month, this will be old news. I've been quite busy getting ready for the conference, and I'll be much happier when it's finally over.

On May 2-3, 2001, the doors at the Tampa Convention Center will open to 4,000 corporate and government/education business professionals for the region's largest Business-to-Business technology event of the year, the Third Annual Tampa Bay Information Technology Exposition & Conference (ITEC). ITEC will feature more than 2000 products and solutions, representing the latest developments in Computers, Telecommunications, Internet/ Intranet, Software, Networking, Imaging and Records Management, Multimedia, Video Conferencing, Client Server, Network Security, Disaster Recovery, ATM and much more. The Tampa PC Users Group will have a booth at this event and we need volunteers. I'll get the tickets to anyone who may be interested in attending as soon as I receive them.

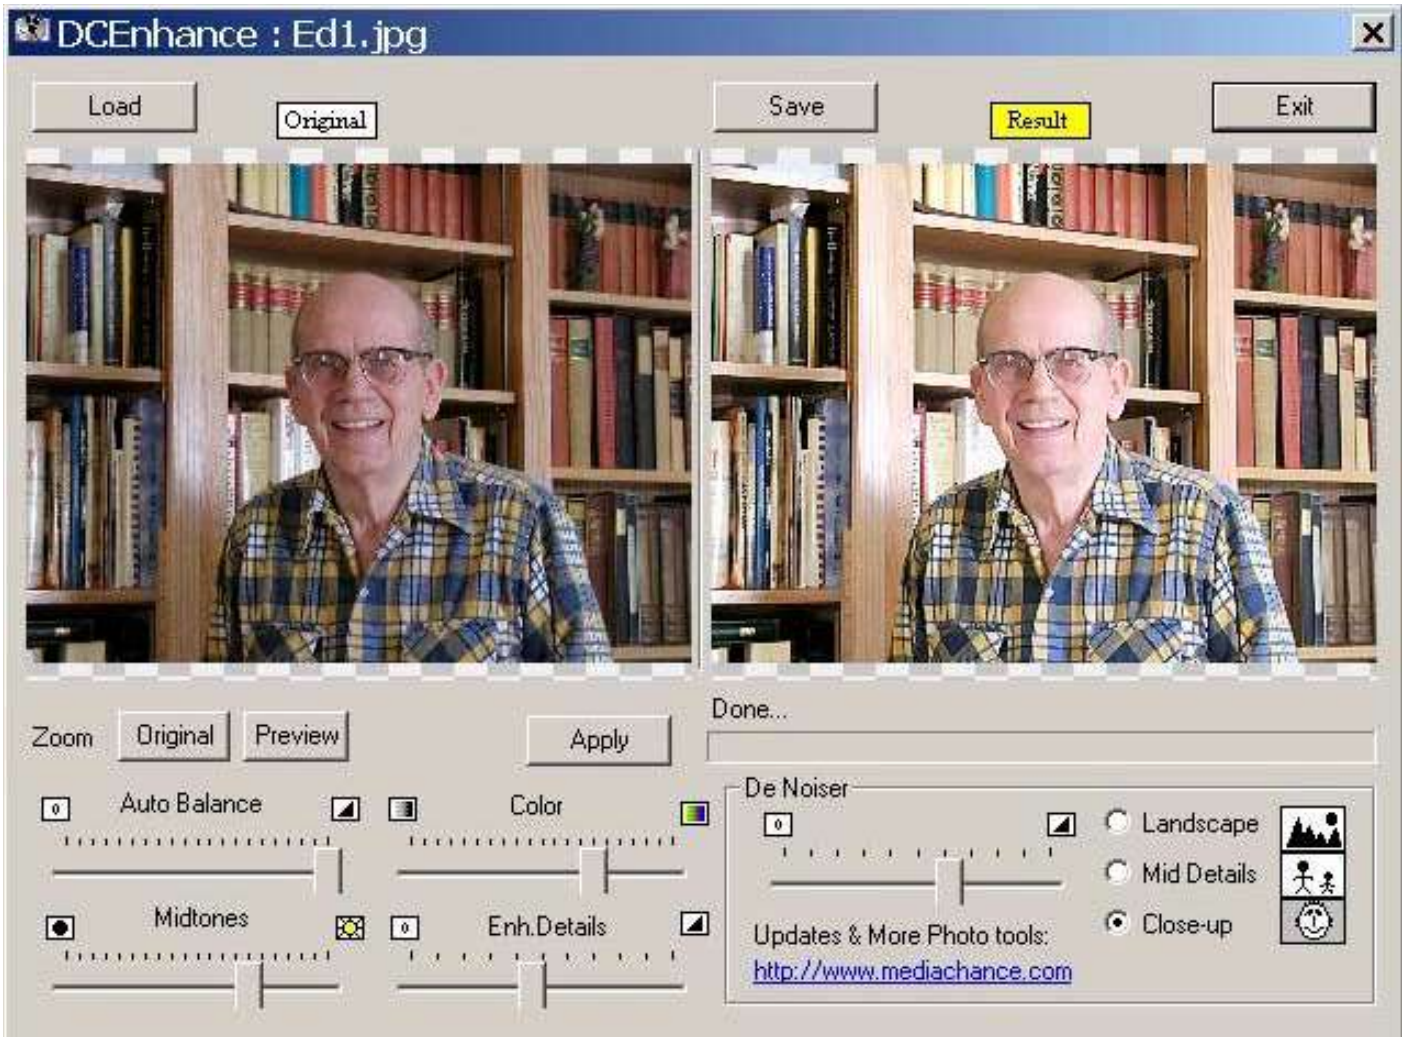
Software Review of Digital Camera Enhancer

By Larry Anders, Librarian, Tampa PC Users Group
larryanders@msn.com

I've always been a fancier of good software, and, better yet, I've always fancied good **FREE** software. ***Digital Camera Enhancer*** (DCE) is both. I'm not really sure how I came across this excellent digital photo utility program but if one of you reading this article told me about it… thanks! If not, read on.



Even with the best digital cameras I've found that the average digital photo still needs a little help, especially in the "brightening-up and noise department." DCE solves this problem and so much more. MediaChance, the makers of DCE, bills this software as *almost idiot proof,* and I agree.

I've got some of the best software made for enhancing digital imagery, and some of these programs would probably do a better job than DCE if I learned how to use the software properly. But none of the best stuff does it faster and definitely not easier.

As I mentioned earlier, you will notice the greatest improvement in your photos if there are bad lighting conditions, especially for photos taken inside or in the shadows. But it doesn't automatically adjust every photo. Sometimes the adjustments are so subtle it's hard to tell anything changed at all.

Initially, when running the program for the first time it will ask you about your camera and try to set itself up automatically to make the proper adjustments for your specific camera. But if you are not satisfied with the results you can always try your hand at adjusting the settings to your own liking. The DCE window

(DCE……..Continued on page 7)

(DCE……..Continued from page 6)

shows your original photo alongside the enhanced photo. There are manual slide-bar adjustments for **Auto Balance, Color, Midtones, Enhanced Details and De Noise**. I found the auto settings were perfect for my camera and I haven't needed to touch the slide adjustments on my photos. You can also zoom in and out and preview the changes before applying them. I have a relatively new upper-end Sony, but I was amazed at the difference between the original and DCEnhanced photo.

Once you decide the enhanced photo is the one you want to save, DCE gives you an option of which format (JPG, BMP, PCX, PNG, TGA & TIF) you would like to save it in. I typically choose JPG because that's the native format of my camera and seems to be the all around best for size, color, etc. DCE also lets me choose the compression ratio I want for my JPGs. Prior to saving, CE adjusts all of the settings previously mentioned above plus it automatically enhances the edges, then saves the new file. If you try to save it using the original name, DCE warns you to use a new name so you can keep the original file intact. One area that DCE excels in is noise reduction and skin smoothing, which makes for some great close-ups!

You don't have to have a digital camera to use this program. It works well on any digital image that needs a little help. (Remember, if the picture is well balanced DCE won't make any adjustments at all.) I tried it on some of my older scanned images, and it did an outstanding job. I also used DCE on some of my older digital camera photos and was quite impressed. DCE will also make better images of the photos you capture from the Internet.

DCEnhancer is one of those programs that come along every now and then that's a real steal… especially at the price! Give it a try and you won't be disappointed. I guarantee it!

By Mary Sheridan, President,
Tampa PC Users Group
mcpease@mindspring.com

I began using e-stamp a couple of years ago. I loved that I no longer had to go to the post office. Over the years I've had some really unpleasant experiences at the post office and avoiding going there really appealed to me.

I had lots of trouble with e-stamp. I couldn't get a lot of the address book features to work. I would save addresses and never find them again. I would type in an address and when I tried to print it, it wasn't there and nothing was printed. I lost quite a bit of postage and, more importantly, the time it took to try to get the program to work.

Last fall e-stamp announced that they were no longer going to be in the consumer postage business. I didn't want to go back to using regular stamps, so I found stamps.com. I didn't like the fact that I would be charged $4.49 no matter how much postage I used. The e-stamp program had only charged 10 % when I bought postage, and it didn't matter how long it took to use the postage. But, they weren't around anymore, and besides, I'd had all that trouble.

I'm sold on stamps.com now. Everything works beautifully. The address book stores the addresses just as it should with no problems. The postage prints perfectly every time. I'm saving 30 minutes a month from the time that it used to take to pay my bills. I guess I really should go to a bill paying service online, but I still have "trust issues" about that kind of thing.

The stamps.com was easy to set up. Everything is done online, so I didn't have to buy any software. Every time I print postage I remember the trouble I had with e-stamp and it really makes it worth the approximately $5.00 a month that I pay. I've heard that the stamps.com company may be in trouble, but I hope not. I've found something that helps me a lot and I hope it's around for a while. ◆

(Roundup……..Continued from page 4)

everyone," the judge said during a hearing held on March 2, 2001.

But wait again! Napster is also appealing the decision of the 9th Circuit, and the matter could be accepted for review by the U.S. Supreme Court, in which case everything now pending before the district court in California would come to a screeching halt.

But wait **again** again! There's another hearing scheduled for April 10, 2001, and at **that** hearing proposed class-action lawsuits by others ganging up on the Nappers—including independent record labels and music publishers—are scheduled to be discussed.

And wait, wait, **wait** yet again! A mediation among the parties is also scheduled for March 9, 2001, where they're supposed to try to hash it all out in some manner that everyone can live with (but the music-people may not cooperate; they may say screw you to the Napster folks, wishing to make an example of them as they come up with plans to handle the Napster alternatives mentioned below).

So...bottom line is that Napster is today (or yesterday, or perhaps tomorrow) installing a filter system to protect copyrighted music in an effort to forestall the district court judge from entering an injunction that will shut them down entirely. In the meantime, Napster has frantically been trying to cut a deal with the RIAA where the Nap-people will be able to provide copyrighted music on some kind of subscription basis where subscribers will pay Napster, which in turn will fill the pockets of the RIAA and their musicians. But the RIAA, being greedy and evil, and smelling blood, hasn't bitten so far.

Stay tuned for what the district court does. It'll be on all the front pages and TV shows soon, perhaps before this even comes out in print.

Now, all that being the case, what is the rest of the world to do? I mean, everybody wants free music, and they don't care whether it's got any steenking copyright protection or not, and they want to keep stealing...er...**sharing** it.

Enter Gnutella, Bearshare.com, Napigator, the anarchist-designed Freenet, Aimster, Audiogalaxy Satellite, CuteMX, LimeWire, Hotline, iMesh...oh, there're lots and lots of alternatives gurgling and bubbling and growing like bodysnatcher pods out there in Internet-land. As to how they work, I couldn't say, and I leave it to all of you out there who want to steal...er...**share** copyrighted material to figure them out (and maybe write reports on how they work for the TPCUG Newsletter).

In the meantime, remember that it's not only music that the struggle is being waged over. This battle is only the opening show for a war that will continue into the future. Music is just the first front in the war; ebooks and all other kinds of text are on the horizon, along with all types of picture or representational artwork to be argued over, and probably audiobooks and other types of readings will open yet another front in the war. Even farther on, when super-broadband access is available to us all, **movies** are going to be the battle zone du jour. But all that's another struggle, and far in the future (say 12 to 24 months or so from now). ◆

Powermarks: A Different Way to Handle Bookmarks/Favorites

By Wade Herman, Tampa PC Users Group
wherman1@tampabay.rr.com

A friend recently recommended I try the Powermarks program. The program is available online from http://www.kaylon.com, and you can try before you buy. If, like me you have a lot of Bookmarks (over 2500) and have CRS Disease, this program may be for you.

My first impression when using it was "I don't like it!" After getting acquainted with it, I changed my mind! Being a long time user of Internet Explorers Favorites, where you organize your favorites in a definitions tree, the representation appears to be completely disorganized. Each entry is placed in a flat database as opposed to the hierarchical representation in Explorer. The reason for the flat database is that searches are performed very rapidly. If you don't understand all of this, do not despair; the technical stuff is unimportant.

The first thing you do on installing the program is import all of your current Bookmarks/Favorites to the program, which is very easy. To use the program, simply begin typing words that define the Bookmark you want to find. Each time you type in a character, the program begins searching for the string. For instance, typing in "Tampa Tribune" will yield all of the Bookmarks beginning with"T" then "Ta"… narrowing to all containing Tampa"… finally narrowing to those containing "Tampa Tribune". Unless you are a very fast typist the Bookmarks will appear almost instantly because the search does not wait for all of the letters to be typed before beginning the search. Finally, select from the displayed bookmarks the one you are looking for. The **Big** feature is that you can easily edit words to be searched for in each Bookmark! For me, the problem in trying to organize Bookmarks by headings is all too often, when I Bookmark a page, I find it may fit in more than one category and have to make a choice. When I later want to find it, I have to try several possible categories before I find where it is.

Bookmarking a new page is very easy but different. Click on the Icon to "Bookmark and edit key words." You will see the Heading and key words that will be saved. You may change the Heading and key words to ones that have the most meaning for you. For example, I have seen sites labeled like "Homepage for the XYZ Corp." Who cares about the words "Homepage the Corp.", so throw them away and add two or three you will immediately recognize. Likewise, some of the key words defined in the HTML code may mean little to you, so erase them and add words that come to your mind whenever you think about that site. It takes but a few seconds, and now you will never have to search multiple categories to find where you put the Bookmark.

The purchase price of Powermarks is $24.95. Kaylon allows you space on their computer to store your Bookmarks in case your computer crashes. With this program you can still use your Favorites in Explorer or Navigator, if you wish, and there is a Synchronize button which will update Powermarks from Navigator or Explorer.

Tampa Convention Center
10:00am - 4:00pm Daily

Tampa Bay Information Technology Exposition & Conference (ITEC). ITEC will feature more than 2000 products and solutions, representing the latest developments in Computers, Telecommunications, Internet/Intranet, Software, Networking, Imaging and Records Management, Multimedia, Video Conferencing, Client Server, Network Security, Disaster Recovery, ATM and much more.

Special Interest Groups

Microsoft Access SIG

This SIG meets the first Monday of the month at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6:30 PM. For information contact either William LaMartin at *lamartin@tampabay.rr.com* or Merle Nicholson at *merlenic@tampabay.rr.com.*

Genealogy SIG

To be included on the TPCUG genealogy mailing list, contact Jenny Lind Olin at 960-5723 or *jlolin@tampabay.rr.com.*

Visual Basic for Applications SIG

This SIG meets the third Tuesday of the month, at the Gateway 2000 Store on North Dale Mabry at 6:30 PM. For information, contact Merle Nicholson at *merlenic@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting at MOSI and is devoted to a general Windows and computing discussion. Mary Sheridan moderates the discussion.

were scanned in and the list of his equipment that he has acquired over many years.

Scanner:	HP5370 and an HP PhotoSmart photo scanner
Camera:	Canon Powershot G1 digital and a Nikon
Printers:	Alps MD1300 for the photos
Software:	Adobe PhotoShop and Corel Photo-Paint

Two good web sites mentioned are: Http://www.dpreview.com for digital camera reviews and http://www.luminous-landscape.com for photographic techniques, opinions and images.

In his presentation, William took pictures, with and without flash. He then transferred these files to his notebook computer, made adjustments to the size and made some contrast changes.

William showed us some of his varied interests in copying old B & W family photos, Mardi Gras photos scanned from slides and close-ups of wild flowers from a 35 mm camera and scanned from negatives with the HP photo scanner.

He also demonstrated his "Hyde Park Project" where he is taking digital pictures of all 400 plus houses in Hyde Park and is arranging them in a new Visual Basic program that he wrote to manage and display them.

He concluded by showing a panorama of his back yard that consists of multiple digital pictures taken with his Canon G1 and merged with Photo Stitch.

Thanks must go to William LaMartin for an excellent and informative talk on the hottest topic in home computing.

At the last meeting, it was suggested that we establish a novice user class in the computer lab at MOSI, if we are able to hold the regular meetings in a different part of the museum. I have a call in to Al Pesche at MOSI, so I don't have anything definite yet. There is a need for the novice classes, and we have members who are willing to act as "teachers" for the class, so it may prove to be workable.

We are planning to change the time of the regular meeting from 6 PM to 6:30 PM. Several people are having a difficult time being there at 6 PM. The changes won't take effect until May.

It's always fun working with this great group of people, and I hope to see a big turnout for the next meeting. ◆

President's Message

By Mary Sheridan, President, Tampa PC Users Group
mcpease@mindspring.com

May 2001 will be our last meeting at MOSI. I'll miss the place. It's been so convenient to my home, but things change. I'd like to thank the museum for allowing us to meet in their computer lab all these many months. We're moving to the Jan Platt Library (details located elsewhere in the newsletter). I'm hoping the move will serve as a new beginning for our group. Thanks to William LaMartin for doing the legwork on the new location.

I thought the Morgan Stanley Online presentation at our last meeting was very interesting. I'm amazed at how savvy our people are on so many topics. Lots of those present seemed to have investing down pat. The questions were probing, and it was fun to listen to the discussions.

(President.....Continued on page 5)

Beginning with the May meeting, the meeting time is changed to 6:30. Beginning in June, we will meet at the Jan Kaminis Platt Regional Library, 3910 S Manhattan Avenue, Tampa.

June 13: To be announced
July 12 (a Thursday): Pens that scan and upload text to your computer

The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

Minutes of the April Meeting

By Bruce Register, Program Coordinator,
Tampa PC Users Group
bregis@gte.net

President Mary Sheridan called the meeting to order at 6 PM. President Sheridan announced the **MAY Meeting is our LAST MEETING AT MOSI.** The June meeting will be held at the Jan Kaminis Platt Library at the corner of South Manhattan and Euclid Avenues. She also announced that the May meeting at MOSI will begin the change to meeting at 6:30 PM rather than 6:00 PM.

A general discussion was held about various topics of interest to the group. It was announced that ITEC will be at the Convention Center. TPCUG was given several free tickets for the event on May 2 and 3. There will be many exhibitors who will make the visit very worthwhile. Those who have attended previous ITECs stated that the exposition features top-notch exhibitors and educational sessions. The full list of Special Features and Functions is available at http://itec.asmcorp.com/c4/tam/. President Sheridan has free tickets ($20 value). Her phone number and email address are on the left side of this. Also, Adobe had a free all day presentation on April 26. Microsoft will present Microsoft TechNet Briefing on May 8 at the Tampa Airport Marriott. Register at http://msevents.microsoft.com. Another free meeting is the Microsoft Office XP at the Hyatt Westshore on June 2, 2001 beginning at 1 PM and ending at 3 PM. This is a live event with the Microsoft showcase and announcements.

Bruce Register, Program Coordinator, introduced Ray Hall with Morgan Stanley Dean Witter. Mr. Hall is a financial advisor who spoke on the use of electronics in trading. His company provides several services of an innovative nature. His company provides much free information and also provides financial service and advice on a fee basis for those who desire to use them. Etraders are advised to utilize a professional service that supplies good research analysis. His company provides several programs and services that include online and phone information. They have an Analyst Research Report for their customers and have a program called Mutual Fund Center. They serve risk investors and income investors and all in between. Ray Hall of Morgan Stanley Dean Witter can be reached at ray.hall@msdw.com. With the Palm Pilot and other machines, one may now trade from any location at any time. Mr. Hall emphasized that a new marketing day is upon us in which competition is very fierce. He feels strongly that his company has molded to serve the needs of the customers with exemplary courtesy and latest techniques. With the current bear market, Mr. Hall recommends that each investor have a managed account portfolio so that the investor may quickly move as desired in a fluctuating market. This report touches on only some of the "tips of the iceberg" services that MSDW provides. Our group energetically partici-

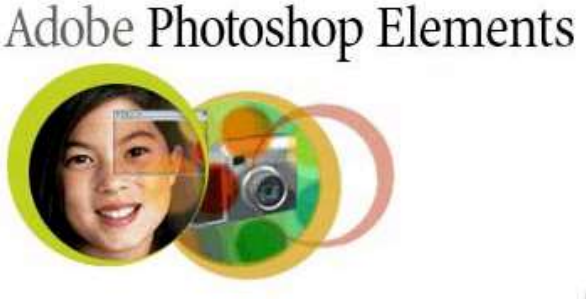
Adobe Photoshop Elements

By Larry Anders, ELibrarian,
Tampa PC Users Group
larryanders@msn.com



I think most people will agree that Adobe Photoshop is right close to, if not at, the top of the list of digital imaging editing programs. And I think those same people will also agree that it is at the top of the list for difficulty in learning to use. Photoshop is by far a professional editing tool, designed for professionals, and it's quite expensive too (street price about $600). Adobe wisely realized that amateur digital image editors needed a tool also that would be easy-to-use, powerful like Photoshop and competitively priced. Voilà, along comes ***Adobe Photoshop Elements***.

For $99 full price, or $69 for a competitive upgrade for registered owners of Adobe PhotoDeluxe, Photoshop Limited Edition, Arcsoft PhotoStudio, Corel PHOTO-PAINT, Jasc Paint Shop Pro, Microsoft PhotoDraw and PictureIt!, MGI PhotoSuite, Ulead PhotoImpact and PhotoExpress, you can get a state-of-the-art digital imaging program designed to improve your color printouts and web applications. ***Elements'*** editing tools are based on Photoshop software, with a lot of the features included that are built into Photoshop, but ***Elements*** also comes with a whole host of new tools designed specifically for ***Elements*** and not found in Photoshop.

Upon launching ***Elements*** you can be off and running by utilizing the *Quick Start* screen that provides easy and centralized access to the primary file creation and acquisition features. You can start from scratch or load an existing image, copy something from the clipboard, acquire an image from a scanner or digital camera, or click on the tutorial button and get detailed instructions and tips. There is a *Hints Palette* that provides easy-to-understand illustrations of each tool in ***Elements***, not just the name of the button, but also a brief description and usage tips relating to that tool so you can learn what each tool does in a hurry.

A new item called the *Recipes Palette* is a handy feature that interactively teaches you how to perform a particular task but still gives you full control, if you want it. You can get instructions on such things as adding a gradient effect to a graphic, creating a transparent text panel, removing noise (dust and scratches), removing a color cast, or touching up a photo. There is also a "do-it-for-me" button if you're in a real hurry. The program comes loaded with recipes and you can download additional recipes from Adobe's web site.

There is a *File Browser* that displays graphic files as thumbnail images. This allows you to search visually for a file while you are still inside the program. There are several color correction and retouching tools, such as *Color Adjustment Variations* which automatically generates and displays multiple versions of the same image so you can easily identify the color adjustment you want. There is a *Red Eye Brush Tool* to let you remove camera flash with pinpoint accuracy instead of applying a red-eye reduction command to the entire file. There are also *Level Adjustment Controls* that let you precisely adjust colors, brightness, contrast, and black and white levels of an image using numeric value slider bars, and the results are previewed instantly before being applied.

We all take or scan not-so-great photos. ***Elements*** lets you crop and straighten these less than perfect images with one command. There is also an *Adjust Backlighting* command that lets you darken images because of too much flash, or a *Fill Flash* command that instantly lightens images from not enough flash or light. Also, there are darkroom techniques called *Dodge*, which lightens a specific area, or *Burn,* which darkens a specific area of an image.

How many times have you taken a series of photos in a row to create a panorama effect by pasting the photos together? *Adobe Photomerge* is included that will automatically resize, skew, and blend portions of multiple images into a seamless panorama. All you have to do is copy two or more photos into a separate folder and ***Elements*** does everything automatically for you. I have a couple of panorama programs now that I have been using, but I guarantee they are definitely not this easy, nor are the results as good.

One of the carryovers from Photoshop is ***Elements'*** ability to create and edit composite images containing multiple layers. Each layer is editable independently of any other layer, thereby allowing you to create some dramatic effects, such as realistic 3D text, that may otherwise take much more time to create. There is also a rather large library of *Layer Styles*, such as glow, bevel and drop shadow, that you can apply to a chosen layer with a simple click of the mouse.

Included also are drawing tools, such as the *Custom Shape* tool which will let you add graphic elements to your images by choosing from a library of shapes and symbols. There is a wide variety of brushes and something called the *Impressionist Tool* that will allow you to make believe you are Monet or Renoir and apply effects to the entire image or just certain

(Elements……..Continued on page 4)

(Elements……..Continued from page 3)
parts or layers.

The *Text* tool allows you to add text freely to an image with total control of the fonts and type sizes. There is a *Warp Text* command to transform text such as fisheye, flag, wave and arch. You can type horizontally or vertically and bend and distort any which way you choose.

There is a *Filters Browser* that displays thumbnail images of some 95-plus special effects so you can see how the filter will affect your image. When you find the one you want, just drag and drop a filter's thumbnail onto your image and the filter will be applied automatically.

You can experiment with your image and not worry about the changes you've made because there are multiple levels of undo in the *History Palette*. There is also a built-in *Background Eraser* that will let you create professional, seamless composite images. By simply dragging the tool across the portion of the image you want to keep, you can then erase the background without affecting the foreground object. Then just copy and paste the foreground object into another image and create a new composite image. You could make yourself or your friends show up in some strange places. No wonder photos are not used as evidence in a court of law any longer.

One fun tool is the *Liquify* filter that lets you quickly distort an image by interactively pulling and twisting the image as if it were made of putty. Your changes don't have to be real dramatic either. Say you have a picture of your mother-in-law who always frowns when she's around you. Take a picture of her and put a smile on her face subtly. (If you're like me you'll be tempted to put clown lips on her, but this time just ever so lightly make her smile.) Then show her the difference. If she doesn't like the picture, then go back and put the clown lips on her.

If you're into publishing your photos on a web page, like I am, ***Elements*** will make your life easier and your web pages load faster and look better. Using the *Save for Web* command lets you precisely and interactively optimize graphics for posting on the web by fine-tuning your output. I have a web site that mainly houses photos of family and friends. What used to take me hours to prepare for posting to the web now takes minutes, and the quality is much better. By using *Web Photo Gallery* I can now automatically produce photographic web pages without the coding hassles I've had in the past. Just a couple of mouse clicks and a couple of choices and I'm ready to upload. Wow! What a difference.

Elements follows through with Photoshop's ability to produce great printed results. Another added feature is the ability to create a *Picture Package* that automatically generates copies of a photo on a single page to maximize the use of expensive photo-quality paper by printing multiple layout options such as: two 5 x 7 images; four 4 x 5; one 5 x 7 and four 2.5 x 3.5; two 4 x 5, two 2.5 x 3.5 and four 2 x 2.5, and many more picture package templates (20 in all). You can change the resolution and color mode of each print job as well. A thumbnail contact sheet of all the images in a particular folder can also be printed with full control of resolution, color mode, layout, number of columns and rows, etc.

Adobe's excellent ability to manage color has also been built into ***Elements***, letting you choose full color management for the best print output, limited management for the best web output, or no color management if you think your images don't need any help. One feature that will come in very handy if your camera doesn't produce one of the major graphic file formats is *Batch Convert*. You can automatically convert multiple image files from one format to another. Simply choose the source file format, size and resolution and those settings will be applied to all files in a designated folder. You can also batch rename files from your digital camera to file names that make more sense.

I don't think I've covered all the features yet but I have at least hit the high points. I'm still playing with and testing ***Adobe Photoshop Elements***, but, suffice it to say, I think Adobe's got one hot commodity on their hands. Adobe thinks so too because they are giving you thirty days to try it out for free. Just go to http://www.adobe.com/products/photoshopel/demoreg.html, fill out a short form and download the free file. The file size is 53.4 megabytes. If you don't have cable or DSL, Adobe has provided a small VBOX Guaranteed Download Container, which will manage the download process and allow you to resume interrupted download sessions, should they occur. Save this program to your desktop. Once the download is complete, double-click on the VBOX icon to download the tryout to your system.

Adobe Photoshop Elements is really hard to beat. It takes the place of several other programs that I am currently using and appears to do a better job. The price is reasonable and best of all it can be tried for **FREE**. System requirements are a Pentium class processor, any version of Windows 98 or better (or Mac 8.6 or better), 64 MB of RAM, 150 MB of hard disk space, at least a 256 (8 bit) color monitor with 800 x 600 or better resolution and a CD-ROM drive.

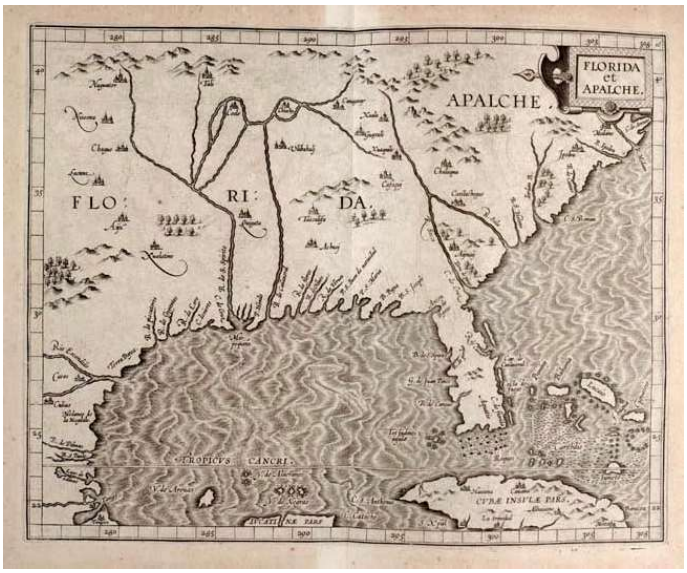
What have you got to lose? Give it a try. **You won't be sorry!** ◆

(President……..Continued from page 1)

On May 2-3, 2001, TPCUG had a presence at ITEC. Because of the publication time for the newsletter, I'll be writing more about ITEC in the next issue of Bits of Blue.

Our July meeting will not only be at the new location, but it also will be on Thursday, July 12th instead of Wednesday the 11th. The library wasn't available on Wednesday and luckily Bruce Register was able to change his scheduled presentation to the 12th. I hope this doesn't present a hardship for anyone. It was the only reasonable way to work out the problem.

Don't forget, we will be changing our meeting time starting in May. The Windows SIG will begin at 6:30 and the presentation will begin at 7 PM.



Happy computing! ◆

(Minutes……..Continued from page 2)

pated in a very interesting Q and A session. He responded to very specific market questions. The Tampa PC Users Group is very appreciative for the presentation. He gave us several door prizes that were given away.

Some asked for contact information for JRInkjet, last month's presentation. It is http://www.tubecomputers.com and email: sales@tubecomputers. ◆

A Few Meandering Thoughts

By Tim Condon
Tampa PC Users Group
tim@free-market.net

MEANDERING THOUGHT #1: VIRUSES, WORMS, AND OTHER BAD STUFF

If you're connected to the Internet---and who among us is not?---it's getting increasingly important to start thinking about security and protection from these things (don't ask me what the differences are among them; look it all up on the Internet, where all knowledge in the universe now resides). The reason I mention this area is because I've been hit lately, repeatedly, with several viruses, one of which is named the "Bymer Worm" and another known by its name of "ttfload.vbs" or "ttfloads.vbs" (the latter is what's called a "visual basic script," which is why it has the .vbs ending on the file that gets snuck into your computer).

Those two viruses aren't as destructive as some other payloads; over time they'll slow your computer down, interfere with the operation of your network, cause various anomalies to occur that make you think you've got a hardware or software problem, etc. But there are others out there that will try to destroy your computer system, erasing all or part of your hard drive in the process. Those little babies are another story. Right now, your story is this:

A. You need to have a real-time anti-virus program installed on your machine, running at all times, particularly when you're logging onto the Internet. And you need to have a regular schedule when you run your anti-virus program and scan every file on every hard drive in your system (I do mine monthly; others prefer a more frequent schedule). The most popular anti-virus programs appear to be Norton Anti-Virus, Trend Micro's PC-cillin, and McAfee's anti-virus program. Do some investigating on the Internet, where all knowledge in the universe now resides, to find out more for yourself. (I use the McAfee ActiveShield and Virus Scan Online products, and they work well.)

B. You also need to have a relatively new type of program that's been invented just in the last year or two. The general moniker of such programs is "personal firewall." There are plenty of them out there, including some pretty good ones which are free. Because of the repeated attacks on my system, I've found, downloaded, and now use a free one called "Tiny Personal Firewall." Its technology is said to be based upon U. S. Navy encryption and firewall technology, and many people speak very well of it. It certainly has been working for me. Do a search on the Internet (where all the knowledge in the universe now resides), and you'll find tons of info about Tiny Personal Firewall, as well as other popular programs that do the same thing. Particularly at risk in this area are cable and DSL connections (which are "always on" in the background, and thus subject to being attacked at any time by hackers).

To find out just how exposed you and your computer may be when you're logged onto the Internet, go to the following location, where Gibson Research has set up a free service that checks your computer's vulnerability as you watch: Go to http://grc.com, and then click on the Shields Up! icon. You'll be able to download a small free program called "Shields Up Test," and then be stunned to find out just how "open" your computer is to adolescent hackers.

MEANDERING THOUGHT #2: ONLINE BACKUP SERVICES

We all know that backing up our computer systems and data is absolutely essential. Especially in the case of businesses. Our entire businesses now "live" on computers, and (a) theft of our computers or (b) hardware breakdown or (c) a fire in your building or (d) other natural disaster could very well shut your business down. Up until recently the solution was one of a variety of back-up technologies, including zip drives, tape drives, CDR (rewritable CD-ROM's) drives, and even good old fashioned disks. Now there's another technology surging as an answer to this ancient (say, 10-year-old) problem: Online backup services.

With an online backup service, basically what you have is a company with huge backup capabilities. You connect with them over the Internet and upload your data files, business files, or the contents of your entire computer network, to their storage drives. Then, no matter what happens to your office (earthquake, fire, hurricane, attacks by giant beetles, etc.), your essential files are stored safely way far away, from whence they can be quickly and easily downloaded.

Couple of caveats. First, you really want to be on some kind of a broadband connection such as DSL or cable modem if you're going to use an online service. It takes a lot of time to upload your files to such a service. But who cares, if the uploading is happening overnight? Second, although most of these backup services offer free accounts, those types of accounts are limited in size. If you want to safely back up your entire business with an online service, you'll be paying a not-too-big monthly fee. If you want to try out such a service, the obvious thing to do (as I am) is sign up for a free service with only 25 to 50 megabytes available, and try it out. I'm currently compressing all my data files, and a few others for safety's sake, and uploading them to an online service called Connect.

For more information, do a search for "online storage" providers on the Internet, where all knowledge in the universe now

(Meandering……..Continued on page 7)

(Meandering……..Continued from page 6)
resides. Some of the companies that you'll read about include those located at http://www.myspace.com, http://www.xdrive.com, http://www.freedrive.com, http://www.idrive.com, and http://www.driveway.com. Check'em out.

MEANDERING THOUGHT #3: VIRTUAL PRIVATE NETWORKS

If you travel much and could use remote access to your home or office computer files, you need to take a close look at http://www.mangosoft.com. This company has created an astoundingly easy implementation of a virtual private network ("VPN") which you can try out for free for 30 days (see if it works, after all). The implementation is called "mangomind" and will create an "extra hard drive or drives" on any computers you want when you download the software from mangosoft. The "extra hard drive(s)" will simply appear on your home or office computer, just like extra drives on a local network. And the service sets up so that it or they will be easily accessible to your laptop or other computer from anywhere else through an ubiquitous Internet connection.

Up until now, VPN's have been somewhat expensive and unwieldy, reserved for the big corporations with the money and techies to make it all work. I tried out the "Mangomind drive" (as they call it) VPN and found it to work incredibly easily. It's just like having an unlimited network connection that you can access from anywhere when you're whiling away the time at a deposition in New York, Singapore, Costa Rica, or wherever. Consider what that means (about the Mangomind drive, not the foreign deposition): You can get onto your home or office computer system and pull up any file, any document, any information you need, about any case, from anywhere, just about as easily as you do when you're in the office itself.

I didn't keep the Mangomind drive implementation, which costs something like $25 per remote user per month, because I don't travel that much, and I don't have a bunch of lawyers in the office who need to share. Perhaps some of the rest of you do. It would pay you to check out the Mangosoft offerings, just in case.

Oh yeah, one other thing. "What's a virtual private network," you want to know? Beats the hell out of me. Look them up on the Internet, where all knowledge in the universe now resides, and learn all about them.

MEANDERING THOUGHT #4: NAPSTER, CYBER-NARC AND E-BOOKS

By now everyone knows the sad, unfolding tale of Napster. The Internet music-sharing service where copyrighted music is downloaded "for free" is in the process of being squashed by the evil Recording Industry Association of America (RIAA), along with some rock bands who have piled on, including Metallica and Dr. Dre. While Napster attempts to fight off the barbarian hordes with help from high-powered legal talent (notably David Boies, last seen representing Al Gore in Florida and before the U.S. Supreme Court), other free services are taking over, multiplying like cockroaches in the walls. Jockeying to take the place of Napster are music sharing/stealing (depending on your outlook) services, including Gnutella, Freeinet, Aimster, Napigator, and lots and lots of others.

But wait! The RIAA and their rock star supporters have birthed a new phenomenon, "Cyber-narc"! This is a private company that cybernetically "sniffs" throughout the Internet, finding computers that are sharing or offering to share copyrighted music. When they find such a computer, they accost not the computer-users but the ISP (Internet service provider), telling them that someone they're providing service to is illegally sharing copyrighted music, and **they** (the ISP) will be sued if they don't put a stop to it. So the ISP then goes after the music-sharers, cutting them off if necessary. I ask you, is this a great idea or what?

Perhaps more importantly, however, is the looming battle over electronic books and texts. The Internet is, above all, a supreme tool for information-sharing. And the "digital information" can be in the form of music, or books, or pictures, or speech, or non-music sounds, or anything else that can be rendered into other bitstreams. Who gets hurt when everyone is able to share everything with everyone? You would think the artists and writers and poets and the such. But it's not that, not really. The **real** victims of such an information-sharing revolution will be those who make their money off of being the "middleman" between the creators and the consumers. That is, the distributors. In the case of music, it's the big record labels. In the case of moving pictures (coming to a computer screen near you, soon, just wait), it's the film distributors. In the case of books, it's the publishing/distribution industry. In each case huge amounts of money are skimmed off by those who "reproduce and distribute" the product, whether it be music, moving pictures, or writing. The middlemen.

So, perhaps predictably, about two months ago megapublisher Random House filed a lawsuit against a tiny new "ebook publisher," RosettaBooks LLC, accusing the new company of illegally selling electronic copies of books written by Random House authors. Which in turn started a giant imbroglio over who exactly **owns** the rights to distribute electronic renderings of books. The head of RosettaBooks fired back at Random House, saying that his company had contracts with the Random House authors to distribute their writings electronically. Random House fired back that **they** owned the exclusive rights to distribute the works electronically ("ebooks," as

(Meandering……..Continued on page 8)

(Meandering……..Continued from page 7)
they're increasingly being called).

If you go to http://www.rosettabooks.com, you'll see a quite interesting selection of ebooks for sale, including some authors who are otherwise published by Random House. Of course the prices are still ridiculously high, "25% off retail price," but that will change. And the industry still awaits a truly handy ebook reading device, which hasn't been invented and marketed yet. But the future is still visible: Less paper, more bitstreams; less ink, more digital rendering; less warehousing and trucks, and more instant downloading.

In the meantime, the lawsuit between Random House and RosettaBooks apparently continues.

MEANDERING THOUGHT #5: PUBLIC RECORDS ONLINE-"YOU CAN'T DO THAT!"

With all the ferment going on throughout the civilized world (not to mention the uncivilized parts, like China) regarding the Internet, it would seem to be a "given" that public records such as you find in courthouses (mortgages, property deeds, judgments, satisfactions, etc.) are going "online," and soon, right?

Well...not really.

But wait! Don't "public records" mean "public records"? Can't anyone go down to the courthouse and pull out any court file or other public records and peruse its contents? That's true. But some people, and apparently some courts, think that public records shouldn't be public if it's "too easy" to access them. For instance, there's a battle going on in Virginia right now over whether to allow the posting of public court case documents on the Internet. Some say that criminals and businesses and other nefarious types can send "crawlers" or Internet robots around to collect personal information from court records if they're posted on the Internet, and then use that information for all sorts of nefarious purposes. Similar battles are going on in Texas, Kansas, New York, Ohio, and all over the place otherwise.

The problem is that traditional public records exist in what experts call "practical obscurity." After all, who takes the trouble to go down to the courthouse to pull those court files and sniff out information about individuals. But when it's right there on the Internet, for everyone to see, including your Aunt Matilda, well, that's seen as far different.

Hold on, says the media-driven Reporters Committee for Freedom of the Press. Those **reporters** sure do go down to the courthouse and sift through those court records to get what they need, but they don't want it kept off the Internet either. The executive director of the reporters committee, Lucy Dalglish, says, "This is all kind of nutty, part of what I call technology hysteria....If something is so sensitive that it needs to be sealed, you can do what people do now: Ask a judge to seal it."

One prominent battle in this area was lit off when one of the parties in a libel suit set up a web page and moved to post entire discovery depositions of parties involved. Invasion of privacy? Public records? A First Amendment issue? The judge in that case initially granted an injunction against posting the depositions, finding that irreparable harm could come to one or more parties if the stuff was posted (you can imagine what areas the defendant's lawyer got into when the plaintiff was deposed; it soon degenerated into juicy tidbits about extra-marital affairs, drug usage, and other great stuff).

Which way will this issue break? Who knows? Stay tuned for more on this emerging battle.

MEANDERING THOUGHT #6: DSL FOR EVERYONE COMING

For us big-town people in places like Tampa and Orlando, Miami and Ft. Lauderdale, getting broadband internet connections is no big thing. Many of us even have choices between ADSL ("asynchronous digital subscriber line," or "DSL" for short) and cable. However, for you country people, there's often no broadband offering at all. This is because cable Internet access systems piggyback on cable TV lines, and lots of places still don't have cable television offerings. As for DSL, there are range limitations; it only works within a few thousand feet of a telephone company switching station. As a result, only about 65% of the average telephone company's market is reachable with present technology.

But that's all about to change. At least one company, Symmetricom, as of January 2001 successfully demonstrated a "repeater" for DSL applications. The new technology is said to have demonstrated a 30-fold improvement over conventional DSL installations. Meaning that broadband Internet access through DSL service will soon be available to 95% of the average telephone company's market. Stand by. Broadband access will soon be here for everyone.

MEANDERING THOUGHT #7: FABULOUS, FREE, FILE-FORMATTING TOOL

Finally, there's a new software tool out there which can be obtained for free, for previewing and printing out various types of files. It comes, oddly enough, from Kinko's, the copying, printing, photographing, collating, coloring, and everything else store. The program is called, quite originally, the "Kinko's File Prep Tool" and can be downloaded for free from http://www.kinkos.com (or obtained in CD-ROM format at any Kinko's store). What's the big deal about it? Consider

(Meandering……..Continued on page 9)

(Meandering……..Continued from page 8)
this:

Everyone has heard of the Adobe Acrobat Reader, the program that reads "PDF" ("portable document format") formatted files. The PDF format is a de facto standard for rendering and reading of pamphlets, books, magazines, pictures, web pages, etc. It can be obtained for free, and virtually everyone who's spent any time on the Internet has downloaded a copy.

Of course, there is another Adobe Acrobat program, the one that is utilized to **create** the standardized Acrobat programs. It's **not** free. Not by about $250. What's the value of such a program? Standardization. When you create an Adobe PDF file and put it on the Internet for downloading by whomever---as many, many downloadable files are---you want to know that when the file is opened it will look exactly as you have set it up to look and that anyone can read it with the same, standardized reading program. That's hard to do with word processing programs, for instance, since the program on one machine might be (and usually is) set up with different settings from the program on another machine. Not to mention that someone who wants to read your document may not even **have** a copy of the program to read it.

Also, the Adobe program handles all kinds of formats in converting to the PDF format. It doesn't matter if the file you're converting is a word processing file, a web page, or a graphics format file. They all come out so that they're readable on the standard Adobe Acrobat reader program. **But...**while you can obtain a free Acrobat reader program in numerous places on the Internet, you must pay about $250 to obtain a copy of the Adobe Acrobat program that **creates** files in the standard PDF format.

So...enter the Kinko's File Prep Tool program. You can get it for free, and it does essentially the same thing as the Adobe Acrobat program that creates PDF files. Except when you install the Kinko's program, you obtain the capability of creating "KPF" files from any other program (it works like you're "printing to a KPF printer"); once you do that, anyone with a copy of the Kinko's program can open and read your document, whatever it may be, or have, or contain, or look like. Very handy. And of course the price is right. And one other thing. It's also...ahem...rumored that Kinko's KPF files can also always be read by the free Adobe Acrobat reader program. Interesting, hah?

Well shucks. I trust I haven't meandered too far afield for everybody. Much of what I've written above may be common knowledge to many of us computer-geek-types. But it's all new, at some time or another, to everyone else...all part of the incredible technological advances rushing upon us. This is just a small effort to outline some of those changes.

(Meandering……..Continued on page 12)

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

Web Bugs and HTML formatted mail in general caught my attention last month. If your email software supports HTML style messages, as most do, then you can send and receive email messages that look just like web pages. Microsoft's Outlook Express makes it easy to put pictures, links and formatted text in such messages, but if you want some of the other things like sound and items created with Java Script you have to be able to do the coding yourself.

To be able to enter the code, you need to be able to work with the source code. If you do not see three tabs in your New Message window saying Edit, Source and Preview, click on the View menu item and make sure Source Edit is checked. You should then have a Source tab. Click on it to see and modify the HTML source code of the message.

So what does this have to do with web bugs? Well, if I insert the following Java Script into the message's source code

```
<SCRIPT language=JavaScript>
document.write("<IMG SRC=http://www.
lamartin.com/images/small/a00100.gif>");
//document.close();
</SCRIPT>
```

every time this message is read, it will go to my web site and download the file a00100.gif. I will then be able to look at my web site server log file and determine when the file was ac-

itec

May 2-3, 2001
Tampa Convention Center
10:00am - 4:00pm Daily

Tampa Bay Information Technology Exposition & Conference (ITEC). ITEC will feature more than 2000 products and solutions, representing the latest developments in Computers, Telecommunications, Internet/Intranet, Software, Networking, Imaging and Records Management, Multimedia, Video Conferencing, Client Server, Network Security, Disaster Recovery, ATM and much more.

Special Interest Groups

Microsoft Access SIG

This SIG meets the first Monday of the month at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6:30 PM. For information contact either William LaMartin at *lamartin@tampabay.rr.com* or Merle Nicholson at *merlenic@tampabay.rr.com.*

Genealogy SIG

To be included on the TPCUG genealogy mailing list, contact Jenny Lind Olin at 960-5723 or *jlolin@tampabay.rr.com.*

Visual Basic for Applications SIG

This SIG meets the third Tuesday of the month, at the Gateway 2000 Store on North Dale Mabry at 6:30 PM. For information, contact Merle Nicholson at *merlenic@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Mary Sheridan moderates the discussion.

cessed and by what IP address(es). The person who read the email will, however, not be aware of this since the file is a 1 pixel graphic that is very small and white and, thus, doesn't show up on his white email page.

Norton AntiVirus versus Microsoft Publisher When using Microsoft Publisher, I can simply right click on text in a text box (like the article you are now reading) and bring it up in Microsoft Word for editing. That is I could before I installed the newest version of Norton AntiVirus.

When I attempted to bring up Word, I got a message something like: A Word Story Editing error occurred……. A search at Microsoft for such text revealed that it was a conflict with Norton AntiVirus. They gave a solution which was also repeated at the Norton site. The only problem was that the solution didn't work—as other people had told them in the discussion forum that Norton was hosting on such problems. I added my two cents worth and received the response that it should work.

The supposed solution was to unregister the DLL Officeav.dll using regsvr32 /u "C:\program Files\Norton\AntiVirus \Officeav.dll" in the Windows Run text box. After going back and forth with Norton via email for a day with no improvement, I decided to simply rename the DLL by putting a $ in front of the name so that it couldn't be found. That solved the problem.

Apparently on some systems simply unregistering the DLL worked, but possibly because I am using Win Me it took more drastic action in my case. Who knows?

Taskbar Stuck I went to help a new client with her computer problems, and the first thing I noticed was that her Windows Taskbar was on the right side of the screen and could not be moved — even though moving and resizing of the Taskbar was enabled in the Taskbar's advanced properties. A search at http://search.microsoft.com revealed that the solution was to simply restart Windows in Safe Mode, then shut down and then restart Windows as usual—and they were correct this time.

Show Desktop Icon Missing The next problem was that there was no Show Desktop icon on the Taskbar. You know, the icon you can click on to minimize all open windows so that you have your desktop back. Well, I could find nothing at Microsoft on this, but http://www.deja.com/usenet came through with several newsgroup articles with the solution. The solution was:
Find the Show Desktop file in C:\windows\system and drag it to the appropriate place on the Taskbar. Nothing to it when you know what to do.

Map A new meeting site—in June—requires a new location map. I have created one, and you can view it at our web site at http://www.tpcug.org/images/library_map.jpg. If you can't type in all that, there is a link to it on the Announcements page.

For the curious, to make the map, I first open a mapping program like Street Atlas USA, view the area I want a map of and copy the screen to the Clipboard. Next I open a "drawing" program, Adobe Illustrator, and paste the map in from the Clip-

Meeting Preview: Ray Hall will tell us about using computer software in investing. As usual, Mary Sheridan will conduct a computing and Windows discussion for the first 30 minutes of the meeting.

President's Message

By Mary Sheridan, President, Tampa PC Users Group
mcpease@mindspring.com

If you haven't heard yet, MOSI has told us we have to find another location. We can meet at MOSI in May but will have to be moved for the June meeting. I was sad at first and then realized that maybe it would be a good thing. The room at MOSI had gotten very crowded and it was always a headache finding someone to open the door for us. William LaMartin has suggested a library branch that looks promising. Merle Nicholson has told us in the past that we could use the TECO facility on 9th Ave. Any-

(President.....Continued on page 5)

**Beginning with the May meeting,
the meeting time is changed to 6:30.
Beginning in June, we will meet at a new location.**

May 9: To be announced

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members. Our mailing address is P. O. Box 3492, Tampa, FL 33601-3492.

However, for business concerning this newsletter, Bits of Blue, please contact the Editor, William LaMartin, at 821 S. Boulevard, Tampa, FL 33606-2904; 813-251-3817; lamartin@tampabay.rr.com.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII, Microsoft Write, Microsoft Word, or Word Perfect file to the editor at 821 South Blvd., Tampa, Florida 33606-2904 or to lamartin@tampabay.rr.com.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

The use of trademarked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

Minutes of the March Meeting

By Mary Sheridan, President,
Tampa PC Users Group
mcpease@mindspring.com

Mary Sheridan had a Windows SIG from 6 PM until 6:30. At 6:30 the meeting was opened and club business was discussed.

At 7:00, Bruce Register induced our presenters. He explained that he had met Claire Emanuel at the FACUG Spring Conference and she had graciously agreed to do a presentation for us. Kevin Hunt was also on hand to help with the presentation.

Claire began the presentation by explaining that she represents a company called Tu.Be. Computers located in Englewood, FL. Tu.Be. Computers are distributors for many types of computers and computer related products. They are also the distributors for JR Inkjet. JR Inkjet is a seven-year-old British based company. JR Inkjet developed the Universal Refill Ink Kit. Their refill kits can be used with over 400 different types of cartridges. Claire showed a slide show explaining how to refill an ink cartridge. Make sure you refill your cartridge over a protected surface, like the sink or a counter top covered with paper towels because you might get a few drops leak out of the cartridge and you don't want to make a mess. Be careful how you handle the cartridge's print head. They are usually metallic and might be damaged if you touch them. Cartridges should be refilled when they aren't quite empty. When cartridges are allowed to dry out, they may not be useable anymore. The refill kits come with a flush, so if your cartridges have dried out, you can still possibly use them by first running the flush through the print heads. The flush kit will dissolve the dried ink. The starter kit that Claire had for sale contained two 20 ml bottles of black ink. The amount of times you can refill your particular cartridge with the starter kit depends on how much ink your cartridge holds. The kit comes with the primary colors, cyan, yellow and magenta. JR Inkjet offers the starter kits at a special price to

Netgear 314 Gateway Router

By William LaMartin, Editor,
Tampa PC Users Group
lamartin@tampaby.rr.com

If you are using a cable or DSL connection to the Internet and have more than one computer, you need one of these routers. In the September 2000 newsletter (http://www.tpcug.org/newsletter/nl_2000/September2000/cable_router.htm), Larry Anders wrote about his good experience with the Linksys router. This month I am writing a similar laudatory article on the Netgear router with a four port 10/100 Mbps switch.

For several years, I have had a network connecting the four computers I and other family members use around the house. And, as described in an article in the April 2000 newsletter (http://www.tpcug.org/newsletter/nl_2000/april2000/comments200004.htm), I had even run extra cable so that I could connect the upstairs computer to the downstairs cable modem when I wanted more than a regular dial-up connection for that computer. But I had resisted the Microsoft Internet Connection Sharing feature of Microsoft Windows 98 SE and Windows Me since some aspects of it didn't appeal to me. Neither did the installation of proxy server software, which also allows you to share an Internet connection, which I tried way back in 1997 and wrote about in an article in the December 1997 newsletter (http://www.tpcug.org/reviews/december97.html). But after Larry's article I began researching such routers and watching the pricing.

Last month when I stopped by CompUSA for some new antiviral software, I noted that they had the Netgear 314 router on sale for $129, down from the usual $169 by way of an instant $20 rebate and a $20 mail in rebate. So I could wait no longer.

The router's installation is basically very simple. Each of your computers that will be connected to it will need a network card. These cards need to each have Client for Microsoft Networks installed, as well as the TCP/IP protocol with the TCP/IP that is bound to your network card set to obtain its IP address automatically. This can all be achieved by a right click on the Network Neighborhood icon on the desktop (Network Places in Win Me) and then a click on Properties.

Next, to install the router, with everything powered down you connect your cable or DSL modem to the Internet port on the router, then connect the network cable from each of up to four computers to one of the four Local ports on the router. Finally you plug the router's power adapter into an AC outlet and then power everything up. Everything worked right out of the box for me with the exception that I couldn't see the files on one computer from the other computers. That problem was solved by enabling File sharing for that computer's drives.

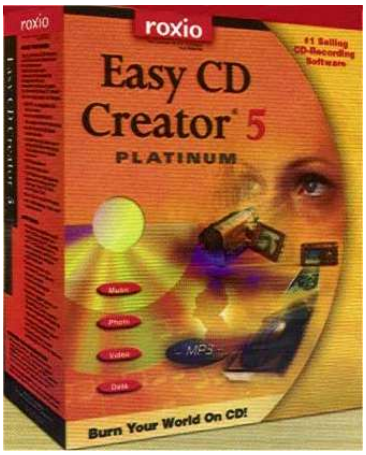
The Netgear 314 Router is the same size as the cable modem

The router dynamically assigns each computer on the network an address like 192.168.0.2, 192.168.0.3,…. The router itself has address 192.168.0.1, and you communicate with it via a Telnet to this address. When you do this Telnet you are presented with many menus which allow you to configure the setup in many ways. For example, if you want to be able to run a Microsoft NetMeeting session from a specific computer on the network, say, computer 192.168.0.2, then you will need to use Menu 15 to assign ports 1720 and 1503

(Router……Continued on page 7)

Easy CD Creator 5 Platinum Software Summary

By Larry Anders, Librarian, Tampa PC Users Group
larryanders@msn.com



The best just keeps getting better. Several years ago, when I got my first CD burner, Easy CD Creator (EZCD) came in the box with the burner. It was not the latest version, but it didn't take me long to realize this was to be a software package that I would become very familiar with. Because I had that older version of EZCD that came with my burner I was qualified to buy the upgrade, which I did, the same day I got my burner.

I put off purchasing my first burner for quite a while, mainly because of the cost, and also because it was a whole new world of computing that I knew nothing about. But they don't call it Easy CD Creator for nothing. Within 5 minutes of installing my first version I had burned my first CD. Now that's EASY!

Suffice it to say that Adaptec, which I guess now goes by the name of Roxio, has always tried to make EZCD your one stop shopping for CD burning software. And with version 5 Platinum they've gotten enough software to let you do things on CD that you probably never thought you would or could.

As I indicated in the title, this is more of a summary than a review. Here's what you get with Easy CD Creator 5 and some of the things you can do:

- **Easy CD Creator 5 Platinum (of course – but hold on to your hat!)** Easily creates data, audio and multimedia CDs on your PC.
- **SoundStream 2** Enhances the sound quality of MP3 files or records from analog (phonograph, tape or microphone) or digital sources while filtering out the pops, clicks and hisses. Loudness balancing for tracks from disparate sources. Save CDs to HD to create a virtual jukebox of compressed CDs on your computer.
- **Direct CD** Save directly to a CD as if it were a hard drive. Previously, this type of CD could only be read

by another CD burner using Direct CD but now it will automatically "make-writable" on eject so that basically any CD reader can read it.

- **Take Two** Use your CD-R/RW Drive to recover from hard disk disasters.
- **Spin Doctor** Turns your scratchy LPs into Digital quality CDs (nearly).
- **CD Copier** Copy directly from one CD to another, but remember… if you don't own the rights, copying commercial CDs to sell or give away is illegal. Recordable CDs created with such material should be for personal use only.
- **VideoImpression** Easy to use video editing features such as trimming, combine, text overlay and transitions to video clips. Includes MPEG 1 video encoder to save video in the correct format for VideoCD Creator.
- **Photo Relay (which includes Photo Album and Video Postcard)** Make your own photo albums adding sound and narration or email video postcards that any PC can view without any special software.
- **VideoCD Creator** Become a Hollywood director and make your own videos with your very own multimedia studio. You can edit video clips, add text or apply transitions between scenes.
- **CD Label Creator** When you're all done creating, make your very own labels to cover your newly created CDs and CD cases.
- **Sound Editor** You not only have the ability to edit video but audio as well.
- **Session Selector** You don't have to burn a CD all at once any longer. Start it now and finish it later by starting a new session.
- **Web-CheckUp** With EZCD you're always assured of having the latest updates. Just go to the website and give yourself a check-up.

You can also download Internet music, including MP3 tracks, and record to your own CD's, create

(Easy.....Continued on page 9)

(President……..Continued from page 1)

one else who has any potential locations, or just some new ideas, please let a board member know about it.

The Spring Conference for the Florida Association of PC Users Groups was a huge success. We had 140 attendees representing 34 user groups. There were people from Michigan, near Knoxville and Atlanta. The food was excellent. The conference was well planned and a great learning experience for everyone who attended. The attending members from TPCUG were Jenny Lind Olin, Bruce Register, Kevan Sheridan and Mary Sheridan. Mike Hodges was only able to attend the Saturday sessions, but hopefully he found it a valuable experience. The APCUG representatives attending the FACUG conference held a round table session discussing what APCUG has to offer user groups. Two members of the APCUG approached me after the conference. They said their representative from Florida has resigned from the board of advisors and asked if I would consider filling the position. They assured me it wasn't going to consume too much time, so I agreed to help them out.

Editor's Comments: Microsoft Windows Media Encoder, Adobe Atmosphere and Renegade Fonts

By William LaMartin, Editor
Tampa PC Users Group
lamartin@tampabay.rr.com

Renegade Fonts Let's do the font bit first. In the June 1996 newsletter I mentioned a problem in Microsoft Access caused by the Hatten font installed with Microsoft Publisher 98. It was the first time I had run across the fact that having a certain font installed on your computer could cause a program to malfunction. I must admit that I don't understand how a "bad" font could cause a program to crash if the program doesn't use that font, and I don't think the program in question, NetMeeting, used any of the fonts I deleted to resolve the problem, since they were all dated before 1995.

Here's what happened. On a computer on which I had done a clean installation of Windows Millennium several months earlier, I decided to do a NetMeeting. On doing this, after NetMeeting had essentially loaded, I got the message "CONF caused a general protection fault in module GDI.EXE." If I closed out this message, NetMeeting would also close. If I just left the message up, then NetMeeting seemed to run sort of OK. There were problems, but they could conceivably be the fault of the other person in the meeting. A check of the Internet and Microsoft's site produced no mention of such a problem.

This past week, which was a couple of months later, I again tried out NetMeeting and received the same error message. However, this time much more seemed wrong. So, as I had done before, I went to Microsoft and downloaded the current version of the program and reinstalled NetMeeting. I also got the newest version of the Internet Explorer package and installed it. The error was still there.

I then searched the http://www.dejanews.com/usenet site (now redirected to Google) for that error message and found out that others were now having the same problem and that Microsoft had said it was caused by incompatible fonts. I went to the article at Microsoft and found out that I needed to remove all fonts dated differently than the date on my Win.Com file and see if NetMeeting ran OK. I did this—and it did. So some program that I had installed had installed one or more fonts that NetMeeting didn't like.

To get as many fonts back as possible, I reinstalled them in blocks ordered by date until the problem reappeared. The problem returned when I added back fonts dated earlier than 1995. I didn't really care about any but two of these fonts, so I reinstalled these two, which caused no problem, and threw away those remaining before 1995.

I have left out a very important detail—how did I remove the fonts and then get them back? I will let you think about that for awhile. You might try it on one font and then think how well what you did would work for hundreds.

Windows Media Encoder Those of you who check your email or look at our main web page, http://www.tpcug.org, know that I put at our site several Windows Media Player files of audio versions of some of the articles in the March newsletter. It was an interesting experiment.

If you would like to record audio and/or video in Windows Media format, go to Microsoft and download the free Windows Media Encoder. It also allows you to change audio and video files in other formats to the Windows Media Player format.

Adobe Atmosphere, really Adobe Atmosphere Beta Builder and Browser plug-in, allows you to create 3D virtual interactive worlds and to view them in your browser. The builder and the browser plug-in can be downloaded for free from http://www.adobe.com/products/atmosphere/main.html. I am sure the browser plug-in will remain free, but in the release version the builder will be a retail product.

(Editor……Continued on page 7)

(Editor……..Continued from page 6)

As you may know, I have played with 3D virtual worlds before, and there is a "TPCUG Virtual Reality" link on our main page to prove it. That was done in a piece of software written by, I think, a company called Cosmo Software. Corel packaged Version 1 of the program with its WebMaster suite and called it CorelWeb.World back then. I later tried Version 2 of HomeWorld or some such name from Cosmo Software and almost had a much better TPCUG world created when my trial time period ran out. I didn't love or need the program enough to purchase it, so the improved TPCUG Virtual Reality world never saw the light of day on the Internet.

The above mentioned 3D rendering for the Internet used a VRML plug-in for your browser. Now such technology is an integral part of Internet Explorer in its latest versions. Atmosphere, however, does not employ VRML but rather its own technology. That is why you need to download their Atmosphere plug-in to view worlds created in Adobe Atmosphere. So, do it right now. Go to http://www.adobe.com/products/atmosphere/main.html and get the browser plug-in. Once you have done that you can view my first attempt at http://home.netcom.com/~lamartin/aa1_test/first.htm. To see more professional examples, click on one of the Adobe book marked links that appear on your browser.

The image on this page is a screen capture of my first world created with Atmosphere Builder. It is not very polished, but it gave me a chance to try out the program. You are viewing the scene from inside a tunnel. There is a photo gallery where you can view the photos on the walls. There are stairs to climb and portals that if entered will transport you to other 3D worlds. The man you see in the image is an avatar representing another visitor to the world other than yourself (you do not see the avatar representing you—however you can choose what it looks like and others visitors to the world will see him). There is a chat feature that allows you to chat with all other visitors to the world.

One feature I've done just a little with is the use of Java Script to make the world a little bit interactive. I have used this idea to play a sound when someone moves their mouse over a particular object and to jump to my web site http://wwwlamartin.com when they move their mouse over a LaMartin.Com sign in the world.

Adobe hosts an Atmosphere discussion forum where you can ask for help and, as you get better at building worlds, give help. The Builder program really appeals to me, but, after getting my first world up and running, I am going to have to let it rest for awhile and get some other things done. ◆

(Router……..Continued from page 3)

to address 1922.168.0.2.

Similar considerations exist for interactive games like Quake, or using a particular computer as a web or FTP server. To be able to use your computer for such purposes, you will have to assign certain ports to a particular computer and possibly remove certain default filters that are implemented in the default setup of the router. There is a very detailed manual in Adobe Acrobat format that describes how all of

(Router……..Continued on page 9)

FACUG Spring Conference

By Jenny Lind Olin, Treasurer,
Tampa PC Users Group
jlolin@tampabay.rr.com

Why Would Anybody Want to Attend the Florida Association of Computer User Groups' Spring Conference? It is a good occasion to have fun, meet a lot of people who talk "computerese," see a lot of software demonstrated, get a lot of free software, or purchase software at reduced prices. You can get six meals for a mere $35.00 per person, the total cost of the registration. You can stay in a hotel, bring your mobile home, stay with relatives, or drive back and forth. So there is no cooking, doing dishes, making beds or housework for two complete days.

The Spring Conference is not all about having fun and getting away from it all. It also provides a great opportunity to talk to other leaders from other computer user groups to learn what they are doing to gain and keep their membership, what kind of programs they offer, how they have solved some of the same problems that may be challenging your group.

Granted, Friday night is mostly social. The only responsibility you have is to pick up your stuffed bag of goodies and study your Schedule of Events. Then, after a couple of hours of socializing with new and old friends from years before, you are on your own until breakfast the next morning. Then it is nonstop all day long.

This year, Apple Computer sponsored the Saturday breakfast and gave a presentation. On our way out of the room we picked up a tube which contained a couple of posters. The Apple hardware design is so modern it makes you want to own something that is not consider a clunker anymore. Apple had provided a free sweatshirt which was found in the book bag (like the ones you carry your books back to the library in) picked up at the registration desk.

Also in the bag was a black tee shirt from Borland with a slogan on the back: "Go.com yourself." I thought that was clever. Those book bags were sponsored by JR Inkjet and Jasc Software. The printing of the Schedule of Events was through the courtesy of Office Depot, who had also given us a small stickem pad and a plastic box for our paper clips, part of the stuffing in our bags. So you see there is a lot of involvement from the vendors to make the Spring Conference a lot of fun.

Adobe Systems Incorporated sponsored the Saturday luncheon and presentation. Everybody was given an Adobe GoLive 5.0 package for Professional Web authoring and site management. The Dinner Event was sponsored by FACUG, but the prizes for the contest winners were sponsored by different vendors. The prizes for the winner of the Home Page Contest and the Newsletter Contest were from Adobe. Adobe is always so generous with those prizes. They helped stuff our book bags with several CDs, which included the latest version of Adobe Acrobat Reader software, Adobe Active Share software and trial versions of about ten of their products in both PC and Macintosh format.

The Logo Contest prize was sponsored by Corel. The Community Service Award was sponsored by FACUG. So you can see where prizes were given out for doing something great or just for being there.

The grand finale for Saturday evening was the Annual Business meeting where the new officers and board of directors were introduced. Our president, Mary Sheridan, was elected the state FACUG secretary. Congratulations are in order for that honor.

The Sunday breakfast and presentation by Mary Sue Cameron, who was very cheerfully animated, was sponsored by Microsoft. Everybody received a backpack from Microsoft. The Sunday luncheon and presentation were sponsored by MGI Software. We all received a ticket each time we entered the dining area. After each presentation there was a drawing and about five big software items were given to those lucky winners. Sometimes they marked one chair or gift package left on the table and so one person at

(FACUG……Continued on page 9)

(FACUG……..Continued from page 8)

each table received a prize. The suspense was just awesome.

There were several other sponsors who provided prizes along with the above mentioned sponsors for the conference. Then at the Sunday afternoon "Displays," products were demonstrated, questions answered, and free software given out. Then we had "The Big Bang," which is the final drawing where there was a choice of many prizes. Everybody received something, although it was more beneficial for those who were called first. Those sponsors were Aladdin, Borland, Cassady & Greene, Corel, Demo Catz, Intuit (who gave everybody a Quicken 2001 Suite package like the one that was raffled off at our last meeting). Somehow I missed out on that offer. Those packages must have gone fast.

Was it all play and no work? No. We did have two sessions in the morning and two sessions in the afternoon with a choice of four different subjects being covered at each. We had our "Panel / Round Table" meetings offering such subjects as Running a Users Group, New Member Orientation, Building and Maintaining Membership, Programs and Presentations, Publicity and Public Relations, Advertising, Fund Raising, Working with Volunteers, Running a Software Review Program, Treasurer's Q & A, Newsletters, Web Design, APCUG Workshop, and Creating SIGs. One group has a Pig SIG where they meet at a restaurant every month and talk about computer stuff. A good idea for those who need more social events in their lives.

I was very impressed this year by the addition of Tech Sessions where you could go see different software being demonstrated. Some of the demonstrations were Digital Video Editing, and presentations by Adobe Systems, Jasc Software and Microsoft on their particular products.

Now I think I will go dot.com myself. ◆

(Easy……..Continued from page 4)

MP3s from your own music CDs, back up important files such as spreadsheets and financial data (or other important files), and free up valuable hard drive space by moving large files such as audio, graphic and multimedia files to CD.

These are only some of the things you can do with EZCD Creator. For $99 street price ($49 upgrade), it's hard to beat Roxio's Easy CD Creator 5 Platinum. If you haven't tried it, try it. If you have, then it's time to upgrade and burn, burn, burn! ◆

(Router……..Continued from page 7)

this is accomplished. However, for the average users, the default setup will probably do what they want.

user groups of $29.00. The kit also comes with a syringe and plugs needed for some cartridges. The kit retails for $45.00. You save money by being a member of the user group.

You can save approximately $160.00 by using the starter kit to refill their cartridges if you buy a new ink cartridge every time the inks runs out They also have a black refill kit with only black ink. It comes with everything the starter kit has except the flush. Another kit that they sell is the color kit. It has cyan, magenta, and yellow inks, the syringe and plugs, but flush. All kits come with complete instructions on how to refill your cartridges. Most people who buy the starter kits then buy the larger bottles of refill ink. They have a 16 ml bottle of black ink and a 250 ml bottle. JR Inkjet has a lot of repeat customers. The have a toll free help line for any problems or questions you may have. Most cartridges have sponges inside, so you are refilling the sponge with ink. The color cartridge has three chambers with sponges. The ink is water-soluble and can be cleaned up with soap and water. The kit contains a tiny hand drill in case you need to make a hole in your cartridge, depending on the type of cartridge you have. JR Ink is dye based as opposed to pigment-based ink. Their ink is the highest formula ink. It is refined to 1/2 a micron to fit through the smallest ink jet. JR Inkjet is in the process of trying to get into the retail market. They are selling the kits on the Home Shopping Network. JR Inkjet was the first refill ink company. As long as you refill the cartridge before the sponges get dried out, you should be able to refill a cartridge ten times before you have to replace it. Printer Companies will often make their money on the consumables like the ink cartridges instead of the printers themselves. The inkbottles will last for a couple of years until they're opened. Claire then fielded questions from the group. You can buy an injector kit if you lose your syringe. All these items can be found on the Internet at http://www.tubecomputers.com. Claire had plenty of merchandise with her for sale. JR Inkjet uses Yahoo for their business web site. We thanked Claire and Kevin and took a short break. JR Inkjet donated two refill kits for our raffle. Bob Parks and John Witmer were the winners of the refills kits. Other door prize winners were: Clark Evans, a clock; Merle Nicholson, Quicken 2001 Suite; Jim Purcell, CD case; Mike Hutchinson, Corel mug; Tom Goff, T-shirt; and Brian Lance. ◆

On May 2-3, 2001 TPCUG will have a presence at ITEC. It will be at the Tampa Convention Center and the hours are 10 AM -6 PM. If you can volunteer anytime during these two days, please contact a board member. We will be working at the information desk and two of our members will be judging the World's Sexiest Geek contest.

Don't forget, we will be changing our meeting time starting in May. The Windows SIG will begin at 6:30 and the presentation will begin at 7 PM.

Until our next meeting, happy computing! ◆

President's Message

By Mary Sheridan, President, Tampa PC Users Group
mcpease@mindspring.com

June 13th will be our first meeting in the Jan Platt Library. The meeting will begin at 6:30 PM. It is a very nice meeting room, and I'm hopeful we may be able to increase our membership because of the move. Anyone who has friends in that part of town, please encourage them to join us at our new location.

The meeting on May 9th was very interesting. It was technical, but everyone seemed to be intrigued and reacted with enthusi-

(President.....Continued on page 4)

Beginning in June, we will meet at the Jan Kaminis Platt Regional Library, 3910 S Manhattan Avenue, Tampa at 6:30 PM

July 12 (a Thursday): Pens that scan and upload text to your computer

All other reproduction is prohibited without the specific written permission of the original author.

The use of trademarked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

Minutes of the May Meeting

By James Weber, Secretary,
Tampa PC Users Group
jlweber9@mindspring.com

We started our meeting with the Windows SIG at 6:30 PM. Shared high-speed Internet access is still a hot topic. William LaMartin has an outstanding article on our web site covering just this issue. It was in our April 2001 newsletter and can be found at http://www.tpcug.org/newsletter/nl_2001/april2001/netgear_router.htm. Wireless networking is becoming more visible but the cost is still too high in most people's opinion.

Mary Sheridan began the general meeting at 7:00 PM by announcing a change in venue for our monthly meeting. We will be going to the Jan Platt Library building at 3901 S Manhattan starting in June. She then announced our presenter, Mr. Sebastian Frey of 4D.

4D makes a web enabled data base program that includes a web server application and internal data encryption. 4D is intended as a tool for the small to middle size business but is scaleable to larger server configurations. System requirements are a modest Pentium 233 class CPU with a minimum of 32 MB of memory (48 recommended) and Windows 98 SE. The built in web server software is intended for "light work" and Mr. Frey suggested that a large web sever farm would want to use something like Apache or IIS. The web development tool has a built in debugger to assist in fixing web site code that may be improperly written. The encryption system works within the database itself, so if security is compromised from the outside, the information in the database cannot be downloaded or viewed.

For purchasing information go to http://www.4D.com.

Mike Hodges won a copy of 4D as a door prize. Lisa Fagan won a T-shirt.

(Minutes.....Continued on page 7)

TypingMaster 2002

By William LaMartin, Editor,
Tampa PC Users Group
lamartin@tampabay.rr.com

One of the most useful courses I took in high school was typing. That first became evident when I went to college and had English papers to type. It was then useful in my first job, but I think I really came to appreciate it when I first started using personal computers in the early 80's. You communicated with the computer through its keyboard. And the better you could type, the better you could communicate.

With programs like TypingMaster, anyone can become a proficient touch typist in a few weeks, I think. But you have to work at it. It isn't magic; it isn't something you absorb. It is something you attain through completing the lessons that the program leads you through.

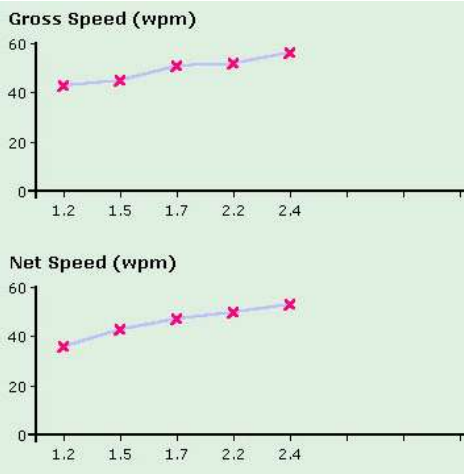
You start with positioning your hands in the home position and then practice typing simple two and three letter combinations. I am a fairly good touch typist, but I have fallen into some sloppy habits over the years. I am using the program to retrain myself, and what amazes me is how tired my hands get while doing the exercises. I have to remind myself to sit correctly and try to relax my arms and shoulders as I type.

Next, you practice typing short strings of characters that require you to occasionally reach up one row from the home row like "lassie". Again, although I am considered an "Expert" by the program, my arms and hands are quite tired by the end of the exercise. I am simply not used to typing for a five minute stretch without a break.

The program gives you a break between such exercises by offering you a typing game. The first such is the Bubble Game where bubbles float up, some with letters associated with them. As soon as you see such a lettered bubble, you are supposed to type in the letter. This is quite easy for an experienced typist—until the lettered bubbles begin to come fast and furious. The next such games consists of clouds floating by, some with words under them. But you have to do a bit more here than simply type in the words as you see them. You must first select the cloud with a word by using either the space bar to move forward or the backspace key to move backwards to it—only then will typing in the word get you points. So you see, these games are not really all that relaxing.

Then it is on to typing short sentences like "Kafka is as sad as a fake jade lass." Nobody says that what you type in practice has to make sense. That finishes lesson 1. And on the last exercise I typed a net speed of 47 words per minute. My goal is to get above 60 words per minute by the end of the lessons.

After mastering the home position, you move on to keys above or below the home row. First you work on r and u in combination with the keys you have



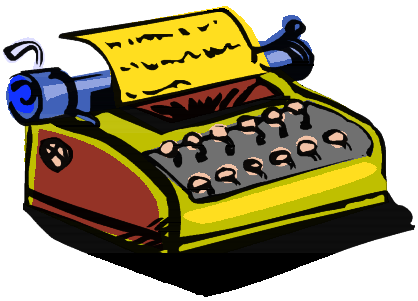
(Typing… … ….Continued on page 4)

(Typing… … ….Continued from page 3)

already learned. And here is when I began to make a few errors. Next it is on to another sentence test, where I manage to up my speed and accuracy a bit. And this is followed by the balloon game.

Next there is a paragraph test, which is the closest thing to a real-life typing test that I have had so far, in that the sentences in it almost make sense. We are still only using the middle two rows. I had a gross speed of 53 wpm and a net speed of 43 wpm with a 94% accuracy. I am not yet back to my high school speed, but I am only on lesson 2.5 of 12.

In addition to the Complete Training course, there are the Numeric Keypad course, the Refresher course, the Special Marks course, and the Typing Training for Typists course.



Along a different line there is ProTrainer, which is described by the company as follows :

> ProTrainer analyzes your typing while you are using your word processor, email program or any other Windows application and detects your most difficult keys and words. Based on this information ProTrainer is able to create fully tailored exercises for your current needs.

I let the company describe it since I haven't tried it yet. That will come after I have completed the 12 lessons.

TypingMaster 2002 is a good program with a non-cluttered interface. If you want to become a better typist, the price is right at their web site. TypingMaster 2002 with ProTrainer is $39.90, and TypingMaster 2002 Standard is $29.90 as online downloads. If you prefer to order the program on CD, add $5.00. http://www.typingmaster.com/.

They even have a free online typing test at the site. So go to the site and see if you even need the program. You may already be a world class typist. But I doubt it. ◆

(President… … ….Continued from page 1)

asm to the speaker. He was very knowledgeable and answered all questions with ease.

Here's a second reminder, that our July meeting will be July 12th instead of Wednesday the 11th. The library wasn't available on Wednesday, and luckily Bruce Register was able to change his scheduled presentation to the 12th. I hope this doesn't present a hardship for anyone. It was the only reasonable way to work out the problem.

Today I attended the Developer's Launch of Microsoft Office XP (for experience, they said.) The event was held at the Clearwater Harborview Center in Clearwater, FL. The suite of programs includes Microsoft Word Version 2002, Microsoft Excel Version 2002, Microsoft Outlook Version 2002, Microsoft PowerPoint Version 2002, Microsoft FrontPage Version 2002, Microsoft Access Version 2002, and Microsoft Publisher Version 2002. Microsoft is working on integrating their products with all kinds of handhelds and portable

(President… … ….Continued on page 5)

(President… … ….Continued from page 4)

devices.

The presenter at the launch said there are 250 million Microsoft Office users in the world today. He also noted that 90% of all PC users have Microsoft Office. I thought this was surprising and didn't realize how widespread the use of this product had become.

There were additional products being promoted at the launch. Microsoft SharePoint Portal Server was one. This program enables collaboration over the Internet and intranets. The functions of this program were many and it seemed to be a "must have" for business teams. Other products were Microsoft Visio Version 2002, and SharePoint Team Services. You can get more information about any of these products at Microsoft.com/office.

For those who like free stuff, there was a nice ballpoint pen, a copy of MapPoint Version 2002, a 30-day trial of Microsoft Visio Standard, a 120 day evaluation copy of SharePoint Portal Server 2001, and a Microsoft Office XP Title Sampler.

(President… … ….Continued on page 9)

Internet picture of the month

Buying a New Computer

By Jenny Leitzke
Tampa PC Users Group
Leitzke4@tampabay.rr.com

Last week we took the plunge and purchased a new home Compaq computer. It was the Cadillac version and began becoming obsolete as soon as we walked, computer in arms, out the door. We prepared ourselves before the purchase by making a checklist of everything we needed or wanted. The purchase went very well. Loading the software did not. We now wish we had made an ordered list of the software and files we wanted to transfer. Like our home, the old computer was in dire need of some Spring Cleaning. We did not want to transfer over all the old software or all the old files. This is where the work came in.

First problem: The printer. The old Hewlett Packard printer works great for our needs. When loading our old software, we were alerted that one of the software files was bad on our disc set. We could not load the software successfully. Our old printer was not listed under optional printer types you wish to add either. No problem, they said, just download it off the Hewlett Packard web page. Yes, they had it. No, we couldn't download it. We didn't have Internet service on the new computer yet, and the file was too large to copy onto disc from the old computer. What to do? Install the old Internet service onto the new computer. Sounds simple right? Wrong. Like any semi-intelligent person, we used the wizard that comes with the new Compaq Windows ME. We pulled up the AT&T WorldNet service wizard and let it do the work for us. There are default settings the wizard begins to select for you. Since people don't load server software on a regular basis, the default settings sounded pretty good the first time we went through the process. That was when the problem started. The new wizard incorporated the business option of having a 9 before your access number. Of course, in our household that does not apply. Next, the wizard automatically applied "00" before the access number. Each time we tested the sign-on, we called the operator. After 3 times, it still wasn't connecting. The operator was getting a little annoyed with us, so we stopped to see what was actually happening. We began selecting different options in the boxes. Over the next 30 minutes, when we finally found the selection, that gave us the desired access number that our modem should have been dialing in the first place. Wizards don't always make the installation process easier. We were then able to activate our existing account on the new computer. We went to the Hewlett Packard web page, downloaded the correct software, and danced like elves at a wedding when the software loaded successfully. We are happier campers now that we can print.

Second problem: The silly little software programs that we take for granted. Some necessary software is not already loaded on the new computer. For instance, Acrobat Reader (for viewing documents) and Music Box (for listening to clip art music clips) were two programs missing. These are available as a free download at many different sites. When we tried to remember which sites, we couldn't. After a few days on the Internet and opening web sites, our computer automatically loaded both of these files. Voila!

Third problem: Our eyes were bigger than our desk. Make sure you allow enough room for all the additional items you have now purchased with your computer. We have extra computer ports so of course we added a scanner, a three speakers set, and a joystick. Don't forget the Cadillac 19" monitor we could live without.

(Computer……Continued on page 7)

(Computer… … ….Continued from page 6)

Fourth problem: When changing Internet service companies, be prepared to give up your well-loved email address. With a world to deal with, someone else out there might have already selected your cute email address. You might need to add a number to the end of it. Warning: If the other email name is almost identical to yours, everyone you know might accidentally send your email to that other person. With AT&T WorldNet we were able to use a 10-digit address. With our new Road Runner service, that address is limited to 8 digits only. Good-bye cute addresses with more than 8 digits.

Last: With the bad comes the good. We had Road Runner service installed for free on the new computer. Being a student at the University of Florida, we received a $10.00 a month service discount. Our access is fast and it doesn't tie up the phone line any longer. We have two girls in the house to do that. We really cut a deal on the free installation. They ran the cable up into the attic, and out the garage. A year or so ago, with lawn work being done, the original cable line was accidentally cut outside. The Road Runner people dug up and buried all new cable. For free. We threw in the two cold sodas.

More next month I'll be back with feedback on those new items we purchased with the computer. ◆

(Minutes… … ….Continued from page 2)

Brian Lance won spell checker software.
Mike Brazas won two T-shirts and a “Missing Manual” computer help book.

The meeting ended at 8:40 PM.◆

Email Strippers

By Jenny Lind Olin, Treasurer, Tampa PC Users Group
jlolin@tampabay.rr.com

Adding a stripper for your email doesn't make for more smut. It actually cleans up those untidy >>> in those forwarded messages that people send. I wish people would not send me those, but they still do. To clean your dirty email to make them easier to read, I recommend one or all of these three Utilities.

A. emailStripper
B. Stripmail
C. eCleaner

All three can be downloaded and installed for free. All three do the job of cleaning those untidy and annoying >>> in your forwarded email messages. All three are easy to use.

How to get them:
A freeware application, eCleaner (447 Kb) is found at http://www.members.tripod.com/schin26/index.htm

EmailStripper (165 Kb) is a free program which strips ">" and other formatting characters restoring your forwarded Emails to their original format. Get it from http://www.printcharger.com/emailStripper.htm

Stripmail (265 Kb), is freeware. Download it from: http://www.dsoft.com.tr/stripmail/

You will need to download the program and install it. I think placing an icon on your desktop or task bar would be helpful to quickly have it handy to use. We don't like to use stuff we have to go look for.

(Stripper… … ….Continued on page 8)

(Stripper… … ….Continued from page 7)

A. The easiest program to use is emailStripper. It only has one option: select [Strip It]. It also will add a link to the bottom of the message so you can encourage your friends to clean up their email. If you don't like that, you can delete it before you send your stripped-clean message. Any formatting will be lost so this one is not good for verses.

B. Stripmail is very simple to use. It has two selections: [Do It All] or [Strip]. [Do it all] will get rid of the paragraph formatting so is not good for cleaning messages that are in verse.

C. eCleaner is the best for cleaning verse-style email. Last updated: January 24, 2000. A unique feature of this program is you can incorporate the eCleaner function directly into the email toolbar. There are several options to choose so it will take a while to learn what each option actually does. When using eCleaner first select [Clean] and then you have a second option to [Clean], [Remove Symbols], or [Remove Indent Marks]. The second [Clean] will change your verse format to prose which is probably not your desire. You will find these on the pull-down menu or use the icons on the taskbar. Other Options under [Clean] are [Remove HTML], [Remove Headers], [Convert to Courier], or [Remove Indent Marks].

There are other options to check ON or OFF to make them defaults.

When I pasted the stripped clean message into my Outlook Express message box I had to change the Paragraph Style to Normal get the lines to be single-spaced. I don't think AOL people will have to worry about that step.

Now you want to select or highlight ALL OF THE MESSY PART of your email. Then Copy [Control C] or use your Edit menu next to File and click Copy. Bring up your emailStripper, Stripmail or eCleaner program from the desktop. Now Paste (Control-V) or use your edit menu next to File and click Paste. eCleaner automatically copies the new clean version to the clipboard. If you make manual changes then you will need to manually select, copy, and paste.

These copy and paste options are available in all three of the email cleaning programs, too. After you have cleaned your email you will need to copy and paste the new, stripped-clean message into a new email message window.

Pretend you want to send this to a friend:

>> Living on Earth is expensive, but it does include
> > a free trip around the sun.
> >

[Strip it] with emailStripper, [Do it all] with Stripmail, or [Clean] with eCleaner This is what you will send:

Living on Earth is expensive, but it does include a free trip around the sun.

What about this mess:

> > >Hello There Nice Person
> >> > > >
> >> > > >Did Anyone Ever Tell You,
> >> > > >Just How Special You Are
> >> > > >The Light that You Emit
> >> > > >Might even Light a Star

Using emailStripper results in this:

Hello There Nice Person

Did Anyone Ever Tell You, Just How Special You Are The Light that You Emit Might even Light a Star

This email was cleaned by emailStripper, available for free from http://www.printcharger.com/emailStripper.htm

Using Stripmail, click the [Do it all] button gets the

(Stripper… … ….Continued on page 9)

(Stripper… … ….Continued from page 8)
same results. eCleaner will do the same as above if you choose the "smiley face" to "clean."

After selecting the messy part, use Stripmail, select [Paste], [Strip], and [Copy], return to your email message and [Paste] and you get what you see below. Use eCleaner and [Remove Indents] and get this also:

Hello There Nice Person

Did Anyone Ever Tell You,
Just How Special You Are
The Light that You Emit
Might even Light a Star

Now I expect I will not get messy email messages any more. So what will I find to growl about now. ◆

(President… … ….Continued from page 5)
We arrived too early, at 8:45 AM. The event didn't start until 10 AM and was over at 3 PM. We had a very nice box lunch with turkey or ham sandwiches, potato chips, pickles, lettuce, tomatoes, cookies and an apple. It was a long day, but as a learning experience, it was time well spent. At least it made my column longer than it would have been otherwise.

Happy computing! ◆

A look back at 1991

President's Column

By Harvey Bruneau

Well another year is coming to a close. Voting for our 1992 officers will take place after the main presentation by Microsoft. Please be sure to make your nominations prior to that time. Present nominations are listed in the Secretary's Report column. It certainly was an exciting year in the PC world. Next year may not see as many lawsuits, mergers or innovations since many companies have been swallowed up by bigger ones or just plain went out of business. However, endusers will have some serious decisions to make about hardware and software selections in the coming year. Hardware decisions will be mainly based on the processor manufacturer (Intel, AMD, CT, or Whirlpool) and the bus architecture (ISA, EISA, Microchannel or Greyhound). The ever growing list of nonstandard standards is the main reason for falling hardware prices which should continue to drop through the 1st quarter of 1992. In the software arena, the decision will be among operating systems and environment. Please remember that Windows 3.0, the present environment leader, is just a shell which executes other programs. Windows 3.0 does require an operating system (DOS 3.1 or higher) before it can be used. The major battle of the year should be between IBM (OS/2 2.0) and Microsoft (Windows 3.0). IBM has a real challenge ahead of itself to overcome the head start which Microsoft has. It will take some fancy marketing by IBM for OS/2 to establish even a foothold in the PC arena. Additionally, DR DOS 6.0 (Digital Research, owned by Novell) could add to the fight against Microsoft dominance. Below is the tree [omitted here] we will need to climb in 1992. The wrong decision in either hardware or software could put you on the wrong branch. Hopefully as a group we can help each other determine which branch is best suited per individual. Unfortu-

Visual Basic for Applications SIG

This SIG meets the third Tuesday of the month, at the Gateway 2000 Store on North Dale Mabry at 6:30 PM. For information, contact Merle Nicholson at *merlenic@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Mary Sheridan moderates the discussion.

nately, I believe that one branch will not be the answer for everyone. Each member may have different requirements of a PC, and only a specific branch may provide the desired results. However, the common denominator between all of us is that we do use a PC.

Last meeting I mentioned that I had ordered, from Gateway 2000 (mail order), a 486 33 MHz PC on the 11th of November. This was the 1st time I had used a mail order company. The PC cost $2645 + $95 for shipping for a total of $2740. The price included a tower case, 4 Mb RAM, 1.2 MB & 1.44 MB floppies, l6 bit VGA board with 1 MB, 14" color crystal scan monitor, 120 Mb HD, Microsoft mouse, MS DOS *5.0* and Microsoft Windows 3.0. *This 486 machine is still cheaper than my original IBM PC that I purchased in 1984.* The day after placing the order I faxed a confirmation letter to my Gateway salesman. The letter confirmed the product I ordered along with detail about possible refund, price guaranty, service and support as it was presented to me. I don't mind telling you that was a lot of money and at 1st I was concerned. However, after reading reviews of Gateway products, seeing the Dun & Bradstreet rating of Gateway 2000, and hearing favorable comments from existing Gateway users within our user group, most of my concerns went away. Gateway promised that my PC would arrive in three weeks, which placed delivery around the 1st week of December. In actuality the PC was delivered in 11 days. The PC booted the 1st time and brought me into Microsoft Windows. Of course Gateway loaded DOS *5.0* and Windows 3.0 before shipping. So far this has been a pleasant experience. The main reason for getting the PC was to get into the Windows environment and yet still have the option of installing OS/2 2.0 when it arrives. After copying all my data from my old PC, I loaded three new Windows product which I have never used. These included Corel Draw, Perform Pro and WordPerfect. It wasn't long before that 120 MB drive was full. I decided to install Stacker V2.0 compression software to increase the drive capacity. In all, my disk space doubled to 240 MB for a cost of only $89 additional dollars. The only other

problem I can see is that running Windows programs on a 14" screen is hard on the eyes. This is mainly due to the fact that data is displayed smaller than on a text based system.

My comments are not meant as an endorsement for Gateway 2000 products or that you should buy a 486 PC. You should determine your needs, budget and vendor comfort factor before you purchase.

From Marylee and me, we wish you and yours the best for the holidays and the coming new year. ◆

President's Message

By Mary Sheridan, President, Tampa PC Users Group
mcpease@mindspring.com

The June 13th meeting was a big success. It's been a long time since we've had as large of a turnout. People who arrived before 6:30 PM began setting up the tables and chairs. After some minor changes, we started the meeting at 6:30 sharp. The acoustics aren't the best in the world, but we hope to be able to arrange the chairs and tables to maximize everyone's ability to hear the presenters.

William LaMartin wanted to get the newsletter assembled early

(President.....Continued on page 9)

We meet at the Jan Kaminis Platt Regional Library, 3910 S Manhattan Avenue, Tampa at 6:30 PM. The meeting is on a Thursday this month only.

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members. Our mailing address is P. O. Box 3492, Tampa, FL 33601-3492.

However, for business concerning this newsletter, Bits of Blue, please contact the Editor, William LaMartin, at 821 S. Boulevard, Tampa, FL 33606-2904; 813-251-3817; lamartin@tampabay.rr.com.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII, Microsoft Write, Microsoft Word, or Word Perfect file to the editor at 821 South Blvd., Tampa, Florida 33606-2904 or to lamartin@tampabay.rr.com.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

The use of trademarked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

Minutes of the June Meeting

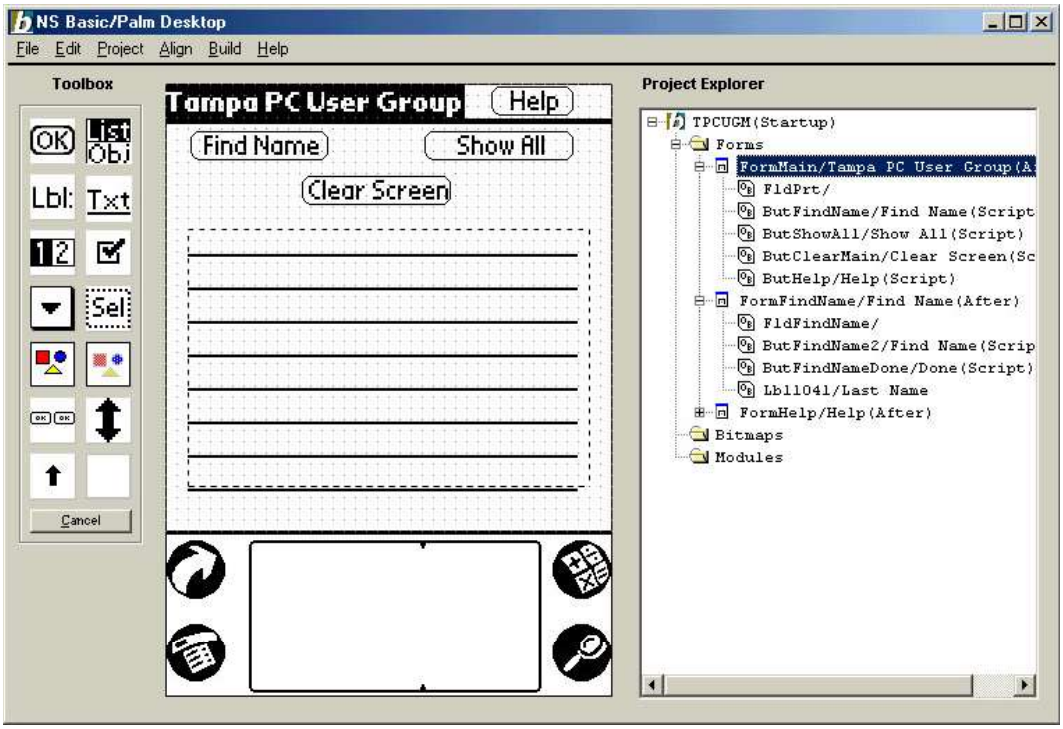
By James Weber, Secretary,
Tampa PC Users Group
jlweber9@mindspring.com

This was our first meeting in our new location, the Jan Platt Regional Library, and we started at 6:30 PM with the Windows SIG. Mary Sheridan filled us in on the big Office XP roll out and a few problems at the Hyatt. She also requested that anyone with historical information on our group contact her. We have been around since 1984 and started out as the "IBM Users Group" (which has carried on in spirit in our "Bits of Blue" newsletter title), and Mary wants to preserve some of that history.

The General Meeting started at 7:00 PM with Officer Gene King of the Tampa Police Department's Firehouse Squad and Mr. Howie Taylor presenting their Computer Acquisition and Placement Program. The purpose of this program is to find computers that individuals or corporations are willing to donate for use in a computer lab in a low-income neighborhood. The labs are set up in the Community Center of a target neighborhood as a way to faster computer literacy in areas that have been experiencing a "technology gap".

The first program started in Oak Park when it grew out of a conversation with a local business owner and Ofc. King as a way to get the local community more involved in computer literacy and the effect it could have on the children who live in the area. The original program survived by volunteer effort and was called "Cyberworld" by the kids who participated. The growing pains of success forced the project to evolve into a non-profit organization now known as CAPP. CAPP is still accepting donations of computers that meet some very low standards: a Pentium class CPU, sound card, network card, 15' monitor, 1 Gig hard drive, CD, and head phones. They would also appreciate any assistance from technicians or tutors and general-purpose help with cleaning and painting.

(Minutes.....Continued on page 5)



Programming the Palm with NS Basic

By William LaMartin, Editor,
Tampa PC Users Group
lamartin@tampabay.rr.com

In the July 2000 newsletter I wrote about my Handspring Visor (think Palm handheld). Online the article is at http://www.tpcug.org/newsletter/nl_2000/july2000/visor.htm. And at the July 2000 meeting, I gave a presentation on the Palm/Handspring handheld devices. Part of the presentation was a demonstration of the Palm Operating System Emulator (POSE), a program that runs on a PC giving you a Palm looking interface where you can run and test programs for the Palm OS.

The real use of POSE is in testing programs one has written for the Palm. At that time I had discovered a little program called PDA Toolbox that allowed you to do simple programming for the Palm without really writing any code—just selecting objects and setting their properties. No real calculations were possible.

Now a year later I have revived my interest in Palm programming with the discovery of NS Basic, an Integrated Programming Environment (IDE). The IDE is displayed on this page. It looks a bit like the Visual Basic or Delphi IDE. You have a collection of **objects**, like a text field on the left that you can place on the **form** in the center. You then can right click on the object and set various properties for the object. On the right is a listing of all the objects in the project displayed in the **Project Explorer**.

The project in the picture has three forms. The form being displayed is the Main form, which contains four buttons and a large text field.

For each of the buttons, I have written code using a scripting language that is very like BASIC. If you remember any version of BASIC, you will be right at home with NS Basic.

The list of objects, statements, and functions is:

```
Abs, Acos, Acosh, AddDays, AddMonths, AddYears,
Alert, AppLaunch, Asc, Asin, Asinh, Atan, Atan2,
Atanh, Beep, Bitmap, Button, Call, Ceiling, Chain,
CheckBox, Chr, Cos, Cosh, CreateWindow, Cursor, Dat-
eVal, DateMMDDYY, Day, DayOfWeek, DayOfYear,
DbClose, DbCreate, DbDelete, DbErase, DbFind, DbGet,
DbGetNoRecs, DbInsert, DbOpen, DbPosition, DbPut,
DbRead, DbReadNext, DbReadPrev, DbReset, DbUpdate,
Define, DegToRadians, Delay, DestroyWindow, Dim,
Display, Do / Loop, DrawBitmap, DrawChars, DrawLine,
DrawRectangle, End Function, End Sub, End Type, End
If EraseWindow, Exit Do, Exit For, Exit Function,
Exit Sub, Exp, Field, FillRectangle, FirstOfMonth ,
Floor, For, Format, Function, Gadget, GetEventType,
GetKey, GetPen, Global, Gosub, Goto, Hour, HourMin,
HourMinAMPM, If /Then/ Else / EndInStr, Int, Label,
Label, LastOfMonth, LCase, Left, LeftPad, Len, Let,
List, LoadLibrary, Log, Log10, LTrim, MenuDraw,
MenuErase, MenuReset, Methods, Mid, Minute, MMDDYY-
ToDate, Mod, Month, MonthDay, MsgBox, Next,
NextForm, NoOccurs, Now, PopUp, PopupDate, Popup-
Time, Pow, Power10, Proper, PushButton, RadToDe-
grees, Rand, Redraw, Rem, Repeater, Return, Right,
RightPad, Round, RTrim, Scrollbar, Second, Select
```

(NS Basic……Continued on page 4)

(NS Basic……Continued from page 3)

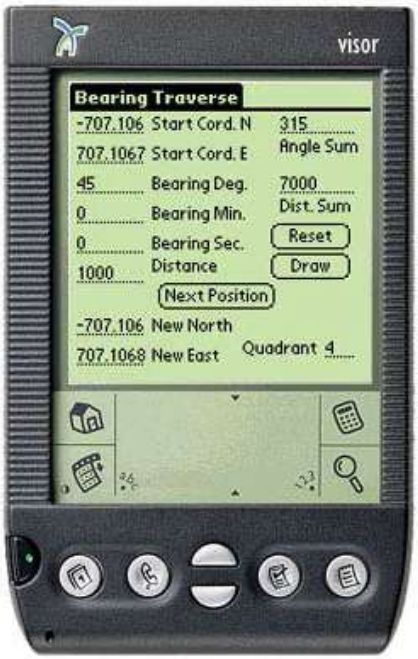
```
Case / Case / Selector, SerialClose, SerialDial, Se-
rialHangup, SerialOpen, SerialReceive, SerialSend,
SerialSet, SetCurrentWindow SetEventHandled, Shift
Indicator, Sign, Sin, Sinh, Sound, Sqrt, Stop, Str,
Sub, SubtractDays, SubtractMonths, SubtractYears,
SysEventAvailable, SysInfo, SysTrapFunc, SysTrapSub,
Tan, Tanh, TestNum, TimeVal, ToDate, Today, ToTime,
Trim, Trunc, Type, Ucase, Val, Year, YearMonth,
```

So, you see, that there is a lot of power here.

To use the mathematical functions above, you will need to load the MathLib.prc (50 KB) into your Palm along with the program you have created. Additionally, all programs created with NS Basic require that the NSBRuntime.prc be loaded into the Palm device. The NSBRuntime.prc file is 86 KB, so any program you write will have that much overhead. However, you only have to load it once no matter how many programs created with NS Basic you load. This is similar to the overhead of the Visual Basic runtime files that are required in the Windows environment when you want to run a program created in Visual Basic.

I have only had the program a few days but have basically figured most everything out. Of course, I already know BASIC and have been programming in Visual Basic. Additionally I had already used POSE to test the much simpler programs I created last year with PDA Toolbox.

A Word of warning. If you want to work with Palm databases using NS Basic, you will probably want to take a table you have in a regular database like Microsoft Access and convert it to a Palm database. NS Basic doesn't have a utility to do this for you, but one can be had at a Yahoo group for NS Basic users.



With trepidation I went to Yahoo, created a profile or whatever is necessary to get a Yahoo email address, and signed on to the NS Basic group, http://groups.yahoo.com/group/nsbasic-palm. I say with trepidation because at one point a good portion of the junk email I received came from Yahoo addresses. That has subsided in recent months. The group is a good source of information on NS Basic and of Palm programs created with it that can be downloaded and studied. Based on messages there, it appears that people are using NS Basic to create significant programs used by their companies in a commercial environment.

I have now created two similar Palm programs and two associated Palm databases that display name, address, telephone number, etc. for a group of individuals and allow searches by name or address. One is for the members of the Tampa PC Users Group, and the other is for my neighborhood association. That shows I have figured out non-keyed database access on the Palm using NS Basic.

Next I recreated a couple of programs I had written in our Visual Basic SIG as demonstrations, one using financial calculations, the other using trigonometric calculations to solve a standard surveying problem that member Mike Hutchison introduced to us. Here is what the second program looks like running on the Palm Emulator (it has a Handspring Visor skin). The program has a second screen where a graph of what is being surveyed is displayed.

I was basically able to drop the Visual Basic code into NS Basic, make a few changes and have a

(NS Basic.....Continued on page 7)

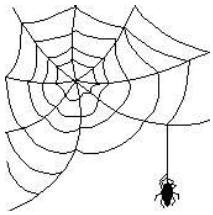
(Minutes… … ….Continued from page 2)

Mark Anderson, a computer security specialist, gave a brief presentation at 7:35 PM. He passed along some security advice that may sound simple, but I guarantee everyone reading this forgets to follow his tips:

- Avoid e-mail attachments from unknown senders.
- Don't open anything ending in .EXE, .VBS, etc as these are executable programs.
- Use and keep updated your anti-virus software.
- Back up your hard drive or all essential information.

After this basic starter advice, Mr. Anderson talked about how the "tool" menu in Outlook can be used to filter out strange or unwanted e-mail by going to the "Message Rules" line and clicking "Blocked Senders List". A menu box pops up where you can set criteria to forward or delete either e-mail from specific people or things that would look like spam or contain personally selected key words. E-mail addresses and news groups can also be blocked out completely. Mr. Anderson then talked about another type of security program called a firewall. The two that Mr. Anderson uses are Black Ice (http://www.Networkice.com) and Zone Alarm

(Minutes… … ….Continued on page 7)



Internet picture of the month

One of the Storyville Portraits by E. J. Bellocq

Storyville was the red light district of New Orleans in the early part of the 1900's. A local photographer, E. J. Bellocq, photographed some of the women who worked there around 1912. At http://www.masters-of-photography.com/, the Masters of Photography site, you can view some of these photos, the one above being one of the more modest. In addition to Bellocq, while there you can view the works of many of the better known photographers of the 20th century. Additionally there are articles about the photographers.

CD Burning Woes

By Mike Hutchison, Tampa PC Users Group
myankee@ij.net

Once again I have wandered into the wood, blithely accepting the stories about how easy and fun it was all to be only to find the reality somewhat different. A few months ago I purchased an Iomega CD burner. The acquisition was largely based on a very positive experience with Iomega's 100 MB Zip drive. The machine comes with Adaptec DirectCD, Adaptec Easy CD Creator, Music Match Jukebox Plus, Adobe ActiveShare, Adaptec Toast & an HTML help manual. (There is precious little as far as printed manuals for hardware or software.) Another factor weighing in favor of buying the machine was the Adaptec software which was user friendly, or at least this was what I had heard and read. Of course, as you computer literate, super-users know, it is now actually Roxio in the stead of Adaptec. Lastly, as far as factors affecting purchase as the printed registration cards ask, was the price which was competitive with other similar units. I know those who know of my reluctance to part with any denomination of lucre will be incredulous but this really was the least heavily considered aspect in this case.

At the outset I will confess that I made the quintessential rookie mistakes with regard to choice of CD media for specific jobs. I think that they (Adaptec/ Roxio) should do a little more comprehensive job explaining that the DirectCD software installs software which allows a CD-Rom drive to read the files on a CD created with the burner. This software is a UDF reader. UDF stands for Universal Disk Format, which is a file system for use with packet writing. Once you can read the files and open them with their native applications you can save them under different names to your hard drive after making any needed edits. Or just right-click the file in Windows Explorer and you have your normal Windows options: Open, Print, Send To, Cut,…….. and down at the bottom, Properties. The reason I mention this menu choice in particular is that you might have to click Properties and uncheck Read Only so that you ***can*** do the needed edits.

One of the first CDs I burned was some data I thought I would, in reality, not have to get to again. Why record it at all you may ask. Well, I was just playing with the new toy, and making some more room on my hard drive. Reason 2- see Reason 1. (He thought he would never need the stuff again.) In any event, a client calls and wants me to do some work on one of the jobs on the CD in question. OK, no problem thinks I and off I go to the CD rack. I tried to access the file in the regular CD-Rom drive. Nothing doing. I put the CD in the burner, now the folders and files can be seen but can't be moved, copied, imported, etc., etc.

So I get on the horn to Tech Support after wasting a suitable amount of time with the generic HTML help. The essence of their input was as follows:

1) eliminate as many programs running in the background as possible when recording a CD. This advice is intended to address two potential problems: resources and conflicts.
2) Memorex CD media is <u>not</u> supported by Iomega. Tech Support thinks the specific disk is bad and I can't effectively argue with them since Sony disks made and accessed in the same ways and conditions have had no glitches, and two Memorex disks have burped in this machine; however they were different type burps.
3) They gave me a URL to go to see a list of supported media: http://www.iomega.com/support/documents/10706.html
4) In Easy CD Creator4, when using the Create CD button and the dialog box opens, Under CD Creation Setup-Write Method you want to click the Close CD button. If this is the case why is it not the default choice….anyone's guess, but there is a button at lower right to set this and any other changes you have made as defaults.

Oh yes, I let 'em talk me into uninstalling and reinstalling the software. I know, I know, I should have

(CD…… ……Continued on page 7)

(CD… … … .Continued from page 6)
just gone and gotten a beer and come back and called them and said I had done the deed. In any case, after reinstalling the software, the data on the CD in question was still not accessible.

In summation, when the Adaptec Direct CD Wizard asks if you want to format the CD, the only correct answer in a practical sense is yes. This format process will take from 25 to 45 minutes per the progress bar/dialog box (and in actual practice can take much longer). Iomega HTML style Help says a formatted CD-RW can hold about 530 MB and a formatted CD-R will handle 620 MB. One footnote on formatting: once the format is started it can not be cancelled. Waiting up to 90 minutes for a CD-RW to format is a difficult dose of medicine to take in terms of time but would seem to be the only way to ensure full functionality. Also, in lieu of a resolution per se, I am going to stick to "supported media" at least for the short term future. The only other suggestion I have to offer is test CDs that you have made to make sure that you can open files with the application which created them, make edits to those files and save them to other folders or drives. In other words, make sure you have a working backup before deleting any files on your hard disk. The fact that the CD burner can see the folders/files (and follow a path as I could do with this problem CD) is not enough. ◆

(Minutes… … … .Continued from page 5)
(http://www.Zonelabs.com), which is one of my favorites. A firewall is designed to keep the nefarious types of computer users out there from getting into your computer without your permission. Zone Alarm adds a benefit that it will also not let programs or applications "phone home" from your computer without your knowledge or permission. Security programs such as firewalls usually offer three different levels of security preference, Low, Medium and (guess what) High, that the user can choose. As with any program, carefully read any documentation that comes with your security program before installation because the wrong combination of settings can render your computer sterile.

We then had our raffle where Wade Herman won a finger mouse, Joe Peck won Spell Checker Plus, Manuel Fernandez won an ink refill kit, and two lucky but unnamed members each won a T-shirt. The meeting ended at 8:21 PM. ◆

(NS Basic… … … .Continued from page 4)
functioning program—until I tried to do the drawing. The problem I had with that was in positioning and scaling the drawing on the screen. Theoretically it should be no more difficult than in Visual Basic, but for me it was.

I also had trouble with the scope of variables I declare, and to make things work I ended up with a lot of global variables. This is slightly different from Visual Basic.

A full working demonstration copy of NS Basic can be downloaded by a link on the page http://www.nsbasic.com/palm/info/faq.html. The exact link is http://www.nsbasic.com/pub/Palm_files/updates/NsbasicDemo.exe. The only restriction is that it is good for 30 days and any applications you create will only work for five days. Of course, you may recompile them, and they will work for another five days. The program costs $99. The general web site is http://www.nsbasic.com/.

If you would also like to investigate the competition, here are three links:

AppForge ($299) http://www.appforge.com/
CASL ($65) http://www.caslsoft.com/
PDA Toolbox ($25) http://www.pdatoolbox.com/

All, I believe, have free demo versions. ◆

A Look Back at 1991

Secretary's Report of the January 1991 meeting

PRESIDENT'S REMARKS

a) Membership is now on an anniversary basis (based on the date that you joined) rather than on the old calendar year basis.

b) Our Bits of Blue newsletter is now being prepared using WordPerfect as the publishing program. The Editor would appreciate any and all public domain graphics. Also needed are articles from the members for the newsletter.

c) In response to a comment that some other clubs get more favored treatment from various vendors, it's because those clubs have more members than we do. Vendors are always looking for the greatest audience to spread the word about their products.

d) A presentation of Lotus 1-2-3 Ver 3.1 is scheduled for next month. In March, a representative from the Software Publishing Corp will present Harvard Graphics. Later in the year, Aston-Tate will discuss the merits of dBase IV.

e) Owners of Magellan (Lotus) are eligible to receive, for free, seven new file viewers. You will now be able to view Quattro, WordPerfect, Word for Windows, etc. documents while in Magellan.

f) MS-DOS 5.0, now in beta testing, is scheduled for release the first half of this year. It is said to have QuickBASIC, handle upper memory usage, and have some elements of PC-TOOLS.

g) Logitech has announced a new mouse. For left-handed people! Comments from the members revealed that the IBM mouse has a button to do the same thing and that some software packages provide a left-handed facility.

h) We have a lot of good material on the Bulletin Board. Log on and check it out. We now have 120 meg of disk space.

i) If you have any ideas for education classes or presentations, please get in touch with me (Harvey Bruneau) or Ed Kant. We might consider a short session of about 15 minutes before the meeting starts. We have to talk to IBM about getting additional meeting space if there is enough interest in having classes on specific subjects. We do have some volunteers.

IBM PRESENTATION

Chris Mayer, our IBM compatriot, gave an excellent demonstration of OS-2 Ver 1.2 running on a 486-95 with an XGA monitor. The XGA video was awesome. Great color and the resolution was remarkable.

Chris had 8 to 9 windows open and zipped from one to the other with effortless ease. The power of the PC and of OS-2 was very obvious in that a program in one window would continue to run while you were working on another program in another window.

Many of the terms unique to OS-2 were defined, including "threads." In effect, programs are "threaded" when they run in the same application window. As an example, he used an animation program that had two eyeballs follow the cursor motion of the mouse; each eyeball was independently following the mouse cursor.

Also the term "concurrent processing" was clarified. A single processor machine, by definition, can only process one job at a time. What OS-2 does is prioritize the various jobs and give control to each of them according to their priority. When a program is suspended, a "picture" of the machine (register contents, current memory address, flag settings, etc.) is stored with that program. Later, when the program is activated, the "picture" is used to restore the machine to be exactly as it was when it was suspended.

(1991……Continued on page 9)

(1991… … ….Continued from page 8)

Because of time constraints, the Communication and Data Base Managers could not be demonstrated. Chris Mayer did an excellent job of presenting IBM's newest "products." He knew the equipment, he knew the operating system, and he knew how to communicate. He deserves a "Well done" from all of us.

COMPUTER COMPASS MAGAZINE

Bradley Friedman distributed copies (gratis) of his new magazine. It is a directory of computer and business professionals in the Tampa Bay area. He is looking for feedback from computer users and would appreciate any information you can offer.

Humidity and our Computers

By Jennifer Leitzke, Membership Coordinator, Tampa PC Users Group
Leitzke4@tampabay.rr.com

As we reach the middle of summer in Florida, computer users should take some additional precautions while traveling with their computers and electronic items. The beautiful tropical climate we live in also brings that wonderful humidity. Computers and humidity do not mix well. When caring for or carrying your convenient portable computer items, make sure to allow time for your items to acclimate. Acclimate is defined in Webster's dictionary as: to accustom to a new climate or to new conditions. Example would be when you are inside a cool room and go outside and put on your sunglasses, they fog up on you. Just think what the temperature/ humidity change does to your computer circuits and LCD screen. From the house, to the car, to the office, to the restaurant, all different temperatures and all different climates. A suggestion was given, to allow your computer items 1 hour to acclimate to avoid harm.

I made several calls around Tampa to engineers and air-conditioning specialists this week, and I was told the following information:

Rooms where computers are kept ideally should maintain a temperature of 70-82 degrees. You don't want to get much hotter than that. Commercial computer rooms keep their humidity levels at around 50%. Homes and offices can be a little more flexible, to 65-75% humidity. More humidity than that is not very good. They suggested possibly resizing your room air-conditioner or getting a dehumidifier to better control the environment.

Take a minute and read the article written by Lawrence J. Magid from the Los Angeles Times, detailing a recent trip of his and how humidity & heat threw a wrench into his situation. http://www.larrysworld.com/articles/upriver.htm. ◆

the event in conjunction with Comdex, and this is the second time I've been able to attend. The APCUG event starts on Saturday, November 10 and is over Wednesday November 14th. Comdex starts November 12th and runs through the 15th (Monday through Thursday).

Our July meeting will be on Thursday, July 12th.

A huge thank you to everyone who helped out at the Microsoft Extreme on June 2nd. For those who didn't attend, when we arrived at the Causeway Hyatt to set up the event, we found that Microsoft had sent all the supplies and the AV equipment to the Hyatt Downtown. The Causeway Hyatt was gracious and found us a room that accommodated 600 people. They set up chairs and a serving area outside the room. They put up registration tables and signs for us. They were simply wonderful.

The AV people arrived and had the feed from Seattle, Washington ready to go in a short time. They had to leave most of their equipment at the downtown Hyatt, so the show was much less than it would have been. They had to leave behind additional speakers to make it easier to hear the event and additional monitors so that everyone could see. If you attended and had problems either hearing or seeing, now you know why.

The TPCUG people were amazing. Jenny Lind Olin, Mike Hodges, Bruce Register, Kevan Sheridan and Herb Atwood jumped right in and helped anywhere they were needed with little or no instructions. I'd especially like to thank my children: my daughters, Marcia Bennington and Michelle Hominsky and my son-in-law, Jay Hominsky. I was supposed to bring ten people to the event with me and without my kids, I would have been in trouble.

Microsoft contacted me after the event and said it planned to send everyone who helped a free copy of Office XP. I went to Microsoft.com and the price for the standard version is $479.00 and the upgrade is $239.00, so Microsoft is giving us a pretty nice "Thank you."

President's Message

By Mary Sheridan, President, Tampa PC Users Group
mcpease@mindspring.com

I really enjoyed the presentation at the July 12th meeting. I thought I knew all about the scan pens, but when I found out I could transfer the data between the pen and my Palm Pilot, I was much more interested. I was lucky enough to win one of the pens as the door prize. I've been using the pen every day since I've gotten it. I received the extended memory that I bought yesterday via UPS. I now can have a language translation and a dictionary onboard the pen. I'm really excited about the possibilities.

I reserved my room at The Orleans Hotel and Casino in Las

Minutes of the July Meeting

By James Weber, Secretary,
Tampa PC Users Group
jlweber9@mindspring.com

We had a miscommunication between the editor and the secretary, so the minutes for July are not available. However, the meeting isn't too hard to reconstruct.

WizCom gave us a presentation on their various scanning pens, with the emphasis on the QuickLink pen. The presenter in the photo below, Ron Jabera, gave a presentation that was good enough to convince a number of members to purchase the various versions of the pen at the meeting.

The pen was quite accurate in capturing text one line at a time from various documents used in the demonstration. See the review of the pen in this

(Minutes… … ….Continued on page 12)

QuickLink Scanning Pen

By William LaMartin, Editor,
Tampa PC Users Group
lamartin@tampabay.rr.com

I, like several others in the group, ordered a QuickLink Pen following the demonstration at our monthly meeting in July. I am fairly skeptical of such items, but the actual scanning of text we selected at the meeting convinced me that it works. The amazing part being that it performs Optical Character Recognition (OCR) right after scanning in a line of text, and in the demonstration the results were quick and accurate. With the thought that I must surely have a use for such an item, and if I didn't my daughter would, I ordered one at the special user group price of $129.

Of course, when I got home I had second thoughts and wondered if I really needed the pen. Then I wondered some more after I went to Amazon.com and saw they were selling the pen for $116 plus shipping. Well, the presenter was a real nice guy, and I appreciated him telling us about the pen. Otherwise I probably would have never known about it, so I wasn't going to complain too much about six or seven dollars more than necessary. Also, a check of other online retailers showed the pen selling for considerably more, e.g. $150.

How do I feel after receiving my pen and trying it out? Well, I am still not sure that I really have a need for it, but it does work quite well—with a little practice.

Here is a paragraph scanned with the pen from Page 535 in chapter 15 of *Professional Active Server Pages 2.0*. I have enclosed the correct word in [ ] where an error occurred.

> Jnce[Once] the user has selected all of the titles that they wish to purchase, they can choose to move to the purchase phase of the application. In this phase, they are presented with detailed information about the items that they are purchasing, E~orig 'a;_th [along with] costs for taxes and shipping. After reviewing the information, the user can choose to amend their order, in which case they would be returned to the Check Selections phase of the application.

Not bad. It made errors in the words Once, along, and with. Missing the O in Once could be attributed to the page needing to be flattened more, since there was a large curve toward the binding, and I flattened it more before scanning in the next line. Also it is always possible that my hand wavered a bit when I went over the words "along with". And that brings me to my main problem with the pen--I get a bit tense trying to concentrate on keeping it on a straight path directly over the line being scanned.

Having the text only in the pen really doesn't do you much good. You want it in your computer. To get it into your computer, you have three routes: A serial connection (provided) between the pen and your computer, an infrared connection if your computer supports this, and finally beaming to a Palm Pilot or Handspring Visor. The last method is the one I used first. I beamed what I had scanned to a memo in my Handspring Visor, then Hot-Synced the Visor with my computer.

To use the infrared or the serial connection, you need to install the QuickLink Desktop Application on your computer. This also gives you several more features. One is Scan to PC when you have the pen connected to the computer with the serial cable.

I just used the pen to scan in the following text that describes this feature. Only one error was made, and that could be attributed to the left margin of the text being close to a dark vertical band in the man-

(Pen… … …Continued on page 4)

(Pen… … ….Continued from page 3)
ual. The manual says:

> The Scan to PC application enables you to use your Pen as an input scanning device in order to scan information ~ firectly [directly] into an application on the computer. The Pen enters scanned information into the application at the location of the input cursor.

At this point, I was still getting the scanned text in my PC via a beam to the Visor and then a Hot-Sync to the PC. Time to try out the serial connection between the PC and the pen. After following the instructions in the Communications Wizard of the QuickLink Desktop, I could not get the PC and the pen to communicate. Well, the first problem was that I needed to change the serial setting from COM1 to COM2, since that was where the pen was connected. (In this day of USB I have almost forgotten about COM ports.) Still no communications.

A good bit of thinking and tinkering with the settings, then I remembered that on my last trip I couldn't get my laptop computer's modem to work. A little sleuthing there showed me that the modem thought the COM port was busy, and I discovered that was caused by my Visor's Hot-Sync program running on the laptop. Once I closed that, the modem worked fine. Even though the Hot-Syncing uses a USB port it somehow makes other applications think the COM port is busy. Once I recalled that, all I had to do to get the PC and the pen to communicate was to close the same Visor Hot-Sync program on my main computer.

Now I, among other things, could scan a few lines of text directly into any Windows application running on my computer. Here is what I brought into Word from the Quick Link manual:

> Congratulations on your choice of a state-of-the-art WizCorn [WizCom] QuickLink PenTM. Inside its tip your Pen contains a sophisticated electronic eye mounted above two rollers. This eye enables you to scan in different types of printed information, such as notes, addresses or business cards, Internet links and tables, anywhere you are. You can later transfer, 01 [or] "quicklink", the information to your computer.

Only two errors occurred. Pretty good, and it was also fairly fast.

The QuickLink Pen does not do quite as well on the Tampa Tribune, making errors in four of 85 words scanned in one trial. I got similar results in other trials.

It works equally well when rolled left to right as when rolled right to left. The latter method is easier for me since I can see the text being scanned easier in that mode.

You can get extra memory (proprietary flash memory) for the pen which will allow you to scan in more than the average 1000 pages with the normal 2 MB of memory. Of course, no one is probably going to need to store more than 1000 pages. But the extra memory also allows you to run dictionary and language translation modules that you can download for free from the company's web site, http://www.wizcomtech.com. Additionally it will allow you to run additional applications developed in the future.

WizCom Technologies also makes other version of the pen: the Quicktionary II and the Reading Pen II. The Quicktionary II does translations and definitions of words and contains a voice module so that you can hear the results. The Reading Pen II is meant for individuals with reading problems and provides audible definitions and pronunciations.

WizCom apparently is not alone in having the idea of a scanning pen. They have competition from C-Pen, http://www.cpen.com. ◆

(President… … ….Continued from page 1)

Vegas for the November APCUG-Comdex event. The Orleans is the host hotel for the APCUG Fall conference. I paid for my registration and Kevan's and then found out that I didn't have to pay for registration because I'm an officer now. The APCUG event starts on Saturday, November 10 and is over Wednesday November 14th. Comdex starts November the 12th and runs through the 15th (Monday through Thursday). If any of our officers or anyone who would like to be an officer in the future is interested, please contact me at mcpease@mindspring.com or visit http://www.apcug.org for more information.

Everyone needs to be thinking about who will be our next president. I think two years is enough for me. We need fresh faces and fresh ideas to keep our group growing and changing into a better organization. I will help the new president in any way I can to make the transition smooth and seamless.

Kevan Sheridan, our member-at-large, will start preparing a roster of candidates for the upcoming year to present at the October meeting. That isn't very far off, so please be thinking about whether

Book Review of
New Webmaster's Guide to FrontPage 2002

By Larry Anders, Librarian,
Tampa PC User's Group
larryanders@msn.com

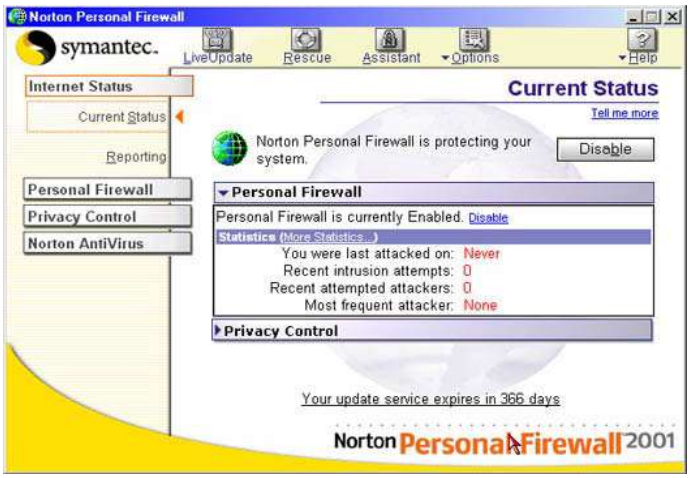
First, let me tell you that in the past I have written several articles reviewing software and hardware, but to my knowledge, this is my first book review. I'm flying blind here, so maybe you shouldn't expect too much.

When I saw that this book was available for review I immediately volunteered to do it because I was interested in finding out what was new in the next version of FrontPage. I have been using FrontPage since Microsoft decided to develop this type of software, and since reading New Webmaster's Guide to FrontPage 2002 (***NWG***) I have purchased my upgrade to FrontPage 2002 (***FP2002***). Not to say I purchased my upgrade of ***FP2002*** because of reading ***NWG***. I would have upgraded anyway because I think FrontPage is the best program out there for creating and maintaining a web site. Now, on to the book…

The subtitle to ***NWG*** is "*The Eight Steps For Designing, Building, and Managing FrontPage 2002 Web Sites*." Furthermore, the book's cover quotes the Wall Street Journal as saying "*it aims at mainstream business rather than techies or raw novices*." I hate to start out this way but I strongly disagree with the Wall Street Journal's assessment. I think this is a terrific book for anyone wanting to learn about creating a serious web site. (By serious I mean something other than a family picture album.) And you don't have to be interested in developing just a business related site to get something out of this book.

I was disappointed to find that, for the most part, the book dealt with overall techniques applicable to web sites in general and not just FrontPage. The authors, Jason Gerend and Stephen Nelson stated that they felt one problem with most books about FrontPage is that they are only about FrontPage. Duh! Maybe that's why they are books about FrontPage. You think? Well, if that is what they think, then their book certainly is *not* wrong. They could probably have titled the book "New Webmaster's Guide to Designing, Building and Managing Web Sites – with a ***few*** applications relating to FrontPage 2002." But then again, they probably wouldn't sell as many books with that title.

Don't get me wrong. I think it was a very good book on how to build a web site and do it right, but I was misled by the book's title. If you'd really like some good instructions on how to develop a web site here are the eight steps suggested in the book:



1. Determine your web's goals
2. Lay your foundation
3. Collect and organize your content
4. Create your web site
5. Create your pages
6. Polish your pages
7. Add interactivity to your web site
8. Deploy your web site

NWG is well worth its $24.95 list price and is probably less expensive if purchased on-line. There is a lot of good information in this book that someone new to web site design, or a seasoned designer, can find helpful. But don't expect it to give you all the ins and outs of FrontPage 2002. You'll have to purchase a book about FrontPage 2002 for that, or read an upcoming article of mine on what's new in FrontPage 2002. ◆

Norton Personal Firewall 2001 ver. 3.0

By Bob LaFave, Tampa PC Users Group
boblala@ij.net

After building a new computer a couple of months ago, I was looking at the Sunday ads and saw that Norton Firewall 2001 was on sale for less than $20. And I needed to install a firewall on the new "toy". I have used Sybergen Secure Desktop on my last computer and Zonealarm on my kids' computer but have never used the Norton, so I went ahead and purchased it.

I always read the program instructions before I make a major mistake in installation, and this manual scared me. *It seemed that there was too much control and I was going to need to make each setting individually or I was not going to have access to the web.* I set the manual next to the bed for future reading before I decided if it was worth installing.

Since then I have reread the manual once or twice a week and slowly convinced myself that the manual was written to show what the total power of the program was if needed and what individual settings could be made to control the network communications of the computer. This is both for Home Networking and the Internet connections.

If you want, you can control your Personal Confidential, Cookies, Browser Privacy (this prevents

a web site seeing what browser you use and what the last web site visited was), ActiveX controls, Java Applets and more, but really very few settings need to be set up.

The default settings that Norton uses when you install their Firewall need very little change. Norton has a list it uses to scan your system to identify the programs that access the web during installation and it asks you what to allow on these before you ever get on the web. I installed it and so far every situation I met on the web has been taken care of easily. Any program that tries to communicate from your computer to another is prevented until you allow it. You can allow just one time or allow complete use in the future with just a couple of clicks. Each instance you are given a "Threat Level" and "Choices" of whether to allow it.

Norton installs an Icon in the "Systray" and puts a simple toolbar that they call "AlertTracker " that pops out and notifies you of any activity on the side.

Logs are kept of all activity and statistics of your connection so that you can have a good idea of what is happening while on the web. As with other products you need to periodically update this program for new fixes for new dangers.

If you have Norton AntiVirus installed, the update does both programs at the same time and allows

(Norton……Continued on page 8)

(Norton……Continued from page 7)
you access to the Virus program from inside the Firewall startup screen.

As a test of "HOW GOOD" it worked I went to: Shields up test at http://www.grc.com, Sybergen test at http://scan.sygatetech.com, and Norton's test at http://security1.norton.com and did their internet security test. Norton Firewall passed each test, and my computer was not seen as other than an IP address.

The only bad that I can find in a month of use is

that this program also needs subscriptions yearly for the Update part of the program to be used. This subscription, like Norton AntiVirus (which is $3.95), is for one year and will be $6.95 per year. ◆

you are interested in running for office and let Kevan know.

I'd like to thank our current officers for all the hard work they do. If an organization is running smoothly, it looks like the leaders don't have much

(President……Continued on page 10)

Looking back to 1991: Minutes of the May 1991 Meeting

Harvey Bruneau was the sole speaker for the entire meeting. Software Publishing had to cancel its scheduled presentation on GeoGraphics. It is believed that the local representative had to attend a seminar about the new product that SPC is about to announce. Steve Spears was to give a presentation but had to cancel at the last minute. Seems that Steve's company had a system crash on their mid-west server. What with air freighting new material and having to go to work at 4 in the morning, Steve has an interesting (?) career.

Harvey spoke about some recent product announcements. Some of the items were:

- Version 5 of DOS is scheduled for release in June. The upgrade price is $100.

- WordPerfect for Windows is due to be released in July. It will be called Version 6. The product was demonstrated at Harvey's office and Harvey said that it looks great. He also reported that anyone buying WordPerfect between 4/1/91 and until 30 days after the product release is announced, registered users can get an updated license from WordPerfect. It will cost $15 to get the update disk, $29 for the manual, and $19 for the work book – plus $5 for shipping and handling.

- MicroSoft's Trackball was shown. It attaches to the side of the keyboard. The trackball is packaged with its own case and several varieties of clamps to fit the side edge of keyboards. If you want to attach the trackball to a regular desktop PC, you need an extension cable since the supplied cable is rather short. The coiled cable is of an adequate length for laptops or portables. Logitech offers a similar device.

- Hewlett-Packard has lowered its price for the Desk Jet printer. They have announced the Laser Jet IIIP with a price of $1595; same 4 ppm as the

(1991……Continued on page 9)

(1991… … ….Continued from page 8)

IIP but with the new engine of the III model (resolution enhancement). For $1895, you can get the laser jet fax which routes fax material to the laser printer.

- Hewlett-Packard now offers a palm-top computer with Lotus built into it. The keyboard is very small and would be awkward for touch typists. But if you're only entering numbers into Lotus, it's adequate.

- Okidata has a new 24 pin printer being offered for $349.

- Tandy (Radio Shack) is allowing up to $500 for your old PC toward the purchase of certain new PCs that Tandy offers.

- Version 7 of PCTOOLS is now available. List price is $179; upgrade price will be $49 until July 1st. Until August 1st, anyone with a competing product will be able to get the new version for $59. It is said to have a Windows-like appearance. It will offer back-up through Windows, launch Window program applications and protection or detection of over 600 computer viruses.

- Prodigy has been accused of accessing data on user machines. The Los Angeles District Attorney is checking this allegation. One of the members spoke about seeing some of his records in one of Prodigy's .DAT files.

- Virus problem. America On-Line distribution disks may be corrupted. One member reported that the virus seems to affect floppy disk behavior. He said that he couldn't copy files to a floppy disk. And that the middle half of his directory listing was gone. He reported the problem to America On-Line and they said they were not aware of it. He called three weeks later to check and again they said that they were not aware of the problem!

- Permission had been obtained to extend the 4/30 deadline on the Geoworks coupons for another 10 days. These coupons enable a buyer to get the Geoworks Ensemble for $50, a tremendous saving compared to the list price. The street price is between 130-150 dollars.

- Comments on the working demo of Ami-Pro were solicited. A member reported that he was quite impressed with the features of this high-end word processor. It's easier to work with than the DOS version of WordPerfect. It can substitute as a desktop publishing program. He remarked that, although there were virtually no instructions supplied, it was quite intuitive - very user-friendly. He also said that, as with most Window applications, there is no UNinstall procedure. The working copy WILL comb the physical hard drive to find Windows. When it finds it, it installs itself into Windows. To uninstall it, you have to modify the various .INI files then remove the pertinent files.

LAP LINK Presentation:

Harvey demonstrated Version 3 of Lap Link, a software package that enables two PCs to be connected for file management. Both serial and parallel connector cables are supplied with the package. The software splits the screen and shows both the local and the remote machine. He noted that the ports on both machines must agree. And that parallel hookups were preferred for their speed as compared to serial transfers.

This program enables you to copy files to/from one PC to another when incompatible floppy drives are installed on the PCs. Harvey showed just how easy it was to copy and delete files on either the local or the remote machine. You do have to be careful and keep track of which part of the screen represents the local or the remote PC. He said that it took about 35-45 minutes to copy over 100 meg of data between two machines.

SECRETARY'S COMMENT:

Our president deserves a round of applause and our

thanks for the great job he did at our last meeting. It was unfortunate that the scheduled speakers had to cancel. But as they say in the vernacular, Stuff happens. So, Harvey had to carry the whole meeting by himself. He's always ready to fill-in if one of the scheduled speakers has to cancel; but to carry both ends speaks well of his willingness to help our users group. Thanks Harvey, for a job well done under trying circumstances. ◆

From the June 1991 Bits of Blue

(President… ……Continued from page 8)

to do. What we forget is how much hard work goes into making things run smoothly. So thanks to Mike Hodges, James Weber, Jenny Lind Olin, Kevan Sheridan, Bruce Register and especially to William LaMartin who maintains the newsletter and our web site. I'm hopeful about Jenny Leitzke's taking on the membership chair position. Jenny has lots of energy and good ideas, and I think she's just what our group needs. Thanks to Bob LeFave for taking care of the badges. I really appreciate how everyone helps put the tables and chairs out and back up for the meetings. By everyone helping, it's done quickly and we're able to get out of the room in a timely manner.

Don't forget it's "Back to School" time, so if you have to shop, be careful. ◆

President's Message

By Mary Sheridan, President, Tampa PC Users Group
mcpease@mindspring.com

I wasn't able to attend our August meeting. I had a weird problem with my leg and foot. After about a million dollars worth of tests, my leg and foot are better and neither I nor my doctor knows what was wrong. I'm glad it was nothing serious, but it is a little irritating to have a "mystery" ailment.

Plans are being firmed up for the FACUG fall conference. The conference will be held in Lakeland, FL at the Imperial Lakes Country Club, 6 Country Club Lane, Mulberry, Florida 33860. The conference date is Saturday, October 13, 2001 from 8:30 AM until 4:30 PM.

The FACUG (Florida Association of Computer User Groups) is the leading regional association of its kind in the country; FACUG is a southeast regional non-profit tax exempt association of independent

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members. Our mailing address is P. O. Box 3492, Tampa, FL 33601-3492.

However, for business concerning this newsletter, Bits of Blue, please contact the Editor, William LaMartin, at 821 S. Boulevard, Tampa, FL 33606-2904; 813-251-3817; lamartin@tampabay.rr.com.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII, Microsoft Write, Microsoft Word, or Word Perfect file to the editor at 821 South Blvd., Tampa, Florida 33606-2904 or to lamartin@tampabay.rr.com.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

The use of trademarked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

Minutes of the August Meeting

By James Weber, Secretary,
Tampa PC Users Group
jlweber9@mindspring.com

Our August meeting started at 6:30 with the Windows SIG. There was some discussion as to how to recover Windows or a Windows program when error messages concerning "Missing or Corrupt VxD" pop up. For those who didn't know, VxD stands for Virtual Device Driver, the small "x" filling in for any number of devices installed in Windows. If a VxD is deleted or, more commonly, overwritten by a new program, any number of odd things, from a refusal of a program to run up to the dreaded "blue screen of death" can occur. In a worst case scenario, Windows will refuse to boot. This brought us into the second area of discussion, how to make a boot disk. The easiest way is to use the "Startup Disk" tab under Start>Settings>Control Panel>Add/Remove Programs.

Our presentation began at 7:05 with Ms. Tara Shiffer (taras@tampabay.rr.com) of 4D Marketing (http://www.4dmarketing.net), who was provided by Digital Chainsaw (http://www.digitalchainsaw.com), a web hosting and site promotion company. She told us how to make a web site more appealing to the different types of search engines in use on the web today and what sort of things turn the search engines off. A brief summary of how a search engine works is that you contact a search engine company (Yahoo, Google, etc.) by their individual processes. If you fail to follow their guidelines, you're automatically excluded. Once you're accepted, the search engine will send out a program called a robot or spider to sift through and record information from each page and sub-page for the search engine's database. How your pages are set up has a lot to do with how many hits you receive. There was far too much information presented to cover here, but 4D Marketing offers a class covering at length all the items touched on during the meeting.

After the presentation we had our drawing. Congratulations to Gary Ennis on winning a copy of PhotoDelux 4.0.

The meeting ended at 8:00. ◆

Replace Napster Legally, I Think!

By Larry Anders, Librarian,
Tampa PC Users Group
Larry@AndersNet.com

Well, I will have to admit it, "I was a ***Napster*** junkie," and when it effectively went down, so did I. I went into a techno depression the likes of which you have never seen. My withdrawal was so bad I didn't even want to get near my computer. My wife got really nervous because I was hanging around her so much.

I tried a few of the imitations but to no avail. That's all they were… ***Napster*** want-a-be's. Then a ***GOOD*** friend of mine told me about ***KaZaA,*** and **I WAS BACK pounding the keyboard!!!** But, believe it or not, that is not what this article is all about. I was going to write about KaZaA, but I was afraid someone would read my article and tell the download police and shut it down too. So, I'll leave you on your own to discover KaZaA. (Suffice it to say, you won't be sorry.)

When I realized my hard drive was filling up from all the MP3s on my computer, I went looking for a good all around recording program, and, believe me, I tried a bunch of them, but I won't bore you with those. I settled on ***MUSICMATCH jukebox 6.1***, and got a lot more than I expected. Just some of the things it will do are:

- Make **your** own CDs from your MP3s
- Turn **your** music collection into MP3s
- Play **your** MP3s, CDs and Windows Media
- Tune into MUSICMATCH Radio
- Manage **your** digital music collection
- Print custom CD labels and song lists for **your** tunes
- Get free downloads and artist info for **your** tunes
- Send **your** music to **your** MP3 player

(NOTE THE WORD **YOUR .**) I've heard so much lately about what is legal and what is not, I didn't really know what was what and what was not. (Whoa! Maybe I'll try poetry next – maybe not.)

First, let me tell you that what I'm about to tell you next works for me because I have broadband Internet connections both at work and at home. One of the best features about ***MUSICMATCH*** to me is the Internet radio stream

it feeds to your computer. I have not tried this program on dial-up so I'm not sure of the quality of that feed, but the quality is excellent on cable and DSL. A couple of clicks of the mouse, choose the genre of music you like, and voilà, you are listening to quality music, without the DJ's talk interrupting the process.

Most of the above is available on the Freeware version of ***MUSICMATCH***, but my gosh, for $19.99 you also get:

- Multi-session CD burning (at up to 24X)
- Customize and save equalizer settings
- Create and print custom CD labels and liners
- Custom visualizations (skins)
- Print your music library and play list
- Free online technical support
- Radio MX free for 30 days

That last item above, Radio MX, is a service ***MUSICMATCH*** provides for about $30 a year. With it you get additional items such as:

- Artist Match, create stations with up to 25 favorite artists
- CD-quality sound, 128 KBPS high fidelity sound
- No Ads, no banners or radio advertising as you listen
- Skip Button, skip songs you don't want to hear
- My Station, customized to the music you listen to most
- Era Stations, music from your favorite years
- Station Mixer, blends your favorite genres together
- Portability, log into your favorite stations wherever you go

Okay, okay… so what is all this leading to? Now that I was able to listen to the type of music that I wanted, whenever and wherever I wanted, and at CD-quality, all I needed to do was record this music. So… I did a search on Google.com for "record streaming audio", and I came

(Replace……Continued on page 9)

The Invisible Internet Reader

By Tim Condon, Tampa PC Users Group
tim@free-market.net

Stupid, stupid, stupid, stupid, stupid, stupid!

Yeah, yeah, yeah, what am I whining about, you all wanna know. Well. Consider this. We've all heard the old saw within the computer-literate universe…if cars had improved as much and as fast as computers over the last 20 years, they'd travel at the speed of light, get zillions of miles per gallon, and cost $1.98 brand new. But they haven't, have they.

Which brings us to what I'm complaining about. The Internet. Look, admit it or not---and most now do, even the Big Doubters of yesteryear, like Bill Gates---the Internet is the biggest thing to happen to humanity since, oh, **language**, or **fire**, or **agriculture**, or something similarly small like those. We all just **love** to peruse the Internet and the inexhaustible (to each of us, at least) supply of knowledge, entertainment, prurience, wisdom, comedy, etc. that it has to offer, right?

Which brings me right back to what I've been talking about here: It's coming! It's imminent. I really mean it! Any time now! Better watch out! What? Why, the appearance of a simple appliance, about the size and shape of a book, that can be cradled in our laps or on our chests when we lie in bed, in order to comfortably enjoy the cornucopia of all that is the Internet.

But it doesn't exist? **What??? Shocccccckkkk!** You figure we've got just about everything, here in the computer-Internet universe, right? Well, if it ain't here already, why, it's just over the horizon. Sing along with me! "Soooome wheeeere, Over the rainbow…Soooome wheeeere…" But **Stop!** That's what I'm tellin' ya! **It ain't happening.**

What have we got that we can comfortably hold and clutch to our bosoms, to peruse the Internet? Not those "lightweight" laptops! No in **my** bed! Uh uh! It cuts off the circulation in my arms and legs. Oh, **well** then, why not just stop being lazy and sit up in front of that big fat monitor on the desk, and peruse all ya want, till your heart's content? Well, because it's **uncomfortable**, you dolt! That's why we're all sitting around thrumming our fingers, wondering when the geniuses who brought us the computer revolution (and they **are** geniuses) are going to give us something **comfortable** and **convenient** that we can read anywhere **comfortably** and **conveniently!**

Is all **that** too much to ask for?

Well, yes, apparently. There are all **kinds** of reading appliances out there **right now**. But of course most are linked up with one big fat publishing conglomerate or another. And you think their main concern---or any concern at all, let's-face-it---has anything to do with allowing us to read what we want and when we want to? **NOOOOOOOOO**, of course not! They're all scrapping around about what kind of **encryption** schemes they can use to make sure we don't read one of their precious books more than once, or that more than one set of eyes don't get to peruse the same pristine orthography.

