Article from the VAR corner on OS/2 by Bob Fultz 4

Q & A, Need to Knows and Board of Directors listing 5

President's Podium

It is wonderful to see the good turnouts that we have been having lately at our meetings. I know that we can increase our attendance if we let our friends know about our group, the good information and the fellowship that is available here. Remember, the more people that we have attend on a regular basis, the greater the expertise that we have available to our group. Addi-

NOTICE

COME ONE, COME ALL

THIS MONTH'S MEETING IS AN OPEN INVITATION TO EVERYONE WHO RECIEVED A NEWSLETTER OR INVITED BY A MEMBER. WE HOPE YOU WILL FIND THERE ARE MANY ADVANTAGES IN A USER GROUP & THINK ABOUT JOINING.

DOS LESSONS

Will be presented at the February meeting by Russ Merritt.

MEMBERSHIP

We are on our annual membership drive. This month's newletter will be distributed to over 600 names with an application as the last page. Join in and bring a friend to this month's meeting!

tionally, we are far more likely to attract the top software and hardware companies to give us demonstrations.

We want to extend our warmest thanks to Kathy Johnson and IBM for their excellent demonstration of the PS/2 Model 50 and a general discussion of the thrust of the whole new IBM Personal Computer Operations. The improvements in the video resolution and the new Micro Channel Architecture do show that these new machines are designed for the late 80s and early 90s when we can expect the software to match their capabilities. My only caveat on these machines is that the Models 50 and 60 are based on the 80286 chip which I regard as no more than a souped-up 8088 chip in capability. Personally, I would not plan on any purchases of these AT type machines if I needed true multi-tasking capability and could afford one of the new 80386 machines that are now rapidly entering the market.

Next meeting we will see a demonstration of the Quattro Spreadsheet and Paradox Database by a Borland Representative. We will have an overhead projector to make this demonstration visible to all.

We look forward to seeing you there. Bring a friend and have a good time!

Steve Speairs, President

PC VIRUS

All of us have been following the spreading news of the computer virus with a great deal of apprehension and interest. The destruction that one of these bugs could cause makes our hearts skip a beat and sweat pop out on our palms. I have already had one of my superiors inquire about the safety of our operations and programs and what damage the virus could cause. While IBM and others are looking for ways to kill this dastardly bug, I would like to repeat suggestions on how to detect the bug's effects and some safety measures.

First, make a backup copy of your hard disk. If you are still using floppies exclusively, backup all of your major programs and their data files. Put these backups into a safe place and keep them there. If you are not currently infected by the virus or if you are hit by the virus later on, you may be able to reload from this backup only after checking it and cleaning it with a virus killer program that I am sure we will have by D Day, May 13th.

Secondly, you should monitor the sizes of your programs that will never change (.EXE or .COM) and if they do change then you can feel pretty certain that they have been infected.

Third, you can periodically check your RAM Memory usage through such programs as the WordPerfect Library where you should look for an unnamed program that should not be there.

Finally, you can wait for Friday, May 13th, 1988, when the current virus is scheduled to destroy your data. Don't say that you have not been warned!

MEETING NOTES

Meeting Chairman, Bob Fultz, informed the group that Borland would be giving a demonstration at the Februrary meeting. He also passed out literature concerning ***Awsome IO,*** which he saw at the most recent Comdex show. It reformats and improves performance of a hard disk up to 30% by keeping all files contiguous and lists for $595.

It was annouced that we would be doing a mass mailing for the February issue of the newsletter in hopes of recruiting new members. We will be using a print shop to reproduce the newsletters.

Our Librarian, Russ Merritt, spoke of the continuing review of program disks in Sun City, informed new members of availability of the library disk, and stated that the PC Sig Bulletin Board is still not operational.

Kathy Johnson, Systems Engineer for IBM, gave a presentation on the new line of IBM PC 2's and their operating system, OS/2. She confirmed that the operating system is still incomplete, addressable memory above DOS 640k would be available, multitasking uses Micro Channel Architecture, and VGA graphics. Also, she discussed the new graphic user interface for windowing, Presentation Manager, although it too is still incomplete. Ms. Johnson completed the presentation by demonstrating the ease of disassembly of the PC for replacement parts.

During the question and answer session the new *COMPUTER VIRUS* was explained by Steve, and more specifically the *ISRAELI VIRUS*. For more information, refer to the article on page 2, PC VIRUS.

BORLAND SHIPS SIDEKICK PLUS

Borland International has just begun shipping a new version of its popular desktop utility bundle, this one called SideKick Plus. The product that initiated the desktop utility category and started the rush to RAM-resident programming, SideKick has been among the ten best-selling programs for almost three years and boasts more than 1.5 million users. As its name suggests, SideKick Plus offers more notepads, more phone books, and more calculator types than its predecessor.

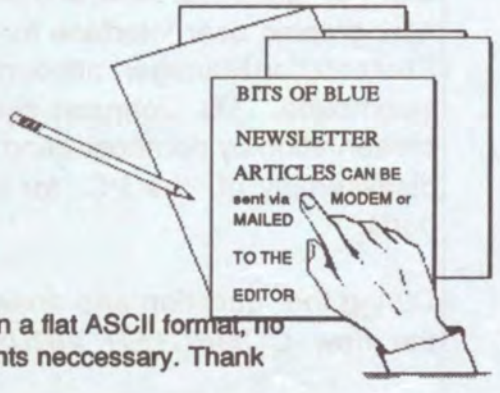
The $150 program is also equipped with a form generator, a file manager for naming and moving files, a data communications script writer, and an outliner. SideKick Plus is compatible with the LIM 4.0 Expanded Memory Specification, so that all but 64K of its 384K worth of modules can sit in high memory, solving the increasingly common RAMcram problem. SideKick Plus users can redefine its hot keys to reduce conflicts with the other terminate-and-stay-resident programs.

The current SideKick will remain on sale for $85. An OS/2 version of SideKick Plus is planned.

[PC World, Feb. '88, Top of the News, Mike Hogan]

The VAR Corner

The OS/2



SOLUTION

Author: Bob Fultz

OS/2 is here and I wish to address the effect, at least how I see it, that it will have on our use of microcomputers. First, let us understand that OS/2 is not for everyone. The operating system alone demands a large investment in either new hardware or an expansion of that which we already have. An Intel 80286 or 80386 based PC with a 60 meg hard disk (or bigger) and 2 meg RAM minimum is a must. The operating system alone will take over 1 meg, not including any application which you intend to run. So we have an investment of $1000 to $2000 in memory and storage alone for the AT or PS/2 model 50/60 owner, and $8000 to $10000 for the rest of us. *Just to run OS/2 and our existing DOS applications!*

Similarly, we will need new versions of existing software and/or new products which will take advantage of the capabilities of OS/2. Our current DOS applications, while able to work under OS/2, will still limited to the 640K barrier as always. While OS/2 is not multiuser, multitasking will still be available. Early users claim it is very slow when using disk intensive programs. Also, some early reports show that it is difficult to switch between protected-mode and real-mode operations (by some reports you have to re-boot the system). OS/2 may not be as transportable as DOS has been, allowing different versions of OS/2 to run on other vendors machines. Because of these problems it appears that OS/2 will not overtake DOS until sometime in mid 1989. By then we will be looking forward to OS/2 for the 80386 family of Intel processors.

After all the technical jargon and difficulties are cleared out of the way, I feel that it will be the users who will decide whether OS/2 will take over in 1989. DOS will not die quietly, it still has a long life ahead. EMS will take care of that. There are a large number of the users out there who will never need what OS/2 has to offer and whom will never spend the required monies to upgrade hardware. Yes, OS/2 will open up a new era of microcomputing, but it's impact is up the road a long ways yet.

Send them in a flat ASCII format, no tabs or indents neccessary. Thank you!

Q & A

Got a question? Bring your questions to the meeting or mail them to the editor. We'll put it in the newletter along with the answer so that everyone can benefit.

Articles are a great contribution but, for those of you who can't donate that much time, try a Q & A!

President's Podium

Well, we done did good at the show and all over! As you all know, the Executive Board, had some legitimate concerns about the booth staffing, but thanks to a dedicated effort by our members, we had the booth staffed for the entire show! I want to extend the official thanks of the club to these people; Pete Matassa, Norman Jones, Ken Vitoff, Robin Pokoj, Heidi Martinez, Walter Welch, Robin Green, Ann Sanborn, Steve Scott, Victor Marrerro and Bill Fuller. If there is anybody that I missed in this list, please let me know and I will give you the credit and gold star that all of you above so richly deserve.

In terms of the response, Heidi is starting to send out the follow-ups to the over 100 responses that we got. Considering that

RALPH WHITLEY SR.
GEORGE COX

Change in Dues Policy

At its last meeting, the Board of Directors voted to increase club dues to $20 per calendar year effective January 1st, 1989. This increase is necessary in order to cover the costs of new equipment, operating our Bulletin Board, printing newsletters, postage, etc.

Also, let me take this opportunity to remind everyone of the change in dues policy approved by the Board at its July meeting, which aligned membership dues/renewals on a calendar year basis. Current members will receive an invoice for membership renewals in the mail in late December unless 1989 dues have been prepaid. If you have any questions, please call Heidi Martinez at 962-6700.

CLUB DUES POLICY

RENEWALS:
$20 per calendar year Due January 1st

NEW MEMBERS:
$20 Joining first year before March 31st
$15 Joining first year before June 30th
$10 Joining first year before September 30th
$ 5 Joining first year before December 31st

COLOR COPIES
. . . for an impact that sells.

From the copy of a color graph your computer made for shareholders, to a color photo fact sheet in a proposal, or the illustrators latest creation, to your daughters wedding picture. Whatever it is, we're sure you'll be pleased with the photo print quality.
VOLUME PRICING AVAILABLE.

PRESIDENTS PODIUM CONTINUED FROM PAGE 1

our booth was on the 2nd level and beyond the first stairs down to the exhibitor floor, I think that we did very well indeed. To those of you who are receiving your first newsletter through your new membership or our trial subscription program, we bid you welcome and invite your participatic in our meetings. We do have one problem that we caused ourselves by duplicating the September newsletter for handout. We did not get to update the change in the annual member dues from $15. to $20. for the coming year. Consequently, some of these were changed by hand while others went unchanged. Since the offer was supposed to be $25. for membership to the end of 1989, we are contacting all of those who have paid the $15. dues and offering them a $7.50 credit towards their 1989 Dues. We hope that they will understand the mixup and not feel that they are being unfairly treated.

I want to urge all members to make a special effort to come to the meeting on Wednesday, 10/12/88, because that is when we will hold our election for the next year's club officers. We would like to have as many voting as possible. All paid members are eligible to have their nam placed in nomination from the floor for any offic

LIBRARY TIMES

By: Russ Merrit

Apologies to Steve Spears and Bill Fuller - the programs you gave me did'nt get added. for the membership, next month look for the program Steve demo'd a couple of months ago and for a bunch of good utilites from Bill Fuller.

The reason for the delay was that I got a little too busy downloading PC-Sig progams from Computer Dimension's bulletin board (and a 2 week vacation). Here are the new additions:

DISK127.ARC	C03	PC-MUSICIAN
DISK279.ARC	C04	PIANOMAN VER 3.0
DISK595.ARC	F12	BASIC GAMES & PROGRAMMING
DISK 256.ARC	F13	DOS & PROGRAMMING UTILITES
DISK105.ARC	F14	PC-PROFESSOR (BASIC INSTRUCITON)
DISK019.ARC	F15	ARCHIE (BASIC INSTRUCTION)
DISK615.ARC	G14	ORACLE, TAROT & ICHING (FORTUNE TELLING)
DISK218.ARC	K15	ADDRESS MANAGER
DISK387.ARC	K16	KEEP IN TOUCH (DESKTOP MANAGER)
DISK405.ARC	K17	PC DESK TEAM (DESKTOP MANAGER)
DISK608.ARC	N13	AUTOMENU
DISK642.ARC	N13	MENUMASTER
DISK118.ARC	N16	QYS DOS (MENU, MESSAGES, CALENDAR)
DISK268.ARC	N16	QYS DOS (DOCUMENTATION)
DISK686.ARC	N18	HELP DOS
DISK052.ARC	N20	DOS UTILITIES #1
DISK254.ARC	N20	DOS HELP (NOT THE SAME AS N18)
DISK284.ARC	P16	PC-SIG SAMPLER #8
DISK543.ARC	P17	UTILITES ET CETERA
DISK319.ARC	P18	DOS UTILITIES #18
DISK111.ARC	P19	FILE UTILITES #1
DISK 252.ARC	P20	LISTMATE/LOAD-US BY SWFTE
DISK113.ARC	P21	SCREEN,KEYBOARD, FILE COMPARISON

Later, I expect to list tha actual files that each of these ARC'd disks contains in the Library Disk. Such list were not done at this time because of time contraints. Hopefully, the general description will suffice for now.

Russ

PRESIDENTS PODIUM CONTINUEDFROM PAGE 2

and to participate in the election.

As I close this final President's Podium for my term in office, I want to thank all of those people, both on the board and elsewhere, who have contributed so much effort to making my job easier. It has been a very trying job at times but when I think of how we have gone from an almost totally moribund group to the currently active and thriving club now, I am thankful that I am leaving this position on a high note. May the new president take us even higher!

Again, thanks and I will be seeing you at the meetings ... Steve Speairs

A full feature library to add spell checking functions to your Clipper, DBASE IV, Foxbase+, and QuickSilver Applications.

D·Spell is accessed by standard function calls from within your applications. Use D·Spell to check spelling in character and memo fields without leaving your applications!

- Over 70,000 word dictionary
- Auxiliary user defined dictionaries of up to 1000 words each
- Custom Dictionaries (120,000 words) available
- Checks 18,000 words per minute
- No Additional fee for up to 100 application copies
- Sample source code included
- Capitalized words and fields recognized in replacement

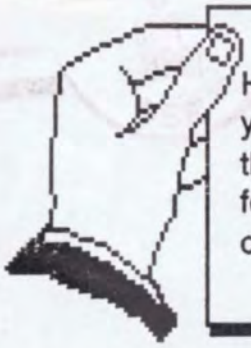
MEETING TID BITS

* Russ Merritt provided information about a Label Maker program. He asked for a volunteer to "fix" the BASIC program in order to honor printer control codes.

*Sandra Solomon from Borland was our guest speaker. She demonstrated SPRINT, their newest word processing program.

The suggested retail price for SPRINT is $199.95. The package boasts importaion of Postscript graphics, shortcut keys for ease of operation and provides the facility for Multiple documents being open simultaneously. Every three seconds SPRINT automatically saves the current documents loaded into memory, or more often if you customize it to do so. It provides multiple interfaces so the user has the feel of using a wordprocessor they already know as well as a recovery feature.
]



John Pugh was the winner of a complimentary copy of SPRINT!

* Mace and Byline from Ashton Tate will be October's adjenda. WordPerfect and Flowcharting will demonstrated in November.

* Presence at the Business Expo helped to increase our membership significantly!

* A raffle drawing was suggested for each meeting whereas each member paid $1 to puchase a chance to win half the pool and the other half would help supplement the club.

* There is a SMART and a NOVELL users group forming in the Tampa area.

Have a computer item you need to sell? Let the editor know. Drop a few lines of detail with cost and phone number!

SOFTWAREREVIEW

By Edward P Buzza

AUTOMAXX ver 3.0 - A combined file manager and menu system.

The file manager is capable of displaying directories and files; renaming them; making and removing directories; editing file attributes; single or mass delete, copy, or move; whereis and search features; customized printer setup; file wipe; and unerase file and unremove directory abilities.

Through the use of an ASCII data file, the program builds a customized menu system that supports 50 menu screens, including nested menus. It can link with any editor to view and/or edit files. It can also link to an ARC compatible program.

The program provides a popup calendar, a calculator, timed execution of menu options, screen save with clock, keyboard macros, and an extensive on-line help facility.

TTThere a shareware version called AMAXX216.ARC that can be obtained from some Bulletin Board Services. This .ARC version has been placed in the library. The registered version (3.0) also has a few "goodies": 1) an extended directory that allows you to add comments to your files, 2) a text view utility which supports all text modes of EGA and VGA adapters, 3) a disk recovery program that will unformat a hard drive, 4) a password feature, 5) a program to customize the colors of AUTOMAXX, and 6) popup menus rather than the LOTUS like command menus of the shareware version.

AUTOEXECuting Along

by Steven Speairs

In the last article, January 1989, we showed a straightforward 'AUTOEXEC.BAT' File that performed a few basic tasks like verifying/setting the system clock and then went on to use that information to set the DOS prompt and then it quit. All told, this is a simple an example of an 'AUTOEXEC.BAT' file as you are likely to find.

For some people this is quite sufficient as they have created this 'AUTOEXEC.BAT' file for themselves and they have a relatively straightforward use for their computer system. For others, however, the additional power available through the 'AUTOEXEC.BAT' file is too tempting not to use. Additionally, several software packages also make modifications to the 'AUTOEXEC.BAT' file in order to improve that package's usability/performance.

In this months article we shall take the 'AUTOEXEC.BAT' file to another level where it performs friendlier actions that go a step further in preparing the computer for use. These actions range from making use of programs that give information about the system's current status to a quickie menu system that can be used to give an idea of what the system has for the user to work with.

Starting with the simple 'AUTOEXEC.BAT' from last month, we first add a call for the 'CHKDSK.COM' program with the '/F' parameter. This will give us 3 pieces of information that can be quite vital for us to know. First it will detect and allow us to fix any incidence of shared clusters. This is a case where 2 or more files share use of the same space on the Hard Disk. To find out what it means, you should check your DOS Manual about this. It is sufficient here to say that this is important and it is here that you start a fix for this problem by answering 'Y'es to the response question if this condition is detected. Once this damage has or has not been detected, then the 'CHKDSK.COM' program will list the TOTAL, USED and AVAILABLE space of the default Hard Disk. Finally, it will list the current Standard RAM (640K Max) and what is still available after DOS has been loaded. If there were any other TSR programs in the 'AUTOEXEC.BAT' file ahead of this command, then the RAM available (FREE) would be reduced by their RAM requirements.

Next command is 'MIRROR.COM' which is one of many found in the various Hard Disk utility programs like PCTOOLS, NORTON or MACE. This command makes a back-up copy of the Hard Disk's File Allocation Tables (FAT) to the end area of the Hard Disk. Doing this allows you to use the counterpart of the copy program to restore the FAT if anything, such as a rogue program or power surge causes damage to the original. Without the FAT, the Hard Disk cannot find its data and you are parted from all of the work that you have done to that point.

Finally, you clear the screen and then call in a text file that has the menu of your favorite programs. This text file is simply typed to the screen so that it is the last thing shown before the DOS prompt. The listing of the programs can be done with a letter or number preceeding each selection and instructions can be included to say that each program can be called by

January's 'AUTOEXEC.BAT';

What shall I read now!

by Steven Spears

We, who have been in the PC Field for any length of time tend to forget how confusing and overwhelming it can be for the novice. Even the most intelligent and alert of them can get quickly overloaded when they first try to find information on computers.

The real novice is generally exposed by going to a computer store to try to find the knowledge that he needs there. I will thank those of you who are now grinning to wipe that smile off your faces. Remember, you too were once a novice! It makes sense to expect this but it is like going to a car dealer to learn about the Belchfire 5000! You generally wind up with a salesperson who is more anxious to see the credit rating on your card than he/she is to demonstrate how little they know about what is being sold. Also, to be honest, the store cannot survive on teaching computers to the novice because all too often that person will take the good salesperson's advice about what to buy and go down the street to buy it at the place which does not pay the teacher's expensive salary!

The richer novice hires a consultant to buy him the computer that he needs. This works so long as he/she has the money to pay for the consultant's research and the consultant really understands what the client wants! The gap here can be horrendous indeed!

So the really smart PC novice goes into the news stand/bookstore and buys an unprejudiced magazine that says precisely what is needed to do what! The only problem here is that the computer magazine rack is now the same size as the automobile magazines and even more confusing! Some of the real old timers in this area can remember when Byte was about all there was available and was found only in the computer stores. It was the size of your average Newsweek and that was mostly how-to articles and advertisements for wire-wrapping kits. Now Byte, which is one of the oldest of the magazines, is in every magazine rack, is seldom less than 350 pages, and is a shrimp to some of its younger competitors.

So, as a service to man (& woman) kind, I thought that I would give a brief reader's guide to the magazine rack. I don't pretend to be unbiased or to have included all of the magazines available for the PC world in here. The majority of these magazines concern MS-DOS machines although many do make references to the Mac and its kin. I have tried to be accurate in my impressions and to give the reader an idea of what each magazine is about.

I have divided the Computer magazine field into 6 categories ranging from the General Computer News Weeklies to the dedicated Application magazines like Lotus. Between these two extremes are magazines that are genuinely oriented towards the novice and those that are aimed squarely at the expert who is going for the optimal system. Some magazines try, with varying degrees of success, to cover both the novice and expert ranks but no one is recommending that a novice spend his hard-earned dollar on one of the expert-type publications!

Continued Page 7

AUTOEXEC Cont.

each program can be called by hitting the corresponding number or letter. For example, one line can say 'L : Lotus 1- 2-3 Spreadsheet. '. To make this work, you can then code corresponding batch files that have the actual instructions to change directories and activate the desired programs. It is important in this kind of use that each of these batch files also contain the instructions to return to the root directory and then to re-display the menu text again. Using the menu line for the Lotus 1-2-3 as shown above, you would create a separate batch file with the name 'L.BAT' that would have in it the following commands; 'CD\LOTUS', '123', 'CD\' and 'TYPE MENU.TXT'.

This is not the only way, nor is it the most efficient way to have a menu-driven system for your computer. It is, however, a simple one and one that can easilybe experimented with by you at your leisure. §

IN THE BEGINNING

Sydney PC UG

I In the beginning, there was vacuum. Then the earth was created. After a while, the vacuum tube was invented and so were better radios. And it was good. Then great war and pestilence fell upon the earth. And in the wake of the destructions came a new idol unto mankind which was built of thousands upon thousands of vacuum tubes. And they called it the computer. And it was good, too.

II But the idol grew prolific and waxed greater in its demands for space and power. So the transistor was invented. For a while, everything was OK.

III Then came the cold war. Next, Sputnik was launched into orbit. There were missiles in Cuba. So John F. Kennedy said let there be an American moon mission. And there was money for the new technology.

IV And the idolaters called upon their wire-wrap gods to provide the answers needed. But the idols demanded more in return. So integrated circuits were created. And this was wonderful.

V Before long, Neil Armstrong took a small step on the moon. Then Intel designed the 4004 microprocessor chip to control a calculator. This was very good indeed.

VI But this small idol foreshadowed things to come. Though its demands for memory were small, the 4004 was fruitful and multiplied. The 4004 begat the 8008 which begat the 8080 which begat the 8086 which begat the 80186 which begat the 80286, and so on...

VII And each had siblings and cousins and some competitors, too. And their numbers grew great within the land. For each gave its worshippers better, faster answers, but in return required more memory.

VIII And memory chips grew abundant amidst the gods. But they were quick to obsolesce and their value steadily declined. And so their numbers grew even greater. Memory chips were the ambrosia of the gods and they drank deeply.

IX But the multiplicity of idols caused dissent among the faithful. For those who followed the 8080 were memory-frugal and called 8086 programmers memory hogs. For while the former groped to save half a dozen bytes, the latter sought ways to splurge half a dozen kilobytes.

X But soon enough they learned the error of their ways. For their high gods proved finite and memory limitations caught up with them. But the wisdom of their frugal brethren had gone unheeded.

XI And they were sore afraid. For their applications grew too big and end users wanted more per-dollar performance from their software without another change of hardware...

READ CONTINUED

In the News category there are two principal players; InfoWorld and PC Week, but you can only find InfoWorld at the newsstand. This is because while InfoWorld aims itself at the general populace and user, PC Week sells itself to its advertisers by limiting its free subscriptions to people already actively involved in the MicroComputer arena. Consequently, while both cover the breaking news very similarly, InfoWorld does reviews of hardware and software while PC Week works on the corporate world's interests of what is being done by whom and why.

In the Genuine Novice Category there are 3 Magazines of note; PC Resource, Personal Computing and Computer Shopper. PC Resource is, in my mind the best magazine to recommend to a novice interested in an MS-DOS PC. It has the reviews and tests that are clear, concise and easy to get into. Personal Computing, is one of the older magazines that tries to cover the waterfront but has little depth to its coverage. I have not found it to be that useful. Computer Shopper is the GIANT of this genre. It is an enormous tabloid magazine that is chock full of everything including the kitchen sink! The reviews are of wildly varying quality and are so spread out in this unique format that reading this is either a love or hate relationship!

In the intermediate level there are the 2 best known of the MS-DOS dedicated magazines; PC Magazine & PC World. They even had an evil twin birth where, when one was bought without the editorial staffs knowledge, the majority of them went out the door to start the other one. My choice here is for PC Magazine which seems to have a more active role in pushing for PC Standards and has some of the best columnists in the business! PC World has the better artwork and is written to a more novice user understanding. They both are heavyweights in the test and review business.

In the Expert category of magazines there is PC Tech Journal which takes off from where its older brother, PC Magazine, stops in its reviews. This is the magazine to use to soup-up your PC into a '386 configuration. It concentrates mainly on the hardware side of the coin. Its software counterpart is Dr. Dobbs Journal (formerly Dr. Dobbs Journal of Computer Orthodontia and Computer Calisthenics)! This is the one for refining your 'C' program into the smallest memory module with all of the bells and whistles!

In a more general view, there is Byte, the grand old man and authoritative voice of the Micro World, and PC Computing, which as one of the newest kids on the block, is an interesting blend of Computer exotica and overview of computer impact on the world. Both are well written but Byte is definitely more technical while PC Computing is more eclectic.

Finally there is the class of magazines that are application-specific and as such cover there dedicated areas in much more depth than the other magazines. Magazines such as Lotus, published by Lotus and devoted to its products will show you Lotus' secrets to get the best out of 1-2-3 and Symphony. Likewise, Ashton-Tate's Tech Journal will give you all it can about dBASE, now devoting most of its space to dBASE IV bug reports! However, don't expect a hard-hitting review of the differences between Excell, Quattro and 1- 2-3 in Lotus! A different approach is that of the magazine DataBased Advisor which reviews and assists its readers in using the multitude of different database products such as dBASE, R-Base, Paradox and their auxiliary tools.

The reason that there are so many magazines is that there is so much information out there to be told. The computer field is still very much in its infancy and this is characteristic of that age. At some point we may have computers so powerful as to be able to do anything we desire and help its user without any other source of help. Until we get to this point, we will need these magazines and other helping references to get the most out of our dollars and computers. I hope that this brief review of some of the magazines out there gives you an idea of where to look for that needed help. §

THE ENFORCER

Gathering articles from members for the newsletter is becoming extremely difficult. Steve Spears has come to the rescue and volunteered to become "THE ENFORCER"! Steve will take over the job of A-SAD (Article - Solicitor, Asker, Demander). So PLEASE, when Steve comes around asking for input dig deep into your creative hearts and help us get some "MEAT & POTATOS" (to coin a phrase from our President) into BITS OF BLUE.

JANUARY MEETING MINUTES

Harvey Bruneau encouraged users to submit articles for our club Newsletter so we can get "more meat and potatoes" into the publication.

"Beware of Dbase IVs network problems" warned Harvey. Vern Semrad President of the Dbase Users Group, said the new release has some very good features but there are many bugs.

Linda Confer of Software Publishing Corporation was our guest speaker. Linda gave us an overview of the PFS product line:

PFS:First Choice - Integrated file management, communications, spreadsheet and graphics package.

PFS:First Publisher - Entry level desktop publishing package.

PFS:FIRST GRAPH - Entry level graphics presentation package.

PFS:PROFESSIONAL WRITER - Word Processor

PROFESSIONAL FILE - Flat file management program

PROFESSIONAL Plan - Spreadsheet analysis program

HARVARD GRAPHICS - H end Graphics presentation package

HARVARD PROJECT MANAGER - Scheduling Project Management package

OFFICE WRITER - Word processing package originally written for the WANG.

Linda then demonstrated First Graphics. First Graphics is a presentation package for producing data and text charts. The package is targeting for the occasional users who wants good quality output at a low price, First Graphics retails for $149.00. §

LIBRARY NOTES
By RUSS MERRITT

For those who didn't get the disk assignments at the January meeting, they are as follows:

PC DRAFT I.....B04
FLOWCHARTING.....B05
CHURCH DATA SYSTEM.....D12
TURBO C TUTORIAL.....E01
A86 ASSEMBLER.....F16
TEXT EDITOR.....H06
BUSINESS THINGS.....K18
FILE UTILITIES.....N21
SCREEN MGMT UTILITIES.....N22
LOTS OF UTILITIES.....N23

The current issue of the Library Disk is January, 1989. To get an update, bring a formatted disk for exchange, (a copy of the last library disk, for example) or $1.00.

AND THE WINNER IS...

As we generally do, we had some very good prizes given away at the January meeting. The software donated by some members who are retailers and by guests making presentations represents some real dollar values our members and guests have taken home just for attending our meetings and participating in our "door prize raffle".

HIGHLIGHTER PEN
won by Ann Sanborn

PFS:First Graph donated by SPC Software
won by George Cox

Coffee Mug donated by SPC Software
won by Linda Dunkerly

Computer-Size Screwdriver
won by Bob Whatley

$28.00 50/50 Raffle Prize
won by Robin Pokoj

DONT FORGET TO PURCHASE "RAFFLE TICKETS" FOR PRIZES $1.00 AT THE DOOR

THIRTEEN WAYS TO DO IT AND ONE WAY TO DO IT AGAIN

By Walter D'Ull, NY PCUG

Attorney do it according to law.

Opera singers do it on a high note.

Librarians do it by the book.

Lotus users do it in a cell.

Witches do it under a spell.

Typists do it manually and electrically.

Nurses do it with tender loving care.

WORDPERFECT devotees do it functionally.

MS WORD users do it on command.

Q & A users do it with and Intelligent Assistant.

Database reporters line them up in rows.

Modem users only remotely do it, if at all.

NORTON users restore it, so that it can be done again.

VIRUS ANTIDOTE NOTE

By Russ Merritt

Maybe for beginners or others who forgot...The recommendation in the December newsletter to use the Assign Command to avoid Virus and Trojan Horse attacks appears sound. However, be aware that the Assign Command is external and when you Assign C to A, Drive C is no longer available since all requests directed to Drive C are automatically routed to A. Solution:- reboot or put a DOS disk in A and type ASSIGN to get everything back to normal.

Linda Confer

Linda Confer is a marketing representative for Software Publishing Corporation, the publisher of several of the top selling software programs in the Microcomputer market today. We are especially pleased when people like Linda see fit to join our group. We see that as a vote of confidence by software companies in our organization. We continue to see large numbers of computer-persons in attendance at our meetings. That is very gratifying to me as a member since 1985. I have been through the ups & downs of the club, and, I see nothing but good things ahead.

We are growing, and we are getting better at doing the things micro users in the Tampa Bay area look for in a USER group. I base that on two observations. I see experienced users that I have not seen for awhile coming back to meetings. I see and talk to people who are just starting to use a microcomputer and are coming to the meetings to learn. That's why I joined the group a few years ago. That's what a USER group is all about - all levels of experience and expertise getting together to share knowledge, questions, and answers. Our president, Harvey, has a wealth of experience of computers in several different computer environments. But, we are a MICROcomputer group. My opinion is that even Harvey learns something about MICROs at our meetings. That tells me we are doing something right.

Thanks for coming.

PRESIDENT'S PODIUM

Harvey Bruneau

Just as memory chip prices are beginning to come down from the last International Trade Commission (ITC) decision, a new Anti-Dumping movement is underway.

The (ITC) is studying a recent determination by the Commerce Department's Office of Anti-Dumping which states that Sony, Maxell and Fuji are dumping 3.5" diskettes on the U.S. market. This investigation was launched by a petition from Verbatim. If the ITC determines that dumping has hurt U.S. manufacturers, prices for the dumped diskettes would increase as high as 51%. Presently, half of the 3.5" diskettes sold in this country are imported. The commission will make its determination in late March.

What amazes me is that when the products in question are sold to only a few consumers, in relation to the total consumer population, its called dumping. But when the masses are involved its OK to sell it at a cheaper price than anywhere on this world.

I refer to the oil industry in specific. The middle east has been selling us oil at a lower price than we can produce it ourselves. This in fact has resulted in the states of Texas, Louisiana and other oil producing states to cap their oil wells resulting in massive cutbacks in American jobs. Is this not dumping. While it would be political suicide for the government to suggest raising oil prices to reflect the world market, they do not seem bothered in raising prices of products whose consumers are few in numbers.

Of course I don't want to pay $2-3.00 a gallon for gas, but when 3.5" diskettes are the standard next year, I will not want to pay 50% more than today's going price.

Why are they picking on the computer industry when the American home electronic, automobile, steel and oil have been OK to dump on in the past?

I can't wait until the day that IBM complains to the ITC that foreign clones are being dumped resulting in unfair competition. §

Investigators from the department of Anit-dumbing search high & low for evidence of disk dumping.

R.L.Poko

HELP!

by Harvey Bruneau

We have need for a few devoted members to step forward and volunteer some time and effort as board members. Board members serve a one year term and are elected by the general membership.

Our immediate need is for a **Librarian** to maintain our Public Domain software library which is brought to the meetings for members to copy. Russ Merritt has been doing a good job in the past but feels a better job could be done by someone who could devote more time.

Additionally, the positions of **Secretary** and **Education** are open. The secretary is responsible for taking minutes (notes) of each meeting. The notes are printed in the following months news letter. Presently this position is being done by a volunteer on a meeting by meeting basis. The education person is responsible for organizing and providing educational presentations for the general membership. These presentations can be lessons in DOS or anything pertaining to microcomputers and do not have to be done on a regular basis.

In conclusion, if you can help us with one of these positions it would be greatly appreciated. You can either call and tell me which position you would like to be nominated for or during our meeting, at nomination time, stand up and be heard. We will have a special election for these positions and the terms will be pro-rated to coincide with terms of the existing board members. §

FastTrax ver 3.9

A disk optimizer and file de-fragmenter

Edward P Buzza

This program optimizes hard disk and floppy disk performance by consolidating pieces of files and directories. It not only places files in contiguous disk clusters, it assigns most files to the least number of disk cylinders resulting in increased track-to-track efficiency.

In contrast to other disk optimizers/de-fraggers, this program allows you to assign frequently used directories, programs and/or data to the "fast tracks" nearest the FAT. Directories and files are grouped by priority: top, high, normal, and low. Also, the amount of "free space" can be divided and placed between the priority groups, or wherever you want it.

While the program only optimizes disks, it does so far better than NORTON or PC-TOOLS. Using the "safe" (and slowest) option, it took only eleven minutes on an AT (10Mz, 64ms access hard drive) to optimize and de-frag 600 files in 28 directories (almost 12 million bytes). It has received highly favorable comments from leading trade magazines (See PC Magazine - Oct 11, 1988).

GRiDLock

By Steve Scott

A friend of mine, who I hadn't seen in years, stopped by my office at the dealership the other day. He works for General Motors so we began talking about some of the changes which have taken place since I left the company. More and more, he said, he was becoming detached, dependent on voice mail, E-mail, and other non-traditional types of communications which isolated him from contact with his own species. Wasn't it nice, he went on, that we had a few moments to talk about the good old days.

He explained that he had just been through two weeks of training in the mental tundra of Lansing, Michigan, and would be proud to show me the object of his intense study. So much for the good old days! He took me out to his company car, popped the trunk, and showed me an array of electronic gadgets the likes of which I had never seen, except for one piece: a GRiDCase 1530 PC, which he unceremoniously flopped onto the pavement. (Laptop 80386, 12.5 mhz, 40 mb, gas plasma display, battery operated)

Now this guy is no dummy, but I knew he couldn't tell DOS from a dump truck. So what was it all for, I coyly asked, hoping above all hopes that Steve Spears didn't already have the beta version. Sorry, Steve, this is some radical high tech GM proprietary stuff.

Cars are built with on-board computers to monitor and control about 40 engine functions thousands of times per second. These on-board computers can develop bugs which cause serious engine problems. Sometimes the technicians (they should no longer be called mechanics) who work on these computers need a helping hand. My GM buddy is their guru and showed me the latest in electronic diagnosis. What I am about to describe is a service done by many dealerships using more conventional means.

The GRiD is taken to a sick car and fitted to the diagnostic port of the on-board computer. Several other wires are hooked to ports on the engine itself. While the car is being driven, the cellular modem dials a GM access number which, via satellite link, puts the technician on line with an IBM main frame in Lansing, Michigan. The main frame listens to the engine, diagnoses any problems, reprograms the EPROMs of the car's on-board computer if necessary, and spools the results of the session down to the hard disk of the GRiD for later review. The screen notifies the technician of needed repairs and adjustments, like replacement of the spark plugs, which cannot be done by satellite link (yet). The whole operation, start to finish, takes about ten minutes.

