➪ 50/50: As a followon to a discussion of ways to generate funds to help finance our impeding relocation, one member suggested the organization keep all the proceeds of the door prize raffle, instead of using half as a raffle item. This idea seemed to have broad support, and a motion was offered and seconded to do just that, effective with the next general meeting (December). Some supported the proposal to eliminate 50/50, but felt that since an unusually small representation was present that it would be best to publicize the idea on the BBS and in the newsletter, and take a vote at and early in the December general meeting before any raffle tickets are sold. An amended motion to that effect was offered and seconded. So it will be.

INDUSTRY NEWS

There wasn't a great deal of time for this segment, but a few items were discussed:

➪ DOS 6.2 is being marketed throughout the computer world. List is $9.95, but it is streeting for as low as $8.32. MS has pointed out this is a stepup, not an upgrade in the traditional sense. Most of the initial shipments are already gone, with many stores awaiting the next shipment. It is also available for download from CompuServ for free, except for CompuServ charges which are reportedly in the $8 range. It was reported that one of the conditions of downloading from CompuServ is that the download cannot be shared with anyone else; I am not sure why such a restriction since MSDOS 6.2 is protected by copyright laws, except that this forces DOS 6.0 users to pay something between $810 to obtain the upgrade to either CompuServ or a retailer, unless you buy from MS direct. It should be noted that MSDOS 6.0 must be loaded on the computer to install 6.2.

MSDOS 6.2 contains a number of nice refinements as well as improvements in some of the major programs, such as MemMaker and DoubleSpace. 6.2 adds onepass disk copy (long available in other software, but not DOS), and commas in memory and disk space readings. When the membership was asked for any difficulties encountered with 6.2, only one reported a problem he could no longer load one of his older programs, even after making an appropriate entry in the SETVER program. It would appear, then, that MSDOS 6.2 is a go and is worth the $810.

ê Fast Modems: Harvey noted that the price of 14.4 bps modems had tumbled and are now widely available in the $150 range, and have been seen as low as $130. This is probably associated with the marketing by some manufacturers of 28.8 bps modems. Only 2 or 3 are presently marketing the 28.8s. Give due consideration before jumping in, however, because a standard has not yet been developed and agreed to for the 28.8, and you could end up with a proprietary modem that will not be compatible with the standard. And, of course, you will not find many (if any) places that will support the 28.8 for some time in the future. I have trouble finding many functionally higher than 9600 baud.

➪ WP 6.0 DOS/WIN: In response to some bugs reported to WP about these programs, WP will be coming out with an interim maintenance release in the first quarter of '94 for both programs. If you are a user, keep an eye out for it.

PRESENTATION Offline Express

Thanks to the beneficence of Kevan Sheridan, our SYSOPs, we enjoyed an excellent overview of Offline Express, an offline mail reader for DOS. Yet, it is much more than that. Though Kevan hasn't said so (in my presence, anyhow), I believe his reasons for volunteering to give the presentation is that this program will allow the user to get more benefit from the BBS and our connection to FIDO NET, while at the same time tying up the BBS less time and thereby making the BBS more available for others.

I am one of those that have not yet tried the benefits of the TQM mail door, so all of Offline Express was new to me. And I am duly impressed. As I understand Offline Express, it provides for automatic logon; bundling and downloading of messages you have set it to download; bundle, compress and upload any mail you have to upload and to the appropriate echo, all automatically. My impression is that it is similar in concept to the similar aids used with CompuServ. It will also decompress the mail you have downloaded and display same for you to read offline. Among its many features are:

➪ Works with all popular communications programs

➪ A 112K spell checker which will check automatically message text created in Offline Express.

➪ Multi conference capability; downloading/uploading exchange with multiple ECHOs in a single session automatically.

➪ Provides a "skip list" capability to avoid downloading from selected people and/or messages with a specified content.

➪ Provides an address book for correspondence.

➪ Supports cut and paste.

➪ Supports a mouse, MCI and CompuServ.

Kevan says that it is a real time saver for the user and for the BBS. A "test drive" version is available on our Bits of Blue BBS as OLXTD.EXE. It is a selfextracting file of about 228K. Simply download the file, place it in a directory of your choosing, and type OLXTD, hit Enter, and walla Offline Express Test Drive is loaded for you to try out. I understand that it is fully functional, but does not include a couple of the niceties. The first time you crank it up, you should look at the settings in the program just to make sure they are right for your particular machine and situation, but the program itself has been pretty accurate on its own.

Requirements are very minimal, and will work with just about any IBM compatible from an XT up. I do not have price information, but I believe it can be purchased direct following a test drive, with all necessary info contained in the OLXTD file. It is presently available bundled with at least one com program, QModem for $79 for both programs.

Kevan, MANY THANKS for a superb overview of what appears to be a very useful program we are in your debt. We also appreciate your arranging to receive any and all members who wish to avail themselves of the opportunity to visit the BBS and get any help from you we might need in using our BBS. I for one plan to take advantage of the offer. (For those who didn't, by the time you read this it will be too late for this go around.)

MANY THANKS!!!

(Continued on next page.)

(Continued from previous page.)

AND THE WINNER IS

Thanks to the efforts of our illustrious Prez who secured some goodies for our group, along with the 50/50 cash drawing, there were some very nice raffle prizes. Those among us to have the good fortune to win are:

Merle Nicholson	MS Arcade
W. T. Slagle	CommWorks
Steven Atran	50/50 ($33)

The meeting adjourned at about 9:05 PM.

♦♦♦♦

PRESIDENT'S COLUMN:

We made it. Marylee and I survived yet another week of COMDEX/Fall, the largest and best known computer show in the country. This show had more than 2000 exhibitors from around the world showing their products to over 170,000 attendees. It can be overwhelming if you try to visit the six main sites. But hey, its a passion and my job, damn the feet full speed ahead.

Imagine a computer show spread out over the Tampa Convention Center, the Thunder Dome, Curtis Hixon Hall, the Performing Arts Center, the Sun Dome and the Bayfront Center but contained within a two mile circle and you begin to get the picture. All of these Tampa Bay sites still could not contain all the vendors of COMDEX/Fall. In addition to that imagine walking in to a computer show with 2000+ exhibits maned by the employees representing each specific product where you can ask questions or view live demos.

COMDEX/Fall is also the place and time of the annual user group summit meeting put on by the Association of Personal Computer User Groups. This meeting is the world's largest gathering of user group leaders and officers. The summit provides officers with an opportunity to share ideas to effectively run, maintain, promote and enhance a user group. This year over 300 officers attended. Additionally, the officers attend a meeting to recognize user groups that have developed and implemented community service programs within four specific categories; *Education and Training in America's Schools*, *Education and Training for the Economically Disadvantaged*, *Medicine and Health* and *Social and Civic Welfare and Improvement*. This award program is known as the Computer Industry REACH (Recognizing Exceptional Achievement in Community Help) Awards and is sponsored and funded by some well known companies including Ziff-Davis Publishing, Microsoft and Apple. This year five groups were recognized for their achievements. From helping the visually impaired and disadvantaged inner city residents to developing and supporting a 200-node wide area network for the U.S. Olympic Festival '93, all groups showcased what can be done with an idea, volunteers and the willingness to share their time and knowledge. These groups were each awarded $15,000 to apply to their specific projects. Three of these groups are no larger than ours which shows that a group does not have to be a large group to provide a worthwhile community project.

The summit is also a chance for user group officers to meet and listen to national vendors and see their products on a more personal note. This year over 45 vendors, from the big vendors like Microsoft, IBM, Lotus, Hayes, Adobe and Borland to the smaller ones like Cambell Services, askSam Systems, GST Software and Mustang Software, sponsored roundtables, breakfast meetings, luncheons and receptions to promote their products, share their vision and answer questions. The Microsoft reception is always my favorite. It's not just because of the great food that Microsoft provides us with, it's the visit and presentation by Bill Gates himself. No transparencies or slick computer multimedia presentation, no suit or tie, just plain old english from a podium. Bill shares his thoughts and vision of the computer industry, Microsoft and this year NAFTA. He then opens the floor to questions from the audience. Bill is at ease as usual around 300+ user group officers which at times can be a bit testy. During his one hour visit he was enlightening and humorous. Of course his competitors may tell you otherwise.

Following are my thoughts, opinions which I compiled from COMDEX/Fall.

MOST PREVALENT

This year CD ROM disk were everywhere. This inexpensive medium will be a standard for distribution of PC related items by the end of 1994. This not only means distribution of software like MS Office, Novell 4.0 and Corel, but consumer products like educational software, magazines and technical CDs full of information and references. Imagine over 600Mb of data on a CD, no diskette shuffle when installing a large program. Several vendors were showing off a new way distributing software through a try before you buy approach. Even Gateway is selling this idea. You buy a CD from a vendor with over 40 leading applications on it for you to try. If you like one or more products you call the vendor and give them a credit card number and voila they send you the manuals and give you the key to unlock the program(s). Ziff-Davis issued their first copy of PC magazine on CD at COMDEX. It's different reading a magazine from your monitor than from your favorite lounge chair. However, I can imagine one day when the computer can read the article off the CD to me via a sound card and some software while sitting once again in my favorite chair.

The down side of this technology is the selection process of buying a CD ROM drive. There are too many choices and variations. Each drive has a specific function. Before you buy determine your needs. Do you want to just be able to install software from CD, do you want to use it for occasional access to graphic libraries or reference materials or do you want to use for interactive entertainment, education and yes even medical diagnoses. At a minimum and if you can afford it, look for drives that have: access time of 300ms or less, dual speed with a

(Continued on next page.)

(Continued from previous page.)
transfer rate of 150Kbps to 300Kbps or higher, SCSI interface, support the High Sierra and ISO-9660 standards and are MPC compliant. Remember that a lot of CD drives may not come with the required interface card. Ask before you buy. If you already have a standard SCSI card or sound card with a SCSI connector in your system you may be able to attach your new CD drive to it.

The ever-growing abundance of CD titles will make CD ROM drives a necessity not just a specialty item. Just as the 3.5" diskette drive evolved, CD ROM will evolve and become a standard in PCs replacing the 5.25" diskette drive.

VERY PREVALENT

PCMCIA those credit card size computer cards that go inside notebooks and sub-notebooks are increasing their versatility. In addition to memory, FAX/modems and network PCMCIA cards which have been around awhile, there are now: SCSI, sound, and 100+ Mb hard drive PCMCIA cards. Eventually desktop computers will be fitted with PCMCIA slots to accept all these cards. Imagine adding or replacing these cards on your desktop without the hassle of pulling off the cover or messing around with jumpers. I did see one company, DATA I/O 1-800-332-8246, that was selling interfaces designed to use existing PCMCIA cards on your desktop. One version allowed connection through the parallel port while a second version installed in an empty drive bay. I found this product to be WAY COOL! One concern I have about these small PCMCIA cards is that they will be vulnerable to damage and theft.

NEW STANDARD

Look for Intel Corp.'s Peripheral Component Interconnect (PCI) Local Bus to become the high performance desktop Bus standard of the future, however long that is. With a following of at least 150 industry leading companies the non-proprietary PCI Local Bus will supersede and replace the VESA Local Bus currently being used in many PCs today. I am sure you are thinking "great now you got ISA, EISA, MCA, VESA and now PCI when will it end".

NOT TOMORROW

After seeing and talking to vendors about Windows NT, V.34 (V.Fast) and the PowerPC it became evident that none of the products are ready for prime time, YET.

Windows NT is available today as a network operating system, but as a desktop operating system it needs work. Many vendors within the Microsoft floor space were showing their products running under NT. However, quite a few were showing non-shipping products. It made me wonder how much of those products demos were done with smoke and mirrors. It should take Microsoft about a release and a half to get the product usable as a desktop OS. Of course the Chicago release of Windows will be out before then and many individuals may be satisfied with it instead. I must admit that some 3rd party vendors were extremely ecstatic about Windows NT, even to the point of showing me NT instead of their products. I believe that this kind of dedication is a positive sign for NT.

IBM and Apple displayed their PowerPCs at COMDEX. Neither of which is available today or tomorrow. Look for these PCs to be available in quantity during the final part of 94. These new PCs will give Intel a run for their money if they can get the product to market. The benefits of the PowerPC is that it will run just about any operating system including DOS Windows, NT, OS/2, Solaris, Workplace OS and IBM new AIX version 4.x. Of course at this time that's what the marketing people are telling us.

V.WHAT?

Hayes, Microcomm and Practical Peripherals all demonstrated very fast modems. All of course were non-standard. The new high speed non-standards demonstrated were: V.32 *terbo* at 19.2Kbps and V.Fast class (V.FC) at 28.8Kbps. The standard that you and I want is V.34 (V.Fast) and is stated to be approved by the newly named ITU-T (formerly CCITT) in late 1994. Can I put some more acronyms in this article? In order to use any of these high speed protocols (V.32 *terbo* and V.Fast class (V.FC)) you must have the same vendors modem on the other end. Unless you have immediate needs for this high speed and you are sure that the modem you connect to is similar, you should wait until the standard is approved. Hayes stated that you could buy there V.FC modem today and pay for the upgrade to V.34 when it becomes a standard.

AND MORE

Microsoft has at least three new products that provide more functionality than their predecessors. The new mouse driver for the MS Mouse, Windows for Workgroups 3.11 and version 2.0 software of the MS Windows Sound System are worth upgrading to.

Adobe has a real HOT PROSPECT with Acrobat. This family of software will allow you to send fully formatted documents as a file - containing distinctive typefaces, color, graphics and photographs - created on your computer to other computers, regardless of the hardware platform, operating system or application software used to create the originals. Receivers will in turn be able to print, view annotate and store the document on their own system. I hope to be able to use this software to produce a complete file copy of the newsletter for distribution through the BBS.

Compaq will be bundling a slick replacement product, Tabworks, for the existing Windows program manager with their PCs. Tabworks uses a familiar look and feel. If you can imagine a three ring binder with tabs you will understand this simple idea. This interface provides a very clean looking desktop thereby reducing that group icon clutter. Simply place your groups on the tab sheets and your desktop screen looks like your junior high notebook. While Compaq did not write this product they will have sole distribution rights for one year before other vendors offer it.

(Continued on next page.)

(Continued from previous page.)
The above only represents some of my thoughts and opinions which I wanted to share with you. If time permits I will share additional items at the December meeting.

At this time Marylee and I wish to thank the APCUG, all the sponsoring vendors and Dun & Bradstreet Software for a successful COMDEX.

STILL MORE... NON-COMDEX COMMENTS:

Please come to the December meeting to vote for YOUR CHOICE. Your vote will determine the officers (President, Vice-President, Secretary and Treasurer) for 1994 and whether to keep the 50/50 door prize. Read the secretary's report for a current list of nominations and details about the 50/50 door prize. Your vote is important. If you have any additional nominations there is still time to make them at the meeting prior to the vote.

Many of you will notice a renewal slip in the current newsletter. Please take the time to fill it out to renew your membership. The $20 investment is the best PC investment for the money. Of course you will also be helping our group. As you should be aware by now we will be changing our meeting site in February. Our new home will be the Ybor room of the HCC campus. By the time of the December meeting, I will have signed a contract for the use of the Ybor room through the end of 1994. It will be the first time in the past five years that our group will be charged for meeting space. The board of directors and I felt that in order for the user group to grow and flourish we needed to move to a larger facilities. HCC was one of the few sites that satisfied our needs.

Unfortunately, we do not have a computer or projection equipment to put on a presentation. HCC currently does not have the equipment we need either. I have contacted some of the local vendors for a donation or to see if we can barter for a PC. On the positive side no vendor said NO, but more importantly none said yes. I will continue to pursue this with the vendors. Specifically, we need at least a 486/mhz DX with 120 Mb hard drive, 4Mb RAM and VGA monitor. The current cost for the PC is around $1500. If you can help us to acquire a PC or even the parts to build our own please contact me.The big ticket item is of course a video projection panel like the Proxima ColorWorks or the InFocus PanelBook 450. These are the inexpensive models and are priced around $3500. If you have added the amounts of the equipment, we are looking at around $5000. Once again if you have an idea on how we can borrow, rent or acquire these items give me a call. I can be very humble.

Harvey Bruneau

SOFTWARE REVIEW:

Home Release 2
Review By: Jim Clark
Tampa PC Users Group

What It Is: Home is a home design CAD program for DOS from Autodesk. It is part of Autodesk's Home Series, which also includes: Kitchen, Bathroom, Deck, and Landscape. Home has been developed for people considering building a home or adding to their existing home. It provides the capability to explore ideas in the computer and help make layout and a host of other decisions that go into home design plans. The final product can then be printed and "will be accurate enough to give to an architect or contractor." Price wise, it is a low-end program, but it has a good bit of power for the money and it provides the capability to develop floor plans for any size home you might wish to draw or design. I can imagine some other simple objects that could be drawn using this program, but it is designed specifically for home plans and really would not be very satisfactory for any other use.

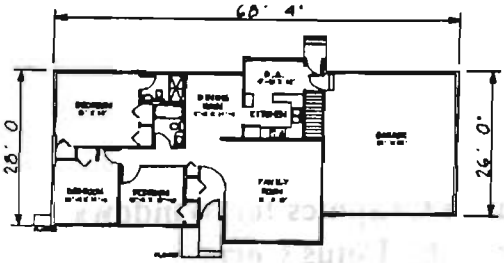
Features: Home has the capability to draw floor plans of any size, though much of the work in creating very large plans will have to be accomplished with only the current portion on the screen -- meaning a bit of zooming in and out. It can create very precise plans, allowing precise placement of all walls and objects; the precision of the plan will, of course, depend on the preciseness of the input. Walls and lines can be drawn accurately at any angle, with 45 and 90 degree increments as menued choices. Wall thickness and height are also controllable, but the program includes no provisions for different wall heights in the same plan -- as exists in many homes with cathedral ceilings. Elevation drawings can also be created. The user can select either metric or imperial measurements.

The program includes a basic but limited selection of floor plan and elevation view symbols for swinging, pocket and sliding doors, 36" high sliding windows, side and arch lites, and garage doors -- all in standard sizes. No symbols are provided for windows taller than 36" nor for styles other than sliding, and only floor plan symbols are available for bi-fold doors. Basic electrical symbols are provided, including even a smoke detector, but strangely omitting ceiling light fixtures and "J" boxes. Standard size symbols are included for major appliances and kitchen bathroom fixtures, major items of furniture, and even a few disabled symbols. Fills are also provided for fireplace, door, exterior wall, floor (interior and exterior) and roof finishes. Fills cannot be created, but a drawing capability is available to draw items desired and not included with the program. The only problem here is that such items will not show up in 3D views/printouts nor in the list of materials, but they will appear in 2D views/printouts.

Yes, the program does include a capability to create and printout a list of materials -- the list being a list of items used from the symbols libraries (outlets, sinks, doors, windows, etc.), with quantity, but not including any construction materials or drawn

(Continued on next page.)

(Continued from previous page.)
items. Home has a limited text capability (with a choice of two fonts) that can be used to add items to the list and/or to place labels and any other desired information on the plan. Text size is also selectable, but size is expressed in inches (scaled to the plan dimensions) instead of points or CPI. Point-to-point dimensions, though, are a menu item and can be inserted accurately and easily by selecting from the dimensions menu and pointing and clicking the mouse a couple of times.



Home includes "3D Plan" as a stand-alone portion of the program that can be ran by itself, or activated from within the basic program. It will take any 2D plan created in Home and display it on screen where it can be viewed in three perspectives: Floor plan, which is the same as in 2D; overview, where you get a 3D view as if you are elevated to 12-15' above floor level and at a distance you select from the structure -- giving an overall 3D perspective of the proposed structure; and an eye-level perspective. Floor plan is used as a launching point for the other two perspectives and is used for selecting the point from which you want to view the structure and the angle from that point that you want to see. Once the view is selected and shown on screen, one can navigate or "walk" around and through the drawing, getting appropriate 3D displays on the screen. Moves are made in 1 or 5' increments, and angles in 5 or 15 degree increments, with each change causing the program to recalculate and display the results to the screen. Calculating, recalculating and display of each on the screen takes a lot of time -- or a fast machine. A "walk" through the house using my computer would take a couple of hours. Alternatively, one could switch back and forth between overhead and eye-level views, changing the location and angle of view each time, and view all of the important areas in much less time. All of the views available in 3D Plan can be printed, as can the 2D plan at any stage of development.

The 3D Plan also provides the capability to change colors on individual items on the screen, thereby allowing one to test color schemes for all portions of the plan. While it is not likely that the precise colors viewed in the plan will be found on or for all of the actual items, I would think this could be a very helpful feature in making color decisions.

Symbols and drawings can be changed easily -- moved or deleted and reinserted elsewhere if desired. Walls can be changed as well, but doing so is a good bit more complicated. The program includes an "oops" feature which all users will use -- and find handy. Oops will remove up to the last 25 steps taken, with a "redo" capability if you err with oops. But, if you "oops'd" the last 10 steps, for example, after correcting the error you will have to recreate the last nine oops items if they are to remain in the plan.

Home supports most printers, using drivers for selected standards and their compatibles. It will print plans at any scale or size you choose that your printer is capable of printing. Home uses a .GCD format as its standard for files saved, but provides the option of also saving plans in Drawing Exchange Format (.DXF) used by many other CAD programs (and word processors and DTPs), or the .DWG format used by AutoCAD. These option formats allow taking plans created in Home to some commersial printers where they can be produced in standard building plan size. The following drawing is a sample of a Home output:

Installation: The program comes on three 3.5" HD floppies. Installation is easy and quick, taking only a few moments and requires only that you select drive and directory. Usually no AUTOEXEC.BAT/CONFIG.SYS changes are required.

Documentation: The owners manual is fairly comprehensive and provides step-by-step instructions and tutorials. There are a few instances, however, where the manual has not kept pace with the program (or visa versa). The tutorial for one portion of the program, for example, focuses on a specific floor plan which is **not** included on the program disks. The program includes on-line help as well as well, but is limited to brief descriptions of menu items. Autodesk provides free technical support, but only on toll lines; initial contact is through an 800 number, but a tape quickly refers technical support calls to their toll numbers.

Requirements for Home according to the manual are: An IBM PC or better with 640K RAM; one floppy disk drive; a hard drive with 3 Mb of free space; DOS 3.0 or later; a video graphics card with at least 640 X 200 resolution; a mouse. However, it recommends a 286 or better with 2 Mb EMS, a VGA card and a math coprocessor. I would say that the recommended is the absolute minimum, and one should be prepared for some rather slow performance in 3D or with large floor plans. I have a 386DX/40 with 128K external cache and 8 Mb of RAM, but without coprocessor, and I found many times that a coprocessor and/or a faster machine would save a good bit of time. And instead of using 3 Mb of hard disk space, the program occupies 5.5 Mb on my HD.

Cost: Home may not be immediately available in all software stores and may have to be ordered in. It lists for $59.95, with a street price at Egghead of $41.99.

My View: Notwithstanding the tutorials, I had some difficulty getting the hang of the drawing mechanics of the program. After some practice, however, I got the hang of it and began to

(Continued on next page.)

(Continued from previous page.)
create a good bit faster. I used the "oops" feature quite a few times in the process. I am not sure that one could create with the program all of the plans required for building permits in our county. However, had I this program several years back when we were designing our home, I believe it would have been of considerable help in making our decisions and would likely have resulted in finding before-hand at least a few of the changes we would now make. SOFTWARE REVIEW:

Freelance Graphics for Windows Release 2 by Lotus Corp.

Review by: Alford Poole, Tampa PC Users Group

It's hard to tell what lurks beneath the shrink wrap in some software packages. "The fastest, easiest way to a great presentation," is this true or just hype? The Freelance Graphics for Windows box lists three steps: 1 - Select a look, 2 - Choose a page layout, and 3 - Fill in the blanks. Can the business person, trying to come up with a snappy presentation to bolster sagging sales or a student needing multimedia for a class project, find this software of value? To find out, let me take you on a tour through the contents of the box.

First we find several well-written manuals and booklets using images of the monitor screens frequently and easy to understand text. At the end of each chapter of the User's Manual are good tips on using the chapter material and where to look for additional information. Another booklet has color and black and white pictures of all 65 SmartMasters and black and white pictures of all the symbols. Thus, you can make some option decisions before you turn the computer on.

On the disks we find the SmartMasters, each with 11 page layouts for title, bulleted lists, charts, tables, and organization charts. All are optimized for color or black and white output and just need the blanks filled. An Outliner is linked to the SmartMasters so edits in one show up in both. A Page Sorter makes it easy to view small images of your presentation and rearrange them. There are 108 defined charts and data can be imported from 1-2-3, Excel, Symphony, dBase and SYLK files. More than 20 file formats are supported including ASCII, CGM, WMF, and PCX, TIFF and BMP graphics. Also, DDE and OLE, so only about 10 letters in the alphabet are not supported. There are drawing tools for creating graphics and WYSIWYG word processing and a spelling checker.

Installation was a breeze, after I replaced my floppy drive that decided not to read cylinder 79 anymore. The default, full package option, fills over 19 MB of disk space. Add a little more if you install the Adobe Type Manager with 13 Type 1 fonts.

A three minute Quickstart leads into a half hour interactive animated demo where you watch the computer create a title page and bulleted list and then you try it. Creating a chart, using the outliner, creating a table, and managing your presentation is covered in the same manner. Though the tutor session shows you which buttons to push, there are still some unexplained icons, but help is close through the "?" button at the top of nearly every screen.

The test presentation was a media service demo. Choosing the SmartMaster set was the first hard decision. Several looked good. I selected a boxed menu set and then the fun began - literally. Typing in the titles and bulleted lines was really easy and everything lined up automatically. I toyed with changing the color scheme, but the default seemed to look the best, they really did do a good job coordinating the color palettes. An imported graphic from Imageline Business Clip Art was added to the title page with a few clicks of the mouse and typing *.* for Files to change the extension. A WordPerfect graphic also imported without a hitch. The Outliner looks like a legal pad and worked great for quickly setting up new pages. The only snag came while rearranging text in a double bulleted page. I figured out what to do without going to the manual.

My 13 year old son also created a slide show. He made his a lot more spectacular with each page loaded with graphics and a different technique for each slide change. The sad part was that he made his without ever cracking the wonderful manual and in less than half an hour. We have different philosophies concerning learning to use new software. His is "just push that button and see what happens" while mine is "maybe we should check the manual before we push that button." My son learns quickly, is fearless and confident and hey, I'm over 40!

A slide show that works by itself, without Freelance or Windows, only took a few clicks of the mouse. In the stand alone version some fancy replacement effects, multimedia objects and Screen Show buttons become unusable. The presentation still looks great and you don't have to lug your PC anywhere to show it.

Another neat feature is the ability to create buttons out of just about anything on each screen. I created one out of a block of text and when clicked it jumped the show to a previously specified page. Another application could be opened and used in this way.

Smarticons, Freelance's shortcut buttons, are easy to customize through drag and drop. The default set has 1-2-3, Ami Pro, and Notes buttons and if you don't have those programs they can be deleted and a new set of icons created. To start the new set, click the icon button at the bottom of the screen.

(Continued on next page.)

(Continued from previous page.)
You can make slides, overheads, prints, flipcharts, posters, and banners of your presentation using a modem and the Autographix software. The nearest Autographix office is in Orlando and they promise overnight service if they receive your info before noon. Costs are $12 per slide, $8 per transparency, $6 per print, and duplicates are a few dollars cheaper. Two day deliveries are also cheaper.

You can create speaker notes to remind you of what to say during the presentation. You can also make audience handouts with up to four presentation screens on one page.

There are two mildly exciting movies, one of a revolving globe and one of a "laser," but the neat thing is that you can import other movies and use them as objects. Several WAV files are included too.

Lotus has an introductory toll-free hotline (good for 90 days), 60 day money back satisfaction guarantee, 90 day warranty, and a Lotus Customer Assurance Plan. They want their customers to be happy campers. I used the hotline to find out why I got error messages from time to time. The response time was about average, maybe a five minute wait, but the service technician was very helpful. We narrowed it down to either memory problems due to too many drivers (Stacker, Bernoulli, Direct Access, mouse, CDROM, etc.) or possibly an outdated driver. Booting with fewer drivers seems to have helped.

To answer the original question of hype or not, it depends. It depends on how involved a presentation you want and your level of experience. After the tutorial, creating a good looking generic presentation can be done quickly, but who wants to be plain? A creative presentation takes time and patience to learn the special features of this package (and there are plenty). This software is a powerful tool that delivers and would help both the business person and student create great presentations.

Minimum hardware requirements:
* 286 PC.
* EGA graphics card.
* DOS 3.1, Windows 3.0.
* 9MB available on hard disk.
* 3MB of RAM.
* A mouse is required.
* Freelance is network ready.

Those wishing to take the self guided tour of Freelance Graphics for Windows and already having Freelance, Harvard Graphics, Powerpoint, WordPerfect Presentations or other presentation product for Windows, DOS or OS/2 can buy the upgrade package for $98.98. Otherwise, it is $349.99.

For more information contact: Lotus Development Corp., 55 Cambridge Parkway, Cambridge, MA 02142 (800)343-5414

Game Review:

LINKS386PRO: INNISBROOK

By: Matt Nicholson, TPCUG

The latest course for Links386 Pro, Innisbrook-Copperhead, is most noted for its spectacular scenery. Although it is located in Tarpon Springs, it is more like playing in South Carolina, with one difference. I was playing on the Pro difficulty level one time, and I hooked it viciously into the trees. My lie was technically on pine needles, but it was actually on an alligator. Judging by his lack of movement, I took him as scenery and played through while a bird watched in mid-flight, also motionless.

Despite the lack of nature animation, the course is very pleasing to the eye. As far as difficulty is concerned, I'd give it a six on a scale of ten. I scored a nine under par on the second time I played, while my opponent, a recrorded player that came with the course, scored a pitiful eight over par. There are, of course, other recorded players who, unlike pathetic Veronica, could kick my butt. Nine under is good, but megatons of luck were pushed in my direction. On normal days, I'd be lucky to get two under. For a more challenging course, I suggest Firestone, Harbour Town (comes with Links386 Pro), or Mauna Kea.

As a follow-up on my previous article, here's a few things that I've discovered. When you install Links386 Pro, make sure you install the correct video driver for your card. If you cant quite remember what brand of video card you have, check the _____. It would be a good idea to make a boot disk, to give it enough memory to run, and to automatically install the proper video driver. My computer locked up every time I tried to play Links386 Pro, until I made the boot disk. I suggest acquiring as many courses as possible because they each have a new version of links386.exe, mine was upgraded from 1.07 (from Mauna Kea) to 1.10 because of Innisbrook. I saw no change, but in the long run, I felt safer.

To summarize, it was nice playing on a course close to home, and the scenery is great, but overall it was too simple. For more information contact: Access Software Incorporated 4910 West Amelia Earhart Dr. SLC, UT 84116 1-800-800-4880; 1-801-359-2900; 1-801-596-9128 FAX

LIST.COM Utility Program

Do you keep your utility programs in a directory that is in your PATH statement? If not, create one; then put all those small utility programs that you use in that directory. For starters, put PKZIP.EXE, PKUNZIP.EXE, LIST.COM and FV.COM in that directory. FV.COM is one of the programs bundled with LIST.COM.

Many of you have used the LIST program written by Vernon D. Buerg. The latest version, LIST90.EXE, is on our BBS. While many use it only as a text file reader, it is loaded with worthwhile features.

One use is as a file manager. You can move up and down the directory trees and change to another disk drive. It's very easy to rename, copy, delete, and otherwise rearrange your files. Sure, it's not as fancy as the "drag and drop" modules of other file managers; but if you're browsing disk files from the DOS command line, this is a handy feature.

Another is to look inside .ZIP files! If your unpack program (ARC, ARJ, DWC, LBR, LZH, PAK, ZIP, ZOO) and Buerg's FV.COM are available[1] to LIST, highlight the .ZIP file and press V to view the contents of that packed file. And if you want to look at one of the files inside that .ZIP file, press Alt-I, position the flashing cursor on the particular file, and press the Enter key. Just be sure that the disk with the .ZIP file has enough room to unpack that file.

It also has a block capture feature. Often when browsing a file, it has a snippet of data here and some lines there that you want to capture and either print or save to file. With LIST (and the text on the screen), scroll the text until the start of the block is at the top of the screen and press Alt-M. Scroll the text until the end of the block is at the bottom of the screen and press Alt-B to mark the block. Press Alt-D to save to file or press Alt-P to print the marked block. Press Alt-U if you made a mistake and need to start over or just to clear the block.

But if you want only a few lines and the above method blocks too much text, there is an alternative. Scroll the text until the start is at the top of the screen and press Alt-M as before. Now scroll the text again, up or down, until the end of the block is at the top of the screen and press Alt-M again. Now press AltD or Alt-P.

1. The programs are in a directory shown in the PATH statement.

by Ed Buzza

Contributions, please

Each month, we'd like to publish in this column those tips, techniques, tricks that you have found useful. Whether software or hardware, it makes no difference. Don't worry about words, punctuation, spelling or writing style. Just get the material to Ed Buzza somehow; a message on the BBS, a note at the meeting or in the mail, - whatever. Ed said he's willing to edit whatever he receives. And you will be given credit for the material.

LOCAL BATTERY SAVIORS

By: Tom Schroeppel

We portable computer owners live and die by our batteries. Recently my Toshiba notebook's internal backup battery, which powers the AutoResume feature and HardRam disk, bit the dust and took me with it.

I logged onto the CompuServe Toshiba forum looking for help. While waiting for an answer, I pulled from my files a flyer I had picked up somewhere for a Tampa battery supplier, Micro Precision.

I called Micro Precision and spoke with Dave Lund, who was very helpful. He invited me to bring my Toshiba into his office for resuscitation.

Within minutes of my arrival at Micro Precision, Dave and his partner, Wade Smith, had custom-built a replacement battery for me. As a bonus, it even had a little more power than the Toshiba original!

When your computer batteries die, I'd recommend calling these guys first.

The cost was very reasonable. How reasonable I discovered when I got home and logged back onto the CompuServe Toshiba forum. A Toshiba parts distributor had left me a message, offering to sell me a Toshiba-brand replacement backup battery for approximately three times what I had just paid Micro Precision--plus overnight shipping!

Micro Precision is a supplier of batteries and battery packs to original equipment manufacturers, so they know their business. They can even rebuild your dead battery packs with new cells, at a fraction of the cost of a new pack.

When your computer batteries die, I'd recommend calling these guys first.

They're located at 13440 Wright Circle, Tampa, Florida 33626, in the Tri-County Business Park near Tampa Bay Downs Race Tract. Their local number is 854-2861. They also have a toll-free number: 1-800-544-8421.

HAVE A SAFE AND HAPPY NEW YEAR!

We're moving!

February 9, 1994

Directions to our new meeting site: Take Interstate 4 to 21st Street exit, South to Palm Avenue, West to 15th Street to Hillsborough Community College -Ybor Room, 2001 14th Street, Tampa, Florida 33605

MEMBERS HELP-LINE

The following phone list is provided for our **Tampa PC Users Group** members in an effort to establish local support for those frustrating times which we have all encountered while using our PC's. Please note that these are members that have volunteered to help you, treat them in a courteous manner. Be sure to ask if it is convenient for them to help you now, or if you should call another time. It would also be helpful to have your documentation and have it handy when you call. *(Don't expect help if your software is an illegal copy or you do not have documentation!)* **TPCUG** is not responsible for the information or advice provided by volunteers. Volunteers may or may not be experts in the subject matter. You are on your own with any advice received. Be aware also that some of these volunteers may be consultants in their area of expertise. If you are interested in volunteering to answer members questions, either leave a message on the BBS or fill in the forms provided for this purpose at the meetings.

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII file or in a commonly available word processor format, such as WordPerfect 5.2, or Ami Pro 3.0 on diskette to the editor at 9402 Hidden Ridge Place, Tampa, Florida 33637 or send it by modem to BBS (813)239-3704.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

Commercial advertisements will be accepted at the following rates:

	1 month	3 months	6 months
Full Page	$60.00	$162.00	288.00
Half Page	$40.00	$108.00	$192.00
Quarter Page	$22.00	$60.00	$106.00
Eight Page	$12.00	$33.00	$58.00
Business Card	$10.00	$27.00	$48.00

All advertisements must be prepaid by check payable to TPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if it is not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, Marylee Bruneau at (813) 985-3338, for space availability and for further information.

This newsletter is created with Ami Pro for Windows from Lotus Corp. and Corel Draw from Corel systems.

Secretary's Report

MINUTES OF 12/8/93 MEETING and PERSONAL COMMENTS

By: Jim Clark

The meeting began a few minutes late at 6:10, led by our illustrious Prez, Harvey Bruneau, with a modest representation of members present and a several visitors. Important user group business was scheduled for the evening, along with a presentation of an intriguing software program.

USER GROUP NEWS

⇨ Elections: The floor was opened to any additional nominations for the five elected positions on the Tampa PC Users Group Board of Directors. None were offered, the nominations were closed, and preparations for the election began. A motion was made, seconded and approved by the majority present that those persons nominated for positions for which there was no opposition be elected in block to fill those positions. There were three nominees for the position of Vice President: Michaline Ostrowski, Don Patzsch, and Al Poole. Two votes were taken, with the first narrowing the field to two nominees since the first vote did not produce a clear winner. Those elected to serve through December 1994 are as follows:

President	Harvey Bruneau*
Vice President	Al Poole
Treasurer	Tom Cone *
Secretary	Jim Clark *
Member at Large	Roger Waters*

* = Sole nominees

⇨ 50/50: A decision was taken by the membership during the November meeting to take a vote at this meeting on a motion to eliminate the split of money collected for the door prize drawings, with the user group instead retaining all of the funds to help offset our need for funds to finance our relocation and other needs. A vote was taken on the motion and it carried by a large majority: At this meeting and all future meetings, all funds collected for the door prize drawings will be retained by the user group.

⇨ New Meeting Location: Harvey announced that beginning with the February 1994 meeting our meetings would be held at the Ybor City campus of the HCC. A map was included in the last newsletter. While equipment arrangements had not yet been completed for that site, the facilities are excellent and the normal meeting agenda would obtain, including a vendor presentation:

⇨ Software Reviews: Harvey announced that he and Marylee had obtained a number of software programs at Comdex for review by our group. A listing of the programs available will be posted on the BBS and in the next newsletter. Please contact Marylee Bruneau about any of the programs you would like to review.

⇨ Adobe Acrobat Explained: Harvey informed the membership of a BOD decision to acquire a license for Adobe Acrobat readers for all group members. Abobe Acrobat allows

(Continued on next page)

(Continued from previous page)
converting the output of most major programs into a common format, retaining all formatting characteristics of the original document, allowing all computers with a reader to display and printout, if desired, any document as it was originally created, whether or not the viewing computer has any of the software tools of the creating computer. Not only will this be a considerable convenience to our members and group administration, but it is expected to lead to considerable savings in distribution of the newsletter.

⇨ Meet Your BBS: A number of our group took advantage of an offer by our SYSOPs, Kevan Sheridan, to meet the Bits Of Blue BBS at the site of the BBS computer. Kevan explained a bit about the BBS and answered all questions with demonstrations where appropriate. It was a very interesting and informative session for all participants. Kevan received enough feedback from those participants to know the evening was worthwhile, and accordingly has scheduled another Meet Your BBS Nite third Wednesday in January. It may well become a regularly scheduled event. Come to the meetings and/or watch the BBS for more current info of this.

⇨ Caution In Buying CDs: Low cost CD's are flooding the market, many of which are not worth their few $$ price. Harvey advises that you look before you leap when purchasing CDs; even a cheap CD is a waste if it is not useful.

INDUSTRY NEWS

⇨ Word 6.0 Bugs: A number of bugs have shown up in the recently released Word for Windows 6.0. Microsoft has announced there will be a release in February to correct these problems.

⇨ 28.8 Modems: Harvey informed that these modems which use parallel ports are now available from at least two vendors. Cost is in the range of what the 14.4 used to cost.

⇨ Sound Technology: Summarizing his readings from articles on the subject, Harvey reported that sound technology was now on the fast track and we could expect in the nottoodistant future that a vocal interface between user and computer would be a lot more practical.

PRESENTATION askSam for Windows, Ver. 1.0

Philip Schnyder, President of askSam Systems, favored us with his presentation of their software program, askSam for Windows. We have been hearing a good bit about that program for a while now and I, at least, have really not known what the program is about only glowing words that it is a great program. BUT WHAT IS IT?? Philip was here to answer that question. A very simplified answer is it is a very powerful, super flexible, very userfriendly information management/database program. I now understand why it was so much of a mystery for me, because even after having seen a demo of the program I am having considerable difficulty coming up with description for you. What I can tell you for sure is that it is a great program.

Designed with a view of doctors, lawyers and others who deal with random information which they need to retain and be able to quickly recall when needed, askSam is a free form information management system. While it can be used pretty much as a conventional dbase to retain and recall structured data, its greatest value lies in its ability to store and recall information in unstructured form; that is, input information of just about any size and shape randomly into the same data base and then be able to quickly recall that information in usable form, using a single or many criteria, and in a wide variety of formats and views. How fast can it retrieve? Philip says they have tested: With a 486/33 using DOS 5 and Windows 3.1, it took 15 seconds to search a 5.2 Mb data base. (I am not sure that this is useful information since timing is affected by so many variables, including criteria, format, available memory, etc.) In any case, the demo I saw was fast.

I was too intrigued with the program to get many notes. I did note the following: The limit on the number of criteria one can use in searches is unknown at present, but is well in excess of that one is likely to ever need; each record can be up to 300 pages (yes, three hundred pages) long; supports OLE of text and graphics; supports direct imports of ASCII, RTF, Word Perfect and dBase/FoxPro formats; exports in ASCII, RTF and CDV. Features not yet a part of the program, but which are in the works include a spell checker and the ability to conduct multiple data base searches. Philip recommends a 386 machine with 4 Mb of RAM to run the program, though it will function with lesser capability. The program requires 2 Mb of hard disk space. askSam lists for $395, with a street price somewhat less than that. Those present at the meeting were given the opportunity to purchase the DOS or Windows version at a great savings for $125. Phil explained that the DOS and Windows versions are essentially the same, the differences in summary being that the Windows version is some easier to use, while the DOS version has a few more options. Phil, we THANK YOU VERY MUCH for your visit, for a great presentation of a super program, and for the copies of askSam you donated for our door prizes. You have a real winner in askSam. We look forward to your next visit in our new quarters.

AND THE WINNER IS:

Thanks to the generosity of askSam Systems, who donated 2 copies of askSam, and to Brainchild Computer, who donated a copy of MS Word Assistant, there were some very nice door prizes. Those among us to have the good fortune to win are:

Tom Church	Cup
R. W. Davis	MS Word Assistant
Bill White	askSam (DOS)
Tom Schroeppel	askSam (Windows)

The meeting adjourned at about 9:00 PM.

♦♦♦♦

Check Your Address Label!

The newsletter mailing label shows the date your membership renewal is due. This is your only notice of an expiring membership along with the colorful renewal applications tucked inside your last newsletter. Don't let a simple oversight result in your name being removed from the mailing list. Keep your membership current, renew today by mailing a check to the attention of the treasurer or bring it with you to the meeting this month.

PRESIDENT'S COLUMN:

Here we are in 1994. Elections are over, holidays are over, presents are gone and now the bills and the tax forms are coming. That is why I scheduled Computer Associates to show us two of their products, Simply Tax & Simply Money, at the January meeting. These products will help keep track of your financials and help you prepare your taxes. Door prizes will include these products.

This will also be our last regular meeting at IBM. IBM has been a gracious host to us for several years. However, our need for a larger space to accommodate our growth has required our move. Effective February our meetings will be held at the Ybor room of the HCC Ybor campus. The meeting will still be held on the second Wednesday of each month beginning at 6:00PM. Look for a map in this newsletter to provide you with directions.

At the December meeting all incumbent officers were re-elected un opposed. Welcome back Harvey Bruneau, Roger Waters, Tom Cone and Jim Clark!

As you may be aware, Tom Cone, was holding three positions, Vice-president, interim Treasurer and Membership Director. This was in part due to the loss of William Fuller, our 1993 Treasurer. Bill's relocation to Jacksonville necessitated an immediate replacement for which Tom volunteered to assume the job for the remainder of the 1993 year. For 1994 Tom indicated he would accept the nomination for Treasurer and volunteered to again to be Membership Director. This left the Vice-president position open. Fortunately, and for the first time that I can remember, there were three nominations for Vice-president. Alford "Al" Poole was elected as Vice-president. Please join me in welcoming Al into his additional and new role with our group. Al and his son Matthew have been contributing enlightening newsletter columns for us. Al has also been learning and helping Kevan with the BBS.

All volunteers have also decided to stay on. While Ed Buzza will no longer be teaching classes he will still be Education Director. I believe the time has come to put more than just reviews in the newsletter. With that in mind I have asked Ed, and he has accepted, to be the editor of a tips and techniques column for our newsletter. This column will be based on contributed articles from everyone, not just Ed.

Marylee Bruneau will continue as our editor. Thanks to Marylee for creating a newsletter every month on her own and implementing bulk mail in 1993.

Larry Anders will continue to roam bulletin boards and other information highways to provide us with great and current software and information for the diskette library and BBS. If you are looking for a specific type of software product and we don't have it on the BBS, leave him a message on the BBS. If anyone can find software it's our Librarian Larry.

Kevan Sheridan will still devote his energy as SYSOP to providing us with the best BBS he can. If you have any questions about anything related to the BBS, modems or communications leave a BBS message for Kevan.

Tom Cone will continue as Director of Membership in addition to being the Treasurer. Tom has also been involved as the welcome committee at meetings to make guest feel welcome and help new members into our group. We are in the process of looking for an official volunteer greeter that can work with Tom. Questions about our group or membership should be directed to Tom.

I believe that 1994 should be the most exciting and challenging year ever for us. Our group and HCC will mutually benefit from each other. We will have a larger pool of knowledge to gather and share information from. This will include students and faculty of HCC and ourselves. This year should be the year that we finally get our Special Interest Groups (SIG) going. Based on conversation I have had with HCC faculty, we may be able to hold some SIG meetings or classes at the Ybor and Dale Mabry campuses at no additional momentary cost. Of course SIG's and classes will only be available if we have volunteers to run them. Contact me or Ed Buzza if you would like to teach a class or run a SIG group. We need to begin the process of organizing these events now.

Last year the board of directors voted to create a family membership. This year the board has created a third membership category. The new category, effectively immediately, will be for current HCC staff and students at a cost of $15.00.

Harvey Bruneau

SOFTWARE REVIEW:

Add Impact! By Gold Disk

Review by: Matthew and Alford Poole, Tampa PC Users Group

Imagine you've just completed the perfect presentation with your favorite Windows program. You review it one more time, slide by slide and then wish some key points could be emphasized just a bit more. Now, imagine soaring rockets, zooming titles, music, narration, and all manner of spif and pop added to those key points. That is what AddImpact! is all about. AddImpact! works with Freelance, WordPerfect, CorelDraw, Excel and other applications that support OLE (Object Linking and Embedding) to add emphasis and make the presentation more exciting.

Installation: Weird things happened during installation. A little window appears with a registration reminder which can be maximized. There isn't any more text to read, so maximize only if you don't want to watch the little gauges move as the files are expanded and installed. The installation process takes total control of the cpu so it is hard to get back to see how the installation is progressing. Mouse clicks and key punches become useless. When the screen saver kicks in, the stars don't move. We need more power, Scotty!

Our mouse is an old Mouse Systems Optical (no moving parts) with a 1987 driver. I suspected it was not 100% Windows compatible and was to blame for the lack of control, but a new Microsoft mouse gave the same results. Standard installation requires approximately 9MB of hard disk space.

The first thing you notice after clicking the AddImpact! icon is sand flowing in the hourglass. When all the sand drops down the hourglass flips to start the sand flowing again. Clever.

Major Features:

* Popup tool bar. Start AddImpact! from within an OLE client, AddImpact! adds itself to the menus for easy access.
* 125 animated clips. Brief messages for business or fun such as fireworks, balloons, airplanes, or ringing phones with someone saying something cute.
* 75 sounds and music clips. The WAV files are very short while the MIDI files are musical and much longer.
* PC Speaker Driver for sound with or without sound card. Yes, it will work without a sound card, but compare swimming in a pool to splashing around in the puddle left by your car's AC. It's worth a few bucks to swim in the pool. Even a cheaper 8 bit audio card that comes with speakers will work.
* Recording software. For narration, this feature is cost sensitive too. The better quality sound cards and microphones will give the best results.
* Animated text tool. Text can do just about anything, from rotating to changing size.
* Pathbased animation. Actors can move to any position, even off the screen, with a click and swoop of the mouse. They are layered so they can pass on top of or below other actors. Animation Works Interactive Movies (.AWM) and Screen Craze Movies (.SCM) can also be opened or read.
* Embedded features for distribution without AddImpact!.

Documentation: The manual not only explains how to use AddImpact! through tutorials, it also explains features available in other software packages that are seldom used due to LMF (Large Manual Fright). You too, can become a qualified Linker and Embedder by following the instructions.

Support: There are tech support phone and fax numbers, but they are not toll free.

Test Results: The first time Matthew used AddImpact! he made a short movie of smaller fish swimming rapidly across the screen and being eaten by other, larger fish. It took him about 20 minutes to get used to making animation clips, after that it was "fun and easy."

The test for OLE was to embed and link movies into a WordPerfect document. The manual explained the procedures and the test went according to plan. Trying to get a movie to play within a designated window was not as successful. At first I thought the window was too small. Enlarging it helped, but the actor still played half in and half out of the window.

A recorded message was imbedded into a Windows Write document. The icon, a movie projector, was easy to change using the Windows moreicons library. This, and changing the movie label, is useful to distinguish the movies from each other.

Matthew embedded his fish movie into a Freelance presentation. The results were good, the movie played automatically, but the presentation stalled right after the movie completed. Clicking the mouse resumed the presentation. There was a whole lot of hard disk activity before and after the movie (probably due to the sounds). There was less disk activity when the soundless Freelance animated movie played.

Documents and presentations can be distributed with a playback system. The receiver of the document must activate AddImpact! by double clicking on the AddImpact! icon first. After adding the playback server the movies and playback icon could be moved horizontally, but not vertically. Without the playback server the movies can be moved in any direction.

Limitations: The PC speaker driver can play basic WAV files (simple sounds) without a sound board, but music or speech is very distorted. Even worse, sound stops the action and makes

(Continued on next page.)

(Continued from previous page.)
the motion jerky. We're not talking Hollywood here. Adding a sound board to the system dynamically improved the quality of the audio output and the action was nonstop while sounds played.

To preview sounds, they must be Selected, Played and then Removed. A single preview button would be preferred when testingseveral sounds. A preview button for the movies would also be an improvement.

In a Windows Write narration test, double clicking the movie icon brought up the Open Wave File window. Choosing anything except the preprogrammed file caused the window to disappear and then reappear. The narration played fine, but then the icon was left selected.

You can create your own text actors using a variety of fonts, colors and sizes, but actors cannot be modified after conversion to a bitmap (to size the actor). Neither the manual nor the menus hint that editing or creating a graphic actor is possible with AddImpact!.

Evaluation: The movies themselves are interesting enough to use as is to enhance and add excitement to documents and presentations. The emphasis improves rememberability of key ideas. Having that rocket go off at the right time could keep the audience awake and paying attention. Although there were a few quirks in the tests, AddImpact! can enhance products like Freelance Graphics. The assortment of ready to use clips are quick to employ. Just plug 'em in, double click, and watch your audience perk up.

Minimum Requirements: Windows 3.1, 10mhz 286, 2MB RAM, 4MB free hard disk space, VGA(16 or 256 color), mouse.

Recommend Configuration: Windows 3.1, 386SX, 4MB RAM, 10MB free hard disk space. Also supports SVGA or higher(up to 256 colors). An MPC compatible sound card with Windows drivers and microphone are needed for recording narration.

Cost: $79 at local computer stores.
Publisher info: Gold Disk Inc., PO Box 1540, Buffalo, NY, 14205, 18004653375

SOFTWARE REVIEW:
Adobe Type Set - Value Pack

Review by Alford Poole TPCUG

When you switch to different software it takes time to discover all the features of the new package. I'm thankful for this opportunity to work with, and thus learn more about, the Adobe Type Manager (ATM), which came with WordPerfect 5.2 for Windows, and hope that this review might help others too.

What are scalable fonts all about? Instead of each letter that you type being the same uniform size throughout your document you can vary the size of the type of a whole paragraph, a word or even each letter of a word. You can start as small as 6 points and go as large as 72 points, depending on the font and application.

Some true type font packages are, well, plain compared to the Adobe Type Set package. Others may list more fonts but some may be the same font with different attributes such as bold, italic or bold italic. I like the variety of the Adobe Value Pack - each font is unique. You get 17 decorative headlines, 5 texts, 5 scripts and 3 ornaments & symbols and the front cover of the box opens to reveal examples of the different type faces.

A Quick Installation Card included with the package gives instructions for installing the whole package or just the fonts.

OS/2 1.3 or greater also comes with ATM. If you don't already have ATM installed then install it through Windows using either the Files - Run - a:\install or the Windows File Manager to locate the INSTALL.EXE program on the floppy. You must exit to DOS (but not by using the DOS Prompt button) and restart Windows to use the ATM program. Also, when new fonts are added, Windows must be restarted to use the new fonts. ATM will take advantage of pre-built (soft) fonts or resident fonts (cartridge fonts or fonts built into the printer) if they are available if you select the "Use Pre-built or Resident Bitmap Fonts" checkbox in the ATM Control Panel. This will reduce the amount of printer memory used and may improve performance.

My first problem came in trying to get the fonts to show up in WordPerfect 5.2 for Windows. They were accessible in Windows Write but would not show up in the fonts menu of WordPerfect. Documentation for the ATM said to reselect the printer. What it should say is "select Windows Printer Driver instead of the WordPerfect Printer Driver in the Select Printer menu if the Adobe fonts don't show up. "Further digging in the WP Reference tome mentioned that WP Printer Drivers would work with ATM if you have MoreFonts or Prime Type. Isn't that nice?

The Readme file lists several programs that will not work with ATM such as CorelDraw 2.0 and earlier and Harvard Draw 1.0.
(Continued on next page.)

(Continued from previous page.)
Others are listed as having limitations, mainly using the type as graphics. There is no mention that ATM supports font embedding.

ATM loads all the fonts you have installed when you start Windows, so if you want to get to Windows faster, unload some less used fonts.

For the print test I used 48 Point type so irregularity or "jaggyness" would be more noticeable. AG Old Style and Blackoak, from Adobe, and Arial Italic and MurryHill fonts that came with WordPerfect, were used with a NEC P2200 24 pin dot matrix printer. Results were interesting. With ATM all printed fonts looked nice. Without ATM AG Old Style turned to regular Arial and Blackoak turned to a less bold type. MurryHill literally turned into Greek using Greek symbols for most of the letters. Italic Arial and Courier remained unchanged. "Jaggyness" of the letters was not much different with or without ATM. Hard copy looked much better than what you see displayed on the screen. Turning ATM on and off takes some time as the printer info is updated each time. Without ATM the Adobe fonts disappear from the font menu.

How do you get the nifty fonts into your document? Unless you want your text to look like a roller coaster ride, changing the type is quite easy. Using the Character button in Windows Write, you can change fonts and size of the letters. Using Reduce Font and Enlarge Font the type can be changed to the next size down or up quickly. In WordPerfect, using the ruler from the View selection, makes changing fonts and sizes fairly quick also.

If you do any kind of newsletter, Christmas letter, or write letters to your member of Congress, these fonts could put more zip in your message. Unleash that creative genius - get scalable!

Contents:
* Adobe Type Manager software v 2.02
* 30 typefaces
* Quick Install card and User Guide booklet
* Discount coupon and catalog for more type

Requirements:
* Windows 3.x or OS/2 1.3 or greater
* 286, 386 or 486
* 1 MB RAM (2 recommended) for Windows
* 4 MB RAM (6 recommended) for OS/2
* Hard disk and one HD floppy drive (uses about 1 MB of disk space) Printers supported:
* PostScript and HP LaserJet Printers
* Dot matrix and inkjet printers
* All other output devices supported by Windows and OS/2

Compatibility:
* Nearly all Windows 3.x and OS/2 1.3 or greater applications
* DOS applications: MS Word 5.0 or greater, Ventura Publisher 2.0 or greater, WordPerfect 5.0 or greater(DOS installation utilities available through enclosed fulfilment card)

Adobe Type Set Value Pack is available at Egghead Software for $39 (before CUE).

You can contact Adobe Systems Inc. at 1585 Charleston Road, P. O. Box 7900, Mountain View, CA 94039-7900 1-800-83-FONTS (833-6687)

Welcome New Members!

Dr. Larry Brooks
Tom Church
S. Glenn Fetty
Linda LaForest
Elaine Marmel
Bob Sanders
Joseph Tingley
Sandy Windham-Harring

Volunteer Highlight:

There is one among us that has been contributing a good bit of time and talent for the betterment of our user group. We would like to recognize this individual and let you know what he is doing for all of us. We hope we will have enough active members and volunteer help from our membership to incorporate this kind of recognition in every newsletter.

In recent months this person has devoted quite a number of hours learning the BBS from Kevan Sheridan, our BBS SYSOP, and then helping Kevan maintain the BBS. Kevan reports this person as quite helpful to both he and the BBS. In addition, this volunteer has written a number of articles for our Bits of Blue newsletter, helping inform his fellow hackers and at the same time enhancing the value of our newsletter. Who is this person? All of our members that don't already know him will come to recognize his name, for the membership recently voted him to the office in our User Group of Vice President. He is: **Al Poole**

Many thanks for all your help, Al. This group can only be as good and useful as the membership is willing to put into it; we are all very familiar with the GIGO saying, "Garbage In, Garbage Out." It is clear that you recognize that GIGO applies to our group, with a little different expression NINO, "Nothing In, Nothing Out." We look forward to benefiting from your contribution as a member of the BOD this coming year which we are confident will help make our organization ever better. Thanks again!

User's Corner

TAPE DRIVE. For sure, tape drives are in! With street prices ranging from $160180 for Colorado Memory's 250meg Jumbo, it warrants serious consideration by anyone with a 200meg (or larger) hard drive.

It is a lot faster than backing up to floppy disks and one cartridge takes up a lot less space than a stack of floppies. On a Gateway p60, it took 11 minutes to backup almost 90meg of data on the hard drive. Restoring that data took about 18 minutes.

But, you say, $180 for the drive and $25 for the tape is expen sive! Not if you do a cost/benefit analysis. Let's assume that you use the three level backup system (set A is the oldest, set B is next, and set C is the latest and you rotate the disk sets).

For $255 (180 for the drive and 75 for the 3 tapes), you have a system that will backup 250meg of your programs and files; and that's 3 deep! Buying 750meg of floppies is a lot more expensive. Using 1.4meg floppies at an average cost of eighty cents, you'd spend about $430; and an awful lot of time shuffling those disks in and out of the PC. Besides, what else are you going to do with that money you got for Christmas?

Or you can spring for the Colorado "Trakker", the portable tape unit. It's street price is around $370. Pretty steep but it IS portable and it plugs into your parallel port! No cards, no drive bay, no dip switches, nothing. And you don't lose the printer, it plugs into the back of the tape drive. A great idea for an office environment or even a bunch of friends chipping in and sharing the tape drive.

WORDPERFECT 6.0 FOR DOS. Call up your last macro by pressing <AltF10>, <DnAr>. The last four macros will be displayed in a dialog box. Highlight the one you want and press <Enter>.

PKWARE. These programs are the most commonly used programs to compress/decompress files. But the command line interface is something else. Fortunately, there are font ends, or shells, that make life a lot easier. For Windows, one of the best is WINZIP and for DOS there is SHEZ. Look for them on your favorite BBS or in your user group library.

♦♦♦♦

Windows Tip from Capital PCUG

To use your mouse to copy from an MS-DOS based application running in a window, from the application's Control Menu select the Edit, Mark dommand. With Windows 3.1 you can then use the mouse to highlight the area of text you want to copy. Return to the Control menu, then select Edit, Copy to copy the highlighted area of text to the Clipboard. The data can then be pasted into an application for either MS-DOS or Windows.

To run a tutorial that teaches the basics of using a Mouse and Windows, choose the Windows Tutorial command from the Help menu in the Program Manager.

♦♦♦♦

Handy Windows Screen Blankers

Extracted from Windows Sources Mag, which had been submitted by Richard Shoemaker, of NPCUG.

You can make Windows' screen savers blank the screen on demand: Look for the screen savers with an SCR file extension in your Windows directory and copy, don't just rename, each SCR file to an EXE file (for example, copy SSFLYWIN.SCR to SSFLYWIN.EXE). In Program Manager, select "FileNew" and click "Program Item", then "OK". Type the description and the screen saver's EXE file name in the Description and Command Line text boxes. Add "/S to the command line and click "OK". when you want the screen blanked, doubleclick the new icon.

(The above tip, was discovered and submitted by Jim Clark, TPCUG to share with our members.)

LINGO

compiled by Brian Hodes
The Calgary Personal Computer User Society

When someone talks about a "computer language", we usually think of programming languages like BASIC, 'C', Assembler and so on. If you merely want to *use* a computer, you don't need to learn anything about these languages at all.

No matter how far removed you want to remain from the inner workings of the machine, there is one language you do have to learn: lingo.

Let's take a look at some of the terms which make up computer lingo.

ASCII: (American Standard Code for Information Interchange). a 7-bit code capable of representing alphanumeric characters and control codes in a form acceptable to machines.

BOOT: To start up a computer system, usually by switching on the power. Some computers must be booted with a floppy disk in the drive (a boot disk) which contains the disk operating system (DOS).

DISK STORAGE: A type of mass memory which stores data on a magnetically sensitive disk.

RECURSIVE SUBROUTINE: A subroutine that invokes another subroutine, which in turn, invokes the original subroutine again.

REGISTER: A unit of memory that is contained within the processor circuitry itself, as opposed to main memory or mass storage.

RELOCATABLE CODE: Code that can occupy any position in main memory.

RUN TIME: The time at which the program is executed. Also, the amount of time required to execute the program.

SECOND SOURCE: A manufacturer who produces a product that is interchangeable with the product of another manufacturer.

SEED: An argument that is used as the initial value for a pseudo-random number generator.

SIMULATION: A computer program that mathematically models a process.

SINGLE STEPPING: Having the computer execute a program slowly so that the user can watch each step and its effects.

SOFTWARE LICENSE: A contract signed by the purchaser of a software product in which he is usually made to agree not to make copies of the software for resale.

SOURCE CODE: Code that is to be processed by a systems program such as a compiler or an assembler.

STATEMENT: A single computer instruction within a computer program.

STRING: A variable that contains alphanumeric text.

SUBROUTINE: A program segment that may be invoked by another section of the program. A subroutine call differs from a simple jump instruction in that after completion of the subroutine, execution of the program will return to the program section that invoked it.

SYSTEMS PROGRAM: A program that does not perform actual problem solving but rather is used to control system operations or act as a programming aid.

TRAP: A hardware- or software-implemented function that signals the processor whenever a specified condition occurs.

UTILITY: A frequently-used program or subroutine. Utility routines are most often associated with systems programs rather than applications programs.

VIRTUAL DEVICE: An imaginary device that the processor assumes to be present, e.g., a ramdisk.

WORKSPACE: A loosely defined term that usually refers to the amount of memory available for programs and data.

OS/2 Tip

Eric Larsen, Kentucky-Indiana PCUG

OS/2 2.1 Installation with SVGS Cards

If you have a SVGA card and display, you may have noticed that your video cums up in VGA resolution after you install OS/2.2.1. The SVGA utility usually supplied with a SVGA card cannot be loaded during OS/2's initial installation. To access the SVGA modes, perform the following steps:

1. Boot your machine after installing OS/2 2.1 to the Os/2 System folder.
2. Select System Setup, the Selective Install.
3. Choose to install SVGA support. During that prorcedure, you will be prompted for your SVGA utility diskette.

Once this installation is complete, you can select from the SVGA video modes supported by your card.

BOOK REVIEW: OS/2 For Dummies

Review by: Alford Poole, Tampa PC Users Group

You've probably seen the For Dummies books, bright yellow and black covers. Well, the author of Windows For Dummies, and coauthor of PCs For Dummies, Andy Rathbone has also written OS/2 For Dummies. I wasn't quite sure reading one of these books in public was a good idea, image you know. I'm not a computer wizard, but I thought Dummies were real potato heads who needed their hand held while being taught how to use the DIR command step by step. What a surprise! "Is OS/2 as Cool as They Say on TV?" is the title for the first chapter. He presents the basics in a simple and fun style making it easy to get acquainted with a complicated piece of software.

Overview: OS/2 For Dummies is a reference book for OS/2 2.0 and 2.1 users and want to be users. It will help you install OS/2, if you haven't already done so, or make it run better if you have.

Major Features: Inside the front cover is a cheat sheet with helpful hints like: Cutting and Pasting Stuff, Fixing Mistakes, Helpful Shortcut Keys, and Fiddling Around with Objects. There are road signs as icons to point out special sections such as Windows Stuff, DOS Stuff, Things to Remember and Technical Stuff. Gray boxes mark Technical Stuff for easy avoidance. There are lots of tips on how to improve OS/2. Like changing Windows icons to OS/2 icons (a ten step process) and silencing the Shredder.

Documentation: The book is well organized and includes Contents at a Glance and a Table of Contents with each chapter broken down into many subheadings. There is also a plain English glossary, an appendix Fiddling with FDISK, and an index. At the back of the book are several blank pages to list Files I Should Never Delete, Computer Gurus, their phone numbers and Favorite Snack Bribe, and Stupid computer Mistakes I've made (And Should Never Make Again!). No more cryptic notes in the margins.

Limitations: This book won't tell you if your hardware will work with OS/2 it has a stock answer for when it doesn't call the manufacturer and bug them to send you an OS/2 driver.

Evaluation: OS/2 For Dummies is great for beginners or intermediates who would like help with OS/2. The use of humor goes a long way in making the learning process more enjoyable. Example: "Computer nerds relax by fiddling with their computers, whether that involves rearranging the computer's power cables to flow in a straight line or changing OS/2's desktop from its traditional dull gray to the livelier color of a Hostess Fruit Pie filling." This book fills a gap between the F1 key and advanced manuals and will help you feel comfortable working with OS/2.

Cost and availability: $19.95 and you can subtract 25-30% at most large computer stores. Publisher info: IDG Books Worldwide, Inc., 155 Bovet Road, Suite 310, San Mateo, CA 94402 18007622974 ♦♦♦♦

Book Review:
"GATES: HOW MICROSOFT'S MOGUL REINVENTED AN INDUSTRY AND MADE HIMSELF THE RICHEST MAN IN AMERICA"

A Book Review by: Marc Valley,
Pikes Peak Computer Applications Society, Inc.

The American Dream To be a millionaire or how about a Billionaire? Forbes magazine announced that Bill Gates, at the age of 37, was the richest man in Americahis personal wealth $7 Billion. William Henry Gates was born on October 28, 1955 in Seattle Washington. He is the only son, second child, of William Henry Jr. and Mary (Maxwell) Gates.

I read this book with enthusiasm and impatience. It isn't a book that you read through in a couple of nights. You are given so many facts and events that you must take your time reading it. Sometimes I'd go to the index and reference an item and go back to read it. By the way the index is awesome. I normally could read this sized book in 34 nights, not so with this one. It took about eight nights of reading to finish it.

> "It was developed through more than 20 hours of interviews with Bill Gates, reviewing personal files and access to Microsoft employees."

Stephen Manes and Paul Andrews did a superb job of writing. Some of the more interesting parts of the book tell of Microsoft's dealings with "Big Blue" (IBM) and Apple. The ups and downs are all in here. From the development of DOS, Windows, Presentation Manager, OS/2 and everything in between. The book is described in the final chapter "Full Disclosure" as being "an independent enterprise". It was developed through more than 20 hours of interviews with Bill Gates, reviewing personal files and access to Microsoft employees. The authors also point out that the information in the book was fully researched by their staff, not Microsoft's. What the authors tried, and did, was present a complete history of Bill Gates and Microsoft as accurately as they could being on the outside. You will not read that Bill Gates was an angel nor will you read that he was a cutthroat business man, you will read the facts. A man does not get to be as rich as Bill by allowing himself to be run over.

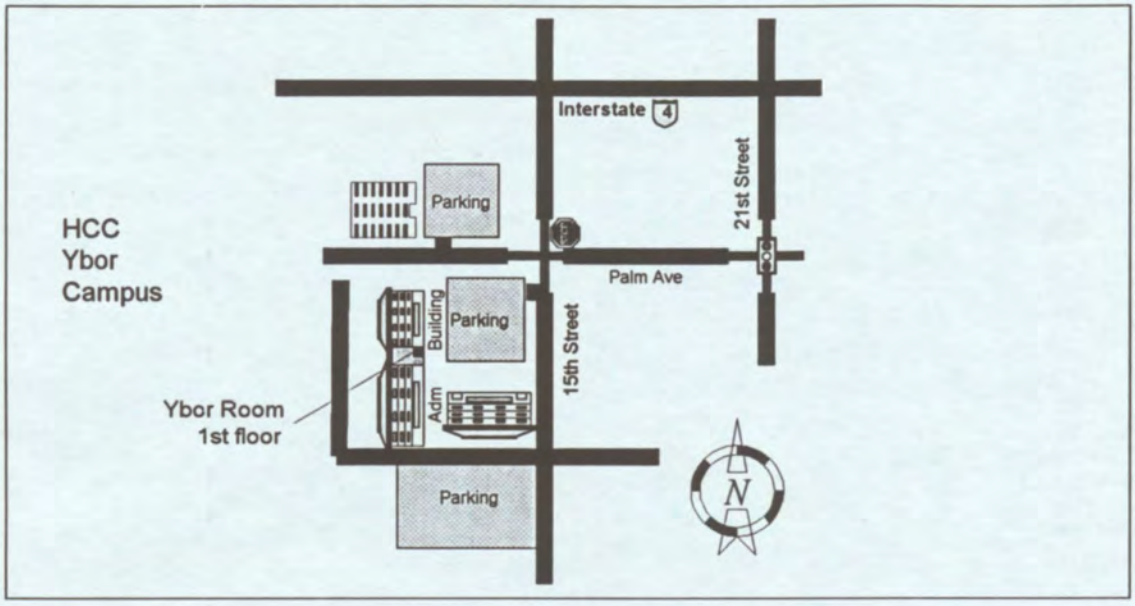
Whatever you get out of this book, I believe that it will be fantastic. This book is so full of facts and opinions and because everything was so fully researched, I decided that it is the best biography I have read to date. I do not hesitate to recommend it for your reading pleasure. " Gates: How Microsoft's Mogul Reinvented an Industry and Made Himself the Richest Man in America", by Stephen Manes and Paul Andrews, $25.00, Doubleday, 666 Fifth Avenue, New York, New York 10103. ISBN: 0385420757.

Software Review:
UFO

Review by Gary W. Wodka, Madison PC User's Group

They're baaaaaack! In fact, they're all over everywhere! There's no escaping the UFOs!!! Well, actually, the historical records of the UFOs are back. In fact, a new CDROM multimedia program from Software Marketing Corporation titled, "UFO: The Planet's Most Complete Guide To Close Encounters," gives you just about all the information there is about the collected "XFiles" of UFO sightings, contacts, abductions and encounters in one place. Included are 1228 of these events, dating back to biblical times, through the first part of 1993.

This program comes in two forms: CDROM (reviewed here) and 3.5" diskette. I can't imagine the diskette is anywhere as complete as the CD, since the CD includes over 175 MB of information, photos, video and sound. Installation from the CD copies a few files to your hard disk, but the majority of the program runs from the CD. UFO installs a runtime version of Microsoft's Video for Windows so you'll be able to view the movie clips.



When started, you'll be faced with a screen composed of four sections, with a centerscreen overlay. This overlay is where you tell the program what to look for. You have a choice of sightings, abductions, photographic evidence, videos, mutilations, multiple witnesses, and whether death or injury was involved. You can select the range of years you'd like to search. Once these parameters are selected, the search is on.

The four windows are the Locator Map, with dots over the globe where sightings and encounters have taken place. Behind this is the list of events, chronologically. The second window is a description of the event, with the date, place, time, number of UFOs, and number of witnesses. Also here are radio buttons if there is photographic evidence and textual evidence. Clicking on either of these buttons brings up the photos, video and other text. The lower left window is for the image of the UFO if one is available. And finally, on the lower right is the Event Discussion of the selected event.

That's about all there is, but the fun's not over yet. Since this is a Windows program, you have access to all of this information and can use it in other programs through use of the Clipboard. Text, photographic images and map images can be copied to the Clipboard and imported into other documents.

There's a "Search" function in UFO that allows you to search by date, location name, and locator map. You're able to see at a glance just how many sightings there have been in your area. From what I can determine, there have been sightings EVERYWHERE in profusion. As I searched through the chronological calendar, I discovered that 1897 was a good year for extraterrestrials. Then things slow down until World War II. Beginning in 1942, and again in 1944, there were many sightings in Germany and Japan, especially.

In both of these areas, it seems that many photographs were taken (according to the textual descriptions), but none are included in the photographic evidence. They must have been destroyed in the war, huh? Where videos are available, they are pretty neat! I'd suggest at least a doublespeed CD player to view them without jerks.

Is there anything besides curiosity involved here? Hard to say. I know that I did learn a few things. I won't spoil your fun, but watch out for the caustic angel hair and those men in black!! It could be hazardous to your health.

Editorial Comment:

The review article titled "Adobe Type Set - Value Pack" by Al Poole appeared in the October '93 newsletter. The duplication of this article in this January newsletter is an editorial error discovered after printing. The following article was the intended software review for this issue of Bits of Blue. Our apologies for any inconvenience this may cause our readers.

Software Review:

Adobe Wild Type

Review by: Alford Poole, TPCUG

Wild characters: dudes making totally rad letters with skate boards, cute critter letters, and spooky quake letters are just a few of the typefaces included with the new Adobe Wild Type.

Adobe Wild Type consists of fourteen fonts. Five tame fonts complement Critter, Cutout (paper cutouts of people), Studz (letters with rivets), Rad (guys and skateboards), Mythos (mythical type), Toolbox (this is my favorite), Quake, Giddyup (rope letters), and Giddyup Thangs (western graphics).

Installation: Adobe Type Manager (ATM), version 2.51, comes with the fonts and is easy to install. Remember, the more fonts you add the longer Windows will take to load. Either limit the fonts you load to the ones you need or remove older, less used fonts.

Features: Font size adjustable from 6 to 48 pts in WordPerfect, 8 to 72 in Windows Write. ATM supports the Windows Printing System.

Documentation: Font examples are on the back of the box. Charts for character access for Windows applications and ASCII character codes are now included in the rewritten user manual. An index might have been more useful.

Support: Adobe has 24hour automated technical support and a fax request line, ATM and type support, and a PC support line (all you pay for is the phone charge). They even offer to help with third party software problems.

Test Results: Only Rad needed to have the font cache in ATM increased to 160K to be seen or printed in WordPerfect 5.2. All the rest did fine with 96K. Using smaller type sizes, detail was lost and they were harder to read on the screen than in print. With larger sizes detail and readability improve. Type smoothness was excellent. Some fonts have only capitals and no special number characters: Critter, Mythos, and Toolbox. Quake and Giddyup plus the tame fonts can do small letters and numbers that look like the capitals.

Options: Adobe will send low density 3.5 or HD 5.25 disks at no additional cost. For 15 dollars and tax they will send Font Foundry for users of DOS applications like WordPerfect 5.0 and 5.1, Microsoft Word 5.0 or greater, Ventura Publisher, or WordStar Professional and users of HP Laser Jet series II or III or other PCL4compatible printers.

Evaluation: Adobe has crafted a fine package of typefaces. The tamer typefaces are modified versions of older typefaces, and work well with the wild ones. These fonts may not be for everyday use, but they can add excitement to memos, letters, presentations, or anything else to attract attention. With ATM making changes in fonts is easy and using the fonts themselves is just as easy as any of the other Windows fonts. Recommended for those who could use a walk on the wild side, but don't want extra hassles. Get radical!

System requirements: 286 or better, Windows 3.0 or greater, or OS/2 1.3 or greater, 3.5inch HD floppy drive, hard disk, 1MB RAM(2MB recommended).

Cost and availability:
SRP $60

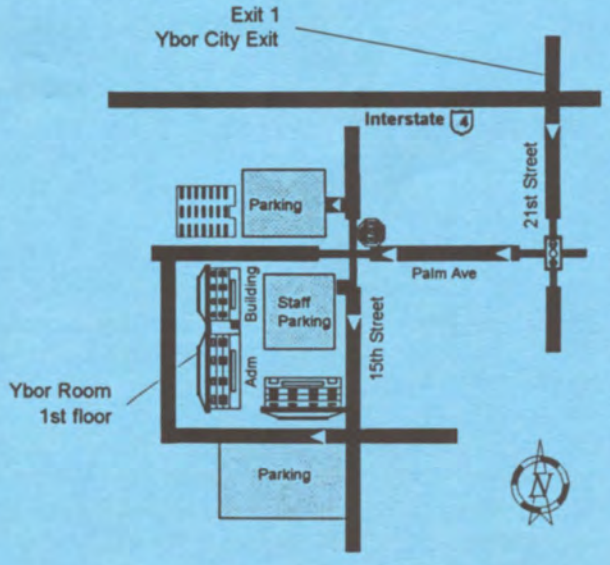
A Monthly Publication of the
Tampa PC Users Group, Inc.

Bits of Blue



Vol. 7 No. 2 February, 1994

MEETING
(2nd Wednesday every month)

DATE: February 9th, 1994
TIME: 6:00 PM
PLACE: HILLSBOROUGH COMMUNITY COLLEGE
Ybor Campus
(Corner of Palm & 15th Street)
Ybor Room

DIRECTIONS:

Take Interstate 4 to 21st/22nd Street (Ybor City) Exit 1, South to Palm Avenue, West to 15th Street to Hillsborough Community College. **Guest please sign in.**

Come to the February 9th meeting and check out our new facilities!

FEBRUARY 9TH AGENDA:

Demo of **DESKVIEW** -
a DOS based Multi-tasking operating environment

By: Tom Cone, of Tampa PC Users Group

7:30 PM - Break
7:45 PM - Open Discussion
Door Prize Drawing -
OS/2
CA's Simply Money
and Miscellaneous items

INSIDE THIS ISSUE

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII file or in a commonly available word processor format, such as WordPerfect 5.2, or Ami Pro 3.0 on diskette to the editor at 9402 Hidden Ridge Place, Tampa, Florida 33637 or send it by modem to BBS (813)239-3704.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

Commercial advertisements will be accepted at the following rates:

	1 month	3 months	6 months
Full Page	$60.00	$162.00	288.00
Half Page	$40.00	$108.00	$192.00
Quarter Page	$22.00	$60.00	$106.00
Eight Page	$12.00	$33.00	$58.00
Business Card	$10.00	$27.00	$48.00

All advertisements must be prepaid by check payable to TPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if it is not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, Marylee Bruneau at (813) 985-3338, for space availability and for further information.

Secretary's Report

MINUTES OF 1/12/94 MEETING and PERSONAL COMMENTS

By: Jim Clark

The meeting, our last general meeting in the IBM Lake Pointe facilities, began on time at 6 PM, with our President, Harvey Bruneau, presiding. There were fewer members present than normal, probably because most had not yet received the newsletter which serves as a reminder, and perhaps because this was the last meeting at the lovely Lake Pointe building. A simultaneous meeting of the OS/2 Users' group undoubtedly also drew some of our members. Unfortunate for them because they missed some very good info and an excellent presentation.

USER GROUP NEWS

➳ New Meeting Location In February: Harvey reminded all that this was the last meeting in the Lake Pointe building and that the February meeting would be held at regular time at the Ybor City campus of Hillsborough Community College. A map is included on the back page of the current newsletter, and will be in the next newsletter as well. Harvey also reported that while he does not yet have a computer for the group in his possession, he does have a promise of a donor computer. Arrangements have also been made to borrow from his employer Dun & Bradstreet a projector on a very temporary basis; that is, we cannot make such an imposition for very long and we must obtain our own projector in the notverydistant future.

➳ NonProfit Status: Harvey reported that the Post Office has approved our application for nonprofit status. That means our newsletter mailing cost will drop again by about 30-40%. (There is no connection between this and our application to the IRS for nonprofit status which is still pending.)

➳ Student Memberships: Harvey informed the membership of a BOD decision to create a new membership category Students & Staff (of the HCC only). Annual membership fee is $15. The good rapport established already in our relationship with the HCC has led to them making available space for use by our SIGs.

➳ Meet Your BBS: All were advised that Kevan, our SYSOPs, was holding another Meet Your BBS Nite on the third Wednesday of this month. If good participation continues at this excellent learning opportunity, it may well become a regularly scheduled event.

➳ Word Perfect Presentation Rescheduled: Word Perfect has rescheduled their planned presentation at our February meeting to the April meeting. Harvey is working with Microsoft to come in for a presentation at the February meeting. CorelDraw is still scheduled for the March meeting.

INDUSTRY NEWS

➳ 100 MHz 486's: Word in the industry is that these machines will be available this year. They will be only slightly slower than present Pentiums and will cost considerably less like in the $2500 range.

(Continued on next Page)

(Continued from previous page)

➳ MS Excel: For those looking for the 5.0 version of Excel, Microsoft has announced that it will ship next month.

➳ Windows For WorkGroups: Version 3.11 of this program will be widely available soon. Be aware that while OS/2 is compatible with Windows for WorkGroups 3.1, it is not compatible with Windows For WorkGroups 3.11.

PRESENTATION

CA Simply Money & Simply Tax

Computer Associates (CA) graciously made available for our benefit one of their Product Consultants, Marty Steiner, to give us a rundown on two of their products Simply Money and Simply Tax. Since very few of those present knew much about CA, Marty gave us a little info about the company. It was surprising for most of us to learn that CA is the second largest software company in the business and has been around from the start. In fact, many years ago they produced the second spreadsheet program to be marketed Super Calc. They have been big in the mainframe area all this time, and are now working to improve their recognition in the PC world; hence, the Simply Money and Simply Tax programs they have been making available for only a S & H charge. CA has software covering just about the full spectrum of computer applications word processing, data base, spreadsheet, etc. some 13 major applications in all. Marty then gave a brief review of Simply Money and Simply Tax:

Simply Money is a program for recording and monitoring personal and business finances. It is a great deal more than a check writing program, and has features which tie together all sorts of accounts and investments into a comprehensive package. In addition to writing checks and maintaining checking accounts, Simply Money handles credit card accounts, cash and savings accounts, credit lines and loan accounts, mortgages, asset and liability accounts, budgeting, and a wide variety of investment accounts, including stocks and mutual and taxfree funds which can be tracked and updated via modem. Business applications include accrual and cash basis accounting, payroll accounting and business reports. All of the accounts in a financial data base can be linked together so that a single transaction affecting more than one account will be reflected in all accounts involved. Reports and graphs can be created quickly and easily for any of the accounts simply by clicking and dragging. In fact, except for the entry of data via the keyboard, all operations in Simply Money can be handled simply and easily with 'clicks' and 'drags'.

As a user of Simply Money I can tell you that it is simple, flexible and easy to use, though I will admit that I have not even scratched the surface of its capabilities. Requirements to load and use Simply Money are: A 286 or better machine, with at least 2 Mb of Ram (4 recommended), mouse, 5 Mb of hard disk space, DOS 3.1 or later, and Windows 3.1 or later. At the present time, it is available only as a Windows program.

Simply Tax is a comprehensive personal and small business tax preparation program. It, too, appears to be very customizable, comprehensive and easy to use. It allows entry of data for the tax returns via interview, questions and answer, or direct entry, all of which appear easy, direct and straight forward. Included are some 90 forms, schedules and worksheets it is very comprehensive. Its many features include: Use of data from Simply Money, Quicken, Lotus, Dollars & Sense and Managing Money, and uses Tax Exchange Format (.TXF) which allows import of data from other accounting programs; automatic overflow statements to accommodate more entries than IRS forms provide; a quick tour to familiarize the user with the program; a tax forecasting capability; data validation; tax preparation checklist; cross reference help; comprehensive contextsensitive online help; depreciation history and reference tables; automatic links to appropriate form & line; depreciation history and reference tables; averages of itemized deductions with an audit alert to notify of entries which exceed substantially the averages; tax tips to help identify ways of reducing tax liabilities; and a 'what if' capability, to name just a few.

Simply Tax will print out all of the return forms ready to file we are told that when printed on a good laser printer the forms will appear identical to the IRS forms. Alternatively, it has the capability and includes instructions to file the tax return electronically.

Simply Tax is available for Windows or DOS. Requirements for the Windows version of Simply Tax are: A 386 or better machine with 2 Mb of RAM (4 Mb recommended), 5.5 Mb of hard disk space, Windows 3.1. A mouse is recommended. Requirements for the DOS version are: Any IBMcompatible PC with 640 K of RAM (500K available), 3.5 Mb of hard disk space, and DOS 3.0 or later. Mouse is optional. Just about any Epson/IBM/HPcompatible printer can be used with either version.

Simply money can be obtained by calling 1800FREEMONEY. Cost is $6.95 to cover S & H. Simply Tax can be obtained by calling 18007FREE TAX. Cost is $9.95, again for S & H. If ordering both programs, call the Simply Tax number.

Marty and Computer Associates, we THANK YOU VERY MUCH for your visit, for familiarizing us with your company, for a great presentation of two of your programs, and for the copies of Simply Money you donated. You have a couple of great looking programs in Simply Money and Simply Tax. We hope you will favor us with presentations in the future on upgrades to these programs, as well as introduce us to your other programs.

AND THE WINNER IS

Thanks to the generosity of Computer Associates, who donated several copies of Simply Money, and collections obtained by Harvey and Marylee at Comdex, there were some very nice door prizes. Those among us to have the good fortune to win are:

Larry T. Brooks	Simply Money
Cheryl Petty	Simply Money
Doug Rapphun	Simply Money
Dan Whitman	Simply Money
M. N. Martenez	Carrying case
W. L. LaMartin	2 cups

In addition, 2 people won monitor borders and at least 9 people won psychedelic sunglasses.

The meeting adjourned at about 8:30 PM.

♦♦♦♦

PRESIDENT'S COLUMN:

Reminder: Our new meeting place is at the YBOR room of the HCC YBOR campus.

A map is included on first page of this newsletter to provide you with directions. I look forward to seeing each one of you there.

By now all the software and hardware that you received for the holidays should be installed. I hope that each of you had success in the installation procedures and are happy with your new products. However, I am sure that some of you experienced difficulty with some products. Whether good or bad we would like to publish your thoughts and experiences in our newsletter. Send your comments to the editor or to Ed Buzza via the bulletin board or mail and we will see that they get published. Let your experiences help others.

This weekend three separate conversations with different people brought to light how unfriendly computers are to beginner and novice users. Hey even experienced users have problems from time to time. It doesn't seem to matter if a person is a DOS or Windows user, neither environment is as easy and intuitive as it should be or claims to be. Sure computers become easier to use over time, but that's only after the computers and software *have trained us* in their use. Its true, we are trained by the software and hardware to do something correctly. I can remember when I had a real tough time understanding directories and sub-directories, the path statement and the use of a modem. It should have been easier for me back then with only one real DOS and one processor (8088). Has computing gotten easier since those days in the eighties? Not really. If you think it has, take a novice computer user to CompUSA or Computer City today and ask them to pick a Sound Blaster sound card and a CD ROM drive. Sound Blaster has four different sound cards and there are at least four times that in CD drives. The choice of operating systems and computers available are also overwhelming.

OK so we got Windows. Vendors have added a graphical look to DOS programs. Windows applications are suppose to be easier to use because they have a common look and feel. It's true that as you use more Windows applications there is a certain common menu look and basic command structure that is always present. It also true that Windows can be fun and more productive when it's configured correctly. Of course, the fun and that common look and feel doesn't help you the first time you use Windows. And the percent of commands and menus which are common are subject to debate. If you get a chance look at Ami Pro from Lotus and Microsoft Word. Both are designated as word processors. What percent is common? The same can be said about Quatro Pro and Excel. It should be easier.

Communication among each other is difficult when we don't know that the C> prompt and DOS prompt are similar. Just determining which connection is for a mouse, serial or parallel device or even a modem jack can be difficult for the 1st time users.

I hear more and more people say that they don't understand computers because they are computer illiterate. That just isn't true. We, the human race, taught computers what they know, not the other way around. People are not computer illiterate, in fact I believe that computers are human illiterate.

My reason for going into all this detail is that many of you have experienced some of the above. Your experiences, shared with others, can help make these human illiterate computers easier to learn and use. That's the basic foundation of a user group. Monthly vendor presentations are fine, but we need to share our own knowledge amongst ourselves and the community. We need to implement Special Interest Groups and classes to help educate each other. We need more volunteers to add their names to the membership help line.

We need your help in other areas. We would like to organize a computer swap meet. How about a membership drive to boost our finances? Do you know of companies or individuals that would advertise in our newsletter? If you have some ideas on any topic leave me or any board member a message on the BBS or call us.

Harvey Bruneau

UMAX OFFERS HANDBOOK TO FLATBED SCANNER USERS:

Features Practical Tips for
Desktop Publishing and OCR Applications

UMAX Technologies, Inc. (UTI), announces that it is offering a free handbook to new or future users of flatbed scanners. The handbook shows how to achieve maximum results in two of the most widelyused scanner applications: desktop publishing (DTP) and optical character recognition (OCR). Called "The Practical Guide to Scanning," the handbook explains the importance of DTP and OCR as viable productivity tools and provides stepbystep "howto" tips for both applications. Additionally, the 30page handbook explains the basics of document publishing. It shows how to combine text and graphics for persuasive, professionallooking output. Included are guidelines to help scanner buyers choose hardware and software products suited to their application requirements.

"We commissioned 'The Practical Guide to Scanning' because we believe in giving the scanner practitioner useful information and real solutions," said Andy Chang, Director of Product Marketing at UMAX. He added, "In addition to providing excellent scanning hardware, we like to see both new and experienced scanner users get the most out of their equipment."

For a free copy of "The Practical Guide to Scanning," requesters may either call or write to UMAX Technologies, Inc., 3353 Gateway Blvd., Fremont, CA 94538, Reference: Scanner Handbook. To order by telephone, call 18005620311 or (510) 6518883.

UMAX Technologies, Inc. (UTI) markets a broad range of high quality image and OCR scanners for the desktop publishing and office automation markets. Its parent company, UMAX Data Systems (UDS), located in Taiwan, develops and manufactures scanners and related products. Founded in 1987, UMAX offers its products through dealers, OEMs, and VARs.

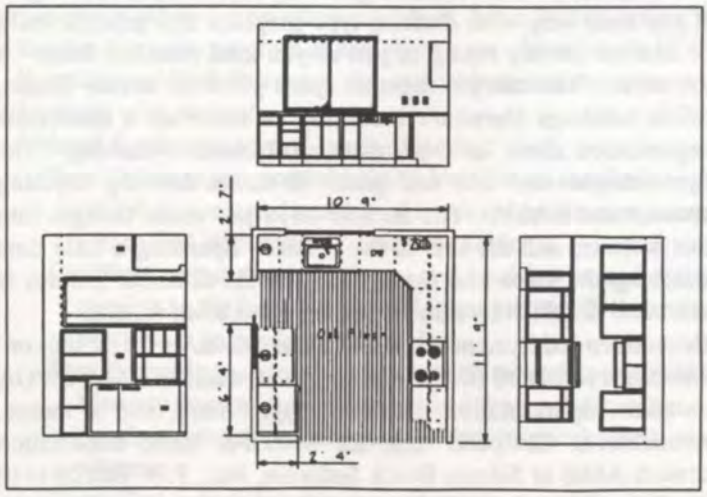
Software Review:
Kitchen & Bath for DOS
THE HOME SERIES

Accurate Kitchen & Bathroom Design Made Easy



By Renate Marsh, Tampa PC Users Group

Kitchen & Bath by Autodesk is one of the software programs of their Home Design Series. And of course, all Home Series products work together (other Home Series: Home, Deck, Landscape). Do you feel like remodeling your kitchen or bathroom? Better yet, do you want to design your own new kitchen or bathroom? Then this Kitchen & Bath program is for you. I always considered it a complicated process to draw and design floor plans to suit my needs and budget, not to mention that my hand drawings are not the greatest. Using the Kitchen & Bath program with its many pre-drawn symbols makes it easy to create any floor plan. Even if you are new to computers, you will be able to create professional looking drawings.

Bathroom Design

The tutorial in the manual gives step by step help and instruction to create a design for a kitchen and a bathroom right from the start. All the commands are menu driven, a click with the mouse gets you from one menu to the next. A multiple of color coded symbol menus reduces your free style drawing to a minimum. Place symbols of doors, windows, fixtures, appliances, and furniture anywhere in your floor plan.

Kitchen Design

What I liked the most since Kitchen & Bath was doing all the drawing and designing for me, I could create several different floor plans and compare them with each other. You also have a choice to generate a "shopping list" for each plan. The program will list all the doors, windows, type of appliances, fixtures, etc. that has been used for a particular plan.

Of course, as with most tasks or jobs, planning and preparing your design is very important. The manual tries to help you analyzing the needs you have for your planning and creating a floor plan. It also gives instructions how to take and enter actual measurements to obtain accuracy. In the manual or in the program you have a choice of following the Imperial system of measurements (inches) or the metric system.

Besides the manual, you have an "On Line Help" system with detailed instructions as you create a floor plan. Once you have created a floor plan you can make it come alive with different color schemes; and you can load your drawing into the 3DPlan program which will give you a totally new and realistic perspective of your drawing.

During the whole process of creating my own floor plan, I rarely used the keyboard. Almost every command and action is done with clicking or pointing with the mouse. I would not want to use this program without a mouse. Other requirements: DOS version 3.0 or later; a video graphics display adapter and monitor, operating in minimum 640 x 200 mode; an IBM XT, AT or 100 % compatible computer; 640KB of RAM; 3MB of free hard drive; preferable 2MB expanded memory and a math coprocessor.

List price for each Home Series: $59.95 Company: Autodesk, Inc., 11911 North Creek Parkway South Bothell, WA 98011 Tel.: 1 800 228-3601

♦♦♦♦

IMPORTANT DATES!

Mark your calendar - March 25, 26 & 27! These are the dates for a mini-Comdex style computer show that is being planned for Orlando through the auspices of the Florida Association of Computer User Groups (FACUG). Tampa PC Users Group, Inc. is a member of the association.

Plans call for approximately 300 vendors to have booths in the Orange County Convention Center over that March weekend. Headquarters for the user group round tables and discussion groups will be next door at the Clarion Hotel.

More details will follow next month.

Software Review: IntelliDraw 1.0 for Windows

By Aldus

Review by: Alford Poole,

Tampa PC Users Group

"Now what would happen if . . . " "Whoa, that looks weird!" "Neat!" "Wish I had this last year for math class." These are comments made by my son as he took IntelliDraw for a spin. This is drawing with a difference. Have you ever thought the computer and software should be doing more of the work when doing graphics? If so, then check out IntelliDraw, an interesting collection of tools for creating graphics, designing room layouts, and creating organizational charts.

IntelliDraw takes up 3.5 MB, add a little more for product filters (1.5 MB to choose from), and 6.2 MB of clip art. The filters are to help IntelliDraw and other graphic programs work together. The package includes Adobe Type Manager (version 2.0) and a font disk.

Watch the training video first. It is over an hour long and gives a good overview of the major features. You also get a good feeling about the programs capabilities. A second viewing might help cut down the learning time. There are two manuals, a User Manual contains exercises similar to those presented on the video, the other is a reference manual. The User Manual assumes intelligence of the user - as you go along it doesn't repeat all the steps previously covered. The package also includes a handy quick reference card to explain the different toolbars and buttons.

Phone support is available Monday through Friday, 8:00 a.m. to 5:00 p.m. (Pacific Time). The call is not toll free, but they are prompt. It took less than five minutes to get answers for two questions made at 7:30pm (our time). Each time IntelliDraw launched, a window would pop up saying, "File Error, Cannot find PSCRIPT.DRV." Clicking the Close button made the window go away and the program continued to set itself up. After reinstalling IntelliDraw and searching the whole hard drive, PSCRIPT.DRV could not be found. The tech rep explained that this was a postscript printer driver (I knew that) and could be loaded through Windows Control Panel. The window did go away (I knew it would). Question two was why the dialogue boxes took 30 seconds or more to disappear, even when clicking Cancel. Answer: POINTER.EXE was loaded in WIN.INI and was causing a conflict. Putting a semicolon in front of the offending line in the WIN.INI fixed that problem too. The call was worth it. Fax is also available.

IntelliDraw is a feature-packed program. Using the User Manual as a guide takes you through the basics, shows you which buttons to push to get the right results. What I liked best was aligning each component of a drawing. There are guidelines that appear when an object lines up with part of another object. My computer and flower vase drawing might not have been as pretty as theirs, but it was fun to do. Duplicating objects and then having them all line up with equal spacing with just a click of a key is a thrill. Ok, my thrill threshold is a little low, but drawing was never this easy before. The results were better than I expected.

An Info window explains any object or button that the mouse arrow pauses over. A click of the mouse can move, reduce to a title bar, or eliminate from the screen the tool bars (palates). Grouping and ungrouping objects is no problem. There are shortcut keys or menu choices for just about every action.

"Sticky" connectors, used between objects, are stretchable while maintaining their connections. IntelliDraw can automatically adjust charts, like family history, scheduling, organizational, or whatever. For example, if you wanted to resize all the boxes, just change one and then all the rest are altered also.

I could not locate SLDTEMPL.IDT mentioned in the User Manual, so I attempted a slide show from scratch. It was tedious, but not really a bad experience. You have total control over each aspect of the slides because there is lots of versatility. One neat thing to use while doing space plans are dimension lines. They show changing measurements, so as you create plans for a new shed or patio, any changes to the dimensions will reflect in the measurement numbers, automatically!

An experiment at map making (without any research) was interesting. Line shapes drawn for roads reshaped easily, but after a few roads were drawn, parts of previously drawn roads disappeared. Time to view the video again. Importing an interstate symbol from another program did not work due to incompatible formats. The experiment ended with a General Protection Fault. Another test with a large text file ended the same way. Importing a smaller text file worked much better. If you type your text in another program, don't bother formating it. IntelliDraw works better when there are no spaces to deal with. There is no filter to import Micrografx Designer or Windows Draw images in .DRW format, but if files are exported as .PIC or .EPS then IntelliDraw can use them. IntelliDraw does not currently support the Kanji alphabet. Well, be assured, I was crushed too. Also, the screen savers that worked in other Windows programs don't with IntelliDraw. This could be why the GPF popped up in the above experiments - memory conflicts with the screen saver.

IntelliDraw is diverse and goes way beyond basic drawing. If you need help with drafting-type graphics this product could be like the calvary riding in just as you load your last bullet - a job saver. You can put together space plans for dream houses, office buildings (furniture included), or make up a modifiable organization chart, or experiment with creative drawing. The Symmetrigon tool is a real gem. It makes drawing anything symmetrical EASY. The authors have put much thought into this software and the user is the winner. Spending a little time watching the video and learning to use the different features is essential. IntelliDraw also comes in a Macintosh version.

Recommended System Requirements: Windows 3.1, a 386- or 486-based MS-DOS compatible computer, 4MB of RAM, a VGA or other highresolution graphics adapter card, and a mouse. Available at Computer City for $99. For more information contact Aldus at Silicon Beach Software, Inc., P.O. Box 261430 San Diego, CA 92196 (619) 695-6956

Software Review:

Check3It Pro Version 1.06

Review By: Jim Clark
Tampa PC Users Group

What It Is: Check It Pro is a DOS-based collection of computer information, testing and diagnostic tools which can be used individually or as a comprehensive package. It is broken down into two volumes: Sysinfo, and Advanced Diagnostic Software. Created by TouchStone Software Corporation, the two volumes can be purchased separately or as a single unit.

Volume I, the Sysinfo volume, makes available information about the hardware, configuration and settings of your computer, and measures performance of the hardware. It provides information in greater detail than all of the computer informational software I have used that has been incorporated into multi-purpose software. It is menu controlled in a way that all of its capabilities are quickly and easily accessible. Sysinfo provides information on: CPU; hard and floppy drives; BIOS; conventional, upper/UMB and extended and expanded memory; com and parallel ports; DIP switches (if installed); TSRs; IRQ usage (where devices are connected and on); interrupt vector assignments; I/O address map; device drivers; hard drive tables; and viewing and editing of CMOS settings and CONFIG.SYS and AUTOEXEC.BAT files. Sysinfo also provides Windows summary information, and allows viewing and editing of .INI files. The performance feature provides for measuring performance of the CPU, hard and floppy drives and video against a range of measurement standards, from XT to 486.

Volume II, Advanced Diagnostic Software, is a flexible package of diagnostic and testing tools which can be used as a comprehensive package, or each of the tools making up the package can be used individually. This allows installation on hard andportions of the program on floppy disks. The entire program can be loaded on a 2.88 Mb floppy, but is too large for lesser capacities. Selected portions of the program can be loaded onto 1.44 and 1.2 floppies, and the installation program makes provisions for that. This does not mean that the license allows unrestricted use. To the contrary, the license restricts use by one user at a time; the licensee can have portions of the program on floppies to allow use on other computers, but only one person may be using the program at any given time. Workbench licensing and Pack-Pricing is also available to accommodate locations with multiple users.

Volume II provides several levels of testing:

- Burn-in test to run non-interactive tests for an indefinite period or a selected number of times to burn in equipment and to find intermittent or elusive problems.
- Certification test that adds floppy and hard drives, and monitor to the burn-in test, and is used to certify that a machine is in good working order.
- Test Everything guides the user through tests of everything: Memory (system & video), hard and floppy disks, system board, serial and parallel ports, video, mouse, joystick, and printers;
- Quick Test, which has no user interaction, tests all components internal to the computer;
- Tests of individually selected component/s. For all tests, including those listed above, the user has the option of specifying the number of times the test is to be run.

All of the foregoing is controlled through a clear and easy to use menu. And context-sensitive help is available at all times. When Vol. II components are loaded on floppies, however, control is limited to the command-line. In this case, one enters a command to active specific .EXE files, from CKALL, which tests the components in the Quick Test, to the individual component test programs, such as CKLPT. Each of these command-line entries require input to control at least two switches. No, it is not all that difficult since entering only the filename as a command brings up a help screen which tells all that is needed to properly execute the program to meet your needs.

The results of all the foregoing tests can be directed to the screen, printer or to disks as reports or journal files which can be viewed and/or printed later.

Other Features: Volume II also includes other useful tools:

- A hard drive low level formatter which includes all the tools needed to low level format or refresh most hard drives, including IDE and SCSI. This feature is clearly should be used ONLY by someone that knows what they are doing.
- A virus scan program that detect the presence (but not repair or remove)most viruses, including polymorphic viruses. Update to the virus program are available from TouchStone for a nominal charge when updating is needed.
- A program to create a rescue disk, or what many of us would consider a boot disk, with some nice additions: System files, of course, plus AUTO & CONFIG files renamed, important programs, and selected useful Vol. II files, plus a text file to tell how to use the rescue disk.

Installation: Installation of Check It Pro on a hard disk is easy and quick, taking me only a few moments. And there is little to do beyond selecting the storage directory for program. Installation on floppies is a bit different; Individual applettes can be loaded as desired until you run out of space, but a problem is encountered when loading packages. I had some trial and error learning to do before I found out just what packages could be loaded onto floppy from a space standpoint; Vol. I can be loaded on a HD floppy, and the CKALL package of Vol. II an be loaded on a 1.44 floppy, but the system package (menu controlled) can be loaded only on 2.88 or larger disk.

Documentation: The owners manual is comprehensive and clear regarding loading and use of Check It Pro, with separate manuals for each of the volumes. Good context-sensitive, on-line help is provided in the full program, and adequate help is provided for command line use.

Requirements for Check It Pro are quite low: IBM compatible XT or better machine, DOS 3.1 or later, and any IBM-compatible monitor. No specs are given for RAM. Vol. I requires 720K of hard disk space or a floppy with 720K or more space. Vol. II requires 3.5 Mb of hard disk space, and up to three 720K or two 1.2/1.44K floppies if you want to load segments of the program to floppies. (Continued on next page.)

(Continued from previous page.)

Cost: The list price of the Check It Pro, Vol. I & II package, is $149.95. As you would expect, the street price varies considerably. I have seen a street price of $89. However, shopping around a bit could well result in a better price.

My View: Check It Pro is a very nice computer info and diagnostics package and I have found it useful. One limitation I noted is that testing of com and parallel ports is limited using only the software. For complete testing of these ports, loopback plugs are needed. While these are available from TouchStone and some retail sources, one does not become aware of this limitation until reading the documentation. Though it is a very good program, as just a computer user I am not sure I would buy it at $89+loopback plugs price, if I were not having computer troubles I was having trouble solving; tech types and technicians, on the other hand, would find a great deal more use for the program.

The program is available at most good software stores, or it can be purchased from:
TouchStone Software Corporation
2130 Main Street, Suite 250

User's Corner

Printer Controls. Everyone's got a printer, right? Right. But how many make use of the printer's features at the DOS command line? You display a directory and redirect it to the printer with a command like: DIR > PRN and the printout isn't *really* what you would like it to be; the list of files is all scrunched up against the left margin and it prints right over the page perforation. And you wanted to hole-punch it and file it in a three ring binder.

Well, take a look at the ONCL (Output Numbers on the Command Line) utility that is included with the New Member Disk(s). And dust off the manual that came with your printer. For now, let's just deal with that old reliable - a dot matrix printer.

The problem with sending commands to the printer is that so many of them start with the Escape character (ASCII 027). You can't just enter it at the keyboard because DOS interprets that as a Cancel operation. That is why you need ONCL.COM. It lets you embed the Escape character in the printer command string that you send to the printer.

The samples shown below are commands for the NEC P2200, but they are the same for the Panasonic 1124 (check your manual, they're likely the same for yours). The command ONCL 27,108,10 > PRN will set the left margin to 10. The command ONCL 27,78,12 > PRN will set the perforation skip to 12 lines; in effect, a top and bottom margin of one inch.

In fact, you can create your own print menu by writing a BATch file using this little utility. Or, if you use the EDIT program in DOS Ver 5 or 6, you don't need ONCL; just use the ECHO command instead. In EDIT, enter Ctrl-P, Esc to generate the Escape character for the print string. Just be sure that the string is redirected to the printer.

WordPerfect 5.1 or 6 for DOS. Sometimes you've filled the screen and you wish you could move everything up a bit so there'd be some blank space at the bottom–to improve readability. Just hold down the Alt key and tap F3 twice. This turns the Reveal Codes window on, then off. The size that you've set for the RC window will govern the amount of blank space. On an extended keyboard, tap F11 twice to get the same effect.

Professional Write. IMHO (that's Modem Rider lingo for "In My Humble Opinion"), this program has the best address merge capability of any of the well known word processors. The Address Book module is really a small data base program. Only, it's predefined as an address book. But hey, that's what you want in a word processor. Right? Right!

The address record format is pretty much the standard stuff: title, first and last name, position, company, street address, city, state, etc.. It also provides two comment lines. And this is what adds to the value. Let me explain.

You can search an address file for any item in the address record or for *any part* of an item! At a blank address form, position the cursor on the field/item you want to search for, and enter the data. You search for partial data by entering a "wild card" (two periods) before and after the data. For instance: entering ..Mo.. in the street field will cause the search to look for every street address that has mo in that field. Like: [Mo]ney Rd, Ala[mo]sa Ave, or Ada[mo] Drive.

By placing key words in the comment fields, you can select addresses for a newsletter, greeting cards, or–whatever! Although an address file is limited to 2,000 records; you can have more than one address file.

...Ed Buzza

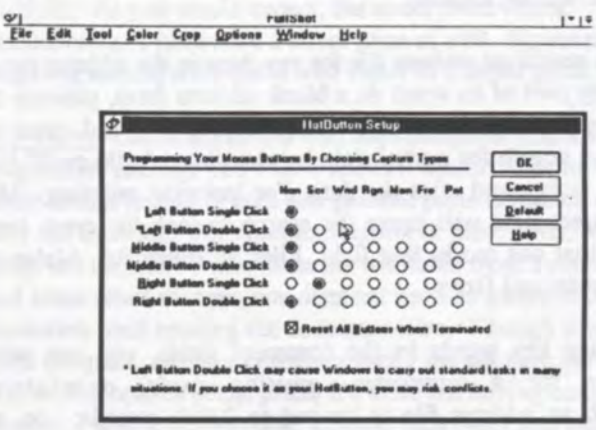
Software Review:

FullShot 2.0
Image Capture Program for Windows
(Reviewed by PC News Syndicate).

FullShot is an image capture program which allows users an easy way to take snapshots of Windows screens which may be used in manuals, training handouts, presentations, marketing materials or for any other purpose. The tools built into FullShot provide a flexible way to select and capture anything on a Windows screen from the complete image, to a single menu, a command button or even the cursor. It automates the procedures of freezing images in precisely the desired form so users can focus on the program.

FullShot is simple to use. Images may be captured using hot keys, Hotbuttons, or HotIcons. Captured images are saved in sequentially numbered files. And, many of the options may be customized to suit the users preferences.



Altogether, windows may be captured in any of 16 different ways. The mouse may be used to define the desired area. The desired screen objects (title bar, menu bar, single menu, or cascading menus with or without backgrounds) may be defined automatically. Captured images may be sent to the Windows clipboard, the FullShot window, a printer or any combination.

Additional builtin flexibility lets the user capture images in B/W, 16 color, 256 color, 32K HiColor, 64K HiColor and 16.8M True Color. Color images may be transformed to B/W or gray scale to suit the capabilities of the printer being used.

Preferences for size and orientation allow the user to use Zoom in and Zoom out commands. Images may be scaled to any size

(Continued on next page.)

(Continued from previous page.)

by percentage or by pixel and may further be rotated any of 4 ways or flipped horizontally or vertically. Artistic enhancements allow the user to specify single or multiple frames including their size or color to be applied around captured images.

FullShot imports from all and exports to most of the formats listed below:

BMPWindows bitmap
CLPWindows Clipboard
CURWindows Cursor
DIBDeviceindependent bitmap
GIFGraphics interchange format
ICOWindows icon
RLERunlength encoded device independent bitmap
PCXPaintbrush
TIFFTag Image File Format
WPGWordPerfect Graphics format

Finally, FS allows the user to capture a full or partial screen from any graphics system which supports Windows and prints on any printer that has a Windows driver using any of nine different page alignments.

FullShot requires Windows 3.0 or higher, a Windows compatible mouse and a 3.5 or 5.25 disk drive. It retails for $99.95 from Inbit, Box 391674, Mountain View, CA 94039. Phone (415)9671788, FAX (415)9678614. (Reviewed by PC News Syndicate).

FOR SALE - Unopened copy of WordPerfect 5.2 for OS/2 for the price of $100.00 - leave a message for Merle Nicholson on the BBS if you are interested.

MEMBERS HELP-LINE

The following phone list is provided for our **Tampa PC Users Group** members in an effort to establish local support for those frustrating times which we have all encountered while using our PC's. Please note that these are members that have volunteered to help you, treat them in a courteous manner. Be sure to ask if it is convenient for them to help you now, or if you should call another time. It would also be helpful to have your documentation and have it handy when you call. *(Don't expect help if your software is an illegal copy or you do not have documentation!)* **TPCUG** is not responsible for the information or advice provided by volunteers. Volunteers may or may not be experts in the subject matter. You are on your own with any advice received. Be aware also that some of these volunteers may be consultants in their area of expertise. If you are interested in volunteering to answer members questions, either leave a message on the BBS or fill in the forms provided for this purpose at the meetings.

A MESSAGE FROM OUR TREASURER: Here are the reports showing our User Group's financial condition at the end of 1993. As requested by the membership last Fall, they are being published here in the first quarter of '94. If you have comments or suggestions about the reports let me know. I monitor the BBS frequently, so a message there would be convenient for me. If you wish to discuss them at a meeting, try to find a time when I'm not busy with other members or visitors. I welcome your comments.

For you non-accountants (like me!), the Balance Sheet shows our financial condition at a specific point in time.i.e. at the close of business 12/31/93. In contrast, the Income Statement covers all income and expense activity for the entire calendar year. Each item on it represents the total for that category of income or expense for the entire year. Our books are kept on a cash basis. No effort is made to prorate memberships which began before 1/1/93 or which extend beyond 12/31/93.

Tom Cone, Treasurer 01/29/94

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII file or in a commonly available word processor format, such as Microsoft Word, WordPerfect 5.2, or Ami Pro 3.0 on diskette to the editor at 9402 Hidden Ridge Place, Tampa, Florida 33637 or send it by modem to BBS (813)239-3704.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

Commercial advertisements will be accepted at the following rates:

	1 month	3 months	6 months
Full Page	$60.00	$162.00	288.00
Half Page	$40.00	$108.00	$192.00
Quarter Page	$22.00	$60.00	$106.00
Eight Page	$12.00	$33.00	$58.00
Business Card	$10.00	$27.00	$48.00

All advertisements must be prepaid by check payable to TPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if it is not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, Marylee Bruneau at (813) 985-3338, for space availability and for further information.

Secretary's Report

MINUTES OF 2/9/94 MEETING

and PERSONAL COMMENTS

By: Jim Clark

This was our first meeting in our new quarters at the Ybor City campus of the HCC. And the facilities are excellent. We have a large circular coliseum-type of room which can be divided fairly easily into two rooms using a built-in partition. The half we used for this meeting will comfortably accommodate over 100 people, with at least 85 seated at tables facing the 'well' in the center of the room; in excess of that number would be seated in comfortable folding chairs. The other half of the room is setup to accommodate almost 200 people, all of which would occupy comfortable folding chairs. All in all, I think the facilities are excellent for our purposes. HCC made available an overhead projector for our use, but a computer and color panel were and are our responsibility; all three are needed for presentations. Our group has not yet been able to acquire either of the missing pieces of hardware, but Harvey saved our bacon this time by borrowing a color panel from his workplace and making a laptop computer available for the meeting. This is not an arrangement that is available for very long and our group simply must come up with our own equipment.

I found the campus very easy to find and to get to. Parking is ample, but is located in three different lots. None of us being very familiar with the layout, some had difficulty locating parking. As we use these new facilities and become more familiar with them, I am confident that we will like our new location as much as or more than the super IBM facilities we had been using. Come on out and see for yourself -- you will enjoy yourself, and you are sure to learn something new.

WordPerfect Corporation, which had been scheduled for a presentation at this meeting, has been rescheduled tolater in the year. Tom Cone, our Treasurer, graciously filled in the opening that was left by WP with a rundown on a program he uses daily in his law office -- Desqview -- and he did a great job, with good interchange with other members. Presentations by one of our own are particularly enjoyable for me because I think we get more of a user prospective, and there is usually much more interchange between presenter and audience. In addition, there was considerable time available after the presentation for free-wheeling interchange between those present on any random computer problem/subject suitable for group discussion -- and that is what happened. In my opinion, that is what this group is all about -- the exchange of knowledge among ourselves, ***supplemented*** with knowledge from vendors and other sources.

(Continued on next page.)

(Continued from page 2)

USER GROUP NEWS

Ybor Campus Parking: There is a fairly large lot for open parking across the street (Palm Ave) on the north side of the complex, with some of the spots reserved for staff; there is another fairly large lot for open parking on across the street on the south side of the complex; and there is a staff parking lot in the northeast quarter of the complex. Harvey will confirm what parking is available for our use; look for more info on this subject elsewhere in this newsletter.

Non-Profit Status: The Post Office computer has carried our group in non-profit status for the last two months, saving us about 50% ($17) off our bulk mailing rate. However, we had not received official notification of award of that status. You guessed it -- earlier this month the PO informed us that we owed them some $$ for the last 2 month's mailings and that they would not award non-profit status until the IRS also approved same for us. So, we are back to bulk mail rates (which is not all that bad - about $37/mo, versus about $20/mo) until the IRS grants non-profit status.

PRESENTATION -- Scheduled:

WordPerfect has rescheduled their planned presentation until later this year, plans for the near future are as follows:

CorelDraw — March

Adobe Systems — April

Microsoft — May

Visio by Shapeware — June

INDUSTRY NEWS

Word Perfect Rumor: - WordPerfect Corporation is undergoing a reduction in force at the present time, as many corporations have and will continue to do to stay competitive. A rumor has been circulating, probably associated with the RIF, that WP has produced its last upgrades of both the DOS and Windows versions of its WP word processors. WP Corp has denied that and other articles report that new upgrades will be out for both versions of WP in the next few months. A major change that has occurred, however, is that free tech support has be reduce to 180 days free tech support, beginning with the first call for help. Various 'for fee' tech support options will be available after that.

MS Access: For those looking for the next upgrade to MS Access, Microsoft has announced that it will be available in April.

Windows For WorkGroups: Version 3.11 of this program is on the market now. Be aware that while OS/2 is compatible with Windows for WorkGroups 3.1, it is not compatible with Windows For WorkGroups 3.11. Also be prepared for MS plans to drop their Windows program as a separate entity and to make Windows for WorkGroups its sole windows package. As a Windows user, that causes me no great concern, EXCEPT -- what does that do to my cost? And, surely provisions will be made to avoid loading unwanted portions of the package to minimize use of disk space, but will they? No answers to these and other related questions, yet!

PRESENTATION -- Desqview

Tom Cone uses this program daily in his office. He chose that program as an alternative to Windows, or other multitasking options. Tom reported that he was looking for a program to speed up his computer work by allowing multitasking to avoid the lost time that otherwise occurs when switching from program to program. Many of us would immediately think of Windows or OS/2. But Tom didn't want the speed cost of these programs. So, he looked around and settled on Desqview, which, by the way, is what your BBS uses operating in a window of Desqview -- that allows the BBS to function normally while our SYSOPs accesses and performs software maintenance on the computer.

Tom very ably demonstrated the features of the program, including creating, using, sizing and switching between windows, all of which is accomplished easily with mouse clicks or short-cut keys. The number of windows that can be opened was not known, but Tom had 5 or 6 open and working at one time, which would be more than adequate for most users. When using a 386 or better machine, all open windows are active and can be working in the background; the more memory the more windows can be open, active and working. For 386 or better machines, Desqview comes bundled with Quarterdeck's QEMM program. A memory manager, QEMM makes the most of the memory available on the machine, and Desqview does an excellent job of allocating that memory to use it to best advantage for the programs the user starts. Yes, you can tweak memory use for particular programs to insure that a minimum amount is available. In fact, the user can do considerable tweaking to customize Desqview to suit particular druthers. Desqview also includes a program called Manifest, which provides detail to the screen (or printer) about your computer and its setup; it is much like similar computer information programs in Norton Utilities and Windows, among others.

Desqview will even run Windows in one of its own windows (if for some reason one would want to), but only in standard mode. You can also open Desqview windows back to DOS while applications are running in other windows. In some respects, Desqview is similar to Windows (but with DOS speed). Tom reports that programs do crash on occasion in Desqview. As in Windows 3.1, sometimes one can just shut down and restart the offending program. Other times, it may be necessary to restart Desqview. And, some occasions may require rebooting the computer -- just as in Windows.

Desqview will run on a 286 machine and one can have several windows open, the number depending on available memory, but one cannot multitask on a 286; only the active window can be working. With 386SX or better machines, the number of

(Continued on page 4)

(Continued from page 3)

windows open and working is tied directly to memory requirements of the programs loaded and the total memory available on the machine. Desqview uses expanded memory (EMS), but simulates EMS from from extended memory (XMS) on those machines which don't have EMS. Tom reports that he sees no signs of any degradation in speed from using EMS and its' paging -- it is fast!! Desqview also uses virtual memory (swapping to disk) when RAM has been exhausted, but there is a speed penalty when that occurs -- as is the case in Windows.

Tom did not have current pricing info, but when he bought his Desqview/QEMM package about a year ago, the street price was about $140. Tom made it a point to make us aware that in his view Desqview is not truly a Windows competitor, for it doesn't have the graphical interface powers of Windows. But, for those who want to multitask with the speed of DOS -- which Windows doesn't have -- Desqview is certainly a super alternative. Tom, thank you for a great presentation. It was both informative and enjoyable.

AND THE WINNER IS

Thanks to the generosity of IBM, who donated a copy of OS/2 for Windows, Computer Associates, who donated a copy of Simply Money, Brainchild Computer, who donated a copy of MS Windows Entertainment Pak, and collections obtained by Harvey and Marylee at Comdex, there were some very nice door prizes. Those among us to have the good fortune to win are:

M. N. Marteny—T-shirt, Mouse Pad & MS Entertainment Pak
D. A. Clary— Adobe Type Manager
G. Jurado— Adobe Type Manager
Renate Marsh— Simply Money
Bill LaForest— OS/2 for Windows

The meeting adjourned at about 9:00 PM.

" WE MAKE A LIVING BY WHAT WE GET, WE MAKE A LIFE BY WHAT WE GIVE."
—Winston Churchill

PRESIDENT'S COLUMN

The Olympics are **finally** over. Congratulations to all the athletes and the Norwegian people. Rumor has it that each skating judge will be replaced by a PowerPC from IBM and Apple in the next Winter Olympics. This should provide a un-bias method of rating skaters. Of course those skaters wearing Intel clothing will receive a 1/10 point deduction.

Our first meeting at our new HCC home was a success. It was a learning experience for all of us just to determine how to setup the room for a presentation. Fortunately, we had no vendor waiting on us to get setup. As you are aware we still do not have any equipment (overhead panel and computer) of our own. The process is going to take more time than I initially planned. Thanks to all of you in attendance for your patience during that initial setup time. My thanks to Tom Cone, our treasurer, for filling in for WordPerfect. Tom did a fine job at presenting a DOS multitasking alternative to Windows and OS/2.

The upcoming presentation, by Anthonio Sanchez of Corel, will be attended by one of our largest crowds to-date. Corel has invited all it's registered users, through a mail-out, to our meeting. With this in mind you may want to get to the meeting early to get a good seat. In addition to presenting CorelDRAW 4.0 Anthonio will demonstrate Ventura Publisher which Corel recently acquired from Xerox.

Non-Profit Status

The Post Office which assigned our group a non-profit status several months ago has notified us that we are no longer considered a non-profit group in their eyes. This in turn means that our cost of mailing the newsletters has almost doubled. Apparently a computer error within the Post Office temporarily assigned us non-profit status. Just kidding. We will get our non-profit status as soon as the IRS has determined that we our eligible. Eligibility is based on information contained on the IRS forms Marylee filed with them. If all goes well we should be approved as a (501)c3 non-profit group in the second quarter.

Florida Educational Technology Conference

During the 1st week of February I had the opportunity to attend the 14th Florida Educational Technology Conference at the Tampa Convention Center. This conference is for the educators of Florida and is not open to the public. I was very fortunate to obtain a pass at the last minute. The conference provides the educational professionals with an opportunity to see what hardware and software is available to them and their schools in order that they can better communicate and help students acquire the knowledge that they need.

It was amazing. I never realized how many educational products were available. Not just games mind you but actual products to help teachers and students alike, from preschool to college. It also was the first time I ever noticed a close balance between Apple and PC products at a computer show. Normally, PC compatibles dominate a show when both platforms are present. Of course Microsoft was there with products for both platforms. What was unusual was the presence of Compaq Computer Corp. Why you ask? Well Compaq does not even attend Comdex, the biggest computer show in the country. But there they were with a massive booth and a line of 60+ educators around their booth. As I got closer I realized they were not looking at the Compaq hardware which sat on their individual pedestals, but in fact were all in line to put for a free stuffed animal wearing a compaq shirt. That's your basic marketing 101 at work. It brought back memories of Comdex where people will stand in line for 45 minutes to get a chance to win something free. But hey, educators are humans and they deserve freebies too.

While there were a lot of fine products one specifically caught my eye. It was a communication tool displayed and sold by Audio Visual Innovations of

(Continued on page 5)

(Continued from page 4)

Tampa. This tool was a 4' by 3' touch sensitive writing board called the **SMART 2000**. This definitely superseded the electronic white board I saw at Comdex in 93. If you can imagine a large (3x4) color screen attached to your PC that you control by touch, you may begin to get the idea. Just think of running Windows in front of a crowd by touching the menu options instead of using a mouse. I always lose the mouse pointer when a presenter zooms across the screen to show me some slick feature. But with the **SMART 2000** you always see what menus and commands the presenter is selecting because he has to touch them. If you are in a paint program just draw a figure by hand. Well by now you should of gotten the idea. If you didn't I guess you had to be there. In all the show was great. I just wish two things. One is that the show was accessible to the public and two that all schools could afford to purchase and use the wonderful products they needed to help communicate and educate. These products could certainly help our kids get prepared to survive the complex future that awaits them.

Harvey Bruneau

WHO SAYS TALK IS CHEAP?

Like the eight-track tape, the Veg-o-Matic, and air-for-nothing at gas stations, free technical support for software is becoming an endangered species. Software companies have been hit by thinner profit margins due to spiraling-downward retail prices and are not charging for support that had been free. Here are some typical costs for tech support:

Borland - Free 800 number installation and configuration, then $2 per minute on 800 number.

Lotus - Free for first 90 days on 800 number, then $2 per minute on 900 number, $129 annual flat-fee support.

Microsoft - Free for first 90 days on 800 number, then $2 a minute on 900 number; $129 annual flat-fee support.

Software Publishing Corp. - Free for first 90 days on 800 number, then $2 a minute on 900 number; $79-$99 annual flat-fee support. *(Reprint from Ridge Runner, publication of Ridge Area Computer Users Group - Lake Wales, Florida)*

On-line help vs. manuals - A personal point of view alternate title: Listen up Ed, there is another perspective

By: Merle Nicholson, Tampa PC Users Group

This is about a lament we heard; that companies are cheapening their products by providing on-line documentation because it's less costly. I don't agree. I think on-line *should* be more expensive than paper. One thing I'm sure we will agree on, without question, is that excellent on-line docs are better than ill-prepared paper books. But there is more to it than that.

I have one product Rumba (Wall Data - $498 street, $795SRP) that has no paper docs at all; and the company is proud of the fact. It has only mediocre on-line docs, and frankly I resent it.

Personal Communications/3270 3.0 (IBM) has abysmal on-line help and five pounds of truly worthless books. The on-line is a description of the menu commands; ridiculous. There's no way to find out how to do something by subject. Good thing it's a good, intuitive product. If you get this at your workplace - head for the nearest paper recycle bin and forget F1.

Let's look at Visual Basic for Windows. I paid $150 for it (It's $339 now). It has very good paper docs, and truly outstanding on-line. Which do I use? Paper gets maybe 2%, and on-line gets 98%. Why? The on-line is indexed to the hilt. There is nothing you can't find quickly. You can set bookmarks to jump back to and you can step forward and backwards anyplace you've been; there's definitions of terms in pop-ups in surprising neat places. You can highlight or double-click on a programming command, press F1 and the full reference for that command starts. There are pop-ups for related topics everywhere that you click on and get the full text of the related subject; click on "back" and you go back to where you were. If I lost the reference books, I wouldn't really care. There *is* a paper Programmers Guide (not a reference) that is intended to be read; any beginner would need it; it belongs on paper. One real advantage to the on-line; you can cut and paste programming code from the help to the programming windows. Last time I tried that with the books, it didn't work and I had to scrape the glue off the screen afterwards.

The same for WordPerfect 5.2. I've *never* looked at the paper docs since I went to Windows; not once, and I would rate the on-line help quality only average. Word processors need reference material you can look up. Let's save the paper.

I can't see myself reading a novel or Bits-of-Blue for that matter, on-line until the PC, CPU and a 300dpi screen, is small enough to put in my lap or hold above my head laying on the couch. I read fast and I want to see two whole pages of text in front of me and it can't weigh more than a pound or two.

If I want to *look something up* while I'm at the computer, nothing can beat on-line if it's well done. If I need to *read something*, the book is best. I'm willing to bet that creating *good* Windows help is ten times the investment in creative manpower; which is why you see bad stuff out there. But IT CAN BE DONE.

To summarize: 1) What counts most is quality. 2) Both methods have their own unique uses. 3) If they need to cut costs and eliminating books will do that, then they should re-invest some of that money in providing quality indexed on-line help. Thanks.. Merle

SOFTWARE REVIEW: HSC Digital MORPH

By Gary W. Wodka,
Madison PC User's Group

Terminator 2 made me sit up and go "Wow!" The shaving commercial where the faces change but the lather remains the same was even more amazing to me. "How do they do that?" I asked myself. Now I know!

The process of changing one image into another is known as "tweening" or "morphing." If you have enough computer resources, you too can morph! But it's not for the entry-level system. In order to look professional, you must have equipment like a professional. The program I'm talking about is HSC Software's new Digital MORPH (DM). This program allows you to do the great things we've come to expect from state-of-the-art movies and TV.

Installation

Installation wasn't too hard. The hardest part was making sure the system could handle it. Minimum installation requires Windows 3.1 (NOT 3.0!) running in enhanced mode, 8 MB RAM (16 MB is recommended), a mouse, and a math coprocessor. I tried running the program on two different systems. My home system has 8 MB RAM and is a 33 MHz 486DX system. My office system is a 66 MHz 486DX system with 16 MB RAM. I prefer to run DM on my office setup! It was almost twice as fast and gave smoother performance of the finished product. I could, however, live with the home version.

As you install, several files are loaded that you probably already have from your Windows installation, including Packaging, Animation, Sound and Video files. As the files are loaded, you are asked if you want to replace those already there. Before you answer, the DM install program gives you the dates of the existing files and the new files. You are given the opportunity to update or not, depending on the dates of the existing files. DM installs in just under 5 MB and creates its own program group under Windows. In addition, the SYSTEM.INI and WIN.INI files are modified, and a DIGIMORPH.INI file is created.

Morphing

Once installed, you're ready to try your hand at "Speilburging" (I coined it, and I like it!). The first thing you'll want to try is a basic morph. The 120-page User's Guide gives you everything you'll need to do everything you've ever wanted to do in a morph setting. But the first few pages (Quick Start Guide) will have you morphing in less than 10 minutes.

To create a simple morph between two graphics files, simply choose New Morph from the file menu. You'll be asked if you want to morph between two images. I chose "Yes." Using the two sample images, "Boy" and "Girl," you'll have both a source image and a destination image. You'll then choose how your final image will look: 100 percent girl, 100 percent boy, or somewhere in between. Since I was interested in seeing a true morph, I chose 100 percent girl.

In order to perform a morph, the computer must know which points on the master and destination photo to use. So you'll outline key parts of the images. In the two images I used, the eyes didn't line up, nor did the noses or mouths. First I outlined the face of the source image (boy), the eyes, the nose and the mouth. Then, by simply clicking on the girl's image, the lines I drew on the boy were transferred to the girl. By dragging the lines to form the proper shapes around the face, eyes, nose and mouth, I was able to create a perfect morph.

After drawing the lines, select Do Morph and the rest will be history. Actually, not yet. You first have to tell the program how many interim frames to create. There are 15 frames per second.

I experimented with a half second, one second, and two seconds (30 frames). The two-second morph gave the best results. There was a gradual transformation from the boy to the girl that had the guys at the office "ooohing" and "aaahing."

Warping

In addition to morphing, DM provides the ability to do warping. This is a technique used to reshape portions of an image. For example, I could take my boss's picture and make the nose grow! Or the ears! Of course, I wouldn't show him the results, but the rest of the office got a charge out of it!

Warping is accomplished by moving points on a grid system. When selecting Warp from the menu, a grid is placed over your photo or graphic. You can change the size of the grid to small, medium or large. To warp, just drag intersecting points on the grid. It will take a little practice to get this technique down, but the results will be worth the effort. There is an option on the menu to provide for Curve Fitting. This option will take longer to process, but the results will look better. The intervening frames will curve, rather than being short, choppy straight lines.

(Continued on page 7)

(Continued from page 6)

Image Enhancement

DM provides a series of brushes for modifying the color and texture of an image. There are seven brush types, and each does something different. By using the brushes, you can recolor an image or any part thereof. With the Airbrush you can remove wrinkles from your wife's photo (she'll really appreciate that!). You can smooth parts of an image with the Blend brush. The Color brush merely paints in a chosen color (it is the simplest of the brushes to use). The Pull brush copies the area underneath it and deposits it where the brush is moved to. The Tint brush can give your photos a translucent sheen, and there is an Undo brush to make up for your mistakes (and believe me, when practicing, you'll make plenty!).

Full Motion Animation

In addition to the static morphs described above, DM allows you to create full motion animations. I must warn you, however, that these are not for the faint of heart or wimpy of machine! To work with full-motion animation, you'll have to unpack an animation file into a series of individual images or frames, and warp or morph each frame individually, then pack them back into the animation files. This takes forever! If you have the patience, the result is outstanding!

File Size

Once you've created your morphs, warps, etc., you'll have to save them. I hope you have some extra hard disk space! A two-second video, even using the compressions provided in DM, was just over 500K. If you had to create a series of animations, you'd need an extra hard drive to store them.

The Best and the Worst

If I had to choose the best feature of Digital MORPH, it would be that the program is so easy to use. I was able to morph and warp within 10-20 minutes of unpacking the program. And the results were quite remarkable.

If I had to choose the worst feature of Digital MORPH, it would be that it took a long time to work on a slower machine. On my 33 MHz machine, each frame in the animation sequence took approximately 20 seconds to create. In a two-second video, that means 30 times 20 seconds, or nearly 10 minutes. That process was cut down to six seconds/frame on the 66 MHz machine. I guess it's time to upgrade again!

Digital MORPH is a product of:
HSC Software 1661 Lincoln Blvd, Suite 101 Santa Monica, CA 90404

SOFTWARE REVIEW: You Need Business Cards Fast

By: Deborah M. Johnson,
Pentagon PC User Group

Whether yours is a fledgling new business or a Fortune 500 company, you probably at some time have wished you could print your own business cards. Maybe your title changes from day to day, or maybe you are hiring new employees faster than you can get business card requests to an outside printer. Whether you need customized messages for the many different hats you wear, or just a few cards for a new employee, WordPerfect 6.0 for DOS has the solution for you!

Print your Own!

First, buy Avery Laser Business Cards, form #5371. They are currently available in bright white card stock (though colors are promised), 10 cards to a sheet, 25 sheets to a package. Then, start WordPerfect 6.0 for DOS. From a blank screen, choose your form: Click on Layout, choose Page, select S Labels. Press the down-arrow key to highlight "Avery 5371 Business Card" and select 3 Edit. On the Edit Label screen, choose 8 Label Margins and type in 0.2 (for a 2/10" margin all around) and press Enter at each of the four margin prompts. Click on "OK" on the Page Format screen. With "Avery 5371 Business Card" still highlighted on the Labels screen, press 1 Select. Then, click on "OK" at the Page Format screen. Your form is now set up.

Now you need to type in your information. The following format will give your business cards a very professional look. First, press Shift/F6 to center your company's name. To choose a very large font for your company's name, click on Font, choose Font, then select 1 Font CG Times, 2 Size 10pt, and 4 Relative size 5 Very Large. Click on "OK." Type in your companyÆs name, right-arrow once to pass the [Very Large Off] code, and press Enter. Press Enter once more to add space. Then Shift/F6 again to center your employee's name. To choose a large font for the name, click on Font, choose Font, then select 4 Relative size 4 Large. Click on "OK." Type in the name, right-arrow once to pass the Large Off code, and press Enter. To center the job title, press Shift/F6, type in the job title, and press Enter. Press Enter twice more to add space. At the left margin, type in the business phone number, press Alt/F6 to flush right, type in the company address, and press Enter. At the left margin again, type in the home phone number, press Alt/F6 to flush right, type in the company city, state, and zip, and press Enter. Add extra hard returns where necessary in order to fill the "page" completely and space out your information so it is readable.

Copy this first business card using your favorite method until there are 10 altogether. One way is to do this is to delete and restore your first "page" 10 times. Just press Home Home Up-arrow, Ctrl/PgDn, Yes, Esc, Restore. Then Esc and Restore 9 more times. Shift/F7 and press 7 Print preview to spot check the layout on the page before printing.

For a more customized look, you could also add a graphics box (for your company logo), a line, or a border. How ever you design your business cards, try WordPerfect 6.0 and the Avery business card form. Create custom business cards for all your company's needs!

Deborah M Johnson is a WordPerfect Certified Resource and manages her own computer consulting/training business. She is a contributing editor for National Computer Tectonics and the PC Register.

SOFTWARE REVIEW: Multimedia Make Your Point

By: Alford Poole,
Tampa PC Users Group

The title of this Asymetrix software explains it all. If you need to make a point with a presentation, Multimedia Make Your Point (MMYP) version 1.0, could be just what you need.

The box makes this claim "The easiest way to create multimedia presentations for Windows 3.1 . . . It's as simple as point, click, and present." Catchy words, but there are a few things to consider. Like: how simple of a presentation do you want? Do you have lots of long lines of text? Do you want nifty transition effects between slides? The answers to these questions could decide whether this program is right for you.

MMYP takes about 5 MB of disk space if you load all the options. Besides the MMYP files there are Autodesk Animation samples and sample MIDI, WAV, and Metafiles (over 60 in all).

Major features include professionally designed presentation templates, tool bar, menu bar, and a status bar. You can import graphics from any Windows metafile, bitmap, computer graphics metafile, MicroGrafx Draw file, or TIFF file. Some animation files are quite good. I especially liked the revolving earth flick.

The 54 page instruction booklet, the size of a CD jewel case, seems a little brief. But, it does have an index.

There is also on-line help. Asymetrix gives a 90-day money back guarantee and free tech support, you just pay for the phone call.

A neat demo file comes with MMYP and shows how a multimedia presentation can look and sound. To select a template there is a nice preview feature that shows a small version of the template . The background colors and bullets are easily changed and the changes are reflected in the small version. When it looks right save it and then start making the presentation. The 30 templates provided are well done, but it is nice to be able to change them
so easily. In one slide that had a line of text that wrapped to the next line, the lower portions of the letters on the second line were cut off. Reducing the font size did not help. Also, any text that won't fit in the test block doesn't show up in the presentation.

There are three transition effects. Choosing one applies it to all screen changes in the presentation. I would recommend "None." The effects are really S-L-O-W (this is on a 486-33mhz machine). The dissolve is more like putting layers of film over the screen and then removing them to reveal the next picture. Not impressive. These need some more work.

Is it as easy as point, click, and present? Yes. MMYP may not have as many bells and whistles as other products, but the ones it has are useful and could have heavy use on a day to day basis. This would work better for traveling demos than in house presentations. Due to the line length and number limitation (six lines max), using the included templates could be challenging if you needed to list more topics.

Would I recommend this product? If you use very few words in your presentation, want basic features and want to include multimedia, maybe. But, for $69.95 plus $6 for shipping, you can have Lotus Freelance Graphics 2.0 from Surplus Software (1-800- 753-7877). It has some super transition effects (and they are fast), use of text is much more versatile and it has quite a selection of additional features. So take your pick, the VW or the Caddy. They'll both get you where you want to go, only in this instance the sale price is about the same.

System Requirements: 386 20-MHz or higher, Windows 3.1, VGA card, mouse, DOS 3.1 or higher, at least 3 MB RAM (4 MB recommended), floppy drive, and 3-5 MB free hard disk space.

MMYP is available for $75 at Computer City. Asymetrix Sales: 800-448-6543, FAX: 206-637-1504 Address: 110-110th Ave, N.E., Suite 700, Bellevue, WA 98004

Software Review

DECK for DOS THE HOME SERIES

Accurate Deck Design made easy by Autodesk

By : Ronald A. Hargreaves,
Tampa PC Users Group, Inc.

If you are the type of person who likes to plan, design, and possibly build or contract to build home improvement projects such as a deck or dock, then this is the program for you. If not, don't read any further.

Whether you're expanding an existing deck or starting a complex, multilevel deck from scratch, Deck software lets you transform your ideas into detailed working plans right on your PC. This program should be call DECK/DOCK because it can just as easily be used to design a self-contained dock attached to land or floating. I used this program to design a deck and dock in conjunction with a new home that my wife and I are going to build on a lake in Pennsylvania.
The Users Manual (254 pages) is quite comprehensive. It is well designed and user friendly. It is worth your time to peruse it before attempting to use the program. Even though you can jump right into using the program by taking advantage of the menu-driven options, unless you are familiar with CAD type design concepts, (which I was not)
much time can be saved by reading the manual first. The chapter on advanced techniques provides you with the methods you need to design decks around trees and spas, create multilevel elevation views, draw railings on elevation-view stairs, use angles other than 90 degrees, and create custom symbols. There is also a very good "On Line Help" capability built into the program.

FEATURES:

* **Built-in 3D viewer** lets you "walk through" your design, using up to 64 colors, before the construction process begins. This is fun aspect of using this program. By pushing a few buttons, you get a 3D perspective of your design from your choice of view, i.e. eye-level (moving left or right around any side) or top down.

* With **accuracy to 1/16"** you can create precise working plans without any hand drawing.

* **Symbols**, color-coded for easy identification, add details like grills, furniture and potted plants.

* With the **Undo/Redo feature** you can easily rework the last 25 steps of your design.

* **Variety of textures and surfaces**, like wood, earth, concrete, grass and brick, add realistic detail.

* **Automatic "Shopping List"** feature lets you print the list to take with you when buying materials or asking a contractor to bid on the job based on your design and material needs.

* Easy to learn and use **step-by-step instructions** get you up and running in less than 30 minutes, although like any program, the more you use it, the more proficient you get.

CAPABILITIES:
Export 2D files to AutoSketch(R) and other CAD programs via DXF(TM) format. Load drawings in Generic CADD(R) 5.0 or higher. Save files to AutoCAD(R).DWG format. Load 3D drawings into Generic 3D Drafting(R) Release 2 and Autodesk 3D Concepts for Windows.

SYSTEM REQUIREMENTS:
IBM PC, XT, AT, PS/1, PS/2 or 100 percent compatible; 640K RAM with DOS 3.0 or higher; hard drive; floppy disk; two or three-button mouse; graphics card (Hercules monochrome or color, MCGA, CGA, EGA or VGA; color display requires minimum EGA). Recommended: Math coprocessor; extended memory (XMS). Printer Support: Supports 9-pin, 24-pin printers, HP LaserJet or 100 percent compatible, a nd HP DeskJet 500/550c.

Many of you may have read the software review by Renate Marsh that appeared in the February, 1994 issue of "BITS OF BLUE". Renate reviewed a sister program of THE HOME SERIES by Autodesk called Kitchen & Bath for DOS. Many of the same comments that were made pertaining to that program can be applied to DECK, i.e. "planning and preparing your design is very important" and "Once you have created a floor plan you can make it come alive with different color schemes; and you can load your drawing into the 3DPlan program which will give you a totally new and realistic perspective of your drawing." All Home Series products work together. These include "Home","Kitchen & Bath", "Landscape" and "Deck".

List price for each Home Series: $59.95
Company: Autodesk, Inc., 11911 North Creek Parkway South, Bothell, WA 98011
Tel.: 1-800-228-3601

Software Review

Print Cache Revisited

Version 3.1

By: Jim Clark,
Tampa PC Users Group

The October 1993 *Bits Of Blue* newsletter contained a review I had written on Print Cache, Ver. 3.1, by Laser Tools. I gave the program rather high marks in that review, and described what a fine job I thought it did. I also mentioned that I had a couple of problems I was working to resolve with Laser Tools technical support.

The Problems: Well, those were just the beginning of the problems I have had with the program. That is not to say that you would have the same problems (or any at all, for that matter) on your computer. The problems I have are when using Windows programs, with one exception. Among the problems are:

(Continued on page 10)

(Continued from page 9)

* Print Cache will not recognize a driver for LPT2 and insists on using a substitute driver which slows down printing in Windows. I have made certain my controller is set properly and several different computer information and diagnostic programs all show no conflicts for LPT2. This is the non-Windows problem -- this is a setup problem and occurs when setting the parameters for Print Cache operations.
* When reprinting a document (a new printing of the same document, as opposed to copy 2 of a single print instruction) Print Cache sometimes does not intercept and pass on the printing instructions to the printer. Repeated attempts to print the document result in the same outcome. In those circumstances, you have to go to DOS and disengage Print Cache, and change to the Print Manager print spooler to complete your printing job, or restart Windows.
* At other times under like circumstances, and sometimes on second print jobs, Print Cache will print random scattered gibberish in the document, forcing a reprinting after disengaging Print Cache and changing to Print Manager, or restarting Windows.
* At still other times under similar circumstances Print Cache will print only a line or two and cause a form feed, print another couple of lines and form feed, and so on. One must then employ the same procedure outlined above to extricate.

I have found that clearing the Print Cache buffer each time before printing minimizes the occurrence of these problems, but is not a 100% solution. And it is only a preventive precaution; if one of these printing problems does occur, clearing the buffer will not help -- only disengaging Print Cache or restarting Windows works for me.

The problems are likely peculiar to my configuration. I have tried many different configurations, including eliminating TSRs without success. I have ran diagnostics, examined INIs, etc. etc., and have not found a solution. That brings me to the most important part of this update.

Lack of Technical Support: I was in contact with Laser Tools technical support while I was writing the original review. I talked with them 3 or 4 times. They seemed not too interested on the phone in the details of the problem or the configuration of my computer, and were quick to suggest trying this or that. I began to feel after the 3rd call that the only way I would be able to get Laser Tools tech support to really look at my problems was to send them considerable detail about the problems, including samples, and complete details about my computer and its configuration -- which I did. I received no response from technical support. I then wrote management about my problems and sought help finding solutions. Again, no response. So, I am still on my own.

My View: Except for the LPT2 setup problem, I have not had problems with Print Cache in DOS and when using DOS programs, and it saves a lot of time. Print Cache is a very worth while program WHEN IT WORKS properly. My experience in Windows, however, has been just the opposite -- and I use Windows most of the time. And when it doesn't work properly, it is more hindrance than help and will slow you down considerably. Whether you will have any trouble with the program will likely depend on your particular computer and setup. Based on my experience, you may not get significant support from the Print Cache technical support folks. If you purchase the program, you might want to insure that the seller will allow you to return the program for a complete refund if you have any troubles you can't live with.

WHEN IN CHARGE,
PONDER.
WHEN IN TROUBLE,
DELEGATE.
WHEN IN DOUBT,
MUMBLE.

Volunteers Needed!

Our Board is seeking several volunteers who would commit themselves to help organize a committee for planning, developing and the ultimate presentation of a financially successful **Consignment Table** for our membership. The general idea for this consignment table would be as follows:

Members would bring computer items, which they no longer use or need, to the meeting (to be determined). You can likely sell it to another TPCUG member.

The volunteer members on the committee would help in making the sale. There would be a form for each item received, indicating the price and description of the item, and a receipt for the item would be given. At the end of the meeting the money would be counted, and the seller will receive 90% of the money received for their item.

Everyone benefits! The seller would benefit by unloading unused items, a buyer would be able to shop for those bargains, and as members of TPCUG, you would be assisting in raising much needed revenues, as the group would receive 10% for the treasury.

TPCUG would assume no obligation whatsoever with respect to any consigned material. Material left unclaimed, or unsold material that is donated will be disposed of for the benefit of TPCUG.

Dedicated individuals, interested in volunteering for this project, please contact Marylee or Harvey Bruneau (985-3338) for additional information and for a list of others coming forth to assist you on a committee for this exciting, profitable event.

USER'S CORNER

Horror Story. This unidentified gentleman had a 486 and was pleased that it's performance was better than his old 286 computer. One day he was messing around and noticed a button marked "turbo" and pressed it wondering what would happen. Well, that PC took off like rain in a hurricane. Now he is really pleased!

... Anonymous

Horror Story II. Another unidentified gentleman had a bunch of files on his PC at home. He'd used PKZIP before but had never looked at the full help screen that it provides. This time he did and noted that it would do just what he wanted. So he ZIPped the directory, all the subdirectories (even empty ones), and all the files; set the flag to Move and Erase old files; and all this with just one command. And he was proud!

Then he proceeded to unzip some files. Big problem - no unzip program. It was inside the ZIP file, had been erased, and he had no other copy at home. Nowhere. Oh sure, he had the original copy at the office, but,...

... Anonymous II

WordPerfect for DOS Ver 6. Use the Look option (3) in File Manager to view .WPG files. You can also view .PCX, CGM, etc., files. It's quick and shows the full graphic. No more having to import the file and using the View module as you did in version 5.1. And in V6, you can Retrieve a graphic without first creating a graphic box. Use the same Look option to play MIDI (Musical Instrument Digital Interface) or .WAV waveform) files if you have a sound board in your computer. Be sure that WP is configured for the sound board.

With version 6.0a of WP, I had problems with the sound module. The MIDI files played okay but the "progress bar" didn't work. When the waveform files played, the progress bar worked but you couldn't play the file again; you had to reload the sound player module (just Look at a text file then Look at another wave file).

Tribune Trouble. For many moons I have been sending a request that a notice of our meeting be published. If everything goes right, it appears in the Monday edition, in the Agenda column of the Business section. Well..., the person whom I had been contacting has moved on to a better job within Mother Trib. And somewhere between my mail box and theirs, it seems that the February notice got lost. *Sorry, folks; stuff happens.*

Windows 3.1:

- Title Bar. Once in a while, you will move a window beyond the top of the screen and then can't grab it. Just press <Alt>-<space><m> and then the DnAr key until the title bar moves down to where you can retrieve it.
- Video Drivers. You changed to another video driver, restarted Windows, and now you've got garbage or a blank screen. Bummer. Because now you can't change back to the old (and good) driver from inside Windows! But there is an easy way to fix this. At the DOS command line, log onto the Windows directory and type: SETUP /L. This will bring up the DOS version of Window's setup program and let's you reinstall your old driver.
- New Settings. You can click the "Save Settings on Exit" so that the current settings will be in effect the next time you fire up. Problem is that you forget to turn off the Save Settings when you exit and you've messed up your setup. Next time, click the Save option, then hold down the Shift key while you click Exit. Windows does it's thing about saving the new setup but does not exit! Now click off the Save option and you'll be all set the next time you run Windows.

—- Ed Buzza

MEMBERS HELP-LINE

The following phone list is provided for our **Tampa PC Users Group** members in an effort to establish local support for those frustrating times which we have all encountered while using our PC's. Please note that these are members that have volunteered to help you, treat them in a courteous manner. Be sure to ask if it is convenient for them to help you now, or if you should call another time. It would also be helpful to have your documentation and have it handy when you call. *(Don't expect help if your software is an illegal copy or you do not have documentation!)* **TPCUG** is not responsible for the information or advice provided by volunteers. Volunteers may or may not be experts in the subject matter. You are on your own with any advice received. Be aware also that some of these volunteers may be consultants in their area of expertise. If you are interested in volunteering to answer members questions, either leave a message on the BBS or fill in the forms provided for this purpose at the meetings.

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII file or in a commonly available word processor format, such as WordPerfect 5.2, or Ami Pro 3.0 on diskette to the editor at 9402 Hidden Ridge Place, Tampa, Florida 33637 or send it by modem to BBS (813)239-3704.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

Commercial advertisements will be accepted at the following rates:

	1 month	3 months	6 months
Full Page	$60.00	$162.00	288.00
Half Page	$40.00	$108.00	$192.00
Quarter Page	$22.00	$60.00	$106.00
Eight Page	$12.00	$33.00	$58.00
Business Card	$10.00	$27.00	$48.00

All advertisements must be prepaid by check payable to TPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if it is not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, Marylee Bruneau at (813) 985-3338, for space availability and for further information.

This newsletter is created with Ami Pro for Windows from Lotus Corp. and Corel Draw from Corel systems.

Secretary's Report

MINUTES OF 3/9/94 MEETING
and PERSONAL COMMENTS
By: Jim Clark

This was our second meeting in our new quarters at the Ybor City campus of the HCC. Things went more smoothly this time and it was a very good meeting. Actually, it was an excellent meeting, with a "Biggie" vendor presentation -- CorelDRAW 4.0. Our facilities are quite flexible now and we have the space to setup for different size crowds. Hence, CorelDRAW was not a 'standing room only' session as they had been in our IBM facilities. For those who haven't been out to the Ybor City site, you should certainly do so. The location is easy to find and very accessible from the interstate.

Your Board of Directors has not yet found a solution to our pressing need for a 486 computer and a color panel for our meetings, but we have managed very well so far -- borrowing at the first meeting here, and Corel have their own equipment, as do most of the larger vendors. But we can't rely on that -- Anyone have a spare 486/33 and/or color panel they don't need and can donate to the group??

USER GROUP NEWS

Special Interest Groups (SIGs): John Lucas is organizing an OS/2 SIG. It should get started in the very near future. Meetings will be held at the IBM building from which we just moved. Look for more info on the BBS and newsletters.

Phillip Ficarota has volunteered to organize a CorelDRAW SIG if there is sufficient interest. Decisions about time and place have not yet been made. If you are interested in participating in this SIG, please get word to one of the User Group officers or Phil -- via the BBS or any other way, but the sooner the better.

INDUSTRY NEWS

Microsoft/Stacker Conflict: - The courts have rendered a decision in the disagreement between these software leaders. Stacker has been awarded some $120 or so million from MS, while MS has been awarded about $12 million as result of their countersuit. And, MS is refrained from using the technology that the suit was all about. Hence, MS will soon be coming out with MS-DOS 6.21 which will have a version of DoubleSpace that is minus the 'borrowed' technology, and presumably it is now illegal to use the DoubleSpace version in MS-DOS 6.2.

Stacker/MS Windows for WorkGroups Incompatibility: Stacker 4.0 is not compatible with the recently released MS Windows for WorkGroups 3.11. Stacker is working on a fix which you might expect in the not-too-distant future. Meanwhile, be aware.

DX4s Coming Soon: Word is that the new 486DX4s (75 and 100 MHz 486s) will be coming out in the near future. as we have previously reported, they are only minimally slower than the pentiums and are a good bit cheaper in price. If nothing else, they will likely produce continuing downward pressure on prices. Then, too, how fast is fast?

(Continued on page 3)

(Continued from page 2)

Superbase Becoming History: Software, Inc., has announced that they are dropping their Superbase database program from their product line. I personally hate to see that happen because Superbase is a super database program; the competition and pricing are apparently overpowering it.

Dell Show Big $$ Loss: Dell Computer's recent financial statement shows a loss of $40 million on sales of $2.9 billion. We report this not to imply that Dell is in financial trouble. Rather, we can all expect some changes to be made at Dell, for they won't long stand for those kinds of losses. Pricing action is forcing all to cut their costs and/or improve productivity and efficiency.

PRESENTATION -- CorelDRAW 4.0 The Corel Corporation was good enough to allow their Product Specialist, Antonio Sanchez, to visit with us and give a presentation of their newest release of CorelDRAW, Ver. 4.0. As has been reported before in this space, CorelDRAW is a very powerful program and one could not hope to demonstrate more than a small portion of its capabilities in the time available at our meetings. So, Antonio elected to highlight the differences between versions 3.0 and 4.0 -- and those that we saw are significant. Actually there have been many changes. Here are just a few:

Powerline: A capability has been added to take any line(s) you might want to draw and convert that line(s) into a wide variety (like hundreds) of designs, including ribbon, trumpet, wedge, teardrop and woodcut shapes.

➔ Creative Bitmap Editing: Allows creating startling combinations of graphic images with special effects and animation.

➔ Scanning Support: Advanced direct scanning has been added, including a powerful OCR.

➔ New Fills & Graphics: With added fills, CorelDRAW now includes over 1.2 million. The clipart library has also been increased from 14,000 to 18,000.

➔ Welding of text and graphics is now provided and eliminates a problem that existed with earlier versions when text and graphics overlaid.

➔ Animation capability has been greatly enhanced and can produce really impressive results.

➔ Blending capability has also been enhanced and gives the power to blend literally any object to any other with user-defined sequencing.

➔ Powerful animation of graphics in MOVE has been further enhanced, and includes 125 CorelMOVE animation's and 420 cartoons.

➔ The word processor has also been enhanced.

➔ Now supports 99 levels of undo.

➔ News to me is that CorelDRAW has a comprehensive DTP capability. Imagine creating a flyer, newsletter or other similar publication with the graphic and text manipulation capabilities of CorelDRAW. WOW!!

CorelDRAW 4.0 comes on 11 - 3.5 " HD floppies and a CD. The program itself takes 37 MB of hard disk space when fully loaded, but the user has the option of selecting out any portions of the program not needed. The CD contains the 18,000 graphics and 750 fonts included with CorelDRAW 4.0. One needs an IBM-compatible 386 or better machine for the program, Windows 3.1, 4 MB Ram (8 recommended), a mouse or tablet, and a VIA or better resolution monitor. Cost is $595 MSRP ($249 upgrade) and about $399 street. Companion to CorelDRAW are several Photo CD Collections, each containing 100 beautiful pictures with a common theme, which list for $49.95 Each.

Antonio reports that CorelDRAW 5.0 is to be released on 20 May, which will provide further improvement in an already very, very powerful program. We can all recall Ventura Publisher. Well, Corel now owns that program and a greatly enhanced and improved version of that program will be bundled with CorelDRAW 5.0. Seems like a great combination to me.

Antonio and Corel, THANKS MUCH for a super presentation of your very impressive program, CorelDRAW; it is truly an amazing program. Antonio did a bang-up job of showing many of its new features.

AND THE WINNER IS Thanks to the generosity of Corel Corporation, who donated all of the door prizes, there were some very nice door prizes. Those among us to have the good fortune to win are:

M. N. Marteny	Photo CD
M.J. Ciccavello	Photo CD
Larry Anders	Photo CD
Steven Atran	Photo CD
T. Goff	Photo CD
Jeff Jenkins	Corel SCSI
Bill LaForest	CorelDRAW 4.0

In addition, five members were lucky winners of a Corel Mouse Pad.

The meeting adjourned at about 8:35 PM.

WELCOME NEW MEMBERS!

Maria Jo Ciccarello
Ben Corvette
Tom Goff
Sherry Jackson
Jeff Jenkins
Ray Mickiewicz
Tom Reilly
Michael Smith
Dave Wyler

WE ARE HAPPY TO HAVE YOU IN OUR GROUP!

☺☺☺☺☺

PRESIDENT'S COLUMN:

Let me begin by apologizing for the late arrival of the newsletter. As parents, Marylee and I got caught up in the marriage process of her son, my step-son, David. For those of you who only have one child I am sure that you understand the once in a lifetime experience of this event and ceremony and where the priorities are when it relates to family. Over 100 relatives and friends from around the country came to partake in the joyous occasion at Lowry Park Zoo. Let me add that while we did not get the newsletter out on time I did get David signed up as a member.

With that said I would like to inform everyone that we will be starting an OS/2 and Corel SIG (special interest group) very shortly. The OS/2 SIG will be chaired by John K. Lucas. John is a current member of both our group and the IBM OS/2 group. He is a Sr. Systems Programmer for H. Lee Moffit Cancer Center & Research Institute and has wanted to be part of an OS/2 SIG group for a long time. Initials plans indicate that the monthly meeting will take place on Tuesday evenings of the fourth week at our old meeting place, IBM. If you are interested please contact John at home (voice) 948-7621 or FAX 949-4749.

The Corel SIG group will be chaired by Philip Ficarrotta, also a current member of our group and Corel user. The audience for this group will be for beginning to intermediate Corel users. Initial plans indicate that the meetings will take place at the Dale Mabry HCC campus. At this time a date has not been selected. If you are interested in participating with this SIG please contact Phillip at 879-2780.

In this newsletter you will find a survey. The board has elected to create the survey in order that we can measure the needs of the group and determine the hardware and software representation that make it up. As of the April general meeting the survey will be given to new and renewal members.

Even after my comments of being careful and limiting movement during the general meeting when the lights are out, I saw members tripping on the steps. I found it odd that more people tripped when the lights were on than off. For your safety please be careful when walking around the Ybor room.

We need a logo for our group. With all the talent in our group we should be able to come up with a logo that represents us. Get those art programs loaded and start the left part of your brain. Submit the art, in any IBM PC compatible format (TIF, PCX , CDR ....) to the Editor, Marylee Bruneau through the bbs or mail. The address can be found on the inside cover of the newsletter. Logos submitted must be unique and not violate any copyright laws. The selected logo will be the sole property of the Tampa PC Users Group. Logos submitted will not be returned. A T-shirt, hat and Tote bag goes to the artist of the selected logo.

Last months newsletter was done in MS Publisher and required an effort to get it out the door. Marylee started this months newsletter with MS Publisher only to go back to AmiPro from Lotus Corp. While some members within our group like MS publisher, Marylee and I feel that we must leave it behind for a better tool. The lack of a good layering technique, negative results with OLE, General Protection Faults and a slow screen refresh has left us wanting for something else. MS Publisher with all its Wizards is good if you publish the Microsoft way, but if you are from the Burger King generation where you get it your way, then you may want to look at some other product. Pagemaker is starting to sound good. Of course it cost somewhat more than the $84 of MS publisher.

In the March newsletter, I mentioned having a swap meet of some type to unload all that old computer stuff that is sitting around our homes and offices going to waste. To my dismay and that of the board I did not even get one nibble of interest. Is a Flea Market or Garage Sale more enticing?

We need new members. Surely most of you know someone that has a computer but is not a member of our group. Bring them to a meeting and let them experience what a user group is about. We can help them and they can help us.

Harvey Bruneau

Misplaced Humor: Signs of Our Times

Here are some signs and notices written in English that were discovered throughout the world. You have to give the writers an "E" for Effort.

In a Tokyo Hotel: Is forbidden to steal hotel towels please. If you are not a person to do such thing please not to read notice.

In a Bucharest hotel lobby: The lift is being fixed for the next day. During that time we regret that you will be unbearable.

In a Liepzig elevator: Do not enter the lift backwards, and only when lit up.

In a Belgrade hotel elevator: To move the cabin, push button for wishing floor. If the cabin should enter more persons, each one should press a number of wishing floor. Driving is then going alphabetically by national order.

In a Paris Hotel elevator: Please leave your values at the front desk.

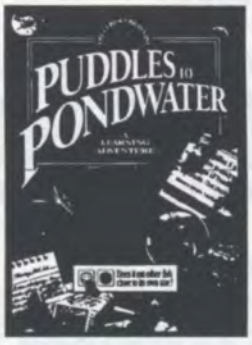
In a hotel in Athens: Visitors are expected to complain at the office between the hours of 9 and 11 a.m. daily.

In a Yugoslavian hotel: The flattening of underwear with pleasure is the job of the chambermaid.

In a Japanese hotel: You are invited to take advantage of the chambermaid.

In the lobby of a Moscow hotel across from a Russian Orthodox monastery: You are welcome to visit the cemetery where famous Russian and Soviet composers, artists, and writers are buried daily except Thursday.

In an Austrian hotel catering to skiers: Not to perambulate the corridors in the hours of repose in the boots of ascension.



Partial reprint,, thanks to the 12/93 KCA Computer Group Newsletter. Look for more in next months B.O.B.

Software Review:

Puddles to Pondwater

from Niad Corp.

By: David Burch, Tampa PC Users Group, Inc.

The set up for Puddles to Pondwater is very simple. I followed the instructions and didn't run into any problems. The program requires at least a 286 system with 4.0 MB hard disk space, 640 K RAM and a mouse. Puddles to Pondwater runs in DOS.

Puddles to Pondwater is an excellent environmental education game. It includes detailed descriptions and information of over 100 animals from six continents. It allows the user to learn about several common pollutants and their effects on the environment. The information is authentic, detailed, and interesting.

Starting as a Junior field biologist you attempt to work your way up the ranks to the Worldwide Chief of Operations. Advancing is no easy task. Working from a base station known as the Bio-Ark you have a number of tools on hand. There is an Aquarium/Terrarium complex that stores the animals you correctly identify. There is also a classification center and a classification key. The combined use of these tools makes identification of the animals found on various continents possible. By searching the water and land and identifying animals, you increase your chances of being invited to another continent in order to solve their pollution problems. Being invited to other continents gives you access to their animals to increase the collection in your Aquarium/Terrarium complex. Every so often you are asked to take a test to advance in rank. If you answer five of the ten questions properly you will be advanced to the next rank. Solving these problems teaches the user about some common pollutant problems our world faces every day.

This game format allows an excellent learning experience for all. Although the box is not marked I would suggest the minimum age be 8 years. The major problem I ran into was in the identification of the animals. Sometimes the animal information was inadequate for identifying the animal. The problem came with questions concerning animal coloration. The only references for coloration questions were in the graphic image of the animal in question. A few times these graphics were not adequate to answer. For example a question might be asked about the color of the animals belly when the belly was not clearly visible. A few times I was only able to identify the animal by guessing. Besides this minor problem which only occurred in a few occasions, the classification key method allows the user to learn a commonly used biological method for identifying animals.

Puddles to Pondwater has some excellent credentials. Written by educators specifically for school age children, a previous version of PTP is used in over 4000 schools according to the literature. PTP offers an excellent background for basic biological and ecological principles. As humans and animals on this planet we are dependent on our environment to survive. Our present situation places our planet's environment dependent on our near future actions. This makes environmental education very important especially that of children.

Manufacturer's suggested list price $59.95 USD

Software Review:

ANDREW Tobias' TAX CUT for windows.....headstart edition

By: Nicholas Klak
Tampa PC Users Group, Inc.

Andrew Tobias and financial software seem to go together. This package from MCAA software is a continuation of several years of programs in the tax software business. If you have looked at some of the reviews in computer magazines this year, you will find this package highly rated. That makes this review harder to do.

I found the program overpriced, and cumbersome to use. Part of the problem was in the "head start edition." A headstart edition is one that is available about the first of the year. All the tax preparing software companies put one out. These packages are not written with some of the last minute changes which congress usually enacts. They do not print out usable forms for submission to the I.R.S.. The final edition is available later at a reduced price, providing you have saved the appropriate coupon or sent in your registration card. Sad to say I have been sloppy in doing that sort of thing with my software. The price of this package is about $39.95 at Super City and Comp. USA. The smaller the store the higher these packages sell for. This is a competitive price with its rival program, Turbo Tax. I was disappointed to read that the final edition could be had for an additional $29.95. What a rip-off. Why buy a headstart edition? My advice is to wait for the final edition of any tax package. Don't waste your time on outdated and non printable forms.

Tax Cut took seven megs of memory to install. The procedure was typical of a windows installation and executed flawlessly. The program supports the importation of TXF. files . This is an agreed upon file format by most of the software makers of financial software. Data can be entered from Quicken, Microsoft Money, CA-Simply Money and many others. This is an asset that is now shared by almost all of the financial programs on the market. Tobias's program uses a "navigator" to guide you around the various parts of the program. I found it to be too simple in its approach. If you have ever filled out some tax form you expect items to be in a logical order. All tax forms begin the same way. You expect that certain items will follow others. All 1040 type forms ask for name, address, and city. No big deal. This navigator made a five minute job of inputting you address. Wages from a W2 are the first money figures on all tax forms. This is followed by the interest income from banks. I had to look for an input area to put in bank interest income. I found it under investments. When one wishes to input information, an on screen help area is displayed. That is helpful, however the layout of the help is confusing. The middle of the screen has some dialog which asks a question. "Do you wish one dollar to go to the presidential campaign fund?" Some help for the question would be across the top of the screen and some more help was on the bottom. I found that to be disconcerting. I was always looking at all the page to see if I left anything out. I knew what I wanted to do and wanted to just move on. By the way the amount is Three dollars in the final edition.

Andrew Tobias" Tax Cut would not be my first choice for a tax program. Well then what would one do? Price is always a consideration. Especially when you may not be set on a specific program or are experimenting with your computer as a useful tool.

I recently purchased Parson's Tax Edge at Super City for $14.95, in its final edition. It also uses the "navigator" as its guiding you through its package. While not reviewed here I feel compelled to pass on an alternative. Parsons tax program was much more to my liking. If you still need a tax package, Parsons Tax Edge for windows is recommended.

Editorial Comment:
We apologize for not including this article in last month's newsletter, as it may have been of some help to those members filing last minute returns and trying to decide on a tax software package

Software Review:

Spanish Scholar for Windows
The two way translator & thesaurus for Windows Version 2.0

By: Beatriz and Mark Saunders,
Tampa PC Users Group Inc.

This program is advertised as a two-way English to Spanish translator, with dictionary and thesaurus.

Requirements:

Spanish scholar is a Windows 3.1 application and the minimum requirements for installation are an 80386SX PC or better, MS DOS 3.1 or higher , a VGA video adapter and monitor, and 2Mb of RAM memory. My installation used 5.9 Mb of hard drive space. The program comes on three high density (3.5") diskettes. The package contained a coupon to exchange the 3.5" diskettes for the 5.25" size.

Installation:

The installation uses the standard Windows 3.1 method with a few differences. The program asks the user if they want the installation prompts and instructions in English or Spanish. If the spanish interface is chosen for the install then Spanish becomes the default interface language for the program's operation. The install program uses a version of the Install Shield windows installation software that has attractive progress graphs and indicators.

I installed the software on a 386DX33 machine with 8 MB Ram and a super VGA card (the target machine for this review) and a Compaq 486 DX266 Eisa with Compaq Qvision Super VGA and experienced no installation or operational errors during the testing. At one point I did get a number of General Protection Faults while simultaneously running

(Continued on Page 7)

(Continued from Page 6)
Microsoft Excel for Windows 4.0. Leaving windows and re-starting seemed to fix the problem.

Spanish Scholar provides interfaces (macros) for the popular packages of WordPerfect, Microsoft Word, Lotus Ami Pro, and Microsoft Excel. With the Microsoft products when the macro is executed a Spanish Scholar menu option is placed in the menu bar. For Word Perfect the option is placed under the Macro Menu. I was not able to test using Ami Pro.This capability provides an easy way to start Spanish Scholar from inside the host word processor.

On-Line Help:
The Windows on-line help provided with the software is available in either English or Spanish. Included in this help are fairly complete rules for conjugating verbs, genderizing phrases, and setting the formality of written text. It was quite interesting to review a topic in English and then switch the help to Spanish and try to follow it.

Operation:
The program provides a clean half-screen interface with menus for File, Edit, Words and Help. The Words menu has a translate option that opens a second screen with a split text entry window. Below the menu is a button bar with choices for English or Spanish interface, translation direction, printer setup and word search.

In its default mode the program is setup to translate individual words. A text box is provided where the English or Spanish word can be entered and then by pressing a button the translated word and its part of speech is displayed. If the word can have multiple meanings then all of the meanings that can be found are displayed. The display of multiple meanings is a menu option.