Hell, by this time more electronic reading appliances and e-reading appliance companies have gone bust than are now available. Rocket eBook and Softbook: Both gobbled up, acquired by Gemstar last year and replaced by the Gemstar REB 1100 and REB 1200. And, of course, you can only read Gemstar ebooks by downloading them by a modem (part of the reader) from **Gemstar's** collection of stuff to read. So sorry, can't just scan the Internet, or download stuff from the Internet to read later. And these two barkers cost $299 (for the el cheapo REB 1100) and $699 (for the REB 1200). How's **that** for a deal to get locked into someone else's small library? (Oh yeah, you can't share books with the Gemstars either; you can only transfer your entire library from your reader to someone else's---they wouldn't want you to be able to re-read a book while someone else was reading it.)

And **one other thing**, too: The copies of books that you download using ebooks (the Gemstars, and others also)---no printing, no ink, no trucks carrying tons of books in a distribution network, no paper and dead trees, no bookbinding and covering---cost **just about as much**, as the damned books we're trying to get away from (dead trees, anyone?). Why? Because the ebook people think the same way that IBM thought back at the dawn of the Revolution: "Lock those stupid customers in to our own proprietary system, and they won't have anywhere else to go! We can charge'em whatever we want!" (Cackle, cackle!)

Okay, let's blow off the Gemstars, and go over to the Franklin eBookMan offerings. The EBM-900, EMB-901, and EBM-911 are three devices that share some

(Reader.....Continued on page 5)

(Reader… … ….Continued from page 4)

characteristics. They all have Franklin's proprietary operating system---can anyone scream out **LOCK-IN SCHEME?**---they're all expensive ($130, $180, and $230 respectively), they're all slow, and they all try to do too much when they're just supposed to be **ebooks**. What? Oh, Franklin is screwing around with them being PDA's (personal digital assistants) and listening devices (**unencrypted** MP-3's only, of course), including both audiobooks and music.

HEY! ALL YOU EBOOK COMPANIES! All we want is an implement that can read books in various non-proprietary (and proprietary, if we so desire) formats, including Adobe Acrobat, Microsoft Reader, Glassbook standard, Everybook (if it's still out there) and other formats. **Is that so hard???**

But I digress. I guess we could all agree that ebooks are one thing, and Internet readers are another thing. But I don't think they really are. Look, since all the geniuses in the industries Out There can't seem to get it together, let's go ahead and design what we need ourselves, right now.

First, a color screen of reasonable size will be needed, with an optional on-off back light. Perhaps it could be the size of the upcoming Microsoft tablet computer, but an entire **computer**---with its attendant expense and complexity---isn't what we need or are looking for. But

(Reader… … ….Continued from page 5)
the **size** is right. Size matters. It'll have to be color, probably an LCD, because all those monochrome screens are deadly borrrrrring. And probably a touch-screen so we can navigate reasonably well without mousing around or having to have a keyboard. (Of course, it would have some buttons here and there, to aid in navigating, but this is a **reader**, stupid, not an incipient AI system or supercomputer.)

Second, the little booger should be fairly lightweight, with batteries that work a reasonable amount of time… say, at least 5 or 6 hours at a sitting (and lots more is possible, given what's out there in the way of low-power technology). Of course, unless those batteries are some kind of super alien artifacts, we've gotta be able to plug the thing into the wall when needed also.

Thirdly, stop screwing around with the proprietary standards and private operating systems in an effort to lock the reader in to a manufacturer's personal library. We're supposed to be selling reading implements, not trying to set up a flaming book-monopoly! So the thing should probably run on some kind of Linux-standard operating system and be able to accommodate all or most of the ebook standards out there, including Microsoft ClearType, Adobe Acrobat, the Glassbook standard, etc., etc.

Fourthly, the thing should be able to connect up easily and efficiently to the Internet, whether through a USB port, a PCMCIA port (that stands for "People Can't Memorize Computer Industry Acronyms"), an old-fashioned ethernet port, or whatever. But it would have to have broadband connectivity, cause that's where the world, and the Internet, are headed. **AND**, it would have to have some capability to connect up to your regular desktop or laptop, so as to be able to transfer stuff (books, pictures, what-have-you) back and forth (and thence be able to email stuff to our friends, if we have any).

Fifthly, it would have to have some storage. No hard drives or spinning floppies to run the batteries down. Probably some kind of flash memory. Just a few megs, so you could transfer stuff off the Internet and into your reader to enjoy without running drives whining in your ear.

Sixth…give us a break, will ya, on the price? Sure, you may be the first-to-market, and so you want to stick the early-adapters with as high prices as possible…but if I'm right, **everyone** is going to be an "early-adopter." So you don't have to jack up your price structure in the beginning so as to screw the first people who want to use the thing. You'll still make billions, so how about restraining your socialist greed ("socialist" greed because any kind of socialist political system is the ultimate in locking in a customer base…in the case of communists and Nazis, **literally** "lock in" and "lock up"). The price, therefore, should be somewhere south of $100. And puh-leeze, don't give us the fairy-tale that "it's not possible." It'll be here soon enough. You wanna be first or **not**?

Did I get everything? Maybe, maybe not. The rest of you can yell at me. But I think the above pretty much outlines what the market needs…and it ain't there yet.

Perhaps as important as what features are **needed** are those features that **we don't want or need!** Consider. The ebook-Internet reader doesn't have to play music. It doesn't have to read audiobooks to us. It doesn't have to turn into a salad-maker that slices and dices and shreds and dreads (it rhymes, that's all I can say). It doesn't have to **play games** (my blood pressure's going up again), because it's for **people with brains** who want to read…not teenagers.

And it doesn't have to have cutesy little features like a clock on the screen and a place that tells you what the date is (if you don't know what the date is, look at your damn watch; it's near the end of your arm, on your wrist). Or funny little helpful pictures or cartoons. Or a calculator. Or an address book. **It ain't a PDA, guys!**

Neither does it have to have twin-Pentium 4 chips running at 2 gigahertz each. It needs to be reasonably quick, but not a flippin' supercomputer. And it doesn't have to do numeric calculations. It probably will have a low-power Transmeta Crusoe chip in it, or something similar from AMD or Intel running at 500 or 600 Mhz. And---did I mention it before?---**No blasted games are needed!**

No. Just give us a simple implement that can easily connect up to the Internet and download those books and articles we want to read, store them in a reasonably-sized flash memory, and display them on a reasonably-sized backlit color touch-screen. It ain't rocket science.

(Reader… … ….Continued on page 9)

Notes on Office XP (mainly Word)

By William LaMartin, Editor,
Tampa PC users Group
lamartin@tampabay.rr.com

I have been using the various Office products for many years and have written numerous reviews of them in this newsletter. What more is there to say? They are great products. They will do things that the average user will never even dream of. And they get more expensive and complicated with each new version. Although Microsoft has made an effort to make XP more user friendly—think Smart Tags.

First, note that you will not be able to buy one copy of Office XP and install it on all the computers in your office or home (unless you avail yourself of one of the cracks to the activation process that are supposedly out there on the Internet.) With Microsoft's new activation process you will be stopped if you try to install it on more than one desktop computer and one laptop computer. The activation process collects information about the computer and sends it to Microsoft. Subsequent installations will trigger a denial if the new installation is on a computer that differs substantially from the first one on which it was installed. A phone call to Microsoft and their OK is the only way that this subsequent installation will work. If this bothers you, don't buy Office XP. There is always WordPerfect.

Of course, if you are happy with Office 97 or Office 2000, then there is probably no need to upgrade anyway. Just as our computers have gotten to the point that they do everything we need, so has our software. I have been using XP Professional for about two months and haven't found anything that has made my life easier, although I have only used it in a casual way and not done a proper investigation as would be necessary if this were to be a real review of the product.

Office XP installed in less than 10 minutes over my previous installation of Office 97. So I now have Office XP on the Compaq computer I use most. I have Office 97 on my laptop and my old Gateway that I still use a bit. My daughter's newer Gateway has Office 2000, for which we have misplaced the CD and need to see about getting a copy of it from Microsoft. I even have Office 95 on an old laptop. So I am no stranger to Microsoft Office.

After the installation, on opening Word for the first time I received an error message: "Microsoft Word has encountered a problem and needs to close. We are sorry for the inconvenience." Now that is real nice.

Not a good start, but here is where the new technology came into play. I was offered the opportunity to submit an error report to Microsoft. Which I did and immediately received the following response: "Microsoft thanks you for taking the time to send us information about the program error that you just experienced. After investigating error reports provided by users like you, our engineers devised a workaround for this problem. This article contains information that may help you avoid encountering this problem again in the future."

The article described how the problem was caused by an incompatibility with the PDFMaker.dot add-in that is included with Adobe Acrobat 5.0. Most people don't have the full version of Acrobat, so they would never get such a message. The article went on to tell how to work around the problem and that Adobe was working on a permanent solution. Pretty impressive, I think. I have never had feedback like that before.

A new feature I am less impressed with is Microsoft Document Scanning, listed under Microsoft Office Tools. It will scan a page of text for you, perform OCR on it and put it in your Word document. But I find that TextBridge Pro does a considerably more accurate job with the OCR. There is also the feature to insert a picture into a document via the scanner without leaving Word. This might be useful to some. I didn't install the speech recognition feature, so I can't comment on it.

Another neat feature—but how much do you really need it—is the ability to translate single words into another language (if you have installed that language module). If you want to translate more than one word, you need to sign up with one of the two online translation services that work with Microsoft. It is free to have a computer do the translation. If you want a person to do it, you will have to pay. I chose the computer version of the Mendez translation service for the following example.

Here is the English sentence to be translated:

This is a test of the online Mendez translation service for Microsoft Word 2002. It will translate a body of text--not just one word as Word's built in translation does.

The French translation: C'est une épreuve du service de traduction Mendez en ligne pour Microsoft Word 2002. Il traduira un corps de texte--pas seulement un mot comme Mot a construit dans traduction fait.

(XP… … ….Continued on page 8)

(XP… … ….Continued from page 7)

The Spanish translation: Ésta es una prueba del Méndez en línea el servicio de traducción para Microsoft Word 2002. Traducirá un cuerpo de texto--no sólo una palabra como la Palabra ha construido en la traducción hace.

As I said, the service is free. You just have to download a small plug-in, and you will need a Microsoft Passport (which is also free).

One of the more written-about new features of Office 2002 (another name for XP) is the smart tag. To test it I typed the following sentence into Word: The Tampa PC Users Group meets at 3910 S Manhattan Ave., Tampa, FL .

After typing this into Word, when I move my cursor over the address, a little square box with an "i" inside a circle appears. If I click on it, I am given a selection of smart tag actions, two of which are "Display Map" and "Display Driving Directions". If I click on "Display Map", my browser is opened to the Microsoft Expedia site where an interactive map is displayed showing the location of our meeting site. Of course, you need to have a live Internet connection for this to work.

The Word "Save As HTML" option has been enhanced—and has caused me problems. Don't get me wrong. It works. It just works too well. For example, suppose I have a Word document consisting of only the following sentence: "**This is a test of a simple HTML page created from this very short Word document.**" Here is the HTML code generated by saving it as a Filtered HTML document in Word 2002. If you think this is bad, save it as a non-filtered HTML document (it will contain more Office specific tags)

```
<html>
<head>
<meta http-equiv=Content-Type content="text/html; char-
set=windows-1252">
<meta name=Generator content="Microsoft Word 10
(filtered)">
<title>This is a test of a simple HTML page created from this
very short Word
document</title>
<style>
<!--
 /* Style Definitions */
 p.MsoNormal, li.MsoNormal, div.MsoNormal
        {margin:0in;
        margin-bottom:.0001pt;
        font-size:10.0pt;
        font-family:"Times New Roman";}
@page Section1
        {size:8.5in 11.0in;
        margin:1.0in 1.25in 1.0in 1.25in;}
div.Section1
        {page:Section1;}
-->
</style>
</head>
<body lang=EN-US>
<div class=Section1>
<p class=MsoNormal><font size=3 face="Times New Ro-
man"><span style='font-size:
12.0pt'>This is a test of a simple HTML page created from this
very short Word
document</span></font></p>
</div>
</body>
</html>
```

Quite a bit to produce one sentence. Office 97 produces the following much simpler HTML code.

```
<HTML>
<HEAD>
<META HTTP-EQUIV="Content-Type" CONTENT="text/
html; charset=windows-1252">
<META NAME="Generator" CONTENT="Microsoft Word
97">
<TITLE>This is a test of a simple HTML page created from
this very short Word document</TITLE>
</HEAD>
<BODY>
<P>This is a test of a simple HTML page created from this
very short Word document.</P>
<FONT SIZE=2></FONT></BODY>
</HTML>
```

The 2002 HTML is very hard to edit. For example, without wholesale removal of the extra coding you can't even change the font size or color. Office 2000 has a utility for stripping out this extra code called Office 2000 HTML Filter, I think, but no such utility yet exists for Office 2002.

I think the objective of all the extra code is to make the HTML document appear as close to the original Word document as possible. But it comes with a price. For example, when you view the 2002 HTML document in a browser, changing the viewing text size has no effect on the document.

Well, I am almost out of space, and I haven't even gotten

(XP… … ….Continued on page 9)

(XP… … ….Continued from page 8)

to Excel and Access. In what space remains let's talk about Web Queries in Excel. With a Web Query I can link any tabular data on the web to an area of cells in an Excel worksheet—for example, the stock information for Microsoft's own stock at MSN's Money Central. I could do this for any stock. Using the Web Query, I thus can set up worksheets in Excel containing the tabular data and have it refreshed as often as I like, say every 15 minutes. But stocks are not the only web data that you can import. How about the weather information for New York City's Central Park at http://www.weather.com. Or the AP headline news. The possibilities are boundless.

In closing, the only thing I noticed different in Access—other than that it had a different file format from previous versions— had to do with Visual Basic for Applications programming. It is of no interest to the average user, but if you are going to use a construct like

```
Dim MyDB As Database, MySet As Recordset
Set MyDB = CurrentDb
Set MySet = MyDB.OpenRecordset("Main")
```

then you will need a reference to the Microsoft DAO 3.6 Object Library. Something that was not required in Office 97. It took me a little while to figure that one out.

More next time. I really haven't had time to look for new features. It takes all my time to just use the features I already know. ◆

(President… … ….Continued from page 1)

computer user groups with 46 member groups, including PC and MAC groups. The group was founded in 1993 to assist user groups in the performance of their managerial and educational activities, to promote communications among local user groups, and to facilitate relations between user groups and the computer industry. FACUG is the successor organization to the Florida Suncoast Conference of PC User Groups. Suncoast was one of the early regional groups having been started in 1989 in Sarasota. (http://www.facug.org)

I am finalizing my plans to attend the fall event for the

(President… … ….Continued on page 10)

(Replace… … ….Continued from page 3)

up with a program called ***Total Recorder*** (for $11.95), and there I was.

Now I can choose the type of music, download a particular title, artist, genre or era with ***MUSICMATCH,*** and record away with ***Total Recorder***, which gives you several easy ways to save files in different formats. I, of course, have chosen MP3s, and I'm very satisfied with the outcome.

Now, tell me, is this any different from an updated version of taping a song off an old- fashioned analog radio using a cassette recorder? I don't remember the recording industry telling me that I couldn't do that, so I guess I'm legal now… or not!

By the way, check back next month and I'll tell you about some neat stuff to play all these audio files on. ◆

(Reader… … ….Continued from page 6)

But wait…maybe it is. After all, here we are in the 20th plus year of the entire computer Revolution. And not only is this simple implement not on the **market** yet… it's not even on the horizon, as far as I can see. Can you? Can any of us? ◆

Special Interest Groups

Microsoft Access SIG

This SIG meets the first Monday of the month at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6:30 PM. For information contact either William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merlenic@tampabay.rr.com.*

Genealogy SIG

To be included on the TPCUG genealogy mailing list, contact Jenny Lind Olin at 960-5723, or *jlolin@tampabay.rr.com.*

Visual Basic for Applications SIG

This SIG meets the third Tuesday of the month, at the Gateway 2000 Store on North Dale Mabry Mabry (just south of Columbus Drive) at 6:30 PM. For information, contact Merle Nicholson at *merlenic@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Mary Sheridan moderates the discussion.

Did You Know This Trick

By Jenny Leitzke, Membership Coordinator, Tampa PC Users Group
Leitzke4@tampabay.rr.com

Microsoft has a number of cute tricks up its sleeve, and, although an experienced user, I am still discovering them. During a training class this week, I learned that in Microsoft Office you can customize your Toolbar Icons to have different pictures from the ones originally assigned to them. This will also drive anyone borrowing your computer absolutely batty trying to identify them.

Follow these simple steps:
Click "View"
Click "Toolbars"
Click "Customize"
Click Tab "Commands"
Click on the Icon you wish to change
Click "Modify Selection"
Click "Change Button Image"
and ala kazam your new Icon. Still the same function, but you have chosen the picture to associate with it.

If you would like to change it back again,
Click "Modify Selection"
Click "Reset Button Image"
and your Icon is back to the original picture before you fiddled with it.

Have fun, but be careful. Too much power is always a little dangerous. ◆

APCUG. APCUG (Association of Personal Computer User Groups) is an organization dedicated to helping member computer user groups succeed. The APCUG helps to foster communications by operating as an informal network between user group organizations and also with companies that provide computer related and Internet related goods and services. The APCUG also assists member groups in the fulfillment of their educational missions and activities by sharing with officers of member user groups the knowledge of what it takes for user groups to better serve their members. The APCUG operates as a 501(c)(3) non-profit organization. (http://www.apcug.org)

Microsoft is planning their next event on October 20th at 10 AM. I'm not sure what TPCUG's involvement will be, but I may need to ask for volunteers to work the event.

I will not run for president again. I think people get stagnant and complacent when they stay in one place for too long. I'd like to see the board at least shake up positions. The best situation is to find new people to come into the board, bringing new ideas and new energy. If it ends up being the same group of officers again, then at least we should switch positions on the board, so we all know how to do each others' jobs. The member-at-large will present a roster of candidates at our October meeting. If you or anyone you know would make a good officer, please contact Kevan Sheridan(kevan57@tampabay.rr.com) (813-988-6480). Remember this is an election, and you can run for a position even though an existing officer may stand for re-election.

Happy Computing! ◆

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

Minutes of the August Meeting

By Mary Sheridan for
James Weber, Secretary,
Tampa PC Users Group
jlweber9@mindspring.com

Mary Sheridan had her Windows SIG/open discussion session from 6:30 PM to 7:00 PM.

The representative from TBO (Tampa Bay Online), Debra Benoit, was the presenter. TBO.com is the online front door for the Tampa Tribune and WFLA. Debra works for the advertising department, and her talk was about ways to maximize traffic to your web site.

Debra explained that the Internet has changed a great deal in the last few years. In mid-1999 the most popular search engines were indexing 15% of web sites. That figure is down by 35% today. This means that it can be very difficult to get your web site "found" on the Internet. Debra stated that 68 million people made purchases on the internet in the first quarter of the year 2000, and that was up 53 million from 1999. Seventy two percent of all Internet users became online shoppers in the year 2000. This means that public confidence is changing and more people are starting to trust doing business on the Internet. The first thing you need to do to promote your web site is to publicize it everywhere you go. Business cards, signs, stationary, ads, any place where you have your business name, you should also have the URL to your web site listed.

Many search engines index your web site by the number of links you have available. So the more links you have the more exposure you may be able to get.

It was a very interesting meeting, with lots of questions and answers. Debra was well-versed in her profession and was able to field all the questions with grace and good humor. ◆

Magellan's GPS Companion for the Handspring Visor

By William LaMartin, Editor,
Tampa PC Users Group
lamartin@tampabay.rr.com

I have had this new toy—the GPS Companion—for several months, a birthday gift from my wife and daughter, but am just now getting around to writing a review on it for the newsletter.

As pictured on this page, this device is a 12 channel global positioning receiver that attaches to the Handspring Visor's Springboard expansion port. Two pieces of software come with the unit: Map Companion and GPS Companion. They are installed from the Map Companion CD, which also contains maps of the entire United States. These maps are broken down by county within each state and then further broken down by individual municipality within each county. I think there are more than 20,000 such county and city files.

For example, to cover all of Hillsborough County, FL, you will need to load into your Visor the Hillsborough County map, the Tampa map and the Temple Terrace map. The amount of memory your Visor has will determine how many maps can be loaded.

I have one of the early Visors with only 2 MB of memory. I have added an 8 MB Springboard memory expansion module but have found out that—although it is a great place to store files and programs—many programs cannot be run from there and data stored there cannot be accessed if that data must also be written to. Plus, obviously the 8 MB memory expansion module cannot be attached to the Visor at the same time the GPS Companion is attached. Thus, I am limited to 2 MB for my maps and any other Visor programs that I want to be loaded.

My solution is to load all the maps I might need—a few at a time—and then move them to the expansion module along with programs that I also won't be using at the moment.

For example, I might leave only Hillsborough and Polk Counties in Florida, along with municipalities Tampa and Temple Terrace, in the main memory but have Pinellas, Highlands, Pasco and several other counties, along with their separate municipalities like St. Petersburg, all loaded into the expansion module. That way I would have all of Hillsborough covered, also Polk except for its municipalities. Of course, if you have a newer Visor with a much larger memory, that is even better.

So, how well does this GPS work? When you attach it to the Visor, the Visor turns on and the GPS Companion program starts. However, you must still start the GPS. It can take anywhere from less than one minute to almost 10 minutes for it to get a fix. However, it usually does it on the quicker end of the time scale. With the GPS Companion program you are given your heading, speed, longitude, latitude and elevation. If you switch to the Map Companion, you see your position on the map, which you can zoom in and out. And, as you change locations, the map scrolls.

It would be nice if the two programs were combined, where you didn't need to switch back and forth. And it would be nice if there were a map that showed the counties of each state. I know the positions of many of the Florida counties, since I have lived with them for many years. But on a recent trip to New York, I flew to New York City, spent a few days and then rented a car to travel to the country. I figured out I

(GPS… … ….Continued on page 4)

(GPS… … … .Continued from page 3)
needed Westchester County, since I knew it was to the north, but what about other counties? I didn't know the names of them. Then while driving through Westchester, I came to Sleepy Hollow and my map disappeared since I hadn't included the city of Sleepy Hollow. There are 29 separate municipality maps you need to include with the Westchester County map.

So I have concluded that while quite good when you are walking or when you are driving around a city like Tampa, the GPS Companion leaves a bit to be desired when used in a car on a trip spanning more than one county. For that I will have to rely on Street Atlas USA on my laptop and the GPS unit that came with that program. However, it is certainly not as compact a package as the little Visor device.

I should note that on the plane trip, I sat by a window and tried to get the GPS unit to fix, but it didn't. I have read of others having no problem getting a fix with the same unit on their plane trips. It does, however, work well for me in an automobile.

If you are familiar with a city, then the GPS isn't of much use, since you can often walk a block and see a street sign and also look at the skyline to see where you are. But it would come in handy in a strange location. I certainly could have used it when I got turned around in the outskirts of Sleepy Hollow, but unfortunately I hadn't loaded that map.

The GPS Companion uses two AAA batteries which are supposed to last about 10 hours. But note that while the GPS unit is attached, the Visor remains on—and that also runs down the Visor's batteries. So take a lot of batteries on your trip. The unit costs around $150. ◆

President's Column

By Mary Sheridan, President,
Tampa PC Users Group
mcpease@mindspring.com

I'd like to express my deepest condolences to everyone who lost someone in the recent tragedies in New York, Washington, DC and Pennsylvania. We have all been shaken to our roots by the events of September 11th, and it will be a long time before we feel safe again. In the spirit of keeping things moving and not letting terrorists change our way of life, we held our meeting on September 12th.

We had an understandably light turnout, but it was an interesting meeting and I'm glad we didn't cancel it.

A long time user group representative of Adobe Corporation, Louise Miller, was let go on Friday September 28, 2001. Members of the APCUG and FACUG had written hundreds of letter trying to save Louise's job. I don't know if this means that Adobe is phasing out their involvement with user groups, or if Adobe is having financial problems. Whatever the reason, it certainly wasn't Louise. She was a wonderful market representative and will be missed by many.

The FACUG fall conference will be held near Lakeland, FL at the Imperial Lakes Country Club at 6 Country Club Lane, Mulberry, Florida 33860. The conference date is Saturday, October 13, 2001 from 8:30AM until 4:30 PM.

Microsoft is planning their next event in the area on October 20th at 10 AM. All of the user groups around the country are wondering why they haven't heard from Microsoft about this event yet. No one seems to know if the company is handling the events with in-house personnel or if someone has just dropped the ball on the organizational end of things. If we do need to have a presence at the

(President.....Continued on page 5)

(President… … ….Continued from page 4)

event, I hope I can count on the support of all of you who have helped in the past.

Kevan Sheridan, member-at-large, will present a slate of candidates at our October meeting. It's still not too late you throw your hat in the ring. Just see Kevan before the meeting.

I've gotten my president's column to William LaMartin late this month. I'd like to thank him for his patience and for all the hard work he does month after month making our newsletter great.

Happy Computing. ◆

July 2000 from the Staten Island Ferry — William LaMartin

Neat Stuff to do with your Digital Audio

By Larry Anders,
Librarian, Tampa PC Users Group
Larry@AndersNet.com

As a follow-up to last month's article, I said I would let you know about some neat stuff on which to play all the MP3's you're downloading. I travel a lot, and for quite a while now I have been taking my tunes with me to listen to while traveling. I have an HP 548 PocketPC that has a built-in music player that plays either MP3 or WMA files. WMA, in case you're not familiar with the term, is Window's answer to a compressed music file. Only WMA is about half-again the size of an MP3, which for a traveling music player is great, more music in less space. The capability to convert MP3 to WMA is built into most of the popular music players, including ***MusicMatch***, which I reviewed last month.

With my collection of MP3s pushing 3,000, I wanted some way to listen to the tunes in my family room on my "good" stereo system. So I purchased a new DVD/CD player that has an MP3 decoder built it. Now, I just burn a CD with whatever songs I choose, plop the CD into the DVD player and can listen to one CD for several hours.

Because I have this ability while I am at home, I also wanted to have more choice while I was traveling. So, I started looking around and eventually settled on a ***Phillips EXP-103*** personal CD player that has built-in MP3 decoding capabilities. With two AA batteries I can listen to up to 10 hours of music. The Phillips is also CD-Rewritable compatible, so I can record different selections for each trip using the same CD over and over again. With the Phillips CD player I also got a car kit, which allows me to plug-in my portable CD player into a cassette tape adapter that plugs into the tape player in most rental cars. I recently found out that the tape adapter also works with my PocketPC also giving me a greater selection to listen to on the road. The kit also included AC and DC power adapters.

Last month I told you about ***MusicMatch*** allowing me to listen to and record streaming audio on my home PC, and that the quality was excellent (CD-Quality) because of the cable modem. Well, obviously I don't record everything I listen to but I would like to listen to the streaming audio in other parts of my house, especially in the family room. Enter the ***Kima KS-110 Wireless Audio System***. With the Kima system all you do is plug the speaker cable that comes from the PC into the back of the Kima transmitter and then plug a cord provided from the transmitter to the speakers. Place the Kima receiver close to an FM receiver (radio), within 1000 feet of the transmitter, and anything coming through your computer can be heard on the radio in the other location. A little adjusting is required for gain and signal strength and the receiving radio has to be adjusted to either an 88.1 or 88.3 frequency but that's it! And the quality of the sound is great, or at least I think so.

Of course, it doesn't have to be just music or streaming audio. Anything that you can hear through your speakers on your computer can be heard through the FM receiver at the other location.

So you see, there are a lot of neat things that can be done with the digital audio we have available to us these days. I'm sure there are many other things, and I would be interested in hearing about them myself. If you have any ideas or suggestions send

(Digital……Continued on page 9)

Character Map Savvy

By Jenny Lind Olin, Treasurer,
Tampa PC Users Group
jlolin@tampabay.rr.com

Sometimes when I am typing E-mail messages in Outlook Express, I brag a lot about the nice weather we are having, especially when it is 72°, and I need the degrees symbol. I have just been typing out the word "degrees" because the symbol is not on the keyboard. Well using the symbol is very simple once you know how. I knew about this because I always used **résumé** and **c/o** [editor's note: my printer would not print the symbol that looks like c/o so you are seeing the letters c/o instead of the symbol] in my resume writing days, but my friend David Henry recently brought this to my attention.

Even though I don't cook or write mathematical formulas any more, I use fractions now and then. Which looks better **1-1/2** cups flour or **1½** cups flour? In MS Word it will automatically convert to the neater format but not so in your E-mail. The trick is to hold down the Alt key while typing in the code 0189 for the ½ or 0176 for the degrees symbol (°). This must be entered on the numeric keypad on the right of the keyboard and the Num Lock must be set on.

There are a few other symbols or "special characters" I use from time to time in the same way and so I keep a sticker on my PC desk for easy reference. Here is a collection for your consideration:

ALT plus	Symbol
0162	¢ Cent Sign
0163	£ Pound Sign
0167	§ Section
0176	° Degree Sign
0182	¶ Pilcrow Sign (Paragraph Symbol)
0153	™ Trade Mark Sign
0169	© Copyright Sign
0174	® Registered Sign

Fractions:

0188	¼
0189	½
0190	¾
0185	¹ Superscript One
0178	² Superscript Two
0179	³ Superscript Three
0124	| Vertical Line
0129	□ Box
0149	• Bullet
0183	· Middle Dot

It is so easy to do by using the characters in the Character Map. They seemed to be hidden, but you can find them at Start | Programs | Accessories | System Tools | Character Map. (In Windows 95, skip System Tools). You can change the font to get the characters for the specified font you are using. Use the Font drop-down box to select the type font. For instance, select Times New Roman. The display shows all 224 characters available in the selected font. Place the mouse pointer on a box of your choice and left click to see an enlarged version. If it is the special character you need, write down the Alt Plus formula found in the lower right corner.

This trick should work in any Windows application such as word processing or E-mail. Alternatively, you can click the character you want; hit Select, then Copy to place it on the clipboard. Back in your document, paste it at the cursor position. You can select several characters and place them in the clipboard if you wish.

For the more Advanced:

With a slightly different formula:

2153…2154, Alt + X ⅓… ⅔ Thirds

..215B…215E, Alt + X ⅛… ⅞ Eighths

Use PressWriter Symbols in the font selection

Type Alt + 0234 = ê

Just in time for Halloween, Select Webdings:

Type " =

Type ! =

Secretary's Report

TAMPA IBM PC USERS GROUP
MINUTES OF 7/10/91 MEETING

PRESIDENT'S REMARKS

- Version 5 of Microsoft DOS was a lively topic. At least half of the members in attendance have the new version. Do read the various text files in the new version, especially the notes on applications. For a short while, Egghead and WorkPlace are offering this new version at a big discount. IMPORTANT - Do create a Boot Disk first.
- IBM and Apple are now working together; seems to be Them vs. Microsoft and Intel. Apple will provide the software applications; IBM will provide the operating system; and Motorola will provide the computer chips.
- "Vaporware" and hardware "pronouncements" tend to drive everybody crazy. No sooner is one upgrade announced to be released at a future date, than the one beyond that is also announced. Case in point: the 486 50 MHz chip and the 586 chip announced at almost the same time. The corporate world cannot, and will not, wait; it will go with what's available when needed.
- You can buy the OS/2 version 1.3 for less than a hundred dollars if you already own IBM DOS. You then get version 2 for free when it's available. Else, you can buy version 2 for an estimated $150 when it comes out.
- Computerland (national) withdrew some local area franchise licenses. Comment from the floor was that the local owner shut down the ones that he owned because he's in some financial bind - his bank withdrew his loans.
- It's official - Borland has purchased Ashton-Tate. IBM seems to look with favor upon Borland. Should be an interesting summer.
- IBM and Sieman (Germany) have joined in building 16 megabyte memory chips. Seems to be an effort to reduce dependency upon Japanese suppliers.
- IBM BBS - access now available to members of user groups. It'll cost you a long distance call to log on to this BBS based in Atlanta. The data phone line is: 404-835-6600. Public domain files are on line as well as information about IBM hardware and software.

OS/2 VERSION 2

Our IBM host and guardian, Chris Mayer, demonstrated a beta version of IBM's latest OS/2 2.0 offering. OS/2 can run Windows and DOS applications in a multi-tasking environment. While Chris had a few OS applications on the test computer, he had a lot of DOS applications - and ran them like a charm! It was really something to see. Bouncing back and forth between DOS applications without losing a beat.

OS/2 can give almost 620k RAM to each DOS application. You can run Windows in each "virtual" machine and you can have as many virtual machines as you want.

To demonstrate the versatility of OS/2, Prodigy (an on-line service) was started, then WordPerfect and Lotus 1-2-3 were fired up. While using Prodigy, WordPerfect and Lotus were still running in the background (a little slower, but running). Chris then brought up another DOS program (Meta Stock Professional) and flipped back and forth from the stock report section of Prodigy to the Meta Stock program. As if that weren't impressive enough, he also brought in Flight Simulator and an OS/2 word processor (DeScribe)!

(1991… … ….Continued on page 9)

(1991… … ….Continued from page 8)

Chris then showed how easy it was to "cut" an object from the Flight Simulator graphic screen (part of a building) and paste it into DeScribe. He said that this procedure works both ways: OS/2 to DOS and DOS to OS/2. Flipping back to Prodigy, the news item about Borland acquiring Ashton-Tate was brought to the screen. He then brought up Windows 3 to show how easily OS can run many diverse applications.

(NOTE: It was difficult to count all the different jobs that Chris was running, but I counted ten (10) applications that were open at one time.) The great thing about OS/2 is that it sets up a virtual machine for each application. Now when an application crashes, only that particular virtual machine crashes, the rest of the system is still running. Contrast this multi-tasking methodology with that of Windows: when one Window job crashes, everything must be rebooted.

OS/2 version 2 will include Windows 3 and it emulates DOS 4.0. It will be offered in two versions. The Standard Edition will take up l5 meg of space on the hard drive and is intended for single users. The Extended Edition needs 25 meg of hard drive real estate and is intended for LAN setups and large relational data base managers. It is believed that the new version will be announced before the fall COMDEX, probably by October. OS/2 is a whole new ball game.

- It makes full use of the 32 bit features of the 386 and higher PCs.
- Has enhanced functions for DOS
- I/O bus makes no difference
- Processor path must be 32 bits
- Uses flat 512 megabyte address space

Memory is divided into 4k pages that can be flipped in and out of the hard drive. It can handle a virtual memory size of 512 megabytes by using a hard drive to simulate actual memory. The flat addressing scheme equates the memory address to the actual address on the hard drive via 4k pages. And while it is stated that up to 16 windowed full screens are available for DOS applications, as many as over 200 have been run.

Once again, Chris has come through with flying colors. He was asked to give this presentation on rather short notice. Plus, he was running a beta version of the new software and had not seen the manual for the new version. Can you imagine the kind of show he could put on after reading the manual and working with the release version? Thank you, Chris, for a great job and an excellent preview of OS/2 and the future of personal computers.

Editor's Comments

By William LaMartin, Editor,
Tampa PC Users Group
lamartin@tampabay.rr.com

September has been a bad month, and all this computer stuff doesn't seem that important after the massive loss of life in New York City. Only a few of us have spent time in the World Trade Center or the Pentagon, but almost everyone has been on a commercial airliner and can picture the horror of the recent hijackings. That we were not on one of those planes is simply a matter of luck.

Since the *Bits of Blue* is really not the appropriate venue for coverage of stories that deviate much from computers, I will conclude this topic by noting that I have included two photos from trips to Manhattan the past two summers. The first, on page 5, was taken in July of 2000 and shows the World Trade Center Towers in the NYC skyline in a view taken from the Staten Island Ferry. The second photo, on the front page, is a close up of those towers taken in July of 2001. Both were taken in less than ideal conditions. It was hazy and overcast for the skyline photo, and the close up was taken looking directly west into the late afternoon sun. But they are all I have of those lost structures, so I will cherish them.

People talk of how the Twin Towers dominated the Manhattan skyline, but in over 300 photos that I took the past two trips, I only have two images containing the World Trade Center. The city is massive, and 300 photos just doesn't cover that much.

We are changing the meeting day of the Microsoft Access SIG to the first Tuesday of the month from the first Monday. The Visual Basic for Application SIG continues to meet the third Tuesday of the month.

Attendance has been a bit at off the regular monthly meetings. Of course, that was understandable this past month with the meeting the day after September 11. I encourage you to attend the regular meetings. It will make the group stronger, and you will most likely learn something about computers that you didn't know. ◆

Meeting Preview: Mike Galvin from Office Depot will tell us about new computer products. As usual, Mary Sheridan will conduct a computing and Windows discussion for the first 30 minutes of the meeting.

President's Message

By Mary Sheridan, President, Tampa PC Users Group
mcpease@mindspring.com

We had another good meeting this past month. The presenter was from Executrain, and he was knowledgeable about his topic. He fielded many questions from our members and answered them all.

I'm just back from the Microsoft Windows XP event. They had 1000 people registered and less than 400 were in attendance. I know there were many registration duplications, but other than that, I don't know why there was such a difference in the numbers. Microsoft hired a professional event person for the event and a security guard. A Microsoft field agent was also on hand.

(President.....Continued on page 10)

An unopened copy of Microsoft Office XP Professional will be raffled off at the November meeting.

The use of trademarked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

apcug Member of The Association of Personal Computer User Groups

Minutes of the October Meeting

By James Weber, Secretary, Tampa PC Users Group
jlweber9@mindspring.com

Our meeting started at 6:30. Elections are coming up soon and a call for nominees was put to the group. Microsoft held their Windows XP Event at the AMC Veterans Theater on October 20, 2001. Our president, Mary Sheridan, was able to get about ten people present to volunteer.

We also had Mr. Revis Bland from New Horizons learning center (http://www.newhorizons-tpa.com) present a catalogue of classes available in the Tampa and Clearwater areas.

Our main presentation started at 7:05. Mr. Kyle Brodie of Executrain (http://www.executrain.com) demonstrated some of the new features of the Office XP suite. The biggest new feature of all XP programs is a “task window”. This is a separate window containing a list of the most commonly used functions within the particular program. The menus and windows can also be customized easier than previous versions of Office.

Office XP now recognizes print from writing tablets and offers voice recognition and text to speech. Excel XP added color to the tabs at the bottom of the open tables, rows and columns are now highlighted, and the auto sum function has been enhanced. Power Point XP has added new templates and outlines of slides, and the actual slides are more visible to ease use and development of a presentation. Access XP databases are more readily transferred to other XP programs. Front Page XP added a drawing tool bar to enhance creating your own web content.

There were a large number of T-shirts given away, as well as three trial versions of Office XP. The meeting ended at 8:05. ◆

What's Up with the Digital Copyright Wars?

By Tim Condon, Tampa PC Users Group
tim@free-market.net

What's the latest in the digital copyright wars? These are battles that are remaking copyright in the age of the computer network.

They include battalions in Washington, DC, including lobbyists doing their jobs; venal politicians without understanding; venal, lying industry representatives who understand only too well; and industrious, idealistic fighters from think-tanks like the Electronic Frontier Foundation (EFF) and the Center for the Public Domain who try to foment understanding among others. Such as those making the laws.

First the bad news. When last we checked in on this particular battlefield, Napster.com had been vanquished. The music file-sharing service was attacked by a pile-on group of lawyers representing, among others, the Recording Industry Association of America (RIAA), the rock band Metallica, rapper Dr. Dre, and some musical has-beens like Deborah Harry and Aimee Mann.

Napster lost. It settled with some of the pile-ons, including issuing corporate apologies to some of the musicians. But the RIAA's lawyers are still pushing. They want monetary damages for copyright infringement against Napster. This will not only destroy Napster as a business entity, one of the goals of the RIAA, but will also establish an important legal precedent to be used to attack the post-Napster file-sharing services.

Napster, down but not completely out, is fighting a scrappy rearguard action. The RIAA wants the federal district court in California where they're appearing to rule as a matter of law that Napster is liable for copyright infringement damages. Napster fires back that the court hasn't even been shown that the music industry companies backing the RIAA **own** the songs which Napster is said to have violated the copyright on.

The RIAA tells federal judge Marilyn Hall Patel that the court can take it as a "given" that the record companies owned the copyright on all those popular songs. Napster riposted that there's no way to tell the truth of that unless the Napster lawyers have a chance to look at the **contracts** the record companies have with the various musicians.

OOOOoooohh. The RIAA and the record companies don't want **that** to happen. Why? Simple. Because it would show that the entire modern music recording industry has been built upon wholesale exploitation and economic rape of young, idealistic musicians.

Why? Because it would open up questions about why people are forced to pay $15 to $18 for compact disks that cost 35 cents each to produce.

Why? Because it would open up questions about how each member of one band, a trio named "TLC," made less than $50,000 each in a year after they sold 16 **million** albums and toured nationally to sold-out arenas. Where did all that money go? Check in with the Dixie Chicks. Their first album sold 10 **million** copies; their second album has sold 7 **million** copies and counting. Well, at about $14 each (conservatively), that comes up to over $200 **million**. Dixie Chick Natalie Maines responds "I don't even have a million dollars in the bank. Tell me where this money goes. I have no idea." And they're said to be some of the luckier musicians, with "a great manager [and] great attorneys," says another of the Chicks.

What's going on here? And what does it have to do with Napster and the Napsteronian services that are following?

On the one hand, it has to do with the viciousness and greed of the music recording industry. But on another level it is merely one "front" in a battle raging across cyberspace, across the legal landscape, and across an academic world concerned with economics, property ownership, and copyright. The problem is that the way the music recording business has evolved, the recording companies control distribution. If you control distribution of copyrightable work, you control a **bunch** of the economic infrastructure of an industry.

But wait! What about the publishing industry? In that business the **authors** almost always own the copyrights, and they almost always have ultimate say on who publishes what of theirs, and how. Well, then, how is it that in the **music** industry, the copyrights to the music and songs are almost always owned by the **recording companies**? Well, it's partially because musicians are usually younger, less savvy, poorer, less educated, and more easily talked, scammed or cheated out of what they've created. (Feel free to read up about the numbers of old rock musicians who live penniless because they don't control the music and songs that they created.)

What is going ON here!?! Simply put, the Internet is going on. All of a sudden, the record companies—not to mention the movie companies—can't monopolize the distribution channels as they've been able to do in the past. **Now** it turns out that music and songs and books and tomes and **movies**, for gawd's sake, can all be easily copied and reeeeeelly easily sent all over the world, to anyone who wants a copy. The distribution monopoly is being broken down by the onrushing Internet.

So the battles—the thrusts and parries—the hooks and jabs—the lawyers ripping and tearing at each other in venues all across the land—continue. And it's all happening so fast I can hardly report it to you. The exchange in federal court above between Napster and the RIAA happened a couple of weeks ago on October 10, 2001. And within the past year or so....

(Digital…….Continued on page 4)

(Digital…….Continued from page 3)

Bad news: Congress passes the Digital Millennium Copyright Act (DMCA), which includes "anti-circumvention provisions" relating to digital encryption coding. That is, it is made illegal to publish or publicize "hacks" or "cracks" of encryption coding that is used (by the recording industry and movie industry) to thwart copying and sharing.

Good news: The motion picture association comes up with an unbreakable encryption system to "scramble" digitized movies, to protect against the illegal copying and sharing of movies.

Bad news: "2600," sometimes referred to as a "rogue hackers magazine," decides to publish DeCSS (De Contents Scramble System), the new decryption code for the unbreakable encryption system, above, and is immediately sued by the Motion Picture Association of America (MPAA), an industry group representing eight of the biggest Hollywood movie studios. The MPAA asks the court to issue an order of "prior restraint" against 2600, thus running squarely into the First Amendment, which abhors prior restraint.

Good news: The Electronic Frontier Foundation (EFF) takes up the case of 2600, arguing that the DMCA is being utilized and interpreted in such a way as to stifle freedom of speech and expression and is thus impinging on the First Amendment.

Bad news: The court grants the MPAA's request, ruling that 2600 is enjoined from either publishing the DeCSS code or providing online links to anywhere the DeCSS code can be obtained.

Good news: Napster comes on the scene and becomes one of the most astounding success stories in the Internet's short history.

Bad news: Napster gets piled-on in court and has to fight a desperate rearguard action or become extinct.

Good news: Napster's rearguard action may bust open to public scrutiny the contracts in the recording industry where musicians are often little more than indentured servants, making about 10% royalties on their music even in the best of cases.

Bad news: The Big Five record companies backing the RIAA have announced that they're creating a duopoly for online music. Sony Music and Vivendi Universal's Universal Music are setting up a pay-me service called "Pressplay," while AOL Time-Warner's Warner Music, EMI Group and Bertelsmann's BMG are forming another pay-me service called "MusicNet."

Good news: In mid-October 2001 the U.S. Justice Department announces it is investigating whether the record companies are cooperating in order to kill off any competition in the still-evolving online music industry (such as...Napster).

Bad news: The RIAA and the MPAA gang up and file lawsuits against MusicCity, Kazaa and Grokster, three post-Napster file-sharing services that were beginning to share not only music files but whole **movies too**. In addition, similar legal actions were able to shut down Scour, another sharing service, and pushed Aimster, another such service, close to bankruptcy.

Good news: Swarms of other music-sharing services start popping up from all over the world. Besides Grokster, MusicCity, and Kazaa, there appear AudioGalaxy...Gnutella...Freenet... Gnotella...FastTrack...iMesh. "One, two, many Napsters!" seems to be the chant.

Bad news: The recording industry fights back and tries another technological fix. The Secure Digital Music Initiative (SDMI) produces uncrackable cryptologic coding to protect music files and other digital works from being copied and shared. The SDMI holds a "Hack SDMI" contest, daring hackers to try cracking what they call their new "watermark" system.

Good news: Six months later Professor Edward Felton, a Princeton University cryptology expert, and a few of his students announce they they've cracked all the watermark schemes. Prof. Felton prepares to present a formal academic paper at the Fourth International Information Hiding Workshop, explaining how the crypto watermarks were cracked.

Bad news: Professor Felton is threatened with a lawsuit by the RIAA if he presents or publishes his paper, based in part upon the DCMA anti-circumvention provisions. The threat is effective. Professor Felton withdraws his paper from the conference, noting that "litigation is costly, time-consuming, and uncertain, regardless of the merits of the other side's case," and saying he and his group didn't want to "expose ourselves, our employers, and the conference organizers to litigation at this time." The threat of lawsuits by the RIAA is thus used to stifle not only the free speech of 2600, but also academic freedom and research. Seems to work great!

Good news: Everyone realizes that Professor Felton's work was already being distributed throughout the Internet anyway. And the EFF files suit on behalf of Professor Felton and his colleagues. Noting that the DMCA contains criminal provisions for use against individuals or companies that violate the non-circumvention provisions, and that parts of the DMCA interfere with academic research and scientific progress, the EFF asks the court to overturn as unconstitutional some provisions of the DMCA.

Bad news...

Heyyyy...wait a minute. We all get the picture, right? We're in the middle of a business and technological revolution! Right now chaos reigns. It's open legal warfare over technology that threatens the distribution monopolies of two very, very lucrative

(Digital.....Continued on page 5)

(Digital……..Continued from page 4)
industries: music and movies.

Where will it all end? Probably before the U.S. Supreme Court. But that may not even put a stop to it (think about the "final" abortion decision in 1973, and the battles still raging over that). Possibly before Congress again. The whole notion of copyright is being transformed by modern technological advances, and the "old system" is breaking down.

From this ferment, presumably, will eventually arise some kind of steady-state where creators of music and movies can be fairly rewarded for their creativity, while the old distribution monopolies wither away.

And you know what? All of this is merely prelude. It's a prelude to a far more important issue that will come to the fore within the next year or so. As I've noted before, eventually, somehow, some hardware company is going to get it through their thick heads that there is a **market** for light, inexpensive, clear, electronic reading appliances with reasonable battery lives. That's all it's going to take. One company.

When that implement is produced, and when the early overpricing inevitably declines with mass production, millions upon millions of those things are going to be sold. Ebooks. **That's** where the final digital showdown is going to happen. Because whereas music and movies are fun and entertaining, **books** can and do deal in the most fundamental and important commodity of all: Pure information. Fasten your seatbelts. ◆

Internet picture of the month

Windows XP has arrived

By Larry Anders,
Librarian, Tampa PC Users Group
Larry@AndersNet.com

If you're ***NOT*** like me, and have decided to wait for all the bugs to show up in the latest incarnation of Microsoft's newest operating system before taking the plunge, then I've got a site for you to take a look at while you wait. (By the way, I wouldn't expect too many bugs with WindowsXP. This software was beta-tested by over half-a-million users.) InfiniSource has created quite a site related to all the Windows operating systems and if you've got a problem or a question about anything from Windows 95 forward to XP this is a good place to start. (http://www.windows-help.net/index.shtml). The site this article is concerned with is http://www.windows-help.net/WindowsXP.

One of the features I was really interested in was the Windows XP Upgrade Advisor. The Upgrade Advisor is a tool that checks your system hardware and software to see if it is ready for upgrade to Windows XP. If you run Upgrade Advisor while you are connected to the Internet, and if your system needs updates that are available on the Windows Update Web site, Upgrade Advisor will find and install the updates for you. Can't get much easier than that. I used the Upgrade Advisor when I upgraded to Windows 2000 and it saved me some time and headaches.

If you're not aware of it, there are two different versions of WindowsXP. Another nice feature on this site is a thorough comparison of both the Home Edition and Windows XP Professional. Most home or small business users can probably get by with the Home Edition (and save $100) but XP Pro has all the features of the Home Edition plus several other features like added security, remote access, access to files & folders on a network even when disconnected from the server, and backup and automated system recovery, to name just a few. There are several more. And if you're into web publishing Windows XP Professional includes the IIS Web server 5.1 software. In my case, I felt the extra $100 was well worth the investment.

If you want to use the upgrade version, like I did, you need to realize that some older versions of Windows are only upgradeable to XP Pro. Below is a table from the site that lists the upgrade options:

Previous Version	Win XP Home	Win XP Pro
Windows 3.1	NO	NO
Any Evaluation Version	NO	NO
Any Server Version	NO	NO
Windows 95	NO	NO
Win 98/Win 98 SE	**YES**	**YES**
Windows Me	**YES**	**YES**
Windows NT 3.51	NO	NO
Windows NT 4.0	NO	**YES**
Win 2000 Professional	NO	**YES**
Win XP Home Edition		**YES**
Win XP Professional	NO	

And yes, if you purchase the Home Edition now, you can upgrade to Professional later. If the price is the deciding factor, the ERP of Windows XP Home Edition is $199.99 for the full version, and $99.99 for the upgrade, while the ERP for the full version of Professional is 299.99, and the upgrade is $199.99.

There are many, many more features on this site like free downloads, etc., but this writer's intention wasn't to tell you about all of them. I just wanted to entice you to visit the site and find out for yourself. And even if you're not considering XP, there is plenty of information to help you out with whatever Windows operation system you're using. Check it out. I think you'll get something out of it. ◆

Editor's Comments: Delphi, Lost Office CD and cmdninst.exe

By William LaMartin, Editor,
Tampa PC Users Group
lamartin@tampabay.rr.com

Delphi Programs In the past I have made reference to the programming language Delphi from Borland. I find it a nice complement to Visual Basic, since, unlike VB, for fairly simple programs it allows you to create applications that don't require an installation package to install the program. Of course, you can also use Delphi to create just as complicated a program as you would in VB.

I have posted some of these programs to my lamartin.com web site at http://www.lamartin.com/vb/delphi_examples.htm. Here are their descriptions.

Automated Browser Log Run this program, and while you surf the web it will keep track of everywhere you go. When you're finished you can save the log file. Of course, Windows provides a history of where you go also, but you can't save it to a text file.

Share a Network Clipboard I work with two or three computers arrayed around my swivel chair, which is on rollers. While working on one computer, I frequently want to send some text to one of the other computers. My former way of doing this was to copy the text to Computer A's clipboard, open up Microsoft Notepad, paste the text into it and save this clipboard file to Computer B's hard drive over the network. That is inconvenient. This program speeds up the process. Simply run the program on Computer A and Computer B, then a mouse click on each computer gets the copied text transferred.

This program is not meant as a substitute for the Windows accessory, WinPopup. WinPopup will transfer only a small amount of unformatted text. This program will allow the transfer of large amounts of formatted text.

Get Blocked Email Senders List Microsoft Outlook Express has a blocked email senders list to which you can add either an email address or an entire domain from which you wish to have the messages automatically put in the Deleted folder. You can, of course, view this list in Outlook Express, but as the list gets large (mine is now over 500) it is not convenient to view it as presented--especially since it is not alphabetical. This program captures that list, orders it alphabetically and allows you to copy it to the clipboard. One advantage of this is checking if there is someone on that list that shouldn't be there. The program depends on finding this list at a certain place in the registry, which may vary for different versions of Outlook Express. It does automatically find the listing for different identities using the same computer. I would be interested in any feedback on the program for those using Win NT/2000 or other versions than 5.0 or 5.5 of Outlook Express. I have tested it with win 98/ME and Outlook Express 5.0/5.5.

WHOIS Search This program performs a WHOIS search for Internet domain name registration. However, life is not as simple as it used to be. Now you need to first do a search using whois.crsnic.net to get the Registrar of the domain, then, if you want more details, do a second search using the WHOIS server of the Registrar of the domain. Of course, the same information may be obtained by doing the search using your WWW browser to do the search. This program just simplifies the process.

Get List of Files in Directory With this program when you select a drive and directory on your computer, the list of files in the selected directory is displayed. You can then print the entire list to your printer, copy the entire list to the clipboard, or copy selected items to the clipboard. This solves the problem of Windows not providing such a feature (although, if you can recall the method, a list can be gotten in DOS).

Looking Back to 1991

Tampa IBM PC User's Group
Minutes of 9/11/91 Meeting

INTEL is having trouble with their 486-50 chip and has stopped making them. The problem crops up when used with AUTOCAD. Dell and IBM are still shipping PCs with their version of the chip. INTEL is also being sued by AMD about the use of the name "386" for their chip.

Bits of Blue delivery date has been decided by majority vote. The Editor will make every effort to have the newsletters in the hands of the members about 7-10 days before the meeting date. The question was raised because some members are not attending, and it was thought that later delivery would serve as a reminder to attend the meeting.

Marylee Bruneau, Bits of Blue Editor, was roundly applauded by the members in recognition of her outstanding efforts in preparing the newsletter.

Training sessions on DOS Fundamentals (same as last time) will be given again. The three session course is scheduled to begin with the October meeting. Course time will be from 5:45 to 6:30 p.m. Watch the BBS and the newsletter for confirmation of this course. You do not need prior registration to attend. The first session will cover PKWARE (PKZIP and PKUNZIP) and a DOS tutorial program.

Secretary duties will be shared by Charles Howe, Jim Clark, and Ed Buzza.

DOS 5.0 problems and solutions have been documented by Fred Kyle in a WordPerfect formatted file available on the BBS. Since this is a five page document, it was not placed in the newsletter because it would raise the price of postage. Some copies are available at the meeting for those who are interested.

DOS 5.0 seems to be the predominant operating system for the majority of group members. AND they're pleased with it! Perhaps the most significant feature is the improved shell, provision for using a mouse, the DOSKEY utility, and the undelete and other file utilities licensed from Central Point Software (PC TOOLS). It also allows task swapping but that is a **s-l-o-w** procedure.

PACE has a pretty good buy for a fax (4800 baud), modem (2400 baud) circuit board - just $99.00.

DR DOS 6.0 will be available soon and will feature disk compression. This feature could double disk capacity.

Harvey (The President) expressed regrets that he couldn't bring us the latest news about PC technology. He has been quite busy and just couldn't find the time to cull these most interesting tidbits from the various trade publications.

SOFTWARE PUBLISHING CORPORATION PRESENTATION

Linda Confer demonstrated the DOS version (3.0) and the alpha copy of the Windows version of Harvard Graphics. This is not to be confused with the 2.3 ver for DOS which is still being marketed as a separate package. Since the 3.0 ver requires a 286 PC, or higher, it is not considered to be an upgrade to the 2.3 version.

Registered users of ver 2.3 can get ver 3.0 for $125.00. If you have ver 3.0, you will be able to get the Windows version for $50.00 when it is released sometime between [now and] this winter.

The new package includes a completely rewritten draw module (old Draw Partner accessory); it provides for macros and the ability to add eight additional programs to be launched from the main menu. The Chart Gallery brings up chart templates (pie, bar, 3-D, line, etc.) that make building a presentation fast and easy. You can create your own templates and add them to the Gallery.

The Intelligent Charting concept allows for adjusting the font size to make the text fit the chart. It uses Bitstream scaleable fonts for this purpose. It can also be used to prepare speaker notes.

Up to 210 boxes can be shown in organization charts. Also, it is very easy to select/create a subordinate from the master chart. Of course, such attributes as foreground and background colors and graphics are easily handled. Further, these attributes

(1991……..Continued on page 9)

(1991……..Continued from page 8)

can be carried across chart lines.

The new draw module is quite impressive. Especially the Status Box which shows the element currently being used. There are over 500 symbols (coins, arrows, currency symbols, trees, etc.) that can be animated or used as fade symbols. There are 32 palettes, each with 64 colors, besides the customization that lets you select your own colors.

In the area of animation, one image can be evolved into another; arrows can fly to a target graphic; bar graphs can use a plant symbol that grows to represent the bar value - all this in addition to various wipes and dissolves.

One nice feature is the use of "hidden" buttons that can be mouse selected to jump to another chart rather than follow the scheduled order of presentation. The Presentation module includes 17 different backgrounds (clouds, trees, planets, etc.) or you can create your own.

Linda also demonstrated the alpha version of Harvard Graphics for Windows. That the program is pretty solid was proved by the fact that it ran without ever "locking up." The DLL (dynamic link library) feature was well shown with an EXCEL spreadsheet serving as the base for one of the presentation charts.

GeoGraphics is a mapping program. Showing such items as counties, zip codes is done with ease. The Pentagon used this package for some of its TV presentations of the Desert Storm operation.

Software Publishing Corporation has been long known for its very "user friendly" PFS series of programs for the home and small business user. Recently, the company decided to get more involved with the corporate environment and sold the PFS series to Spinnaker Software.

THANKS:

Special thanks to the Software Publishing Corporation for their generous donation to the group of copies of Professional File, Professional Write and Harvard Graphics. And a very special "Thank You" to Linda Confer for her excellent presentation.

THE WINNERS:

Harvard Graphics - Ron Mirth
Professional File - Ben Benedict
Professional Write - Ed Buzza
50-50 - Dee Gabbard ◆

(Editor……..Continued from page 7)

Lost CDs about six months back, I needed an Office 2000 CD to add a feature to the Office 2000 suite installed on one of my computers, and I couldn't find the CD. I tore the house apart for several days to no effect. I then contacted Microsoft via email to try and get a free replacement (I provided documentation). Finally a fellow said he could take care of that and asked for my mailing address. I provided the address, but nothing ever came in the mail. Follow-up emails to the fellow went unanswered. Microsoft has a number, 800-360-7561, to call for replacement software, so I called it, provided documentation that I owned the Office 2000 Professional suite, gave them my credit card number for an approximate $28 charge and then received the CD in the mail a few days later. Pretty good service.

Except that it was Office 2000 Premium instead of Professional. Well, I didn't want to bother them by telling them that they had really sent me Office 2000 Pro plus FrontPage 2000. I already had FrontPage, so it wasn't like I was getting something I didn't already have. Unfortunately when I used the Premium CD and tried to add features to Office Professional, the add/remove program told me it wanted an Office 2000 Professional CD and would go no further.

Another call to Microsoft produced a replacement Office 2000 Professional CD sent via one day air. You can't beat that for service.

This illustrates one result of Microsoft's new attempt to cut down on piracy. It is obvious why you would

(President……..Continued from page 1)

The event went off without a hitch, and I was glad that our user group had the chance to be part of it. I'd like to thank Le Bennington, Marcia Bennington, Lisa Fagan, Tim Hamilton, Mike Hodges, Bob LaFave, Jenny Lind Olin, Jim Weber and Kevan Sheridan for all their hard work. Microsoft is supposed to give copies of Windows XP to everyone who volunteered. I'll get your copies to you as soon as I can. I didn't see any of our members in attendance, but I was pretty busy and may have just missed you. If I did, thank you for attending the event.

The FACUG fall conference was an incredible success. There were 92 attendees and a record number of sponsors. The lucky people whose numbers were called first received copies of Office XP, Paint Shop Pro and lots of other really nice software titles. Macintosh had a strong presence at the conference. They brought software for the Apple platform and the Apple users were thrilled to win it.

I will be in Las Vegas from November the 10th through the 17th for the APCUG Fall Conference. I'm excited about going. I went two years ago, and it was lots of fun. Because of the few articles I write for the newsletter, I'll be able to get a press pass for Comdex. A press pass enables better access to some of the speakers and events. I know that security will be an issue this year, so I'm not sure what to expect.

Don't forget to nominate your favorite person at the November meeting. Happy Computing! ◆

(Editor……..Continued from page 9)

need a CD to add features, although it is not all that obvious—except to cut down on piracy—why you need the Professional version instead of the Premium since the Word, Excel and Access programs are the same for both versions. What will shock you, though, is that if you want to uninstall Microsoft Office 2000, you may also need the original CDs to be able to uninstall. It is all tied up with the new installation method of using Windows Installer to handle both the installation and the de-installation. I haven't experienced this myself so I don't know if it is al-

ways the case, but there are certainly more than a few people in the Office Usenet newsgroups who claim to have run into the problem. So don't lose those CDs.

Cmdninst On Start-up, my Windows Me computer sometimes hangs, and CTRL-ALT-DEL shows the file cmdninst is causing the problem. The only solution is to reboot, then everything is OK. According to Microsoft, "Cmdninst.exe is the Configuration Manager Device Installer launcher. Along with the Windows Configuration Manager (Configmg), Cmdninst.exe is a component that drives the process of detecting and installing devices and their nodes in the hardware tree along with the allocation of resources." They say that problems are caused by outdated device drivers on the system. Not knowing what driver might be outdated, I simply chose to restore the file cmdninst.exe to see if that would help—so far it has. ◆

Meeting Preview: Christmas Party and Election of officers. As usual, Mary Sheridan will conduct a computing and Windows discussion for the first 30 minutes of the meeting. Perhaps she will also tell us about COMDEX.

President's Message

By Mary Sheridan, President, Tampa PC Users Group
mcpease@mindspring.com

As the year draws to a close, I'd like to thank each and every one of you for giving me the chance to serve as your president. It's been a great opportunity for me to meet and get to know many wonderful people. I hope I've benefited the user group, and I look forward to being involved in the future wherever I might be needed.

I'd also like to extend a great big thank you to everyone who volunteers their time and effort to make our user group an educational and worthwhile experience.

Kevan and I just returned from a week in Las Vegas where we attended the APCUG Fall Conference and COMDEX. The conference was a huge success. The primary function of the APCUG conference is to help user group leaders learn ways to make their user groups the best organizations possible. Steve Ballmer had dinner with us and gave a funny, informative and interesting talk. It was much easier to sit through than Bill Gate's keynote speech at Comdex. The round table sessions at the APCUG conference were about getting new members, forming SIGs, and getting people to advertise in your newsletter, just to mention a few of the topics. It was a valuable learning experience, and I hope I'm able to disseminate the information in order to enhance our group.

(President.....Continued on page 2)

January 9: To be announced. Check our web site

* * OFFICERS * *
President: Mary Sheridan(mcpease@mindspring.com) 988-6480

However, for business concerning this newsletter, Bits of Blue, please contact the Editor, William LaMartin, at 821 S. Boulevard, Tampa, FL 33606-2904; 813-251-3817; lamartin@tampabay.rr.com.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII, Microsoft Write, Microsoft Word, or Word Perfect file to the editor at 821 South Blvd., Tampa, Florida 33606-2904 or to lamartin@tampabay.rr.com.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

The use of trademarked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

Minutes of the November Meeting

By James Weber, Secretary, Tampa PC Users Group
jlweber9@mindspring.com

Our meeting started at 6:40 PM with V.P. Mike Hodges presiding in Mary Sheridan's absence. Nominees for next year's Board of Directors was announced in preparation for a vote at December's meeting.

The nominations were as follows:

President	Kevan Sheridan
Vice President	Mary Sheridan
Secretary	James Weber
Treasurer	Jenny Lind-Olin and Mike Hodges
Member at Large	John Witmer

It was moved to accept the nominations and seconded.

Office Depot was kind enough to send two representatives as presenters this month. Mr. Joe Pimprel and Mr. Dave Fernandez brought in a Palm Pilot M505 as a demonstration item. This sweet little PDA made it all around the room and had quite a few drool marks on it by the time it got to me. The M505 is the latest high end Palm model and comes equipped with a 65k color 16-bit display that offered decent photo quality images considering the screen's size. The M505 runs off of a 65 Mhz processor and 8 megs of storage space standard, with a 64 meg upgrade available. This may not sound like a lot of resources, but remember that it was not long ago we were all atwitter over our 486DX 33 machines, and Palm applications are not the Microsoft bloat ware we have grown accustomed to in the past few years.

The M505 will hook up, via a cradle with a USB connecter, to either a PC or a Mac. It will also sync with another Palm over an IR connection. May upgrades are available such as a wireless modem or keyboard and applications abound from either a retail outlet or over the internet.

We ended our meeting at 7:50pm. Congratulations to Bruce Register who won a full copy of Office XP Professional. ◆

(President……Continued from page 1)

Microsoft had a rather large presence at Comdex. They had partnered with a slew of vendors who use Windows and it made for a large part of the show. I was disappointed at the lack of innovations this year. Most of the technology has been around for a while and the new things, like the Handspring Treo (a pager, cell phone and PDA combination) are just being rolled out without many of the bugs being worked out. The Treo is a good example because it sounds like a great idea until you find that only two companies are capable at this time of

Death of Paper on the Horizon

By Tim Condon, Tampa PC Users Group
tim@free-market.net

For some time now—**years**, in fact—the computer industry, futurists, pundits, geeks, and assorted hangers-on have been ballyhooing the imminent appearance of "the paperless office." And "the end of ink-and-paper books."

Yeah, yeah, bah, blah, blah. In fact, studies in the past ten years have shown that the computer revolution has **increased** the amount of paper used (to the delight of companies like International Paper, Hammermill, Xerox, St. Joe's Paper, etc.).

Does this mean that printed-and-bound books will have a long and distinguished history yet to play out in our world? Will we remain chained to the bonds of paper (and its attendant cuts and slices) forever?

Well…yes and no. Paper is such a wonderful medium, and so handy, and so inexpensive, that it will continue to play a large part in both publishing and business. The thing is, however, that it's going to be subject to a **major** impact in the next few years. And the ultimate outcome is hardly in doubt. Yes, I have spotted the future, and it's going to hit the market in 2003.

It's called "electronic paper." One variant is being developed by a partnership of an American company, E-Ink, and a Japanese company, Toppan Printing. And a division of a European company, Royal Philips Electronics, has already bought exclusive global rights for a period of time to manufacture and sell displays based on that technology for PDA's and electronic books for a $7.5 million investment.

Electronic ink printing consists of using a plastic sheet with millions of tiny "microcapsules" suspended in a clear fluid inside the sheet. One variant has each microcapsule—about the diameter of a human hair—being either white or black. The white particles are positively charged, and black particles are negatively charged, and all can be moved about by application of an electric current. The other variant has each of the tiny particles sporting both a black side and a white side; they can be caused to rotate or spin based on applying electrical current.

Either way, see the possibilities? You apply a negative electric charge to the back of the sheet and the black particles recede and disappear, or the two-tone particles turn or spin. Apply an electric charge to the front of the sheet in places and the black particles appear, or two-tone particles spin again.

The two-toned, rotating particles are being pushed by Gyricon Media, headed up by Nicholas K. Sheridon, who invented the "spinning" version of e-ink as early as the 1970's. But Xerox wasn't interested at the time, and the research was shelved until more recently. Sheridon called his invention "Gyricon" (a Greek term for "rotating image").

The "dual particles" type of e-ink—i.e. all-black particles and all-white particles floating around together—was invented by Joseph Jacobson of the Massachusetts Institute of Technology (MIT) Media Lab. He called his discovery "electrophoretic ink" because the process is based upon electrophoresis---the movement of charged particles in liquid when impelled by an electric current.

Either way, "e-ink" sounds like a reasonable moniker.

One of the big advantages of e-ink is that it can approach the legibility of the printed word on paper and be visible in low light (no backlight needed). Another is that it takes very little power, and can retain its "state" when the power is turned off (meaning AA batteries could run a reading device).

So it was no surprise when E-Ink and Toppan recently demonstrated an e-ink reading device at the U.S. Commerce Department's National Institute of Standards and Technology (NIST) eBook 2001 Conference in Washington, DC in November 2001. Their prototype "dedicated reading device" weighed 9 ounces, ran on two AA batteries, was about a centimeter thick, and had a seven-inch diagonal screen. The device also included a memory card slot and had the ability to synchronize with a desktop PC. It's going to cost about $300 and will be on the consumer market by the end of 2003.

Bingo: End of bound-paper books, yes?

Well, not quite. One problem is that the idiots who control much of manufacturing and publishing today (may I engage in name-calling for a moment?) have concentrated most of their energy on devising ways to control intellectual property—that is, copyrighted material—both before and after it has been purchased. They don't want people to be able to share books with anyone else (unless your ability to read the book is disabled), and they **certainly** don't want you to be able to copy it. In some cases they even have schemes afoot where you won't be able to read a piece of writing more than once without their permission. (And how do you get permission? Why pay them more money of course!)

Thus, with most of the publishing industry concentrating on restricting access to information, there hasn't been a lot of real innovation to be had. A light, handy, energy-conserving appliance that enables everyone to download and trade digital materials freely hasn't appeared yet. In fact, many of the presently available reading device companies have worked closely with publishers to make sure that no sharing is allowed, resulting in ebooks that are being marketed with prices equal to or higher than printed paper books. Ridiculous? Sure. Didn't I tell you these people were idiots? In striving to protect their information monopolies and precious profit margins, they've retarded the nascent ebook market.

(Paper…. …. ….Continued on page 4)

(Paper… … ….Continued from page 3)

But help is on the way. All we need in order to stop chopping down so many trees, and having to laboriously haul tons of books and magazines from one side of the country to another, is a reasonably priced reading appliance that works with all or most of the competing ebook formats (think Acrobat .pdf files, the Linux open-ebook standard, Microsoft's Reader format, Glassbook Inc.'s Electronic Book Exchange [EBX] format, HTML, XML, and even regular old .TXT file formats).

That's what E-Ink and Toppan look like they're going to come out with (while Gyricon Media is currently concentrating on large signs being marketed as "SmartPaper"). And while the e-ink technology can now only show black and white and shades of gray, color is on the horizon. Thus, while the advent of "smart paper" and "electronic ink" won't mean the immediate end of printed-paper books and magazines, e-ink reading implements **will** start eating into the traditional printed-paper markets, and eventually supplant them.

Interestingly enough, both companies working on the micro-capsule-based printing can espy a competing technology on the horizon, even as we speak. That competing technology will be based on light-emitting semiconductors made from carbon-based compounds (think about reading "self-lit printing" where the ink emits its own light, like little neon letters). And **that** technology has some Very Big Guns behind it: Labs at both Eastman Kodak and IBM are working to perfect it, and the thinking is that it will be a viable alternative to the electrophoretic printing processes explored above.

Does it make any difference which sci-fi technology eventually wins out? Not really. The important thing is that portable-reading devices with long battery lives, sharing capabilities, and good utility be widely and inexpensively available to everyone. And that's what E-Ink, Toppan, Gyricon, IBM, Kodak, and others are aiming at.

Just give it a year or two. And then prepare to see the gradual phasing-out of printed-paper books and magazines. Trees are rejoicing. ◆

Tim Condon reading the paper

DriveCopy 4.0 from PowerQuest

By Jim Weber, Secretary, Tampa PC Users Group
jlweber9@mindspring.com

While recently upgrading to a new 30gig hard drive I was struck by the novel idea to migrate all my stuff from the "old" 15gig hard drive currently nestled in a drive bay and use the 30gig as my C drive. Well, you can just about imagine my joy when I was offered a copy of DriveCopy 4.0 from Power Quest for evaluation. I have used several Power Quest products over time, such as Partition Magic, and have always found them to be solid programs that performed just as I needed, but this time I had a different result. Out of the box I found Power Quest again had the novice user in mind and there was a large and well laid out "Quick Reference" poster that covered how to install the software, a new hard drive, set jumpers, and change BIOS settings. Clearly these people know the needs of their customers and are willing to put some extra effort in making them happy. I was also glad to see a real paper manual. There are far too many companies that hide manuals on the CD as a Word or PDF document. It may be a cost saver for a software firm, but it can be a real annoyance to the end user if the computer they are trying to fix is broken and the only documentation available needs a functioning computer to be viewed.

When you load DriveCopy, it doesn't install in the classic sense. You won't find a new application or file folder that opens within Windows. Your options are to run from the hard drive or make a boot floppy. On the next boot, DriveCopy pre-empts the boot process and loads its own operating shell in what's called a "virtual floppy" that deletes itself when you exit. From here you can choose to do an entire disk copy, pick a specific partition, or make a back up to a new hard disk. Since I wanted to do an upgrade, I chose the "Replace" option with "check for bad sectors" and "Verify Disk Writes" checked. DriveCopy recognized both drives correctly as far as size and partition information. I clicked the "Entire Disk to Disk" copy button, then all and proceeded as I hoped. Now for the bad part. After about 5% is copied, I get an error, #49 write fault, and get kicked back to the start screen. No problem, I think. I'll just turn off error checking and do it again. Well, all I got again was the same error message.

Since my computer was a gutted mess on my desk, this is where I was glad to have a real manual to crack open (for the first time) and see what troubleshooting help it could provide. Bad sector? Run Scan Disk and check for problems. Well, neither Scan Disk nor Norton reported any problems on my source drive. Anti-virus software running in BIOS? Nope. This system is only one year old and supports DMA 66, so there was no EZ-Drive or anything to interfere with the boot process and both drives were recognized correctly by the BIOS during boot. I even resorted to making boot floppies to avoid any corruption at the source disk. Nope, not that either. I was getting to where

(DriveCopy.....Continued on page 5)

(DriveCopy……Continued from page 4)

I saw "#49 write fault" each time I closed my eyes, kind of like staring at the sun too long. I was beginning to suspect a problem with my shiny new hard drive (which would be a tragedy beyond words). Fortunately I have a shiny new copy of Windows XP to go with my shiny new hard drive, so I did an install from the XP CD. XP did all the partitioning and formatting and installed without any problems. I haven't noticed any errors or hang-ups on the new drive.

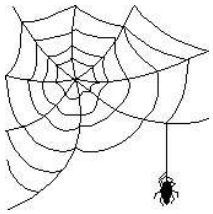
As I said when I started this article, I like Power Quest and its products. There is enough provided with DriveCopy 4.0 in the way of utilities and documentation to show that they aren't scrimping on production or support. One small confession before I continue. I didn't contact Power Quest for help. For one, my computer was in pieces and I just wanted to get things back together quickly, and, second, once I loaded XP I no longer had a spare hard drive to play with. I really don't have any other basis of comparison with DriveCopy 4.0 until I can find someone else to try it out and see if this is a program failure or a hardware conflict. I hate sending out flame mail until I think I have my facts straight, but DriveCopy 4.0 gets two big thumbs down from me until further notice. ◆

Editor's note: Jim would be happy to pass along this product to another member of the group to see if he or she can have success. And I would think that they probably will, since it would not be the successful piece of software it is if everyone had Jim's experience.

Additionally, Tampa PC Users Group members may purchase DriveCopy 4.0 at a special price of $25 by ordering from the secure web site at http://www.ugr.com/order/. Indicate the special price code of UGEVAL01 with your order.

Internet picture of the month

The Lords Proprietors' Inn



The Lords Proprietors' Inn comprises three restored homes on over an acre of grounds in the Historic District of Edenton, NC.

According to their web site: The Inn offers sixteen elegant guest rooms, and two luxury suites. The Whedbee House dining room is located in the center of the Inn's grounds, and provides the setting for truly fine dining. The cuisine is sophisticated, with a distinct taste of the region. Our marvelous full breakfasts receive comparable praise.

The Joy & Problems of a New Computer

By William LaMartin, Editor,
Tampa PC Users Group
lamartin@tampabay.rr.com

A couple of weeks back, I took delivery of a new Gateway computer. It is the fifth Gateway we have had in 10 years. All of those have not gone to me. My son received one when he graduated from college and my daughter received one for Christmas in 1999. Only the first one, a 386, has been relegated to the garage. The others are still being used, although the Pentium 166 is now used mainly for programs that I didn't care to install on newer machines. And it is the one with the original HP IIc scanner that will accept legal size documents.

The new computer is now networked with four other computers in the house, and therein lies a good part of this article—getting the network and printing to work properly after adding the new computer.

My first Gateway was a 33 MHz 386 computer with, I think, four MB of RAM, a 120 MB hard drive and a 14" monitor. This computer is an 1.9 GHz Pentium 4 with 512 MB RAM and an 80 GB HD with a CD writer and a DVD. It has two USB ports in the back and two in the front. These computers now come standard with 15" flat screen LCD monitors. I think these two computers cost about the same amount. And 2001 dollars are worth a lot less than 1991 dollars.

One strange thing is that the speakers with the new computer don't seem to have an on/off switch. However, the 1991 computer didn't even come with a sound card or modem. They were purchased later.

To install Win XP or, as in my case since it was already installed, on first time use requires the authentication process that you have heard so much about (to keep you from putting it on more than one computer). The process is painless if you are connected to the Internet.

After getting set up and connected to the network, the first thing I wanted to do was copy data files from all the other computers on the network. There was no problem accessing the files on the Windows 98 computer and the Windows 98 SE computer, but the Windows Me computer posed a problem. I could see the new Win XP computer from the Win Me computer but not the other way. So I could have copied the files, but I wanted to solve the problem of not being able to get the Win Me computer into the Network Places of the Win XP computer.

With some fiddling, I discovered I could do it if the drive on the Me computer wasn't password protected but not if protected. I then traced the problem to the Me computer having a name with a space in it. Apparently XP doesn't like spaces but they are OK in Me & 98. One problem solved.

I next noted what had been mentioned in the press about Java and XP. Larry Anders sent me an URL that had some JAVA applet on it. Before Internet Explorer 6.0, which comes with XP, could run the applet, I had to download the 5 MB Java Virtual Machine. No trouble over a cable modem, but it is still not clear to me why Microsoft didn't include this feature. Some say it is their dislike of Sun Microsystems, but there may be more to it than that.

I ordered a new copy of Microsoft Office XP Professional with the computer, since you save a little money this way. I have copies of Office 95, 97, 2000, and XP. So why did I need another? Well, I wanted to put XP on the new computer, and under the new rules of Microsoft (actually the old rules now being enforced by the authentication process) you can only put your Office XP on a desktop and a laptop, and my other copy of Office XP was already on a desktop. So that was one set of programs that I didn't have to install, but they did have to be authenticated just like Windows XP. Now they are bound to that computer. Next I need to install my other major programs.

They were Adobe PhotoShop, Illustrator and Acrobat, Microsoft Visual Basic and FrontPage and Borland's Delphi. Also other programs like TextBridge Pro scanning software and the Family TreeMaker program. I am leaving Quicken on my second computer and will get a new version of FrontPage before installing it. I am still using FrontPage 98 and need to move up to FP 2002. These are the main programs I use.

Then there was the hardware to be installed: a USB HP ScanJet 5730 flatbed Scanner and my Canon G1 digital camera. I also wanted to eventually attach an HP 4 Plus printer and an Alps MD 1300 printer to the new computer. Finally, I wanted to move my HP PhotoSmart photo scanner from the older Gateway that I was moving to another room to the newer Compaq that would be my second computer. Much of this meant new drivers would have to be found

While installing either the USB drivers or the application software for my Canon G1 digital camera, I got a message something to the effect that the software or hardware didn't meet the Windows XP logo and that if I proceeded I might destabilize my computer. I had already read up on this, and Canon said it was OK to ignore the warning. I did, and the camera and its software work fine in Windows XP Pro.

The USB HP ScanJet 5730c installed with no problem. However, the second time I tried to use it, it wouldn't work. So I went to the HP site and found out that I needed to download a patch. I did this and it has worked fine since. I really do appreciate being able to get updated drivers from the Internet.

Additionally, XP picked up the three printers already on the LAN. But, as you will see later, all is not well with XP and printing over the network—at least for me.

Borland's Delphi 5 installed with no problem, as did Visual

(New Computer……Continued on page 7)

(New Computer……Continued from page 6)
Basic 6 with its service pack 5. TextBridge Pro 98 installed OK but wouldn't install a menu item in Word. The Instant Access that, I believe, is supposed to do this produced an error—Win XP did not like it at all. These sorts of features almost never work in an operating system more than one version removed from the one it was written for. So for the time being, I can't invoke TextBridge from Word. I have to run TextBridge, do the scan and OCR and save it as an RTF file, which I then open in Word. Perhaps it is time to upgrade TextBridge—now owned by ScanSoft. Except they do not yet have an XP version. I do note that they have a "special" version of their OmniPage Pro 11 described as a Microsoft Special for $299.99. I think I will pass on that. It is really too feature rich. I will wait on the new version of their TextBridge Pro.

By the way, the OCR was almost instantaneous on this 1.8 GHz machine. Anyway, Office XP has Scanning and OCR functionality built-in as Office Document Imaging. However, using Microsoft Office Document Imaging, I got an error when I tried to send a scanned and OCR-ed page to Word: "The server threw an exception." If I simply copied the OCR-ed text and then pasted it into Word there was no problem. Could this have had something to do with installing TextBridge? No! It is Norton Antivirus (I have more than one problem with Norton AV and Office).

I only discovered the solution to this problem the next day when I started opening Word documents and watched how long it took to open them. I noticed a message at the bottom of the screen to the effect that a virus scan was being requested. Well I went into Norton 2002 and shut down this feature, since on a Pentium 4, 1.8 GHz computer you shouldn't have to wait 30 seconds for a short Word document to open. Now the documents open fast.

After doing that I recalled the problem with Office Imaging not being able to insert OCR-ed text into Word, and immediately suspected Norton. I tried the Office Imaging again. Now everything worked as advertised. Antivirus software is very necessary to our lives, but it can also be very bothersome. And I think Norton could do a little better in checking on compatibility. It is not like Microsoft Office is just any out-of-the-way product.

Norton caused a similar problem in creating this newsletter in Microsoft Publisher. If I tried to edit an article in the Publisher document using Microsoft Word, I received an error message about Windows not having enough memory. I knew from experience that this was caused by Norton. And, as I have written in a previous newsletter, I knew Norton's solution of unregistering the officeav.dll did no good. However, a check of my old friend http://www.deja.com/usenet provided the solution that seems to have escaped Norton: Turn off Script Blocking in Norton AV.

A pleasant surprise in Win XP was that Note pad has a new default font and that it now remembers the directory you last used. I really got irritated in the past when NotePad would always go first to Windows.

Now let's talk a little about networking. Win XP and networking apparently presents a problem for a sub collection of users. If you want evidence, go to the Usenet newsgroup Microsoft.public.windowsxpnetwork_web. You have to get it from the news server msnews.microsoft.com.

As mentioned before, I had a bit of trouble getting the XP computer to see the Win Me computer, but it was nothing major. I should note that only TCP/IP needs to be used for networking with XP, and all of my computers use only that protocol and work fine—with the exception that it can take 20 to 30 seconds for the XP computer to see the folders of the other computers. Going the other way is almost instantaneous. Many people report this situation.

A more troubling problem when I first set up the network was that the XP computer would take forever to print to the printers attached to other computers on the network. For example, when I would print from Word on the XP computer, it would take 30 seconds for the print dialog box to appear, then another 30 seconds for Word to background print a three word document, then a final 30 seconds to send it to the printer. If I attached the printer to the XP computer, all of this was almost instantaneous.

A worse effect of this network printing problem was that, as I discovered, it caused Adobe PhotoShop and Illustrator to take 100 seconds to load. I solved this problem by creating a dummy default printer on the XP computer. Then not only did the Adobe applications open very fast, there was no longer any delay in the printer dialog box appearing in Word. Unfortunately, if I really wanted to print, I needed to select a printer on the network—and this would again take time. But at least the Adobe applications would open quickly.

I never did speed this network printing much (I discovered a service called TCP/IP Print Server in XP's computer management section, and it did seem to help) and would like to know a solution. My solution was to connect my HP LaserJet 4 plus and Alps printers to the new XP computer. Now it prints fast to them, and my other computers print quickly over the network. I still have to wait to print over the network to my daughter's HP DeskJet.

Much to my surprise there is still a command prompt. And you have to use it to find your network settings. Win XP doesn't have the program WinIpcfg. It does have IPconfig, which you run from the command prompt in a "DOS" Window—even though there is no DOS. You can get the command prompt in Accessories or by simply typing cmd in the Run text box. And what I like about this type of DOS window is that it has a vertical scroll bar so that you don't lose a record of what you have done as more text is added, as happens in the Win 98. Finally, you can

Looking Back to 1991

Secretary's Report
TAMPA IBM PC USERS GROUP
MINUTES OF 11/13/91 MEETING

(I did not join the meeting until the DOS class ended at 6:30 PM; what happened at the meeting prior to that time is unknown.)
In his typically thorough fashion, our President brought to the meeting much information relating to developments in the PC world that he had come across since the last meeting. Among those items were:

- A brief discussion of EXPOTECH recently conducted at the new convention center in Tampa. One could see some of the latest developments in PC hardware there, as well as find some very good buys. Harvey cautioned, however, that some of the vendors at such as EXPOTECH may not be from the local area and you might be hard pressed to get follow-on support in such instances.
- A new book store, "Book Shop", had opened across from University Square Mall. It is apparently a warehouse kind of store with a very good selection in the computer field, as well as discount pricing. Harvey reported that there appeared to be no organization in shelving the books and he therefore had some difficulty in locating selections. A good place to buy from a price standpoint.
- Harvey reported that the long awaited Comp USA computer store should be opened before the end of the year. It is being set up on Hillsborough between Himes and Dale Mabry. Visitors to their other store locations in Miami and Atlanta, among others, have made glowing remarks about these stores - especially low pricing. It will be a welcome addition to our sources. A word of caution: This is strictly a discount operation in a warehouse environment where you pretty much have to know what you want when you go in. It has rock bottom prices and service is commensurate.
- A new upgrade to Laplink is now available.
- The Far Side has come out with a personal information manager (PIM) program. One "advantage?" of this program over other PIMs is that it adds Far Side humor. On the other hand, some report utility shortcomings in this program compared to other PIMs. Look it over to be sure it does what you want before you put your money on the line.
- Harvey reported that Intel and IBM have joined together in a collaborative effort in computer chip development. Some discussion followed as to why, with a wide range of whys expressed. We will just have to wait and see. One thing for sure, though, is that both firms believe it in their best interest.

Our club has grown to about 160 members now. Though this is some short of the 200 goal Harvey had set for 1991, we have grown a great deal. The workload had also grown a great deal and more member support and help are needed. The elected officers cannot continue to carry the entire load by themselves. Some very good improvements have been made to date in serving the needs of our members and we want to continue to improve and expand. Here are some of the things YOU can do to help:

- Make yourself available to serve as an officer with the club - and it is not to late to do so for the coming year; elections are at the December meeting. If you can't do that, make yourself available to assist.
- Provide articles for the Newsletter. If you come across information of general interest to the membership, submit it for the newsletter. Write a review of one of the programs you have and submit it. If you hear of or have developed some useful utility or technique which has been beneficial to you, submit an input to the newsletter. You know, our newsletter is a bit like a computer - no input, no output. Please help.
- We would like to expand areas of instruction to include word processing, data base, spreadsheet, communications, DTP, etc. BUT, we need people willing to conduct classes on these subjects. To date we have held two classes on DOS (the second in progress now), both of which have been conducted by Ed Buzza, our workhorse who also provides newsletter articles, program review presentations at our meetings, etc., etc.; he is doing far more than his share now. Come on people, share your expertise with your fellow club members. Contact Ed Buzza or Harvey Bruneau.
- We would like to get involved, as a club, in community service - give something back to the community. We need your thoughts on how we might do that.

NOMINATIONS: The President opened the floor to nominations for the elected positions in the club to serve during 1992. The following nominations were made:

President	Harvey Bruneau
Vice President	Steve Spears
Treasurer	Bill Fuller
Education	Ed Buzza
Member At Large	Roger Waters
Secretary	
(Co-secretary)	Jim Clark
(Co-secretary)	Charles Howe

Elections will be held at the December meeting. Nominations will be open until the time of the elections.

Come on now, be prepared to make your nominations at the December meeting, or better still, volunteer yourself for one of these positions.

COMING PRESENTATIONS: The President reported that the following lineup had been completed for guest presentations:

DECEMBER - Microsoft Visual Basic, MS Works, MS

(1991……Continued on page 9)

(1991……..Continued from page 8)
Money, MS Publisher.
JANUARY - Word Perfect for Windows FEBRUARY - Corel Draw

PROGRAM REVIEW: Following a break, our own Ed Buzza gave a review of Soft Key's Key Publisher. This is a DTP program which is identical to Timeworks' Publish It 1.2. DAK (a California based electronics mail order firm with which most of us are familiar) made a deal with Timeworks for a license to sell Publish It 1.2 under a different name and with different documentation; Timeworks had developed version 2.0, which is now on the market.

Key Publisher (KP) is a very flexible low-end DTP program. It has a lot to offer, especially for the price, and makes an excellent entry level DTP program. I say entry level recognizing that this program could well serve all of your DTP needs. On the other hand, the low end programs cannot compare in power and flexibility with the high end DTP programs like PageMaker.

KP is not word a processor, but it has a word processor capability so that text can be entered from the keyboard into the program without difficulty. You are out of luck on spell check and thesaurus, though. Similarly, KP is not a graphics draw program, but it does have a limited draw capability. Among the features of Key Publisher are:

- Imports ASCII text files as well as files in the format of several of the major word processing programs.
- Imports graphics in several formats, including TIFF, PCX, GEM, 1MG and EPS.
- Ability to create and retain "style" (master) sheets which saves much time on repeat publications.
- All low end DTPs are memory hogs in that they handle both graphics and text as bit maps. But KP makes better use of conventional memory than some other low enders. The program does not use extended memory.
- The program will handle about 30 pages at one time, but I think you would run out of memory before that time if you use many graphics.
- The program is slow on the slower computers if you edit text or alter pages toward the beginning of a multiple page document because of the redraw time. However, redraw time can be reduced by hiding all graphics.
- Hands [Handles] pages from 3.75 X 6.5" to 8.5 X 14", with several sizes in between, landscape or portrait.
- Flexible column guides, with up to six columns allowed.
- Has six fonts, two of which can be sized in increments from 7 to 60 points; the other four offer only two sizes 15 (or 16) or 30 points. All of the standard styles are available, but only light is available in text effects.
- Graphics and text frames can be moved anywhere on a page, but cannot be rotated, flipped or distorted in any way.
- The "Help" available in the program is fairly good, but it is not location sensitive; that is, when you ask for help you are offered a help index from which you choose the area of help you want. And you cannot obtain help when you are in a dialog box.

And so on. Ed gave an excellent presentation of Key Publisher, but space here precludes giving further detail. Though limited compared to the high enders, it is a nice program and fairly easy to learn. He clearly showed that you get a lot of bang for the buck with this package which can be had from DAK for a mere $9.90, plus $4.50 S&H. If you are interested, here's the contact:

(New Computer……..Continued from page 7)
select all the text in this window, copy it and paste it into a program like Notepad or Word. This would be useful for those who want a list of files in a particular directory.

Win XP has a built in faxing program that seems to work quite well. I was able to send faxes of Word documents and then receive faxes. What is missing is the ability to scan a document from within the FAX console and then send it as a FAX. However, if you have a program that will do a black and white scan at 200 dpi, you can simply scan from this program and then print to the FAX driver. Since this computer has the Microsoft Office XP Document Imaging tool, I use this to acquire the scanned image then print from it to the XP FAX driver.

The FAX Console has an In Box, an Out Box and a Sent Items box along with a built-in viewer. It is not as full featured as WinFAX Pro, but it is quite good. By the way, I think to use WinFAX Pro with XP you will have to purchase the newest version of the program for around $100.

I wanted to add my laptop to the network, so I needed to find some more space. The router only accommodated four network connections, and they were all taken. But I had an old 10 mbs, four port hub with an additional uplink port. So I unplugged the oldest computer from the router, connected the hub's uplink port to that now free port on the router and then connected the disconnected computer to one port on the hub and the laptop to another port on the hub. The laptop could see the other four computers on the network and all could see it except the new XP computer. So all I had to do now was set up a network place on the XP computer for the C drive on the laptop. The wizard found the laptop and asked for the password

Special Interest Groups

Microsoft Access SIG

This SIG meets the first Tuesday of the month at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6:30 PM. For information contact either William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merlenic@tampabay.rr.com.*

Genealogy SIG

To be included on the TPCUG genealogy mailing list, contact Jenny Lind Olin at 960-5723, or *jlolin@tampabay.rr.com.*

Visual Basic for Applications SIG

This SIG meets the third Tuesday of the month, at the Gateway 2000 Store on North Dale Mabry Mabry (just south of Columbus Drive) at 6:30 PM. For information, contact Merle Nicholson at *merlenic@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Mary Sheridan moderates the discussion.

Election of Officers at the Dec. Meeting

nominations are:

President	Kevan Sheridan
Vice President	Mary Sheridan
Secretary	James Weber
Treasurer	Jenny Lind-Olin and Mike Hodges
Member at Large	John Witmer

(New Computer……Continued from page 9)

for the C drive, and I clicked on OK–and nothing happened. The exact situation as I had encountered earlier in setting up the C drive on my Compaq computer as a network place for the new Gateway XP computer. And the cause of the problem was the same—a space in the name of the computer. I took out the space from the name of the laptop, rebooted the laptop and used the network place wizard again on the XP computer, and this time when I clicked OK I was presented with the file structure of the C drive on the laptop. Success.

With everything working, it was time to move some computers. The oldest of the three computers in this room was relegated to a back room of the house and the newest computer took its place. The oldest flatbed scanner, the HP ScanJet IIc accompanied the old Gateway computer to the back room. The HP 4 Plus printer and the Alps MD-1300 were connected to the new Gateway, and, as I said, that did away with the delay in printing over the network from the XP computer. A new driver for the Alps was required.

I took the old Iomega parallel 100 MB drive from the banished Gateway and installed it on the Compaq computer after first going to the Iomega site and getting the latest drivers. I only use the Iomega for backups of important data that I don't want to bother with putting on a CD. Years back, though, it was my main backup medium.

There were two jobs remaining. The first, to see if I could install the HP PhotoSmart Photo scanner on the Compaq. This scanner uses a SCSI interface, and it was daisy chained to the HP IIc flatbed scanner that was banished along with the old Gateway. I have a relatively new HP 5370C scanner connected to the new Gateway with a USB cable. HP provided a proprietary SCSI card with the photo scanner and I never used it since I daisy chained it. Now I need to install a SCSI card in the Compaq computer for the scanner. HP tells you where to go to get updated drivers for the card. Once there you find that the manufacturer, while providing the drivers for Win Me and Win 2000, says that they will not support them and suggests you buy a new PCI card that they guarantee will work in Win Me. I downloaded the driver for the card and also have 80 MB of updated application software I downloaded from HP for the photo scanner and gave it a try. To make a long story short: It didn't work—possibly due to an error on my part.

Anyway, I purchased a new SIIG PCI SCSI card. It installed fine using a built-in Windows driver. I installed the Photo Scanner software—and again got the same error message as before when I tried to run the software. But this time I did a little thinking: I had Windows search for new hardware. It found an unknown device. I had it install it—and low and behold it discovered it was an HP Photo Scanner with a number I can't remember. Now the scanner with its new and better software is working fine on the Win Me Compaq computer.

One final problem. After the move, I discovered that the old Gateway in the other room connected to the hub by 75' of network cable could no longer see the other computers' folders, even though they could see its folders. It could browse the Inter-

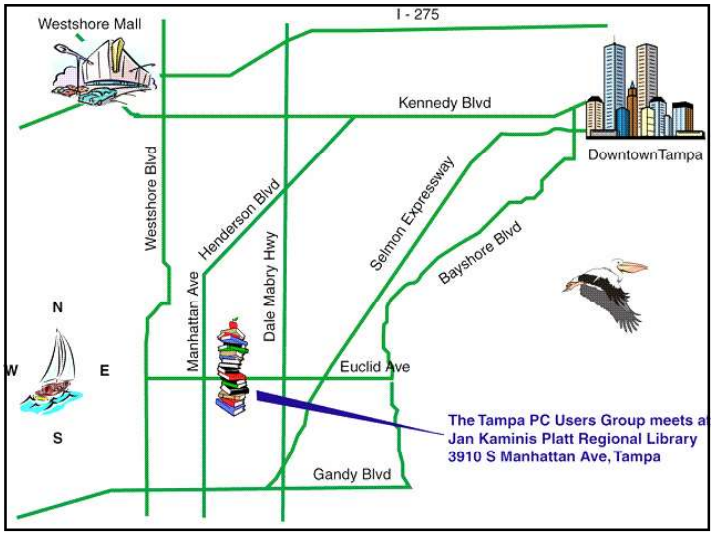
handling the GSM cellular network. Once it becomes main-stream, then it will be a lot more appealing to me. I was also expecting much better pricing at the event and saw the only real deals were those offered through the user groups via APCUG.

I'd like to note that without being a member of the FACUG and the APCUG, it would be nearly impossible to get decent speakers to come to our meetings. And, as software and hardware vendors tighten their belts, we need to realize that the software donations to our raffle will become less and less.



But, on a more positive note, our membership is up and we have more money at the end of this year than at the end of last year, so it looks like we're in pretty solid shape.

Thanks again for letting me be your president. I hope to see many of you at the Christmas Party.

Happy Computing! ◆

Meeting Preview: Hardware Presentation and update on the recent COMDEX. As usual, Mary Sheridan will conduct a computing and Windows discussion for the first 30 minutes of the meeting.

President's Message

By Mary Sheridan, Vice President, Tampa PC Users Group
mcpease@mindspring.com

Another year rolls around, and here we are still together. My article will be short and sweet. This is for the January edition of Bits of Blue, and since the president-elect hasn't been formally inducted yet, I guess it's still my job to write the president's column.

I got an Eyemodule II for my Handspring unit for my birthday (Christmas Eve). I'm having a great time with it. It's not great photography, but it links into my Outlook address book. Next time I meet someone new, I can grab a quick picture of them and jot down their name. Then when I run into them again, I won't have to be embarrassed because I remember the face but can't remember the name. I haven't really used it yet, but my granddaughters have taken over 50 pictures of each other, so I know it at least works.

(President.....Continued on page 9)

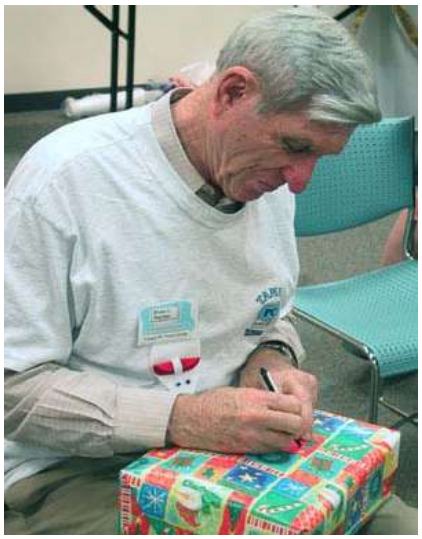
Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.



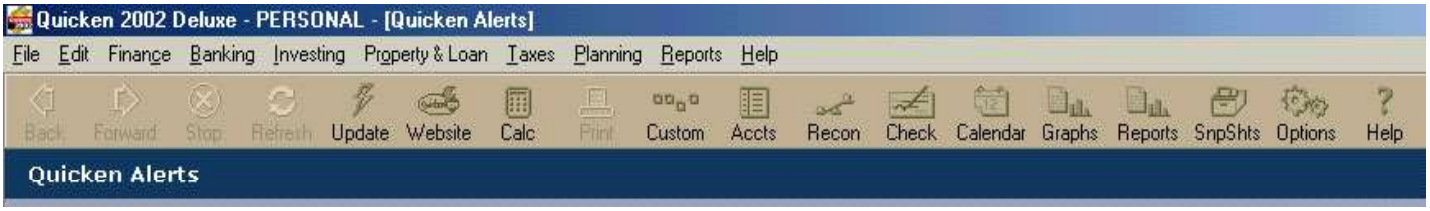
apcug Member of The Association of Personal Computer User Groups

Minutes of the December Meeting

By Jenny Lind Olin for James Weber, Secretary, Tampa PC Users Group
jlweber9@mindspring.com

We had our annual Christmas party and election of officers. The officers elected were:

President: Kevan Sheridan
Vice President : Mary Sheridan
Treasurer: Mike Hodges
Secretary: James Weber
Member at Large: John Witmer



Bruce Register with his prize

Jenny Leitzke played Santa and brought a mouse ornament for everyone who attended. They were such cute items and so appropriate for a computer user group.

There were three blind door prizes [as they were wrapped in paper suitable for the season] available for the raffle which brought in $53. Winners were as follows: Bruce Register won the Windows XP software; John Witmer won a T-shirt, and our visitor Nancy Williams won a cap. ◆

Gary Ennis and Jenny Lind Olin with food

Header for all Quicken Registers

Quicken 2002 Deluxe

By William LaMartin, Editor,
Tampa PC Users Group
lamartin@tampabay.rr.com

I have been a satisfied Quicken user since 1991, starting with the DOS version and moving up to their first Windows version when it became available. Over the years I updated to their newest version when it became available until the 98 version, when I stopped updating since it did about everything I wanted. I did, however, install their patches that would make Quicken 98 year 2000 compatible. My review of Quicken 98 Deluxe is at our website at http://www.tpcug.org/reviews/quicken98.html.

But with a new computer it was time to upgrade to a new Quicken, since if I were to install the old one on a different computer it would no longer be year 2000 compliant, the patches all having been done online with no software to save for future use.

The Quicken installation asks for no serial number or other type of authentication. It gives you the choice of what components you wish to install. I chose not to install

Quicken Home Inventory
Debt Reduction
Emergency Records Organizer
Deduction finder

Quicken 2002 Deluxe requires 59,290 KB of space. I think the original DOS version used at most two 3.5 floppies.

I installed it fresh on the Compaq computer – not my new Gateway computer. I like to use two computers with some software on one and other software on the other. Right after installation I got a message that _delis has caused an error in _ISDELEXE. _delisio will now close. This seemed to cause no problem, and a search at http://groups.google.com/ indicates it has to do with cleaning up temporary installation files after the installation is complete.

Quicken asks you some personal questions – married, children, house, etc, which I would have just as soon preferred to skip but found it easier to just go along and answer so that I could finish the installation. There is then the option to watch a video. I don't believe the video is a good as the one for Quicken Deluxe 98.

To register Quicken is very slow. It took a long time to make the Internet connection to their server. Once I got the fill-in form to display, filled it in and then tried to send it to Quicken there was another long wait and the process never completed. I might note that I installed Quicken 2002 Deluxe (their copy) on another person's computer, and their registration didn't even get as far as mine did. So Intuit needs to improve the registration process.

After the registration you click Done and get the chance to set up accounts. I didn't want this. I wanted to use the Restore from Backup feature to get my old data. You don't use import since that only brings in one account at a time. So I first backed up my Quicken data on the computer it was on one last time. Then I mapped the drive this backup was on as a network drive on the computer I was installing the new Quicken on and restored from that location. You want to use the QDF file. Everything appears to have come in perfectly, including the printer settings for printing checks from Quicken.

The interface is completely different from Quicken 98. For each account, you have a register view and

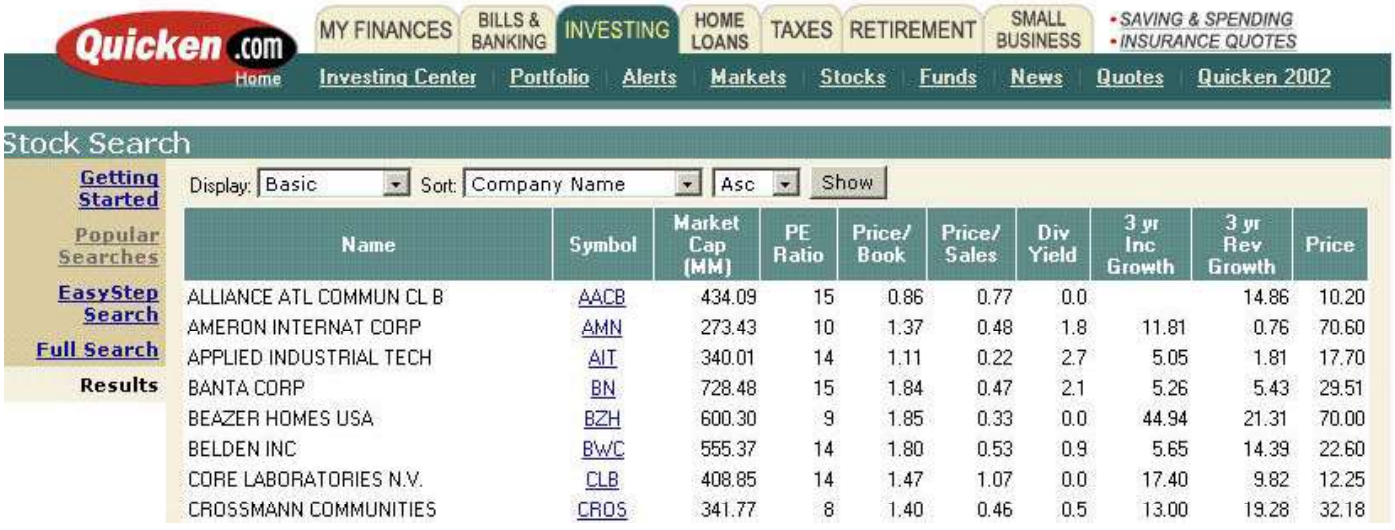
(Quicken…… ….Continued on page 4)

(Quicken… … ….Continued from page 3)

an overview. The register view is just that—a listing of the transactions in tabular form for that account. The overview presents the account attributes, like account number, interest rate if applicable, etc. and also has a graph of the account balance each day for the past month, quarter, 12 months or whatever interval you choose. I was surprised to see from the graph of my checking account for this quarter that on one day the account was $2,000 in the red. I never actually overdrew the account so that simply indicates that I wrote checks to pay bills (which would take several days to reach the payee by mail) before I credited deposits to the account. But this is an instance where a graphic points out something that you might not note in the register.

In the overview there is also a pie chart of expenses. You can make this full screen to better view it. Again the graphic can literally open your eyes. In my case it is a bit depressing how large the percentages are that go to taxes and insurance.

Finally, at the bottom of the overview screen is a list of the scheduled transactions to be paid from this account in the near future.



I feel that it is very important to backup my Quicken data to media that I can remove from the computer so that it won't be lost in something like a lightening strike. For this I use a Zip drive since my main file is now almost 12 MB—much too large for multiple floppies.

I at first had a problem backing up my files to the Zip drive connected to another computer on my network until I realized that I couldn't simply browse the network from the backup location folder dialog in Quicken. When I did this to select the location, I would get an error when I tried to backup. What I needed to do was first map that Zip drive as a network drive on the computer with the Quicken program. Then I could use the backup location dialog to select the backup folder in the Zip drive. However, none of this matters anymore, for now the Zip drive is connected to the computer with Quicken.

One nice feature is that when you reconcile a credit card bill and have Quicken print a check for payment, it will look at your scheduled transactions list to see if there is something there that matches what you are doing. It then asks you if the scheduled one and the one you are paying are the same and if so it removes the scheduled transaction from the list. In the past—at least in Quicken 98—after paying the bill from the reconcile process you then had to go to the scheduled transaction list and have it entered in the checking register and then delete it from the checking register.

When I enter a payment or a change in a scheduled transaction, I sometimes get a warning that this action will cause me to exceed my budget. Do I want to change my budget? Apparently at one time very long ago I set up a budget.

(Quicken.....Continued on page 5)

(Quicken… … ….Continued from page 4)

I have two Quicken files I use—personal and business. When I want to backup a file, the screens I get are much better than in Quicken 98, but there is still the problem of Quicken choosing the target folder to be the one most recently used. For example, if I most recently backed up my Personal file, and I then want to back up the Business file, the default backup folder is the one I used for Personal, and I have to browse for the Business folder. It is a small thing, but it would be nice if Quicken would remember which backup folder went with each file.

Quicken is much more than a simple checkbook or register for your credit card accounts. It allows you to track loans and investments, to do planning and to present all this in reports to view on screen or print. If you desire, Quicken will gladly handle all your financial transactions—for a fee.

One such service is online bill payment. This is basically $10/month for 20 bills. If you actually had 20 bills you could use this feature with, it would come to $.50/bill which is just a bit more than a stamp.

Quicken would like to help you with investing in stocks, funds, etc. On the previous page you saw a portion of a screen capture of Quicken's choice of

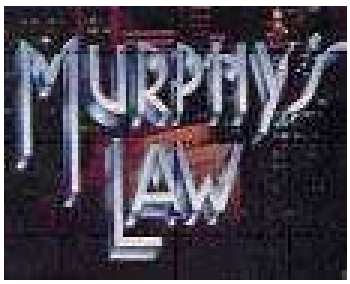
Santa's Last Name is Murphy



By Larry Anders, Librarian, Tampa PC Users Group
Larry@AndersNet.com

I hope you had a great Christmas! Mine was a good one, spent with family and friends, opening presents, eating a lot and trying to forget what had happened to me on Christmas Eve day. Remember these two Murphy's Laws: "if anything can go wrong, it will go wrong" and "all's well that ends."

It had been a very long time since I had had a major computer problem, and I forgot that the longer it has been since you've had a major problem, the closer you get to another one! When installing a new operating system or virus protection program I ALWAYS create a copy of the emergency repair or recovery diskettes… *except this last time*. I recently purchased a new 100-gig drive and decided to start out clean with a new version of Windows 2000. It had been over a year since I purchased my last computer and a lot of stuff had slowed down the old 30-gig drive.

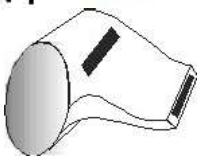
I had been very careful not to burden the new drive with a lot of needless programs, and for a couple of months it was operating like a brand new system all over again. I typically don't turn off my system unless it starts acting a little funny, and that is what it was doing Christmas Eve morning. So, I rebooted and then it happened. I met Mr. Murphy and the blue screen of death, with a message that said, "***inaccessible_boot_device***." There was some other verbiage saying that it may be caused by a virus or some recently installed new hardware. My virus definitions were up-to-date, and the only new hardware recently installed was the hard drive that had just crashed.

Well, there were a lot of things I should have done to be prepared for something like this, but I hadn't done any of them, and the more I thought about what I had lost the more upset I got. As I would learn later, the easiest thing I could have done was to have made an emergency repair disk, but Windows 2000 doesn't ask you to do that when the system is installed. And something I did not know at the time is that you cannot make a boot disk in Windows 2000 like in Windows 98. Under this situation, you boot to the Windows 2000 CD and insert the recovery disk when asked.

Well, when I realized that there was apparently nothing I could do, I booted to my "D" drive, which is actually my old, original 30-gig drive. The new 100-gig drive could be seen but not accessed. I got a "corrupt or inaccessible drive" error. I started calling friends and relatives and ended up with several possible cures. My biggest and most immediate concern was to get some very important work data off the drive, no matter if I could recover the rest or not. But the more I thought about what was on the drive, the more I realized there was a lot more data on that drive that I did not want to actually live without.

My daughter, Lauren, who is the MIS director for a company here in Tampa, told me about a program that might do the job for me by Ontrack called ***EasyRecovery*****,** and it did! I installed EasyRecovery and proceeded to ease my mind. The data recovery process was pretty straightforward but I soon realized that the 50-gigabytes of data weren't going to fit on the remaining 14-gigs of space on my old drive. So, I went shopping Christmas Eve and bought myself a new 80-gig drive. I took a day off from the recovery process Christmas day and got back at it late the following day. I installed Windows 2000 on the new 80-gig drive, re-installed EasyRecovery and copied all the files from the 100-gig to the new 80-gig drive. Once my data was safely backed up, I sent Mr. Murphy on his way, or at least I thought I did.

For some reason, when I booted to my new drive, I could not read my old "D" drive, so I re-booted to the old 30-gig drive and got the blue screen of death on my old drive. But, earlier in the day I had made an emergency repair disk for that drive. So, I booted to my Windows 2000 CD, put in the repair disk when asked, and I was back to normal, on the "D" drive. I then re-booted to my new 80-gig drive and made an emergency repair disk for it, which I should



(Murphy… … …Continued on page 12)

Windows XP Home Edition

s

and

s

By Mike Hutchison, Tampa PC Users Group
myankee@ij.net

Once again, Microsoft has plunged ahead cramming more features (many of which have dubious utilitarian value to most users) into an operating system before they get the basics fully ironed out. Do you really need your computer to periodically access an Internet time server to see if your system clock and date values conform to the values contained therein? Do you really want to have to go into a dialog box to prevent this from occurring? (If the modification is desired: Double-click the clock on the taskbar, make any changes to date / time as usual, go to the Internet Time tab and clear the Automatically Synchronize with an Internet Time Server check box.) This is a minor feature overload example compared to the Microsoft Management Console (MMC).

The MMC allows the user to manage the machine that the console is running on and remote computers. In **rough** terms, a console is the basic unit of the MMC's user interface. Per the Help in the MMC: You can use MMC to *create*, save, and open administrative tools that manage hardware, software and network components. The MMC can be run on the various Win 9x and Windows NT operating systems. The MMC does not perform administrative functions; it hosts tools that do. There are two general ways you can use the MMC:

1. User Mode-working with existing MMC consoles to administer computer/s.
2. Author Mode - creating new consoles or modifying existing ones.

The primary type of tool that you can add to a console is called a snap-in. For example: Disk Management is a snap-in that allows the user to manage disks and volumes in a graphical environment. On the Compaq machine which I recently bought, in part hoping that the XP OS would provide greater stability than 98, you go into Control Panel Administrative Tools.

Once in that far, you see shortcuts for Component Services, Data Sources(ODBC), Performance, Computer Management (the MMC), Event Viewer and Services. To get to the Disk Management snap-in, double click Computer Management. Next, expand the Storage category so that Disk Management is displayed. You must log on as the computer administrator or be a member of the Admin's group to use Disk Management. This snap-in can be used to: change drive letters and paths, format disks, create or delete partitions, upgrade basic disks to dynamic disks and eject removable media. Basic disks are disks that contain primary and extended partitions and logical drives, mirrored volumes, striped volumes, spanned volumes and RAID-5 volumes. Dynamic Disks are hard disks that contain dynamic volumes, of which there are five types: simple, spanned, mirrored, striped and RAID-5. Note: Only Windows XP and Windows 200 can access dynamic disks.

Another snap-in is the WMI or Windows Management Instrumentation. The purpose of this is to let you manage your enterprise over the Internet or an intranet. Shared Folders is a MMC snap-in which allows you to view and manage shares on the computer you are using, remote connections to the computer you are using and files that are in use by remote users. I have been told that the nature of many of these features reveals the underlying structure of Windows XP; namely, Windows NT.

Many of the things found in the MMC are repetitions of System Tools familiar to Win 9x users. I guess to boil it down; it seems odd that Microsoft tries to put ultra-power user features into an OS which also includes "cookie cutter" send pictures (or *now in XP* make your own movie on your PC) of the grandkids, burn CDs, store My Favorite J Lo tunes, junk. I think

(Windows XP……Continued on page 9)

Looking Back to 1992

From the January 1992 Bits of Blue

Secretary's Report
MINUTES OF 12/11/91 MEETING

There was the customary announcement of upgrades. Windows 3.2 is in early beta testing. It is not a 100% certainty that the Borland/Ashton-Tate merger will be permitted by the FTC.

Kirk Covert of Microsoft demoed three recent Microsoft releases destined for home and small business use.

Microsoft Money - Write checks, track expenses, create budgets, organize your assets and plan your financial future ($48). (This product won by Tom Cone)

Microsoft Publisher - Inexpensive desktop publishing with features found in higher priced packages. Use to designed flyers and newsletters ($138).

Microsoft Works - A combination of important business tools including word processing, spreadsheet analysis, database management, charting and drawing ($138).

Although Visual Basic was on the agenda, it was postponed due to Kirk's time constraints. The majority of the attending membership really wanted to see this product and asked Kirk to come back at a later time for a demo.

Elections: The entire slate was voted in without balloting for individual office. Ed Buzza left the position of Secretary to fill the position of Education. Jim Clark and Charles Howe will share the position of secretary.

The president (Harvey) announced that he was working cooperatively with a New York publishing company, which contacted him, to get exceptional subscription rates for computer magazine subscriptions. Harvey has concerns and apprehensions about telling members to send money to a company he is not familiar with. He is researching the company to make sure it's legit. Following is a sample of 1 year rates for some of the magazines available.

Byte:	9.00
PC Computing	9.00
PC Magazine	17.00
PC novice	8.00
PC World	10.00

PRESIDENT'S COLUMN:

Well, another year (1992) to make our group bigger and better. It seems like I said this the last 3 or 4 years. As usual, I am not sure if your vote for me is one of "Hey, Harvey, you're doing a good job as president and we want you to continue" or "Well, he is the only nomination so we'd better vote for him." As for the other officers, I am personally really happy to see them come back for another year. These people: Ed Buzza, Larry Anders, Kevan Sheridan, Roger Waters, Marylee Bruneau, Bill Fuller and Steve Spears are the glue and nucleus of our group. Without their behind the scene help I could not do my job and the group would flounder. Of course we welcome the new kids, Jim Clark and Charles Howe for '92. Additionally, a big thank you to IBM and Chris Mayer for the help and resources they have provided. IBM has taken some of the worries and problems we have experienced in the past away. In all, you are provided with the best available resources for a volunteer non-profit group. If you think they are doing a good job, please take a minute out of your time to tell them so. A sincere recognition from a fellow PC user can keep us going for a while. At times we are frustrated by the lack of any feedback from members, whether it be positive or negative. While not our intention, we were the best kept secret in Tampa. We have begun with a more aggressive exposure campaign to make our group known. In 1991, we finally created a handout/ brochure to explain our group and its benefits. These can be found in retail stores like Computer Supplies, Software Etc., The Computer Factory and CompuAdd. It's only a start, and we will add more, but we still need your help. Last meeting several of you

(1992……Continued on page 9)

(1992……Continued from page 8)

wanted those flyers to pass out. Look for them at the January meeting. My membership goal for this year is pretty high but yet attainable.

1. Membership by 12/31/92 to 300.
2. Create Special Interest Groups (SIG) for:
    a. Word processing
    b. Database
    c. Spreadsheet
    d. Windows
3. 9600 baud BBS

The first two goals will be easily accomplished with your help. Take and distribute flyers to interested friends or companies. Let a board member know of stores willing to distribute our flyers. If you feel others could benefit from your knowledge, volunteer to lead a SIG group. I have mentioned some SIG groups above, but our group is not limited to only those. SIGs do not need to meet on a regular basis, but they should have an accountable leader.

As our membership increases so will our rewards. The more members, the more experience we bring into our fold to share, the more local authors of articles we can add to our newsletter and the more volunteers we can get to enhance our group beyond what we know have. There is a lot that we can do to help ourselves, but it will require the general help of you, our members. Do not put the entire future of our group growth in the board members' hands**. Help us get bigger and better**.

1992 should be the year of a major battle. IBM vs Microsoft. Should IBM and Microsoft ship their new products, Windows 3.1 and OS/2 2.0, in the 1st quarter it will be something to see. If you got the horsepower (386+), the product works as advertised and the price is under $99. OS/2.0 will be a great operating system. Microsoft will need to add more than fixes to its Window product to keep IBM at bay. Even if IBM gave away OS/2 in '92, it surely won't unseat Windows. However, in '93 the tide could turn. Remember Windows requires an operating system (DOS, OS/2 ...) to run.

Harvey P. Bruneau ◆

(Windows XP……Continued from page 7)

that if Microsoft took the Home/Professional categorization process just a half to one full step further to include Home Office (or some such designation) it would benefit many users. For instance, in my case they could omit any joy stick / game support, accessibility options, speech capability, etc., and I would be just as happy. Instead, according to a reference book bought to help cope with the new OS (*Windows XP Home Edition COMPLETE* from Sybex-$19.99), which was also used heavily to jot down these lines, Pro XP has **all** of the Home Edition features (superfluous or otherwise) and then some.

I would prefer that they see to it that the Wizards for Networking perform as advertised, as just one instance of practical functionality that this user wants as opposed to constantly trying to coerce you into accessing the Net to update Windows.

Footnote with regard to network configuration in Windows XP Home: Norton Internet Security 2002 will put up a roadblock in terms of your network computers seeing each other. So far, the best I can do is set Norton Internet Security so that it does not come on automatically when the machine boots. My three machines then can see other and seem to still see each other if you subsequently put the Internet Security program on, which would seem prudent if you are going to try to access the net from one of the other machines. ◆

(President……Continued from page 1)

As vice-president, I plan to concentrate on membership. Things like getting more and better benefits for existing members and finding new members will be on my agenda. Anyone with suggestions, please feel free to bring them to me or phone me at 988-6480 or email me at mcpease@mindspring.com.

(President……Continued on page 10)

Special Interest Groups

Microsoft Access SIG

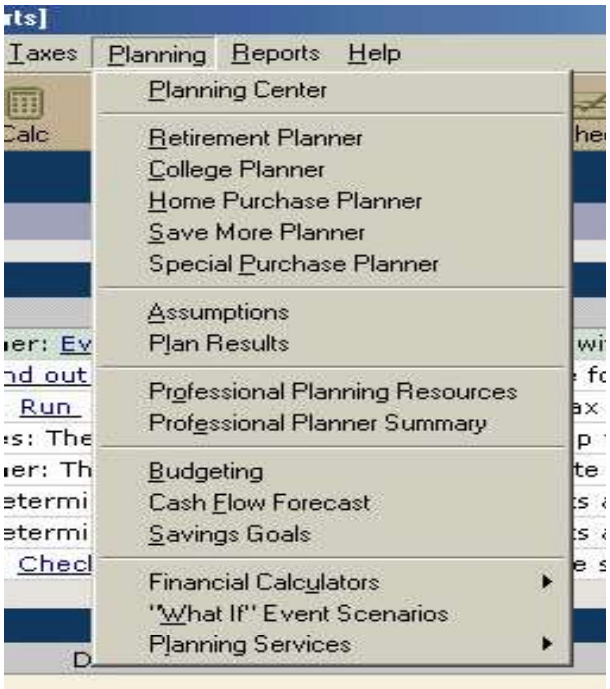
This SIG meets the first Tuesday of the month at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6:30 PM. For information contact either William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merlenic@tampabay.rr.com.*

Genealogy SIG

To be included on the TPCUG genealogy mailing list, contact Jenny Lind Olin at 960-5723, or *jlolin@tampabay.rr.com.*

Visual Basic for Applications SIG

This SIG meets the third Tuesday of the month, at the Gateway 2000 Store on North Dale Mabry Mabry (just south of Columbus Drive) at 6:30 PM. For information, contact Merle Nicholson at *merlenic@tampabay.rr.com.*



Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Mary Sheridan moderates the discussion.

(Quicken……Continued from page 5)

Small Cap Value Stocks. Of course, you have to be connected to the Internet to use this feature. You can set up alerts to know when selected stocks reach certain values. Quicken provides plenty of current information on stocks, mutual funds, etc.

One final thing I would like to mention is planning. As the screen capture here indicates, Quicken provides a number of planning features. I could have used the Home Purchase Planner 26 years ago when we bought our first home. I recall running all sorts of calculations in a FORTRAN program through a main frame computer that I had access to at the time to convince myself that it was better to buy than to rent.

Of course, in the process of helping you understand how much house you can afford, Quicken will also give you the opportunity to visit QuickenLoans.com. And that illustrates the direction the software has taken over the years. You have the original record keeping with which Quicken started, the added Investment and Planning features, and now all of the financial services they offer over the web.

The program is around $59 retail, and I recommend it. If you are not interested in all the bells and whistles, then there is a Basic version for less. ◆

(President……Continued from page 9)

Once again, I'd like to say how grateful I am to have been given a chance to serve as your president.

Happy Computing! ◆

have done immediately after I installed it, but sometime I surprise myself.

Then I got an idea. I inserted my original blue screen drive, booted to the Windows 2000 CD and inserted the 80-gig hard drive repair disk when asked to do so and I was back up and operating after only 5 days.

What caused it? I don't know! Will it happen again? I don't know! Am I ready if it does? You bet your sweet #@$!!!

The reason I am writing this article is to remind you, and me, to backup your important data right after you create it. And if you haven't made a recovery disk, do it now! And be prepared, or at least think you are prepared. Murphy also says, "If you perceive that there are four possible ways in which something can go wrong, and circumvent these, then a fifth way, unprepared for, will promptly develop."

Another of Murphy's Laws is, "All great discoveries are made by mistake." In my case it should read, "All great discoveries are made by the mistakes made." And, I make a lot of great discoveries! ◆

President's Message

By Kevan Sheridan, President, Tampa PC Users Group
president@tpcug.org

I hope you enjoyed Super Bowl Sunday. Was that a game or what? Did you even notice there were only 27 cameras instead of 31? Perhaps not. Many companies are still trying to find ways to cut back on expenses and television networks are no different from companies that support PC Users Groups.

We have less time now to spend and more things to do. We want more out of a PC group than ever before. I find myself, after working with computers for almost twenty one years and being a member of this group for more than fifteen, having a harder time keeping up with all of the new complexities and multiple layers of computing. The user interface may be considerably easier to learn and use than in the days of MS-DOS but one look in the book store should give clear evidence that it's no longer possible to pick up one four-hundred page book and learn the entire operating system.

(President.....Continued on page 10)

By Kevan Sheridan for James Weber, Secretary, Tampa PC Users Group
jlweber9@mindspring.com

This was the first meeting at the Art Pepin Hospitality Room. Many last minute arrangements had to be made in order to replace the Jan Platt library room. There was no product demonstration planned for this meeting.

The Windows SIG, led by Mary Sheridan, started things off at 6:35 PM. She announced the names of the 2002 officers. There were several topics during this session but the most interesting discussions revolved around the meeting location and why we had to quickly find a new meeting room. Library scheduling conflicts with our regular meeting night was the most pressing reason and thanks to Pepin Distributors, Inc and John Witmer (of Pepin Distributors) we were able to find a new location so quickly.

It was noted that we had met at the Jan Platt Library in south Tampa for 7 months and, comparing the trip from south Tampa, William indicated his trip was 15 minutes quicker than previous trips to the MOSI location further north. Several other locations were discussed as options but those present agreed that the current room worked well and John Witmer indicated he would inquire about our using the room regularly.

Mary Sheridan is interested in starting a Hand Held Personal Digital Assistant SIG (Palm, Handspring, etc). She will begin by writing articles for the newsletter. Jenny Leitzke started a discussion of interesting and cool Christmas gifts, including web cams and USB hard drives. GROUPS.GOOGLE.COM was announced as a great place to find user to user product help.

After a 15 minute break, Kevan Sheridan (2002 president) took over the meeting to cover several quick topics including:

- Thank you to John Witmer and Pepin Distributors for the use of the meeting room

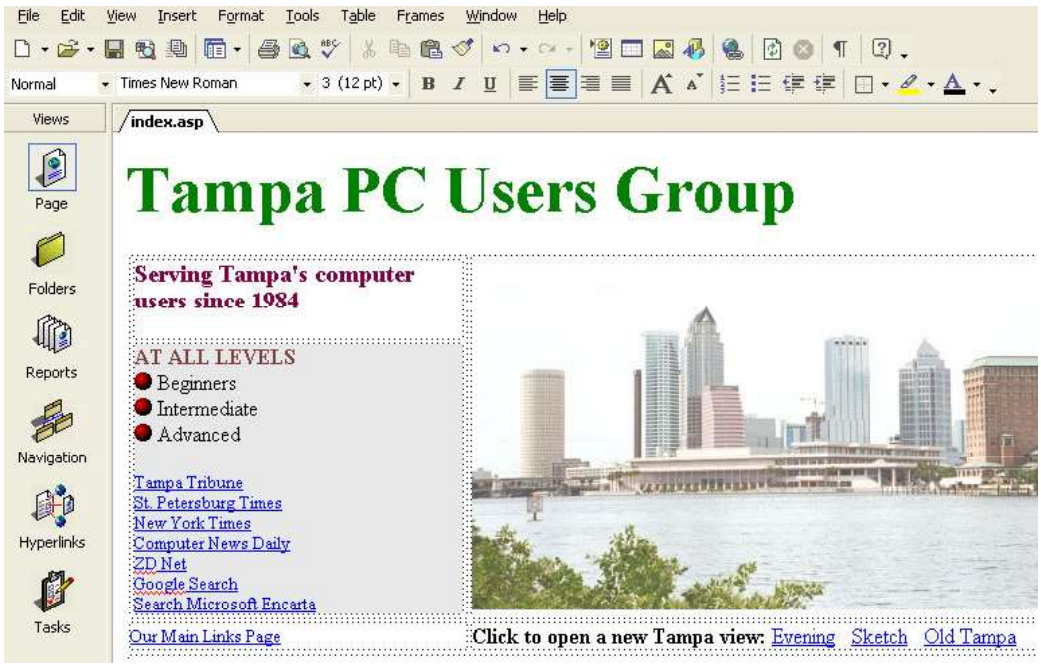
Microsoft FrontPage 2002

By William LaMartin, Editor,
Tampa PC Users Group
lamartin@tampabay.rr.com



Microsoft has produced FrontPage 97, 98, 2000 and now 2002. I reviewed FP 98 in our June 1998 newsletter. For the review check online at http://www.tpcug.org/newsletter/june1998/front_page98.htm. I have actually owned all these versions, but didn't use 2000 since it got installed as part of an Office 2000 Premium installation on a computer here that I don't use regularly. And since the new activation of Microsoft products allows you to only install such software on one desktop and one laptop computer, I could then only install it on my laptop. My main computer still had FP 98, which I was fairly content with. I really didn't need most of the new features of 2000 like database connectivity and hover buttons, since I achieved database connectivity using Active Server Pages and VB Script. And I could create hover buttons with one of the many Java scripts that were available on the Internet. Of course, if I had not had such programming options then I would have been more interested.

FrontPage is a program that combines point and click creation of HTML pages in a visual environment where you can simply drop in the things you want along with having the ability to manage your web site. It keeps track of all the details for you—as long as the site you are publishing to is a FrontPage enabled site, something that is fairly standard now at no extra cost. I recall the days of getting everything to my sites using FTP, where I had to keep a list of what files needed to be uploaded and what files needed to be deleted, etc. FrontPage keeps track of such along with checking your site for things like broken links and the typical download time of a page.

What is new in FrontPage 2002? First, I should note that 2000 added hover buttons, database connectivity, the ability to edit more than one page in a web simultaneously and, in fact, to have more than one web open at a time. It also allowed you to work without having server software installed on your computer.

These webs are called disk based webs. Disk based webs (which you will, of course, eventually publish (upload) to a server on the Internet) made life simpler for those who found dealing with the separate server software a bit burdensome. For FP 2002, if you are running Millennium or Windows XP Home you will have to use disk based webs since I know of no server software that will run on these systems and use FrontPage server extensions. It is possible that Windows 98 will support Microsoft Personal Web Server and FrontPage 2002. So if you are serious about FrontPage and want to be able to test out certain components along with Active Server Pages (ASP) on your local machine, you should use FP 2002 on a computer running Windows 2000 or Windows XP Professional, since they both come with Microsoft

FrontPage 2002's Interface in Page View

Some Incredible News

By Larry Anders, Librarian,
Tampa PC Users Group
Larry@AndersNet.com

Any of you who have read my past articles in *Bits of Blue* know that I am always looking for something to make computing fun. I guess I just get bored too easily. When I first got involved in the personal computer revolution, just about every new program that came out had a "gee whiz factor" for me. That's why I got involved with our user group as the librarian so many years ago, so I could stay on top of all the new software that was being introduced. If I got the software first, then I could impress all my friends with my expertise. Quite frankly, there wasn't a whole lot of expertise involved, other than learning how to use the programs. I've always loved to see the looks on people's faces when they asked, "How'd you do that?"

Well, as time has passed and the Internet has put the world at our fingertips, software of all kinds has been made readily available to us all. Originally there was freeware and shareware but now you can download a trial version of just about anything that's out by just going to the distributor's website. The Internet also provides access to plenty of good ***FREE*** programs that are out there also. This month I'm going to tell you about a great free program that will also make your computing fun again. I thought about not telling anyone about this so they wouldn't know "how I did that", but… what the heck, spread the fun around!

I'll give credit to my nephew, Joey, for passing this one along to me. A couple of weeks ago he sent me an email with a link to IncrediMail. He said, "Check this out, it's really neat!" So I went to http://www.incredimail.com to check it out! He was absolutely correct. And better yet, it was *FREE!*

IncrediMail is email that has finally evolved! (I didn't say that – they did. If fact, that's their slogan.) Once you start using IncrediMail your email will definitely not be boring any longer. It is loaded with visual and sound effects to fit your every mood and change the mood of anyone you send an email to. IncrediMail actually looks and functions a lot like Outlook Express, which I use, so there was no learning curve associated with getting up and running quickly as with most new programs. And the recipient on the other end does not have to have IncrediMail to see the "goodies".

Here's what IncrediMail's website has to say about its special features:

- **Notifiers**: Vivid animated characters will announce the arrival of new email. Select a Notifier that best suits you from our online collection. Contrary to other email products, IncrediMail Notifiers will let you know that you've got new mail even if your email program is closed (as long as you are connected to the Internet, of course.)

- **Letters**: IncrediMail lets you take full control over what your emails look like. Whether you need to be formal or informal, or are feeling happy or sad, IncrediMail's Web Gallery offers you a constantly updated collection of Letter backgrounds that fit every occasion. Go ahead, breathe some life into your emails!

- **3D Effects**: Emailing just like in the movies. With IncrediMail you can feel the thrill while you send and receive your emails. When you send an email, you will see it fly away into oblivion or sail into the deep ocean blue. When you delete, see your emails shredded before your very eyes or crumpled up like your ordinary office paper. These are just a few of the 3D effects you will see using IncrediMail.

- **Animations:** Enhance your emails with exciting and lively animations embedded into the body of the email message and not as attachments. What better way to express yourself than to incorporate a relevant animation in your message to convey your thought and to set the mood.

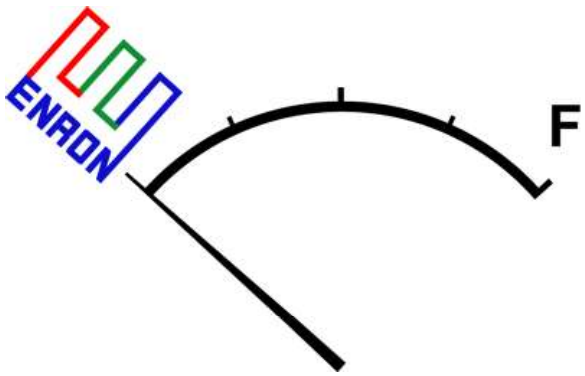
(Incredible.....Continued on page 5)

(incredible……Continued from page 4)

- **Emoticons**: Add some life to your emails by inserting emotion icons (emoticons) into the text of your email message. Why use :) when you can use .

- **Sounds:** The IncrediMail Online Gallery offers you an ever-growing collection of diverse sounds and sayings that can be added to the background of your emails at the click of a button.

- **Voice Message Recorder**: Personalize your emails even more by adding your own voice to your emails.



- **Multimedia Attachment Preview**: Automatic preview of attached media files including images, movies, flash and sound.

- **Capturing Animations from the Web**: Grab any gif animation from your Internet browser and add it directly into your IncrediMail Style Box.

- **Ecards**: Sending and receiving ecards has never been so quick and easy. For IncrediMail, ecards are just another type of email. Your friends will appreciate receiving a real self-contained ecard directly to his or her inbox rather than a link to an

My Handspring Prism

By Mary Sheridan, Vice President, Tampa PC Users Group
mcpease@mindspring.com

I bought a Palm III for my husband in 1998. The following year, I bought him a Palm V and I took his Palm III. I used it on and off. I mostly forgot to take it with me, so it was not very helpful. I had problems with duplicate data when I would synchronize with the computer. It was frustrating to go in and manually remove duplicate records. I cannot say I had any real problems with the Palm III. It was not that easy to read and I simply left it at home too much for it to be much of a benefit.

In November, while attending Comdex, I got a good deal on the Handspring Prism. I really liked the readability of the screen. It is a color unit and very easy on the eyes. I got the unit for $249.00 and they threw in a free travel charger. I could have gotten a copy of Documents to Go for $79.00 with a $79.00 rebate, but I did not know what the program was and did not think I needed it. I bought Documents to Go a month later and could not live without it. I sure missed a deal.

I received a camera attachment for the Handspring for Christmas. It is a very neat device. I can take pictures and attach them to my address book. I no longer have to struggle with being able to remember a face and not being able to put a name to it. That is the theory; anyway, I have not met anyone new since I got the camera. I do not know exactly how much the camera cost, but I found a price range of $149.00 to $199.00 on the Internet.

I bought an Audible device that I ordered from Audible.com. It can play audible pre-recorded books and publications or MP3 files. Because I am a member of Audible, I was able to get the device for $49.00. I have been downloading Stephen King books and I can listen to them in the car. The Audible device came with an adapter that plugs into the cassette player and plays through the car stereo.

The Handspring uses the Palm operating software, so everything is the same as using the Palm III. I was glad that the graffiti (shorthand for the Palm) was the same and I did not have to learn anything (cannot be learning new things at my age…ha ha). I have not had any problem with the duplications when I synchronize. No doubt, the software is an upgraded version.

I am very happy with my Handspring and recommend it to the group. There are many modules available for the unit: a GPS device, extra memory, and a phone, to name a few. I would like to see a Handspring representative come to our group and give a presentation. They were offering discounts to the user groups at the APCUG fall conference. You can obtain further information on the Handspring Prism at http://www.handspring.com ◆

(FrontPage… … ….Continued from page 3)

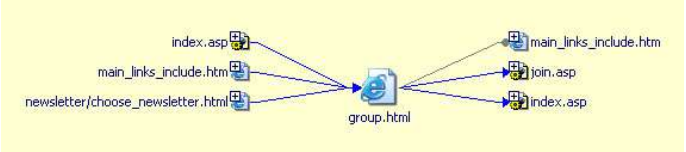
Internet Information Server (IIS). This was my primary reason for wanting XP Professional as the operating system on my new computer.

So, again, what is new in FrontPage 2002? The interface looks the same as 2000, but now when you have more than one page open for editing, there is a tab for each file that you can easily click on to move back and forth between pages. There is a file upload component which required either a purchase of such a component or very knowledgeable ASP coding ability in the past. You have the new multi-item Office 2002 Clipboard. There are link bars, the ability to insert web content from MSN, MSNBC and Expedia. And there is now a nice Photo Gallery feature. Also there are new items that I have yet to deal with such as: new drawing tools, better Cascading Style Sheets (CSS), integration with SharePoint, and the ability to apply

(FrontPage… ……Continued on page 7)

(FrontPage……Continued from page 6)

XML formatting to HTML.



One definite improvement is the protection of ASP code within an HTML page. With FP 98, I would use the FP editor to create the visual look of any ASP page, then switch to Note Pad to do the ASP coding—and too bad if I made the mistake of then opening the page in the FrontPage editor and saving it. My ASP code stood a good chance of being ruined.

I like the program. It has served me well over the years, and the new features and improvements make my life easier. I don't use disk based webs but instead use server based webs. Windows XP Pro comes with Microsoft Internet Information Server 5.1 and FP server extensions 2000 (2002 server extensions are a free download).

The way I deal with web development involves the FP program used to create the web pages and manage the resulting web site both locally with IIS running on my local computer and at the hosting site on the Internet. This is the same setup I have used since I started with FrontPage 97. However, back then you had to use web based FrontPage webs and your local web server was the simple Personal Web Server for Win 95. The web server IIS 5.1 that comes with Win 2002 pro is the same software as used by major web hosting companies with the exception that you are limited to at most 10 connections since the software is meant only for testing sites.

My first question on getting my new computer was how to properly transfer all my FrontPage webs on two older computers to this new computer. From reading the FP Usenet newsgroup I knew that simply copying the files over was not correct. This would destroy some of the FP features that made FP so useful. After consulting the newsgroup, I concluded that the proper way to do the transfers was as follows:

On the new computer, in IIS create a new FrontPage Extensions web (a subfolder of the

A map of all hyperlinks into and from the group page

C:\Inetpub\wwwroot folder) of the appropriate name. Open a web in FrontPage on the old computer and publish it over the LAN to the new empty web that was just created on the new computer. This method preserves all the FrontPage settings. I did this for each of the FrontPage managed webs I had on two older computers.

The next step was now to publish these new versions of the webs to their Internet versions at various web hosting companies so everything would be synchronized. I started with smaller webs—ones of just a few megabytes, and it appeared as if FrontPage was sending up all the files. Now this would take a long time for my larger sites consisting of 50 MB – 100 MB. However, when I published the TPCUG site, a 50 MB site, only a few files were sent. And the files sent were ones that I had made some changes in before publishing. So before publishing the other large sites, I made minor changes to a few of the pages before publishing to the Internet. And in all cases only those few files were sent. Note that all the other files were already at the site and FrontPage checks to see if the ones locally are newer and thus need sending. But why did it send all the files for the small sites and just the changed files for the large sites? I don't know, but if changing at least one file will cause it not to send all the files (Each time I had requested the default of sending only changed files) I think I will do that if I ever need to publish from a new computer again.

This new version has made my life a bit easier—once I familiarized myself with IIS (which, of course, is unnecessary if you only work with disk based webs on your local computer).

To see some of the features of FrontPage and to use one of them to vote in a mock election go to these two pages I have created:

Http://www.tpcug.org/test/test_2002.htm and
Http://www.tpcug.org/test/vote1. ◆

Looking Back to 1992

From the February 1992 Bits of Blue

TAMPA IBM PC User Group
MINUTES OF 1/8/92 MEETING

The President, Harvey Bruneau, opened the meeting at approximately 6 PM. He introduced the officers elected at the December meeting who will serve thru 1992. They are:

President	Harvey Bruneau
Vice President	Steve Speairs
Treasurer	Bill Fuller
Education Director	Ed Buzza
Member At Large	Roger Waters
Co-Secretaries	Jim Clark & Charles Howe

CLUB NEWS:

- Harvey announced that the WordPerfect folks could not make this meeting and they have been rescheduled for March. Meanwhile, our own illustrious Education Director, Ed Buzza, would fill in with a presentation on Professional Write for DOS.
- The President emphasized one of the most important functions of our club - computer education for our members and the need to get going on SIGs. The pressing need here is for knowledgeable volunteers to make themselves available to lead SIGs covering the more significant software on which they are proficient. COME ON, MEMBERS! There is a lot of talent in this club. Share your knowledge with others! VOLUNTEER TO LEAD A SIG! And, give a presentation on the software to the club! (Note: A presentation to the club would be an excellent introduction to your SIG.)
- In pursuit of the goal of achieving 300 members, Harvey informed us that he was placing our flyers at strategic retail outlets that would allow same. And in response to queries last month, flyers were available for members to spread around as well.
- In response to a question about tax software for 1991, the membership was informed that the shareware program AMTAX91 was now on our BBS. One member also advised of a freeware spreadsheet template that was available on other BBSs and should be on ours in the near future. If interested, keep your eye out for 91fm1040. Reportedly, this freebee will work on most major spreadsheets (I know it will work on Lotus and Quatro Pro; apparently others as well).

INDUSTRY NEWS:

- The President reported that one rater of computer suppliers has rated Gateway as #1 overall. Others in our group commented on Gateway - all of which was very favorable. This is not by way of a commercial, rather it is one of the functions of this club - to make all members aware of suppliers who have good products and services at reasonable prices.
- It was reported that the Comp USA store at Himes and Hillsborough was to make a soft opening on 11 January, with a Grand Opening to be sometime later.
- A few problems have been reported with Microsoft Word 2.0 for Windows - mostly with the spell checker, grammar checker and MACRO functions. There was a brief discussion of some of the problems, but I was unable to catch the comments. Be Aware!
- Windows 3.1 reportedly is due out in April. If interested, start looking about that time. As an aside, one member reported a RUMOR, I emphasize RUMOR, that Windows 3.1 had deliberately been designed to not work with DRDOS. DRDOS users might want to investigate before buying. And we all should be concerned IF this rumor is true and reconsider Microsoft as a whole and the implications such an action would have for the industry. Let's hope it is false!
- Harvey reported that the early copies of OS/2 Ver 2.0 are out to selected users. But, all of its features have not been Beta tested, though IBM indicates that Ver 2.0 has been tested in-house. General release to the public is now scheduled for the end of March. We'll see then whether or not that will lead to the software battle of the century.
- Intel is reportedly out of the 386 microchip business since there is too much competition and too little money in it, and is now pushing 486 and higher

(1992……Continued on page 9)

(1992……Continued from page 8)
chips. Many expect a rather large decline in prices to take place over the next year.

- Following a break, Harvey shared a few comments on language translators. He related that he had received French Assistant from Santa Claus and he was pleasantly surprised and reported that it was pretty good for a $49 program. Though it will not make coherent translations for every bit of our personal English, it does a fairly good job on proper English. Check it out (also available in Spanish, German & Italian) if you need a translator.

PROGRAM REVIEW: Professional Write for DOS

In typical fashion, Ed Buzza gave an excellent comprehensive presentation on PFS: Professional Write, now owned and published by Spinnaker Software Corp.