After the demonstration, I asked my buddy to bring the GRiD to my office. I hit ^C, exposing him to DOS for the first time, and gave him a copy of PC-WRITE. "Y-Y-You mean," he stammered in utter amazement, "I can actually type my reports on this thing?" §

RBBS Bytes

By Kevan Sheridan

Baud Rate 300/1200
Number 239-3704

One of the benefits of being a member of the IBM PC Users Group is the Bits of Blue electronic Bulletin Board, and every member should learn how to take advantage of this valuable asset and its offerings. Unfortunately, many members do not understand what a RBBS is or how to fuliy use it. This month I want to introduce the BBS to you and encourage the membership to use and enjoy the Board.

Our Remote Bulletin Board System (RBBS) consists of a XT compatible with a 20M hard drive and a 300/1200 Baud modem. It is accessible 24 hours a day, seven days a week. It contains a variety of free public domain programs which include games, DOS tools, tele-communication packages, and much more. The board also has a computerized bulletin board, an electronic mail system, a files system,and much, much more. And all of this is just a modem call away.

When you call the Board use your name to tell the system who you are. If you have not called the Board before it will ask you if you wish to register as a newuser. When you answer YES the system will then ask you about your 'setup'. For a simple first time use answer No or None to most of these questions. Later, when you learn what they mean you can change them with the utilities. From there remember to read the prompts. If you have trouble enter a question mark for further help. Once you have called the system once you can then 'TURBO LOGON' by this you just enter you FULL name AND Password when asked for your FIRSTNAME. If you have done it right you will see dots as you type your password. §

COMPUTER GLOSSARY

by Charles Bassline, Datamation

ADA - Something you need only know the name of to be an expert in computing. Useful in sentences like We had better develop an ADA awareness.

BUG - An elusive creature living in a program that makes it incorrent. The activity of debugging or removing bugs from a program ends when people get tired of doing it, not when the bugs are removed.

CACHE - A very expensive part of the memory system of a computer that no one is supposed to know is there. DESIGN What you regret not doing later on.

DOCUMENTATION - Instructions translated from Swedish by Japanese for English- speaking persons.

ECONOMIES OF SCALE - The notion that bigger is better. In particular, that if you want a certain amount of computer power, it is much cheaper to buy one biggie than a bunch of smallies. Accepted as an article of faith by people who love big machines and all that complexity. Rejected as an article of faith by those who love small machines and all those limitations.

HARDWARE - The parts of a computer system that can be kicked.

INFORMATION CENTER - A room staffed by professional computer people job it is to tell you why you cannot have the information you require.

MACHINE INDEPENDENT PROGRAM - A program that will not run on any machine.

MEETING - An assembly of computer experts coming together to decide what person or department not represented in the room must solve a problem.

MINICOMPUTER - A computer that can be afforded on the budget of a middle-level manager.

OFFICE AUTOMATION - The use of computers to improve efficiency in the office by removing anyone you would want to talk to over coffee.

ON LINE - The idea that a human being should always be accessible to a computer.

PERFORMANCE - A statement of the speed at which a computer system works; or rather, might work under certain circumstances, or was rumored to be working over in Jersey about a month ago.

PRIORITY - A statement of the importance of a user or a program. Often expressed as a relative priority, indicating that the user doesn't care when the work is completed so long as he is treated less badly than someone else.

QUALITY CONTROL - Assuring that the quality of a product does not get out of hand and add to the cost of its manufacture or design.

REGRESSION ANALYSIS - Mathematical techniques for trying to understand why things are getting worse.

STRATEGY - A long-range plan whose merit cannot be evaluated until sometime after those creating it have left the organization.

SYSTEMS PROGRAMMER - A person in sandals who has been in the elevator with a senior vice-president and is ultimately responsible for a phone call you will be receiving from your boss.

FEBRUARY MEETING MINUTES

Vickey Kelly from Blumberg Communication demonstrated two computer overhead presentation systems and a desktop slidemaker.

Ultimate Presentation System - In Focus Systems Inc - This high end PC viewer system comes equiped with 1 Megabyte of onboard memory for storage of presentation graphics, high resolution display - 640 x 480 pixels, infrared remote control, battery memory backup, and a special effects generator. The unit retails for $2795 and can be purchased or rented from Blumberg Communications.

QA-50 - Sharp - This LCD brings overhead projection into the computer age as an education and presentation tool. It uses sophisticated shading controls to project computer created information from almost any IBM PS/2, IBM PC/XT/AT, or compatible in images of high depth and clarity. Retail $1395.

MONTAGE FR1 Film Recorder - Presentaion Technologies - This desktop slidemaker will typically generate presentation slides in 3-4 minutes with up to 16.7 million colors, on requlars 35mm slide or print film, or instant slide film. Retail $5995. §

LIBRARY NOTES

by Russ Merritt

At the February meeting the following new disks were made available:

B06	**GRAPHICS**	Two programs - PCPG, a drawing program and the other a collection of drawings using typewriter letters and symbols.
E02	**PC TEACHER**	A good program that graphically represents the path command.
E03	**MATH/TYPING**	EQUATOR, a teacher program for various equations, Jr. High/High School level. UTMP is a math drill program. PC-TOUCH is the typing tutorial.
E04	**EDUCATION**	IQBUILD - Easy to difficult problems; History Education, high school level; MATH TUTOR, for grades 1-6; MUSIC & EDUCATION: a mixed bag (Grade School/Jr. High School)
G14	**FOLLIES**	Games
K19	**BOOKKEEPING**	Simplified Business Bookkeeping
K20	**CAL - FIN**	One group of programs provides a scheduling calendar and a labeling program; the other, TIME & MONEY, is for financial record keeping.
K21	**CPA - LEDGER**	DOUBLE ENTRY BOOKKEEPING. NOTE - The documentation disk was marked as no longer available by PC-SIG.
P22	**AUTOMAXX**	A combined file manager and menu system. See the write-up in February BITS OF BLUE.

Added to our list of Demo Disks is VP-GRAPHICS and dBASE IV. §

F.Y.I.

by Harvey Bruneau

» A new TSR software product called BATTERY WATCH ($39.95) by Traveling Software, will allow you to check the battery life, in hours and minutes, of your portable computer as you use it.

» Service Merchandise has been added to IBM's pilot program to resell IBM hardware (Model 25).

» dBASE IV Anomalies -
I have uploaded a current listing of known bugs and remedies for dBASE IV. This list is directly from Ashton-Tate and only represents anomalies which they are willing to acknowledge at this time. Check the board for update.

» PC Magazine's (vol 8 # 4) ZCOPY. I had the opportunity to use this program for an actual real life use. While initially I had trouble determining which Com ports I was on and the jargon used in the documentation, I did get it to work. If you have a need to move/copy data from PC to PC having different or like diskette formats, this is a handy product. You will need one null modem and two copies of this software. Look for this program on our BBS. My thanks to Vern Semrad for providing the software to me in an hour of need and to Bob Flanders (program creator) for returning my call.

» WordPerfect 5.0. Earlier versions of WordPerfect (WP) are incompatible with Sidekick. When the memory-hungry WP overwrites the portion of RAM that Sidekick uses, The keyboard will lock up. To correct problem, activate WP with wp/nc/wk instead of usual wp. You will be able to use WP but sidekick will be disabled.

LAWS OF COMPUTER PROGRAMMING

1. Any given program, when running, is obsolete.

2. Any given program costs more and takes longer.

3. If a program is useful, it will have to be changed.

4. Any given program will expand to fill all available memory.

5. If a program is useless, it will be documented.

6. The value of a program is proportional to the weight of its output.

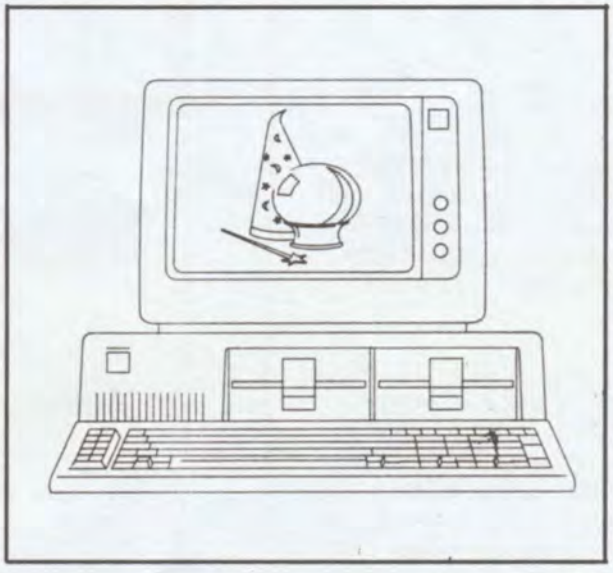
7. Program complexity grows until it exceeds the capabilities of the programmer.

8. Make it possible for programmers to write programs in English and you will find programmers cannot write in English.

- LAN MAGAZINE

WHAT HAPPENS WHEN THE COMPUTER IS TURNED ON AND WHY DO I GET THAT BEEP !

by Steve Spears



The computer is, by itself, a completely useless consumer of electricity that functions as a feeble heater and a poor night light. You cannot even pickup any channels on that dumb TV that you paid so many bucks for. Of course, most of us would never dream of buying any computer that was so limited, but this is the condition that every new computer is in before the software is installed.

Before the computer can do anything, it must be instructed in the actions that it can perform, from how to read the keyboard keys to how to display to the monitor. This is done by various programs that are loaded into the computer from various sources so that it can become the powerful tool that we now know it is. The only thing that the computer chip knows to do at the start is to look at a specific location for instructions. This first step in a computer startup is called the IPL or Initial Program Load and is completely automatic.

The actions that are performed next come from a particular piece of computer hardware called the ROM chip and is known by the computer jargon as 'Firmware', which identifies a chip with a permanent program load. This is a memory chip that has been loaded at the factory with a series of programs that tell the computer where to look for more information and what to do with it. It also provides the most basic routines for the computer to use in the processing of the data that goes through it. The average layman might well think of this piece of equipment as a combination roadmap and basicphrase book. There have been well known incidences when a computer has gone through several generations of ROMs as the manufacturer has improved the performance of the computer and its equipment. Any really basic change in the computer's motherboard will require a change of this chip.

With the information that is read from the 'Firmware', the computer will then perform the required tests of it's environment and tools that are required by the instructions read from the 'Firmware'. This is called the 'POST' which stands for Power On Self Test. In this operation, the computer will check its allocation of memory, the disk drives, the cards that have been installed and the video circuits. The more memory and devices that the computer has, the longer the 'POST' takes to perform. Different computers handle the 'POST' different ways.

The original PC had a very primitive 'POST' that actually went out to look for anything it could find in the way of memory (512/640K Maximum) or other devices. The AT type machines contain a configuration file in a battery backed- up file that was read at the start. This told the computer to check the

normal operations but also to check for additional Expanded /Extended RAM and the installed Hard Disk etc. The newer computers, such as the PS/2 IBM line go even further by making this file the master list of devices and alerting the user to the presence of a new device or the absence/failure of a previously installed ,device at this time. As a rule, those devices that are connected to the ports, Serial and Parallel, are not included in the 'POST' because they can be of such a varied nature that there is no way that the computer's 'POST' can keep track of what a normal response should be.

A failure of the 'POST' generally produces the dreaded 2 beep warning signal instead of the much more desireable single beep of 'POST' success. The actions that follow depend upon how serious the failure of the 'POST' is. There are cases where the actual 'Firmware' ROM chip or the CPU itself has gone bad, (lightning strike!), and all you get is the power light on the computer and all it does is just sit there. This is a case of Brain Death and, unless you are a computer Technician, you best be prepared to shell out some money or else use your computer as a boat anchor. Less serious failures of the 'POST' produce error messages followed by the 'Hit [F1] to continue ... '. This means that the machine is still functional but you had best check out the problem before going much further. While the 'POST error messages are cryptic at times, they can generally lead you or the technician in the right direction for repair.

This use of the 'POST' operation also defines the difference between the 'Cold' and 'Warm Boot'. The 'Cold Boot' is the same as turning your computer on using the 'BRS' (Big Red Switch) and will always cause the machine to do the 'POST'. The 'Warm Boot' simply recycles the machine and avoids the time consuming 'POST'. This is what you get when you press the [Ctrl] + [Alt] + [Del] keys together. Incidentally, for those who do not know, there are simple programs available in our library that perform these actions without having to actually flip the 'BRS' or hitting the [Ctrl] + [Alt] + [Del] keys. They can be very handy at times for those who need them.

Now you know what the computer is doing in that period of time between the moment you turn it on and the moment you see it start to read the DOS disk and start to perform the actions required by the 'CONFIG.SYS' and then the 'AUTOEXEC.BAT' files. May you never get that totally blank look from the screen and may your double beeps be few and far between! §

DIRECTORY DISCOURSE

by Vern Semrad

A friend of mine recently destroyed a large dBASE application on his hard disk because he (for some strange reason) entered DEL . (DEL <space> dot). If he had been in the root directory of the drive, nothing would have happened. Since he was in a sub-directory, what he typed was exactly the same as typing DEL *.*. When you do a DIR of a sub-directory, the first line has a period, and the second line has two periods. The period refers to the current sub- directory, and the two periods refer to the directory (or sub-directory) one up from the current sub-directory.

When you are in a sub-directory, you can always move up one directory in the tree by entering CD.. unless you are already in the root directory.

Along with the above, you can get a list of all of the sub-directories in any directory or sub-directory by simply entering DIR *. (DIR Star Dot). If you have the habit of naming files without an extension, you will also get those, since you are asking for a DIR of all files without a name extension. Sub-directory names don't have extensions, so that's what you get. I know we all give filename extensions to files we create, don't we?

Did you also know that if you are moving from the root directory down the tree to a sub-directory or from a sub-directory down one level to a sub-sub-directory, you don't need to type the backslash. From the root directory, you can move to DIRECT1 by simply entering CD DIRECT1. From sub-directory DIRECT1, you can move to sub-sub-directory DIRECT2 by entering CD DIRECT2.

If you wish to move HORIZONTALLY in your tree structure, you then must include the backslash. Example: To move from sub-directory LEVEL1_A to sub-directory LEVEL1_B, you must enter CD\LEVEL1_B or CD \LEVEL1_B. Yes, directory and sub- directory names can have dashes and underscores.

Everything I said so far applies ONLY to DOS 3.X

Have you ever been copying a large number of small files from a hard disk to a floppy and got the message "UNABLE TO CREATE FILE FILENAME"? The reason for this is that a floppy has a limit of holding 112 files. The message was generated when DOS tried to copy the 113th file. The way around this is to create a sub-directory (call it anything you like) on the floppy, then copy the files to this sub-directory. The 112-file limit on a floppy only applies the root directory of the floppy. The same holds true of the 512-file limit on a hard disk. There is no limit to the number of files that can be in a sub- directory except for disk space.

Have you ever tried to remove a sub-directory (RMDIR or RD DIRECT1) and gotten the message "DIRECTORY NOT EMPTY"? You go to that sub-directory, do a DIR, and only see the the . and the .. on the first two lines. The reason is that there is a hidden file in that sub-directory. If you have software such as PCTOOLS, you can see all the files in a sub-directory, including the hidden ones. If you don't have the software, do a CHKDSK from DOS. If CHKDSK reports more than two hidden files (the ones required by DOS), chanceees are you have a hidden file somewhere that you didn't know about. How did it get there? Sometimes, software gets a little goofy and creates a hidden file. Back in the days when a lot of software was copy-protected, part of the copy-protection scheme was to create a hidden file that had to be present for the software to run. You can change the hidden file attribute with the DOS ATTRIB command, but you have to know the name of the file. Again, lacking the software to do this, you can find out the name of the file by doing a CHKDSK/V. This will take a while, and you willl have to read fast while the filenames scroll by, but you can stop the scrolling with CTRL S. Look for a filename that you don't recognize.

If you would like more information like this, let one of the board members know at the next meeting. §

PRESIDENT'S PODIUM

Harvey Bruneau

I don't suffer from Wade Boggs disease. Neither do I have the alleged gambling problems as they say Pete Rose may have. But I do suffer from Harvey Bruneau disease (PC-Technologic). That's the disease where every time you read or hear about a new state-of-the-art PC product which interest you, you want it or more information about it. Whether its a new 50mhz coprocessor from Yarc Systems Corp. (really), a Multisync 3D monitor from NEC or Publisher's Paintbrush from Z-SOFT, I want it. I have talked with others who suffer the same faith as I. Is there a rehab center out there for people like me. My wife usually brings me down to reality when I mention things like scanners and VGA equipment/software purchases, but that only last until I pick up another computer magazine with new product announcements. I presently read or review 10-15 PC magazines/journals a month, each having some kind of new product review.

I am fortunate that upon occasion I do get to review products. When I can't, the second best thing is that I can generally find someone at our user group who has tested or used the products which I haven't, saving me money and considerable time.

I can relate to the robot, NUMBER 5, in the movie 'SHORT CIRCUIT'. Although designed as a robot for military use, through some accident he acquired the basic mental characteristic of a human. From then on, he wanted INPUT, knowledge of the daily events of human life, which he got from contact with people, television and books in order to understand and emulate them."

While I don't want to be a computer, I do want to understand them and use tools which make my life easier and more productive.

If you dont have this disease send money or new products to those who do. If you do, you have my understanding, I know what its like to want to test these products without there being 48 hours in a day or a LOTTO winning in the bank. §

WAR ON DOS

by Lee Jones, Brevard PC UG

As a special witness to the President's War on DOS Committee, Bill the Cat reveals his sordid past: At first, I did it just on weekends, with my friends, you know? We never wanted to hurt anyone. The girls loved it. We'd all sit around the computer and do a little DOS. It was just a kick. At least that's what we thought. Then it got worse. First I heard about pipes - what a trip! Then I came across multiple level directories. You'd think that just a little would be enough, but soon they were six and seven deep and my hard disk was almost unreadable. Yeah, just a few more and then I'll stop, I said to myself. And then - dare I say it? Batch files! This horrible aberration starts innocently but soon you have problems entering any command because you have no idea where it will take you - but I know - yes, to - nested batch files! Arrrrgh! Oh, sure, I tried different shells to get off the DOS habit, but the Esc key was too handy and I was too weak. As soon as I was left alone, I could be found doing ATTRIB, REN and even an occasional DEL. I'm so ashamed; my children found me one night actually FORMATing. It got so I'd have to do some DOS during the weekday nights - all night. After a while I

THOUGHTS ON ILLITERACY

by Richard T. Rogers, Tucson UG

You know you're computer-illiterate when:

1) You think an Apple is the fruit that first caused discord in the Garden of Eden.

2) You call the drug abuse center when your kid tells you he has a blown memory.

3) You think a nanosecond is the length of time Grandma promises to stay with you next summer.

4) You think a head crash is the result of sniffing too much Duco cement.

5) You think serial communications have something to do with Snap, Crackle and Pop and parallel communications means you and someone else see eye to eye.

6) You think BASIC is simple as Pascal died during the French Revolution.

7) You think a boot is useful only when dealing with manure or bad weather.

TELECOMMUNICATIONS FRENZY

By Vern Semrad

At the next meeting we will be talking about Telecommunications. Simply stated, that is one computer talking to another computer. Telecommunications can involve a PC talking to another PC, a PC talking to to a MiniComputer, or a PC talking to a Mainframe. The receiving computer can be in the same building with the sender, or the receiver can be in another city. The proximity of the receiver to the sender determines the hardware and software required to effect the communication. Our discussion will involve one PC talking to another computer in another city, or at least, in another location where direct cabling would not be feasible. In the meeting, we will make a PC in the meeting room talk to other computers in remote locations. Obviously, this will require the use of phone lines and modems. For those new users, a modem (acronym for Modulator-Demodulator) simply converts one type of signal to another for transmision. Then, the modem on the other end converts the signal back to the original type of signal for the computer on the other end to read. We can get into more detail if anyone desires, but the details are actually kinda boring if you are not an electronics student. I am not, so I don't really care what goes on so long as my machine can talk to the other machine. I do know what is happening, because I read a lot, but, knowing what is happening at the electronic level is neither necessary nor interesting to the average user. We will call our own IBMPC User Group RBBS (Remote Bulletin Board System). It is called the Bits O' Blue, and it is operated by Kevan Sheridan. He is called the SYSOP (System Operator). I have asked Kevan to help with this part of the demonstration. We will call one of my computers at home to demonstrate the capabilities of PROCOM'M PLUS. There are at least ten dozen Communications programs on the market. Many commercial programs have Communications software built into the rest of the program. Examples are WordStar 2000 Plus, MicroSoft WORKS, pfs:First Choice, and ENABLE. I own a couple of these, and, I can tell you, none of them compares to PROCOMM PLUS. The third service we will call is PCMAGNET. If you are a subscriber to PC Magazine, you know about the utilities section in the last part of the magazine. If you don't subscribe to this magazine, and you are serious about micro-computing, shame on you. Steve Speairs gave an excellent summary of all the PC publications a couple of newsletters ago. If you are going to subscribe to ONLY one magazine about computing, it should be PC Magazine. If you have just won the FL lottery, subscribe to everything you have the time to read. NOTE: "Time to Read" is the key. PCMAGNET is operated through

PRINTING WITH NETWARE 2.1+

In Novells NetWare 2.0a, SPOOL began to spool a job to disk and ENDSPOOL ended the spool and sent it off to the printer. In NetWare 2.10 and higher, the easy-to-understand commands have been replaced with the more esoteric CAPTURE and ENDCAP, respectively. Some existing menus and some applications will no longer function until you upgrade to new version of the software. To avoid this, go into PUBLIC directory and copy ENDCAP.COM to ENDSPOOL.COM. Then copy CAPTURE.COM to SPOOL.COM. Then upgrade to the latest version of the application software when it comes out.

-The Network Reporter

Cont Page 9

MARCH MINUTES

By Russ Merritt

OPENING ANNOUNCEMENTS:

o Businessland has asked for a better deal from Compaq to handle their products.

o Aston-Tate has announced a delay in the release of their dBase IV compiler.

o Dell Computers has announced a drop in their prices.

o Club has Board position of Member-at-Large open.

PRESENTATION: HEWLITT-PACKARD

Their review of the market place and HP's position in it has led to this late entry in the PC market. At the low end is a Lap-Top which is a cooperative venture with Zenith - it's their machine with HP enhancements.

On the high end, they are offering their versions of the 286 and 386 machines competing directly with Compaq.

In the discussion that followed, they offered to return to present more in depth their high end personal computers and their laser jet printers and desk jet printers.

MORE ANNOUNCEMENTS:

New members are to receive a library disk. If you haven't received one, see the Librarian. As the library disk is updated, members may get a new one by exchanging a formatted disk or paying $1.00.

Vern Semrad preview his presentation for next month and reminded members of his offer to download PC Magazine Utilities from the magazine's bulletin board. He requested members to leave requests on the Club Bulletin Board.

A new club member donated books and a Turbo C package.

NEW MEETING PLANS:

April - Vern Semrad
Modem Communication
FAT (File Allocation Table)
DOS Directories

Future -
Borland Paradox, 3.0
Bob Fulz - Viewlink & Spinrite
Ashton-Tate - Framework III
AST - Computers

Future Computing

Steve Speairs

The Personal Computer (PC) has come such a long way since it earliest inception about 12 years ago that it is difficult to stand aside from all that history to try to take a look at what is coming down the pike. Yet, if you do take the time to make the effort, you quickly realize that we are basically wasting computer resources because the PC is still such a new tool. The wonders that we can achieve with a really usable PC will be nothing short of amazing, even to those of us who are working with these machines today.

A common truism in our industry, that is used to emphasize how far the PC has come from its first renditioning, says that if the car industry had progressed as far as the computer industry, then Rolls-Royces would have the horse-power of an aircraft carrier, get a 1000 miles to a gallon of gas, cost $0.75 each and be the size of a roller-skate. The ridiculousness of the image just goes to reinforce the progress that has been made so far. However, as the wise old philosopher once said, you ain't seen nuttin yet!

At the present time we are using our computers for information processing only. While this covers a wide area of word processing, information storage and retrieval and other similar chores, it is still a small portion of our average daily activities. The primary fault in our use of computers is that they are still so isolated. While we speak of the networked computer, this only means that the computer is capable of exchanging information with other similar computers. What is yet to come, but come it will, is the capability of tieing the computer into most of our daily activities.

Just recently, a conference of major appliance manufacturers agreed on a standard communication bus that would allow a PC to monitor and control the use of these various devices. Currently, this ability can be minimally performed by using a PC to turn power on and off on appliances by hooking an auxiliary power controller like the BSR X-10 to the computer and then having the computer control power switching modules that are mounted between the socket and the appliance power plug. What this new standard will do is to allow the computer in each appliance to tell the master computer, your PC, its status, problems and operation at all times. Thus if your Air Conditioner's Fan was jammed, you would be able to get a warning message and a complete diagnostic of the problem.

Progress in the

Cont. Page 6

FUTURE Cont.

software field of expert systems and Artificial Intelligence (AI) will allow your PC the ability to function as an active partner in your efforts to control your environment. Instead of you having to do the scut work of trying to track down all of the details of a given problem, the PC will work within the parameters that you have set to do the leg work that you need to have done.

A sample of the kind of work that we might expect and the level of cooperation that is possible AND probable, would be as follows;

It is April 6th, 1999, (10 years from now), and you, J.Doe, are an average citizen, going about your daily life. You are scheduled to fly to Buffalo, NY on a business trip at 10AM on Trump Airways. You have already made the plane reservations from your office computer, but these have automatically been copied to your home computer as standard operating procedure. You have a standard 6AM wake-up call and you know that it will take about an hour to get to the airport. While you are asleep, your computer is taking care of your phone messages, none of which have a priority code high enough to require you being awakened early. It has checked the weather report and adjusted the house air Conditioning for the forecast high humidity and rain. While monitoring the news, it finds that there has been a terrorist threat made by the Frank Lorrenzo Fellowship Society that has forced the FAA to up the pre-flight screening to 2 Hours. Additionally, the North-East Corridor Coalition has instituted a road block on Eisenhower to protest the new Rapid Transit Plan injunction brought by the Insect Society to protect an endangered insect nest. The total transit time has now made the flight impossible to make even though it is now only 5AM. Before waking you, your PC contacts your office computer and the transit database. There are no other logical flights to Buffalo before an expected snow storm that will cut off travel by early afternoon. Instead of the travel, the computer neetwork contacts all participants with the pre- arranged plan 'B' of a tele-conference replacement. Since the local travel is still embargoed by the road blockage, the PC allows you to sleep an hour late while also pre-processing the office work for your later use. It also schedules a service call by the plumber to fix the hot-water heater which has signaled that it's heating coil is about to fail. When you awake, you

get all of the changes, your current phone and mail messages and have your coffee ready for you after you get out of the shower.

This all sounds like Science Fiction, but there is nothing here that is impossible for the computer to accomplish right now. Where the progress is required is in the communications interface with the outside world and in the software that can make the decisions and follow-ups that would be needed upon receipt of information changes. The outlook for these is quite favorable, as we are seeing the moves for more universal communication interfaces and ever more powerful hardware and software.

However, the standard caveats do apply here in that there will be problems and that this is no utopia. Just imagine what would happen in this scenario if your computer went down, OR, worse, if the Cyber Terrorist Front for the Liberation of Human Slaves let loose a really effective virus that shuts down all of the computers and ALL the connected devices. Then you could find your home sweet home a very dismal and uncomfortable place indeed. Just remember - Caveat Emptor! We get what we want but what we want is generally more than we get! §

WAR ON DOS Cont.

couldn't even wake up in the morning, when I got any sleep at all, without having that craving to go do DOS. Then it started affecting my job. I would have to do it during my break. Maybe a MODE command or two. I eventually started doing DOS just to get through the day. Of course, it screwed up my mind so much that I couldn't even function as a normal cat. DOS got me. I'm lucky today. I've overcome my DOS problem. It wasn't easy. If you're smart, just don't start. Remember, if a weirdo in a blue suit offers you some DOS, just say no. MS DOS - Just say no! A special message brought to you by the President's War on DOS Committee. §

ELECTRICITY: ONE MAN'S OBSERVATIONS

by John Buxton, Fargo Moorhead OK UG

I was never taught about electricity at school, nor was it the topic of dinner conversations for my parents. But what with reading, and having to change light bulbs or tune a transistor radio, I have picked up a fairly sound working knowledge of electrical matters. It's not comprehensive. I still don't fully understand why you can't boil an egg on an electric guitar or run a BASIC program on a washing machine.

Most electricity is manufactured in power stations where it is fed into wires which are then wound around large drums. Some electricity doesn't need to go along wires (that used in lightning, for example). This kind of electricity is not generated, but just hangs around in the air, loose. Electricity makes a low humming noise, which may be trained (pitched) at different levels for use in doorbells, phones and electric organs.

Electricity must be earthed, that is,to say it has to be connected to the ground before it can function (except in the case of airplanes, which have special arrangements). Although electricity is said not to leak out of an empty power point, that power is still live. The proof is if you happen to shove your finger in the opening. If it is not leaking, then what is it doing to your finger?

Electricity has but two ingredients: negative and positive. One ingredient travels along a wire covered in red plastic (lately changed to brown which won't show the dirt as much); the other moves along a wire covered in black plastic, lately changed to blue in the interests of racism. These two wires meet together in a plug, where ingredients are mixed to form what we call electricity.

Electricity is stored in batteries. Big batteries do not necessarily hold more electricity than small ones. In big batteries, electricity is just shoved in very loosely, whereas in small batteries (for transistor radios), it must be packed flat. A switch controls a small clamp or vise, which grips the wires very hard so that the electricity cannot get through. When the switch is flicked on, the wire is relaxed and the electricity travels to the light bulb, where a piece of wire, called the element, is left bare. Here for the first time we can actually see the electricity in the form of a spark. This spark is enlarged many times by the curved bulb (which in fact is made from magnifying glass).

It is time to discuss the fuse wire. I'm amazed that a technology that can produced colored electricity for use in traffic lights and harness negative electricity for use in refrigeration should still be manufacturing a fuse wire that is too thin. Using chicken wire, I now have a fuse box which for six months has been as impregnable as the Bank of Argentina. (Even if my spin dryer bursts into flames because too much electric power is fed into it.) I know my knowledge is imperfect. I haven't yet explored the subject of neon signs (how do they make the electricity move about?) or pop-up toasters (how does the electricity know when the bread is brown?)

Logic will eventually answer all of those questions, but that will have to wait. The light on my desk has just gone out. §

CHANGES IN *YOUR* BOARD OF DIRECTORS

LIBRARIAN - Russ Merritt resigned and new member Tom Westmoreland has accepted this position.

SECRETARY - Ray Thigpen resigned and Russ Merritt has accepted this postion.

MEMBER AT LARGE - Heidi Martinez resigned and this position is still open.

LOOK WAY AHEAD FOR OS/2

International Data Corporation, a market research firm in the Framingham, Massachusetts, has published a report on the OS/2 operating system offered by both Microsoft and IBM. "Despite the press coverage that OS/2 has received, its sales have not rocketed," claims Nancy Mc Sharry, senior analyst of IDC's PC software services. "There are few applications currently available that will run under it, and there are several other barriers to market entry which will inhibit its growth for the next five years." Here are some highlights of IDC's report:

o Worldwide OS/2 shipments are predicted to grow from 334,200 in 1988 to 7.5 million by 1992.

o Market penetration will be 25 percent by 1992. As older 8088/6 machines are retired and newer 80286 and 80386 machines are installed in their places, OS/2 will begin to emerge as the primary operating system. However, OS/2's minimum requirement of and Intel 80286 processor and 1.5M for memory currently rules out the bulk of the installed base of the personal computer market- place, inhibiting its emergence as a standard in the short term.

o OS/2 will be offered in two different versions from Microsoft alone and in four versions from Microsoft and IBM. It will standardize around one of the Presentations Manager versions because of its graphical interface capabilities.

o IBM's sales of OS/2 dominated in 1988 and will prevail through 1989, but Microsoft's sales will rule by 1992, as compatible sales surpass true Blue sales.

o 80386-based processors will provide the heaviest sales for OS/2 until 1991, when 80486 processors will take over. Developers are finding that the system runs too slowly on 80286 processors to be of practical use to the end user.

o Presentation Manager sales will eclipse the command-based version's sales. PM sales will account for almost 90 percent of OS/2 shipments by 1992.

The report, entitled OS/2 (#3566) includes five-year market forecasts of various segment of the system.

HOW TO MANAGE EFFECTIVELY IN A "NERVOUS" ENVIRONMENT

Managing effectively is difficult enough when a company is doing well, but it gets a lot tougher when business is off or when the company is in the midst of downsizing. The trap: letting your concern for employees who are understandably nervous about their future interfere with your ability to lead. Here are four suggestions on how to avoid this trap and how to motivate employees when they need it most.

o **COMMUNICATE OPENLY.** Avoid tendency in tough times to withhold information, even if the information is unpleasant. The rationale: the less you communicate, the more you fuel the rumor mill, which usually paints a picture even bleaker than what is actually the case.

o **CREATE ADDED JOB SATISFACTION WITH MORE RESPONSIBILITY.** Instead of playing the roles of "cheerleader" or "psychiatrist," neither of which will work very well anyway, give employees an opportunity to prove their mettle by increasing their responsibility (assuming, of course, the employees are capable of shouldering the responsibility).

o **STAY VISIBLE.** One of the most reassuring sights for employees nervous about their company's future is to see

Telecommunications Cont.

CompuServe. What they don't tell you when you subscribe to PCMAGNET is that, through PCMAGNET, you have access to anything on CompuServe. If you are a long-time reader of PC Magazine, you know that PCMAGNET is the successor to the old "Readers Information Service". The major difference is that under the old system, the phone call was a long-distance call. Plus, you could never get on. By hooking up with CompuServe, the call goes through TeleNet, and the call is a local Tampa call. Most major On-Line services are connected to either TeleNet or TymNet. It seems that most use TeleNet. If you wish more information on TeleNet, see me at the meeting. TeleNet (without any On-Line services) has its own phone number with a little message service. You can talk to them either voice or modem. I will upload an index of all files available for downloading from PCMAGNET to the Club bulletin board. If you are a regular reader of PC Magazine, you know they generally publish three different languages of their software. You will find an .ASM file, a .BAS file, and a .COM file. The XXXXXXXXX.COM file is ready to run. The XXXXXXXX.BAS must be run through BASICA or GWBASIC. That will create the .COM file. If you want the .ASM file, you must be an Assembler programmer. Then, you know you must assemble the program, link it, and, probably run EXE2BIN from DOS to create the .COM program. For most of us, giving us the .ASM and .BAS files probably seems useless. They have a good reason for doing this.

If you are a programmer, you want this code so you can make your own personal enhancements. In my opinion, this is a great service provided to us by the magazine. They have recently added .DOC files for several of their programs. This saves us the hassle of thumbing back through old copies of the magazine to find out how to use a particular program we like. The final word is this. COME TO THE MEETING. I promise, it will be very interesting for everyone. Also, I will be doing all the demo on a very slick little computer setup for Telecommunications. See you then. VERN §

Cont. Manage

their managers carrying on their normal tasks. The message: don't allow the situation to force you into a shell. Make yourself available and be prepared for constant questions about what's going on in the company.

o **STAY IN CONTROL.** As Alec Guiness proved in the famous movie Bridge Over the River Kwai (although he may have taken the principle too far), people worried about their situation tend to thrive on firm leadership. So, while you might be tempted to slack off out of sympathy, your interests and your employees' interests will be better served by maintaining high performance standards, regardless of the situation.

HINTING FOR FUN & PROFIT

By Steve Spears

Have you ever had the desire to throw the DOS Manual that comes with your computer into the fire because it is so difficult to use in the normal emergency mode when you need to know the answer RIGHT NOW! Have you ever been particularly frustrated because you used that DOS command just a while back but you cannot remember what variations or parameters were used to accomplish the task you now want it to do.

It is a common problem and one that cannot really be solved in the DOS Manual format because that is intended as a reference book and what you really want is to repeat the command that was used before. The DOS Manual is written to give all of the parameters (switches) for every use of each command. This makes it quite frustrating because you basically have to relearn the command each time you use it and go through all the pain of the same or similar mistakes to get it right.

Of course, this is not only DOS but also applies to use of anything else you use your computer for, from word processing to spreadsheets to accounting. In all of these there are always commands and operations that you use once in a blue moon that you know you have done before but just cannot remember how you did it. What you really want is someone to lean over your shoulder to give you some quick hints from your previous efforts and let you get on your way.

There are some software packages now on the market that will do this in some form or another for one or more applications. However, in this article we will be discussing how to create your own 'HINT' file. This is something that you create on your own to store your own experience for the next time that you need it. All it requires from you is some preplanning, good work habits and a couple of common software tools.