Once a word has been translated a menu option is available to "Conjugate Verbs" which upon selection provides a screen showing samples of the word in phrases depending on the present or past indicative, and the singular or plural usage. This is very handy for academic study or for a person actively trying to learn the new language.

A second mode is document translation. For this a second screen opens with a vertically split text editing window. The Spanish Scholar manual claims this window can have up to twenty different buffers open at the same time. The size of these buffers will be small if you chose to do this because from my experience if the buffer is more than 4 to 5 KB the editing window will not accept any more text. What is useful here is the interface that is provided to popular word processors where paragraph or portions of the word processor document are copied into the Spanish Scholar window, translated, and the copied back to the original document. For this reason the buffer size limitation is not a problem provided the user has another Windows word processor installed.

The editing window allows entry of basically unformatted text and which all appear to be bold. When the user is ready to translate the text in the window they only have to select the buttons for the direction of the translation, and the options to translate the entire document at once or word by word. There is a button on the button bar to start the translation.

If the user selects word by word the translator will perform this by displaying the original text highlighted in the upper text window and the translated text in the bottom window. If a word to be translated has multiple or ambiguous meanings then the first screen with the word search will be displayed and the user can select the meaning they want. This is assisted by the on-line help which contains a detailed grammar reference and a verb conjugation screen which provides example usages.

If a translation is set up and the user opts to have the Spanish Scholar translate the entire document the end result can be pretty poor. In this mode if a word is found that multiple meanings the user is not prompted and the first meaning found is replaced into the translated text. Also the translator portion of the software will not touch words it cannot find and there is no ability to add words to the dictionaries. Because of the these problems the translation suffers and ends being a mix of Spanish and English words that do not make a great deal of sense. For business use or communicating with persons whom the writer is not well acquainted I would avoid using this mode.

I tested the document translation with a number of different styles documents ranging from personal letters to technical articles (one of which was a Windows Readme file) to news text copied from Prodigy. What I was looking for was a certain target style of document that the program could translate and I found that personal letters probably translated the best although some of them ended up sounding pretty funny. What was also curious was to translate a file into Spanish and the re-translate the translation back into English. The result would end up pretty different from the original

Personal View:
Spanish scholar's utility is in it's powerful on-line help and ability to provide translations of individual words or short phrases. For a student of Spanish or a Spanish speaking person learning English I feel it could be a helpful tool. But For heavy duty document translation it falls pretty flat unless the user selects the single word translation mode. Even in this mode the context of phrases can be lost and the resulting translation inaccurate unless the user has a fair knowledge of both languages. A feature missing in Spanish Scholar for language students is that competing translation/teaching programs are using multimedia to actually pronounce the word or phrase with a native speaker's tone and inflection. This can be an invaluable aid but probably would require the Spanish Scholar to be delivered on many diskettes or on CD, something not currently available. Overall I feel that Spanish Scholar is a useful program.
Road Scholar Software 1-800--243-7623-ext 720

The Tampa PC Users Group Library of Files

The file library for the Tampa PC Users Group is a selection of files, hand picked and tested by the club librarian. Our library prides itself on **QUALITY - NOT QUANTITY!** The library is stored on 3.5 , high density diskettes, and is usually available at every general users group

1. You must bring your own formatted diskette.

2. If you bring your own PC to the meeting you may copy files to your hearts content, under the supervision of the librarian.

3. If the librarians own PC is used, the librarian will make the copies for you. Please be reasonable and limit the number of files to be copied. Remember... the librarian is a member too and is interested in the presentation for the evening.

4. There is always a list of the files in the library provided in booklet form at the meetings for you to look at and choose from. This list is also available in ASCII text format for you to copy onto your own diskette, to take home. This same text file is updated regularly and uploaded to the clubs Bits of Blue BBS for downloading.

5. If you have been unable to attend a general meeting and need a file, just leave a message on the BBS for Larry Anders and the file will be uploaded as soon as possible.

NOTE: If there is a special file you are looking for or are interested in, ask the librarian. The Tampa PC Users Group is a member of the Association of Shareware Pro-fessionals and receives a CDROM each month full of the latest Shareware releases.

THE FILE LIBRARY IS A PRIVILEGE FOR CLUB MEMBERS IN GOOD STANDING. PLEASE DONT ABUSE THIS PRIVILEGE!

MEMBERS HELP-LINE

The following phone list is provided for our **Tampa PC Users Group** members in an effort to establish local support for those frustrating times which we have all encountered while using our PC's. Please note that these are members that have volunteered to help you, treat them in a courteous manner. Be sure to ask if it is convenient for them to help you now, or if you should call another time. It would also be helpful to have your documentation and have it handy when you call. *(Don't expect help if your software is an illegal copy or you do not have documentation!)* **TPCUG** is not responsible for the information or advice provided by volunteers. Volunteers may or may not be experts in the subject matter. You are on your own with any advice received. Be aware also that some of these volunteers may be consultants in their area of expertise. If you are interested in volunteering to answer members questions, either leave a message on the BBS or fill in the forms provided for this purpose at the meetings.

Software Review
WordPerfect Presentations, Version 2.0

By: Renate Marsh, Tampa PC Users Group, Inc.

This is a very comprehensive presentations graphics program that will give your slide shows the professional layout and look you always wanted. I am working with this program for the last 2 months and I am still at awe to see it work. I have to emphasize "to see it work" because I don't feel that I do much work at all to create a slide show with

WordPerfect Presentations.

This program comes with a great collection of Slide Show Masters (I counted them: 65!), and each Master contains a sub-group of master templates. The templates of the Masters show a similar background, but are set up individually for different types of information. There are bullet charts, organizational charts, Title page, Text page, Data Chart, and quite a few more to be able to put together one of the best slide shows possible. You use only one or two Masters in one show to give your presentation consistency, but the sub-templates can be used in any variety or repeatedly within that one show.

Every template saves me the trouble to create my own background, title, sub-title, charts, or data. Once I have planned my slide show, all that needs to be done to choose my templates and enter my text and data. WordPerfect Presentation has already done my formatting and setups. Now if I feel very adventurous and creative, I can start a slide show from scratch. The programs features and tools are right at my fingertips and so plentiful that my imagination can have a field day. Help is everywhere. Besides Help-on-Line and the Help menu, there is a Tutorial and a Quick Tutor (for people in a hurry)which can teach you in 30 seconds to 3 minutes how to complete a task. There is Context- sensitive help, which means you can get help at the very moment you are using a specific feature.

My most favored features are the Button Bars. They can be visible set up on screen in different positions to be used. Buttons are like macros (automation of an action or feature) only much easier since you do not need to remember a macro name or letter. Though, you definitely need to use a mouse to activate or create your button bars. Once you have set up your buttons all you have to do is click on them to get any kind of features or action - truly with just a click on your mouse. I created a special button bar just for my slide show function and I believe within 20 minutes I can have a very professional, presentable slide show. I created a slide show for this review out of the Tutorial manual which gives you step by step instructions on how to set up a slide show. Then I converted each slide into a WordPerfect graphic, entered my WordPerfect word processor and started to write this review and included all 7 slides of my show for you to see. Converting, importing, and exporting is a simple matter of choosing what kind of file and for what application you want to use your slides or pictures. Not to forget: since I was able to have my slides in thumbnail format all at once on the screen, I could move them around at will; slide no. 3 became no. 5. Two slides I created just for fun, I could delete again and add another one on to it. The flexibility and ease of this program has not stopped yet to amaze me. It is actually fun to create a slide show - wish I could do this as a job assignment all the time.

WordPerfect Presentations comes with a Shared Application program. This can save you quite some space on the hard drive, but you have many features of WordPerfect programs available in all programs. Since this WordPerfect Presentation is for Windows, the shared application include File Manager, QuickFinder, Speller, Thesaurus, Graphic Conversion, Language Module, Hyphen Utility, Macro Facility, Macro Command Inserter, and Printer Programs. You also can order additional WPCorp products for Windows to include in your Shared Application. Files that take up a lot of space and memory are only installed once to be used by all.

WordPerfect Presentation also comes with its own drawing program for you to create your own slides. To enhance your slides even more, you are able to include sound clips, but your sound hardware must be installed and set up correctly in Windows. Also, you can create speaker notes which will then accompany each slide in your show, and they also can be printed and used as cue cards. The possibilities are endless.

System requirements: A 386 or higher CPU; 2MB memory (4MB recommended); a hard disk with at least 17M of free disk space; a graphic adapter and monitor supporting EGA, VGA or higher graphic cards; DOS 3.1 or higher; Windows 3.1 or higher, a mouse. You have a choice of custom installation eliminate some files to gain space or place your graphic files on floppy disks. Though, the operation of the program will be much slower if you have to get files from the floppy disk.

To emphasize again, WordPerfect Presentations will do most of the work for you when you create a slide show presentation, but it also gives you the opportunity (with a lot of help from the program) to create your own slides, using the drawing program to import images like your logo. It is a very powerful program, especially since it will share major files with other WPCorp. products and therefore saves space and is speedy.

Wordperfect Corp., 1555 N. Technology Way, Orem, Utah 84057 (801) 228-5004 Suggested Retail Price $395.00

FIDONET

By: Kief S. Morris East Tennessee, PCUG - PC Register

If you've called very many BBS's, you've probably run across those boards that demand that you press the escape key before the BBS presents you with a prompt for your name. You may have noticed that these boards have message areas that get hundreds of messages a day, most of whom aren't even posted by people who call that board. How the heck do they do that? What all does this Fidonet thing offer to BBS's and their users?

Fidonet is the hobby BBS's answer to Internet. Over 20,000 sysops worldwide have joined into the network to become part of this international community. For users of a Fidonet BBS, the network offers communication with other users around the country and worldwide, allowing them to get the latest word on new products, and help in using them. Increasingly, Fidonet boards are using the system to offer their callers more and more benefits, including getting the latest shareware files through automatic distribution, and even Usenet Newsgroups and Internet E-Mail.

The Origins of FIDONET

Fidonet's humble beginnings came with Tom Jennings, the San Francisco author of the Fido BBS software. Wanting to exchange messages with a friend helping test the program in Baltimore,

Tom built in a feature that would let them automatically send messages back and forth. Thus, netmail was born.

How Does The Dang Thing Work?

The key to a Fidonet BBS is it's "Front-End Mailer", or Mailer. This program runs when there is no activity on the BBS. When a call comes in, the mailer determines if it is another mailer or a human caller - if it's a human caller, who announces his nature by pounding on the escape key, the mailer turns over the reigns to the BBS program.

If it's another BBS's mailer, the two exchange identification, and then exchange any mail or files they have intended for the other BBS. The mailer is also set up with a schedule for when to call out to deliver mail, or to "poll" another board to see if there is mail waiting.

What Kind Of Stuff Do They Transfer?

The basic element of Fido communication is Netmail, a person to person message used extensively by sysops. It's a more or less private E-Mail message. Netmail was the sole reason for Fidonet in the beginning, but what really opened the net up was Echomail - away for different BBS's to share public message areas.

When a user calls a local BBS and enters a message in a Fidonet conference, the message is exported from the BBS message base and packaged up for delivery to other BBS's. The program that does this is an "Echomail Processor". The next time the board's mailer connects to the mailer of the BBS with which it trades mail, the message will be passed on. The next BBS enters the message into its own message base, for its users to see, and also passes it on down the road to other boards.

Through this method, messages you post in the Fidonet "Windows" confer ence on one board are seen within days on every other Fidonet board that echoes that particular conference. Likewise, you see messages posted on other boards and can reply to them.

Currently there are 480 different message area topics on the oMcial Fidonet distribution system (the "Backbone"), ranging from "Abled", the disabled users' information exchange, to "Zymurgy", for discussion of beer home brewing.

How Do They Organize Ouer 20,000 BBS's?

Not easily! The largest organization level is the "Zone", which generally comprises a continent. These are:

ZONE	AREA
1	North America
2	Europe
3	Pacific (Australia, etc)
4	South America
5	Africa
6	Asia

Below this level are Regions, which are comprised of nations or portions of a large nation. Tennessee is a part of Region 18, which includes the Southeast US and the Carribean. Nets are local organizations of Fidonet BBS's. Their geographical size depends on the concentration of BBS's in an area. In Tennessee we have 8 Nets:

NET	NET NAME
116	Middle Tennessee
123	Mid-South Net
362	Chatta-Net
3615	Tennessee Valley Net
3621	Clarksville
3627	Cumberland Area
3642	Upper East Tennessee
3643	Rural SE Tennessee

Each BBS in Fidonet is referred to as a "Node" (although a BBS with more than one line my have more than one node),

(Continued on page 11)

(Continued from page 10)
and has a node number. The Zone, Net, and Node numbers arestrung together to form a Fidonet Address. For example, a BBS in North America (Zone 1), in the Tennessee Valley Net (Net 3615), with the number 210 assigned to it within the net, would be "1:3615/210".

At the Net, Region, and Zone levels there are Coordinators responsible for their group. The Net Coordinator (NC) helps new nodes join Fidonet by issuing them a Fidonet address, and putting an entry for them into the local Net's part of the Nodelist. The Nodelist is a weekly directory of all Fidonet BBS's, used by mailers and other software to get the phone number and other info for other members of the network.

The Nodelist, although not structured for humans to read easily, is credited as the largest and most accurate BBS list in existence. This is because it is administered at each level of the or ganization. The Net Coordinators make sure each node in their net is active, and send updated weekly listings for the net to the Region level. The Regional Coordinator (RC) compiles these into the Regional section of the Nodelist and sends that to the Zone Coordinator (ZC). The six Zone lists are compiled by one of the ZC's into the full nodelist, which, as of the most recent list, is 1.7 Megabytes in size.

The Echomail Organization

All of those Coordinator positions were thought up to handle the original, netmail oriented Fidonet. As Echomail became bigger and bigger, a parallel structure came into play to handle it. In each local net there is a NEC (Net Echomail Coordinator), who may be assisted by Hubs. Each node calls a hub to get its echomail. The hub, in turn, calls a Regional Hub, which is administered by the REC, which in turn calls one of three Zone Hubs, also known as "Backbone Hubs". This organization as a whole is referred to as the "Back-bone", and runs all of the Echomail in Zone 1. There is no organized system for sharing echomail with other Zones, but many echoes are carried internationally anyways.

Still Growing!

Fidonet gets bigger every week, and is expanding in new directions. Just as echomail started as a new concept that grew to a major operation - in fact, the lifeblood of the network today - some- thing new has been becoming a larger and larger part of the Fidonet. File Distribution has been around for some time, but this past year has become organized and widespread.

File distribution is patterned after the echomail concept. If different BBS's can share messge areas, with all messages in each area sent to every other board that participates in that area, why not do the same thing with file areas? Unlike echomail areas, most File Distribution Areas (FDA's) can only have files entered from a limited number of locations. At these locations, new files are entered into the file area, and when a BBS set up to receive that area calls the first board, the files are automatically sent over, moved to the second board's download directories, and copied for that board's downlinks. Thus, the latest version of McAlee's Scan, a shareware virus detection program, can be distributed to hundreds of BBS's around the continent within a few days, requiring little or no itervention by the sysops.

This is a great boon to sysops, who can quickly build a large collection of recent, quality shareware. Users benefit as well, being able to find the latest shareware on local boards in a timely manner.

The file distribution system began vith the Shareware Distribution Network (SDN) and Shareware Distribution System (SDS), two closely related Organizations. The SDS and SDN were Generally restrictive about who could and couldn't participate in their distribution, but the software has advanced to the point where any Fidonet sysop an set it up. Thus, the old organizaions are giving way to a new, more reely available group called the Filebone. The Filebone patterns itself in ome ways after the Echomail "Back-one" system, letting any sysop with compatible software link in for easy, fast files

Playing Witb Tbe Big Boys - Internet And Usenet Via Fido

Gateways in many areas allow the Iterchange of Fidonet and Internet Communication. The Internet is a system that connects different nets, mainly large systems at universities, installations, and Corporations, to exchange mail and military and other government installations, and Corporations, to exchange mail and files. Usenet is a collection of message reas called newsgroups, which operate very much like Fidonet echomail, distributed via the Internet and other means.

Connecting to the Internet and Usenet is of growing interest to Fidonet systems. Those BBS's which have this connection can offer their users the Usenet Newsgroups, which are very active and interesting message areas. They can also offer Internet E-Mail, giving them a way to exchange person to person messages with practically anybody who has any interaction with computer networks. An Internet address is the closest thing to a universal E-Mail address there is - they can be used to communicate with individuals at universities, computer companies, newspapers, government, Fidonet, Compuserve, and more. Having this service available on your friendly neighborhood BBS can be very useful, not to mention economical.

Sounds Neat - Wbere Do I Sign Up?

If you have a modem, just call up one of your friendly neighborhood Fidonet boards. If you're a sysop, contact a local Fidonet board to get copies of a mailer and echomail processor for your BBS, and ask the sysop for advice on who to contact to get your Fidonet address. Then you're ready to join the international electronic community!

Secretary's Report

MINUTES OF 4/13/94 MEETING and PERSONAL COMMENTS

By: Jim Clark

A nice turnout for this meeting and everything seemed to go very well. There was a good bit of time for an open forum kind of interchange between members, along with presentations briefly reviewing a couple of very nice Abode programs -- one of which most of you will be using in the not-too-distant future: Adobe Acrobat and the Acrobat Readers.

USER GROUP NEWS

➪ **Membership Survey:** A membership survey form was created by the Board of Directors (BOD) recently for the purpose of gathering the information from the membership needed to help guide our future efforts and the allocation of some rather slim resources. The survey was handed out to those present, and was included in the newsletter for those not present. **All members are asked to complete the survey form as soon as practicable and return it to the BOD, or bring it to the next meeting. Your input is very important and will help your BOD a great deal in making the decisions that must be made in the near future.** The data will be held in strictest confidence and will only be used as statistical data.

➪ Special Interest Groups (SIGs): Preparation for SIGs on OS/2 and CorelDRAW are in their final stages of preparation and all preparations should be complete by the next general meeting. Both will likely be meeting not long after the next general meeting. It is therefore recommended that any members interested in participating in either of these SIGs be sure to attend the next general meeting. It appears that the OS/2 SIG will likely meet in the IBM facility, and the Corel SIG will likely meet at the Dale Mabry campus of the HCC.

INDUSTRY NEWS

➪ Merge Mania: Competition in the software world has led to what seems to be merger mania. In addition to the passing of Word Perfect, recent announcements include Adobe acquiring Aldus, Symantic buying Central Point, and Intuit buying Best Software. Whether the objectives of the companies involved will be achieved is yet to be seen. In the long term, however, this merger mania could have a negative effect on competition, but it would seem the mania has not yet approached that level.

➪ "Simply Tax" Refund For Some: As many know, Computer Associates, a big name in the main frame world for a long time, has been trying to make their name recognized in the PC world by marketing Simply Money and Simply Tax for only S & H charges. Those that acquired Simply Tax before the final version was available had to pay $9.95 for the early bird version, and then another $3.95 to get the final version. After receiving numerous complaints, Computer Associates has agreed to refund the $3.95 charge to those who request same in writing. So, if you want your $3.95 back you will have to contact Computer associates and request it.

(Continued on page 2)

(Continued from page 2)

➪ MS Maintenance Upgrades: Maintenance upgrades are now out for MS Word For Windows 6.0 and for MS Windows 3.1. The upgrades change the program designations to 6.0a and 3.11, respectively. No charge is involved and they are available form numerous electronic sources, in including the MS BBS and CompuServe. They are also available on our own Bits of Blue BBS as WORD60A.EXE and WW0981.EXE.

➪ Professional Write Upgrade: Harvey reported that Professional Write 3.0 is available to all present owners of Professional Write, or any competitive DOS word processor, for $65 from Professional Write.

➪ Win Fax PRO Upgrade: Version 4.0 upgrade to that program is available for $49 at 1-800-268-6082.

PRESENTATION -- Adobe

William C. Lindsay, South Eastern Account Manager for Adobe Corporation, generously agreed to give us a brief overview of two of Adobe products: Photoshop 2.5.1 and the Acrobat package. I say 'brief' overview because, although Bill spent a good amount of time accomplishing that end, the scope of the power and features of these programs makes anything short of a several hour review 'brief'. Bill proved to be a very able representative for Adobe and he gave an excellent presentation of both packages. I can't hope to cover, even briefly, all of the features Bill demonstrated, but here are a few:

Photoshop: Adobe says that Photoshop is "The world's leading photo design and production tool." I don't know whether that is accurate or not, but I do know that if there is anything you might want to do with an electronic photograph it would seem that Photoshop will do it very well and very fast. You can create your own, scan images into it, or import from a host of formats. Once in image (negative or positive) is in the program, it can be manipulated in just about any way you can imagine: Change the image to a negative or positive image; change colors (w/16 million available) of any part or all of the image; create duo-, tri- and quadtones; provides for simultaneous viewing of a range of color options applied to the image to aid in making choices; export and import all or any part of an image to other programs and/or as replacement/added components of an image; create any tint/hue changes desired; create and add in graphics created with the versatile and powerful built-in drawing tools; add in any text desired using the large selection of fonts included, or Windows fonts, and manipulate their size, shape, and color to your hearts content; etc., and then print out or export your finished product to any of a wide variety of formats, including that to create an actual film negative.

Photoshop is truly a very powerful program and can handle 40-50 MB images and includes excellent on-line help. It also includes 100 beautiful licensed images, covering a wide variety of subjects. It handles a large selection of file formats (import and export). Windows 3.1 (or later) is required, of course, and it will run on a 386, but a 486 with 8 MB RAM is recommended. The specific amount of disk space the program requires is unknown, but it is in the several MB range. But one needs a good bit of free disk space to accommodate images, especially when handling the 40-50 MB variety.

Photoshop is available for IBM-compatibles and Mac. It lists for $895, but is available for substantially less. One flyer from a retailer was available at the meeting listing an Adobe Photoshop/ Illustrator (also a high end program) package for $679.

Acrobat: Adobe Acrobat is actually a family of related programs, which includes Acrobat Exchange, Acrobat Distiller, Acrobat Reader, and Acrobat Starter Kit. Acrobat Exchange is the starting point. It converts many commonly used document formats into what is called a Portable Document Format (PDF). This common format then can be read by the other components of the Acrobat family. The components are available in DOS/Windows and Mac. Hence, once a file is converted to the common PDF format it can be read by any PC with a Reader, regardless of operating platform or other application software. "Big deal," you say, "I can do just about that much with ASCII format." The BIG difference is that acrobat retains all formatting of the document, including fonts, page layout, graphics, etc., literally all of the features of the original, so that what the reader shows on the screen and prints out to a printer, if desired, is exactly the same as the original document. The host computer need not have the fonts nor graphics used in the original document; Acrobat takes care of that. Acrobat, then, allows the interchange of documents between computers, overcoming the limitations of different hardware, operating systems and application software. Interestingly, in many cases the PDF file is substantially smaller than the application file from which the PDF was created.

Acrobat Exchange allows one to create, view, collate, annotate, manipulate and print PDF documents. Acrobat Reader allows viewing and printing any PDF document, and gives the ability to access any annotations, bookmarks and links that are a part of the PDF file. Acrobat Distiller converts postscript language files into PDF files. Acrobat Starter Kit is a 10-user license package of the Exchange and Distiller components, or everything a workgroup of 10 needs to use Acrobat.

For the DOS/Windows version, a 386 machine with at least 3 MB of hard disk space is needed. The street price for none of the components was available at the meeting. List price is: Exchange - $195; Distiller - $695; Reader - $50; and Starter Kit - $1,395.

Bill and Adobe, thank you very much for a super presentation. You have a couple of very powerful and useful programs in Photoshop and Reader. We will soon be distributing Readers to our members and then using Acrobat Exchange and the Readers to post our newsletter to our members electronically.

AND THE WINNER IS

Thanks to the generosity of Adobe Corporation, who donated all but one of the door prizes, there were some very nice door prizes. Those among us to have the good fortune to win are:

Don Simonds	Adobe Wild Type
Joe Crochet	Adobe Wild Type
E. Jurado	Adobe Type On Call
Mark Saunders	Adobe Type On Call
Mark Saunders	Almost Perfect Book

The meeting adjourned at about 8:35 PM.

PRESIDENT'S COLUMN

My article will be short this month.

Thanks to those of you who have filled in your surveys and returned them to us. In order for us to get a good understanding of the needs of the group we need as many of those surveys returned as possible.

It finally looks like the OS/2 SIG (Special Interest Group) group will be a reality. The first meeting is scheduled for 6 PM on May 26th on the fourth floor of the Lakepoint One building across from Tampa Bay Mall. IBM will furnish the space, computer and projection equipment. The SIG leader will be our own member, John Lucas. If you have not done so, contact John at (813) 948-7621 if you are interested. My sincere thanks to John for showing the continuous interest in forming and running this SIG over the last six months. Additionally, I want to thank IBM and Brad Brown for allowing us to use their resources, once again, for this SIG group. The space has been reserved for our OS/2 SIG group into the fourth quarter.

The Corel SIG group is still being organized and the forming of a Windows SIG group is in the early stages. Initial plans are to have these SIG groups meet at the HCC Dale Mabry campus.

During our last meeting, the Tampa Bay Computer Society formerly the Pinellas IBM PC User Group, asked, through one of our members, if we could provide access to our BBS for a worthy cause. The worthy cause is the placement of PCs with modems in the Spinal Injury Wards of the St. Pete VA Hospital. At the meeting I stated that I would bring the subject up at the next BOD (Board Of Directors) meeting. It was decided at the BOD meeting that, with only one phone line, our group did not have the resources to provide additional BBS access without impacting the BBS service of the existing membership.

We are currently looking to add a second hard disk to the BBS. If you can help us in obtaining a 400Mb or larger IDE drive call me at 985-3338. Donations or bartering are humbly accepted.

Our BBS may need a new home this year. If you have any suggestion contact me or any board member at the numbers list in this newsletter.

I look forward to seeing each of you at the May meeting.

.....Harvey Bruneau

Murphy's Law

Leakproof seals - will.
Self starters - will not.
Interchangeable parts - won't.
There is always one more bug.

Software Review: Q-DOS Collection

Review By: Jim Clark,
Tampa PC Users Group, Inc.

What It Is: Q-DOS Collection, by Gazelle Systems, Inc., is as the name implies, a collection of DOS utility-type programs. It includes 7 utilities: Q-DOS 3, a file and directory management utility; Back-It, a file backup utility; OPTune, a hard disk optimizer and defrag utility; PCscan, a virus detection and correction utility; Q-MENU, a DOS menu shell utility; FAST!, a disk caching alternative to SmartDrive, and other competitors; G-Edit, a text editor; and GZFormat, a floppy formatter. I call these utilities because of what they do and how they are used by most of us. Actually, they are independent programs that can be ran independently, with some directly accessible through Q-DOS 3, with the remainder accessible by selecting the executable file, and all of which can be directly accessible thru Q-MENU.

Q-DOS 3: Is a comprehensive file and directory management program that provides the capability to quickly and easily: View the directory structure of any drive, and the all files contained therein; copy or move files and/or directories (and any files/sub-directories therein) from and to any drive on your computer; erase files and/or directories, with a capability for unerase if a mistake is made -- provided it is accomplished before any writing to that disk occurs; prune and graft directories as desired within the current drive; make and rename directories, and rename files; view the contents of files, though only files containing text are intelligible; view and change attributes of any file; execute executable files; scan the current drive to pick up any changes make to files since logging on to the drive; display dual windows to permit comparing directory structures and /or files; find specific files on any drive; access via menu option OPTune, Back-It and QFormat Q-DOS Collection utilities.

Q-DOS 3 has a lot of utility as a file manager. It can be operated effectively from the keyboard, with a mouse, or any combination thereof. It is fast and accomplishes all of the above functions quickly. I am entrenched in using a different file manager, however, and initially navigating my way around Q-DOS 3 has been a bit cumbersome. One feature that I have been accustomed to which is not available in Q-DOS 3 is summary statistics on the drive selected -- like total number of files on the drive, total amount of space used and how much of that is wasted space, and other summary data which I find helpful from time to time. Some of the info -- total, used and free space -- is available, but you must select that as a menu item. The directory tree is blown up a bit too much so that it shows only 4 levels of directories on the screen at one time, including the root, and one cannot get a good perspective of the tree. I find myself scrolling vertically several screens and often horizontally as well to find the directory I have interest in. On the other hand, chasing down a directory in the file section is easy -- if you know where the

(Continued on page 5)

(Continued from page 4)

directory is located in the first place. I expect after more use I will become accustomed to Q-DOS 3 and find it easier to use. It is a very nice file manager, giving the user a lot of power at the controls.

Back-It 4: This is a full-feature backup utility that is also very fast and customizable. It will backup from a single file to as many hard drives as are installed in your computer. Once backed up, subsequent back up can be limited to only those files that have been changed. Backups can be set to occur automatically, with various options available, including three levels of verification, and modification of archiving flag. Three compression levels are also available: None, normal and super. Interestingly, Gazelle says that using super compression on more recent computers (higher MHz 286s and up) can actually be faster than normal compression; it is very fast on my 386DX/40. One can create up to 50 presets (backup plans) that can then be accomplished with a couple of clicks of the mouse.

The directory tree in Back-It looks the same as the tree in Q-DOS 3 -- only a zoomed in perspective is available. Beyond that, selections for backup down to the directory level can be accomplished quickly and relatively easy. Files, however, are not displayed but may be entered from the keyboard into a file selection list, but file selections are limited to 16 for any one backup -- which can be groups of files (e.g., *.DOC), or specific files. I am accustomed to being able to select individual files for backup and have not yet gotten used to not having that feature; but, then, I don't use that feature often. One especially nice feature of Back-It -- that is missing in many of the other backup programs -- is that it supports tape drives, or any kind of DOS drive, for that matter. It will also format floppies automatically. Back-It provides for any level of backup desired, from full to a single file; updates to those backups; multiple volume backups in a single session; and network backups, all of which can be scheduled to occur at any time you select.

The Restore feature is quite fast as well, and has the same kinds of options that are available in most good backup programs: Restore to any location; complete restore, or select as little as a single file; retain or not the directory structure and the file archives backed up; verify the restored files if desired; and can recover most damaged files if there are any in the backup set when restoring

OPTune: OPTune includes a number of features. Its optimization /defrag feature is quite user friendly and customizable. It has four levels of optimization, the highest level of which packs the files in selected sort sequence end to end, while at the other end is a directory only optimization. If you have any doubt about getting into trouble with any particular optimization, it even has a Simulated option that will go through the entire selected optimization/defrag procedure, except actually making any physical changes, and will report any problems encountered. And OPTune is FAST at all levels of optimization/defraging. Gazelle recommends that appropriate commands be placed in the AUTOEXEC.BAT file to optimize/defrag at every startup to keep your drive(s) in top condition and fast working order. Once optimized, daily optimization as Gazelle recommends takes only seconds -- unless major changes have been made on the disk.

OPtune includes a Check Disk feature very similar to DOS, except it is a lot faster, it works with all disks using any version of DOS from 2.0 up, and works on all disks/partitions of any size up to 2 gigabytes. VERIFY/FIX is another feature that will examine in detail the physical condition of your disk, correct and/or move data on bad sectors, and reportedly can identify surface areas that are likely to give problems in the future and mark them as bad sectors. It also includes a TUNE-DISK feature which will correct and strengthen low level format signals on the disk. This features is, of course, usable on only older hard drives (MFM/RLL) and cannot be used on the newer IDE, EDSI and SCSI drives.

The documentation does not address compressed drives. I was concerned about that since most of my hard drive space is compressed, so I called Gazelle Tech Support. They advised that OPtune was not compatible with SuperStor or Stacker, but was compatible with DoubleSpace. Those using other disk compression programs should check with Gazelle for compatibility.

PCscan: This is a virus detection and correction utility that functions from the DOS prompt. It is not a TSR program, but can be ran at any time from the DOS command line. It can also be setup to run at boot to scan any and all of your memory and/or directories/drives. As with any command line command, there are a number of switches available, but never fear -- they are available to your screen by typing PCscan. Here, again, this utility is fast. Another nice aspect is that updates to the known virus pattern bank is available from TRENDs BBS Utility without charge to registered owners; TREND is the creator of PCscan.

FAST!: This is a very good caching program, in my opinion. I have used an older version of Fast! in lieu of SmartDrive for quite some time now. It has always been a good bit faster than the older versions of SmartDrive, but SmartDrive was improved considerable with DOS 6. Fast! has similar read/write options as others do, and it support write buffers. Fast! is a straight-away caching program that uses less memory per unit of cache than does SmartDrive, and is at least as fast. For a 1 MB cache on my computer, for example, Fast! uses 14.5K of upper memory, while SmartDrive uses 27.5K. The manual states that Fast! Is even faster and uses even less memory on 386s and up if the EMS version of it is used (included with package). Fast! supports hard drives only. It is best installed at boot in the AUTOEXEC.BAT file, but may be installed in conventional memory from the DOS prompt. Once installed, all features can be controlled at the DOS prompt or with hot keys.

(Continued on Page 6)

(Continued from page 5)

Q-MENU 2.0: Q-MENU is described as a hard disk menu system that greatly simplifies execution of difficult or repetitive DOS commands by giving you an easy way to organize them into a structure that you can navigate by pressing a few keys. The completed menu structure allows even a beginning computer user to run applications without having to learn DOS. It does have a lot of capability, as described in the next paragraph, but getting started is not intuitive and takes a bit of effort to learn how to set the menus up.

The menu structure is completely user definable. It will support up to 10 levels of menus, with room for 500 menu items, each of which may have multiple commands. Up to 80 menu items can be available per screen. Q-MENU can be used to activate any DOS command -- start applications, change the environment, execute a batch file, etc. It supports password protection and 50 line text mode, it offers screen saver options, and is network compatible. Once a menu structure has been created, changes to suit personal desires or accommodate changing situations can be accomplished quickly and with relative ease. It is a competent menu program, but don't look for a lot of bells and whistles.

G-Edit: This is quite a powerful text editor that can edit up to 10 files simultaneously with a combined size of up to 16 MB -- YES!, 16 MEG. Files to be edited can be loaded via the command line at the time G-Edit is started, or from within the program. G-Edit will support 10 windows tiled at one time, but that is clearly not practical. The windows can also be stacked and sized as desired, and any of them called to the front for work at any time. The multiple windows are very helpful in allowing viewing and editing of more than one file at a time; for example, changes in the CONFIG and/or AUTOEXEC file often require that changes also be made in the other. And, G-Edit allows moving text between windows via a buffer, and provides markers that are quite helpful in moving around quickly in larger files. It also has find and replace features that aid in navigating within a file and speed up editing.. If you have a VGA or better monitor, you can set the display in G-Edit to show up to 50 lines. G-Edit does not support a mouse , however, and requires some getting used to for those of us that are addicted to a mouse. Notwithstanding, it is a very good editor.

GZFormat: A DOS, Q-DOS 3, or TSR formatting program. If loaded as a TSR, hot keys make it available at any time if you find a need to format a floppy. I have not used it as a TSR, but have used it from Q-DOS 3 and the DOS prompt. It is an adequate formatter that operates with about the same speed as DOS 6.2 format. The real advantage of GZFormat, however, is as a TSR or while in the Q-DOS 3 file management program.

Installation: Q-DOS Collection comes on three 3.5 floppies, and is available on 5.25 floppies. Installation is done from the DOS prompt, but Q-DOS 3 can be loaded during installation to be available through Windows. Installation *can* be accomplished quickly, depending on how fast you are at making decisions; among them are where you want the program loaded, what, if any, of the features you want loaded at boot by the AUTOEXEC file, but many of the decisions relate to configuring the different programs to your particular computer and desires and can delayed until later.

Documentation: The manual in Q-DOS Collection is fairly complete and fairly easy to read. Help is available within each of the programs within the package as well, though it is a little too sketchy in some. For the most part, it is context sensitive and is some cases - like OPtune - is automatically presented on the screen for any menu items selected. But you may have to refer to the manual for help in depth. In one instance (Q-MENU) the manual documentation and on-line help is very sketchy, though the Q-MENU program includes a 19-page README file that can be printed out for more complete documentation. A toll-free 800 number is provided in the manual, but a call to that number gets you a referral to a toll number for tech support; the one call I have made to that number brought a quick, courteous response.

Requirements: While requirements vary for each of the included utilities, are very minimal and any computer having the following capabilities can run them all: Any IBM-compatible PC or better with PC/MS-DOS 3.0 or newer , 384K of RAM, and a hard drive with 3.5 MB of available space.

Cost: The list price for Q-DOS Collection is $179, but Gazelle is selling it for $79. I do not have a local street price because I have been unsuccessful in finding a local software outlet that carries the package. I know of people that have used a version Q-DOS for a number of years now -- and still do, so it has been around for some time. While it is an effective, comprehensive package of utilities, perhaps it is not a shelf item in our area because it does not have a lot of the bells and whistles that seems to dominate in the newer software being produced now.

Exasperation, Personified
Translation - What Did I Mean to Say?

The exasperated help-line caller said she couldn't get her new Dell computer to turn on. Jay Albinger, a Dell Computer Corp. technician, made sure the computer was plugged in and then asked the woman what happened when she pushed the power button.

I've pushed and pushed this foot pedal and nothing happens, "the woman replied. "Foot pedal?" the technician asked. "Yes," the woman said, "this little white foot pedal with the one switch." The "foot pedal," it turned out, was the computer's mouse, a hand-operated device that helps to control the computer's operations.

(reprinted from Bits & Bytes Magazine, TPCS 4/94)

TeleGrafix Starts Revolution with RIPterm

Review by: Kevan Sheridan and Alford Poole, Tampa PC Users Group, Inc.

Remote Imaging Protocol (RIP) sounds technical, but RIP is a new graphic wave rolling in on telecommuting shores. RIPterm version 1.54.00 for DOS by TeleGrafix Communications, Inc., is a graphical interface for on-line hosts and end users to replace or enhance ANSI.

RIPterm uses RIPscript, a concise, optimized language for instructing a compatible terminal program to display graphics. Instead of using the decimal numbering system, it uses Hexi-Tri-Decimal (HTD), which uses 36 digits (0-9,A-Z). HTD can store a number in fewer digits than decimal, thus increasing transmission efficiency. For example the number 1024 (decimal) is SG (Hexi- Tri-Decimal). 1024 takes 4 bytes to transmit, but SG takes only 2 bytes.

Download RIPterm and try giving it a whirl. We think you'll be pleased with the graphical difference and besides the price is right.

After unzipping RIPTM154.ZIP, available on Bits of Blue BBS (239- 3704), the files need sorting into program, icon, and font directories. The files take less than 1.8 MB of space on the hard drive.

How it works: The files located in the icons directory are called up by the host computer and assigned positions on the end user monitor. This saves time because the files are already on your side of the telephone line, all they need are instructions on how to appear on the screen. The host sends the instructions and then your screen shows the graphics and buttons.

Although RIPterm is not a high cost product, it comes with quite a few features. Text transmitted from the host can be reviewed with Scroll Back. Download protocol can be set to Automatic Z-modem and batch upload/download are possible. Multiple phone directories can contain up to 100 phone numbers in each. There are pull down menus and hot-key support and you can edit or run external applications or shell to DOS from within RIPterm. Your data is secure (nothing can be uploaded without your permission). RIPterm supports extended (XMS) or expanded (EMS) memory, has custom IRQ and base I/O address settings, and editable keystroke macros. RIPterm also comes with a digital manual and context sensitive, keyword driven on-line help. The best feature is the price - RIPterm is FREE!

Test Results As End User: After installing RIPterm and making a few calls I discovered a BBS listing in User Friendly with RIP. Alas, the number was disconnected. Then I tried the BBS at the school where I'm taking a class. As I logged on a nice graphic of Wildcat appeared and then a menu with three-dimensional buttons and graphics came on screen. They are using RIPscript on their Wildcat BBS. I could use my mouse or the hotkey letters to make selections. Neato! There was a picture of a disk for files, an envelope for E-mail, and a flowery graphic for the logoff button. When I scrolled through filenames, they were inside a 3-D frame. There was even a game called RIPuz.

RIPterm is now available as an option on Bits of Blue BBS, thanks to the Cellar Door BBS and many hours of effort reconfiguring our BBS by our Sysop, Kevan Sheridan. When you first log on you'll be asked to choose how you want to view information on the BBS. If you have RIPterm, choose "Graphics." You'll also need to download a new icon file, BOBICONS.ZIP. You can do this, unzip the file into your icons directory and continue your session (the icon file is small and you have 180 seconds to unzip the new icons and return) before the BBS logs you off.

There was only one problem with downloading using Z-modem protocol. If you have a 50K (or any size) packet file named BITSOBLU.QWK and then try to download another one the file transfer starts at 50K and makes a mess. The manual covers this and it only happens using the auto Z-modem download option. Renaming or deleting the packet after viewing is necessary. Also, a few letters got dropped or scrambled while on-line, but was an infrequent occurrence and since changing to a modem with a 16550 UART chip has stopped altogether.

If you don't like RIPterm, but like RIP, QModem Pro and Telix communications programs also support RIPscript.

Test Results As Host BBS: Bits of Blue BBS uses RBBS-PC software which is a user supported package. Cellar Door BBS created modification merges to add RIP Graphics to RBBS-PC. Many file configurations had to be changed to add the ability to use RIP. Menus also had to be reworked to be compatible with our set up of RBBS-PC. Now, there are more options to offer users, but using RIPterm is not a necessity for using the BBS. There are also some areas that don't support RIP. The TQM door for example. Alt-R resets the window and makes the initial menu go away so you can see more than eight lines of text. There is always something to fix or improve . . .

There are many other BBS software products that support RIPscrip Graphics such as PCBoard, Remote Access, Searchlight, TBBS and The Major BBS. As you call different boards you'll find others that will let you use the three-dimensional buttons to make your choices.

TeleGrapfix also makes RIPaint, used by the host to make menus and screens with clickable buttons ($200) and RIPdraw, another graphics maker ($35). Guess which one is easier to use and is more useful?

This is neat stuff. Working with a good terminal program can make calling the local BBS's a lot more fun. Download RIPterm and try giving it a whirl. We think you'll be pleased with the graphical difference and besides the price is right.

Minimum System Requirements: PC, MS-DOS 3.0, 430K RAM, hard disk, EGA video adapter, modem. Mouse (Microsoft compatible) and color monitor strongly recommended.

Freeware on Bits of Blue BBS (239-3704), filename RIPTM154.ZIP.Download it today and check it out.

Computer Stress

Submitted by Steve Krivit, The Open Forum, Vol. 2 No. 1, January, 1994.

I get in the elevator and double-press the button for the floor I want.

Not only do I check my e-mail more often than my paper mail, but I remember my network address} faster than my postal one.

I go to balance my checkbook and discover that I'm doing math in octal.

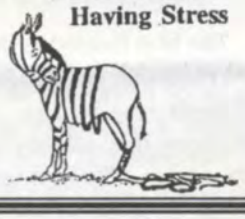
I'm writing a business report, and get to the end of the line in the middle of a sentence, tack on a "/", and continue writing on the next line.

Asked about a bus schedule, I think "Is it 16 or 32 bits?"

After fooling around all day with my stuff, I pick up the phone and start dialing an IP number...

My wife says, "If you don't turn off that contraption and come to bed, then I am going to divorce you! " whereupon I chastise her for omitting the ELSE clause.

I am reading a book and look for the space bar to get to the next page.



I look for my car keys using: "grep keys/dev/pockets"

I try to sleep, and think..."telnetxxx.dreams.heaven

I count sheep, and go "0,1,2,3,4,5,6,7,8,9,A,B,C,D...".

I dream in 256 palettes of 256 colors.

I Think I'm Having Stress

MEMBERS HELP-LINE

The following phone list is provided for our **Tampa PC Users Group** members in an effort to establish local support for those frustrating times which we have all encountered while using our PC's. Please note that these are members that have volunteered to help you, treat them in a courteous manner. Be sure to ask if it is convenient for them to help you now, or if you should call another time. It would also be helpful to have your documentation and have it handy when you call. *(Don't expect help if your software is an illegal copy or you do not have documentation!)* **TPCUG** is not responsible for the information or advice provided by volunteers. Volunteers may or may not be experts in the subject matter. You are on your own with any advice received. Be aware also that some of these volunteers may be consultants in their area of expertise. If you are interested in volunteering to answer members questions, either leave a message on the BBS or fill in the forms provided for this purpose at the meetings.

Software Review: SPEED by Knowledge Adventure on CD-ROM

Review by: Matthew and Alford Poole, Tampa PC Users Group, Inc.

At the heart of Speed is a MacGillivray-Freeman IMAX Movie that starts with a cave man hunting (trying to catch a deer) and being hunted (by a tiger) and goes through the history of our conquest for ever greater speed. It continues to the bicycle, the steam engine, the internal combustion engine, through hotrods, rocket cars, airplanes all the way to the incredible SR 71 and the Apollo space flight. You have control of the movie. You can stop at anytime and even go forward hitting key frames.

The movie lasted quite a long time, considering it is on computer. However, don't go out and buy this program expecting to play a game - there ARE games on it, but they're more to see if you paid attention during the movie.

Matthew had no problem installing the software. It took approximately 8.5 MB of hard disk space for full effects or would use 2.5 MB for minimal installation.

Speed has three simulations; speed of thought, human speed and roller coaster. The roller coaster was really jerky and didn't look too hot with the sound on, but when we disabled the sound, it looked almost like real life. This is unfortunate because the background music and sounds add to the visual effects, The IMAX movie also flowed much better with the sound off. Running programs from CD-ROM isn't quite as wonderful as from your hard disk.

Speed has four extended learning modules that cover windpower, steampower, air speed and feeling speed. These seem aimed at a younger crowd.

Games: 1) Speed Matching: you try to match a given speed with an animal or machine that travels at that speed. 2) Speed Reading: moving down a "Hall of Speed," you read three speed facts and then a question. If you get the question right you go on to the next level, if not you hear a scream and start over. 3) A-Mazing Speed: you navigate through a maze choosing the fastest of two animals or machines. Using a mouse to go through a maze is a little tricky (a joystick might give better movement control).

The manual is clearly written and has an appendix for parents and teachers with tips on how to get more educational value from Speed. There are also a few experiments with speed in the real world.

Speed is a DOS program, please look on the side of the box to see if your sound card is listed. If so, Speed will probably work in Windows too. Speed does not work under Windows with a Reveal sound card. The only other problem we experienced was the video jerkiness.

Why do we upgrade our computers? Usually to buy faster equipment. The science of computer speed needs further development for this program to reach its full, VCR video like, potential (or we need to shake loose massive amounts of cash for upgrades). There are several variables to consider: speed of CPU (ours is a 486DLC 33Mhz), speed of RAM chips (our 5th MB is slower than the 60ns of the first 4 MB, so they all operate at the slower speed), number of SIMM's (the more the better), the sound card (ours is an 8 bit Reveal, surely a Pro Audio Studio would work a little better), the video card (an accelerator with RAM might help too) and the speed of the CD-ROM drive (ours has about 219ms access, no slouch, but could still be part of the problem) and maybe cache memory size could make a difference. The point is: with the jerkiness of the video, it doesn't make me want to see it again.

Speed is innovative and in the forefront of multimedia educational software, but would I recommend buying it? Would students use it a third, fourth, or more times? Well, it would make a good supplement to young children's understanding of speed, but with older people it probably won't be given a second or third viewing. The initial excitement wanes quickly when it isn't Super Mario quality.

Minimum System Requirements: VGA, PC or MS-DOS 3.1, 386 PC, 520Kb RAM, sound card, 2.5Mb hard disk space and a CD-ROM drive. The software will run using the keyboard, but a mouse is recommended.

Cost and availability: $35 at CompUSA.

USER'S CORNER

DIRNOTES.COM. This utility program from PC Magazine (it's on the New Member Disk) can be a big help in managing files. Entered at the DOS command line, the program creates an ASCII list of the files in the current directory. The neat thing is that it let's you add a descriptive title for each file.

One use is to run DIRNOTES in the Windows and Systems directories. Annotate the file list to show W31 . Then, *after* installing a Window application, run DIRNOTES again. Now annotate the newly listed files with the name of the new application. Helps when you want to uninstall the application.

Another use is to identify all those work and temporary junk files that you create when working on that BIG document. After the document is in it's final form, you know what files to delete.

File Safety. The First Law of Computing: Thou shalt back up thy data files. Let's face it: disks fail; files get corrupted, lost, and erroneously deleted; the FAT and directory tables get bolixed; and power blips can be nasty. There are ways to recover from some of these disasters *sometimes*!

A small change in work habits can pay big dividends. After loading or retrieving a file that you are going to work on, immediately save the file with a new name and index the extension or filename (file.002). As you work on the file, periodically save it (if the application doesn't have an automatic backup) and bump up the extension number (.003, .004, etc.)

If you mess it up, *don't* save it, just reload the last file that was saved. If you did save the messed up file, start over with the last good file.

When it's finally finished, save it twice! Once in it's regular directory and again in another (backup?) directory. Or, better yet, save the second copy to a floppy diskette. Now it's safe to delete the interim files that were created.

Modem Settings. This is specifically about Qmodem V4.5 software and the Gateway Telepath modem. Load Qmodem. The screen will show the statement You are in TERMINAL mode . Turn on capture mode <CtrlHome>; but instead of accepting CAPTURE.CAP as the filename, enter TELEPATH.LOG instead (or filename of your choice).

Press the following keys: <A> <T> <I> <3> <Enter> to see the modem description. I get: Sportster 14,400/Fax V4.1. By pressing <A> <T> <I> <4> <Enter>, the V.32bis settings are shown. Entering a number from 0-7 with the ATI command will show other data. Of course, your data may be different.

Bring up TLELPATH.LOG (or print it) and compare the settings to the information in the modem manual. Amazing what you find in the reference manuals!

If you need the settings for the Telepath modem for Procom for Windows, download the file WMODEMSK.ZIP from our BBS. Also, check out the HSMODEM, QMODEM, and QMODEMU conferences in the TQM Mail Door of our BBS.

Windows - DOS Prompt. When shelling out to the DOS command line, Windows posts a message about typing EXIT and pressing the <Enter> key to return to Windows. As you work in DOS, or enter CLS, those messages scroll right off the top of the screen. It's easy to get so involved with what you're doing that you forget that you've shelled out to DOS from Windows. And even load a second copy of Windows!

In the AUTOEXEC.BAT, add the following line:
SET WINPMT=Enter 'EXIT' to return to Windows$_$P$G
that will cause DOS to show this specialized prompt *only* when it is shelled out to DOS. This SET can be entered at the command line prior to loading Windows instead of modifying AUTOEXEC.BAT. But it's easier, and DOS won't forget, if AUTOEXEC.BAT sets this specialized Windows prompt.

Book Review:

Almost Perfect

By W. E. Pete Peterson

Review by: Ed Buzza, Tampa PC Users Group, Inc.

When he left in March 1992, the author was the executive vice president of WordPerfect Corporation. For ten years, he was one of the three members of the governing board. In this book he gives some insight of the corporation from it's earliest beginnings.

Satellite Systems Incorporated was born in the summer of 1977. In September 1979 it became Satellite Software International and it's first product was SSI*WP - a word processor that worked only on Data General computers. The author coined the word "WordPerfect" for their product. A word that the corporation adopted in 1986 as it's name, the WordPerfect Corporation.

The book is very well written and the words flow easily from page to page. It chronicles the author's twelve years of experience with the corporation and how a small software company with sales of $400,00 in 1980 had sales of $550 million twelve years later. Interspersed in the narrative are various anecdotes of family life and the fiercely competitive world of software development.

Of note is the interplay of product design, delivery time, competing products, and of manipulating the trade media. Also touched upon are such thorny issues as who controls product design– programmers, management, or marketing. Of particular interest are the marketing ploys and stratagems employed; not just by WordPerfect, but by other software developers as well. The importance of COMDEX and the manner of introducing a product to the public is especially enlightening.

The subtitle of the book "How a Bunch of Regular Guys Built WordPerfect Corporation" pretty well describes it's contents. How three men built a software empire on a shoestring, an idea, and lots of hard work. At times, even family members were pressed into service; duplicating disks at home, inserting replacement pages in manuals, and even cleaning the offices. By trial and error, they taught themselves how to run a software business; a very lucrative business.

While the book is interesting and reads well, one is left with the impression that it is incomplete. It doesn't really get down to the nitty gritty. WordPerfect's delay in moving it's main product to Windows is only briefly, and sketchily, explained. And, with their plans to have WordPerfect standardized across a vast variety of operating systems, there is little in-depth information given to explain their decisions to develop these plans or to cancel them.

Throughout, the author writes of management style and conflict. Not only among the founding fathers but within the management hierarchy. Perhaps his management style can be exemplified by his own words:

"I felt a job was about work, and the personal, political, and social aspects were important only when they were important to the welfare of the company. I certainly was happy if employees enjoyed their work, but I wanted them to understand that their enjoyment and fulfillment were not the ultimate focus of WordPerfect corporation."

Yet these very words are seemingly contradicted by his remarks elsewhere. He believes that anyone should be able to communicate with anyone else "even if that lets a custodian communicate directly with the CEO." He prefers that supervisors be advisors rather than bosses. Advisors were to treat their employees with respect and kindness; who knew how to praise as well as how to reprimand without being overbearing or unfair. A strong advocate of a flat management structure (one advisor for 10-20 people, and as few layers of management as possible), yet he was concerned that all employees be properly trained and treated with respect.

While some of these principles are laudable and should be embraced by workers and management, they see short shrift in today's corporate climate. What with mergers to achieve "economies of scale" that wipe out whole departments and with "downsizing", perhaps one can forgive the employee who does not view the corporation as a benevolent parent. But, sadly, many employees do not work for a corporation, they just work for a paycheck.

The book is published by Prima Publishing, P.O. Box 1260BK, Rocklin, CA 95677; telephone (916) 786-0426. The list price is $18.95. ISBN 1-55958-477-7.

Software Review

International Keyboard Kit

for MS Windows 3.1

Review by: Renate Marsh, Tampa PC Users Group, Inc.

Using a wordprocessor on a PC instead of a typewriter or pen is heaven on earth, but now we can top that and take it one more step beyond the wordprocessor capability.

Languages! Many of us know and need to use at least a second language. Wouldn't it be nice if our computer can produce documents in spanish, french, german, or even russian?

Users who work with different languages in the Microsoft Windows environment will welcome the International Keyboard Kit (I.K.K.) Software. This program allows you to have a second language right in your Windows to be used with any Windows wordprocessor at any time. The installation is easy and fast and a permanent visible icon lets you switch from the US language to the second choice language in seconds and back to your original language. You also can display at any time a graphical keyboard layout for the present language in use to see which letters are used with the keys on your keyboard.

I tried out spanish and german and kept the german keyboard layout permanently since I write quite a few letters to Germany. There are only five different settings on my keyboard for the german language, after a couple of days I knew them by heart and could type documents as fast in german as in english. I used three different wordprocessors, WordPerfect for Windows MS Word for Windows MS Write, and typed some correspondence in spanish and german. All the documents had different fonts assigned to them just to see how much variety I can use. The documents looked great in both languages.

The International Keyboard Kit Software lets you choose almost any Western European language. Also, up to 12 languages may be assigned as "Hot" keys for instant switching from one to the next language. For the Eastern European or Russian languages addons of Cyrillic Fonts and Eastern European Fonts are available with the same company and can be ordered additionally.

The cost of International Keyboard Kit is only $30.00 and the addons are also the same price each. I.K.K. is working on add ons for Greek, Hebrew, Music Notes for writing sheet music, and Flow Chart symbols.

A PC and a wordprocessor is really great, and now you can add the best and easiest Multilingual software, International Keyboard Kit, to your system and instantly switch to many different languages which is better than great, it is fantastic!

Requirements: Microsoft Windows 3.1

Software Review

ECCO™

SuperPIM.

Review by: Bob Sanders,
Tampa, PC Users Group, Inc.

ECCO is not an editor.
ECCO is not an editor.
ECCO is not an editor.

I have to keep reminding myself of that fact as much as I wish it were not true.

ECCO was not intended to be an editor. It is a Personal Information Manager (PIM). As the ECCO short tour puts it, some people live in a spreadsheet, some live in an editor. ECCO promises to make you live in your PIM. I must have been one who lived in an editor.

ECCO is actually ECCO Professional from Arabesque® Software, Inc. in Bellevue, WA. (Arabesque pronounced Air-a-bessk, more of a k sound at the end). Arabesque Software refers to ECCO as the industry's first SuperPIM. Arabesque means Grace, Power, Movement and Motion. Arabesque wants to represent these same qualities to their customers. ECCO, in Latin, means "Behold", in Italian, it's "Here, there and everywhere". ECCO is a name that fits the product.

A Personal Information Manager does just what it says; it manages all of your personal information (that is entered into the database) - phone calls needing to take place, the actual phone numbers/addresses, project planning/scheduling, you name it. The computer can dial the phone for you, it can manage data bases, with its internal clock, it can tell time and announce appointments and so on. You just need something to pull it all together. A PIM is supposed to do just that.

ECCO is a Microsoft Windows program. The better display you have, the better any product (including ECCO) looks. CPU speed same, the faster, the better. I didn't find anything CPU intensive so anything that runs Windows should handle ECCO with ease. The HELP screens are the only parts of the entire system that you may notice slight delays but nothing out of the ordinary. It handles the HELP screens about as fast as any other Windows program.

This review has been edited from its initial writing. To give a product as extensive as ECCO a fair shake, I needed to write about the major features. This turns out to be nearly a small booklet in itself. For a magazine, this is fine but for a newsletter, it can take up a lot of space. To shorten the review, I have attempted to trim information that would seem obvious. Since this is a judgement call, it was difficult to decide what to leave in and what to cut. Rather than type in the sales pitch on the back of the box, I have truly reviewed the product and added my own comments. Hopefully, you can get not only the jest of what ECCO does, but a little bit more as well. Notice the sections are labeled; If you get tired of reading, skip over any sections you wish.

VERSION

ECCO comes in two editions, ECCO Simplicity and ECCO Professional, this review is specifically for the ECCO Professional 2.0 version. It was announced on April 18th and should be released soon (mid May). The 2.0 version adds several new features over the previous versions. I am not familar with the ECCO Simplicity edition or how it is different from the Professional edition. When I refer to ECCO, I am referring to the Professional edition unless stated otherwise.

The product comes with a manual, a small intro, quick guide booklet and, it also has another small booklet, the Advanced Features Tutorial.

SPECIFICALLY

ECCO allows you to arrange your life by supplying you with a calendar, a phone book, and an outliner. The outliner itself allows several ways of looking at the data. A columns view gives additional flexibility. The colums view is actually a mini-spreadsheet. There is also a graphic view of a project. Data is contained in folders just as you might contain data in your desk.

ECCO is not a sit-down-learn-in-one-day program. At first, I was even apprehensive because of all the functionality that is provided. It does not take too long to feel comfortable because the uses are natural.

INSTALLATION

The installation was a breeze. It handled inserting the wrong disk (of four disks) after I got started. It even allowed me to override the default directory to install into. I hate applications that MUST be installed as an entry in the root directory. Most root directories are crowed enough. I install all Windows applications under a WINAPPS directory. I don't want any application installed under the Windows directory either because I want to be able to upgrade Windows at some point and install the new one into a different directory. When I get ready to remove the old Windows directory, I will copy *.INI to my new Windows directory; I don't want to migrate applications or delete around them. These are my two main installation pet-peeves and ECCO worked flawlessly from a directory name of my choosing. It created the directory as it was not there already.

The manual warned that installation *may* have some difficulty if installing from Norton Desktop for Windows or any other shell other than the standard Windows shell. Arabesque had not been able to reproduce some reported problems but since some calls had come in, an appropriate warning was in order. When the manufacturer can't reproduce a problem, it is more likely specific to a particular users situation so I immediately attempted to install under Norton Destop for Windows. Guess what? No problems whatsoever. I also installed under the standard Windows shell with the same successful results. After the installation, I was prompted to run a short tour if I wanted, otherwise, I could run it later. It is very graphic and consists of part of the standard HELP provided for the product. The second installation, I passed on the short tour option.

DISK SPACE AND RAM REQUIREMENTS

With as much functionality as ECCO provides, it is not surprising that it consumes as much as 7Meg of disk space. This is not only the trend but necessary to provide the capabilities that were not available a few years ago. As the cost of disk drives drops, this does not seem to be as much of a factor as it was a few years ago as well. On system memory requirements, it seems to work smoothly with 4 Meg of RAM. 8 Meg of RAM didn't seem to make a lot of difference. This is more due to the fact that there is not a lot of processing going on other than swapping the currently selected view in and out of memory. Some HELP displays were a bit slower on 4 Meg because there is so much help available. ECCO specifies a requirement for only 2 Meg of RAM.

HELP

The HELP text is the most comprehensive help text of any Windows program that I have ever seen. The entire manual is online! Context sensitive HELP is available so no matter where in the program you are, you have direct access to the HELP text about the current ECCO activity. Many words are highlighted to allow for jumps. There are sections of the ECCO help that just say [MORE]. Clicking on these (jump) [MORE] boxes brings on a whole slew of additional information. Initially, I spent more time in the HELP windows than in the application; that is because the online help was there, I did not have to go to the manual to research something. I did read several parts of the manual but the

(Continued on poage 13)

(Continued from page 12)
jumps available in the online help allow me to get to the specific topic I want faster and without having to pick up the manual. With so much help text, it is difficult to keep track of what you have read and what you have not read because the same jump word or phase may appear in several different places. You can start on a jump word and after a couple jumps get back to a screen that has the original jump word highlighted. You can select that jump word again if you like and go down the same path again or you can chhose to go off in another direction. I have attempted to break programs like this by alternating from one word to the other to see how deep it would recurse upon itself before crashing. They always wear me out and never fail. *This is actually part of Windows and not specific to ECCO. ECCO simply used the help capabilities extensively!* Backing out by clicking on the BACK button takes just as long as it did going in; you see the same two views alternating back and forth just as entered. I would like to see help text that knows what jump words I have read and will change its highlighted color to a different color after it has been displayed. Of course, it would still have to be accessible if I chose to read it. I also want to see an EXIT button, one that would not require me to use two mouse clicks, or to pull down the file menu to exit HELP. Unfortunately, ECCO does not solve this pet-peeve.

Of couse, using the BACK button always backs out to where you started, backtracking each step you took along the way. In fact, most programs grey out the BACK button when you get back to where you first selected HELP. ECCO will take you back to the very start of the entire ECCO HELP. This is generally before the location that you first initiated HELP if you entered HELP through context sensitive help. You may or may not appreciate this feature. This starting HELP window seems to take a tiny bit longer to paint as it is mostly a graphic display. It has all of the HELP topics. When you move the mouse pointer over the different topics, you find that they are actually *jumps*. A video tape is an expensive *(but effective)* teaching add on for a manufacturer to include in a product. ECCO has come as close to a video tape as possible without going into a multimedia presentation. You should appreciate the help available.

The OUTLINE

ECCO gives you several ways to view the world and one of the handiest is through an outline. An outline is an easy way to break down almost anything, a project, a speech, a report, a review, etc.

ECCO is not a full fledged outliner! Outliners are different from editors. The difficulty is in rearranging text. With an editor, rearranging text is not as much of a problem, there are no numbers attached to the beginning of the text. An outliner program has to deal with the leading numbers. Moving text requires renumbering.

In ECCO , the numbers are 1 to n. You may also use Roman numerals, Alpha-Numbering, and of course upper and lower case of these.

Outlines begin with a folder icon. Below it are numbered icons that can be indented to form a true outline. Each icon represents an *item*. Please notice that the word *item* is used specifically in this review as it is the word of choice when referring to data inside ECCO.

An item may be collapsed (hiding what is under it) or expanded. The "item icon" has to be large enough to easily place the cursor over it to collapse or expand entries under that level. The icon does not need to appear on the final printed page; in fact it does not make an ideal bullet as it is wider than it is high. When printing, you may select to print the icon or not. There is no such choice for also not printing the numbers. On the good side, you may choose to print only the selected items or all items; items as shown (some collapsed, some not collapsed) or expand all for printing.

Items can be selected to be mailed as easily as printed. Files may be imported or exported using the File menu.

The outlining editing capability allows you to move *items* about just by clicking on them and while holding the mouse button down, move it around to a different numbering level (up or down) or to a different indentation level (left or right) before releasing the mouse button. The <tab> and Shift <tab> character causes a left to right and right to left movement. Text is automatically renumbered.

A carriage return generates another level at the same level as at currently if below the folder. Entering a carriage return at the folder generates an entry indented under the folder.

All of the standard Windows cut and paste capabilities allow for easy editing of outlines.

All of the folders can be displayed at the right of the screen. Coping data to different folders is as easy as dragging data from the outline item to a folder. Or dragging a folder to an outline adds the contents of that folder to the outline where dropped..

Outline data can also be viewed in columns, or even graphs.

A project management example is included to help in using all of the features of the outliner and the entire program. This example gets down to the specific tasks, the job title of the person doing the task, the name assigned to, completion dates expected, tasks already completed, etc. The examples really showed how to use the product. These examples are stored in *templates.* The templates can be used to start your own projects, and if desired, even the original templates themselves can be modified. Several templates have been added for the 2.0 release. Nice.

There is even a version of ECCO for workgroups that will work on a LAN allowing several members of a project to share data.

A Tickler feature allows you to enter alarms that you can have ECCO remind you of later. Phones calls to make, appointments, etc. This is a very important part of ECCO.

PHONE BOOK

The phone book is pretty standard but this one allows for several phone numbers including a celluar phone number slot.

CALENDAR

The calendar allows easy access to any date for planning, data entry, alarm setting, etc.

NEW TECHNOLOGY

ECCO has a bit of new technology. It is called the SHOOTER. It actually is a Windows enhancement that is active anytime ECCO is active. Anytime ECCO is executing, a small arrow appears at the far left of the title bar, both in ECCO and your current WIndows application. The arrow is inside a square the same size as the Restore/Close Down box and right next to it. Therefore, it doen't take up much space. If you are in a different Windows application, by clicking on the SHOOTER arrow, you get a window that allows you to send *selected* text from your current application to the active ECCO view. It simply bypasses the need to Copy to the Clipboard, select ECCO and then paste. The feature is bidirectional; *selected* text can be sent from ECCO to other open Windows applications as well. If the current ECCO file is not the one you wish to sent the selected text to, the SHOOTER icon allows you to choose first. The text can be send as editable text or as an OLE link or object. You can send Graphics just as easily as text. In fact, if you don't want to send the selection to ECCO at all, you can choose any other open application, even the one you are sending from! If an application is not running, ECCO has a launch (a rocket image) MENU button to start it.

The SHOOTER Window can also allow you to go straight to ECCO if you are in a different application. SHOOTER executes as a separate application so it is also available from the task list.

If you don't want the SHOOTER icon to be next to the Restore/Close Down box, you can *drag* it to any location you like or even hide it.

(Continued on Page 14)

(Continued from Page 13)

MENU BAR

Speaking of dragging, the menu bar at the top is also customizable by dragging. The menu bar has several common functions identified as icons. Not every function possible is displayed on the menu bar. Not only is it less crowded this way, it gives the menu bar a less intimidating appearance when you first start using the product. The function you last performed is displayed at the far right of the menu bar as a menu icon. You can always click on this icon to perform the last function again. This icon is always changing depending on the last function performed. You can drag (right mouse button) this icon onto a blank area of the menu bar in order to prevent it from going away when you select the next function. You can end up with a menu bar just about as crowded as your desk.

You can also hide the entire MENU bar or bring it back with a click of the mouse button.

OLE , DDE and Interfacing to other Products

ECCO is up-to-date; it has OLE and DDE support and can therefore interface to other Windows products very smoothly. Importing data from other applications is supported. A specific interface to several other packages is available from Arabesque at no charge; just tell them which ones you want.

DIFFICULTIES, . . . BUT . . .

I had some editing difficulties (in ECCO 1.0) when I "SHOT" a text outline from MS Write into an ECCO outline view. Blank lines became individual items in ECCO. Version 1.1 or later changes this to allow "SHOOT"ing selected text to a single item. The original selected text contained a <tab> character that now appeared in the ECCO outline. I attempted to FIND and REPLACE "*<tab>" but when I entered <tab> in the FIND data entry field, it causes the cursor to jump to the REPLACE WITH data entry field. This is not ECCO 's fault, this is standard Windows application usage. In any event, I finally had to remove each one by hand. Since ECCO has context sensitive help, I attempted to call up the help on replacements but the help text showed a different FIND and REPLACE example. This might have been due to a result of product evolution, with HELP text not being updated fully or the FIND and REPLACE portion of the program not being updated to what was intended (implied by the HELP example).

Previous PIM Experience

My previous experience with PIMs was somewhat limited but the need was always there. I identified the need back in 1983 when I was having to keep track of all the *initial* phone calls I needed to make, the ones that I needed to call back that had called but missed me, the ones that I needed to call again who weren't expecting a call from me because I didn't get through the first time, the ones that I needed to call again because they didn't call back, and so on. The categories just kept on forming. In addition to keeping track of contacts, I needed to keep track of the project itself, its progress, what needed to be done, etc. I needed a Personal Information Manager.

Sidekick. That will do the job! This was before Microsoft Windows 1.0. Borland's Sidekick was a Terminate-and-Stay-Resident (TSR) program that allowed you to do your regular job and still bring up Sidekick the very moment you needed it with a Hot-Key combination. At the time, it was great; . . . but it still had a long way to go.

I had used outliner programs before. I started with the Brown Bag Software version of PC Outline, a DOS program. The author didn't make any money on it as shareware so he sold the rights (in exchange for royalties) to Brown Bag Software, who in turn went out of business so he still didn't make any money. The start of a great product got stopped before it really got off the ground. The author spoke to the Sacramento PC Users Group a few years back. He explained that the PC Outline, even though dead, had many more users now than when it was being promoted. It is because the need was always there, PC Outline was the only solution at the time. Imagine putting PC Outline and Sidekick into one program. Imagine that the two functions knew about each other.

The author of PC Outline also explained that he was working on a much more comprehensive Windows based program called GrandView, to be sold by Symantec. Before I got a chance to see GrandView, I happened to work for a company that used MORE, a Macintosh program also from Symantec. MORE is a true outlining editor with very sophisticated renumbering, etc. MORE and GrandView originated from different companies and so they are very different even though they provide much of the same functionality. Since Symantec now owns both products, there is no intention of making MORE available on the PC; it would compete with GrandView.

I didn't just live in an editor world but an editor/outliner world when I used MORE. An excellent outliner makes any editing/project planning/scheduling task easier. The outliners lack a phone book and calendar interface. You can have them as separate applications but they don't interface very well. ECCO solves this problem.

With Windows being introduced several years ago, it is surprising that PIMs didn't appear almost immediately. PIMs definitely got a late start. The same need has been there, the solution has not.

When PIMs did start appearing, they had many shortcomings. They just didn't cover the entire picture. I tried several shareware Windows PIMs but still I wasn't satisfied. Most were good products. Good products breed competition, and competition breeds better products. Finally ECCO has arrived.

Fortunately, several individuals who understood the PIM needs formed together to create ECCO. I am sure that ECCO too will evolve and be improved upon by Arabesque Software Inc, its creator or a competitor will surely produce a better mouse trap. At the rate of new improvements to the original ECCO version 1.0, it appears that the Arabesque Software people are serious about leading us into the future of what PIMs will be used for.

PRICING

The 2.0 version is available through several distribution outlets for much less than the retail $395. Upgrades to version 2.0 from version 1.0 or 1.1 is only $49. To find the dealer (actually mail-order) firm nearest you, call 1-800-457-4243. They will tell you most major software dealers carry the product. For example, Micro Warehouse, PC Zone, Egghead, etc. 800-Software sells version 1.1 of ECCO Professional for $284. They also have the Simplicity edition for $58 (Retail $79).

Customer service is available direct from Arabesque in Bellevue, WA from 6AM to 6PM PST at 1-206-885-0559. There is no cost, only that it is on your nickel. On Compuserve, enter "GO ECCO".

CONCLUSION

I spoke to Arabesque Software about my own wishlist for ECCO and found out that other people had wanted the same things and that in fact, the developers had already added these features into the product. Several improvements had been made in the 1.1 and now 2.0 release. For example, the outline numbers now can be in Roman Numerals, etc. They beat me to the punch.

The 2.0 release has added FAX integration into the software (Delrina WinFAX Pro). The enhanced Tools Menu makes launching applications easier - and to live in ECCO!

The 2.0 release has added several features that make ECCO even nicer for workgroups. Users can share phone books, outlines, etc. There is automatic 2-way file synchronization. Group scheduling is available using MAPI, VIM, or MHS mail programs. This can make project planning truly a group effort with less hassle. Look out Lotus Notes! ECCO may suffice in many situations where Lotus Notes would be used but at far greater $ saving.

(Continued on Page 15)

(Continued from Page 14.)

I think the product is great! My earlier shortcomings with it are really not justified because they involve making ECCO an editor or a full fledged outliner.

By writing this review as an outline in ECCO, it was easier to see the entire picture by collapsing the text and looking at the headings. Rearranging entire sections was simple. I didn't need to select entire paragraphs, I selected the collapsed outline item and moved it where I wanted it. SHOOTing the finished review to a word processor was simple of course.

Only because I got used to the outliner MORE, did I find any shortcomings in ECCO. ECCO does not allow the same range of editing capabilites in the outline view as an outlining program would. It appears however that these limitations are being removed as ECCO improves on its outlining abilities. Maybe I will continue to live in an editor/outliner world after all.

I have only begun to recognize how many ways I can use ECCO. You should be glad. If I were to write this review six months from now, it would be a book!

Ababesque, ECCO, Borland, Sidekick, PC-Outline, Brown-Bag Software, Symantec, Norton Desktop for Windows, GrandView, Macintosh, MORE, Lotus Notes, Delrina WinFAX Pro, Compuserve, Micro Warehouse, PC Zone, Egghead, 800-Software, MS Write, Microsoft, and Microsoft Windows are recognized as trademarks.

Software Review

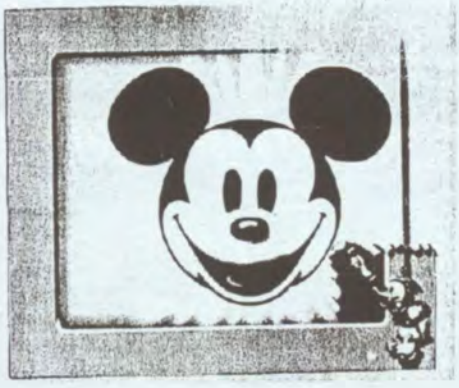
The Disney Collection Screen Saver For Windows

By: Renate Marsh, Tampa, PC Users Group, Inc.

The Disney Collection Screen Saver is a multimedia product and protects your monitor from screen burn out in the fun way. It is part of and compatible with all the other screen saver programs from Berkeley Systems. Their most famous one is the After Dark Screen Saver program with the flying toaster. Though, I am totally taken with the Disney Collection and its music and animation.

When I first installed this program, I spent 3 hours just listening to and testing each module. Luckily I was by myself because I was so enchanted with this program, I am sure I had a silly smile on my face and at times laughed out loud.

The Disney Collection Screen Saver has more than 15 different Disney animation to entertain you while your monitor is idle. This program comes with the After Dark Control Panel which gives you the choice to set up each animation to your liking; i.e. the 101 Dalmatian screen saver module gives you a choice of how many dogs on the screen, how often do you want the to bark, do you want your screen cleared first.



Also, you can use the demo to test each screen saver module, set up your own random file to have a different screen saver every time the program is used.

The Setup Dialog Box gives you a choice of sound, hot keys, password for windows and network, sleep time (after how many minutes of idleness do you want your screen saver to start), and many more commands. One choice that is available I have not used as yet: To have just a plain old blank screen, but it is there to choose.

A 27 page manual has all the information you need to set up this program, to troubleshoot, and maintain. It describes in detail all the option and possibilities you have within this program. It also describes all the files needed and where they are located and what files in your system have been changed when this program was installed. You forgot your password? The manual gives you a solution for that too.

Of course, since animation is included, it takes quite a few your bytes out of your system. The Disney Collection Screen Saver requires 8.5MB to install but needs as a total 10MB of hard disk space to operate under. 386 CPU or higher but uses Windows in Standard or Enhanced mode. Needs MSDOS or PCDOS version 3.3 and up. MSWindows 3.0 and up. 4MB of RAM. VGA color display adapter and monitor. It will not run under EGA or CGA display systems.

The Disney Collection Screen Saver is a multimedia at its best. And let us not forget, it is there to protect your screen from burning (I forgot, because this program is so much fun to check out, watch, and listen too) Berkeley Systems Company information: Order no.: 1 800 3445541 Technical Support: Phone: 510 5405535 FAX: 510 8499426 Mail: Berkeley Systems, Inc. 2095 Rose St. Berkeley CA 94709

MISPLACED HUMOR: (Continued)

Here are some signs and notices written in English that were discovered throughout the world. You have to give the writers an "E" for Effort.

On the menu of a Swiss Restaurant:
Our wines leave you nothing to hope for.

In a Swiss mountain inn:
Special today -- no ice cream.

In a Bangkok temple:
It is forbidden to enter a woman even a foreigner if dressed as a man.

Outside a Hong Kong tailor shop:
Ladies may have a fit upstairs.

In a Baogkok dry cleaner's:
Drop your trousers here for best results.

Outside a Paris dress shop:
Dresses for street walking.

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII file or in a commonly available word processor format, such as WordPerfect 5.2, or Ami Pro 3.0 on diskette to the editor at 9402 Hidden Ridge Place, Tampa, Florida 33637 or send it by modem to BBS (813)239-3704.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

Commercial advertisements will be accepted at the following rates:

	1 month	3 months	6 months
Full Page	$60.00	$162.00	288.00
Half Page	$40.00	$108.00	$192.00
Quarter Page	$22.00	$60.00	$106.00
Eight Page	$12.00	$33.00	$58.00
Business Card	$10.00	$27.00	$48.00

All advertisements must be prepaid by check payable to TPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if it is not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, Marylee Bruneau at (813) 985-3338, for space availability and for further information.

This newsletter is created with PageMaker 5.0 from Aldus Corp. and Corel Draw from Corel Systems.

Secretary's Report

MINUTES OF 5/11/94 MEETING
and PERSONAL COMMENTS
By: Jim Clark, Tampa PC Users Group, Inc.

A very good turnout for this meeting, which held the promise of a great presentation by one of the largest PC software companies -- Microsoft Access. And the promise turned into reality - a great meeting and a great presentation.

USER GROUP NEWS

➪ Membership Survey: Harvey reiterated the why's and wherefore's of the member survey now underway. Thanks were given to those who had completed and turned in their survey form; those that had not yet done so were implored to please do so as soon as possible. The information will be of considerable benefit to the Board of Directors in guiding the direction of the user group and our BBS, and in making our group of greater benefit for all members..

➪ Hard Drive For BBS: Harvey again noted for the group that the BBS has only one 212 Mb hard drive available to serve all the purposes we want of the BBS. The hard driver is full, and we need to acquire a 500 Mb + hard drive, preferably from donation or barter. Members were asked to look for ways to come by more hard drive space. One of our members offered a 200 Mb to the group, an offer that was quickly accepted. The 'new-to-us' hard drive should be installed in the near future and we will likely see more files available for download in coming weeks. While this is not a long term solution, it will allow us to improve the BBS, and it gives us some breathing space. A BIG THANK YOU from all of us to ELAINE MARMEL for her generosity.

➪ Special Interest Groups (SIGs): The OS/2 SIG is off and running. The first meeting is scheduled for 26 May - the 4th Thursday in May, at 6 PM, in the IBM facilities on the 4th floor of the Lake Pointe One building across ML King Blvd from Burdines in the Tampa Bay Mall. Subsequent meetings will be held in the same location and at the same time, but on the fourth Tuesday of each month. Many thanks to John Lucas for organizing and leading this SIG.

The CorelDRAW SIG is still in the organization stage, with obtaining meeting facilities at the HCC (Dale Mabry campus) the stumbling block. We hope to have good news on this in the near future so we can get this SIG going.

➪ Possible BBS Move: Harvey informed us that the present location of the BBS may not be available to us in the future. Presently located at our SYOPS' place of employment, that business in presently in the throws of reorganization, and tenure of our BBS is a bit uncertain. We need to be prepared to relocate the BBS should that become necessary, perhaps on short notice. All members were asked to keep an eye out for a potential alternate location, at least semi-permanent in duration, for the BBS. Please pass on any suggestions you may have to any of the members on the Board of Directors.

Continued on page 3

Continued from page 2

➪ VA Patients Access To BBS: Harvey reported that the Board of Directors had determined that with only one phone line to our BBS it would be unfair to our members and hinder their access to the BBS. For the present we will be unable to grant access to our BBS to the VA hospital patients as had been requested by the Pinellas User Group.

➪ Review Software Available: Software provided by vendors for our review are published monthly in the newsletter. Since the last newsletter went to print, we have received 4 more software programs for review. All members willing to try the software and write an objective, comprehensive review are invited to contact Marylee (Newsletter Editor) about reviewing any of the the software available. A quality review benefits the entire group and the reviewer becomes the owner of the software reviewed.

➪ Public Relations Volunteer Needed: Membership growth of our user group does not reflect the quality of our group nor the benefits available from membership. What we need is someone that can take the bull by the horns and get information about our group in front of the PC users in the Tampa Bay area -- strategic placement of fliers, contact with area computer retail outlets/shops, etc., and develop other ideas and mechanisms to make the community aware of the Tampa PC Users Group. If you can contribute to this effort, please contact any member of the Board of Directors.

INDUSTRY NEWS

➪ MS Access 2.0: Release of Microsoft Access, the newest database program developed by Microsoft, has been released. Reportedly, sufficient copies are not yet available at all retail outlets to meet current demand, but keep checking if you are interested -- or order direct from Microsoft.

➪ Word Perfect 6.0a: A maintenance upgrade to Word Perfect 6.0, identified as WP 6.0a, is now available from Word Perfect. Distribution is not automatic and you must contact Word Perfect to get your free upgrade.

PRESENTATION -- Microsoft Access 2.0

Skip Purdy, Systems Engineer for Microsoft Corporation, was on hand to give us a rundown on the newest release of Microsoft's database program, Access 2.0. As an Access 1.0 user, I was anxious to see what changes had been made. I wasn't disappointed for there are numerous very good improvements. That is not to say that version 1.0 is deficient -- rather it is to say that Microsoft has taken a very good program and made it a heap better. Emphasis in 2.0 has been placed on making the program substantially more powerful and even more user friendly, so much so that a novice can jump in and do a credible job with it in short order. Many of the routine actions have been automated, and just about everything in the program can be customized to one's circumstances and needs.

Among other things, tool bars have been standardize with the other Microsoft Windows programs; button clues and right mouse-button short command help have been added; wizards have been expanded and made easier, and now include personal and business needs; control of fonts within the program; quick sorting of the data within the database, and drag and drop reorganization of data within a table or other organized manipulations of the basic data base; copies data in RTF format, which means all formatting goes with the copy; seamless integration with Word for Windows; supports OLE and works with any OLE application; reports and other outputs can include graphics of a variety of formats; includes a direct tie-in with a fax and provides for timed dispatch of faxes directly from Access; and many, many more. If you are a data base user, I believe you will want to take a look at Access 2.0 -- it includes a lot of 'easy to use' power.

Machine requirements for use of Access 2.0 are the same as for 1.0, except that 2.0 disk space requirements are more, now requiring about 20 Mb of hard disk space with all options loaded. Cost of an upgrade from an earlier version from Microsoft is $99, or $129 for a competitive upgrade. You can probably find a little better price at some of our retail outlets -- when they have the program in stock.

To Microsoft and Skip Purdy, THANK YOU VERY MUCH for an excellent presentation of a great program. Your overview of Access 2.0 increased geometrically my anticipation of beginning to use the program myself.

AND THE WINNER IS

Thanks to the generosity of Microsoft Corporation, who donated MS Access 2.0, and other vendors, there were some very nice door prizes. Those among us to have the good fortune to win are:

Tom Goff	MS Access 2.0
Parker Monroe	Links Course Add-on
J. C. Robinson	Cannon Mouse Pad
Jim Clark	Cannon Mouse Pad

The meeting adjourned at about 8:40 PM.

Editorial Comment:

There will be several margin, layout and deisgn errors within this issue of ***Bits of Blue***. Please forgive me, hopefully each issue will improve. So far PageMaker appears to be the best product for getting our newsletter out, now that we are at 16 pages. If you have any questions or comments regarding PageMaker please do not hesitate to contact me. I will be attending a class on PageMaker on the 28 and 29th of June, so look for improvements in the July B.O.B.

Marylee Bruneau

PRESIDENT'S COLUMN:

Internet the Information Super Highway

What the heck is Internet and how can it benefit me or my company? What do I need to use and access it? Will this Information Super Highway be like the Tampa Malfunction Junction? These questions and more will be covered at our next general meeting. Come out and listen to George Pilat, president of Intelligence Network Online Inc., discuss these issues and answer your questions.

501(c)(3)

She did it! A positive attitude and continuous perseverance by our Editor, Marylee Bruneau, finally brought some well deserved sunshine to our group. For over six months Marylee has been dealing with the IRS in establishing our group as a 501(c)(3). It's official and retroactive back to October when we first filed the application. For the immediate future this means that we can reduce our postage rate for the newsletter and permits those who donate items to our group to get a tax write off. For the long term this should provide us with donated computer equipment and miscellaneous items which we can use to promote our growth and implement community projects. This new status applies through December of 1997 at which time the IRS will review to group to see if it still meets the qualification for 501(c)(3) status. Our status can be kept intact by promoting education and special projects within the Tampa Bay community. If you have hardware or unregistered software that you don't use, now may be a good time to donate. Hey don't forget the company you work for may also have things that they would like to donate. Please ask your company. Even products that do not work are acceptable. Please join me in thanking Marylee for a job well done.

More BBS disk space

During my opening remarks at last month general meeting I stated that our group was looking for a hard drive to increase the BBS storage capacity. I mentioned that I was not too humble to beg, barter or whatever to get an additional hard drive. To my surprise and out of the back of the room I heard a voice say,"I got a 200 Mb drive you can have". Pinch me it can't be true I thought. It was as if Ed McMahn had said we won the Publisher Clearing House. A great big thank you to Elaine Marmel and may your hard drives live forever. We provided Elaine with a letter acknowledging her contribution to the group which may be used for tax purposes. Anyone donating equipment to our group will also get an acknowledgment letter.

Bad news turned good

Of course there was some bad news last month. The BBS was out of business for a while. After several days of tinkering and tweaking the BBS still had problems. Al Poole ,our VP, decided enough was enough and performed a magic trick. He pulled cards and chips and placed them back in there proper spots. Ok it was not a rabbit, playing cards or casino chips he pulled but the results were still magical. The BBS worked again. Thanks Al for rolling the sleeves, hey where did that ace come from, and getting us back online. Of course now that the BBS is working again, Al and Kevan are figuring out the procedure for installing that newly donated hard disk.

OS/2 SIG

The first meeting was conducted on the 26th of May. The meeting was the first of many to come. Our SIG leader, John Lucas, has added his name to the list of volunteers in the members help-line. John will provide help on OS/2. Please note that the next OS/2 SIG group meeting will be held on Tuesday June 28th. Contact John or Ed Buzza for additional information.

Here we go again

Over the years our editor has used several software products to create this newsletter. This months newsletter represents the fifth product, Aldus Pagemaker for Windows, to be used since Marylee became editor. As unofficial assistant editor I can tell you that its not immediate fun in the Bruneau household when we switch software or hardware. Some people may think that we are changing too often and that we deserve the abuse we bring on ourselves. However, if you have ever put a 12 page newsletter together on a monthly basis, you no what work is involved. Hey if software can make the job easier then so be it. Additionally, our newsletter is growing to 16 pages which a true desktop publishing package can handle.

General

If you have any tips or techniques that you would like to have published please contact Ed Buzza in order that he can include them in his column.

Harvey Bruneau

Softwart CD-ROM REVIEW -

America Adventure

By: Ed Buzza

America Adventure belongs in the category commonly referred to as edutainment. It educates while it entertains and is one of a series of CD-ROM products offered by the Knowledge Adventure corporation. Like other CDs of this type, it is a book that has been translated into the multi-media computer format. With a few important differences: sound and search capability.

From the main menu, selections include a few games (identify states by their outline, the state capitols, and famous landmarks), a gallery of all the presidents (with each portrait being metamorphosed into the next), an animated population chart of the United States showing growth by state, a series of video animations (movie clips), and the main tour.

The main tour shows a screen with icons across the top for several categories: people, history, natural wonders, native Americans, wars, arts, food, states, and immigration. The screen also shows several inserts: the globe which can be scaled from 100 miles to a view of the galaxy; a text window showing information about the subject, which can be printed; a row of icons for sound, library, print, zoom, retrace, and exit to the main menu; the video or graphic screen; and a scrollable time line.

As you click on a subject, it is shown in the main window with a voice narrating a brief message about the subject. The music is in keeping with the subject as is the text screen. And the global map pinpoints the geographic location. Use the zoom feature to show the main window insert in full screen mode. The shuttle blast off graphic is spectacular.

After you get past the Golly, Gee Whiz phase (although some remnant will remain), this is a very nice educational tool. The user is encouraged to move the cursor to find signposts in the form of pop-up balloons. When clicked, the program jumps to show that subject. As you keep researching deeper and deeper into the program, you might get lost. No problem, at all times you are only a click or two away from the main menu.

Informative, educational, and entertaining, it should appeal to all and especially to children in the first to seventh grade of school. Sound, graphics, and animation are quite well done. Of particular value is the pronunciation of various words and names. Can you pronounce Sacagawea?

Setup was a snap. Just enter the command to install, answer a few questions: type of sound board, Windows install?, and whether to install a minimum (3.25 MB hard drive space), quick (4.5 MB) or fast (7.3 MB) version of the program and the drive and directory for the program. Another 3.3 MB disk space is needed for a demo of the other, similar, products from the vendor.

While a CD-ROM can hold over 600 MB of data, this one has a lot of empty space. It uses about 106 MB for America and 198 MB for the commercials; so almost half of the disk is empty! Another thing, the price is a bit high for this type of software. Suggested retail price is $79.95. Office Depot wants about $60 and CompUSA charges about $35.00 (go figure). Considering the subject matter and other competing products, a price of around $20.00 would be reasonable. And at that price, they'd sell a ton of them.

System requirements are: 386+ under DOS 3.1+; color VGA or SVGA; if using a CD-ROM drive, one that supports ISO 9600; about 11 MB of space on the hard drive if using the disk version, or at least 3.3 MB if using the CD-ROM version; and 520 RAM. A mouse and a sound board, while optional, is recommended.

The product can be ordered from Knowledge Adventure, Inc., 4502 Dyer Street, La Crescenta, CA 91214. (800) 542-4240.

FRIENDS OF THE USER GROUP:

We acknowledge the following firms for their support:

- CompUSA
- IBM
- PC Warehouse
- Software Review
- Custom Computer Wholesale
- Staples
- Sunrise Computer Supplies & Parts
- Brainchild (Software Dist.)

We also acknowledge the following national software vendors for their excellent demonstrations and contributions of evaluation software to our group.

- Access Software
- Adobe Systems, Inc.
- Borland
- Corel Systems
- GeoWorks
- Lotus Corp.
- Microsoft
- Software Publishing
- Symantec
- Traveling Software
- Wordperfect

WELCOME NEW MEMBERS!

WE ARE HAPPY TO HAVE YOU IN OUR GROUP!

MEMBERS HELP-LINE

The following phone list is provided for our **Tampa PC Users Group** members in an effort to establish local support for those frustrating times which we have all encountered while using our PC's. Please note that these are members that have volunteered to help you, treat them in a courteous manner. Be sure to ask if it is convenient for them to help you now, or if you should call another time. It would also be helpful to have your documentation and have it handy when you call. *(Don't expect help if your software is an illegal copy or you do not have documentation!)* **TPCUG** is not responsible for the information or advice provided by volunteers. Volunteers may or may not be experts in the subject matter. You are on your own with any advice received. Be aware also that some of these volunteers may be consultants in their area of expertise. If you are interested in volunteering to answer members questions, either leave a message on the BBS or fill in the forms provided for this purpose at the meetings.

SOFTWARE REVIEW:

Managing your Money

(DOS Version 1.0)

By: Lester D. Heitlinger
Tampa PC Users Group, Inc.

Managing Your Money for DOS may be operated from Windows. Experienced Windows users should not experience any difficulty in operating this program from all versions of Windows. While there is no Windows icon in the program there are several icons available on the Bits of Blue BBS in case you must have one.

Requirements:

System requirements are: An IBM Compatible Computer, a hard disk with at least 4 megabytes (MB) of free space and a minimum of 640K RAM. MYM recommends at least 1MB of XMS or EMS memory, preferably 2MB which MYM will use automatically. If you are using a mouse be certain that you have a DOS mouse driver (even if your mouse works without one in Windows).

Installation:

Installation is from three supplied 3.5" Double Density Disks which are not copy protected.

Operation:

I experienced some difficulty in importing my Quicken data (from Quicken V.6). I tried several different techniques. The program insisted on tendering an incorrect balance. After several attempts I corrected the problem by making manual entries. Anyone starting from scratch should not encounter this problem.

The manual gives complete instructions regarding entering one's current assets. As with any new program it is imperative that one reads (and follows) instructions. This is not an easy program to operate. There is help available in the program but I found the user's guide to be more helpful in solving problems encountered when entering assets.

Some difficulty occurred when initially entering stock prices since market prices are quoted in fractions (ie: 45 7/8ths) and one must convert these fractions to decimals. When updating stock prices the fractions are available to the user.

Once I had all my data entered correctly, things ran smoothly. There is a desk facility included with the program which contains ten features such as Time Summary, Appointments, Phone Calls, Calculator, etc., which can be called up by "quick keys." These features are superfluous. Most computer users already have similar features installed through other programs. Frequently, when changing creens, the program inserts little "cutesy" sayings which I found

Managing Your Money was tested on an IBM compatible 386DX 33mb Compudyne Computer with a VGA monitor. No hardware problems were encountered. Free technical support is available either through Compuserve or directly through a toll call.

Personal Observation:

From a purely personal point of view, Managing Your Money is a useful tool for keeping records of investment portfolios if one has no other system of records. The checkbook program, in my personal opinion, is not equal to that of Quicken. The desk facilities are superfluous.

Managing Your Money is produced by: MECA Software, Inc., P.O. Box 912, Fairfield, CT 06430-0912 and sells for $32.92 at Egghead Software.

SOFTWARE REVIEW:

Seize The Day !

By: Connie Kincaid, Tampa PC User's Group

You know that out of touch feeling you get when working at the computer for hours? I'll bet you do if you have ever spent some in-depth hours without the light of day. It seems as if time stands still. Then suddenly you emerge to realize that time has flown by. If this sounds familiar, you'll appreciate the difference that makes Seize The Day different. This is not just another calendar program. This program looks at your system clock and simulates changes in the time of day with scenes that change as time changes. Seize The Day uses one half of the screen for the calendar portion of the program and another half for a gallery of changing scenes. These animated scenes all have something moving in them such as a babbling brook or falling snow. The scenes can be closed, left open when the calendar is closed or viewed with the calendar. Essentially the gallery operates as a separate window. The scenes change with the time of day and with the time of year. Seize The Day comes with a standard set of scenes from around the country. There are also several add-on packages that provide a wide selection of scenes from around the country, art and inspirational messages from a variety of environments (for a small fee $19.95 - $29.95).

Installation: Installation was fairly simple and lasted approximately 20 minutes. That is probably a maximum time because I like to stop and read everything during installation. Seize

Continued on page 8

Continued from page 7

The Day is a Windows compatible program. I installed it from File Manager. I did run into an error on disk #2 but nothing seems to be effected. In order to properly run the scenes you need to configure Windows to display 256 colors and at least 512K on the video card. Installation gives you the option to install three segments: the Gallery (5.5 MG), Daybook (1.1MG) and Alarm Sounds (1.3MG). Installing the whole program took just over 8MG of disk space. When installation was complete, I was prompted to call a 1-800 number to register. I called in the evening and was given a reasonably brief number to type in to unlock the program. If I had not wanted to call, I could have chosen to run the program in demo mode which would allow me to see everything but save nothing. Fortunately someone answered the phone, gave me a number and sent me on my merry way in a few minutes.

With my new program unlocked I began to explore the many features of this amazing calendar. I was prompted to open a new daybook (the calendar portion of the program) and realized that I could have more than one calendar or more than one person could have a calendar daybook under this program. I was also given the option to password protect my daybook. (I learned years ago to steer clear of passwords as much as possible so I didn't take advantage of the feature.)

The program offers many features not available in other calendar programs. This is just a brief summary of the features offered.

Program features:

Living World Gallery - Twelve pictures (one for each month) that vary the amount of light , weather and other features as the time of day changes. Each picture is animated so that some aspect of the picture is constantly in motion. For example, in February there is a gentle waterfall. In June there is an evening lightning show. If you want, you can use the Time Travel feature to view other days and times.

Calendar - The calendar can be viewed by the day, week, month or year. This calendar allows the user to enter recurring events easily. Items entered in the calendar portion can be 'dropped and dragged to the To Do List which is also visible with the daily view of the calendar. What a great idea for people who like to plan more than 24 hours into a day. The events in the daily planner can be marked done and tracked in a history file. Also, events may be picked up by the tick mark that precedes the item and dropped for easy rearranging.

Daily Planner - The daily planner allows you to enter events such as meetings, birthdays, etc. that can be marked DONE and added to a history of completed tasks. But, unlike the To Do List, these activities do not automatically roll forward to the next day if they are not marked DONE. I personally like being able to separate the things that I want to roll forward until they are completed (like doing my taxes) from things that I would not roll forward if they don't get done that day (like attending the PC User's Group - there is just no point in attending it on Thursday when the group only meets on Wednesday).

To Do List - The To Do Lists are not linked to the day which means uncompleted tasks are automatically carried forward until marked DONE. Seize The Day also keeps a log of the tasks completed for handy reference later.

Journal - This feature allows the user to keep notes linked to the current date . This comes in handy as a short diary.

Personal and Business Lists - Seize The Day may be one of the first address books to recognize that users need different information for business associates than for personal correspondence. The Personal list has room for 2 name lines and 1 phone entry per record while the Business list has room for 3 name lines and 3 phone entries per record. This layout is very handy for the way personal information usually differs from business addresses. Of course either format could be used as needed to accommodate the information.

Alarms - Bells and whistles can be set to remind you it is time. You may choose from any of 20 .WAV files that come with the program or add your own .WAV file to the list. You may be reminded at the designated time or in advance. Advance warning could be minutes, hours, days or weeks in advance.

Each feature has a button that is displayed in each screen to allow easy toggling from one feature to another. Any of the above may be printed for a traveling 'hard copy'.

Ease of use: This program was very easy to get started with. The screens are more than intuitive. They are labeled simply and nothing is buried several layers deep in menus whose logic is hard to follow. The manual is included in the program and can be dragged as a separate window to another area of the desktop and viewed while using the information contained in Help. (What a great idea!)

System requirements: Windows 3.1, 2MG of RAM, minimum of 3 MG hard disk space (8 MG for all features), VGA display (640 x 480) with 256 colors for Living World, Sound Blaster (or compatible) for full sound effects.

Conclusion: This program seems to take calendars to a new dimension of time and time management. I would strongly recommend it for anyone who has the disk space and enjoys scenery.

Suggested Retail Price: $59.95

Seize the Day, Inc. , P.O. Box 833/ Nizhoni Way, Calistoga, California 94515 Phone (707) 942-9391

SOFTWARE REVIEW:

UNDERSEA ADVENTURE

by **Knowledge Adventure**
Review by: Alford Poole, Tampa PC Users Group

"Dive into a fascinating underwater frontier." You can almost see the plaque on the Great White's teeth as it chomps and gnashes at the introduction to Undersea Adventure. This is unique educational software that grabs and keeps your attention as you learn about life in our oceans and seas.

Installation: CD-ROM installation requires from 3.25 to 6 MB hard disk space depending on the operating speed you want. My 13 year old son handled the installation and selected the fastest speed option, using 6 MB of hard drive space. He also install a 3.3 MB demo program to sample other Knowledge Adventure products such as Dinosaur Adventure, Bug Adventure, and Speed.

CD-ROM multimedia full-motion video and stereo sound is usable under DOS or Windows. The digital movies worked surprisingly well. They were the smoothest I've seen, with good detail clarity and nonstop sound. As you get closer to an object in the 3D areas, the detail turns to pixel blocks, but almost everything was recognizable.

Documentation: After my son installed the software, I let him explore it for a day or two and then asked him to give me a tour. Although he didn't use the manual, we covered all the major features of the program. This is a well-crafted piece of software. Ok, I peeked at the manual and it is well written, informative and includes a learning guide in the appendix to help with the learning process.

Support: BBS, FAX and non-toll-free technical support. This is one product that I didn't run into problems serious enough to consider calling for help.

Test Results: The test drive was quite enjoyable. Our system is a 486DLC 33mhz, 5 MB RAM, 8 bit sound card, Toshiba 3401 CD-ROM drive, and 1 MB VGA card set to 256 colors. The system was fast enough to play the flicks from the CD and still have good motion and sound.

Use the cursor, a cute little starfish, to move around the main menu, a wheel house of a boat. Select objects to do things or read the note balloons that pop up while moving the mouse around. For example, to go to the Undersea Movie Theater, click on the box of popcorn sitting next to the wheel. To take the Ocean Tour, click on the compass. This one could help young readers improve their reading skills. Printed words are boxed as they are read so the sounds can be associated with them. Choose the dolphin off the port bow for Who Am I? game. In this one you guess the animal using enlarged body parts as clues. Or choose the lighthouse for Can You Find Me? Here you identify animals in pictures by listening to and seeing the animal name. Click on the deep sea fishing boat and play What Do I Eat? When it wanted Sea Urchin I picked Elephant Seal and it responded "I don't THINK so." Click on the steering wheel for Undersea Reference. There is plenty of information here. We tried the print feature and got a report on oceans, climate and weather for the North Atlantic Ocean. It explained how the ocean helps to determine the temperatures of different areas of land. Neat stuff. The report was from "The Random House Atlas of the Oceans." Clicking on the fish picture takes you to Marine Animal Lab, which gets down to guts and bones of several marine animals, literally.

Limitations: "Sound Device in use." This is what popped up when I tried Undersea Adventure under Windows. The program started to run anyway, minus sound or music. This improved the motion of the video quite a bit (on rerunning it under DOS I noticed more jerkiness in the video), but the sound and music sure makes the program more interesting. Going back to the Readme file helped me find the problem. The printer and sound card were sharing the same IRQ. Change a jumper and off we go. Funny, how it workedjust fine under DOS . . .

Evaluation: Did we learn something and was it an enjoyable experience? Yes and yes. Humor is frequent, keeping things lively. A manatee says, "Hi, I'm a manatee. I used to be a boyatee, but I grew up."

It seems adaptable to a wide range of age groups and aquatic knowledge. A young person could keep coming back to this program to learn more as they grow and mature. The more mature user could get more out of the reference section learning about aquatic life in different regions of the world. Matthew is having fun exploring the program and has already learned a lot. You should hear what he wants to put in the aquarium now!

The full motion videos were a real plus to me. Very impressive. Keep up the good work at Knowledge Adventure. Recommended for anyone who wants to learn about marine life and have fun too.

Now for a pop quiz to see if you were paying attention. Would you expect to see Echinoderms on the menu at Wendy's anytime soon? Ok, that was an easy one. Would Cnidarians go well on a peanut butter sandwich? Right, it depends on their flavor.

Minimum System Requirements: 520 KB RAM, VGA, 386 PC, PC/MS DOS 3.1. Mouse and sound card recommended. **Cost and availability:** $39 at Computer City. Publisher info: Knowledge Adventure, Inc.,4502 Dyer Street, La Crescenta, CA 91214 (818) 542-4200 or (800) 542-4240 for orders.

SOFTWARE REVIEW:

HOME SURVIVAL TOOLKIT

(for Windows)
HOME REPAIRS
The Home & Yard Series
From.....Books That Work

Article by.....Larry Anders, Librarian
Tampa P.C. Users Group

Put your ideas to work with the Electronic Book of Home Repair.

A few years ago, before I became totally addicted to personal computing and BBSing, I fancied myself as a pretty handy man to have around the house. Over the years I have collected a good selection hand and power tools to make my home repair activities as easy as possible. But, because of my super-dooper, multi-media PC system I ended up at my work-bench much less than before.....until now! Now there is a way to put my computer to work on home repairs. Now I have a good collection of intelligent tools too.

The Home & Yard Series eliminates the guess work in choosing the right paint, cleaning agent or hardware. You can acquire useful information in a new format that has been designed by professional builders, artists and writers. The Home Survival Toolkit combines sound and animations that you control to show you how-to-do-it.

For example: To see how to connect a wire to an electrical terminal just click the mouse on the play button and watch! To determine how much paint you should buy for two coats in your bedroom just key in the dimensions of the room and....walla! If you own an older home there are special instructions to follow so as to not create more work in damaging the older construction materials.

Some of the areas covered in the chapters are Emergencies, Tools, Plumbing, Electrical, Heating and Cooling, Painting, Outdoors, etc. There is a survival guide section that includes toll free numbers for most major appliance manufacturers, and tips on stain removal, paints and adhesives. There are also cost estimators for paint, attic ventilization and concrete. Definitions are just a click away. Search for specific words and topics. Tips are included from veteran contractors and you are alerted to common dangers and mistakes.

Get help fast to:

- ☐ Stop a water leak
- ☐ Shut off a gas line
- ☐ Fix a dripping faucet
- ☐ Put out fires
- ☐ Wire a new outlet
- ☐ Remove stains
- ☐ Stop a run-on toilet
- ☐ Tape drywall seams
- ☐ Find studs
- ☐ Unclog gutters

Learn how to use, buy and rent:

- ☐ Hand and power saws
- ☐ Cordless drills
- ☐ Combination squares
- ☐ The right hammer
- ☐ Levels
- ☐ Cement mixers
- ☐ Adjustable wrenches
- ☐ Post hole diggers
- ☐ Rototillers
- ☐ Wallpaper steamers
- ☐ Power washers

....and much, much more!

If you are a windows user then you already know how to install the Home Survival Toolkit. Just issue the RUN command from the FILE menu and type A:SETUP (or B:SETUP). Follow the provided dialog box and install automatically or change to your specifications. Installation was straight forward with all the necessary safeguards built-in.

To install and run you will need a 100% IBM compatible PC with 12 megabytes of free disk space, 2 megabytes of RAM, minimum, Windows 3.1, and VGA. (Although there was nothing mentioned in the documentation about needing a mouse, I personally recommend using one.) For top performance a sound card is optional but not required. After installation Home Repairs will appear as a new icon in the Books That Work program group in your Program Manager. Documentation is minimal but enough. You just need to know how to click your mouse button to get started. A non-toll-free technical support number is provided if you should have trouble and a number for Books That Works BBS is also provided.

If you're looking for more shelf space for all those computer magazines then purchase the Home Survival Toolkit and get rid of some of those old Do-It-Yourself home repair books and replace them with a fast and practical electronic reference for your home.

Street price is under $50. For more information contact Books That Work, 285 Hamilton, Suite 260, Palo Alto, CA 9430, or see your local retailer.

Shareware Review:

Starting this month I will try to review a shareware program or two that I find worth the registration fee. Here's number one.

By: Larry Anders, Librarian,Tampa PC Users Group, Inc.

File Manager StepUp! Version 2

the File Manager Extender
Copyright (c) 1994, ChaoSoft. ($20)

Since I began using Windows 3.1 I have always felt that the File Manager was missing alot. Not anymore! Last month I found File Manager StepUp version 1, which I felt added enough options to File Manager, that made it well worth the $20 registration fee. Well, when I received the registered version there was a notice that version 2 would be out soon. It's here and it's great!

FM StepUp is a powerful and innovative File Manager extender for Microsoft(R) Windows(tm) 3.1, 3.11, and Windows for Workgroups (tm) 3.11.

FM StepUp makes the File Manager an actually user friendly application. With FM StepUp installed in your system you can perform various file management operations easier and faster.

FM StepUp enhances standard dialog boxes of the File Manager, providing them with additional useful features (history lists, remembering your previous commands; 'verify' check boxes; 'browse' buttons; 'view'/edit' file, and many more).

FM StepUp allows you to combine most frequently used commands of the File Manager into the Quick Menu, so you can access them just pressing the right button of your mouse.

FM StepUp makes your able to easily create, view, edit, or print arbitrary files, not necessarily associated with an application, and you can assign your favorite viewer or editor to do this.

FM StepUp provides you with some unique or hard-to-find commands, allowing you, for example, to figure out the total size of a directory, including all its subdirectories; change date or time of the file; run the default screen saver whenever you want it to; etc.

FM StepUp allows you to add your own commands to the File Manager and easily execute them. You may use this possibility to launch frequently used applications directly from File Manager menu, or to perform preprogrammed operations over files selected in a File Manager's window (like UnZip or UnArj).

If you are a network administrator, FM StepUp can help you to restrict some of the File anager's capabilities (in almost the same way as you do it for the Program Manager), allowing you to prevent your users from performing potentially dangerous or undesirable commands.

FM StepUp is highly customizable. You are in charge of almost every aspect of its functionality - from the size of the history lists to contents of the Quick Menu and Execute Menu.

The way File Manager should have been from the beginning!

Unlike most other Windows applications, FM StepUp is not a stand-alone program: there is no special executable file you would run to start the FM StepUp. To use the FM StepUp software, all you need is to properly install it, and it will run automatically every time you run the File Manager.

THIS IS SHAREWARE: TRY BEFORE YOU BUY !

You may try this program for the evaluation period of up to 14 days. After that time, you are required to purchase the software through registration or else discontinue its use. That I find worth registering. ☐☐☐☐

USER'S CORNER

WORD PERFECT - BLOCKING. When blocking text, position the cursor at the beginning of the block. Then when you press any regular key, WordPerfect will extend the block to the first occurence of that key; whether it is an alphabetic, numeric, punctuation, or the Enter key. Press another key, or the same key, and the block will be further extended as above.

About rectangular blocking in WordPerfect:
In WP5.1(DOS): position cursor at top left/right, Alt-F4, move cursor to bottom right/left, Ctrl-F4, 3 Rectangle (select option or press F3).

In WP6.0(DOS): position cursor at top left/right, Alt-F4, move cursor to bottom right/left, Ctrl-F4, tab to Type, <Enter>, 3 Rectangle, <Enter>, choose action.

...Contributed by Larry Anders

DOS - REDIRECTION. When a DIR command is entered, DOS will display the contents of the directory on the CON device — the CONsole or monitor. The directory display can be redirected to the printer or to a file. The redirection is done by using the > symbol.

Entering the following:

DIR C:\DOS > A:\DIR.TXT

will create the DIR.TXT file on the A: drive with the listing of the DOS directory on the C: drive. Substitute PRN for the file specification shown above and the listing will be redirected to the LPT1 printer (if it's on). Warning: if the DIR.TXT file already exists, it *will* be overwritten.

Enter the following:

DIR C:\UT >> A:DIR.TXT

and DOS will redirect the console data and APPEND it to the DIR.TXT file on the A: drive. That is the purpose of the >> symbol on the command line (redirect console data and *add* it to what has already been written). Further, if the file does not exist, DOS will create it. So, if you want to redirect data to a file, adopt the habit of only using the >> symbol. In these examples, DIR.TXT will hold the \DOS directory listing followed by the \UT directory listing.

DOS BATCH FILES. Even with all the features that DOS 6.2 and that Windows 3.1 have, there are still things that only a batch file will do. A batch file is nothing more than a set of DOS commands in a file with .BAT as the filename extension. Enter the name of a BATch file at the command line and DOS will execute each of the commands in that file as though it were a program; as though they were entered one line at a time at the command prompt. The AUTOEXEC.BAT file is a classic example.

TIMEDATE.BAT FILE. If you've read this far, might as well put some of this to good use. Using your favorite ASCII text editor, enter the following commands — *do not enter the line numbers*.

```
1   @ECHO OFF
2   IF "%1!"=="!" GOTO Syntax
3   ECHO | MORE | DATE | FIND "Current" >> %1
4   ECHO | MORE | TIME | FIND "Current" >> %1
5   GOTO End
6   :Syntax
7   ECHO Need a parameter for Date and Time stamp.
8   ECHO PRN = printer; CON = screen; or
9   ECHO D:\DIR\FILENAME = disk file.
10  :End
11  REM Send date and time to file, printer or screen.
12  REM If file, need drive\dir\filename as parm 1.
13  REM If printer, show PRN as parm 1.
14  REM If screen, show CON as parm 1.
```

Save the file as: TIMEDATE.BAT either on a floppy or in your utility directory. TIMEDATE does require a parameter to execute properly. The parameter must be: PRN, CON, or a full file spec.

The use of the @ symbol in line 1 in DOS 4 (or higher) prevents the line from echoing. Line 2 checks for the existence of parm 1 (the first parameter). If parm 1 is missing, then "!" is equal to "!" and the batch file will branch/jump (GOTO) to line 6, labeled :Syntax.

Lines 3 and 4 are a bit tricky. ECHO, DATE and TIME are commands but MORE and FIND are filters. The DATE command shows the FIND to get the "Current ..." which is itself filtered through MORE. And all this is passed to the ECHO command (which provides the <Enter>) that is redirected to parameter 1.

Whew! That was a toughie. I may not have explained this properly and if anyone has a more accurate or clearer explanation, please let me know.

Line 5 tells DOS to go to the line labeled :END (line 10). There is no END command to tell DOS to quit the batch job. The batch job is ended when the command on the last line is executed.

Line 6 is labeled :SYNTAX and was referenced by line 2. Lines 7, 8, and 9 tell the user (the dumb bunny) that a parameter is needed. In other words, where do you want the TIME and DATE to be shown? Line 10 is labeled :END and is used by the GOTO command in line 5. Lines 11-14 are REMarks and are ignored by DOS. After line 14 is executed (ignored in this case), the batch file is ended and DOS returns to the prompt line.

New members may want to review TEACHER.BAS on the New Member Disk(s) for an explanation of how DOS handles BATch files in relation to those with a .COM or .EXE extension. Those who are interested in BATch programming may like the BATPOWR conference on our Bitsoblu BBS. It is an excellent conference and the people who are "regulars" are really knowledgeable. Lots of good advice and many innovative techniques. If you want to learn more about batch programming, jump on this conference.

... Ed Buzza

A Lesson To Be Learned From the Automobile Industry

By: Robert X. Cringely

APCUG Industry Commentary Subscription Series Article #21
April, 1994 or later. Copyright (c) 1994, APCUG, All Rights Reserved. Permission granted for reproduction in official publications of member organizations of the Association of PC User Groups.

American software companies are merging and buying each other as fast as they can. In the last few weeks, alone, Novell has bought WordPerfect Corporation and the Quattro Pro spreadsheet business from Borland, Adobe Systems has bought Aldus, and Symantec has bought Central Point.

What we are seeing is just the start of a process of maturation that will take several more years to finish. It exactly parallels what happened in the American automobile industry earlier this century.

In 1920 there were about 300 American companies building automobiles. By 1930, this number had dropped to 25. By 1940 there were 10. Today there are three, if you ignore the Hummer. The same thing is happening in the software business, only faster. We took 70 years to accelerate from zero to 100 million cars, but we torqued to 100 million PCs in less than 20 years. So expect the software shakeout to take five years, tops, starting a year ago.

The shakeout in the American automobile business began when Alfred Sloan brought together a dozen car companies under one name — General Motors — creating a company so big, with such economies of scale, that the other car companies had to grow, too, or be unable to compete. In the software business of today, Microsoft is General Motors, with nearly half the industry sales. Novell is Ford. Lotus Development is Chrysler. Everyone else is either a merger candidate, a maker of expensive custom cars, or doomed.

All the smaller companies want to merge with Novell, because Novell is considered the only company that can stand up to Microsoft. Even Lotus wants to merge with Novell, though Lotus CEO Jim Manzi's ego demands that we call it Lotus buying Novell, rather than the other way around.

In this particular round of consolidation (other rounds will follow), all the big players are concentrating on filling out their application suites (packages of several bundled applications like Microsoft Office, Lotus SmartSuite, and Borland Office), because suites are the future of applications. Of course only Microsoft makes big bucks with its suites, at least so far. That's in large part because Redmond's suites are the best integrated, so they sell the best. It's to improve integration, to make the products work better together, that WordPerfect needed to own Quattro Pro. It's to have a suite at all that Novell needed to buy WordPerfect. It's to avoid certain death that WordPerfect needed Novell.

So, if every big company needs a suite, and every suite needs a database, this stage of the consolidation is far from finished. Look for Lotus and Novell to soon start fighting over the bones of Borland. Conventional wisdom says Borland can't survive on its own, and giving Novell one million free copies of Paradox (included in the deal to sell Quattro pro) clinches that. Borland can't expect to make any money selling Paradox if Novell has a million free copies to literally give away, and Borland doesn't have enough money to simply wait until all Novell's Paradox copies are gone.

Lotus wants to weld onto Notes the media server bits of Interbase. Paradox, too, would be a nice higher-end database to go with Approach. Borland's language group could either be merged into Lotus or sold to Computer Associates, the Ferengi of the PC industry.

Novell likes the Borland databases, too, but won't move until after Borland pays damages to Lotus for the 1-2-3 macro infringement case. An American court recently found Borland guilty of violating some Lotus copyrights, but the penalty Borland will have to pay has not yet been set. Novell doesn't want the judge to award Novell money to Lotus, and so will wait until after the judgment is ordered to make an offer for the rest of Borland.

Whichever company gets Borland, the other will turn its attention to either Powersoft or Gupta, two companies that have good technology but probably can't survive as independents in the long run. Lotus likes Powersoft a lot, and might run in that direction anyway.

So here are my predictions for how the American software industry will change over the next few months. This is important information if you own (or are considering) products from any of these companies.

(1) Novell will keep buying pieces of Borland until:

a - all that is left is the Lotus liability

b - the Borland stock price drops to a point it is cheaper to buy the whole company

The Quattro-Pro deal has not been completed yet. Jim Manzi of Lotus and Ray Noorda are talking about a settlement if Borland would cease to exist.

(2) Lotus has offered to buy the Paradox database from Borland and terminate the legal settlement. Borland might go for that.

(3) Borland's new CEO was hired by the major stock holders and has total control of the company. Philippe Kahn, who founded Borland, is only an advisor now. The new CEO has a reputation of selling companies in parts.

(4) Lotus wants Paradox and Borland's Mail API's, but does not care about the language compilers. IBM wants the compilers. Look for one of the big database firms (Sybase or Oracle) to buy Interbase and gut it for its technology. No one seems to want dBase which is ironic, since I've seen dBase for Windows and it could be a **BIG** winner. Buying Borland's dBase business would be a good chance for some Japanese company to get a jump-start in the worldwide applications business. Sprint would be an awesome addition

Continued on page 14

Continued from page 13

to a mail product, but Lotus and Microsoft haven't figured it out.

(5) Who will buy Quarterdeck? Something happened to them recently (which I can't share) that may put them in the market for a new owner. Microsoft needs their technology. They'd be a good fit to some of Novell's upcoming R&D efforts.

(6) Symantec? Interesting situation. All of their products are very profitable, however, their business is dependent on things Microsoft is doing poorly. I expect them to buy the compiler group from Borland.

(7) Powersoft? The good money is on Lotus buying them, however Computer Associates is interested as well. The **smart** move would be for Powersoft to buy Borland's compiler business.

(8) Microsoft? The U.S. Department of Justice is reconsidering whether to take legal action against Microsoft for trying to run a monopoly and Bill Gates is scared. Microsoft messed up big-time with the Stac Electronics case, where they were shown to have willfully violated Stac patents on data compression technology. I predict DOS will be put into the public domain as a settlement. In true Gates style, it will be brilliantly timed and have no impact on Microsoft. When Windows 4.0 ships, DOS could become useless. Just like donating the Crown Jewels one week before they turn to dust.

(9) Hostile takeovers? You cannot acquire a software company with a hostile take over. All of the value of the company is in the minds of the developers, the only people on the globe who can get a new $100,000 a year job in 30 seconds. Annoy the developers and your company is worthless. Anyway we're about due for some stupidity in the industry. I predict Computer Associates or Symantec will mess up in 1994.

(10) Software Publishing? Almost worthless and directionless. They're looking for a new owner. Symantec almost makes sense.

(11) Micrografx? Another misguided company. They would be a good deal for Lotus or Corel. They'd be most valuable to Microsoft but egos and old grudges between Bill Gates and Micrografx CEO Paul Grayson will prevent that.

Of course this model comparing American software companies to American automobile companies says nothing about Toyota, Nissan, or Honda. That stage won't be reached for another 10 years, but eventually some foreign software companies **will** break into the U.S. market and teach even Microsoft a very expensive lesson.

*Robert X. Cringely is an **InfoWorld** field editor from Palo Alto, California, best known for his "Notes from the Field" gossip column. This column is read by more than 500,000 computer professionals every week. He surfaced in public appearances in 1992 when his book, Accidental Empires, was released. Look for another new book later this year.*

Cringely is a former Stanford professor and foreign correspondent.

Book Reviews:

By: Hugh Bayless, MBUG (APCUG)

New From Jamsa

Kris Jamsa, the best-selling author of computer books, has started his own publishing company, Jamsa Press, and the results are outstanding. Among his best offerings are a new series of beginner-level books with titles that begin with "Rescued by ..."

Rescued by Windows, teaches beginners how to use Windows 3.1 in a series of 5-minute lessons that teach you what you need to know in as painless a way as anything I have found yet. Beautifully illustrated with full-color screen-capture pictures, even the most ignorant neophyte will find the going easy. On the other hand, experienced users will be surprised at how much can be learned as well.

Rescued by Word for Windows, does the same thing for version 6 of Microsoft's best-selling word processor. In a series of 5 to 10-minute lessons, you can learn everything you need in order to use Word for Windows effectively and efficiently.

Rescued by DOS, is the ideal book for the first-time DOS user and is a great help to anyone upgrading to Microsoft DOS 6.2. Like all the other books in this series, it uses full-color illustrations in 5-minute lessons that make it easy to learn and master DOS.

All three of these books are outstanding for their clarity and logical organization. They would be ideal textbooks for a beginner's class or SIG. Each is priced at $19.95, either from your computer bookstore or from Jamsa Press, 2821 High Sail Court, Las Vegas, NV 89117.

Get On-Line

According to the Electronic Mail Association, the use of E-mail is increasing by 50% per year in American Businesses. If you are one of the thousands who are just starting out with E-Mail and are wondering how to use that modem you just acquired, this book by Lamont Wood, a frequent contributor to Byte, Datamation, Omni, and other magazines, may be what you are looking for.

This John Wiley & Sons book is a good basic instructional book for the neophyte, explaining in illustrated detail how to install a modem, how to install and use several of the most popular communications programs, upload and download files, automate your calls, how to access the leading on-line services, how to communicate on the road, and how to protect your files from viruses. The author's advice is sound, "Stop worrying and have fun!" $24.95 at most computer bookstores.

MISPLACED HUMOR: (Continued)

Here are some signs and notices written in English that were discovered throughout the world. You have to give the writers an "E" for Effort.

In a Rhodes tailor shop: Order your summers suit. Because is big rush we will execute customers in strict rotation.

From the Soviet Weekly: There will be a Moscow Exhibition of Arts by 15,000 Soviet Republic painters and sculptors. These were executed over the past two years.

In a Tokyo bar: Special cocktails for the ladies with nuts.

A sign posted in Germany's Black Forest: It is strictly forbidden on our black forest camping site that people of different sex, for instance, men and women, live together in one tent unless they are married with each other for that purpose.

In a Zurich hotel: Because of the impropriety of entertaining guests of the opposite sex in the bedroom, it is suggested that the lobby be used for this purpose.

In a Rome laundry: Ladies, leave your clothes here and spend the afternoon having a good time.

In a Czechoslovakian tourist agency: Take one of our horse-driven city tours--we guarantee no miscarriages.

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII file or in a commonly available word processor format, such as WordPerfect 5.2, or Ami Pro 3.0 on diskette to the editor at 9402 Hidden Ridge Place, Tampa, Florida 33637 or send it by modem to BBS (813)239-3704.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

The use of trade marked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted at the following rates:

	1 month	3 months	6 months
Full Page	$60.00	$162.00	288.00
Half Page	$40.00	$108.00	$192.00
Quarter Page	$22.00	$60.00	$106.00
Eight Page	$12.00	$33.00	$58.00
Business Card	$10.00	$27.00	$48.00

All advertisements must be prepaid by check payable to TPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if it is not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, Marylee Bruneau at (813) 985-3338, for space availability and for further information.

This newsletter is created with PageMaker 5.0 from Aldus Corp. and Corel Draw from Corel Systems.

Secretary's Report

MINUTES OF 6/8/94 MEETING

By Ed Buzza, Tampa PC Users Group, Inc.

Jim Clark is out there in California enjoying himself and has left the gathering of the minutes of this meeting to a "volunteer" appointed by our eminent President, Harvey Bruneau himself.

USER GROUP NEWS

Non-profit status: After months of hard work by Marylee Bruneau, IRS has granted us 501(c)3 status. Also, she has obtained non-profit mail status for our corporation from the US Post Office. This will help reduce some of our newsletter costs.

PageMaker: This top end desktop publishing program is now being used to prepare the newsletter and appears to be very user friendly.

Print plant: The editor is looking for a new source to print the newsletter. Preferably in the Temple Terrace area. The use of scanned images, while excellent when printed, suffer in image quality (too dark) when processed by local copy centers. If anyone has any suggestions, please contact Marylee or Harvey Bruneau at 985-3388.

BitsoBlu BBS: The BBS had a bit of trouble a few days back. But it's fixed. Thanks in large part to Al Poole. Between he and Kevan, they tore that BBS completely apart, poked and prodded, examined all the boards, etc., etc., and put it back together. Now it works but neither Al nor Kevan know just exactly what caused the initial problem.

INDUSTRY NEWS

Comdex: It was a bigger show than last year. One of our members said there wasn't enough time to see all that was there. The demo on ACCESS suffered from some minor glitches. It was pointed out that ACCESS puts everything into one data base file. It can export pieces of that data base to other data base programs and will import it's own exports and work on them. Thus an ACCESS user and a Paradox user can both work on the same exported file.

OS/2: The personal version is now in beta release. It's available from CI$ and IBM; but it is not to be posted on any other source or BBS. The release is on 21 diskettes and costs about $15 plus S&H. It will run on a system with 4 MB RAM; and the swap file can be turned off. Call (800) 251-2177 for details.

MS-DOS 6.22: The new version of DOS has a new disk compression module and is due out at the end of this month. $50 for 5.0 and earlier users, $10 step-up for version 6.x users. The new version has nothing new for 6.2 users. Users were cautioned not to have Stacker 4 already installed and then install DOS 6.22. You are advised to install DOS 6.22, then install Stacker. Symantec programs, and some others, need a patch

see **Minutes** ....Continued on page 3

Minutes...Continued from page 2

to cope with the new compression module.

PC-Tools: This venerable software developer has been bought by Symantec.

Borland: They lost $70 million last quarter. dBase 4 for Windows now sells for under $100. With such a drop in earnings, the sale of Quattro to Novell along with a million copies of Paradox, the future doesn't look well for Borland .

DELL monitors: Dell has recalled 63,000 monitors because there were 32 reports of them overheating and catching fire. The monitor being recalled is the DL-1460N1, a 14" SVGA, sold during 1992-93. These were sold through Sam's, Cosco, and CompUSA. Dell will arrange for pickup and replacement free of charge. For further information, call (800) 913-3355.

CD-ROM: There is a facility in the USF area that will put your pictures on CDs. In fact, anything you want can be put on CDs; text, instruction manuals, graphics, etc.. Cost depends on a number of factors and there is a marked difference in price if the pictures are negatives or positives.

PRESENTATION — Internet

George Pilat of Intelligence Network Online gave an excellent discourse on Internet; its origins, uses, and the role of his company in using Internet. The fact that Mr. Pilat spoke for ninety minutes extemporaneously and gave a logical step-by-step presentation of a complex process, speaks volumes for the depth of his knowledge about on-line retrieval systems.

Internet:

In the early 70s it was a net work of DOD computers (Advanced Research Projects Agency - ARPANET) to establish a communication network in the event of a nuclear war. During the late 70s, other networks were created initially serving universities and later, commercial organizations. The research portion of ARPANET was replaced by the National Science Foundation (NSFNET). Elsewhere, international networks were being established and they tied in to each other and to United States networks. Today, nternet is the fastest growing network in the world with over 2 million computers and over 20 million users. The primary tools are:

E-Mail: Basically, a message handling service. E-mail is often faster and cheaper than conventional mail

Newsgroups: There are about 7,500 to choose from. While each group is centered on one topic or theme, overall, topics cover everything from A to Z. Many of the people in these groups are subject matter experts. Ask for help and you'll get expert help.

Gopher: A search tool that helps in locating a certain body of information. The material can be read on-line or downloaded to your computer.

Telnet: An Internet facility that allows logging onto another computer; faster than modem dialing.

FTP (File Transfer Protocol): Allows the downloading of files from any other computer on Internet.

IRC (Internet Relay Chat): Interactive discussion groups where several people can talk/listen at the same time. There are over 1,000 channels/groups available. A private TALK mode is available.

The Internet is funded through federal grants. Access to the Internet by the lay public is possible through some BBSes and commercial servers such as IntNet Online, Compuserve, Delphi, etc..

IntNetOnline:

Intelligence Network Online, Inc., offers a variety of services; access to Internet being one of them. These services are offered through a high end UNIX platform with over 20 GB of online storage. At present, all modem lines are 14.4 (and downward) and 28s will soon be installed. The available account styles are:

Shell Dial Up: Normal dial in PC running through their computer. Shell uses command line prompts, no graphic interface. Uses "pine" program to handle E-mail. Cost is $29/month with a one time $29 setup fee. There are no hourly charges, usage time is unlimited. A tutorial diskette is furnished to all new users.

Dial Up PPP: Point to Point Protocol allows you to be registered with your own location. In effect, you have your own Internet set (like a mini server). Can use Mosaic, a public domain graphical interface, to navigate through the system.

Dedicated PPP (SLIP): Serial Link Internet Protocol. Once logged in, you are on 24 hrs/day, the line never goes down. E-mail is instant. Can have friends log in on your computer and they can use your machine to access Internet.

Dedicated Line: Offers 56 kb speed (commercial speed). Commonly used where like 30 people are online. Uses the frame relay service of GTE. This service is being offered within the six county area of Tampa (Hillsborough, Pasco, Pinellas, Polk, Sarasota and Manatee). The frame is for 24 hrs/day and 56 kb servers are installed at each of the nodes. T1: 1.45 MB speed or the equivalent of 24 56kb channesl as an entity.

For further information, call (813) 442-0114.

Thanks to the generosity of our vendor friends, we have the following winners:

Will Goble - Simply Money
Gene Wade - CorelDraw V4

After a few general questions/answers, the meeting adjourned at 8:40 pm.

PRESIDENT'S COLUMN:

Internet

I hope everyone got at least a basic idea about Internet, the global information superhighway, at our last meeting. I hope to schedule a live Internet presentation later this year. As many of you probably noted, a whole new language filled with acronyms and buzzword is used to relate to the navigation and use of the information superhighway. While these terms are new to us they have in fact been around for quite a long time. Of course you all heard the CIA acronym used along with the word LAOS during the presentation. I hope that everyone realized that those are not Internet words. I am not sure how the presentation diverged into a discussion of the covert operations of the 70's. Anyway cybersurfing the highway can be rewarding once you have all the tools and have built up the experience. Only you can determine if this digital highway is for you. It is anticipated that the highway will have over 100 million users worldwide by 1998. Whether you just want to use the most basic piece, email, or have access to detailed information about anything, I would recommend you get your hands on one of the many books available from your local book store. I use The Instant Internet Guide by Brent Heslop & David Angell to clarify the proper netiquette and help me understand the highway.

BBS & CD ROM

Please note that a CD ROM drive has been added to the BBS which will provide access to additional online files available for download. We have a subscription that will provide us with a monthly CD containing files from the Association of Shareware Professionals.

July presentation will be a big bang!

This month's meeting will be presented by Broderbund. This will be the first time that six different products have been demonstrated during a general meeting. There should be a product for everybody. The products include:

Living Books - Interactive "electronic books" for children based on stories and books of proven literary value.

Kid Pix - Creativity tools that can be used to enhance studies across all curriculums.

3-D Home Architecture

Print Shop CD - Desktop publishing for greeting cards, signs, stationery, calendars, banners and more.

Myst - Surrealistic adventure game with 3-D photo-realistic graphics

Harpoon II - Naval game

Of course special user group offers and door prizes of Broderbund products will be made available.

Tampa Tribune moves onto information Superhighway

The Tampa Tribune, in conjunction with Prodigy, is in the process of starting a new service. *Tampa Bay Online*, an interactive local news and information service for personal computer users in the Bay area will begin operation in August. Imagine reading the daily paper online including photos, graphics and other miscellaneous information. Once again Bill Gates's vision, "Information at your fingertips" is taking another step forward. A paperless society is in the future and the Tribune is doing its part to speed up that process before we run out of trees. The presentation to our group of *Tampa Bay Online* by the Tribune has been tentatively scheduled for the August general meeting. I say tentative because this product debut by the Tribune to the general public, is scheduled for the day after our general meeting. If Murhpy's law interferes, during the days prior to the grand opening of this service, it could result in the postponement of the presentation to our group, until a later date.

We need your help

We need you to help our group. Bring a guest and get them to join our group. Pass out our flyers to your business associates or friends. Donate those computers and miscellaneous computer items sitting around your home or business. Our group can get bigger and better, but only if you help us. Remember we are now classified with the IRS as a 501(c)(3) non-profit organization. Donations are tax deductible. Check with your tax accountant for proper deduction filing.

Harvey Bruneau

Editorial Comment:

As I mentioned in the last newsletter, I used PageMaker to publish the June *Bits of Blue*, which I received 3 days before the newsletter deadline. I struggled thru, with relatively few real problems, but it was evident to me that I needed some expert training in this powerful product. On June 28 and 29th I attended a PageMaker class from 9 to 4 at Learey Technical Center. The class at Learey was extremely beneficial to me, of course the fact that I had a teacher (Jennifer Spooner) with a thorough knowledge of the product, helped me immensely. Jennifer not only did an excellent job in teaching this product, she was very helpful to those in the class that were somewhat new to the whole windows environment. She kept the experienced students challenged and at the same time gave out valuable pointers to the beginners. I immediately came home and began putting the July *B.O.B* together utilizing all that I had learned in my class.

see **Editorial...** Continued on page 5

Editorial....Continued from page 4

For those of you interested in taking some computer classes either for personal or business reasons, Learey Technical Center has a printed brochure of the classes they are currently offering. The classes are very reasonable in price and I wish to share with you, our members, the following information concerning the school:

Learey Technical Center became official July 1, 1993. The Center is named in honor of Fred D. Learey, a former GTE Florida president during the 60s and a prominent business and civic leader for more than three decades. Because he initiated partnerships between business and education, the School Board dedicated the Center in his memory.

The Center provides training for business and industry in 4 areas: Industry Services, Health Industry Services, Public Service and Apprenticeship. The Industry Services Training Program consists of computer, supervision, and employee development training. The Computer Department instructs more than 16 software application in both DOS and Windows versions, including CorelDraw, DOS, Excel, Harvard Graphics, Lotus, Word, WordPerfect and Quicken.

Learey Technical Center sets the standard for employee training and development in the Tampa Bay Area serving business and industry since 1983 in the names of Industry Services Training Programs and Tampa Bay Evening Vocational Schools. Call Mary Ellen Beiletti at 231-1907 for program or class information.

I also owe a word of gratitude to one of our seasoned members, Ed Buzza, for some of his helpful Pagemaker hints and tips. Thanks Ed, I tried to use them all!

Marylee Bruneau

Software Review:
Automap Road Atlas for Windows
Automap Destination Europe

By: Ed Buzza, Tampa PC Users Group, Inc

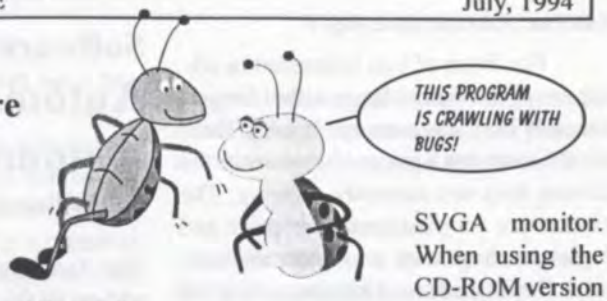
The *Automap Destination Europe* is an add-on to the must-have *Automap Road Atlas*, therefore the comments here treat them as one package.

Installation was a "no-brainer." Start Windows, pop in the first disk and tell Automap what directory you want it in *and* your name and company! This program has one of those irritating features where they insist on writing back to the floppy disk. Rule #1: Always do a diskcopy of the master disks and install from the work/archive copies. This program gets tiffy if the first (install) disk is write protected. Another anomaly is that of the three disks (the Road Atlas set), two are high density and one is double density. And it has no "uninstall" option!

There is a great deal that the user can do to customize the program. Such options as the level of detail in showing names, route numbers, small cities, parks, points of interest, mountains, etc.. City icons and roadways can be customized to show different colors and sizes. Whether all cities and towns are named is up to the user. Caution: showing the names of ALL the towns can be time consuming on a slow PC and without an accelerated adaptor card.

Using the map zoom in/out feature of the program is very intuitive. A tape measure simile to measure straight line distances is a nice touch. Planning or marking a route can be as simple as clicking on the starting and ending points of the trip. Provision is made to avoid user defined routes, use only interstates, calculation of shortest and/or quickest routes, and whether to travel a preferred route. Another attractive feature is that at most city points, you can call for nearby points of interest--and it shows how far away they are. The program can print a report showing the itinerary with directions, mileage, and estimated times. Surprisingly, the calculated mileage is quite accurate. By adjusting certain variables, the calculated times are also very reliable.

On a scale of one to ten, this program is about a six. Writing to the install disk is very annoying and one questions the value of it when it can (and should) be installed from a work copy. Not having an "uninstall" option these days, is almost criminal. The biggest drawback is that there are *no* city maps! Not even a shaded outline to indicate city boundaries. Even when the scale is at maximum zoom (about a 9 mile area will fill the screen), there is no sense of the size of a city. And if all features are turned on (parks, names, route numbers, mountains, etc.), they are written on top of each other. There is no adjustment for these items in relation to map size. While fine at the maximum zoom level, it is very disconcerting at the state or national level. Further, it is only after opening the manual that one is told that many local roads will not be shown; only those that are part of the national road system.



The master program needs about 5.5 MB of space on the hard drive and the add-on needs an additional 3 MB (the box says 1.5 MB, the install sheet says "at least 2 MB", but actual count shows over 2.4 MB--so figure on 3 MB). At least 2 MB of RAM is needed (4 MB is recommended), MS-Windows, ver 3.0, and using a mouse is highly recommended. The vendor is Automap, Inc., 1309 114th Ave. SE, Suite 110, Bellevue, WA 98004. The street price is around $60 for the master program and around $40 for the add-on.

Software Review:

Bug Adventure from Knowledge Adventure

CD-ROM MULTIMEDIA

Review By: Renate Marsh

Products that are fun and educational as BUG Adventure is, will give you and your children an interactive way to learn together what our world is all about. The Knowledge Adventure Family Series are created to be enjoyed by everyone within a family, class, or any other type of group of all ages. It says on the box of the program Bug Adventure that it is for the ages 3-8. What an assumption! I had as much fun as any child might have and just taking a walk through the program I learned more about insects and nature than in the last 10 years or since my school days.

Once Bug Adventure is installed and set up properly, one can easily move about the screen and choose any activities from the main menu. The pointer of the mouse is a little lady bug and while moving around the screen it opens up bubble balloons with notes of any of the activity that can be performed.

Bug Adventure has a bug reference index, guessing games, an animated picture storybook, a 3D viewer of the insects, a talking and picturized reference manual, and to top it all off - it also has a "BUG" movie theater. Whatever screen one is on, the bubble balloons give hints and directions and sometimes have a surprise ready for the viewer. The sounds and music of this program are delightful and enhance any action or picture to its' fullest; if you don't have a sound card as yet, Bug Adventure also runs without a sound, but you will be missing a lot. The notes in the balloons send you from one activity or information to the next. There is nothing to study or remember about how this program works. On the DC-ROM version the balloon notes can be read to the viewer. On the disk version the viewer still has to read all the directions and information, but either version gets the viewer from one place to another and back. Many objects on every screen open up a note balloon when the lady bug pointer moves over it to let the viewer know all the different direction to go to from that point on.

With the program comes a special 3D pair of glasses to examine and discover the visual effect of 3D insects, apparently trying to crawl out of the screen and onto the nose of the viewer.

Bug Adventure works either in DOS or Windows. Any big graphical program does better when installed in DOS. Though, this one came with a CD-ROM disk, the program still has to place quite a few files onto the hard drive. The DOS environment is less of a problem and always much faster, unless you have the newest of the new in computer technology.

The User Guide manual is only a 30 page book because the on screen help is fantastic and continuous. The control buttons on the bottom of the screen or the various exit buttons always get the viewer back to the main menu. A big stop sign is the "exit the program sign". Though, one section in the manual is a Learning Guide parents or teachers can use to help the children or students to learn while having fun playing with BUG Adventure. I see this program as an exploration into the BUG world for all the users - big and small. I learned so much just reviewing BUG Adventure for our club. Did you know that a moth might look like a butterfly? I always thought a moth is of grey or brown color. Did you know that there is a type of spiders that go fishing in the water? Well, the Honeycomb Theater in BUG Adventure has a movie that shows all the details about this performance, under water and above.

System requirements to run Bug Adventure: A 386 CPU is required, a 486 & up CPU is recommended. A color VGA or SVGA monitor. When using the CD-ROM version you need a drive that supports ISO 9660. Hard disk space: 9MB, for CD-ROM: 5MB hard drive space. RAM free: 520KB & up. A mouse is optional, but the program runs much smoother with one than using the keyboard alone. A sound device like Sound Blaster or compatible required for CD-ROM version, but optional for the program with disks installation. A printer is also optional but it will give you the opportunity to print all the Bug Adventure text files. Not only that, you can also capture the images and creating bit-mapped files (BMP) by using the <Ctrl-PrtScr> command. Make sure that you turn off any sound and music before you capture images. Once the bit-mapped file is created you can use many different graphic programs to retrieve and print these images.

The most common questions and problems are already answered in the back of the manual. Make sure you read those questions and answers before contacting the company, since many questions are explained and answered in details in that booklet.

The cost: CD-ROM version: $79.95 - disk version: $59.95. Contact Knowledge Adventure at:

4502 Dyer Street
La Crescenta, CA 91214
Order: 800 542-4240
Support: 818 542-4200

The reality of the images and movies of this Bug Adventure program will amaze every viewer. Have fun and at the same time learn about the secret creepy, crawly bug world which is all around us.

Software Review:

CROSSTIES for windows 3.1

by CrossTies Software "The Next Generation Information Manager"

Reviewed by: Nicholas Klak, Tampa PC Users Group, Inc.

The package this (PIM), personal information management software, came in was sizable and impressive. A slick fold-out carton, with a velcro snap, contained the software. A video tape with about eight minutes of instruction was included. The video tape was interesting but not very important to the understanding of the program. The video consisted of a CNN., Larry King look alike, complete with suspenders and a blue button down shirt, intoning the need for informational management in one package. The low toned voice ends the tape with the statement, "Crossties, the greatest thing since windows".

Crossties loads in through the Windows program manager. No surprises here. It does take longer to load that one might expect since the entire program is only on three high density disks. They can be duplicated so their is no problem about vault storage of the originals. The minimum machine needed is a 386 with four megs of ram. Eleven megs of hard disk space is necessary for the program to run. The program files are greatly compressed on the three original disks. This is version 1.0. That means that it has not been revised. As always we must be aware that new software has the possibility of "bugs". For all that warning, I saw no indication of faulty workmanship.

Crossties has three books that come with it. A quick reference booklet of fourteen pages gives an excellent and clear understanding of the menu and button bars. A second book of about one hundred pages called, "Getting Started", is the life saver for the user. It contains many well illustrated directions and relatively large print. A step by step tutorial is carefully and logically run through. The third book is the users guide. Another well illustrated text with good print. The material is covered in fifteen chapters and six appendix sections.

Upon starting the program you must choose between two data bases. A sample data base which contains the information for the tutorial and the standard data base which is used for entering the real information you wish to organize. I strongly suggest that you go through the tutorial several times. This is not the kind of program which is intuitive. There are logical sequences to steps taken but without several tries at the tutorial, they are not apparent.

The installation process goes through all the directories in your hard drive. These are all listed as programs which can be linked to or from. One of the differences of this program and other PIM's is that not only do you create a large data base of information on people and things within a community of interest, but you can also "link" people and documents within your database.

The tutorial begins with you as an office manager for the Southern Mutual Company of Dallas, TX. You have fifteen people who work for you as insurance agents and financial planners. Your boss is Debora Adams. You must use your database to schedule your day and rearrange appointments. The tutorial is well paced and not so long as to be tedious.

Importation of information from other PIM's is possible. Other PIM data supported are from Packrat, Ecco, Commence and Act. Data from dbase or as text files can also be accepted. I was able to import documents from Word Perfect and Microsoft Word . My favorite word processor, Microsoft Works, was not supported directly but I was able to import the text as an ascii text file. All documents can be linked to any information in the database and to any person. These documents, however, can not be edited. They are frozen in time when imported. Macros are able to be created. That is good news for all of us that like to have them. They can be recalled by a "button" which you add to you menu bar. The bad news on this is that to create the macro, you must write a short program. I have always struggled with the smallest of batch files. If you must have macros, be prepared to write several small lines with cryptic instructions. The manual gives complete instructions. Information can be transferred from one area to another without difficulty. This is accomplished through the editing commands of Cut and Paste. A screen automatically pops up to ask one more time,"Are you she you want to do this?"The flexibility of the appointment calendar was most impressive. Without typing you can change time, duration of meeting and dates. Everything is mouse and keyboard controlled. I preferred to use the mouse prompts but for those who are die-hard keyboarders, they will feel quite at home. The day timer schedule can be printed out in any size or origination including pocket size as small as 1" x 4".

The main activity that the program is designed to do is to manipulate a database which you have created, added to or imported. As mentioned earlier, Crossties imports data from other PIMS. You have your choice of setting up these projects for a group or an individual. I was able to go to several programs and copy items from them. The Crossties diamond symbol inserts itself in the menu bar of the activity and you click on it to link that item to your grouping. The ability to link fax information to various projects is stressed. Faxes may be sent or received and a special fax alert is displayed when you receive one. Email is also covered in detail. Crossties assumes this vehicle of sharing information is of great importance in the business world.

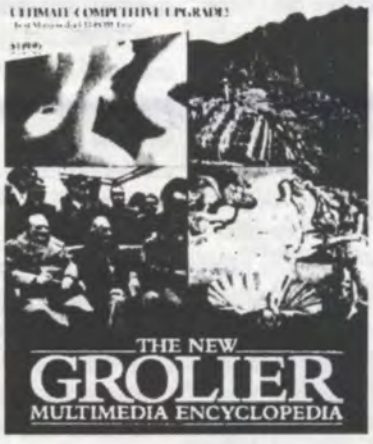
One aspect of the program which is mentioned but not promoted is its ability to facilitate multitasking. I was

see **Crossties**...Continued on page 8

Crossties....Continued from page 7

able to use Print Shop Deluxe for windows within Crossties. I could create and save a picture and then put it in a Crossties individual file. My Print Shop actually printed faster while it was within the Crossties mode than when it was only in Windows. This is the best multitasking program I have used. You can copy or cut what you want, click to another menu, select your destination and the paste it there. Programs may be included or deleted from the Crossties setup after the original installation. Either possibility has no effect on your Windows setup. Windows keeps its programs secure from the effects of this program. I opened up over six different operations at the same time and The program never faltered.

Crossties is a program which needs study and practice. The authors have written a complex and useful product. While it isn't intuitive, it is achievable. You will not run out of learning opportunities with this. The price is right. Computer City has it for $89.00. Other PIM'S are substantially higher. Technical support is available Monday through Friday 9:00A.M. through 5:00PM. C.S.T. A B.B.S. operated by them is also available. Unfortunately, No 800 number is given for either service.



I recommend this product. It has to be learned. Those In the business world will find it less confusing than those who are not. It has great possibilities as a vehicle for multitasking. ❑❑❑❑

SOFTWARE REVIEW:

GROLIER -- MULTIMEDIA ENCYCLOPEDIA

Review by: Larry Anders, Tampa PC Users Group, Inc.

If you own an IBM-compatible PC, 386sx or better, with Windows 3.1 and don't have a CD-ROM drive - **GET ONE!** - because now you have a reason! **The New GROLIER Multimedia Encyclopedia (NGME) is the reason!**

You can now take an adventure or relive exciting historical events without ever leaving your computer. Just imagine being part of the Apollo 11 crew and watching the Eagle lunar module as it pulls away from Columbia on its way to the first moon landing or learn about human embryo development from a step-by-step animation and narration.

NGME has **MULTIMEDIA MAPS** that lead you on an animated journey through time and make it easy to view individual historical events.

KNOWLEDGE EXPLORER has audio-visual essays that combine photos, music and narration to provide a comprehensive overview of such subjects as the human body, space exploration and the lands and people of Africa, to name a few.

MOVIES are included that feature motion video sequences of such memorable events as Lindberg's first transatlantic flight and Martin Luther King's "I Have A Dream"speech.

Some of the narrated animated sequences offer clear explanations of such subjects as aircraft technology, weather and the solar system.

A **TIMELINE** is included that enables you to travel along a continuum of time - from prehistory to the present - stopping along the way to learn more about important periods, dates, topic and events.

There is a **KNOWLEDGE TREE** that makes it easy to narrow broad searches into specific areas of interest.

Included on the CD-ROM are all 21 volumes of the *Academic American Encyclopedia* containing over 33,000 articles on a wide variety of subjects, including Science, World History, Music, Art, thousands of pictures, high-quality sound, full color maps, fully updated encyclopedia text and much, much more. And all this for under $100 street price.

Any of this information that you would like to use can be copied into any Microsoft Windows-compatible word processor, manipulated to your heart's content, and then printed out.

Along with the previously mentioned requirements a VGA color card and monitor is required but SVGA is recommended. A Microsoft Windows-compatible sound card and drivers are required for audio. Hard disk with at least 1.5 MB of free space, 4 MB of RAM and mouse. The CD-ROM must be MPC-compliant (150 KB/sec sustained throughput) for optimal playback of movies and animators. For printing, a Microsoft Windows-compatible printer is required. There is also a network version available.

Installation is straight-forward like any Windows based program by just using the **R**un command for the **F**ile menu.

I own four other CD-ROM based encyclopedia programs and none of them come close to the **NEW GROLIER MULTIMEDIA ENCYCLOPEDIA**. But don't just take my word for it. Ask my daughter in high school, or my other daughter in college, or my wife who is a teacher, or MACWORLD, InfoWorld, Compute, PCWorld and BYTE magazines. They all rate it very high.

So do I! ❑❑❑❑

User's Corner

USER'S TIPS

DOOMSDAY KIT - A Bootable Diskette. Every PC owner should have a "Doomsday Kit." It should have a bootable disk for the A: drive. It's a good idea to put instructions for the use of the disk in a README text file on the disk. And know where to find the neces-sary manuals for the files on that disk. To create a bootable disk, put a blank disk in the A: drive and enter the following: FORMAT A:\ /S /F:nnn where /S tells DOS to put the system files (MSDOS or IBMDOS, IO or IBMBIO) and COMMAND.COM on the diskette. The /F switch tells DOS how to format the disk and "nnn" states the capacity of the disk (360, 720, 1.2, or 1.44).

COMMAND.COM (DOS V6.2) itself holds the "internal" commands:

BREAK CD CHCP CHDIR CLS COPY CTTY DATE DEL DIR ERASE EXIT LH LOADHIGH MD MKDIR PATH PROMPT REM REN RENAME RMDIR SET TIME TRUENAME TYPE VER VERIFY VOL CALL ECHO EXIST FOR GOTO IF PAUSE SHIFT ERRORLEVEL

For a basic kit, copy onto the bootable diskette the follow-ing DOS files: BACKUP, CHKDSK, FDISK, FORMAT, MEM, RESTORE, UNDELETE, UNFORMAT, and XCOPY. Also rec-ommended is LIST.COM, a file viewer and manager utility writ-ten by Vernon D. Buerg.

- ASCII Text Editor. An ASCII editor belongs with these files. Copy the EDIT and QBASIC files if nothing else is available. There are smaller size edit programs that will suffice for creating batch and configuration files. Consider QEDIT, TED, or even EDLIN.

- Backup/Restore. Also copy BACKUP and RESTORE from the DOS directory if these were used to create backups. If a third party backup program is used, a copy of that program should be part of the kit.

- CMOS. Last, a program(s) that will save and restore the CMOS (Complementary Metal-Oxide Semiconductor) settings which hold basic data about the computer. If nothing else, call up the settings on the monitor and write them down. With the Phoenix chip, Ctrl-Alt-Esc will show the settings. Check the instruction manual for your computer. DO NOT make any changes unless you know what you are doing! Read the instructions on the screen or in the manual; just look, record, and exit. PC-Tools (Central Point Software) has utilities that can save and restore CMOS. There are other programs available includ-ing CMOS13.ZIP, a shareware utility on BitsoBlu BBS.

Windows 3.1 - Help. You can create your own help screens. Bring up any application and click on the Help Menu. In the Help window, select the item you want to add notes to, click on Edit, then on Annotate. Enter whatever notes you want to record for that particular Help item, Save, Exit. Windows will place a paper clip icon on that help screen as a reminder that you have your own help notes for that subject. You can also print or save-to-file any of the Help topics. Just click File, Print; or choose Edit, Copy to clipboard, Paste to a document and save the file.

WordPerfect - File Bloat. Have you ever noticed that some of your text files are larger than they should be? That you have about 2k of text but the file size is over 6k? WordPerfect puts a file header or prefix at the front of every file saved in its own format. That prefix contains information about the file, the printer being used, the fonts, etc.. One of the things contribut-ing to file bloat are deleted fonts. Every time you change a font, data is added to the prefix. If you delete a font, the corresponding prefix data is not deleted! And if scalable fonts are being used, about 2-3,000 bytes are added. Of course, you can save your text files in ASCII format if all you want is the raw data. i.e. No formatting codes. There is a better way. At a blank document screen, enter a single space then retrieve the bloated file. The "junk" is stripped from the file because the codes in the new document govern the retrieved information. Now save the file and there should be a reduction in file size. There is one caveat, if you changed fonts without deleting the old font codes, the old codes will be carried to the new prefix. So before retrieving into the "blank, one space" docu-ment, delete any unused font changes in the old file.

BUGGY SOFTWARE. More and more it seems, new versions of software have more bugs than ever before. The old saying "Never buy version 1.0 of *anything*" is truer today than it ever was.

Before installing a new program:

Run CHKDSK to guard against lost clusters or cross linked files.

Run a defragger to clean up the hard drive.

Copy AUTOEXEC.BAT and CONFIG.SYS to another directory or to a floppy diskette.

For Window applications:

Use INCTRL (it's on our BBS).

Backup Windows to tape, another directory, or to floppy disks. At least save WIN.INI, PROGMAN.INI, SYSTEM.INI, CONTROL.INI, MAIN.GRP, and STARTUP.GRP in another directory or to a floppy diskette.

Make backup/work copies of the master disks.

Install the new program using the backup disks.

Run the new program to see if it works!

Run CHKDSK to see if anything was messed up during the installation.

Compare/check for any alterations to AUTOEXEC.BAT or CONFIG.SYS, especially the PATH command. Do the same for the Window .INI and .GRP files mentioned above.

Ed Buzza.....

SOFTWARE REVIEW:

Quicken for Windows Version 3

The Personal Financial Manager

Review by.....Don Meng, Tampa PC Users Group, Inc.

Required: 100% compatible (or IBM), 2MB RAM, Windows 3.1 running in Standard or Enhanced mode, at least 5MB space on hard drive, Windows supported monitor and printer. Test installation: 386, 20 mhz, 5MB RAM, Windows 3.1 Enhanced, 100 MB space available. HP 4 laser jet.

When I got the opportunity to review Quicken for Windows several reasons popped up. For years I had not used any of the accounting packages because I kept all my own records on spreadsheets. And I would never use a program to write checks! But I have seen a couple of people who do it, and more, not only just writing checks and balancing their statements, but paying electronically, running three or four check books, reconciling the whole works in minutes, keeping their investments, etc.

In addition, I am involved in SeniorNet, a computer training program for people over 55 years of age, and one of the highest demands was for a course in Home Financial Management using Quicken. So starting this fall we are going to offer a course and it would be good if I knew the program.

And finally, earlier this year, my wife asked me to make a list of where all our accounts are. After showing her how to get into QPRO, I gave up. Quicken is the solution for us!!

Obviously I started from scratch, so it was a simple installation. I had read the start up manual and a great deal of the User's manual. Both easy to read and very clear, including warnings to avoid TSR's when loading. So I had to disable my automatic virus checker and special screen saver. Got everybody out of the house and sat down at 8:15, copied the 2 3.5" disks for backup purposes. (I always use backup disks for installation.) Ready to go at 8:30 and by 9:00 was completely installed and ready to follow the CUSTOM install - Quicken belongs in my Applications directory.

Choosing to load the hardest book first, I loaded my checkbook starting on January 1, 1994. After one month, I began to see why the wife would have a difficult time if I was not here - my handwriting is almost unreadable!

But I made it and by 10:30 I finished up book #1. This is probably the easiest program I have ever loaded. There are so many cues, hints and suggestions you almost can't go wrong. Every once in a while a Qcard would pop up and they are great. Context sensitive help right while you are working. Let's look at only a few of the best parts, loading the check register.

Date: today's date was there. Click the icon and the months calendar show. click left arrow five times and you are in January, click on the 1 and go. If your transaction is on the 4th, press the plus key 3 times and it is there. Press the Tab key to go to Num.

Num: Enter the check number & press the Tab key. (But what if it is a deposit? Anything but a number brings a drop down menu. Since I make quite a few errors I typed ERR. And BEHOLD!!! the next time I had to enter an error, I type an e and the program automatically typed ERR! this trick works for DEP(deposit), TXFR [transfer], etc. It is beautiful.) Tab key again.

Payee: Enter the payee and press Tab. You go to the Payment column. (The next time you pay this payee, you get a suggested name: for instance type A, the program suggests the last payee, such as American Express. Since I also pay Anthem Insurance, that pops up when I enter An.) Press Tab

Payment: Since Anthem Insurance payment is the same every month, the suggested payment was there the second time I paid and all I had to do was press the Tab key to go on. (If this transaction was a deposit or credit error, the cursor went automatically to the Deposit column.)

Deposit: Since my Social Security is the same every month, this box has the suggested deposit. Press Tab.

Payee: {again} There is a memo field for describing the transaction. File it in and Press Tab.

Payee: {again} There is a category field - you MUST make an entry in this field.

[This is the place where you should spend most of your study time before starting. If you have a category of expenses or income which is not standard, you can add them as you load your data. For example, I make so many errors that I set up a category called Adjust-ments. If you plan this carefully your charts and graphs later on will be much clearer.]

After you check all the data in that transaction, click the Record button and you go to the next record. It is as simple as that.

Then I started checking through all the options, writing a check, charts, graphs - every button on the screen. You ought to see how much the "Utility" category takes out of your assets. You get a pie chart in default and if you use the Utility category for

See **Quicken**...Continued on page 11

Quicken ...Continued from page 10

sewer, water, electricity, telephone, the pie chart shows it very clearly. Quicken almost makes spending money fun. I guess it would if I had a large amount of dollars left to put in savings after paying all bills. And when I next reconcile with the bank, I am going to be able to read what I wrote and I'll bet I balance a lot quicker.

Since we run three checking accounts, the next step is to enter them and tie them all together. Then, this is so simple, I am going to enter all the data on my credit cards, categorize all the charges and then combine all expenditures to find out where the money goes, besides out.

For the future, I expect to start using the electronic payment feature, and also budgeting. The budget procedure looks powerful, and since I now control my own escrow accounts for the house, that will be a help. Also I will add investment accounting, a personal balance sheet, and by the end of the year my wife will be able to understand where we are and what to do if I am not here to help her. Quicken to the rescue!!

The Billminder facility will help her more than anything else. You can set the program up to remind you that you have a payment to make today as soon as you turn on your computer, or when you start Windows, etc. And if you have gone on vacation, when you come back it will tell you everything you were supposed to have done, until you acknowledge every transaction reminder.

The capability I will use the least is the Reports section. I ran a few of them, and if I was running a business, I certainly would use them. Loan handling used to be a big one which would have been a boon - you know, helping your kids get a house, major improvements, cars, etc. It is simple to set up and track loans and the reports are very useful.

Quicken for Windows Version 3 is the most user friendly software I have seen or used. If it's friendly features have been there for years I can see where the big software firms are getting some of their ideas.

Installation: Extremely easy, the software was write protected but not copy protected. It alerts you if you do not following instructions, and permits a custom installation. You control the whole thing.[My autoexec.bat file is always Read Only and this did not hurt the installation.]

Documentation: I rate the documentation at 9.5 out of 10, 10 being the best. The 'Getting Started Guide' is easy to read [If a person has installed Windows, this is a simple but clear book, well written. I only had to mark the book in three places: 1. Where they warned you about TSR's and the need to remove them during installation. 2. If you had an earlier version or the DOS version, watch out for the file conversion. & 3. On page 18 where the 'First Time Setup' screen appears with the caption: The only time you'll see this window is the first time you start Quicken. Warnings like that upset me because I don't like to reinstall. But later in the book you find out you can correct for that problem.

If you register, you get FREE, Unlimited Technical support. Since I could not register this edition, and since I had no trouble, I did not test the Tech Support. The pc magazines do that well and Quicken comes out good. The registration card is obnoxiously place in the front of the 'User's Guide.' There is a 4 page section telling you how to avoid calling Intuit, extolling the virtues of all the help available in the program and the manuals. The last page clearly lists all the ways to get them if you do need them.

You get sample checks, envelopes, a catalog of their supplies, a savings certificate for $30 for TurboTax for Windows, and an intro to Checkfree electronic payments.

I plan to use Quicken, with Checkfree, recommend it for anyone for their personal finances and look forward to our classes at SeniorNet.

Intuit, Inc., P.O.Box 3014, Menlo Park CA 94026, 1-800-624-8742

MISPLACED HUMOR:

Here are some signs and notices written in English that were discovered throughout the world. You have to give the writers an "E" for Effort.

Advertisement for donkey ride in Thailand: Ride on your own ass.

In a Copenhagen airline ticket office: We take your bags and send them in all directions.

On the door of a Moscow hotel room: If this is your first visit to the USSR, you are welcome to it

In a Norwegian cocktail lounge: Ladies are requested not to have children in the bar.

In a Budapest zoo: Please do not feed the animals. If you have any suitable food, give it to the guard on duty.

In an Acapulco hotel: The manager has personally passed all the water served here.

In a Tokyo shop: Our nylons cost more than common, but you'll find they are best in the long run.

From a Japanese information booklet about using a hotel air conditioner: Cooles and Heates: If you want just condition of warm in your room, please control yourself.

From a brochure of a car rental firm in Tokyo: When a passenger of foot heave in sight, tootle the horn. Trumpet him melodiously at first, but if he still obstacles your passage then tootle him with vigor.

Partial reprint, thanks to the 12/93 KCA Computer Group Newsletter.

SOFTWARE REVIEW:

QmodemPro for Windows v1.10

Review by: Alford Poole, Tampa PC Users Group

The unknown is always scary. Faxing was an unknown till I got a fax/modem, but even with the capabilities at my finger tips, I balked at trying something so different. Then I found a local office depot that would receive faxes for five cents, so I could punch out faxes and let someone else stay on-line to catch the replies. The software that came with the modem, QuickLink II FAX, was functional, but limited.

I've become a fan of multitasking (as well as Windows can do it anyway) and had recently tried a Windows terminal program called Excalibur. Excalibur was very impressive, multitasked well when downloading files, but when I tried to call a Bulletin Board System (BBS) that had Fidonet, the program couldn't handle typing ESC twice to start the BBS software. Fidonet is one of my favorite BBS activities, so Excalibur went to the cyber space dungeon. Then along comes QmodemPro for Windows, a white knight, from Mustang Software, makers of QmodemPro for DOS and Wildcat BBS software. QmodemPro for Windows focus is making communication with computers, whether between computers, with BBSs, or sending and receiving FAX, fast, easy and interesting.

Features: Several local BBSs support RIP (Remote Imaging Protocol from TeleGraphix), including our own Bits of Blue. To use RIP with QmodemPro for Windows all it takes is a few clicks of the mouse to select it as an emulation for each RIP supporting BBS or as the default to have it available for all sessions. There is also a generous helping of other terminal emulations available to choose, from ADDS VP60 to Wyse 185.

The package includes both 3.5 and 5.25 high density floppy disks, and installation went well, except the last question asks about using a fax driver as the default printer. The question wasn't mentioned in the documentation, but either way, if your choice is not acceptable the driver is easy to change. Choosing the fax
driver gives you the benefit of being able to send faxes directly from any Windows application. At the end of the installation Last Minute Changes pops up for your perusal.

QmodemPro for Windows has a built in GIF viewer for working with GIF and BMP graphics files and it supports sound cards. This means you can assign WAV sound files to specific events during your QmodemPro session. Six basic WAV files come in the package, or use your own to personalize events. "Reestablish communication," starts my session with QmodemPro and a big bell sounds when a download completes. These two WAV files did not come with the package, but they were easy to add to the events sound list.

*"Especially made for BBS users, **QmodemPro** for Windows can help you get the most out of your modem."*

Another cool feature of QmodemPro for Windows is the ability to review information in the scrollback buffer at the click of the mouse. This is handy if you forget to start a log file and want to see what's happened recently in your session - while on-line or after you hangup.

If you would like to host other callers, QmodemPro for Windows can set up a mini BBS using the Host mode capabilities to handle messages, files and pages.

Documentation: Each manual (there are two: Users Guide and Script Guide) has a colorful graphic design on the cover and the insides are well done too. Easy to read type fonts, lots of illustrations and even a philosophical quote at the beginning of each chapter.

Support: The technical folks at Mustang can be reached in quite a variety of ways: by phone, fax, mail, CompuServe, GEnie, and America Online. A one month free subscription to CompuServe is included with QmodemPro for Windows.

Test Results: Scripts, scripts, scripts. I'd heard of them and even seen them in action, now I have a couple that work too. With a single click the modem will dial Bits of Blue BBS, log on, go to the TQM door, download a packet and log off. And its so fast! The script language SLIQ (Script Language Interface for QmodemPro) is based on BASIC (Quick Basic by Microsoft). It is so comprehensive you could probably write a script to get the kids off to school each morning. There is also a Quicklearn feature for creating scripts without learning the language and a compiler, debugger, and editor. The script for QmodemPro for Windows is a little different from QmodemPro for DOS, so if you are making the switch or are new to scripts, read up on the differences or definitions.

Up/down loading in the background is really handy (right now a 328KB file is uploading while I type this), especially if you connect to a 2400 baud modem and are transferring a large file. The one working in the background now will take about 19 minutes to complete. Meanwhile I can tell you about a few more neat features of QmodemPro for Windows, like collating copies. If you have several different pages to print and need more than one of each page and would like them collated, QmodemPro can do it. Instead of printing the number of copies for each page, you get sets, already collated. Is this great or what? The reference section of the User Manual is loaded with other neat stuff.

See **QModem-Pro...**Continued on page 14

QModem-Pro.. Continued from page 13

The default terminal window is set between an upper screen tool button bar and a lower screen macro button bar with spiffy design strips on each. This all protrudes into the terminal window space and when you call a BBS it displays 25 lines in a smaller than usual space. Squished characters result which are harder to read and tiring after a while. Removing the button bars and increasing the number of lines to be displayed improved the readability greatly.

Options: QmodemPro for Windows does not come with Off Line Express, an off line QWK mail reader, as QmodemPro for DOS does, but is available for $40 from Mustang.

Evaluation: This is an excellent product and I have no reservations about recommending it to anyone who needs a communications package they can grow into. Especially made for BBS users, QmodemPro for Windows can help you get the most out of your modem. Mustang has made their product usable, productive and full of neat features and details. An example of attention to details is found in the status window. While downloading a file the status window shows all the standard information plus it gives the Throughput and Efficiency of the transfer. Keep up the good work at Mustang Software!

System Requirements: 386 or better, 4 MB RAM, VGA or better graphics card and monitor, 5 MB available hard disk space, Microsoft Windows 3.1 or higher, standard or enhanced modes, Windows compatible mouse, COM1-COM4 or Digiboard with comm drivers, any internal or external modem. Network modems: LAN
modems via INT 14, NASI/NCSI using appropriate Windows comm drivers. Class 1 or Class 2 FAX/modem capabilities for handling faxes.

Cost and availability: Suggested retail price $99 through Mustang Software using the phone number below or at Software Etc. Publisher info: Sales (800) 999-9619 Mustang Software, Inc. Office (805) 873-2500 P.O. Box 2264, Bakersfield, CA 93303 BBS (805) 873-2400 FAX (805) 873-2599

SOFTWARE REVIEW:
Disk Optimizer for Windows, Version 2.00

Review By: Renate Marsh

What is a Disk Optimizer? Wy do I need it? How does it work? Where will it do any good?

What is it? Well, as much as you need to tune-up your car, your software and hard drive needs the same kind of care and tune-up. The Windows environment is a great invention but it does need maintenance after you used it (abused it as I do at times) for some times. Disk Optimizer is the cleaning crew that performs tasks when your computer is idle to repair damages to the disks layout. What is so incredible, this Disk Optimizer knows when your keyboard and mouse is idle and it jumps right into action to use this opportunity to do its work to defragment your hard drive in the Windows environment, to sort out the bits and pieces of your files and store them in a continues string, or to explain it better - to optimize your workspace the best way possible. This program is set up automatically in Windows, but if you feel like your DOS environment needs the same care and optimation, then you also have the possibility to go to your DOS prompt (C:>) and run Disk Optimizer for your DOS programs.