Ed reported that PW is installed simply by copying the program files to the desired directory - no "install" program is involved. The program requires 512K of RAM and an 8088 or higher. It works best with a hard drive, but will work with two floppies - though you may do a bit of swapping and it will be quite a bit slower when disk access is involved. Among the features of PW are:

- Has built in grammar and spell checkers.
- Has a built in address book feature which accepts ASCII delimited files from databases. This allows, of course, merging form or standard letters with a mailing list.
- Setup for the program is very easy and it has excellent printer support, including an extensive list of supported printers and an unlisted printer option, and a control code option for lasers.
- Keyboard MACROS.
- Very good on-line help.
- In contrast to some word processors. PW has toggle choice of insert/overwrite.
- Shows the percentage of memory used of that available for documents. Capacity of the program varies with memory available, but it has relatively good capacity - with only 512K conventional RAM the program will hold about 70 pages; with upper memory, about 85 pages.
- Excellent controls, including blocking (including rectangular/column), line/box drawing, maneuvering on the page and throughout the document, print and save in pieces, are but a few.
- It is mouse supported, and includes a calculator.

This is a pretty good program, but you should note that this is strictly a word processor; today we see many "word processors" which are closer to DTPs than WPs. This is not one of those. It does support multi-column formats, however. But, it does not support graphics - except for charts produced in PFS programs - such as First Choice and PFS Window Works.

One other note about this program - there is little similar between it and Professional Write for Windows. The latter is a much more powerful program and includes many DTP features, including graphics handling. When asked about relative value, Ed indicated that in today's environment the $149 price for PW for DOS was a little high and that for a few more bucks you could get a more powerful program (e.g., WP 5.1).

Having given you this brief summary of the extensive review that Ed gave us, all that is left is to say, "Thanks, Ed, for your typical super presentation. We all appreciate the presentation and all of the effort you put into it."

Copyright Laws: After the presentation a discussion of copyright laws developed. It was noted that some businesses and private individuals are rather loose with regard to the proprietary rights of others - passing around copyrighted software. We might all do well to review/refresh ourselves and reread the license agreement for copyrighted software we hold. The very beginning of one PFS program I hold, for example, says "This Software is licensed, not sold to you by Spinnaker, owner of the product, for use only under the terms of this License..." We all should know and adhere to the copyright laws. ◆

Special Interest Groups

Microsoft Access SIG

This SIG meets the first Tuesday of the month at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6:30 PM. For information contact William LaMartin at *lamartin@tampabay.rr.com or* Merle Nicholson at *merlenic@tampabay.rr.com.*

Genealogy SIG

To be included on the TPCUG genealogy mailing list, contact Jenny Lind Olin at 960-5723, or *jlolin@tampabay.rr.com.*

Visual Basic for Applications SIG

This SIG meets the third Tuesday of the month, at the Gateway 2000 Store on North Dale Mabry Mabry (just south of Columbus Drive) at 6:30 PM. For information, contact Merle Nicholson at *merlenic@tampabay.rr.com or* William LaMartin at *lamartin@tampabay.rr.com*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Mary Sheridan moderates the discussion.

ecard on somebody else's web site. Make everyday a holiday with IncrediMail.

- **Handwritten Signatures**: IncrediMail offers a simple tool for you to add your handwritten signature into your emails. We are committed to making things seamless and hassle-free. (This is actually NOT their best feature!)

So, you ask, how do we get all this, and for free? Well, in the free version there is a link at the bottom of every email leading the reader back to the IncrediMail website and there is also pop-up advertising within the program itself. Everything else seems to function alright. But for $29.95 you can get IncrediMail Premium that has no link at the bottom, no advertising pop-ups, more control over incoming email (like previewing email on the server before downloading it), extra skins to change the way overlay looks, special VIP technical support and loads of other notifiers and letter templates.

Do yourself a big favor and check out the demo at http://www.incredimail.com and you'll see everything I've been talking about and much more. It really is a neat program and I guarantee the recipients of your emails will be saying, "How'd they do that?" ◆

(President……Continued from page 1)

With multimedia, broadband and many other relatively new terms we need to find the right mix of information sources. Now that we have a new meeting location we also need to increase our exposure to the public. We will be working on two of these areas in the coming months.

The Florida Association of PC Users Groups (FACUG) will be holding their spring conference during the first weekend in March. This is where Board members go to learn more about running a PC group. It's a great place to learn what other PC groups are doing to help their groups grow.

ITEC is an annual showcase for technology and once again we will be present. We are currently working on an agreement that will give us a booth near the main floor. This event was good exposure for us last year and we can use your help: We need volunteers to help man the booth during the show (details can be found at http://events.goitec.com/overview/?ec=TAM02) and everyone to help us distribute free tickets. Each ticket will have a code that will tell the promoters of the show the tickets came from us. Please let Kevan or Mary know if you will be able to help. E-mail to president@tpcug.org or call (813) 988-6480.

Please send any ideas, requests or complaints to president@tpcug.org. Let's have some fun learning this year! ◆

Meeting Preview: Paul Willies of Long Bay Communications, http://www.longbaycommunications.com, will tell us how to design and build web sites. As usual, Mary Sheridan will conduct a computing and Windows discussion for the first 30 minutes of the meeting.

President's Message

By Kevan Sheridan, President, Tampa PC Users Group
president@tpcug.org

I am recharged! We just returned from a long weekend of user group learning sessions and round tables. The FACUG (Florida Association of Users Groups) events are always interesting and informative. This year the biggest software items covered digital images or movies and how to handle/manipulate/save them. For less than $600 (plus a computer) you can now turn your PC (or MAC) into a very capable video editing system that rivals $50,000 systems of just a few years ago. According to some people with the APCUG (Association of PC Users Groups), Florida has one of the best regional annual meetings in the country. Almost 10% of the PC groups in the country that have signed up with Mindshare are based in Florida. All that says Florida is a great place to use your PC.

When you do use your PC, chances are that you wish you knew a better way to do something. That is where a PC users group, like ours, can help. Not by a few people standing at the front of a room speaking but by the people who attend the meetings and have worked with it before. The networking before, during breaks or after the meetings is a great time to find out very interesting things, things that are hard to find out

(President.....Continued on page 2)

Notice: New Meeting Site—See Above
April 13: To be announced. Check our web site

* * OFFICERS * *
President: Kevan Sheridan (president@tpcug.org) 988-6480
Vice President : Mary Sheridan(mcpease@mindspring.com) 988-6480
Treasurer: Mike Hodges (mike.hodges@cae.com) 962-2114
Secretary: James Weber (jlweber9@mindspring.com) 671-1612
Member at Large: John Witmer (JWITMER@Pepindist.com) 963-3760

APPOINTED (Volunteers)

Editor: William LaMartin (lamartin@tampabay.rr.com) 251-3817
Librarian: Larry Anders (Larry@AndersNet.com) 989-9119
Programs: Bruce Register (bregis@gte.net) 968-8170
Membership: Jenny Leitzke (Leitzke4@hotmail.com) 968-9000

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members. Our mailing address is P. O. Box 3492, Tampa, FL 33601-3492.

However, for business concerning this newsletter, Bits of Blue, please contact the Editor, William LaMartin, at 821 S. Boulevard, Tampa, FL 33606-2904; 813-251-3817; lamartin@tampabay.rr.com.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII, Microsoft Write, Microsoft Word, or Word Perfect file to the editor at 821 South Blvd., Tampa, Florida 33606-2904 or to lamartin@tampabay.rr.com.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

The use of trademarked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

Minutes of the February Meeting

By Kevan Sheridan, President, Tampa PC Users Group
president@tpcug.org

The Windows SIG (Special Interest Group) began at 6:40 PM led by Mary Sheridan. Several interesting topics were covered during the session. The president began the regular meeting at 7:00 PM. The introduction of officers and handing out of sample newsletters to visitors took place next. The VBA SIG (first Tuesday of the month) was announced for March 5th and the Access SIG for March 19th, the 3rd Tuesday of the month. Sign-up sheets for both were passed out during the meeting. (See SIG section on page 10 for exact times and locations.)

John Witmer, our Member at Large, performed the main demonstration for the evening. The topic was using Excel in the real world and included several varieties of spreadsheets from the simple (employee name tracking and vacation/sick time tracking) to the more complicated (Pivot Tables using data imported from a mainframe computer output report). One gem was example of the use of conditional formatting. The spreadsheet cell displayed a red flag when the expense report line did not balance. John showed how to set up the criteria for using the conditional formatting. The Pivot table spreadsheet was very involved and interesting.

After the Excel demonstration there were several announcements made and a Question and Answer session followed. One question was about network printers and an HP computer. In a Windows XP network, the HP computer was adding network printers without allowing the use of them. To add to the problem there was only one printer on the network and Control Panel – Printers – Delete Printer would not work.

The meeting ended at 9:00 PM and there were several free items on the back tables for attendees to pick up. ◆

Why Partition Your Hard Drives?

By Wade Herman,
Tampa PC Users Group
wherman1@tampabay.rr.com

A little background:

My daughter's Christmas wish list included the wish that Santa would help her upgrade her old Pentium II 233MHZ Cow computer (never can remember that company's name). Since Santa's computer was almost as old, he felt could justify an upgrade also.

I began doing some research for the best deal on a new case, motherboard and memory. The object was to get the best components at a good price. Just can't understand buying cheap components cheap. Nowhere is the price difference between Chevrolet and Cadillac quality less than in the world of computers. Unfortunately, there are lots of choices, and products are upgraded at blinding speed so you must do your homework or deal with someone you trust. After spending hours online and visiting several local emporiums it occurred to me that I had ignored sources within our own users group. These members apparently do not feel comfortable talking up their business to our members so I will do it for them. Everyone I talked to had very good experiences with them. Problems are always a possibility, but we have very knowledgeable people with a personal interest. However, unless you have some technical expertise this is not the route for you. You cannot expect them to hold your hand through every step. Should you run into some problem beyond the answer of a question, what you will pay for help will be less than at other sources and they are interested. Yes, I had a few minor problems. They were solved quickly, by the Head Honcho, not some tech support person typing your question into a computer!

I settled on an AMD 1900XP processor and Motherboard, 512MB DDR Ram, with 80GB 7200RPM drive. In a spiffy case with 4 full size bays and 2 floppy bays.

I made an image of my old 20GB onto the new 80GB drive, using Norton Ghost, so I avoided having to reinstall my software on the new drive. Pretty Cool!

What is Partitioning?

The little metal box that stores the information is called the Physical Hard Disk Drive. It may be thought of as a big storage box in which you place folders in some order defining programs and inside the folders you place files which contain the information to execute a program or store data. The greater the storage capacity of the drive the more difficult it is to keep your data logically organized and easily accessible. From an organization standpoint it is much easier to efficiently organize data if you have multiple smaller storage boxes or filing cabinets assigned to different categories of information. This is what partitioning allows. You may have just one Physical Drive but now you can divide up (Partition) areas of that drive to look to the computer like you have a number of smaller independent drives. When creating these Logical Drives (Partitions) you can assign them different sizes depending on the amount of data you will be storing. Using Partition Magic you can change the size of a partition without losing data stored in the partition. The primary or boot partition is automatically called C: and is the drive the computer uses to load the operating system (Windows) at startup. Here I install Windows related programs and name the drive "Windows". I make the next partition, Logical Drive (D:) and name it "Programs". Here I store most of the programs I use. The next partition, Logical Drive (E:) I might call "Data". Here I would store data files for letters, spreadsheets, databases. Logical Drive (F:) might be called "Games". Logical Drive (G:) might be called "Music" and so on.

Now why go to this trouble?

This makes it easy and quick to back up your data files that change often. Just tell your back up program to back up that Logical Drive. No need to back up your Windows or Program files if you have not added something new.

(Partitioning……Continued on page 4)

(Partitioning… … ….Continued from page 3)

If files on a drive change often, these are the ones that need to be defragmented, and the smaller the drive the quicker this operation takes place. Files will load faster as the disk will not have to search over the entire Physical Drive for program fragments.

If you do a file search and know that the file resides in the Logical Drive you have set aside for "Data", the search time may be much shorter as the computer will not have to search the entire Physical Drive. Reduce disk space waste. Many people do not realize that the space used on a disk is always more than the actual file size. On drives more than 32GB, storage space is allocated in multiples of 32KB. If the file is only 1KB in size it will use 32KB of drive space, wasting 31KB of disk storage space. If the file is 33KB, it will occupy 64KB. If the Logical Drive is made between 8-16GB, then the 1KB file will occupy only 8KB of disk space, wasting only 7KB of disk space instead of 31KB.

There is now a separate FAT (File Allocation Table) for each Logical Drive so if one becomes corrupted, a fairly common defect, the other Logical Drives will probably still be accessible. Additional bootable drives can be created to allow multiple operating systems on the same machine.

If the above has tweaked your interest in partitioning your hard drive, then read my review of Partition Magic 7.0 in this newsletter. ◆

(President… … ….Continued from page 2)

organization. Thank you for helping us to be a better PC users group.

I welcome your comments and suggestions. Please send them to president@tpcug.org. ◆

Pocket Printer A6 from SiPix

By Mary Sheridan, Vice President, Tampa PC Users Group
mcpease@mindspring.com

I was asked to work as a volunteer at the SiPix booth at the Photographic Marketing Association Conference in Orlando last weekend. It was very interesting, and I'm supposed to receive a free Pocket Printer for my efforts. The Pocket Printer prints from a Palm, Pocket PC, a laptop, or the desktop computer. It uses a wireless infrared connection for use with infrared devices, a serial cable or a USB connection. It does not use ribbons or cartridges; all you need is the special paper for the printer to print with thermal technology. It weighs 14 ounces and is powered by four AA batteries.

The SiPix Company is a Digital Imaging Appliance Company. Besides the A6 Pocket Printer, they have two portable photograph printers, the PocketColor 200 and the PocketColor 100. They also have digital cameras. For more information go to: http://www.sipix.com. ◆

Lost CD Drives, Wrong End of the Cable and Internet Programming

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

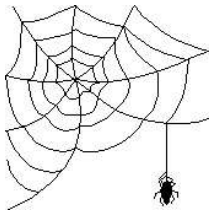
Needing something to fill space in the newsletter I thought back on the previous month and came up with the following items. The first two are the results of helping members with computer problems; the others have to do with a combination of web work and programming.

Lost CD ROM Drive A member called with the news that he had done a Windows Update from the Microsoft site, and when he rebooted he had no CD drive. A strange way to lose your CD drive. At first I didn't attach too much importance to the update and had him check in Windows Explorer—no CD drive there. Then a check of Windows' Device Manager in Control Panel said that the CD Drive was there—and everything was OK. Obviously not too accurate.

However, a further check of devices indicated that the Primary and Secondary IDE controllers were not functioning properly. Well, that could certainly cause a problem with the CD drive. At that point, the member said that he had printed out detailed instructions for the update and one of the items updated was the Intel drivers for the IDE controllers. Furthermore, it said that if something went wrong with the update you could uninstall it via the Update Wizard Uninstall. To get to it you go to Start | Programs | Accessories | System Tools | System Information and then click on the menu item Tools | Update Wizard Uninstall.

Uninstalling the Intel update and the rebooting brought the CD

(Lost CD… … ….Continued on page 6)



Internet Picture of the Month

One Photo from Here is New York
from
http://hereisnewyork.org/

This is an exhibition and sale of photographs dealing with the World Trade Center running on the ground floor of 116 Prince Street, NYC 10012 . All of the prints displayed will be sold to the public for $25, regardless of their provenance (+ $10 for Internet orders). "The net proceeds will go to the Children's Aid Society WTC Relief Fund, for the benefit of the thousands of children who are among the greatest victims of this catastrophe." The web site has around 3,000 photos. All images are printed on 11 x 17 paper and the images are 9 x 14 or 14 x 9.

(Lost CD……Continued from page 5)
drive back. If there hasn't been an update to uninstall and you have problems with the IDE controllers, I think the way out is to remove them in Windows Device Manager and reboot, letting Windows reinstall the default drivers.

Wrong end of the cable Another member called to talk about hard drive problems. He now had two drives, but could only see one of them. He had the one with the operating system set to Master and the other set to Slave but could only see the Master.

I then questioned him about what sort of drive cable he was using, and he said it was one of the new style ones that supports Cable Select. He had tried to set the drives to use Cable Select, but the result was the same. Although not knowing much about Cable Select, I suggested that perhaps both ends of the cable were not equal with such a cable—one was possibly meant for the motherboard and the other for the drives.

Well, in fact, he had positioned it in the way that seemed easiest to connect the two drives without thinking that one particular end may be meant for the mother board. After switching the direction of the cable—and having a hard time connecting the drives (since it was easier to do it the other way)—on boot up both drives were recognized. Another new piece of information to store away.

Accepting credit cards Last year I got involved with building a web site for someone who wanted to accept credit cards. If you recall, we had a presenter last year who specialized in optimizing your site to get more attention from the search engines but had formerly been in the web site creating business. And one of her gems of wisdom was that she wouldn't go anywhere near creating such a site. It was too difficult and it was best to purchase a shopping cart program with all of this built in.

Well, I can't resist a programming challenge—and you do need certain programming skills if you want to do this. First, you need to know that to accept credit cards you need both an Internet Merchant Bank Account (different from a regular Merchant Account) and an Internet Payment Gateway Account. My client already had a Merchant Account, which would allow them to set up an Internet Merchant Account (for a fee) and an Internet Payment Gateway Account (for another fee).

The Internet Payment Gateway is the web site that I would have to write code to interface with. Each such gateway has its own specifications and methods which you can download from their web site. I looked at AuthorizeNet and SurePay. AuthorizeNet was the easiest, allowing you to pass them certain variables via ASP code. SurePay allowed you to use JAVA, CGI, or ASP to pass their collection of required variables as an XML string. I chose ASP and got my introduction to XML.

To make a long story short, I figured out both the AuthorizeNet method and the SurePay method and was able to test each using their respective site's test modes in submitting test orders. And the lady was correct that it is not for the faint of heart. But it is something that can be done with a knowledge of ASP. Unfortunately, my client decided to continue with an 800 number for orders instead when they realized that before anything was sold, it would cost at least $600 in base fees without even selling anything. Then, of course, there is the additional transaction fee for each transaction paid to both the Internet Merchant Bank and the Internet Payment Gateway—not to mention the extra programming fee.

That work, however, was not in vain. Not only did I learn how to do something that I didn't know before, I now have a potential application of that knowledge. Someone wants to sell software for download over the Internet and, of course, take credit cards for payment.

Downloading Files But this introduces another wrinkle that you probably haven't considered. How do you allow only those who have paid to download a file? The typical method to download a file on the Internet is to provide a link like http://www.tpcug.org/filetodownload.exe. But we can't use this method since the first person who paid and thus was directed to the link could then provide that link to additional individuals. You can introduce session variables, cookies, hidden input fields, and databases, but, omitting the details, believe me, every scheme that I came up with involving just these items could be cracked by a knowledgeable person.

I finally settled on using a custom DLL as the center of my method. Luckily I had just been working with writing DLL's both in Visual Basic and Delphi. In fact, I found on the Internet a DLL created in VB that would do just what I wanted—stream a file (from an undisclosed location on a server) to a browser for download to one's computer. So I didn't even have to write one myself. But this DLL had one drawback (as do all DLLs written in VB). It needed to be registered on the server—something that most web hosting companies will not do for you because there is too much chance of such a DLL bringing down the server.

What I needed is what they call an ISAPI DLL. VB can't create these, but Delphi can (in addition to the other type of DLL). With a little work (I am not real proficient in Delphi), I created an ISAPI DLL that would stream the file from the undisclosed location. With the ISAPPI DLL, I can just drop it into any folder with execute permissions, like the cgi-bin folder, at the web site. And to download the file, now all I have to do is put something like response.redirect("http://www.tpcug.org/cgi-bin/MyDLL?File=filename&customerid=S25301").

But, you say, what have you gained? All I need to do is give the above link to anyone who would like to download the file—the actual location of the file has been hidden, but the link will still download the file. If that were all there is to it, you would be correct. But there is more. Once you pay, either in a cookie, database or text file, it can be recorded whether or not you are allowed to download a file, and, as soon as you download the file, that permission can be withdrawn—and the DLL checks all of this. So even with the above link to the DLL, only the person authorized to do the download will be allowed to do it once.

And we are out of space once again. ◆

My PartitionMagic 7.0 Experience

By Wade Herman, Tampa PC Users Group
wherman1@tampabay.rr.com

The program was supplied to our Tampa PC Users Group by the generosity of PowerQuest.

I have used PartitionMagic almost since its inception. I have always been very pleased with the results. Each new version has added worthwhile features, and this version is no exception. Now the program can be run directly from Windows and supports 80 GB drives.

On opening the box came the first big surprise, a User Guide of 151 pages, which for the most part is quite definitive. They even included easy to find telephone support numbers and 30 days of complementary telephone support, but, of course, you must pay the toll charges.

My elation was tempered when I received an error message on attempting to install the program, indicating the problem was probably with Norton AntiVirus. Checked to be sure that it was disabled and that I had clicked exit on the GoBack program. I could find no help in the User Guide or at the PowerQuest web site. I screwed my courage to the sticking post and decided to call their technical support. I do not know other's help desk experiences, but my experiences over the past year have been horrible to the point that I have greatly reduced my software purchases.

I meditated and said a few prayers and dialed. After about 8-10 ringie dingies, you will never guess what happened! A cheery real honest to God human voice answered —difficult to imagine I know. I could hardly contain my irrational exuberance! Gave her the required information and was switched to the tech support "Q"; now the real test. An understandable computer voice informed me there was one person ahead of me in the system. How encouraging. The elevator music was clear and soothing, and they assured me I was very important several times and they had extended wait time due to heavy call volume (one in Q). The wait time was about 13 minutes. When the tech answered, we went through the numbers disabling Norton AntiVirus and Internet Security, and I exited GoBack from the Systray. When that did not work, he recommended that I run PartitionMagic from the Rescue Disks. He assured me that would get around the problem. As he appeared to be anxious to get on to the next person in the "Q", I let him off the hook and re-booted the computer with the rescue floppies.

It booted OK but no mouse, D@&n, and the tech was gone. Then the light: my mouse is USB. Rebooted and this time at the GoBack splash screen hit the space bar and from here closed down GoBack amid various warnings. Now no problem running Partition Magic, so I should be home free. I wished to create a new partition between the last partition and the unused 40GB. When I attempted this, the dialog box asked which of the existing partitions I wished to take space from? None was not an option. User guide does not appear to cover the situation, so I decided to try online tech support. The response was to tell me to watch the cutsie online video, which is just a video depiction of the printed instructions. I decided to not select any of the options and see what would happen. Low and behold it worked. The new Logical Drive's drive space was taken from the unallocated 40 GB.

Once you get the program working it certainly lives up to its claims and is quite intuitive. A key feature of PartitionMagic is that if you run out of space on one of the Logical Drives you can expand its size by taking unused space from other drives without losing any data. If you need to reassign drive letters, a program is included that will reassign drive references so programs which need to reference other drives will recognize the new drive letter assignments properly.

If you have a large Hard Drive, I feel that partitioning is almost a must, and PartitionMagic is the best and easiest means of accomplishing this otherwise tedious and intimidating task. ◆

Looking Back to 1992

From the March 1992 Bits of Blue

Secretary's Report
TAMPA IBM PC USER'S GROUP
MINUTES OF 2/12/92 MEETING

Once upon a time there was a…..

No, that's not right. Let's see. Oh, yes. The meeting began approximately on time, but something seemed different, and it look a while for me to figure out what. But, then my 486/50 mind figured it out after just a few NS's - Harvey, our President, was not there. Instead, our distinguished Director of Education, Ed Buzza, was filling in for our eminent Vice President, Steve Spears, who was to fill in for Harvey who was out in Arizona on what Ed reported as a "well deserved vacation".

In any case, Ed opened the meeting and carried the first few minutes. Steve then took over and conducted the remainder of the meeting. Here is a summary of what transpired (please remember that I do not hear well - I may not have heard it all)

CLUB NEWS:

- Ed reminded everyone that the January newsletter has some good info in it on how to use the equation editor to make large print.
- Ed noted that WordPerfect is scheduled in to make a presentation on WP 5.1 for Windows at our meeting in March. He also pointed out that the current issue of PC Magazine has a review on the most popular mid- to upper-end word processors. In that review PC Mag. rated Word For Windows and AS Pro above WP 5.1. Those contemplating an upper-end WP might want to read that article first.

INDUSTRY NEWS:

- Steve reported from one source that Intel wants to create a new BUS standard which is completely open. Intel feels that the current standards are not adequate for the 4 MHz chip.
- Apparently there are several chip producers that are developing a "doubling chip" to double the internal speed of the 486 chip. Since this would only directly affect internal speed, it is anticipated that the doubling chip would result in about a 50% increase in throughput speed.
- In the chip area, Northgate has combined their chip development with development of a mechanism for the boards which would permit very easy installation and removal of the chips. From a user standpoint, this sounds very good - but I suspect that if it works out it might have a substantial impact on the cost of the boards on which that technology is included.
- Steve cited several examples to illustrate the declining prices in the computer field, noting that it is a user's market and will likely continue to be for the foreseeable future.
- Steve noted that the Gateway 486/133 had been selected as the Best Hardware of the year and DOS 5.0 as the Best Software of the Year - for 1991, of course.

PROGRAM REVIEW:

CorelDRAW

Steve introduced Leslie C. Dort of Corel Systems Corp. who would give us a demo of CorelDRAW. Leslie began by noting that she had provided a number of different informational materials for those interested, including quite a few demo disks. Leslie emphasized that while there are a few special versions of CorelDRAW (OS/2 PM, UNIX OSF?Motif, and UNIX OPEN LOOK), the program most of us are likely to be interested in and the one she would demonstrate requires Microsoft Windows. She then proceeded to outline the current and near-term future of CorelDRAW. The last major release was version 2.0. A maintenance release (2.01) was also out and all owners of 2.0 should have received the 2.01 release free of charge. Version 3.0 was in the works and should be released before the end of 1992. Corel would be marketing a "Blockbuster Bundle" which would include:

CorelDRAW and CD ROM
- An internal CD ROM drive
- An interface kit (with an 8 bit SCSI)

Leslie made a point of informing us that the SCSI in the Corel package would be the first true interface, and it would be capable of supporting 7 external devices. When the bundle would be available was not clear.

The bundle would include 10,000 pieces of clip art, 200 fonts, Art Show 91, and would be usable in 5 languages. The bundle list price will be $1295 for new CorelDRAW

(1992……Continued on page 9)

(1992……Continued from page 8)

purchasers and $595 for upgrades. An external CD ROM drive could be had — and that is recommended to save a slot - for an additional $100. A 16 bit SCSI can also be had for an additional $100. The SCSI will also be available as a separate item for $195 for the 8 bit version and $300 for the 16 bit variety. But Leslie pointed out that CorelDRAW is not really in the business of making or marketing hardware — they are and intend to continue as a software company.

In getting to the demo, Leslie noted that CorelDRAW [obscured text] rated in its niche and that it is excellent for presentation graphics, supporting word processors with graphics and special effects, and for DTP. She reported amazement at the variety of uses that have been found for the program, including engraving.

Leslie is very knowledgeable on CorelDRAW and proceeded to give a very comprehensive and very quick demo of a very powerful program (the 2.01 maintenance version). I could not even hope to put into text what I saw her demonstrate of the program. In short, I can't imagine anything that one might want to do with text or graphics that CorelDRAW can't do - and she made it look very easy. It gives super control of text (with a supply of 150 fonts in the normal package as a foundation, or you can import with ASCII or from most major word processors) and almost unlimited control of graphics - and the capability to make text graphics which then gives phenomenal control of text. Mirror, skew, size, curve, swirl, extrude, bend, fan, rotate at any angle, stretch, etc., etc., etc, is a short list of the many special effects things you can do and any combination thereof.

It supports (imports and/or exports) EPS, Windows Metafiles, BMP, CGM, GEM, DXF, WPG, TIFF, PCX, PIF, Video Show, SCODL, HPGL, and the AI format for Adobe Illustrator file formats. Included with the standard package are 3300 symbols and 700 pieces of high-quality art. Of course, with CorelDRAW you can make your own symbols and graphics. It includes three standalone utilities:

- CorelTRACE, which convert bitmaps to vector.
- Mosiac, which is a visual file manager as well as a powerful batch printing, importing and exporting utility.
- WFNBOSS, which is a font import/export utility that convert fonts from major vendors to CorelDRAW .WFN format.

If you get the impression that I was impressed with the program, you're right — it is the best drawing/graphics/special effects program I have seen, bar none.

After the presentation, Leslie passed out quite a few prizes as part of a question and answer period. Included were several mouse pads and a SCSI manual. All of the winners of these prizes did not provide their names to me, so I know only a few, who are:

Ruth Radlein SCSI Manual
Brad Krantz Mouse Pad
Floyd Thrower Mouse Pad
Bert Karpinski Mouse Pad

CorelDRAW requires a 286 or better machine, hard drive with at least 8-10 meg for the program, an EGA or better display, any printer supported by Windows, and Microsoft Windows. I suspect, however, that the program might be a little slow on the 286.

To Lesley (and Corel Systems Corp) we give you a very BIG " Thank You" for a superb demonstration of a super program — and for all of the goodies you provided. We are indebted.

AM-TAX91

Following Leslie's demo of CorelDRAW, our own Don Patzsch gave a review of the Shareware program AM-TAX91. This program is available on our own and the Sunshine BBS as AM-TAX9IA.zip.

It is quite a nice little program, is relatively easy to use and is fairly well documented. It will work on just about any IBM compatible computer that has 320K of usable RAM, any monitor, and just about any IBM or Epson (or compatible) printer. It will work with floppies, but a hard drive is best.

The version downloaded from the board supports the 1040 and Schedules A, B, C, D, Dl, El, E2, F, R and SE, as well as W-2s. The program completely prints all of the forms in a form acceptable to the IRS, except for the 1040 form - the data for which has to be copied to the IRS form. Registration costs $20 for which you get printed documentation and additional capability, including printing of the 1040 in a form acceptable to the IRS.

There are also more capable versions available to deal

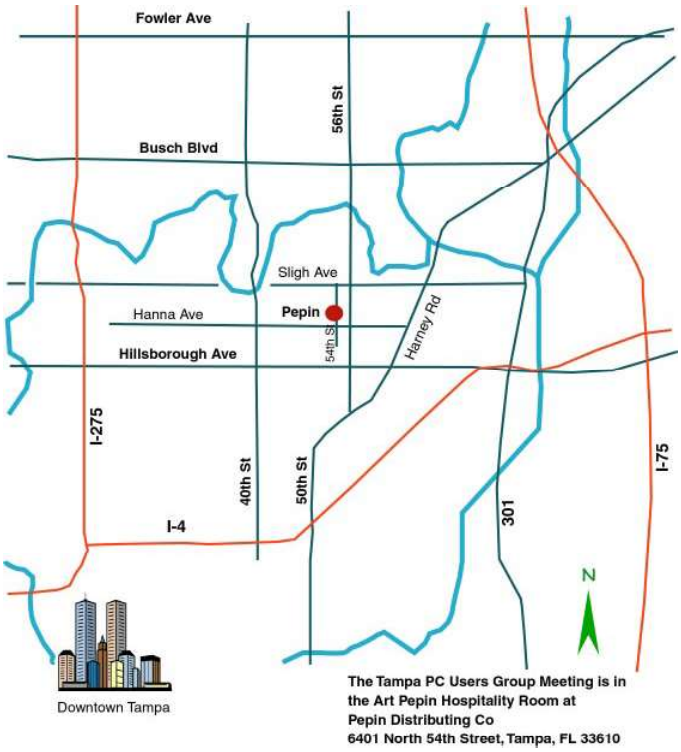
with more complicated returns - each with a modestly higher registration fee. However, for those whose tax return needs do not extend much beyond the forms supported by the basic program, this seems to be an excellent and relatively inexpensive way to go. (Of course, the freebee 92FM1040.ZIP, for use with Lotus 123 or Quatro Pro, is also available.)



Thanks, Don, for an excellent presentation and introducing us to this program.

AND THE WINNER IS:

After the presentations, Steve began the drawings, using our lovely guest presenter, Leslie, to good advantage. She drew the following lucky names:

Kevan Sheridan CorelDRAW
William Fuller IFX Business Expense Report program
Al Anderson 50/50 ($62)

CONGRATULATIONS! We are happy for you - and a bit jealous, as well.... ◆

Meeting Preview: Tom Cone will demonstrate how to use the Alpha Five database program. In his words: "I use it because many powerful features have been put in easy reach for the non-programmer, while the underlying scripting language is powerful enough to permit custom applications to be rapidly developed for others. This combination means that the package is immediately useful to end-users and developers alike.

President's Message

By Kevan Sheridan, President, Tampa PC Users Group
president@tpcug.org

Well, it's that time of year again. The time we begin to prepare for Tampa Bay's #1 Technology Event. We will have tickets available at this month's meeting. If you register for this event online (highly suggested well before the event) please use the Registration Code of TX1769. This is really a great event to attend and it's just as great to work in our booth. The show runs from 10:00 AM until 4:00 PM at the Tampa Convention Center and if enough people volunteer to help out we could each work two hours in the booth. There is not much to it, all we want to do is get our name out there and have people join our group. Please send e-mail to president@tpcug.org if you are interested. Perhaps you could also help us distribute tickets? All there is to it is to explain the use of the registration code printed on the back of the ticket.

On a lighter note, let's talk briefly about some fun learning software. The programs I am talking about are Solitaire, FreeCell and Hearts. Yes, if you are a beginner and have a newer version of Windows, you already have these valuable card games on your computer. IF you haven't already, find them under GAMES or ACCESSORIES | GAMES. What do

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members. Our mailing address is P. O. Box 3492, Tampa, FL 33601-3492.

However, for business concerning this newsletter, Bits of Blue, please contact the Editor, William LaMartin, at 821 S. Boulevard, Tampa, FL 33606-2904; 813-251-3817; lamartin@tampabay.rr.com.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII, Microsoft Write, Microsoft Word, or Word Perfect file to the editor at 821 South Blvd., Tampa, Florida 33606-2904 or to lamartin@tampabay.rr.com.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

The use of trademarked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

apcug Member of The Association of Personal Computer User Groups

Minutes of the March Meeting

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

Paul Willies

Mary Sheridan fielded computer questions and answers for the first 30 minutes of the meeting. Bob LaFave also answered several questions by demonstrating how to solve the problems on his computer connected to the projector.

The main presentation was given by Paul Willies of Long Bay Communications, http://www.longbaycommunications.com/.

Paul's business is designing, building and maintaining web sites. But that is not exactly what he spoke about. Rather he described a new product he and a programmer have been developing that allows far-flung organizations with numerous member groups to maintain their membership records, their meeting schedules, etc. on the web where they can be immediately accessed, modified and updated.

This is done in a secure environment, so that payment of dues or membership information is safe. Every action requires a certain level of access. Any member of a local group would have access to update their personal information, but only designated local officers would be allowed to change other information concerning the local group. Information of a national (or international) scope could only be changed by individuals with the appropriate higher level of access.

Paul said that the project was done totally outside of the Microsoft software orbit. The site is hosted on servers running either Linux or Unix software, the web programming language is PHP, and the database that is behind everything is MYSQL.

Additionally, he showed how, by using templates, each local organization could bring their current membership database into the new setup as a onetime uploading of their data.

It was an interesting presentation, demonstrating that there are very practical uses of the web. I believe this product is aimed primarily at the nonprofit sector of organizations. ◆

Homework and Computer Frustrations

By Merrill Friend, Tampa PC Users Group
mfriendtampa@worldnet.att.net

Usually I look very carefully into purchases I make, but I really blew it this time. I wanted a laptop computer. I needed the portability, and this was the answer. I selected a Compaq Presario with XP Home Edition installed. I really didn't give it much thought. After all it is Microsoft software, and if it has a Microsoft word processor and spreadsheet it can't be too different from what I am already using on my desktop computer, can it? It has seemed to me that every time Microsoft has come out with a new product it has been an advancement over its previous product, so why should this one be any different? And surely it is going to be compatible with all earlier Microsoft products, isn't it? Of course it is, I reasoned illogically!!!

So I get my dandy little laptop home and turn it on. A "Welcome" screen appeared telling me the need for registration of the hardware and software and suggesting that I handle the registration right now through the internet. I really didn't care to register just then and was disappointed to find that the computer and software manufacturer had conspired to push me along in this direction. It was rather like having a high pressure salesman sitting at your elbow. Heck, I had just turned the darned thing on and wasn't ready to do start registering anything just yet. But the welcoming screen just wouldn't turn me loose.

Compaq and/or Microsoft's motivations were clear, however, since under the guise of welcoming me as a client they were steering me toward registering through the FREE AOL program which came with my computer. All I really wanted to do right then was explore my new computer and the XP software but I couldn't get rid of this pushy "Welcoming" gibberish. Since I already had an internet provider, I opted to skip the installation of AOL's service as well as the immediate registration of my computer and the XP software since those tasks required an internet setup which I hadn't handled yet.

The next question the charming "Welcome" screen asked me was what I wanted to name my computer, which impressed me as an awfully ridiculous thing to do. Why in heaven's name would I want to name my computer? I certainly didn't want to name it after the kid who programmed this pesky "Welcoming" screen. Had I done that it wouldn't have been a very flattering name. I thought once about naming it "Bill Gate's Alter Ego," but thought better of it. I didn't want to see that in front of me on a regular basis. Perhaps the naming had something to do with the possibility of my using my computer as a part of a local area network, but no reason, not even that one, was given for naming the computer.

"I don't want to adopt you," I finally said out loud to the computer, "I just want this crazy screen to go away so I can get on with using this machine." I then realized that naming the computer was "optional" so I skipped that step. I have always been rather slow at reading all the directions and somehow in my haste to get on with it I missed that little word "optional". The software then permitted me to gradually work through all the mandatory "welcomes" and I finally got to the desktop. I am thankful that the kid at Microsoft who did the programming of this "welcoming" sequence didn't also program in a temper tantrum to yell and scream at me when I opted to skip those steps the kid and his bosses all obviously felt were so important. At this point, however, I wouldn't have been surprised at anything.

My Internet provider is AT & T. Apparently Microsoft doesn't like them. Of course they don't own them either. The desktop of Microsoft XP contained icons for contacting CompuServe, AOL, and MSN but no Icon to use to set up my account with AT&T. Fortunately, years ago on a much older computer I printed out my passwords and usernames for that account. I also was able to copy the settings I was using on another computer to the appropriate places on the laptop and this made the job manageable. I had stubbornly decided that I was not going to be intimidated by my computer manufacturer or the software provider as to whom I was to use as my internet provider. No matter how much personal effort it took I intended to continue with my personal choice of internet provider. After all I paid for this machine; it now belongs to me and I'll use it as I wish, thank you.

Then I went into the Microsoft Works software that came with the computer and pulled up the spreadsheet product. I had some Excel files on my other machine. "Works" was able to read one of them but couldn't understand two formulas in the other spreadsheet. By redoing these formulas I could get "Works" to accept the second Excel spreadsheet. I then began actually comparing the two spreadsheets and found that the "Works" spreadsheet has far fewer features than does Microsoft Excel.

Had I done my homework I would have already known this, but such is life. One needs only to turn on two computers and bring up Excel on one and "Works" Spreadsheet

(Frustrations…… ……Continued on page 5)

Express Thumbnail Creator

By Larry Anders, Librarian,
Tampa PC Users Group
Larry@AndersNet.com

First, let me begin by apologizing to ExpressSoft (and William LaMartin – our newsletter editor) for taking five months to get around to reviewing this software. Believe me, it's no reflection on the software, just my busy schedule.

Now… on with the review. Just a few days after I read about the latest version of Express Thumbnail Creator (ETC) in one of my computer magazines, William posted the software for review and I was excited to give it a test drive. After reading the article I was definitely interested. I, like many other people these days, have my own website, which has turned out to be a collection of photographs to share with my family and friends.

When I first started posting the pictures to my website, I would painstakingly take the time to code the pages to show the photos somewhat how I wanted them to appear. I could never seem to get it just right nor the same every time. As time passed, different programs were developed to assist in preparing image collections to be published to the web. I tried a bunch, but none were as simple and fast as ETC.

Without reading a thing, I installed ETC, started the program, chose to **Create a new project** and clicked Next. I then clicked the "+" to add images to the collection. (If you're not sure what the images are, there is a preview window when you click on the file to remind you.) I then chose the folder I wanted to save the project to (better to create a new one for each project) and then selected the default settings for the next 8 clicks. Then I chose to **Generate all** (as in thumbnails, images and the web pages), and my first collection was ready to be published to the web. Really! Less than five minutes and it was done, and I was hooked! And, I got this program for free because I agreed to review it. What a deal! (I'm throwing this comment in because good software is available for our members to review most all of the time.)

Once I finished my first project, I was ready to go back and see what I could customize so my web postings wouldn't all look the same. (Back to the 8 clicks I breezed through.)

1. <Select a **Style** for your gallery> There are six styles to choose from for a background-primarily color schemes.
2. <Modify the look of your **Thumbnails**> Choose the size of thumbnail, crop the image, add a colored border, rename the image file, add a drop shadow and image quality settings.
3. <Full-size **Images**> Resize the original image that will be displayed when the thumbnail is clicked, add a colored border, convert filenames to lower case, auto rename and image quality settings.
4. <**Index Tables>** Customize table size (rows & columns), layout (cell padding & cell spacing), add borders and include a background of your choice.
5. <**Index Pages**> Title your primary page for the gallery, choose the location and graphic for your navigation bar on each index page, and select a background graphic and color.
6. <**Image Pages>** Customize your links, filenames, navigation bars, background pictures and color on each full-size image page.
7. <**Titles**> Customize titles of index and image pages
8. <**Generate**> Generate all the pages automatically and then preview them.
9. <**Upload**> Sometime in the near future ExpressSoft plans to add an upload feature – but it's not ready for primetime as of this writing. I use FrontPage and had no problem publishing
10. <**Finish>** Save the project and you're done, honest! That's all there is to it.

There are other tweaks I did not mention, but those were the primary adjustments that can be made. This software is excellent (and easy) for creating photo galleries, and not only for publishing to the web. You can easily copy these files to a CDR/RW and share your gallery with your friends and family. Just plop in the newly created CD and type the name of the main page and it's as if you were viewing the gallery on the Internet. The software sells for $39.95 and you can order it online at http://www.express-soft.com. You should add this package to your software collection.◆

(Frustrations… … ….Continued from page 3)

on the other and go across the column heading selections at the top of each spreadsheet to see much of what has been left out of "Works." And for those reasons "Works" is compatible with Excel only on the simpler more basic spreadsheets.

One deficiency in the "Works" spreadsheet which was real important to me was the inability of the "Works" spreadsheet program to protect that part of the spreadsheet where permanent formulas exist, thus preventing their inadvertent change or removal. This is a feature of Excel but is not supported on the "Works" spreadsheet. The only way to protect a file under "Works" is to make that entire worksheet "read-only." Not a practical idea unless you only want to read the worksheet and not ever work with it.

When I was growing up and someone said this or that product had "the works," it meant it really had everything. I have learned that it doesn't meant that as far as Microsoft "Works" is concerned because that program obviously has less than other Microsoft programs I am familiar with. Thus, its name seems somewhat of a misnomer.

But you probably already knew that anyway, didn't you? You certainly did if, unlike me, you had done your homework. To those of you who haven't done your homework, read on.

After I saw what had been done to the spreadsheet pro-

Handspring Prism

By Mary Sheridan, Vice President,
Tampa PC Users Group
mcpease@mindspring.com

This is my second article in the "Handheld" series. Instead of starting a "Palm" SIG, a series of articles will be written about the handheld devices. I encourage input as to what things you would like to see more information about. Either the Palm Platform or Windows CE, it does not matter. I will be happy to research the issue and write an article about it.

I got the Prism while I was in Las Vegas attending the Fall APCUG conference. I bought it at the Handspring booth at Comdex. There were two primary reason I chose this unit over the others; 1. The screen is wonderfully easy to see and read and 2. The price was in my range (because of a APCUG coupon I paid $249.00). I began shopping for a new Personal Digital Assistant (PDA) last summer. I had been using a Palm III for a little over a year. The address book had helped me out a couple of times, but that was all I used it for. Once I was able to see the newer units with much easier to read screens, I realized there had been a problem using my unit because it was hard to see. Even with the backlight on, it was still difficult to make out the characters. I had initially planned on trying to get a 'deal' on the newest Palm unit, but once I compared the various units, I walked away with the Handspring.

There were better units and I was really tempted to buy the HP Jornada. BUT, the cheapest price I could find on the Jornada was $599.00. I just could not justify this much money, not knowing for sure if I would really use it more often than I had my Palm III.

The units are less than $450.00 today, but still a lot of money IMHO.

HP Jornada

Anyway, back to the Handspring Prism. There are over fifty modules available for the Prism. These modules are digital cameras, mobile phones, wireless internet devices, MP3 player…the list goes on. The modules are plug-and-play. Just plug them in and they work, no drivers to install or wires to plug in. The modules are very easy to change. They are small and very portable. The Prism comes with the usual software that comes on a Palm Pilot; Addresses, Date Book Plus, Calculators, etc. Because the Prism uses the Palm Operating System, the unit is fully compatible with any other Palm device. I can transfer data to and from my computer by placing the unit in its cradle (easily connected to the computer by USB connection) and pushing a button. It's even easier to transfer data to another Palm based unit by simply 'beaming' the data via infrared port. The unit comes with software that is compatible with either a PC or a Macintosh.

Many of the previous features are standard in other handhelds, but since I own the Handspring Prism, it's easier for me to start with this unit and then compare the other units to this one. I use my Prism every single day. I have it with me all the time and I find new uses for it at least once a week.

I'm investigating a pedometer unit that clips onto your waistband like other pedometers do. The module has some interesting software that does some extensive 'fitness' calculations. It sells for $39.00 and unless I am able to talk myself out of buying it, I will write an article in the future about the unit.

Please send any suggestions for the handheld column to mcpease@mindspring.com.

◆

Firehand Software

By Wade Herman, Tampa PC Users Group
wherman1@tampabay.rr.com

Firehand Technologies makes two basic products to assist you in organizing, editing, and displaying your graphics and multimedia files. The company only markets it products on the web at http://www.firehand.com/products/. The first thing I appreciate about their products is that you can download a fully functional trial copy. I especially appreciate this feature because over the past year I have purchased two pieces of name brand software that were so buggy on my machine that I have had to remove them. Another program did not meet my requirements. Leaving me stuck with over a hundred fifty dollars in useless software. For me, try before you buy is hard to beat.

The first product "Firehand Ember" is a graphic file viewer and editor. The edit function is quite limited and does not include any Red Eye Removal function, which is most needed for anyone who takes digital flash photographs. The program's main claim to fame for me is that it is a comparatively small, rapidly loading program that produces excellent quality displays of almost all file formats. What I like most is that you can set it to automatically adjust the image size to fit on your screen. Quite often I receive pictures taken in a resolution that exceeds the resolution of my screen, and, thus, to see the entire image without scrolling you must resize the image in a program such as PhotoShop, which is very time consuming. With this program the resolution of the file is not changed but it will automatically fit your screen. Try it, I think you will like it.

The other program is "Firehand Lightning." It allows you to create versatile slide show presentations of collections of photographs. This program creates a single highly compressed file containing all of the images with the viewer as an integral component. Thus, the file can be viewed on most any PC without the need for any other program on the receiving computer. You can send the file over the net or burn a CD ROM. In addition, you can imbed printed or audio annotation. With this function you can record the voice of your little darling and have it automatically play when the picture appears or you can add background music. Pretty cool. The program allows you to select from a variety of transitions between images, such as dissolves and wipes. My only complaint here is that the transition apparently must remain the same for all images in the presentation and the time on screen cannot be adjusted for individual images. There is much more, so if this sounds interesting go to their site and peruse the features, or better yet download the trial and get some hands on experience for free.

Do it before the meeting, as when I purchased the program I asked if they would be willing to donate a program as a Door Prize for our group and they kindly agreed. If the opportunity arises, please express your appreciation to them. ◆

(Frustrations… … ….Continued from page 5)
gram, I pulled up the "Works" word processing program. Again, I was disappointed and again the same computer by computer comparison was easily be made of each of these two products.

So what was my solution? Phone an expert and get another viewpoint, as I should have done in the first place. So I phoned our own William LaMartin, who suggested that I should be able to successfully install my Microsoft Office 97 software on this new laptop which uses XP Home Edition. I tried that, and it worked fine giving me access to the programs I wanted.

I had been led to believe by a computer salesman when I bought my new laptop that Microsoft Works would be fully compatible with Excel and Word. Had I been told the truth, I would have wanted my laptop outfitted with the latest editions of these programs. When I found that what I was told wasn't true, continuing with the old tried and true software was the easy answer for me. And if I buy any more computers, I now know one store to leave off my shopping list.

Next, I looked for a list of printers and was initially unable to find such a list. I went online to Hewlett Packard, who made my 820Cse printer, to get a driver for XP, only to remember that HP had obsoleted this printer a couple of years ago and no longer provides support for it.

As an aside I should tell you I bought this printer in1996 and at one time thought it would have to be replaced because, when it printed, the ink streaked over the paper and certain lines did not print. I contacted HP then and learned that it was obsolete so they couldn't help me.

But HP has a users discussion board where I went with my problem. Some other HP user had had the same difficulty I was having and told me that there is a "tub" under-

(Frustrations… … ….Continued on page 9)

Looking Back to 1992

From the April 1992 Bits of Blue
PRESIDENT'S COLUMN:

Ok let's all get strapped in. The roller coaster is a fixing to start. Just as I was preparing for the OS/2 vs. Windows 3.1 battle someone pulled the rug out from under me. First, I am told, and later read, that the parent company I work for, Dun & Bradstreet, is considering buying Lotus Corporation. Ok, that's pretty major stuff by itself, but it didn't stop there. Next, I read where Novell is looking to merge or buy Software Publishing Corporation (SPC), the makers of Harvard Graphics. Now, fact or fiction, I am still trying to figure out both of these deals. Finally, the knockout punch, Microsoft buying Fox Software for 175 million. This deal seems to be fact and will probably be a done deal within the next couple of months. If you are an XBASE user, the last deal will be very important to you. Microsoft, after many years of trying to create their own database product, has opted to buy a very good and established product. My understanding is that Microsoft will not stop working on their own product, yet Microsoft is now aiming squarely at Borland International's dBase. FoxPro by itself is a very good and extremely fast database language. If Microsoft does the right things to FoxPro to evolve it into the Windows environment it will be a powerhouse. The race to the Windows database arena and market share between Borland and Microsoft should benefit all XBASE users. These two giants will not be the first to market a Windows database product. Companies like Software Publishing Corporation (Superbase 4), Computer Associates (dBFast) to mention a few, are already there. It will take a couple of new releases to see if Microsoft can convert FoxPro from a prince to a king, or court jester. Borland has a fight on its hands, first to regain the trust of previous dBase users which still have a bad taste from the original release of dBase IV, and now the entry of Microsoft into the jousting contest.

On April 6th Mr. Bill (Gates) will once again do his magic. He will introduce the long awaited release of Windows 3.1 at Comdex Windows World. His presentation will be shown via satellite around the country. If all goes well I will see it at the Hyatt in Tampa. Anyway if you have Windows already, start saving that upgrade money (around $49.00). This product will be shown by Microsoft at our June meeting.

OS/2 2.0 has been released to BIG corporate land via BBS and other electronic means. To date I have only heard from beta sites. The product has not been seen on any shelves. I read that IBM is thinking about $49.00 for the product. At this time I am not sure if that is for an upgrade or anyone who has DOS or what. If you plan on getting and installing the full works of OS/2 2.0 make sure you've got 30Mb of disk available, at least a 386 20 MHz with 4Mb of RAM as a minimum.

If you have been waiting for a notebook with great color, I saw one. CompUSA recently had an open house for corporate types to meet vendors and kick the tires of their products. Vendors included Symantec (the Norton people), Dell Computer, NEC, WordPerfect and others. NEC had on display their new NEC Ultrallte SIJ2SC. It's one of the few color notebooks which uses an active matrix thin film transistor display. That's a mouthful. Basically it means that each screen pixel is controlled by its own transistor. This produces a sharper focus and brighter colors than passive matrix screens. The list price of the notebook is under $6,000. If you are interested in buying one good luck. CompUSA does not have any in stock.

Sometime back I shared my opinion about the use of 14" monitors with Window word-processing software. I stated that the text was too small to read. Well I have an update on this continuing saga. I recently upgraded my discontinued 14" NEC 3D monitor to a 15" NEC 4FG monitor. At first I was very pleased. This monitor has a new color system which you can set, reduced ELF, VLF and magnetic field (Marylee says all that stuff is good for me). However, NEC decided to discontinue applying the anti-glare coating found on its previous monitors. To date this has produced the 1st computer related problem to my body since starting in this field in 1974. I now have a good case of eye strain which I attribute to the complete reflection of myself (scary) and everything behind me outside the building. I talked to the NEC rep at CompUSA about the problem and asked why they had decided to remove the anti-glare coating. In a nutshell he stated that the market had asked for that feature or lack thereof and that my problem may be an individual one (ouch). While talking to him I noticed that the 4FG monitor he was demoing had a NEC anti-glare screen attached. Of course it's no longer called that; it's now called a NEC MultiSync monitor lens and retails for $79-$199 depending on which of their monitors you have. As I stood there still smarting from the NEC rep's comment that it may be an individual problem, two individuals came up pointing to the NEC 4FG monitor. A young man in his twenties and an older man in his late forties. The young man said "See, that's what I need to prevent my eyestrain." Well, I can tell you my poor eyes lit up when I heard that. I talked to them and explained that I now suffered from the same problem and that I felt that NEC was nickel and diming us by making us buy their product

(1992……Continued on page 9)

(1992……Continued from page 8)
(monitor lens) to prevent this. I confronted the NEC rep who overheard this conversation "Must be another case of an individual problem!" I said. "NOT!" I have ordered the NEC monitor lens to see if the eyestrain goes away or if I should bring back the 14" NEC 3D. Presently, I am highly disappointed with the new NEC monitors. Of course this is my story and 1st hand opinion. I couldn't help notice that other opinions are different: PC Magazine (January 14th issue) selected the NEC F series as one of the Best of 1991 products, PC WORLD (December 1991 issue) rated the 4FG as a BEST BUY for a Windows monitor, PC/Computing (December 1991 issue) selected the NEC 5FG as one of their 1991 MVP, and, lastly, in the April 14th issue of PC Magazine, John C. Dvorak makes the comment about the NEC 4FG that "I can't recommend this monitor enough" in his Inside Track column. Maybe its just me and one other end-user but this has the smell of the initial dBase IV 1.0 recommendations and great initial reviews by the press several years back. I wonder where the human factor of an end user comes to play in all these press opinions.

Look for the continuing monitor saga in the future.

Harvey Bruneau ◆

(Frustrations……Continued from page 7)
neath the place where the printer ink jet cartridges reside when the computer is not actually printing. While sitting there excess ink from the print cartridge drips into this tub. Over the years the tub gets full. He suggested I clean out that "tub" of excess gooey ink residue that had accumulated over the years and my printer would work fine again.

He was correct, and I suspect that has possibly kept my printer going much longer than some others of this model. Whenever the ink jet cartridges moved over that full "tub" some gooey ink residue would rub off on the bottom of the cartridge and ruin the print. Just cleaning out the vat or "tub" with a wooden Popsicle stick cured that problem. I was warned not to touch anything else and not to use any cleaning fluids or lint bearing cloth.

But, back to the XP printer driver problem. I actually have two printers, the HP mentioned above and an ancient wide carriage workhorse Okidata dot matrix, over ten years old which my wife uses for excel spreadsheets. Okidata's web site said that XP contained a generic printer driver, called the 193 Plus-IBM Okidata. I connected the printer to the laptop. Then I went to the Control Panel and asked to install it. It asked for disks, which I didn't have, so I skipped that process and installed the generic driver. I then printed out some e-mail I had on my machine and thought I was home free.

But then I pulled up my "Works" word processor and brought up a 65 page document that had looked fine hours earlier only to see that it had now become a lot of unreadable gibberish. That's when I realized that "Works" uses true type fonts and the old Okidata does not. Apparently Outlook Express doesn't use true type fonts either because my e-mail had printed out fine on the Okidata. Concerned about getting the "Works" word processor working correctly I removed the Okidata printer from my machine and my "Works" word processor again displayed a clearly readable copy of my previous work.

I had never encountered such a situation previously when I was not actually attempting to print something and could not read the document because of the printer selection. Of course, at that time the Okidata was the only printer driver active on my laptop, and perhaps that was the key cause of the problem.

Next I decided to try the same process with my obsolete HP printer no longer supported by HP. I connected the printer and laptop, turned the printer on and then turned the laptop on and, once powered up, got a message on the desktop that my laptop had detected new hardware. The old Okidata did not have plug and play features but the HP and the Laptop did, and the XP Home Edition recognized it. The installation wizard came up and I opted to install the printer. When I was asked for a disk, I selected automatic installation since HP had not provided XP support. I was given two generic XP printer choices. I picked what appeared to be the right one for my printer. Then a test page was printed, and I was in business.

Did it include all the features that this printer was capable of? No, it did not, but enough features were there so that I could print letters on legal size and regular paper. I cannot print in "book" style on both sides of the same sheet of paper, which I will miss, but at least I have a printer and don't yet have to go out and buy another one. If I need book printing, I can still do that on my desktop, where I still have the fully supported HP drivers on Windows Me.

Special Interest Groups

Microsoft Access SIG

This SIG meets the first Tuesday of the month at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6:30 PM. For information contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merlenic@tampabay.rr.com.*

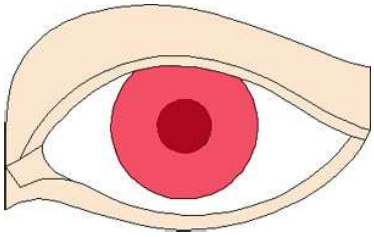
Genealogy SIG

To be included on the TPCUG genealogy mailing list, contact Jenny Lind Olin at 960-5723, or *jlolin@tampabay.rr.com.*

Visual Basic for Applications SIG

This SIG meets the third Tuesday of the month, at the Gateway 2000 Store on North Dale Mabry Mabry (just south of Columbus Drive) at 6:30 PM. For information, contact Merle Nicholson at *merlenic@tampabay.rr.com,* or William LaMartin at *lamartin@tampabay.rr.com*

Windows SIG



This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Mary Sheridan moderates the discussion.

Red-Eye: Its causes and how to deal with it

By Wade Herman, Tampa PC Users Group
wherman1@tampabay.rr.com

I think we are all familiar with that picture that is lovely except for the horrible red spot in the center of the subject's eyes, Red-Eye. The first thing to note is that it only occurs in flash pictures and the darker the room the more pronounced the effect. Fortunately, digital photo editing programs can greatly reduce the problem, but it is still best to eliminate the problem at the source when possible.

The effect is caused by the light from the flash reflecting off of the rear of the eye, the retina, which contains translucent blood carrying capillaries. Thus, the reflected light is red. The reflected light is passed back out of the eye and imaged by the camera. In dark surroundings, the iris of the eye, like that of the camera, opens to pass more light, thus the more pronounced the effect. Professional photographers deal with the problem by offsetting the flash source 6-10 inches from the plane of the camera lens. In this case, the reflected red light is offset so it does not pass through the camera lens. The amateur photographer does not want to carry around such a bulky contraption, so another solution has been developed. Unfortunately, it does not

work very effectively. In this case just before taking the picture the camera sends out one or more preflashes in hopes of making the eye's iris small enough that little light is passed back to the camera even though the flash and lens are very nearly on the same axis. Unfortunately, the preflashes are seldom strong enough or long enough to cause the iris to constrict before the main flash and may cause the person to blink at the wrong time. This feature often does considerably reduce battery life but little else.

What can the photographer do? Only use the flash when there is no other way to sufficiently light the subject. Turn on additional lights and open drapes. Remove lamp shades from lamps out of view of the camera. If you must use the flash, place a bright light source in the direction the subject will be looking, thus constricting the subject's iris. Have the subject look at an object off camera.

If all of this fails to give acceptable results, then obtain a retouching program that has a good Red-Eye Retouching feature. ◆

(Frustrations……Continued from page 9)

I am a bit disappointed at HP for dropping support of my printer. When I called them on the phone they admitted they have other printers that are older than mine which still receive HP support, so age alone was not the criteria for dropping support on this model. XP Home Edition does seem to provide generic support for a wide range of printers from the ancient Okidata to the much more recent HP. (Hey, did I just pay Microsoft a compliment? Darned if I didn't, and my machine didn't lock up when I did it, either.)

Should my next printer be an HP? I really don't know. But I will consider other models as well when that time comes, and I'll try to do my homework this time, not only on printers but also on software and computers as well. It might surprise you to learn this, but I never did like homework. ◆

Bits of Blue

May in Tampa

A Monthly Publication of the Tampa PC Users Group, Inc.

Vol. 15 No. 5 May 2002

Meeting

Computer Crime

Wednesday, May 8, 2002
6:30 PM
Art Pepin Hospitality Room
Pepin Distributing Co.
6401 N 54th St
Tampa, Florida

Meeting Preview: Russell Hayes of the FBI will discuss computer crime. As usual, we will have our Windows/computer discussion for the first half hour of the meeting.

There is no President's message this month, so we will substitute a photo of our April presenter, Tom Cone. Tom gave a very informative and well presented demonstration of the "friendly" database program Alpha Five. For details, see the Minutes column on page 2.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

Minutes of the April Meeting

By Mary Sheridan, Vice President,
Tampa PC Users Group
mcpease@mindspring.com

Mary Sheridan started the Windows SIG at 6:30 PM. Mary is turning over the moderation of the SIG to Kevan Sheridan, our new president. The SIG/Q&A will continue indefinitely.

Kevan Sheridan took over the meeting at 6:45 PM. Kevan welcomed everyone and introduced the officers. He announced that the Access SIG and VBA SIG are still being held at Gateway on Dale Mabry. Check page 10 for dates and times. Kevan brought the Microsoft T-shirts from the Extreme event and they were given to anyone who wanted one. He also had the tickets for the upcoming ITEC event, May 1st and 2nd. You can register for the event on the Internet from a link on the tpcug.org website. Be sure when registering for the event to include the number **TX1769** so the TPCUG gets credit for your attending the event. Kevan still needs volunteers to staff the tables for the event at the Convention Center in downtown Tampa.

Bruce Register announced the scheduled presenters for the next couple of months. He has an FBI agent scheduled to discuss Internet crime for our May meeting. In June, Steve Singer of RDI will give a talk on computer hardware. Then Kevan called for a 10 minute break.

After the break, at 7:10 PM Kevan introduced the presenter for the evening, one of our own members, Tom Cone, doing a demonstration of Alpha Five database software. Tom doesn't actually represent the company, but he uses and likes the product very much. The company has been through many changes in the last few years. A new version of Alpha Five is due out in June. This software lets non-programmers build fairly sophisticated databases. Tom demonstrated the Alpha Five Windows database program Version 4.5. The single version of this software sells

Eureka Everybody! I Have Found It!

By Tim Condon, Tampa PC Users Group
tim@free-market.net

The Death of Magazines (and books...and newspapers)

I know, I know: The imminent demise of paper—and all that we read on it—has not only been greatly exaggerated, but wrongly proclaimed just about every year for the past decade. Nevertheless, that doesn't mean it ain't gonna happen.

There will come a time, I am firmly convinced, when the developed world will stand on the edge of a precipice. A little nudge, or even a flinch, will be enough to push us over into the abyss...whereupon we spread our collective wings and fly off into another reality. So to speak! Think about when the Mediterranean Sea was a basin (presumably the lost city of Atlantis nested there somewhere) empty of water. The problem was, lo those umpteen zillion years ago, most of the basin was below sea level. Not to worry: A "plug" at the entrance to the valley, at what is now the Straits of Gibraltar, kept the water from the Atlantic out.

Or at least it did until there was a little nudge or a flinch. Probably from a pterodactyl who inadvertently landed. Just when things were ready. Just when the plug was ready to disintegrate. And a helluva waterfall resulted. (Talk about rising **water** tables!)

But I digress, right? What the **hell** does all this babbling have to do with The End of Paper? Just this: We're on a cusp kind of like that right now. It's not physical, like that ancient sea, but it's just as staggering and world-changing. I refer, ahem (roll of drums), to the **real** imminent death of paper.

And I think I've found the implement that's going to make it happen.

But first a look at the duds that have gone before: Ebook reading devices. From the Ebookman to the REB 1200 to the Franklin Ebook, they're all attempted hustles either by the book publishing companies or in cooperation with them. They all include draconian restrictions on ebook format and/or what you can copy and/or where you can get it from, etc. Stupid, stupid, stupid. But that's the nature of the beast when you're threatening the extinction of an entire and well-established industry. The book publishing conglomerates, like the music recording industry, isn't going to go away easily. They'll kick and bite and scratch and try to use governmental power and threats and various kinds of extortion and blackmail...and anything else they can come up with to stave off the inevitable.

Then there are the tablet computer people. Failure after failure. Everyone trying to protect their precious profit margins, everyone thinking that way to make a mint is to set prices so high that only the top 1% of the population would want to buy such toys. Even today, check out most of the prices. For a simple reading appliance that will connect to the Internet-with a **wire** is even fine-they march off across your eyeballs: $1,900 (the Flair web tablet). $1,500 (the SIMpad SL4). $1,650 (Honeywell's Web PAD II). $1,600 (the PenCentra 200). $1,500 (the Acknowledger CE). These barking dogs go on forever. There are plenty of others. Almost all over $1,000.

And then there's the much-anticipated Microsoft Tablet Computer, a solution to a problem that doesn't exist. I'll stick my neck out and predict it will be a huge flop. Costs too much. Doesn't do what we need it to do. Or rather, does more than we need it to (which is in part what drives the price up so). And besides, the job's already taken by the desktop and laptop computer.

Look, this isn't rocket science. Let's tick off what we're facing, what we've got, and where we need to go. All knowledge-and I mean **all** knowledge-has either already migrated or is in the process of migrating onto the Internet. How could it be otherwise? We human beings are evolutionarily **bred** to share knowledge. It's how we **survive**. It's what we **do**. It's an **instinct**, if you will, and a powerful one at that. What's the most revolutionary, most extraordinary way of sharing knowlege? The Internet? No. The writ-

(Eureka ……..Continued on page 4)

(Eureka…….Continued from page 3)

ten word. Then comes moveable type, Gutenberg, mass-produced paperbacks, general literacy (in that order), and romance novels (my favorite).

It all takes paper, right? Well not anymore. Because of the Internet. Electronics and the written word. Simple, right? **Not!** Why not? Because the dummies in the computer industry haven't **yet** been able to put two-and-two together, in order to give the entire world what it's been waiting for: A simple, useable, lightweight implement that can be used for TWO THINGS, okay? One, surf the Internet and **read**, you dummies. And second, handle email (and even that's not an absolute requirement; I'm talking about destroying just about the entire book and magazine publishing industries, so a mere "Internet reader" will suffice, thank you).

What is holding us back? A giant conspiracy by the printed-word publishing conglomerates to save their industry? Nah! A holding action while government can figure something out to stop all that free knowledge from flowing and sloshing around everywhere? Go **on**! No, it's just...lack of foresight.

A couple of years ago I had a **huge** argument with the CEO of a company that was on the verge of "doing it right" with an ebook reading device. But for some reason he was stuck-**stuck!**-on the idea of a "codex" electronic reader. That is, not a "tablet" but a thing that is hinged in the middle and "opens." A book, in other words. Look, I said, at least slap a couple of engineers on it and implement a simple alternative, a tablet, even if it's only secondary and an afterthought. No, no, he wouldn't hear of it. If they'd put out my damned tablet reader at the time, by now they'd be as big as Microsoft. Or some behemoth like that.

But nooooooooo! He wouldn't listen. And so the death of paper...and the death of the printed-word publishing industry...remains only a fond dream (think of all those trees we'll save!). But wait! Wait, wait, wait, wait!

Now I espy a bunch of hippie-sounding guys who...are...actually ...Putting. It. Together. I can't for the **life** of me understand why no one's done it yet. But there it is, and here they are, as of April 9, 2002. Out they pop from their stealth-mode cubicles or wherever, and simply...**say** it. Why ask why? Why are they developing their "information appliance" (that will cost under $700)? Well, duh: "We found there was an incredible opportunity to take advantage of a glaring hole in the marketplace." Get that: "Glaring hole." Now **that's** an understatement.

These guys are called DOT Design Technologies. They hail from (where else) northern California not far from Silicon Valley (San Mateo, to be exact). And they're about to Get It Right. It's called the "X-tend information appliance" (see what I mean about "information" being the key?), and it's the brainchild of a guy named Todd Shafer. It's based upon an "open platform" concept, and — get this — it uses Linux as its operating system (no Microsoft straightjacket!).

The X-tend is going to have a 10.4 inch touch-sensitive screen, and it will connect to the Internet through any of a number of different methods, including 802.11 wireless, Ethernet cable, dual USB, etc. Oddly enough, it also will be able to run your entire entertainment center (as in, replace all those remotes for the TV, the VCR, the DVD, the stereo, the CD-ROM changer, etc.).

But wait! There's still a chance to kill the thing! (Calling Barnes & Noble, calling Borders!) Shafer only has this little beast in the "virtual prototype" stage. And he's looking for funding to complete the prototyping and release it into the world. (Calling Harper/Collins, calling Bertelsmann, calling Simon & Schuster, calling Random House!) So this should be interesting. We all know the old urban myth about the carburetor that ran on water, snapped up and buried by the oil and automotive industries. No money to be made there!

Well, this is a **real** chance for an industry to try to kill a product that could do real serious damage to its profit margins. I mean, if the Internet becomes the preferred publishing venue — which it must — and

(Eureka……..Continued on page 5)

(Eureka…….Continued from page 4)

you've got an "information appliance" that you can curl up in bed with and read in the dark because of its wonderful gently backlit screen...what part is there left to be played by the clunky, smelly, tree-murdering, traditional conglomerate publishing industry?

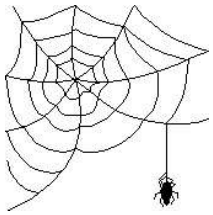
Indeed. **Watch your back, Todd!** And please don't give in to the zillions of dollars they're going to be offering to co-opt you. You'll make **multi**-zillions more if you stick with the rest of us, the world, and you'll be a great emancipator to boot. Not a bad appellation, that. ◆

Internet Picture of the Month

Daffodils
From
http://www.bbg.org/daffodilwatch/photos.html#nehemia

According to the Brooklyn Botanic Garden, "The Daffodil Project was born in response to the tragedy of September 11, 2001, and blossomed into a citywide volunteer initiative to plant one million daffodil bulbs in public spaces."

The photo above is from the Brooklyn Botanic Garden's site, http://www.bbg.org.



(Minutes…….Continued from page 2)

for $149.00 retail or $129.00 for the user group. The product is bundled with a zip code database that retails for $29.00. Our members can get the $180.00 value for only $129.00. Multi-user versions are also available that will run via a LAN with 10 – 15 users. This is a relational database, not a "flat" database.

The program is laid out in a very user friendly man-

DC AutoEnhance

Automatic Digital Camera Enhancer and Batch Processor

by Larry Anders, Librarian,
Tampa PC Users Group
Larry@AndersNet.com

Many of us by now have bitten the bullet and purchased a digital camera. With the prices ranging from $79 to well over a $1000, there is a price range for almost everyone. I know because I am on my second one and considering a third.

Although the photographs from digital cameras have gotten much better since my first Sony Mavica of five years ago, they are still not perfect. They all seem to need a little something, whether it be brightening, sharpening or something to make it perfect. Now, I am not saying that the photos I take with a regular film camera are all perfect, but in some sense there's not much I can do about them once the picture is developed and printed, unless I want to scan them in one at a time and "fix" them. At least the digital photos are somewhat ready to be "fixed", or probably better put, adjusted to your liking.

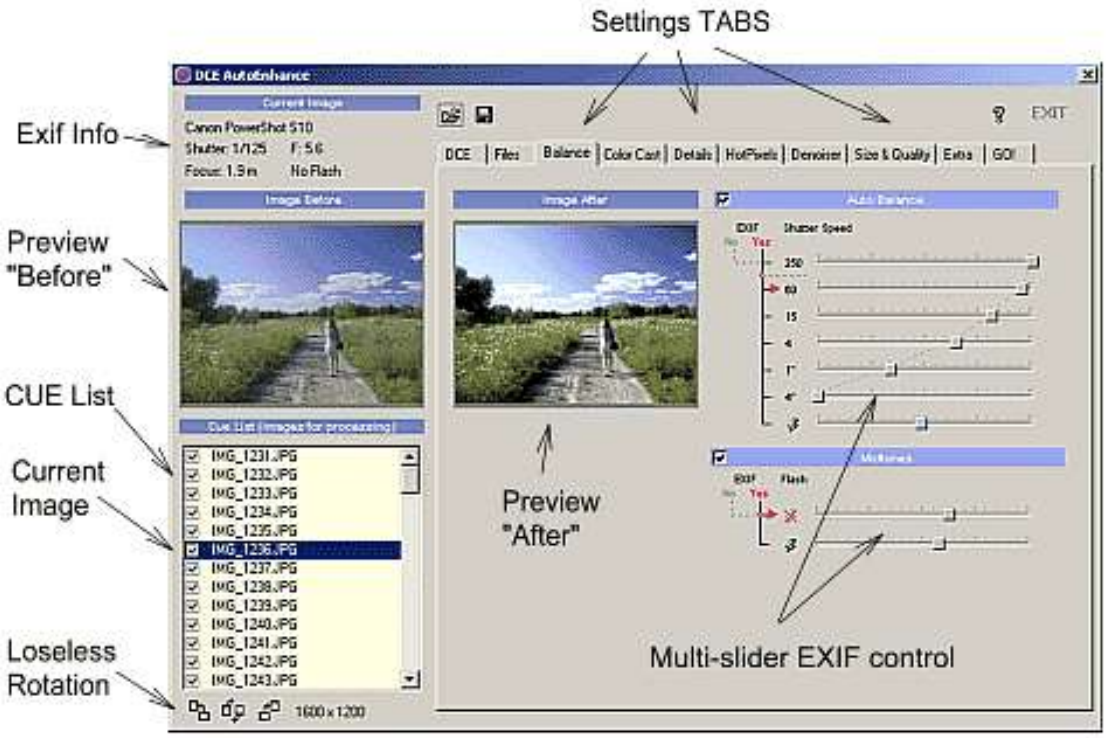
Most any graphics program today will import the image produced by your camera and let you make the adjustments you deem necessary. I have reviewed a few of those programs in this newsletter in the past, such as: JASC Paint Shop Pro, Adobe PhotoShop Elements, and my favorite, because it is free, Digital Camera Enhancer from MediaChance. The one problem I have with all the above software is that only one photo at a time can be processed. Most of the time that is okay, but recently I published a large amount of pictures to my website and it took a couple of hours to prepare the photos. By preparing I also mean resizing for optimal loading on a PC that doesn't have a broadband Internet connection. Two hours to process these photos was totally unacceptable, so I went looking.

NOTE: William LaMartin, our newsletter Editor and Webmaster, tells me that Adobe PhotoShop can batch process graphic images. But at over $600 for the latest version 7, and a learning curve that will take me into the next millennium, I decided to look elsewhere. (PhotoShop is no doubt the best program of its kind on the market for professionals, which I am not.)

I searched the Internet and found a few programs and almost wrote an article on EyeBatch Image Processor, until I visited MediaChance's website, http://www.MediaChance.com, again and found my favorite program had been upgraded to a commercial batch-processing program called ***DCE AutoEnhance (DCE)***. (The free version is still available under the camera tools section.) There is a fully functional evaluation version of ***DCE*** available for the download. The only restrictions on the eval version is that you can only batch process five photos at one time and the evaluation period is only good for 30 days. That is more than enough to put ***DCE*** through its paces. It only took me five minutes to know this program belonged in my arsenal of tools. Enough for the history… on with the review.

DCE has all of the tools of its free sibling but it also goes quite a bit further when adjusting and enhancing batches of photos. I know what you're thinking: "How can you adjust all photos the same if each one was taken at different times, under different conditions." Well, MediaChance uses something called **Exif Metadata** that your digital camera stores with the images and processes that data accordingly. (I didn't know my camera stored anything other than the image.) So **DCE** knows whether the shot was taken with or without flash, in the day or night, etc., and adjusts itself accordingly.

Some of the features shown and talked about at http://www.mediachance.com/dce/features.html are:



DC……Continued on page 7)

(DC…….Continued from page 6)

- Automatic Balance (Most digital photos are a little dark. This will balance out the light and contrast.)
- Remove Blue cast (Removing the extra blueness brings the sharp color back.)
- Adjust Mid-tones
- Enhance Colors (With this you can give a boost to the colors – without over-processing them.)
- Enhance Details
- Remove Hot Pixels (This removes the "dust" or white dots from photos that have a longer exposure time – like evening shots without a flash.)
- De-noise the image (The new high mega-pixel cameras might add more detail than we really need. This filter smoothes out the roughness while leaving the needed detail in.)
- Portrait De-Focus Filter (This was included especially to smooth out skin tones.)
- Resize the image (This is the real time saver for me. I feel I get a better photo by taking higher resolution snapshots and then reducing the size before uploading to the web. This may or may not be true, but it makes me feel better.)
- Finds the JPG quality for each image according your needs
- Add a text or Exif data such as date of shot taken, shutter speed, ISO etc. into the image with great control about the colors and parameters (You have full control over the size, font, color, background color and transparency and position. I haven't seen this ability in other digital processing software up to this point.)

Don't forget, most of the above mentioned features are all automatic, but if you get that one photo that you think needs a little more tweaking, there are manual adjustments on just about all of the features.

Because of the time it had taken me in the past to prepare my photographs for the web, I had actually all but stopped, or rather slowed down considerably, taking pictures to post on the Internet. This past Christmas I took a great deal of pictures that never made it to my website. They will now, a few months late, but what's wrong with Christmas in July. I just got a Christmas present in April when I found DC AutoEnhance, and you can too. Just go to: http://www.mediachance.com/dce/index.html, download the evaluation version and you can see what I'm talking about. You'll be surprised to find out your digital photos aren't really as good as you thought they were, but they can be - I guarantee it!

If you decide that ***DCE*** does the job for you, send MediaChance the $35 registration fee so they'll keep making good software. And, while you're at their website, look around. There's a lot of other good stuff to try out. ◆

Looking Back to 1992

From the May 1992 Bits of Blue

Secretary's Report

TAMPA IBM PC USER'S GROUP
MINUTES OF 1/8/92 MEETING

!! Harvey's opening remarks centered almost entirely on the just released Version 3.1 of Microsoft Windows. Several computer stores in the area were offering the upgrade and the complete package at bargain prices. Sad to say, but these low prices were for a limited time only. Installing the upgrade takes about 20 minutes on a 386. It takes only about 6 minutes to install as a new package.

!! Big feature is that it's fast. It loads faster, prints faster and the file manager is even faster. Another big feature is True Type, the on-the-fly font generator built into Win 3.1. True Type does work with WordPerfect for Windows, which could not access the Win fonts in the prior version.

!! There are two installation modes: express (which loads everything and needs about 11 meg on the hard drive) and custom (which lets you choose the modules that you want installed). There was no problem in installing the new version over the old version. It is not a good idea to install the new version as a second copy in another directory; there may be conflicts in references to the old files. Still no relief for Uninstalling Window applications.

!! There is now a "Start Up" Group (old Load and Run options) that makes it easier to set up your Window sessions. Also, you can use Control-drag to drag a copy of the icon to a new location. The Control Panel now provides for adjusting Window boxes and font sizes. You can shrink a DOS window to about a fourth of its full screen size and still read the text.

!! The latest version of OS/2 is due by the end of this month. To install the whole kit and caboodle will take about 30 meg of space on the hard drive.

!! On behalf of the User Group, thanks to ROBCO of Lutz for this evening's presentations. Should any of you be interested in their services, (813) 949-7686 is their office phone and (813) 949-7784 is their fax number.

LANtastic Presentation

David Gallagher of ROBCO, Lutz, described the benefits of LANtastic; rated as the number one peer-to-peer network package. This program makes the productive power of a full-featured LAN (Local Area Network) available at an economic price to, typically, small business users. It allows for resource sharing (printers, disk storage, FAX, modems, CD ROMs, etc.) without the need for a dedicated server machine. Any work station can act as the server.

Security levels, audit trails, and passwords are easily established or changed. Various services or accesses are easily enabled or disabled for any station. In fact, log in can be restricted to a particular period of time and/or a particular day.

Also, in a small network, ROBCO can set up the system so that a LAN manager is really not needed. Of course, as the number of work stations increases, so does the need for a LAN manager. One of the latest features is that of voice support. Hardware requirements are rather modest: 13k per station and 40k per file server. It can use the common network adapters such as Ethernet, ARCnet, Token Ring and LANtastic.

Right Hand Man II Presentation

Gerry Roberts, also of ROBCO, demonstrated Right Hand Man which is available from the Futurus Corporation. This is the new, commercial version of the old shareware program. Many new features have been added to make this product a very desirable addition to a LAN system.

It is a TSR (Temporary, Stay Resident) program that occupies only 4-6 K of memory. In and of itself, it is a revolutionary network E-Mail, scheduling, fax and phone message center. One nice feature is the Scan module which will determine the first available time slot for a meeting of selected individuals. The scheduler module can keep track of individuals as well as teams or work groups. The data file, dBase compatible, is like a free form Rolodex file; making it easy to set up records in the various files.

(1992……..Continued on page 9)

Editor's Comments

By William LaMartin, Editor,
Tampa PC Users Group
lamartin@tampabay.rr.com

Access & VBA SIGs We have had some pretty interesting SIGS recently where a member presented a project on which they would like some help getting started. The last was a cookbook in Access of interest to Jim Purcell. He has presented us with a number of interesting problems to solve. Next meeting we will be working on one offered by John Witmer involving keeping track of employee accounts.

Windows Scripting Host At our last VBA meeting, Merle Nicholson introduced us to the Windows Scripting Host and gave examples of simple scripts which accomplish some very useful tasks. It really got my attention, and I plan on seeing what I can do with such scripts. Perhaps in a future newsletter I will include a few for you to try. They are just text files that you double click on to run.

XML (Extensible Markup Language) At that same VBA SIG, I presented VBA code that would allow you to export a Microsoft Access table to an XML file and also code to import an XML file in a specific format to a table in Access. This is useful in Access 97 and 2000 but not in 2002, since Access 2002 can both import and export information in the XML format. By the way, XML is a platform independent language for describing data. In XML, our membership data would look like:

```
<?xml version="1.0" encoding="UTF-8" ?>
<dataroot>
  <members>
    <lastname>Doe</lastname>
    <firstname>John</firstname>
    <company></company>
    <Address>888 Maple St</Address>
    <City>Tampa</City>
    <State>FL</State>
    <memberzip>33606</memberzip>
    <homephone>255-9999</homephone>
    <renewmonth>200205</renewmonth>
  </members>
  <members>
     ……
  </members>
  <members>
    ……
  </members>
……..
</dataroot>
```

Where each block

```
  <members>
    ……
  </members>
```

contains one member's data, and there would be as many such blocks as we have members. This is the simplest form of XML document. Of course, things can get much more complicated.

XML and Amazon.Com Shortly after I did the XML presentation in the VBA SIG, Amazon sent me an email to the effect that they were testing out a new XML interface to their database that would allow developers to directly query their database. With the information they gave me, with what little I already knew about XML, and with some help from the developers' discussion forum at Amazon , I was able to make it all work. The result is an additional link to Amazon.Com at our home page, http://www.tpcug.org, that allows you to directly query the Amazon database without ever leaving the TPCUG site—and as before the TPCUG will get 5% of any purchases you may decide to make at no extra charge to you. Give it a try. ◆

(1992……..Continued from page 8)

Right Hand Man Remote provides the ability to dial in from one PC to another. Usually, one station of the LAN would be set up to wait for remote call-ins. Then uploads/downloads of E-Mail and phone messages can be sent/received in full duplex mode.

The cost is under $500 for a five user setup. ◆

Special Interest Groups

Microsoft Access SIG

This SIG meets the first Tuesday of the month at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6:30 PM. For information contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merlenic@tampabay.rr.com.*

Genealogy SIG

To be included on the TPCUG genealogy mailing list, contact Jenny Lind Olin at 960-5723, or *jlolin@tampabay.rr.com.*

Visual Basic for Applications SIG

This SIG meets the third Tuesday of the month, at the Gateway 2000 Store on North Dale Mabry Mabry (just south of Columbus Drive) at 6:30 PM. For information, contact Merle Nicholson at *merlenic@tampabay.rr.com,* or William LaMartin at *lamartin@tampabay.rr.com*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Kevan Sheridan moderates the dis cussion.

Helpful Hints Corner

By Jenny Leitzke, Membership,
Tampa PC Users Group
Leitzke4@hotmail.com

Here is another shortcut key that you might have missed that works in MS Word. This short cut will change the font size on any highlighted text in a Word document you are editing.
Ctrl +] = increase font size
Ctrl + [= decrease font size

To clear old entries from your Internet Address Bar, go to TOOLS in the web menu bar, select INTERNET OPTIONS, choose CLEAR HISTORY and this will clear out all previously listed web addresses from your web address bar.

To clear your personal data you have entered into any web forms, go to TOOLS in the web menu bar, choose INTERNET OPTIONS, and click on the CONTENT tab, click on the AUTO COMPLETE button, and, when you select CLEAR FORMS, all the personal data you have saved to forms on the web will be erased. ◆

(Minutes……..Continued from page 5)

ner. Drop down menus at the top allow the user to work with tables, reports, forms and all the other features of a relational database. The forms are quite easily customizable; the data can be sorted by typing information into any field in the form and doing a sort. You can do searches and queries of the forms data. The browse feature allows you to see many records at once. You can use browse and run a query of any field in the database. The program has a script recorder. You can write in query operators such as less than, <, and greater than, >. The queries are very flexible and support standard wildcards. After a query is run, the number of records found is shown at the bottom of the screen. All aspects of the program work with the print function.

When you open a form in design mode, a drag and drop menu is available and holds all of the available fields for the data table for the form you are creating, plus a tool box. You can design the fields with imbedded controls. You can build lists with preset data to maintain control of how the data is entered onto the forms. This is done with field rules. Data can also be posted to an external table.

Tom designed a form for the group's membership and showed us how many of the features of the program are used. It seems to be simple to design a

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

Minutes of the May Meeting

By Bruce Register, Program Chairman, Tampa PC Users Group
bregist3@tampabay.rr.com

President Kevan Sheridan opened the meeting at 6:30 PM, May 8, 2002 AD, at the Art Pepin Hospitality Room with the usual discussion session. William LaMartin told of his problem with Win Me that was solved by searching "Google Groups". His History file was corrupted. He followed the directions found in the Google/Group message to solve the problem. Wade Herman reported a problem with Road Runner and Outlook Express. He had to reset his Road Runner mail server settings.

Program Chairman Bruce Register reported that the FBI presenter had to cancel at the last minute. Steve Singer will present information about the new hardware at our next meeting. Membership Chairperson Jenny Leitzke presented "Walking you through Learning at Gateway." She made a very interesting presentation. This was obvious by the many questions that she fielded very well. Jenny's job involves problem solutions and search. People who purchased a Gateway computer can receive a "free" enrollment KEY which permits a one year access to the Learning Gateway application. Otherwise, one must purchase the KEY.

The Learn at Gateway website, http://www.learnatgateway.com/, is a great place to find all kinds of information. The "Enrollment Key" is $99 unless otherwise provided by Gateway. Gateway does not let you try a demo before buying. She walked through some of her purchased courses for her presentations so that we might see the actual courses rather than just reading them in some promotional brochure. There are home work assignments with each "Learning". You can take as many of the courses as you like in a year for $99 or by otherwise having been given the "Enrollment Key" from Gateway. You may take a test and receive a certificate for each successful course completion. You take practice

Larry@AndersNet.com

A few months back I wrote a review of an email program with a lot of bells and whistles called IncrediMail. While this is an excellent program to spice up your emails, a lot of people do not wish to change email programs. So, if you are using Outlook Express 5 or later, Outlook 98 or later, or Netscape 6.1 or later and have no desire to change, there is a way for you to add a little life to your plain old text messages. It's called Scrippy.

Scrippy is a stationary editor/creator that lets you add graphics and sound in the form of embedded borders, backgrounds and sound files to your emails. And best of all you don't need to know a thing about HTML coding. You can use multiple backgrounds to create a layered effect, your borders can scroll and you can do just about anything you want to your fonts. I had no idea that email was capable of all these effects.

You really don't need to do much of anything to get up and running and creating email stationery in a very short time. There are 16 samples pages included in the program. Just choose any one of them and use it as it is or change it to your delight. Then, once you get the hang of it, open a blank new page and create your own. It's not rocket science. The interface is really simple to use with all kinds of pop-up help items throughout the program. If you forget to do something or do not follow the parameters correctly, most of the time Scrippy lets you know immediately. At any time, while making the changes to the samples or designing your own, you can click on Preview and see your results immediately. If you don't like what you see just undo and start where you left off. When you're done Scrippy automatically saves the file to where you can access it in your email program. Not very difficult and not much of a learning curve at all.

Graphics supported are: JPG, GIF, animated GIF, and PNG formats. Sound files supported are: MID, WAV, AU and AIFF, as well as streaming audio formats.

The creators of Scrippy explain the concept this way: Scrippy stationeries are composed of objects, which you select and customize. The following objects are available:

- Background. Multiple backgrounds can be used, overlapping each other to create layered effects.
- Message. Text message and/or graphics. Full control of fonts and colors.
- Sound. You can also have multiple sounds.
- Scrolling border. You can insert as many of these as you like, at any of the screen edges. They can move in various directions at a variety of speeds.
- Ticker. An animated text message in the status bar at the bottom of the stationery window. Lots of different animation options.
- Positioned objects. You can insert a single copy of an image, or a scrolling repeated copy, using a position based on any of the window edges or the center of the window.
- Containers. Containers are a powerful tool, which can be used to create layers of "stationery within stationery". Containers allow recombination of other Scrippy objects in many different ways.
- Frames. A visible border placed around another object or group of objects.
- Objects, which overlap, can easily be dragged and dropped to change the visual layering sequence.

Oh, and because Scrippy creates HTML coded documents you can also create web pages with it that can

Spam, Pay for Placement and Nimda

By William LaMartin, Editor,
Tampa PC Users Group
lamartin@tampabay.rr.com

Spam We all hate it, and at times there seems little can be done about it. I know people who periodically change their email addresses to cut the flow of it. Sometime within the last 12 months I started keeping a blocked senders list in Outlook Express, along with several "mail rules" that blocked messages containing certain words in the subject line, messages with certain words or phrases in the body of the messages, and messages from certain domains.

I got so desperate at one point that I was blocking all mail from yahoo.com and hotmail.com, since they seemed unable to stop the flow of spam from their servers. Of course, the mail wasn't really blocked; it was simply automatically dumped into my deleted folder, where I would carefully look at the senders to make sure that I wasn't deleting a message that wasn't spam—surprisingly there are actually people with yahoo and hotmail address who are not spammers.

I found myself spending way too much time on adding people to the blocked senders list and updating the "mail rules". After all, I was getting from 40 to 70 such messages per day—and 95% of them were coming in on my NetCom account. The Road Runner account luckily has stayed fairly spam free.

What to do? Earthlink, the company that absorbed NetCom several years back had the answer: Spaminator, their spam blocking program that stops messages from ever leaving their servers if the senders are on Spaminator's Spam list. I enabled it for my account, and the result was amazing. I am now getting, perhaps, three spam messages per day in my NetCom account, and when I go check at Earthlink to see what messages have been blocked—all of the messages are spam, and there are a lot of them. For example, around 11:00 PM I deleted all the blocked messages at Earthlink that had accumulated during the day—30 or so. And this morning there were 38 more messages that had been blocked between 11:30 PM and around 8:30 AM. By the way, if you don't delete the blocked messages, Earthlink will automatically delete them after three days.

Since I am having a bit of trouble filling the newsletter this month, here are the subjects of the 30 deleted messages last evening:

Pay for Placement Have you used a search engine lately? Certainly you have, but did you know that the links appearing at the top of the list were probably "paid links". Yahoo calls them Sponsor Matches and describes them as follow: "*Sponsor Matches are search results that are paid for by businesses or organizations and provided through an alliance with Overture Services (formerly GoTo.com).*" Google calls them Sponsored Links and has two types—those that appear at the top of the returned search results like those of Yahoo and ads that appear in boxes to the right of the results. More on Google's little ad boxes later, for that is the only paid placement that I have actually used.

(Spam.....Continued on page 5)

(Spam…….Continued from page 4)

The situation is the same for all the other search engines, I believe. It is just another manifestation that the Internet is really not free, and when the venture capital runs out someone has to pay. In my opinion, though, it is unfortunate that sponsored ads, I mean links, are appearing right in among the search results. It is sort of like a newspaper running ads as news stories and putting them on the front page at the top.

At Overture (http://www.overture.com), the company that Yahoo mentioned as providing the sponsored matches, potential advertisers actually bid on key words. The person bidding the most, gets the highest listing. What they are bidding is how much they will pay for each click on their ad, I mean sponsored match. The price for the top placement can be anywhere from a few pennies to several dollars. Yes, there are companies willing to pay as much as $5 if you click on their link for life insurance. To verify this, go to http://www.overture.com and put in the search phrase life insurance. Today the top listed "life insurance" link there costs $5.08, and number 40 on the same page costs $.54. Of course, Overture had better have some pretty sophisticated software to detect pranksters from doing multiple clicks on that

(Spam ……..Continued from page 5)
link, for at $5 per click, it will add up. Additionally, I think Overture also has a $20/month fee.

I got into all of this because someone called and wanted to know why his real estate page had disappeared from Google. It had been there for months when you searched for his city and the words real estate. Having followed the pay for placement situation for the past year, I advised that the only sure way of being listed was to pay. And the best option to me seemed to be Google's AdWords program where you say what you are willing to pay for your ad to be displayed when certain keywords are searched. The more you pay above their minimum price for a particular keyword, the better your placement. Most small town names can be had for a nickel, but the phrase "real estate" has a minimum price of $.32 at Google AdWords. But you don't want to use just "real estate" since that would not be specific enough. Instead you use a phrase like "Tampa real estate"

I chose a collection of about six keywords and phrases and started the program. After about a week, 4006 people have viewed pages at Google with the ad, and 71 have clicked on the ad for a click-through rate of 1.7% at a total cost of $12.13 ($.18/click). By the way you can set a limit to how much you will spend in a day. We chose $5, and you can see that we have not come close to using that amount.

But that is just for Google, where, by the way you can still get a commercial site listed for free—there is just no guarantee that it will ever be returned in a search. What about other search engines? Well, Yahoo now charges $299 (double that if it is adult entertainment) just for submitting a commercial site to them—with no guarantee that they will list your site—and no refund if they don't. Also, Yahoo, Lycos, AOL (AOL might be dropping it) and MSN, I think, use the Overture service, so to get a decent placement on them you will need to go to Overture and bid on your keywords and phrases. I just hope life insurance is not one.

Nimda My son is visiting now, and he has been doing a lot of work with his software development over the Internet. I just give him a connection to the router, and everything was working fine. But yesterday when a thunderstorm came through, I said that I wanted to shut everything down and disconnect. I did that, but then he said that he would like to keep working since it didn't seem so bad. So with all my computers disconnected, I connected his computer directly to the cable modem. In less than 10 minutes he noticed strange activity on his machine. He disconnected the connection to Road Runner, but it was too late. He had the Nimda virus.

Here is how he got it. He had a new laptop computer on which he had hurriedly installed all his necessary programs before the trip. It runs Windows 2000 Server. That means that it also has Microsoft Internet Information server (IIS)--and he and not bothered to install the patch that protects IIS from Nimda. With IIS running (he didn't even need it but it runs automatically) when he connected directly to the cable modem without the protection of the router's firewall, within 10 minutes one of the Nimda infected computers on Road Runner's network--and there appear to be plenty of them--had nailed him.

Earlier he had purchased McAfee's antiviral program for 2000 Server off the Internet, but it wouldn't work and he was, in fact, trying to get his money back from them. Norton's version costs $400, so he hadn't bought that. What to do? The regular Norton Antivirus program couldn't be installed on 2000 Server, but I suggested reestablishing the network connections, mapping his C drive as a network drive to one of my computers (the Windows Me one), and letting my Norton AV on that computer scan the mapped drive for viruses. We did that--and it found 48 infected files on his computer, cleaning up all the ones that had originally been his (except Netscape.exe) but failing to clean up the ones that the virus had added--but quarantining them. He then downloaded from Symantec the cleanup up tool for this virus and ran that. So his computer now seems OK.

But after reconnection to the network, my XP computer had a message from Norton saying that it had detected a file with the Nimda virus. And every time you clicked OK to that message another message popped up with the same message but for a different file. This went on for at least 20 files. All the files were in the C:\Documents and Settings\All Users\Documents folder, the only one on the XP com-

From Don Patzsch's Point of View

By Don Patzsch, Tampa PC Users Group
patzsch@helios.acomp.usf.edu

Editorial Note: Don was kind enough to answer my request of the members for material for this newsletter. Don is one of a handful of people who have been in the group longer than I. In recent years, though, his active participation in our Windows oriented group has declined as his interest in non-Windows computing increased. But every-now-and-then he sends us a note on his view of computing. I rarely agree with Don, but that is why I am happy to have this article—a differing point of view is good for everyone.

We have been asked to sit down and write something about what we as individual computer users are doing; the idea is that other user group members may be interested. Articles are needed for a newsletter. Each of us is doing something that we should write up so that others may benefit from taking a look at whatever we are doing!

When I read that, I wondered just how many people are really interested. So I will try to write something sensible and describe what my thoughts have been in the field of computers that might interest others. Perhaps I might start by describing the CD-Rom that came in yesterday's mail.

The title of the CD is "Software Developers Tools". "Improve your Applications Performance on Windows and Linux." "From the people who know processors." (The CD comes from Intel). Do you suppose that Intel is telling us something?

Now let's go back several years. As an individual I bought only IBM computers, and I could not get across the reason I bought them to others. Unless you experience something you can not understand what that thing is all about. You can only guess.

As time went by, I noticed that there was a force acting on the computer industry that was not right. So I began to look around me and to try to find something that would change the computer world. It was not hard to find. I looked at all the operating systems that were not MS Windows. There was Minix, Xenix, Unix, and many others like those. Then came Linux. Linux is not an operating system. Linux is a core idea that can be expanded to become an operating system. Thousands of computer programmers all over the world looked at Linux and recognized the value of this kernel. Programmers from all over the world began to write add-ons. Very soon the additional work done by all those programmers began to bear fruit.

First a basic operating system began to take shape. Maybe we could look at it as thought it were DOS. DOS was written by some people, and then MS bought it. After a time, IBM and MS began to try to emulate the Apple computer. Apple used a mouse which was designed by the Xerox people. Windows is an add-on to DOS that allows the use of a mouse.

When Linux appeared, it was not the only variation of UNIX. The kids at Berkeley wrote FreeBSD. That is another operating system. IBM took Linux and ran with the ball. Apple took FreeBSD and ran with the ball.

If you were to take a computer and run it, with either Linux or FreeBSD, you would not have any trouble using those operating systems because they use "Windows" in just the same way as the Windows you use. I decided to buy a computer using the FreeBSD system so I could see what it is like. I bought the Apple Mac G4, with dual processors, because it won't be long before we have 64 bit and 128 bit programs.

I am writing this to give you a bit of an idea of what it takes to learn how the Apple system works. I assume you are new to this type of computing, as I am. First, I brought the computer up in Mac OS X. OS ten is based on FreeBSD, reworked by Steve Jobs to operate his NEXT computer when he left Apple. FreeBSD is very similar to Linux. When you bring up a Mac in OS X, you see windows that are the same as MS Windows and many of the keys are used in exactly the same way as those on my IBM. The screen opens with a series of icons on the right side, and you click or double click to bring up a word processor or a spreadsheet or whatever. Now, I use a mail program called

(Don Patzsch……..Continued on page 8)

(Don Patzsch……..Continued from page 7)

PINE. The University Network and the Freenet Network have Pine available, and I have been using it for so long I am used to it. To use Pine, I need to telnet to either the USF network or the Freenet. Now in MS Windows, you use telnet directly. But in the Mac, you use the secure version of telnet called ssh. It took me months to learn how to use ssh. I went to the Apple store at the new shopping center near the airport, and I went to various computer user group meetings, but no one seemed interested in using telnet, so I had to read books to find out how it works. A friend from Johns Hopkins came over and showed me how to use "Better Telnet" a program that runs under OS 9, but I wanted to stay with OS X as that is why I bought the Apple Mac. Most programs run just as they do on MS Windows.

Those are the things that went through my mind, and that is what I have been doing. I am sure you are doing more interesting things, and so your articles would be more appropriate than mine. I have three computers on my desk. One is exclusively Mac, one is exclusively Windows, and the last is exclusively Linux. It is very simple to turn on one or the other as they all work with exactly the same functions. The Mac is now sold with OS X on every computer. This should give you an idea of where the industry is going.

Editor: As a follow-up, I asked Don to elaborate of several of his comments. Below are my questions and his answers.

Editor: Why did you once buy only IBM computers but have now switched to Apple?

Let's see—how many years did IBM supply the TPCUG with a beautiful place to hold our meetings? In 1982 I bought an IBM PC because there was no other PC. Since that time IBM has kept me informed of so much information about my computers, I couldn't list all that help. IBM invited me and my wife to the Yacht Club at Disney. The things we were given there are fabulous. There are many other things I could say.

Editor: Why do you use Pine for email?

I prefer the command line for most of my work. I started using Pine many years ago at USF, and it is the mail system on the Freenet. I can do just about anything I want in PINE. Pine was written at the University of Washington, and I went out there to see several places, including the U of W. Pine is a free and open mail program. I have never had a problem with it.

Editor: Why are you so interested in telnet?

I use telnet so I can get to the command line at USF. Also on the Freenet. I can use UNIX programming from there to read much info I can't get any other way. If I were to want to connect to a friend's computer, I can easily run it from a telnet connection. Telnet simply means connect my computer to that one. You can easily use pass through and have several computers around the world at your finger tips at once.

Editor: Why do you dislike Microsoft?

Here is what came today—A story from the press about Microsoft being forced to make changes in Windows XP. They are forced to open up the operating system so that OEM's may put in a different browser or change other things they don't like. MICROSOFT HAD TO BE FORCED BY COURT ACTION TO DO THAT!

Not long ago, Bill Gates and Steve Balmer made a video tape to be presented in court in the suit by the DOJ and some states. Government attorney Boies showed the court the lies that were contained in the tapes. Bill Gates and Steve Balmer would be in jail for contempt of court if they were not able to buy their way out.

Not long ago, we had a Presidential election. One Supreme Court which was mostly Democrats voted for Gore and another Supreme Court, mostly Republicans, voted for Bush.

That is why I believe that money will buy the verdicts and the delays that Microsoft has enjoyed. I

(Don Patzsch……..Continued on page 12)

Looking Back to 1992

From the June 1992 Bits of Blue
by Harvey Bruneau

PRESIDENT'S COLUMN:

Thanks, Jim. For those of you who read the minutes of the May meeting, please believe me when I tell you that I didn't pay Jim any money to write that about me. However, I appreciate the good words from Jim and others about me and our group. Just remember that our group exists solely on the dedication of a small group of volunteers of which I am only one. A sincere attaboy to a board member is one of the few rewards he or she gets for contributing time to our group.

If you missed the May meeting, well you lost. We had two vendor sessions. Randy Johnston of Symantec (you know, those people who bought Norton out) did a bang-up job! The total amount of money collected ($98) for the raffle was the largest I can remember. That speaks a lot for the Symantec products that were donated. Unfortunately, my three bucks didn't win that Norton Desktop for Windows or half of the collected money. Well maybe next month. Our second presentation by John Fought of Datafiex (St. Pete) covered three CAD programs. It was slick to look at the model of a house from the outside and then go inside the house to look out. Of course this was the high end 3D product, but it was neat.

That May meeting was mighty long and I will try not to schedule two vendors at the same time in order that we can all get home at a reasonable time.

The June meeting should be a dandy! Kirk Covert of Microsoft will demo Windows 3.1 and Visual Basic. This is a must see presentation if you are new to the Windows environment or Visual Basic programming language. While I am sure Kirk will field questions, please realize that he is here to demo these programs not to replace the Microsoft support department.

As I mentioned at the last meeting, the management of the building (not IBM) has done away with the security guard to the building. This means that if you are late there is a good chance that you may not get in. Be on time.

Over the last three meetings I have noticed more noise than usual during our meetings. This noise is usually from conversations in the audience. While no one has complained, I feel that I must speak up before this gets out of hand. I personally find it irritating and embarrassing. Please respect the others around you who are trying to listen to the presentation and to the spokesperson providing us with their personal time. If you must carry on a loud lengthy conversation, use the hallway or wait until the break.

Word-processing in Windows on a 14" screen, revisited. Also mentioned at the last meeting, WordPerfect has released an update to WordPerfect for Windows. Of the several new features, there is one that alleviates that eye squinting that I have been whining about for the last several months. It's the new ZOOM feature. This feature allows you to zoom the document in and out to your liking. This means that your 10 point text can look bigger by zooming to 150% or the max of 400%. The latter is a bit much but 150% is easy on the eyeballs. Maybe when I get my new bifocals I can go back to the standard 100%.

Since we are on the subject of word-processing and WordPerfect, we are planning on offering the famous Ed Buzza WordPerfect classes again. At our last board meeting the general feeling was that these classes should be offered the same night and time as the general meeting. The class would last approximately one hour and rejoin the general meeting during its break and after the vendor presentation. If you have questions, concerns or opinions about the class bring them up at the general meeting or leave a message for me or Ed Buzza on the BBS. ◆

Special Interest Groups

Microsoft Access SIG

This SIG meets the first Tuesday of the month at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6:30 PM. For information contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merlenic@tampabay.rr.com.*

Genealogy SIG

To be included on the TPCUG genealogy mailing list, contact Jenny Lind Olin at 960-5723, or *jlolin@tampabay.rr.com.*

Visual Basic for Applications SIG

This SIG meets the third Tuesday of the month, at the Gateway 2000 Store on North Dale Mabry Mabry (just south of Columbus Drive) at 6:30 PM. For information, contact Merle Nicholson at *merlenic@tampabay.rr.com,* or William LaMartin at *lamartin@tampabay.rr.com*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Kevan Sheridan moderates the dis cussion.

(Scrippy…….Continued from page 3)

be viewed by users of Internet Explorer 5 and later, and users of Netscape 6.1 and later.

All of this for $39, but it is free to try at http://www.scrippy.com/. And, there seem to be a lot of other people interested in Scrippy on the Internet. Just do a search and see what you come up with. There are tutorials and stationery everywhere. Try it and you will see how easy it is to make your email recipients say, "How'd they do that?" ◆

(Spam…….Continued from page 6)

puter that I had shared with all users on the network. Note that I reconnected the XP machine to the network at the same time I did the Me computer, and the virus apparently immediately went to work on both of them, but could only get to that one folder on the XP machine. Norton seemed to have taken care of everything, since none of the offending files were still there. I then did a full system scan with Norton that found no infections.

When I began testing my main programs, all worked except Photoshop. Photoshop would load, but when I tried to open a file, nothing happened. I rebooted the computer, but that didn't help, so I reinstalled Photoshop, and everything was OK. I can't figure

(Spam…….Continued on page 12)

(Minutes…….Continued from page 2)

tests also. The program recommends specific areas for further study if you missed those related questions. We watched PowerPoint Tutorial (Learning Gateway). New Horizon and Gateway use essentially the same presentation. Gateway's costs less.

The tutorial acquaints the student with the correct terminology so as to make easier understanding in the tech world. One can also get college credits for courses through Element K Course Books that are available for purchase. A student forum opens for group discussions. In fact, you can make a direct connection to the teacher. One may go to Element K website and preview resource books contents. Element K books are in the Learn at Gateway Resource Center. Continuing Education courses with 10 hours are equal to 1 CEU (Continuing Education Unit). Some CEUs are recognized by the American (something or other, my hearing aid did not pick this up) that issues recognition of accomplishments.

As you progress with each sub unit, you are assessed (tested) for each unit and then assessed for all of the units somewhat like a final exam. One may let others use their sign on to access these courses to a limited degree. (I think that may mean others in the office as long as two are not "signed on" at the same time for the same application.) Jenny presented the subject matter very well. ◆

could continue to list reasons that I do not like Microsoft and its ways, but let's go to zdnet and read about many businesses that have switched to Linux because they want to get away from Microsoft and its overcharges. Star Office is now actively seeking to outdo Microsoft Word. The Federal government has started to use Star Office. I think anyone who reads about what is going on in the computer industry recognizes that the way Microsoft operates and charges is why people are turning away from Microsoft, as I have. ◆

(Spam……..Continued from page 10)

how Photoshop got damaged, since it should not have been accessible to the virus. Perhaps Norton damaged it somehow in its repair efforts.

My son now has the patch for IIS, but still no anti-virus program for the laptop. He can't bring himself to buy Norton AV for 2000 server at $400. By the way, even if you are running behind a router, if you have port 80 open for a computer running IIS you are at risk--unless you have the IIS patch. ◆

Meeting Preview: AgeSpan (http://www.agespan.com/) will give a program on their approach to computing for older individuals. As usual, we will have our Windows/computer discussion for the first half hour of the meeting.

President's Message

By Kevan Sheridan, President, Tampa PC Users Group

The slow, raining days of summer are now in full swing. Or are the days getting cooler as winter starts to cool things off? I look outside and see hot and rainy days and sit inside at my computer and hear about how things are getting colder in Australia (it's winter down under). I have family there and we've been talking through Instant Messaging (IM) quite a bit. I've even been introduced to new family members only through IM. It's the new way to keep in touch with people. I don't seem to be alone either, as many people are discovering the advantages of Right-Now short messages. Even in the workplace an IM can be faster and less disruptive than other methods of contact such as knocking on a door or calling a phone extension. I'd like to hear about your experiences with Instant Messaging too. Please send e-mail to president@tpcug.org if you have any stories or questions.

I'd like to thank you, the group members, for your continued support and meeting attendance. I look forward to seeing you at the next regular meeting! I welcome your comments and suggestions. ◆

August Meeting: To be announced

* * OFFICERS * *
President: Kevan Sheridan (president@tpcug.org) 988-6480
Vice President : Mary Sheridan(mcpease@mindspring.com) 988-6480
Treasurer: Mike Hodges (mike.hodges@cae.com) 962-2114
Secretary: James Weber (jlweber9@mindspring.com) 671-1612
Member at Large: John Witmer (JWITMER@Pepindist.com) 963-3760

APPOINTED (Volunteers)

Editor: William LaMartin (lamartin@tampabay.rr.com) 251-3817
Librarian: Larry Anders (Larry@AndersNet.com) 989-9119
Programs: Bruce Register (bregis@gte.net) 968-8170
Membership: Jenny Leitzke (Leitzke4@hotmail.com) 968-9000

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members. Our mailing address is P. O. Box 3492, Tampa, FL 33601-3492.

However, for business concerning this newsletter, Bits of Blue, please contact the Editor, William LaMartin, at 821 S. Boulevard, Tampa, FL 33606-2904; 813-251-3817; lamartin@tampabay.rr.com.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII, Microsoft Write, Microsoft Word, or Word Perfect file to the editor at 821 South Blvd., Tampa, Florida 33606-2904 or to lamartin@tampabay.rr.com.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

The use of trademarked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

apcug Member of The Association of Personal Computer User Groups

Minutes of the June Meeting

By Wade Herman, Tampa PC Users Group
wherman1@tampabay.rr.com

Steve Singer

Thanks to Steve Singer for an excellent presentation.

He showed us a neat new telephone. If two people have them, then they can talk to each other any where in the world over the Internet using voice over IP. He also showed the latest in Bluetooth technology. He explained the differences between 80211A and 80211B wireless connections. 80211A is better than B with more range and more privacy and is, of course, more expensive.

He showed some motherboards, one with processor for a little over $100. Also the latest in video cards and processors and the differences in LCD displays.

One interesting item was a portable top of the line computer with everything for $2,000. Everything except a battery. Visit his site at http://morevalu.net. ◆

Opera

By Richard Clary, Tampa PC Users Group
jclary@ij.net

Opera is a browser that runs under Windows, Linux, Mac OS, and Solaris. Recently, Opera Release 6 has received favorable reviews from ZDNet. Being a "software junkie", I decided to try it. On Monday afternoon, I installed and registered Opera. Much to my surprise, on Wednesday morning, I realized that Opera was my browser of choice. I am writing this article with only one week of experience with Opera. I still have much to learn.

Opera installation was straightforward. I purchased the Opera CD ($15) and Opera registration codes ($39) from BMT Micro, Inc. Installation and registration took about 15 minutes, and I was on line with Opera. The advantage of registering Opera is that it removes advertising from Opera.

Opera has a tool to import the Favorites from Internet Explorer (IE) into the Opera Bookmarks. This took about one minute, and all of my IE Favorites were available from Opera.

Opera can operate in either of two modes, Windows on Opera, or Windows on Windows. Windows on Opera is more UNIX-like, while in Windows on Windows mode, Opera has the look and feel of Windows. I prefer the Windows on Windows mode because I can use the Windows Task Bar to manage multiple Opera windows.

The email facility in Opera is limited. There is no tool in Opera to import the Outlook Express (OE) Address Book into the Opera Contacts. Still it was not too difficult to copy and paste some of my OE Address Book to the Opera Contacts. All I ever expect to use Opera email for is to email a link to a page I am viewing.

My environment is as follows:

Windows 98 SE
Intel Celeron processor 400 MHz
RAM 128 MB
Modem 56 kb
Internet Junction, dial up connection.

Opera generally outperforms IE. The tests presented here are not sufficient to quantify the relative performance of Opera and IE, but they are representative of my experience. For this test, I browsed three web sites I visit almost every day with Opera and IE. The sites are Bay News 9, CNN Money, and Daily F1.

Bay News 9 was the simplest test. I simply loaded the first page. Opera took 42 sec. while IE took 51 sec. CNN Money was a little more complicated. I first loaded CNN and then navigated to the business page. Opera took 42 sec while IE took 88 sec.

Daily F1 was the most complicated test. I launched Daily F1, chose the English language version and navigated to four other pages from the main menu. Opera took 43 sec. While IE took 63 sec. This supports my intuition that Opera is a faster browser than IE in my environment.

Opera freely admits that their browser does not support all features of all web pages. They do plan to add support for more features. The only anomaly I have experienced with Opera is that it sometimes shifts columnar data to the left. Opera is not a replacement for IE. For example, McAfee Security Update requires IE.

Security is presented differently in Opera than in IE. Opera informs the user when a transmission is unsecured. By comparison, IE notifies you when you enter and leave a secure site. According to articles in the Support section of the Opera web site, Opera is a secure browser, and is suitable for commercial and financial transactions.

The zoom feature in Opera is the best I have ever seen. Opera will zoom in and out either from the keyboard (+, -, and *) or from a pop up menu on the Address Bar. This is great for me. I only have about six or seven percent of normal eyesight. Opera is the

(Opera……Continued on page 5)

XML-What's that Spell?

By Mike Hutchison, Tampa PC Users Group
myankee@ij.net

Extensible Markup Language or XML is a specialized version or variant descendent of Standard Generalized Markup Language (SGML), which is the "parent" of HTML. XML allows people working in this language to define their own elements. Some people refer to it as a meta-language, a language used to describe other languages, or to hear some tell it, vocabularies. HTML does not have this functionality. And on the negative side of the ledger with respect to SGML vis-à-vis modern data exchange is the fact that SGML has been around since the 70's. It can't be expected to work in a networked, interactive online application environment. The intent is for XML to work with HTML (& SGML) rather than trying to completely replace them.

XML tries to define a sub-set of SGML which is meant for web use. One early use of XML was Microsoft's Channel Definition Format. It made the assignments of documents for push delivery over the Internet. Push here refers to technology which sends data to users on a regular schedule. XML has different subtypes of it's own: OSD, CDF, Synchronized Multimedia Integration Language or SMIL, Chemical Markup Language-CML, Mathematical Markup Language-MathML.

XML is a plain text file; like HTML, it can be created in Notepad. The language has few rules and these relate only to syntax. For example, all attribute values in XML must be in quotation marks.

In HTML the use of quotation marks for the value of attributes is more flexible. Another rule is that XML is case-sensitive. It does not ignore "white space". The first element of an XML document must be something like this: <?xml version="1.0"?> .

Even though you can write XML with Notepad, you probably don't want to attempt creating a custom parser for each application that you come up with in the same fashion. It also bears mentioning that Microsoft came out with an XML Notepad (a special version of Notepad with the creation of XML files in mind). When Internet Explorer 5 came out it carried full support for the W3C XML standard and came with a built in parser component for XML. A check of the W3C web site indicates that they are still on the XML 1.0 specification. MSXML 2.0 was Microsoft's primary XML processor, and it shipped with IE 5; MSXML 2.0 was freely available as a stand-alone, redistributable file. The W3C says an XML processor is software that can read XML documents and access their structure and content. A parser, by way of review for the writer's benefit, is a program (often part of the compiler) that gets input of various types, and breaks it up into parts that can be processed by other programming elements. The parser frequently is utilized also to check for proper syntax.

HTML uses markup to describe the structure of a document while XML markup is a description of a document's content. HTML and XML both use tags which are words enclosed with <brackets> and attributes e.g., color="olive". HTML spells out what each of these things means, but XML uses the tags to delimit pieces of data; that is, tell where a specific piece of data begins and ends. XML does not require a DTD (Document Type Definition). It can be transformed easily using Extensible Style Language. One basic concept of XML is that data should be exchanged in the form of documents—that is, some sort of form or document (invoice, purchase order, etc.) that non-techie business folks are familiar with, replete with the data that makes it a useful entity.

XML "data islands", a Microsoft concept, can be added to a HTML document. There are two ways to do this that meet syntax constraints:

The XML data can exist inline, surrounded by XML open and close tags.

```
<XML ID="XMLID">
  <XMLDATA>
    <DATA>TEXT</DATA>
  </XMLDATA>
</XML>
```

The **XML** element can have a **SRC** attribute, the value of which is the URL for an XML data source.

```
<XML
SRC="http://localhost/xmlFile.xml"></X
ML>
```

The **XML** element is present in the HTML Document Object Model. It is in the **all** collection and is seen by the browser as just a regular node. The XML data within the **XML** element can then be accessed by calling the **XMLDocument** property on the **XML** element.

(XML.....Continued on page 5)

(XML……..Continued from page 4)

One last note: XML is not just for use in web applications. It is also intended to be a cross-platform medium between different computer systems.

Here are some links:

Http://www.webdeveloper.com/xml/
Http://www.ucc.ie/xml/#spec
Http://www.w3.org/XML/1999/XML-in-10-points
Http://www.w3.org/XML/

These last two are from the World Wide Web Consortium, the people who write the Bible on XML and HTML and DOM, DTD, etc.

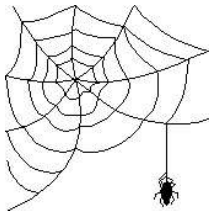
For a practical demo don't forget the XML-Search-Amazon-locally on the TPCUG home page. ◆

Internet Picture of the Month

Steve Fossett's Balloon
From
http://www.spiritoffreedom.com

After, I believe, six attempts, Steve Fossett finally made it around the world. His Bud Light Spirit of Freedom completed the first solo flight around the world.

It was done at an average speed of 70.2 mi/hr and duration of 13 days, 16 hours and 17 minutes. The distance traveled was 19688.3 miles.



(Opera……..Continued from page 3)

most low vision friendly program I have ever used.

Two other cute features of Opera are sounds and references. You can configure Opera to play WAV files when certain events occur. My Opera says "Hi", "Goodbye", and "You have mail". Also, if you

Editor's Comments

By William LaMartin,Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

Spam Last month I mentioned that I had enabled Earthlink's spam filter, Spaminator, for my NetCom email account with them, and that it seemed to be working well. I made one factual error in that I said that blocked email was held on their servers for three days before being deleted. It is actually held for 10 days. Right now I have 372 messages being held, an average of 37/day. I don't even bother to check on them anymore, letting Spaminator take care of that. To delete the 372 messages myself I would have to view 19 pages of 20 messages each, selecting all messages and then deleting them.

Of course, some spam is still getting through on that account. Furthermore I can find no such feature for my Road Runner email account. I am probably getting about 50 spam messages a day with Spaminator stopping 37 of them and the other 13 getting past Spaminator or coming in on the Road Runner account. My own spam filter set up in Outlook Express probably catches half of those.

Google AdWords Also last month I mentioned pay for placement in getting web sites listed on the search engines. I described setting up an AdWords account with Google to have an ad appear in a box on the right-hand side of a Google search results page when certain key words were part of the search. The web site owner only pays when someone clicks on those words. And it seemed to be working fine. But apparently Google made a change in their calculation formula since when I checked the statistics at a later date it showed:

Out of 18,801 impressions (views of a page with their ad on it), there were 321 clicks (a 1.7% click rate) with an average cost/click of $187,484.90 for a total cost of $60,182,653.00.

That was somewhat above my budget limit of $5.00/day. Obviously someone didn't do a check with real data after some change was made to the code that calculates this information.

Overture Since the above only got you guaranteed exposure on Google, I later set up an account with Overture (http://www.overture.com) and bid on several key words and phrases. This gets your links placed in the "sponsored links" sections at the top of searches in Overture, Yahoo, and most other search engines.

Since I did the cheaper "self submission", of the material to Overture, I was supposed to have to wait three to five business days, have someone phone me to verify certain credit and other information, have them review the web site and other things. Really, it sounded a bit overdone—and most of it probably never occurred since I never received the phone call—but everything was set up and running over a weekend.

The Overture advertising has only been running for about one day, and has produced only two clicks. Certainly much less than the Google AdWords produced in their first day. At the rate it is going, we will produce far less clicks than required to reach the $20 minimum charge each month. But one day isn't much of a test. After a month we should know if Overture produces results. Of course, I could bid more for some of our key words, and that would get us a lot better position. Even though we had no problem getting on Overture's first page of results with a bid of $.07 for a certain key word, since Yahoo displays only the top three bidders on such a word, we would have to bid $.40/click to be also listed there—with no guarantee that the formerly number three bidder wouldn't up his bid to, say, $.42 for that word.

Telnet Before the World Wide Web there was Telnet. Member Don Patzsch is probably just about the only person left in the U.S. using Telnet, everyone else has moved on to the web when seeking information. I just did a search on Google for "Telnet" and found a site with a directory of "historic" Telnet sites—universities, libraries, governments, etc. Of a random sampling of six of these, none still functioned.

One Telnet site that still functions, though, is at our Tampa/Hillsborough Public Library. Even though they have moved everything to the web including their

(Comments……Continued on page 7)

(Comments…….Continued from page 6)
card catalog, they still maintain their Telnet site. This site used to be the only way to view their card catalog. Originally you had to dial in with a modem directly to the site. Later you could access it via the Internet.

Once connected to the library site, you were presented with a DOS window where you entered key strokes to navigate and retrieve data. There are no mouse clicks and pretty looking pages, and thus it is not used by many other than Don Patzsch—and me. In fact, it is the only Telnet site I use, and I hope the library doesn't discontinue it because every two years or so I use it for a special project of mine.

Those of you have visited my web site, http://www.lamartin.com, are probably familiar with the link there to my database of the collection of old photos of Tampa taken by the Burgert Brothers between the 1890's and the 1960's. I don't have the actual photos, just a database that you can search and about six web pages, each with upwards of 1,000 photo descriptions with links that can be clicked on to take you to the actual photo at the library site.

I did this originally because the only way of getting a listing of such photos was to use the Telnet link to the card catalog, do your search, then copy the photo link to your clipboard, open your browser, paste the link to your browser and then view the photo. At my site you could simply view the information about the photos, choose the one you were interested in and click on it to go to the photo at the library site. That was then, but now the library has moved to the web, and you can do essentially the same thing at the library's site.

While the search feature at my site is now duplicated by the library's search, they still don't have the listing of all the photos available spread over several web pages that you can browse to see if something strikes your interest. For that reason alone, I decided to update my listing of the photos. When I last updated the information about two years ago, there were approximately 5,000 photos online; now there are over 8,500.

So how does one go about getting card catalog information on 8,500 items. You do it by programming an automated Telnet process. When I did this the first time, I wrote a Visual Basic program that interacted with the Windows Telnet program to request the information on each of the Burgert photos and record the results in the Telnet program's log. I did this in batches of, say, 500 items at a time. Next each batch's log file had to have the text parsed for only the information I wanted: Title, Date, Notes, Link. Then everything had to be checked for errors and put in an Access database. It was a lot of work, even with the automation. By the way, for each of the 8,500 plus items, about five Telnet commands needed to be issued to retrieve its data. But that is what computers are good at.

This time around I decided to write new software in Delphi since Delphi has its own Telnet component, and I could, thus, have better control over the process. So I wrote three programs. The first ran the Telnet sessions and saved the results, minus all the returned text that tells Telnet where to position lines on a screen, into a text file of raw results. Then my second program parsed out the information I wanted from this raw text. Finally, my third program took this parsed data and stored it in a database.

I probably won't have my site updated with the new database until after I get this newsletter out. I think this time I will break down the separate HTML pages into date ranges, like all the photos before 1920, etc. ◆

(Opera…….Continued from page 5)
double click a word on a web page, a pop up menu appears. Two options on this menu are Dictionary and Encyclopedia. If you click on either of these options, Opera takes you to an appropriate page on Information Please.

After one week of experience, I believe Opera is the right browser for me. Opera is faster than IE over a dial up connection. I really like the zoom feature of Opera. And Opera is fun. ◆

Looking Back to 1992

From the June 1992 *Bits of Blue*

Secretary's Report

TAMPA IBM USER'S GROUP
MINUTES OF 6/10/92

Well, we had another good meeting. But, I'm sure I will hear many sighs of relief when I tell you that you won't have to read here about the meeting as much as you normally would. You see, the day after the meeting the index finger of my left hand and a radial saw had an encounter — and my finger lost. No sympathy, please; there has been no great loss — a few hundred $s in emergency room charges, a great deal of inconvenience, and a relatively short report of the last meeting. Don't worry, though, I will be back in usual, verbose form for the next report.

Another difference in this report is that it is not an accurate account of what transpired at the meeting — the program presentations were made at the very beginning of the meeting, followed by news and discussion, instead of the usual opposite sequence. This report is in the normal sequencing.

CLUB NEWS:

Harvey mentioned recent developments with seven! popular programs:

- Procom for Windows is now shipping — and it is getting high marks from industry media.
- Word Perfect for Windows maintenance upgrade is available. Call their 800 number if you are eligible. Cost is S & H - not more than $15, and if you complain of a specific major bug giving you a problem with your current version, you may not have to pay the S & H.
- Harvard Graphics for Windows maintenance upgrade is now available for $15. While I didn't hear specific mention, presumably you can call the HG people for the upgrade.

There was general discussion of upgrading the Bits of Blue BBS with a faster modem. Harvey pointed out that the biggest problem is $$$! We would gladly upgrade to 9600 baud — if someone would donate the modem or the money for same. This is the same problem with other desirable BBS upgrades — like storage space; it is very limited, and we wouldn't have as much as we have were it not for the generosity of our VP, Steve Spears, who donated two 65 MB drives (for which our gratitude has never been publicly expressed — "Steve we really appreciate your gift of the hard drives. It has helped make Bits of Blue more usable for us all, and we appreciate it very much. Thank you!"). If the club is to buy another modem, it is Harvey's view that we should get the 14,400 baud modem. Whichever, the club needs more funds to make such expenditures. Possible sources include: Donations, obtaining more members, selling advertising for the newsletter. What are your thoughts?

A member suggested that we may save money by eliminating our club financed refreshments for break time at the meetings. A vote was taken and the overwhelming majority were in favor of doing away with the refreshments. And so it is! Do not plan on a snack at the next meeting — it won't be there. (See Commentary below.)

Harvey announced that planning was underway for another Word Perfect for DOS class to be given by our Education Director, Ed Buzza. In response to a question raised by our Pres about class frequency and timing, the consensus seemed to be to have the classes every Wednesday evening, except our regular meeting night, from 6-7 PM. Chris, our IBM baby-sitter, indicated that would be OK from IBM's standpoint. Planning for the class will likely be completed at the next board meeting (6/24). More info will follow — watch the BBS.

Harvey announced that the following presentations will be made at the next meeting:

- GeoWorks Pro, to be reviewed by our own Tom Cone. Some say that this program is better than Windows. It is a GUI. I have Geo Works, and it is a nice program. BUT, it is similar to Windows in that it runs only programs tailored for it —

(1992……..Continued on page 9)

(1992…….Continued from page 8)

and there aren't many of those I am aware of — or shell to DOS where multitasking is not available. One big advantage is that it will work on just about any computer — from an XT up. I am looking forward with great anticipation to Tom's review of the Pro version.

- Our SYSOP, Kevan Sheridan, is going to update us on using our BBS and the new features/capabilities that have been added recently. I need this very much — I hear comments at the meetings about BBS features about which I know nothing. I look forward to Kevan's presentation as well. I think our next meeting may well turn out to be one of the best yet. I would suggest that you not miss this one.

PROGRAM PRESENTATIONS

Windows 3.1
Kirk Covert, Regional Sales Rep for Microsoft, was on hand to give a quick review of Windows 3.1. Kirk's review assumed knowledge of Windows 3.0 and he touched on only some of the changes that were made in 3.1. Kirk noted that there are over 1500 changes in 3.1, and he would touch on only a few of them.

Probably the most significant change is that 3.1 is a lot faster (3 - 4 times faster) in all operations than 3.0, including printing. That is a very welcome improvement to all Windows users.

Other significant improvements include:

- Object Linking & Embedding (OLE)
- Alt+Tab program selection
- Scalable outline TrueType fonts (including 13 fonts) and driver that gives WYSIWYG on the screen and high quality print. (Kirk states that TTF saves disk space. Maybe so when compared to fonts for laser printers, or bitmapped fonts, but I do not find that is necessarily true when compared to Adobe Type I or Atech's Fastfonts).
- Has come a long way toward eliminating the infamous UAE'S OF 3.0. You still have unrecoverable application errors, but there is usually some explanation and you no longer have to restart Windows — you are presented with choices: Returning to the application, closing the offending application, or restarting Windows. This gives you the opportunity to perhaps be able to save data in the offending application, and usually avoids the need to close down other applications.
- File Manager has been greatly enhanced and now includes drag & drop capability to copy, move, delete, and print files, and activity programs loaded with any file generated by that application.
- Includes a good tutorial
- Includes quite a few more Icons, as well as a better and easier to use Icon viewer.

Kirk noted that a Technical Resource Kit, which includes some neat programs — such as Smartdrive Monitor, System Monitor and a Graphics Viewer (all popular formats) — was available from Microsoft for $20, including S & H. They looked like nice-to-have programs. If interested, call 1-800-426-9400. Kirk also mentioned that the 32 bit Win NT was on the way without any clue as to timing.

Microsoft Visual Basic:
Kirk continued with his presentation with a brief review of Visual Basic. I am not into programming in any form, so much of what was presented and discussed was beyond me. Here are some impressions I was left with: It is a Windows program and anything written with Visual Basic is compatible with Windows. The program was developed with the user in mind — that is, it is user oriented; Kirk indicated that it was easier than "C." The program includes an Icon maker/editor. Kirk indicated that some knowledge of Basic programming is needed, but not nearly as much as before Visual Basic.

To Kirk and Microsoft, a BIG THANKS for a job well done and for the donation of a copy of Visual Basic.

OVERDUE THANKS:

(1992…….Continued on page 10)

This SIG meets the first Tuesday of the month at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6:30 PM. For information contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merlenic@tampabay.rr.com.*

Genealogy SIG

To be included on the TPCUG genealogy mailing list, contact Jenny Lind Olin at 960-5723, or *jlolin@tampabay.rr.com.*

Visual Basic for Applications SIG

This SIG meets the third Tuesday of the month, at the Gateway 2000 Store on North Dale Mabry Mabry (just south of Columbus Drive) at 6:30 PM. For information, contact Merle Nicholson at *merlenic@tampabay.rr.com,* or William LaMartin at *lamartin@tampabay.rr.com*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Kevan Sheridan moderates the dis cussion.

(1992…….Continued from page 9)

We have several "unsung heroes" among us that work behind the scenes for our benefit. I think it more than appropriate that at least once in a while we acknowledge their contributions for our benefit and give them a bit of thanks. One was appropriately mentioned by one of our members at the meeting:

- Marylee Bruneau, our Newsletter Editor, who has not only given a lot of time and effort to putting out an informative and interesting newsletter, but she has done an outstanding job in doing so. As our member said at the meeting, she produces a very professional product. And, she continues to make it even better. Marylee, THANK YOU. We really appreciate your efforts and a SUPER job!!
- The other is Chris, our IBM baby-sitter. Chris gives us a lot of time and effort, and most of us aren't aware of any of it. We just take his effort and product for granted — we come to the meeting in some very nice facilities, computers projectors and whatever else all set up for use, and things just sort of click along smoothly. Well, it is not all by accident — Chris makes a very big contribution to make it happen that way. We owe IBM a very big thanks you for use of their facilities, and a similar very big thank you to Chris for all he does in the background to make our meetings so enjoyable and productive. THANK YOU CHRIS and IBM!! We really appreciate all you do for our benefit.

AND THE WINNER IS:

Four software prizes were given away to lucky members with raffle tickets. Microsoft donated Visual Basic. The other three programs were games, the donor of which I am not aware. And there was a nice 50-50 prize. THE LUCKY WINNERS ARE:

Microsoft Visual Basic	Ran Weinberg
Miniature Golf	John Walden
Hill Street Blues	Chuck Bowasox
Tie Break	Barry Yocum
50-50 ($51)	Richard Pope

COMMENTARY:

Those members present at this meeting voted to eliminate the club-financed refreshments that have been provided during break time. I usually enjoy a cookie or two, and the lines are always long with people waiting their turn at the goodies. Yet, when it came time to vote whether or not to keep the goodies, the vote was overwhelmingly NO! Why? I voted against the refreshments. My reasons were many fold:

- We make a big mess, goodies often scattered all over the floors. Someone has to clean that up — guess who, the club volunteers and our host, IBM.
- Secondly, the money the club spends on the refreshments could be used to help finance some

much needed equipment.

- Then, too, we have been consuming 30 minutes or more in break time, principally because it takes a long time for everyone to get through the line. I would rather see that time used for productive purposes (the business at hand, that is) and the meeting be a little shorter in duration. I wouldn't want any less coverage at the meetings, but I would like to see them a little shorter. And I think we need a rest room and stretch break, but it needn't be as long as the break we have been having. I know there are some who come directly from work and except for the snacks at the meeting, get nothing to eat until they get home. I hope they can find another source for a tide-me-over. I think the pluses of eliminating the refreshments at the meetings overwhelm the minuses. What do you think? ◆

Editor's comment: How much would he have written without the finger injury?

Bits of Blue

August in Tampa

A Monthly Publication of the Tampa PC Users Group, Inc.

Vol. 15 No. 8 August 2002

Meeting

Protecting your Computer

Wednesday, August 14, 2002
6:30 PM
Art Pepin Hospitality Room
Pepin Distributing Co.
6401 N 54th St
Tampa, Florida

Meeting Preview:

President, Kevan Sheridan

Edgar Duarte will discuss the relationship of your computer to the world…what is in your computer, hardware and software and how it interrelates to the Internet. He will discuss firewalls and how firewalls work and interact with those attempting to get into your system. He will interpret the blocked messages that your firewall reports to you. He will demonstrate zone alarm while connected to the Internet. He will discuss how users around the world come into your computer and use your home or office computer as a staging area for their own manipulative gains.

Edgar is a retired electronics engineer from the federal government. He has an interest in two companies that assist large companies in setting up and maintaining their systems.

As usual, we will have our Windows/computer discussion for the first half hour of the meeting. ◆

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members. Our mailing address is P. O. Box 3492, Tampa, FL 33601-3492.

However, for business concerning this newsletter, Bits of Blue, please contact the Editor, William LaMartin, at 821 S. Boulevard, Tampa, FL 33606-2904; 813-251-3817; lamartin@tampabay.rr.com.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII, Microsoft Write, Microsoft Word, or Word Perfect file to the editor at 821 South Blvd., Tampa, Florida 33606-2904 or to lamartin@tampabay.rr.com.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

The use of trademarked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

apcug Member of The Association of Personal Computer User Groups

Minutes of the July Meeting

Craig German

Following our usual announcements and Windows/ computer question and answer period, Craig German of AgeSpan, http://www.agespan.com/, gave us a presentation on AgeSpan's various programs and services for seniors.

These services include a web site with information geared to seniors, a computer with optional touch-screen monitor and special keyboard with oversized letters, and their own dial-up Internet service provider. The latter, according to Craig, uses the Internet business backbone instead of the usual Internet backbone, the result being fewer hops to get to your Internet destination, hence faster service.

Craig was an enthusiastic and polished speaker, and we thank him for his excellent presentation. ◆

Jasc® After Shot™ Premium Edition

By Larry Anders, Librarian,
Tampa PC Users Group
Larry@AndersNet.com

Well, here I am on vacation at beautiful Indian Rocks Beach, Florida, looking out the window of our condo at an outbreak of red tide… so what better time to take a few minutes from my vacation and tell you about my latest find on the Internet, just free for the download.

Although I am a native Floridian and wouldn't trade our fine state for any other state in the Union, I am not much of a beach-sitting, sun-worshiper. While my wife bakes to a golden-brown medium-rare, I usually bring along my notebook and a couple of programs to test out on the trusty old notebook. I do love to walk along the beach at sunset as the Gulf of Mexico swallows up that big orange ball and click away with my digital camera. A few years back one of the photos actually ended up on the front of our Christmas card. I know that may sound a little strange but if you received one of the cards you'll understand; if not, I took one of the more beautiful sunset shots, and using Jasc's Paint Shop Pro, added a string of colorful beads around the sunset scene, and that became the cover of our Christmas card for that year.

Using that as a segue, just before leaving on vacation this year, I visited http://www.jasc.com to see what, if anything, was new since my last visit and found their latest offering in the view-download-organize-manipulate your digital images world called **After Shot™ Premium Edition**. I figured if it was half as good as Paint Shop Pro has always been, then it would be worth my time to look at it.

System requirements are pretty standard: A Windows-based system using Windows 98 or higher, 64MB of RAM, 60MB of free hard disk space, CDROM drive, etc. Also needed for certain features of the program are QuickTime, Internet Explorer and Adobe Acrobat Reader. They also suggest that your video display be set to True Color (24-bit) so you can view digital images with photographic image quality.

Installation was straightforward as any other Windows-based program except that After Shot "investigates" your system configuration and automatically makes recommendations for installation of additional software, if needed, like the programs mentioned in the previous paragraph.

I suggest the first thing you do is run the After Shot Tour to familiarize yourself with all the features and also check out the tutorials included. When After Shot is started, it opens on the Browse Tab that looks very similar to Windows Explorer with the folders, or directory tree, on the left side and thumbnail views of images on the right. On the left side are four tabs, *Browse, Info, Keywords* and *Search*. From the Browse tab you can create new albums or open existing ones by browsing to the location where the images are stored. While viewing an album you can sort the images in any number of ways, such as name, date, size and type. You can also rename a single image or a batch of images. Double-clicking on any thumbnail opens the image and switches to the Info tab, which gives you image information and camera settings (EXIF data). Although not required, the Info tab allows you to enter image specific titles and descriptions, which can be useful when used by other features of After Shot, like Slide Show and Print and Web Layout tools.

If you take the time to enter information about your images using the Info and Keyword tabs, it sure makes it a lot easier to find what you may be looking for when you click on the Search tab. You can set search criteria such as Image Title, Image Description, Album Title, Album Description, Filename and Album Name.

Jasc divides After Shot into five groups of tools:

Organizational tools – which I discussed above
Acquisition tools – *twain, digital camera* and *card reader support*
Photo Editing tools – *crop, Quick-Fix* (adjust colors, contrast and brightness automatically), *batch*

(After Shot……Continued on page 4)

(After Shot……..Continued from page 3)

process (Quick-Fix: rotate, rename and resize all your pictures with one click of the mouse), *individual image adjustment* (adjust the contrast/brightness, color, hue/saturation, sharpness and equalization of your pictures one at a time) and *quick red-eye removal*.

Sharing tools – *on-line print services* (Shutterfly.com), *print templates* (over 40 easy-to-use print templates, including standard photo sizes like 4x6, 8x10, etc.), *Web* (create web photo albums and you can upload your pages to the Web right from After Shot), *Movies* (instantly turn a series of pictures into a movie that you can save in .MOV format to share with family, friends or business associates. Requires QuickTime to play and view. You can also load, play and add effects to AVI or QuickTime movies.) and *computer screensavers and wallpaper* (use your own digital photos for your computer wallpaper or as a screensaver).

Cool tools – *slide shows* (create slide shows using individually selected photos or entire albums), panoramic views (create panoramas by stitching several photos together), *text* and *sound* (add a soundtrack or captions to your photos, narrate photos, record greetings or write your own captions with After Shot's annotation features).

I've only touched the surface of the ability of After Shot, because **after all, I am on vacation!** But it didn't take long to realize this program is a keeper. Jasc has produced outstanding software in the past and continues to do so with **After Shot™ Premium Edition**. You can download a complete uncrippled trial-version that is good for 30 days from the Jasc site, which should be more than enough time for you to put it through its paces. To keep using the downloaded version after the trial period it will cost you $45, or you can get it in a box for $49. If you already have a collection of digital images, or have a digital camera and are looking for an easy way to get the photos off the camera and into an album to organize, edit and share, then this program is for you. Try it. I think you'll like it. Thanks Jasc, for another fine program! ◆

Death of a Hard Drive

By William LaMartin, Editor,
Tampa PC Users Group
lamartin@tampabay.rr.com

Of all the computers I have owned, I have never had a hard drive go bad on one until a few days back. Fortunately, it was on a computer that I really don't use for much anymore.

The Story I was looking for the most recent version of a Visual Basic program I had written two to three years ago. I had an installed version of the program that said it was version 1.3.3, but version 1.3.2 was the highest version I could find in my VB projects. All of these older VB projects had been created on a Pentium 166 computer bought around 1996, I think. That computer had been retired to a back room last year when I added a Gateway 1.8 GHz Pentium 4 as my main computer to a Compaq 333 and an IBM ThinkPad used as secondary machines.

At that time, I had, I thought, copied all data files from the old Gateway 166 and the Compaq to the new Gateway. So I didn't really need the old Gateway 166. But it did have installed a collection of older programs that I chose not to transfer to the new Gateway or the Compaq. Programs like WinFaxPro, Corel Draw, Corel Photo-Paint, Micrografx Graphics Suite, Delrina PerForm, Visual Basic 4 (an older 16 bit version). And it did have my first CD Burner and my first scanner—an HP IIcx (original price, $1,000!). So the old computer could have its uses: scanning legal sized documents, which the newer flat bed scanner ($400) could not do, or using Corel Draw to export Draw documents as Adobe Illustrator documents. The same for exporting Corel Photo-Paint files as Tiff's or some other graphic format.

Well, I now needed to check the old computer to see if I could find the VB project. So I stretched network cable to it and turned it on. During the boot it produced a message to the effect that there was a problem with some file names or something on one of the drives. So I rebooted, thinking it was just a one time problem. The next time I was informed that Scandisk, which wanted to run because of an improper shut-

(Death.....Continued on page 5)

(Death…….Continued from page 4)

down, could not run since it could not read some data on drive F. Well, I just opted out of that and moved on and finally got the computer booted to the desktop. But I could tell that things were not running properly. The computer's reactions were real slow. So I ran Scandisk again on the F drive with similar results.

Time for SpinRite. Recall that SpinRite is supposedly like Scandisk on steroids. I booted from the SpinRite floppy and ran the program to check the F drive. It told me that it found four bad clusters and then proceeded to do its thing. Unfortunately, its thing didn't get very far, and it said that it couldn't proceed. So much for SpinRite.

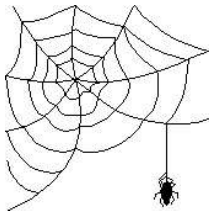
Now drive F is actually on the secondary hard drive in that computer. The main hard drive is partitioned as drives C & E; the secondary drive as drives D, F & G. Logical drives D & G seemed OK, and, of course, the operating system was on the other hard drive entirely. So I still had a computer, but a lot of the programs were installed on drive F.

The more I tried Scandisk on drive F, the worse things got. When I started, I think (unfortunately, I didn't take notes) I could access parts of F with Win-

(Death…….Continued on page 10)

Internet Picture of the Month

AOL's Decline



From

http://online.wsj.com

As a reminder of the Internet bubble collapse, we have the stock price of AOL over the past 24 months. AOL now consists of the former AOL Internet service and TimeWarner, which were merged January 11, 2001.

At the time, Time Warner executives were ecstatic. Ted Turner compared the deal to the joy he experienced when he lost his virginity. I bet he now wishes he had his AOL virginity back.

Editor's Comments

By William LaMartin, Editor,
Tampa PC Users Group
lamartin@tampabay.rr.com

Is the Internet losing its grip? Last month I mentioned I had checked an account with Google for their AdWords advertising campaign and it showed I owed $60,182,653.00—a bit above my $5/day limit. When informed, they responded that it was just a technical error and would be corrected.

This month I have experienced problems with online orders from Gateway and Amazon—again technical problems.

The **Gateway** problem was simply that an order I placed for a replacement keyboard for my new computer (spacebar not working properly) apparently never got placed. After waiting a week, I called them and got a person within one minute. Unfortunately, it took that person and two other people almost an hour to get the keyboard on its way again. My impression is that the people I have dealt with at Gateway over the phone in the past were considerably more efficient than this last group. But my email tells me that a new keyboard is on the way. However, email is not always a true indicator of your order status as my Amazon story indicates.

Amazon.com gives our group a referral few of 15% for books ordered through the link at our site. But on software or electronic items that can have a high price, the fee tops out at $10. Anyway, if I want something that Amazon has and their price is as good as any other reputable (not all online merchants have a good record) seller, then I order from Amazon, except that I purchase most non-technical books from a local bookstore.