The most important of these software tools is some form of a memory resident (TSR) notepad program. Anybody who

WORST TREND

From Time Wars, by Jeremy Rifkin

Many people have so accommodated themselves to the new sped-up time frame of the computer that they have become impatient with the slower durations they must contend with in the everyday clock culture. In clinical case studies, psychologists have observed that computer compulsives are much more intolerant of behavior that is ambiguous, digressive or tangential. In their interaction with spouses, family and acquaintances, they are often terse, preferring simple yes-no responses. They are impatient with individuals who are reflective or meditative. Computer compulsives demand brevity and view...interacting with others only as a means of collecting and exchanging useful information. Above all, they put a high premium on efficient communication. Says psychologist Craig Brod: They prefer to communicate with people who are 'system literate' so as to transfer information quickly. People who talk too slowly or in general terms are avoided or ignored. Could be the end of the cocktail party as we know it. §

JUNK CALLS

by Mark Justice Hinton,
BCS PC SIG

You are at the dinner table (or perhaps taking a shower) when the phone rings. You answer and an obviously recorded voice says, Hello, this is Hal the Computer, and I'd like to send you some information about aluminum siding. Please wait for the tone and then tell me your name and address. If you are like most people, you probably went all the way through this first experience, maybe giving a false name or address for future contact. You'll probably just hang up the next time you get such a call, marking it as simply another annoyance to put up with. You get calls all the time from this or that organization, and it is easier to hang up on a machine than on a person. Unfortunately, this may be the shape of things to come. At least one company is attempting to assemble a nationwide network of affiliated computer operators to distribute telephone advertising (telemarketing). Its sales pitch to manufacturers and politicians includes the cost effectiveness of computer-originated calling, as well as the to survey responses to that calling. Their expressed goal is to be able to reach one million homes a day by the 1988 election. Because of the relatively low cost of this kind of marketing, it doesn't take a very high response rate to justify this method. Computer calling is fundamentally different from other marketing tactics. You decide when to watch TV or listen to the radio, and when to deal with your junk mail. The phone, however, forces you to accommodate it; it can ring at any time, and could be about something vitally important. Unlisted numbers have been protection from unwanted human callers, but won't be against computers generating phone numbers. You could put another machine between you and the outside world, but to be forced into such a defensive posture with what may well be your lifeline to the outside world strikes me as outrageous.

As computer hardware costs decline and demand for such services rise, nothing will prevent dozens of companies and entrepreneurs from

knows me, knows that I swear by Borland's Sidekick & Sidekick Plus. While these can be RAM Memory hogs, they are so useful to me that I would be hard put to do without them. For you, any small and quickly accessible text editor would probably do but I would caution against using a full word processor because you want something that is really quick and saves easily. Also you want another software tool that is even free and found in our Public Domain Library. It is the PC Magazine utility program called 'DOSKEY.COM'. What it does is to maintain a list of the last 15 DOS commands executed so that you can quickly rotate through the stack of these last commands, using the keyboard arrow/cursor control keys, to read or re-run them. While this is quite handy at all times, it is extremely valuable for what we are about to do here.

Let us take as an example the desire to read, sort and store in a file, a directory listing by date. While there are many DOS Shell programs that do this, what we are doing is something that you would use just often enough in standard DOS to make it nice to have a 'HINT' file to help you remember how to do it. Of course, you have to start this by looking in the DOS reference manual for how to perform this task. What you find is that you use the 'DIR' command with the 'SORT' filter command and a 'PIPE' to the file you want to save the listing in.

After playing with these commands for a time you finally get the command at the DOS prompt to do what you want and it will look like this;

DIR|SORT/+23>DIR_SORT.TXT

The file name that appears after the '>' will be whatever you want it to be and you may have had '/+22' to accomplish the same results. (Please note that this sort routine really only works for months! You can very easily find two or more different years being sorted together because they have the same month in common.) Once you have this command doing what you want, you can recall it from the last, most successful iteration, by hitting the up- arrow cursor key once to get that last command.

Now add this command to your 'HINT' file by using your notepad and entering it as it appears on the DOS command line. If you are using Sidekick Plus you can use the import function of [Ctrl][Del] and [Ctrl][Ins] to bring this line into the notepad. Once in the notepad, you can add whatever comments that you desire that will help you in future instances of using this command, such as using '/+9' to sort by extension etc. In the future, you can locate these examples in your 'HINT' file by browsing it, or if you have the capability like Sidekick Plus, using the SEARCH ability to find keywords like DIR or SORT!

A further elaboration of this whole idea is to make separate 'HINT' files for each major application you might have like 'HINT_DOS' and 'HINT_123' etc. That way you will not have to browse through Lotus 1-2-3 functions while trying to find a DOS 'HINT'.

And the Winner is...

50/50 DRAWING - won by William Roberts

APRIL MINUTES

By Russ Merritt

Prior to the main presentation, Bill Fuller asked if there was interest in presentations from the book, DOS Power Tools, a compilation of material from PC Magazine. There was a definite request for such information. Bill said he would review a chapter at the next meeting and at subsequent meetings as long as interest continues.

The main presentation was by Vern Semrad. He brought his computers and demonstrated ZCOPY.COM, a program from PC Magazine to permit file transfer between PC's via Null Modem.

He also demonstrated PC communication technique by telephoning via modem to his own system at home and then to PC MagNet, PC Magazines bulletin board. The communication program in use was PROCOM. The advanced version of this program is not shareware and must be purchased. Shareware versions of PROCOM are available on Bulletin Boards. §

README

Allan S. Greenberg, UCLA PC UG

How many times have you rushed back to your computer with the hottest piece of software ever, and ever so anxious to load it into your souped-up 386 machine, you rip off the shrink wrapping, fraying the edges of the manual in the process, and pop the first diskette in the floppy drive. Just as you are about to execute the automatic installation procedure, a small piece of paper flutters out of the diskette jacket with the words printed on it, CAUTION - see README.DOC on this floppy. A little worried that maybe this auto-installation procedure may end up erasing your hard disk or taking a couple of megabytes of RAM out of service, you decide to take a look-see. You enter the command: TYPE README.DOC. What happens? It turns out the file is about 32Kb long and everything goes scrolling by. Well, you've been here before, so, you're clever by now. You load it into your word processor. But when it comes up you see you left the margins and tabs set for Aunt Tillie's funeral notices. The README.DOC doesn't look so good with spaces reserved to print flower designs. A simple batch file to cure these problems is READ.BAT. It just has one short line: MORE << %1. All it does is take a file with the name passed in %1 and stuff it into the DOS MORE command, This latter command is a combination of TYPE plus CTRL+NUM-LOCK. That is, it pauses after filling the screen with text. You almost don't need a batch file since it is so short, but I found myself using it so often, and continually tripping over the << sign, that I put it in a batch file. You use it as: READ README.DOC. While most of us have listing utilities of one kind or another, I still find myself using this little batch file. One reason is that I'm lazy. To use a list function from a utility typically requires more keystrokes to start it up, and more later to exit. The READ batch file terminates at the end of the file, but if you want to get out sooner, use CTRL-BREAK. Most list utilities also limit you to the size of the file they will accept, while there is no limit with READ.BAT. Of course simplicity has a price: you can't scroll backwards, and you can only advance a full page at a time. I have explicitly included the full path for the subdirectory where the more command resides on my hard disk, but if you have the path in your environment, you can leave it out. Not happy with wasting a whole cluster worth of space (2048 bytes) on my hard disk for a file that is only about 15 bytes long, I have embellished it. I added the option that if you type "D" (D is for directory) as in "READ D", you will get an alphabetized listing of your default directory. If you type "READ D C:\DOS", then you will get an alphabetized listing of the DOS directory on the C: drive. Obviously, if you have a file named D (no extension) you won't be able to read it. Rename it. I have one additional trick. If you want, you can put comments or remarks in the batch file without using the REM prefix. The way to do this is to skip over them with the command "GOTO" and a label indicating where you want to go. This works because the batch files are executed by COMMAND.COM in an interpretive mode. If it doesn't execute a line in the batch file, it doesn't know from nothing that it isn't correct. In the following listing, I have used line numbers enclosed in parentheses get around the column formatting of the newsletter, which is not compatible with ASCII file formatting. Do not put these line numbers in the batch file, unless you like error messages.

```
(0)  echo off
(1)  rem the name of this batch file is read.bat.
(2)  goto start
(3)  use lines for making any *&%$#@
(4)  or anything else you may want
(5)  :start
(6)  if %1null==null goto message
(7)  if %1==d goto directory
(8)  if %1==d goto directory
(9)  c:\dos\more  %1
(10) goto end
(11) :directory
(12) dir %2 | c:\dos\sort | c:\dos\more
(13) goto end
(14) :message
(15) echo.
(16) echo the read.bat takes one or two parameters:
(17) echo 1st can be the path\filename or a d to indicate a directory listing.
(18) echo 2nd can be null, in which case the default directory is sorted and listed.
(19) echo2nd can be the drive:\path for a sorted directory listing.
(20) :end
```

Junk Continued

entering the market. Unlike the mail, these junk calls will come anytime day or night. If you take the phone off the hook or don't answer, the computers will just call again until they get through. The convenient phone will quickly become a burdensome vehicle for marketing that interferes with your interests and privacy.

How can we stop this? First, don't hang up. When you get one of these calls, wait until you have an opportunity to respond, then tell the machine your name and that you support legislation to ban the use of such solicitation methods. Next, contact the company or political party whose product is being sold this way and tell them you refuse to buy their product until they stop using such methods. Finally, write (or call) every possible politico (city, state and federal) and tell them you resent this invasion of your home and want it prevented.

As members of a PC users group, we have a special responsibility in this matter. If we take a stand on this issue, no one can accuse us of being Luddites, opposing any technological progress. We also have access to sellers of these technologies, and they may listen to us. Those less informed, like many of our political representatives, will have to respect our informed dissent. Think about this the next time the phone rings. §

CHECKS-3.ARC

By Olin Beers

This is a checking program I wrote in dBASE III+ to keep track of my Check Book. It is a EXE file as I have run it through CLIPPER. I kept adding new modules to it as I run across things that needed to be done. I started writing it in 1985 and it has evolved to its present form.

MAIN MENU

1- It has an unlimited number of checking accounts ability. By that I mean you may have as many checking accounts as you want.

2- You can enter checks, deposits and bank charges.

3- You can enter canceled checks, deposits or bank charges.

4- You may delete check entries or deposit entries if you have made a bad mistake.

5- You may edit any check.

6- You can check for duplicated checks, deposits, or bank charges.

7- You may Display checks that are canceled, all checks, all un-canceled checks, or checks that are for tax purposes.

MAINTENANCE MENU

8- You can re-index the database

9- You can create a new Bank Database (New checking account).

10- You can Change Bank Database File (change to a different checking account)

11- You can move canceled Deposits, Bank Charges, and Checks to a storage file. EXAMPLE : May-89.DBF for May 1989 storage.

12- You can delete all data from a dBASE III+ Database on any drive. This is handy if you want to empty a Checking Account (or any other dBASE III+ database).

All inputs have a stored memory variable that will give you a chance to just hit <ENTER> if that is what you want to do. The main Checking Database is CHECKS.DBF on Drive C:. You are shown a listing of the available Checking Accounts Names to choose from either from the main menu or from the "Change Bank Database File" found in the maintenance menu.

I am releasing it as Shareware, as I want to share it with others. I want to keep the Copyrightand hopefully get a small remuneration of $15.00 from anyone that sees a use for my program.

There is a CHECKS.DOC, in ASCII form, that can be printed on you printer that describes the program and shows the menu's etc. §

PC Communications
By Don Patszch

Part of the jungle of communications confusion is the large number of different protocols available to use. I have been using modems now for over 3 years and have downloaded over 7000 files. I always use the 'XMODEM' protocol because; 1. It Works, 2.) It's Free and 3.) It does multiple File downloads with a single command. I have used this program for years with no errors. I even have my modem operations timed so that it can download at night and thus I can have the files when I get up in the morning. Since this works so well, I see no reason to use the 'YMODEM' or 'ZMODEM' protocols. Since it seems that there are new versions of 'ZMODEM' appearing on the bulletin boards every week, I figure that they really must be some reason for all the work being done to it!

If you download a lot, you will like to see the sorted list of all the files you have. I really like the program 'QSORTL' because it can sort your entries by Directory, first letter or whatever you want. One source for a lot of downloading is the COMPUSERVE Commercial Database. If you do use this on a regular basis and are always downloading the same things, then you should know about 'TAPCIS'. This program will perform an automated COMPUSERVE access that gets you in and out with a minimum of time and charges. It is well described in the April issue of the Boston Computer Society Newsletter.

At some point, you will also like to transfer files between computers without using modems or floppy disks. This is because modems are too slow and floppy disks don't have the capacity. What I use is a program called 'DESKLINK' ($95.00) from Traveling Software Co. This program provides you with 2 serial port connectors that you place on your two machines. You then hook the machines together with an ordinary telephone cord. The provided software then enables one machine to control the other and while doing this also temporarially redesignates the computer's drive letters so that there is no conflict between the machines. Esentially, you now have a mini-LAN that does not conflict with any other LAN you may be currently hooked to. All transfers are now simple copies from one disk drive to another. You can also have a printer hooked up to either machine for hardcopy. §

PC Bulletin Board Hints
By Don Patszch

Perhaps some of you are not familiar with the bulletin boards and would like an explanation of the log-on procedures. When you get access to a bulletin board, the first thing you get is the name request, "FIRST NAME?". At this time you can either follow along the prompts and enter only what is requested OR you can enter all that is needed at that prompt.

For most bulletin boards, the common log-on procedure is to give the following prompts;

FIRST NAME? Harry
LAST NAME? Smith
PASSWORD? XYZR
{Usually most BSBBs will echo dots or blanks when entering the Password!}

You can use the all-in-one method as mentioned above by entering the following string at the "FIRST NAME?" Prompt; "Harry;Smith;XYZR". This gives the bulletin board all it needs for the log-on. Use of the semi-colon ';' delimiter is not necessary in most circumstances but it is a practice I always use. Your password should be of 4 or more characters in order to make it more difficult for anyone else to guess yours. Some people find it easier to use their telephone numbers backwards for this purpose. If you know what application that you are going to want to use, you can add that command to this string after the password. Use of this string sign-on is especially easy for use in a script or macro sign-ons.

PS: An interesting feature of the USRobotics modems is that they support the use of letters in the dialing mode. This means that you can code the number (813) 113-4256 as (813) 11DIALM and it works just as well. This may or may-not be workable on other modems. §

OS/2 Thoughts
By Don Patszch

I currently have an IBM Model 70, (80386 - 20 MHz), that I bought with the thought of being able to run 'Multi-tasking' operations on it. This is the running of multiple programs with the ability to switch or 'stoplight' between the programs at will or to even have them all running simultaneously in the computer. For me, as a HAM Radio Operator, it helps me to think of IBM's MicroChannel as a 'Packet' data operation. As in Packet Radio, on the MicroChannel Architecture, you send information in blocks which gets more done at any given time.

Anyway, I bought the new DOS 4 to use on this machine while I learned about IBM's new OS/2 Operating System. There has been a general progression in DOS from DOS 1.0 to the new OS/2 v.1.1, with each one being easier (Ed.: NOT Easy!) to use. In DOS 4, there is a view of how the Presentation Manager (PM) that is found in the PM versions of OS/2 work. For those who want to learn more about OS/2 and its workings, I can recommend the articles by Charles Petzold, who has been devoting his writing to OS/2 exclusively over the past year. [Ed. HOT NEWS: IBM is about to offer significant discounts on the purchase RAM for OS/2 Standard & Extended Editions as well as discounts for OS/2 Application Packages.] I would not buy OS/2 until I had an actual use for it, but now that I do, the time is here.

I will say this for those of you who claim that IBM is too high priced, all you have to do is to shop around a little. I have called the local ComputerLand in Brandon and gotten a discounted price over the phone and have seen many advertisers in the Sunday paper offering IBM equipment at discounts, especially Sears. There are many ways of buying IBM at discount if you just go and look for them. §

USER GROUP NOTES
Don Patszch

The USF IBM Users Group is changing its meeting times FROM 5PM - 7PM TO 7PM till ? (Everybody gone). This is to make it easier for people to attend our meetings. Have you ever wondered why the Pinellas Users Group has 2000+ members while the Tampa Users Group has so many fewer? There is only one group for all of Pinellas, while in Hillsborough there is USF, Tampa and Brandon! There are advantages to smaller meetings than Pinellas' 400+ average, but they also get people like Pete Peterson (Word Perfect) and Bill Machrone (PC Magazine).

The Boston Computer Society, which is the largest group in the nation, was able to get $20,000.00 worth of USRobotics 9600 Baud Modems donated to it. This is just one example of the ability of the larger user groups to attract substantial doantions and presentations. The newsletters also benefit by having a larger group of writers to contribute. Would any of you like to read the newsletters of the Houston Users Group? You may be surprised at what their people write!

Maybe we don't want this kind of group, but it seems to me we might at least approach the other Hillsborough Users groups to see about taking advantage of numbers in getting things like the other user groups have done! §

SLICE

By Don Patszch

There is an interesting program available off of the free BSBBs that is called 'SLICE.COM'. It comes from the PC Magazine issue Vol.8 No.9 and is available from the Sunshine BSBB or through Vern Semrad of our own user group.

What this program does is to automatically prompt you to insert another disk when you are writing a file to a disk that does not have sufficient space to hold it. This program will allow you to split the file being written over two separate volumes and allow you to be able to use it later. §

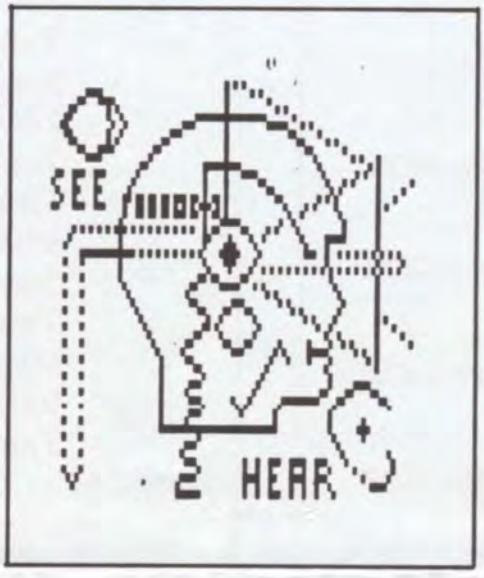
ON-LINE MANUALS

By Peter Chow, UCLA PC UG

The idea of computer on-line manuals has been around since time immortal (at least since time computer) and various implementations have been attempted. Since the introduction of the concept of HyperText by Nelson, on-line manuals seem to have taken on a newer look and higher level of utilization. The concept of HyperText centers on current state of computing – an interactive approach. Information (text, graphics or sound) is presented on the computer and a certain portion of that information is 'sensitive' and more related information can be obtained by selecting that portion. Multi-tier material can be created and the reader can complete the reading and obtain the information desired at various levels. A simple example of this could be: information of computer history in an overview form, with 'sensitive' spots on major computer development areas where more detailed information can be obtained. In each detail information layer, the

Continued Next Page

On-Line Continued



designer and engineer and major technological breakthrough are made 'sensitive' and even more detailed information can be captured. A reader can just read the overview of the computer development history or s/he can be more thorough and get a comprehensive view of the whole historical process. Another fine example could be the anatomy of human whereby at the top level, you would have a picture of a man and make each organ and place of interest 'sensitive.' With each successive stratum, more detail isrevealed before the reader's eyes until eventually, the genetic and bio-chemical level is reached. There are several products like this on the market right now that bring the power of hypertext to the consumer. Apple's HyperCard is an excellent example of hypertext technology. However, it is only available for an Apple MacIntosh with at least half a megabyte of memory. In the future, I will try to search out and report on programs that are more closely related to the HyperCard product for the PC. This article will be limited only to two commercial products that I've come across that have the basics of hypertext with immediately usable information.

The products are both 'engines' with available 'databases' of information categories and they are all text-oriented. They are both modeled after the reference manual of old. The first one is Peter Norton's Guides and the other one is Flambeaux' Help! product line. Although both are in this same category, they are not competing products, per se. Of the two, Flambeaux' product is both more flexible and has more usable features.

Norton's Guides is a memory resident product and by the time you read this article, they will have a version for the OS/2 environment. As a memory resident product for the DOS world, this program takes up about 67Kb of memory. When you press Shift-F1 (configurable of course), a half screen window pops up and you are ready to 'read' your

For $100.00, you get one language database (this product has only programming languages from Norton Computing and they are C, Pascal, BASIC and ASM with OS/2 API functions available later) and the reader program with additional databases at $50.00 each. Although the package isn't copy protected, you are not allowed to distribute any part of the files and there are no separate purchases for the reader alone. Included on the reader program disk are utilities to make your own databases. The manual describes the process quite well, but it is a very tedious process with embedded commands in ASCII text and a two-step compiling procedure (compile and link). I still don't understand the reason for the link part of this process.

This product is geared toward languages or function listings because you can only make databases that resemble quick reference guides. At the top, you get a table of contents screen with individual entries as 'sensitive' areas. When you are 'in' the second level of detailed information you see 'See Also' list at the top with a description, or help for the function as the remainder of the textual information. In essence, this is a two-tiered system. Although the

information presented is very helpful (much like the original manual by either MicroSoft or Borland), it is very 'dry' and technical in nature. One can sit and read this information only when confronted by an absolutely dire question. To help this fact, Guides can 'read' the current word your cursor is on and position you to that particular 'page' in the database if a match is found. This product is truly an on-line manual in the sense that it only can present to you in a quick reference style format.

Flambeaux' help product line consists of DOSHelp! and TechHelp! It can operate as either a DOS program (perfect for DESQView), as a memory resident program or in a special 'pass through' mode that loads itself and the text editor (or any other application) so that it is memory resident and unloads itself when you quit out of the application. It, too, consists of a reader program and one of many (in this case two) databases. This product in many ways is the same as Norton's with the following exceptions: it is not 'dry' reading; it is not in quick reference style but in 'chapter' format; it more closely resembles HyperText; it takes up less memory (57K) and it costs less. However, unlike Norton's Guides, this product does have problems working on an AST machine with an EGA card (works fine on my no name clone EGA system at home!). In actual practice, this product is more 'usable' than Norton's because of the presentation style. It also contains one feature that lacking in Norton's – printing of the information you are currently reading. In all, I much prefer this product to Norton's if it were not for the availability of the databases. There are some experimental hypertext databases on my BBS now ready for you to download that are written for Norton's Guides. I would expect some for the other product soon. However, in order to really capture this niche, the product should be flexible enough that one can add more 'chapters' to the database as easily as one might in a word processor. The author of the Flambeaux products has indicated his intention in this regard, but the projected date of release is still unknown.

DOSHelp!, TechHelp! and DevKit are published by Flambeaux Software, 1147 East Broadway Street Suite 56, Glendale, CA 91205. They are listed for $34.95, $89.95 and $35.00 respectively.

Norton's Guides is published by Peter Norton Computing, 2210 Wilshire Blvd, Santa Monica, CA 90403-5784. The Guides program itself is listed for $50.00 and each language (Assembler, Pascal, C, and BASIC) software manual lists for $50.00 as well. The OS/2-API manual, not yet released, retails for $100.00. §

The Craziest Machine

By Steve Speairs

We have all had cases, I'm sure, where we have a situation that has caused us to doubt our sanity and the status of the world-at-large. Now, I am not talking about your minor glitches or programming bugs here, this is the area where you turn your eyes up to heaven and say, like Job, 'Why me, God?'. This is the kind of problem that has you chewing your finger-nails and then examining them to see how close to your elbow you have gotten. It is instructive to the user community, I think, to show a problem like this and the steps taken to solve the problem. While it is unlikely that this exact same problem would happen to you, but you never know!

The day started off normally for me, in my position as a PC & LAN (Local Area Network) operator for my company. I had a routine call to reload the network software on a machine that had had its controller card and other pieces of hardware replaced. The situation seemed normal enough at the time and I had done similar jobs many times before. I went to the user in question and checked the Hard Disk of this IBM PC-XT286 and was pleased to see that the software was already on the disk and that all that was needed was to change the 'AUTOEXEC.BAT' file to call it up for use.

The current 'AUTOEXEC.BAT' that was already there was a simple operation that mainly loaded Sidekick (SK) and then quit. The service technician was still there, packing his tools, and I verified with him that there was an Intel Above Board in the machine and that he had put the machine through all of the standard memory tests on that board. The current 'CONFIG.SYS' had both the Intel Memory Driver and the 3COM LAN System Drivers so there was nothing in this file that needed changing.

Exuding confidence, I sat at the keyboard and made the required changes to the 'AUTOEXEC.BAT' so that it would now load the necessary programs for accessing the 3COM LAN. Since 'SK' was already there from the current 'AUTOEXEC.BAT', I used it to make the changes and then warm-booted, [Ctrl][Alt][Del], the system to get access to LAN. I was mildly surprised when, as I watched the machine start, I saw the familiar 'SK' load box come up. I said to the technician that I really must be losing it because I could swear that I had removed the 'SK' load command. However, this wouldn't be the first time that I had made such a mistake and I know that it wouldn't be the last either. So, I made the changes again, only this time paying a little more attention to what I was doing. I checked my corrections and once again rebooted the computer.

This time, I knew I had made the required change so I was really taken aback when the rather unwelcome 'SK' load box reappeared. After

Continued Page 3

some few minutes taken to make sure that I was changing the 'AUTOEXEC.BAT' in the Root Directory, I also double checked to see if there were any special or unique commands that may be causing this odd behavior. Not seeing anything that looked suspicious, I tried the 'AUTOEXEC.BAT' change again, did a 'DIR' to make sure that the change was saved onto the Root Directory and then rebooted again. By now I just grunted when the 'SK' showed up and proceeded to look at the contents of the Root Directory. The blasted thing showed no signs of my file change or indeed anything that had the current date. I double checked the time and date to be sure that they were correct and sure enough they were.

By now, of course, things were really getting serious. It was time to start exercising all of my legendary skill to find what was causing this very annoying behavior. After all, I did have my reputation on the line. Knowing how some really sneaky people can cause weird behavior in PCs, I decided to short-circuit the normal loading process by deleting the 'AUTOEXEC.BAT' file entirely. Surely, this would keep any chained program call that might be several levels down from making a monkey out of me! Rebooted and you can guess the results! OK, I now decided to remove both the current 'AUTOEXEC.BAT' and its predecessor 'AUTOEXEC.BAK', just to be sure! Same results! Now I tried the same thing only I tried a power-off just in case there was a sneaky RAM- Resident program that was laughing at me. You know what happened.

Just to make very sure about the possibility that 'SK' or some other RAM- Resident software was doing this to me, I killed off all that I could of these programs and drivers that were loaded and then used a RAM monitor program called 'PMAP.EXE' to review the PC's RAM contents. There was nothing there so I tried the reboot once again with exactly the same results! OK, maybe the 'CONFIG.SYS' had a well disguised problem in it, so I deleted both it and its 'CONFIG.BAK' file. No change in the results.

OK, no more Mr. Nice Guy, it was time to roll out the heavy artillery. After making a copy of the Root Directory in a new sub-directory, I deleted all of the files except for 'COMMAND.COM' on the Root. Same results. Now I deleted everything off of the Root, including the hidden files! Same thing happens. No matter what I do, the computer wakes up like there had been no changes! This was getting to be serious

Continued Page 4

Craziest Continued

weird! I now load up my PCTOOLS to really check out what is beyond the surface level of the Disk's logical structure. My mind was starting to speculate about viruses and other assorted horror stories while my confidence was sinking faster than the Stock Market in October, 1987.

The one thing that was now starting to ring a bell was the presence of a file, 'BACKUP.M_U', that I recognized from previous usage as the FAT copy made by the Paul Mace Utilities for the use in data recovery and other similar operations. The thought now was that there may be some switch set somewhere to cause this copy of the FAT file to be used instead of the real one. If this was so, then no changes to hard disk contents could be recognized because until this file was updated, it would just overwrite whatever else was done. This happens because when you delete a file, DOS does not actually erase the physical location of the file. Instead it simply marks the file's address in the FAT as vacant by putting a blank in the first byte of the file name field.

(PS. This is how the un-delete operation programs are able to work. They merely look

MAY MINUTES

By Russ Merritt

The planned presentation by Steve Spears was delayed for another session due to lack of the overhead projector. A general discussion about various aspects of computers was led by Harvey Bruno.

The beginning DOS session by Bill Fuller did take place, using an easel and paper pad to describe the events to be expected when copying files. Another beginners session will be given next month.

Bill Fuller also announced an apparent bug in WordPerfect 5.0. If a space is included in the naming of a file, the document will be saved but cannot be retrieved or renamed using WordPerfect. The solution is to use a file manager program or DOS to rename the file. If DOS is used, the question mark needs to be inserted in place of the space. EXAMPLE: if the file name is MY FILE.DOC the DOS rename command will be REN MY?FILE.DOC MY_FILE.DOC, and now the file can be retrieved in WordPerfect. This was confirmed by your Secretary. When I called WordPerfect, they said this was corrected in the version issued as of April 12, 1989. §

SERIAL COMMUNICATIONS

By Vern Semrad

I promised you all at the last meeting that I would expand a little on a question that came up at the April meeting when I was demonstrating serial communications. Here goes.

We will first discuss bits & bytes, then talk a little about modems. We'll wind it up on a discussion of telecommunication protocols

Bits & Bytes. When we type an "A" on the keyboard, the computer has absolutely no idea what that means. Computer processors only understand 0's and 1's. That was a zero, not the letter O. We could carry that a little further to mean "ON's" and "OFF's", but we don't need to get that deep here. Remember when I said the difference between parallel and serial communications was that in parallel communications, all eight bits of a byte are transmitted at the same time. In serial communications, a byte is sent down the wire one bit at a time.

What do we mean by that. Let's explore the BIT. I think we all know it takes eight bits to make a byte. A BIT is a BInary digiT. What is binary? The binary numbering system is a system that evaluates ALL numbers to the BASE 2 instead a BASE 10 as in our decimal numbering system. We won't dwell on that.

I said a computer doesn't know what the letter A is. How do we send the word "The" to a processor or over a modem. Some brilliant soul devised a system called ASCII (American Standard Code for Information Interchange) to which we can convert every symbol we can possibly type on the keyboard. Obviously we need a symbol for all the letters of the alphabet, both upper and lower case. We need a symbol for the numbers 0 through 9, and some other characters such as hyphens, periods, commas, and the like. We can get by with about 128 such conversions.

Lets take our word "The". If you've ever looked at an ASCII chart (that's one of the features in Sidekick), you saw that the letter "T" is ASCII 84, the letter "h" is ASCII 104, and e is ASCII 101. That's still not good for computers and modems. Remember, I said computers understand 1's and 0's. That ASCII 84, 104, and 101 have to be further converted to BITS (BInary digiTs). The 84 converts to BINARY 1010100, 104 to 1101000, and 101 to 1100101. NOW, we have something computers and modems can understand. And, we can send the word "The" through the modem.

We are now at our next problem. Computers talk in this digital language, but telephones do not. Telephones talk in an ANALOG system. Now the modem comes to the rescue. The modem (acronym for MODulator-DEModulator) at the sending computer converts the computer's digital signal to an analog signal so the telephone line can understand it. The modem at the receiving computer converts the analog signal back to a digital signal so the receiving computer can understand it.

Isn't this all wonderful. All this is going on, and we think we just said the word "The". But, there's more

In ASYNCHRONOUS communications (as opposed to SYNCHRONOUS), these two talking computers have to establish some ground rules for their conversation. In synchronous communications, the gap or space between bytes going down is uniform. It's like threading buttons on a string. Each button is uniformly spaced on the string. Not so in asynchronous communications. Since the spaces are not uniform, we have to set up some controls called start bits, data bits, stop bits, and parity bits.

Parity can be Odd, Even, or None. If our data bit

Continued Page 6

Serial Continued

length is 8, we don't need a parity check. If our data bit length is 7, we must have either odd or even parity. When you set COMX: parameters to 12,N,8,1, you are telling the COM port that you will be transmitting at 1200 baud (approximately 1200 bits per second), using NO parity check, sending 8 data bits, and 1 stop bit. Here's the reason for the stop bit. Remember what we said about asynchronous communications. The spaces between data bit chunks are not uniform. The stop bit tells the communication that this is the end of this byte or chunk or bunch, and the next thing you see coming down the wire will be the next chunk or bunch.

How about the start, stop, and parity bits? The start bit is always a 1, and the stop is always a 0. With the parity bit, the sum of our 1's and 0's and the chosen parity (odd or even) determine what the parity bit will be.

Remember the "T" was 1010100. The sum of the numbers is three - odd. If our selected parity is E - Even, the parity bit must be a 1 to make the sum even. If the sum of the 1's and 0's had been even and our selected parity was even, the parity bit would have had to been 0 to keep the sum even.

Why go through all this malarkey. Because in serial communications, when the sending computer sends something down the line and the receiving computer's instructions for verifying integrity of the transmission indicate the transmission was corrupted, the receiver says, "Send it again. I don't think I heard what you said". WOW! This is a lot of work to tell the other computer that I typed a "T".

You will see that an RBBS never asks for Even or Odd parity if the data bit length is 8. The odd or even parity is only required when the data bit length is 7. In other words, you might see "12,E,7,1", but, you will never see "12,E,8,1". If the data bit length is 8, the parity will be "N" for None.

Now, to the original question. What about protocols? I felt the preceding discussion was necessary to really get a feel for what we were talking about. So far, we have talked about sending one word, or more specifically, one letter. If we didn't have something more sophisticated than what we have talked about so far, the two talking computers would spend all their time verifying transmissions instead of transmitting information.

ENTER THE WORLD OF PROTOCOLS!

Protocols are nothing more than methods of sending some data down the line in what some people call packets that are larger than one byte. You can call them packets or chunks or bunches or anything you like, but the technology is the same.

We'll start with XMODEM. XMODEM was developed by a fellow named Ward Christensen. This guy must be some kind of computer genius. He has written all kinds of software, and lots of it is around on bulletin boards.

When you select XMODEM as your protocol, here's what happens. Data is sent down the line in 128-byte chunks (or packets or bunches). When the chunk is received, the receiver goes through its error-checking procedure and sends one of two signals back to the sender. It

Continued Page 7

And the Winner is...

Harvey Bruno brought in a bunch of dBase IV TKO Sweepstakes disks from Ashton Tate. For the many winners, they have until May 31st to send in their entry.

Note to the Winners: I apologize if your name is not correctly displayed. When we requested that you put your name on the winning ticket no one said PRINT. When the next winners turn in their tickets, have mercy on your secretary - PRINT YOUR NAMES!

goes through its error-checking procedure and sends one of two signals back to the sender. It either sends an ACK (acknowledged) or an NAK (NOT acknowledged). If the sender receives an NAK, it sends it again. If you ever use this protocol and you want to get an idea of how fast the two computers are doing their thing, watch the screen in PROCOMM and use your stopwatch to time the number of seconds for each 128-byte chunk to be sent and received. With a 1200 baud modem, I think you will find it takes about one second for each chunk to be sent, received, and verified. One reason so many people and bulletin boards use this protocol is that it is VERY reliable. Don related in the last newsletter that this was the only protocol needed. This is true to a point. This is true if you are satisfied with the slowest of all protocols in transferring data.

I think the next most popular protocol is YMODEM. YMODEM is very similar to XMODEM except that it send data in 1024-byte chunks. That's why you will sometimes see it referred to as XMODEM-1K. I'm not really certain that YMODEM is the same as XMODEM-1K. I have experienced some serious problems trying to interchange the two. Maybe somebody in the group can help me with this one.

I do know that if YMODEM is an available protocol on your RBBS or on-line service and you select it as your download or upload protocol in your commuications software, you probably won't have any problems. If you try to mix XMODEM-1k and YMODEM, I won't guarantee the results.

A word about YMODEM. If you time transmission of chunks as you did with XMODEM, you will find that it takes about eight seconds per packet. Then, why would XMODEM be slower than YMODEM? Because XMODEM is making eight times as many error checks and verifications as YMODEM.

We'll touch on one more protocol - KERMIT. KERMIT was developed at Columbia University. It was actually developed as a protocol between different operating environments, such as mainframes and PC's, since it supports transmitting data between 7-bit and 8-bit systems. Transmission of data using KERMIT is faster because it is a full-duplex system. That means verification of receipt of data can be sent from the receiver to the sender while data is traveling from the sender to the receiver. That is unlike XMODEM or YMODEM which are half-duplex systems. That means the sender sends data to the receiver, then must wait for the verification to come back before it can send the next chunk.

One last topic and we'll wrap this up. Error-checking. In the world of PC's, there are essentially two, CRC and checksum.

First, Checksum. We'll use XMODEM for the example. The sending computer first sends a SOH (Start Of Header) control character. It then sends a binary packet number. Next comes 128 bytes of data, and last comes the error detection byte or bytes. If you add the "ones's" in this packet, that becomes the Checksum sent from the sender to the receiver. If the receiver's Checksum is the same as the senders, the receiver sends an ACK, and it is OK for the sender to send the next packet or chunk.

In CRC error-checking, as the packet is being sent, the sender runs the entire chunk through some kind of algorithm or equation and comes up with an answer to the equation. The receiver runs the packet through the same equation, and, if it comes up the same answer, it sends the ACK that it is OK to send the next packet. I don't know what that equation or algorithm is, but, I guess I don't need to know since it works.