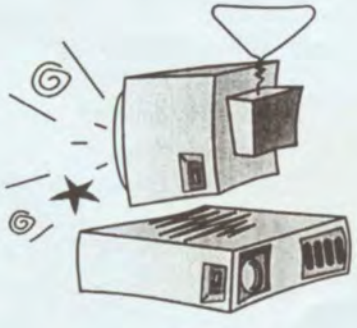
Why do I need it? As with your car, the daily wear and tear on your hard drive and Windows can slow down your operation within any of your programs, especially in Windows. Fragmentation of files is one of the greatest problem within your system. DOS and Windows do not care where they scatter your files while saving them. Worse, they take them apart and place part of them in one slot and another part into another slot. Just one file might be scattered around in more than a dozen slots, and it takes time to find all the parts to present them to you as the user in one piece. Your hard drive works overtime to complete this job. Installing Disk Optimizer makes it easier on your hard drive and gives you faster service.

How does it work? Besides many other services, the installed Disk Optimizer defragments your hard drive. It takes all the bits and pieces of one file, places the file in one spot up front of your hard drive, in one piece. The time savings are tremendous, since your system only has to search for one complete file to open it up for you. Your hard drive does not have to work overtime all the time to present any file to you or to run any program as smoothly as possible. The Windows Disk

Optimizer is especially fantastic since it will operate while your machine is idle and will stop its action when you continue to work on something in your programs and continue again where it left off to optimize you system.

Where will it do any good? I installed the Disk Optimizer on my Laptop. My desktop computer has Stacker installed and these two programs are not compatible at this time. The company SoftLogic Solution is working on this problem right now and will sent out an update. Also known conflicts and problems are with Norton Desktop, version 1.00; After Dark Screen Saver, and DOS 6.0. My laptop is running in DOS 6.0 and Windows 3.1 and I had no problems whatsoever. Though, I noticed something quite terrific. My hard disk was performing much faster than before I installed the Disk Optimizer and when I checked the sys-

See **Disk...** Continued on page 15



Disk... Continued from page 14

tem my files were in orderly fashion lined up in one piece each up front of my hard drive. What a beautiful sight!

The Help Files and the Manual of the program tell you how to set it up to have it automatically loaded when you turn on your computer. In the Windows environment you can forget about it being there. It will take care of your hard disk fragmentation automatically. In DOS you just need to type the command <OPTIMIZE> at the < C:>DOWIN > directory and a menu driven screen display will let you select the drive to optimize, and also let you choose different kind of actions. It is best to choose: Complete Disk Reorganization for the first time. You do have to make sure that no other programs are running at the same time, like any of your TSR programs or multitasking environments.

My hard drive on my Laptop is happy, cleaned up, and running at top speed. When I run Windows and any Windows program, I don't even need to think about it. Once a month, I will run Disk Optimizer in DOS and that will make me happy too.

System Requirements: Windows 3.1 running in 386 enhanced mode; 0.8MB (800,000 bytes) free space on your hard drive. Company: SoftLogic Solutions, Inc. One Perimeter Road Manchester, NH 03103 To order call: 1 800 272-9900 Technical Support call: 1 603 644-5555 FAX: 1 603 627-9610

CD-ROM REVIEW:
Clip Master Pro

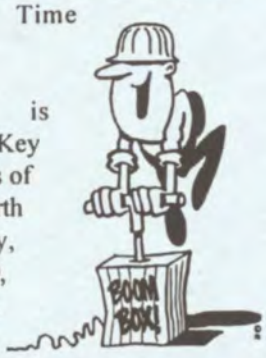
Review by: Ed Buzza

The Key ClipMaster(c) Professional Image Library contains 5,001 images in .TIF (Tagged Image File Format - bit mapped graphics) format on a compact disk. All the images are black and white—no color. On this page are a couple of those images.

The name on the reference manual is shown as ClipMASTERPRO; all scrunched together with no spaces. The street price is around 21-23 dollars but I got my copy at the Office Depot in Brandon for $31.94 (tax included). One of our members got it for $23 at CompUSA.

For the price and the quality of the clipart, this is a *real* bargain. For the PC user who prepares newsletters, flyers, club bulletins, or just wants to dress up personal correspondence, this is almost a "must have."

None of the files are compressed. Installing the utilities is just a matter of creating directories and copying files from the CD-ROM. Utility programs are included for both the DOS and Window environments. Being an old dinoDOSarus, I use the DOS utilities.



One of the programs lets you create a catalog of graphic files and lets you view that catalog. Within the directories on the CD-ROM are catalogs or "galleries" that show a low resolution thumbnail of the graphics. The same program shows information about the graphic such as pixel size, number of colors, creation date, etc.. The example shown here is 693 x 855 pixels and has a file size of 74,557 bytes. Using a 300 dpi/inch printer, you get a very sharp image if you size the graphic at a width of 2.3" with automatic height adjustment.

There was no problem in importing these graphics into Express Publisher, Word for Windows, WordPerfect 5.1 and 6.0 for DOS, and Publish-It. The clipart is categorized as: alphabets (fancy letters for drop caps); animals (gator included); business (comic and serious); cartoons (with a sweaty penguin); computer (30 pix); exercise (20 of these); fashion (over 350); travel (not bad); food (like that BLT); frames/borders (can be used as mortises); headings (advertisement style); health care (so-so); holidays/special events (over 500 from New Year to Christmas); miscellaneous (it really is); people (babies to grandparents); religion (from the bible to the torah); retail (sales logos and headlines); and sports/recreation (they're all here).

The DOS system requirements are: CD-ROM drive, MS CD-ROM extension version 2.10 or higher; DOS 3.0+, 286+ w/640k RAM, VGA video, 2MB of free memory, a hard drive, and an HP LaserJet compatible printer or an Epson compatible dot matrix printer. The Windows requirements are: Windows 3.1+, 286+, 4MB of free memory. Any Windows supported video adapters, monitors, and printer drivers. Mouse recommended.

There is also a CD-ROM version for the Macintosh (Classic, SE, IIcx w/4MB memory, a hard drive and a laser printer; System 7 and Color Quick Draw required and Quick Time recommended).

The product is marketed by SoftKey Software Products of Florida, 4800 North Federal Highway, 3rd FL, Building D, Boca Raton, FL 33431.

It's a blast man!

SPECIAL NOTICE: OS/2 SIG

is scheduled for Tuesday, August 23rd at 6:00 p.m. in room 436 on the fourth floor of the Lakepoint One building across from Tampa Bay Mall.

AUGUST 10th AGENDA

Tampa Tribune presents Tampa Bay Online

An interactive local news and information service to personal computer users in the Bay area. It will provide the entire local content of The Tampa Tribune daily -- including photos and graphics. Subscribers may obtain unlimited timely information about the Tampa Bay region and its resources.

Up Coming Presentations:

September 14 - **IBM - New Personal OS/2**

October 12 - **Gold Disk**

November 9 - **to be announced**

December 14 - **Broderbund - new products**

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII file or in a commonly available word processor format, such as WordPerfect 5.2, or Ami Pro 3.0 on diskette to the editor at 9402 Hidden Ridge Place, Tampa, Florida 33637 or send it by modem to BBS (813)239-3704.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

The use of trade marked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted at the following rates:

	1 month	3 months	6 months
Full Page	$60.00	$162.00	288.00
Half Page	$40.00	$108.00	$192.00
Quarter Page	$22.00	$60.00	$106.00
Eight Page	$12.00	$33.00	$58.00
Business Card	$10.00	$27.00	$48.00

All advertisements must be prepaid by check payable to TPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if it is not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, Marylee Bruneau at (813) 985-3338, for space availability and for further information.

This newsletter is created with PageMaker 5.0 from Aldus Corp. and Corel Draw from Corel Systems.

Secretary's Report

Minutes of 7/13/94 Meeting
By: Marylee Bruneau, Tampa PC Users Group, Inc.

The Secretary, Jim Clark, was not present for this meeting and an alternate secretary was not available to take written minutes.

AUGUST 13TH PRESENTATION:

Harvey announced the presentation that is scheduled for the August meeting is **Tampa Bay Online,** a new service being announced the day after our general meeting by the Tampa Tribune, to the Tampa Bay community. This should be an extremely interesting presentation and all are encouraged to attend the August meeting for a Sneak Preview of **Tampa Bay Online** before it is formally introduced to the general public.

PRESENTATION:

The presentation by Broderbund was cancelled at the last minute, and has been re-scheduled for December of this year. All members present were understanding and graciously filled in the meeting time with a very active Question and Answer session. The open discussions were holding the attention of the members. Comments by some of our members at the completion of the meeting indicated that this type of meeting is extremely beneficial for the group.

THE WINNER IS:

Alan Jankowski - Quicken for Windows
The Meeting adjourned at 8:35 p.m.

FRIENDS OF THE USER GROUP:

We acknowledge the following firms for their support:

- CompUSA
- IBM
- PC Warehouse
- Software Review
- Custom Computer Wholesale
- Staples
- Sunrise Computer Supplies & Parts
- Brainchild (Software Dist.)
- Realtron

We also acknowledge the following national software vendors for their excellent demonstrations and contributions of evaluation software to our group.

- Access Software
- Adobe Systems, Inc.
- Borland
- Corel Systems
- GeoWorks
- Lotus Corp.
- Microsoft
- Software Publishing
- Symantec
- Traveling Software
- Wordperfect

Book Review
PC first-Aid Kit

By: Alford Poole, Tampa PC Users Group

We expect PC's to live long and prosper, punching out letters, crunching numbers and helping teenagers with their homework. Anxious feelings grip our hearts when "Error: Invalid File Name" or worse "Current Drive Is No Longer Valid" flashes across the screen. Cosmic concern develops when we hit "Print" and it doesn't or we realize the deleted file was a .BAT instead of .BAK. Our choices are limited: the warranty expired yesterday, the toll-free service number has been disconnected, the dealer has moved to Oregon, and the manuals are . . . well, manuals.

Marty Jerome and Wendy Taylor, coauthors of The Streetwise Guide to PCs (Addison-Wesley), are Senior Editors at PC/Computing and have put together a paramedic's bag of tips in PC First-Aid Kit. This book and accompanying 3.5" disk of utilities, gives steps to try to cure your PC's illness yourself. It also covers when to get the patient into capable hands for repairs and when to break out the shovel.

Documentation: Chapters cover problems with the system, drives, printers, keyboard, mice, video, memory, Windows, DOS, and repair shops. If you'd like to learn more about a virus, there's a chapter on them too. Good reference material. The Appendix has information on editing CONFIG.SYS, AUTOEXEC.BAT, WIN.INI, and SYSTEM.INI and DOS commands (those that are helpful and those to avoid).

Software: The included software is an impressive line up of products from XTree, McAffee Associates, Dariana, Ontrack Computer Systems and TouchStone. The installation program dumps all the files for all the utilities into one directory and although this may not be a big deal to seasoned PC users, could be a bottle neck for novices trying to get their system back in order. The moral is: play with the utilities and get a feel for what they can do before trouble strikes. XTree Lite will help with file management, McAfee's VIRUSCAN can help keep out bugs (this one is shareware) and Sleuth can help analyze your system.

Evaluation: This is not a highly technical book, although plenty of details are included to help you understand how your PC works. PC First-Aid Kit is designed to help you analyze your problem, suggest a possible work around or fix and get you back to work as quickly as possible. I would especially recommend that first time PC buyers put PC First-Aid Kit on the shelf next to the computer manuals. PC First-Aid Kit will probably get more use.

Cost: $24.95. **Publisher info**: Addison-Wesley Publishing Company, One Jacob Way, Reading, MA 01867

Book Review
WordPerfect 6 Power Tools

by Gordon McComb.

Reviewed by: Ed Buzza, Tampa PC Users Group, Inc.

Overall, the book is excellent. It is well written and is easy to read and understand. The material is presented in orderly and logical fashion which is commendable considering the subject matter of the book. While the reader may have a question or two at the beginning, they are answered further along in the reading.

Caution: This book is not for those who are brand new to WordPerfect. If you got your copy of WordPerfect just last week, read the reference manual first. This book does assume that you do have some working knowledge of WordPerfect 6 for DOS. At least, you should be able to create, save and retrieve documents. If you have some knowledge of writing macro instructions or of programming, you should have no trouble.

Writers of "how-to" books and of instruction manuals are mandated to write at the learning level of eighth grade school children. Yet this book maintains a fine balance by presenting twelveth grade material in words an eighth grader can readily understand. The author makes very good use of captured screen graphics and pull-outs which are of a great help to learning what is being taught.

A diskette (3.5" HD format) is furnished with the book. It unpacks into about 4 MB of files containing macros and templates. Many of the macros and templates are set up so that the user can customize them for personal use. While some power users and macro gurus may claim that some of the macros are "fluff" or "fillers" to pad out the collection, it should be understood that not everyone will use every one of the files presented. And they do serve to show how good macros are written to make word processing an easy task.

Chapter 17, Using Merges, is very, very good. It is one of the best parts of the book. It takes the reader by the hand and carefully walks through the process of building the necessary files and accomplishing the merge. Then the whole process is further simplified with the inclusion of various macros and templates that makes child's play of a rather awkward and difficult procedure.

The various parts of a macro instruction such as variables, macro commands, arrays, and logical structure are explained clearly and lucidly. Examples are given that you can key in and try with your data on your computer. Better yet, use the macros that are furnished. And while you're doing that, try out the templates for the calendars and the different types of letters ranging from fax cover sheets to resumes.May 21, 1994

The book suggests that you unpack the disk files into your regular WordPerfect directories on the hard drive. You may want to set up a different structure. Especially if you do not want to devote 4 MB of space for these files. And, more to the point, to make it easier to delete those files you do not want to keep permanently.

Perhaps a \BOOK directory with MACRO and \TMP subdirectories for the macros and templates. Then after reading the book and using the various macros and templates, transfer those you want to keep to your regular directories and delete the \BOOK directory along with the

Continued on page 4 see **WP Power...**

WP Power...Continued from page 3

subdirectories and files.

If you want to learn how to write macros for WordPerfect 6 for DOS, visit your favorite book store and get a copy of this book. It should be a required manual for the WordPerfect resource person on your staff or if you just want to write better and more advanced macros.

The book retails for $40 and is published by Random House, Electronic Publishing, 201 East 50th Street, 3rd Floor, New York NY 10022. ISBN 0-679-75156-4

Shareware Review

Larry's MPILE of Files

By: Larry Anders, Librarian, Tampa PC Users Group, Inc.

So you're looking for a real neat utility program for WINDOWS, well..... look no further. This month I've found BusinessCards for Windows v2.01.

What is BusinessCards? BusinessCards for Windows is a free form database program, useful for keeping track of any type of textual information. You can use BusinessCards to organize and manage any vital information, such as names, addresses, and phone numbers. Moreover, you may use BusinessCards to store random data, such as video or CD titles, short articles, descriptions of collection items, etc.

With BusinessCards/ you decide how to present and organize information: there are no predefined forms or record layouts. You may enter and store your data the way, that is most useful for you. Using BusinessCards Attachments feature, you also can easily keep track of any number of external files, associated with specific card. For example, you can just clip all your contracts or invoices to card with your clients address.

BusinessCards is easy to use software. It has friendly and convenient notebook-like user interface. I expect you will be amazed by how fast you can learn to use it effectively.

BusinessCards is compact - there are no requirements for megabytes of free disk space or extra memory. So if you are busy business traveler, you will be able to keep both program and data files on diskette and use them at clients site. Since BusinessCards directly reads and writes Windows Cardfile files, there should be minimum problems, converting your existing address or price database.

Specifically, with BusinessCards you can:

- Represent any unstructured textual data in a usual business card form.
- Scan your data quickly using easy to follow book-like interface and work with each card individually by selecting it.
- Access the most often used commands by clicking on appropriate toolbar button.
- View the table of contents for quick and easy navigating through entire BusinessCards file.
- Control the way your information is displayed by taking advantage of the fonts, colors and alignment styles available.
- Find exactly the information you require by using powerful Searching feature.

For experienced Windows users, BusinessCards for Windows also offers advanced features such as:

- Attachment feature, which allows to associate specific business card with any number of external files.
- Launching external applications from inside BusinessCards, passing a file name associated with a business card.
- Transferring data between the BusinessCards format and Windows Cardfile file format.
- Configurable toolbar, which allows you to assign any menu command to any toolbar button.
- User preferences feature, which enables to set up various user options and save them for the next BusinessCards session.

The program author, Michael Dvorkin, is a member of the Association of Shareware Professionals (ASP). ASP wants to make sure that the shareware principle works for you.

Shareware is a distribution method, not a type of software. You should find software that suits your needs and pocketbook, whether it's commercial or Shareware. The Shareware system makes fitting your needs easier, because you can try before you buy. Shareware has the ultimate money-back guarantee -- if you do not use the product, you don't pay for it.

Registration is only $19.95. This is alot of program for 20 bucks!

Software Review
Back-It for Windows

by Gazelle

Review by: Alford Poole, Tampa PC Users Group

"Captain?"
"Yes, computer?"
"It's been a while since the data banks were backed up."
"How long?"
"Since the last Klingon attack."
"Hmm, can the crew still play Asteroids during the backup?"
"Yes, Captain."
"Good, nothing worse than an idle crew. Computer, commence backup of data banks."
"What data banks? . . . Ha, ha, just foolin'. Commencing backup."
"Scotty."
"Aye, Captain."
"Beam the computer to the center of the nearest star?"

Continued on page 5 see **Back-It**..

Back-It ...Continued from page 4

Backups. The most recent pile of floppies is dated 17 Dec 93. Why is that? Aren't backups fun? Don't I follow a strict backup schedule, so I can sleep at night? Right. Life and software get better with time. Gazelle Systems has a product that promises to backup data in the background (while in Windows) and has a scheduler, so we don't have to remember any more. Even with floppies? Let's try it out.

Major Features: Besides doing something productive while the backup is in progress, Back-It for Windows has Backup Preset Icons (more on this below), supports 2.88 floppies and viewing and choosing of individual files for backup. There are three levels of backup compression and support for a long list of tape and network devices (those that support standard DOS commands such as Novell or Netware). Specific kinds of files may be selected (EXE, DOC, WRI etc.), multiple volumes can be backed up within one session and Back-It for Windows is Back-It 4 (Gazelle's DOS backup program) compatible and unformated floppies are used on the fly.

Backup Presets: These are predefined sets of backup instructions and parameters that control the backup process. One for full and one for modified are included as examples. You can make up to 50 different presets and store each as icons and use by double clicking the icon. If you use the scheduler, they can be automatic. Painless backups, I love it!

Documentation: 126 page printed manual with lots of illustrations and both mouse and keyboard instructions.

Support: Gazelle offers a toll free tech support phone number . . . but when you call, you are given another regular long distance type number. Rats! They also have a BBS and can be reached through CompuServe and MCI Mail.

Test Results: Times quoted in the following paragraphs are used only as examples to illustrate comparisons in different methods of backup.

After deleting many files from the C drive, there were still more than I thought would fit on 45 floppies, so I went through the directories and tagged the most important files to backup. A curious thing happened while doing this: when using the up or down arrows to view the directory tree the folder icons would disappear. There would be a gap where the folder icons should be. Clicking where they should be brought them back. Using the elevator bar gave normal scrolling through the directories. Curious.

While the backup was in progress I brought up WordPerfect and there was no noticeable slow down in typing speed. Disk #3 is backing up right now as I type. If you are typing when it finishes a disk the disk drive stops and a message that the disk drive is available appears. While the backup pauses, you can use the drive for other tasks. Back-It for Windows doesn't automatically go back to your previous program. With WordPerfect 5.2 for Windows, I had to move the mouse (using the arrows or typing other keys didn't work) to where I left off typing to start again. Ditto for QmodemPro, Back-It did not automatically return control to the foreground application.

Time for one 1.44 floppy: at maximum backup priority the time varied when nothing else was going on - 1:36 to 2:46. While typing in WordPerfect 2:59, while using File Manager: 2:59. This was surprising. I thought using the hard disk would slow the backup down, File Manager was a little slower. With the backup priority set to minimum and nothing else going on the time was 2:07 and went to 4:03 while using QmodemPro. The default for the backup was normal Error Correction, normal Verification, and super Compression. The Back-It icon lets you know how it is progressing, 32%, 55%, etc. 63 MB of files estimated to take 43 disks, but with the maximum compression, only took 33. I like it! On another test on 47 MB of data on a removable drive it speculated 32 disks and took 26.

Tape or removable media drives eliminate the disk swapping and make the backup totally in the background. Another test to backup 14.7 MB of data from a hard drive to an Iomega removable media drive took 3:50 and created a 9.3 MB file. This is definitely the way to go. A tape backup will be slightly different, but once going, will work away while you pursue other tasks. A caution: while doing a second backup to the Iomega I switched to Windows File Manager and checked the Iomega drive. This resulted in a smaller backup file, but the file got an error message when I tried to use it. Moral: don't access the drive being backed up.

Back-It Scheduler: Automatically added to WIN.INI at installation and is loaded when you crank up Windows. Set this baby up for daily, weekly, full, or just the modified files to date and let the computer do the remembering.

Restore: More trouble with the vanishing directory tree as the up and down arrows are used. Picked out one deleted file to restore from backup disk #1. The file was restored, but all the rest of the files on the disk scrolled through the viewing window and then Back-It asked for disk #2. Panic! Did it want to go through all 32 disks although 100% complete was showing on the screen? I expected it to copy the one file and be done, no extra checking needed please! I hit CANCEL and went back and tagged a file on disk #3. Same thing, Back-It requested disk #1, went through all the files, asked for #2, went through all the files, asked for #3, went through the files, restored the tagged file, asked for disk #4 . . . Some time could be saved by popping disk #3 in to start with. The Backup Report lists all the files and which disk they are on. Back-It can't figure out from its report which disk the file is on and ask for that disk. This may be a hard thing to do, but it would sure speed things up, especially if you have to use floppies for backups. The larger your backup files the more this could be a problem. Imagine backing up your 540 MB or 2-gigabyte hard drive and then needing a single file restored!

Restoring a file from the Iomega gave similar results. The files didn't flash by in the little window, but it did go through the backed up files and at :43 restored the file, at 1:52 the restore finished. The tagged file was less than 1 KB. Interesting. Also, the restored files were all from the DOS directory. When they were restored the first went into the correct directory, the second went into

Continued on page 6 See **Back-It**

Back-It ...Continued from page 5

\DOS\DOS and the third went into \DOS\DOS\DOS!

Evaluation: Using the floppy in the background method is disruptive to the train of thought, but with practice, can be mastered. The disruptions are worth while to be able to do something else besides waiting for the next beep to load the next disk. Back-It is easy to set up and use, I can live with the few quirks mentioned above. The only enhancement needed would be support of for OS/2's HPFS. I think Back-It for Windows is going in the right direction with user friendly backup software.

Ok, I've got my data backed up. Will you be able reconstruct your data after the next Klingon attack?

System Requirements: 286 or higher processor, Microsoft Windows 3.0 or later, One MB of free hard disk space for installation. Back-It will only run in either Standard or Enhanced modes.

Cost and availability: $65 from Gazelle. Hard to find in local stores.

Software Review (DON'T WAIT TO CROSS THIS BRIDGE)

Review by: Larry Anders, Librarian Tampa P C Users Group, Inc.

I recently decided to get serious about another area of personal computing - SCANNING. For Christmas this past year I purchased an HP DeskJet color printer as a present our entire family could use. Now that I had the ability to print pretty color pictures and photos of our family it only seemed natural to me to trade my 256-gray scale hand scanner for a flatbed color scanner. So I started reading reviews on flatbed scanners. The HP ScanJet IIcx consistently came out on top in all areas except one...the IIcx did not include OCR (optical character recognition) software. Being I was more interested, at the time, in printing color images, I decided on the IIcx, but soon decided than an OCR program was next on my agenda. I remembered that while I was reading the reviews on scanners I kept noticing an advertisement for an OCR package from Xerox Imaging Systems called TextBridge™ OCR for Windows, version 2. Since Xerox has set the standard for copiers for years, name recognition was an obvious plus. Their advertisements compare TextBridge to the high priced packages, claiming that there is no reason to spend $500 or more for some of the professional OCR software when TextBridge can do the job for under $100. Well, I was game if Xerox was. I asked Xerox to put their product where their mouth was ...and they did! They sent me a copy to review.....So here goes!

TextBridge OCR for Windows is software that can convert scanned image data into text that can be recognized by a number of word processing, spreadsheets, databases and other text formats that run under Microsoft Windows, version 3.1, in enhanced mode only, with at least a 386 or higher processor, at least four megabytes of system memory (eight recommended), and DOS version 5.0 (or higher). Approximately 3.5 megabytes of hard disk space is also required. TextBridge will also run under IBM's OS/2 version 2.

TextBridge will recognize and convert scanned and on-line page images into text files that you can open, edit, reformat, republish or apply in any other way of your choosing.

A number of popular desktop and hand scanners are supported by TextBridge to convert recognized text into many popular text formats. P ractically any scanner that supports ISIS (Image and Scanner Interface Standard) or the TWAIN standard can be used to input hard copy documents into TextBridge, which takes the scanned images, performs OCR, converts the recognized text to the format of your choice and stores it as a file. Also, TextBridge can recognize and convert on-line page images stored in TIFF (Tagged Image File Format). These images typically come from fax modems.

TextBridge provides an easy-to-use interface and a powerful set of built-in capabilities. For example, the preview

Continued on page 7 See **Don't Cross**

Don't Cross...Continued from page 6

tool lets you view and zone portions of pages before OCR. The Verifier lets you interact with the OCR software to achieve the highest possible accuracy.

According to Xerox, TextBridge incorporates Xerox Imaging Systems' industry-leading document recognition software, and includes a number of technologies developed by Xerox Palo Alto Research Center (PARC), where modern computer interfaces originated. Consequently, TextBridge provides the most accurate OCR and format retention results on the widest range of documents, such as:

_ documents with point sizes ranging from 6-point to 72-point type in practically any typeface (TextBridge can reliaby recognize type smaller than 8-point nly from images scanned at 400 dots per inch resolution).

_ documents printed on typewriters, photo-typesetters, and impact, ink-jet, and laser printers

_ photocopied, degraded, or dirty documents

_ documents with single- or multiple-column layouts

_ documents containing halftones

_ on-line single- or multiple-page TIFF images from fax modems and other sources

_ hard-copy faxes

_ documents composed in English, French, Italian, German, or Spanish (TextBridge versions shipped in international markets can recognize an even greater number of languages).

TextBridge is designed to be easy to learn and use. However, if you need assistance, TextBridge provides a complete hypertext-based on-line Help system. In any of TextBridge's screens, you can select Help and display a Help window about that particular screen.

Installing TextBridge software is a two-phase process. First, you install the software files as you would any software under Windows by choosing Run from the File menu. Second, you run a scanner setup program to link TextBridge to your scanner's system-level or TWAIN source driver. After this you are ready to save hours of typing time.

(You can also use TextBridge without a scanner to recognize TIFF files produced by fax modems. TextBridge treats on-line TIFF image files as one or more scanned page images. TextBridge can process both single- and multiple-page TIFF files).

Unless you have an automatic document feeder you must run your native scan program before scanning each new page so that it can interface with TextBridge. (This is the ONLY negative feature of TextBridge I could find). Then choose scan and away you go. TextBridge allows you to preview the text before the final scan. During this stage you can create one or more zones to define the page area(s) to be processed, allowing you to resize, move, position, overlap or delete these zones. Once you are done previewing the page you are ready for the final scan and the OCR process.

One other option given by TextBridge is to verify and/or correct questionable words. When TextBridge encounters the first questionable word, it opens the Verify window, and displays the questionable word highlighted in a Word edit box and an image of this questionable word is highlighted for context. With the Verifier, you can move through the recognized text and accept or correct TextBridge's recognition decisions. Your input helps TextBridge improve recognition as the job progresses. On a multiple page document you generally only need to verify one or two pages, then end verification.

TextBridge has Auto Page orientation that automatically determines the orientation of a page, rotates it in memory if necessary, then begins the OCR process. TextBridge can also ignore Photos and Halftones and recognize multiple columns on a single page.

My favorite feature is the ability of TextBridge to run from within virtually any other Windows application. By running TextBridge Application Server prior to opening a Windows application such as a word processing or desktop publishing program, TextBridge OCR actually becomes a menu item under the File option. When scanning from within an application the recognized text conforms to that application's format and enters the application at the cursor's location.

TextBridge also has a way of recognizing certain proprietary fax images other than TIFF formats such as PCX, DCX, Corel, etc. TextBridge OCR Printer is designed to appear in Windows applications as just another target printer. By choosing TextBridge OCR Printer in the Print Setup option of File menu this enables you to "print" an image to a recognized and formatted text file, therefore allowing you to be able to recognize virtually any image format.

I was extremely impressed with TextBridge OCR for Windows. My deal with Xerox was that if I thought their advertising was correct, I would purchase their product. Well, I do believe there is truth in advertising, at least in this instance, so I purchased the software.....BUT.... Xerox offered it direct for $99 plus postage. I found it, by shopping around, for $81.95 shipped to my door. They kept their part of the bargain; I kept mine.

Bravo to Xerox Imaging Systems! This (text)Bridge is worth crossing!

SOFTWARE REVIEW
3-D BODY CD-ROM

From Knowledge Adventure Series

By: Renate Marsh, Tampa PC Users Group, Inc.

The picture in this review might suggest that we have a Halloween program - but far from it. 3D-BODY is not at all associated with Halloween and not spooky at all, but quite amazing and fascinating. This program takes you on a journey through your body with fantastic detailed pictures, information, movies, great sound and voice. I used the word journey because you actually can take a tour through the heart and many other organs to see their mechanism and how they work.

How Knowledge Adventure put this program together I do not know, but they completed an amazing job producing 3D-BODY. It is sectioned off in four main subjects: Body Reference, Body Recall, Body Adventure Movies, and Emergency.

Body Reference: Here you have a main screen with a full size or torso part of a body which you can rotate with your mouse or the arrow keys on the keyboard. With the CD-ROM version like this one you can also use up and down movements of your mouse or arrow keys to see the body or torso at a certain depths level. Another small image frame is on the other side of the screen showing you detailed parts of the body. You can choose which detailed body part you want to see and get information from by simply clicking on any part of the main body. Every information or help is provided by you clicking on objects or moving your cursor around the screen until a balloon pops up with particulars. You can move from one body part to the next without getting lost. The 3D-BODY logo is always somewhere on the screen and clicking on it gets you back to the main menu. Believe me, this is very good to know. I clicked my mouse and jumped from one subject to the next. All of the sudden I realized that I have no idea how I got there and where I am. Though until now, I do believe, I only saw 1/10th of the whole Body Reference part, there is so much on that subject.

To side-track a little bit. This CD-ROM version of 3D-BODY has great music and all kind of other sounds (of course, you need to have a sound card). Any information on a specific subject or object will be read to you which my eyes appreciate very much. The disk version does not has the "read to you" capabilities and I consider that one of the best features of this program.

Body Recall: Here you can play guessing games (at least I did a lot of guessing). You try to match a body part picture with the description. If you get a match, you then can click on that image to get more information about that part of the body and another click returns you to your game. A total of three levels with six matches each can keep you occupied for quite some time. It is a lot of fun to play this game, so it is hard to let go.

Body Adventure Movies: Have you ever taken a drive through your heart? Here you can travel through several organs to experience the inside of our body system. The main menu in this theater gives you several image choices on the bottom of the screen, click on one of them and away you go. Your choices how to view any of the movies include the 3D feature and a pair (or two) of 3D glasses to use come with the program. You get the full impact of the 3D version if you sit at least a couple of feet away from your screen. This movie section is quite impressive, you want to watch them all.

Emergency: On the main menu you have a door you can go through and above it you see the sign Emergency. Once you wander through that door you are in a hospital type surrounding going crazy to get the hang of moving with your mouse along the hallways of the hospital. It takes some maneuvering until you get used to it. The first time I landed outside of the hospital looking at the city in the background and couldn't find my way back in. My friends, when driving with me in a car, always think my orientation is terrible, but this was pushing it a bit, getting lost in a hospital in a program on screen! Once I got the hang of it somewhat I did find the different types of emergency rooms. With images on the wall a scenario is set up for a type of an emergency. You click on any of those images to play the game and solve the problems of versified emergencies. Each room specialized in one type of organ or object. I have no doctors mind, I wasn't that good at it.

3D-BODY is supposed to be a program for the ages 7 to 12 (it says so on the box). But, as with all the other programs of the series Knowledge Adventure, all ages will enjoy this program and learn a lot while having fun.

With the CD-ROM version you need to use very little of your hard drive (2MB). A VGA monitor is a must though and a sound card brings the program alive with stereo music and sound. The CD-ROM version cost $69.95, disk version $49.95. 3D-BODY can be installed in DOS or Windows. With this program you do take an adventure journey through the anatomy and inner workings of the human body and having fun while doing it.

Software Review:
QEdit 3.0 for OS/2

Review by: Alford Poole, Tampa PC Users Group

My introduction to QEdit came through our Sysop of the Bits of Blue BBS. Maintaining the board takes a lot of time and there are lots of text files that need constant editing. At the beginning of my learning sessions he would whiz through changes and even edit several files at once, flipping back and forth between files to compare differences. When I tried QEdit, it was a pain because the commands were foreign. I didn't like to keep asking Kevan what to use to mark a block or delete a line, so I continued to use MS DOS's Edit to make text changes. As time went by and I continued to watch and learn, it seemed that QEdit had more flexibility and was much faster to use than Edit, if I could only learn what keys

Continued on page 9 See **QEdit..**

QEdit...Continued from page 8

to push. I downloaded QEdit 3.0C and started playing with it at home. It didn't take long to become converted.

Installation of QEdit for OS/2: QEdit for OS/2 comes with Qedit Advanced (for DOS) and the install program installs both versions (in separate directories). The installation takes less than 700KB. An interesting note here, MS DOS's Edit takes only 413 bytes of disk space while QEdit for OS/2 takes over 68KB and the Advanced edition takes about 54KB (the shareware version takes less than 53KB). The only thing is that DOS's Edit needs Qbasic to be able to run, and it weighs in at 194KB of disk space!

Major Features: The following was taken from the Fidonet Qedit echo (use the TQM door on our Bits of Blue BBS to get to see latest questions and answers on QEdit). George J. De Bruin, SemWare Technical Support, answers to the question, "What will it (QEdit 3.0) do for me that the older version will not do?"

* Contains a fully-integrated SPELL CHECKER that suggests spellings for misspelled words.
* Offers ENHANCED PRINTING OPTIONS including assignment of the print device, adjustable line spacing, line numbering, and more.
* Increases the MAXIMUM LINE LENGTH to 1000 characters, providing additional file editing capabilities.
* Features IMPROVED MACRO CAPABILITIES including an automatic startup macro, increased macro space, multiline macros, and more.
* Provides enhanced ASCII CHART capability, allowing you to directly insert the selected character into the text.
* Allows you to CONFIGURE THE DATE AND TIME FORMATS.
* Includes ADDITIONAL SORT OPTIONS for ascending, descending and case-insensitive sorts.
* Offers IMPROVED TAB HANDLING including variable tabs, smart tabs, and fixed tabs.
* Gives you the ability to display a PICKLIST OF SCRATCH BUFFERS to choose from.
* Allows you the option to show the HEX AND DECIMAL values of the current character on the StatusLine.
* All new 174 page manual, including documentation on QMAC, advanced macro writing tips and more.

To the question, "I am well pleased with the one that I am now using and would like to know the cost of updating to the newer version also, where to write for the update?" Mr. Bruin responded:

QEDIT ADVANCED v3.0
* Upgrade from previous version of any SemWare product - $19.95
* New copy - $59.00

QEDIT FOR OS/2 v3.0 (includes QEdit Advanced v3.0)
* Upgrade from previous version of QEdit for OS/2 - $19.95
* Upgrade from any other SemWare product - $35.00
* New copy - $79.00

QEDIT TSR v3.0 (includes QEdit Advanced v3.0)
* Upgrade from previous version of QEdit TSR - $19.95
* Upgrade from any other SemWare product - $49.95
* New copy - $99.00

SHIPPING
* US/Canada/Mexico - $5.00

CompuServe: 75300,2710
BBS: (404) 641-8968 (type ORDER and follow the prompts) SemWare Corporation, 4343 Shallowford Rd, Suite C3A Marietta, GA 30062-5022

The above was pasted from another text file and edited using QEdit.

Test Drive Results: OS/2 has two built in editors: System Editor, suitable for text-only editing such as .CMD files, CONFIG.SYS or AUTOEXEC.BAT) and an Enhanced File Editor, suitable for files that require formatting and printing. The Enhanced File Editor wraps lines of text and inserts line breaks that can ruin CONFIG.SYS and other system files. With QEdit configured not to wrap long lines of text, it can edit any file and still give you formatting and printing capabilities. On the other hand, both OS/2 editors are mouse friendly. The mouse is still available while using QEdit for OS/2 for doing things on the OS/2 desktop, but not within QEdit itself. The keyboard commands can be faster than the mouse (after you learn a handful).

For example, if you need to move two lines of text to another location, move the cursor to the first line and hit HOME (if the cursor is not at the beginning of the line). ALT-A drops an Anchor to begin the block. Arrow down once, then hit END to go to the end of the line. Type another ALT-A, to end the block, and then move the cursor to where you want to move the two lines. Hit ALT-M, to Move the block, and ALT-U, to Unmark the block, and voila! The move is complete! Much time can be spent fiddling with CONFIG.SYS, AUTOEXEC.BAT or .INI files. This is where QEdit really shines. Moving between files and comparing things that work to things that just caused the computer to go into Limbo Land is a major time saver. I used QEdit exclusively to try to get a CD-ROM to work with OS/2. The OS/2 partition is HPFS (High Performance File System) and so DOS's Edit (on a FAT partition) couldn't get to the OS/2 CONFIG.SYS. When the OS/2 boot failed, I could use the OS/2 floppy startup and then use QEdit for OS/2 to continue the experimentation. Even OS/2's editors need the desktop to function, so QEdit was the best solution. QEdit windows are much quicker to set up for viewing multiple files than OS/2's E.EXE. I am really pleased with QEdit's speedy performance.

Evaluation: Using QEdit Advanced on the BBS is the only way to go. It's speed, flexibility and configurability save us lots of time. Sure, if all you need is something to look at yourCONFIG.SYS or AUTOEXEC.BAT once or twice a year when you add or delete software, then DOS's Edit will do fine. But, if Edit doesn't wave the flag for you, download QEDIT3C.ZIP (DOS version) and try it out. Be careful though, it could lead to a long and satisfying relationship. QEdit is so good I'm using it right now to type this review, it's so much faster than

Continued on page 10 See QEdit...

QEdit.. Continued from page 9
cranking up windowsand WordPerfect or another major word processing software. Qedit also works better on a small screen (like this 13" VGA). It doesn't do fonts or check grammar, but is a meat and hold the potatoes program. Once you know the commands and set up a few macros it will surprise you how much more you can to do in less time.

This may sound like an advertisement, but SemWare has taken the seemingly simple task of editing text files and produced a much more powerful tool than the editors that come with the operating systems software.

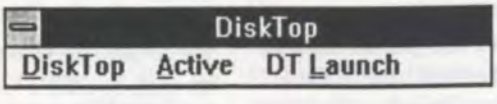
System Requirements:128 KB of RAM, OS/2 v2.0 or greater, one floppy drive, Color or monochrome monitor with 80-colomn display, 70 KB disk space (or 200 KB if the spell-checker dictionary is loaded).

Software Review:

DiskTop for Windows Version 1.0

CE Software, Inc.
Review by: James R. Hutton, Tampa PC User Group, Inc.

DiskTop for Windows simplifies working with files. In a Files window you see all files and sub-directories in a directory, view different directories, volumes or open more Files windows for more views. Anything in a Files window can be moved, copied, deleted or renamed.



The software comes on one double density diskette. Before you install you must be running on an IBM PC or compatible with DOS 3.3 or greater. Running Windows 3.0 or greater with at least 640K of memory. The program only takes up 200K of hard drive space that is a little less than WINFILE (Windows File Manager) but with a lot more features.

Some of the features are the powerful way in which you can quickly and easily find files, programs, anything on your computer. Multiple search attributes lets you find items without having to remember their name, size, type or dates they were modified or created. View drives or directories of all items at once. DiskTop Sort feature lets you view files by name, size, date, type or kind. Move files quicker than copying and deleting. DT Launch sets up menu items that launch programs or files anytime, anywhere. DiskTop Extras allows access to most DiskTop features within the Open or Save dialog boxes.

The DiskTop window looks like all Windows programs. The program window has a title bar, and you can move the window anywhere on the screen by clicking on the title bar with the mouse and dragging. The menus are the central point for controlling DiskTop for Windows.

The DiskTop menu gives you many options to manage your files and your computer. Move, copy, delete, even find files and directories using DiskTop's advanced file's management features. If you are a long-time DOS user, you will be surprised by how easy DiskTop makes it to find files on your disk. It searches every directory on your hard disk as well as any mounted floppies and network disks with a single find request. More importantly, DiskTop makes it possible for you to work with the files as a group after you have found them. Using DiskTop's preference options you can even customize DiskTop to reflect your own personal requirements.

The Active menu allows you to either minimize or restore all the open applications as well as individually activate any applications already on the desktop. Use the Active menu to keep your desktop in order.

DiskTop is more that just a program to copy and moves files. You can add programs to DiskTop's Launch menu. Then whenever you want to open a program, you merely select its name from the menu. No more looking through the different groups in the Program Manager. DiskTop lets you attach documents to a program so that you can open the document, and its associated application, simply by selecting the document from the Launch menu. You also can create launch groups of applications that are launched at the same time when you select the name of the launch group from the menu. You can even make timed launch groups that automatically open at a predetermined time.

I recommend this program. It has a lot of great features with ease of use. It replaces the Windows file manager with not adding to the overhead.

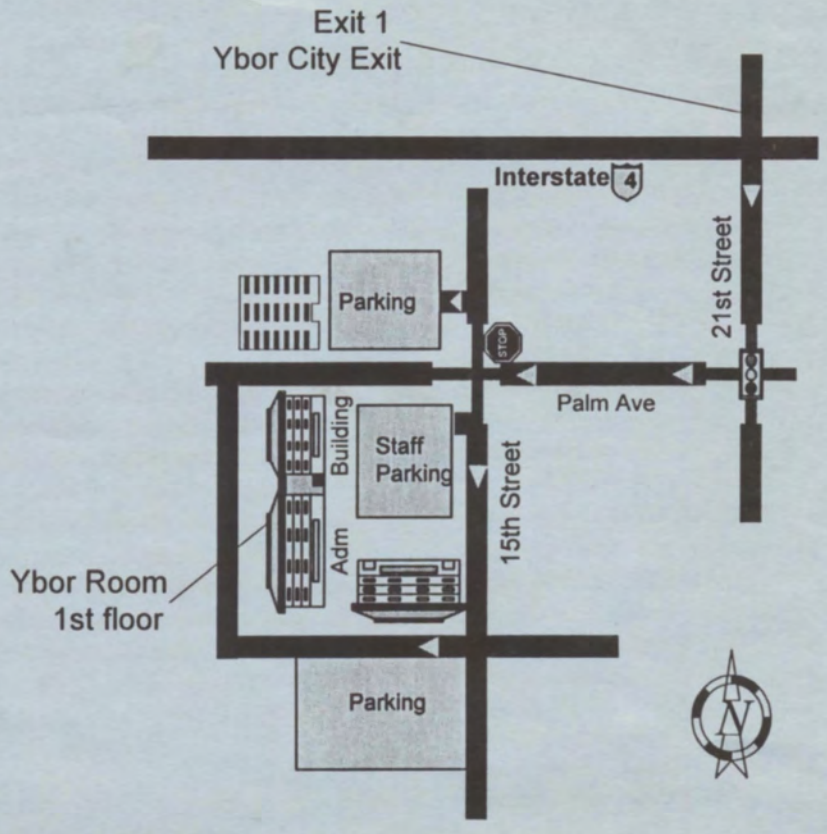
ADOPT the Bits of Blue BBS !

The TPCUG Board. of Directors has announced a fund raising drive to benefit our Bulletin Board System. Here are the highlights:

WHY: Our Bulletin Board System (BBS) is one of the most popular and beneficial services our group provides to the membership. The recently completed membership survey indicated that the number one priority for the BBS is improving accessibility by adding a second phone line. A second phone line also means a second high speed modem. Running a close second is support for adding greater on-line file storage capabilities. Our BBS is running on a Gateway 486 that was anonomously donated to us. On-line hard disk storage is limited. In addition, the BBS monitor failed and had to be repaired. done. We have also recently added a CD-ROM drive, so that an entire library of shareware material is available. Both of these were funded from our Group's Treasury without any increase in dues.

THE BOTTOM LINE: Our budget does not have the funds required for a larger drive, a second modem, nor the costs of a second phone line, so we are asking for your help. This is a good opportunity to assist yourself and our group as a whole. We hope you will take advantage of it! If you approve and appreciate the BBS, don't applaud...send help in the form of a check! Thanks!

PURPOSE: To raise money specially earmarked for the BBS. Funds are needed to expand on-line hard disk storage, to purchase a second high speed modem, and to cover setup and 1st year operating costs for a second phone line.



GOAL: Raise $1,500 by the close of the September membership meeting (9/14/94).

WHEN: Bring your checkbook to the August or September membership meetings, or send your check to Tampa PC Users Group, P.O. Box 3492, Tampa, FL Remember, the TPCUG is now a 501(c)3 Charitable Organization, so your contributions may be tax deductible.

MEMBERS HELP-LINE

The following phone list is provided for our **Tampa PC Users Group** members in an effort to establish local support for those frustrating times which we have all encountered while using our PC's. Please note that these are members that have volunteered to help you, treat them in a courteous manner. Be sure to ask if it is convenient for them to help you now, or if you should call another time. It would also be helpful to have your documentation and have it handy when you call. *(Don't expect help if your software is an illegal copy or you do not have documentation!)* **TPCUG** is not responsible for the information or advice provided by volunteers. Volunteers may or may not be experts in the subject matter. You are on your own with any advice received. Be aware also that some of these volunteers may be consultants in their area of expertise. If you are interested in volunteering to answer members questions, either leave a message on the BBS or fill in the forms provided for this purpose at the meetings.

Bits of Blue

Vol. 7, No. 9 September, 1994

MEETING
(2nd Wednesday every month)

DATE: September 14th, 1994
TIME: 6:00 PM
PLACE:
HILLSBOROUGH COMMUNITY COLLEGE
Ybor Campus
(Corner of Palm & 15th Street)
Ybor Room (See map on last page.)

INSIDE THIS ISSUE:

Minutes of 8/10/94 Meeting 2-3
President's Column 4-5
COHERENT (Unix Clone) 6-8
Seaworthy 8
Prehistoria 9
Perfected 10
Magazine Deal for TPCUG 12-13
Publish-It 14
Members Help-Line 15

SPECIAL NOTICE: OS/2 SIG

is scheduled for Tuesday, September 27th at 6:00 p.m. in room 436 on the fourth floor of the Lakepoint One building across from Tampa Bay Mall.

September 14th AGENDA

Presentation by:

Target Software Group, Inc.

Product to be demonstrated:

CA$HGRAF OFFICE *PLUS*
"The World's Most Powerful
Single-Solution Office Software"

Up Coming Presentations:

October 12 - **Gold Disk**

November 9 - **IBM OS/2 Personal**

December 14 - **Broderbund - new products**

*** * 1994 OFFICERS * ***

PRESIDENT: Harvey Bruneau 985-3338
VICE PRES : Al Poole 876-9445
TREASURER:Tom Cone 224-9052
MEMBER AT LARGE: Roger Waters 276-1019
SECRETARY:Jim Clark 986-3888

APPOINTED (*Volunteers*)

EDITOR: Marylee Bruneau 985-3338
LIBRARIAN: Larry Anders 989-9119
MEMBERSHIP DIRECTOR: Tom Cone 224-9052

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII file or in a commonly available word processor format, such as WordPerfect 5.2, or Ami Pro 3.0 on diskette to the editor at 9402 Hidden Ridge Place, Tampa, Florida 33637 or send it by modem to BBS (813)239-3704.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

The use of trade marked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted at the following rates:

	1 month	3 months	6 months
Full Page	$60.00	$162.00	288.00
Half Page	$40.00	$108.00	$192.00
Quarter Page	$22.00	$60.00	$106.00
Eight Page	$12.00	$33.00	$58.00
Business Card	$10.00	$27.00	$48.00

All advertisements must be prepaid by check payable to TPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if it is not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, Marylee Bruneau at (813) 985-3338, for space availability and for further information.

This newsletter is created with PageMaker 5.0 from Aldus Corp. and Corel Draw from Corel Systems.

Secretary's Report

MINUTES OF 8/10/94 MEETING
and PERSONAL COMMENTS
By: Jim Clark, Tampa PC Users Group, Inc.

Another very good meeting, but the very wet weather played havoc with attendance — which was down to less than half the norm. Too bad, too, because Prodigy gave a good thumbnail of their service and the Tampa Tribune gave a rundown on the new Tampa Bay Online service they were to kickoff the next day.

USER GROUP NEWS

✔ ADOPTBBS: Harvey elaborated on a brief article in the August Bits Of Blue newsletter about the kickoff of our Adopt The BBS fund raising drive. In essence, our BBS has limited capacity which needs to be expanded and improved. A recent membership survey outlined member priorities for the BBS — more files and add a second phone line, which also entails another high-speed modem. A number of actions have been taken to cut costs and generate more revenues. These have all been helpful, but as yet have done little more than offset increasing cost, such as the rental fees we now have to pay for our general meetings. Our treasury simply doesn't have the funds to accomplish the needed improvements to the BBS. Hence, the Board of Directors elected to raise the needed funds from membership donations. Adopt The BBS is to run through the close of the September meeting. If you want the BBS to be improved and are willing to help with that effort, please send in your check to the TPCUG marked for ADOPTBBS, or bring it to the September meeting. Jopin those of us who want our group to continue to get better.

INDUSTRY NEWS

✔ IBM Dropping Amber Line: IBM has announced that it is stopping production of its Amber line laptop computers. Full support for these computers will continue, however.

✔ ACCESS 2.0 Problem: Industry news reports that Access 2.0 is giving some users problems with losing data. Those affected are users operating Windows for WorkGroups 3.1 and using SCSI drivers, and then only when accessing the SCSI heavily. While the info is not clear, it would appear that the problem exists only when the SCSI is on a personal machine as opposed to in a network situation. Work is in progress to solve the problem.

✔ Intel Dropping Some Modem Lines: Intel is apparently contracting its modem production and has announced it is dropping some of its less profitable modem lines; it would appear competition and continuing cost cutting pressures have prompted the move. I do not have details to publish here, so if you are thinking about an Intel modem, you might want to check to see if the one in which you have an interest is one of the lines being discontinued.

✔ Windows 4.0: Word in the industry is that Microsoft will

See **Minutes** *Continued on page 3*

Minutes...*Continued from page 2*

be delaying release of Chicago/Windows 4.0 until the 2nd quarter of 1995. Meanwhile, IBM's work on its OS/2 Personal is nearing completion — IBM will review this new competitor before our group at our September meeting.

PRESENTATION — Prodigy & Tampa Bay Online

Prodigy: Peter Drummond, Retail Sales & Marketing for Prodigy, was on hand to give a brief rundown of Prodigy for those not already subscribing to that online service. He outlined how Prodigy had now grown to become the largest online service in the country with the most subscribers. Among the many statistics provided, there are bulletin boards for just about every area of interest you might think of and, collectively, they handle some 100,000 notes each day. Pete's principal purpose was to introduce Prodigy as a means to get to the new service that is coming online on Prodigy — Tampa Bay Online (TBOL). As a Prodigy user, however, I can tell you that there is a wealth of information available to subscribers in just about any area of interest. It has a Windows-like environment (graphical interface) in both its DOS and Windows versions of the software and in spite of the breadth of areas covered by the service — from news & weather; to business & financial news and investing online;, to banking online; airline info & online reservation/ticketing;, to many, many bulletin boards; to games; and on and on — navigation within Prodigy is fairly easy.

In contrast to the other online services, Prodigy offers multiple levels of subscription. However, over 90% percent of the subscribers chose the Value membership. This $14.95/month subscription gives access to over 90% of Prodigy features without further access or time charges. Less costly subscriptions are available, down to as little as $2/month. This allows subscribers to purchase the service most suitable for their needs. They also offer a free trial membership that allows one to try out the service without cost. You might want to take advantage of that offer.

Tampa Bay Online (TBOL): The bulk of our presentation time was devoted to hearing about this new service for the Tampa Bay Area. Nanette Holland, TBOL News Editor, and Allan Gengler, TBOL Bulletin Board & Information Editor, were on hand to introduce this new service to our members. And they did an excellent job of doing just that. It appears to be an outstanding service. It will provide online all of the goodies contained in the Tribune, except for the national/world news that the Prodigy service already covers, plus other items of interest to Floridians that are not included in the Tribune. Among the latter are computer news and information, including product reviews by our own members; community profiles; beach guides; weather updated periodically, including current radar views; hurricane information and historical data; lottery info; articles prepared for but not published in the Tribune; info on public parks in Florida; and on and on. Another very big plus for TBOL is that it, too, has bulletin boards for notes and messages on just about any subject between TBOL and subscribers, and between subscribers.

Also with a graphical interface, TBOL 's opening screen offers 4 or 5 'highlight' items, plus access buttons for each of the following categories: News/Opinion; Sports; Business; Bay life; Entertainment; The Florida Key; Bay Talk; and Classified. Yes, all the want ads are available on line. Clicking on each of the categories leads you to a similar screen for the contents of that category. Much like the Tribune, it includes itemss of interest to all Floridians, and local news for counties from Citrus County to the north, to DeSoto/Highland Counties to the south, and Polk County to the east. Moreover, a good bit of the info available (such as lottery numbers, or recipes from previous weeks, to name but a couple) is archived so that several days or weeks of back info is available,. Most of what you see can be downloaded to printer and/or file.

I tried the service just before beginning this report and I like what I see. It is, in fact, as easy to navigate within as it appeared to be during the presentation. It is very easy to use, easier in my opinion than finding things in the Tribune itself. Moreover, the news in TBOL is available the evening before the Tribune hits the street. And it is less expensive than the newspaper, costing only $4.95 per month, the charge being billed on your Prodigy statement. I don't mean to suggest that TBOL is a replacement for your Tribune subscription. Rather, I am trying to give you a feel for the high quality and timeliness of service that I saw. TBOL is free for the first weekend for anyone interested in trying it out. That, of course, will have long since passed by the time you read this, but I would expect that TBOL will offer some additional free weekends to acquaint those who missed the first offer. Keep your eyes open. But you don't have to wait — they have made it easy and for those enrolling now, the first month is free. Even if that is no longer available when you finally decide you would like to try TBOL, $4.95 is not an exorbitant cost to not wait for the 'trial' periods or free months; just tinkering with TBOL for a month is worth the $4.95.

Many thanks to Peter Drummond of Prodigy, and Nanette Holland and Allan Gengler of the Tribune for an excellent presentation of your services. You have been most helpful and we look forward to the continued progress of your respective services.

AND THE WINNER IS

Thanks to the generosity of Asymetrix and Computer Associates, there were a couple of very nice door prizes. Those among us to have the good fortune to win are:

Rob Davis ----- Simply Money
Herb Atwood -- Multimedia Make Your Point

The meeting adjourned at about 8 PM.

TTTT

Write! ✍

Tampa PC Users Group needs writers! Share what you've learned with your fellow members.

PRESIDENT'S COLUMN

It is with deep regret that I announce the resignation of Ed Buzza as our Director of Education. Ed has been extremely instrumental in the life of the group through his dedication and generosity. Through his knowledge and patience he taught us, through his wisdom he guided us and through his writings he enlighten us. The TPCUG owes Ed a great deal of gratitude, more than we can ever repay.

Ed will continue to volunteer on the Members Help-Line. Thank you Ed.

Tampa Bay Online

We are on TBO (Tampa Bay Online) via Prodigy. TBO, from the Tampa Tribune, is providing the TPCUG with resources to place information about our group on their service. Currently three software reviews written by our members and general information about the TPCUG is online. The TPCUG has agreed to provide TBO with four reviews a month. Any TPCUG article printed in the Bits of Blue newsletter can be a candidate for TBO providing its not the current newsletter issue. Articles to be placed on TBO are selected by the President and Editor of the TPCUG. For those of you wishing to leave me mail on Prodigy my ID is DYHJ67A.

Over the last five years I have asked for help from our members. The plea was mostly for volunteers or member involvement to help the TPCUG. Since I was elected in the eighties, I see that the volunteers and elected officials have accomplished a lot.

However, I am still troubled by what I see and don't see.

I see that it is the same handful of members which are striving to better the TPCUG. These people are like you, they have jobs and families. They aren't computer geeks or nerds. Why do they contribute and others don't. Is it the big bucks that the TPCUG pays them, is it the fame and glory, is it those home made cookies that we have at our house for some of the board meetings. Ok sure Marylee's cookies are "to die for" but I don't think that's the reason. No one gets a paycheck either. In fact most of them pay for things for the user group and never asked to get reimbursed. It must be the fame, glory, bennies and perks. Yeah that's it we all get a new generation computer from CompUSA every year, Computer City provides us with all the free software we need, Bill Gates flies us all to Washington for our input into new technologies, we get twelve extra days of paid vacation from our jobs to promote the user group and our significant others, friends and family just think we're normal for spending more time with a computer than them.

I believe its because they want to contribute to others in whatever form they can. They believe in the user group concept and the benefits that can be provided to its members and community. Volunteering is not for everybody. But I do think that each member has a responsibility to put something back into the TPCUG other than the yearly dues. I hope that each one of you have gotten a benefit from our group and it was more than a free software product. If you have not I am sorry we just don't have the volunteers

What I don't see is growth in membership. Last year my goal was to have a membership of three hundred. It didn't happen. I have the same goal this year and we currently need around 100 new members more to attain that goal. If you want to know how you can contribute please read the following sections.

New Membership Category

In our continued efforts to expand our group the board of directors has approved a new membership category effective immediately. We now have a corporate membership category. This category is provided for the businesses who wish to participate in our group and provide our services to it's employees. For $50, a business can sign-up three employees with full membership privileges. To join our group as a corporate member the business must submit, on company letterhead, the intentions of joining our group along with the three full names of the employees (we need addresses), the enrollment form and of course $50. Additional employees of that business can join for $15 each. All employees will get full membership privileges. The renewal date for a corporate membership is based on the initial enrollment of the business. This means that all employees renew on the same date no matter when they enrolled.

FAX numbers

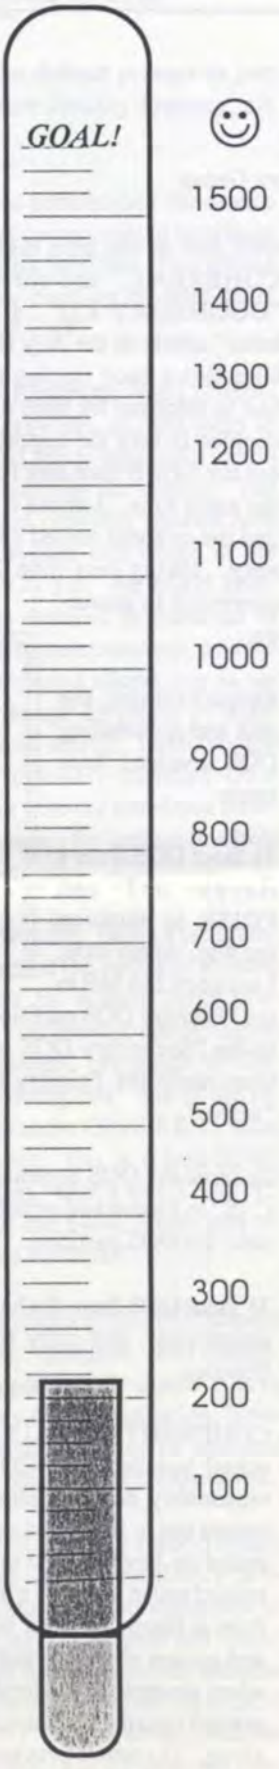
We are in the process of building a database of local FAX numbers. The purpose of this database is twofold. One is to notify members and non-members, individuals or businesses, of our monthly meetings and it's agenda. Two as a cost effective marketing strategy of promoting the TPCUG to the Tampa Bay community.

I believe that this process will provide a positive impact on the growth of our group. We need your help to collect these local FAX numbers in order that we can build this database. Look at the business cards that you have accumulated over the years, go through the phone book, get them from your friends that work for other businesses. Once you have FAX number(s)that you wish to add to the database please provide them in writing or ASCII format including name (individual or business), phone number and routing information if necessary, to Marylee Bruneau through the BBS (phone number), mail (Marylee Bruneau Attn: FAX List, 9402 Hidden Ridge Place, Tampa, Fl 33637 or call 985-3338. This data will be compiled into an xBASE file which will be used with WinFax Pro. Faxing will occur on a week night the week before the meeting.

Magazine Subscriptions

Please note that we have included a list of 30+ computer magazines in this newsletter which you can subscribe to or renew your existing subscriptions. Used the attached order form to order. By using the order form the user group gets credit and a little bit of money for each subscription. The prices are right for you while providing revenue to the group. Additionally, there is a list of approximately 500 titles contained in the file 94_GUIDE.ZIP on the BBS which you can download. These titles cover every type of magazine found in a doctors reception room plus more and you even get current issues. Its not to early to place that Christmas order for someone

See **President's...** *Continued on page 5*



President's....*Continued from page 4*

special or even yourself. Whether it's about fashion, science, money management or hobbies there is a magazine for everyone. Several of the board members have already tried this service and are very satisfied. If you need additional information please contact our VP, Al Poole.

Adopt the BBS

At last months meeting I kicked off the "Adopt the BBS Campaign". This campaign has been set forth to get the funds and equipment to add a second phone line to the BBS. This is a result of the surveys which you, our members, filled out. **The highest request included a second line and more files.** Since the surveys, we have added more files by attaching a CD ROM drive which we purchased and an additional 120Mb hard drive which was donated to the BBS. However, the TPCUG does not have current funds to establish a second line. We have established a limit of $1500 which will cover the cost of installing a second phone line, one years operation and a high speed modem and 500Mb hard disk. How can we overcome this issue? Through tax deductible contributions from you or even non-members of money and/or hardware. We need a 14.4 modem or higher and large 500Mb hard disk. Currently we have over $200. We will be maintaining a progress indicator (a Dollar $$$ Thermometer in the newsletter) on the BBS.

If you read all that, thanks for your time. I hope you found an area that you can help us in. If you haven't don't worry their are still plenty of opportunities: you can just bring a guest, buy extra door prize tickets, volunteer to run a swap meet, volunteer to do a presentation, write your own articles for the newsletter covering your tips, techniques, or experiences, donate computer equipment, upload new files to the BBS, volunteer for the membership help line. Still nothing, call me with your ideas.

SOFTWARE AVAILABLE FOR REVIEW:

Screenscapes - Transform your monitor with spectacular wall papers. - Vendor: Kiwi Software

Managing Your Money (DOS)- Complete Financial Software Program - Vendor: Meca Software

XtraDrive Lite - (Windows & DOS) Doubles your disk capacity. vendor: Integrated Information Technology

FidelityOnLineExpress - Direct Line to Wall Street - Meca Software

WinWay Job Interview for Windows - Interview with confidence & win the Job. - WinWay Corp.

Your Deck - Design & Build How-to Software (Sunset)

Little Monstor at School - Interactive, Animated Stories for Children

Space Age - Arts & Letters 3 in 1 Software = Multimedia + Clip Art + Drawing

Magic Theatre - Easy way for kids to create, narrate, and animate their own computer movies ages 6&up.

(Contact Marylee or Harvey @ 985-3338 if you are interested in doing a review article for the newsletter on any of the above software.)

SPECIAL OFFER!

Free software....**Micrografx** is offering copies of their **ABC SnapGrafx** (regularly $299!) business users drawing package free through September 30th. There is an $8.95 shipping charge. Call **1-800-653-3510** to order. **SnapGrafx** includes frequently used templates for organizational charts, flow charts and other diagrams, making it more "user friendly" for the casual user. Requires Windows 3.1 Check supplier for further system requirements.

Software Review:
COHERENT

Reviewed by: Jeff Edwards, Tampa PC Users Group

COHERENT is a Unix clone for 386/486 Personal Computers. I had seen it in the trade magazines for years, but when the advertisement arrived in my office just at the end of long stint working on an obsolete computer and operating system, both the timing and message on the envelope were perfect: "COHERENT - now you can be a Unix expert for just $149.90". After confirming that COHERENT can co-exist with DOS (I had no intention of giving up PowerC, Qedit, and Procomm+) and that it would run on my minimal Dell 386SX (it needs 2 MB RAM, 20 MB hard disc space, and one 1.2 or 1.44 MB floppy) I placed my order.

I've barely skimmed the surface after working with it for only a few weeks, but it is already apparent that COHERENT will not only be a nice vehicle for learning the basics of Unix, but that it provides several unexpected bonuses as well. Just in case anyone else out there might be as interested as I was, this review gives my initial impressions in time to take advantage of the special pricing that the company says will expire on September 16, 1994.

THE PACKAGE. The package arrived four days after my order, and my first impression was that it was just a bit mind boggling. It included 5 floppies containing the basic operating system and utilities; 3 floppies containing COHERENT's X-Windows clone; one floppy of games for X-Windows; a 1200 page COHERENT manual; a 200 page X-Windows manual; a 64 page COHERENT installation procedure; and a 15 page X-Windows installation procedure. The manuals all appeared to be very well done, and the installation guides appeared to be clear and concise.

PREPARATION FOR INSTALLATION. The first step in installing COHERENT is actually to re-install DOS with part of the hard disk reserved for COHERENT, and for that task the "DOOMSDAY KIT - a bootable diskette" article in the July issue of Bits of Blue was a good starting point. Since I had to reformat the hard disc anyway, I decided to take the opportunity to swap out my 50 MB hard disk for larger one at the same time. I chose a 410 MB unit, and the swapout turned out to quick and easy, taking less than 2 hours from power-off to power-on.

Re-partitioning the disk and re-installing DOS involved three steps:

1) Boot DOS from a floppy and run FDISK to partition the disc. In my case, I assigned 256 MB to the "Primary DOS partition" and the rest to the "Secondary DOS partition", and then made the Primary DOS partition "active".

2) Issue the DOS command "FORMAT C: /S" to format and write the system files onto the DOS partition.

3) Boot DOS from the hard disk, create directories, and copy files back from floppies.

COHERENT INSTALLATION. The actual installation of COHERENT was reasonably fast and simple, and that turned out to be a good thing, because I ended up having to do the installation a total of seven times! To install, you boot from a floppy (it must be the A: drive) and answer questions and insert floppies when prompted, preferably reading the printed installation instructions as you go along. The whole process takes about 1-1/2 hours of you choose all the optional checking and un-compressing.

TECH SUPPORT. When I booted the new system from the hard disc for the first time, it hung up with cryptic hexadecimal code in the upper right hand corner of the screen instead of displaying the COHERENT sign-on prompt. Shortly thereafter, I learned that although COHERENT tech support is "free", it is not the easiest thing to come by, and once you get it, it may not be the most useful thing in the world.

I called COHERENT's Chicago area tech support number and was immediately put on hold listening to a Mark Williams Company commercial. This wasn't so bad the first couple of times through, but by the time a real person came on the line a half hour later, my attitude had take a definite turn for the worse.

> *....COHERENT will not only be a nice vehicle for learning the basics of Unix, but that it provides several unexpected bonuses as well.*

The tech support person I talked to didn't know what to make of the error code that appeared when I tried to boot, and after asking me several questions, decided that the problem probably had to do with my using a monochrome VGA monitor but choosing a VGA driver during the installation. I tried to tell him that the computer didn't even know that the monitor was monochrome, but he had no better ideas, so we spent another 15 minutes of long distance time trying various "patches" before he gave up and said he'd just have to mail me a set of floppies with a different video driver.

PERSISTENCE PAYS. Not one to give up easily, I set about re-doing the installation, each time trying a different combination of optional selections (floating point support; additional users; passwords; VGA/mono; daylight savings time conversion; etc). I hit pay dirt on the fifth attempt: the COHERENT sign-on prompt appeared after booting, and from there on everything went accord-

Coherent...*Continued on page 7*

Coherent...*Continued from page 6*

ing to the book.

I'm still not sure what the problem was with my initial installation, but I think it had to do with selecting the optional "virtual consoles" feature and not having enough memory in my system to support it. Although the documentation says nothing about memory requirements over the minimum 2 MB if you're not installing X-Windows, I found that the system kernel couldn't even be linked on my system if I included the optional "streams" support during installation.

INSTALLATION POSTSCRIPT. A set of two floppy disks arrived in the mail about a week after my conversation with tech support, and I decided to give them a try even though by that time I had the system up and running for almost a week. To make a long story short, the new disks didn't change the original situation a bit, so I ended up with a system built from the new disks, but with the same combination of options that had finally been successful with the old disks.

BOOTING COHERENT. To boot COHERENT instead of DOS, you simply hit the "1" key (for partition number one) while the ROM boot program is trying to access the floppy drives. If you don't hit the "1", DOS boots automatically just as it did before COHERENT was installed. Starting COHERENT is not nearly as fast as starting DOS, however; on my system with 150 MB assigned to the COHERENT partition, COHERENT takes about 1-1/2 minutes to check its file system each time you boot up.

STANDARD SETUP. In order to give COHERENT a little more familiar look and feel, at least while I was beginning to learn the system, I ended up making a series of "standard changes" immediately after installation:

1) I selected the Korn shell instead of the Bourne shell as default. This allowed me to make the next two changes:

2) I select "EMACS style" instead of "vi style" command line recall. This makes command line recall similar to DOS's Doskey feature.

3) I change the default prompt to just display the current working directory, ala DOS.

4) I change the permissions for device "/dev/at0a" to allow any user to read from the DOS hard disk partition. This allows quick and easy copying of files from DOS to COHERENT!

HELP/MAN/APROPOS. The COHERENT system provides on-line help in three levels, and this is especially useful if you're just learning the system. The HELP command provides concise help on command syntax and usage in the style of MS-DOS 5.0; the MAN command provides detailed explanation of commands and system concepts; and the APROPOS command allows you to access MAN write-ups on topics of interest via a keyword search. I believe that these are all relatively standard Unix commands, but with my non-Unix background, this is easily the best on-line help system I've ever used.

THE 'C' COMPILER. Being a programmer, I decided that the best way to learn Unix would be by writing some programs, and so I set about to convert some of my DOS/PowerC programs to COHERENT. In doing this, one of the really nice things about COHERENT soon became apparent: this is a true 32-bit operating system, with a true 32-bit 'C' compiler, and the 640K limitations of DOS simply do not exist!

My initial impression of the 'C' compiler is that it is fast, complete, and reasonably well supported. It doesn't have much in the way of documentation, however; the manual refers you to standard textbooks for basic 'C' documentation.

THE ASSEMBLER. My second happy discovery was that COHERENT provides a full featured 32-bit assembler to go along with the 'C' compiler and linker. I got interested in the assembler because the first program I converted from DOS to COHERENT was a cross-platform CRC checker that I use for program configuration control, and it ran more than 3 times slower in the 32-bit 'C' version that in the original 16-bit PowerC/PowerC assembler DOS version.

The COHERENT assembler was my first foray into 32-bit protected mode programming for the PC, something I had been wanting to do for a long time anyhow. It didn't take long to learn the basics, however, and my CRC little subroutine (which includes some "line" counting logic) was debugged and incorporated into the final program within a few hours of starting the project. The final execution speed was not quite as good as the 16-bit DOS version; I suspect that this was because my PC is only a 386SX with no cache, and that the 32-bit version would run considerably faster on a PC with a real 32-bit architecture.

THE DEBUGGER. The COHERENT system does have a debugger, but by today's standards it is a throwback to the dark ages. Suffice it to say that if I have anything really complicated to prototype, I'll surely go back to DOS and rely on the $19.95 PowerC Trace, which is about a million times easier to use.

TEXT EDITOR. A decent text editor is essential if you're going to do any serious software development, and COHERENT provides at least two: elvis, a "vi" clone, and "me" (microEMACS), a scaled down clone of EMACS. I chose to learn "me", firstly because it has some "C" debugging capabilities built in, and secondly because it seemed to be much more like the DOS editors I normally use.

MicroEMACS is a perfectly usable full screen editor, but it's not nearly as nice as DOS offering such as Qedit. For example, it took me a full day to develop a small set of 'bullet proof' basic keyboard macros (such as single-key duplicate line and delete line), whereas the same task took closer to 15 minutes for Qedit. A lot of the problem was that the "me" documentation was incomplete and in some instances just plain wrong.

OTHER FEATURES. The COHERENT package has hundreds of basic features

See Coherent...*Continued on page 8*

Coherent...*Continued from page 7*

that I just haven't had time to try, not the least of which are multitasking and "native mode" access to a huge number of Unix-based networks and public domain databases. Also, if you're interested in such things, Mark Williams Company claims that COHERENT will run the Unix versions of WordPerfect, Lotus 1-2-3, and several other "standard" programs right out of the box.

SUMMARY. If you prefer Windows to DOS and you spend most of your time running your favorite half dozen application programs, you'll probably have very little interest in COHERENT. If you're a working programmer with an interest in learning Unix, however, you might give COHERENT some serious thought. This package came with a sixty-day money-back guarantee, and at the time of this writing, I've used it less than three weeks. All the trials and tribulations not withstanding, I think the best way to summarize my impressions is this: COHERENT with X-Windows for $149.90 is a bargain to compare with PowerC for $19.95, and I wouldn't even consider asking for my money back.

Mark Williams Company, 1-800-636-6700 ☆☆☆☆

Software Review:

Seaworthy Two WWII Simulators on one CD-ROM

Review by: Alford and Matthew (PT Boat) Poole, Tampa PC Users Group

The Seaworthy CD-ROM contains two World War II simulators, PT Boat and Sub Battle.

Installation is easy from the CD-ROM and takes less than 2 MB's of hard disk space for both games. These "classic" DOS (or OS/2) games run from the hard drive.

PT Boat

General Quarters! Man your battle stations! Do you ever wish you could go back in time to World War II and take command of a Patrol Torpedo Boat? That YOU could be the person giving the orders to fire torpedoes, or launch rockets at the enemy? Now you can, with PT Boat, a fast-paced action game taking place in the Philippines during early World War II.

You really have to pay attention and be on guard while you're playing PT Boat, because you never know whether you will be ambushed by a squadron of Zeros, attacked by a cruiser, or (my dumbest mistake) run aground and get stuck! (Oops!)

The game is sufficiently documented to help you learn the controls. It took me about 45 minutes to have the controls, indicators, etc. memorized.

Limitations: When saving a game, it prompts you to enter the name of the file you want to save (default is SAVEGAME.PTB). If you enter a different name, it will work, but when you go to restore the game, you have to retype the filename (don't forget what it's called - there is no list of available files).

Evaluation: Overall, it is a VERY good simulator, well worth buying. It keeps your attention, is realistic, and very addictive, I keep playing it even after having won several missions. On a scale of 1-10, I rate it about 9.6.

Sub Battle

The documentation contains a Quick Reference Card and instruction booklet with a historical perspective of both the American submarines and German U-boats.

Sub Battle starts you off 28,000 ft from the nearest target. Traveling at 21 knots, it takes a while to get within firing range. The convoy is also traveling away from you, this is good because it takes a while to figure out which keys to push to make things happen. When within 10,000 ft I fired a torpedo at the escort ship, it had detected me and was heading down my throat! The screen started flashing red, sounds of explosions blared from the speakers, while various damage reports scrolled on and off the screen. Where did the airplanes come from? While bombs and bullets hammered me, the escort sank, and I soon followed.

The instructions suggest sneaking around in front of the convoy and then waiting until they are in range to sink the armed ships. Use the deck guns for the unarmed ships and antiaircraft guns for the airplanes. Ah, that sounds like a plan!

Limitations: Sub Battle uses the keyboard exclusively. Joysticks are supposed to work, but our Gravis Game Pad caused the view dial to spin wildly and didn't control anything. Sub Battle and PT Boat will work in OS/2, but not in Windows (not enough memory!).

Evaluation: After getting used to working in real time for maneuvers (no instant gratification here), my enthusiasm has grown. This is like the real thing. When the action does start, it is fast and furious. There is also time compression for bold souls with nimble fingers. I think playing these games enhance our knowledge of battles fought during WWII. While not as graphically advanced as "Rebel Assault" or some of the latest games, PT Boat and Sub Battle are none the less quite entertaining and certainly more educational. Full speed ahead for Seaworthy!

Minimum System Requirements: 286 CPU, DOS 3.3, EGA graphics, 550KB free RAM, CD-ROM drive, 2MB free hard disk space.

By Digital Illusions, Cost and availability: $29.99 for SeaWorthy CD-ROM, or $19.99 for PT Boat and $24.99 for Sub Battle from Alliance Interactive Software, 1859 N. Pine Island Rd. #103 Plantation, Florida, 33322 Phone (305) 423-4289, FAX (305) 424-9054, CompuServe 73744,521. SPECIAL OFFER FOR USER GROUP MEMBERS ONLY: PT Boat Simulator $9.99, Sub Battle Simulator $9.00, Seaworthy $15.00 call 1-305-423-4289 to order, offer expires 9/15/94. ☆☆☆☆

Software Review:
Prehistoria

A Multimedia of Who's Who of Prehistoric Life

Review by: David Burch, Tampa PC Users Group

It's a CD-ROM that gives you the power to search through 500 million years of earth's history. Prehistoria is an excellent resource for all ages interested in how life on our planet developed. It includes over 500 prehistoric animals, many full color renderings of these animals, narrated animations and video clips.

To run Prehistoria you need at least a 386 20MHz or faster, 4M free hard disk space, 4M RAM, and a CD-ROM drive. The easy to use setup software installs an icon for Prehistoria in Windows. My system is 486 66MHz with 8M RAM. Response was quick although some of the videos were still a little slow.

Prehistoria provides the user with, exact time period, locations of fossils found, size, text and even an audio pronunciation of the animal's name, on all of the animals represented. Searching through the many animals and information is made rather simple with a variety of different navigational tools. The Gallery is a graphic searching feature that groups animals by similar features. By starting your choice with one of the major animal groups (fish, amphibians, reptiles, birds, mammals, etc.) you enter a graphical index of the animals Prehistoria covers. Choices are made by selecting groups of animals. You work your way down the classification chart by pointing and clicking on the picture of the animal or group of animals that most interests you. Time Tracker allows you to choose from 11 geological eras. During each era chosen a dynamic map shows the position of Earth's continents. By then choosing the major animal groups, Prehistoria searches for the animals found in those groups within that particular era. The animals on this list and their information can then be viewed. The Creature Show takes you on a slide presentation of the animal's life-like illustrations, where you can stop at any time and check an animal's stats. By using the Classifications search Prehistoria allows you to advance through the scientific hierarchy of prehistoric creatures.

The most interesting feature of Prehistoria is the Grolier Museum. This feature contains over 40 full video clips. Clips include talks with several famous paleontologists and geologists. While animations cover current theories of the development of prehistoric Earth, dinosaur extinction and the lives of dinosaurs. Also included within the museum are a bibliography and a museum listing allowing the user further reference to this exciting field. I had an excellent time searching through the prehistoric time tables and would definitely recommend this CD to anyone interested in natural history.

Grolier Electronic Publishing, Inc. 1-800-285-4534 SRP $69.95.

David Burch received a BS degree in Zoology from USF in December, 1993 and has been employed by Busch Gardens for the past 6 years in the Conservation Education Dept. He is currently working in the Graphics Arts Department for the Busch Gardens Zoo Department and is working on undergraduate courses for a second degree in Geology.

USER'S CORNER

WORDPERFECT 6.0 FOR DOS. When you select the Look feature while in File Manager and you see the Doc Summary, just press 3 (Look) again and you will see the document itself. Also use the Look feature to view graphics; no more having to create a graphic box and retrieving a graphic file just to see what it looks like as in version 5.1. And use the Look feature to play sound clips (assuming that you're set up for sound in WP. If you'd like a calendar macro that you can personalize with your own reminder notes (birthdays, anniversaries, etc.), down-load EB-CAL from the bulletin board. Version 6.0b is now shipping. Cost is $17. Corrects some bugs. Now provides for a ruler.

LIST.COM Many people use this versatile utility but how many have really used some of it's little known features? If you have many directories on a hard drive or a lot of files in a directory, using the TREE or MEM command results in a scroll so fast that all you see is the last screenful of data. Recently, there was a post in the BATPOWR conference that mentioned the use of the /S switch. This switch tells LIST to use a piped file as input. By piping the output of these commands through LIST, you can use the scrolling feature of LIST to review the data. Plus, you can use the utility's ability to capture part (or all) of the data and write it to a new file or to the print-er. The command is as follows: MEM /C | LIST /S The next time that you are at the computer, try it.

WINDOWS 3.1 HELP The Help screens are very useful, especially the ability to jump to other topics. You've seen them, the topics in that icky green color that's so hard to read. Well, you can change that color! First, backup the WIN.INI file. Copy it to a "SAVE" directo-ry or to SAVEWIN.INI or to a floppy diskette. Fire up Windows, click on Main, SysEdit, WIN.INI. To expand the window, any window for that matter, double click on the Title bar. Scroll down to [Windows Help] and add the following line: JumpColor=0 0 128 to select deep blue, instead of that wimpy green. Save the file and exit SysEdit. Exit to Program Manager. Click Options, set Save Settings to On, and click File. Now_hold down the Shift key and then click on Exit Windows (or hold down the Shift and Alt keys and press F4). Windows will now be updated and you didn't have to exit and reboot Windows! Turn off the Save Settings if you want Windows to come up the same way every time. To see other colors and their RGB values, click on Colors, then on Palette. Setting two of the values to zero and the other to 255 will give you a solid

See User's ...*Continued on page 10*

User's...*Continued from page 9*

primary color. The double click on the Title bar is easier than trying to click on that small arrow to change window size. Depending on your Windows setup, you may need to double click the Title bar twice to get a full screen window.
WINDOWS 3.1 SOLITAIRE Instead of dragging aces up to the foundation row, just double click on the ace and it will jump up there whether the ace is one of the cards in the tableaux or in the talon. Same for the deuces, treys, etc., that are built onto the foundation.

Software Review:

Perfected! Version 3.0 for WordPerfect 6.0 DOS The Office Expert Series

Review by Renate Marsh, Tampa PC Users Group

No more paper files!

Are you using WordPerfect 6.0 for DOS at your place of business? Then this program Perfected! is almost a "must have" to automate all your many office tasks. Perfected! is like an "Add On" program to WordPerfect (WP from now on). It utilizes many of the advanced features of WP to simplify most of the daily and repetitive office tasks. What is so amazing that my WP looks at times like a database program when used in combination with Perfected!. That's because this program with the help of WP advanced merge commands does perform many functions of a database within the frame of the WP program.

What setups do we need in an office environment? How about an Address Book? Perfected! has a template or setup of a customer/client address database, ready set up to be filled in with data. You only need this one Address Book for all your addresses, just assign a different category code for different groups. Once you have recorded a name and address (and of course saved your file), then this information stays in the Address Book within your Perfected! office program setup and all or part of it can be plugged from the database to be used on labels, envelopes, in memos, letters, or on/in many other templates supplied by Perfected!.

For mass mailing this Address Book is perfect since it also has several choices of commands, like to sort by zip code, before using it for mass mailing. One or more addresses can be plugged into the daily tasks of an office: writing letters, letterhead settings, fax cover sheet, view telephone numbers. Perfected! is there with its setups to get you going. All templates are WP files and can be treated that way when you save, retrieve, or merge.

You can also create and edit a variety of nametags for the Avery nametag products, or create an attendance list to print out along with your nametags. Perfected supplies your office with forms to use for telephone messages, telephone logs, notes, and other types of routing slips. Perfected! includes an invoice and purchasing order setup within WP with automatically updating invoice and order numbers. It will keep a running log of both of them for you to keep track of your accounts. Both forms can also be printed with your letterhead and if multiple copies are required, purchase colored paper and print multiple copies, since printing is so speedy and it will save you so much on costs of supplies.

Need to keep track of you petty cash? Perfected! produces petty cash vouchers, keeps a log of disbursement amount, and calculates balance. Templates for different headers, footers, financial reporting, administration forms, time scheduling forms are also included in this program. You even can use your own file system management which will keep a log for all your files, lets you print file labels and hanging folder tags with your laser printer.

What I liked best of all is a setup of a merge file with different types of paragraphs which I can plug into any form letter I need to send out. This is like a library of paragraphs I can set up which are then available any time I need them. Any form, template, or database can be edited. Sections can be deleted or added on.

Perfected! has it all for your office needs and if you are already a WP 6.0 for DOS user, it uses the same environment and including the program will be easy. The manual gives a step by step description for each tasks or keys to use. The automation in your business should be snap when you use this fantastic program Perfected! with WP 6.0 for DOS.

System Requirements: Besides WordPerfect 6.0 for DOS this program needs 4MB of your hard drive and a laser printer. I don't have an order telephone #, but the address is:
Niad Corporation
85 River Rock Drive, Suite 200
Buffalo, NY 14207
Tech. Support #: (905) 470-0868

Bring a friend or two to our general meeting!

There are many people out there who would greatly benefit from joining our group. And, there are many people who would be able to assist others in our group with their knowledge and expertise. When you bring a guest or meet a potential new member at our meetings, please make them feel welcome and encourage them to join our group. If every one of our members would aggressively recruit just one new member - Imagine what that would mean to our group!

TALENT TREE STAFFING SERVICES

We are looking for highly motivated, skilled, and dependable people. As a Talent Tree employee, you can put your skills to good use, earn top pay, and start working immediately.

We are committed to attracting and keeping the best employees. You'll work with some of the best people in business, finance, and industry. Enjoy challenging assignments and gain valuable experience with nationally-recognized companies. We can place you in the following areas:

Word Processing	Secretarial/Reception
General Clerical	Customer Service
Administrative Assistant	Data Entry

Sharpen your skills and learn new ones. Talent Tree provides training with state-of-the art technology - whether you want to brush up on your present skills or learn new ones. It's all part of our continuous training program available to our employees.

Start a new career today! For work that's personally rewarding and professionally challenging, call us today.

Software Review:
PUBLISH-IT! Ver 4 for Windows

This is a medium level desktop publishing (DTP) program. Although not at the same level as PageMaker or Quark Express, this is a very powerful package in it's own right.

Installation is very simple. Open Windows, run INSTALL, tell it the drive and directory and feed in the three 1.4 MB diskettes. Take a bit of time to go through the Quick-start Mini-manual. Within a couple of hours, even without any DTP experience, almost anyone can produce an attractive flyer or simple newsletter.

Publish-It! is an excellent introduction to DTP. The manual is very, very good. Lots of illustrations of menus and screen layouts. The left side of the pages in the manual is used to show tips, keyboard shortcuts, icon buttons, menus and sample text. The program is rich in features and is very easy to use. For example, the spelling and hyphenation files are in ASCII format. And they can be edited with any ASCII editor!

The program has a set of templates that you can use or you can make your own. Everything in the document is contained in frames: text, graphics, and special effects. The master page concept is supported very well. Common items as logos, headers and footers, page structure, and styles can easily be made part of the master page. Use of a master page ensures consistency of work product throughout the document and every time it's used.

Rulers and guidelines are there to create and position frames. A floating menu shows the stories, graphics, and other objects (OLE-object linking and embedding is supported) that are part of the current document. Click on a frame to make it active, click on the story in the menu box, and the text flows into the frame. A dotted line at the bottom of the frame means there is more to the story. Draw another frame, either on the same page or on another page, click on the story title and the rest of the story flows into this second frame. This automatic frame linkage works in sequential page fashion_you can't go from page 1 to page 3 then backwards to page 2.

While single letters and words can be formatted, the basic construct is the paragraph. Since a hard return defines a para-graph, a single line, like a headline, becomes a paragraph. And that is the key to the versatility of this program. Styles are applied to paragraphs, even single line paragraphs. Styles define the typeface, point size, attributes like italic or bold, para-graph spacing, tab settings, indents (including hanging indents), line justification, letter spacing, etc.. All these can be placed in a named style.

The style name "Body text" would define the format of all paragraphs considered as regular text. All text is body text until the paragraph is tagged with another style. Headline style may have it's own, different format; at least the point size should be larger than that for body text. The bullet style obtains it's bullet character from any symbol font available in Windows such as Wingbats.

There can be more than one "Body text" style; just create the new style, or copy and modify an existing one, and give it a unique name. The same is true for headlines, subheads, bulleted text, etc.. Headers and footers are treated separately from paragraph styles. Automatic page numbering (including "page x of n pages") is available. Different headers and footers can be set up for left and right pages. And three separate parts of the header can be right, center, and left justified_no more guessing or measuring to get it just right.

The Power Text module manipulates text. Put it in an up or down arc, circle, or even a spiral. Various colors, gray shades and patterns are on tap for the fill and line styles. Power text can be rotated to any degree, skewed, reversed, mirrored, squashed, stretched and shadowed.

The Key Pad is a TSR module that operates like the Character Key module in Windows_only this one is better. The symbols and letters are larger; they are very easy to read. Key Pad can be used with other Window applications.

Publish-It! can import text in a variety of formats: ASCII, RTF (rich text format), MS-Works, Windows Write, Word for Windows and DOS, WordPerfect 4 and 5, and WordStar. Graphic formats that can be imported include: CGM, EPS, GEM, GIF, PIC, PCX, TIF, BMF and WMF. The user is cautioned that the newest versions of some word processors should save files in an older version format. i.e. Documents in WordPerfect V6 should be saved in version 5 or RTF format.

Overall, this is an excellent product. It is superior to First Publisher and Express Publisher both in terms of features and ease of use. There are over 70 templates (from business cards to newsletters), clipart, and 16 fonts included in the package.

Requires MS-Windows 3.1, DOS 3.1+, EGA or better, minimum of 2 MB RAM but 4 MB is strongly recommended, at least 4 MB of space on the hard disk, a mouse, a floppy drive, and any printer that can handle graphics. The vendor is Timeworks, Inc., 625 Academy Drive, Northbrook IL 60062. The price: $60.00, Office Depot, Brandon FL.

Tip on Fonts

Ed Buzza, TPCUG

FONTS. We've all seen the ads "50 fonts included, FREE" or "120 fonts for only $39.95." Be careful; you may be reading something that they're not saying. Correctly, a font is a typeface of a certain style in a specific point size. Times and Helvetica are the names of two different typefaces. Normal (or Roman), bold, italic, condensed, black are styles of a particular typeface. Point size is measured in 1/72nd of an inch. A 72 point font is one inch high measuring from the baseline to the height of the tallest ascender (d,b, as opposed to g,p). So, Times Roman 12 pt is one font while Times Roman 14 pt is a different font. With scalable fonts (True Type in Windows), the choice of point size is no longer as important as it once was. Still, the typeface and style govern a font. A set of scalable Times and Helvetica in normal, bold, italic, and bold italic is eight fonts; yet many will say it's only two! They may be justified in their thinking because many word processors and desktop publishing programs will create a bold or italic font using the normal font for the basic outline. Before you spend your money, check and be sure that what you're buying is really what you expect it to be.

FRIENDS OF THE USER GROUP:

We acknowledge the following firms for their support:

- CompUSA
- IBM
- PC Warehouse
- Software Review
- Custom Computer Wholesale
- Staples
- Sunrise Computer Supplies & Parts
- Brainchild (Software Dist.)
- Realtron - Appraisal Magic

We also acknowledge the following national software vendors for their excellent demonstrations and contributions of evaluation software to our group.

- Access Software
- Adobe Systems, Inc.
- Borland
- Corel Systems
- Grolier
- Knowledge Advenenture
- Microsoft
- Symantec
- Traveling Software
- Wordperfect

WELCOME NEW MEMBERS!

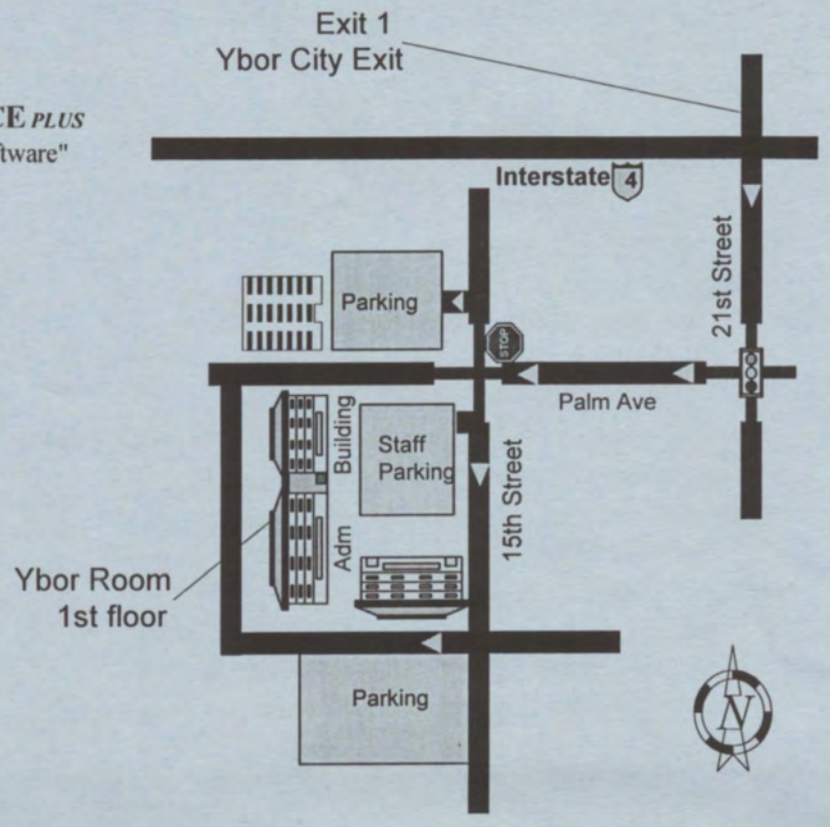
Philip A. Lear

John A. Meroth

Tom Wolf

WE ARE HAPPY TO HAVE YOU IN OUR GROUP!

MEMBERS HELP-LINE



The following phone list is provided for our **Tampa PC Users Group** members in an effort to establish local support for those frustrating times which we have all encountered while using our PC's. Please note that these are members that have volunteered to help you, treat them in a courteous manner. Be sure to ask if it is convenient for them to help you now, or if you should call another time. It would also be helpful to have your documentation and have it handy when you call. *(Don't expect help if your software is an illegal copy or you do not have documentation!)* **TPCUG** is not responsible for the information or advice provided by volunteers. Volunteers may or may not be experts in the subject matter. You are on your own with any advice received. Be aware also that some of these volunteers may be consultants in their area of expertise. If you are interested in volunteering to answer members questions, either leave a message on the BBS or fill in the forms provided for this purpose at the meetings.

Name:	Phone No:	Day:	Time:	For help on:

Bits of Blue

Vol. 7, No. 10 October, 1994

MEETING
(2nd Wednesday every month)

DATE: October 12th, 1994
TIME: 6:00 PM
PLACE:
HILLSBOROUGH COMMUNITY COLLEGE
Ybor Campus
(Corner of Palm & 15th Street)
Ybor Room (See map on last page.)

INSIDE THIS ISSUE:

Minutes of 8/10/94 Meeting 2-3
President's Column 4
Quicken Companion 5-6
Science Adventure 7-8
Power Pak for Windows 8-9
Integrity Master 10
The Next Windows 10-11
Nominations Needed 12
Members Help-Line 13
Special Incredible Rates -Magazines 14-15

SPECIAL NOTICE: OS/2 SIG

is scheduled for Tuesday, October 25th at 6:00 p.m. in room 436 on the fourth floor of the Lakepoint One building across from Tampa Bay Mall.

October 12th AGENDA

Presentation by:

Brainchild

Computer Distributions

Jason Kimenker will discuss the basics of buying a PC. He will bring miscellaneous add-on hardware and software products to review and consider for your existing PC system.

UP COMING PRESENTATIONS:

November 9 - **IBM OS/2 Personal**

December 14 - **Broderbund - new products**

BARGAIN TABLE

We will have a Bargain Table at this months meeting. Come early to shop. And ...Remember your PC related discards are another's treasures, bring your PC items you no longer need or use and donate them to the group. **All proceeds will benefit TPCUG.** All sales final.

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII file or in a commonly available word processor format, such as WordPerfect 5.2, or Ami Pro 3.0 on diskette to the editor at 9402 Hidden Ridge Place, Tampa, Florida 33637 or send it by modem to BBS (813)239-3704.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

The use of trade marked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted at the following rates:

	1 month	3 months	6 months
Full Page	$60.00	$162.00	288.00
Half Page	$40.00	$108.00	$192.00
Quarter Page	$22.00	$60.00	$106.00
Eight Page	$12.00	$33.00	$58.00
Business Card	$10.00	$27.00	$48.00

All advertisements must be prepaid by check payable to TPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if it is not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, Marylee Bruneau at (813) 985-3338, for space availability and for further information.

This newsletter is created with PageMaker 5.0 from Aldus Corp. and Corel Draw from Corel Systems.

Secretary's Report

MINUTES OF 9/14/94 MEETING
and Personal Comments by
Jim Clark, Tampa PC Users Group

This was another great meeting, but the rain was once again not a friend to our meeting. However, the rain did not interfere with the very good meeting that took place, including a fine presentation on a very new and powerful program — Ca$hGraf Business Office.

USER GROUP NEWS

- ADOPTBBS: Harvey gave a brief summary as to what the Adopt The BBS fund raiser is all about and why, and then pointed out that the newsletter includes a how-goes-it thermometer to reflect our progress toward achieving the funding needed to improve the BBS — add a second phone line, another modem to support that line, and add a 500+ MB hard drive to provide more file storage capacity. He reported that as of newsletter publication time only $200 in contributions had been received. He emphasized how important the additional funding is to the BBS and urged all members using the BBS to lend their support to this fund raiser.
- MEETING ANNOUNCEMENTS VIA FAX: Harvey announced that the Board of Directors (BOD) had decided to send notices of our general meetings via fax to area business and educational institutions as a means of making those organizations aware of us and what we do. These one page notification flyers would be sent to a selected group of organizations for the next meeting. Any organization that desires the notifications should inform the user group at the address shown on the back page of this newsletter, along with organizational info (name, address, fax number, etc.), or notify any member of our BOD. On the other hand, anyone who receives the flyer via fax that does not wish to receive future notifications should also let their wishes be known in the same manner.
- CORPORATE MEMBERSHIP: The BOD has created a new membership category, Corporate Membership. Annual membership fee is $50, with membership commencing when the application for membership is approved and continuing for one year thereafter. This includes membership for three (3) corporate personnel, each of which would have full membership rights. The corporation may sponsor membership for additional corporate personnel if desired for an annual membership fee of $15 per person; however, the expiration of these memberships will be concurrent with the expiration of the sponsoring corporate membership. Each of these additional personnel will also have full membership rights. The initial application should be sent to the user group under corporate letterhead, and include the names of all corporate personnel for which membership is requested. Requests to add additional personnel may be submitted at any time thereafter; this request, also under corporate letterhead, must include the names of the

See **Minutes** *Continued on page 3*

Minutes.. *Continued from page 2*

additional persons for whom membership is requested.

➧ TBOL PARTICIPATION: Tampa Bay On-Line is in full swing on Prodigy. Harvey explained how our user group is participating — providing reviews and articles for posting on TBOL. All articles provided by us to TBOL will have first been published in our own Bits Of Blue newsletter. Several, usually about four, will be posted on TBOL every month; articles are be retained on TBOL until they become outdated. Nothing will posted on TBOL by this user group until after it has been made available to our own membership.

➧ INDUSTRY NEWS: A number of news tidbits from the industry were tossed out from the podium and from the membership as well. Probably the item of greatest interest is that Microsoft has selected a name for Chicago/Windows 4.0 — the name announced is 'Windows 95,' after the year in which it is expected to be released. Yes, the industry now expects 'Windows 95' to be released in the 1st or 2nd quarter of 1995. (Will it have to be renamed Windows 96??)

➧ PRESENTATION — Ca$hGraf Business Plus

Our own St. Petersburg-based Target Software Group, Inc., favored us with a visit by four of their staff. Richard Muscarella, Sales Manager, gave us a rundown on the company and the development of Ca$hGraf Business Plus — a comprehensive, interactive financial management program designed for small businesses. Rich explained how the company and this program evolved. Ca$hGraf was in development about 5 years and was first released only last May at Comdex. It has won numerous awards since release from a variety of industry reviewers and critics. The name of the software evolved from Ca$hGraf, to Ca$hGraf Office Plus, then to Ca$hGraf Business Plus because of a need for a name which more accurately reflects the breadth and comprehensiveness of the program. Rich described it as the only fully integrated, single solution financial management software available, and the only piece of software a small business would need. Moreover, Rich explained that great emphasis was given during development to ease of use and true user friendliness, the result being that anyone would be an effective user in a very short time. That lead in raised our level of expectations and set the stage for the presentation of Ca$hGraf Business Plus.

Chris Payne II, Regional Representative for Target Software, followed Rich with a review of Ca$hGraf. The introduction given by Rich soon became evident in the review. A very comprehensive program, Ca$hGraf includes: A financial awareness and goal tracking system, with loan and savings scheduler; full business accounting, including budgeting and projections; supports both cash and accrual accounting simultaneously; handles 3 types of invoices; does credit memos and billing statements; provides a general ledger; does full perpetual inventory with location and multi-location and price levels by item; handles check writing and deposit tracking with up to 99 accounts; provides a preset and user definable database; complete instant text and graphical reporting on all data in the program; provides contact management in client database with 'Phone Script", and autodial throughout; includes word processing, complete with spell check and thesaurus, and mail merge from databases and financials; prepares purchase orders; prints to preprinted forms or will accept and fill in scanned forms; supports bar codes; does time and billing accounting; supports tab tables; provides a day planner and appointment scheduler for an unlimited number, to name just a few. And all of these features are fully integrated and interactive so that data in any portion of the program is instantly usable in all other areas of the program. Boy, that is a mouth full!!

The size of the files that Ca$hGraf will support are limited only by the limitations of the host computer and disk drive space. Ca$hGraf is not yet network compatible, but a network version is currently in development. Meanwhile, an easy to use full security capability already exists within the program that provides the capability to limit individual user access to specific areas of the program. True context sensitive help is available at every location within the program. Moreover, a single comprehensive manual provides ready information about the program in the unusual event that you cannot find your answer with from on-line help. And if that still isn't enough, free technical support is provide by Target Software via toll free telephone. To speed up the learning curve, Target includes a 1½ hour video tape with every copy of the program; this video gives the guidance needed to use the program effectively quickly.

Ca$hGraf Business Plus requires a 386 or better computer, with at least 4 Mb of RAM (preferably 8 Mb), Windows 3.1, and a total of 11 Mb of hard disk space for program files. The program lists for $299, but is available at an introductory price of $199 for a limited, but unspecified time. For those in need of that kind of program and but did not attend this meeting, you blew it because Target made the program available to those present for an even better price — better luck next time.

To Target Software, Rich and Chris, and all who helped with the presentation, THANK YOU very much for an excellent presentation about Target and Ca$hGraf. We appreciate your making our membership aware of both Target and Ca$hGraf.

➧ AND THE WINNER IS

Thanks to the generosity of Target Software Group and Brainchild Computer Distributions, there were a couple of very nice door prizes. Those among us to have the good fortune to win are:

Dave Clary	MosesAll!!
Tom Cone	Ca$hGraf Business Plus

The meeting adjourned at about 8:45 PM.

TIP

To make MS-Word6.0 or 6.0a run a little faster,: edit the WINWORD6.INI file in the Windows directory, and put the following lines in the [Microsoft Word] section:

BitMapMemory=1024
CacheSize=256

President's Column

PRESENTATION -
This months presenter, Gold Disk, has been rescheduled to early 1995. Unfortunately, the representative from Gold Disk had to reschedule at the last minute due to a change in his business schedule.

Fortunately, I was able to schedule one of our local vendors for a presentation. Jason Kimenker of Brainchild Computer Distributions, Inc. happily accepted my last minute invitation to present at our meeting. Brainchild has two PC retail stores at which you can purchase a full variety of PC hardware and software. Of course Brainchild goes further than your average PC retail store since they take national, corporate, state and federal orders. One of the stores is located in Tampa at 1910 W. Busch Blvd., and one in St. Pete. Jason, from the Tampa store, will bring miscellaneous hardware and software items to show. Additionally, he will discuss the basics of what to look for when buying a current PC. Jason will also review what add-on products for your PC you should be considering to purchase. These may be hot items to get for the upcoming holidays. This will be the first time that we actually have a variation of hardware to show. This meeting will be a great opportunity to ask detailed questions about hardware and software.

BARGAIN TABLE -
Hey want to help yourself and the Tampa PC User Group? Well at this month's meeting we will have a bargain table chock full of miscellaneous PC items for sale. The table will be located on the South side of the Ybor room. The items have been acquired through donations from vendors and fellow members. Pass by this table and see if you can find your bargain. If you have an item sitting at home or work that is of no value to you, bring it to the meeting and donate it. We can put it on the bargain table at a future meeting.

NEW MEMBERSHIP RATES -
For over five years our membership rates have stayed the same. However, the cost of operating the TPCUG has grown and the membership count has not increased enough to offset that cost. Paying for meeting space and insurance are just some of the new expenses we incurred this year. Of course additional moneys have been spent over the years to run and maintain the BBS, produce brochures and newsletters just to mention a few items. Having said all that, the Board of Directors has decided to raise the dues effective January 1995. You can avoid paying that higher rate by renewing your membership early. If you wish you can renew for more than one year. Look at your mailing label attached to your newsletter. If it has 95 on it then you are a prime candidate for early payment. Just renew your membership at the meeting or by mail, using the current rates, by the end of November 1994. Mail renewal must be postmarked before the 1st of December 1994. We will add to your renewal date based on the number of years you renewed. For those of you that have a December 94 renewal year on your label and wish to avoid the rate increase, we must receive your renewal payment before year end 1994. All rates will be raised $5.00 except for the corporate rate which will be raised $10.00.

ELECTIONS -
Once again elections for the board of directors are around the corner. At the December meeting you will vote for the 1995 board of directors. It is time to think about the nominations for office.

Harvey P. Bruneau

Our Apology to Brainchild Computer Distributions

We erred in our August and September newsletters by identifying this fine firm as 'Brainchild (Software Dist.)". Their Correct name is Brainchild Computer Distributions, of course. They have been a friend of this user group and its members for some time, providing software donations and quality computer products. (full line hardware and software) and services at a very competitive prices.

Brainchild Computers Distributions, you would think that the least we could do is get your name correct. We do apologize! and a big **THANK YOU for being our friend.**

It is SLOOOWLY rising....
CAN YOU HELP?

SOFTWARE AVAILABLE FOR REVIEW:

XtraDrive Lite - (Windows & DOS) Doubles your disk capacity. vendor: Integrated Information Technology
WinSense - the Windows Optimizer
AnyView - Screen Commander for Windows
Your Deck - Design & Build How-to Software (Sunset)

Magic Theatre - Easy way for kids to create, narrate, and animate their own computer movies ages 6&up.
CA$HGRAF Office Plus - The World's Most Powerful Single-Solution Office Software!
PC Tools for Windows Ver 2.0 -Control and expand the power of Windows.

(Contact Marylee or Harvey @ 985-3338 if you are interested in doing a review article for the newsletter on any of the above software.)

Software Review:
Quicken Companion for Windows Version 2

Home Inventory, Stock Quotes & Tax Estimator add-ons to Quicken 3/Windows

-Required: 100% compatible (or IBM), 2MB RAM, Windows 3.1 running in Standard or Enhanced mode, at least 5MB space on hard drive, Windows supported monitor and printer.
-OPTIONAL(but highly recommended): Quicken for Windows, Version 3.
-Test installation: Pentium 90, 16MB RAM, Windows for Work Group 3.11 Enhanced, 1 GB space available. HP 4 laser jet.

QUICKEN HOME INVENTORY

Quicken Companion for Windows is another highly friendly and valuable piece of software from Intuit. Before doing anything I read the manual and again found it to be clear and easy to read. Also learned about the advisability to use it in conjunction with Quicken for Windows.

First I wanted to take a look at the program in a stand alone mode. Since the test bed was brand new and did not have Quicken loaded, this was ideal. And I had a good comparison to go with because I already have a complete inventory in QPRO for DOS.

Anytime a company says you can inventory your home in one hour, you have to be skeptical. Not believing them, I followed their recommendation and two hours later I was done with the first step. What they actually recommend is remembering everything you can in each room, then printing a copy and go to that room to fill in what you missed. And is it surprising how much you forget you have!

A big reason for a home inventory is insurance, and since we live in the hurricane belt, with a few tornadoes thrown in for good measure, this program will be very valuable. And then you also have fire and burglary. So when you are done, make sure you have a safe place off premises to keep a copy of the records.

In the opening screen, choose a location by clicking the arrow by 'View by Location' and you get about twenty suggestions. Start with the room you are sitting in and just plug away. Click in the 'Item Category' box, click on the down arrow on the right side and you will get a drop down menu of 25 or so suggested categories - furnishings, electronics, decorations, etc. Choose one and list all the things you can see in your room. Click in the 'Item Description' box, click on the detail button on the right, and another pop down menu gives you many items. Or you can just type your item in, which is what I did later on because it was so much faster.(Like 'Table, dining, walnut')

Being well versed in Windows, I then pressed the Tab Key twice to go to the 'Replacement Cost' field. Here, Intuit shows how friendly they are with users, because in a preferences box we'll talk about later, you can choose to move between fields by pressing the Enter Key! (I avoid the Enter Key like the plague - get into more trouble with Enter than any other key except Del.) Type in your estimate of the replacement cost, especially if your insurance policy has that provision.

> For instance, to replace our solid walnut dining room table today probably would cost $1,500 or $2,000. We can seat ten comfortably. When we bought it 37 years ago, the whole dining room set cost $295, yet our table is in like-new condition. We have pictures of it so we can discuss the replacement cost with the adjustor if we have a catastrophe.

When you next press the Tab Key to go to the 'Resale Value' field, a dollar figure is already suggested. You can override it, but in the preferences box you can set the percentage rate for each item.

Then press the Tab Key again and you are ready for the next item. It is a simple as falling off a log.

So after doing all the rooms I could think of I thought about the details. We have lots of boxes, probably sixty or seventy with things we use occasionally. They are in the attic, on a storage shelf, in the garage, in closets, etc. What do you do with them? Since I have them all in QPRO, I decided to leave them there temporarily, but listed QPRO as a source and entered the value carried in that file. But I added new boxes because I was cleaning up, and very easily added 'Box994A' and listed its contents. Then 'Box994B' and listed its contents, etc. Since some of those contents are current software programs, I went to the item and was able to add the serial number, the number of disks in the set, etc. You can completely describe each individual item to your hearts content.

And now, preferences, which makes the program so personalized for you. Click in the 'Preferences' box and you get a dialog box with many choices.

Suggested Item List Preferences

-Use suggested values for new items? (Default is on)

-Automatically set Resale Value: (Default is on)

- % of replacement cost (Default is 50%)

So in the above you have control and can make changes.

Inventory List Preferences

-There are several items in here for warnings and I suggest they all be left turned on (the default)

-Show cents in currency fields (Default is off)

General Preferences

-Treat the Enter Key as a tab. (Default is On) If you are not used to Windows programs, I suggest you leave this one on.

-Remind to backup on exit. (Default is On)

Since I am a backup freak I recommend you leave this on and have a floppy disk available at all sessions to put the backup data on a removable source.

-Default Insurance Policy (Default is Homeowner)

If you are doing cars, or boats, or business computers you can change to that policy for each session.

See **Quicken** *Continued on page 6*

Quicken... *Continued from page 5*

There are many additional assets, such as numerous reports, lists, inventory valuations, and even the ability to update the inventory directly from Quicken. Say you bought a new projection television. When you enter the purchase data, you can tell Quicken to update Home Inventory. How simple can it get?

Recommendations:

A superb program! After I did this as a stand alone package, I loaded Quicken 3 for Windows into the Pentium, told Companion to update Q/W 3, which then was automatically opened, checked the Home Inventory Menu and there it was. Beautiful.

Have Quicken loaded before you start, then follow the manual and YOU will have your first cut at your home inventory within an hour, just like they say.

QUICKEN QUOTES

Added requirement: Modem.

-Quicken for Windows, Version 3 installed.

-An online service: You can use Quicken Quotes Hotline or CompuServe basic services account if you a user.

Since the test bed is not equipped with a modem yet, the package will be valuated at a later date. A couple of points, though, for your thinking purposes.

The Quicken Quotes Hotline is a 900 phone number with a cost of about $1.00 per minute. If you are a CompuServe customer, there is no added charge, because the Quotes Hotline actually uses CompuServe to get the quotes.

If you update your portfolio on a weekly basis from the Hotline, the program is so well designed your cost will probably be very reasonable, since the quotes will be retrieved very fast.

A very valuable part of the package is: before accessing Quicken Quotes Hotline, you get a dialog box telling you the costs! You must click okay before you incur any costs. If you are confident you are correct, you have the option of turning the warning dialog box off for future use. Might be wise to leave it show every time, especially if you have expert grandchildren who know how to use your programs.

QUICKEN TAX ESTIMATOR

Version 2

Options: Recommend you use this after you have installed Quicken Version 3 for Windows. It does not work with earlier versions of Quicken, nor with the Version 1 Tax Estimator.

Bad news from 1993 for me, my estimated taxes cost me a bundle, plus a penalty for the first time. So I explored this one first, just to see how things are going. They are not going as well as I would like, because I **am** under withholding.

Good news for 1994, though, thanks to the Tax Estimator, I now have time to adjust the withholding so at least I don't get a penalty.

One of the reasons for all this uncertainty is the impact of three things: Social Security earnings, earnings from businesses, and wages. I forgot that last year up to 50% of Social Security earnings were taxable, and this year that goes to 85%. And I did not think I was earning enough to worry about that, but I was wrong. It touches very deeply low in the middle class.

But the 1994 tax structure in effect today is going to wallop me and it will you if you have anything other than wages earned with withholding helping you. And you can get the answers you need by using the tax estimator!!

You can even use the what-if strategy available. Plug in an annuity coming due and decide what impact it will have on 1994 taxes whether you cash it in, in 1994 or 1995. The same for capital gains. They are called scenarios in the program.

Although you can fill in all the boxes without Quicken installed, which I did, you can import data you need for a calculation and you should have it available.

Choose the filing status that applies to you - single, married - joint, etc. Choose one of four options: 1993 old, 1993 new, 1994 old, or 1994 new.

Quicken warns you that it is you (and your accountant or attorney) who is responsible for using the correct rates. And you can click on the rates button and modify the rates if changes take place before you file. Of course, this is just an estimator - you can't file tax returns from this package.

You enter the wages and salaries for both you and your spouse, if applicable, directly into the box. They should be easy to forecast.

For the other entries, you click on the title box and it gives you another dialog box. For instance, Interest & dividend income, you enter the estimated taxable amounts, then click OK and they are carried to the totals sheet. The same for Business income, capital gains, etc. The catch all is Other Income. This is where you list Social Security (the taxable portion, if you can figure it out. Very complicated!), pensions, etc.

As you add all this data, the estimated tax is automatically calculated. Tells you your marginal and average rate and has a table for estimated payments made and balance due. Comes January 15th 1995, I am not going to be happy, but I am not going to get back into a penalty state.

If you have Quicken installed as recommended, and if your data is all entered in detail, all that data can be imported directly into the tax estimator and it goes into the correct account after you review it for accuracy.

Another big plus for Intuit! This package is a boon to anyone with income from more than one source, or has special tax treatment - in other words can not use the 1040 easy form.

Quicken Companion for Windows Version 2 - Price: $25.00 at CompUSA.

Intuit, P.O. Box 3014, Menlo Park, CA 94026 (415) 322-0573 Support (415) 858-6051 ❓❓❓❓

User's Corner:

SMARTDRV CACHE. At the end of your PC day, enter the following command at the DOS prompt: SMARTDRV /S to see the number of hits and misses. Divide the number of hits by the number of misses. If the number is 6 or higher, it's doing a good job; if the number is usually 5 or lower, consider increasing the minimum cache size.

To cache the CD-ROM drive, be sure that MSCDEX is loaded before SMARTDRV. To see if the CD-ROM is being cached, check it's drive letter under the information shown by the SMARTDRV command.

.....Ed Buzza, TPCUG

Software Review:
Science Adventure

by Knowledge Adventure

Review by: Jo Ciccarello,
Tampa PC Users Group

Knowledge Adventure's " Science Adventure" does indeed meet up to it's credo: Learning through Discovery". Unfortunately, the user has to discover some basic operations by discovery instead of through clear documentation. The program itself is chock full of seemingly endless scientific and historic information. It is a maze of curious and wonderful facts and science. To the younger user, (my child is five which is 1 year younger than the recommended age) the program loses its charm after several minutes. It is too confusing, too hard to figure out on its own. The manual, even with an adult's aid, is short on functional usefulness and long on cute verbiage. The adult user can get around this, but I'm afraid the younger ones are going to find it too hard to mess with and lose interest.

Perhaps part of the problem is my configuration or my sound card. The manual does list what sound drivers will cause what problems. Unfortunately, my card fell into one of the categories listed. Consequently, when there is spoken word and video playing, my card will not handle both at once. I usually get video first, then the audio.

Let me tell you what the program requires and what I used it with. This may guide you to determining whether you are able to try the program. The box lists the age range as 6 years to adult. It works with DOS or windows, the version I worked with is the CD-ROM version. There is some loading/installing of software from the CD and you do have to keep the CD in the reader as you use the program. It REQUIRES: a MPC CD-ROM drive, 9 MB hard disk space, 540 Kb RAM available, color VGA or SVGA, PC/MS-DOS 3.1 or higher, 386 PC or higher. It RECOMMENDS: a mouse, a sound card and a 486 PC. It lists that it supports PC Speaker, Sound Blaster, Ad Lib, DSP Solutions, Logitech, Pro Audio, Disney, Microsoft, ATI, Covox, Artisoft, Aria*, Gravis* and other compatible sound sources. (* When set in Sound Blaster emulation mode)

My system is a hodge podge of various brand peripherals. My PC is a 486sx Packard Bell Executive model. It has a split hard drive with a total of 230 megs memory and 8 megs of RAM. I use DOS version 6.2 and windows 3.1. My CD-ROM is a NEC CDR-25 Express model. The manual instructs you to be sure that your CD-ROM supports ISO 9660 but I could find nothing in my literature from NEC whether mine supports it. I took my chances. I'm not even sure what that is. I took a look in a Computer Shopper article and still found it unclear but they made it sound as if any CD-Reader made recently is compatible. The sound card I have is a Cardinal Sound Studio. Its emulation is the AdLib driver. Hence the problems.

Installation was easy. Instructions were accurate. Being a CD it was naturally write protected. It does allow drive and directory selection. It automatically configures your system and tells you what the old file's name will be called. Documentation for installation was accurate and helpful. Documentation on the program itself was fair as you will hear about.

There are numerous aspects to this program. When you first get on board you come to an opening screen, the audio is a pleasing-to-the-ear melody. In the center there is a small picture of what they term as the lab, where you can go back to start in a different direction or avenue to knowledge seeking. What you find yourself in is a circular room, with many doors/panels/kiosks that you can point yourself in and by using the arrows on your keyboard or your mouse, you can send yourself through to that one's adventurous knowledge laden experience. (One thing that was extremely frustrating to me was that although the manual states on page 7 how to exit from any of the rooms to the lab, it is not until page 21 that it tells you - in a not very highlighted way - how to actually leave the program. AND for those of us who like to try any of the other tried and true usual ways of exiting a programs, let me assure you that it is not any of those! It is Alt-X or Alt-F4. You can exit through a door, it is the one that has a stylized "G" over it. And by the way, to get back to the lab while in the middle of an experience, all you have to do is press ESC twice.)

There are 23 different exercises in science finding that you can experience. Some are games, some are merely demonstrations, some are elaborate yet entertaining slide shows. All are enjoyable. Here are brief descriptions of what you are in for:

1) The Mobius Strip. This demonstration shows what looks like an infinity symbol. You are able to follow the path on this ribbon which proves it only has one side.

2) Living Blackboard. Shows basic demonstrations of pi, x/y graphs but runs short of explaining practical applications of each.

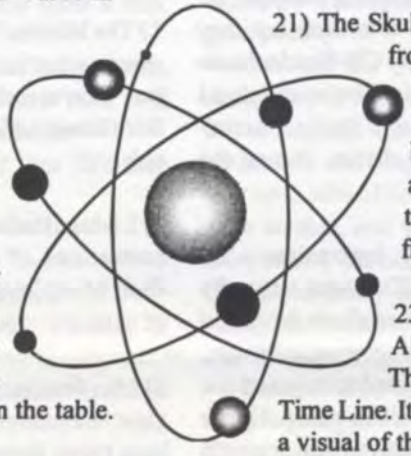
3) Microscope. Has 24 different slides to view as if under a real microscope. Subjects range from AIDS to the Weevil.

4) Threads of Science. 166 different thread subjects from Accidental Discoveries to X-rays. a button can bring you to another type of adventure: the Science Reference. Subjects have a timeline, a category, a globe to reference where you are talking about. It even has an adult and a young adult level of text written for you to choose from. It can also show you several examples of the topic discussed.

5) Prism. Explores light through different shaped prisms and colors.

6) Bogus Scientist Game. A barred Door leads you to the Bogus Scientist Game. You start in a library with busts of different scientist who have facts for you to listen to. Unfortunately, in this game, when the text runs out at the bottom of the text box there is no way to get the rest of the text. Although the audio does give you the complete text. You must go to the convention rooms to actually play

See **Science**..*Continued on page 8*



the game where various figures, when you click on them, will tell you a different science fact. If it is not true and you click on the police robot on the wall and catch them in the act, you get points. You later go to another room to cash in your points for another adventure.
J

7) Science Quiz. You can score points with correct answers to various questions asked of you. A multiple choice scenario. Students with correct answers get a cartoon show for their reward.

8) Music. Shows you sound patterns when clicking in different points of the picture that simulate various sounds.

9) Coil Magnet. An interesting aspect of physics, but this kiosk doesn't really explain it fully for my taste.

10) Periodic Table of Elements. Shows each of the elements, gives their pertinent information and arrangement on the table.

11) Globe. Shows by country, subjects of discovery nature are highlighted. You can rotate an image of the globe and click on a selection to hear the featured discovery.

12) The Exit Program door. Has a stylized "G" on it. That's it. You have to guess.

13) The Orbit. Movie shows the moon orbiting the earth while the earth orbits the sun.

14) The Pendulum. Shows the effect of weight, length and gravity on a pendulum. 12 different situations shown in a movie format.

15) A Roller coaster. A movie of a simulated roller coaster ride. Shows speed, weight, and barf quotients.

16) Gears. Shown on a bicycle, the higher the difference in ratio of the gears, the faster the speed although the higher the force needed to achieve that speed.

17) Time Line. Also accessible through Threads of Science, it is information along a timeline.

18) Hyper Gallery. Wall photos allow you to quickly access related information.

19) Pulleys. A cute animated movie about how compound pulleys facilitate lifting.

20) The Heart. Zoom in on the human heart and its various parts.

21) The Skull. Examine the skull from different angles.

22) Stonehenge. A brief information about and examination of Stonehenge from different angles.

23) Science Reference. Also accessible from Threads of Science and Time Line. It allows you audio and a visual of the topic.

24) Science Theatre. As if you are in an actual theatre, the curtains part and you are given the choice of 102 different movies to watch while a description of each is given. (This is where I could not hear the audio while the visual was going on, I usually got audio after visual.)

The program is not bad, it is, as I stated earlier, packed full of information. It just gets frustrating when even the on screen help is not entirely clear. For instance, when in the room for the game, Find the Bogus Scientist, the help lists a robot button to press to get the answer as part of the play of the game, what is not actually written in the manual or expressed audibly is that you have to be in a second room, not in the library where the scientist busts are, to get that button to show up on the screen. Only in experimenting and generally nosing around the program do you eventually come across it.

One thing to it's credit, the manual does list a 24-hour Bulletin Board System phone number for you to gain access to commonly asked technical questions and answers and be able to download new drivers, order new products or even register your products. The cost is only for the call.

All in all, I would recommend this product for its content, but not especially for its clarity of use. A warning, if you're the type of person that requires everything to be spelled out for you, get ready for a major frustration headache. If not, enjoy the adventure of figuring it out!

The program lists for about $49.00 on the street. The version is 2.0 and the address of Knowledge adventure is 4502 Dyer Street, La Crescenta, CA 91214. Phone (818) 542-4200.

Software Review:
Power Pak for Windows

by PC-Kwik
Review by: Alford Poole, Tampa PC Users Group

Have you wanted to cache your CD-ROM, your printer, your screen, or your floppy drive to make them operate faster? Or speed up Windows loading? Have you wanted to replace Smartdrive or wished typing while printing in Windows was not such a jerky experience? Struck any nerves yet? Improving PC performance while operating in Windows (and DOS) is what Power Pak for Windows is all about.

Power Pak for Windows installation is a little technical, but help screens are available. Power Pak takes less than 2Mb of hard disk space and installed two programs (13Kb) into conventional memory and one (21Kb) into upper memory. These numbers could vary, depending on your system configuration.

The user manual is surprisingly thorough. I mean how complicated can a cache program be? Microsoft's DOS 6 manual gives Smartdrv less than three pages of

coverage and refers to the HELP screens for further enlightenment. Using HELP SMARTDRV at the DOS prompt within Windows resulted in the system rebooting. Anyway, the help screens contain info on the three Smartdrv parameters and 12 switches. Power Pak for Windows has 15 pages devoted to parameters - in the manual! The only documentation shortage noticed was when WINOPT (Windows Kwikload program) locked up the system (after using WINOPT and attempting to go back to Direct Access, a menu program). The manual does say that WINOPT need only be used once and then afterwards only when Windows programs are added or removed. This info solved the lockup problem.

Super PC-Kwik 6.0 works with DOS 6.2, but will it work with other programs such as Stacker 4 and QEMM 7? The manual says yes.

Support: Read the manual, try PC-Kwik's FaxBack Service, or call Technical Support by phone, CompuServe or the Internet.

Test Results: Our system has all the required system elements plus a CD-ROM and Bernoulli removable media drive. Our PC suits us, but may be a factor in testing a program that needs to work with a variety of software/hardware configurations. The results are only applicable to very similarly configured systems. That said, here are the results: Using the WINOPT, Windows optimizer program, Windows now loads in 13 seconds, three seconds faster than before!

I used Knowledge Adventure's Speed CD movie to test the CD-ROM cache and detected little improvement in performance. The sound was still good, while the video was good when there were small amounts of movement on the screen, if background movement was involved then the video was jerky. Speed is a DOS program and maybe it was made jerky, even with the KwikScreen hardware option there was no improvement in the video. However, there was a noticeable improvement in WordPerfect for Windows 5.2. Moving around in documents has more snap. I like it!

Testing print speed in Windows is an interesting endeavor. Using WordPerfect with or without Power Pak, the printing started almost immediately after the print windows were done. Returning to work on a document was much improved when using Power Pak. There was much less printer hesitation while typing. Power Pak almost makes Windows multitaskable.

A cache for the Bernoulli drive, added manually, took only 224 bytes of RAM. Most of the programs on the Bernoulli are DOS based and seemed to work as fast as programs running off the hard drive. This is good, the Bernoulli has a much slower access time.

During one testing session QModemPro for Windows failed to initialize the modem with Power Pak operational. Although RIPterm (DOS) seemed to work fine, there are many variables that could have caused this one time glitch. Incoming FAX capabilities were being tested (lesson here: only test one product at a time) and it turned out that the phone lines were reversed (Phone to Telco socket and Telco to Phone socket) when the surge protector malfunctioned. Silly computer!

Options: Super PC-Kwik, the main cache program, will also work with DOS. Power Pak also includes a Remove program to remove Power Pak if needed.

Evaluation: More attentive manual reading would have saved the hassles of READ.ME file searching and CONFIG.SYS and AUTOEXEC.BAT tinkering. This was the result of using WINOPT, as mentioned previously, before understanding how it works.

Nobody likes to wait while the computer does it's stuff and PC-Kwik's Power Pak for Windows helps speed up the processing. Using a disk cache means the disk drive is physically used less, so your drives live longer. Clicking on the Super PC-Kwik Meter tells you how much less your disks are being used. Checking right now revealed the cache buffer size is 2592K (8 Mb RAM) and there were 4973 logical transfers and 1607 physical transfers for a savings of 3366 transfers. Think of that over the life of your hard drive! Highly recommended!

System Requirements: 386, 486 or Pentium, Windows 3.1, 2Mb hard disk space, 4 Mb RAM recommended, KwikScreen requires a Super VGA monitor capable of running in 256-color mode with a non-accelerated video card.

Cost and availability:$45.95 + $5 S & H through PC Connection.

PC-Kwik Corp., 15100 SW Koll Parkway, Beaverton, OR 97006-6026, (503) 644-5644 FAX (503) 646-8267.

October Special for TPCUG members: Power Pak for Windows or Power Pak for DOS can be purchased for $39.95 plus $6.50 S & H or Super PC-Kwik Disk Cache 6.0 by itself for $19.95 plus S & H by calling PC-Kwik at 1-800-333-7259 and using the order code "5A1" to get the special discount. This offer is good til the end of October.

A helpful WindowsTip From the Monterey Bay PC Users Group:

If you start encountering system errors when installing a new piece of software in Windows it may be due to a peculiarity in your SYSTEM.INI file. Before calling Tech Support, use your SYSEDIT to look at your SYSTEM.INI file.

Double-click on the SYSEDIT icon in Program Manager and then select SYSTEM.INI. Click on Search/Find. In the Find box, enter a [and click on Next. Keep clicking on Search and Next, each time making sure that each line enclosed in [...] has a blank line above it. Whereever a blank line is lacking, enter one and contineu until the end of SYSTEM.INI. If there were any [...] brackets enclosing a word group without a blank line above, that was probably your proble. Save the altered file and exit Windows. When you re-start Windows, you'll probably find that your problem is gone.

Software Review: Integrity Master

by Stiller Research

Review by: Alford Poole, Tampa PC Users Group

"Oh no, Bob just used my machine! It took me a week to figure out what he did last time!"

"Hey George, I had a disk with Maltese Amoeba over the weekend."
"Great. I recently saw African Queen. That Bogart is a great actor!"

Have you ever wanted to keep track of what files come and go from your system? Or know more about the dreaded "V" word, but didn't know who to ask? Integrity Master (IM) can track your system and give you an update on changes at anytime, give you a list of all the changed files since the last time you made a report and let you know if there are any virus-like changes. IM will check your memory, boot sectors, FAT tables, and all the files on your system.

Installation is easy and IM can be used from a floppy for better security. The interface is user friendly, I didn't need the manual to complete a scan of all the drives.

The 128 page manual, Defeating Viruses and Other Threats to Data Integrity, is divided into two parts. The first deals with using IM and the second, data integrity and viruses. Plenty of information is packed on each page and there's an index for quick reference.

Support: A text file is included with a short questionnaire to help gather information if contact is needed from Stiller Research or Advanced Support Group (faster, but more expensive than Stiller).

Test Results: Keeping track of what files are added to the system rates pretty high for me. If a shareware program doesn't work out, it is great to be able to know exactly which files to delete so there will be enough room for the next batch. The scanning process seems quick, considering virus presence is checked simultaneously.

Limitations: Some anti-virus programs create a database file of all the files in each directory. IM creates a small file in each directory (like MS DOS 6's Anti-Virus CHKLIST.MS). The documentation says these can be hidden, but is not recommended. This is a red flag that you are using an anti-virus or security program, but the files are encrypted so that only IM can figure them out.

Options: Upgrades are available on an annual ($45) or one time ($5) basis. IM also comes with a program called RunMaybe that will execute a program, DOS command, or batch file on specific days. RunMaybe a backup program?

Evaluation: My confidence level is high on this product. I've not had (to this date) any trouble with viruses, but if that day comes, IM is ready to take 'em on. I use IM to keep tabs on the departure and arrival of files regularly. Highly recommended for control of your system and peace of mind from viruses.

System Requirements: DOS 2.0 or later, 256K free memory

The shareware version is I-MSHARE.ZIP and is on many bulletin boards. To register and receive the latest version and the manual, send $35 plus $4.50 S&H to the address below.

Stiller Research, 2625 Ridgeway St., Tallahassee, FL 32310-5169 Sales: (800)788-0787 or (904)574-0920. FAX: (904)574-7884. Stiller Research can also be reached through the Internet, Genie, CompuServe and Prodigy.

Special Offer!

Kurta Corporation for the Kurta PenMouse Tablet along with CorelDRAW 3.0. The number to call is 1-800-562-0010. This offer is available in the US and Canada. Pricing is $234.95 for the CDROM Version and $259.95 for the Diskette/CDROM Version. This offer expires October 31/94. Please quote offer KAA111XX.

The Next Windows

By: Larry Ogintz, Editor, of the PC 101 Monitor, Millburn, NJ

You have to give credit to Microsoft. Despite the fact that Windows 3.1 and MS-DOS operating systems run on an estimated 140 million PCs worldwide, they want to get rid of them. But, they have something new in store for everyone. The newest version of Windows, code-named "Chicago" is on the way. And if it works like it's supposed to, say good-bye to your old operating systems.

Whether you love or hate Microsoft and their products, they spend an enormous sum on usability testing and devote a lot of attention to customer feedback. What they discovered was something that most people already knew. Using a computer was hard. The operating systems were anything but intuitive and easy to use. In fact, according to their own lab tests, it took a novice user over nine minutes to figure out how to start Notepad, a simple Windows application, without any prompting. Not exactly an endorsement for a supposedly "easy to learn and use" graphical interface. Enter Chicago.

Chicago is a complete overhaul of Windows. It will be a completely self-contained operating system, not just a graphical interface for DOS. The best part is, it will run on a 386 computer with as little as 4 megs of RAM! The mission for Chicago developers was to maintain backward compatibility for most of the computers out there. Of course, if you have a Pentium with 32 Megs of RAM, so much the better.

The biggest change will be that you will no longer require MS-DOS. Chicago will in fact produce a better environment for your DOS applications. This will be accomplished through what's called, "Zero Conventional Footprint Components." Some DOS programs do not run under Windows due to the fact that by the time you load DOS-based device drivers (CD-ROMS, SCSI drivers, etc.), TSRs (Terminate and Stay Resident) and maybe some network drivers, you wouldn't have enough conventional memory (the first 640 kilobytes of

See **Chicago.** *Continued on page 11*

Chicago...*Continued from page 10*

memory) to run your program. Chicago will provide 32-bit protected-mode components that will replace many of the 16-bit real-mode components now being used, which will provide the same type of working environment while improving overall system performance. And, it will use NO conventional memory! In some cases, this can free up to 225 K of conventional memory for use! Plus, DOS windows will be able to use mouse support and True-Type fonts.

Perhaps the biggest plus for computer users will be "Plug and Play." Microsoft estimates that over fifty percent of custumer support is related to the installation of new components such as sound boards, video cards, modems, etc. The goal of Plug and Play is: install a new hardware device and it will work. This is a formidable task. Under Chicago, all devices will be configured automatically. You will never (hopefully) have to deal with interrupts, IRQs (interrupt requests), DMA (Direct Memory Access) channels, etc. On boot-up, Chicago will detect and configure your devices. Just imagine the time saved in this one area. This is supposed to work with all currently used hardware and as manufacturers start to make hardware that complies with the Plug and Play standard, it will be even easier.

Of course, speed, robustness and ease of use are some of the other areas addressed by Chicago. Chicago is a 32-bit operating system with some 16-bit com-ponents necessary to run some of today's applications. If you have an application that is written as a 32-bit program, it will run extremely fast and efficient under Chicago. Also, many components such as printing, video functions and other basic computer functions will be written as 32-bit (rather than current 16-bit models) which will speed these tasks tremendously. For example, under Chicago, when you send a document to the printer, you will almost immediately be able to resume any other task while printing.

With its 32-bit engine, Chicago becomes what is called a preemptive multitasking environment. Basically, this will provide protection form errant applications when you have more than one program running. For example, if you had a spreadsheet, word processor and DOS game running at the same time, and one program crashed, the other programs will be protected and all that would be necessary would be a "local reboot". Previously, under Windows, if a Windows program crashed, you sometimes had to reboot your computer because the errant program would not give up resources (those little 64K heaps of memory that constantly plague Windows users). A preemptive multi-tasking environment provides true protected-mode usage. This should almost certainly do away with General Protection Faults, the leading cause of crashes under Windows.

This should almost certainly do away with General Protection Faults, the leading cause of crashes under windows.

Ease of use is addressed by a completely new interface. Gone on start-up will be the ubiquitous Program Manager (although Program Manager and File Manager will be retained for compatibly and for transition purposes), and in its place will be a neat, clean screen with a Taskbar on the bottom with a Start button. As applications are opened, an icon and description are added to the Taskbar to allow for smooth transition from program to program.

Many other changes are logical, For example, a new display icon located in the Control Panel will handle everything related to displays. This includes changing video resolutions, a function previously found illogically under Windows Setup. A new feature, Explorer, will replace File Manager. This has been described by Microsoft as "File Manager on Steroids". Power users will love this. Explorer will be totally customizable with all kinds of searches possible. Use of the right mouse button will bring up context-sensitive menus from almost every area of Chicago. Help screens will have a "?" icon that, when dragged to a certain area of your help screen, will invoke a wizard that will take you step-by-step through your task. Also added: support for long file names. You will be able to use file names of up to 255 characters in length (although the ancient 8.3 naming format can be used for DOS compatibility).

Chicago is still in the beta test stage. Microsoft hopes to release it by the end of 1994. When it arrives, it should change the face of computing just like Windows 3.1 did. In short, if Chicago works like it's supposed to, computers should be easier to use, more powerful and more fun. This will open up computing to even more users while making it easier for novices and beginners. Microsoft ain't dumb!

NOMINATIONS NEEDED

It's that time of year again! Time to nominate your choice for officers of the Tampa PC Users Group. Only this year, more than one officer has expressed their desire to no longer hold office. Some of the officers have held their positions for several years and feel that maybe it is time to inject some new blood into the management of our association. So, as members of our users group it will be up to you to nominate a full slate of officers.

Any full member may nominate any other member for office. Nominations will be taken during our October and November meetings and the slate will be published in the newsletter. The election of officers shall be held during the meeting in December. All full members present at the December meeting will be able to vote.

Below please find a description of the duties for each of the officers.

1. **President**: The president shall foster and promote direction, leadership, education, and organizational goals. The president shall act as the legal head and chief administrative officer; exercise supervision of the corporation and its activities; represent and speak for the organization; preside at meetings of the members; appoint and discharge committees; sign letters or documents necessary to carry out the mission of the organization; and preside as the chair of the Board of Directors.

2. **Vice President**: The vice president shall assume the duties of the president in the event the president is absent or incapacitated or at the request of the president. {and} the vice-president automatically} becomes president {up}on the death, resignation, or permanent incapacity of the president.

3. **Secretary**: The secretary shall serve as the chief recording and correspondence officer and the custodian of the records of the corporation. The secretary shall take such steps as necessary to prepare and certify the correctness of member and Board of Directors meeting minutes; preserve all records, reports, and official documents of the corporation except for those specifically assigned to the custody of others; sign official documents to attest to their authenticity; and carry on the official correspondence of the corporation as directed, except for those matters assigned to other officers.

4. **Treasurer**: The treasurer is responsible for the collection of funds, their safe deposit, and the expenditure of all funds for the organization; and for keeping an accurate record of the collections and expenditures. The treasurer shall submit a report at the Board of Directors meeting and prepare an annual report to the members. The treasurer shall issue payments for bills submitted to the corporation.

5. **Member at large**: The member at large shall serve in the capacity of an ombudsman for the members of the organization; propose a slate of candidates for the offices of president, vice president, secretary, and treasurer; and perform such other duties as requested by the president. The member at large shall, to the best of one's ability, be accessible to the members and to bring to the attention of the Board of Directors those matters that the members do not wish, for whatever reason, to bring to the floor of the meeting.

The above elected officers as members of the Board of Directors of the Tampa PC Users Group, Inc. shall appoint:

Education Officer
Newsletter Editor
Bulletin Board System Operator
Librarian

as well as other chairpersons and committees needed to fulfill the requirements of our corporate charter.

If you feel that its time for a change then stand up and let it be known at our next meeting. If you feel you or some other member qualify to serve as an officer, then take heart and take interest. This is YOUR association. Maybe its time YOU got involved. Its easy to pay your dues and sit back and let the same few people continue to provide for you. Maybe its time for YOU to get involved.

FRIENDS OF THE USER GROUP:

We acknowledge the following firms for their support:

- CompUSA
- IBM
- PC Warehouse
- Software Review
- Custom Computer Wholesale
- Staples
- Sunrise Computer Supplies & Parts
- Brainchild (Computer Distributions, Inc.)
- Realtron - Appraisal Magic

We also acknowledge the following national software vendors for their excellent demonstrations and contributions of evaluation software to our group.

- Access Software
- Adobe Systems, Inc.
- Borland
- Corel Systems
- Grolier
- Knowledge Advenenture
- Microsoft
- Symantec
- Traveling Software
- Wordperfect

WELCOME NEW MEMBERS!

WE ARE HAPPY TO HAVE YOU IN OUR GROUP!

MEMBERS HELP-LINE

The following phone list is provided for our **Tampa PC Users Group** members in an effort to establish local support for those frustrating times which we have all encountered while using our PC's. Please note that these are members that have volunteered to help you, treat them in a courteous manner. Be sure to ask if it is convenient for them to help you now, or if you should call another time. It would also be helpful to have your documentation and have it handy when you call. *(Don't expect help if your software is an illegal copy or you do not have documentation!)* **TPCUG** is not responsible for the information or advice provided by volunteers. Volunteers may or may not be experts in the subject matter. You are on your own with any advice received. Be aware also that some of these volunteers may be consultants in their area of expertise. If you are interested in volunteering to answer members questions, either leave a message on the BBS or fill in the forms provided for this purpose at the meetings.

PRESIDENT: Harvey Bruneau 985-3338
VICE PRES : Al Poole 876-9445
TREASURER:Tom Cone 224-9052
MEMBER AT LARGE: Roger Waters 276-1019
SECRETARY:Jim Clark 986-3888

APPOINTED (*Volunteers*)
EDITOR: Marylee Bruneau 985-3338
LIBRARIAN: Larry Anders 989-9119
MEMBERSHIP DIRECTOR: Tom Cone 224-9052

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII file or in a commonly available word processor format, such as WordPerfect 5.2, or Ami Pro 3.0 on diskette to the editor at 9402 Hidden Ridge Place, Tampa, Florida 33637 or send it by modem to BBS (813)239-3704.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

The use of trade marked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted at the following rates:

	1 month	3 months	6 months
Full Page	$60.00	$162.00	288.00
Half Page	$40.00	$108.00	$192.00
Quarter Page	$22.00	$60.00	$106.00
Eight Page	$12.00	$33.00	$58.00
Business Card	$10.00	$27.00	$48.00

All advertisements must be prepaid by check payable to TPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if it is not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, Marylee Bruneau at (813) 985-3338, for space availability and for further information.

This newsletter is created with PageMaker 5.0 from Aldus Corp. and Corel Draw from Corel Systems.

Secretary's Report

MINUTES OF 10/12/94 MEETING
and Personal Comments by
Jim Clark, Tampa PC Users Group

Well, wonders of wonders, it wasn't pouring down rain for this meeting. And it was a good session with a very interesting presentation — a look at some of the latest hardware on the market and where it is likely to go from here. Those that didn't make the meeting missed out on a lot of very interesting information and an excellent give and take.

USER GROUP NEWS

➧ MEMBERSHIP DUES INCREASING: Harvey gave a brief summary of the decision the Board of Directors has taken in light of increasing user group costs — to increase annual membership dues by $5, except the corporate membership which will increase $10, all effective 1 January, 1995. Membership dues will then look like this: Regular Membership - $25; Family Membership - $35; HCC Student & Faculty - $20; Corporate Membership - $60 (includes 3 corporate personnel), with additional corporate personnel at $20 each.

New members joining between now and 1 January and renewals of memberships expiring before 1 January, 1994, will enjoy the current rate. Memberships expiring in 1995 may be renewed between now and 30 November, 1994, at the current rate. Beginning 1 January, however, all memberships and renewals will be subject to the above listed rates. All memberships renewing early will have one year tacked onto the expiration date of the current membership.

➧ CONSENSUS - EXPOTECH A FLOP: Harvey asked for opinions of the EXPOTECH in Tampa this year. This generated a good bit of discussion, most of which was that of disappointment at the reduction in booths this year and the scarcity of computer vendors of interest to the most of our membership; the bulk of the vendors provided services, some of which had little or no relationship with high technology.

➧ ELECTION OF CORPORATE OFFICERS: Nominations for the five elected TPCUG corporate officer will be open and solicited at the November 10 general meeting. Elections will take place early in the December 14 general meeting. Nominations may be made until just before the election at the December general meeting. The five elected corporate officers are: President, Vice President, Treasurer, Secretary, and Member at Large. Newly elected officers will assume their positions effective 1 January 1994.

All members are asked to give the nominations some serious thought and to make their nominations at the November or December general meetings, or mail your recommended nominations to the TPCUG Nominating Committee at the TPCUG corporate address (shown on the last page of this newsletter).

See **Minutes** *Continued on page 3*

Minutes.. *Continued from page 2*

INDUSTRY NEWS: Probably the most important bit of information brought out is that the new OS/2, OS/2 Warp 3.0, has been released and is available for $79, before a $25 rebate. Pretty good price, I would say. One word of caution, however, is that if you are considering getting OS/2, be sure to check the compatibility listing IBM provides for OS/2 to make sure your hardware and software is compatible.

PRESENTATION — A Look At Some Of The Latest In Hardware.

Following notification by Gold Disk that they would be unable to make their scheduled presentation at this meeting, Harvey contacted Jason Kimenker, from our own Tampa/St. Petersburg Brainchild Computer Distributions, Inc., to see if they could fill in. Like the proverbial "knight in shining armor", Lee Vaccaro and Jason responded to our short notice request and put together a presentation on some of the latest in computer hardware. What's more, Jason did an admirable job with the presentation. And as it turned out, I think it was one of the most interesting and informative sessions that we have had during the several years I have been a member — and I have missed but a very few of the general meetings.

I won't even attempt to summarize the information Jason passed on, but among the hardware Jason reviewed were: Modems; PCI technology, compared to VESA; CD-ROMs; Soundcards, especially in a current Microsoft Office bundle; AMD chips, compared to Intel; and the DX4/100 chip. Jason did an excellent job of reviewing these new products and was clearly well versed on them. His discussion was not only very informative and interesting, but it generated a lot of give and take with the membership. Some tid-bits that I will pass on are:

28.8 Modem: V.34 standard was approved earlier this year is now being put into 28.8 modems. Though it is currently available only in the Robotics Sportster, all manufacturers should have them out soon.

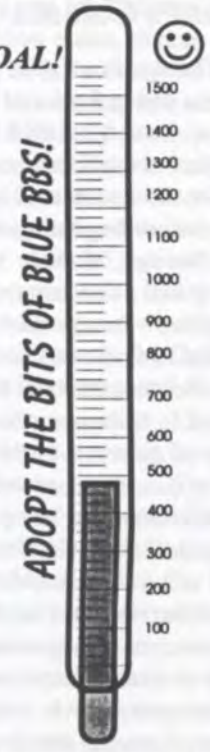
PCI Technology: If you are considering the purchase of a Pentium, be aware that the 60 MHz chip is giving the most trouble.

CD-ROM: The double speed CD-ROM is probably adequate for most of us, but you should consider the quad speed if you are into multimedia sound/video very much because it will provide near-movie quality. New controller cards are also coming out that will support up to 4 floppy drives, and 4 IDE drives one of which can be used for a CD-ROM. This will not only allow increasing the number of IDE drives one can operate, but can free up an expansion slot by eliminating the need for a separate card for the CD-ROM.

AMD Chips: Have proven at least as good as Intel chips and are considerably cheaper; like AMD has a DX2/80 MHz chip that sells for about the same as Intel 66 MHz chip. Also, a 586 line of chips will be out soon in competition with the Pentium line and is expected to be about $200 cheaper.

DX4/100: If considering purchase of this new technology, be sure the voltage of the chip is compatible with your motherboard; some of the earlier chips are 3.2 volts, while 5.0 volts is most common.

Jason and Lee, thank you - and Brainchild Computer - for a GREAT presentation and the most useful and helpful information you provided, not to mention your generous contributions for our door prizes.. We hope that you will agree to do give us a similar presentation again in the not-too-distant future.



AND THE WINNER IS

Thanks to the generosity of Lee Vaccaro and Brainchild Computer Distributions, Inc., there were a several very nice door prizes. Those among us to have the good fortune to win are:

Joe Crochet	OS/2 2.1
Dave Claire	Printer stand & mouse pad
A.J Mester	Printer stand & 100 diskette box

In addition, J. Whitmer, S. Atron, Van Ost, M. Nicholson, R. Davis and J. Robinson won mouse pads.

The meeting adjourned at about 9 PM.

*Almost 1/3 there....**CAN YOU HELP?***
THANKS TO ALL WHO HAVE CONTRIBUTED!

SOFTWARE AVAILABLE FOR REVIEW:

XtraDrive Lite - (Windows & DOS) Doubles your disk capacity. vendor: Integrated Information Technology

SHERLOCK - The ultimate filing and retrieval system for Windows.

LAPLINK for Windows - remote control and file transfer.

(Call 985-3338 for info on review software)

President's Column

The question goes something like, If a tree fell in the forest but no one was there to hear it , would there be a sound? OK, I can tell that you are wondering if I ate too much Halloween chocolate before beginning this article. Seriously though, if there was a user group but it had no officers would there be a user group? I really don't know and I don't want to find out. DO YOU? As you know elections for the 1995 officers will be held in December. At our October board of directors (BOD) meeting most of the current board members announced that they were not planning on serving again. How can this be you wonder? Well when you consider that most of the BOD has been serving the TPCUG for five years, you may get the picture. It takes some dedication to run the TPCUG. This dedication does, over time, consume some of your energy, personal time and business time. Unfortunately the BOD is not made up of Energizer Bunnies. We don't run on batteries, we do have families, jobs and enjoy life outside of computers when possible. There are less than ten people running the TPCUG. Perhaps if we had more members and help the TPCUG would not be faced with this situation. It is now time for some of you to step forward and either nominate yourself or find someone that will accept a nomination for the position of president, vice-president, treasurer, member at large or secretary. Of course the volunteer positions can be applied for also. Don't wait until its too late before you act.

October Meeting

All I can say is, it what a great meeting. See the Secretary's report for a more detailed recap. My thanks to Jason Kimenker of Brainchild Computer Distributions for his down to earth and candid presentation. This meeting embodied one of the basic concepts of a PC user group. Sharing and learning the PC knowledge. It was evident that we need to schedule more of these types of meetings.

Bargain table

The bargain table proved to be a success. We had well over one hundred computer related items for sale. From books to software and hardware, we had everything. Thanks to those of you who purchased the items and also to those of you which donated items for us to sell. We still have a lot of items left and have collected some additional items since the last meeting. Marylee will be selling these items again at a three family garage sale on November 12th at 3910 Mullein Ave in Tampa from 7AM-4PM. Proceeds from the sale of the items on the TPCUG table will go to the TPCUG. If you have computer related items that you would like to donate to the group for the garage sale, please bring them to the November meeting.

Christmas Items

Yes it is that time again. It seems like it was just yesterday that the programmers at our office were pulling down their Christmas lights from the ceiling sprinkler heads. With that in mind here are some items that you may want to consider for the Holidays.

1. CD ROM - A double speed with 200ms or faster access at under $300 should be the minimum followed by a quad speed under $500. I prefer a SCSI interface since it provides more growth potential. Look for these compatibility items; Multisession support, CD-Audio and Kodak Photo CD.

2. Sound - 16bit stereo or higher, MPC-2 compliant for under $200 and it should be a Sound Blaster model

3. Speakers - your choice. Unless you plan on playing your music CD collection on your computer you don't need high end speakers. If you want to listen to your music collection, play them on a $200 boom box not your $3000 computer.

4. CD ROM software - be careful here. There is a lot of junk CDs available. However, there is enough good software available to break your wallet. Before you buy, make sure your PC meets the recommended hardware and software requirements. A good multimedia software product can look bad on an inadequate PC. I would suggest a minimum of a 486.

Determine the intended audience and purpose for the software. Is it for education or recreation. For adult or kids. Many great educational software products are abandon by kids after a couple of hours because they are not game oriented. Some software may have too much violent content for small children. Look for interactive software that challenges your kids and gets them to use their brain not just a mouse or joystick. I guarantee you that a child will get more from interacting with a computer than watching the Lion King or Ghost Buster for the umpteenth time. It is your choice.

Products like Grolier's encyclopedia or Microsoft Encarta are very good products for the entire family and are available for under $100. If your are looking for clipart (10,000 images) from a major vendor with a minor price tag look at Corel Gallery for under $40. For great animated stories for kids look at the Broderbund Living Books series. Products like Little Monster At School are an excellent choice. If your into shootem-up games I highly recommend Comanche Maximum Overkill or Rebel Assault.

5. If your going to buy a modem stick with a 14.4 Kbps fax/modem as a minimum for under $150. I like the Practical Peripherals models. Keep in mind however that the new standard is v.34 (28.8Kpbs).

6. If a new computer is on your list then it better be no less than a 486/DX266. The preferred system is a 90Mhz Pentium. Either choice should come with VL-Bus or PCI, 8Mb, 300+Mb HD,

See **President's** *....Continued on page 5*

President's....*Continued from page 4*

Double speed CD-ROM, 16Bit sound, 15" monitor, Windows 3.11, DOS 6.22 a bunch of software and a THREE YEAR WARRANTY. Prices should range from under $2000 for 486 to less than $2500 for the Pentium. Of course if you wait till the Christmas of 95, that same Pentium will cost $1,000 less since it will be old technology by then.

Well that should provide you with enough ideas on what to get me for Christmas. Please remember that we need your nominations to begin by the next meeting. Also, don't forget the garage sale.

Harvey P. Bruneau

EDITORIAL COMMENT:

Our apology to **Don Meng**, who wrote the excellent software review article in last months issue titled: **Quicken Companion for Windows Version 2.** We did not include his name as the author of that wonderful article. Don is very proficient with the Quicken products and this is evident by his article. With 35 years experience in data processing, Don now teaches personal computer usage for the home and in School System Industry Services & adult education classes. He helped get SeniorNet, a program for people over 65 years old to learn computers, started at

Software Review
Graphics Tools!

Review by: James R. Hutton, Tampa PC User Group

As a PC programmer that likes to dabble with graphics I was very interested in looking at this package. Graphics Tools! lets you create easy-to-use media collections. It also boasts a sophisticated image editor and a screen capture program to help in creating the right look for your application.

To install this program you must have a IBM PCs 386 or higher, with 2MB RAM (4MB for image processing), 5-11MB hard disk space, VGA graphics card and monitor, mouse, Windows 3.1, and DOS 4.01 or higher. I found out that even though that I had a VGA monitor I still to upgrade my driver for the program to load. I did find the monitor driver on the local bulletin board. The install uses a very user friendly install program in which you click on the buttons for the option that you want. The documentation encourages you to make copies of your Graphics Tools! disks and store the originals in a safe place, and use your backups for the installation. The installer provides two options - "Complete Installation" and "Custom Installation." Complete Installation install Graphics Tools and all other files including imported/exported filters, clip art, and digitized images. This installation requires approximately 11 MB of hard disk space. Custom Installation lets you choose which applications and groups of files you want to install. This is for those that have limited hard disk space, or do not plan to use certain features within Graphics Tools!

Once the program was installed you can start using the different programs that come with the package. Media Manager is a catalogers that can be used to organize your images, clip art library, sounds, multimedia presentations, and application linked files. Each item added to a Media Manager collection is represented by a thumbnail bitmap in the Media Manager window. The Capture program allows you to Captures any window, pull-down menu, dialog, area, arbitrary area, or full screen with the push of a button. You can capture and save to a file, send it directly to the printer, or display the captured area in Image Tools or the Image Processor. If Capture is not open, it is launched and the setup dialog is displayed. I found out with most of the add on programs that if they were not loaded that the program would launch it. You can also click on the Capture icon from within the Command Bar to perform the same operation. The Convert feature supports conversion between dozens of different graphics file formats. There are a lot of supported file formats from vector file formats to bitmaps file formats to fax file formats. Batch processing allows you to convert one or more files to multiple formats at the same time. I was very impressed with this feature since I receive graphic in different format and have to convert to PCX or BMP format for the programs that I use. This program also supplies an Image Tools window for basic editing chores such as tracing and viewing images. The Image Processor allows you to perform more advance image processing functions, as well as provide scanner support, special effects, color control and manipulation, and other image manipulation features.
Also included with Graphics Tools! are; 700 clip images, and 150 professionally photographed digitized images. To access the clip art collections of the included CD, you need a CD-ROM drive and appropriate device drivers installed Graphics Tools! has Free and Unlimited service through DeltaPoint Technical Support They can be contacted by phone, fax, or through one of the On-line Service. For the price of this program it's hard to beat the capabilities of this program. Graphics Tools! puts a lot of image-processing and editing power in the hands of the Windows users. And in the burgeoning field of multimedia, program's media manager is just the tool one needs to get the job done.

Software Review
The Discoverers

By Knowledge Adventure, Inc.
Review by: Renate Marsh, Tampa PC Users Group

By now we know that Knowledge Adventure has programmed many of the best educational programs we have on disks or CD-Rom. My review is about the CD-Rom version. The Discoverers is one of the best programs Knowledge Adventure has put out. Though, I haven't seen all of them. The people at Knowledge Adventure might still surprise me. The program has so many movies about Discoverers around the world that my computer turns into a mini TV, except it is under my control to get more details on any subject. Also, the games with detailed descriptions of the discoverers (after I guessed and picked the right person) are a special treat that TV cannot give me.

We might call Knowledge Adventure programs educational, but to move around in them is pure fun and enjoyment. Did you know that beautiful paintings have been discovered in a cave in Spain? Painted on a rock ceiling by men 10,000 years ago? Did you know that dolphins cam watch television and

understand commands given to them by way of TV? Did you know about the hardship explorers had to go through to reach the Antarctica or to find a passage from the Atlantic to the Pacific ocean? Do you want to be there when Columbus discovers this round world? These questions cover only a small portion of the vast information presented to you by way of movies, games, and detailed instructions.

Thanks to CD-Rom any discover story comes alive on your screen with beautiful clear sound and music, if a sound card is available on your system. A mouse is the best device to move around in The Discoverers. Moving your mouse pointer around the screen has little balloons appear in many places giving you encouragement to click there with your pointer to go on to more detailed information or to see a movie about the subject.

Explorers and discoveries are presented here from around the world, past and present. Subjects are man's greatest achievements in history, science, music, literature, and art. It all comes alive when wandering through The Discoverers program. The wandering around is made easy not only by the tell-tale balloons, but also with function and command buttons, starting right at the main screen all the way within the program. You can go forward, backward, return to the main screen and start again. A manual is hardly needed, except that The Discoverers manual includes a Learning Guide for students or your children. It includes sample projects related to discoveries (making a compass, understanding time, making a kite, and many more). It also includes a Question and Answer section to solve or make you understand the most common problems about the software, sound, installation, or hardware compatibility. One section gets you acquainted with the family of software learning tools from Knowledge Adventure, Inc.

The Discoverers can be installed in DOS or Windows. Though, I would always recommend that any big graphical, movie type program with sound be installed within DOS; but I only have a 486SX computer with 25Mhz. Using Windows you better have lots of memory and more Mhz. A Pentium wouldn't hurt at all. The group of Knowledge Adventure icon will be created in Windows and the manual lets you know about the add-on lines in the command files in Windows. But The Discoverers can be installed in a 386 and up and will run fine, just slower with a slower machine.

Learning and educating can be fun for all children or students, for me and for you as proven again with this program The Discoverers by Knowledge Adventure, Inc.

Book Review:

CD-MOM
The Mother of All Windows™ Books

CD Version
by: Woody Leonhard & Barry Simon

Review By: Larry Anders,
Librarian, Tampa P C Users Group

Read any good books lately? If you're a Windows freak like I am, I've got a book you just might be interested in. CD-MOM, The Mother of All Windows™ Books — MOM for short, claims to have the largest, most useful collection of software ever assembled, and this just may be true. The size of MOM will shock you at first. It's actually 2 inches thick. It is in no way a technical reference on the how to's of Windows. Most of that stuff you should know about already, even if only by accident. MOM does take information found in boring technical references and presents it to you in a way you can use and understand without having to be a rocket scientist.

Windows 3.1 running in 386 Enhanced mode with a mouse is highly recommended, but not necessary. Hopefully everyone has upgraded to version 3.1 by now, if for nothing else but stability. If you are still using a 286 then you can only run in Standard mode, but you should really consider a system upgrade. As for the mouse, MOM has a lot to say

See **CD-MOM**...*Continued on page 7*

CD-MOM....*Continued from page 6*

about when to use a mouse and more importantly, when not to. However MOM will not tell you what is Windows 3.1 specific and where Standard and Enhanced modes differ. The authors of MOM figured that if you use Windows enough to even think about buying a book on it, you should have upgraded by now.

For the most part MOM is in plain English. Every now and then the computer-eeze comes out but only when necessary. When this happens the font is different to warn you that a computer thing is coming. All through the book there is a cast of characters utilized to get the authors' messages across. MOM, of course, plays herself with a mixture of emotion, silliness and words of wisdom. IGOR, points out the stuff that could prove detrimental to your health, like gaps in Windows, problems with applications, bugs, etc. Finally is CTO Mao, the Chief Technical Officer who is the tips man. He'll read it to you straight from his little red book.

MOM reads like no other computer book I have ever read. It is definitely not your typical hint or secrets books. This book reads like you're having a conversation with several different people who are computer literate but know how to explain it in a way you can understand and feel comfortable with. For instance, one of MOM's first statements goes like this. "I'm sure that nice Mr. Gates means nobody harm. Just look at him, that boyish face, those glasses slipping down his nose. Cuddly enough to hug and spank, simultaneously. Surely Microsoft can do no wrong, with a fine boy like that at the helm. But I must say this talk of a divorce with IBM has caused me some sleepless nights. Who's going to take care of the kids"? The authors of this book went to great pains to fade into the background and let the characters take over, evolving into a life of their own.

Even if you don't own a CD-ROM, as long as you can beg or borrow the use of one, you'll only need it for a few minutes. CD-MOM has so much on it no serious Windows user should be without it. If you've ever wondered what it's really like using programs like Ami Pro, on your machine, with your work, CD-MOM includes an enormous selection of working models from the major software vendors. Just copy the files on your hard disk, install the model and take the program for a test drive, right there on your own machine. There are dozens of working models, of many top Windows applications, that you can choose from and try out on your own computer. The latest Windows drivers for printers, video cards, sound boards, and much more. A full, commercial copy of WinCIM -for Windows access to CompuServe, plus a free CompuServe sign-up and your first month of basic services free. A hundred shareware and freeware fonts - good ones, not throw-away junk. Video clips. Movie trailers. Thousands of icons. The best electronic newsletters. Concert-quality audio recordings. Fun "system event" sounds. Latest versions of the top 100 Windows shareware and freeware programs, utilities, wallpaper, add-ins, replacements, games, etc., ad nauseam. In case you don't have a CD-ROM and don't have any place to borrow one....fear not! There is a copy of this book with diskettes that is ten bucks cheaper than the CD version, but of course this one doesn't have near the good stuff on the diskettes as on the CD. Although, there is a coupon included in the non-CD version that will allow you to purchase the CD for ten bucks when you finally decide to buy that CD-ROM drive. Truthfully, computing today without a CD-ROM is like having a television without a VCR. Come to think of it, I have two VCRs. Maybe its time to purchase my second CD-ROM drive.

I'm not going to go into all the information that can be found in The Mother of All Windows™ Books. Just suffice it to say that there's a lot of information in 2 inches of book and it's all in plain English. If you want the straight scoop on Windows just let MOM take you where no book has gone before!

Book Review

The Visual Guide to Microsoft Access

By: Walter R. Bruce, III
Dan Madoni
Rich Wolf

Review by: Carol Robinson, Tampa PC Users Group

One of the best things about this book was the software that came with it. I had already purchased the Access program as I will soon be using it at work, so I was anxious to "get up to speed".

The software that came with the book had two databases, the Contacts database that you actually create, and the Ventana database that has been created already, and is ready for your perusal and use. Installation is simple, and I do not believe that it even took ten minutes to do. I used the defaults that the installation offered, although I was given the option to make different selections.

This book starts out with a "whirlwind tour" of Microsoft Access, which is just enough to give you a taste of the softwares' potential. Chapter 2 explains what a database is, and why it is important to take some time to determine what information you want in your database, who will use your database and will they be comfortable using menu bars, pull-down menus, and pop-up menus, or is the user comfortable with the native Access interface? What security issues must the database address? Will users be allowed to change data or just view it? Do you want to generate forms, reports, or letters from the information in your database? What about adding/updating information in the database?

The book then takes you step-by-step, complete with illustrations, through the creation of tables, queries, forms, reports, OLE, graphs, macros and Access Basic. I'm impressed with the "wizards", "cue cards", and online help that have been built into Access. The Wizards are so simple and easy to use, simply answer the questions and Access creates the form for you. If you decide to change one or any of your answers,

See **The Visual Guide**..*Continued on page 8*

The Visual Guide... *Continued from page 7*

simply click the "<back" button with your mouse to make any necessary changes.

There are two ways to create a table, form, or report. The easiest method is to use the wizards that are built into Access. Simply open the database you desire, select the item you want to create (i.e., table, form, etc.) and then select the "new" or "design" button. At that point you have the option of using a wizard or designing your own table or form from scratch (which is easier to do than I expected). The creation possibilities range from a very simple form to overly elaborate forms. The possibilities are endless, and I had a lot of fun learning how to create forms with the nifty tools that are available in Access.

As I progressed through the Visual Guide, I found some "intelligence" was expected, as I would be instructed to create a simple form or import data from another database without the directions on "how to". I generally attempted these instructions without looking things up, but sometimes my forgetfulness won out. Anyway, locating the information that I needed was not a problem.

Queries - The programming code underlying the queries in Access is a language called Structured Query Language (SQL), which is supported on a wide variety of computer platforms. By using SQL, Access can communicate with other computers and retrieve the information you need. Queries can be used to perform many tasks, from retrieving specific records from a table to manipulating data contained in multiple tables. The ability to quickly create queries to perform these functions is one of the many features that make Access such a revolutionary PC database product. Again, the Visual Guide takes you through the query wizards, and then on to creating queries "from scratch".

OLE - Visual Guide has a good discussion of what OLE is in general terms, what it was in Access version 1.x, and finally, OLE 2.0. I found this interesting as my knowledge of OLE is slim and none. Visual Guide walks you through embedding and linking documents, as well as editing existing OLE objects inside Access. You can also convert an OLE object to a picture.

Graphical Presentations - I had fun with this section as the graph wizard has nine different types of graphs. As you select which graph you want the wizard shows you immediately what it will look like.

Macros - Macros were illustrated in the book, starting with the most simple ones and then leading on to the more complicated ones.

Access Basic - This is where the real programming power lies. Access Basic picks up where macros leave off. Access Basic is an event-driven language, meaning that you first write the programming code, but that all of that code just sits there until you tell it to go (you basically define some routines, and they just sit there until an event, such as clicking a button or opening a form, triggers one of them). Access formats the lines of code that you type as well as checking for proper syntax. There are two benefits to this, the first being that you do not have to wait to run your program to find out that you made mistakes when coding your procedures. The second benefit is that Access does not have to check the entire program for mistakes before you run it. Again, the authors of Visual Basic take you through the very basics before proceeding to more complicated programming.

There is a chapter on the installation of the Access program itself. The recommended requirements are: IBM compatible 486SX (486/66 desired), 16 mb of ram, 19mb of hard drive space for a typical installation, VGA display, Microsoft mouse, MS-DOS 3.1 or higher, Windows 3.1, Windows for Workgroups or Windows NT 3.1 or higher. I'm running the full installation of Access on a Compaq Contura 3/20 386SL, 10mb of ram, 212mb hard drive, MS-DOS 6.2, Windows 3.1 with no problems.

This book is well written to include detailed instructions, explanations, and illustrations. I found it to be an excellent "hands-on" instructor in teaching me Access 2.0. The book is published by Ventana Press, Inc., P.O. Box 2468, Chapel Hill, NC 27515; telephone (919) 942-0220. The list price is $29.95. ISBN 1-56604-070-1.

Book Review
Mosaic Quick Tour For Windows

Reviewby: Hugh Bayless, Montery Bay Users Group

Suddenly, everyone is talking about Internet, and one of the words mentioned most frequently is Mosaic. So what is Mosaic?

Mosaic is the key to open the the world of hypermedia _ the world of the Internet. Mosaic is a Windows program developed by the National Center for Supercomputing Applications (NCSA) at the University of Illinois, and it's FREE. But I am getting ahead of myself.

There are basically three ways to access the Net. Only the first two types of access can utilize Mosaic:

1) Direct or dedicated connections between your computer and the Internet. This type of connection is quite expensive and is usually only used by very large organizations like universities, government agencies, and local service providers.

2) Temporary dial-up, commonly called SLIP/PPP connections, which are routed through a local service provider who has direct or dedicated access. As of the last word I received, there is no local service provider on the Monterey Peninsula, but that will probably change in the near future.

3) Dial-up accounts, in which your computer becomes a terminal on a local host computer that's connected to the Internet. With this type of indirect or "host" connection, all of your interactions with the Internet are through programs that run on the host machine. This is the cheapest type of connection, but also the most limited.

If you are going to access the Internet through one of the service providers like NETCOM, DELPHI, or BIX, you won't be using Mosaic, but you won't be getting full access to the Internet either. If, on the other hand, you are going to use a SLIPP/PPP connection through a local or nearby service provider, you will need Mosaic. Mosaic is free, but you have to

See **Mosaic...** *Continued on page 9*

Mosaic....*Continued from page 8*

download it from NCSA. The book tells how you can do this before you have Mosaic loaded in your computer. And, after you have downloaded Mosaic, the book tells you how to install and use it.