I had been looking to upgrade Microsoft Visual Studio to Visual Studio .Net—a $549 item. When I was about ready to buy, I noted that Amazon was selling it for $465, as good a price as I had seen, so it was time to order. And the user group would get $10. Additionally, Microsoft was offering a $300 mail-in rebate for orders placed before September. So the net price was pretty good (I paid $400 with no rebate for the upgrade to Borland's Delphi). Further, on such a large order I was to get free shipping if I didn't mind a few extra days for delivery. That is where I made my mistake.

After placing the order, I would check its status at Amazon every few days. Nothing happened for the first few days, then a message that the order was being prepared for shipping and could not be changed appeared. That stayed there for five days until I lost patience and sent an email to Amazon—and to my surprise received a very quick response that I should ignore what the web site said. The order had shipped. Two days later I got an email message from Amazon saying that my order was delayed and would not ship for awhile. I promptly copied that and sent it with a reply to the first message I had received. A quick response to that said that, like the web site, there were other parts of Amazon that were confused and that my order had indeed been shipped and I should receive it within six days. One hour later the order was delivered by UPS. The next day I got an email from Amazon saying that my order had been shipped.

Does it sound like the left hand does not know what the right hand is doing at Amazon? Two other times in the last four months I have tried to order items from Amazon that the web site said were supposed to normally ship within 24 hours, but which were, in fact, very much out of stock. One was a programming book, *Windows Script Host Programmer's Reference,* and the other was a digital camera. I had to cancel both orders, since right after ordering, I found out that the item would be delayed a couple of extra days, then a week, then not available until the middle of the next month. That was OK for the book, but not the camera. I finally had to give up on the book too, though, because it apparently really is temporarily out of print. I think Amazon had better get their database people on the ball—or hire a few back that they may have fired in a cost cutting move.

Success Online Now to how the Internet can really help you. For years I have done a little electronic/electrical work where I need a small butane torch and 3/32 inch, white, heat shrink tubing. For years I had

(Comments……Continued on page 7)

(Comments……..Continued from page 6)
bought the compressed butane cylinders from RadioShack and the heat shrink tubing from a local electronics store, which closed, then from a local music store, which is now also closed. RadioShack no longer carries the compressed butane cylinders—because of lawsuits, it was suggested—and another local music store said there was no longer much interest by musicians in heat shrink tubing. So, as I have done so much lately, I turned to Google.

An Internet search produced not only the cylinders, but also the site of the manufacturer of them and the torch they went with. Apparently the lawyers have not yet put them out of business. I also found several electronic supply sites offering the size and color of heat shrink tubing I needed. I placed my online orders and had the items within three and five days, respectively.

Visual Studio Dot Net Professional Earlier I mentioned getting VS .net. (See the small dot. That is the way it should be written.) Since Dot Net has been in the news a good bit lately, perhaps a few comments are in order. My first comment is that it is going to take me a year to figure out this new programming environment that combines C++ .net , C# .net Visual Basic .net (and as a free download J# .net) into one development package that installs three GB of stuff on your hard drive. You need Windows NT 4, 2000 or XP Professional as an operating system on the system where you do the installation.

It is described as a platform for building XML Web services and applications. I have been going through the walkthroughs to learn how to do such things using VB .Net as a language. And I can tell you this is not your father's Visual Basic. But as I have more time to devote to it, I am sure it will begin to be easier.

By the way, to run a Windows program created with it requires that the client computer have the .net framework installed. That is a mere 20 + MB download from Microsoft. Perhaps it is already included in XP. So you can see that this will not immediately replace the regular Visual Basic as a programming tool. ◆

Technology Notes

By Don Patzsch, Tampa PC Users Group
patzsch@helios.acomp.usf.edu

On July 11, 2002 Audio Visual Innovations University 2002 was held at the Saddlebrook Resort in Wesley Chapel, north of Tampa. This is an elegant Technology Expo. Free gourmet breakfast and lunch.

I attended the Emerging Technologies presentation in the Royal Palm West. The presenter had a radio microphone and a very good projector that was connected only to a 110 volt a.c. outlet.

In the projector is a server. I think it was running Linux. The projector sends the presenter an email to show the remaining lamp life and other things. You may change the input to 16 or 32 bps at the podium via radio. The program is transmitted to the projector via radio. No need to go to the projector to check any connections or adjust any controls.

We were told about the newest RS-232 white boards and the 132 bit security that changes encryption data every few seconds. OTC wireless makes the radio equipment for the projector that was in use. Projector Pilot is the name of a setup to add radio to a projector that is older and has none of these functions.

Global Streams' On Q software sends a presentation anywhere. Large corporations are now using IP telephony over the network. This saves long distance via phone lines. Gateway Products builds IP telephony gear.

I picked up perhaps 60 various pieces of literature on the latest and greatest white boards, projectors (I had no idea there were so many manufacturers of projectors now), wireless touch panels, multimedia processors, digital video processors, wireless videoconferencing document stands, etc. It will take weeks of examination of these brochures before I will be familiar with all the new equipment available. Perhaps you will want to attend the show next year. ◆

Looking Back to 1992

From the August 1992 *Bits of Blue*

Secretary's Report

TAMPA IBM USER'S GROUP

MINUTES OF 7/8/92

This meeting proved that we can improvise when we do not have a scheduled vendor presentation. We did it all in-house this time, and it was a very good, interesting and worthwhile meeting - in very large measure due to the effort and talents of Tom Cone, who gave an excellent rundown on GeoWorks Pro, and our SYSOP, Kevan Sheridan, who gave a rundown on the FIDO Net of which our Bits of Blue BBS is now a part. And, there were a large number of members and guests on hand to take advantage of the opportunity. If you weren't there, you missed another good one. If you are not a "regular" at the meetings, a bit of advice -- you really should be, because every meeting is interesting and packed with useful info.

CLUB NEWS:

Harvey opened the meeting noting the "new look" of the newsletter and soliciting views on same. The response was an approving round of applause. Good work, Mary Lee (and helper Harvey).

Harvey also noted that newsletter volume was at a breakpoint - 200 copies for mail distribution. That is the breakpoint for non-profit mail status (which takes time to arrange) and that the logistics of handling the increasing volume is becoming something of a burden for him and the editor to handle by themselves - in addition to their other club obligations. Be prepared for some changes in the not-too-distant future and to make yourself available to help if you can.

Harvey pointed out that non-current addresses cost the club $8, and deny the affected party the newsletter. Please keep your address on record with the club current. When your address changes, send a change of address to the address shown on the front of this newsletter -- PLEASE!

Our Prez summarized a decision taken at the last meeting to end club-financed refreshments at our regular meetings to make funds available for club needs. Later in the meeting we returned to this subject with a different twist. The funds for the refreshments came from 50% of the proceeds of the sale of "raffle" tickets at our meetings. The other 50% of the proceeds have been given away as one of the raffle prizes. The idea of also retaining this 50% to finance club needs (e.g., a new modem, etc.) was offered as a proposal. Discussion and a vote on this were deferred due to the late hour, but will likely be presented again at the next meeting.

Harvey announced that our Education Director, Ed Buzza, would begin a 4-class series on Word Perfect 5.1 for DOS at 5:45 PM -- 45 minutes before our regular meeting on Sept. 9.

The 2nd and subsequent classes will be held at the same time on our regular meeting nights for Oct., Nov. & Dec.

Each class will be 45 minutes long and will dismiss at 6:30 to rejoin the regular meeting in time for any program reviews that may be scheduled.

Four 45 minute classes is not, of course, enough time to cover a sophisticated program like Word Perfect in great depth. But I caution you to not let this be a deterrence to your taking advantage of this opportunity. ED IS GOOD and will cover a lot of ground in a short time - plus, it will be a good opportunity to ask questions.

PROGRAM PRESENTATIONS:

GeoWorks Pro

Our own Tom Cone is an attorney and uses GeoWorks Pro as his "desktop" and he finds it meets his needs very well. Tom decided a rundown of the program at one of our meetings might prove beneficial to others. This meeting was the time - and he gave an excellent rundown of the program, including the following:

It has an environment much like MS Windows, with many of the same kinds of features as Windows. (I believe it is easier to use than Windows.)

One big advantage is that the program will work on an XT. It requires a minimum of 512K RAM (likes 640K), DOS 2.1 or higher, and needs about 7 MB of hard disk space. It will work with just about any monitor, including monochrome and CGA (which gives B&W picture).

Another good benefit is that some users report laser quality print from a 9 dot matrix printer. (I have a 24-pin DM and I do get very good quality out of GeoWorks 1.2, but it is no better than I get from Windows 3.1, Adobe, Powerpak, or Bitstream Facelift, all of which are very good quality.)

The program provides three levels of use: Beginner, Intermediate, and Advanced:

The BEGINNER level is limited to the desktop features: An excellent planner/scheduler, address book, calculator, note pad/text editor, and a solitaire game and a banner maker.

The INTERMEDIATE level provides the forgoing, plus GeoWrite word processor, GeoDraw drawing program, a scrapbook, and immediate access to DOS at all times. Applications are available thru icons for all documents stored on disk. This level of GeoWorks Pro is locked into a document sub-directory of Geos where documents are stored. Each document is represented by an icon on the screen. Double clicking any document icon will load the application that generated the document, with that document loaded into the application. This level makes available a "waste basket" into which you can move files, individual and up to and including entire directories -- a convenient feature of file maintenance. Another nice feature is capability to store additional info about your individual files, including up

(1992……..Continued on page 9)

(1992…….Continued from page 8)
to 200+ characters of notes (similar to high end word processors). It also provides the capability to group/ungroup files/objects for manipulation, a formatting capability, and file management.

The ADVANCED level provides all of the above. However, instead of being locked into a document directory, a desktop is used, with all applications represented by icons. The desktop is called Geo Manager and is similar in nature to Windows managers. Applications, other than those mentioned above, which appear on the desktop include:

Geo Com; a nice, flexible communications program; and a realities kind of address book with links to Geo Com and the Planner.

GeoWorks Pro can be bundled with Quattro Pro SE, a scaled down, but still powerful version of Quattro Pro. Quattro Pro SE is not a GeoWorks application, but GeoWorks Pro has been designed to allow importing from Quattro Pro SE spreadsheets whatever info you may require.

GeoWrite is somewhat more powerful than WinWrite in that GeoWrite allows use of columns - up to 4. GeoWrite accepts files only in ASCII or GeoWrite. GeoWrite will import a wide variety of graphics, but it does not wrap text around graphics - you can have no text that is not a part of the graphic on the same lines as the graphic.

Other nice features of Geo Works Pro include: A special viewer that allows looking at prospective cut/paste imports into GeoWorks applications; GeoWorks Pro allows shutting down with applications running and files loaded into those applications; it will be returned to that same configuration at next start-up. Another nice feature is the cost; some at the meeting reported purchasing the program for as little as $59. That is cheap. Thanks, Tom, for a super presentation. I have GeoWorks 1.2 and like the program very well, and GeoWorks Pro is a good improvement over that. The biggest problem I have is that, like Windows, it does not have powerful enough built-in programs -- word processors, DTPs, etc. - to meet my needs. Unlike Windows, however, there are no major applications on the market written for GeoWorks Pro. Hence, you are limited to the internal features of GeoWorks Pro and shelling out to DOS to use other applications.

FIDO Net

Kevan Sheridan, our Bits of Blue BBS SYSOP, gave an excellent rundown of the FIDO Net system that our BBS recently joined. A layman's definition of FIDO Net is "a worldwide message network" that allows the exchange of messages between any subscribing BBS anywhere in the world. At present, there are some 17,000 nodes on the FIDO Net. It is a real bargain for us - costing only $3.50 per month for the 10 ECHOs we have subscribed for:

Desqview	Shareware
Novell	QModem
Windows	ZModem
Virus	OS/2
WordPerfect	Disney

Each ECHO on our BBS is limited to the 500 most recent messages. Thus, there are some 5,000 FIDO Net messages on our BBS at all times. That is a LOT of reading. Hence, you are asked to select Only those conferences (ECHOs) you are most interested in and download for subsequent leisure reading, rather than tie up the BBS reading the messages. It should be noted that the Net is designed for the exchange of messages between BBSs and not messages among members of the same BBS; Bits of Blue members sending messages to other BOB members should use the main conference message feature.

For turbo log-on to the BBS, type: (first name) (space) (last name) (space) (password) (space) (!). That will get you to the main menu where you then select Join Conferences. You may then select any conference you desire, with the FIDO Net conferences listed as Public Conferences. M gets you to the QWK mail door. The first time, you must select the compression system you will use (e.g., ZIP) and the conferences you are interested in downloading; these can be changed later if desired. The BBS will keep track of the conferences you select and the messages you download so that the next time you download, only those messages added since your last download of that conference will be downloaded.

You may read the messages on the BBS, but that is not practical and really limits the utility of the BBS for all members. You are asked to download those FIDO Net conferences you are interested in -- it takes a lot less time to download than to read, and you can then read at your leisure. But, you will need an off-line mail reader. The BBS has at least two available:

OLX-TD.EXE for use with DOS, and WINQ200.ZIP for use with Windows. (I believe both have essentially the same features, but I will mention only OLX, which Kevan described.)

When you first crank up OLX (Off-Line Express), you must configure the program to your computer, identifying such as your upload directory, download directory, etc. It is suggested that you set the FIDO Tagline to "Yes". OLX will then allow you to read all messages or selectively read, to print all or selectively print, and/or to save all or individual messages. It is reported to be a nice and easy-to-use program and should meet all your needs in dealing with FIDO Net downloads.

Kevan, you did a super job. I haven't used this new feature yet, but I believe I can do so with confidence after having the benefit of your review of the system. Thanks much, from all of us.

AND THE WINNER IS :

The following had the good fortune of winning some very nice prizes:

(1992…….Continued on page 10)

Special Interest Groups

Microsoft Access SIG

This SIG meets the first Tuesday of the month at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6:30 PM. For information contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merlenic@tampabay.rr.com.*

Genealogy SIG

To be included on the TPCUG genealogy mailing list, contact Jenny Lind Olin at 960-5723, or *jlolin@tampabay.rr.com.*

Visual Basic for Applications SIG

This SIG meets the third Tuesday of the month, at the Gateway 2000 Store on North Dale Mabry Mabry (just south of Columbus Drive) at 6:30 PM. For information, contact Merle Nicholson at *merlenic@tampabay.rr.com,* or William LaMartin at *lamartin@tampabay.rr.com*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Kevan Sheridan moderates the dis cussion.

How To Backup Your PC	Bill White & Roger Waters

COMMENTARY:

I recently ordered 0S2/2.0 from a Massachusetts mail order firm, Corporate Software. I received the program after some justifiable delay, due mostly to the need to send in proof of ownership for upgrade price purposes. I had anxiously awaited marketing of 0S2/2.0 after having seen a couple of demos of the program and reading several articles describing the program.

After receiving the program, I used a good bit of scarce "spare time" to read the documentation. I was interested in all of the documentation, especially loading and start-up, with a particular interest in compatibility. I learned much, including that compatibility info was contained in files on the disks -- not much help until I loaded the program. I learned, among other things, that the program included Windows 3.0 and not 3.1. Since 3.1 is a great improvement over 3.0, I wanted to know if 0S2 was compatible with Win 3.1. I also had some other technical questions.

So, I called Tech Support at IBM. I learned that 0S2 was not compatible with Win 3.1. During the course of the conversation, I mentioned disk compression programs. At that point I was also informed that 0S2 was not compatible with any disk compression programs on the market (Stacker, SuperStor, DoubleDisk) and would not recognize the compressed disks. These factors made 0S2/2.0 unsuitable for me.

At that point, I looked at the return documentation from Corporate Software. Among other things, it said it would accept return of only unopened or damaged products. That left me out. I should have read the company's documentation before I opened, you say! It wouldn't have made any difference. I had no reason to believe that I would not want the software -- I had no indication on the surface that the program was not compatible with my setup (to the contrary, compatibility data is imbedded in the program), or contained features I would not want (e.g., Windows 3.0).

So, what are the options: (1) Send in to the producer of any software you have an interest in your complete setup to ascertain compatibility; (2) Buy the software and be stuck with any that you cannot use; (3) Don't buy software from a source that will not permit legitimate returns, including incompatible software. The latter is now my practice, along with complaints to the companies involved in this exercise. I would suggest that all software purchasers give similar thought regarding their purchases. WHAT DO YOU THINK? ◆

(Death…….Continued from page 5)

dows Explorer. Now F was off limits and would hang the computer when you tried to access it.

I talked the problem over with member Merle Nicholson, and the only solution was to first try and simply reformat F using PartitionMagic. However, that couldn't be done either. So the final recourse was to use PartitionMagic to delete F. I did that, and it gave me back smooth operation of the computer—I suppose it was no longer spending time trying to communicate with F.

Before deleting F, I had tried to uninstall the programs installed there, but that was a no go. So after deleting it I tried again. A few allowed me to do this;

others said that they couldn't find their files, but they would remove themselves from the startup menu; and the ones that had used InstallShield as an installation program wouldn't do anything.

I suspect that the rest of the second hard drive will eventually exhibit the same problems. But the original drive is fine, and I still have the old computer—and, by the way, I found that VB project on drive C.

I wonder if letting a computer sit unused for a long time can cause such hard drive problems. I hadn't put power to that computer in several months. I had another computer that I let sit for several months, and then on trying to boot it found that the video card had gone bad. Another older computer that had sat for about six months with no use wouldn't boot properly since it had lost its CMOS data for the hard drive due to a failed CMOS battery.

Anyway, back up your data, because you never know when you are going to need that backup.◆

Meeting Preview:

The program this month will be Instant Messaging and Trillian software–Communicate with Flexibility and Style–presented by Kevan Sheridan

Trillian is everything you need for instant messaging. Connect to ICQ®, AOL Instant Messenger(SM), MSN Messenger, Yahoo! Messenger and IRC in a single, sleek and slim interface. Come see how you can use direct, real time e-mail. Trillian is available at http://www.trillian.cc or http://www.ceruleanstudios.com

As usual, we will have our Windows/computer discussion for the first half hour of the meeting. ◆

August presenter Edgar Duarte Penaloza

October Meeting Topic: To be announced

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members. Our mailing address is P. O. Box 3492, Tampa, FL 33601-3492.

However, for business concerning this newsletter, Bits of Blue, please contact the Editor, William LaMartin, at 821 S. Boulevard, Tampa, FL 33606-2904; 813-251-3817; lamartin@tampabay.rr.com.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII, Microsoft Write, Microsoft Word, or Word Perfect file to the editor at 821 South Blvd., Tampa, Florida 33606-2904 or to lamartin@tampabay.rr.com.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

The use of trademarked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

apcug Member of The Association of Personal Computer User Groups

Minutes of the August Meeting

By Mike Hodges, Secretary, Tampa PC Users Group
mphs@aol.com

Bruce Register, our program chairman, introduced our speaker, Edgar Duarte Penaloza. Bruce, a Real Estate Appraisal Instructor, had discovered Edgar as a student in one of his Real Estate Appraisal courses. When Bruce discovered that his home PC had been compromised by a mischievous hacker, Bruce engaged Edgar to resolve the problem. Without Bruce's permission or knowledge, Bruce's home PC was being used as a remote server. Having been most impressed by Edgar's knowledge and rapid solution to his home PC security problems, Bruce requested Edgar to come and speak to all of our members.

The presentation again made us realize the value of our membership to keep each of us not only very well informed but also alert to the mischief that hackers can wrought on the unsuspecting PC user. Edgar's presentation was dynamic and thought provoking, and our questions were numerous. Edgar, a Tampa resident, is a principal of a local computer network solutions company, called Data Communications and Computers Corporation. Edgar comes from Colombia, and had for eighteen years previously been employed by the U. S. Postal Service as an electronics engineer.

Before commencing his presentation of Zone Alarm, a firewall security program, Edgar connected to his AOL account from his HP laptop, utilizing a 56K modem and the Internet Explorer browser. Edgar had found the Zone Alarm software when he needed to protect a real time satellite data-link to an expensive oil field control system located in a remote mountainous region of Colombia. Edgar's research for a software protection system led him to a technical seminar being held in Arlington, Texas in 1999. There, Edgar met engineers from Zone Alarm, a small California-based company. Edgar presented a power-point presentation he specifically generated for our meeting.

(Minutes……Continued on page 7)

Hard Drive Replacement

By Bob LaFave, Tampa PC Users Group
boblala@ij.net

A few months ago I started my computer and received the message, "Boot from ATAPI CD-ROM: Disk boot failure, insert system disk and press enter." I went and quickly hit Alt-Ctrl-Del to reboot and see what had happened. Luckily the next boot went without problems, but I would receive the same message from time to time on startup, and I started to debug the drive. I ran the Maxtor utility " Power Max" and received an error code: N80S20, with a reference to "Smart Parameter Failure" and instructions to "Please call Maxtor service and support ...", along with other instructions. I called the toll free number and easily got a service representative. After reading the error codes to them, I was issued a RMA and told I would have a replacement shipped within 3-5 days. This took less than 5 minutes; my only concern was that they could not tell me what was going ***BAD*** with the hard drive or how long it would last.

Boy, was I glad I could still get the computer going by just rebooting. I never had to do Alt-Ctrl-Del more than 3 times, but I could still boot, and I hoped to not lose the defective hard drive until I received the replacement. I had a complete image of the drive on CD's made with Veriatas Simple Backup within 2 months' time and also had Power Quest Drive Image 3, so I was not too concerned.

I received the new hard drive seven days after calling and proceeded to transfer the complete hard drive to the new one. I first tried Drive Image 3 and for some reason never got very far. After starting the program and verifying the drives and determining what needed to get transferred, I would get an error message about " Not Enough Memory" before it would start the transfer, and after 3 tries I gave up on Drive Copy. I have 512 MB of ram and didn't want to bother with finding out why it didn't work, ***yet***. I still had a complete "Restore" using the CD's that I had made using Veritas Simple Backup. I proceeded to doing the complete restore, and, following instructions, I fed my CD's in and finally finished and went to restart as instructed. This was simple to do, as easy as using, say, HP's restore procedure that comes with their computers. I had restored several HP's for people using their restore CD's, and, except that I had many more, 16 in total, the Veritas process was as easy as HP's. I had no problem restarting and went about seeing what I actually had.

After looking at my Desktop and directory structure, I was fairly certain that I had a good Restore and turned off the computer and went to bed. On startup, I received an error about finding Registry problems and went ahead and ran Scanreg from my WinME startup diskette. I restarted and got all the way to the Desktop and then noticed that it appeared different. It looked as if several icons were missing, and, after looking at my directory structure, it appeared I was missing programs. I restarted hoping it would get better. ***It didn't!*** Again, I got the Registry error message and, after using Scanreg from the Startup diskette again, I got to the Desktop. This wasn't promising, as the Desktop showed differently yet again. I have fought Microsoft before so **……** Let me see plans A and B flopped so here goes plan C.

Maxtor includes a utility with its hard drives called Max Blast Plus II, and it not only will check for correct installation and doing format for Fat32, it also has the ability to copy from one drive to another. I had asked the Maxtor representative about this feature when I had originally called and he stated if I had another program such as Drive Copy, I should use it first, noting the Maxtor utility was very basic and not that good. Guess what?

Running the Maxtor copy program took almost the same amount of time as the Restore I had done, was actually easy to follow, and I was able to get to my Desktop without any error messages. COOL. This was looking promising. Nothing appeared to be changed on either the Desktop or the directory structure so I started to check each installed program by starting it. I found two programs that had problems and would not start so I uninstalled each and then reinstalled. It worked and I'm back to where I was. It took about 8 hours total over 3 days to get there, and, again, it was a learning experience. I now have a new 3-year warranty on a new hard drive and "I gained space". The old drive was 60 Gig and 5400-RPM but no longer available, so I got an 80 Gig 7200-RPM hard drive as a replacement. ◆

Norton Clean Sweep 2002

By Merrill Friend, Tampa PC Users Group
mfriendtampa@worldnet.att.net

Recently I began getting messages on my old Dell P166s that I was running out of disk space, so I deleted some programs I no longer needed and got rid of an accumulation of cookies that were of no continuing value and was surprised that very little disk space was actually released. I then deleted the internet cache files but still my hard drive was nearly full.

Using Windows Explorer I reviewed the programs listed there and found some files from programs I had removed using the Add/Remove programs feature of Windows 98se. Apparently these remaining files were not automatically removable. I wanted to remove them to free up hard disk space but I didn't know how to do it safely. I had heard about Norton's Clean Sweep software and decided to see what it could do for me. It turns out the program was selling for $29 at Comp USA with a $25 mail in rebate on items sold through the date of my purchase so I certainly wasn't risking a lot of money by giving it a try. It was my lucky day.

The software box said the program would work with Windows XP, Windows 2000, Windows NT and Windows 98 through Windows me. In my case it required 18MB of hard disk space and I had enough space available for my installation. (The amount of hard disk space and memory needed did vary based on which of the above operating systems was in use.)

The outside of the box touts the product with such phrases as "Frees valuable disk space", "Removes unwanted programs safely and easily", "Gives your computer a one-click cleanup", and "Cleans out internet clutter".

Installation was simple and required a restart of the computer to begin to function. Two new icons appeared on the desktop. One was for the Clean Sweep program and the other was for Fast and Safe Cleanup, as Norton calls it.

The Fast and Safe icon brings up a screen telling you how many bytes of space are available to be safely cleaned up instantly. If you choose to proceed, this feature eliminates all files in your web browsers Web Cache folder. It also cleans internet history files, empties all files in the Windows Recycle Bin, and deletes all temporary files from your Windows/Temp folder. Temporary files are files that other programs have created and not deleted. It also deletes all lost cluster files created by the Windows System utilities CheckDisk and ScanDisk.

These categories can be set by the user by checking the type of file to be cleaned so the user can decide to clean up only the internet history files or only the temporary files by simply selecting the category desired. Each category will reflect the amount of space that choice will free up so the user will know the amount to be freed before making a choice.

The program may also be set to delete all files in selected categories after Windows starts or may be scheduled to delete files in selected categories on a specific day and time.

The Clean Sweep part of the program was of the greatest interest to me. "Safety Sweep" appears to be the default option for Clean Sweep. Individual files are highlighted with a green or amber marker. When "Safety Sweep" is enabled only green highlighted items can be removed by and all selections are automatically backed up in a compressed format and can be restored if needed or desired. "Safety Sweep" can be disabled by the user allowing both green and yellow highlighted items to be selected and backups are optional but highly recommended.

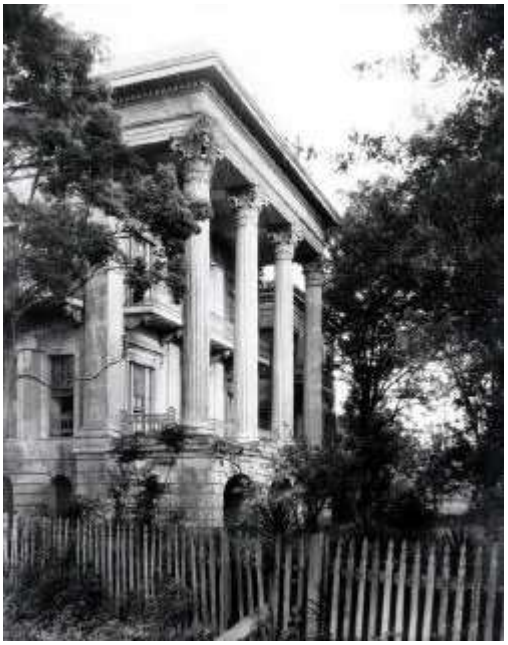
In my situation I found that when I had removed a good-sized database program from the hard drive, a large number of DLL files remained which took up a huge amount of disk space. I had already uninstalled the program using Windows add/install feature but these DLL files remained. I decided to disable "Safety Sweep" and remove all these files, both those marked green and those marked yellow, and to back them up in the event I found it necessary to re-

(Clean.....Continued on page 5)

(Clean……..Continued from page 4)

store them.

I then read the report the software generated about what files it had deleted. As it turned out, there were still a very few files which were marked as "read-only" which were not removed but these utilized only a small amount of disk space and were not a big concern. I then tried other programs on my computer to see if any bells and whistles sounded because of the need for any of the deleted programs but fortunately nothing happened.



Erring on the side of caution I waited a few days trying other features of my machine and all worked well. Then I went back to Clean Sweep and totally deleted the files that were backed up since these backups were also taking up much of the needed disk space.

Even then the files were sent to the recycle bin and I had to delete them from there as well. I had now recovered over 165MB of space most of which had been used by the database DLL files and was I well pleased with the program.

The program may also be used to eliminate unwanted Active X controls downloaded from a web

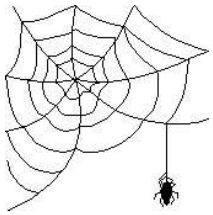
Internet Picture of the Month



Belle Grove Plantation
From
http://www.lsu.edu/diglib/

The Louisiana State University digital library has many old photographs pertaining to Louisiana, including many plantation structures.

This plantation home, Belle Grove, built in 1857 at the center of a 7,000 acre sugar plantation lasted into the 1950's, eventually succumbing to deteriation and finally a fire in 1952. Costing a fortune to build, with 75 rooms and silver doorknobs, it lasted less than a century.

Editor's Comments

By William LaMartin, Editor,
Tampa PC Users Group
lamartin@tampabay.rr.com

Lightening Wade Herman was to write a last minute article to fill this page of the newsletter. He said that he could relate the rebuilding of his daughter's computer after a lightening strike at her house. He had to replace everything: power supply, hard drive, motherboard, CD drive and modem, all of which he purchased from our friend in the parts business—Steve Singer.

Well, he is going to have to visit Steve Singer again. I know that you will find this almost impossible to believe, but Wade's computer was struck by lightening this afternoon while he was half through the article. Sounds like "the dog ate my homework" story, doesn't it? But I believe him since he lives only a block from me, and shortly before he called me with his tale of woe, I had hurried to shut down my computers and unplug them because of a loud thunder clap that hit with no low rumbles as a prelude. Wade said that his lights flickered when the thunder rolled. A block away mine didn't. I was lucky. By the way, he had a UPS and a surge suppresser between the power and his computer. Of course, there are the phone line and the cable modem, which I am not sure were protected.

Visual Studio .Net As I mentioned in the last newsletter, I have purchased Visual Studio .Net and am attempting to learn it. By the way, Microsoft came through with the $300 rebate in only a couple of weeks. After a month, I can say that I have made better progress than I expected. Recall VS .Net is a programming environment where you can use either C++ .Net, C# .Net, or Visual Basic .Net to write your code. Furthermore, you can create applications either for the desktop or the web. I have been focusing on learning how to use Visual Basic .Net for web applications, since I know Visual Basic and I would like to be able in the future to replace my use of Active Server Page code for web work with VS .Net.

The image at the bottom of this column is a screen capture of the main page of the web application I created. It is actually about 10 applications that can be accessed from this main page.

The data grid example displays a membership database, where you can click on any column to order by that column and where you can add, edit or delete memberships. The interactive calendar allows you to move through the months to see what meetings are scheduled and to also see what memberships are due or coming due.

The next example allows you to send an email from the web-page. It could be to anyone you choose, and it could also have an attachment if I had chosen to combine it with the Upload a File example. The Upload a File example allows you to upload a file from your computer to the web site. The Download a File example allows you to do the opposite—but not by clicking on a link. This method of downloading is of interest if you don't want the downloader to know the location of the file, e.g. if you want to only let them download after they have paid for the file.

The Crystal Report example displays a database style report on a web page. The mailing labels report is a specialized version of such report that would allow you to print one page at a time of labels from the web site (this idea needs a bit of work yet to be made practical).

The Get Web Page example simply scrapes the source code from any web page you indicate. The Address Checker example accesses the Post Office site to check an address and put it in standardized

(Comments……..Continued on page 12)

(Minutes……..Continued from page 2)

Zone Alarm is a firewall. A firewall is defined as a system that protects your PC so that nothing can enter your PC from the Internet without your knowledge. A good firewall, however, must distinguish between good and bad traffic. Each PC has its unique IP address. Also, each router has its own IP address. A router is itself a hardware firewall of a limited type. However, a software firewall can provide much greater protection from unwanted traffic than a router alone. An identity search routine can pass through a router to capture a user's PC IP address. Firewall programs are generally very easy to install. Software firewalls nestle between your network card and your Internet connection. The router firewalls are known as NAT firewalls. Advanced hackers can, however, defeat a NAT firewall. Advanced software firewalls utilize Space Packet Inspection (SPI). All transmitted or received data streams are inspected by the software firewall program such that any spaces are closely inspected to detect any inserted packets within the primary data package. The firewall software also inspects to determine the existence of any imbedded "exe" i.e. executable files within the Internet data stream. Often unscrupulous hackers imbed these files in gaming programs and other popular Internet downloads.

Next, Edgar described Trojans and viruses. A virus was defined as a program that attempts to violate the space within a PC and can also reproduce itself out to other PCs. A Trojan is a user-uninvited program that does not reproduce itself but causes mischief within or from your PC. A recently discovered Trojan called BioNet is a Trojan server that exploits the Windows Terminate Process function. The BioNet server permits anyone using the BioNet "Remote control" client on their end to remotely control the victim's machine.

Internet Explorer 6.0 users have been recently cautioned to upgrade to at least version 6.02 to protect from a weakness inherent in the earlier versions of the browser.

The more recent Windows operating systems are considered more secure than the earlier systems. NT and its derivative 2000 operating systems are classified as "administrative state" operating systems whereas the earlier operating systems such as 95, 98 and ME are classified as "fully privilege". The difference between the classifications is that for each installed program an administrative state system requires a verification by you, the administrator, permitting the individual software to be installed, whereas in a fully privileged operating system, no such intervention is required.

A Trojan detector scans your hard drive looking for Trojans. A Trojan program once imbedded in your PC seeks to take control of your operating system. A good firewall program will verify that the incoming ISP is who they claim to be and will also verify that your transmitted IP address is yours and yours alone. Protection in the form of a firewall with a good anti-virus program is highly recommended. Once your firewall has detected an intrusion attempt, it is recommended to reboot your PC. Cable and DSL or other broadband systems are considered particularly vulnerable as users are generally continuously connected to the Internet. Port 53 is the domain name connection.

A "sniffer" is either a small but expensive computer or a piece of software that examines network traffic.

Depending on the type of operating system you use, one can identify your own IP address by inspecting the contents of "winipcfg" or "ipconfig". Use your "accessories" program file to reach DOS Prompt. Type in "ipconfig" or winipcfg" and the IP address will print out for each installed Ethernet adapter.

The Zone Alarm Pro was demonstrated. The firewall software maintains a log of all attempts of Internet data passage. Inspection of the log from Edgar's PC showed that Windows Explorer made many attempts to transmit data. A visit to the site http://www.grc.com, demonstrated that the Zone Alarm program was protecting the Edgar's computer.
Zone Alarm retails for approximately $40. ◆

Looking Back to 1992

From the September 1992 *Bits of Blue*

Secretary's Report
[*Editor's Note: Either Jim Clark or Charles Howe*]

TAMPA IBM USER'S GROUP
MINUTES OF 8/12/92 –

The focus of this meeting was on IBM's OS/2 Version 2.0 and there was a good turnout to learn what they could about the program. While a few other subjects were discussed, the presentation of OS/2 and the before & after discussion of same occupied about 90% of the evening. Things moved a bit fast for this hard-of-hearing reporter, so I am sure that I will only scratch the surface of what transpired — another reason you should all turn out for these always interesting and worthwhile meetings.

CLUB NEWS

Harvey reminded all present of the Word Perfect 5.1 for DOS classes that are to start next month and continue fo the subsequent three months. They will convene on our regular meeting nights at 5:45. They will be conducted by our own inimitable Ed Buzza. An excellent opportunity for those interested. Please be on time --Ed has a lot of ground to cover in a short time.

Our Prez informed us that our Board is considering trying to start a S for communications -- using a modem and a BBS. A good bit of interest was evident from those present and Don Patzsch, who has been CO-SYSOP and technical answer man for the large Sunshine BBS for a number of years, agreed to lead the SIG. It appears another very worthwhile and productive project is about to get underway. Watch for more info on this.

The president of the Tampa Bay OS/2 User Group was present and invited all interested in OS/2 to join their group which meets from 3-5 PM on the 4th Monday of the month. The next meeting is August 24. The meetings are held at the same place as ours -- room 450 of the Lake Pointe One building (IBM facilities). The group focuses exclusively on OS/2 with a view toward exploring and learning about the many features of OS/2, and to solve user problems with same. For more information, call the group coordinator, Joe Poston, at (813)343-3488. If you are an OS/2 fan, give it a shot.

Steven Woas, the author of a new book, Learning DOS: A Beginners Guide, was on hand. He noted that his new book is a basic treatment of DOS designed specifically for new computer users and is written in easy-to-understand language. It retails for $14.95, but he is making it available to all of our members at 40% off -- or $9. George Pollak of Computers and More was also on hand. George announced that he would make available an internal 14.4 modem w/FAX capability to all members for $229. And, if 10 or more of the modems were purchased by club members, he would donate one to the club for its use. If you are interested, George can be reached at 254-2810 or 251-6833.

INDUSTRY NEWS - Harvey covered quite a few notes of interest from industry news, with several additional contributions from those present. I was able to take sporadic notes on some, including the following items:

Microsoft is getting into the sound card business and reportedly will have one on the market by the end of the year. The reported reason is that it will be a means for Microsoft to help push Windows. If that is true, we could expect very competitive pricing on their card. Those considering buying a sound card might want to wait awhile.

QMS (I believe I heard) is coming out with a 32 page/minute — I repeat 32 page/minute — laser printer. Hey, that is fast! I think I also heard a price of something like $2995 for the machine.

Several of the chip/computer manufacturers are coming out with a 68 MHz line of chips/computers. And, I guess we are still scratching the surface, with much more powerful and faster chips/machines on the horizon.

An upgrade for Harvard graphics was report in the BOB newsletter just a couple of months ago. Well, still another upgrade for Harvard Graphics is out. Wow! (Such rapid changes are not restricted to Harvard Graphics, however.)

PROGRAM PRESENTATION:

We were fortunate to have Chris Mayers, our IBM representative, on hand to give us a presentation on IBM OS/2 Ver. 2.0. 1 am not about to try to cover all that Chris showed us and the many features he pointed out about the program -- it is much too powerful and feature-loaded to do that.

Some compare OS/2 with Microsoft Windows - and to the extent that they both use windows and have graphic interface, and allow multitasking, and have a few other similarities, a comparison can be made. But in reality, comparing OS/2 and Windows is an apple/orange comparison. First off, OS/2 is an operating system, just as DOS and UNIX are operating systems. Windows is not -- it is based on and must have the operating system DOS, and it is subject to the limitations of DOS. Among the many features and capabilities of the OS/2 (Ver. 2.0) program are:

OS/2 includes and will run DOS and Windows and any applications made for them, as well as its own operating system and applications.

OS/2 supports true 32-bit processing, multi-threading and will

(1992……..Continued on page 9)

(1992…….Continued from page 8)
allow up to 240 (yes, two-hundred, forty) virtual DOS windows. That is to say, up to 240 different programs could be run at the same time -- with any mix of DOS, Windows and OS/2 programs.

It would seem that OS/2 gives almost total control of all facets of the environment and desktop, including detailed control of settings for each program and the memory allocated for its use.

It includes a mini-database program and a mini-spreadsheet program which can handle small needs, but neither compares to dB IV or Quatro Pro. It also includes an editor, but does not include a word processor.

The installation program allows considerable latitude in which portions of the program you may load -- or not load. Hence, features loaded and HD space requirements can pretty much be tailored to meet your needs.

OS/2 may be shut down with programs operating, and it will load to that same configuration when next started.

At installation, you can configure your computer as exclusively using the OS/2 operating system; as dual boot where the computer will boot using the same operating system used when last shut down, but will allow you to select the alternative system (OS/2 or DOS) and then reboot; or to make the choice of operating system during start-up each time you start the computer. When in the DOS mode, only DOS supported operations are available to you. When in OS/2, all DOS/Windows/OS/2 operations are available. I believe the main reason the DOS-only option is included is because there are a very few programs that will operate only in a pure DOS environment.

One would think that the documentation for such a powerful program would be quite extensive - and it is. Except, it is not in written form. The written documentation is rather limited, covering primarily installation and information affecting that activity. Program documentation is loaded onto the computer and is available online - and it is very comprehensive and accessible -- with excellent cross-referencing. The index, for example, allows a search feature for any subject and will report all locations where info on that subject can be found - and you can switch immediately to any one of the them.

Online help is super and includes a glossary, a command reference and a tutorial.

Chris covered many other aspects and capabilities of the program, in spite of a glitch which interrupted things, but I did not get notes on them all. It is a super-powerful program and worth consideration by all, including Windows users. It is not all peaches and cream at this point, however. There are a few bugs still, one of which showed up tonight, but IBM's working hard and fast to solve them all. OS/2 Ver. 2.0 includes Windows 3.0, not 3.1, and OS/2 does not recognize disk space controlled by compression programs like Stacker and Super Stor. But, most of these drawbacks will be corrected with an upgrade expected before the end of the year, that rumor has it will be free to Ver. 2.0 owners.

We understand that the producers of Stacker and Super Stor (and presumably the others) will soon have products on the market that will work with OS/2. It is also rumored that Stacker may be included with the OS/2 upgrade -- but I emphasize that that is RUMOR.

Chris reported that requirements to run OS/2 Ver. 2.0 are: 386SX or better; 4 meg of RAM minimum (will operate, but not well), 6 meg gives much improved performance, and 8 meg better still; and a 60 meg hard disk. Loading the complete package takes about 30 meg of HD space. Minimum load takes about 15 meg of space, while a standard loading would take something on the order of 20 meg. Printer driver support is very comprehensive, with 5 HD floppies full of printer drivers supporting just about any printer that is IBM compatible. Video driver support is not as good and OS/2 has drivers only up to standard VGA (8514 mode), and it appears that IBM is going to rely on the many manufacturers of video cards to develop their own drivers.

OS/2 is available at just about any software outlet, or can be purchased from IBM direct (l-800-3IBMOS2). The $49 Windows-upgrade introductory price ended July 31. The Windows-upgrade price is now $79, but one of those present at the meeting stated that a $16 rebate is available (but how and where you can get the rebate, I do not know).

Chris (and IBM), a BIG THANK YOU for the program you donated and for a job very well done, in spite of the computer glitch. You have a very powerful and useful program.

AND THE WINNER IS:

The following members were lucky enough to have a winning ticket at the drawing and won some very nice prizes, with one member winning two prizes:

PCRX (Virus Pgm)	George Pollak
Learning DOS (Book)	D. A. Clary
Turbo C++	Kevan Sheridan
OS/2 Ver. 2.0	D. A. Clary
50/50 ($37)	Charles Howe

(You know, there is something suspicious here. I bought the winning tickets at the meeting, but I didn't win anything. It has been that way for some time. I think I will ask for a congressional investigation. You people had best be a little nicer to me!) ◆

Special Interest Groups

Microsoft Access SIG

This SIG meets the first Tuesday of the month at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6:30 PM. For information contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merlenic@tampabay.rr.com.*

Genealogy SIG

To be included on the TPCUG genealogy mailing list, contact Jenny Lind Olin at 960-5723, or *jlolin@tampabay.rr.com.*

Visual Basic for Applications SIG

This SIG meets the third Tuesday of the month, at the Gateway 2000 Store on North Dale Mabry Mabry (just south of Columbus Drive) at 6:30 PM. For information, contact Merle Nicholson at *merlenic@tampabay.rr.com,* or William LaMartin at *lamartin@tampabay.rr.com*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Kevan Sheridan moderates the dis cussion.

New Drives

By Don Patzsch, Tampa PC Users Group
patzsch@helios.acomp.usf.edu

If you had taken off both sides of your computer so that you could see inside easily, you would notice the prominent cables. The cable that interconnects your drives is a parallel cable which means that it has at least seven wires, and they are arranged in a flat cable with wide connectors.

Now a new system is becoming available, and it is a serial system, which means much smaller cables and much faster transfer of data.

SCSI drives are faster than the ATA drives we have been used to. The new SATA drives are faster and they will change your old 133MBps to perhaps 600 MBps. A real increase in speed. SATA is backward compatible to the present ATA (IDE) drives.

The price is expected to be similar to the present drives. Fiber channel and SCSI drives are more expensive, about four times more expensive. So look for the new drives late this year or early in 2003.

The new computers will have less wiring to hamper the air flow inside your computer and should make the machines less expensive and faster! ◆

(Clean……..Continued from page 5)

page to your computer hard disk and to remove unwanted plug-ins or unwanted cookies. There is also a "live update" procedure for upgrading the software similar to that provided on other Norton products.

I haven't used the product long and haven't yet used all its features but so far it has been a big help in what I wanted to do and I would recommend it to anyone with similar problems. ◆

form. The Miscellaneous example contains several small applications that test out various methods of inserting information into a web page.

Before VS .Net, I had done essentially everything above by using either ASP pages with VB script or by using ISAPI DLLs created with Delphi. The advantage of VS .Net is the ease with which it let me do these things—once I had figured out how to do some basic things in the new environment.

Don't expect to see any of this on the web soon, since at present the only place I can run VS .Net web applications is on my own computer, which is fine since I need to do a lot more learning before going live.

As for regular Windows desktop programs created in VS .Net, they will have to wait to be seen away from my computer also, since I will continue to use either Visual Basic or Delphi to write them for anyone else other than myself. ◆

Bits of Blue

October in Tampa

A Monthly Publication of the Tampa PC Users Group, Inc.

Vol. 15 No. 10 October 2002

Meeting

Programming

Wednesday, October 9, 2002
6:30 PM
Art Pepin Hospitality Room
Pepin Distributing Co.
6401 N 54th St
Tampa, Florida

Meeting Preview:

William LaMartin will present an overview of writing computer programs using Microsoft Visual Basic, Borland Delphi and Microsoft Visual Basic .Net from within Visual Studio .Net.

This will not be a technical presentation, so you will not be inundated with an endless stream of code—just enough to give you a taste of what is happening behind the buttons of a program. The different programming languages will be compared and examples of the final products produced will be shown—some of which you might find useful and can download for free.

As usual, we will have our Windows/computer discussion for the first half hour of the meeting. ◆

See page 6 for the story of the cracked Compaq. Did he do it, or did Compaq create its own crack?

The use of trademarked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

apcug Member of The Association of Personal Computer User Groups

Minutes of the September Meeting

By Peggy Pulliam, Tampa PC Users Group
pegrance@yahoo.com

At the September meeting, Kevan Sheridan presented a way to consolidate Instant Messaging. Instant Messaging (IM) is a way of talking with someone else on the web by typing a message and sending it immediately while the other person is right there to see it at the moment and answer you back.

Businesses find this works in the customer service section when a caller asks a question that the service rep doesn't have the answer to, but his buddy in the office does. Since they are on the web at the same time, they IM the associate and get the answer, and the caller never has to know who had the actual answer. People like it because they can get an answer fast or send a message right now.

Connect to MSN Messenger, Yahoo! Messenger, ICQ and IRC, and most of the time to AOL® Instant Messenger (AIM) in a single interface. What we saw was a way to coordinate all of them through "Trillian". Each person you have entered the name of is shown in your "buddy list", and you can see if they are online, if they have actually done something recently, or might have stepped away from the computer. They can be on any of the six services mentioned and still be managed through Trillian. So you don't have to have your AIM box open and your MSN box open and your Yahoo box open. From that one place, you can talk to any of your buddies if they are available and if there are two or more you can get to an area where the group of you can all IM in the same screen! You cannot, however, chat with someone on one of the systems if you don't have an account on that system set up for instant messaging.

You can block people from seeing that you are online, in case there's someone you don't want sending you messages, or you want to plan a secret party. You can block the whole list from seeing that you are online and do your research without being interrupted by someone sending an IM. You can make the window transparent so it doesn't completely block out the things underneath it on your screen, you can set different sounds, change the look of the box on your desktop, send pictures or links for web sites, and other fancy things, too, that Kevan didn't have time to show us. One other thing he did show is the log feature where your IM words are recorded and saved on your computer. This will help when someone types "Jo's phone number is 555-5555" and you go on chatting and close the IM windows and forgot to note it down.

This will speed and open up communication a lot! Best of all, it is completely free in the version we saw and without ads too! Http://www.trillian.cc will get you there if you want to try it out. ◆

Auto Trip Planning & GPS Routing

By Merle Nicholson, Tampa PC Users Group
merlenic@tampabay.rr.com

Microsoft Streets & Trips 2002
DeLorme Street Atlas USA Deluxe v2.0-2.1
DeLorme Street Atlas USA v8.0

My wife and I enjoy traveling by car. We travel around our state for bicycling sites and canoeing and have family and friends scattered around the U.S. enough that augmenting the experience with travel software has been both practical and enjoyable.

This article is incomplete as a software review. Instead I hope to describe how and why we enjoy it and to help with the selection of products.

We're actively using two trip planning products at the same time. We use the DeLorme Street Atlas USA Deluxe for actively tracking in the car, and the Microsoft Streets & Trips 2002 for route pre-planning. We have three copies of Streets and Trips 2002; one for each of our personal desktops and one for the traveling notebook. We have one copy of Street Atlas USA on the notebook. The GPS unit is attached to the notebook when in the car.

Automobile trip planning and routing uses software (and hardware) to:

1. Plan a trip in advance or modify a trip enroute.
2. Print maps and "Trip Tickets".
3. Provide for any detailed street map or highway needs.
4. Track your current position using GPS, or track your current position along a planned route using GPS.
5. Look up any place, address, business or facility and place it on a map or integrate it into a planned route.
6. Find where you are, where you're going, how to get there and when you'll get there.

Our interest began in 2000 with yet another product, Rand McNally Deluxe Streetfinder 2000, software that included a GPS unit; and although it was interesting, we found it difficult to use, so we switched to Microsoft Streets and Trips 2000 and discarded the Rand McNally. To be fair, I have not looked at Streetfinder since, so I do not know if that product has been improved or not.

We've since upgraded Streets & Trips 2000 twice, to 2001 and 2002. This product has stayed the same through this time with no noticeable changes other than updating the databases. It's the product that we have the most experience with and use it for our standard of comparison. It's relatively inexpensive, too. Our first one was $20 with a $20 rebate. With GPS, Streets & Trips places your location accurately on the map as you travel. It does not actively compare your real track or position to the planned route, so there's no recalculation of how far to get there or when. We have used this software for some major trips including one three week trip of 6300 miles, and we do like the product very much. But I wanted it to track where we were along a route so we'd know how far it is to the next location. So we looked at Street Atlas USA.

I borrowed an unused copy of Street Atlas USA version 7 from a friend, looked at it, mapped ourselves a couple of short trips; compared it to Streets & Trips and removed it because it just did not compare favorably. Although it would track a route, the user interface was very difficult, the graphics were clunky, and it just did not stand up to the quality of Streets & Trips. Then DeLorme came out with Street Atlas USA version 8, and I revived my interest in it. They completely rewrote the user interface, and it bears no resemblance to the previous version. There is also a Deluxe version that I saw in a store that was bundled with a yellow GPS unit in the package for $149. I looked it up on the DeLorme web site and decided I wanted the Deluxe version without the GPS priced $10 more than the standard, searched for anyone that had it, failed to find anyone and then ordered directly from DeLorme. I paid only $10 more than the standard was at CompUSA, so I was happy with the $59 cost. The Deluxe version is 2.0-2.1. It's the Deluxe version of Street Atlas version 8. Isn't there a better way, guys?

I've begun writing this as we're traveling. I'm using MS Word, with Street Atlas also running so I can switch between them as needed while my wife is driving. Right now we're on our way to Chattanooga, then Tampa, having spent a few days in Indianapolis, with a day trip to Chicago. Our total round trip will be about 2450 miles. We just used our software to find a Barnes & Noble Café outside Bowling Green to get a good "café latte" and a scone. We'd never been to Bowling Green, yet we were able to leave the interstate, drive a mile and a half to Barnes & Noble and back with no hesitation or loss of time. Our decision was based simply on a search of candidate cities on our route and my nervous system's demand for caffeine. We simply could not have done this without software and a computer.

HARDWARE

In early 2000 we started traveling with a Compaq Pentium 120MHz notebook and used it on some major trips including a 6300 mile trip in 2001. We had just a few months using a Toshiba Pentium 233 and then purchased our current notebook, a Gateway 1.2GHz Celeron with 256MB memory and a 20G HD ($1,228 shipped to the house). Since there is no Gateway brand car charger available, we also bought a 120 Volt 140 Watt inverter for the car to power the charger cube, and also a power adapter cable for the GPS.

We decided to buy a new notebook to have hard drive space enough to load the entire product CD so that the CD does not have to be in the drive when searching the databases. Both earlier notebooks had very limited disk space. The new one, with 20G, still has 13G left after loading the full databases of both

(Trip……Continued on page 4)

(Trip……..Continued from page 3)
products, along with XP Home and MS Works. Our new machine is very fast for these purposes. Please note that the Pentium 120 was useable for running Streets and Trips in case you can find a used one for a couple of bucks. Ours was free because the previous owner did not want to spend $250 for a new battery. We simply used the car outlet, and shut the notebook down more often, after removing the outlet from the car's ignition switch.

A few words of caution about notebooks. Many now do not have serial and parallel ports. The one we ordered from Gateway would not have had a serial port for our GPS if we hadn't decided to order it at the Gateway store and told the salesman we needed one. The same model Gateway online has no serial port. We would have had to get a much more expensive model, or purchase a new GPS for USB, a very rare item. As it was, the unit also did not have a keyboard/mouse port, but we were prepared for that.

GPS

The GPS, as purchased, pulled its power from the keyboard connector. Fortunately, Rand McNally still sells the GPS and an accessory power cable. Our setup is actually better now because the GPS needs a few minutes to acquire satellites when first powered up, so we leave it plugged into the lighter socket all the time when traveling, except overnight. Many other GPS units are on the market that are suitable for attaching to PCs. Besides the Rand McNally unit, DeLorme sells one bundled with a copy of Street Atlas. The advantage of these two units is price. They don't have any controls or display. They're intended to sit on the dash while you're driving and have no other purpose. Most other GPS models have computer interfaces, and both Streets and Trips and Street Atlas handle several protocols, even some that are specific to particular models. My GPS has one output protocol "NMEA 2", and both software products have "NMEA 2" in the communications setup. I also own a Garmin GPS for our sailing and canoeing. It has two output settings, one being NMEA 2. I don't use this GPS in the car because the Rand NcNally unit is less conspicuous and has an external power cable.

The only place in the car that allows reception from the satellites is on the dash, underneath the sloping windshield. I have it in a small gray felt drawstring sack to make it look less like an electronic device and as a shield from the sun. GPS signals are very weak, so the signal is interrupted by anything overhead and even tall trees to the sides. This has not proven to be a problem but once, when we were looking for a planned turn under the Elevated in Chicago.

THE CAR

I've rewired the cigarette lighter sockets in both our cars, bypassing the ignition switch;,and in the case of our van, directly to the battery, with multiple outlet adapters. All this is not totally necessary, but bypassing the switch we feel is worth the work, and I used heavier wire while I was at it. We leave the system powered up while we're in a restaurant on the road, most times just closing the lid, which immediately turns the screen off (I think.. how do you tell?). The notebook's power settings will also power the screen, processor and hard drive down even while it's on external power, which in this case is our car battery.

HOW WE USE THE SOFTWARE

My wife and I stop frequently while traveling, if only stopping for five minutes, usually to trade off driving. We've found we rarely get fatigued even for a ten hour drive. The notebook sits in the lap of whoever is the passenger at the time. There is room on the floor of the van to put it when there's nothing going on or when leaving the car. The windows are tinted and we use an insulated screen on the windshield and usually drop a towel over it and also take it inside motel rooms.

We use Street Atlas to track our route using GPS tracking. The navigator/passenger uses the software to anticipate events coming up, turns, stops, track how far it is to some event (a turn or a planned stop or traffic merging from another highway is information the driver needs). We use it to locate motels and restaurants in advance. We use it to look up and call hours in advance for hotel reservations, for instance, using our cell phones.

The route is shown on the screen as a map. You zoom in and out showing various levels of details on the map, right down to the corner where you turn, or zooming out to show a whole state if you wish. Street Atlas also has voice announcements warning you of upcoming turns at intervals as you approach. While somewhat useful, the voice announcements are no substitute for a navigator/passenger. When you zoom in, locations of stores, restaurants, exits, services and hotels are shown.

We plan our trip at home on one of our desktop machines using Streets and Trips, sometimes a month in advance, and discuss it for a while, look up scenic locations along the way, plug those stops in with an anticipated length of stay, and use the Internet to research the stops. A good example is this trip we're on. We discovered that we could fit in three hours at Mammoth Cave if we left Chattanooga by 8:00 AM and we could still get to Indianapolis by supper without making our host in Indianapolis wait. It was worth the small amount of work.

With the software, you plug in the Start and End locations, using addresses or place names, then any stops along the way. You have a profile entered that determines the times of day that you start and end. You also can set it so that you do rest stops, say every two hours for 15 minutes. There are profiles that determine how fast you drive on all the various types of roads and set some criteria of a road type preference, so that in our case we may prefer to go a longer distance and stay on interstates. Also, if you put in an average cost of gasoline and your car's miles per gallon, it will estimate your gasoline cost. The software calculates your route, supplies maps, puts a route on the screen and displays or prints written driving instructions.

(Trip.....Continued on page 5)

(Trip…….Continued from page 4)

After the route is planned and before leaving, we take the time to put Start, Stops and End, and Vias into Street Atlas and make any time of day adjustments. This really takes just a few minutes. So far we have not regretted the use of two software packages.

STREETS & TRIPS VS STREET ATLAS USA

I'll try to describe the difference between the two. We like and use both, but it probably is because of our own preferences. And I'll admit that as we use Street Atlas and become more familiar with it, our use of Streets and Trips may diminish.

Streets & Trips is a Microsoft product that *looks* like a Microsoft product. It has all the standard menus and easy to use buttons. It has better graphics than Street Atlas, and produces better presentations if you're printing maps. It is much easier to learn to use, especially if you're a regular computer user and familiar with the operations of Windows. There are a few things that need improving, like the starting and stopping of GPS tracking is buried in the cascading menus instead of being on an exposed button. They've forgotten that you can be operating this in a moving car using a cheesy touch (touchy) pad. Also, it samples the GPS location only every 15 seconds. At 60 MPH, that's 1,320 feet between samples, and sometimes we were confused about which turn to take.

Streets and Trips does have GPS tracking, but it does not interact with a planned route. It leaves all the ETA calculations up to the user to work out in his or her head. And that's all right, I don't have a real problem with that, but it prompted me to look elsewhere. It has a very large database to search,

Warranty on Compaq Laptops

By Merrill Friend, Tampa PC User's Group
mfriendtampa@worldnet.att.net

About three months ago I bought a new Compaq Presario model 710 laptop from Comp USA. Before I left the store the salesman tried to sell me a one year maintenance contract. As I recall the cost would have been $149. This contract, as I remember the salesman's explanation, would even cover accidental damage.

Since I had used several laptop computers over a number of years without any damage to the exterior of any of them I really wasn't too concerned about accidental damage to the unit. I have carried laptops on airplanes from Tampa to Baltimore to Miami to Tampa without any problems and safely by car all over the State of Florida so I didn't expect this to be a problem. Also I planned to carry the unit in a carrying case, which should provide reasonable protection. In other words, I have always taken good care of my equipment and expected to continue this practice in the future so why spend another $149 needlessly.

Then one day after I shut down my laptop and closed the top I noticed a small crack down near the rear hinge. "Where did that come from," I wondered as I carefully examined the lid speculating on the cause of this new crack. I had no recollection of bumping the computer case against anything or setting it down hard and I certainly had not banged it against anything when it was not protected in its case. My conclusion was that perhaps there was some fault in the plastic material from which the lid was manufactured. Perhaps, I speculated, the hinge was too tightly connected, placing too much stress on the plastic covering of the top when the screen was widely opened, although I had never heard of this happening with any other laptop I or my associates had used in the past.

At this point I got out the computer's warranty information and dialed the toll free number provided for my use. I went through the usual menu of pressing different numbers on my tone phone until I got to a live person and could describe my problem. I didn't make a note of the exact time this all took but I was pleased that within 10 minutes at the most I had a real person on the line.

The "real" person wanted my name, address and phone number, as well as the model and serial number of my computer. Fortunately, I had written all this information on the material that came with the computer, using the form Compaq provided, even though I had already registered my computer online as soon as I got it hooked up to my Internet provider. Then the "real" person asked me for the date I bought the computer, and I didn't recall that information, although I could have found out by going back through my credit card records. I told her that I had registered my product online and couldn't they find all they needed from the information I gave them then.

Her response to this was that she didn't have my registration information on her computer. "You will have to talk to customer service about that. They have access to that information on their computers." She then told me she would send me a box to pack my computer in for its return to the factory for repairs. She didn't know if the warranty would cover it of not; that is something to discuss with customer service, she added. Then she transferred me to customer service.

The guy that answered the phone in customer service seemed perplexed at my call. He told me that he understood that I was being transferred to him because I was disputing my warranty dates. I explained to him that I was not disputing anything, I just didn't recall the exact date I bought the computer or the date I registered it, and the lady I talked to initially didn't have access to that information on her computer. He then checked and confirmed the registration date of my warranty and confirmed that I had warranty coverage.

Then he advised that I might hear back from the company's repair service telling me they would only repair my computer if I paid them $300 and if this occurred I should call back and talk to someone in customer service because they "Might" be able to help me on this.

I had read the Limited Warranty which stated that "Damage from misuse, abuse or neglect" was not covered. Of course, I feel strongly that I did not misuse, abuse or neglect my computer in any way so I have never felt responsible for this damage.

But now I began to worry that Compaq wasn't going to cover this under their warranty but customer service had given me hope that it wouldn't cost an entire $300. At this point the $149 maintenance policy was looking pretty good but I had already passed on that opportunity several months earlier.

The very next day the box arrived from Airborne Express and I was told I had three days to return it free via Airborne to Compaq. I was only three months into a one year warranty. So I packed the computer as instructed, called Airborne and they picked it up the same day and returned it to Compaq's repair facility in Houston.

Several days passed so I called to check on the status of the repairs. I had been given an account number and the tone phone menu asked that I punch it in. I did so, and the person I got this time required a lot less information than on the first call. They then transferred me to repair service. The lady at repair service asked me for my account number, and I gave it to her. She said, "That is not your account number. An account number has ten digits and that number is only eight digits long." I then explained that this was the only account number I had been given. So then I had to give her the computer model

(Laptop……Continued on page 7)

(Laptop…….Continued from page 6)
and serial number again, and, after putting all this information in her computer, she gave me the 10 digit account number she was using. "Be sure you use this 10 digit number on all calls about this repair." I promised I would do so.

I was then told that my repair was not covered by warranty, and they could either repair it for $300 or send the computer back to me unrepaired. "What do you want us to do?" she asked. Remembering customer service's advice to call them before agreeing to pay $300 for the repair, I told her I would think about it all, call back later in the day and tell her how to handle the repair.

I then dialed the menu again and asked for customer service. Now where is that nice guy who told me to call back to customer service before paying $300 for repairs? Well, he certainly wasn't there this time. The guy I did get politely told me that once repair service has made up their minds on whether to charge for the repairs or not there wasn't anything he could do. I'd just have to pay the $300 if I wanted it fixed.

So once again I dialed the toll free number, and, after the usual wait, I was asked for my account number. Remembering that I now had a 10 digit number I entered that number. The telephone equipment told me that was not a correct account number and to re-enter it. So this time I entered the 8 digit number and I was put through to another real person who routed me back to repair service. When they asked for my account number (I was getting smart by now), I gave them the 10 digit number.

That person said they were getting ready to return my computer un-repaired. I told her that I didn't want it returned until it was repaired and was willing to pay them the $300 they wanted. She then took my credit card information and gave me an order number. Several days later my laptop was returned by Airborne, repaired and seemingly in good order.

I have the impression that HP and Compaq are making a good effort at handling two computer systems for the two newly merged companies of Hewlett Packard and Compaq Computer, which perhaps explains the different account numbers and the inability for some of their personnel to find all needed information on a single computer network. Nonetheless, everyone was friendly and the repairs were handled very efficiently.

And yet I still wonder how strong that plastic is that is used on the cover of those Presario laptops. Nervously, I bought an even better padded carrying case and I still wince every time I open and close the lid and feel it flex slightly at the force necessary to open it fully, hoping I will not ever again see another mysterious crack beginning near one of the rear hinges. I remain convinced that Compaq's design of this convex lid, or the materials used in its construction, is the primary causal factor in the damage sustained by my laptop. ◆

Editor's Comments: Scanner Problems

By William LaMartin, Editor,
Tampa PC Users Group
lamartin@tampabay.rr.com

It is nice to see such nice long articles from the members. That way I have to write very little to finishing filling the newsletter. In fact, if I had used 12 point type, the newsletter would probably already be full.

HP PhotoSmart Scanner Revisited In the August 1998 newsletter, http://www.tpcug.org/newsletter/august1998/photo_smart-scanner.htm, I wrote about getting a 35 mm negative and slide scanner. In the December 2001 newsletter, http://www.tpcug.org/newsletter/nl_2001/december2001/new_computer.htm, I wrote about moving that scanner from a Windows 98 computer to a Windows Me computer and the problems I had in doing that. For Windows Me I had to get a new SCSI card and the new scanning software from HP. But I got it working and did a bit of scanning with it. However, I don't do that much scanning anymore since most of my photos are now taken with my Canon PowerShot G1 digital camera, which I have had for almost two years. But I have many, many black and white negatives, color slides and color negatives that I would like to archive digitally. I scanned in a number of them for my web site and other uses, but I hadn't done a systematic scanning in of everything.

Several weeks back I decided to begin that project. I would scan in the negatives and slides using the PhotoSmart scanner connected to my second computer while doing my normal work on my main computer, which is right next to it. I started with black and white negatives from 1970 (I have earlier stuff than that). These negatives are ones I processed myself and were cut into lengths of 4. I immediately ran into a problem that I had encountered intermittently after installing the scanner on the Windows Me computer. At unpredictable intervals I would get the error message "Hpi_cntr has causes an error in HPI_IH.DLL" and the program would close. Start it back up, scan some number of negative strips, and the error would occur again. I never found a solution—until I moved on to later dated negatives that were cut in lengths of six negative frames to a strip. All of a sudden there were no more error messages.

I believe I know what caused the problem. The scanner is set to scan a maximum of five negative frames. On the strips of four, it sometimes couldn't determine where the end of the fourth frame occurred due to sloppy work with scissors on my part, and that apparently caused the software to crash. When I moved to strips of six frames, it always could determine where the last frame was, in this case the fifth frame. So the problem is solved for negative strips longer than five frames, but what do you do for lengths of four or five. Well, there is no user setting for this, but you can go into the Windows registry and

(Comments…….Continued on page 10)

Looking Back to 1992

From the October 1992 *Bits of Blue*

Secretary's Report
TAMPA IBM USERS GROUP
MINUTES OF 9/9/92

As I sat waiting for the "starting gavel", I noted the gathering of the clan in the very nice facilities IBM makes available to our group and thought how fortunate we are. In addition to these super facilities, we always have a professional presentation of current software by industry reps and/or one of our own, we have a willing source of help with any computer problems we might have, we have access to some excellent training and education in SIGs, we can keep up to date on the most important industry developments. etc., etc., and we get to meet and mingle with some very nice people. And there are always several valuable raffle prizes given away to some lucky members. We always have a nice turnout for our meetings, yet there are many who are members of our group that never attend the meetings. I wonder if they know what they are missing.

CLUB NEWS:

Our Prez informed us of the current SIG on Word Perfect 5.1 for DOS, which was holding one of its classes at the time, and announced that the SIG on Modems & Using the BBS would be held next month -- time and date to be announced. All interested in this group were asked to put their name and phone number on a list — these folks would be contacted by Don Patzsch with the time and place for the SIG. Don Patzsch, a Co-SYSOP for the large Sunshine BBS and an expert in this area, will head up this SIG. Judging from the line of folks waiting to put their name on the list, it is going to be a nice group. Kevan Sheridan, our BOB SYSOP announced that he had ordered our new 14,400 baud modem for the BBS. A 6-8 week delivery is involved, so Kevan is looking toward a Nov/Dec operational date. Club objectives downstream are to add another phone line to the BBS, upgrade the computer to 386 level, and add storage capacity. •We have come a long way, baby—with Kevan's able efforts—and we are going a lot further in the future.

INDUSTRY NEWS:

Harvey informed us of a number of developments in the industry, on only a few of which I was able to get notes.

IBM will be coming out with their new gaggle of PCs next month, including a couple with ISA. A significant part of the announcement is that they will be marketed through national retail outlets, such as Work Place.

New/relocated computer stores: CompuAdd has relocated from its former Fowler location to one on west Hillsborough, west of Dale Mabry, in the same complex as the Sports Authority. A new computer superstore, Computer City, will be going in on Dale Mabry between Kennedy and Cypress.

It appears that at least one company is coming out with a laptop computer that will have a bubble jet printer as an integral part. Harvey observed that that could be a problem -- if you have to have the printer repaired, you would also lose use of the computer. Looks as if that could be handy for the traveler, though.

Software Upgrades:

- MS Money 2.0 will be out next month.
- A new upgrade for Quicken for DOS is on the way. A free upgrade for the Windows version is also out, but you have to ask for it -- so, if you own Quicken for Windows, best get on the phone and make a call to the Quicken folks.
- FoxPro for DOS and a Windows BETA version should be released in October.
- The second interim release (2.0b) for MS Word for Windows will be coming out soon

Still in the software area, the Aldus Corp is perhaps the first major software producer to announce that it will not develop a 32-bit version of PageMaker for IBM's OS2/2.0.

It has been reported that the new Xtree for Windows has some problems. I did not catch all the info, but did hear mention of SuperStor. Check it out before you buy.

Harvey noted that in one of the publications he reviews it had been reported that Windows software now outsells software for DOS. (Think about that just a little bit.)

Speaking of Windows, Harvey observed what could be a very risky situation. In the interest of conserving $$$$ in a multi-computer situation to network and install Windows on the central computer. That's fine, BUT -- what if the central computer goes down? If you are using Windows programs, what do you do???

PROGRAM PRESENTATION

We were again blessed with the expertise and talents of John Johanasmeyer of WordPerfect Corporation, this time to give us a rundown on WP's Presentation program, version 2.0. This was the second Beta version for DOS. A Windows version will be forthcoming later. Its direct competitors are other upper end graphics and presentation programs -- CorelDraw, Applause, Harvard Graphics, to name a few. WP believes that their Presentation package is superior to those of all of their competitors.

It appears to be a super program, but I am not into that kind of software and am not in a position to judge one way or another. I do know that I would like to have some of the capabilities I

(1992……..Continued on page 9)

(1992…….Continued from page 8)
observed. It seemed capable of doing just about anything I could think that anyone would want to do in the way of preparing a computer presentation -- and do it easily and well. Some of the features I noted are:

- Will produce and handle (import and export) both bitmapped and vector based graphics, and the listing of supported graphics formats is extensive.
- Includes a bitmap editor that allows editing of bitmapped graphics in fine detail.
- Allows manipulating both text and graphics in just about any manner one could imagine.
- Includes a WP 5.1 spell checker.
- Includes a "John Madden" draw capability — you know, redraw the play on a rerun of the play
- Supports .WAV and .MID, and includes hundreds of .MID files and the capability to create .WAV. While it will use the computer sound system, a sound card is certainly desirable to take advantage of this feature.
- Automated or manual presentation of slide shows, and one can quickly and easily reorganize a presentation.
- The output of the program can be transported to and used from another computer via floppy. The other computer need not have Presentation loaded, for the runtime program Presentation will load onto the floppy along with the output will allow presentation with the other computer. Interestingly, the file size per slide seems very small indeed, and the runtime package is only about 75K. So, a single 1.4 Mb floppy would hold a very large presentation. Runtime does not give the capability to modify the presentation, however, so the presentation you take in this manner is the only presentation you can give.
- Includes over 1000 pieces of clip art.

I don't recall any mention of supported text formats, but I did note that Presentation 2.0 would accept directly text input from any version on \VP 5.1.

I don't recall any mention of equipment requirements beyond needing about 15 Mb of hard disk space. Just as with any graphics package, the faster your computer, the better off you are. While Presentation may run on a 286, I would guess that you would want a 386 or better, or you may be twiddling your thumbs a good bit. I believe John was using a 386/40 laptop on which the program ran very well. The retail price is set at $495, and no clues were available about expected street price.

John did a great job of presenting what appears a super program, and I haven't done justice to either. Many thanks, John, (and Word Perfect) for an entertaining and informative presentation (and all the goodies, of course) -- another WordPerfect job VERY WELL DONE!!
AND THE WINNERS ARE:

With the generosity of WP Corp and GeoWorks, there were quite a few raffle prizes this meeting, and the lucky winners are:

WP Cap	William Coleman
	Martin Miller
	Kevan Sheridan
	Roger Waters
WP Shirt	Larry Anders
	Susan Atwood
Box 3.5 disks	Larry Anders
WP Graphics Lib	Roger Eggleston
GeoWorksPro	Cheryl Pett
Money Matters	Larry Anders
50/50 ($36)	Chuck Himes ◆

(Trip…….Continued from page 5)
and it rarely has disappointed me.

Street Atlas USA is harder to use and to learn to use, but it offers more features. The user interface is not "Windows-like". Everything is on tabs at the bottom. It's really a clever, unique way to pack a large amount of information in a small space, but it is unlike any other program you've used.

The first couple of times I used it on short trips I thought I would discard it and revert back to Streets and Trips, but I'm glad I persevered. It took this one really long trip of 2450 miles to come to the realization that it would do everything that Streets and Trips will do but only after a good many hours of practice. The database search and information it supplies are equally as good as Streets and Trips, just selected and presented differently. In addition, it tracks the progress of your trip against the planned trip, and gives you a continuous re-estimate of your ETA for the next stops and destination. It announces upcoming turns and will announce on demand (press F5). It even tells you when you're "off route". It also has voice recognition for a large set of commands, like "next turn" being the same as pressing F5. I have not used the voice recognition feature.

One thing that annoys me is when your route backtracks. Say you plan to leave the interstate, go a mile down the road with some turns and return to the interstate the same way. It (understandably) doesn't know whether it's coming or going, and announces the turns as if you're doing both at once, doing double announcements. We've learned to hot-key the sound off as the solution. Sometimes it selects a route that doesn't make sense where it may leave the interstate, go down a road

Special Interest Groups

Microsoft Access SIG

This SIG meets the first Tuesday of the month at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6:30 PM. For information contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merlenic@tampabay.rr.com.*

Genealogy SIG

To be included on the TPCUG genealogy mailing list, contact Jenny Lind Olin at 960-5723, or *jlolin@tampabay.rr.com.*

Visual Basic for Applications SIG

This SIG meets the third Tuesday of the month, at the Gateway 2000 Store on North Dale Mabry Mabry (just south of Columbus Drive) at 6:30 PM. For information, contact Merle Nicholson at *merlenic@tampabay.rr.com,* or William LaMartin at *lamartin@tampabay.rr.com*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Kevan Sheridan moderates the dis cussion.

Virus Alerts - Hoax or Real Threat?

By Jenny Leitzke - Membership Coordinator
Info@tpcug.org

Thank you to Computer Users for your defense against everyday computer attackers. Many of you receive emails addressing such concerns of new viruses that could very well destroy our beloved computer, and many of you act quickly to get that information out to as many people as you know. Please check these email alerts you receive to verify them as a real threat before you take any action. Much of the harm is by hoax emails, which are designed to jam up email servers with unnecessary emails. McAfee and other virus software companies place important information on their sites about which emails do address Real viruses threats or just Hoax chain letters, to get everyone alarmed of an impending threat. Book mark any one of the three sites below as sources to check when you receive these emails.

McAfee Security Alert Page
http://vil.nai.com/vil/content/alert.htm

Symantec/Norton
http://www.symantec.com/avcenter/hoax.html

Topic Alert Verification Page
http://www.topic.on.ca/VirusOrHoax/

Note: "It Takes Guts to Say 'Jesus'" is just another hoax message that has found its way into the netstream.

Another VERY easy way (and we love easy) is to go to www.google.com and type in the name of the warning you just received. You will easily find several entries that will instantly tell you who has already verified your email as real or hoax.

Thanks for looking out for each other. Friends and Family are the best for watching our backs. ◆

(Comments…….Continued from page 7)
make the change there to either 4 or 3, whichever produces error free scanning.

I tired of negative scanning, put it away for awhile and moved on to some color slides. I scanned in about 270 and everything seemed to be going fine until I decided to take a close look at my results with Photoshop. Horrors. Under enlargement, they were out of focus with red or green borders around certain parts of the photo. And a random sample showed that all the slide scans were this way. I recalled having had this problem before, but couldn't recall what the solution was other than to recalibrate the scanner. That did no good. Time for the Usenet newsgroup search on Google. I got nothing there—probably because I didn't phrase the question correctly. Time to put a question to the rec.photo.digital newsgroup directly. I had my answer within a couple of hours from two different individuals. The solution: simply unplug the scanner from its power source for one minute and replug it and everything should be fine. It was. How simple, but I couldn't recall it.

With all my problems I thought that I might need to buy a new scanner, but for the time being that does not seem necessary. A lucky observation and the Usenet newsgroups have made the old scanner usable, I am back to rescanning my color slides, and the results look good. But a new Nikon CoolScan IV was looking mighty nice—except for the $800 price. ◆

for a while and return back onto the interstate. It's usually easy to fix by adding a "Via" to force the route. So after it plans the route, you need to review it closely and correct for this. After having coped with it a couple of times, it isn't too big a deal. It is more difficult to add Start, Stops and End. You cannot convert a Stop to an End for instance. You must delete it and recreate it. Streets & Trips does a much better job on this.

They have announced a new release of this product, for $35 for registered owners. Added is the ability to split the screen so that you can track your position at two levels of details, and for that reason alone, I'll upgrade it.

To conclude , if my needs were more casual, and I did not value continuous GPS comparison to a planned route, I would use Streets & Trips, otherwise I'd use Street Atlas USA. My own solution is to use both. You can run both at the same time, but do not attempt to have the GPS tracking on both. ◆

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

apcug Member of The Association of Personal Computer User Groups

Minutes of the October Meeting

By Peggy Pulliam, Tampa PC Users Group
pegrance@yahoo.com

The meeting started with discussions of Windows situations and a new virus, "bugbear". Norton Anti-Virus will find it. Be sure the update your Norton AntiVirus daily!

We discussed http://www.mdhub.com. It is a site through which, if the doctor is registered with the hub, you can contact your doctor.

Contact Mary Sheridan for information on winning a trip to New York having to do with Mindshare starting a program about "what you do with your computer".

The main presentation was an awesome showing of how programming works. Our presenter thought maybe he'd scared members away with the prospect of watching how programming is done. "Boring and complicated" seemed to be the expected lot of those of us in attendance. But William LaMartin showed us how programming works using Visual Basic, Delphi and Visual Studio .Net.

It was a simplified look, and we saw how it worked and just how much effort goes into creating a little button for us to click to add a name or a picture or some other feature to an application. A really cool part was seeing how Visual Studio. Net programs can be written and used on the web.

He also shared some VB and Delphi programs he had built and stored for download on his web site. These programs can be downloaded by any of us to use. One was a voice recording and repetition program, lots of ways to use that. My canaries still don't sing to it, they continue to sing to the noise of the water faucet from the kitchen, but I might just use those canary noises I can capture for my wav dings and pings for different actions on my computer. Just a thought. Anyway, it's at

A Few Windows Tips and Tricks

By Tim Condon, Tampa PC Users Group
tim@free-market.net

I had the happy opportunity recently to go to a continuing legal education course where the subject was… technology in the office! Computers! Scanners! Software! Great stuff!

But first, I need everyone to know how enthralled I was to be meeting at the Pepin Distributing facility: I wanted to write an entire article singing paens just to that! You see, I hadn't been to a TPCUG meeting for quite a while (I admit it, I admit it), but I really **did** want to see Kevan Sheridan's presentation regarding Trillion and the various instant messaging products. Okay, okay, I figured to myself, I'll go and sit in a bare concrete room on an uncomfortable folding steel chair (I mean, what **else** would you expect at a beer distributing headquarters?). And man was I delighted with what I found! That place is **nice**. It's comfortable, open, convenient, easy to give presentations (although some might complain that the walls are somewhat horny—see the page 1 photo)…but who **is** the guy who nabbed that facility for our meetings? My hat is **off** to you, good buddy, whoever you are!

Now. Ahem (cough, cough). You wanted to hear about computer and technology stuff. Well…yes, let's talk.

How about a "pen drive," which is a little thingie that looks like a fat pen (it even has a little top with a pocket-clip to put in your shirt pocket) and plugs into one of your USB ports? These things come in various storage sizes from 32 meg to 1 Gig (!), ranging in price from about $60 for the itsy bitsy teeny weeny one to about $1,200 for the Gigabyte boomer (plus about $25 for the little docking station to transfer the data from the fat pen to your own machine). Fascinating! You can move your data around in your shirt pocket now.

Here's another cute little innovation, called "Activewords" (go check it out at http://www.activewords.com). What this service does is make it possible for you to type in a word or click on a word **anywhere you may be on your computer screen**, and the word you write or click will start a program for you. It's like a "universal macro." In fact, the company calls this little ditty a "universal hypertext link" (UHL), and says, "To use a UHL you simply select or type a word or phrase and trigger its UHL by pressing the ActiveWords key (any Function-Key you designate). You can activate a UHL anywhere...anytime...in any application, document or view." Sounds strange, doesn't it? But the concept is really pretty simple: The service replaces icons with words (and most us of know one or two hundred thousand words, as opposed to…how many icons, a few dozen?), and makes it easy and "universal" to invoke the macro. You want to check your stocks, and you happen to be doing a word document? You type in "stocks," hit your chosen F-key, and **bang**, you're there. You want to check out the weather, and you happen to be working on a spreadsheet? Just type in "weather" and hit that F-key, and you're at the weather site. Sounds intriguing. Costs $30 per year, or $2.50 per month. I don't know about the rest of you, but I might try it.

We all love spam, right? Not! **You** may like spam, but I hate spam…or should I say Ihatespam? Because that's the name of a nifty new product that is said to be a very good spam-buster. It filters those irritating unsolicited commercial emails out of your inbox! It's on the web now for sale at http://www.sunbelt-software.com/product.cfm?id=930, courtesy of Sunbelt Software, for $20. Sunbelt Software says, "No configuration or setup needed, install it once and it works! Works with Outlook and Outlook Express. AOL version coming soon. Does not lose emails you really need to see." Sounds great. And I heard a guy talk about it that said it was the

(Tips……Continued on page 4)

(Tips……Continued from page 3)
"ultimate spam-buster." The price is certainly right. Will someone in the TPCUG buy a copy and see if it works as well as advertised?

Then there's the good old Ad-Aware program that sniffs out secret advertising programs running surreptitiously on your computer. If you don't have it, you may be surprised to see how much junk and running programs advertisers have slipped into your machine while you weren't looking. Here's how the progenitors of Ad-Aware describe it: "Ad-Aware is a multi-spyware removal utility that scans your memory, registry, and hard drives for known spyware and scumware components and lets you remove them safely." I like that: "Scumware." Notice how it rolls off your tongue? And get this: This little baby is available from Lavasoft for **FREE** download. The. Price. Is. **Right**! Go find out all about it at http://www.lavasoftusa.com/.

Ahhh…is not the computer industry and scientific community just **wonderful**? Things happening every day, and every day gets better, better, better, in every way! (I think I feel a **song** coming on….)

Lessee (rummaging around in giant toy bag), what else have we got here. Aha! Here's another little free gem, by a software guru named Mike Lin. It's a tiny little program that lets you, and **only** you, control what's starting up in your main launch pad when you turn on your computer. Here's what Mike says about it: "Startup Control Panel is a nifty control panel applet that allows you to easily configure which programs run when your computer starts. It's simple to use and, like all my programs, is very small and won't burden your system. A valuable tool for system administrators!" "Small?" Hell, I downloaded the thing in about 4 seconds flat. Go get it at http://www.mlin.net/StartupCPL.shtml.

Running out of space on your hard drive? Remember when a 5 meg drive cost about $2,000? Remember when there weren't any external hard drives? Fast forward to today: If you need some extra disk space, how about the radically cool Maxtor 3000LE. For as low as $135 you get 120 GIGAbytes (yeah, you read that right) on an external drive that connects via USB port and runs at 5400 rpm (low noise level). The thing looks **way** cool: Red around the outside, white in the center part, a cross between a giant ladybug and some kind of dangerous poisonous **frog**. Great for backing up and taking the hard drive home with you.

PCPitstop is an online diagnostic service run by PC Magazine. Here's the gen on it from the site: "At PC Pitstop we can help you get your PC in top form -- running fast, stable and secure. PC Pitstop runs diagnostics on your PC to identify things that might help improve performance. The process is fully automated, private and safe. The test will not change any settings on your PC. After the diagnostics run, we'll give you tips for improving all kinds of things. Best of all, the service is free!" Try it out at http://www.pcpitstop.com/.

We all know about the magazine Consumer Reports, right? It's one of the greatest resources in the world if you're contemplating buying, building, getting, renting, finding, or using…something…**anything**! Well, it's online now. Big deal, right? Wrong. For an annual subscription charge of $20, here's what you get (in the words of the Consumer Reports people): "Subscribing to ConsumerReports.org gives you instant, unlimited access to our exclusive unbiased Ratings and recommendations of products and services! Anytime you need it, you can get detailed buying information on ALL the products we've tested over the past four years. That's thousands of products in hundreds of categories! What makes us different? Unlike other web sites, we give you completely objective product information. We buy all the products we test right off the shelf, and we accept no advertising or sponsorship of any kind. So the information you get is completely unbiased and accurate." Good stuff. In **addition**, they've got a new and used car price guide; a Travel Letter; a Health Newsletter; and a Consumer Reports Book Store. Check it out at http://www.consumerreports.org.

Finally, I wish to tell you all about this incredible little service that I've glommed onto called "Go to My PC." (no kidding). It's an online service that lets you get into and run your remote computer from no

(Tips.....Continued on page 5)

(Tips…….Continued from page 4)

matter **where** you are…over the Internet. The service costs $20 a month or $180 a year, and has a free trial period. You'll get hooked if you try it, just like I did. I only live five minutes from my office, but this thing is **so** handy and convenient that I immediately signed up with them for a year. You're in New York and need to get into your office computer? No problem. You're in Russia or Bora Bora, and need some file from your home office machine? No problem. It's really pretty cool, and I've gotten into the habit of leaving my office computer turned on at night so I can go home and just continue doing my office work after dinner. It's quite amazing. Once you're signed on (with multiple passwords), your remote computer screen pops up, and it's like you're sitting right there at your remote computer itself. Do whatever you want. Very handy. (Caveat: You need some kind of broadband connection to get the most out of this little baby… but it's well worth it.) Check it out at https://www.gotomypc.com/.

Enough! Enough babbling! As we all know, there are countless little tricks and gadgets and services that we all run across now and again. Well take the time to jot'em down and send a little description to Fred so he can include them in the newsletter! Great stuff! Share the wealth! Let's help each other out! TPCUG! ◆

My 2003 Wall Calendar

By Merrill Friend, Tampa PC Users Group
mfriendtampa@worldnet.att.net

Recently I read an article in a digital camera magazine suggesting various ways of exhibiting photographs. One that caught my fancy was the preparation of a Wall Calendar for friends and family. The article I read said interested persons could find templates for such calendars on the Internet so I cranked up Google and went shopping.

Frankly, it wasn't as easy as it sounded to find the type of calendar template I wanted. I wanted something that looked nice enough for business or personal use. That left out those shaped like hearts or those with funny picture motifs. Finally I found what I wanted at a site called http://mycustomcalendars.com.

The camera magazine article I read suggested that such calendars would make interesting gifts. Grandparents like those that show their grandchildren's activities over the most recent year. You can bore your friends with photos of your trip to Alaska or last year's woodworking projects. Calendars for valued business clients are another option. The themes seem to be endless.

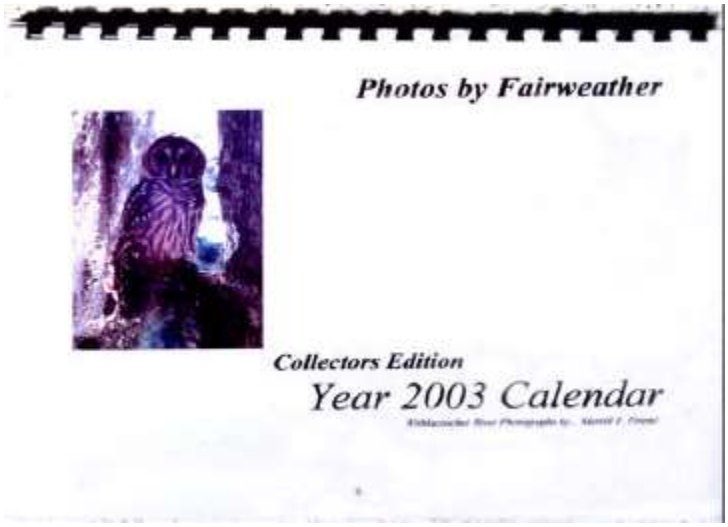
In my case, I have enjoyed fishing and exploring the Withlacoochee River for over thirty years. A number of my Central Florida friends share my enthusiasm for these activities, so this year I compiled photos of various river scenes which my friends and I are familiar with and used one of these photos for each month in the preparation of a wall calendar for 2003 which I will distribute to these special pals at year's end.

Mycustomcalendars.com provides a free calendar template for downloading for either a wall type calendar or a desk version. The template was prepared using Microsoft Word so it is compatible with the software most of us use. Complete instructions can be downloaded from this site.

The Internet instructions suggest using Hewlett Packard double-sided glossy (44-LB) brochure paper that I purchased at Office Depot for about $17.95 for 50 double-sided sheets. The calendar is printed on one side of the sheet and a photograph on the other side. As each page is flipped over another photograph is shown. I took the web site's suggestion and used this paper, and I am satisfied with the result. It is barely heavy enough for the job, but it is at an affordable cost.

The printer I used is an old DeskJet 820 Cse Professional series printer that was designed as a business color printer. It prints at about 300 dpi, and, while it prints in color, it does not compete with the latest color photo printers, but it does have its advantages and disadvantages.

On the plus side, it produces an acceptable calendar



(Calendar……Continued on page 7)

(Calendar……..Continued from page 6)
image at a reasonable cost. On the minus side, it is slow. I was able to produce about six calendars with thirteen 8x10 images on a single $31 color cartridge using this printer. It took about five minutes for each color picture. Given a choice of "Economy", "Normal" and "Best" printing qualities I selected "Best" for the pictures and "Normal" for the black ink only calendar pages. HP suggests that "Normal" is what should be used, but I got noticeably better prints using the "Best" setting and used it even though it was the slowest setting. Also, the photos were JPG images previously saved under "My Pictures," which were pasted into place on the Microsoft Word program. I was using Microsoft Word as part of Office 97. When I had pasted the image in place, I would right click on the mouse and get a menu which let me "format the picture," allowing me to change the brightness and contrast of the image thus produced. It also allowed me to change the dimensions of the picture to adjust to the space available. I used this feature on many of the pictures because the pasted image was often darker than it had appeared on the monitor and the colors were somewhat harsher. Also, some images did require some small adjustment in size. The nice thing about using Microsoft Word was that I didn't have to switch to a photo program to make these minor changes, although many of these photos had printed out far better on an Epson photo printer using Epson photo paper. But that was as I had expected since the Epson 785EPX was designed for photo work and the HP I was using was not.

As an alternate I did attempt to print these calendars using the Epson photo printer, but it did not like the two sided HP paper. None of the images were acceptable using HP brochure paper, and I did try various paper settings to get it right, but nothing I did worked. I rechecked printing on the Epson printer with Epson paper and the results were wonderful. Why then not use the Epson for the calendar project? The biggest reason was cost. The Epson has a smaller color cartridge than does the HP which costs about $21. I have been able to get it to produce roughly fifteen excellent quality 8x10 color prints. That's about $21 in color ink costs for a single calendar against $31 for color ink costs for six calendars with the old HP Desk Jet. Since I was making calendars and not exhibition color prints I went with the HP printer and paper. Epson does have a double-sided matte paper but I didn't try it in view of the increased costs of color ink. Of course, if you are doing this project for the grandparents you would probably forgo the additional expense and use the photo printer.

The calendar is bound together with a spiral plastic comb binder that Kinko's will bind for you with a clear plastic cover front and back. Their charge is $4.95 per calendar. Office Depot quoted me about $3.50 per calendar or you can purchase a small manual binder machine from them for $59 and they will sell you the plastic sheets and plastic combs. These are inexpensive items. If you bind a lot of materials this is the way to go. It is all finished with a hole punched through the front plastic cover and all the calendar pages so each can be flipped up and hooked on the nail hanger as each month expires. Hang it up and that's it.

Now all I have to do is learn how to take better photographs. ◆

Front cover of the calendar

Looking Back to 1992

From November 1992 *Bits of Blue*

PRESIDENT'S COLUMN:
By Harvey Bruneau

Without getting into politics too much, you may have noticed that the country has a new president elect. I don't know about you, but I am glad that the air waves have returned to normal. All those commercials, debates and mud slinging attacks on each other started really getting old after a while. Hey, by the way, nominations are being accepted for the 1993 officers and I guarantee the campaign will be fast and clean. I forgot to open the floor for nominations at last month's meeting. You can make nominations for the following positions: President, Vice-President, Secretary, Member at Large and Treasurer through the mail, BBS or at the next two meetings. These nominations, as well as the elections, are important to the future of our group. Elections will be held during the December meeting and should last a whole 15-20 minutes.

Once again our members did a complete night of talking, presenting and two way communicating. Don Patzsch's presentation on modems covered the technical and rudimentary ins and outs of modems. Thanks, Don. The second part of the presentation, done by Kevan and myself, covered the use of our Bulletin Board System (BBS), online and live. I actually had fun talking and explaining the BBS while Kevan navigated around the BBS through the keyboard, and also explained the BBS. I also learned, as I believe you did, how to use features of the BBS of which I was not aware. The open forum between you, the audience, and Kevan and myself was great.

Of course our own Director of Education, Ed Buzza, conducted the second class, of a four part series, on WordPerfect for DOS. The November class will cover one of my favorite WordPerfect features, Tables. The crossword puzzle in last month's newsletter was built with this feature.

One of our members has volunteered to head a Windows Special Interest Group (SIG). The time, location and hardware/software resources have yet to be determined. If you would like to join this group, please leave me a message at (813) 932-6745 or on the BBS. SIG groups are for members only and are free. If you would like to run your own SIG, please let me know.

Please notice that board members Tom Cone and Larry Anders are setting examples by writing articles for the newsletter. We need additional articles contributed by the other 200+ members. They can be about new products you have acquired, tips & techniques, or whatever information you feel is informative to the group.

Due to a timing conflict, Software Publishing will not be presenting at our November meeting. I am in the process of rescheduling the presentation of SuperBase 4 (Windows database). However, we will be giving away a complete copy of SuperBase 4 at the meeting to one of you lucky members.

Fortunately, Microsoft has accepted my invitation on short notice to present some of their current and brand new Multimedia products. These products will include Cinemania, Word/Bookshelf for Windows, Beethoven and discussion of multimedia extension under Windows. A new Windows extension, Video for Windows, that lets Windows users play video on a PC without additional hardware, may also be presented.

We are still waiting on that new 14.4k modem from US Robotics that we purchased a while back. Indications are that it will be installed this year.

Friday the 13th is closing in on us. More than half a dozen viruses are supposed to expose themselves (eek) on Friday. You can protect yourself by downloading McAfee's antivirus from our BBS and running it on your system, or buying a commercial product and installing it. Also, remember that antivirus software does not look inside compressed files such as ZIP files. It is possible to scan the EXE and COM files on your hard disk without finding a single virus. However a virus may be attached inside a compressed file and when uncompressed it becomes active. Make Backup! of your most Important data. ◆

Editor's Comments

By William LaMartin, Editor,
Tampa PC Users Group
lamartin@tampabay.rr.com

Meeting At our October general meeting, the attendance was the lowest that I can recall in my memory, and I have been in the group about 11 years. Of course, our membership is about one fourth what it was in the early 1990's, and our meetings reflect that. But last month was even lower than usual.

I suppose there are two basic reason for low attendance: no interest in the topic or something more important or more interesting to do. Perhaps it was the first night for a new TV show. I wouldn't know, since I rarely watch TV. Since I was the presenter, I hope it wasn't a dislike of the presenter. Perhaps it was the topic: Programming—Visual Basic, Delphi and Visual Studio .Net. I had promised to make it non-technical, but maybe even a non-technical talk on programming is too technical. With computers, it is sort of like cars, I think. 99% of the people just want to drive them and don't care about what is under the hood. But, enough of that.

Viruses As I am sure most of you do, I get quite a few viruses attached to my emails each week, the main one being the klez. But I have Norton Antivirus installed on my three main computers, and as of late it has caught everything, as best I can tell. But the other day while on a trip and using my laptop, all of a sudden I got a message about a file, C:\Windows\ scrsvr.exe, that was going to be quarantined. Where did that come from? I hadn't gotten any message about any problem when downloading my email a few minutes earlier.

I went to the Symantec site to read about this worm. The exact page is http://securityresponse.symantec.com/avcenter/venc/data/w32.opaserv.worm.html. Norton apparently doesn't detect it immediately—only after it has tried to write itself to the Windows directory—and after it has put a line in the Win.ini file to have Windows run it on the next startup. Thank goodness for AV software.

Photo Scanning As mentioned in last month's newsletter, I am still scanning negatives and slides into my second computer. At present I have scanned in 4,802. About two thirds of these I have also backed up to CDs, since we all know that hard drives can not be trusted, don't we. This is a long term project, and I am only up to the late 1970's. The 1980's should contain a fair number of photos, but I think the 1990's should contain less. It is interesting how photography and computing have converged.

Snakes and Computers Speaking of photos, member Gary Ennis forwarded me an email with a sequence of photos of a technician removing a snake from a computer. One of them is below. No details were given, but I assume that the snake entered the computer via the fan opening, stayed awhile, and then tried to leave the way he came in when he heard someone coming to turn on the computer. But he didn't make it out before the computer was turned on, and the fan got him or he was electrocuted. Of course, for the snake to get into the computer he first had to get into the building where the computer resided. Have you checked your home for snakes lately? ◆

Special Interest Groups

Microsoft Access SIG

This SIG meets the first Tuesday of the month at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6:30 PM. For information contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merlenic@tampabay.rr.com.*

Genealogy SIG

To be included on the TPCUG genealogy mailing list, contact Jenny Lind Olin at 960-5723, or *jlolin@tampabay.rr.com.*

Visual Basic for Applications SIG

This SIG meets the third Tuesday of the month, at the Gateway 2000 Store on North Dale Mabry Mabry (just south of Columbus Drive) at 6:30 PM. For information, contact Merle Nicholson at *merlenic@tampabay.rr.com,* or William LaMartin at *lamartin@tampabay.rr.com*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Kevan Sheridan moderates the dis cussion.

Technology

By Don Patzsch, Tampa PC Users Group
patzsch@helios.acomp.usf.edu

Not long ago, Radio Shack sold USB flash memory in the 64mb size for $49. USB flash memory of this size is about the size of your middle finger. You plug it into your USB connector, and it shows as the next hard drive on your computer. No software needed.

Yesterday I put the memory on my PC and copied the files I wanted to back up. I happened to take 41 MB each time for two transfers to my Mac.

You may transfer PC files to a Mac and expect them to run OK if they are text or similar files. The reverse, from Mac to a PC will not work.

I put in a CD-R in the superdrive (CD and DVD burner) and I set the burn format to play on a Mac or PC, with the option of adding to the CD later, if I wanted to back up more files to that same CD.

It's kind of neat to think you can back up your PC to CD by using the Mac burner on someone else's Mac. Makes planning a lot simpler. I have no reason to want to set up a network right now, but this idea makes me wish I had one! ◆

(Minutes……..Continued from page 2)
http://www.lamartin.com if you want to play with it and invent some uses of your own.

We also learned about what Hash is and how that can be helpful in maintaining the integrity of a written page; plus a program available for us to use. No one will be able to fool you into thinking they have not adjusted anything on your page; the hash will detect even one character change on a whole page.

AND, after the presentation, three lucky winners got GREAT raffle prizes. I am supposed to announce them here, but have lost their winning ticket information. I thought I had the lucky winning ticket when I bought mine, but that is not the case or I would remember who won and which of the three prizes she selected!

If you missed this meeting, you missed a good one.

It was very smooth, and I felt like I'd go home, update my AntiVirus and see if I could program a little something. ◆

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members. Our mailing address is P. O. Box 3492, Tampa, FL 33601-3492.

However, for business concerning this newsletter, Bits of Blue, please contact the Editor, William LaMartin, at 821 S. Boulevard, Tampa, FL 33606-2904; 813-251-3817; lamartin@tampabay.rr.com.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII, Microsoft Write, Microsoft Word, or Word Perfect file to the editor at 821 South Blvd., Tampa, Florida 33606-2904 or to lamartin@tampabay.rr.com.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

The use of trademarked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

apcug Member of The Association of Personal Computer User Groups

Minutes of the October Meeting

By Peggy Pulliam, Tampa PC Users Group
pegrance@yahoo.com

The meeting started with discussions of MSN and AOL having new versions, business versions and a new instant messaging version coming out.

Elections will be held at the December meeting.

The unopposed, at this time, nominees are:
President- Kevan Sheridan,
Vice President- John Witmer
Treasurer- Mike Hodges
Secretary- Peggy Pulliam
Member at Large- Mary Sheridan

The December meeting will include the Christmas Party December 11 at the meeting room location. It is a great location, and Mary Sheridan would like suggestions of what food you want. Everyone can bring a dish of some sort to share, too, and there is always more than we can eat. We'll have music and a raffle for some really great stuff, one prize being a Windows XP Professional CD.

Don't forget the SIGs at 6:30 at Gateway on Dale Mabry (see page 10):
Access on the 1st Tuesday of each month.
Visual Basic the 3rd Tuesday of each month.

Mike Hodges told us about Median and Visa, two computers available inexpensively from overseas. Follow up with him for further information about them.

The presentation was about *CPU,* a magazine for professional and experienced computer users, and *Smart Computing*, a magazine (written in easy to understand language) and an online site full of information designed to increase productivity and help the, shall we say, "less experienced" of us. It is still full of interesting information even for those who have been computing for a long time. If you become a

Software Review

By Larry Anders, Librarian, Tampa PC Users Group
Larry@Andersnet.com

As of this writing, Christmas is less than a month away, and I think I may have an idea for a gift that everyone will enjoy.

It's very possible that someone you know is getting a digital camera for Christmas…or maybe they already have one. Or, maybe they're getting a DVD player…or already have one of those too. Or, maybe that someone is you. If you answered yes to any of the possibilities above, then read on.

If you have a digital camera, a collection of digital photos from the web, or a bunch of scanned images and a DVD player (and a CD burner), PictureToTV (P2TV) is touted as professional photo video made easy. In just a few clicks and a couple of drags and drops you can be showing your photo collection on your TV using your DVD player. A friend of mine, who does not have a DVD player, told me about this program, and it sounded too good to be true. Actually, it sounded too easy to be true. But it did sound interesting, so I thought I'd waste a blank CD and give it a try. (What the heck… I needed something to write about.) But, I was right… it was too good to be true. It took about five minutes. I used all the default settings, burned the CD with the software included in the program, plopped it into my DVD player in the family room and, voila, it didn't work.

I went back into the program and from the help menu went to support on the Internet and checked out the extensive listing of compatible DVD players and mine was one on the list. What now? I was really excited about being able to do something like this so I wasn't about to give up. What was peculiar was that it showed the photo I had chosen for the album cover with the number 1 next to the album on my TV screen but when I pushed play nothing would happen.

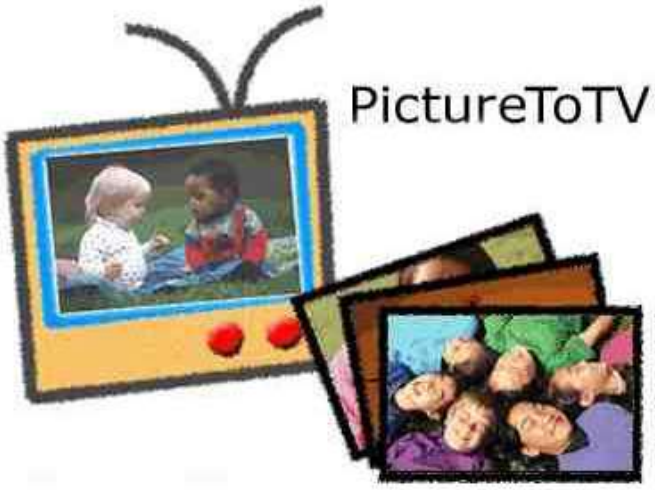
This time I went back into the program and read the help file introduction. Under getting started and steps to bring your pictures to TV, this is what it said:

Create a new project.
Add your albums to the project.
Organize and rename your albums.
Import pictures into your albums.
Customize your albums by adding music and transition effects.
Customize your album menu.
Burn your project to CD.

That's all there really is to it. There's no rocket scientist qualifications needed here. I had followed all of the instructions; I just figured that it must be some kind of incompatibility with my DVD player. But in the spirit of not giving up I sent an email to the support department at P2TV, and the next day got the answer I was hoping for. There was nothing wrong with my DVD player.

P2TV is designed to create as many different albums as the space will allow on the CD you are writing to. Each album is automatically assigned a number sequence. When I created my first album I only created one album, therefore, as I mentioned above, the album I created was assigned the number 1. The email I received from the support department admitted that the next version of P2TV would better explain how to "PLAY" the video on the TV. All I had to do is press the number 1 on my remote. I was impressed. It looked professional and it was easy to use.

You can choose from a variety of transitions between photos and add your favorite MP3s as background music. You don't need any extra CD burning software. It's all built in. You can also preview your work before burning it onto the CD. P2TV simulates your TV and the DVD/VCD player in software.



Future enhancements planned are:

(Picture……Continued on page 4)

(Picture……Continued from page 3)

1. SVCD Mpeg2 plug-in
2. Cropping of images - This is useful for portrait pictures so that they can fill up more screen estate on the TV, which has a landscape orientation.
3. Text captions - Ability to add text to the pictures.
4. Individual image control - Ability to customize transition effect and delay for each image.
5. DVD format & writer support.
6. Ability to import home video into the project.

If you go to http://www.picturetotv.com/index.htm, you can download a trial version. See if it's not as easy to use as I said it was. And don't forget to press 1. The price is only $39.95 and it's worth every penny! Merry Christmas! ◆

Editor's Comments

By William LaMartin, Editor,
Tampa PC Users Group
lamartin@tampabay.rr.com

Another year has gone by for me as newsletter editor. What you say, it is not the end of the year yet. Well, I actually did my first newsletter in December 1995. That makes 84 issues, and it is interesting to look back over the old issues and see what the topics were at the time. For awhile I have been running either the secretary's report or the president's message from newsletters that are 10 years old. This issue has the secretary's report from December 1992.

A couple members suggested that I put more current material in the newsletter in place of the 10 year old articles. I would be happy to if they would write those articles for me. That notwithstanding, I kind of like the 10 year old articles. They remind me of a time when , although well over 10 years old in 1992, personal computing still had that new feel to it since there were so many new things coming out all the time. Of course new things still come out all the time, but, to me at least, for the most part they are just better versions of what we already have: Visual Studio.NET instead of Visual Studio (I don't think anyone in the group cares much about that but me anyway); Corel Draw 11 instead of Corel Draw; Microsoft Access XP instead of Microsoft Access (see the 1992 article); 30 speed CD drive instead of a 1 speed CD drive; an 80 GB hard drive instead of a 1 GB Hard Drive.

What is really new since 1992? Well, I certainly like my digital camera, but its arrival didn't have the same excitement as did the arrival of my first scanner (which was actually purchased in 1994). And, of course, nothing can compare to that purchase of an Apple IIe in 1983.

The early 1980's were certainly an exciting time in personal computing. There was a buzz then—a bit like the Internet buzz we went through, perhaps five or six years ago. The personal computing excite-

(Comments……Continued on page 5)

(Comments……..Continued from page 4)

ment really carried through the early 1990's, the growth of computer user groups being one indication. Our meetings of the TPCUG were exciting. At those meeting Microsoft, WordPerfect, Adobe, Corel, Delrina, MicroGrafix and other leading software companies gave us our first glimpse of many of the programs that are now standards: Word, Excel, Access, PowerPoint, Publisher, WordPerfect, Corel Draw, Adobe Photoshop and Acrobat. And many that were standards but no longer exist or just barely exist: Delrina PerForm, Comm Suite and WinFax Pro; MicroGrafix's Graphics Suite. And don't forget IBM's OS/2. We had quite a few meetings devoted to that doomed operating system.

A lot was happening—and there was no World Wide Web. We had the BBS, and that was it. But the newness was wearing off. Version 2 of Access was not as exciting as Version 1; although it was enough to put Superbase, the first Windows database which was demonstrated at one of our meetings, out of business. And, as the excitement waned, so did our membership.

But in the mid 1990's the Internet arrived to the masses with AOL and Prodigy fighting it out. And both companies gave presentations at our meetings. I thought, now, here is the solution to our membership problem. The Internet will revive an interest

Navman GPS e Series

By Merle Nicholson, Tampa PC Users Group
merlenic@tampabay.rr.com

Navman GPS is a Global Positioning System receiver made specifically for notebook computers. It's unique because of its USB connection to communicate with your trip planning and travelling software. It's sold by Rand McNally in their retail stores and on the Internet.

A couple of words of caution from the start. As packaged, the software does not work on Windows XP. Only Win 95, 98, ME, *NT 4.0 or higher, Windows ME Windows 2000* (Italics mine). Sorry guys, but Windows XP would qualify as "higher". So the packaging is misleading. But help is available for Windows XP. Read on.

The package contains the satellite receiver, Rand McNally Streetfinder software, USB and COMx: drivers, connection cables and a single lever suction cup to mount the receiver to the windshield. The GPS obtains its power from the USB connection, reducing the number of cables to use it down to one.

I assumed that with Windows 2000 and Windows 4.0 or higher, that it would work on XP, so I bought it. The Rand McNally StreetFinder worked only after I downloaded an XP patch from http://www.randmcnally.com. The installation was straightforward and the software obtained my position from the GPS after the 2 minute warm-up. But the GPS did not work with other trip software, namely Microsoft Streets and Trips and Delorme Street Atlas USA Deluxe.

So I returned the Navman GPS to the Rand McNally store. The salesperson said "I'll bet you have Windows XP!" and cheerfully credited my card with the full refund. The reason I returned it? Of the three products, Streets and Trips, Street Atlas and StreetFinder, the Rand McNally StreetFinder is by far the weakest of the three, and the Navman worked only with StreetFinder. The GPS receiver that I'd used for the last two years had died, and I needed a replacement.

So I did two things. One, I sent a note to the technical support group at http://www.navman.com, the New Zealand manufacturer of the GPS explaining the situation, explained that I thought that they were hanging their hat on a very weak product, and asked that I be notified when a fix was available for XP. Second, I set up my boat's handheld GPS to work on the notebook. It's a Garmin GPS 76 that has marine navigation markers in its database and would work very well on the notebook except for a couple of things. One, it runs on AA batteries, and an adapter for a car would cost $35. Two, I didn't like the idea of it sitting below the windshield because it looks valuable enough to be stolen and I was concerned that the extra heat under the windshield may shorten its life. But for now, I'd decided to use it. It does have one advantage: It has WAAS* reception, making it very accurate down to 17 feet, a very big improvement over standard GPS of 65 feet or so, depending on what source you read. In practice, you don't need WAAS accuracy in a car, but well, gee … it just feels better, doesn't it?

My older Rand McNally GPS had died a couple of months ago. I feel that I may have contributed to its demise. It had two connections, one was an adapter to a cigarette lighter socket and the other to a 9-pin COM port on the computer. The notebook sometimes got confused with the GPS plugged in; I think it was interpreting it as a mouse because the cursor would jump all over the screen unless you plugged the GPS in after starting up the travel software. It was misbehaving when it died and I think I had unplugged and plugged it back in and maybe zapped it.

(Navman …….Continued on page 7)

---

* WAAS = Wide Area Augmentation System which improves the accuracy of GPS with transmissions compensating for the deliberate built–in error. Your receiver must be WAAS capable by design.
See http://gps.faa.gov/Programs/WAAS/waas.htm

Merle's Navman setup with Gateway Laptop

(Navman…….Continued from page 6)

The nature of USB should allow inserting and removing a GPS safely, which is one of the reasons I was interested in the Navman, the other being that it obtains its power through the same connection. That and the fact that many notebooks do not have COM ports kept my interest high enough that I'd decided I'd wait and see if Navman would fix the XP problem. It took them less than two months; I got a note from Navman USA technical support with the drivers I needed. They are intended for both Windows 2000 and XP.

So I went back to the Rand McNally store and bought it again for $139 + tax.

The fix they sent me contains two small drivers. One is for the USB. It installs in response to the USB system's detecting the GPS for the first time. The other installs to map the USB's GPS signals to a fake COM: port (COM6: in my case). With the two drivers installed, my MS Streets and Trips and my Delorme Street Atlas 2003 (notice I upgraded in the meantime, from 2002 Deluxe) both worked. In each, I went to the GPS setup, selected NMEA signal type and COM6: 4800,n,8,1, and after the warm-up period, it put me exactly in my back yard. I was no longer lost! Yea! Woo Hoo!

Accompanying this article are two pictures, one from the navman web site and one I took. Notice the difference?

Despite the problems, I do recommend this product. It's unique. It works well and is convenient. Rand McNally stores, $139, or one of the following:

(Comments…….Continued from page 5)

in user groups. Well, it didn't. In fact, once the World Wide Web (not to be confused with the Internet) was generally available, people could find much more information about computers (and other things) there than they could by participating in a computer club. So, I think, the Internet, while a boon to us computer users, has been bad for computer clubs. It is just the way things work.

Also computers work so much better now than they did 10 years ago. Do you recall all the problems we had then getting modems to work so as to access the BBS. Back then hard drives were not auto detect. In a phrase, there was no plug-and-play. It was plug-and-pray. And if you needed a driver, you had to call the manufacturer and have them send it to you via snail mail—unless you were lucky and were able to download it from their BBS site on your 9600 baud modem.

So, times have changed, and, in my opinion, computer clubs are not as relevant to most computer users as they once were. If any of you have some ideas how to make our club more useful to computer users, I know we all would be like to hear them.

The club has changed, we no longer have a BBS since the web site has taken over that function. We no longer have a WordPerfect SIG since very few

Looking Back to 1992

From December 1992 *Bits of Blue*

Secretary's Report
TAMPA IBM USER'S GROUP
MINUTES OF 11/11/92

As the witching hour approached, I noted a nice group had arrived to attend the BOB meeting, and the room was a beehive of activity - numerous small groups talking and picking each others brain, and Don Patzsch conducting his second of seven classes on modems with quite a few folks participating in the class. Off in another room, Ed was conducting the third in a series of four classes on WP 5.3 for DOS. I miss the BOB meetings only when I have no other choice, for even the time before the meeting starts is productive and interesting. This night was no exception. And then, our illustrious President called the meeting to order.

CLUB NEWS

- WP 5.1 Class - The fourth and final class in this series will be held same time (5:30 PM). same place (IBM Bldg) on 9 December, just before the regular BOB meeting.
- Don's second modem class was held in the regular BOB meeting room this time because of a conflict with the ongoing V 5.3 class, and the modem class had to be cut short when the BOB meeting began. The third class will be delayed until January, and that and subsequent classes will have use of a private room and benefit of the planned 45 minute duration. Don has laid out instructions for a total of seven classes. He is providing in-depth instruction, complete with handouts for both present and future reference.
- Harvey announced that a member had volunteered to lead a SIG on Windows. A show-of-hands survey of those present indicated ample interest in the SIG. The problem now is arranging facilities. Harvey indicated that he would try to arrange same, hopefully in time for a January start for the SIG. More info will be forthcoming.
- Harvey cautioned that a virus reportedly in circulation is triggered to strike on Friday the 13th.
- Windows users are well aware that programs installed in Windows make changes during installation in various Windows files/directories. At one time or another, these hackers are faced with the problem of deleting one of these programs. Unless you have retained a copy of all the .INI files and a pre-installation directory listing, there is no way to know just what changes were made with the installation of that program. On the BOB BBS is a program known as In Control that is an answer to that problem. In Control will record in an .WRI (Windows Write) file all changes made by installation of individual programs in Windows. When one decides to delete a program installed in Windows, you need only view the .WRI file to determine what changes need to be made to completely eliminate the program from all Windows files/directories. The only gimmick is that you have to have used In Control when you installed the program in Windows - that is to say, In Control is not retroactive.
- Presentation planned for the DECEMBER MEETING is MS WORK GROUP FOR WINDOWS. This is a networking program which ties individual PCs together without the need of servers, LANs, etc., but it is compatible with these as well. Looks like a nice program that will likely be hot in the work/business world.

INDUSTRY NEWS

- Harvey reported that a PC Magazine book, DOS 5.0 Memory Management, was very interesting and worthwhile for anyone interested in getting more memory out of his computer. It includes some ten utilities on disk which help identify available memory and obtain use of same.
- A parallel to the foregoing, DOS 6.0 is expected to be released in the 1st quarter of 1993. Reportedly, it will include Stacker and better memory management. Whether it will be as much of an improvement over 5.0 as 5.0 was over its predecessors remains to be seen.
- MS database program for Windows, called Access, is now being released. It is reportedly a very nice program. It will have an introductory price

(1992……..Continued on page 9)

(1992…….Continued from page 8)

through 31 January of an amazing $99; amazing because this is a high- end program that will list for $695 after Jan 31. (Looks like MS wants to get lots of copies in use.) I have seen some of the advertising literature on the program, and it truly looks like a "goodie". Kirk Covert says that MS FoxPro has been the fastest (and best) on the market to date, and that Access is even better.

- We previously reported that MS has said that it is getting into hardware only as needed to push its software products. That was said at the time they came out with a sound card to push and take advantage of the new MIDI capabilities of Windows 3.1. Now, MS is coming out with a card for use with IIP printers to speed up printing. One could say that this is an effort to offset the notoriously slow printing cycle in Windows. Come on, now!
- MS Windows NT Beta version is now available from MS for $59. We are told that you need 12 MB of memory and a CD ROM to make use of the program. Anyone interested should call MS.
- Western Digital has come out with a chip that will check your computer for viruses. Interesting, but not enough info is yet available. Like, how do you update the chip for new viruses?
- The last issue of PC Computing should be of interest to Windows users - it contains 172 pages of goodies about getting the most from Windows. If you are a Windows user, you might want to check it out.

PROGRAM PRESENTATION — MICROSOFT MULTIMEDIA

On hand to give us a brief rundown on some Microsoft Multimedia goodies was the inimitable Kirk Covert, Regional Sales Rep for Microsoft, a welcome and well-known personality at BOB. Kirk reported that MS had many things going in the multimedia area and that he would touch on only a few. He noted that multimedia is very useful in the worlds of education, business and entertainment - personal and otherwise. Multimedia requires a sound card and a CD ROM. Among the things MS is producing are:

First, MS is coming out with a new sound card. It is a 16 bit, 5 channel card -- it will handle 5 channels of sound simultaneously. It would be BUS compliant, but not MPC compliant -- but could be made so as an option. He wasn't sure about the price, but thought it would be on the order of $295 list.

As a corollary, Kirk pointed out that sound on computers involves huge files. Computer speed is important, of course, to handle the large files. Also very important is the capability of the CD ROMs - no matter how fast your computer is, if your CD ROM is slow, multimedia will be slow. He suggested checking throughput and transfer rates, and insure that it meets MPC specs.

BEETHOVEN: This was the first MS multimedia disk reviewed. It contains Beethoven's complete 9th Symphony and, among other things, in depth info on the life and times of Beethoven and the 9th Symphony. It allows random access via menu to any part of the music. It sounded great using, according to Kirk, run-of-the-mill speakers. If a price was mentioned, I did not hear it.

CINEMANIA: This disk contains data on some 19,000 movie titles and 3,000 people, including actors, directors, etc. It has considerable detail on the movies, the stories, the studios, and people involved, including their voices. It, too, is easy to use and provides quick, easy access to any of the data it contains. In answer to a question of keeping current in the field, Kirk reported that updates would be available from time to time. List price is $79.95.

BOOKSHELF/BOOKSHELF FOR WORD: This disk comes as a stand alone, and bundled with Word for Windows, which provides for direct access from the Word program or the desktop. Bookshelf includes seven or eight books; I didn't get all the titles. It does include quotations, including voices; a thesaurus; a dictionary; a 16-book encyclopedia (going to 26 books with the next release)

(1992…….Continued on page 10)

Special Interest Groups

Microsoft Access SIG

This SIG meets the first Tuesday of the month at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6:30 PM. For information contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merlenic@tampabay.rr.com.*

Genealogy SIG

To be included on the TPCUG genealogy mailing list, contact Jenny Lind Olin at 960-5723, or *jlolin@tampabay.rr.com.*

Visual Basic for Applications SIG

This SIG meets the third Tuesday of the month, at the Gateway 2000 Store on North Dale Mabry Mabry (just south of Columbus Drive) at 6:30 PM. For information, contact Merle Nicholson at *merlenic@tampabay.rr.com,* or William LaMartin at *lamartin@tampabay.rr.com*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Kevan Sheridan moderates the dis cussion.

(1992…….Continued from page 9)

with oral instructions; a world atlas, complete with flags and national anthems; and a world almanac. It seemed to be a very, very nice package. Kirk reported list price as $295 for Bookshelf, and $595 when bundled with Word for Windows. All the packages were very impressive and Kirk did - as usual - a super job of presenting them to us. Many thanks, Kirk and Microsoft, for some really nice programs and a job very well done.

AND THE WINNERS ARE:

With the generosity of several, including Sunrise Computer Supplies & Parts, a member or two and the creators of SuperBase 4, there were a number of nice raffle prizes this meeting, and the lucky winners are:

Superbase 4	Dave Williams
Computer Games:	
Days of Thunder	Marlin Miller
Weltris	Wilfred LaForese
Clue	Wayne Laurentes
Tetris	Jim Clark
Computer book	E. Kaestner
Cmptr Magazines	Dave Williams ◆

(Minutes…….Continued from page 2)

member with them, you get the magazines at your door at a 64% savings over the newsstand price and you also get 24 hour-access to the website smartcomputing.com, which is a substantial website. All the earlier magazines are online; and you can search for your subject and page after page of information will be collected for you to look through and find your exact answer. There is online tech support and tips on how to get the most out of your computer. Q & A boards and chats are available to help with difficulties or to share information you may have. There are product reviews and more information than you will believe at your fingertips to help you with your computer.

Our group, Tampa PC Users Group (TPCUG), is registered, and, if you join, the TPCUG group receives credit ONLY if you mention the club's numbers: For *Smart Computing* #11644, for *CPU* #310.

If you have questions and are looking for links for computer information, go to http://www.tpcug.org and then go to member Don Miller's site (http://donmiller36.home.att.net/). It is loaded!

Dave Dakin won the raffle for one of the subscriptions we learned about at the meeting; hopefully that will keep him busy and out of trouble. John Witmer and Brian Lance each won a T-Shirt! ◆

people have an interest in WordPerfect and few people probably think there is a need for a word-processing SIG, but they would be surprised at how much there is in Word that they do not know that would be of use. We certainly no longer have an OS/2 SIG. We do have a Microsoft Access SIG and a Microsoft Visual Basic for Applications SIG, but few attend, thinking the material too advanced for them (and it may be).

What is next for the group? It has been suggested that we drop the printed version of this newsletter, since it is also made available on the web. I have toyed with the idea—especially when I look at the extra time required to print it, assemble it for mailing and then mail it. But if I didn't have the deadline of getting the printed version out on a particular date, then I might not get anything out.

So, what does this group need to get it really going again? Exciting computer times like we had in the early years. ◆

Bits of Blue

January in Tampa

A Monthly Publication of the Tampa PC Users Group, Inc.

Vol. 16 No. 1 January 2003

Meeting

Pocket PCs

Wednesday, January 8, 2002
6:30 PM
Art Pepin Hospitality Room
Pepin Distributing Co.
6401 N 54th St
Tampa, Florida

Meeting Preview: Merle Nicholson will demonstrate a hand-held computer with Microsoft Pocket PC, projected on our big screen. The presentation will show the features of Pocket PC (Windows CE) and its compatibility and connectivity to Windows. In addition, a demo will be done of the built-in programs like Word, Excel and Pocket Streets and Trips and how the user interacts with them will be done. Merle will also do a quick tour of two Pocket PC web sites showing the many programs that are available.

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

apcug Member of The Association of Personal Computer User Groups

Minutes of the December Meeting

By Peggy Pulliam, Tampa PC Users Group
pegrance@yahoo.com

The meeting this month was the Holiday Party. We had holiday music and videos going on the big screen and plenty of good conversation and delicious food!

The business portion of the meeting consisted of the uncontested election of the officers and a member at large. John Witmer presented the slate, the motion to vote was made and seconded. The eager officers unanimously agreed upon are: President, Kevan Sheridan; Vice President, John Witmer; Treasurer, Mike Hodges; Secretary, Peggy Pulliam; Member at Large, Mary Sheridan.

After the dinner we had a raffle with six prizes, the major one being the Microsoft Windows XP Pro, which went to Wade Herman. Mike Hodges won a computer microphone; Peggy Pulliam won a Mini Radio in the shape of computer with key board and a mouse for the on/off switch; Cheryl Alexander won a magnet with a frame and memo holder for hooking on the side of the computer; Ed Purcell and Brian Lance each won the Links 2003 Gold Simulator Game. Very nice prizes. ◆

Treasurer Mike Hodges, our raffle ticket salesman

Paint Shop Pro 7.04

By Merle Nicholson, Tampa PC Users Group
merlenic@tampabay.rr.com

Jasc Software's Paint Shop Pro is a graphics and photo editor. It contains tools for creating, editing and retouching images and enhancing photos. Newly added is the capability to create multi-layered vector graphics. Printing has taken on a wholly new look with a "Print multiple images". And web design features have been added.

All of us in TPCUG will remember that in years past Jasc was actively supporting User Groups and did good presentations yearly at our meetings, making us all familiar with Paint Shop Pro. The first I remember was version 3, available as shareware, and then on to version 4, still as shareware. Those versions didn't even have nags to buy. Jasc has built on those very good foundations and is now up to version 7.04, billed as Jasc Paint Shop Pro Anniversary Edition.

It's available as a download from their site. I obtained mine as an upgrade from my previous version 5 for $49. As I recall, there was a user group price, but it was the same price as the upgrade anyway. Regular price is now $74 as a download, and $82 boxed, plus shipping, I'd assume. And for previous owners, the upgrade price is available.

The download is an 80 MB single installation file. So you'd better have broadband, DSL or cable.

The package contains three programs: Paint Shop Pro 7.04, Animation Shop 3, and Jasc Media Center Plus 3.10. Also included are "Anniversary Edition Product Tour", "Bonus Pack Highlights", "Getting Starting Guide" and "Tutorials". I went through all of them and gained something from every one. They're very well written and presented. It's very impressive.

The basic product should be very familiar to those who have previous versions. The basics are unchanged, but they've reorganized the features on the menus and added toolbars. They've also implemented "rollup" toolbars. They work very well. Normally they show as just a small window title bar, and when you pass the cursor over them they pop to their normal size. It's obvious they spent a great deal of time on this. I have much less problems finding what I want even though they've added many, many new tools and features. I especially like the "Enhance Photo" menu.

The very first thing that got me excited about this version was the "Print multiple images" on the file menu. As it happens I had been doing a lot of searching to find a software product that would allow me to arrange my print images on the page before printing. I found a trial version of one that looked promising, but it also had many problems, so I discarded it. Paint Shop Pro 7 solved the problem very elegantly.

For instance, I want to place two 5x7 photos on an 8-1/2x11 sheet of photo paper. "Print multiple images" does this. I've used it a number of times now, even when I had only one image, because I can place it accurately anywhere on the printed page. To use it, you get a thumbnail view of each image and you drag it to a view of your full page of paper. Then grab them and push them around within the printing area until they're arranged. It has grid dots on the page to aid in this and also an option to snap to the grid for even more accuracy. I like to have photos lined up so I can use my photo cutter to slice down more than one photo at a time. This, combined with the resize feature to establish the print size, trims a half hour off each printing. I really like this.

I'll admit that most of my time spent with PSP is simply resizing, cropping and printing photos. But sometimes I do more. We received a photo in the

(Paint Shop……Continued on page 4)

(Paint Shop……..Continued from page 3)

mail that somehow got sliced getting it out of the envelope. I scanned it after taping the pieces together. It was a grandson snapshot that also needed composing (centering the subject) and cropping. I used the clone tool to copy the adjacent image into the area needing repairing. I had to eliminate the cut marks, and, while I was at it, defocus (blur) the background somewhat. Blurring also helped with painting over the cut marks. There's a tool for doing each of these things to the photo. I'll admit I spent a lot of time with this, but the result was a really terrific 5x7 photo, framed and sitting on our credenza right now.

One thing I just did was doing a re-print of a family photo that I'd scanned a couple of years ago. The photo itself is very valuable to us. We had to borrow the photo from a relative to scan in and we had to mail it right back. The problem was that somehow the scanned result had a reddish hue to the skin tones. It was very noticeable. When I got the new PSP 7, I discovered it has an automatic color balance, and a "remove color cast," all under "effects, "enhance photo". It worked perfectly. I reprinted it, and it's one of our most prized 8x10 family pictures.

I went through the help files on the other two included products, Animation Shop and Media Center Plus, and found both easy to understand and to use for a beginner. It's obvious that Jasc has spent a great deal of time on their help files. The following two paragraphs are a direct quote from them.

"Jasc Animation Shop 3.04 is a powerful yet easy-to-use program that creates animations from one or more graphic images and offers a wide variety of effects and transitions for enhancing animations. Used as a standalone application or as a complement to Paint Shop Pro, Animation Shop 3.04 allows users to easily create animations for use on a Web site or in a presentation."

"*Media Center Plus is a management and publishing program for*

Apple iPod for Windows

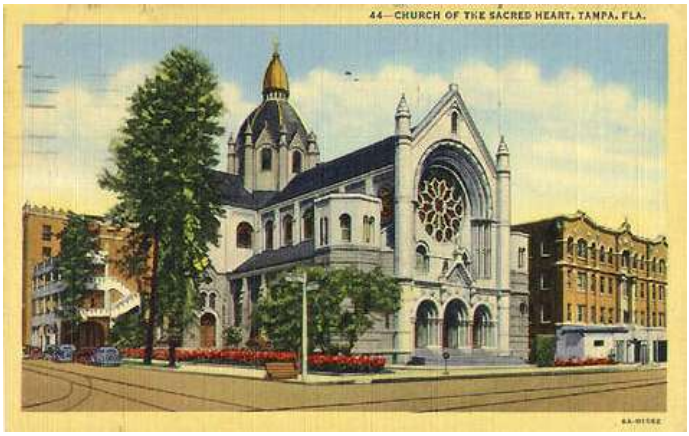
By William LaMartin, Editor,
Tampa PC Users Group
lamartin@tampabay.rr.com

To quote Apple: "In response to insistent demand from PC users, the world's best MP3 player now does Windows. iPod [is] fully integrated with the award-winning PC media player — MUSICMATCH Jukebox Plus™. So every song you add or playlist you create will automatically transfer to your iPod".

I have not bought anything from Apple since sometime in the 1980's, but my wife figured that our daughter needed one of these new Apple music players for Christmas. The Apple iPod can now be interfaced with a Windows computer, so non-Apple users can now download their filched MP3 music files into the latest cool gadget that costs just $300 - $500. The iPod comes in three versions: a 5 GB capacity, a 10 GB capacity and a 20 GB capacity. The more capacity, the more money. Additionally the 10 GB version, which is the one we purchased, is, I think, a new thinner style.

Unfortunately, we didn't read the fine print on the box, and the salesman didn't warn us about the requirements, so there was no iPod use on Christmas day. The iPod gets its music files from a PC, and the requirements for that PC (written in small print) are: Windows Millennium or higher and a firewire port. My daughter's computer is a 600 MHz Gateway running Windows 98 Special Edition. So the day after Christmas, it was off to the nearest place selling a PCI 1394 firewire card, CompUSA, where I bought the cheapest one I could find, a CompUSA branded one for $30 that had four 6-pin firewire ports. The card installed without a problem in the computer.

(iPod.....Continued on page 5)



(iPod……..Continued from page 4)

Note that all Windows operating systems from Windows 98 Special Edition on support firewire. Given this, I thought the Windows Millennium or higher requirement was probably not accurate. Well, upon trying to install the iPod software, which is nothing but MusicMatch Jukebox as best I can tell, I got the message that I was using an unacceptable operating system. It is a requirement of MusicMatch that the operating system be Millennium or higher. What to do? Well, there was no choice but to go find that copy of Windows Millennium Upgrade that I had bought for that very computer when Windows Me first came out but had never installed since everything seemed to be running fine and stable with Windows 98 SE. Also, I had another computer in the house running Windows Millennium that seemed to have a few problems that I suspected (perhaps unjustly) were related to Millennium.

But now I had no choice if I wanted my daughter to be able to use the new device. So I first uninstalled GoBack from the Gateway 600, since I recalled reading that you shouldn't install Millennium on a computer running the original version of GoBack because there would be problems. Then I installed the Millennium update, which went on flawlessly, as best I can tell. The only thing I really checked was to see if the local network still worked with the

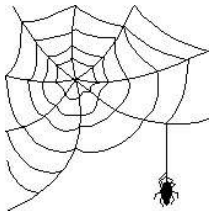
Internet Picture of the Month



Church of the Sacred Heart

at

http://thebestofusa.com/thrutheyears/

Thru the Years, is a collectables business with some postcards posted on the Internet. They have several from Tampa. One is of the Church of the Sacred Heart. It is described as follows: "This magnificent structure is one of the most noted Catholic edifices of the country. It is equally imposing within, the interior being fashioned along Gothic lines most attractively."

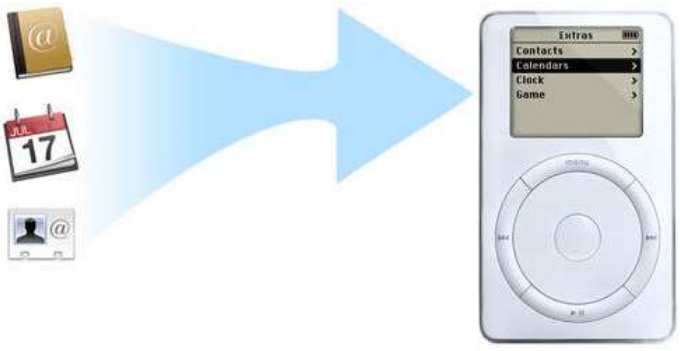
(iPod……..Continued from page 5)
new Millennium. It did.

I note, for those who dislike Microsoft, that installing the iPod software subjected me to more detailed registration requirements than I can ever recall having for a Microsoft product. For the iPod itself you have to enter its serial number (which you need a magnifying glass to read) along with detailed information about yourself. The MusicMatch software requires similar detailed information. One of them even requires your age—this is not a field you can omit. For the paranoid, what are the chances that the iPod serial number will be used track your listening habits—even if you decline to have MusicMatch, I think it was, monitor your listening habits so as to be able to better make suggestions for your listening pleasure?

Now, we were ready to connect the iPod to the computer via the new firewire port and download some music to the iPod. By the way, the printed instructions that come with the iPod seem minimal at best. In fact the iPod itself seems to be intentionally designed along some minimalist guidelines. There is an PDF file that will tell you what to do—sort of. And the MusicMatch program has a help section, but none of this is very detailed in my opinion. It took us numerous attempts to actually get files transferred. According to the instructions, all you have to do is connect the device to the computer, and it will start MusicMatch Jukebox and download the playlist in Jukebox to the IPod. Not. I finally accomplished this by having the MusicMatch software find the attached device and manually dragging the songs from the playlist to the device—like you would do when you are selecting files to burn to a CD.



The PDF manual does address this issue, I should admit. Under "When I connect my iPod to my computer, nothing happens", it says "Open MUSICMATCH Jukebox and choose "Download files to portable devices" from the File menu. You should see the iPod icon in the devices window."

If you want to listen to MP3s, the device is certainly good for this. The quality of the sound and the ease of use are good. Additionally for around $50 you can get a car charger and a cassette tape adapter which will allow you to play your iPod through your automobile's cassette tape player. And, I must admit, that having around 2000 songs available for your listening pleasure could make those long trips better.

Finally, one charge is good for about 10 hours on the iPod, and, as indicated above, the 10 GB version will provide you with around 2,000 songs based on the average length and compression of such MP3 files. Additionally, you can import your Microsoft Outlook contacts or your Palm Desktop's addresses to the iPod.

You may read about the iPod at Apple's site http://www.apple.com/ipod/. There are also other sites, like http://ipodlounge.com/, devoted to the iPod.

I think Apple devotees are upset with Apple for porting the iPod to the Windows environment. What I wonder is, a year from now, will the iPod for Windows be outselling the iPod for Apple. ◆

USB Woes

By William LaMartin, Editor,
Tampa PC Users Group
lamartin@tampabay.rr.com

It all started about nine days ago as I write this. I had purchased a USB 2.0 card to install in my main computer so as to better accommodate the 40 GB USB external hard drive connected to it. The USB 2.0 drive has been working fine for the past year connected to a regular USB port, just running much slower that it was capable of.

I followed the directions in installing the SIIG USB 2.0 card, using the provided driver instead of letting Windows XP Pro search for one. Note Windows XP Pro does not have a driver for USB 2.0, but Windows XP Pro Service Pack 1 does provide a driver. I have Win XP Pro SP1. Everything seemed to install fine, and a check of the external drive showed that it was transferring files between itself and the C drive about 10 times as fast as it did under a regular USB connection. Now, in addition to the four USB 1.1 ports that came with the computer, I had an additional five USB 2.0 ports that would also support USB 1.1. Real nice. No!

Always expecting the worst, after the installation I checked a few of my USB devices to see if they would connect OK. The Canon G1 camera connected fine; however, the HP ScanJet 5370C scanner had problems. Windows Device Manager said everything was fine with it, but none of the programs that used the scanner could find it. No problem. Just remove the scanner from Windows Device Manager, unplug it from the USB port and then plug it back and let Windows find it again. No good. I tried that several times to no avail. I thought about reinstalling the HP scanning software but decided that wasn't the problem since other software could not find the scanner—even though I could right click on the scanner in Control Panel and have a test run on the scanner where everything was said to be fine. How did installing the USB card cause this problem when the scanner wasn't even connected to the card? What to do? Things are pretty bad when a reinstall of the hardware doesn't bring things back to normal.

Then I thought, I am using Windows XP. It has a System Restore feature. Why not take the computer back to before I installed the card? I did just that. I restored the computer to the previous day. When the computer rebooted, it said that it had found new hardware—the USB 2.0 card (it wasn't there the day before)—and this time I let Windows use its own driver. And the scanner could now be found by all the programs that used it. Thank you, System Restore.

That was last week. Today when I booted the computer, I received the message that new hardware was found, a ScanJet 5370C scanner, and Windows was installing software for it. Uh, Oh. That didn't look good, and it wasn't. A quick check showed that none of my programs that used the scanner could find it. On checking Windows Device Manager, one thing was different: the scanner was now referred to as ScanJet 5370C #2. However, I couldn't find a ScanJet 5370C, which should not be the case if we had a #2.

Removing this device and allowing Windows to find it again produced nothing new. But I had an ace in the hole; all I needed to do was use System Restore to go back to the previous day. I did that, but the scanner still wasn't available. I went back several more days. Still no functioning scanner. I suppose the problem was that I really didn't know when last the scanner functioned properly because it had been more than a week since I last used it.

In desperation, I searched the Internet and the HP site for information. I found that plenty of others had received the error message that the scanner could not be initialized, but I found no solutions. While at HP I decided to download the latest version of the HP PrecisionScan Pro software and drivers for the scanner. But after uninstalling the old version and trying to install the new version I got the error message: "can't create output file:

(USB…….Continued on page 8)

(USB…….Continued from page 7)
C:\sj666\ENGLISH_ISDel.exe." I looked in the folder C:\sj66, and there were a lot of files there including the supposed problem file. So I just double-clicked on the setup.exe that was there, and the installation went ahead fine. I now had a new version of the PrecisionScan Pro software. But that changed nothing. It couldn't find the scanner either.

But I was beginning to understand the problem. It appeared that I had two copies of the scanner installed, ScanJet 5370C #2 and ScanJet 5370C. However, Windows Device Manager only listed the #2 one. And every time I deleted it, it came back. What to do. Well, in browsing the newly created folder C:\sj666 as part of the installation of the new version of PrecisionScan Pro, I noted that there was also a diagnostics sub-folder, and in that folder there was an executable, HPSysDig.exe. I ran it, and it produced a window similar to Windows Device Manager. But under Imaging Devices I now had listed the two versions of the scanner. I deleted the one without the #2. But the software still couldn't find the scanner. However, after a reboot of the computer, I now had ScanJet 5370C in Windows Device Manager, and the scanning software found the scanner (the #2 is only attached if there are two versions installed).

My question: Why didn't both versions of the scanner show up in Windows Device Manager as it did in HP's diagnostic program? Perhaps there is some setting in Win XP's Device Manager that keeps duplicate devices from not being shown unless you choose to display them. And why did Windows all of a sudden decide to install a second instance of the scanner in the first place?

You have undoubtedly heard enough about USB problems, so I won't go into how I trashed USB support and other things on my laptop and the troubles I had in returning things to normal. Suffice it to say that it has been a bad USB month here. ◆

Looking Back to 1993

From the February 1993 newsletter (the January 1993 newsletter had no local content)

SECRETARY'S REPORT
Minutes of meeting - 01/13/93
By: Ed Buzza

Instead of Jim Clark's scintillating coverage of what transpired at our User Group meeting, I did the best I could to record the proceedings. There were many topics of discussion and my 2k scratch pad memory barely coped with what went on. In another room, Don Patzsch conveyed some of his vast knowledge of modems to a group of interested, and appreciative, club members -- more classes to follow. Our indefatigable president called the meeting to order and spoke on a variety of subjects.

CLUB NEWS

- Membership annual dues. $20 for a single membership; $30 for a family membership.
- New membership benefit. A free raffle ticket will be given for each new membership or renewal taken at the regular meeting. For family membership, only the primary member (head of household) will receive a free raffle ticket.
- New computer. Through the very generous kindness of one of our members, who remains anonymous, the BBS now has a brand new 486-33DX Gateway computer. Also, our BBS is now equipped with a 14.4k bps modem. We are in the process of acquiring Desqview so that the Sysop can do some multi-tasking instead of having to wait in line to do some work on the system.
- Guests. Please tell your guests to PRINT their name and address when they "sign in" at the door. We send a sample newsletter to all guests but we do need a legible name and address for mailing.
- Christmas presents. Santa was good to our president this year. He got a Pro Audio Spectrum 16 sound board, with speakers. Prices for the sound board at various dealers in town vary quite a bit.

(1993…….Continued on page 9)

(1993…….Continued from page 8)
Highest was $239 and lowest (Workplace) was $197.

Harvey also shared with us his opinions and comments on The Video Blaster board which he is testing for his employer. The Video Blaster board not only shows TV on the computer monitor, it can also capture video images and save them to disk. But video capture takes up a LOT of space on the hard drive. Ten seconds of 8 bit color needs over 9 meg - and that is without sound

The video board is about $400 locally but only around $320 mail order. Our prez had a bit of trouble with these boards. What he thought was hardware or software failure was really due to one speaker being bad and one of the video jacks not working.

- Business news. Everex has filed for Chapter 11. In contrast, IBM is doing well with Value Point and with PS/1 computers. IBM now offers a 3 year warranty.

- Software news. EXCEL Ver 4 is really nice, Harvey was impressed with the new features. PageMaker Ver 5 is now available. Approach is a very good data base, user friendly, and easy to learn.

- Stacker. Stacker Version 3 is now shipping. Harvey had no problem with installing or using this package but others have reported trouble. The new version lets you stack across floppies. Best of all, Stacker is on the floppy so you can run it from there on a PC that doesn't have Stacker.

- PKWare. The new version of PKWare is now on the BBS. It does a better job on compression. One 400k tile was compressed an additional 60k. There have been problems reported using this version with OS/2, Desqview, and with QuarterDeck - from losing UMBs to the system being rebooted. Also, Norton AV needs an update (it gives a false virus reading).

- Membership benefits.

  1. A monthly meeting on the second Wednesday of the month. The meeting place is the IBM Customer Center, Lake Pointe One Bldg., 3109 W. Martin L. King Blvd., Room 450.
  2. 24 hour, 7 day access to Bits of Blue Bulletin Board.
  3. Monthly Bits of Blue Newsletter.
  4. Hardware/software demonstrations or presentations by vendors of major corporations or by User Group members.
  5. Donated software/hardware and 50/50 pool given away based on raffle drawing at the meeting.
  6. Library of shareware and vendor demonstration programs for copying.
  7. Various educational classes, e.g., Modems, BBS, WordPerfect, DOS, etc.
  8. Discounts at Sunrise Computer Supplies.

- Games. "Wolfenstein" is now passé. "Catacomb Abyss" is the latest thing. Also, "Heaven and Earth" is supposed to be THE game. As one member said, "It'll take you a year!"

PRODIGY

Kathryn Nakib, a Senior Marketing Representative from Prodigy Services Co., demonstrated some of the new features of Prodigy®.

It is the largest on-line service of its kind with over two million members. Prodigy can be described as sort of like cable TV for personal computers. Over 850 services are available for the base subscription of $l4.95 on a monthly basis. A yearly subscription averages out to about $12.95 per month. A subscription covers up to 6 members in a household.