I know this has been kinda long, but, you asked me a question, and I answered it.

HAPPY COMPUTING

PIPING AND I/O REDIRECTION

By Peter Chow, UCLA PC UG

Since version 2.0 DOS supports I/O redirection. To put it simply, processed information from one program can be used as the input of another program. A popular example of how piping and I/O redirection works is:

DIR | SORT | FIND /V "i" PRN

The above sorts the current directory listing and prints out onto the printer.

for FAT locations with this blank byte and prompt you to provide the real first character. Since the file still exists, unless it has been overwritten by a subsequent operation, that is all that is needed to recover from a deletion.)

The problem here was that I had no idea of who had done this or when because this file had no time or date stamp associated with it! So I decided to get the Mace Manual and see if there was a software switch that had been set to do this crazy thing. The simple answer, found after much reading was that there was no mention of any such capability. So, now for some Long Distance calling for help from Mace's Tech Support Line in Oregon. IF there was a bug OR if there was a hardware DIP switch that was responsible for this, then they could have very likely encountered it in the past. Also, the fact that this machine had just been serviced, could have led to a switch be moved accidentally. Additionally, the fact that this was a true-Blue IBM, not some unknown clone, gave confidence that if this was a bug in the hardware/software combination, it should be known of.

The call to Mace, produced a very skilled and helpful Tech Support person named Mike Lee. Together, we spent an hour and a half in trying different combinations of changes and usages to see if there was any way that the MACE Utilites could create or resolve this current situation. Unfortunately, the answer was no and no and we ended up with him promising to try to duplicate the problem in Mace's Labs and they would get back to me the next week (This was a Friday Afternoon).

Oops, now I really am starting to see things ... After being burned a couple of times, I was always checking, with a 'DIR' command, the results of any action that I performed. Without exception, this showed the results expected, ie. date and time match to the changes made. Now, though, I had loaded some working software tools onto the hard disk to help in the examination and suddenly they have disappeared from the hard disk. The MACE files from the telephone call to the support line have gone along with the PCTOOLS that I tried using. Even the sub-directory has

Continued Page 9

disappeared with no trace.

Repeating these steps with great care, I see that the files show the message of having been copied to the hard disk and that they are visible when I do a 'DIR' command on their location. I can call them up one time for use of the various executable files but they proceed to disappear upon the use of the second DOS command and the prompt shows control being returned to the Root Directory. The weirdness has gone from not having the changes when rebooting to now not having them after just a few DOS Commands.

The day was almost over and the user needed to have her machine, so, with great reluctance, I agreed to reformat the hard disk so that we could reload the pertinent software for use on Monday Morning. I was reluctant because not knowing what could cause such a problem machine, made me feel like I was destroying something that could hit with even worse consequences later on. However, I was saved from my concern, when I discovered that the machine would not even allow the use of the 'FORMAT' command on the hard disk. It just did not recognize the 'C:' Drive, even though I could easily read it in just the next command.

At this point, you have all of the clues to the solution to this total craziness. If you are in Sherlock Holmes' class, you could say 'Its Elementary, my dear Steve' and would have saved me much toil and headache as I went dashing off after the various Red Herrings that are involved here. However, you weren't here and I was so I proceeded on my way to my considerable frustration.

Now, I am going to be very mean here and not reveal the solution to this mystery except at the next meeting of the PCUG on Wednesday June 14 at 6 PM. It will be interesting to see who has what solutions and who the various Sherlocks are amongst us. If you have a solution to this problem, put it on a piece of paper and give it to me at the beginning of the meeting. I will judge the answers on the best diagnostic solution and there will ba a prize awarded to the one I think best. Remember, that old Holmes' Axiom '... when you have eliminated the impossible, only the answer remains'!

P.S. > This is not the result of a Virus or Trojan Horse. All other possibilities remain, both hardware and/or software!

A Plethora of Confusion!

By Steve Spears

Have you noticed lately what an endless bounty of hardware and software is being made available to us and what it is doing to our poor brains and wallets? Those of us who are old timers or who have access to some of the old magazines are the ones who are most sharply aware of this change because we can see it in black and white. However, all of us are reaping the advantages AND disadvantages that this abundance is bringing us. We are rapidly learning that there is no such thing as a completely free lunch and that everything is relative in the business place.

In just the recent past, 5 years or so ago, you could say with some degree of confidence that there was some combination of hardware and software that was the best for a given task. That combination and task could be specified as a TANDY 100 for a reporter or a COMPAQ Model II for a traveling consultant with Lotus, dBASE and CrossTalk loaded on its 10 Meg Hard Disk. While there may have been valid points made for any given package or combination, there was a sense of general agreement as to a given what the leading package was.

Now, just try to get an agreement on what the best system is and all you will get instead is a good argument. About the only area in the entire Personal Computer field where there is any agreement at all is where there are still patent and copyright restraints active. The most visible example of this is the Macintosh which is from a sole supplier, Apple, and thus has an almost single standard in terms of hardware and Operating System. This monopoly occurs only because Apple was willing to discard compatibility with its other (Apple II) line and strike out in a totally new direction.

In our MS-DOS world, we now have multiple standards in almost every area of hardware and Operating System that has inevitably led confusion and multiple choices. In the recent past where we might have chosen VisiCalc, dBASE II and WordStar as our software to work on a CP/M PC that had 64K of RAM available, we now have to determine whether we want to be working on an 8086/8, 80286, 80386 or a 8086/8 with an accelerator card, and whether we are using DOS 3.x, 4.x, OS/2, Windows or some other Operating System variant or assistant etc... In terms of the software, we have long since left the time when there was a single operational or market leader package as in the times of WordStar, Lotus or dBASE II. Now each and every category has 2 or more names that spring to mind and are equally well regarded.

Thus, we are now reaping the whirlwind of the marketplace that our Capitalistic Marketplace tends to encourage. Our day's of certainty have passed and we must make buying decisions based on factors other than pure leadership or capability. If you already own and like a given software package, you will tend to continue to buy its upgrade instead of looking at its competitors. The problem here is that the others may have features that you need and are not getting from your current choice. So the question becomes whether you sacrifice your expertise in your current package for the features in the new one and the time needed to learn it.

This is one of the reasons that market-share is so important to the software manufacturers. With sufficient market-share, a company can have the current new sales support the upgrade process and then be able to create better, more feature-laden upgrades. They can then keep their upgrade costs down to the point where they can pre-empt the competition and thus keep the majority of their customers. It is for the market-share that such companies as Borland have sent out many free copies of Quattro in order to prime the pump. While such giants as Lotus and Ashton-Tate do seem to have high upgrade costs, you cannot be certain of what it means. Their is a corporate mentality that thinks that high upgrade costs help support high retail prices and that if you have a really significant upgrade, people will be willing to pay that price. Ashton- Tate has found the fallacy to that in the very sluggish sales of dBASE IV and Lotus may have taken a page from their book in its purported actions of late in the 1-2-3 v.2.2 & v.3.0 Upgrades. According to the InfoWorld Industry Gossip Column, 'NOTES FROM THE FIELD' (08/28/89 Vol.11#39), Lotus is allowing subscribers of its' LOTUS Magazine and others to purchase any number of upgrade packages for the $150 apiece instead of the shrink-wrapped package cost of $495.00 (before 12/31/89) $595.00 (1990).

Will this keep up? I don't think so and here are a couple of reasons why I hold this opinion. To continue this increase in available hardware and software requires the continual entry into the marketplace of a lot of new players. This is because there is a continuous dropout rate of companies merging and failing. However, we are getting far beyond the day of the small programmer or hardware shop that could take a flyer on the market for profit shares and work out of a converted garage. There will ALWAYS be some of these and some will make it into the big time, but over- all they will be a smaller and smaller portion of the market. Programming and Hardware facilities both have costs going through the roof and so there is less time and Capital available for a new venture to experiment and get something right the first time. If you don't have it right that first time then the odds are that you won't get a second chance because of the high level of competition.

In essence, I think that we will see a similar scenario to what happened to the automobile industry over the past century. Just as they started off with a multitude of types, Electric, Gas and Steam, and then standardized on gasoline power, so we will probably standardize on an Operating System and CPU engine over the next decade or so. The suppliers will shrink in numbers just as we saw the demise of the Stanley Steamer, the Hudson, the Tucker and the Kaiser brands of automobiles. In terms of software, the shrinkage will take much longer and still have heavy competition well into the next century.

In short, the multitude of decisions needed to be made in the computer purchase and upgrades are here to stay for a long time to come. While it provokes problems for those of us who venture out to offer our opinions and ideas, it is still far preferable to a shortage situation where there is no decision required because all that you can buy is what the single seller has determined you need. I may be caught out by a friend or client who has found a better bargain or a more capable package, but at least it is available. Have fun choosing and remember that it is more important that what you buy works well for you than that you have the newest and most expensive one on the block! §

FAT's, DIR's, Etc.
Some talk about Disks, be they Fixed or Floppy
By Vern Semrad

As you know by now, I try to make my contributions to this Newsletter informative. Many of you already know about the things I will be discussing. But, I'll bet very few have actually seen this information on your screen.

For this discussion, I will be using a floppy disk, but, everything I will talk about also applies to a hard disk. Also, ALL the screen pictures used here have been edited to conserve space. But, the screen pictures were ACTUAL screen pictures before editing.

Knowing where to find and edit data on a disk along with some pretty slick software I have make it possible for me to UN-zap a ZAPPED dBASE file.

First, the organization of a disk. The first thing on any disk is the Master Boot Record (MBR). Here you will find information such as the operating system used to format the disk (DOS 3.3, 3.2, etc.). If your HARD disk is partitioned, i.e., 40 MB Physical disk divided into C: and D:, that information is also stored here. The following is picture of the MBR.

```
  Drive:A  Sector:0      Cluster:BOOT   Dir:ROOT.DIR       File:--------.---
         0  1  2  3  4  5  6  7  8  9  A  B  C  D  E  F    0123456789ABCDEF
000000:  EB 34 90 49 42 4D 20 20 33 2E 32 00 02 02 01 00    .4.IBM  3.2.....
000010:  02 70 00 D0 02 FD 02 00 09 00 02 00 00 00 00 00    .p..............
000020:  00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 0F    ................
```

Notice in the ASCII portion (right side), this disk is formatted under PCDOS 3.2.

Following the MBR are the TWO copies of the File Allocation Table (FAT). Note I said the TWO copies of the FAT. DOS always keeps two copies of the File Allocation Table on a disk. If the first FAT gets damaged, it can be restored from the second. If both are damaged, you are in trouble.

The FAT is like a book index. It is where DOS stores information about where a file is stored on a disk. Data contained in a file can be stored anywhere on a disk, depending on the empty space on a disk. The information about what clusters and sectors contain any file's data are contained in the FAT. REMEMBER: FAT #1 and FAT #2 should be identical.

Next on any disk comes the Disk DIRECTORY. This simply tells us what is stored on that disk. It doesn't tell us anything about where anything is, only what's on the disk.

After this basic information comes the actual data. This can be your application files (.EXE, .COM, .OVL, .DTA, .DBF) or anything else. This is just the DATA on the disk. Let's look at the layout of a typical disk.

```
 Disk information for media in drive A:

Total available sectors on media.....720
Sectors per cluster allocation unit.....2
Sectors per File Allocation Table(F.A.T.).....2
Number of sectors in ROOT directory.....7
F.A.T. #1 starts on sector.....1
F.A.T. #2 starts on sector.....3
ROOT directory starts on sector.....5
DATA for this media starts on sector.....12
The media is.....2  sided
The media is.....not  8 sectored
The media is.....removable
```

As you can see, we are working on a floppy disk (5¼ 360K). It says 720 sectors are available. That makes sense since 40 Tracks X 9 Sectors/Track X 2 sides = 720. It also says that FAT #1 starts in sector 1, FAT #2 starts in sector 3, the DIRECTORY starts in sector 5, and the DATA recording begins in sector 12. Now, we will start peeking into those sectors.

Continued Page 5

PRESIDENT'S PODIUM
Harvey Bruneau

EARLY RELEASE. WHO WINS.

Ever wonder why some companies seem to announce product shipping date before its completed. Generally its to stay ahead or even with their competition. Whether it's hardware or software these vendors are hoping that their announcement will make you reconsider or postpone a decision to leave their product or purchase another vendors similar product. This is called the freeze factor. They are betting that you will purchase their product sight unseen. Ever buy a house that way. Did you pick your spouse or significant other with a blindfold on. I didn't think so.

Software vendors are notorious for asking you to send in your upgrade money or purchase their current product now in order that you may be among the first to receive the new product when it ships. JUST SAY NO. Ask a dBASE IV purchaser if he got his moneys worth either by upgrading or 1st time purchase.

Many of the big boys COMPAQ, IBM, WORDPERFECT, MICROSOFT, LOTUS, BORLAND, ASHTON-TATE, FOX, 3Com and NOVELL to mention a few play the game. Unfortunately bigger does not mean better. For instance ASHTON-TATE decided to ship a bug infested incomplete dBASE IV 1.0 after missing more than one delivery date. This early product release has allowed ASHTON-TATE competitors to be winners at the expense of users. Of course now that word-of-mouth has gotten around ASHTON-TATE is in deep trouble. A $19 million loss and over 200 employees terminated with no better outlook on the horizon.

WORDPERFECT has been dominant in wordprocessing for some time. MICROSOFT, in order to keep up, released its answer, WORD 5.0, in hope of surpassing WORDPERFECT. While WORD has some nice new features, the product has glitches. It has problems converting documents from the previous release of WORD. There are other problems related to hardware which have also surfaced. Once again the winner is the competition and the loser is the user. These bugs aren't as serious as ASHTON-TATE's but the product shouldn't have been released until corrected.

LOTUS did the right thing. Although around two years late and a loss in market share Lotus 3.0 has hit the streets with favorable reviews. The jury is still out, but so far it looks like a good clean product. Users and LOTUS win.

There are many more stories like the ones above. The point is that the user generally gets the short end of the stick on early released products. The Japanese are getting more involved in software and hardware development. If our current vendors don't get their act together they could go the way of the American automobile industry by the year 2000. §

Q & A
By: Russ Merritt

Spreadsheet

Q: For SMART users - The AVERAGE command has a pitfall. If your figures include a single cell as the last item in a range, the calculation will not be correct even if there is no data in that cell.
A: The solution seems to be to have the last referenced area to include two cells. If either or neither are blank, the average calculation will be successful. SMART has been contacted. The respondent did not know if this apparent bug had been corrected by the recent update.

Word Processing

Q: For WORD PERFECT 5.0 users - Following the disclosure by Bill Fuller in a recent meeting that Word Perfect permitted file save with a space, but would not allow file retrieve.

A: I discussed this with another Word Perfect user. Here it was disclosed that naming a file CON would destroy the document. Both items were called in to WORD PERFECT. The space problem was solved by the April update disk. Now, whenever the space bar is hit in naming a file, that file will be saved, immediately! Some solution.

When the representative tried the CON, he got a illegal name message. He was on a LAN system. He then tried it on a PC and it blew the file away. Further experimenting showed that all DOS reserved names reacted the same way. For WORD PERFECT users, the following DOS reserved names will cause irresovlable problems: CON, AUX, COM, LPT, PRN, NUL. I have personally tested only the word CON. I leave it to others to do their own experimenting. §

FAT'S, DIR'S, ETC. Continued

Next comes the Disk DIRECTORY. This is simply a Table of Contents of the disk. It looks like this.

```
  Drive:A  Sector:5      Cluster:RtDir  Dir:ROOT.DIR       File:--------.---
          0  1  2  3  4  5  6  7  8  9  A  B  C  D  E  F    0123456789ABCDEF
000000:  46 52 45 45 20 20 20 20 44 4F 43 20 00 00 00 00    FREE    DOC ....
000020:  53 4C 49 43 45 20 20 20 44 4F 43 20 00 00 00 00    SLICE   DOC ....
000040:  52 45 50 45 41 54 53 20 44 4F 43 20 00 00 00 00    REPEATS DOC ....
000060:  4D 4F 56 45 20 20 20 20 44 4F 43 20 00 00 00 00    MOVE    DOC ....
```

Notice again on the ASCII side there are four files on this disk, FREE.DOC, SLICE.DOC, REPEATS.DOC, AND MOVE.DOC.

We know that when we delete a file, DOS strips away the first letter of the filename. Part of undeleting that file involves restoring the first letter. Let's see what happens when we delete all four files by typing DEL A:*.*. Here's what the disk directory looks like now.

```
  Drive:A  Sector:5      Cluster:RtDir  Dir:ROOT.DIR       File:--------.---
          0  1  2  3  4  5  6  7  8  9  A  B  C  D  E  F    0123456789ABCDEF
000000:  E5 52 45 45 20 20 20 20 44 4F 43 20 00 00 00 00    .REE    DOC ....
000010:  00 00 00 00 00 00 6C 7A A9 0A 02 00 80 00 00 00    ......lz........
000020:  E5 4C 49 43 45 20 20 20 44 4F 43 20 00 00 00 00    .LICE   DOC ....
```

Notice the missing first letters from FREE.DOC and SLICE.DOC. Using a sector editor, I will now go into the directory and restore that first letter on one of the files. The directory looks this now.

```
  Drive:A  Sector:5      Cluster:RtDir  Dir:ROOT.DIR       File:--------.---
          0  1  2  3  4  5  6  7  8  9  A  B  C  D  E  F    0123456789ABCDEF
000000:  46 52 45 45 20 20 20 20 44 4F 43 20 00 00 00 00    FREE    DOC ....
000020:  E5 4C 49 43 45 20 20 20 44 4F 43 20 00 00 00 00    .LICE   DOC ....
000040:  E5 45 50 45 41 54 53 20 44 4F 43 20 00 00 00 00    .EPEATS DOC ....
000060:  E5 4F 56 45 20 20 20 20 44 4F 43 20 00 00 00 00    .OVE    DOC ....
```

See the first letter back in place in FREE.DOC. You have just seen half of what happens when you use UNdelete software like Norton Utilities to restore a file you accidentally erased. All that remains is rebuilding the FAT so DOS will know where all the parts of that file are.

We can do more of this in the future if you like. I will wrap this up with a helpful hint to any of you who have to import raw ASCII data into your favorite database program. I have to do this a lot with data from mini-computers and mainframes. We know the data most often comes to us in SDF format, i.e., fixed- length records and fixed-length fields. The data looks like this.

```
0014354 0687  303   00100000000002800000420000013000RLANDO J  CAPAZ  01  0817
0014580 3956  101   00800002500004400000660000013000LEON G MARUT JR   01  0817
0013718 4209  302   00100000000002800000420000000750CHARLES A MILLER  01  0817
```

Before we can import this into something like dBASE, we have to determine the position in the record of the beginning and end of each field. I used to load this file into a word processor and using the cursor position indicator, mark the start and end of each file. You can do this by making yourself a text header that simply is a numbering system to tell you where each character is in the record. It looks like this. The pointer is ASCII 206.

```
         1111111111222222222233333333334444444444555555555566666666667777777
12345678901234567890123456789012345678901234567890123456789012345678901234567

```

A VIRUS AMONG US?
By Russ Merritt

Not too long ago I downloaded WPM5.ZIP from our Bits of Blue and found a Word Perfect pull down menu system. Unfortunately, there was no way to test it without loading it in my Word Perfect directory and linking it to PATH.

First, the EXE program was check for any ASCII characters that might indicate a potential problem. With that bare assurance, the program was installed. It worked as advertised.

On Sunday, August 20th, (about 2 weeks after installing the menu program) suddenly the CSL (clear screen) Command would not work. Command.Com was recopied and everything was fine. About 3 hours later the same problem occurred and was solved in the same way. It was now afternoon thunderstorm time and the PC was unplugged. On Wednesday evening, August 23rd, the PC would not boot. I rebooted with a floppy, copied Command.Com from the DOS directory to the Root, and rebooted successfully. WPM.EXE was then deleted from Word Perfect. Work continued successfully.

On Thursday evening, August 21st, the PC booted successfully. On Saturday, August 26th, the WP.MNU was deleted. However, when working in Word Perfect the SHELL (Cntl/F1) would not work, saying Command.Com could not be found. The final file, a macro created by WPM.EXE (ALTZ.WPM) was deleted. As of this time everything seems o.k.

I have written to the name given in the DOC file. He was asked if any other problems such as occurred here had been reported or was it possible that someone had tampered with the program. Any response from this inquiry will be shared with the membership as soon as it is received. If there is no response, you will also be advised.

Unfortunately, the corrupted Command.Com files were not kept and so there is no easy way to analyze what may have occurred. Members should use care with this menu program until more is known. If others have had any experience with WPM.EXE, WP.MNU, good, bad or indifferent, please share it with the membership. It may be that this is a simple incompatibility problem with my PC. §

TEN TIPS FOR PERFECT COPIED IMPRESSIONS

1. Keep the glass on your copier well maintained. Clean it often with a soft rag and a window cleaner. Be careful not to scratch the glass with rings or other sharp objects.
2. Prepare your original on a clean white sheet of bond paper.
3. To produce a good dark copy, always use black ink. Never use blue as some copiers will not pick it up.
4. Whenever possible use an original document, not a copy of the document, as an original.
5. Use "Whiteout" to eliminate errors on an original document.
6. Use "Just for Copies" on any copies that you are using as an original.
7. Use glue instead of tape to make an addition to an original. Tape has a tendency to distort copies and may give you a shadow.
8. Do not fold originals.
9. Store originals in an envelope or file folder to ensure that they do not get ripped or torn so they can be reproduced easily the next time you need another copy.
10. Bring your documents to Perfect Impressions. We are always happy to help you prepare your originals so that your impressions are perfect.

LOTUS MACROS
By JOY JAMESON

ONE OF THE MOST USEFUL LOTUS MACROS I KNOW IS:

\E {?}{DOWN}/XG\E~

PLACE THE CURSOR ON THE \E AND HIT /RNLR TO NAME THE MACRO. TYPE ALT E TO START THE MACRO SEQUENCE.

THIS IS FOR ENTRY AND ALLOWS YOU TO USE THE KEYPAD. TURN NUMLOCKS ON. FOR OLDER MACHINES YOU CAN USE THE SHIFT KEYS TO WORK THE ARROW KEYS TO MOVE AROUND. WHEN YOU ENTER, THE CURSOR MOVES DOWN ONE ROW. TO ENTER ACROSS TYPE THE WORD RIGHT IN PLACE OF DOWN. TO TYPE DECIMALS (MONEY) AUTOMATICALLY USE.

\E {?}{EDIT}{LEFT}{LEFT}.{DOWN}/XG\E~

THESE WORK IN OLDER AND 2.0/ 2.1 VERSIONS. TO STOP ENTRY YOU HIT CONTROL BREAK. THIS WILL GIVE YOU AN ERROR MESSAGE IN 2.1 SO HIT ESCAPE AND YOUR BACK IN NORMAL READY MODE. §

FRIENDS WITH A NEW HARD DISK

By Ed Buzza

A friend, relative, or a client has just installed a hard drive on their computer (or just got a new computer with a hard drive) and has come to you for help.

"What do I put on this thing?", "How do I use it?", "What kind of directories should I set up?", and "What stuff do I put where?" are just some of the panicky and urgent questions that they expect you, the GURU of the PC Kingdom, to answer. If you've gone through this more than once, you swear you're going to get organized the next time and do this thing right. Perhaps the following will help. At least it's a way I've found to be helpful.

First and foremost, insist that the client (that's fancier than saying "user") READ THE MANUAL. The DOS manual, that is. The client should be familiar/comfortable with the Command Line. Then walk and talk the client through the process of setting up subdirectories, the logic of directory tree structures, and point out the limitation of the number of entries in the root directory as being the reason for needing subdirectories.

There are always exceptions, but tell the client to keep as few files as possible in the root directory. The bare minimum of files should be: COMMAND.COM, CONFIG.SYS, and AUTOEXEC.BAT. The rest of the root directory should then contain the client's directories.

The following might be a minimum structure:

- \DOS

Include most of the DOS files. It is suggested that you do NOT include ASSIGN, FDISK, JOIN, RECOVER, SUBST, XASSIGN. Tell the client that these are powerful (dangerous) commands that can be added after the client is an expert. Also there is no real reason to include all of the KBD drivers nor some of the other commands, like SHARE, that could lead the new client into trouble. It's a good idea to rename FORMAT.COM to FORMAT!.COM and provide a FORMAT.BAT program that will ONLY format the A: or B: drive.

- \NAME-OS

This is the directory where all the "goodies" are placed. Many people will set it up as \BIN or \DOS\BIN to hold those little programs that make up for what DOS doesn't supply such as LIST and PKUNZIP, etc.. Using the client's name or initials will stick in his/her mind as to where all the goodies are.

- \WP

Typically, all the Word Processor directories or programs would be grouped together. Consider using the name of the program as the directory name, e.g. If your Word Processor's main program is E88.COM , then it would be copied to the \WP\E88 directory. By doing this, the client has a ready reminder that the directory name is also the program name that would be entered on the Command Line.

- \UT

This is a good place to hold all the Utility type software. Whether it be NORTON, PCTOOLS, PKware, or Batch files that you set up for the client.

- \GAMES

Say what you will, the client will have a game or two on the hard drive; if not now, later. So why not provide for it at the very beginning?

- \DRAW or \GRAF

Seems as if everybody has one or more paint programs to satisfy that artistic urge in all of us. Again, use the program/directory name convention when setting up directories under this category.

- \WORK or \JUNK

It's a good idea to set up a directory in which nothing is ever placed. Tell the client to use it as the current or default directory at all times. Then, if the client messes up a COPY command for instance, it will go into \WORK and the client will know about the error and - best of all - just where the miscreant file went since there should not be anything in this directory.

CONFIG.SYS: For the neophyte, it should provide at least for loading ANSI.SYS, setting FILES and BUFFERS to 20, and turning BREAK on. Other device drivers need to be added to accommodate a mouse or a memory board.

AUTOEXEC.BAT: Here is where you prove your worth as an expert. You can define "hot keys" to call up a menu, redefine Function keys as keyboard macros, show DATE and TIME at initial startup, run CHKDSK, etc.. As a minimum, it should set the PATH, DATE and QUIT.BAT: A batch job of this kind should be part of any sign-off procedure used by the client. It should remind the client to backup critical files, run CHKDSK, and then PARK the hard drive.

COMPLIMENTARY FILES: Keep the faith and do not give the client any pirate copies of commercial software. DO give the client some of the many shareware programs that are commonly used (and explain that shareware means that you DO register the program). A few suggestions:

PKZ101.EXE - Unpacks to create PKUNZIP & PKZIP & manual; Use to unpack .ZIP files.
PKX35A35.EXE - Unpacks to create PKXARC & PKARC & manual; Use to unpack.ARC files.
LIST62A.ARC - LIST.COM & manual; browse files & more.
AMAXX261.ARC - File manager & menu system with manual. **TEACHER.ARC** - Explains PATH vs path commands.

You may also wish to give the client copies of the PC Magazine Utilities, Volume I and II.

BASIC SOFTWARE PACKAGES: Nine times out of ten, the client will ask "What's a good package for ... ?" Now comes the hard part. Do you recommend commercial or shareware packages? It depends on the client's intended use of the equipment and the client's financial status. For the neophyte, I recommend PC-TOOLS, First Choice and First Publisher.

THE TRAVEL KIT: One thing more. If the client agrees with your suggestions regarding the setup of the hard disk, you should make the job as easy as possible. Create a Startup Disk that contains a Batch program to create these suggested directories and that will copy the various files (including the shareware files) to the client's hard drive. Oh sure, you could play mumbly-peg on the keyboard and impress the client with your wizardry as you MD and CD and COPY and whoops! your way through; but be a professional (you are the guru), set it up ahead of time. After all, this is what it's all about. Get organized. Do it right the first time and the second time will be a snap. §

AUGUST MINUTES

By Russ Merritt

A few people arrived only slightly drenched, but in spite of the weather and summer, we had a good turn out.

Lightning again occupied the early announcements. One member reported losing two mondems and two television sets since the last meeting. It seemed the telephone line and the cable may have been the culprits.

It was reported that IBM had announced that it will discontinue the PS/2, Model 60.

The major presentation was by Microsoft - the program, WORD 5.0, a powerful and greatly enhanced word processing program. There was a free exchange of information in the question and answer session that followed the presentation.

The Microsoft representative gave the club a copy of their free EXCEL test program, a full working program, but with the spreadsheet size restricted. It is a high density 5.25 disk and requires EGA to run. For those who would like their own copy, call Microsoft at 1(800)541-1261. Ask for the working model of EXCEL. Please be sure to specify disk size.

Harvey Bruneau announced that he had two 10 mg hard drives for sale at $100.00 each. Bob Fulz offered Serial Port or Bus Mouse at $65 with PC Paint and Menus. A high resolution mouse is available for $85. §

CLASSIFIEDS

FOR SALE: DOLPHIN SAILING SIMULATOR Program -Requires IBM compatible and CGA or CGA monochrome adapter. Bought new for $49.00. First twenty bucks takes it. Call Tom Schroeppel at 839-0724

FOR SALE - 2 10MB HARD DISK CABLES & CONTROLLER $100 each call Harvey Bruneau 932-6745

Wanted - I am looking for a **commercial scheduling program** (note: not project management). It must accept constraints on employee assignment as to hours, breaks, etc. Part time and full time employees must be allowed. It must accept assignment needs on at least 1/2 hour segments, preferably in 15 minute intervals. Call Russ Merritt at 882-1993 or see him at the monthly meeting if you know of any such program.

Salesperson wanted - must have strong accounting knowledge and good sales skills. Commission only but with a high percentage of net profit. Leads furnished. Call the Operating System at 287-5515, ask for Bob Fultz.

Inventory Clearance Sale

UI Programmer	$90.00	Symphony 1.2	$250.00
Lotus Metro 1.1	$39.00	Lotus Report Writer	$40.00
Corefast 1.34	$70.00	Fastback 5.14	$50.00

DOS Tips ...
...ANSI.SYS COMMANDS
By Edward Buzza

ANSI.SYS is a console driver that controls the actions of the keyboard and the screen -- e.g. the console. ANSI.SYS can be used to set video mode and attributes, redefine keys and set up keyboard macros, and control the cursor and screen erasures.

All ANSI commands have the same format: ESC code (ASCII 027), left bracket "[", one or more parameters (sometimes, none), and an ending function code. If there are two or more parameters, they are separated by semicolons. Normally, there are no spaces in an ANSI command. For example, "ESC[1;32;40m" is an ANSI command where ESC (ASCII 027 code) and the left bracket character form the ANSI escape sequence to set a bright(1) green foreground(32) on a black background(40) as the video attributes(m).

The problem in using ANSI commands is that pesky ESC character. As soon as you hit the ESC key to begin an ANSI command, DOS interprets the ESC key depression as a signal to cancel the current command. So, how do you enter an ANSI command? Within the PROMPT command, the $e sequence of characters is interpreted by the PROMPT command as the ESC character (ASCII 027)! So by using the PROMPT command, ANSI commands can be entered fairly easily.

There are other ways to enter ANSI commands than through the PROMPT command. PC Magazine produced ESC.COM and ONCL.COM to provide an escape sequence that are easier and more practical to use, especially in Batch files.

Using EDLIN, the sequence "Ctrl-V[" creates the ESC character. Note that the left bracket is part of EDLIN's requirement to form the ESC character and that another left bracket must by entered for the ANSI command. Thus using EDLIN to send the ANSI command to set the video attribute to yellow on black, the line would be: ECHO Ctrl-V[[1;33;40m where Ctrl-V[is the EDLIN convention for entering the ESC character; the second [is part of the ANSI escape sequence; 1 sets the video attribute to High Intensity (bright/bold); 33 signifies a bright brown foreground (yellow); 40 signifies a black background; and m is the ANSI function code for setting screen attributes.

Granted, ANSI.SYS is limited in what can be done. There are other programs available such as NANSI.SYS, ZANSI.SYS, and FANSI-CONSOLE that can be found in shareware catalogs and on BBSs that are a big improvement over ANSI.SYS. Then too, there are the commercial packages such as PROKEY and others that make ANSI seem like a tricycle entered in a race with motorcycles. But, it's free, it's handy right there on your DOS disk, it can put some pizazz in your batch files, and in a small way, let you do things the way you want them done. §

The ANSI.SYS video attributes are as follows:

Attributes	F'ground	Color	B'ground
0 = All off	30	black	40
1 = High intensity	31	red	41
2 = Normal intensity	32	green	42
4 = Underline	33	brown	43
5 = Blink	34	blue	44
7 = Reverse video	35	magenta	45
8 = Invisible	36	cyan	46
9 =	37	white	47

CUSTOM CONFIG.SYS

By Edward Buzza

During the "booting" or loading process that occurs after you turn on the computer, the first thing the computer does is read the disk boot sector and then load the DOS hidden system files. Then a system initialization routine searches the Root directory of the drive from which it was booted for a CONFIG.SYS file. CONFIG.SYS is just an ASCII file that further defines the computer's configuration. If CONFIG.SYS exists, its instructions are carried out. Whether or not there is a CONFIG.SYS file, DOS then loads the command processor (COMMAND.COM), loads and executes AUTOEXEC.BAT (if it exists) and waits for your commands.

But there will be times when you want the computer configured differently. Some people keep two or three different versions of CONFIG.SYS and of AUTOEXEC.BAT on the boot disk and will copy the one they want as the active file and then do a reboot. For example: CONFIG.NON - No RAM drive in expanded memory; CONFIG.512 - 512K RAM drive in expanded memory; CONFIG.SYS - a copy of .NON or .512 above

You can reduce the clutter in the root directory by booting from a floppy containing a customized CONFIG.SYS file. Just create a few Boot disks with the appropriate CONFIG.SYS (and/or AUTOEXEC.BAT) files on them. This technique is really handy in loading TSRs (Terminate & Stay Resident programs - like "Sidekick") or device drivers only as needed. Mark the disks as to what they are and boot with them on startup or when rebooting.

Hint: If ANSI.SYS is loaded, change the PROMPT command to reflect the current CONFIG.SYS. The prompt could be in reverse video or show an identifying string. e.g. PROMPT $e[7m$pge[m - Drive & dir in reverse video; PROMPT Rpg - R then drive & dir, normal video.

Just remember where you have the PROMPT command - CONFIG.SYS or in AUTOEXEC.BAT. §

CUSTOMIZED PROMPT

By Edward Buzza

The PROMPT command is a fun thing to work with. All of us are familiar with the standard "PROMPT" command (A> or C>) and a lot of us are familiar with "PROMPT pg" which will show the current drive and directory and the > symbol. But there is a whole lot more that can be done with the PROMPT command if you have ANSI.SYS loaded in your machine. To do this, add the following line to your CONFIG.SYS file: DEVICE=ANSI.SYS If it's in the DOS directory on the hard drive, then the line should be: DEVICE=C:\DOS\ANSI.SYS

You can put any string of characters you want in the PROMPT command. For instance, entering "prompt Yes, Master?" (don't enter the quote marks), will show just the phrase "Yes, Master?". If you were to enter "prompt pg Yes, Master" you would see the current drive and directory as well as the message at the prompt line. Try it, it works. Just be sure that you NEVER use the < or the > or the | symbols. Never! DOS always looks for these symbols for redirection of data or piping through filter programs.

If you have a color adaptor board, you can customize the color of your DOS screen. Entering "prompt $e[1;32;40m$p$g" (again, don't enter the quote marks) will show the prompt in bright (1) green (32) color against a black (40) background as the new video mode (m). Now do a CLS and see the new video mode. To get back to normal, just enter "prompt e[mpg". §

What is YOUR Most Valuable PC Tool?

By Steve Spears

For those of you who have already written for this newsletter, (Thanks!), I probably do not need to tell you that the most difficult portion of the task is getting the durn thing started! This month, I have started about 4 different articles and found each of them unsatisfactory for this month's newsletter. The reasoning varies, but essentially I just didn't feel comfortable with the direction that the article was leading. If you have never written, (Why Not!), then you may not realize that the words take a life of their own and lead you to areas that you had no intention of exploring at the current moment.

Anyhow, while stewing over this writer's block and feeling harried by Robin's deadline, I was running through the ideas that I had already written down and suddenly realized that I was looking at the answer on my screen. Everybody has tricks of the trade and tools that he uses consistently and by dint of that constant use has become expert at. So this article will be about my favorite PC tool, ie one that I have found to be the best or most usable, BY ME, in its catagory. In essence, this will be a long-term use report, just like those done by the car magazines on test vehicles that they have used for a year or more.

The standout program in my bag of tricks is one that I have already demonstrated to the user group, Borland's Sidekick Plus! I have been using it for well over a year now and have found it to be very usable in areas, somewhat usable in others and a dud in a couple of others. Along the way, I will present a couple of other programs that fill in for those bad areas and I will talk about how I would like Borland to improve this beast when and if it does!