MOSAIC Quick Tour For Windows is written by Gareth Branwyn and published by Ventana Press. If you will be using Mosaic, this book will be the best introduction to it that you could find anywhere, and the $12.00 price makes it one of the best book bargains around. You can order it direct from Ventana by calling 1-800-743-5369 and paying an additional

Book Review

The Secret Guide to Computers

By: Russ Walter
Review by: David P. Henry, Tampa PC Users Group

The Secret Guide to Computers by Russ Walter (who calls himself "Russy-poo") and the elves, mostly female apparently, and published by himself, address: "bedroom at 22 Ashland St., Somerville, MA 02144". Russ earned math and teaching degrees from Dartmouth and Harvard, taught for a while, then became "seduced by a computer to whom he's now happily married". If you're not already convinced this book is a bit out of the ordinary, get this: You can call Russ at his home number 617-666-2666 for free advice on any computer related topic any hour of the day or night - he says. "I'm near the phone 85% of the time...If you get an answering machine, just leave your number and I'll call you back at my expense, even if it's long distance" When I phoned him to try this out, he was on another call, but phoned me back in Tampa within 15 minutes. He gave me the exact information I wanted. I have this image of Russy-poo in bed, attended by his elves and surrounded by his 40 computers, his computer books and papers stacked to the ceiling and talking like a guru to his adoring disciples all around the world. Surely he has a flowing mane and a long white beard?

The Secret Guide is obtainable by direct mail order from the above address and is priced at $15; or $12 a book for at least 2 copies; $9 a book for at least 4 copies; and $6 a book for at least 60 copies. It just shows what can be done if the expensive publishing industry is bypassed. The formula is evidently extremely successful, as the Secret Guide, originally published in 1972, is now in its 19th edition.

The material in this 640 page, large format paperback is based on lecture notes accumulated over the years, and covers a wide variety of topics - like an encyclopedia but without the alphabetic sort as an organizing principle. It covers a wide range of material including hardware and peripherals, DOS and Windows, other (non-IBM) systems, shopping for a computer, many mainstream applications, several computer languages (including his own assembly language called SEXY ASS, because its a Simple, EXcellent, Yummy ASSembler), utilities, repairs and computer careers - all written in a light, humorous and engaging style.

How would you like to write a review of an encyclopedia? Especially one that claims to be "...the world's only complete computer tutorial: it covers everything important about computers!" Well, that's how I felt when preparing to review this highly entertaining book which is primarily aimed at the novice, but which also has much of interest for the expert.

The Table of Contents lists eight major areas: Buyer's Guide, Operating Systems, Word Processing, Databases, Spreadsheets, Wild Applications, Programming and Endnotes. Within each area there is a brief introductory background followed by several pretty well independent chapters. For example, the area on Programming (270 pages) contains chapters on BASIC, DBASE, PASCAL, C, LOGO, FORTRAN, COBOL, Strange Tongues and Assembler. On the other hand Wild Applications with chapters on Graphics, Desktop Publishing, Sound, Multimedia, Communications, Accounting, Personal Programs, Games and Artificial Intelligence is only 68 pages long. Obviously, you do not get so much depth in those areas where Russ has apparently less interest and, presumably, less expertise.

Most chapters about specific software products consist of a tutorial (the ones covered more thoroughly such as DOS, Word Perfect and BASIC are very good) such as you often find in the User's Guide which accompanies the product when you buy a program such as DOS. The product package also includes a Reference Guide; The Secret Guide doesn't. So it clearly doesn't replace printed product manuals, or commercial single-topic books for that matter, especially in the shorter articles (13 pages on DBASE or 5 pages on Ami Pro): the amount and depth of the material on a topic reflect Russ' own interests. But would it be useful to a prospective purchaser? In my opinion, the longer chapters are too detailed to be useful as a buying guide for a purchaser, who would probably prefer the typical review-length article of a couple of pages as found in computer magazines. There are several What to Buy articles comparing some of the main hardware and software products and these are well worth seeking out and reading. They have firm recommendations, list and discount prices, and include dealer's names and phone numbers.

So, if The Secret Guide is not very helpful as reference material, and it is difficult to locate its review material, just what is it most useful for? Its not the kind of book you settle down to read from cover to cover. To test my theory that it is the sort of book you enjoy best by just dipping into different items in a more or less random fashion, I made up a list of topics off the top of my head that I was curious about, and looked them up. They were: Express Publisher / hyphenation rules / RAMAC / Internet / Sys Request key / Toolbook / code page / draw vs. paint / DRAM / postScript / pixel / Amiga / MacIntosh / BIOS / scanner / config.sys / DOS versions / modem / UNIX / baud / virus / backup / pentium / fax. I drew a blank on the first eight topics (I shuffled my random list before typing it) and supposed that they weren't considered important enough to be included. I classified what I found on the others as follows:

Not very useful: BIOS / scanner / baud / virus / pentium

See **The Secret** .....*Continued on page 10*

The Secret... *Continued from page 9*

A useful smattering: DRAM / PostScript / pixel / Amiga / UNIX / fax

Genuinely useful: MacIntosh / config.sys / DOS versions / modem / backup

For example, even an experienced IBM user is likely to find out something new and useful in the article "Boot" under DOS. You might conclude that when any computer question comes up, you should make The Secret Guide your first point of reference; you stand an even chance of finding a useful answer. But if you draw a blank, or find a reference which is "not very useful" you will probably be out of luck, because the book doesn't give many references to other sources, except for the computer languages. Here's where footnote references to items in a bibliography might have been helpful. Despite these reservations, I feel many knowledgeable users will find this book very useful and enjoyable.

Keeping a reference book up to date in the fast moving computer field is a daunting challenge, and it seems that Russ makes a major effort to do so. For example, while comparing the current 19th edition published this summer with its 18th edition predecessor published in the Fall of 1993, I found there were major new articles on DOS 6.2, multimedia computers and Pentium.

The last is in a thoroughly practical and illuminating discussion on chip technology. In introducing a table comparing the characteristics of various chips, Russ has this to say:

You've seen that a Pentium is the fastest Intel chip, the 8088 is the worst, and other chips are intermediate. But how much do those chips differ from each other?

Don't ask that question to a computer salesman! Computer salesmen dispense lots of misinformation about computers, because the salesmen are lying or stupid. Usually the salesmen are lying and stupid! Here's a famous riddle...

What's the difference between a used-car dealer and a computer salesman?

Answer: The used car dealer knows he's lying.

For the novice, Russ writes in a rather simplistic yet comforting way. His somewhat dogmatic style may be ideal for beginners or high school students but might grate on someone more familiar with the topic. There are no half-hearted opinions in this book; Russ tells you exactly what to do. For example, from the article on Notebook computers:

"The first rule about buying a notebook (or laptop) computer is: don't buy one unless you must! Try buying a desktop computer instead!

Though notebook computers are portable and cute, you pay a lot for portable cuteness.

Suppose you want a computer containing a 486SX-33 with 4M RAM, 210M hard drive, 1 floppy drive, color screen, DOS, Windows, and mouse or trackball. To get a desktop computer containing all that, you pay about $1000; to get a notebook computer containing all that, you must pay about $1900 instead...So don't buy a notebook unless you must."

If you are a novice, I feel comfortable in heartily recommending this book to you. Russ has the born teacher's gift of being able to "put it across" very well, and uses the teacher's tricks of repetition, variety and good humour to make the beginner feel at ease.

Novice or expert, you will find the real pleasure of this book will be in browsing a huge range of material, and in enjoying the relaxed, off-beat, whimsical tone of much of the writing.

WRITING PRODUCT REVIEWS

By: Ed Buzza, Tampa PC Users Group

Some people claim that they can't write. They don't mean that they're illiterate or not physically capable of writing, they're saying that they don't know how to put their thoughts down on paper. They say that they don't know the format or style to use. Or they fear possible embarrassment or being made fun of for using poor grammar or for not using high-falutin' words.

To all this, I say *censored*! If you can talk, if you can think, if you can type — you can write! Blessed be the person who writes at the eight grade school level,. The intelligent will recognize the intent and applaud the effort. The less literate will at least understand what has been written. Those who would look down their noses and adopt a patronizing air are to be pitied, not scorned.

For example, someone might say 'An expository evaluation of the intrinsic merit of this laudatory mechanism refutes beneficial acquisition.' I'd rather see that someone say "It ain't worth nuthing." Anyone can use "big" words, all you need is a dictionary. What is needed are words that give information, that convey thoughts, and are readily understood by almost all people. There will always be exceptions but there's nothing you can do about that.

So, for those of you who would like to write a review of a product but "don't know how to write," the following outline is meant to help you; to guide you in writing an article for the newsletter. Don't need to be fancy, just the facts as you know them and as you say them.

Title and author:

PRODUCT REVIEW (use this as your title or headline) by (enter your name).

Product name (start of first paragraph):

Enter name of product. Is it a high, medium, low level type?

What kind of product is it (type of software or hardware, word processor, paint program, modem, scanner, etc.)?

See **Writing...** *Continued on page 11*

Writing... *Continued from page 10*

Description or purpose (second paragraph):

Describe what it does. Abstract from package hype but your definition is preferred. Briefly describe it's features or modules.

Installation and use (third paragraph):

how easy is it to install? Custom install or must install everything? Do you need to delete old version? Tell of any problems when you installed.

Overall impression (fourth paragraph):

If upgrade, is it faster, better, how? Is new version more complex? Do you need or like the new features? Describe the documentation - complete, good, lousy, good/poor examples, good/poor graphics.

What do you like about it? What do you dislike? How does it compare to other similar products that you own or have used?

Requirements:

How much RAM (conventional, expanded, or extended)? How much space on Hard Drive (minimum and maximum)? Any special needs like SVGA, mouse, modem, CD-ROM, sound board, adaptor boards, etc.?

Can it be used on 8088, 80286, 80396+? What version of DOS does it need? Is it Windows only and which version? Where there any surprises that the package did not mention?

Product data (closing paragraph):

Product name and version; manufacturer's name, list price, street price and source (check any trade magazine or local computer store).

Using the above guidelines, try to keep the article at about 500-700 words or about one page. It's really not that difficult at all. And if you need help, write a rough draft and ask the Editor or me to review it for you. We'll be glad to help.

Reprinted from the August, 1992 issue.

The Tampa PC Users Group Library of Files

The file library for the Tampa PC Users Group is a selection of files, hand picked and tested by the club librarian. Our library prides itself on QUALITY - NOT QUANTITY! The library is stored on 3.5" , high density diskettes, and is usually available at every general users group meeting. Access to the file library is simple if you follow these rules:

1. You must bring your own formatted diskette.

2. If you bring your own PC to the meeting you may copy files to your heart's content, under the supervision of the librarian.

3. If the librarian's own PC is used, the librarian will make the copies for you. Please be reasonable and limit the number of files to be copied. Remember... the librarian is a member too and is interested in the presentation for the evening.

4. There is always a list of the files in the library provided in booklet form at the meetings for you to look at and choose from. This list is also available in ASCII text format for you to copy onto your own diskette, to take home. This same text file is updated regularly and uploaded to the club's Bits of Blue BBS for downloading.

5. If you have been unable to attend a general meeting and need a file, just leave a message on the BBS for "Larry Anders" and the file will be uploaded as soon as possible.

NOTE: If there is a special file you are looking for or are interested in, ask the librarian. The Tampa PC Users Group is a member of the Association of Shareware Professionals and receives a CDROM each month full of the latest Shareware releases.

THE FILE LIBRARY IS A PRIVILEGE FOR CLUB MEMBERS IN GOOD STANDING. PLEASE DON'T ABUSE THIS PRIVILEGE!

CRAFTS AND COMPUTERS

While browsing through a magazine (Family Circle Holiday Crafts 1994) at a friend's craft shop I found a "Computer Corner". I like both Crafts and Computers so I continued to read....to sum it up the article was about "on-line services" specifically for both MEN and WOMEN crafters.

America On Line
Crafts and Sewing Forum, 1-800-827-6364. This BBS includes Needlework, Quilting, Holiday Crafts and Woodworking.

Battling the Upgrade Path

By: Steve Bass, Pasadena IBM Users Group

Some people think a computer should be like your father's Oldsmobile—choose a destination, drive to wherever you're going and get on with your life. Unfortunately, many of us use the computer in a different way — like the '64 Pontiac GTO of our adolescence, we tinker with it. It's almost become an obsession; fine-tuning the computer's operating system, squeezing out every last drop of power and adding special hardware, pushing the performance envelope.

The software industry helps this process along with minor software upgrades—a new version of the product—every six months or so and major changes every twelve to eighteen months. The hardware folks are no bargain either. The current rage? The local bus, a slot on the system board that lets your video card (and, on some systems, the hard disk controller) get direct access to the CPU with, well, what else...added performance. And within a year, they're going to ask you to send your 486 to your brother-in-law and buy a Pentium, the chip that's next in line, awaiting your computing dollar.

Look at the last six months: Stacker moved up to version 3.0, PCKwik upgraded their caching program, Paradox bumped to 4.0, Quicken's up to 6.0, WordPerfect/Windows released a new version and Ventura's latest is 4.1. I've got more but let's move to 1993. Watch for DOS 6.0, a new WordPerfect/DOS, Microsoft's Windows NT, an improved Access, another version of Lotus' 1-2-3 and, well, you get the idea.

And because software companies depend on your need to fiddle, they make it easy to upgrade and switch, further complicating your life. Listen to this: At a recent user group meeting in Long Beach, Lotus offered to let you upgrade your Windows word processor to their $495 list price AmiPro for $80. Did you miss the meeting? No sweat because it's available through mail order for $99. It sounds like a bargain but, with very product, no matter how easy, there's a learning curve and, ultimately, downtime for you.

Want more? Some programs don't work with upgrades from other programs. Windows 3.1 didn't work well with Quarterdeck's QEMM 6.0. Once you ran the new version of Fastback, a program to backup your hard disk to floppies, you could no longer use the old version of the program — it wouldn't read the files. A nuisance if you then decide you don't like the new version.

Remember, no matter how valuable the upgrade, it takes time away from your immediate goal—using the computer for productivity.

Don't get me wrong, there are some programs worth upgrading. Quicken for DOS, an accounting program, for example, offers some new features that make the program more efficient, decreasing the time I need to spend with it. On the other hand, Borland's database program, Paradox 4.0, made significant changes to the programming language, something I never use. They also made minor changes to the interface, enough, though, that I have to spend time fiddling, increasing the time I need to spend with the program.

I've got some guidelines to help you decide whether to take the upgrade path.

- Cop an attitude. Rather than let yourself get dazzled by the advertising copy (or even a personal letter from Philippe Kahn, Borland's president), put yourself into an analytical position that forces the company to prove it's worth upgrading.

- . Think critically. Before you decide to upgrade, minimally read three magazine reviews with a copy of the advertising prospectus in hand. Carefully examine the list of new features and compare them with not only the reviewers' comments but what's not mentioned.

- Try it out. Examine the product at a local software discounter —many stores have a computer and are given an evaluation copy from the company. Bring along a file you're familiar with because spending time with the product is the best way to evaluate its potential for increasing your productivity.

- Ask others. If you're a member of a users group, find time to ask others during the Random Access session or while you're networking before the meeting starts. Many user groups offer a list of volunteers willing to share their skills —and opinions — with others in the group. If you have a modem, post the question on an electronic bulletin board. If you're a subscriber to an on-line service like CompuServe, America On Line or Prodigy, monitor the company's forum or conference. You'll get the chance to see hard core users interact and get a tremendous insight into the product's relative value.

- So the next time you're trying to decide whether, uhm, excuse me, it's Federal Express with the new version of Wordstar. Did you hear about the way it...

Steve Bass is the president of the Pasadena IBM Users Group and a Contributing Editor for PC World.

FRIENDS OF THE USER GROUP:

We acknowledge the following firms for their support:

- CompUSA
- IBM
- PC Warehouse
- Software Review
- Custom Computer Wholesale
- Staples
- Sunrise Computer Supplies & Parts
- Brainchild Computer Distributions, Inc.
- Realtron - Appraisal Magic

We also acknowledge the following national software vendors for their excellent demonstrations and contributions of evaluation software to our group.

- Access Software
- Adobe Systems, Inc.
- Borland
- Corel Systems
- Grolier
- Knowledge Advenenture
- Microsoft
- Symantec
- Traveling Software
- Wordperfect

WELCOME NEW MEMBERS!

Keith Hamilton
Carl Oligny
Margaret Petro
Kathrine Powell
Beth Sawyer
Kevin Sawyer
Ryan Sawyer

WE ARE HAPPY TO HAVE YOU IN OUR GROUP!

MEMBERS HELP-LINE

The following phone list is provided for our **Tampa PC Users Group** members in an effort to establish local support for those frustrating times which we have all encountered while using our PC's. Please note that these are members that have volunteered to help you, treat them in a courteous manner. Be sure to ask if it is convenient for them to help you now, or if you should call another time. It would also be helpful to have your documentation and have it handy when you call. *(Don't expect help if your software is an illegal copy or you do not have documentation!)* **TPCUG** is not responsible for the information or advice provided by volunteers. Volunteers may or may not be experts in the subject matter. You are on your own with any advice received. Be aware also that some of these volunteers may be consultants in their area of expertise. If you are interested in volunteering to answer members questions, either leave a message on the BBS or fill in the forms provided for this purpose at the meetings.

LIBRARIAN: Larry Anders 989-9119
MEMBERSHIP DIRECTOR: Tom Cone 224-9052

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII file or in a commonly available word processor format, such as WordPerfect 5.2, or Ami Pro 3.0 on diskette to the editor at 9402 Hidden Ridge Place, Tampa, Florida 33637 or send it by modem to BBS (813)239-3704.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

The use of trade marked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted at the following rates:

	1 month	3 months	6 months
Full Page	$60.00	$162.00	288.00
Half Page	$40.00	$108.00	$192.00
Quarter Page	$22.00	$60.00	$106.00
Eight Page	$12.00	$33.00	$58.00
Business Card	$10.00	$27.00	$48.00

All advertisements must be prepaid by check payable to TPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if it is not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, Marylee Bruneau at (813) 985-3338, for space availability and for further information.

This newsletter is created with PageMaker 5.0 from Aldus Corp. and Corel Draw from Corel Systems.

Secretary's Report

MINUTES OF 11/9/94 MEETING
and Personal Comments by
Jim Clark, Tampa PC Users Group

An important meeting for our group, with nominations for officers, and the weather, though a bit threatening, cooperated. We also had a major and increasingly popular piece of software to be reviewed — OS/2 Ver. 3.0 Warp.

USER GROUP NEWS

➧ SECOND BBS 14.4 MODEM ON HAND: Our group has acquired a second 14.4 modem for use with the BBS. It is an external version and will be placed into use as soon as the ADOPTBBS fund-raiser generates enough funds to pay for installation and first year's use of a second telephone line. Harvey called attention to the how-goes-it chart in the newsletter which shows the generation of funds still far below that needed to upgrade the BBS with more file space and a second telephone line, and he emphasized the importance of supporting the ADOPTBBS fund-raiser if we are to realize these improvements in the BBS.

➧ NOMINATIONS: Harvey reported that several of the present officers who have served for several years have expressed their intent to not serve in the coming term. However, most decided that the loss of so many on the BOD at one time could jeopardize continuity for the group and agreed to serve again, if nominated and elected, but for only one more year. Harvey pointed out that it is essential for creativity as well as the continued life of the group that new blood come aboard the BOD. It was also noted that our members must become more active in helping the group to improve by contributing their time and effort to generate new members and perform services for the group as a whole.

Nominations were made for the elected positions on the BOD as follows:

President:	Harvey Bruneau (incumbent)
Vice President:	None (it was not known if Al Poole would serve again)
Treasurer:	Tom Cone (Incumbent - not present at the time and assumed he would serve)
Secretary:	None
Member At Large:	Roger Waters (incumbent)

No new blood was nominated for any of the positions. Members may submit nominations via mail and/or make nominations at the December meeting up to the time of the election. It is extremely important to the group that additional nominees be obtained and that these positions be filled.

Harvey outlined what should be some of our objectives for the coming year, and will be if he is again elected. These included more SIGs, more member-to-member sessions at our meetings where we could help each other with problem solving, using things we already have, working on computers, using DOS, Windows, the BBS and others, demonstrations on installing and setting up components, etc.; and membership of at least 300. None of these objectives are achievable without more active participation from our membership. One of the easiest ways we could all help is to bring in just one new member. Try it, you might like it!

Minutes.. *Continued from page 2*

➪ PRESENTATION — IBM's OS/2 Ver. 3.0 Warp

IBM was good enough to make Carolyn White, one of IBM's Workplace Marketing Specialists, available to give us a rundown on the new version OS/2, called Warp, they just released. And a fine job she did, too. She began by noting some of the reasons 'Why OS/2?' Among them are safer operations because program failures, such as occur in Windows are contained within the offending program and do not force rebooting the computer as is now usually the case in Windows and DOS; OS/2 is an operating system itself and doesn't rely on DOS or any other operating system; it provides better memory management, and is not inhibited with the constraints that have long limited DOS; allows simultaneous operation of DOS, Windows and OS/2 applications and supports interchange of information between all three; and it is an operating system designed to make best use of new hardware technology.

You all are at least a little familiar and know what a large and powerful program it is — well beyond the scope of this little section of the newsletter. I will only point out some of the improvements that have been made compared to previous versions of OS/2. First, IBM says that this program is designed specifically for the home PC user, the student and the business executive, and great emphasis has been placed on making it truly user friendly. Warp combines the advanced OS/2 32-bit operating environment with new features for productivity, reduced memory requirements, and ease of use and productivity enhancements. Among them are:

✔ Redesigned and simplified installation that automatically configures your system; imagine avoiding all those address and configuration conflicts.

✔ Much faster and smoother operation of Windows and Windows programs.

✔ Enhanced print performance and significantly improved monochrome and color bitmap printing due to new 32-bit printer drivers.

✔ New easier to use tutorial that shows best use of OS/2 to fit your style.

✔ Customizable program Launch Pad ready access to your most used applications and features.

✔ Automatic configuration of PCMCIA cards through a "Play at Will" interface which permits putting in another PCMCIA card without having to reboot you r laptop.

✔ Includes a set of popular OS/2 windows audio device drivers.

✔ Improved user interface and graphics.

✔ Now requires only 4 Mb of RAM.

✔ Warp also includes a number of features and utilities in a 'Bonus Pak':

✔ OS/2 CompuServe Access.

✔ Person-to-person for OS/2: Desktop conference software where you can share files or multimedia with another computer.

✔ FaxWorks for OS/2 where you can send, receive and print faxes as ;you desire.

✔ IBM Installation Utility & System Information Tool which allows quick, convenient access to detailed info about your soft/hardware.

✔ Access to Internet which will automatically configure for free hours on IBM's WEB service, and includes several Internet applications including Gopher, Mosiac, NewsReader and E-Mail.

✔ Provides a suite of applications including a word processor, spreadsheet, report writer and database.

✔ An organizer to keep track of addresses, phone numbers, to-do lists, and calendars all in one place.

Requirements for OS/2 Warp are a 386 machine or higher, 4 Mb of RAM (though 8 Mb or more is preferred), DOS 3.1 or higher installed if you plan to run DOS applications, Windows 3.1 or higher installed if you plan to run Windows applications, and 30 Mb of disk space for minimum loading and up to 55 Mb for a complete installation, including all the bells and whistles. Carolyn was using a 385/25 MHz with 8 Mb of RAM for the demonstration and while performance was not really fast, it was acceptable. And what a bargain. IBM reports a street price of under $80; Computer City has OS/2 Warp on 3.5" floppies at this writing for $69.97. Carolyn and IBM, THANK YOU very much for a great introduction to a super program. OS/2 has been and is of great interest to our members and we hope that you will keep us abreast on future developments.

➪ AND THE WINNER IS

Thanks to the generosity of Carolyn White and IBM., there were several very nice door prizes. Those among us to have the good fortune to win are:

Dan Whitman	OS/2 mouse pad; OS/2 Progammers Guide
Dave Clary	OS/2 cups
Herb Atwood	OS/2 T-shirt
Steven Atran	Disk Optimizer
Roger Waters	Cash Graf Office
Joe Crochet	OS/2 Warp

The meeting adjourned at about 9 PM.

SOFTWARE AVAILABLE FOR REVIEW:

XtraDrive Lite - (Windows & DOS) Doubles your disk capacity. vendor: Integrated Information Technology

WinSense - the Windows Optimizer

AnyView - Screen Commander for Windows

Your Deck - Design & Build How-to Software (Sunset)

Space Age - Arts & Letters 3 in 1 Software = Multimedia + Clip Art + Drawing

CA$HGRAF Office Plus - The World's Most Powerful Single-Solution Office Software!

MULTIMEDIA MAGIC CD - by Gold Disk - Everything you need to enjoy the magic of multimedia.

SHERLOCK - The ultimate filing and retrieval system for Windows.

PC 911 - Automatic Rescue Utility for your PC

FIRST AID for Windows Users - Fixes problems fast and automatically.

Kinderventures - The Wanderoos Go Exploring (ages 3 to 8) CDRom

PROCOMM PLUS for Windows - Intuitive Data & Fax Communications Software.

RUSA - Interactive Art Tour - St. Petersburg, Russia CDRom.

DO-OVER! - Change the look of Windows with a bonus utility to speed task switching.

GeoPublish - Trial size word processor & disk management suite (Shareware).

TuneLand staring Howie Mandel - Interactive Cartoon CDRom (ages 3 and up)

(Call 985-3338 for info on review software)

President's Column

Elections

Another year is coming to an end. This means several important things are going to happen this month. Of course there is the notification from the IRS, it's time to Christmas shop, my birthday, New Years Eve and most importantly BOARD MEMBER ELECTIONS. These positions include President, Vice President, Treasurer, Secretary and Member at Large. This year we will have ballots that you must fill in during the election process. Just select the candidates you want by selecting their name or you can write in a name. This process is important so please come out and vote. Of course you can nominate yourself or any other member prior to the election.

Second BBS Line

Some of you that have been on the BBS lately may have noticed that we now have a second line (237-4997). While we have not yet reached our goal of $1500, we did get enough donations to implement the second line. These donations came in the form of money (THANKS to all of you who contributed $$) and other contributions. The other contributions came in the donation of a brand new Intel 14.4 modem by an anonymous member and the use of an existing phone line from the good folks at Realtron. While the user group is paying for the monthly access of the second phone line, we did not have to pay an installation charge since it was already in place but not used by Realtron. Of course should Realtron need that line in the future we will need to install our own line. Anyway thank to Realtron and the anonymous member who left the new modem in my office.

At the November board meeting, it was decided that the second line would be setup so that only members could use it. We felt that this was the right choice since you, the members, made the contributions. The original line is of course is available for members and the general public.

The adopt the BBS fund is still open. While the second line is installed, we still need your donations to enhance the BBS. One enhancement that has been brought up during the board meetings is the upgrading of our US Robotics modem to the new 28.8 (V.34) standard. The upgrade cost $99 and could be used by those of you getting those high speed modems for Christmas and to speed up the nightly process of updating the message base from FIDONET. The original goal of $1500 included a big hard drive (500Mb+) for the BBS. The hard drive is another reason that we are keeping the fund open. Of course if someone donates a Western Digital Caviar 540Mb we would all be very appreciative. We will not turn down a bigger drive either. If you can help, call me at 962-2554 or 985-3338, lets talk.

SIG Groups

At the last general meeting one of our members generously offered the use of his office facilities to our group for use of Special Interest Group meetings. This includes computer, projection equipment and space for 20 people. It has been determined that a SIG will be formed and focused on electronic communication. This will cover modems, BBS and Internet. The goal of this SIG is to promote the proper use of electronic communication and prevent you from being roadkill on the information superhighway.

At this time a SIG leader has not been designated nor has a meeting night been determined. We need a SIG leader and an Internet account before we can move forward on this SIG. Interested individual should contact me.

We can have two SIG meetings a month at the facility offered to our group. If you have an idea for the second SIG or you want to run it, please call me.

New Rates

A reminder that membership rates have increased and are now in effect. Each membership rate has increased $5 except for the corporate rate which has been increased by $10.

Happy Holidays

The Board of Directors join Marylee and I in wishing each of you the best for the coming holidays.

THANKS TO ALL WHO HAVE CONTRIBUTED.

Old Drivers on New Software

By: Bill Allen, North Orange County Computer Club, California

Many club members may be aware of the following. I was not. For those who, like me, are still learning I submit this anecdote. I recently bought the Microsoft MS Office software, which includes MS Word, Excel, and Power Point. When using MS Word I could not get any of the TrueType fonts to appear, although they were available for Excel. My son-in-law loaded his MS Office package on my computer and was able to use MS Word with all the TrueType fonts I had on my machine.

I called the Microsoft forum on Compuserve for some expert advice. Most of what I got was specifics on how to leave messages on Compuserve, which I apparently did incorrectly. The little I got regarding MS Word and TrueType Fonts was right out of the manual, which I had already read and tried. I signed off after getting no real help. In groping around to solve my problem it occurred to me that the printer driver might be the cause of the problem. I believed it had to be unlikely that a printer driver could prevent MS Word from recognizing Windows TrueType fonts. But that turned out to be the case.

In checking my Windows drivers using my trusty XTreeGold, I determined that the HP-IIP PLUS printer driver loaded by Windows was dated 1988. That's a six year old program. Could that be the problem? It was.

A quick modem call to Microsoft's bulletin board located a 1993 driver. I replaced the old driver with the new one. That solved the problem. Now I had all my TrueType fonts available for MS Word and Excel. It may be that other drivers provided with current copies of Windows, MS Office, etc. will also be old enough to be incompatible with new software, even from the same manufacturer. This could be the result of a possible lack of quality control at Microsoft. So much for Total Quality Management! Hopefully, this story will help another computer neophyte solve a similar problem in the future.

Book Review:

More Windows for Dummies

Review by: Alford Poole, Tampa PC Users Group

Andy Rathbone's sequel to Windows for Dummies is a snappy delight, full of more handy tips and explanations to help make the most of Windows.

More Windows for Dummies has five parts. Part I deals with everyday stuff: Windows basics, installing new software, graphics and sounds, and the history of Windows development. Part II helps you make Windows do more such as working on a laptop, use the new stuff that comes with DOS 6, use Terminal, and use multimedia. Part III shows examples of other people's desktops, mouse fixups, and more about CONFIG.SYS, AUTOEXEC.BAT, and swap files. Part IV "More Advanced Ugly Tasks Explained Carefully' has chapters on unzipping files, uninstalling old programs, creating PIF files, editing INI files, and dumping unneeded Windows files. Part V wraps up with more tricks, shortcuts, and tips and even tells how to uncover the Hidden Credits in Windows 3.1!

Here are a few tips I found useful:

Make File Manager look the way you want it to: "While holding down Shift, double-click on the box in File Manager's upper-left corner - the box that usually closes File Manager down. Holding down Shift while double-clicking tells File Manager to remember the way it's currently set up. The next time you load File Manager, it will look the same as it does now."

"To complete the trick, make sure there's no check mark next to the Save Settings on Exit option from File Manager's Options menu. That way, File Manager remembers its current layout only when you tell it to." The Shift-double-click trick also works for Program Manager.

Replace highlighted text; "After highlighting some text you'd like to replace, immediately begin typing in replacement text. Your first keystroke will delete the highlighted text, just as if you'd pressed Del."

Put Windows on a diet; "If you want to strip Windows to its bare bones - a shell of a beast with little power - then buy Microsoft's Windows Resource Kit. It describes all the files you can remove to bring Windows down to 2.6 MB almost enough to fit on your digital watch."

There are four pages of file extension descriptions to help ferret out deletable files to free more hard disk space. I love this kind of info!

More Windows for Dummies supplements the Windows manual and answers lots of nagging questions. If only manuals could be written this way...

Cost and availability: $19.95, minus discount, at CompUSA or Computer City.

Publisher info" IDG Books Worldwide, 155 Bovet Road Suite 310, San Mateo, CA 94402-9833 Sales and Info: 1-800-762-2974.

Reminder for Membership Renewals:

$25 (individual)

Tampa, Florida 33601-3492

THOR is in town!

The Tampa-Hillsborough Online Resource is now available to connect you to the Tampa-Hillsborough County Public Library via your computer.

Requirements:

- Computer with modem (up to 14.4 baud rate)
- Emulation program for VT100 or ADDS Viewpoint (they mean communication software: RIPterm, Qmodem, Telix, etc.)

To use Dial Access:

- Set your modem for 8 bits, parity - none, 1 stop bit and echo off and dial 276-2770 through the modem.
- When conected, press <Return> until you see a logon prompt.
- At the logon prompt, type "thor" (in lower case - they may be using UNIX) then <Return>.
- At the prompt:
  System emulation....:WY50-VP
  Dynix emulation.....:WYSE
  Is this okay? ([Y]/N)
  Answer N (no).
- Enter the number of the emulation you are using. (The most commonly used emulation is Digital VT100, so choice 10 or 12 should work).
- You may choose to test your emulation by answering Y or to bypass the test by entering N. If in doubt, check it out.
- If you typed N, you will be sent to the THOR Greeting screen. Enter <Return> and the THOR search menu appears.
- You may now perform all the same functions you perform at the public access library terminals.
- When you are finished searching, select Logoff on the THOR search menu. IT IS VERY IMPORTANT THAT YOU FORMALLY LOGOFF. (they must be using UNIX)
- In consideration of others who wish to use Dial Access, they ask that you limit your time on line to fifteen minutes per session.

While you are online, check out some of the neat computer books available like: The Internet Unleashed, Cruising Online, Larry Magid's Guide to the New Digital Highways and a couple of my favorites: More DOS for Dummies and More Windows for Dummies. The books can be put on hold and/or sent to the library branch closest to you and you will be notified by mail when the book(s) become available. Happy reading!

Prices Drop for Online Services

Prodigy, in an attempt to keep up with America Online's lower prices, has just changed its pricing structure to capture new subscribers. The new Prodigy pricing will offer minimal users of its services the option of a monthly rate of $9.95 for five yours online, compared with the present flat monthly rate of $14.95 for unlimited use. At the same time, America Online dropped its extra hourly charge from $3.50 to $2.95.

All of the online service providers are trying for a larger share of a growing market. Prodigy says it serves over one million homes, in addition to commercial accounts. America Online, the least expensive provider, claims a total of about a million subscribers. CompuServe, the most expensive of the services, claims over two million subscribers worldwide.

Software Review:

Quotes on Line by askSam

Review by: Alford Poole, Tampa PC Users Group

Fulton J. Sheen observed: The mind is like a clock that is constantly running down and must be wound up daily with good thoughts. Quotes on Line (QOL), a collection of quotes from Keith D. Mohler, can help wind up our minds.

A database of quotes presents a unique challenge for quick and easy access to lists of related quotes. To make it user friendly and simple seems to have been the goal at askSam. How does it compare with tomes like Bartlett's Familiar Quotations or the Oxford Dictionary of Quotations? QOL is a collection of 12,000 quotes. Bartlett's has almost 20,000 and Oxford has over 17,000. Where QOL shines is in its speed of collecting groups of quotes and not having to retype the quotes selected once found.

The 28 page QOL manual covers the basics: installation, search and output. QOL installs itself onto hard drive with only one query: do you have a color monitor?

Test Results: The main menu consists of Quotes, Help and Exit. Under Quotes are three more choices: Topic Search, Author\Source Search, and Full Text Search. The Full Text Search takes the longest, but is still quick.

Selecting a quotation is a simple two key operation. Selected quotes can be saved through creating or adding to an ASCII text file or output to a printer. Each time you go back to the list of selected quotes you go back to the beginning of the list. Bummer! This is annoying if your list is long and you want to output several selections. I used Windows to cut and paste the quotes to other documents (like this one).

There are a few typos as in St. John Ervine's, "The is no instrument so deceptive as the mind." A spelling checker would not catch that one, but Grammatik did.

QOL also has an undocumented screen blinker that kicks in after a few minutes of inactivity.

Limitations: QOL lists very few sources and no dates. Both Bartlett and Oxford list sources, dates and authors.

No going back! When viewing the quotes or list of authors there is no reverse gear to go back to the previous page or screen. No mouse support either. No way to add new quotes.

Evaluation: Even with the above limitations this program is worth considering. Going through a few pages of mind-expanding thoughts occasionally will do anyone some good. The following (also the other quotes included in this article) are found under the topic of "mind":

William L. Phelps:

"At a certain age some people's minds close up; they live on their intellectual fat."

Toledo Blade:

"A great many open minds should be closed for repairs."

Reading one quotation a day would take over 33 years to exhaust QOL's supply. QOL is great for writing letters, articles or even memos. Add a little culture to the office with a few quotes. "The growth of the human mind is still high adventure, in many ways the highest adventure on earth." Norman Cousins.

System Requirements: IBM PC, AT, PS/2 or compatible with at least 384K RAM. Monochrome, CGA, EGA, or VGA monitor. PC or MS-DOS 2.0 or higher. 4 MB free hard disk space for installation, 2.6Mb after installation.

Cost and availability: QOL: $49 through askSam, Bartlett's Familiar Quotations and Oxford Dictionary of Quotations are available in hardback editions for $40 and $35 at Barnes and Noble book stores.

Publisher info: askSam Systems, P.O. Box 1428, Perry, Florida 32347 (904) 584-6590

Software Review:

CD-ROM Almanac

Review by: Hugh Bayless, MBUG-PC

Parsons Technology has just brought out one of the most truly useful (as opposed to merely entertaining) CD-ROMs that I have yet seen. It is the 1994 Information Please Almanac for Windows. While I have not compared it, item by item, with the printed version of Houghton Mifflin's book version of the Almanac, the CD-ROM version had all of the data that I did look up. That's pretty impressive in itself. But, the CD-ROM version makes possible search features that are not possible in the printed version. You can search for words, topics, or phrases to find precisely what you are looking for. But, if you prefer, you can browse through the Almanac at least as easily as you would with the book version. Topics covered are all of those you would expect to find in any almanac _ census data, crime data, election results, economic data, famous personalities, postal rates, toll-free numbers, and all the rest. What you couldn't do with the book version but is easy with the CD-ROM version is copy text from the almanac to the Windows clipboard and then include it in a document prepared in your Windows word processor. You can also simply print an entry direct from the almanac. This is one CD-ROM that I intend to keep within easy reach all of the time.

The 1994 Information Please Almanac is available in both DOS and Windows versions, on either CD-ROM or disk. The DOS version requires a 286 or higher, 2MB RAM, and 7.25MB hard disk space. The Windows versions on floppy disk require a 286 or higher running Microsoft Windows 3.x, 4MB RAM, and 7.25MB hard disk space. The CD-ROM version requires a CD-ROM drive and only 1MB of hard disk space. All versions are available for $49 each from Parsons Technology, 1-800-223-6925.

Electronic Mail Defined

By: Linda Hargraves, Tulsa Computer Society

I decided to write this article because I frequently get questions from people who don't understand the concept of mail. I thought that if I explained the different types of mail, it might help others to be more interested in writing messages to other people.

Electronic mail or E-mail is a general term used to convey messages sent from one person to another person on a local BBS or a national one such as CompuServe, Prodigy or a mail system used by a company to get messages from one person to another. Just like the U.S. Mail (nowdays referred to as Snail Mail, because electronic mail is much faster) needs to have a person's street or post office box address in order to deliver mail, electronic mail needs both the sender and the receiver's address in order to get the mail delivered.

You may see several different terms used to mean mail. On some systems, it may be called Conferences, Forums, Topics, Message Bases or some such name. There are four basic forms of message systems: local, echo, netmail & Internet mail. The actual name used for mail is not as important as the type of mail. Some bulletin boards are connected together by a network. Each BBS has an address in that network that allows mail to be sent between one BBS and another in the network. Public mail is mail that may be read by anyone on the BBS or in the network. Private mail is normally only read by the person who writes the mail and the person it is addressed to. All sysops have the ability to read all mail but don't normally read everthing.

Local (public or private) - Mail that stays on the system it is written on. Mail is addressed to the sysop or to anyone that calls that particular BBS.

Echo (public) - Mail that is written by one person to another person or to Everyone on the BBS and can be read by every person on any other BBS in the network.

Netmail (private) - Mail that is written by one person to a specific person on another BBS in the network. You must use the person's name plus the address of the other BBS in order for him to receive the mail. Netmail access is not available for general use on some systems.

Internet Mail (private) - Mail that is written by one person to a specific person on any system anywhere in the world that has Internet access. Internet mail may be written to anyone as long as you have their address. It can be sent to any of the major online services or e-mail services like MCI:mail. An example of an Internet address is my own address below:

Linda Hargraves on ACCESS AMERICA (BBS) - lhargraves@accessamer.com

The first part of the address in front of the "@" sign is for the logon name of the user. Sometimes the whole name is used as in "linda.hargraves" with a period between the two names. You cannot have spaces in any part of the address. If you use a middle initial like mine Linda L. Hargraves, you will need to write it like this: linda.l.hargraves or llhargraves because you cannot use 2 periods after the initial like this: linda.l..hargraves.

CompuServe uses a series of numbers separated by commas as the user ID, so you will need to exchange the commas for periods in the user ID. As an example, Don Singleton's address is 76154,26@compuserve.com and the commas would be changed to periods as in: 76154.26@compuserve.com to write to him on Internet.

The second part of the address after the "@" sign is the place the person is located at, called the domain address. It can be a commercial business, a BBS, a government or military agency, a educational institution or a non-profit organization. The address also can show an international organization or different county. The most common domain names are shown below.

Domain	Type
.com	Commercial
.edu	Educational
.gov	Military
.int	Governmental
.net	Internet resource
.org	Non-profit
Domain	Country
.au	Australia
.ca	Canada
.ch	Switzerland
.de	Germany
.dk	Denmark
.es	Spain
.fr	France
.il	Israel
.it	Italy
.jp	Japan
.mx	Mexico
.nz	New Zealand
.pl	Poland
.ru	Russia
.tr	Turkey
.uk	United Kingdom
.us	United States (rare)
.va	Vatican

Commercial Online Services

America Online	@aol.com
Bitnet	@bitnet.com
Bix	@bix.com
CompuServe	@compuserve.com
Delphi	@delphi.com
GEnie	@genie.com
Prodigy	@prodigy.com

Electronic Mail Services

AT&T EasyLink Services	@attmail.com
MCI Mail	@mcimail.com
Sprint Mail	@sprint.sprint.com

Fidonet BBS Internet Addressing

ACCESS AMERICA 1:170/808

The first number indicates the zone, in this case, 1 is United States. The second number indicates the net number, which in the example is Tulsa, OK. The last number indicates the node number for the computer and if there is a point it will follow the number like 808.1 for me if I had a BBS up all the time.

The internet address is a bit different in that the numbers are written backwards.

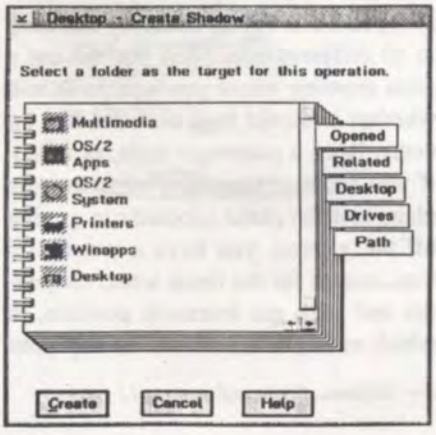
In the example: 1:170\808 my Fidonet address would be: lhargrave@f808.n170.z1.fidonet.org

Local Internet Providers Black Gold Internet Gateway - colonel.cline@bgbbs.com

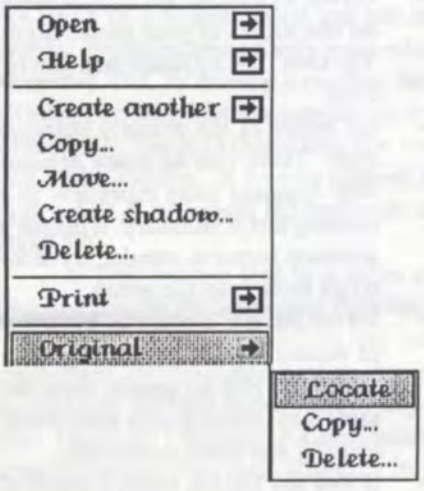
Galstar Internet Sales - mlester@galaxy.galstar.com

Although I have given you some of the most widely known addresses, there are a variety of variations depending on the person or department that you want to contact. It is very important to learn the domain name which is on the left side of the @ sign of the address.

OS/2 Tips, Tricks, and Secrets



By: Leleith Kilburn,
Tulsa Computer Society



Using Shadows in OS/2

Sometimes it is handy to have copies of an object in several different places. If the object is a file, disk space consumption and file synchronization become an issue. The shadow feature in OS/2 allows you to create copies of an object without those worries. A shadow is an object created from an original object. Any changes made to the original are made to the shadow and any changes made to the shadow are made to the original object.

To create a shadow, click the right mouse button on the original object to display the popup menu (Figure 1). Chose Create Shadow from the list. The dialog box will display the desktop folder and any open folders on the desktop as target locations for the shadow object (Figure 2). If you click on the Related or Desktop tabs, you will get a tree view of possible locations for the shadow object. Choose Path if you want to type in a specific location. Click on a location and the shadow object will now exist in that location.

There is no way to tell a shadow object from the original except for the icon text and the popup menu. The icon text of the shadow object will be a different color from the original. The color will be what you have chosen in the scheme palette. The popup menu of the shadow object will contain an additional item at the bottom called Original (Figure 3). Clicking on this item brings up a

menu with three options that act on the original object. Locate takes you to the original object. Copy allows you to make a copy of the original object. Delete allows you to delete the original object. However, if you delete the original object, you will also delete all of its shadows.

Deleting a shadow does not delete the original. Objects like the system clock and drive objects can not be copied. But you can make shadows of them and put them in as many places as you please. The shadow concept also gives you complete freedom in arranging your folders without having to worry about consuming disk space or synchronizing data files.

Book Review

Planet Internet

Review by Hugh Bayless, MBUG-PC

This book, by Steve Rimmer, is an extremely interesting guide to what's out there on Internet. Rather than just listing all of the possible Internet addresses, it gives a random sampling of what you can find and explains those samples in some detail _from Clinton jokes to ways to destroy the earth.

Ever hear of Devilbunnies? There is a newsgroup with the title "alt.devilbunnies" and if you wonder what it's all about, the author couldn't figure it out after logging onto it several times. Maybe you could do better. Want information on cats, David Letterman, Spam _ that's right, SPAM _ or the weather in China? It's all there, somewhere.

The book is well-written and very informative, but someone got carried away with the artwork and many pages have "watermark" printing overlaid on the text that makes the text sometimes very hard to read. If you are starting to explore Internet, this could be a great help in deciding where and what to explore.

Published by Windcrest/ McGraw-Hill, Planet Internet sells for $24.95.

Prodigy adds two newspapers

Prodigy recently added the Times Mirror Co. newspapers the Los Angeles Times and New York Newsday on the computer network.

The addition of these two publications brings Prodigy to five online newspapers. The others include: the Atlanta Journal-Constitution, The Dallas Morning News and **The Tampa Tribune.**

Editorial Comment:

In reference to the President's Column this month (Page 4 SIG Groups) the following article should prove to be beneficial to those of you stepping forward to lead a SIG Group. Remember, TPCUG needs you to volunteer to share your knowledge and expertise with the rest of the group. You will in turn feel a tremendous accomplishment by helping others learn about their PCs. It's not difficult, see the closing comment of the following article reprinted from the Tulsa Computer Society, and come forward to lead a SIG Today for your Tampa group!

---

10 Hopefully Helpful Hints On Presenting to a Sig

By: Paula Sanders
Tulsa Computer Society

TCS needs you! With a constantly expanding membership, the formation of new sigs, and the continuation of old ones, the need for new programs keeps escalating.

How often have you listened to a speaker and wanted to share your love of a new program or excitement with a piece of hardware but didn't think you could speak before a group of people? While you can tell all your friends about your "new find," you feel that you couldn't address a group. However, sharing your ideas with a group is much easier than learning a new program. With some hopefully helpful hints, you can become adept at addressing your favorite sig.

Everyone who has attended a sig or the general meeting knows that the audience covers the full range in knowledge from novice to expert for any particular program or type of hardware. This range of knowledge can seem daunting. But, if you will remember that there will always be someone who knows more than you do about the subject, you can use those people to help you in your presentation by asking them to answer questions that you can't. How you plan your talk, will depend on what your goal is. Hopefully, these helpful hints will help you.

- You need to know why you are in front of the group. Are you giving general information about a product, speaking about a small aspect of the product, or instructing others on how to use it?
- Since the members of the TCS Sigs reflect many levels of knowledge, you need to know how to address this problem. Address your talk to the middle range but speak to the novice and expert as well by (a) giving a brief overview of the function of the product to interest the novice in it; and (b) give special advanced tips to the experts even if these are too complicated for the beginner to fully understand.
- Do not let yourself get bogged down on one aspect of your presentation. The time flies by faster than you realize.
- Be aware of the group's attention span. There can be many reasons why attention lacks especially in a meeting that is voluntary. If people's attention seems to wander, try to interact more with the group.
- Do not just talk if possible. Make use of visuals - slides, overhead projections, etc. Not all people learn the same way. Some people learn better visually and some auditorially.
- If you are talking about a piece of hardware and how it works, try to have it available both to demonstrate on and to let people look at after the program.
- Use handouts whenever possible. These are especially useful for technical data and as a summary. Also, they can be used in the "IO Port" to inform others who did not attend the meeting. Remember, especially, if you are using visuals, it is hard to take notes in a dim room while looking at a screen. (How to write handouts will be covered in another column.)
- In your presentation, remember English 101. (a) Say briefly what you are going to say; (b) say it and give examples; (c) then, sum up what you have said. Step (b) should be the bulk of your talk. Leave at least 10 minutes at the end of your talk for questions.
- Let the audience know that you welcome questions; but do not let anyone monopolize the floor nor let yourself get side tracked. Do not be afraid to not know something about a product. Never make up an answer! If possible, have a list of sources for further information available.
- Last but definately not least, prepare your talk beforehand. Make sure, as best you can, that all the visuals work.

And remember! Have fun! Let yourself enjoy what you are doing. Everyone is nervous the first time, the second time....

If Operating Systems Ran Airlines

DOS Airline
Everybody pushes the airplane until it glides, then jump on and let the plane coast until it hits the ground again, then push again.... Repeat until arrive at destination.

DOS with QEMM Airline
The same thing but with more leg room to push.

Macintosh Airline
All the stewards, stewardesses, captains, baggage handlers, and ticket agents look the same, act the same, and talk the same. Everytime you ask questions about details, you are told you don't need to know, don't want to know and everything will be done For you without you having to know, so just shut up.

OS/2 Airline
To board the plane, you have your ticket stamped 10 different times by standing in 10 different line. Then you fill out a form showing where you want to sit and whether it should look and feel like an ocean liner, a passenger train, or a bus. If you succeed in getting on board the plane and the plane succeeds in getting off the ground, you have a wonderful trip...except for the times when the rudder and flaps get frozen in position, in which case you have time to say your

See **Airlines...***Continued on page 11*

Airlines...*Continued from page 10*
prayers and get yourself prepared before the crash.

Windows Airline
The airport terminal is nice and colorful, with friendly stewards and stewardesses, easy access to the plane, an uneventful takeoff...then the plane blows up without any warning whatsoever, your luggage however arrives at your destination.

NT Airline
Everyone marches out on the runway, says the password in unison, and forms the outline of an airplane. Then they all sit down and make a whoosing sound like they're flying.

Unix Airline
Everyone brings one piece of the plane with them when they come to the airport. They all go out on the runway and put the plane together piece by piece, arguing constantly about what kind of plane they're building.

NeXTSTEP Airline
The trip is the reward. All the stewards, stewardesses, captains, baggage handlers look great, stylish and friendly. Airline engineers design in no time the custom plane you need for your trip which is built with spare parts from other airlines planes in their factories. This follows a bold move in which its CEO, considering that in fact the "box" does not generate revenue, decided to close his high-tech plant producing black boxes. Your are still buying tickets despite rumors in the press pronouncing the airline dead for the past 3 years. 🖫

The Value of Owning a Modem

By Greg Eden, Melbourne PC User Group, Inc.

No, this is not another article on the Information Superhighway or the Internet. People often ask me why I own a modem. The question to me is--how can anyone survive without one?

A vital use is to keep up-to-date with software patches and drivers. Do you own Norton Utilities 8?. The magazines would have you believe that you cannot use NUS and Windows for Workgroups 3.11 with 32 bit file access. But if you dial into the Norton BBS you can get a patch to overcome that problem, and it works. I am a hobby programmer and I use Symantec C++ 6.1; did you know there is a 6.11 upgrade? I do, because I have a modem. For programmers there are gigabytes of source code waiting at the end of the phone line. Through the Internet and local BBSs you can have access to Dr. Dobbs and PC Magazine source code. At Microsoft sites there is a staggering amount of information, patches and source code.

I recently started using Maestro 288FM Executive modem. This is a V.Fast 28,800 pbs modem. It is upgradable to V34 when this new 28.8 standard is ratified. Do not buy a 28.8 modem unless you can upgrade it to V34 or you will be left with an orphan. Problems immediately arose when I tried to run it faster than 19,200 bps under Windows. But, by owning a modem, the solutions were out there to be found. I use COMMit communications program (a commercial version of the shareware program Microlink). The READ.ME files that came with the software were helpful, but only part of the solution. It became obvious that what was needed was a 16550AF serial port. AVLB IDE multi I/O card with dual 16550 serial ports can be purchased for about $70.

This solution lead to a series of problems. A quick peruse of the Maestro message area on the Melbourne PC User Group BBs and I find there is a bug in Windows. The line in SYSTEM.INI that reads Com2FIFO=TRUE should read =1--Ok, easily fixed, and the system now smokes along at 28.8, **but** it now intermittently freezes up, and only the reset button frees it. My first thought was that the new I/O card was a dud. However, I discovered a replacement serial .386 driver; it is a bug fix to stop the system hanging when there is already data in the FIFO buffer.

Admittedly these modem-obtained solutions were for a modem problem, but the principle is the same for all computer problems. Message areas and newsgroups provide an invaluable source of information on virtually any topic. Without a modem you are in the dark. Most software companies have a BBS and the phone number is generally in the manual. Borland, Microsoft and Symantec all have BBSs in Sydney and they are chock full of patches, fixes, and updates. Without a modem you would never know solutions to your problems exist.

There is a downside to owning a modem. Time wasting. It can take a lot of time to search through newsgroups and download files. Also the best times to ring are late at night, or early in the morning, when everyone else is asleep.

Now that I have solved my Windows comms problems I am about to switch to OS/2--just as well there is a mountain of information out there at the end of my phone line, as I feel I am going to need it. 🖫

Software Review:

Communications Suite from Delrina

Review by: Paul Perdue, CSRA Computer Society

This is a communications package that contains three different programs. There is WinFax PRO which is the world's best selling fax software, WinComm PRO which is a new, powerful and easy to use communications interface and Delrina Fax Broadcast Service, which, for a small price can send a single fax to hundreds of people around the world. These applications that will allow you run fax and other communications at the same time without causing port conflicts. First, we will look at what is required to run, and then we will look at what the programs will do.

WinFax PRO requires 640K of conventional memory, at least 2MB of extended memory, 3MB of hard disk space and a floppy drive. You will also need a Windows supported printer, mouse, Windows 3.0 and DOS 3.1. Next, WinComm PRO needs 640K of conventional memory, 4MB of extended memory, any modem and 3MB of hard disk space. You will also need a floppy disk drive, mouse, Windows 3.1 and DOS 5.0. For Delrina Fax Broadcast, you must have Winfax PRO and WinCom Pro installed but not running. You can install them individually or use the master program to perform a minimum, full or custom installation. The selection you make depends on how much hard disk space you have. The users manual also lists the recommended configuration which will enhance the performance.

WinFax PRO is Delrina's full featured fax program that comes with over a hundred witty cover page designs. Furthermore, you can create your own art work with the internal Cover Page Designer or use your own drawing tools to make your company logo or personal cover page. Phone numbers for FAX recipients can stored in the new and improved phone book. It features the ability to store your notes, billing codes, country and local area codes, send single and multiple document faxes. You can send a single document fax from any Windows application or assemble various documents and send them as one fax directly from WinFax PRO. Documents can also be scanned and saved as a fax attachments.

WinFax PRO also allows you to receive faxes in the background while you continue to work in other Windows applications. You can configure the program to receive faxes automatically and notify you when they have arrived. A fax that has been received can be viewed page by page or you can look at an overview of all the pages. There is also four levels of magnification under which, you can flip or rotate fax the pages. The send and receive logs maintain records of all your faxes. Reuse events to resend or forward a received fax. You also can schedule faxes to be sent out automatically during the day or night to take advantage of lower phone rates. It has that make it easy to use. Any application is only a couple of clicks away with drop down menus and colorful icons. If you really get stumped, a two hundred and fifty page manual and a two page Quick Reference card is provided.

WinComm PRO is a communications interface that can communicate with mainframes, remote PCs, e-mail services or bulletin boards. It has drop down menus and a button bar across the top. There are several icons representing many popular communication services including, CompuServe, Genie, Delphi, Dow Jones and MCI Mail. All you need to do is double click on the icon and have your Master Card ready. If you don't feel comfortable with the icons, you can change the layout so the BBS information is in table format. To add entries to the phonebook just click on NEW and enter the information. Click on "open" to open a new session with the icon that is highlighted. Another convenient characteristic is the ability to drag files from the File Manager and drop them into WinComm. Rather than typing long path names, you can drop a file on "send" to upload it to a bulletin board. The program also has a scroll back feature that let's you read previous screens that are held in a buffer. You can use this feature after you have logged off. Just use the scroll bar on the right side of the screen to review your latest session. If you see something you would like to save, just click on capture and the information will be placed in a file or click on print to print as it is captured.

When I first started reviewing this program, I felt more comfortable with PC Plus (my DOS based communications program). However, the more I used this WinCom PRO the more I liked it. It has a bright and colorful screen and all functions are only a couple of clicks of the mouse away. The only draw back that I can find is how small window where your communication session takes place. PC Plus uses a full screen, unfortunately, with WinCom, there is a half screen window. I suppose I'll have to breakdown and buy those glasses to read the small type. The third program is geared toward the business user. Fax Broadcast allows you to setup an account with Delrina. When you have an important fax to send out, you send it to Delrina and they will transmit it to hundreds of people at the same time. This will save you money and the time it takes to send hundreds of faxes.

Delrina Communications Suite Delrina 6830 Via Del Oro Suite 240 San Jose, CA. 95119 Phone (408)363-2345 Price-$129.00 .

HAPPY HOLIDAYS!

FRIENDS OF THE USER GROUP:

We acknowledge the following firms for their support:

- CompUSA
- IBM
- PC Warehouse
- Custom Computer Wholesale
- Sunrise Computer Supplies & Parts
- Brainchild Computer Distributions, Inc.
- Realtron - Appraisal Magic

We also acknowledge the following national software vendors for their excellent demonstrations and contributions of evaluation software to our group.

- Access Software
- Adobe Systems, Inc.
- Borland
- Corel Systems
- Grolier
- Knowledge Advenenture
- Microsoft
- Symantec
- Traveling Software
- Wordperfect

WELCOME NEW MEMBERS!

Wayne Beurnier
Bob Guentner
Arjay Morgan
Richard Morris

WE ARE HAPPY TO HAVE YOU IN OUR GROUP!

MEMBERS HELP-LINE

The following phone list is provided for our **Tampa PC Users Group** members in an effort to establish local support for those frustrating times which we have all encountered while using our PC's. Please note that these are members that have volunteered to help you, treat them in a courteous manner. Be sure to ask if it is convenient for them to help you now, or if you should call another time. It would also be helpful to have your documentation and have it handy when you call. *(Don't expect help if your software is an illegal copy or you do not have documentation!)* **TPCUG** is not responsible for the information or advice provided by volunteers. Volunteers may or may not be experts in the subject matter. You are on your own with any advice received. Be aware also that some of these volunteers may be consultants in their area of expertise. If you are interested in volunteering to answer members questions, either leave a message on the BBS or fill in the forms provided for this purpose at the meetings.

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII file or in a commonly available word processor format, such as WordPerfect 5.2, or Ami Pro 3.0 on diskette to the editor at 9402 Hidden Ridge Place, Tampa, Florida 33637 or send it by modem to BBS (813)239-3704.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

The use of trade marked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted at the following rates:

	1 month	3 months	6 months
Full Page	$60.00	$162.00	288.00
Half Page	$40.00	$108.00	$192.00
Quarter Page	$22.00	$60.00	$106.00
Eight Page	$12.00	$33.00	$58.00
Business Card	$10.00	$27.00	$48.00

All advertisements must be prepaid by check payable to TPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if it is not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, Marylee Bruneau at (813) 985-3338, for space availability and for further information.

Secretary's Report

MINUTES OF 12/14/94 MEETING
and Personal Comments by
Jim Clark, Tampa PC Users Group

Another important meeting for the TPCUG, with elections taking place for the five elected positions on the Board of Directors. And there was a good turnout for this important event, as well as for a fine presentation by a very popular software vendor Broderbund.

USER GROUP NEWS — A foul-up by the Ybor Campus staff, who had just closed the campus that day for the holiday season and hadn't made arrangements for our use of the facility, caused a delay in the start of our meeting, cutting down the time available for user group and industry news.

➧ **SECOND BBS PHONE LINE IN OPERATION:** Thanks to the donations received so far in the adopt the BBS campaign, the generosity of an anonymous donor of a 14.4 modem, and an offer by REALTRON (the host site of our BBS) who is allowing use of an existing phone line for the BBS, paying only the monthly phone bill, our second line to the BBS has been put into operation and is now available for all MEMBERS. This line, 237-4997, is reserved exclusively for members in good standing. Harvey also called attention to the how-goes-it chart in the newsletter which shows the generation of funds still far below that needed to upgrade the BBS with more file space and other improvements. He emphasized the importance of supporting the ADOPTBBS fund-raiser if we are to realize these improvements in the BBS.

➧ **NEW SIGs BEGINNING:** Harvey announced the offer of one of our members, , to host two SIGs at his business facility near the intersection of Anderson and Waters. Mr. Hodges is also making available for these SIGs his computer equipment Plans are already under way to begin an Internet SIG in February; final plans will be announced at the January general meeting; reservation will also be open at that time. Space will be limited to 20 people for each class.

Harvey also solicited people to lead other SIGs, such as but not limited to Windows, DOS, communications, or any of the many popular software applications, to name but a few. One need not be an expert in the SIG subject, but need only have an interest in it and be able to guide the learning experience for all. If you have an interest or would like to discuss the matter further, please contact Harvey.

➧ **ELECTIONS:** Harvey announced the names of the members nominated for the five elected positions on the Board of Directors and opened the meeting to additional nominations from the floor. Receiving none, Harvey proceeded with the election and issued guidance on completing the ballots which had been provided. The ballots were collected and counted, producing the following elected BOD officers who will take office in January:

President:	Harvey Bruneau (incumbent)
Vice President:	William LaMartin
Treasurer:	Tom Cone (Incumbent)
Secretary:	Bruce Register
Member At Large:	Connie Kincaid

See **Minutes** *Continued on page 3*

Minutes.. *Continued from page 2*

Congratulations to you all. We are confident that you will do an excellent job for the TPCUG.

INDUSTRY NEWS:

INTEL PENTIUM CHIP: The bug in Intel's Pentium chip has received a good bit of publicity lately. Intel says the bug has been fixed and all of their new chips do not have the flaw. They also say there has been a big to-do about nothing, that the probability of anyone having trouble with the chip is negligible, that there is no need to replace them, and they have no plans to do so. They will, however, replace the chips for anyone having trouble. Informally, word is that they will replace the chip for anyone requesting same, but it may take a while since they are well behind the demand for their Pentium chip.

PRESENTATION — BRODERBUND

Tad Brickson, Southeast Sales Representative for Broderbund Software, Inc., was kind enough to make a presentation for us on some of the Broderbund software. Tad noted that Broderbund had some 147 software titles, categorized into three broad categories — productivity, education and entertainment. However, he wisely chose to limit his discussion to an overview of the company and a brief review of 4 or those titles. Sitting here writing about Tad's presentation, one thing seems to dominate my thoughts — consistent with all four programs is that they seem to be very easy to use; a bit like a multiple choice test where all the answers really are good answers and you can't go wrong.

PrintShop 2.0 for Windows: This is probably the best known and most popular Broderbund title and it is a really good one. I have used Print Shop Deluxe for DOS and Windows, both of which are fine programs. But, Print Shop 2.0 makes major improvements, adding labels and business cards to the list of things one can create in the other programs — greeting cards, signs, banners, letterheads and calendars. Even more emphasis has been placed on user friendly — and it is truly easy to use — while adding significantly to the text, graphic and layout template options available, and including the capability for almost unlimited user control of all of these. It would be tough to dream up a creation in any one of the categories of documents that Ver. 20 is designed for that one couldn't produce in minutes, selecting only from included layout options; the toughest part would be you determining what words you wanted to say in the document. Ver. 2 will handle a variety of graphic formats PCD photos, and it provides the capability to print out in any density now available in popular printers or expected to be available in the foreseeable future.

Print Shop 2.0 for Windows is available on floppy disks and CD-ROM. Both have the same program, but the CD-ROM version includes more goodies than the floppy version - 73 versus 30 TrueType fonts, for example, and some 1600 pieces of clipart, and 25 PCD photos. The floppy version has a good supply of clipart, though well short of the CD-ROM, and no PCD photos. The CD-ROM version also includes Print Shop Companion. Originally conceived as a program for youngsters, Print Shop has evolved into a powerful, very flexible program suitable for all ages and purposes, including business.

Math Workshop: An example of the education category, Math Workshop is a program designed for younger kids. It does an excellent job of teaching in an entertaining way. Like Print Shop, this program is very easy to use, yet contains a wide variety of options. The graphics are well done and entertaining, even for adults. It provides a number of different levels of difficulty and several different approaches to the learning of math.

3-D Home Architecture: Another example of a productivity program, 3-D Home Architecture shines above the other programs in its category that I have seen for its power, speed and ease of use. Home Architecture is very easy to use, almost intuitive. It is well laid out, fast and very powerful, allowing switching between 3-D and 2-D views and between 3-D views quickly and easily with a click or two of the mouse button. Imagine a house suspended in air, for example, giving one the ability to view the structure for any angle, including from underneath — that is the kind of capability built into Home Architecture. Unlike other programs I have seen, this program will create a useful list of construction materials. Tad was using a 486/33, with a mathco, for the demo. As fast as the program operated on that machine, I would judge that it would operate fine on a 386/25 or better with mathco, but may be a bit tedious with lesser capabilities. A mathco is not a criteria, but because of the very large amount of complex calculations that take place, it makes a big difference in how fast the program operates.

Myst: Tad informed that this is the best selling entertainment software in the industry today. It is an impressive program, for sure, with stunning graphics. Tad was able to do little more than demo the graphics in the program, however, but reported that it could be addictive in that once you get started it may be difficult to stop. One of our members who had tried the game confirmed that it is very fascinating and hard to quit.

Tad, thanks very much to you and Broderbund for an excellent presentation and the opportunity to view some of your great software programs. We will look forward to seeing your updates to these programs, and perhaps an introduction into some of your other programs.

AND THE WINNER IS

Thanks to the generosity of Brainchild Computer Distributions, who donated Fox Pro 2.6 for Windows, and Broderbund who donated the rest of the door prizes, there were several very nice door prizes. Those among us to have the good fortune to win are:

William LaMartin -	Garden Plant Selector
Kelly Saunders -	CNN Time Capsule
John Whitmer -	New Car Buyers Guide
Merle Nicholson -	Plumbing Essentials
Jenny Lind Olin -	Royal Flush
George Jurado -	FoxPro 2.6 for Windows

The meeting adjourned at about 8:40 PM.

President's Column

I certainly hope that each of you had a great holiday. Although our last meeting started out on a different foot than usual, it turned out great. I want to thank some folks for the successful meeting. One is Tad Brickson of Broderbund Software and of course the HCC security guard who went out of his way to help me find two overhead projectors. But mostly, I want to thank each of you that attended. It was one of the best attended December meetings in several years.

Additional thanks for electing me into my sixth year as president. I believe that I am know eligible for TPCUG retirement benefits.

1994 was a very productive year for our group. We were classified as 501(c)3 non-profit group by the IRS. We finally got bulk mail going and got a bulk mail permit. Our newsletter contained more articles by our own members than ever before. Over 600Mb of additional storage was added to the BBS. Additionally, a second phone line was added. Our first SIG (OS/2) was started. A members help line service was implemented. All of this was accomplished by the hard work and donations of the Board of Directors and members.

With all that accomplished, some may wonder what's left for 1995. Well, while we have not yet had our first board meeting of 1995, I have some goals.

1. The creation of additional SIG groups, Internet and MS Access, are a good start, but we will need more of them. These SIG groups are a must and provide a valuable educational service to members with specific product needs. SIG groups require a place to meet, a PC and a leader in order to function.

2. An active membership of 300 by November. A larger group means a richer pool of knowledge, more volunteers and more benefits to us all. A membership drive can help, but would it not be simpler if each one of you committed to signing up one new membership in 1995. Certainly you know a family, friend or co-worker that would benefit from our group.

3. Involvement in our community. With all the PC k nowledge and expertise that our group has, there must be a project that we can implement and manage to help our community.

4. The creation of an electronic newsletter. This will be done using Adobe Acrobat allowing us to post the newsletter on the BBS or any similar medium. The layout and formatting of the paper newsletter would be maintained allowing anyone to read on-line or print it as it looks when mailed to you.

These are only a few of the goals I have for 1995. There will be more. Each of you can contribute to many of these goals. Ask yourself how you can help. If you draw a blank call me and I'll help you decide. Why not renew your membership for several years instead of one. Donate equipment that we can use either for our group, a community project or sell at our bargain table. We can use a 28.8k modem or a 500Mb HD for the BBS. Old computers can be used for our SIG classes or installed in the community. Bring in that old stuff and help us out. Remember your donations may be tax deductible.

1995 Officers

The December meeting included the elections of the 1995 officers. Please join me in welcoming the new board members, William LaMartin, Bruce Register and Connie Kincaid. Of course I will miss the parting board members, Jim Clark and Al Poole. Read the secretary's, Jim Clark's, last report for the details of the election results. Please take the time to thank Jim for his contributions to the group. While we are losing our vice-president, Al, he will continue on as CO-SYSOP with Kevan Sheridan on the BBS.

A previous board member is rejoining us in a new role. I am pleased to announce that Ed Buzza has accepted the position of Advisor to the Board of Directors. The views and opinions provided by Ed will help the Board of Directors (BOD) to make more informed decisions. Other appointed officers include the return of Marylee Bruneau (Editor), Al Poole (CO-SYSOP), Larry Anders (Librarian), Kevan Sheridan (SYSOP) and Tom Cone (Membership Director). While it looks like we have a full compliment of officers and volunteers we can always use more. For now we need someone to take on the responsibility of membership director which Tom Cone currently occupies. Tom will focus on his Treasurer position once someone assumes the membership position.

SIG Groups

I am very pleased to announce the addition of an Internet SIG group. This group will be limited to 20 members and will be opened to enrollment very soon. Additional information will be posted on our BBS as it becomes available. The formation of a Microsoft Access Group is also in progress and should be ready in February. We also have the opportunity to create another SIG group as soon as we find a topic and SIG leader. But don't forget that we have an OS/2 SIG group run by John Lucas. Those of you getting into OS/2 WARP should attend this SIG. In all, we will have four SIGs by the end of the first quarter.

Harvey Bruneau

KEEP IT COMING! Bits of Blue is mailed at bulk, non-profit rates. Such mail is not forwarded, we must depend on you to let us know when your address changes. To keep **Bits of Blue** coming, be sure we have your current address. Thanks

Software Review

Video Director, version 2.0

By Gold Disk Inc.
Review by: Katherine M. Powell, Tampa PC Users Group

"Lights! Camera! ..." well, you know how it goes. And if you shoot any amount of video you also know that you end up with waaaaay more footage than you or anybody else would care to see. That's normal. So, if you want to make more viewable tapes, you need to leave some of those shots of your feet and the ground on the cutting room floor.

Video editing has been around since video recording started, but most of the tools affordable by the casual videographer are hardware components, like edit controllers, mixers and titlers. Even with more software starting to make the scene, most packages are for morphing and special effects and are at least $500.

Video Director is more affordable ($200 or less) and does the job of the hardware components I mentioned. And you cannot buy those components for what this package costs. It basically acts as the controller between the source deck (the deck you're copying from) and your record deck (copying to). There is a special cable, the SmartCable, that comes with the software and connects these decks to the serial port. The software provides a way to document segments or clips of the videos in a database and manipulate the information to create your final masterpiece.

Sounds easy! Well, before you run down to you local software superstore, be aware that there is still a good deal of setup, tweaking and commitment involved. This is not plug and play stuff. First you will need at least a 386 16Mhz PC with a minimum of 2MB RAM, a VGA monitor and running Windows 3.1 or higher. I ran it on a Pentium 90 system with 8MB of RAM and 2MB of Video RAM, so I wasn't testing the lower limit. Then you will need an available serial port. And you will need two (2) VCRs, either decks or camcorders or a combination of the two. Of these, one deck will need to be infrared remote control equipped and there needs to be a set of video and audio cables connecting the two decks. A TV monitor that is connected to the record deck will be needed to view the footage. Finally, one deck will need to be LANC compatible or have some edit controlling jack. This is a biggie. Most Sony products or 8mm camcorders will have this feature, though.

Still ready to run out and buy it?

Installation was easy and without incident. "Good, I'll just slip the tape I want to edit into the Sony camcorder, plug in my cables and set up my record deck. My record deck? It's over by the TV. Hmmm." If you have a camcorder, location is no problem, but unless your computer is within a few feet of the VCR by the TV, you either have to move that deck or have another VCR. You would almost have to be a hobbyist to have that equipment setup. Add one more thing to that list above.

OK, let's get to the software itself. The Windows based screens impressed me right away. I did notice a few places where part of the window didn't always refresh after another window was active over top of it, but in general they were easy to understand and they guided me through the steps I needed to complete the process. There are windows for the source and record decks, for logging clips and for editing and creating a tape. The menu bar at the top has three buttons for steps 1, 2 and 3. Selecting these buttons in order arranges the workspace with the appropriate windows for that step and walks you through the needed information.

To begin editing, get your popcorn out and watch the tape on the source deck. Now, don't get butter on the mouse! You wont have any need to touch the video equipment once you put the tapes in your decks since the SmartCable gives you complete control at the computer. While you're watching, you will be selecting the clips you want to keep and making any notes about them in the clip window. This takes some playing with to fully understand what information will be useful later. Fortunately, the manual that comes with Video Director is pretty easy to understand and helpful.

"I have all the clips selected, so now I'm ready to make the tape, right? ". Hold on. A true masterpiece requires careful editing even after you choose what's hot and what's not. Step 2 provides an Event List window or storyboard. You can include all or some of the clips you've just picked, add effects (add more hardware to that list we started) and rearrange the order. You could add titles or sound or computer graphics at this step with additional hardware. I priced some video capture boards and computer output to video boards that were needed to do any additional effects and found them costing $300 and up. My imagination was reasonably priced at free, so that will do for effects now.

The clips have beginning and ending tape locations logged, so when you choose Step 3 and pick 'GO', it takes all the information you've compiled and begins making an edited tape for you. Really. This part was fun! I sat back and watched the source and record decks go back and forth between play and fast forward, record and pause. And the popcorn went faster now. I had two free hands!

It was a far less than perfect answer to my editing needs, but the price makes up for that quickly. I would like to see more software that followed this example and more video equipment being built ready to interface with computers. "That's a wrap!"

Magic Theatre - Windows/CD-Rom Version

Review by: Renate Marsh, Tampa PC Users Group

Are we and the children ready to create our own movies with our computer? We certainly are and Knowledge Adventure/Instinct Corporation Software is here to help us along. This software is a Magic Theatre once you got your creativity going to develop, narrate, and animate your own computer movie. It is a program for children ages 6 years & up, but what can I tell you - I must belong to the "UP" group since I created all kinds of movies and had as much fun as any child.

By the way, Magic Theatre is the first program that allowed me to hear my own voice come out of my computer. Now I do know I still have a German accent after more than 20 years residing in the good, old USA. Magic Theatre is fascinating. Not only can you record your own voice and music while you create a movie on the screen, but this program has so many props in a special library to be used and interchanged for your movie ideas. Here you have background sceneries, all types of animated characters and music to choose from, drawings, painting tools and sound effects.

The setup to move around in this program does require a mouse. All that is needed to get going is to click on the icons around the outer frame of the screen. Click with the right mouse button on any of the little icons and you will hear a help voice that tells you what this icon has in store for you. You have no problems to create your own movies within a few minutes after you installed Magic Theatre on your computer. It took me a little while to get my music going within this software, but the little manual that comes with this software told me how to go into Windows to set up my MIDI driver and MIDI Mapper to hear music. It also has some great magic tips for movie making. There is quite a difference in drawing a picture and be done with it or creating a continuous moving pictures with sound.

I cannot wait to try this program out with some of the children at church. I can see already how they take over my computer for the day. Children do like to use their artistic skills, voice, and drama to tell their own story and present it to an audience. Magic Theatre allows them and us to do it and the results are very amazing, and the movies are created with such ease within this program.

Every time you start Magic Theatre, it presents different types of mini-movies to show you what this program is capable of. It is a delight to watch every one of them and you are inspired to use your own imagination and drawings to create a movie.

The program Magic Theatre came with a free microphone (a $29.95 value as an introductory offer). It needs Windows 3.1 and up, Sound Blaster or compatible sound card. 4MB memory, 256 SVGA. CD-Rom requires 4M storage, floppy disks require at least 18M of storage space for the big library of props that come with Magic Theatre. Using narration the movie production requires 600K of hard disk space per minute, without narration 5K are needed per scene. Since Magic Theatre is a Windows environment program and needs all the space it can get while running, it is best to close all your other applications. Though, the program makes sure they and the Task Manager are disabled while Magic Theatre is running. This protects any of your other data and makes this program run smoothly.

Book Review

Making Movies With Your PC

Prima Publishing
By Robert Hone and Margy Kuntz
Second Edition, 272 pages, Illustrated, $24.95
Review by: Harry Ludowise, Portland PC Users Group

This book explains how you can edit, and display digital video on your computer, using some additional hardware and software. Because the quality of your finished video depends on the quality of your source material, scripting, lighting, and camera work are discussed as well. The book gives fairly comprehensive instructions for video editing using "Microsoft's Video for Windows" and "Adobe's Premiere," but the hardware and software for these programs is expensive and most likely will cost more than your computer did.

The book is divided into four parts. Part I, "Video-editing Basics," includes the first five chapters and is primarily about the mechanics of editing although some camera work is included.

During editing, the picture will not be the same as the one you are accustomed to seeing on your television set. Video consumes an enormous amount of memory. For example, one second of normal video takes up 9.2MB of memory. In order to make it practical to work with a reasonable length of video on the average computer, three techniques are used. The first, data compression, can reduce the memory needed for a second of video from 9.2MB to 500K. The second technique is to drop frames. Normal video contains 30 frames per second. The software described in this book will typically eliminate 40 to 50 percent of the frames. The third technique is to reduce the information needed to create the picture. This means the picture quality will be reduced to the point that it must be viewed on a small portion of your screen. The authors recommend about 1/16 of full screen or 2.5 by 2 inches.

When the editing is completed, the final step is to save the video to its final form. The picture quality and the missing frames are restored, and the dissolves

See **Movies...***Continued on page 7*

Movies... *Continued from page 6*

and special effects are assembled for the first time. This can be a slow processes, taking several hours for a short video. The finished video may then be viewed on your PC or transferred to ordinary video tape for viewing on a VCR.

Making a satisfactory video involves much more than the mechanics of editing. Therefore, as you might expect, more than half the book covers camera work, lighting, writing scripts, and editing for effect. For example, Chapter 3, "The Picture Tells the Story," explains the various types of camera shots and when to use them to create the desired effect.

In Part II, "Into the Cutting Room," chapters 6 through 10, the authors get into the real work of editing. In this part they explain how to use the camera together with editing to express ideas and tell stories. For example, Chapter 6, The Grammar of Visual Storytelling," the authors show how to analyze a film, and how to create continuity using only a single camera. Two simple projects are discussed in this section, producing a group discussion video and a sales demonstration video. The authors demonstrate how to prepare a simple script, called a paper cut. The paper cut allows you to recognize potentially boring sequences, and other faults early enough in the project to figure out ways to eliminate them. The proper use of music and special effects are also discussed in part II.

Part III "Becoming a Professional," chapters 11 through 14, covers sound effects, lighting, and advanced camera work. The emphasis in this part of the book is on the use of the camera.

The last section, Part IV, is a series of appendixes, which lists recommended books and magazines for additional information. There also is a list of manufacturers of video editing equipment, and a glossary.

I recommend this book to anyone who has a camcorder and who wishes to learn better camera technique. It would also be useful to anyone thinking of editing video or film. Roughly a quarter of the book is devoted to editing with "Adobe Premiere" and "Microsoft Video for Windows" but the editing techniques described would have some value to anyone editing video. Unless you are serious about making video, however, the book is not for you. It does not discusses computers except as useful tools for editing video. Prima Publishing, 1994; PO Box 1260BK, Rocklin, CA 95677-1260.

Software Review

PC911 Version 1.0

Review By: Jim Clark, Tampa PC Users Group

What It Is: The name appropriately indicates the function of the program — created by Cybermedia, Inc., it is a rescue program designed to keep track of the critical configuration and boot files of your computer and create and maintain an emergency boot disk that will permit you to boot your computer from a current boot floppy in the event you have difficulty booting from your hard disk, restoring the critical files on your hard disk in the process. It also maintains a log of configuration changes, thereby giving the capability to revert to a previous configuration easily. PC911 can detect many of the cards installed in your computer and report potential conflicts found if more than one peripheral is set to use the same IRQ, DMA, etc., offering alternative settings to avoid the conflict. While PC911 automatically backs up and monitors critical Windows files, and will restore these files when needed, it is a DOS program and operates only in DOS.

PC911 does these things by collecting and storing in files the configuration information about your computer and backing up critical configuration files at the time of installation. It also creates an emergency boot disk containing all the critical files and configuration information to boot your computer in its normal configuration and restore damaged files on the hard disk. It can operated from the DOS prompt, or at the time of boot through an entry in the AUTOEXEC.BAT file; the latter would seem the way to get the most benefit. Since PC911 is not a TSR program — it does its thing and then closes down, having updated, as necessary the critical configuration information/files it monitors — and therefore does not consume memory. The only evidence you see of it working are statements at the end of the boot process showing that it has done its thing, or a screen identifying a change or problem if one is found.

Does it slow booting down? Yes, but only very slightly — about 2 seconds — unless it detects a configuration change and you have selected to have the program report all changes to you and/or the emergency boot disk needs to be updated. It will then call the change to your attention and offer an opportunity to make note of the reason for the change before it records the changes to its backup files. It will also offer to update the emergency boot disk if any changes have been made in the boot files (CONFIG.SYS or AUTOEXEC.BAT).

PC911 can be customized to your particular needs and desires, and provides several useful utilities : Reports IRQ/address uses of existing cards and allows direct entry of the same info for any cards that PC911 cannot detect; can report unused IRQs and DMAs; allows review of prior configuration files and/or restoration of anyone of them as the active file; provides for user selection of any other files for monitoring and automatic backup by PC911; will warn at boot of low memory and/or disk space, if desired, when either is below values selected by the user; includes a system information utility that will provide data about the computer's hardware and operating systems. In addition, PC911 can be used in PCs connected in networks, with the backup data stored on either the server or the PC.

All well and good — it doesn't take any memory, it doesn't significantly slow the boot process, and it does automatically a lot of very nice things for me. What are the drawbacks? No major ones that I can see, unless one expects too much from the program. For example, I

See **PC911...** *Continued on page 8*

PC 911...*Continued from page 7*

have an unknown problem in my computer that causes the mouse and/or keyboard to become inoperable at irregular intervals, requiring restarting Windows as a minimum, and sometimes rebooting the computer. I also have problems using the LPT2 port. PC911 has not identified a problem or conflict. That is to imply that PC911 is limited to what it says it is — a boot rescue program and not a PC trouble shooter. Though it keeps track of IRQs, DMAs, etc., and may help identify conflicts for cards you add to your computer, its principal purpose is boot rescue

Installation: Simple, clear cut and quick. PC911 comes on one 3.5" HD floppy. Insert the floppy in the appropriate drive, type "PC911" at the prompt for that drive, and you are off and running. Other than PC911 prompting to accept or change the location to which it will install itself, PC911 does everything automatically.

Documentation: The small owners manual is comprehensive and clear regarding loading and use of Print Cache. The explanation for using all of its features is clear and adequate. There is no on-line help file, but instructions are provided on each screen. Technical support is free, but is available only via regular long-distance lines.

Requirements for PC911 are minimal: Any IBM-compatible PC, MS-DOS 5.0/PC-DOS 6.0/Novell DOS 6 or above, and 800K of uncompressed hard disk space. Yes, it is compatible with major popular disk compression programs, such as Stacker, and will monitor, backup & restore critical INI files for those programs. Program files use about 525K of disk space; the remaining space is needed for backup.

Cost: PC911 is not readily available locally. In fact, you will likely have to order directly from the Cybermedia or special order through one of the local software outlets. Cost via special order is about the same as the MSRP - $59.95.

My View: A useful utility program, especially for those fairly new to computers. At $60, however, it seems a bit expensive in today's software market. Perhaps a better price could be obtained dealing directly with Cybermedia. For additional information, contact:

Cybermedia, Inc.

Printing Halftones and Gray Fills

By Richard Leonetti,
Portland PC Users Group

Understanding dots-per-inch (dpi), lines-per-inch (lpi) and your printer.

For most graphics work, we do our fills, include our photos and print it on our laser printer without a second thought. Then one day we want to send something "out" to a different printer, maybe because it is in color, or a larger size than our printer handles.

Suddenly, we are confronted with understanding dpi's, lpi's and gradient fills on the "outside" printer, or worse, get back an expensive print done "outside" and it looks different than we expected.

To improve my results I decided to study these variables, and this is what I found.

Historically the printing trade has created half tones and grays photographically by overlaying a dot screen on the image. The grays were broken into uniformly spaced small dots, using larger diameters where the image was darker and smaller ones where the image was lighter. The uniform spacing of the dots was called screen resolution and is measured in "lines per inch."

With desktop publishing, that process has been eliminated with output going directly to a laser printer or imagesetter. Because these printers produce dots of uniform size and spacing, shades of gray (or color) can only be produced by turning on and off some of these much more closely spaced black dots.

Authors of books and software manuals often assume that a square area of printer dots is manipulated to produce the equivalent of the changing size photographic dot, and hence a shade of gray. Often this formula is shown:
(printer resolution [dpi] ÷ screen ruling [lpi])2 + 1 = printed shades of gray
For a 300 dpi laser printer, at the standard 60 lpi, the formula yields 26 shades of gray. The logic is that a 5-by-5 group of printer dots, manipulated in all possible 25 combinations, plus all white, yields 26 combinations or shades. 300 printer dots, divided by groups of 5 is the 60 lpi.

The software print driver is the program that tells each printer where to put the dots. Testing this process, I printed a variety of test grays using a NEC 95, 300 dpi printer. For print drivers, I used a PostScipt and HP III driver supplied with windows 3.1, and a different PostScript driver that came with PageMaker 5.0. Instead of the 25 grays expected both PostScipt drivers gave me 32 shades of gray (plus white) and the HP driver 64 shades of gray (plus white). At "60 lpi" all three drivers used a of 4-by-8 grid of print dots arranged like figure A. To darken the gray, the driver first fills a 4-by-4, offsetting the grid by four on the next line. The horizontal and vertical "dot spacing" is 37.5 per inch, but the dots really are nearer on the diagonal giving 53 lines per inch. So even though the software says I want printing at 60 lpi, I'm actually getting only 53 lpi in return for a boost in the number of gray shades from 25 to 32 plus white.
For this 4 by 8 grid, the math is (300 ÷ 4) ÷ 1.41 = 53 lpi.

The HP driver delivers 64 shades of gray from the same 4 by 8 grid by a small non uniformity. Instead of adding one small printer dot to each larger group of dots for the next darker shade, it achieves an intermediate shade of gray by adding a single dot to every other horizontal row, then balancing it up on the next darker shade.

Carrying this scheme on, you can calculate the PostScript driver, a 300 dpi printer and a 7 by 14 grid will give 30 lpi and 98 grays plus white. And that is what happened when I used 30 lpi.

Although I did not test this, it likely that for a 600 dpi printer, the default 85 lpi setting uses a 5 by 10 grid

See **Printing**....*Continued on page 9*

Printing...*Continued from page 8*

and yields 50 shades with PostScript and 100 shades with the HP scheme, plus white. Try your print driver—printer combination to find out.

It is important to understand the number of grays the printer can produce so you can anticipate the "banding" you will experience in large gradient fills. For example, at 60 lpi with 33 shades available including white, a gradient fill from 60% to 30% will show (.60-.30)x(33) or about 10 bands. Divide the size of the fill by the number of bands, and you will know how large they are. 2 inch fill with 10 bands means they are 0.2 inches each, and you will see them. Generally your eye will see banding larger than 0.1 inches. If you cut the lpi to 30 lpi, the number of grays increases to 99, and the bands on this 2 inch fill shrink to .07 inches and you don't see them. The trade off is no banding but larger, more visible dots.

With halftones (photos) there is a balance to be struck between increasing numbers of grays and larger number of lines they require. The generally accepted "best" balance of these two is shown in the table and samples appear in most books on the subject.

A related topic is just what resolution to scan any halftones to be used in your document. The basic rule is you must scan at a higher resolution than you will print, but anything more than double the print resolution is wasted information, needlessly swelling you scan files. The norm is to scan at 1.5 to 2.0 times the print resolution for half tones. Suggested scan rates are also in the table.

Black and white material with no grays, is best scanned at your highest scan resolution since sharp edges are desired. Anyway, with only black or white to store the scans take only a small amounts of space.

Richard Leonetti is a Portland PC User Group member; contact him at (503) 246-4952 with your comments and feedback. - ed.

Writing Add-Ons

Andrew J. Gnoza, III,
El Paso, Texas (APCUG)

Like money and fonts you can never have enough templates for your word processor or DTP software. Most people either don't want to or don't know how to create templates for reoccurring tasks such as making invoices, FAX coversheets or style sheets for newsletter pages. Here are some of the better packages I have seen that you may want to consider for your writing tasks.

HotDocs V:2.0 turns your Windows word processor into a powerful business document machine. The software automates production of standard business documents like: letters, proposals, contracts, legal documents, RFP's, and others. With Hot Docs you can quickly use any of the templates by inserting names, numbers, dates and you are done. You also have the ability to make templates and add them to the existing lists to choose from at a later time. Normal SOP with a word processor is to cut, paste, rewrite, edit, move, and proof reading a business documents over and over again. With HotDocs templates producing a perfect document is simply a matter of answering a few questions, the answers are placed into the appropriate blanks throughout the document and you print it. Done. HotDocs requires a IBM or compatible 80386 PC or faster CPU, VGA display, M/S Windows V;3.1 and a Windows word processor; WordPerfect 5.2 or 6.0, Microsoft Word 2.0 or 6.0 or AmiPro 3.0. A hard disk with 2 MB of space is also required. For more information contact CAPSOFT Development at (800) 500-DOCS or (801) 763-3900.

Design Portfolio for M/S Word for Windows 2.0/6.0 or WordPerfect for Windows 6.0a/6.1 from Streetwise Software is loaded onto your word processors menus and you are then a mouse click away from professional looking documents. The software is very easy to use and includes over 170 professionally designed pages that include FAX cover sheets, letterheads, memos, certificates, resumes, business forms brochures, calendars and more. An integrated address book lets you point and click to insert names into your design Portfolio documents. As an added bonus design Portfolio ships with 35 True Type fonts (you never can have too many fonts) and over 150 quality clip art images to dress up your documents. The software comes with a guarantee that if you can't create professional documents within five (5) minutes just return the software to Streetwise and you'll get a full refund (60 day time limit from date of purchase). Contact Streetwise Software at (310) 829-7827.

DesignKit for AmiPro V:3.0 from Logic Arts Corp. is a set of over 100 ready to use AmiPro style sheets. With the this add on you select the template you want, add your customized text and print it out. Because this add on is not a separate program, your existing hardware and software setup for AmiPro is all you need to install the templates. Used in conjunction with Adobe Type Manager (ATM) which ships with AmiPro you have all you need to create professionally looking documents. Installation is through the Windows "RUN" command which automatically performs the steps to place the styles into the appropriate sub directories on you hard disk. All you do to use a template is load the style sheet from the pull down menus in the word processor. The kit includes a rubber stamp function to place gray scaled text onto your document such as: CONFIDENTIAL, NEW, URGENT and 22 others as well as some clip art. To contact Logic Arts call them at (804)-266-7996.

Layouts is a set of templates for Aldus PageMaker that were designed by award winning graphic artists to enhance the abilities of your PageMaker software. A total of 219 templates make your first time encounter with PageMaker a breeze and the more you use PageMaker and Layout the more proficient and creative you become. Templates include those to: do brochures with two, three and four panel styles; newsletters for single and multi column layouts; flyers; business cards; letterheads; envelopes; and business reply cards. The templates are customizable so you can adapt the existing ones into forms that meet your specific needs, including changing fonts to

See **Writing**...*Continued on page 10*

Writing.... *Continued from page 9*

create an entire new look. The out put is printer/camera ready and meets Printer'sApprentice specifications. For more information contact Postcraft International at (805) 257-1797.

DesignKit for Aldus PageMaker from Logic Arts Corp. is a collection of over 50 ready to use documents that includes: brochures, manuals, calendars, stationary, news releases, certificates, and many other templates. You get all the pieces of the document puzzle wrapped into one software application. Professional help from an award winning designer is included on the pull down menus, saving you the time of not having to go elsewhere to get the assistance you need when you need it. Point and click with the mouse lets you change the format, style, font , layout, etc instantly. DesignKit helps you present information in a way that captures attention and moves your reader to take note of what they are reading. Included is a logo library and some clip art. To contact Logic Arts call them at (804)-266-7996.

SmartPad for Aldus PageMaker embeds powerful toolbars right into the application with over 50 buttons make you more productive using the DTP software. Formatting control, graphics shortcuts, special characters, file operations, toolbox selections, and program launching are all right at your finger tips. You can access file and clipboard commands with a single click on the Main toolbar. With a simple installation routine from Windows, automatic start up feature its very intuitive to learn, no big manuals to read through, from cover to cover the Reference Guide is only 17 pages long. Before you know it you are running and gunning through one of the most complex and productive software packages on the market today, Aldus PageMaker. A demo version is available for $10.00 which can be applied to the retail price of $49.00. For more information call toll free (800)-434-0202.

Let There Be Light!

Submitted by Eldon Graham
with careful coaching by Crystal Graham

How many Windows programmers does it take to change a light bulb?
472. One to write WinGetLightBulbHandle, one to write WinQueryStatusLightBulb, one to write WinGetLightSwitchHandle, etc.

How many managers does it take to change a light bulb?
We've formed a task force to study the problem of why light bulbs burn out, and figure out what, exactly, we as supervisors can do to make the bulbs work smarter, not harder.

How many MIS guys or gals does it take to change a light bulb?
MIS has received your request concerning your hardware problem, and has assigned your request Service Number 39712. Please use this number for any future reference to this light bulb issue. As soon as a technician becomes available, you will be contacted.

How many WordPerfect support technicians does it take to change a light bulb?
We have an exact copy of the light bulb here and it seems to be working fine. Can you tell me what kind of system you have?
OK. Now, exactly how dark is it? OK. There could be four or five things wrong . . . have you tried the light switch?

How many Microsoft technicians does it take to change a light bulb?
Three. Two holding the ladder and one to screw the light bulb into a faucet.

How many Microsoft Vice-Presidents does it take to change a light bulb?
Eight. One to change the bulb, and seven to make sure Microsoft gets $2.00 for every light bulb ever changed anywhere in the world.

How many software testers does it take to change a light bulb?
We just noticed the room was dark. We don't actually fix the problems.

How many software developers does it take to change a light bulb?
The light bulb works fine on the system in my office . . .

How many C++ programmers does it take to change a light bulb?
You're still thinking procedurally. A properly designed light bulb object will inherit a change method from a generic light bulb class, so all you'd have to do is send a light bulb change message.

How long does it take a DEC repairman to change a light bulb?
It depends on how many burned out bulbs he brought with him.

How many Windows users does it take to change a light bulb?
One. But he'll swear up and down that it was just as easy for him as it would have been for a Macintosh user.

How many Apple Newton users does it take to change a light bulb?
Foux! There to eat lemons, axe gravy soup.

How many Microsoft engineers does it take to change a light bulb?
None. Bill Gates just redefined Darkness (TM) as the new industry standard.

Software Review

"STREET ATLAS"

*CD-ROM Review by: Mark Eager, Contributing Editor, Pikes Peak Computer Applications Society, Inc. (P*PCompAS)*

When I'm in a strange town, (stranger then Colorado Springs), I always like to have a map to help me figure out where I am and how to get where I want to be. And, like any man, I don't like to ask for directions — (I am a man of the sixties, not the nineties). With Street Atlas by DoLORME Mapping, I can prepare and print maps for any city or area of the US. and include as much or as little data as I need.

First off, Street Atlas is not a trip planning package, like DoLORME's Map 'N' Go. What it does is provide maps of any area in the US. and allow the user to include or exclude any local feature information needed, such as lakes, mountains, etc.

Besides producing detailed, street-level maps, Street Atlas also provides the tools for a user to quickly locate a street, area, etc., merely by clicking on a button and entering information. A search can be done by place name, phone number or Zip. It can also search with partial information, such as the area code, part of a Zip Code or place name. Each map comes with elevation lines to indicate variations in local topography, places of interest, such as airports, parks and lakes, and can list block numbers for streets in urban areas.

The opening screen of Street Atlas displays a map with a status bar at the bottom indicating a magnification of between 3 and 16 along with distance information—(One inch =X). Help is available by hitting the F1 key. There is a small window showing an overview map of the area surrounding the detailed area on the main map and a floating tool bar of option buttons. The Toolbar can be arranged as buttons along the top edge of the screen and overview map on or off to make more room for map viewing. At any time during map viewing a map legend can be displayed by clicking on the "KEY" button in the Toolbar or by choosing Legend under the View pull-down menu. You can also change the magnification level to show more or less detail.

Locating a particular street is simple. First, you can search a map you are already viewing, as long as you are at magnification level thirteen or higher. If you are not already viewing an area, then you can locate the area you think the street is in by doing a search by Place name, Zip Code, or Phone number. You can use partial spellings, numbers, etc., in this search.

For example, suppose you are looking for a street in the Peyton area. You can do a Place search for Peyton. Street Atlas will give a list of matches and you can select Peyton from that list and then click on LOCATE. This will center the map on the Peyton area. From there you can do a search for a particular street name. Remember, you can do a partial-spell search if you're not sure how to spell the street name.

You can also search via phone number, with either area code only, area code and exchange, or the complete number with area code. If you don't have the phone number, but do know the Zip Code, then do a search from that. Either method will bring up a list of areas that match the search parameters, and you select the one you want and then click on locate to center the map on that area. From there, it's just a short street search to locate the street you are looking for.

Street Atlas allows you to copy any map to the Windows Clipboard for use by another program, such as a word processor. You can also pan in any direction by moving the mouse pointer to that section of the map and clicking with the left button. Clicking with the right button allows you to identify a street that your mouse pointer is on and places a label with the street name next to the street itself. Clearing any labels you have inserted is as easy as clicking on the erase button from the Toolbar or the pull-down menus.

The one area of the program I had a problem with was Printing. Street Atlas allows you to print any map you have in the viewing area under any magnification. The one problem with this, is in Gray Scale rendering. Street Atlas uses Gray Scaling to differentiate between features on the map, such as highways, local streets, and large and small cities. If your printer doesn't handle gray scale well enough, some details on the maps will be unreadable.

I discovered my Panasonic KX-P2123 couldn't handle gray scale well, causing individual streets in major cities to be unreadable due to the shading of the city boundaries. The streets were there but covered by the shade used to show the city area itself. My laser printer, however, worked flawlessly. So, be advised that you should make sure you printer can handle gray scaling properly before you buy Street Atlas. You can call the company at 1-(207)-865-7098 between 08:30 and 17:00 EST for help in confirming your printer's ability. You can also contact the manufacturer of your printer for help in this area.

Street Atlas requires an IBM or 100% compatible system with a 386 or higher processor. A minimum of 2MB - 4MB recommended and 2.5MB of space on the hard disk, Microsoft Windows V3.1, DOS V4.1 or later, VGA MONITOR, a Microsoft compatible mouse and a CD-ROM drive is also necessary.

Installation is a breeze. Open the File Manager, select the install floppy drive, double-click on "Setup.exe," and you are off and running.

Street Atlas installed and ran on my 486DX2-66 with no problems or slow-

downs, except when printing to my postscript laser printer, which I expected anyway, since my laser is old technology and not fast to begin with. Street Atlas is easy to use and great at making up maps before taking any trips. It doesn't do trip planning, and although, it did show quite detailed maps of the rural areas east of Colorado Springs, it didn't have our new airport yet, (or that big mess east of Denver :-)). If you are looking for a decent street atlas, look no further. Street Atlas will do the job just fine. It can be had locally for $75.00, and mail order at $89.00 and up, although you might find someone who has it cheaper.

Update on Sound Cards

By Rob O'Daniel - The DOS Umbrella
Reprinted from the "Blue Chip News" a publication of the Saginaw Valley Computer Association

In the past year, the PC audio industry has surpassed the previous two or three years. Last year, buying a sound card meant choosing between Creative Labs' Sound Blaster Pro (SB Pro), MediaVision's Pro AudioSpectrum-16 (PAS-16), Advanced Gravis' UltraSound, Microsoft's Sound System, Turtle Beach's high-end Multisound, or a small handful of others. But now, the choice is staggering!

This year's offerings include Creative Labs' newest offering, the Sound Blaster 16 ASP (in three different flavors!), MediaVision's revamped Pro Audio Studio-16, and more than a half dozen different cards based upon Sierra Semiconductor's Aria chip set.

Add to this Microsoft's soon-to-be-released Sound System 2 and Roland's highly anticipated RAP-10, and the choice begins to get a bit tough. Complicate matters further by tossing Creative Labs' add-on daughter board called WaveBlaster and Turtle Beach's add-on called Maui, both designed to marry high-end wavetable synthesis with digital audio-capable sound cards, into the mix. What to do? Which one is best? Which should you choose?

Which One Is Best? Which Should You Choose?

Well, the decision making process is one thing that has remained unchanged in the past year. You must have an idea — at least a general concept — of what you'd like to accomplish with your new sound hardware before you go shopping. How do you shop when you may have never owned a sound card before? Well, to evaluate your needs and goals for a sound card, you should ask yourself a few questions:

What do you want to use this card for?

If games are your bag, you will want to stay within the realm of Sound Blaster compatible music cards! If you are a serious game aficionado, you will no doubt want to consider a solution that combines both stereo digital audio for sound effects and high quality MIDI capabilities for stunningly realistic orchestrated game sound tracks. In the past, you could only do both by combining a sound card and a separate MIDI synthesizer card. This year, you have the option of buying a wavetable add-on for your sound card — if you choose the right card. Also investigate Creative Labs' WaveBlaster and Turtle Beach's Maui add-ons first. Also keep a lookout for AVM Technology's soon-to-be-released wavetable product built around a Kurzweil chip set that was recently mentioned in Computer Shopper. Advanced Gravis' economical UltraSound is also worth considering; the UltraSound now has more capable software to support MIDI within many games and is garnering more industry support this year.

If your primary concern is multimedia, Sound Blaster compatibility isn't a big issue. For multimedia, consider a card that has both Sound Blaster compatibility, is capable of handling multiple inputs, and supports stereo .WAV playback at rates up to 44 kHz. MediaVision's Pro AudioSpectrum-16, Logitech's SoundMan 16, and Microsoft's Sound System are worth a look.

For MIDI sequencing, obviously you need not be as concerned with Sound Blaster compatibility. Take a look at wavetable based cards such as MediaVision's new Pro AudioStudio-16XL, Advanced Gravis' UltraSound, one of the Aria-based cards (such as Diamond Computer System's Sonic Sound), Orchid's SoundWave 32, or Turtle Beach's Multisound. These cards, and many others, have MIDI muscle to make your compositions come to life.

On a Budget?

Consider Creative Labs' Sound Blaster Pro Deluxe, Aztech Labs' Sound Galaxy Pro NX16, Logitech's SoundMan 16, or Advanced Gravis' UltraSound. There are many vendors offering feature-packed sound cards in the $110-150 range.

How important is compatibility?

Again, if you are into games or rely more on DOS-based multimedia or education programs, Sound Blaster compatibility is a must. For gammers, the SB Pro Deluxe offers stereo music and sound and won't break your budget. Bear in mind that cards that only say they are Sound Blaster compatible are only offering monaural music and sound, whereas cards that offer SB Pro compatibility will take advantage of DOS-based programs that support stereo music and digital sound.

What about vendor support?

Even more so this year than last, you must consider how viable support will be when purchasing a sound card. Will the vendor be able to offer technical advice or provide you with the latest Windows drivers? The AudioPro Buster-16 sound card may seem like the hottest ticket in town, but if the manufacturer isn't around to provide support, you will probably have a difficult time finding any software that will work with your new card. Read message boards and magazine articles to try to determine what level of support you can expect from the company that is offering this oh-so-hot sound card. Chances are, if you are buying it from an electronics catalog, a department store, or from a computer shop you aren't very familiar with, there could be problems. Best to pay a few dollars more and get a well-known product produced by a reputable company.

How important is a 16-bit sound card?

In the context of computer audio, 16-bit refers to the sample resolution. While 16-bit digitized audio is being touted as a 'must have' by most magazines, how much do you really need it? Consider that uncompressed digitized audio recorded in

See **SoundCard...** *Continued on page 13*

Sound Card...*Continued from page 12*

stereo at 44 kHz and 16-bit requires more than 10.5 megabytes of storage per minute and you'll see that, while the sound might be impeccable, the storage requirements make it unrealistic for most computer owners. (16-bit, 44 kHz, stereo digital audio is commonly referred to as 'CD quality' since those are the sampling settings generally used by the compact disc recording industry.)

But what about CD-ROMs? While it is true that 5 or 10 megs is a drop in the bucket on a 600+ megabyte storage medium, consider this: Why load a huge .WAV file into your memory and play it back, when you could simply play recorded sound information off of the CD-ROM just like your home stereo plays a standard audio CD? This approach frees the system of the tremendous load of having to process a potentially huge digitized sound.

With this in mind, it's unlikely that 16-bit digitized audio will be supported by mainstream software vendors until a compression standard is settled upon. The 16-bit feature of a sound card is probably not reason enough to warrant the additional $50-100 cost. However, this is not to say that a 16-bit sound card won't have some other, more usable, features that would suit your needs. Once you've decided your needs, it's time to start reading reviews, talking to computer hardware dealers, investigating all the nitpicking details, and asking LOTS of questions! Be patient—chances are, you'll only be buying one sound card for the next two or three years, so you certainly aren't going to be happy if you rush out and buy a product that becomes obsolete before it's six months old. Don't try to be the first person on your block to get the newest whiz-bang sound card or you may get stuck with hardware that garners no third party support. While some of the new software innovations, such as surround sound and 3-D audio, certainly sound appealing, don't let that be the sole basis for your hardware decision because there may be no software companies supporting that feature for many months to come. Rob O'Daniel is the PC Music & Sound Forum Leader for America On-Line and can be reached as PC RobO. *Courtesy of North Orange County Computer Club, California.*

Software Review
"SPINRITE v3.1"

*Review by: Mark Eager, Contributing Editor, Pikes Peak Computer Applications Society, Inc. P*PCompAS*

SpinRite V3.1, by Gibson Research Corporation is a hard disk utility for user maintenance of hard disks. Like MSDOS's Scandisk, it is used to help a user maintain their hard disk with minimal effort. However, it goes way beyond the capabilities of Scandisk and gives the user a host of tools for working with hard disks.

SpinRite V3.1 requires that the system be booted from a clean boot disk, because it uses all the available system resources. Consequently, some TSR's and device drivers could interfere with operations. The manual helps the user determine which ones are necessary and which aren't and how to add them to the boot disk.

The main screen allows the user to start SpinRite with the default settings, go to the Options sub-menu, or exit the program. The Options sub-

See **Spinrite...***Continued on page 14*

Spinrite...*Continued from page 13*

menu allows the user to change settings, view drive information or run the hard disk benchmark test.

There are five main settings that can be viewed or modified. The first is the level of SpinRite Operations. The other four allow the user to select where the Operations Log File will go, how many Prior Logs are retained, and whether to include Drive Information and Benchmarking Information in the log.

There are seven different levels of operation. Level 1 employs a simple read-only test, similar to ScanDisk's, for checking the disk surface. Level 2 goes deeper and adds data recovery using SpinRite's DynaStat Data Recovery that attempts to recover unreadable data and then rewrites it to its original location or moves it as needed. Level 3 adds to Level 2 by employing a complete read and re-write on every sector of the drive to realign the data on the hard disk. Level 4 adds light testing of the drive for physical defects using a series of special data analysis patterns. Level 5 goes further, adding a moderate defect analysis of the hard drive, which is three times deeper testing then the previous levels. Level 6 is SpinRite's deepest surface testing and data recovery. Level 7 uses the same deep testing employed in Level 6, but goes one step further by testing sectors of the drive that had previously been marked bad. If these areas pass all of SpinRite's rigorous deep level testing, they are returned to full use, but only if all pattern tests are completed successfully.

The hard drive Information Option will display a wealth of information on the drive including cluster use, used cluster space and bad cluster information, just to mention a few. It can also display the model type, drive serial number and firmware revision if that information is available on the drive.

The hard drive Benchmark Tests will show the drive's random sector access in milliseconds and the sector access velocity in megabytes per second. Along with them will be the Burst Transfer rate and the Sustained Transfer rate in bytes per second. With this information, the user can tell just how fast their hard disk really is.

SpinRite V3.1 is extremely flexible, even while running. The program can be interrupted at any time by pressing the ESC key. This allows the user to choose to cancel the operation, suspend the operation, resume a suspended operation, suspend the operation and exit or simply return to the main menu. Not enough, you say! OK, how about this. SpinRite V3.1 uses multitasking to allow the user to display any one of 7 different screens, even while the program is testing the drive.

The Graphic Status Display will bring up a display similar to that of ScanDisk or Norton's Disk Doctor. The Real-Time Activities screen will display the immediate details of what SpinRite is currently doing, along with summaries of the current operation since it started.

The detailed Technical Log, allows the user to peruse a text log of each event that has occurred during testing. The user can scroll back through the most recent 200 lines of this log, without interrupting the testing going on. This means the user can examine the test results in a real-time environment, instead of waiting for the test to complete.

Both the Surface Analysis Monitor and DynaStat Data Recovery Screens, display data of a more technical level. This is useful for the more technical user, but most users won't have much need to view these screens.

SpinRite V3.1 does have a small list of known incompatibilities listed in the manual's appendices. Any user is advised to thoroughly read this section before starting any testing to avoid problems due to any incompatibilities. More important then that, the manual strongly recommends that the software be backed up before testing begins. That's usually a given, when performing hard disk operations of this nature, since only a fool would risk data that is not backed up. Running Chkdsk or ScanDisk is also recommended before starting any testing.

SpinRite V3.1 can be run un-attended from a batch file or by using a set of DOS command line keywords. Because of the introduction of hard disk compression software, SpinRite has been designed to be compatible with the AddStor's "SuperStor, V2.0" or later, Microsoft's "DoubleSpace, V1.0" or later and Stac Electronic's "Stacker, V2.0" or later. If you are using any other compression program you can contact the SpinRite Technical support group at 714-362-8900 for compatibility questions.

SpinRite V3.1 will not work with large capacity drives set up using On Track's software BIOS setup. However, it will work fine with large capacity drives set up using "Drive Pro," from Micro House, which does the same thing -- better I might add, in my opinion -- as On Track.

Since SpinRite V3.1 is intended for the non-technical, the manual is short and sweet. Everything needed to run SpinRite is explained in easy to understand terms. The program also includes a Hypertext system that is filled with interesting and valuable information for both the first time, and the experienced user.

The amount of time SpinRite needs to complete its task depends on the level of testing the user desires. The deeper the testing and recovery, the larger the drive, the longer the test will take. The nice thing is being able to select the level of testing as needed to solve a possible hard disk problem.

SpinRite has always been an excellent hard disk utility and the latest version is no slouch. I highly recommend this program as an addition to anyone's utility library. You won't be disappointed with SpinRite V3.1 and it may even help prevent a major hard disk problem before it gets out-of-hand. As a tech, I use SpinRite V3.1 to troubleshoot problems Scandisk can't handle. I give it a Five-Star rating.

SpinRite V3.1 requires an IBM-compatible PC, XT, AT, PS/1 and PS/2 system equipped with a floppy drive, 350KB of free RAM, Mono, EGA or VGA display (no CGA) and DOS version 2.1 or later. SpinRite owners can upgrade to V3.1 for $29.00. Non-owners can purchase SpinRite for $69.00 plus $4.00 S&H. To order, call 1-800-736-0637, Monday through Friday, from 8:00 a.m. to 5:00 p.m.

SECRETARY'S REPORT

Meeting 1/11/95. Minutes and comments as I understood them. Bruce Register, Sec'y

The meeting was called to order by President Harvey Bruneau. Some 53, MOL, attendees.

Elected Officers are:

President: Harvey Bruneau
Vice President: William LaMartin
Treasurer: Tom Cone
Secretary: Bruce Register
Member-at-Large: Connie Kincaid

Appointed Positions are:

Education Officer
Newsletter Editor
Bulletin Board System Operator
Librarian

President Harvey reported many bits of interesting information. He asked that the members let him know what subject matter that the members would like at the meetings and SIG meetings.

President Harvey reported that SIGs (Special Interest Groups) are scheduled.

Internet SIG...January 24, 1995, 6 PM, Reflectone Corporation, Tampa West Boulevard. The building is located south of Waters near Anderson Road. Security is tight; entrance is through the north entrance for only persons on the advance cleared list. If you signed up before the class max'ed out, your name will be on the security list for entry. Charles Howe is the leader. We thank Mike Hodges and Reflectone Corporation for making this possible.

Microsoft Access. February 16, 1995, 6 PM, 3903 North Dale Mabry Boulevard. Mark Saunders is the SIG leader; Sergio Mendez, Connie Kincaid are among the assistants.

SIG enrollments can be made on the Bulletin Board; however, you should report your name exactly as it appears on the TPCUG membership list. Look at your membership card or the address label on the BITS OF BLUE.

SIG sessions are open to TPCUG members only. Have you renewed yet? President Harvey asked that everyone submit topics that we would like to experience, not only in SIG but also in discussions at regular meetings. He also asked for SIG leader volunteers. Please make a note of your comments and hand them to President Harvey. Written comments are less likely to be forgotten or misunderstood. Lets help our long-serving President by putting them in writing.

President Harvey announced an upcoming SIG on OS/2. Come, listen and watch BITS OF BLUE for details at the appropriate time.

Caere Corporation will present program March 8, 1995.

Delrina will present April 12, 1995.

MISCELLANEOUS COMMENTS

(As I understood them, factual or not)

Brainchild offers discounts on products and labor to TPCUG, membership card showing, members. One store is in St. Pete; the other is at 1910 W. Busch Boulevard.

President Harvey stressed the request that each of us bring in one new member in 1995...early in 1995.He also stressed the need for receiving renewal membership dues for 1995. Please encourage your fellow member friends to renew. Do not let member friends fall by the wayside.

The TPCUG Board is considering all aspects, known, or made known, to them regarding a more suitable meeting place. Please jot down your comments "however you feel' regarding a change or not to change. Give your thoughts to President Harvey.

INDUSTRY NEWS:

Windows 95 will not run OS/2.

Lotus is developing an application to run on OS/2 under contract with IBM.

Notebook with Windows 95 must have "plug and play" docking stations with recognizes notebook Windows 95.

Some people, today, are spending more on speakers for computer systems than they spent on their stereo systems. Why not just hook up to the stereo; save money; spend the savings on computer needs.

Gold Disk will make multi-media presentation at TPCUG meeting February 8, 1995. Meeting starts at 6 PM, Auditorium, Administrative Building, HCC, Ybor City. Security guards are positioned in the parking lots.

PRESENTATION:

A speech by Bill Gates at Fall Comdex '94 was presented by Harvey with equipment provided by Will Goble.

President Harvey announced that the manner of this presentation is a FIRST for TPCUG. A machine (computer) with a video card in it that allows one to hook up a VCR to the machine that has a video and sound card. The computer connects to a display panel positioned on the top of an overhead projector. The display is then view on the "movie" screen. The sound card in the machine permitted plugging into the external speakers.

On with Mr. Gates... Microsoft is presenting (The following are excerpts from Mr. Gates speech.)

"Microsoft Tech Net to help software users like replacing intel chips and how to cure Intel Chip problems."

"40 million PCs are out there and will double in the next ten years."

"...on line service will be improved...Windows 95 will assist on line services through innovated ideas."

"Stereo vision (3-D) is being developed to provide ....viewing...(we) will not see this as mainstream for 3 or 4 years"

"Internet can be accessed from computers of all types." "Information Highway with all types of information by anyone will be available to anyone who wants it."

"Video is down the highway (Information Highway) at a future time."

"Fox Pro is to be released in January 1995 at a Fox Pro meeting."

"Microsoft Access is becoming the common tool and...unifies all languages."

"E-Mail is in major use in business. Our E-Mail is our primary application in our company (Microsoft). Our E-Mail includes spreadsheets....(other documents)."

"Beta use (Beta Windows 95) allows you to use all the connectivity to any number of machines without license problems...this is to allow a user to test application and get ready for the release of Windows 95."

"The real question is 'Will the industry run Windows 95 or OS/2' (and) is a dead-end (discussion). OS/2 and Windows 95 are just competition."

"All new machines that you buy after Windows 95 will come with Windows 95 already installed."

"In three or four years, the high end users and low end will operate from one platform instead of two as they come together in the future."

"Bus will become standard...VL....people will likely move to a 64 bit bus level."

After the Bill Gates video presentation, the door prizes were given away.

ALAN JANKOWSKI - UFO for Windows

Gerda Anderson- Optimizer for Windows

the meeting adjourned, approx. 8:50p.m.

PRESIDENT'S COLUMN

Goal

At the last meeting I asked each member to set a simple goal for 1995. Bring in one new membership. That is, within all the remaining months of 1995, commit yourself to getting one new membership signed up. Is that difficult? Is that a lot for me to be asking of each of you.? The answer to both is no. I must say I was extremely surprised when, during the break, a member approached me and said "I didn't realize you were looking for members". I also made another simple request , I would like to see more women among our members. Once again during break a sincere question from one of our lady members, "are you serious about more female members". Certainly" I said "Women have just as much to contribute as anyone else", I don't believe computers have a gender gap. I look at my associates at work as examples. We have a lot of talented ladies that know their stuff. From Administration to Programming, they use and share their knowledge to benefit our business. Sharing is good. For that matter, the same applies to kids and teenagers. They too have something to offer, to both adults and their peers. I think of the Visual Basic programming work of someone like Matt Nicholson and see a high school student that yearns to learn and share with others. Last time we talked his quest was to learn Visual C++. You know he could be the next Bill Gates. My point I guess is that we have a lot of good existing members in our group that want to share what they know. We have a larger group of members that want to learn more than what they already know. And of course there is the biggest group, those that are not members and can contribute knowledge and those that want to learn but don't know where to turn. Your goal is to go out and seek these people and get them signed up.

Discount

Our friends at Brainchild Computer Distributions have generously offered the members of the Tampa PC Users Group a 3% courtesy discount on all advertised items, including sale items. Members can also get a 10% discount on labor rates. To qualify for either discount you must present your valid TPCUG membership card. This offer is good until further notice from Brainchild Computer Distributions. Brainchild Computer Distributions, Inc has two stores. One located at 1910 W. Bush Blvd in Tampa and 2887 22nd Avenue N. in St. Pete.

Special Interest Groups

There here. Well it's official, the TPCUG now has three Special Interest Groups (SIGs). The focus of these groups is to provide and share knowledge within a specific topic. S the side bar in this newsletter for time and location of the SIGs. An Internet and a Microsoft Access SIG have been added to the existing OS/2 SIG. Enrollment for each new SIG is now closed. Due to limited seating both SIGs were filled in a hurry. There are still plans underway for two additional SIGs to cover the basics of computer hardware/software and another on modem communication .

Software Review

LAPLINK FOR WINDOWS

V. 6.0

Review by: Nicholas Klak,

I have computers, lots of computers. Quite often I want to transfer data from one to the other. I find a program on one computer that I want transferred but the disks have long since fallen into that black hole where all missing things end up. Dragging files off a hard drive in sequence can be only sometimes successful and time consuming. What to use? Laplink to the rescue.

Laplink has been around for years. It is made by Traveling Software in Bothell, Washington. This particular edition is version 6.0. for windows. It is packaged in an attractive box about eight by eleven inches and three inches deep. The minimum requirements for operation are DOS 3.3, Windows 3.1 or 3.11, 386 enhanced mode, and four megabytes of memory. It occupies five megabits of space on your hard drive and requires a VGA monitor. Having all of that as a given, you are presented with an attractive package, the cover of which is adorned with statements extolling the virtues of the program. A serial and a parallel cable were include. Already I was impressed, free hardware!

The transfer of date is possible by serial cable, parallel cable, or modem. A new wireless system called AirShare is possible as well as transfer of data using Novell supported networks and Windows for Workgroups IPX network.

Two manuals are supplied. A quick start one of forty four pages and a larger main manual of one hundred and sixty eight pages. Both were well illustrated and the print was easily read. I hate to read manuals so I determined to test this program's "user friendliness" by reading the least possible. I had never used Laplink in any version before. I did resort to a fifteen minute scan of both manuals and several peeks while setting up the program. While not as intuitive as the old Print Shop program, Laplink was not complicated. The program was supplied on two three and a half inch disks and they were not copy protected. I copied the masters and used the copies as working disks.

I used the parallel cable to connect my 486 to my 386 laptop. The program required a minimum of four megabytes of memory in both machines. The two keys to a successful connection are in the address drop down menu and the connection drop down menu. Each computer must have a distinctive address name, such as 486 or 386 or any other name you choose. The program must be installed and active on both computers. The connection is automatic as soon as the addresses are selected. You are presented with a split screen. The host on one side and the remote on the other. Either computer can scroll the drives in either machine and files can be transferred to or from either machine. It is mousified. You can select a directory to transfer and it asks if you wish to create a directory on the other computer. Transmission of data seemed quite fast although I did not time it.

The program ran as advertised. It was not difficult to run and should be easily used by the vast majority of computer users. I liked the flexibility of being able to use it in several different transfer modes. If you want a program that will transfer all kinds of files by several different methods, this is the program.

Traveling Software, 18702 N. Creek PKWY, Bothell, Washington.

Book Review

Starting on the Internet

Reivew by: G. L. Hollander,
North Orange County Computer Club, California

Electronic Highway Books Recent Information Superhighway publicity has peaked public interest in the Internet. Many promotions target personal computer users, the public sector most ready for this future. Internet evolved in the 1970s from the ARPAnet, a network of university and government computers. Just as PC users access their favorite BBS, full Internet users can access libraries and networked computers with priceless databases all over the world. As an important national research resource, the government has underwritten most long-distance connection costs.

Individuals can have two types of Internet access: Interactive and message-based. Interactive access allows full access to files (ftp - file transfer protocol) and connected computing power (telnet prompt) throughout the world. Message access provides messages and newsgroup conferences at a fixed board, maybe your local BBS, which relays them to the Net periodically in batches Messages are either Email (sent to private mailboxes) or newsgroup messages (posted by subject in a BBS conference). Most individuals without school or work access must use an intermediary, usually a commercial Internet provider.

While Internet has served the government and university communities for decades, new users need help. Many books compete for this market, some merely hyping future benefits, describing a specific software system, or explaining the network customs. PC (IBM or MAC) users need to know how to get on the network and how to use it for their interests. This article reviews three recent books with a focus on how well the authors recognize and satisfy the user's needs.

Book Summaries: The Instant Internet guide is a 200-page pocket-size book that promises "a reality check" "so that any-

one can navigate the Internet". The book's first half is devoted to two specific Email and newsgroups readers, Pine and Tin. The second half covers interactive access to text-oriented UNIX systems; including the needed UNIX commands for controlling the remote computer. Despite its 1994 date, this book ignores image- based (GUI) interfaces like MOSAIC, which almost eliminate the need for UNIX code. The appendix lists about 20 service providers and contains a short checklist for selecting one.

The book's strength is its clear writing and its command and keystroke level detail. However, the detail fits only the specific environment. If its coverage matches your environment, it could be a useful introduction and handy reference for the first few weeks on-line.

The Internet Companion Plus is another 200-page pocket-size book that promises to enable "anyone with a PC or MAC and a modem to join the Internet". It reads like a Sunday paper supplement; and leaves the same feeling of satisfaction. It substitutes anecdotal trivia for needed detail. Lack of focus forces a reader to seek better sources for an intelligent Internet decision. The so-called free $40 software is a start-up disk for the WorldLinkþ network provider.

The Whole Internet User's Guide & Catalog contains 540 regular-size pages of well organized and presented information for the Internet user. About 365 pages describe the different Internet uses in user terms, while the rest are appendices with Internet conference descriptions, provider lists, and other useful data. Each chapter takes the reader through one aspect of Internet use with many examples and illustrations. For example, the Pine and Tin readers mentioned above are covered in about 10 pages in the Email and newsgroup chapters.

The book reflects the author's long hand-holding experience with novices at the University of Illinois. Its clear and logical presentation allows a non-technical user to understand some intricacies of the Net. The more technical aspects are touched, but the author references other sources for information beyond the interest of a serious user. The book is comprehensive, yet its 15 chapters can be selected as modules for any reader's specific interest and background. The book is professional and serious, but makes its points with a conversational style and humor. The book is up-to-date, with good coverage of MIME, MOSAIC and the World-Wide Web. At first, computer club members may find the UNIX examples strange, but they will soon recognize their similarity to DOS and BASIC commands.

The reviewer noticed two significant, but correctable, shortcomings. To intelligently select a network provider, readers must search the book for nuggets before working with the 20-page provider list in Appendix A. Secondly, the index is too skimpy for such an extensive reference. The index pointed to only 20 percent of the answers to realistic user questions, although the book contained over 80 percent!

Recommendation:

Everyone serious about using the Internet needs The Whole Internet. For a brief general introduction, the free Beginners Guide to the Internet (BGI13A.ZIP) and The Big Dummy's Guide to the Internet (BDG22TXT.ZIP) on most bulletin boards are better than the other two books. Lastly, who publishes instructions pecifically for access through the common (non-UNIX) BBS systems (PCBoard, Mustang, etc) now carrying the Internet? Brent Heslop & David Angell. The Instant Internet Guide. Reading, MA; Addison-Wesley Publishing Co.; 1994. $14.95.

Tracy LaQuey with Jeanne C. Ryder. The Internet Companion Plus. Reading, MA; Addison-Wesley Publishing Co.; 1993. $19.95.

E Krol. The Whole Internet User's Guide & Catalog. Second Edition. Sebastopol, CA; O'Reilly & Associates, Inc.; 1994. $24.95.

For user group discounts, 10%+, contact publisher at 800/998-9938 or order@ora.com.

Software Review

Bodyworks 3.0

An Adventure in Anatomy

Review by: Doug Cooper, Portland PC Users Group

Bodyworks 3.0 is a CD-ROM multi-media anatomy reference, with color pictures, sound, and text concerning the human body. It is organized with hypertext and you can zoom, in hypertext fashion, in on details of pictures as well. Menus and a toolbar let you look at the various systems. It also has timed quizzes, lessons, animated clips it calls "movies", an index, a glossary, bookmarks, and 3-D views. It allows you to store medical records in a database for up to 50 people besides yourself. You can copy pictures or text to the Windows clipboard.

This program comes on a CD-ROM and requires an IBM PC, with Windows 3.1 and 4 MB RAM, a VGA adapter (Windows 256-color driver recommended), a CD-ROM drive, a Microsoft or compatible mouse, and Sound Blaster or compatible sound card for sound. The program takes about 2 MB of hard disk space for files needed to access the CD-ROM.

Installation:

I installed the game on a Dell 486DX-33 with all the required equipment including a Sound Blaster Pro, and the Windows 256-color driver loaded. I had no major problems using the program once it was installed.

Installation went smoothly after I figured out what was wrong with the instructions. To install it on a hard disk, you go into Windows and run the CD-ROM's SETUP.EXE, but the manual said to install it from DOS by typing "Install" from the CD-ROM drive.

Other than the faulty installation instructions, the manual that came with the product is fairly simple to understand, and not really necessary to read. My kids found it fascinating and my wife wished she had had it when she took Human Anatomy classes. This was a very easy

program to learn to use, and it helps you to pronounce the medical terms, using the sound board to talk. However, the pronounciation part talks in a featureless monotone, and the result actually sounded humorous at times.

Tools:

Some of the "Tools" accessible from the menu bar were disappointing. I thought the 3-D views weren't useful. The 3-D smooth shapes were extremely lacking in detail, and only got more abstract with the angular and wire-frame views. I had difficulty understanding what use any of the 3-D views had, the way they were done.

The best movies, about one-third of the movie selection, had sound. One showed childbirth, with some narration, for example. About another third of the movies were slightly useful, showing some movement but no sound, such as the heart beating. The remaining portion were just silly, such as the one of a skeleton turning around and around on a platform endlessly, or likewise for a set of lungs. In the case of the lungs, they should have been demonstrating breathing and circulation.

The Glossary didn't have a Search feature, so you'd have to scroll through hundreds of selections to find your entry. Since the other "Tools" generally did have the Search feature, I thought this was inconsistent.

The Medical Records feature, accessible from the "File" menu item, seemed nearly useless to me. I couldn't get it to print the one record I put into it. Since I wasn't really interested in this feature, I didn't pursue the issue of printing.

Value:

I didn't call the technical support number. From what's in the manual, they seem dedicated to support, however. There are four pages of Troubleshooting help, on top of the page which covers "For Further Assistance".

Egghead Software carries Bodyworks 3.0 for $39.98. This is probably a reasonable value for an anatomy reference, and much simpler to use than a textbook. The hypertext organization of it makes looking up details of a topic easy.

Publisher: Software Marketing Corp., 9830 S. 51st St., A-131, Phoenix, AZ, 85044. Phone (602) 893-3377, Fax (602) 893-2042. Technical support is available at (602) 893-8481 or the Fax line. -

CLIPindex for CorelDRAW

Andrew Gnoza, III, El Paso, TX, (APCUG)

CorelDraw's vast clipart library contains virtually every piece of clip art you'll ever need. Now with CLIPindex for CorelDRAW you can quickly locate the image, or images that best suit your design needs. The perfect companion to your CorelDRAW Clipart Handbook, CLIPindex also shows you how to locate and load the image you want from the library. The printed index sells for $17.95 from M2 DESIGN. Software Review

Rome — Pathway to Power

Review by: Robert Singer,
North Orange County Computer Club,
California (NOCCC)

The ancient Romans were known for their cruelty and greed, and caused much hardship in expanding and maintaining their empire. In Rome — Pathway to Power, you play the part of a down-and-out slave named Hector who wishes for a better life and will do anything to accomplish this objective.

Game Scenario: When you begin this game, you see a screen showing the small Roman town of "Herculvaneum" nestled below an active volcano. As you hear military music and the blare of trumpets, you are told to deliver a scroll to Fellonius the Consul" and thus you begin your military adventure.

This game plays very much like a movie with your first objective to get out of the town of Herculvaneum which is about ready to be destroyed by an active volcano. Afterwards you make your way to Rome where you purchase a slave or two, save the emperor and finally find yourself in command of four divisions of military soldiers in the British Isles.

At each phase of this game — from your trip to Herculvaneum, to your trip to Rome and then to the British Isles — the plot thickens as you wonder what new adventure awaits your character. You also become more involved as you not only need to lead your character, but gain control of four military division that fall under your control.

User Interface:

As in most adventure games, you have the option of moving your character, greeting others, placing items within inventory, and following other characters of interest that are displayed on the screen. To move your character you simply point and click on the screen with your mouse, or access a map of the city and point to the location you wish Hector to move. More complex interactions, such as stealing an item of clothing or removing an item from inventory, require selecting a menu choice from the control box at the side of the screen which activates a popup menu.

As the game progresses you gain access to a military control box which allows you to issue commands to your troops such as advance, halt, attack, retreat, rally, follow and watch.

Installation :

This DOS based game was easy to install on my 486 IBM clone. The manual has sections written in English, Spanish, French and German.

Conclusion:

Those of you who enjoy military adventure games, and enjoy the challenge of a series of puzzles that are scripted out like a movie will enjoy this game. My only complaint with this game are that the user interface could be simplified for easier play and that added music could have made this other-

wise well thought out game that much
better. I would consider this game a pretty good value for the money.

Requirements:

Rome — Pathway to Power was created by Firstlight and published by Maxis. It works with IBM AT and 100% Compatibles, requires a hard disk; VGA & 640k RAM required, DOS 3.1 and above. It supports Sound Blaster, Roland & Ad Lib; Includes 3.5" 720k and 5.25" 1.2 MB disks, 5.25." 360k disks are free upon request To my knowledge, Rome — Pathway to Power, can only be ordered by calling 1-800-MAXIS. The game lists for 19.95 plus 5.00 shipping. After registering the game you will receive a free Rome Hints and Tips booklet; become entitled to 2-years free replacement of defective media, and low-cost updates and upgrades; become entered in a weekly drawing to win Maxis games and accessories and receive a Maxis newsletter filled with hints and tips concerning some of Maxis other products.

Buying a Laser Printer

By Hugh Bayless, MBUG (APCUG)

About a year ago, I bought a Sharp JX-9400 laser printer because Sharp advertisements proclaimed that it had a toner cartridge capacity of 5,000 pages and the lowest cost-per-page of any of the current crop of printers. Its price of $399 was very attractive too. When I asked the salesman the price of a replacement toner cartridge, he said he didn't have a price list handy but it would be about the same as other laser printers, somewhere around $40. So I bought the Sharp laser printer, and everything was fine until the "TONER LOW" message appeared on the display panel after only 2,500 pages, not the 5,000 they promised.

Why did I only get 2,500 pages when Sharp said I should get 5,000? It seems that the toner cartridges Sharp installs in their printers when they are first sold are only half-full. But that was only the beginning. Next, I learned the true cost of a replacement cartridge (toner and developer only) is $200 instead of the $40 I had been told. And if I need a new drum, it's another $200. When I got on the telephone and shopped around, I learned that there are no refilled cartridges available for Sharp laser printers because Sharp makes the toner and will not sell it except in a new cartridge.

On the other hand, if I had bought a Hewlett-Packard LaserJet for about $200 more than I paid for the Sharp, I would have been able to buy replacement toner, developer and drum packages for only $89 and recharged toner/developer cartridges for as little as $30. A Hewlett-Packard laser printer would have cost more to start with, but would have saved me a lot of money in the long run.

The next time, I will remember that old advice from the days of Rome's glory _ caveat emptor _ let the buyer beware.

Essential Guides from Mike Murach

Book Reviews by Hugh Bayless, MBUG (APCUG)

The Essential Guides are designed specifically to help a PC user convert or upgrade to a new software release, and they do it very well. All of the information is not only explained, but it is clearly illustrated with actual screen captures that let you see precisely what you will get when you perform the operation.

Organization of this series of books is excellent, permitting the user to quickly find the desired function explained in a single place _ no more searching through page after page to learn about a single function. Since chapters are organized by function, you only need to read those chapters that cover the functions you want to perform.

The Essential Guide: 1-2-3 for Windows, Release 4, by Ann Prince, is a handbook that no user of the software will want to be without. While no book can entirely eliminate the need for learning the changes that come with an upgrade, this one can reduce the time spent to some 3 to 5 hours. The list price is $20.00

The Essential Guide: WordPerfect 6.0 for Windows, by Joel and Tom Murach, does for WordPerfect what the previous book does for 1-2-3. Illustrations tell you everything you need to know and the learning process is reduced to the absolute minimum. If you are upgrading to version 6.0, you need this book. The list price is 25.00.

As usual, Mike Murach & Associates offers our user group members a substantial discount when ordering direct _ call 1-800-221-5528.

Your price for the Essential Guide: 1-2-3 for Windows is $16.00 and the Essential Guide: WordPerfect 6.0 is $20.00, both with free shipping.

The Pentium Again!

(posted on APCUG Globlenet..
As if flunking the math test were not enough, now we find that Intel's Pentium chip has a problem with future dates. Granted, the problem won't appear until midnight of 12-31-99, when the system clock should roll over to the year 2000. It doesn't. At the stroke of midnight, Pentium machines will flip over to 1-1-1980.
Probably Intel expects all Pentium machines to self-destruct before the end of this century, but considering how many IMB-XT machines are still chugging away in less-demanding jobs, it is a safe bet that some Pentium machines will be around to see the year 2000 arrive _ as 1980

Microsoft Access SIG

We will be having the first Access SIG meeting on Thursday February 16, 1995, at the Dun & Bradstreet Software office, located at 3903 Northdale Blvd., Suite 113E, (look for the burgundy awning for the entrance) Tampa. The door locks at 6:00 pm, however, we will have someone keeping an eye out for late arrivals. PLEASE SIGN IN WITH A SIG LEADER.This first meeting will last approximately one hour. We will take the first few minutes to get acquainted. We can then begin discussing what type of format we would like the SIG meetings to follow.

Sergio Mendez
Mark Saunders - MARKS@DBSOFTWARE.COM
Connie Kincaid

OS/2 SIG

OS/2 SIG, Next meeting: Tuesday Feb. 28, at 6:00 p.m.
Location: IBM Lakepointe One Bldg., Room 436
Topics: Customizing the Launch Pad, Using EPM and REXX to create small utilities Installing WARP
BE SURE TO SIGN IN.

John Lucas
JKLUCAS@MAILSERV.MOFFITT.USF.EDU)

Internet SIG

There were approximately 20 attendees at the first meeting of the Internet SIG. The basics of using a COMM program were covered, with particular emphasis on uploading and downloading files. Signing on was demonstrated, and several topics related to a shell account were discussed.

The next Internet SIG meeting will be Tuesday, February 28, 1995, Time: 6-8pm at Reflectone Corp. Training Center. This meeting will repeat the topic of uploading and downloading. Commands such as: "whois", "ftp", "telnet" and "ping" will be discussed. Seating is limited to 20, so prospective attendees must have pre-registered.

Directions: Proceed west on Waters from N. Dale Mabry across the railroad tracks (which is about 1 and 1/2 miles), take second left on Savarese (United Technologies bldg. is just beyond it.) Proceed on Savarese until you reach the Reflectone bldg. Take the North door. If you need to ask directions, there is a security guard at the location. PLEASE SIGN IN WITH A SIG LEADER.

BEGINNERS: Charles Howe is also prepared to conduct very small meetings five or so, where the basics of signing on to the BBS or to an ISP will be demonstrated and attendees can practice. Call Charles for additional info at (813) 968-1207.

Charles Howe -HOWE.COSTECH@INTNET.NET

MEMBERS HELP-LINE

The following phone list is provided for our **Tampa PC Users Group** members in an effort to establish local support for those frustrating times which we have all encountered while using our PC's. Please note that these are members that have volunteered to help you, treat them in a courteous manner. Be sure to ask if it is convenient for them to help you now, or if you should call another time. It would also be helpful to have your documentation and have it handy when you call. *(Don't expect help if your software is an illegal copy or you do not have documentation!)* **TPCUG** is not responsible for the information or advice provided by volunteers. Volunteers may or may not be experts in the subject matter. You are on your own with any advice received. Be aware also that some of these volunteers may be consultants in their area of expertise. If you are interested in volunteering to answer members questions, either leave a message on the BBS or fill in the forms provided for this purpose at the meetings.

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII file or in a commonly available word processor format, such as WordPerfect 5.2, or Ami Pro 3.0 on diskette to the editor at 9402 Hidden Ridge Place, Tampa, Florida 33637 or send it by modem to BBS (813)239-3704.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

The use of trade marked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted at the following rates:

	1 month	3 months	6 months
Full Page	$60.00	$162.00	288.00
Half Page	$40.00	$108.00	$192.00
Quarter Page	$22.00	$60.00	$106.00
Eight Page	$12.00	$33.00	$58.00
Business Card	$10.00	$27.00	$48.00

All advertisements must be prepaid by check payable to TPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if it is not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, Marylee Bruneau at (813) 985-3338, for space availability and for further information.

This newsletter is created with PageMaker 5.0 from Aldus Corp. and Corel Draw from Corel Systems.

SECRETARY'S REPORT

TPCUG MEETING 2/8/95, 6 PM
Ybor Room,
Hillsborough Community College, Ybor Campus
Minutes and Comments by Bruce Register

President Harvey Bruneau called the meeting to order. Comments and information was given regarding **SIGs, miscellaneous and vendors.**

SIGS

Microsoft Access - February 16, 1995, 6 PM Promptly.. 3903 Northdale Boulevard, northeast corner of Mapledale and Northdale. Reservations are closed due to limited seating. Next SIG-Microsoft Access is same place, March 16, 1995, 6 PM (sharp-Security Officer must permit entrance at the rear entrance of the building). Sign up early.

OS/2 - February 28, Contact John Lucas for time, place and openings/sign-up.

Internet - February 28, 1995, 6 PM, Promptly,. Contact Charles Howe. As of February 8, 1995, seven seats were available. You can use BBS to sign-up. Promptness is required because of security at Reflectone is tight and required. From North Dale Mabry, go west on Waters to TAMPA WEST sign on the south (left) side of the street (if you pass Anderson Road, you have gone too far), turn south at TAMPA WEST sign, go one block to dead end, turn right one block and take a "forced" left turn, go south about a half block to north entrance of Reflectone Building. You must enter north end and be prompt at 6 PM because security will unlock door and escort us to the meeting room. It reminds me of the Pentagon; you don't stray or wander around.

ANOTHER SIG is under consideration. Let Harvey know your interest. A tax SIG was mentioned as a possibility. It is timely. Harvey wants your opinion. He reads BBS regularly. Send him a message.

MISCELLANEOUS

Harvey reported a monetary gift from GTE to TPCUG. GTE has a program for recognizing their employees who make a contribution of time and effort to community and educational activities. In recognition of Roger Waters many hours of devotion to TPCUG, GTE donated some $430 to TPCUG. Thank you Roger! Thank you GTE!

Harvey reiterated the goal of every member in 1995 is to bring in at least one new member.

VENDORS

"IBM has recalled power adapters for IBM Thinkbook 360 & 375. If you have one, contact IBM for a replacement part.

"HP DeskJet 500, 550 and 560C have glitches in rollers. Call HP for replacement parts.

See **Minutes** ....*Continued on page 3*

Minutes....*Continued from page 2*

"Pentium prices have dropped and are expect to drop some more before the end of March.

"Some surprises have been received by Pentium users who have replaced the old chip with the new chip. Spreadsheets run and calculated under the old chip will carry the same chip errors along with the spreadsheet under the new chip. Solution: when you load the spreadsheet, recalculate the entire spreadsheet under the new chip. Easy solution!

"Many companies are tied so completely to Microsoft that they feel that they cannot change software when errors and software problems occur. Some feel that Microsoft, unintentionally, releases software with problems. When this occurs serious difficulties could occur. Some companies (end users) are so critically dependent upon Microsoft's various packages that they feet it is better to suffer than to try to change it all.

"Hardware vendors and software vendors are planning on the future world of Microsoft Windows 95, whenever it is released. IBM OS/2 Warp is the competition. Some feel that sufficient market acceptance of OS/2 would result in a much more healthy competitive market—one without monopoly.

"Some feel that Microsoft Windows 3.1 will not only lose its state of the art position but will also become extinct to OS/2 and Windows 95-relatively soon after release.

"PS2 mouse ports make your life easier.

"Don't use Windows 3.11 32 bit File Access on Gateway, Compaq or Notebook computers. Problems may occur!

SOFTWARE VENDOR DEMONSTRATION

Mr. Robert Morgan of Gold Disk, presented two software products-ASTOUND AND VIDEO DIRECTOR. His general comments during the demonstration ran along these lines: ASTOUND was developed, originally, on a MAC platform. Since then, they have developed it on Windows platform. Their market demand has been pleasing.

ASTOUND is chasing the PowerPoint (by Microsoft) presentation market. ASTOUND loves multimedia machines. ASTOUND is a presentation package. One can create/use handouts, slides and video clips. A cable connects the computer with video, camcorder and stereo for use in creating presentations. The process was demonstrated to be very fast. We watched a presentation being developed before our eyes!

ASTOUND for Windows allows one to integrate the power of multimedia. Sound, animated texts and graphs, and digital video appeared to be easy to add into presentations. Import of files from other presentation packages and from other sources such as clip art, etc., are an emphasized feature.

"No special training is needed...just a few clicks", according to Mr. Morgan. Any object may be animated; you can add digital video animation, sound and synchronized narration. You can save to disk(s) and send or hand to your clients with a full demonstration of what service or product that you offer. A user can even add interactivity by making any object button to control your presentation. Slides, overhead projections and video tapes are computer based. On screen presentations appear to be most welcomed as tools for instructors and public speakers. The sophisticated production that we have seen on television news, TV advertising, etc., appears to be available now to anyone with inexpensive equipment. The cost of the software is unbelievably low.

ASTOUND has menu bars, pull down and pop up menus. Robert Morgan feels that all the help that you need is on the screen available "for the clicking." ASTOUND can perform 3-D presentations (like you see with CAD). "The time line is the heart of the presentation. Much time is saved compared to other programs." Voice over editing is permitted. Mr. Morgan demonstrated by placing a graphic voice track on the screen. The "uhs" and "ahs" can be erased right on the graphics screen. Animation and graphics are very easy to do. One can put together a demo presentation disk to market your product or service and give out the disks. Minimum Requirement: ASTOUND; 486, 4MB (8 MB is better), 66 MHZ. Cost: ASTOUND: Retail, $399; Computer City $129. Gold Disk SPECIAL OFFER TO TPCUG $79.00 ASTOUND/Video Director bundle SPECIAL OFFER TO TPCUG $150.00

VIDEO DIRECTOR software. Plug you computer to camcorder or VCR. Video Director has three modes: Icon, Text and Graphics. A tape library is nice to work with. The video clip that you developed with ASTOUND can be selected to be saved on tape (you have already saved it to disk in the ASTOUND software). "Pull in the clips that you want. Click to make tapes. One can create the video clip, click the camcorder to make a video tape for replay on the VCR and go have a cup of coffee while your take is being recorded. Minimum Requirement: Video Director; 386, 2MB. VIDEO DIRECTOR; Retail, $199; CompUSA, $119, SPECIAL OFFER TO TPCUG $89.00.

Editorial Commment: See Kathrine Powell's excellent review article on Video Director, Ver. 2.0, in Bits of Blue, Jan., 1995 on Page 5.

Yep! The prices are a correct quote of Special Offer from Gold Disk.

Robert Morgan gave an excellent presentation of these two software programs. Comments were concise, understandable and meaningful. His demonstration was well planned. He is GOOD!

Robert Morgan and GOLD DISK donated the door prizes. We all appreciate this generosity. The following door prize winners appreciate them even more than the rest of us!

Jay Reese	MultiMedia Magic
M. N. Marteny	MultiMedia Magic
John Lucas	ASTOUND
M. N. Marteny	VIDEO DIRECTOR

Harvey thanked all for coming. He reminded all to return here (Ybor Room at HCC YBOR Campus, adjacent to the Administration Building) March 8, 1995, 6 PM. Bring a friend. Sign up a new member. Use the BBS.

SOFTWARE AVAILABLE FOR REVIEW:

WindowWasher - the Ultimate Optimizer for Windows with Intelligent Data Compression

Dashboard & Sidekick for Windows (Value Pak)- a convenient Push-Button Utility Panel for Windows and a Fast Functional and Friendly Personal Organizer.

OnFile -for Windows, Arranges your files into fun-to-use "notebooks"

Page Magic - 100 pre-designed templates for brochures, flyers, etc.

XtraDrive Lite - (Windows & DOS) Doubles your disk capacity. vendor: Integrated Information Technology

AnyView - Screen Commander for Windows

Your Deck - Design & Build How-to Software (Sunset)

Space Age - Arts & Letters 3 in 1 Software = Multimedia + Clip Art + Drawing

CA$HGRAF Office Plus - The World's Most Powerful Single-Solution Office Software!

SHERLOCK - The ultimate filing and retrieval system for Windows.

Jump*Start KINDERGARTEN - Knowledge Adventure getting a head start on education. (ages 4-6)

Kid's ENCYCLOPEDIA - The Random House (ages 7-12)

RUSA - Interactive Art Tour - St. Petersburg, Russia CDRom.

DO-OVER! - Change the look of Windows with a bonus utility to speed task switching.

CD ESSENTIALS- The Windows software utility that lets you automatically access, play and manage your CDs from Windows.

SPACE ADVENTURE- Knowledge Adventure up-to the moment exploration of outer space. (8-adult)

AVIATION ADVENTURE - Knowledge Adventure complete world of Flying (8-adult)

TuneLand staring Howie Mandel - Interactive Cartoon CDRom (ages 3 and up)

(Call 985-3338 for info on review software)

President's Column

Contributions

Thanks to GTE and Roger Waters for their generous contributions to the Tampa PC Users Group. GTE has an excellent program where they will donate a monetary amount to a non-profit group, 501(c)3, for GTE employees that perform work for that group. The donation is based on amount of the time that the employee volunteered his or her time. Roger, our 1994 Member at Large, helped out by getting the mail from our PO Box, contributing in the board meetings and helping out with many aspect of the regular general meeting. This help included membership enrollment and door prize drawings. In all Roger help whenever we asked. Of course it was really a pleasant surprise when Roger presented me with the news of the GTE program late last year. A couple months after filling out the paper work we received a check from GTE for $430. Our treasurer, Tom Cone, was ecstatic when he was told the good news. Of course he had not yet heard the other foot coming down. This foot represented approximately $700 dollars in bills which included a new six month lease at HCC, one year of insurance for TPCUG and the yearly corporate filing with the Government. Ouch. You can look at the TPCUG's 1994 financial statement in last months newsletter and see that it takes money to run a volunteer group. Thanks again to Roger and GTE. If you want to thank Roger or GTE, order an ISDN line or just add all the frills to your personal phone line.

Membership

Membership is growing. However, it will need to grow at a faster rate to achieve our goal of 300 members by year end. Remember the goal which I have asked each of you to fulfill, "bring one new membership to TPCUG this year". Short of donating your money, this is one of the best ways of keeping the TPCUG vibrant and alive.

Newsletter articles

While we have a good basic pool of writers for our newsletter, we sure could use some more. Please help by providing the editor with some of your experiences, tips or techniques. Additionally, vendors have provided the TPCUG with full working copies of software which is available for review. Find the section in the newsletter that list the products available and contact the editor if you see a product that you would like to write a review about. All articles submitted are eligible to be printed in our newsletter and placed on Tampa Bay Online via Prodigy. This means a circulation of over 6,000 readers and good exposure for us to the community and vendors.

Bargain table

The May meeting will include THE BARGAIN TABLE. Since our last bargain table meeting, donations of unwanted PC items have steadily been coming in. If you have any unwanted PC items that you would like to donate to the TPCUG please contact me at 962-2554 or 985-3338 and I'll arrange to have it

See **President's**...*Continued on page 5*

President's.. *Continued from page 4*
picked up. All proceeds benefit the TPCUG and may be claimed as a tax deduction.

Adobe Acrobat 2.0
It finally arrived. What is Acrobat you asked? Well it is a set of software products that will allow the TPCUG to distribute, and you to read, documents created or received by the TPCUG, in an electronic format without losing the documents original visual richness. This capability to read or print is available to those individuals using DOS, Windows, Mac or Unix. Our initial intention is to make the DOS and Windows Acrobat reader software available for download from our BBS. Once you have the readers, any PDF (Portable Document Format) document can be displayed intact with color and fonts. The same applies to printing. The initial idea is to produce the newsletter in the Acrobat PDF format. Then it can be placed on the BBS, Internet, Prodigy or wherever. Additionally, our flyers and other miscellaneous information can be electronically distributed. Look for the DOS and Windows Acrobat readers on the BBS in March and miscellaneous PDF files.

Look forward to seeing you at the meeting. Bring a guest.

Harvey Bruneau

Surfing the Halls of Congress

Newt Gingrich, new House Speaker and James Billington, Librarian of Congress announced the first of the year the availability of Thomas, a Congressional on-line public-access information system. Users worldwide can surf with Thomas, the halls of Congress, viewing such information as the full text of House bills, the House of Representatives Gopher, the C-SPAN Gopher and the text of the resolution adopting the rules of the 104th Congress. The Thomas Uniform Resource Locator is HTTP://THOMAS.LOC.GOV.

Software Review

Little Monster at School

Review By: James Hutton,
Tampa PC Users Group

I usually spend time reading stories to my children, but it was fun to have the computer read them this story. This program gave my children the opportunity not just to read a story but have the story read to them. And with the use of a mouse, touch the different area on the screen an make different things happen. It took me some time to get my computer back after showing my childern this program. The program is so easy to run that my children mastered it after the first time I showed it to them. I was very impressed that the program will also speak in two different languages both English and Spanish, giving them the opportunity to also learn a new language.

Little Monster at School tell the story of Little Monster and follows him from the time he wakes up, having breakfast, going to school, going to the different classes, and going home. This is truly a learning program for kids showing the words as the computer speaks to them. But also giving you the chance to go over the words as many times as you want. It also allowed them play with the different items on the screen to keep them interested and wanting to come back.

Installation was very easy with this being the CD-ROM version. This program will run completely from the CD-ROM leaving the much guarded hard drive space alone for other things. I like this because I am always looking for hard drive space. You must be running Windows 3.1 or higher, with DOS 3.3 or higher, have a 386 or better CPU, 4MB RAM, Super VGA video, Sound Blaster compatible sound card, and a CD-ROM drive. If your video is not set for 256 colors this program will not run.

If you have children between the ages of 4 and 11 this is the program they will thoroughly enjoy. But beware you might have trouble getting your computer back from them.

Mercer Mayer's/Living Books, Windows/CD-Rom, Cost $34.99

Software Review

PAGEKEEPER For Windows
Version 1.1 by Caere

Reviewed by Larry Anders, Librarian
Tampa P C Users Group, Inc.

If you've been computing for any length of time you probably have quite a collection of various electronic files. Whether you're a dedicated user of just one or two programs or use many different programs that save these electronic files to many different formats there is now a program that will index and organize your existing electronic files so that you can get more out of what you have stored on your PC or network than you ever thought possible. **PAGEKEEPER™**.

PAGEKEEPER from Caere is a revolutionary information management system that lets you collect information from virtually any source, store it on your PC or network hard disk, and access it on demand.

The Smart Way to Store, Manage, and Find Your Information

PAGEKEEPER

PAGEKEEPER has a built-in OCR (optical character recognition) that lets you scan text and images right into your PC (scanner required). When it's time to find a document, **PAGEKEEPER**'s advanced search and retrieval technologies will find what you want, even when you don't know exactly what you're looking for. You can forget about the hassle of searching through piles of printed papers or spending hours rambling through hard drives trying to tie a file name to some specific information you're looking for. With **PAGEKEEPER** you can have a library of information at your fingertips like, magazine articles with charts and graphs, data sheets with illustrations, even letters with signatures, all within reach. And once you've found the document you want you can actually *use* it. You can copy and paste parts of it into your working application. Export it using one of its many text or graphics formats. If you're on a network you can even share it with a friend or colleague using **PAGEKEEPER**'s built-in e-mail.

System requirements are :

- Minimum 386; 486 recommended
- 4MB memory
- Windows™ 3.1
- Scanner optional

PAGEKEEPER utilizes Caere's SuperCompression™ technology that lets you keep both the text *from* your document and the image *of* your original document. Documents with similar content can easily be found using Caere's Document Agent Search™ feature.

The program installs as most all Windows based programs do by selecting *Run....* from the *File....*menu and typing A:(or B)setup. The full installation requires over 10MB of disk space but 3 to 4MB can be recaptured if you erase the tutorial files after you feel comfortable with the operation of the program . **PAGEKEEPER** comes with an excellent tutorial that will quickly get you up to speed on:

- Creating and opening databases
- Working with information folders
- Viewing documents in their original format
- Viewing and modifying the contents of a document
- Performing different types of searches to find information you need
- Importing new documents into a database by either importing an existing file or scanning one directly into your folder
- Adding notes to your documents (which are searchable)
- Sending documents to other users on a network

PAGEKEEPER has a completely customizable Button Bar allowing you to execute the commands you use most frequently with the press of a button. Documents can be viewed in their native format including all original graphics or they can be viewed strictly in text format. The built-in OCR capabilities are some of the best and fastest I've ever seen, including spell-checking the entire document while the text is being recognized. **PAGEKEEPER** has the ability to scan several pages into one document. I installed this package on a 486/66 and the search capabilities were *incredibly* fast. **PAGEKEEPER** will search for all occurances of your search criteria or restrict its search to only the document(s) that contain(s) all the criteria. Whatever notes you may have attached to the document can also be searched for. **PAGEKEEPER** displays anything that is relevant to your search, but to make your task easier it ranks them in order of importance - using colors. Once you have found the documents you need, they can be stored in a separate folder so you don't have to search for them again. These documents can then be cut and pasted into any other Windows application or exported to any of *59* different formats.

If there is a down side to **PAGEKEEPER** its the disk space needed to save both the original scanned image and the text file. Although the files are saved in a compressed format it still requires ample disk space to accomplish this and **PAGEKEEPER** will not allow you to delete the original graphic-based scan. But, if you're a serious PC user, with lots of data to access and manage, a $250 investment for a new half-gigabyte drive is well-worth the advantages and cost of **PAGEKEEPER**. Street price for **PAGEKEEPER** is approximately $399.

Virtually anyone who works with printed words and images will find that **PAGEKEEPER** can help them use information better and faster than ever before.

Caere Corp. , 100 Cooper Court, Los Gatos, CA 95030, 1-800-535-SCAN. ■■■■

Software Review

WinSense Version 2.0

Review By: Jim Clark, Tampa PC Users Group

What It Is: Created by SoftLogic Solutions, Inc., and now owned by EWARE, WinSense is a program to optimize MS Windows to provide best performance and to improve the user's knowledge and understanding of the Windows program. I emphasize that this is a Windows optimization/information program, not a diagnostic program; WinSense does a lot of nice things to optimize Windows performance, but it does not seek out and identify Windows problems. Specifically, it:

- Automatically looks at your hardware and examines existing Windows settings in light of a user profile that you input at installation, and makes specific recommendations on 43 different Windows option settings to help optimize Windows performance. The program submits these recommendations to the user for approval and/or change as one may desire, and will then automatically make the changes, as approved and/or modified by the user, in the Windows INI files. In addition, the program creates and makes available to the user advisories on a number of Windows option settings, 12 in my case, including advice on swap file size. Any action resulting from the advisories that one chooses to implement will not be done automatically by WinSense, however. Both the list of recommendations and the advisories may be printed out.

- Provides the capability for easy viewing and safe editing of all Windows INI files. One need not be knowledgeable on how the INI files are laid out for WinSense provides a search feature that allows locating the appropriate section of any INI by: Subject (appearance, etc.); the program involved (i.e., Word for Windows); by INI file and section within that file (i.e., Desktop), or by the option keyword name. The default setting and the range of possible settings is shown for each option. When viewing/editing any Windows option setting one has immediate direct access to the Knowledge Base for an explanation of that option. The viewing/editing feature can also be used with any text file (no larger than 65K), including INI files for non-Windows programs. It also provides the capability to view and compare different INI files, or different copies of the same INI file.

- Provides an INI file management system that automatically makes changes to INI files after you have made all changes to any INI file in WinSense, and backs up those Windows INI files and others which you have told the program to back up. WinSense retains in back up files copies of each of the last 9 versions of each Windows INI file; the user can view, compare and/or restore any of them at any time. The program also allows the user to create and name a 'permanent' backup set that the user can restore at any time. While WinSense does back up all changes to Windows INI files that one may make daily or several times a day (i.e., printer selection, desktop colors, and other frequently changed minor adjustments) to its backup files, such minor changes would not be reflected in the 'permanent' backup set; hence, one would have available a base set of files available at all times.

- Provides a large WinSense Knowledge Base to explain and help understand over 350 Windows option settings. It also provides descriptive narrative of the Windows functions and is tied directly and in context to the view/edit feature described earlier. The Knowledge Base is always available, is context sensitive when viewing/editing option settings, and comes complete with direct access cross referencing, a glossary and definitions. Some of the information may be considered rather basic by some 'old hands' at Windows, but newcomers, novices and intermediates like me will find it helpful in having ready access to explanations of Windows options and settings, and an easy way to locate and modify those option settings.

The program allows for a great deal of individual customization and many aspects may be changed at any time, including the user profile. In fact, one should change the user profile when any significant change is made in the hardware or use of the computer. It also provides the capability to create custom menus and even offers an option to reduce some of the detail the program provides by default; that is, 'experts' can make the screens more terse and less cluttered. One can also use WinSense to view, edit and backup non-Windows INI files as well.

One should update the user and system profiles every time there is a major change in hardware or software, or there is a change in the user profile, and then have WinSense look at the Windows settings again in light of those changes. WinSense will than produce a new set of recommendations for Windows option settings. While I am not sure that the options WinSense has given recommendations for on my computer is standard on all computers, it makes recommendations on 43 option settings in my computer and gives advice on 12 more. Those option settings cover a wide range, but leaves potentially some 300 options settings for which it makes no automatic recommendations. However, all may be viewed and edited in WinSense, with the Knowledge Base immediately available to provide an explanation of and information on them all.

Installation: WinSense comes on two 3.5" . HD floppies. The program is installed using normal Windows program installation procedures and installation is simple, clear cut and quick One will be prompted to verify directory location and name for installation and asked to com plete a profile which seeks to identify certain aspects of how the computer is

See **WinSense....** *Continued on page 8*

WinSense....*Continued from page 7*

equipped and will be used (i.e., network, CD-ROM, and primary and secondary uses). During the installation process WinSense automatically takes inventory of the hardware, examines all Windows INI files in the context of a user profile completed earlier in the installation and makes recommendations at that time for all of the settings it reviews.

Documentation: The program is pretty well documented in its 108 page manual. Context sensitive on-line help is available from most areas to give help on using WinSense. In addition, the Knowledge Base provides an explanation of Windows option settings and functions which should prove helpful to all in dealing with Windows, especially those who are not Windows technocrats. The Knowledge Base is available at all times in WinSense. Technical support is free, but is available only via regular long-distance lines.

Requirements for WinSense are minimal: Any IBM-compatible 286 or higher CPU, Windows 3.1 or later version, and a 3.5" floppy drive for installation purposes. While the manual states a requirement for 2.5 Mb of hard disk space, program files take up 2.8 Mb of space on my computer, plus additional space is required for the backup copies of the INI files. WinSense is compatible with major popular disk compression programs, such as Stacker.

Cost: WinSense is not readily available at local software outlets but may be special ordered from Egghead Software, and other major software retailers, or perhaps directly from EWARE (though there is presently no 800 listing for them). Currently, the special order price at Egghead for this version is $49.95.

My View: A useful utility program that will insure that one has backups of current critical Windows INI files, will assist in getting the best performance from Windows, and provides a ready source of information and guidance on Windows functions and option settings. It is not a panacea, nor a trouble shooter, however. It also provides a relatively easy means of getting to the appropriate section of the appropriate INI file for viewing and editing. All of the files that WinSense will view and edit can be viewed and edited by other means, of course. Similarly, all of the information that is available in WinSense is also available from other sources. But WinSense pulls all of this together to a single source and on one screen, and makes the entire process a lot easier, quicker and much less frustrating. I will retain and use WinSense on my computer. It is likely that as the program becomes more widely known it will become more readily available at a more popular price. For additional information, contact:

Software Review

First Aid for WindowsVersion 1.2

Review By: Jim Clark, Tampa PC Users Group

What It Is: The name appropriately indicates the function of the program — created by Cybermedia, Inc., it is a program designed to find problems in the Windows environments and for certain Windows applications, and then helps with the resolution of those problems by recommending solutions and fixing many of the problems, if you so desire. The program consists of 2 main components: First Aid, and the First Aid Monitor.

From the First Aid component, the main operating component, one inputs setup information tells the program what hardware and applications are installed and what checks are to be made. How the Monitor operates is also controlled from this component. Here one can have the program create an inventory of the computer's components, including software applications supported by First Aid; the inventory can then be viewed and/or printed out. First will, on command, perform checks and report problems in 6 areas - Windows environment, Printing, Applications, Multimedia, Performance, and Network.

- In the Windows environment, the program checks the setup of fonts, the display setup, and mouse and keyboard to insure that appropriate drivers are installed and the configuration is reasonable; File Manager for appropriate file associations; Program Manager for appropriate setup of groups and icons, and their relationship with programs they represent; and Application Embedding to determine the existence and validity of OLE and DDE links.

- In the Printing area, First Aid checks to insure that appropriate drivers are installed and that Windows is configured to use installed printers. It does not, however, actually check the printers for operation.

- In the Applications area, First aid includes the capability to check and report setup and internal problems for a number of select popular major applications. It will check and report problems with the setup of all the components of each application that you select. This version of First Aid supports: Lotus 1-2-3, ver. 4.0; Access 1.0 & 1.1; Ami Pro 3.0+; cc:Mail 2.01; CorelDraw 4.0; Excell 4.0 & 5.0; Freelance Graphics 2.0+; Harvard Graphics 2.0; Improv 2.1; MS FoxPro 2.5; Paradox 4.5; Power Point 4.0+; QuatroPro 5.0; Quicken 3.0; MS Word 5.0 & 6.0; Word Perfect 6.0; and MS Publisher 2.0. (The '+' following the version # indicates subsequent decimal upgrades of that version are included.) (I seem to recall that during reading of the manual and exploring First Aid I came across info

See **First Aid....***Continued on page 9*

First Aid... *Continued from page 8*

that indicated support for later versions of these applications could be obtained from Cybermedia, but I could not find no such reference when it came time to write this review.)

- First Aid Multimedia checks include all device drivers, including actual operation of them and the components they drive: Sound, video, attached musical instruments, if any, and CD-ROM. Each of these to be tested must be configured in First Aid, including a musical CD in the CD ROM drive, before First Aid can check them.

- In the Performance area, First Aid can check the SMARTDRV caching utility settings for efficiency (but it does not recognize other caching utilities), virtual memory settings for adequacy for the system, and for the presence of an expanded memory manager. The program can also be set to warn if Windows GDI or User memory falls below a user-selected level.

- The Network feature of the program support only Novell Network and Windows for WorkGroups at the present time; it will operate only partially or not at all on other network systems. For compatible systems it will check and report problems relating to the network drivers, mapped drive changes, network printing capability, and accessibility and availability of the server(s).

Problems identified by First Aid in conducting these checks are reported in a Problem Panel window. The Problem Panel can be divided into 2 windows, with one window showing the basic problems and the other showing more detail of contributing factors; alternatively, one sees only the basic problem window. Here one can select Diagnosis for any given problem reported and get another window which again shows the selected problem, but it also shows solution(s) to the problem. One then has the choice of having First aid automatically fix the problem; the user manually fix the problem by selecting, in turn, one or each of the solutions offered; saving the solution to disk; asking for more detail about any of the solution(s) offered; or dismissing the problem.

The First Aid Monitor is, in effect, a Windows TSR. If configured in First Aid and setup to load when Windows is started, it will monitor operation of all of the features supported by, checked and set up in First Aid and report to the screen when any problems are encountered. It can even be configured to automatically correct problems it supports when those problems occur; however, I suspect that most of us would prefer to review the problem and proposed solutions before action is taken.

Installation: Simple, clear cut, easy and quick. First Aid comes on two 3.5" HD floppies. Follow the normal Windows application installation procedures, answer a couple of questions about owner, SN and location, and very shortly First aid will become a part of your system. It also provides an uninstall capability should one ever want to remove the program.

Documentation: The small owners manual is comprehensive and clear regarding loading and use of First Aid. The explanation for using all of its features is clear and adequate. Context sensitive on-line help is also available; a little basic in some areas, it is still quite useful. Moreover, First Aid Help also includes a HelpDesk option which provides access to a rather extensive Knowledge Base that offers considerable detail on Windows settings and relationships; again, a bit basic in some areas, but very helpful for the less experienced. Technical support is free, but is available only via regular long-distance lines.

Requirements for First Aid are minimal: Any IBM-compatible 386 or better, DOS 5.0 or above, and Microsoft Windows 3.1 or later. Program files use a little less than 3 Mb of hard disk space.

Cost: List price of First Aid is not known by me, but I have seen advertised prices in the $35 range.

My View: While I have a good bit of experience with computers, I am far from an expert in computers and I find First Aid a very useful and helpful program and worth the money; I would think that Windows novices would find it most helpful. I have not encountered any significant problems since installing First Aid, but it has been most helpful in cleaning up a good bit of residue and in correcting several settings in Windows. It is a program I intend to keep on my system.

The one problem I have with First Aid is that the text in the Problems and Solutions windows is tiny and I have difficulty reading it, and there is no way to zoom in to make the text larger. Larger text and/or a capability to enlarge the text would bve very helpful

For additional information, contact:

Microsoft has its own **BOB!**

Bob, was once known as Utopia. It is Microsoft's latest product, designed to reach the computer beginner or novice. **Bob** sits on top of Windows and uses an interface similar to the rooms in a home were cartoon characters tell you how to maneuver around in your computer's applications. For an example, click on a piece of paper on a desk and **Bob** launches a scaled-down version of Word for writing.

Bob's street price is around $100. It includes a calendar, an address book, e-mail, a personal finance program, a household manager, a guide to financial information and a geography game.

Six reasons why 1-2-3 for DOS users should upgrade to 1-2-3 or Excel for Windows

by Mike Murach

When I upgraded from 1-2-3 for DOS to 1-2-3 for Windows, Release 4, I did so with no enthusiasm and considerable reluctance. After all, I was a master of 1-2-3 for DOS, and it let me do everything I wanted to do. So why did I need the new program? And how many hours was it going to take with the new program just to get back to where I was with the old program?