There are a variety of Custom Choices that are available but at additional cost. However, you are told in advance that a particular service is an additional cost item before you enter that service.

9600 baud is available ($2/month) in a number of cities and is being expanded to other cities almost daily. The highlight screen has been redesigned and can be customized. Auto log-on is available and you can change your password. A version for Win-

(1993…….Continued on page 10)

Special Interest Groups

Microsoft Access SIG

This SIG meets the first Tuesday of the month at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6:30 PM. For information contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merlenic@tampabay.rr.com.*

Genealogy SIG

To be included on the TPCUG genealogy mailing list, contact Jenny Lind Olin at 960-5723, or *jlolin@tampabay.rr.com.*

Visual Basic for Applications SIG

This SIG meets the third Tuesday of the month, at the Gateway 2000 Store on North Dale Mabry Mabry (just south of Columbus Drive) at 6:30 PM. For information, contact Merle Nicholson at *merlenic@tampabay.rr.com,* or William LaMartin at *lamartin@tampabay.rr.com*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Kevan Sheridan moderates the dis cussion.

(1993…….Continued from page 9)

dows is due later this year.

BillPay USA is an added fee Custom Choice that lets you pay your bills through your checking account. The fee is $9.95/mo. for up to 30 transactions. Another Custom Choice is the Strategic Investor that shows information about stocks and mutual funds. Data such as quarterly and annual income, dividends, quick and current ratios, balance sheet, performance, etc., is shown and can be downloaded to your printer or popular spreadsheet, database or word processing programs; information on stocks incurs about a 15 minute delay.

There is no shareware download except through the ZIFFaet service. For an added fee of $7.50/hour, and a 4 cent/minute surcharge for 9600 baud, you can access PC Magazine, Computer Shopper and PC Computing.

The basic service has a lot of topics for almost every taste. The over 400 bulletin boards cover such topics as art, computers, education, food and wine, games, religion, seniors, sports and travel. EASY SABRE helps you find information about airline flights, schedules, amenities, and you can book a flight and even rent a car and make hotel reservations from your personal computer.

Electronic mail is available and is limited to 30 messages. After that, a fee of 25 cents is charged for each message. E-mail is held for you for up to two weeks. At this time, all messaging is done on-line; there is no facility to write, spell check and compose your messages offline.

DOOR PRIZE WINNERS:

Meeting Preview: According to our presenter, Gene Barlow, his presentation will focus on the following topics: How to Move to Windows XP; Backing up your Hard Drive; and Securing your Hard Drive. Windows XP has garnered a lot of attention this past year. Many users are looking for ways to move their computers to the new operating system, but aren't sure what is the best way for them to go. Gene will outline six ways that you may use to get to Windows XP. He will describe advantages and disadvantages of each approach. If you are thinking of going to Windows XP in the future, this is a presentation you will not want to miss. In addition, he will talk about his CD called "Discovering Your Hard Drive."

Gene will bring handouts and door prizes as well. Special user group prices on these products will be offered at the meeting and available to take home with you. It should be a super meeting. Bring a friend and don't miss it!

March Meeting Topic: To be announced. Possibly Digital Photography and the Computer

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

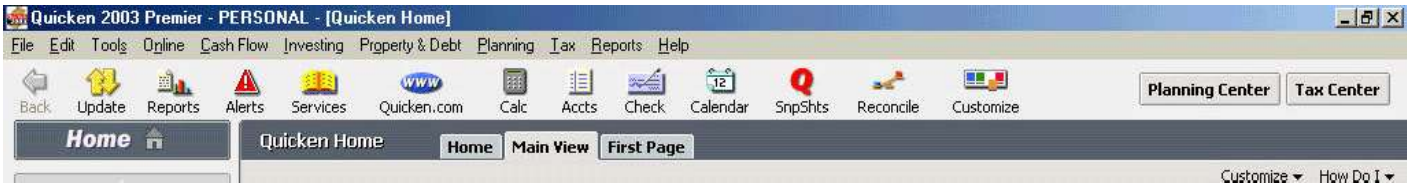
Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

apcug Member of The Association of Personal Computer User Groups

Minutes of the January Meeting

By Peggy Pulliam, Secretary,
Tampa PC Users Group
pegrance@yahoo.com

Announcement: FACUG (Florida Association of Computer User Groups) is having their User Group Expo -- Spring Conference in Kissimmee. Contact Mary Sheridan if you are interested in going and interested in expanding our group's activities. Who knows what all else they will provide besides fun and samples!



There was some discussion about ZoneAlarm, a system firewall. Apparently when it was deleted it didn't completely uninstall all its parts and remained to cause trouble blocking Internet access completely. If you are having a problem you can check at the "system configuration manager" on your computer and see what is running at startup. Then you can find it and get it deleted.

As part of the benefit of membership in TPCUG you receive the newsletter, can get a great T-Shirt with our logo on it for only $6.00 and attend two Special Interest Group (SIG) meetings each month.

We have Visual Basic SIG on the 3rd Tuesday each month at 6:30 at Gateway. We have Access SIG the 1stt Tuesday at 6:30 at Gateway. See the SIG report in this newsletter as to whom to contact to make sure the meeting is on and there is room before you plan on going! These meetings are very flexible and can cover your needs in these areas, just bring your questions. More people are always welcome at these meetings.

Our Feature Presentation was from Merle Nicholson on the "Pocket PC". An incredible little instrument. He showed exactly how to use it and demonstrated many of its features. It uses a lithium ion battery for indiscriminate charging, (You don't have to wait 'til it is really low before charging it for fear of developing a shorter charge span.) This little pocket pc records to wav files, has a docking station connector and smart media storage. You can even get a cell phone attach-

(Minutes……..Continued on page 12)

Quicken 2003

By William LaMartin, Editor,
Tampa PC Users Group
lamartin@tampabay.rr.com

Quicken is one of those program that gets a new makeover every year. I don't normally upgrade just one year after installing a version, but Quicken sent me the newest version for review, so I installed version 2003 over the version 2002 on my second computer where I keep Quicken. It installs fine over a previous version if you choose to install in the same directory. The space required for a complete installation is an unbelievable 156,832 KB, 156.8 MB. I whittled that down to 154.6 MB by not installing the Home Inventory, Emergency Records, Organizer and Debt Reduction features. The installation is fairly quick and requires a restart.

The installation dropped all sorts of shortcuts on my desktop—Quicken Premier, Built for Quicken (link to a Quicken Master Card), Get $50 at NetBank (when you open an account), Quicken Broker and TurboTax.com. I will remove all of these since I have no interest in them. For me Quicken is simply a program to keep track of my checking, savings, credit cards and a few investments. About the most exotic thing I do with it is use it to print checks from the computer. This is not to say that there is anything wrong with all the additional features provided by Quicken; it is just that I have no interest in them. Of course, all of these extra features aimed at investing and accessing your accounts online are, I am sure, of interest to others. In fact, at our last meeting several members mentioned how well they liked using Quicken to go online and update all of their accounts or to pay bills.

I have used Quicken since 1991, so I must be happy with it. There is a review of Quicken 98 and a review of Quicken 2002 at this site at the addresses http://www.tpcug.org/reviews/quicken98.html and http://www.tpcug.org/newsletter/nl_2002/january2002/quicken_2002.htm, respectively. You might want to look at the 2002 one since most of what is said there also applies to Quicken 2003.

Right off I found one improvement in moving from 2002 to 2003. Version 2002 seems to have had a bug in that on my computer and on the computer of one other person for whom I provide computer support, sometimes a text area would appear completely blank. On my computer, it would occur when reconciling an account. I would be, say, reconciling a credit card account and then switch from the reconcile window to the credit card register window, make a change in one entry and then want to switch back to Reconcile. Normally Quicken provides a little "Return to Reconcile" button within the register to be clicked on. But frequently in 2002 it was either not there or the text in it was missing. Knowing from experience where to click, I could always easily return to Reconcile, but to a novice user this could be a problem. That problem has so far not occurred in version 2003. There was another problem with 2002 refusing to automatically enter the payee's name when I wanted to print a payment check for a credit card account that was set up under 2002. There was no such problem with accounts set up using earlier versions. I will have to wait several weeks to see if that problem is solved

Of course, with each new version, you get a new user interface. Quicken views this as a plus since they have added features. But to a previous user it can be a negative until he or she becomes acquainted with it. Also, so much information is included that I don't see how it could be viewed on anything less than the 1024 x 768 screen I use. However, Quicken provides you with the ability to customize what you see. The program comes with three default views: Home, Main View, and First Page. You can customize these or add new views. So, I have just custom-

ThumbDrive SMART

By Larry Anders, Librarian,
Tampa PC Users Group
Larry@AndersNet.com

Every now and then some techy thing (or in this case 'trekkie' thing) catches my eye, and it happened again recently. While browsing through the CompUSA flyer in last Sunday's paper, I noticed an ad for something called a ThumbDrive SMART. The ThumbDrive SMART just happens to be one of the smallest portable storage units in the world. If our newsletter editor has left the size of the graphic to the right as it was the way I sent it to him with this article, then that is its actual size. It is about the size of a BIC lighter, only thinner, and it weighs only 12 grams. But… it holds 251MBs of data; any kind of data, including, but not limited to, music, documents, spreadsheets, pictures, etc.

You simply plug it into an available USB port and voila you have another drive that is assigned the next available drive letter. After that you treat it just like you would any other drive on your system. It is totally compatible with any Windows' platform (Windows 98 and 98SE need to have drivers loaded – which are included) or any Mac OS 8.6 and higher. You obviously also need to have at least one USB 1.1 (or higher) port. I just took my ThumbDrive out of its package, plugged it in and a "G" drive appeared.

It reads at 700Kb/sec and writes at 350Kb/sec. Not the fastest thing in the world, but I'm not complaining. No external power is necessary because the USB port powers it. There is a small status LED light to show drive activity and there is a small write-protect switch on the bottom in case you want to make sure your data is safe. I think the key word in this paragraph is "small."

If there is any disadvantage it may just be its small size. The cap or cover comes with a shirt clip so you can just clip it in your pocket like you would any pen or pencil, but it is so light you wouldn't notice it missing very easily. It also comes with a key-ring attachment, which may be the best way to transport it, unless of course, you have a habit of losing your keys.

There's not much more to say about it. It's really simple to use. I have been transporting CDs or ZIP drives between office and home for some time now, but not anymore. My bottom line cost will be $99 after my rebate. If want to see more about it go to: http://www.trekstorusa.com/thumbdrive_smart.htm and check it out, but it's more dramatic when you hold it in your hand. ◆

(Quicken……..Continued from page 3)

ized the Main View to get things the way I want them.

The first time I tried to reconcile an account, I ran into a problem. There was no Reconcile button on the tool bar, which in past versions you had to click to start the reconciliation process. I looked in Help; indeed you needed to click on the Reconcile button. But it wasn't there. However, there was a customize button there, so I clicked on it, and it provided a list of buttons that could be added to the tool bar. But there was no Reconcile button listed. What to do? As usual, I went to Google to see if others were having a similar problem. But that produced nothing. Later in the day, I clicked on the Customize button again, and again the list of available buttons did not contain a Reconcile button. However, this time I noticed a small check box at the bottom

(Quicken……..Continued on page 5)

(Quicken……..Continued from page 4)

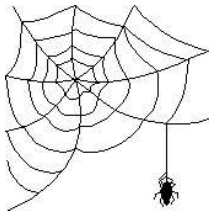
of the window that said "Show more items". A click on that produced more items in the available list—and the Reconcile was there, and I had my Reconcile back.

The Reconcile problem above is indicative of what is, I think, becoming a problem for Quicken. It is getting too complicated for many users. I can always figure out how to get done what I want to get done, since I have been using Quicken for 12 years and spend a lot of time with computer programs. But for the casual user all of these features and options, like adding or removing the Reconcile button from the tool bar, are a problem. In the past 12 months I have helped two people figure out how to use Quicken. They simply could not set up basic accounts and use them. These same people had somehow mastered Microsoft Word enough to write well-formatted documents. Possibly, however, the problem for them was not taking the time to read the instructions.

The most noticeable thing to me about Quicken 2003 is the continued push into the online world. They encourage you to use something called One Step Update. This allows you at one time to update all your accounts directly from their respective financial instructions, plus pay bills, transfer money, download stock quotes and export selected data to

(Quicken……..Continued on page 6)

Internet Picture of the Month



Bucs dominate Raiders 48-21, rule the NFL

In their 27th season, the Tampa Bay Buccaneers finally get to hold the trophy. Dominating on both offense and defense, the Bucs brushed off the feared Oakland Raiders 48-21 on Sunday in Super Bowl XXXVII for the franchise's first NFL championship in its first-ever Super Bowl appearance. The victory capped a season of team records set under the guidance of first-year coach Jon Gruden, who at 39 becomes the youngest coach ever to win a Super Bowl. Complete coverage in Monday's St. Petersburg Times.

In their local Tampa Bay competition, the Saint Petersburg Times online site had their online coverage, captured above, within minutes of the game's end. The rival Tampa Tribune responded much more slowly with theirs.

(Quicken……..Continued from page 5)

Quicken.com. All you have to do is to set this up with Quicken, agree to pay a fee for online banking (which I can't find - is it $9.95?) and then set things up for each financial institution that supports transaction download and online bill payment. You set all of this up from Quicken. Each request is passed on to your bank, credit card company or brokerage, and when they supply a user name and a PIN you are set to go with that account. Don't confuse this with going online to your bank using a web browser and viewing your accounts. All of this is done directly through the Quicken program.

To use a program like Quicken you need discipline. If you don't enter your data regularly, then it is of no use to you. The ability to get most of your information from your financial institutions via the web and the one step update is a plus here. Of course that will be of no use if you want to also track cash purchases and cash income. So Quicken will tell you as much as you tell it. It is a great tool for analyzing your finances—but only if you give it the data—and that can be a lot of work.

Once everything is set up, you can even pay bills while traveling if you have access to an Internet connection and a web browser. Additionally, it appears that you can upload as much as desired of your financial data to Quicken.com and also access it via a web browser. I must confess that I am not comfortable with that. I don't want all of my financial data stored anywhere but on my own computer.

To learn about the program, there is both a printed version and an Acrobat version of the "Getting Started with Quicken 2003" to offer you help, in addition to the program's help file. By the way, one contributor to the large installation size is an additional computer video explaining Quicken. In the past it seems that you accessed this on the CD. Now it is part of the installation.

Quicken Premier is $70; Quicken Deluxe is $50. Read about them at http://www.quicken.com. ◆

FACUG 2003 Spring Conference

By Mary Sheridan, Member at Large,
Tampa PC Users Group
mcpease@mindspring.com

It is time for the 2003 FACUG (Florida Association of Computer User Groups) spring conference. The conference is held in the Kissimmee Civic Center in Kissimmee, FL the weekend of February 28th. The three day conference is open to all computer user group members whether they belong to the FACUG or not. The conference is for the leaders of user groups to learn ways to be better leaders.

Conference registration fees are: $35.00 if postmarked by February 1, 2003, $50.00 if paid between February 1st and February 15th, $60.00 on site; nonmembers are $60.00 by mail and $70.00 on site. Tampa PC Users Group is a member of the FACUG, so the member's price applies.

Some of the topics of the conference round tables are: How to run a hardware SIG, treasurers' duties and responsibilities, new member orientations, working with retailers and vendors, personal digital assistants, running a user group, branding, building and maintaining a user group database, how the user group supports home computer networking, and creating a user group website and newsletters.

I am the treasurer of the FACUG this year and am

More Woes

By William LaMartin, Editor,
Tampa PC Users Group
lamartin@tampabay.rr.com

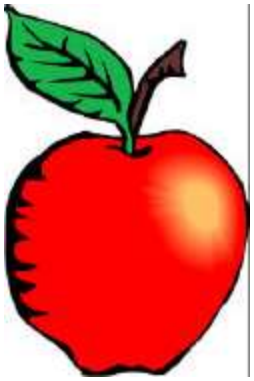
HP ScanJet 5370 Last month under the title USB Woes I mentioned how installing a USB 2.0 card caused me to lose my HP ScanJet 5370 C scanner and what I had to go through to get it back. Well, the scanner is functioning fine in normal flatbed mode. In fact, the Looking Back to 1993 article on page 9 was scanned in from an old newsletter using that scanner. But another problem has developed. What sort of month would it be without a new problem? There would be nothing to write about.

The HP ScanJet 5370 C scanner comes with a five inch by five inch transparency adapter so that you can scan transparencies or large negatives. (See http://www.tpcug.org/newsletter/nl_2001/january2001/ScanJet5370 Cse.htm for a photo of the scanner along with my original article about it.) In fact, scanning large negatives is the only reason I bought the scanner. It seemed like an economical way to scan the many large negatives I had of old family photos and the newer 6 cm x 7 cm negatives I had taken in years past. My HP PhotoSmart film scanner would only process 35 mm negatives, and the older HP iicx 14 inch flatbed scanner had no adapter to scan any negatives.

Unfortunately, I think, my negative scanning days with this scanner are done. After two years, I can no longer get the software to go into photographic negative mode. When working correctly, if you want to scan a negative, you put the negative on the scanner and place the transparency adapter on top of it. You then tell the software to use the transparency adapter, and the scanner turns off the normal scanning light and turns on the light in the transparency adapter. That still works, However, the option in the software to go into photographic negative mode stays grayed out—and nothing I tried like reinstalling the software, reinstalling the scanner, etc. did any good. So I sprung for a $25 talk with HP only to be told that it was a hardware problem, and the only solution is a new scanner.

I find it hard to believe it is a hardware problem, but in my research I have seen others say that HP told them the same thing. I think if the software were written properly that everything would be OK since other scanning software I have, called VueScan, can produce a pretty good result. It is a much better result than the HP software produces in just transparency mode. Unfortunately the VueScan software's result is not quite acceptable and my email correspondence with the author of VueScan failed to produce a solution. He answered one email, then no more. He is apparently harassed by too much email from the many people who have bought his software, and I got lumped into the group that are worth only one email.

So, I have a problem. I have, perhaps, 200 large negatives of my own still to scan, and I may come by more in the future from family members. I would like to eventually digitize these images. I have basically two options if I want to do that. Buy another HP flatbed scanner that has a large transparency adapter—a $300 - $500 proposition—which I am loath to do since I think they have made a defective item. Or I can buy a regular negative scanner that will accommodate large negatives—probably close to a $1,000 proposition. At present I am going to do nothing, since none of these negatives has to be scanned at this moment, and hope that an economical solution presents itself in the future.



Internet Explorer Problems What do you do when you need to download something from the Internet and your browser is kaput?

This all started, I think, with the installation of the .Net Framework on my laptop. You need to install the .Net Framework (the installation executable is 20.8 MB) in order to run programs written in any of Microsoft's new .Net languages. The installation went fine, only noting that my computer had an old version of the commctrl.dll which would be replaced with a correct version after I rebooted. After a reboot, I installed a program that I had written in Visual Basic .Net. Parts of it ran fine until I needed to access the accompanying database. Then I got the

(Woes……..Continued on page 10)

Don's Apple

By Don Patzsch, Tampa PC Users Group
patzsch@helios.acomp.usf.edu

About January 15, 2002, I ordered an Apple Mac computer from what I thought was an Apple 800 number. It probably was just a regular sales outfit. Judy, the saleswoman told me several things I do not believe to be true. The computer arrived at my home on January 22, 2002.

It is the largest and most complete Mac that was available at the time. About a week after the computer arrived, I saw an error message that said, "One of your two processors (CPU's) is bad, call for service." The computer was warranted for one year, parts and labor.

I decided to wait till a month had passed before I would call. If anything is going to go wrong with a new machine, I believe it is likely to go bad in the first month. I wrote to Apple people in California and kept writing for some time as I wanted to be sure I had a good trail of letters in case anything serious should develop.

It was about November 14, 2002, before I took the machine, with Apple's approval from headquarters, to the International Plaza Apple store to have the processor replaced. The serviceman went to his computer and looked up the record and told me he would replace both processors. (They are on a separate printed circuit board.) He did the replacement, and the invoice said $1,058.40 for the processors and $85.00 for the labor; total $1143.40. No charge to me as this was in-warranty replacement at the approval of the company offices in California by telephone and writing.

I bought the computer to find out for myself about the OS X (OS ten). That is one great program. Easy to use, and with practically no need to reboot ever. The operating system, OS X, is quite similar to Linux. Both are based on UNIX.

Because of all the conversation and letters between myself and Apple, I believe I have received a rebuilt computer. I do not believe Apple puts a date on the computer at the time of manufacture.

It is now January 15, 2003. My Mac does not function. I press the start button, the light comes on that indicates the machine is starting, and it immediately goes out when I remove my finger from the start button. I called the local Apple Store at the Int'l Plaza. They said, "Bring it in." I did, and the serviceman said he will repair it and it will be ready tomorrow. No cost to me. It was ready the next day, and the cost was $135.00 for labor and $630.00 for the new motherboard. Total $765.00 was covered under the warranty.

When you want to see into an Apple G4, you simply press the button, and the side of the computer opens down. All the power supply and other items not related to the motherboard are inside the cabinet, but the motherboard and associated parts are on the side of the computer that is lying on your table. This makes the access absolutely the best I have seen. Add a hard drive or memory and it is all open and simple to work with.

Now, what do I think of the machine, the G4? It is a great machine. It is fun to use, but not as fast as I was lead to believe it would be. It may be useful in the way I wanted, because the dual processors will prove useful when 64 and 128 bit programs designed for this feature become available. I expected to keep this machine for years, and I hope these programs are available later this year. Some have been out for a while, but they are intended for work of a greater complexity than mine.

P.S. If anyone is interested, I will write up a story on the details of how each OSX component works and how each computer program works with this Apple Mac G4. By the way, my IBM computers never give me any problems even though they are turned on and off as many as 10 times in one day. ◆

Looking Back to 1993

From the February 1993 Bits of Blue

PRESIDENT'S COLUMN:

A couple of members mentioned that they missed my President's Column in last month's newsletter. Thank you for noticing and stating so. Simply put, I was recouping from 1992 and the holidays which always include Food, Family and Fun. These are my favorite 'F' words. Of course there is one that I don't like, 'Financial debt' which is incurred during the holidays, then comes to visit me a couple of months later. Marylee always says it's better to give than to receive so I always make sure that I give myself something during the holidays. I am sure that's what CompUSA also thinks when they give me a bill for stuff I purchased for the holidays on my charge card. I certainly hope that the Holidays and Santa were good to each of you and your families.

At our December meeting I announced that one of our members had donated a computer to our group. The computer was a Gateway 486. This system has replaced our old 286 BBS PC which required TLC on a regular basis from Kevan to maintain its daily operation. Additionally, the 286 did not have expansion capability for future growth of the BBS without a premium investment. The board felt that it was not in the group's best interest to invest money into the 286. We had decided that the minimum system we needed was a 386/mhz with 4Mb of RAM and a 120 HD. All we needed was a generous donation from a vendor or more money in our bank account to acquire this PC. Neither occurred or would occur in a timely matter. However, out of the blue a PC showed up donated by an anonymous member. To date I am not sure who donated this system. Could it be Mr. or Mrs. Claus or even one of Santa's helpers? I don't know but the donation has revived my belief in Santa. I think he or she has retired in Tampa from the North Pole and is a member of group. Anyway, whoever you are, on behalf of our group I wanted to say — THANK YOU!

The elections are over. Hooray! Now we have a new president and an old president. The country elected Mr. Clinton as our new president and the user group elected me as the old president. This will be my 5th year as president. Trivia Question: Who has been on the board longer than me? I never thought in 1988 when I was first elected that I would do it beyond one year. Well, every year it gets better. I certainly would not have done it if we didn't have a staff of dedicated volunteers. Look at the names under the officers' section, seek these people out during a meeting or get on the BBS and tell them THANKS. They are the ones making this all possible. We have a new Vice-President this year. Tom Cone has been in charge of membership relations in the past. He will continue in that capacity in addition to his new position. Additionally, members are slowly coming forward and volunteering their services. We are extremely fortunate to have a good group of volunteers. Please join me in welcoming back Tom, Bill, Roger, Jim, Ed, Marylee, Larry, Kevan for 1993. Of course, we welcome and need more volunteers.

My goals for this year: 300+ membership, bulk mailing, formal Special Interest Groups (SIGs) including Windows, OS/2, DOS, word processing & spreadsheets. Other SIGs will be started as we get volunteers to run them. Additionally, we will implement a process for members to acquire free software based on a written review of the product. Vendors are willing to give full working evaluation copies of software to our group based on a written review. The board will implement procedures for this process soon. Presently our inventory of reviewable software includes:

- Lotus Organizer for Windows - Personal Information Manager by Lotus Development Corp.
- FASTLYNX - File Transfer System by Rupp Technology Corp.
- Adobe Type Set - Software Fonts by Adobe Systems Inc.
- Star Trek the Screen Saver for Windows by Berkeley Systems
- Express Publisher for Windows - Desktop Publishing w/ Text Appeal - Logo builder by Power Up

(1993…….Continued on page 10)

Special Interest Groups

Microsoft Access SIG

This SIG meets the first Tuesday of the month at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6:30 PM. For information contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merlenic@tampabay.rr.com.*

Genealogy SIG

To be included on the TPCUG genealogy mailing list, contact Jenny Lind Olin at 960-5723, or *jlolin@tampabay.rr.com.*

Visual Basic for Applications SIG

This SIG meets the third Tuesday of the month, at the Gateway 2000 Store on North Dale Mabry Mabry (just south of Columbus Drive) at 6:30 PM. For information, contact Merle Nicholson at *merlenic@tampabay.rr.com,* or William LaMartin at *lamartin@tampabay.rr.com*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Kevan Sheridan moderates the dis cussion.

(1993…….Continued from page 9)

Software Corp.

- KUI - Keyboard User Interface for Windows by Softac Corp.

If you are interested in reviewing products please contact me in order that I may add you to our list. Reviewers will need to meet the qualifications specified in the procedures written by the board before any software is handed out for review.

Last year I stated that in 1992 there would be a battle between IBM and Microsoft and their respective 32 bit operating systems. Windows NT and OS/2 were going to duke it out. It never happened because NT didn't ship. Now rumors are that Microsoft will ship a subset of NT just to get it to market in order to prevent IBM from slowly building an OS/2 following. While these two giants have been battling with their marketing machines, Novell purchased the rights to UNIX. It will be interesting to see if this group turns into the *Three Amigos*, *Three Stooges*, *Three Little Pigs* or just *Three's a Crowd*. Meanwhile the classic old DOS is fixing to be upgraded. If this OS is as good as DOS 5.0 was, bring it on Microsoft! As Ray Charles would say, "YOU GOT THE RIGHT ONE BAAAABY. UNH UH." DOS still works for the masses, and Mr. Bill (Gates) knows there is still money in it.

Harvey P. Bruneau ◆

(Woes…….Continued from page 7)

message that .Net required MDAC 2.6 or higher, that's Microsoft Data Access Components. I had MDAC 2.7 ready and waiting, so I installed it along with Jet 4.0, and my new application ran perfectly on the laptop.

Many people have objected to the size of the .Net Framework installation, but once it is installed it makes the .Net program installations much smaller, and eventually it will become part of many things that Microsoft installs, so it will automatically be on your computer.

What does this all have to do with Internet explorer (IE). Maybe nothing, but after all of the above I tried to access the Internet with IE and received an empty browser window with a message of Done in the status bar. Trying different URLs didn't help. A shut down and a reboot of the computer produced the same problem. I tested my Internet connectivity with ping and tracert. Everything was fine. It appeared that IE 5.5 was damaged, but how do you go to Microsoft's site to get a new version if your browser doesn't work. The solution was that there was an old version of Netscape Navigator still on the laptop. Feeling guilty, I used Navigator to go to the Microsoft site and install IE 6.0. In retrospect, I think I could have just used another computer to download the small setup program you put on your desktop and then clicked on to do the actual download and installation, transferred that program to the laptop and then ran the setup program. ◆

Meeting Preview: William LaMartin will present a program on digital photography. He will discuss how he uses both film and digital cameras and both flatbed and film scanners to acquire images and get them into the computer. More importantly, he will then discuss what to do with the images once you have them in your computer, focusing on the use of Adobe Photoshop and Adobe Illustrator.

Newsletter Change Beginning with the April newsletter we will no longer be using bulk mail to send out 200 plus copies. We will only be mailing the newsletter to our paid membership and a few special friends of the group using regular first class mail. When the group had 200 members, bulk mail made sense. As our membership dropped over the years, we padded the mailing list so as to stay above the 200 minimum for nonprofit bulk mail. But the board of directors has decided it is time to scale back and save a little money and a lot of effort. For those nonmembers who will no longer be receiving a mailed copy, you can, of course, still read the newsletter online at http://www.tpcug.org. ◆

April Meeting Topic: Dave Whittle representing Roxio

* * OFFICERS * *

President: Kevan Sheridan (president@tpcug.org) 988-6480
Vice President : John Witmer (JWITMER@Pepindist.com) 963-3760
Treasurer: Mike Hodges (mphs@aol.com) 962-2114
Secretary: Peggy Pulliam (pegrance@yahoo.com) 253-0438
Member at Large: Mary Sheridan (mcpease@mindspring.com) 988-6480

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members. Our mailing address is P. O. Box 3492, Tampa, FL 33601-3492.

However, for business concerning this newsletter, Bits of Blue, please contact the Editor, William LaMartin, at 821 S. Boulevard, Tampa, FL 33606-2904; 813-251-3817; lamartin@tampabay.rr.com.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII, Microsoft Write, Microsoft Word, or Word Perfect file to the editor at 821 South Blvd., Tampa, Florida 33606-2904 or to lamartin@tampabay.rr.com.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

The use of trademarked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

Minutes of the February Meeting

By Peggy Pulliam, Secretary,
Tampa PC Users Group
pegrance@yahoo.com

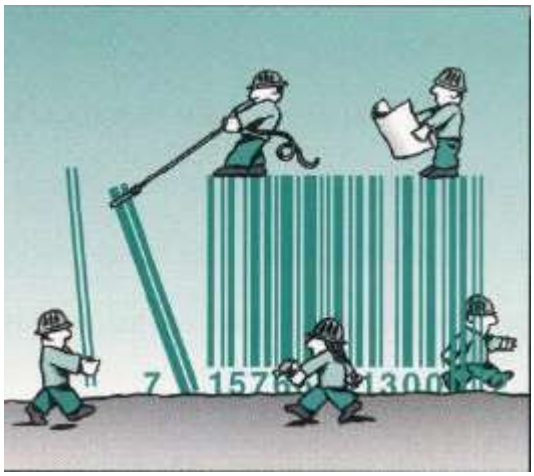
Did you know that the club gets a commission when you go to shop at Amazon.com by first checking in at our web site – http://www.tpcup.org – and then clicking on the Amazon link? Go there to shop for your books and other items that Amazon carries. Make a little note of it so you don't forget when the time comes.

You also get a discount at Comp USA if you use your TPCUG card. Now you may not have received a card, but send a request to mcpease@mindspring.com - ask and you shall receive, or so I have been told.

Our featured speaker was Gene Barlow - with Power Quest and Access Data. He and his wife were there, with some of their products available for sale. And after we heard what the products do, there were quite a few sales. Some members have been using these products for years.

Gene gave a great presentation of his products from his laptop. He had a separate external hard drive that was very small and demonstrated the ease of backing up and storing information off site, thus being prepared for the worst.

He talked about managing your hard drive "the heart of your computer system". A script of what we went over is on the web at
http://www.ugr.com/products.html



"Discovering your hard drive" is an informative CD he has prepared which is available to user group members for $20. An educational tool that makes getting people acquainted with computers a little easier.

Using the product Partition Magic, you can install a Windows XP upgrade in a partition for it separate from Windows 98. You then have two separate operating systems and can switch to one or the other as needed depending on the application you are wanting to use.

How About Those Bars?

By Ron Weinberg, Tampa PC Users Group
rswjbr@att.net

They seem to everywhere, bar codes. Coke cans, software boxes, furniture, car parts, mail, and a million more everyday and not so everyday items and places. The ubiquitous bar code is a modern day phenomenon that serves two basic purposes, identification and inventory control. They are the essential component of the (AIDC) Automated Identification and Data Capture industry.

For the PC user, amateur or IT professional, they are another very useful utility. Uses are virtually unlimited. Cataloging and tracking parts, hobby collections, retail or wholesale items, storage boxes, ID cards, tickets, work orders or other documents, luggage tags, etc., etc.

Groceries and general merchandise carry UPC bar codes which are controlled by the Uniform Code Council, an issuing authority. This is much like the way domain names are controlled. UPC codes are limited to genuine business applications. However, there are many other bar code symbologies freely available for use. Code 39 is one of many popular codes. Often they incorporate check digits to minimize errors.

Some of the new two dimensional (2D) codes are capable of containing vast amounts of information so that direct reads eliminate the necessity for any lookup files.

In this article I will not go into the technical specifications of each bar code, but rather I am trying to provide more general information to suggest using bar codes for your own needs and ideas.

To use bar codes you will need a scanner as an input device which can be plugged into your keyboard circuit and will deliver the scanned codes to your program and/or display screen. Other RS232 serial port and USB varieties are on the market. Scanners can be Laser, Light Pens, or CCD, the latter being safer and less expensive for amateur use. Today's sophisticated professional scanner gun is often wireless. Some may require a translator box (wedge) and power supply, others are self contained. The scanner is programmed to accept one or more type codes by scanning control code bars into itself. If you elect to use a specific code or unusual size label be sure your scanner has that specific capability.

Various bar code fonts and label stock are readily available for common PC printers. High volume users can purchase special bar code printers such as those made by Zebra.

A wide variety of off the shelf software is available. Two examples are LabelWorks, complete package, and Speedbar, which allows cutting and pasting codes. These programs can accept scanner input as if it were keyed in.

The basic concept is that the bar code acts as a key to a record in a file or database. The file can contain as much or as little related information as desired.

You will find bar codes not difficult to use and understand. They will allow easy access to data and offer solutions to many problems.

Much more specific information is available on the Internet or you may contact the writer through the Tampa PC Users Group. ◆

Ad-Aware

By Merrill Friend, Tampa PC User's Group
mfriendtampa@worldnet.att.net

I recently acquired a copy of a product known as AD-Aware 6. What it does is scan system memory, registry and hard drives for known spy ware and give the user the option of safely removing it from the computer. I heard about it from a column by Doug Stanley in the Tampa Tribune. The product is available from http://www.lavasoftusa.com. The basic program can be downloaded for free.

I was interested in the product because I wanted to know if any "bugs" had been introduced into my computer to spy on my internet activity and provide advertising activity or personal information to others. I was amazed to find that the software reported about five separate "events" where the Registry had been altered to provide information to others. There were another half dozen "data miners" implanted to mine information for advertisers. I was pleased to learn that this free software would enable me to remove all this information, including that which was in the Registry area. The software offered to back up or "quarantine" this information first so it could be replaced in the event something were to go wrong. So I went with the "quarantine" option and proceeded to delete all this stuff. As I proceeded with the free software I had a few moments when I wondered if I would end up with a non-functioning computer, but all went well. When I finished I looked at the list of newly quarantined items and rebooted the computer. It restarted and worked fine. After a few days I finally felt comfortable enough to remove the quarantined files altogether. The computer continued to function fine.

When the program first starts you have the options of using the default scan, of selecting specific drives or folders to scan, or of selecting a quick system-check, which scans the memory, Registry and Windows folder.

Other options provide for the creation of an "Automatic save-log file." This is needed if technical support is needed following an incomplete or improper removal. This file provides a starting point to determine what happened.

"Automatically quarantine objects prior to removal." This will back up and store all of the files automatically.

"Safe Mode." This option forces Ad-Ware to get your explicit permission prior to initiating any process or procedure.

Other flexibilities include options to:
"Scan within archives" – This allows the program to check compressed or backed up files.
"Skip non-executable files"- not recommended for an initial scan.
"Skip files greater than (x) KB"- Allows the user to define file size limits.

The "Memory and registry" section options are available to:
"Scan active processes"-
"Scan Registry"- This is a normal registry scan.
"Deep Scan Registry" This allows the program to scan the registry recursively.

If the user uses Internet Explorer, a separate option is available: "Scan my IE favorites for banned URL's." This option allows the user to locate and remove suspicious content from favorites.

Now I wanted to block new attempts by advertisers to implant these spy devices and learned I could have that, too, at a price. Ad-Aware **Plus** is available with **Ad-Watch**, which monitors your use of the Internet and stops all of the known advertising gimmicks from invading your computer. I say "known" because the software seems to work something like a virus detector and requires that you go online regularly to the Lavasoft site to update information on the latest spy ware trying to sneak a peek into your machine. The Plus version costs under $30 so I decided to spend the money on the upgrade. Ad-Watch also blocks pop-up ads, which is a feature I have long desired.

(Ad-Aware.....Continued on page 5)

(Ad-Aware……Continued from page 4)

Ad-Watch is a very intriguing addition. It can be set to load on Windows startup. It can then be set to operate manually or automatically. The program offers "real time accuracy." This determines the speed at which the program responds to detected items. This means how many different concurrent threads Ad-Watch will analyze. At the higher settings more CPU cycles will be required. Three settings are available.

"Basic"- lowest setting uses the least resources and is good for old or limited systems.
"Medium"- Mid range setting and a good compromise in intermediate systems.
"High" – Uses slightly more resources than medium and is recommended for modern systems.

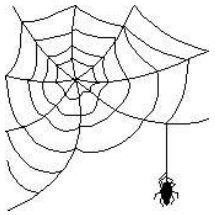
Other very useful options are:

"Lock startup sections in Registry - The startup (run) sections of the registry will be locked. No changes will be permitted.

"Block possible browser hijack attempts" – Stops suspicious files from attaching to and taking over the browser.

"Block suspicious processes"- Blocks all suspicious

(Ad-Aware……Continued on page 6)



Internet Picture of the Month

St. Paul's Episcopal Church
Edenton, North Carolina

This is one of the postcards from the site http://edenton.com/. The specific page is http://edenton.com/history/oldphoto/oldshow.htm. Edenton was the first permanent settlement in North Carolina and is a delightful place to visit if you like old places. If you can't make it in person, the site has 80 old postcards for viewing.

(Ad-Aware……..Continued from page 5)
processes on the system.

"Lock executable file associations" – Blocks (only) the most common associations (used by worms and viruses) so that they cannot stealthily change executable, shortcut and registry file associations.

Unfortunately, I am still getting more spam than I wish but much of that probably comes come from information gathered about me before I installed Ad-Aware.

Interestingly, this product is made by a Swedish company and is marketed in a number of European countries.

I understand there are two kinds of software used by advertisers: 1. Adware, which installs itself after you click "I agree" or legally consent to the software being implanted. Of course, if you didn't read and understand all the fine print before "agreeing" you may have agreed without being aware of it. 2. Then there is spy ware which may install itself without your consent. An article on the Internet recently indicated that this company distributed 4.5 million free copies of Ad-Aware. Those interested in more information on this subject might go to http://www.news.com and look for the article titled PC Invaders. Search under the name PC Invaders for the April 18, 2002 article. ◆

(Minutes……..Continued from page 2)
Backup your whole system before adding XP. Use a Windows 98 installation CD in the CD drive to get the XP upgrade to let you use the upgrade version; because of the partition it can't "see" Win 98 so you wouldn't be able to use the upgrade. Other than that, you won't have any trouble. Windows 98 takes 1 to 2 GB, Win XP takes 2 to 4 GB. He does his applications and data on separate partitions.

Another product we heard about is Drive Image. According to Gene, if you have been using computers for any length of time and you have not experienced a hard drive failure, you are lucky and rare. You want to back up. Collect a copy of everything (even the programs) in the hard drive and save it off the computer – even away from the building is safest. Backing up the data to another – external – hard drive monthly was demonstrated using a small external drive that Gene attached to his laptop. With Drive Image you can back up your hard drive in the same computer. If something gets corrupted, you have it right there. This kind of talk always makes me nervous because I know I don't have things backed up sufficiently, and I am one of the rare and lucky ones so far. I did lose everything in my Palm Pilot, though, so I have a mini experience to start me worrying properly.

The next products, Wipe Drive and Secure Clean, are used to keep the hard drive safe when you are giving it away for good. These get rid of all data and all traces of the data. Maybe you didn't know that information has been recovered from computers which had supposedly been cleaned and uninstalled professionally. These products will take it all off, or cover it over, so no trace can be found.

Gene donated door prizes: Wipe Drive and Partition Magic, and the Club gave a fancy T-shirt – so there were three lucky winners. If you weren't there, you know it wasn't you, but it could have been. See you at the next meeting. ◆

Presenter Gene Barlow

3D-Album® for Windows

By Larry Anders, Librarian,
Tampa PC Users Group
Larry@AndersNet.com

I'm not sure where to begin on this one except to say it's one of, if not the best, programs of this nature I have ever had the pleasure to use, and I do mean pleasure. Now that I have given you my closing remark, I guess I don't have to finish this article and can just tell you not to waste any more time and just go buy 3D-Album! But then our newsletter editor would be upset with me so I'll carry on about this excellent program for a few more lines.

I've been on a roll my last few articles talking about programs to make your digital images look better (quality-wise) and sharing them with the world. 3D-Album is not designed to make adjustments to your photos; however, it can take some of your worst photos and show them in a manner that no one will notice if they are bad or not. I guarantee that you will hear a lot of "gee-whizzes" or "how-did-you-do-thats" from whomever you "show" your picture presentations to. It's up to you if you let them know how easy it really is.

Micro Research Institute, Inc, the creator of 3D-Album, bills this software package as the "Ultimate in 3D *Photo* Presentation." I think they are short-selling themselves by just using the word *Photo*, because if you are like me, you have a collection of a lot of graphic images from all over the place. I think a better catch-phrase would be the "Ultimate in 3D Image Presentation."

3D-Album is quite graphics intensive, so there are minimum requirements that should be adhered to before trying it at first, which are:

PC with 200 MHz or higher clock speed.
Windows 98, 2000, ME, XP, or NT 4.0.
64 MB RAM with Windows 98, NT 4.0; 128 MB recommended.
128 MB RAM with Windows 2000, XP; 256 MB recommended.
3D video card with 16MB RAM or higher, supporting OpenGL.
800 x 600 screen resolution or higher.
24, or 32 bit color depth.
Sound card.
CD ROM or DVD Drive.

Now, these are minimums, and, obviously, the more the better.

3D-Album installs itself with 23 terrific 3D styles (presentations) to display your pictures with well over 50 other available styles for ***FREE***, just for the download on the Internet. Many software companies charge for additional templates, so FREE is good.

The program is designed with a Windows-type Explorer main interface, or maybe that's a Mac-type interface. Whatever its appearance, it is simple to use and easy to figure out without having to read a lot of instructions before making your first creation. And I like that! There are 12 album style categories such as **Album**, which actually has automatic (or not automatic) album-flipping pages, **Cube**, **Photo Frames**, **Movies** and **Seasonal** (including holiday) themes, to name only a few. Under each of those categories are several (depending on if you downloaded all of the FREE extra styles like I did) choices.

I may be getting a little ahead of myself here. The easiest way to see what is available when you first start using 3D-Album is to first make sure the **Preview** button is clicked, then click Organize and select the folder with the images you want to present. In this area, although 3D-Album itself doesn't concentrate on editing your images, it will load your favorite editor for you if you want to make some changes. Now choose the presentation style you want to use. When a style is chosen, a section at the bottom shows the options you have to customize the presentation styles of each to your liking. The presentation area is also where you can add background sound such as MP3, WMA, WAV or MIDI. When you are satisfied with your presentation, click on **Build**. Now you have to choose what kind of presentation you want to create. Here are your choices.

(Album……Continued on page 8)

(Album ……..Continued from page 7)

Application – This will create an .EXE file that can be run on someone else's computer as a stand alone application, even if they don't own 3D-Album. You can also create an auto run CD that will show your presentation automatically by just inserting it into the CD-Rom drive.
Screensaver – Build a screensaver to use in Windows.
HTML start page – All the files are created to be added to a website to literally show your presentation to the world.
Zip file for emailing – Everything you need to prepare your presentation to be sent by email.
Self-expandable .EXE file for email – This file will automatically extract itself when it is received by the email recipient.

Although this may sound extremely simplified, don't let the simplicity fool you into thinking the presentations aren't professional-looking, because they are. The full software I just discussed sells for $39.95 direct. If you're not interested in web page design, email functions and are not suddenly going to become a professional presentation maker, you can get a limited edition copy for just $8.95 (http://visvivasoftwareinc.goemerchant7.com/). There is also an add-on by Visaviva Software Products for $19.95 called **Animation Capture** that will produce video outputs to MPEG, WMA, AVI and RealPlayer from 3D-Album software output. With the proper programs (like Nero - or other programs I have written about recently), these Animation Capture outputs can be exported to VCD or SVCD that can be played on your household DVD player and viewed on your TV. If you'd like to see some demos of what can be easily done with 3D-Album go to: http://www.3d-album.com/demo/index.html and check them out. This is not the first version of 3D-Album, so it is a tested program. There is also a Frequently Asked Questions page with just about everything you may ever need to know about 3D-Album.

It's not too often that a program comes along like this with all the features, ease of use and priced to fit almost anyone's budget. I highly recommend you add this software package to your collection. I also highly recommend that when your friends say,"Gee-whiz,

(Album ……..Continued on page 12)

Looking Back to 1993

From the March 1993 *Bits of Blue*

SECRETARY'S REPORT
MINUTES OF 2/10/93 MEETING
By: Jim Clark

WOWeee!!? If you were not at this meeting, you missed a REALLY GOOD ONE!! . Corel Corporation was good enough to send a lovely and efficient rep to give us a presentation on CorelDraw. And we had a big turnout, with many guests. Don Patzsch and Kevan Sheridan were conducting their very popular modem class in another room while our user group meeting room began to fill. By the time our meeting started shortly after 6 PM, the room was just about full. The folks attending the modem class found few seats left when their class let out at 6:30, and some had to stand or sit on the floor. But it was well worth the inconvenience.

CorelDraw is a large and powerful program, and it takes considerable time to just touch on its capabilities. Our illustrious Prez wisely chose to keep other normal meeting activities to a minimum to allow as much time as possible for the presentation.

INDUSTRY/CLUB NEWS

- Word Perfect 5.2 is on the market; one member reported that at the $34 upgrade price it is an excellent bargain, especially since it includes Adobe Type Manager 2.5. WP 6.0 is expected to be available this summer.

- PageMaker 5.0 will be on the street soon and the reviews of the program have been very good.

- MS DOS 6.0 should be out in a couple of months. It will include a compression program that some believe is very similar to Stacker, the creators of which are suing Microsoft.

- Gateway continues to be a leader in computer sales, but many report their sales are growing faster than their capability to provide technical support. Some report that it is very hard just to get through to them, and with their taped leave-a-message answering facility, it is harder to be able to talk with anyone. But it is also reported that when you finally get to talk to a human, you are given excellent service. Gateway says it is working on the problem and is adding many new support lines and some 75 additional tech support personnel. Look for tech support at Gateway to improve.

(1993……..Continued on page 9)

(1993…….Continued from page 8)

- Harvey reported that a premier issue of PC Novice magazine is available at many of the computer stores - like Comp USA, Work Place, Office Depot, Computer City - that contains a lot of basic PC info. It is free at Comp USA (and probably at all the locations) and is a worthwhile pickup.

The vendor presentation scheduled for March is Lotus SmartSuites.

PRESENTATION -- CorelDraw

Corel Corporation was kind enough to send a knowledgeable and professional representative -- Denise Zutrauen -- to give a presentation of CorelDraw 3.0 to our User Group. And the turnout for the presentation -- like the program --was quite good.

CorelDraw 3.0 is a Windows program. I have never used CorelDraw nor any other similar graphics package, so I have no basis for comparison. As CorelDraw users already know -- it is a very powerful program and it seemed to me that it can do just about anything that one might want to do in the way of creating graphics and presentations. I can't imagine anything one might want to do with text, for example, that this program will not do -- bearing in mind, of course, that CorelDraw is a graphics package, not a word processor (though it does include spell-check, hyphenation, columns, a thesaurus, and other word processing features). As Denise noted, she could spend days covering all the features of the program; I do not propose to even cover the highlights of this very powerful program in the limited space of this newsletter.

Denise stated that CorelDraw consisted of 12 applications, and it does. From a user standpoint, however, I would say it has four major applications -- Draw, Chart, Photo-Paint and Show for illustration, charting, bitmap editing, and presentations -- with the other 8 applications supporting these majors. The other 8 include:

CorelTrace, which allows bitmap graphics (photos, etc) to be converted to vector graphics; CorelMosiac, a visual file manager which gives the capability to preview application files, view Kodak Photo CDs, print catalogs of artwork and Draw files; Capture, which allows the capture of anything created in CorelDraw and export as a .WMF; and Show Run-time, which gives the capability to run presentations on computers that do not have CorelDraw installed.

Version 3.0 uses TrueType fonts, but will support the proprietary fonts used in the previous CorelDraw versions. It imports text from all the major word processors and PCX, TIF, EMP, Al (EPS), GEM, PlC, HPGL, CGM, PIF (GDF), PICT, WMF, GIF and TGA graphic formats. It will export in these same formats, as well as EPS, SCODL, WPG and TTF. It will export in color and gray-scale, with user definable resolution, and it has a 24-bit color capability. CorelDraw includes over 150 True Type fonts, over 4500 clipart images and symbols, and a host of templates, bitmaps and special effects. A bonus CD that comes with the package includes 250+ True Type fonts and 12000 clipart images and symbols, along with more templates, animation flics and CorelPaint samples. It is also network ready.

The program appears to be well connected with consistent and intuitive interfaces and appears to be relatively easy to learn. It uses roll-up menus throughout and reportedly includes excellent context sensitive online help. And, it supports OLE, DDE and MDI.

The program requires Windows, of course, and it will reportedly run on a 286, but I suspect it would be quite slow. A minimum of 4 MB of RAM is required, but here again, the more the better. A minimum loading of the program would take up 12 MB of hard disk space, while an installation with all the bells and whistles would consume 30 MBs. If you load it on a machine using Windows 3.0, then you must have Adobe TM 2.0, which is not included with the CorelDraw package. A mouse or tablet is required, as is VGA or better video.

One in the audience asked about any problems of compatibility between CorelDraw and compression programs such as Stacker. Denise responded that they had received some calls reporting varying problems, but there had been nothing consistent in the problems, not out of line with problems reported with other interfaces. Others in the audience reported no problems in using CorelDraw with Stacker.

Denise stated that Corel was expanding its technical support and training in several ways, including providing more fax and mail support, and training on CorelDraw at outlets throughout the country, as is now provided at Comp USA in Tampa.

The CorelDraw graphics package lists for $595, but is available at local outlets for $395. I do not take those numbers lightly, but there sure is a lot of capability in the package.

Denise and Corel, a great big THANK YOU for a super presentation of a super powerful program, and for Corel goodies you left with us. We are more enlightened on and impressed by your program -- CorelDraw 3.0.

(1993…….Continued on page 12)

Special Interest Groups

Microsoft Access SIG

This SIG meets the first Tuesday of the month at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6:30 PM. For information contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merlenic@tampabay.rr.com.*

Genealogy SIG

To be included on the TPCUG genealogy mailing list, contact Jenny Lind Olin at 960-5723, or *jlolin@tampabay.rr.com.*

Visual Basic for Applications SIG

This SIG meets the third Tuesday of the month, at the Gateway 2000 Store on North Dale Mabry Mabry (just south of Columbus Drive) at 6:30 PM. For information, contact Merle Nicholson at *merlenic@tampabay.rr.com,* or William LaMartin at *lamartin@tampabay.rr.com*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Kevan Sheridan moderates the dis cussion.

AND THE WINNER IS

Thanks to the generosity of Corel Corporation, Powerup Software, and Sunrise Computer, along with the 50/50 cash drawing, there were some very nice raffle prizes. Those among us to have the good fortune to win are as follows:

Ron Mipth	Copy holder/Disk cleaner
Ana Elliot	Corel ArtShow 3
Joe Esposito	Corel ArtShow 3
D. Gaigano	Express Publisher
John Witmer	Corel SCSI Software
Philip Tyrgansk	CorelDraw 3.0
Mel Flynn	50/50 ($93)

The meeting adjourned at about 8:40 PM ◆

April in Tampa

A Monthly Publication of the Tampa PC Users Group, Inc.

Vol. 16 No. 4 April 2003

Meeting

Whittle's Picks

Wednesday, April 9, 2003
6:30 PM
Art Pepin Hospitality Room
Pepin Distributing Co.
6401 N 54th St
Tampa, Florida

Meeting Preview: David B. Whittle, author of *Cyberspace: The Human Dimension* and named by *Working Woman Magazine* as "one of America's most original technological thinkers," will be our presenter.

The topic will be **Whittle's Picks - Quality Software Products Anyone Can Use.** Mr. Whittle will demonstrate or introduce products of general appeal to computer users, including hidden gems from Comdex and from companies with outstanding, innovative technologies, including Intel, 3D Album, Muvee, iSeeMedia, Alpha Software and Creo. There will be a question and answer period, as well as door prizes and special product offers. Non-members of the group are invited to attend and take advantage of this special opportunity. ◆

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members. Our mailing address is P. O. Box 3492, Tampa, FL 33601-3492.

However, for business concerning this newsletter, Bits of Blue, please contact the Editor, William LaMartin, at 821 S. Boulevard, Tampa, FL 33606-2904; 813-251-3817; lamartin@tampabay.rr.com.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII, Microsoft Write, Microsoft Word, or Word Perfect file to the editor at 821 South Blvd., Tampa, Florida 33606-2904 or to lamartin@tampabay.rr.com.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

The use of trademarked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

apcug Member of The Association of Personal Computer User Groups

Minutes of the March Meeting

By Peggy Pulliam, Secretary,
Tampa PC Users Group
pegrance@yahoo.com

At the meeting we welcomed several visitors and went straight into a presentation of digital photography.

Digital Photography involves:

1. Taking the picture, so you will want to have a digital camera or pictures you've already taken. You can visit a site at http://www.dpreview.comto see digital camera reviews. In the meantime you can scan pictures into the computer from the supply you have in shoeboxes already.

2. Getting pictures into the computer, straight from a digital camera or disk or storage device. You can visit http://www.luminous-landscape.com for techniques and opinions.

3. Doing something with the pictures. What we saw was about step three--the "digital darkroom" --using Adobe PhotoShop. This was incredible. You can change the background, fix the coloring and the red eye. You can fix them a little or a lot. The features we saw show how to layer the picture so you can change one part of the picture, make it look like the picture was taken in a completely different location by changing the background, or the person can be adjusted to look like they are holding something other than the puppy, for example, by changing just that portion, and you aren't losing the picture you already had! Nor are you adjusting all the layers of the picture, fascinating. Many professional looking possibilities are also available if you were to use PhotoShop Elements, without the complications and costs of the real professional PhotoShop software.

Our presenter was William LaMartin. He prefers a digital camera that uses the flash card for storage of the pictures and says that Epson makes the best consumer photo printer but developing and printing at the local processors or drug stores is also a way to get some pictures done while you are contemplating what type printer you want to get.

We learned how to take the red eye out and balance the lighting in the picture, better the complexions, even make a person look pounds thinner! He had a butterfly moving around and landing on a flower too. A collection of photos from the back yard was transformed into a panorama of the backyard.

By the end of the evening, William had adjusted a photo of his lovely daughter, transforming her into something else; with purple hair, wider eyes, puffy lips, altered eye color and I'm not sure what all else. I was glad to see that the main picture was still there and the altered one could be saved or not! I vote "Not". There

Need to buy a new PC and do not know what to buy?

By Mike Hodges, Treasurer, Tampa PC Users Group
mphs@aol.com

Do not feel alone. Free enterprise is still very evident in the PC market and one can spend easily between $500 and $6000. So what to do? How can one feel comfortable within this dynamic market environment where technology is moving so rapidly. Very few of us, I believe, fall within any real predefined requirement. So I believe the first rule of the road is not to be in a hurry and at the same time do not dilly dally excessively as the PC technology is rapidly evolving and so is the overall market place. If you are like me, given time, one can do a thorough or close to thorough due diligence and then feel comfortable that you have made the right decision. If your decision is purely based on price you do, however, face a predicament.

I will start with the premise that you still have an operating PC but are becoming disenchanted with what you currently own and are looking to move up-market for any one of a variety of reasons. Since early 1998 I have been churning data on my basic Pentium I, 300 MHz based machine. I am connected by DSL and all is well with fast downloads and good graphics on a sizeable 13" diagonal display. My major concern has been hard drive space and a lack of general inter-connectivity. I recently bought an all-in-one-printer/fax/scanner and again ran into problems. It turned out that my USB port on the basic Pentium Intel-based IBM ThinkPad 600i series laptop PC running Windows 98 standard early edition did not even have the USB port enabled. For me this was the last straw, and my 12-month desire to upgrade was now a firm requirement. I had been forever, it seems, attempting to free up space on the 2 GB hard drive and the overall performance of internet connections were forever throwing up the message "out of disc space, run Cleansweep now!" I had been frequently going to my computer and left clicking on the C drive icon and then selecting Properties to see how little spare hard drive space was available. Sometimes only about 150 KB and sometimes 25 MB of space was inhibiting rapid internet downloads.

So as I do not upgrade but maybe every five years I needed to list my requirements. I am not a gamer and therefore did not need the fastest gun in the West but believed I wanted to be in the high speed range in order to feel respectable. I needed as much hard drive space as affordable. I needed another laptop as I anticipate much business travel in the next few years, as in my past five years. *I wanted good connectivity, I had burnt out many modems in the past at various hotels. I wanted a full Microsoft Office package and I wanted to own my own CD burner and a good DVD reader. I was not as yet too familiar with the latest wireless connectivity rage but wanted to be ready to leap with grace when that segment stabilizes in the next 12 months. Therefore, I wanted a laptop that was at least wireless enabled.* OK, I was now ready to espouse a plan of action.

1 Determine basic and optional requirements
2 Read as many magazine articles as could be found
3 Survey all the advertised specials
4 Get online and search each vendor's latest offerings and prices
5 Get some learned advice from peers
6 Get some hands-on before making a final decision.

Fortunately when you buy infrequently, price for me was not a limiting factor as long as I did not feel pressured or rooked. However, I was not sure that I needed another laptop as the one I had is still quite functional as long as I do not attempt to stash any more software on it or lash it up to any additional external devices. Maybe I could manage with a desktop, save money and have plenty of future expansion capability and use my ThinkPad on the road. So my decision making was temporarily impaired, and I extended my search across both laptops (now called notebooks) and desktops. Finally I decided that I would forever be wishing I carried an elegant notebook with me when on field assignments and that maintaining data across two machines would be somewhat burdensome. So I finally was able to focus on the "notebooks" and not the desktops. So next I sat in the local library and read computer magazines from cover to cover. On the net at CNET, the Dell Inspiron 8250 was the favored PC whereas, in the PC World magazine, the Gateway 600X was the highest rated. I read the April 2003 edition of PC World that sells for $6.99 in the bookstores. However, when you use the library you are required to read the latest editions without removal from the library and as a consequence they do not sit by your recliner for weeks awaiting your attention. On Sunday 23 March, the Sunday papers advertised over 30 separate PC's. I went to Office Depot and obtained their computer sales brochure to round out my survey. Initially I was concerned that Compaq and Gateway may not survive many more years in the marketplace. However, I had read that Dell support was generally not the best.

OK, this saga is now fast coming to a close. I include with this article my survey of 35 machines as advertised on 23 March 2003. A funny thing is that on 30 March I could only find brochures from Best Buy and Circuit City with the Sunday papers, and each of those had far more coverage for TV's and only a few PC's compared to the previous week. In the previous week CompUSA, Staples, Best Buy, Circuit City and others advertised extensively. Beware, as the stores attempt to make up packages that are as different as cheese from each other and therefore direct comparisons are extremely difficult. I surveyed Dell, Gateway, IBM, eMachines, Sony, Toshiba, Compaq and HP brands. Most of the offers require multiple supplier discounts that the buyer has to request in the form of rebates.

I decided I would visit the Gateway store at Columbus and Dale Mabry and the Dell kiosk in Citrus or Westshore Malls. At the Gateway store many notebooks were on display including the 15.7" display 600X model. I then went to the Dell kiosk in Westshore Mall and was informed that the 8500 would not be available for display until mid-April and that the 8200 series was

(New PC……..Continued on page 4)

(New PC……..Continued from page 3)
not available either as it had been discontinued in favor of the non-available 8500. Gee, fortunately before my outing to the retail outlets I had set my sights on the Gateway on account of the PC World article. The Gateway sales guy printed me out a quote that again was different from the PC World configuration but was more in line with my detailed requirements as he ascertained them to be. The Gateway store was a happy, comforting experience, and my machine has been ordered and I expect delivery within a week. Gateway promises 13 days, but I expect the machine will be out of Taiwan and on my doorstep by 4 April. I do believe I will be happy, and I know I am relieved the search is ended.

Finally, before committing myself and considerably armed with as many facts as I could collect, I sought out advice from my peer group members. Fortunately, being a member of the TPCUG provided a number of knowledgeable types on which to call. Our esteemed editor being the final point person I called from the Gateway store parking lot and received his green light on my final choice of PC.

The computer's specifications are:

- Gateway 600X with added options
- Processor: 2.2Ghz-M (M means it runs cool)
- Memory: 512MB DDR SDRAM (Single module, readily upgradeable by adding another 512MB)
- Floppy Drive: Modular 3.5" (Many other manufacturers have discarded the floppy drive)
- Hard Drive: 60GB Ultra ATA...add $75.00
- Optical Drive: 24x/10x/24x CDRW and 8x DVD Combo
- Expansion slots: Two type II or one type III PC Card slots
- External Ports: 2 USB, IEEE 1394 (FireWire), SVGA, Parallel, Serial, PS/2
- S/PDIF, NTSC/PAL Video Output
- Operating System: MS Windows XP Professional
- Application Software: MS Office XP Professional...add $220.00
- AntiVirus Utilities: Norton Internet Security with Belkin Surge Kit…add $70.00
- Screen: 15.7" SXGA TFT Active Matrix
- Video: ATI Mobility Radeon 9000w/64MB DDR Video memory
- Extra Mouse: USB Optical Mouse…add $20.00
- Multimedia Package: SoundBlaster Pro Stereo Speakers and Microphone
- Battery: High Capacity Lithium Ion with AC Pack
- Modem: Integrated V.92.56K
- Network Adapter: Integrated Intel PRO 10/100 VE Network Connection
- Internet Service Provider: One year AOL internet access
- Wireless Networking Adaptor: Integrated 802.11b Wireless

(New PC……..Continued on page 10)

FACUG Spring Conference

By Jenny Lind Olin, Tampa PC Users Group
jlolin@tampabay.rr.com

The 2003 Florida Association of Computer User Groups (FACUG) Spring Regional Conference met February 28 - March 2 in the Kissimmee Civic Center, Osceola County, which is near Disney World. I have attended several of these annual meetings and find they are well-planned events. If you make your reservation before the deadline, the event is very financially reasonable. The FACUG Spring Conference is a wonderful time for meeting other computer-oriented people and exchanging ideas. It seems somebody always has a success story to tell, or they are excited about the upcoming program that they are planning.

When I walked in Friday night there was a small buffet of crudités (fresh veggies) and chips with dip, cheese bites, and similar pickings, plus drinks. I was a little "taken back" because I thought the plan had reverted back to the Friday night dinner. In the past there was a very pleasant dinner evening -- good food, a presentation, and at least one really neat "give-away" item. I didn't need to worry. There was, indeed, a very nice dinner and presentation sponsored by Adobe that night.

Times have changed and the freebies are not so forth coming, but the Spring Event is really a bargain if you just consider the food you get. Never mind how hard it will be to work off all those calories. If nothing else, we were very well fed. The large round tables of ten very friendly people gave us an opportunity to exchange ideas and just get to know other groups better. Everybody seemed to be in a good mood, especially at meal times.

The theme this year, which has been a trend for several years, was digital processes. I have to admit it is about time I bought a digital camera and tossed out my Brownie. I could then get started removing red eye (a process that has progressed from A to Z in the past few years), making first time photos look professional by manipulating the background, changing the lighting, and touching up old photos now by copying "patches" and pasting them in flawed areas, and organizing photos in computer albums, to name a few. All are very sophisticated processes using today's new software.

A new vendor this year was Smart Computing Magazine. All received their latest issue and a couple of the door prizes were annual subscriptions, a notebook with a collection of the previous year's issues, and a Smart Computing hardcopy encyclopedia. If you attended the November 2002 general meeting of the TPCUG, then you will recall Kevan Sheridan's presentation on Smart Computing Magazine. We saw an updated version of that presentation. During the demonstration of the Smart Com-

(FACUG.....Continued on page 5)

(FACUG…….Continued from page 4)
puting website, someone suggested they create an Internet Explorer toolbar add-in for directly searching the Smart Computing website and they seemed very receptive to that idea.

At another session, this vendor also conducted a roundtable session on their user group program. Their demonstration program changes often so expect to see another demonstration before long. Smart Computing Magazine has a program that requires the User Group to have a link to their website: http://smartcomputing.com If five members subscribe to one of their magazines, then the user group gets a free subscription.

Microsoft, the time-honored and well-loved vendor, did several presentations during the weekend. They had their problems as their shipment went to another address and never made it to Kissimmee. The Microsoft agent, Alan Chitlik, had recycled his cardboard boxes and had left an old address on one side of the box. Guess which address Federal Express used. In spite of Alan's sharing his thoughts with Federal Express, they were not willing to overnight the package so it was scheduled to arrive at the civic center the Monday morning after the conference. Alan still did an excellent job with his presentations.

One suggestion I would make for other meetings of this type is to coordinate some of the gifts. Microsoft gave us shoestring type lanyards which held a ballpoint pen. We had a pen in our FACUG bags but I could never find mine. A pen around my neck would have been more convenient. Microsoft doled these out Sunday afternoon, but they would have been better used if they had been in the canvas tote bags we received as we checked in at the registration desk. These bags were sponsored by Borland, Comcast, and Cerious Software. Also, Apple gave us all a large notebook at the very end, and

IconUtils

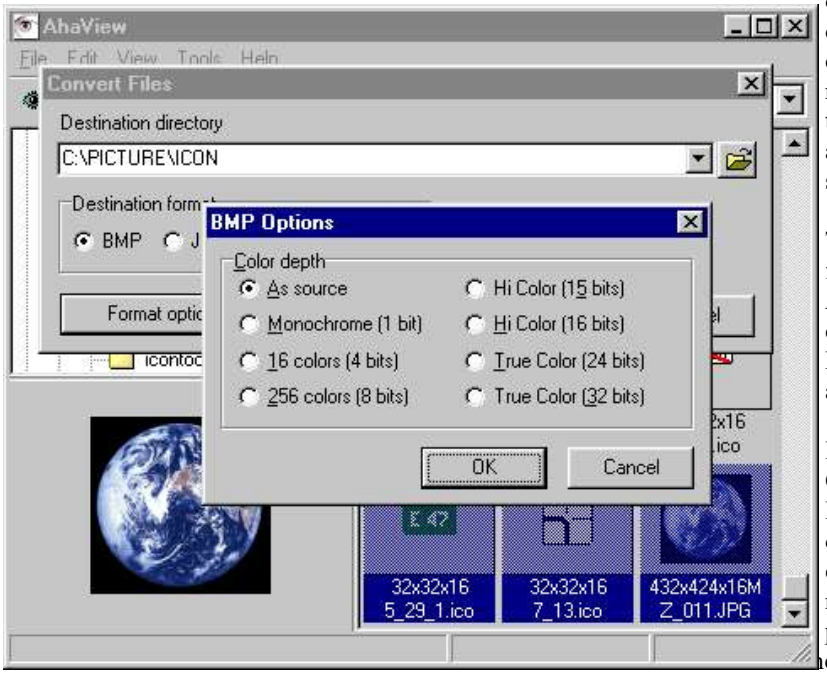
By Bob LaFave, Tampa PC users Group
boblala@ij.net

IconUtils is a software suite that includes the five separate programs that I will describe below. With ***IconUtils*** you can create your own unique icons and cursors or customize existing icons and cursors. You can also take images and convert them to icons or do the reverse and convert icons to graphics images. This gives you a unique look and feel so you can tailor your desktop icons and display various folders uniquely so that you can distinguish them at a glance. ***IconUtils*** is priced at $54.95 as a download from Aha-Soft at http://www.iconutils.com.

AhaView is the first program listed in the start menu and would be $19.95 if ordered separately. ***AhaView*** is a picture viewer and converter that supports all popular graphics formats, including JPEG, GIF, PNG, BMP, ICO, CUR, ANI, WBMP, XPM, XBM, PSD. The viewer has a directory tree that you can scan to a folder that contains supported formats, a thumbnail section that displays all items found, and a small area below the directory that shows a highlighted item in a slightly larger view. You can browse images in thumbnail mode and do various graphics manipulations such as Copy, Rename, Delete, Convert and more. You can then double click any image and go to a full screen view of any picture, and if needed you can browse the other files in the folder as a slide show. I found it easy to use since it is very similar to both ACDSee and IrfanView, which I have used in the past but liked that these five programs in ***IconUtils*** together take up very little space, 7.70 MB compared to ACDSee taking up 6.71MB and IrfanView 5.39MB. I also believe it displays it's thumbnails faster when large quantities of graphics, icon, or cursor files are viewed.

Any to Icon is the next program and is also listed at $19.95 online as a download. ***Any to Icon*** is an icon converter that allows you to convert BMP, JPEG, GIF, PNG, WBMP, XPM, XBM, PSD and WMF images to Windows icons. You can convert single graphics or you can batch process all files in a folder and can break down entire icon libraries into individual icons. Icons can be extracted from libraries and some file types such as exe, DLLs, cpl, and more. The program is similar to a wizard in that you progress from selecting the graphics or library and point and click till you create the final desired icons. As you progress you are given the choice to change color resolution and size to create your customized icons.

ArtCursors is the next program in the *start menu folder* and is available as a single download for $29.95. ***ArtCursors*** is a cursor editor, cursor library manager, and cursor creator. You can find and edit single cursors or you can import, export, manage and create cursor libraries. Libraries are multiple cursors contained in a single file name and allow simple file storage. ***ArtCursors*** can create and edit static and animated cursors with color depths to up to 32-bit True Color, and you have different paint tools, including gradient fills, to customize to your hearts content. You can also convert graphics images to cursors and import cursors from icon and library files. This program workplace is set as a grid canvas that allows for easy creation or customization of cursors. I was able to create a simple arrow pointer in minutes.



ArtIcons Pro is next and can be purchased separately online as a download for $29.95. ***ArtIcons Pro*** is an icon editor and icon library manager that does for icons what ***ArtCursors*** does for cursors. You can find, create and edit icons or import and export icons, both single icons and libraries. As with the cursors, you can also import, export, create and manage icon libraries. The icons that you create or edit can be of variable size and color depths up to 32-bit True Color, and it supports the new icon format in Windows XP. The tools are much the same as in ***ArtCursors*** with the same toolbars showing each tool name as you hover your mouse over each tool, and you can change effects, such as rotation gradient and fill. You can convert graphics images to icons and import icons from cursor files or from library files. You can scan files and folders for icons and arrange icons into libraries.

(ArtIcons…….Continued on page 7)

(ArtIcons…….Continued from page 6)

Icon to Any is the last included program and is $19.95 if you wish to purchase it separately as a download. This program is pretty much the reverse of ***Any to Icon*** that is described above. ***Icon to Any*** starts with Windows icons and cursors and converts them into graphics images, either BMP, JPG, PNG, GIF, ICO, CUR, WBMP, PSD, XPM, XBM and RC formats. It also has a wizard style interface, and it's very simple to process multiple files at once, plus you have control over size and color (again True Color 32-bit) and pick in which format to save it.

The online site had a ***FREE*** download page with icons, cursors, and graphics to download. There are ***Libraries Samples*** so that you can figure out what they are. You can also order specialized icons from them of your own design, but I think that with these five programs and a little bit of time most users will be amazed at what you can create on your own. I have no artistic abilities and easily customized and created icons and cursors. Overall, I found each program easy to use, the ***HELP*** sections explained each process I tried and did so quickly. I had no problems downloading or installing ***IconUtils*** or figuring how to begin each operation. Each is similar to other programs I have used over the years and most users will be comfortable with these programs. If you like to individualize your computer then this would probably be just the program you would need and would enjoy using. ◆

(FACUG…….Continued from page 5)

it would have been nice to have it at the beginning so we could take notes during the presentations. Maybe it doesn't make as much of an impression to receive it when you register, but the longer we have it in our possession and use the gift, the more time we have to become aware of the vendor. I am certain that Office Depot, another helpful vendor, would be able to give notebooks of maybe a smaller size that could be included in the tote bag.

I was very impressed by the websites roundtable session. During the session the leader was able to bring up several club websites and critique them. He suggested minimizing the graphics so they will load faster. He was not thrilled with animated graphics on the website. He loved having a menu visible on each page so the navigator could move around and especially get back to the beginning. He suggested the counter was not necessary and suggested the webmaster contact the provider to furnish them with the statistics concerning their website. One suggestion I thought of afterwards was suggesting all members use the user group's website as their homepage default.

Ken Bundy of Lake Wales, Ridge Computer Users Group, was the leader of the session on "Running a User Group." He had some very good ideas. One I especially believe is that groups need to train members to perform as officers and ultimately be prepared to be the president. Another was to have the board members listening and reporting on suggestions and comments from the membership. He said his officers all wore golf shirts of the same color at the meetings. Thus all officers are recognizable by any visitor. One club used different colors for the name tags, one color for officers, one color for volunteers, and one color for the regular membership. One club gave their volunteers those neat wallets that you can wear around your neck and use for a name badge. One club gave pins the shape of the state of Florida for a year of volunteering.

The Saturday afternoon vendor panel consisted of the following seven vendors: Peggy Ireland, APCUG; Alan Chitlik, Microsoft Mindshare; Scott Sterns, Microsoft O/S Interaction Team; Kevin Moulder, Office Depot; Peter Bloxam, Comcast, Brian Bess, Comcast; and Ken Torres, Comcast.

I was impressed with the attitude of the Charlotte County Personal Computer Users Group. They had an Expo planned for the following weekend, so they were donating all the gifts they won at the FACUG conference for the benefit of their upcoming event. They needed as many prizes as they could get for door prizes. They have a wonderful community facility to their event - sharing the proceeds with them. They also have the same problems that other clubs have in that not everybody will allow them to hang their posters which they are

Looking Back to 1993

From the April 1993 *Bits of Blue*

Secretary's Report
MINUTES OF 3/10/93 MEETING
By: Jim Clark

I must say at the outset that our Prez, Harvey Bruneau, is doing a great job. I thought it was another great meeting!!

That the meetings are always enjoyable and productive is in large measure due to the efforts of our Prez. It seems that Harvey always has arranged a super presentation either by a major vendor and/or by one of our own on a new program and/or one of current interest to our group. And he brings many items of interest from the industry to us each month. Behind the scenes, as well, he pushes to make our group ever better. He receives support from a small, but great group of people who serve in some official capacity in our group: Maiylee Bruneau, our editor, who puts together a super newsletter; Tom Cone, our VP, who most know as a pleasant and helpful greeter at our regular meetings, but who also helps in so many behind-the-scene ways; Kevan Sheridan, our SYSOP, which is a time consuming and challenging task, has done a great job maintaining, improving and expanding our BBS; Bill (William) Fuller, our treasurer, who has done a super job taking care of the group's finances and books, and is so helpful in many other ways--Good luck, Bill, you will be missed; Roger Waters, our Member-At-Large, who does what needs to be done; Ed Buzza, Education Director, who helps us all learn more in classes he conducts or arranges, and on a person-to-person basis anytime, anywhere; Larry Anders, our librarian, who not only does a great job of maintaining our software files but also contributes to our group in so many creative and helpful, but, unsung, ways.

It is due to the efforts of these folks that our group continues to produce a useful and enjoyable product, and continues to grow. It takes a lot of time and effort on their part -- and I, for one, REALLY APPRECIATE IT. Don Patzsch, an active member, is currently doing a bang-up job with a comprehensive modem/BBS class that he has been conducting. (I have wanted to take advantage of that class, but other responsibilities have taken priority so far.) Arranging and conducting this class has taken a good bit of Don's time and effort -- the classes don't just happen automatically. A GREAT BIG THANKS to all of you!!

INDUSTRY/CLUB NEWS

In the rather limited time available for general discussion -- the meeting had started a little late and time was needed for the rather large program that was to be reviewed -- a number of items of interest were bought up, including:

- There was a discussion about discounts provided to members by CompUSA. See the President's column for additional information.
- Harvey reported that his organization (a Dun & Bradstreet company that provides human resource and financial applications to corporate clients) is now using Microsoft's WorkGroup for Windows and it is proving very helpful for them. It is an addition to their network system and is used primarily for internal communications and exchange of data. If you have a multiple-computer office, you may want to investigate the program and what it might do for you.
- There was considerable discussion of Stacker 3.0, started by one who reported a number of difficulties, including compatibility and other computer problems. However, there were no other problems reported from the many other Stacker users among those present. Harvey reported problems with decompressing a drive, a new feature with Stacker 3.0. I run SuperStorPro, which also includes the decompress feature, rather than Stacker. I note in my manuals that the decompression works only with drives compressed by the program, inferring that drives compressed with earlier versions cannot be decompressed with SuperStorPro -- but I haven't tried it. That may be the case with Stacker 3.0 as well. A question was raised about the impact of compression on speed. The answer was that there appeared to be no discernible degradation for normal operations; while decompression does take time, that time is offset by the smaller size of files that have to be read and written. One reported the only noticeable degradation was in the time required to load programs, such as D-Base. There seemed to be consensus among those who spoke that they were reasonably happy with their drive compression program.

PRESENTATION - Impov For Windows

Lotus Corporation was good enough to send to us a knowledgeable representative, John O'Loughlin, to give us a preview of Lotus's new program, Improv For Windows. I must tell you at the outset that I am not an expert on spreadsheets; my experience is limited to use of a 6 x 6 matrix a couple of times.

They term Improv their new "Dynamic Spreadsheet for Windows" with "Functionality Beyond Traditional Spreadsheets." Though John really tried to explain to me what they meant by dynamic, I can't describe to you what they mean by dynamic. My copy of Webster dictionary says dynamic is, "full of force and energy; active; potent." I would have to agree with that definition as a description of Improv. It is a very powerful program that appears to be quite user friendly (that is probably what they mean with "intuitive"). John whipped up new spreadsheets in just a few moments; manipulated with ease the data in just about every way one could imagine, including responses to questions from the floor, "Can you do thus and so?"; and created almost instantaneous charts. Among the many features of the program that give it "Functionality Beyond Traditional Spreadsheets" are:

- Dynamic viewing that lets you rearrange and edit data instantly with drag and drop; hide, show, collapse and expand capability; and switch from flat to 3-D multi-page mode.

(1993……..Continued on page 9)

(1993…….Continued from page 8)

- User defined English language formulas which are stored separate from the data and can be applied to many cells at once -- being much like styles in a word processor, it makes for much easier creation and editing. And the formulas are very easy to create -- a few selections using the mouse and,Walla, there it is.
- Multi-dimensional spreadsheet modeling with the capability to analyze up to 12 categories of data, each of which can have up to 63,999 items and allows linking and saving up to 100 worksheets in a single file.
- Innovative user interface with a floating panel that lets you instantly view and set colors, fills, line and text styles; edit and drag & drop any object on screen; right button Quick Menus; smart fill of familiar worksheet categories (years, months, dates, etc.); SmartIcons for common Improv commands; status bar that provides quick access to fonts, formats, styles and other basic attributes.
- Flexible formatting/printing/reporting; includes Adobe Type Manager, with 13 scalable fonts, and uses True-Type fonts as well; print preview to verify page layout and appearance; complete page setup formatting, including headers and footers; portrait, landscape, fit-to-page and scaleable printing options.
- Develop applications with state-of-the-art tools, including L scripting language record and playback scripts which can be edited and attached to icons or presentation objects; Application Programming Interface (API) toolkit; and Lotus Dialog editor to create custom user interfaces to Script programs.
- Supports DDE and OLE client and server for smooth integration with other Windows applications, and it reads/writes WKI, WK3, XLS(4.0) data, formulas, numeric formats and styles.
- Professional creation of graphics quickly and easily, selecting a range of data, pick a graph type from over 20 major chart and graph types, including 3-D bar and pie charts, rotate 3-Ds for the best angle, create and print multi-page presentations, hot link multiple charts and worksheet tables, and annotate presentations with text, images, other drawings and OLE objects.
- It is reported (and appears to be) relatively easy to learn. In addition to context-sensitive menus and Quick Menus, and the simplicity and ease of creating and editing/manipulating spreadsheets, it also has context-sensitive help and an "Exploring Improv" quick-start guide.

Hardware/software requirements for the program are: 386SX/20-class or higher computer (with 33 MHz desired), Windows compatible displays (VGA resolution desired) and printers, 4 MB RAM minimum (with 6 desired), Windows supported mouse, Windows 3.1 or later, and 10 MB of hard disk space.

What does this wonderful package cost? List is $495, but there is a special introductory price of $99 that will be good until May 31. As a limited special, John is making available to members present at the presentation a copy of Improv for $49 using a limited number of controlled coupons he is providing our Prez (members present had to sign-up for this offer); the coupons will be available at the next meeting.. Those members not present at the meeting should watch the BBS, or check with an officer at the next meeting to ascertain if the $49 offer has been extended to all members desiring a copy.

To Lotus Corp and John O'Loughlin, thanks for a wonderful presentation of a great program, and for your generosity with the programs and the special pricing for Improv. It looks like to us that you have another winner.

AND THE WINNER IS

Thanks to the generosity of Lotus Corporation and Sunrise Computer, along with the 50/50 cash drawing, there were some very nice raffle prizes. Those among us to have the good fortune to win are as follows:

William Coleman	Disk cleaner & Mouse Pad
M.M. Marteny	Lotus Organizer (2)
David Geiger	Lotus Organizer
Ed Buzza	Lotus Organizer
Luis Vergara	Lotus 1-2-3
Kevan Sheridan	Lotus 1-2-3
Kit Kelley	Lotus Freelance Plus
John Waldon	Lotus Ami Pro
Ed Buzza	50/50 ($85)

The meeting adjourned at about 8:40 PM ◆

(Minutes…….Continued from page 2)

might be a need for that with some pictures, or maybe a Halloween poster, you never know.

The presenter said that he was not an expert with PhotoShop and had much more to learn--if he only had the time. He has begun a project to scan in all his old photos and get them into some order and a meaningful collection. He's also created some special portfolios of photos from the neighborhood where he lives and the photos of plants and flowers that he has taken.

The other software, Adobe Illustrator, gives you the ability to create designs, your own greeting cards and many other graphic ideas in which you may incorporate your photos.

Lucky winners at this month's meeting took away four great door prizes: A copy of Photo Shop Elements, Photo Gallery clip art, an old laptop computer and a copy of Spell Catcher. ◆

Special Interest Groups

Microsoft Access SIG

This SIG meets the first Tuesday of the month at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6:30 PM. For information contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merlenic@tampabay.rr.com.*

Genealogy SIG

To be included on the TPCUG genealogy mailing list, contact Jenny Lind Olin at 960-5723, or *jlolin@tampabay.rr.com.*

Visual Basic for Applications SIG

This SIG meets the third Tuesday of the month, at the Gateway 2000 Store on North Dale Mabry Mabry (just south of Columbus Drive) at 6:30 PM. For information, contact Merle Nicholson at *merlenic@tampabay.rr.com,* or William LaMartin at *lamartin@tampabay.rr.com*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Kevan Sheridan moderates the dis cussion.

Hewlett Packard's Inkjet Cartridge Recycling Program

By Jim Purcell, Tampa PC users Group
Edward_J_P@MSN.com

This program provides customers with an environmentally responsible solution for disposal of end-of-life HP inkjet cartridges. The program enables HP to recover recyclable materials and responsibly dispose of non-recyclable residuals.

HP works with some of the most advanced recycling resources in the world to recover usable materials from their used inkjet cartridges. The recycling process is unique to HP inkjet cartridges and includes steps for grinding, separating and recovering plastics, stainless steel, and precious metals such as gold and silver. All HP inkjet cartridges except those from DesignJet 2000CP, 2500CP, 3000CP and 3500CP are included in the program. There is a separate program for LaserJet cartridges.

HP will mail prepaid envelopes to you which will hold up to two cartridges. They also will provide prepaid boxes for mailings of more than thirty cartridges. To obtain your prepaid envelopes you can visit the HP web site at http://www.hp.com/recycle or call 1-800-340-2445. ◆

(Comments…….Continued from page 1)

and mail via first class postage the newsletter to only our membership and a few friends of the group. If you are satisfied with reading the newsletter online and don't particularly care to read the hard copy of the newsletter and would be just as happy to not receive a mailed version, contact me to have your name removed from the mailing list. That would save the group about $.70. However, the newsletter is a benefit of the group, and everyone is entitled to a mailed, printed version for as long as we print and mail one.

You will note that most of the articles in this newsletter are set at 10 point type, whereas in most recent newsletters most of the articles were in 12 point type. There is a simple reason for that. I got more material than I bargained for when I begged and re-begged for articles this month. On Friday, I had one article; over the weekend I got several more. For that I am very appreciative, but can't we all do this just a few days earlier. This last minute editing is running me ragged.

I also want to thank the members who currently help me assemble the newsletter. They are Jenny Lind Olin, Wade Herman, Jim Purcell and Lew Kaminga. ◆

using to advertise their Expo.

Times are changing and it is quite evident by the lesser number of vendors available at the conference, the lack of vendors sponsoring the conference events, and the lesser amount of software that was given away. I wonder if the responsibility is ours, the club or the individual, in that we need to encourage more software purchases by our members. Could we accomplish this by providing a means of learning to use new software through general meeting presentations, classes, and SIGs?

I really enjoyed this spring conference and hope to attend more in the future. The registration was close to 200. That tells me there was a real interest across the state in the conference. What little disappointment was expressed came from those old-timers who have been spoiled by the generous software gifts that have now dwindled. Part of the fun was seeing the familiar faces and learning new ones. If you have never attended a FACUG conference, you might want to plan to experience a great weekend next year about the first weekend in March. I will see you there. ◆

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

apcug Member of The Association of Personal Computer User Groups

Minutes of the April Meeting

By Peggy Pulliam, Secretary, Tampa PC Users Group
pegrance@yahoo.com

This month at the Windows Special Interest Group, held just before the special speaker part of the monthly meeting, we discussed the little arrow to the right of the "back" button of Internet Explorer. It shows you where you have been surfing. If you have never clicked on that arrow, try it sometime. Alt F4 closes the current window. That's a good thing to know, too. Other difficulties with Windows were discussed, and the other members present provided lots of solutions.

Each of us at the meeting received a copy of "Computer Link Magazine", a magazine customized for the local Tampa Bay area! See http://www.TampaComputing.com for more information on that.

WINDOWS XP is the PRIZE FOR NEXT MEETING!! All you need (if you win) is 200 MHZ, 64 MB Ram, 16 MB Video Ram. Be sure to come to the meeting May 14th; you can't win if you don't show up, that is for sure.

Our speaker for April, Dave Whittle with *whats4me.com,* introduced us to many interesting types of software and exclusive User Group prices, too. He searches for, finds and presents groups with the coolest and latest software coming out. I'll tell you some of what he showed us, but without the showing part you miss some great ideas of ways to use your computer.

3D Album - by Micro Research Institute. Incredible visual effects for displaying your photos in a slide show. Sort of like walking through the space age or a museum with your pictures in the place of the famous ones.

PhotoVista 2.0 and Photo Vista Virtual Tour - by iSeeMedia. The first creates panoramas from a series of photos, automatically stitching the scene together correctly. He had some wonderful family travel pictures to demonstrate it. The Virtual Tour creates interactive web sites. Dave said some famous websites use that software, like Porsche and Lexus and Tiger Woods. That's worth taking a look at for a little demonstration of the product.

He showed us Alpha 5 Version 5 - by Alpha Software. The newest release of the database product that manages information. Ease of use and learning seems to be the big pull for Alpha 5. It was a smooth demonstration of the program's capabilities. If you weren't there, you can contact them to find out more because it's hard to describe, but clubs and churches and other groups could really use this.

One other piece of software, Six Degrees - by Creo. This software is a desktop application for Microsoft Outlook users. After

(Minutes……..Continued on page 9)

HP's Media Center 854n PC & Windows XP Pro Media Center Edition

By Larry Anders, Librarian, Tampa PC Users Group
Larry@AndersNet.com

Well, last month I finally retired my 3+ years old Gateway computer that I had been upgrading since it was about 6 months old and decided to look for something new. I had been using Windows XP Pro on both my home and office computers, so I knew I would settle for no less than Microsoft's most stable architecture to date. While shopping around, I happened into CompUSA at the very time they were setting up a new line of PCs by HP. This new PC also had a new superset of XP Pro installed called ***Windows XP Media Center Edition (MCE)***, hence the name of my new computer, ***HP Media Center 854n PC.***

I had read some pre-introductory promotional info on MCE, but I did not realize it was already out to the public. [I don't usually look at computers when I am shopping because I don't want to see how outdated my current computer already is.] The 854n is actually a 2nd [or maybe 3rd] generation MCE computer by HP that is $300 cheaper than its predecessor, the 873n. I'm not sure what is different between the systems other than some speakers and updated software, but the 854n seemed ready for prime time, and so was I. My last two PCs have had internal TV cards, but they were never fully integrated into the operating system like this setup.

Gateway actually sells a similar model with MCE that comes with a 42" flat-screen monitor that can be set up in the family, or TV room. We already have a large-screen TV in the family room so I settled on a 19" Samsung flat-panel monitor instead, sold separately from the PC itself. But my computer is directly behind the wall my TV sits against so I have plans to go through the wall directly into the TV once I get all of this new stuff figured out. Then I can watch, or listen to whatever is played on my PC on the TV in the family room.

The HP 854n comes with more bells and whistles [and additional software] than one could imagine not too long ago. It has an Intel Pentium 4, 2.53 GHz processor with front-side bus speed of 533MHz. It also comes with 512MB of DDR SDRAM [expandable to 1GB with one open slot-which I did]; a 120 GB hard drive; a DVD+RW/CD-RW combo drive and a 48x CD-ROM drive [which I immediately replaced with a 52x CDR/RW drive]. The DVD writer is 2x and the combo CDR portion is only 12x, so after being used to writing at 48x I wasn't about to step backwards before I got the new computer home.

The graphics card in my opinion is excellent. It is an NVIDIA GeForce MX440 with 128 MB DDR RAM. I was told the new system came with a 5.1 integrated stereo sound and did not realize until I got it home it was only 2.1 sound. [Like I said, this was a brand new system being set up when I bought it, and I truly believe the salesperson thought it was 5.1] My disappointment didn't last long because my neighbor, who was helping me set up the new computer at home, left for a moment and returned with a 5.1 card that he had purchased in Germany a few months earlier and realized he could not use when he got back to the states. We popped in the card and voila, surround sound. XP recognized it immediately. [Funny thing, though, I learned later, most TV isn't surround sound when it's live anyway, but it is after it is recorded and played back.] I forgot to mention earlier, I had also bought a new Lansing surround sound speaker system, with sub-woofer, one center control speaker and four satellite speakers. So 2.1 sound [typical stereo with sub-woofer] would not have worked with this speaker system.

What makes MCE different is that it comes with a personal video recorder, which is a high-performance hardware encoder compatible with digital cable, satellite TV or just regular old-fashioned antenna TV.

Considering this is called a media center PC, the computer also comes with a host of external media ports including: 5 USB 2.0; 1 serial; 1 parallel; 2 PS/2; 2 IEEE 1394; and a 6-in-1 media card reader that reads all standards of digital media cards used in digital cameras today. [No more having to connect my digital camera via the USB cable.] I just slide my memory card into the appropriate slot, and it becomes another drive letter.

The 854n also comes with all the standards like: fax/modem; network card; mouse, keyboard, etc. But wait. The keyboard is anything but standard. Many of the features of MCE can be accessed directly from the keyboard. Oh yeah, there is also a remote infrared [IR] sensor that comes with the system too, fully integrated directly into MCE. It allows the remote control to communicate with the computer, and also controls your cable or satellite set-top box.

So, now you know about my new computer, what about MCE? This is what Microsoft has to say about it. "Media Center is a single, unified full-screen portal for all of your entertainment, designed for viewing and remote control interaction from a

(Media……..Continued on page 4)

(Media……..Continued from page 3)
distance. The easy-to-navigate menu screens feature customizable sound prompts, animated transitions, and backgrounds. Fonts, layouts, and transitions are consistent across all entertainment experiences and with the Windows XP experience."

You cannot buy an upgrade to convert an existing PC to MCE. It only comes pre-installed on MCE-built computers. There is just too much stuff in the operating system and computer that is interdependent on each other for an upgrade to work properly without hours and hours of effort and tweaking. It would not make sense to try and put together a system that would work properly when you can buy a box like I did for $1400.

One of MCE's primary functions is built around the personal video recorder [***PVR***] mentioned earlier. In my case I connected the TV cable to the TV card in the PC, booted the computer and answered some questions about my cable connection and before long it was downloading the TV schedule related directly to my setup and my locale. I must say, the TV listing [***Guide***] on my computer is now much better than what is actually provided by the cable company.

The Guide is an easy-to-navigate grid view of up to 14 days of upcoming programming. The channel lineup can be customized to remove channels that you don't want to view. You can search the Guide for up to 14 days of upcoming programs by title, keyword, or categories such as: Movies, Sports, and Kids and subcategories such as Dramas, Football, and Cartoons. When you find a show that interests you, press the Details (or More Info) button on the remote control to view a description, cast listing, rating, and other program details. The Guide automatically retrieves TV listings from the Internet once or twice each day or you can manually update the Guide at any time.

During the initial setup of your TV connection you can choose to use closed captioning or utilize the secondary audio channel, which may contain a different language or alternate versions of the audio program.

So, you if want to record a specific program or a series of programs and you're not sure when they air, just do a search, make a couple of clicks of the mouse or remote and forget about it. It's really that simple! Oh, and if there is a programming change MCE automatically checks the Guide for the latest programming information, ensuring that your shows are recorded even if the programming schedule changes. So it's actually the program that is the basis for recording, not the time slot. If a recording is set for a previously scheduled time, an alert helps you choose which show to record. You cannot record two programs at once and you cannot watch one program while recording another – yet. But you can watch a previously recorded program while recording another.

Another prominent feature of MCE is the TIVO like ability to stop live TV. Just press Pause on the remote control or the keyboard or mouse. Press Play (or press Pause a second time) to start watching where you left off. A pause buffer automatically captures the last 30 minutes of live TV, so you can rewind any time you're watching. Transport controls let you navigate live TV: pause, rewind, instant replay (jump back seven seconds), fast forward, skip (29-second advance), frame-by-frame advance, and more. If you're watching a program you decide you want to record, just press the record button and the recording will stop automatically when the program ends. Again, the program and not the time slot controls this action. And yes, there is also a manual record menu that lets you specify a specific date, time, channel and recording time period.

There are parental controls to help block TV programming according to a parent's specific and unique needs. Block all movies, block unrated movies, and/or set the maximum allowed MPAA movie rating (G, PG, PG13, R, NR).

Once your program has been recorded to the hard drive, just choose which recorded program you want to view and there it is, ready and waiting. While watching the recorded program, if you need to pause or stop for any reason, you can set a bookmark at the location where you stop the playback, and when you resume watching, the program automatically cues the playback to that bookmark. MCE helps you manage your recorded TV, letting you keep the recorded show for one week, until manually deleted, until watched once, or until hard drive space is needed to record other shows. You can also choose the level of quality of the recording to control hard drive space. Media Center has four levels of recording quality that you can choose - Fair, Good, Better, and Best. Here is the approximate amount of disk space that each recording level will consume:

Quality	**Approximate GB/Hour**
Fair	1.0
Good	2.0
Better	2.5
Best	3.0

When the program is recorded it is encoded into a new Microsoft format with an extension of ***DVR-MS. DVR-MS is an MPEG2 file wrapped with ASF*** [Advanced Systems Format is an extensible file format designed to store synchronized multimedia data.] to allow metadata about the recorded program to be stored. Apparently, in the first release of MCE there was no ability to burn a recorded program to DVD so it could be watched on a stand-alone DVD player connected to your TV, but that was quickly remedied with a patch. Subsequently, the version of MCE that came with my new PC now has the ability to convert the new DVR-MS files to standard-type DVDs with a program called MyDVD, which is included.

There is a lot more to Windows XP Pro Media Center Edition than what I have just covered so far about the PVR. DVD content can be played-back in high-quality full-screen mode for viewing at a distance or in an inset window while navigating

(Media.....Continued on page 5)

(Media……..Continued from page 4)

Media Center or working in other areas of Windows. Parental Controls can also be used to block DVD content according to a parent's specific and unique needs, like blocking all movies, unrated movies, and/or setting maximum allowed movie rating.

The ***My Music*** folder makes recording, playing, locating and organizing your music in a visual way easy by making it easy for you to find what you're looking for. ***My Pictures*** is your digital album for all of your pictures. View and scroll through pictures in the My Pictures folder by using your remote control or your keyboard and mouse. Select a folder of pictures and press Play Slide Show to view pictures as an automated slide show. You can set the slide transition delay time, set the slide show to display your pictures randomly, and play music in the background. And all of this can be controlled by the remote.

I think you get the picture that MCE isn't just a few multimedia applets that have been added to Windows XP. All of this has been carefully thought out, and it is apparent that Microsoft has worked on this for quite a while. There's still a lot more to all of this, like a whole host of included new software that I am not familiar with as of yet. I'll save that for a later article once I've had a chance to learn more about all of its capabilities.

In case you are using MCE and don't know, I have found an excellent newsgroup devoted to MCE at: http://communities.microsoft.com/Newsgroups/default.asp?ICP=windowsxp&sLCID=US&newsgroup=microsoft.public.windows.mediacenter that has a bunch of people ready to lend a hand and answer your questions. Most of the users in this group have already experienced some of the situations you're about to and are very willing to help out. There are also sev-

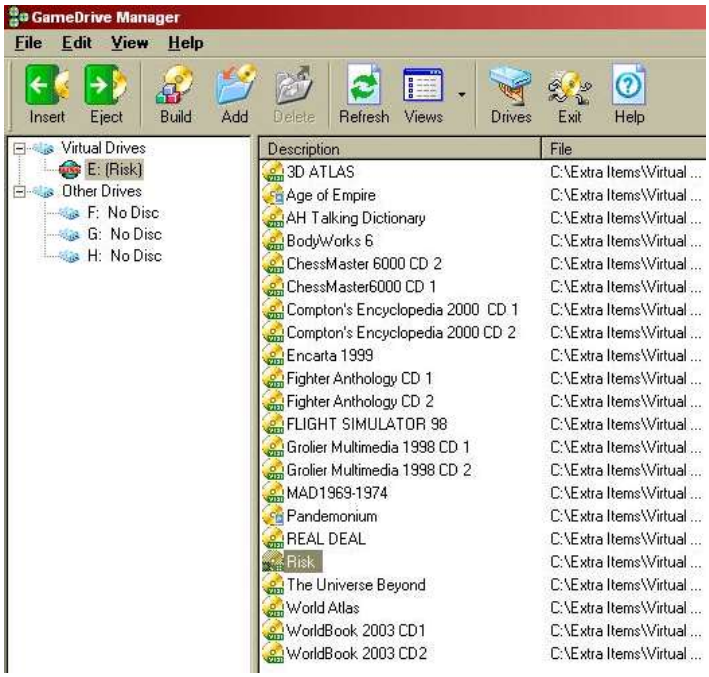
Game Drive

By Bob LaFave, Tampa PC Users Group
boblala@ij.net

I have one bad habit left. Yes, I did give up the cigarettes and drinking, and I feel much better now; but I still have ONE. I will buy software that I shouldn't because it "*calls to me as I walk down the aisle*." If I hear what I call *reference or learning type* programs such as an encyclopedia or atlas and (possibly the worst) a *game,* then I just have to answer their plea. Over the years I have answered the call way too many times and created a problem that I have finally found a solution to, "*how to play these programs without having all those damn CD's all over the place and having to put them into the CD-ROM ".*

GameDrive is a Virtual Drive by *FarStone Technology Inc*. that I found at Best Buy while browsing the racks. I went home and after going to their web site and researching at Google for reviews of this and similar programs, I bought it. Two reasons at the web site convinced me to try this program: it would eliminate the need for CD's before playing, and it would be faster when the program was on the hard drive rather than playing on the slower CDROM. You can visit http://www.farstone.com and review the list of advantages there for more *features and benefits*. I purchased the program for $19.95 on my next visit to Best Buy. This program creates images of CD's onto your hard drive and places them into a library to use instead of your finding your CD and inserting it into your CD drive for each program. **MAKE SURE YOU HAVE ENOUGH SPACE FOR YOUR USE BEFORE PURCHASING THIS PROGRAM.**



System requirements are Windows 98SE and above, a CD drive to install from, 25MB of hard drive space for the installation files, a Pentium 233mhz and enough RAM (19KB of RAM is used for each virtual drive in use).

GameDrive's installation was typical of other programs today, and all you have to do is follow an *InstallShield Wizard* and agree to the license, enter a serial number and make choices such as what directory to install plus other options. I make sure I read the manuals before I install new programs, and this one went smoothly.

After installation, ***GameDrive*** can be launched by selecting **Start** on taskbar, then **Programs\GameDrive\GameDrive Manager** and by looking for the ***GameDrive*** icon that appears in the Windows system tray.

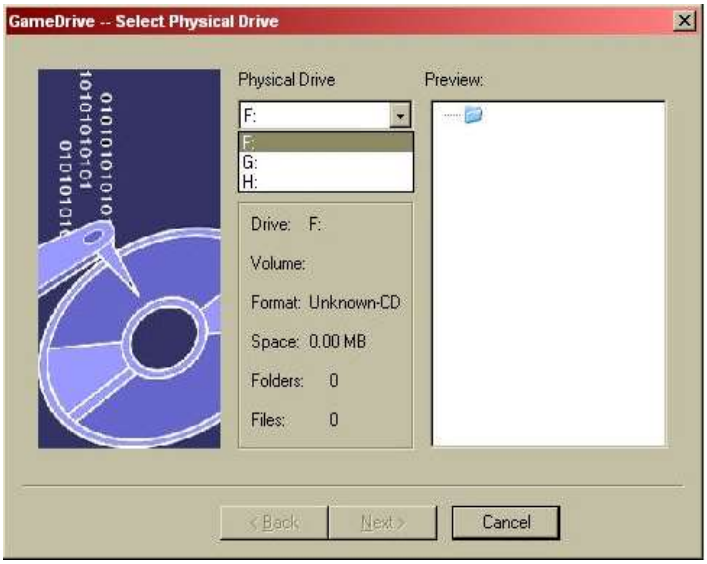
The main ***GameDrive Manager*** is much like **Windows Explorer** to view and get around. Mine created the **Virtual Drive (E:)** and left my CD drives listed as **Other Devices (F: - H:).** The right panel shows the CD's by name that I had loaded at that time.

The process of entering a CD into your ***Library*** is to insert a CD into your CD drive and pushing the ***BUILD*** button; a Wizard will

start that will guide you step by step. First, you select the physical CD drive that contains the CD. Second, ***GameDrive*** verifies that the selected hard drive has enough space for storage and the folder and VCD file name. Third, you select the CD read method. You can choose ***Normal*** for most CD's and an ***Intelligent Method*** for VCD's that do not run as expected and may be protected by having inaccurate volume information to prevent coping. You can also choose ***Compression*** to save space. There are other steps to build different types of files, such as mixed mode CD's that also contain audio tracks.

Now that you have a CD converted to a VCD file in your library you just select the file with your mouse and then push the ***Insert*** button and an animation graphic appears and the CD is now in your ***Virtual Drive*** ready to use. In the picture above, you can see that the ***Virtual Drive*** contains the ***VCD*** game ***Risk*** as CDROM drive E:. The game will now play as if the CD is inserted in a physical CDROM. You can also eject just by going to the ***Eject*** button.

Now for some other general information that you might be interested in. You can create ***Multiple Virtual Drives.*** You are limited by the number of letters in the alphabet to 26 total drives. You are then able to load multiple CD's or ***VCD's*** that are needed for some games. I have ***Baldur's Gate*** that contains five CD's to play. After I took the picture showing the *Risk* game, I did build all five CD's into the **Library** and actually load all five. To create a new ***Virtual Drive,*** you just go to the ***Drives*** button and add it. You will have to restart your computer any time you add or delete a ***Virtual Drive***.



RapidCache is a unique CD caching utility program that uses an incremental caching algorithm found only in ***GameDrive*** that is included. It can be started from the Program folder on the Start

(GameDrive…….Continued on page 7)

(GameDrive……..Continued from page 6)
Menu or from the File Menu in the program. It allows you to set your **Physical CD Drives** with a larger cache amount than Windows allows, which is 214 kilobytes when set at Quad-Speed or higher. It should increase the performance and the manual says to "experiment" to get maximum performance. You have settings over each ***Virtual Drive*** and ***Physical CD Drive*** in your computer. I set mine to "Cache all files" and "Max Caching Mode" with a size of 8192 kb to start and will experiment as they suggest.

This program like many more today includes a ***LIVEUpdate*** feature that is accessed from the ***HELP*** Menu. Unlike other program that I have, this ***LIVEUpdate*** was only usable after I went to the web page and registered and a code was emailed to me. I had to enter the code to use the feature the first time. This was done to inform me that the ***LIVEUpdate*** feature was by subscription and that it would have to be renewed after a year for a ***FEE.*** Now, that was not expected, and I will fight that feature next year; I believe they said it was $4.95. I would suggest that you read the web page and also download the online Manual in PDF format before buying. You can also purchase this product online as a download for $19.95 and save on the taxes.

I used the program with Data, Music, and Mixed Mode CD's and was able to use each as I normally would if I inserted a physical CD. Now I just go and insert a ***VIRTUAL CD*** and have no wear on any of the CD's; now I don't have to burn a copy for my protection against scratches or other misuse. On games that had lag before as the program read from a **Physical CDROM**, I now had none. This is because it does read at a much faster speed from the hard drive. Another feature that I didn't expect and like is that when I ***Insert*** a ***VCD*** into the ***Virtual Drive,*** I could double click the **ICON** of the name in the left panel and the CD would open in much the view you would get by going to **MY Computer** and opening an inserted **Physical CD**. This allows you to view those files if needed or any other operation you could perform with the **Physical CD** ◆

Editor's Comments and Software Review

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

New SIG Meeting Location Starting this month, the Access and Visual Basic SIGs will meet at the Kate Jackson Community Center at 821 S Rome Avenue. That is just south of Old Hyde Park Village. The move was necessitated by Gateway no longer being able to guarantee a room at a fixed time and date in advance. We are appreciative of Gateway providing a room twice a month over the past several years.

Alpha5, 3D-Album and PhotoVista Virtual Tour As did many of you at our last meeting, I found the software presented intriguing.

Although **Alpha5** appears to be a good database program for those not up to beating their heads against the wall to learn how to use Microsoft Access, I had no interest in Alpha 5, since I have indeed beaten my head against the wall more than once in the years that I have been learning Access. Almost anything can be done with Access as regards the presentation and manipulation of data--but you have to have paid your dues in study to know how to do it. Visit our Access SIG if you think you have an interest.

My interest was in the two graphics-oriented programs. **3D-Album** is just a cute and sometimes stunning way to present a collection of images. You can use it to display them on your computer, send an album via email to a friend (this method is less than ideal), create a screen saver or put the album on the web. I have created two different albums on the web of the same 16 photos at my site http://www.lamartin.com. Take the link near the bottom of the page to "Virtual Tours and Other Such Experiments", then select the 3D Displays link.

When you click on a 3D Display for the first time, you will be asked to download a 2 MB plug-in for Internet Explorer (and theoretically for Netscape Navigator if you use that browser--but I haven't checked this out). This is what actually produces the display. The download is a one time thing. It downloads fairly rapidly on a broadband connection but will take some time on a dial-up connection.

This is where I found my first problem with one of the software packages purchased at the meeting. The download produced a warning that the file had an out-of-date certificate of authenticity (it was six months out of date). It took me several emails to convince the software manufacturer, Micro Research Institute, Inc., that there was a problem. Their first approach was to tell me to ignore the message. The second was to tell me to change my browser setting to not warn about such things. I then suggested that it wasn't very professional for a software company

Looking Back to 1993

From the May 1993 *Bits of Blue*

Secretary Report
MINUTES OF 4/14/93 MEETING
By: Jim Clark

The meeting began just a few moments late (at 6:10, to be precise), but it was another good meeting, with quite a nice group in attendance. In addition to a vendor review of an impressive software program, there were some very interesting discussions on items of interest to a great many of us. Once again, our meeting was guided by the astute leadership of our illustrious Prez, Harvey Bruneau.

INDUSTRY/CLUB NEWS

Quite a few items of interest were discussed during the meeting, including:

That Comp USA is unofficially allowing discounts for members of our group on many items purchased at Comp USA was confirmed by our Prez. A discount is not given on all items, especially low cost items (e.g., DOS 6 Upgrade, floppy disks). However, the savings can be rather substantial on other items; one member received a 20% on a $50 hardware item, for example. On more expensive items, members have reported $40 or more savings. To receive the corporate discount, take your purchases to the Corporate Desk and show your User Group membership card.

There was considerable discussion of DOS 6.0, with varying opinions from our membership. Harvey introduced the subject, reporting general satisfaction with all DOS 6.0 features used thus far by him at Dun & Bradstreet, including MemMaker, Anti-Virus, and optional boot. He had not yet used DoubleSpace.

- Most indicated that DOS 6.0 was easy to load, and they had no troubles in doing so. A couple of others reported some problem in loading and setting it up. All felt that documentation left something to be desired, with the manual provided containing little to no technical info.
- Most comments about MemMaker were along the lines that it was not quite as good as the stand-alone memory managers at ferreting out more memory, but that it was a good alternative for those who do not need the last byte of memory and who do not want to pay the price of the stand-alone products. And it certainly simplified the task of making upper memory available and loading TSRs in same.
- The DoubleSpace feature generated the most divergent opinions. Several reported problems, including some boot problems which appeared after installing DoubleSpace. One with a CD-ROM, loading the driver in upper memory, reported booting problems following installation of DoubleSpace. Some reported the compression ratio not as good as with Stacker. Others reported it does not allow compressed drives to be decompressed -- as the stand-alone products do.
- Few commented on the Anti Virus, and one reported that the built-in Anti Virus was making his job somewhat easier and that he liked the feature thus far.
- All those who had used the Optional Boot feature seemed to like it quite well. Some of those who had experienced boot problems reported that the AllBoot switch solved their boot problem. The ability to select a clean boot from the hard drive was viewed as a very welcome improvement by all who had experienced booting problems -- negating the need to boot from floppy.

A review of DOS 6.0, and all of its features, sometime in the not-to-distant future would be welcome by all DOS 6.0 users, followed by a seminar to discuss problems experienced and solutions found.

PRESENTATION — SuperBase

Software Publishing Corporation was good enough to send to us a knowledgeable representative, Paul Tondera, Corporate Account Manager, to give us a preview of their program, SuperBase, Version 2.0 — a fully relational database program for Windows. Paul noted that SuperBase is not something new on the market or in Windows, but that it has been around managing data in Windows for over eight years. Hence, it is not something new with a lot of bugs, as is the case with the new programs now on the market; it has evolved as a well-founded, sound and very powerful database program. I am not knowledgeable on databases and have no basis for comparison, but I can say that SuperBase certainly appeared to me to be very powerful, functional and easy to use.

Among the many features Paul reported and/or demonstrated are: A forms-generating capability; a Quick Reporting feature which produces reports in detail; easy setup and modification of all reports and forms; drag and drop editing; provides for query by example; allows up to 999 indexes per file; provides full multi-media support; imports and integrates sound and video files into SuperBase; uses built-in procedural language; provides automatic recording of macros and can use basic macros and those created in "C"; imports from all the major DB programs, as well as ASCII, and exports in most of the same formats; the forms creator uses predefined fields which simplifies forms creation; includes the capability for merging of mail and label files, and SB allows merging of 2 databases. SuperBase is also network ready.

In some respects, SuperBase 2.0 is the least demanding for hardware capabilities of any of the major DB programs. It will load into and work in a 286 machine, for example. A VGA monitor is required, as is 1 MB of RAM, though 2 MBs of RAM are recommended. And 7 MB of hard disk space is required.

(1993……..Continued on page 9)

(1993…….Continued from page 8)
SuperBase 2.0 carries a list price of $795, but has a street price in the range of $500-550. If you already own a previous version of SuperBase, the upgrade price is $149. Those using other DB programs can purchase a SuperBase competitive upgrade for $199.

Many thanks to Software Publishing Corporation and Paul Tondera for an excellent presentation of a great DB program and for your very generous software contributions.

AND THE WINNER IS

Thanks to the generosity of Software Publishing Corporation and Sunrise Computer, along with the 50/50 cash drawing, there were some very nice raffle prizes. In addition, Sunrise Computer donated quite a number of computer items that were distributed to those who could use them, including printer ribbons, covers, and static guards; these items are not reflected here. Those among us to have the good fortune to win are as follows:

Larry Anders	Disk cleaner & Mouse Pad
Herbert Atwood	Mouse Pad
Jim Clark	Mouse Pad
Gene Wade	T Shirt
Bill White	Computer Lock
Parker Monroe	Fanny Pak
Kevan Sheridan	Harvard Graphics for Windows
Luis Vergara	Harvard Graphics 3.0
Tom Cone	SuperBase 2.0
Gene Wade	50/50 ($50)

The meeting adjourned at about 9:00 PM ◆

(Minutes…….Continued from page 2)
setting it up, it automatically creates and updates a listing of links to the messages you send and receive. So, months later when you are searching for a certain message with a vital piece of information -- it is very easy to locate even if you aren't a filing genius.

We received a pretty good demonstration of each of these, and we had to opportunity to purchase them for an even further reduced price for being at the meeting. The User Group price is great. You can check it out at http://www.whats4me.com. We had a good time and hope to see you at the next meeting, where someone is going to win a big prize. ◆

(Comments…….Continued from page 7)
to offer downloads with expired certificates unless renewing it was something they couldn't afford. They then completely changed course and said that the problem was their fault and that it would be fixed within the day--and it was. Good for them.

As an aside, I have several ActiveX controls I have created at my site for which you would get the same warning if you tried to download them. Since I am not making any money from the examples at my site, I am not going to pay the $400 per year for a certificate for such things. Of course, everyone trusts that I am who I say I am, so there is really no need for a certificate--is there. In reality, such certificates only guarantee that the software provider is who they say they are. The certificate does not guarantee that the software is virus free or indeed is not a virus itself.

PhotoVista Virtual Tour Maker iSeeMedia has not been as forthcoming in responding to a similar problem I found when I installed their PhotoVista Virtual Tour Maker, which is a very nice program nonetheless. When you start the PhotoVista Virtual Tour Maker software, it wants you to register, but the registration immediately produces an error message when you try to submit the registration. Additionally, when I created a virtual tour to place at my web site that used a Java viewer, the viewer had a yellow button with Zoom written on it. I assume that its purpose is to take you to the software manufacturer's web site. When you click on it, however, you are sent to a web address that no longer exists at MGI--the previous owner of the software, not iSeeMedia--the current owner. In fact, this software still has MGI written all over it. It installs in an MGI folder on your computer, etc. I went to the iSeeMedia web site and downloaded updates for both the Virtual Tour Maker software and the PhotoVista Panorama, which is part of the Virtual Tour Maker package. However, these updates did nothing to remove all the references to MGI.

It appears to me that iSeeMedia has done nothing to the software since taking it over from MGI. There is a forum at the iSeeMedia site to discuss problems with their software. But I see no evidence of anyone from iSeeMedia participating. Furthermore, they have a form you can fill in at the site so as to report a problem, but it has a mandatory field for your registration number. Recall that I couldn't register the product, and there is no registration number on the CD. So that does me no good. There appears to be no way to get email support. Dave Whittle, who presented the software to us, said he would relay my concerns to them, but I have heard nothing from that.

I just checked the iSeeMedia site again. They do have something new there. They say that they have a new plug-in viewer. However, that is not what I want. I do not like forcing people to download large, specialized viewers if I can help it (as you had to do for the 3D-Album) That is why I prefer the Java viewer, but there is no update for that. The Java viewer they

Special Interest Groups

Microsoft Access SIG

This SIG meets the first Tuesday of the month at the **Kate Jackson Community Center at 821 S Rome Avenue** in South Tampa at 6:30 PM. For information contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merlenic@tampabay.rr.com.*

Genealogy SIG

To be included on the TPCUG genealogy mailing list, contact Jenny Lind Olin at 960-5723, or *jlolin@tampabay.rr.com.*

Visual Basic for Applications SIG

This SIG meets the third Tuesday of the month at the **Kate Jackson Community Center at 821 S Rome Avenue** in South Tampa at 6:30 PM. For information, contact Merle Nicholson at *merlenic@tampabay.rr.com,* or William LaMartin at *lamartin@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Kevan Sheridan moderates the discussion.

(Comments…….Continued from page 9)
have is basically two years old., and I am sure that is in the same state that it was when MGI had the software.

All of that said, as indicated above, **I like the product**. You can see the results at my site at the above-mentioned link. I have put three virtual tours there: A tour of two rooms in a house, a tour around a pond, and a tour of Ft. Blount Park in Bartow, Florida. Be sure to read the instructions before starting so that you will know how to move about.

I used PhotoVista to make a stitch of around 18 - 22 photos for each 360 degree panorama. The photos were taken with my Canon G1 digital camera attached to a tripod .The software did a fairly good job with very little manual adjustment necessary. I then imported this panorama into the PhotoVista Virtual Tour Maker and produced the tours you see on the web.

One thing I discovered about outdoor panoramas is that you want to take them on an overcast day. That way you do not have to deal with the sun shining straight into your camera lens at some point. If you are shooting a 360 degree panorama, then at some point you are going to have to face the sun unless the sky is overcast--or it is high noon. Another thing you have to consider for any panorama is movement of objects. Since each photo needs to overlap the previous one by 25 to 30%, you really need everything to remain the same in those two shots. So moving people or cars can be a problem.

I have not tried the third program in the PhotoVista Virtual Tour suite, PhotoVista 3D Objects. To use that you really need a rotating platform on which you place the object to be photographed from all sides. Seems like we used to have such a thing in the kitchen years ago that held spices and rotated. But that is long gone.

To close, let me give you an example of the sort of thing we do in the **VBA SIG**. Visual Basic for Applications lets you automate things in any of the Microsoft Office products. Originally you could only do this in Word, Excel and Access, but Microsoft has now expanded this to include PowerPoint, FrontPage and Publisher. This was done in either Office 2000 or Office 2002.

Most of our examples in the SIG have come from programming in Access, Excel and Word, but here is one that I just came up with for Publisher.

Ever since moving this Publisher newsletter document to the Gateway I bought around 1 1/2 years ago, when I open it I get a warning about it having a font--Copperplate--that isn't on the new computer. I could have loaded the font, but I wanted to find what text used that font. I looked and looked several times but could never produce it. Publisher, unlike Word, does not provide for searches based on formatting like the type of font. So I finally got around to writing some VBA code to accomplish the task. It found the text on page 5 in the Internet Picture of the Month heading. Here is the code:

```
Dim x As TextRange
Dim i As Integer, j As Integer, k As Integer
Dim s As String

For k = 1 To Application.ActiveDocument.Pages.Count
    For j = 1 To Application.ActiveDocument.Pages
(k).Shapes.Count
        If Application.ActiveDocument.Pages(k).Shapes
(j).Type = pbTextFrame Then
            For i = 1 To Applica-
tion.ActiveDocument.Pages(k).Shapes
(j).TextFrame.TextRange.Length
                If Application.ActiveDocument.Pages
(k).Shapes(j).TextFrame.TextRange.Characters(i,
1).Font.Name = "Copperplate" Then
                s = s & " " & CStr(k) & " " & Applica-
tion.ActiveDocument.Pages(k).Shapes
(j).TextFrame.TextRange.Characters(i, 1)
                Else
                End If
            Next
        Else
        End If
    Next
Next
MsgBox (s) ◆
```

eral Microsoft MVPs that keep a watch on this site. I've used it a few times already, and it has been a great source of help. It's not that MCE is that hard to use or learn, I just typically don't read the instructions until I have a problem or can't figure something out on my own, and by using the newsgroup I have been able to get right to the solution and back to computing.

In conclusion for now, there is a lot of new stuff in this rendition of Microsoft's latest operating system, and I personally feel they've done a good job with this release. Just about the time I get a little bored with computing something comes along to catch my fancy, and I think this one will keep me fancied [and busy] for quite a while.

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

In the September 2002 newsletter, I mentioned purchasing Visual Studio .Net and gave some examples of the type of programs I was at that time writing to test it. At the October 2002 meeting, I did a presentation on programming where I gave examples of programs I had written in Visual Basic, Delphi and VB.Net. I had my home computer set up as a web server for remote access where I displayed examples of web applications created within the Visual Studio ASP.Net framework using VB.Net. I had to use my computer, since no site where I had web sites hosted at that time supported the ASP.Net framework. Within the past month that has changed, and I can now host such pages at my site and the

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

apcug Member of The Association of Personal Computer User Groups

Minutes of the May Meeting

By Peggy Pulliam, Secretary, Tampa PC Users Group
pegrance@yahoo.com

Our meeting started a little late at 7 PM. We talked about our Special Interest Group meetings, which are being held at the Kate Jackson Community Center in Hyde Park. This is a great new location for the Access and Visual Basic Groups. The meetings are tailored for the group that arrives, so don't be worried that you won't fit in; just show up with your questions and have some fun learning new things.

The main part of the meeting was started, and Merle Nicholson presented Windows XP. It is very crash proof – so Merle says and some others in the room agreed. The door prize at this meeting was a copy of Windows XP, which we had been working up to for a few meetings.

The start menu comes up with the last five or six programs used. Your favorites and the ones you use all the time will be there for you to click on without having to go to the Start area and choosing from the longer list.

The My Pictures area allows you to do a slide show with your photos. Any folder of photos can be viewed as photos and as a slide show. This is a feature that used to require special program software but is now standard. You can organize your photos very easily.

Power Toys were shown; you get those from the Windows Download area. There are interesting, helpful utilities for Windows available there.

XP carries an account manager with it for security. Two users can share or NOT share by setting that up according to their needs.

Customize your desktop in the Display area – you have options of backgrounds, and on User Accounts XP lets you set what you want a user to be allowed to do. So if you have a guest who will be using your computer

Delorme Earthmate USB GPS

By Merle Nicholson, Tampa PC Users Group
merlenic@tampabay.rr.com

I've written about using travel software in previous articles. This is a quick update on the latest GPS on the market – the Delorme Earthmate USB. Delorme had a previous model (with a serial connector) that went out of production perhaps a year ago, and this is the replacement. It's intended to work with software on your PC, usually a notebook that travels with you.

This new GPS is pretty unique. It's WAAS capable for greater accuracy, and as you can see, it's tiny. Unlike the previous model, it has only one cord and uses no battery, being powered from the USB port (and therefore your notebook's power supply). It

works. That's about all you can say about a GPS, because a GPS is just a little piece of hardware that makes your software work as it should. We sit ours fully forward on the dash against the windshield, the only place any GPS will pick up the satellite signals in your car.

I have only one wish, that the cord was as soft and flexible as its competitor, the NavMan e-Series GPS. But it's the right length, 6 feet. It comes with two

software drivers. One is the USB driver that makes it work with Delorme Street Atlas 2003. The other driver is a COMM port driver for use with other programs. It makes the GPS signals appear as a COMM port, in my case COM4:4800,N,8,1. Keep in mind, physically, it has a USB connector, and that's all you use. But the COMM port driver makes it look to the system as a COMM port – a fake one, because physically it's just USB.

The GPS started working with Street Atlas 2003 immediately after installing the first driver using the USB interface, but then as I wanted it to also work with Microsoft Streets and Trips, and also SailGPS, my own sailboat software, I installed the second driver successfully, tested it with the Microsoft software, and went back to Street Atlas, and it didn't pick up the satellite signals. So I did a couple of uninstalls, reinstalls and then wrote Delorme's on-line help. I received an answer within a couple of days. They told me what to do about this. It seems that when you install the second driver to make it look like a COMM port, it disables the USB driver for Street Atlas. So you need to set the Street Atlas to look at the COMM. And it worked just fine. I later got a note from Delorme that tells how to designate the driver to only one of the two USB ports – a feature of Windows XP, which would allow me to use USB for Delorme and Serial for the others. I've not tried this yet. Delorme deserves a great deal of credit for their fast and informative responses to my email. I recommend this GPS for its price, size and software support. ◆

Happiness is: a New PC and/ IntelliMover

By Mike Hodges, Treasurer, Tampa PC Users Group
mphs@aol.com

This article is a sequel to the article published in the April newsletter entitled, "Buying a new PC". My intent of publishing this article is to inform those who were curious what I thought of my new purchase. Well, the PC I had selected, namely the Gateway 600X notebook, arrived within seven days after the order being placed, as I had anticipated in the article, a week before promised, at 6.59 PM on Friday 4 April. UPS does not deliver to residences after 7pm, so it was a close call, and I was delighted that I had the whole weekend to set up and exercise my latest purchase. Referring to the April article, you will see I paid a moderate price for this highly recommended machine. See my previous article at http://www.tpcug.org/newsletter/nl_2003/april2003/newsletter_frameset.htm for the machine configuration and the comparison chart with other PCs.

First, let me say I remain delighted with my choice, and I am convinced that this is because I had conducted a thorough selection process. I had the machine unpackaged and up and fully running in under 30 minutes, and this was achieved in spite of the fact that I had never actually owned a machine with an XP operating system before.

Prior to the machine arriving I was able to track the order on the Gateway web site on a daily basis, all the way from order arriving at the plant in Taiwan, shipment from Taiwan within the following 48 hours and delivery via Alaska to my door. I was aware the machine was already in Tampa by 7 AM on the day of delivery. The longest delay, and therefore the longest day, appeared to be on the final day with the machine riding around Tampa in the UPS local delivery truck. More so as I had to leave my house at 5 PM, two hours before the UPS delivery arrived at my door. Fortunately I was able to have someone standing by to receive the UPS delivery at my house, so convinced was I that the package would arrive that very day.

So on the following Saturday morning, I set to work and was delighted that within 30 minutes I had the new machine unpackaged and fully up and running and set about to verify that all the features were working as advertised. I loaded my first DVD and was delighted at the superb graphic display. I was able to verify my Verizon DSL connection and 56K modem and floppy drive operation all within the next 30 minutes. The only feature that I could not test was that the PC was in fact wireless enabled as I did not own a transmitter to verify this ordered feature. In all respects the machine appeared to be sizzling fast as compared to my old IBM 1998 vintage ThinkPad 1400i. Recently I set up my old 1998 vintage 300 MHz IBM laptop and was dismayed how slow access and set up was as compared to my new 2.2 GHz Gateway 600X. I had now grown accustomed to the speed of all that I do with my new PC so that the old IBM machine is pretty much ancient history in my house. You may recall that the final straw with maintaining my old machine was that the USB port was not enabled and as a consequence I was not able to hook up another recent purchase, namely an HP V40, All In One copier, fax scanner printer. This HP V40 I was also able to get running with my new PC within just ten minutes. All that remained thereafter was for me to transfer the two gigs of mostly graphic data from my old PC to my new notebook. At Gateway, at time of the initial PC purchase, I had also purchased IntelliMover, a program designed to help speed up this otherwise laborious file by file transfer. Again the process was trouble free. First I loaded the IntelliMover CD onto the IBM laptop and followed the wizard instructions and then selected all the files I wished to transfer. Most likely I selected 98% of the two gigs of data. It is always difficult to leave anything, once created, behind and not generally thereafter readily accessible. I then loaded the IntelliMover CD on my new PC and then, when prompted, I hooked up the provided parallel to parallel cable to connect the two PCs. The IntelliMover package had provided two sets of cables, a USB interconnect cable and a parallel port interconnect cable. Because my old IBM PC did not have an enabled USB port I was relegated to the parallel connections. The file download required eight, yes eight, hours to transfer all the designated files through the parallel port. The USB connection would have been six times faster and therefore could have completed the transfer in 80 minutes. However, I must say the process was relatively simple and easy

(New PC.....Continued on page 5)

(New PC…….Continued from page 4)

to follow, and indeed all the files I selected have apparently transferred from the old machine to the new machine without loss. I highly recommend that as you build up programs on your PC you maintain a large envelope in which to store all the program and backup CDs supplied. In the event one has problems or moves to a new PC or it is necessary to restore the PC disc drive; thereafter, all the materials will be readily found in one package. These days we appear to be awash in CDs, and an envelope holding all those programs that will be needed for recovery is a great safeguard from panic and frantic searches at a possible future date.

So now I have achieved my objective; I have retained all the intense data files, mostly graphics previously generated on my old PC, have plenty of hard drive space, 60 gigs for future use and I am working in the Microsoft XP Professional environment. With my old PC setup I forever had to delete files to make room for additional applications or downloads. I have even been able, at last, to set up the video cam that Verizon provided me when I initially signed up for DSL some thirty months ago. So now I can be even more productive than previously, in all my computing labors.

Happy computing to all.

(New PC…….Continued on page 10)

Windows XP Update Q811493 Hotfix

By Merle Nicholson, Tampa PC Users Group
merlenic@tampabay.rr.com

Perhaps you have seen recent articles on an XP update that says that Microsoft has withdrawn a security patch from its list of recommended updates. In case you want to check to see if you're one of the 600,000 people that installed it, go to your Add/Remove Programs and check the list of updates for Q811493 Hotfix. If you have any reason to suspect that your computer is not running well since the date you installed this, you can remove it. I did – a month ago, and it made a dramatic difference. But you need to decide for yourself. There's a revised version made available on May 28th … read on.

This fix applies to Windows XP, Windows 2000 and NT only. It's an update that plugs a security problem where a person can break into your computer. But in this case, the person needs to be logged on locally (actually sitting at your PC or logged in with terminal server) to do so.

The fix, when installed, apparently interacts with firewall and anti-virus software and continuously consumes some of the resources of your machine. The hotfix was originally released as a "Critical" update April 16th. Within a week, Microsoft had removed it from the "Critical" list and moved it to the "recommended" list, and as of May 27th it was removed from the updates list altogether.

That's how I came to install it myself; I have my Windows update set to automatically download all "Critical" updates. I always read these before consenting to install. I read this one, and installed it. No reason not to, and went on with my life. Except … in mid-April I knew that my machine was running slower. I put up with it for a week, reminding myself that I need to backtrack and see what I may have done to cause this, and kind of putting it off. It was slower enough that sometimes I'd be reminded that something was wrong, but not enough to interrupt my current programming project to try to determine what it was.

And a coincidence happened. I was at my PC, contemplating a strategy to find what was happening to slow it down when I got an email from William LaMartin with a copy of an article about this hotfix that users were reporting was slowing down their PCs. So I did some news searches, came up with some newsgroup complaints, and found the hotfix number. That identified it for me in my uninstall list, so I uninstalled it, and the difference was dramatic! I had a fast machine again. I had installed it on my notebook and my Windows 2000 machine too. It didn't seem to affect my Win2K machine adversely.

Subsequently reading the Microsoft literature in the following weeks, they were still recommending that everyone install this, but to remove it if it caused problems. Microsoft was claiming that, newsgroups complaints aside, they were receiving very little feedback on this hotfix.

So if you have Windows NT, Windows XP or Windows 2000, check your Microsoft fixes and see if you've installed it as I did, determine if possible if your machine is running slower and remove it if necessary.

May 28th Update ! This **revised** hotfix is back on the "Critical updates" list. So if you were one of the 600,000 people that installed the original release, you may want to consider uninstalling it, and reinstalling the new. If you think you need it at all, that is. Read on.

Excerpted from
http://www.microsoft.com/technet/treeview/default.asp?url=/technet/security/bulletin/MS03-013.asp

Why has Microsoft reissued this bulletin?

Subsequent to the release of this bulletin and the associated patches, a performance related problem was identified with the Windows XP Service Pack 1 version of the patch. This problem is unrelated to the security vulnerability discussed in this bulletin; however, the problem

(Hotfix……Continued on page 7)

(Hotfix…….Continued from page 6)

has caused some customers to notice performance degradation on Windows XP SP1 systems after applying the patch.

Microsoft has corrected this problem and reissued this bulletin on May 28, 2003 to advise on the availability of a revised patch for Windows XP Service Pack 1. ◆

(Minutes……..Continued from page 2)

you can set that up and limit access. You can get sophisticated with all the bells and whistles, but you don't have to and can work up to fancier settings after you learn a few more things.

XP comes with some CD burning capabilities built in, so you don't need to get CD software for basic needs in burning CDs, and it walks you through each thing very smoothly.

Merle suggests that partitioning your hard drive, to keep your earlier programs running, is not necessary – most everything is easily updated. BUT there are other programs that won't work with XP so you'll want to make the decision separately, but there are XP updates to cover most needs. XP won't run DOS though, so if you have any of those to run you definitely want to partition and keep your earlier Windows version available for running DOS.

Expect to spend a few hours getting your new XP set up if you are updating programs because you will be going on the web to find the updates and downloading and get them onto your computer, but once that's done you're all set and, like he said, it's pretty crash proof, so it will be worth the effort.

It looks as though we can count on a fairly easy set up and a good stable operating system once we walk through the steps. Windows XP is trying to make it

(Minutes…….Continued on page 10)

(Comments…….Continued from page 1)

TPCUG site among others, since they are now being hosted on Windows 2003 servers.

Go to http://www.lamartin.com/dotnet/main.aspx to view several examples. If you are using an older version of Netscape (like 4.7) you will not see the pages correctly. But this should not be a problem for most visitors to the site, since visitors to lamartin.com use Internet Explorer over Netscape Navigator in a ration of 60:1. At the TPCUG.org site the ratio in favor of Internet Explorer is 45:1.

The ASP.Net framework installed on the Windows 2003 servers allows me to use any of the Visual Studio .Net languages to write code for web pages very much like I write code for Windows desktop applications. I can not create an HTML page that has more functionality than could be created in the past--I can just do it a lot easier in an environment where I have error checking and debugging. The ASP.NET framework on the server is responsible for rendering the page into HTML.

One nice feature of this new setup is that it allows me to take advantage of Web Services, which are applications residing on remote servers that I can hook into with my code and then use either to do calculations or provide data to my web pages. The provider of the web service can either charge for it or provide it for free. Obviously I am accessing only free services at this point. Two such are the Weather and Pig Latin examples at the URL listed above.

By the time you read this, I may possibly have a few more examples posted at the above URL. At the moment, I am working at connecting to the Microsoft TerraServer Web Service. You recall TerraServer. It is the site where you go to view satellite photos from around the world. So far, I have figured how to get a longitude and latitude for any given U. S. city and state combination. But I am still working on retrieving the image tile centered on that location. However, I am not sure I want to get too involved with satellite photos at my site, since it might cause my bandwidth usage to surge, costing me an additional fee for my site. ◆

Looking Back to 1993

From the June 1993 *Bits of Blue*

Secretary's Report
MINUTES OF 5/12/93 MEETING and PERSONAL COMMENTS

By: Jim Clark

The meeting began just a few moments late at 6:20, the delay due to "mechanical problems" (had some difficulty getting the NT [New Technology] to work). But, it was yet another good meeting, with quite a nice group in attendance. This meeting was particularly interesting because the subject was current and interesting to just about everybody who uses an IBM compatible computer — the new operating system DOS 6.0 — and because it was an "open forum" type of a session lead by our astute Prez, Harvey Bruneau. Harvey was to be ably assisted by our talented librarian, Larry Anders, but work demands arose which prevented Larry from making the meeting. Like the legendary knight in shining armor atop a large white steed, Harvey carried the evening by himself.

INDUSTRY/CLUB NEWS: Since NT had delayed start of the meeting, and there is a lot in DOS 6.0 to discuss, industry and club news were omitted.

PRESENTATION — MS-DOS 6.0

No formal presentation was prepared nor intended since this was to be a forum, or seminar type of treatment of DOS 6.0. Harvey guided the discussion by introducing the major changes in MS-DOS 6.0 compared to DOS 5.0 and giving a brief review of each: Double Space, Anti-virus, MemMaker and the changes to the MEM command, Backup, Defrag, InterLink and Selective Boot. Installation was also discussed, as were some upgrades of 5.0 features, such as UNDELETE, and some new commands, such as DELDIR, MOVE, and NUMLOCK.

Documentation: The documentation in the manual with the upgrade version is a little sparse and is not nearly as complete as the DOS 5.0 manual; it focuses principally on the changes that have been made from the 5.0 version. (Apparently no one was aware of the documentation that comes with the full version of DOS 6.0, for no one spoke on that subject.). For upgrading to DOS 6.0, then, one should hang onto the manual that came with DOS 5.0. On-line help is quite extensive, however, and one need only type the command at the DOS prompt followed by /? and a help screen appears revealing the hows and whats of the command. Alternatively, type help at the DOS prompt and a screen showing all DOS commands appears, double click on any you're interested in and, walla, the info appears.

Installation: There were a number present who reported varying levels of difficulty, some requiring some changes to their boot files before satisfactory installation and operation could be achieved. However, I personally had no difficulties installing DOS 6.0, and it seemed that most present who were using DOS 6.0 had no difficulty. Installation instructions seemed adequate for the most part. Rumor had it that one must have DOS 5.0 installed to be able to install the DOS 6.0 upgrade. However, the instructions indicate that one must have only a previous version of DOS to install the upgrade to DOS 6.0. That is logical since a disk partitioned and formatted by an IBM-compatible DOS is required in the first instance, But one need not have a complete installation of any previous version of DOS to install DOS 6.0 — it is enough to have a DOS partitioned and formatted disk. The earliest reported version of DOS to which the DOS 6.0 upgrade has been applied by those present was DOS 3.0.

Double Space: For most, Double Space was fairly easy to install -- and it works as advertised. It appears that it is not as efficient at compression, nor does it have some of the features of the better stand-alone products (i.e., Stacker), but it does do a fairly good job simply. One big advantage is that it loads before anything else and no statements in CONFIG.SYS is required, and except for those needing an uncompressed area for Windows swap, all files (including boot files, such as HIMEM, etc.) may be compressed. The degree of compression using any existing compression program varies with the type of files being compressed - ZIP files almost none, spreadsheets a lot. So, the terminology of doubling disk space that they all use must be taken with a grain of salt. Articles have reported an average disk compression using Double Space at between 1.6-1.8 to 1.

I do not use DSpace, but I tried it on a new disk I was installing. It compressed at about the same degree as SuperStor PRO. Most articles I have read give Stacker a little better compression ratio. I didn't stick with DSpace because it creates another uncompressed drive with a minimum size of 200K for every compressed drive (or partition) compressed. I run one uncompressed and three compressed partitions. DSpace therefore created an additional 3 drives - one for each compressed partition - giving me 7 drives to deal with in all matters relating to drives. Another feature I did not like is that DSpace does not make provisions for decompression, as do both SS Pro and Stacker -- though some report that decompression is so difficult at this point that it is not really a valuable feature, access to DSpace once installed is limited to DOS; an interface with Windows is not yet a part of the program.

There have been quite a few reports in the news since DOS 6.0 release indicating a lot of difficulties have been encountered with DOS 6.0, including DSpace. A couple of folks at the meeting also reported difficulty with DSpace - trouble resulting in loss of data. Microsoft says that there are 3 million copies of DOS 6 out now and they have received only about 1% of that many calls, and a lot less than that which involved anything significant. Still, there have been some serious problems; problems which will no doubt be corrected in the not-too-distant future.

Anti-virus: This is a welcome addition to DOS, especially for those who haven't purchased anti-virus protection. It can be installed in both DOS and Windows. It includes detection and correction of 800 viruses, and includes 2 upgrade coupons for $9.95

(1993……..Continued on page 9)

(1993……..Continued from page 8)
each. What will happen after that is not known now, but some form of upgrade will likely be continued — as they all do. This feature can be installed as a TSR, but to install all of its protections (features) takes about 46K of memory (23K of conventional and 23K of upper), a fairly high price. Two cautions were noted: Don't have the anti-virus program TSR when installing new programs on your computer; and be very careful about using the auto correction of detected viruses feature because some false alarms occur with some types of files in some circumstances, and you could lose files.

MemMaker: Another welcome new feature for DOS, especially for those who don't already use another stand-alone memory management program, like QEMM. This feature is also easy to use. It can be installed at the time of installing DOS 6.0, or at a later time. Though not as efficient at rooting out all of the unused memory and managing memory as the top stand-alone memory management programs, it does a fairly respectable job finding and using unused memory, and auto loading into upper memory. And, it is very easy to use. If you don't already own a memory management program, or don't want to invest the bucks in one, this is certainly a good alternative.

Backup: Previous versions of DOS have included a backup capability. The major difference here is that this is a full blown menued program, and it allows for compression of the backup files, It also provides for a range of backup -- from complete, down to a single file, all of which can be selected by the user. This, too, can be installed for DOS, or Windows, or both. It is a good improvement, but here, too, it is not as comprehensive nor as efficient as the top stand-alone programs on the market. Again, for those who don't now own a backup program, it is a very welcome addition.

An article in a local industry paper stated that this feature would only backup to floppy drives. That is difficult to believe. The manual is silent about the types of devices one can backup to, but a member present noted that the only device he has been unable to use is a tape drive.

Defrag: A fairly fast and easy to use addition to DOS. Some reported it not as fast as the better disk/file maintenance programs. Defrag doesn't have all of the capabilities of Norton Disk Doctor or PC Tools, of course, but I have found it as good at defragging for my simple purposes as the other programs I have used, including earlier versions of NDD. Defrag is available only at the DOS prompt, and shouldn't be run at the DOS prompt through Windows.

InterLink: InterLink does the same thing LapLink does -- connect 2 computers together and allow the interchange of files/info between the two. It does not include cables, as LapLink does, and some report it is more cumbersome to use. Nevertheless, for those without LapLink or a similar program, it provides an otherwise missing capability. This feature is available from the DOS prompt.

Selective Boot: A very welcome feature by all DOS users who boot from hard drives. This feature is too sophisticated to go into here in detail. Suffice here to say that it allows for a clean boot from the hard drive in event of some configuration problem which prevents a normal boot -- in effect eliminating the requirement of the past to boot from a floppy in similar circumstances. (This does not mean you shouldn't keep a bootable floppy, though.) This feature also allows one to boot in any configuration desired by selecting desired options during the boot process. It doesn't happen automatically, however; these capabilities must be set up, except for the clean boot which requires only pressing F5 at the appropriate time.

New/Modified Commands:

Undelete: An undelete capability was available with DOS 5. DOS 6 has expanded a great deal on that capability and developed a menued program which can be installed in DOS, Windows, or both at installation time It provides for three levels of undelete: Sentry, Tracker & Standard. Sentry & Tracker levels use disk space to store the files or information about the files which will not be overwritten and thereby removed from recovery, as with the previous undelete command and with the DOS 6 Standard level of undelete. The old undelete command is still available at the DOS prompt as well.

Move: Another welcome, but dangerous, addition to DOS. The MOVE command allows for moving individual files and up to and including complete directories — replacing the old individual files copy/delete method. It is very easy to use. That combined with the magnitude of action that can be involved makes it a command that should be employed with great care

NumLock: Another very welcome addition, especially for those of us with an older machine which does not have provisions in CMOS for configuring NumLock. NumLock can be turned on or off at the DOS prompt, or as a command in CONFIG.SYS.

SmartDrive: I believe this program has been "upgraded", but it functions remain essentially the same as with DOS 5. One word of caution came up at the meeting: If using the Double Buffer feature of Smart Drive, be sure to allow sufficient time when shutting down for the data in the buffers to be written to disk; some have lost data when they haven't allowed sufficient time for the write before turning their machine off. How much is sufficient, I don't know, but I would allow several seconds as a minimum.

Delete Directory: Also a long-wanted capability, DELDIR allows for deleting directories without first having to empty the directory of all files and subs. It., too, is a dangerous command and should be used very cautiously.

In summary, DOS 6.0 provides some very nice additions to

Special Interest Groups

Microsoft Access SIG

This SIG meets the first Tuesday of the month at the **Kate Jackson Community Center at 821 S Rome Avenue** in South Tampa at 6:30 PM. For information contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merlenic@tampabay.rr.com.*

Genealogy SIG

To be included on the TPCUG genealogy mailing list, contact Jenny Lind Olin at 960-5723, or *jlolin@tampabay.rr.com.*

Visual Basic for Applications SIG

This SIG meets the third Tuesday of the month at the **Kate Jackson Community Center at 821 S Rome Avenue** in South Tampa at 6:30 PM. For information, contact Merle Nicholson at *merlenic@tampabay.rr.com,* or William LaMartin at *lamartin@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Kevan Sheridan moderates the discussion.

(1993…….Continued from page 9)
DOS 5.0, but some believe that it should have been given a 5. designation rather than a full number change which signifies a fundamental change, as opposed to added bells & whistles. It has a lot of new and welcome additions, however, especially for those who don't now have similar capabilities in utilities from other vendors. It is a large capability for not too many bucks, especially the upgrade version. Some problems have cropped up with some of the new features; apparently, the more sophisticated the configuration and/or operation, the more likely one is to encounter any problems. I, for one, however, running a home computer 386/25, with multiple hard drives, modem, scanner, 3 printers, Windows 3.1, and a host of Windows and DOS software of all varieties, have had no (zero, that is) problems with DOS 6.0. And, I am confident that Microsoft is working very hard and fast to come up with answers to all problems encountered so far.

THANKS MUCH, HARVEY, for an excellent job of guiding us through as much of DOS 6 as time would allow. It was a productive session!

AND THE WINNER IS

Thanks to the generosity of Microsoft (who donated a copy of Access) and your User Group (who donated a copy of DOS 6.0), along with the 50/50 cash drawing, there were some very nice raffle prizes. Those among us to have the good fortune to win are as follows:

Kit Kelley	MS Access
Donald Houston	DOS 6.0
Mike Diaz	Mouse Pad
Kevan Sheridan	50/50 ($52)

The meeting adjourned at about 8:45 PM ◆

(Minutes…….Continued from page 7)
easy for everyone; with the increasing numbers of people using computers, that's an important feature; while not losing the advanced features either, seems they have done a good job!