I use SK+ constantly and consistently in both my working machine at GTE where it imposes a considerable RAM cram on the 3COM network and also on my home machine where the combination of a 386, 2 Meg RAM and an 18ms Hard Disk make it a real pussycat. On the machine at work, where 3COM leaves only about 420K, loading SK+ uses 72K to leave a mere 346K of RAM to work in. While this is NOT a desirable state of affairs, I can and have been living with it because I have gotten such good use out of SK+ in performing my job. On the home machine the 72K of RAM that SK+ uses is hardly noticable and I can easily run other programs in the 480K of RAM that is left in the Conventional 640K RAM standard.

SK+ consists of 7 operations; File Manager, Notepad, Outlook (Out-liner), Time Planner, Phonebook (Communications), Calculator and ASCII Table. In addition, there is a scratchpad area that serves as a transfer spot for copying/moving data between applications and SK+. As I said before, not all of SK+ is equal in usability, although I am sure that a lot depends upon the needs and desires of the user. In my normal day of work, I am mostly called upon to make notes, write reports, to attend meetings and to send status messages. Consequently, I have become very dependent on SK+'s Notepad, Outliner, Phonebook and Time Planner functions. Other people, using SK+ for different activities, could easily have different impressions and ratings for SK+'s operations.

Taking in order SK+'s menu of operations, the File Manager operation is SK+'s ability to perform file manipulations. Certain of its functions can be VERY Handy, such as being able to format from this TSR without losing the data or program currently active. I know several times where that has saved a hapless Lotus user from a fate worse than death! Overall, however this section suffers from a poor user interface and single file orientation that complicates multiple file manipulation. I would give this section a grade of B. When I need to really work with files, I pop-up PCTools' PCShell which I regard as the new top dog in this area.

The Notepad and Outlook (Out-Line) sections are where this program really starts to shine. Each of these has the ability to have 9 windows active at any given time (along with a window for each of the other five operations as well)! These 2 operations work on the old Word Star command structure which has become the equivalent of the 'lingua franca' for the computer world, ie. so many people know it as a second language/key stroke operation. In each you can import and export text and transfer smaller portions between by using the scratchpad. I have used these operations to prepare status reports from already prepared boilerplate, to write dBASE-type programs and most of my initial word-processing. Where necessary, I will then take these straight ASCII test files and import them into Word Perfect for spell-checking and to accommodate sizes larger than SK+'s 90K file limit. While I

Continued Page 5

Tools Continued

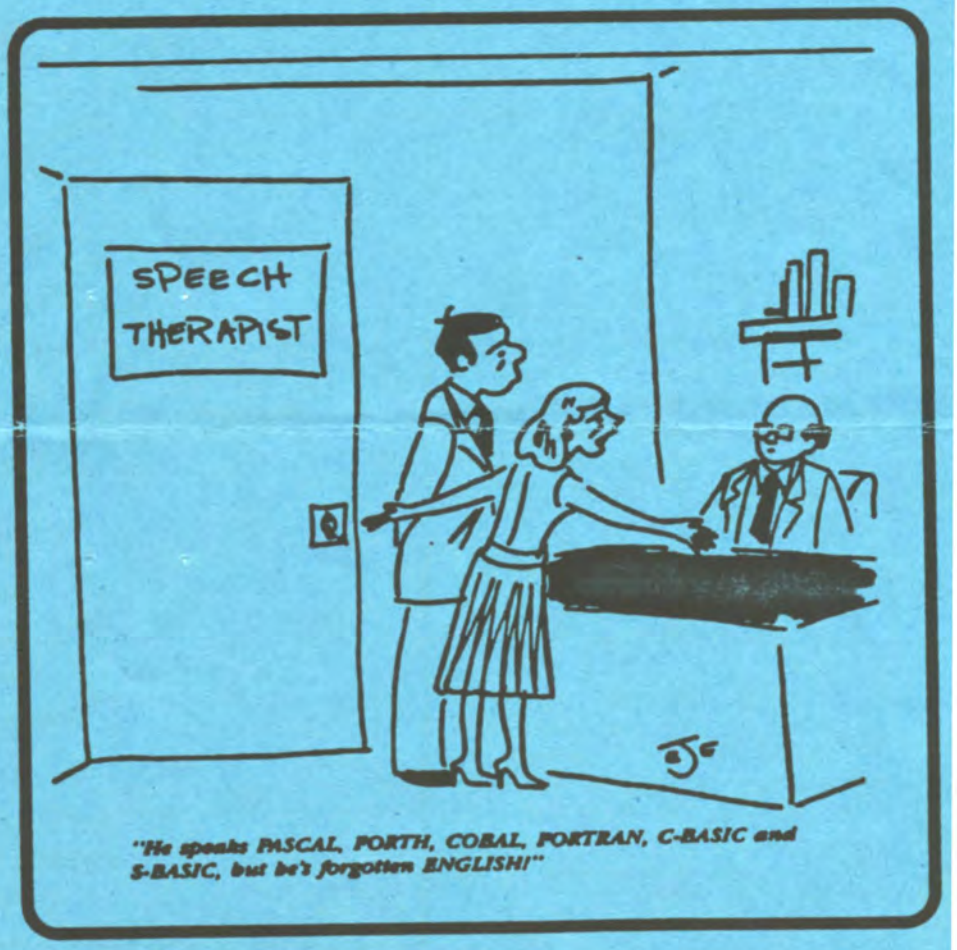
would dearly love to have a spell-checker in SK+ and a macro control language for the entire SK+ program, I willingly give this area an A.

The Phonebook is supposed to give you full background communications with script/command language control. Since one of my machines does not have any modem and on the other I have the superior ProComm Plus software, I use this section mainly as an individual database containing information on the various people I know and work with on a consistent basis. For this function I give the Phonebook a B.

The Timeplanner is a real dreamboat. It has the ability to show a day planner/appointment book, a calendar matrix and a schedule planner showing blocked times. I use this operation to schedule appointments with an alarm, keep track of my spending and exercise and to maintain my working logbook. The ability to copy appointments and to schedule repeats on a daily, weekly, monthly (by date or by day of week), and annually make this almost perfect. I do want a to-do scheduler added and a better set of activity markers for the display, but overall this gets an A!

The Calculator section is a disappointment. I have found its interface to be clumsy and non-intuitive. While it boasts of its ability to operate as 4 different types of calculators, Business, Scientific, Programmer and Formula, the display stays the same and can be very confusing. After several attempts, I have either used my own trusty Hewlett-Packard calculator, or I have gone to use the WordPerfect Library's Calculator or PCTools' version. Consequently I grade this one as a C.

What can one say about the ASCII Table. You either use it and know what it does or you don't and don't care. All that I can tell you is that it is the easiest way I know of to put the 'special' characters on the display and onto a written document that I know of. All you have to do is to pick and choose what you want and it will be dropped where you want it in your ASCII Text file. If something does what you want it to do and does it with no fuss or bother, how else is there to grade it but with an A?



OK, now you have it, this is my favorite PC Tool, warts and all! If you disagree with my choices or comments, I invite you to write your own article about your favorite! I am sure that the newsletter editor will be happy to make the space available! §

NEW MEMBERS

Please welcome the User Groups oldest new member:

Eduardo Ramos

Eduardo has been a memeber since January 1989 but due to an oversite he's never made the "New Members Column". Eduardo now has the dubious honor of being our "Oldest New Member".

"He speaks PASCAL, FORTH, COBAL, FORTRAN, C-BASIC and S-BASIC, but he's forgotten ENGLISH!"

SEPTEMBER MINUTES

By Russ Merritt

Egghead Software couldn't make it and has been rescheduled for November. Lotus is scheduled for October.

Harvey lead a discussion of current events in our PC world.

(For those who heard my dissertation on the secretarial duties, this translates into "Harvey talked.")

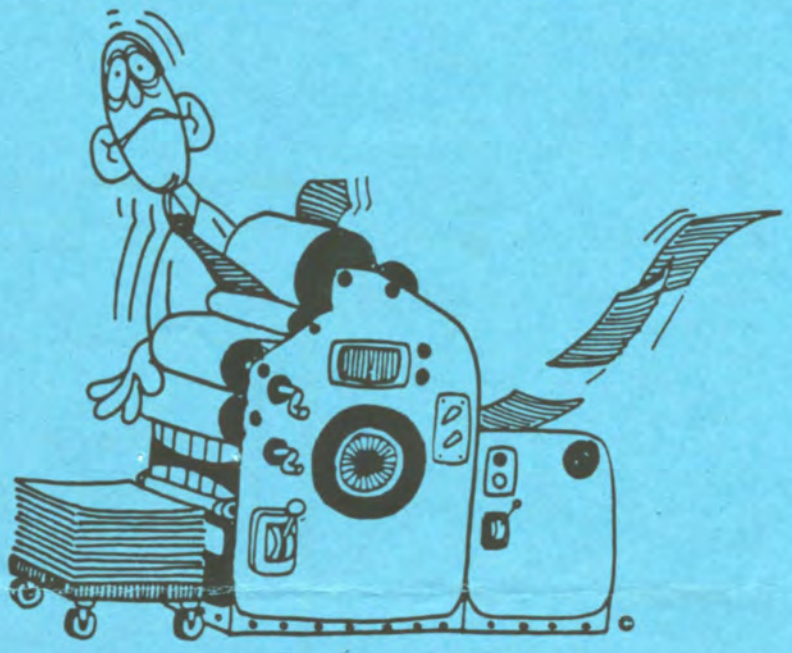
ANNOUNCEMENT: A new PC store has opened in Tampa:

COMPUADD
1707 E. Fowler Ave.
Tampa, FL 33612
(813)971-904

Several of our members have had very good experiences with their mail order operation. Copies of their catalog were distributed. It was noted that the in house prices were the same as in the catalog.

NOMINATION OF BOARD MEMBERS - Our annual ritual to fill membership in our Board has begun. please don't wait to be nominated. VOLUNTEER! (BAD WORD)

This club - ANY club - depends upon (1) membership attendance and (2) volunteer leadership to prosper and grow. Most of us make it through phase (1) and a few make that extra commitment to phase (2). This year we need a few more 2's.



Your immediate past librarian and current secretary will not be present at club meetings next year. The current Librarian has been on travel status on every meeting night except one since he volunteered and he may not be available next year. Our current newsletter editor has been put on travel status and is no longer available.

As to experience - I undertook the library responsibility with slightly more than one year's experience on a PC. I saw the library as an opportunity to learn, and it was. If you know something about Desk Top publishing and want to get some hands on experience, then the Newsletter Editor's job is for your. If you are currently strapped for time, then the Secretary or Member-at-Large may fit your bill.

Talk to any of the officers about the time commitment that my be required of any office. It may surprise you to find how little you have to give to take the second step in this club's success.

The following is the status of nominations as of the September meeting:

President - Harvey Bruneau
Vice-President - Steve Spears
Secretary - OPEN

VIRTUAL DISK

By Edward Buzza

You have two floppy disk drives and no hard disk and you're tired of swapping the DOS disk in and out every time you turn around. If you have DOS Ver 3.x, there is a solution. The problem is the way DOS handles COMMAND.COM. The COMMAND.COM file is the heart and soul of DOS. Within COMMAND.COM are the 'internal' DOS commands: DIR, TYPE, VOL, RD, PROMPT, RENAME, COPY, CD, RMDIR, PATH, REN, DATE, CHDIR, BREAK, EXIT, ERASE, TIME, MD, VERIFY, CTTY, DEL, VER, MKDIR, SET, CLS.

The following are also 'internal' DOS commands within COMMAND.COM that are used in BATCH files: NOT, REM, PAUSE, ECHO, ON, GOTO, SHIFT, IF, FOR, OFF, ERRORLEVEL

But DOS does not keep the entire COMMAND.COM in RAM all the time. When DOS runs an application program, only part of COMMAND.COM stays in RAM; the rest, called the "transient portion", is freed for use by anyone. Of course, when the application program ends and DOS takes over again, it needs the whole COMMAND.COM program so it reloads it from the boot disk -- if it's still in the drive. Since it's not, you have to swap disks. And this gets boring in a hurry.

One solution is to set up a virtual disk on your machine. This is nothing more than setting aside a part of RAM to be used as though it were a hard disk. But, you don't know how or are afraid to try. Don't be. It's fairly simple.

Put your DOS disk in drive A and format a system disk in drive B. Now copy the following files from the DOS disk in drive A to the drive B disk: ANSI.SYS, DISKCOPY.COM, EDLIN.COM, FIND.EXE, FORMAT.COM, MORE.COM, SORT.EXE, and VDISK.SYS. And let's call the disk in the B drive the "RAM Boot Disk." The addition of these files will let you do quite a bit without the DOS disk in the A drive.

Next, using your favorite

ASCII word processor or EDLIN, create a CONFIG.SYS file on the RAM Boot Disk with at least the following lines:

```
DEVICE=VDISK.SYS 70
DEVICE=ANSI.SYS
FILES=20
BUFFERS=20
```

The number 70 on the first line tells DOS to set aside 70K for the virtual (RAM) disk. Using DOS 3.2 file sizes, this is enough to hold the files we're going to put there. If you have a different version of DOS, you may have to adjust this figure. But remember that whatever amount of RAM you set aside for a Virtual Disk will reduce the amount of memory left for application programs.

On the RAM Boot Disk, create an AUTOEXEC.BAT file with at least the following lines:

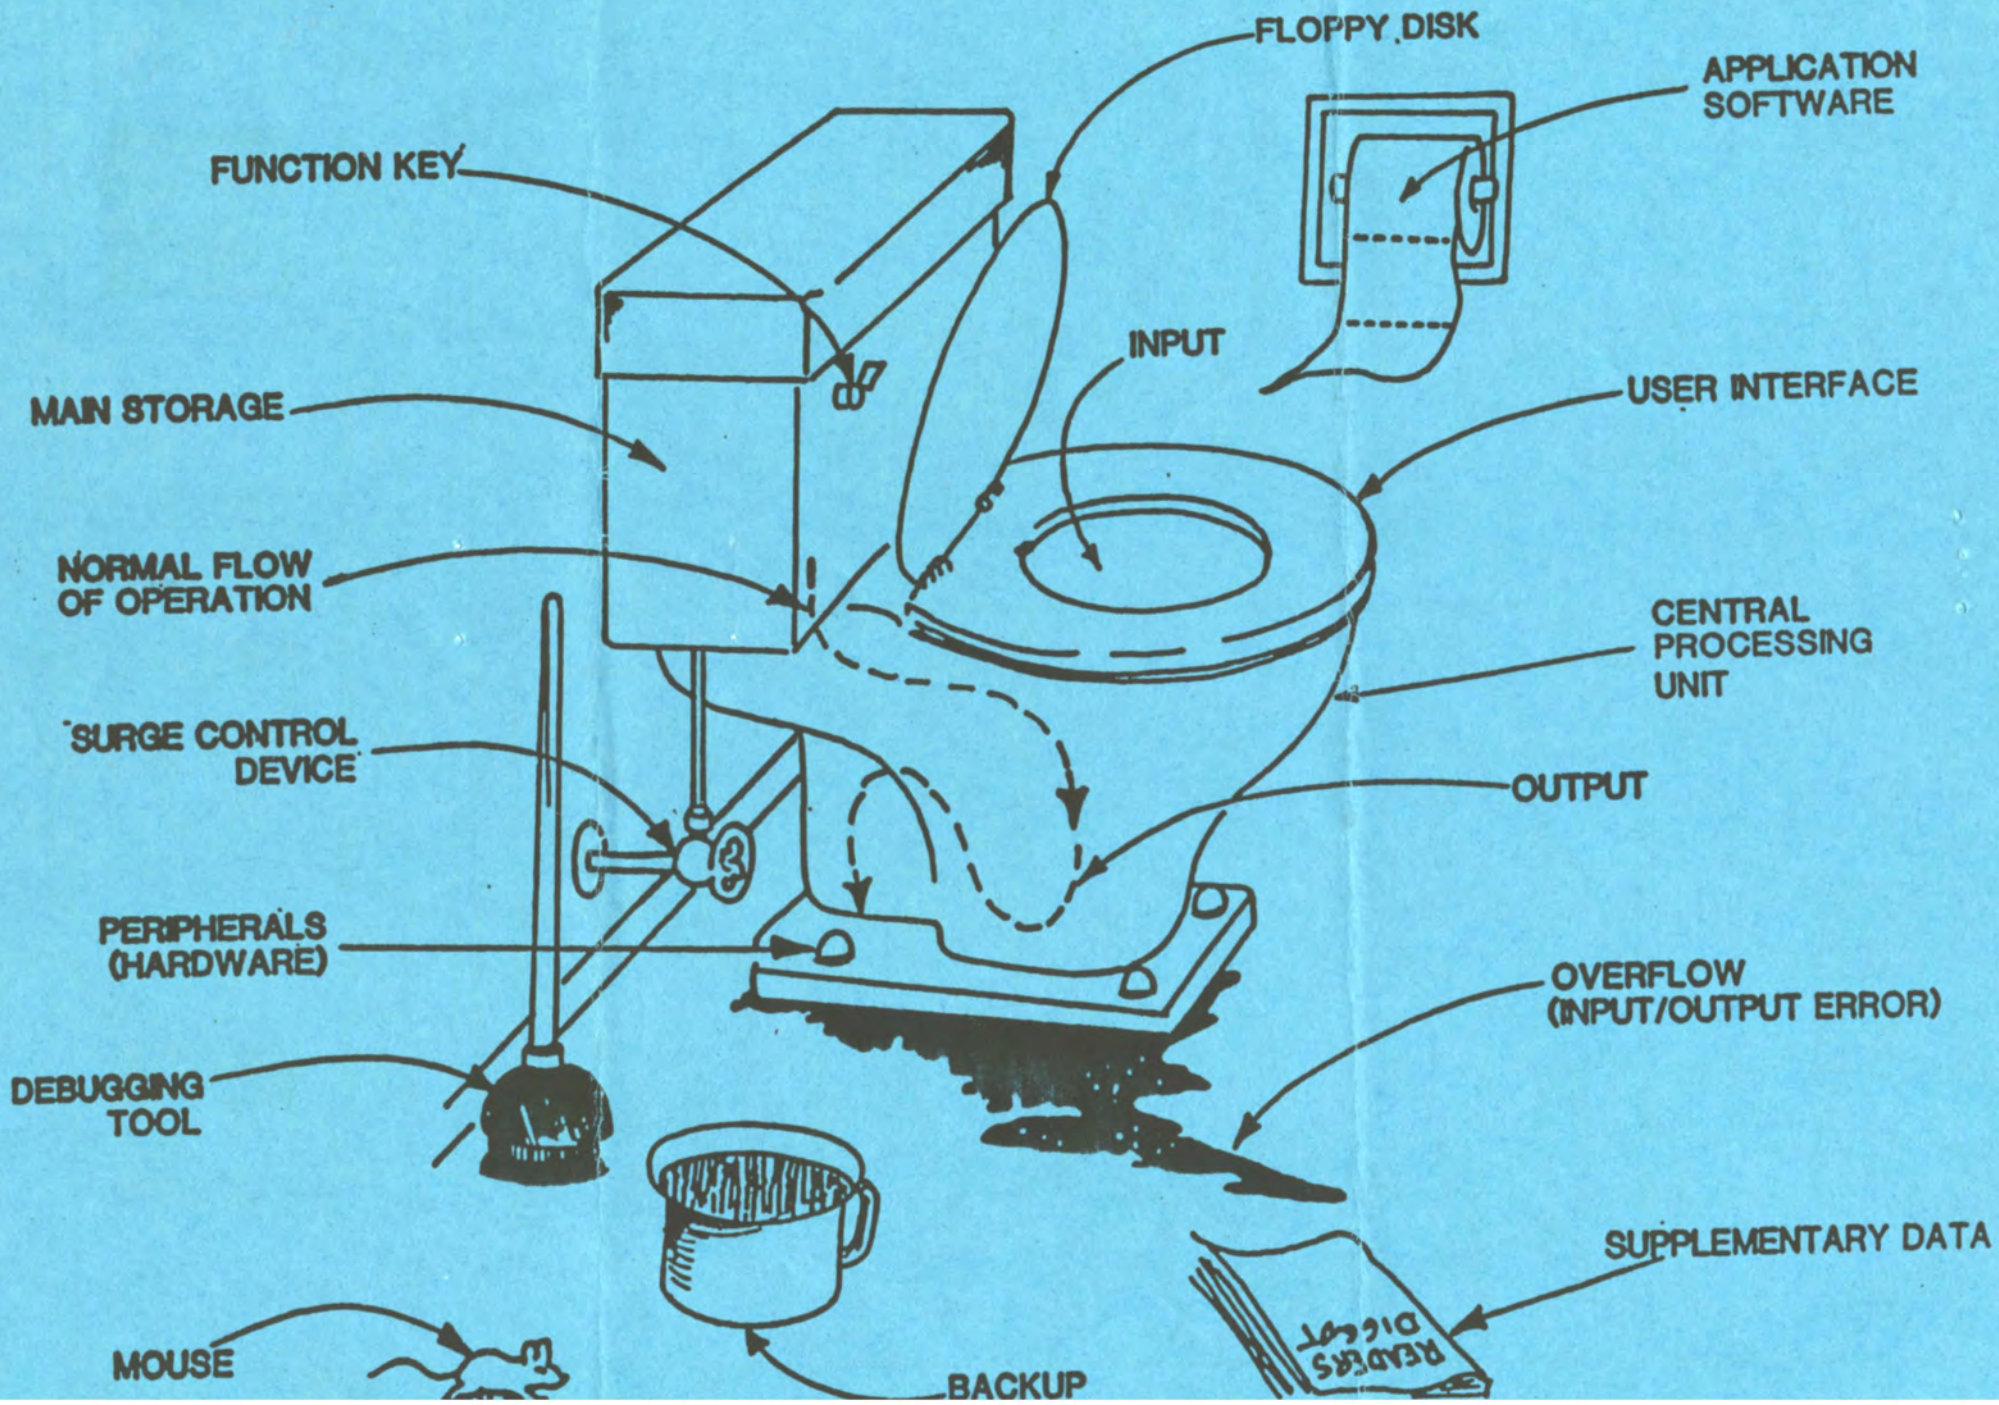
```
C:
CD \
COPY A:*.COM
COPY A:*.EXE
SET COMSPEC=C:\COMMAND.COM
PATH=C:\;A:\
PROMPT V$P$G
```

This Batch file will copy COMMAND.COM, and the other needed files, to the RAM drive (C:) and tell DOS to look for COMMAND.COM on the C drive. That is accomplished by the SET command. When the RAM drive is created, DOS will assign the next drive letter to that drive. Since you have two floppy drives (A: and B:), DOS will use C: to mean the RAM drive.

Also the PATH command tells DOS to look in the root directories of both the A and the C drive for any commands entered by you at the DOS command line. The PROMPT command will cause the letter V (as a reminder that you have a Virtual Disk) and the drive and directory to be shown at the prompt line. e.g. VC:\> or VA:\>

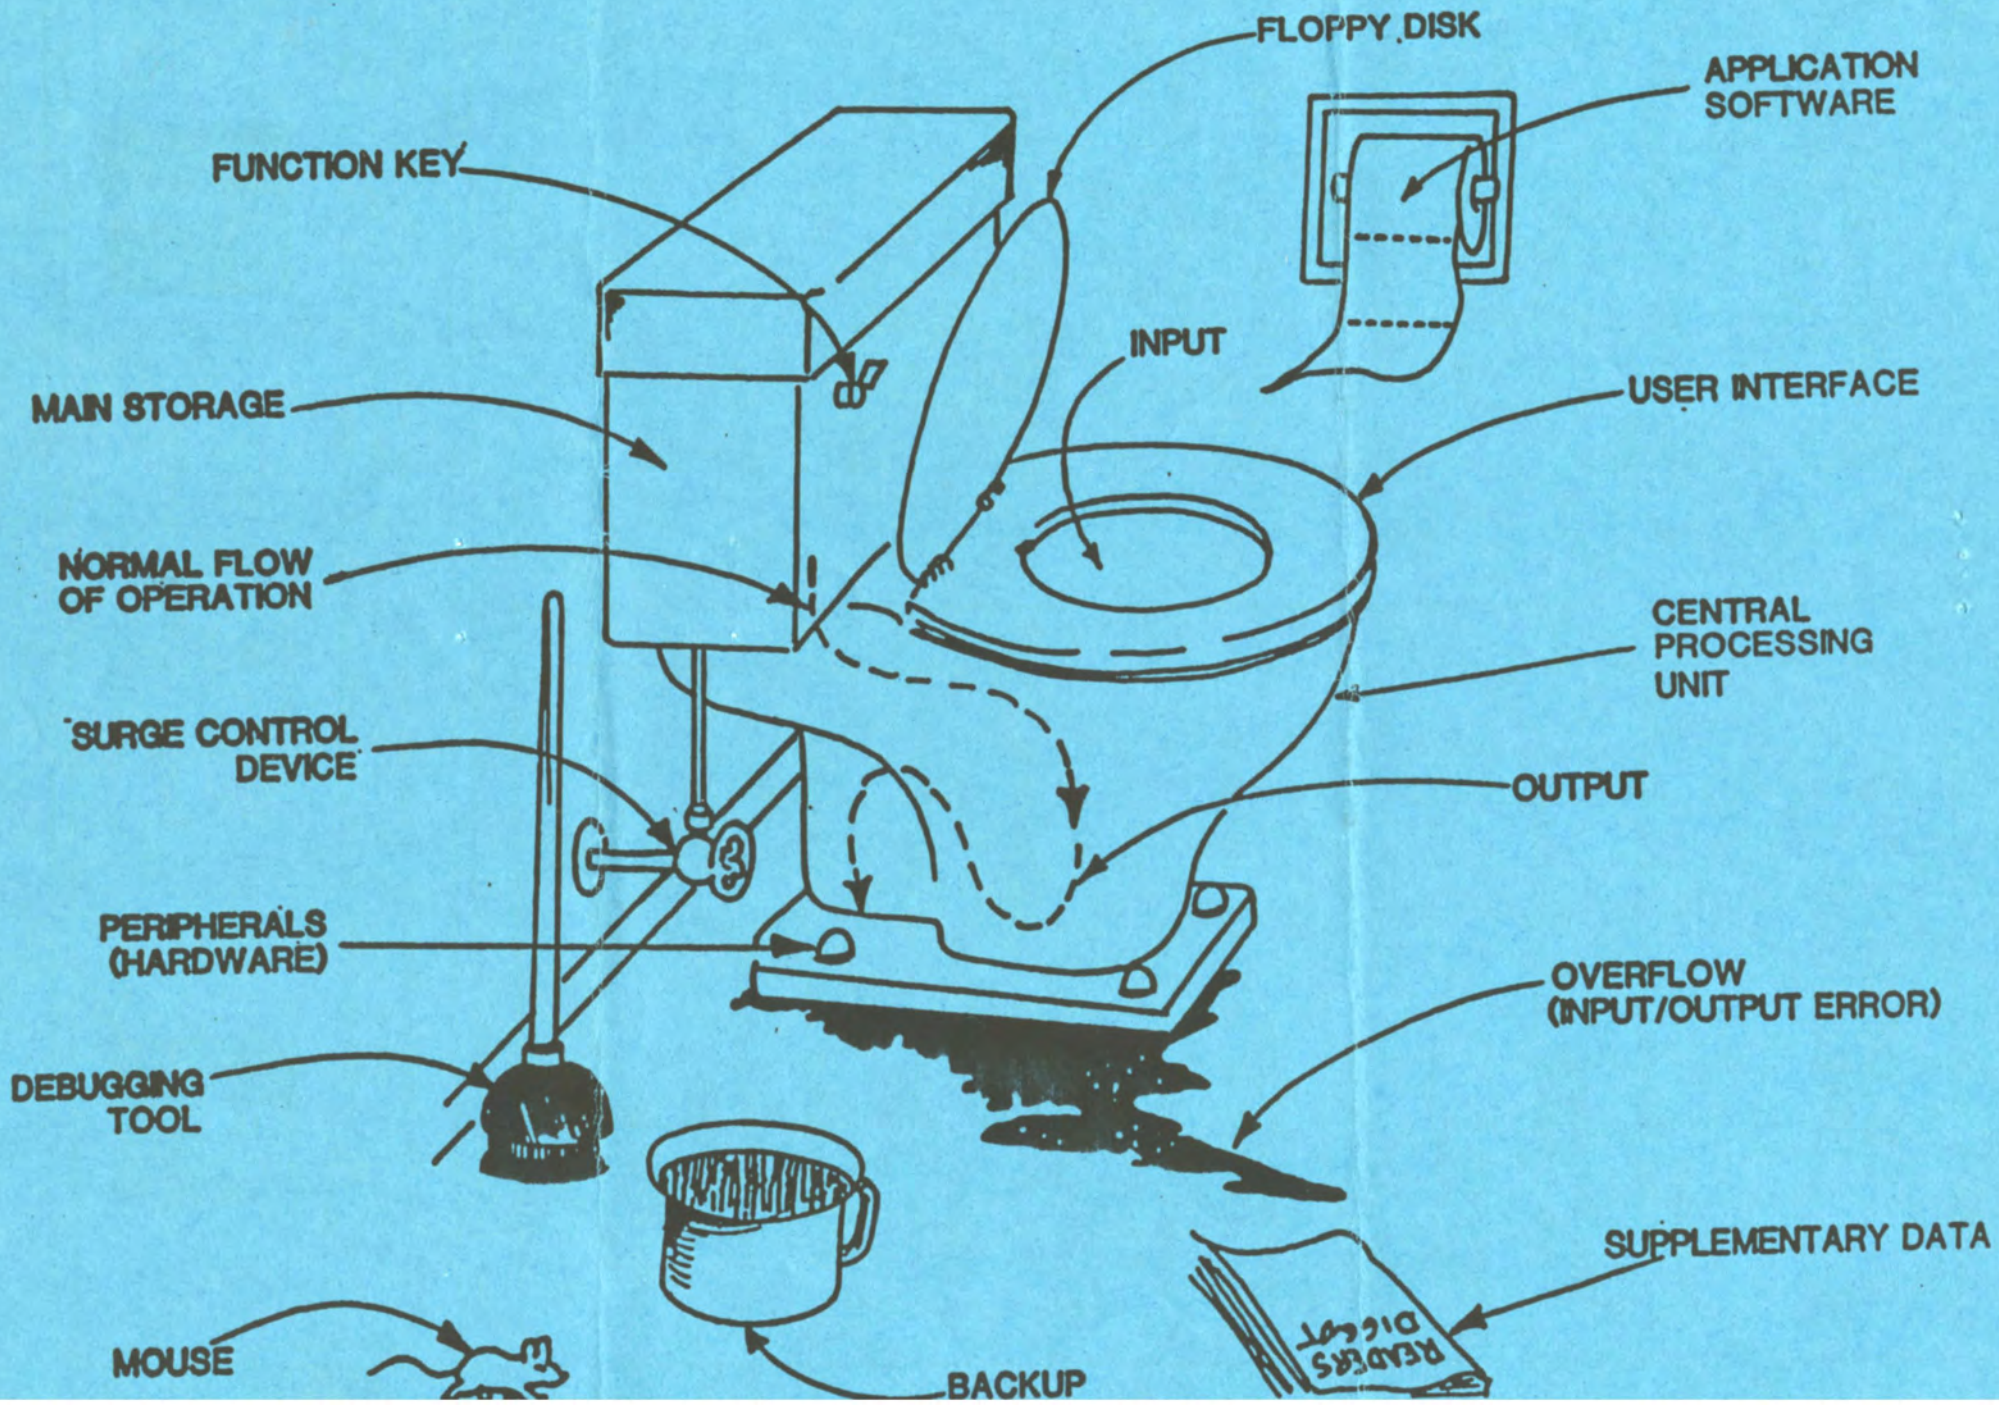
That's it. Now use the RAM Boot Disk in drive A: in place of the DOS disk when you turn on your PC or do a reboot and you're in business. Of course, if you use any other 'external' DOS command, you'll have to insert the DOS disk as before. A word of caution: if you turn off the PC or do a Ctrl-Alt-Del, the contents of RAM, AND THE VIRTUAL DISK, are gone. So be sure that the RAM Boot Disk is in drive A when you start or reboot the computer.

Note: If you do have a hard drive, it will be assigned as C: whether or not you have two floppy drives! So if you have a hard drive, DOS will use D: to mean the RAM disk. One last note: if you don't need FIND.EXE, the shareware LIST.COM would be an ideal replacement or you can bump up the size of the VDISK.SYS parameter to accomodate it. §



LOTUS QUESTION

? By Russ Merritt ?



I am currently comparing year to date fiscal data for 10 different items monthly. The data is selected by formula to appear in a report. The current year formula works fine since it always is from the same cell, the current year to date total. However, last year's data requires the formulas in the report be changed monthly to correctly select the comparative month to date total. How can I find a formula for last year's figures that will not require a change in the monthly report?

Backing It Up
By Steven E. Spears

In light of the recent scare with the 'Columbus Day' / 'Friday the 13th' Virus and the potential danger that we all face from Hard Disks wearing out, I have an obvious question for my readers here, 'When was the last time that you FULLY backed up your Hard Disk'? If the answer was within the past year, you are among the minority of PC users. If it was within the past month, you are within the very small number of smart PC Users. Of course, if I asked when was the last time you backed up your Hard Disk prior to that, then that answer might put you back in the great majority who have no regular backup provision for their machines.

When asking why they have no regular scheme for backup, the most logical answer is that the process is too time-consuming and laborious with the standard equipment that is easily available at hand. Also, Hard Disks have become increasingly reliable with longer times between failures. With the advent of such programs as Steve Gibson's SPINRITE that helps to refurbish Hard Disks by restoring the magnetic track that gradually dissipates over time, many of us have not experienced a total Hard Disk Failure. However, so long as we use mechanically based devices such as Hard Disks, they will eventually fail, and the longer that we use them, then the more data will be lost and the more disastrous the failure will be!

A worthwhile habit to insure the longest possible life for your Hard Disk is to leave the PC Box on, even when you are not using it (Except for Thunderstorm season). If you can avoid frequent on-off cycles, the hardware will last much longer since the great killer of Hard Disks is bearing wear and read/write head crashes, both of which most frequently occur when the disk starts and stops spinning.

When Hard Disks were a mere(?) 10 Meg in size, it was relatively easy to backup the data onto floppy disks in the course of an hour of swapping and labeling the disks produced from the DOS BACKUP Operation. If you were real lucky, you might find some use for them later when you discovered that the RESTORE part was generally less than usable. This entire area became a lucrative field for 3rd party software such as FASTBACK and BACKIT who made the backup and restore much easier and even (gasp) user-friendly. However, the problem remained that the operation itself was time consuming and irritating to perform.

The availability of High-Density disks that could hold 4 times the data of the old DS-DD disk format helped this situation so long as the software could recognize the new format and so long as the Hard Disk was still of a manageable size. However, many of us have gotten used to using 32 Meg Hard Disks and even to having multiple Hard Disks Volumes as well. With the more data to back up, that means more disks to dedicate to that task and the longer one needs to sit and feed the monster.

OK, now we are at a point where we recognize the need for auxiliary equipment to perform the required backup. There are four ways to perform backups that are currently available. First is to backup to a different Hard Disk. This gives you an advantage of having ready access to your backup and the ability to continue normal operations even when your 1st Hard Disks goes bye-bye. The disadvantage is that unless this second Hard Disk is in a separate enclosure, it is sharing the same conditions that effect the first Hard Disk. Thus an electrical surge or an earthquake type jar would probably render both Disks useless at the same time.
(40 Meg Internal without Controller = $359 / $8.98 per Meg.)

The second way is to use an auxiliary Hard Disk type of mechanism like the Bernoulli Box. This is a high-Capacity Storage device that is usable as a Disk Device while also being removable for storage and security. It works for its purpose but has limited storage capacity (10 to 44 Meg) and requires the use of a manufacturer-specified storage medium (44 Meg Cartridge $84). It is also

Software Review CO.COM
By Edward Buzza

This program, written by Michael Mefford, is available on the PC MAGAZINE Utility Disk. It copies, moves, and deletes files individually or in tagged groups from directory listings that can be sorted by name, extension, size, or date. The directory that it displays also shows ALL the file attributes (hidden, system, archive, and read-only).

The "tagging" facility makes it very convenient to split or move files to another disk or disks as well as to another directory or directories. Arrow keys are used to navigate through the directory and the plus (+) key is used to tag files. The tagged files are indicated with a plus sign (+) and after being copied or moved, the indication is changed to an asterisk (*). The move function first copies the file and, if the copy is successful, then the original file is deleted. Function keys are used to initiate the various actions and 'deletes' must be verified. I think this program is one of the safest ways to delete files.

There are other programs that will do what CO.COM does (and a lot more, like PC TOOLS, NORTON, MAGELLAN, etc.), but CO.COM is used at the DOS command line; you don't have to crank up a big program just to move or delete a few files. §

*O*utput *N*umbers on the *C*ommand *L*ine
By Edward Buzza

ONCL.COM

ONCL.COM is an acronym for "Output Numbers on the Command Line." and was written by Philip Erdelsky. It is available on the PC Magazine Utility Disk. The program sends control codes, indeed any data, to the printer, screen, or to a file. Just type ONCL followed by the decimal values for the desired characters. The program will send the characters to the standard output device (the screen) from which they can be redirected to a file, an output device (e.g. a printer), or to another program.