If you have the same misgivings about moving to a Windows spreadsheet program, here are six reasons why it's worth taking the time to upgrade. This assumes, however, that you have a 486-based PC or better; otherwise, you probably won't be happy with the speed of your new program. This also assumes that you're going to upgrade to Excel 5.0 or 1-2-3, Release 4 or 5. If you upgrade to one of the earlier releases, the reasons for upgrading aren't going to be as obvious or as compelling.

1. The new interface helps you work faster

Studies show that a graphical user interface like the one for 1-2-3 or Excel for Windows can help you work from 25 to 50 percent faster than you can with a DOS interface. This is true whether you prefer to use the keyboard or the mouse. As you start to work with your new program, you'll discover better ways to move and copy cells; better ways to format or align the data in cells; better ways to change the font or font size; and on and on and on. In fact, improved productivity may be the best, though least obvious, reason for upgrading to a Windows spreadsheet program.

2. You can simplify your work by combining two or more worksheets in a single file

With either Excel or 1-2-3 for Windows, you can keep more than one worksheet in a single file. For instance, you can keep 13 budget worksheets in a single file: one for each month of the year and one that summarizes the data in the 12 other worksheets. This feature lets you organize your data in a way that simplifies your work. In particular, you no longer have to keep related data in separate files, and you no longer have to create huge worksheets that consist of several versions of the same items of data.

3. The formatting, layout, and printing features make you look good effortlessly

With either Excel or 1-2-3 for Windows, it's easy to format a worksheet with special fonts and font sizes, vertical and horizontal lines, and shading or colors. It's also easy to lay out the pages so they print horizontally instead of vertically, and it's easy to size a worksheet so it prints on a single page. You can do all this with just a few clicks of the mouse, and the result is better looking worksheets that are easier to read and understand.

4. The charting feature is a joy to work with

With 1-2-3 and Excel for Windows, it's easy to create, format, and print charts in a wide variety of forms. If you currently use 1-2-3 for DOS to prepare charts, this is reason enough to upgrade. The Windows programs are that much better.

5. The learning curve is more like a molehill than a mountain

When you start Excel or 1-2-3 for Windows the first time, you may want to turn it off and go back to 1-2-3 for DOS. For me, it was that overwhelming. But if you stay with the new program for a few hours, you'll find that it's much easier to use than 1-2-3 for DOS. And when you want to learn a new feature, you'll find that's a lot easier too. Besides that, both Excel and 1-2-3 for Windows make it easy for you to convert your 1-2-3 for DOS spreadsheets to the new format.

6. This may be your last significant conversion

The latest releases of Excel and 1-2-3 for Windows are major improvements over 1-2-3 for DOS. The new programs are so good in fact that it's hard to imagine any significant functional improvements in the next decade. In addition, it certainly appears that the windows interface is here to stay whether it's in the form of Macintosh, OS/2, Windows NT, or Windows 95. As a result, there shouldn't be any significant operational changes in the next releases of the Windows spreadsheet programs.

What this means is that you may never again have to make a significant conversion to another spreadsheet program. Yes, there will be some trivial differences in operation as you move from one program or operating system to another. And, yes, there are bound to be some new features that you'll want to try in future releases of the programs. For the most part, though, the skills that you learn as you upgrade to Excel or 1-2-3 for Windows will be the skills that you use for at least the rest of this decade.

This article was written by Mike Murach of Mike Murach & Associates, Inc. Mike's company has published four books on spreadsheet applications including The Practical Guide to Lotus 1-2-3 for DOS *(releases 2.X and 3.X)*; The Essential Guide to 1-2-3 for Windows, Release 4; *and* The Essential Guide to Excel 5.0 for Windows. *To order, call 1-800-221-5528 and mention this article to get your User Group discount.*

Microsoft Access SIG

The Access SIG meeting will be on March 16, 1995, at the Dun & Bradstreet Software office, located at 3903 Northdale Blvd., Suite 113E, (look for the burgundy awning for the entrance) Tampa. The door locks at 6:00 pm, however, we will have someone keeping an eye out for late arrivals. PLEASE SIGN IN WITH A SIG LEADER.

PeopleScheduler® Plus 2.0, the perfect solution for employee profiles, attendance and schedules!

Regular Price $129.00
User Group Discount - $50.00
Your Price $79.00

Special User Group Offer!

PeopleScheduler Plus improves work schedules, employee time, attendance, and your bottom line! PeopleScheduler Plus works the way you do, by letting you choose the schedule names by shift types, job and workgroup names, time and attendance codes, and more. PeopleScheduler Plus will organize all your employee information, and tie together scheduling, time and attendance, and time away planning.

✓ **Save hours of precious time.** TimeVisualizer lets you do "what-if" scheduling and our Breaks AutoScheduler® takes the pain out of creating break schedules.

✓ **Avoid costly conflicts.** Our software automatically catches schedule conflicts and alerts you early – before trouble starts!

✓ **Create high quality reports.** You will produce high-quality schedule reports in minutes that would take hours to produce by hand or with a spreadsheet. You get pre-defined management reports that organize employee files, track time and attendance records, time-away plans, and more. You can also export data and create customized reports.

✓ **It's that simple.** You can import your existing employee data, and take advantage of our Coaches to speed your start up.

PC Tools *for* Windows 2.0

Review by: Alford Poole, Tampa PC Users Group

All men know the utility of useful things,
but they do not know the utility of futility

(Chuang-tzu 369-286 B.C.)

Pre-crash warnings, performance boosters, productivity enhancers, file management, disk analysis and repair, hard disk backup, and virus protection are the guts of Central Point's PC Tools *for* Windows. To give you an idea of the massive scope of this utility package, there are 14 printed pages of "What's new for v2."

Installing PC Tools *for* Windows is involved. Along the way you rebuild your desktop, create an Emergency Disk, schedule PC Tools *for* Windows programs (Backup, Diskfix, AntiVirus and Optimizer), convert Norton, Fastback, MS-DOS backup files, and go through PC Tools Windows Configuration. The installation takes up to 18 Mb of hard disk space. If you have a memory manager you will probably need to reoptimize. Using the full install, my Windows initial loading time went from 13 seconds to 36 seconds. Time to unload some more fonts! If you use the Quick Launch feature for your applications plan to make a few return phone calls or wash the breakfast dishes during initialization.

The PC Tools *for* Windows Desktop is similar, yet very different to the familiar Windows Desktop. Among the additions are a disk drive button bar, menu button bar and a CrashGuard bar that display resources used and the time and date. This is useful if you are running low on disk space.

Using Central Point Screen Capture was an educational experience. You probably knew that when you cut or copy something from a Windows document it goes to the Windows Clipboard. Screen Capture images can also go to the Clipboard and then be edited with Windows Paintbrush. My experiments with capturing images to file resulted in large bitmap files (400K+). Pasting the Clipboard images to a document uses much less disk space.

Central Point offers several support options: Basic Access - 30 day complimentary phone support then you have the following options: AccessOne - $25 pay per call (toll free), Access Plus - $129 single user annual plan (toll free), there is also a CPS Bulletin Board, TTY/TDD service for the hearing impaired, CP SOLVR Voice Response (Toll Free), FaxBack, CompuServe, or America Online.

Besides the CrashGuard tool bar, System Consultant and File Companions are new for this version of PC Tools.

System Consultant recommended five changes to our system: 1) Turn off INT28 Critical Variable in SYSTEM.INI, 2) Reduce BUFFERS (to 10), 3) Use Print manager, 4) Enable 32 bit disk access and 5) change Swap File from Temporary to Permanent. Changing 1, 2 and 5 was quick and reversible if the results were not good. I left 3 and 4 because I use another print manager and have vague remembrances of not good experiences with the 32 bit disk access engaged.

File Companions are file management tools and are available with a click of the right mouse button or from windows where the little open file drawer icon shows up. These fall in the "nice" category. Nice if you take the time to learn how to use them to copy, delete, move, etc. your files. Once learned they will save a trip to File Manager.

The AntiVirus program scanning must be very thorough, it took a lonn-g-g-g time to do 120MB of files. VWatch (installed at boot up so it works with DOS also) caught a virus on a floppy before it could do any damage. For $49 you can get Central Point's Continuous Anti-Virus Protection Service.

Using the Move feature in File Manager got some interesting results: trying to move C:\MAIN\UTIL*.* to E:\MAIN\UTIL where E:\MAIN\UTIL already exists got the message "E:\MAIN\UTIL\UTIL does not exist, create it?" After several attempts with the same results, I went to DOS and was successful. The manual says the move works for moving files or directories on the same drive. My fault, I wanted to move stuff to another drive!

By the way, the 885 page manual is well written and on-line help and a tutorial are available for those new to the Tools.

Other neat touches: Deleted files and their recoverability status (from Excellent to Destroyed) can be viewed when listing files. Zipped files are treated as directories so individual files are listed. File viewer can be used to see contents of most files.

If you like rearranging your living room or bedroom furniture then this utility package is for you. Your desktop will look different plus you'll have a whole basket of new toys to play with. The File Manager enhancements alone are worth the upgrade price. Recommended for anyone who wants Windows to work better or needs a utility package of good tools to handle system maintenance. A teenager might say, "This is an awesome package!"

Minimum System Requirements: 386 CPU, Microsoft Windows 3.1, 4MB RAM (8MB recommended), up to 18MB free disk space, and Microsoft Windows 3.1 compatible mouse.

If you already have an older version of PC Tools, Norton Desktop or Utilities, Fastback, XTree or HP Dashboard then you can get the PC Tools for DOS (version 9) or Windows version 2.0 Universal Upgrade for $49.99 at CompUSA. If you don't have one of these packages then the price is $99.99.

Microsoft Access® Solutions Pack

Version 1.0

Microsoft Access Solutions Pack for the Windows™ operating system has four ready-to-run, business applications that you can use with Microsoft Access version 2.0 to track your sales, fixed assets, service requests, and events. Our design goals for this product are threefold:

- To create applications that are fully functional, so you can use them for your own business needs right out of the box.
- To create applications with helpful sample databases and documentation, so you can learn even more about Microsoft Access.
- To create applications with code samples that can help you design your own custom solutions with Microsoft Access. You can also extend the functionality of the packaged applications for your own needs or for others in your organization. Microsoft is partnering with those customers who are interested in supporting and extending these applications.

Sales Manager

Sales Manager is designed to make storing, tracking, and finding information about sales contacts and business opportunities simple. With its help, you can:

- View detailed information about sales contacts and their companies.
- Identify sales opportunities and coordinate campaigns to win them.
- Generate mailing lists targeted to reach contacts in a particular company, department, or city.

Asset Tracker

Asset Tracker helps you keep track of all the tangible, nondisposable items a growing business needs to remain competitive in today's world. With its help, you can:

- View detailed, up-to-the-minute information about your assets.
- Trace an asset, or group of assets, to a specific location, department, or employee.
- Generate reports that list the current status, value, and location of your assets.

Registration Desk

Registration Desk is designed to make event registration speedy and efficient. With its help, you can:

- Create a customized registration process in minutes.
- Sign people in and out quickly and track when each registrant arrives and departs.
- Print identification badges for registrants automatically.

Service Desk

Service Desk will help you manage service requests from receipt to completion. With its help, you can:

- Enter new service requests and assign due dates and staff to work on them.
- Prioritize service requests and manage the queues they are assigned to.
- Communicate with requesters via acknowledgment, late, and completed notices.

Purchase information

Microsoft Access Solutions Pack is scheduled to be available through resellers or direct from Microsoft in the spring of 1994. Suggested retail price is $64.95. Requires Microsoft Access 2.0.

WHY MICROSOFT WINDOWS 95 MAKES SENSE FOR TODAY'S PC USER

Easiest Windows operating system yet.

Navigate your system quickly with powerful new tools:

❖ *The Start button and taskbar are your primary jump off points* for working with program and documents, and they are always visible, even when applications are open full screen.

❖ *Windows Explorer* unites File Manager, Program Manager, Control Panel, and Print Manager from Windows 3.1 into a more efficient tool for browsing and managing your PC's resources.

❖ *Natural, full-length filenames*. File-names can be up to 255 characters long, making it easy to find what you're looking for.

❖ *Plug and Play frees you* from manually setting up hardware devices. Windows 95 detects and configures Plug and Play, compatible devices automatically.

❖ *Customize and use resources efficiently.* Just click the right mouse button wherever you're working, and a context menu appears in order to help you manipulate objects directly.

❖ *Microsoft Exchange is your one-stop inbox* for viewing and working with such things as: Electronic mail from multiple sources, faxes, documents, and bulletin boards.

❖ *Automatic file synchronization.* Windows 95 Briefcase automatically updates files between two PCs. so you can easily keep files on your portable PC in synch with your desktop PC or the network.

A Faster, more powerful Windows.

❖ *Increase your productivity.* A 32-bit architecture delivers better performance and reliability in areas such as networking, printing, communicating, and multimedia.

See **Why '95.** *continued on page 11*

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII file or in a commonly available word processor format, such as WordPerfect 5.2, or Ami Pro 3.0 on diskette to the editor at 9402 Hidden Ridge Place, Tampa, Florida 33637 or send it by modem to BBS (813)239-3704.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

The use of trade marked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted at the following rates:

	1 month	3 months	6 months
Full Page	$60.00	$162.00	288.00
Half Page	$40.00	$108.00	$192.00
Quarter Page	$22.00	$60.00	$106.00
Eight Page	$12.00	$33.00	$58.00
Business Card	$10.00	$27.00	$48.00

All advertisements must be prepaid by check payable to TPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if it is not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, Marylee Bruneau at (813) 985-3338, for space availability and for further information.

This newsletter is created with PageMaker 5.0 from Aldus Corp. and Corel Draw from Corel Systems.

SECRETARY'S REPORT

TPCUG MEETING 3/8/95, 6 PM
Ybor Room, Hillsborough Community College,
Ybor Campus
Minutes and Comments by Bruce Register

Harvey our president, called the meeting to order. Comments and information was given regarding SIG, vendors and miscellaneous.

SIG

March 16, 1995, 6 PM Promptly. SIG-Microsoft Access. 3903 Northdale Boulevard, northeast corner of Mapledale and Northdale Boulevards. Reservations are closed due to limited seating. First signup first served! Next SIG-Microsoft Access is same place, April 20, 1995, 6 PM (sharp-Security Officer must permit entrance at the rear entrance of the building). Sign up early. Use Bulletin Board.

March 28, 1995. OS/2. Contact John Lucas for time, place and openings/signup.

March 28, 1995, 6 PM, Promptly, SIG Internet. Contact Charles Howe. Seats are available. You can use BBS to signup. Promptness is required because security at Reflectone is tight and required. From North Dale Mabry, go west on Waters to TAMPA WEST sign on the south (left) side of the street (if you pass Anderson Road, you have gone too far), turn south at TAMPA WEST sign, go one block to dead end, turn right one block and take a "forced" left turn, go south about a half block to north entrance of Reflectone Building. You must enter north end and be prompt at 6 PM because security will unlock door and escort us to the meeting room.

If you would like to have a particular SIG, let President Bruneau know your interest. President Bruneau wants your opinion. He reads BBS regularly. Send him a message.

A two day SIG regarding basics and BBS, etc., is in talking stages. Connie KIncaid is thinking that the interest in overviews of PCs, DOS, Hardware, etc., is strong enough to warrant the effort to bring us this educational and functional SIG. What a treat for us neophytes and for the more advanced. Let Connie and Harvey know of your interest.

Harvey asked for VOLUNTEERS to call non-renewal members to encourage them to continue being a member by paying the low, low dues.

Harvey strengthened the reminder that the goal in 1995 is for every member to bring in at least one new member.

There is a new store in town. CompuAmerica. See the USER FRIENDLY newspaper for more information.

See **Minutes** ....*Continued on page 3*

Minutes....*Continued from page 2*

Harvey presented Adobe Acrobat. He demonstrated how to download ACROREAD file and how to read the BITS OF BLUE newsletter through BBS. He says software download will take about 15 minutes. You can click anything in BITS OF BLUE; you can go right to the article and then you can print it, even in color if you like. You can click on an article and move it around. Harvey has put in tabs for "hot links". If you want to download BITS OF BLUE instead of receiving it in the mail, notify the Editor. You can use TPCUG Bulletin Board (BBS) to access it.

TPCUG paid for ADOBE ACROBAT but you can download ACROREAD without license/registration problems.

Harvey plans to put BITS OF BLUE on PRODIGY and ON LINE AMERICA.

Contributions to Bulletin Board will continue to be accepted.

The Editor of BITS OF BLUE will surely appreciate receiving quality fillers for BITS OF BLUE.

SOFTWARE VENDOR DEMONSTRATION

Mr. Andrew Domnauer, District Sales Manager, CAERE CORPORATION, Atlanta, demonstrated OMNI PAGE AND PAGEKEEPER. CAERE has five OCR products. He stated that OMNI PAGE PROFESSIONAL is a high end product. Wordscan and OMNI PAGE are middle line; others are OMNI PAGE DIRECT and WORD SCAN.

He demonstrated scanning a page with graphics, using different sizes of text and also multiple columns. He emphasized and showed the ease of doing this. He said, "This OCR product holds the format in place" You tell OMNI PAGE the scanner product that you are using and OMNI PAGE recognizes text in 6 to 72 points.

When you bring in text, apply text editor to spell check. OMNI PAGE even reports the "success of the scan accuracy." Graphics sharpens images in an easy format. You can add special effects to your work. The program has the ability to retain or hold the "look and appeal" of the original document. You can save the document in your word processor application such as WordPerfect 6.0. You can fax the image. You can scan and use DEFER OCR to editor at a later time. A feature called 3DOCR helps clarify when the original document is "not to good." PAGEKEEPER , requires 7 MB to install, is a database program with OMNI PAGE built in. You can retrieve information from virtually any source. Special dealer price is available to TPCUG members. We are very grateful to Mr. Domnauer and CAERE CORPORATION for the demonstration and for the software that they contributed for door prizes.

COMMENTS by various members for our benefit and edification:

THE TPCUG BARGAIN TABLE will be presented at the MAY meeting. That particular meeting will be across the street from our regular meeting place in the auditorium due to the need HCC has for our May meeting night. Harvey asked us ALL to look around for LEGAL software, hardware, connections, etc., that you might like to contribute. Please look around now! Everybody gains. TPCUG gains!

TUBOTAX and TAXCUT have been reported to have some problems.

MICROSOFT Resource Guide at a cost of $19 is a good source for help with unique problems.

Winners of the door prizes were:

Merle Nicholson	Pen Set
D. A. Clary	T-Shirt
Larry Anders	T-Shirt
Margaret Petros	WINSENSE
#177 Sec'y got ticket but didn"t get name.	PAGEKEEPER 2.0

Remember our long time friend and contributor to TPCUG Ed Buzza. He has been ill. We have missed Ed's presence.

President Bruneau thanked all for coming. He reminded all to return here (HCC YBOR Campus, ADM Auditorium) April 12, 1995, 6 PM. You will not want to miss DELRINA's presentation. Who knows what great door prizes await TPCUG members. Only members are eligible for opportunities of receiving door prizes. Bring a friend. Sign up a new member. Use the BBS.

News Briefs:

Acquisition approved
Stockholders of U.S. Robotics, Inc. approved the Skokie, Ill., modem maker's acquisition of Megahertz Holding Corp. The two companies will now operate under the names U.S. Robotics Access Corp and Megahertz Holding, Inc. and be subsidiaries of U.S. Robotics Corp.

OS/2 Warp to go in 300 Bank of Boston locations.
This will be more than 2,000 PCs and 600 servers. The IBM computers will be powered by Intel 486DX2/66 MHz chips. Multitasking capabilities was a big reason for using OS/2 Warp, plus it supports Bank Pro, a software program Bank of Boston wants to use to improve service.

President's Column

InPut + PutIn = Winner

As always your InPut is welcomed. Whether it's on how we can grow our group, make better use of our general meetings, the BBS, the newsletter, SIGs or whatever you think is needed to nurture our group into a healthy organization, please share your thoughts with a board member. While InPut is a healthy thing for an organization please remember that it is only the first part of the equation. More often than not it requires a second step which I call PutIn. By this I mean that a new idea generally requires individuals to PutIn time to bring ideas or projects into reality or bear fruit. In a volunteer organization there are many excellent ideas that surface as InPut but too few individuals who PutIn the time to accomplish them. When this happens the formula looks more like ***InPut - PutIn = Loser***. Wouldn't it be great if all good ideas turned out to be Winners instead of Losers. Until we have more people who PutIn, the officers will not be able to implement or accommodate all good ideas. However, we can always listen or review opinions and ideas from members and nonmembers alike and hope that someone will volunteer to PutIn. Will you?

Thanks to the volunteers

At last months meeting Marylee, our Editor, requested volunteers from the membership to create a temporary task force. The task for these volunteers was to contact members whose membership had expired in the months of January, February and March and remind them that their membership had expired and get them to either renew or determine why they did not want to rejoin our group. In all the there were 41 members expired of which most were single memberships. We had five volunteers step forward and offer to help. I want to thank each one of you for contributing your time to help the group. The results of the task force were both positive and informative. As a result we will be creating a formal task force whose function is membership retention.

Bargain table

A reminder that the May meeting will include THE BARGAIN TABLE. The bargain table will consist of computer related items. If you have any unwanted PC items that you would like to donate to the TPCUG please contact me at 962-2554 or 985-3338 and I'll arrange to have the items picked up. **All proceeds benefit the TPCUG and may be claimed as a tax deduction.**

Special Interest Groups

A reminder that we currently have three SIGs. They include OS/2, Internet and MS Access. See the SIG section in this newsletter for specific information on each group.

We are currently in the process of rescheduling the Internet group to a different night. This is due to a scheduling conflict with the OS/2 SIG group which meets on the same night. Many members have stated that they would like to attend both SIG meetings. Charles Howe will discuss the change with the Internet group and determine the new meeting day. The change should become effective by the May meeting. Up to date information will be presented at future general meetings and be posted on the BBS and in the newsletter as it becomes available.

A new SIG, **PC Fundamentals**, will be available in June and focus on educating attendees on the basics of PC hardware and software. While this group is in the SIG category it will follow more of a traditional classroom curriculum and thought by our own Connie Kincaid. Due to limited seating and a balanced teacher/student ratio, enrollment will be limited. However, this two month class will be repeated several times during the year.

Harvey P. Bruneau, President

TTTT

GOOD NEWS FOR DOS LOVERS --

IBM forsees a great opportunity awaiting them to develop a DOS up-grade. They will attempt to fill the void left by Microsoft, who has chosen not to continue the development of MS-DOS up-grades.

PC-DOS 7, is now in beta, and is commited to trimming memory needed to run the system, leaving as much as 70 KB of extra memory for other drivers and applications. Lotus Development and Novel will continue to invest in DOS.

So 50 million plus DOS-only users will not be left in the dust.

Book Review

Internet in Plain English

Book Review by Hugh Bayless, MBUG

This is the book that made me realize that there are still many areas in which I am totally ignorant. Internet is one of those areas _ you need to learn a whole new language in order to even know what people are talking and writing about. Bryan Pfaffenberger has done very well in writing a book to help people like me, who only speak English, to learn to speak, think and read Internet.

There are many books that explain how to use Internet, but this is the first one I've seen that explains the language you have to know before you can fully understand what the authors of all those Internet books are talking about when they discuss Gopher, NIS, IAB, Mosaic, interpedia, and PDN.

Internet in Plain English, by Bryan Pfaffenberger, is published by MIS Press and retails for $19.95.

TTTT

SOFTWARE AVAILABLE FOR REVIEW:

1) **OS/2 Warp for Windows** - 32 bit operating system
2) **My First Encyclopedia** - Knowledge Adventure (ages 3-6)
3) **Microsoft BOB** - 8 essential hosehold programs, calendar, letter writer, checkbook, and more...
4) **Aldus Persuasion** - Presentation Graphic Software
5) **Microsoft Complete Basketball** - Hoops!
6) **QuickBooks for Windows Ver 3.0**
7) **Quicken for windows Deluxe** (CD Rom or Diskette ver. 4)
8) **Quicken for DOS,** (Ver. 8)
9) **3-D Home Architect** - Broderbund - Home designs and floor planning.
10) **Adobe -Type on Call-** 2 free fonts, call to buy more fast from Adobe
11) **ABC FlowChart** - by Micrografx
12) **Fonts for You** - Fantazia Concepts - 6,000 fonts
13) **WindowWasher** - the Ultimate Optimizer for Windows with Intelligent Data Compression
14) **Dashboard & Sidekick for Windows** (Value Pak)- a convenient Push-Button Utility Panel for Windows and a Fast Functional and Friendly Personal Organizer.
15) **OnFile** -for Windows, Arranges your files into fun-to-use "notebooks"
16) **XtraDrive Lite** - (Windows & DOS) Doubles your disk capacity. vendor: Integrated Information Technology
17) **Your Deck** - Design & Build How-to Software (Sunset)
18) **Space Age** - Arts & Letters 3 in 1 Software = Multimedia + Clip Art + Drawing
19) **Jump*Start KINDERGARTEN** - Knowledge Adventure getting a head start on education. (ages 4-6)
20) **Kid's ENCYCLOPEDIA** - The Random House (ages 7-12)
21) **RUSA** - Interactive Art Tour - St. Petersburg, Russia CDRom.
22) **DO-OVER!** - Change the look of Windows with a bonus utility to speed task switching.
23) **CD ESSENTIALS-** The Windows software utility that lets you automatically access, play and manage your CDs from Windows.
24) **SPACE ADVENTURE-** Knowledge Adventure up-to the moment exploration of outer space. (8-adult)
25) **AVIATION ADVENTURE** - Knowledge Adventure complete world of Flying (8-adult)
26) **TuneLand** staring Howie Mandel - Interactive Cartoon CDRom (ages 3 and up)

(Call 985-3338 for info on review software)

Book Review

Simple Internet

Review by: Dr. Paul Hoffman Jr., Capital PC Users Group

I could not wait to get and read the new book *Simple Internet*. The promotional material sounded great:

Meet Archie Finger, Private Eye, an Internet illiterate hired to solve the mystery of a missing person-on-line.... Travel along the information superhighway with Detective Finger as he uncovers electronic clue after clue, prompting him to learn the most exciting, useful Net tools, programs, fun on-line files, and databases. Etc.. etc.

First let me tell you my Net aware less. I had taken the first two courses That CPCUG gives on the Intemet, "First Steps on the Internet" and "Next Steps." These were great! Besides that, I had purchased and skimmed three or four other books on the Intemet, and had progressed far enough to send and receive e-mail. But FTP, Gophers, WWW, and Veronica were still outside of my abilities at the time I started this book. Wth anticipation, I grabbed my high-lighter pens—can't read anything without a good highlighter—and sat down to learn more about "The Net." All of the other Waite Group's books that I had read were good how-to-do-it books and I was looking forward to learning lots.

But there is too much filler, fluff, and empty space in *Simple Internet*. When finish reading a book, one indication of how good I thought the book was, is the number of marks. Red marks indicate information that I might want to come back to later. More important is the number of green marks. The green marks highlight ideas that I want to try as soon as possible. Sadly there were only 9 green marks.

This is a definite thumbs-down. It was a great idea. But there was so much of an effort to make it different, that it was too different for my tastes. Maybe it would be enjoyed by seventh or eighth grade students.

A much better book is Internet Slick Tricks by Alfred and Emily Glossbrener. It has more pages, much more information, and costs less—$16.00 vs. $16.95 for Archie et al. Another possibilility; is the Video Tutor: Introduction to the net. For $31.95 you can sit in your living room and get an hour and fifty minute tour of the Internet. Obviously you can look it as many times as you need, and rerun those sections that need more attention. I saw the write-up of the video in the Winnipeg PC User Group magazine, Tid Bits N Bytes, and obtained my copy by e-mailing a request to *shareviews @mbnet.mb.ca* . If you not mastered the process of e-mail try (204) 837-2639. Forget Archie Finger, Private Eye, and get Glossbrenners' book or the video, or both.

Simple Internet by Jeffrey Cogswell is Published by Waite Group Press, 200 Tamal, Corte Madera, CA 94925. List price is $16.95.

Software Review

The Face of Life and Smithsonian's America.

Reviews by: William F. LaMartin

Under review here are two CD-ROMs developed by Creative Multimedia, *The Face of Life* and *Smithsonian's America*. I have seen both for sale by mail order, each for $29.95, but at the time of this review I could not locate them locally. I have, however, seen *The Face of Life* for sale at Comp USA in the past.

Both programs list as system requirements a 486SX/25 or above computer running Microsoft Windows 3.1, 4 MB of RAM, 5 MB hard drive space, a double speed CD-ROM drive, 256 color Super VGA monitor, and a SoundBlaster or compatible sound card with Windows Drivers.

The Face of Life installed from the CD-ROM in less than one minute and took up about 3.3 MB on the hard drive. *Smithsonian's America* installed almost instantaneously, and, as best I could tell, only installed one small file. Perhaps that explains why the Smithsonian program didn't run as smoothly as did *The Face of Life*. Despite the recommendation, you can run these programs on a 386/33 with a single speed CD-ROM drive, but for the newsreels in *The Face of Life* I found a double speed drive gave much better results.

The Face of Life is a collection of all the Life Magazine covers for each week from 1936 through 1972 along with a sampling of advertisements, letters to the editor, and photographs appearing in those magazines. In addition to the material from the magazines, they add a listing of major world events, US events, books, movies, songs, fads, and a trivia quiz for each year.

Working from the "Editors Desk", where there is a typewriter(search tool), a sheet of contact prints(photo essays), radio(popular songs), advertisement folder (Ads. of the era), a press camera (access to menu), a copy of *LIFE* (access to newsreel, picture of the week, and events of the week), you choose the issue you want, then begin to relive the past.

Following the advent of the 35 mm camera, *LIFE* brought a new type of journalism to America—Photo Journalism—telling its stories through the camera lens. With this CD you can relive some of that. See a young Marlon Brando on the cover of the April 4, 1960 issue, Khruschev pounding on the table at the United Nations in the March 28, 1960's newsreel, Germany invading Poland in the newsreel footage of November 20, 1939, and General MacArthur on the cover of the December 8, 1941 issue.

I have several old *LIFE* magazines around the house. Upon comparing them to what is on the CD, I was surprised to find a lot of material missing. I guess CD's just don't hold as much as you think when newsreels, photos, and sound are included. For example you only get five or six ads for the entire year on the CD, when there are more than that in any one issue of the real magazine. My July 13, 1959 issue had 16 letters to the editor, the CD for that date had only one. These shortcomings notwithstanding, I enjoyed the CD because I like old photos. In fact my major disappointment was that whenever I transferred any of these images to the Windows clipboard, the colors of the photos either arrived there mixed up, or upon trying to paste them from the clipboard into an application they didn't transfer properly.

The second program *Smithsonian's America*, an exhibition on American History and Culture, is based on the American Festival 94 exhibition mounted in Japan to commemorate the 140th anniversary of the establishment of official relations between Japan and America negotiated by Commodore Perry, which according to the narrator on the CD "Promised a firm, lasting, and sincere friendship between the two countries".

The organization of this CD is based on the following eight categories: American Ideals and Images, The Peopling of America, Entertaining Americans, Politics and Protest, Western Frontiers, Conquering Space and Time, Americans at Home, and Looking American. Further each of these categories is broken down into several subcategories. Then for each subcategory you get a "Picture Show" consisting of a sequence of still photos and drawings accompanied by a narration and background music. For example, under Entertaining Americans, two of the subcategories are Jazz and Motion Pictures, each with its short picture show explaining the topic.

Again, I found the old photos and drawings interesting, but the coverage on any topic is fairly shallow, which would make it more suitable for a young person than for an older adult. As before, I suppose this is because the audio and visual material take up so much disk space there isn't room to go very deeply into any topic. Unfortunately, based on the history I learned in school, there seems to be a bit of political correctness running through some of the narrations—not a lot—just enough to be noticeable (you'll have to buy the CD to check me out on this). And I suppose the reason that World War II is absent from the material is that it represents a short break in the "lasting and sincere friendship between the two countries".

I recommend *The Face of Life* for those over 40 and *Smithsonian's America* for the younger crowd

Software Review

Kinderventures™ "The Wanderoos Go Exploring"

for Windows™ and Macintosh®

Review by: Katherine and Mary Powell
Tampa PC User Group Member and offspring

From the onset this software caught our attention with a stuffed bear right in the box! (Then we opened it and realized it was a type of kangaroo). Mary thought this was great and put the kangaroo (uh, Wanderoo) right next to the monitor when we started the program.

Installation was quick, but we received too many errors when starting up. This seemed to clear after the second install, though.

The opening screen is very nice, but there was no visible navigation aids or menus and we had to stop and read the software guide before continuing. The guide was fairly well written, and we were on our way before long.

The setting of this game is a forest and twin Wanderoos (Wandering Kangaroos) Pocket and Tails are the guides to exploring. What the child is exploring are videos about different topics, memory games, counting games and interactive hunting for Wanderoos.

The game begins at a campsite in the forest from which they may choose to do any number of things. To start the main seeking game, the child goes into a tree house and creates a new Wanderoo and names it. Then they proceed to the fountain where six Wanderoos scatter down six different paths in a game of hide and seek. From here the navigation is pretty good. There are sign posts with the topic that each path explores. For children who cannot read, there is a friendly flower next to each sign that will read it for them when they click on it. This is a must anymore as most children come to expect this kind of help. Exploring topics involves playing videos about them, taking pictures and saving them in an album and playing matching games for extra credit.

The object of the game is to tag all six Wanderoos as you go exploring. When this is accomplished, there are two more levels to explore before the game is over.

If the explorer wishes the return to the opening campsite, they can go into a schoolhouse where they will find a classroom. From here, there are games involving the alphabet, numbers, shapes and colors.

For a five year old, this was an engaging game that was fairly intuitive. The objective seemed to be too lofty, however, and Mary lost some interest in catching the Wanderoos. The main window couldn't be exited from unless the hidden menu was exposed and so Mary called to have me start and stop the program. She can start and end all of her other Windows applications on her own, so I found this to be an item that could use improvement.

Overall, it was a worthwhile learning game and we both recommend you jump on out and explore it!

Quick Tip

Bob Beck, Quad Cities Computer Society (2/95)

Getting a lot of files spread across your hard disk with the extension. TMP? You can safely get rid of 'em. They are just leftovers from running programs that create files with the extension. TMP while you're running the program, and erases them when you exit the program normally.
So why are they still there? If you're running the program and experience a lockup, or shut off the computer while the program is running, they are left hanging around forever, in limbo, but using up storage space on your hard drive.
You can use your favorite utility to move about the hard disk and delete them, performing yourself your applications' failure to perform its clean-up chores, kind of like cleaning up your kids' rooms. But it you're using DOS 6.2X there's an easier way. Add the following lines to your AUTOEXEC.BAT file:

```
IF NOT EXIST C:\TEMP\~*.TMP GO TO NEXT
ECHO "Y"|DEL C:\TEMP\~*.TMP
:NEXT
C:\DOS\SCANDISK/ALL/CHECKONLY
```

The procedure will slow your bootup process a little, but will perform the chore for you as a tradeoff.
You should be aware that the only drive on which *.TMP files will be deleted in the above scenario is C. If you want to clear other partitions on your hard disk, it will be necessary to add several lines for each such drive, substituting the drive designation in lines one and two with the appropriate drive letter, as

```
IF NOTEXIST C:\TEMP\~*.TMP GO TO
NEXTC
ECHO "Y" | DEL C:\TEMP\~*.TMP
:NEXTC
IF NOT EXIST D:\TEMP\~*.TMP GO TO
NEXTD
ECHO "Y" | DEL D:TEMP\~*.TMP
:NEXT D
C:\DOS\SCANDISK/ALL/CHECKONLY
```

and so on.
You could of course, set this up as a .BAT file and just run it when you want to do some housecleaning.

Microsoft Access SIG

The Access SIG meeting will be on April 20, 1995, at the Dun & Bradstreet Software office, located at 3903 Northdale Blvd., Suite 113E, (look for the burgundy awning for the entrance) Tampa. The door locks at 6:00 pm, however, we will have someone keeping an eye out for late arrivals. PLEASE SIGN IN WITH A SIG LEADER.

For more info call Mark Saunders at: 949-6936 or
MARKS@DBSOFTWARE.COM
Sergio Mendez at --799-6589
Connie Kincaid--661-8185 - Leave a Message.

OS/2 SIG

OS/2 SIG, Next meeting: will be: April 25, 1995 at 5:45 p.m. Location: IBM Lakepointe One Bldg., Room 436
This meeting will cover reformat without backup and restore "Partition Magic"
BE SURE TO SIGN IN.

John Lucas
JKLUCAS@MAILSERV.MOFFITT.USF.EDU)

Internet SIG

The Internet SIG met on Tues. March 28th. Topics discussed were ping, whois, finger, gopher, archie and veronica. The approach was through Scott Yanoff's Internet services goper server.

The next Internet SIG meeting will be Tuesday, April 25th, 1995, Time: 6-8pm at Reflectone Corp. Training Center. The first half hour will be largely devoted to fostering useful online practices. Then the topics covered at the March meeting will be illustrated once more. Participants are urged to go to the keyboard and demonstrate something they have become knowledgeable about. Call Charles for additional info at (813) 968-1207.

Directions: Proceed west on Waters from N. Dale Mabry across the railroad tracks (which is about 1 and 1/2 miles), take second left on Savarese (United Technologies bldg. is just beyond it.) Proceed on Savarese until you reach the Reflectone bldg. Take the North door. If you need to ask directions, there is a security guard at the location. PLEASE SIGN IN WITH A SIG LEADER.

MEMBERS HELP-LINE

The following phone list is provided for our **Tampa PC Users Group** members in an effort to establish local support for those frustrating times which we have all encountered while using our PC's. Please note that these are members that have volunteered to help you, treat them in a courteous manner. Be sure to ask if it is convenient for them to help you now, or if you should call another time. It would also be helpful to have your documentation and have it handy when you call. *(Don't expect help if your software is an illegal copy or you do not have documentation!)* **TPCUG** is not responsible for the information or advice provided by volunteers. Volunteers may or may not be experts in the subject matter. You are on your own with any advice received. Be aware also that some of these volunteers may be consultants in their area of expertise. If you are interested in volunteering to answer members questions, either leave a message on the BBS or fill in the forms provided for this purpose at the meetings.

Software Review

Under A Killing Moon

Review by: Cliff Goble, Tampa PC Users Group

The great, fairly new game Under a Killing Moon is finally here. To install this game, it requires at least a single speed CD-ROM (150kb/sec), 386/25 or better CPU, SVGA display, 2megs of hard disk space available, 4 megs of RAM, mouse, and sound board. I ran it on a 486DX2/66MHz IBM compatible with 8 megs of RAM, and a 1 meg VLB graphics card. I would highly recommend having at least 8 megs of RAM, a 486 processor, and a double speed CD-ROM. The 8 megs of RAM makes a tremendous difference on the graphics in the movement mode, and the interactive mode. The installation was fairly easy, but I did refer to the instruction manual once. While you are playing the game, you may change the configuration of the view, the sound setup and so on, so when you are all loaded up and something's not working correctly, there is no need to quit the game and go to a different setup menu every time something is wrong.

This four CD adventure contains great cinemas throughout the whole game. It also features James Earl Jones as the "great P.I. in the sky." This game takes you to a new virtual reality setting. You play a man named Tex Murphy, a P.I. who hasn't had very many cases lately, has no money, and really no life. You kind of run into a little luck and start getting a few cases at the beginning but nothing real serious, yet. The game is rather very basic to play but a it gets a bit tricky sometimes. If you are unlucky enough to basically predict the whole game, which it sometimes is, it kind of ruins the challenge. In the parts that aren't predictable you must pay attention to minor details here and there. There are two types of modes, movement mode and interactive mode. The movement mode and interactive mode toggle back and forth by double clicking the right mouse button, pressing the spacebar, and if you have a three key mouse' just by simply pressing the middle button will do it for you (which I never could get to work). You don't move around with the keyboard, instead you use the mouse which can be a pain to get through tight places (a good way to avoid this is not to go too fast unless you are in a hurry.) The up and down arrow keys are used to look up or down for clues (make sure you use them throughout the whole game.) When looking at the normal view in movement or interactive mode, things look 3-D, but when you look up or down, you notice that things, such as plants, are flat and just rotate as you move around. When you are in interactive mode, you have basic actions you can take such as talk, get, turn on or off, open, or move, etc.

After a while you will sort of find this game addicting, if you play it enough. Under A Killing Moon is definitely the game to have. If you like games that will last you more than two days, this is the one for you.

Access Software Incorporated, 4910 W. Amelia Earhart Drive, Salt Lake City, Utah 84116 (801)359-2900 1-800-800-4880 SRP: $49.95

Internet Access Company going Public with Stock

With more people logging onto the Internet every day, a large provider of access to computer network plans to offer investors a chance to buy into its business.

Performance Systems International, Inc. plans a public offering of 3.3 million shares of stock. Performance Systems plans to offer the shares at $7 to $8 each and hopes to raise 22 million.

The company plans to add 100 more hook-ups to the Internet to the 99 already operating in the U.S. They also operate in Tokyo and plan to expand to England.

Software Review

Procomm Plus for Windows Version 2.0

Review by: Scott Lawson, Tampa PC Users Group

I was pleasantly surprised to find that I could get this software up and running without opening the manual. The installation booklet covered a step by step installation. I made a backup of my current communications software Procomm Plus for DOS before the installation, because mistakes sometimes happen.

I always install new software from a disk copy. This protects the originals, as a backup. The set made from a DOS disk copy did not work. A backup made with the Norton disk duplicate worked fine.

The express installation could not auto detect my modem, an Intel Satisfaxtion 400. My modem was on the list of available and supported modems. My first call after installation didn't go through. I did have to go into windows advanced COM port setup to correctly set the COM ports, address and interrupts.

Up and running, I was able to call out to Datastorm Technologies. There are no provisions for reading the dialing directory from Procomm Plus for DOS, so I manually retyped it. File folders organize the numbers in the dialing directory into groups.

File transfers have be simplified, no more page-up or page-downs to send and receive files. Almost every thing needed in available on the tool bar, and accessible by a mouse click. It did take a few days to memorize the new tool icons and locations. There is also the ability to create custom tool bars, if the defaults don't have a needed tool. I'm beginning to really like the graphical interface.

File transfer speed is identical to the DOS version I get about 1620 characters per second on a zipped file. The file transfer status now shows the percent-

See **Procomm Plus...** *...continued on page 11*

Procomm Plus *continued from page 10*

age of completion on the file as well as the batch transfer. A timer also shows the 'actual' time left on file transfers.

I have windows running with standard VGA 640 x 480 (old monitor). I would recommend using Super VGA with this program since the screen fonts can be difficult to read at lower resolutions. The display can use any font available to Windows.

There is extensive documentation provided for both the software and the aspect script language. I can see both of these manuals have grown in thickness from the DOS version. I have not needed to write any new script programs. The only time I have used the aspect language was to customize the Host mode setup.

One of the new features of V2.0 is the ability to send and receive faxes. I was not able to get my computer to answer incoming faxes. I called Datastorm and found that they do not support the fax class of my modem. They support a 400e but not a 400. I was not pleased with that. I have tried to get Intel to fix this problem.

I had been using Procomm and Procomm Plus for DOS for years and I am very happy with their Windows version. It gives me the ability to transfer files to floppy, or run another Windows application (Solitaire) without leaving Host mode. I keep the modem computer in host mode almost 24 hours a day for company file transfers. I will be able to move the company's communication software to the windows platform, one of the last applications still on DOS. Now all I have to do is decide which GUI OS to steer the company toward, OS/2 Warp, Windows 95, or Windows-NT?

Datastorm, 2401 Lemone Blvd., Columbia, MO 65205 (314)443-3282. SRP $69

Why.. '95... Continued from page 1

❖ *Work on several tasks at once* with fast, new 32-bit programs that support preemptive multitasking and multi-threading-threading and run on their own memory space, so errant programs can't affect one another.

❖ *Focus on your documents instead of the programs* that created them. Programs that use OLE, Microsoft's strategic object technology, let you create and edit documents easily, allowing you to work not only within a single document, but within multiple programs.

❖ *Built-in networking.* Windows 95 is network-ready, providing easy 32-bit access to network resources, even simultaneously.

❖ *Connect to servers* running Novell, NetWare, or Microsoft Windows NT Server, the Internet, or other PCs running Windows 95 from a local or remote connection using a phone line.

❖ *Easy networking anywhere.* Dialing in remotely to network services is just like connecting to them from your desktop PC, a couple of mouse clicks and you're ready to run.

❖ *Automatic multimedia upgrade.* Windows 95 can provide full-screen, full-motion video on today's high-end PC with no special hardware assistance.

❖ *Play today's hottest games* on Windows 95, thanks to faster graphics support for Windows- based action games.

Compatibility is built in.

❖ *Works with all current software:* Your existing 16-bit programs and drivers for windows, Windows for Workgroups, and MS-DOS are completely compatible with Windows 95. Programs meet or exceed their current performance on Windows 3.1.

❖ *Runs on today's PC platform.* Use Windows 95 on a PC with as little as 4 MB of memory (8MB recommended and a 386DX processor.

What can Windows 95 Do for Our Organization?

❖ *For organizations*, Windows 95 provides an opportunity to cut overall computing costs while increasing the efficiency of users and those who support them. This helps reduce the support burden of PC' Groups, increase control of the desktop, and improve end-user productivity.

❖ *For users at every level* of experience, Windows 95 ushers in a new generation in computing.

❖ *Smooth migration* to Windows 95. Testing shows users of Windows 3.1 become more productive in just one hour with Windows 95 and end-user transition is eased with reference aids such as a computer-based tutorial and powerful new Help System.

HOW TO HANDLE DATES AND TIMES

by Connie Kincaid,
Tampa PC User's Group

An employee leaves on October 28th for vacation and returns on November 3rd. How many days was the employee on vacation? A client comes into the office at 11:30 AM and leaves at 12:45 PM. How do you keep track of the fractions of an hour to bill your client by the hour? You worked on an important project from 10:15 PM to 6:25 AM the next day. How do you calculate the amount of time spent on the project?

These questions are relatively simple to answer with fingers (and sometimes toes) when they only plague us once in a while. But if you've ever had to automate keeping track of time in a spreadsheet or database, you have encountered the mysteries of time keeping on computer. (Perhaps someday computers will have fingers and toes and then it will be easy for the computer to figure out these problems. Meanwhile.....)

Let's review the basics. There are 60 seconds in a minute, 60 minutes in an hour, 24 hours in a day and 365 days in a year. You already knew that. The computer doesn't. The computer only knows whole numbers and fractions of whole numbers (expressed as decimals).

The computer also doesn't know about calendars or clocks. "But MY system knows the date and time" you protest. "It marks it on every file every time I save it. I can go to a DOS prompt and type TIME to see the time or DATE to see the date. I tell you, it's in there!" Let's look at how the computer sees times and dates.

See **Dates and Times...** *...continued on page 11*

SECRETARY'S REPORT

TPCUG MEETING 4/12/95,
Minutes and Comments by Bruce Register

President Bruneau called the meeting to order. Comments and information was given regarding SIG, vendors and miscellaneous. Some members have downloaded BITS OF BLUE. You must have Windows and download Adobe Acrobat Reader to download the BITS OF BLUE. The April issue contained 300 KB. First, you download the reader then use it to download the BITS OF BLUE NEWSLETTER.

The MAY MEETING TPCUG will be across the street (north side of street from regular meeting place) in the performing arts building. The bargain table and an excellent program composed of demonstrations, questions, and answers regarding many of your concerns including working through the bulletin board (RBBS) and using the Adobe Acrobat Reader. Bring your individual questions for which YOU need answers. Come prepared to get those answers to the questions that "you never asked but wished that you had asked." Be prepared to sigh, "I did not know that!" One of the joys of TPCUG is that members are always ready and willing to help each other.

THE TPCUG BARGAIN TABLE will be presented at the MAY meeting. That particular meeting will be across the street from our regular meeting place in the auditorium due to the need HCC has for our May meeting night.

Contribute to the BARGAIN table. Harvey asked us ALL to look around for LEGAL software, hardware, connections, etc., that you might like to contribute. Please look around now! Everybody gains. TPCUG gains!

MICROSOFT Resource Guide at a cost of $19 is a good source for help with unique problems.

SIG

May 18, 1995, 6 PM, promptly, is next SIG-Microsoft Access. 3903 Northdale Boulevard, northeast corner of Mapledale and Northdale Boulevards. One or two may be squeezed in due to limited seating. Be there at door at 6 PM, a few minutes before 6 PM is better. A Security Officer must permit entrance at the rear entrance of the building. Sign up early. Use Bulletin Board. Meeting is the 3rd Tuesday of each month. Instructors and SIG leaders are superb!

April 23, 1995, SIG OS/2. (Always 4th Tuesday of Month) Contact John Lucas for time, place and openings/signup.

June 6, 1995, 6 PM, promptly, is next SIG Internet. Contact Charles Howe. Seats are available. You can use BBS to signup. Promptness is required because security at Reflectone is tight and required. From North Dale Mabry, go west on Waters to TAMPA WEST sign on the south (left) side of the

See **Minutes** ....*Continued on page 3*

Minutes....*Continued from page 2*

street (if you pass Anderson Road, you have gone too far), turn south at TAMPA WEST sign, go one block to dead end, turn right one block and take a "forced" left turn, go south about a half block to north entrance of Reflectone Building on left. You must enter north end and be prompt at 6 PM because security will unlock door and escort us to the meeting room. There will be no SIG Internet in May due to scheduling of OS/2 on the same 4th date. The next SIG Internet meeting will be the first Tuesday of the Month.

If you would like to have a particular SIG, let President Bruneau know your interest. President Bruneau wants your opinion. He reads BBS regularly. Send him a message. Many have not tried to use the Bulletin Board. Use it, you can't hurt it.

SIG SOFTWARE & HARDWARE. Connie Kincaid has the two day SIG regarding basics and BBS:

Hardware, June 27, 1995, 6:30 PM.
Software, July 25, 1995 6:30 PM.
Place: Reflectone Building. See SIG Internet above for directions, security, etc.

Harvey asked for VOLUNTEERS to call non-renewal members to encourage them to continue being a member by paying the low, low dues. Various reasons were given to the VOLUNTEERS by non-renewals. From "I forgot" to "I lost my interest" and all kinds of good response in between. Most non-renewals appreciated the call. The responses were helpful.

EACH ONE SIGN ONE. Harvey strengthened the reminder that the goal in 1995 is for every member to bring in at least one new member. Some have already exceeded this goal. Where do you stand! You will be surprised how many people are unaware of how easy it is to get such excellent help. Ask those browsers in the computer store, check out line; even your Pastor will want to know. They will not know if you don't ask. Please do; better, bring them.

Harvey reported that you should that you should download Adobe Acrobat ACROREAD file to download the BITS OF BLUE newsletter through RBBS. ACROREAD download will take about 15 minutes. You can click anything in BITS OF BLUE; you can go right to the article and then you can print it, even in color if you like. You can click on an article and move it around. Harvey has put in tabs for "hot links". If you want to download BITS OF BLUE instead of receiving it in the mail, notify the Editor. You can use TPCUG Bulletin Board (RBBS) to access it.

Financial contributions to Bulletin Board will continue to be accepted, needed, desired and appreciated..

The Editor of BITS OF BLUE will surely appreciate receiving quality fillers for BITS OF BLUE. Some of members have insertions already. Put in your sharing of knowledge, hints, help, etc.

Some members reported receiving BETA WINDOWS 95 ($39). One member reported "running 16 bit and will not change to 32 bit until the final release of WINDOWS 95 come out."

Tampa College, on West Hillsborough, is looking for speakers for their PCUsers groups. They meet on Saturdays. If you feel that you have something to offer and want to be helpful, give them a call.

SOFTWARE VENDOR DEMONSTRATION-Comments and statements are:

Mr. Hartley Macklin, Manager of User Group Relations, Delrina Corporation presented Delrina's several existing and new to be released programs. He made an excellent "discount offering" to TPCUG members. "Delrina is the leader in communication and forms products. Delrina has 650 employees in five countries and will be hiring an additional 150 within the next 60 days. Delrina can send out 10,000 faxes for you anywhere in the country. WinFaxPro can be used to download a fax that is awaiting you in your FaxMailBox. This is a Delrina service.

Delrina has Communications Suite "Strategy" (WinFaxPro and WinComPro) for stand alone applications. They are for mainstream market, i. e., Windows 95 & MacIntosh. Applications for OS/2 will be in the future as OS/2 users increase to 20,000,000. WinComPro is for Bulletin Boards. Delrina "is getting a toe hold on Internet." They have Internet Messenger. WinComPro provides for Internet E Mail. Echo Lake is soon to be released for consumer programs. Scrapbook applications, biography photos, and forms are popular applications. Graphics works well.

Hartley gave a BETA copy of Echo Lake to the TPCUG Editor for review. He donated several software products to the TPCUG door prize program. He said, "If you can print it in Windows, you can fax it with WinFaxPro. There are no exceptions regardless of the application; DOS print will not work; it must be a Windows application that will print in Windows. He demonstrated the ease of use with Microsoft Word whether faxing to one or to several recipients. You can select style and other features. One can "grab, drag and drop" from one phone book to another. In addition, mail can be sent to those in the address book that are selected to receive mail. (FYI-BFT means "binary file transfer). BFT and whole files can be transferred.

WinFaxPro has menu and tool bars. The "item log" manages the folders with choices and icons. Right mouse button capabilities speeds use. WinFaxPro "Viewer" cleans up fax "dirt" from faxes; it will even add your signature. You can doodle on your fax or draw on it, etc. He demonstrated using

See **Minutes** *....Continued on page 4*

OCR. He took Microsoft word, created a fax and turned the fax back to Microsoft Word. You can hook up any twain scanner and back up with WinFaxPro. He says the current WinFaxPro is a tremendous improvement over WinFaxPro 3.0.

Delrina PerForm Designer for Windows was release in December 1994. "It is so easy to use; it is a 'form for idiots' ". It shows you what you see before you get it. It is easy to put in your logo just like you did your signature. The special to TPCUG members present that night only was $39; not the suggested retail price of $129. He presented several other special "one night only" offerings. Several of us took advantage of them.

Many COMMENTS by various members for our benefit and edification were shared.

Winners of the door prizes were:

WinSense	Gary Peterson
Bag	Ennis
Corell CD	Ennis
Delrina Com. Suite	Richard Morris
Delrina Com. Suite	Carol Robinson
Delrina Com. Suite	A. Morgan
Delrina PerForm	Bob Davis
Delrina PerForm	Merle Nicholson
T-Shirt	Frank Kinsinger

Thank you Hartley Macklin for the presentations and door prizes.

President Bruneau thanked all for coming. He reminded all to return across the street for meeting on May 10, 1995, 6 PM. You will not want to miss the exciting BARGAIN TABLE and the help round-tables. If you are not looking for help, come on, you will learn something anyway. If you can help others, this is your chance. Who knows what great door prizes await TPCUG members. Only members are eligible for opportunities of receiving door prizes. Bring a friend. Sign up a new member. Each one sign one. Enjoy the BBS.

Digital will use Windows 95!

Digital Equipment Corporation has announced they will preload the Microsoft Windows 95 operating system on its Plug and Play desktop and notebook systems, as soon as it is available. Digital has signed a Windows marketing development agreement with Microsoft, that ensures that Digital's customers will be able to take advantage of the new operating system. In addition, Digital is one of five companies chosen by Microsoft to provide telephone support for Windows 95.
(Excerpt from Charlotte Bytes, CCPCUG, article by Wayne D. Waterfield)

SOFTWARE AVAILABLE FOR REVIEW:

1) **Microsoft BOB** - 8 essential hosehold programs, calendar, letter writer, checkbook, and more...
2) **Aldus Persuasion** - Presentation Graphic Software
3) **Microsoft Complete Basketball** - Hoops!
4) **QuickBooks for Windows Ver 3.0**
5) **Quicken for DOS,** (Ver. 8)
6) **3-D Home Architect** - Broderbund - Home designs and floor planning.
7) **Adobe -Type on Call-** 2 free fonts, call to buy more fast from Adobe
8) **Fonts for You** - Fantazia Concepts - 6,000 fonts
9) **WindowWasher** - the Ultimate Optimizer for Windows with Intelligent Data Compression
10) **Dashboard & Sidekick for Windows** (Value Pak)- a convenient Push-Button Utility Panel for Windows and a Fast Functional and Friendly Personal Organizer.
11) **OnFile** -for Windows, Arranges your files into fun-to-use "notebooks"
12) **XtraDrive Lite** - (Windows & DOS) Doubles your disk capacity. vendor: Integrated Information Technology
13) **Your Deck** - Design & Build How-to Software (Sunset)
14) **Space Age** - Arts & Letters 3 in 1 Software = Multimedia + Clip Art + Drawing
15) **Jump*Start KINDERGARTEN** - Knowledge Adventure getting a head start on education. (ages 4-6)
16) **Kid's ENCYCLOPEDIA** - The Random House (ages 7-12)
17) **RUSA** - Interactive Art Tour - St. Petersburg, Russia CDRom.
18) **DO-OVER!** - Change the look of Windows with a bonus utility to speed task switching.
19) **CD ESSENTIALS-** The Windows software utility that lets you automatically access, play and manage your CDs from Windows.
20) **SPACE ADVENTURE-** Knowledge Adventure up-to the moment exploration of outer space. (8-adult)
21) **AVIATION ADVENTURE** - Knowledge Adventure complete world of Flying (8-adult)
22) **TuneLand** staring Howie Mandel - Interactive Cartoon CDRom (ages 3 and up)
23) **PC DOS** 7 - from IBM
24) **Harvard for Windows ChartXL** - Compelling charts from critical data from Software Publishing Co.
25) **Harvard for Windows Montage** - Easy way to organize your graphics from Software Publishing Co.
26) **Spider-Man Cartoon Maker** - ages 5-up
27) **Delrina Communications Suite 2.1** - WinCommPro and WinFax Pro
28) **OnCmd** - xBase for OS/2 - xBase database development environment for Native OS/2

(Call 985-3338 for info on review software)

PRESIDENT'S COLUMN

May meeting

A reminder that the May meeting will be held across the street (PALM Ave) in the HCC Theatre building. Don't forget to bring your American cash or checkbooks in order that you can purchase items from the bargain table. Guest are invited and can purchase items also. ALL proceeds go to the Tampa PC Users Group.

Thanks

I want to thank those members who brought or invited guest to our last meeting. It really made me feel good that there were so many new faces in attendance. Several of the guest joined our group that night. While the goal I proposed to each of you is to bring in one new membership in 1995, you can of course bring in more. Anyway, a sincere thank you to each of you for your efforts and contribution to the Tampa PC Users Group.

Additional thank goes to the members who have donated items to be sold at the May meeting bargain table. A reminder that items can be donated year around and that donations can qualify as tax deductions on your corporate or personal tax return. Please either bring items to be donated to the meeting or contact Harvey Bruneau at (813) 985-3338 or 962-2554 (ext. 715) to schedule a pick up of the items.

No words can describe my thoughts of the episode that went on during the last meeting. Several members contacted me after the meeting to express their concern of the behavior exhibited by some members during the Delrina presentation and the negative impact it generated about our group to the presenter, guest and members. Frankly, I agree that the conversations and debate going on during the presentation were distracting and reflected negatively upon our entire group. Some guest did not join our group because of this uncalled behavior and some members left because they had enough. I must remind everyone that the presenters are our guest and are here because I have invited them. We do not pay these presenters to present, give us special product pricing or donate their products to our group. In fact it cost these companies a lot of money to send their representatives to us. In this instance Hart came from Canada. This kind of treatment of presenters will only result in vendors refusing to attend our meetings. I do not want negative word of mouth conversations to circulate among potential members or presenters that the Tampa PC Users Group is a disrespectful group due to the actions of a few members. This problem can be solved by stopping the side conversations going on among yourselves and the debates with the presenter of whether product A is better than product B. In the future I will personally stop the presentation and ask the individuals to be quiet or leave the meeting. Those of you that wish to debate between products or whether a glass of water is half full or half empty should form a SIG group. Fortunately, Delrina has asked to come back for another presentation in January.

SIG/Classes

It's official. We now have a **new class, PC Hardware & Software Fundamentals,** and will be taught by Connie Kincaid. This class will last two months (June-July). It will be repeated in October-November for those of you that were not able to join the first class.

The process is underway to create a new **Graphics** Special Interest Group (SIG) which will begin in August. Additional information will be forthcoming as we finalize the details. Stay tune to the newsletter and the BBS for additional information.

See SIG or Secretary articles in this newsletter for further detail information on the SIGs currently available.

Constructive opinions and comments are welcomed and can be addressed to me on the BBS or Internet.

Harvey Bruneau
HPB@DBSoftware.com

Vacation Planning?

Map'n'Go Wins Award!

Map'n'Go, won the prestigious award for "Best New Use of a Computer" in the Software Publishers Association's annual Excellence in Software Awards. Map'n'Go is a sophisticated multimedia travel planning program on CD-ROM, that takes the guesswork out of planning trips in the US, Canada, Mexico, and the Caribbean. Street price is $39.00, and through July, a manufacturer's rebate of $10 is available. For information, (800) 452-5931 or contact them on Internet http;// www.delorme.com

Software Review

Quicken 4 for Windows Deluxe CD-ROM

Review by: William F. LaMartin
Tampa P. C. User's Group

I have used *Quicken* from Intuit to record my financial transactions for almost four years. First there was the DOS version; then I switched to the Windows version as soon as it was available. That gave me advantages like having more than one account open on screen at the same time. Of course, there were little improvements I could wish for like a drop down calendar in the date field, a drop-down calculator in the amount filed, or buttons on each account register that carry out frequently used actions like deleting and finding transactions. Now that I have the *Quicken 4 for Windows Deluxe CD-ROM* (I somehow missed versions 2 & 3 for Windows), I have all of that and much more.

The Deluxe CD-ROM edition is really a two part creature, from my point of view. First we have our old familiar *Quicken*—much enhanced as to convenience features—a little enhanced as to what it actually does. The second part consists of the excellent tutorials, well done talking tutorials, the financial planning , stock guide and stock quotes, "Ask the Experts", and the home inventory data base. In fact, if you don't plan on subscribing to their stock quote service via your modem (you can get the same information from the on-line services) or subscribing to the Tradeline® Stock Guide(the historical performance of 6,000 + securities updated each 6 months), I would recommend just purchasing either *Quicken 4 for Windows* or the *Quicken 4 for Windows CD-ROM* (with this you get the on screen user manual and multimedia tutorials—which are pretty good.) and save about $20. The Deluxe CD-ROM version is priced at $59; the basic *Quicken 4 CD-ROM* is $39. Almost any store carrying software will have them.

Quicken 4 for Windows Deluxe CD-ROM installs very easily, but will consume 24 MB of your hard drive for the full installation (and it leaves most of the extras on the CD). They claim you need a 486 computer with 8 MB of RAM, 24 MB free on your hard drive, an MPC2-compliant CD-ROM, and a video board and monitor capable of running 256 color VGA. Scares some of you away already, doesn't it? Since the system I had *Quicken* already loaded on is a 386 with 10 MB and a single speed CD-ROM drive, I decided to first try it out there. Surprise. Everything worked fine—including the multimedia talking tutorials and the multimedia "Ask the Experts" section. Possibly the experts' heads moved a little jerkily as they gave me their "tips" via the single speed CD-ROM, but the movement in the talking tutorials (people jumping around, talking, and pointing at the *Quicken* account register) was perfect.

For those of you new to *Quicken*, it allows you to track your money by setting up accounts, e.g. Checking, Savings, Visa, other debit accounts(like your mortgage balance), other assets (like a bond account). You then create a list of categories, e.g. Medical, Groceries, Dining, and Auto, so that when, say, you enter a check in the checking account you can assign it to one of your categories. If a transaction involves more than one category, you can split the transaction among those categories.

After setting up your accounts and categories and entering data, you can do things like reconcile your check book, pay credit card bills, print out reports(cash flow, itemize by categories, net worth, etc.), and set up a budget. Of course, *Quicken* would like you to integrate all this with paying your taxes by also earmarking certain categories , say, charitable contributions or income, as tax related so that at the end of the tax year you can purchase their add on program *Turbo Tax* and drop your already selected data right into it. During the year you can use (for free) the *Quicken* Tax Planner to estimate those taxes. Additionally you can just throw away that old checkbook, purchase checks suitable for your printer, and print checks directly from the program. After four years, I am finally going to give this a try. The only drawback is that the checks cost more per check ($.10 /check is you buy less than a 1000) than the bank will charge you. But just think of the convenience of not having to fill in those lines by hand.

For the experienced *Quicken* users, you get the old *Quicken* plus the following partial list of new features in the base program.

Financial Calendar Enter scheduled transactions in the calendar; display or print the calendar

Reminder Each time you start *Quicken* you are reminded of scheduled transactions (you select how far in advance to be reminded) and notes for the day. This is different from Billminder that is activated when you turn on you computer.

Forecasting Creates a graph of your future cash flow and account balances based on scheduled transactions and budget amounts.

Option Buttons Edit, Find, Close, and other buttons right on the register and other windows where you need them. No need to go to the menus.

Drop down Calendar & Calculator No need to go to the menu anymore; it's right there in the field.

Account selection bar At the bottom of the register lets you switch accounts easily.

Snapshots Instant overview of your finances.

The extra material on taxes, stocks and mutual funds includes these separate modules

See **QUICKEN...** *Continued on page 7*

Quicken...*continued from page 6*

Quicken Tax Guidebook Advice from tax experts; mainly tips. One tip is titled "Lowering your tax bill by hiring your child." Don't expect too much here.

Quicken Quotes℠ Use your modem to check on stocks and mutual funds. This involves a fee.

Tradeline® Stock Guide Graphically displays historical data on more than 6,000 securities. This involves a fee for an update on the information.

Your Mutual Fund Selector Interactive multimedia guide to aid your selection of mutual funds.

Ask the Experts Interactive video advice from Jane Bryant Quinn and Marshall Loeb.

Finally there is the

Home Inventory A specialized database to record household items and pertinent data. The data can be quite detailed with serial numbers, model numbers, room location, purchase price, etc.

This is a good solid product, and, as noted above, I much appreciate both the new conveniences like the drop-down calculator in the amount field and the added features like the financial calendar, the reminder, and the forecasting. I am less enthused about the tax advice and stock information. That said, I am sure, though, that such advice will be of value to many, and with all the room available on a CD-ROM, the more the merrier (since the data isn't taking up my hard drive space, and I can delete those modules that access this data from my hard drive). Intuit has made a good product better, and you can even register it via a toll-free modem call if you don't want to mail in the registration. The one thing that hasn't changed since my older version, though, is its inability to make me stick to my budget.

Intuit, P.O. Box 3014, Menlo Park, CA 94026 (415) 322-0573, Support (415) 858-6087

Software Review

OnFile 1.0

Review by George Kretschman, CCPCUG

I cannot remember the number of times I have been hardpressed to find a file. The eight character name and three character extension made sense to me at the time I saved it. Then when it was time to retrieve it, there was no indication of the file contents, I had forgotten the directory too. I guess most of us have just learned to accept this as a way of life in our PC oriented world. OnFile promised to change all this.

This article is based on a review copy of OnFile and an evaluator's guide written specifically to assist in reviewing the first release of OnFile. Installation was typical of a Windows program. After the installation,, the evaluators guide led me through a well designed 30 minute hands-on tour of OnFile. This hands-on tour exercised all the capabilities of the program in a clear and concise manner.

OnFile has an Auto Book feature that can automate the process of building a book.

OnFile organizes files in a series of books. Each book contains a table of contents, index, tabbed chapters, and topics. The user can organize his files, creating different books to hold related information. As an example, you could create a book concerning "Writing Projects for 1995." Within this book you could create chapters such as Computer Users Group, Business Correspondence, etc. In the chapter "Computers Users Group" you can place "Topics" (pages). A topic could be the file containing the evaluation report of OnFile. The best part of this is that you can use up to 100 characters to create a topic title and up to 255 characters to write a description of the file. The "Topic" would be associated with a normal DOS eight-character name and three-character extension. It really is not as complicated as it sounds. One trip through the hands-on Tour had me right on track. In addition to organizing files into books, subdivided into chapters with topics, OnFile can also view a file without loading the application that created the file. OnFile supports more than 50 file types. This is the one area where I ran into a problem. I use Express Publisher quite extensively. When I attempted to view an Express Publisher file (EWD), OnFile seemed to load Express Publisher (quite time consuming) in order to display the file. Even though Express Publisher appeared to be loaded, I was unable to exercise any function of that program. The amount of time it took to view the file was about as lengthy as it would have been to close OnFile, call up Express Publisher, and retrieve the file By calling the file up through Express Publisher I have the advantage of being able to modify the file.

OnFile also is capable of displaying a thumbnail image of each file but this appears to be functional only with Microsoft Word files. I do not use Word so I was unable to evaluate this feature. If you had been very careful in using file extensions, OnFile has an Auto Book feature that can automate the process of building a book. I must admit I have been very careless in naming my files. Be cause of this, I was not pleased with the results of using Auto Book. This I feel was my fault and not OnFile's.

OnFile is an easy way for Windows' users to organize and quickly locate their files. It can save time that ' had been spent searching for files and increase user productivity.

Minimum Requirements: 386 or higher, IBM-PC or compatible, Windows 3.1 or higher DOS 5.0 or higher, 4MB hard disk space, 4MB RAM, Mouse, VGA or higher display. Software Publishing Corporation 3165 Kifer Road P.O. Box 54983 Santa Clara, CA 95056-0983

Microsoft Access SIG

Recap of the Access Sig meeting on April 20, 1995 - began with a demonstration of how Aaccess can connect to remote Sybase tables that were physically in Atlanta.

Connie Kincaid showed her application written in Access that will be used to track user group announcements submitted to local newspapers. Clay Borkholm showed a set of tables for using Postal Service zip code information in an Access application. Joe Zamrin showed a system that he uses to track time spent on various projects at his work. We spent a little time just discussing problems that the participants were having.

The next sig meeting will be at 6:00 PM on May 18, 1995 at the D&B offices. at the Dun & Bradstreet Software office, located at 3903 Northdale Blvd., Suite 113E, (look for the burgundy awning for the entrance) Tampa. The door locks at 6:00 pm, however, we will have someone keeping an eye out for late arrivals. PLEASE SIGN IN WITH A SIG LEADER.

We are planning to walk through the creation of a simple stand-alone application with a database, a form, a menu, and a report.

For more info call Mark Saunders at: 949-6936 or *MARKS@DBSOFTWARE.COM*

Sergio Mendez at –799-6589 OR Connie Kincaid--661-8185 - Leave a Message.

HARDWARE & SOFTWARE SIG

Connie Kincaid will lead the two day SIGs regarding computer basics and BBS,
Hardware: June 27, 1995, 6:30 PM,
Software: July 25, 1995 6:30 PM
Place: Reflectone Building (See Internet SIG for directions

Internet SIG

The next Internet SIG meeting will be Tuesday, June 6th, 1995, Time: 6-8pm at Reflectone Corp. Training Center. This SIG will be the last meeting (for a while) emphasizing working with a shell account, as opposed to SLIP or PPP. A printed summary highlighting what has been covered will be available.

The Internet SIG meetings will be the first Tuesday of the month to avoid conflict with the OS/2 SIG, however there will not be a meeting on Tuesday, July 4. Call Charles for additional info at (813) 968-1207.

Directions: Proceed west on Waters from N. Dale Mabry across the railroad tracks (which is about 1 and 1/2 miles), take second left on Savarese (United Technologies bldg. is just beyond it.) Proceed on Savarese until you reach the Reflectone bldg. Take the North door. If you need to ask directions, there is a security guard at the location. PLEASE SIGN IN WITH A SIG LEADER.

Charles Howe -HOWE.COSTECH@INTNET.NET
Michael Hodges

OS/2 SIG

OS/2 SIG, Next meeting: will be: May 23rd, 1995 at 5:45 p.m. Location: IBM Lakepointe One Bldg., Room 436 BE SURE TO SIGN IN. SIG Leader will be John Meroth, for this meeting, he will discuss how to take advantage of OS/2 & mailreaders.

Contact: John Lucas
JKLUCAS@MAILSERV.MOFFITT.USF.EDU)
OR
John Meroth at (813) 831-7878 anytime except 6-8pm.

MEMBERS HELP-LINE

The following phone list is provided for our **Tampa PC Users Group** members in an effort to establish local support for those frustrating times which we have all encountered while using our PC's. Please note that these are members that have volunteered to help you, treat them in a courteous manner. Be sure to ask if it is convenient for them to help you now, or if you should call another time. It would also be helpful to have your documentation and have it handy when you call. *(Don't expect help if your software is an illegal copy or you do not have documentation!)* **TPCUG** is not responsible for the information or advice provided by volunteers. Volunteers may or may not be experts in the subject matter. You are on your own with any advice received. Be aware also that some of these volunteers may be consultants in their area of expertise. If you are interested in volunteering to answer members questions, either leave a message on the BBS or fill in the forms provided for this purpose at the meetings.

Software Review

"Multimedia Magic CD" by GoldDisk

Review by: Nicholas Klak, Tampa P.C. Users Group

Multi Media Magic C.D. is a collection of five programs offered to the public. Each program on the disk is a part of one program. Let me point out that these are working programs and not "cripples." The programs are not complete but they do work. The disk sells for $39.99. at Comp USA. The combined cost of the programs they represent would be about $500.00.

Installation of the CD is from the program manager in Windows. A program group will be set up that contains all the icons, and there are lots of them. Minimum equipment necessary to run the programs consists of any 386 with windows, four megabytes of ram, three megabytes of hard disk space, a CD windows compatible drive, VGA monitor and a Windows compatible sound card. The sound card is only absolutely necessary for one program.

Animation Works: This program lets you experiment with the art of moving objects. You can be a movie creator! The directions are straight forward and with some practice it is possible to see a bird, or other object you select, fly across the screen with their wings flapping. The tutorial is well worth your time and repetition of the tutorial is recommended. Creating a movie is made easier by offering several "paths" for the object to travel. This path is followed by the object at up to forty frames per page. Each object is chosen from a group entitled "actors", hence the directions instruct you in "movie making". Sound can be added to each scene through imported wave or midi files. New actors can be created if you possess the talent and patience.

Halo Desktop Imager: This program was the winner of a P.C. Magazine editors award. It is the best image control program in its field. It allows you to manipulate the tone, brightness and intensity of a picture with handy slide bars. Almost all formats are supported for import. TIFF, GIF, PCX and on and on. They can be printed on any printer windows supports. My favorite option is to take an imported picture file and size it to the page. No hassle. You get a full page print out. Another great feature is the poster option. Any picture can be made into a very large poster. After printing just join the pages together on the back and a beautiful poster has been created. The scan in portion of the program has been left out. The printing feature alone is worth the price of the CD.

AudioDirector: This is a digital sound editing application which allows you to use sounds which have been recorded. Both eight bit and sixteen bit sounds in monophonic and stereophonic form can be imported. With a microphone you can record your own sound and include them in your sound files. The editing process shows a screen with spiked vertical lines above and below a horizontal line. These spikes lines represent sounds. The program allows you to copy the spiked lines repeatedly and by doing so you can create a sound loop. Sounds can also be converted from one format to another, a handy thing for importing sounds to other programs.

AddImpact: This program deals with object linking and embedding, (OEL). Pronounce this "Oh-Lay". The tutorial and booklet information on this was concise and informative. The short of it is that you can add sound and /or graphics to another document. This is not quick or easy. Patience will, however, lead to success. Lots of icons, called actors, were supplied to imbed and animate. The editing was limited because this was not the entire program.

ScreenCraze: This is a collection of programs to spice up your windows screens. You might also say, clutter up your screens. Dozens of screen savers are provided. Both sound and moving graphics are included in many of the screen savers. These can also be added to your After Dark menu or they are accessible through an icon on the bottom of your screen. A familiar menu setup is provided for duration of time until it begins and which ones to select for use. I chose random selection, to test them out. Some are quite clever, such as a telephone which rings and answers itself. Wall paper for windows is also available. It is optional. I was not ready for any more wallpaper but here are some. The use and frequency of ScreenCraze is optional. One very interesting option is the establishment of one or two passwords. Two can be enabled at the same time. A network manager might have access to all the computers with one and a personal password would be available to privatize your computer from your fellow workers.

Multimedia Magic CD at thirty nine dollars is a super buy. Any one of the programs was worth the price.
Gold Disk, 2250 Scott Blvd., Bldg. 14, Santa Clara, California 95054-3107 (408)982-0200

We Cannot hope to build
a better world
without improving the individual
toward this end,
each of us must work
toward his own highest development
accepting...his share
of responsibility
in the general life of humanity.

Dates & Times.....*continued from page 1*

In most software applications, the computer thinks time started at the turn of the century. For the computer, day 1 was January 1, 1900. Day 2 was January 2, 1900 and so forth. The computer just keeps counting from the turn of the century to the date being considered. It counts actual calendar days which means it doesn't forget February 29th in leap years. It doesn't become baffled by the fact that some months have 30 days and some have 31. Why? Because it doesn't know months and years. It just keeps counting each day as one more day. So May 10th (our next meeting) is day number 34,829. (That's alot of days since the turn of the century.) The software converts that day number into a date format that we people types recognize.

The computer views time as a fraction of an a day. So to the computer 24 hours equals 1, 12 hours equals 0.5, 1 hour equals 0.041667 (1/24 to be exact). Again, the application converts these fractions to a time format that we understand. To the computer, May 10, 1995, 6 PM looks like 34829.75 (since 6 PM is three-fourths of the way through the day).

How can we apply these concepts to automate our time/date tracking problems? Let's go back to our examples.

Example 1: An employee leaves on October 28th for vacation and returns on November 3rd. How many days was the employee on vacation? October 28, 1995 is day 35,000. November 3, 1995 is day
35,006. So, 35,006 - 35,000 is 6. The employee was gone for 6 days. The software handles displaying the days as dates to you and me. But it sees the numbers to do the math.

Example 2: A client comes into the office at 11:30 AM and leaves at 12:45 PM. How do you keep track of the fractions of an hour to bill your client by the hour? To the computer, 11:30 AM looks like 0.4792 and 12:45 PM looks like 0.5313. The difference is 0.0521. So would you charge your client 0.0521 times your hourly rate? Your client would love you but you would go broke. Your client was in your office for 0.0521 of one day not one hour. So you would charge your client 0.0521 * 24 or 1.25 times your hourly rate. (All numbers have been rounded to 4 decimal places but most actually carry more decimal places. I didn't want this to start looking too crazy.)

Example 3: You worked on an important project from 10:15 PM to 6:25 AM the next day. How do you calculate the amount of time spent on the project? This one can get a little bit tricky because you crossed midnight. We need dates as well as times in most applications. So let's say this was right before the above mentioned employee went on vacation. You worked from 10:15 on October 27, 1995 (34999.9271) to 6:25 on October 28, 1995 (35,000.2674). The difference between the start time and the stop time is 0.3403 (of a day) times 24 (hours in a day) equals 8.1672 hours.

If you're like most people, you probably counted this on your fingers and toes alot faster than I explained it. But in most applications today, you don't have to go through all this. I just did it so you can understand what the computer is doing. This will make it alot easier to understand the results you get. For example, as I was typing the above examples, I toggled over to Excel and typed in 10/28/95 (or 06:25, etc.) and then formatted the cell to display either the date/time value or the number value behind the date/time. Excel (and many other spreadsheet and database applications) understand several popular date and time formats and will automatically convert those keystrokes to a date/time value for you. The only tricky part comes in understanding what the result means when you do some math with dates and times. If members are interested, I can give you some more complex examples in future issues. I hope this helps you understand some of the basic things you can do to track and calculate dates and times.

EDITOR POSITION AVAILABLE

The current editor of the Bits of Blue has given notice that she will not be able to continue publishing the newsletter effective January 1, 1996.

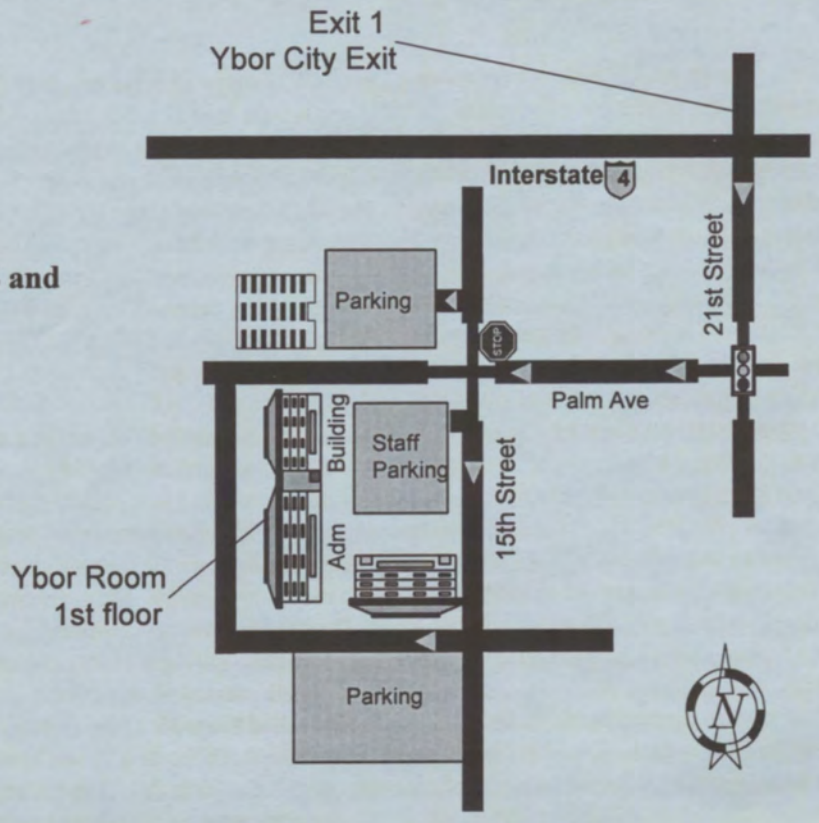
The requirements for this position are:

- Commitment of approx 3 or 4 full days work a month (can be evenings and weekends - that's when she usually does it!)
- Knowledge of PageMaker or another suitable desktop publishing application, Corel Draw or similar drawing and graphics program, database management software.
- Willing to learn how to prepare bulk mail and take the sorted newsletters to the airport postoffice each month.
- Computer equipment with enough power to handle the page layout of a 12 to 16 page newsletter with graphics and a modem to access the Bits of Blue Bulletin Board and the APCUG bulletin board for articles.

Please contact the current editor, Marylee Bruneau for further details at 985-3338.

RENEWING YOUR MEMBERSHIP?
WE CERTAINLY HOPE YOU WILL.

AND



WHEN YOU DO, BE SURE TO MAIL YOUR CHECK AND ANY ADDRESS OR NAME CHANGES TO:

Microsoft Word Viewer version 6.0 for Windows

Microsoft has released Microsoft Word Viewer, a small application that enables users who do not own Microsoft Word for Windows, to view and print Word documents exactly as they appear in Word. Word Viewer gives users the flexibility to view page layout, zoom, outline, headers/footers, footnotes, and annotations. Word Viewer allows you to read and print Word documents, but it does not allow you to edit them, although you can copy information from the document and activate OLE objects. Thanks to Word Viewer, people who own any version of Microsoft Word for Windows, or Word for the Macintosh versions 4.0 and later, can now share their documents with users who do not own Microsoft Word. Compressed, Word Viewer fits onto one 3.5" 1.44 MB floppy disk. We encourage users to copy Word Viewer freely and distribute it to friends and co-workers along with documents they have created in Word format.

Use Word Viewer to view Word documents posted on the Internet

This product also allows users who wish to post richly formatted Word documents on the Internet to share such documents with people who might not own Microsoft Word. In order to use this product for viewing Word documents on the Internet, you must configure your Internet browsing tool to recognize Word Viewer as a helper application. Please consult the owner's manual of your browsing software in order to learn how to achieve this. Documents with the suffix ".doc" will be recognized by Word Viewer as Word files.

Microsoft Word Viewer is Freeware!

This product is "freeware". Users are encouraged to copy and distribute Word Viewer to friends and co-workers or post it onto public electronic bulletin boards. This product is available on the Tampa PC Users Group BBS.

*** * 1995 OFFICERS * ***

MEMBERSHIP DIRECTOR: Tom Cone 222-8925

BBS -- (813)239-3704 Line 1 (813)237-4997 Line 2

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII text file, Microsoft Write or Microsoft Word to the editor at 9402 Hidden Ridge Place, Tampa, Florida 33637 or upload to the BBS.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

The use of trade marked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted at the following rates:

	1 month	3 months	6 months
Full Page	$60.00	$162.00	288.00
Half Page	$40.00	$108.00	$192.00
Quarter Page	$22.00	$60.00	$106.00
Eight Page	$12.00	$33.00	$58.00
Business Card	$10.00	$27.00	$48.00

All advertisements must be prepaid by check payable to TPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if it is not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, Marylee Bruneau at (813) 985-3338, for space availability and for further information.

This newsletter is created with PageMaker 5.0 from Aldus Corp. and Corel Draw from Corel Systems.

SECRETARY'S REPORT

TPCUG MEETING 5/10/95, 6 PM
Minutes and Comments by Bruce Register, Secretary

Many of our members and visitors enjoyed the TPCUG Bargain Table. The efforts of the donors and donees (purchasers) are much appreciated by all the members The President thanked all for contributions of items and contributions from your purchases/double barreled bargains. He stated that we might do the TPCUG BARGAIN TABLE again in December 1995.

After considerable and adequate time, President Bruneau called the meeting to order. Comments and information was given regarding SIG, vendors and miscellaneous. Several comment and questions were raised and answered. Harvey asked for comments from those who have downloaded BITS OF BLUE. (FYI: You must have Windows and download Adobe Acrobat Reader to download the BITS OF BLUE. The April issue contained 300 KB. First, you download the reader then use it to download the BITS OF BLUE Newsletter.)

The JUNE MEETING TPCUG will be back at our regular meeting place, the HCC Auditorium - Ybor Room.

SIGS

MICROSOFT ACCESS: June 15 (3rd Thursday), 1995, 6 PM, promptly, at 3903 Northdale Boulevard, northeast corner of Mapledale and Northdale Boulevards. One or two may be squeezed in due to limited seating. Be there at door at 6 PM, a few minutes before 6 PM is better. A Security Officer must permit entrance at the rear entrance of the building. Sign up early. Use Bulletin Board. Meeting is the 3rd Tuesday of each month. Instructors and SIG leaders are superb!

OS/2: {Always 4th Tuesday of Month) Contact John Lucas for time, place and openings/sign-up. (Read the SIG information page.)

INTERNET: June 6, 1995, 6 PM Contact Charles Howe. Seats are available. You can use BBS to sign-up. Promptness is required because security at Reflectone is tight and required. From North Dale Mabry, go west on Waters to TAMPA WEST sign on the south (left) side of the street (if you pass Anderson Road, you have gone too far), turn south at TAMPA WEST sign, go one block to dead end, turn right one block and take a "forced" left turn, go south about a half block to north entrance of Reflectone Building on left. You must enter north end of the building and be prompt at 6 PM because security will unlock door and escort us to the meeting room. The next, and thereafter, SIG Internet meeting will be the first Tuesday of the Month.

See **Minutes** ....*Continued on page 3*

Minutes....*Continued from page 2*

President Bruneau wants your opinion. If you would like to have a particular SIG, let him know your interest. He reads BBS regularly. Send him a message.

The Bulletin Board is easy to use. You cannot mess it up. Try it whether member or non-member of TPCUG. Many have not tried to use the Bulletin Board. Use It, you can't hurt it. Check out the HUMOR Board, also while you are on.

SOFTWARE & HARDWARE: Connie Kincaid has the two day SIGs regarding basics and BBS:
Hardware, June 27, 1995, 6:30 PM.
Software, July 25, 1995 6:30 PM.
Place: Reflectone Building. See SIG Internet above for directions, security, etc.
Check with Connie for reservations. If it is filled, ask her about a repeat

DESKTOP SIG: is in the planning stage for August.

EACH ONE SIGN ONE goal in 1995. Harvey reminded us that the goal is for every member to bring at least one new member. Just ask those whom you casually meet in places of business. If someone asks you a question while you are browsing the computer store, acquaint them with the benefits of TPCUG. What did your neighbor say when you invited them? You didn't Well bring them next time on June 14, 1955. Bring a "whole"" carload; they will thank you for being a good neighbor.

Use of the Bulletin Board and a demonstration of Adobe Acrobat was presented. A Q & A session was lively and helpful, even for those of us who did not ask questions? We learned also.

Kevin Sheridan, SYSOP, showed a tree of files on the RBBS. He noted the new EXPRESS mail file. Over 144 files related to messages are available. He accessed the RBBS so that we could follow the steps on the overhead screen as he walked through the prompts and responses. Mail door is working perfectly but 255 lines continued to lock up the system. Kevin installed SILVER EXPRESS to solve the problem so that messages of 255 or more can be handled.

Some comments on this and that were given. The RBBS Menu has a different color combination than previously. Al Poole, Asst. SYSOP, has done an excellent job on the system. Kevin walked through BULLETINS Menu. We watched Bulletins retrieval. Files have been categorized matter. PDF extensions are ADOBE ACROBAT files. You can change your color setting by using Utilities Menu on the RBBS (Bulletin Board main menu). Kevin recommended that we use Z-MODEM Protocol for download. Upload will ask you for that information each time. You can use numbers rather than names of "doors"", i. e., TQM door is the 1st. Type in the number of mail conference to turn on that conference. RIPTERM.4 is RIPTERM communication program to download; go to files. RIPTERM is basically a form of graphics and can use a mouse. All uploads on RBBS are scanned for virus before accepting upload. "Express System" explains the RBBS and how it works. When TQM or EXPRESS are packing main, your screen may look as if nothing is happening but the RBBS is packing the mail. Just wait it out. Downloading messages shows a spinning propeller as it packages messages. Message numbers in series should be separated by a comma or a space in between. Sending a message to (ALL) exposes the messages or questions to everyone. The phone numbers to the Bits of Blue BBS are (813) 239-3704 and (813) 237-4997. In uploading, give one filename and short description, then go into upload. Harvey has a directory called UPLOAD. He enters files there for upload. (Me too, I'll bet you do or will).

Harvey demonstrated ADOBE ACR0BAT ACROREADER 2.0. He demonstrated the download of BITS OF BLUE. He installed categories in a new left hand column. He inserted Quick Tabs. Harvey is making BITS OF BLUE available to TAMPA BAY ONLINE. You can click on anything that shows in blue text and then ZOOM ADOBE ACROBAT ACROREADER will download other information, i. e., New York Times when you are in Internet.

Winners of the door prize OS/2 WARP:
Ever hear of "COALS TO NEWCASTLE" John Lucas OS/2 WARP SIG Instructor won the software. Congratulations, John!

President Bruneau reminded all to return across the street to the HCC Administrative Auditorium for meeting on June 14, 1996, 6 PM. Who knows what great door prizes await TPCUG members. Only members are eligible for opportunities of receiving door prizes. Bring a friend. Sign up a new member. **Each one sign one**. Enjoy the BBS.

PRESIDENT'S COLUMN

Local Vendor

This months presentation will be by a vendor from our own back yard. Landmark Research International Corporation, located in Clearwater, is well known for it's Windows troubleshooting software, **WinProbe**. However they have many other products including **DataSafe** which allows you to crashproof Windows, **Uninstall-it** , a tool to uninstall Windows apps, and now **MagnaRAM**, the ultimate tool which provides more speed, memory and allows you to run larger programs within Windows. Come to the meeting for this exciting presentation and a chance to go home with some of these fine products.

What a bargain!

I want to thank those of you that contributed to the successful Bargain Table sale during the last meeting. The contributions came in multiple forms. First were those individuals and companies who donated all the items that were available. Then there were the people who I volunteered on the spot to manage the tables. Of course one of the most important were those of you who gave your hard earn cash for items. Finally, to those many volunteers that help load/unload the items from my truck.

Based on the success, we are planning on having the next Bargain Table around year end. Individuals or businesses that have items to donate to the TPCUG should contact me at 962-2254 ext. 715, or any board member to arrange for pick-up. A receipt for IRS will be provided.

Performing Arts building

Many of you expressed your opinions about our temporary meeting site. I am glad to say that all were positive. If enough of you like the HCC Performing Art room, we may look at renting it for 1996 meetings.

Mid Year

Well we are entering the mid-way point of 1995. The outstanding positives are the new SIGs which have been added. Much of that credit goes to those individuals who have volunteered their time, equipment and facilities to promote these groups. The distribution of the newsletter in electronic format via Adobe Acrobat is also a plus. However, there are still some issues that need attention. Many of you have successfully reach your goal of bringing in one at least one new membership for 1995. Some of you have even brought in more than one new member. Despite the efforts our membership is slowly going backwards. This means more work needs to be done. Specifically, we need to make our presence known in Tampa. This can happen via word of mouth, flyers, TPCUG business cards, newspapers and assorted other methods. While some of these items are being done now there is no consistency in the process nor a dedicated individual responsible for this cause. Are you the one that can get this important process organized. If you are call me at 962-2554, ext. 715.

Several of you have suggested the creation of a generic TPCUG business card which would contain pertinent information about TPCUG and could be passed out by everyone. This is great idea which we will implement as soon as possible.

Reminder

A reminder that we are looking for a newsletter editor for 1996. The individual will get Pagemaker 5.0, Corel 5.0 and Adobe Acrobat. These software products are currently in use to generate the newsletter. The individual should have MS Windows, a 486 and a laser printer. The sooner we can find someone the sooner we can begin the transition and training (if needed). Contact Marylee at 985-3338 for additional information.

Harvey Bruneau,
President

News Briefs:

Intel drops prices

The **sub-$2,000, 100-MHz Pentium PC** could become a reality by year's end. In another major pricing action, chip maker Intel Corp. last week dropped prices on its Pentium chips byup to 31%. The biggest reduction was on the midrange 90-MHz chip, which will cost between $377 and $546. Intel also rolled back prices on its recently announced top-of-the-line 120-MHz Pentium chip by 21%. The cuts, which are part of Intel's regular quarterly pricing announcements, are expected to further accelerate the Pentium migration. Some analysts now say that the cutover to the new processor could be completed as early as the third quarter of this year.

Packard Bell at the top

Consumer market leader **Packard Bell Electronics, Inc.** has zoomed to the top of the U.S. market. According to preliminary data from market research firm International Data Corp., Packard Bell shipped an estimated 591,000 units in the first quarter of this year, up 37% from the previous year. Meanwhile, **Compaq Computer Corp.**, which finished last year as the king of the desktop market, was second last quarter with 530,000 units . Finishing third for the quarter was **Apple Computer, Inc.** with 477,000 units. Former market leader **IBM** came in fourth with 410,000 units.

Q: What is a Web Page?

A: It is an electronic billboard running on a machine directly connected to the Internet. Web pages contain information, advertising, and pointers to other pages (known as "links"). Unlike many other Internet services, Web pages can contain graphics and are easy to navigate.

Software Review

Fonts For You, 6000 Fonts

by Fantazia Concepts, Inc.

Review By: Jim Clark, Tampa PC Users Group

What It Is: *Fonts For You* is a collection of 6000 fonts on CD-ROM. It comes complete with a manual includes, but the bulk of which provides samples of all the fonts on the CD-ROM. The sub-title is a bit misleading in that the CD-ROM does not contain 6000 *different* fonts. While it does contain 6000 fonts, in reality it provides only 2500 *different* fonts which are in 3 different formats: All 2500 in each of TrueType and Adobe Type Manager (ATM) Type 1 formats, and 1000 fonts taken from the 2500 that have been created in Geoworks format. I use the term "only" reservedly because 2500 fonts is a lot of fonts.

It should also be noted that the term 'font' is used here in its classic sense. Some of us install only the regular (or basic) font of any given typeface family on our computers and rely on Windows or other sytems/applications to simulate bold, italic and other versions of the font using the regular font as the foundation, rather than take up disk space with those fonts. *Fonts For You* provides at least 2 variations of almost all of its regular fonts, excluding only dingbats and some of the special fonts, and has several variations of most of the regular fonts, including one or more of condensed, extended, italic, lefty (italics to the left), cracked, hollow, mangled, spiked, spotted, striped, and wavey. The fonts in TrueType and Type 1 formats are virtually identical, while the 1000 fonts created in Geoworks format vary slightly due to the limited complexity Geoworks can support in its fonts.

I have been used to common names for basic fonts and its file, with shred-outs of that name for all variations of the basic font; Arial for example, with bold (B), bold italic (BI), italic (I), condensed (C), etc., for the variations. That identification system works fine with a limited number of fonts, although there is often no correlation between the font name and the filename. However, that system becomes a nightmare when you are dealing with 2500 fonts. Consequently, Fantazia Concepts came up with a system that provides ready correlation between font name and filename, and relatively easy management of the fonts. The fonts are segregated into 24 style categories, with some of the categories further subdivided for organizational purposes. The 24 categories are: Dingbats, basic, border, contour, cracked, digital, gothic, handwritten, holey, hollow, jazzy, mangled, outline, Roman, script, shadow, spiked, spotted, striped, unique, wacky, warped, wavey, and 3D. As is evident in this list of categories, this package just about covers the waterfront.

See **Fonts....***Continued on Page 6*

Fonts... *Continued from Page 5*

This organization is reflected both in the names of the fonts and in the filenames. The font name for the Roman font in the samples below is Roman 16 Italic. The filename for the font is R16I, a direct correlation. It takes a bit of adjustment to get used to the name system, but when one learns the system and the categorization it is easy to use and works well. Most of the fonts include an extended character set, but do not including some of the special fonts do not have a complete keyboard set; border fonts, for example, and some of the outline fonts. All of the fonts I have tried seem to be of good quality and print out well. Here is a sampling of some of them at 16 points:

BORDER FONT SAMPLE
CRACKED FONT SAMPLE
Handwritten Font Sample
Holey Font Sample
Hollow Font Sample
Jazzy Font Sample
Mangled Font Sample
OUTLINE FONT SAMPLE
Roman Font Sample
Script Font Sample
Spiked Font Sample
Spotted Font Sample
Striped Font Sample
UNIQUE FONT SAMPLE
Wacky Font Sample
Warped Font Sample
Wavey Font Sample
3D Font Sample
SHADOW FONT SAMPLE

Installation is very simple — no installation is required. A program is included on the CD-ROM for viewing the fonts and copying them to your hard drive (or any other drive desired), but no provisions are made for installing the fonts directly into Windows. At present this *fontmenu* program is a DOS program which may be ran in a DOS or a DOS window in Windows. In fact, one may install and use the fonts in Windows without copying them from the CD-ROM. While this would save a lot of disk space, it doesn't seem practical since that would mean dedicating a CD-ROM drive to supporting fonts in Windows. One may use the program provided to select and copy font files from the CD-ROM to any directory on your hard drive; alternatively, Windows File Manager (or any other file management program or the DOS copy command) can be used to copy the files since viewing and selection of the files may be done using the manual provided. Fonts are installed in Windows through the Fonts icon of Windows Control Panel. A Windows based *fontmenu* program is currently being developed and will be provided to all registered holders of *Fonts For You* when it becomes available.

Documentation: The manual includes several pages describing how to view, select and copy the fonts using the *Fontmenu* program provided on the CD-ROM. It also provides guidance on how to install the Type 1 fonts in Adobe's ATM and TrueType fonts in Windows, all of which is simple and straight forward. No guidance is provided, however, on installing fonts in Geoworks; presumably, Geoworks users are familiar with font installation or already have adequate documentation. Text files on the CD-ROM also describe in a little more detail how to use the *Fonts For You* program. The remainder of the manual, some 291 pages, shows a sample of each of the 2500 fonts. They also describe some of the other offerings of Fantazia Concepts. The most important instructional files have been translated into a number of other languages, including German, Japanese and Italian, and are included on the CD-ROM.

The registration form and a form to register any problems with any of the fonts are also on the CD-ROM as text files. These may be mailed or faxed to Fantazia. Fantazia Concepts report that all of the fonts have been tried and tested in a variety of programs and on different computers. Fantazia will attempt to solve any font problem encountered, recognizing that there is an infinite variety of programs and circumstances in which these fonts might be used.

Requirements: The manual provides no requirements statement. However, an implicit requirement is a machine capable of running Geoworks or Windows. This is only partly correct, however, since there are DOS programs capable of using TrueType fonts, and 3rd party software is available which allows us of the fonts in DOS programs. ATM is also available for use with DOS and DOS programs. Hence, there are no real requirements beyond a computer that is IBM compatible and a CD-ROM drive.

Costs: This font package is not yet available in local software stores. Fantazia Concepts has established a list price of $89.99. For a limited, but unspecified time the font package may be ordered directly from Fantazia Concepts for $49.99.

My View: This is a very nice package of fonts — it includes a large and very good collection of fonts. It provides a wide variety of basic fonts, along with many variations, plus more specialty/display fonts than most home-PC users would ever need. Those in the advertising business, or producers of flyers and other eye-catching publications will find great utility with this font package. As a home-PC user, however, I would like to see more in the way of fill variety suitable for various special occasions, like national and religious holidays, birthdays, weddings, etc.

For more information contact Fantasia Concepts at:
Fantazia Concepts, Inc., 34544 Lakeshore Blvd., Eastlake, OH 44095 Phone: 1-800-951-0877, or 1-216-951-5666
Fax: 1-216-951-9241

Software Review

"PAGE MAGIC"

Review by: Frank Kinsinger, Tampa PC Users Group

Page Magic has been an extremely versatile desktop publisher to work with. It is easy to learn and flexible in its design. I have some experience on both high end window products and low end DOS-BASED products. I found Page Magic to be a nice compromise between the two.

This Windows based program is great for the smaller business or for the casual user. System requirements are within reason for this type of desktop publisher. Page Magic listed requirements are a minimum of 2 megabytes of RAM (4MB Recommended); IBM PC or Compatible 286 or Higher Processor (386 Recommended); Hard Disk Space, 4 Megabytes minimum and 11MB maximum; Microsoft Windows 3.1; Any Monitor supported by Windows (except CGA); Mouse or other pointing device supported by Windows; Any Printer supported by Windows.

Installation is standard, one may proceed without any hitches. The setup program steps you through the installation and informs you of the progress. The "disk sequence checker" ensures that the correct disk is loaded before copying the data to the hard drive. For those who wish to keep DOS directories and subdirectories grouped, it is possible to change the default directory to any directory, or subdirectory, in order to control the system configuration during installation. The Page Magic installation states that the program SHARE.EXE is required to be running while using Page Magic. SHARE.EXE (DOS) is normally associated with network systems but is required for Page Magic. The install program will ask if you wish the install program to add SHARE.EXE to the autoexec.bat or if you wish to add the statement manually.

I loaded the Page Magic software on a 486DX2-50 with 8 megabytes of memory running DOS 6.2. I run Windows 3.11 on a non-network system with an SVGA monitor.

Page Magic has provided several useful features.

Page Magic is fully WYSIWYG. That is, What You See on screen Is What You Get when you print your document.

Page Magic also provides a word-processing feature that allows you to enter, edit and check text for spelling mistakes. You may find meanings for selected words. You may also import text from selected word processors or ASCII text files. Page Magic has formats for Microsoft Works, Word for Windows,WordStar, and others. However, Page Magic supplied the Word Perfect formats for versions 4.0 and 5.0 and none for version for 6.0. When using the word processor feature with Word Perfect 6.0, it becomes necessary to save the text as an earlier version. This causes a chance of losing some of the formatting commands incorporated in the latest versions of Word Perfect. I am not familiar with word processors other than Word Perfect so I cannot judge how the other software is affected by the text features.

In Page Magic documents, you can include pictures and graphics by: (1) drawing them with Page Magic's own drawing tools (2) importing them from any of the art applications supported by Page Magic or (3) object linking and embedding them from other Windows applications. Once a picture is put into a frame, you can add labels, boxes, lines, arrows, and so on.

The Page Magic software came with a full operations manual. A smaller, quick start book is for those who really hate to read the manuals, was also included. The quick start is complete enough to load the software. It explains all the button bar icons, and it allows a new user with some desktop publishing to start building a document. I feel that the manual provided with the software is sufficient to learn and enjoy using the software. I do not feel that this software requires an audio or video tape tutor to learn how to use it.

The manual provides a toll call number for technical support and help. The manual does not address any charges, or lack of charges, for the support assistance. At this writing, I had no need to call for support, so I cannot comment on the quality of the service; installation was easy!

Product retails for $49.99.

Software Review

PerForm for Windows

Review by William F. LaMartin,
Tampa PC Users Group

Delrina, makers of *WinFax Pro*, produces at least three programs to assist in dealing with forms, both paper and electronic. They are, in descending order of complication, *FormFlow*, *PerForm Pro*, and *PerForm*. *PerForm Pro* is obviously a slightly more powerful version of *PerForm*, but *FormFlow* is in a different league, intended for network situations, where the forms travel around an office electronically. At each stop individuals, depending on their access level, are allowed (or required) to provide input to certain fields of the form. All of this is easily transmitted electronically anywhere in the world. In theory no one need write anything on a piece of real paper. And in theory a form never gets lost on someone's desk.

PerForm, the subject of this review, has a considerably more modest goal: To allow the individual or small business to either create blank forms to be printed out and filled in by hand or to create electronic forms with fields to be filled in on the computer. In the latter instance, the form could still be printed on paper, but additionally, and this would make **Delrina** happy, using *WinFax Pro* it could be faxed from the computer to the intended recipient at a distant location.

In my opinion, it is this ability to fax this electronic form that is the real use of this program. For I could certainly use my word processor to create blank forms to be printed out and filled in by hand. And using PerForm to electronically store the information I type into the form's fields on the computer could just as well be accomplished by my database program. Indeed PerForm operating in the electronically fillable mode is really just a specialized database with each copy of a form you fill being another record of the database.

I also know that I can fax from both my word processor and database, and additionally with a bit of work I could create a database report that could be printed to *WinFax* or some other faxing program and would look a lot like the form I created in *PerForm*. *PerForm*, however, makes all this a good bit easier—and cheaper. I found *PerForm* locally at prices from $69 to $89.

So how do you create a form in *PerForm*? Since it is a well designed Windows program, you simply drag and drop the text, fields, tables, and graphics you choose where ever you want them on the blank form with which you started. And every object on the form is easily modified by choosing the modification you desire from the tool bar. For example, given a fillable field on the form you may specify the font to be used, the size of the field, its margins, whether it is opaque or transparent, type of border, etc. Additionally you may perform calculations in a field; I counted 52 different ones available from the following categories: mathematical, statistical, financial, date/time, database, table, and one logical one, the if....then....else statement.

PerForm comes with about 40 predefined forms; Invoice, Purchase Order, Bill of Lading, etc. You can use these, modify them to suit your needs, or make your own from scratch. I chose to make a purchase order form for my business using their purchase order form as a guide, but making mine from scratch so that I could learn as much about the program as possible. Like any other program, there are methods that after you learn them make things go much faster. For example, if your form will have several fields that are going to be the same size and have the same properties, then after creating one field, simply duplicate it, say, 10 times by entering 10 in the duplicate dialog box.

After getting my Purchase Order form like I wanted it, I decided to tackle the ultimate in forms. The much maligned 1040 Federal Tax Form. I wasn't going to try to recreate it, simply use my flat bed scanner to scan it in actual size and then bring it into PerForm as a graphic object and then create the appropriate fields at the positions where information is to be entered. Well, I couldn't find a blank 1040 around the house, but I did come up with a blank 1120 corporate tax form, did the above on it and was quite pleased with the results. If you are very careful to scan it full size, insert in full size into PerForm, then place the fields carefully on the scanned background 1120 form, you can even print out only the fillable fields without the background scan onto a blank 1120 form that you have put into your printer, and it will look just like you typed everything in on the official form (of course, everything would look correct if you simply printed out the form you created including the scanned image onto a blank sheet of paper, but that is easy).

The next time I place an order to the industrial supply house I sometimes use, instead of calling in my order, I think I will fax it from my computer to them the night before using my newly created Purchase Order. However, I am pretty sure that I will not be faxing in my tax return next year; I will, though, give some thought to filling out the form electronically on the scanned form's image and then printing the data to the official form. Ideally **Delrina** would provide tax forms that could be downloaded free from their BBS to be used with *PerForm*, but I guess that is why other companies produce tax programs.

Unlike a word processor, not everyone with a computer will need a form producing program. So, after getting this far in the review if you haven't yet come up with a concrete application for this program, then it is probably not for you. But if you have, then I am sure *PerForm* will not let you down.

Software Review

Elastic Reality

Software to transform the world!

Reviewed by: Larry Anders, Librarian, Tampa PC Users Group

So, you've got a deep passion for special effects. Maybe it goes back to your childhood when you sat in a theater, popcorn forgotten, horrified by a monster climbing out of a flying saucer. Although you cheer and scream with the rest of the crowd, simple awe and terror aren't enough for you. From the start, you've demanded to know, "How do they do that?" For a select few, that curiosity leads to a career in the business. **Many** *Elastic Reality* users create special effects (or *"FX"*) for TV, film, advertising, or commercial design.

You don't need to be a professional, however. With a 386 or better PC, running Microsoft Windows, even the casual hobbyist can create some of the coolest,eye-bulging special effects. Whether you're a weekend dabbler or the industry's senior image wizard, with *Elastic Reality* your world will never look the same.

Elastic Reality is the first 32-bit desktop WYSIWYG (What You See Is What You Get) video transition program and probably the most advanced commercially available warping and morphing effects system in the world. It can also be used to create other types of visually-striking effects such as "break-aways" (where parts of the image detach and move in various directions), caricatures, page peels, twirls, and other types of effects where areas of an image are being stretched, shrunk, or broken apart. With a little practice and *Elastic Reality* you'll be able to create your first morph, warp, or transition within minutes and create morphs that rival the ones you see on TV and film in a matter of hours. In fact, you'll be working with the same software that created a lot of those very same special effects.

What is warping and morphing? Warping and morphing are simple concepts to understand and learn. The process of warping an image involves creating Bezier curve shapes that describe the starting or source shape and the ending or target shape, then linking (joining) them together to form a correspondence. These shapes describe areas or objects in an image. The correspondence between shapes describes the amount and direction that the image will be "pulled" or distorted. Its like your images are rubber sheets, having elasticity. These shapes allow you to push, pull, and restrict the movement of the image. The process of morphing is merging two warped images together. Normally when you bring two images together, you are mixing a percentage of one image with the other image. Morphing adds the step of warping each image so that the merging will make it seem that one image is transforming into another—the outlines in the image are aligned with each other.

There's lots more to *Elastic Reality* th an morphing, though. With *Elastic Reality* you can also make composites which are foreground images that appear in front of unusual backgrounds, such as placing the New York skyline in front of a Rocky Mountains backdrop or superimposing a picture of yourself standing next to President Clinton. You could be the next Forrest Gump! *Elastic Reality* can also help you create several kinds of animated images. For instance, you can provide two pictures that define the start and end of a motion sequence. *Elastic Reality* fills in the intermediate frames for smooth movement.

Computers have drastically altered the work of the FX artist. Effects that used to require lots of physical hardware and labor now occur in silicon chips at the speed of imagination. The advantage of using a computer for visual effects is that you have total control over an image. After all, to the computer, a picture is just a collection of pixels, individual dots or "picture elements" that correspond to data values in the computer's memory. The computer will happily move those pixels around, change their colors, or obliterate them. In the hands of an imaginative FX artist, computer power can make you wonder if you really saw what you think you saw.

The *Elastic Reality* package also includes *TransJammer*. This powerful tool automates much of the work that normally goes into digital video effects. With *TransJammer*, anybody, even beginning image wizards, can instantly create professional quality special effects. Just specify the pictures you want to transform and choose an effect. It's really easy to produce dazzling images and most of your popular file formats are supported such as TIFF - BMP - FLI - JPEG - GIF, etc.

The entire process is really very easy to learn with excellent on-line help throughout the entire program. The software installs as most all Windows based programs do by selecting **R**un.... from the **F**ile....menu and typing A:(or B)setup. The package also comes with two manuals; one Getting Started manual that is more of a hands-on introductory tutorial to the main features of *Elastic Reality* and another manual that breaks down each feature or topic into more detail. Whether you just want to play or make a career out of special effects what you can create with *Elastic Reality* is limited only by your imagination!

Elastic Reality. List price: $495. (I have seen mail order pricing at $369)Requires: 4MB RAM minimum, (8MB recommended), 6MB hard disk space, Microsoft Windows 3.1 or later; math coprocessor recommended. Elastic Reality Inc., Madison, Wisconsin; (608)273-6585.

MEMBERS HELP-LINE

The following phone list is provided for our **Tampa PC Users Group** members in an effort to establish local support for those frustrating times which we have all encountered while using our PC's. Please note that these are members that have volunteered to help you, treat them in a courteous manner. Be sure to ask if it is convenient for them to help you now, or if you should call another time. It would also be helpful to have your documentation and have it handy when you call. *(Don't expect help if your software is an illegal copy or you do not have documentation!)* **TPCUG** is not responsible for the information or advice provided by volunteers. Volunteers may or may not be experts in the subject matter. You are on your own with any advice received. Be aware also that some of these volunteers may be consultants in their area of expertise. If you are interested in volunteering to answer members questions, either leave a message on the BBS or fill in the forms provided for this purpose at the meetings.

PRODIGY by CEL connection:

By Steven Hess,
Tampa PC Users Group, Inc.

If you have wondered how the "information highway" has progressed, you have probably noticed the appearance of "cellular connection" devices, and cellular modems. Unless you have much patience, or a LOT of bucks, save your money for when the systems get more compatible.

My research started with the devices that allow connection to a CEL phone, that provides an RJ11 jack for your usual modem. I balked at paying for a device that would cost $250 and only connect to the CEL phone, so I went with what should be an effective combination. I purchased a Motorola UDS CELLect 14.4, +FAX for connecting to my Motorola MicroTac Flip phone. Since the both products were by Motorola, a company I believe produces world class communications gear, I figured I had the right hardware.

In reading the information, I discovered that the UDS modem had two jacks, one for a standard RJ11 phone line, and a second one for the CEL phone connecting cable supplied. Switching between the jacks is done with a AT command string. The book suggests not leaving the two connected while attempting communications.

My first attempt was to send a fax to a machine in the office. It worked fine, except that the phone HAS to be selected to the ANALOG cellular system. In other words, there is NO advantage to the Cellular One Digital Network, as it won't work. This is explained by the manual, for the modem as well. Setting the phone is easy enough if you have a Digital Network connection, by the setup menu. If you have an analog network phone, you have all you need.

Connecting to information services was more difficult. Using the standard phone line, CompuServe and GEnie were a snap, with no changes needed in the setup. Bits Of Blue was no problem either, with connections at 14.4 Reliable dialed up whenever the line was not busy. Prodigy, however, has some kind of a bug with this modem. I have contacted Motorola UDS Tech support, and even got to a "Level Three" Tech support on Prodigy,

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII text file, Microsoft Write or Microsoft Word to the editor at 9402 Hidden Ridge Place, Tampa, Florida 33637 or upload to the BBS.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

The use of trade marked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted at the following rates:

	1 month	3 months	6 months
Full Page	$60.00	$162.00	288.00
Half Page	$40.00	$108.00	$192.00
Quarter Page	$22.00	$60.00	$106.00
Eight Page	$12.00	$33.00	$58.00
Business Card	$10.00	$27.00	$48.00

All advertisements must be prepaid by check payable to TPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if it is not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, Marylee Bruneau at (813) 985-3338, for space availability and for further information.

This newsletter is created with PageMaker 5.0 from Aldus Corp. and Corel Draw from Corel Systems.

SECRETARY'S REPORT

TPCUG MEETING 6/14/95, 6 PM HCC Administration Building, Ybor room. Minutes and comments by Bruce Register, Secretary

President Bruneau (Harvey) called the meeting to order. He announced that the presentation by Landmark Research International Corporation of MagnaRAM and WINProbe had to be rescheduled. However, they did send several door prizes which were given away.

Miscellaneous comments and information were given. The new release of Windows, Win95, appears to be on schedule for it's August 24th release date. Costs are expected to be around $100 to upgrade from OS/2 or Windows. The standard non-upgrade version will cost approximately $200. While Win95 has not yet been released, Microsoft has already announced upgrades, code named Memphis and then Nashville to be released late 95 and 96.

Microsoft is expected to released MS Office95 and MS Office95 Pro shortly after Win95. Win95 will be required to run these new suites.

IBM purchased Lotus and Novell is rumored to be buying Borland.

A suggestion/comment: If considering the purchases of WIN95, one might consider installing from the CD version rather than taking the risk that one or more of the 23+ floppies might have a problem...Murphy's law is still active and well! SIGs. See elsewhere in the BITS OF BLUE.

PRESENTATION: Harvey demonstrated **"Windows 95**, Final Beta Release". A few comments about this and that. These comments do not come close to including all of the information or statements covered by Harvey during his presentation

Harvey used a 486/50Mhz notebook with 16Mb of RAM for his presentation. The program boots up in windows mode, not a DOS prompt. However, Win95 still has a DOS window to run your favorite DOS applications. Windows applications can be found by pressing the START button and then navigating through menus. WIN95 can be setup to install or run from a network server as well as a local PC. Win95 does not require AUTOEXEC.BAT or CONFIG.SYS. However, AUTOEXEC.BAT and CONFIG.SYS is supported, if needed, for older applications and backward compatibility. Harvey stated that personal test run by him at his office demonstrated that Win95 (BETA) was faster than Windows for Workgroups 3.11 when running on similar configured Compaq 486/66 PCs.

Minimize, Maximize and Close buttons, are completely different than the current Windows products. Most of the Accessories have a new look in Win95. The familiar File Manager of Windows has been replaced by Win95's "Explorer".

Harvey stated that due to the higher level of graphic detail in Win95 he recommended a 17" monitor. WIN95 has shortcuts which reduce time and strokes. Use of the right mouse button has been implemented throughout Win95. Password security for access to the PC and networks is available in

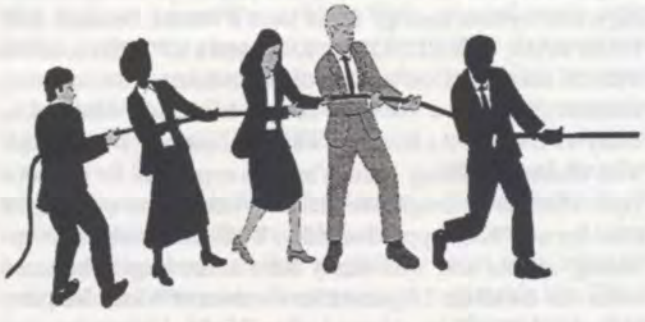
WIN95. WIN95 includes an enormous amount of drivers for supporting and installing a full set of hardware components.

In WIN95, you install programs in the same manner as you do under Windows. Multitasking was fast and easy. During this presentation Harvey ran as many as twelve windows without locking up the system. The windows included three DOS sessions and Windows versions of Word, Excel, Powerpoint, Visio, Uninstaller 2.0 and many more applications. WIN95 "recycle bin" keeps deleted files until the user selects to empty or restore the files. WIN95 does so much so well. Harvey presented so much more information.

You really needed to be there to enjoy and see the detail of this Win95 presentation.

Screen saver, clocks etc., use up valuable Windows resources. When one deletes Windows icons, it does not delete any installed software or directories. You should use an uninstall to remove software from Windows and your hard drive.

MORE THIS AND THAT. (PCMCIA cards are nowadays known as the PC Cards. Just thought you might like to sound esoteric about computers.)



Regarding hardware, Harvey says "Be safe by buying standard products. Special promotional products are sometimes different from standard hardware and could cause some frustrations"..."Cheaper may not always be as good."

Many specific and personal computer problems/questions were answered during the break. If one has a problem, there is SOMEONE present who knows the solution. Just ask! The "helping spirit" is great at TPCUG. Expert assistance is available on the phone also. Just see that page in the BITS OF BLUE Newsletter.

CONGRATULATIONS TO DOOR PRIZE WINNERS:

WINProbe — Richard Nabors
MagnaRAM — Richard Van Horn

Thanks to Landmark Research International Corporation of Clearwater for the prizes. We look forward to their future presentation. Thanks, fellows!

Lets ALL pull together
for
a successful TPCUG

PRODIGY by CEL*.....Continued from page 1*

with no communication possible. What was happening, was the mo would connect, (using Prodigy for Windows), and give me a Communications Error that was different than the usual screens. Nobody could help, so I just tried the Prodigy suggestions of turning off all error correction, and all MNP compression. I then tried turning off something that should make no difference, trellis coding at 9600 baud. For some reason, this allows me to connect as before, and nobody knows why. The trellis coding is used only from the modem connect level, and according to Prodigy Tech support, they would see my ID appear, then drop access. This makes little sense to me, however, adding B3 to the AT command string allows connection.

It is probably not a problem with the particular modem, as I replaced the unit on a return, and the second unit did the exact same thing.

Now that I can connect to Prodigy with the POTS line, I tried to connect with the Cellular. At first, I tried by editing the PRODIGY.INI file, and saving it as an alternate file name. Copying the various setup files saves having to use Prodigy's software to change between setups. I have now saved files for connecting at work, (dial 9), at home, via the CEL phone, and so on. Copying one of the files over the PRODIGY.INI file allows Prodigy to just dial an autologon with the new file.

I read in the book that the factory default Cellular connection uses LAPM or MNP, at 7200 baud. I could not reliably connect Prodigy with it's requirement for no error correction, so I find that the connection speed maximum is 2400 baud. It is slow, but acceptable, but you will have to be careful with the phone. I think if I move too near the antenna, it drops carrier enough to drop the line, and of course, if the plug is wiggled than that will drop as well. I have to set the phone on the desk next to me, the length of its cord, and not move around.

In addition, Prodigy offers a 800 service, that carries a surcharge of .12 cents a minute, but would be the preferred method over a long distance call. Unfortunately, the service is noisier than the straight dial up, (at least on the Cellular One service) and is MUCH more prone to dropping the line.

Conclusion: I have spent $280 for a modem, (usable as a regular fax modem as well), and about $40 in test calls, to find out that the system will connect to Prodigy at a second rate 2400 baud, and is susceptible to other quirky things like where you sit. In the near future, the MOBIDEM system for digital communications will be out, and is designed for this kind of thing, but the cost of the modem is over $1400.00 now. Perhaps I should have waited, but I want my mail on vacation, just like the guy in the AT&T ad on the beach. Maybe with a $5000 EO, but with the more mundane equipment I have it's more like YOU MIGHT, than YOU WILL.

PRESIDENT'S COLUMN

June Presentation - I was disappointed when Landmark notified me that they were not going to be able to present at our June meeting. With only a short notice before the meeting, it was not possible to schedule another vendor. Although he never got a chance to do his presentation, I want to thank our own Tom Cone for volunteering to do a presentation. As usual I got carried away with myself and dominated the meeting with my Win95 presentation. I can't stop myself sometimes. I certainly hope that those of you in attendance got as much out of the presentation as I did.

Help Needed - In my column last month I mentioned that we were looking for a replacement newsletter editor. This individual will take over the duties from Marylee for the 1996 year. However, we would like to get someone onboard as soon as possible so that we can begin a smooth transition into the 96 year. To date there has been no response.

We are also looking for early candidates to fulfill officer positions. Look at page 2 for the positions in question While I am not sure which current officers will volunteer again next year or in what capacity, lets not wait until our elections in December to realize that we have no volunteers to run the business of the Tampa PC Users Group in 96. In next months newsletter I'll post job titles and descriptions.

If you are interested in helping and are willing to volunteer your time and effort for a good cause then please call me at 985-3338 or 962-2554 ext. 715.

SIGs - I can't express enough thanks to Reflectone and Michael Hodges for providing the facilities and resources to hold two of our SIG meetings. Similarly, I thank Dun & Bradstreet Software and IBM for providing their facilities and resources to the MS Access and OS/2 SIG groups. Without the contributions of these companies there would be no SIGs.

The 1st meeting of the hardware SIG ,led by Connie Kincaid, was an enormous success. Connie mentioned that those in attendance were grateful yet thirst for more at the end. A reminder that Connie will be presenting her software SIG on July 25th. Both of these SIG meetings will be repeated later this year by Connie. Thanks Connie for a job well done and your unselfish dedication to furthering the education of our fellow PC users.

Items Wanted - A reminder that we are collecting equipment and software for the December bargain table and special community projects yet to be announced. Donations are eligible as a tax donation since we are a designated 501(c)3 non-profit group. If you have any computer related items to donate Please bring them to any of the following; general meeting, SIG meeting or contact Havey Bruneau at 962-2554 ext. 715 for pick-up.

A 28.8 modem for the BBS would also be appreciated. Don't forget that we are still taking donations for the BBS.

Win95 - It wasn't that long ago that my belief was **WHEN95?**. However after conversations with many software vendors and using the Beta version, I do believe Microsoft will ship the long awaited Win95 this August.

I am sure many PC users are wondering if Win95 is going to affect them and if they should bother upgrading to it. The answer for both is a resounding YES. Of course there are those who will say NO. Well those are the individuals that still use old 57 Chevys and VWs to get around and THAT'S OK. However, I think most of us would rather have the new models with AC, stereo, airbags, power steering, and if cruise control and power windows come with it that's even better. Keeping up with PC hardware alone has not been pleasant for most of us. It seems that the state of the art hardware technology we buy gets outdated faster and faster every year. This new release of Windows will not only speed up the outdating of hardware but will now begin to outdate existing software at a fast pace.

Despite all of the hoopla and hype or how many bugs it has when released, Win95 will be next major dominating operating system for the masses. No I don't have stock in Microsoft. My experience and common sense tells me that, for now, Microsoft is the undisputed front runner in the OS and GUI world. In the year 2000 Packard Bell may replace Microsoft, but that's a column for another day.

Some things to consider; Win95 will be preinstalled on most new PCs, at best there will we one last release of MS DOS before Microsoft puts it to rest; software vendors will eventually stop developing 16bit Windows apps and develop 32bit apps for Win95 and Windows NT, the same will be true for drivers, hardware vendors will develop plug and play products. When will all this happen you might ask, I anticipate that this shift will be completed by the end of 1996. Of course by then we will have updated Win95 twice.

How would I prepare and implement Win95 and it's technology if I could? If you are not in a hurry and you don't need the immediate benefits of Win95, wait till the 1st update. It should be out in the Q4 of 95 and include some worthwhile patches to the original release. The minimum computer system should be a 486/66, 16MB RAM, 300MB HD, 14" 28. dot pitch VGA monitor. Of course if you are planning on buying a new system then go for at least a 90Mhz Pentium with 16MB RAM, 1GB HD, 4X CD ROM and a 17" VGA monitor with 28. dot pitch. Don't skimp on the monitor. Also, take into consideration that a 90Mhz Pentium is already outdated in today's PC world. As far as software applications, I would stick with whatever existing 16bit Windows apps I had for at least a year. There are enough benefits in Win95 alone without the need for new 32bit apps. Secondly, Win95 is a brand new operating system and will surely have some bugs. The same holds true for all the 1st generation versions of Win95 3rd party software that will be released after Win95. Unless you feel lucky or have a dedicated IS staff then wait for these new products to be tested and proven by others.

Harvey Bruneau

Book Review

Word For Windows Design Companion

By: Katherine Shelly Pfeiffer

Review by: Herbert Atwood
Tampa PC Users Group

I was initially disappointed in this book in that it is targeted towards a very intensive "desktop publishing" audience rather than a general purpose type book for those of us that are not so involved in desktop publishing.

This book was written as a source of information and ideas for anyone who uses Word for Windows, to include both 2.0 and 6.0. Chapter two contains a brief summary of features and commands in both versions of Word, with Word 2.0 being denoted in parenthesis.

Chapter three is a brief introduction to design. Before starting each new project, consider the following questions: What is the purpose of this document? Who will read your pages? Are your readers busy people who want their information in bytes and blurbs, or are they looking for in-depth analysis? Answering these questions will help you design and structure your document for your "target audience".

The author also has a brief discussion of what she calls the "dynamic duos", namely structure and order, style and tone, harmony and contrast, positive space and negative space (white space), and finally symmetry and asymmetry. These are important because each is dependent on the other. She recommends making a specimen template and then print samples of your typefaces to use as test blocks in designing your layouts (an excellent idea in my opinion, who can remember all the typefaces they may have?).

The author then briefly touches on line space, line lengths and column widths, kerning and letter spacing, and then on to page layout basics. In page layout basics, the author discusses the use of grids as a "page skeleton" in order to help one design and organize the page elements and use of positive and negative spaces.

Here the use of "attention-getters" is also discussed. Changing type, using negative space, changing column structure, i.e., using one large column rather than two smaller ones can be effective. Use of graphic devices such as dingbats (dingbats are typographic ornaments used to signify the end of a text section or to introduce list items). These items quickly draw the reader's eye and add visual excitement to one's document.

Rules and boxes can be used as well. Rules are lines placed under headlines for emphasis and separation. Be careful when using these, however, as they create barriers as well. Boxes should be used with sections of text that can be read both separately and in conjunction with the related text.

Shading can be used as graphic patterns behind, above, or under items to be emphasized. Again, too many elements will create confusion. Illustrations and photographs are excellent attention-getters. Studies have shown that ideas accompanied by illustrations (to include photographs) make a stronger and longer lasting impression.

The rest of this book goes into design, step-by-step, from page setup, to the use of type, and finally production tips to include illustrations. This book is published by Ventana Press, Inc., P.O. Box 2468, Chapel Hill, N.C., 27515; telephone (919) 942-0220. The list price is $21.95. ISBN #1-56604-075-2.

SOFTWARE AVAILABLE FOR REVIEW:

1) Microsoft BOB - 8 essential household programs, calendar, letter writer, checkbook, and more...
2) Aldus Persuasion - Presentation Graphic Software
3) Adobe -Type on Call- 2 free fonts, call to buy more fast from Adobe
4) WindowWasher - the Ultimate Optimizer for Windows with Intelligent Data Compression
5) OnFile -for Windows, Arranges your files into fun-to-use "notebooks"
6) XtraDrive Lite - (Windows & DOS) Doubles your disk capacity. vendor: Integrated Information Technology
7) Your Deck - Design & Build How-to Software (Sunset)
8) Space Age - Arts & Letters 3 in 1 Software = Multimedia + Clip Art + Drawing
9) Jump*Start KINDERGARTEN - Knowledge Adventure getting a head start on education. (ages 4-6)
10) Kid's ENCYCLOPEDIA - The Random House (ages 7-12)
11) RUSA - Interactive Art Tour - St. Petersburg, Russia CDRom.
12) DO-OVER! - Change the look of Windows with a bonus utility to speed task switching.
13) SPACE ADVENTURE- Knowledge Adventure up-to the moment exploration of outer space. (8-adult)
14) AVIATION ADVENTURE - Knowledge Adventure complete world of Flying (8-adult)
15) TuneLand staring Howie Mandel - Interactive Cartoon CDRom (ages 3 and up)
16) Harvard for Windows ChartXL - Compelling charts from critical data from Software Publishing Co.
17) Harvard for Windows Montage - Easy way to organize your graphics from Software Publishing Co.
18) DataSafe - Crashproofs Windows
19) Personal Attorney - helps you prepare the 16 most needed legal documents.
20) Small Business Attorney - includes over 70 contracts and documents for small business.
21) Managing your Money Plus - Finance package, check book and more.
22) Managing your Money Windows - Finance Package
23) Managing your Money DOS - Financial Package
24) ECHO Lake Capture and share family memories - The Multimedia Family Album

Software Review

PC DOS 7 by IBM

Review by: Alford Poole, Tampa PC Users Group

I was almost liking Windows after installing PC Tools for Windows. There were no GPF's (General Protection Faults) for quite some time, then while using Central Point Backup for Windows to back up the hard drive and reaching 98% complete - bingo, GPF! The last %@!*#! straw! I also love to strike a blow against the Empire, so when the opportunity came to switch from MS DOS 6.2 to another operating system I gleefully accepted.

IBM's PC DOS version 7's box promises it has full-featured Windows and DOS utilities, new on-line help and reference tools. Stacker 4.0 (Stacker replaces Super Stor in this version), and Central Point Backup for DOS supports high speed diskettes and tape drives and - no more GPF's! Ok, the part about GPF's isn't really on the box.

IBM's PC-DOS 6.3 came with several Central Point (CP) utilities: CP Backup, CP Memory Optimizer and CP Scheduler. Additional tools available for installation with version 7: PenDOS, Phoenix PCMCIA, CP Undelete for Windows, IBM Antivirus for Windows or DOS, REXX (REstructured eXtended eXecutor language - instead of BASIC), CP Backup for Windows or DOS, file update, RAMboost, docking support, Dynaload, E Editor (similar to EDIT, but more like QEdit) and CD-ROM support.

PC DOS 6.3 installed on the Bits of Blue BBS with all its complexities with no problem. I hoped for the same experience on my machine with version 7. The manual gave instructions for installing under different configurations including Boot Manager which we have. The installation took about half and hour and the old DOS files (MS DOS 6.2) were backed up to floppies using the "A" drive (no choice of drives). Any extra DOS files (like List or other utilities you might have added to the DOS directory) remain after the installation. The amount of hard disk space needed to install the programs depends on which ones you want to install. 6MB of free uncompressed hard disk space will get you started with PC DOS and Central Point Backup for DOS if you don't have Windows. You'll need 18.5MB of uncompressed space to install PC DOS plus all PC DOS and Windows optional tools.

After the installation there was no noticeable change in system performance. So what did I expect? DOS is DOS right? Same old DIR, COPY, MOVE, CD, FORMAT, DEL, ETC. There are neat new things too. CPBackup for DOS is a much better program than the old BACKUP and RESTORE routine. The PC DOS Shell is good for file management and has graphic icons, but won't cause GPF's. Just wish it would show more information such as space taken up in directories by files when viewed (yeah, like Windows File Manager). If you need help remembering to make backups or execute other DOS programs at specific times, let Central Point Scheduler between backups just to avoid being reminded so often.

Guess how many 3.5" floppies are in the PC DOS 7 box. 20? 15? No peeking! That's right, five. That's it! Thanks to Stacker's XDF (eXtended Density Format) the 1.44MB diskette capacity is increased to approximately 1.86MB. Wait a minute, those numbers don't add up to a 2:1 ratio, what's the deal? Well, it seems this is something pretty to look at, but not really to use. You can copy the DOS disks using the XDFCOPY command, but you cannot create XDF floppies for your own files. No big deal! Once Stacker is setup 5.25" formatted floppies can be compressed to 2.8MB and 3.5" formatted floppies can be compressed to 3.4MB. Really neat! Now some of those great shareware games will only take up two disks instead of three.

For all you faithful EDLIN users, beware, EDLIN.EXE was deleted from this version of PC DOS 7. The good news is that if you have a licensed copy of Edlin you can copy it to your system. Whew!

Documentation consists of almost 600 pages in the User's Guide, and lots of information on-line through a viewer. The viewer can be started from the DOS command prompt, PC DOS Shell, OS/2 and Windows. Both the manual and on-line help are easy to use and understand. Using the on-line system is required sometimes since the manual refers to the on-line source for further details on some topics and if you want info on PC DOS Command Reference, DOS REXX and DOS error messages there are three on-line books. These are also available in hard copy form for optional purchase.

Over the years I've talked to several IBM tech support people and found them knowledgeable and helpful, even to the point of receiving a follow up call the next day. IBM offers several ways to receive additional help with PC DOS: a toll free number for "getting started" activities with recorded information and information on how to reach a real person (toll call may be required), on-line through CompuServe, by FAX, mail, BBS and extended services are also available.

How does PC DOS 7 improve on DOS 6.x, PC or otherwise? Utilities. More and better utilities. If you want Stacker 4.0 or some spiffy Central Point programs, then buy this bundle and save some cash. Did I really need this upgrade? Is it a blow against the Empire? Perhaps. If you are still running under DOS 3 or 4 do yourself a favor and upgrade. You'll be amazed at the improvements to DOS. If you have DOS versions 5 or 6 and don't have Norton Utilities, PC Tools or some other system management tools, then there are still quite a few new toys to enjoy. There is quite an assortment of goodies in the box, yet if you already have some of the products then the difference after installation won't seem like much. On the other hand if you feel like striking a small blow against the Empire . . .

Sure, I still have Windows 3.1 installed on our system and am even using it to write this review, and sure it is working fine now, but there are times when you just need to get in touch with the inner machine, check things out at the COMMAND prompt. I am comforted knowing that the heart of the system is dominated by Big Blue code instead of Mr. Bill's. Is there really any difference? Mostly in the cyberspace between my ears.

System Requirements: IBM compatible personal computer with a 1.4MB 3.5-inch diskette drive for this package (CD ROM packages also available), DOS (3.3 or higher) installed on the hard disk, 512K system memory and 6MB to 18.5MB of free hard disk space. A mouse or compatible pointing device is also recommended.

PC DOS 7 Upgrade Edition retails for $47.99 at CompUSA in either the 3.5" floppies or CD-ROM formats. By the way, Stacker 4.0 by itself is $89.97 and PC Tools (by Central Point) is $99.99 at the same store.

PC DOS is published by International Business Machines Corporation, Old Orchard Road, Armonk, New York 10504.

WHEN YOU THINK YOU'RE INDISPENSABLE

Sometime when you're feeling important
Sometime when your ego's in bloom
Sometime when you take it for granted
You're the best qualified in the room.

Sometime when you feel your going
Would leave an unfillable hole
Just follow this simple instruction
And see how it humbles your soul.

Take a bucket and fill it with water
put your hand in--up to your wrist
Take it out and the hole that's remaining
is a measure of how you'll be missed.

You can splash all you wish as you enter
You can stir up the water galore
BUT STOP, and you'll find in a minute
That it looks quite the same as before.

There's a moral in this quaint example
Just do the best that you can
Be proud of yourself but remember
There is no indispensable man.

Software Review

My First Encyclopedia

by Knowledge Adventure

Review by Katherine and Mary Powell Tampa PC User Group Member and offspring

Like most parents, if my young child is going to 'play' on our $3000 computer, we prefer that she a) learn something, b) have fun and c) **not** spill chocolate milk on the keyboard. While this software package could not prevent the unwanted spills, it offered fun while learning and one thing more...return appeal! She wants to 'play' with it all of the time!

As far as system requirements, it is very *now* in that the use of multimedia (sound & video) is extensive and will require a *now* kind of PC, i.e., an IBM 486SX or greater running at 25 Mhz with at least 4 MB of RAM. In addition, the video must be 640X480 by 256 color SVGA and the sound device must be MPC compatible. It must have an MPC compatible CD-ROM, a mouse device, and 8 MB of free disk space as well. And this is the minimum! We installed it on a Pentium 90 with 8 MB of RAM and a double speed CD-ROM, and another Pentium 90 with 16 MB of RAM and a quad speed CD-ROM. The CD-ROM speed definitely made the biggest performance difference.

Be prepared to tweak the sound device or display. I had to change the default video settings on one system before it would even install. On another system, the sound required some equalizing in order to hear the speaking over the background music. While this all sounds painful, I found a friend in the User's Guide. It was informative, well organized and genuinely helpful.

The opening screen provides clear choices that are easy to access with a mouse. Once inside, a large tree is the guide to all sorts of topics ranging from medicine to agriculture or anything you might find in an encyclopedia. It would be difficult to make an error navigating through here since almost anything they do will result in an activity. Mary has become somewhat computer literate at the ripe old age of 5, but it was still easy to see any child would get the idea right away. The tree itself is so full of interesting things that it provokes a child's natural curiosity.

There are a group of older children that appear in windows to verbally guide, instruct and inform the child every step of the way. Clicking on an object will either enter another screen or launch a window that explains what it is. Other screens can be rooms of more objects or a learning game. These are nested all through the program and cover the many different topics. The key is that children can explore at their own pace and about whatever interests them.

There are many different learning games and all sorts of topics to explore it would take a very long time to see it all. I guess that's where the return appeal I mentioned comes in. Mary is still learning new things every time she uses this program...and she thinks she just playing!

SYMANTEC AND DELRINA JOIN FORCES TO EXPAND PRESENCE IN COMMUNICATIONS MARKET IN $415 MILLION DEAL

Cupertino, Calif., July 6, 1995 symantec Corporation (NASDAQ;YMC) and Delrina Corporation (NASDAQ:DENAF and TSE:DC) today announced they have signed a definitive agreement to combine in a deal with an estimated value of US$415 million to Delrina shareholders. By joining forces, the two companies will combine their individual resources to take full advantage of the rapidly growing communications market. It is anticipated that the merger will be completed in November, 1995.

Software Review

DASHBOARD & SIDEKICK, a Great Team

Review by Robert Davis, Tampa PC Users Group

This is a dual package containing SIDEKICK and DASHBOARD. I started off installing SIDEKICK. Not much bad about it... The best feature of SIDEKICK is the Calendar which has the ability to schedule things virtually any way you want to. For example, you can just specify a particular time and date. You can specify a recurring event (like going to a PC meeting) to remind you every 2nd Wednesday, or any particular day of months, or the last day or last Thursday, or the 10th of each month, etc. The program has great flexibility in this area. Go to Yearly calendar, click & drag over multiple days & get a Multi-day event option. You can show things like trip to Colorado, or Vacation days, etc. And, all event entries have an alarm feature that can be turned on with a choice of several different alarm sounds.

SIDEKICK has a card file feature, too. Although it does not have a work and home phone entry, the phone number line is long and has intelligence. If you add for example "wk= 123-4567 Hm= 987-6543" and select the entry to dial the phone, it will show an option to dial the 1st or 2nd phone number. That is, it realizes there were two numbers in the line and sets up an option to dial either #. I expected it to stuff the whole line of numbers and comments into the number to dial area. It did not do this. A major plus for SIDEKICK.

There are three notes areas with boiler plates for business, personal, and SIDEKICK Tips notes areas to create, for example a proposal or thank you note. There is also a nice calculator with an electronic tape showing what has been entered. Also, if you have YOURWAY files you can move them to a SIDEKICK subdirectory.

You can drag and drop things, too. That is, just drag a name from one of your cards to the phone icon and drop it and presto! It dials their phone number. There are other drag and drop features too, like a trash bucket to delete things with. Or drag a card to a boilerplate in the notes and it fills in pertinent information from the card.

SIDEKICK requires about 4 to 5 Mb of hard drive space, (unless on a compressed drive, it may need 10 Mb), a 386 processor or better, Windows 3.1 or later, and a minimum of 4 Mb of RAM. Although you may never need it, SIDEKICK has 2 types of support. Their 900 number costs $2.00 per minute after the first minute. Their 800 number costs $14.00 per call. This seems a bit expensive, but as easy as I found SIDEKICK to use, I may never have to use it.

This product may be better for a laptop so you could carry it around with you and keep notes and reminders of appointments, etc. It's a very useful basic database type program.

After running SIDEKICK for a few weeks, I decided to load up DASHBOARD. I wasn't really excited about trying this program until I loaded it up. It was very easy to install, and the product is just great! It sets up all the groups from windows into folders with tabs. Click on a tab, it displays all the programs in the group vertically down the screen and in alphabetical order, Double click the tab and you get the old Program Manager type group display. I like the vertical list a lot better than the Program Manager type display. Seems easier for me to see what I want to load up. Also, you can click & drag a group tab and move it to a different place, thus you can arrange the order of the group tabs to suit your taste.

Below the tabs is a clock and optional calendar displayed. Double click on the clock and you get the menu to set up alarms. These can be recurring or single events and it even has a "Snooze" button which you can set to repeat every so many minutes like on your alarm clock. Next are some Prog windows, and then a resource window showing how much memory is still available, etc. Next to that is a window showing the current Windows default printer.

There is an option that allows DASHBOARD to replace PROGRAM MANAGER as your windows shell. After using DASHBOARD for about 10 minutes, I saw the benefits of doing this. When that option is selected, DASHBOARD requires you restart Windows and gives you an option to do so. I did, and it came up correctly the first try. It also has an uninstall feature should you decide to not use it.

Both SIDEKICK and DASHBOARD, although not essential things to have, seem to be very worthwhile programs that serve particular purposes. Although there was no price on the package, a check in the Computer Shopper shows the dual package available for under $50, which seems like a reasonable price for this neat pair.

Ziff-Davis Announces Winners of Its 1995 Shareware Awards Competition

CD-Quick Cache,
Greatest Paper Airplanes and
Heretic Programs

Take Top Honors

Editors from Ziff-Davis Interactive, PC Magazine, ComputerLife and Computer Gaming World evaluated more 1,300 programs in 16 categories, selecting one winner in each category based on its innovativeness, quality and value. Each magazine additionally selected one program to receive its Best of Year Overall Award.

The overall winners are:

PC Magazine Best of Year Overall Award: CD-Quick Cache by Circuit Systems — Of this winner in the **DOS**

Shareware Winners... *Continued on Page 9*

Shareware Winners..... *Continued from page 8*

Utilities category, the editors noted, "This great CD-ROM cache delivers great performance and its logic successfully detects and optimizes random reads."

CornputerLife Best of Year Overall Award: Greatest Paper Airplanes by KittyHawk Software — Winner in the **Home & Hobby** category, this cool paper airplane-folding software provides a brief history of flight and a complete library and instructions to create an entire fleet of first-class paper aircraft.

Computer Gaming World Best of Year Overall Award: Heretic by Raven Software/id Software — Winner in the **Action Games** category, Heretic is an outstanding action game sequel that propels users into a fictional universe and delivers impressive special effects. With its win, Heretic marks the second straight year that id Software has captured both action game and game of the year honors.

The other 1995 Shareware Awards Winners are:

Business Computing and Applications Development (selected by PCMagazine)

Business and Finance: Scheduling Employees for Windows by Jan Jansen/ Guia International — An easy-to-use, full-featured program that tracks employees' hourly and daily schedules as well as vacation and travel days.

Communications: SlipKnot by Peter Brooks/MicroMind —This graphical Web browser saves World Wide Web surfers substantial time and money by letting users connect to the Internet via a standard Unix Shell account, eliminating the need for a SLIP or PPP connection.

Major Applications: SmartTracker Inventory by Insight Software Solutions — An innovative program that organizes and catalogs information about personal possessions.

Math & Science: Judy's Tenkey by Dan Stickel — A feature-rich calculator that functions in three modes — pocket calculator, adding machine and RPN scientific — and features a "live" tape display, statistics, trig and financial functions.

Networking: Inner-Net by Jim Runkel — This easy-to-use program enables group desktopbased discussions over office networks with unlimited channels and allows you to page users using pop-up alert boxes.

Programming Tools: CEnvi for Windows by Nombas — An interpreter/compiler that uses C syntax and provides a great environment for C hackers to write batch-like programs.

Utilities-Windows: TextPad by Helios Software Solutions — This souped-up NotePad can edit multiple files of any size and in a variety of ways including font changes, word wraps and many others.

Home Computing and Education (selected by ComputerLife)

Education: Piano Professor for Windows by SofTech Multimedia — This outstanding electronic piano tutor brings out the Beethoven in everyone. The program links visual and audio cues to reinforce key positions relative to a note's tone and position on the scale.

Graphics: Jasc Media Center by JASC, Inc. — An easy-to-use program that organizes all media files into a single organized media center. It creates albums of media files including sound clips, bit maps and animations, which can be sorted, searched, printed, played or viewed on screen.

Multimedia: NoteWorthy Composer by NoteWorthy Art Wave — This sophisticated music composing program enables composer wanna-bes and talented musicians to experiment with notation and instrumentation to produce scores of musical masterpieces.

Personal Productivity: Time and Chaos Professional by iSBiSTER International — A simple and very helpful tool that organizes even the busiest person's life. This comes complete with address book, calendar, to do list, autodialer and appointment scheduler and out-values just about any Personal Information Manager on the market.

Games (selected by computer Gaming World)

Card & Casino: Casino Verite Blackjack by QFIT — A great game that enables players to apply the rules of almost any casino with enough options, card-counting tables and solid tutorial advice to hit the jackpot every time.

Puzzle & Logic: Word Search Construction Kit by Insight Software Solutions — A super program for gamers and teachers alike that delivers built-in hours of play value and enables l! you to modify and develop your own puzzles.

Strategy: World Empire III for Windows by Viable Software Alternatives — An amazing program for wargaming that delivers the addicting strategy of RISK with a geopolitical bent and ruthless characters.

The Ziff-Davis Shareware Awards are co-sponsored by Ziff-Davis, publisher of the leading computer magazines, and Ziff-Davis Interactive, which offers the ZiffNet™ and ZD Net™ online information services about computing on CompuServe, PRODIGY, eWorld, AppleLink, and the Internet's World Wide Web, as well as other electronic information products about computing. The Ziff-Davis Macintosh Shareware Awards, sponsored by MacUser magazine, will be awarded at MACWORLD Expo Boston, August 8-11, 1995.

Available for Downloading from ZiffNet

All the winners and programs nominated for the 1995 Ziff-Davis Shareware Awards are available for downloading from the software libraries on ZiffNet on CompuServe. To access the programs, ZiffNet members should GO PBSAPPS and look in Library 23/ZD Shareware Awards. CompuServe members may join ZiffNet by typing GO ZIFFNET. Users wishing to connect with ZiffNet directly may call 1-800-895-4596 for instructions about how to log on to the service.

Special Interest Groups Info

Microsoft Access SIG

The next sig meeting will be at 6:00 PM on Thursday, July 20, 1995 at the Dun & Bradstreet Software office, located at 3903 Northdale Blvd., Suite 113E, (look for the burgundy awning for the entrance) Tampa. The door locks at 6:00 pm, however, we will have someone keeping an eye out for late arrivals. PLEASE SIGN IN WITH A SIG LEADER.

For more info call *Sergio Mendez at --799-6589 OR Connie Kincaid--661-8185 - Leave a Message.*

Hardware & Software SIG

Connie Kincaid lead the Hardware SIG on June 27th, and reported there was a good turn out and that it was very successful. She will lead the Software SIG on Tuesday, July 25, 1995 at 6:30 PM

Place: Reflectone Building

Directions: Proceed west on Waters from N. Dale Mabry across the railroad tracks (which is about 1 and 1/2 miles), take second left on Savarese (United Technologies bldg. is just beyond it.) Proceed on Savarese until you reach the Reflectone bldg. Take the North door. If you need to ask directions, there is a security guard at the location. PLEASE SIGN IN WITH A SIG LEADER.

For More Information contact: Connie Kincaid--661-8185 - Leave a Message.

Internet SIG

There will not be a meeting in July. The next scheduled meeting will be Monday, August 7th. Call Charles for additional info at (813) 968-1207.

Directions: Proceed west on Waters from N. Dale Mabry across the railroad tracks (which is about 1 and 1/2 miles), take second left on Savarese (United Technologies bldg. is just beyond it.) Proceed on Savarese until you reach the Reflectone bldg. Take the North door. If you need to ask directions, there is a security guard at the location. PLEASE SIGN IN WITH A SIG LEADER.

Solutions?

A Software Engineer, a Hardware Engineer and a Departmental Manager were on their way to a meeting in Switzerland. They were driving down a steep mountain road when suddenly the brakes on their car failed. The car careened almost out of control down the road, bouncing off the crash barriers, until it miraculously ground to a halt scraping along the mountainside. The car's occupants, shaken but unhurt, now had a problem: They were stuck halfway down a mountain in a car with no brakes. What were they to do?

"I know," said the Departmental Manager, "Let's have a meeting, propose a Vision, formulate a Mission Statement, define some Goals, and by a process of Continuous Improvement find a solution to the Critical Problems, and we can be on our way."

"No, no," said the Hardware Engineer, "That will take far too long, and besides, that method has never worked before. I've got my Swiss Army Knife with me, and in no time at all I can strip down the car's braking system, isolate the fault, fix it, and we can be on our way."

"Well," said the Software Engineer, "Before we do anything, I think we should push the car back up the road and see if it happens again.

Quad-Cities Computer Society, contributed by Dale Neil

MEMBERS HELP-LINE

The following phone list is provided for our **Tampa PC Users Group** members in an effort to establish local support for those frustrating times which we have all encountered while using our PC's. Please note that these are members that have volunteered to help you, treat them in a courteous manner. Be sure to ask if it is convenient for them to help you now, or if you should call another time. It would also be helpful to have your documentation and have it handy when you call. *(Don't expect help if your software is an illegal copy or you do not have documentation!)* **TPCUG** is not responsible for the information or advice provided by volunteers. Volunteers may or may not be experts in the subject matter. You are on your own with any advice received. Be aware also that some of these volunteers may be consultants in their area of expertise. If you are interested in volunteering to answer members questions, either leave a message on the BBS or fill in the forms provided for this purpose at the meetings.

Open Letter to Mr. Manzi and Mr. Gates

By Philippe Kahn

Two recent editorials by Lotus Development's Jim Manzi and Microsoft's Bill Gates have created quite a controversy. Mr. Manzi says that Mr. Gates competes unfairly, while Mr. Gates takes exception to Mr. Manzi's criticism and invokes free enterprise as the sole source of his success. Having been part of this industry for more than a decade and having helped shape it with new technologies, I feel compelled to respond to both gentlemen. Too much energy is being expended in courts of law, and a bit of creativity can save us from turning the software industry into a legal playground. Our mission is to serve customers and continue to grow the software industry through technical innovation.

Mr. Manzi, innovate, don't litigate.

Let me first address Mr. Manzi's criticism of Mr. Gates. Mr. Manzi, you accuse Mr. Gates of anti-competitive practices. This is very hypocritical. If anyone has used anti-competitive practices in the software industry, it's you, Mr. Manzi.

Let me refresh your memory. Over four years ago, you unfairly attacked Borland by alleging copyright infringement. You knew, like all of us, that "systems" and functionality cannot be copyrighted. Nevertheless, you relentlessly tried to put our company out of business. We had the best technology, but you decided to beat us in court, and not compete in the marketplace. You actually privately told me several times to "get out of the spreadsheet business," and you boasted in the Wall Street Journal that you were going to perform a "cashectomy" on Borland. Your lawyers gave continual interviews to the press and even convinced stock market analysts that Borland would have to pay you as much as $300 million in damages. That amount would clearly have put Borland out of business. Unfairly you destabilized our company: you put doubt in the minds of our customers, you questioned our viability, you manipulated public opinion right up to the day when the Court of Appeals issued its opinion.

The ruling two weeks ago was a landmark for the whole industry and a vindication of Borland — a unanimous decision of the Court of Appeals affirming all of Borland's rights. We never doubted this outcome. How-

SECRETARY'S REPORT
TPCUG MEETING 7/12/95, 6 PM

Ybor Room Auditorium, HCC Ybor Campus
Minutes and Comments by Bruce Register, Secretary

President Bruneau (Harvey) called the meeting to order.

Miscellaneous Comments and Information were given:

Windows 95 (W95), standard edition, is advertised for $499 or $599
with Access. Release appears to be on schedule for soon release. Watch for
"competitors upgrade" and Microsoft upgrades for less money.

Harvey reminded the group that TPCUG has several software products for review.

NEWSLETTER, BITS OF BLUE. Kinkos, Carrollwood, mixed the pages in assembling the July Issue. The error was not noticed until delivery was received and mailed. Just pull the staples, arrange correctly and re-staple. Sorry!

BITS OF BLUE will be loaded on RBBS real soon. Time just ran out. It could not be uploaded sooner due to other demanding time requirements. Check it out in the next couple of days for downloading.

SIGs. SIG schedules are listed near the back page in the BITS OF BLUE newsletter.

SIG Hardware. There have been many most favorable comments regarding the high quality of the presentation and the material. Thanks, SIG leader Connie Kincaid.

PRESENTATION: Harvey presented Lynda Orban, KNOWLEDGE ADVENTURE, makers of educational and entertainment software. Lynda flew in from California to make her most interesting presentation to TPCUG.

KNOWLEDGE ADVENTURE provides a large range of software products in CD-ROM or 3.5" diskettes. Lynda reported on several products on which Steven Speilburg participated or is participating on. KNOWLEDGE ADVENTURE staff are excited about innovative developments that are creative, adventuresome, etc. All are designed to encourage individual thinking and individual growth within a pleasant and enthusiastic environment. Their products are a real learning experience.

KNOWLEDGE ADVENTURE is already preparing products for Windows 95. Release of them will begin soon. Lynda presented parts of several movies in 2-D and 3-D. The movies can be interrupted while an information reference window appears. Most of KNOWLEDGE ADVEN-

See **Minutes**.....*Continued on Page 3*

Minutes.....*Continued from Page 2*

TURE products run on standard machines rather than requiring high end technological machines. One does not have to go out and buy new equipment. Some products run on DOS; others run in Windows.

We were treated to a trip inside a human heart in 3-D. We ventured through 3-D Dinosaur Adventure while wearing 3-D glasses (we kept the glasses after the presentation). We paused and went, at will, to "reference areas" to learn the weight, length and height of each prehistoric animal. After satisfying our quest for information about whatever, we returned to the movie.

Lynda created a Spiderman movie of her (or our) design before our eyes. Then, she immediately played the movie just created. It was complete with a city, streets, street repair excavation, a thug, police car with siren wailing and, then, eventually Spiderman chasing the thug. After Spiderman, we toured the airplane museum in the Aviation Adventure product.

You can not believe the low price specials offered to TPCUG.
CONGRATULATIONS TO DOOR PRIZE WINNERS:

My First Encyclopedia	Patricia Van Horn
Spiderman	Kevan Sheridan
Aviation Adventure	G. Ennis
Real King T-Shirt	Everett Bowyer

Thanks to Lynda Orban and KNOWLEDGE ADVENTURE for three software prizes.

The next regular meeting of TPCUG will be Wednesday, August 9, 1995, 6 PM at Ybor Room, Administrative Building, Ybor City HCC.
Come and bring someone, your dentist, neighbor or friend, etc.

Open Letter.....*Continued from Page 1*

ever, we can't erase the irreparable damages that you caused our company, our customers and our shareholders over the last four years. This suit cost Borland and its shareholders millions of dollars, and probably robbed Borland of a bright future.

Even the day after the landmark decision, in statements to the press, your General Counsel, Tom Lemberg, claimed that "The lawsuit has still been a success for Lotus because it's stopped others from making compatible spreadsheets". Is that what you call success? Is that what you call fair competition? And, yesterday you decided to appeal the decision to the Supreme Court. May I suggest that you and your customers may be well served by investing less in your legal department and more in your research and development teams.

Mr. Gates, don't "stick it" to the industry.

As you know, Mr. Gates, a lot of issues were raised recently when Judge Sporkin read an internal Microsoft memo where some of your executives expressed an intention to "stick it to Philippe." You can understand that it's a bit worrisome for me to be in the sights of one of the most powerful companies in the world (it's also flattering!).

When I founded Borland over a decade ago, Microsoft was Borland's first competitor. You were already a large company. We were a bootstrapped garage operation. Through great technology, Borland grew to become the leader in developmental tools. A healthy competition developed between your large company and our more modest enterprise. As a consequence, the rate of innovation in the tools market continued to increase. We prevailed in tools, but you took the lead in applications and databases. I have to say that Mr. Manzi's unfair competitive practices certainly helped you—all of our competitors flourished as we weakened under Mr. Manzi's relentless attacks on our reputation. However, unlike Mr. Manzi, who tried to use the legal system to gain a competitive advantage, you, Mr. Gates, competed in the marketplace—and you did a very good job of it. You deserve credit for that. You've actually done such a great job at it that today Microsoft clearly dominates the software industry.

Some say that Microsoft is like a government that has been democratically elected but is now tempted to take advantage of its position of power. Mr. Gates, prove these critics wrong. Use your position of leadership to foster industry practices that will help the software industry grow to its next stage of maturity, assuring our customers that the software industry will remain fair and competitive for decades to come. To your credit it seems that, in today's environment, non-Microsoft products can be successful. For example, Borland's recently released Delphi has established a leadership position in the tools market very rapidly. Sidekick, recently released by Starfish Software, has become the world-leader in personal organizers. Both are succeeding because of their quality and technical merits. Will that become the norm, or will these two recent examples of success be the exception?

Mr. Gates, the ball is in your court. Windows 95 is a great operating system. Borland and Starfish are among the many software companies around the world that are building the great products to reinforce that. You now have an opportunity to prove all of your detractors wrong. Take the high road. You and Microsoft are in a position to help build personal computing into the next century and make it one of the most exciting industrial endeavors ever. As an industry, we can help people around the world become more productive, stay better organized, and communicate better. Your leadership is needed here.

See **Open Letter**.....*Continued on Page 9*

President's Column

I certainly hope that each of you weathered hurricane Erin without any major problems. In the aftermath of this storm it's easy to for many individuals in the Tampa Bay area to say the storm was a wimp. Never the less the center of the storm came less than forty miles from Tampa. It certainly could have been worse. Personally, I thought it was going to be, based on information coming across from the news media. We should all be prepared for these storms and not chance a disaster. Ask the people in the Florida panhandle how they liked Erin. I am sure they have a story that is 180° different than ours.

After the storm, the story The Little Engine that Could came to mind. Two events happened that caused me to think of this. One was the backups I created for our small data center the night before the storm was to hit and the second was Erin itself. My nightly backups are usually performed on a 4Gig Mountain tape drive. Unfortunately, it had failed the week before and I was waiting for a replacement from Mountain. While waiting for the replacement drive I purchased a 4Gig Conner tape drive from Computer City to ensure that I would have daily backups. At this point Erin was not even a tropical storm. After conversations with tech support from Arcada and Conner it was determined that limitations of the Arcada software that was included with the Conner drive was not going to allow me to properly backup my Novell server. By now Erin was a hurricane and bearing down on Florida and still no replacement drive. Well on Tuesday it was finally time to put plan C and D into action. Plan C was the use of Colorado Trakker 250Mb tape drives. Fortunately I had two. It took a lot of tapes and some time to backup four gigabytes but it worked. This was a case of the little tape drives that could.

The second reminder is to look at the damage caused in the Pensacola area. Who thought that Erin, that little bitty storm could do over $200,000,000 worth of damage. I guess it was the little storm that could.

I mentioned in my column last month, we are looking for early candidates to fulfill officer positions of the Tampa PC Users Group for the 1996 year. Elections will be held in December. Lets not wait until the elections to realize that we have no volunteers to run the business of the Tampa PC Users Group in '96. Following is a list of officers needed to run a PC user group and their associated brief job description. I have added some positions which do not currently exist but are important. Additionally, I have placed the names of those individuals currently assuming, in whole or part, the responsibility of each position.

President (Officer) Harvey Bruneau
Duties: Ensure the delivery of the group's mission to its members. Lead meetings and provide overall direction. Serve as overall representative of the user group to the public.

Vice President (Officer) William LaMartin
Duties: Act as president during president's unavailability and chair key committees. Fill other key roles as determined by group needs.

Secretary (Officer) Bruce Register
Duties: Manage correspondence and records. Records minutes from group's general and board meetings.

Treasurer (Officer) Tom Cone
Duties: Oversee financial resources, recording, and reporting.

Director/Chairperson/Committee Head/Task Leader
Tom Cone
Committee/Task: Membership
Duties: Coordinate new member recruitment and existing member retention. Manage database and membership communication.

Committee/Task: Program Director Harvey Bruneau
Duties: Handle planning and direction of speakers, presentations, demos, special events, and other programs. Periodically query members to identify speakers and programs of interest, satisfaction, and dissatisfaction.

Committee/Task: Vendor Relations Harvey Bruneau
Duties: Responsible for communication with vendors (hardware and software; local, regional, and national) regarding working with the group, special events, obtaining review products and door prizes, and other activities.

Committee/Task: Volunteer Coordinator All officers
Duties: Coordinate volunteer recruitment, management, and recognition.

Committee/Task: Equipment Manager Bruce Register, All officers
Duties: Manage inventory, transportation, availability, and storage of equipment owned by group or used by group.

Committee/Task: Marketing/Public Relations
Connie Kincaid, All members
Duties: Direct publicity, including media relations, community relations, and special event promotion.

Committee/Task: Advertising Marylee Bruneau
Duties: Manage advertising sales in user group newsletter and advertising placements for group activities.

Committee/Task: SIG Director William LaMartin
Duties: Assist special interest groups with program development, publicity, membership, meeting arrangements, and other tasks.

Committee/Task: Newsletter/Magazine Editor
Marylee & Harvey Bruneau
Duties: Oversee editorial development and submissions, design, production, and distribution of newsletter. Prepares and sorts mail according to bulk mail postal regulations. Creates electronic version, Adobe Acrobat, of newsletter. Selects and

See **President's**.....*Continued on Page 5*

President's.....*Continued from Page 4*

distributes articles to be published on Tampa Bay Online via Prodigy.

Committee/Task: Bulletin Board Sysop Kevin Sheridan/ Al Poole
Duties: Maintain and operate group bulletin board system.

Committee/Task: Librarian/Resource Center Coordinator Larry Anders
Duties: Coordinate shareware, public domain software, and other resources for group.

Committee/Task: Software Review Editor/Coordinator Harvey & Marylee Bruneau
Duties: Get review software from vendors, coordinate getting software to review writers, and follow up on reviews.

Committee/Task: Legal Counsel Tom Cone
Duties: Advise group on legal issues.

Committee/Task: Finance
Tom Cone/William LaMartin
Duties: Advise and oversee financial management.

Committee/Task: Development/Fund-raising
All officers
Duties: Plan and oversee fund-raising events and activities.

Committee/Task: Community Relations/Outreach
Harvey & Marylee Bruneau
Duties: Manage community services activities and serve as contact person with community at large.

In conclusion, if you are interested in serving your group in any one or more of the above positions, share those thoughts with the officers in person at the monthly meeting on the BBS or by phone. **The future and the success of the Tampa PC User's Group depends volunteers committed to leading the group.**

Trust Measure

Some measure their lives
by days and years,
Others by heartthrobs,
passion and tears.
But the surest measure under the sun
is what in your lifetime
for others you've done.

Ruth Smeltzer

Software Review

OS/2 Warp

Review by: Nicholas Klak, Tampa PC Users Group

International Business Machines, better known as IBM., has continued to try to assert dominance in the personal computer market. OS2, in its several versons, represents an attempt at capturing the operating system market for personal computers. OS2 version 3/warp is the latest attempt.The selling price at most computers stores is about seventy dollars.The Microsoft Corporation with its DOS and Windows versions has dominated the operating system market for most of the 1980's and 1990's. Every computer used must have an operating system. Which one will be your choice?

A review of OS2 could be made without reference to the issue of Windows 95, but that hardly seems realistic. Windows 3.xx and Windows 95 are real and they have the numbers to dominate the market. What then, is the value of OS2. Does the public need one more review of this product?

Unless you have been in a large box for the last two years or are completely unaware of computers, you are aware of the Windows 95 vs OS2 system fight. OS2 is here now. Tons of software has been written for Windows 3.xx and Windows 95. Much less has been written for OS2.Both Windows 95 and OS2 have a 32 bit operating system. Temper that with the reality that you must have 32 bit software to take advantage of this speed. That will not be a cheap switch. What about running our present software? That, I think, is one of the important considerations. What will run on the new systems? I have peeked at the Windows 95 literature. It will run our old software in 16 bit mode, but you must have at least a 386 DX/ 33 machine. What about OS2? What does it offer?

I decided to approach this review from a different position than I had previously seen. That is, the position of the minimum requirements possible as listed by the manufacturer. Windows 95 recommends at least a 486 SX with four megabytes of memory. I have several computers and I decided not to entrust the new operating system to my computer in everyday use. The concept of reviewing OS2 on a minimum machine was, therefor, a convenient scenario. Windows 95 requires a 386 DX be used if it was a fast one. (No 386 SX allowed here.) OS2 requires a 386 SX or DX with four megebytes of ram as its minimum. I decided to use a Packard Bell 386 SX /20 with four megabytes of memory and eighty megabytes of hard drive space freed up. I was determined to find out if OS2 version 3 with warp could operate effectively at this level.

I benchmarked my Packard Bell 386/20 SX, at "16" using Norton Utilities. Not a good start and a portent of things to come. The box containing OS2 Warp is about the size and heft of a desk top dictionary. Not the big one in the library, but the kind you have on your shelf at home. My OS2 package contained twelve disks for the basic installation. This took

See **OS/2 Warp**.....*Continued on Page 6*

OS/2 Warp.....*Continued from Page 5*

over one and a half hours to complete. Also in the package were several printer disks and several video disks. A bonus pack of programs was also included. The" Bonus Pak" included a fax program, Internet connection program, multimedia programs and IBM Works. IBM Works is a sort of expanded Microsoft Works. The advertisement on the box exclaimed that OS2 enhances your existing DOS and windows programs. What a friendly and all inclusive statement!

The installation was smooth and nearly flawless. One disk had to be reset, (started at a different spot) but after one and a half hours the "duel boot" system was installed. This duel boot allows the use of OS2, DOS and Windows programs to be used. Indeed, I ran several DOS programs at the same time. Actually they were taking turns being active which is different from actually working at the same time.

I also installed IBM Works. It has a word processor, database, spreadsheet, charting, forms and several other features.This installation took about fifteen minutes. Ten megabytes of disk space was used to hold the program.

Boot up time for OS2 on my machine was about four minutes. It seemed longer. The time needed to get the "program manager" for Windows up was another two minutes. DOS programs were installed automatically with an icon for each one. I ran my old,"New Print Shop"and tested it for a speed comparison. It took only sixteen second to load. I then loaded a ready made sign, "garage sale". It loaded instantly. Printing it out on my Hewlett Packard 500 ink jet printer, took seven minutes. This same job running under a straight DOS system can be done in about three minutes. Changing printers under OS2 is accomplished by selecting the printer icon on the desktop. Interrupting a printing job to change printers or assignments causes problems. The "spooler" of the printing mode will not allow any new activity until the previous activity is done. It appears that OS2 has all the faults of Windows Print Manager. You must wait for all the printing jobs to be completed before a proper shutdown can occur. There probably is a way around this but I did not find it in the time I reviewed this. The spooler can, and should, be turned off. Running the same Print Shop program, mentioned above, as a DOS program in Windows under OS2, was a nightmare. It took sixty minutes to print most of the garage sale sign. Printing was reduced to three second bursts every five minutes. My screen saver kicked in and I was flying (stumbling) blind. System reset was my only alternative. At that point I terminated the printing attempt.

" IBM Works looked like a nice program", I thought. "Here at last was a 32 bit program written directly for this operating system." My hopes were quickly dashed. It was sluggish to say the least. Any changes were made at a snails pace. It was now evident to me that OS2 would not work under the minimum requirements advertized by IBM. Sorry about that but that is the bold bad truth. I know others who are using OS2 with success but I have concluded that it takes more of a machine than a 386 SX with four megabytes of ram.