I couldn't believe my ears when they called one of my ticket numbers for the prize! So I went home with a new copy of Windows XP.

We hope to see you at the SIGs and at the next meeting on June 11th, we have a good time and there's always some kind of refreshments and usually some prizes to win. ◆

Vol. 16 No. 7 July 2003

Meeting

Presentation

Surprise

Wednesday, July 9, 2003
6:30 PM
Art Pepin Hospitality Room
Pepin Distributing Co.
6401 N 54th St
Tampa, Florida

Meeting Preview: The presentation topic was not available at press time. Preceding the presentation, Kevan Sheridan will conduct the usual half-hour Windows SIG.

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

Since we are a small group, it is not easy to get vendor presentations, and it is impossible to get presentations from major players like Microsoft and Adobe. That is why it is so important for our own members to give presentations whenever possible. Last meeting Kevan Sheridan gave the presentation; prior to that Merle Nicholson did the presentation. Earlier I gave a presentation on digital photography. Now we need for more members to step up and offer to be presenters. We all have different interests and expertise, and it is interesting to hear about things different from our usual computer routine. So it is your turn to step to the plate. Tell Kevan what you have in mind for a presentation.◆

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members. Our mailing address is P. O. Box 3492, Tampa, FL 33601-3492.

However, for business concerning this newsletter, Bits of Blue, please contact the Editor, William LaMartin, at 821 S. Boulevard, Tampa, FL 33606-2904; 813-251-3817; lamartin@tampabay.rr.com.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII, Microsoft Write, Microsoft Word, or Word Perfect file to the editor at 821 South Blvd., Tampa, Florida 33606-2904 or to lamartin@tampabay.rr.com.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

The use of trademarked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

Minutes of the June Meeting

By Peggy Pulliam, Secretary,
Tampa PC Users Group
pegrance@yahoo.com

Kevan Sheridan provided a very interesting two-part presentation. On John Witmer's desktop computer without an operating system, he installed Windows XP Professional. During the first part of the installation he went over the options we had during the installation and pointed out things we should consider regarding the choices available. The second part of the presentation was the installation of Zone Alarm and Spybot Search and Destroy on a second computer.

First, we saw *Zone Alarm* – firewall protection – installed and operated. It checks out any activity into or out from your computer and lets you choose which activities you want done.

If you don't have this you will want to get it. There are so many ways for someone to get at your computer, and there are people out there with so little to do and who find it fun in fact to try to bust through. Who knows what they really want. Half the time there isn't anything they could really want, but they can mess up your information and spread computer viruses that you are definitely better without. If you have your home business or your personal business on your computer, that's just about everyone, you definitely want to find out more about Zone Alarm. Trojan Horses try to infect your computer. Virus Protection and Anti-virus programs will help protect – along with a firewall. You want them all.

"Spyware" can get into a computer; it tracks activity and even tracks keystrokes so it can get your code names by storing the keystrokes: its controller can retrieve your information. *Spybot Search and Destroy* is about the only thing that will handle spyware says our presenter, and it's a free download!

When you load Spybot and go through and select which things to get rid of, you will want to keep many "cookies": you are going to need them for other requirements. For instance, when you go to a site and want to receive a newsletter from them, say the Wall Street Journal, they require the use of a cookie to get that done; plenty of other sites do, too, you'll see when you try it. Not everything that gets on the computer without your doing it specifically is bad, but you want the choice and it's good to have it pointed out which ones are suspect; you learn about your computer doing it, too. If you delete something and later find that you now have a problem, it is all recorded and the choice can be reversed.

A lively discussion took place about how in the world something could get onto your computer and set up an application and program on your computer. One camp claiming it couldn't be done, period. The other swearing it had done just that.

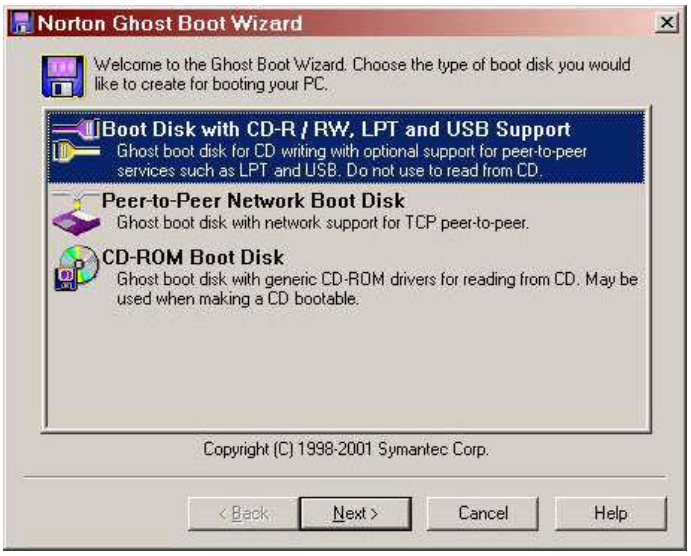
(Minutes……..Continued on page 5)

Backing Up a Complete Hard Drive

By Bob Lafave, Tampa PC Users Group
boblala@ij.net

Over the years, I have tried different programs and methods to back up the computers that I have used and have never been completely satisfied with the results until now. I have tried programs that run in the Windows environment and programs with which you create diskettes to use in a DOS mode and have run into different problems.

I have used PowerQuest programs that you use from DOS and had created images that I was unable to use to restore the data when needed or to use in the Windows environment. I have used the Windows Back Up included with Windows versions as an extra which was not installed in the latest versions but included on the installation CDs, but could not use it to restore a complete system if a hard drive decided to die. I have used Veritas Simple Back UP and NTI Drive Backup, both of which work in the Windows environment but, after making a backup, presented me with problems when trying to restore. Even the Windows Restore feature that is in the latest versions is not what I needed. This restore feature ***WILL NOT*** restore from a hardware failure; nor can you restore ***SPECIFIC Information*** that you need. Restore is designed to help you ***RECOVER*** to a previous time if you installed a program that did not work or created other problems. You can recover your system to a time before the problems began. And Restore has problems itself in that conditions have to be present that take you to a useful time.

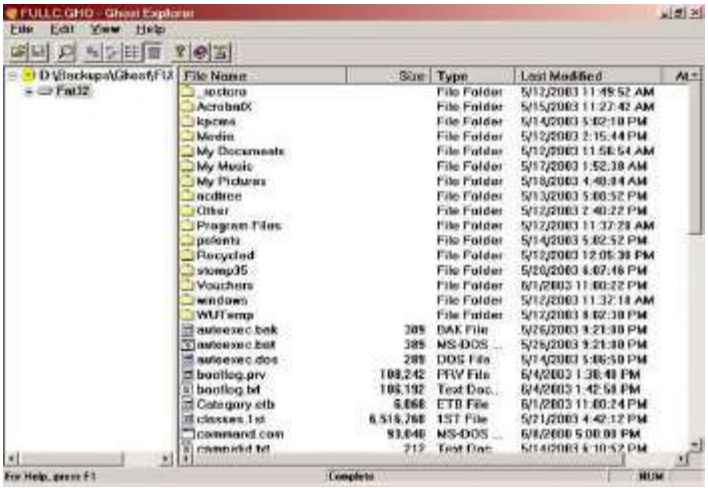


I had about given up with trying to find a reliable method that would work with an ***LARGE*** amount of data on the hard drive and work ***fairly quickly*** to create the image. I wanted a program that would create an image that could be used to ***restore the hard drive easily in the future*** in case a complete restore was needed. And lastly, I wanted a program that ***allows access to the data from inside the Windows environment and lets you restore or even change parts of the data***. So what do I do to ensure I am now protected, and how do I keep it simple enough to be quick, convenient and accurate?

I found Norton Ghost 2002 version 7.0.0.411 that came with Norton System Works 2002 Professional. This program is what I have been looking for to back up a whole hard drive. It is on the System Works installation CD in a separate folder and can be installed by itself without installing any other programs if you choose to do so. The program is also available as a stand-alone program and is $49.99 online at Norton. If you search at other sites, it is anywhere from $25.00 to $68.00. If you look at System Works, it is $69.95 for the 2003 version and between $15.00 and $49.00 for version 2002. The Norton site was all I could find for the 2003 version. My choice would be to find Norton System Works 2003 and use the parts that you need and feel safe using. The 2003 version includes GoBack® 3, Personal Edition by Roxio™, Norton Ghost™, Norton CleanSweep™, Norton Utilities™, and Norton AntiVirus™. The 2002 version I have was a gift so I definitely am using the parts that I liked, which in 2002 included WinFax Basic.

The program takes up only 5.56MB of hard drive space when installed and is in C:\ Program Files\ Symantec\Norton Ghost 2002 folder. The two individual icons that are put on the Start Menu after installation are Norton Ghost Boot Wizard and Norton Ghost Explorer. To use the program, you must first use the Boot Wizard to create a diskette to use to create the image in a DOS mode.

The Wizard takes you step by step and includes a



(Backing up…….Continued on page 4)

(Backing up…….Continued from page 3)

help button to explain each step. You can make choices that allow you to create the image to a hard drive, CD R/RW, or USB connections. Instructions for a peer-to-peer network and making a CD bootable are also given. The Explorer is used to view the image that is created and to restore information, along with other data manipulations. You can restore an individual file(s) or folder(s) to a new folder you specify, you can add new data to the image, and you can change information and then replace it back into the stored image. This is all done inside the Windows environment. But in order to do a complete restore, you need to be back in the DOS mode. A pdf manual is installed to the directory and is accessed from the Explorer Help menu by clicking the choice for Implementation Guide. Along with the normal Help files in both the Boot Wizard and Explorer, this manual will tell you just about everything you need to know. If you do have a problem you can go online to Norton support and carry out troubleshooting with their tech support via email. I had a problem that was not listed in their knowledge base that I could find, and I used Norton Online Support to find a solution.

The problem that I encountered was the creation proc-

ess would incorrectly identify how much empty hard disk space was available on the storage hard drive. I was trying to create an image of about 8 GB and had over 40GB of empty space but I was receiving an error saying *I did not have enough room on the storage media.* Norton support instructed me how to collect the information they needed and what commands would be used to gather the information and had me download a utility to help in the gathering. After they looked at what I sent, support explained to me that the problem was because the hard drives I was using were of the same size. I was told how to override the check of space by using a " command line switch," and everything has worked great. It took three days of correspondence, but I got the correct answer without a charge.

The method I have used since then as I build a computer for someone or create other full system backups is:

If the computer does not have a second hard drive, I use an extra that I install in it temporarily; this is needed as storage. I could use the program to burn the image to a CD R / RW, but I have found that if you have an error in the process you have to restart at the beginning. If you are going to span a large number of CDR's with the image, you only have to find out one time that if the CD blank you are using is defective you have to start all over. In other words, if you need to make 15 CD's and you put in a bad CD blank after 14 are made, or your computer burps, you have to start over and waste lots of CD blanks. You can control compression of data so you can save some space. I also have an extra CD burner that I use when needed for the next part. I create the image using more "command line switches" that break the data into 700MB chunks that will burn to each CD blank. After I create the entire image, I can then burn each 700MB file and not waste my time or blank CD's.

I now have an image at a point in time that can easily be restored.

For weekly backups now on my computer, I now use Ghost. If you want to do this you must have a separate hard drive to which to back up the data. If you look in the ads, you can get a second hard drive cheaply today. The destination storage of the image must be different from the storage location of the image that you are creating. I usually take less than an hour to create a full backup of around 8 GB and have not experienced any problems as I had with the other programs. The program limits the size of the images to no more than 2 GB before it will span to a new section, but this only means that you get more

(Backing up……..Continued on page 5)

(New PC…….Continued from page 4)

files that end in a .ghs extension. As an example: my backup is named FULLC and the first section is called FULLC.gho and the next section is automatically named FULLC001.ghs … and so on until all information is included in say the Nth CDR which would be FULLC00N.ghs.

These files are all recognized by the Ghost Explorer as the backup FULLC and allow for data manipulations if needed. Now when I stupidly delete files I can just go to Ghost Explorer and restore the individual files easily. ◆

(Minutes…….Continued from page 2)

If you have some fuel for that discussion, please send it in writing to the president, Kevan Sheridan. We can all hear about your input at the next meeting.

We then continued with the Windows XP Pro installation. It was a very enlightening evening. And, as usual, we had some great door prizes.

Ron Weinberg won a copy of Partition Magic. Wade Herman won two items, Microsoft Money 2003 and a club T-Shirt.

See you all next month ◆

Paint Shop Pro 8

By Larry Anders, Librarian,
Tampa PC Users Group
Larry@AndersNet.com

Well, if you haven't noticed, JASC software has done it again. Paint Shop Pro 8 [PSP8] was recently released, and if you're into any kind of digital imaging, whether your image is acquired from scanning, digital camera, or stuff captured from the web, PSP8 needs to be in your arsenal of software.

I looked back on our website, http://www.tpcug.org and saw that I reviewed this software package in 1996, but I believe I also reviewed it way before that in its early existence as a purely shareware program. By 1996 it was becoming a major contender. Well, there is no doubt that it has arrived. PSP8 is a first cousin to Adobe's PhotoShop but at a fraction of the cost, a lot easier learning curve and some features I think Adobe wished they had. With PSP8's new *Automated Productivity Scripts*™ you can start correcting your digital images right out of the box by just clicking a button that says, **Enhance Photo** and then **One Step Photo Fix** [Real hard!]. I was impressed with the difference in what I thought was a pretty good digital photo that PSP8 corrected for me automatically.

To make the learning curve much easier, JASC integrated a Learning System that is always available just a click away. There are five categories of quick guides that deal with:

- Automation and Customization [keyboard shortcuts, custom toolbars, etc.]
- Basic Tasks [create, save, e-mail, crop an image, etc.]
- Correcting Photos [straighten a crooked picture, remove red-eye, etc.]
- Graphic Projects [add a picture frame, drop shadow or text, etc.]
- Photo Projects [make a picture look old or convert it into a greeting card, etc.]

These are only some of the examples of what is readily available and easily accessible. There are also over 40 movies in the PSP8 Product Tour. You can't help but easily learn how to use many of the features available.

One of the things I typically dislike most is having to learn a new program, or relearn a program because of major changes made in the newer version. I will admit I was a little put-out when I first opened JASC's latest rendition because it didn't look like I thought it was supposed to. But, within a very short time, I realized the changes made were for the better, and I got over it and moved on to learning what else was new.

I suppose it was about time that JASC made some sweeping changes. It's been looking the same for several years now. I kind of liken it to walking into my favorite hardware store and finding they've changed everything around. I have to look over all of the other stuff to find what I am looking for and usually find something I can't live without. [You think they do that on purpose?] We sometimes get so complacent in using a software program for only particular things time after time that we forget its other capabilities. Such is the case with Paint Shop Pro 8, and it's obvious a lot of thought and planning went into this version because there is a lot of new stuff to look over.

One of the new additions is what JASC calls *Dynamic Personalization*™ that lets you tailor the program to what works best for you. New palette docking options, custom toolbars, and the ability to place any tool or command on any menu or toolbar in the program lets you customize PSP8 to your liking. Plus, you can save your custom workspaces or choose from a variety of preset workspaces for different workflow options. And if you continually do some of the same things over and over, you can now save time by recording, editing and saving commonly used tasks with *Automated Productivity Scripts*™. These scripts can be applied to a single image or a batch of images. You can also create and save your own tool or effect presets to reuse or share with other users.

PSP8 now has what is called an *Effects Browser* that will let you see the changes to be brought about by whichever of the many effects you choose to apply to

(PSP8……..Continued on page 7)

(PSP8…….Continued from page 6)

your image. Of course, there is always the *Undo* button also.

Another of the new features I particularly like is the print templates. You can just about accommodate any printing project you might have with the many templates provided, which support many standard photo sizes, combination packs and commercial papers. In the last version you could place multiple images on one page but not nearly as simply as you can now. Just drag and drop, place where you want, adjust the sizes and print. And, if you like your layout [template], you can save it to use again at a later time.

The ability to read or convert to and from just about any format has always been a plus with Paint Shop Pro, and now PSP8 supports about 50 formats, including the newest file formats such as: JPEG 2000, enhanced EPS PostScript 3 and wireless bitmap (WBMP).

One of the other new features [tools] I really like is the ability to straighten a crooked scan or digital photo by just marking a single line on the image that is suppose to be either horizontal or vertical and, voila, it is straightened out. Also, if something has the wrong perspective, you can mark four points on an image that is supposed to be rectangular and straighten the perspective.

There are tons of new tools and effects, along with the standards typically found in top notch digital imaging and graphics editing software, to help you literally work smarter. If you're new to Paint Shop Pro, get it. If you are a previous or current user, then it's time to upgrade. Download price is $99, with a box price off the shelf of $109. I've also seen up to $30 in rebates floating around too. It's a major upgrade to an already excellent program. But don't take my word for it. Go to http://www.jasc.com and try out a fully functional copy for free for 30 days and see if you don't agree. It will be well worth the download time. ◆

LindowsLite OS

By Bob LaFave, Tampa PC Users Group
boblala@ij.net

I was visiting with Steve Singer at RDI, and he mentioned that he is now a distributor for LindowsLite version 3.0.23. After we talked for awhile, he offered me the program to experiment with. Of course, I could not refuse, so I tried it on my current computer. By using my current computer, I could compare how it performs versus my Windows ME that I currently use. Lindows is being advertised as the cheaper solution to Windows. Lindows' full version includes more programs than just an OS, and you should save by just buying their full package over, say, Windows and then purchasing MS Office. Lindows is also being offered preinstalled on computers and is sold through the Wal-Mart chain. LindowsLite is a smaller version that does not include the more advanced programs such as StarOffice Suit. The Lite version has basic programs included which give you an operating system and what I would call other basic programs. These basic programs give you word processing, Internet access through your ISP, Internet messaging and more. There are also free programs that can be downloaded from http://www.lindows.com in what they call a Lindows Jr. membership for the Lite version. The Jr. member-

Looking Back to 1993

From the July 1993 *Bits of Blue*

PRESIDENT'S COLUMN:

By Harvey Bruneau

I was unable to attend our last meeting due to business commitments. I want to thank our VP, Tom Cone, for stepping up to fill the void. Since I did not write a president's column last month and I missed the meeting, I will write a larger than normal column this month. I bet you thought I would spare you. Wrong!

DOS 6.0 DoubleSpace:

20 minutes! For those of you at the DOS 6.0 meeting, 20 minutes represents the time it took DOS 6.0 DoubleSpace to compress my 486/25mhz PCs 209Mb hard drive with about 40 Mb of data on it. If you remember, I closed the DOS 6.0 presentation by starting DoubleSpace on the PC. During the process I rebooted and restarted the process several times to experience that *what if* feeling. It's the same feeling I have about winning the state lottery. I do not recommend rebooting your PC during the DoubleSpace process unless you feel lucky! During the process we saw different estimates of time displayed by DOS 60 as it tried to calculated the total amount of time it would take to complete the compression process. The time varied between one and two hours. Since our meeting ran late, we decided that we would not sit around past 10 PM to see it finish. At that point I powered down the system with DoubleSpace running. Once I got home I turned the PC back on and started the process again. When I checked the PC a half-hour later during a TV commercial break, the job had completed. AMAZING! On the screen was a message displaying the process was complete and the time it took. At this point I was baffled, why did it display to us one to two hours and run in 20 minutes at my house. Well, there are several reasons I imagine, but the one I like is AI (Artificial Intelligence). In retrospect, DoubleSpace knew the exact time it would finish. It based this time not on the file types and megabytes to compress but the fact that the membership was ready to go home. It knew it would not complete during our regular meeting and it knew the time it took for me to drive home and restart the procedure. In reality AI knew it would take between one and two hours to complete. OK, so maybe I'm stretching it a bit with the AI stuff. It did complete in 20 minutes. However, the process to remove DoubleSpace was even a bigger challenge. It took the better part of half a Saturday to remove DoubleSpace without losing any data. Prior to starting the rebuild process, I could've sworn I heard Clint's (Dirty Harry) voice "*You feel lucky, punk?*" in our house. While I use DOS 6.0 and it is a good product, I personally do not recommend the use of DoubleSpace at this time. Microsoft reports DOS 6.0 sales in excess of 4 million copies. Microsoft says 2 percent of DOS 6.0 customer support callers believed they had experienced a loss of data. However, support technicians were able to help most customers reconstruct or salvage their data. The results were that only .5 percent of customers lost data. That may seem like Microsoft did a good job, but .5 percent represents 20,000 customers with some kind of data loss. Those numbers sure bring back the sound of Clint's voice.

COMDEX:

Comdex really consist of two parts. One is Comdex *"The World's #1 Computer and Communications Marketplace for Resellers and Corporate Decision Makers" and Windows World "The Official Conference and Exposition for Windows Computing".* Several vendors and products drew the attention of large crowds. WordPerfect 6.0 for DOS appeared to garner the biggest crowds in each of its theater type presentations. Microsoft also had big crowds attend its continuous hands-on session of Visual Basic 3.0. This product will be the hot product for the masses. Its ease of use, power and great flexibility will allow non-programmers to create almost anything. Windows NT with third party products running on it was displayed in one of the Microsoft areas while IBM had a similar area for its OS/2 2.1 offering. Microsoft seemed to garner more interest. Intel also drew a big crowd with their Pentium show.

One last thing I noticed was the broad availability of green PCs and peripherals. No, these are not items which are available to those suffering from the Incredible Hulk syndrome. This is a futuristic move for saving our planet and ourselves by changing certain facets of PCs and peripherals. They include power management, consumables and personal health.

The typical 8 hour use of a PC consumes $35 dollars a year while the 24 hour use of the same PC cost $105. The average PC consumes 162 watts while the IBM green PC will consume 36 watts. If current trends continue, the EPA estimates that PCs will represent 10 percent of the energy used. The EPA estimates that a monitor is only looked at 20 percent of its power-on time. Even screen savers are accused of using 20 percent more power than a blank screen. The future PC and peripheral will monitor themselves and reduce their power appetites when not in use.

We waste more paper than ever before. Businesses consume 775 billion pages of paper a year. How many of us: copy a fax when we first receive it; copy or print to single sided paper when we can print it double sided, print that document several times before we get that just right printout. The technology to view faxes from your PC is here as is the capability to print double-sided copies. Many software packages include a preview mode or WYSIWYG to show you what a page of printed text will look like before you print it. Email software systems are abundant to reduce the paper flow which chokes many companies. Many vendors at Comdex promoted their products as Green enabled.

Our health is another issue. Ergonomics and electromagnetic emission are important issues today. We are spending more of our time with our computers than ever before. At one point PCs were used for business at work. As prices drop, PCs are invading our homes as education, game and auxiliary work machines. Mice, more so than keyboards, are evolving as ergonomic, or, as I would say, hand-friendly. The Swedish National Board for Measurement and Testing has provided a standard (MPR II) for monitors producing electromagnetic emission. Several vendors had monitors that would go in sleep mode when not in use, and most said they adhered to the MPR II standard.

The EPA has created a program which will discourage waste. President Clinton has mandated that in the near future vendors

(1993……..Continued on page 9)

(1993……..Continued from page 8)
wishing to sell PCs to the government will have to meet guidelines stated by the EPA in the near future. Once in place PCs purchased by the Federal government will need to meet the guidelines of this program

I saw one thing that I never in my wildest dreams expected to see. The weirdness kicked in as I realized that an IBMer in a polo shirt was demonstrating to me IBM DOS 6.0 (not available yet) on a CompuAdd and Gateway PC. Way to go IBM. Speaking of Gateway, their systems were prevalent throughout Comdex and used by most of the big companies for demonstration purposes. ◆

(Lindows……..Continued from page 7)
ship costs nothing additional, and you have 17 programs available after you register your Lindows OS on the web site.

You can also buy a full membership for $99.00 as an upgrade. This entitles you to about 1,777 programs that are on the site. There is a charge for some of the programs, but they are offered with a discount for the members. The majority of the programs are FREE to members. Whether you are using the Full or Jr. memberships, these downloaded programs are part of the OS itself. The web site is accessed from the taskbar icon for what they are calling Click-N-Run warehouse.

Before adding Lindows to your existing system or purchasing in a prebuilt machine, I would advise you to go to the web site and view what you have available in both programs and hardware choices. Currently there are limited choices of both for programs that you are used to, and some of the hardware you currently have may not have drivers and you may not be able to use them. What I have found out so far is that Lindows appears to be a stable OS that can be used for people with specific needs. If you have hardware items that you expect to use or software that you expect to add, check before you purchase to see if Lindows is compatible. For people looking for a cheaper first system or a second system, Lindows may be for you.

I have a 4.2GB Fujitsu hard drive that I installed Lindows on by itself. Not wanting to affect my current data, I figured this would be the safest way. The Lindows OS CD is made to install from your CD drive so you must be able to boot your computer from the CD to install; no diskettes are needed. I scanned the CD beforehand for any read me files or other documents for any instructions but was unable to find any. So I just put the CD in and waited. The installation started and went along the same as many other programs do: You get a screen that has a wallpaper that tells you the steps that are occurring.

This first screen is detecting and loading your computer graphics, system, modules, CD-ROM and other hardware. No choices are offered at this point. The first choice is how to INSTALL Lindows on the computer, as part of currently used hard drives or by itself on a single hard drive. I chose the single hard drive and was asked for a computer name and password; the hint was given to not forget the password if used because there is no way to recover if forgotten. Easy choice is to not use a password. You are then asked to verify the setup of your choices for installation of hard drive, name and password. After you accept your choices, the installation screen changes to a wallpaper that has a installation process gauge to watch, and on the right there is a preview section showing graphics of what the Lindows program can do. This process is much the same as others and went along smoothly until it reached 99% installed and I received a " Fatal Error 600". No other information was given, so I just restarted the whole process to see what I got; I had no way to get to the internet without shutting down the computer and changing IDE cables for hard drive access. Again, it went through the same sequence and at each I was asked to make my choices again; no information was saved from the previous try. The installation went to the same spot, and I received the same error.

I have installed Windows many times on different machines and know some of the problems that occur in its installation. One I know is that with the high speeds of CD-ROMs and the computers themselves, sometimes you need to slow everything down. In Windows you can look at the read me and it will tell you methods to do this. Here I just had a hunch. I went and took the installation CD from the 48-speed CD and put it in a slower 20-speed drive…. success.

Special Interest Groups

Microsoft Access SIG

This SIG meets the first Tuesday of the month at the **Kate Jackson Community Center at 821 S Rome Avenue** in South Tampa at 6:30 PM. For information contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merlenic@tampabay.rr.com.*

Genealogy SIG

To be included on the TPCUG genealogy mailing list, contact Jenny Lind Olin at 960-5723, or *jlolin@tampabay.rr.com.*

Visual Basic for Applications SIG

This SIG meets the third Tuesday of the month at the **Kate Jackson Community Center at 821 S Rome Avenue** in South Tampa at 6:30 PM. For information, contact Merle Nicholson at *merlenic@tampabay.rr.com,* or William LaMartin at *lamartin@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Kevan Sheridan moderates the discussion.

(Lindows…….Continued from page 9)

This time the installation did not stop. After only about 10 minutes I got " Installation is now Complete," and it rebooted. I then got "Shutdown Complete ... Please remove CD if installed from a CD ... Press any key to continue." The restart went to the Lindows desktop, and I had a box with choices to make of: Set Time, Advanced and Finish.

Set time was easy since it showed the current time, advanced was more extensive and had choices of Set Administrative Passwords, Set Display Resolution, Add Users and Rename Computer.

I changed none of these and just went to Finish and received a "Congratulations".

I was now at the Lindows Desktop without any tasks to perform other than exploring what features were available and how to get things done. There is an animated tour available both from the desktop and at the web site that is a brief explanation of the icons. I found that there is an icon of an orange life vest in the bottom taskbar that gives you access to help that you will find very useful. As I have explored over the last couple of weeks, I have found most of what is in Lindows. Lindows did not like my printers, and the web site will explain that in general Lexmark printers will not work; there are more than 1000 printers from 40 names supported but not Lexmark. It will recognize my Z11 printer, but as of yet I have not found any settings to make it work. My Lexmark i3 is also recognized as a USB printer, but again no success as making it work yet. Lindows only likes certain modems; as of now I have only my external modem recognized and working. Lindows does not recognize my internal modem or my USB external modem: the web site has a list of modems that will work with no problems and the chipset used for the modems. Lindows found my sound card, PCI control card and the 2 CD-ROMs still connected, and they all appear to work. My Canon scanner and HP Photo scanner are recognized, but I have not found a way to see if they are working or not; these are both USB and the Lindows Web site says USB is fully supported. Lindows likes my USB SanDisk 6 – 1 Card Reader and Logitech webcam, but I am still trying to find software for the webcam.

I will continue to play with Lindows for awhile and see what happens over the next few months with the hardware items that are not currently working and see what software is available at other web sites for Lindows. My overall opinion so far is:

Would I or will I change to Lindows in the current version … NO. It does not offer me any reason to on a system that is currently configured as a Windows system, either because of current hardware or software limitations that are usable inside the Lindows OS.

Would I purchase a system that has Lindows preinstalled … YES. I would check the system out beforehand to see what was included, but if it could do what I wanted with the hardware and programs in-

stalled, I would consider it compared to similar machines available in the price range. I went to Wal-Mart and played with a system they sell with Lindows preinstalled and it seemed to be a quality product but was limited in what it would do.

Lindows OS is very similar to Windows in both looks and how to get things done, but so is Linux. To see how Linux looks and behaves, you can go on the Internet and do a search for Linux Knoppix and you should find listings where this version is free and will run from a CD. You can download an .ISO image and burn it to a CD, and the CD will be bootable from a CD-ROM. The CD will boot to the Linux desktop and you will have accessible programs to experience the Linux environment. No installation files are added by playing with the CD. Both systems are similar to Windows and are trying to be alternatives that can fill certain needs and pricing for computer manufacturers and users. Only time will tell as to advantages of these and other systems. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

In the previous newsletter I suggested that members step forward and volunteer to do presentations since it is getting difficult to land presenters except possibly in cases where they have a product to sell. And these products are never major pieces of software, since the days of presentations by companies like Microsoft and Adobe are in the past. Well, we didn't find a presenter for July and none of you came forward, so on returning from a trip to New York City, I thought about what I could present. While there, I traveled to a data center in New Jersey with people who were installing a new server. I took photos and spoke with the owner of the center about the data center industry in general. I thought

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

apcug Member of The Association of Personal Computer User Groups

Minutes of the July Meeting

By Peggy Pulliam, Secretary,
Tampa PC Users Group
pegrance@yahoo.com

We had a discussion about what it means when a business says it is "Restructuring IT"; seems to be another way of saying "downsizing". We talked about effects it might have on computer users. There will probably be a few more loose agents in the field and those who want to will be taking their chances on forming their own organization and freelancing and consulting. We could be looking at a whole new development coming soon.

We didn't have any specific questions to cover in the Windows section of the meeting, and we went straight away to our presentation.

William LaMartin showed us a trip to a data center, Tellurian Networks, in Newton, New Jersey. He had some pictures he'd taken from his recent trip there. The building was great. It will retain its old fashioned look from outside and is in the progress of being face-lifted. It is in a quaint section of town, but when you get inside the old outside shell, you are actually in a new building with all the features of a modern data center, like thumb print entry locks to enter the secure sections. It is positioned in Newton because it is very near a Sprint location.

We saw photos of the data center where the servers were stacked one atop the other; a server is only a little over one inch thick, but contains one Terabyte, that's 1000 Gigabytes, of hard disk space. Whew. The space is very clean and neat and kept very cool, so bring a sweater. There are "hallways" between the stacks where a mobile desk is brought to accommodate work on the servers. The one they were installing while our presenter was in the shop with his camera at the ready was for streaming media on the web. It runs Microsoft Server 2003 software. The generator to keep the place up and running in case of difficulties with the electricity

A guide: How to outlive the bad guys

Or "Less is best" Or "Don't use crap software"

By Merle Nicholson, Tampa PC Users Group
merlenic@tampabay.rr.com

This is my own personal opinion on how to protect your computer from the bad stuff on the internet and also how to protect yourself from the worst of all … yourself. It's a dissertation on how I keep my own PCs successfully running smoothly and relatively trouble free. So if you agree or disagree, I hope you may find something of use here.

A quick summary of my own best practices.

- Have a hardware internet firewall.
- Have a good quality anti-virus installed, running and kept up to date, always.
- Don't use instant messaging (IM) or file sharing programs.
- Don't use gaming sites where a continuous connection is required.
- Never open any email without first knowing or checking on the source; delete all others without reading them.
- Never open or run any email attachment unless you personally know the source and trust them. (And know where you can find them).
- Don't install any crap software.
- Disable "convenience" resident programs.
- Periodically review your startup program list and also your running processes and at least attempt to investigate and document their original authorship.
- Never install any software to "fix" a software problem or an operating system problem. (See 7)

The teenager problem:

Right off, after reading my list, you're going to say .. "I have a teenager. He/She will make my life miserable without IM and Kaaza." Well, I had a couple of teenagers once myself and you certainly have my sympathy. There's only one solution to this problem. They need their own PC. Yes, set up so they can't use yours and can't access yours through your network, and when theirs dies or otherwise get unusable, reformat and restore from a restoration CD. And make them reinstall their own programs. They'll be better, humbler adults for it. Upgrade everyone to Windows XP Home so you have security features so they can be blocked from access to your own computer and also suffer less from crashes.

An alternative – and a good one – is to set up XP with multiple accounts, one for each user and restrict theirs so they cannot install programs. They must go to an administrator (you) to install. This is not ideal, because you'll have to give in and install some crap software and you're on your way to software hell, but at a more controlled pace.

Crap software:

1) Instant Messaging and file sharing .. Don't. I've even renamed my Microsoft Instant Messenger executable and substituted a 0 byte executable of the same name. That prevents it from running at all. Same for any file sharing program. You're putting your system at risk by using them. Eat more vegetables, exercise, reduce your red meat consumption, and refuse to share files.

2) Software that fixes software. Registry cleaners, software that eliminates duplicate .DLL's (who cares!), Ad-Aware, software firewalls, Norton Systemworks etc, etc. You don't need them. My own rule: If I want my PC to run trouble-free, I need LESS software, not more. Why add software to fix the bad software I've installed? Go through your Add/Remove Software list and make sure you're still using everything! Uninstall if you don't! This will free up more hard drive space than a "cleaner" ever will. The registry "bloat" you've heard about is pretty much a myth. Don't install crap software, and your registry won't have any crap in it. It's just data in a file - a database. Windows accesses what is asked of it, and doesn't know about the extra crap in it.

Most of the "crap software" has one thing in common. They're "always on". They start up when Windows starts and run "resident". They provide a "hook" or a "monitor" to accomplish something

(A Guide……..Continued on page 4)

(A Guide……Continued from page 3)
when needed. Anti-virus works this way, but so does IM and things like MS Office's "Fast Find", which is of value only when you're using it, not all of the time. As time goes on, more and more of these things get installed, and pretty soon, you're experiencing crashes or simply a PC that is too slow to be useful to you. You don't always have to uninstall the program to get rid of the offending resident. You can easily disable Office's Fast Find from the Startup in MSConfig, for instance.

People have paid me very good money to fix PC's that to them are just "broken". If they run at all, they run so slowly they might as well be broken. When I get the PC the first thing I look at is the number of icons in the system tray. Invariably, the system tray is loaded up (say more than 6), and if I find RealPlayer and ZoneAlarm, I know that I'm in for a lot of work.

3) Good software you don't need. Fast Find, Quicken Bill Minder, MS Scheduler, RealPlayer, Kaaza and Zone Alarm fall in this category. Replace ZoneAlarm with a hardware firewall. If you MUST have RealPlayer, at least disable the windows startup, but I think Windows Media Player will do most of us just as well, and it least it goes away when closed. You put your PC at great risk using any file sharing programs, and the goal here is to greatly reduce all resident programs. At least learn to remove file sharing from being resident, launch it when needed and close it out when not needed.

Other examples of good resident programs you don't need are like my scanner utility that used to load with Windows. This thing sat in my system tray and shuts off the light tube after 10 minutes of no use. Because the scanner lacks an on/off switch! So I've killed the resident program and I unplug the scanner! I use my scanner, but maybe a fraction of a percent of power on time; why run it all the time? Likewise, a resident program detects when I connect my Fujifilm camera. It was in my system tray just to launch the camera picture viewing program. Duh! I can click on the viewer program icon when I need it.

3) Hardware firewalls. This device sits between your cable modem and your PC. It blocks intruders very effectively. It's programmable from your own web browser, but as far as I know, they are suitable right out of the box with no programming necessary unless you're running a web server or you're doing file sharing. If you're doing file sharing, some port(s) must be opened up (exposed) to the Internet. Some firewalls are preprogrammed to open up for the most popular programs. That they need to be opened up in the first place should tell you something about the risk of file sharing!

The real advantage of hardware firewalls is that they also provide wired and wireless networking within your home or business. You can find these high quality devices as low as $50. Look for them in weekly newspaper sales.

Finally: I think I'm pretty successful in keeping my computers trouble free. Here's my criteria for selecting software.

I buy and install only software that I feel will be productive for me. If I install, use it and find that I'm not totally happy with it, I uninstall it immediately. I'd never install a utility program that purports to "fix" something. After installing any software, I immediately check the system tray and also check the running processes list to make sure I have not installed a resident program. If it has a resident program, I find some way to disable it or I simply uninstall the whole thing.

I use the major brands of anti-virus. I have registered copies of Norton Anti-Virus, McAfee Online and AVG free version. I scrupulously keep all of them up to date at least weekly. When my notebook is not connected to my network, and therefore not connected to the Internet, I may disable active anti-virus checking.

I'm very, very cautious with all mail and attachments and newsgroups. I probably delete most files sent by friends, unless I specifically have discussed the purpose with them and am expecting the file. Don't bother sending me jokes, I delete them. Everything questionable is deleted. I have the Internet se-

(A Guide…….Continued on page 12)

was behind the building. It is amazing what power is there and how much information and business was going on in a small town behind a gentle façade of a corner building on a small town shopping street!

He took us, via pictures and web sites, to a couple of other data centers. One was here in downtown Tampa. The day of the large data center is gone, and smaller companies are taking their place. What used to be the large data centers are now also used for back-up space for larger companies.

He also showed us several virtual tours he had created at his web site, http://www.lamartin.com, using the Photo Vista software which was demonstrated at a recent meeting. The software did a great job and William presented an enlightening presentation.

Mike Hodges surprised us with a door prize donation of Windows XP Pro! Doug Mullis won the XP, and he won a fax machine too; lucky night for him. John Conrad won Spell Catcher Plus.

We hung around and talked for a while after the meeting, and some of the group went for dinner or a snack afterward! You can't talk too much about computers. ◆

Norton Ghost 2003

By Bob LaFave, Tampa PC Users Group
boblala@ij.net

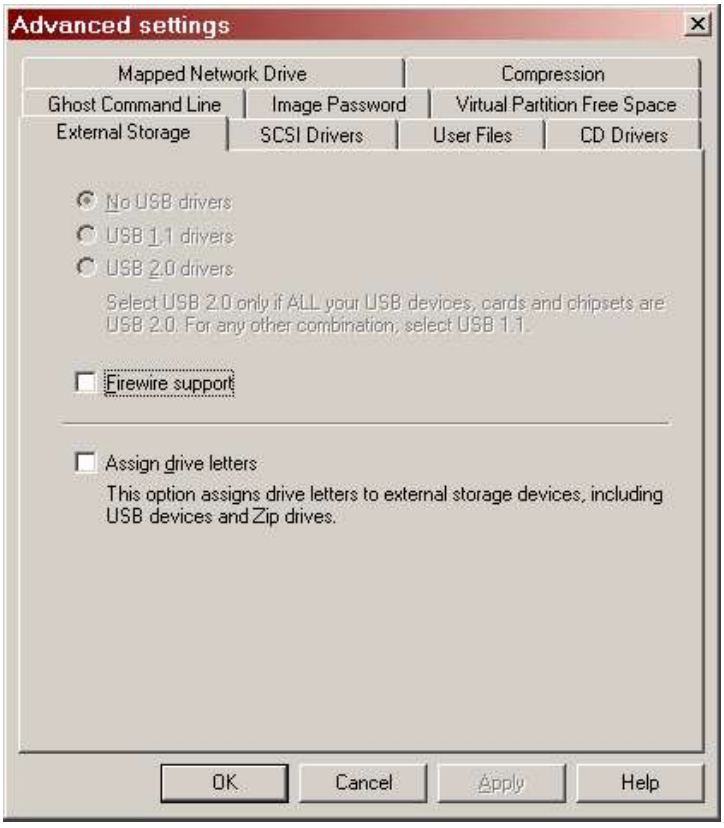
I had just finished the article on Ghost 2002 (http://www.tpcug.org/newsletter/nl_2003/july2003/backup.htm) when I was able to get a Norton SystemsWorks 2003 containing Ghost 2003 OEM from Steve Singer at RDI, and am I glad I did. The 2003 version has so much more to offer than the previous version, but I think what is most important for others is that it is simpler to use and does much more.

As you start the program you now have three choices on what to do:

- Ghost Basic
- Ghost Advanced
- Ghost Utilities

Ghost Basic gives you three choices.

- Backup
- Restore
- View Log



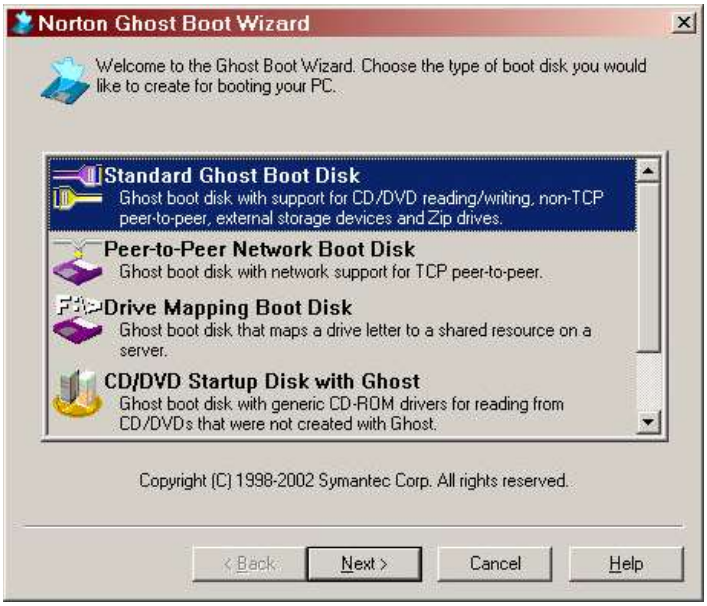
Backup and Restore start easy-to-follow wizards that take you step by step to do what they say. View Log takes you to a Task Log of previous processes. This isn't much information, but it really is that simple to do both the Backup and Restore. Point and click your way through the wizards.

In Ghost Advanced, you again start well-thought-out wizards:

- Clone
- Run Ghost Interactively
- Peer to Peer
- Create Virtual Partition
- Image Integrity Check

Again you just point and click your way through a wizard that is very self-explanatory.

Each screen of the wizards has a help button that will explain each choice you have to make. You can clone a computer, start backup from here, work over networks that can be any configuration, and check a created image for completeness. The advanced settings allow many individual settings that provide the correct drivers for your particular system.



(Ghost……..Continued on page 7)

(Ghost…….Continued from page 6)

Ghost Utilities offers what the previous version contained: Norton Ghost Boot Wizard and Norton Ghost Explorer along with an easy access to the Norton Ghost User's Guide in Adobe PDF file. The boot Wizard allows the user to create a Boot Disc that can be used to start Ghost in a DOS environment. The Boot Disc is created again using an easy to follow wizard that you just point and click till finished.

In this new version the Boot Disc is not needed to create an image because you can now run Norton from inside the Windows environment. As you finish up the process that you have chosen, Norton Ghost now creates a "Virtual Drive" on your hard drive and restarts the computer into a DOS environment and starts the Ghost process without needing a Boot Disc.

Other changes in this version are that you now are not asked any questions when starting to create an image since you do all settings from the Windows wizards and after the image is created the computer is restarted back into Windows automatically. This is simple and is what I like most with this version. You still need the Boot Disc to restore an image to a hard drive from other backup storage media; a second hard drive or CDR's would be examples.

The Ghost Explorer stays the same as in the older version. You can use the Explorer to view the created image files much as you use Windows Explorer to view the contents of storage media. You can also easily extract any file(s) needed, open files and change them, delete files from an image and also add files to an image.

The user guide is now 221 pages that can answer most any question you could have when using. I would suggest that any new users go through the user guide before trying the program. The new version also contains a tutorial that is a quick way to review the program's different actions of the offered wizards. You can use the tutorial in either a Demo mode where you just watch the actions or in an Interactive mode where you can follow the process and click the choices as the wizards proceed.

This program is a must for anyone that wants a reliable and easy to use program to back up their system into image that can be easily restored in case of hardware failure, cloning one system to another, or for protection from virus damage. ◆

(Comments…….Continued from page 1)

that I might be able to get a presentation for our group out of this information. What you saw at our meeting in July was the result.

Apparently all is not well in the data center world where there is far more capacity than need. The owner of the data center I visited said that only five percent of data center capacity nationwide was being used. It appeared to me that no more than 40% of his cabinets had anything in them. But that is a lot better than 5%. Do you recall several years back when they were worrying if California was going to have enough electricity to supply all the data centers that were being built. I think I even remember an article in the local paper speculating on the availability of power for data centers being planned for Tampa. They mentioned a new one to be put in an older

Looking Back to 1993

From the August 1993 *Bits of Blue*

Secretary's Report

MINUTES OF 7/14/93 MEETING and PERSONAL COMMENTS

By: Jim Clark

He's Back!! Yes, our illustrious Prez, Harvey Bruneau, is back and chaired our meeting. While Harvey seemed glad to be back in the saddle again, the timing of our meeting was again not the most opportune for him and Marylee. It was their 10th wedding anniversary. Notwithstanding, they shared some of their precious time with us on this special day for them. And after presenting Marylee with a dozen lovely roses, Harvey proceeded with our meeting, announcing that he had every intention of having a short meeting and then taking his lovely spouse to a special place in celebration of the special occasion. (Check the time of adjournment to see how successful Harvey was at meeting his timing objective.) Harvey then launched into the meeting in our regular format.

INDUSTRY/CLUB NEWS

A member of our group had told Harvey in the past they would be willing to lead a special interest group (SIG) on OS2. Several at the meeting indicated they would like to participate in an OS2 special interest group. Harvey announced that he would try to arrange a SIG to begin at 5:30 on our regular meeting night in September. Further details will be provided at our next meeting and in the next newsletter.

Software presentation objectives for the next few months are:

August	Word Perfect 6.0 (DOS)
September	Windows NT (If released by that time)
October	CorelDraw 4.0
Not-too-distant future	IBM 0S2, Ver. 2.1

Harvey had read several reports of problems being encountered with CorelDraw 4.0. An interim maintenance release should be available in a couple of weeks. To obtain one, call CorelDraw at 1-800-836-3729.

Harvey related briefly some of his experiences at Comdex in Atlanta. He noted that the Comdex in Atlanta is considerably smaller than the Las Vegas Comdex, but that it is still a very worthwhile gathering to attend, and one will see at both more computer related hardware and software innovations than can be seen at any other location in the world. Harvey recommend attending either if you can, giving priority to the large Comdex at Las Vegas if a choice is available.

Microsoft has announced their intention to make MS Visual Basic the macro language of MS Word, MS Access, and Excel; one could expect that it will end up as the macro language in all of MS software products.

MS Access 1.1 maintenance upgrade is out. It can be purchased from MS directly for $19.95, or call MS for a coupon which will allow purchase from local retailers for $14.95.

It was reported that anyone interested in Superbase, a high-end database program reviewed just a couple of months ago in this newsletter, could be obtained from Software Publishing Corp. for $99 IF you mention one of its competitors.

Harvey informed all that a program he recently acquired, called Romaterial, I believe, is a neat fun kind of utility ROM. It includes about 500 icons and a calculator with voice answers in any one of 5 different voices. Plus several other features, all for a street price of $17.

PRESENTATION JetForm 3.1

The JetForm Corporation was kind enough to make their Regional Sales Manager, Randy Hippe, available for a presentation on their software program, JetForm 3.1 for Windows. Randy related a shaggy dog story of how the twain shall never meet, the result being that the material he had expected to have for all present about their program was not available; it was floating around the UPS system and/or several hotels. In introducing the program, Randy noted that they have versions for DOS, Windows, Macintosh, and were working on OS2

This program is much different than I had expected. I have used a forms program with which one could create a variety of custom forms. Well, JetForm does that, from the simplest to the most complex, quickly and easily. But it does so much more, and it is this part where the program really shines, and which makes this program so much different from the forms program I had used.

JetForm is a very powerful forms program. It really comes in two packages: JetForm Filler, which is principally a filler program, and JetForm Design, which includes JetForm Filler and Design as well. JetForm is clearly designed to meet the needs of businesses/organizations that deal with many different people and/or things. Randy showed and informed us about so much I could not keep up with my notes, but I was impressed that it could create just about any form one would need (invoice, order, etc.) and then fill them in with speed and intelligence. Some of the many features include:

- Import directly from just about any major software; you need only tell the program once where to get the desired data. And, it can import data from several sources for the same form. JetForm also includes a database capability of its own.
- The version demonstrated had an excellent graphical interface, complete with button bar and a huge number of icons (macros) with which to customize to suit individual needs.

(1993……..Continued on page 9)

(1993……..Continued from page 8)

- Easily built-in intelligence in the forms to perform whatever calculations may be needed automatically.
- Built-in automatic address book.
- Allows creation of forms in JetForm from scanned images which can be quickly converted to JetForm forms, complete with intelligence, etc.
- Capability to transmit output via paper or electronic means, such as email, another step toward a "paperless" world.

The requirements for JetForm are minimal. The DOS version requires only that you have 640K of RAM, for example. There appear to be no requirements peculiar to JetForm. If you use the Windows version, if you have the capability to run Windows, you have the capability to run JetForm. Unfortunately, Randy didn't mention how much disk space was required for the program, and since no literature was available at the meeting, that kind of information is not available to us at this time.

JetForm Filler lists for $129, and JetForm Design lists for $495; street prices (usually special order) run about $93 and $328, respectively. Why buy the filler without the design capability, one might ask. Several reasons are possible: You have need for several filler programs, but need only one design package, is one. Another is JetForm offers form design services as well as on-site consultation services, and training if needed.

Randy covered many aspects of the program beyond this brief accounting. I can't cover them all here. It is clearly a very powerful and useful program for those needing that kind of capability. And, for those that do, it would appear that JetForm is a program worthy of further investigation.

A BIG thanks to JetForm and Randy Hippe for a fine presentation on an excellent program and for the copy donated for our use.

AND THE WINNER IS

Thanks to the generosity of JetForm Corporation, Lotus Corporation, Borland and Sunrise Computer (who donated several maintenance items), along with the 50/50 cash drawing there were some very nice raffle prizes. Those among us to have the good fortune to win are as follows:

Roger Waters	JetForm Design 3.1
W.F. LaMartin	Lotus Organizer
Russ Stepp	Object Vision 2.0
Preston Goossen	0S2 Book
Russ Stepp	Sunrise Mx Package
Preston Goossen	50/50 ($48)

The meeting adjourned at close to 9 PM; good work, Harvey. ◆

(Comments……..Continued from page 7)

building downtown. Possibly that new data center was never placed in downtown Tampa.

Networking In the past month two members contacted me with problems getting networking set up on their laptops. One was on an older laptop running Windows 98, the other on a new laptop running Windows XP Home.

First the new laptop. The owner used the XP networking wizard to set up his network consisting of the XP laptop, a Windows Me desktop and a Linksus cable/DSL four port wireless router. He had Internet connectivity but could get nothing to work as regards networking, and the laptop's manufacturer, Gateway, said it wasn't their problem since the network card was working fine in the computer and they couldn't be responsible for the rest of the computers in his house. Looking at my network setup while talking with him on the phone, I first discovered that he really could see the new laptop from his desktop computer--he just hadn't known how to do it. He was trying to use a Remote Desktop Connection instead of simply using Windows Explorer or going to Start | Run and putting "\\ComputerName" in the text box and pressing Enter, where ComputerName would be the appropriate computer you want to view.

Getting the new XP laptop to view the desktop took a bit more work. To make the story short, I basically had him undo all the settings that the networking wizard had set and replace them with the ones that work on my systems. As I recall, the problem was a setting or two in WINS configuration of the advanced TCP/IP network settings. One was disenabling LMHOSTS Lookup. After that, everything was OK.

For the fellow with the older laptop, he wanted to connect to two desktops running XP and a new Linksys router, I went through my usual checking of network and network card settings to no avail. The laptop could not ping the router. He had already contacted Lynksys support to no avail. I suggested that he bring his laptop to my house to see if I could get it

Special Interest Groups

Microsoft Access SIG

This SIG meets the first Tuesday of the month at the **Kate Jackson Community Center at 821 S Rome Avenue** in South Tampa at 6:30 PM. For information contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merlenic@tampabay.rr.com.*

Genealogy SIG

To be included on the TPCUG genealogy mailing list, contact Jenny Lind Olin at 960-5723, or *jlolin@tampabay.rr.com.*

Visual Basic for Applications SIG

This SIG meets the third Tuesday of the month at the **Kate Jackson Community Center at 821 S Rome Avenue** in South Tampa at 6:30 PM. For information, contact Merle Nicholson at *merlenic@tampabay.rr.com,* or William LaMartin at *lamartin@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Kevan Sheridan moderates the discussion.

(Comments…….Continued from page 9)

to connect to my network, or if with one of my network cards it would connect.

He brought it over, I connected it to my router--and he was on Internet and connected to my network.

So what was his problem. It was either his router or the network cable at his house. Since he had tried the connection with different network cables which worked fine for his other computers, that wasn't the problem. And the router worked since the other computers were communicating with it. What was different about the laptop?

Returning home, he again contacted Linksys, but this time spoke with the router people instead of the network card people. They had him do the usual of assigning an IP address to the laptop, which you shouldn't need but had been tried before, but added another wrinkle. They had him slow down the connection. In the properties of the network card on the advanced tab there is a drop-down box where you can select your LAN speed. The default is Auto Sense. Linksys had him change it to 10Mbps--the slowest connection. I think that is what did the trick, not the fixed IP address.

Networking seems to be a problem. I thought I had pretty much mastered it, but missing the slowing down of the connection for one of the computers shows me that I don't know everything. Of course, one doesn't really want to have to slow down the networking to make it work. Since it worked at full speed connected to my network, something is deficient about his setup at home--possibly his router.

New Laptops These new laptops are certainly nice. The other member with a networking problem has a new Gateway M500s, which seems like a real good buy at $1,499. It has a very large screen with resolution higher than 1024 x 768, a 40 GB hard drive, 512 MB RAM, 2.2GHz Mobile Intel Pentium 4 Processor, etc. Its only drawback from my point of view is that you really can't change the configuration--you buy it the way it is and, I suppose, allow Gateway to sell it a bit cheaper as a result.

It sounded like an ideal computer for my daughter in college, except that the operating system is XP Home which can't be upgraded in the purchase, and I wanted her to have XP Professional. Why, you ask? Well, I want to snoop on her. Not really, but I would like the ability to access her computer remotely (at her request and with her permission, of course) using Remote Desktop Connection and take control of her computer so as to try and fix any problem she may be having. For this to work, the computer being accessed needs to be running XP Professional, not XP Home. The computer I am using to do the accessing can be running anything from Windows 98 on up as long as the Remote Connection software is installed on it.

After doing my research and visiting the local Gateway store with my wife and daughter, we settled on the

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

Worms August has been a bad month for computer worms. First there was the Blaster which exploited a flaw in DCOM RPC using TCP port 135 in Windows XP and Windows 2000. Microsoft had supplied a fix over a month back, but many people had not applied it, including several of our members. You really need to have Windows automatically check for updates whenever you go online. The second worm, SoBig.F, has been clogging up email inboxes for the past 10 days or so.

I first came into contact with SoBig.F while traveling. The

This month's meeting started on time with Mike Hodges officiating.

We were reminded to keep our e-mail addresses up to date so important messages don't go astray. The newsletter is online too! Http://www.tpcug.org. Newsletter article submissions are encouraged, so if you have information to share on a likely topic, send them to the editor.

Remember that the Special Interest Group meetings are held at the Kate Jackson Community Center in Hyde Park on the first Tuesday and the third Tuesday of the month.

Our discussion ensued about viruses and how they can get in through a buffer overrun. Microsoft supplies critical updates at the Windows' update site. Use them to seal the holes the viruses are finding.

Mike conducted a survey of those present as to programs for future meetings. The subjects are: Scanning, Excel, PowerPoint, Notebooks, Internet Telephone Calls, Digital Photography, Outlook, Video Editing, Photo Albums, Databases, Microsoft Word. There were a few others, too, but these should keep us going for a while and also branch out into other future meetings.

We learned about a Google Tool bar which kills pop-ups. Bruce Register told us about his experience with the Blaster worm. Many more topics were covered, and it was quite an informative meeting.

Bruce Register is the happy winner of the door prize "Wipe Drive", and Jim Purcell won a T-Shirt.

After the meeting ended, some of the group went on to meet later where there was food and continued talking for a while longer. ◆

AIPTEK DV2

By Bob Lafave, Tampa PC Users Group
boblala@ij.net

The AIPTEK DV2 is a multi-functional camera and voice recorder that does four tasks: Digital still camera mode (takes 1280 X 1024 X 24Bit jpeg), PC camera mode (Web Cam), AV recording mode (avi digital files), and Voice annotation mode (voice recorder in wav format). Sounds like a lot for this little gadget, but it does do them all. The web site at http://www.aiptek.com/index2.php has all the specifications for any surfers to view. First, the price was great. For $89.99 plus shipping, I received not only the DV2 but also a digital watch that they are currently selling for $19.99; still the DV2 is worth much more. The still mode jpeg's are really nice. I can place them as wallpaper, and they look great. They are of equal quality to many other pictures that I have found over the years on web sites. The pictures are true 1.3 mega pixel resolution. With 16MB of memory built in, you get only 15+ pictures, but the DV2 can take an optional 512 MB Compact Flash card to increase that number to over 600 before changing cards. The flash card is also useful if you are going to take digital movies. The 16MB of built in memory gives you only about 2-3 minutes of video with sound. Add the card and you can get almost 100 minutes of digital avi with sound. If used for a voice recorder only, you get about 30 minutes with the 16MB of memory and almost unlimited with a memory card. The sounds are not recording quality by any means, but, if used for reminders or note taking, the quality is fine and, when taking videos, is acceptable.

During a rainstorm, I recorded the rain, wind, and thunder, and it can be heard along with my commentary of what was taking place. Lastly the DV2 is a web cam that is better in quality than the Logitech web cam that I have. There is separate software called *Mega DV Manager.* This picture shows the web cam mode looking out a window. You can take still pictures or AV recording from this application directly to the computer.

When the DV2 is used as a web cam, you are connected by USB; this is really convenient at home, especially if you get a USB extension for added range. This is the only software that needs to be installed for the use of the DV2, but six more programs are included. The programs are:

- Microsoft NetMeeting, for internet communication.
- CyberLink PowerDirector Pro, to edit and create movies on CD's.
- CyberLink Media Show SE, for making animated slide shows.
- CyberLink VideoMail, to create and send video emails.
- Ulead Photo Express, to edit and create illustrations and photos.
- Ulead Photo Explorer, for visual file management.

I could write individually about each of these programs, but I think it would be easier and provide more information for those who are interested to visit:

http://www.gocyberlink.com/english/index.jsp for descriptions of CyberLink programs and http://www.ulead.com for Ulead programs information. What I will say is that there is very little that you will not be able to do with the still images or digital AV that you take using the included software.

(DV2 ……Continued on page 4)

(DV2……..Continued from page 3)
If priced separately, the software itself is worth far more than the cost. Some programs are older versions or OEM versions.

Overall, for the price you get a great multi-functional camera with a LCD display with easy to follow instructions that allows you to record most any choice you can make. Yes, you do have to purchase a Compact Flash card to extend the features, and this will cost as much if not more than the DV2, but I think it is a well thought-out product. Between the DV2 and its included software, what more could you ask for.

The AIPTEK DV 2 is also sold at Best Buy and is where I found it when browsing the shelves. Their cost is $99.99 including tax. AIPTEK products are sold at Circuit City also. ◆

(Comments……..Continued from page 1)
first day of the trip I didn't bother to check my email. The second day I had about 30 messages with the worm attached. The next day there were about 120 with the worm, and the following day after only 15 hours between checks, there were around 150 bad messages. For the most part RoadRunner was now replacing the attachment with a message of their own to the effect that they had deleted the attachment since it was infected with the SoBig.F worm. Needless to say, on a dial up connection I have to use when traveling, it was a slow go downloading all of them and deleting them. After that, the messages sort of tapered off

On the day I received the 150 or so messages in less than 15 hours, I think it was Thursday, August 21, I was checking out my daughter's computer setup in her dorm room when I noted that I couldn't go anywhere on the WWW. I then checked email, and it worked. I checked that I could go to the university's main page, and it worked. But you couldn't get anywhere outside the university. I then tried to ping several outside sites like tpcug.org, IMB.com and Microsoft.com. No luck, the university was cut off from the world. I called the campus computer help line and was told that they were taking very heavy traffic. Apparently the worm was jamming everything. It didn't get back to normal until the next day.

On returning to Tampa, I had to face all those bad emails again, since while traveling I have the email program leave the mail I read on the server. But I downloaded them all and deleted them.

It was relatively quiet for a couple of days, then there was a bit of heightened activity of just short of 100 wormy emails over a 24 hour period. Then came a day or so of next to nothing on the worm front. And then, all hell broke loose with over 350 such messages in a day. After that the worm infected email tapered off to almost nothing. And that is where things stand now.

This sort of thing is getting to be a major disruption for me. 350 bogus emails in a day takes up your time. The odd thing is that they all came in on my RoadRunner account and none on my Earthlink account, which is the one that gets the greatest number of Spam messages.

The only funny part of it was all the messages I received from U. S. Senators, bogus ones at first caused by the worm, then later legitimate ones to me as replies to bogus ones sent to them by the worm with my email listed as the sending email. Of course, the replies were pro forma and stated that they were too busy to respond to me individually due to security reasons or the large volume of messages received by their office and that I should write them using the regular mail.

Printer To go with the Gateway we bought for my daughter to take to college, we also purchased an HP 2175 all-in-one printer. That seemed like a good idea since it gave her both a scanner and a printer. Everything seemed fine with it both here in Tampa and at college. However, the evening before we

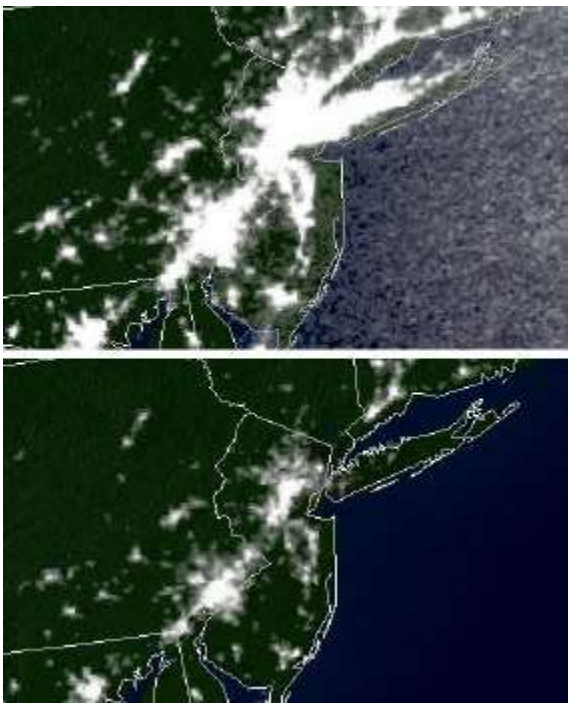
Electronic Recycling Day

By Mike Hutchison, TPCUG
mmyankee@ij.net

Here's is a reminder about the County's Household Electronics Collection Day. It is on October 25, 2003, 8 AM to 2 PM at the East County Collection Center, CR 579, 1/4 mile North of I-4 Exit 10.



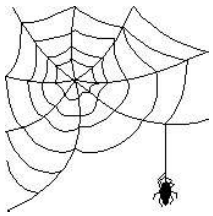
They are accepting TVs, VCR's, computers and computer components, microwave ovens, cell phones, telephone, power supplies (one presumes this would cover cell phone batteries) and other small household appliances at this collection.

NO Commercial/Business electronics accepted.

For schedules and other information about Solid Waste Management Department events, contact the SWMD at 813-272-5680 or visit the website: http://www.hillsboroughcounty.org/solidwaste/chemical.html for Residential Collection events, or http://www.hillsboroughcounty.org/solidwaste/cesqg.html for Commercial/Business collection events.

(Above was excerpted from The Recycling Planet, a quarterly report put out by Hills. County)

Internet Picture of the Month



Blackout: Before & During

Aug. 14 & 15, 2003 cropped photos from the NOAA site, http://www.noaa.gov/. The satellite images were taken before and after of the historic blackout of the Northeastern United States. These cropped photos center on the New York City area. "NOAA processed the night lights data taken by the Defense Meteorological Satellite Program (DMSP). NOAA archives the data from the satellite."

Wireless Home Network

By Merle Nicholson, Tampa PC Users Group
merlenic@tampabay.rr.com

I've added wireless capability to put my notebook wirelessly on my home network. I can use the notebook anywhere inside my house and in my back yard, too. My spouse wants me to test it in the detached garage. I haven't asked why yet.

I've had a home network for several years and been very happy with its features and functions. I've had Roadrunner Internet access for several years. I managed to be on the RR network soon after it was available in Tampa, and I quickly set up my home network with Sygate Internet-sharing software, similar to the Windows Internet sharing that is now available. A year or so ago I replaced the Internet sharing with a Linksys Cable/DSL router, and I've been very happy with it, especially for its built-in firewall. It has a four-port switch to handle my network. I do have an older hub attached to provide a couple more ports.

The hardware firewall in the Linksys is wonderful. I was able to remove my software firewall and greatly improve the performance of that PC.

I have four hardwired computers in my home. One, my oldest, just manages my telephone now as its only function. It had served other functions over time, like holding online backups, and it originally did the Sygate Internet access. It's just a P-166. Its function now is to answer and hang up on anyone calling in with an unknown caller ID. It blocks people and businesses that we have identified and announces who is calling for everyone we do know. I love the hang-up part.

Then my wife and I each have our personal computers, and I have a Windows 2000 machine now collecting online backups from all the other machines and running my SQL Server. But we also have a one-year-old notebook that is mostly unconnected. When I want to update Windows or anti-virus signatures or move files from other computers, I set it up on my office workbench where I have a spare network cable to the hub. It came home to me that I needed to improve it when I was watching the Wimbledon tennis matches in the living room, that I had a lot of down time that I could be using productively if only I had my notebook. I have a couple of software projects going on that I'd like to be working on. So wireless is the way to go if I can get it cheaply enough.

I felt that since I don't have an overpowering reason to do this, I needed to do it cheaply. That eliminated the new high-speed "G" systems. So it had to be the older "801.11b" 11Mbps system because I can find them on sale right now. I got a D-Link Cable/DSL router for $40 after rebates and a NetGear for $30 outright, no rebates, both from Office Depot. No other costs except sales taxes.

The Router:
The router I got was not ideal. Remember that I have a Linksys router, and I don't want to disturb it. The ideal device is a "Wireless Access Point" device. An Access Point is designed to do exactly what I need; add wireless to my network. But guess what … they're $100! No way! So I got this wireless router.

How I hooked it up:
The new router has a "Wan" port where you are supposed to cable your DSL or Cable Modem. I've left this empty. It has four switched ports where you can plug in Ethernet cables to hardwire computers directly. I picked one of these ports and cabled it to a similar port on the Linksys router, using a crossover cable. The port I picked on the Linksys is the one I was using for the hub. I disconnected and retired the hub. So I have six ports for computers now, three on each of the routers because the interconnect cable between them uses one each.

It doesn't work .. yet:
OK, right off, some of the network isn't working. So I have to fix it. The problem is, I have two competing routers. A router's function is to provide firewall protection and also to be a DHCP. A DHCP assigns

(Wireless……..Continued on page 7)

(Wireless……..Continued from page 6)
an internal IP address to each of your computers, and you can't have two doing this at the same time. Also, both routers have the same fixed IP address. You access the router's setup with any web browser. The only PC working was the one that was hard cabled to the new router. The first thing I did was change the new router's fixed IP address. Then I started disabling stuff in the setup. The most important thing was to disable DHCP. Then each of the computers worked after releasing and renewing each computer's IP address using either Winipcfg (Win 98/ME) or IPConfig (Win/XP and Win/2000).

Finally:
It really works well. 11Mbps really is fast enough. Internet access is still very fast. When I think about it, my network started out to be 10Mbps and bumped up to 100Mbps only a year ago when I bought the Linksys. I replaced the PC network cards to 10/100 about the same time. The only problem I have is that, for the moment, I don't know the IP address of the new router, so I can't configure it any further if I wanted to without resetting it. I don't know why this is, but my guess is that it doesn't have one any longer. I accessed the configuration of the Linksys and looked at the DHCP client list. All the computers were there. I don't see any practical disadvantage since the new router has an external reset switch that will set everything to the factory defaults, and I can start over again. ◆

(Comments……..Continued from page 4)
were to come back to Tampa, she called to say that the printer was producing a message on the computer to the effect that it might be running low on ink. Well, we hadn't printed much more than a dozen pages to see that it worked OK. However, I recalled that in the description of the printer, there was a statement that it came with starter cartridges. 12 pages doesn't seem like enough for even starter cartridges, but what the heck; off to the local CompUSA to buy, for about $50, a replacement pack of a black cartridge and a color cartridge. Then to the dorm to install the new cartridges, and guess what. You know what: The same message appeared when you wanted to print. Fifty dollars that shouldn't have been spent

A quick check of the HP site said that all that really needed to be done to be finished with the spurious message was to reset the printer's mind by turning on the printer (it has to be on to make the cartridges accessible), removing the cartridges, removing power from the printer for at least five seconds, returning power to the printer and replacing the cartridges. I am sure you can guess what the result of that was--same error message. But it got worse.

When I put power back to the printer and put in the first cartridge it started trying to print before I could put in the second cartridge. So I had to unplug it so as to keep it from printing without the second cartridge. Perhaps there was a print job in the computer's print queue. I don't know. But it seems to me it shouldn't try to print with the holder for the second cartridge still open.

I finally tricked it into letting me put in both cartridges by not closing the lock on the first until I had the second cartridge also inserted. Then I pushed them both closed at the same time. This second problem made me think there is something wrong with a sensor for the second cartridge.

What to do? Nothing. The printer was bought in Tampa, and the receipt was in Tampa so I couldn't take it to the local CompUSA. And once back to Tampa, I didn't want my daughter to have to deal with returning it to CompUSA (by then the time to do that might have already passed), and I didn't want her to have to send it back to HP since she would have no printer and anyway the box it came in was in Tampa.

The printer prints fine, and the message can be made to go away for a month. After a month, she can make it go away for another month, and as with her previous printer, she can tell when it is running

Looking Back to 1993

From the September 1993 *Bits of Blue*

Secretary's Report

MINUTES OF 8/11/93 Meeting and PERSONAL COMMENTS

By: Jim Clark

Another BIGGIE?! Yes, if you weren't at this meeting, you missed another biggie. We had a presentation on one version of probably the most widely used word processor — Word Perfect 6.0 (DOS) — made by the inimitable John Johannesmeyer who has a special knack of getting across a lot of info in a very enjoyable way. And, we had a vote on our Articles of Incorporation (AOI) to change the name of our group. Although we had a good crowd, it was not the wall-to-wall crowd J had expected for this event. It was a productive and enjoyable evening.

CLUB NEWS

- Name Change: Harvey explained the several reasons the Board of Directors (BOD) felt that a change in our name was necessary: 1) Our name is so similar to other groups in our area that we are often mistaken for them; 2) Our present name incorrectly implies that only persons using true IBM PCs are eligible, whereas in reality we are open to users of any PC (as well as those that don't use computers at all, but have an interest in them); 3) Because of the similarity of names, some distributions from the computer industry intended for our group are often sent to one of the other groups; 4) We are applying for non-profit status with the IRS and it is important that our name reflect our true situation — membership in our group is not limited to a select group of people, but is open to all.

- The BOD had agreed upon and proposed to the membership that our name be changed to "Tampa PC Users Group". There were other ideas proposed from the floor during discussion, but in the end it was agreed that this name would probably meet our needs the best; it reflects our openness, and at the same time would also help keep our established identity in the industry. A motion to change our name to "Tampa PC Users Group" was made and seconded. A vote was held, and the motion carried without opposition.

- Financial Reports: A motion was made to incorporate into our newsletter a financial report to let members know what our financial status is. The motion did not specify a time table for such reports. It was noted that financial reports are available for review by any and all of our members at all of our meetings and that for such reports to be included in the newsletter frequently would consume valuable space and create additional work on the volunteers serving the organization. Considerable discussion ensued as to the need for such reports and, if needed, the frequency of them. An amended motion was proposed to publish a financial statement, consisting of an Income Statement and a Balance Sheet, during the first quarter of the calendar year with an as-of date of the last day of the previous year. The motion was seconded and carried without opposition.

INDUSTRY NEWS

- CorelDraw Update: A number of bugs have shown up in the recently released CorelDraw 4.0. To rectfy most of these problems, CorelDraw has developed and is distributing a free update. If you are an owner of CorelDraw and have registered, you should receive your update automatically. If you have not registered, you will have to call CorelDraw at 1-800-836-DRAW to get your update.
- Word Perfect for OS/2: Word Perfect Corp says they are now shipping this version of WP.
- Stacker/Novell Agreement: An agreement has been reached that will incorporate Stacker software in future releases of Novell and DR-DOS. Inasmuch as Stacker seems to be the most popular disk compression software, this agreement will no doubt expand Stacker's share of the disk-compression market and should enhance the value of Novell and DR-DOS programs.
- MS Access 1.1 maintenance upgrade is out. It can be purchased from MS directly for $19.95, or call MS for a coupon which will allow purchase from local retailers for $14.95.

PRESENTATION — Word Perfect 6.0 (DOS)

John Johannesmeyer, area manager for Word Perfect Corporation, was on hand to give an overview presentation of WP 6.0 (DOS). It is a very powerful program and no one could review all of its features in the limited time available, but John did cover a bunch of them--and I shall be even more brief here.

To start with, WP 6.0 is very similar in many ways to WP 5.1 — that is, it does all of the things 5.1 does (plus a bunch) and those things can be accomplished in pretty much the same way as 5.1 if one so desires. Some of the key combinations are different, but if one uses phonetics they are very much the same. V/P 6.0 can be operated in a variety of ways, from a clean screen that would remind you of all of the earlier versions of WP, through pull-down menus on the screen, to a Windows-like operation, complete with user-definable tool bars. One does not have some of the capabilities with 6.0 (DOS) that are available in Windows, such as DDE, but it appears to offer all other benefits of a Windows-like graphical interface. Like Windows, WP 6.0 makes use of all extended and expanded memory installed on the computer and otherwise available for use.

Among the major capabilities offered in WP 6.0 is a very capable spreadsheet built right in. This spreadsheet provides over 100 functions, including all of the ones used most often by most spreadsheet users. And the spreadsheet is indeed very nice. Also included is an efficient send-fax capability so that one can send faxes from within WP 6.0 (the host computer must, of course, otherwise have a fax capability). And, the

(1993……..Continued on page 9)

(1993……..Continued from page 8)
desktop publishing capability of WP 6.0's recent predecessors is still available -- but it has been enhanced and made more powerful than ever. Among the many other features of WP 6.0 are:

- WP 6.0 can be operated in text or graphics modes; text mode takes less memory and looks much like WP 5.1 on the screen; and graphics mode which takes more memory and runs more slowly, but gives full benefit of the graphical interface (i.e., WYSIWYG).
- Up to nine documents can be opened and working at one time. This makes transferring information between several documents (up to nine) very easy.
- Word processing has been enhanced with features such as Grammatik V grammar checker now built in, and drag and drop editing of text. And, 6.0 will import from all of the popular major word processors.
- Provides a conversion macro to convert on the fly documents from previous versions of WP.
- Macros from WP 5.1 are convertible and creation of macros is easier.
- A comprehensive and detailed table creation and control capability - a very powerful and versatile feature. One can create and modify a table structure in just about any way I can imagine with just clicks of a button, and embed formulas as desired.
- Good control of graphics compared to other word processors, including scaling and drag-and-drop moving. It also allows the choice of block wrap of text around graphics, or contour wrap with a click of a mouse button The program will import some 15 different graphics formats, including all of the most popular.
- Another feature that is particularly "nice" is the Watermark. One may import a graphic in any of the 15 formats supported and make it a "watermark" — a graphic that is printed lightly to become a background to any printed document.
- Enhanced, powerful desk top capabilities, including easily set up and controlled column layouts, with any combination of single and multiples allowed on the same page. Automatic text flow between columns and balanced columns are available.
- Some of the other features are: Extensive documentation and context-sensitive online help; drag-and-drop text editing; spell checker; thumbnail preview of up to 32 pages at one time; document length limited only by space; envelope printing, with bar-code capability; hypertext (electronic referencing for documentation); supports full color printing; embed sound in any place desired in a document, with the sound becoming a part of the document file (assumes a sound capability built into the computer); uses Adobe and Bitstream Speedo fonts, with third party software providing True Type capability as well; and many, many more.

Requirements: John says that WP 6.0 (DOS) will run in text mode on a 286 machine. A 386 with 2 MB of RAM will allow operation in text or graphics modes; more RAM will give faster operation. (A 486SX25 laptop was used for the demo, and it worked very well.) The program needs about 420K of free RAM, after all TSRs are loaded. A minimum load of the program uses about 7M of hard disk space-- loading all features takes about 14 MB.

Costs: List price of the program is $495. Upgrade from WP 5.1 lists at $129.95, but has a street price of around $89. A competitive upgrade is available for a little more, but one must be upgrading from a competitive program with a list price of at least $395.

Word Perfect Corp is implementing a program called Easy Move. This program will allow a purchaser of WP 6.0 (DOS) to obtain the software for the Windows version for $29.95, or $59.95 for the program with complete documentation. This "Easy Move" applies to lateral versions and/or earlier versions, but not to later versions; that is, a 6.0 licensee could Easy Move on any 6.0 versions (Windows, DOS or OS/2), or any 5.X versions, but could not do the same on 6.1 or later. John emphasized that one is not purchasing an additional license, but is only expanding an existing license. Hence, if one owned a license for one program and Easy Moved on another, and subsequently gave or sold one version, that person wilt have sold or given away his license for both versions.

Word Perfect Corporation and John Johannesmeyer, many thanks for an excellent presentation of your very powerful new version of Word Perfect for DOS. It is truly an impressive and powerful program, and, John, your presentation was both informative and entertaining, as usual.. MANY THANKS!

AND THE WINNER IS

Thanks to the generosity of Microsoft Corporation (who donated a copy of Microsoft Access), our own Sunshine Computer (who donated several peripheral items), and Word Perfect Corporation (who donated several WP T-shirts), along with the 50/50 cash drawing, there were some very nice raffle prizes. Those among us to have the good fortune to win are as follows:

Jerry Inman	WP T-shirt
Ed Buzza	WP T-shirt
George Pollak	WP T-shirt
Melvin Flynn	WP T-shirt
Kevan Sheridan	3.5" disk case & 25 diskettes
Frank Gallio	FD cleaning kits
Phillip P. Ficarrotta	Mouse Pad
R. A. Friedel	Microsoft Access
Don Keeney	50/50 ($54) ◆

Special Interest Groups

Microsoft Access SIG

This SIG meets the first Tuesday of the month at the **Kate Jackson Community Center at 821 S Rome Avenue** in South Tampa at 6:30 PM. For information contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merlenic@tampabay.rr.com.*

Genealogy SIG

To be included on the TPCUG genealogy mailing list, contact Jenny Lind Olin at 960-5723, or *jlolin@tampabay.rr.com.*

Visual Basic for Applications SIG

This SIG meets the third Tuesday of the month at the **Kate Jackson Community Center at 821 S Rome Avenue** in South Tampa at 6:30 PM. For information, contact Merle Nicholson at *merlenic@tampabay.rr.com,* or William LaMartin at *lamartin@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Kevan Sheridan moderates the discussion.

(Comments…….Continued from page 7)

out of ink by observing the results of printing.

However, this is just another reinforcement of my feeling that HP is putting out products lower in quality than they did a few years back. I also have a newer HP flatbed scanner that cost $300 a couple of years back that has lost its ability to scan photographic negatives with the HP software. HP says that it is a hardware problem and nothing can be done.

The new HP 2175 printer/scanner cost $200. My first HP flatbed scanner cost $1,000 in 1994 and my second HP laser printer cost $1,400 in 1995. So at that time I had a printer/scanner combination that cost $2,400. Perhaps you can not make such a thing that is rock-solid reliable for $200.

Wireless Access Merle Nicholson has an article about setting up a wireless home network in this newsletter. Like Merle, I have had a home network working through a router for a number of years. With the addition of my daughter's new laptop with wireless connectivity, I wanted to allow it to connect wirelessly to the network, although it also had a regular Ethernet connection we could have used to connect it with network cable.

My method of accomplishing this was to purchase a Lynksys Wireless-G Access Point (model WAP54G) and connect it to one of the ports on my already existent Netgear router.

To install the Access Point, you simply plug it into the network and run a piece of software from a CD to do a minimal configuration. One thing you should do, in my opinion, at this point is set the Wired Equivalent Privacy (WEP) encryption for the wireless network. This will generate a WEP key. You will then need to enter this key into the wireless setup of any computer that wants to access your network wirelessly. If I hadn't done that, anyone could stand near my house with a laptop with wireless connectivity and log into my network.

With the WEP key entered into the laptop's wireless setup, the laptop was connected at 54 Mbps, which is the correct speed of the new g wireless standard, not as fast as the 100 Mbps of my hardwired LAN but faster than the old wireless b standard of around 11 Mbps.

As anyone who has tinkered with routers know, you are supposed to be able to configure them by pointing your web browser to their address on the local network. The address for my Netgear router is 192.168.0.1. Linksys routers have an address like 192.168.1.1, I think. Similarly you can configure (in more detail than the software program allowed) the Linksys Access point. The default address is 192.168.1.245, and I could not reach that with my browser. A little thought told me to go back into the software program for configuring the access point and change the address of it to 192.168.0.245, so that it was "on the same page" as the Netgear router. Once

(Comments……..Continued from page 10)
that was done, I could access it with the browser.

With the wireless access point in my computer room on the SE corner of the house downstairs, the laptop picks up the network fine in the kitchen which is about 50 feet away and through one or two walls. When I go upstairs to the back bedroom, which would be on the NW corner of the house upstairs, it still works, but the speed is reduced to 5.5 Mbs from 54 Mbs. If I go into the downstairs room below that bedroom it works at 54 Mbs--if I face the direction of the access point while holding the computer. That distance is about 50 feet and has two walls to go through. The windows have metal frames and dividers too, so that may make a difference. If I face away while working with the computer it appears to lose the connection occasionally.

So it appears that it would be better to put the access point in the middle of the house. Possibly even upstairs in the middle. I till try that when I have a lot of time to play with things. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

More Worms In the previous newsletter, I said August had been a bad month for computer worms, with the Blaster and the SoBig.F. Well, those have disappeared for the time being to be replaced by another, W32.Swen.A@mm, which Symantec originally called Automat.AHB.

The email carrying the new worm most often is designed to look like it is coming from Microsoft. It has a very Microsoft-appearing graphic across the top of the email and begins with the following text:

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members. Our mailing address is P. O. Box 3492, Tampa, FL 33601-3492.

However, for business concerning this newsletter, Bits of Blue, please contact the Editor, William LaMartin, at 821 S. Boulevard, Tampa, FL 33606-2904; 813-251-3817; lamartin@tampabay.rr.com.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII, Microsoft Write, Microsoft Word, or Word Perfect file to the editor at 821 South Blvd., Tampa, Florida 33606-2904 or to lamartin@tampabay.rr.com.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

The use of trademarked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

Minutes of the September Meeting

By Peggy Pulliam, Secretary,

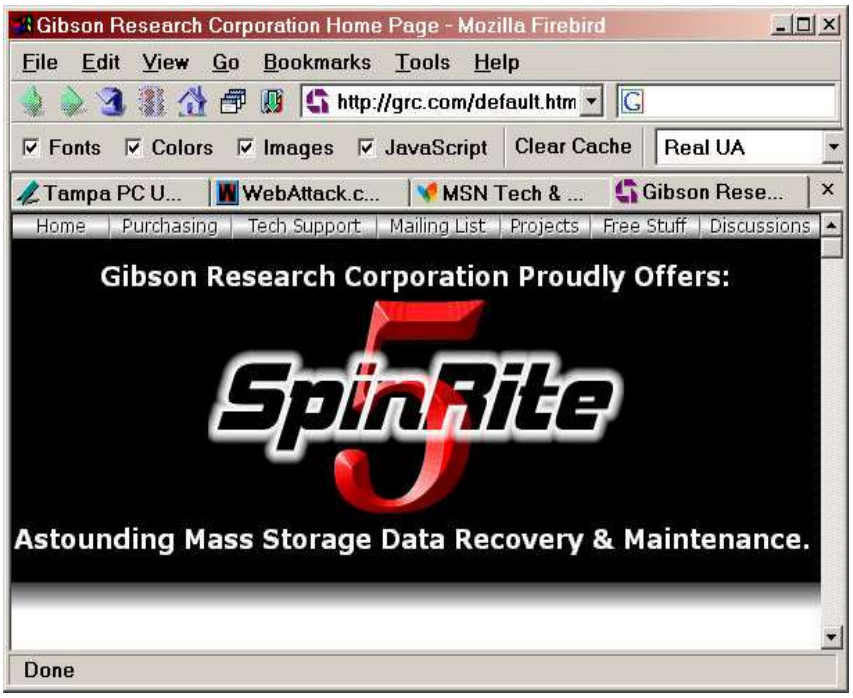
pegrance@yahoo.com

Before the meeting we had a Windows XP Q & A meeting. Some of the things brought up were very interesting to the group, and the people with questions got some answers. Some of the things that seem obvious to one person were a stumbling block for another. Like using Outlook Express for mail and not being able to get attachments. There is a setting you have to use in Tools | Options | Security where you uncheck "Do not allow attachments to be saved or opened...". We were advised to keep those anti-virus applications up and running! We talked about protecting from pop-up ads with the free Google tool bar. Many other things were covered in the half hour we used. Did you know that TPCUG.org has a discussion group and you can ask questions there and get some direct help?



Our presentation started at 7:00. Kevan Sheridan, president of TPCUG, showed us how to use Outlook XP to organize, communicate and remember what goes on with our mail, calendar and contacts. Those of us who have been "using" Outlook found out that, as we'd expected, there is a lot more to be done to use it to its full potential. You can use a single click while you are in the "contacts" and you will get a map to the address of the contact. You can also click and send them a letter all addressed and just needing to be typed, envelope, too. You can add an extra time zone on your calendar and know what time you will be arriving in another part of the world in that time zone and what it would be in your own time zone. (So you can know just how jet-lagged you ought to be feeling.) You can add your e-mail accounts and get them all from Outlook and still keep them separate, not have to go chasing around to separate web sites for your mail.

We learned a great deal, and I have since been experimenting with Outlook on my computer and have come up with some more questions and learned a few more things that make life easier. We will be

(Minutes……..Continued on page 5)

Take a Chance

By Bob Lafave, Tampa PC Users Group
boblala@ij.net

Have you ever complained about the way that Internet Explorer behaves? Some of my complaints have been:

How slow it seems to be in the current version 6--wasn't it faster years ago?

Have you noticed how much of the computer resources that IE6 uses, and do you reboot your computer after getting off-line so as to recover your resources?

Are you sick of all the popups that appear on most of the web pages today? Granted the cost of sites have to be recovered, but all the ads !!! Buy a popup starter or similar program!!

Have you ever wanted more than one page open but hated to have all the windows of IE open and your task bar running out of room because of these multiple copies of IE open?

These are some of my main complaints against IE, and I have looked for other browsers to use, but I have been careful not to install a browser that would conflict with IE or Windows. Microsoft does provide excellent support but heaven forbid you install a NON-SUPPORTED program. I remember installing IE5 beta from the Microsoft Update site for Win98. Three weeks after I installed, I went to Windows update and received a message stating I could not use update because I had a NON-SUPPORTED BROWSER. Give me a break…. Tell me after a couple of weeks…. Have you ever fought a version of IE and tried to uninstall the program? That is when I made up my mind to find an alternative browser that was more to my liking.

The browser I use most of the time for convenience and speed is currently called **Mozilla Firebird,** a free browser that can be downloaded at http://www.mozilla.org/projects/firebird/release-notes.html. The name has changed from Phoenix to Firebird in the latest version 0.6 because of another company using the Phoenix name. The web site has all sorts of information so I suggest you take a trip and surf to find out all the good stuff, but I will list my reasons for using it.

How easy it is to install. Did I say install? Forgive me. Go to the site and download a Zip file of about 6.6MB and unzip the file into a folder of your choice. Create a shortcut to the execution file MozillaFirebird.exe to place on your start menu and that's it. This browser makes no changes to your system that I can find. The first version I used I downloaded and put on a Zip disc to see if it is possible to run that way. It is, so I then placed it in a folder on the hard drive and feel safe that none or very few changes where made.

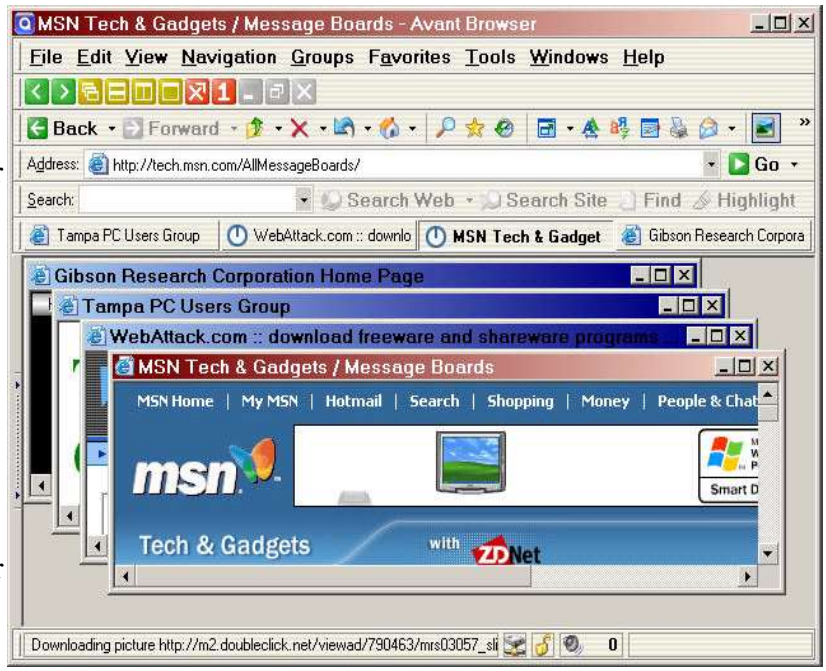
Some features:

Built in popup stopper that is easy to set up and understand. It is SOOOOOOOOOO nice to surf with no ads.

(Chance…….Continued on page 4)

(Chance…….Continued from page 3)
Multiple TABBED windows that may be opened at the same time. I have had as many as 5 or 6 site pages open and I can easily access any page from the TAB that each page has. The TABS are below the browsers' toolbar and above the browser windows. Just click the tab and you have the page. Cool or what.

Faster than IE on opening pages. It even will easily open a site that IE has problems with. The site I have the biggest problem with is opening up my HotMail account. I get to the page, put in my password and Wait, and Wait and Wait some more. Some times I get in on the first try, but 9 out of 10 times I get the blank page labeled, **"The page cannot be displayed,"** and, if I refresh the page, I get to sign in again. I don't want to spend 5 minutes on my dial-up trying to access one page. I get in every time with Firebird in usually under 10 seconds.



Firebird does not have the blank page labeled "**The page cannot be displayed"** when a site is unavailable. You get a popup saying, "**Site name could not be found. Please check the name and try again".** This happens in seconds, not minutes as IE does at times.

There are sites I cannot go to, such as Windows Update page, but the sites are few and far between and some plug-ins are not available yet. This is still a work in progress but I think it is great so far.

My second choice for a browser is called **Avant Browser**, and you can get it at http://www.avantbrowser.com, and it is also free. Again, I suggest you surf to the site and see what is offered. I hope it is still there because, as I am writing this, the site has been down periodically for a month. Avant is also easy to install in that it acts as a add-on to IE. Much as a skin, it uses the IE features and adds needed functions. A couple reasons I use Avant are:

Avant also is a TABBED browser but has many more options than does the Firebird browser. There are many options on how to show the open pages. This can be set so conveniently that this is the best point.

There is also a popup blocker included that again is easy to use and works great. You also have an audio alarm you can set that sounds each time an ad is blocked. You can look at the browser's bottom bar and see the block with the speaker and a number (0 is the number in the picture below). This block shows that the sound is on when a popup is blocked and shows the number of ads blocked since you started your surfing session.

I can go to any site that is made for IE.

There are many other reasons to use both of these browsers, and I wish each of you would surf to their information pages for full descriptions.

I still do use IE for some tasks but usually only when I have to, and on most of those I can use the Avant browser since it uses the IE base and is identified as IE at most sites, including the Windows Update page. Avant also has version changes and can be checked from the Help menu. Firebird's version is best checked by going to the web site and seeing what the current version is. ◆

(Minutes……..Continued from page 2)

having more of this type meeting, since it gets good group participation and we all enjoy the chance to ask or advise.

Thank you to Kevan and the rest of the group for keeping this going. See you at the next meeting. (And don't forget there are Special Interest Group meetings for Access - 1st Tuesday and Visual Basic - 3rd Tuesday each month at the Kate Jackson Community Center in Hyde Park.) ◆

GuruNet

By Larry Anders, Librarian,
Tampa PC Users Group
Larry@AndersNet.com

If you use the Internet as much as I do for searches, definitions, pictures, and just all around reference, then I think I have found a utility program you may be interested in trying. It's called GuruNet and is billed as the ultimate reference tool (http://www.gurunet.com). It has over 100 encyclopedias and dictionaries and works in any Windows program. It's like having a search engine on steroids, but when you perform a search you don't just get a bunch of links to look through, you get a more clear and succinct answer to your search. Click on any word in any program and you'll get an instant explanation of the word.

There is a free version for the download and with it you get the *Basic Reference* that gives you a…

- Dictionary of general word definitions, with audible pronunciations, a
- Thesaurus of synonyms, including related and contrasting words and
- Translations of words from English into 14 languages: Dutch, French, German, Greek, Italian, Portuguese, Russian, Spanish, Swedish, Traditional Chinese, Simplified Chinese, Japanese, Arabic and Hebrew
- Spell checker
- Just 1-click on *any* word *anywhere*—not only in browsers
- The free version also gives you a seven day trial to the full GuruNet, which gives you the above plus
- Encyclopedia
- Business, finance, investment, company info, etc.
- Advanced reference: history, literature, idioms, acronyms, etc.
- Science/tech: computer encyclopedia, math, genetics, etc.
- Legal dictionary and cases
- Medical and health topics
- Government: U.S. Presidents, Cabinet, Congress, documents
- People: biographies, celebrities, authors, royalty, etc.
- Places: countries, states, cities, stats, flags, weather, etc.
- Religious references: Bible, Old & New Testaments, Islam, etc.
- Leisure: food, recipes, music, movies, TV, etc.
- Automatic translation of GuruNet topics into 11 languages
- Sports
- Shopping
- … and much, much more

There really is too much to try and cover in this article. If you will go here: http://www.gurunet.com/page.pl?p=products_examples and take a look you will see all of the reference material available.

When GuruNet performs a search, it brings up a page with a several tabs on it that breaks down the search into what I call categories. For example, I did a search for the word "computer," and a window popped up with three main tabs. The first, "**Did you mean**" kinda asks me to further clarify the context of the word. The second tab, "**GuruNet Public Library,**" has a host of sub-tabs, such as **Encyclopedia** to give you a detailed explanation of your search and **Sign Language**, if you want to learn how to sign the word. Other sub-tabs include **Products**, **Quotes About**, **WordNet**, **Translations**, **Images** and **News**.

There is a third tab that is "**Search Web**", which is just what it says, your search found on the Internet. Except GuruNet brings back responses from Google, Vivisimo, Teoma and All The Web, all at one time, each on a separate tab with your searched item just a click away.

GuruNet installs a small, unobtrusive Topic Bar just above the clock in the right hand bottom corner on the Status Bar. With one click it slides out and you enter your search criteria and then it slides back into hiding when not in use. And, don't forget you can just put your cursor on any word in any application, hold the ALT key down and click the mouse for an automatic and instant explanation and definition of the word. It can't get too much easier than that!

(GuruNet……..Continued on page 7)

(GuruNet……..Continued from page 6)
Some of the good features of GuruNet are free to keep, whether you get the full version or not. But I think after trying the full version for seven days you just may be enticed to want to have all this power at your fingertips. I was and it has become a permanent feature. Give it a try. It's worth the time for the download. ◆

(Comments……..Continued from page 5)
thus infect your computer.

Never run an attached file to an email message. And never believe that Microsoft is sending you a message telling you to do so. Microsoft does not send such email messages.

I simply deleted the first 100 or so such messages that came in; then, after an update to my Norton AntiVirus it started intercepting them, and finally my ISP, RoadRunner, started intercepting many of them at the mail server and removing the virus--but still sending a message to me that it had removed a virus for the message. However, all this intercepting did nothing to keep me from being inundated with several hundred such messages each day for the last week. It has slowed a bit, but I am sure that by the end of today I will have deleted over 100 such messages.

One of our members got so overwhelmed in the first couple days of the attack that he simply abandoned his email address for a new one. I really don't have that option. What is interesting is that for several years most of the junk email that came to me came via my NetCom (Earthlink) email address. The RoadRunner one was fairly free of junk email (even though the address is plastered all over several websites and in the Usenet newsgroups). These last three viruses, however, that have bombarded me for the past month or more with up to 350 messages in a day come almost exclusively via the RoadRunner address.

Just think how bad things would be if I were someone who was important and had my email address plastered everywhere. Perhaps, then, I would have to do what another one of our members who uses Earthlink did. She set up an Earthlink feature that only allows people on a list managed by her to send email messages to her. If you are not on the list, as was the case for me, when sending her an email, you get a return email from Earthlink wanting to know if you would like to request to be on the honored list. I responded in the affirmative and was put on the list of acceptable emailers, but you know no spammer or virus sender is going to request such permission--and thus she is safe from them. Of course, some of her friends may opt out also. I don't think RoadRunner has such a feature.

VBA SIG and Outlook Last meeting Kevan Sheridan took us through a tour of Microsoft Outlook showing us many of the features of this contact list, email client, calendar, etc. management program. Many in the audience were quite impressed by its features, especially for those involved in a work group environment where meetings need to be scheduled and the answering of emails needs to be prioritized.

Another interesting aspect of Outlook is the ability to use Visual Basic for Applications (VBA) to program Outlook. Most such programming is involved with automating processes in Outlook or creating customized forms. But in our most recent VBA SIG, I went in a different direction: A routine to retrieve the particulars (Date, Sender, Subject, etc.) of each message in, say, the Inbox and place it in a database. This could actually be quite useful and serve as an accessible backup of your Inbox messages. You put the code below in the Tools | Macro | Visual Basic Editor section of Outlook. Furthermore, in the Visual Basic Editor, you need to set a reference to the Microsoft Office DAO 3.6 Object Library. Finally, you need to create an Access database named OutlookData.mdb with the appropriate fields to accept the data.

Here is the code (you are not expected to follow it unless you have some experience with VBA):

Looking Back to 1993

From the October 1993 *Bits of Blue*

Secretary's Report

MINUTES OF 9/8/93 MEETING
and PERSONAL COMMENTS

By: Jim Clark

Must be because the new school year has started the number attending this meeting was down a good bit from our normal group, in spite of the fact that we were having a Microsoft presentation on their Windows NT program. Those who were there learned about a great program.

CLUB NEWS

New Meeting Location: This was the most important item discussed in club news area. Recognizing that we have overflow crowds on occasion and that the space crunch is inhibiting growth of the group, the Board of Directors (BOD) has been discussing and investigating potential new locations for our meetings for several months. During the last few weeks Marylee Bruneau, our newsletter editor, has aggressively searched for a new location. Having investigated a very long list of potential locations, Marylee was successful in identifying two that had reasonable prospects, adequate space, a willing host, and a price we could afford. The better of the two is the Ybor City campus of HCC. Our Prez, Harvey Bruneau, brought these circumstances to the floor and solicited reaction from the members present. Several commented, all favorable, with at least two who had attended that campus noting that it is an excellent location with outstanding security. With that, Harvey indicated that the site would be visited and the specifics of the facility would be explored in greater detail. If suitable, his objective date for moving is in time for the February meeting. More at the October general meeting.

INDUSTRY NEWS

- MS DOS Upgrade: MS has version 6.2 of DOS in the works, to be released in the not-too-distant future. It will no doubt minimize some of the problems that have been reported with Double Space, as well as provide improvements in other areas.

- New SmartDrive: Quite a few folks have reported loss of data on shut down when using SMARTDRV in read/write mode. That is reportedly because SMARTDRV may not write to disk for several seconds and those shutting down quickly do so sometimes before SMARTDRV has written to disk. An update of SMARTDRV.EXE is now available on CServ as well as other locations. This version corrects the delayed write problem at shutdown.

- Windows Replacement: Industry news has it that MS now has in Beta testing (or Alpha, depending on which report you read) a program that will be a replacement for Windows. Called Chicago, this program will be much more powerful than Windows and will replace DOS, Windows and Windows for Workgroups.

- Computer Training: Working with computers in the business world and a wide variety of software, Harvey reported on his experience with one source of computer training his firm uses, Executrain. Without going into much detail, which might be construed as a "plug" for Executrain, Harvey reported that the folks there are well-qualified, do a great job of instructing and provide follow-up support. If you need training on any of the many major software programs Executrain provides instruction on, that firm is certainly worthy of your consideration.

PRESENTATION: MS Windows NT 3.1

We were fortunate to have John Jenner, Senior Systems Engineer (Florida) for Microsoft Corporation, join us and give a presentation of Windows NT. He gave a very enlightening presentation. Especially in the early portion of the review of Windows NT, I felt a bit like a fish out of water because I had absolutely no knowledge of networking and client server systems. By the time John had finished, he had con-

(1993……..Continued on page 9)

(1993……..Continued from page 8)
vinced me that it was a super program for network/client server systems.

There are two versions of the package Windows NT and Windows NT Advanced Server. The basic differences between the two center on the size of operations each will support. NT, for example will support two processors, while NT Advanced will support four processors and is an unlimited server. It will also support Mac systems. Both versions are very powerful and loaded with features, only a few of which I made decipherable notes on:

- Compatible with x86-based, RISC based and SMP systems and expanding.
- Compatible with a host of networking options: IBM LAN Server, MS LAN Manager, MS Workgroup for Windows, and TCP/IP networks; and with Banyan Vines, DEC Pathworks, IBM SNA networks and Novell NetWare with some additional software.
- Compatible with a number of "operating systems": MS DOS, Windows, 32bit Windows, POSIX and OS/2.
- Consistent with appearance and functioning of Windows and Windows for Workgroups, and John says that users of these programs are already 80% of the way toward using Windows NT. However, NT has included a feature not now in the other Windows programs, but which we have found so useful in others, a tool bar which provides direct click access to a host of commands.
- A true preemptive multitasking environment.
- Provides an "application interface" and "provider interface" which, among other things, permits otherwise incompatible components to communicate, and it isolates each application so that trouble with one has no direct effect on the others.
- Recognizes and works with FAT, OS/2 and NTFX formatting/filing systems.
- Provides a spectrum of "personal" and "common" security options that are easy to set up, with centralized control of user profiles and actions, which are applied at user logon. Supports up to 2 gigabytes of virtual memory, provides power failure protection with uninterruptible power support and includes built-in backup.

Requirements to use Windows NT on an x86-based system are: At least a 386 computer; will operate with 8 MB RAM, but at least 12 MB RAM is recommended; one HD floppy disk drive; at least 40 MB hard disk space for minimum loading and 80 MB of space for full loading, plus paging space of at least 2 MB, with recommended paging space twice the installed RAM; and VGA, Super VGA or other graphics adapter compatible with Windows NT. A RISC-based system needs more RAM and hard disk space, plus a CDROM drive.

Costs: Windows NT lists for $495, with a $295 upgrade price tag.. Windows NT Advanced lists for $1995. No street pricing was available to this writer.

Many thanks to Microsoft Corporation and John for a great presentation and giving us a look-see at what appears to be a super client server capability, and for the programs you donated to our group. It is all very much appreciated.

AND THE WINNER IS

Thanks to the generosity of Microsoft Corporation (who donated a copy of Microsoft Windows NT and a copy of Windows for Workgroups), our illustrious Prez who secured some other goodies for us during his travels, along with the 50/50 cash drawing, there were some very nice raffle prizes. Those among us to have the good fortune to win are as follows:

M. Kapalas	MS Windows NT
Martin Miller	MS Windows for Workgroups
Steve Hess	Windows NT book
???	Windows NT book
Phillip Ficarrotta	Shirt
M. Kapalas	Cap (times 2)
Jay Reese	50/50 ($58)

The meeting adjourned at about 8:45 PM ◆

Special Interest Groups

Microsoft Access SIG

This SIG meets the first Tuesday of the month at the **Kate Jackson Community Center at 821 S Rome Avenue** in South Tampa at 6:30 PM. For information contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merlenic@tampabay.rr.com.*

Genealogy SIG

To be included on the TPCUG genealogy mailing list, contact Jenny Lind Olin at 960-5723, or *jlolin@tampabay.rr.com.*

Visual Basic for Applications SIG

This SIG meets the third Tuesday of the month at the **Kate Jackson Community Center at 821 S Rome Avenue** in South Tampa at 6:30 PM. For information, contact William LaMartin at *lamartin@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Kevan Sheridan moderates the discussion.

Dim MyDatabase As DAO.Database
Dim MyRecordset As DAO.Recordset
Dim i As Integer

'establish a connection and logon
Set ol = CreateObject("outlook.application")
Set ns = ol.GetNamespace("MAPI")
ns.Logon

'get default Inbox Items folder
Set myfolder = ns.GetDefaultFolder(olFolderInbox)
MsgBox ("There are " & myfolder.Items.Count & " Inbox Items")

Set MyDatabase = DAO.OpenDatabase("C:\My Documents\Access\OutlookData.mdb")
Set MyRecordset = MyDatabase.OpenRecordset("Inbox")

'loop through all the Inbox items
For i = 1 To myfolder.Items.Count
MyRecordset.AddNew
MyRecordset.Fields("Date") = myfolder.Items(i).SentOn
MyRecordset.Fields("Sender") = myfolder.Items(i).SenderName
MyRecordset.Fields("subject") = myfolder.Items(i).Subject
MyRecordset.Fields("Body") = myfolder.Items(i).Body
MyRecordset.Fields("HTML") = CStr(myfolder.Items(i).HTMLBody)
MsgBox (CStr(myfolder.Items(i).HTMLBody))
MyRecordset.Update
Next