Printer Example: ESC M is the control code for Elite pitch on an Epson compatible printer. The decimal values for these codes are: ESC=27, M=77; so the command "ONCL 27 77 > PRN" will set the printer to Elite pitch (don't enter the quote marks). Entering the command "ONCL 27 12 > PRN" will cause a form feed. No more turning the printer off-line, form feed, and then forgetting to turn the printer back on!

File Example: Entering the command "ONCL 13 > A:CR.DAT" will create the file CR.DAT on the A: drive and the only thing in that file will be a carriage return character because the decimal value 13 IS a carriage return.

Screen Example: To generate an ANSI escape sequence, with ANSI.SYS loaded, consider the following ONCL and ANSI lines:

```
    ONCL 27 91 51 55 59 52 52 109
'ONCL command
        ESC [ 3 7 ; 4 4 m        'ANSI escape sequence
```

Either command will set the screen to blue text on a white background - but we all know the problem

of trying to enter the ESC character on the DOS command line! To actually set the screen you need to do a CLS; or enter "ONCL 27 91 74" which is the decimal value of "ESC [J" - the ANSI equivalent of CLS.

MORE ABOUT HARD DISKS

By Vern Semrad

For the members who were at the November meeting, this will be a repeat, since I had written this for the November newsletter. I will add a couple things at the end to REFRESH the article. Which leads me into the main topic of the article.

A few meetings ago, Steve Spears demonstrated a program called SPINRITE from Gibson Research. This is a dynamite program and should be considered by EVERYone who has a hard disk. (And who doesn't nowadays?)

One of the features Steve touched on rather lightly was the the REFRESH option. Essentially, Steve said that unused portions of a hard disk tend to lose their capability to read and write data. This was news to me. I had never heard that before.

I recently had an opportunity to witness the validity of that statement firsthand.

I bought a hard disk that had been discarded due to what was perceived to be a disk failure. So, I knew going in that the disk had numerous bad sectors. Before I bought it, I had run MACE UTILITIES Remedy function and determined that the disk was virtually unusable. I offered the previous user a garage sale price for the disk, and he took it. Since I knew the disk was ridden with defects, I let it sit on the shelf for several months.

I finally decided to try it in one of my computers, since I was constantly running out of space on the one drive I had.

I installed it and began running the MACE Remedy function on the drive. I have both MACE 4.2 and MACE 5.0 (MACE GOLD), so, I kept alternating between the two versions. One checks the disk sector by sector, and the other checks the disk file by file. After about a month of doing this, MACE had declared that this disk was truly unusable. It had locked out so many clusters (Head & Cylinder) that nothing (I have other disk diagnostic software) would even work on the drive anymore.

At this point I was ready to give up and throw the drive in the trash. Then I remembered about the Refresh function of SPINRITE. The previous user had never used more that about one-third of the space on the drive. The drive was about two and one-half years old when I bought it. This means that 2/3 of the clusters and sectors had never been used, that is, they had never been written to or read from. Since I don't own SPINRITE (yet), the only way I had to write something to EVERY sector on the disk was to low-level FORMAT the disk. For those of you who are just beginning to use a hard disk, BEWARE!!!, there is NO recovery from a low-level format. I repeat, there is NO RECOVERY from a low-level format.

Since I had nothing to lose, I spent the better part of a weekend performing low-level formats of this disk. I low-level formatted this disk about 20 times using both low-level formatting software and the DOS built-in low- level formatting feature called "g=C800:5".

The end result was a fully functional hard disk (at least temporarily). The first few times I ran MACE on this disk, I got absolutely NO errors, meaning NO bad clusters or sectors. I then started using the drive as if it were a perfectly good drive, but knowing that it was once was unusable. I only put data on this drive that I can AFFORD to lose (RBBS download files that I am going to put somewhere else anyway).

As I continue to use this drive, I occasionally lose data, but, since I know when I write something to this disk, it must NOT be something crucial to my operations, I only write data to this drive that either is NOT crucial or can be recovered from some source such as a floppy.

Now, back to the point of this article. Steve said all areas of a hard drive need to be used. I now believe this, (not that I didn't believe Steve) because I have seen the actual results of not using areas of a hard disk. The Refresh function of SPINRITE simply writes something to every sector of the disk and then probably discards it, but the entire disk has been used. The moral of the story is, "Use it or Lose it".

CAUTION ! ! ! ! ! !

Remember what I said about low-level formatting. There is NO RECOVERY from a low-level format. ! ! ! !

SoftLogic Solutions (who publishes Disk Optimizer) has just announced a new release of Disk Optimizer that has a refresh function built in. If Disk Optimizer is your Un-fragmenting software, you can upgrade for $7.00 and get a REFRESHER. I have it on order. If it works, I will report it at the meeting. §

VIRUS

BY RUSS MERRITT

The problem of virus detection was discussed at our October meeting. IBM has a shareware program for $35 that they have made available to their customers. It checks all files for known signatures of existing viruses. The normal conditions of sale also include not allowing the program to appear on bulletin boards, a caution that this program can also become infected if not kept in a write protect mode. The ban against Bulletin Boards is also to try and prevent someone from adding their virus to this program. As of this time the program rights cannot be bought by a PC Club. §

FORMATX.BAT & XFORMAT.BAT

By Russ Merritt

THIS BATCH FILE WAS WRITTEN TO FORMAT MULTIPLE FLOPPIES USING DRIVES A AND B ALTERNATELY WITHOUT KEYBOARD INPUT. THE RETURN.BAT FILE CALLED IN FORMATX.BAT CONTAINS A CARRIAGE RETURN (013) ON ONE LINE AND "N" AND ANOTHER CARRIAGE RETURN ON THE SECOND LINE. THIS MEETS THE REQUIREMENTS OF DOS 3.3 WHICH ASKS YOU TO ENTER WHEN THE DISK IS IN THE DRIVE AND ASKS FOR (Y) OR (N) AT THE END OF THE FORMAT COMMAND.

CONTROL-BREAK WILL STOP PROGRAM, BUT IF YOU DO THIS WHILE A DISK IS BEING FORMATTED, THE DISK WILL NOT BE USABLE. BETTER TO OPEN THE DRIVE DOOR WHEN THE FORMAT IS FINISHED FOR THE LAST DRIVE, THEN DO CONTROL-BREAK WHILE THE PROGRAM IS HUNTING BETWEEN DRIVES A AND B.

THE FORMAT WILL START IMMEDIATELY SO HAVE A DISK ALREADY IN A: BEFORE INITIATING THIS BATCH JOB. IF YOU WANT SOME TIME TO INSERT DISKS, PUT A PAUSE COMMAND BEFORE EACH FORMAT COMMAND. YOU COULD ALSO PUT IN AN ECHO LINE TO TELL YOU WHICH DRIVE SHOULD RECEIVE THE FLOPPY.

NOTE: IF YOU USE THE TYPE COMMAND ON RETURN.BAT ALL YOU WILL SEE IS THE "N".

XFORMAT.BAT IS ALSO INCLUDED FOR THOSE DOS VERSIONS WHICH ONLY REQUIRE "STRIKE ANY KEY" AND BY CALLING ITSELF, THE REQUIREMENTS TO CONTINUE FORMATTING ON THE NEXT DRIVE ARE MET.

FORMATX.BAT READS AS FOLLOWS:

```
LOOP
FORMAT A:<RETURN.BAT
FORMAT B:<RETURN.BAT
GOTO LOOP
```

(see 1st paragraph for contents of RETURN.BAT)

XFORMAT.BAT READS AS FOLLOWS:

```
LOOP
FORMAT A:<XFORMAT.BAT
FORMAT B:<XFORMAT.BAT
GOTO LOOP
```

EXCEPT FOR THE TEXT PRINTOUT OF THE TWO BATCH FILES, THIS IS THE DOCUMENTATION INCLUDED IN FORMATX.ZIP RECENTLY UPLOADED TO BITS OF BLUE. §

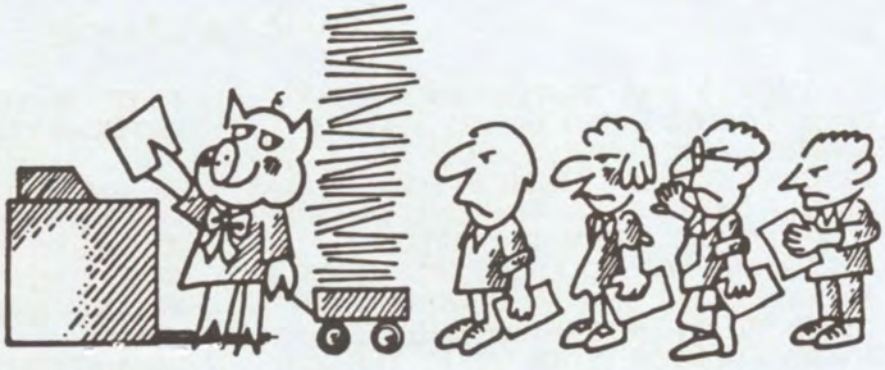
NOVEMBER MINUTES

By Russ Merritt

Harvey presented news on the more recent events in our PC environment.

The major presentation was by EGGHEAD SOFTWARE. They demonstrated a number of games currently being offered. Among those shown was SimCity, Flight Simulator, Leisure Suit Larry IV, a new NBA Basketball offering -- there were more. Hope you were there to enjoy them. Also demonstrated by EGGHEAD Software was the new "SCANMAN PLUS" hand held scanner. The Scanman did an excellent job of scanning in images. Software provided with Scanman Plus allows you to edit and modify images you've scaned in. Scanman Plus runs for approx $200 - $250. Some GREAT ideas for Christmas.

As announced at the last meeting, Russ offered for .sale 5 1/4 diskette boxes (will hold 3) for $1. These had been donated by Bill Fuller. These will be offered at each meeting until they are gone (current inventory - 35).



No new nominations were made from the floor for board members. Elections are scheduled for the December Meeting. Also dues for the 1990 calendar year are payable now. §

REMINDERS

* This month we WILL be holding elections for 1990 Officer Positions.

* It's that time of year again...time to break-out the old check book and write that $20.00 check to the TAMPA IBM PC USERS GROUP for your annual dues. Please send your check with the application at the back of the newsletter (be sure to check renewal on the application).

"I'll only be a minute."

When you have to get a big copy job out, you can tie up your office copier for considerably longer than "a minute".
Don't hog-tie your office copier or your staff the next time a big job comes along. Call us instead!

NEW vs. OLD:

By Vern Semrad

The first three program I learned were WordStar 3.3, dBASE II, and Lotus, Rel 1A. I now OWN (at list price and we all know nobody pays list price), about $12,000 worth of software. BUT, I keep ALL previous versions of all the software I own. Here's why.

My first real computer was a 2-floppy drive system with 512K RAM, a portable. I could carry WordStar 3.3 on one floppy, Lotus on one floppy, and dBASE Ii on one flopppy. That meant I could run the application from A: and use B: as my data disk. I now own (to name a few) WordStar 2000 Plus Rel 3.0, (20 diskettes), dBASE IV, Developer's Edition (20 diskettes and no snickers, please), PARADOX 3.0, (15 diskettes), WordPerfect 5.0 (12 diskettes), and many others.

The point is this. I own the latest version of PCTOOLS, MACE, and others. I still carry PCTOOLS ver 4.X in my case of utility programs. Granted, I can't do everything with the old version that I can do with the latest version, but, the old version still does a lot of things I need to do. AND, I can carry the old version around on a 360K floppy, because it takes up only 126K of space on a disk.

In my opinion, the two most powerful Word PUBLISHING (processor) programs are WordPerfect 5.0 and WordStar 2000 Plus. I do ALL of my writing of Batch files, some dBASE programming, and miscellany with a little text editor from PC Magazine called TED. TED stands for Tiny EDitor. TED takes up only 3K wherever it resides.

Back to my original point. Newer and Bigger doesn't always mean better for YOU. Don't discard something because a newer version has come out. Get the new version, because upgrades USUALLY don't cost much, but, keep the old version. §

50/50 Raffle - Joy Jameson
Eatable Goodies - Russ Merritt

Backing it up Cont

one of the most expensive of the backup options. (44 Meg Internal System $1,088 \ $24.73 per Meg.)

The third way of storage/backup is the streaming tape approach. This is very popular right now since you can install the drive unit in the standard half-height drive-bay of a PC and thus not need a separate enclosure or added desk space. The capacity of such a tape system ranges from 20 to 80 Meg per Tape and performs the backup quickly (18 minutes for 40 Meg). However, because it is a tape, it cannot be used for real-time access operations like the first two selections. It is really reserved just for the backup process. (40 Meg Internal $379 / $9.48 per Meg.)

An interesting variation on the Streaming Tape operation is to use a Video Tape Recorder (VTR) to make your data backup. There is one specific brand that I know of that comes from Alpha Micro under the name of VideoTrax which works with IBM Compatible machines. It is noticeably slower than the streaming tape backups, requiring 72 minutes for a 40 Meg backup, but since it does it on a standard VHS or Beta Video Tape, the cost of the system is much reduced. The auxiliary board for the computer costs $300 and can either use a standard home VTR ($200) or a special one from Alpha Micro that has the capability of slaving the VTR to the computer for complete remote control ($600). The maximum capacity of a single standard T-120 VHS Tape is about 200 Meg operating in the Extended Play Mode of the VTR. The single absolute requirement of the VTR is that it have Video In and Video Out RCA Plugs for the board to transmit & receive the data. (200 Meg External $500 / $2.50 per Meg.)

The forth, and most advanced, of the backup options is the WORM Optical backup system. This consists of an Optical Disk with Write Once and Read Mostly (W.O.R.M.) mechanism. What this does is to enable the user to keep all the incremental changes stored as he/she goes along. Since the Optical Disk (similar to a Compact Disk) has so much capacity (up to several Gigabytes), it has the room to have multiple versions of complete files stored permanently on it. These disks also have the advantage of being easily filed and securely locked away like the Bernoulli Disks. The data stored on these disks is far easier to access than tape storage and is far more durable than magnetic disk storage. Their costs are still being set but will probably run in the neighborhood of $1,400 for a 600 Meg WORM, which is the cheapest cost per Meg of storage. Its access speed is between that of floppy and Hard Disks, so it is much faster than the streaming tape backup. (600 Meg $1,399 / $2.33 per Meg.)

Incidentally, the long-term storage system of Steve Job's NeXT Computer is the Multiple Write version of this Optical Disk. It has the technology to erase previously written information on the Optical Disk so that it has all the ability of the magnetic Hard Disk but can store more at only slightly slower speeds. §

MORE ON UTILITIES

By Vern Semrad

This will be primarily for new Microcomputer users. I have a plethora of utility programs without which I feel I cannot function. Most of them are public domain or shareware. I have a disk with about 20 of them that I carry around whenever I am working with a client's computer that has none. I have just discovered two that have been around for some time, but I had never used them. They are both FREE Public Domain programs from PC Magazine. They are DR.COM and RN.COM. As with everything from PC Magazine, they are both small and do a lot.

RN is a utility that will let you create directories, delete directories, REName directories, and some other things. From RN, you can call up DR. DR lets you do some really neat things within a directory. One of the best is the capability to 1.) Sort the files within a directory on any of the four sort fields in a DIR listing, 2.) DELete a file, or 3.) REName a file. The slickest feature of DR is that if you have MANY .TXT or .DOC files in a directory, you can select any ASCII text file and actually read that file on screen. I started using this program in a subdirectory that contained about 100 .DOC files. With a text file browser such as BROWSE or PAGE, I had to exit the file browser after each file and re-enter the next file. With DR, you sort your directory on the extension, go to the first file with a .DOC extension, press the [CR], and, Boom, you read the file. Press the [ESC] key to leave that file, down arrow to the next file, press the [CR] key, and you're browsing the next .DOC file.

Slick stuff, AND, it's FREE.§

Backing It Up on Video
By Steven E. Spears

In line with my article on types of backup available on and for Personal Computers, my mention of the Video Tape Recorder (VTR) Option is the one that I personally use and have found quite useful. I chose it because I liked several aspects of its operation, such as dual use of this now common house hold item and the fact that the recording medium, VHS Tapes, are so cheap. I did have a potentially advantageous situation in that I had an old VHS that I thought that I could recycle for dedicated use in this operation

The use of Video Tape Recorders (VTR) to backup computer data is a variation of the streaming tape operation that uses an auxiliary board in the computer, a wire link to the VTR and a standard VTR which can be either a VHS or Beta format so long as the machine has Video-In and Video-out ports. These are the connections that you usually would use to plug a video camera into and are required because the operation has to by-pass the usual built-in TV Tuner. The only provider of this operation that I know of is ALPHA MICRO out of California but I do understand that there are some others that are also offering this type of backup. ALPHA MICRO also offers a more powerful VTR operation with a VHS Machine equipped with a computer control port that allows for complete program control of the backup operation. The auxiliary board costs about $300. and the specialized VHS machine costs about $600.00. The VHS machine can be used for normal TV operation as well when it is not being used for computer backup.

The backup operation using this setup is not quite as fast as the more common streaming tape setups and is certainly not as compact or as convenient, but it does have the attraction of being cheaper and making dual use of what is now a common household item. The capacity of a single Video Tape is measured by the amount of time that it plays since the backup operation works at an absolute speed of about 1.8 minutes to backup 1 Meg of data at a 4 times copy level (See Below). Therefore, you can use a VHS T120 on SP (Standard Play) to backup about 60 Meg of data with a 4X redundancy of the data. If you have a larger disk, you can switch to a slower playing speed and thus increase the recording time and capacity correspondingly. The maximum recording for a VHS machine would be using a T160 Tape at the extended play (EP) setting which gives the capacity of about 260 Meg of data. This gives a cost factor of about $1.92/Meg based on using the $300 board attached to a $200 VHS Machine. The cost of the VHS tapes is so low today that it is almost negligible and the fact that you can use the VTR for other operations is correspondingly a freebie.

Operation of this system is relatively easy and uses a reasonably user- friendly interface program. Starting it up you have a choice of making a backup, restoring from a backup and verifying the integrity of an already created backup tape. Also on the main menu are a couple of the remote control options for the computer controlled VTR as mentioned above. When you choose to make a backup, you are prompted for the choice of making a file-by-file or a disk image backup. If the choice is for file-by-file then you can backup up multiple logical disks and or different directories or combinations of these options. If the choice is for disk image, then you are limited to choosing either the entire disk or some directory(s) of that single logical disk. The disk image is also limited to the 32 Meg limit of DOS 3.X. In the file-by- file, you can also work in the incremental mode to backup only the changes from a prior backup operation by using the archive status attribute indicator for each file.

Once all of the specifications have been entered, the program prompts you to perform all of the VTR routines of loading the tape, rewinding it and setting it on recording. Once you have performed all of these tasks, the program will then start sending the data and indicate progress with a fuel gauge type of display. I have had no problems with leaving this running overnight to backup my 4 logical Hard-disks. The restoral and verification both operate in much the same fashion and the system does keep a log of the backups on both the Videotrax Subdirectory and makes a backup log that is stored on each tape. One further intelligent measure used to make the backup process as successful as possible is the ability to make multiple redundant copies of the data to avoid dropout losses from older magnetic tape. The program defaults automatically to a 4X redundancy which makes 4 simultaneous copies of each byte of information, but that level can be varied from 1X (no redundancy) to 16X. Of course this changes both the amount and time for the backup, but if you are working with absolutely vital data, then this can be very reassuring!

Overall impressions of this system are good to very good. I did have a real problem with the stated specifications versus the real world in that I bought the system on the basis of the claim that it would work with any VTR. When the old VHS that I had intended to use as a dedicated backup machine was declared to be absolutely unrepairable by the shop, I went and bought a good quality VHS machine at my employee store only to find that it did not have a Video-In port and so was useless. Anybody want a good bargain for an Xmas gift? Once I surmounted this obstacle, I have found this reasonable and quite useful. The backup is easy and you can store the tapes almost anywhere and there is a real sense of satisfaction in knowing that you really do have a good backup! If you want more information, I am available for consultations and demonstrations. §

INTERRUPTS ...and TSRs

by Ed Buzza

TSR is an acronym for: Terminate Stay Resident. When a normal program is terminated, the last thing it does is signal DOS that it is finished. DOS then deallocates the amount of RAM occupied by that program and makes it available for the next program. When a TSR program is first loaded, it "modifies" DOS so that when it terminates, the RAM it occupies is NOT deallocated. So, while it has terminated, it is still resident within RAM. It kind of "goes to sleep" until its "hotkey" is struck.

To understand how TSRs work, an understanding of "interrupts" is necessary. When DOS is loaded, it sets up an "interrupt table" at the very beginning of memory. It contains a four byte address for each of the 256 interrupts. Each interrupt, hardware or software, is assigned a number from 0 to 255. The first address points to the routine that handles interrupt 1, the second address for interrupt 2, and so on. The Interrupt Table is also called a "vector table" because the interrupt address points to the routine that will actually handle the interrupt, hence "vector" or direction.

All programs have access to the Interrupt Table because it is an easy and efficient way to "patch" DOS to do things that were never thought of when the original DOS was written. It is this patching ability that makes TSRs possible.

The processor chip in the keyboard sends an interrupt signal as well as the associated data codes whenever a key is pressed and released. DOS transfers/jumps to the routine located at the interrupt table address assigned to the keyboard interrupt. Normally, this is the DOS routine that puts the data on the standard output device, the console or monitor screen, then analyzes the data to see if further processing is necessary.

Since the interrupt table is "patchable", application programs and TSRs substitute an address of their own in place of the DOS address that was there. This is why words such as 'DIR' and 'COPY' are just words to the word processor application and are in no way related to what these words mean to DOS when entered at the DOS command line. In short, the application program has "taken over" the keyboard.

To explain more fully, the following assumptions are made:

1) INT-9 is the keyboard interrupt number (9).

2) TAB-9 is the ninth entry in the interrupt table.

2) TAB-9 is set to 5000 by DOS at start-up.

3) 5000 is the address of the DOS keyboard routine. As long as only DOS is running, every keystroke generates an INT-9 and DOS goes to TAB-9 in the table, finds the address (5000) and jumps to that address (which contains the DOS keyboard routine).

Let's look at what happens when a TSR is loaded, either from the command line or from AUTOEXEC.BAT at boot-up, into RAM starting at memory address 6000. One thing it will do is take the address that is at TAB-9 and store it within itself (let's say at 6100). Then it will put it's own address (6000) in TAB-9. Now when a key is struck and an INT-9 is generated, DOS will jump to the address at TAB-9. As it always does. But this time, instead of 5000 (the address of DOSs own keyboard routine) being the address in the ninth entry, the

address of 6000 is encountered --put there by the TSR! Now we have:

1) INT-9 the keyboard interrupt number (9).

2) TAB-9 the ninth entry in the interrupt table.

3) TAB-9 set to 6000 by the TSR -- Note the new address.

4) 5000 the address of the DOS keyboard routine.

5) 6000 the starting address of the TSR.

6) 6100 the address of the original TAB-9 entry (5000).

The TSR will then look at the keyboard data to see if it is the "TSR Hotkey". If it IS, the TSR then takes over and starts executing. If it is NOT the "TSR Hotkey", the TSR will use the address that it took from TAB-9 and jump to that address — (5000, DOS routine). Note that TAB-9 is STILL set to 6000 to handle any future "hotkeys".

Now when the word processor application is loaded at the command line, assume that it will go into RAM at 7000. Like the TSR, it too will take the address at TAB-9 and store it within itself (let's say 7100). If the TSR hadn't been loaded, TAB-9 would show 5000 (DOS keyboard routine). But since the TSR is already loaded, TAB-9 shows 6000. The word processor will also take over the keyboard and put it's own address (7000) in TAB-9. Here we have:

1) INT-9 the keyboard interrupt number (9).

2) TAB-9 the ninth entry in the interrupt table.

3) TAB-9 set to 7000 by the word processor -- Note new address.

4) 5000 the address of the DOS keyboard routine.

5) 6000 the starting address of the TSR.

6) 6100 the address of the original TAB-9 (5000) entry.

7) 7000 the address of the word processor program.

8) 7100 the address of the TAB-9 entry (6000) set by the TSR.

Here is where it gets tricky. When a key is struck and an INT-9 is generated, control is transferred to the address in TAB-9 which is now 7000, the word processor. If the data is not recognized by the word processor, (i.e. Alt-W) the word processor ignores it and will jump to the TAB-9 address it stored at 7100 to get more data. Since this is 6000, the TSR jumps in to look at the data. If it's the TSR HotKey, it takes over; if not, the TSR jumps to the TAB-9 address it stored (5000) and DOS takes over.

That's it. Admittedly, this dissertation is not technically correct. Nothing was said about interrupt requests, interrupt returns, TSRs that use an entirely different technique, scan codes, the keyboard buffer, etc.. But if you have some glimmer of what interrupts are and how TSRs work, then this article has served its purpose. ?

And the Winner is...

50/50 Raffle - **Steve Speairs**

DAFFYNITIONS -- Ed Buzza

Assumed Decimal Point - Located two positions to the right of a programmer's current salary in estimating his/her own worth.

Bit - The increment by which programmers slowly go mad.

Byte - What mad programmers do.

Chaining - A method of attaching programmers to desks to speed up output.

Checkpoint - When your check book balance says "No more computer stuff."

Core Storage - A receptacle for the center section of apples.

Counter - A device over which martinis are served.

Disassembler - An unattended five year old child.

Error - What someone else has made when he disagrees with your computer output or personal opinion.

External Storage - A wastebasket.

Fixed Word Length - Four-letter words used by PC owners in a high state of confusion.

Floating Control - A characteristic exhibited when you have to go to the restroom but cannot leave the computer.

Floating Point - The absolute limit before floating control is lost.

Flow Chart - A graphic representation of the fastest route to the restroom.

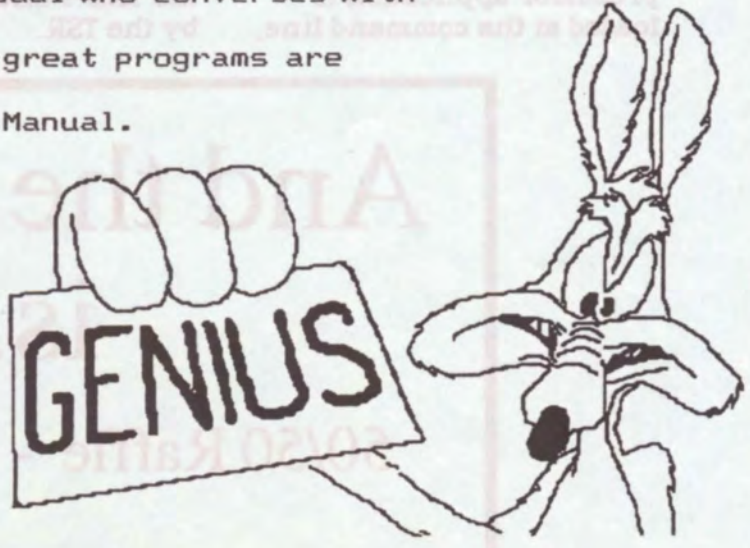
Input - Food, whiskey, beer, aspirin, etc..

Internal Storage - A receptacle for food, whiskey, beer, aspirin, etc.

Macro - The last half of an expression of surprise: "Holy Macro".

Memory Dump - Amnesia

Programmer - A red-eyed individual who converses with inanimate objects.



RAM - The sign under which all great programs are born.

ROM - An acronym for: Read Our Manual.

WORM - Attitude assumed by husband asking wife to buy new computer.

XYZ - The three axes of a 3D CAD screen that will turn you into a Xenophobic, Yaupping, Zendik.

1.0 - A program version that you never buy!

INTERRUPTS ...and TSRs

by Ed Bugza

TSR is an acronym for: Terminate Stay Resident. When a normal program is terminated, the last thing it does is signal DOS that it is finished. DOS then deallocates the amount of RAM occupied by that program and makes it available for the next program. When a TSR program is first loaded, it "modifies" DOS so that when it terminates, the RAM it occupies is NOT deallocated. So,while it has terminated, it is still resident within RAM. It kind of "goes to sleep" until its "hotkey" is struck.

To understand how TSRs work, an understanding of "interrupts" is necessary. When DOS is loaded, it sets up an "interrupt table" at the very beginning of memory. It contains a four byte address for each of the 256 interrupts. Each interrupt, hardware or software, is assigned a number from 0 to 255. The first address points to the routine that handles interrupt 1, the second address for interrupt 2, and so on. The Interrupt Table is also called a "vector table" because the interrupt address points to the routine that will actually handle the interrupt, hence "vector" or direction.

All programs have access to the Interrupt Table because it is an easy and efficient way to "patch" DOS to do things that were never thought of when the original DOS was written. It is this patching ability that makes TSRs possible.

The processor chip in the keyboard sends an interrupt signal as well as the associated data codes whenever a key is pressed and released. DOS transfers/jumps to the routine located at the interrupt table address assigned to the keyboard interrupt. Normally, this is the DOS routine that puts the data on the standard output device, the console or monitor screen, then analyzes the data to see if further processing is necessary.

Since the interrupt table is "patchable", application programs and TSRs substitute an address of their own in place of the DOS address that was there. This is why words such as 'DIR' and 'COPY' are just words to the word processor application and are in no way related to what these words mean to DOS when entered at the DOS command line. In short, the application program has "taken over" the keyboard.

To explain more fully, the following assumptions are made:

1) INT-9 is the keyboard interrupt number (9).

2) TAB-9 is the ninth entry in the interrupt table.

2) TAB-9 is set to 5000 by DOS at start-up.

3) 5000 is the address of the DOS keyboard routine. As long as only DOS is running, every keystroke generates an INT-9 and DOS goes to TAB-9 in the table, finds the address

Continued Page 3

(5000) and jumps to that address (which contains the DOS keyboard routine).

Let's look at what happens when a TSR is loaded, either from the command line or from AUTOEXEC.BAT at boot-up, into RAM starting at memory address 6000. One thing it will do is take the address that is at TAB-9 and store it within itself (let's say at 6100). Then it will put it's own address (6000) in TAB-9. Now when a key is struck and an INT-9 is generated, DOS will jump to the address at TAB-9. As it always does. But this time, instead of 5000 (the address of DOSs own keyboard routine) being the address in the ninth entry, the address of 6000 is encountered --put there by the TSR! Now we have:

1) INT-9 the keyboard interrupt number (9).
2) TAB-9 the ninth entry in the interrupt table.
3) TAB-9 set to 6000 by the TSR -- Note the new address.
4) 5000 the address of the DOS keyboard routine.
5) 6000 the starting address of the TSR.
6) 6100 the address of the original TAB-9 entry (5000) .

The TSR will then look at the keyboard data to see if it is the "TSR Hotkey". If it IS, the TSR then takes over and starts executing. If it is NOT the "TSR Hotkey", the TSR will use the address that it took from TAB-9 and jump to that address -- (5000, DOS routine). Note that TAB-9 is STILL set to 6000 to handle any future "hotkeys".

Now when the word processor application is loaded at the command line, assume that it will go into RAM at 7000. Like the TSR, it too will take the address at TAB-9 and store it within itself (let's say 7100). If the TSR hadn't been loaded, TAB-9 would show 5000 (DOS keyboard routine). But since the TSR is already loaded, TAB-9 shows 6000. The word processor will also take over the keyboard and put it's own address (7000) in TAB-9. Here we have:

1) INT-9 the keyboard interrupt number (9).
2) TAB-9 the ninth entry in the interrupt table.
3) TAB-9 set to 7000 by the word processor -- Note new address.
4) 5000 the address of the DOS keyboard routine.
5) 6000 the starting address of the TSR.
6) 6100 the address of the original TAB-9 (5000) entry.
7) 7000 the address of the word processor program.
8) 7100 the address of the TAB-9 entry (6000) set by the TSR.

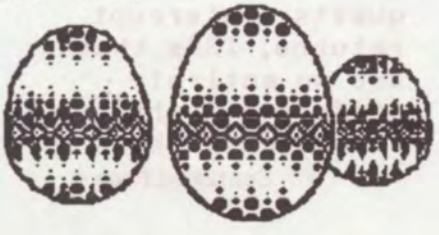
Here is where it gets tricky. When a key is struck and an INT-9 is generated, control is transferred to the address in TAB-9 which is now 7000, the word processor. If the data is not recognized by the word processor, (i.e. Alt-W) the word processor ignores it and will jump to the TAB-9 address it stored at 7100 to get more data. Since this is 6000, the TSR jumps in to look at the data. If it's the TSR HotKey, it takes over; if not, the TSR jumps to the TAB-9 address it stored (5000) and DOS takes over.

That's it. Admittedly, this dissertation is not technically correct. Nothing was said about interrupt requests, interrupt returns, TSRs that use an entirely different technique, scan codes, the

Continued Page 4

INTERRUPTS Continued

from pg.3



keyboard buffer, etc. But if you have some glimmer of what interrupts are and how TSRs work, then this article has served its purpose.?

PRESIDENT'S COLUMN

We presently have openings for the two officers; Secretary and Librarian. The duties of each are:
Secretary - take minutes at the meetings and send in ASCII file to the BBS and or the Editor of the Club.
Librarian - bring our diskette library collection to meetings and record changes.

If you would like to fill either of these offices contact: HARVEY BRUNEAU at 932-6745 or any of the Board Members listed in this news- letter. You may also leave a message on the BBS. Small Pay - Excellent benefits! Happy Easter To All.

MARCH MINUTES

The meeting was called to order by President HARVEY BRUNEAU and STEVE SPEAIRS alarmed us with a demonstration of his DeskTop 5!

DeskTop 5 includes a variety of useful operations:
- note pad
- outliner
-appointment scheduler
- Macro editor
- telecommunications
- calculator
- alarm/snooze

STEVE mentioned that he prefers the Desk-Top 5 Appt. Scheduler over SideKick's as DT's calender has more selections: everyday, weekdays only or week-ends only. Most do not give the weekend only option. It also has a JOB JAR. (Don't let the wife find this!)

The calculator is like the HP12c - Reverse Polish Notation. You may actually need to buy the Hewlett Packard Calculator book to become expert with all of the functions if you are not familiar with this type of mathematical operation. It is complete.

Then there's the handy ALARM/SNOOZE. This was different for most but the Members volunteered (jokingly) that "if you sleep near the computer" or "With a computer" the alarm would be handy. (A meeting you should not have missed, very entertaining but also informative.)
We enjoyed Random Access Refreshments during our break and then continued to learn a bit about PC Tools.

PC Tools comes with a Caching System Utility, Compression to back up disk & Security feature file encryption - DES Data Encryption System.

BRIEF and DBRIEF it was remarked are "about the best editor for program- mers to use" with "QEDIT as a close 2nd".

DON PATSZCH offered to give HARVEY a name and Phone number through which the Tampa IBM PC Users Group can receive a free WordPerfect 5.0. (useful for Bits of Blue -We ALL want that number!)

Of Quattro vs.ExCell, Quattro can link more spreadsheets.

We are still trying to upgrade the BBS with another HD. Be patient -we are working on it.

No raffle this meeting -no losers ... WE ALL WON! Board meeting followed.

DAFFYNITIONS

Assumed Decimal Point - Located two positions to the right of a programmer's current salary in estimating his/her own worth.

Bit - The increment by which programmers slowly go mad.

Byte - What mad programmers do.

Chaining - A method of attaching programmers to desks to speed up output.

Checkpoint - When your check book balance says "No more computer stuff."

Core Storage - A receptacle for the center section of apples.

Counter - A device over which martinis are served.

Disassembler - An unattended five year old child.

Error - What someone else has made when he disagrees with your computer output or personal opinion.

External Storage - A wastebasket.

Fixed Word Length - Four-letter words used by PC owners in a high state of confusion.

Floating Control - A characteristic exhibited when you have to go to the restroom but cannot leave the computer.

Floating Point - The absolute limit before floating control is lost.

Flow Chart - A graphic representation of the fastest route to the restroom.

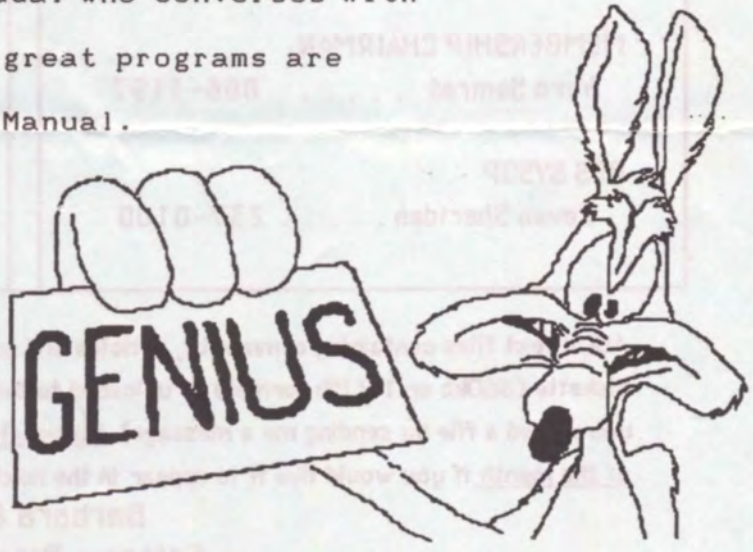
Input - Food, whiskey, beer, aspirin, etc..