Uninstalling OS2 from my system was an undocumented adventure. The manual gives instruction on "selective" uninstall, not a complete uninstall. Nothing within the program allows a complete uninstall. A partial removal of fonts, etc. is allowed but nothing more complete. I guess IBM. never thought anyone would? Fortunately I did have Norton Commander on the hard drive. I went to the DOS programs after boot up to began deletion. There was a full screen edition of my old standby utility, "Norton Commander." Already I felt better. OS2 had not saved a backup of my autoexec.bat and config.sys files. I did, however, have backup files which had been kept by my Norton Utilities program. I renamed both of those files with the proper extender. Manual deletion of the OS2 files was accomplished. A reboot of my machine brought back the Windows 3.1 system I previously had.

Please be advised that my experiences with OS2 ver3.0/warp was on a low powered machine. This, however was supposed to do the job. The end line is that it did not. Most operations were so long in time as to be useless. Will I install it in a faster machine? I doubt it. Perhaps I am too intrenched with Microsoft to switch.

Warp'd Humor

Top 10 Reasons IBM is buying Lotus

10. IBM Finance could not run their Visicalc spreadsheets in OS/2 Warp.
9. IBM wants to show Microsoft that they have better Antitrust lawyers.
8. IBM thought they were buying the auto company.
7. Lotus CEO Jim Manzi mooned Lou Gerstner on the Lotus Home Page.
6. IBM's own email product, ccProfs, never caught on.
5. It was the easiest way for IBM to acquire copies of Windows 95.
4. Bill Gates double-dared Lou Gerstner.
3. Lotus Warp rhymes with basketball guard Otis Thorpe.
2. IBM will rename Lotus' spreadsheet program to 1-2-3.3 billion.
1. The Notes server in Armonk is down.

Software Review

MapLinx for Windows

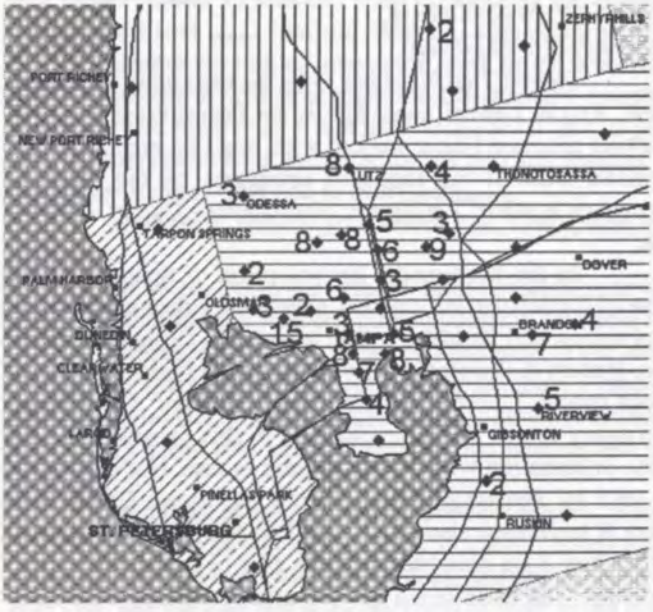
Review by: William F. LaMartin, Tampa PC Users Group

MapLinx for Windows is a database mapping program that will plot on a United States map the locations of any data you may have containing a zip code field. It is obviously targeted at sales and marketing people. But its street price of $89 - $99 makes it accessible to anyone interested in maps and data.

It imports from most major database applications, like *Access, Approach, dBase, Lotus 1-2-3, Paradox*, or just a plain comma delimited list of fields in a collection of data records. So getting data to plot should be no problem.

It has built in integration with programs like *GoldMine, Maximizer*, and Pro*Phone*. Its use with ProPhone is one of the applications that caught my attention. From *ProPhone*, I simply select those phone numbers of interest (typically gathered by some search), send them to *MapLinx*, and get my graphical representation.

Taking our user group database from several months back, MapLinx produced the plot you see on this page of our members in Hillsborough, Pasco, and Pinellas counties. I then added the labels indicating the number of members per zip code. The numbers add up to less than our total because all family members are counted as one entry for the plot.



Now what sort of things can be done with this map on screen. First, let me say that it looks much better on the computer screen than in this printout. I can zoom-in and zoom-out with my view. I can select any region with a selection rectangle. Then the map acts like a database and provides me with whatever information is in the database for each of the records associated with those diamonds in the selected area. For our user group that is basically just address, telephone number, and date of membership. I could do the reverse procedure. Search that database from MapLinx for a particular name, then have *MapLinx* label that person's location on the map.

One very useful feature is being able to measure distances on the map. For example, I could choose a potential meeting site, then use that as the center of a circle and determine how many members were in , say, a 5 mile radius, or a ten mile radius. You can, of course, see the usefulness of this in dispatching services. For, given a zip code, *MapLinx* will label it on the map. You can then, using the distance feature, expand the measuring circle from that zip code until you encompass the nearest hospital, service center, post office, or whatever other type of locations you used *MapLinx* to represent on the map.

This program is not like a word processor or a drawing program. There isn't really much to learn. It is easy to use and works well. The smallest boundary lines it draws are county boundaries—which on the US map scale are quite small areas. But if you desire to see the actual zip code boundaries, then for $99 more you can have that too.

MapLinx Co., 5068 W. Plano Pkwy, Plano, TX 75093-5099. Phone: 214 231 1400. Fax: 214-248-2690

List price: $149 Street price $89 - $99

Each diamond represents the center of an area code where at least one **Tampa PC Users Group** family resides. The numbers indicate how many families are in a particular area code. No number equals one family.

QmodemPro offers multithreaded file transfers under Win 95

Mustang Software Inc. will ship a Windows 95 version of QmodemPro on August 24 that uses 32-bit multithreading to enhance file-transfer rates even when minimized on the task bar.

Available until the end of September for $129 retail or $49 as an upgrade, QmodemPro supports Telephony API and Mail API and is an Object Linking and Embedding 2.0 client. The product includes a BASIC-like script language for customizing, macro keys, a host mode, support for 35 terminal emulations, and 11 file-transfer protocols. A graphics viewer for reviewing GIF, BMP and JPEG files is also included.

Mustang Software, in Bakersfield, Calif. is at 800-999-9619.

Software Review

Arts & Letters SpaceAge - CD Rom

Review by: Renate Marsh, Tampa PC Users Group

!Wow! That word has to be the beginning of this review. Arts & Letters SpaceAge is the fastest most versatile drawing program I have worked with, and I do include in my opinion most of the topnotch programs on the market. SpaceAge is a 3 in 1 software: Multimedia - Clipart - Drawing.

In the Multimedia Encyclopedia of SpaceAge you have all the detailed information, slides, and videos about space exploration and its history. The subjects to explore are endless: History & People (you can listen to their famous speeches about space), Launch Vehicles, Space Centers, The Future, and many more. The Encyclopedia in this program has all these information with a click of your mouse. Not only am I amazed by SpaceAge but apparently the Space Center and Nasa is impressed also as indicated on the cover of the programs box. I am delighted with the ease of usage within this program. The main menu has big picture buttons with each topic written right below it. The SpaceAge Theater button gives you a choice of running a slide show or watching a video. Actual photographic pictures of famous space history with narrations will let you re-live exciting explorations in outer space in our country and around the world.

Since SpaceAge is a 3 in 1 Software you receive 2 manuals with the software. One gives you detailed instructions how to use SpaceAge Encyclopedia and Multimedia, the other tells you all about the Drawing program and how to use the clipart, including props and scenery to create presentations. Both manuals have lots of pictures to explain one feature or another. Those manuals are very helpful with all their hints and tricks how to create your own scenery or to move around in this program, but SpaceAge is so easy to maneuver that you will install it and go your own way for quite a while before you remember the manuals. The On-Line Help and On-Line Glossary are so extensive with lessons, samples, and detailed description that you might forget to check out the manuals.

The Arts & Letter Drawing program has a new feature (at least it was new for me) called Flex-Art which make your creations come alive. It is so much fun to use it and to change your object movements. Look at my little astronauts. I duplicated the one standing up and changed the duplication into the one bending down. The possibilities of creations are endless with this feature and it is amazing how the body parts blend together after you changed their positions. Space stations or rockets can be taken apart, objects can be placed into the hands of astronauts - there must be hundreds of variations to use this feature called Flex-Art. Now this is fun! And I have to mention this one important aspect of this program. When I edited and changed objects and parts around, the redraw of the scenery or picture were fast. My frustration with other programs in that field was mounting, but Arts & Letters Drawing program proved it - re-draw while editing can be swift. Hundreds of space and other clip-art let you design your own space station. Included ready made props and scenery let you create instant art in minutes.

Arts & Letters main program with over 10,000 clip-arts is called Arts & Letters Express (which I ordered right away while checking out SpaceAge for this review). If you are interested Arts & Letters also has a WarBirds and Dinosaur program set up in the same fashion as SpaceAge and you can contact Computer Support Corporation to receive a FREE demo CD Rom which will give you a guided tour of each program plus their complete Drawing program to use right away. Just the demo disk is quite impressive and entertaining.

You of course do need a CD Rom, sound card, Windows 3.1 or higher, and a 386 CPU - preferable 486 with this version. There is also a disk version on the market but be prepared to have a lot of free hard drive space. Get the FREE demo CD Rom to check out Arts & Letters products. My review does not give them justice at all because there is so much more to these programs then one short review can tell you. Computer Support Corporation 15926 Midway Road Dallas TX 75244 Tel: 214 661-8960 Fax: 214 661-5429

Arts & Letters Express - Guided Tour

Review by: Renate Marsh, Tampa PC Users Group

Here we have the most impressive CD Rom demo disk I have ever encountered. Even though it includes a complete Drawing program for you to use with many typefaces and over 400 clip-art images, this CD Rom is FREE! Just write, call or fax your desire to have this CD Rom to Computer Support Corporation and they will send you one.

This CD Rom will introduce you to the following programs: Arts & Letters Express, Arts & Letters SpaceAge, Arts & Letters Dinosaurs, Arts & Letters WarBirds and of course the complete program of Arts & Letters Draw which can be activated and used by you right after the installation. The Guided Tour installation of Arts & Letters Express gives you an installation choice of 3 languages: English, German, and Swedish. As a born Berliner, I had to install the German version and it was quite impressive to follow the guided tour in my native language.

I am supposed to write only a short paragraph about this CD Rom and there is no way to give you all the fantastic details in a short little paragraph. Get in contact with Com-

puter Support Corporation and get your own free CD Rom. Arts & Letters Draw is quite powerful with its Drag and Drop feature and with its instant art using ready made scenery and props. The Draw program includes many features you only would normally find in a very expensive Desktop Publishing or Draw program.

Their main purpose with this CD Rom is to draw your attention to their programs, especially Arts & Letters Express which is a very uncomplicated DeskTop Publishing program. Easily a rival of the many desktop software that are out there. It has a complete color and image management which can be combined with various sound effects. The guided tour shows you all its capabilities. What impressed me the most, one can turn a straight standing man into a jogger with selecting parts of the legs and arms and rearranging them into a running position. In the SpaceAge, Dinosaur, and WarBirds guided tour, it demonstrates the same with the rockets, dinosaurs, and airplanes. And of course, I have a full functional Draw program where I did try out some of the creations I have seen on those guided tours. Get your pen, fax, or phone going to order this CD Rom for yourself; tell them you heard about their free CD Rom in our club newsletter. After viewing the CD Rom guided tour, and you order the program Arts & Letters Express which comes with over 10,000 clip-art images (cost $99.00), register right away and you will receive an Arts & Letter Typography CD Rom with over 1000 fonts again for FREE. Arts & Letters software are great and Computer Support Corp. do offer us quite a bargain.

Computer Support Corp. 15926 Midway Rd Dallas TX 75244
Tel.: (214) 661-8960 Fax: (214) 661-5429
System Requirements: 386 SX or better - CD Rom drive at least 4MB Ram (8MB recommended) Windows 3.1 or greater Mouse or other pointing device

Open Letter..... *Continued from Page 3*

The US will continue to dominate the Software Industry — with or without Microsoft.

The US software industry, led by Microsoft, is the clear global leader. As a matter of fact, the top 10 software companies in the world are US companies. Let's take that incredible economic advantage into the next century. Let's make sure that Windows 95 provides a fair opportunity for innovative products such as Delphi and Sidekick. This will help customers, increase the rate of innovation, and, in the long run, profit Microsoft. It will strengthen the US software industry and Microsoft. Most of all it will help build the vision that you among others have been pursuing for the two last decades: a computer on every desk and in every home.

Mr. Manzi, refocus your efforts. Mr. Gates, take the high road.

So, to conclude, Mr. Manzi, please refocus your efforts. You should keep your criticism to yourself; you have no place to complain about Mr. Gates or Microsoft. Your anti-competitive practices are the worst in the industry. I predict that your Notes and Smartsuite customers are going to increasingly worry about your commitment to open systems and innovation.

Mr. Gates, in the name of the software industry, please provide leadership by making Windows 95 a level playing field where all can fairly compete and succeed. We will all get behind you, and we'll all put more creativity to work as we continue developing the best software in the world. Out of courts of law and government intervention!

[Mr. Kahn is Chairman of Borland and CEO of Starfish.]
(Editor Note: Originally published in the Wall Street Journal, this open letter was down loaded from a Compuserve forum where it had been placed for republication.)

"SnagIt" Snags Anything

Tulsa Computer Society (APCUG)

SnagIt is a very handy image capture utility which will capture anything from a total screen image to a single icon. The evaluation copy is fully functional with a help file that is outstanding. In the May issue of "PC Computing", this utility was given a 5 star rating. Although this is a "Windows" program, it is possible to capture full screen DOS images as well. This process is a bit complicated but by following the directions in the help file it is manageable.

This program works somewhat like using the print screen option to send an image to the clipboard, however, the versatility is much more advanced. The output can be sent directly to your printer, the clipboard or a BMP file. The fantastic part is that you are not limited to just full screen capture. Choices vary from the previous to region, entire window, last active window or the window client area. The window client area allows you to "Snag" the window without boarders, title bar or menus. This is just the click of the button when this input method is selected. The title screen is such a capture. Image output can be monocrome, color or dithered greyscale. I found that using monocrome when printing to a black and white printer gave the best results.

Brian Livingston states that **"SnagIt is the utility that "Microsoft"** forgot." If Mr. Livingston (the father of how to use Windows) gives this a resounding thumbs up then who are we to argue. I used "WinZip" to install this program and therefore the two files, exe and hlp, take a mere 196K of hard drive space. There are other associated files that you can install or by keeping the zip file available they can be accessed with "WinZip".

SnagIt is in the software library of AOL as SnagIt22.zip, through the Internet at address ftp://garbo.uwasa.fi/windows/util/snagit16.zip or from the TCS bulletin board as SnagIt22.zip. The registration information is from a region image capture on the program's information screen. The $59 fee to the shareware author seems a little high to me, but if you have more than just occasional need to do screen captures this program is as versitle and easy to use as you will find. Try the evaluation copy and have a snagin good time!

Special Interest Groups Info

Microsoft Access SIG

The next sig meeting for September will be announced in next months Bits of Blue and on the BBS. There will not be an Access SIG in August due to vacations.

For more info call *Connie Kincaid--661-8185 - Leave a Message.*

Hardware & Software SIG

Connie Kincaid lead the Hardware SIG on June 27th, and the Software SIG on Tuesday, July 25, 1995. She reported there was a very good turn out and she received many request for repeats of these informative SIGs. Watch the announcements in the Bits of Blue and the BBS for schedules on these proposed future meetings.

For More Information contact: Connie Kincaid--661-8185 - Leave a Message.

Internet SIG

The next scheduled meeting will be Monday, August 7th. It will be conducted jointly by Charles Howe and Dan Guy. Dan will start his freshman year at Wilkes University in September. He will navigate the Web. Call Charles for additional info at (813) 968-1207.

Directions: Proceed west on Waters from N. Dale Mabry across the railroad tracks (which is about 1 and 1/2 miles), take second left on Savarese (United Technologies bldg. is just beyond it.) Proceed on Savarese until you reach the Reflectone bldg. Take the North door. If you need to ask directions, there is a security guard at the location. PLEASE SIGN IN WITH A SIG LEADER.

Charles Howe -HOWE.COSTECH@INTNET.NET

OS/2 SIG

OS/2 SIG, Next meeting: will be: Tuesday, August 8th, 1995 at 5:45 p.m. Location: IBM Lakepointe One Bldg., Room 436 BE SURE TO SIGN IN. SIG Leader will be John Lucas Subjects: Customizing the Desktop and REXX programing.

Contact: John Lucas
JKLUCAS@MAILSERV.MOFFITT.USF.EDU)
OR
John Meroth at (813) 831-7878 anytime except 6-8pm.

MEMBERS HELP-LINE

The following phone list is provided for our **Tampa PC Users Group** members in an effort to establish local support for those frustrating times which we have all encountered while using our PC's. Please note that these are members that have volunteered to help you, treat them in a courteous manner. Be sure to ask if it is convenient for them to help you now, or if you should call another time. It would also be helpful to have your documentation and have it handy when you call. *(Don't expect help if your software is an illegal copy or you do not have documentation!)* **TPCUG** is not responsible for the information or advice provided by volunteers. Volunteers may or may not be experts in the subject matter. You are on your own with any advice received. Be aware also that some of these volunteers may be consultants in their area of expertise. If you are interested in volunteering to answer members questions, either leave a message on the BBS or fill in the forms provided for this purpose at the meetings.

SECRETARY'S REPORT

TPCUG MEETING 8/9/95, 6 PM
HCC Ybor Room Auditorium
Minutes and Comments by Bruce Register, Secretary

President Bruneau (Harvey) called the meeting to order.

Miscellaneous Comments and Information were given:

Harvey Bruneau shared Hurricane Erin preparedness. He stressed the importance of being serious about equipment and data. Losses can occur from wind, storm, rain, or sprinkler systems; or, maybe even static electricity in the building through the metal superstructure or conduits. He emphasized backup systems. UPS and dedicated plugs are just some of the terms that have familiarity.

Planning is required for most ongoing systems before making a cold splash into W95. Some of your previous applications may not run in W95 without adding this or that software that you previously had within your software system. Some may elect to increase hard drive capacity so as to accommodate a dual boot, W95 and Windows 3.11. W95 will only run on Intel or clones. Other platforms gives one an opportunity for other considerations.

Many interesting opinions were expressed regarding many applications.

(Secretary's opinion—Some people seemed to be polarized toward W95 or OS/2 Warp. Sometimes these strong opinions become almost argumentive as emotional preference is aggressively manifested; Our President, Harvey, seems to be exceptional at keeping peace while allowing everyone their say One of the many benefits of TPCUG is the openness of the expressions by the members. We are exposed to other viewpoints. We are then able to have better understanding before making decisions).

Much open and frank dialogue permeated the meeting. Several members stated that they thoroughly enjoyed and appreciated the broad participation. Several expressed opinions regarding the future of the computer world. All comments were enlightening and confidence builders.

Someone suggested that TPCUG could set up a 286 in a retirement facility to fulfill the desire to provide community service. Volunteers are needed to do it; suggestions such as this are great and hopeful but "we need doers" according to one opinion. The interface by individual members reflected enthusiasm during the break. One member stated the "refreshing sight to see pairs, threes, etc., groups exchanging information, assistance and fellowship." Sharing info and ideas are just one of the great benefits of TPCUG, Harvey stated.

See **Minutes.....***Continued on Page 3*

Minutes.....*Continued from Page 2*

Harvey reported that GTE has offered to present ISDN at their downtown GTE building. More later as plans develop. Several members responded with delight. Look for messages on the bulletin board.

Some members have avoided using the TPCUG BBS. Do not hesitate to try it. You cannot break it. You cannot hurt it. You will enjoy the experience. If you have stage fright, just call one of those most willing helpers listed in the back of the BITS OF BLUE. Any of them will be glad to talk you through the access. In helping me, they have even "fired up" their own computer while talking to me over the phone. They would ask "Do you see....."? etc. They really like to assist you. Do not hesitate!

Miscellaneous comments were "stay away from 5 volts and 60 Pentium", "Lotus Approach is better than ACCESS", "Be prepared to upgrade; but you may continue with your present system and may not need to go to the latest technology. If you need it; do it. If you do not need it; you might want to consult you pocket book before jumping in." Other comments were also appreciated.

PRESENTATION:
Tom Cone, Treasurer, shared a tool that he finds useful. Creator, V6.0, writes programs. It is a "code generator". It is not particularly sophisticated and is very easy to use. Tom presented highlights of the program rather than giving training detailed. He likes the program and uses it in building report programs. You tell it what kind of information you want to track and the type of screen you want. Creator then builds the program. You add fields as you desire. Creator is a commercial program that sells for $99 MOL (More or Less).

CONGRATULATIONS TO DOOR PRIZE WINNERS:

Pagekeeper	Steve Schoeneck
CD Murder Mystery	Wil Goble

The next regular meeting of TPCUG will be Wednesday, September 13, 1995, 6 PM at Ybor Room, Administrative Building, Ybor City HCC. Come and bring someone, your spouse, pharmacist, neighbor or friend, etc.

Software Review
Quick Books by Intuit

Review by Jamie Clark, Tampa PC Users Group

As an owner of a small home business, I have always dreaded the bookkeeping chores. My normal mode is to collect a pile of receipts, bills, invoices and other scraps of paper into various piles. Once or twice a month, I look them over, pay any that I owe, send out bills to any clients that haven't been billed in a while, and then return them all to the pile again. Maybe I have scribbled "Paid" on some, or "Past Due" on others, but usually I end up spending most of my bookkeeping time trying to figure out what is going on. When it gets too confusing, I stuff it all in the file cabinet and hope that it will clear itself up in time for taxes.

Luckily for me, the folks at Intuit seem to be a sympathetic group. They put together QuickBooks for Windows for all the small businesses and their piles. QuickBooks is an easy to use, small business accounting package that makes it much easier to track everything the small business owner needs to follow, and more. All without requiring you to learn cryptic accounting terms or magical number concepts.

Users of Quicken will find the look and feel of QuickBooks familiar. QuickBooks uses a "paper form" interface wherever it can. Filling out a check or an invoice on the screen is just like filling one out on paper. QuickBooks also uses the QuickFill feature to eliminate duplicate typing, by finding information from elsewhere in the system and placing it where it thinks you need it. If you have already been using Quicken for your small business, QuickBooks will even import your files.

Installation and startup are quite easy with the help of the online QuickTour demo and the Getting Started manual. Between the two of these aids, you will quickly have all the information you need about your company, your clients, and your vendors, entered into the system. After that, you are ready to roll. While you are learning the program, Qcard pop-ups attached to each dialog box will help you along.

QuickBooks running under Windows95. New users are helped along by the Qcard help attached to each dialog box.

See **QuickBooks..***Continued on Page 4*

QuickBooks.....*Continued from Page 3*

QuickBooks handles all of your accounts receivable, accounts payable, inventory, budgets, checking, and many more things that I will never use. It provides you with an easy way to enter new items, and easy to understand reminders when old items need attention. It has a considerable amount of smarts concerning recurring bills and invoices, letting you reuse the information and prompting you when you forget one. It remind you of overdue accounts, both yours and the other guy's, and even helps you cut a check if it is you that needs to pay up. Output is easily customizable, from your invoices and checks to the plethora of reports. QuickBooks prints on most of the standard laser printer and dot matrix checks and invoice forms. They are even nice enough to give you a couple of samples and a catalog so you can order more. You can also view your plummeting sales figures in graphs and charts for the number impaired and even print them out to share with a friend.

Overall, QuickBooks should more than adequately meet the needs of any small to medium sized business. I have used it for several months and have had no problems getting everything out of it that I needed, and then some. My bills are being paid on time and my clients are getting billed twice as often as before. A happy situation for me. I am even looking forward to tax time when I export all of my year's accounts straight into TurboTax and hit the "Where's My Refund?" button. And with the available payroll supplement, QuickPay, I might even hire someone to come clear out all these little piles of paper.

Software Review

SPIDER-MAN

CARTOON MAKER

Review by Scott and Jimmy Lawson,
Tampa PC Users Group

Knowledge Adventure has a large selection of educational and entertainment software available. Spider-Man Cartoon Maker definitely falls into the entertainment category. The computer skills needed are minimal. The program is easy to use. Most kids will not need the manual.

The program is Windows 3.1+ based on a CD-ROM. The installation gave two options, playing off the CD with a small directory on the Hard Drive, or fully installing onto the Hard Drive. The minimum hardware requirements for software are a PC with Windows 3.1 or higher, MPC compatible sound card and speakers, 4 MB memory (8 MB memory recommended), and a 16 color 640 x 480 monitor (256 color SVGA recommended). If you have a microphone available, kids can store their own voices into the cartoon. I ran the program on a 486-66 MHz with 16 MB memory, 2X CD-ROM, and a SVGA monitor. The program ran from the 2X CD-ROM with no problems.

Simple icons lead the player through the act of creating their own cartoons. A thumb down icon will undo the last command entered. A question mark icon will start audio help, explaining in detail any other selected icon or item. There is a large selection of items to place into the cartoons. These items are separated into libraries. The background library starts the cartoon by selecting the scene. A stamp library is filled with foreground items. There is also an animation library, with Spider-Man and his villains. A moving object library has cars, planes and other vehicles. Finally a trace library, so that the

player can color some items themselves. A snapshot menu of available items in each library makes selecting easy. In addition to placing and moving graphics, audio may also be added. Music and sound effects from a library can be added, as well as your own recorded voice or sounds.

I know that my opinion is not the final word where games are concerned so I will let my son, Jimmy (age 10), finish the review. Spider-Man is his second favorite comic book character, after Venom (one of Spider-Man's Allies and Foes).

I though that Spider-Man Cartoon Maker was a very fun game. I really loved the graphics. They looked just like the comic books. The background scenery was also just like the comic book. One of my favorite things about the program was that unlike other drawing software, the characters moved. The animation made the program really cool. The program also has a trace library to make customized characters. I liked how you can also have the comic strip replay by itself. There were some things that I didn't like. It took too much time to display some graphics. Some of the screens were hard to get out of. There is no icon to erase things that you don't want. You have to start the screen over if you really mess-up. I think it will sell good. I would buy it.

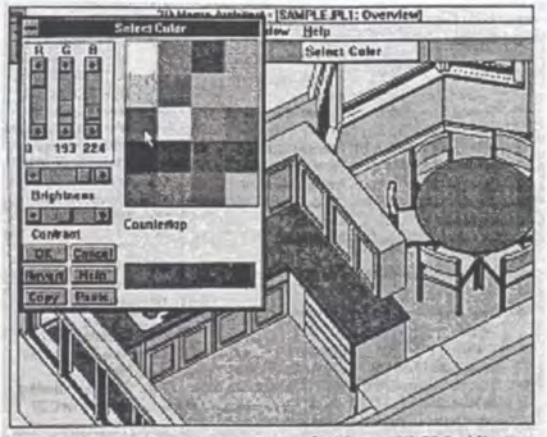
3D Home Architect

by Broderbund

Review by Katherine Powell,
Tampa PC Users Group

Having taken mechanical drawing and being a "do-it-yourself" type homeowner, this package appealed to me right away. Designing a dream home or even just making simple changes to my current residence would be fun. 3D Home Architect had the added appeal of providing the interactive 3D views and editing, and I wanted to see my current house from all these different angles and try "what if" scenarios out from the safety of my keyboard and mouse.



Running under Microsoft Windows 3.1, your minimum system requirements will be an IBM 386 or greater with at least 4 MB of RAM and a VGA display, however a 486 is recommended and a color SVGA display is highly recommended. The manual clearly states that a mouse is essential, "If you haven't got one, you cannot use the program". I installed it on a Pentium 90 with 8 MB of RAM and an SVGA monitor.

Installation was quick and easy. Once loaded, I was able to double click that new icon and start drawing immediately. Or was I? Although the interface was very nicely laid out, my first attempts were somewhat frustrating. OK, they were unidentifiable masses of walls and objects. I figured at this point I should at least *look* at the manual. This is one software package that requires some reading invested. The manual was excellent! It provided a tutorial in the second chapter that was well worth going through.

After the tutorial, I felt like an expert. I began my project by drawing my house. It started out great and I loved how easy it was to get the basic walls and doors up. Once again, I found myself getting frustrated though as I began to do more and more complicated things. It took all day to play with the package and learn the limitations and nuances. Then I was an expert!

There is furniture and fixtures available to help make your plan more realistic. There were limited selections, though, and some of the furniture was not sizable. You can color these items for even more realism and the color selector was quite good. However, the number of colors that you can assign to your furniture, walls, floors, etc., was limited as well and I found this annoying. The package has limited decorating capabilities but, in all fairness, this was not what it was intended to do.

The real strength of this software package came to light as I began to play with the 3D options. You can view your plan from nearly any angle. There are camera objects that put you inside the rooms and from there you can modify colors and some sizes and other specifics. There are elevation views from any side or cross section you choose. Finally, there is an overview of the plan that shows you the 3-dimensional plan from above, below, behind...anywhere you wish!

POINT-AND-CLICK: Mouse your way to a perfect home with 3D Architect.

Other interesting features include the PlanChek™ option that goes through your plan and makes suggestions for changes you may wish to consider. You can generate a materials list of everything you will need based on your plan. This is in a spreadsheet form that includes a column for prices, so you could print out the list and begin checking prices at the hardware store! The SmartParts™ technology makes putting things together faster and stops you from doing things you shouldn't, like putting a door where it can't be properly installed.

There is a companion booklet with sample plans that are also installed as plans for you to view through the software. These are handy to view for ideas, or to see how something complicated was handled.

Although there are limitations, and there was some frustration in learning to use this software, it is a very worthwhile package that I plan to continue to become an expert at.

AOL Users

America Online has a beta version of its World Wide Web access available online now. Located using the KEYWORD: WWW you can download this Version 2.5 free of charge. Remember, you must do it in the window in this area or you will be charged. By the way its only for Windows. It works GREAT!, and is simple to use.

It may also be installed in conjunction with your present **AOL** software. Best of all there is no extra charge for this Internet access. What a great way to experience this new technology.

Special Interest Groups Info

Microsoft Access SIG

The next sig meeting will be Thursday, Sept. 21, 1995, at 6:00pm. **NEW LOCATION!**
Directions: Proceed west on Waters from N. Dale Mabry across the railroad tracks (which is about 1 and 1/2 miles), take second left on Savarese (United Technologies bldg. is just beyond it.) Proceed on Savarese until you reach the **Reflectone bldg**. Take the North door. If you need to ask directions, there is a security guard at the location. PLEASE SIGN IN WITH A SIG LEADER..
You must call to register in advance with Connie if you plan to attend this meeting.
For more info call *Connie Kincaid--661-8185 - Leave a Message.*

Hardware & Software SIG

Connie Kincaid will lead a Hardware SIG on Tues. Oct. 24th at 6:00 p.m. Location: Reflectone (see above for directions)
The Software SIG is scheduled for Tues. Nov. 28th at 6:00pm. Location Reflectone.
You must call to register in advance with Connie if you plan to attend either or both of these SIG meetings.

For more info call:: *Connie Kincaid--661-8185 - Leave a Message.*

Internet SIG

Contact Charles Howe at 968-1207 for information on date, time and agenda for the next Internet SIG meeting.

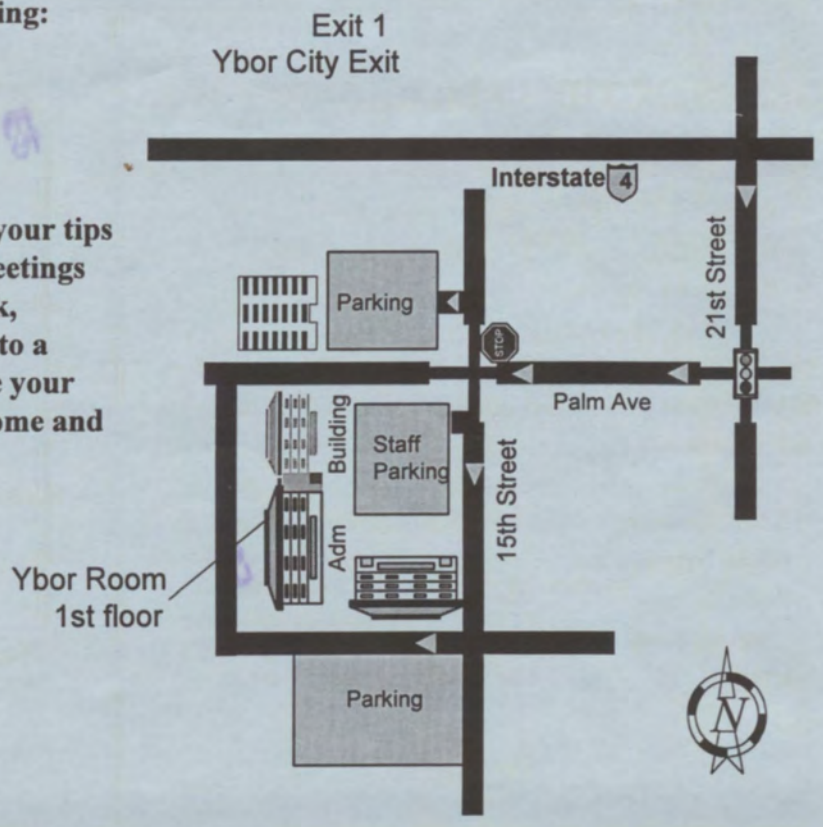
MEMBERS HELP-LINE



The following phone list is provided for our **Tampa PC Users Group** members in an effort to establish local support for those frustrating times which we have all encountered while using our PC's. Please note that these are members that have volunteered to help you, treat them in a courteous manner. Be sure to ask if it is convenient for them to help you now, or if you should call another time. It would also be helpful to have your documentation and have it handy when you call. *(Don't expect help if your software is an illegal copy or you do not have documentation!)* **TPCUG** is not responsible for the information or advice provided by volunteers. Volunteers may or may not be experts in the subject matter. You are on your own with any advice received. Be aware also that some of these volunteers may be consultants in their area of expertise. If you are interested in volunteering to answer members questions, either leave a message on the BBS or fill in the forms provided for this purpose at the meetings.

New Editor for Newsletter

By William LaMartin

To help Marylee Bruneau out of the bind she got herself into by taking on one or two jobs too many, I am relieving her of this one a month or two early. Does the new editor normally take over with the January newsletter, where the work is done in December, or the February newsletter, where the work is done in January? Which ever way you answer that question, I am finding that there is a bit of work involved in meeting the standard her issues of *Bits of Blue* set in the past. Luckily I have past issues to study and use their layout as a template for the layout of this issue.

There is no need to reinvent the wheel, so this issue should look a lot like past issues. I will probably make changes as I get into this and learn the ropes of setting up a newsletter. One change already is a slightly expanded map of our meeting site. Ideas from the membership about what would be of interest in our newsletter are welcome. Times change, and what was important to include five years ago may no longer be of interest to the general membership since we now have so many different sources of computer information.

With the short notice in preparing this and the fact that we have no backlog of finished reviews of software by members of our group, I asked two members, LarryAnders and Don Patzsch, to contribute articles for this issue, so that not every review is copied from another APCUG member newsletter. I hope Harvey came back from COMDEX loaded with complementary copies of software for our members to review for the newsletter.

Harvey did bring back a good bit of information from COMDEX. See

see **Newsletter**.....page 7

SECRETARY'S REPORT

TPCUG MEETING 11/08/95, 6 PM
Administration Building Auditorium, HCC
Minutes and Comments by Bruce Register, Secretary

(Thanks to Jenny Olin for taping the meeting for me in my absence at the meeting)

President HarveyBruneau called the meeting to order. Miscellaneous Comments and Information were given:

Harvey announced that the newsletter has not been published for the two previous months. His wife Marylee, is pursuing a change of professional career and has "been buried in the books" plus their computer at home had to be rebuilt, etc.

William LaMartin will be doing the newsletter in the future.

The TPCUG BBS has two numbers; 980-1295 and 980-2725.

The floor was opened for nomination for 1996 Officers. Voting will be at the December 13th meeting.

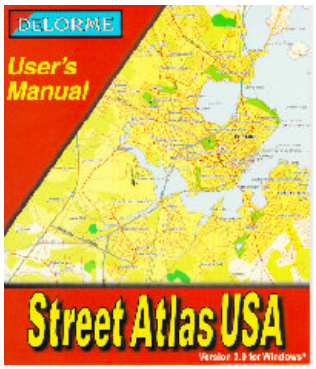
President	Connie Kincaid
Vice President	Jenny Olin
Treasurer	Will Goble
Secretary	Bruce Register
Member at Large	Margaret Petro

Some discussion was held about the duties and activities of the Board. For the last few years Harvey and Marylee have hosted the meeting at their home...etc., etc.

PRESENTATION:

Thank you William LaMartin for the presentation of Genealogy Research. William discussed how he uses the computer in genealogical research.

First he accesses the genealogical conferences available on our BBS using communication software such as *WinCommPro* or *ProComm* and downloads the conference messages in compressed QWK packet form from a TQM mail door session on the BBS. He then uses the off line mail reader *OLX for Windows* to read and respond to those messages that interest him. This process is facilitated by using OLX's search feature to search for particular names of interest.



See **Minutes.....**continued on page 4

Software Review

DeLorme's Street Atlas USA® and Phone Search USA™

Review by Larry Anders, Librarian
Tampa PC Users Group, Inc.

I read an advertisement recently that asked the question, "ever wonder how Santa finds your house?" Well, word is he uses DeLorme's *Street Atlas USA*® 3.0 and *Phone Search USA*™ to find and map the homes for his deliveries and I can well understand that. I have personally been using *Street Atlas USA* since version 1.0 and it just keeps getting better and better. New to this 32-bit version 3.0, that takes full advantage of Windows 95, are a powerful search engine that lets you locate a specific address and ZIP code on the map, and a set of map-customization tools, which allows you to create your own maps that can be annotated and edited as needed. Also with version 3.0 they have added *Phone Search USA* as a companion program. The quality of the printed map on a 300 dpi laser printer rivals any professionally printed maps I have ever seen. When I say this I am not speaking from total inexperience. In college I studied cartography (map making) and wanted to follow that as a career path at one time. I'm glad I didn't now....I could be out of work because of this program.

If you're looking for a real neat gift for that special computer person for Christmas let me tell you a little about some stockingstuffers everyone can enjoy.

First things first, these are the system requirements:

- IBM or 100% IBM-compatible PC with 386SX or higher or 100%-compatible processor running at 33 MHz or faster.
- 4 MB RAM minimum (8 MB recommended).
- 4 MB of hard disk space.
- ISO 9660-compatible CD-ROM drive with 650 BM read capacity and Microsoft® CD-ROM extensions.
- Microsoft® -compatible printer (not plotter) recommended, with 1.5 MB printer memory for 150 or 300 dpi laser printing, 6 MB for 600 dpi.
- Microsoft Windows-compatible mouse.
- Microsoft Windows-compatible VGA card and monitor.
- Microsoft® Windows version 3.1 or later (including Windows® 95 and Windows NT™).
- MS-DOS® version 4.01 or later.

DeLorme's *Street Atlas USA* combines detailed, street-level maps of the United States with tools that rapidly locate and display them. Highways, populated places, rivers, lakes and mountains are labeled. The maps have elevation lines and tints to show you variations in topography. *Street Atlas USA* includes the address ranges of streets and marks airports, parks and other points of interest. The overview map provides a reference to the area surrounding the main map view and a legend to help you interpret map features. *Street Atlas USA* also has tools to customize, preview, layout and print maps directly or copy them to the Windows Clipboard.

In addition to the wealth of map data available, *Street Atlas USA* provides several tools to access the maps. You can locate a map by ZIP Code, by the name of a city or town, or by telephone area code and exchange. You can search for and highlight street addresses on detailed maps using the Find Address tool. You even display the ZIP Codes for any of the maps you are viewing. You can move around the maps or use the In and Out tools to show maps at higher or lower magnitudes. *Street Atlas USA* automatically provides the level of detail appropriate for the geographic area shown on each map.

Street Atlas USA 3.0 has an additional advantage: it works with DeLorme's new *Phone Search USA*. *Phone Search USA* is a digital phone directory containing over 80 million residential and business listings. You can search by name, by phone number or by business type. You can limit your search to a specific city, state, ZIP Code or area code and exchange. You can look up all the restaurants in town, find an old friend or relative, locate a client or E-mail map files to other version 3.0 users. With unlimited exporting, you can use your search results in any word processor, database or spreadsheet program. Best of all you can locate the listings on *Street Atlas USA* maps It's as if the phone book had a map for any listing.

Street Atlas USA comes on one CD-ROM while *Phone Search USA* comes on 3 CD-ROMs. Street price for each program is approximately $80. My upgrade price for each as a registered user was $39. DeLorme offers direct purchasing for $79 each program.

So, if you made your Christmas list and checked it twice consider these programs as gifts for someone whose naughty.... or nice!

(DeLorme, P.O. Box 298-205, Freeport, ME 04032, 1-800-452-5931(205), Fax: 1-800-575-2244, http: //www. delorme.com)

Minutes.....continued from page 2

He then demonstrated the use of the free form database *AskSam* to show how he saves messages of interest so that at any time in the future he may do one of *AskSam's* many different searches to relocate information in these messages. Off the genealogy topic he demonstrated other features of *AskSam*, e.g. its hypertext feature when used as a word processor (think of *AskSam* as a combination word processor and database. Back on to genealogy, he finished with a demonstration of the specialized genealogical database program *Family Tree Maker for Windows*, where one stores all the pertinent information about a family line and is then able to display or print out this information if various forms: family descendant charts in tree form or outline form, ancestor charts, and relationship tables.

SOFTWARE AVAILABLE FOR REVIEW

1. **Microsoft BOB** - essential household programs, calendar, letter writer, checkbook, and more...
2. **Aldus Persuasion**- Presentation Graphic Software
3. **Outside IN** for Windows - Instant Access to any file-- View, copy print search, launch & manage files.
4. **Harvard ChartXL** for Windows -Compelliong charts from critical data. Software Publishing Co.
5. **Window Washer** - the Ultimate 0ptimizer for Windows with Intelligent Data Compression
6. **On File** -for Windows, Arranges your files into fun to-use "notebooks "
7. **Partition Magic** - IBM Shrink, expand, move, and convert hard disk partitions - for OS/2 & DOS
8. **OnCmd** - On-Line Data xBase database development environment for native OS/2
9. **Family Fun Pack** for OS/2 Warp CD
10. Jump Start **Preschool** - Knowledge Adventure - getting a head start on education (ages 2-5) Windows CD
11. Jump Start **Kindergarten** - Knowledge Adventure getting a head start on education. (ages 4-6) Win. CD
12. Jump Start **First Grade** - Knowledge Adventure getting a head start on education. (ages 5-7) Windows CD
13. **Space Adventure** - Knowledge Adventure up to the moment exploration of outer space. (8-adult)
14. **Aviation Adventure**- Knowledge Adventure complete world of Flying (8-adult)
15. **X-Men Cartoon Maker**- Knowledge Adventure (ages 5 & up) Windows CD.
16. **Casper Brainy Book**- Knowledge Adventure Interactive Storybook (ages 4-8) Windows CD
17. **TuneLand** staring Howie Mandel - 7th Level. Interactive Cartoon (ages 3 and up) Windows MPC CD
18. **Personal Attorney**- helps you prepare the 16 most needed legal documents.
19. **Managing your Money Plus** - Finance package, check book and more. Windows CD
20. **Managing your Money Windows** - Finance Package
21. **ECHO Lake** - Delrina Capture and share family memories - The Multimedia Family Album
22. **Internet in a Box** - The complete internet solution for Windows.

PRESIDENT'S COLUMN

by Harvey Bruneau

Change is good. Change is constant. While these statements aren't profound they are the norm in the world of computer technology, especially the PC world. Of course not everyone will agree that Win95 or OS/2 is better than DOS but everyone is entitled to their opinions. At the December meeting you will each have an opportunity to get involved in this change process. I am, of course, referring to the election of new officers for the 1996 year. They include the following positions President Vice President, Treasurer, Member at Large and Secretary. As of this writing the following were nominated President *Connie Kincaid*, VP *Jenny Olin* and *Michael Hodges*, Member at Large *Margaret Petro*, Treasurer *Will Gobble* and Secretary *Bruce Register.* Nominations will stay open until just before the voting process begins at the December meeting. We are very fortunate to have a full slate of nominations for each position. Some positions even have two nominees.

As you may all know by now, I have chosen not to run for president this year. After holding that position for six years I need to step back and let someone else lead the group. This change is good for the group and me. I thank you for allowing me to serve as your president for those many years. I also want to thank all of those volunteer board members that worked with me over the years. Were it not for them I couldn't of lasted more than one year. Additionally, Marylee has handed the position of editor over to William LaMartin in order that she can focus on attaining her A.S. degree in Nursing. This is a tremendous change and opportunity for Marylee. Please join me in wishing her the best in this endeavor. The newsletter you are reading has been designed by William LaMartin.

I wish each of you the best during the upcoming Holidays.

Comdex/Fall '95

Once again I attended Comdex "The Worlds #1 Information Technology Marketplace for Resellers and Corporate Decision Makers". Comdex/Fall is always held in Las Vegas and is their largest show/convention of the year. Armed with my press badge, a good pair of walking shoes and an insatiable appetite for knowledge I set out among the miles of aisles within the more than half a dozen sites. This year Comdex expected over 200,000 attendees. Final estimates were around 250,000. For those of you interested I have placed the keynote speeches by Lou Gerstner, Chairman & CEO of IBM, and Bill Gates, Chairman and CEO of Microsoft on the BBS as an Adobe Acrobat file call KEYNOTE.PDF.

Following are my thoughts and my experiences of Comdex/Fall '95.

Internet

Of course Internet was a hot item. The focus was predominantly on one piece of Internet, the World Wide Web. Everyone was showing their Home pages, Web browsers, HTML (HyperText Markup Language) editors or explaining the benefits of setting up an Internet account through them. However, it became evident over a couple of days that the story was not in the current state of the Web, but in fact the future of the Web. Many vendors demonstrated their new proprietary software that will be incorporated into Web pages. It is was really fascinating to see products like JAVA, HTML 3.0, VRLM and Blackbird incorporated into Web pages. The inclusion of sound, video, 3D virtual reality and other features really add a lot to a Web page. These products will raise the level of interaction with the Web, but at what cost? Currently there is a standard, HTML, which can be viewed by almost any good browser. However, Microsoft, Netscape and others have decided to add their own new extensions to HTML that will require special or proprietary Web browers or filters. I believe that these new non-standards, while beneficial, will create divisions among the Web surfers, much like the separation of DOS, Windows, Mac and OS/2 users of today. Remember change is good. These changes should be noticeable during the 1st half of 1996.

ISDN

ISDN (Integrated Services Digital Network) looks to be a hot prospect. ISDN is a digital phone line/network that lets you communicate at speed of 128kbps. At about five times the speed of a 28.8 modem it should be the preferred way to connect to the Internet or to telecommute to work. This standard includes support for accessing all network services, allowing voice, data, fax, video and graphics to use the same line, with all the error free performance associated with digital technology. Imagine accessing the net while having the ability receive and make phone calls simultaneously. Of course ISDN is not as cheap as a standard phone line and modem but as the demand for this technology increases the prices will drop.

If you are planning on getting an ISDN look at the BitSURFR Pro ISDN modem from Motorola. It allows you to connect your computer to the ISDN line in addition to providing you with two analog ports for phones, faxes or even an analog modem.

MPEG

MPEG (Motion Pictures Experts Group) is really going to be big in 1996. This data compression technology will allow you to play full-screen, full-motion video on your PC. Combined with other technologies, MPEG will be a boon to multimedia, video-conferencing and the Internet. While this

Software Review

Adobe Photoshop 3.0

Review by: Dave Garcia
The Mile High Computer Resource Organization
Denver, CO

Graphics Design Software, Adobe Systems Inc.,1585 Charleston Road, P. O. Box 7900, Mountain View, CA 94043, (415) 961-4400 Retail: $549.00 (PC Zone) Upgrades: $145.00-179.00

Overview: Comprehensive software for creating painted images, and editing scanned images.

Pros: Now supports multiple image layers, improved color control, improved interface. Cons: Long learning curve for first time users.

Requirements: 386 or 486 processor, (Pentium recommended), DOS 5.0 or higher, MS Windows 3.1 or higher, (DOS 6.0 recommended), WlN32s, 10 MB RAM (16 MB recommended), 16 MB for Windows NT, (32 MB recommended), 20 MB Hard Disk Space, 256 Color Display Adapter, (24-bit color adapter recommended), Mouse, (Sound Card & C19-ROM recommended) Optional - Scanner

Installation: Photoshop is a 32-bit application and requires the MS WIN32s subsystem. This allows 32-bit applications to run under 16-bit Windows 3.x. The setup program installs WlN32s automatically when you install Photoshop. You can install from diskettes or from the Deluxe CD-ROM, both are included. In addition to the Photoshop application, the CD-ROM contains the User Guide, Plug-in Filters, Stock Photography, Tutorial, Technical Notes, Acrobat Reader, and Tryout versions of other software.

Adobe Photoshop 3.0 offers an improved interface, and provides support for multiple image layers, new color adjustment features, and new filters. All together the changes offer greater control and keep Photoshop ahead of the image-editing pack.

The new Photoshop interface has a toolbox containing 30 different tools (two of them new), three new floating palettes (Layers, Options, and Commands), and six redesigned palettes (Brushes, Channels, Paths and three color palettes.) The toolbox and palettes are floating and can be arranged anywhere on the screen. The palettes are also collapsible to give you more screen viewing room when you're not using them. The new tools are Move, which lets you reposition selections, and the Sponge tool, which lets you control the saturation of colors in an image as you paint.

The Layers Palette allows you to create composite images by combining multiple layers. The implementation of layer support was something that all Photoshop users have been waiting for. If you're not familiar with layers, imagine three separate transparencies, one has a picture of you on it, another one has your mothers picture, and another has fathers picture. Each is a layer. You can edit and reposition each layer separately, try it in combination with the other two layers and continue editing each until you are happy with it, then combine the three layers to create a composite family photograph. You can copy elements from one layer into another simply by dragging and dropping. You can also add special effects to your layers using the Opacity controls and Blending modes. For example a 50% opacity setting would give an element a somewhat transparent effect. Blending modes control the lighting appearance of layers and their elements.

The Options Palette provides a single location for the options for each tool in the toolbox such as Opacity and Blending modes for the Pencil and Paintbrush tools.

The Commands Palette allows you to quickly access frequently used commands and palettes with a single click. You can add your own commands, and you can modify the commands that Photoshop supplies in the command palette. The Brushes palette now gives you the capability to create, edit, delete, and save your own custom brushes To create a brush you define the diameter (size), the hardness, the spacing (distance between brush marks in a stroke), the angle of a non-circular brush, and the roundness, which indicates whether the brush is a circle, an ellipse, or a straight line. As with most of the Photoshop tools practice makes perfect (well, almost perfect).

The Channels Palette. Every Photoshop image contains one or more Channels which represent color element information. For example, an image created in RGB mode has three channels, one each for Red, Green, and Blue information. In Version 3.0 additional channels, called alpha channels, can now be added to an image for storing, editing, and loading temporary masks (selected portions of an image).

The Paths Palette controls all of the Pen tool functions. When you draw with the Pen tool you can save the path that you have drawn as a path name. Then you can reuse it later on, and even fill the path with color. Three color palettes, Picker, Swatches, and Scratch, separates the functions of the former Color palette. The Picker palette displays the color values for the foreground and background colors and allows you to edit these colors using one of five different color models. The color models are (Gray scale RGB, CMYK, HSB, and Lab. The Swatches palette contains just that, swatches of colors. You can select from the swatches to create foreground and background colors You can add or delete colors to the palette, and even create your own customized swatch palettes. The Scratch palette is so called because it is a scratch-pad area that allows you to mix your own colors and then select them for use as foreground or background colors. It's also a good place to experiment when creating your own brushes.

New filters include the Lighting Effects filter, the Dust & Scratches filter, the Mezzotint filter, and the Clouds

filter. The Lighting Effects filter allows you to add up to 16 different light sources, such as a spotlight, to an image. this filter offers a lot of versatility to give an image a special effect, but it takes a lot of experimentation. The Dust & Scratches filter allows you to remove dust ant scratch areas picked up in a scanned image. The Mezzotint filter is another special effect that converts an image to a random pattern of black and white. There are ten different patterns to select from. The Clouds filter gives you just that, a sky Image with clouds.

Photoshop is a very powerful graphic design tool for professionals. The system requirements and the learning curve involved preclude it from use by the occasional user. But if you are a professional graphics artist or designer, or want to be, then AdobePhotoshop V3.0 has everything you need.

President.....continued from page 5

technology is available now as an add-on, look for MPEG to be a standard feature included in new PCs.

Video Conferencing

With the advent of the two previous technologies video conferencing is rising to the top as a viable technology. While the initial users may consist of large corporations it should not be long before you can video conference with your family and friends over the Internet. But if you don't have ISDN or MPEG you can still setup video conferencing on your network. Look atQuickCam for Windows from Connectix. This simple yet powerful product includes a digital video camera, which plugs in to your parallel port, and software for under $150. It also allows you to create snapshots or videos and video conference with any other QuickCam user on your network.

CD Technology

The CD technology that we use today will be history. Multiple vendors are now in the process of setting the next CD standard, Super Density Disc. Today CDs hold 650MB of data, but in the future (1996) a 5.25" CDs will contain anywhere from 4.7 GB to 17GB. The bad news is that you will need to purchase a Super Density CD ROM drive. The good news is that it will be able to read all your old CDs. This technology will allow the distribution of full length movies on CD. You will be able to select up to eight dubbed language tracks and 32 subtitled language tracks. Of course many other applications will benefit from this new mass storage format.

The above comments cover only a few of the many products that caught my attention. Come to the December meeting to hear about other technologies which I think will rise to the top in the future.

Newsletter.....continued from page 1

his President's Column where he shares some of this information with us.

There is a little overlap there with DonPatzsch's ISDN article. I asked Don to write about ISDN since most of you weren't in attendance when GTE gave us a very good presentation on this telecommunications technology. We are very appreciative to GTE for taking the time to do this for our group and for group member and GTE employee Roger Waters for setting it up.

Like Harvey said in his column, theinternet is the big thing now, and I could certainly use one of those fast ISDN lines as I wait for my World Wide Web (WWW) sites to produce their graphics. But at $.02/minute, I will just have to forgo it for now. In a bow to theinternet, though, as space permits I will include some of the WWW addresses that I have visited recently that may be of interest. They are literally thousands of such sites to visit, and, I suppose, the number is growing by the hundreds each day. For example, my neighbor, a Realtor, just got her listings with photos of the houses on the WWW. I'll try to pick sites to list that have some informational value.

This newsletter can be viewed in Adobe Acrobat format by downloading the file PCNL1295 from our BBS. The telephone numbers are listed on page 2. If you don't have the Acrobat reader, you need also to download the file ACROREAD.EXE from the BBS. There is much more than reading our newsletter online for which the Adobe reader can be used. One such is viewing and printing out the IRS forms you download from the Treasury's WWW location listed on page 4 in this newsletter. Another interesting use is viewing the eight page summary of the NY Times in Acrobat format that you can get free at the WWW location listed on page 4.

If you are using software or have read a computer related book you think others might be interested in, discuss it with me. There might be a newsletter review there. I prefer to use our own talent. We can not depend only on software donated by vendors for reviews. There just isn't that much coming in anymore. The software that LarryAnders reviewed was software that he purchased. I welcome others to do the same.

Don't forget the election of officers this coming meeting. And don't forget to thank Harvey andMarylee as they leave office for all their contributions to our group.

Software Review

Lotus SmartSuite for OS/2, Release 1.1

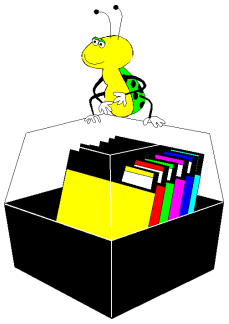
Review by JohnSeckman,
Serra Vista IBM PC User Group

In order to run this package of applications, you must have the IBM OS/2 operating system installed and running. My installation is a dual-boot system, which gives me the choice of booting up in either DOS or OS/2.

Lotus SmartSuite for OS/2 consists of the following applications:

Lotus 1-2-3 Spreadsheet for OS/2, version 2.1 Lotus 1- 2-3 is a powerful spreadsheet far outdistancing the version I first used years ago. New features include the ability to drag and drop objects in the Workplace Shell to open, move, print or discard files; to automatically expand or compress the print range to fit the page; to include powerful 3-D Worksheets; Solver and Backsolver goal-seeking technology; to enable file linking and drawing layers; and to automatically link charts and data between 123 spreadsheets and Freelance Graphics. This marriage of 123 with OS/2 means you can perform multiple tasks at the same time. As Lotus claims, you can print monthly reports while calculating a spreadsheet while downloading an external file via your modem. This version takes approximately 8 MB of hard disk space.

Lotus Freelance Graphics version 2.1 This presentation graphics program is powerful and very easy to use. My first attempt went without a hitch. From handouts to color slides and overheads you just fill in the blanks. You can link live data from your 123 spreadsheets or insert text from Ami Pro. Included are a tutorial that helps getting started; 40 SmartMasters that automatically guide you through the process of creating slides, overheads and handouts; powerful text editing, drawing, charting and presentation tools to automate the process. Included are over 500 symbols and pictures and 13 Adobe Typefaces. As mentioned earlier you can automatically link charts and data between 123 and Freelance Graphics however to do this both must be the same version, i.e. 2.1. This version takes approximately 5 MB of hard disk space.



Ami Pro for OS/2 version 3.0 This easy to use word processor works and thinks the same way you do, in words, pictures, symbols and colors creating letters, reports, newsletters, calendars, memos and proposals. Features include editable, customizable icon images; quickly move text, tables and icon images on the screen by simply dragging them to a new location; clip art, symbols, scientific equations, automatic bullets and numbered lists; includes outlining, built-in-tables, grammar checker, spell checker, thesaurus, WYS/WYG display, revision marking and pull down menus. I could not use all the capabilities of Ami Pro as my CPU is limited to 8 MB of memory. This version takes approximately 17 MB of hard disk space.

cc:Mail. This was not tested in that I do not have access to a LAN and I was not subsidized for long distanced telephone expenses. Lotus describes this as the worlds most popular LAN-based mail system. Features advertised are send and receive mail from any SmartSuite application; create new mail messages directly from the desktop by selecting or dragging and dropping attachments onto a MTO for automatic routing to pre-defined recipients; seemlessly communicate with other cc:Mail users in the DOS, Windows, Macintosh and UNIX environments; also communicate with users on other mail systems including PROFs, All-In-One, AT&T, MCI, SMTP and other via optional products. Require approximately 2 MB of hard disk space.

Requirement: Hardware: IBM PC or compatible (386 or higher) including IBM PS/2 and COMPAQ. A mouse (required for SmartIcons). An EGA, VGA, XGA, SVGA, or IBM 8514 or 8515 graphics card. A printer supported by an OS/2 printer driver. Disk: High-density disk drive required. Installation of all products requires a minimum of 23 MB of hard disk space. Additional space is required for optional features. Networks: Designed for use with networks that support OS/2 2.1 or OS/2 for Windows including IBM LAN Server and Novell OS/2 Requester. Memory: 12 MB RAM minimum required.

Summary: This is an excellent set of desktop programs which have been optimized for OS/2. I found the speed of these programs to be impressive. The package comes with a full set of detailed manuals, one for each application. If you are running OS/2, this is a must-have package of applications at a very low price.

Lotus SmartSuite for OS/2, Release 1.1, Lotus Development Corporation, Cambridge, MA. For more information call Lotus at 1-800-343-5414. This package is also available by mail order from MicroWarehouse, 1-800-367-7080.

ISDN : Integrated Services Digital Network.

by Don Patzsch, Tampa PC Users Group, Inc.

Lets start with recognizing the DOS configuration. DOS was originally intended to provide an operating system for one computer and only one person operating that computer.

Unix is a multi-tasking and multi-user, operating system. That means that if you have a computer set up with the UNIX operating system, many people may operate that one computer at the same time, as a network, or with simple terminals.

POTS is plain old telephone system. With your present line, you expect to be able to call one person and talk in voice operation. One telephone number per two wire line.

We plan now to tell you about ISDN. ISDN is a system in which you may do many things at one time with the single ISDN 2 wire connection. More than likely they will use the wires you already have at your home. You may talk with people by voice as you do now, and you may send a fax, and you may have two computers talking to one another, all at the same time on that one ISDN connection.

If you call into a network with your computer on an ISDN connection, you are then part of that network. You may expect to use your computer at its fast receive and transmit, just as though you were in the office and using one of their computers, only now you are at home using your own computer. In the past, you may have been used to using a modem and waiting while it screamed and made other noises and took a relatively long time to connect. With ISDN you are on the network in a few seconds, with no handshake noises and no line noise problems. Because the system does not take its power from the telephone line, you may lose all connection when the power is interrupted

You will have to have a way to connect to the ISDN line, as it is not the same as the plain old telephone service. Some devices are known as TA or Terminal Adapter. The Motorola Bitsurfer Pro is such a device. You may plug in two analog telephones or a fax and a telephone. You may use the telephone and the fax without the extra cost shown as .02 per call and .02 or .01 per minute. Those apply to data only. The extra costs per minute are expected to be eliminated in a month or two from now, in other words just into 1996.

At this time, the costs forinstallling ISDN are as follows. From the time you place your order, to the time you may use the system, is now five working days. The installation and the Motorola Bitsurfer cost about $600, and the members of the Tampa IBM PC User Group were given a discount of 50% at the meeting on October 16. This tells me that all of the ISDN pricing is tentative at this time and will come down as time passes, probably quite rapidly. Competition rears its ugly head in January of 1996.

The monthly costs at this time are: From 10 A.M. to 8 P.M. there is a charge of 2 cents per data call locally, and 2 cents per minute, or about $1.20 per hour for data only, telephone calls and faxes are not affected by this charge. From 8 P.M. to 10 A.M. and on weekends, the data connect charge is 2 cents per call and 1 cent per minute, or about 60 cents per hour. Again these charges are probably going to be removed in a few weeks. The standard monthly charge at this time is $37 per month.

I had planned to provide various bits of information from users of the system locally, some in Brandon where I live and some in Tampa. I wanted to get their reaction after using the system for some time. If there is any interest, I will write a second article on this subject with more detail by far.

Lets go over it again: WHAT IS ISDN? ISDN stands for Integrated Services Digital Network. (Not plain old *analog* telephone service.) The ISDN is capable of carrying voice, data, fax, and X.25 packet data over the same media and through the same kind of connection, hence the name Integrated Services. Digital in ISDN implies that all connections to the ISDN are made through digital devices, such as Terminal Adapters, ISDN telephones, Point-of-Service Terminals, T1 and E1 DSU/CSUs, Group IV fax machines, etc. Analog devices, such as standard telephones. modems. and Group III fax machines are generally connected to the Public Switched Telephone Network and cannot be connected directly to the ISDN.

Two types of ISDN are available. BRI, and Primary Rate Interface ISDN, known as PRI. Both services use bearer channels known as B channels to carry user calls., be they data, voice, fax, or even packets. The B channels operate at a data rate of up to 64K bits per second. (twice as fast as a 28.8 modem) and they can be "bonded" or connected so that you can send and receive data at 128K bits per second. This does not consider compression, which can increase the actual transfer speed. There is also a D channel operating at a rate of 16K bps. It can also handle X.25 packets. It is used for signaling. The two B channels and the one D channel operate over a single pair of wires. The call is paid for by the one who initiates the call, and billing is based on the time connected, not the amount of data transmitted. Basic Rate or BSI is based on two B channels and one D channel. You may use the D channel if there is no signal information needed, to increase the total to 144 plus 16 or 160kbps.

The PRI system is based on 23 B channels, and a single D channel, in this country, but in Europe it is 30 B channels and one D channel. PRI is usually a 4 wire trunk. I won't go into further technical details unless there is a request for

See **ISDN.....**Continued on page 10

Special Interest Groups

Microsoft Access SIG

This SIG Meets on the 3rd Thursday of the month at 6:00 PM at the Reflectone Building. Directions: Proceed west on Waters from N. Dale Mabry across the railroad tracks (which is about 1 and l/2miles), take second left on Savarese (United Technologies bldg. is just beyond it.) Proceed on Savarese until you reach the Reflectone bldg. Take the North door. If you need to ask directions, there is a security guard at the location. PLEASE SIGN IN WITH A SIG LEADER
For more information call Connie Kincaid - 661-8185 - Leave a Message.

Internet SIG

This SIG meets the first Monday of the month. Next meeting is December 4, 1995 at 6 PM at the Reflectone Building. You must sign up to get on list and to get by security. See Microsoft Access SIG for directions to Reflectone.
Contact Charles Howe: at 968-1207 or HOWE. COSTECH@INTNET NET

Genealogy SIG

This SIG normally meets the third Wednesday of the month. at 7:00 PM at a member's home. However the December meeting will be December 6 at 7:00 PM.
Contact SIG Leader Jenny Lind Olin. at 960-5723 for directions and RSVP.

Book Review

Silicon Snake Oil: Second Thoughts on the Information Highway by Clifford Stoll

Review by Carol Theodore, Los Angeles Computer Society

Has your e-mail been lost? Have you connected to a site only to be inexplicably dropped? Spent hours doing research on-line and then lost it? You are not alone. The hoopla is as never ending as the profusion of Internet providers and web sites. Everyone sings the praises of this exploding technology; those who are not on-line feel that they are missing out. Here is a serious analysis of the Internet by the author of "The Cuckoo's Egg", an Internet user since it was the Arpanet. This is no crackpot naysayer but a concerned participant asking important questions. Does the Internet help us communicate better or just faster? Is e-mail really faster than snailmail? Cliff Stoll thinks that e-mail may impede communication by encouraging us to dash off the message. In writing a letter, one is almost forced to think about what one is saying. In addition, e-mail trans-mission may not be as reliable as we may think. Stoll says that it gets lost more often than mail sent the old-fashioned way: the U.S. Postal Service actually has a better record than e-mail. How about the on-line library? There has been much discussion and much written about books on-line. However, Stoll contends, there has been too little thought addressed to how this should be done. Many libraries, including the Library of Congress, have on-line catalogs, but the books can-not be checked out on-line; they remain where they are. Stoll cites national and international copyright laws as tall barriers. Other questions deal with data storage and retrieval: what methods will be used and how can they be kept current with changes in the technology. Libraries have been sold complex computer systems as a way to save money at the expense of other essential services such as books and librarian support. A good librarian is worth much more than the most extensive on-line catalog. Stoll's conclusion is that the Internet, however useful, has been oversold as a fast link to information and as a better way for people to communicate. The questions posed in this book are valuable. If we are going to benefit from all that the Internet can offer, we must consider what that is and how it can best be utilized

---

ISDN.....continued from page 9

that. PRI is about the same speed as a T1 line.

The PPP protocol is a standard data link, it supports multiple network layers including IPX, DECnet, Appletalkl, and OSI. PPP is actually a whole set of specifications to cover the different aspects of Wide Area Network communication. The Internet Engineering Task Force is responsible for the PPP protocol. (standards). These processes were necessitated because not all the RBO's and certainly not the European system were coordinated. Standards had to be set up.

ISDN was started in 1980, and Europe is way ahead of our usage. To keep this brief, I will not go into a discussion of the difference between the ISDN and the Frame Relay systems, ADSL, nor the new Internet telephone service that operates in full duplex. With the new system you may call any individual if you have his address on the net, and you may set up your own scrambling system with the software.

MEMBERS HELP-LINE

The following phone list is provided for our Tampa PC Users Group members in an effort to establish local support for those frustrating times which we have all encountered while using our PC's. Please note that these are members that have volunteered to help you, treat them in a courteous manner. Be sure to ask if it is convenient for them to help you now, or if you should call another time. It would also be helpful to have your documentation and have it handy when you call. (Don 't expect help if your software is an illegal copy or you do not have documentation!) TPCUG is not responsible for the information or advice provided by volunteers. Volunteers may or may not be experts in the subject matter. You are on your own with any advice received. Be aware also that some of these volunteers may be consultants in their area of expertise. If you are interested in volunteering to answer members questions, either leave a message on the BBS or fill in the forms provided for this purpose at the meetings.

Thank you Harvey andMarylee

By William LaMartin, Editor, Tampa PC Users Group,Inc

This past month has given me a taste of what Harvey and his wife Marylee have been doing for our group these past years. I took over the duties of this newsletter,Marylee's old job, starting with the December issue and thought that quite enough. Then Harvey called me two days before the December general meeting saying that he had to go to Atlanta on business and needed me to run the meeting and do a presentation of LotusScreenCam. So I went out to his home that evening to get the things I needed for the presentation, and he filled my car trunk with old software, etc. for the bargain table sale. Apparently part of being president of TPCUG is being part pack horse.

So after spending several hours preparing my presentation, running off 20 new name tags, printing out 50 copies of a special software offer to our group, making up some disks with copies of thScreenCam presentation on the BBS for anyone who might be interested, collecting the software people had requested for review, and gathering extra copies of the newsletter that had taken up so much time a couple of weeks back, I was ready to cart everything to Ybor City for the meeting. I admit that most months my User Group duties will not be this demanding, but I have presented this little compilation to give you an idea of what Harvey andMarylee have been doing for our group in the past. That's why I and , I am sure, all of you say

"Thank you, Harvey andMarylee."

Secretary's Report

TPCUG MEETING 12/13/95, 6 PM
Administration Building Auditorium, HCC
Minutes and Comments by Bruce Register, Secretary

Vice President William LaMartin called the meeting to order. President Harvey Bruneau was out of town. Miscellaneous Comments and Information were given:

Election
The election was held. The following were elected:

President	Connie Kincaid
Vice President	Mike Hodges
Treasurer	Will Goble
Secretary	Bruce Register
Member at Large	Margaret Petro

Tom Cone moved that the slate be declared by acclamation. The Motion Carried.

Bargain Table
The Bargain Table was successful. Several people found their prizes. The TPCUG benefited with over $200. Appreciation was expressed to all item donors and to all who purchased.

William mentioned Comdex and referred us to Harvey's article in the BITS OF BLUE newsletter. Charles Howe stated that the Internet SIG would be held January 8 instead of January 1. No meeting on New Years Day. Jenny Olin will hold the Genealogy SIG on the third Wednesday of January, January 17.

Someone suggested that an inventory be made of needs, such as panel, good OH projector, etc., and that fund raising projects be performed to provide acquisition of needs.

Tom Cone announced that the financial report will be published to the membership in the first quarter of 1996 as set by precedent.

Presentation
William LaMartin demonstrated Lotus ScreenCam software. This is software which records sound and all screen activity as you work. It can be played back as a training tool or sent to a friend. He put the first part of the demonstration along with the Lotus ScreenCam player on a floppy for those who wanted a copy. This is the same principle as with the on-line version of the newsletter on BBS. Adobe Acrobat is used to make the on-line version of the newsletter. We as members can download the Acrobat Reader file, ACROREAD.EXE, to view the

See **Minutes.....**continued on page 3

Minutes.....continued from page 2
newsletter We install this reader file on our computer. Then we can print the BITS OF BLUE or view it on our screen. We can copy it to a disk and send it to someone who has ACROREAD, the reader. In the same way we can view, using Lotus ScreenCam player, the demonstration William presented about the BBS.

William previously recorded, on Lotus ScreenCam, his access to the BBS using the Windows 3.1 Terminal program--a bare-bones communications program most of us have--and demonstrated it to the TPCUG meeting. Prior to the meeting, he called in to BBS as a visitor named Fred Newuser and moved around. He went through the first time caller questions, stated that he was a new paid up member of the group, requested to have his access level upgraded, read messages, etc. In a second session, after the SYSOP had upgraded his access level, again using the terminal program he signed on as a member by giving his password. He moved around and tutored us more. In a third captured session, he accessed the BBS using WinCom PRO, a full featured communications program. In this session he demonstrated how to sign on, move to the File Menu, search for files, and download a file. In this session, his narration was also captured, making the file much larger.

Lotus ScreenCam provided a "movie" of every stroke, every cursor move and even William's sound monologue while he was recording the presentation. Simply stated, he opened ScreenCam on his computer at home on Monday night. He then had his communications software call the BBS. All of the three times he logged on and logged off the BBS were recorded as it happened. At the meeting, he turned on the computer and let it run by itself as he and we watched a movie of the monitor and every thing that he had done earlier. To conlclude he demonstrated how simple it was to do one of these screen captures.

The shelf price of the program is $99. You might shop for a street price of say maybe $69 or $79. He whetted my cyberspace appetite. I really had a serious conversation with Santa. You may post a message to William for a disk. He copied his presentation on a 3.5 floppy and charged $1 each.

Unfortunately, the overhead projector provided by HCC was considerably less than desired. The laptop and the panel provided excellent quality. The overhead did not. However, William's presentation of the recorded "movie" was great. So good in that the poor OH visual was negated and did not dim anyone's intense interest.

DOOR PRIZE WINNERS:

PageKeeper	Richard Morris
Type On Call	Will Goble
Your Deck	Michael Leiss
T Shirt	Dave O'Connor

Please mark your calendar for the next TPCUG meeting on January 10, 1996. Bring a friend. Bring a spouse...Bring somebody!

President's Column

by Connie Kincaid, President Tampa PC Users Group

As the new year dawns, it brings many changes to the Tampa PC User's Group. The most obvious are the many new officers elected last month. I am sure that they are listed in other columns so I won't list them here. But I want to assure everyone that we have once again compiled a group of intelligent, big hearted, loving servants who want nothing more than to help the group members grow in skills and confidence. One of the most frustrating things is to want to help and not know what people want or need. So, please talk to the board members and let them know what's on your mind..

I want to take some space and time to thank Harvey and Marylee for all their efforts on behalf of this group. My first computer was an Appld IIe (no hard drive, dual single density floppies, 56K of RAM and Apple Works). It's amazing to me that I was able to do as much as I did with that computer. When I moved to Tampa in 1991, I knew I couldn't hang on to that technology much longer. I tried almost every PC user group in town at that time. I didn't know if I wanted to go to a MAC, Amiga, PC or anything else. I found that they were all growing and changing so rapidly that I couldn't base my decision solely on the capability of a given technology because that was sure to change. With my background in Psychology, I know that people make the products not the other way around. So I went back to the groups one more time and decided to invest my future with the people I found in the Tampa PC User's Group. I found that this was one of the few groups who could attract "geeks", "nerds" and "newbies".. I haven't regretted it one minute. The magic behind having something for everyone lies in the board. But the charisma to present it has been in Harvey and Marylee. Harvey through his work at Dun & Bradstreet comes equipped with enough knowledge to hang in there with the best and enough stage presence to do it with grace and style. Marylee has been the quieter counter balance that also helped prevent "boy's club syndrome". I remember many meetings when she and I were the only two females in a very crowded room. I want to thank Harvey, Marylee and every member of the board for making me feel welcome in those early years when all appearances would have led me to believe I didn't belong

Software Review

SYNCWARE FILL

Review by William LaMartin,
Editor, Tampa PC Users Group, Inc.

The *Windows Sources* magazine ad intrigued me. It said "Kiss your Typewriter Goodbye! Say Hello to *SYNCWARE FILL*!" and was accompanied by the eye-catching color photo reproduced below in black and white. This program promised to do easily what I had been spending a fair amount of effort doing: Filling out printed forms on the computer, or, more precisely, filling out scanned in copies of printed forms on the computer using Corel Draw. Not exactly what first comes to mind when you mention Corel Draw.

The process was tedious, and the resulting files (if I wanted to save them) were large. Neither of these objections is the case for *SYNCWARE FILL*. Best of all, you can try out the program until February 1, 1996 for free via download from the World Wide Web at http://www.syncware.com. What you get is a 1.6 MB compressed file that self extracts into a program that is a full featured "lite" version of *SYNCWARE FILL* ver 1.0.

Actually the lite version does everything I desire. Let's suppose I have, say, an IRS form that I wish to fill in on the computer instead using a typewriter or pen, both of which make corrections or changes difficult. I simply start *SYNCWARE FILL*, put the form in my scanner, then tell the program to "acquire" the form. Once the form is scanned into the program, I can place text anywhere on the form I desire, use any size font I choose for the text, draw lines or rectangles on the original form, or erase parts of the original form. And, if as in most forms, I have text that appears in columns or in rows, I can select some of the text I have entered and then right align, left align, top align, or bottom align it with the press of a button.

It is all very easy, and the result printed out 100% accurate as to size on my laser printer. One couldn't ask more of a free program. Unfortunately it is only free until February 1. So how does one go about purchasing this program. I couldn't find it locally, but I called their 800 number, talked with a very helpful and informative fellow named Tony, and have the following purchasing information to relate.

The lite version from the internet only utilizes the quick fill feature of *SYNCWARE FILL*; there is additionally the ability to create templates where one would tab from one fillable form field to the next, the ability to integrate data from other OLE compliant Windows applications, and to perform both data entry and form filling functions with your databases.

Tony said that the price of version 1.0 was $149, but now they were offering it at half price since version 2.0, a 32 bit WIN95 application (which will also run under WIN 3.1), is coming out in several months. Version 2.0 will list for $199, with the upgrade probably being $40 - $50.

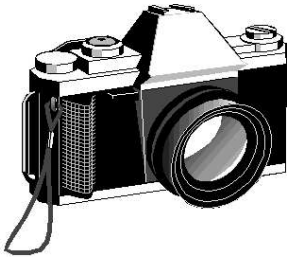
PhotoWorks from SeattleFilmWorks



Review by Bruce Register, Secretary, Tampa PC Users Group, Inc.

I received what I thought was junk mail from Seattle FilmWorks offering free two rolls of film and a process for putting your photos onto a floppy disk. I have shot thousands of frames with my camera to be used in my work. I returned the card. After I had forgotten about it, two weeks later, a mail package arrived with two rolls of film. I shot 19 images on a roll in my 35 mm camera when I went to a family reunion in October and decided to give the system a try. I mailed them in the postage paid envelope with a check for $15.80 which covers some $3 or $4 S&H. Some week or so later, I received a mail package containing two sets of color prints, a 3.5 floppy with the "album" consisting of the 19 images. Also included were two 3.5 floppies containing software to run the program. The two sets of color prints with developing at my local discount one hour express would cost about the same amount, and there I can get my prints in one hour; however, I get no floppy with the images on them and get noPhotoWorks software. I thought I got a good deal if I had the time to wait a few days. I could have received the graphic images via the Internet immediately after they were developed if I had an address. The prints would then follow by snail mail had I chosen the Internet to get the images quicker. If I had a color printer I might prefer Internet delivery.

Seattle FilmWorks offered a new roll of film with every order at no extra charge, the choice of prints or slides or both from your film, postage paid film mailers first class both ways in snail mail, and "absolutely risk free guarantee." They did all that plus the floppy with my 19 images plus the two 3.5 floppy disks with thePhotoWorks software. With this software I can rotate, crop, cut, change resolution and other things that I do not even know yet. I even sent photos by fax from my computer to two different recipients. On the Internet I could send my Christmas photos anywhere in the world.

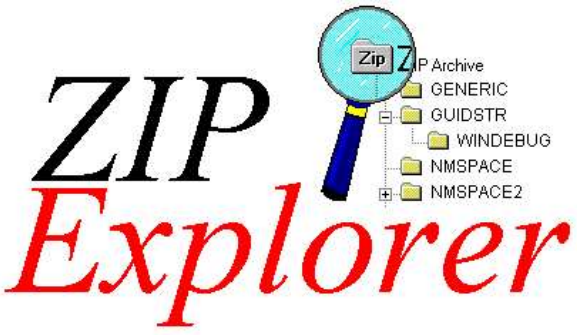
To install the software, I opened Windows 3.1 to Program Manager. I inserted disk #1 in the drive and clicked run in the file menu. On the command line I enteredA:\setup and ENTER. My screen displayed a message that all of my available colors were not installed. "Go to windows installation". I ignored this for now and followed screen instructions which were so easy and quick to follow. "Setup complete" I restarted Windows and selected the icon for PhotoWorks. Instructions instructed me to insert the disk with "Pictures on Disk". I was asked to name the "album" of the images on the disk. I named the album "reunion.95" The program copied the images from the floppy to the hard drive. I double clicked on "thumbnail". A strip of the photos came across the screen. At this point, I printed the "thumbnail" strip on my B&W Epson 1500 Action Laser. They printed better than they looked on the screen. I followed instructions and printed a number of images on copy paper. Now, I was ready for the Big Time!

Later when I openedPhotoWorks, I made several mistakes in naming albums. I learned that I needed to learn a language that I do not use in my circles. I pressed PhotoWorks and then Album. The "album" gave me two tutorial albums. Naturally, I did not want to spend time learning...i.e. when all else fails, read the instructions. I never had to read the instructions as it was so easy. I selected "albums" and I got no reunion.95. I backed up and took another approach. I pressed the icon "folder". That gave me the same "Open" window. "Album" or "download" rendered "Reunion. 95." I clicked "Images". My "Album" "Reunion.95" appeared. I clicked on an image 45430_9.SFW (640 x 480 x 24 BPP). This was photo exposure image # 9. I printed the image in B&W. It looked good with great resolution. I printed the other images with no problems. I rotated them easily.

Feeling so good, I decided to experiment and get full advantage of those colors that I had been told were available on my system and I was not using. From "Main" menu I changed to 768 x 1024 monitor resolution. I returned to Program Manager to find the strangest array of colors and patterns like I have never seen before. I could only get out of the locked up situation by Ctrl-Alt-Del. MY WINDOWS SYSTEM DIED COMPLETELY RIGHT THERE. I reentered the system and changed the resolutions back to 600 x 800. That did not cure the problem. I still had a screen with Fourth of July colors. After hours of trying to salvage without reinstalling Windows, I gave up and reinstalled windows.

After getting windows running again and spending hours of time getting my system back where it was, I got bold and decided to fully utilize my "available" colors that PhotoWorks told me that I had. I CRASHED AGAIN. This time and 5 hours later, I had reinstalled Windows and restored all my programs. Many individual applications had to be reinstalled themselves. I lost some enhancements, data, etc. Now I decided to leave the monitor settings alone.

see **Seattle FilmWorks**.....page 7



Seattle FilmWorks..... continued from page 6

BUT...after a while with the system working well, I got bolder and decided to move around within the PhotoWorks. I discovered that "Layout" on the menu bar had a selection called "scale" that permitted me to set the resolution to 768 x 1024 in portrait or 1024 x 768 in landscape. SO THAT IS THE WAY THEY MEANT TO DO IT. WHY DID NOT THEY TELL ME!!!!

I like the program and will order the "More Features, More Fun! Upgrade to PhotoWorks Plus for Just $14.95." I am not sure what that will do but I am impressed so favorably with what I have that it has to be good, especially for the money. I am writing SeattleFilmWorks to see if I might upload PhotoWorks on the BBS. SeattleFilmWorks, 1260 16th Avenue W., Seattle, WA 98119 or call (206) 283-9074.

ZipExplorer for Windows 95

Review by Larry Anders, Librarian,
Tampa PC Users Group, Inc.

© 1995 Silicon Prairie Software
All Rights Reserved.

As we bring in the new year with new officers and a new Bits of Blue Editor, as librarian, my New Year's resolution will be to try and provide a review of at least one *SHAREWARE* program each month. My first installation comes under the heading of ***SUPERIOR SHAREWARE.*** This is one of the **FINEST** add-on programs for Windows 95 I have come across yet.

ZIPExplorer is an extension to your Windows Shell which allows you to interact with compressed ZIP archives as if they were normal folders on your hard disk. You can open ZIP archives as you would any normal folder, and inside you will find the files and directories that were added to the archive by whomever originally created it.

ZIPExplorer is all you need to work with existing ZIP files: it contains all of the necessary decompression code, and does not rely on any external programs.

The following is a quick list of 20 of the things you can do with ZIPExplorer, and how to do them.

1. ZIP archives will now appear on your desktop and in folders with a special icon that looks like a normal folder but that has "Zip" emblazoned on it.
2. You can double click these new icons to open the archive as if it were a folder. You can also right-click the icons and select "Explore" to open them in a hierarchical tree-style view. From there, it behaves just like a normal explorer.
3. Once the archive is opened (as in item 2, above) you drag new items from your desktop or any folder into the archive to compress them.
4. You can also drag any item out to your desktop or a folder to extract them.
5. You can create a new ZIP archive anywhere by selecting the New/ZIPExplorer Archive menu from your desktop (or in any folder).
6. You can right-click any item and select "Extract To Path" to extract items to a specific location without having that destination open in the explorer.
7. You can "Copy" items from an open archive and "Paste" them anywhere in the filesystem any number of times (as long as the folder you copied from remains open).
8. You can drag or paste items directly into Exchange messages.
9. You can drop files and folders onto a ZIP archive's icon (just as if it were a normal folder) to compress items into the archive without actually opening it.
10. You can set the passwords for extracting items and for compressing new items with the ZIPExplorer/Set Passwords menu item in any archive folder.
11. You scan select any or all of the items in an archive and select "Scan For Viruses" from any of the selected items to invoke your favorite virus scanner on the files before you extract them.
12. You can delete any set of selected files and folders within an open archive from the context menu of the selected items or by pressing the Delete key.
13. You can set the level of compression for new items that you add by selecting the ZIPExplorer/Options menu in any ZIP folder.
14. You can quickly extract (or "checkout") files from an archive by selecting "Extract to Path" from the archive icon without actually opening the archive.
15. You can drag the archive to the place you wish to extract the files to and then select "Extract Here" from the icon's

Partition Magic, version 1

Review by DonaldPatzch, Tampa PC Users Group, Inc.

The first thing I did with the Partition Magic program that the Tampa PC UG gave me to review is to read the manual. It says to BACK UP before doing any experimental work.

I use an IOMEGA Bernoulli 150 megabyte disk backup. I am of the opinion that tape drives are too expensive and too cumbersome. The hard disk type of backup provides a disk that you can use instead of the C:> hard drive on your computer. In other words, it backs up the disk in a very short time, and the backup can be used just as the regular disk is used. You can get a directory in a flash, and you can "run" any program from either disk.

Now, I have DOS and Windows 3.1 on the present hard drive, and other programs, so they are also located on the backup disk. I wanted to set up a place for the OS2 Boot Manager, which means moving the whole setup over a little as the Boot Manager has to be in the forefront of the hard drive. It must be a primary partition as well as the DOS-Windows must be in a primary partition. So I set aside 2 megabytes at the start of the disk, by "moving" the existing operating system over toward the back of the disk, by two megabytes. This is one neat feature of Partition Magic.

Now I can break up the rest of the 540 megabyte hard disk into three more primary partitions and as many logical drives as I like. You know, one thing the manual is good for is to act as a textbook on formatting and setting up a hard disk. There is a lot of information in it.

OS2 can be booted even if it is installed in a logical drive. So I will set up a separate primary drive for the LINUX program, and a spare drive or two in case I want to add something later. I am doing all this while the original programs are still on the hard disk and they will not be disturbed, except to move them and maybe shorten the partition in which they are now located. I set up the 2 megabyte space ahead on the C:> drive with no previous experience with Partition Magic, and with little effort. No effect has been noticed on the use of the hard drive C:>, although I went back and tried each program to make sure no change had taken place!

This Partition Magic program can be used in a DOS computer, or as I will be using it, in an OS2 computer. You may set the program up on your hard disk, or use a floppy. When you bring the program up, you see a window in which your partitions are clearly laid out. There is a window for the physical drives on your machine, another window for the Partitions, and in that window is a layout of the various hard disk letters to correspond with those on your disk. Also in that same section is a Volume window. Each separate volume is shown and each has the type (boot manager, extended, FAT, etc. designation). Everything is in different colors so that you can easily see what you are being shown on the chart. There is also an Options window in the above window. That shows you the Check (check disk), Info., Resize, and Convert buttons. You may convert a FAT Boot Drive to an HPFS Boot Drive, if you want to use the long file names, and get the other advantages of the HPFS system in OS2.

The company has now written a new Partition Magic Version 2 for DOS and Windows (both 3.1 & 95). This is available now for $49.95. The new Version 2 for DOS and OS2 sells for $69.95.

The advantages of Version 2 are

- Non destructive clusterresizing. When you resize a FAT partition clusters are automatically resized. This can save a lot of space especially if you are using a gigabyte hard drive or larger.
- Format. You can format a new partition with version 2 from Partition Magic.
- Hide/unhide partitions. Hide any data partition.
- Expand Windows95 root directory.
- Set active partition.

This program will be very useful to me.

Additionally, in the package I reviewed is an advertisement for the program System Commander. System Commander allows you to make a boot menu of all the operating systems you wish to use. Information on it can be obtained at 1-800-648-8266. The Company is V Communications, Inc., and it is in San Jose. The cost is $99, except if you buy it from Indelible Blue (from IBM), it costs $69.

Software Review

Impos/2 Version 1.2 *

by Jose De Jesus

This review appeared originally in the *OS/2 December 1995 Monthly Newsletter* on the WWW at http://www.austin.ibm.com/pspinfo/os2nl.html

Impos/2 is an image-processing program for OS/2 developed by a German company called Compart Systemhaus GmbH. *Impos/2* is a powerful program that is a major player in the OS/2 graphics market. I'll explain what it can do, but first, let me give you the bottom line: the product costs $99 and offers features and performance found in much more expensive software. You won't be sorry if you buy it now, but you may want to wait for the next version, coming soon.

Impos/2 lets you capture images from the screen, from a scanner, from a video overlay board, or from the OS/2 clipboard. The software supports the major graphics file formats, including OS/2 and Windows Bitmaps, Graphics Interchange Format (GIF), Z-Soft's PCX, Tagged Image File (TIF), IBM IOCA (IMG), JPEG (JFIF), OS/2 Metafile (MET), Kodak Photo CD (PCD), TrueVision Targa (TGA), and PBMPLUS 'anymap' (PNM). It supports major scanners like Hewlett Packard's ScanJet series and Logitech's ScanMan 32 and ScanMan 256.

Impos/2 contains many powerful features that you can use painlessly. For instance, you can easily convert an image to and from black-and-white, 16 or 256 colors, gray scale, or true color. To convert a file from one format to another, all you have to do is save it as the new format. More than anything else, though, *Impos/2* excels in image-editing capabilities. Once you load an image, you can do virtually anything with it, from adjusting its contrast and brightness, to color swapping, edge detection, mosaic and embossing modifications, and noise filters. The graphics tools provided in the package include brushes, air-brushes, erase, smear, color cloning, and line and freehand drawing, among other things. Overall, *Impos/2* features a full set of tools that perform flawlessly, and at an excellent speed.

Impos/2 version 1.2 is a good product, but Compart must continue to enhance it. *Impos/2* is a solid start. It just needs polishing. The makers should keep an eye out for those little details that can make a world of a difference. For example, the program's Undo function is in the window's title bar instead of in the main menu bar or in the toolbar -- no wonder I couldn't find it! And wouldn't it be great if there were multiple levels of Undo?

The User's guide and the online documentation need a little polishing. The text is not exactly terrible, but contains too many grammatical errors and reads like a rough draft. Also, the chapters should have numbers instead of just titles. I heard that much of the text's quality was lost during the German-to-English translation. What a bummer! Software like this deserves a better manual.

Some of the enhancements they made in version 2.0:

- More selection capabilities. You can select portions of graphics using a magic wand, a circle selection tool, a square selection tool or freehand. You can then use all tools and filters on your selections.
- A fully configurable toolbar. Users can choose the icons they want to appear in the toolbar. You can also create your own icons to associate with REXX commands. The entire user interface (not just the toolbar) in version 2.0 is programmable using REXX.
- An enhanced user interface. The new version is more WorkPlace Shell-oriented. Every image you load is its own object, and you can load multiple images in one application frame.
- Improved scaling options. Every image can be displayed and edited in all display ratios (compared with version 1.2 in which they can only be displayed in specific, fixed ratios like 1x2 or 2x4). This gives you almost unlimited scaling abilities.
- Multiple views. You can open multiple views of the same image -- for example, a stamp size view and a full screen view. If you edit the image in the full screen view, your changes are automatically reflected in the stamp size view.

Overall, the developers of *Impos/2* got it right. If version 2.0 includes some of the fine tuning mentioned earlier, and Compart manages to keep the price down, I think we'll be seeing a lot more of *Impos/2* in the years to come.

Impos/2 version 2.0 will be available in North America from Indelible Blue, beginning December 20. Indelible Blue will also provide the first level support for *Impos/2*.

Microsoft Access SIG

This SIG Meets on the 3rd Thursday (January 18) of the month at 6:00 PM at the Reflectone Building. Directions: Proceed west on Waters from N. Dale Mabry across the railroad tracks (which is about 1 and l/2miles), take second left on Savarese (United Technologies bldg. is just beyond it). Proceed on Savarese until you reach the Reflectone bldg. Take the North door. If you need to ask directions, there is a security guard at the location. PLEASE SIGN IN WITH A SIG LEADER
For more information call Connie Kincaid - 661-8185 - Leave a Message.

Internet SIG

This SIG meets the first Monday of the month. However, due to New Years the next meeting is January 8, 1996 at 6 PM at the Reflectone Building. You must sign up to get on list and to get by security. See Microsoft Access SIG for directions to Reflectone.
Contact Charles Howe: at 968-1207 or HOWE@INTNET NET

Genealogy SIG

This SIG normally meets the third Wednesday of the month. (January 17) at 7:00 PM at a member's home.
Contact SIG Leader Jenny Lind Olin. at 960-5723 for directions and RSVP.

President's Column..... continued from page 3

there and presenting so many fascinating programs that intrigued me into wanting to learn more.

I want to extend warm new year's greetings to all the members of the board and members of the group. I am looking forward to a promising new year. It recently occurred to me that somewhere in the past two years personal computing has crossed some important social/cultural boundaries. I want to elaborate here but have decided to include more on that thought in a separate column that William can include when space permits. It would seem that we have just about reached the point where having at least one computer in the home is roughly equivalent to having a car, microwave and color TV. It is rapidly being added to a family's "musthave's" list. I think this makes the Tampa PC Users Group an important resource to our community. I would like to enlist everyone's support in letting people in our community know that we are here to serve them.

ZipExplorer.....continued from page 7

context menu for a little extra convenience.

16. You can view documents and run standalone programs from within an archive simply by double-clicking it as you would if it were in a normal folder. Handy for reading "readme" files before extracting them.
17. You can view an open archive in "Details" mode (from the View/Details menu) to see a great deal of information about each item in the archive.
18. ZIPExplorer archives are fully hierarchical, so you can compress entire subtrees into an archive and navigate them normally. You can also drag entire subtrees out selectively to decompress them.
19. When you are dropping (compressing) items into an archive folder, dropping the items onto a folder icon in the archive compresses the new items into that subdirectory. The same is true for dropping items to any directory in the left hand (tree view) pane when you are in explorer mode.
20. You can right drag into an archive folder (or onto its icon) and select from other options, such as "Update", which will replace only files that are older then the ones you are dropping.

OK, I lied. There are actually 21 things: You can even browse and extract things from ZIP archives inside of other archives.

Registration is $29.95, plus $3 S&H from:

MEMBERS HELP-LINE

The following phone list is provided for our Tampa PC Users Group members in an effort to establish local support for those frustrating times which we have all encountered while using our PC's. Please note that these are members that have volunteered to help you; treat them in a courteous manner. Be sure to ask if it is convenient for them to help you now, or if you should call another time. It would also be helpful to have your documentation and have it handy when you call. (Don 't expect help if your software is an illegal copy or you do not have documentation!) TPCUG is not responsible for the information or advice provided by volunteers. Volunteers may or may not be experts in the subject matter. You are on your own with any advice received. Be aware also that some of these volunteers may be consultants in their area of expertise. If you are interested in volunteering to answer members questions, either leave a message on the BBS or fill in the forms provided for this purpose at the meetings.

Some Notes From FACUG

by Connie Kincaid, President Tampa PC Users Group, Inc.

I attended the Florida Association of Computer Users Groups (FACUG) on Feb. 24th and 25th and was amazed at what I found there. FACUG falls under the umbrella of the Association of Personal Computer User Groups (APCUG). APCUG is the parent organization for all users groups in this country. Each has a web page, forums on the on-line services, newsletters and a board to manage their activities. The primary mission for each is to help local users groups be more effective.

The conference actually began on Friday evening but I was unable to attend that portion. The conference was held at the Clarion next to the conference center in Orlando and approximately 33 PC users groups sent over 100 attendees. The conference also had representatives from IBM, Microsoft, Symantec, Corel, Borland, Parsons, Delrina, Micrografx, Intuit, Adaptec, Adobe Systems, America Online, Global Network Navigator, Microhelp, SSK Technology. Each meal was provided to us by a different sponsor who also demonstrated their latest products. The meals were tasty, informative and a good chance to sit and talk to board members of other groups. I can't begin to describe the charity and willingness to share that was manifested by the entire conference.

Between meals there were 2 one hour round tables on different topics. In upcoming newsletters I would like to take a single topic and

Commercial advertisements will be accepted For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if it is not received on time.

Members may insert non-commercial ads at no charge with the following imitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

SECRETARY'S REPORT & MINUTES OF MEETING, 2/14/1996

Minutes and Comments by Bruce Register, Secreary Tampa PC Users Group, Inc.

Vice-president Mike Hodges called the meeting to order. President Connie and family were bedridden with "whatever is going around." Mike expressed all of our sympathies to Connie and Wil with hopes they get well soon.

Mike mentioned the desire to consider a new location for meetings. All members were asked to submit their suggestions. Mike reminded us to look at the SIG Group meeting schedules in the back of the BITS OF BLUE Newsletter.

Regarding entry to Communications SIG, March 4, Reflectone Building, Tom Cone said call him at his office, 949-9698. Mike Hodges said that as long as Reflectone gets the additions to the list before 4 PM of meeting day, entry can be arranged. However, by the time you get a message to Tom and Tom gets a message to Mike, time becomes of essence. Simply plan ahead whenever possible to eliminate miscommunication.

Jim Lindsey, Computer Generated Solutions, made an excellent presentation on "Presentations". He worked through *PowerPoint*. His theme was "How to start up, how to run and how to have fun in building presentations". *PowerPoint* is a presentation package, but it is marked as a "graphics" package. Jim opened *PowerPoint 4.0*, "Presentations that talk to you". He said for us to decide what we want to do. Take inventory of what we have in software programs and databases. Then, determine logical order of arrangement. Numbers can be boring. "You'd rather have depth. You must consider presentations by your competitors...Tables are nice but graphics are generally more interesting...You can build interest into your presentations with graphics." He showed tables with numbers and contrasted them with graphics of the same information.

He presented visual graphics. Then, he introduced sound effects (music) to his presentation that he built. He says, "Do not get carried away by adding to much sound; it's overkill... use sound wisely... the sound should associate with the visual... You can also add moving pictures...clips and cartoons sometimes enhance your presentation... you can add other features, e.g., speaker's outline and notes (such as Jim's handouts)." Jim said that you can also include the same outline notes within your presentation so that the listeners can see the image while reading your outline on the screen and hearing your voice. He said that panels and overhead projectors help

(Continued on page 3)

(Minutes.....Continued from page 2)
with presentations. You may also have your presentation viewed on video monitors well placed.

Jim then demonstrated a presentation that he built for the AMVETS 1996 meeting. He explained what he did as it was being shown on the screen. He used multimedia disks that you can purchase at computer supply stores as a source of graphics, sound an video. These graphics come from CD Media so that you do not have to use HD storage space. You can get media graphics on disks but you use too much hard drive space. He name several CD media products. He says that you can use your own video or imaging equipment and create your own media graphics rather than purchase them.

Jim opened the floor for Q & A. His responses to Q's included comments like "You can use your own sound, bring in sound, fade sounds in and out, sporadically in and our, change directions, etc. Jim used KOSS speakers that are battery amplified with good quality. As a demonstration he turned off the battery supply while the speakers operated from the power supply of the computer through his sound card. "Wave files" bring in sound. You can use your microphone to capture sound in "wave files".

He said that you can get *Microsoft PowerPoint* right now "dirt cheap", probably for a street price of $69. Building your presentation with *PowerPoint* is a 9-step process; he demonstrated (faster than your Secretary could write). Your titles do not change while you do a "build" which affects texts but does not affect titles. Jim's computer had 16 MB ram. He also said that *FreeLance Graphics* and *PowerPoint* are similar. And, *PowerPoint* is not stand alone in the sense that if you want to send someone a presentation and they don't have *PowerPoint*, then you will need also to include the *PowerPoint* viewer.

Jim enlightened us with much more than we are able to relate here.

Due to the illness of Wil, we did not have the coupons for the door prize drawing; we will just have carry over door prizes for our next meeting on March 13. Connie has another great presentation arranged already for that meeting. Please bring a friend! ◆

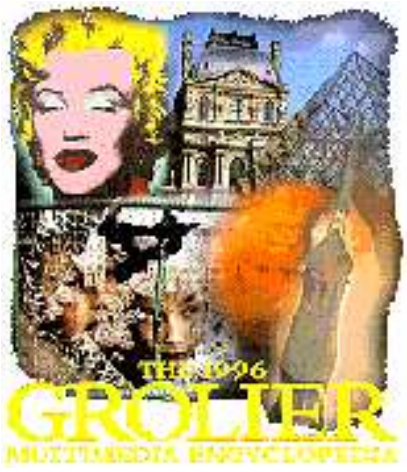
(FACUG.....Continued from page 1)
discuss it in some detail. This month I will give you some of the highlights and cover the first topic in detail.

- **The health of users groups** - Users groups in general are growing is size, budgets and services. Creativity and community support are key elements.
- **How users groups are like a small business** - The are often incorporated as 501(c)(3) charitable organizations. They pay taxes, expenses, have board of directors with elected officers, they must promote themselves to 'consumers', acquire physical assets and they need to have a strategic plan to operate effectively.
- **How users groups serve the community** - Users groups provide education, social events, a channel for donations from the business community to other areas of the community and sometimes are able to get expensive technology to those who need it but can't afford it.
- **SIGs** - Special Interest Groups provide a focused source of learning for every level of interest. They also provide access to technology to people who might not otherwise have time, money or someone to show them how.
- **Technology** - Users groups are the liaisons from vendors to their market. The meetings provide important forums for vendors to 'teach' their consumers. Computer technology as a business relies more heavily on the education of it's consumers than any other mass industry. Users groups bring that education to the public.
- **Vendor relations** - Users groups and vendor have an interdependent relationship. Vendors rely on users groups to 'spread the word' while users groups rely on vendors to give them something to spread.

I will now look at the first of these items in detail.

The health of users groups - In general, PC users groups are growing by leaps and bounds around Florida. I met people from users groups that were specific to one trailer park in a community. I met people from users groups that regularly had 500+ people attending each meeting. The majority of people that I met fell somewhere between those two extremes. Much of the discussion time was spent on managing growth, promoting growth, helping more people in the community and what services to provide the community. The issues that a particular group will face is very strongly related to size. I sense that groups generally fall into three categories: small, medium and large.

The small groups seemed to be characterized by: serving a geographic region smaller than a county, less than 100 participants at meetings, many members belong to at least one other group, single monthly meetings with few or no SIGs, very few if any vendor demos, no physical assets and rely on the community for free meeting sites and other support.



(Continued on page 10)

Software Review

The 1996 Grolier Multimedia Encyclopedia

Review by Larry Anders, Librarian
Tampa PC Users Group, Inc.

This month I have an opportunity to do something I've never done before, re-review a program I reviewed it the first time in July of 1994. At that time I reviewed the original issue of The New GROLIER Multimedia Encyclopedia (NGME). It is now just called The 1996 edition of Grolier's Multimedia Encyclopedia. Back then my comment was "if you own an IBM-compatible PC, 386sx or better, with Windows 3.1 and don't have a CD-ROM drive - **GET ONE! -** because now you have a reason!" Well, today you'll need at least a 486 DX/33 or higher, 4 MB of RAM and 6 MB of hard disk space, a "double-speed" CD-ROM with a 300 KB/sec or higher transfer rate, 8-bit or higher Windows-compatible sound card and a SVGA or higher-resolution display. Also needed is Windows 3.1 or later, MS-DOS 5 or later, and a mouse. Also, new to version 8.02 Grolier now has 12,000 article links to Compuserve Information Services. To use this you will need 8 MB of RAM and 10 MB of hard disk space. If anything they have taken what I thought was the best electronic encyclopedia and made it BETTER!

There are now over 34,000 articles, including 1,200 new and 6,000 revised and updated, that can be browsed, searched, marked, copied, saved or printed. Linked to each article is a gallery of either photos, videos, animations and various other multimedia images such as maps, fact boxes, tables, sounds. There are 150 historical documents, including the Magna Carta, landmark Supreme Court rulings and words from historical figures Plato to Nelson Mandela.

There is an easy to use, all new interface that makes exploring, discovering and learning easier and I guarantee more exciting than you could ever imagine.

Grolier takes the concept of "learning-by-doing" one step further with the use of *Interactivities,* which are dozens of new interactive animations and 3-D models of hands-on demonstrations such as the food chain, finger-spelling exercises and even 3-D renderings of the human brain. There is a total of 15 hours of video, 150 national anthems, 300 classical musical selections, 100 pieces of U.S. historical and world ethnic music, with 125 additional selections.

There is an interactive atlas with 900 maps, all completely interconnected and hyperlinked to articles. There are 77 new *Thematic Maps* to help you understand better with information on world/continent agriculture, climate, vegetation and population density. There are also 166 new *Historical Exploration Maps* and 64 new *City Maps*.

The *Yearbook* is a dramatic recap of events providing a detailed, day-by-day look at the people and events that shaped 1994-95. It includes a media overview of events, a survey of major themes and trends, and a wealth of timely news photos and more.

Timelines helps you explore the relationships between events in world history. This feature divides world history into 10 periods. For each period, there is a graphic

As I mentioned earlier, there are over 12,000 hyperlinks between Grolier and Compuserve, including a connections to special-interest forums, popular publications and databases, chat rooms and more. You get to all of this with a single click.

Any of this information can be copied into any Microsoft Windows-compatible word processor, which can be opened from within Grolier's, quoted and then printed out. As with all copyrighted material, you must give proper credit.

Also included in my copy of Grolier's was a Modern Art CD-ROM from the Maeght Foundation containing the "International EMMA Award Winners of 1995." All of this and a street price of still under $100.

Once again, in my opinion, Grolier is on top of all the rest. This is one software package that the entire family can use to explore, discover and learn in more ways than ever before, and have a whole lot of fun doing it!

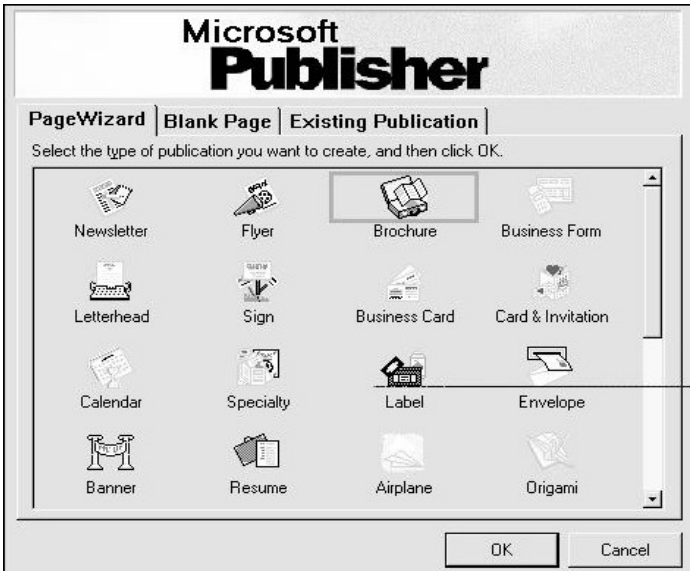
Software Review

Microsoft Publisher CD Deluxe for Windows 95



by William LaMartin, Editor Tampa PC Users Group, Inc.

Consider this an interactive review of *Microsoft Publisher for Windows 95*; for as I write this review I am also using Publisher to put together the March newsletter. When I come across something I want to comment on, I switch from Publisher to *Microsoft Word 7*, where I am writing this, insert the comments into this document then switch back to Publisher. Of course I could easily compose this review in Publisher, since it, as you would expect, also functions as a text editor and spell checker. But being able to create the text and edit it in the more powerful Word 7 is a definite plus--particularly the underlining in red of misspelled words as you type.

I used *Word* to put out the last three newsletters (my first three), and, as with almost everything I have tried to do with it, it did quite well. One problem did occur, though–controlling the flow of articles from one page to, perhaps, several pages later. If I made a change in the first page of an article, then any additional text would flow, not to where it belonged several pages later, but to the next page. Well, even for a program as good as Word, you can't expect it to do everything. That is why there exist publishing programs.

There are probably three levels of publishing programs: low, medium, and high. No surprise there. *Microsoft Publisher* fits in the medium level with a price of $79 that is not much more than some low level programs of more limited scope, e.g. brochure only publishing programs. It is aimed, in Microsoft's words, at "small businesses, home offices, schools, and any organization that wants to self-publish quickly, easily and economically." Sounds like the Tampa PC Users Group doesn't it? If you want to put out a slick, glossy publication with complicated placement and many different layers of complicated color graphics that would have nationwide distribution then Publisher is not for you. You need one of those $500 plus programs. But for the group described above Publisher should do the trick.

The screen-captured window from Publisher in the adjacent column is the opening window for the program and indicates the different types of publications that the program will guide you through the process of creating with its **Page Wizards™**. Anyone who has used any of the newer programs should by now be familiar with wizards which, by asking questions and giving you a series of choices, present you with a template for the particular publication you wish to print—newsletter, brochure, business card, etc.

I didn't choose to use a wizard for our newsletter since I already had the design I had created in *Word* based on the newsletter the previous editor, Marylee Bruneau, had published (using *Page Maker*, one of those high level programs). All I had to do was duplicate it in the new program. Perhaps as time goes by I will incorporate more of the design features discussed in the Publisher manual, but my first goal was to put out this month's newsletter with *Publisher* reproducing the layout of previous newsletters.

A few words about how the program functions, with the newsletter used as the example: First, I created 12 pages with two columns each, with the odd and even pages mirrored (notice how the page number in the header is always on the outside–something I never could accomplish in *Word*). Next, with the text frame tool, I simply draw text frames where I want to place text, e.g. in each of the two columns on each page; with the picture frame tool I draw picture frames where I want to place graphics. I can then insert text in the text frames and graphics in the picture frames. Where appropriate the text frames can then be linked together to make the individual articles flow from column to column and page to page. This is the big advantage a publishing program has over a word processor. For a simple publication that is all you need do.

You can place frames on top of frames, resize frames, move frames from front to back, right align them, top align them, make them transparent, etc. If you understand the use of frames you are a long way to mastering *Microsoft Publisher*. However, as you might expect for the price, Publisher will not do everything. For example, if you have a graphical object you did not create in *Publisher*, say, a picture of a rabbit, *Publisher* will rotate it for you, but it will not flip it horizontally or vertically for you. This would have to be done in a separate graphics program. It does provide you with **Word Art**, which

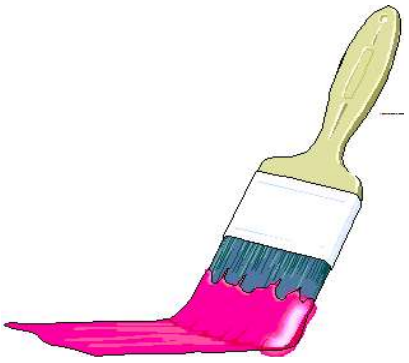
Shareware Review of PaintShop Pro v3.11 (16-bit) & v3.12 (32-bit)

By Larry Anders, Librarian
Tampa PC users Group, Inc.

I was wondering what I was going to tell you about this month until I had a conversation with William LaMartin today, so I'll thank him for the idea.

First, I'll explain what we discussed, then I'll talk about *PaintShop Pro* (PSPro). I was telling William about a nifty utility package I had purchased recently from CompUSA to make T-shirt transfers using a color printer. You get ten - 8 ½" x 11" sheets for $17.95. The product is "T-Shirt Transfers TR-101" distributed by the Creative Products Division of Canon and says its for use with the Canon Color Bubble Jet 4000 and 600 series, but I'm here to tell you it works very well with the Hewlett Packard DeskJet line of printers also. I've used it with my HP-550C and my new HP-855C, and the results were *SUPER*. They can be used on any cotton or cotton/poly blend fabric to personalize T-shirts, sweatshirts, aprons, table cloths and napkins, tote bags or anything else your imagination allows!



Besides the T-shirt transfer package you'll also need a household iron, pillow case, glass or any smooth, hard, non-porous surface (not wood or metal) and of course a cotton or cotton/poly blend, light colored garment to personalize. If you follow the instructions you'll be pleasantly surprised.

Now, to create these transfers you have to have a graphics program that will create a *mirror* image so that when you iron on the transfer the image comes out normal. That's where PaintShop Pro comes in.

Since I've gotten into PC computing I have always been interested in computer graphics and have spent top dollar for some of the best graphic packages out there like, Adobe PhotoShop and Corel Draw. PSPro, by all means is not better, but in most cases its just as good. And for only $69 that makes it a lot better in my book.

PSPro is a raster format image editing program more commonly known as a "bitmap editor". Raster image formats break a picture into a grid of equally sized pieces, called pixels, and record color information for each pixel. Common examples of raster formats include the Windows ".BMP" format and the CompuServe ".GIF" format.
Unlike most bitmap editors, PSPro isn't confined to a short list of raster file formats. It provides full support for all of the most popular raster formats, full or partial support for many less-popular raster formats, and can read nine meta and vector image formats. It can also convert to any of these formats.

One real neat utility that comes with PSPro is the PSPro Browser. When you start PSPro Browser, it opens the Select Directory Dialog Box, which you use to choose the directory that you want to browse. It then creates thumbnails of all the graphic files in the directory or folder. Just click on the thumbnail you want and PSPro opens automatically with that file loaded.

Another feature PSPro has is a screen capture utility to copy an image from within any other Windows-based program directly into PSPro.

During PSPro's installation, you are given the option of adding Paint Shop Pro to your Program Manager. If you do this, then PSPro's Browser's icon will be in the same group as PaintShop Pro's. To launch PSP Browser, double-click on its icon. The screen capture utility is a menu choice and built into PSPro.

There is a complete set of basic image editing tools to cut, copy, and clear, paste, undo and revert to file, empty clipboard, add a border to an image, cropping or enlarging an image, changing an image's width and height, reversing orientation: flip and mirror, and viewing image information.

There is a complete set of selection tools such as standard cursor, color selector, magnifier, image mover, rectangle selector, oval selector, selection adjuster, cloner, lasso, magic wand, and color tool. Also, there is an ample set of paint tools including, standard brush, clone brush, user-defined brush, push brush, airbrush, fill tool, pen, pencil, marker, crayon, chalk, charcoal, swap brush, undo brush, text tool, line tool, hollow rectangle tool, solid rectangle tool, hollow oval tool, solid oval tool, smooth brush, and sharpen brush. But these are not all.

PSPro also supports TWAIN-compliant image devices, such as scanners. TWAIN is an industry standard that allows applications (like PaintShop Pro) to talk to the software that controls an image device. With my flatbed scanner and PSPro I can take any graphic picture or photo and turn it into personalized apparel within a few minutes

With all these tools you can easily see why I can say, "under most cases this, $69 Shareware program can do just as good a job as the *BIG BOYS* do." PSPro comes in both 16-bit and 32-bit versions for Windows95.

Gosh, I love computing and Shareware. And utility packages like these T-shirt transfers makes computing a whole lot of fun again.

You can order PaintShop Pro from JASC, Inc. by payment with check or credit card (MasterCard and Visa). The numbers for ordering are: 1-800-622-2793 or Voice (612) 930-9171 or FAX (612) 930-9172.

Product Review:

Technical Connection Personal Software

*by Karla Meyers, from the OS/2 Monthly Newsletter**

IBM Technical Connection Personal Software is a collection of tools that allow users to have quick access to the latest in service and product support information. And what a truly wonderful collection it is.

The software collection consists of seven components including AskPSP, Solutions Database, Technical Bulletins, Corrective Service Diskettes, Reference and Diagnostic Diskettes, Product Information, and Device Drivers.

The Technical Connection is easy to load and even easier to use. To install it, you simply put the CD-ROM into the system, change to the drive letter designation for your CD-ROM and type install. It really couldn't be an simpler. The icons in the package are well labeled and easy to understand.

If you own IBM equipment, the Reference and Diagnostic Diskettes are indispensable options. It could turn out to be very handy the first time you can't find your reference diskette for your PS/2 Model 70. The list of equipment diskettes is extensive enough to include CD-ROMs and page scanners. I was quite impressed.

OS/2

The Product Information section will keep you up to date on the latest IBM products available. It also includes IBM Dealer Support News, Team OS/2 Newsletters, and several other newsletters from different groups at IBM, including this one. Demonstration software programs are also available here from time to time. This area contains such a tremendous amount of information that it alone makes the Technical Connection subscription worth the price.

The Device Driver section is also indispensable for medium and large companies that use a wide variety of equipment. The video driver list contains drivers from ATI, Western Digital and Cirrus Logic. The PCMCIA section contains drivers from several manufacturers including Toshiba and Apex. Similarly, the CD-ROM section presents drivers from Mitsumi, Sony, Phillips, Chinon and others. As a technician, this section really caught my attention because it would save me from having to call a half-dozen different bulletin boards to get the drivers I need. It's a real time saver.

The Technical Bulletins section is divided into PS/2 Assist and OS/2 Assist. The PS/2 area contains the PS/2 Assistant, the Consumer PC Assistant, PS/2 Marketing, and General Information Assistant. The OS/2 Assist area is an exceptionally comprehensive listing that includes the OS/2 platform product strategy, questions and answers on several software products, employee written software (that does a wide variety of things), the Personal Systems support family (PSSF) problem reporting guide and users guide, and last, but not least, the Technical Solutions Library. The Tech Solutions Library contains information on OS/2 Warp, Communications Manager/2, DOS, LAN, and multimedia. All in all, it is a very complete guide that complements the other sections very well and provides yet another source of solutions.

To stay current with the latest fixpacks and service packs, jump into the Corrective Service Diskettes section. The Technical Connection compresses over 350 megabytes of information and fixes into this area. Most of the fixes concern installation and creation instructions. The fixes cover a wide variety of products including Personal Communications AS/400, OS/2 Warp Connect, and Communications Manager/2. This is another incredible grouping of information and tools to make your support technician's life a lot easier and keep your systems running smoothly.

The Solutions Database allows you to find solutions to reported problems. This is the area where you can get confirmation that you are not the only person in the universe with this problem. This database is a collection of APARs (Authorized Program Analysis Report). Each entry contains a brief description of the closed problem, the symptoms, and the resolution. Previously you could only access this information on a BBS, now you can have it at your disposal at any time. This definitely provides a savings in time and money as well as increased efficiency in getting a problem solved without having to call for help.

I have saved my favorite part of the Technical Connection for last. AskPSP is your own personal help desk. It uses an expert system tool, CasePoint, to allow you to ask questions in everyday English to help you find solutions. It contains casebases on a variety of products including Communications Manager/2, OS/2 Warp, OS/2.X, DCE, LAN Systems, OS/2 Warp Connect, and Novell NetWare from IBM. You will also find a readme file and a tutorial to show you how to use AskPSP.

For example, imagine you were using OS/2 Warp Connect and could not get the software to see your 3COM 3C509b network adapter. By describing the problem to AskPSP and answering its questions, in a matter of minutes you would find that the card probably is not configured correctly. It would tell you to check the transceiver type (set to match the cabling that you are using), to disable the plug & play feature, and to set

(Continued on page 9)

(OS/2.....Continued from page 8)
the modem speed in the softset configuration to 9600 baud. It is really a phenomenal tool that many of the support technicians at IBM actually use. I require it in my bag of tools. A lot of hard work has gone into creating the case bases and we are continually updating them. The effort and commitment to quality are evident.

The cost of the Technical Connection is quite reasonable. A single purchase costs $59. An annual subscription is available with the updates coming either monthly or quarterly. The quarterly updates subscription is $119 per year while the monthly updates subscription is $299. As an initial purchase bonus, the Technical Connection includes a copy of the CD-ROM containing over 275 books on a variety of OS/2 products.

Having been a support technician with several hundred systems to maintain, I wish I had had a tool the caliber of the Technical Connection. I have not seen a support tool of this quality from any other hardware or operating system manufacturer. I highly recommend it to both end users and in-house technicians alike. ◆

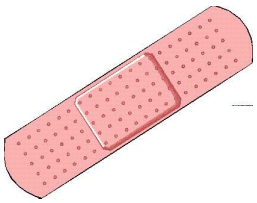
OS/2 users, note: The beta version of Lotus Smart Suite for OS/2 is now available

(Publisher.....Continued from page 6)
allows you to make interesting designs with text as I did on this page with our group's name. Additional tools at your disposal allow you to insert tables, draw various shapes, or use the design gallery tool to apply *Publisher's* design templates.

Tampa PC Users Group

One final thing that *Publisher* won't do is allow you to first print the even pages of a document in reverse order, then on the back sides of these pages print the odd numbered pages in regular order resulting in a document printed on both sides of the paper . This is very handy for small runs of , say, a newsletter that you want to print on your own printer. It is not necessary or even desirable if you are going to use an outside printer. However, it is a feature that *Word* introduced to me that most other programs don't offer—including *Publisher*, but, again, Publisher is only a $79 program.

For the beginner, the design wizards will probably be of the most use. I used the business card wizard to set up a card for me. Then having the basic size and design, I made the modifications I wanted and printed them out ten to a page on heavy stock paper with a laser printer. Finally I cut them out with a trimmer and was pleasantly surprised how professional they appeared. Similarly I tried my hand at a three fold brochure, something I had previously accomplished in Word, but found much easier here.



The CD contains over 1,000 pieces of clip art and 60 True-Type® fonts. The program will automatically fix common fit-and-finish problems with letter spacing in the background without your involvement. It will also identify layout errors and offer suggestions for correcting these, and it provides for setting up your document for outside printing if you so desire (more professional--and expensive--than the way our newsletter is done at Kinko's).

To run this program you will need a 386DX or higher running Windows 95, 6MB of memory and a CD-ROM drive. Retail price is $79 with a $49 upgrade from earlier versions (if you bought the earlier version after 7/15/95 the upgrade is free). Also, for those who insist on sticking with Windows 3.1, Version 2.0 will remain available, also for $79. This program is available in most all software outlets. ◆

Follow-up of review on CleanSweep95 in the February 1996 Newsletter

By Larry Anders, Librarian, Tampa PC Users Group, Inc.

If you purchased *Cleansweep95* version 2.0 check your CleanSweep95 folder (usually C:\Program Files\Cleansweep\) for a file named CSINSM32.EXE. If the date is anything other than 1/16/96 you will probably need the 2.02 patch. This patch can be downloaded from Quarter-Deck's home page at: ***http://www.qdeck.com/*** free of charge. From the home page go to the Technical Support area, click on patches and follow the instructions. The file name, if you are using Win95 only, is **CSPAT202.EXE**. It seems that on some occasions Win95 will lock up giving a "CSUSEM32" (or

(Continued on page 10)

Special Interest Groups

Microsoft Access SIG

This SIG Meets on the 3rd Thursday of the month (March 21) at 6:00 PM at the Reflectone Building. Directions: Proceed west on Waters from N. Dale Mabry across the railroad tracks (which is about 1 and l/2miles), take second left on Savarese (United Technologies bldg. is just beyond it). Proceed on Savarese until you reach the Reflectone bldg. Take the North door. If you need to ask directions, there is a security guard at the location. PLEASE SIGN IN WITH A SIG LEADER
For more information call Connie Kincaid - 661-8185 - Leave a Message.

Communications SIG

This SIG meets the first Monday of the month (March 4) at 6 PM at the Reflectone Building. You must sign up to get on list and to get by security. See Microsoft Access SIG for directions to Reflectone. *Contact Tom Cone at 949-9698 or Charles Howe: at 968-1207 or HOWE@INTNET NET*

Genealogy SIG

This SIG normally meets the third Wednesday of the month. (March 20) at 7:00 PM at a member's home.
Contact SIG Leader Jenny Lind Olin. at 960-5723 for directions and RSVP.

(CleanSweep Patch.....Continued from page 9)
similar) error code. It happened to me, but not right at first.

Fortunately there are people like William LaMartin in our users group who had forwarded a message to me from the WIN95 conference on our BBS concerning the reported problems back on February 19, but at that time I hadn't experienced any problems. I have a new 133 MHz system that has only Win95 and mostly all 32-bit programs and had **NEVER** had one lockup until this past week. After it happened three or four times I got suspicious and went back and re-read William's message. Thanks William!

This patch updates over fifty files in *CleanSweep95* and makes 14 main changes to the program. I thought CleanSweep was great last month but now its even better!

If you don't have access to the Internet yet (and you really should - but that's for another time) let me know and I'll see that you get the patch somehow. I'm sorry if my review led you to purchase the product and caused any inconvenience, but I still think *Cleansweep95* rates an "A." ◆

(PaintShop Pro.....Continued from page 7)

Eden Prairie, MN 55344 USA
$69 plus $5 S/H ◆

(FACUG.....Continued from page 3)

The medium size groups were the majority and while they seemed to differ in many ways, they also seem to share some fundamental similarities. The groups tended to have about 100 to 500 members, serve a county wide area, own or be in the process of acquiring/establishing some of the following: large meeting site (>100 members at a meeting), resources centers where they held SIGs and/or meetings, more that one general meeting per month, novice SIGs, community service projects where their participation will end when some goal is accomplished (not ongoing or open ended projects), boards with more than 10 regular members, home pages on the Internet, and regular vendor presentations (usually quarterly).

Large groups were characterized by: serving multiple counties, meetings with 300 to thousands of attendees, frequent vendor presentations (not always monthly but at least quarterly), open board of director meetings with over 50 attendees, multiple committees reporting to various board members, a permanent meeting site with full presentation equipment setup or rental agreements for their setup, resource centers that were active 40+ hours per week with SIGs during weekdays, evenings and weekends.

This covers a broad spectrum. Most users groups don't exactly fit the characteristics described above. But, these characteristics seem to me to be the trend in Florida. The other significant trend is that a high portion of the volunteers in users groups are retired. Also, the stronger groups enrich more lives by being a part of service to the community in some volunteer capacity. The volunteers seem to take a great deal of personal interest and pride in their project or part of the group. ◆

Computers Across Generations

Some personal thoughts by Connie Kincaid, President Tampa PC Users Group, Inc.

There comes a time in any creative endeavor when the art, the artist and the artistic medium come together in a synergistic moment and each is transformed by the other. In that moment, the piece of art is truly born. The rest is a lot of hard work. My sense of all things computer related tells me that we are in one of these moments (which may actually last several months to a few years). I foresee changes that will alter the social and cultural fabric of our world the way traveling through the air and turning a wheel without a horse changed the way we live.

As I look back, computers started out as the tools of scientist and engineers. These were highly specialized pieces of equipment for highly trained people. The machine itself would do only very specific tasks. But soon other people began to see the possibilities, and our entertainment media brought us visions of machines that would conquer the world (back in the 'world dominance' days). As some people may remember, computers were first developed to calculate how to throw something (missile, bullet, etc.) at an enemy in acts of war. Then we figured out how to hurl a space craft at the moon and get back.

But the computer was good for more than just throwing things. If the computer could figure out how to manipulate objects in time and space, then we could put them to use in factories; hence, the development of the early robots or Computer Aided Manufacturing machines (sometimes referred to as CAM). People struggled with social/cultural demons of displaced workers. As people saw robots replacing people, people assumed robots could have some other 'human like' abilities. Robots were depicted to have varying versions of our

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII, Microsoft Write, Microsoft Word, or Word Perfect file to the editor at 821 S. Boulevard, Tampa, Florida 33606 or upload to the BBS (News section of FILES).

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

The use of trade marked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted at the following rates:

	1 month	3 months	6 months
Full Page	$60.00	$162.00	$288.00
Half Page	$40.00	$108.00	$192.00
Quarter Page	$22.00	$60.00	$106.00
Eight Page	$12.00	$33.00	$58.00
Business Card	$10.00	$27 00	$48.00

All advertisements must be prepaid by check payable to TPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if it is not received on time.

Members may insert non-commercial ads at no charge with the following imitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

Secretary's Report

SECRETARY'S REPORT
TPCUG MEETING 1/10/1996, 6 PM
Administration Building Auditorium, HCC
Minutes and Comments by Bruce Register, Secretary

President ConnieKincaid called the meeting to order. Connie introduced the new officers. See minutes December 1995 BOB Newsletter.
Harvey Bruneau was appointed program coordinator.

PRESENTATION:
Connie introduced JasonKimenker of BCD, Brain Child Distribution, Inc., across from University Square Mall on Fowler. Jason came, as in his presentation in December 1994, to give us information about products, technologies, etc. He probably has more information about more hardware than anyone we have had...right from the top of his head. Some of his comments are as follows.

He says....Pentium is a big flash name but your 486 will still do your work..... Pentium Pro makes the Pentium look like it is standing still....discussed the Diamond 3-D sound card. Prices are constantly dropping..Iomega Ditto tape backup uses a thinner tape to store moreinfo. It stores 800mb of compressed information. Sells for about $149....Anytime you read the specs on tape backup, you cannot save the data stated as compressed...the stated (x)Mb means that the amount of information BEFORE compression is (x)Mb. The actual storage as compressed data is less than the stated amount.

He says ....Upgrading a US Robotics modem, can be done with either a chip or with software depending on your model. To use an ISDN line you must buy an ISDN MODEM (ISDN modem is expensive)...US Robotics has a new modem, aSportster 28.8 DSVD, that also permits voice communication, $299. It is an analog connection.....Most modems have data capabilities and fax capabilities but not voice capabilities at the same time....You can purchase a camera to set on top of your monitor that permits video and voice transmission.

He says ....CD ROM technology is changing fast. Prices are dropping. You want to be sure to include MPEG..... Digital video disks (DVD) will be coming on the active scene. The standard is not yet determined by the industry and therefore is slow to come. DVD system will not be compatible with current market technology.....6x speed drive is about $200 now...that is just for the drive and

See **Minutes.....**continued on page 3

Minutes.....continued from page 2

does not include the other features, speakers, mic, etc. that serious game players want.

Jason showed an HP Surestore CD writer. It is a CD ROM recorder for around $1,000 . It is a quad speed reader and double speed writer . Another year will bring much lower prices, more storage and greater speed. Floptical technology is great but is still searching for industry standards...The Logitech TrackMan Marble, a combination, sort of, mouse and track ball was shown. It is ergonomic and more comfortable than a mouse or track ball. You do not move it on a pad....3 fingers and thumb controls...Ergonomically speaking, monitors that are flicker free, 28 dot pitch, 17 inch are much more comfortable...one should seriously consider ergonomics when purchasing anything today.

He says.....regarding memory, a $30 converter will permit you to change a 30 pin memory to a 72 pin memory....Why doesn't the price of memory fall? Silicon is a commodity, and its price is subject to supply and demand like any other commodity.

Jason showed a ViewStation color flatbed scanner @2400 DPI which should sell for $399 including SCSI control card. It is a dual pass. 300 dpi takes about 10 seconds for documents or one minute at 600 dpi for images. The SCSI card can connect to other hardware.

Now you can buy a top of the line 486 motherboard for about $200...when you purchase any technology, ask what is current and what will be the future direction. Technology is moving very fast. Stay with generic standards...stay away from proprietary.

Jason presented a full program, and he stayed until the lights went out because so many people wanted to discuss so much with him. Thank you Jason for another excellent program.

After his presentation, comments were made about various things. Networking was excellent at the break and after the meeting.

CONGRATULATIONS TO DOOR PRIZE WINNERS:

Window Washer	Charles Howe
Internet in Box	Mike Hodges
Managing Your Money	Roger Waters

Please mark your calendar for the next TPCUG meeting on February 14, 1996. Bring your Valentine!

Thoughts.....continued from page 1

five senses (hearing, sight, smell, taste and touch). While much of this technology is more fiction than fact, the arts and entertainment industry had a lot of fun with it. The more positive visionaries brought us visions of unlimited leisure time and leisure pursuits while the computers did everything . The less positive visionaries brought us stories of the haves controlling the havenots with computer technology (Big Brother). And the direct war themes became infiltrated with spies and espionage. Soon, throwing massive quantities of explosives gave way to strategic information and a few good gadgets (always in the hands of a handsome man that beautiful women adored).

Gadgets became 'sexy' in the hands of handsome stars in spy films. With the new microchip technology, the rich had a new toy store of gadgets to play with. This was a lot more fun than displaced workers and enjoyed quick popularity

Back at the workplace, large companies were growing at a pace never seen before. The worker had to be supplemented by machines that could do repetitive tasks so that people could do more work faster. The computer was quickly the answer. Large companies soon started buying mainframes or time on someone else's mainframe (called time sharing). Suddenly time on the computer became a commodity to be bought and sold. The popular culture didn't do much with the timesharing concept except apply it to vacation homes (hence, timeshares), sexual partners (remember 'open marriages' in the late 60's and early 70's? I won't pin that one directly on computers but, the similarities are striking). A lot of social/cultural forces seemed to pull together to move us from a rather defensive, territorial era to one of sharing resources on many levels.

It seems to me that the next era - personal computing was something of a backlash or pulling back to personal boundaries. People went from network computing with shared resources to having their own 'personal' computer that they didn't share with anyone. That didn't last long. Technology has given us the best of both worlds. We can have our own personal computer that is connected to networks at work, at home or the world (literally). While I don't think we have realized unlimited leisure time thanks to computers, we do spend a lot of leisure time using computers to explore the world and meet other people.

The popular culture has moved out of the movie theater to a noticeable degree and into the Internet. People don't want to be passive consumers. People want to be more involved in their own entertainment. The next wave will bring us a melting together of all the various forms of

TextBridge Professional™ 3.0

Review by William LaMartin,
Editor, Tampa PC Users Group, Inc.

Why does anyone want to perform Optical Character Recognition (OCR)? When you scan in a document or receive a fax you do not have a text based document—you have a graphic. The job of OCR is to transform this graphic back into the original text based product. How accurate this transformation is done is the measure of how well your OCR program is working.

This OCR program from Xerox has extremely accurate character recognition and page layout duplication. It is the best OCR program I have used, and if I had had it when I scanned and performed OCR on a 350 page typewriter written manuscript, I could have saved far better than 50% of my time on that project.

There are basically three levels of OCR programs: what usually comes with your faxing software, those programs costing $100 or less, and the top of the line programs like *TextBridge Professional* and *OmniPage Pro*. If you are going to do a lot of scanning and Recognition, get one of the top programs. The time you save will be worth it.

To use *TextBridge*, you simply place your document in the scanner, make the selections you want as regards, preview or automatic selection of text and graphic areas, training level, proofing data if you are using Word or Word Perfect, whether to save data for later OCR, whether to load a user dictionary, then press the Go button. The interface is really quite simple, and the process moves along fairly rapidly.

In performing recognition on newspaper articles, magazine articles or books, the recognition is almost perfect. The recognition is also excellent on laser printed documents and those generated by electric typewriters. The results are not quite as good with the old manual typewriter generated documents. However, with any problem documents, if you are going to be doing several pages, you can use the training feature for the first couple of pages, save the training data, then use that to improve the results in the remaining pages. If your document has a large number of proper names or specialized terms that are not in your usual dictionary, you may additionally create and load your own dictionary.

Besides accurate character recognition, the preservation of the page layout and formatting is sometimes important. I have been amazed how well TextBridge matches the original font type, size and formatting: If the original had an 8 pitch, bold Arial font, then your recognized text probably will too. If the next line contained a 14 pitch font, then you will have that preserved too. However, don't expect miracles; some formatting is just too complicated to be preserved. In fact, for my work, I often prefer that only the font characteristics be preserved and that I redo the layout of the recognized text in my word processor.

There is an additional feature called Instant Access which by running in the background allows you to scan directly from most Windows applications and have the recognized text sent directly to those programs. In addition if you use Microsoft*Word for Windows* or *Word Perfect* you can perform post-recognition proofing and editing within these programs where suspect words are printed in different colors which correspond to their confidence level and, if desired, view the scanned image of the suspect words.

If you are using Windows 3.1, have a scanner, and want to do OCR, then this program should be a top candidate for the job. However, if you run under Win95, you will want to wait for the 95 upgrade due the first quarter of 96. The reason is that the Instant Access OCR and the Embedded Proofing do not function properly in Win95. The Instant Access feature causes problems with 95's Task Bar, it sometimes refuses to be closed, and it performs very slowly when compared to the standard option of simply first running*TextBridge*, saving the recognized text to a file and then importing it into your word processor. The Embedded Proofreader used with Microsoft Word (I don't know about Word Perfect) is really a 22 page Word Basic macro written for an earlier version of Word. Unfortunately it does not run properly with Word95. With several hours of study and changes I was able to get it up and running, and, more hours would be necessary to completely update it. However, I may leave that to the professionals at Xerox and their release of *TextBridge Professional* for Win95.

$259 retail; $149 competitive upgrade from Xerox,
5400 Hillview Ave., Palo Alto CA 94304

CleanSweep95 : Total cleanup for Windows 3.1, Windows 95 and Windows NT

Review by Larry Anders, Librarian,
Tampa PC Users Group, Inc.

This month, in addition to a review of shareware, I am reviewing a utility program that everyone can use and it's just as inexpensive as shareware. Windows 95 has already made your computer easier to use. But to get the most out of Windows 95, you need to manage your hard disk space. Today's programs are larger than ever and it is likely that at some point you will run out of disk space and find it necessary to delete unnecessary or infrequently used programs and files.

Windows programs have long had a tendency to scatter their contents across multiple directories, making it difficult to purge your computer of all the program's components. Windows 95 itself takes up even more space. Your PC probably contains many redundant, obsolete, and unused files and programs you no longer use. Now is the time to clean up your hard disk.

CleanSweep is the essential uninstaller program for Windows 95, because there is simply no other way to clean up the remnants of your old Windows desktop and manage your new 32-bit environment properly. *CleanSweep* is more than just an uninstall program. It is a multipurpose utility for minimizing hard disk clutter and reclaiming disk space.

CleanSweep can remove unneeded DOS programs and Windows 16- and 32-bit programs and system components. You can also use it to delete unneeded duplicate files. The resulting increase in available disk space will greatly improve your computer's performance and allow you to install new programs.

The main screen of *CleanSweep* 95 follows the Windows 95 theme in that there are five tabs that contain *wizards* - helper programs that guide you step-by-step through a particular process. These five tabs are as follows:

The Program tab contains five wizards. You can uninstall files, archive files, back up files, move files, or transport files to another computer.

The **Uninstall wizard** deletes programs and all related files in the same folder or program group Uninstall deletes not only the individual components (files) of the program, but also any external references to the file, such as program icons or entries in system configuration files (such as the Registry or SYS.INI). The wizard is smart enough to leave program components that are used by other programs intact.

The **Archive wizard** uninstalls programs but saves copies of the program's files in a compressed format for future retrieval. This gives you the best of both worlds, because you can free needed space on your hard disk and still retrieve the program whenever you want. The Archive wizard creates a backup of a program file and all related files in the same folder or program group. The original files and configuration information are deleted from your hard drive. When you need the program, click its icon, and *CleanSweep* restores it.

The **Backup wizard** creates a single, compressed backup file of a program file and all related files in the same folder or program group for use as a reserve in the event that the files need to be restored. Backing up leaves all of the original files and configuration information in place.

The Move wizard moves a program file and all related files in the same program group or folder to another drive or folder location.

The **Transport wizard** transports a program file and all related files in the same program group or folder to a disk or other storage medium. Use this wizard to transport data to your laptop, home computer, or other computers.

To start any wizard, simply click its icon. In general, the wizards will guide you through the process by asking you a question. When you have answered the question, click Next. When you are done, click Finish.

The Cleanup tab contains the Finders that locate specific types of files: the Duplicate File Finder, the Redundant DLL Finder, the Unused File Type Finder, the Low File Usage Finder, and the Orphan Finder. After you locate unneeded files with a Finder, you can delete, archive, back them up, move, or transport them.

The View tab contains three reports that summarize your *CleanSweep* activities.
The Master Log keeps track of all of the actions performed, so you can always look up any file or activity. It will also tell you where a backup was stored and how many bytes of disk space were freed.

The Savings report details the amount of space freed, the amount of spaced used by backups and the total overall savings. All totals are in kilobytes (KB).
The Folder Usage report details folder use.

The Restore wizard restores a program to its original state.

The Options tab contains the Configure *CleanSweep* icon, which customizes *CleanSweep* to suit your personal preferences.

After you install *CleanSweep 95*, Windows 95 will

Software Review

Encyclopaedia Britannica CD 2

by Dick Reaser, Los Angeles Computer Society

This new electronic encyclopedia on CD-ROM provides fast, easy access to text and illustrations from the printed Encyclopaedia Britannica (hereinafter referred to as EB) by means of several advanced searching features. EB is arguably the de facto standard of the world. EB implements both natural-language and Boolean searches. It uses hypertext links to move between related entries in different parts of the database. A Nations of the World section provides easy access to basic information on all nations, including maps, flags, and articles. EB provides a random access feature for browsing among both illustrations and articles. EB contains the approximately 44 million words from the printed version plus 1,000+ articles that are not in the printed version. It has 2,000+ graphics and illustrations as well as Merriam-Webster's Collegiate Dictionary, Tenth Edition.

Here's an old wrinkle. There is a hardware security key that goes into your LPT1 port. You can then plug your printer into the back of this key. Historically, such devices often caused problems. So far, so good on my installation. Hardware minima are a multimedia PC with 10-MB of hard-drive space avail-able and a mouse. Software minimum is DOS 5 and Windows 3.1 or Windows for Workgroups 3.11. A 15-Mb swap file is recommended. Everything is installed directly from the CD. You can choose to put some of the CD files on your hard disk for faster operation. I chose not to take up the extra hard disk space and don't feel I suffered in speed. The program uses Win 32s and the Netscape Web Browser to view data and will install them from the CD-ROM if they are not already present. I had some problems with installation on my old system (with a very slow CD-Drive) so I put it on my daughter's 486DX100 with quad-speed CD-ROM drive. It installed and works like a charm there. Guess it's time to catch up with my kids grandkids and the modern computer world!

Conventional Windows startup brings you to the Home Page which is longer than the screen. The side bar arrows show the bottom of the page with significant launch buttons: Nations of the World, Propaedia, Random Article, and Picture Tour. To find out "What is the longest river in the world?", type it that way into the Query Box. EB finds references that contain the key words, sorts them by priority, and shows the first paragraph of each. In this example, it found the longest river of each continent, so you had to do a little more reading to find out the answer you were looking for (Nile River). The hyper-linked text feature makes further reading very simple. The Propaedia section is a tree-like arrangement of the various branches of knowledge covered in EB and their many divisions and subdivisions. The top level subjects are: Matter and Energy, The Earth, Life on Earth, Human Life, Human Society, Art, Technology, Religion, The History of Mankind, and The Branches of Knowledge. Each of these goes down several levels of refinement. You can then hypertext to those portions that interest you. Although I tried out the random graphics and random article features, they didn't hold my interest very long. Guess that the scope of the information is way beyond my field of interest. The On-Line version of EB appears matched to the CD-ROM version with its HTML. I have not used it yet.

EB documentation is a short VHS video for installation and demonstration and a simple 82-page spiral-bound pamphlet covering installation, the meaning of the menus and buttons, and a short tutorial. Technical support is available through a toll-free number. Like most 800 numbers for products with a fresh release, it was busy most of the time. I was able to speak to a person who referred me to another more technical person. I ended up leaving a detailed message with my question and phone number and they promised to call me back. They did call back the same day but I was out. He left a toll number and his extension where I could reach him directly.

This is an excellent research tool and very easy to use. I wish it would incorporate some audio and animation or video features to make it more multimedia. Just reading a monitor screen isn't very efficient. Of course the searches are what really makes it worth while compared to looking in book indices. Should be great for students.

FasType: A Typing Tutorial

Review by Larry Anders, Librarian
Tampa PC Users Group, Inc.

As always, I stay on the lookout for superior shareware, and in my opinion I have found another one. Many of you may have used this product in the past under an old operating system called ***DOS***. Now Trendtech Corporation has stepped up *FasType* to a Windows platform and has done a fine job of the transformation! From what I've seen this the best computer-based typing tutorial marketed as ***Shareware***.

FasType is ideal for use in a private at-home environment or during spare time at the office, as well as an ideal teaching tool in a classroom environment. Feedback is constant; time durations, Words-Per-Minute (WPM), percent of accuracy, typing errors, and other statistics are displayed at the end of each drill or exercise. Additionally, the highest WPM obtained, and a running average WPM is maintained, as well a typing history of your progress.

FasType has the capability to drill you on all shifted special characters and upper-case symbols plus all CAPITAL letters; you must use the CORRECT Shift key to successfully type any of these characters. You will also be drilled on using the ENTER Key which is required in exercises selected during advanced training.

All drills, exercises, and options are selectable using the menu bar. HELP is available from all of FasType's dialog boxes for quick reference while learning how to type. *FasType* is very flexible for the beginning typist. By using various options from the menus, the beginner can select many combinations of drill sequences. You can adjust your drills to boost your typing skills in those areas that you may feel are weak (e.g. Numbers, CAPITALS, special symbols, etc.), and you can improve your speed and accuracy.

Advanced typists can improve their word-processing skills by using the OPEN TYPING feature. OPEN TYPING gives you the opportunity to type any text of your choice in a full-screen window. You can use the cursor keys to navigate about the screen, adding text and over typing. The program won't catch your misspellings, but you'll be penalized if you use the BACKSPACE key. The OPEN TYPING feature has an EDIT option too so you can use it to modify text files. You can also use it to create and save files that you practiced typing.

If you're an intermediate or advanced typist you can use timed exercises to test your speed and accuracy. You can time your exercises in fifteen second increments for up to one hour.

The drill technique used by *FasType* for teaching you how to touch-type using any of these drill selections is RANDOM PROMPTING. That is, *FasType* will randomly select a character from the list displayed in the text window above the screen keyboard display and prompt you to type the key where that character is located by animating the key and using a metronome-like sound to "click" it up and down. After you press the matching key on the keyboard, the key is reset and another character is selected randomly. This goes on until you have successfully typed the number of characters shown under Drill Count in the typing helpers dialog box. The displayed time in the status bar only starts ticking with your first keystroke, and the number of characters you type is also tracked and displayed in the status bar. You can press the escape key at anytime to end your drill early, but it is suggested that you go for the full count. Keystroke errors are indicated by a beeping noise and a large NO symbol shown over the key you incorrectly pressed. The keyboard prompting continues until you type the correct character.

There is a neat option called *CHOOSE YOUR OWN* in the beginner section that is a powerful tool for selective reinforcement of your typing skills. Common selections include all of the keys in one row, or all of the keys in one or more "columns" of keys. For example, you could practice typing numbers on the keypad area by selecting all the numbers on the number row (1 thru 0), then press the NUM LOCK key so it's ON. When you BEGIN TYPING, you can type the numbers you're prompted for by using the keypad area of the keyboard; this will reinforce your "calculator" skills. You can also choose all of the characters for particular fingers.

Suppose you wanted to practice typing all of the characters addressed by your two index fingers; your index fingers type more characters than any other pair; you could CHOOSE the following sequence of letters: - f g r t v b j h m n u y - and optionally, the numbers 5, 6, 7, 8. Then BEGIN TYPING to exercise your two index fingers ONLY. Can you think of other ways to use this option?

For most computer owners, a word processor and/or a good text editor is one of their most treasured programs. It imparts the freedom to originate and generate documents away from the confines of the office. Often though, a severe flaw in this new freedom to create is the inability to type quickly. Typing accuracy is of less significance, since documents can always be cleaned up magnetically before

Book Review
Outrageous PC FX

Review by LloydMizer, NOCCC

"Outrageous PC FX" is not a tutorial. Rather it is an intermediate level guide to graphics on the PC. This book leads you through an exciting series of the most-daunting special F/X tasks step by step so you can combine images, do sophisticated photo retouching or make color separations without first spending time with boring, basic tutorials. The book is not specific to a particular software program.

The book is fascinating. It shows examples of graphics effects and with the programs provided you will be able to do them. With software available today anyone can change pictures to 'prove' anything the graphics artist wants you to believe. After working with this book you will never again accept any picture at face value -- since you will know how to create that effect yourself.

This book emphasizes the PC as a great graphics platform. When you consider the number of PCs owned by individuals and small businesses it is obvious that the future of limited budget graphics is on the PC.

On the enclosed CD there are fully functioning save-disabled versions of AdobePhotoshop, Aldus Photostyler, Pixar Typestry, Elastic Reality, Adobe Illustrator, Premiere Acrobat. There is a Library of full color and gray scale images, and custom filters. There is a collection of shareware image editing programs and utilities.
Ourageous PC FX, Author: David A.Busch, Publisher: MIS PRESS, List $34.95.

Microsoft Access SIG

This SIG Meets on the 3rd Thursday (February 15) of the month at 6:00 PM at theReflectone Building. Directions: Proceed west on Waters from N. DaleMabry across the railroad tracks (which is about 1 and l/2miles), take second left on Savarese (United Technologies bldg. is just beyond it). Proceed on Savarese until you reach theReflectone bldg. Take the North door. If you need to ask directions, there is a security guard at the location. PLEASE SIGN IN WITH A SIG LEADER
For more information call ConnieKincaid - 661-8185 - Leave a Message.

Internet SIG

This SIG meets the first Monday of the month at 6 PM at the Reflectone Building. You must sign up to get on list and to get by security. See Microsoft Access SIG for directions to Reflectone. **There will be no February Meeting**
Contact Charles Howe: at 968-1207 or HOWE@INTNET NET

Genealogy SIG

This SIG normally meets the third Wednesday of the month. (February 21) at 7:00 PM at a member's home.
Contact SIG Leader Jenny Lind Olin. at 960-5723 for directions and RSVP.

Thoughts..... continued from page 3

entertainment and culture into a technology medium that has yet to be realized. It may come on screens that look like a blank living room wall or holograms or who knows. But I personally believe that by the turn of the century, we will not pursue entertainment by going to it. It will come to us. What will the themes be? Throughout all the technological changes the dominant forces remain the same: sex, power, spirituality and exploring the unknown (not in any particular order). Those presenting it to us will still choose from the two dominant themes of theater: comedy and tragedy. My don't we live in interesting times!

CleanSweep.....continued from page 6

automatically display two symbols in the bottom right corner of the desktop. These symbols represent *CleanSweep*'s Usage Monitor and Install Monitor. These monitors run in the background to keep track of edits to existing configuration files, installation information about any new programs you add to your computer, and how often you use files. All this happens behind the scenes.

Included in my copy of*CleanSweep* 95 was a courtesy copy of*CleanSweep* for Windows 3.1 and 3.11. If you haven't installed Windows 95 yet because you don't have enough disk space, before spending $300-$400 on a new hard drive spend $30 on*CleanSweep* 95. If you're only half the file collector as I am I guarantee you'll recover enough disk space to more than pay for this fine utility.

FasType.....continued from page

printing them. However, the lack of skill in putting thoughts down on paper at a reasonable speed is always frustrating.

The following list will give you some idea of the various authoring speeds available with different writing techniques:

Hunt 'n Peck Typing	15-25 WPM
Ordinary Handwriting	20-30 WPM
Touch Typing (average)	40-60 WPM
Very Good Touch Typing	70-90 WPM
High Speed Touch Typing	100+ WPM

I think the advantages of touch typing are obvious. If your heart's desire is to write The Great American Novel, or merely effective business letters, then it is imperative to learn the art of touch typing. For $29 you'll be on your way to a much more enjoyable computing experience.

MEMBERS HELP-LINE

The following phone list is provided for our Tampa PC Users Group members in an effort to establish local support for those frustrating times which we have all encountered while using our PC's. Please note that these are members that have volunteered to help you; treat them in a courteous manner. Be sure to ask if it is convenient for them to help you now, or if you should call another time. It would also be helpful to have your documentation and have it handy when you call. (Don 't expect help if your software is an illegal copy or you do not have documentation!) TPCUG is not responsible for the information or advice provided by volunteers. Volunteers may or may not be experts in the subject matter. You are on your own with any advice received. Be aware also that some of these volunteers may be consultants in their area of expertise. If you are interested in volunteering to answer members questions, either leave a message on the BBS or fill in the forms provided for this purpose a the meetings.

Some Notes From FACUG - Part 2

by Connie Kincaid, President Tampa PC Users Group, Inc.

Last month I reported some of what I learned at the Florida Association of Computer Users Groups (FACUG). I learned more than I could confine to one month's article so this month I would like to pick up where I left off and finish. Last month I discussed how size affects the activities of a group and how groups tend to fall into functional categories because of their size. This month I want to look at 5 other aspects of PC user's groups.

- **How user's groups are like a small business**- They are often incorporated as 501(c)(3) charitable organizations. They pay taxes, expenses, have board of directors with elected officers, they must promote themselves to consumers, acquire physical assets and they need to have a strategic plan to operate effectively.

Small groups tend to not have 501(c)(3) status. I found that most of them were a small group of people who usually met in a clubhouse that was available to one of the members (usually the founder) at their community residence or a place that was available to a member through their workplace. Their meetings were generally less than 25 people and did not involve overhead projection for demos. They did not own any physical assets (BBS computer, projection equipment, etc.). They tended to have an informal structure. Some may have boards and hold elections while others 'just pitch in' to get the various tasks done. They tended to suffer from growing pains (outgrowing their facilities, a sense of chaos at times) and

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members. Our mailing address is P. O. Box 3492, Tampa, FL 33601-3492.

However, for business concerning this newsletter, Bits of Blue, please contact the Editor, William LaMartin, at 821 S. Boulevard, Tampa, FL 33606-2904; 813-251-3817; lamartin@ix.netcom.com.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII, Microsoft Write, Microsoft Word, or Word Perfect file to the editor at 821 S. Boulevard, Tampa, Florida 33606-2904 or upload to the BBS (News section of FILES).

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

The use of trade marked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if it is not received on time.

Members may insert non-commercial ads at no charge with the following imitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

SECRETARY'S REPORT & MINUTES OF MEETING March 13, 1996

Minutes and Comments by Bruce Register, Secretary

President Connie Kincaid called the meeting to order. We were blessed with one of our largest number of attendees to come to our most recent meetings.

Connie expressed the desire of the Board to meet the needs of the membership, considering that there are many different levels of needs and interest among the membership. To this end, she passed out a survey and asked each person to state an opinion to help guide the Directors of the TPCUG. Please let Connie know how you feel.

Anyone with a meeting place suggestion is encouraged to let Connie know. Also the BBS badly needs a new hard drive to replace one that sounds as if it is on its last leg.

Connie mentioned the donation of equipment for the TPCUG to use in community support. One computer system has been donated for genealogist to use at the downtown public library. Connie mentioned talking with PAL, Police Athletic League, regarding donating equipment and setup for them to work with youth in trying to redirect youth toward worthwhile activities. (The Secretary is for that since his son was robbed at gunpoint and his wife has been mugged twice. All occurred in most unlikely places.)

Jenny Lind Olin mentioned that Hillsborough Public Library is interested in more hardware. She will get information on this. Charles Howe contacted the VA Hospital for possible uses by the veterans there. Charles was enthused by the positive reception. He will investigate further.

Connie is anticipating more PC equipment being donated to TPCUG for community support projects. It was suggested that members might know of possible donor companies. Do not be afraid to ask the CEO to help provide additional support for the community. We already know it works to ask!

Connie suggested that someone might have memory, 1 MB SIMs, to donate for the use in the donated equipment See Connie Kincaid or Wil Goble.

Connie reported on the meeting of the Florida Association of Computer Users Groups. (FACUG). She spent two days with them.

John Meroth offered a free space for a TPCUG Home Page on his future Internet provider service.

(Continued on page 3)

(Minutes.....Continued from page 2)

Since the presenter scheduled to give us a demonstration on how to create Internet home Pages canceled, William LaMartin presented a program on the same topic. Using a live connection to the Internet, he used a browser, Microsoft Internet Explorer, to view some varied examples of home pages. He stated that the underlying file for a home page is nothing but a text file written in hypertex markup language (HTML). William said that the standards for HTML are in flux, with anything after version 2.0 not supported by all browsers. He said, "It is not as hard to do a Home Page as you might think. You can build onto what someone else has done (generic, that is...no copyright infringement permitted)." He demonstrated how you can view the underlying HTML file for a home page in "Notepad" and how you use different tags, denoted by"< >"s, to tell the browser how to display the text as regards to location and size. He demonstrated how to insert a graphic into the home page, which are GIF files, not bitmap files.

Since the file that you use to create a document on the Internet is nothing but a text file, you could use a simple text editor like "Notepad" to design a Web Page, but he said that a special purpose program like *HOT DOG* designed specifically for this purpose makes the job a lot easier. *Hot Dog* is available on our BBS as shareware. Home Pages typically provide one links to other sites. He demonstrated.

Finally, he showed us a home page he had created for the Tampa PC Users Group. It was fully functional allowing a user to view information about the group, view the research interest of the Genealogy SIG's membership, send e-mail to officers or Genealogy SIG members, or view recent newsletters in Adobe Acrobat format. However it was really only on his computer hard drive and awaits that Internet slot that John Meroth has promised.

We thank William for a most interesting program.

Regarding entry to any SIG at the Reflectone Building, be sure to get your name on the list. If you miss the sign up let Mike Hodges know. Mike said that as long as Reflectone gets the additions to the list before 4 PM of meeting day, entry can be arranged. Reflectone is a tight security building. Simply plan ahead.

Congratulations to door prize winners. To be eligible to participate in the great door prizes, one must be a dues paying member. We appreciate those donation of products and of cash to help keep TPCUG alive and active. Thanks and congratulations to:

M. N. Marten Cup Insulator

(Continued on page 9)

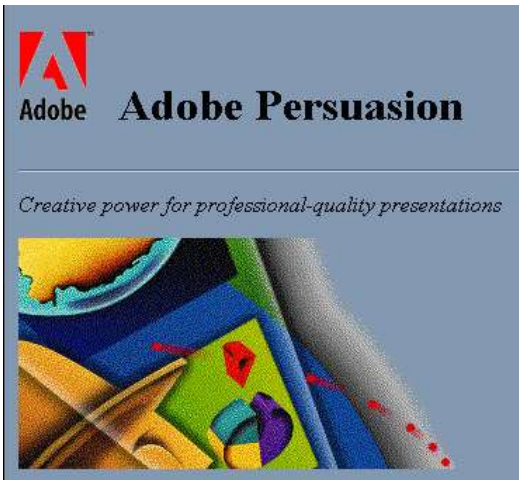
(FACUG.....Continued from page 1)

struggled with the question “How big do we really want to become." There were two different views on this question. Some like the intimacy and manageability of small groups while others wanted the diversity and opportunities that only happen with larger memberships.

Medium size groups seem to be the most diverse. Therefore, they are the most difficult to describe.. The key difference between a small group and a medium group seems to be the decision (commitment) to grow. While small groups seem to struggle to keep a more ‘manageable’ size to their group, medium size groups seem to feel that growth is important to their core mission and seem committed to grow a management structure that corresponds with the growth of the group. Many of these groups are in the process of acquiring status and assets. Status includes: 501(c)(3) status with the government, status with vendors that attracts ‘premier’ presenters and status in the community so that they are sought out as a resource by the general public. The issues that medium groups seemed to struggle most with are advertising and getting more things together to offer the community.

The large groups are fairly secure in their status by all the above measurements. They have been 501(c)(3) organizations for a few years and have some sense of how to do that. They have a strong community presence and often serve a multiple county area. They have a well defined board of directors and often have committees and subcommittees. They often have acquired many assets and rent some real estate on a full time, exclusive use basis. Often these groups have a store front where they offer classes most days and evenings with special events several times a year. They have strong ongoing relationships with vendors and can draw large vendors on a fairly regular basis. These groups often have clearly defined projects and goals. The large groups that were present at FACUG appeared to be managed by ‘young at heart’ retirees. In fact, there seemed to be something of a correlation between the number of retirees on the board and the size of the group. I suspect that if this is in fact true (so far it’s really just some observation and some speculation on my part), it has something to do with time available to do all the leg work, phone work, committee work, etc. The one concern that seemed to be common to all groups was how to get it all done. Every topic seemed to have some element of recruiting and managing volunteer efforts as part of their discussion.

- **How user's groups serve the community** - Users groups provide education, social events, a channel for donations from the business community to other areas of the community and sometimes are able to get expensive technology to those who need it but can’t afford it.
-



The key component to all groups was clearly a desire to educate the public about computers. It was equally clear that

(Continued on page 9)

Software Review

Aldus Persuasion 3.0

Review by Don Patzsch,
Tampa PC Users Group, Inc.

Aldus Persuasion 3.0 comes from the same folks that provide you with Aldus Pagemaker, the real standard in desktop publishing. However, subsequent to our receiving this software, Aldus became part of Adobe.

When you open the package of presentation software you will find a **User Manual** that gives you a lot of tips regarding the distance from the audience, size of the screen, and the size of the letters you should use to put on a successful presentation; a **Chart Manual**; an **Autotemplate Guide**; A **Compact Player Guide**; a **Quick Install Card**; **Tips for Slide Shows**; and a **Pictorial Catalog of the Graphics** included in the package, so you may choose the graphic you want without bringing it up on the screen.

The **Autotemplate Guide** provides you with many color slide views. You can easily see what effect that color has on the templates you will be using by going through the 75 slides shown in this guide. I often use the color templates that are included with the program and all I do is go in and edit the text they have in the template. This allows a quick and easy way to make up something just before you go to the meeting! If you have time, and want to include animation in any slides, or if you want to include sound and or movies, that takes considerably more time to present a continuous program that makes sense to your audience. (You've seen some that do not make sense, right?)

The **Chart Manual** shows you various charts you might want to produce from a spreadsheet, and how to set them up for easy viewing, with your audience in mind. I have seen many presentations that looked good, but were not easy to read due to the colors used.

Installation is quite easy, there are 12 floppy disks, each 1.44 Mb. I did not copy the original disks because the company sent me a new set of disks which I appreciate because I can store the second copy. All of the programs of this type rework your autoexec.bat file and also your win.ini file. If you are using a different operating system I am sure they will go in and change those as well. This is not a problem, but you can see why I occasionally format my C: drive and remove all the miscellaneous bits of old files from here and there!

The manual is just about the right size. It must be read before using the program, as this is a large program. More than 30MB on the hard drive. You may use sound and motion in your presentations. Motion is smooth and clean, the kite flying demo is neat. It shows you how a kite is flown, and how to maneuver one. The program does this by showing a diagram on the left of the screen that gives you the idea of how to manipulate the kite to get it to go through the various motions you might want to emulate, if you were flying the kite outdoors and wanted to make it go through its paces! There are several of these diagrams and including them is a very clever idea, in my way of thinking. Good tutorial.

In looking over the files that *Persuasion* places on your hard drive, I noticed a log file. Evidently, *Persuasion* puts a log of the original setup of the program on your computer. It shows just how install went along. I made a couple of errors and they show up very nicely. Must be a real help to the trouble shooter when you call in for help. The log file is 38K in size on my machine. A tech rep could also see which you have installed of the total program parts.

Three formats are available for the program, 35mm slides, Overhead Transparencies, and Computer displays. Computer displays are presentations using a computer and a typical LCD screen with an overhead projector. The Player allows you to run the presentation on a computer that does not have *Persuasion 3.0* installed.

Apple Quicktime for Windows is included in the disks that come with the program. You may transfer a presentation from the IBM to the Mac and also from the Mac to the IBM computers. This assumes that you have *Presentation 3.0* on both machines.

Suggested Retail Price $395 (U.S.).

For More Information in the USA and Canada, call Adobe at 1-800-628-2320. Or visit Adobe on the World Wide Web at http://www.adobe.com . ◆

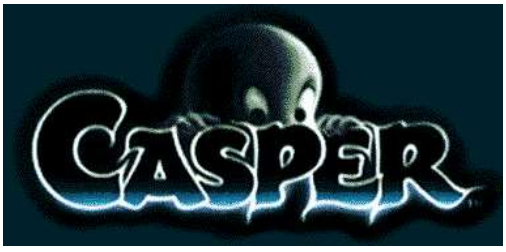
CASPER'S BRAINY BOOK

Reviewed by Scott Lawson,
Tampa PC Users Group



This is an educational program from Knowledge Adventures. It comes on a CD-ROM. The game runs from the CD-ROM, only a scratch directory is set-up on the local hard drive. The minimum hardware requirements are Windows 3.1, a MPC sound card and speakers, 4 MB of memory (8 MB recommended), and a 256 color monitor.

I ran the program on two different computers. A Windows 95 486-33 MHz with 8 MB memory and a 2X CD-ROM, and a Windows 95 Pentium-120 MHz with 16 MB memory and a 4X CD-ROM. Audio and animation were a little jumpy on the 486. There was a increase in speed and clarity on the Pentium, sounds and video were excellent.

This program is divided into five areas. The main area is the story, the Casper story is read (in a male or female voice) as text is displayed on the screen. Each screen is full of objects that come to life as they are selected. The player is encouraged to read along with the program. The three ghosts from the movie (Stinky, Stretch and Fatso) each have their own reading games. Each game has three skill levels, aimed at readers of varying abilities. Stinkie's peek-a-boo is a memory matching game. Stretch's shake rattle and roll is a letter placement game. Fatso's creature feature game is a jigsaw puzzle. There is also a printing program so that each screen from the story can be printed for coloring latter.

I have really enjoyed watching my children use this program. They sit and read along with the game. Casper's Brainy Book is an excellent game for young readers.

X-MEN CARTOON MAKER

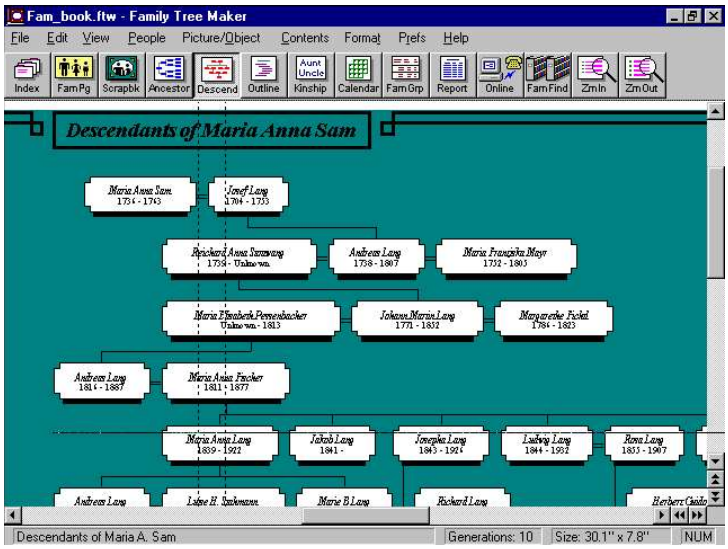
Reviewed by Scott Lawson,
Tampa PC Users Group

This is another program in Knowledge Adventure's cartoon maker series. It is supplied on a CD-ROM, where most of the graphics are stored. The minimum hardware requirements are Windows 3.1, a MPC sound card and speakers, 4 MB of memory (8 MB recommended), and 256 color monitor. A microphone will allow kids to save their own voices in the cartoons that they make. I ran the program from both 2X and 4X CD-ROM's with no problems.

I ran the program on two different computer systems. A Windows 95 486-33 MHz with 8 MB memory and a 2X CD-ROM, and a Windows 95 Pentium-120 MHz with 16 MB memory and a 4X CD-ROM. There was a increase in speed on the Pentium, but I had no problems with either configuration.

The program begins with a simple layout screen that is bordered with icons to lead the player through the creation of their cartoons. There is a small manual delivered but it isn't necessary, voice help is available through out the cartoon. There is a full supply of painting and drawing tools to create any custom drawings. Audio effects are available for background music Voice and sound effects. Editing tools make returning to a specific scene easy. Animated characters and moving objects add life to the cartoons.

Knowledge Adventure has designed their cartoon maker series of programs so that they can share library objects. A character or background music from Spiderman Cartoon Maker (See Bits of Blue Vol. 8, No. 9) can be used in the X-Men Cartoon Maker. This effectively doubles the amount of items that players can add to their cartoons.



My children and I all enjoyed the program. The only drawbacks I noted are the inability to print out the completed cartoon. I would recommend the program for anyone with children who read comics.

Software Review

Family Tree Maker

Review by Bruce Register, Secretary
Tampa PC Users Group, Inc.

Family Tree Maker by **Broderbund** is a well recognized genealogical program that has been highly acclaimed by users on different genealogical bulletin boards. In this review, *FTM* refers to the FTM for Windows and Windows 95. I am reviewing the Family Tree Maker, Deluxe CD-ROM Edition, Version 3.0. Other versions are also available on 5.25 and 3.5 floppies or CD-ROM.

Having seen chit chat on the Genealogical Bulletin Boards regarding different software programs, I was of the opinion that *FTM* appeared to get the most favorable comments. My much cheaper program, *Expert Personal Roots* was satisfactory to me at my level of interest and technical accomplishment until I met *FTM*. *ProOne Family Tree* is still in the unopened box in which I purchased it. Installation in Windows 3.1 was a breeze (I could have installed this same software in Windows 95 if I had wanted to). I have a 486 (requirements are for 386 or higher), I needed 9 MB free HD space; 4 MB RAM is minimum; I run with 8 MB. I felt that the only problem would be operator trouble with me as the operator. Generally, I ask more questions than I see answers in most software HELP or manuals. This software is no exception to that rule. I knew I need much preparation.

In preparation, I scanned the manual, including Table of Contents, Index, Common Problems and chapters on Installation and Getting Started. I have found that "problem discussions" are real time savers. My tendency to "do" then hunt ways to "undo" have caused me much anguish over the past years. After 6 hours of familiarity with the manual and other hard copy inserts, installation began. I inserted the CD-ROM in the CD drive and followed instructions. I went into TUTORIAL and looked around. Just moving around the TUTORIAL is a most interesting stand-alone experience. My *Expert Personal Roots* experience helped in this regard. With an abundance of personal confidence, I uploaded data from my brothers *FTM* database from the 3.5 floppy that he sent me. Skipping ahead and with no further reference to the TUTORIAL, I jumped right in.