MyRecordset.Close
MyDatabase.Close
Set MyRecordset = Nothing
Set MyDatabase = Nothing
```

That is it. See how useful programming can be. Of course, you could do something similar for your Sent Items.

There is no equivalent code for getting the Inbox items in Outlook Express. Outlook Express is not programmable. One time I saw a shareware program that would convert any folder in Outlook Express to a text file (a very large text file in some cases).

You could, however, use my method to put the Inbox messages in Outlook Express into a database by first importing all your Outlook Express Inbox messages into Outlook and then applying my method to the Inbox folder in Outlook. The process could be further refined so that you could write the code to allow you to actually select from the list of all messages a sub collection that you wish to put in the database.

Just a thought What is going to happen to all your old email messages? Are they going to be like old, saved letters that can be read 100 years later. I don't think so. Hard drives will fail. Even if CDs don't degrade (which I think they will), what device will read them 100 years down the road?

If you want to preserve your important messages, you can put them in a database that you

periodically import into the latest such program and save the data to CDs which you periodically save to newer media (newer CDs or whatever the newest medium is). Of course, this depends on you being around to keep this process going. Then, on the other hand, you can do the old fashioned thing and print them out on good quality paper and store the paper versions. But, then, you have to worry about the longevity of the ink your printer used. Such worries are never ending.

I wouldn't worry about it much, though, since probably 99.9% of our emails are not of any long-term value anyway. But it is an interesting question. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

Junk mail In the past few newsletters, I have complained about all the virus laden emails with sometimes several hundred arriving in one 24 hour period. Well, the viruses are still with me, but the idiotic spam for Viagra, Vicodin, pornography sites, reducing your mortgage, increasing your income, etc. have surpassed the virus-laden messages. It seems like it will never end. As I said in a previous newsletter, at least one member has changed his email address in the hope of missing out on the spam onslaught. Another member says that when he opens his email program on Monday at the office after being away for two days, it takes him an hour to go through and delete all the junk.

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members. Our mailing address is P. O. Box 3492, Tampa, FL 33601-3492.

However, for business concerning this newsletter, Bits of Blue, please contact the Editor, William LaMartin, at 821 S. Boulevard, Tampa, FL 33606-2904; 813-251-3817; lamartin@tampabay.rr.com.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII, Microsoft Write, Microsoft Word, or Word Perfect file to the editor at 821 South Blvd., Tampa, Florida 33606-2904 or to lamartin@tampabay.rr.com.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

The use of trademarked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

Minutes of the October Meeting

By Peggy Pulliam, Secretary,
Tampa PC Users Group
pegrance@yahoo.com

The beginning of the meeting was spent discussing Microsoft and other areas of interest. We are looking for volunteers for the Tech show in Tampa, in December of this year. This is a good way to keep our name in view and find new members at the same time while getting all the goodies and meeting the local tech types. Contact Mary Sheridan for dates and information if you can help with that.

Our presentation this month was a Norton Ghost demonstration by Bob LaFave. Just in time for Halloween.

Before that he presented a delightful PowerPoint presentation featuring the talking Microsoft Agents.

Norton Ghost 2003 protects your data from computer disasters. The intuitive Windows interface makes it easy to create regular backups of your hard drive. You don't even need to make a boot disk. File restoration is simple from the comprehensive disk image.

We saw:

- How to use the Ghost Boot Wizard to add or modify a Network Interface Card template
- How to clone or make a copy of a computer using an IP connection
- How to create a disaster recovery disk
- How to use a mapped network drive to create and restore images

You'll need the diskette you make to restore your computer if you lose everything, which has been known to happen. You'll want to prepare for that; if you are prepared for an emergency it doesn't happen.

This program allows you to extract a singular record and place it somewhere. You can start and complete part of it and complete the rest later. Other programs

Valencia Lakes FACUG Conference

By Don Patzsch, Tampa PC Users Group
patzsch@helios.acomp.usf.edu

At Boynton Beach, we saw an elegant building. No expense was spared to produce a very impressive Club House. Valencia Lakes is a sort of circle of houses around a lake. Each home is quite large and is protected by a guardhouse at the entrance. You drive around the lake to access the clubhouse. There is no way I can describe the giant outdoor pool, the exercise room, the kitchen, the room dividers for the main conference area with its very large stage, and the highest ceiling and stage lighting everywhere. All done in the most expensive way. This is one elegant building. The landscaping is worth walking around to view. My wife and I are not envious of others, but come and see this place.

Don't forget that at these meetings, you can pick up copies of newsletters from all around the state. I spend a lot of time reading these newsletters and going to the URL's that you find in each newsletter. Sometimes I think this is a real plus for attending the conferences.

My wife and I were pleasantly surprised by the breakfast, which was supplied by the Bank of America. Right after we sat around having breakfast and meeting the others, we attended the Bank of America presentation. I was delighted to hear how the software was incorporated into the web site. You may pay bills, check on your accounts, print both sides of a check; and many other features of the software were put on the screen. It is all free because Bank of America believes that the savings to them due to the fact that you do all your banking on the web results in less tellers in the bank. Great presentation. My wife won a very large umbrella in the drawings.

Our next session was the Adelphia people's presentation. We decided on this one because I wanted to get the latest on cable modems, etc. There was not much "new" that we learned, but it is always best to see what the future looks like.

After the Adelphia session, lunch was served. Stuffed chicken breast and all the trimmings made for a great session of chatting with the members.

After lunch, a Palm Beach County Sheriff's speaker told us many interesting stories of how people produce counterfeit money and steal others' identity, and also how they had made many arrests. This is a good idea for future conferences, It is interesting to see what the thieves' computers look like, the ones used in counterfeiting and stealing info on the internet. These men spend years finding ways to outwit the felons.

After the lunch speaker, we went to the session on How to Prepare Programs Without Vendors. I expected this to be boring, but I was wrong. Hewie Poplock presented a clear, neat, complete story of where you can look up information on the internet that will allow your members to make up interesting presentations. Everyone chimed in, and a really good session follwed. Hewie's web site is great. You may see almost the whole session by going to http://www.hewie.net/facug.

The next presentation I attended was on web design. This is always a good session because every club is setting up web sites now and dozens of good ideas are passed around. What software do you use, and how do you make your club look good?

Last, but not least, is the afternoon drawing for the prizes. Everyone gathers around and waits for his number to be called so he can go up and pick out the best of what is left! If this group hosts in the future, I will surely want to attend. ◆

Microsoft Office 2003

By *Mary Sheridan, Member at Large,*
Tampa PC Users Group
mcpease@mindspring.com

I spent all day yesterday, October 23, at the Convention Center in downtown Tampa. The reason I was there was the Microsoft Office 2003 product launch. I had breakfast, lunch, learned a lot and had a great time. AND, Microsoft will be sending me a full blown copy of Office 2003 Enterprise Edition and One Note 2003 for attending. Does it get any better?

At the event we received a box of Microsoft 2003 evaluation software. Evaluation copies are 120 day trial versions of the various offerings unless otherwise noted. The kit includes: Office Professional Edition 2003 ($499.00*), Office InfoPath 2003 ($199.00*), Office Front Page 2003 ($199.00), Office OneNote 2003 ($199.00), Office Outlook 2003 with Business Contact Manager ($109.00), Office Visio 2003 ($199.00), Office Project Standard 2003 (60 day evaluation) ($599.00), Office SharePoint Portal Server 2003 ($5,619.00), Office Live Communications Server 2003 ($1,059.00), Windows SharePoint Services 2003 (expires with Windows Server 2003) (no pricing available), Windows Server 2003 (180 day evaluation) ($1,199.00) and Exchange Server 2003 ($1,299.00). Whew, that's a lot of money!

Microsoft Office 2003 Professional Edition has the core programs: Microsoft Office Word, Microsoft Office Excel and Microsoft Office PowerPoint. Plus, the professional edition includes Microsoft Office Access 2003, Microsoft Office Publisher 2003 and Microsoft Office Outlook 2003 with Business Contact Manager.

The emphasis of the latest version of Office products is the team environments in the workplace and the ability to collaborate with others. Microsoft lists the ten top reasons to upgrade as 1. Helps employees make smart and timely decisions because of the programs' XML capabilities, 2. Helps companies protect their information with Information Rights Management (IRM) and you can even set expiration

Outlook 2003's Junk email feature

dates for files, 3. Helps employees better manage the information with improved design in Outlook, 4. XML standardizes the collection and creation of information, 5. Helps company groups take advantage of line-of-business applications, 6. Improves performance and user connectivity to email (cached mode saves lots of time when checking email), 7. Shared workspaces help improve teaming and partnering, 8. Support of XML allows custom solutions to be created, 9. Increases security and privacy, and 10. Simplifies upgrades administration and support. The emphasis is giving some power to the end users and taking some of the workload away from the IT departments.

All editions of Office are written for the business environment. There are, however, many nice features added to the new version that any of us could use. I'm out of writing time so I'll just have to steer you to http://www.microsoft.com/office for any additional information.

*Prices are listed on the Microsoft website. Most of these products can be bought for much less at discount dealers. Products do not ship until November 2003. ◆

(Minutes……..Continued from page 2)

only start and go all the way through; if you are stopped midway, you have to start all over.

It makes building multiple machines with the same image very quick; one image can be used for all the machines. Everything in the registry is moved over. One unanswered question remained about the registration of the software.

At the end, Bob showed us some other cool items too: We saw the Google tool bar. It has pop-up stoppers. Check that out.

Be able to open four pages at one time with the Avant browers. Set the browser up, as you want it. It opens pages faster than Internet Explorer.

We had a bunch of door prizes won by the following people.

T-Shirt	Merrill Friend, John Waldon, Bob Davis, Brian Lance
Spell Checker	Peggy Pulliam, Carlos Nogueira
Microsoft Works	John Waldon
Smart Computing magazine subscription	Brian Lance. ◆

Helpful Free Utilities & Programs

By Bob LaFave, Tampa PC Users Group
boblala@ij.net

If there is anything I like it's ***FREE*** programs that actually help me enjoy the computer and the Internet. Each of these programs is simple but provides needed information or a task that saves me frustration at times and makes using my computer easier. The most you may have to ***pay*** for any of these is to register with your email and name. The first program stops the frustration of remembering the order of the *Icons* on the *Desktop* after Windows decides to rearrange them all. Have you ever had that happen? You start the computer, or restart it, and all the *Icons* have moved. ***Restore Desktop*** will solve this problem. Go to http://www.softwarium.com and download this small, 78 KB, program and you can now save your desktop positions and return to them if ever mixed up. This program gives you the choice to "Save Desktop" or "Restore Desktop" from the desktop Properties menu. Right click your desktop and those two choices now appear. Set the desktop and click "Save Desktop" and you now are one click away from always having that desktop.

Next is ***CD Tray Control,*** which can be found at http://www.janw.de/software/cdtray and allows you to Eject or Insert your CD-ROM drives with keystrokes from your keyboard. This program is loaded on Windows start, from the Start folder and sits in your SysTray and lets lazy people like me open and close each of their 3 CD-ROM drives without bending over by using the keystroke combinations.

Folder Size Shell Extension allows you see the size of each folder and subfolder of your hard drive. You can go to http://space.dolphin.free.fr and download this program and a couple others. This program gives you an extra *Tab* when you look at the *Properties* of a folder in Windows Explorer; the new *Tab* is labeled "Size". When you click the "*Size*" tab you will now see the size of space that the folder and each of its subfolders take in KB or MB on your hard drive. This is much easier than looking at the properties for each subfolder one at a time. This will also work for a hard drive, just click the "Size" tab, and each directory size will be given. This will take some time for larger drives with more data and folders but it is much faster than looking at each separately.

AIDA32 provides system information on your computer that is easy to use and provides complete information on your computer hardware and operating system. You can download the program at http://www.aida32.hu/aida32-shots.php?type=l and find screenshots of the various task. There are also PlugIns that can do benchmarks on the CPU, hard disks, monitor and network. Using this can save you time in finding out the specific hardware installed in your computer. It will identify most brands and models, from the motherboard, video adapter, memory type, operating systems and much more. You can even get an alphabetical listing of all programs by looking under "*Software,"* then clicking the *"Installed Program*" icon.

Fresh Devices at http://www.freshdevices.com has three programs, but I will mention just "***FreshDownload***." This download utility is as effective as any I have looked at and is not ad supported. I have a dial-up connection and I have used this program on many downloads where I needed a resume feature. If the sight supports the resume feature, you can save yourself from restarting a download if the connection is cut. I have downloaded files as big as 700MB using this program. For those with cable or DSL you can have up to eight simultaneous connections at a time. It interfaces easily with IE such that you can turn it on and off easily. It allows you to schedule downloads at a time convenient to you and much more. Be warned that this site does send you email notifications almost weekly. Before you can download you do have to give them a valid email address on which they send the download link back to you.

Belarc Advisor at http://www.belarc.com/free_download.html is a PC auditor***. Belarc Advisor*** builds a detailed profile of

(Utilities……..Continued on page 7)

(Utilities……..Continued from page 6)
your installed software and hardware, including Microsoft Hotfixes, and displays the results in your Web browser. You can then save the results so that you can keep track of your system and installed software, or you can also print the results from within IE. The software audit will supply you with the software versions and licenses when possible.

WCPUID stands for Windows CPU ID and can be found at http://www.h-oda.com for downloading. WCPUID is a program that displays the CPU information of your personal computer and also shows Frequency, Multiplier, Chipset Info and more. You can use this program to determine the CPU for almost any computer.

For anyone who does not have the installation CD's or diskettes for the hardware on your computer, you can use ***WinDriversBackup*** to create that information in case of emergencies. You can download it at http://www.jermar.com. "WinDriversBackup" can identify all of your Windows driver files and save them to a secure location in two simple mouse clicks. Backing up your Windows driver files means they will be available to you the next time you need to reinstall the driver or the whole operating system. WinDriversBackup places the driver files in one organized location of your choosing. WinDriversBackup is especially helpful in situations where you have a computer in your possession and its internal hardware is unknown. WinDriversBackup can identify the hardware on the system and the associated drivers, then back them up to a specified location. WinDriversBackup is even network compatible -- you can just as easily connect to a remote computer on your network and backup driver files. There is both a ***FREE*** and a ***paid*** version, but the ***FREE*** version will be sufficient for most.

Next is a site that you can download 1,000's of programs from different categories. Go to http://www.webattack.com/freeware. What I have done is just pick a category and then surf to see what programs are there. If you see an interesting program, you can find out more specific information both from a review there or by linking to the author's site for more complete information. They give a rating on the program and supply when a program was updated and screenshots when available. There are so many places to find programs that it would be impossible to name even a small number of them. I have tried to give a few that I have found very useful and have not presented any problems for me. When I do find an interesting program and I am deciding if I want to risk it, I always go to ***Google*** and run a search on the program name to see if there is any additional information on the web about the program. This way I have luckily found programs that I can actually use that I feel safe installing up to this time. Good luck in your travels. ◆

(Comments……..Continued from page 1)

A couple of weeks back I checked the catch-all email account at my domain name. It is the one that receives all mail directed to webmaster, admin and any name that doesn't exist. It had 3,000 plus messages and was taking up 16 MB of space. A check right now showed only 631 such messages. All of this is such a strain on email servers--and our patience.

To make matters worse, now some of us are having our emails rejected by receiving email servers. Using my RoadRunner account, I sent a message to a member at his office. It was bounced back to me saying that the server rejected emails from this address, meaning from RoadRunner. Within a few hours of that, I received an email from another member on RoadRunner wanting to know why four messages she sent to Verison accounts were bounced back with similar messages. I told her that apparently RoadRunner IP addresses, or at least a

Looking Back to 1993

Secretary's Report

MINUTES OF 10/13/93 MEETING and PERSONAL COMMENTS

By: Jim Clark

HE DID IT AGAIN? I'm not sure how he does it, but our Prez arranged another biggie — and that's what we had, ANOTHER BIGGIE! It was a great meeting, with the focal point being an IBM presentation on OS/2, Ver. 2.1, and we had a good crowd to enjoy and benefit from the evening.

Having assumed the duties of manning the door, I missed the first 20 minutes of the meeting, and therefore missed a good bit of club and industry news Harvey discussed --but I didn't miss it all.

CLUB NEWS

Software Reviews: Harvey informed all that the newsletter listed vendor products (mostly software at present) our group had received for review. All members are eligible to participate. The individual benefits because he not only learns new products, but also acquires ownership by completing a good review. The group benefits by becoming informed on the latest software. Harvey noted that timely submission of a review on what has now become a perishable product is essential, and those members wanting to participate in the review program must be willing to provide a comprehensive and honest review of the product not later than the agreed time. All members are invited and encouraged to participate. Those desiring to do so should contact Marylee Bruneau, newsletter editor.

Education & Information - Principal User Group Purpose: Yes, that is the primary purpose and function of our user group -- informing and educating all of our members on all aspects of using a PC and related software and hardware and of new developments in the industry. We accomplish that purpose in a number of ways -- through the newsletter, exchanging information at our meetings, vendor and in-house presentations, SIGs, etc. We are adding a new way to this list, and would like to add another:

Help Line: The last newsletter began implementation of our newest effort -- a "Help Line". The Help Line is a listing of members willing to help other members who might need help with specific software or hardware products. The persons listed need only have a working knowledge of the products and need not be "experts" on the products they are willing to support. All members are encouraged to participate -- since we all need help from time to time, the more we have to help through the help line, the better off we will all be. Those willing to join in should post a note to Marylee Bruneau on the BBS, by telephone, at a meeting, or by mail at the address on the newsletter.

Tips & Techniques: Harvey suggested we start a section in our newsletter devoted to this subject -- a place where members could share with others in our group hints and tips they have uncovered that they have found helpful in using a particular piece of software or hardware. We have seen these helpful bits of info in other newsletters and computer-related publications. With inputs from all of our members, a tips & techniques section in our newsletter should prove very helpful for all of us. Submit your inputs to Marylee Bnmeau (or any group officer) via the BBS, or as above.

Fund Raising Ideas: While firm decisions have not yet been made, your Board of Directors has been working toward finding a new meeting location to better accommodate our growing membership. Any relocation will likely require our group to own or rent most, if not all of the computer equipment now being graciously provided by IBM for our use at our general meetings. Yes, we are talking $$$$$ -- and quite a few, at that. We need your ideas and suggestions on ways to raise the funds we will need -- and we need to raise those funds rather quickly inasmuch as we will probably relocate early next year. PU-LEEEZZEE give your ideas and suggestions to any of the officers listed on page 2 of the newsletter, or message one of them on the BBS.

Upcoming Presentations: Harvey has lined up some more big guns in coming months, including

(1993……..Continued on page 9)

(1993……..Continued from page 8)
some of our own: Off-line Express and BBS operations in Nov., Computer Associates in Dec., Word Perfect on WP 6.0 in Feb., and CorelDraw in Mar. are among them. They are all good -- and beneficial. Don't miss a single one if you can help it; I have found them all interesting and rewarding.

PRESENTATION -- IBM's OS/2, Ver. 2.1

We were fortunate to have Dennis Hanson, an expert with IBM on OS/2, join us and give a presentation of IBM's OS/2, Ver. 2.1. He gave an excellent presentation on their newest version of their software package, Version 2.1. It is a large and very powerful package. An overview of such a program is the most that we could expect in the time available, and Dennis did that superbly well. Just listing the features would take pages, but here are a few of them:

- Breaks the DOS 640K barrier. DOS has been the most widely used platform for the PC for many years now, and we have been confronted with that conventional memory barrier all that time. OS/2 eliminates that barrier and makes all the available RAM and most of the available hard disk space available for use as RAM.
- Provides true 32-bit capability, and the list of software being written to take advantage of that capability is growing.
- Full preemptive multitasking/multi-threading, with full speed for each. Memory is allocated to programs on the basis of need, up to the limit of RAM and disk space. If one has enough RAM and disk space, OS/2 will support up to 240 DOS sessions, with each allocated a full measure of memory and operating at the same time.
- Will operate DOS, Windows 3.1 and OS/2 programs simultaneously in any mix, with the capability to copy information between them all, and provides DDE between Windows and OS/2 applications.
- Uses IBM's System Object Model and is truly object Oriented.
- Fully supports DOS and Windows 3.1 applications and eliminates the need for DOS and Windows, though those systems may be retained if desired.
- Can eliminate the current problem of often having to shut down Windows and all Windows applications because of a GPF in one. In fact, IBM recommends that a Windows window be opened for each Windows application you start so that any GPF will cause a problem for only the application in which the GPF occurs.
- Uses the High Performance File System, which is faster than the FAT system and provides other benefits, such as a maximum of 250 character file name. One problem here at present is that if one uses more than the traditional 8.3 character file name, DOS based systems will not recognize the file.
- Includes REXX programming language and the capability to write and modify applications.
- Provides full multimedia support, and provides software-only sound and video. It uses three threads to synchronize sound and video. Dennis demonstrated some of the capabilities of OS/2, overall and multimedia in particular, when he operated two multimedia windows simultaneously while running several other applications at the same time, all of which operated at full speed. And, OS/2 includes the tools needed to write multimedia applications.
- Supports and uses True Type and Adobe Type I fonts.

That scratches the surface of its many features. Well, what does it take to use all that power? Start with a 386, preferably with a 40 MHz board, though a slower board may be used. OS/2 will operate with 4 MB of RAM, but 8 MB or more is recommended. Hard disk space between 15 and 30 MB, depending on the features you load. It provides support for just about any popular monitor or printer.

And what does it cost? OS/2 lists for $149, with a $99 tag for a DOS/Windows upgrade -- and that includes just about everyone. You can find street prices several dollars less. For the kind of power you get, that is a pretty darned good buy.

One member raised a question of how to determine compatibility with OS/2. Dennis gave a number of sources and ways to determine that, including the IBM forum on CompuServe, the IBM BBS, and contacting IBM directly. A side bit of info, recognizing that many people are now using disk compression programs: The only compression program that I have

Special Interest Groups

Microsoft Access SIG

This SIG meets the first Tuesday of the month at the **Kate Jackson Community Center at 821 S Rome Avenue** in South Tampa at 6:30 PM. For information contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merlenic@tampabay.rr.com.*

Genealogy SIG

To be included on the TPCUG genealogy mailing list, contact Jenny Lind Olin at 960-5723, or *jlolin@tampabay.rr.com.*

Visual Basic for Applications SIG

This SIG meets the third Tuesday of the month at the **Kate Jackson Community Center at 821 S Rome Avenue** in South Tampa at 6:30 PM. For information, contact William LaMartin at *lamartin@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Kevan Sheridan moderates the discussion.

(1993…….Continued from page 9)

heard of so far that supports OS/2 is Stacker. There may be others, but I know of some that do not. Check it out.

To IBM, MANY THANKS for lending us Dennis and for the programs you donated — you have been very good to use right along. And, Dennis, you gave a superb overview of a super program and we are in your debt. THANKS MUCH!

AND THE WINNER IS:
Thanks to the generosity of IBM (who donated 5 copies of OS/2, Ver. 2.1), our illustrious Prez who secured some other goodies for us during his travels, along with the 50/50 cash drawing, there were some very nice raffle prizes. Those among us to have the good fortune to win include:

D.A. Clary	OS/2, Ver. 2.1
C. Kincaid	OS/2, Ver. 2.1
Wil Goble	OS/2, Ver. 2.1
Jim King	OS/2, Ver. 2.1
Steven Atran	OS/2, Ver. 2.1
M.N. Martinez	Fastlynks 2 software
Gary Peterson	Mentor Notes
Tom Hoffe	$81

In addition, 5 folks won T-shirts, 3 folks won Computer City mouse pads, and 10 folks won a book on OS/2. Add all of that up and you come up with some 26 door prizes. WOW! The meeting adjourned at about 9:20 PM. ◆

(Comments…….Continued from page 7)

block of RoadRunner IP addresses, were on somebody's "don't accept email from them" list.

And really, that is all it takes. Some guy who doesn't bathe regularly, detests Microsoft and business in general--not to mention his professed hate of spam--sets himself up as the protector of all, creates a database of IPs from which to not accept emails and offers it to the public, possibly at no charge since he hates business. Apparently RoadRunner is on such a list.

Then, there is the problem of your Inbox being so crowded with messages--200 or more in may case per day--that in deleting what you think is spam, you inadvertently delete something of value. I did that earlier in the week apparently, and it has caused a major problem in rescheduling things for next week now that I know from a phone conversation the contents of that email.

To me, the current email problem is much more of a problem than the unwanted phone solicitations for which we now have a don't call list.

Programming and old photographs Those of you have read my offerings over the years know of many of the things I have placed at my web site, http://www.lamartin.com. One was an ASP search

feature and front-end for the Burgert Brothers collection of old Tampa photographs of the Hillsborough/ Tampa Public Library. It is at http://www.lamartin.com/burgert/. I have now updated that to a modern Microsoft .Net version at http://www.lamartin.com/dotnet/TampaPhotos.aspx. Here you can browser the photos ordered by date or do a textual search. The difference is that here the results are returned with thumbnails of the images and the speed of the data return (at least for me) is faster than when using the earlier ASP interface I had created. I am finding that .Net makes programming for the web much easier than in the past. To see more examples, go to http://www.lamartin.com/dotnet/. There you can get the latest news, talk with the web psychiatrist, do a cost of living comparison, check the weather and much more. ◆

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members. Our mailing address is P. O. Box 3492, Tampa, FL 33601-3492.

However, for business concerning this newsletter, Bits of Blue, please contact the Editor, William LaMartin, at 821 S. Boulevard, Tampa, FL 33606-2904; 813-251-3817; lamartin@tampabay.rr.com.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII, Microsoft Write, Microsoft Word, or Word Perfect file to the editor at 821 South Blvd., Tampa, Florida 33606-2904 or to lamartin@tampabay.rr.com.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

The use of trademarked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

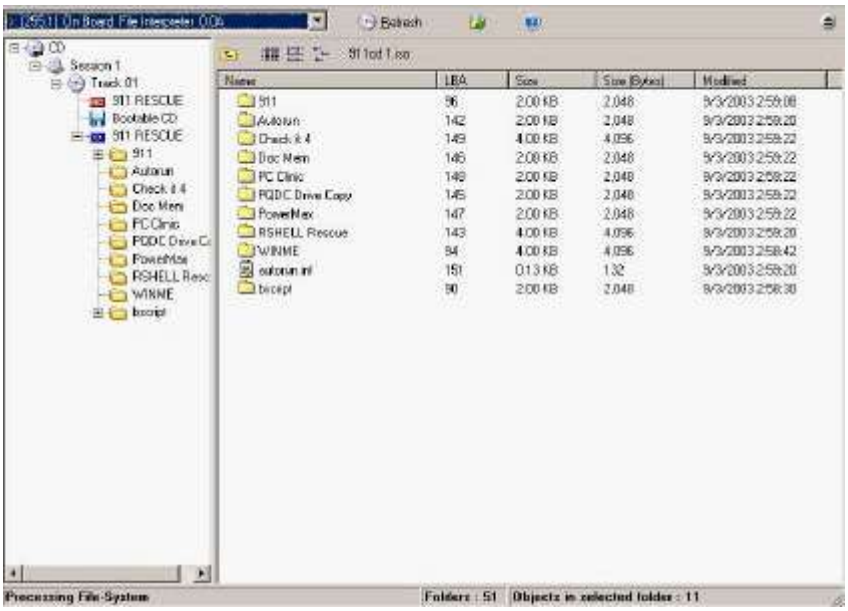
apcug Member of The Association of Personal Computer User Groups

Minutes of the November Meeting

By William LaMartin, Editor,
Tampa PC Users Group
lamartin@tampabay.rr.com

The meeting started with the usual Windows discussion.

Steve Singer from RDI, Inc. then presented his annual talk on what is new with computer hardware. It is something the members always look forward to, and Steve gave his usual knowledgeable and entertaining talk.

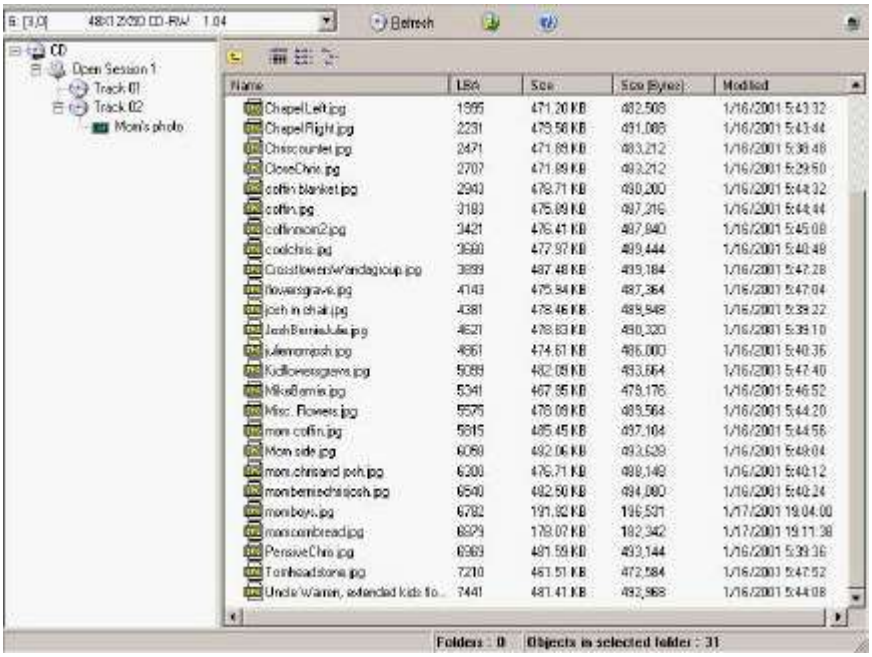


Steve Singer

He started by passing around his personal digital assistant, which is also his cell phone, for attendees to view. He followed this by discussing the various types of memory, motherboards and processors that you can now purchase to either upgrade your existing computer or build a new one. He placed a couple of the motherboards on the central table and passed around two AMD processors so that we could have a closer look.

I must admit I was a bit lost in all the technical details he gave us in describing the various motherboard and processor options. If you want to talk computer hardware, Steve's your man. Steve's site for retail sales is http://morevalu.net/. ◆

IsoBuster for CD/DVD Data Recovery



By Bob Lafave, Tampa PC Users Group
boblala@ij.net

Contents of an ISO File

I had started to use ***IsoBuster*** a couple years ago when I had downloaded my first .ISO formatted files. The .ISO format files are actually images of complete CDs compiled as one whole image, just like ***Ghost*** images do for hard disks and partitions. ISO images can be loaded into several different CD recording software packages to create CDs. I wanted to see what was inside these files without burning to a CD and also wanted to see if I could then extract specific files for my use. I also use GameDrive, which creates a virtual CD-ROM on your hard drive and stores the CD's in a .VCD format. ***IsoBuster*** can extract the data from both .VCD or .ISO files and allows you to explore the individual files and directories. As you can see from the screen capture, the interface is very similar to Windows Explorer or even Ghost Explorer; you open the files in the left panel showing directories and the more specific information is shown on the right. These are just a few of the file formats that you can work with and for a complete list please go to http://www.smart-projects.net. Little did I know what this program is able to do other than interpret these images that I was using.

I had started looking at data recovery from different computer storage methods as a subject I wanted to find more about. I had made a few CD-R's that I could not view with Windows Explorer and I was interested in if data could be seen by something other than Windows Explorer. Who hasn't gone and deleted a file accidentally and hated having to try and remember how to recreate the file or prayed to be able to find a backup copy. And what do you do if you back up the file to either CD or DVD media and when you go to retrieve the file Windows Explorer does not recognize your backup CD disc? Besides, what do you do if the data is, say, a picture that was taken with a digital camera and transferred to a computer for use? Sure you made a copy to a CD-R but that was 2 years ago and now the hard drive on the computer died and your memories on the CD-R are not recognized. Thankfully there is IsoBuster!

Data that IsoBuster found on CD-R

I wish to thank Peter Van Hove, the CEO and founder of Smart Projects. I had e-mailed Peter with my inter-

(IsoBuster……Continued on page 4)

(IsoBuster……Continued from page 3)

est in the data recovery and had asked for permission to review a full version for TPCUG and he was kind enough to send a registration id. Little did I know that shortly after I had activated all functions, my sister would call to tearfully tell me about her computer problems. When she sent me the CD, I placed it in my CD burner and I tried to use the undelete program that comes with Norton System Works 2003, but it does not recognize CD's. I then looked at the CD-R in Windows Explorer and with ***IsoBuster***. Windows Explorer did not recognize the disc, let alone tell me if any files were on the CD. With ***IsoBuster*** I was able to see actual file names of photos that my sister said were on the CD-R. I looked at Help and found out what to do to recover the files and easily was able to recover all photos. At that point I was very happy that I had e-mailed Peter the month before and when I let my sister know that the photos were recovered, you cannot believe her happiness.

Each reader should go to http://www.smart-projects.net and see what this program can help with. The individual features available are too numerous to list but put simply: ***IsoBuster*** uses different recovery methods and can recover most data on CD's if you can see it in the program window when inserted into the CD-ROM drive. The site itself has lots of interesting information on the program that, along with the included Help file, makes ***IsoBuster*** easy to use. There is a ***Free*** version of the program that will do certain tasks such as show you what is contained in an .ISO file; and a ***Full*** version that is a wonder at data recovery from CD/DVD that you may have burned yourself or even CD's that you may have purchased. The full version can be purchased online for $25.95 and a registration code is sent via e-mail. As Peter wrote to me, "**The difference is that for files in the UDF file system (e.g. CDs written with Roxio Direct CD or Ahead InCD, or ...) extraction won't work until you are registered.**" To see what others users think of ***IsoBuster*** you can go to http://www.smart-projects.net/reviews.htm and follow the links to other reviews that have been done. If you don't purchase a full version, I am sure many of you will find uses for the free version along with a couple of the other programs that are on the site. ◆

(Comments.....Continued from page 1)

your computer triumphs and failures.

Amazon Purchases at Amazon.com through our web site like have fallen drastically. Either people are not purchasing from Amazon or, as I suspect, they are forgetting to get there via the link at our web site. If you fit that profile, please remember the TPCUG when you intend to visit Amazon.

Viruses The viruses and junk mail are still filling my inbox. It is down somewhat from previous months, but it is still always between 100 and 200 such messages per day.

1993 I hope you get some value from the reprinting of the articles from 10 years back. Personally, I enjoy recalling how things were in PCs then. Usually I run the minutes of the meetings since that recalls the meetings. This month, though, I went with a very long President's Message where then-president Harvey Bruneau describes his trip to COMDEX, which back then was a much more important event than now, and offers his predictions for the future. Did they come true? Read the article to see what they were.

Send an email card Continuing with my investigation of things .Net I have come up with an example of sending those ubiquitous email greeting cards. If you go to the Visual Studio .Net link on my http://www.lamartin.com, you will now see an option to "Create a Card." There you will be able to combine your brief text into an HTML type email message with a photo selected from a few of the "tourist-type" photos that I have taken over the years and then send it to whomever you choose.

If I could find a free spell-checking web service, I could also run your text through a spell check before the card is sent. I hadn't really thought about one until now. A quick check in Google Groups for the items: spell check "web service" produced a message in a Usenet newsgroup that said Google itself had such a free service in Beta that would allow up to 1000 free Google searches per day, and it included a spelling check.

(Comments……Continued on page 5)

(Comments……..Continued from page 4)

I just signed up for a Google account and already figured out their web service. It is a very simple service that returns what it considers the correct spelling for a phrase that you submit to it. Right now I don't know how long of a phrase you can submit, since it appears that for more than just a sentence or so, the last part of the phrase doesn't get corrected. So, perhaps, soon I will find time to incorporate spell checking into the card.

Google has to be one of the great resources of the web. Most of you know about using Google for the web to locate information on the WWW. But, I think few of you realize that, when doing a Google search, if you select the Groups tab instead of the Web tab you will be accessing the many years of Usenet newsgoups where people have been discussing any topic imaginable.

I use the Groups section almost like a Help file when I am programming in any of the languages. If I am looking for an example of how to do something in Delphi, Visual Basic, or one of the new Visual Studio .Net languages, I can often find it faster in Google than in the particular program's own Help file. As they say, "Google is your friend."◆

Windows Media Center Edition 2004 goes PrimeTime

By Larry Anders, Librarian,
Tampa PC Users Group
Larry@AndersNet.com

Well, it's almost Christmas again and if you're thinking of purchasing a new computer for the family, let me give you a suggestion or two. Microsoft has recently released a second rendition of its digital media operating system, Windows XP Media Center Edition 2004 [MCE]. I originally wrote about MCE back in our May issue of this year. That article can be found here: http://tpcug.org/newsletter/nl_2003/May2003/media_center_pc.htm.

As a reminder, MCE is a superset of Windows XP Professional with additional features allowing the user to access the operating system's digital media features through the keyboard or via an included remote control. Microsoft does not currently sell the software separately, although I purchased my HP 854n Media Center PC last March and received my upgrade a couple of weeks ago from HP free of charge. Consumers must buy a Media Center-equipped PC to obtain the entertainment-based MCE. The media center PC is built around the included TV Tuner and the digital video recorder (DVR) for recording TV shows to the PC's hard drive. Replaying a recorded DVR segment of video in MCE is very similar to what you can do with a VCR. What is different in MCE is a TIVO-like function: being able to pause, rewind, and skip ahead live video. But now in MCE 2004, you can also do it with radio broadcasts.

You can digitally record an entire TV series or program category [educational, kids, lifestyles, movies, news, sports, etc.], watch DVDs and videos, organize and play your music collection, or showcase your digital photos. And, you can do all this from the couch, or your favorite chair, by just picking up the remote control.

It is no secret that Microsoft is trying to move the computer out of the den and into the family room by merging the television and the PC. With most PC distributors offering the larger 42-inch plasma wide-screen TV monitors, with the media center PCs it can easily replace the family TV. I have mine set up in our den [home office] with a 5.1 surround sound system and a 19" flat-panel monitor. I also have a couch opposite my TV and have MCE optimized for viewing from up to10 feet away. If I didn't already have quite an investment in the TV in our family room, I could see this computer setup easily relocating in there. Maybe in the future, but for now, I'm satisfied with my media center PC being located in our den.

I could take most of this newsletter to tell you about all of the features built into MCE but it's easier for you to go here: http://www.microsoft.com/windowsxp/mediacenter/ and check it out for yourself. It's worth your time.

The one thing I was disappointed about with the original version of MCE, and now 2004, is that Microsoft had not built into the operating system the ability to create DVDs or video CDs from your digital recordings without going to a lot of trouble and a couple of conversions in the process. In the first edition of Microsoft Windows XP Media Center Edition, Microsoft introduced the *.dvr-ms file format. Similar in format to *.asf, the *.dvr-ms file enhancements allow the creation of key Personal Video Recording functionality, including such things as time-shifting [record for later viewing], live pause, and simultaneous record and playback. Until now this file format would not allow for direct recording of the saved video. But… enter ***Sonic PrimeTime™.***

PrimeTime is the first [and only] application designed exclusively for, and which integrates into, Media Center PCs. PrimeTime allows for DVD or Video CD burning of saved videos with just a few clicks of the Media Center's remote control. Once installed PrimeTime integrates a "*Create DVD*" button directly into the Media Center menu so that you can create copies of your recordings on standard DVDs or CDs that can be played back on virtually any set-top DVD player.

PrimeTime creates discs that are compliant with OpenDVD specifications. A PrimeTime rewritable

(Windows……..Continued on page 10)

Looking Back to 1993

From the December 1993 Bits of Blue

President's Column by Harvey Bruneau

We made it. Marylee and I survived yet another week of COMDEX/Fall, the largest and best known computer show in the country. This show had more than 2000 exhibitors from around the world showing their products to over 170,000 attendees. It can be overwhelming if you try to visit the six main sites. But hey, it's a passion and my job, damn the feet, full speed ahead.

Imagine a computer show spread out over the Tampa Convention Center, the Thunder Dome, Curtis Hixon Hall, the Performing Arts Center, the Sun Dome and the Bayfront Center but contained within a two mile circle and you begin to get the picture. All of these Tampa Bay sites still could not contain all the vendors of COMDEX/Fall. In addition to that imagine walking in to a computer show with 2000+ exhibits manned by the employees representing each specific product where you can ask questions or view live demos.

COMDEX/Fall is also the place and time of the annual user group summit meeting put on by the Association of Personal Computer User Groups. This meeting is the world's largest gathering of user group leaders and officers. The summit provides officers with an opportunity to share ideas to effectively run, maintain, promote and enhance a user group. This year over 300 officers attended. Additionally, the officers attend a meeting to recognize user groups that have developed and implemented community service programs within four specific categories: Education and Training in America's Schools, Education and Training for the Economically Disadvantaged, Medicine and Health and Social and Civic Welfare and Improvement. This award program is known as the Computer Industry REACH (Recognizing Exceptional Achievement in Community Help) Awards and is sponsored and funded by some well known companies including Ziff-Davis Publishing, Microsoft and Apple. This year five groups were recognized for their achievements. From helping the visually impaired and disadvantaged inner city residents to developing and supporting a 200-node wide area network for the U.S. Olympic Festival '93, all groups showcased what can be done with an idea, volunteers and the willingness to share their time and knowledge. These groups were each awarded $15,000 to apply to their specific projects. Three of these groups are no larger than ours which shows that a group does not have to be a large group to provide a worthwhile community project.

The summit is also a chance for user group officers to meet and listen to national vendors and see their products on a more personal note. This year over 45 vendors, from the big vendors like Microsoft, IBM, Lotus, Hayes, Adobe and Borland to the smaller ones like Cambell Services, askSam Systems, GST Software and Mustang Software, sponsored roundtables, breakfast meetings, luncheons and receptions to promote their products, share their vision and answer questions. The Microsoft reception is always my favorite. It's not just because of the great food that Microsoft provides us with, it's the visit and presentation by Bill Gates himself. No transparencies or slick computer multimedia presentation, no suit or tie, just plain old English from a podium. Bill shares his thoughts and vision of the computer industry, Microsoft and this year NAFTA. He then opens the floor to questions from the audience. Bill is at ease as usual around 300+ user group officers which at times can be a bit testy. During his one hour visit he was enlightening and humorous. Of course his competitors may tell you otherwise.

Following are my thoughts, opinions which I compiled from COMDEX/Fall.

MOST PREVALENT

This year CD ROM disks were everywhere. This inexpensive medium will be a standard for distribution of PC related items by the end of 1994. This

(1993……..Continued on page 8)

(1993……..Continued from page 7)

not only means distribution of software like MS Office, Novell 4.0 and Corel, but consumer products like educational software, magazines and technical CDs full of information and references. Imagine over 600Mb of data on a CD, no diskette shuffle when installing a large program. Several vendors were showing off a new way of distributing software through a try before you buy approach. Even Gateway is selling this idea. You buy a CD from a vendor with over 40 leading applications on it for you to try. If you like one or more products you call the vendor and give them a credit card number and voila they send you the manuals and give you the key to unlock the program(s). Ziff-Davis issued their first copy of PC magazine on CD at COMDEX. It's different reading a magazine from your monitor than from your favorite lounge chair. However, I can imagine one day when the computer can read the article off the CD to me via a sound card and some software while sitting once again in my favorite chair.

The down side of this technology is the selection process of buying a CD ROM drive. There are too many choices and variations. Each drive has a specific function. Before you buy determine your needs. Do you want to just be able to install software from CD, do you want to use it for occasional access to graphic libraries or reference materials, or do you want to use it for interactive entertainment, education and, yes, even medical diagnoses. At a minimum and if you can afford it, look for drives that have: access time of 300ms or less, dual speed with a transfer rate of 150Kbps to 300Kbps or higher, SCSI interface, support the High Sierra and ISO-9660 standards and are MPC compliant. Remember that a lot of CD drives may not come with the required interface card. Ask before you buy. If you already have a standard SCSI card or sound card with a SCSI connector in your system you may be able to attach your new CD drive to it.

The ever-growing abundance of CD titles will make CD ROM drives a necessity not just a specialty item. Just as the 3.5" diskette drive evolved, CD ROMs will evolve and become a standard in PCs replacing the 5.25" diskette drive.

VERY PREVALENT

PCMCIA, those credit card size computer cards that go inside notebooks and sub-notebooks, are increasing their versatility. In addition to memory, FAX/modems and network PCMCIA cards which have been around awhile, there are now: SCSI, sound, and 100+ Mb hard drive PCMCIA cards. Eventually desktop computers will be fitted with PCMCIA slots to accept all these cards. Imagine adding or replacing these cards on your desktop without the hassle of pulling off the cover or messing around with jumpers. I did see one company, DATA 110 1-800-332-8246, that was selling interfaces designed to use existing PCMCIA cards on your desktop. One version allowed connection through the parallel port while a second version installed in an empty drive bay. I found this product to be WAY COOL! One concern I have about these small PCMCIA cards is that they will be vulnerable to damage and theft.

NEW STANDARD

Look for Intel Corp.'s Peripheral Component Interconnect (PCI) Local Bus to become the high performance desktop Bus standard of the future, however long that is. With a following of at least 150 industry leading companies the non-proprietary PCI Local Bus will supersede and replace the VESA Local Bus currently being used in many PCs today. I am sure you are thinking, "Great, now you got ISA, EISA, MCA, VESA and now PCI--when will it end?"

NOT TOMORROW

After seeing and talking to vendors about Windows NT V.34 (V.Fast) and the PowerPC it became evident that none of the products are ready for prime time, YET.

Windows NT is available today as a network operating system, but as a desktop operating system it needs work. Many vendors within the Microsoft floor space were showing their products running un-

(1993……..Continued on page 9)

(1993……..Continued from page 8)

der NT. However, quite a few were showing non-shipping products. It made me wonder how much of those products demos were done with smoke and mirrors. It should take Microsoft about a release and a half to get the product usable as a desktop OS. Of course the Chicago release of Windows will be out before then and many individuals may be satisfied with it instead. I must admit that some 3rd party vendors were extremely ecstatic about Windows NT, even to the point of showing me NT instead of their products. I believe that this kind of dedication is a positive sign for NT.

IBM and Apple displayed their PowerPCs at COMDEX. Neither of which is available today or tomorrow. Look for these PCs to be available in quantity during the final part of 94. These new PCs will give Intel a run for their money if they can get the product to market. The benefits of the PowerPC is that it will run just about any operating system including DOS, Windows, NT, OS/2, Solaris, Workplace OS and IBM's new AIX version 4.x. Of course at this time that's what the marketing people are telling us. V. WHAT?

Hayes, Microcomm and Practical Peripherals all demonstrated very fast modems. All of course were non-standard. The new high speed non-standards demonstrated were: V.32 turbo at 19.2Kbps and V.Fast class (V.FC) at 28.8Kbps. The standard that you and I want is V.34 (V.Fast) and is stated to be approved by the newly named ITU-T (formerly CCITT) in late 1994. Can I put some more acronyms in this article? In order to use any of these high speed protocols (V.32 turbo and V.Fast class (V.FC)) you must have the same vendors modem on the other end. Unless you have immediate needs for this high speed and you are sure that the modem you connect to is similar, you should wait until the standard is approved. Hayes stated that you could buy their V.FC modem today and pay for the upgrade to V.34 when it becomes a standard.

AND MORE

Microsoft has at least three new products that provide more functionality than their predecessors. The new mouse driver for the MS Mouse, Windows for Workgroups 3.11 and version 2.0 software of the MS Windows Sound System are worth upgrading to.

Adobe has a real HOT PROSPECT with Acrobat. This family of software will allow you to send fully formatted documents as a file - containing distinctive typefaces, color, graphics and photographs created on your computer - to other computers, regardless of the hardware platform, operating system or application software used to create the originals. Receivers will in turn be able to print, view, annotate and store the document on their own system. I hope to be able to use this software to produce a complete file copy of the newsletter for distribution through the BBS.

Compaq will be bundling a slick replacement product, Tabworks, for the existing Windows program manager with their PCs. Tabworks uses a familiar look and feel. If you can imagine a three ring binder with tabs you will understand this simple idea. This interface provides a very clean looking desktop thereby reducing that group icon clutter. Simply place your groups on the tab sheets and your desktop screen looks like your junior high notebook. While Compaq did not write this product they will have sole distribution rights for one year before other vendors offer it.

The above only represents some of my thoughts and opinions which I wanted to share with you. If time permits I will share additional items at the December meeting.

At this time Marylee and I wish to thank the APCUG, all the sponsoring vendors and Dun & Bradstreet Software for a successful COMDEX.

STILL MORE... NON-COMDEX COMMENTS:

Please come to the December meeting to vote for YOUR CHOICE. Your vote will determine the officers (President, Vice-President, Secretary and Treasurer) for 1994 and whether to keep the 50/50 door prize. Read the secretary's report for a current list of

(1993……..Continued on page 10)

Special Interest Groups

Microsoft Access SIG

This SIG meets the first Tuesday of the month at the **Kate Jackson Community Center at 821 S Rome Avenue** in South Tampa at 6:30 PM. For information contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merlenic@tampabay.rr.com.*

Genealogy SIG

To be included on the TPCUG genealogy mailing list, contact Jenny Lind Olin at 960-5723, or *jlolin@tampabay.rr.com.*

Visual Basic for Applications SIG

This SIG meets the **third Wednesday (this is a change)** of the month at the **Kate Jackson Community Center at 821 S Rome Avenue** in South Tampa at 6:30 PM. For information, contact William LaMartin at *lamartin@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Kevan Sheridan moderates the discussion.

(1993…….Continued from page 9)

nominations and details about the 50/50 door prize. Your vote is important. If you have any additional nominations there is still time to make them at the meeting prior to the vote.

Many of you will notice a renewal slip in the current newsletter. Please take the time to fill it out to renew your membership. The $20 investment is the best PC investment for the money. Of course you will also be helping our group. As you should be aware by now we will be changing our meeting site in February. Our new home will be the Ybor room of the HCC campus. By the time of the December meeting, I will have signed a contract for the use of the Ybor room through the end of 1994. It will be the first time in the past five years that our group will be charged for meeting space. The board of directors and I felt that in order for the user group to grow and flourish we needed to move to larger facilities. HCC was one of the few sites that satisfied our needs.

Unfortunately, we do not have a computer or projection equipment to put on a presentation. HCC currently does not have the equipment we need either. I have contacted some of the local vendors for a donation or to see if we can barter for a PC. On the positive side, no vendor said NO, but more importantly none said yes. I will continue to pursue this with the vendors. Specifically, we need at least a 486/mhz DX with 120 Mb hard drive, 4Mb RAM and VGA monitor. The current cost for the PC is around $1500. If you can help us to acquire a PC or even the parts to build our own please contact me. The big ticket item is of course a video projection panel like the Proxima ColorWorks or the InFocus PanelBook 450. These are the inexpensive models and are priced around $3500. If you have added the amounts of the equipment, we are looking at around $5000. Once again if you have an idea on how we can borrow, rent or acquire these items give me a call. I can be very humble. ◆

(Windows…….Continued from page 6)

disc may be revised without access to any of the original source files that went into creating the existing material on the disc. If the existing disc is a re-writable format, Sonic's Edit-on-DVD™ technology allows the changes to be written directly back to the same disc without first transferring the entire project to the hard drive. PrimeTime uses high-quality MPEG-2 video encoding allowing up to 4 ½ hours on one DVD. Dolby Digital is also converted to a much tighter compressed PCM format to save space but still receive cinema-quality sound.

I have created both DVDs and Video CDs [VCDs]. The DVDs are of excellent quality and sound, while the VCDs leave a little to be desired, but considering you can buy a CD for as little as twenty cents in quantity, you may be willing to forgo a little quality. I personally use re-writable DVDs for most of my recording. That way, at some point in the future I can

always reuse the DVD. Hopefully soon Sonic will also allow you to burn Super VCDs and the quality should get better. Oh yeah, it took about one hour and fifteen minutes to burn a one hour program that I had previously recorded, and I did it all from my couch.

I was impressed with its ease of use and its integration directly into MCE. There were no surprises during installation and not much reading before I was burning my first DVD. PrimeTime retails for $79.99 and is an indispensable tool if you're an owner of a Window Media Center PC. You can find out all you want to know about PrimeTime here: http://www.ravisent.com/products/primetime/default.asp. Keep up the good work, Sonic, and … Merry Christmas to all! ◆

lamartin@tampabay.rr.com

Digital Camera My Canon G1 digital camera is now three years old. It is hard to believe that it has been that long since I purchased it along with a 340 MB IBM Microdrive. The price of the camera was about $900, and the Microdrive was $302. See my original article in the newsletter about the camera at http://www.tpcug.org/newsletter/nl_2001/january2001/canong1.htm.

It has cost me about $400/year to own the camera so far. Oh, there was also the replacement battery at around $45. I have taken 4,867 photos with the camera and saved 3,463 of them. A quick calculation shows that it has cost $.36 for

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

Minutes of the December Meeting

By Peggy Pulliam, Secretary,
Tampa PC Users Group
pegrance@yahoo.com

Our meeting was festive and fun. We started the meeting and introduced the officers, who are the same for the coming year: President, Kevan Sheridan; Vice President, John Witmer; Treasurer, Mike Hodges; Secretary, Peggy Pulliam; Member at Large, Mary Sheridan. The rest of the Holiday Party consisted of good camaraderie and lively discussions -- and the food was delicious, with shared dishes and desserts.

Your Board is happy to serve again and looks forward to a New Year of surprises and shared information. We are glad to say that the meeting room at Pepin Distributors is available for the coming year on our meeting nights. It is easy to find, and we have plans for informative and interesting meetings the second Wednesday of each month in this NEW YEAR 2004!

Include some Computer Usage and new computer-trick learning in your plans for a successful and happy New Year. Join us. ◆

(Comments……..Continued from page 1)

each saved photo (including the price of the new battery). It has cost $.25 for each photo taken. This is probably no cheaper than using a film camera, and at this point with the digital camera I only have a file--not a printed photo. But, oh, the convenience.

I get very good results scanning the negatives taken with my film camera into digital images on the computer, but this is nowhere as convenient as simply downloading photos from the digital camera

(Comments……..Continued on page 4)

Review of ClipMate 6.2 [Clipboard Extender]

By Larry Anders, Librarian,
Tampa PC Users Group
larry@andersnet.com

For all that Microsoft Windows operating system is and all the utilities that have been added to it over the years to make it all-encompassing, one thing that has always been missing is the ability to work with multiple clips. The clipboard in Windows is based on a FIFO [first in, first out] design. If you want to work with more than one clip at a time or some clip you made several days ago, you're out of luck. But not with ClipMate.

You don't have to work with just one piece of clipboard data any more. ClipMate enhances the native clipboard functionality by remembering all items (both text and graphic) that are copied to the clipboard and storing them in "collections" for later pasting. ClipMate works seamlessly as a Windows companion and you will never accidentally lose a piece of clipboard data again. ClipMate's new relational database can hold hundreds or thousands of clips - of all formats including Text, Graphics, and HTML. And with ClipMate's SQL-based search engine, you'll be able to find your data, and the Shortcut feature keeps your most-frequently used clips right at your fingertips.

Having access to thousands of previous clips is a good thing if you can find the data that you're looking for more easily than typing it again. With **QuickPick**, you can "filter" the titles in the current collection by merely typing the **"?"** key, followed by some text [not case sensitive] that you expect to find in the title of a clip. As you enter each keystroke, the list is updated to show your "hits" up at the top. Keep typing to narrow down the search.

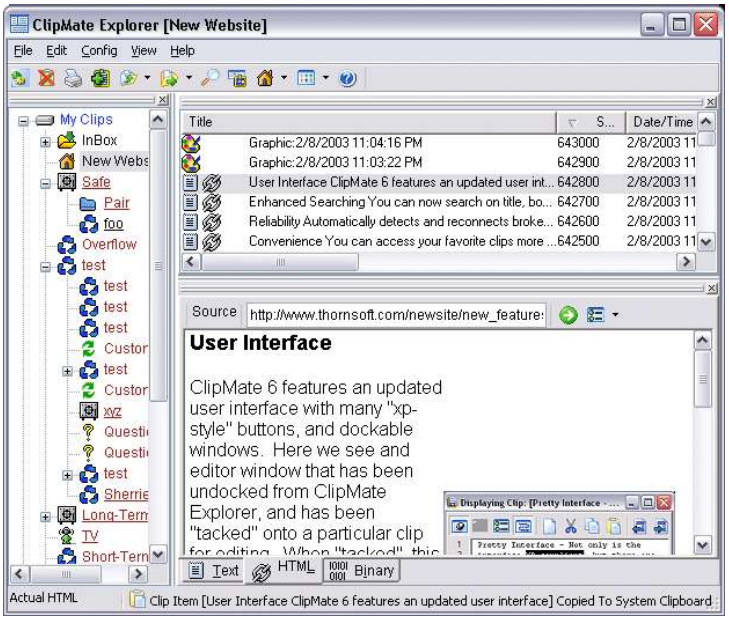
Similar to QuickPick, the **Shortcut** function searches "shortcuts" that you assign to important clips (such as your Visa card info), i.e., V for Visa or M for Mastercard, D for Discover, etc.). This data does not even have to reside in the current "inbox" collection. Shortcuts work across collections and

even databases (if you use multiple databases).
It is fully integrated with **QuickPaste**, so simply picking the item that you want and pressing <ENTER> will enter your data automatically. Then by invoking QuickPaste again, choose another item to enter, etc... The selection remains "live" until you cancel it with the ESCape key.

Clips are saved to the database immediately when captured or edited. Images are stored in the database as JPEG objects, further reducing space and speeding retrieval. Deleted clips are held in "trashcan" status for two weeks, allowing easy retrieval. You can optionally encrypt sensitive clips with 56-bit ARC4 encryption. This is great for passwords, credit card numbers, etc., if your computer isn't always physically secure.

You can encrypt clips with a "blanket" encryption key, or you can do them all individually, but, don't forget your key! The security is so good that even the developers of the software cannot break it, and there aren't any back doors. So, if you lose or forget your key, your info is encrypted for good!

You can now search by title, body text, the name of the creating application, the source URL, data types, dates, encryption status, deletion status, and more. For example, you can search for all Bitmaps created by PaintShop Pro within the past 30 days. And you can SAVE that query, so that you can run it again sometime. The queries run quickly, and the results sets look just like a regular collection. You can print, delete, QuickPaste, etc., from the results. And if you view the results in ClipMate Explorer, you'll see a new column showing the collection that each clip is currently assigned to.



In addition to the standard windows screen capture

(ClipMate……..Continued on page 4)

(ClipMate……Continued from page 3)

keys (PrintScreen for the whole screen, Alt+PrintScreen for the current window), there is also **Area Screen Capture** that gives you a "rubber band" mouse selection, so you can specify an area of the screen to grab, and **Object Screen Capture** - similar to the above, but you simply click on any screen object, and that object is captured as an image. For example, click in a browser window and you'll get a picture of the contents of the window - but not the toolbar, menu, titlebar, etc.. Click on the toolbar, and you'll get an image of the toolbar. Some will find it a bit odd - others will find it to be a lifesaver, as it can save a lot of clean-up that you'd otherwise get with an area capture.

I've only touched on a few of ClipMate's capabilities. Thornsoft Development has been improving upon ClipMate since 1991. I suggest you go here: http://thornsoft.com/viewlets.htm and check out the tutorials available on this site to see the ease of use and some of the things possible with ClipMate. I have to say that I think this is probably the most useful add-on to Windows that I have ever used. I had absolutely no problem paying the $25 registration fee for this fine program, but you don't have to pay to try it out. Go to http://thornsoft.com and download a fully operational trial copy and see if you don't agree with me. You can convert the evaluation version to the fully-registered version at any time during (or after) the 30-day evaluation. Give it a try! ◆

(Comments……Continued from page 2)

into my computer. The film camera undoubtedly produces better images, but the G1 does a quite adequate job if you don't want to produce a print larger than 8 x 10 and you avoid harsh lighting conditions like very bright sunlight. The G1 actually does quite well in low light situations. To see some of my low light shots with the G1 go to http://web.tampabay.rr.com/lamartin/ and view the holiday light photos of my neighborhood. The photos range over the last three years.

Canon is now producing the G5, I think. Several of our members own G3s. These cameras cost more than your average digital camera, and, I suppose, they are aimed at the advanced amateur--and they produce excellent results. I recommend using the highest resolution and least amount of compression in taking the photos. That way you get the maximum amount of information. Hard drive space is cheap. Then you can put any photos you would like prints of on a CD and take it to your favorite one-hour photo place for printing.

Remote Desktop My son visited us for the holidays and every day spent some time accessing his computer in New York City via the Remote Desktop feature of his NYC computer running Windows 2000 Server and my daughter's computer running Windows XP Pro. When he left Manhattan, he left his computer running and connected to the Internet through a DSL connection. He noted his IP address on the Internet and hoped that the connection did not go down and come back with a different IP address.

Once in Tampa, he went to my daughter's laptop and started the Remote Desktop Application (Start | All Programs | Accessories | Communication | Remote Desktop) . He entered the NYC computer's IP address, and since the computer in Manhattan had been configured to accept Remote Desktop logins, he was asked for a username and password. After logging on, he was working on his home computer. He could start programs on it, work with any files, and run Outlook to send and receive email from his computer--not the one in Tampa. Of course fast broadband connections are vital for this kind of work.

(Comments……Continued on page 5)

(Comments……..Continued from page 4)

When we traveled to my hometown to visit my mother and sister, he wanted to access his NYC computer from there. My sister has a broadband connection on a computer running Windows 98. That was fine. All that was needed was to go to Microsoft and get the requisite software to allow her computer to be a client computer for a Remote Desktop setup.

Note that any computer running Windows 98 or higher can function as a client for a Remote Desktop Connection. However, the computer that you want to access remotely (the server in the setup terminology) must be running either Windows 2000 Server or Windows XP Pro--that is XP Pro, not Home). That was one reason that I wanted my daughter's new laptop for college to have XP Pro as the operating system. I had hopes of being able to access her computer at her request to help with any problems she may be having with it. Unfortunately when I tried to access it via a Remote Desktop Connection at her school, I found out that the school wouldn't allow that.

Web Logs That's web logs--not WebBlogs, which seem to be all the rage. A web log is a text file that logs all of the visits to a web site. It is something

E-mail Talker

By Bob LaFave, Tampa PC Users Group
boblala@ij.net

Julia Rolling of Scorpio Software offered ***E-mail Talker*** to the TPCUG for trial use to review its operation. I wanted to look at this program because, as many members know, I am interested in both the MS Agent and Speech technology and I have used programs with the animated Agent characters in the

past. The features on ***E-mail Talker*** can be viewed at http://www.scosoft.com/Product.htm and can be downloaded, 3.55 MB in size, for a FREE 21 day evaluation period at http://www.scosoft.com/Download.htm . After the trial period, registration is required for $19.95 under U.S. and international copyright laws.

Installation went smoothly, and upon Windows restart the program was set to start and run in the background with an icon placed in the Systray. This can be changed under Options with the General Tab if you decide against running the program at all times.

You can determine which gesture the Agent character uses when appearing and what he says. The Character tab sets up which Agent character you use, the speaking voice used, and the font used to display the text being read. With the Time tab you determine if you want the time announced in an interval you choose, with the character voice and gestures also being determined by you. The Anti-Spam tab allows you to set filters with words of your choice so as to not read messages containing objectionable words. Some settings allow you to *Preview* the settings that you are choosing.

Under Accounts, you set up your Hotmail or POP3 e-mail accounts that you would like to check. There is no setting limiting the number of accounts. You do need to know your basic e-mail account user information during setup. You need to know: email address, your password, the email server name and login name.

After finishing this setup of accounts, I was ready to see what ***E-mail Talker*** could do. It is very similar in appearance to the split screen that most users are used to with e-mail programs, a screen to show total messages and another screen to show what a specific message contains. You control what gets read from the header, subject and message content to the body text. Also, you will only get printed text read by the program; text that is contained in graphics is not read. This is actually kind of ***FUN*** to listen to. You get to set the voice type to normal, monotone, or whisper. Then you can set the speed and pitch of the reading voice until you can get a voice that is easy to understand and more human than machine in likeness. I had variable results with the e-mail part that can be split into whether I was using it for Hotmail or POP3 mail. I had pretty good results with Hotmail but sporadic use with POP3.

Hotmail worked much as expected and according to the settings I had made during setup. The program correctly got the current mail in my Inbox in Hotmail and read each message that was understandable. If you look at the main screen you can see that there are buttons to either *Skip* or *Stop* a message being read. These buttons are very useful with Spam and with some work you can set up the Anti-Spam feature to also stop undesirable messages. POP3 was never to my liking in its operation. I would have three messages shown from the account, and upon checking with Outlook Express I would find that I had other messages not acknowledged by ***E-mail Talker*** or

(E-Mail Talker…….Continued on page 10)

(Comments……..Continued from page 5)
that the server software does. A web log lets you know what is really happening at your site--what are the most visited pages, what time of the day is most active, how many visits on a particular day, the IP address of the visitor, and what pages get none or few visits. For the TPCUG.ORG site and my personal lamartin.com site, the web logs run close to 10 MB each for a month's data. For a commercial site, it could be more than that for one day's activity.

To make any sense of all this data you need log analyzing software. At one time I bought some such from Web Trends, I think. It was their scaled down version, and it made nice graphs, but it did not allow you to see past the first 10 pages in any category--the most visited 10 pages but not the 11th or 12th. So I created my own log analyzer in Microsoft Access.

Using my log analyzer, I have that for the month of December, 2003, the TPCUG site had an average of 155 unique visitor sessions each day and the lamartin.com site had an average of 234. The TPCUG site used only a total bandwidth of .25 GB, and lamartin.com used 1.4 GB (many more images downloaded). At the TPCUG site, Internet Explorer made up 58% of the page views, Netscape Navigator made up 1%, and other browsers and web crawlers made up the remaining 41%. At lamartin.com, Internet Explorer registered 75%, Netscape Navigator 1%, and other browsers and web crawlers 24%. So, at least at these two sites, Netscape Navigator is basically a nonentity. What I mean by a web crawler is something like the Google Bot which visited 761 different pages at the TPCUG site in December. That is how Google knows what is at the TPCUG site. And that brings the following to mind.

ASP.Net and Google As noted above, Google periodically visits web sites like our TPCUG site and indexes many of the pages there. It can do this because it can follow the links that are given in the underlying HTML on any page where it lands. On web pages created by ASP.Net, you may or may not have such links in the underlying HTML. It just depends on how you allow the user to browse to other pages. If you use regular hyperlinks, then everything is fine for Google. It sees them in the underlying HTML. But what about those buttons I use to access other pages at the .Net Test at TPCUG? Go to the main .Net test page at http://www.tpcug.org/Main.aspx and do a "View Source" in your browser. You will not be able to find a single link to another page at the site, I believe. So what are Google and all the other web crawlers going to do? I don't know.

.Net Speaking of the .Net version of the site, for which I placed a link on our home page, I want to thank those who tested it to see how well it displayed in browsers other than Microsoft Internet Explorer. They pointed out several problems in displaying the page properly, and I was able to trace the problems to errors in my code that, when corrected, made the pages display correctly in all browsers tested except Netscape Navigator 4.7.

Santa If you are observant you can tell that I am stretching this article out to fill the newsletter. If I had gotten that third article I asked for, I wouldn't have needed to be so long winded. Now that Santa has come and gone perhaps some of you will have some articles for me on what he brought you for Christmas. As for myself, this is probably the first time in a long time that Santa brought me no computer-type present. I was hoping for a new laptop since my current one is five years old, but I received none. Santa undoubtedly knows best--probably has inside information on drastic price reductions in the near future on such items. Indeed, I have noted some real good prices on laptops with the specifications I want in the CompUSA ads. They were from Compaq and Toshiba, I think. So far, it appears that Gateway has not lowered their prices on the 450 series much if any since we bought one from them for my daughter in August. ◆

Looking Back to 1994

From the January 1994 Bits of Blue

Secretary s Report
MINUTES OF 1218/93 MEETING
and PERSONAL COMMENTS

By: Jim Clark

The meeting began a few minutes late at 6:10, led by our illustrious Prez, Harvey Bruneau, with a modest representation of members present and several visitors. Important user group business was scheduled for the evening, along with a presentation of an intriguing software program.

USER GROUP NEWS

Elections: The floor was opened to any additional nominations for the five elected positions on the Tampa PC Users Group Board of Directors. None were offered, the nominations were closed, and preparations for the election began. A motion was made, seconded and approved by the majority present that those persons nominated for positions for which there was no opposition be elected in block to fill those positions. There were three nominees for the position of Vice President: Michaline Ostrowski, Don Patzsch, and Al Poole. Two votes were taken, with the first narrowing the field to two nominees since the first vote did not produce a clear winner. Those elected to serve through December 1994 are as follows:

President	Harvey Bruneau*
Vice President	Al Poole
Treasurer	Tom Cone *
Secretaay	Jim Clark *
Member at Large	Roger Waters*

* = Sole nominees

50/50: A decision was taken by the membership during the November meeting to take a vote at this meeting on a motion to eliminate the split of money collected for the door prize drawings, with the user group instead retaining all of the funds to help offset our need for funds to finance our relocation and other needs. A vote was taken on the motion and it carried by a large majority: At this meeting and all future meetings, all funds collected for the door prize drawings will be retained by the user group.

New Meeting Location: Harvey announced that beginning with the February 1994 meeting our meetings would be held at the Ybor City campus of the HCC. A map was included in the last newsletter. While equipment arrangements had not yet been completed for that site, the facilities are excellent and the normal meeting agenda would obtain, including a vendor presentation.

Software Reviews: Harvey announced that he and Marylee had obtained a number of software programs at Comdex for review by our group. A listing of the programs available will be posted on the BBS and in the next newsletter. Please contact Marylee Bruneau about any of the programs you would like to review.

Adobe Acrobat Explained: Harvey informed the membership of a BOD decision to acquire a license for Adobe Acrobat readers for all group members. Adobe Acrobat allows converting the output of most major programs into a common format, retaining all formatting characteristics of the original document, allowing all computers with a reader to display and printout, if desired, any document as it was originally created, whether or not the viewing computer has any of the software tools of the creating computer. Not only will this be a considerable convenience to our members and group administration, but also it is expected to lead to considerable savings in distribution of the newsletter.

Meet Your BBS: A number of our group took advantage of an offer by our SYSOP, Kevan Sheridan, to meet the Bits Of Blue BBS at the site of the BBS computer. Kevan explained a bit about the BBS and answered all questions with demonstrations where appropriate. It was a very interesting and informative session for all participants. Kevan received enough feedback from those participants to know the eve-

(1994……..Continued on page 9)

(1994……..Continued from page 8)
ning was worthwhile, and accordingly has scheduled another Meet Your BBS Night, the third Wednesday in January. It may well become a regularly scheduled event. Come to the meetings and/or watch the BBS for more current info on this.

Caution In Buying CDs: Low cost CD's are flooding the market, many of which are not worth their few $$ price. Harvey advises that you look before you leap when purchasing CDs; even a cheap CD is a waste if it is not useful.

INDUSTRY NEWS

Word 6.0 Bugs: A number of bugs have shown up in the recently released Word for Windows 6.0. Microsoft has announced there will be a release in February to correct these problems.

28.8 Modems: Harvey informed us that these modems which use parallel ports are now available from at least two vendors. Cost is in the range of what the 14.4 used to cost.

Sound Technology: Summarizing his readings from articles on the subject, Harvey reported that sound technology was now on the fast track and we could expect in the not too distant future that a vocal interface between user and computer would be a lot more practical.

PRESENTATION askSam for Windows, Ver. 1.0

Philip Schnyder, President of askSam Systems, favored us with his presentation of their software program, askSam for Windows. We have been hearing a good bit about that program for awhile now and I, at least, have really not known what the program is about, only glowing words that it is a great program. BUT WHAT IS IT?? Philip was here to answer that question. A very simplified answer is it is a very powerful, super-flexible, very user-friendly information management/database program. I now understand why it was so much of a mystery for me, because even after having seen a demo of the program I am having considerable difficulty coming up with description for you. What I can tell you for sure is that it is a great program.

Designed with a view of doctors, lawyers and others who deal with random information which they need to retain and be able to quickly recall when needed, askSam is a free form information management system. While it can be used pretty much as a conventional database to retain and recall structured data, its greatest value lies in its ability to store and recall information in unstructured form; that is, input information of just about any size and shape randomly into the same database and then be able to quickly recall that information in usable form, using a single or many criteria, and in a wide variety of formats and views. How fast can it retrieve? Philip says they have tested: With a 486/3 3 using DOS 5 and Windows 3.1, it took 15 seconds to search a 5.2 Mb data base. (I am not sure that this is useful information since timing is affected by so many variables, including criteria, format, available memory, etc.) In any case, the demo I saw was fast.

I was too intrigued with the program to get many notes. I did note the following: The limit on the number of criteria one can use in searches is unknown at present, but is well in excess of that one is likely to ever need; each record can be up to 300 pages (yes, three hundred pages) long; supports OLE of text and graphics; supports direct imports of ASCII, RTF, Word Perfect and dBase/FoxPro formats; exports in ASCII, RTF and CDV. Features not yet a part of the program, but which are in the works, include a spell checker and the ability to conduct multiple data base searches. Philip recommends a 386 machine with 4 Mb of RAM to run the program, though it will function with lesser capability. The program requires 2 Mb of hard disk space. askSam lists for $395, with a street price somewhat less than that. Those present at the meeting were given the opportunity to purchase the DOS or Windows version at a great savings for $125. Phil explained that the DOS and Windows versions are essentially the same, the differences in summary being that the Windows version is somewhat easier to use, while the DOS version has a few more options. Phil, we THANK YOU VERY MUCH

(1994……..Continued on page 10)

Special Interest Groups

Microsoft Access SIG

This SIG meets the first Tuesday of the month at the **Kate Jackson Community Center at 821 S Rome Avenue** in South Tampa at 6:30 PM. For information contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merlenic@tampabay.rr.com.*

Genealogy SIG

To be included on the TPCUG genealogy mailing list, contact Jenny Lind Olin at 960-5723, or *jlolin@tampabay.rr.com.*

Visual Basic for Applications SIG

This SIG meets the **third Wednesday (this is a change)** of the month at the **Kate Jackson Community Center at 821 S Rome Avenue** in South Tampa at 6:30 PM. For information, contact William LaMartin at *lamartin@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Kevan Sheridan moderates the discussion.

(1994…….Continued from page 9)

for your visit, for a great presentation of a super program, and for the copies of askSam you donated for our door prizes. You have a real winner in askSam. We look forward to your next visit in our new quarters.

AND THE WINNER IS:

Thanks to the generosity of askSam Systems, which donated two copies of askSam, and to Brainchild Computer, who donated a copy of MS Word Assistant, there were some very nice door prizes. Those among us to have the good fortune to win are:

Tom Church	Cup
R. W. Davis	MS Word Assistant
Bill White	askSam (DOS)
Tom Schroeppel	askSam (Windows)

The meeting adjourned at about 9:00 PM. ◆

(E-Mail Talker…….Continued from page 6)

find that some messages where incomplete. I worked with support via email, and we never found a reason why I was having this trouble with POP3. Support sent troubleshooting information and files for me to try and after 2 weeks of correspondence I was left with:

"Thank you for your help in solving your mailbox checking problem. We tried hard, but have no positive results. We cannot guarantee that E-mail Talker will work perfectly on email accounts like yours. We plan to include modifications to the next version of E-mail Talker, which will help to work more stably on such POP3 accounts. The release is planned for the beginning of December. The current version (ver. 3.30) works perfectly with Hotmail accounts as well as with POP3 accounts, which meet all requirements of RFC 1939 Post Office Protocol - Version 3 including realization of optional POP3 commands."

I did ask to be included in any testing that I could do with the new version and will write a new article if I am asked to test.

The other features that the program has are announcing the *Date*, *Time*, or using the *Clipboard* feature. By pressing the date or time you get the chosen character to say just what the date and time are as set in your computer. The Clipboard feature allows you to copy any text that you choose to the Windows Clipboard feature and by pressing the Clipboard button the selected text will be read back to you.

This program is what I consider a fun luxury program since it does what other programs are designed to do and adds or deletes features from the programs that we use now. This program adds the use of the Agent characters and voice, but you lose accuracy

(E-Mail Talker…….Continued from page 10)

when checking your mail. I cannot currently trust what is read and would always check the email accounts using the more conventional methods that I have used until now. This would have to be done anyway in this version since *E-mail Talker* only checks and reads the current contents of the Inbox in both accounts that I set up. The other folders that are in the accounts are not accessible that I could determine. You also need to use the normal method to delete the messages from the server. After I would check e-mail with *E-mail Talker* and deleted a message, I would still need to use my normal method to delete the message from the server.

I like this program and hope that I get a chance to see improvements in its current operation. I think this program could be very useful not only as a fun program but also more importantly as an aid to anyone with limited eyesight who would like to use some computer features and specifically e-mail accounts.

Meeting

Software for Consideration

Wednesday, February 11, 2004
6:30 PM
Art Pepin Hospitality Room
Pepin Distributing Co.
6401 N 54th St
Tampa, Florida

Meeting Preview: Dave Whittle will present the software of several companies he represents. We will also have the usual half-hour Windows SIG.

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

This is a full newsletter this month, so there's no room for more than a very short note from your editor. That is the way it should be most of the time.

Dave Whittle will be demonstrating new versions, I presume, of some of the software he showed us on his visit last year for panoramas, 3D slide shows and databases. I actually used two of the titles I bought from him at that presentation, and you can see the results at http://www.lamartin.com/virtual.htm. There are three virtual tours and two 3D displays.

My HP ScanJet 5370 Cse scanner died last month and was replaced by an Epson Perfection 3200 Photo Scanner. So you'll probably be seeing a review of that next month. ◆

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

Minutes of the January Meeting

By Mike Hodges, Treasurer,
Tampa PC Users Group
mphs@aol.com

Our Member at Large, Mary Sheridan, opened the meeting in her inimitable way and provided us an invaluable update on the current PC viruses and remedies and the after-effects of certain spy-ware programs and other counter-measures that one can take to best protect one's PC activities. Mary also extended an invitation to all to attend the Florida annual users group weekend conference to be held in Kissimmee starting at 6 pm on Friday, March 5. Mary then announced and introduced the elected officers for 2004, who remained unchanged from 2003. Mike Hodges, the incoming and outgoing treasurer, announced that the goal was to achieve 50 paid-up members for 2004 and already seven members had signed up in January. Mike then requested that members volunteer to support the Board as program chair or in any other capacity.

Our presenter, Dave Dabney from LC Technology International of Clearwater, then provided us a very informative live demonstration of his company's data recovery/restoration software products. First, however, Dave afforded us some good tips that would help us not require the use of his products as in "prevention is better than cure."

- Partition your hard drive and separate your data from your system drive.
- Take your memory card out of your camera before air travel to avoid x-ray memory dumps.
- Beware of the low battery warning and remove memory card before completely draining your battery.
- Do not edit pictures on your camera card in camera. First download to PC.
- Use multiple spare cards instead of deleting a few unwanted ones so as to make room for a few more pictures.
- Ensure flash cards and memory cards are prop-

A Novice's Struggle with CD-RW Drives

By Merrill Friend, Tampa PC Users Group
mfriendtampa@worldnet.att.net

Some time ago I purchased a Buslink Ultra-high speed CD-RW external drive for a laptop which had only a CD Rom drive. The Ultra High Speed unit has a maximum write speed of 52X, which is plenty fast. Then I got some Ultra high speed CD-RW Memorex discs and I was in business. After installing the drive, which connected using a 2.0 USB port, all worked fine. I could easily record, erase and record again on those fabulous Memorex discs. I could select various record speeds, and all I tried seemed to work effortlessly. I also got some Sony high speed CD-R 700MB discs, which also worked fine and were considerably cheaper. This external drive was supported by Nero software. I was happy.

Later I purchased a new Gateway laptop computer with a built in CD-RW drive with Roxio software installed. Since everything had worked so well with the Buslink external drive I expected that I would have the same wonderful and smooth experiences with the Gateway drive. I should never have been so naïve.

I tried my Memorex ultra high speed CD-RW discs in the Gateway computer and got a message from Roxio that I had not installed proper media in the drive and should immediately place a blank CD-RW disc in the drive. I tried one Memorex after the other in the drive and got the same message on all of them. I then tried the Sony CD-R discs which the drive did recognize and I was allowed to burn a CD-R disc.

Next, I went to Roxio's home page at Roxio.com. The first thing I needed there was the identification of the specific version of Roxio Software I was using and the serial number of the product. I was told that I could get that information by opening the Roxio program and then clicking on "HELP" where I could see the software version as well as the serial number. Well, I got the software version but no serial number. I was to learn later that this was because the Roxio software came installed on my computer, and I didn't have a separate Roxio disc with a serial number. Without a serial number I couldn't get technical support from Roxio. I had learned the software version was 5.3.5.10. I then called Gateway and they said it was Roxio's problem. Now why wasn't I surprised to hear that?

I ended up joining the Roxio online discussion group where a serial number is not needed. I soon learned I did need one more bit of information. I needed specific details on the type of CD-RW drive that was installed in my machine. I went to "My Computer", clicked on the CD-RW drive and selected properties and learned that I had a QSI CDRW/DVD 242U drive. Armed with all this data I was able to fully delineate my problem to the discussion group. Within a few hours I had one very good and helpful response.

The respondent indicated that he had researched my drive somewhere and learned that the RW rating for that drive is 10X Maximum. Thus it would be unable to read my Ultra High Speed Memorex discs. He then advised me that there are three speed groups for RW drives. Per this person, the speed categories are as follows:

Low Speed, which is from 1x to 4x
High Speed, which is from 4x to 12x
Ultra High Speed, which is from 12x to 24x

He also added that Memorex discs are the most problematical for use with various machines and software, although they had worked perfectly with the external Buslink Ultra High Speed drive previously. I was advised by the writer that he had also had difficulties with Memorex discs of the correct speed range and had changed to Verbatim discs of 650MB size suggesting that the 700MB size of the Memorex may have also been a factor. He stated that the Verbatim drives worked fine.

I began shopping around for different brands of CD-RW discs. I didn't find any Verbatim discs, but I did locate some "High Speed" Maxell discs at Office Depot so I bought a small package of them. These discs were recognized by my laptop, but my machine

(Novice…….Continued on page 5)

Tiny Cars 2

By Bob LaFave, Tampa PC Users Group
boblala@ij.net

Tiny Cars 2 was offered by Natalia Matveeva from ***REALORE Studios*** for review to the TPCUG, and I quickly answered that I would be a willing test subject. I mean, who can refuse playing a game and providing William with food for his "***Newsletter Monster***!" You can download the game at http://tinycar2.realore.com for trial and purchase the full version for $19.95. No CD is available and the file is 9.7 MB in size with the current version being 1.10.

Tiny Cars 2 is a throw back to the first games that were produced for computers years ago, simple arcade type games that we all can play and enjoy. The game is easy to start, either as full screen or windowed, and has a simple option menu to set up.

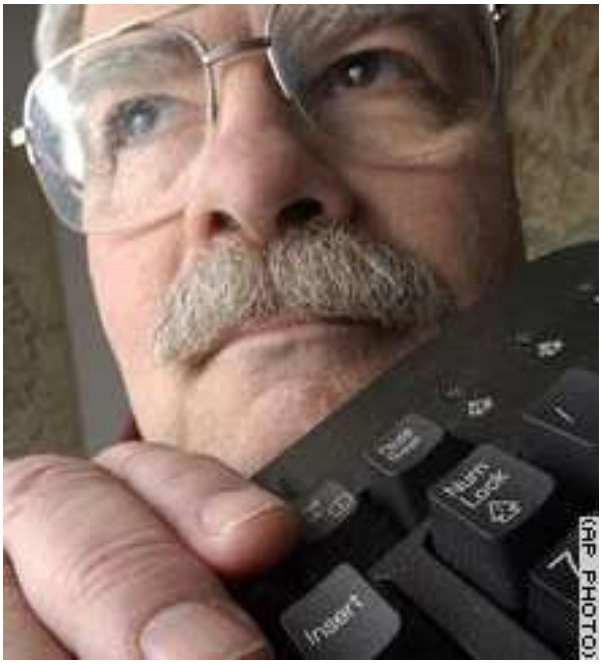
The options provide for controlling the sound of the game, controlling either the four keyboard arrows or joystick, and a "Check for Updates" feature to keep the game updated with the latest version. The update feature starts your web browser and goes to the REALORE site and gives you a message of your version and the current version. You then have a link to the download of the newest version. You can set the type of race as either Single or Championship and review the top times by racetrack by going to the Scores screen. The Help options are three simple pages with game instructions and purpose. Once the type of race is selected you can then choose Profile that sets how hard the racecourse is and the player's name. You then get to Select Car to choose the car that you are going to use. Next is the Select Track for the track that you are going to race, and finally the race will start.

This setup can be done quickly and is easily understood, no remembering a bunch of control codes. Yes, that is the best part of this game. I can play it and enjoy it at my age. That is not to say that I dislike complicated games ***but:*** I will say that I do not have the time, concentration, or memory available to play some games today. I have tried with my sons ***Playstation*** and ***Xbox,*** and I cannot get comfortable using all the buttons that you have to push, some multiple times, for playing the games. I can control four arrows using both my hands and easily go forward, backwards, left or right to navigate the course. It's even easier with my joystick in that all I have to do is point in the direction that I want to navigate. As for getting around the course in the least amount of time and avoiding the other cars and picking up the four ***Bonuses*** that are available (look at the Help Screen page 1) by driving under them, I can easily handle the game and have enjoyment instead of stress.

The game is definitely PG rated and is safe for children to play. Yes, you can crash into another car but

(Tiny Cars…….Continued on page 10)

(Novice……..Continued from page 3)



indicated it would only read and write to this disc at a 4x speed. No other speeds were available on my machine. I tried writing to them and they worked satisfactorily although slower than I had anticipated. I was also able to erase material satisfactorily. So now I at least had a working CD-RW drive, albeit a slow one.

After all this difficulty, I began to wonder just why CD-RW drives are needed? Why not just a CD-R? Wouldn't that do just as well? All the new machines seem to be coming out with CD-RW drives, so naturally I wanted to have the latest most modern drive but what exactly can I do with it? I looked through the stock of CompUSA and had difficulty locating any CD-RW discs except for those Memorex discs mentioned earlier. Yet there were literally tons of CD-R discs of various manufacturers. That should have told me something. The CD-R's were also much less expensive and available in large packages at a discount.

For my purposes I felt the CD-RW would be helpful in making up discs to save and organize material which I might reorganize or make minor changes to from time to time until the project was finalized. Then when I had the material in its final state, I could put it all on one CD-R disc as a per-

StrokeIt Command Editor

By Larry Anders, Librarian,
Tampa PC Users Group
Larry@AndersNet.com

Recently I upgraded my computer system to a new Windows XP Pro Media Center Edition machine that is built around a TV card and a dynamite 5.1 surround sound system. Along with the computer, I also purchased a new 20" flat panel monitor. At the same time my wife bought me all new furniture for my computer room. [If you don't know, a computer room is what you call one of the bedrooms your kids used before they moved out on their own.] Part of my new computer furniture is a desk unit that has a center drawer which has a front that folds down to reveal the keyboard and mouse. The drawer is long and wide and slides out rather far. If fact, it pulls out far enough to allow me to almost lie down in my chair while working [or playing] on my computer. But alas, I was having a problem enjoying this relaxing form of computing. Occasionally I have to sit up and type commands into my computer. Well, not anymore. At least I don't have to sit up as much as I did before.

The other evening I was watching one of the lovely ladies, Sarah Lane, on TechTV's The Screen Savers program and voilà, there was my answer. Now don't get me wrong! I spend a lot on time on a computer every day and have for years; so much time that I have already had carpal tunnel surgery on both hands. I figure the best way to prevent this sort of repetitive stress syndrome in the future is to keep my arm as straight as possible while operating the mouse. And when you're practically lying down your arm is almost straight so there shouldn't be any stress on your hand… right?! [It's possible I could be a little lazy, too.] Well anyway… back to my voilà.

Sarah was showing a ***FREE*** program that she had discovered called ***StrokeIt***. [Clean up that dirty mind!] ***StrokeIt*** is an advanced mouse gesture recognition engine and command processor. Simply put, mouse gestures are simple symbols that you "draw"

on your screen using your mouse. But with ***StrokeIt*** installed, these doodles can now tell your computer what to do by recognizing the mouse stroke and performing an action associated with a particular mouse gesture. If you're a Palm or PocketPC user, you're already used to drawing similar gestures with your stylus.

I am using the standard defaults that installed with ***StrokeIt***, which allow me to draw gestures by pressing down my right mouse button and drawing. But if you would be more comfortable using the left or middle buttons it's your choice. For example, right now if I were to press my right mouse button and drag a diagonal line from right to left, the current window I am working in will minimize. There are default configured gestures for programs such *Chat Programs, Explorer, FlashFXP, Internet Explorer, K-Meleon, Kazaa, LeapFTP, Media Player, mIRC, Mozilla, Nero Burning Rom, Netcaptor, Netscape 4.x, Outlook Express, Pegasus, Photoshop, Serv-U, The Bat!, Visual Studio, Winamp 2.x, Windows Desktop, WinRAR, and Winzip.*

StrokeIt also comes with 24 default gestures that work in most any program. For example:

- If you draw a "C" the current window or program you are in will close
- A stroke from down to up will perform the

(StrokeIt…….Continued on page 7)

(StrokeIt……..Continued from page 6)

"copy" command
- A stroke from up to down will "paste"
- A right angle from right to left then down will pop up the search window

I think you get the picture [or gesture]. Although these are built in you have the option to change the program in many ways. If you feel that you would rather have a different command associated with a predefined gesture, you can change that, or vice versa, you can change the gesture associated with a particular command, or you can just create and add a gesture created by you with a command that applies to a particular application that is not included with ***StrokeIt***. ***StrokeIt*** defines an application as a program or a group of related programs, that are configured for special use by ***StrokeIt***. The actions defined for each application will run when a configured gesture is performed in any window owned by that application. If for some reason you don't want gestures to be active in a particular application, then you can disable gestures in a particular application altogether.

There is a learning mode to teach ***StrokeIt*** to recognize new gestures, or better recognize existing gestures. Simply draw the gesture and ***StrokeIt*** will show you which gesture, if any, that motion is associated with. There are several websites devoted to ***StrokeIt*** with good instructions available for all of this so you don't have to be a programmer to know how to make changes.

This program could literally become your right hand [or left as the case may be]. Best of all **it is absolutely free!** Just cruise on over to http://www.tcbmi.com/strokeit/, read about it and then download it, **FREE**. The download will only take you a few seconds, even on a dial-up connection, because the file size is only 121 KB. This deal is really hard to beat. So the next time you're practically reclined in your computer chair and don't feel like sitting up in that correct posture just ***StrokeIt!*** ◆

(Novice……..Continued from page 5)

manent record. Now I am beginning to feel that the cost of the CD-RW discs plus these slower speeds may not be worth the effort. Also, I may end up owning five different brands of CD-RW discs in order to find one or two that will work well with my equipment.

Perhaps I might just as well make a CD-R disc and redo it as needed in its entirety and throw the previous ones in the trash as the new ones are made. Perhaps that will work just as well.

I may have one other option. That would be to install the Buslink external CD-RW Ultra High Speed drive to this laptop and use it for all my serious CD-RW work. The question I am struggling with is will this cause a conflict with my Roxio software for the factory installed CD-RW drive.

I suspect it should not since the Nero software for the Buslink external drive is designed to work only with that external drive (per instructions on the box). The Roxio software would continue to be used for the originally installed drive. If anyone has any other thoughts on that please let me hear from you. ◆

Looking Back to 1994

From the February 1994 Bits of Blue

Secretary's Report

MINUTES OF 1/12/94 MEETING and PERSONAL COMMENTS

By: Jim Clark

The meeting, our last general meeting in the IBM Lake Pointe facilities, began on time at 6 PM, with our President, Harvey Bruneau, presiding. There were fewer members present than normal, probably because most had not yet received the newsletter which serves as a reminder, and perhaps because this was the last meeting at the lovely Lake Pointe building. A simultaneous meeting of the OS/2 Users group undoubtedly also drew some of our members. Unfortunate for them because they missed some very good info and an excellent presentation.

USER GROUP NEWS

New Meeting Location In February: Harvey reminded all that this was the last meeting in the Lake Pointe building and that the February meeting would be held at the regular time at the Ybor City campus of Hillsborough Community College. A map is included on the back page of the current newsletter and will be in the next newsletter as well. Harvey also reported that while he does not yet have a computer for the group in his possession, he does have a promise of a donor computer. Arrangements have also been made to borrow from his employer Dun & Bradstreet a projector on a very temporary basis; that is, we cannot make such an imposition for very long and we must obtain our own projector in the not very distant future.

NonProf Status: Harvey reported that the Post Office has approved our application for nonprofit status. That means our newsletter mailing cost will drop again by about 30-40%. (There is no connection between this and our application to the IRS for nonprofit status which is still pending.)

Student Memberships: Harvey informed the membership of a BOD decision to create a new membership category Students & Staff (of the HCC only). Annual membership fee is $15. The good rapport established already in our relationship with the HCC has led to them making available space for use by our SIGs.

Meet Your BBS: All were advised that Kevan, our SYSOP, was holding another Meet Your BBS Nite on the third Wednesday of this month. If good participation continues at this excellent learning opportunity, it may well become a regularly scheduled event.

Word Perfect Presentation Rescheduled: Word Perfect has rescheduled their planned presentation at our February meeting to the April meeting. Harvey is working with Microsoft to come in for a presentation at the February meeting. CorelDraw is still scheduled for the March meeting.

INDUSTRY NEWS

100 MHz 486: Word in the industry is that these machines will be available this year. They will be only slightly slower than present Pentiums and will cost considerably less, like in the $2500 range.

MS Excel: For those looking for the 5.0 version of Excel, Microsoft has announced that it will ship next month.

Windows For Work Groups: Version 3.11 of this program will be widely available soon. Be aware that while OS/2 is compatible with Windows for Work Groups 3.1, it is not compatible with Windows For Work Groups 3.11.

PRESENTATION

CA Simply Money & Simply Tax Computer Associates (CA) graciously made available for our benefit one of their Product Consultants, Marty Steiner, to give us a rundown on two of their products, Simply Money and Simply Tax. Since very few of those present knew much about CA, Marty gave us a little info about the company. It was surprising for most of us to learn that CA is the second largest software company in the business and has been around from the start. In fact, many years ago they produced the second spreadsheet program to be marketed, Super Calc. They have been big in the mainframe area all this time and are now working to improve their recognition in the PC world; hence, the Simply Money and Simply Tax programs they have been making available for only a S & H charge. CA has software covering just about the full spectrum of computer applications: word processing, data base, spreadsheet, etc.; some 13 major applications in all. Marty then gave a brief review of Simply Money and Simply Tax.

(1994……..Continued on page 9)

(1994……..Continued from page 8)

Simply Money is a program for recording and monitoring personal and business finances, It is a great deal more than a check writing program and has features which tie together all sorts of accounts and investments into a comprehensive package. In addition to writing checks and maintaining checking accounts, Simply Money handles credit card accounts, cash and savings accounts, credit lines and loan accounts, mortgages, asset and liability accounts, budgeting, and a wide variety of investment accounts, including stocks and mutual and tax-free funds which can be tracked and updated via modem. Business applications include accrual and cash basis accounting, payroll accounting and business reports. All of the accounts in a financial database can be linked together so that a single transaction affecting more than one account will be reflected in all accounts involved. Reports and graphs can be created quickly and easily for any of the accounts simply by clicking and dragging. In fact, except for the entry of data via the keyboard, all operations in Simply Money can be handled simply and easily with clicks and drags.

As a user of Simply Money I can tell you that it is simple, flexible and easy to use, though I will admit that I have not even scratched the surface of its capabilities. Requirements to load and use Simply Money are: A 286 or better machine, with at least 2 Mb of Ram (4 recommended), mouse, 5 Mb of hard disk space, DOS 3.1 or later, and Windows 3.1 or later. At the present time, it is available only as a Windows program.

Simply Tax is a comprehensive personal and small business tax preparation program. It, too, appears to be very customizable, comprehensive and easy to use. It allows entry of data for the tax returns via interview, questions and answer, or direct entry, all of which appear easy, direct and straight forward. Included are some 90 forms, schedules and worksheets; it is very comprehensive. Its many features include: Use of data from Simply Money, Quicken, Lotus Dollars & Sense and Managing Money, and uses Tax Exchange Format (.TXF) which allows import of data from other accounting programs; automatic overflow statements to accommodate more entries than IRS forms provide; a quick tour to familiarize the user with the program; a tax forecasting capability; data validation; tax preparation checklist; cross reference help; comprehensive context sensitive online help; depreciation history and reference tables; automatic links to appropriate form & line; averages of itemized deductions with an audit alert to notify of entries which exceed substantially the averages; tax tips to help identify ways of reducing tax liabilities; and a "what if" capability, to name just a few.

Simply Tax will print out all of the return forms ready to file. We are told that when printed on a good laser printer the forms will appear identical to the IRS forms. Alternatively, it has the capability and includes instructions to file the tax return electronically.

Simply Tax is available for Windows or DOS. Requirements for the Windows version of Simply Tax are: A 336 or better machine with 2 Mb of RAM (4 Mb recommended), 5.5 Mb of hard disk space, Windows 3.1. A mouse is recommended. Requirements for the DOS version are: Any IBM compatible PC with 640 K of RAM (500K available), 3.5 Mb of hard disk space, and DOS 3.0 or later. Mouse is optional. Just about any Epson/IBM/HP compatible printer can be used with either version.

Simply money can be obtained by calling 1800FREE-MONEY. Cost is $6.95 to cover S & H. Simply Tax can be obtained by calling I8007FREE TAX. Cost is $9.95, again for S & H. If ordering both programs, call the Simply Tax number.

Marty and Computer Associates, we THANK YOU VERY MUCH for your visit, for familiarizing us with your company, for a great presentation of two of your programs, and for the copies of Simply Money you donated. You have a couple of great looking programs in Simply Money and Simply Tax. We hope you will favor us with presentations in the future on upgrades to these programs, as well as introduce us to your other programs.

AND THE WINNER IS

Thanks to the generosity of Computer Associates, who donated several copies of Simply Money, and collections obtained by Harvey and Marylee at Comdex, there were some very nice door prizes. Those among us to have the good fortune to win are:

Larry T. Brooks	Simply Money
Cheryl Petty	Simply Money
Doug Rapphun	Simply Money
Dan Whitman	Simply Money
M. N. Martenez	Carrying case
W. F. LaMartin	2 cups

Special Interest Groups

Microsoft Access SIG

This SIG meets the first Tuesday of the month at the **Kate Jackson Community Center at 821 S Rome Avenue** in South Tampa at 6:30 PM. For information contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merlenic@tampabay.rr.com.*

Genealogy SIG

To be included on the TPCUG genealogy mailing list, contact Jenny Lind Olin at 960-5723, or *jlolin@tampabay.rr.com.*

Visual Basic for Applications SIG

This SIG meets the **third Wednesday (this is a change)** of the month at the **Kate Jackson Community Center at 821 S Rome Avenue** in South Tampa at 6:30 PM. For information, contact William LaMartin at *lamartin@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Kevan Sheridan moderates the discussion.

(1994…….Continued from page 9)

In addition, 2 people won monitor borders and at least 9 people won psychedelic sunglasses.

The meeting adjourned at about 8:30 PM. ◆

(Minutes…….Continued from page 7)

their way across reams of previously good data.

- Save data files to a CD frequently.

When any of the above fails or you are having difficulty accessing data, then LC-Tech can be your safe haven and lead you to recovery. Viruses and power failures cause most memory failures that LC-Tech software can restore for most users nine out of ten times.

Dave stated that LC Tech prefers to walk customers through their products rather than let them struggle alone. Customers are sold more on working from a strong knowledge base rather than being brought around after they may have stumbled. He encouraged potential customers to call (727) 449-0891 and be guided through the demo to be found at http://www.lc-tech.com. All are encouraged to call and have the demo demonstrated. LC-Tech is an international company well positioned in Europe and the USA. LC-Tech has supplied significant recovery to many US Federal agencies. Once it took a week to restore one terabit of data for the US Navy, but most jobs are completed same day. The product is currently very stable and the current version was issued over two years ago. The first product was issued in 1996. LC-tech is a major recoverer of damaged physical drives as a depot of last resort as well as a

Meeting Preview: Gene Barlow will present his ideas on backing up your hard drive with PowerQuest software. We will also have the usual half-hour Windows SIG.

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

We haven't had a swap meet in years, so April's meeting should be interesting. Only bring hardware and software that works. You won't see my old scanner that I just replaced, since if it quit working for me, I doubt it would start working for you.

Bob Lafave in his article tells you what you can do with your photos once you have them on your hard drive. In my scanner article, I tell you how to get them on your hard drive. Next month we would like to see your article in the newsletter.

Our SIG meeting location is again in flux, so if you don't receive an email regarding location before the meeting, contact me. ◆

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

Minutes of the February Meeting

By Peggy Pulliam, Secretary,
Tampa PC Users Group
pegrance@yahoo.com

We had our usual Questions and Answers about Windows at the Windows SIG. We heard about methods to file taxes quickly and easily available with Turbo Tax. And Mike Hodges (TPCUG treasurer) has offered assistance if you want help with IBM repair.

Our featured presenter was Mr. Dave Whittle who represents several software companies and has taken it upon himself to show us some of the new and fun things available in the way of software. He has been acquainted with user groups since 1979 and has a way with presenting things to a group to keep everyone interested.

He was demonstrating on an IBM ThinkPad T-40 with 1.6 MHz Intel Centrino processor, a cool-running processor with wireless connectivity. It runs very fast because Intel has redesigned the cache and other things to increase the speed and prolong battery life easily to 5-7 hours. No Joke! And it really does run cooler. You won't need a thermal pad to actually use it on your lap. He also mentioned that you can get a presentation seminar kit from Intel for the group at http://www.intel.com/personal/pcug/.

For $20 a month any "hot spot" can be used to contact the web using your prescribed wireless service. As an example, there are hot spots at major bookstores in cities around the nation. He travels a lot and has found it completely trustworthy.

On his laptop he showed us **3D Album** -- Lots of different ways to present pictures and add music to your presentation, making sharing pictures a lot more fun. Just open the program, point to your photos, choose a presentation style from over 70 choices and click "build"!

lamartin@tampabay.rr.com

My HP ScanJet 5370 Cse scanner totally died toward the end of January, right when I needed it to scan in the material for the "Looking Back to 1994" article from the 10 year-old newsletter. However, I need a flatbed scanner for much more than that. I use it to scan photos and negatives (35 mm and much larger ones). I also use it to copy and fax documents. So a new one was in order.

Not another HP this time. I have owned three HP scanners. Unfortunately the 5370 had more than its share of problems in the three years I had it. Here is a bit of its history:

- For my original review of the scanner in January 2001, go to http://www.tpcug.org/newsletter/nl_2001/january2001/ScanJet5370%20Cse.htm.
- For my first problem with it as a USB device, go to http://www.tpcug.org/newsletter/nl_2003/january2003/usb_woes.htm.
- For the death of the 5370's negative scanning feature, go to http://www.tpcug.org/newsletter/nl_2003/february2003/more_woes.htm

Time to give Epson a chance. I know most people wouldn't consider paying over $100 for a flat bed scanner, but since I intend to use it to scan large negatives I need a scanner that would not only have the negative scanning ability but also would give quality results. The Epson Perfection 3200 Photo scanner fit the bill. I am quite happy with it when scanning both printed material and large negatives.

It will also scan 35 mm negatives and slides. In fact, I am scanning in color slides as I write this. I had planned on continuing to use my HP PhotoSmart photo scanner for that. But the HP PhotoSmart scanner started acting up by kicking the slide back at you. Then the HP scanning software started crashing--probably because of the hardware problem with the scanner. So it was time to totally switch to the new scanner for everything.

The Epson seems to give results just as good as the PhotoSmart scanner for slides when scanned at the same resolution of 1200 dpi that I usually use for slides. The PhotoSmart scanner only goes to 2400dpi, while the Epson goes to 3200. Now there is all this stuff about color depth, etc. that a dedicated slide and film scanner is supposed to beat a flatbed on, but the reviewer in the review I mentioned in the next paragraph seems to think that the new Epson can hold its own in this area.

I could write a long review of this scanner but could not begin to touch the review that is already available on the web at http://www.photo-i.co.uk/Reviews/interactive/Scanners/Epson_3200/page_1.htm. This review with many, many images is about the most complete such review I have ever seen. It is also very complimentary of this Epson scanner. So I will just spend a little time relating my impressions of the scanner and accompanying software.

The scanner has a resolution of 3200 x 6400, quite a jump from the HP 5370 with a 1200 x 1200 resolution. It can accommodate negatives from 35 mm to 4" x 5". It connects to your computer with a USB 2.0 connection (but will use USB 1.1 if that is all you have). It comes with Adobe Photoshop Elements 2.0, SilverFast negative scanning software from LaserSort Imaging, and Epson Scan scanning software.

Presto! OCR software is provided. Additionally, if you have either OmniPage or TextBridge OCR software installed, the scanner will use those OCR engines if you wish. The scanner is priced right at $400 at CompUSA, and when I bought it there was a mail-in rebate worth $100.

I installed the Epson Scan and the SilverFast software both as a Photoshop plug-in and a TWAIN plug-in. If I am scanning a photo or a document, I use the Epson Scan software. If I am scanning a negative or slide, I use the SilverFast software. You can use the Epson Scan software to scan negatives

PhotoMix Collage

By Bob LaFave, Tampa PC Users Group
boblala@ij.net

PhotoMix Collage from fCoder Group is a program that I like very much. You may visit the WebPages at http://www.photomix.com/ to see all the features that this program contains. The reason I liked it so much is the ease at which I was able to create the figures below. The figure on the left shows the default window that PhotoMix opens in and the toolbars that divided the work area. The larger center area is the work area that you can either work with a blank or choose from the included frames or layouts. If you look to the right of the work area you can see some of the layouts that are included. The frames and layouts can both be easily scrolled, and to pick your choice you just need to double click your choice. To use a frame you need to have a picture selected in the work area; you double click your choice and the picture is changed. The layout is chosen before you choose any pictures; you select a layout by double clicking the picture showing the template and the work area would then change to the layout template chosen. You then would fill in the template with the pictures of your choice. The bottom area is a viewer that allows you to choose pictures that you add to your image list; you must show the images you are working with in this area. You have a directory tree so you can easily go to your pictures to choose which ones you wish to use. If you have multiple pictures in a directory each is shown as a thumbnail, which makes selection easy and quick. The other figure just shows that you can increase the work area size by pushing little blue arrow buttons that retract or expand the other two areas as needed.

When you go to choose the pictures that you want to work with you get a choice of over thirty format types. The common types such as TIFF, BMP, JPEG and many more can be used along with Cursors; Animated Cursors and Icons can also be selected. When you look at the file-type drop down menu the first two choices are " All supported raster files" and "All supported vector files". The individual types are then in a long list if you wish to use a specific type. To create the figures above I started with a directory with JPEG's of my son. I selected a starting file, and while holding down the "Shift" key I was able to select multiple files quickly to then appear in the bottom viewing area. You also can add images from " Clipboard" to your image list. To place the picture into the work area is just "drop and drag". Further placement inside the work area or changing of the picture size is both quick and easy for anyone who has edited pictures in other programs. The picture has a halo showing that it is selected with spots that can be grabbed by the mouse for sizing, with the cursor changing to a "Resize", and the cursor will change to the " Move" crosshair that Windows uses. As you place pictures and need to move the pictures to exactly fit them to each other, you can use the normal Windows method of using the keyboard arrow keys for precise movement. You also have a "Action" menu to choose from that has picture align-

(PhotoMix…….Continued on page 5)

(PhotoMix……..Continued from page 4)

ment and rotation choices. For those using picture quality printing paper, this feature allows you to place multiple pictures exactly on a sheet for printing with a specific border for cutting each. The same would be used for printing the same picture multiple times on one sheet. You will save money by not wasting printing paper. For those who wish, there is also a "Layer" function in the tool area on the right where you have already chosen the "Frame" or "Layout". You can easily add pictures to overlap and keep, say, just faces as the predominate feature of the collage.

You may save the project in the same multiple formats that you can open. Combine multiple pictures into a more easily stored compression format such as JPEG's. You may also save in the program specific format to create collages, save your layout, and save your framing format that you have created. For those who wish, you may also save your creation to the desktop to be used as wallpaper. This feature is found from the "File" menu as "Set as Wallpaper". How easy can it get? There is also a feature to email your finished project with the click of a button. You are then given the choice of format and if you would like to have the file zipped for sending.

(PhotoMix.....Continued from page 5)

The program has large specific " Hint" descriptions as your mouse hovers above a button that I found pleasant. So many programs today see how small and cryptic they can be rather than how helpful. The "Help" files also seemed easy to follow. Each of the three areas--the project work area, the image list and the right hand layout, frame, layer area--has a convenient blue "?" button that takes you to the help files for that specific task.

The program installed easily without problems and leaves a little program group with Help, Start Program, Home Webpage, and Uninstall Information. There is an "Update" feature available from inside the program. Under the "Help" menu is a choice for "Update PhotoMix". To use the update feature you must have a registered copy; this is checked against the database that they have. The program can be downloaded as a trial with a file size of 12.2 MB, but to have a paid version the cost is $29.00, or you can have a CD sent to you for $44.00.

PhotoMix is well thought out to what features are included and very easy to use. I would think anyone who does photo processing could find many creative uses for PhotoMix. I am glad that fCoder offered this program for review to the Tampa PC Users Group and I got to experiment with my scanned photos. ◆

(Epson…….Continued from page 3)

and slides, but the SilverFast software is specialized for this and gives you more options, including scratch and dust removal options.

Here is how the scanning works for slides; negatives are done in a similar manner. First I put four slides in the slide holder on the scanner glass. It is very important to make sure you have the arrow of

(Epson…….continued on page 7)

ALL ARE WELCOME TO OUR HARDWARE SWAP MEET

At our April monthly meeting by popular demand we will be holding a PC hardware exchange meeting. On previous occasions it has appeared true that one man's trash is another man's treasure. This meeting will provide all of us a chance to clear out our living spaces and offices, dens, studies or get away lairs of all that superfluous or no longer used computer equipment. Yes, you can bring software and CD's to the meeting for exchange or disposal. The good news is, even if you do not find a buyer at the price you had in mind or even cannot give away the item for a miserly $1, you are not obliged to take it home again. So this will be a true opportunity to make a few dollars or at least unload items to liberate your living space for other new treasures at home. Our esteemed member Brian Lance has the kind permission of his company, Computer Corner, to remove any and all unclaimed items at the close of the meeting so we do not need to cart the unsold items home again at the end of the meeting, unless you want to that is.

So what are the rules? None really. Just bring your stuff to the meeting. Place a price tag on the item at any price of your choosing. Sell the item to anyone who shows--does not have to be a member necessarily--at whatever price anyone is willing to pay and pocket the money. If you wish to voluntarily donate 10% of your take to the TPCUG, the treasurer will welcome your money, no questions asked. If you do not want even to donate $1 for each sale, still no questions asked. We just want you to come and enjoy yet another one of our interesting evenings. I, for one, will be looking forward to unloading a dot matrix printer, two HP inkjets, an unopened A/B switch box, and some unused software and a host of other items, but not my Apple II. I will keep that as a memento of times past for a few more years. So mark Wednesday, 14 April, at 6.30 PM to 8.30 PM on your calendar as "Computer Clearance Day". See you at our normal meeting place, the Pepin Hospitality Room.

Mike Hodges, Treasurer, Tampa PC Users Group
mphs@aol.com

(Epson……..Continued from page 6)
the slide holder pointing to the upper right-hand corner of the scanner or you will waste an hour as I did one evening trying to figure out why your scans are mainly bright light. Apparently the scanner needs markings on the slide holder to tell it what it is scanning. If it can't find those markings, things come out very bad. I tried all sorts of setting changes to try and make things work before I noticed that I had the holder upside down. Once oriented correctly things worked beautifully as they had a few days earlier.

Next I open Adobe Photoshop Essentials 2.0, click on File | Import and select the SilverFast plug-in. When SilverFast opens, I first do a prescan. That shows me thumbnails of my four slides. If I have scanned in slides before, I have four frames outlining the thumbnails. I click on the first thumbnail to enlarge it, readjust the frame to exactly position the image, auto adjust the exposure and then scan. This returns the scanned slide to Photoshop where I rotate it if necessary, make minor exposure corrections and save the file to my hard drive. It takes about eight minutes to scan four slides using this procedure. The result is an approximate1550 x 1050 pixel, 4.6 MB file good for printing something like an 8 x 10 photo of good quality.

If you push the one button on the front of the scanner you are presented with the Epson Smart Panel from which you can do all sorts of quick scanning. The options include:

- Scanning to file
- Scanning to OCR
- Scanning to Application
- Scanning to Email
- Copy

And others.

It is a very nice scanner, and I highly recommend it. ◆

(Minutes……..Continued from page 2)
Next we saw **Muvee Auto Producer** 3 which has some new technologies. You add still pictures and music to match the mood of the pictures, and the program analyzes and automatically adds them, edits out the junk, puts it together and makes a really nice movie presentation. Use your super 8 movies on CDs; if you have really bad footage that just won't go together, you can use a "still" style so the poor footage is still good for viewing if you use Muvee Auto Produce 3.

Photo Vista Panorama 3.0 -- Lets you take pictures and stitch them together to make a 3D panorama picture of your snapshots stitched together.

Portable Document Format **Active PDF Symphony** is a much less expensive replacement for Adobe's full-version Acrobat. There are two different parts to this, a **Composer** to create the PDF document and the **Maestro** that lets you edit it.

Check these out on the web for more information, but if you want to buy them be sure to go through the club because Dave offers us a discount.

It was another good evening of presentations of software nearly everyone can use. We had a door prize, too: MS Money, which Jeanne Gillespie won. ◆

A beach resort scene scanned with the Epson scanner from a small photo taken in the New York City area in the 1920's. Does any know if it is Coney Islands?

Looking Back to 1994

From the March 1994 Bits of Blue

Secretary's Report
MINUTES OF 2/9/94 MEETING
and PERSONAL COMMENTS

By: Jim Clark

This was our first meeting in our new quarters at the Ybor City campus of the HCC. And the facilities are excellent. We have a large circular coliseum-type of room which can be divided fairly easily into two rooms using a built-in partition. The half we used for this meeting will comfortably accommodate over 100 people, with at least 85 seated at tables facing the 'well' in the center of the room; in excess of that number would be seated in comfortable folding chairs. The other half of the room is set up to accommodate almost 200 people, all of whom would occupy comfortable folding chairs. All in all, I think the facilities are excellent for our purposes. HCC made available an overhead projector for our use, but a computer and color panel were and are our responsibility; all three are needed for presentations. Our group has not yet been able to acquire either of the missing pieces of hardware, but Harvey saved our bacon this time by borrowing a color panel from his workplace and making a laptop computer available for the meeting. This is not an arrangement that is available for very long, and our group simply must come up with our own equipment.

I found the campus very easy to find and to get to. Parking is ample but is located in three different lots. None of us being very familiar with the layout, some had difficulty locating parking. As we use these new facilities and become more familiar with them, I am confident that we will like our new location as much as or more than the super IBM facilities we had been using. Come on out and see for yourself-- you will enjoy yourself, and you are sure to learn something new.

WordPerfect Corporation, which had been scheduled for a presentation at this meeting, has been rescheduled to later in the year. Tom Cone, our Treasurer, graciously filled in the opening that was left by WP with a rundown on a program he uses daily in his law office -- Desqview --and he did a great job, with good interchange with other members. Presentations by one of our own are particularly enjoyable for me because I think we get more of a user prospective, and there is usually much more interchange between presenter and audience. In addition, there was considerable time available after the presentation for freewheeling interchange among those present on any random computer problem/subject suitable for group discussion -- and that is what happened. In my opinion, that is what this group is all about -- the exchange of knowledge among ourselves, supplemented with knowledge from vendors and other sources.

USER GROUP NEWS

Ybor Campus Parking: There is a fairly large lot for open parking across the street (Palm Ave) on the north side of the complex, with some of the spots reserved for staff. There is another fairly large lot for open parking across the street on the south side of the complex, and there is a staff parking lot in the northeast quarter of the complex. Harvey will confirm what parking is available for our use; look for more info on this subject elsewhere in this newsletter.

Non-Profit Status : The Post Office computer has carried our group in non-profit status for the last two months, saving us about 50% ($17) off our bulk mailing rate. However, we had not received official notification of award of that status. You guessed it-- earlier this month the PO informed us that we owed them some $$ for the last 2 month's mailings and that they would not award non-profit status until the IRS also approved same for us. So, we are back to bulk mail rates (which is not all that bad - about $37/mo, versus about $20/mo) until the IRS grants non-profit status.

PRESENTATION — Scheduled:
WordPerfect has rescheduled their planned presentation until later this year; plans for the near future are as follows:

CorelDraw — March
Adobe Systems — April
Microsoft — May
Visio by Shapeware — June

INDUSTRY NEWS

Word Perfect Rumor: - WordPerfect Corporation is undergoing a reduction in force at the present time, as many corporations have and will continue to do to stay competitive. A rumor has been circulating, probably associated with the RIF, that WP has produced its last upgrades of both the DOS and Windows versions of its WP word processors. WP Corp has denied that and other articles

(1994……..Continued on page 9)

(1994……..Continued from page 8)
report that new upgrades will be out for both versions of WP in the next few months. A major change that has occurred, however, is that free tech support has been reduced to 180 days free tech support, beginning with the first call for help. Various "for fee" tech support options will be available after that.

MS Access: For those looking for the next upgrade to MS Access, Microsoft has announced that it will be available in April.

Windows For WorkGroups : Version 3.11 of this program is on the market now. Be aware that while OS/2 is compatible with Windows for WorkGroups 3.1, it is not compatible with Windows For WorkGroups 3.11. Also be prepared for MS plans to drop their Windows program as a separate entity and to make Windows for WorkGroups its sole Windows package. As a Windows user, that causes me no great concern, EXCEPT what does that do to my cost? And, surely provisions will be made to avoid loading unwanted portions of the package to minimize use of disk space, but will they? No answers to these and other related questions, yet!

PRESENTATION — Desqview

Tom Cone uses this program daily in his office. He chose that program as an alternative to Windows or other multitasking options. Tom reported that he was looking for a program to speed up his computer work by allowing multitasking to avoid the lost time that otherwise occurs when switching from program to program. Many of us would immediately think of Windows or OS/2. But Tom didn't want the speed cost of these programs. So, he looked around and settled on Desqview, which, by the way, is what your BBS uses operating in a window of Desqview -- that allows the BBS to function normally while our SYSOPs accesses and performs software maintenance on the computer.

Tom very ably demonstrated the features of the program, including creating, using, sizing and switching between windows, all of which is accomplished easily with mouse clicks or short-cut keys. The number of windows that can be opened was not known, but Tom had 5 or 6 open and working at one time, which would be more than adequate for most users. When using a 386 or better machine, all open windows are active and can be working in the background; the more memory, the more windows can be open, active and working. For 386 or better machines, Desqview comes bundled with Quarterdeck's QEMM program. A memory manager, QEMM makes the most of the memory available on the machine, and Desqview does an excellent job of allocating that memory to use it to best advantage for the programs the user starts. Yes, you can tweak memory use for particular programs to insure that a minimum amount is available. In fact, the user can do considerable tweaking to customize Desqview to suit particular druthers. Desqview also includes a program called Manifest, which provides detail to the screen (or printer) about your computer and its setup; it is much like similar computer information programs in Norton Utilities and Windows, among others.

Desqview will even run Windows in one of its own windows (if for some reason one would want to), but only in standard mode. You can also open Desqview windows back to DOS while applications are running in other windows. In some respects, Desqview is similar to Windows (but with DOS speed). Tom reports that programs do crash on occasion in Desqview. As in Windows 3.1, sometimes one can just shut down and restart the offending program. Other times, it may be necessary to restart Desqview. And, some occasions may require rebooting the computer -- just as in Windows.

Desqview will run on a 286 machine, and one can have several windows open, the number depending on available memory, but one cannot multitask on a 286; only the active window can be working. With 386SX or better machines, the number of windows open and working is tied directly to memory requirements of the programs loaded and the total memory available on the machine. Desqview uses expanded memory (EMS), but simulates EMS from extended memory (XMS) on those machines which don't have EMS. Tom reports that he sees no signs of any degradation in speed from using EMS and its paging -- it is fast!! Desqview also uses virtual memory (swapping to disk) when RAM has been exhausted, but there is a speed penalty when that occurs -- as is the case in Windows.

Tom did not have current pricing info, but when he bought his Desqview/QEMM package about a year ago, the street price was about $140. Tom made it a point to make us aware that in his view Desqview is not truly a Windows competitor, for it doesn't have the graphical interface powers of Windows. But, for those who want to multitask with the speed of DOS -- which Windows doesn't have -- Desqview is certainly a super alternative. Tom,

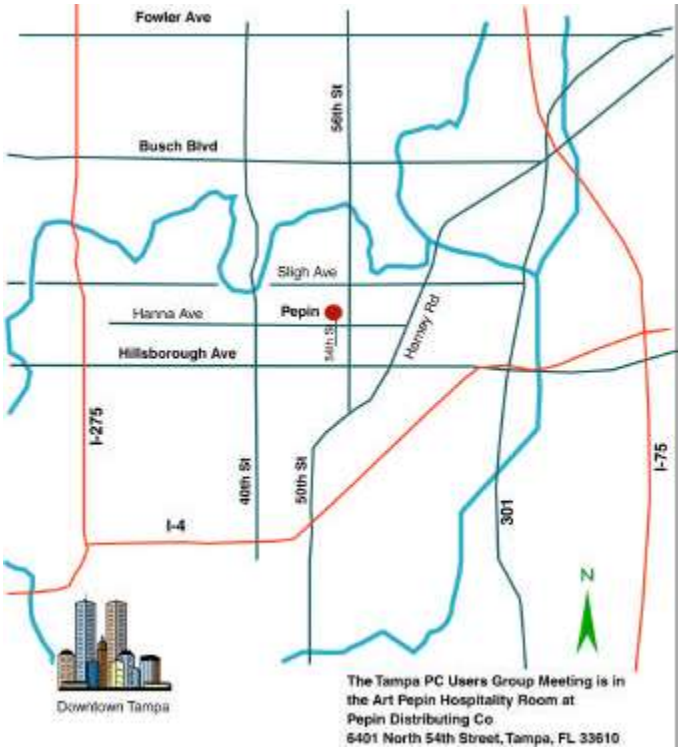
thank you for a great presentation. It was both informative and enjoyable.



AND THE WINNER IS

Thanks to the generosity of IBM, which donated a copy of OS/2 for Windows, Computer Associates, which donated a copy of Simply Money, Brainchild Computer, which donated a copy of MS Windows Entertainment Pak, and collections obtained by Harvey and Marylee at Comdex, there were some very nice door prizes. Those among us to have the good fortune to win are:

M. N. Marteny—T-shirt, Mouse Pad & MS Entertainment Pak

D. A. Clary	Adobe Type Manager
G. Jurado	Adobe Type Manager
Renate Marsh	Simply Money
Bill LaForest	OS/2 for Windows

The meeting adjourned at about 9:00 PM. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

We have a full newsletter thanks to the members who have provided articles. I even had to reduce the font size a bit on some articles to make everything fit.

While I was away for a week (and checking my email while traveling), I received 639 email messages of which only 66 were not spam. So essentially 10% of my email is something I want to see. I am sure you are having much the same experience. I used to get even more spam. Additionally, it seems that I am receiving a smaller number of legitimate messages. I suppose it is another case of the bad driving out the good. People are simply getting tired of wading through all the junk and are not sending as many messages as in the past. ◆

May Meeting Topic: Intel, Hyper threading and the Pentium 4, presented by Kevan Sheridan

* * OFFICERS * *

President: Kevan Sheridan (president@tpcug.org) 988-6480
Vice President : John Witmer (JWITMER@Pepindist.com) 963-3760
Treasurer: Mike Hodges (mphs@aol.com) 962-2114
Secretary: Peggy Pulliam (pegrance@yahoo.com) 253-0438
Member at Large: Mary Sheridan (mcpease@mindspring.com) 988-6480

APPOINTED (Volunteers)

Editor: William LaMartin (lamartin@tampabay.rr.com) 251-3817
Librarian: Larry Anders (Larry@AndersNet.com) 989-9119
Programs: Mary Sheridan (mcpease@mindspring.com) 988-6480
Membership: Mike Hodges (mphs@aol.com) 962-2114

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members. Our mailing address is P. O. Box 3492, Tampa, FL 33601-3492.

However, for business concerning this newsletter, Bits of Blue, please contact the Editor, William LaMartin, at 821 S. Boulevard, Tampa, FL 33606-2904; 813-251-3817; lamartin@tampabay.rr.com.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII, Microsoft Write, Microsoft Word, or Word Perfect file to the editor at 821 South Blvd., Tampa, Florida 33606-2904 or to lamartin@tampabay.rr.com.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

The use of trademarked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

Minutes of the March Meeting

By Peggy Pulliam, Secretary,
Tampa PC Users Group
pegrance@yahoo.com

We had our usual Windows Special Interest Group meeting with questions and answers about using Windows and the ins and outs of that.

Our featured speaker was Gene Barlow with User Group Relations. One of the companies he represents was PowerQuest, which has just been purchased by Symantec. It is possible that they may discontinue the user group programs.

The presentation showed that research had been done by White Canyon software, which found that much of the supposedly deleted information on computers that people had donated or given away, thinking they'd cleaned them of private information, still had retrievable private information on the hard drive.

Their product, Wipe Drive, writes over the entire hard drive, leaving nothing to be read at all. Gone.

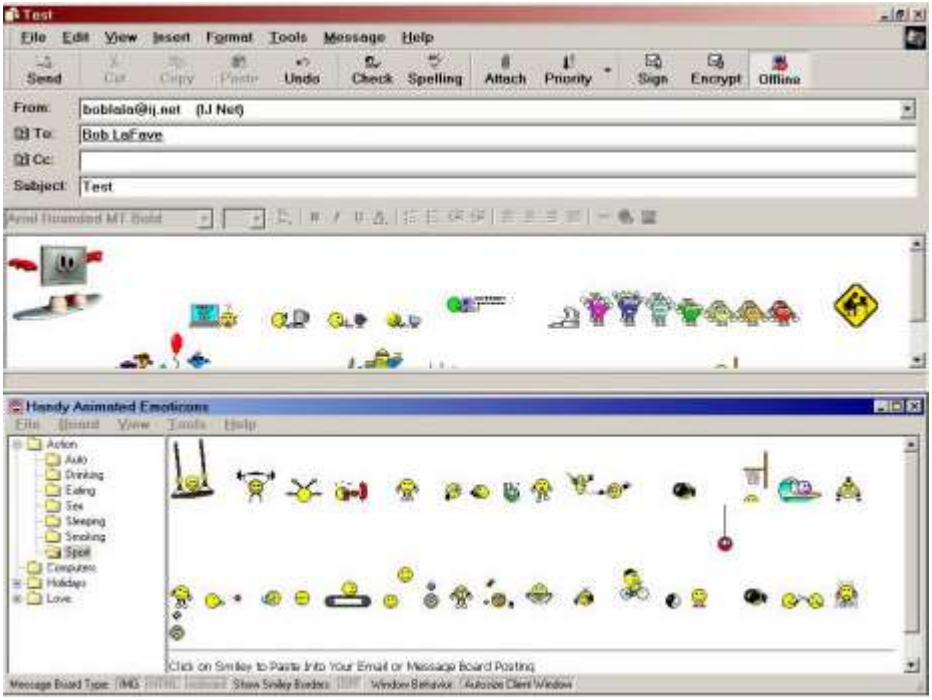
Secure Clean is a another product that selectively erases data. It leaves the Operating System and/or other programs you designate by choice to keep on the hard drive. You can scan for mistakenly deleted files; it shows you how many it has found and it will even go over email messages. This allows you to restore something before wiping it clean; you can find something you thought was lost.

Hard drives fail, so back up the system AND the data. Using an external hard drive is best for this. With a laptop you have to backup to an external drive. With a personal computer you can use Partition Magic to create extra drives to use for back-ups. Gene showed us several clever ways to back up networked computers too. The products are available at User Group special prices now, but we don't know for how long.

Gene offered Secure Clean for the door prize which Brian Lance WON! ◆

Handy Animated Emoticons

By Bob LaFave, Tampa PC Users Group
boblala@ij.net



Emoticons can be described as a series of keyed characters used especially in e-mail to indicate an emotion, such as pleasure :-) or sadness :-(. They have evolved into little graphics to indicate emotions and tasks in a shorthanded writing. As you can see from the program Window below from "Handy Animated Emoticons", they have become quite diverse and colorful. This program from ScoSoft is easy to use and does save you time when wanting to include emoticons in your email writings. You can visit http://www.scosoft.com/handy-animated-emoticons.htm to get a complete description. The program itself is available as a download for $19.95 online.

You can also place these figures into text documents, such as an MS Word document. All that is needed is for you to have open both a document and "Handy Animated Emoticons" and to pick an insertion point and click your choice with your mouse, and the emoticon will be automatically placed. Although the emoticons can be placed in MS Word and other text editors, they will not show as animated, only stationary graphics.

The picture shows how the program will automatically open in a split screen with a choice of view of "Auto Size Client Window" with your working application such as MS Word or MS OutLook Express on the top portion and "Handy Animated Emoticons" on the bottom. This allows you to view where and how the emoticons are placed when composing. In the text document, you place your cursor at the insert point and then go to the bottom program screen and "Click" your choice. This point and click is all you need to do. You can also pick to view the Windows Behavior as "Float" or "Float, Float Always on Top". I personally like to use just "Float" so that I have a larger screen of the program I am using to compose the text message.

You should look at the website for what programs are compatible for use to see if you can use the emoticons as a point and insert or possibly as a paste into other formats. You have to remember that this is animated, and these figures perform different movements when you place them into emails or when you read them in an email application reader. The program comes with almost 500 emoticons, and you can also add emoticons to the viewer directory. These emoticons are animated gif's in format and you can put these graphics into the interface to easily place them into messages.

This program is for fun only and is not for all. If you want to liven up your e-mails and be a little creative, then you will enjoy it. Anyone who knows me is used to me using animated gif's in my Outlook Express emails and now can expect a few of these emoticons, also. ◆

WebLog Expert

By William LaMartin, Editor
Tampa PC Users Group
lamartin@tampabay.rr.com

If you manage web sites, then in most cases you wish to know the most visited pages at a site and a bit about the visitors to the site: what pages they visit, their paths through the site, and where they come from. The web server's log of your site provides this sort of information--once the data has been analyzed. And that is where a web log analyzer program such as WebLog Expert comes in.

A number of years back I purchased a program called Virtual WebTrends, a lite version of WebTrends. Since it didn't give me as much data as I liked, I created an Access database full of queries and reports that provided a much better analysis of the web log data, but it didn't have all the pretty graphs of Virtual WebTrends.

With WebLog Expert I now get all those pretty graphs but also much fuller reporting, equivalent to the full featured WebTrends version (which was very expensive). If you go to their web site at http://www.weblogexpert.com, you may try out the program for free, with the cost being $75 if you decide to keep the program, or you may simply download a lite version to use for free. The free lite version may be quite sufficient for analyzing your simple web site.

What sort of information does a web log analyzer provide? First, let's look at a typical entry in a log. An entry for the log at the sites I maintain consists of 18 data fields. The more important of these are date, time, the file (page) requested, the visitor's IP address, and the User-Agent, which contains information about the browser and operating system of the visitor.

I have placed the analysis generated by WebLog Expert for the month of March for the TPCUG.ORG site at http://www.tpcug.org/stats200403. Go have a look. The raw log file was a 6.5 MB text file. The log file for my personal site, lamartin.com, for the month of March is almost three times that size. And I assume that for a major site, the log file for only one day could easily be 20 or 30 MB. The job of the web log analyzer is to make sense of all this data.

If you look at the TPCUG analysis, you will see that

- It had 8,177 total visitors for the month
- It had an average of 255 visitors each day
- The average visitor viewed 1.8 pages
- The activity was close to the same for each hour of the day
- The most accessed page was an article on Email Strippers by Jenny Lind Olin (I wonder if these people were really looking for that type of stripper)
- 76% of visitors were from the United States
- Netscape was listed as the browser being used by 51% of visitors. I know this is an error and will discuss it below.
- Something called Xenu's Link Sleuth was the most active spider closely followed by Inkotomi Slurp and the Googlebot

As I mentioned, I do not believe that 51% of the visitors to the site use Netscape Navigator. And a look at the web log with my Access database analyzer found the phrase "netscape" in the cs(user-agent) field of only 217 of the log's records. It found "MSIE" in 13,263 such records. I don't know what phrase WebLog Expert uses to determine the Netscape browser and the Microsoft browser, but I think whatever they use is wrong.

One feature you get with the Expert version is the ability to tell the country of origin of visitors. This is done using a fairly sizable database of IP addresses and the associated countries. A very surprising statistic at my personal site, lamartin.com, was the large number of visitors from China--almost 10% of my visitors. A bit more investigation showed that they were going to only one page--http://www.lamartin.com/asp/ip.asp, the page that will tell you your computer's IP address. That was

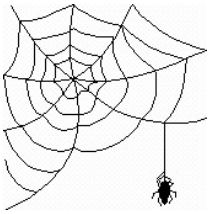
Internet Picture of the Month



Houmas House
At dusk

From the site http://www.houmashouse.com. Houmas House is one of the larger remaining plantation homes up river from New Orleans. It is open to the public and has a new owner who has populated it with period pieces from his antique collection. At one time it was the seat of a 20,000 acre sugar plantation. A few miles further up the River Road, one can take a right turn and return to today in the form of a giant oil refinery.

(WebLog…….Continued from page 4)
quite a surprise to me.

I like the program and find it quite useful in determining what is happening at the sites I manage. It has more nice features that I unfortunately don't have room to mention. I find the analysis of my personal site more interesting than that of the TPCUG, since the material at my personal site is much more varied than that at our user group site. What people are interested in is always surprising. ◆

Confession Of A Wanna-Be Geek

By Mike Hutchison, Tampa PC Users Group
myankee@ij.net

Confession may be good for the soul; this one does the ego of this wanna-be geek boy none. I tried to open a .pif which was attached to an email which I recieved on March 2nd. There were some minor extenuating circumstances, but we shall not dwell on them now. A .pif file is, as even I knew prior to this misadventure, a Program Information File. They hail from the Windows 3.1 days. They were used to store settings and options which told Windows how to operate the DOS program that a specific PIF was associated with. Nowadays, in XP time, the PIF has faded from the spotlight.

There is, however, one use for them that has been demonstrated recently. Namely, as a vehicle for the Netsky worm. There are at least 4 varieties of this worm. According to the Norton Support site, the other types are descendents of the W32.Netsky.C@mm. I managed to get D flavor. When I tried to open the PIF, my computer began trying to send email messages. Lots of email messages. Norton was scanning as many as 15 at one point. I had to do a Ctrl-Alt-Del to get out of Outlook Express. The W32.Netsky.D@mm is a recent variation to arrive on the scene (again, according to the Norton site it was discovered on March 1st). I had just updated my virus definitions two days previous to the day my problem occurred; in other words, the day before Norton discovered the thing. Nevertheless, this was acting like a virus, so I ran a full system scan of the affected computer. It came up clean.

I deleted the email and attachment and got Outlook Express calmed down. Thought that perhaps I had lucked out. When I ran Outlook Express the next morning, it was soon clear that I had not lucked out. Soon I had Norton scanning 30 outgoing messages. This was before I had even received my messages, let alone sent any. I have well below 30 contacts in the address book. Anyhow, next I called up tech support at my ISP to see if they were hearing anything about PIFs. They were and had been deleting them at a rapid pace. Next I described the situation to William LaMartin. Sounds like a virus, said he, and I had best get myself hither to the Norton Live Update site, which I did. The Virus Definitions part of the update was small, but Netsky must have been in there. When I did another full system scan of the computer after the Live update download, it found 41 files infected with W32.Netsky.D@mm.

These files were all PIFs but were created by the worm after the payload trigger. Then I went back to the Norton Support site and downloaded a Netsky removal tool. The Norton instructions said, among other things, to run the removal tool twice after disabling the System Restore check box which is found in the System Restore tab when you right click My Computer and then click Properties. Norton says in the instructions for running the removal tool **do not** skip this step. They then recommend running Live Update for latest definitions. The removal tool can be downloaded at http://securityresponse.symantec.com/avcenter/venc/data/w32.netsky.u@mm.html
.

Some background information on the Netsky D worm (once again courtesy of Norton Support): It is a mass mailing worm that scans drives C through Z on the computer, and it then uses its own SMTP engine to email itself to the email addresses that it finds. The size of the attachment is 17,424 bytes. Systems which are affected by the worm: Win 2000, Win 95, Win 98, Win ME, and Windows XP. Systems not affected by the worm: Linux, Mac, Unix and Win 3.x. One of the messages in the body of the email which brings this worm to your machine that is listed by Norton matched the one I got. To Wit: See the attached file for details. I have a customer who has people whom I have no prior knowledge of sending me email with ads for a publication attached to the email. I have no other excuse. I won't even try to claim that I thought it was a .pdf instead of a .pif. Like they say; **Just don't do it. If you don't know who it is-delete it.**

Addendum: March 9th, 2004- I was still having trouble sending email normally, so I went back into Outlook Express under Tools – Options, then clicked the Connections tab and removed the check mark from the Hang Up after Sending and Receiving check box. I think I had this checked while I was trying to get Outlook Express to stop sending all the spurious messages. Then sort of as a whim, I ran a full system scan of the machine with Norton AntiVirus. It showed 39 files infected with Netsky. Back to Norton Live Update for the latest virus definitions. This time I had Norton AntiVirus quarantine and then delete all infected files. Then back to Symantec support site for some reading about the Netsky K variation and a download of the latest Netsky Removal tool. This was Version 1.0.4 as of the morning of the 9th. It was Version 1.0.3 the first go-around. I then ran the removal tool twice with System Restore disabled as before. So far all seems right in my email world. A full system scan reports no infected files.

(Geek……Continued on page 12)

FACUG Spring Meeting

By Don Patzsch, Tampa PC Users Group
patzsch@helios.acomp.usf.edu

At Kissimmee, Florida March 5, 6, and 7, 2004, over 150 people attended the Spring Regional Conference of the Florida Association of Computer User Groups. This represents 35 groups from around Florida, some Mac, some PC and Linux occasionally, also.

On Friday night, we register for the Conference and each person is issued a cloth bag of goodies and vendors' brochures. Refreshments were available (free, of course), and we break into small groups to get together with the "regulars" from all over the State, whom we've met at previous meetings.

Every city has an interesting story to tell. Kissimmee, Florida is no exception. In 1881 Hamilton Disston signed a 1 million dollar IOU to the State of Florida. He bought four million acres at 25 cents an acre, and he immediately sold two million acres to Dutch capitalists to get the money to pay for all four million acres! There is more to the story, but let's get back to the FACUG and its president, Larry Tyler, who sets up the Kissimmee Civic Center space and also a motel agreement so we may stay in Kissimmee at a special rate. Larry and his helpers do a great job each year.

On Saturday morning, Smart Computing sponsored the breakfast. Marcie described the various magazines they produce and told us how to access all the articles in all the magazines online and for free. Smart Computing and its sister magazines are written in simple English so that even a novice may read them easily. PC Today, CE, and CPU are some of the magazines they produce. All have their articles on the website and all are available to you as a subscriber to Smart Computing. (The one I take.)

After every meal, there is a choice of three sessions to attend. Dave Dockery talked about why user groups need websites. He described the costs, and others told of their experiences and costs. Dave then went on to describe how they use a simple program to send out the news to any and all of their 1,400 members. Many ISPs limit your sending email to 100 members. He is at http://www.tampa-bay.org/. You will find useful info and newsletters there.

The second session we chose was the APCUG workshop, by Peggy Ireland and Steve Morgan. Florida has the most user groups. California is second. Some groups did not know you do not have to be a member of FACUG in order for your group to join the APCUG. APCUG will host your website, and makes up a listserv. Your user group may make up a member list so that you may send to one location and have the email go to all your members. We attend these sessions so we may stay abreast of what the folks at APCUG are thinking and doing this year. Go to webboard.apcug.org.

After the second session is lunch. Intel sponsored this lunch. Dave Whittle was the spokesman. Dave told us about the Centrino chips for laptops and how the Pentium 4 lets Windows see two processors at once. There is a seminar available on CD re: Centrino, Pentium 4, and Digital Home. Try http://www.intel.com/go/pcug. Dave will provide articles for newsletters.

The next session was on new developments in digital photography. This is the type of session that makes us all excited and interested in coming to these conferences. Rod Scher gave us a real insight into how to set your camera for depth of focus and the time of the lens opening. He presented some neat tables to illustrate his talk. He discussed the optical vs. digital zoom.

The next session we took in was Smart Computing. Marcie described the advantages the company provides for user groups: free magazines, permission to print articles in newsletters, and some information that duplicated her talk at the breakfast event.

Next, the vendors were asked to sit as a group and let the audience ask questions. Later each vendor was given a table and anyone could visit with them or buy their products.

Dinner was sponsored by Microsoft. Alan Chitlik did photos inside email, and he stitched some photos together.

Sunday breakfast was sponsored by Jasc. The program Paint Shop Pro v 8 was shown and demonstrated ably. This whole conference was dominated by photography.

Our first session was given by Alan, and he described the Microsoft music format, and copying CD music and labels. He told us that digital video requires about 198 megs per minute. His topic was, "What Alan wants to show you." Good presentation and some duplication of his other talks.

Our last session was Communicating by Dave Gerber of the Sarasota PC group. He gave us a handout and described how they get around the limit of 100 email messages. One of their people, Forrest, wrote a program so

Looking Back to 1994

From the March 1994 Bits of Blue

Secretary's Report

MINUTES OF 3/9/94 MEETING
and PERSONAL COMMENTS

By: Jim Clark

This was our second meeting in our new quarters at the Ybor City campus of the HCC. Things went more smoothly this time, and it was a very good meeting. Actually, it was an excellent meeting, with a "Biggie" vendor presentation -- CorelDraw 4.0. Our facilities are quite flexible now, and we have the space to set up for different size crowds. Hence, CorelDraw was not a "standing room only" session as they had been in our IBM facilities. For those who haven't been out to the Ybor City site, you should certainly do so. The location is easy to find and very accessible from the interstate.

Your Board of Directors has not yet found a solution to our pressing need for a 486 computer and a color panel for our meetings, but we have managed very well so far -- borrowing at the first meeting here, and Corel had their own equipment, as do most of the larger vendors. But we can't rely on that -- Anyone have a spare 486/33 and/or color panel they don't need and can donate to the group?

USER GROUP NEWS

Special Interest Groups (SIGs): John Lucas is organizing an OS/2 SIG. It should get started in the very near future. Meetings will be held at the IBM building from which we just moved. Look for more info on the BBS and in newsletters.

Phillip Ficarota has volunteered to organize a CorelDraw SIG if there is sufficient interest. Decisions about time and place have not yet been made. If you are interested in participating in this SIG, please get word to one of the User Group officers or Phil -- via the BBS or any other way, but the sooner the better.

INDUSTRY NEWS

Microsoft/Stacker Conflict: - The courts have rendered a decision in the disagreement between these software leaders. Stacker has been awarded some $120 or so million from MS, while MS has been awarded about $12 million as result of their countersuit. And, MS is restrained from using the technology that the suit was all about. Hence, MS will soon be coming out with MS-DOS 6.21, which will have a version of DoubleSpace that is minus the "borrowed" technology, and presumably it is now illegal to use the DoubleSpace version in MS-DOS 6.2.

Stacker/MS Windows for WorkGroups Incompatibility: Stacker 4.0 is not compatible with the recently released MS Windows for WorkGroups 3.11. Stacker is working on a fix which you might expect in the not-too-distant future. Meanwhile, be aware.

DX4s Coming Soon: Word is that the new 486DX45 (75 and 100 MHz 486s) will be coming out in the near future. As we have previously reported, they are only minimally slower than the Pentiums and are a good bit cheaper in price. If nothing else, they will likely produce continuing downward pressure on prices. Then, too, how fast is fast?

Superbase Becoming History: SPC, Inc. has announced that they are dropping their Superbase database program from their product line. I personally hate to see that happen because Superbase is a super database program; the competition and pricing are apparently overpowering it.

Dell Shows Big $$ Loss: Dell Computers recent financial statement shows a loss of $40 million on sales of $2.9 billion. We report this not to imply that Dell is in financial trouble. Rather, we can all expect some changes to be made at Dell, for they won't long stand for those kinds of losses. Pricing action is forcing all to cut their costs and/or improve productivity and efficiency.

(1994……Continued on page 9)

(1994……..Continued from page 8)

PRESENTATION -- CorelDraw 4.0 The Corel Corporation was good enough to allow their Product Specialist, Antonio Sanchez, to visit with us and give a presentation of their newest release of CorelDraw, Ver. 4.0. As has been reported before in this space, CorelDraw is a very powerful program, and one could not hope to demonstrate more than a small portion of its capabilities in the time available at our meetings. So, Antonio elected to highlight the differences between versions 3.0 and 4.0 -- and those that we saw are significant. Actually there have been many changes. Here are just a few:

Powerline : A capability has been added to take any line (s) you might want to draw and convert that line (s) into a wide variety (like hundreds) of designs, including ribbon, trumpet, wedge, teardrop and woodcut shapes.

- Creative Bitmap Editing: Allows creating startling combinations of graphic images with special effects and animation.
- Scanning Support: Advanced direct scanning has been added, including a powerful OCR.
- New Fills & Graphics: With added fills, CorelDraw now includes over 1.2 million. The clipart library has also been increased from 14,000 to 18,000.
- Welding of text and graphics is now provided and eliminates a problem that existed with earlier versions when text and graphics overlaid.
- Animation capability has been greatly enhanced and can produce really impressive results.
- Blending capability has also been enhanced and gives the power to blend literally any object to any other with user-defined sequencing.
- Powerful animation of graphics in MOVE has been further enhanced, and includes 125 Corel MOVE animations and 420 cartoons.
- The word processor has also been enhanced.
- Now supports 99 levels of undo.

News to me is that CorelDraw has a comprehensive DTP capability. Imagine creating a flyer, newsletter or other similar publication with the graphic and text manipulation capabilities of CorelDraw. WOW!!

CorelDraw 4.0 comes on 11 - 3.5" HD floppies and a CD. The program itself takes 37 MB of hard disk space when fully loaded, but the user has the option of selecting out any portions of the program not needed. The CD contains the 18.000 graphics and 750 fonts included with CorelDraw 4.0. One needs an IBM-compatible 386 or better machine for the program, Windows 3.1, 4 MB Ram (8 recommended), a mouse or tablet, and a VGA or better resolution monitor. Cost is $595 MSRP ($249 upgrade) and about $399 street. Companion to CorelDraw are several Photo CD Collections, each containing 100 beautiful pictures with a common theme, which list for $49.95 each.

Antonio reports that CorelDraw 5.0 is to be released on 20 May, which will provide further improvement in an already very, very powerful program. We can all recall Ventura Publisher. Well, Corel now owns that program and a greatly enhanced and improved version of that program will be bundled with CorelDraw 5.0. Seems like a great combination to me.

Antonio and Corel, THANKS MUCH for a super presentation of your very impressive program, CorelDraw; it is truly an amazing program. Antonio did a bang-up job of showing many of its new features.

AND THE WINNER IS Thanks to the generosity of Corel Corporation, who donated all of the door prizes, there were some very nice door prizes. Those among us to have the good fortune to win are:

M. N. Marteny	Photo CD
M. J. Ciccavello	Photo CD
Larry Anders	Photo CD
Steven Atran	Photo CD
T. Goff	Photo CD
Jeff Jenkins	Corel SCSI
Bill LaForest	CorelDraw 4.0

In addition, five members were lucky winners of a Corel Mouse Pad.

The meeting adjourned at about 8:35 PM. ◆

Special Interest Groups

Microsoft Access SIG

This SIG meets the first Tuesday of the month 6:30 PM. The meeting location varies. For information contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merlenic@tampabay.rr.com.*

Genealogy SIG

To be included on the TPCUG genealogy mailing list, contact Jenny Lind Olin at 960-5723, or *jlolin@tampabay.rr.com.*

Visual Basic for Applications SIG

This SIG meets the **third Wednesday** of the month The meeting location varies. For information contact William LaMartin at *lamartin@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Kevan Sheridan moderates the discussion.

The Good Old Days

By Ron Weinberg, Tampa PC Users Group
rswjbr@verizon.net

Do you remember the good old days when things cost less (or did they?)

We all know that from time to time replacements or upgrades to our systems are necessary.

You can search the net or scour the newspaper ads for the best deal. One thing is certain, hardware prices continue to drop. Bargains abound on all but a few state of the art models.

But most of us don't realize the real values in today's systems. Compare any one of them to the first PC which I was privileged to use.

It was June 1982, not too long after IBM had introduced their first mass-produced and mass-marketed personal computer, ancestor of all non-Apple systems in use today. Although our company had a substantial mid range system, our Controller requested an IBM PC because of the notoriety and publicity it had been receiving.

At the time there was only one place in Tampa that you could buy one, ComputerLand on Fowler Ave., which disappeared years ago.

After carefully discussing the equipment, options and pricing we made the following purchase.

- Model 5150 64k IBM-PC with Disk Drive (a 5.25" floppy) - $2295
- Model 5151 IBM Monochrome Monitor (12") - $345
- Monitor/Printer Adapter Card (this was not standard) - $345
- Data Mac 64k Memory Upgrade Card (k not MB) - $495
- 2nd Diskette Drive - $570.00
- Communication Adapter - $150
- IBM DOS Operating System - $40
- Printer Cable - $55
- VisiCalc Software (this was before advent of Lotus 1-2-3 and Excel) - $250
- Desktop Planner (another pre-Lotus software) - $300
- Box of 5.25" Floppy Diskettes at no charge - $0
- Sales Tax at 5% - $242
- **TOTAL: $5,087**

Yes, $5,087, without a printer. Only 128K of memory, and hard drives did not yet exist for PC's. Even more amazing is that there was 90% inflation between June 1982 and December 2003, making the cost $9665 in today's dollars.

While this information may not make spending on a new box less painful, no one can say you will not be getting a lot more bang for the buck than in the old days. ◆

Tech support at my ISP mentioned in response to a question from me that one does have to *do* something to something in a received email message to get into trouble. Still, they say it is a good idea to keep the right side of your Outlook Express workspace as one pane, stay away from the Preview pane on the bottom. ◆

(FACUG…….Continued from page 7)

they can send email to each of 1,400 members real fast. Other clubs may use their service for $5 per month. Go to http://www.SPCUG.org.

Adobe sponsored the Sunday lunch. Dave Helmly showed us the latest Adobe Photoshop Magic. Adobe is a unique company. It would take a great deal of space to go through Dave's presentation. Most of us were thoroughly surprised at the one click changes you may make in your photos.

Goodies too numerous to mention were given out during the sessions and on Sunday afternoon at the wrap-up. Larry and his assistants are to be congratulated on another successful conference. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

What to write about this month? I have a new copy of Microsoft Office 2003 Professional that I want to write a review of, but I haven't had enough time with it to be able to compare it in detail to Office 2002. Perhaps I will be ready by next month.

Some of our members have started a digital imaging SIG. It will meet the fourth Monday of the month, commencing May 24th, at 6:00 PM at Pepin. There is no doubt considerable interest in that in the group. As you probably have gathered from my past comments and articles, it is also one of my interests. And that ties in with the topic of my article for this month--something on digital photography. ◆

The Nikon D100 SLR Digital Camera

By William LaMartin, Editor,
Tampa PC Users Group
lamartin@tampabay.rr.com

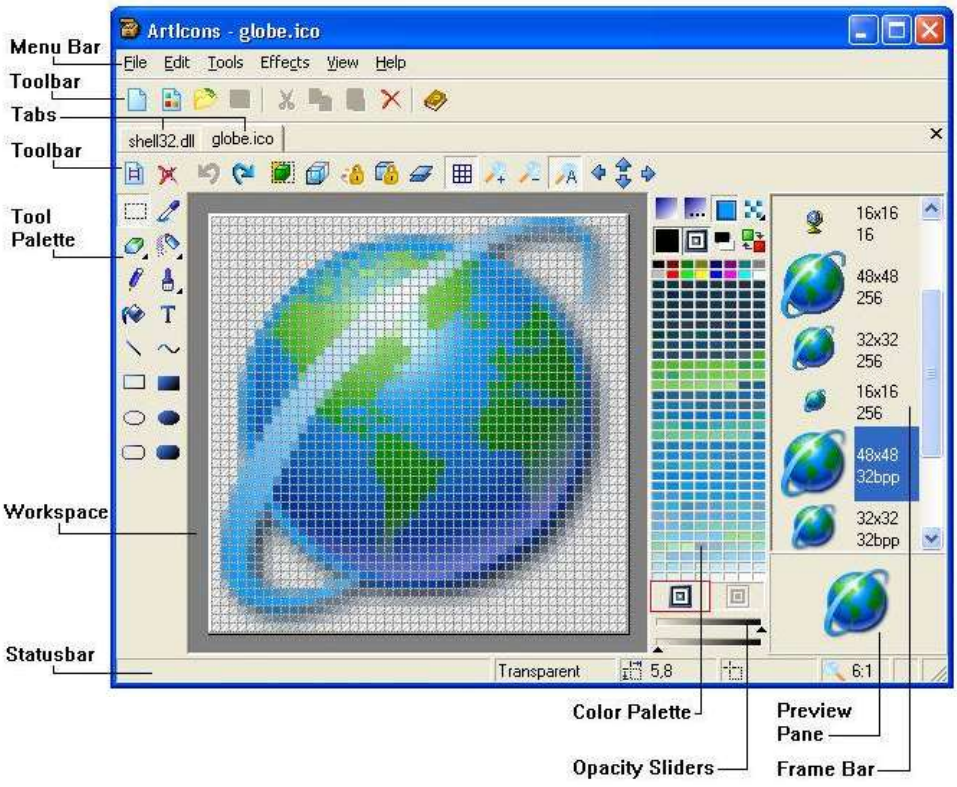
I have wanted a single lens reflex style digital camera every since I saw Ford Bond's digital Nikon SLR when he gave us a presentation on digital photography in November of 2000, http://www.tpcug.org/newsletter/nl_2000/december2000/minutes200012.htm. Now I have one, the Nikon D100.

This article is not going to be a detailed review of the camera. That has already been done much better than I could do it at any number of web sites. One I particularly like is at http://www.dpreview.com/reviews/nikond100/. What I hope to convey here is a comparison of this camera to my digital Canon G1.

For the past few years, most members have seen me taking photos at the meetings with the Canon G1, a small but upper-end consumer digital camera that is now about 3.5 years old. I did a review of it at http://www.tpcug.org/newsletter/nl_2001/january2001/canong1.htm. I have really worked that little camera, taking around 5,400 images in the past 3 years and four months. From looking at the folders where they are stored, it appears that I have retained 3,870 of them. So I have retained about 72% of the images I took. Furthermore, the average size of a file is 2,056,629 bytes, where the files were saved at the largest size (2048 x 1536 pixels) and with the least compression possible. On a recent trip to New Orleans, I took around 250 photos with the Canon, retaining around 230 of them. And I am happy with most of them.

So, if I am happy with what the G1 produces, why move up? Well, because I am not completely happy. There were just some things the G1 didn't do well, and I had learned to work around them as best I could. And the fact that it did better than any other comparable digital in its price range that I had seen gave a sort of satisfaction. But every time I took a photo of a house in bright sun and the lawn in front had splotches that appeared totally washed out, or when I tried to photograph a moving object--even a slowly moving trolley car in New Orleans--and I knew that I had to aim a bit ahead of the trolley to be sure that the trolley was captured when the camera decided to actually take the photo after all its calculations, I thought about that better digital. Then there were those photos taken in available light that had some strange colors around the edge or where two walls joined in a room that I knew wouldn't have such a problem if I had used my film camera.

Finally, I thought of another photography project I wanted to do in the near future which I probably wouldn't be able to do if I waited more than six months and for which I wanted to use a digital camera, and that made the decision for me to drive over to North Tampa Photography and purchase the D100. It is sold without any lens. However, I can use the lenses I already have for my Nikon film camera, which is the main reason I never even considered the competing Canon digital SLR, which I am sure is a fine camera. A typical Nikon lens will cost you around $500, so you don't want to have to buy any more of them than necessary.



One surprise was that the camera will not work with my Nikon SB-27 speedlight in Through the Lens Mode (TTL). It will only work that way with two of the newer speedlights made by Nikon. I did get it to work with the SB-27 in auto mode and the camera in

ArtIcons Pro 4.01

By Bob LaFave, Tampa PC Users Group
boblala@ij.net

In the April 2003 newsletter, http://www.tpcug.org/newsletter/nl_2003/april2003/icons.htm, I did a review on *IconUtilities Suite* by Aha-soft, http://www.aha-soft.com, and now I'll look at just one program that has been updated from the suite, *ArtIcons Pro 4.0*. You can find a complete description on the web at http://www.iconutils.com/articons/index.htm. From the main page you can link to pages for the cost, $39.95 for the full version and variable costs for upgrading from various other Aha-soft products, along with history, awards received, F.A.Q., and screenshots of the program. I will try to add to the previous article with more details on the program and what is "*NEW*" in version 4.0.

I'll start with the main program window showing the location and description of the individual controls. As you hover your mouse over each button you have a *Hint* over each but you also have a description of the button in the lower left *Statusbar* area. I would like to ask you to look at the two sections that I consider the most useful, the *Color Palette* and the *Frame Bar*. In the *Color Palette* you can see how the colors are presented in different gradients for each. This allows easier color transaction and blending. The predominate colors of the individual icon are shown when editing or changing an existing icon, and when creating a new icon, the full color spectrum is presented. If you need a transition, the shade is easily available without calling up an individual color palette from within the program. The *Frame Bar* area shows the individual icons that are in the different display resolutions. The newer icons are created in *Libraries* that include multiple icons. With ArtIcons you can *Export* any specific icon from the viewing area to work on or to use. This gives greater clarity in the high resolutions available today. You can create a new icon or convert an existing icon from a monochrome (1 bit) up and through 256 colors (8 bit) and finally to True Color + Alpha (32 bit).

The *Customize Windows Icons* feature is much like the *Effects* tab in Windows *Display Properties* but with much greater control over how and what icons are used and displayed in your Windows environment. As you can see in the picture on the next page, under the *Desktop* tab there are many more choices for you to use in customizing your work. From the picture you can see Control Panel, Printers, Desktop and History to name just a few. Each tab offers more choices in a particular area. The *Start Menu* tab allows you to change the icons being used on your Windows Start Bar such as the Run, Shut Down, etc. buttons.

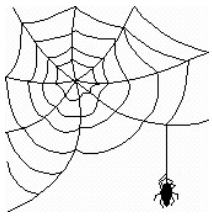
(Icons……..Continued on page 5)

(Icons…….Continued from page 4)

The *Drives* tab allows you to change how hard drives, CD ROMs and other icons in *My Computer* are displayed. Change any of these icons to what you would like, not what Microsoft decided. The *Miscellaneous* tab shows icons such as the Default icon Windows uses to represent unknown file types and even the Printers default icon. Once a Tab is chosen, you can use the buttons on the right not only to change the icons that are displayed, but also to restore any changes to any group or to change any individual icon back to the Windows default.

(Icons…….Continued on page 6)

Internet Picture of the Month



Potato Panic

From the site http://www.photo.net/. The photographer is Dick Smolinski. Not everything has gone digital. This photo was taken with a Mamiya RB67 using Kodak Ektachrome

Some of these links will join the many already on the Links page at our web site, where you need only click on the name.

(Icons.....Continued from page 5)

The new feature that is added to this version is *Layers*. What I like about layers is how you can use layers like you would use transparencies in adding to a drawing. Think of having a pretty uncolored painting on a sheet of paper and placing a clear plastic sheet over the paper. You then can add colors to the plastic without affecting the paper below. This leaves the original intact from editing mistakes that would destroy the original. Any changes are easily accepted or deleted. For example, I can start with an icon of a tower computer, Layer 1, and make additions of colors in two more layers, defining the shape and adding color to what was a grey, dull icon. I never changed the original, and it is left alone as I tried to be creative. Once I am satisfied, I save the colored project and have the new icon to play with.

This program allows you to easily change or create icons to enhance your computer's visual appearance. It is not for everyone but can be quite fun and allows you to create a little bit of individuality in your computer. I love it. ◆

Spy Sweeper

By Robert Davis, Tampa PC Users Group
RobDavis@ij.net

Spy Sweeper is a neat little program to check for spy-ware. Its purpose is to detect and eliminate harmful spy-ware that may threaten one's privacy. Sometimes email may contain spy-ware.

I recently purchased and installed this software because I suspected I had extra stuff running on my computer. Apparently I was right. Spy Sweeper found 20 odd pieces of software to quarantine and over 3,800 other traces! My PC seems to run faster now, too. However, every once in awhile it freezes for about 10 seconds. (I am still running Windows 98.) I suspect Spy Sweeper is doing something. This program is easy to install and costs about $30 at CompUSA. Other than the rare freeze for a few seconds, it is non-intrusive and seems to do a good job at catching those pesky traces and Trojan programs. After installing, go to Options and Active Shields to be sure it checks for what you want. ◆

(Nikon.....Continued from page 3)

manual mode.

The current version of my Canon is the G5 which is a 5 megapixel camera and costs around $520, considerably less than the $900 I paid for my G1. The 6.1 megapixel D100 without a lens costs $1,495, and, as I mentioned, a Nikon Zoom lens can go for around $500. So what do you get by paying an extra $1,500 for the SLR type digital camera and lens? Why, you get better photos!

- They are sharper and cleaner looking.
- The color balance is almost always correct, with no need for modification in a graphics program.
- The camera is ready to snap a photo the instant you turn it on.
- High speed image processing shows you the photo taken in the preview screen almost instantly. Note with a SLR digital, you don't see the photo in the screen on the camera's back until the photo is taken, since the camera's mirror is in the way before the photo is snapped.
- This same high speed image processing allows the photo to be taken the instant you press the shutter release (except on some flash shots in my testing), and the camera has a large enough buffer to allow you to take 3 frames per second to a maximum of 7 or 8 photos.
- Focusing is very fast.

These last two items are also what separate the Nikon D100 from the Nikon digitals that cost twice

(Nikon.....Continued on page 7)

Nikon……..Continued from page 6)

as much again: Faster and longer continuous shooting and the ability to quickly automatically focus large lenses. Think long, heavy telephoto lenses for sports photography. I note that the 24 - 120 mm Nikkor zoom lens I use with the D100 by itself weighs more than my old Canon G1.

That brings up the main disadvantage (other than price) of the digital SLRs--size and weight. I had really come to enjoy the small size of my Canon G1 when compared to my Nikon film camera, which is about the same size as the new D100.

Here are three of my first photos taken with the D100. The top photo is of Wade Herman's parrot cropped from a larger photo taken with the built-in flash. The bottom photo is of a neighborhood cat on his porch shot with the zoom lens at full extension. The photo above is a slightly cropped version of a bee taking nectar from a small flower in the alley behind my home. This photo was taken with an AF Micro Nikkor 60mm lens (close-up lens). The other two photos were taken with an AF-S Nikkor 24-120 mm lens.

All three photos have been considerably reduced in size and compressed greatly to make them usable when the newsletter is put at the web site. However, the quality is still there. The bee is only 56 KB, the cat is 86 KB and the parrot is 121 KB. Check out these photos in the online version of the newsletter to see them in color and with a much better rendition.

Another difference between the Canon G1 and the Nikon D100 is that the Canon uses battery power to go from wide angle to zoom. With the D100 and a zoom lens attached, you use your hand to rotate the zoom ring on lens. This is just one of several reasons for the surprisingly long battery life of the D100. It looks like I am out of space, so other observations will have to wait. ◆

.

Looking Back to 1994

From the May 1994 Bits of Blue

Secretary's Report
MINUTES OF 3/9/94 MEETING
and PERSONAL COMMENTS

By: Jim Clark

A nice turnout for this meeting, and everything seemed to go very well. There was a good bit of time for an open forum kind of interchange between members, along with presentations briefly reviewing a couple of very nice Abode programs -- one of which most of you will be using in the not-too-distant future: Adobe Acrobat and the Acrobat Reader.

USER GROUP NEWS

- Membership Survey: A membership survey form was created by the Board of Directors (BOD) recently for the purpose of gathering the information from the membership needed to help guide our future efforts and the allocation of some rather slim resources. The survey was handed out to those present and was included in the newsletter for those not present. **All members are asked to complete the survey form as soon as practicable and return it to the BOD. or bring it to the next meeting. Your input is very important and will help your BOD a great deal in making the decisions that must be made in the near future.** The data will be held in strictest confidence and will only be used as statistical data.
- Special Interest Groups (SIGs): Preparation for SIGs on OS/2 and CorelDraw are in their final stages of preparation and all preparations should be complete by the next general meeting. Both will likely be meeting not long after the next general meeting. It is therefore recommended that any members interested in participating in either of these SIGs be sure to attend the next general meeting. It appears that the OS/2 SIG will likely meet in the IBM facility, and the Corel SIG will likely meet at the Dale Mabry campus of the HCC.

INDUSTRY NEWS

- Merge Mania: Competition in the software world has led to what seems to be merger mania. In addition to the passing of Word Perfect, recent announcements include Adobe acquiring Aldus, Symantec buying Central Point, and Intuit buying Best Software. Whether the objectives of the companies involved will be achieved is yet to be seen. In the long term, however, this merger mania could have a negative effect on competition, but it would seem the mania has not yet approached that level.
- "Simply Tax" Refund For Some: As many know, Computer Associates, a big name in the main frame world for a long time, has been trying to make their name recognized in the PC world by marketing Simply Money and Simply Tax for only S & H charges. Those that acquired Simply Tax before the final version was available had to pay $9.95 for the early bird version, and then another $3.95 to get the final version. After receiving numerous complaints, Computer Associates has agreed to refund the $3.95 charge to those who request same in writing. So, if you want your $3.95 back you will have to contact Computer associates and request it.
- MS Maintenance Upgrades: Maintenance upgrades are now out for MS Word For Windows 6.0 and for MS Windows 3.1. The upgrades change the program designations to 6.0a and 3.11, respectively. No charge is involved, and they are available form numerous electronic sources, including the MS BBS and CompuServe. They are also available on our own Bits of Blue BBS as WORD6OA.EXE and WW0981.EXE.
- Professional Write Upgrade: Harvey reported that Professional Write 3.0 is available to all present owners of Professional Write, or any competitive DOS word processor, for $65 from Professional Write. Win Fax PRO Upgrade: Version 4.0 upgrade to that program is available for $49 at 1-800-268-6082.

PRESENTATION -- Adobe

William C. Lindsay, South Eastern Account Manager for Adobe Corporation, generously agreed to give us a brief overview of two Adobe products: Photoshop 2.5.1 and the Acrobat package. I say "brief" overview because, although Bill spent a good amount of time

(1994……..Continued on page 9)

(1994……..Continued from page 8)
accomplishing that end, the scope of the power and features of these programs makes anything short of a several hour review "brief". Bill proved to be a very able representative for Adobe, and he gave an excellent presentation of both packages. I can't hope to cover, even briefly, all of the features Bill demonstrated, but here are a few:

Photoshop: Adobe says that Photoshop is "The world's leading photo design and production tool." I don't know whether that is accurate or not, but I do know that if there is anything you might want to do with an electronic photograph it would seem that Photoshop will do it very well and very fast. You can create your own, scan images into it, or import from a host of formats. Once an image (negative or positive) is in the program, it can be manipulated in just about any way you can imagine: Change the image to a negative or positive image; change colors (w/16 million available) of any part or all of the image; create duo-, tri- and quadtones; provide for simultaneous viewing of a range of color options applied to the image to aid in making choices; export and import all or any part of an image to other programs and/or as replacement/added components of an image; create any tint/hue changes desired; create and add in graphics created with the versatile and powerful built-in drawing tools; add in any text desired using the large selection of fonts included, or Windows fonts, and manipulate their size, shape, and color to your heart's content; etc., and then print out or export your finished product to any of a wide variety of formats, including one to create an actual film negative.

Photoshop is truly a very powerful program and can handle 40-50 MB images and includes excellent online help. It also includes 100 beautiful licensed images, covering a wide variety of subjects. It handles a large selection of file formats (import and export). Windows 3.1 (or later) is required, of course, and it will run on a 386, but a 486 with 8 MB RAM is recommended. The specific amount of disk space the program requires is unknown, but it is in the several MB range. But one needs a good bit of free disk space to accommodate images, especially when handling the 40-50 MB variety.

Photoshop is available for IBM-compatibles and Mac. It lists for $895, but is available for substantially less. One flyer from a retailer was available at the meeting listing an Adobe Photoshop/Illustrator (also a high end program) package for $679.

Acrobat: Adobe Acrobat is actually a family of related programs, which includes Acrobat Exchange, Acrobat Distiller, Acrobat Reader, and Acrobat Starter Kit. Acrobat Exchange is the starting point. It converts many commonly used document formats into what is called a Portable Document Format (PDF). This common format then can be read by the other components of the Acrobat family. The components are available in DOS/Windows and Mac. Hence, once a file is converted to the common PDF format it can be read by any PC with a Reader, regardless of operating platform or other application software. "Big deal," you say, "I can do just about that much with ASCII format." The BIG difference is that Acrobat retains all formatting of the document, including fonts, page layout, graphics, etc., literally all of the features of the original, so that what the reader shows on the screen and prints out to a printer, if desired, is exactly the same as the original document. The host computer need not have the fonts nor graphics used in the original document; Acrobat takes care of that. Acrobat, then, allows the interchange of documents between computers, overcoming the limitations of different hardware, operating systems and application software. Interestingly, in many cases the PDF file is substantially smaller than the application file from which the PDF was created.

Acrobat Exchange allows one to create, view, collate, annotate, manipulate and print PDF documents. Acrobat Reader allows viewing and printing any PDF document, and gives the ability to access any annotations, bookmarks and links that are a part of the PDF file. Acrobat Distiller converts postscript language files into PDF files. Acrobat Starter Kit is a 10-user license package of the Exchange and Distiller components, or everything a workgroup of 10 needs to use Acrobat.

For the DOS/Windows version, a 386 machine with at least 3 MB of hard disk space is needed. The street price for none of the components was available at the

With the high volume of often dull and impersonal emails we deal with, there are times when it is nice to add a little humor or liveliness to your correspondence. This is easily done by adding emoticons or smileys.

Emoticons Mail 2.3 is an easy-to-use program that enables you to insert smileys in your email messages. It supports Microsoft Windows 95/98/ME/ NT/2000/XP and provides Premium support of **Outlook** 2000/2002/XP/2003 and Premium support of **Outlook Express** 5.x/6.x.
It will not, however, work with other email or word processors.

A simple download installation places access in your system tray. Thereafter, the program loads at Windows start up but can be set to only load on demand.

More than 800 smileys are included, broken down by categories: General, Action, Love, Sad, Goodies, Japanese, Holidays and Favorites. Each category has a number of subcategories and many of the emoticons are animated. The Favorites holds your 50 most recent choices and has a My Photos section which allows you to add new emoticons from external files. The program provides a nice but not unusually large or unique selection of smileys.

A single click on the system tray opens the program and a single click easily attaches the smiley to your email as a tiny gif file with nothing to download.

A great many more emoticons in similar categories as well as many additional categories are available via free downloads so why buy Emoticons Mail?

Here are several valid reasons:

- Free emoticons programs often contain ad ware or spy ware to enable them to be "free".
- No offensive smileys are included.
- No Speedbar or other tool bar is added to your system.
- You can add your personal emoticons.
- You do not need to have an Internet connection when you are adding emoticons.
- The recipient is not required to download anything and does not need an Internet connection to view Emoticons Mail smileys (if they are using Outlook or Outlook Express).

You can download the program from Maxplugs.com for $19 and get lifetime updates and a 60 day money back guarantee. ◆

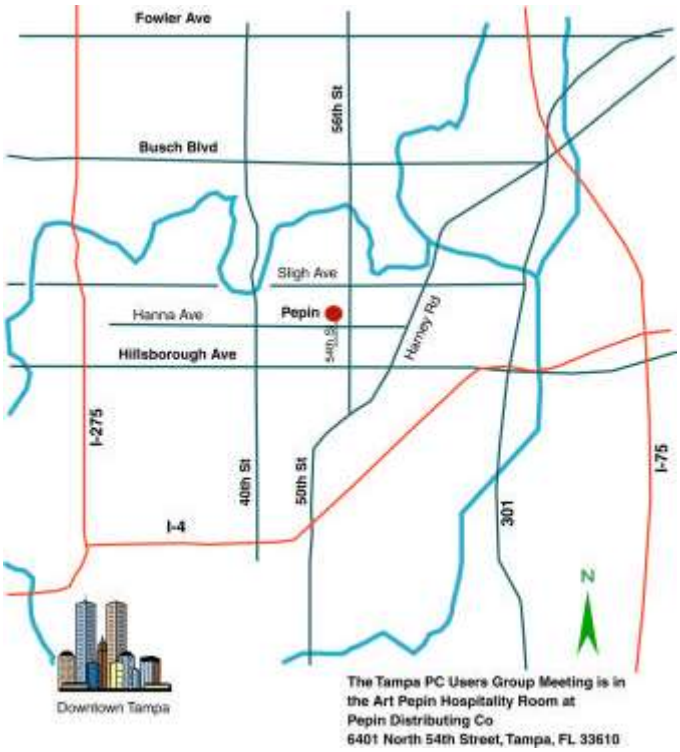
meeting. List price is: Exchange - $195; Distiller - $695; Reader - $50; and Starter Kit - $1,395.



Bill and Adobe, thank you very much for a super presentation. You have a couple of very powerful and useful programs in Photoshop and Reader. We will soon be distributing Readers to our members and then using Acrobat Exchange and the Readers to post our newsletter to our members electronically.

AND THE WINNER IS

Thanks to the generosity of Adobe Corporation, which donated all but one of the door prizes, there were some very nice door prizes. Those among us to have the good fortune to win are:

Don Simonds - Adobe Wild Type
Joe Crochet - Adobe Wild Type
E. Jurado - Adobe Type On Call
Mark Saunders - Adobe Type On Call
Mark Saunders - Almost Perfect Book

The meeting adjourned at about 8:35 PM. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

I hear that the digital imaging SIG got off to a fine start. It is the fourth Monday of the month at 6:30 at Pepin. Unfortunately, Monday evenings I am not always free to attend at the moment.

I have finally gotten around to writing about Office 2003. It is hard to do because there is so much ground to cover and I want to do more than just rephrase what is on the software box. or at the Microsoft site. I think I have done that. In a nutshell, there is not that much new in this version if you are not a corporate or collaborative user and if you don't worry about document rights and such things. ◆

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members. Our mailing address is P. O. Box 3492, Tampa, FL 33601-3492.

However, for business concerning this newsletter, Bits of Blue, please contact the Editor, William LaMartin, at 821 S. Boulevard, Tampa, FL 33606-2904; 813-251-3817; lamartin@tampabay.rr.com.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII, Microsoft Write, Microsoft Word, or Word Perfect file to the editor at 821 South Blvd., Tampa, Florida 33606-2904 or to lamartin@tampabay.rr.com.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

The use of trademarked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

apcug Member of The Association of Personal Computer User Groups

Minutes of the May Meeting

By Peggy Pulliam, Secreary,
Tampa PC Users Group
Pegrance@yahoo.com

Before the TPCUG meeting this May we had our usual Windows SIG where we learned that if there is trouble booting up your computer, lost drivers, etc., boot in Safe Mode, then reboot. It reloads the original drivers, and you should be able to get going again. You can also use MSConfig.exe to see what is running on your computer and help troubleshoot.

Tampa PC User Group member Bob Lafave has a CD of Shareware he has compiled available. If you are interested contact him at boblala@ij.net.

The meeting this month was about the Intel Pentium 4 Processor with Hyper-Threading technology! Kevan Sheridan presented the overview. Circuitry is added, and a single processor is recognized by the operating system and multi-threaded application as TWO logical processors – increasing productivity like crazy.

Kevan started us out with a hilarious clip from the movie Men in Black II (the post office scene) to help us get the idea of what it would be like. It's like having another set of arms to do your work. When you have this capability you won't see the pauses that happen when you are running a program. For example, with a game you may have seen this. An object on screen halts for just a moment and then continues. This doesn't happen with Hyper-Threading technology. It works at the hardware level. Hyper-Threading Technology requires a computer system with an Intel Pentium 4 processor supporting Hyper-Threading Technology and an HT Technology enabled chipset, BIOS and operating system (your XP Home will work for the OS). Performance will vary depending on the specific hardware and software you use. See http://www.intel.com/info/hyperthreading/ for more information, including details on which processors support HT Technology.

We as a club have an opportunity to be granted one of these processors by Intel, and we are planning to apply for it. If that works out, we will have a demonstration in the REAL with all the fixings!

The meeting ended with questions and comments about the technology and our door prize, *Publisher 2002,* of which Merrill Friend was the lucky winner. ◆

Office Professional 2003

By William LaMartin, Editor,
Tampa PC Users Group
lamartin@tampabay.rr.com

How many reviews of Microsoft Office have I written? Let me count the times. And here we go again. It is not that I dislike Office; in fact, I use its programs everyday. I am just running out of things to say about it. Furthermore, this newest version's new features, as far as I can tell, are aimed mostly at corporate users. For example, they will benefit from the new XML integration, which makes it much easier to move information from one program to another, including programs outside the Office suite. Additionally, the new version has much-enhanced collaboration features--again something more geared for corporate and intranet usage, as opposed to the individual user. In all honesty, there is really no reason for the typical member of our user group to upgrade to Office 2003 if they have Office 2000 or Office XP. However, if you are still using Office 97, it is time to move up.

For my newsletter review of Office 2000, go to http://www.tpcug.org/newsletter/nl_2000/march2000/microsoft_office_2000.htm and http://www.tpcug.org/newsletter/nl_2000/april2000/ocffice_2000_part2.htm. For my notes on Office XP, see http://www.tpcug.org/newsletter/nl_2001/september2001/officexp.htm.

Before you rush out to buy Office 2003, you need to check your operating system. This version of Office will only install on Windows 2000, SP3 or Windows XP. The installation requires approximately 500 MB with the options I selected. That includes Word, Excel, Access, PowerPoint and Publisher, along with Visual Basic for Applications for each of the applications and Microsoft Document Imaging. After I made my selections, the actual installation took less than five minutes. Then there is a check on the web for updates.

After the installation, on the first run of one of the applications, the activation wizard starts and completes quickly. Following that, you are given a chance to register, which is not required. It is good that it is not required, since my attempts at registering never completed. I can't remember the problem, but I think they were supposed to send me an email with some information that I was then to use to finish the registration. The email with the information never arrived. But activation is what is important. That is what will supposedly keep you from installing the programs on more than one laptop and one desktop computer and also check if it is a pirated copy.

As to new features, Outlook 2003 has received the greatest overhaul. It has a new, larger preview pane called the Reading Pane. It provides junk email filtering and in the calendar view gives you the ability to display two calendars side by side. I don't use Outlook 2003 much except for doing mail merges with Word and for programming it with VBA—mainly to see if I can do the programming instead of using the programming for creating needed applications. I do use Outlook XP on my second computer as my contact manager and calendar. But on my main computer, my email program is Outlook Express. I think my reason for that goes back to when it was considerably safer to use Outlook Express instead of Outlook for email since it was not programmable and thus less subject to virus attacks than was Outlook. Since then a lot more security has been built into Outlook, and I should perhaps reconsider my use of Express.

Word, Excel and Access appear less changed, and all use the same file format as Office 2000. Access has a new file format, but you can, however, set Access to default to the Access 2000 format. Word has added a neat Read toolbar that formats your document into two pages where they appear much as they would look if they were printed as a book. This makes it much easier to proof-read or browse a long document and also allows for minimal editing in this format.

SmartTags, introduced for Word and Excel in earlier versions, are now available for PowerPoint and Access. Recall that a SmartTag is a feature that is applied to text such that when your mouse hovers over the text, you are provided additional information. For example, holding the mouse over an address might possibly supply a link to a map of that address.

(Office……Continued on page 4)

(Office……Continued from page 3)

In Word, Excel and PowerPoint there is a new menu item under Tools, called Research. This allows you to go to a collection of sites on the web to do a search for information on a topic. There is also a translation feature available that will translate a word, phrase or document. The translation is done at a web site (http://www.worldlingo.com) and the translation is displayed in your browser. So you need to be connected to the Internet for this—unless there is a built-in translation ability that I missed.

Here is the French translation of the SmartTags paragraph above:

> *SmartTags, présenté pour le mot et excellent dans des versions plus tôt, sont maintenant disponible pour PowerPoint et accèdent.Rappelez-vous qu'un SmartTag est un dispositif qui est appliqué au texte tels que quand votre souris plane au-dessus du texte, vous êtes des informations additionnelles fournies.Pour l'exemple, tenant la souris au-dessus d'une adresse pourrait probablement fournir un lien à une carte de cette adresse*.

Now here is the English translation of the French translation:

> *SmartTags, presented for the word and excellent in versions earlier, are now available for PowerPoint and reach.You point out that SmartTag is a device which is applied to the text such as when your mouse planes above the text, you are provided additional information. For the example, holding the mouse above an address could probably provide a bond to a chart of this address*.

Much of the annoying auto formatting has been turned off by default. In Word XP, for example, it could be quite frustrating to try and start a new line with a lower case letter since Word would by default keep changing the letter to a capital. If you started a line with "1.", then some text, Word would want to start the next line with "2.". So that is an improvement.

Now for a few annoyances:

One annoying thing (at least for me) that has not changed is the way Word saves a document as a web page (htm, html). Word 2003 has two ways to save as an HTML page, filtered and unfiltered, but both produce HTML code that most old time HTML coders would consider cluttered. The purpose, I am sure, is to produce a web page that is as close as possible in appearance to the Word document. However, this has the byproduct of producing web pages for which you cannot change the font size in your browser. My way of producing more standard HTML code from a Word document is to copy the text that is in the document, paste it into WordPad, then copy that text and paste it into FrontPage (or any other web page editor). That will yield a web page for which the font size can be changed in the browser.

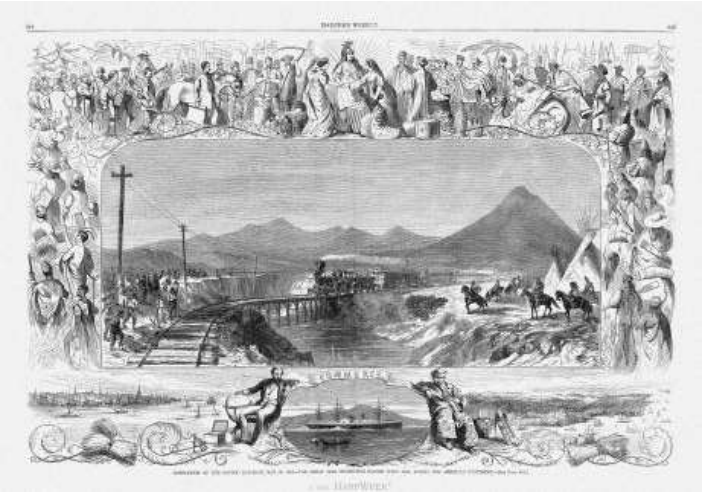
Another annoyance was what appeared to me to be an Office program's propensity to go online for help on a topic when all I want is for it to search its own help database. That was until I realized that the default was for online help but that I could easily change it to offline help. So that is not really an annoyance.

To me a more serious problem is in Microsoft Document Imaging—something that perhaps not many people use. Microsoft Document Imaging allows you to scan in and OCR a printed document. In Office 2000 and Office 2002 I could save the result in Rich Text Format (RTF). However, in Office 2003, if I try to save the results in RTF, I get an error message. The only format that I am able to save my OCR'ed results to is in HTML. I have searched Google and the Microsoft site, and not only can I not find a solution, I can't even find any mention of the problem. Norton Antivirus has caused similar problems in the past, but the Office plug-in for Norton is disabled in my setup, as is script blocking, so I have no solution at the present other than saving the OCR results as a web page and then extracting the text

(Office……Continued on page 5)

(Office……..Continued from page 4)

from there. There seems to be next to nothing on the web about Microsoft Document Imaging. Is no one but me using it?



A great deal is made over XML in the reviews of Office 2003 that I have seen. First, it is noted that to get it you need Office Professional and not a lesser version. Then they say that it facilitates the exchange of data between Office and other programs. Then they say no more, since I don't think they know any more, and most people, in fact, don't want to know any more.

I don't know much about XML myself, but here is what I do know and how I use it. First, in Office XP Professional I could export an Access table to an XML file—actually two files, one ending in .xml and the other ending in .xsd. The .xml file contained the data and the .xsd file described the field types of the table (the schema for the data). Also in Excel XP you could save a sheet as an XML spreadsheet. So saving to XML is not new with Office 2003. What is new is that you can now additionally save a Word document in XML format. I see no such option for Publisher 2003 and PowerPoint 2003. However, it appears that you can save a PowerPoint document as a Word document, which, as noted, you can save as XML.

A Word XML file is nothing but a text file contain-

Information on RAID 0 and Serial ATA

By Merle Nicholson, Tampa PC Users Group
merle@merlenicholson.com

For the May meeting, Kevan Sheridan gave an excellent and fascinating talk from Intel material on Pentium 4 Hyper-Threading. Several points of discussion were raised, and during that I realized that I needed to do some research.

One interesting slide was given showing an optimal P-4 system using two Serial ATA RAID 0 drives that suggested that if you had, say, two 80G drives, you would have a total of 160G. And that is the case. I looked it up at an excellent site at Advanced Computer & Network Corporation http://www.acnc.com/04_01_00.html.

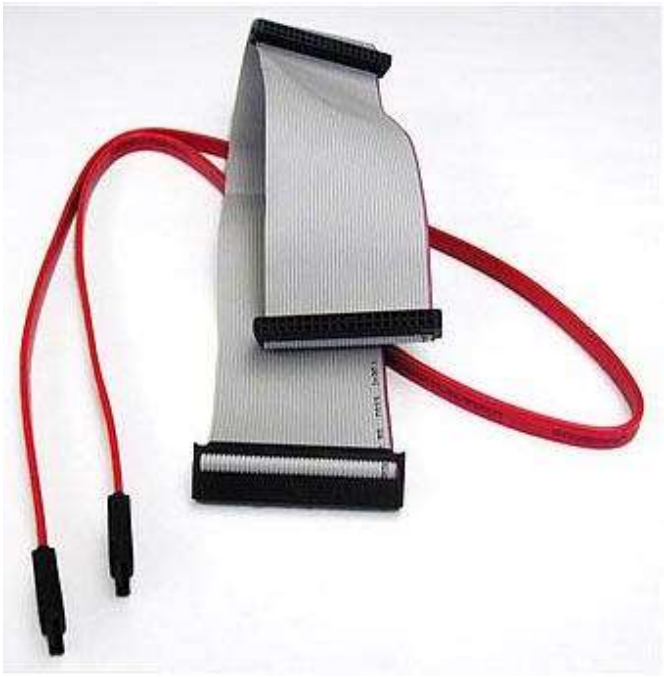
RAID 0 uses a minimum of two drives and is used to maximize throughput:

Characteristics/Advantages

- RAID 0 implements a striped disk array, the data is broken down into blocks, and each block is written to a separate disk drive.
- I/O performance is greatly improved by spreading the I/O load across many channels and drives.

Best performance is achieved when data is striped across multiple controllers with only one drive per controller.

Disadvantages



- Not a "True" RAID because it is NOT fault-tolerant
- The failure of just one drive will result in all data in an array being lost

Should never be used in mission critical environments

This is interesting to me, since my own personal computer has one SATA drive and one unused channel, with RAID 0 built onto the motherboard.

Serial ATA is a standard newer than the usual IDE (ATA and Ultra ATA) drive standard. SATA has become very common, with RAID SATA support built onto the motherboard at a very small cost premium.

Over the past couple of years we've seen the "burst rate" rating for hard drives go from 33MB/sec to 66, 100 and finally 133. I tried to find some direct speed comparisons – Parallel ATA to Serial ATA, but gave up on it due to conflicting terminology. The Seagate website claimed only a 1 to 5% improvement in throughput, but also cited the smaller cable used improving air flow (see picture), lower production costs due to the easier-handling connectors, and lower power consumption.

Processors

Kevan mentioned a big discrepancy in megahertz ratings of processors and noted that you just can't trust a megahertz number any more, and that's absolutely correct. An Intel P-4 3000 runs at 3000MHz, and an AMD XP 3000+ runs at 2167MHz. Looking at the specifications, the most glaring difference is that the AMD processes nine instructions per cycle to the Intel's four.

Also there's a difference in the number of integer registers and floating point registers. AMD does offer benchmark comparisons for both AMD and Intel.

Documentation is offered on the site that explains the benchmarks. One interesting thing is that the numbers suggest that for some benchmarks, the P-4 may have better performance with Hyper-Threading turned off.

◆

(Office……..Continued from page 5)

ing the text of the Word document, along with document information like creator and time of creation, along with loads of formatting information. Thus, a program that understood the Microsoft Office Schemas could extract the data and formatting from the XML file and reproduce the Word document.

The only way I have used XML in Office is to export Access Tables to XML files and then use them as data sources on web sites. This is necessary at some hosting companies hosting Microsoft ASP.Net pages (the pages end in .aspx instead of .asp or .htm or .html). They consider using Microsoft Access databases as data sources at ASP.Net sites a security risk, but the XML files are safe since they are just text files. It may strike you as odd that it is safe to use Access with Active Server Pages (ASP) but not with ASP.Net pages (ASPX), but they are different technologies.

Here is what a table of books in my library looks like when exported to XML. You can see the structure with field names like ID, Title and Subject. This table contains 527 entries and is another example of one of my unfinished projects. I would guess that I am about 30% through entering my books.

So you have now seen more than you wanted to about XML, but at least now you will have some idea of what people mean by the term. Oh, by the way, it stands for Extend Markup Language.

To finish, let me briefly describe how I use the different Office products.

Word I use Word for letters, articles like this one, longer monographs and for business documents containing embedded and linked Excel tables and charts. I also use it in conjunction with Outlook in doing email merges for around 250 email addresses. I should note that in the 2003 version, the email merge seems to run faster than in the XP version.

Excel I use it to calculate my business and personal taxes, to do "what if" business scenarios and to keep track of various items involving numbers.

Access I keep databases for this user group membership, my neighborhood organization, the data required for various web sites that I manage, personal information like the database of books mentioned above and for analyzing the data in the server log of my websites. It is the Office component to which I most apply my Visual Basic programming ability.

(Office……..Continued on page 10)

Looking Back to 1994

From the June 1994 Bits of Blue

Secretary's Report

MINUTES OF 5/11/94 MEETING
and PERSONAL COMMENTS
By: Jim Clark, Tampa PC Users Group, Inc.

A very good turnout for this meeting, which held the promise of a great presentation by one of the largest PC software companies -- Microsoft Access. And the promise turned into reality - a great meeting and a great presentation.

USER GROUP NEWS

- Membership Survey: Harvey reiterated the why's and wherefore's of the member survey now underway. Thanks were given to those who had completed and turned in their survey form; those who had not yet done so were implored to please do so as soon as possible. The information will be of considerable benefit to the Board of Directors in guiding the direction of the user group and our BBS and in making our group of greater benefit for all members.
- Hard Drive For BBS: Harvey again noted for the group that the BBS has only one 212 Mb hard drive available to serve all the purposes we want of the BBS. The hard drive is full, and we need to acquire a 500 Mb + hard drive, preferably from donation or barter. Members were asked to look for ways to come by more hard drive space. One of our members offered a 200 Mb to the group, an offer that was quickly accepted. The 'new-to-us' hard drive should be installed in the near future, and we will likely see more files available for download in coming weeks. While this is not a long term solution, it will allow us to improve the BBS, and it gives us some breathing space. A BIG THANK YOU from all of us to ELAINE MARMEL for her generosity.
- Special Interest Groups (SIGs): The OS/2 SIG is off and running. The first meeting is scheduled for 26 May - the 4th Thursday in May, at 6 PM, in the IBM facilities on the 4th floor of the Lake Pointe One building across ML King Blvd from Burdines in the Tampa Bay Mall. Subsequent meetings will be held in the same location and at the same time, but on the fourth Tuesday of each month. Many thanks to John Lucas for organizing and leading this SIG.
- The CorelDraw SIG is still in the organization stage, with obtaining meeting facilities at HCC (Dale Mabry campus) the stumbling block. We hope to have good news on this in the near future so we can get this SIG going.
- Possible BBS Move: Harvey informed us that the present location of the BBS may not be available to us in the future. Presently located at our SYOP's place of employment, that business is presently in the throws of reorganization and tenure of our BBS is a bit uncertain. We need to be prepared to relocate the BBS should that become necessary, perhaps on short notice. All members were asked to keep an eye out for a potential alternate location, at least semi-permanent in duration, for the BBS. Please pass on any suggestions you may have to any of the members of the Board of Directors.
- VA Patients Access To BBS: Harvey reported that the Board of Directors had determined that with only one phone line to our BBS it would be unfair to our members and hinder their access to the BBS. For the present we will be unable to grant access to our BBS to the VA hospital patients as had been requested by the Pinellas User Group.
- Review Software Available: Software provided by vendors for our review is published monthly in the newsletter. Since the last newsletter went to print, we have received 4 more software programs for review. All members willing to try the software and write an objective, comprehensive review are invited to contact Marylee (Newsletter Editor) about reviewing any of the software available. A quality review benefits the entire group, and the reviewer becomes the owner of the software reviewed.
- Public Relations Volunteer Needed: Membership growth of our user group does not reflect the quality of our group nor the benefits available from membership. What we need is someone who can take the bull by the horns and get information

(1994……..Continued on page 9)

(1994……..Continued from page 8)

about our group in front of the PC users in the Tampa Bay area-- strategic placement of fliers, contact with area computer retail outlets/shops, etc., and develop other ideas and mechanisms to make the community aware of the Tampa PC Users Group. If you can contribute to this effort, please contact any member of the Board of Directors.

INDUSTRY NEWS

- MS Access 2.0: Microsoft Access, the newest database program developed by Microsoft, has been released. Reportedly, sufficient copies are not yet available at all retail outlets to meet current demand, but keep checking if you are interested -- or order direct from Microsoft.

- Word Perfect 6.0a: A maintenance upgrade to Word Perfect 6.0, identified as WP 6.0a, is now available from Word Perfect. Distribution is not automatic, and you must contact Word Perfect to get your free upgrade.

PRESENTATION -- Microsoft Access 2.0

Skip Purdy, Systems Engineer for Microsoft Corporation, was on hand to give us a rundown on the newest release of Microsoft's database program, Access 2.0. As an Access 1.0 user, I was anxious to see what changes had been made. I wasn't disappointed for there are numerous very good improvements. That is not to say that version 1.0 is deficient -- rather it is to say that Microsoft has taken a very good program and made it a heap better. Emphasis in 2.0 has been placed on making the program substantially more powerful and even more user friendly, so much so that a novice can jump in and do a credible job with it in short order. Many of the routine actions have been automated, and just about everything in the program can be customized to one's circumstances and needs.

Among other things, tool bars have been standardized with the other Microsoft Windows programs; button clues and right mouse-button short command help have been added; wizards have been expanded and made easier, and now include personal and business needs; control of fonts within the program; quick sorting of the data within the database, and drag and drop reorganization of data within a table or other organized manipulations of the basic data base; copies data in RTF format, which means all formatting goes with the copy; seamless integration with Word for Windows; supports OLE and works with any OLE application; reports and other outputs can include graphics of a variety of formats; includes a direct tie-in with a fax and provides for timed dispatch of faxes directly from Access; and many, many more. If you are a data base user, I believe you will want to take a look at Access 2.0-- it includes a lot of "easy to use" power.

Machine requirements for use of Access 2.0 are the same as for 1.0, except that 2.0 disk space requirements are more, now requiring about 20 Mb of hard disk space with all options loaded. Cost of an upgrade from an earlier version from Microsoft is $99, or $129 for a competitive upgrade. You can probably find a little better price at some of our retail outlets -- when they have the program in stock.

To Microsoft and Skip Purdy, THANK YOU VERY MUCH for an excellent presentation of a great program. Your overview of Access 2.0 increased geometrically my anticipation of beginning to use the program myself.

AND THE WINNER IS

Thanks to the generosity of Microsoft Corporation, which donated MS Access 2.0, and other vendors, there were some very nice door prizes. Those among us to have the good fortune to win are:

Tom Goff	MS Access 2.0
Parker Monroe	Links Course Add-on
J. C. Robinson	Cannon Mouse Pad
Jim Clark	Cannon Mouse Pad

The meeting adjourned at about 8:40 PM. ◆

Special Interest Groups

Microsoft Access SIG

This SIG meets the **first Tuesday** of the month 6:30 PM. The meeting location varies. For information contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merlenic@tampabay.rr.com.*

Digital Imaging SIG

This new SIG meets the **fourth Monday** of the month at Pepin Distributors at 6:30 PM. For information, contact Mary Sheridan at mcpease@mindspring.com.

Visual Basic for Applications SIG

This SIG meets the **third Wednesday** of the month at 6:30 PM. The meeting location varies. For information contact William LaMartin at *lamartin@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Kevan Sheridan moderates the discussion.

Scottish Scientist Clones Another!

By Merle Nicholson, Tampa PC Users Group
merle@merlenicholson.com

Nah .. no big deal, it's just a disk drive. The message of this article is that if you want to clone a disk drive you need to go out and spend Zero dollars; that's $0.00 on disk image software. Don't let the salesman convince you that you need to buy Disk Image or Ghost if all you want to do is go to a larger (or smaller) drive. The software's free, and you might already have it.

My Project: I'm running out of room on my server drive where I do backups, so I want to replace the 20G with a 60G from my personal system. So I bought an 80G Serial ATA drive for my personal system because it's faster than the 60G Ultra 133. And I'm doing two clones: 60 to 80 on my personal system, and 20 to 60 on my server, and I'll have a 20 left over for another computer I'm building. I got an excellent retail price on the 80G SATA.

The Software: I do have Drive Image v8.0, but I elected to ignore that and use a utility from Western Digital. It's free for the download. It's called "Western Digital Data Lifeguard V11.0 for DOS". There is a companion "DLG Diagnostic for DOS" for repairing or diagnosing problems on a Western Digital Drive. Both Seagate and Maxtor have similar offerings. I've used both, and I recall that the Maxtor (probably) uses the same program as Western Digital; they're both made by *Kroll Ontrack*. It's been some time since I used the Seagate, so I don't recall much about it except that I'm confident that it's functionally the same.

So, if you buy a retail hard drive and need to clone the data from an old drive, look at the CD that comes with it. If you have an OEM drive (no box, even!), all you need to do is download from the manufacturer's website. Maxtor, Seagate and Western Digital all have them, and they're free! You'll see that they all have hard drive diagnostics and repair utilities – all of which I've successfully used. Some have image backup software. ◆

(OIffice……..Continued from page 7)

And we feature it in one of our Special Interst Groups.

PowerPoint is used to do presentations like the ones I have done for this group on digital photography, programming and the visit to a data center.

Outlook I use it as a contact manager and calendar but not for my email. I do use it along with Word and Access for email merges.

(Office……..Continued from page 10)

To reiterate what I said in the beginning, if you already have Office 2000 or Office XP and are not working in a corporate environment with collaboration and are not a person who has to have the latest version of everything, then this version is probably not for you. For me it is nice to have, since it integrates with Visual Studio 2003--something I did not go into in this review.

If you already have Office, CompUSA is offering an upgrade to Office Professional 2003 for a net price of $180 after an instant rebate of $50 and a mail-in rebate of $100. That looks like a good deal. Their price for the non-upgrade Office 2003 Professional package is $500.

Again, you must have Windows 2000, SP:3 or Windows XP to install Office 2003. If you are using windows 98 or Me, then you can purchase Office XP--for not that much less than Office 2003. So go out and get yourself a new computer with XP installed, and then you can purchase Office 2003 Professional for $500--which is probably not much less than what some of the cheap new computers cost.◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

It is getting a bit hard to fill the newsletter with articles by only our members. Merle bailed me out last month and again this month. However, I still have to write a good bit to fill in the remaining blank space. And my time for doing that is much tighter than earlier in the year. So I need some help with articles.

This month I wanted to write a nice long article about Adobe Photoshop CS, to which I just upgraded along with Adobe Illustrator CS. But I haven't had enough time to work with it to do it justice. So for this month I will write a little about Photoshop CS, nothing about Illustrator CS, a bit about my new HP iPAQ 4355 Pocket PC and a bit about Visual Studio 2003 and web services.◆

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

Minutes of the June Meeting

By Peggy Pulliam, Secretary,
Tampa PC Users Group
Pegrance@yahoo.com

Our June 9th meeting started with a bang of thunder and the rain pouring down outside the Pepin Distributors Meeting Room, but we had a room full of people for the Windows SIG which resulted in some lively conversations and questions and answers.

This was followed by a presentation of Trend Micro Internet Security 2004. This program offers virus protection of all sorts, a personal firewall, and has spam control and website blocking and many more features. You can protect your files and data easily. It checks for viruses every time you open, copy move or save a file, blocks spy ware, scans email messages and attachments.

You can set a schedule for the scans to take place or you can click and scan every file on your system right then and there, even floppy disks and macro viruses in Word or Excel documents!

If and when Trend Micro warns you that there is a virus outbreak or other intrusion attack, there is an emergency lock that immediately stops all incoming and outgoing Internet; you aren't locked out by someone else or the program.

All of this is set up in a very user friendly and comprehensive system. You don't have to know how it all works to set it up and get it protecting your computer and data. You can leave understanding it all up to the TrendLabs' engineers and support personnel. Any viruses or files that Trend Micro does not detect or cannot clean you can even send to their virus engineers who will dissect the file and get a cleaned file back to you in a couple of days.

That's pretty good tech support, and there are web pages with troubleshooting information for your use, too.

The presentation was followed by a discussion amongst those in attendance about what other protection systems are available and pros and cons for them and comparisons with Trend Micro.

It was only drizzling when the meeting ended, perfect timing. ◆

Three Mini-reviews:

- **Adobe Photoshop CS**
- **HP iPAQ 3455 PocketPC**
- **Visual Studio 2003 & Web Services**

By William LaMartin, Editor,
Tampa PC Users Group
lamartin@tampabay.rr.com

Adobe Photoshop CS

Last month I wrote about Office 2003, and since you, without doubt, read the article you will recall that it required a computer running Windows 200 SP 4 or Windows XP. The same is true for Photoshop CS. So don't run out and upgrade to it or buy it if your operating system doesn't meet these specifications.

However, if your system meets specs and you do a lot of work with images and have already tried Adobe's baby version, Photoshop Elements 2.0 (which is a very nice program) but want more power, then, by all means, go out and get Photoshop CS. I recommend it highly and have found a lot of useful and quite powerful features in CS that were not in my older version 5.01 of Photoshop. CS is actually version 8.

As I mentioned in my comments on page one, I have not had time to really go deeply into the new features and will, thus, probably write a more detailed review later. But since the newsletter needs filler and I have spent some time with it, here are my observations.

First, after the installation, the product has to be activated via the Internet. You don't have to do anything except follow instructions. This is part of Adobe's scheme to prevent unauthorized copying and distribution of their software. The activation sends Adobe the product's serial number along with a just-created activation number. You are allowed to put a copy of the program on your desktop computer along with your laptop, and I had no trouble doing this. I did have trouble with the online registration (which is not required and is mainly to keep you posted of updates, etc.). I received some sort of Java null pointer error on two attempts. So much for registering. I have had similar problems registering Microsoft products. But since activation is what is important, I don't worry about it. But it makes me wonder about the testing that goes into some of this.

First off, there was a very valuable movie on a separate CD that gave about an hour of quite good introduction to CS and its new features. It is produced by a separate company which will sell you 24 hours of such training for around $300. Based on the hour I saw, it is probably worth it.

The features, I investigated are below. Most are new, but the Contact sheet in a less robust form was in version 5, and the Healing Brush and Patch tool were introduced in an earlier version, possibly version 7. I will illustrate them with a photo of member Wade Herman since he is not here at the moment to object. To see the image in color, view the newsletter at our web site.

The features are:

- Color Replacement tool
- Healing Brush tool
- Patch tool
- Text on a Path tool
- Shadow Highlight
- Web Photo Gallery
- File Browser
- Create Panoramas

(Mini……..Continued on page 4)

(Mini……..Continued from page 3)

- Contact Sheet

Color Replacement Tool I used this to change Wade's hair from gray to my version of blond. I also changed his shirt from a dull, dark gray to the nice blue you see.

Healing Brush Wade, like all of us who live in Florida and are over 50, has some skin blemishes. To remove them, normally you would have to pay your dermatologist $100 a visit. Here Wade got it for free with the healing brush. The healing brush is much better than the Photoshop clone tool in removing blemishes. It matches the texture, lighting, transparency, and shading of the sampled pixels to the source pixels. Thus, the repaired pixels blend seamlessly into the rest of the image. The healing brush does its painting with a lot more thought than does the clone tool.

Patch Tool To use it you select the area you want to fix, then drag that area to another area that has the same color and texture as the area you want to remove but none of the unwanted blemishes (like bags under eyes) and release it. The area is then "patched (bags removed).

To finish off, I removed the background and gave Wade a new occupation--plumber. There were no new tools used here. Of course, I could have used text along a path to put the occupation on a curve instead of using normal text.

Shadow/Highlight Adjustment This worked wonders on a cemetery monument taken facing into the sun. A piece of trivia is that all cemeteries I have seen have the grave stones facing east. Hence, if you show up in the afternoon to take photos, you will be shooting to the west and into the sun. That will result with a washed out background and a dark monument. The Shadow/Highlight adjustment fixes this in one click.

Web Photo Gallery This is one of the automation tools. Using it, you turn the images in any folder into a slide show ready to be placed at your web site. You have a choice of styles and image sizes. I created two such shows and placed them as examples at http://www.tpcug.org/photoshop/slideshow and http://www.tpcug.org/photoshop/slideshow2. When you view the shows, note the Image Information. That is information, except for the file name, that I was able to add to each image (inside the image file) using Photoshop's file browser.

File Browser In the File Browser you get a new interface for grouping collections of image files. You may then work with them either as a group or individually. For example you could do a batch rename or a batch resize, etc.

Panoramas There is a feature called Photomerge that will create a panorama from selected images. Of course, they should be images that overlap and are in order. I have created panoramas in the past with stitching software (mainly 360 degree ones), so I took the collection of images that I had used for that and tried Photomerge on it and couldn't really notice any improvement. When I have time I want to take some photos with my new Nikon D100 for a panorama and see how Photoshop stitches them together.

Contact Sheet II This feature goes back to version 5, but here it is much improved. For any collection of images you can create a contact sheet or sheets like the old photographic version with as many images of your choice of size that will fit on a sheet and as many sheets as it takes to do the collection. You may also use the files names as captions.

And that is more than I planned to write, and I only scratched the surface. There is so much power in Photoshop. For example, I suspect that a thorough discussion of the many uses of layers alone would fill a book

HP iPAQ 4355 Pocket PC

In July of 2000, I wrote about my new Handspring at http://www.tpcug.org/newsletter/nl_2000/july2000/visor.htm. I really found it useful when traveling. Using it with Vindigo allowed me to be standing on a street in Manhattan and ask it to display all the Ital-

(Mini…….Continued on page 5)

(Mini……..Continued from page 4)

ian restaurants within a certain distance of my location. Or I could ask it to show me all the nearby bookstores. My family even gave me a GPS module to go with it. Now that was real convenience. But time marches on, and the Handspring's very limited memory eventually relegated it to just keeping track of contacts and notes of things to do. The newer applications, including the newer versions of Vindigo, required too much memory.

Well, four years later, I have an HP iPAQ 4355 Pocket PC, a far cry from the Handspring Visor. For some perspective, Larry Anders got one of the first Pocket PCs, the HP Jornada, and wrote about it in the article http://www.tpcug.org/newsletter/nl_2000/june2000/pocket_pc.htm. So I am only four years behind Larry. But this new Pocket PC is also a far cry from that first one like Larry bought. In fact, Larry said that after the original novelty wore off, the very limited battery life of the unit forced him to move back to his Palm Pilot for travel. However, he now tells me that now he has on order Dell's newest version of the Pocket PC, and he assures me that the battery life of these new units is much improved.

I won't bore you with a lot of specifications. If you want them, go to the HP site, http://www.hp.com/, and click on the handheld link. But briefly, it has 64 MB of memory, a 3.5 inch TFT 64K colors display, 400 MHz processor, integrated 802.11b wireless

Using Two Monitors

By Merle Nicholson, Tampa PC Users Group
merle@merlenicholson.com

I've been using two monitors for several months, enough time to do a couple of major programming projects and a couple of minor ones to figure out how they work and what they're useful for.

Here's a picture of my sloppy computer table showing my most recent configuration. It uses a new Samsung 17" LCD on the left and a MAG 18" LCD on the right, both using 1280x1024 resolution. 1280x1024 is the "native" resolution of both monitors. "Native 1280x1024" means that the monitors have exactly that number of pixels physically built into the screen.

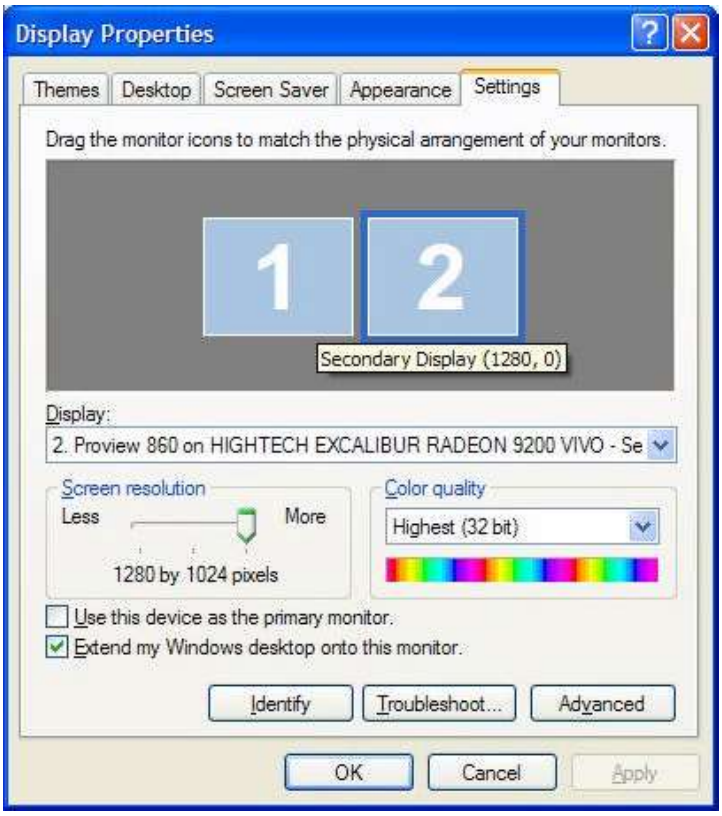
I've been doing a slow upgrade of my computer over the last year, starting with the MAG monitor, a Jetway motherboard, capable of AMD 3.2G Barton CPU and Serial ATA hard drive. My eventual goal was for two large monitors, 3.2G CPU, 80G SATA hard drive.

My previous system had on-board video which was unsuitable for that. I had a kind of surplus 15" LCD monitor that my wife gave me after I bought her a new 17" Samsung last Thanksgiving. I finally got it all together after buying a "made with ATI" video card that has three outputs, VGA, S-Video (TV) and a DVI connector, and built-in capability for two monitors.

So I used the MAG at 1280x1024, and the 15" LCD at 1024x768 for a couple of months, and decided it was a real aid to my programming productivity. So I waited for sales and found the Samsung for $369 on-line at Buy.com, free shipping, no sales tax. Patience pays off, for sure. Notice that there's a significant difference in physical size between a 17" and an 18".

In the photo, I have this article going in the left screen (the primary screen) and Office Online on the right as a reference. No switching from task to task, just move the mouse pointer from one to the other to manipulate the windows.

Using Access, I usually have the code window on the right and the forms on the left with the help on the left also. The code window is where you program in VBA and again, you need to have the help up and visible whenever you're programming.



I typically have reference screens on the right. You can't program anything without references and help screens, and switching from one to the other on a single screen really slows you down. For a couple of years, I'd experimented with multiple desktops. But I found that just more trouble that it was worth.

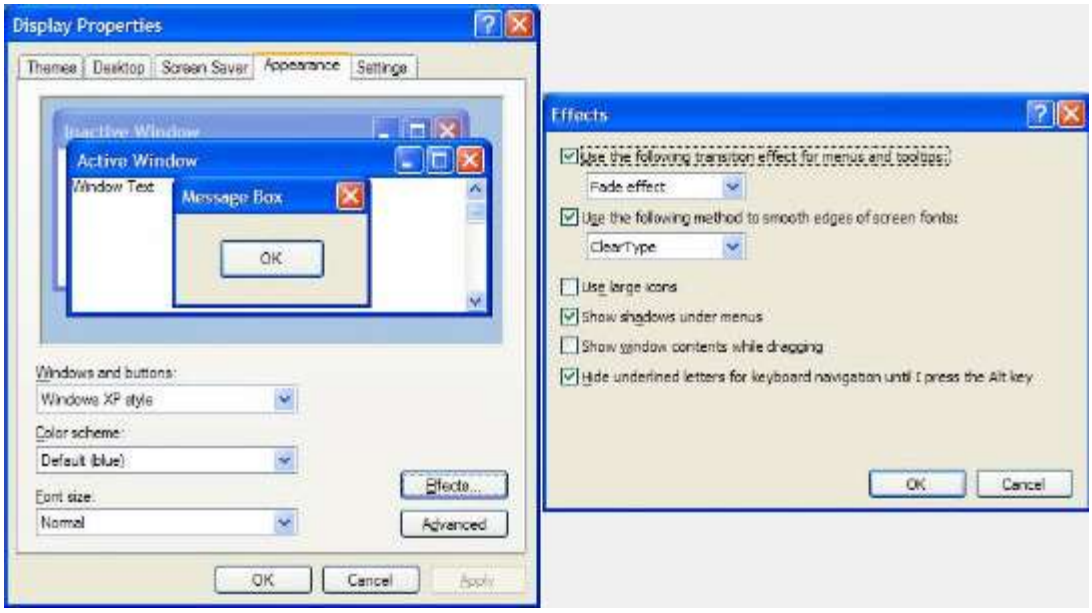
The physical setup is simple. The video card has a VGA connector for the primary display. I used a DVI-to-VGA adapter ($6) to adapt the DVI connector for

(Monitors……..Continued on page 7)

(Monitors…….Continued from page 6)

the secondary display. If I'd bought an LCD with digital input, I could have used it directly, with no adapter. But monitors with DVI cost much more.

The software needed comes with the card, and also two monitor support is native to XP. All that it now takes is the settings. Notice in the settings panel (Start, Control Panel, Display, Settings tab) that a secondary screen appears as 2. And the "Extend my Windows desktop onto this monitor" checkbox is checked. I frequently uncheck this when I don't want the right-hand monitor on; then Apply or Ok, and the monitor automatically goes blank.



You may ask, why not just turn the monitor's power off when you don't need it? The answer is that then some things may get accidentally lost on the right side, because the computer really doesn't know the monitor is physically turned off. With everything on, my screen size is actually 2560x1024. If I disable the right screen in Display properties, it reverts to 1280x1024.

All in all I find my programming productivity is way up. I don't have time lost going back and forth between Help and the code windows. Also sometimes it's just convenient to have more screen to say run my TV card on the right side when there's something on TV that I can't miss, and also have a deadline to meet on a project. That's rare, I'll admit. More often I'll use the web browser to do internet searches for programming solutions in Google Groups.

As an aside, if you have an LCD screen you may want to try ClearType to improve the clarity of your text on-screen. It really improved mine – dramatically. But don't be surprised if it's worse. Here's how you do that:

Go to Start, Control Panel, Display, Appearance tab, Effects button. Select the "Use the following method to smooth edges of screen fonts" check box, and select "ClearType" in the drop-down box, then Ok, Ok.

Look at the results, and undo it if your fonts are not improved. ◆

Secretary's Report

MINUTES OF 6/8/94 MEETING

By Ed Buzza, Tampa PC Users Group, Inc.

Jim Clark is out there in California enjoying himself and has left the gathering of the minutes of this meeting to a "volunteer" appointed by our eminent President, Harvey Bruneau himself.

USER GROUP NEWS

Non-profit status: After months of hard work by Marylee Bruneau, IRS has granted us 501(c)3 status. Also, she has obtained non-profit mail status for our corporation from the US Post Office. This will help reduce some of our newsletter costs.

PageMaker: This top end desktop publishing program is now being used to prepare the newsletter and appears to be very user friendly.

Print plant: The editor is looking for a new source to print the newsletter. Preferably in the Temple Terrace area. The use of scanned images, while excellent when printed, suffer in image quality (too dark) when processed by local copy centers. If anyone has any suggestions, please contact Marylee or Harvey Bruneau at 985-3388.

BitsoBlu BBS: The BBS had a bit of trouble a few days back. But it's fixed. Thanks in large part to Al Poole. Between him and Kevan, they tore that BBS completely apart, poked and prodded, examined all the boards, etc., etc., and put it back together. Now it works but neither Al nor Kevan knows just exactly what caused the initial problem.

INDUSTRY NEWS

Comdex: It was a bigger show than last year. One of our members said there wasn't enough time to see all that was there. The demo on Access suffered from some minor glitches. It was pointed out that Access puts everything into one data base file. It can export pieces of that data base to other data base programs and will import its own exports and work on them. Thus an Access user and a Paradox user can both work on the same exported file.

OS/2: The personal version is now in beta release. It's available from CI$ [sic] and IBM; but it is not to be posted on any other source or BBS. The release is on 21 diskettes and costs about $15 plus S&H. It will run on a system with 4 MB RAM; and the swap file can be turned off. Call (800) 251-2177 for details.

MS-DOS 6.22: The new version of DOS has a new disk compression module and is due out at the end of this month. $50 for 5.0 and earlier users, $10 step-up for version 6.x users. The new version has nothing new for 6.2 users. Users were cautioned not to have Stacker 4 already installed and then install DOS 6.22. You are advised to install DOS 6.22, then install Stacker. Symantec programs, and some others, need a patch to cope with the new compression module.

PC-Tools: This venerable software developer has been bought by Symantec.

Borland: They lost $70 million last quarter. dBase 4 for Windows now sells for under $100. With such a drop in earnings, the sale of Quattro to Novell along with a million copies of Paradox, the future doesn't look well for Borland.

DELL monitors: Dell has recalled 63,000 monitors because there were 32 reports of them overheating and catching fire. The monitor being recalled is the DL-1460N1, a 14" **SVGA,** sold during l992-93.These were sold through Sam's, Cosco, and CompUSA. Dell will arrange for pickup and replacement free of charge. For further information, call (800) 913-3355.

CD-ROM: There is a facility in the USF area that will put your pictures on CDs. In fact, anything you want can be put on CDs: text, instruction manuals, graphics, etc. Cost depends on a number of factors, and there is a marked difference in price if the pictures are negatives or positives.

(1994……..Continued from page 8)

PRESENTATION — Internet

George Pilat of Intelligence Network Online gave an excellent discourse on Internet; its origins, uses, and the role of his company in using Internet. The fact that Mr. Pilat spoke for ninety minutes extemporaneously and gave a logical step-by-step presentation of a complex process speaks volumes for the depth of his knowledge about online retrieval systems.

Internet:

In the early 70s it was a network of DOD computers (Advanced Research Projects Agency - ARPANET) to establish a communication network in the event of a nuclear war. During the late 70s, other networks were created, initially serving universities and, later, commercial organizations. The research portion of ARPANET was replaced by the National Science Foundation (NSFNET). Elsewhere, international networks were being established and they tied in to each other and to United States networks. Today, Internet is the fastest growing network in the world with over 2 million computers and over 20 million users. The primary tools are:

E-Mail: Basically, a message handling service. E-mail is often faster and cheaper than conventional mail.

Newsgroups: There are about 7,500 to choose from. While each group is centered on one topic or theme, overall, topics cover everything from A to Z. Many of the people in these groups are subject matter experts. Ask for help and you'll get expert help.

Gopher: A search tool that helps in locating a certain body of information. The material can be read online or downloaded to your computer.

Telnet: An Internet facility that allows logging onto another computer; faster than modem dialing.

FTP (File Transfer Protocol): Allows the downloading of files from any other computer on Internet.

IRC (Internet Relay Chat): Interactive discussion groups where several people can talk/listen at the same time. There are over 1000 channels/groups available. A private TALK mode is available.

The Internet is funded through federal grants. Access to the Internet by the lay public is possible through some BBSs and commercial servers such as IntNet Online, CompuServe, Delphi, etc.

IntNet Online

Intelligence Network Online, Inc. offers a variety of services, access to Internet being one of them. These services are offered through a high end UNIX platform with over 20 GB of online storage. At present, all modem lines are 14.4 (and downward) and 28s will soon be installed. The available account styles are:

Shell Dial UP: Normal dial in PC running through their computer. Shell uses command line prompts, no graphic interface. Uses "pine" program to handle E-mail. Cost is $29/month with a one time $29 setup fee. There are no hourly charges, usage time is unlimited. A tutorial diskette is furnished to all new users.

Dial Up PPP: Point to Point Protocol allows you to be registered with your own location. In effect, you have your own Internet set (like a mini server). Can use Mosaic, a public domain graphical interface, to navigate through the system.

Dedicated PPP (SLIP): Serial Link Internet Protocol. Once logged in, you are on 24 hrs/day, the line never goes down. Email is instant. Can have friends log in on your computer and they can use your machine to access Internet.

Dedicated Line: Offers 56 kb speed (commercial speed). Commonly used where like 30 people are online. Uses the frame relay service of GTE. This service is being offered within the six county area of Tampa (Hillsborough, Pasco, Pinellas, Polk, Sarasota and Manatee). The frame is for 24 hrs/day and 56 kb servers are installed at each of time nodes. T1 : 1 .45 MB speed or the equivalent of 24 56kb channels as an entity.

Special Interest Groups

Microsoft Access SIG

This SIG meets the **first Tuesday** of the month at 6:30 PM. The meeting location varies. For information contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merlenic@tampabay.rr.com.*

Digital Imaging SIG

This new SIG meets the **fourth Monday** of the month at Pepin Distributors at 6:30 PM. For information contact Mary Sheridan at mcpease@mindspring.com.

Visual Basic for Applications SIG

This SIG meets the **third Wednesday** of the month at 6:30 PM. The meeting location varies. For information contact William LaMartin at *lamartin@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Kevan Sheridan moderates the discussion.

(Mini…….Continued from page 5)

card, integrated Bluetooth and an integrated keyboard (very small) with backlight.

The wireless LAN feature is very nice. It connects to the Internet instantly from anywhere in my house through our wireless network and allows me to send and receive email as well as browse the web on its version of Internet Explorer. For those interested, it also supports MSN Messenger. I have yet to try it out in a public hot spot.

Using Internet Explorer on it has prompted me to consider making a special page at the web sites I run, including tpcug.org, that is designed for viewing by a Pocket PC. Our links page is an example of a page that displays well on the Pocket PC. Our main page does not display well--those Java hover buttons are nowhere to be seen.

Using Visual Studio .Net 2003, I am supposed to be able to write programs for the Pocket PC, and I plan on doing that as soon as I get time. When I do, you will probably read about it in a future article.

Visual Studio 2003 & Web Services

I did a presentation to the group, I think, within the past 12 months where I demonstrated some programs I had written using Visual Basic .Net, one of the programming languages within Visual Studio .Net. And I think I have mentioned web services to the group before. Briefly a web service is an application you place on a web site that can be accessed with a request which will then send back a response. Of course, for the web service to be of any value, it has to send back some information that you would like in response.

Examples of web services are ones that provide the weather for a particular zip code, stock quotes, address correction information, etc. Web services are not meant for the world at large; they are designed so that programmers can write programs, either web based or Windows desktop programs (or Linux programs), that can access the web service to provide raw data or manipulation of data.

I have written three web services recently using VB .Net. One is a simple cost of living calculation, the other accesses the Library of Congress to retrieve book information based on a submitted ISBN and the third is for our user group officers. It provides membership information. These web services reside at my web site and the TPCUG site. Just by knowing the URL of the service a programmer can access it and use it in the program. For example, by accessing the cost of living service with a beginning year, an ending year and an initial amount of money, the cost of living service will send back to the program how much it is worth in the ending year.

For the user group, I wrote a Windows program and distributed it to the officers that, when they are connected to the Internet, allows them to look at our

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

Last month I mentioned how it was getting hard to fill the newsletter with our own articles. This month the situation is worse. Merle Nicholson, who has rescued me for the past two months, is apparently running out of steam. However, he still contributed a short piece this month. Others who have been so helpful in the past apparently have writer's block, and those who have never contributed are still withholding their creativity from us.

So what to do? Perhaps I should shorten the newsletter by four pages (one sheet of paper). I had planned to write the Wireless article for this month, and it is here, but I hadn't planned on

However, for business concerning this newsletter, Bits of Blue, please contact the Editor, William LaMartin, at 821 S. Boulevard, Tampa, FL 33606-2904; 813-251-3817; lamartin@tampabay.rr.com.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII, Microsoft Write, Microsoft Word, or Word Perfect file to the editor at 821 South Blvd., Tampa, Florida 33606-2904 or to lamartin@tampabay.rr.com.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

The use of trademarked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

apcug Member of The Association of Personal Computer User Groups

Minutes of the July Meeting

By Peggy Pulliam, Secretary,
Tampa PC Users Group
Pegrance@yahoo.com

The July 2004 meeting started with the Windows SIG which ended with a question about how to use foreign characters when you type in Spanish or other languages. According to one member, it seems to have changed with Office 2003 and Windows XP--at least on one of his computers. And we hope to hear the answer at the next Windows SIG!

Mary Sheridan conducted the Microsoft Office 2003 Demonstration. We learned about organizing mail with some cool new features. We learned about different layouts that are available making your work easier depending on what you want to do at the moment, like read the material or work with rearranging it. When you are rearranging a document, you can "track changes" and lock down a document or part of a document. This lets someone edit the text or even parts of the text, but protects the parts that have final approval or the headers--or whatever you want protected. It allows research from where you are without having to leave to go to the web. There is a language button under "Tools" you can use to translate a whole document!

The Clipboard allows more space, the items on the Clipboard can be moved and used in other Microsoft Office programs. There are lots of tours and demos to be used. Microsoft.com has free training available for everything if you have an activated product.

There's plenty more to learn where this ended, so we may have another presentation on Office in the future! ◆

Wireless in Manhattan

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

On a recent trip to Manhattan, I had the chance to try out the wireless connectivity of my new HP Pocket PC iPaq 4355. Every chance I had, I would produce it, turn it on and see if there were any wireless networks available. The first try was at the Tampa airport—nothing. The second try was at the JetBlue terminal at JFK in New York. A banner advertised free wireless connectivity provided in the terminal by JetBlue, but there was no way my family was going to let me pause for more than a moment on the way to baggage claim. Then at baggage claim I had to scan for our bags, then catch a cab, and then the opportunity was gone.

Once in the hotel, there were two wireless connections listed as available—but they really weren't since they didn't allow connections. While walking around the Upper West Side there were always several connections listed as available, but almost none would let you in. This was a far cry from what I had read several years back when wireless routers first became widely available and articles were written about how easy it was to cruise the streets and sidewalks of Manhattan and find a place to connect to the Internet. In the ensuing time, people apparently have learned how to secure their wireless networks and have no interest in sharing a connection with strangers.

In reverse order in which I encountered them in my walks in various parts of the city in the next paragraph is a list of the names of wireless networks I encountered. Of these, only Terrace, Columbia University, the two Bryant Park ones and the one named default let me on. The Bryant Park ones required a sign on from a web page, and I didn't have time to do it, though. The default one, which was at or near a McDonald's on Broadway was OK for email but didn't provide enough bandwidth for viewing web pages with my laptop (I went to the hotel for my laptop in the hope of doing some serious work once I had discovered the connection with the iPAQ). T-Mobile available at Starbucks costs around $30/month or $.10/minute with a 60 minute minimum session in Manhattan. I think the charge in Tampa is less than that.

Default, NetGear, META_NYC_WLA…., Bleeker3, Mfo010, NY Amsterdam, NETGEARH, Moazami, 3CWireless, Stacy Lyn Giunta, Gur, tmobile, Verizon Wi-Fi, fa1779zvpo, NYSAK, BP-PKRR, Bryantpark.org, TOMMYB, Emgott, Columbia University, Terrace, MAX-BG, Elinkdsl, Marianne Wireless, Wireless, SkyLan_Interent

Some of the networks, like SkyLan_Internet and Verizon Wi-Fi, would popup in many parts of the city.

Bryant Park, http://www.bryantpark.org/, deserves special mention. It was one of the first places in the country, I think, to provide an outdoor wireless hotspot to anyone who comes to the park with a wireless device. You can read a description and see how to

(Wireless……. Continued on page 4)

(Wireless……..Continued from page 3)
connect when there at http://www.bryantpark.org/amenities/wireless.php.

It was interesting to see all these people in the park staring into laptops along with the signs admonishing people to be quiet in this section of the park. It was almost like being in a library reading room. Indeed, Bryant Park is located behind the main branch of the New York City Library between Fifth Avenue and Sixth Avenue (Avenue of the Americas) and between 40th Street and 42nd Street.

So why can't Tampa have something like Bryant Park? First of all, Tampa is really short on parks. Our city fathers of many years past saw fit to let Tampa develop with very few parks. There is a nice small park, Kate Jackson, in my Hyde Park neighborhood that has been recently renovated; it contains a small area with benches and paths among the shrubbery that is fairly isolated from the more noisy areas and, I think, would be a good candidate for such a hot spot. I am sure others can produce candidates in their neighborhoods. And, of course, there is Lykes Gaslight Square in downtown.

Speaking of my neighborhood, I decided to walk a bit of it to search for hotspots. I found a lot. Apparently wireless routers are everywhere. I found in excess of 30 and did not walk past more than 60% of the 400 houses in the neighborhood. I think about 10 let me connect and, of those, six gave me a connection to the Internet.

Back to Manhattan The Vindigo subscription I purchased for the Pocket PC again helped me to find restaurants in Manhattan, but I miss the Zagat reviews and ratings that were in it several years back. Now, instead of Zagat reviews you get reviews from the New York Times that may be over four years old. I think Zagat went out and created their own paid subscription service. The shopping information and maps in Vindigo are also of use. And I can load restaurant, shopping and entertainment information for as many cities as I like from Vindigo under my one year subscription. So far, I have only added Tampa. Unfortunately, there don't appear to be any reviews for the Tampa restaurants, and some restaurants that have been closed for more than a year are still listed.

If you are interested in using the subway while in New York, there is an excellent program for the Pocket PC called Tube New York that provides current schedule information on all the lines, a map of the lines and a trip calculator that figures your route for a starting station and an ending station. It will then do an animated simulation of the trip on the route map. The version of the program I have also includes an overlay map of the streets of Manhattan from about 50th Street south. The route maps cover the entire system.

Email problems Once you have lucked out and found a wireless connection that will let you on, you want to check your email. Well, before the trip, I set up an email account in Pocket Outlook on the iPAQ for my RoadRunner email account. It worked fine in my house on its wireless network. When I first tried to send and receive using it on the trip, I received an error message to the effect that I could not send. I should have known that would happen, since all ISPs that I know of will not relay email messages sent over another ISP's network. I needed to be using RoadRunner if I wanted to send a message using my RoadRunner account.

I then had two options. I could try to use RoadRunner's web mail or I could use an email account I created on the server that hosts my web site. It will accept messages originating from other domains since it requires authentication.

Well, it turns out that if I try to use RoadRunner's web mail using the Pocket PC's Pocket Internet Explorer program, I can enter my username and password, but then I go nowhere. If I try to setup an email account on the Pocket PC in Pocket Outlook, I run into the problem that the smtp server part only allows me to use the same username and password that the incoming part uses. And for some perverse reason the lamartin.com email setup requires that smtp precedes your incoming username in its smtp setup. So there is no way to set up my lamartin.com email to both send and receive. And just like Road-

(Wireless…….Continued on page 5)

(Wireless…….Continued from page 4)

Runner, if I try to access my lamartin.com account via their web mail Internet page I get nowhere. In their case, I get a Java error.

When I returned to Tampa I contacted RoadRunner and the host for my website. I found that RoadRunner did not provide a special page for Pocket PCs to access for web mail, but MyHosting.com, my web host, did provide a special page that worked with Pocket PCs where I could send and receive my lamartin.com email.

That got me to thinking. Why not create a page of my own at my web site that would allow the sending of email from the pocket PC. Web sites have the ability to send emails using their own server. I did that--but I am not going to give out the URL here since I don't want the whole world sending emails from my web site.

That got me to thinking some more. Why not create a web service at my site to send such emails that could be accessed from a program that I wrote for the Pocket PC. And I did just that. I wrote the web service that resides at my site. And I now have a program that I wrote using Visual Studio .Net and installed on the Pocket PC to send emails. So on my next trip to the big city, I will be able to send emails with no problem once I find a wireless connection.

(Wireless…….Continued on page 12)

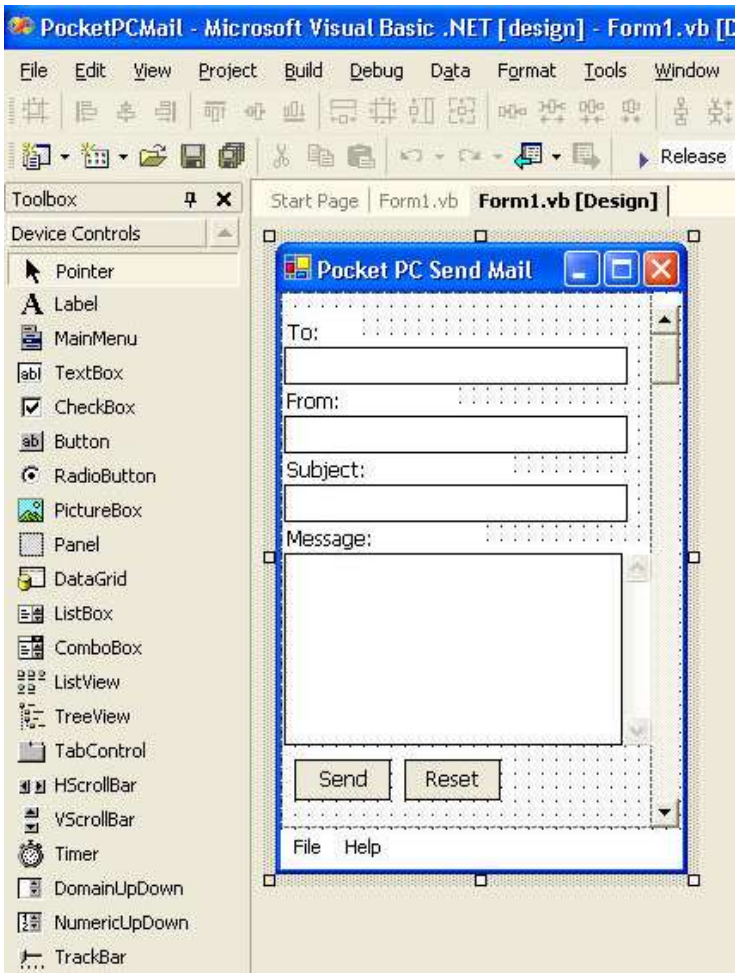
Programming the Pocket PC using Visual Studio.Net



By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

In my other article, Wireless in Manhattan, I mentioned writing a program for my new Pocket PC that allowed me to send email whenever I could find a wireless connection. In this article I want to go into the differences between creating a program for the Pocket PC and other "Smart Devices" and creating a program for a regular computer.

First off, as you all know, most regular computers run on the Windows operating system. The Pocket PC's operating system is a baby version of that called Windows CE. Visual Studio .Net allows you to create programs for both operating systems, with the exception that the tools you have for working in Win CE are considerably more restrictive than those available for working in Windows.

I have touched on Visual Studio .Net before, and you may recall that it is a programming environment with several different programming languages from which to choose when embarking on a programming project. There are Visual C++ .Net, Visual C# .Net, Visual J# .Net and my language of choice Visual Basic .Net.

To begin a Pocket PC project using VB .Net, you simply open Visual Studio .Net, and select options that allow you to create a new Visual Basic .Net Smart Device Application. The picture to the right is the left part of my workspace--the Intergraded Development Environment (IDE)--that Visual Studio created for me. What you see now is the result of my adding controls to the blank form on the right to create my Pocket PC Send Mail application. The controls are chosen from the toolbox on the left. The controls available for a Smart Device application are fewer than those available for a regular Windows application. And the individual controls used in a Smart Device application are quite often much less configurable than their counterpart in a Windows application.

Partial view of Visual Studio IDE

For those familiar with Visual Basic, the code is not that much different. Here is a listing of the code that is run when the Send button is pressed:

```
Dim Password As String = ""
        Password = LCase(Trim(InputBox
("Enter Password")))
        If Trim(Password) = "" Then
            MsgBox("Password required")
            Exit Sub
        End If

        If Trim(Me.txtTo.Text) = "" Or Trim
(Me.txtSubject.Text) = "" Or Trim
(Me.txtFrom.Text) = "" Or Trim
(Me.txtBody.Text) = "" Then
            MsgBox("All entries require
text")
            Exit Sub
        End If
```

(Pocket……..Continued on page 7)

(Pocket…….Continued from page 6)

```
        Dim ws As New SendMailSvc
        Dim Result As String
        Result = ws.SendMail(Password,
Me.txtTo.Text, Me.txtFrom.Text,
Me.txtSubject.Text, Me.txtBody.Text)
        MsgBox(Result)
```

The "SendMailSvc" in the code above refers to the web service I wrote (as a Visual Studio ASP .Net Web Service application) that resides at my web site and handles the email request. It resides at a URL that has been added as a reference to the current project.

As you work on your program, you want to test it. The easiest way to do this is to have Visual Studio run it in the Pocket PC Emulator, which is a software program that "emulates" a real Pocket PC. A screen capture of it with my program loaded is at the right. My own Pocket PC does not look in the least like the skin of the one at the right. What you see is just a generic version of such a device.

To install such a program on someone's Pocket PC, their device must first have the Microsoft .Net Compact Framework installed. It is not part of the operating system Windows CE. This is equivalent to the requirement that to run a program created in Visual Studio .Net on a Windows computer, the computer must have the Microsoft .Net Framework. The big difference is that the Framework for a Windows computer is around 24 MB, the Compact Framework for a Smart Device is around 1.5 MB. To install the Compact Framework on your device, you download a Windows executable from Microsoft (around 14 MB since it must take into consideration all the different processors that a Pocket PC may have) and run it on your computer while the Pocket PC is synced to the computer. Again, I stress that installing the Compact Framework on your device only adds about 1.5 MB of files--not 14 MB.

Once you have the Compact Framework installed (you only need to do it once), to install a program created in Visual Studio to the Pocket PC, all you have to do is copy one CAB file created by Visual Studio to the device and then click on the file. There is a different CAB file created for each of the different processors that a Pocket PC may have.

Pocket PC Emulator

If the developer is ambitious, he or she can create an installation package that has all the CAB files included and, based on what it determines the target device has as a processor, uses the appropriate CAB file to do the installation.

If anyone has any ideas for programs for the Pocket PC, I am interested in hearing about them. I have created three that are useful to me and am interested in trying others. That the newer versions of the device allow you to connect to the Internet via wireless connections when they are available opens up all sorts of possibilities.◆

Looking Back to 1994

Editor's Note: Usually we reprint the minutes for the month in question, but for August 1994 the minutes were extremely short. As a substitute, the president's column for July 1994 is reproduced.

From the July 1994 Bits of Blue

PRESIDENT'S COLUMN

By Harvey Bruneau

Internet
I hope everyone got at least a basic idea about Internet, the global information superhighway, at our last meeting. I hope to schedule a live Internet presentation later this year. As many of you probably noted, a whole new language filled with acronyms and buzzwords is used to relate to the navigation and use of the information superhighway. While these terms are new to us they have in fact been around for quite a long time. Of course you all heard the CIA acronym used along with the word LAOS during the presentation. I hope that everyone realized that these are not Internet words. I am not sure how the presentation diverged into a discussion of the covert operations of the 70's. Anyway cyber surfing the highway can be rewarding once you have all the tools and have built up the experience. Only you can determine if this digital highway is for you. It is anticipated that the highway will have over 100 million users worldwide by 1998. Whether you just want to use the most basic piece, email, or have access to detailed information about anything, I would recommend you get your hands on one of the many hooks available from your local bookstore. I use The Instant Internet Guide by Brent Heslop & David Angell to clarify the proper netiquette and help me understand the highway.

BBS & CD ROM
Please note that a CD ROM drive has been added to the BBS which will provide access to additional online files available for download. We have a subscription that will provide us with a monthly CD containing files from the Association of Shareware Professionals.

July presentation will be a big bang!
This month's meeting will be presented by Broderbund. This will be the first time that six different products have been demonstrated during a general meeting. There should he a product for everybody. The products include:

- **Living Books** - Interactive "electronic books'' for children based on stories and books of proven literary value.
- **Kid Pix** - Creativity tools that can he used to enhance studies across all curricula.
- **3-D Home Architecture**
- **Print Shop CD** - Desktop publishing for greeting cards, signs, stationery, calendars, banners and more.
- **Myst** - Surrealistic adventure game with 3-D photo realistic graphics
- **Harpoon II** - Naval game

Of course special user group offers and door prices of Broderbund products will he made available.

Tampa Tribune moves onto Information Superhighway
The *Tampa Tribune*, in conjunction with Prodigy, is in the process of starting a new service. *Tampa Bay Online,* an interactive local news and information service for personal computer users in the Bay area, will begin operation in August. Imagine reading the daily paper online including photos, graphics and other miscellaneous information. Once again Bill Gates' vision, "Information at your fingertips" is taking another step forward. A paperless society is in the future and the *Tribune* is doing its part to speed up that process before we run out of trees. The presentation to our group of *Tampa Bay Online* by the *Tribune* has been tentatively scheduled for the August general meeting. I say tentative because this product debut by the *Tribune* to the general public is scheduled for the day after our general meeting. If Murphy's law interferes during the days prior to the grand opening of this service, it could result in the postponement of the presentation to our group, until a later date.

We need your help
We need you to help our group. Bring a guest and get them to join our group. Pass out our flyers to your

(1994……..Continued on page 12)

(Comments……..Continued from page 1)
doing more. Necessity then led me to write the article on programming for the Pocket PC using Visual Studio .Net. I know, most readers tolerance for programming articles is pretty low, so I tried to keep that fairly short. Thus, there is still over a page to fill. Forgive me if I am forced to fill the space the best way I can; thus, the following observations.

Never click on anything in an email without hovering your cursor over it to see where it leads and never click on attachments. I have told that to myself and others many times. Last week a relative received an email from her ISP stating that it had detected a large number of emails originating from her computer and that she was obviously infested with a mass-mailing worm and she needed to click on the attached file and read the instructions on how to clean up her computer.

As you might have guessed, the email was not really from her ISP--it just appeared to be--and the file to be clicked on did not contain the promised instructions. It contained the latest version of the MyDoom mass-mailing worm --and her computer ground to a crawl. The mouse would only move in slow jerks, programs took forever to open, etc. When she called me, I had her start in Safe Mode and run msconfig to see what was in the startup. There were a couple of things there that were obvious problems. Service.exe is the only one I can recall at the moment. Anyway she had loads of things starting up that shouldn't be. I had her uncheck all of those and reboot. The computer seemed much better but was still not normal. Next she ran Norton Antivirus, but it found nothing. Oh, I forgot to mention that Norton gave her a warning when she clicked on the attachment--but somehow it did not protect her. Since I wasn't there I don't know, but maybe it gave her several options and she chose the wrong one.

Next day when she boots the computer, Norton comes up and gives her some message, she then goes to the Symantec site and based on that message determines that she has MyDoom, but her computer is so crippled that she cannot download the fix. So I go to Symantec, get the FixMyDoom.exe and send it to her as an email attachment. It takes her forever to download her email. Finally it comes in and she is able to run the fix. It says that it has found all these problem files and quarantined them and reset the registry settings to what they should be, etc. Then, per instructions, she shuts down and reboots and runs the fix program again to remove any remnants of the worm that may have been in memory during the first fix.

I will say it again--do not click on anything in an email--and I will add do not believe any email that tells you it is from your ISP, your bank or Nigeria.

Now that I am on a do-not-do-thing jag, here is one more: **do not hold down the shift key when deleting anything.** If you do, you will not be able to retrieve it from the recycle bin for files and folders or from the deleted items in emails. But you say, "I only hold down the shift key when I know that I will never want the item again." My answer to that is there is always a chance that I will make a mistake and actually want it tomorrow or I will make a mistake and delete something other than what I think I am deleting.

The recycle bin is there for that purpose--to save you from mistakes. It causes no problem to let deleted items sit there for, say, a week before being deleted permanently. You don't even have to look at the items before emptying the bin. Most, if not all of them will have been there long enough to be retrieved in case you suddenly find a need for them.

In the past two years I have had at least two queries from members who used the shift key when deleting, but then wanted their stuff back. There is only one possible solution , and that is to purchase software that can under the right conditions restore the deleted files.

Just recently someone deleted an entire folder of email (the entire folder, not just the messages in it) by holding down the shift key while supposedly deleting only one message in the folder. It was a relatively unimportant folder, so the consequences were not grave, but what if had been the inbox containing two years worth of messages?

Finally, let's talk about buying computers. When

Special Interest Groups

Microsoft Access SIG

This SIG meets the **first Tuesday** of the month at 6:30 PM. The meeting location varies. For information contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merlenic@tampabay.rr.com.*

Digital Imaging SIG

This new SIG meets the **fourth Monday** of the month at Pepin Distributors at 6:30 PM. For information contact Mary Sheridan at mcpease@mindspring.com.

Visual Basic for Applications SIG

This SIG meets the **third Wednesday** of the month at 6:30 PM. The meeting location varies. For information contact William LaMartin at *lamartin@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Kevan Sheridan moderates the discussion.

Office Updates

By Merle Nicholson, Tampa PC users Group
merle@merlenicholson.com

If you use Office 2000, 2002 (XP) or 2003, it's a good idea to go to the Office Updates on the Microsoft web site occasionally. The Download page has a product scanner somewhat like the Windows Update where it scans the Office products that are installed on your system and selects the ones that you need.

I was surprised that it did an update for my Microsoft Visio 2002 Standard package. I had bought that separately from my copy of Office XP.

While you're at the website, poke around for more free stuff like new templates and graphics and articles on how to do stuff. There's a wealth of information there and it's easy to find.

To get there, go to http://office.microsoft.com/home. Under *Home*, select *Downloads.* There you'll find *Updates* for the product scanner. ◆

(Comments……Continued from page 9)

the Gateway store was in Tampa, I tried to always buy from it, since I had bought Gateway computers for many years, was happy with them and wanted to support the store since they had been nice to our group. Well, Gateway closed all its stores this year, so that is no longer an option. Thus, when the relative of MyDoom fame said she wanted a new computer, I first went to the Gateway site, but things were different. There is now very little that you can customize, I confirmed in an online chat with Gateway. In fact, only one of the 710 series computers (not the one we wanted) came with Windows XP Professional. All the others came with XP Home, and when you click on the customize button, there is no way to change XP Home to XP Professional--even though on a previous page there is the message: "Gateway recommends Microsoft Windows XP Professional". You also cannot change the hard drive size. This is not the Gateway I have bought computers from since 1991. So it was off to the Dell and HP sites.

The Dell site was a bit tacky to my taste with messages in red that read something like "Limited time offer"; "ends Wednesday". So after a quick look around it was on to the HP site. The HP desktops seemed aimed at the low-end market, and I must admit a long standing prejudice against HP computers based on a few bad encounters with them. However, at the same site Compaq desktops were available and infinitely customizable. You can have Windows XP Professional if you want, you can have any type of monitor, hard drive and amount of RAM you want. This is the way it should be. So, this time, the order goes to Compaq. I am afraid, at least for the time being, 13 years of buying mostly Gateways is over.

Now, couldn't one of our members have written something similar to the above, giving the newsletter more variety and adding to my knowledge, too.◆

(Wireless…….Continued from page 5)

In closing, it would be nice if there were some sort of universal wireless service travelers could subscribe to that could be used in airport terminals, hotels, coffee shops, etc. Now if you are lucky enough to find a for-profit service in such an establishment, say, at a Starbucks, it is not going to be the same service you find down the street at a McDonald's or at the airport. And few of us want to pay for wireless connectivity—especially more than one service. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

Hurricanes and Computers Without a change from the predicted course for Hurricane Charley, it is not clear that I would now be typing this column at my computer in a room under a giant oak limb in a house about 600 feet from the Bay in Tampa. First, it is not clear that the room would still be of use after what I saw oak trees did to homes in Hardee and DeSoto Counties south of here. Second, even if my room had been spared, I am not sure we would have electricity, phone service or cable service yet. There are so many more houses in the Tampa Bay area than in the area hit by the storm, and in my part of Tampa, at least, we have almost total tree cover. The power lines would not have stood a chance. I can see it taking

Minutes of the August Meeting

By William LaMartin, Editor,
Tampa PC Users Group
lamartin@tampabay.rr.com

Since our secretary was traveling and we can not figure who was responsible for taking notes in her place, here is an abbreviated description of what happened at our last meeting.

The meeting began with the usual Windows computer discussion.

Bob LaFave then did a presentation on the Intel Digital Home Experience. Bob has summarized the main points of the presentation in the following paragraph. Thanks, Bob, for the presentation and synopsis.

Integration of consumer electronics with the current home PC's into today's home. Using wired and wireless networks, it is now available to use your computer as a media center. You can access audio digital music, a TV tuner, digital videos stored on the PC throughout the network to enhance your home. How Intel's CPU's with Hyper-Threading technology allows for multi-users to enjoy different media types at the same time throughout the home. ◆

(Comments…….Continued from page 1)

more than just a couple of weeks to get power back to everyone.

So what does all this hurricane stuff have to do with computers? Well, if you don't plan ahead you may not have any computers or any of your data after a storm. And even if your computer survives the storm, you most likely won't have any electricity to power it. Even if, as I, you have an electrical generator to provide temporary power, you most likely won't have a phone line or cable connection that

(Comments…….Continued on page 7)

FrogPad One-Handed Keyboard

By Merle Nicholson, Tampa PC Users Group
merle@merlenicholson.com

Quoting from the FrogPad website, "FrogPad™ is a one-handed keyboard to be used with USB Keyboard compatible PDA's, Pocket PCs, Tablet and Wearable PC's, and other mobile applications".

To be honest, I didn't read that statement when I bought mine for my desktop machine. They're promoting the Bluetooth model with that statement, and I purchased the original "Ion" USB model ($150), not the Bluetooth model. I suspect the Ion USB model is being discontinued now that the Bluetooth model is available. There are still some USB models available, along with free shipping as of this writing, 8/19/04. There are Apple FrogPads and also left-handed versions of each model. The Bluetooth models are $175, plus the cost of a USB Bluetooth transceiver if you don't have one for an additional $35.

Alternative keyboards have always been around. There are a dozen or more available right now. The more interesting are the "chording" keyboards some of which resemble game controllers for either one or two hands. If you're interested, a Google search for "alternative keyboards" will turn up plenty.

So why buy an alternative keyboard? There are several reasons that you may want to try one. First and foremost is the very real possibility that you can – with practice – type faster. After all, there's nothing sacred about the QWERTY layout. By that I mean that the keyboard you're using was not designed for the purpose that you actually require. It has been enlarged (more keys), but not actually redesigned except once since 1873. And that change simply rearranged the keys from an alphabetical format to QWERTY, being designed to eliminate key jamming of all-mechanical typewriters. Alphabetical format would probably be better.

So you may ask, why don't they just study the problem a bit, and then design a good one? Well the answer is, they have, many, many times, and hardly anyone notices. Technical excellence rarely wins out over momentum and marketing. If it did, we'd all be using Apples, Ataris or Commodores. Remember that the IBM computer of 1984 was no great shakes. If speed and typing efficiency means anything, at the least, we'd be using the proven Dvorak keyboard arrangement, available at no cost to everyone!

One concern that I've always heard is that time spent on a different keyboard may detract from or harm one's skill on a conventional keyboard. My own experience tells me that it's completely unfounded. I used a different keyboard (for APL programming) for twenty years, and switched back and forth many times daily with no problems. The human brain is a remarkable thing and fully capable of learning two (and more) keyboards.

Back to the FrogPad, reasons you may want this particular alternative keyboard are: small size, a really well-thought-out layout, and a comfortable hand position. It's small, fully functional and easy to learn. The Bluetooth model offers even more possibilities, with portability and, in time, a wide variety of devices.

This device measures 5-5/8 by 3-7/8 inches and about ½ inch thick. It needs no software. On XP and Win 98SE, it installs automatically and instantly, just as you'd expect of any keyboard. I was able to try it out on Win 98SE since my personal computer dual-boots between XP Home and 98SE.

As you can see in the pictures, the pad is quite small. After an hour or so of using it, I put my regular key-

(FrogPad ……Continued on page 4)

(FrogPad…….Continued from page 3)
board aside and haven't used it since. This is because I found myself tempted to revert back to the regular keyboard in times of frustration and because I wanted to keep myself on track to learn the FrogPad as fast as possible.

I find the positioning of the pad very comfortable. I've angled it about 20 degrees and placed a terry cloth under the heel of my hand. It's far more comfortable than with the old keyboard. I'll buy a gel hand rest next time I'm at the computer store.

This FrogPad is frog green, with white, yellow and green lettering. See our website, http://www.tpcug.org, for the web version of this article; it has color pictures. Other FrogPads are white. Check out the FrogPad website, http://www.frogpad.com.

The pad has ten lights on it to tell you the status of the functions. There are fifteen letter keys plus Space and Enter for characters. The remaining eleven letters are keyed by using the Space key in conjunction with one of the fifteen. With the Number, Symbol, and Shift keys, that makes twenty keys in all. It amazed me how little time it took to learn the position of all the letter keys and a good number of the most-used other characters like Tab, Comma and Period. They are well-thought-out to minimize keystrokes. Other symbols and actions are more difficult, and I'll talk about that later.

Obviously, each key has multiple functions. Just looking at one key alone, the W near the top right, it types: w, m, W, M, a colon, a dollar sign, a 9, F9, pause and Break. That's ten functions.

You position your three center fingers in the center of the pad, on the E, H and T keys. The thumb rests on the space key, and the pinky rests on the Y key. The pinky is used on the Y, Enter, and the Shift. The index finger covers the left six keys. The thumb is used on the Number key as well as the Space. The Period is typed with Space+Enter, and Comma with Space+Symbol. The other important keys are Delete (Number+U) and Backspace (Number+I).

All this is surprisingly easy to learn. It's much more natural than a standard keyboard. And I haven't been tempted to abandon it at all.

To describe one of the various modes, the Number key is pressed to switch into number mode. This converts the fifteen keys into a number pad and also to Function keys if used in conjunction with the Space key. The Number key is pressed again to switch out of number mode. The operation of the Symbol key is the same. That will get access to the two symbols on the right side of each key. In the case of the W key, that's the colon and dollar sign.

The Number and the Symbol keys interact so that one switches the other off. And the Symbol key remembers if it turned the Number key off and turns it back on if Symbol is turned back off. The Shift function is most interesting. Pressing and releasing the Shift key will capitalize just the next letter key you type. To enter

Caps Lock, press the Shift key twice.

The company assures us that all keyboard functions are represented on the FrogPad, so I'll admit here that I haven't learned some. I'm not having any problems typing this article because at least my head knows where every key is, even if my fingers do not. I'm not fast yet, because I'm still "thinking" my fingers into the positions for many of the keys. My top speed is just 23 wpm on a standard keyboard, and I'll be happy to match or exceed that on the FrogPad. It's coming along, and I'm practicing some each day using a program I wrote that presents the most-used 1000 words in the English language.

But I'm a habitual programmer, and the keyboard requirements for programming are much different. I do a

(FrogPad…….Continued on page 5)

(FrogPad……..Continued from page 4)

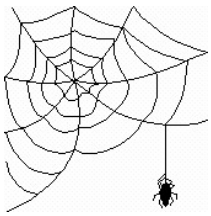
lot of selecting of text using Shift+arrow keys, then Ctrl+C, Ctrl+V or Ctrl+X. In other words, Select, Copy, Cut, move the cursor and Paste, without using the mouse. Here the FrogPad doesn't shine, at least for me. To use a Ctrl+ function, you press Number+E to enter Ctrl mode, select Space+T (that's a C), then press Number+E again to take it out of Ctrl mode, move to a new location, back into Ctrl mode, select Space+D (that's a V), then press Number+E again to take it out of Ctrl mode again. It doesn't seem worth it, and isn't.

A similar problem exists for entering symbols. You do a lot of entering of parentheses and brackets and double-quotes when you program, and to do that takes a minimum of three key presses each. I think that the Symbol key should work like the Shift key and pop out of Symbol mode with one other key press.

Now to be realistic, programming isn't about typing quickly. My guess is that I type maybe five or six wpm when programming. Programming is 95% research, testing and thinking. So I believe that my productivity will not suffer much. And I consider it a challenge to my ingenuity to find solutions. For instance, I can adopt the use of the mouse more for cutting and pasting. Also, I find that the keyboard arrow keys, Tab, Home and End keys are, if anything, quicker, because the FrogPad requires less hand movement. On a conventional keyboard, your hand must leave the home row to use many, many keys; on the FrogPad you

(FrogPad……..Continued on page 10)

Internet Picture of the Month



Toppled Arcadia, FL Water Tank

Hurricane Charley did a lot of damage in Florida. The photo above is of a water tank felled in the storm. Much of Arcadia may be without water for some time.

The photo is from http://www.schnittshow.com, where there is a collection of aerial photos at http://www.schnittshow.com/hurricanecharley2004.html. Go there and get your fill of destroyed house trailers.

PHOTODEX ProShow Gold

By Larry Anders, Librarian, Tampa PC Users Group
Larry@AndersNet.com

I've written a couple of reviews in the past about programs that will take your digital images, either taken with a digital camera, scanned or borrowed from the Internet, and do something special with the images. And those software packages were good, or I wouldn't have written about them to begin with. But I've found one that is better, and quite impressive at that.

ProShow Gold is a program with nine modules to let you create professional-looking slide shows to share with your friends, use for business, or just for fun, I guess. It's as easy as just selecting your images, drag and drop them onto a show window, add sound in the form of music or a digitally recorded track of commentary and choose from over 280 nicely-done transition effects between slides. You can even mix in a video with the still images.

I just used the phrase "still images", but with ProShow Gold your images are anything but still. Next time you watch a television ad notice that you hardly ever see just a still image used in a professional commercial. ProShow Gold gives you this ability to add motion effects, such as panning, rotating and zooming [also known as Ken Burns effects, referencing a documentary filmmaker who popularized these effects]. You can make subtle little changes in the image, or call dramatic attention to a portion or spot on the image, and it only takes a few seconds for each shot, or, if you have several images, just let ProShow Gold randomly select your motion effects [and transitions] for you.

Once you've chosen the images, transitions, sounds and motion effects you can create a show title screen with menus if you have more than one slide show. If you're not into math and calculating the time needed for each slide to match your music, then let ProShow Gold sync the soundtrack by automatically setting both the transition times and slide display times. After you've decided how the slide show is going to look and sound, then you have to decide how to share it. As I mentioned earlier, there are nine ways to share slide shows and they are:

- Create a DVD to play on any DVD player
- Create a video CD that will play on most of the newer DVD players
- Create an Mpeg1 or Mpeg2 video file
- Share the slide show online by uploading it to the Photodex website
- Upload the slide show to your own website--ProShow Gold creates all the code you need
- Create an executable self-contained slide show that can be played on any Windows computer without any other special software
- Send that executable by email
- Create auto run CDs that will start automatically by placing the CD into a Windows computer
- Create Windows screensaver files [.scr]

There are several settings for each of the above listed slide show outputs. Suffice to say, there are plenty of choices. There are two programs to choose from, and both are free for the downloading: ProShow and ProShow Gold. Below is the difference between the two.

(Comments…….Continued from page 2)

works so as to go on the Internet. Of course, if you don't have a home left, what happened to your computer and data may not be of great consequence to you. That notwithstanding, let me relate what I did to prepare as the storm bore down on Tampa.

Omitting what we did to secure our home in general, here is what I did as regarding my computers. First, I backed up to CD all my data files and photos files that I had not already backed up. I keep fairly up-to-date on backups, so that was not a very big chore. If I had had to start from scratch, it would have been a very big problem, since the photos alone comprise over 50 GB. Then I made backups of the websites I manage and all of my programming files for Visual Basic, Delphi and Visual Studio. Other data that needed backing up were for programs like Quicken, Family Tree Maker, Access, Word, Excel--all the usual suspects.

Once I had my backup data on CDs or DVDs, I put them in a different place from where the computers reside. Of course, it would have been better to store them off site. And for a small amount of data, if desired, I could have uploaded it to some of the many servers for websites I have access to. All of those servers are outside Florida.

The final thing for me to do as regards computer preparation for the storm was to get the two computers and their associated printers and scanners in the first floor room under the giant oak limb moved to another location in the house. I decided to wait until a couple hours before landfall to do this, since there was always the possibility that the hurricane would choose other victims. And it did. Our good luck in Tampa was other Floridians' bad luck.

Moving Data to a New Computer I assisted a relative recently in purchasing a new Compaq desktop computer. It is a beauty with Windows XP Professional, one GB RAM, 250 GB hard drive, 3.2 MHz Intel Hyper Threaded processor and a 17" flat panel display. Much more computer than she really needs, but she keeps computers for a long time, and who knows what she will need six years from now. Besides, it is the computer I would have ordered for myself.

Knowing that she would want to get all her data, email messages and other such things copied from the old to the new, I decided the best thing to do was buy a wireless router for her, and I found a real good buy on a Netgear WGR614 54 Mbps at CompUSA. The plan was to connect the new and old desktop computers to the router with cables and transfer her data over the network connection. Of course, that could just as well be done with a crossover cable or with a cheaper, non-wireless router. Ah, but the wireless router would also allow me to connect to the network with my notebook computer when I visited. That way I could tap into her broadband connection, and we could easily exchange the occasional file we sometimes share. Finally, with all the rebates, the wireless router was as cheap as a regular router.

With the old computer now connected to the router and configured to share its files, I tested the file sharing with my laptop computer and left her printed instructions on how to set up her new compute when it arrived. I would help her with the new printer and retrieving any files she couldn't find when I next returned.

By the way, the old computer used Windows 98, so I simply shared the C drive and made it password protected. I also enabled WEP on the router so that a casual passerby would not be able to enter her wireless network.

On my second trip over, I set up the new computer to be on the same workgroup as the old computer and then "View Workgroup Computers" from the new computer to find the old computer, put in the password and had access to all its files. We copied all her photos, Word documents, Excel documents, and miscellaneous things like Family Tree Maker files.

To get all her email messages, I mapped a network drive on the new computer to the C drive on the old computer and then from Outlook Express on the new computer imported all the old messages from their

Looking Back to 1994

Secretary's Report
MINUTES OF 8/10/94 MEETING
and PERSONAL COMMENTS
By: Jim Clark, Tampa PC Users Group, Inc.

Another very good meeting, but the very wet weather played havoc with attendance — which was down to less than half the norm. Too bad, too, because Prodigy gave a good thumbnail of their service and the Tampa Tribune gave a rundown on the new Tampa Bay Online service they were to kickoff the next day.

USER GROUP NEWS

ADOPTBBS: Harvey elaborated on a brief article in the August Bits Of Blue newsletter about the kickoff of our Adopt The BBS fund-raising drive. In essence, our BBS has limited capacity which needs to be expanded and improved. A recent membership survey outlined member priorities for the BBS — more files and add a second phone line, which also entails another high-speed modem. A number of actions have been taken to cut costs and generate more revenues. These have all been helpful, but as yet have done little more than offset increasing costs, such as the rental fees we now have to pay for our general meetings. Our treasury simply doesn't have the funds to accomplish the needed improvements to the BBS. Hence, the Board of Directors elected to raise the needed finds from membership donations. Adopt The BBS is to run through the close of the September meeting. If you want the BBS to be improved and are willing to help with that effort, please send in your check to the TPCUG marked for ADOPTBBS, or bring it to the September meeting. Join those of us who want our group to continue to get better.

INDUSTRY NEWS

IBM Dropping Amber Line: IBM has announced that it is stopping production of its Amber line laptop computers. Full support for these computers will continue, however.

ACCESS 2.0 Problem: Industry news reports that Access 2.0 is giving some users problems with losing data. Those affected are users operating Windows for WorkGroups 3.1 and using SCSI drivers, and then only when accessing the SCSI heavily. While the info is not clear, it would appear that the problem exists only when the SCSI is on a personal machine as opposed to in a network situation. Work is in progress to solve the problem.

Intel Dropping Some Modem Lines: Intel is apparently contracting its modem production and has announced it is dropping some of its less profitable modem lines; it would appear competition and continuing cost-cutting pressures have prompted the move. I do not have details to publish here, so if you are thinking about an Intel modem, you might want to check to see if the one in which you have an interest is one of the lines being discontinued.

Windows 4.0: Word in the industry is that Microsoft will be delaying release of Chicago/Windows 4.0 until the 2nd quarter of 1995. Meanwhile, IBM's work on its OS/2 Personal is nearing completion — IBM will review this new competitor before our group at our September meeting.

PRESENTATION — Prodigy & Tampa Bay Online

Prodigy: Peter Drummond, Retail Sales & Marketing for Prodigy, was on hand to give a brief rundown of Prodigy for those not already subscribing to that online service. He outlined how Prodigy had now grown to become the largest online service in the country, with the most subscribers. Among the many statistics provided, there are bulletin boards for just about every area of interest you might think of, and, collectively, they handle some 100,000 notes each day. Pete's principal purpose was to introduce Prodigy as a means to get to the new service that is coming online on Prodigy—Tampa Bay Online (TBOL). As a Prodigy user, however, I can tell you that there is a wealth of information available to subscribers in just about any area of interest. It has a Windows-like environment (graphical interface) in both its DOS and Windows versions of the software, and in spite of the breadth of areas covered by the service — from news & weather; to business & financial news and investing online; to banking online; to airline info & online reservation/ticketing; to many, many bulletin boards; to games; and on and on — navigation within Prodigy is fairly easy.

In contrast to the other online services, Prodigy offers multiple levels of subscriptions. However, over 90% percent of the subscribers chose the Value membership. This $14.95/month subscription gives access to over 90% of Prodigy features without further access or time charges. Less costly subscriptions are available, down to as little as $2/month. This allows subscribers to purchase the service most suitable for their needs. They also offer a free trial membership that allows one to try out the service without cost. You might want to take advantage of that offer.

Tampa Bay Online (TBOL): The bulk of our presentation time was devoted to hearing about this new service for the

(1994……..Continued on page 9)

(Comments……..Continued from page 8)
Tampa Bay Area. Nanette Holland, TBOL News Editor, and Allan Gengler, TBOL Bulletin Board & Information Editor, were on hand to introduce this new service to our members. And they did an excellent job of doing just that. It appears to be an outstanding service. It will provide online all of the goodies contained in the Tribune, except for the national/world news that the Prodigy service already covers, plus other items of interest to Floridians that are not included in the Tribune. Among the latter are computer news and information, including product reviews by our own members; community profiles; beach guides; weather updated periodically, including current radar views; hurricane information and historical data; lottery info; articles prepared for but not published in the Tribune; info on public parks in Florida; and on and on. Another very big plus for TBOL is that it, too, has bulletin boards for notes and messages on just about any subject between TBOL and subscribers, and between subscribers.

Also with a graphical interface, TBOL's opening screen offers 4 or 5 "highlight" items, plus access buttons for each of the following categories: News/Opinion; Sports; Business; Bay Life; Entertainment; The Florida Key; Bay Talk; and Classified. Yes, all the want ads are available on line. Clicking on each of the categories leads you to a similar screen for the contents of that category. Much like the Tribune, it includes items of interest to all Floridians and local news for counties from Citrus County to the north, to DeSoto/Highland Counties to the south and Polk County to the east. Moreover, a good bit of the info available (such as lottery numbers, or recipes from previous weeks, to name but a couple) is archived so that several days or weeks of back info is available,. Most of what you see can be downloaded to printer and/or file.

I tried the service just before beginning this report and I like what I see. It is, in fact, as easy to navigate within as it appeared to be during the presentation. It is very easy to use, easier in my opinion than finding things in the Tribune itself. Moreover, the news in TBOL is available the evening before the Tribune hits the street. And it is less expensive than the newspaper, costing only $4.95 per month, the charge being billed on your Prodigy statement. I don't mean to suggest that TBOL is a replacement for your Tribune subscription. Rather, I am trying to give you a feel for the high quality and timeliness of service that I saw. TBOL is free for the first weekend for anyone interested in trying it out. That, of course, will have long since passed by the time you read this, but I would expect that TBOL will offer some additional free weekends to acquaint those who missed the first offer. Keep your eyes open. But you don't have to wait — they have made it easy and for those enrolling now, the first month is free. Even if that is no longer available when you finally decide you would like to try TBOL, $4.95 is not an exorbitant cost to not wait for the "trial" periods or free months; just tinkering with TBOL for a month is worth the $4.95.

Many thanks to Peter Drummond of Prodigy, and Nanette Holland and Allan Gengler of the Tribune for an excellent presentation of your services. You have been most helpful and we look forward to the continued progress of your respective services.

AND THE WINNER IS

Thanks to the generosity of Asymetrix and Computer Associates, there were a couple of very nice door prizes. Those among us to have the good fortune to win are:

Rob Davis	Simply Money
Herb Atwood	Multimedia Make Your Point

The meeting adjourned at about 8 PM. ◆

(Comments……..Continued from page 7)
known location on the old computer. Retrieving her address book took me a moment since it was not stored in a Windows Address Book file ending with .wab. I suspect it was in some sort of old Outlook file. I gave up looking for it and simply exported it from Outlook Express on the old computer as a comma delimited file and then copied the file to the new computer and imported it into Outlook Express there. To retrieve her Favorites folder, I simply copied its contents from the old computer into the Favorites folder on the new computer.

That's all there was to copying all the important files from an old computer to a new one.◆

(Photodex……..Continued from page 6)

If you like what you try, ProShow is $29.95 whereas ProShow Gold is $69.95 and can be found at: http://www.photodex.com/ . If you're into digital photography then this software needs to be added to your library. It's actually fun to watch the looks on people's faces when the see these still pictures 'moving' for the first time. This software is definitely a keeper. ◆

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Kevan Sheridan moderates the discussion.

(FrogPad…….Continued from page 5)

never do. And that's a NEVER.

I seem to look at the FrogPad almost not at all, whereas I'm almost always looking at a standard keyboard, not because I don't know where the keys are, but rather to constantly reposition my fingers. With the FrogPad, I always know where my fingers are because they don't move around that much.

One criticism I have is the placement of the lights. The Scroll, Caps and Num Lock lights are on the right, obscured by my hand, where the left side is completely visible on a right-hand FrogPad. And I do think that the problem of the Cut, Copy and Paste could somehow be accommodated. Please don't think the criticisms dampen my enthusiasm for the product. I certainly like the FrogPad, and when I can think of a good excuse to buy a Bluetooth model, I'll get one.

The Bluetooth version has some differences. I posted the question on the website Blog, and got this reply from Earlene Kaiser, Mgr. Business Development:

"We have added the following functions that are not available on the USB at this time: Alt and Ctrl keys are now accessible in one key stroke and are only active until you press the next desired key (i.e., Ctrl A or Alt Tab). On the USB, one must turn these functions On and Off. Similarly, the App and Command keys are also available in the same manner as above. Shift Lock is accessed by simultaneously pressing the Shift Key and the Space Key. Caps Lock is accessed by simultaneously pressing the Number Key and the Shift Key. The Number and Symbol modes must be turned On and then Off on both the Bluetooth and the USB."

So with my concerns about the use of Ctrl addressed, the Bluetooth version probably would have been a better choice for me.

This my first long document using the FrogPad, and after almost three weeks, numerous emails, and one VB program written and then rewritten – I have a couple of observations.

One, that surprised even myself, is that I can close my eyes and accurately visualize the placement of all the letter keys, numbers and several symbols. That's far better than I can do with the QWERTY keyboard, which I've been using for almost thirty years.

Two, I almost never look at the pad, whereas, normally I'm almost always looking at a conventional keyboard to reposition my fingers. I do a lot of mistyping now on the FrogPad because I want to go faster than my brain will allow, but that's getting better.

And Three, I find myself a little disoriented each first use of each day. I've found that a few minutes repetitious practice overcomes this.

The FrogPad website is a good resource. There are two blogs--one FrogChat and one Technical blog--where a couple of company officers are active and are inter-

ested in servicing any questions. The blogs do suffer some from a couple of frequent participants with too much time on their hands. The poetry is interesting, but doesn't belong on technical or product blogs.

Available at Amazon.com and at http://www.frogpad.com, $150-$175.

Technical Stuff:

I found that I had to enable "USB Legacy Support" in BIOS for the first time. This wasn't because of Windows - or the FrogPad for that matter - but because of the Dual-boot menu that Win XP puts up. The FrogPad wasn't operative during that time, and presumably any USB keyboard wouldn't be either. The change to BIOS fixed that up and was quickly accomplished. The FrogPad works during POST on my motherboard, and in BIOS, but I have a fairly new PC. If your PC has USB as an add-on card, you may need to keep a standard keyboard handy or even plugged in. Having two keyboards plugged in, one being USB, at the same time is no problem. Keep in mind also that Win 98SE was the first Win OS to have good USB support. ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

Shorter Newsletter This newsletter is only eight pages instead of the usual 12. I have decided to change to this format for months when the material is insufficient to fill, without a lot of padding, the larger format.

More Hurricane Last month I mentioned how in preparation for Hurricane Charley, I backed up my software and prepared to move my computers to a safer location only to abort the move when Charley suddenly steered clear of Tampa. Well, since then two more hurricanes, Frances and Ivan, have threatened Tampa, with Frances passing nearby and dumping a lot of water on us as it made its way from east to west across the state.

With Frances aiming at Tampa, before turning in for the evening, I unplugged my main computer from everything and moved it, along with monitor, printer and scanner, to a safer room than the one it normally occupies with the giant oak limb overhead. The next morning the only damage we had was a lot of small limbs down in the yard. So back to the room the computer went, and I connected everything back before turning it on.

Minutes of the September Meeting

By Kevan Sheridan, President, Tampa PC Users Group
president@tpcug.org

The Windows SIG (Special Interest Group) discussion began at 6:45 PM. Several small group topics were covered during the session. The president began the regular meeting at 7:00 PM.

Laura Royal, Financial Criminal Investigator with the Office of Financial Regulation, Bureau of Investigations (http://www.fldfs.com/), performed the main demonstration for the evening. The topic was **A Case Study: Securities Fraud on the Internet - Putting the Pieces Together**.

This program took us from start to finish of how an investigator uncovered a pump and dump investment scheme promoted through a message board on the Internet. We covered the basics of beginning the case with a complaint about $33.00 which led to uncovering a $3 million fraud from a company in Sarasota. We walked through the investigation process, bank record analysis, investigative resources, witnesses, the Internet message board and the bogus press releases. We learned what it takes to obtain a search warrant, perform an arrest and prepare for trial. As a consumer you can report suspected fraud at http://www.fldfs.com/Data/Fraud/Report%20Suspected%20Fraud.asp or you can request assistance at http://servicepoint.fldfs.com/eservice_enu/start.swe . Overall, this was a very interesting demonstration. The meeting ended at 8:40 PM. ◆

(Comments……..Continued from page 1)

Then strange things started to happen. After booting the computer, I got messages stating that it had found new hardware, etc. The new hardware was a USB scanner and a USB external hard drive. Later on that day, when I connected my digital camera to download the photos of flooding a block away, I also got the same messages about new hardware. This didn't make sense. I had disconnected all of these peripherals while the computer was turned off and reconnected them before I turned it on. What was going on? Member Bob LaFave had the answer. He said that I must have connected the USB devices to different USB ports than they were connected to before. If that were the case, and it was, they would be treated as new devices.

Bandwidth As Hurricane Frances was leaving the area after passing north of Tampa a bit, its winds were just right to produce a

Quick Look:
Delorme Street Atlas USA 2005

By Merle Nicholson, www.tpcug.org
merle@merlenicholson.com

Street Atlas USA 2005 is a very good product that is simply getting better year after year. It is travel mapping, travel planning, real time auto navigation, a "point of interest" locator, and much more. This version adds many functional improvements in addition to the expected highway and database updates. I'm going to be covering some of the improvements and also go over the disappointing installation problems. If you're upgrading from a previous version, my own experience should save you some time.

At the minimum, even if you don't travel with this software on a notebook as I do, you can make use of it on a desktop at home for travel planning and mapping. It's useful as a substitute paper map of the city – for any city in the US for that matter – or perhaps to find the nearest Starbucks in Orlando if you're visiting there and have a Latte attack. I think just about anyone can find a good use for at least some of the features. And at $49.95, you can't beat the price.

My own interests extend to nearly the full capability of the software. I'd say the only thing I have no personal interest in is the hands-free voice command feature. I use a Delorme Earthmate USB GPS attached, and also an inverter to power the notebook charger while in the car. My next acquisition will be a Bluetooth version of the Earthmate, so I can eliminate the too-heavy USB cord that attaches to the GPS.

New Features
First and foremost, it's faster. The program startup is very noticeably faster, something I appreciate especially on my not-too-fast notebook. The most important change they've made is to recalculate the route dynamically when you're off the planned route. Say you're out of state and in unfamiliar territory, and you decide to leave the highway for a gas stop. When you're a certain distance off route, the program changes the planned route to get you back on track from wherever you are, and gets you back there the shortest (or fastest) way. What a difference this makes! Way to go, guys!

As you're moving on a planned route, the synthesized voice anticipates turns and warns you ahead of time of upcoming turns. They've improved this by announcing the next TWO turns. Perhaps this doesn't sound like much, but in practice it's a much needed improvement I didn't know I needed.

They've simplified the saving of route files. There was a big controversy over the redesign of this product several years ago (in the 2002 version, I think) and the file system was clever, but just too complex. Several other displays have been improved, and the large database expanded even further. There's a GPS Points of Interest (POI) Radar search that is much easier to use. It searches for categories of items (stores, restaurants, exits, rest facilities) along the route, (optionally) in a forward direction. Good going, Delorme!

I do have a couple of complaints. There's extra blank room on the right hand toolbar where a badly needed compass and speed indicator could go (and maybe altitude), and while that information is certainly available on a tab, you have to switch over to it and back to the usual tab, which for me is the next turn display. Another complaint I have is that there is no useful scale on the display to estimate distances. I say useful, because there is a fixed length bar that has a label specifying the length. How useful is a scale that says "2000 ft"? Or "500 ft"? Instead of 2000 ft it could be a slightly longer variable length bar that has marks to .5 miles. That'd be useful.

There's a "clear trails" button that's necessary to get rid of the green breadcrumbs wherever you go, but it's in the wrong place in a hard to find location on one of the GPS tabs. And trails should automatically clear when you reverse your route.

Considering the complexity of this program, and make no mistake about it, this is a very complex program, it's reliable and after a steep learning curve, easy to use. It has to be the premier product of its type. For campers, hikers and bikers, there's a topographical version and also a version for Pocket PC's. There are versions that also package their very fine GPS with the software. One deal is a package that bundles the Pocket PC version with the Bluetooth GPS for $150.

Installation problems
If you don't have a previous version installed on the target computer, and you don't have the Earthmate USB GPS driver software, you shouldn't have any problems. I had both products, and if they had included instructions to uninstall the three previous products before installation (in my case, S&T USA 2004, S&T USA 2004 Data, and the USB GPS driver), I wouldn't have had any problems either.

The installation program doesn't recognize the existence of any previous version, so all the settings you may have had for the previous version are lost to the new one. You'll probably want to edit the preferences to designate the speed traveled on each highway type, change the preferred highway and several other items, and you just have to do them all over again, just as you had to do the previous year.

To top it all off, the Earthmate USB GPS driver must be replaced with a new one, and the existence of the old one isn't detected until the end of the main program installation. So at the end of a very lengthy program installation, it informed me that I needed to uninstall the old driver and then do the setup again. I uninstalled the driver from the control panel and also discovered that my 2004 version was still functional, so I uninstalled that, too. Then the new setup failed, with a message that temporary files could not be copied from some temp directory and with instructions that I must delete the main program directory manually. So I did

(Street Atlas…….Continued on page 4)

(Street Atlas…….Continued from page 3)
that and, with both versions blown off the computer, I could start all over again. I'm still awestruck. It's hard to believe that a computer program of this quality could not have an intelligent installation program written for it. If that CAN'T be done, at least add two sentences to the instructions: "First, uninstall any previous versions, including the Earthmate USB GPS driver" and "All your previous custom settings will be lost".

Finally
The Earthmate driver installation has an optional serial port mapper, so that if you have other software that can read the NMEA standard GPS sentences, you can designate a "fake" serial port. This is very useful. If installed, you must also use the serial port designation for S&T USA 2005. The GPS connection settings are easy to set up.

The product comes on a two CD set for $49.95 ($39.95 + S&H promotional price for existing registered customers). The second CD is the database that can be used in your CD drive; installing it on the hard drive is optional. There's a DVD version with a 31-million-business-telephone database on it, and various other packages including the topo version, Pocket PC and WAAS-enabled GPS, both USB and Bluetooth Logger. Look at the various packages at http://www.delorme.com ◆

(Comments…….Continued from page 2)
storm surge in the bay just south of our neighborhood. I have seen such high water, perhaps, half-a-dozen times in the 23 years I have lived here. It covers Bayshore Boulevard and creeps up the streets off Bayshore to varying distances depending on how quickly the elevation of the street rises.

I was ready with my camera to take some photos as soon as the rain slacked off a bit . With a modified plastic food bag covering the camera, except for an opening for the lens, and some wading boots for me, I set out. The water was only one inch deep in the road in front of my house, but, as I walked the one block to the bay, it reached mid-thigh as I came to the sidewalk on the city side of Bayshore. In the street, of course, it was deeper. For about five or six blocks I walked along the sidewalk photographing the water lapping at the doors of some homes but only up to the first or second steps of those built higher from the ground. Quite frequently I had to wipe the camera lens with some paper towels I had brought along. Later in the day I went out and photographed the odd tree or two that had been blown down by the storm.

I then put about fifty of the photos at our neighborhood website, http://www.oldhydeparkfl.org in the form of a slide show. Then I sent an email to the 226 homes in the neighborhood for which I, as the keeper of the database, have email addresses, telling them about the placement of storm debris for pickup

Easy CD-DA Extractor Ver. 7

By Larry Anders, Librarian, Tampa PC Users Group
larry@andersnet.com

Since the early days of CD ripping [converting a retail CDA music file into a digital format such as MP3 or WMA], I have used various programs to do the ripping. When converting various MP3s into music files that will play in my car, I have also used various programs. But up until now, nothing seemed to be able to do it all. Now, Easy CD-DA Extractor [ECD-DA] will do it all with the right click of a mouse. ECD-DA is all-in-one audio software that rips, burns and converts between formats.

The program has a typical Windows style layout that allows you to drag and drop files to rip or convert, but I prefer the right mouse clicking from within Windows Explorer. You can highlight one or several at a time, right click and then choose what you want to do. Some of the features are:

- Volume Normalizer and Compressor, Fade In/Out, Silence deletion from the start and end of a song
- Download and upload disc information from/to the freedb, the Internet Compact Disc Database
- Copies "Copy-Protected" CD's
- Input formats: MP1, MP2, MP3, WMA, Ogg Vorbis, MP4, M4A, AAC, FLAC, Musepack, WAV, Shorten, and Monkey's Audio
- Output Formats: MP3, Windows Media Audio 8, Windows Media Audio 9, Windows Media Audio 9.1, Ogg Vorbis, MP4, M4A, AAC, FLAC, Musepack, VQF, WAV, AIFF, Monkey's Audio, and any command line encoder
- Error Recovery, reads audio from badly scratched CD's
- Reads and Writes CD Text
- Supports all CD-recorders without need to update the program when a new CD-recorder becomes available, all CD-recorder parameters are automatically detected

If you want to try a free copy go to http://www.poikosoft.com/download.html . If you like it, the cost is $29.95, and all updates in the future, minor or major, are free. ECD-DA does not install any spyware or anything else that is not placed in the installation folder.

I enjoy my music and this program makes it a lot easier to enjoy my music. ◆

(Comments……..Continued from page 4)

and noting that there were photos of the storm's aftermath at our site.

Then all hell broke loose. The site normally averages no more than 10 visitors per day. The first full day the photos were at the site there were 4,025 visitors, creating 435,728 hits and consuming 22 GB of bandwidth. The site's bandwidth allocation is 20 GB/month--a pretty generous allotment for an inexpensive site. What to do? Reduce the number of photos in the show. I reduced the photos to around 20.

The next day the site had 12,008 visitors with 860,630 hits consuming 36.5 GB of bandwidth, with that reduction. Be careful what you wish for; you may get it.

Time for another reduction. I reduced the number of photos available to nine. And the third day, with 6,679 visitors and 223,343 hits, the bandwidth usage was 7.87 GB. And it has been slowly going down from there with a few blips higher. As I write this 12 days after the photos were put at the site, there have been 72,763 visitors, 2,788,623 hits, consuming 114.3 GB of bandwidth. For all those who think the Internet is free--the 94 GB in bandwidth over the 20 allowed is expected to cost $184.

When it works, word-of-mouth advertising is an amazing thing. All of those people who came to the site did so because of those 226 emails I sent to the neighborhood, plus about six that I sent to others.

Editorial Note After writing the above about moving my computer for Hurricane Frances, I had to do the same thing for Hurricane Jeanne. Luckily for me, Jeanne's final path took her north and east of Tampa, so we received maximum winds of no more than around 60 mph or so. Not enough to bring down that big oak on my house. People in the south central and eastern portion of the state were not so lucky. Four hurricanes in about five weeks. Who would have thought it?

(Comments……..Continued on page 7)

Internet Picture of the Month

Damage from Hurricane Jeanne

This photo of a damaged house between Vero Beach and Melbourne is from the online version of the Miami Herald at http://www.miami.com/mld/miamiherald/

Many roofs were no match for the 120 mph winds as hurricane Jeanne came inland on the Florida coast between West Palm Beach and Melbourne.

Looking Back to 1994

From the October 1994 Bits of Blue Newsletter

Secretary's Report
MINUTES OF 9/14/94 MEETING
and Personal Comments by
Jim Clark, Tampa PC Users Group

This was another great meeting, but the rain was once again not a friend to our meeting. However, the rain did not interfere with the very good meeting that took place, including a fine presentation on a very new and powerful program — Ca$hGraf Business Office.

USER GROUP NEWS
ADOPTBBS: Harvey gave a brief summary as to what the Adopt The BBS fund raiser is all about and why and then pointed out that the newsletter includes a how-goes-it thermometer to reflect our progress toward achieving the funding needed to improve the BBS — add a second phone line, another modem to support that line, and add a 500+ MB hard drive to provide more file storage capacity. He reported that as of newsletter publication time only $200 in contributions had been received. He emphasized how important the additional funding is to the BBS and urged all members using the BBS to lend their support to this fund raiser.

MEETING ANNOUNCEMENTS VIA FAX: Harvey announced that the Board of Directors (BOD) had decided to send notices of our general meetings via fax to area business and educational institutions as a means of making those organizations aware of us and what we do. These one page notification flyers would be sent to a selected group of organizations for the next meeting. Any organization that desires the notifications should inform the user group at the address shown on the back page of this newsletter, along with organizational info (name, address, fax number, etc.), or notify any member of our BOD. On the other hand, anyone who receives the flyer via fax that does not wish to receive future notifications should also let their wishes be known in the same manner.

CORPORATE MEMBERSHIP: The BOD has created a new membership category, Corporate Membership. Annual membership fee is $50, with membership commencing when the application for membership is approved and continuing for one year thereafter. This includes membership for three (3) corporate personnel, each of which would have full membership rights. The corporation may sponsor membership for additional corporate personnel if desired for an annual membership fee of $15 per person; however, the expiration of these memberships will be concurrent with the expiration of the sponsoring corporate membership. Each of these additional personnel will also have full membership rights. The initial application should be sent to the user group under corporate letterhead and include the names of all corporate personnel for which membership is requested. Requests to add additional personnel may be submitted at any time thereafter; this request, also under corporate letterhead, must include the names of the additional persons for whom membership is requested.

TBOL PARTICIPATION: Tampa Bay On-Line is in full swing on Prodigy. Harvey explained how our user group is participating in providing reviews and articles for posting on TBOL. All articles provided by us to TBOL will have first been published in our own Bits Of Blue newsletter. Several, usually about four, will be posted on TBOL every month; articles are be retained on TBOL until they become outdated. Nothing will posted on TBOL by this user group until after it has been made available to our own membership.

INDUSTRY NEWS: A number of news tidbits from the industry were tossed out from the podium and from the membership as well. Probably the item of greatest interest is that Microsoft has selected a name for Chicago/Windows 4.0—the name announced is "Windows 95," after the year in which it is expected to be released. Yes, the industry now expects "Windows 95" to be released in the 1st or 2nd quarter of 1995. (Will it have to be renamed Windows 96??)

PRESENTATION Ca$hGraf Business Plus
Our own St. Petersburg-based Target Software Group, Inc. favored us with a visit by four of their staff. Richard Muscarella, Sales Manager, gave us a rundown on the company and the development of Ca$hGraf Business Plus—a comprehensive, interactive financial management program designed for small businesses. Rich explained how the company and this program evolved. Ca$hGraf was in development about 5 years and was first released only last May at Comdex. It has won numerous awards since release from a variety of industry reviewers and critics. The name of the software evolved from Ca$hGraf, to Ca$hGraf Office Plus, then to Ca$hGraf Business Plus because of a need for a name which more accurately reflects the breadth and comprehensiveness of the program. Rich described it as the only fully integrated, single solution financial management software available and the only piece of software a small business would need. Moreover, Rich explained that great emphasis was given during development to ease of use and true user friendliness, the result being that anyone would be an effective user in a very short time. That lead-in raised our level of expectations and set the stage for the presentation of Ca$hGraf Business Plus.

Chris Payne II, Regional Representative for Target Software, followed Rich with a review of Ca$hGraf. The introduction given by Rich soon became evident in the review. A very comprehensive program, Ca$hGraf includes: A financial awareness and goal tracking system, with loan and savings scheduler; full business accounting, including budgeting and projections; supports both cash and accrual accounting simultaneously; handles 3 types of invoices; does credit memos and billing statements; provides a general ledger; does full perpetual inventory with location and multi-location and price levels by item; handles check writing and deposit tracking with up to 99 accounts; provides a preset and user definable database; complete instant text and graphical reporting on all data in the program; provides contact management in client database with "Phone Script" and autodial throughout; includes word processing, complete with spell check and thesaurus, and mail merge from databases and financials; prepares purchase orders;

Microsoft Access SIG

This SIG meets the **first Tuesday** of the month at 6:30 PM. The meeting location varies. For information contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merlenic@tampabay.rr.com.*

Digital Imaging SIG

This new SIG meets the **fourth Monday** of the month at Pepin Distributors at 6:30 PM. For information contact Mary Sheridan at *mcpease@mindspring.com.*

Visual Basic for Applications SIG

This SIG meets the **third Wednesday** of the month at 6:30 PM. The meeting location varies. For information contact William LaMartin at *lamartin@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Kevan Sheridan moderates the discussion.

(1994…….Continued from page 6)

prints to preprinted forms or will accept and fill in scanned forms; supports bar codes; does time and billing accounting; supports tab tables; provides a day planner and appointment scheduler for an unlimited number, to name just a few. And all of these features are fully integrated and interactive so that data in any portion of the program is instantly usable in all other areas of the program. Boy, that is a mouth full!!

The size of the files that Ca$hGraf will support are limited only by the limitations of the host computer and disk drive space. Ca$hGraf is not yet network compatible, but a network version is currently in development. Meanwhile, an easy-to-use full security capability already exists within the program that provides the capability to limit individual user access to specific areas of the program. True context sensitive help is available at every location within the program. Moreover, a single comprehensive manual provides ready information about the program in the unusual event that you cannot find your answer with on-line help. And if that still isn't enough, free technical support is provided by Target Software via toll-free telephone. To speed up the learning curve, Target includes a 1 1/2-hour videotape with every copy of the program; this video gives the guidance needed to use the program effectively quickly.

Ca$hGraf Business Plus requires a 386 or better computer, with at least 4 Mb of RAM (preferably 8 Mb), Windows 3.1 and a total of 11 Mb of hard disk space for program files. The program lists for $299 but is available at an introductory price of $199 for a limited, but unspecified, time. For those in need of that kind of program who did not attend this meeting, you blew it because Target made the program available to those present for an even better price, Better luck next time.

To Target Software, Rich and Chris, and all who helped with the presentation, THANK YOU very much for an excellent presentation about Target and Ca$hGraf. We appreciate your making our membership aware of both Target and Ca$hGraf.

AND THE WINNER IS

Thanks to the generosity of Target Software Group and Brainchild Computer Distributions, there were a couple of very nice door prizes. Those among us to have the good fortune to win are:

Dave Clary - MosesAll!! [networking card]
Torn Cone - Ca$hGraf Business Plus

The meeting adjourned at about 8:45 PM. ◆

(Comments…….Continued from page 5)

Windows XP Service Pack 2 I have now installed Windows XP Service Pack 2 on my main desktop computer and my laptop. If you don't have a broadband connection, it is probably better to get the CD from Microsoft since each of the downloads was in the neighborhood of 100 MB. I think the amount of download necessary is determined by how much updating has already been done to XP, Internet Explorer and Outlook Express.

For my laptop, the download was 114 MB at a speed of around one MB every three seconds. For the desktop computer, the download was around 96 MB. I think the download and installation on the desktop took a little over an hour.

After the update and a reboot, on the laptop the only difference, other than what I will mention about Internet Explorer and Outlook Express below, was that I now had to give permission for the sync of my Pocket PC to the laptop.

After rebooting the desktop and opening Internet Explorer, the first thing I noticed was that whenever I clicked on any link, a window popped up and requested that I insert the Microsoft Money 2002 installation CD. This was mighty odd. I had never used Microsoft Money, but it had come free with the computer two years ago.

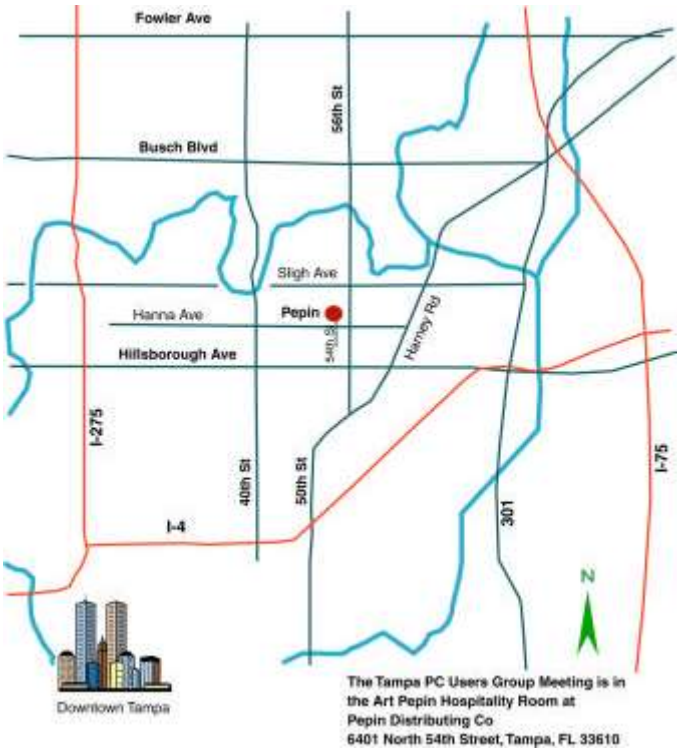
First Class Mail

☐ *Member: Your membership is up for renewal*
☐ *Vendor: Your product was reviewed on page ___*



(Comments…….Continued from page 7)

So I did a little research on the Internet, and there were only a few messages about such (none pertaining to XP), and the consensus was to uninstall Money and some other Money component I can't recall the name of. Money uninstalled OK, but the other component produced an error when I tried to uninstall it. The solution for that was to download the W indows Installer Cleanup utility and run it to remove Windows Installer settings for that item. I did that. But on the next reboot of the computer, I received the message "This action is only valid for products that are currently installed."

That forced me to examine the registry for stuff related to Money. I found three items, one of them one of those strange ids like {CF5193F7-6B37-11D5-B7D2-00AA00A204F1}, that I think might be called GUIDs. I backed those up and then deleted them, and now I get a boot up without the message. Why installing SP2 caused all of this is a mystery.

Two nice features are that IE now automatically blocks pop-ups and Outlook Express blocks linked images unless you request that they be shown. The downloading of those linked images could be used to indicate to spammers that you received the email and thus that your address was a good one to keep spamming.

There are a lot of updates out there from Microsoft that you should install. There is one for Office that fixes the new JPEG vulnerability. I could tell of my travails with that on one of my computers, but there is no more space this month.◆

This is going to be another short newsletter. The articles are just not there. Possibly the newsletter needs to change--to what I don't know--but the difficulty in getting articles from the membership is the driving force behind the need to change. So this month we not only have an eight page newsletter, we have an eight page newsletter with 12-point type. Last month we used 10-point type.

Microsoft Office Update In the October newsletter, I wrote about installing Windows XP SP2, which is supposed to reduce the chance of various malicious attacks being successful. There were also Microsoft Office updates out that you were supposed to install for similar reasons. The Office updates, as

Minutes of the October Meeting

By Doug Mullis, for Secretary Peggy Pulliam
dmullis@tampabay.rr.com

Mary Sheridan kicked off our usual half-hour Windows SIG at 6:30 PM. Mary was impressed with the Firefox Mozilla Internet browser she saw demonstrated at the FACUG Fall Conference in Clearwater and suggested we try it.

Mary reminded us that 2005 TPCUG officers will be elected in December, so we need a slate of officer nominees by the November meeting. It seems all current officers except secretary Peggy Pulliam are able to remain in office, but remember, they did this last year as well. We need members to step forward to relieve those who have served so well. Treasurer Mike Hodges, although willing to serve, is now teaching evenings and will miss our regular monthly meetings. It is hoped volunteers William LaMartin, Larry Anders, Mary Sheridan and Mike Hodges will continue as Newsletter Editor, Librarian, Program Chairperson and Membership Chairperson, respectively.

At 7:00 PM, president Kevan Sheridan began our regular meeting. He distributed CD's of Microsoft's Service Pack 2, reminding members to first uninstall firewalls and make sure all programs are current. After installing, make sure everything is working, including your firewall.

At this point, our guest speaker, Randall Nagy, president of Soft9000.com, was introduced to tell us about Microsoft's .NET system. If you have Windows XP, you're probably using .NET for system updates which was designed to simplify distributed application development. Microsoft Machine Independent Language (MSIL) relieves the programmer from having to learn another program language to install new applications.

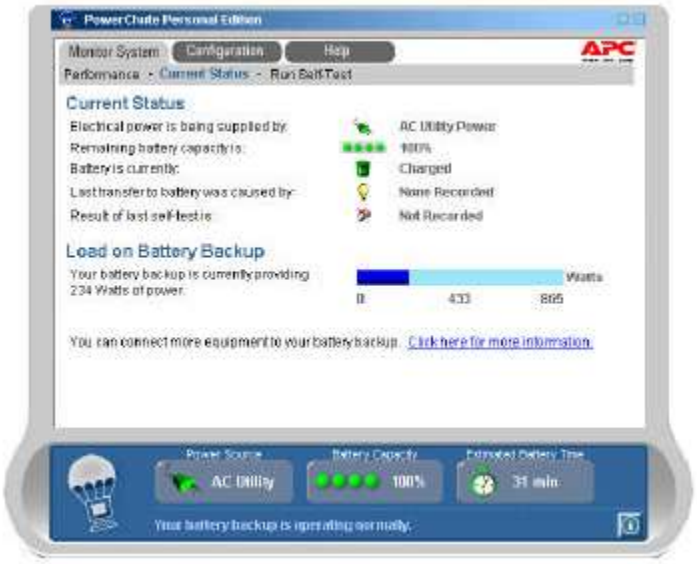
apcug Member of The Association of Personal Computer User Groups

APC Back-UPS 1500 and PowerChute

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com



All these many years of personal computing, since 1983 with an Apple and since 1991 when I changed to a PC, I have been running without a battery backup. And believe it or not, I have rarely lost any work to a power interruption or outage. Furthermore, we didn't even lose power during the recent siege of hurricanes.

But about a week after the last hurricane to pass near Tampa, the power flickered off twice in two days, and on the last one, I lost about one-half-hour of work. After a little research, I went out and purchased an APC Back-UPS 1500, the best UPS that I could find easily, for $200. The 1500 stands for 1500 VA. I always thought volts x amps = watts, but I am confused now since the maximum wattage supplied is 865 watts.

This device provides six outlets that are both battery backed-up and surge protected and two additional outlets that are only surge protected. Additionally there is a phone line pass-through that provides surge protection for a phone line. There is no protection provided for a cable or DSL line. See the photos at right. Although the photo of the front of the unit has RS in the name, it looks exactly like what I purchased with XS in the name.

The device when positioned vertically resembles a small thin computer. You may also position it horizontally. But be warned, when positioned horizontally, there is a only one correct side to be the down side.

What is of particular interest is the software that comes with the unit. It is called PowerChute Personal Edition. With this software you can monitor the status of the backup unit and configure how it functions. To the left is a screen shot of my current status. As indicated, 234 watts of power are being consumed. This is for two computers, two flat panel 15" monitors, a cable modem, router and wireless access point. If I bring the flatbed scanner to life, it would add at most another 30 watts. The APC unit communicates with the software via a USB connection to the computer.

What you cannot add to the backup is a laser printer. I plugged my old HP LaserJet 4 Plus printer into the backup, turned it on and watched the APC unit's PowerChute software go berserk with warnings about ex-

(APC……Continued on page 4)

(APC……..Continued from page 3)

cessive power use. So if you want to be able to print during a power outage with a laser printer, get a bigger unit.

As indicated in the first picture, the estimated time that I could run the two computers on the battery is 31 minutes. As the backup is configured at present, when five minutes of time remains on the battery, the software will initiate an orderly shutdown of the computer (only the one connected to the USB cable). The shutdown point is adjustable in the configuration tab of PowerChute. You may also adjust how sensitive the unit is to power fluctuations. This determines under what circumstances the unit will switch to battery backup due to electrical noise. You may also adjust when the battery backup kicks in if the AC voltage goes above or below certain voltages. My unit is set to kick in above 138 volts and below 97 volts. ◆

(Comments……..Continued from page 1)

best I can recall, went OK on all the computers in the house except for the one upstairs running Windows Me and with Office 2000 Premium installed.

On that computer, I connected to the Microsoft site and went to the Office section, where a search of updates yielded that to get SP3, I had to first install SP1a. So let the download begin. After it ended, and the update began to install I received the message "The file E:\data1.msi is not a valid installation package for the product Microsoft Office 2000 SR-1 Premium," or something close to that. My first thought was that I had put in the wrong version of Office since I had about three different CDs with Office 2000. But a try with the others produced the same error. And the one I originally used had written on its sleeve that it was for this particular computer. Time to go to Google, which produced something from Microsoft's site stating the following:

"CAUSE: This issue occurs if you have Microsoft Works Suite 2000 with Microsoft Word 2000 installed on your computer. The Office 2000 SP-3 Setup program searches for the earliest version of Data1.msi, and Data1.msi for Works 2000 is not compatible with the SP-3 Setup program." I was trying to install SP1a, but I was sure it was the same problem.

Well, Works had come installed on this computer, and it was a version of Works that contained Word. Microsoft's solution to the problem--an hour of work: First, completely uninstall Works. This was not a quick as it sounds. There were all sorts of programs, like a mapping program, that the computer considers as part of Works. I think I had to uninstall about six programs to get rid of Works. Second, you do a normal uninstall of Office 2000, including Publisher. But that is not the end of it. There are two utilities you must download to remove the remaining Office 2000 CD1 files and the remaining Office 2000 CD2 files. After all of this you can then reinstall Office 2000 Premium. But be warned, you now have to go back to the Microsoft site and get the SP3 update. The SP1a update that it tried to first install was based on the erroneous information that having Works on the computer caused. Keeping up-to-date is not easy.

Missing Floppy As you may recall, I helped my sister with the purchase of a new Compaq computer several months back. It has taken several trips to visit her to get everything up and running perfectly.

One thing I had put off until the most recent trip was to see why she had no 3.5 floppy listed. When she first received the computer and booted it for the first time, she received an error message regarding the floppy. Since she didn't really need the floppy at the time, I had her go into the BIOS setup and disable the reference to such a floppy. That way she didn't have to look at the error message every time the computer started.

This trip, I decided to take the cover off the computer and see if what I suspected was true--that the floppy drive was not connected. Sure enough, when the computer's side cover was removed there was the floppy's power cord dangling. Guess that those Compaq assemblers in Mexico had been drinking too much Tequila. Once connected and the reference set to it in the BIOS, everything was fine with the 3.5

(Comments……..Continued on page 5)

(Comments……..Continued from page 4)

floppy drive.

I think most computers now come without such drives. That certainly is the case for laptops. I suppose in the day of USB thumb drives and cheap CDs, there isn't much need for them. But my sister had backed up many things to floppy disks over the years that she needed such a drive to transfer the files to the new computer.

Adobe Streamline is a handy piece of software for those involved with graphical work. It will transform a raster graphic (bitmap) into a vector graphic (line art). Tiff and JPEG files are examples of raster graphics. They are pixel-based and cannot be enlarged without losing quality. Encapsulated Postscript files (EPS) and Adobe Illustrator (AI) files are vector based and can be resized without any loss in quality.

Not all raster graphics lend themselves equally to being made into vector graphics. At this point, I have done very little with Streamline, but I quickly discovered that black and white images are far easier to change to vector graphics than are images with many colors. Also, if the image has text in it, you need the text to be quite large to achieve a good transformation.

As I work with the program, I should have more to

Looking Back to 1994

From the November 1994 Bits of Blue Newsletter

Secretary's Report
MINUTES OF 10/12/94 MEETING
and Personal Comments
by Jim Clark, Tampa PC Users Group

Well, wonders of wonders, it wasn't pouring down rain for this meeting. And it was a good session with a very interesting presentation — a look at some of the latest hardware on the market and where it is likely to go from here. Those that didn't make the meeting missed out on a lot of very interesting information and an excellent give and take.

USER GROUP NEWS

- MEMBERSHIP DUES INCREASING: Harvey gave a brief summary of the decision the Board of Directors has taken in light of increasing user group costs —to increase annual membership dues by $5, except the corporate membership which will increase $10, all effective 1 January, 1995. Membership dues will then look like this: Regular Membership - $25; Family Membership - $35; HCC Student & Faculty - $20; Corporate Membership - $60 (includes 3 corporate personnel), with additional corporate personnel at $20 each. New members joining between now and 1 January and renewals of memberships expiring before 1 January, 1994, will enjoy the current rate. Memberships expiring in 1995 may be renewed between now and 30 November, 1994, at the current rate. Beginning 1 January, however, all memberships and renewals will be subject to the above listed rates. All memberships renewing early will have one year tacked onto the expiration date of the current membership.
- CONSENSUS - EXPOTECH A FLOP: Harvey asked for opinions of the EXPOTECH in Tampa this year. This generated a good bit of discussion, most of which was that of disappointment at the reduction in booths this year and the scarcity of computer vendors of interest to most of our membership; the bulk of the vendors provided services, some of which had little or no relationship with high technology.

ELECTION OF CORPORATE OFFICERS: Nominations for the five elected TPCUG corporate officers will be open and solicited at the November 10 general meeting. Elections will take place early in the December 14 general meeting. Nominations may be made until just before the election at the December general meeting. The five elected corporate officers are: President, Vice President, Treasurer, Secretary, and Member at Large. Newly elected officers will assume their positions effective 1 January, 1994.

All members are asked to give the nominations some serious thought and to make their nominations at the November or December general meetings, or mail your recommended nominations to the TPCUG Nominating Committee at the TPCUG corporate address (shown on the last page of this newsletter).

INDUSTRY NEWS:
Probably the most important bit of information brought out is that the new OS/2, OS/2 Warp 3.0, has been released and is available for $79, before a $25 rebate. Pretty good price, I would say. One word of caution, however, is that if you are considering getting OS/2, be sure to check the compatibility listing IBM provides for OS/2 to make sure your hardware and software is compatible.

PRESENTATION — A Look At Some Of The Latest In Hardware. Following notification by Gold Disk that they would be unable to make their scheduled presentation at this meeting, Harvey contacted Jason Kimenker, from our own Tampa/St. Petersburg Brainchild Computer Distributions, Inc., to see if they could fill in. Like the proverbial "knight in shining armor", Lee Vaccaro and Jason responded to our short notice request and put together a presentation on some of the latest in computer hardware. What's more, Jason did an admirable job with the presentation. And as it turned out, I think it was one of the most interesting and informative sessions that we have had during the several years I have been a member — and I have missed but a very few of the general meetings.

I won't even attempt to summarize the information Jason passed on, but among the hardware Jason reviewed were: Modems; PCI technology, compared to VESA; CD-ROMs; Soundcards, especially in a current Microsoft Office bundle; AMD chips, compared to Intel; and the DX4/100 chip. Jason did an excellent

Special Interest Groups

Microsoft Access SIG

This SIG meets the **first Tuesday** of the month at 6:30 PM. The meeting location varies. For information contact William LaMartin at *lamartin@tampabay.rr.com,* or Merle Nicholson at *merlenic@tampabay.rr.com.*

Digital Imaging SIG

This new SIG meets the **fourth Monday** of the month at Pepin Distributors at 6:30 PM. For information contact Mary Sheridan at *mcpease@mindspring.com.*

Visual Basic for Applications SIG

This SIG meets the **third Wednesday** of the month at 6:30 PM. The meeting location varies. For information contact William LaMartin at *lamartin@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting and is devoted to a general Windows and computing discussion. Kevan Sheridan moderates the discussion.

(1994…….Continued from page 6)

job of reviewing these new products and was clearly well versed on them. His discussion was not only very informative and interesting, but it generated a lot of give and take with the membership. Some tidbits that I will pass on are:

28.8 Modem: V.34 standard was approved earlier this year is now being put into 28.8 modems. Though it is currently available only in the Robotics Sportster, all manufacturers should have them out soon.

PCI Technology: If you are considering the purchase of a Pentium, be aware that the 60 MHz chip is giving the most trouble.

CD-ROM: The double speed CD-ROM is probably adequate for most of us, but you should consider the quad speed if you are into multimedia sound/video very much because it will provide near-movie quality. New controller cards are also coming out that will support up to 4 floppy drives, and 4 IDE drives one of which can be used for a CD-ROM. This will not only allow increasing the number of IDE drives one can operate, but can free up an expansion slot by eliminating the need for a separate card for the CD-ROM.

AMD Chips : Have proven at least as good as Intel chips and are considerably cheaper; like AMD has a DX2/80 MHz chip that sells for about the same as Intel 66 MHz chip. Also, a 586 line of chips will be out soon in competition with the Pentium line and is expected to be about $200 cheaper.

DX4/100: If considering purchase of this new technology, be sure the voltage of the chip is compatible with your motherboard; some of the earlier chips are 3.2 volts, while 5.0 volts is most common.

Jason and Lee, thank you - and Brainchild Computer - for a GREAT presentation and the most useful and helpful information you provided, not to mention your generous contributions for our door prizes. We hope that you will agree to give us a similar presentation again in the not-too-distant future.

AND THE WINNER IS

Thanks to the generosity of Lee Vaccaro and Brainchild Computer Distributions, Inc., there were a several very nice door prizes. Those among us to have the good fortune to win are:

Joe Crochet	OS/2 2.1
Dave Claire	Printer stand & mouse pad
A.J Mester	Printer stand & 100 diskette box

In addition, J. Whitmer, S. Atron, Van Ost, M. Nicholson, R. Davis and J. Robinson won mouse pads.

The meeting adjourned at about 9 PM. ◆

Common Language Runtime (CLR) allows different languages to share information. Mr. Nagy says ".NET" is known as the "Virtual Execution System".

After a short break, several attendees won T-shirts displaying "I'M DRAWING THE LINE," targeting hacker viruses and worms, with Microsoft's Service Pack 2 being our protector. The meeting was adjourned about 8:40 PM. ◆

(Comments…….Continued from page 5)

say. One thing of note is the vast reduction in file size when going from a raster graphic to a vector graphic. You can go from several megabytes to just 20 or 30 kilobytes. In the example I had my best success with, the black and white image went from around 5 MB as a TIFF file to just 40 KB as an EPS file. That makes it a lot easier to send the file to a print shop, as this one was destined to go for use in a yard sign. ◆

lamartin@tampabay.rr.com

Data Loss Two incidents in the past week have given me pause to think about this subject.

Server Failure A few days back I checked the neighborhood website I maintain, http://www.oldhydeparkfl.org, and was greeted by a message stating that maintenance was being performed and the site would again be available as soon as possible. When the message was still there after 12 hours, I sent an email to the web hosting company and received the following message.

Unfortunately we have had a major catastrophe. Our data centre technicians replaced a power supply in the machine hosting

Minutes of the November Meeting

By Doug Mullis, for Secretary Peggy Pulliam
dmullis@tampabay.rr.com

President Kevan Sheridan conducted our usual half hour Windows SIG starting at 6:30 PM, He suggested we try Google Gmail as it is almost Spam free and costs nothing.

We will have election of officers for calendar year 2005 at our December meeting. The slate of nominees is Kevan Sheridan for President, John Witmer for Vice President, Mike Hodges for Treasurer, Doug Mullis for Secretary and Mary Sheridan for Member at Large.

At 7:00PM, President Kevan Sheridan began our regular meeting. We have three special interest groups: Visual Basics, Microsoft Access and Digital Imaging. These groups will get back on schedule after the holidays. At our December meeting we have scheduled a Smart Computer presentation and our Holiday Season party.

Our speaker for the evening was Steve Singer, President of RDI. Steve told us of and demonstrated the latest hardware on the market. Some items covered were a Blue Tooth headset for your cell phone, an HP iPAQ with cell phone and camera, a USB dock for notebooks, the latest Motherboards with AMD Athlon Sempron 64 bit and 32 bit processors, also an Intel Celeron D (said to equal the Pentium 4), a very small Konica Minolta 6 meg DiMage G 600 Digital Camera with 3 power zoom lens, and a desktop computer which allows two users to run different programs at the same time (2 monitors,2 keyboards, 2 mice etc).We all wondered what next?

The meeting adjourned about 8:45 ◆

apcug Member of The Association of Personal Computer User Groups

A Couple of Christmas Gift Suggestions

By Larry Anders, Librarian, Tampa PC Users Group
Larry@AndersNet.com

Well, by the time you get this newsletter there will only be a few shopping days left for Christmas. If you or your family, friends or loved-ones don't have a DVD burner yet you should put that on the list. They are relatively inexpensive now and so is the DVD media to burn to, whether write once or re-writable.

I have always loved music, and I have been collecting music for several years now, ever since ripping CDs to MP3s first became popular. I was originally amazed at how many MP3s one could record to CD. Then along came DVDs which hold over six times that amount and now dual layer DVDs hold almost twice that, etc, etc. I think you get the picture.

I have a retail stereo store near my home that sells all of their CDs for $10.99 each and for years I have afforded myself the luxury of trying to purchase a couple each week. I said try to purchase because sometimes there just isn't anything there to purchase that I either like or don't already have. Like most people I am typically only interested in one or two songs on each CD, unless it's an old Beatles or Eagles CD. I have all of the words to all of their songs memorized, but that just shows my age.

Anyway, I began ripping the tunes I wanted off the CDs to start my own personal listening collection. As I travel a lot, being able to take just one or two CDs loaded with all the music I wanted to listen to made it much easier. Once we were able to write to a CD more than once I started ripping entire music CDs as soon as I purchased them and archiving them away. I could usually get about 10 to 12 store-bought CDs on one archive CD. Along came DVD players that played MP3 CDs and I was able to put in one data CD that could play unattended for a few hours.

A while back I became a PocketPC user. The Dell Axim I use also has the ability to play music files. To save space on my storage cards I started converting some of my MP3s to Microsoft's WMA format, which is about a factor of 10 smaller in size than MP3s and still sounds basically the same, and putting them on CDs. As you can imagine it did not take long before my house was becoming overrun with CDs.

I invested in my first DVD burner when they were still kind of expensive and so were the blank DVDs so I was a little slow to start archiving to DVD but the sheer number of CDs stacking up in my house forced me into starting. Now I have two DVD burners and am thinking of getting one of the new dual layer models next.

But archiving to DVDs caused another problem. Now I could not play my backed up MP3s on my DVD player in the family room. I could never understand why a DVD player would play a data CD of MP3s but not a data DVD of MP3s. So I started a little research on the Internet.

I found a couple of upper-end DVD players that would play "MP3-DVDs" but they were more than I wanted to spend and they also did not have all of the capabilities that my current DVD player had. Not being one to give up easily (or maybe I just waited long enough for the competition to appear), I discovered the **Pioneer DV-578A-S,** a Universal DVD/CD/SACD/DVD-Audio player, and this little baby plays everything I have at home, including VCD and SVCD movies, jpeg files which are the standard for most digital cameras, and it will also play WMA files. The reviews were good and the price was only $149 locally. I unplugged my old DVD player and plugged in the new one with absolutely no problems.

So, theoretically, I could burn one DVD that could play music that could last for days. *WOW!* What do you think will be next?

HAPPY HOLIDAYS! ◆

(Comments……..Continued from page 1)

your site. When this machine was turned on after the power supply replacement, there was a major problem with the new power supply which caused a damage to all four of the hard drives (including our backup HDDs), the motherboard and RAID card in the machine.

They replaced that server but had no backup to restore to it, although they were sending the hard drives out for data recovery which could take over a week. Additionally, the three emails they supposedly sent to me never reached me--possibly getting lost in all the SPAM I receive. As with all my sites, I have an exact copy on my own computer (and backed up on CD) that I was able to republish to the replacement server. The only possible problem is that some of the neighborhood residents may have recently changed their password information online, and that data was lost with the online version of the membership database. Also, the statistics for the site reside on the drives that are at data recovery. This is the site where I posted flooding photos of the neighborhood which received a large amount of interest--22 GB of data transfer in one day. So those statistics were somewhat interesting.

Hard Drive Failure The second incident was the erratic behavior of one of my external USB hard drives. This was a 40 GB one made by Maxtor (model 3000 LE) that is several years old. I noticed a few weeks back that this drive would all of a sudden go into some sort of auto play mode where a window would pop up and the names of files would flash by real fast. Momentarily I would receive a request to configure what programs would handle certain file types. I always clicked cancel and everything was fine. Then occasionally, this drive, listed as drive F, would be missing from the My Computer listing. Unplugging one or both of the USB or power cords to the drive would fix this problem--up until this last time. No amount of disconnecting and reconnecting got the drive back. Fortunately I only used this drive as a backup drive, so nothing was lost. And the next day, although the drive was missing after I booted the computer, after several hours it went into this auto play thing, and I had it back. But it is certainly not to be trusted and will be retired. When this drive is having problems, the green light that indicates the drive is doing something blinks rapidly and you can hear clicking noises from inside the drive--not a good sign.

New External Drive Only a few days before all of this, I had bought a new Maxtor 160 GB external hard drive ($199) that supports both USB and FireWire connections. I wanted this as a backup for all the photos, negatives and slides I have scanned in over the years and for all the digital photos I have taken in more recent years. These photos are also backed up on CDs and DVDs, but they are much more accessible on this external hard drive.

This drive has something called One Touch Storage and Backup with a button for such on the front. That is, it does if you install the software that comes with the drive. Since I am only going to use this as storage for my photography efforts and possibly some other file backups like my programming and web sites, I have no need for the one touch thing. But for those who would like a complete backup of their main hard drive, this looks like the thing--and I might get another such drive just for that purpose. Not only can you do a selective backup of files, but also you can back up everything, including the operating system, computer settings, and your applications. This backup can then be used to restore your computer to its state before a hard drive failure or other disaster. This is accomplished with the Dantz Retrospect software provided on the CD.

Photo Database With all these photos now on a hard drive (and backed up to CD & DVD), I needed a way to efficiently give the photos descriptions and dates. A typical path for a photo is G:\HP PhotoScan\Black & White 1970's\1974\March\Scan928.tif.

First, I created an Access database to contain my photo information with fields such as year, month, path, and file name. Then using VB.Net, I wrote a program with two main parts. The first part allows me to select a folder containing photos and have all of the names of the files in the folder added to this database along with the year, month and folder path. This eliminates all typing except for entering descriptions as described below.

(Comments……..Continued on page 5)

(Comments……..Continued from page 4)

The second part of the program displays the database table containing this information. Here when I click on a record, the associated photo is then displayed. This allows me to easily enter a description of the photo. Of course, it is going to take me some time to create all of the descriptions, since there are about 5,700 photos alone in just the HP Photoscan folder's sub folders. Then I have the photos scanned using my old HP flatbed scanner and my newer Epson Perfection 3200 photo scanner. Then there are all the digital photos I have taken and then all the slides and negatives I have not yet scanned.

When I am finished, if I want a photo with a bird in it, all I have to do is search the database table. This should produce all photos with the word bird in the description. Similarly, and more importantly, I could search for a particular individual.

When I do finally get most of my non-digital photos on the computer along with all the ones taken in recent years with a digital camera, how do I protect and preserve these photos? As I noted earlier, computers can be totally destroyed or their hard drives can simply fail to function. My protection scheme at present is to have every photo on two different hard drives--preferably on two different computers and to have at least one CD or DVD backup of each image, then after several years make new CD or DVD backups and also put the photos on still newer hard drives or whatever new storage media may come out. ◆

Internet Picture of the Month

Winter

One of the tens of thousands of photos at PBASE.Com, http://www.pbase.com/. This is a place to post and share your photos. It is also a place to view others' photographic efforts. Some of it is very good but most of it is of considerably less quality, in my opinion.

You can create a free trial account. But people who pay have galleries with more features. I came across one fellow with over 5,000 photos posted.

Looking Back to 1994

Secretary's Report
MINUTES OF 11/9/94 MEETING
and Personal Comments
by Jim Clark, Tampa PC Users Group

An important meeting for our group, with nominations for officers, and the weather, though a bit threatening, cooperated. We also had a major and increasingly popular piece of software to be reviewed — OS/2 Ver. 3.0 Warp.

USER GROUP NEWS

SECOND BBS 14.4 MODEM ON HAND: Our group has acquired a second 14.4 modem for use with the BBS. It is an external version and will be placed into use as soon as the ADOPTBBS fundraiser generates enough funds to pay for installation and first year's use of a second telephone line. Harvey called attention to the how-goes-it chart in the newsletter which shows the generation of funds still far below that needed to upgrade the BBS with more file space and a second telephone line, and he emphasized the importance of supporting the ADOPTBBS fund-raiser if we are to realize these improvements in the BBS.

NOMINATIONS: Harvey reported that several of the present officers who have served for several years have expressed their intent to not serve in the coming term. However, most decided that the loss of so many on the BOD at one time could jeopardize continuity for the group and agreed to serve again, if nominated and elected, but for only one more year. Harvey pointed out that it is essential for creativity as well as the continued life of the group that new blood come aboard the BOD. It was also noted that our members must become more active in helping the group to improve by contributing their time and effort to generate new members and perform services for the group as a whole.

Nominations were made for the elected positions on the BOD as follows:

President:	Harvey Bruneau (incumbent)
Vice President:	None (it was not known if Al Poole would serve again)
Treasurer:	Tom Cone (Incumbent - not present at the time and assumed he would serve)
Secretary:	None
Member At Large:	Roger Waters (incumbent)

No new blood was nominated for any of the positions. Members may submit nominations via mail and/or make nominations at the December meeting up to the time of the election. It is extremely important to the group that additional nominees be obtained and that these positions be filled.

Harvey outlined what should be some of our objectives for the coming year, and will be if he is again elected. These included more SIGs, more member-to-member sessions at our meetings where we could help each other with problem solving, using things we already have, working on computers, using DOS, Windows, the BBS and others, demonstrations on installing and setting up components, etc.; and membership of at least 300. None of these objectives are achievable without more active participation from our membership. One of the easiest ways we could all help is to bring in just one new member. Try it, you might like it!

PRESENTATION — IBM's OS/2 Ver. 3.0 Warp
IBM was good enough to make Carolyn White, one of IBM's Workplace Marketing Specialists, available to give us a rundown on the new version of OS/2, called Warp, they just released. And a fine job she did, too. She began by noting some of the reasons "Why OS/2?" Among them are safer operations because program failures, such as occur in Windows, are contained within the offending program and do not force rebooting the computer as is now usually the case in Windows and DOS; OS/2 is an operating system itself and doesn't rely on DOS or any other operating system; it provides better memory management, and is not inhibited with the constraints that have long limited DOS; it allows simultaneous operation of DOS, Windows and OS/2 applications and supports interchange of information between all three; and it is an operating system designed to make best use of new hardware technology.

You all are at least a little familiar and know what a large and powerful program it is — well beyond the scope of this little section of the newsletter. I will only

point out some of the improvements that have been made compared to previous versions of OS/2. First, IBM says that this program is designed specifically for the home PC user, the student and the business executive, and great emphasis has been placed on making it truly user friendly. Warp combines the advanced OS/2 32-bit operating environment with new features for productivity, reduced memory requirements, and ease of use and productivity enhancements. Among them are:

- Redesigned and simplified installation that automatically configures your system; imagine avoiding all those address and configuration conflicts.
- Much faster and smoother operation of Windows and Windows programs.
- Enhanced print performance and significantly improved monochrome and color bitmap printing due to new 32-bit printer drivers.
- New easier to use tutorial that shows best use of OS/2 to fit your style.
- Customizable program Launch Pad for ready access to your most used applications and features.
- Automatic configuration of PCMCIA cards through a "Play at Will" interface which permits putting in another PCMCIA card without having to reboot your laptop.
- Includes a set of popular OS/2 Windows audio device drivers.
- Improved user interface and graphics.
- Now requires only 4 Mb of RAM.
- Warp also includes a number of features and utilities in a “Bonus Pak"“:
- OS/2 CompuServe Access.
- Person-to-person for OS/2: Desk-top conference software where you can share files or multimedia with another computer.
- FaxWorks for OS/2 where you can send, receive and print faxes as you desire.
- IBM Installation Utility & System Information Tool which allows quick, convenient access to detailed info about your soft/hardware.
- Access to Internet which will automatically configure for free hours on IBM's WEB service, and includes several Internet applications including Gopher, Mosaic, News Reader and E-Mail.
- Provides a suite of applications including a word processor, spreadsheet, report writer and database. An organizer to keep track of addresses, phone numbers, to-do lists, and calendars all in one place.

Requirements for OS/2 Warp are a 386 machine or higher, 4 Mb of RAM (though 8 Mb or more is preferred), DOS 3.1 or higher installed if you plan to run DOS applications, Windows 3.1 or higher installed if you plan to run Windows applications, and 30 Mb of disk space for minimum loading and up to 55 Mb for a complete installation, including all the bells and whistles. Carolyn was using a 386/25 MHz with 8 Mb of RAM for the demonstration and while performance was not really fast, it was acceptable. And what a bargain. IBM reports a street price of

under $80; Computer City has OS/2 Warp on 3.5" floppies at this writing for $69.97. Carolyn and IBM, THANK YOU very much for a great introduction to a super program. OS/2 has been and is of great interest to our members and we hope that you will keep us abreast of future developments.

AND THE WINNER IS Thanks to the generosity of Carolyn White and IBM., there were several very nice door prizes. Those among us to have the good fortune to win are:

Dan Whitman	OS/2 mouse pad; OS/2 Programmers Guide
Dave Clary	OS/2 cups
Herb Atwood	OS/2 T-shirt
Steven Atran	Disk Optimizer
Roger Waters	Cash Graf Office
Joe Crochet	OS/2 Warp

The meeting adjourned at about 9 PM. ◆

lamartin@tampabay.rr.com

It is a new year. What is in store for us in computing? Probably more consolidation in both hardware and software companies. 2004 saw Gateway buy eMachines and then turn themselves over to eMachines president to see if he could make Gateway profitable. IBM sold their PC unit to a Chinese company after 3.5 years of unprofitability, and Corel acquired Jasc Software, the maker of Paint Shop Pro. Only a few months to a year earlier, I don't recall how long, Corel itself had been bought and taken private by a venture capital firm called Vector Capital. And the TPCUG has a slightly smaller membership than last year, but we are still plugging along.

Minutes of the December Meeting

By Doug Mullis, for Secretary Peggy Pulliam
dmullis@tampabay.rr.com

This being our annual Holiday Season Party, we did not have our usual SIG session. We did have a presentation by Smart Computing Magazine scheduled. This publication was formerly called PC Novice.

President Kevan Sheridan started the meeting at 7:00 PM by introducing Marcy Gunn to tell us about the magazines and web site offered by Smart Computing. Marcy was assisted by Scott Banks and Kelly Lambertson, all from Nebraska and happy to be in Florida at this time of year.

Packets were distributed containing the January 2005 issue of Smart Computing, a 2005 calendar/mouse pad, a publication, How To Get Trouble-free Email, a pen and user survey, the submitting of which gave us a chance at door prizes. Marcy outlined the offerings of the subject magazine which is presented in plain language for the novice PC user. They also offer PC Today and CPU (Computer Power User) for more technically oriented users.

Smart Computing has a Cover Story section on current items of interest, a Tech Support Center, a Review section for both software and hardware, and a section on how to keep your system operating at peak.

Next Marcy told us about the Smart Computing web site, free to magazine subscribers or for $17 annually to non-subscribers. This gives you online access to all four of their publications, allows you to research articles and then create your own personal library of research results. Also the web site has a Question & Answer board and a Tech Support Center which lists many error messages you may encounter and actions