Internal Storage - A receptacle for food, whiskey, beer, aspirin, etc.

Macro - The last half of an expression of surprise: "Holy Macro".

Memory Dump - Amnesia

Programmer - A red-eyed individual who converses with inanimate objects.



RAM - The sign under which all great programs are born.

ROM - An acronym for: Read Our Manual.

WORM - Attitude assumed by husband asking wife to buy new computer.

XYZ - The three axes of a 3D CAD screen that will turn you into a Xenophobic, Yaupping, Zendik.

1.0 - A program version that you never buy!

NEW MEETING PLACE - SOON

From: HARVEY BRUNEAU

To: ALL MEMBERS

Re: NEW MEETING PLACE

Effective June 13th our meetings will be held at IBM on Buffalo across from Tampa Bay mall. They will furnish us with the meeting space and hardware as needed. This is a great opportunity for us. Lets start getting the word out. Should anyone of you have suggestions, complaints or questions leave a message or call me. Harvey P. Bruneau 932-6745 or 962-2554

PRESIDENT'S COLUMN

We still have openings for the two Board Members; Secretary and Librarian.

The Secretary takes minutes at the meeting and sends them to the Editor via the BBS.

The Librarian has access to many valuable software programs; maintaining our diskette library collection & bringing them to meetings.

If you would like to offer your support, please contact: HARVEY BRUNEAU at 932-6745 or any of the Board Members listed in this newsletter. Excellent benefits!

PFS: FIRST PUBLISHER

..the critically acclaimed personal desktop publishing program. FIRST PUBLISHER transforms ordinary word processed documents into outstanding publications. With FIRST PUBLISHER, it's easy to prepare newsletters, flyers, reports, announcements, and much more.

PRODIGY IS: a low cost information Bulletin Board, like Home Shopping. Easy to use menu driven; provides "information at your fingertips" i.e. stock quotes, catalog shopping, weather reports, long distance w/o fee communication, etc. No hidden or added fees, flat $9.95/mo.

APRIL MINUTES

The meeting was called to order by President HARVEY BRUNEAU. There was some difficulty with the portable PC used for our meeting demonstrations but as STEVE SPEAIRS smacked a mosquito the PC was up and running and we decided that was the only bug.

We learned that today computers with a Hard Drive can be turned on as needed instead of being left on indefinitely as there is not the "thermal-dynamic shock" like there was in the past.

Members discussed the possibility of cars being sold equipped with devices similiar to those of law enforcement officials, i.e. location maps. The numerous diskette count in some packages was discussed. When you "install" them some actually "unzip" or "unarc" themselves.

STEVE reminded the club that THE BOOKMAN has a catalog listing on the BBS and as a paid member we get a good discount. If we buy through our Club we get an additional discount. Let any of the Board Members know if you would like to participate in this offer.

KEVAN SHERIDAN gave a well rehearsed demonstration of QUICKEN by INTUIT. Owning his third version of Quicken it is obvious that Kevan likes this product and was just the person to show it off.

QUICKEN is #1 Best-selling, award-winning financial software. Kevan remarked that the only time he ever read any of the book was "how to install", from then on the menus and message lines are so clear that you may only need your book on rare occasions.

Quicken 3.0 includes:
- Check Writing/Bill Paying
- Budgeting
- Bookkeeping
- Tax Recordkeeping
- Financial Reporting

It is excellent for managing cash flow and would be perfect to use for personal or small business financial management.

We recessed for refreshments returning for the brief business portion of the meeting. There were many goodies raffled and many winners. A Board meeting followed with most of the Board members present.

Keep your Membership ACTIVE by sending Your Dues.

THE APRIL WINNERS ARE:

ROGER WATERS	-	Ashton Tate Sun-Visor
STEVE SPEAIRS	-	Ashton Tate Sun-Visor
ED BUZZA	-	Ashton Tate Frisbee
BARBARA PECK	-	Centech diskettes from SUNRISE
BARBARA PECK	-	Ashton Tate STEP IV WARD Software
PETE MONROE	-	1 Fresh bottle of Coca-Cola
WALTER WELCH	-	"Winsome" Miniature Rose Bush
WALTER NAGY	-	$9.50 "CASH - Split"

**** DUES NOTICE ****

To All our Loyal Members:

If you have not paid your 1990 dues, you may do so by mailing your check to the Club PO Box or by bringing it to a meeting. We do not send past due notices. We depend on our members to pay voluntarily. If your payment was not made by January 31st then it is **"PAST DUE"**.

We are back in business with the newsletter. Our new editor, Barbara Peck, is doing a fabulous job. We are going to have some very good presentations this year. When we don't have a presentation by someone from outside the club, our meetings are still very informative. Mingling with the members is always helpful, you always learn something. Thank-you for your participation and your dues payment.

WINDOWS -

MICROSOFT CORP.

...soon to release a new version of WINDOWS. In some 1990 PC Magazines the Microsoft Mouse ad mentions Windows Version 3.0 and MS-Paintbrush. However, in the MS-WINDOW ads I've seen "Microsoft Windows/286" and "Microsoft Windows/386". According to the March 27, 1990 issue, Microsoft recently released WORD FOR WINDOWS. So place your bets on which Window KIRK will show - we can't lose with any of these!

THANKS to SPC

The Tampa IBM PC Users Group Board and members extend a sincere thank-you to Software Publishing Corp. for all of the software donated and for LINDA CONFER. A big thanks to LINDA for the super demonstration and upgrade of PFS:1st Publisher 3.0. We appreciate your support and generosity.

MAY MINUTES

HARVEY called the meeting to order and introduced our Guest speakers.

A PRODIGY representative explained the telecommunication services and gave FREE Prodigy software to all. One advantage with Prodigy (compared to similiar services) is the flat rate of $9.95 per month(no hidden charges).

LINDA CONFER from SOFTWARE PUBLISHING CORP. presented a 1st rate demonstration of the new release PFS:FIRST PUBLISHER Version 3.0. Some of the new features that LINDA emphasized were:

- Circle Drawing
- Graphic/text overlay

F2 - Layout Options, adjust & gallery
F4 - Set Up Fonts
F7 - Set Line Width
-High Resolution Art

SOFTWARE PUBLISHING Corporation donated PFS: FIRST PUBLISHER Version 3.0 to the Club, (The upgrade is already being put to use and is definitely appreciated.)

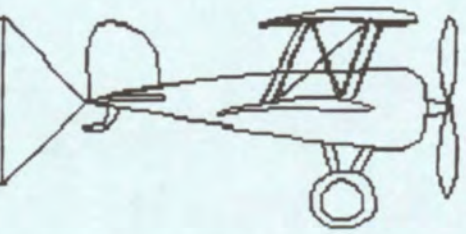
We recessed for refreshments returning later for a brief bit of business.

MICROSOFT will be at our June 13 meeting. Effective June 13th our meetings will be held at:

IBM Customer Center
Lake Pointe One Bldg
3109 West Buffalo Av
Room 450

SPC again showed their interest and support by donating three more PFS Software Programs. Most stayed hoping to win however, only 3 lucky people cashed in on 3.5" & 5.25" disk Version 2.1 of: PFS: FIRST GRAPHICS, PFS: FIRST PUBLISHER or PFS:PROFESSIONAL WRITE.

CONTROL ROOM



...by ASHTON-TATE:

is a potpourri of PC Utilities which includes disk recovery and disk cache, virus detection, keyboard macros, and programs that analyze the hardware components in your PC. It retails for $129.

Keep your Membership ACTIVE by sending Your Dues.

DOS TIPS

Ed Buzza

Sorting Directory Entries

When a program name or command is entered at the DOS prompt, DOS checks COMMAND.COM to see if the command is one of the internal programs within COMMAND.COM. If it is not, DOS then looks through the current directory for the program. If not found, DOS will then look through each of the directories listed in the PATH for the requested program. If DOS finds the program, it is loaded and executed. If not found, then DOS flashes it's infamous message "bad command or file name."

DOS could find the program quicker if the appropriate .EXE or .COM file is at the very front of the directory.

DOS could find the program quicker if . . .

But you say that you don't have control over where the various files are installed or that it's too much of a hassle to copy the files one at a time just to get them in the proper order. Well, help is available but let's look at another item.

. . . help is available . . .

When a DIR command is issued, DOS shows the files in the same order as they are listed in the directory table. And the files are entered in the directory table as they are created. So the first one created will show in the first entry of the table. Sort of a FIFO (first in, first out) order system. The subdirectory names are also listed in the directory table, again in the same order as files are (even though they're not files, DOS treats them as if they were for directory purposes). Wouldn't it be nice to have all the subdirectory names listed first, then the files?

The answer to both of these problems/peeves is found in PCTOOLS(tm) and in Norton's Advanced Utilities(tm). Go to

continued

DOS TIPS
- Sorting Directory Entries

continued

the Special menu in PCTOOLS(tm), select Directory Sort, and make your choices. After sorting, you will be prompted by a dialogue menu that allows you to view the new order and also to Update the directory table on the disk. With Norton, use the Directory Sort utility but show only the drive (a: or c:, etc.). A menu will then pop up allowing you to make your selection. One BIG difference: within the menu you can Move the various entries around to suit yourself.

UPCOMING SPEAKERS:

JUNE 13 - Microsoft
JULY 11 - Ashton-Tate
AUGUST 8 - WordPerfect

P. O. BOX SNAFU

TIBMPCUGPOBI

Well, we goofed again. For those of you who didn't know, I am the official TIBMPCUGPOBI (Tampa IBMPC User Group PO Box Investigator). I took over this duty from Robin Pokoj about a month and a half ago.

What I didn't know was that just before I took over, our box rent expired, and the Post Office closed our box. Fortunately, several kind souls called me at home to tell me that they had mail sent to the box returned to them.

The box rent has been paid, the PO Box is once again open, and you can send your dues payments to:

Tampa IBM PC Users Group
P.O. Box 3492
Tampa, FL 33601-3492

Sorry for the inconvenience.

Vern Semrad

AND THE WINNER IS . . .

HARVEY BRUNEAU - DINERO!! (50/50 Drawing)
DON PATZSCH - Coca-Cola (re-loaded by STEVE SPEAIRS)
Everybody - PRODIGY Software donated by PRODIGY
MERRILL FRIEND - PFS: First Graphics Software 2.1
donated by SOFTWARE PUBLISHING CORP.
NORBERT LUKE - PFS: First Publisher Software 2.1
donated by SOFTWARE PUBLISHING CORP.
JAY REESE - PFS: Professional Write Software 2.1
donated by SOFTWARE PUBLISHING CORP.

Thanks to all the winners for printing their names on the winning tickets.

MEMBERSHIP UPDATE

Apparently, several of our loyal members forgot to turn over the pages of their calendars last January. This is a friendly reminder that the year is now 1990. Please send in your membership dues and keep your membership in good standing.

Our group is getting more organized each month, and the benefits of membership continue to increase. Harvey's agreement with IBM to hold our meetings at their Tampa facility will be a definite boon to our existence. We won't have to worry about presentation facilities as we have in the past. Harvey has some outstanding Programs lined up for the coming meetings. One of the best presentations will be at the June meeting when MICROSOFT comes to town to show WINDOWS 3.0. ASHTON-TATE is scheduled for July and WORDPERFECT will be back in August to show DrawPerfect, another one of their excellent products. If past presentations by their representatives are an indication, these will be meetings you won't want to miss.

Barbara Peck is developing the Newsletter into a quality publication that will get better and better as time goes on. ONLY paid members will receive the newsletter on a continual basis.

Finally, I want to say a few words about a membership benefit that is worth the cost of membership all by itself. That is the Bulletin Board.

Kevan Sheridan has taken a foundering system that has been around for several years, bordering on extinction numerous times, and developed it into one of the premier RBBS's in the Tampa area. It seems every time I log onto the board, Kevan has added another feature. The new RBBS software he is using is as good as any I've seen, and I call a lot of boards. Thanks to many contributors, we are getting more and more outstanding ShareWare and Public Domain software on the board.

The E-Mail feature of the board is also outstanding. This is one feature that, sadly to say, is greatly under used. With more participation from members, this board could develop into the primary electronic message center for the Tampa Bay area.

When you stop and think about all the features and benefits of membership, twenty dollars per year is really a bargain. Won't you help us in our efforts to build our group? Please send in your dues today.

Thanks..... Vern Semrad

The Tampa IBM PC User Group!

WHAT EXACTLY DOES MY TWENTY DOLLARS GET ME?

o 24 Hours a day/ 7 Days a week

Prompt Service from our BBS.. We do not operate from someones Home, where the System goes down when someone decides to do some work. We are always up and running.. (Barring Natural Disasters and/or Acts of God)!

o Full E-Mail Capabilities

You can send mail to anyone that is a Registered user of the BITS OF BLUE BBS (Official Bulletin Board System of the Tampa IBM PC Users Group). You have the capabilities of sending Private mail as well as public messages.

o Over 200 On-Line Files

Sure, Other boards may have more files than us. But does more mean better? We offer the most current updates of Public Domain Software. We also have a club library of more than 3000 Files.

o Full support from the Tampa IBM PC User Group

The Tampa IBM PC User Group is a non-profit organization dedicated to serve the needs of the PC User. From the most technical of the techies to the simplest of the simple. Any questions that you may have will be competently answered by someone in the club.

o Access to club meetings

Each month the group meets on the second Wednesday to discuss the latest developments in the PC world. There are usually one or more major demonstrations held at each meeting. We have many vendors come to our meetings with a demo of their latest and greatest. Companies such as Ashton-Tate, Lotus, Microsoft, and others have all sent representatives to our meetings. Some of them even bring door prizes!

o Access to club library

The club maintains a library of more than 3000 files on diskettes. This library is brought to each meeting and members are encouraged to copy files or whole diskettes from this library. A computer or two is also provided to make the copies possible during the entire evening; before, during, or after the meeting.

o Newsletter

The club produces a monthly newsletter that contains many interesting articles as well as the latest news available to us from the PC world.

o Discounts at local Bay Area Businesses

There are several businesses that offer discounts to members of the Tampa IBM PC User Group, most of whom are Members themselves!

continued

CLASSIFIED

Opportunities for members to serve on Board of Directors. Secretary and Librarian NEEDED.No experience necessary. The Secretary takes minutes at the meeting and sends them to the editor. Having a Secretary would probably speed things up with publication of the newsletter. This would be an excellent way for someone new to become more acquainted with our group. If interested in either Secretary or Librarian call HARVEY at 932-6745

PURPOSE

The Tampa IBM PC User Group is a non-profit organization dedicated to serve the needs of the PC User - from the most technical of the techies to the simplest of the simple. Any questions that you may have will be competently answered by someone in the club.

. . . to encourage, enlighten, and inform

Our purpose is to benefit ALL computer users, not only IBM and PC-compatible. We invite all interested individuals to join us. Our intent is to encourage, enlighten, and inform.

WHAT EXACTLY...? continued

BITS OF BLUE - BBS NEWS

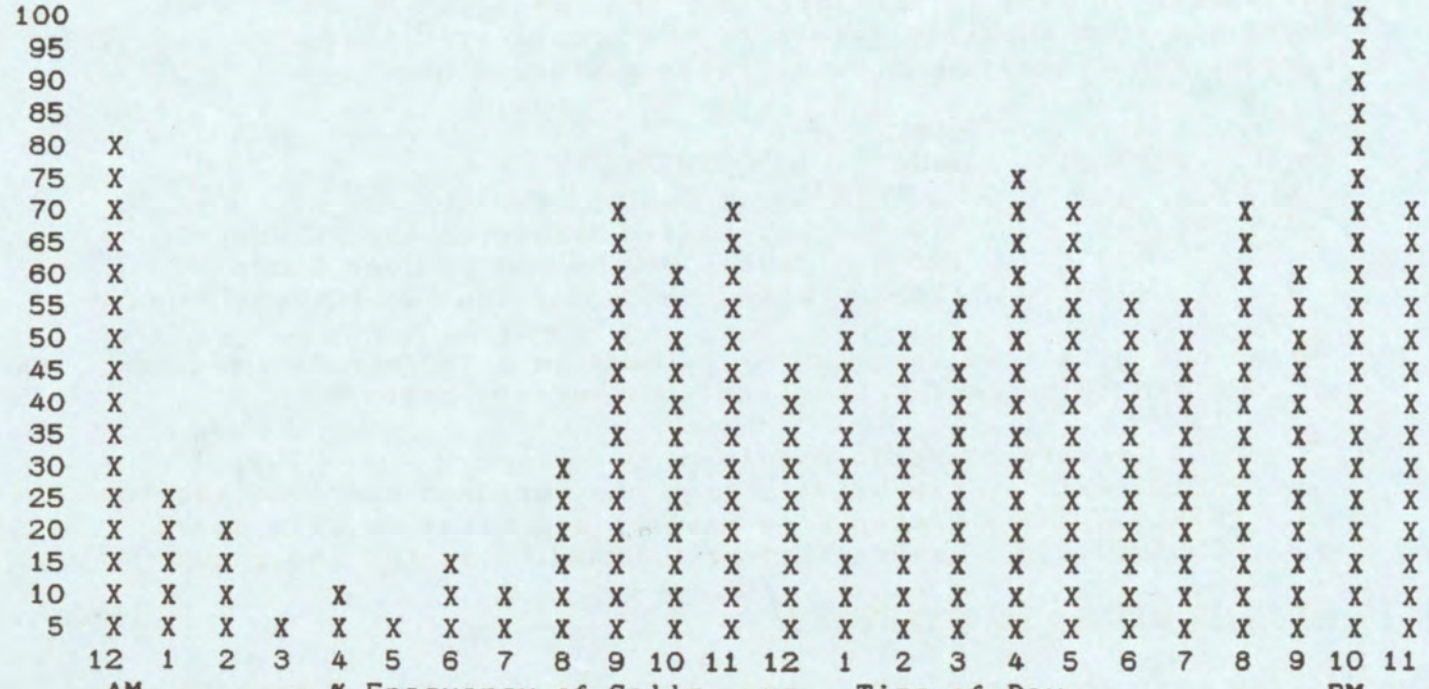
While Bits of Blue is the Board for the Tampa IBM PC Users Group, there are some specific levels in the access structure. The access levels, requirements and time limits available are:

Level	Mins Per Call	Mins Daily	REQUIREMENT
5	15	30	Guest Caller
7	45	70	Unverified Member of the PC User Group
8	120	120	Member of the IBM PC User Group
9	120	120	Board Member of the IBM PC User Group

➡ We now give time credits for uploads on a TWO minute for ONE minute basis!!!! (available to current members only) ⬅

➡ Guest Callers may also download:
PKZ102.EXE - Zip Utility from the Personal download section
MSTRLIST.ZIP - Master File List of all files on this board
PCUGSUBJ.ZIP - Latest list of LIBRARY files for the group

BITS OF BLUE - NEWSLETTER



If you Join the Tampa IBM PC User Group Club, you will Receive your monthly issue of Bits of Blue (Newsletter) and Full access to the Board. The Tampa IBM PC UG Meets on the 2nd Wednesday every month at 6:00 pm. Dues are $20 A year. To join our club come to a meeting and sign up or mail the attached application with a check for $20 to: Tampa IBM PC Users Group. P.O. Box 3492, Tampa, FL 33601-3492

Welcome to Bits of Blue

The following Graph shows Busiest Time as 100%

The information above may be viewed by selecting Bulletin 10 - USAGE STATISTICS on the Board.

BUGS OR BUNNY?

If you logged onto the BBS back in April you may have noticed that we were experiencing technical difficulty.

It all began around Easter... sending the Sysop to investigate. While he suspected it to be just a Bug he Continued to Track the cause (Learning the true meaning of Spring Break).

BBS is up and running strong

It wasn't long before Kevan discovered that a little chocolate bunny had gotten a hold of the Mother Board and made a real mess of things - fried Chips everywhere!"Please Don't Kill me!" a voice cried out as he Located the bunny. (BUGS, of course). He explained that a Call from Kermit brought him here. Kermit was spreading the word at lightening speed that he had Data about "20 eggs one could Pick up for Free, not to worry about Cash".Their Chat came to an End when Bugs Reported that he "didn't know Zip about any Mother being bored!" (Well, nobody talks about Kevan's Mom!) He Booted Bugs out exclaiming "Go! and leave the Megs." Ready to Exit Bugs remarked "Save the Routine, Doc, and YOU keep them eggs, they're all scrambled!"

Bewildered, Kevan rubbed his eyes, when suddenly he Recalled. He was at the controls one day talking to himself about "Cache being a problem, adding 20 Megs, and someone having a New Mother Board!"

UPTOWN / BBS - UPGRADE

Yes - The BBS is up and running strong with many additions and great changes. Our Sysop KEVAN SHERIDAN has spent more hours than most people spend on a regular job working on the conversions. All of his time and everyone's patience (his included) have paid off in a big way. He made some nice improvements.

The board has had a new 20 meg hard drive and disk cache installed. Other new features include new transfer protocols (Kermit, True Ymodem, ZMODEM, and PUMA), increased upload credit, and some interesting System Statistics (some of which KEVAN has turned into Bulletins - see page 8).

The Bulletin Board is based on an IBM PC XT and Runs Version 17.3 RBBS-PC. The Software for it is currently available for downloading. This system adjusts to the parameters of the caller. If you have any problem leave a message for the Sysop using the C)omments when the system asks for a function.

...see it for yourself.

Make an effort to check out the board soon if you haven't. It looks tremendous. Don't take my word for it - call and see it for yourself. KEVAN is there for good news too. Leave him a message letting him know what you think of it. Your FEEDBACK is very helpful and rewarding. Watch for an article in coming months as KEVAN outlines some details of the conversion.

APPLAUSE II -
by ASHTON-TATE

Applause II is a business presentation package. It includes applications for charting, drawing, and electronic slide shows. Using Ashton Tate's Applause II you can Build charts, add artwork, and then output to screen, slides, printer, overheads and more.

Suggested retail price - $495.
Current retail Price - $299.
It could be yours for just $1 - as ASHTON TATE has donated APPLAUSE II and CONTROL ROOM for our JULY door prizes.

INTRODUCING
LARRY ANDERS - LIBRARIAN

The Club is proud to announce that our new Librarian, LARRY ANDERS is our No.1 Uploader on the BITS OF BLUE BBS. This means that LARRY has donated more shareware (programs permitted to be freely copied) to our BBS than any other member. As a member, you too can have these programs in your personal collection. LARRY will bring the Club Diskette Library to the meetings where you may copy the those programs you want. Please bring your own formatted diskettes. He will also maintain the list of our collection and keep us notified of changes. Welcome to the Board, LARRY.

MEMBERSHIP INFORMATION

When you need to inform the Board of Directors of address changes, please address your message to the Membership Chairman, VERN SEMRAD. Addressing it to the BBS SysOP slows down processing of your membership (as he has to forward it to the Chairman, also). Our Membership Chairman maintains all address information, prints newsletter labels, and (along with the Treasurer) maintains data on who is a paid member & who is not. You will save some time when you forward membership messages, questions, or payments to: VERN SEMRAD at 886-1197 or Address inquiries to:

Tampa IBM PC Users Group
Membership Chairman
P.O. Box 3492
Tampa, FL 33601-3492

BITS OF BLUE - SAMPLE ISSUES

The Club is designing a 1 pg Newsletter with 1/2 pg Membership Application on the 2nd side, reserving regular Newsletters for Members. This is our FREE copy; & possibly for future BBS callers.

THANK-YOU MICROSOFT & KIRK

The Tampa IBM PC Users Group Board and members extend a sincere thank-you to MicroSoft Corp. and KIRK COVERT for his fine demonstration of newly released WINDOWS 3.0. Learning about "WINDOWS" was a pleasure.

JUNE 13, 1990 MINUTES - 1st Meeting at IBM Location

HARVEY called the meeting to order. STEVE SPEAIRS introduced the Board members and commended KEVAN SHERIDAN, our BBS SysOp, on a job well done. (KEVAN upgraded our Club Bulletin Board & added several new features.) Thanks to VERN SEMRAD, our Membership Chairman, the TIBMPCUG was listed in the Data Bus, and in the Agenda and High Tech sections of The Tampa Tribune. HARVEY turned the meeting over to Guest speaker KIRK COVERT from MICROSOFT.

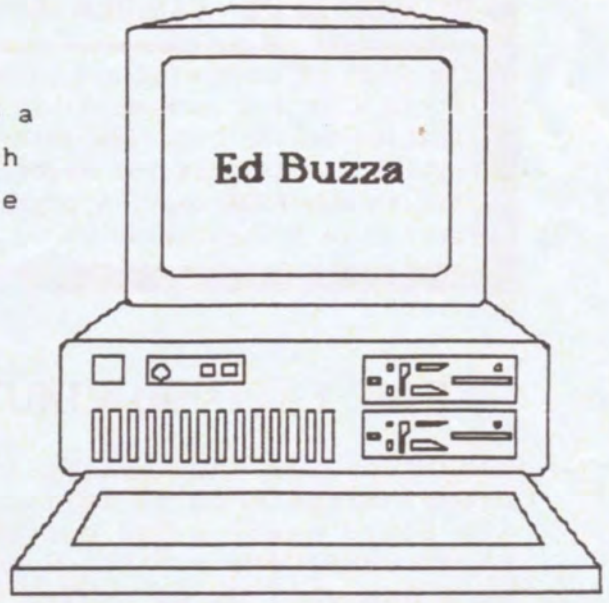
Once again KIRK made another great MICROSOFT presentation showing us a video of newly released WINDOWS 3.0. It was done in a clever and humorous "Wheel of Fortune" theme where we met WENDY(representing MS-WINDOWS), her opponent BACK-SLASH,& the hostess GLADUS QUO. After the video he took us on a complete tour of WINDOWS 3.0 using an IBM 386 SX computer, furnished by IBM. KIRK began by explaining WINDOWS three modes. He also pointed out that it is very network aware and has a new Solitare Game (Addictive). The suggested retail is $149 - Current retail price $99. KIRK invited questions and did a tremendous job of answering them before we recesseed for refreshments. [Recap of WINDOWS 3.0 in a later issue.]

STEVE SPEAIRS, our own technical wizard, showed & explained Ashton-Tate's CONTROL ROOM, a built-in consultant (UTIL) that analyzes system capabilities.

The business portion was short, but informative. HARVEY showed us a COMPAQ LTE 286 LapTop,also called a "NOTEBOOK" computer due to its size.(COMPAQ LTE 286 courtesy of KEVAN SHERIDAN and his employer.)

An ASHTON-TATE representative is presenting APPLAUSE II at our July 11 meeting. (See front or back page for New Meeting address and location.)After the 50/50 cash drawing HARVEY thanked CHRIS, our IBM Host.

GREEN Turns GREENER!!



THE WINNER IS . . .

ROBERT GREEN wins 50/50 Cash Drawing

MEMBERS - To Claim Prizes: Please PRINT your name and prize on the winning ticket.

BATCH STUFF

Have you ever wished that you could make a decision from the keyboard while in a batch job? Have you wanted to be able to have the batch job do different things by entering one or more keystrokes? You can, you know. There is a small program, GETKEY.COM, that is available on many BBSs and from shareware sources that will do the job for you. What GETKEY.COM does is act like a PAUSE command, without a message, waiting for a keystroke. When any key is pressed, GETKEY then sets ERRORLEVEL to the ASCII value of the keystroke.

ERRORLEVEL is an area of memory where DOS, or some applications, store an error code upon the completion of certain tasks. Normally ERRORLEVEL will show a value of 0-4 (e.g. 0=normal, 1=user terminated, 2=prog error, etc.). Since GETKEY.COM sets ERRORLEVEL to the ASCII value of the keystroke, it can be tested by the IF command. The IF command provides for branching; so, by testing ERRORLEVEL, the batch program can jump/branch to another part of the batch program.

For instance: We put a couple of messages on the screen asking the user to select option one by pressing F1 and to select option two by pressing F2 (we only put two options on the screen). Now the ASCII value of the function keys ranges from 59 (F1) to 68 (F10). Now, if GETKEY.COM is executed, it waits for a keystroke, and if F1 was pressed ERRORLEVEL is set to 59; and if F2 was pressed ERRORLEVEL is set to 60. If any other key is pressed, ERRORLEVEL will be set to the value of that key. We'll use this in a moment.

Remember that the "IF ERRORLEVEL" test is true if the value being tested is the same OR HIGHER than the value found in ERRORLEVEL. By testing for a value higher than what we are looking for, we catch any erroneous keystrokes. Then by "stepping down" we can test for all the good values. And finally, after exhausting the good values, catch the rest of the erroneous keystrokes.

(continued on page 5)

(BATCH . . . *continued from page 4*)

To illustrate this whole thing, let's look at a sample batch program (the semicolon and following text are only for illustration).

```
ECHO OFF
CLS                                     ;Get a clean screen
ECHO    Press F1 for a DIR of A:        ;Screen message to...
ECHO    Press F2 for a DIR of B:        ;...show options
GETKEY                                  ;Wait for keystroke
IF ERRORLEVEL 61 GOTO ERROR             ;Test for high error
IF ERRORLEVEL 60 GOTO B                 ;Test for F2
IF ERRORLEVEL 59 GOTO A                 ;Test for F1
:ERROR                                  ;Label, and low error
ECHO      You MUST press F1 or F2       ;Tell the dummy
GOTO END                                ;Quit batch
:A                                      ;Label, F1 option
DIR A:                                  ;Do F1 option
GOTO END                                ;F1 option finished
:B                                      ;Label, F2 option
DIR B:                                  ;Do F2 option
:END
```

Note that the :END label is required for the error test and for the completion of the F1 option. No "GOTO" is needed after the test for low value because the prior ERRORLEVEL tests will not be true. According to this batch program, only the F1 (59) and F2 (60) keystrokes are valid; everything else is an error. o

Now, you can get fancy and put up a text-graphic or even a graphic screen to show the various options that you want the user to have - just like a menu system. To handle this sort of thing, you need to hide the cursor and prevent the cursor from advancing beyond the 25th line. But, that's another article.

If you are really interested in setting up your own menu system or learning about batch jobs, get the book "Supercharging MS-DOS"(tm) by Van Wolverton published by Microsoft(tm) Press. There are two versions, one with a disk containing all the routines in the book, and the other without the disk.

WORDPERFECT 5.1

by WORDPERFECT

WordPerfect is one of the most popular word processors today. WordPerfect 5.1 is now "Easier to use" and has More than 30 New Features. Some new and/or improved features are: Tables, Merge (Magnified & simplified), Mailing Labels (creating is a breeze), Spreadsheet Data can be imported directly into a document, Equation Editor(makes equations easy to write). With all of the New features WP 5.1 still runs in 384K of memory, the same as WP 5.0. WordPerfect 5.1 is more than a word processor for creating documents. It is used for newsletters, brochures, and major presentations, as well. (WordPerfect is the most common application used for publishing newsletters among 11 of the PC User Groups at the SunCoast Area PC Users Groups Conference 7/28/90.) If anyone would like to donate Word Perfect 5.x to the Club, please, Contact our Editor, Barbara Peck at 885-9935. We would love to try WordPerfect 5.1 for OUR newsletters. - This MUST be an UN-REGISTERED version.

DRAWPERFECT

by WORDPERFECT

With DrawPerfect you can have your own art department right at your fingertips ... or at your mouse's! You can create drawings, charts, and graphs & with little effort bring them into your WordPerfect document or output to screen, printer, overhead transparencies, slides, and more. Current Retail Price - $349.

Batch Commands

by Ed Buzza

As mentioned in a prior article, this is the "other story" about the GETKEY.COM program (and a few others). It is very easy to expand the power of batch jobs through the use of a few utility programs. With a handful of programs, you can create custom menus for yourself or others, get runtime decisions from the keyboard, hide or show the cursor,or put the cursor wherever you want. These programs are: ANSWER.COM, ASK.COM, GETKEY.COM, IDECURS.COM, LOCATE.COM and SHOWCURS.COM.

When DOS puts something on the screen, it's as though DOS "painted" the screen with the data. It stays there! This feature enables us to put a menu on the screen and, by using LOCATE.COM, we can then ECHO instructions in the same spot on the screen. By keeping the cursor away from line 24, the screen does NOT scroll. Just remember, if you overwrite a message, the new message must be as long as the original. Otherwise, what's left of the original message will still be there.In effect, ECHO is "painting" new data on top of the old data.

These programs, plus ASC.COM, CHECK.COM, ESC.COM, and ONCL.COM, and this article are available in the file BOB-BAT.ZIP on the Bits of Blue BBS or in the club library. Documentation for all programs is included.

Now let's put some of this to use. Create the following batch program (do NOT type the semicolon nor the data after it, it's only for your information) and name it BOBTEST.BAT:

```
ECHO OFF
CLS
HIDECURS                          ; Make cursor invisible
LOCATE 10,20                      ; Position ghostly cursor
ECHO This is a Bits of Blue test. ; Put up a message
LOCATE 12,30                      ; Set new position
ECHO Press any key to continue.   ; Put up a message
REPLY                             ; Wait for keystroke
LOCATE 10,43                      ; Behind "...Blue"
ECHO revelation.                  ; Overwrite "test."
LOCATE 12,55                      ; On top of period
ECHO , please.                    ; Note spacing
REPLY                             ; Let user see results
SHOWCURS                          ; Make cursor visible
ECHO End of BOBTEST.BAT
```

Now don't just read this thing - create the batch file and run it. Just be sure that the batch file and the commands it uses are in the same drive and directory; or that the drive and directory are in your PATH statement. Of course, you can put these routines in whatever directory holds all your other utility programs (and that the PATH statement reflects that drive and directory).

The other commands (ASC, CHECK, ESC, ONCL) were included as part of this package to add a little more power to your batch files. ASC.COM can be popped up when you forget just what the ALT number is for that particular drawing character

continued pg.7

July 11, 1990 - Minutes - 2nd Meeting at IBM

Our president called the meeting to order and promptly turned it over to Kevin Nollan. Kevin is the local representative for Ashton-Tate. He did and excellent job describing the features of Applause II. This is Ashton-Tate's business graphic and presentation program. It allows you to produce printer output, overhead transparencies, 35mm slides, and, of course, a PC slide show. As demonstrated, the program seems to be very easy to use (move the mouse, click; move the mouse, click; and you're done). Applause II has a wealth of features: custom color palettes, full function drawing board, chart & word templates, Bitstream fonts, pull down menus, 3D charts, library of 400 images, and import/export filters for the major database, spreadsheet, and graphic files as well as ASCII.

Literature and demo diskettes were made available to the members. Kevin apologized that he wasn't able to bring along a copy of Applause II and of ControlRoom to be donated as door prizes. He promised that they would be there at our next meeting. He did more than redeem himself however by donating a copy of dBASE IV.

After the Ashton-Tate presentation Harvey did his usual superb job of informing us of the new products, trends, and in general, what's going on in the world of personal computers. Some of the items he mentioned were:

1) New UPS devices-- one that fits into a slot in the PC & another that is built into the power supply unit.
2) Hewlett Packard's announcement of LaserJet IIID(prints on both sides)suggested price of $3595.
3) Pizazz (a screen capture program) is highly regarded.
4) Bug in Windows3 that can wipe out all data on the hard drive. The combination of using Smart Drive with some 3rd party partitioning software (On Track, Golden Bow) seems to be the culprit.
5) If you get an "Incompatible" message when loading SmartDrive, pay heed. If you go ahead with the loading, you're in deep trouble .
6) A 3 1/2 floppy disk will soon be available that will hold 20 meg of data. This new disk drive is very expensive.
7) If you get the Excel upgrade you get the new Windows 3 for free.

The president also reminded all of us that only club members (paid up club members) are eligible for door prizes.

At the next meeting, WordPerfect will demonstrate their Draw Perfect program.

Just a Reminder....

(Secretary's note: If you haven't yet paid your dues, do it now.)

the WINNER is. . .

B.B.S..... Bargain Basement Software or Bulletin Board System

by Larry Anders

While flying the friendly skies recently and not having my portable PC with me to bide my time, or not having any documentation on a new program I was trying to learn, I decided to read the airline magazine in the seat pocket in front of me. To my pleasant surprise there was an article on my favorite subject; Bulletin Boards! The article was written by Belinda Bailey, a free lance writer and computer consultant from Greensboro, NC. The following is a summary of her article, but bear with me - I am not a free lance writer ..... just a part-time computer consultant.