FTM is a very user friendly program. I felt the ability to cruise, at one's own selected depth, to be a real plus. *FTM* is dual functioning. It is as simple and slow or as advanced and fast as one's level of technical knowledge will permit. One of the advantages is that *Broderbund* offers a tremendous amount of reference information under the Family Archives CDs program. These CDs contain data that has been collected about individuals and family, geographical areas, localities, settlements, etc. The total cost can run over $1,000 for the set. However, there is good likelihood that most of these CD's are already available in a well stocked local library. *Broderbund* also offers an information exchange service for users who contribute and retrieve information submitted by other users called World Family Tree CDs. This should reduce research time. Why reinvent the wheel. Quality of information, however, is no better than what is input.

Entering individual and group data is simple. One just needs to follow the prompts. Reminders and choices under *FTM* are helpful. The manual is more user friendly than most manuals "written by programmers for programmers" rather than for users. The latter thought is a very strong personal opinion developed from years of experience and "millions" of pages read. *FTM* manual writers appear to fall into the same trap; but less than most. A component writer, "or chapter writer", will throw in a term as though it came out of the blue. You will not find the term in the index or in the Contents. After reading and reading of seemingly unrelated material, one may find the term buried. More wasted time on research eventually turns up the term and an understanding. One gets the feeling that manual writers do not always read the other chapters in the manual or they do not speak to other writers. I admit to being a cynic regarding this phenomenon, but I am a user. Real world experience will sometimes do that to one. I want to shout "Thank you for giving us this beautiful program that we would not have except for you but please field test the manuals and HELP screens." I wanted to find out about file extensions so that I could import photos.. It is neither in the index nor in the Contents. Read, read and read! The subject of extensions is buried in "Managing your file" This relates to my own quirk. In *FTM*, the search indices are easy to use by and large.

Software Review

PMView (from the IBM Monthly Newsletter)

*by Maxine Senn-Yuen**

PMView version 0.92 is a graphics viewer and editing tool for OS/2. This software package offers many useful features for viewing, enhancing, organizing and converting a wide range of graphics formats, including BMP, EPS, GIF, IFF, JPEG, Photo CD, PCX, PIC, PPM, PNG, TIFF and TGA.

PMView has a narrow learning curve, so you can start using the software right away. When you select File Open, *PMView* searches for all the graphic files in your current directory. If the program has already created thumbnails for your graphics, they will be displayed along with the file names in the File Open window. The program can be set to automatically create thumbnails of all the graphics in that directory in the background while you work on your computer. Once the thumbnails are created, you'll have a handy graphical index every time you re-open that directory in the future. The thumbnail facility takes the guesswork out of finding the right image. You can also setup *PMView* to create thumbnails only when a graphic is loaded, saved or converted. This option is best for users with very large graphics collections on CD-ROM.

OS/2

You can perform many operations on your graphics from the File Open dialog box, without ever opening a single image. Right-click on any thumbnail, and you'll see a list of options for that file. You can check the file size, image size and color depth of that graphic here. You can also rename or convert the image into a different format. Right-click in the File Open window (but not on a thumbnail) and you'll get a list of viewing options. Here you can sort your thumbnails by image size, type, file name and file size. You can also randomly scramble your thumbnails if you prefer less, not more, organization. Choose the Sticky Select option if you want to select multiple thumbnails with only your mouse. This feature is great if you want to convert a batch of files into a different format, or if you want to create a slide show.

The Slideshow function is another unique feature in *PMView*. Open multiple thumbnails from the File Open window and the Slideshow will automatically launch. Or you can start the Slideshow by drag-and-dropping graphic files on to the main *PMView* window. The Slideshow is an easy way to create and practice business presentations.

PMView has decent, though not comprehensive, editing tools. The program lets you crop, stretch, rotate or flip any image. When you select a rectangular portion of an image, a handy Track Info box tells you the size and location of the selected area, and lets you type in a new location or size. *PMView*'s handy Screen Capture utility lets you capture any portion of your desktop, including parts of a window that lie outside the visible screen.

PMView offers some important image enhancement features as well. The package includes several filters you can apply to your graphics to create special effects (like an "embossed" effect). You can also create your own user-definable filters. In addition, *PMView* lets you adjust the brightness, contrast and red-green-blue balance of your graphics. You can convert the color depth of any image from color to black-and-white to grayscale. You can correct the Gamma factor, create a negative or "solarize" your graphics. You can even save an image with more colors than your video card or monitor can display. If you make a mistake while editing a graphic, you can simply undo your last change. Although the program has only one level of undo, it has a useful recall function that reloads any of the last eight files viewed.

PMView has some very handy features for creating graphics for the World Wide Web. It allows you to save GIF files in interlaced mode, with transparent backgrounds or a background color you specify. This feature is important if you want to create eye-catching HTML 3.0-compliant Web pages. You can also save your JPEG files as something called progressive JPEG, which lets Web browsers load the images progressively, like interlaced GIF.

Printing is a snap with this software. *PMView* uses your standard OS/2 printer drivers, but allows you to modify your printer setup to print your graphics optimally. For example, you can print your graphic across more than one page to create poster-sized hard copies.

Context-sensitive help is available throughout *PMView*. Hit F1 at any time, and you'll get help for the task you're trying to perform. Although the program doesn't have a tutorial, you can probably learn to use most of its features from its well-organized help contents which describe, menu-by-menu, all of *PMView*'s features. The help index also includes Frequently Asked Question for some functions. In addition, the authors Raja Thiagarajan and Peter Nielsen are very responsive to users' questions or suggestions.

On the whole, *PMView* was easy to use and had a smooth, polished feel. The program was very well-threaded and ran quickly on my 486DX2-66 (although the authors say it has been optimized for Pentium processors). The slideshow and

(Continued on page 9)

(PMView.....Continued from page 8)
thumbnail functions were most impressive. Serious graphics users will also appreciate the customizable filters and other graphic enhancement features. All in all, I think *PMView*'s $40 registration fee is well worth the price for such a fast, complete graphics package.

PMView is now available in both English and French versions. To download a copy, visit http://copper.ucs.indiana.edu/~sthiagar/pmview/pmview.html or htt p://www.wilmington.net/bmtmicro/catalog/pmview.html. The shareware version is a full-featured app with no "disabled" functions, so you can test all the program's features before you register. If you have limited graphics needs, then less expensive shareware programs like PMJpeg will probably serve you adequately. But if you work with graphics all the time or have large, disorganized clipart collections, then I highly recommend *PMView*.

* This article is based on the author's personal review of the product and should not be viewed as an IBM endorsement of such product. ◆

(c) Copyright IBM Corp. 1994, 1995, 1996. All rights reserved.

(Family Tree.....Continued from page 7)
Reports can be tailored to one's own design. Several print formats are available for the most discriminating genealogist. GEDs are exportable and importable. Data backup is continuous and automatic. Information merges directly into your family files. I am excitedly encouraged to become more deeply involved in *FTM.* I recently reviewed *PhotoWorks* from Seattle FilmWorks. For the review, I took my family reunion photos on 35 mm Seattle FilmWorks film and received printed photos as well as graphic files on a 3.5 floppy. *FTM* accepts such graphics as an enhancement to your Family Tree data (once you find "extensions" buried in the manual text).

This program is an excellent piece of software, and it does for you just about anything that you can imagine. Genealogy is a hobby for me; therefore, I am interested in a very user frendly program that requires little training time. I feel that *FTM* is such a program. The software program procedures, etc. appear to be well planned for harmonious continuation in my usage. What a great time for genealogical novices to be alive! *FTM* is available in DOS or Windows and Windows 95 on disks or CDs. The street price for the version reviewed is $59.95 (plus tax) at the largest two local suppliers. I recommend this program to the "novice" and the "veteran". ◆

(FACUG.....Continued from page 3)
there was no one way to do that. Groups large and small found creative ways to connect with the community. To list some of the activities mentioned: pancake breakfasts, picture scanning concession at the flea market, publicized donations to those in need, lectures and demos at the mall, library, local bookstore, speakers for career day at schools, participation in technology fairs as well as general meetings and SIGs.

• **SIGs** - Special Interest Groups provide a focused source of learning for every level of interest. They also provide access to technology to people who might not otherwise have time, money or someone to show them how.

Medium and large groups almost universally had SIGs as a recognition that they had grown too large to meet the needs of the membership for a more personal experience and as a way to meet diverse information needs. Larger groups offered more SIGs in fairly direct proportion to the group size. Interestingly, there didn't seem to be much consensus about what SIGs a group should have other than a New Member SIG.

(Continued on page 10)

Special Interest Groups

Microsoft Access SIG

This SIG Meets on the 3rd Thursday of the month (April 18) at 6:00 PM at the Reflectone Building. Directions: Proceed west on Waters from N. Dale Mabry across the railroad tracks (which is about 1 and l/2miles), take second left on Savarese (United Technologies bldg. is just beyond it). Proceed on Savarese until you reach the Reflectone bldg. Take the North door. If you need to ask directions, there is a security guard at the location. PLEASE SIGN IN WITH A SIG LEADER
For more information call Connie Kincaid - 661-8185 - Leave a Message.

Communications SIG

This SIG meets the first Monday of the month (April 1) at 6 PM at the Reflectone Building. You must sign up to get on list and to get by security. See Microsoft Access SIG for directions to Reflectone. *Contact Tom Cone at 949-9698 or Charles Howe: at 968-1207 or HOWE@INTNET NET*

Genealogy SIG

This SIG normally meets the third Wednesday of the month. (April 17) at 7:00 PM at a member's home.
Contact SIG Leader Jenny Lind Olin. at 960-5723 for directions and RSVP.

(FACUG.....Continued from page 9)
Beyond having some sort of 'Introduction to Computers' lasting 6 or 12 weeks, the SIGs were as diverse as anything else about the groups. One of the top concerns about SIGs was insurance. SIGs were meeting in schools, peoples homes, churches, libraries and conference rooms at established businesses. Most conference attendees were unclear about their liability in these diverse locations and their insurance needs.

- **Technology** - Users groups are the liaisons from vendors to their market. The meetings provide important forums for vendors to 'teach' their consumers. Computer technology as a business relies more heavily on the education of its consumers than any other mass industry. User's groups bring that education to the public.

The user's groups are the best way to find a room full of intelligent, curious people who *want* to sit still and hear all about a vendor's latest idea. What a deal for the vendors and what a deal for us the consumers. The vendors get to teach us how to use their latest and greatest, and we go out and teach others. It benefits everyone.

- **Vendor relations** - Users groups and vendor have an interdependent relationship. Vendors rely on user's groups to 'spread the word' while user's groups rely on vendors to give them something to spread.

Saturday evening at the conference was an open discussion with a panel of the vendors attending the conference. The vendors were very candid and frank in their comments to the user's groups as well as the groups being very forthright with the panel. I can't find words strong enough to describe the thoroughness of the commitment from the vendors to support user's groups. The best I can do is offer an analogy. Have you ever seen a real, live Christmas tree that wasn't green? I don't mean an artificial one or one that has been spray painted to look like an artificial tree. With a real Christmas tree, you can hang anything on it and still see that it is a green Christmas tree holding it up. With the vendors, you could throw almost anything at them and still see that underneath it all was their commitment to user's groups. That commitment was an integral part of everything they said and did. In return, they wanted from the users groups a couple things: a chance to bring their wares to the public's attention and HONEST, HONEST, HONEST reviews of their products. In Communications studies, it is the textbook classic communication feedback loop. Vendors hire lots of people who are breaking new ground in technology. It may be lots of fun for them, but, if the market doesn't want to go there, it's expensive fun, not a profitable business. Vendors need to show the public (via the user groups) their latest and greatest and need to ask us (the public via the user's groups) 'What do you think?' It's the way they find out whether or not they are on the right track. Please note, a glowing review of a boring or poorly constructed program is just as much a disservice to this process as an unwarranted poor review. It's like telling your children how cute they are when they accidentally do something wrong and then wondering why they keep doing it. (I certainly don't mean to imply that vendors are children - the same principle applies to adults too.) Vendors want and need user's groups to test drive their products and give them feedback about how they are doing. The real goal is to make technology work for people, not people work for technology.

I want to express my most heartfelt gratitude for the opportunity to attend this conference. It was certainly valuable to me as your new president. I hope that my review of this conference helps everyone in the group understand our part in the big picture. I know that attending this conference helped me feel connected in ways that were not clear to me before. If

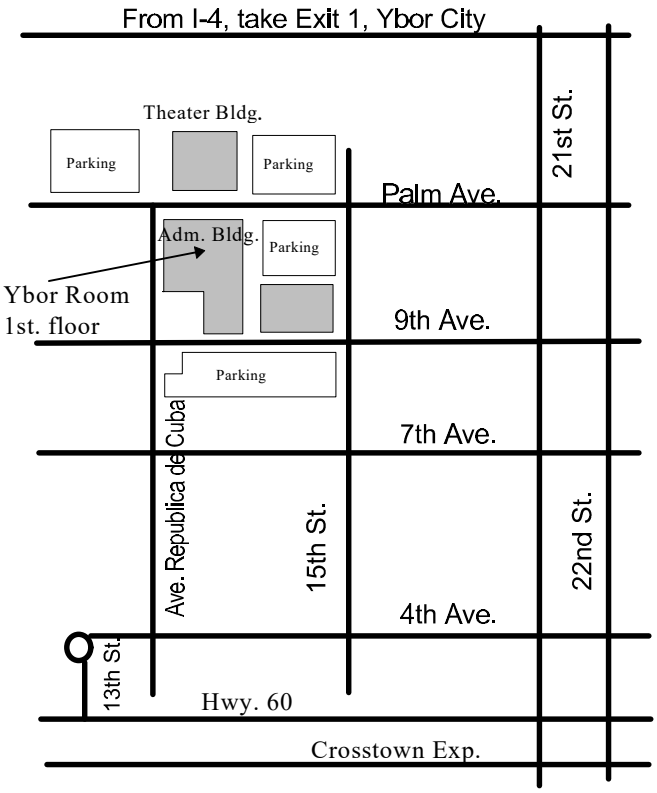
MEMBERS HELP-LINE



The following phone list is provided for our Tampa PC Users Group members in an effort to establish local support for those frustrating times which we have all encountered while using our PC's. Please note that these are members that have volunteered to help you; treat them in a courteous manner. Be sure to ask if it is convenient for them to help you now, or if you should call another time. It would also be helpful to have your documentation and have it handy when you call. (Don 't expect help if your software is an illegal copy or you do not have documentation!) TPCUG is not responsible for the information or advice provided by volunteers. Volunteers may or may not be experts in the subject matter. You are on your own with any advice received. Be aware also that some of these volunteers may be consultants in their area ofexpertise. If you are interested in volunteering to answer members questions, either leave a message on the BBS or fill in the forms provided for this purpose at the meetings.

Computer News & Comments

by William LaMartin, Editor Tampa PC Users Group, Inc.

This is the usual location of the President's Column. However, this month Connie said she really didn't have anything to contribute. I too may not have anything to contribute, but since I have all this empty space to fill I must come up with something.

The first thing that comes to mind is that I now have been doing the newsletter for six months. It's interesting, more work than I thought it would be, and I have learned a little. The first thing I learned is that each issue must consist of a multiple of four pages. That is, you can't have a 10 page newsletter; it must be four pages, eight pages, twelve pages, etc. This is mandated by the size of paper used in the process, 11 x 17 printed on both sides with each piece of paper containing four pages. So to fill up this 12 page issue, I need to write this column.

By the way, I always welcome guest columns, in case some of you have an itch to get into print. It can concern anything computer related and not too biased. Most of our articles have been software reviews; however, I think the readers would also like to hear a little more about hardware. And Larry Anders has such an article in this issue. Larry, I need not point out, has been very helpful in providing articles for the newsletter, writing about software he has bought with his own money (we don't have that much non-game Vendor donated software available for review) or writing about his most recent shareware discovery. Another topic in need of more coverage is OS/2. I do what I can by searching the Internet for articles that we can

Commercial advertisements will be accepted For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if it is not received on time.

Members may insert non-commercial ads at no charge with the following imitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

SECRETARY'S REPORT & MINUTES OF MEETING April 10, 1996

Minutes and Comments by Bruce Register, Secretary

President Connie Kincaid called the meeting to order. Connie introduced each of the TPCUG Officers and Appointees. She asked that if anyone with a meeting place suggestion to let her know.

The first 25 minutes of the meeting was dedicated to informal networking, etc. During this time, a popular activity was William LaMartin's "close up huddle around and hands on" demonstration of and about the Internet's World Wide Web. There from 10 to 15 persons gathered close all during that 25 minute planned activity. William answered questions and assisted with problem queries. This activity appeared to be a hit. It was set up across the room away from the networking conversations. Margaret Petro supplied the 17" monitor for this demonstration. The networking was also planned for people to talk to each other about problems, questions, information exchange, etc. This planned activity appeared to be well received also. Some people just cannot get to meetings at 6PM. These two activities served a good purpose while accommodating those late comers who were interested in the planned presentation of Microsoft Office.

Connie reported on the survey Most people seemed to be interested in hardware, people tracking, communications and “something to do with money”. Perhaps making money with your computer....

Reminders were given for SIGs Communications, Genealogy and Microsoft Access. Connie asked for requests for SIGs of interest. Mike Hodges reminded that those who do not sign up for SIGs at Reflectone must call Mike before 4 PM of the day to get their names on the security list which is posted at the entrance for use by security personnel. Call Mike at 887-1675 to get on list if you have not already signed up. Each meeting list does not carry over to the next. So, sign up each time.

Discovery Day at Eckerd College is a really exciting for people such as TPCUG members and visitors. It is free! All Day Saturday, April 27. Mike Hodges and Margaret Petro have further information.

Comments were provided regarding different Internet providers. Good suggestions and information came from this discussion.

RAM chip prices have been dropping-one source advertised 4

(Minutes.....Continued on page 3)

(Minutes.....Continued from page 2)
MB chips for $89 or 8 MB chips for $139. (What a steal, Secy).

TPCUG has adopted charities to help with computer equipment that was donated to TPCUG. The three charities are: Police Athletic League; Veterans Hospital; and Tampa Hillsborough Public Library--One computer has already been donated to the library for genealogists in particular.

Connie presented "Managing your personal affairs with Microsoft Office". Most of the presentation involved the database part of Office, Microsoft Access. There are many features in this application. She explained "combo box" for selecting items from a menu. She explained "auto dialer" feature; she inserted certain parties and organizations for dialing. She explained many features, functions, etc., by walking through. She created "household inventory" as a simple example that most of us want and all of us need. She and others shared stories of losses in which inventories with pertinent information would have been helpful. The "table" and "report" forms, etc. for the program were demonstrated, even with type and term of warranties on each item.

Using “Snap To Guides" makes designing of the form easier. She stated that one may store a photo of the household item right on the information table. One may then have an electronic file. Seattle Filmworks, (see previous review in BITS OF BLUE) will provide you film, prints and 3.5 floppy of you photos. Cost is cheap, less than $16 for 20 exposures. Eckerd will put you photos on a 3.5 floppy. They advertise it for "screen savers". (Your secretary gets many rolls of film developed at Eckerd for commercial purposes and inquired after the herein reported meeting as to cost. ...was quoted $30 for 24 exposures....I did not ask if that included film developing and prints)

All created fields are retrievable, changeable, "findable", etc., as long as they are not in the "note section". The note sections provide a place to put all kinds of miscellaneous information about "whatever". Connie demonstrated a search of a number string, e.g., "3213". Every phone number in the file that contained the search number in total or in part was found. The "3213" search produced an auto tag number that contained the string "3213" somewhere in the license number. Every field was searched for that string, except the Note Section" field.

Connie demonstration a creation that she did for the TPCUG presentation. Several questions came from the group as to "how to", "can you", "what if". Connie simply inserted, deleted, changed or whatever to demonstrate answers to all of the questions. She created a table and then imported from EXCEL. One can import from many other applications. She showed "how you can get simple results from a sophisticated template".

The demonstration was well received. Since that meeting, the Secretary has 'bumped" into members, at some other location, who expressed delight in Connie's presentation. It must have been effective because Connie's ACCESS SIG was full a week later.

Congratulation to Door Prize winners:

(Comments.....Continued from page 1)
legally reprint but would prefer some home grown articles.

Those of you who come to the meetings probably gather that I do a fair amount of Internet browsing based on my demonstration of how to build a home page and the Internet browsing session we did before the beginning of the last meeting (which we will probably continue as long as there is an interest and Margaret Petro is able to lug that 17" monitor to the meetings). And those who crowded around the monitor at that meeting also noted what a difficult time I had connecting to the Internet that last meeting. My provider was simply overloaded and wouldn't let me own.

Only the day before I had heard some industry expert saying that the Internet would have to crash and burn before it got better. And I have seen more than one article titled something like "Gridlock on the Internet". If you go online at the usual busy time between 4:00 PM and 9:00PM you might agree with these pessimists. I personally have seen more than enough of the slow response of Web sites and retrieval of files. I remember, in particular, trying to download a file from Microsoft's WWW software location. It was supposed to take less than twenty minutes. After almost two hours it was only 90% retrieved when I lost my Internet connection. Then realizing that I could also get the file from the Wang Web site, since they developed the program for Microsoft, I tried there and --surprise--got the file in 20 minutes. Moral of the story: Some Web locations are much more crowded than others. In the past few weeks I have gotten much better service from my

WebCompass by Quarterdeck

Review by William LaMartin, Tampa PC Users Group, Inc.

If you use the Internet you need a search engine like Lycos, Yahoo, Webcrawler, Infoseek, etc. And if you use the Internet a lot you need WebCompass, a meta-search engine than allows you to combine all these individual search engines along with any other search engines into one combined search . However, WebCompass is much more than a meta search engine, it also creates an index of the topics on which to search and supplies summaries of the individual articles under each topic whenever possible. Once you have configured the program to use whatever search engines you prefer and selected the topics you desire information on, WebCompass will work in the background finding , cataloguing, and describing the World Wide Web (WWW) HTML pages and Usenet Newsgroups messages which contain information pertaining to your topics.

To use WebCompass you, of course, need an Internet connection and a WWW browser. Quarterdeck supplies their version of Mosiac if you don't already have a browser. They also supply a pre-configured version of their Internet WebServer, a program that coordinates all this background activity between the Internet and your computer. WebCompass will run under Win 3.1, Windows 95, or Windows NT.

My installation under Windows 95 went smoothly from the CD-ROM drive. And since I use Microsoft's Internet Explorer as my WWW browser, I didn't install the Quarterdeck Mosaic component of the setup. To run the program, you connect to the Internet via your Internet service provider (NetCom in my case), start the Quarterdeck Internet Server program, Start you WWW browser, then go to the WebCompass home page which has been installed on your hard drive.

What I did first was to do several simple searches to see how WebCompass compared with the individual search engines I was familiar with. Without a doubt if you want to know about oxford University, e.g., it would be faster to simply use a single search engine, say, Lycos, to do the search; however, it is faster than doing each search engine independently (they don't by any means find the same articles so it is best to use more than one) and in the long run more efficient to let WebCompass do this search using Lycos plus all the other search engines that WebCompass contains. Then once you have your results, which are just links to documents on the WWW or Usenet Newsgroups messages, you can designate Oxford University as a topic and add whichever of the articles you want to the topic.

You can set up as many different topics as you wish, additionally WebCompass comes with 40,000 or so topics pre-installed with their descriptions and variations on spelling. However, I haven't found this topic database of any use in my work. But it perhaps has a value in providing related topics to the one you are searching. Once you have some topics on which you want information, you start WebCompass' Search Agent, and it will search in the background while you do anything else you want with your computer, including Internet browsing on your own. When the Agent is finished, you will be provided with a list of WWW locations of documents for each topic, and within each topic the documents have been further broken down into categories (not too accurate of an assignment in some cases) and a summary of the content of each document when that can be retrieved in the time allotted (you can configure the Agent as to how much time to spend on each attempt at retrieving information) This allows you to decide whic if any of these documents you wish to add to the topic.

If you have a search engine you wish to add to those in use by WebCompass it is an easy process; although I had a little trouble adding some extra search engines for Usenet Newsgroups until I noted that the check box saying "don't link to documents at this site" needed to be deselected when adding this type of search engine but not when adding WWW search engines. The Help let me down here. Help, in fact, is a weak point with this program. The manual provided is quite thin and mostly deals with installation of the program. There is "online help"; however, this is a large HTML file that takes an inordinate time to load. So it is probably best to print out this file to have it readily available. The program is not really that complicated, and after a few false starts I figured out the best sequence of steps to define my topics of interest, search for documents, and then edit this information as to what was worth saving. Again after a false start or two I was able to add new search engines to the collectin already in WebComapss, disable some of the search engines WebCompass provided but which I didn't find useful, configure the program as to what search engines I wanted to use, and finally tell the program how long it should try to contact a location before moving on to the next one (anyone who has browsed the WWW much knows that you can't always get a location to answer). Finally you can tell the Search Agent how often you want it to refresh the data in eac topic, say, for example, once a week.

Jump Start First Grade by Knowledge Adventure

Reviewed by Mary and Katherine Powell
Tampa PC Users Group

I thought we had seen some wonderful software for kids...until now. This program has held my daughter's attention longer than any other. It is so versatile and creative that it's hard to imagine that she will ever get tired of it. Oh, by the way... it's also educational!

The program comes with a CD ROM and users guide. System requirements include a 486SX 25mhz PC or higher, double-speed CD ROM, 7.5 MB hard disk space, 4 MB RAM, 640 x 480 x 256 color SVGA graphics, Windows 3.1 or greater, MPC-compatible sound card and, finally, a mouse or other pointing device.

Installation was so easy that Mary, age 6, did it herself. It was your typical windows installation window that prompted you for the directory and program group and then handled the rest.

The program begins in an interactive classroom. Anything the child clicks on reacts by performing or taking them somewhere else. I have seen a few children's packages use this approach and it holds their attention very well. Children naturally want to explore, so a window like this will occupy them for quite some time!

There is a guide, a 'wiener dog', named Frankie. He is with them everywhere they go, describing the game or prompting them for what they need to do next. He acts as more than on-line Help. He actually talks to the child, encourages them, and gives them hints to help decide what they are supposed to do.

Each activity teaches a basic skill, like math or reading. Math games include working a cash register in the lunch room, adding or subtracting marbles on the playground, or following a recipe in the kitchen. There is a good letter recognition game, like in the sandbox where they have to help Frankie find buried letters with the metal detector.

The level of difficulty is guided by the child. There are rooms with progressively harder games and Frankie is always there to assist them. It is designed to help children in kindergarten begin to understand the types of basics they will have in first grade. Now, I know school curriculum is different everywhere, but this software is flexible enough to cover a broad range of abilities. I noticed that there were some games Mary didn't do well in at first, but she tried them again and again until she mastered the skills. Now, she tries harder games building on what she has learned.

We were so impressed with this program that we plan to get her the "Jump Start Second Grade" when she starts first grade next year. Now, all we have to do is decide which college she will attend.

Managing Your Money's Personal Attorney

Review by Robert Davis
Tampa PC Users Group, Inc.

Managing Your Money's Personal Attorney Version 1.0 (MYMPA) is a Windows program. It creates legal forms you can use and update as often as necessary. MYMPA gives rudimentary legal advise. It also warns you to seek legal counsel when needed. Although MYMPA is a Windows program, the forms print out in regular ASCII text format. Basically, the printing goes fast but there are no great graphics.

This program helps you prepare some basic and necessary forms such as a Living Will, Last Will & Testament, General Power of Attorney, Medical or Special Power of Attorney, and Revocation of Power of Attorney. You can create a Promissory Note, Bill of Sale for Motor Vehicle, or a General Bill of Sale. For business, it will create an Employment Agreement, Independent Contractor Agreement, Offer of Employment Letter, Demand Letter for Money Owed, and a Bad Check Notice. Lastly, you can make a Defective Product Complaint Letter and a Request for Credit Report. These forms with their legal advice can help you use and/or print what you need. The legal advice may also aid you in avoiding basic legal problems.

I Installed this on 3 machines. Two are running with Dashboard for Windows, and one is not. All three are 486 processors running Windows version 3.1. One Dashboard machine went OK, but the other lost the MYMPA icon in the MYM

(Attorney.....Continued on page 7)

(Attorney.....Continued from page 6)

group it created. It was a simple fix to just add the item into a group. However, this may be a problem for a novice PC'er. The machine without Dashboard installed without a hitch. It does create a MYM Group if you don't have one, but you can just drag & drop the single icon into another group if you prefer. Then you can just delete the newly created MYM group.

There is a wealth of information in this program. It starts out with a questionnaire that suggests various chapters you should read through in the Advise section. The Advise Section has 12 Chapters on everything from Wills & Trusts to Going to Court, and when you need a Lawyer. And filling out a form is easy since it always tells you what it is looking for in an answer. For example, when filling out the Independent Contractors Agreement, the first Input is the Corporation Name with comments. The comments tell you if it is a fictitious name, enter the real name followed by DBA and the fictitious name. In fact, every input request has a comment that guides you on what to enter.

MYMPA does have some limitations, though. It will not print any blank forms. It does say you can fill out a form, save it, and then edit it with a word processor. This seems a long way to go to get a blank form. Blank forms may be needed if you are not at the computer. I would also like to create different forms to fill out other than what is provided. This may be beyond the scope of the program, though.

MYMPA requires a minimum hardware of a 80386SX or better, a 3.5" Floppy disk, a hard drive with about 2 MB of free space, 4 MB of RAM, and any common printer to print the documents. You must be running Windows 3.1 or higher. The price of MYMPA at CompUSA is $24.95. The value is there if you have a need for these forms and want to do them on your own. ◆

Microsoft BOB: A Triumph and a Failure

by Tim Condon, Tampa PC Users Group

Microsoft's BOB, a suite of programs aimed at "home users," is both a triumph and a failure. To be sure, it evoked almost uniform scorn among established computer users when it came out, and today continues to draw these really irascible comments, out of all proportion to its supposed sins.

First of all, what is the thing. It's a "home productivity" program that Microsoft came out with in early 1995. It consists of eight integrated programs that come in a highly stylized front-end, including colorful "rooms" containing various usable objects that can be moved about. You also get your choice of more than ten little cartoon-like "helpers" which range from a small dog, to an animated earth, to a lightning bug, to an obnoxious rat with a basketball, and others, all ranging from "most helpful" to "least helpful," depending on what level of assistance you might want).

The programs in the BOB suite include a calendar, with a to-do list and reminder provisions; an address book; a letter-writer, which is a simple but colorful word processing program optimized for personal correspondence; a checkbook, with provisions for arranging to pay your bills electronically, a la Checkfree; a "household manager" database for keeping track of personal possessions, insurance policies, important papers, medical records, favorite restaurants, travel plans, etc.; an e-mail communications program; a trivia game, GeoSafari; and a front-end to access other Windows-based programs. It requires Windows 3.1 or higher, at least 32 megs of storage, and at least 8 MB of memory, and doesn't really move very fast even with a Pentium 100, since it's a graphics-heavy program. Suggested retail price is $55, which means street prices are probably on the order of $40 or $45.

BOB is the result of a huge research program Microsoft

Review of Snappy…Video Snapshot

by Larry Anders, Librarian
Tampa PC Users Group, Inc.

Anyone who has read any of my reviews in the past knows that I am always looking for something that makes computing ***FUN.*** Well, I've done it again! *Snappy…Video Snapshot*, fits the bill. I had been tempted to purchase Snappy for quite some time because of the relatively low price for what it said it did, ($199) but it just seemed too good to be true. Well, I had an opportunity to purchase it *almost new* at a very attractive price from one of our members, so I did. I should have purchased it long ago and been enjoying it all along.

What is *Snappy*? *Snappy* is a 2½" x 5" video digitizer that plugs into your parallel port and becomes a bridge between you and most of your consumer electronics. Snappy grabs from any video source, such as: VCR, camcorder, TV Tuner, cable Box, laserdisc player, satellite tuner, Nintendo, Sega, Atari, PlayStation, 3DO, CDI, Mavica or Xapshot still video camera, security system, video-out from another computer.

No matter what kind of source you feed into *Snappy*, it will squeeze every last bit of resolution out of the original video signal and bring it into your PC as a perfect still. People who are using *Snappy* are either traditional imaging professionals, businesses that want to use video images, and the fastest growing segment of the computer market, home PC users. With *Snappy's* low cost, you now have a way to bring your own faces, photos and families into your PC. And with the low-cost color printers of today, what you do with these photos is only left up to your imagination.

Snappy works with almost any PC program because it saves industry standard image files such as: BMP, PCX, TIFF, and even the compressed JPEG format. *Snappy's* TWAIN interface lets you bring images into most PC graphics programs directly, without saving and reloading. Including: Fauve Matisse (included with *Snappy*), Adobe PhotoShop, Aldus Freehand, Corel Draw, Microsoft Imager, Fractal Design's Painter, Microsoft Publisher, Aldus Pagemaker, Aldus PhotoStyler, Softkey's PhotoFinish, Deneba Canvas, and many more.

What can you use it for you say?: School reports, Real estate databases, Store your photo albums onto your PC, put your face on the Internet, Christmas and birthday cards, instant digital photography with no chemicals, interactive multimedia presentations, business reports, desktop publishing, sports imaging, insurance verification, graphical employee databases, morph your family, friends and coworkers (Gryphon Morph is also included with *Snappy*), photo retouching, ID cards, instant personalized T-shirts and posters, time-lapse digitizing, home security, interior design/set design/landscape design, newsletters, brochures, catalogs, bulletins, medical visualization (plastic surgery), on-screen instant make-overs, scientific and legal imaging, remote visual monitoring via modem, grab texture maps for 3D programs, label VCR tapes with actual video frames, capture backgrounds for paint software, personalized baseball cards, and many more.

It all sounds complicated, but *Snappy* is incredibly easy to use and setup. All users need to know is that they can grab images from video sources that look as good as photographs. At less than $200, *Snappy* provides an inexpensive source of digital images and offers an entry into digital photography for many people who would never have tried it before. And it really isn't difficult to be up and running in 10 minutes. Just plug the battery (included) powered hardware module into your parallel port, connect the video cable (included) to your video source, install the Window's based software and you are ready to be pleasantly surprised. System requirements are minimal such as: 386 or better, Windows 3.1 or better, pointing device, minimum VGA 640 x 480 x 16 colors (16- or 24-bit display card recommended, but not required), 4-Mbyes of RAM, 4-Mbytes of hard disk space, and an unused parallel port. (My parallel port wasn't unused. I just unplug my printer while I'm using *Snappy*). And of course, because *Snappy* takes pictures from video sources and brings them into your PC you must have some kind of video source available - such as a camcorder, VCR, laserdisc player, or TV tuner.

Along with the *Snappy* hardware comes Fauve Matisse SE, a graphics program that will allow you to retouch, add titles, change backgrounds, or otherwise improve your captures. Also included is Gryphon Morph 2.5 that will allow you to Morph, Warp and add all kinds of special effects. Everything you need to get started immediately is right in the box. Even the box is kinda neat.

Snappy appears to me to be the lowest cost color video digitizer that offers high quality video stills while being the easiest hardware add-on for a PC that I have ever seen. This one is a keeper!

Play Incorporated, 2890 Kilgore Road, Rancho Cordova, CA 95670-6133. Phone 916-851-800, FAX 916-851-0801, http://www.play.com. Retail Cost $199 ◆

(BOB.....Continued from page 7)
mounted into computer-human interfacing. It is intended as a "home productivity" application, and is targeted at the 70 percent or so homes that still didn't contain computers as of early last year (that percentage is doubtless dropping), a huge untapped market. In BOB, Microsoft tries to both serve and entice that market. Looked at that way, the program has somewhat noble intentions: It is intended to make computer use "fun" and "easy" for all those people out there who haven't joined the revolution yet.

On the other hand, BOB immediately earned the scorn and enmity of many established computer users. Many, such as PC Magazine columnist Robin Raskin, thought BOB "too cute" in its cartoonish rooms and animated helpers. Others, such as computer columnist John Dvorak, thought BOB was "the most unique user interface ever introduced to the computing public," but found the interface to be "uninteresting and beside the point"...yet fascinating and useful to his 9-year-old son. Dvorak predicted BOB would be a hit with kids, but "not destined to become a commercial success."

And then there were those many who just plain didn't like BOB, period. Locally, in the Feb. 1996 issue of Computer Connections, one columnist wrote: "Dog product of the year, Microsoft Bob, is approaching his one-year birthday. Fortunately, sales have been poor. Excluding OEM sales, estimates of units sold range less than 300,000...Look for a new version in the fourth quarter of this year with anticipated new junk including telephony features and less cartoon-like personal guides as well as integration of modules from other Microsoft packages. Enough is enough."

Actually, my 10-year-old daughter found it pretty interesting, and my 84-year-old mother is regularly fiddling with it on the Pentium 100 machine I got for her, slowly exploring the program, and liking it. There is definitely a market out there for BOB, albeit perhaps not a giant one. But few of us in the TBCUG would find it compelling. ◆

Two members excited by our monthly meeting

(Comments.....Continued from page 3)
Internet provider, so they have either added capacty or lost customers. And, I think, in general, the suppliers of information will upgrade service to meet demand--if there is a profit in it for them.

Don't let the above comments keep you from trying the WWW if you already haven't. For it is a wonderful resource. For the $20 per month that most providers charge now for unlimited access you get a window on the world from your computer screen. In addition to corresponding with people all over the world with e-mail, I have access to newspapers, magazines and virtual art galleries far removed from Tampa, Florida. Being a rancher, among other things, when I wanted to find in depth information about the recently hot topic of "Mad Cow Disease" in England, I went to the source: English newspapers. And with the help of the Internet search tool WebCompass, described elsewhere in the newsletter, I located a virtual clearing house of information on this bovine disease--in the most unexpected of places--Japan. Want to find out about your ancestors? Just use one of the search engines to locate a site listing both the word genealogy and your family name. With a lot of luck you will make a useful connection. I dd.

Then there are those strange requests you get from friends. One of our members studying to be a nurse called me looking for a cow's heart. I kid you not. The one she was using for dissection had deteriorated so much that it wasn't useable. In fact I actually had access to such an item since a cow had just died on the ranch, and all I would have had to do was go to the ranch and remove the desired item for said cow. But that was a little more than I was up to. So what to do? Why, of course, go on the Internet and search for "cow" and "heart". However, I am sad to say, the world wide intellectual community let me down. I could only find a sequence of photos of the dissection of a pig's heart. But they should look the same, shouldn't they?

The only way to learn about the Internet is to sign on and begin looking. Start with some of the sites that I have been putting in the newsletter for the past six months. Probably some of those sites no longer exist, since like ordinary mailing address, they are only good as long as the people you want to contact still live there.

I am amazed by the growth in home pages on the WWW since I started looking about two years ago. I have seen estimates of 13 million web sites with one million new ones each month. Looks like there are a lot of sites I will never visit.

Is there anything happening in computer news not concerned with the Internet? Well, Compaq is now the leading PC vendor, followed by Packard Bell, then either Apple or Hewlett Packard depending on who does the reporting. Next are IBM, then Gateway. Both HP and Gateway showed very strong

Communications SIG

This SIG meets the first Monday of the month (May 2) at 6 PM at the Reflectone Building. You must sign up to get on list and to get by security. See Microsoft Access SIG for directions to Reflectone. *Contact Tom Cone at 949-9698 or Charles Howe: at 968-1207 or HOWE@INTNET NET*

Genealogy SIG

This SIG normally meets the third Wednesday of the month. (May 15) at 7:00 PM at a member's home.
Contact SIG Leader Jenny Lind Olin. at 960-5723 for directions and RSVP.

(WebCompass.....Continued from page 4)
You can try out a stripped down version of this program by downloading the Personal Edition of WebCompass from the Quartedeck Web site at no charge. If I am not mistaken, this version only allows you to use the multiple search engines in real time--not in the background as the Search Agent does in the full fledged program, where it additionally organizes the data found in each topic and summarizes it. In other words, in searching for information on Oxford University, this program would save you from having to select each search engine, Lycos, WebCrawler, Yahoo, etc. individually and then do the Oxford University query for that individual search engine. But you don't get the ability to automatically in the background build up a file of information on Oxford University.

While testing the program I had it go out and search on seven topics: my hometown, a disease a friend has, the university my son will attend (not Oxford), "Mad Cow Disease", a college in England which solicits American students to study overseas but doesn't seem to have much of a track record (not Oxford), and two different family surnames I do genealogical research on. Now each time I connect to the Internet, start up WebCompass and activate the Search Agent feature it will in the background begin to search for information on these topics, adding new documents it comes across and if an appropriate amount of time has elapsed updating the existing documents. What more could you ask for: You have your own low-paid, never complaining research assistant. All you have to do is check on him from time to time and delete any documents he has found which are of no interest to you based on the summaries he has provide for you.

The program sells for $89.99. ◆

(Comments.....Continued from page 9)
growth in the first quarter. Note, though, sales volume certainly doesn't equal profit.

CompUSA, which operates 98 superstores had earnings up 45%. I can personally understand this since six months ago at Comp USA I bought some toner for one of my printers for $95; a couple of weeks ago at the same store I paid $115 for the same toner. Chip makers, however, are not doing so well since bloated inventories of PC's are forcing PC manufactures to cut back on chip purchases.

Prodigy is cutting its work force by 20%. Prodigy's situation relative to AOL reminds me of Word Perfect's plight compared to Microsoft's Word for Windows. The operative word is Windows. Prodigy was first on the scene, but stuck with their cumbersome DOS style interface with adds taking up the bottom third of the screen. Even running under Windows, Prodigy looked like a DOS program with large text and very little content on each screen the viewer was presented. It is obvious why America on Line swept past them so rapidly. Same thing for Word Perfect. They were first, but waited too long in moving to Windows, and when they did their first attempt was hamstrung by kludging their DOS program into a Windows one instead of being able to start fresh with a Windows program. However, the Internet and all its rapid change threatens AOL and even has Microsoft scrambling to adapt. ◆

My Five Year Old Computer

by William LaMartin, Editor, Tampa PC Users Group, Inc.

Now that we are about to get a new computer in the house, I think it only fitting that I pay my five year old Gateway 386/33C its due. It has been a superb and hard working machine, as I am sure it will continue to be, since the new computer is meant mainly for my son's C++ programming. Many a time the software package said "Minimum requirement: 486/66, 8 MB RAM,.....etc." But in all except one case that I can remember (and I am not even sure a Pentium would have run that ill constructed piece of software well), the Gateway 386 performed quite a respectable job on the software. I get a laugh reading all the computer experts' opinions that to run Win 95 you need a 486 machine with 16 MB RAM, better still a Pentium, since this machine is running '95 very well.

So what is going on here? I think the secret to the machine's success is due to Gateway's using quality components originally and the upgrades I have added. I have always believed that a fast processor with a slow video card or with no cache memory is not much better than a slow processor. And most importantly a lack of memory can cripple the fastest processor. This machine started out with 4 MB RAM and a 120 MB hard drive whose access time I can't remember. The machine now has 13 MB RAM, two very fast hard drives with a total capacity of about 2 GIG, a sound card, 14.4 modem, and a 4X CD drive.

In general things zip along at an acceptable speed. The only programs that I would like more processor speed on are ones involving

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members. Our mailing address is P. O. Box 3492, Tampa, FL 33601-3492.

However, for business concerning this newsletter, Bits of Blue, please contact the Editor, William LaMartin, at 821 S. Boulevard, Tampa, FL 33606-2904; 813-251-3817; lamartin@ix.netcom.com.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII, Microsoft Write, Microsoft Word, or Word Perfect file to the editor at 821 S. Boulevard, Tampa, Florida 33606-2904 or upload to the BBS (News section of FILES).

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

The use of trade marked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if it is not received on time.

Members may insert non-commercial ads at no charge with the following imitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

SECRETARY'S REPORT & MINUTES OF MEETING May 8, 1996

Minutes and Comments by Bruce Register, Secretary

President Connie Kincaid called the meeting to order. Connie introduced each of the TPCUG Officers and Appointees.

The first 20 minutes of the meeting were dedicated to informal networking, etc. As according to our planned new procedure, William LaMartin held a "close up huddle around hands on" demonstration of and about the Internet during the networking session. He moved the computer up front and used the big screen for demonstrations during the 15 minute break before the drawing for door prizes. Everyone could see it from anywhere in the room. The networking had been planned for people to talk to each other about problems, questions, info. exchange, etc. This planned activity appeared to be well received also. Some people just cannot get to meetings for a formal presentation beginning at 6 PM. These two planned activities served a good purpose while accommodating those late comers who were interested in the planned presentation by Frank Kinsinger of DocuMagix's PaperMaster.

Mike Hodges reminded us to be on a sign-up list or to call him before 4 PM of the SIG day to get our names on the security list which is posted at the entrance for use by security personnel. Call Mike at 887-1675 to get on the list *if you have not already signed up*. Each meeting list does not carry over to the next. So.o.o.o, sign up each time.

Tim Bryce, OS/2 Users Group, visited and pitched the IBM and OS/2 Users Group. He gave us promotional glimpses of IBM's new products.

Visitors were given visitor's tags. Thanks to Larry Anders for making them and having them ready. TPCUG members like to recognize and give special, warm greetings to visitors.

Mike Hodges asked that if anyone wanted to help with SIGs to let him know. If anyone wants a new SIG Group on ANY APPLICATION (that means any software program), let Mike know. Mike accomplishes a great and appreciated effort in providing the high tech meeting place for the SIG groups. No SIG request is too elementary to be considered; Connie's "Hardware Basics" and "Software Basics" were both well attended by novices and veterans alike.

Ford Bond announced a program at MOSI (Museum of Science and Industry on East Fowler) that will assist youth from three years old and older this summer with the 15 computers they have. In the fall, they will have 30 computers and want

(Minutes.....Continued on page 3)

(Minutes.....Continued from page 2)
to assist "youth of all ages" from three to 105 years of age. Some classes are free, some with nominal fees. Ford encourages all to assist in promoting and spreading the word. He also requested that anyone with abilities and interest in volunteer instructing, please contact him. Ford is a "brand new" member of TPCUG. Call Ford at 986-6300 or 986-6309.

Don Patzsch reported on ATT. If you are a user of ATT long distance service, you can get 5 hours free every month on ATT Internet Provider Service. If you use more than 5 hours, you pay an hourly rate but only for the minutes you use. Unlimited access, as with most providers, is $19.95. Non-ATT users must pay $24.95.

Mike Hodges asked for a show of hands of those interested in a Laptop presentation. A majority of those present was interested. Connie stated that it is the intent of TPCUG to cycle hardware presentations during the year. A Laptop presentation will satisfy those objectives.

PRESENTATION

Frank Kinsinger gave a presentation on DucoMagix's PaperMaster, a step in the direction of the paper-less office. PaperMaster "brings everything up like you are looking at a filing cabinet and drawers." In fact, you see cabinets and drawers. You go to a cabinet (one among the several that you can create) and open a drawer. You then go to a folder of particular interest, e.g. Real Estate Offered for Sale, and then to a specific file folder on the sale of a particular property, market area, street or submarket. He faxes or scans articles to his computer. He then uses PaperMaster OCR to clean up the document. This program is especially useful for paper pack rats (such as your TPCUG Secretary). One may clip an article of particular interest, scan or fax it to your computer. "Print" it to "PaperMaster." Move it to a cabinet, then to a drawer, then to a general folder and then into a specific folder. It will stay there forever or until you do house cleaning. You may THEN THROW AWAY THAT CLIPPED ARTICLE. You get rid of that piece of paper. You still have it filed into a folder in your computer instead of in a physical metal file cabinet or in a stack on your desk or stacked on your floor area.

Frank stressed that scanners are an excellent way to get documents into the system. He uses fax since he does not have a scanner at his home. Quality of document (text or graphics) depends upon the source. Frank showed us documents that he faxed for use in this presentation. He demonstrated the "straighten page" capability of PaperMaster. One probably does not have any other software to straighten a document that came out in a slanted (oblique) manner after having been received through scanning or faxing. PaperMaster straightened the page perfectly. After pressing the "straighten page" icon and performing OCR, one may open the document in WordPerfect or other word processor. PaperMaster has built in OCR (Optical Character Recognition) to be used in turning a graphical presentation of the document into a text based version.

Frank had faxed a document with some graphics map on it as well as text. He then brought up the map and added text on top of the map to call attention to certain features on the map or to provide qualifying data sources. Frank uses PaperMaster to store his correspondence regarding prospects or clients in his real estate business with Orange Realty of Tampa. He demonstrated how he stored a letter in WordPerfect into a cabinet, drawer, multiple folder and specific folder. A folder may be a path, directory, file or document.

Frank stated that William LaMartin had uploaded a Demo Version on the BBS. This file allows full use of PaperMaster but limits the volume of bytes and doesn't support scanning. While one may use it to do most everything Frank demonstrated, one will want to purchase the unlimited version after being satisfied that it will do all that is claimed and desired. The test drive Demo Version is free for the downloading.

Everyone praised Frank for a very good presentation. Several people stated that "we would like to see more member presentations by people who use a program. They can tell us what they did and how they did it as well as give their positive and negative comments. "

Congratulation to Door Prize winners:

Borland Quattro Pro	Bruce Register
CD Disk-Power Tools	Bambi Stoll
MS BOB	Michael Leiss
Internet and Job Searching	Gary Ennis
CompuServe CD Disk	Larry Anders
SMC Cap	Wil Goble

Congratulations Bambi on winning on the first night as a new member. New members get a ticket on their first night without having to make a donation. Only regular members who make a DONATION to the TPCUG for equipment acquisition and upkeep are eligible for the door prize drawing. ◆

Train Your Bird To Talk!

Review by Larry Anders,
Tampa PC Users Group, Inc.

Last year I visited a pet store to purchase my daughter some rabbit food for her award winning flop-eared rabbit. This particular pet store had just put out on display about 50 cockatiels in a rather large aquarium sitting on the floor. I reached my arm into the aquarium to try and pet one of the birds and they all scattered, except this one little pearly pied (gray-yellow) girl who jumped right on my arm and scampered up to my shoulder. My daughter looked at me and said, "we're gonna take this one home, aren't we Dad?" Well, she was right! It's a year and a half later now, the bird is a permanent fixture, and is just as spoiled as the other three women in my household. Oh yea, I named the bird "PC". Wonder where that came from? Actually it stands for *'personal cockatiel'* and she is my personal bird because she will not have much to do with my wife or two daughters. The only trouble I have with "PC" is communicating with her. Come to think of it, I had the same trouble with my other two daughters!

Well, this time I thought I'd do it right, so…..enter the computer. I guess the trouble I had communicating with my other two daughters is the same I have with "PC", … lack of patience. But we all know the one thing a personal computer can do, and do well, is repetition. If you've ever owned a bird and tried to teach it to talk, the two primary things needed are patience and repetition. Then what better tool than a personal computer for teaching a bird to talk!

I had seen ads for rather expensive machines and other devices in bird magazines that would teach birds to talk, and almost sent for one, until I was wandering around cyberspace one day recently and found a Shareware program that was just what I was looking for….and MUCH cheaper, too…. "TRAIN YOUR BIRD TO TALK!"

The only requirements for this software package are Windows 95, a sound card and speakers and a microphone if you want to use your own voice, although the program comes with eight built-in phrases to get you started. Once the program is loaded, to start playing a particular phrase just click any one of the eight buttons that correspond with the phrase you would like to teach your bird. If you decide to try a different phrase just click on a different phrase button. The speed that the phrase is repeated can be set to repeat from every one to ten seconds. Just click the arrows or the scroll bar itself. And…. there is a *STOP BUTTON* to give you silence, and believe me, sometimes you need that….or your bird will.

When you get tired of the eight built-in phrases, you can record a new phrase over an existing phrase, create a completely new phrase or open a phrase that you may have made in a different program or downloaded from an on-line service or BBS. Of course, all of your phrases can be saved for later use. Any *.WAV* file will work. Just remember to keep it short. After all, this **is** to train your bird. You can set up any or all of your available eight phrases for a 24 hour period and create up to 100 cycles.

That's really all there is to it. The program comes with a pretty thorough on-line Help system that covers everything you need to know and how to do it. If you don't own a bird, ***GET ONE!*** You don't know what you're missing. If you haven't upgraded to Windows 95 yet, ***DO IT!*** This program should be reason enough since it requires Win 95.

Of course, both of my daughters have a personal computer in each of their rooms and I've been thinking about installing this program on their computers just so I don't have to keep saying "CLEAN YOUR ROOM or MAKE YOUR BED" over and over again!

If you're interested in this program you'd better hurry. The price went up 59% since I registered my copy last month but, oh yea, it was only $5 originally. **Isn't Shareware GREAT!**

Retail price $7.95

Multimedia Encyclopedia of Science Fiction by Grolier

Reviewed by James E. Kalshoven
Tampa PC Users Group

As I installed Grolier's Science Fiction: The Multimedia Encyclopedia of Science Fiction (G-SF), I thought of all the great SF I'd read beginning in the 7th grade and continuing until my interest and time decreased in graduate school. But G-SF recaptures those halcyon days in its quality and scope. This is obviously a work of love on the part of the authors, but less obviously a work of love on the part of the computer programmers. The CD is an expansion and update through 1995 of the book *The Encyclopedia of Science Fiction* (Little, Brown, 1993), edited by John Clute and Peter Nicholls. The transfer to a hyper linked CD-ROM is outstanding. Like other Grollier products, however, windows do not expand to fill the monitor size. One size fits all, so you get use to the PgUp and PgDn keys. Such things as a small search-result window with no horizontal scroll bar and no keystroke short cut for the copy command are indications of a non-standard Windows interface. One other oddity is the treatment of articles such as 'The' and 'A' as indexable terms in doing a book search. So *A Voyage to Arcturus* is listed under A.

In remembering one of the first SF novels I read, I did a word search of the whole G-SF on Heinlein's *The Puppet Masters*. I was somewhat disappointed that the novel did not merit a brief review on its own but was impressed at all the essays it showed up under. These essays are a trademark of the G-SF. My search turned up essays on topics such as 'Paranoia', 'Parasitism and Symbiosis', 'Invasion', 'Social Darwinism', and so on for a total of twelve. The essays are quite long and detailed with substantial hyper links. But there is no search capability within the essay. Using Heinlein again, I searched for another esoteric work: *Have Space Suit -- Will Travel*. This turned up three essays: One on the author, one on 'Children in SF' and one on 'UFOs'. The book was discussed in the 'Children in SF' in context as one variant on four types which use children. While one might disagree on the selected types, it certainly is thorough and well thought out, stimulating the reader to other works that branch from the one that had been searched.

The essays are grouped under broader themes such as 'About SF', 'Life Forms', 'Science and Technology', and 'Time'. With the hyper links and extensive scholarship, it is an explorers delight. There is extensive reference to television, movies, comic books. Film, video, and audio clips, pictures of SF art and book covers are also fun to look at and listen to and learn from.

The first thing I recommend is for the user to pull down the Help menu and go to 'About This Disc'. This is more than a publisher and version box. It is a narrative discussion on the history and layout of the G-SF, a clear indication of the care put into this extensive content.

This is a delightful and impressive piece of software, a layout with a basically attractive and inviting interface. I recommend this to anyone who enjoys or is even curious about the literature and art of SF.

What does "Merlin" Mean?

IBM reveals plans for next version of OS/2

by Tim Bryce,
Tampa Bay OS/2 Users Group

Contrary to popular belief, "Merlin" (project code name for the next release of OS/2) is not a reference to the magician of King Arthur's court. Rather, it refers to a pigeon hawk, a small falcon, a name that is consistent with IBM's latest product naming convention after birds of prey, e.g., IBM's "Eagle" series of file servers.

As a product, Merlin represents some significant enhancements in the operating system that were revealed only recently at the IBM Technical Interchange in Nashville (April 22-26) and the OS/2 TeleSeminar held April 29th.

Knowing that Merlin was in the works, many existing users weren't sure if there would be significant improvements in the product to justify an upgrade, particularly for OS/2 Warp Connect users. Initial reports on Merlin indicated that it would feature an improved Graphical User Interface (GUI) and connectivity for the Internet. This alone would not warrant an upgrade. Fortunately, IBM added several other enhancements that make this release important and justify an upgrade, most notably speech recognition and universal client support for network operating systems. Although the product is only now entering beta-test, reports indicate Merlin will have the following features:

SPEECH NAVIGATION AND VOICE-TYPE DICTATION

OS/2 will be the first operating system with integrated speech navigation and voice dictation. The decision to include this was made in the eleventh hour by PSP management (IBM's Personal Software Products division). As late as March, IBM officials refused to commit to speech support. However, the decision to adopt speech is a significant move, if for no other reason than to generate media attention.

IBM has been working on speech support for some time now. Their VoiceType Dictation software has been on the market for quite awhile and has begun to snowball in terms of popularity. The decision to embed this technology, therefore, comes as no surprise.

The speech support included in Merlin is touted as easy to learn and use, which is very important. The speech navigation portion of the product allows the user to open and close icons as desired (folders, command files, and executable programs). This will be particularly useful for starting an Internet session (more on this later).

Speech support, however, will come at a price. For starters, it will require at least 16mb of RAM (or preferably higher) and a fast processor, either a Pentium or a 486 at 133mhz. Of course, you will also have to have a decent sound card and microphone (is a video camera far behind?). To many users, Merlin will represent a substantial upgrade in hardware. But if you do not require speech support (and a lot of us will not), you should be fine with your existing OS/2 hardware configuration.

Speech navigation and VoiceType dictation will be more beneficial to end users as opposed to application developers or technicians. Let's not forget physicians and attorneys were the prime markets for VoiceType Dictation prior to Merlin. Not surprising, there will be upgrade fees for special dictionaries for these professions. It will be interesting to see what applications are developed that truly capitalize on speech recognition, particularly games (imagine a game of Doom or Heretic with speech support!)

OS/2

Initially, voice support will be available for the U.S. and U.K. English, German, French, Italian and Spanish. Because of the complexities of the Oriental languages (Japanese, Chinese, Korean) requiring the Double Byte Character Set (DBCS), it may be some time before OS/2 supports these other languages.

UNIVERSAL CLIENT

IBM launched OS/2 Warp Server in February as a universal file server for just about any client: OS/2, Windows (3.x and 95), DOS, and various flavors of UNIX. This was a smart move by IBM because it no longer confined them to a single operating environment (OS/2). Now, with Merlin, IBM is going to do the same thing on the client side by allowing OS/2 to integrate with the popular network operating systems: OS/2 Warp Server, Novelle NetWare, Banyan Vines, and Windows NT.

This aspect to OS/2 is perhaps more significant than speech support even though it won't necessarily generate the same amount of press. Basically, IBM is recognizing that companies do not have one homogeneous computing platform any more and will want to integrate everything. By having universal clients and universal servers, IBM will now be able to penetrate more companies and markets. This approach is in sharp

(Merlin.....Continued on page 8)

(Merlin.....Continued from page 7)
contrast to Microsoft who doesn't seem to grasp heterogeneous computing.

USER INTERFACE

Screen images of the proposed Merlin graphical user interface have been circulating on the Internet for some time now. However, IBM was more definitive when they demonstrated Merlin at the Technical Interchange. A lot of the changes can best be described as cosmetic (e.g., setting notebooks will appear horizontally as opposed to vertically, bubble help, and new system fonts). Perhaps the biggest change will be the new WarpCenter, an icon ribbon that was developed based on a popular technique used by Lotus. WarpCenter will replace the LaunchPad, a favorite of OS/2 users since it was released with Warp. Although the initial reaction to the ribbon has been favorable, the Merlin beta-test should tell us if OS/2 users will really accept it.

INTERNET SUPPORT

IBM has been a big supporter of the Internet ever since they introduced their Internet Access Kit (IAK) with OS/2 Warp in 1994. Their IAK has won industry acclaim for its superior features and ease of use. Now it appears they are going to further simplify it by allowing the user to create icons representing favorite Internet sites and accessing the site by speech navigation. This will be different than the QuickList as provided in the IBM WebExplorer. Instead, users will be able to say something like, "Open Yahoo," whereby the web browser and Internet dialer are initiated taking you to the Yahoo web page (http://www.yahoo.com/).

Although the WebExplorer remains the favorite browser among OS/2 users, it is possible that IBM and Netscape are planning to introduce an OS/2 version of the popular Navigator web browser. Although there is no documentation to substantiate this claim, there has been a lot of scuttlebutt on the Internet that such a development is in the works. Further, application forms for independent software vendors to participate in the Merlin beta-test makes mention of a "Netscape Plug In." With the web browser war heating up between Netscape and Microsoft, such a move to OS/2 may very well make sense. What this means to the WebExplorer is anyone's guess. If the OS/2 version of the Navigator comes to fruition, look for IBM to drop the WebExplorer. We'll probably find out with the final release of Merlin.

OTHER ITEMS

There are a host of other enhancements planned:

- Improved installation facilities, including support for plug n' play.
- Developer API extensions to simplify the migration of 32-bit programs to OS/2. It is still uncertain whether Merlin will support Win95 apps. At minimum, the new API set will simplify conversion.
- Support for industry standards such as OpenDoc, OpenGL, and JAVA. IBM scores a coup here by offering the first JAVA enabled operating system. It is rumored that Microsoft will only provide JAVA support for its web browser, not the operating system. In sharp contrast, OS/2 will include run-time code for JAVA applications, a JAVA Developers Kit, and a JAVA enabled web browser.
- Dual SMP (Symmetrical Processing) support - although welcomed, this is a curious feature in that OS/2 Warp Server is still without SMP support (although it is forthcoming shortly) and not many "client" machines come with dual processors.
- A new and improved BonusPak - the first BonusPak basically consisted of IBM Works (word processor, spreadsheet, graphics, and data base suite), the Internet Access Kit, and other communication applications (terminal emulator, fax machine, and CIM for OS/2). It is not clear what the new BonusPak will consist of but look for a few speech enabled apps to be included, such as an Internet telephone.

MARKETING

As always, IBM is gearing up to market Merlin to business (particularly banking, manufacturing, and insurance) and not to the home user. They're primarily targeting professional people who need to be "connected" to their business via computer. More and more, IBM is positioning OS/2 as an "industrial strength" operating system to run a business. From this perspective, the average home user will feel understandably abandoned. This is a shame since OS/2 has a lot to offer the home user in terms of stability and connectivity. IBM still has problems marketing to the general public and feels more confident selling to business instead.

With Merlin, it appears there will no longer be "red box/blue box" versions of the operating system (for customers with DOS and Windows/and for customers without). This will greatly help to eliminate confusion as to which version to purchase.

Pricing will be critical. Currently, the best prices for OS/2 Warp Connect (the immediate predecessor to Merlin) ranges from $124 (red box) to $159 (blue box). Although these prices may indicate what a new OS/2 user can expect to pay, existing customers will balk at such a fee to upgrade. An enticing price is necessary to assure users will want to upgrade.

(Merlin.....Continued on page 9)

(Merlin.....Continued from page 8)
The beta version of Merlin will be distributed on or shortly after May 22nd. Independent software vendors and European users are already signing up to receive the release. Beta test periods normally last 90 days, this means we can expect to see the final release of Merlin (or whatever the final product name is) sometime around September.

IBM is much less confrontational to Microsoft in selling OS/2 than it has been over the last few years. They more or less have capitulated to Bill Gate's marketing magic to capture the hearts and minds of the general public. Instead, IBM is content focusing on the corporate world. OS/2 has obviously evolved into a very rich and technically superior operating platform. Microsoft is years away from the type of features that will be taken for granted by the Merlin user (e.g., speech navigation, connectivity, JAVA support). IBM is simply hoping that the corporate user will become so dependent on OS/2 that they will also want to run it on their home computer. Will Merlin be the death of Windows? Hardly. But it will put Microsoft in a very bad light, particularly to corporate users, a market Microsoft is still struggling to penetrate.

So what does Merlin mean?

It has been two years since IBM issued a major release of OS/2; a short time to some, but an eternity by marketing standards. In order to convey its commitment to the product, IBM needed to issue a substantial release that will broaden its market share and enhance its technical credibility. In addition, IBM is beginning to describe future modifications/improvements to OS/2, far beyond Merlin. This type of talk is particularly encouraging to OS/2 users, both current and potential purchasers, who may be afraid of being abandoned by IBM. So, bottom-line, what does Merlin really mean? That IBM is deeply committed to the operating system and has no intention of backing off from it.

Tim Bryce is with the management consulting firm M. Bryce & Associates, Inc. (MBA) in Palm Harbor, an OS/2 independent software vendor. (Computer.....Continued from page 1)
graphics. I certainly would like my *Street Atlas USA* and *Map and Go* maps to print faster—my *HP Laserjet 4 Plus* printer prints fast enough, but the computer takes a long time to compose the map and send it to the printer. And those *Corel Draw* pages take a long time to redraw as they get more and more complicated. Additionally, I think that *WebCompass*, which I reviewed in the May newsletter, would have benefited from a faster computer, but I am not sure, since the Internet itself is so slow. However my other applications—the *Microsoft* ones, *Word, Excel, Access, Publisher,* and *Visual Basic*; and the non-Microsoft applications, *Quicken, Family Tree Maker, Lotus Organizer, WinFax Pro & WinCom Pro, PerForm, OLX for Windows, AskSam, TextBridge Pro*, and many, many more—all move along at an acceptable speed. Now, since I don't play games often I can't judge the 386/33's performance there except to note that it did well with *Myst*. I am sure, however, there are multimedia titles out there that would be too much for it.

Perhaps the machine is not as fast as I think it is, and I have just gotten used to it; sort of like an old, comfortable shoe. However it certainly is more than adequate to put out this newsletter using *Microsoft Word* and *Publisher* for text and layout along with *Hewlett Packard* scanning software and *Corel Graphics 3* and *Corel Photo Paint 5* for graphics. But it will be an interesting comparison to make when the new Gateway P5-166 with 32 MB RAM arrives in a couple of days. ◆

Special Interest Groups

Microsoft Access SIG

This SIG Meets on the 3rd Thursday of the month (June 20) at 6:00 PM at the Reflectone Building. Directions: Proceed west on Waters from N. Dale Mabry across the railroad tracks (which is about 1 and l/2miles), take second left on Savarese (United Technologies bldg. is just beyond it). Proceed on Savarese until you reach the Reflectone bldg. Take the North door. If you need to ask directions, there is a security guard at the location. PLEASE SIGN IN WITH A SIG LEADER
For more information call Connie Kincaid - 661-8185 - Leave a Message.

Communications SIG

This SIG meets the first Monday of the month (June 3) at 6 PM at the Reflectone Building. You must sign up to get on list and to get by security. See Microsoft Access SIG for directions to Reflectone. *Contact Tom Cone at 949-9698 or Charles Howe: at 968-1207 or HOWE@INTNET NET*

Genealogy SIG

This SIG normally meets the third Wednesday of the month. (June 19) at 7:00 PM at a member's home.
Contact SIG Leader Jenny Lind Olin. at 960-5723 for directions and RSVP.

Announcing SoftBrain 95

You've doubled your RAM, you've doubled your speed, you've even doubled your CPU. You're still hungry for more. What to do next?

Double Your Brain!

Since the introduction of the Altair in the mid-1970s, the power of the average personal computer has grown at an exponential rate. Today's notebook computer possesses orders of magnitude more processing power than the Apollo astronauts took with them to the moon. You and I wouldn't think of booting up with less than a PowerPC or Pentium; Neil Armstrong cruised a half-million miles and made One Giant Leap™ with TTL circuitry!

Despite the explosion in processing power and the accompanying plunge in costs for RAM and hard disk storage, many computer users are still disappointed with the performance of their personal computer systems.

"In 1985, when I bought my Mac 512K and an ImageWriter II," says Roy Cardiff, an early Mac adopter, "it took me about a day to write and edit a 10 page memo. Now that I have a Mac 8500 32/1080MB and a color laser printer, it takes me... about a day to type and edit a 10 page memo."

Indeed, our detailed analyses show that over the course of a 24 hour period, 99.94% of all processor cycles are spent waiting for you, the computer user, to do something. In other words, the bottleneck today is not in your computer--it is in your head.

The lesson is plain. If you want to get more out of your computer, you're going to have to improve *your* performance. To help you along, we've developed **SoftBRAIN 95**.

In our beta testing, we have found that **SoftBRAIN 95** significantly increases the rate at which experienced users are able to get work done with their computers:

Good ideas per hour:
w/o SoftBRAIN 95
w/ SoftBRAIN 95

Bad ideas per hour:
w/o SoftBRAIN 95
w/ SoftBRAIN 95

Coherent sentences per hour:
w/o SoftBRAIN 95
w/ SoftBRAIN 95

(Your results may vary. We've noticed that people with a general propensity for bad ideas produce a majority of bad ideas with **SoftBRAIN 95**. We're working on a fix. In the meantime, we do not recommend **SoftBRAIN 95** for idiots, MBAs, or government employees.)

Look for **SoftBRAIN 95** at your local retailer/mail order house. Available soon!

MEMBERS HELP-LINE

The following phone list is provided for our Tampa PC Users Group members in an effort to establish local support for those frustrating times which we have all encountered while using our PC's. Please note that these are members that have volunteered to help you; treat them in a courteous manner. Be sure to ask if it is convenient for them to help you now, or if you should call another time. It would also be helpful to have your documentation and have it handy when you call. (Don 't expect help if your software is an illegal copy or you do not have documentation!) TPCUG is not responsible for the information or advice provided by volunteers. Volunteers may or may not be experts in the subject matter. You are on your own with any advice received. Be aware also that some of these volunteers may be consultants in their area ofexpertise. If you are interested in volunteering to answer members questions, either leave a message on the BBS or fill in the forms provided for this purpose at the meetings.

Transplant Time?

by William LaMartin, Editor, Tampa PC Users Group, Inc.

Last month I wrote about how pleased I was with my five year old Gateway 386 computer. I still am; however, with the arrival of the new Gateway P5-166 I have something much faster with which to compare it. And I must admit, my old computer comes up a bit lacking. But, then, that is as one would expect. The real problem is how well it now compares to the other 386 machine in the house which I have recently turned into a 486/80.

This rebuilt 486/80 with 16 MB RAM tests out at a little over four times as fast on throughput as does my faithful 386/33 with 16 MB. And the upgrade of the 386/33 with 8MB RAM to a 486/80 with 16 MB of RAM costs less than $350. That's correct; less than $350 using an entirely new 16 MB RAM SIMM costing $165. I recall spending almost $140 less than nine months back for four 1 MB SIMMs. Prices have really fallen on RAM, and that is what made all of this possible. Since in the past, the high price of RAM precluded me from making such an upgrade because to move from the 386 motherboard to a 486 motherboard required abandoning my 30 pin SIMM memory and purchasing 72 pin SIMMs.

I decided that this machine needed some help after configuring it for my daughter's use and noting how sluggish it responded. It had been my son's machine before the arrival of the new P-166. No wonder he spent most of his computer time on the 486 laptop. It had never been a very good machine, made by a clone maker and given to us

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members. Our mailing address is P. O. Box 3492, Tampa, FL 33601-3492.

However, for business concerning this newsletter, Bits of Blue, please contact the Editor, William LaMartin, at 821 S. Boulevard, Tampa, FL 33606-2904; 813-251-3817; lamartin@ix.netcom.com.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII, Microsoft Write, Microsoft Word, or Word Perfect file to the editor at 821 S. Boulevard, Tampa, Florida 33606-2904 or upload to the BBS (News section of FILES).

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

The use of trade marked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if it is not received on time.

Members may insert non-commercial ads at no charge with the following imitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

SECRETARY'S REPORT & MINUTES OF MEETING June 12, 1996

Minutes and Comments by Bruce Register, Secretary

President Connie Kincaid called the meeting to order.

Connie announced that the Board of Directors decided to auction two laptops at the July 10 meeting. These are 386's with power pack, etc.

Editor's Note: The two laptops to be auctioned are Compaq 386/20's with 4 MB RAM and 60 MB hard drives capable of running Windows 3.1. They work. Minimum donation to start the autcion will be $100 each.

William LaMartin reported on the TPCUG Home Page that he created and John Meroth donated space for on his internet provider system at no charge to our group. The group gave John and William a round of applause.

Presentation: Mel Fox and Charles Aldridge presented *Personal Secretary: Voice to Text Software* . The program listens to the way an individual person says words. The system then extrapolates sounds and words from one's own individual voice. It forms a marriage with one's voice. The most recent version lets you say some 50 words from which it gets better and better at extrapolating words. The program learns each time it is used. This technology is on the threshold of voice recognition. Mel said, "For instance, in the near future you will be able to walk up to your front door and say something like 'I'm home'. Through voice recognition, your front door will unlock and swing open for you to walk in with both arms loaded and not even have to touch a door knob much less a key. In time, you will be able to call your bank over the phone. The bank's computer will recognize your voice and will extrapolate the words and carry out your commands...all by talking to the bank's computer."

Charles said that "it will take about three hours for the program to learn from you and you to learn how to do the program. The next phase of the setup will take about 20 hours at a minimum to get the program operating for you as you like for it to run. You cannot have a misspelled word in this program because the vocabulary is large and knows how to spell all words." He demonstrated by speaking medical terms. There are legal, standard and other versions of dictionary vocabularies available. One can make corrections by keyboard or by voice.

(Minutes.....Continued on page 3)

(Minutes.....Continued from page 2)

A minimum of a 486/100 computer is recommended; however, it will work on less. Twelve MB RAM is a minimum, but if you have 40 MB RAM, the system runs much faster since you can load the entire program into memory.

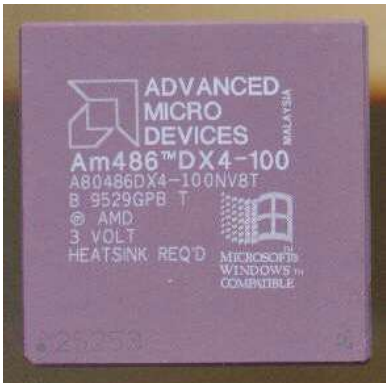
Charles demonstrated the program. He started it with his voice command only. He said. "WAKE UP." The program opened. He said, "GO TO WORD PERFECT." WordPerfect opened. Charles told us that a training process is required in which you train the program to recognize your pronunciation. He wrote documents without using his hands. If the program does not recognize the word, you must tell it to "CORRECT WORD"; you repeat words that sound like the unrecognized word. The program is, therefore, trained to recognize your inflections and pronunciation.

During the demonstration, Charles wanted to tell the audience something that he was doing. If he spoke to the audience, the program would think that he was talking to it. So, he said, "GO TO SLEEP." He told us his remarks. Then the said, "WAKE UP." The program resumed. He opened a vocabulary window to train the program to HIS voice commands. He went to the vocabulary window. He repeated a word or phrase until the program understood (got trained).

Charles said that you can use the *Sound Blaster* card or use a digitizer card which is quicker and more efficient. The program is available in DOS Vers. 2.01 and MAC Vers. 2.03. Price is about $500 - $2,000. The price is higher when one desires more applications. We thank Mel and Charles for the program.

Bargain Table: We had a bargain table sale. The bargain table was full of more hardware and software goodies than I have ever seen at such a "flea market". Prices were cheap. Many people bought much. The remainder was donated to the Police Athletic League (PAL).

SIGs: Regarding entry to any SIG at the Reflectone Building, be sure to get your name on the list. If you miss the sign up let Mike Hodges know through the BBS. Mike said that as long as Reflectone gets the additions to the list before 4 PM of meeting day, entry can be arranged. Reflectone is a tight security building. Simply plan ahead whenever possible to eliminate miscommunication.



Next Meeting: The next meeting is a hardware meeting. The auction will be accompanied by hardware demonstration as per popular request. Connie asked us all to pass the word to our friends. Come and bring someone! ◆

(Computer.....Continued from page 1)

by a relative. We, of course, were grateful to have it. But to get it to perform anywhere near the level of the Gateway 386 we had to replace most of it's components, and it still had occasional unexplained problems which couldn't be resolved. We basically replaced everything except the motherboard, processor, keyboard, and floppy drives. Not such a free computer, was it? Well, now the motherboard and processor have been replaced, and it zips along like the new machine it is.

When I got the itch to do something about the machine I called member John Meroth, who suggested I talk with member George Pollak, who is in the business of building computers. I did just that, and he suggested a 486 motherboard and an AMD 100 486 processor costing $160. Then an additional $160 would provide 16 MB of Ram for the 486 board, since the RAM on the 386 board was not compatible with the new board. Sounded good to me.

However, almost immediately after I hung up the phone my son came in with the components that the Nicholsons (also members) had removed from a 486 in upgrading their computer to a Pentium. Not only did they have a motherboard and processor, there was an expensive Number 9 video card and a Promise 2300 enhanced IDE I/O card , the latter two items providing an additional boost in performance. And the price was the same as for the new processor and motherboard. Member Wil Goble provided me with a 16 MB SIMM and I was on my way.

Out with the old motherboard and in with the new. It wasn't a perfect fit, being smaller than the original one it turned out that the right side of the board was not easily supported. Not to worry, Will suggested bubble gum between the case and the motherboard. I settled on modeling clay. Pop the cards in and boot the computer. Except that it wouldn't boot. Think, think, think. Solution--slow down the processor just a little. By changing the jumper settings on the motherboard you can change the clock speed of the processor and the multiplication factor. As set when I first tried to boot, the processor was running at a tripled 33 MHz, which would be reported as 100 MHz. I reset the jumpers to double the 33 MHz, and running at 66 MHz the computer booted perfectly to Windows 95. Time to check the throughput with a diagnostic program. It reported that things could be better. I made some changes (as recommended in the manual with the motherboard--you

(Comments.....Continued on page 9)

Fun Stuff

by Larry Anders, Librarian
Tampa PC Users Group, Inc.

I've been personal computing since the early 80's when I purchased my first Commodore 64. From the very beginning my concept of PC'ing has always been synonymous with ***"having fun"***. I switched to the IBM compatible format in the mid 80's when I found out I could have more fun because of the amount of software available for the compatibles. Each successive upgrade since then has been made to increase my enjoyment factor. Most upgrades have been in the hardware area such as: hard drives, sound cards, CD-ROMS, scanners, video capture, color printers, etc. New operating systems and software such as OS/2, Windows and scads of Shareware have made PC'ing much more enjoyable. But now there is a entity that puts all of these things together (and adds a few more things). The **INTERNET.**

In some of my last few articles I've alluded to the Internet as something I'd talk about later, well….its later. In the past few weeks I've found so much fun stuff to do with and on the Internet I thought it was time to pass the information on. This is not a *how-to* or *what-to-do* article, but more of a tiny bit of *what's-out-there* article. I will suggest though if you are new to the Internet or wanting to learn about it start of with a service like CompuServe or America On Line that has Internet access built-in, then switch to a dedicated ISP (Internet service provider) to save money. Most all ISPs now offer unlimited Internet access for a monthly charge of under $20 and most give you your first month *FREE* or discounted.

First of all…what is the Internet? The Internet can be thought of as a worldwide network of networks originally used and paid for by the military, scientific and academic communities. The Internet that has been around for years. It does not originate from any one source and is not owned by anyone. Some people say the Internet has taken on a life of its own - like an alien life form. When the GUI (graphical user interface) was introduced to the Internet, a marriage was made in heaven and its been growing and changing by leaps and bounds on a daily basis ever since. But what is so neat about the Internet is when you connect to it, you become part of it.

What's out there? Well….let me to be the first to admit that I am a *Shareware Hound.* (Shareware is software distributed for trial use, without charge. The author requests payment if the software is found useful). I became the Librarian for the Tampa PC Users Group so I would have an excuse for collecting and examining all this software. And my gosh, there is Shareware galore on the Internet. How do you find it you say? *PC Computing Magazine*, published by Ziff-Davis Publishing, has made it easy for you. In July's issue they have listed and described what they claim to be the 1,001 best Internet downloads of this amazing free stuff (and a lot of this is *FREE-WARE* that never has to be paid for). And what's better than that they have put it all together at one place on the Internet. Go to "http://www.pccomputing.com" and download to you heart's content. *This same issue of PC Computing Magazine also has an excellent manual on Windows 95 included.* Such a deal!

Probably the most used aspect of the Internet is the ability to send E-mail next door or around the planet in just seconds. Now you can do this part of it **TOTALLY FREE.** There is a service called Juno whose motto is *"E-mail Was Meant To Be Free"* that provides you with your own electronic mail address on the Internet. You can use this address to exchange messages with any of the millions of people around the world who communicate with each other by e-mail. Juno also gives you an easy-to-use software package that makes sending and receiving e-mail as simple as using a telephone and an answering machine to pick up your messages. Best of all, Juno is free - there are no membership charges, no monthly charges, no per-message charges, no fees of any other sort. (At most, there may be a cost of a local phone call to connect your computer to Juno's server, as with any other on-line service but there is no charge here in the Tampa Bay area). It's a little like television; Juno carries advertising, so you don't have to pay to use it. When you are reading and writing your mail, you are not connected by telephone to Juno's main computers. When you choose to get or send your mail, your computer will briefly connect by telephone to Juno's central computers. There is currently no file transfer or attachments associated with this service. But what do you want for nothing! If you're interested you can download the software "JUNO.ZIP" from our BBS, *Bits of Blue,* or go to "http://www.signup@juno.com" on the Internet and sign up.

Lastly, for this month's article, if you're using the Internet to communicate with friends and relatives on a regular basis why not *"talk"* to them over the Internet or

leave them a *"voice-mail"* instead of just plain old E-mail. And guess what? This also is FREE, except for your normal ISP charges. (It cannot be used in conjunction with the above mentioned JUNO service). I recently visited *"http://www.netspeak.com"* and downloaded a beta copy of their Internet phone program called *"WebPhone".* WebPhone is a

Software Review

Jump Start Kindergarten by Knowledge Adventure

Reviewed by Fred Buss
Tampa PC Users Group

I have been looking for a program for my Grandson, something besides Rebel II, Star Wars or Full Throttle. I saw in the "Software Available for Review" section of *Bits of Blue* a program for getting a head start on education called *Jump Start Kindergarten* for ages four to six. My Grandson has just turned six years old and completed kindergarten.

I have Windows 95 so I installed it with my install icon, and everything was going good until I received an error message saying I didn't have enough memory. I used the telephone number in my *Bits of Blue* newsletter and called Merle Nicholson on the Members Help Line, and he walked me through my problem, and the program installed very nicely.

I set my Grandson down with the Kindergarten program and he started to use it with great ease. It is very educational with the child learning to create and form sentences by clicking figures that represent characters, places and actions. It also teaches numbers, the alphabet, time, months and has coloring objects which are interesting. It not only keeps him occupied but teaches at the same time. The five songs on the CD can be used on any CD player.

I'm anxiously awaiting my granddaughter, who is 22 months, to reach the level of maturity to get another form of *Jump Start* for pre-school ages two to five.

Software Review

Works for Windows 95 from Microsoft

Review by Gary Peterson
Tampa PC Users Group Inc.

When Works wouldn't install I was prepared for the worst, I'd heard and read several horror stories about calling Microsoft help and waiting on hold for a long time and then getting someone who was no help at all. I was surprised to get right through to a knowledgeable, polite man who helped me edit my sys.ini file and I was off and running.

I was anxious to compare this version versus the version of Works I bought with my first computer 4 years ago.

The difference was night and day. The old version of Works for DOS was a stripped down office suite far too limiting for my needs even then.

Works for Windows 95 is a full featured suite of integrated programs consisting of a word processor, spread sheet, data base, communications and fax and even bookshelf (a very useful reference lookup of encyclopedia, almanac, thesaurus and dictionary).

Works is easier to learn than other office suites because of the countless "Task Wizards". They guide you, step by step through pre made templates for anything imaginable, letters, flyers, brochures, envelopes, labels, inventories, teachers tests, to invoices and loan repayment schedules, just to name a few.

All the programs are OLE (object linked and embedded) so that if you want your spreadsheet or database file updated by a word processor document or the reverse, it's done.

Works for Windows 95 on CD with Bookshelf is a full featured office suite, not a stripped down version, it would satisfy almost any individual or professional organization.

Extremely low street price of $64.75 makes it a bargain.

System requirements; if you can run Windows 95, you'll have no trouble running this fast 32 bit program. ◆

Hardware:

You Only Think It's Safe

by Fredrick Rea O'Keefe,
Tampa PC Users Users Group, Inc.

Aren't you just a bit proud of living in the "Lightning Capitol" of the world? Most of us like to brag about how bad it is wherever we live, recognizing that we are survivors. And if you haven't had a close call yet, don't you enjoy a small thrill when you talk to a Yankee friend about "What a doozy of a storm we just had! The lightning was just terrible."

In fact, if you own valuable electronic equipment (computer, stereo, ham radio, big screen TV, etc.), you are smart enough to protect it with a surge suppressor.
Right? Sorry, but several experts estimate that your surge protector is probably useless and dangerous if it's between six months to two years old. American Power Conversion, a leading manufacturer of *shunt-mode* superiors, noted the "finite life" of this type of device. If it's based on the common "shunt" designs, as reported many times in the technical press, sometimes at only the first good jolt of electricity on your power line -- the "protective" device could overheat, and even explode or catch fire. That's right, they sometimes overheat and start fires. In any case, until they burn out, these devices deteriorate with every surge which comes visiting. There is no warning of deterioration, often none of failure, and no way for you to test the functionality of your surge protector. As far as anyone can tell, they are good, right up to "The End."

If you are so lucky as to be tending a computer system, it's worse for you. The shunt type suppressors are notorious for shunting current directly to the data reference line, to the computer's motherboard and the boards in peripherals and communications equipment - *by design*! This frequently causes those fun "unexplained" lock ups, subtle and ongoing data corruption, or burn outs of your printers, modems and other equipment.

A shunt-mode device shorts surges to ground, theoretically so the surge won't blow up your equipment's power supply. Unfortunately, the robust power supply is the component best able to handle overvoltages. So what gives?

Until ten years ago, shunt-mode engineering seemed a more beneficial solution than big transformers to disarm constant jolts of electricity on the power lines, which easily damaged the then fragile power supplies in electronic equipment. But, in 1988, when power lines were tested, François Martzloff of the National Bureau of Standards (now National Institute of Standards and Technology) discovered the damage these devices *cause*. The evidence has become solid: *shunt-mode suppressors can do more harm than good,* particularly on a computer network (or with any *interconnected* electronics).

"Why," you might ask, "if this is known, do retailers and computer vendors still sell these devices? Is a $6 "suppressor" any good for my $5,000 computer? Why isn't there a 'warning label'? How come manufacturers don't make a better design?"

Ignorance, apathy, profit, competition to build cheap not good. *("Because our competitors do it, and that's what sells. The buyers don't know any better and don't care." said one of a local Clearwater suppressor manufacturer's engineers.)* After all, aren't vendors in business to sell you something? And what do buyers ask for -- "Sell me something that says 'surge protector', but make it low cost and good; I've already spent too much money!"

To some vendors, as far as low cost add-ons to a sale go, if it doesn't work, that's the manufacturer's look out and your problem; The vendor doesn't warrant the product against electrical damage. Neither do most manufacturers of surge suppressors!

Look at warranties, and you will more often than not read such notices as "this device is not warranted against large surges such as lightning." I kid you not, one manufacturer issues an insurance policy stating "Damage to electronic equipment resulting from [surges] on data lines is not covered." (Do you remember that I pointed out that all shunt mode suppressors dump surges onto the data line!?) And, "Damage caused by failure to provide a suitable installation environment for the product (including, but not limited to, a lack of good ground) voids the warranty." In other words, if you use it and it fails, your warranty and included insurance coverage are void.

That's capitalism. Let the buyer beware. And from whom will you buy a new electronic system when yours burns out -- the same dealer who sold you this device? Who makes a profit? And what is the deductible on a homeowner or business insurance policy (if your equipment is covered)? Probably a lot more than protecting your favorite equipment in the first place with a reliable, fail-safe surge suppressor. To the deductible add equipment depreciation, loss of time and data, (or worse, if you are in business). Sadly, consumer apathy is prevalent,

(Surge.....Continued on page 8)

(Surge.....Continued from page 7)
lower price is the number one buying point, definitely *not value* -- even more so than ten years ago, according to trade polls.

There is good news for you and your valuable electronics. J. Rudy Harford, an award winning inventor, electrical engineer and fine fellow, patented a unique new type of device - a *series-mode* surge suppressor. The importance in the term *series-mode* is that there is zero response time; the device is always active, removing every form of over-voltage, excess current, and noise. Other protective (shunt-mode) devices, even when new, take time to react, and always, always let through powerful spikes.

Zero Surge Inc., in Frenchtown, NJ, was incorporated in 1989, based on Harford's invention. The manufacturer is proud that Zero Surge Suppressors® are designed and carefully hand built in America.

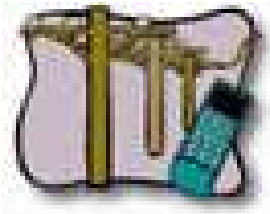
To educate consumers, Zero Surge folks have been busy getting the word out. So, one day real soon now, you, too, will come to know and cherish your very own Zero Surge Suppressor®. (But, you might be bored when lightning strikes nearby, and your equipment doesn't burn out anymore. Sorry, being interesting isn't high on Rudy's list of design criteria!)

Ah, you ask, "What about the warranty?" Good question. Yes, Zero Surge Suppressors® each have an honest, ten year warranty which does not exclude even lightning, and provides a valid million dollar repair/replacement insurance policy for your equipment with each surge protector bought. (Just read the fine print on *your* shunt-mode protector's warranty -- it probably says something on the order of, "Void if damaged by use. Void for interconnected equipment. Void if damaged by a large "lightning-like" surge, ...") Is there any exception to Zero's warranty? Yes, that neither the hot nor the neutral may be wrongly wired (to ground!).

From all the press and technical reports I've seen, the Zero Surge Suppressor® units are rated, at a minimum, to effectively handle UL's® highest test pulse of 6,000 volts at 3,000 amps repeatedly, without decreased protection, and without degrading in performance. That's smart engineering, knowing that no overvoltage, excess current or noise can get through a ZSE, not even the very fast spikes to which other units can't react in time, nor the more damaging, long-term, large "swells."

"Why haven't I, a knowledgeable person in electronics, heard of this?" Well, you have now. Who have you been talking with -- probably well-intentioned people who have an interest in selling "peace of mind" to you, but don't yet know about Zero Surge Suppressor®? Perhaps you have relied on folks who have a vested interest in maintaining an old, deficient technology? It takes a long time for good information to travel, even in this time of the "information highway."

Just so you know, when you switch to the new series-mode Zero Surge Suppressor®, you will be in good company. Novell, Inc., FSU, the New York Stock Exchange, NASA, Sony, NYC Board of Education, Prudential, Citicorp, US Navy, Deloitte & Touche, Government of Canada, broadcasters, universities, government agencies and many more confidently rely on Zero Surge Suppressor®.



A local source of information and supply is Quality Electric Supply, Inc., in Tampa.

Post Script:
Since this article was written, because of the unacceptable rate of failure of UL 1449 listed shunt-mode suppressors, the federal government has developed a requirement for testing suppressors which is intended to rate suppressors. One rating is Grade A, "recommended for the most severe electrical surge environments." Only Zero Surge suppressors have been able to pass the test, earning the Grade A rating. The test is called *UL Adjunct Endurance and Performance Test.* This is a requirement for government purchase, and it should be yours as well. Any product which cannot perform well enough to achieve a Grad A rating may not offer the quality, effectiveness and durability to protect your investment, here in "Lightning Alley." Please be aware that you have a right to receive a *bona fide* copy of the official UL test report, proving the claims of any suppressor manufacturer. Refusal to provide such should be a clear warning to you.

(Fun Stuff.....Continued from page 4)
professional, feature rich voice communication system for the Internet which requires some preparation on your part in order to use it properly and take advantage of all the functions it has to offer. You have to have a sound card and microphone to communicate. It took me about 15 minutes to get up and running. I could have probably been finished faster if I had read the instructions first! The person on the other end to whom you want to talk has to have the software too. But that's no problem, just E-mail them a copy or tell them where they can go to get the software. How does it work? As you speak into the sound card's microphone, WebPhone samples the incoming audio signal, compresses the raw audio signal, encrypts the compressed audio, then transmits it in packets via TCP/IP over your communication link to another WebPhone which receives the packets of compressed audio, pieces them together, decrypts the compressed audio, decompresses the audio, then sends it to the sound card's speaker on that WebPhone's computer for the other party to hear. I know that sounded complicated but *you* don't have to worry about any of that. All I can say is that it works, and if whomever you are trying to contact is not on-line at the time you call, just leave a voice mail message for them which they will receive the next time they check their E-mail. This Beta version is totally unrestricted with unlimited talk time. If you decide to keep it there is a one time charge of approximately $50 per computer for unlimited talk time. Also, almost every major Internet software company has their own version of an Internet phone. Some may have a better deal. This is the only one I have tried and it works great.

Well, that's it for this month. I'll have some follow-up on more FUN stuff in the future. If you have any questions or more fun stuff you've found please send me an E-mail (or voice mail) at "lga696@gnn.com". I'll be waiting to *hear* from you! ◆

(Computer.....Continued from page 3)
would be lost without this paper) in the BIOS settings, and the throughput increased considerably. One more change got things to where they are now. I again moved the jumpers on the motherboard so as to make the processor run at a doubled 40 MHz. Everything was still fine, and we were running at 80 MHz.

The computer was a pleasure to use. All the programs opened fast and ran smoothly. What a difference $335 makes. One problem remained, however. We needed a new CD ROM drive. The old two speed Philips which had worked well under DOS and Windows 3.1 had not made the change to Windows 95 with grace. In fact, it essentially didn't work, and my son had suffered with it for the past several months.. When Win 95 came out, this CD drive like many other one and two speed models was not supported by Windows 95. You had to install the old DOS drivers and suffer the attendant loss in performance. When Philips provided a Windows 95 driver, I downloaded it from their WWW site. Unfortunately as far as I could tell it didn't work properly. The solution was obvious. Go to COMP USA and buy another drive. Again a bargain (although Wil tells me that I paid too much), for $99 I bought a Goldstar 6X CD ROM drive, which upon installation was recognized by Windows 95.

Again I am the beneficiary of a price decline in the computer industry. The first CD ROM I had cost over $400 and was a single speed Philips. The double speed I just mentioned cost around $170. I bought a 4X Mitsumi drive last September for $140, and now the 6X Goldstar goes for $99. I don't have the price of the 8 speed in the new Gateway at hand right now.

So what should I do with my Gateway 386/33? Again, if I upgrade the motherboard and processor to a 486 I will have to dump my 16 MB of 1MB RAM SIMMs (I added 4 MB from the computer I just upgraded). But with RAM prices so low, that will cost only around $160. So just as with the other 386, the whole process should only run $300 - $350. Most likely I will do this, but for now I think it best to digest the cost of the new P5-166 and the 386 to 486 upgrade just mentioned. Or should I just start fresh and build a, say, Pentium 120?

In closing I want to thank the above mentioned members, Wil Goble, John Meroth, Merle Nicholson, and George Pollak for the help and advice in performing this computer surgery. Now that I have done it once, I am an expert. ◆

Microsoft Access SIG

This SIG Meets on the 3rd Thursday of the month (July 18) at 6:00 PM at the Reflectone Building. Directions: Proceed west on Waters from N. Dale Mabry across the railroad tracks (which is about 1 and l/2miles), take second left on Savarese (United Technologies bldg. is just beyond it). Proceed on Savarese until you reach the Reflectone bldg. Take the North door. If you need to ask directions, there is a security guard at the location. PLEASE SIGN IN WITH A SIG LEADER
For more information call Connie Kincaid - 661-8185 - Leave a Message.

Communications SIG

This SIG meets the first Monday of the month (July 1) at 6 PM at the Reflectone Building. You must sign up to get on list and to get by security. See Microsoft Access SIG for directions to Reflectone. *Contact Charles Howe: at 968-1207 or HOWE@INTNET NET*

Genealogy SIG

This SIG normally meets the third Wednesday of the month. (July 17) at 7:00 PM at a member's home.
Contact SIG Leader Jenny Lind Olin. at 960-5723 for directions and RSVP.

Hardware: GlidePoint

by Charles Howe, Tampa PC Users Group, Inc.

A cute, useful, somewhat frustrating (you decide) pointing device has emerged: The Alps Electric GlidePoint. It is small -- will be of interest to laptop owners more than anyone else, but functions with a desktop also. It consists of a screen about 1 inch x 2 inches; the housing is a bit larger and not much more than 1/4 inch thick. There are two buttons on the bottom and one on the top. You move the cursor by resting your finger (and nothing else) lightly on the screen. It is very sensitive. Position the cursor where you want and take your finger off the screen. Then press whatever button you want.

Installation: None, but your mileage may vary. I had recently installed OS/2 using a Logitech Trackball. I was assured that it would work with the Logitech driver already installed by a fellow close enough to OS/2 guru status to ally my fears, so I bought one. It worked. There is a DOS/Windows driver, but I haven't gotten to installing it yet.

Do I like it? Not sure. It is very sensitive, perhaps excessively so, but others with better motor control may feel otherwise. Certainly it would be an alternative, perhaps part time, for someone who uses a mouse a great deal and is concerned about repetitive motion injury. $69 mail order from USA flex. Most likely you can also purchase it locally. ◆

Humor:

Microsoft Tech Support Saves the Day

There was a pilot flying a small single engine charter plane, with a couple of very important executives on board. He was coming into Seattle airport through thick fog with less than 10m visibility when his instruments went out. So he began circling around looking for landmark. After an hour or so, he starts running pretty low on fuel and the passengers are getting very nervous. Finally, a small opening in the fog appears and he sees a tall building with one guy working alone on the fifth floor. The pilot banks the plane around, rolls down the window and shouts to the guy "Hey, where am I? To this, the solitary office worker replies "You're in a plane." The pilot rolls up the window, executes a 275 degree turn and proceeds to execute a perfect blind landing on the runway of the airport 5 miles away. Just as the plane stops, so does the engine as the fuel has run out.

The passengers are amazed and one asks how he did it. "Simple" replies the pilot, "I asked the guy in that building a simple question. The answer he gave me was 100 percent correct but absolutely useless, therefore that must be Microsoft's support office and from there the airport is just a while away."

New Computers, the Internet & our Group

by William LaMartin, Editor, Tampa PC Users Group, Inc.

New Computers

In the June newsletter I spoke glowingly of my faithful Gateway 386/33 computer that was almost five years old. With the upgrades to memory, hard drives, and video I had made over the years it was still serving me well in all aspects of computing except graphics. My DeLorme *Street Atlas USA* and *Map & Go* maps took a pretty long time to print, as did my work with *Corel Draw.* Then in the July newsletter I described upgrading my daughters no-name 386/33 to a 486DX2 80 with 16 MB of RAM. It is now running approximately four times faster than the old Gateway. And along the way I mentioned the arrival of a new Gateway P5-166 with 32 MB of RAM. Needless to say it is faster than the other two computers.

But how much faster? Based on the results of WinTune (a benchmarking program on our BBS), how about approximately 25 time faster on throughput than the Gateway 386/33 and about 6 times faster than the 486/80. I haven't bothered to actually run comparison tests where I timed sending the same map or drawing to the printer from both the 386/33 and the P5-166, but just based on casual observation, I would say that what was a 10 minute job using the 386/33 is now less than a one minute job with the P5-166. Quite an improvement.

However, for most of what I do the extra speed is not all that impor-

Members may insert non-commercial ads at no charge with the following imitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

SECRETARY'S REPORT & MINUTES OF MEETING July 10, 1996

Minutes and Comments by Bruce Register, Secretary

Vice President Mike Hodges called the meeting to order and introduced officers present.

Mike introduced Cathy and Phil Torres who conducted an auction of the two laptops. Melvin Flynn bought one for $145 donation. John Witmer bought the other for $200 donation. The members applauded appreciation to Phil, who is a professional auctioneer, for donating his services for the TPCUG and to Melvin and John.

Frederick "Rick" O'Keefe made a presentation on surge suppressors. His company is CSR Consultants, 13014-363 N. Dale Mabry, Phone 933-1575. These comments are bits and pieces (and my understanding or misunderstanding) of what Rick presented.

He showed us a fire damaged suppressor due to an inadequate system. The average price of a common suppressor is $30 to $50. The better one should run in the neighborhood of $150. He showed us the inside of suppressors. We viewed the "MOV" disks that are in them. The MOVs will burn out and short the surge to the ground, hopefully, without damaging equipment. He said that every time a surge passes through a suppressor, the life of the suppressor is reduced. You cannot know this from the outside appearance. He emphasized the three locations for needed suppressors. 1) From the main panel to the outside. 2) Between the main panel and anything in the building. 3) Middle of the building which generally receives no more than 3000 amps and 6000 volts. You want in a suppressor to be: 1) Durable, 2) Reliable, 3) Safe, 4) Effective. We should never use a suppressor that is not UL "Listed". The old UL-1449 was the top "listed"; now the UL-1449 Adj is the best "listed" that UL has. UL no longer rates; they list. If the device is not UL "listed", do not use it. The UPS is used to tell the rest of the network or system to shut down because there is a problem. He said that a UPS provides no surge protection to your system. The suppressor in the UPS is to protect the UPS so that it can perform its function of shutting down. He says that you need suppressors on "each end" of each piece of equipment. Surges sometimes travel the ground and neutral wires. He reminded us of the need to have telephone lines protected also. Mike Hodges reminded us that Tampa is the lightning capital of the US; lightning in this area is 87 strikes per acre per year. Indonesia is the lightning capital of the world. Other members mentioned the need for lightning arrestors. It was stated that an objective should be to dissipate lightning away from the inside

(Minutes.....Continued on page 3)

(Minutes.....Continued from page 2)

as quickly as possible. We thank Rick for the most interesting and informative presentation. This report only covers a little of what he imparted to us.

Mike introduced Pat Fulton who gave a presentation and discussion regarding laptops. Pat has a company that services and sells laptops. Pat referred to a newspaper clipping regarding an airport scam for stealing laptops. It seems to work like this. When a traveler places a laptop on the inspection conveyer, two people (appearing to not know each other) jump in line ahead of the traveler. One crook goes through the detector quickly and cleanly. The second crook has his pockets loaded with metal objects. The detector sounds off and he starts unloading piece at a time while alarms keep sounding. The first crook is already inside; he simply picks up the laptop as it comes through. Everyone's attention is on the guy with all the metal who creates all the commotion that he can. Meanwhile the first crook quickly gets around a corner and gives the laptop to a third crook who quickly stashes it. No ones knows or sees the third crook. When the traveler becomes alarmed that his laptop is gone, someone might remember seeing the first crook. If they find him, they do not find the laptop. He naturally denies everything and is not caught with the goods. The second and third crooks disappear. Later the third crook returns to take the stash. He may put it inside a suitcase to hide it as he most casually walks out of the terminal with no one the wiser. Mike Hodges stated that the annual loss for this type of scam numbers 208,000.

Back to the laptops, laptops now have CD drives. Pat told us that the average charge time for a battery is from one to two hours and will last about two hours with a color monitor. The best units may last up to seven hours with monochrome. She said that people should buy the laptop for mobility and not for the sole reason of working unconnected to a wall plug. The battery usage time is generally over emphasized. William LaMartin warned us about using a laptop connected to telephone lines other than those of the telephone company. He had a hotel experience in which the hotel had their own phone system. It was not compatible with laptops. He was lucky that his unit was not damaged by the PBX or whatever the system was. Some have not been so lucky. Pat cautioned us about extreme temperatures. She said never leave the unit in a locked car. The heat will damage it. She said when you move around with one in your car, make certain that it is not in direct contact the heat source of direct sunlight. Extreme cold will damage the unit, also. Things happen to laptops; they get stolen, bumped or dropped. She said that one should close a laptop very gently after use. Damage has occurred when someone has closed the laptop quickly while it is hot from usage. A slam close will damage a hot monitor; that is a $500 repair bill. By the way, her company offers 24 hour repair service in most cases. When one buys a laptop one should be

(Minutes.....Continued on page 7)

tant. Writing this in *Microsoft Word* works just fine on the slower computer, as does tracking my expenses in *Quicken*, maintaining the User Group's database of members in *Microsoft Access*, or projecting my business expenses in *Microsoft Excel.* And until I get a faster connection to the Internet than the usual modem connection, the old computer and the new one perform just about the same with that task too. Now, if I had an ISDN connection then perhaps I could tell the difference. Why don't you members of the group take up a special collection so the newsletter editor can pay for an ISDN line and modem to check this out? If the group can send two other officers to Europe (see the photo accompanying the Micrografx article), then certainly this extra expense should be trivial.

There are in actuality a couple of tasks using *Microsoft Word* that I have noticed the faster computer really helps with: Compiling indexes and re-paginating. I have several large documents. One is 350 pages, and the other is over 1 MB of text (I don't remember how many pages it is). Anyway, the 350 page document has an index which is quite extensive, and if changes are made in the document, the index must be re-compiled. This, as with re-pagination, is noticeably slow on the old computer. It is almost done in a flash on the new.

While moving from page to page in *Microsoft Word* is fast enough with the old, doing the same in *Adobe Acrobat* produces a noticeable delay between each page. On the P5-166 the page change is almost instantaneous. So for people with plenty of time and patience, a 386/33 may suffice--especially is there is also a lack of money. If you want to gain speed on the cheap, I think replacing the motherboard and processor and probably memory, to upgrade to 486/100 is the way to go. This computer would be five times as fast as the 386/33, and really is good enough for any application I have tried it on. Recall that in my upgrade to a 486 I couldn't get the chip to run reliably at 100 MHz and had to settle for a 486/80 which is about four times the speed of the 386/33.

I apparently am not the only one who has encountered chips that will not run at their rated speed. I know of an individual who bought a mass-market Pentium 100. It worked OK for awhile, but soon failed. He sent it in for a warranty repair and they supposedly installed a new motherboard and processor. Now he is puzzled why when it boots up it states that it is a Pentium 60 or 75 (I can't remember which). You figure it out,

IOMEGA's ZIP DRIVE

Review by Larry Anders, Librarian
Tampa PC Users Group

I've heard questions lately from several of our members asking about the ***"ZIP"*** drives, as far as what they are and how they work. Well, I've been using one since they were introduced and I think it's one of the best $199 investments I've made since I've been personal computing and I'll be glad to pass on the information to all interested.

The Iomega Zip drive is a light weight portable storage device that uses removable 100 megabyte diskette-like cartridges. It plugs directly into your PC's parallel (printer) port, and can be easily moved from one computer to another, even notebooks and laptops. The cartridges are slightly larger than a regular 3.5 inch diskette, but store the equivalent of 70 diskettes. These Zip cartridges are also inexpensive, compared to the data stored. It works out to about 20 cents per megabyte, less if you purchase the diskettes in quantities of 5 or more.

Although these cartridges look like diskettes, they perform more like hard drives in terms of speed and capacity. They **ARE NOT** quite as fast as hard disks (see the specifications below), but they come close enough to be reasonable alternatives. The main strength is they are removable media, which permit virtually unlimited capacity by exchanging cartridges. Unlike tape, Zip cartridges provide random access. Like tape they offer high capacity, portability, and are well suited for backing-up and archiving. The Zip drive can be used an adjunct "hard disk" drive, especially for temporary projects.

The drive is supported by a simple software driver which makes the Zip disk appear as another drive letter to your operating system. I run my software as a permanent TSR so it's available all the time but you don't have to set it up this way. Actually, no permanent software changes need to be made to your system to use the drive, just run the software when access to the drive is needed.

The Zip drive comes with other software utilities such as: 1) Copy Machine that you can copy one removable disk to another using Single Drive Copy or use Two Drive Copy to make a copy from a disk in any drive (except network drives) to a disk in any other drive (except to CD-ROM drives). The advantage of using Copy Machine to duplicate your data is that you have immediate access to the copies. Backup utilities generally compress data and require much more time for the restore processes. Copying a hard disk may require multiple target disks but Copy Machine automatically spans the target disk set, meaning that it keeps track of where one Target finishes and the next starts. 2) The Guest program is a portable driver that let you easily move your Zip drive from one computer to another without having to permanently install the driver. Just install Guest on a floppy disk and take it with you. 3) The Format tool allows you to erase or prepare a disk for new data. A short format is quick, but does not verify the disk surface. A long format (also called a low-level format or format with surface verify) prepares the entire disk and verifies the disk surface at the same time. 4) The Protect tool enables software protection for a Zip cartridge in a selected drive (it is grayed out as unavailable for all other drives and disks). As a replacement for the conventional write-protect tab on removable disks, this tool provides a wider variety of data protection options for Zip drive users. 5) Making a disk non-removable is sometimes required either by software installations to the disk, or by software running from the disk. This tool allows you to make a removable drive look like a hard drive to the system when necessary. 6) Status provides a quick and easy way to view the selected drive's type and current state of function. 7) and Parallel Port Accelerator is just

what it says it is.

What can you do with a Zip drive? How about low cost archiving with easy retrieval, file backup, temporary storage expansion, multimedia projects (which use large amounts of storage), libraries of images or databases which need not tie up regular disk storage, temporary holding areas for scanned or downloaded files, setup an easy filing system with one cartridge per course, research project, etc., easy to produce backup for secure storage of important files (no special backup software or knowledge required, no permanent device needed), portable mass storage for classroom use (easily attached to an existing classroom PC), transportation of an entire filing system between home and campus offices.

Your computer must have an available parallel port (LPT1) for connection, and be a 386 or better processor running either DOS or Windows (3.x or 95). Newer PC's provide high per-

Software Review

ABC Graphics Suite by Micrografx

Review by WilliamLaMartin, Tampa PC Users Group

I think that I have found a replacement for my aging *Corel Draw* and *Corel Photo Paint*. I have not upgraded to Corel 6.0 since the price is just too steep, and to be honest the previous version has been more than sufficient, doing what I wanted. Having used this package for some time I have managed to figure out how to do most anything I wanted with the it, using Photo Paint most of the time since the majority of my needs involve manipulating graphic images. But after acquiring *Micrografx's ABC Graphics suite,* which includes *Designer 6.0*, *Picture Publisher 6.0*, *ABC Flow Charter 6.0*, and *ABC Media Manager* I think Corel and the other graphic software publishers are in for some intensified competition--especially since this package has a street price of around $300 and a competitive upgrade price of $149.

I have worked for several years with the equivalent of Designer and Picture Publisher. I have no experience with a Flow charting program; however, having learned FORTRAN programming in the 1960's I am quite familiar with flow charts, since then we had to create a flow chart of the program before ever starting on it. It is amazing how I have been able in the intervening 25 years to get any programming done without first starting with a flow chart. Most probably only because what I do now is not all that complicated.

But back to *Micrografx ABC Graphics Suite*. First off, let me advise you of the most remarkable thing. Designer will import any Corel .CDR file through version 5. So all my previous work is right there at my disposal. This is the first program that I have seen that successfully does this--others have claimed to, but failed. For you who are not familiar with what you can do with a program like Designer consider the following simple card I made to go with gift for a neighbor who took care of our bunny while we were in Chicago recently. This is simply a collection of images relating to Chicago I picked from the Internet (another useful feature of the Internet) and inserted in *Micrografx Designer* while adding some text. Of course this is quite simple--no fancy, curved text or layered graphics--just something that I could produce in a few minutes. Unfortunately in the printed version of the newsletter none of the color is visible. For this you must retrieve the Adobe Acrobat version of the newsletter from either our BBS or our WWW Home Page.

The program in the Suite I will be using most frequently is *Picture Publisher* which allows you to retouch and manipulate graphics of all sorts. I have long been an amateur photographer, doing my own black and white darkroom work. And for the past twenty years have been making copies of old photographs of family, places and buildings. Some of those photographs, being damaged, were in need of repair. With a program like Photo Publisher and a scanner you can do that. And with my HP Laserjet 4 plus printing at 600 DPI I get fairly good reproductions. I look forward to the day that I can afford a 1200 DPI printer--and perhaps in the distant future a printer that will give near photographic results.

Picture Publisher allows you to obtain a graphic from either a file or by scanning. You can then manipulate its color, contrast, lightness or darkness. If is a little fuzzy you can "sharpen" it, or if you like such an effect you can make it more fuzzy. I particularly like the methods the program provides for accomplishing

(ABC.....Continued on page 7)

(ABC.....Continued from page 6)
these changes. For example, to change, say, the contrast and brightness of a photo, I simply use the mouse to move my cursor on a two dimensional grid situated next to the photo on the screen. As I move the cursor, for example, to the right, I can view real time changes in the photo as it becomes lighter. Moving the cursor in the vertical axis changes the contrast.

One of the most useful features of such a program is the ability to remove unwanted background objects from a photo. You do this by working with masks. There are about 5 different mask tools to use depending on which suits your purposes. If you have a uniform background that is a different color from what you want to keep you are in luck for you simply have to use the "magic wand" mask tool to click on the unwanted background and then fill the enclosed area with the color white. however, you will probably rarely encounter this lucky situation except when the software vendor is demonstrating the program for you. Most of my work is a bit more messy, and I am forced to use a more labor intensive masking tool to outline the unwanted background and then dispose of it. Most of the photos of members I have put in the newsletter in the past were cut from their backgrounds using such a method.

Of course, once you have cut out the unwanted background you then can add one you like. Remember our group officers Larry Anders and Wil Goble pictured in a past issue wondering whether there was enough money in the treasury to take a tour of Europe. Well with the help of Picture Publisher look what has happened. You don't need to travel to get those impressive photos of you in exotic places. You just need Picture

publisher, a photo of yourself, and one of the exotic places in question. And the *ABC Graphics Suite* CDs provide plenty of stock photos and clipart (30,000 plus clipart symbols).

I could take up the rest of the space in the newsletter just describing what you can do with Picture Publisher. As I said, it is the component I use most. My favorite editing tool is the cloning tool which allows you, by moving the cursor over an area of the image, to produce an exact copy of that area at a different location on the image that you have selected. Cloning is particularly useful in repairing damaged areas if you have a similar place on the image which is in good condition so that you may clone it. Or you may, as above, clone Kevan Sheridan's head onto Don Patzch's photo.

Now there is still more to *ABC Graphics Suite* than *Designer* and *Picture Publisher.* There are *ABC Flow Chart* (design flow charts and analyze performance), *ABC Media Manager* (organize and manage your graphic images), *Instant 3D* (create 3D images), the 30,000 + clipart library, and the seamless integration with *Microsoft Office Professional '95 Suite.* Obviously enough for another article.

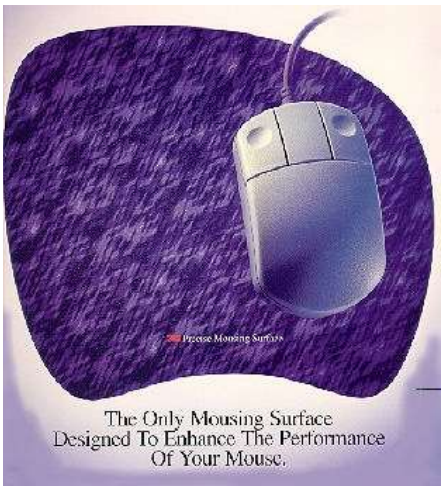
Although I am quite happy with and impressed by this Graphics package, it has one shortcoming—There is only a very slim manual to explain how things are done. The online help is good, but I do miss those fat paper manuals of old. ◆

(Minutes.....Continued from page 3)
certain that the local support is available. Even when purchasing a new unit, you may get home to find that it does not function. Local vendors may not have the capability of simply taking that unit back and giving you another from stock. Pat says you receive a response like, "Here is the manufacturers phone number and here is a packing box that you might have." We thank Pat for a very interesting presentation on laptops.

There was no drawing tonight. Door prizes will be carried over until next meeting. ◆

A Better Mouse Trap?

(don't throw that old mouse away, yet!)



Review by Larry Anders, Librarian
Tampa PC Users Group

Ever had that favorite mouse that you had to put on the shelf because you just couldn't get used to the pointer jumping all over your page? Well, I have, more than once. When Microsoft first came out with their ergonomic mouse I rushed out and bought one almost immediately. I'm on my third or fourth one now but none felt as solid as the first one. When the mouse first gets dirty its simple to remove the ball and clean everything out with a cotton swab and some alcohol. This works for a couple of times but after a while, especially with a track ball on a notebook, the alcohol and swab method doesn't seem to work anymore. Now Curtis, the makers of Rolodex, have a way to breath new life into those old mice. Their product is called *Clean Mouse.*

For approximately $10 you can get the *Clean Mouse* kit from your favorite computer store or office supply house that has all you need to bring those old mice back to life, assuming you didn't throw them away. The kit includes a couple of scrubbing balls that fit what they call standard mice, a Velcro like scrubbing desk pad, a bottle of cleaning solution and a lint-free cleaning cloth. All you have to do is remove the ball, squirt a few drops of cleaning solution on the scrubbing ball and insert the scrubbing ball into the empty mouse cavity. Pass the mouse over the Velcro scrubbing desk pad several times in light circular motions. Remove the scrubbing ball, blow into the empty cavity and wipe out with the lint-free cloth. I cleaned mine a couple of times because it had been sitting on the shelf for a couple of years. Did it work? I'm using it now as I write this article. I'd say it works pretty darn good!

After you've cleaned that old mouse with *Clean Mouse* from above, and want to keep it working in top notch form, take another trip to your favorite computer store and purchase 3M's *Precise Mousing Surface*. 3M has developed a microstructured, low-profiled work surface that will increase tracking control and aid in pinpoint mousing accuracy.

The first things you notice about the new mouse pad is its shape and how thin it is. The shape is designed to conform to your natural hand movements and it has no foam backing like a regular mouse pad. But if you could put this new pad under a microscope you would see what makes it really different. 3M had patented a network of micro peaks and valleys specifically designed to make your mouse move and perform better. They call it WYPIWYG: Where You Point Is Where You Go and say "this surface is specially engineered to provide the optimal coefficient of friction." I say "it makes the track ball grip just right."

Another benefit of this new shape and microstructural design is that it actually keeps the track ball cleaner. Because of the shape there is minimal hand contact with the pad which means less hand oil gets absorbed into the surface. What debris is left behind is pushed into the channels and not on the ball. Clean the new pad with a little alcohol and a lint-free cloth occasionally and that mouse should perform quite well for some time to come. This is probably the biggest improvement in computer mousing technology since the mouse itself!

did they install a slower chip than before or simply slow the one he had down.

In closing this section, let me note that there is one thing that you can't do on a 386 machine--no matter how patient you are: Run *Windows NT*. By design NT will only run on 486 machines or higher. At present we have loaded the newest Beta of NT 4.0 onto the new machine. The interface is very much *Windows 95*, but your control over the computing environment is much greater. I have done very little with it at present, but I did note that configuring NetCom as my Internet provider for NT seemed to be a lot less complicated than doing the same on a Win 95 machine. Additionally, all the programs we have so far installed, as well as printers, seem to be running fine under NT. My big hurdle right now is getting the HP Scanjet llcx scanner up and running on NT—not a trivial task I have read.

(Comments.....Continued on page 9)

(Zip.....Continued from page 4)
formance parallel ports that improve the speed of the Zip drive. The Zip drive includes an additional parallel port which permits you to simultaneously attach a printer or certain other devices that use the parallel port.

Specifications: 7 x 5 x 1.5 inches, weighs 1 pound, 29 millisecond seek time, up to 20 megabyte per minute transfer rate, quiet operation, powered by a supplied AC adapter, Example benchmark - copying a 1.25 megabyte file, conventional diskette drive, 100 seconds, Zip drive, 15 seconds, typical hard disk drive, 5 seconds.

Having one of these Zip drives is like having a hard disk upgrade, mobile storage and a backup drive all in one. And you get the drive, the software and one 100 MB cartridge for under $200.

Internet

Has the Internet taken over your computing life yet? If you let it , it will. Just like the computer itself would preempt everything else in the pre-Internet days. I know some of you have no interest, but an increasing number of our members seem to be signing on. Possibly starting out with online services like AOL and Prodigy, then moving to stand alone Internet providers after they see their online bill growing with their online time. Nowadays for $19.95 on average you get unlimited time on the Internet.

To me what is happening in computing with the Internet versus computing without the Internet today is similar to computing using Windows four or five years ago compared to computing using only DOS. I distinctly recall when I first joined the Tampa IBM PC Users Group (that was our name then) that most members didn't use the Windows operating system (3.0 at that time), and they didn't really see any need for it. In fact, they were a little hostile to it. Today, although most of our members are operating under Windows--most probably 3.1, since the majority has not yet upgraded to 95 to the best of my knowledge, only a minority is regularly using the World Wide Web (WWW).

But just as people moved from DOS to Windows when they saw the increase in productivity and ease of use it provided, I think they will embrace the WWW when its value to them is demonstrated. And with the addition of more and better Web sites each day with real content (not just a photo of the creator and his views on life), I think that will happen. Today people who before saw no need for computers are buying them so as to get on the Internet. And it is not just to download dirty pictures as our US Congress seems to think. They want to make contact with other people (e-mail and UseNet News groups) and gather information (WWW).

I use the Internet every day, usually sending or receiving about four e-mail messages, checking listings to see what new WWW pages might be out there, making sure our group's WWW home page is functioning OK, perhaps going to a computer vendor's site for upgrade or driver information and software, or reading some of the online news sources that I have bookmarked. For example I may receive a message from one of our members here in Tampa, a friend in Colorado, or a software vendor's user group representative in California. Then I may check the *Tampa Tribune's* site where most of the day's paper is on view, not to mention a current doppler weather radar image. If that is not enough news for me I can go to the *Washington Post's* site. By now I probably should get to doing something else, but perhaps just a quick visit to a new online art museum, history site, or genealogical site will not hurt too much.

So, if you are not connected yet., take my suggestion and give it a try. There is a lot of useful information out there just waiting to be found by you.

Our Group

I have been a member of the Tampa PC Users Group for four-and-one-half years. Initially I didn't expect to receive much of a benefit from joining, since I am a person who likes to solve problems on my own. But a neighbor who was in the group kept badgering me to attend, so I did and after the second meeting, joined. It has been worthwhile. I have been introduced to software that I didn't know I needed until someone demonstrated it at one of the meetings. I have even had solutions to a few of those problems (computer related) that I thought I could always figure out for myself provided by fellow members. But the most significant benefit has come since I started doing the newsletter.

I took over the production of the newsletter from Marylee Bruneau at the end of last year, since she said after doing it for several years she no longer had the time it required—and

Communications SIG

This SIG meets the first Monday of the month (Aug. 5) at 6 PM at the Reflectone Building. You must sign up to get on list and to get by security. See Microsoft Access SIG for directions to Reflectone. *Contact Charles Howe: at 968-1207 or HOWE@INTNET NET*

Genealogy SIG

This SIG normally meets the third Wednesday of the month. (Aug. 21) at 7:00 PM at a member's home.
Contact SIG Leader Jenny Lind Olin at 960-5723 for directions and RSVP.

Hardware: Logitech Marble

by William LaMartin, Tampa PC Users Group

Last month Charlie Howe described a new pointing device he had purchased, the Alps Electric GlidePoint, an alternative to the ubiquitous mouse. I, too, have decided to try out an alternative to the mouse.

After going through at least one mouse a year on my computer, and changing a little less frequently on the other computers in the house, I came to the conclusion I ought to at least try another design. What was happening was that the mouse would get so that to make a movement, say to the left, you had to give it a jerk instead of a smooth push. Movement in other directions was usually OK. Furthermore, all the cleaning and compressed air blowing provided very little improvement. In the past the solution was a new mouse--and not a cheap one (they were a guaranteed failure)--a Microsoft Mouse. I didn't know about the mouse cleaner described by Larry Anders earlier.

This last time, though, I decided to go with the Logitech Marble which the fellow from BCD computing demonstrated at one of our meetings late in 1995. It is not cheap, costing around $90. This is not a normal trackball. There are no mechanical linkages; the movements of the ball (marble) are tracked by light. So there is less chance of problems as with a mouse or trackball. Additionally it takes up less space than a mouse since the device does not move. Ask me a year from now how well it is working. So far so good. ◆

(Comments.....Continued from page 9)
someone had better take over or there wouldn't be a newsletter. Since no one else who had the requisite computer hardware volunteered, I said I would give it a try. To do the job correctly, you need a 600 DPI laser printer and a scanner. Additionally the editor needs to have a familiarity with some graphics program and a word processing and/or desktop publishing program. Being familiar with the BBS so as to receive articles posted there by members was also helpful (now e-mail is also satisfying that function). The shoe fit so I decided to wear it. And I have learned a lot. I have honed my graphics skills and my desktop publishing skills—and surprisingly my database skills, since I also keep the list of members and have to perform all sorts of queries and reports to keep up the mailing list and prepare the newsletter for bulk mailing.

Unfortunately I have also honed my stapling and folding skills. Ed Snow helps me prepare the newsletter for mailing, but we could use one more individual who has a very flexible schedule and can come to South Tampa on short notice once a month during a morning. More importantly I need some more content providers. This issue, you will note, consists of mostly Larry Anders and myself doing the writing. I know that you are buying programs and hardware, using them, and forming opinions about them. So, give it a try; tell us about them. That is the purpose of the group: To share ideas and information.

Right now just a few of us are carrying the load. Help us out. I think you will find, as I have with the newsletter, that your contribution will help you as much as it does the group. So, write a newsletter article, do a presentation or suggest a presenter and topic, suggest a SIG topic and lead such a group, attend the monthly meetings.

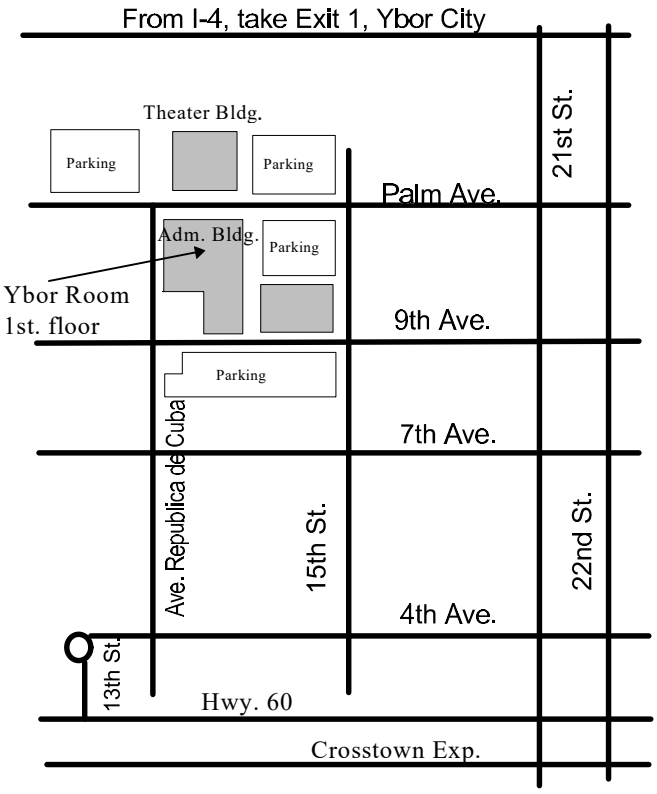
MEMBERS HELP-LINE



The following phone list is provided for our Tampa PC Users Group members in an effort to establish local support for those frustrating times which we have all encountered while using our PC's. Please note that these are members that have volunteered to help you; treat them in a courteous manner. Be sure to ask if it is convenient for them to help you now, or if you should call another time. It would also be helpful to have your documentation and have it handy when you call. (Don 't expect help if your software is an illegal copy or you do not have documentation!) TPCUG is not responsible for the information or advice provided by volunteers. Volunteers may or may not be experts in the subject matter. You are on your own with any advice received. Be aware also that some of these volunteers may be consultants in their area ofexpertise. If you are interested in volunteering to answer members questions, either leave a message on the BBS or fill in the forms provided for this purpose at the meetings.

Comments.....Continued from page 10)

Regarding the meetings, our attendance is off a good bit, and most people attribute that to our moving from the IBM location to the HCC Ybor site along with a drop off in the frequency of big name presenters. The officers, as best we can, are working on solving these two problems. However, this will take time and is sort of a chicken and egg problem: It is hard to get big name vendors with a small attendance, and it is hard to have a large attendance without such a presenter. So help out here—attend the meetings regularly, and the vendors will follow. Let's start now so that by the October meeting when Micrografx comes we will be back on track with a full house. ◆

Computer Hell……..and more hell

by William LaMartin, Editor, Tampa PC Users Group, Inc.

……and more hell

Until today, the last day of August I really questioned my ability to put together a newsletter for September and get it in your mail box (local to the Tampa area only—not bulk mail to California) before the September meeting. I, with my family, was in Virginia for eight days getting my son settled in college and doing the tourist thing—which included a lot of walking and standing. The past five days I have been recovering from all that walking, standing, and sitting in a car for 2000 plus miles. Needless to say sciatic nerve problems are not a new thing to many of you. And they are not new to me—only the severity of this case was new. I literally was not able to sit in a chair for more than a couple of minutes at a time, which sort of limits my ability to use a standard computer setup. Well, I finally found an orthopedic surgeon who could see me (no small feat) and am on my way to recovery.

Computer Hell: Windows NT and the NYB Virus

Windows NT. As you may recall, last month I mentioned that we were running Windows NT Server 4.0 beta 2 on the new machine and everything seemed to be going well except for getting the sound card and the scanner installed. I was impressed by some of its features, but felt that it wasn't yet meant for home use and didn't look

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if it is not received on time.

Members may insert non-commercial ads at no charge with the following imitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

SECRETARY'S REPORT & MINUTES OF MEETING August 14, 1996

Minutes and Comments by Bruce Register, Secretary

President Connie Kincaid called the meeting to order and introduced officers present.

Connie announced the upcoming SIG schedule. No Genealogy SIG in August; will resume in September; 1st Wednesday after regular TPCUG meeting. Communication SIG for first Monday in September is canceled due to Labor Day Holiday; it will resume 1st Monday in October. ACCESS SIG will be held August 22 as scheduled: first Thursday after the regular TPCUG meeting. (Watch for other SIG announcements)
Connie announced that nominations for officers for 1997 will be received at the November meeting with election to follow in December. She asked members to be considering nominees for offices. Present officers are listed in the front of BITS OF BLUE newsletter.

Connie announced that Police Athletic League needs some volunteers to assist with salvaging and setting up the equipment that the members of TPCUG donated to them to use in their youth program. They are trying desperately to salvage our youth in a positive way.

October 9, 1996: Regular TPCUG meeting with presentation by Micrografx. At the September 11 meeting Wil Goble will have his magic camera ready to take images of anyone who desires. Just bring a 3.5 floppy so it can be downloaded on your floppy. Take those self images home or work and use them however you desire. Make Christmas cards, newsletters, family communication, etc. from your very own disk. DO NOT FORGET TO BRING DISK.

The November meeting will be the nominations meeting AND a presentation of Christmas Shopping in the computer world for yourself or gifts. We have always enjoyed the presentations of the state of the art in hardware, software and direction trends.

The December meeting will be the BARGAIN TABLE. Hindsight is poor excuse for foresight; many people have said that they needed some of the items that were at our last bargain table. What was left was GIVEN to PAL. In fact, there was so much in hardware, software, etc., that President Connie

(Minutes.....Continued on page 3)

(Minutes.....Continued from page 2)
announced, "If you have bought something already from the table, you may pick out what you want for just $1." Can you believe software one or two versions old for just $1. Do not miss out...Oh yes, uh, uh, uh, we need your donations of software (unregistered, to be legal), hardware or whatever or we cannot have a bargain table. We upgraded our hard drive with proceeds from the bargain table CONTRIBUTIONS and the door prize CONTRIBUTIONS.

VOLUNTEERS! HELP! Connie asked for volunteers to help do a number of tasks for the good of TPCUG. Many times people want to help and will jump in if asked. What is difficult is that the leaders may not know who is willing or who to ask individually. Thus, Connie asked that all who will, let her or Mike Hodges, or William LaMartin, or other officers, know that you will be available. Ed Snow has contributed immeasurably in helping get the newsletter out each month.

President Connie Kincaid giving the photographer the evil eye

Seniors. Don Patzsch mentioned that USF has programs for senior citizens. "Over 60 get free pass (library card), cost is $50 if not a senior. Also at USF, senior citizens get Tampa Tribune for $60 per year. (Don Patzsch is a compendium of knowledge about many things....Secretary)

MEMORY BEWARE! Memory has gotten down to like $10 per M. A local supplier offered 4M for $29.95 recently. They are reputable. However, a member at the meeting warned us to beware of the memory that you purchase for a bargain and not from a reputable company. It was stated "A local company is selling memory that is not true parity memory but they imply that it is true parity. Get true parity memory."

PRESENTATION: Arup Chakraverty

Arup came prepared to discuss Windows NT 4.0, but we sort of messed him up. We were to have the computer on hand with that program loaded. A glitch occurred in the loading of NT so we had to ask him to change his presentation on site.

(Minutes.....Continued on page 7)

(Comments.....Continued from page 1)
forward to fighting with the scanner or sound card, and mainly didn't look forward to having to pay the price of using NT when the beta expired in six months. I already owned several copies of Windows 95, which I was fairly well satisfied with—especially the hardware plug and play that NT did not support. So since it had been mainly an experiment for my son, and since he had decided to leave me the new computer when he went to college and only take the laptop, it was back to Windows 95. **And there is where the trouble began** (if you don't count configuring the computer for NT, reinstalling the programs I needed to use and bringing my data back when we changed to NT in the first place).

You can't format what you can't find I can't retrace the exact steps that were taken in replacing NT with 95, since I left that to my son. Because the 2.5 GB hard drive was portioned into a 2 GB C drive containing the operating system and a .5 GB D drive where I kept my data, I suspect he simply reformatted the C drive and installed Windows 95 there. After installing 95, we then proceeded to reinstall all the programs I wanted to use. While doing this we noted that something was missing—there was no D drive. DOS showed that there was a drive called D, but could tell us nothing else about it (for example it had no idea of the contents of drive D which contained all my data). OOPS! The D drive was still formatted with the Windows NT file system NTFS. Well, that should be simple to fix, just reformat the drive (destroying my data). However, DOS wouldn't do that. It listed drive D by name, but didn't consider it a drive that it had any control over. We were locked out by the Windows NT file security. OK, all the data was backed up—well at least most of it—so why not just remove that partition using FDISK to regain my .5 GB of disk space. No good. You can't use a DOS FDISK to move NTFS partitions.

Time to call Gateway. The computer and Windows 95 had just come from Gateway, so I thought I had some hold over them. It was 10:00 PM here in Tampa, but they were still at work wherever their technical help lives, and I got quick attention. The tech representative worked very hard on the problem, but every suggestion he had produced nothing. After over an hour he said to let him research the problem some more, and he would have someone else who was better versed in NT problems call us tomorrow. He was a man of his word. They called us the next day—**at 1:00AM**. Well, you can't look a gift horse in the mouth, so we took in the latest cure. It was simply to use Windows NT's FDISK program instead of the DOS version. Unfortunately I couldn't find such a program anywhere on the NT CD-ROM.

Partition Magic to the Rescue. I was beginning to feel a little sick. I could still use the computer, but I had .5 GB of my hard drive that was unrecoverable, and it contained my

(Comments.....Continued on page 8)

FIRST AID 95 DELUXE

Review by Larry Anders, Librarian
Tampa P C Users Group

I have reviewed many software titles during my tenure as Librarian but I have NEVER experienced a bigger waste of money than First Aid 95 Deluxe. I find it hard to believe that CyberMedia can get away with marketing a product of this caliber. What suprises me are the rave reviews on the inside of the box, especially from Windows Magazine that said "First Aid will kiss your desk-top bruises away."

I tried this software package on two different computers to be fair but had exactly the same results on both. I was having problems with both computers and was hoping that First Aid would help me out. All it did was help me out with a review for this month's newsletter.

What it is supposed to do is fix application configuration and setup problems. Fix multimedia by repairing mismatched drivers and setup problems with the most popular sound cards and CD-ROMS. Correct communication problems with accessing the Internet, other on-line services and networks. Check INI files and Windows 95 Registry for invalid entries and repair them. Intercept crashes and General Protection Faults (GPFs) before your work is lost and let you recover from them (HA!). Recover disk space by removing and archiving unused features of supported applications. Roll-back to previous working versions of programs when something doesn't work right. Creates an emergency disk that restores your PC if your CMOS battery dies. Automatically connects to vendor WEB sites on the Internet to get tips and help and download the latest bug fixes and driver updates (HA! HA!). Keeps itself current by downloading updates and new knowledge modules to support new applications.

It says it will:

- Make your life with PCs easier
- Correct over 10,000 known problems and keep your PC conflict free
- Take the risk out of adding new programs and cards
- Surf the Internet for help, current drivers and the latest remedies
- Be your full-time 24 hour per day technical support expert

It comes with versions for Windows 3.11 and Windows 95 operating on at least a 386 or higher, 4 MB RAM minimum, 10 MB hard drive space and VGA or higher monitor. I installed it on a Pentium 133 and a 486/66 with much higher than minimum requirements and had nothing but trouble. It all started shortly after installation on the 133 when First Aid COULD NOT find the file to launch itself. It diagnosed the problem well and told me it could not run so I set the shortcut up myself. During installation it asked for the serial number and tells you that it can be found on the registration card, but it wasn't. The serial number was on the CD-ROM. When it set itself up for Internet access it defaulted to the dial-up scripting built-in to Windows 95 that I DO NOT use NOR could I change. I contacted CyberMedia via the Internet and explained the situation and I am still waiting for an answer. (That was over 30 days ago and I don't really expect an answer.) So I forgot about Internet access. When I ran the diagnostics for the first time it told me that some of my problems were because certain files were missing out of specific folders (sub-directories). But when I checked out the folders the files First Aid said were missing were all there where they were suppose to be.

With First Aid running in the background, it would occasionally pop-up and say that there was a problem and asked if I would like it to A*utoFix* the problem. I answered *yes* every time and the computer would come back and say "Windows cannot start more than one copy of this program at one time" or the system would just freeze-up. (And its not easy to get Windows 95 to totally lock-up on you.) It not only could not diagnose my problems but when I would try to print explanations after a problem I would have print spool problems and my system would totally lock-up again.

When I finally decided that I had had enough and used the uninstaller program that came with First Aid, First Aid came back and asked me where it was installed. Am I nuts or do you think that's kind of strange too? It asked me where it was installed. At that point I started CleanSweep 95 and uninstalled it with a program that I KNOW works. I then installed First Aid on my 486/66 with basically the same scenario, but it didn't take as long before I invoked CleanSweep 95 and got rid of it.

First Aid 95 Deluxe sells for a street price of $50. Save your

Software Review

Automap Road Atlas
by Microsoft

Review by Don Patzsch, Tampa PC Users Group

This is the first time I have ever received a program to review, and with it a review that I can rewrite as "my" review.

I think that providing a "review" of a program is a good idea. More people are likely to read and follow the review than are likely to read and follow any manual.

If you would like to have a "fun" program, this may be what you want. It is easy to load into your computer, and it is easy and friendly to set up and to use. I asked the program to show me where I live, and it promptly provided a small map of Brandon, that included the place where I live. It also placed an x in red color right on the block where I live. If you wanted to send this to a friend from out of town, this would make a neat way to give instructions on how to find your home.

To start from a logical beginning, the program comes on a CD Rom. When you load it, it requires 6.2 MB on your hard disk, and it makes a directory called USA.MAP on the drive. That seems like a neat name to me. I have not used a period in a directory name before.

The program starts with an automobile on a road and appropriate music. There are two icons at the bottom of the screen. Choose "Display Automap Road Atlas" and you will be presented with a map of the United States, with many cities and roads. There is a second icon named "Plan a Trip Using Route Wizard". Bringing up Route Wizard gives you a screen with a place to list the city or location you want to visit.

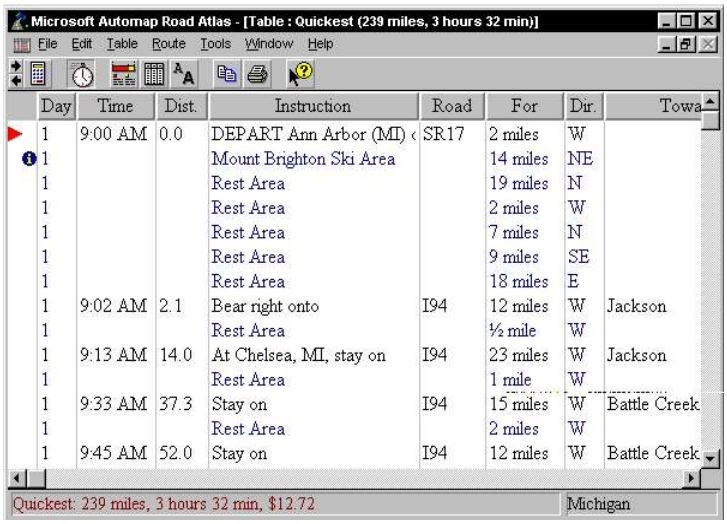
You can view an online demonstration of this program by going to the WWW site http://www.microsoft.com/automap/default.htm

Now you start into the real program. You are first asked, "where are you?". I listed Tampa, FL. Then you are asked "where do you wish to go?". I listed Charleston SC. You are then asked if you want to stop along the way; I listed Savannah GA as a place to stop. Then you are asked for various places of interest you might want to know about along the way, Airports, Land Features, Cities or State information, Parks, etc. This is one neat feature. Next you are asked about how many hours a day you like to drive, example, 9 A.M. to 6 P.M. Now it is up to you to put in some needed information. How much does gasoline cost for your vehicle? What is the capacity of your tank? How fast do you plan to drive? and so on.

You are asked about whether you would like the shortest route, the quickest route, or do you want to select back roads yourself? Another nice feature. Now you click on Finish. You are then presented with three screens in one. You can see each town you will pass through, and you are told which roads to turn onto, and you are given a map of the whole distance. Each item on a separate window so you can page back and forth to see your time of arrival, your total trip time, and all sorts of other details like when you should stop to refuel, etc. This program will give you a great deal of information that you might forget to include in your thinking about when and how to make the drive. It gives you the days needed to make the trip, at the speeds you said you wanted to travel, etc. If you click on any place on the map of your trip, it outlines that description line in red, on the word description of your trip. I happened to click on a place and the red appeared at the time I needed to stop and refuel. Thus before you leave you can guess where you want to buy gasoline. This is one of the nicest and easiest to use programs.

A routing map example from the Road Atlas WWW Demonstration

There is one thing that this program does not cover. We belong to the AAA and have found that in many years the savings we make are more than the cost of the membership. Example, when we rented a car in California last month, the AAA suggested that I use my gold credit card, rather than adding the cost of insurance to the cost of the rented car. I called AT&T and spent some time with the girl who told me that they cover me for fifteen days. We planned on renting the car for fourteen days, so we were covered there. However, some insurance companies do not cover theft in California, so I asked about that. I was assured that I was covered. So that saved us a considerable amount of



(Atlas.....Continued on page 7)

(Atlas.....Continued from page 6)

money. I had forgotten about the coverage provided by a gold credit card.

We go to the AAA to have them advise about the route we take, if we are going to drive. The reason is that they often have up to the minute information on such things as speed traps, road construction, and unusual things that we might experience along the way. A program like Automap Road Atlas can't include this type of information, obviously.

One last thing. If you have children, and they are small, this might be a terrific way to introduce them to the study of geography. There are the sounds and action of the leadin, and there are the places named and the roads laid out from one location to another. I think this would lead to lots of fun with kids, and I do not wish to minimize the actual value of the program for the program's sake. This is just an added gem.

a routing time table from the Road Atlas WWW demonsotration

The price is about $40, it is from the HOME collection of Microsoft. I am sure you can find it at any of the computer stores that handle software.

Once again, I would like to thank the Tampa Group for giving me the chance to review and, of course, keep a program such as Microsoft's Automap Road Atlas, version 4.00 for windows.

More of you should take William LaMartin up on his offers of software for review!
Note: I did not look at the review that came with the program, probably I should have! ◆

(Minutes.....Continued from page 3)

He did a beautiful transition as he is very knowledgeable of Win95 and NT. The audience questions demonstrated much interest. He proved worth of the challenge.

NT was primarily designed for business network users and was not designed for home use. Some say that NT does so much more than Win95 but that the expense for the relative difference is not generally feasible to the average user. He explained the differences in the NT 3.51 and the NT 4.0. There seemed to be a consensus of audience participants in the belief that Win95 is an interim system as Mr. Gates moves us to the NT system. Arup expressed a feeling that 16 bit applications will, maybe, become obsolete in a couple of years as 32 bit becomes more acceptable and as the state of the art reaches the average user. You can download a list of bugs and solutions for NT from Microsoft on the net. When you purchase NT server, you must also buy license for each workstation.

Miscellaneous thoughts were expressed: If you leave your machine on to receive faxes, you can turn off the monitor and printer unless your fax goes directly to the printer. When you turn on your system, whatever system you use, turn on the printer before turning on your machine. That way the computer finds your hardware and does what it needs to as it boots. If you run Progman you get 3.1 program manager in Win95. He mentioned something about "regedit" (your secretary—who is writing this— is too computer illiterate to understand this) opening a registry but said be really careful because you can mess up badly if you try to alter the registry. Unfortunately for you, the reader, so much was said so quickly that the secretary could not keep up with the note taking. Comments that your secretary heard after the meeting were of delight. Arup answered simple questions in understandable terms and did likewise for the advance questions. We really have some computer educated members in TPCUG as was indicative of the audience participation. Thanks Arup for the great presentation. Prize winners were:

Francis Cape	Excel 4.0
Jim Archer	Quicken 95
Fred Buss	Kiplingers Cash Money

Congratulations!

BRING YOUR 3.5 FLOPPY FOR YOUR PERSONAL IMAGE (PHOTO)!!! ◆

(Comments.....Continued from page 3)
data, which I could recover—but with a lot of time spent on re-transferring it. Most of you probably think that you can remove anything from your hard drive simply by reformatting—well, think again. Another example, I believe, of what you can't remove by a simple reformat is the Dynamic Drive Overlay that the On Track Disk Management System puts on your hard drive when you install one of these large hard drives in an older computer without LBA to trick the BIOS into accepting the hard drive. But here, if I am not mistaken, this can be removed from the hard drive using the DOS FDISK.

What to try next? Being a faithful reader of Bits of Blue I had heard about the program Partition Magic from Power Quest which allows you to move partitions at will without losing data and having to reformat as with FDISK. But would it work with a NTFS partition? To find out I simply went on the WWW, found the Partition Magic site and read their literature. I found that I could move NTFS partitions, but could I delete them? The only way to find out was to get the program and give it a try.

Partition Magic recognized the partition as an NTFS one, it then allowed me to delete it, and to finally create a DOS partition in its place. Unfortunately, I did lose my data on the D drive (I still had the backup) since the partition was deleted. But, at least, I had my .5 GB back as usable disk space. And I again filled it with data.

After reinstalling windows 95 and many of my applications, I still had a few more that were absolutely necessary for my daily computing. One was my Web browser Microsoft Internet Explorer. Since Windows 95 installed Microsoft Internet Explorer 2.0 when it was installed, I already had a browser, but I wanted the latest version, so that meant going to Microsoft on the web and downloading the file misie30b2.exe to get the beta 2 version of Internet Explorer 3.0. I believe I downloaded it from one of the Washington DC locations, and had it install itself over the older version. Either just after the installation or upon rebooting the first time following the installation, I received the message "A program has altered the Master Boot Record" Ouch! That didn't look good, but all I had done was what I just described. Certainly no serious harm could come from a Microsoft installation. And everything did seem to go OK.

Computer Hell returns. A couple days later I couldn't find my CD-ROM, i.e. Drive E had disappeared. When the computer booted, the BIOS found it, but as far as Windows 95 was concerned drive E didn't exist. Again what to do? The general rule is to not panic and to try and think your way out of such situations. I looked in the literature that came with the computer, and it mentioned something about installing drivers for the CD. But I knew that shouldn't be necessary in Win 95 as it had been in Windows 3.1. In fact the CD had been getting along just fine without drivers a few days back. Well, it wouldn't hurt to try, so I installed the DOS drivers for the CD and got my CD-ROM drive listed again. Of course this wasn't ideal since using these drivers degraded the computer's performance (as Win 95's device manager informed me). Oh, well, this really was Gateway's problem. Hadn't I already returned the CD-ROM drive that came with the computer because it had started screeching (I called Gateway at 3:00PM and I had a new CD-ROM drive via Federal Express by 9:30 the next morning)?

Gateway to the rescue. So a second Gateway technical support call got me a fellow who really had a handle on my problem. He had me make a few quick checks regarding settings and memory available for DOS programs, etc. and told me I had a boot sector virus called the NYB virus (for New York Beauty also called the B1 virus). Further he stated that there was only one program that would remove the virus, and it was called InVircible and could be gotten from the home page of Vine Computer industry. Only one program of all the well-know anti-virus programs that would do that job? That is what he said.

Needless to say I beat a quick path to the site http://invircible.com/ and downloaded the InVircible program. This is not a full featured version, but after some time trying to figure out the online instructions I was able to use the program to good effect and plan on buying the full version after contacting the author and getting a few questions answered. The first thing the program told me was that I had a boot sector virus, and then it went on to list the many, many programs on my drive that had been 'piggybacked". The program could now clean up these files, but that would be a waste of time, since, as I understand it, you can completely reformat the drive, and the boot sector virus will still be there since it is in memory while the computer is turned on. The only way out of this is to have InVirsible make a rescue disk—preferably before you have an infection, but I had no choice here—and then boot the computer from this disk and let the program do its work. I did this, and the next time I booted from the hard drive I had my CD-ROM drive listed again. InVirsible had saved the day. Also every time I boot up, I am informed of any changes in binary-executable files since InVirsible was last run. So I also get continuing virus protection.

InVirsible seems to be a very good and unfortunately necessary program. So, go to the InVirsible site and read all the press clippings about the program. The program seems quite impressive—especially when compared with the better known commercial anti-virus programs. It certainly saved the day for me.

Hell is relative My problems, however, were not quite over. I had installed the Microsoft Office Professional Suite, but

(Comments.....Continued on page 9)

(Comments.....Continued from page 8)
had not yet run Excel. And the first time I started Excel a very strange thing happened. Excel opened up not the usual single worksheet, it opened up 249 such sheets and refused to allow me to enter the program. By now I was getting to be an old hand at such problems. Compared to what had already happened to me, this was child's play, and I was able to handle it myself.

I went to one of the other computers in the house with the same program on it and opened Excel; everything went OK. What was the difference? I went back to the new computer, un-installed Excel and reinstalled it. The same problem occurred. Did I have another virus? A little more thought led me to look at the Excel startup directory. There were two additional files in that directory on the new computer than in the directory on the old computer. I removed those two extra files, one of which was a macro, and Excel ran just fine. So we have another marco virus similar to the one for Word. Where did it come from? I don't know, and I don't have the energy at this point to try and find out.

For five years since moving from Apple to the IBM format I have been virus free, then in the period of one month I get two separate viruses. Looks like my carefree days are over, and I must now start screening for viruses. Microsoft Is the last place I expected to get a virus, but I am quite sure that is where the boot sector virus originated. Unfortunately I could figure no way to notify them of this through e-mail, and now with the introduction of Internet Explorer 3.0 in final form the offending file is no longer available, so I guess the problem is over. Over, except for anyone who has the virus on their computer still. Where the Excel virus came from, I don't know. Possibly I got it at the same time. It was probably the most benign type of virus that you could get.

I don't need many more months like August 1996. ◆

Members please send your e-mail adress to the editor at lamartin@ix.netcom.com so that it can be added to the group's database

Political Computer Viruses

discovered & submitted by TPCUG member James Kalshoven

PAT BUCHANAN VIRUS:
Your system works fine, but it complains loudly about foreign software.

COLIN POWELL VIRUS:
Makes its presence known, but doesn't do anything. Secretly, you wish it would.

HILLARY CLINTON VIRUS:
Files disappear, only to reappear mysteriously a year later, in another directory.

O.J. SIMPSON VIRUS:
You know it's guilty of trashing your system, but you just can't prove it.

BOB DOLE VIRUS:
Could be virulent, but it's been around too long to be much of a threat.

STEVE FORBES VIRUS:
All files are reported as the same size.

PAUL REVERE VIRUS:
This revolutionary virus does not horse around. It warns you of impending hard disk attack: Once, if by LAN; twice if by C.

POLITICALLY CORRECT VIRUS:
Never identifies itself as a "virus", but instead refers to itself as an "electronic micro-organism."

ROSS PEROT VIRUS:
Activates every component in your system, just before the whole thing quits.

TED TURNER VIRUS:
Colorizes your monochrome monitor.

(Viruses.....Continued on page 10)

Special Interest Groups

Microsoft Access SIG

This SIG Meets on the 3rd Thursday of the month (**Sept. 19**) at 6:00 PM at the Reflectone Building. Directions: Proceed west on Waters from N. Dale Mabry across the railroad tracks (which is about 1 and l/2 miles), take second left on Savarese (United Technologies bldg. is just beyond it). Proceed on Savarese until you reach the Reflectone bldg. Take the North door. If you need to ask directions, there is a security guard at the location. PLEASE SIGN IN WITH A SIG LEADER
For more information call Connie Kincaid - 661-8185 - Leave a Message.

Communications SIG

This SIG meets the first Monday of the month at 6 PM at the Reflectone Building. **No September meeting.** You must sign up to get on list and to get by security. See Microsoft Access SIG for directions to Reflectone. *Contact Charles Howe: at 968-1207 or HOWE@INTNET NET*

Genealogy SIG

This SIG normally meets the third Wednesday of the month. at 7:00 PM at a member's home. **September 18 is next meeting.** *Contact SIG Leader Jenny Lind Olin at 960-5723 for directions and RSVP.*

(Viruses.....Continued from page 9)

DAN QUAYLE VIRUS:
Their is sumthing rong with your komputer, but ewe cant figy-our outt watt!

GOVERNMENT ECONOMIST VIRUS:
Nothing works, but all your diagnostic software says everything is fine.

NEW WORLD ORDER VIRUS:
Probably harmless, but it makes a lot of people really mad just thinking about it.

FEDERAL BUREAUCRAT VIRUS:
Divides your hard disk into hundreds of little units, each of which does practically nothing, but all of which claim to be the most important part of your computer.

GALLUP VIRUS:
Sixty percent of the PC's infected will lose 30 percent of their data 14 percent of the time (plus or minus a 3.5 percent margin of error).

TEXAS VIRUS:
Makes sure that it's bigger than any other file.

ADAM AND EVE VIRUS:
Takes a couple bytes out of your Apple.

CONGRESSIONAL VIRUS:
The computer locks up, and the screen splits in half with the same message appearing on each side of the screen. The message says that the blame for the gridlock is caused by the other side.

AIRLINE LUGGAGE VIRUS:
You're in Dallas, but your data is in Singapore.

FREUDIAN VIRUS:
Your computer becomes obsessed with marrying its own motherboard.

PBS VIRUS:
Your programs stop every few minutes to ask for money.

ELVIS VIRUS:
Your computer gets fat, slow, and lazy, then self destructs only to resurface at shopping malls and service stations across rural America.

OLLIE NORTH VIRUS:
Causes your printer to become a paper shredder.

NIKE VIRUS:
Just does it.

SEARS VIRUS:
Your data won't appear unless you buy new cables, power supply, and a set of shocks.

JIMMY HOFFA VIRUS:
Your programs can never be found again.

KEVORKIAN VIRUS:
Helps your computer shut down as an act of mercy.

STAR TREK VIRUS:
Invades your system in places where no virus has gone before.

HEALTH CARE VIRUS:
Tests your system for a day, finds nothing wrong, and sends

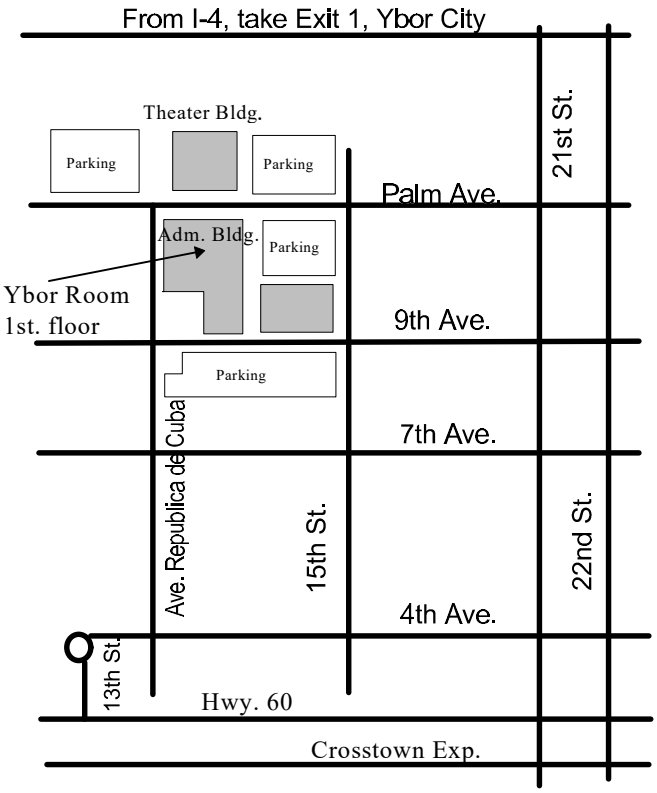
MEMBERS HELP-LINE



The following phone list is provided for our Tampa PC Users Group members in an effort to establish local support for those frustrating times which we have all encountered while using our PC's. Please note that these are members that have volunteered to help you; treat them in a courteous manner. Be sure to ask if it is convenient for them to help you now, or if you should call another time. It would also be helpful to have your documentation and have it handy when you call. (Don 't expect help if your software is an illegal copy or you do not have documentation!) TPCUG is not responsible for the information or advice provided by volunteers. Volunteers may or may not be experts in the subject matter. You are on your own with any advice received. Be aware also that some of these volunteers may be consultants in their area ofexpertise. If you are interested in volunteering to answer members questions, either leave a message on the BBS or fill in the forms provided for this purpose at the meetings.

Not Much Writing Needed

by William LaMartin, Editor, Tampa PC Users Group, Inc.

Thanks to the sudden outpouring of material from our members I don't need to add much myself this month to fill out the newsletter. In fact I probably have more material than the remaining space allows. It's nice to have some additional help. Keep it coming!

Micrografx will be doing the presentation this month. This is the first presentation in some time we have had given by a national vendor, so I encourage you to attend. Since I am the one who asked them, show that you would like more such presentations by your attendance, and I will see what can be arranged for the future. I have enjoyed the presentations by local vendors, computer experts, and our own members, but there is always a little something extra that the presence of a name-brand vendor provides.

Check out our World Wide Web home page. The address is http://www.tbos2cla.com/tpcug/. I have made a good number of additions. Now added are maps of the regular meeting site and the Reflectone site, an Announcements page, and all of the newsletter articles and commentary dating back to March in HTML format. This last item means that you do not have to download and read the individual newsletters with the Adobe Acrobat reader to get the material in the separate articles. However, if you want to see the graphics, Secretary's Report, and a few other items you will still need to read the entire newsletter.

In the space that remains, let me describe latest hot software. If you

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members. Our mailing address is P. O. Box 3492, Tampa, FL 33601-3492.

However, for business concerning this newsletter, Bits of Blue, please contact the Editor, William LaMartin, at 821 S. Boulevard, Tampa, FL 33606-2904; 813-251-3817; lamartin@ix.netcom.com.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII, Microsoft Write, Microsoft Word, or Word Perfect file to the editor at 821 S. Boulevard, Tampa, Florida 33606-2904 or upload to the BBS (News section of FILES).

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

The use of trademarked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if it is not received on time.

Members may insert non-commercial ads at no charge with the following imitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

SECRETARY'S REPORT & MINUTES OF MEETING September 11, 1996

Minutes and Comments by Bruce Register, Secretary

President Connie Kincaid called the meeting to order and introduced officers present. She welcomed visitors: Steve Martin, Lucille Piekenbrock, Brian Payne, Ed Bryan, Ken Boyd, Jim Alters, and John Sims.

William LaMartin has most laboriously created the TPCUG Home Page. Thank you William. http://www.tbos2cla.com/tpcug/ Go to your Home Page. You will like it and will also be proud of an organization that is on the cutting edge!

Connie announced the upcoming SIG schedule. See page 10 of this newsletter for details.

Connie announced that nominations for officers for 1997 will be received at the November meeting with election to follow in December. She asked members to be considering nominees for offices. Nominations will be accepted from the floor; be sure that your nominee has agreed to dedicated service. Nominations committee composed of the Board of Directors will present a slate. Present officers are listed in the front of BITS OF BLUE newsletter.

Micrografx (See review by William LaMartin in past issue of newsletter or download from TPCUG Home Page) will present the program on October 9, 1996. The November meeting will be the nominations meeting AND a presentation by REGNIS COMPUTER of Christmas Shopping in the computer world for your own self or gifts. December is SWAP MEET AND BARGAIN TABLE. The December meeting will give YOU THE MEMBER the chance to sell, bargain, negotiate, wheel and deal with your own treasures for a small table donation ($5). PLUS! Those who just want to donate treasures to TPCUG are encouraged to do so also. We need your donations of software (unregistered, to be legal), hardware or whatever for the bargain table.

VOLUNTEERS! HELP! Connie asked for volunteers to help do a number of tasks for the good of TPCUG. Many times people want to help and will jump in if asked. What is difficult is that the leaders may not know who is willing or whom to ask individually. IF YOU WILL HELP IF ASKED, please put your name on a card and give it to one of the officers at

(Minutes.....Continued on page 3)

(Minutes.....Continued from page 2)
the meeting. Ed Snow, joined last month by Fred Buss, has been helping William LaMartin get the newsletter to you each month...after William has spent hours producing it. Thanks to all of you .

LOOK for "ASK PC WILLY" in this issue of the BITS OF BLUE newsletter. To get your question answered and printed, post your question on the BBS to Wil Goble...the Ask PC Willy address will be set up on the BBS at a future date by the SYSOP.

Wil Goble presented QuickCam Video Capture. Many expressed surprise and joy at seeing this piece of hardware that works so well and so cheaply. About $100. The photo eye sits on your computer or wherever the cord will reach to capture images or series of images. This little camera draws its power from the keyboard connection with the small connection adapter that comes with it. Wil demonstrated that the quality is better if you view or send it ½ or 1/3 screen size. Ford Bond stated that there is a talking and picture version which permits talking and picture transmission and reception. Wil says you can use it on the net. (Your Secretary can't wait to view grandchildren in their own home...cooking, smiling or whatever.) Wil says for about $200 one can get the color QuickCam. One use is to set it up in the shop, leave it on, go home to lunch (or go somewhere with computer access), dial your shop computer from your home and see what is going on! Your computer DOES NOT REQUIRE A VIDEO CAPTURE BOARD to use your QuickCam.

Congratulations to Door Prize Winners:

Bruce Register	WinCom Suite
Roger Waters	Uninstaller
Ken Bryan	Canvass Tote Bag
Scottie Holland	Mouse Pad
Bob Davis	Quick Book Demo Test Drive

We all thank Wil Goble for making our images with QuickCam and putting them on disk for us to use on our personal computer for whatever reason. (Your Secretary's personal problem is that there is so much truth in the captured likeness that now I must acquire a touch up program to get that handsomeness that I thought that I had in real life...Thanks, anyway, Wil. My grandchildren in another city can see me as I really am...grandchildren cannot be fooled) ◆

Free Stuff

Net Findings

by Larry Anders, Librarian, Tampa PC Users Group

In my travels recently down the Super - I - Way of the World Wide Web I ran across another FREE utility that I just had to pass along. The Web is a storehouse of just about every kind of information you can think of and growing by leaps and bounds every day. But searching the Web is time-consuming and demands that users be familiar with the strengths and weaknesses of the various search engines. Up until recently it was only possible to search one engine at a time. If you did not find what you wanted the first time around, it meant repeating the search with a different engine. “Well..… not anymore”!

Thanks to WebFerret, tedious searches are a thing of the past. WebFerret, produced by Vironix, is a wonderfully time-saving program that queries the five big Web search engines *simultaneously*. This program is a must for Windows 95 users….and its **FREE !** (It’s free because there are small splash advertising screens that pop-up on the search tool during the searches. See below.)

It is simple to install and astoundingly quick to run and perform searches. You type your query into the search box and select whether to match all key words together or independently. Web Ferret then searches the major search engines such as Yahoo, Infoseek, Ananzi, AltaVista and Lycos and quickly returns the results.

The advantage of WebFerret is its efficiency and speed. Accessing search engines itself is a slow process, particularly if the Net is busy. On average you can expect to wait a minute or so before being able to begin searching. Loading WebFerret, however, is extremely quick. From the time WebFerret is loaded it will take seconds to begin searching the Web. WebFerret avoids duplications and shows all the relevant sites collected from searching the five engines. And it's simple. A beginner to searching the vast databases of the Web can be up and running immediately.

For the more advanced user there are menu options. With the copy-and-paste option you can copy the results listing into a

(Ferret.....Continued on page 7)

~~Merlin~~ WARP 4

by Charles Howe, Tampa P C Users Group

On Wed, Sept 25, 1996, a few days before this issue of Bits of Blue goes to press, OS/2 Warp 4 will have been announced officially. The effect on the world of personal computers is apt to be large.

What it is: The latest version of IBM's operating system for x86 class computers.

Equipment requirements: It is worth drawing a distinction between theoretical possibility and practical minimum. Any 486 or Pentium class machine, at least 8 MB of RAM and several tens of MB of free disk space will allow an installation, but more resources than that are required for a useful installation. (Installation on a 386 won't necessarily fail, but IBM has stated publicly that it will not make any effort to fix problems that come with use of the 386. If you want to use Warp 4, upgrade.) There is a caveat: one feature can only be run on a machine with at least 24 MB of RAM and with a CPU with a speed rating of at least 100 MHz.

Bear in mind that hard disk space is now not much more than a dime a megabyte, 16 MB memory SIMMs can be had for about $100 and 4x CD-ROM drives (if you can find them) can be had for well under $100.

Cost: As a practical matter, expect to pay $115 (before taxes, or S&H if you buy by mail order) for an upgrade, $185 new; but it isn't clear to this writer how the new vs. upgrade distinction will be enforced.

Contents of the package: 3 CD-ROMs -- the Warp 4 disk itself, a disk full of drivers and a disk of demos of native applications. Note that this means that you must have a CD-ROM drive. Installation from floppies is no more than a theoretical possibility. Are you really going to get a friend to take the CD-ROM and make the more than 100 floppies it takes to install (up from 27 for Warp 3)? Also in the box: a noise canceling microphone! More on this later. The writer's supposition is that there is virtually no printed documentation.

Features: It is impractical to attempt to enumerate all of them. The writer's understanding of what to expect comes from having scanned several hundred thousand lines of the Fidonet OS/2 echo in the past few months. Here, in no particular order, is what impresses me the most.

Multitasking: With OS/2 it is not just possible but practical to execute more than one program at a time. This is not a new feature. Warp 3 did it very well, 95 nowhere near as well.

A typical reaction is, "Why should I get excited about that? I'll never use it." No! Experience shows users becoming familiar with the concept, then becoming avid multitaskers.

Stability: Highly stable. 95 was a vast improvement over 3.1, etc., but Warp 3 had already left it behind in this regard even though Windows 95 was introduced 10 months after Warp 3. Warp 4 solidifies the standards set by Warp 3 in this regard.

Programs to run under Warp 4: Much better than the endlessly repeated assertion, "But there aren't any programs to run under OS/2." Wrong!

To fully appreciate how good the situation is, understand a long-standing feature of OS/2: It runs almost all Windows programs. An early decision(specifically, when the transition from text based OS/2 - versions 1.x - to GUI- versions 2.0 onwards - was initiated), a design goal was to include the capability of running Windows programs from the desktop. A small cadre of able programmers was assigned to this task. They succeeded brilliantly. Although the phrase is seldom heard any more, an IBM slogan was, "A better windows than Windows, a better DOS than DOS". The idea was to start a Win-OS session and call the Windows program, but ordinarily not to run another Windows program under that Win-OS session. If the Windows program was well written, it would function well. A "Better Windows than Windows" was actually achieved: the dreaded UAE was virtually eliminated. This alone was a strong argument for moving to OS/2 2.x and Warp 3.

Does Warp 4 run ALL Windows programs? No, but the number it doesn't run is small. All a developer has to do is to write to what is called (techno babble alert!) the Win32 1.25s API -- not the Win 1.30 API. (He ought to do a thorough port, but that is a different topic.) When you see a Windows 95 logo on a box, ask questions of the publisher. Ask him if it is compatible with Windows 3.1 or 3.11. If it is (conforms to the 1.25s standard), you are safe. The developer isn't taking advantage of OS/2's strengths, but in all likelihood his program will run -- probably better than it will under Windows. And

Create your own personalized multimedia greeting cards!

.....with More Than Words...™ for Windows®95

Review by Larry Anders Librarian, Tampa PC Users Group

Since I began personal computing in the mid '80's, I have always created and sent my Christmas cards by utilizing my PC. I will be the first to admit those first few years were experimental. I remember the first year I just printed labels to go on the envelopes. It sure saved a lot of time. With each passing year, as I added new hardware, the cards got better. Last year was my best yet. The entire card was created (including color photos of the family), printed, and envelopes addressed using my PC. But this year I'm gonna ***blow their socks off*** !

If you're on my mailing list, and I know that you have a PC with Windows 95 or Windows 3.1, with 4Mb RAM and at least 256 color graphics, this year it's ***MULTIMEDIA*** all the way. Krepec MultiMedia Corporation has created a greeting cards program that finally enters the electronic age, **More Than Words…** I can now express my feelings like never before by easily creating my own personalized multimedia greeting cards for all occasions, saving and sending them on diskette, or sending them by e-mail as an attachment.

- More Than Words... is a sophisticated multimedia application which introduces the innovative concept of personalized multimedia greeting cards. The following outlines More Than Words... principal features:
-
- Interactive Multimedia Tutorial · The tutorial will explain step-by-step how to create multimedia greeting cards. Turn your speakers on and enjoy the presentation! (The Tutorial will also show you a few features of the upcoming Version 2.1).
- Catalog of 35 pre-designed cards for all occasions · When you create a card, you start by selecting one for the appropriate occasion from the Catalog. It's like being in a greeting card store!
- Total freedom to customize and personalize the card · The cards in the Catalog are very nice but you, as the card creator, decide how the final result will look and sound. You can change a little or you can change everything. When you access the card editing session, you have at your fingertips an abundance of ready-to-use audio-visual material that you integrate within the card with a simple click of the mouse. More Than Words... comes with the following Catalogs of multimedia material:
- Images · Flowers, sentimental, holiday, celebration, you name it.
- Verses · Dozens of verses for all occasions. You can make the verses truly personal by easily adding the name(s) of the recipient(s) or other personal information (age!) within the verse.
- Music · Various musical themes that suit any occasion.
- Background watermark images
- Sound effects
- Color styles · Variety of colors for the card, background, text (3 colors).
- Intuitive text editor · The simple text editor allows you to personalize any verse, type your own verse if you wish or type a personal text message to the recipient.
- Personal voice message · You can very easily record your personal voice message. It is simply unbelievable the emotional impact it makes on the recipient to hear your familiar voice delivering your personal greeting!
- Personal pictures · You can easily add personal pictures to the cards (of yourself, your family, your new house) or any images which are in digital format.
- Very easy electronic distribution · The "Send" function will automatically package and compress your card together with the auto-playback code into a single .exe file and save it where you want. The extremely small size of the .exe file (given all its multimedia content) makes it perfect for electronic distribution via e-mail, modem-to-modem transfer or on a diskette. For example, with a 28.8 modem it normally takes less than 2 minutes to transmit over the Internet a typical More Than Words... card attached to an e-mail message (better than the postal service!). Your cards will always arrive on time!
- High quality printing · You have the option of printing your personalized card for recipients who do not have a PC. If you have a color printer, you will be surprised how great it looks!
- Electronic User's Guide

System Requirements

You need the following properly installed hardware and software to use **More Than Words...**:

- personal computer with a 486 or higher microprocessor running Windows 95 operating system
- 8 MB RAM
- hard disk with 10MB of free space
- at least 256 color graphics
- 16-bit sound card with speakers

(Greeting Cards .....Continued on page 7)

(Greeting Cards.....Continued from page 6)

- Microsoft Mouse or compatible pointing device
- microphone (if you wish to record personal voice messages)

You can find out, like I did, how much fun it is to create personalized cards, by down-loading a copy of **More Than Words…** for Windows 95 at ***http://kmmc.harvard.net.*** (5.7MB, expect transfer time of about 30 minutes with a 28.8 modem). Once it's downloaded just double-click on the file to install the program. There is also a copy for Windows 3.1 users to create personalized multimedia greeting cards, **More Than Words... ExpressCards** - Version 1.0 for Windows (1.7MB, expect transfer time of about 10 minutes with a 28.8 modem). Just double-click on the downloaded file to install the program. With the assistance of an audio-visual tutorial, you will be able to immediately create your own multimedia cards and see if you like **More Than Words....** If you do like the program and want to print or send your cards, you can purchase the license for only $29.95. Licensed users will receive for free the upcoming update 2.1. I purchased my copy by calling an '800' number and registered immediately.

At the Internet site there are also fully functioning *generic* card samples that you can you can download and send without having to register. Each card offered for downloading has been created for a particular occasion using **More Than Words....**

This is one innovative program optimized for Windows 95 that is loaded with features which will allow you to:

- save money by not buying traditional greeting cards and paying for postage (and soon the savings will exceed the license fee!)
- create an unlimited number of exciting personalized multimedia cards for all occasions
- send the cards by e-mail all over the world at virtually no cost (you can also send cards on diskette)
- make sure your cards always arrive at the right time (it generally takes less than 2 minutes to send a card by e-mail with a 28.8 modem)
- communicate your greetings to the recipient in a very personal, powerful and entertaining manner
- easily create exciting multimedia greeting cards for all occasions.

More Than Words… is ***GREAT!…*** and just in time for Christmas.

Krepec MultiMedia Corporation, $29.95

(Ferret.....Continued from page 3)

word processor and distribute the list of sites to colleagues or keep it for further reference. (A requested feature to save to HTML format, partial or full results, is currently being worked on.)

Once the results listing is displayed, point the mouse at any site and WebFerret displays a brief description of the site's contents.

WebFerret forms part of the NetFerret Finder Series which also includes NewsFerret and IRCFerret. NewsFerret allows users to search specific news articles for a topic of interest, without having to access each newsgroup separately. It automatically joins multipart messages together and can retrieve messages without having to start up a separate news client or web browser. Binary attachments that are encoded with uuencoding, binhex and mime can be automatically decoded. NewsFerret can start up the user's registered news client to access a particular newsgroup in the search results. It uses advanced NNTP commands where available for enhanced performance. Looking for friends, new and old ?
IRCFerret will search the IRC Networks around the world to find them. Searches are specified by the keywords you enter, matching them against every IRC users email address, nickname, and description. You can even limit specific channels to search. The IRC networks will be searched simultaneously, without you having to manually connect and search. Searches are done intelligently and efficiently to save you time and bandwidth. The entire NetFerret series can be downloaded **FREE** from http://www.vironix.co.za/NetFerret/. This deal is tuff to beat!

Vironix Software Laboratories

(Warp.....Continued from page 4)
the number of programs that run under 95 and not under 3.1x is actually quite small.

Applications that take full advantage of OS/2: The standard applications are well covered: word processing and spreadsheet. A suite called StarOffice meets with much enthusiasm. A new version of Lotus SmartSuite isn't completely done yet, but will be RSN. It seems probable that Corel, now owners of WordPerfect and Quattro, will restart developing for OS/2. Corel is particularly threatened by a drawing program called Colorworks. DeScribe, a word processor, has been an eye-popping bargain. A company called Poly-Ex is close to announcing a superb tool set for games programmers. (The writer has seen demos of ColorWorks and the Poly-Ex tool set. They are stunning --arguably approaching the status of being killer apps.) There are several suites of utilities. There are several communications programs. There are several mail readers and several IRC (Internet Relay Chat) programs. There is a vast amount of IBM EWS (Employee Written Software), which IBM doesn't officially support but which mostly work and are free. There is much shareware. When a vendor tells you that there is no software for OS/2, take it with a grain of salt. What he really means is that he doesn't sell it, not that it doesn't exist.

Voice Navigation and Dictation: Linguists have been studying speech recognition for decades with IBM scientists always in the hunt. Now Warp 4 incorporates them as installable options. (Don't know if one can be installed and not the other.) The hardware requirements are at least a 100 MHz CPU and at least 24 MB of RAM. These features should be of great interest to any one with a repetitive motion problem. Also (the writer has never seen this pointed out, but it seems obvious), the ability to do voice navigation should be very helpful to some people with disabilities. A noise canceling microphone is supplied to allow the user to do voice navigation and dictation. Beta testers report that navigation is accent independent but dictation requires some training. Voice macros are possible.

Netscape Navigator 2.0 is being ported to OS/2, i.e., is being written so as to take advantage of OS/2's strengths. It will be available for download by the time Warp 4 becomes GA (Generally Available; IBM speak). It will be available on the club board. Navigation by voice will be implemented, but not until about December 1, when Netscape Navigator 4.0 is released. There will be no Netscape Navigator 3.0 for OS/2.

Installation: Several years ago the writer heard David Barnes, IBM's world class showman and principal presenter of OS/2, praise the capability of Microsoft in creating installation routines. High praise, considering that an important component of his job is to show OS/2 running rings around 95 and NT. Now comes Warp 4, including an entire CD-ROM full of device drivers. At a minimum, installation will be better (easier) because of the greater number of drivers for OS/2, plus the fact that they in one place, a CD-ROM. Will the list prove to be exhaustive? Stay tuned.

Workgroup collaboration: The buzzword is OpenDoc. If all members of the workgroup are using programs that are Open Doc enabled, then one person can operate the spreadsheet, another the word processor, a third the paint program, etc. They can do this over a LAN or WAN or even the Internet. They can be using a variety of operating systems. In theory none of them could be Warp 4, but OS/2 is very thoroughly committed to the standard. OLE is subsumed by Open Doc.

Development techniques: They are beyond the scope of these comments (and the writer's comprehension), but some of the buzzwords are Threads, SOM and DSOM. The Colorworks developers, for example, cited OS/2's threading capabilities (strong) as a principle reason for developing for OS/2 and not for Windows NT (weak) and even more so for Windows 95 (worse). SOM stands for System Object Module and DSOM for Distributed same.

File system and virus protection: OS/2 is comfortable with FAT, the old standby, but you also have the option of choosing HPFS at installation time. You can also mix them -- some drives FAT, others HPFS. HPFS's strengths are its resistance to fragmentation, its resistance to viruses and its thriftiness in using space on hard drives (not stuck with each file, no matter how small, occupying one cluster, which can be as large as 32K with today's drives). Simply put, HPFS has no clusters. The smallest storage space is 1 KB: 512 bytes for the file and 512 bytes for the extended attribute and directory entry. Any additional storage for that file is increased in 512 byte increments as needed.

Buying a computer with Warp 4 preloaded: Possible. Hasn't been easy, but the situation has improved recently and is apt to become commonplace. The premier vendor of OS/2 software, Indelible Blue, 1-800-776-8284, is now selling computers with OS/2 preloaded by mail order. A few companies in the Austin, TX, area are also. It seems likely that some vendors will start to highlight their willingness to deal with it. In particular, it is foreseeable that some store owners will spe-

(Warp.....Continued on page 9)

(Warp.....Continued from page 8)
cialize in adding Warp 4 to machines preloaded with Windows 95. ◆

Connect the World with Merlin (Warp 4) : A worldwide, 24 hour on-line party will be held on Saturday, October 26. Tampa Bay can take pride in the fact that the idea and organization is local. There will be demo sites at CompUSA, Egghead, USF, Caylu Enterprises on South Howard and points in 40 countries around the world. Put the date on your calendar. A feature locally will be that there will be an all night session at the CyberCafe alongside CompUSA.

Ask PC Willy

Answers by
Wil Goble

Dear PC-Willy

Q. I'm using DOS 6.2 and when I run some programs I get "Insufficient Memory" and I can't run the program but I have 8 megs of memory. Do I have to buy more memory?

A. You need to manage your lower memory (below 640k) better. With DOS 6.2 you have a program called MEMMAKER that will do this for you. Just type memmaker at a dos prompt and let it setup your config.sys and autoexec.bat files.

Q. Some people I overheard talking about "hotmetal", just what is this?

A. Hotmetal is actually HTML the abbreviation for HyperText Markup Language which is the language used to generate web pages. Mostly it defines the structure of a document not its page layout.

Q. I'm 14 now and I like to play games on my computer, and I'd like to learn how to write game programs. Do you have any suggestions as to what I might get started with?

A. Well, right now games are mostly written in C or C++ language so getting a program or a course on these platforms would be helpful. But more in demand than games right now is Web pages and Java applications for the Internet. Its a lot easier than C language and you can make some good money making web pages for people when you get good at it.

Q The other day I turned on my computer and it did absolutely nothing, so I turned it off and on again and it

Book Review

Teach Yourself Web Publishing with HTML 3.2 in 14 days.

Author: Laura Lemay

Review by Don Patzsch, Tampa PC Users Group

Whenever we use a device that is expensive to produce, we can look to the Federal Government as the place where the funds came from. So it is in the case of HTML. The Federal Government paid for the Standard Generalized Markup Language (SGML), which is an authoring language that lets users publish information in different formats. HTML is derived from that language.

If you want to produce a home page and send it up to the Internet, there are many ways to do it. You can download a home page you like and just change the text in an editor. You can buy any book on HTML and sit down and read, and then make up your home page very easily. Or you can buy a book like this one and take a few weeks to read and learn the material written up here. This book is very easy to read. I have not found many such books. This book is really very complete. It is up to date. And it is thick, 2 and 1/2 inches thick. It has a CD ROM in the back which has all the programs that are described in the book already typed out for you. There is much more.

The book starts out as most books do, with a resume of where we are in the use of the World Wide Web. Then they go right to work.

The first chapter tells you how to create a simple web page. Then they start telling you how to set up to produce multiple web pages. In each succeeding chapter, they give you a little more detail, such as they tell you about editors and how they work. They tell you about using images (pictures or graphics), color, and setting up a background.

Next they go to Multimedia, sound, and animation. They tell you about blinking. Then they go back to tell you how to design an effective web page. Then they go into Tables, Frames, and they tell you how to link pages. All this is given to you in very simple easy to understand English. I have not read a book so easy to follow and to build their examples.

Now we get to the more interesting parts. They tell you how to put your pages up on the web. They tell you how to set up your own server. This book is complete.

We aren't finished. They tell you about CGI. They give you

(HTML.....Continued on page 10)

Microsoft Access SIG

This SIG Meets on the 3rd Thursday of the month (**October 17**)) at 6:00 PM at the Reflectone Building. Directions: Proceed west on Waters from N. Dale Mabry across the railroad tracks (which is about 1 and l/2 miles), take second left on Savarese (United Technologies bldg. is just beyond it). Proceed on Savarese until you reach the Reflectone bldg. Take the North door. If you need to ask directions, there is a security guard at the location. PLEASE SIGN IN WITH A SIG LEADER.
For more information call Connie Kincaid - 661-8185 - Leave a Message.

Communications SIG

This SIG meets the first Monday of the month (**October 7**) at 6 PM at the Reflectone Building. You must sign up to get on the list and to get by security. See Microsoft Access SIG for directions to Reflectone. *Contact Charles Howe: at 968-1207 or HOWE@INTNET NET*

Genealogy SIG

This SIG normally meets the third Wednesday of the month. at 7:00 PM at a member's home. **October 16 is next meeting.** *Contact SIG Leader Jenny Lind Olin at 960-5723 for directions and RSVP.*

(HTML .....Continued from page 9)
forms and scripts and describe them carefully; you have no trouble following the author. The next section is devoted to Java. You are given a development tool kit on the CD ROM for the Java program. You are given instruction on Java script, creating and working with those scripts.

In the Java section, they make up a stock ticker type of thing. It starts a sentence on the right side of the screen and the words travel slowly to the left side of the screen. You can simply copy this right out of the book if you want it in your web pages. Just change the text to what you want.

The next section tells you about plug-ins, and embedded objects. All the things are given plenty of explanation. They tell you about Shockwave, and Adobe's acrobat amber. Also RealAudio, and Multimedia plug-ins. They don't forget VRML. There is quite a section on creating Pages with embedded objects, and Plug-ins. Last but not least, they discuss ActiveX and Visual Basic. The last chapters are devoted to telling you about testing, revising and maintaining your web site, also MIME types, etc.

Probably you can tell that I am very pleased with this book. Also I can not go into detail about each and every one of the sections in this book, it would require a book length review! You can buy this book for $59.99 at most of the bookstores. That will sound like a lot of money, until you need to make up a set of web pages, and then it will impress you as being fairly priced, because it is such a simply laid out bunch of instructions, that are easy to follow and understand. And it has a lot of things I could not find elsewhere. After I have finished the course, I will have my notes on what the other students have said, and also their questions and the instructors answers. Then too, I will have my notes on what the instructor gives us. After all that, I expect to set up and place a series of pages on the Internet. Don Patzsch, September 11, 1996 ◆

(PC Willy.....Continued from page 9)
worked fine. It's about 3 years old and I haven't had any problems before. Do you think that I'll have to get it fixed soon?

A. If it ain't broke don't fix it. Sometimes when you turn on a computer it will not get the right signals at the right places at the right time. I've seen the same thing happen before but the computer went right on working fine till the hard drive quit. Computers really have only one moving part (hard drive) so really not much goes wrong with them. But dirt and dust can get into the sockets that plug into the boards and sometimes that will cause intermittent problems and just by taking the cover off the computer, and taking all the boards out and plugging and unplugging the wires will sometimes fix things. (It's those times that you'll wonder what was wrong and how you fixed it.)

Well, that's all the questions I have for now, but if you are stumped and can't figure it out write me on the BBS or e-mail me at wilgoo@juno.com or locally call 813-684-8004.

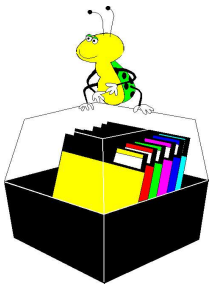
are running Windows 95, are on the Internet, and have a sound card, microphone, and speakers, go to Microsoft's Web site http://www.microsoft.com, and from their free software section get the program NetMeeting. It's free and it's super.



With this program you can carry on live audio conversations anywhere in the world for free with anyone else running the same program. I have spoken with individuals in the Netherlands, England, South Africa, Australia, and Texas who sounded like they were next door; however, I have spoken with people here in Tampa, and the voice quality was not so good.

Additionally, while connected you can share applications. For example, I often start up *Street Atlas USA* and share it with the individual. Within a minute he has a map on his computer of downtown Tampa, and if I give him collaboration rights, he can take control of the map. You could similarly share spread sheets and, I suppose, play a computer chess game. All of this done while you speak in real time.

Get *NetMeeting* and give me a call. ◆

New, Free Internet Software

by William LaMartin, Editor, Tampa PC Users Group, Inc.

First, I'll note that we had a very good meeting last month with **Micrografx** doing the presentation by demonstrating their graphics software. Bob Woods, the presenter, sent me a note saying that he made a mistake when he said that American Greetings will do a mail merge of addresses on envelopes and names in the cards. In fact, it will only do the mail merge for the envelopes. He asked me to pass the information on to the group, which I have now done.

I am continuing to make changes and additions to our WWW home page **http://www.tbos2cla.com/tpcug/**. Stop in for a visit and see the dancing palm tree and changing moon. These animated graphics, I think, only work with the Netscape Navigator and Microsoft Internet Explorer browsers, though. Also, there you will now find all the Internet links that have been appearing in the Newsletter available on the Links subpage, where a click on them sends you to the site. There is a listing of meeting topics and SIG schedules, along with maps to both the Reflectone and Ybor locations. My goal is to both advertise our group and provide useful information. We are certainly appreciative of member John Meroth for providing us free space on his Internet server.

Now to that new software. Microsoft is certainly giving away some interesting software for the Internet right now. The main program, of course, is their browser, **Internet Explorer** 3.0 for Windows 95. I think a version for Windows 3.1 is in the works. I find the program quite good; however, most of the world is still using Netscape's

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members. Our mailing address is P. O. Box 3492, Tampa, FL 33601-3492.

However, for business concerning this newsletter, Bits of Blue, please contact the Editor, William LaMartin, at 821 S. Boulevard, Tampa, FL 33606-2904; 813-251-3817; lamartin@ix.netcom.com.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII, Microsoft Write, Microsoft Word, or Word Perfect file to the editor at 821 S. Boulevard, Tampa, Florida 33606-2904 or upload to the BBS (News section of FILES).

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

The use of trademarked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if it is not received on time.

Members may insert non-commercial ads at no charge with the following imitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

SECRETARY'S REPORT & MINUTES OF MEETING October 9, 1996

Minutes and Comments by Bruce Register, Secretary

President Connie Kincaid called the meeting to order and introduced officers present. She reviewed the SIG schedules with special time changes for this month only. A table was set up with publications donated, free for the taking. This was popular with many members and visitors.

Connie announced the Nominations Committee reported:

President:	Connie Kincaid
Vice Pres:	Mike Hodges
Member at Large:	Margaret Petro
Treasurer:	Wil Goble
Secretary:	No name presented *

Appointed positions

SYSOP:	Kevan Sheridan
Librarian:	Larry Anders
Editor:	William LaMartin

* Present Secretary will serve if no one else comes forward

Nomination will be received from the floor at the November 13th meeting. Elections will be at the December 11, 1996, meeting for the 1997 officers.

The November meeting will be the nominations meeting AND a presentation by REGNIS COMPUTER of Christmas Shopping in the computer world for yourself or gifts. We have always enjoyed the presentations of the state of the art in hardware and software. (This should be an especially informative session as prices and bargains are running rampant, at least it seems so to the Secretary.)

December: SWAP MEET AND BARGAIN TABLE. The December meeting will give YOU THE MEMBER the chance to sell, bargain, negotiate, wheel and deal with your own treasures for a small table donation ($5). PLUS! Those who just want to donate treasures to TPCUG are encouraged to do so, also. We need your donations of software (unregistered, to be legal), hardware or whatever for the bargain table. We upgraded our hard drive with proceeds from the bargain table contributions and the door prize contributions. Two great bargain opportunities PLUS Election of YOUR officers for 1997, PLUS networking with one another. Many people, including your Secretary, have had problem solutions given right there on spot.

Software Review

Microsoft Publisher 97 CD Deluxe for Windows 95

by Larry Anders, Librarian
Tampa PC Users Group, Inc.

As everyone is aware who reads this newsletter, it just continues to get better. The main reason is because we have a dedicated editor, William LaMartin who strives for quality over quantity. One of the tools he uses to produce this newsletter is ***Microsoft Publisher for Windows 95***. I am happy to say that I recommended it to him.

When William took over the duties as editor in December of last year he used ***Microsoft Word*** to produce the first three newsletters. ***Word*** performed quite well for him except when controlling the flow of articles from one page to another. During one of our conversations he expressed his frustrations so I suggested he try Publisher. I have been using Publisher since the first version for Windows 3.1 and highly recommended it. Well, in March of this year he gave us an interactive review of Publisher, and a fine review it was, when he published his first newsletter with it. Now, Microsoft has released ***Publisher 97.***

I've read that approximately three million people use Microsoft Publisher to create the materials they need for their businesses, volunteer interests, and personal use. According to user surveys, 97 percent are satisfied with Publisher - so satisfied they regularly recommend it to their friends and associates. We know that's true. Don't we?!

I think the reason for Publisher's popularity is because it is exceptionally easy to use. You can get creative right away - without learning how to use the software first! The program offers so much design help with PageWizard design assistants that guide you step-by-step to help you create all kinds of projects - brochures, newsletters, flyers, Web sites, postcards, business cards, invitations, greeting cards, labels, signs and banners, stationery and envelopes, calendars, business forms, specialty items, just to name a few! You're guaranteed to create the kind of publications that get results.

Publisher 97 includes an expanded and enhanced collection of clip art, fonts, borders, and design elements and templates - enough to make your creative possibilities virtually unlimited.

And now more content is available online too, with the Clip Gallery Live on the World Wide Web. (You'll need your own service provider for this one.) To make your documents distinctive you can use the built-in features like WordArt special text effects, rotate elements, add gradient fills, start articles with Fancy First Letters, and even recolor clip art in any of 16 million colors. Also, if you already know Microsoft Word or another Microsoft Office program, you're on your way to knowing Publisher. Publisher uses the same menu bars, rulers, and shortcuts where appropriate.

Some of the features include:

- Page Wizards help you design newsletters, flyers, brochures, postcards, Web sites, forms, letterheads, signs, business cards, greeting cards, invitations, calendars, menus, posters, bookmarks, envelopes, banners, labels, resumes, paper airplanes, origami, and more with PageWizard design assistants.
- Step-by-step Design helps you create customized, professional-quality publications, and it couldn't be easier - just click the type of document you want to create, and PageWizard design assistants guide you through the design process, step-by-step.
- Design Gallery allows you to choose from hundreds of coordinated design elements - such as mastheads and pull-quotes.
- Borders will let you select from more than 150 Publisher borders, or create your own custom borders from any piece of clip art.
- Design Checker identifies common design problems (such as too many colors or fonts) and recommends solutions.
- Font Preview lets you preview all your fonts just by looking at the pull down menu. Each type style name appears in its corresponding font. See all your fonts before you apply them to text.
- There ís something for every project and occasion with more than 5,000 clip art images, 150 fonts, 150 borders, and 180 digital stock photos included with the CD Deluxe version (500 clipart images and 45 fonts, 150 borders, and 65 photos on disk version).
- For additional content you can visit the Clip Gallery Live at the Microsoft Publisher World Wide Web site at "http://www.microsoft.com/publisher/" and gain access to 1,000 additional clipart images, plus video and sound clips.
- Select from hundreds of included images in the Clip Gallery.
- Browse for ideas in more than 100 new PageWizard style design templates.
- Add pizzazz with WordArt, which uses special effects to make your text more vivid and memorable.

Software Review

Delrina CommSuite 95

by William LaMartin, Editor,
Tampa PC users Group

This is my second version of CommSuite and my third version of WinfaxPro, its major component. So I have some familiarity with the product. *ComSuite95* is a strictly *Windows95* product, and it contains two more components than did the original CommSuite, which contained only *WinfaxPRO*,the faxing component, and *WinCommPRO* the communications component. The present version has added *TalkWorks* and *CyberJack*. *TalkWorks* (if your modem supports voice) will turn you computer into a messaging center, and *CyberJack* is an Internet Browser which also contains several other Internet utilities such as Gopher, Telnet, and FTP.

So anything you computer may want to do that involves a modem or the Internet, *CommSuite95* can handle—**if you have the correct type of modem.** Most modern modems will have no trouble with the WinComm communications program or the WinFax faxing program. The trouble arises, for example, when you want to combine these two. That is, to have both programs running simultaneously, so that if a fax arrives at your computer, the modem directs it to WinFax, and, if a data transmission arrives, the modem directs it to WinComm. This is called **Call Discrimination.** You can further complicate things by also running TalkWorks and asking the modem to also detect voice calls. My US robotics 28.8 modem was supposed to be capable of doing all this; however, I spent a lot of time in a futile attempt to accomplish it.

I finally went to the Delrina (Symantec) Internet site and searched for tech notes on the problem. The result was the following statement, which I paraphrase: *U.S. Robotics modems do not support call discrimination in Class 1, but they do in Class 2.0. However, WinFax only supports Class 1 and Class 2, not Class 2.0. Class 2 and Class 2.0 are very similar but not the same*. So you see why the average user can sometimes get a little frustrated with computers. Anyway, I am happy to at least have figured out why I can't get call discrimination. In fact, if I have the call discrimination option set, WinFax will not even receive. Happily, though, all of the separate functions work fine independently. And, since I don't really need this option, I am not overly bothered. However, I am sure not everyone will look as benignly on this problem between U.S. Robotics and Symantec.

WinCommPro: I use this program almost every day to connect to our BBS. It has served me well, and I have everything automated using the session scripts. I simply put it in learn mode, log on the the BBS, go through your usual key strokes necessary to download my messages & Fidonet Conferences (I use the TQM Door), then log off. The next time I do this, the script is run automatically when I log on, and that is the last time I have to touch the computer during the online session. I then use an off-line reader (*OLX for Windows* in my case) to read my messages. You can, of course, do much more. One feature I find useful is the Host Mode. Using Host Mode you can turn your computer into a mini BBS, where people using their communications programs can dial your computer to either download or upload files.

WinFaxPRO: This is the most important of the components, and if you have done much faxing using other fax programs you will appreciate the versatility of the program. In fact, some people shy away from it because it contains too many options for their simple once-a-month faxing requirements. If you are only going to do occasional faxing, then the fax program that comes with Windows 95 should be sufficient. But if you require scanner support, the ability to also scan and send multiple pages, the ability to annotate pages before you send them or before you forward them, remote fax retrieval, optical character recognition of received pages, and more, then WinFax is the program for you.

I suppose all faxing programs allow you to be working in a Windows program like your word processor and, when ready to send the current document via fax, to select the particular faxing program as your printer driver and then send the fax. I use this feature with *Microsoft Word* to Fax letters and with another Delrina product, *Perform*, to fax in orders that I have filled in on the computer in *Perform* to an industrial supply house. What WinFax adds is the ability to add fancy cover pages, select the time of day (to save in phone charges) to send the fax, use your scanner as a normal fax machine, and, by beeping your pager, notify you when a fax has arrived at your computer.

The scanning feature is most the important to me. Not everything you want to fax resides in your computer. For example, I have to fax multi-page forms I have filled in regarding our group to various computer vendors. I simply put them in the scanner and WinFax does the rest, be it one page or ten.

TalkWorks: If you want to take revenge on all those companies that have made you navigate your way through all their voice mail boxes and button pushing options, then this is the program for you. With it, you can set up a similar voice mail

ON File from SPC Software

Review by Nicholad Klack,
Tampa PC Users Group

I write for pleasure and publication. The two are not inconsistent with each other, but they do lead to a mixture of files in my word processor. With only eight letters to deal with it is impossible to quickly locate a file written even several months ago. Enter "ON File", a piece of software that purports to organize these same files in any sort of organized collection.

SPC Software Publishing has marketed this, Windows 3.1 and above compatible utility, for everyone who writes on a word processor. The software comes on two 3.5 inch disks and is priced at about the $40.00 level. The book size red box does not advertise that it is Windows 95 compatible, but it is. When I installed it in my "Windows 95" I got a message that, " the operating menu screen did not match the software." I ignored the message and proceeded with the installation. The program continued with a flawless installation. I must point out that the software is version 1.0 and was made over a year ago. I suspect that at least another version is now on the market and my just mentioned installation interruption may indeed not exist anymore. "On File" has a "tool bar" on the top of the layout sheet. Each icon contains several choices within the "button" category. The tasks possible were complete and imaginative. Clip art could be inserted and rotated, and the viewer offered both viewing the article or exporting it to the clipboard. Autobook, is one of the icons. It will quickly step you through the book building process with a selection of your files. Once the book is created you can customize it as necessary.

"On File" purports to read over fifty different file forms, view clip art and organize them in whatever way you choose. My experience confirmed their claim to the extent of the word processors I had. Microsoft Works files did leave a few extra symbols on the top of the print out. I easily cleaned those off. I am used to Microsoft Works not being entirely compatible when imported into other word processors. Indeed of all the popular word processors it is the least exportable. "On File" did not exhibit any problems with Word Perfect and Microsoft Word.

The setup for the program was automatic and straight forward. A tutorial is available from within the program. I suggest that any user take the time to work through the tutorial. In my case I went through the tutorial and found it helpful. The directions for the program consist of five pages on a slick cardboard fold out. I like short instructions and these instructions were indeed economical. I decided to group my writings by categories. I selected, and invented the names of these categories. The opening page becomes the table of contents. An opened notebook is pictured as you begin the program. Vertical tabs are listed on the right side with "your categories" written on each tab. The eight digit limit is not in force within this program. Long titles and long image names are allowed. Keep in mind that you are building a book. Short names can be much more convenient.

"On File" lives up to it's advertised mission. It will organize your various files into several logical "books" The perfect tool for the casual letter writer that wants to keep their correspondence separated or the budding author that has that, soon to be discovered, best seller. ◆

(Minutes.....Continued from page 2)

Presentation: **Micrografx Software** by Bob Woods.

He first demonstrated some programs from *ABC Graphics Suite*. This suite has combined several individual programs by Micrografx:. Flowcharter, Picture Publisher, Designer, Media Manager, Instant 3D and Snap Grafx. ABC Graphics Suite has a suggested retail price of $299.95, but the special to TPCUG Members through December 31, 1996 is $129.95.

The first program in the Suite was Micrografx *Picture Publisher*. This program permitted changing objects, foreground and background. He demonstrated a photo of Stonehenge with blue sky and white clouds. He replaced (by masking off) the sky with a sunset. He inserted a picture of a child into the foreground of the Stonehenge image. He used "twirl" to give an interesting illusion to the sun. This state of the art program permits one to do those things that we see produced on TV by hi-tech staff. That technology is now available in your own home or office. He showed how to develop brochures and book jackets using Micrografx *Designer*. Bob copied the created images into a Microsoft Word document with drag and drop. The *ABC Graphics Suite* works seamlessly with Microsoft Office, Bob said. He demonstrated the *ABC FlowChart* portion of the suite. Here he created an organizational chart and showed how to create a genealogical family tree. This software permits high-end flow charting.

(Minutes.....Continued on page 8)

(Publisher.....Continued from page 3)

- Element rotation can rotate anything - including text, pictures, calendars, ads, coupons, or logos - so your document looks exactly the way you want.
- It's easy to add gradient fills, start articles with Fancy First Letters, even recolor clip art in any of up to 16 million colors.
- There's an Outside Printing Assistant that lets you set up your files easily for most professional printers. And Publisher utilizes Windows 95 image color matching to achieve true color fidelity in printed pieces.
- It's easy to edit text in the Word Story Editor. Just write in Microsoft Word, and let Publisher integrate the text into your publication layout.
- With the Mail Merge feature it's fast and easy to merge address information directly onto your publication. Create and store address lists within Publisher. Or, let Publisher access your Microsoft Word or Microsoft Works files, or files in Microsoft Access, FoxPro®, dBASE®, or other databases.
- Publisher makes it just as easy to create an online publication as it is to create a printed one. The same ease of use and design is built in, so you can create and post online publications to the World Wide Web. The new Web Site Wizard offers design assistants to help you quickly and easily create a multi-page Web site that includes navigational links. And you can use over 100 backgrounds, photo images, and Design Gallery elements optimized for viewing on the World Wide Web. Publisher saves Web pages in HTML format, ready for your Internet or online service provider such as America Online® and CompuServe®, etc. And Web Page Preview allows you to preview your Publisher Web sites in Internet Explorer 3.0 or another compatible browser.
- First Time Help Features and concepts are introduced the first time they are accessed, and 17 online demonstrations offer information to make even advanced design options easy to use.
- And strangely enough, this Microsoft program comes with a real life, 300-page printed manual called Microsoft Publisher Companion that's packed with tips and design principles for professional looking publications. Also included in this manual is a Pictures Gallery of all the clip-art images, included on the CD, divided into categories.

To use Microsoft Publisher 97 on CD-ROM, you need:

- Personal computer with a 386DX or higher processor (486DX or higher recommended) running Microsoft Windows 95 operating system or Windows NT® Workstation version 3.51 or later operating system
- MB of memory (RAM); 8 MB recommended on Windows 95; 12 MB recommended on Windows NT Workstation
- Hard disk space - Typical installation: 116 MB Minimum installation: 9.5 MB
- Note: The CD includes 140 MB of clip art *in addition* to the typical installation.
- CD-ROM drive
- VGA or higher resolution monitor
- Microsoft Mouse or compatible pointing device
- Optional:
  - Modem (9600 baud or faster) required for online features (28,800 baud recommended)
  - Microsoft Internet Explorer 3.0 or compatible World Wide Web browser required for Microsoft Clip Gallery Live and Web Site Preview
  - World Wide Web access required for Microsoft Clip Gallery Live
  - Microsoft Web Publishing Wizard works on Windows 95 or Windows NT Workstation 4.0 or later

If you haven't used Microsoft Publisher before….now is the time to try it! Right now you can go to the Publisher site on the Web listed below and try a ***FREE*** trial copy of Publisher 97. If you like it, for $69 you can own it. You **CAN'T** go wrong. I **guarantee** you'll like it !

Microsoft Corporation at http://www.microsoft.com/publisher/
◆

(Minutes.....Continued from page 6)

*Windows Draw 5.*0 is a new version and a scaled down program compared to *Designer.* Suggested Retail Price $49.95; Special to TPCUG members through December 31, 1996 is $39.95.

Next was *American Greetings*. *American Greetings Create Card Plus* includes 3,000 unique greeting cards that work with color or b/w printers. He demonstrated imports, introduction of graphics, including photos, and other parts of the program interface. This software contains some adult humor that can be "child blocked". You can modify, recreate, rearrange, import, add text or change text, etc. You can change color and typeface to suit. You can address your envelopes and even do mail merge. A self mailer eliminates the need for envelopes. Bonus: A screen saver, *Picture Saver*, is a part of the *American Greetings* program. Suggested Retail Price $29.95; TPCUG special $24.95.

In conclusion he presented *Crayola Art Studio 2.* This program has audio in the multimedia presentation. It is a coloring book for kids 3 years old and up, including great-grandparents. Many rooms are available for entry for different applications. Rooms are full of objects that become animated at the mouse click. One can color with "crayons, water colors or markers." The Suggested Retail Price is $39.95; special TPCUG member price is $29.95.

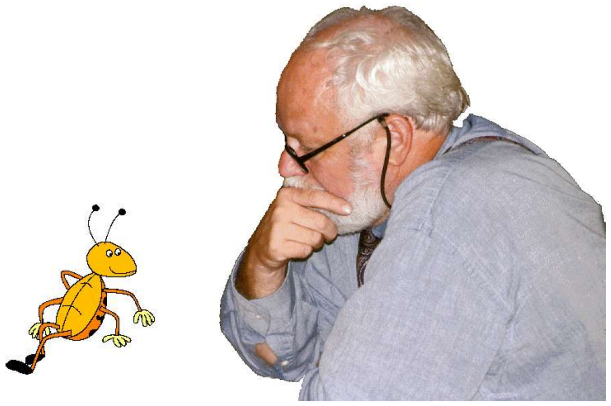
http://www.micrografx.com is their WWW address.

We thank Bob for an excellent presentation AND for Door Prizes. Please send an email to the above website expressing our appreciation to Bob Woods and to MICROGRAFX, INC. for the presentation and door prizes. Do not miss the opportunity to get these excellent quality products for low prices and even better specials to TPCUG.

Door Prizes:

American Greeting Card Plus	Bob Davis
American Greeting Card Plus	Robert Gerda
American Greeting Card Plus	Connie Kincaid
Windows Draw 5 & Print Studio	Bruce Register

Congratulations winners on winning these CD Disk Software Programs. ◆



(CommSuite..... from page 4)

and messaging system for your computer. (Of course you will need a sound card and microphone.) And, since you also have WinFax, you can even set up a fax back service. I chose the simple answering machine option for my setup, and it works fine. And you never have to worry about the recorder tape coming to the end; however, you do need to worry here in Tampa that lightening may strike your computer while it is left running during your summer vacation. Losing an answering machine is a good bit cheaper.

CyberJack: This is Symantec's Internet browser, and I view it as a free add-on to the Suite, since anyone running Windows95 can also download for free Microsoft Internet Explorer or NetScape Navigator. CyberJack is a credible browser. Unfortunately for Symantec and everybody else in the browser business, there is really no way they can compete with Netscape and Microsoft, who have better products that they are giving away. One nice feature of Cyberjack is that it collects several Internet utilities and makes them easily accessible. They are FTP, Archie Finger, Gopher, Telnet, Internet Relay Chat, Image Manager, and Zip Manager.

It's a good suite of communications programs that take advantage of Windows 95 multitasking and multithreading properties and sells for around $99 at major computer stores.

Symantec on the WWW is at

Navigator. And we can only benefit from the competition between these two giants of the Internet.

The next free program is **Microsoft NetMeeting**, an Internet telephone program. They have just released Version 2.0 Beta, which is about a 2.9 MB download. To me, this is the type of program that changes the computing world. Not only can you make "phone" calls to others using the program anywhere in the world at no charge, you can simultaneously share applications, send and receive files, share a white board (for writing and drawing) and carry on a keyboard chat. Only two individuals can speak to each other, but an unlimited number can take part in the keyboard chat feature. Netscape has a similar program called Cool Talk (no sharing of applications), as does IBM and VocalTec, the tiny Israeli company that started it all. The problem is that none of the above, to the best of my knowledge, can communicate with each other. That is changing, because there are some standards emerging now, and the Microsoft product and one by Intel called Intel Phone supposedly can communicate.

Since NetMeeting is the only one of the above I have used let me describe what you can do in a little more detail. First to use this program you will need to be running Windows 95 (one reason why Microsoft might be giving away the program), have a sound card and microphone and be connected to the Internet—preferably at 28.8 (it will work at 14.4, though). To speak to someone you simply look up their name on the list of who is currently connected to one of the servers provided by Microsoft for this purpose, or you can simply "dial" their Internet address.

I have spoken with individuals all over the world, and the audio quality has varied from bad (someone in Tampa) to excellent. I suppose the quality depends first on the quality of your equipment and second on how busy the Internet is. While talking to an individual, say, in London, he can take any active window on his computer and send it to me so that I can see what he is looking at. He can start up the "white board" and we both can draw on it in real time. Additionally, I can start up my mapping program Street Atlas USA and share it with him. He will then after a short delay see what I am seeing, for example a map of downtown Tampa. This is what is meant by sharing an application. I can go further and allow him collaboration. He then can click on the map and take control of it and run Street Atlas from his computer, although it is still residing on mine. Similarly two individuals can work on a spreadsheet or database simultaneously—all the while carrying on an audio conversation. And if that is not enough, one of you could initiate a file transfer. I suppose the ultimate net meeting would be one with Bill Gates in which he shared his checking program (Microsoft Money?) and gave me collaboration rights.

Book Review

Mastering Windows 95

Author: Robert Cowart

Review by Don Patzsch, Tampa PC Users Group

Recently, Microsoft gave us a copy of the Windows95 program. I wanted to buy a book that would give me the information I would need to be able to use the program fully.

One of the things you may do when you get a new program is to go to the library and read several magazines on computers. Byte magazine has Jerry Pournelle. Boardwatch magazine has Jack Rickard. These men are knowledgeable, computer-wise. Read what these men or men like them can tell you about what book they bought and why. You will quickly find out that you can solve any problem in this manner.

On the recommendation of these men, I bought *Mastering Windows 95* by Cowart. This book is divided into sections by a color on the edge of the pages for each section. The first section is "Up and running with Windows 95." A second section is "Exploring Windows 95". Each of these sections is further subdivided into the anatomy of a window, or the organization of your files, etc.

Now why did the book get this recommendation? Let me try to tell you. First, this author is easy to read. When he tells you something, you can understand what he is trying to convey. Many books give you a short sentence that actually says, "Yes, you can do that." Well, what you are looking for is not that, you want to know "how" to do it.

Cowart tells you how and in words that you can understand.

He starts out with a chapter on "About Windows 95". Some other chapters are "The Desktop", "the New file system", "Security", "What programs do not run under Windows 95, so you will want to upgrade them or get rid of them".

He sets up "Tips and Shortcuts" on the two pages just inside the covers, both front and back. These will jog your memory when you get stuck. Want to set the system clock? It is there so you do not have to go to the index and then through several steps to find out what you need to know to set the clock. These Tips and Shortcuts make it easier to use the book.

Now what is inside? That's what we all want to know. Is it easy to find what you want, and is it easy to understand how to follow what he is telling you? Well, lets take the use of the Internet as an example. He tells you how to connect your

Special Interest Groups

Microsoft Access SIG

This SIG Meets on the 3rd Thursday of the month (**November 21**)) at 6:00 PM at the Reflectone Building. Directions: Proceed west on Waters from N. Dale Mabry across the railroad tracks (which is about 1 and l/2 miles), take second left on Savarese (United Technologies bldg. is just beyond it). Proceed on Savarese until you reach the Reflectone bldg. Take the North door. If you need to ask directions, there is a security guard at the location. PLEASE SIGN IN WITH A SIG LEADER.
For more information call Connie Kincaid - 661-8185 - Leave a Message.

Communications SIG

This SIG meets the first Monday of the month (**November 4**) at 6 PM at the Reflectone Building. You must sign up to get on the list and to get by security. See Microsoft Access SIG for directions to Reflectone. *Contact Charles Howe: at 968-1207 or HOWE@INTNET NET*

Genealogy SIG

This SIG normally meets the third Wednesday of the month. at 7:00 PM at a member's home. **November 20 is next meeting.** *Contact SIG Leader Jenny Lind Olin at 960-5723 for directions and RSVP.*

(Windows 95 .....Continued from page 9)
computer to the Internet. He draws pictures of the computer, the modem, and the telephone line. He shows you pictures of a local area network connection to the Internet. He gives you pages of actual photos of the screens you get when you bring up the Windows 95 program. You can see just what to put in and where to type it into the program. It is with simple straightforward descriptions that he makes it easy to set up your particular computer to "get on the Internet".

Now the same is true for "FONTS". He tells you about fonts, and he puts the "wingdings" and "symbols" and other screens of fonts in the book so you can tell what there is for you to use. He describes how to add fonts and remove them. He tells you that true type fonts take up a fair amount of room on your hard disk, and so you may want to remove some of them, as the fonts in your printer may work faster than those that come with the program. All the descriptions are easy to read and easy to understand. Again, he shows you actual screens of Windows 95 and shows you what to put into them.

Now I could go on indefinitely, describing each section of the book. The author goes through each function of Windows 95: Using your laptop, Microsoft Plus, Painting pictures with Windows Paint; e-mail; Customizing your screen with Control Panel; and all the various features of the program.

Lets go back to the beginning of this review. If you want to know something, go to the library and read what other people have to say about the particular subject. Here we wanted to know what book on Windows 95 we should buy. We got the recommendations of two men. We went to the store and looked at a particular section that would tell us one thing we wanted to know about that particular program. We were satisfied that that explanation was something we could understand and use. So we bought the book.

You can do the same when you want to learn about buying extra memory for your new computer. Go to the library and read about memory in a book on "Repairing your pc". Then get on the Internet and search for computer memory. That will give you the URL of a few memory manufacturers. Leave an e-mail and let them know at that manufacturer that you want "cache" memory and you want to know what it is and how to buy it for your particular computer. They will give you their model numbers and their description of the memory you want to buy. Then when you buy it, it will "fit" and work from the word - go. Don't depend on the guy behind the counter, as he may not have any idea of what "cache" memory your computer needs, nor how much of it you really need. If you are willing to do a little work before you buy something, you can save yourself a lot of grief! ◆

(Comments.....Continued from page 9)

Microsoft is also allowing a free download of their Internet authoring program *Front Page* 2.0 beta. This is around a 10 MB download and a good program. Unfortunately this program expires on January 1. What I like about the program is how it makes a map of your WWW site.

Finally, there is this small program called Microsoft Personal Web Server which allows you to turn your computer into an Internet server while you are connected to the Internet.

For these free prgrams go to http://www.microsoft.com/msdownload/downlabc.htm ◆

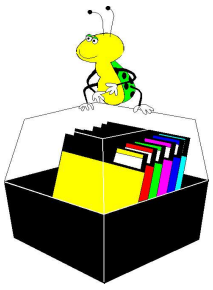
MEMBERS HELP-LINE



The following phone list is provided for our Tampa PC Users Group members in an effort to establish local support for those frustrating times which we have all encountered while using our PC's. Please note that these are members that have volunteered to help you; treat them in a courteous manner. Be sure to ask if it is convenient for them to help you now, or if you should call another time. It would also be helpful to have your documentation and have it handy when you call. (Don 't expect help if your software is an illegal copy or you do not have documentation!) TPCUG is not responsible for the information or advice provided by volunteers. Volunteers may or may not be experts in the subject matter. You are on your own with any advice received. Be aware also that some of these volunteers may be consultants in their area ofexpertise. If you are interested in volunteering to answer members' questions, either leave a message on the BBS or fill in the forms provided for this purpose at the meetings.

POSTNET Barcodes

by William LaMartin, Editor, Tampa PC Users Group, Inc.

Done any bulk mail lately? No? Then you can't imagine what you have been missing. One of the many side benefits of being newsletter editor is the privilege of trying to decipher the many rules of bulk mailing and then deciding which apply to you. Then, once you think you have mastered your little niche of the bulk mail world, the post office changes the rules. That is just what happened to all of us bulk mailers this past July.

Our group being a small nonprofit makes things a little easier —not to mention cheaper—than it is, say, for a Realtor doing his or her mailings. He must now, if he is to receive the lowest possible rate, have his mailing list certified several times each year as to containing only legitimate addresses with nine digit zip codes and carrier route numbers, which people in the business will do for him for a small fee. Or he can buy the appropriate program and the updated CD's each three months and do it himself for about the same cost. Then on his mailings he, of course, must print this information with the addition of a POSTNET barcode. Most likely all of the above will probably apply to our group before long.

So, why my interest in all this and what does it have to do with computers? Well, I am interested because it may soon apply to our group and because someone asked me to help them with just such a problem. Of course, if their super software package, which was supposed to do anything a Realtor could ever imagine needing doing as regards keeping records on and keeping in touch with his clients,

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if ithey are not received on time.

Members may insert non-commercial ads at no charge with the following imitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

SECRETARY'S REPORT & MINUTES OF MEETING November 11, 1996

Minutes and Comments by Jenny Lind Olin due to Bruce Register's absence.

President Connie Kincaid called the meeting to order at 6:27 p.m. She extended a welcome to new members and visitors. Current officers and SIG leaders were recognized. She stated that nominations will be taken from the floor for the election of new officers for the coming year. She invited visitors and members to take advantage of the table with the "freebies." A Micrografx brochure about Windows Draw Graphics & Print Studio, version 5 was passed out as promised last month.

Connie made several announcements concerning the Special Interest Groups (SIGs) as there were some changes in the schedule:

The Genealogy Computer SIG meets on the third Wednesday November 20 (this month), but the December meeting will meet on the first Wednesday, December 4 (next month).

The Access SIG meets on the third Thursday, November 21 (this month), but there will be no December meeting because of the anticipated Christmas activity. The Communication SIG had met on the first Monday, November 4, but there will be no meeting in December because of the unavailability of the meeting facility. The next Communication SIG will be January 6, 1997.

Nominations for the 1997 officers were opened from the floor resulting in the following slate. President: Connie Kincaid was nominated by Jim Clark, seconded by Larry Anders and others. Vice President: Michael Hodges was nominated by Margaret Petro, seconded by Richard Naber. Secretary: Merle Nicholson was nominated by William LaMartin, seconded by Larry Anders and Jim Clark. Treasurer: Will Goble was nominated by Charles Howe and seconded by Fred Buss. Member At Large: Bruce Register was nominated by Margaret Petro and seconded by Larry Anders. Nominations from the floor will also be taken before the vote at the December Meeting.

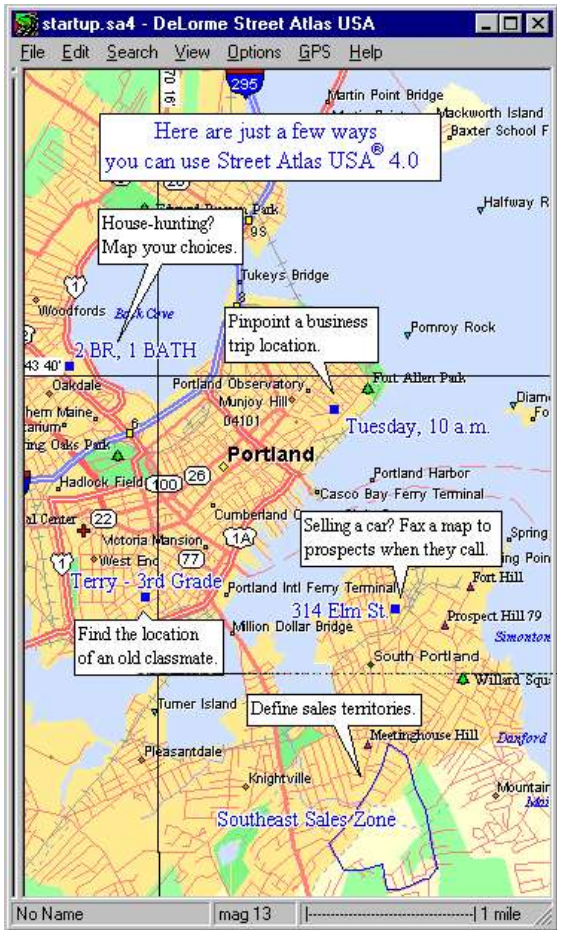
The following appointments were announced and accepted: Kevan Sheridan had agreed to continue as our SYSOP; Larry Anders agreed to continue as the Librarian; William LaMartin agreed to continue as our Editor of the Newsletter "Bits of Blue" and the TPCUG Home Page on the World Wide Web (WWW). Margaret Petro was asked and she accepted the newly defined position as the Educational Chairperson. She will be aiding the present SIGs and creating new Educational programs and new SIGs. Ken Boyd volunteered to help Margaret in her new position.

It was announced that the Swap Meet/Bargain Table would take place at the next regular meeting December 11, 1996. There will be a $5.00 donation per vendor for space at a table. Vendors and members are invited to set up a table to sell their useable computer components. TPCUG will also have a table.

The meeting place "move" from the Ybor Campus of Hillsborough

(Minutes.....Continued on page 6)

Software Review



Street Atlas USA Version 4.0

by Larry Anders, Librarian
Tampa PC Users Group, Inc.

There are only a handful or so of software packages that I have stuck with from the beginning, and Street Atlas USA from DeLorme is one of them. For quite a while now Street Atlas USA has been the best mapping program of its kind, and with version 4.0 it has only gotten better.

New features allow you to:

- Draw lines and shapes
- Measure distances and areas
- Get up-to-date travel information
- Show Zip code boundaries and demographic information
- Copy maps from CD to PC
- Map imported databases and a few other things

You can now add your own lines or various shapes to personalize your maps. Add your own roads, indicate property boundaries, draw a circle to show your house or business in relationship to other homes or businesses or map sales territories.

You can now click on any two points and Street Atlas USA 4 will give you the distance between each point. If you add more points or draw a shape or circle and you will get the area inside that shape. Distances are given in feet, miles or meters and areas are in kilometers, acres and hectares.

Just click on the *UPDATE* button and your Internet service will automatically be started and *"go-online"* to DeLorme's ***FREE*** Internet link for you to get all the latest highway construction information, latest updated weather and other localized current event information such as local festivals, etc., and display them right on your maps. This is really a neat feature!

Street Atlas USA 3.0 was the first mapping program to link to a CD-ROM phone directory, Phone Search USA (also available from DeLorme). With version 4.0 now you can also import names and addresses from your own personal database or contact manager and pinpoint them on street-level maps.

I had always felt that Street Atlas USA was the most detailed mapping software I had used, but now I think it's even better. Now there is also demographic data like population, income, home values, and average age by Zip codes. Also included are area codes and landmarks. You can also denote Zip code and county boundaries.

If there is a particular map or section that you use quite frequently you can copy or download that specific information to your desktop or portable PC for faster access. This could be great for presentations or transferring data to a PC that does not have a CD-ROM.

TAKE NOTE OF THIS…. NEVER GET LOST AGAIN! For $125 you can get Street Atlas USA 4.0 and ***TRIPMATE***, a high-performance, easy-to-use link to the satellite navigation technology of the Global Positioning System. (GPS is a network of 24 orbiting satellites, placed there by the US Department of Defense, that broadcast low-power radio waves.) With a portable PC, Tripmate will locate you on detailed maps anywhere in the United States. An arrow shows your position on the map and moves as you travel using signals that determine your position, altitude, speed and direction of travel. Even though this seems like "Star Wars" technology DeLorme claims it's really easy to use.

Street Atlas USA 4.0 can save a map in its proprietary format that can then be e-mailed to anyone else with Street Atlas 4.0, and viewed and/or printed on the other end. If there is a negative feature with Street Atlas USA 4.0, it's that it cannot be directly saved to any other file or graphic format. The screen can be captured or copied to the clipboard, brought into a graphic type program and then saved in various graphic formats. I would rate this process as only *good*. Whereas printing directly from within Street Atlas USA I would rate as *SUPERIOR*.

(Atlas.....Continued on page 6)

Suncoast Freenet

by Charles Howe,
Tampa PC users Group

A huge resource is available to Tampa Bay area (Hillsborough County, Pinellas County): the Suncoast Freenet. After a few generalities, this article, which is prescriptive in nature, tells you a shortcut technique which will substantially enhance your efficiency in using the Freenet.

Signing up:

If you aren't signed up already, you can do so by dialing 273-3755 (Hillsborough), 298-1653 (Pinellas). Or you can go to a public library and find at least one workstation networked to the server. Follow the directions on the screen in either case.

Accessing after you have signed up:

It is much faster to use a networked computer at a library. The modems you connect to when you dial in from home are 2400 baud only. A third method of access is available if you have a shell account with a commercial ISP: telnet. At the command prompt type

telnet scfn.thpl.lib.fl.us

("scfn" -- Suncoast Freenet. "thpl" -- Tampa-Hillsborough-Pinellas Library.) Then log on in the usual way.

You can telnet to the site and log on as visitor.

Shell account:

The freenet is a UNIX box. You have a disguised shell account. You do not (are not allowed to) type in UNIX commands. You follow the menu. Your menu choices are translated into a series of UNIX commands that accomplish your objective, but you never see them. The all important seeming exception is explained below.

Getting to the Main Menu:

When you log on, a one-screen page shows up. (Nomenclature: A page consists of 1 or more screens -- can be many.) Read it the first time you see it (you will skip by it automatically afterwards), then press the enter key. You are at the second page. Read the first screen, press the space bar (this is UNIX's way of proceeding through text), read the second screen, etc. When you are ready to proceed to the next page -- you will be immediately after you have read it once -- press q (as per the instructions at the bottom of the screen; learn them), then return. The third page shows up. Study it also, but very soon you will find yourself pressing q, return in one motion.

The Main Menu:

The main menu shows up. It is the starting point for whatever you do on the Freenet. When you have settled into a routine of using the Freenet -- know what topics you want to deal with -- you will key in a word (take a shortcut) which will either take you where you want to go or nearly there -- some navigation by menu may be necessary, but not as much and maybe none at all. In this learning phase, we are going through some menus. They will show you how to get at all the shortcut words.

The top line reads

SUNCOAST FREE-NET MAIN MENU (menu = main)

We will refer to it as the Main Menu. From it, choose

1. Suncoast Free-Net (Administration, Help & Index) (admin)

A second menu with the top line

ADMINISTRATION CENTER (menu = admin)

shows up. Choose

14. Suncoast Free-Net INDEX

We have now gotten to the menu that is the centerpiece of this note. We see

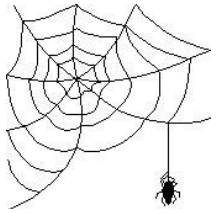
SUNCOAST FREE-NET INDEX (menu = index)

1. A - B
2. C - D
3. E - G
4. H - J
5. K - M
6. N - Q
7. R - S
8. T - Z
9. Index to USENET Discussion Groups
10. Another Index to UDGs

(There is also a two-line set of navigation instructions at the bottom. Many screens contain one of two two-line sets of navigation instructions. If you become a serious user of the Freenet, they will become second nature.)

Each of these menu choices gives you one-line descriptions of

(Freenet.....Continued on page 8)



SOFTWARE AVAILABLE FOR REVIEW

1. **Flight Simulator for Windows 95** - Microsoft-Fly a plane in Windows 95 - CD & Pentium required.

(Atlas.....Continued from page 3)
System Requirements:

- IBM-compatible computer with
- 386SX (33MHz) processor ·8MB RAM ·9MB hard drive space ·CD-ROM drive Super VGA graphics ·256-color monitor mouse ·Microsoft® Windows® 3.1 or later (designed for Windows 95)
- Recommended: 486DX (66MHz) processor or higher color printer
- (for Tripmate you will also need a portable PC, 4 AA batteries, and/or DeLorme's AAA Map 'n Go.)

In my opinion this is the finest software of its kind on the market today. And if you own a color printer, you won't believe the quality of the printed maps. The street price ranges from $40-$50 with an upgrade from version 3.0 directly from DeLorme for $25. I took the upgrade route and got more for my money than most programs I've upgraded lately. This program would make someone a great Christmas gift.

DeLorme

(Minutes.....Continued from page 2)
Community College to the Museum of Science & Industry (MOSI), at 4801 East Fowler, 33617 has been tentatively set for February, 1997.

The membership was invited by Clark Evans to visit MOSI to observe the Ham Radio Station setup. Call 988-0125 to get in free.

Charles Howe informed the group that ISDN is getting close to affordability and is very fast, all digital. He said two companies, Packet Works and Internet Junction (ij.com), resale GTE services for about $37.00 per month. There is no charge for a voice call. GTE charges $.02 per connection plus $.02 per minute after the ISDN line is installed.

Michael Hodges took a survey of on-line users. Eight members use AOL and 2 used MSN, the two services with unlimited access. Two members use Compuserve, none uses Prodigy. Most use other independent Internet providers, and almost everyone in the room had some Internet access. Some people raised their hands more than once, indicating that they use more than one service.

A discussion followed concerning a networking segment of the meeting for employers to meet those looking for computer related work.

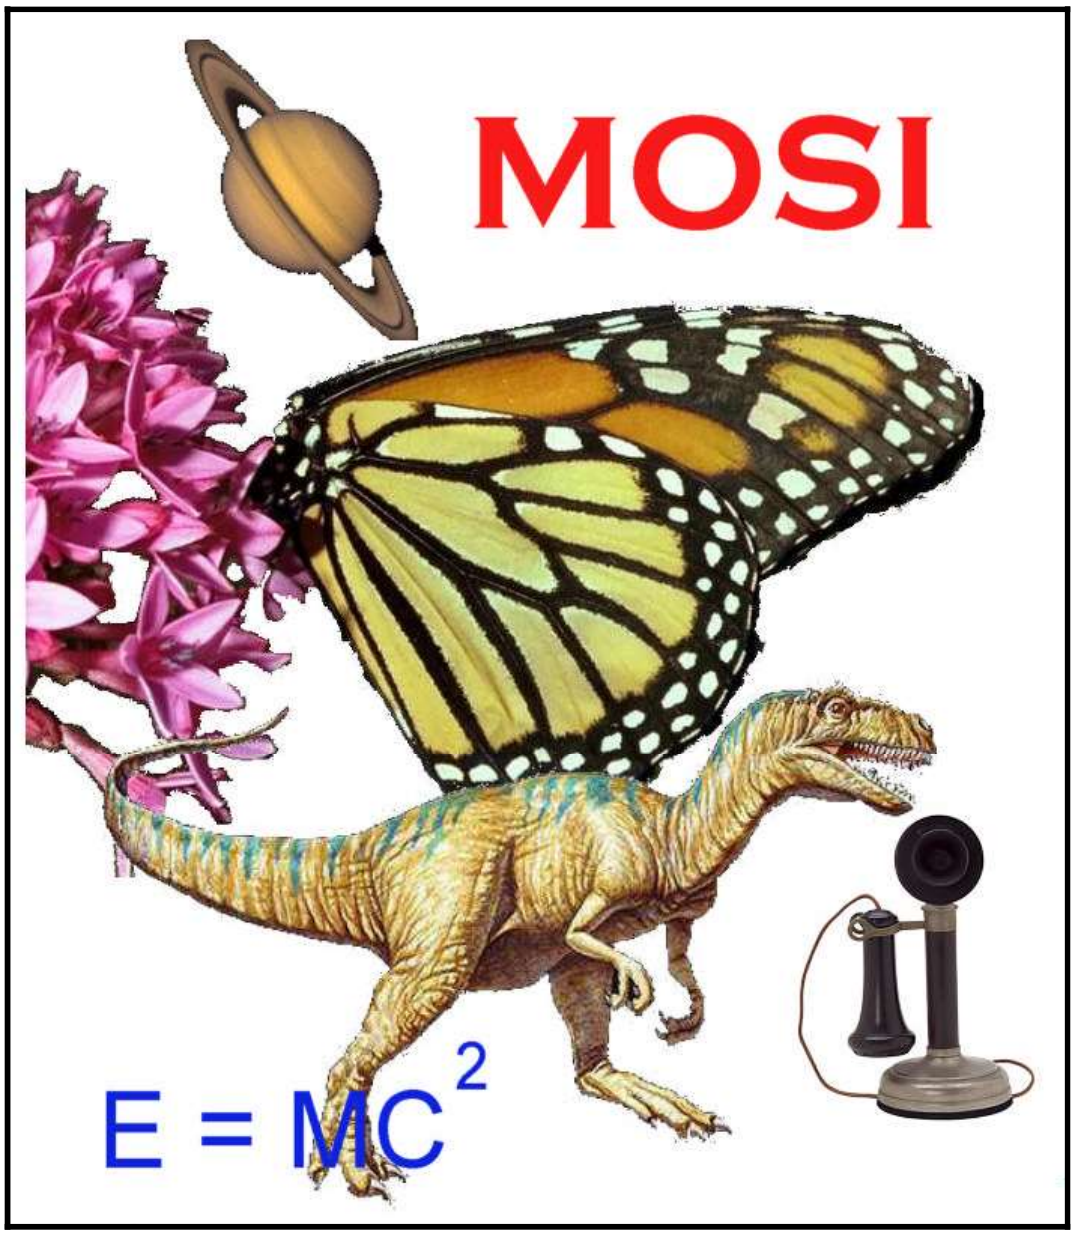
A program about "Upgrading your Computer Components" was presented by Steven T. Singer, Chief Executive Officer of Regnis Distributors, Inc. He has a degree in industrial engineering from the University of South Florida. He stated that to purchase computer components from his company, you would have to have a tax number and have a business license in computers or electronics.

He said proprietary computers are hard to upgrade, you could get a fine middle of the road computer built by Gateway, but you are better off building your own computer (or having it built).

When upgrading your computer system the key words are Bigger, Better, Faster. This is accomplished by getting a faster processor. We have moved from the 286 to a 386, then the 486, next the Pentium Others, 586s and 686s are also available. A faster processor requires a new mother board, available now for under $100. Other means of upgrading entail upgrading the software for the BIOS; new chips for speed and more memory; better video cards or more memory for the video card for more colors.

Before upgrading ask: How fast is it? Does It work? How much does it cost? The time to upgrade is now as prices are coming down. The bottom line, though, is the compatibility testing: what will work with what.

Steve gave a presentation that seemed to capture the interest of everyone. He spent much of the talk describing the many different CPUs available, their advantages and disadvantages. He was being questioned during the break and was still giving out information long after the meeting was over and I was leaving the room. I don't know if I left knowing less about more or more about more. This was definitely one of the most interesting presentations, in spite of its mind-boggling aspect.



Steven can be contacted by phone: (813) 623-3302, FAX (813) 622-8580 or E-mail
RegnisDist@aol.com. His BBS number is 622-8948.

(Barcodes.....Continued from page 1)
really did what any reasonable person would think that it would do based on the program's description, then there wouldn't have been too much of a problem. And if this individual had owned Microsoft Access and Microsoft Word, which together can certainly handle record keeping, mail merge, label printing, etc. with POSTNET barcodes, then there wouldn't have been much of a problem either. But that was not the case, and buying those programs is a somewhat expensive solution to printing mailing labels with barcodes. So I rebuilt the individual's database, since the supposedly super program would only export the fields necessary for mailing, leaving behind all sorts of other client information. I assume that this was to prevent the customer from ever changing to another program. Then with the rebuilt data, we found an inexpensive program called *My Advanced Mail List* which will do the addresses with barcodes on labels or letters. It will also allow you to edit, import and export all of your data fields. Its only shortcoming was that it didn't do mail merge on text documents. But how much do you want for $40. The super program that wouldn't allow you to export all of your

The Computer Chicken

discovered by Merle Nicholson,
Tampa PC Users Group

NT Chicken: Will cross the road in June. No, August. September for sure.

OS/2 Chicken: It crossed the road in style years ago, but it was so quiet that nobody noticed.

Win 95 Chicken: You see different colored feathers while it crosses, but cook it and it still tastes like ... chicken.

Microsoft Chicken (TM): It's already on both sides of the road. And it just bought the road.

OOP Chicken: It doesn't need to cross the road, it just sends a message.

Assembler Chicken: First it builds the road ...

C Chicken: It crosses the road without looking both ways.

C++ Chicken: The chicken wouldn't have to cross the road, you'd simply refer to him on the other side.

VB Chicken: USHighways!TheRoad.cross (aChicken)

Delphi Chicken: The chicken is dragged across the road and dropped on the other side.

Java Chicken: If your road needs to be crossed by a chicken, the server will download one to the other side. (Of course, those are chicklets.)

Web Chicken: Jumps out onto the road, turns right, and just keeps on running.

Gopher Chicken: Tried to run, but got flattened by the Web chicken.

Newton Chicken: Can't cluck, can't fly, and can't lay eggs, but you can carry it across the road in your pocket !

Cray Chicken: Crosses faster than any other chicken, but if you don't dip it in liquid nitrogen first, it arrives on the other side fully cooked.

Quantum Logic Chicken: The chicken is distributed probabilistically on all sides of the road until you observe it on the side of your course.

Lotus Chicken: Don't you *dare* try to cross the road the same way we do!

Mac Chicken: No reasonable chicken owner would want a chicken to cross the road, so there's no way to tell it to.

Al Gore Chicken: Waiting for completion of NCI (National Chicken-crossing Infrastructure) and will cross as soon as it's finished.

COBOL Chicken:

```
0001-CHICKEN-CROSSING.
IF NO-MORE-VEHICLES THEN
PERFORM 0010-CROSS-THE-ROAD
VARYING STEPS FROM 1 BY 1 UNTIL
ON-THE-OTHER-SIDE
ELSE
GO TO 0001-CHICKEN-CROSSING ◆
```

(Barcodes.....Continued from page 8)

data fields cost more than ten times that much.

Now, all of this got me to thinking about how I could print barcodes for mailing without any special program. After a little research on the Internet, I found that to print a POST-NET barcode for an address you first produce a 12 digit number as follows:

Take your nine digit zip, 33606-2904 in my case, and write it as 336062904. Then you add the last two digits of your street address to this. So, since my street address is 821, I now have 33606290421. Finally you need to add what is called the check digit. To get this you add up all the digits in the above number, which comes to 36 in this example. You then select the single digit which when added to this sum would give you a multiple of 10. In my case the check digit is 4, since 36 + 4 = 40. Thus our 12 digit number is 336062904214.

Now, to get a POSTNET barcode out of this all we need is a barcode font. The Internet also provided me with such a font. This particular font requires that you write the zip to be bar-coded as follows s336062904214s. Other barcode fonts want you to use an * instead of the s, others use /'s to enclose the zip. So to get my barcode all I do is write out s336062904214s, select it with the mouse, go to the menu bar of whatever program I am writing this in, select the appropriate barcode font as the font for the highlighted text and you

Microsoft Access SIG

No meeting in December. This SIG Meets on the 3rd Thursday of the month at 6:00 PM at the Reflectone Building. Directions: Proceed west on Waters from N. Dale Mabry across the railroad tracks (which is about 1 and l/2 miles), take second left on Savarese (United Technologies bldg. is just beyond it). Proceed on Savarese until you reach the Reflectone bldg. Take the North door. If you need to ask directions, there is a security guard at the location. PLEASE SIGN IN WITH A SIG LEADER.
For more information call Connie Kincaid - 661-8185 - Leave a Message.

Communications SIG

No meeting in December. This SIG meets the first Monday of the month (at 6 PM at the Reflectone Building. You must sign up to get on the list and to get by security. See Microsoft Access SIG for directions to Reflectone. *Contact Charles Howe: at 968-1207 or HOWE@INTNET NET*

Genealogy SIG

This SIG normally meets the third Wednesday of the month. at 7:00 PM at a member's home. **However, December 4 is the next meeting.** *Contact SIG Leader Jenny Lind Olin at 960-5723 for directions and RSVP.*

PC Willy

Q. Dear PC Willy

Ya know that I've gotten in the mail about 20 to 30 free startup disks from AOL, Compuserve, and Prodigy and some others and I was wondering if I could reformat these disks and use them for other data. Is that allowed?

signed Howed Theygetmyname

A. Dear Howed Theygetmyname

Well you can do anything you want with those disks that they sent you because they're unsolicited advertising. But be carefully about keeping valuable data on them because they are usually not the top of the line disks. I've thrown away about half of the ones that I've received because of errors and bad sectors. Sometimes it's better to just delete all the files on the disks rather than format them. (Be sure to run scandisk on them with surface scan.)

PC Willy

Q. Dear PC Willy

My laptop computer is only about a year old and the battery doesn't seem to hold a charge as good as it did when it was new,any suggestions?

signed Q.K. Typer

A. Dear Q.K. Typer

A lot of batteries will have a "memory effect". That is, when you recharge the battery without completely discharging the battery it will start charging itself faster and faster but not to full capacity. Many machines will cut off before the battery goes dead so the battery never gets to discharge completely and the "memory effect" slowly keeps the battery from charging to its full capacity. A way to overcome this is to use a separate battery charger that will completely kill a battery before it charges it (there are some new ones that do this automatically). But if you remove the battery and put a light bulb (usually a 12 volt car turn signal bulb will do) with wires to the battery and leave it connected for a couple of hours to completely discharge the battery then charge it overnight and kill it again with the bulb 2 or 3 times, that will remove the memory in the battery and make it bounce back to nearly new again. This only applys to NiCad batteries not to the new NiMh ones.

MEMBERS HELP-LINE

The following phone list is provided for our Tampa PC Users Group members in an effort to establish local support for those frustrating times which we have all encountered while using our PC's. Please note that these are members that have volunteered to help you; treat them in a courteous manner. Be sure to ask if it is convenient for them to help you now, or if you should call another time. It would also be helpful to have your documentation and have it handy when you call. (Don 't expect help if your software is an illegal copy or you do not have documentation!) TPCUG is not responsible for the information or advice provided by volunteers. Volunteers may or may not be experts in the subject matter. You are on your own with any advice received. Be aware also that some of these volunteers may be consultants in their area ofexpertise. If you are interested in volunteering to answer members' questions, either leave a message on the BBS or fill in the forms provided for this purpose at the meetings.

think my mail carrier will deliver a letter to me with that bar-code as the only information on the letter.

However, once you have figured out this much, you just have to write a basic program (Visual Basic in my case) that will take an address with a nine digit zip code and turn it automatically into an address with such a bar code and print it on an envelope or label. Well, when you have gone this far you might as well go all the way. That is, write a Visual Basic program which will open a database containing mailing information, then print out mailing labels for a selected group of entries such that the labels also have POSTNET barcodes as described above.

This is an example of what I enjoy in computing. I used the Internet to find the needed information. Then I used my knowledge of Visual Basic programming to produce a solution to my problem of printing POSTNET barcodes. ◆

MOSI, Compaq & OmniForm

by William LaMartin, Editor, Tampa PC Users Group, Inc.

MOSI I am sure most of our members are happy to be moving the meeting site to the Museum of Science and Industry beginning with the February meeting. Unfortunately for me, it will mean a longer drive—at rush hour. For some of you it will be closer than the present location, so that balances out. Driving distance notwithstanding, it has to be a good move for the group. I have watched our membership and attendance at the meetings steadily decline following our move from the IBM building to the present site. It is a simple fact of life that many people over 40 just don't want to be in the Ybor City entertainment district when the sun goes down. I remember one fellow in the computer field whom I invited to our meetings last year. When he found where we met, he said, "There is nothing you could be doing that would make me risk my life by going to Ybor City after dark." We, however, have been coming to Ybor City after dark for almost two years with no ill effects, but such ideas don't die easily. And this perception has been a definite drag on our group. But we have survived and are now ready for a new beginning at MOSI. For this, we are most appreciative of Ford Bond, affiliated with both the Tampa PC Users Group and MOSI, for his assistance in making this move possible.

Compaq I always thought of Compaq as a fairly good company, but some recent events have changed my mind. The first was when a friend wanted to upgrade an older Compaq and found that basically nothing but the hard drive, keyboard and monitor was salvageable due to the proprietary nature of the computer's design. How-

SECRETARY'S REPORT & MINUTES OF MEETING December 1996

Minutes and Comments by Bruce Register, Secretary

DECEMBER MEETING

The December meeting was devoted to the bargain table and swap meet. Several people came away with some real bargains in software and hardware. The networking appeared to be equally rewarding. A lot of questions were answered for all of us.

JANUARY MEETING AT HCC YBOR

The next meeting is January 9, 1997 and is our last at the Ybor location. Since we didn't get around to the formal election of officers for 1997, we will do this at the January meeting.

FEBRUARY MEETING WILL BE AT MOSI

The February meeting will be at MOSI on East Fowler opposite the USF campus. The TPCUG will congregate in the lobby promptly at 6 PM for networking. A 6:30, we will move to the meeting room. The front door will be locked at 6:30 as we move to the meeting room. If anyone is later than 6:30, stand by the front door and get attention of security as they pass to be admitted and led to the meeting room. We certainly do not want anyone to miss the meeting. Sometimes, we just absolutely cannot get there by 6PM or even 6:30...Come on anyway! ◆

(Comments.....Continued from page 1)

ever, that doesn't bother me as much as the following problem a member of our group encountered recently.

Apparently now when you buy a Compaq Presario with Windows 95 loaded you do not get a copy of Windows 95 on a CD or as a collection of floppies. You are advised that you have the "right" to make a backup copy of the operating system. To do this you must feed about 29 disks into your computer. When you are finished, you still don't have a real copy of Windows 95, though, since there is one more disk, a startup disk that you have to use before you can use the first disk that you made (in case you need to reinstall the operating system). In fact, this startup disk apparently partitions your C drive into a standard DOS partition and a nonstandard proprietary "Compaq" partition. Now, you are ready to use those 29 or so disks you made

(Comments.....Continued on page 8)

Software Review

InfoPedia 2.0

by Larry Anders, Librarian
Tampa PC Users Group, Inc.

In the past I've reviewed other multimedia encyclopedias, and I own several, such as Microsoft's Encarta, Compton's Interactive and Grolier's, to name a few. I like them all to some degree. But now there's one that is truly multimedia, down to having your own personal "human librarian" guide to show you what's included and how to use it. There was obviously a version 1.0, which I know nothing about, but I can tell you about version 2.0, which I am going to do now. I am always on the lookout for quality software at a reasonable price and this one scores an "**A**" in both categories.

First, let me tell you about the references Infopedia 2.0 comes with…you get all this:

- The complete 29-volume Funk & Wagnalls New Encyclopedia
  Thousands of articles with hypertext links you can click on to find more information.
- Roget's 21st Century Thesaurus
  More than 450,000 synonyms yield over 1,000,000 word choices.
- Hammond World Atlas
  Explore the world through hundreds of richly detailed full-color maps.
- The 1995 World Almanac & Book of Facts
  The most comprehensive and up-to-date collection of facts anywhere.
- Merriam-Webster's Collegiate Dictionary
  Over 200,000 definitions.
- Webster's New Biographical Dictionary
  Details on the lives of more than 30,000 leaders.
- Merriam-Webster's Dictionary of English Usage
  The ultimate source book on English usage.
- The Merriam-Webster Dictionary of Quotations
  Who said what, when? More than 4,000 quotes from the world's personalities.

Infopedia allows you to search all eight references simultaneously with one mouse click. You can also browse through a gallery of videos, photos, and animations and listen to more than 450 sounds -- an interactive experience that will both inform and entertain you.

Although Infopedia 2.0 uses a single window interface to keep things faster and easier to use, it also comes with six different *View* capabilities. The ***Browser*** is an alphabetical list which displays all the topics. You could just scan the list to find what you're interested in, but, if you start typing, the list will automatically adjust to your topic. The ***Browser*** functions differently depending on which of the six Views is currently active.

- **Index View** - general reference mode that shows every entry alphabetically
- **Media View** - shows only entries that include photos, videos, maps, sound clips or animations - filter-out whichever media you are not interested in
- **Search View** - search for entries that include specific words or phrases - utilize AND, OR, or BUT NOT
- **Book View** - look and feel of a real book - displays Table of Contents - access entire contents of book, including preface, index and notes
- **Subject View** - list of entries within a particular area of interest
- **Project View** - organize research into printable, integrated projects - create customized time-line

Other features include the **Zooming Atlas**... that allows you to zoom in to see detailed maps and information on cities all over the world; **Morphing Maps**... where you can discover how great events in history have reshaped our world and see how the earth has changed over time. (These are narrated entries.) The **Instaview Tool Bar**... gives you instant access to Infopedia's wealth of articles, videos, photos, maps, and

Monty Python and the Quest for the Holy Grail from 7th Level

Review by Jim Weber, Tampa PC Users Group

What would you expect from a game that begins with the disclaimer "No Refunds"? This truly warped humor is your first greeting to the latest game from the Monty Python troupe. Just getting through the opening sequence and actually starting the game will be enough to remind you of why Monty Python had such an avid audience. Monty Python and the Quest for the Holy Grail follows the adventure of King Arthur on his famous quest for the Holy Grail along with all of the usual obscene jokes, sexual innuendo, and references to things only the British would find funny.

The game follows the same story line as the original motion picture, along with the original video clips and dialog from the film. If you saw the movie you have a good idea of what Arthur is expected to do during each scene to progress to the next task on his search for the Holy Grail. Of course if you want to finish the game successfully you have to stick around and search for the various hot spots to find clues and collect items for your quest. (I still don't know why I had to collect a pile of dung.) Some of the hot spots have to be hit more than once to give up all their secrets.

During your search several other small games appear upon completion of a task. "Drop Dead" is a spoof of Tetris played by stacking dead bodies in a pit. The Python comes through when the live ones get thrown in also with their little cries of "I'm not dead." Another game is "Burn the Witch", where witches are burned at the stake in various colors of flame and musical screams. Like the old "Simon Says" game, the object is to repeat the sequence each time as the number of flames increases.

Holy Grail is full of the off color humor that made the original Monty Python series so popular. I personally am a big fan of Monty Python and enjoyed this game. The bizarre and racy British humor associated with the Monty Python series is readily present during game play, so if you wouldn't let your children watch the show, don't get them this game. Also, those of you who don't really get Monty Python probably won't enjoy this game either. Monty Python and the Quest for the Holy Grail falls into a sort of love, hate category of games that make it really difficult for any one to either endorse this game or not. I would have to leave that decision to the individual gamer, but I found the game to be an enjoyable trip through Python Land.

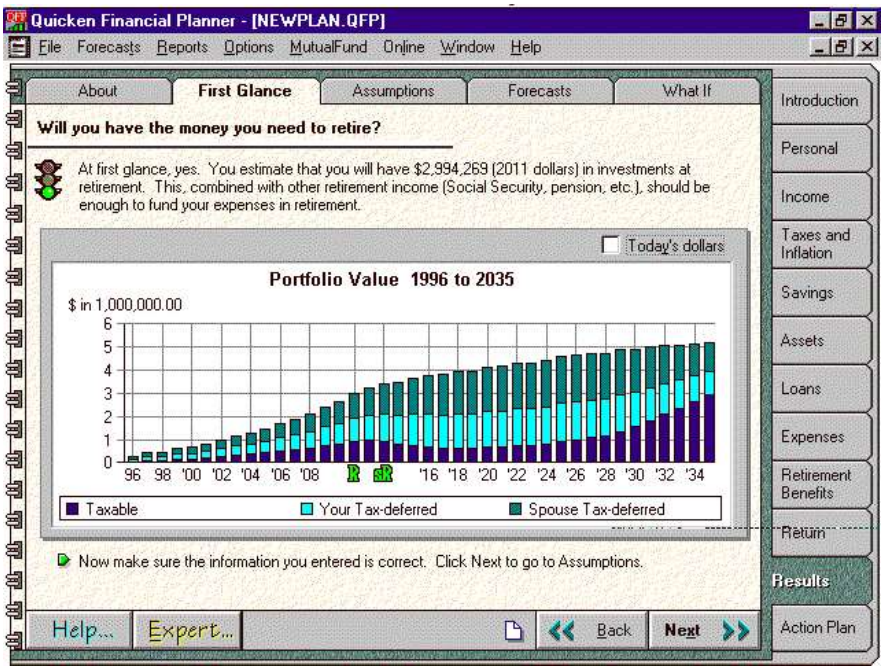
Quicken Financial Planner from Intuit Version 2 CD-ROM

Review by Rob Davis, Tampa PC Users Group



Do you want to retire and have the money to do those things you wanted to do but didn't have time for while you were working? Now that all that Holiday shopping and party fun is over, we may want to look into our financial future. That is what Quicken Financial Planner (QFP) can do for us. It can not give us all the answers for our particular situation, but it can certainly lead us in the right directions for planning our future financial needs.

Although the installation of QFP went without a hitch on my system (running Windows 3.1), this program is not made to run on your old XT! In fact, the system requirements would be considered pretty heavy a few years ago. It requires at least a 486/33, an MPC2 compatible CD-ROM drive with speakers and sound card, running MSCDEX 2.2 or higher, Windows 3.1 or 95, 8 MB RAM or more, a hard drive with at least 16 MB free, a 256 Color VGA Monitor, and about any printer supported by Windows. The video clips and graphics are what you couldn't get with that old XT. I installed this on my 486 DX4-100 with 12 MB RAM, a 2X CD-ROM, and lots of disk space.

Have no fear about reading a thick manual to run this program. There is no thick manual to read. In fact, if I weren't writing this article about QFP, I probably wouldn't need the manual at all. You are guided every step of the way through the initial setup and planning to the view of your future financial state.

It's a simple concept actually. First, you tell the program about your finances by answering simple questions. Next, you can play what if with various entries to see what you may need to change to make your plan work. There is also "expert" financial advice available in the form of video clips and pop up notes to help you make decisions. Then, of course, you can view results on screen or print out summaries, plans and graphs that will detail your path to financial security. The planning can guide you on how much you need to save, what ways you should invest those savings, and how to track your progress.

You can start with the QuickPlan which can be done in a matter of minutes. Later you can go back and add more details to the plan. QFP handles most retirement plans including 401(k), IRA's, 403(b), SEP, Keogh, and tax-deferred annuities. It will also automatically calculate your estimated Social Security Benefits. If set up properly, it can import data from your Quicken account. There is a built in access to the Internet for free access to financial information on the Quicken Financial Network.

QFP is mainly set up for stocks, bonds, annuities, retirement plans, and the like. Although my main investments are in the rental business, I was able to put my rentals and mortgages into my plan. And although this may not be the ultimate in financial planning programs, overall I found it to be very good for planning a financial future and showing the areas that may need improving. ◆

In January, the start of a new Program within the TPCUG

ANNOUNCING THE CAREER CORNER

at the

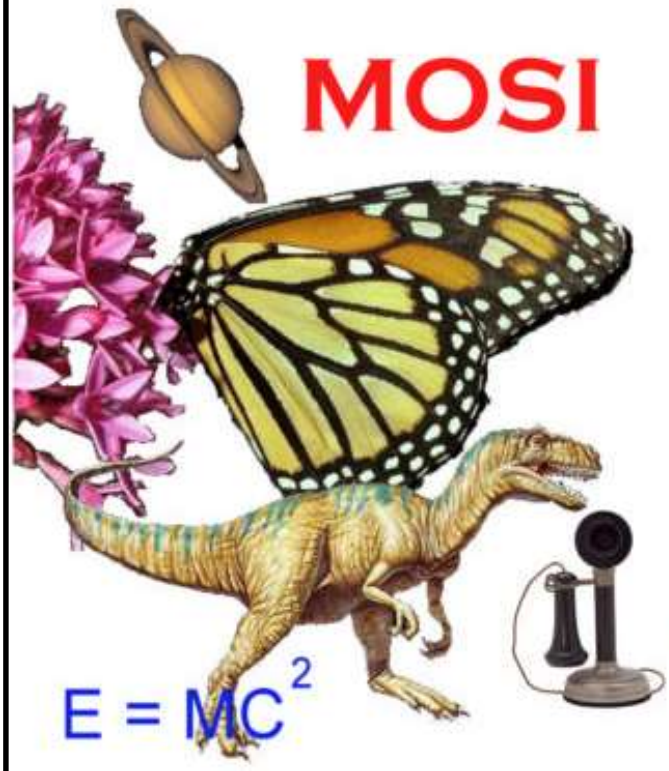
Tampa PC Users Group monthly meeting

From 6:00 to 6:30 PM we will have a networking half-hour at our monthly meeting devoted to potential employers and employees.

The *Tampa PC Users Group* has been serving the greater Tampa Bay community since 1984. The *Tampa PC User's Group* is a non-profit organization dedicated to providing educational opportunities to the community in the area of personal computer technology.

We have been frequently contacted by companies looking for talented Information Systems people. In 1997, we are expanding this "informal networking" into something that will provide more opportunities to serve the community.

When: Wednesday, January 8, 6:00 PM.



Where: Ybor Room, Administration Building
HCC at Ybor City
Corner of Palm Avenue and 15th

What to do: Come prepared to meet potential employers/employees

For additional information, call Connie Kincaid at 801-3532 (days) or 661-8185 (evenings) *connie@cybercup.com*

or Wil Goble 626-1892 (days) or 684-8004 (evenings) *wilgoo@aol.com*. ◆

In February, follow the Tampa PC Users Group to MOSI

Beginning with the **February** meeting, we are moving the site of our monthly meeting from the Ybor campus of HCC to the Museum of Science and Industry at 4801 E. Fowler Avenue, Tampa, FL.

This will be a much better facility for us with computers and projection equipment on site.

We will first gather in the lobby of the main entrance. After the "Career Corner" in the lobby, we will move to the meeting room. ◆

(Comments.....Continued from page 2)
to reload your nonstandard version of Windows 95—you can only pray that there is not a defective one among them. What is the problem with Compaq simply providing a CD version of Windows 95 with the computer? Other companies do it. Do they have to pay Microsoft more if they provide the CD or is it just another method of making their systems proprietary so as to better control their manufacturing process—good for their cost control, but not good for you if you plan on making any changes.

If you run into a problem getting things back in order, you can call Compaq (the call is free if they determine the problem is their fault) and they will send you a" Compaq Quick Restore" CD with accompanying floppy. I assume the floppy is to boot up, put in the proprietary partition, and install your CD ROM drive software. Each model of Compaq has its own separate Restore CD, and the CD will return your computer's hard drive to the state it was in when you purchased the computer. Same question: Why couldn't this CD be included with the computer when you purchased it?

I discovered all of this when a member called requesting help with reloading Windows 95 on such a system. He had never been given the Restore CD, and the startup disk he had only gave him a message saying it couldn't proceed any further because the hard drive appeared to be compressed, and he would lose any data there (he didn't mind that). He didn't know anything about the drive being compressed, but perhaps someone else with access to the computer had done that in the past; then again the message may have been inaccurate. Anyway the solution was to give him a real Windows 95 Startup disk that I made on my computer (everyone should make one), have him then boot from this disk, then remove the non-DOS partition from his drive with FDISK, then reformat the drive, and finally use his 29 backup Compaq disks to reinstall their version of Windows 95. That got him up and running, and he installed some of his non pre-loaded software. The only problem was that disk 22 would not load entirely, and it apparently was the one with sound card drivers on it. So he had no sound.

Connie checks her notes

Later he got the Quick Restore CD from Compaq and tried to restore the pre-loaded programs. Sadly this didn't work. The program ran for six hours and produced nothing but an inaccurate progress indicator bar, which made it to 7 % complete then began to act strangely by exiting the right side of the screen and reappearing from the left side. So you get the idea, the Quick Restore is not very quick; nor does it always work

After the above, I went to the Usnet News Groups on the Internet to look for other people having such problems. There I found others had had problems with the Quick Restore CD and who were unhappy with the lack of a real copy of Windows 95. I found one more problem. Suppose a program that is pre-installed, like the Compaq Phone Center, needs to be reinstalled. From the articles I read, the only way to accomplish this is to use the Quick Restore CD—and this wipes your hard drive clean (if it works), including anything you may have added beyond the pre-installed software. And it is not hard to corrupt Phone Center, since from the Usenet News Group messages I gather that Compaq warns you this will happen if you install a program while Phone Center is running. Not hard to do, since it is in the start up directory of Windows and, hence, runs automatically.

So buyer beware. Is Compaq turning into another Packard Bell by going after the Wal-Mart/mass market computer business? Or am I off base here? Let me know if you bought a Compaq computer recently and are happy with it. Are others having such problems with Compaq or other companies? I am willing to bet that there are many more companies who don't supply full stand-alone copies of the software they pre-load.

OmniForm I don't like to be negative, and this form generating program from Caere gives me the opportunity to be positive. This isn't intended as a review of the product, just a note. Perhaps a review at a later date. As this program demonstrates, Optical Character Recognition (OCR) has really come a long way.

Take some printed form you use regularly, put it into the scanner, and press GO. Depending on the speed of your computer, in moments you have before you on your screen OmniForm's best guess as to the layout and wording of the form ready to be edited. And this guess is very good. I have done 20 plus forms so far, and consistently get very good results. The original form's text characteristics are well preserved. For example it knows the difference between Courier, Times Roman, Ariel, and the different sizes of these fonts; it catches bold, Italics, and underline. Everywhere there is a blank line for information to be provided on the form, a yellow highlighted underlined space appears on the screen. Check boxes on the form appear as yellow highlighted check boxes on the screen. Finally, the OCR performed on the form's text is very accurate. Simple forms

(Comments.....Continued on page 9)

(Infopedia.....Continued from page 3)
sounds -- from anywhere in the program. To find information fast you can use the **Outline feature**… to collapse an article to just the main headings and subheadings. Then, click on a heading and Infopedia expands to the text you want.

If you use Microsoft's Word for Windows, Infopedia 2.0 will link to it. While using the word processor, highlight a word or phrase you wish to look up in Infopedia 2.0. Under Word's "view" menu, choose "Infopedia" and an **Index View** will appear open to the entry closest to the word or phrase highlighted. Also, if you own any of the "Intelli Link" reference series, Infopedia 2.0 will create a link allowing you to access those databases.

As I mentioned previously, Infopedia 2.0 is loaded with **HELP**! There is a fully cross referenced help file with detailed instructions on using all the features, plus tips and suggestions to make your research easier. There is a "Tour Guide" Librarian that will give you a full tour through the interface. Infopedia 2.0 is fully customizable to your preferences. You can save the screen layout and last article upon exit so you can start-up where you left off. You can also display the text in any size font you choose.

Although Infopedia 2.0 is designed for Windows 95 it will run on Windows 3.1x. Under Windows 95 the installation was automatic. I just inserted the CD in the drive and voila. I chose to run it directly from my CD-ROM and saved 8 megabytes of hard drive space.

Minimum System Requirements are:

- CPU: 486 SX, 25 MHz processor or better
- Software: Windows 3.1 or Windows 95
- RAM: 8 MB minimum
- Graphics: SVGA (640x480x256) graphics card
- CD-ROM: Double-speed CD-ROM drive with MSCDEX or better
- Sound: Sound card required
- Mouse: Mouse or other Windows-compatible pointing device required
- Plus: Fully compatible with Windows 95 Autoplay Feature

All of this comes on one CD and lists for $89.95. I received an offer in the mail for all of the above and a free gift of *Explorers of the New World* for an incredible $29.95. It wouldn't hurt to call the 800 number listed below. Whether you have kids in school or college or just want to do something nice for yourself, get Infopedia 2.0. It's an **EXCELLENT** value!

Softkey International
1-800-716-8506

(Comments.....Continued from page 8)
need almost no editing. Complicated forms with small print on legal size paper require more editing—sometimes a lot more, but still much less time than if you tried to create the form from scratch. If you want to create a form from scratch, then the program will do this also.

Once the form is in good shape you can then save it as a template, fill it out on the computer, save the form with the filled in data, fax it, or print it. It is a very useful program for those of us who deal with forms and a step toward the paper-less office.

Oh, I almost forgot, you can designate any of the fillable fields on the form as calculation field and thus do simple mathematics on the form. So in theory you could recreate your 1040 Tax form and have the form calculate your taxes. Whether the IRS will accept this form, I am not sure; although, they will accept the Adobe PDF forms that you can download from their Web site and fill in manually. I believe that a carefully scanned and edited copy with OmniForm should look the same.

Selling for around $200 it is not cheap, but for those who hate filling in the same forms again and again, I think this is the answer. ◆

Tim Condon catches up on the news before the meeting

Special Interest Groups

Microsoft Access SIG

This SIG Meets on the 3rd Thursday of the month (January 16) at 6:00 PM at the Reflectone Building. Directions: Proceed west on Waters from N. Dale Mabry across the railroad tracks (which is about 1 and l/2 miles), take second left on Savarese (United Technologies bldg. is just beyond it). Proceed on Savarese until you reach the Reflectone bldg. Take the North door. If you need to ask directions, there is a security guard at the location. PLEASE SIGN IN WITH A SIG LEADER.

This SIG meets the first Monday of the month (January 6) at 6 PM at the Reflectone Building. You must sign up to get on the list and to get by security. See Microsoft Access SIG for directions to Reflectone. *Contact Charles Howe: at 968-1207 or HOWE@INTNET NET*

Genealogy SIG

This SIG meets the third Wednesday of the month (January 15) at 7:00 PM at a member's home. *Contact SIG Leader Jenny Lind Olin at 960-5723 for directions and RSVP.*

PC Willy

SOME RAMBLINGS FROM PC WILLY

Gone are the days of when if you wanted to run a program you just put in a disk and ran the program on that disk. Then came hard drives that would hold many more, different kinds, and bigger programs. Most of these older programs would install in their own directory and would run peacefully by themselves, one at a time. Keeping your hard drive directory fairly well organized was a pretty simple task, every program resided in its own directory and didn't use other directories from the root directory, but made sub-directories under its own.

As I have been a "hardware" type of guy rather than a programmer type, I usually load a directory maintenance type of program rather than just typing DIR to see what's on a hard drive or in a directory. I use a program called Tree View for DOS, and I think it was written in 1989, but it does fine for me. Some people use X-tree or something like it, and my son uses Norton Commander. It's all up to the user as to what you are most comfortable with.

Having worked on many computers (usually to upgrade), I have looked at many hard drives and was amazed to see the things that happen to people who have installed programs that possibly didn't work right the first time or stopped working for some reason or another, and they reinstalled it again, sometimes in the root (only 512 files allowed) and sometimes in a sub-directory of the program that they were trying to run! One lady had 3 copies of Windows on her hard drive and she was wondering why she was running out of disk space!

Well, anyway as I was saying about programs installing in their own directory, most new installation programs will make their own directory and install accordingly. When MS DOS is installed it goes into one directory and puts a couple of files in the root directory. When Windows 3.1 is installed it makes two directories and maybe a file or two in the root. When Win95 is installed it puts all the files and directories under its own directory and a bunch of files in the root (not too bad).

Well, the other day I put on OS2 and instantly lost control. I mean, I used to know all my directory names and what was in them, but when looking at the tree structure I needed a big screen TV to see the whole tree at once!

Well, I guess the programmers know what they are doing (because it does work), but gone are the days that I know what is in each directory and what the program does. I guess that this is USER FRIENDLY in that the whole hard drive is invisible to the average user (sort of like looking under the hood of a new car).

See Ya next month. wilgoo@aol.com ◆

Newsletter Thoughts

by William LaMartin, Editor, Tampa PC Users Group

Well, my contributors did it again and filled the newsletter, so I only have this small space on the front page. This is a good sign. As I have said, it is the group's newsletter, so we need a group effort.

Consider the newsletter for a moment. I have been doing it now for 17 months. It is a good bit of work and the group's major expense. The first part of the work is my collecting (and writing when necessary) the articles and setting up the layout in the computer. Then it is to Kinko's for the printing (really copying), then back here where with the help of Ed Snow, Fred Buss, Charles Howe and Emelie Juardo it gets stapled, folded, labeled and prepared for mailing. Finally I take it to the post office.

While waiting for the printing, I usually prepare and post the Adobe Acrobat version to our Internet site and BBS. Thus it is there before I even deliver the printed version to the Post Office. For printing and bulk mail it costs about $.70 per newsletter. To put the same material—in color—on the Internet costs nothing. Think about it. Times change. Will there be a time when the online version of the newsletter is sufficient for our group? ◆

At the May 14 meeting, Corel Corporation will demonstrate Corel Graphics 7 & Word Perfect Suite 7.
June 11 - Pilgram Software presenting Pilgram's ISO9000 software.

The use of trademarked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if ithey are not received on time.

Members may insert non-commercial ads at no charge with the following imitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

SECRETARY'S REPORT & MINUTES OF MEETING March 12, 1997

Minutes and Comments by Merle Nicholson, Secretary, Tampa PC Users Group

President Connie Kincaid opened the meeting at MOSI at 6:50PM starting in a very spacious room. This was our second meeting at MOSI. We had three guests.

Connie began by introducing the officers and welcoming the guests, followed by the SIG announcements.

Communications SIG - Meets at Reflectone Monday April 3rd at 6PM.

Geneology SIG - combined with the MOSI geneology group the second Monday.

We discussed the Word Macro virus, experienced by two members. The fix for Word 7 (Windows 95) is posted on the Microsoft Internet web site. Also, the latest security fixes for Internet Explorer are available.

We moved into the adjacent computer lab room for the evening program - a comparison of 1996 Tax software. Ford Bond, assisted by Connie Kincaid demonstrated three tax products; TurboTax 1996 by Intuit, Personal Tax Edge by Parsons Technology, and Tax Cut by H&R Block. There was a great deal of interest in compatibility between the most common personal money management software - Quicken and Microsoft Money.

A short view of Microsoft Money was included in the demo showing us the facilities for entering checks by category. Use Microsoft Money for putting your expenses in order. Personal Tax Edge - the CD-ROM version has extensive videos of a slimy guy coaching you through the entry process, a very slick, high-tech way of making the hard parts at least interesting, if not entertaining. Thanks for a great program, Ford and Connie.

While we were there, Ford started up the Internet browser and connected to the IRS, where you can obtain all the forms you'll ever need.

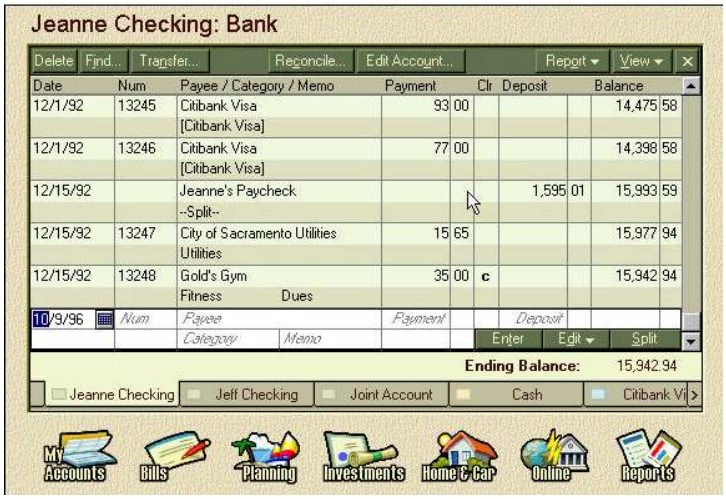
We broke at about 8:25 and held the drawing for door prizes. Richard Nannis drew Harvard Chart XL, Charles Howe won a copy of Beginning Access 95 and Ed Snow won an Adobe cap. ◆

Software Review

Quicken Deluxe 6 for Windows

by Rob Davis, Tampa PC Users Group

Some people may call Quicken a glorified check book register, and maybe it started out that way. But it has turned into a very powerful tool for your finances. This new version has pushed the limits on what can be done with a simple to use and relatively inexpensive personal financial program.



Happily, the installation of Quicken Deluxe 6 from the CD-ROM disk went basically flawlessly. I saw several improvements over the previous versions. The sound and graphics are good, even with my meager 2X CD-ROM. I'm running Windows 3.1, and a 486DX4-100 with 12MB of RAM. The minimum system requirements are a 486, Windows 95 or Windows 3.1, 8MB RAM, 30MB of hard drive space, MPC Compatible 2X CD-ROM, sound board and speakers, 256 color SVGA monitor. They claim you need 6MB more disk space if you load the Netscape software. (My installation only used about 23MB of disk space, that I know of.)

Quicken Deluxe 6 has a new streamlined design making it easier to find and choose what you want to do. Basically, the center is used for the particular thing you are working on. The edges of the screen have icons for all the other things you may want to do. This is my first time using the GUI interface version. It looks like I will be happier with it than with the DOS version.

The help is more helpful, too. There is multimedia video that explains how to get started for the new user. On screen comments guide you on how to fill in any blank, or how to accomplish a task. The 'SHOW ME' button gives animated audio/video explaining how something is done. Another neat feature now is you can do several things like memorize transactions, etc. by clicking the right mouse button, and selecting from a list of options. (This is easier than pressing F4 in my DOS version.)

There is also a 'free' limited access Internet account available. It will let you download stock quotes and reviews. There are tips & tricks and Intuit news and updates available, but you can't browse outside of the Quicken Financial Network. However, for a nominal fee, Quicken can provide a full Internet access account with unlimited browsing and full access to all Quicken Live features.

Quicken Live is a group of features like free price quotes on stocks in your portfolio, a categorized directory of financial sites on the Internet, easy means to download minor upgrades to Quicken, tips on using Quicken, special offers from Intuit, and access to Quicken Financial Network. The Internet can

be a struggle to find what you want, but Quicken claims they can make it easy for you. You can also dial into the Online Banking & Investment center and do online payments. And Quicken can do online accounts with multiple financial institutions as well.

Some other nice features are you can now sort entries (by order) on entry date, amount, or check number (except Investment register). You can also use longer names, account descriptions, etc. There is an improved Billminder, too. It will automatically remind you of bills to pay.

This Deluxe version helps you find hidden or often forgotten tax deductions, too. You just click on the *Planning* icon and then P*ossible Tax Deductions.* I tried this and was led through about 100 possible scenarios. I answered some simple questions. It showed whether I was eligible for some little-thought-of deductions.

One of the other features I liked was the Home Inventory section. You can list everything of worth in your home if you want to. Quicken will assign an estimated value to each item. Of course you can edit the value as you wish. It also has a good list of what to call everything so you can standardize what you name your stuff. For example, you could call your couch a sofa, a couch, a davenport, a hide-a-bed, etc., but in the home inventory list you only find *couch*. By only using names in the standard list, it's easier to group your like things together. (That may be getting a bit too organized!)

For those of you who use *Turbo Tax* for income taxes, this program will output directly into it. For other tax preparation programs, Quicken Deluxe 6 will export your data in TXF format which most of these type programs can use.

The street price of Quicken Deluxe 6 is only about $50. In my opinion you can't get a better personal finance program for the money. ◆

Software Review

Partition Magic 3.0

by Don Patzsch,
Tampa PC Users Group

Let's assume that you are not an expert on hard disks. Then we can begin by making a few statements about hard disks in general. When I bought my first IBM PC back in April of 1982, there was no hard disk that came with the computer. Since that time, IBM has improved the hard disk many fold. Now instead of simply commercial interests using hard disks, we all have them, and fantastic gigabit sizes, too! Now if we say that the hard disk is used to store information, we are at the start of this review. There are two, 2 gigabit hard disks in my computer today. If we say that a hard disk can be divided into compartments or partitions, then we assume that we all know what is meant by that. We want to divide them into partitions because a single partition hard drive may have a minimum storage area of 32K bytes. If we store lots of files on that disk, we will lose 200 megabytes or more in "wasted" space. Many times we end a file with a short word or two, and this would take up a space of 32k bytes on the disk. Titles and other things would also take that much space on the disk, even though they may be only a few bytes long.

So, now we have a newer computer with a large hard disk, or even two large hard disks, and we are ready to begin to use the new computer. We might want to start by partitioning, or dividing each disk into smaller "sections". Assume that we made four 500mb partitions on the disk. The minimum storage space would be 8k bytes. Much better than 32k bytes! And you might do better than that.

Now how and why do we partition? Each hard disk can be divided into four partitions. You may opt for four primary or maybe three primary and one extended partitions.

If you plan to use DOS, you must set aside the first space for DOS, and if you plan to use another operating system, it may or may not "boot" if it is located in a "logical" partition.

By now you could be confused. We have to accept the fact that a primary partition is defined as a partition in which any operating system may be installed and from which it will be able to "boot" up the computer with the operating system of your choice. We have to accept the definition of an extended partition as a way of getting around the four-partition limit. We can easily create three primary partitions with Partition Magic, and also one extended partition. An extended partition can be subdivided into as many "logical" partitions as we want. A "logical" partition is one that is intended to contain data and also certain operating systems loaded into them, that will "boot" from the logical partition. OS2 is such an operating system. So you could have Boot Manager, DOS, Windows95, in the primary partitions, and you could also have OS2 in a logical partition and the Boot Manager will allow you to select DOS, Windows95, or OS2 when you want to boot your computer to start using it.

The manual that comes with Partition Magic Version 3.0 has a very clear and well thought out description of all the terms used in hard disk work, and for that reason the manual is worth the price of the whole package. I suggest that before you start to use the program, you read the manual at least twice. It is well worth the time and effort.

Now, why do we want a program like this? The answer is because there is no other way you can accomplish what this program does. With it you can make space on your hard disk anywhere you like. You can move any program to any partition you like, and not lose any information; the program will run where you moved it the same as where it was before. You can move whole partitions, you can create and delete partitions. If you buy something new, you can create a separate partition for it; say you want to try OS2 or WindowsNT, this is ideal. And with Boot Manager, you can bring up any of the operating systems installed on your computer at startup. At this time, I have WindowsNT Server Version 4 loaded and when I bring up the computer, Boot Manager asks which of the operating systems I have installed I would like to bring up.

Suppose you want to go from Windows 3.1 to Windows95. Just add a partition and put Windows95 there, leave the Windows 3.1 on until you are satisfied that Windows95 is for you. You have great flexibility when you have Partition Magic, Version 3.

You may hide and unhide partitions, convert a FAT file system to an HPFS, format, set a partition active; and remember all these functions are clearly shown on your screen, with each section clearly colored with a distinctive color, and all of them are clearly indicated as to the purpose of each. Each disk is clearly labeled drive C: or whatever drive is shown. There is a drop down menu to change to the other drives if you have more than one installed. If you get the feeling I am very happy with this program and I strongly recommend it, you are correct. The company is coming out with a new Copy program. It really works very well. You can easily and quickly copy a partition from one drive to another, or copy a whole hard disk full of information from one hard disk to another, of the same size or larger size. This might be very useful when you buy a new computer, if they do not supply you with a CD Rom that contains all the operating system, plus all the programs that may be on the computer when you buy it. This is a most unusual copy method. It is fast and easy compared to using a tape backup.

Partition Magic is available at most computer stores, and the

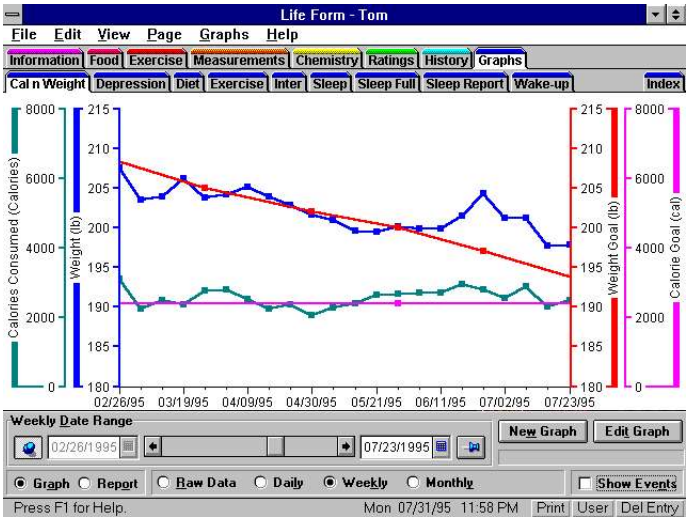
Life Form
Personal Health Management
by Fitnesoft Software

by Mary Sheridan, BBS SYSOP,
Tampa PC Users Group

You can just imagine my excitement! No more walking, no more crunches, no more water aerobics, no more jumping around in a room with 50 other women and I'm the only one facing East. Uh…wait a minute…..

Well, it doesn't do the work for you, but it does an incredible job of charting it. It's main menu is set up like a card file. The program is broken into 9 main categories of data. The categories are information, food, exercise, measurements, chemistry, ratings, history, graphs and reports.



The **Information** area is basic health information about your

doctors, hospitals, pharmacies, health insurers and special medical conditions. After you log your data, you can do reports that would be more than a little helpful next time you are sent to a specialist and you have to fill out a medical form. Everything you would need for the form would be in the report.

The **History** is your health background and any medical conditions that run in your family. This is another good report to take with you to that new doctor.

The **Food** area is outstanding. You can begin to type 'corn' and after 'cor' you get a list of all the corn there is. All you add is the quantity and you get the nutritional data of that

amount of corn. For anyone who's ever had a food journal, this program is the answer.

The **Exercise** section helps you chart your effort and see how your doing in reference to the calories you're consuming. Anyone involved in an exercise program is advised to keep track of their activities. This is the best way I've ever seen of doing that.

The **Measurements** area is more than just your size information. This is where you keep track of your blood pressure and temperature. The measurements are a vital part of a fitness program. They sometimes are the only indication that you are making progress.

The **Chemistry** area stores the results of blood and urine tests.

In **Ratings** you track personal events that cause health problems such as headaches or allergies. By keeping a record of these things, you can sometimes find the cause and make changes that can help you feel better.

The **Graphs** and **Reports** are to let you see how the different types of data compare to the data from the past and the data from other areas.

This program installed into Windows 95 in less than a minute. You can have as many users as you want and you can password protect everyone's data. It has a backup and restore feature to protect your data.

Life Form isn't just for those involved in physical fitness programs, it's for anyone who wants to keep track of their health and their habits. It's a nice piece of software and I would highly recommend it.

If you'd like to order the Life Form CD-ROM for $49.99 call 1-800-607-7637

(Life.....Continued on page 10)

Hardware Review

WebTV

by Charles Howe, Tampa PC Users Group

WebTV -- What is it? How capable is it? Will it do what is claimed for it? Would it fit your circumstances? If so, what brand? Where can it be purchased? Is it a good value?

A small item in the paper several weeks before this was written caught my eye. There would be a demo of WebTV at a Sound Advice over the weekend. (The fact that it was and is on the weekend will be of some importance in the near future.) Curious, I dropped by. It was there, all right, and a Sony guy was there to demo it, but he couldn't do much of anything. Literature hadn't come in as promised.

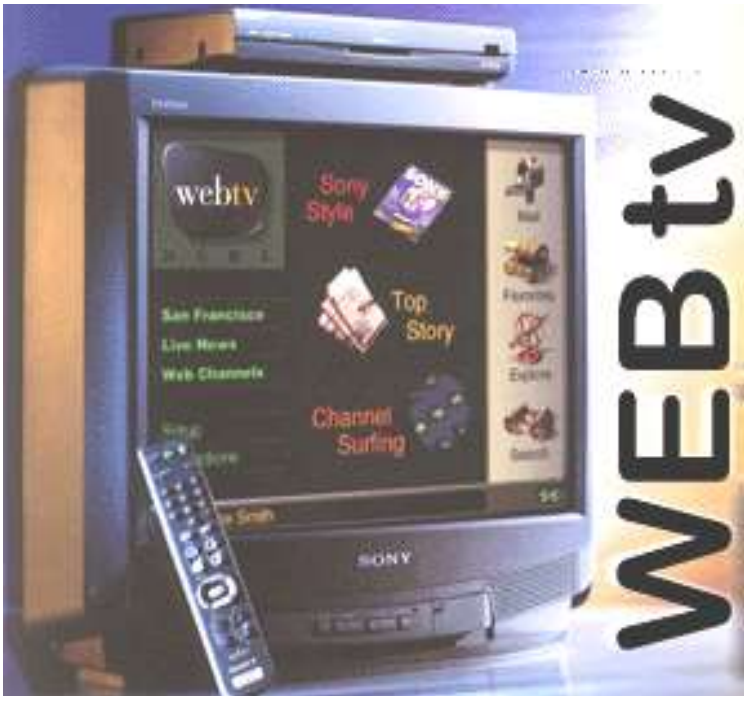
So I went there the next weekend. Different. A Sony gal this time, but more to the point, she could demo it. There wasn't any traffic, so she could let me play with it. Also (very important) she gave me a thick magazine called "What's on the Web", Sony Special Edition. It is fairly close to 500 pages long, many of them with short write-ups of 5 or so Web sites. It is a superb promotional idea. It highlights the jump capability that the Sony unit has. It is possible to go to thousands of different sites by keying in four digits. But you can go anywhere if you key in the URL just as you can with Netscape Navigator or Internet Explorer.

I can't vouch for any other branch, but at that Sound Advice (East Fowler) it is possible to go there at any time the store is open and play with it to your heart's content. I wouldn't have been as comfortable doing that at the Circuit City across the street because of the higher store traffic.

Now on to the specific questions.

WebTV is the generic name for the apparatus that enables you to access the Web using a television as your screen. Sony and Philips market them so far. For $330 you get the basic attachment plus the basic control unit (a clicker, i.e., a remote). For another $70 (Sony) or $80 (Philips) you get a detached keyboard. For all intents an purposes, the keyboard is a necessity. In a few weeks, both manufacturers will offer a printer. No price is given, but an ink jet printer is a reasonable guess. That sounds like another $200 to me. Your television has to have the standard video input jacks. You have to have a telephone jack within reach.

Also, you have to subscribe to the WebTV Internet service at $19.95 a month. The thought occurs to me that it might be possible to use some other ISP, but it would require a very capable hacker. There are a couple of standard problems: You have to have a second line, or face up to the problem that you can't make or receive calls and access the Internet at the same time and you have to have a telephone jack near the TV.



You can send and receive email.

Access is probably as fast as but no faster than any other ISP. The would-be buyer in an outlying or rural area should either assure himself that there will not be any toll charges when he connects or be willing to accept them.

Sound Advice sells Sony but not Philips. Circuit City and Best Buy sell both. Wal-Mart doesn't sell either.

Should you buy? It depends on your circumstances. The point that Sony and Philips are going to try to get across in their advertising is that WebTV takes Web viewing out of your study and by yourself and into the family room with others. There are many ramifications of that notion, the possibility of better parental steering of what sites their children access not least. One other possibility is worth mentioning: its being acquired by older people, people who won't tackle a standard computer. It is so simple to operate that it is reasonable for such people to contemplate doing so. There is one caveat: the keyboard is a bit cramped and there are lots of special keys. This could be a problem for people with impaired vision and/or motor control problems.

I like the product. ◆

Software Review

NavCIS, by Peak To Peak Services & Development, Inc.

by Tom Cone, Tampa PC Users Group

NavCIS helps you "beat the clock" with CompuServe accounts.

NavCIS is an off-line CompuServe navigator which makes working with forums and e-mail efficient, systemized, ... and cheap. It is designed to automate the process of logging on, checking your mailbox, visiting multiple forums (which you designate in advance), collecting message traffic waiting for you there, and collecting message headers in whatever sections of the forum you desire. It then quickly logs you off-line. If you wish, it can build catalogs of the files available for downloading from the targeted forums, and can notify you when new files are added to the on-line library.

I use CompuServe for e-mail and to monitor message traffic in 8 to 10 different forums. Most of these relate to equipment or software which I use in my office. I'm interested in new drivers, software updates, product announcements, and, most of all, the message traffic exchanged by others across the country who use the same stuff I do. Often I learn valuable tips or tricks which help me use my systems more efficiently. On more than one occasion I've posed a question asking for help with some problem or other, only to have knowledgeable volunteers respond overnight with correct solutions or suggestions. It's a great way to obtain inexpensive tech support for the office.

Anyway, here's how I use NavCIS daily. I press a single button and then go pour my coffee. NavCIS automatically logs on, collects all mail and message traffic for me, and collects all new message headers in my target forums. It does this automatically, and quickly. It then disconnects me from the service, so the billing clock stops running. The total time on-line is much less than if I were to sit there and personally navigate among the target forums. I then use NavCIS to view/print/delete my mail. If I want to reply to something, NavCIS helps me prepare the reply while I remain off the clock. I do the same thing with any messages left for me in the forums.

Next, I browse the message headers in each forum. These are little one line descriptions of the subjects of new messages posted with CompuServe since I last visited the forum. If any are of interest I mark it, requesting NavCIS to download the message, and any related or following messages on the same subject. (This is called marking a message thread.) Once I've done this in each forum, all the while remaining completely off the clock, I then press another button and NavCIS goes to work again. First it logs me on, then it sends my e-mail replies, then it visits each forum and downloads the full text of each message (and message thread) I've marked. It then logs me off. Once I'm off the clock again, I read and reply to the messages at my leisure. Incidentally, having the downloaded messages arranged in thread order is a big help, cause it lets you easily follow the on-line "conversation" contained in the series of messages and replies on the same subject.

NavCIS contains other tools which simplify my life with CompuServe. I can use it to transfer specific files between other users, and to and from forums via built-in file upload/download functions. It has many flexible features that make it easy to use, like a built-in spellchecker, and the ability to temporarily deactivate forums, if you don't want them visited the next time NavCIS goes on-line. You can download weather reports and maps. The maps can be viewed "off-line" using the included graphics viewer function. You can also access CompuServe's FileFinder service to search for specific files without first joining each forum in which they might be found.

If you use CompuServe, then this package warrants your consideration. If you use CompuServe a lot, then you deserve a tool like this. NavCIS is available in a Test Edition, which is a full featured, but time-limited version. This let's you try it for 30 days without obligation.

NavCIS runs under Windows 3.x, Windows 95, Windows NT, and also OS/2 (using WinOS2). It requires a 386/20 or faster processor, 4 MB or more of RAM, 6 MB or more of hard disk space, a VGA or higher resolution monitor, and a mouse. Naturally it also requires a modem and a CompuServe Account.

The registered version costs $69 plus shipping.

The Test Edition is available in the "Free Software" section of the PeakToPeak Forum on CompuServe. It's also available on the internet, by visiting the publisher's website, http://www.peaktopeak.com. ◆

Recommended Shareware/Freeware

by Larry Anders, Librarian, Tampa PC Users Group

I thought I'd try something new this month. If you're not on the Internet yet, you really should be. If for no other reason than the wealth of *FREE* stuff that's out there just for the taking. This month I am including "links" to locations on the Internet where you can find some neat Shareware and absolutely FREE software. If you like this sort of thing let me know and I'll continue the column on a regular basis. The role of Librarian has changed since I first took this position. No one seems to be interested in a "physical" library anymore, so I'm trying something new. I'll try to pick out something interesting each month if there is interest.

If you're reading this from the printed newsletter, just type in the link address in your *URL* address area. If you have downloaded the *.pdf* file and are using Adobe Acrobat Reader to view the newsletter, just highlight the link address and copy it into your *URL* address area. If you are using Word 97 you can copy the link address from within Acrobat and paste it into Word 97 and the link will become *hot*. (Just click on the link and you'll be taken there automatically.)

Note that the hyphen in each URL is part of the address

http://www.download.com/PC/Result/TitleDetail/0,4,0-25433,00.html **GK Web Promotion Spider**

GK Web Promotion Spider is a URL registration tool that automates the registration process with nearly 150 search engines and other Web resources. In addition to automatically submitting your site to over 150 (and growing daily) major search engines, directories, and Usenet newsgroups, GK Web Promotion Spider will dynamically optimize your site or page, ensuring maximum visibility on the Internet.

Requirements: Windows 95/NT Demo

http://www.download.com/PC/Result/TitleDetail/0,4,0-25435,00.html **McAfee VirusScan for Windows 95**

Viruses can be accidentally received through disks, bulletin boards, email, networks, and the Internet. VirusScan offers virus detection, removal, and support services to remedy this problem. The program supports Windows 95 and scans all system areas, including local and network drives, CD-ROMs, floppies, boot sectors, file allocation and partition tables, files, and compressed files. It cleans most virus infections from files, master boot sectors, partition tables, and memory, returning them to their virus-free state. Designed for daily operation, VirusScan works to keep your system immune from viruses.

Requirements: Windows 95 Shareware

http://www.download.com/PC/Result/TitleDetail/0,4,0-25368,00.html **HotDog Express**

HotDog Express lets you create and upload a cool-looking Web page in 4 simple steps. Even someone completely new to the Web can use HotDog Express and make a Web page in just 5 minutes.

Requirements: 486, Windows 95, 16MB RAM Shareware

http://www.download.com/PC/Result/TitleDetail/0,4,0-25320,00.html **Computer Tutor for Windows 95**

Computer Tutor for Windows 95 is a 150+-page book that teaches beginning and intermediate users about Windows 95. The tutor contains detailed graphics and information on how to work within Windows 95, as well as how to operate many popular Windows 95-compatible software packages. The tutor can help you learn the Windows 95 environment, DOS environment, Microsoft Word 95, Microsoft Works, WinZip, HyperTerminal, Microsoft Exchange, Microsoft Fax, System Agent, Microsoft Money, Norton Anti-Virus, Netscape Navigator, Netscape Mail, and Microsoft Publisher. It also tells you how to set up an Internet PPP account and includes a graphical appendix of computer parts.

Requirements: Windows 95, Microsoft Word 95 Free

http://www.download.com/PC/Result/TitleDetail/0,4,0-25009,00.html **Top Desk**

Top Desk adds an icon to the system area of the Taskbar, giving you complete access to everything on the desktop: system objects and files, even the Display Properties dialog box.

Requirements: Windows 95/NT Free

http://www.download.com/PC/Result/TitleDetail/0,4,0-24948,00.html **Preschool Pack**

The colorful graphics, songs, and speech of Preschool Pack will be sure to capture the attention of your preschooler. Through five entertaining activities, your preschooler will learn about counting, number recognition, the alphabet, colors, matching, classifying, and their name and phone number. All activities may be performed entirely with a mouse.

Requirements: DOS or Windows 3.x/95 Free

Special Interest Groups

Microsoft Access SIG — Canceled (temporarily we hope)

This SIG Meets on the 3rd Thursday of the month at 6:00 PM at the Reflectone Building. Directions: Proceed west on Waters from N. Dale Mabry across the railroad tracks (which is about 1 and l/2 miles), take second left on Savarese (United Technologies bldg. is just beyond it). Proceed on Savarese until you reach the Reflectone bldg. Take the North door. If you need to ask directions, there is a security guard at the location. PLEASE SIGN IN WITH A SIG LEADER.

Create New HD Space On Same HD

By Bruce Register, Member at Large, Tampa PC Users Group

My Windows 95 program began giving me messages that my hard drive (850 MB Maxtor HD) was running low on space on my C: drive. Upon installation months ago, I partitioned my hard drive as C: 510 MB; D: 242 MB; and E: 98 MB. I used my DISK MANAGEMENT file that came with my Maxtor hard drive to create the three partitions. I am told that Partition Magic does a fantastic operation without changing your existing programs and documents. (See revies on page 4)

I continued to get a message that my C drive was running low on space. I would save files, documents and graphics until the time was available "next week" or so. Not getting around to them created more space demand. The low space message kept coming; I would click "OK". When other messages such as "insufficient memory to complete this operation" started to show, the time for corrective action became immediate. The "low space" message gives a choice of "OK" or "Suggestion". For weeks I would think, "Yea, Yea, I do not have time to read this fine print and when I get around to it..." This time, I clicked "Suggestion" and read the fine print. Several suggested options appeared. One was to run "DriveSpace3". I was told that running DriveSpace3 (it is part of Microsoft Plus! for about $24, which I had on my computer) would create an "H" drive. "H" means Host Drive. The H drive was created with approximately 2 MB of commands that were automatically installed. Now when I start up, the H drive starts quickly and automatically moves the action to C drive. That is what a "Host Drive" does.

What a surprise! My C drive now has 520 MB; My D drive has the same 242 MB and my E drive has the same 98 MB; however, my new H drive now was created and has 500 MB of new space for a total of 1,350 MB of hard drive space on my 850 MB hard drive. I wonder what would happen if I attempted to execute DriveSpace3 on my D and E drives! After I purchase a Zip for backup, I will try that.

I have talked with several people. Their remarks are generally

MEMBERS HELP-LINE

The following phone list is provided for our Tampa PC Users Group members in an effort to establish local support for those frustrating times which we have all encountered while using our PC's. Please note that these are members that have volunteered to help you; treat them in a courteous manner. Be sure to ask if it is convenient for them to help you now, or if you should call another time. It would also be helpful to have your documentation and have it handy when you call. (Don 't expect help if your software is an illegal copy or you do not have documentation!) TPCUG is not responsible for the information or advice provided by volunteers. Volunteers may or may not be experts in the subject matter. You are on your own with any advice received. Be aware also that some of these volunteers may be consultants in their area ofexpertise. If you are interested in volunteering to answer members' questions, either leave a message on the BBS or fill in the forms provided for this purpose at the meetings.

(Hard Drive.....Continued from page 10)
along the line, "I have not used it, I am not too sure about drive space but I hear that the new DriveSpace3 is pretty good...but, there may be problems...I just do not know until I try it." They are glad to hear about it.

I really do not care what or how DriveSpace3 did what it did. I just know that I have all of this extra hard drive space and I do not have to dump documents and software nor do I have to buy a new hard drive. Someone said that cannot be. I told the story of the client who called his lawyer from jail and told him the circumstances of his incarceration. The lawyer said, "They can't put you in jail for that." The client said, "You don't understand, I AM in jail." Well, I do not understand nor do I wish to argue because I AM WITH 500 BRAND NEW MEGA BYTES OF HARD DRIVE SPACE. After moving many documents and some software to the new H drive, I have bookoodles of space on my C drive. No more messages. Thank you Microsoft Plus! None of my documents or software were affected by the DriveSpace3 execution. ◆

Newsletter Comments

by William LaMartin, Editor, Tampa PC Users Group

Kinko's had no blue paper when it came time to print last month's newsletter, so since we were on a tight schedule, the newsletter went out covered in white—albeit a better grade of white paper than usual (at no extra cost). That inspired long time member Ed Buzza to post the following on the BBS. I can't match that, but my comments will appear on page 7.

(Comments.....Continued on page 7)

Bits of Blue No More

By Ed Buzza

Harken whilst the bugles blow tatoo,
Oh claborous, oh frabjous day,
For there's not a bit of blue
In the Bits of Blue today!

With teary eye and palsied hand
Did I hunt that treasured azure band,
Nay, nay, say canst not be true
Nary a bit of blue in Bits of Blue?

For seven years and fourteen moons,
At half past of those yesternoons,
Golden words wrapped in blue I'd seek,
By the postal box I'd read - just a peek

The years are many, the years are long
When first I heard the siren song,
The golden words from the magic quill
Of Robin, Barbara, Marylee and Bill.

Precious words writ and writ for me alone,
More hallowed than if carved in stone,
Each month I'd wait for what was due
In blue wrapped paper, the Bits of Blue.

Gather round whilst heralds sound,
Ka-loo, ka-lay, oh grizzlizound,
With volume ten, number four,
Bits of Blue is blue no more

Tanem, sur tanem

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if ithey are not received on time.

Members may insert non-commercial ads at no charge with the following imitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

SECRETARY'S REPORT & MINUTES OF MEETING April 9, 1997

Minutes and Comments by Merle Nicholson, Secretary, Tampa PC Users Group

The meeting was convened by Ford Bond in President Connie Kincaid and Vice President Mike Hodge's absence.

Announcements: The Geneology SIG is meeting at MOSI, combining with the MOSI group. It meets the second Monday of the month.

The evening program - PC Diagnostics - was presented by Robert Hurt of Data Depot. "Data Depot was founded in 1990 by Robert and Karen Hurt to develop and manufacture leading edge PC diagnostic test products, particularly hardware." (a quote from their "Press and Catalog Information") They produce four hardware devices MiniPost, PocketPost, PocketPost MCA, and PC PowerCheck., and a variety of software utilities and diagnostic programs.

Richard started by giving us a historical outline of the PC diagnostics industry in Clearwater, the products they made - and make. Then a very interesting dissertation on the anatomy of a PC's BIOS and the boot-up (POST) process. He showed off two products that diagnose problems with POST. These products are designed to accurately diagnose 60% of dead PCs. (Dead PC's happen 5% of the time.)

Other products - PC PowerCheck is a card that measures and displays the quality of the power supply voltages. Robert even drew electrical diagrams of a PC's power supply to illustrate the need for a diagnostic card.

Their main product, PC Clinic Pro, is a collection of utilities for professionals that tests all aspects of a computer. One version even has remote control software for remote diagnostics.

Robert is a very entertaining speaker. He kept our attention a full two hours and we would have enjoyed more if we had the time. He's offered to come back and speak again. It was a thoroughly informative and interesting program.

Robert very generously donated a variety - actually a box full of software and hardware, including a complete PC Clinic for the membership to check out. Many of the items donated went to the door prizes. The winners were - Larry Anders - Carmen Sandiego, Ken Boyd - Lotus, Wil Goble - a CD database and William LaMartin - PocketPost Jr.. ◆

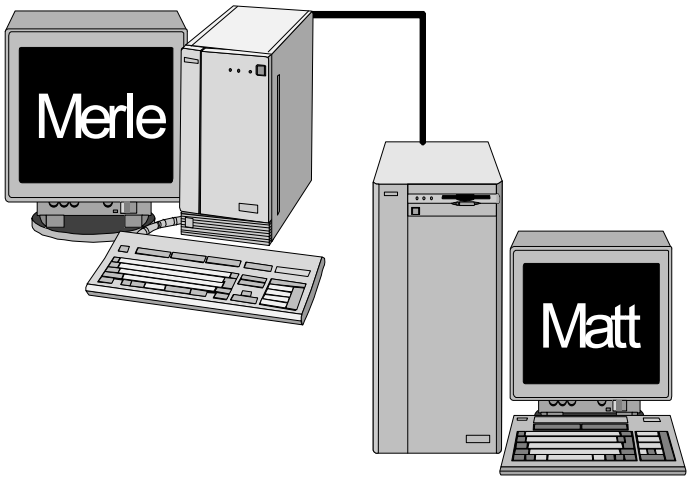
Windows 95 Peer-to-Peer Networking

by Merle Nicholson, Secretary,
Tampa PC Users Group

I really haven't any idea of how many of the homes in the US have more than one PC, but I'll bet it would be a surprisingly large number. My own house has one PC per adult - three when our son Matt is home from college summers and Christmas break. To print from my wife Valerie's notebook, we have a cable switch and a cable lying next to the PC desk so she can plug the cable into the printer port, flip the switch and print to the deskjet. Well, that works very well for the light printing she does; exactly one page per workday. For other things— heavier printing, tape backup and file (and product) sharing, you need more. So when Matt's here, the two Pentiums are networked. We're constantly exchanging files — especially program updates from the Internet.

Microsoft has made networking easy for you software-wise. The hardware is a little more complex.

You need a wire connection from PC to PC. Ours are simple internal ethernet cards, plugged into expansion slots in our PC's, and using RJ45 connectors and UTP (Unshielded Twisted Pair) cable between them. RJ45 connectors are just like telephone jacks, but larger, for six wires. You can also use the more fragile ethernet coaxial cable. Some ethernet cards support both coax and UTP. Be sure you read the box the card comes in to make sure what you're getting.



You can get very inexpensive cards as low as $25 up to $100 for an expensive PnP 3-Com card. They're available as ISA or PCI cards; as PCMCIA cards and even as a small device that plugs into your parallel port. For two PC's you need just a $3 crossover cable, about six inches long. For more than two PC's, you need a "hub" instead. A hub is a small box, about the size of a large modem, with six or more ports to plug in all the PC's. Plug and Play (PnP) cards are the most desirable cards if your PC supports it. It simply makes life easier configuring the software and software support for the card.

The cable needed to go the full distance between the PC's is fairly expensive. You can get this cable in various lengths from the superstores in the area that have the connectors already crimped on. You can have cables terminated by several custom cable companies in town, or you can buy a crimping tool yourself. It's $30 or so, if you have a hankering for owning an obscure tool.

Now for software - this is the easiest part of the process. Windows 95 has all you need built right in. Incidentally, Windows 95 is network-able with Windows NT and also with Windows For Workgroups 3.11. Get the hardware installed first. Win 95 has the drivers for most cards built in, but if you've bought something unusual, make sure the Windows 95 drivers are included with the card when you buy. Then add new hardware through the hardware wizard to make sure Win95 recognizes the card. OK - we're ready. In Win95, if you go to Start, Settings, Control Panel, Networks .. there it is … the Printer and file sharing button. Press this and there are just two things to check. "I want to give others access to my files" and "I want to be able to allow others to print to my printers" Check the first for sure, and the second on any PC with a printer. While you're there, select the "identification" tab and give your PC a name and workgroup name. For our simple household, we use the same workgroup for all PC's. This all installs more software from the Win 95 CD-ROM.

OK .. now you have a use for that Network Neighborhood icon on the desktop! Open it up and you should see a computer symbol for each of the computers on your little network by name. Walk to the other PC, open Windows Explorer, right-click on, say, the CD-ROM in the directory tree. You'll see a new item in the selection list now - Sharing. Select that and select Share, and click Read-only, and don't give it a password. Go to your own PC, open Network Neighborhood, open the other PC and you'll see the CD-ROM on the other computer! Can you run Diablo from it? Sure! So share your tape backup - or go buy one - you should have one anyway. Now, you can't share the tape, but you CAN share drives. That is, if the other PC has shared the entire C drive then you can map to that drive from your own PC, and run your tape to back up that mapped network drive!

You - as a user - can choose what to share to the network. If you go to your "My Computer" you can right-click on it, select share and share the whole drive. Or you can choose to share just one or more directories in the drive by sharing from Windows Explorer. You can choose read-only or read-write with separate passwords (or no passwords) as you wish. Have fun! ◆

Software Review

ASAP WordPower

byFrederick O'Keefe,
Tampa PC Users Group

Up Front Summary:
Product - ASAP WordPower™, ver. 1.95
Publisher - Software Publishing Corporation (SPC)
Class - Presentation Software
PC requirements - WIN 3.1/95/NT; 486 recommended, 3.5MB HD space; 1MB free RAM; VGA 16 or 256 colors. Comes on 1 diskette, plus one optional spelling dictionary diskette. Works well on laptops.
Rating (0-10) - 9
Recommendation - Buy it, even if you don't "need" a presentation package!

Microsoft PowerPoint™ (PP) and other powerful presentation packages are as complicated to learn and use as their output is extensive. Most of us in small business or education don't have time to spend becoming knowledgeable enough to fully use those packages. Yet, we want, and sometimes need, an effective sales tool to lift a presentation above the humdrum.

Help is here -- ASAP WordPower™ (WP). From the folks who bring us the potent Harvard Graphics™ program, and now the PagePlus™ desktop publishing powerhouse.

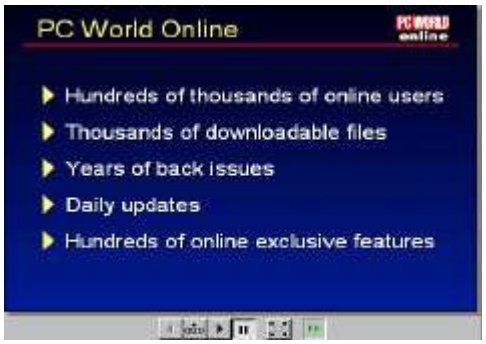
Putting together an attractive, professional presentation in short order is satisfying, and, for a business person, cost effective. The program is so "intelligent" in its doing the grunt work that it is more fun than most computer games! Yes, WP is fun to play with. I spent more time repeatedly redesigning (tinkering) a "show" than it took to lay it all out. It's a great way to learn. Keywords applicable to WP are: easy, quick, extensive preformatted display, intelligent, automatic, artful, pleasing, effective, functional....

Few software programs have performed so well, and right out of the box. The first action to take when you open the box is watching the brief videotape. It shows a bit of what you can do. Then, browse the "Presenting Visually" booklet for good ideas about making interesting presentations. The recommendations are to the point, and right on the mark. If you aren't an artist or designer, WP will do the work for you. Where's the manual to labor over? None is included, and none is needed. The help file is more than enough. You'll rarely need it.

"What is intelligent formatting?" asks the box cover. Answer: Lay out your outline, then let WP format it all for you. Touch it up, and you are done. (It takes some playing to shape everything to one's satisfaction, but playing is just what it is. Non-frustrating, too.) There are 22 layouts (bulleted list, table, organizational chart, etc.), 14 designs (styles, backgrounds), and 18 color schemes. If you don't like outlining, then start with the layouts, and "fill in." The layout of each page can be different, as needed. And with just a click or two of the mouse button.

Some capabilities are: drag and drop objects, with immediate "drag here to..." instructions; import tables and spreadsheet cells; text and associated background resizing to suit you; insert objects (logo, clipart, header/footer... to one or to all pages); a wealth of page-to-page transition effects. WP pages can be imported into other programs, too. There is too much to mention.

"I have PowerPoint. Why use WP?" Because WP is easier and faster for design work. You can swap entire presentations back and forth between PP and WP. And the run-time player lets you safely send out diskettes to prospects and clients with compelling presentations. You will "look great" through your "silent sales person." Heck - e-mail me a copy of your best WP work so I can enjoy it! Use fredrick@tech-center.com to reach me.



Is WP perfect? Nearly so, for its intended market. But I would have liked the ability to vary the color scheme and design scheme page by page; and I want to see word processor-like text drag and drop in the outline mode. That's my one, big suggestion to Software Publishing Corporation. Otherwise, folks, congratulations on an exceptional job.

SPC also published Active Office™, which is a super add on to MS Office 95/97. When I receive my copy, you'll read about it here.

Go to SPC's home page http://www.spco.com/ for information and an online demonstration.

Copyright (c) 1997, all rights reserved. May be printed in APCUG Member PC Users Groups newsletters once only. ◆

To the right is an example of one slide from an Internet Web presentation by PC World created using SPC's ASAP Word power and WebShow.

SOFTWARE AVAILABLE FOR REVIEW

1. **Magic Cap** - General Magic - Organize all your communications: email, fax, etc. - Windows 95 CD

Software Review

Editor's Note: *Software sometimes stays a long time waiting for a reviewer here at TPCUG. That was the case with Delrina's Echo Lake. By the time someone decided they would like to do a review, Delrina was absorbed by Symantec and Echo Lake was sold to Creative Wonders and renamed Family Album Creator. Normally I would not print a review of a program that no longer exists; however, Bruce, after looking at the demonstration version of Family Album Creator available on the Internet, has assured me that Family Album Creator is the same as Echo Lake. Therefore, since he thought so much of the program, I am going to break my rule and print the review.*

Echo Lake
(Family Album Creator from Creative Wonders)

Delrina's ECHO LAKE attracted my attention because it was billed as a novice book writer's dream; at least that is how I saw it. This software guides one through the planning and layout process for a novel or "how to" book.

THE PROGRAM is a great program. I did not know that such a program existed so you can imagine my delight. When the program is opened, a room, called the CABIN appears. Visible icons include: picture on wall hiding a security safe, bookshelves for books you are writing, rolling index to create a new book, story plate for creating a new (chapter) story, drop and drag icon, trash can, planning format to lay out your book, and many other clickable icons.

I really got excited over this program. I have published pamphlets and manuals from long ago with the old mimeograph system cranking one page at a time; later, an electric motor was attached. In fact, my first teenage effort to self publish was with hecktograph jelly in the biscuit pan. In those days there were no copy machines. I went through the "tin" plates that we "burned" and later the paper mats. I even owned an expensive off-set printer "burning" my "paper plates" on the

Xerox Copier. Reflection on the "good ole days" surely makes one realize that now is the "best of the ole days". Therefore, I thought that I had died and gone to an authors heaven when I obtained Echo Lake.

Why is (was) it called Echo Lake? Click on the steaming coffee cup with the upward curl of steam to open the cabin window for a ringside seat to view a lake with eagles and other birds flying, squirrels dancing on the window sill, ducks swimming across the lake, even a Nessie swims by, etc. Echo Lake wants the author to view the peaceful tranquillity of nature while contemplating the intellectual, philosophical inner being. The desk with the three drawers has accessories for click linking to functions. An outdoor garment hangs on a coat rack near the door; click on the coat to go outside; that is, exit the program. With all the easy links, one can click new book and begin writing. Later one may "plan" the book after the writing begins. Echo Lake provided the after the fact opportunity to plan the book because they know that one's uncontrollable enthusiasm prohibits planning ahead; we just jump right in. Remember, "If you do not have time to do it right now, when will you have time to do it over!" One may "play" around with Echo Lake while getting the feel.

One may choose even the style of book cover. Graphics, audio and video are said to be easy to add. My system does not permit me this luxury. Graphics can be manipulated, cropped or otherwise creatively adorned. For the autobiographers, this program inserts memory jogging notes to assist the remembering of those "Oh, I forgot all about that" afterthoughts. The "inspirator" is activated by clicking the red button on the light. Did you get the connection? A light bulb flashes an idea in your head; the programmers have a sense of humor. A cross cut of a tree trunk provides the "Tree Ring" (annual rings) at the end of the book. One uses this for an additional review of the book so that reorganization of the stories (chapters) can be accomplished. The "Tree Ring" should be used in planning before commencing writing. Echo Lake has too many features to include in this review. There are restrictions that I do not think I understand like the warning: "an Echo Lake book cannot be used for any commercial purpose." That I do not understand; if I write and print it, I expect to do whatever I want with the printed copy. Another is that "these books" can be distributed to "no more than 10 people". The legal department may have failed to communicate with the manual writers.

Echo Lake is one of the best and most exciting programs that I have. One of the bonus philosophies is that family researchers can get information from otherwise reluctant family members. When uncooperative family members at reunions

(Family.....Continued on page 10)

(Comments.....Continued from page 1)
This is the first time in three months my contributors have left me more than a column of space to make my comments.

Of course, the big news is that Corel Corporation will be demonstrating their software at the May meeting. This is one of the computer world's premier software vendors. They established their reputation in the graphics market with Corel Draw and its associated programs. Now they have done the computer community a favor by buying a much deflated Word Perfect and pumping new life into it; thus, reintroducing competition to the office suite market. There is nothing like competition to benefit the consumer (us).

Frederick O'Keefe's review of ASAP WordPower from SPC in this issue led me to the SPC Web site, where I saw a demonstration of how this presentation program, along with their Web Show program, can be used to create online presentations. We've had presentations to our group where the presenter used a presentation program such as Power Point or Harvard Graphics to give us what is basically a slick slide show. The above mentioned software now allows you to post such presentations on the Web. Then, individuals using Microsoft Internet Explorer or Netscape Navigator can, after a one time download of either an Active X control or a Netscape plugin, view the presentation on their home computer--with sound if the author provided for such using the Real Audio technology.

This technology from SPC along with the Net Meeting idea from Microsoft is moving us closer to the possibility of a virtual meeting, where members could simply sit at their (well-endowed multimedia) computers and take part in the meetings form their homes. The presentation mentioned above is a one way affair. The Net Meeting, however, is interactive, where files, programs, talk, and video can be shared. Unfortunately, Net Meeting at this point only allows these features between two individuals--and has a tendency to crash. If more than two want to meet, the best they can do is a keyboard chat with the group. But, give Microsoft time, and they will probably have all of the above and more for many people in some future version of their browser.

If we had this technology now, and we all had advanced machines, Corel could stay all snug around their furnaces up there in chilly Canada, from where they could send us a virtual presentation. If that were the reality, then, of course, you would no longer be reading this newsletter in hard copy, but would have gone to our Web site and be viewing it on your computer—or, if preferred, in the color copy you just printed.

This leads me to ask, "Why do we have meetings anyway?" Well, we have them, I think, because people with a common interest in computers and a desire to get out of the house once in awhile find them a useful way of gaining information and meeting others of like interests.

In the time before the Web, user groups and their associated BBSs with their computer related conferences were about the only way of getting computer information other than the computer magazines. You would come to the meeting, see a software product demonstrated, ask a member about the problem you were having with your computer, and possibly get an answer.

Now, you can see software demonstrations at COMPUSA or another mega store. And most of all you can go on the Internet and find not only the answer to your computer questions, you can find information about almost anything.

Let me give you several examples. Recently I needed a new battery for one of our IBM ThinkPads. I went to the IBM Web site, found the page for ThinkPad parts, clicked on my model number and was presented with a parts list with prices and a schematic of the insides of the laptop. I called the 800 number listed, gave them the appropriate part number and had the battery two days later.

Just yesterday, I noticed that if I double clicked on a PDF file, nothing would happen. This must have happened because of a recent installation of Acrobat 3.0. Being a knowledgeable Win95 user, I then did what was required to set up Acrobat as the program associated with the PDF extension. Now, a double click on the PDF file got Acrobat up and running, but also produced a system error message—and no file open. I was stumped. So it was off to do a search on the Usnet Newsgroups with DejaNews. Within 10 minutes I had my answer. I needed to put "%1" at the end of the path to the Acrobat executable file when I did the file type association mentioned above. I frequently more easily find the solution to software problems this way than by going to the software vendor's own site.

However, vendor sites are good for one thing: Software updates, patches, and drivers. Do you remember the days when you had to call the vendor and ask them to mail you a floppy with the appropriate driver on it, or, more recently, search for it at your long distance expense on their BBS site. Now, not only can I get the updated software mentioned, I can get entire programs, sometimes limited time trial versions and sometimes complete programs free of both cost and restraints on their use. I must have downloaded at least six such free and very useful programs from Microsoft and various driver updates to my Hewlett Packard printers and scanner.

So, in this day of the Internet, what can a user group do for you? Send me your thoughts. We need to make our group even more relevant. ◆

Software Review

by Don Patzsch, Tampa PC Users Group

I received four CD Roms from IBM that are targeted at computer resellers. Each disk covers a separate topic.

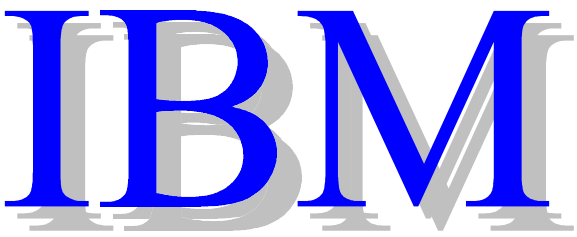
The quality of sound on the IBM disks is excellent. The graphics are FULL SCREEN, and the graphics are top notch.

The first of the four disks is the Marketing Disk. There is over one hour of multimedia information on each of these disks. The disks are intended for resellers to use. There are sections that can be used as is, to set up a computer on the sales floor and place the movie on it to allow continuous running advertisements, describing OS2 WARP Version 4.

This marketing disk is set up with presentations, product literature, and Camera Ready art. The presentations allow the salespeople to put these shows on their computers as demos. The product literature gives the description of OS2 and what hardware you need to run it. A text file tells you how to view and how to copy any section on the disk. Many of the files are .pdf (acrobat) files, full color and excellent graphics.

The second of the four disks is the Interactive Demo of OS2 WARP version 4. This disk contains the demo of the operating system in its entirety. It is very long and it is complete. It shows you how to set up the voice recognition and all the other features of OS2. More on the details later.

The third disk is the World Tour. You are presented with a map, and with various objects on the map, each of which is in a different country. Click on any country and you will be listening to and watching Chip Ramsey, a rock singer. Chip and Roxanne Rolls will give you a story of how OS2 works. A globe rotates in the center of the screen on most of these presentations and is used in a very unique way to add interest to an otherwise very dry story, with much repetition as to how OS2 works and what it will do for you.



The fourth disk is marked Back Stage Pass. It starts by telling you this disk is for resellers ONLY. Once again you have Chip Ramsey and Roxanne Rolls giving you the story of OS2 WARP version 4.

So, using only the disks to find out— What is this OS2 WARP Version 4?

- Each disk shows you how to use a microphone and not your mouse or keyboard to do whatever you want to do. Dictate a letter, change the URL that you are going to see next, and calling up any program on your computer. The voice system is in six languages. That is, any of six languages can be used and there is no "training" needed to start out and do dictation or any of the other things you can do with just your voice.
- Plug and Play is supported by OS2. IBM began using plug and play in 1986 with the PS2 computers. I have one I bought in 1987, and it works fine.
- Multitasking. OS2 warp supports multitasking and does it differently from that in windows.
- OS2 is the first operating system to support Java, Sun's new object oriented language.
- IBM can use this program to run your computer remotely as a service tool. The technician can check your program and see what you have been doing in order to correct a problem.
- Networking. OS2 supports networking and also infra red so that you can update your notebook without wires.
- Power management, pcmcia support, and a Java development kit , are all included in OS2 WARP version 4.
- Internet support is excellent.
- A bonus pack is included.
- An Internet Browser is included.

All these features are completely described and demonstrated in the four disks. Much repetition is to be expected because this is a series of helpful materials intended for resellers to use to make up short demos. In full screen you watch a person dictate a letter by bringing up the program with speech and then writing the letter with only the microphone and his voice. He also shows you how to change to a different URL or, for that matter, get on the Internet by simply voicing his commands.

I am going to stop here, and I would like to tell you that this is the most unusual review I have ever done. It took an awful lot of time to listen to and watch all these demos and try to make a sensible report from that— there is much repetition. The graphics and the sound are terrific, and anyone who wants to use the disks are welcome to have them for a time. I have a copy of OS2 WARP Version 4, and use it. I did not use that copy as material for this review, as I am writing about the four disks mentioned above, and not the actual use of the operating system in practice. Microsoft gave me a copy of their competing system, and so I can easily compare the networking and security and stability of both systems and also compare them both against Linux or any other operating system. ◆

Recommended Shareware/Freeware

by Larry Anders, Librarian, Tampa PC Users Group

Well, I didn't get any complaints from my column last month so I thought I'd try to do it on a regular basis. I visited some of my favorite Shareware hangouts this past month and came up with a few more interesting tidbits that I thought you'd like to know about.

If you're reading this from the printed newsletter, type in the link address in your ***URL*** address area exactly as you see it with NO spaces. If you have downloaded the ***.pdf*** file and are using Adobe Acrobat Reader to view the newsletter just highlight the link address and copy it into your ***URL*** address area. If your are using Word 97 you can copy the link address from within Acrobat and paste it into Word 97 and the link will become ***hot***. (Just click on the link and you'll be taken there automatically.) I double checked all these links, and they worked at the time I check them out. But the Internet is so dynamic, it changes on a daily basis. In case you go to one of these links and you get a message that says it can't find the file or link you can usually find an area at the bottom of the page that will let you search for the file. Just type in the name of the file as listed and you should be transported to the download area for that file. (If you should have any trouble – call me. My number is listed in the front of the newsletter.)

Personal Screensaver

Personal Screensaver is a customizable screen saver that lets you personalize your PC's napping time with your own photos and sounds. Your idling computer will come alive with sights and sounds of your own selection. The endless combinations of images, sounds, titles, and reminders let you create a showcase of your family pictures and memories. The Snap2it feature is a built-in event reminder which will pop-up with images, sounds, and captions on the day of your choice.

Requirements: Windows 3.x or later. Free

http://www.download.com/PC/Result/TitleDetail/0,4,0-25861,00.html

WebWhacker

Personalized Internet content delivery is the key feature that distinguishes WebWhacker as an effective offline browsing product. By preselecting the Web sites that you want to monitor, you can set a schedule for Web pages, text, graphics, and HTML links to be delivered to your desktop computer automatically and unattended. The evaluation software expires after adding and/or grabbing 20 URLs to the Whack list. Each URL can be set to "whack" a maximum of two levels of the Web site. All data collected during evaluation can be used with the permanent (purchased) copy of WebWhacker. WebWhacker 3.0's enhanced speed, site storage on removable media, and automatic updating heighten the performance, flexibility, and portability of offline browsing.

Requirements: Windows 95
Shareware – Fully functional demo

http://www.download.com/PC/Result/TitleDetail/0,4,0-27022,00.html

Free Agent (32-bit)

Free Agent is a robust newsgroup reader that can be configured in many ways. It provides multipane viewing, and news can be read online or offline. There is flexible article purging, database compacting, carbon copying for email and article posting, editing of all fields, and canceling of posts.

Requirements: Windows 95 Free

http://www.download.com/PC/Result/TitleDetail/0,4,0-21550,00.html

VoicePad

Kurzweil's VoicePad can be used to dictate memos, letters, reports and other documents. Users can also format text, navigate through VoicePad menus and dialogs, change its settings, and preview and print documents using intuitive voice commands. VoicePad combines continuous digit recognition with its dictation capabilities so you can always use the keyboard to quickly enter telephone numbers, street addresses, zip codes, dollar amounts, social security numbers, and other numerical data into documents.

Requirements: 5 MB RAM, Windows 3.x/95, microphone, 16-bit sound card, high-quality PC speakers
Shareware – Fully functional demo

Special Interest Groups

Microsoft Access SIG — Canceled (temporarily we hope)

Lotus Notes SIG

This SIG meets every Thursday at Reflectone at 8:30. It is a professional SIG focusing on Lotus Notes certification. Directions: Proceed west on Waters from N. Dale Mabry across the railroad tracks (which is about 1 and l/2 miles), take second left on Savarese (United Technologies bldg. is just beyond it). Proceed on Savarese until you reach the Reflectone bldg. Take the North door. If you need to ask directions, there is a security guard at the location. *Contact Mike Hodges at hodges@reflectone.com.*

Communications SIG

This SIG meets the first Monday of the month at 6 PM at the Reflectone Building. You must sign up to get on the list and to get by security. See Microsoft Access SIG for directions to Reflectone. *Contact Charles Howe: at 968-1207 or HOWE@INTNET NET*

Genealogy SIG

This SIG meets the second Monday of the month at 7:00 PM at the Museum of Science and Industry. *Contact Jenny Lind Olin at 960-5723 or Ford Bond at 987-6309 .*

(Family.....Continued from page 6)
are presented with the Echo Lake Family Album (your book), they do not want to be left out. What a hit this would be at a family reunion! Creative Wonders told me that the subsequent program, called "Family Album Creator", is very, very much better.

The new program is available from Creative Wonders, P. O. Box 51790, Livonia, Michigan 48151. Their support can be reached by email at "cwsupport@cwonders.com. Their website is www.cwonders.com. CompUSA carries the program for $39.95—with a $10 mail-in rebate sticker. I asked for a review copy of their new Family Album Creator to review. I did not get a copy. I have not test driven Family Album Creator, but I did have an opportunity to test drive the "mini-version". . I went to the web site and downloaded the new "mini-version" of Family Album Creator. The "mini-version" permits one to try the program for "5 hours", then, one may decide to purchase it or the program will do something--self destruct, I guess!

At "http://www.cwonders.com" I was afforded the opportunity to view several programs that Creative Wonders sells.. However, my interest was in Family Album Creator. Several components of the program are available for trial. I downloaded the mini-version of Family Album Creator (3.7 MB), Sample Album--Julia's School Days (3.7 MB), Wing10.zip, Help File (288K), Interaction Tour (2.3 MB), and Personal Template (3.12MB). I opened the "new Echo Lake" now called Family Album Creator. Everything that I saw was exactly the same as Echo Lake. Any change from Echo Lake would have to be in the components not available for download.

The Family Album Creator Help File that I downloaded is designed to answer "all" questions about the product. The Help File installs directly into the Mini-Version. The Interactive Tour permits one to "point and click along the way". The voice-over and video helps the learning process. The Christmas Album Template and Birthday Album Template will install into Family Album Creator. The Personal Album Template helps in creating a multimedia album. I have seen enough of the new program, Family Album Creator, that I may acquire the upgrade. I may enjoy it even more than Echo Lake.

Now, I will lean back and click the steaming coffee cup. Maybe something will rub off on me. The philosophical, intellectual contemplation while viewing nature on the lake is worth the cost. Pardon me while I reheat my real cup of coffee in the microwave and click the steaming coffee cup on the screen. I want to watch the birds, squirrels, ducks and Nessie!

MEMBERS HELP-LINE

The following phone list is provided for our Tampa PC Users Group members in an effort to establish local support for those frustrating times which we have all encountered while using our PC's. Please note that these are members that have volunteered to help you; treat them in a courteous manner. Be sure to ask if it is convenient for them to help you now, or if you should call another time. It would also be helpful to have your documentation and have it handy when you call. (Don 't expect help if your software is an illegal copy or you do not have documentation!) TPCUG is not responsible for the information or advice provided by volunteers. Volunteers may or may not be experts in the subject matter. You are on your own with any advice received. Be aware also that some of these volunteers may be consultants in their area of expertise. If you are interested in volunteering to answer members' questions, either leave a message on the BBS or fill in the forms provided for this purpose at the meetings.

Dipstick, a free utility, answers the question: "Which site should I download the file from?" When presented with multiple Internet site locations to receive files from, you'll want to use the fastest connection. Drag the URL links onto Dipstick, and the program will test the speed of multiple connections, by pinging them, and show the fastest link. You can adjust the number and size of pings, plus time-out parameters. Dipstick returns the host IP address, minimum average and maximum round-trip time, as well as packet-loss percentage.

ISO 9000, Hardware Problems & More

by William LaMartin, Editor, Tampa PC Users Group

Regarding this month's meeting topic, President Connie Kincaid tells me that the International Standards Organization oversees the international standardization of almost anything from computers to dog food. They have set a series of standards known as the ISO 9000 standards for businesses that want to do business internationally. Any company that wishes to be ISO 9000 certified must submit to rigorous and lengthy examination by ISO 9000 auditors. It is very expensive and exhausting, but once a business obtains ISO 9000 certification they are believed to be a stable, reliable business that anyone anywhere in the world would be comfortable dealing with. It's really about creating some assurance that a company is reputable. The Pilgrim software is designed to aid businesses in documenting everything about themselves that relates to certification.

It's been a bad month for computer hardware and software.

First the hardware. My almost one year old Gateway P5-166 now has a new 12 speed CD drive. It is the fourth drive that has been in the computer. The computer came with an 8X Wearnes. That failed after a couple of months and was replaced by another Wearnes. A few months later it also failed, and it was replaced by an 8X Toshiba, which for some reason I deemed to be of higher quality. It quit working (drive not ready message) a couple of weeks back, and, as in all the previous cases, after a free call to Gateway technical support and just a few minutes wait I had a tech representative who, after putting me through the usual paces of checking various settings and then disconnecting and reconnecting cables, determined that the drive was defective and promised me another one via UPS in a few days. This time it was a Mitsumi 12X, which

Members may insert non-commercial ads at no charge with the following imitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

SECRETARY'S REPORT & MINUTES OF MEETING May 14, 1997

Minutes and Comments by Ken Boyd & William LaMartin substituting for Merle Nicholson, Secretary, Tampa PC Users Group

The meeting started around 6:45 with Connie Kincaid giving a description of our group, since there were more than the usual number visitors present due to the Corel presentation.

Chantal Smith from Corel Corporation then took over and gave a description of Corel and the types of software they develop. She mentioned, in particular, their move to Java with **Corel Office for Java**.

She next listed the major software packages she would touch on: **WordPerfect Suite 7**, **Corel Office 7**, and **Corel Draw 7.** First to be demonstrated was WordPerfect Suite 7, with the comment that version 8 would be on the shelves shortly.

The suite contains WordPerfect, Quattro Pro and Corel Presentations as major components with many auxiliary components like Envoy, Barista and Corel Flow. She highlighted improvements made to WordPerfect such as: 300 levels of undo, text formatting improvements, shortcuts to frequent operations, improvements in working with embedded spreadsheets, and speed formatting . Next shown were several time saving features to the suite's spreadsheet QuattroPro. And to finish out the suite, we saw how to enhance your slide show in Corel Presentations with movement, transitions, bouncing bullets, tables and charts.

Corel Office 7 was not demonstrated, but it was noted that it was basically WordPerfect Suite 7 with added features like Paradox and Sidekick.

The pièce de résistance of the presentation, of course, was Chantal's demonstration of **Corel Draw 7**. She led us through the creation of a brochure where we saw how to fit text to a path, fill text with a graphic, use interactive color fills and blends, place material on different layers, and much more that I can't remember. I do remember that one manipulation was so impressive it brought applause from the audience.

The program comes with powerful utilities like Dream 3D and PhotoPaint . Needless to say, there is a tremendous amount of clip art and graphics included. One impressive fea-

Software Review

ActiveOffice Can Make Even Me Look Good

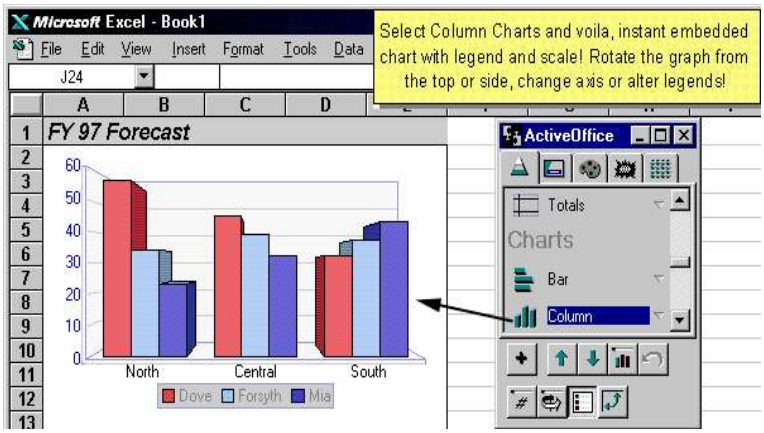
by Fredrick Rea O'Keefe, Tampa PC Users Group

Up Front Summary:
Product - ASAP ActiveOffice, ver. 1.0
Publisher - Software Publishing Corporation (SPC)
Class - Graphics Software
PC requirements - MS Office 95 or 97; WIN 95/NT 4.0; 486/50 or Pentium (recommended); 4MB HD space; 8MB RAM (12MB for NT); VGA 256 colors (works on 16 colors). Comes on 1 diskette.
Street price - about $50
Rating (0-10) - 9
Recommendation - Buy; it's a bargain. Makes your tables, worksheets, and data stand out. Maintains the high performance standards of SPC graphics products.

SPC is famous for the highly praised Harvard Graphics family of programs. For us non-power users, SPC has invented their "Intelligent Formatting" software "engine." As reported last month in my review of ASAP WordPower, this engine makes easy the transforming of text, tabular data, spreadsheets, and flow charts from old-fashioned to lively graphics. ActiveOffice is the first in a planned line of "Active" productivity enhancing software. Based on what I've seen so far, Hooray! However, to benefit, you must own Microsoft's Office 95 or 97 applications.

As with ASAP WordPower, ActiveOffice features straightforward point-and-click to convert highlighted data into your choice of graphic design. And then, you can play with the choices, immediately seeing results. As an example, you can select a table in Word, or a set of Excel cells, and create a 3-D, grid delineated table, or a bar or pie chart, or flow chart type layout. Then, you can resize, change colors and other graphical attributes.

That's as easy as it can get. But, that doesn't do justice to the complexity of what ActiveOffice does for you, or the breadth of the choices you can make in customizing your documents. As with ASAP WordPower, you can convert data, or you can create an "ActiveOffice object" from scratch. Rather than spending time considering graphical design, simply type your material, or highlight what already exists, and let ActiveOffice do the grunt work. It takes longer for me (two-finger typist that I am) to type a few phrases than it takes to convert them into an acceptable presentation object.



Another way to create an object is to select a layout from the ActiveOffice™ menu, drag it onto your document, spreadsheet, or PowerPoint presentation, and drop it. Fill in the object, and be done.

The right mouse button, clicked on an object, allows for a wide range of formatting manipulation, including sizing - a valuable tool you will use often. Once a custom object has been created, you can save it for repeated use. This is great for those price quotes, or equipment descriptions for your proposals. Yes, the recalled object can be toyed with.

Because ActiveOffice integrates with MS Office, it is available with one click of your favorite rodent. OLE (not "o-lay")is the secret to success here. (You don't really want to know, do you?) And, no, Office's built-in layouts and charting modules don't begin to have the ease, breadth or convenience of those with ActiveOffice.

Well, upgrading our office 486/66 with a 200MHz Pentium motherboard forced me to shelve the Diamond Stealth video card we were using, and revert to the original VGA, 16 bit card from the first 386 machine we owned. It works! Even at this rudimentary level, ActiveOffice jobs look great. But, I see that I will need to get a color laser printer to be satisfied -- should one be available which can meet my standards of both text (must be perfect) and graphics (likewise, in both subtlety of shading and color). LaserMaster® printers are the closest, but my business doesn't require typesetting-quality hardware. The point is that ActiveOffice can easily make your printed presentations (make that "profit generating sales materials") good looking enough to warrant quality printing. Junk that obsolete 300 dpi printer!

A Brief Comment on Java

by Don Patzsch, Tampa PC users Group

In 1991, the Sun Microsystems Company wrote an operating system for electrical appliances such as TV's, VCR's, microwave ovens, etc. They first called it Oak, and then changed the title to Java.

In 1994 Sun wrote a browser called HotJava. When the Java program was combined with HotJava, the computer programmers around the world began to take notice of Java, and they began to program with it.

Now really, just what is Java. Java is a computer language similar to C, C++, Pascal, and Module-3. The Java language is based on C++, an object oriented language.

The reason that all the programmers are taking a hard look at Java is because you only have to write a program once, and you can run it on any platform. That means that you can write an applet for the World Wide Web, and it will be readable by Netscape or Internet Explorer, because they are both Java compliant. (Applets written in Java are very short and load into the browser fast. It is easy to write very interesting animations in Java.) You can write the second type of program, an "application", and it will run on a MAC, or an IBM compatible, or a UNIX computer, or on Windows95 or Windows NT, OS2, or even a 64 bit Cray Supercomputer, without going back and making changes in the program for each machine.

C programs require that you link and compile them for a specific type of computer. Java programs are Byte Code and you need to have a program on the computer you want to run it on called an Interpreter, or a Run Time environment. New computers will soon arrive Java compliant, which means they will be able to run applications. An application is a regular program such as a word processor or a spreadsheet. Corel is out now, with a suite that is written in Java.

To clarify, there are two main types of Java programs, "applets", which require a browser, and "applications" which require an interpreter at the user's computer. An "application" is a standalone program. This use of an interpreter is called a "Virtual Java Machine" (VJM). You will be seeing VJM in advertisements for new computers.

Now, due to this type of arrangement of the system, security and portability are "built in". If you download a regular program you may download a virus. This does not happen with Java.

Now - what are the **strengths of Java?**

- Java is simple and easy to learn.
- Java is secure.
- Java is portable. It can be run on any computer.
- Java is object oriented. You don't need to write everything twice.
- Java is Robust. The program you write will behave.
- Java is Multithreaded. You can easily create interactive, networked programs.
- Java is Architecture-neutral. You can upgrade your computer and the programs will still run and behave.
- Java is Interpreted and High Performance. Java was designed to perform well on very low-power CPU's.
- Java is distributed. It handles TCP/IP easily.
- Java is dynamic. You can dynamically link code in a safe and expedient manner.
- Java prevents Memory Leaks.
- Java incorporates automatic garbage collection.
- Java applets are smaller and will load faster.

Now - what are the **weaknesses of Java**?

- Java runs slower when more complex programs are built.
- Java is new and so programmers may be confused until they become familiar with the programming.
- Java requires a runtime interpreter on the user's computer.

One more thing. JavaBeans. Microsoft called their OLE, or Object Linking and Embedding, a means of making changes in the spread sheet automatically when you made a change somewhere else. JavaBeans is like that in the sense that it has the ability to make links to components in other models.

Java is a newer language and therefore it will take time to improve it to the point where other languages are now. The universal approval of Java is shown easily.

Just go to Barnes and Noble or another bookstore, and look at the shelves of books devoted to the Java language. Or better yet, talk to some computer programmers or to some employment agencies. Java is really getting everyone's attention. It works fine with NC's, and NC's are now becoming available in quantities, and from many manufacturers. Java does not need an operating system, or does it actually form an operating system? How will this affect our future use of computers? How will it affect various companies? ◆

SOFTWARE AVAILABLE FOR REVIEW

1. **Magic Cap** - General Magic - Organize all your communications: email, fax, etc. - Windows 95 CD
2. **Tracer -** 7th Level - Launch into cyberspace with a deadly virus on your heels - Windows 95 CD.
3. **Work Safe Office for Windows** - Production Technology Engineering & Management Services - Ergonomic risk analysis for computer work stations - Windows 3.1 & 95
4. **On File** for Windows - Arranges your files into fun-to-use "notebooks "
5. **Family Fun Pack** for OS/2 Warp CD
6. **How Would You Survive?** - Grolier - Multimedia Adventure (ages 7-12) - Windows CD
7. **Jump Start Preschool** - Knowledge Adventure - getting a head start on education (ages 2-5) - Windows CD
8. **Space Adventure**- Knowledge Adventure - up to the moment exploration of outer space. (8-adult)
9. **Aviation Adventure** - Knowledge Adventure - complete world of flying (8-adult)
10. **SFPD Homicide: The Body in the Bay** - Grolier - Murder Mystery Game (ages 13+) - Windows CD