"How you can get sophisticated, commercial-quality software packages at rock bottom prices, plus free home trial!?" Just as enterprising entrepreneurs have flooded the market with faster, less expensive, feature-packed clones of the IBM PC, the software world is rushing to do the same thing. One of IBM's major hardware competitors, Apple Computer Inc, was begun by two boys in a garage. Many of the new software programs being developed have just as humble of a beginning, and just as promising a future. The next Lotus 1-2-3 or WordPerfect may be as close as your local BBS in the form of "shareware". After obtaining a copy of a particular package you can test-drive it on your own computer. If you decide you like the software you may purchase it, usually at a fraction of the cost of its commercial counterparts. Although the cost may be rock bottom, many of these programs are commercial-quality packages.

All you need to dial into a BBS is a PC, a terminal emulation package, a modem and a phone line. "Where do you get the phone numbers of the various BBS you ask?" Just call our very own Tampa IBM PC Users Group's BBS "Bits of Blue." On "Bits of Blue" is a list of all our local BBSs in the Tampa Bay area updated monthly. "This is probably very expensive you say!" Not so! There are just as many FREE Boards as there are SUBSCRIPTION Boards. But even if the Board charges a fee, one good program will pay for itself over and over again. With your membership to our user's group, "Bits of Blue" is free.

Once the terminal emulation package and modem are set up properly, which is usually automatic, all you have to do is have your computer dial the BBS. Once you are connected, type your first and last name when requested. Then, answer all the questions you are asked by typing your answer on the keyboard. The first time you connect to a BBS you are usually asked some routine questions such as what password you would like to use, whether you have a color monitor or not and what download protocol you will be using. Some BBSs ask more questions than others. Once you have answered the questions just make the selections from the menu options presented. If there is an online tutorial or information, and this is all new to you, you may want to read it first. Some BBSs allow first timers to download files immediately while others verify the information about the user first. *continued pg.* 6

continued from pg 5

BBS - BULLETIN BOARD SYSTEM

In either case, once you have reached the file area you may list the files to see if there are any that interest you. Note the names of any you would like to try. Then to copy (download) a file from the BBS to your PC select the download file option and specify the file you wish to download. After a few seconds or a few minutes you will be finished. Once the file is on your own PC, or a diskette in your own PC, disconnect systematically from the BBS and you are almost ready to test-drive the software.

Since most BBSs archive files in special compressed formats to save space, be sure to download the unarchiver as well as any file. You only need to do this the first time and most BBSs use the same format.

When the software is on your computer you are free to try the program. The program may do more or less than its commercial counterparts. If the software does all it claims and meets your needs, you may keep it and use it by simply registering with the developer. You are on the honor system during the home trial. Developers fully expect you to register and pay for the privilege of using their software. In return, you will receive full legal use of the product. By registering, you may receive a bound manual, product support and updates when available. In some cases the shareware version posted on a BBS may only be 90% functional and upon registering you will be mailed a fully functional product, but this is not usually the case.

While commercial companies charge prices in the $250 to $500 range for their packages in order to offset their losses due to software piracy or illegal copying, shareware vendors encourage free distribution at a price range of $25 to $100 for a quality product.

The types of shareware available covers almost every software category known: spreadsheets, communication, database, graphics and many, many more. There are communication packages, spell checkers, compilers, word processors, terminal emulators and of course, games and entertainment. There are even unique applications, such as a Bible search program that finds any word or phrase in the King James Version of the Bible in two seconds or a program to help you install your satellite dish properly. What variety! and only a phone call away.

There is always a concern that a "virus" may be embedded in one of the programs. Most BBS operators or "Sysops" test for viruses in all software before making it available to the public; but you may want to check with the sysop first before you download from a new BBS. You can always download your own virus protection program if it makes you feel safer.

BBSs not only provide files to download but most also provide public electronic mail (E-mail) which acts as sort of an electronic corkboard that users can post messages on items for sale, job listings, notes of general interest, or most importantly, ask for and receive help! The BBS gives you access to a whole network of other users who have been through the same problems as you.

One side benefit of a BBS is the entertainment value. After scanning the BBS for the latest shareware bargains, settle in for a few games. Some are one-person games that you can download and play on your own PC; others are on-line, interactive games that you play while dialed into the BBS. Either way it's lots of fun and a great way to relax. But be careful: Both the games and the bargains are ADDICTING.

Note: As a reminder....we have our own BBS, operated by Kevan Sheridan, which is fast becoming one of the best in the Tampa Bay area. You can help make it better! Join today! - **L.A.**

SUNCOAST Area PC Users Groups Hold Joint CONFERENCE

The SunCoast PC Users Groups met Saturday July 28 in Sarasota to discuss common goals and plans. While the joint Conference was scheduled for 3 hours the interest was so intense that most stayed for the duration of 5 1/2 hours. Board members were present from 11 Florida groups, representing over 3000 PC Users. Attending from Tampa were: Barbara Peck, Kevan Sheridan, and Steve Spears. Many of the topics discussed can benefit our own group. The board will be meeting to discuss ideas from the Conference in hopes of offering even more benefits to our members. Below are some of the topics covered:

NEWSLETTERS
- ADVERTISING in Newsletters
- DATA BUS - FREE Issues
- WHO Will Supply Articles

MEMBERSHIP
- Brochures
- SIG's - Special Interest Groups

LIBRARIES
PROGRAMS (speakers)
HARDWARE/SOFTWARE
BULLETIN BOARD SYSTEMS
ASSOC. OF PC USERS GROUPS

IBM SUPPORT
- Bulletin Board
- PS/2 Support Magazine

FUTURE CONFERENCES
- Group discussions - 1st half
- Combined Overview - 2nd half
- DataBase of Attendees
- Newsletter Exchange
- Manatee: Oct. 20 or 27, 1-7pm

If you would like to add suggestions or have topics that you would like our group to support, please bring them to our attention by calling Harvey Bruneau at 932-6745 and/or put a C)omment or M)essage on the BBS at 239-3704.

COMPUTER SHOWS

September 7-9: Pinellas Square Mall
Business,Computer & Electronics Show
September 28-30: Orlando Expo Centre
Great Southern Electronics & Computer Expo
October 17,18: Tampa's Curtis Hixon Hall
Computer & Business Equipment ExpoTech

continued from pg.3

BATCH COMMANDS

that you want to use. CHECK.COM will help you to check a variety of machine characteristics and data that you can use to customize a batch file for a particular task. ESC.COM is an easy way to enter the ESCape character for ANSI sequences that set the colors of your screen or redefine keys. ONCL.COM has functions similar to ESC.COM.

Many computer people say "One day I'm going to learn how to write a batch job." So why not start today with the above exercise? Batch jobs are very easy to write and can save a lot of repetitive work. -E.B.

THANKS - ASHTON-TATE & KEVIN

Sincerest gratitude to Ashton-Tate and KEVIN NOLLAN from the Tampa IBMPC Users Group. We enjoyed KEVIN's fine showing of APPLAUSE II at our July meeting and appreciate Ashton-Tate's gracious donation of DBaseIV.

BITS OF BLUE - Samples & Flyers

The Club now distributes a FREE 1 pg FLYER with 1/2 pg Membership Application on the 2nd side. SAMPLE issues of the monthly newsletter are available by request.

PARADOX

by BORLAND

Paradox is a popular database management software package produced by Borland International, Inc. With PARADOX you won't spend a lot of time programming before you can start your work - PARADOX does the work for you. PARADOX includes everything from database basics to PAL programming - including complex queries and reports, forms and multi-table applications. (PAL is PARADOX's high level programming language - for the in depth users.) This database is more than just a fact finder with its multi-user capability and presentaton graphics.

THE HELP SCREEN

– A NEW COLUMN FOR NEW COMPUTER USERS

by Edward J. Kant, P.E., Naples, Fl.

This is the first in what I hope will be a continuing series of HELP columns on the most common DOS commands, device drivers, and other useful tidbits. I realize that many of you are fairly experienced DOSers; however, from talking to people at work, at the Tampa IBMPCUG meetings and from my experience as an adult education teacher at Collier County Vo-Tech, I believe there are quite a few of you who would welcome down-to-earth and (relatively) jargon-free communication. I am open to suggestion and encouragement. If, however, this column may be perceived as superfluous, I won't be mortally offended.

Let's start off with three of what I think are among the most used commands in the DOS "vocabulary": **MKDIR (MD)** -- **MaKe DIRectory**; **CHDIR (CD)** -- **CHange DIRectory**; and **RMDIR (RD)** -- **ReMove DIRectory**.

Unless an application has an installation program on the distribution disks, you must usually make up a new directory in which to put the program and overlay files for the application. Many times you might also want to make a subdirectory to hold the data files. I strongly recommend that you arrange your hard disk to keep your data, correspondence and other *CHANGEABLE* files in separate subdirectories from your program files. We will discuss the wisdom of this approach in a later column when we review *BACKUP and RESTORE*.

In general, I will try to use the following discussion structure:

COMMAND NAME	**Internal/external**	**First DOS Version**
⬆	⬆	⬆
Name as used or abbreviated.	Internal to COMMAND.COM or an external program.	1st DOS version where this command appeared.

PURPOSE ⬅ what the command is used for.

SYNTAX ⬅ command with parameters, switches, options, delimiters or other modifiers.

OPTIONS, SWITCHES, DELIMITERS ⬅ what they mean.

DISCUSSION ⬅ a short discussion of where you might use this command along with any cautions, hints, tips, or other potentially useful information.

EXAMPLES ⬅ an example (or several examples) of common usage of the command along with specific hints for that particular combination of switches, etc.

If you have questions, comments, or suggestions, I can be reached on Bits of Blue under EDWARD KANT, on Compuserve at 71020,2722, on GEnie at E.KANT, or on DELPHI at EDKANT. *continued page 5*

Minutes from the August 8, 1990
TAMPA IBM - P.C. Users Group Meeting

by R. & B. Waters

The meeting was brought to order by Harvey Bruneau. H. Bruneau introduced John Johannesmeyer from the WordPerfect Corporation to lecture on WordPerfect 5.1 and DrawPerfect.

John discussed and showed the many features of WordPerfect 5.1 first. Version 5.1's claim to fame is that it is much easier to use. Now included are pull down menus and mouse support. In addition, this newer version has the ability to create tables anywhere in your documents. WordPerfect 5.1 still uses the same amount of memory that 5.0 does, 384 K.

DrawPerfect allows you to create, design, and edit graphics that may be imported into your WordPerfect documents. (Graphics created with DrawPerfect can be used in other applications, not just WordPerfect) Like other drawing packages, DrawPerfect has the basic drawing and editing commands, but included with DrawPerfect is much more. You may view samples of different types of fonts before you choose them. DrawPerfect uses vector graphics to give you more clarity when zooming in on graphics. One neat feature is the ability to create graphic/slide show presentations. These presentations can be output to the screen, the printer, a file or be made into overhead transparencies and 35 mm slides. Included is a run-time version of the slide show application so you may create a slide show, put it on disk and give it to a friend to see or to distribute. This person does not need to have DrawPerfect in order to view it. There are no licensing or royalty fees.

WordPerfect has also come out with two other "Perfect" applications. LetterPerfect is a stripped down version of WordPerfect. (It's ideal use would be for laptop computers that do not have enough memory, graphic support, etc. to support WordPerfect.) LetterPerfect will import a WordPerfect document with commands that it does not support, and leave them there, while you do the basic editing. When you save it, you can transfer it to WordPerfect and the commands LetterPerfect didn't support would still be there, along with your changes.

Rhymer is another application from WordPerfect. Rhymer will rhyme any word or phrase you tell it to and will allow you to specify which part of the word or phrase to rhyme.

Throughout the presentation, John gave away calculators and hats for those members who actively participated. This was one of our best presentations and the group thanks John for speaking.

H. Bruneau announced that BORLAND will be speaking on PARADOX at the September meeting and PRODIGY will do an online demo. At the October meeting, Digital Research will speak on Dr. Dos 5.0 and Delrina will show PerFORM.

H. Bruneau announced that Ashton-Tate has released dBASE IV 1.1.

MAKE DIRECTORY

MKDIR (MD) internal DOS 2.0

Purpose: The **MKDIR** command creates a subdirectory on the specified or default disk drive. Its abbreviation is **MD.**

Syntax: **MKDIR [d:][path]directoryname**

Where: **d:** is the drive for which the current directory will be changed and **path** is the path from the current directory or from the root. All directory names on the path must be separated by a backslash (\). If no path is specified the default (current) path will be displayed.

If the command is entered without a disk drive identifier, the default (current) drive is used. Beginning the path with a backslash (\) tells DOS to create the path starting at the root directory.The absence of a leading slash indicates that you want to create the directory starting at the current directory. Only one directory level may be created by each command, that is, you cannot create two directories at once. Only the root directory has a limit to the number of entries it can have (512 entries -- more than enough for most people). Each subdirectory may contain many subdirectories of its own. The only limitation is that the length of any path from root directory to the desired subdirectory must be less than 64 characters including embedded backslashes.

Examples: **MKDIR B:\DIR1**
Create subdirectory DIR1 on drive B: from the root directory.

MKDIR DIRX
Create subdirectory DIRX on the default (current) disk drive in the current directory.

MKDIR A:\DIR1\DIR2
Create subdirectory DIR2 on drive A: in the directory DIR1 (DIR1 must exist before this command can be executed).

CHANGE DIRECTORY

CHDIR (CD) internal DOS 2.0

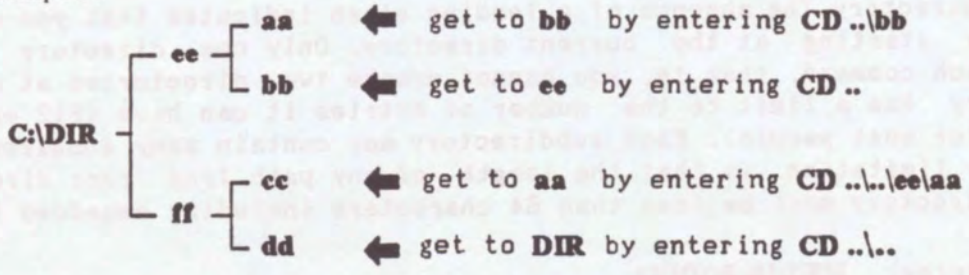
Purpose: The **CHDIR** command changes the current directory of the specified or default disk drive. The abbreviation for **CHDIR** is **CD.**

Syntax: **CHDIR [d:][path]**
If no path is specified the default (current) path will be displayed.

Example: **CHDIR** or **CD**
Displays the current directory.

If a disk drive is specified and no path is given, the default path for that drive will be displayed. *continued page 6*

CHANGE DIRECTORY - (CD) *continued from pg. 5*



Example: **CHDIR A:**
Displays the current directory of drive A:.

Typically no drive is specified because you usually want to change the current directory of the current drive.

Example: **CHDIR \directory\subdirectory**
Changes the current directory to the specified (sub)directory.

A **shortcut** for accessing subdirectories:
If you are a not in the root directory and want to specify another directory higher in the tree or at the same level, the DOS "shorthand" characters ".." will provide a shortcut. Using .. will "move" you to the parent directory of the current directory. If you are in the root directory and try to use CD .. nothing will happen. Directory names and .. must be seperated by a backslash character (\).

Example:

REMOVE DIRECTORY

RMDIR (RD) internal DOS 2.0

Purpose: The **RMDIR** command removes an empty subdirectory from a disk. Its abbreviation is **RD.**

Syntax: **RMDIR [d:][path]directoryname**

The subdirectory must be empty, except for the "." and ".." entries, before the remove operation will be accepted. If the disk drive is not supplied, the default (current) drive is assumed. The path will start at the root if preceeded with a backslash (\), or it will start at the current directory by omitting the backslash. The last directory name in the path is the one removed. Only one directory level may be removed per command. The root directory and the current directory cannot be removed.

Examples: **RMDIR DIR1\DIR2**
Remove the subdirectory DIR2 from directory DIR1 of the current disk drive.

RMDIR DIR0
Remove the subdirectory DIR0 from the current directory.
RMDIR B:\DIR1\DIR2
Remove the subdirectory DIR2 from directory DIR1 on the disk in drive B:.

Mouse Trap

. . . Ed Buzza

Your computer now has a new super duper high resolution VGA card and an upgrade for your favorite program, or a new package, has just arrived. Naturally, you hurriedly install the new software. Gotta try our all the new frills and features: VGA graphics, mouse support, drag down menus, and pop-up help screens, -- in short, a plethora of "good stuff".

You fire up the software, wiggle the mouse -- and nothing happens! No mouse indicator on the screen. No keyboard indicator either. You go to the manual, reread the Install procedure and do it all over again. With a bit of trepidation, you call up the program and, lo and behold, still no mouse! Now what? has to be defective software, right? Right! Hang the phone bill, got to call Tech Support. If you've ever called any vendor's Tech Support for help, you know what a frustrating hassle that can be. Some companies are very good (there are a few), some are lousy (there are a few), and the rest are so-so. Also, they ask some far out questions: what BIOS version and whose is it; what's in CONFIG.SYS; what drivers and what IRQs are being used; type of PC and what's in it; and on and on and on.

STOP. The most common cause is outdated software for the mouse. But, you say, it works fine with all my other software. Sure, but check the date of your mouse software. Most likely, the mouse driver will handle EGA and lower video modes but not VGA mode. More and more of the new software, including upgrades, will check your video board, find that it's VGA, and will set itself up in VGA mode. Fine. Nice feature. Program doesn't ask a whole bunch of questions about your machine; at last, an intelligent and user friendly program. Except that your mouse driver can't handle VGA mode.

Are you dead in the water? Have to rush out and get an upgrade for the mouse software? Maybe. Most video boards come packaged with some software, like menus and utilities. Check your video programs, and the manual, to see if you can't "lock" or set the video board into a certain mode. If so, crank up that video program and set/lock the video adaptor board into EGA mode. Now, start up the new, fancy frills package and you may be pleasantly surprized to find that your mouse is active. It works. There's the mouse indicator. When the new program checked your PC, it could not determine that your "EGA" board is really a VGA board!

Of course, you should check with your mouse vendor from time to time to see if there are any software upgrades for your mouse. I'm sure you've all seen the admonition in the user manuals about using the latest version of mouse drivers. Pay attention, it may save you a bit of grief later on when you upgrade parts of your PC or your other software packages. I will be replacing version 5.01 of my mouse driver with version 6.3 as soon as the vendor processes my recent order. Maybe now I can run version 3 of First Publisher in VGA mode.

TIBMPCUG BoardMeets

The TAMPA IBM-PC Users Group Board met at the home of HARVEY BRUNEAU on August 20 with seven of the nine board members present. Goals and plans were discussed for our own group as well as reviewing the events of the SUNCOAST AREA PC Users Group joint Conference.

One of the main issues discussed was that of membership renewal period, regarding the collection of dues. In the next newsletter the results of this topic will be printed. The board decided to participate in a National Support Group as well as the Suncoast Area PC Users Group.

If you have any topics that you would like our group to support, please bring them to our attention by calling Harvey Bruneau at 932-6745 and/or put a C)omment or M)essage on the BBS at 239-3704.

REFLECTIONS

One of the most difficult things to give away is kindness - it is usually returned. *Cart R. Flint*

OOPS!

EDITOR ERROR - The speaker for the August meeting was JOHN JOHANNESMAYER not Kenneth Mason as stated in the August newsletter.

THANKS WORDPERFECT and JOHN

The Tampa IBMPC Users Group extends Warmest thanks to JOHN JOHANNESMEYER and WordPerfect Corp. JOHN captivated the group from the moment he was introduced until he left the meeting on his "Perfect" journey. JOHN explained that his objective for the evening was for us to "have a good time and learn something new". The tasks were met easily as he mesmerized the group with his humor and detailed knowledge of his products. The club thanks you for an enjoyable and informative demonstration of WordPerfect and DrawPerfect; the donated Director's Chair and the many participation rewards. They will continue to remind us of an excellent speaker and a superb product from a first-rate Corporation.

BITS OF BLUE Newsletter Available on Area BBS's

The August newsletter was distributed to 32 Electronic Bulletin Board Systems this past month by new Member BETTY GOODMAN, Co-Sysop of Compu-Tech BBS. Some of the boards offer online viewing of the newsletter as well as having it available for download. For those without graphics capabilities a printer version is online for download on the Gallifrey BBS at 885-6043.

On the Bits of Blue BBS there are both June and August copies in the Personal Download Section. They are respectively: BOB-0690.ZIP and BOB-0890.ZIP

Many thanks to the various Sysops who have shown their interest, support, and assistance of this media.

Tampa IBM PC Users Group Meeting
and
WordPerfect Review

by Betty Goodman

The IBM PC Users Group met on Wednesday August 8 at the IBM Customer Center. There were 62 people in attendance. Before going into the excellent presentation, I must mention that the above group is a PC user support group which recognizes the advantages of running a BBS as part of that support, namely Bits of Blue. It in turn provides continued support for club members as well as inform non-club members that there is a PC support group available.

I must confess that I left the meeting feeling quite sad. I had previously spent considerable time deciding which wordprocessing package I preferred and eventually adopted Wordstar and deleted WordPerfect. The reason for the sadness now is as follows: WordPerfect 5.1 as presented to the group by sales rep John Johannesmeyer is so obviously superior that I must now delete Wordstar and readopt THE wordprocessing program, namely WordPerfect. The reasons are many. This wordprocessing program is immensely versatile and now it also has mouse capability. The commands have grown vague in my mind, however with the use of the mouse, one does not have to rely on one's memory at all. My husband being a research Math Professor will DEMAND this program, because it is capable of producing the most *perfect* Math symbols, such as Summation, Integral, and square root signs. Its equations look just right and the subscripts and superscripts are excellent. It can also serve similar to a hand held calculator. WordPerfect's many aspects cannot possibly be enumerated here, for they are so varied and so many. One can combine text and graphics by toggling between WordPerfect and DrawPerfect, which is another excellent program by WordPerfect. I was particularly interested to learn about DrawPerfect due to my interest in graphics. The most impressive graphs and pictures are created by DrawPerfect. These pictures and graphs are saved in vector graphics. As a humorous side remark, there now is a RhymePerfect for those of us whose creativity is in poetry or lyrics!

DR DOS 5.0

by DIGITAL RESEARCH (DRI)

DR DOS, is an operating system for computers. Created by Digital Research, Inc.; it is RAM and ROM executable. Their ad states that this makes DR DOS "the operating system of choice by OEMs and VARs worldwide for hand-held computers, diskless workstations, embedded systems, laptops, and powerful desk-top machines."

Computer Shopper says: "It has all the equivalent features of PC/MS-DOS 3.3 and most of those of version 4.0, plus... partitions larger than 32 Mb, on-line help, a larger TPA, and other neat features."

PC Week states: "...DR DOS is faster and cheaper and offers more features than its big-name counterparts."

PC Magazine remarks: that "With DR DOS in ROM,...No disc drives have to be accessed, so the battery suffers less of a drain. [It] also frees memory for use by applications."

PerFORM Designer & Filler

by DELRINA

PerFORM, a Form creation and filler software package produced by Delrina Technology, Inc. makes most paper forms obsolete. It enables you to design, warehouse, and fill custom forms on your IBM PC or compatible. PerFORM Designer & Filler are graphic-based. You see on the screen exactly what your form will be when you print it. It has mouse-driven tools that no other form software has. PerFORM does the work for you; it will import from dBase and ASCII files.

Publish! rated it ♦♦♦♦! and wrote, "Surpasses both MAC programs and the other PC programs." Stewart Alsop, PC Letter, said, "out performs them all."

Electronic News

The October newsletter has been distributed to 32 Electronic BBSs this month by BETTY GOODMAN, Co-Sysop of Compu-Tech BBS. Some of the boards offer online viewing of the newsletter as well as offering it for download.

On the Bits of Blue BBS there are copies of June, August, September and October in the Personal Download Section. Monthly the filename changes to correspond with the month and year. Filename format

is: BOB-mmyy.ZIP
Ex.: BOB-1090.ZIP

Thank you to the many Sysops who have shown interest, support, and assistance of this media.

Board Meeting

The TAMPA IBM-PC Users Group Board met at the home of HARVEY BRUNEAU on September 26 with seven of the nine board members present.Officers reported on their progress toward carrying out previously discussed plans for our group.

A main issue covered was membership renewal period -regarding the collection of dues. The results of this topic are printed in this newsletter. (this page.)

Also, covered were diskettes for new members. See next month's newsletter for a brief list of their contents.

Present any topics that you would like our group to support, to our attention by calling Harvey Bruneau: 932-6745 and/or leave a M)essage on the BBS at 239-3704.

THANKS PARADOX & PRODIGY Speakers

The Tampa IBMPC Users Group extend a great big thank-you to DAVID PRINTZ and Borland International Inc. DAVID gave a very interesting demonstration of Borland's popular data base management program, PARADOX 3.5. DAVID emphasized and impressed the group with the simplicity of using PARADOX that is not usually found with this type of application. For more on this product see the TIBMPCUG Meeting Review by BETTY GOODMAN in this issue. We are also most grateful for the donation of a PARADOX software package.

A sincere thank-you also to KATHRYN LEVANDOWSKI of Prodigy. KATHRYN gave an enjoyable and informative demonstration of Prodigy on-line, explaining the various features offered. Mail-in Upgrade cards and literature were available to all.

REFLECTIONS

Good Judgement comes from experience.
Experience comes from Bad Judgement.

Author Unknown

Change in Membership Regulations

MEETINGS

After attending any three (3) meetings during a calendar year, a guest shall be required to join for further admission during that calendar year.

BBS LOGON-ONS

Further, guest log-ons to the Bits of Blue BBS shall be limited to three (3) sessions during a calendar year.

MEMBERSHIP DUES

Effective January 1,1991, membership renewal dues will be based on the *anniversary date* of application. Date of application will be the date the membership application and annual dues are tendered to the Membership Director.For mail-in membership applications accompanied with a check for annual dues, the *postal cancellation date* stamp shall be the application date.

This change will have no effect on current members whose annual dues must be received on or before January 1st of each year.

In the event renewal dues are remitted within six (6) months after the anniversary date, the ex-member's date of renewal shall be retroactive to the original established, date of application.

Tampa IBM PC Users Group

Meeting Review

by Betty Goodman "bpg"

The Wednesday September 12 meeting of the IBM-PC Users Group was held as usual at 6 P.M. in the architectually beautiful Lake Pointe One Building. The first speaker was Borland's representative David Printz who presented Paradox 3.5. This program provides all the database power one could possibly require. Yet it eliminates the complexity that usually presents itself in database management. Paradox combines superior performance and intuitive operation. I, personally, was impressed with Paradox's graphics capability. With a simple keystroke, tables can be turned into graphics that allow for ease of analyzing relationships in data.

After the intermission and refreshments, a charming demonstration of Prodigy-on-line had the audience captivated.

What is needed to run Prodigy Services:
IBM/Compatibles require 512K, Dos 2.0 or higher, VGA/EGA/CGA, 1200/2400 Baud modem.

Key points of interest:

Value:	750 features, low flat monthly fee, local phone access.
Easy to use:	You need not be a computer wiz to use Prodigy.
Personal:	Using your own personal ID# and password, you can create a personal Path to suit your interests.

Prodigy provides a world of information and services:

Travel:	Book your own airline flights, hotels, car rentals, etc.
Communication:	Exchange messages with members in distant cities.
Play:	Games, fun contests, and exciting quizzes for kids of all ages.
Shop:	Shop for great values on thousands of items.
Finance:	Buy and sell stocks, get quotes, do your banking.
Learn:	Encyclopedia and educational games.
News:	Check the latest updated news.
Weather:	Current local and foreign forecasts.
Sports:	The latest stats and standings.

For information: 1-800-284-5933

There are door prizes and refreshments.

COMPUTER SHOW: Tampa EXPO-TECH
October 17 & 18: Tampa's Curtis Hixon Computer & business Equipment Expo Tech

CONVERGENCE

by Don Patzsch of Brandon, FL

You might ask, "What is going on in today's software industry. Hardware seems to be going much faster than software.

Perhaps one way to look at it is to recall that years ago there were many separate computer manufacturers working completely independently of one another. Now the hardware people have combined many groups of computer functions into ever more complete, individual, "million transistor" chips.

When you view the overall picture, it becomes obvious that the whole hardware industry is "converging". There are fewer companies each year producing comparatively larger chip modules.

Similarly, there are fewer companies each year producing operating systems like UNIX, TRON, OS/2, Windows, and DOS.

Each year fewer and larger CPU chips become available. Motorola with its 68000 series; and Intel with its 80x86 series; are combining the math chip, the CPU chip, and the Cache chip into one mammoth smaller device. The purpose is to provide ever faster computer systems. As competitors come into the market, they are all providing chips that do the same things, and as they are all putting more into smaller chips, parallel CPU chips provide parallel processing and share the total amount of work done, multiplying that effort. The overall picture in the hardware systems then converges. Where there was a mainframe, a supercomputer,a minicomputer, a workstation, and a personal computer, now the whole industry, worldwide, is converging to where we can see in the future, a single computer combining the features of all those listed. Bearing that in mind, IBM has announced its intention to produce programs that will run on UNIX, OS/2, and AIX. The long term, then will see all the operating systems converge into one program that will function with all computers.

The software industry must follow the hardware people, and it is interesting to take a particular program to see how this is working out. We cannot use too many examples in only one article. P.C.Tools, version 6; and Magellan, version 2 form such an example. PCTools started as a utility to make some computer operations easier to do, and easier to understand. Lotus 123 started by making a spreadsheet, but now PCTools and Lotus both give us a "find" and a "view" program. Bring up PCTools on one computer and Lotus Magellan on another. Try to "find" and "view" with each program and you will see that Magellan is infinitely faster and more complete.

The software industry consists mostly of a word processor, a data base, and a spreadsheet. These people were all little independent groups a few years ago, but now, in 1990, they are all producing programs for use with ALL the operating systems. Projecting forward just a little shows that when all these people produce for each operating system, the programmers will get together and iron out all the little problems in the operating systems, UNIX, OS/2, and TRON.

It won't be long before the screen that Lotus used, with the line across the top having all the major commands in view at one time will be the common graphic interface of all software. It wont be long before the tricks Lotus used to produce Magellan will work their way into all software.

(Continued on Page 6 - Convergence)

CONVERGENCE - (Continued from page 5)

Sit back and look into the future. Right now, you only see computers, programs, and systems of United States origin, When the "Third World" gets into computing they will want not only the best features of present day hardware and software, but they will look to other countries and programs as well. Looking into the future, it is not hard to see desks with just one computer on all of them. Terabytes of memory, terabytes of optical read-write storage, parallel processors, screens that are flat, and with the DOUWT operating system. Douwt combines DOS, OS/2, UNIX, Windows, and TRON, but now they have melted into one program.

In 1990 we have not arrived just yet, but what have YOU done to help YOUR User Group push this work faster? It requires the Users to give the programmers the ideas for their work. Why not get involved in any way you can? **- D.P.**

PATH

THE HELP SCREEN

Edward J. Kant, P.E. Naples, Fl

PROMPT

This month's discussion will center on the DOS environment. The environment is a special place in memory (**RAM**) where DOS stores a few special variables and user-defined variables that may be accessed by your applications on an as-needed basis.

In a very broad general sense, the term *environment* refers to a variety of background factors that affect the operation of DOS commands and applications. Among the factors that may comprise the environment at any given time are: the system date; the system time; the current directory; the DOS file search path; the country settings; etc.

The DOS environment also may be thought of in a narrower sense, one more closely related to our everyday usage, as an area in memory set aside for the storage of certain variables that will be used by application programs. Normally, at least the current prompt, the current search path and the filespec of the command processor are stored there. We will discuss the **PATH** command along with **PROMPT** and a few others in a moment.

The **PATH** command is another way to use the environment to customize a variable. DOS recognizes the **PATH** command as an instruction string giving the location of *executable* file search specifications.

The **PROMPT** command allows you to change the DOS prompt to almost any configuration you like. You don't have to settle for the plain vanilla "**C>**" or even the more common "**C:\>**". You may use the **PROMPT** command to set an environment variable that will say (and look) just about any way you wish.

Let's take a closer look at these *environment* variables along with a few examples.

(Continued on page 7- PATH)

PATH

internal DOS 2.0

Purpose: The **PATH** command instructs DOS to search the specified directories for *executable* commands or batch files not found in the current directory.

Syntax: **PATH [d:][pathname][;[d:][pathname]...]**
or **PATH;**
where: **d:** is the drive and **pathname** is the full path specification to the desired directory.

Comments: The **PATH** command lets you tell DOS which directories to search for executable files after it searches your current directory. Remember, *executable* commands are files with the extensions **.COM, .EXE** or **.BAT** The default (boot up) value is no path.

You instruct DOS to search several directories by separating the pathname specifications with semi-colons (;). Using the **PATH** command with no arguments displays the current path.

The search order is implied by the order in which the individual pathnames are listed. The full pathname starting at the root directory must be given. When searching for an executable file, DOS does not change the current directory or disk.

Examples: **PATH C:\;D:\;C;\DOS;C:\DOS\UTIL;D:\WIN**
This path will, after checking the current directory, first look in the root directory on the C: drive, then the root directory of the D: drive, then the C:\DOS directory, then the C:\DOS\UTIL directory and, finally, the D:\WIN directory. If the executable command file desired is not in any of these directories, then DOS will give you the "File not found" error message.

PATH
This command will display the current path.

PATH;
This command will reset the path to the default, or "empty" status.

Notes:

1. The maximum length of the **PATH** is 127 characters including the word "PATH" itself, the space following it and any separating semicolons.

2. The **PATH** remains in effect until reset or until changed. A reboot is not necessary to change the search path.

3. A **PATH** command with invalid parameters or characters will not be detected by DOS until it is asked to do a search. At that time an error message will be generated.

(Continued on page 8 - PROMPT)

PROMPT

internal DOS 2.0, 2.1

Purpose: The **PROMPT** command lets you specify what the DOS prompt should look like and allows you to tailor it to your own liking -- within limits!

Syntax: **PROMPT [text]**
or **PROMPT [$character]**
or **PROMPT [$character.....] [text]** (any combination)
where: **text** is any ASCII text string (words) or character combination and **$character** is any of the DOS meta-characters given in the table below:

Meta-character	Prompt string	Meta-character	Prompt string
$q	=	$t	The current time
$$	$	$d	The current date
$g	>	$p	Current directory
$l	<	$v	The DOS version
$b	|	$n	The default drive
$h	Backspace	$e	ASCII ESCape character
$_	Enter-Linefeed		

Comments: This command lets you change the system prompt at will. If you do not specify a prompt, usually in the **AUTOEXEC.BAT** file, DOS will display a default prompt giving the current drive and a "greater than" symbol(>).

Examples: **PROMPT pg**
This sets the prompt to the current drive and directory followed by a "greater than" symbol (>).

PROMPT TIME = $t $_DATE = d_$p:
This command will give you a three line prompt as follows:

```
TIME = (current time)
DATE = (current date)
C:\:   (assumes you're logged on the root directory of the C: drive)
```

(Note especially the embedded spaces. They will show up in the prompt just as they were written.)

PROMPT $e[7m$n$p:$e[m
Try this on your own machine if you have the **ANSI.SYS** device driver loaded in your **CONFIG.SYS** file. This command sets your prompt to display in inverse video mode and then returns the display to normal mode

PROMPT
This command will reset the prompt to the system default (current drive followed by >).

PROMPT Your wish is my command:
This command will display the text string as written.

Note: In a future column we will discuss the ANSI.SYS device driver and ANSI escape sequences. It is a fascinating subject and with a little imagination, you can do all sorts of wild things, especially in batch files.

DAVIDSON CORP. Demonstrates

Tampa Area Boards and Tampa Board News

If you have a modem you have a vehicle to a whole new world. Just like a car can take you places you have never been, so can your modem. From a store where you can purchase items to far away galaxies. Your modem can take you there! With one phone call you can travel there without leaving the comfort of your own home. The only information you need are the BBS tele phone numbers to dial. This is where a local source has helped us. Dennis Rodriguez of Aerotech has been putting together lists of local area bulletins boards since the mid 80's. The list includes valuable pieces of information for your use. It includes: Maximum baud rate, when the BBS was started, how much disk space (for files),and a brief statement about the features of the BBS. This list is FREE and can be found on most any local BBS. It is available on BITS of BLUE as both a bulletin (#4) and a file (TAB10.90).

Dennis also compiles a newsletter of information about Tampa Area Bulletin Boards(also, found on most BBSs as: TBN10.90).Each month files are updated and the filenames are changed to correspond with the month and year. Look for: TABmm.yy (Tampa Board List) and TBNmm.yy (Tampa Board News)

If you have a BBS you would like listed, or if you would like more information, call Dennis Rodriguez of Aerotech at: 654-3000 Happy BBS'ing!

XTreePro Gold

"The world leader in disk management"

by Executive Systems, Inc.

XTreePro Gold is a hard disk file manager for personal computers. Created by the XTree Company, a division of Executive Systems, Inc.; it is a very popular file managing utility. It was the "Editor's Choice" of PC Magazine - June 12, 1990. Once you organize your hard disk with XTreePro Gold you can forget about difficult DOS commands. You can perform functions like tag, copy, and move files in a snap! With XTreePro Gold you can locate files by content, too. Using the Text Editor, you can edit files within XTreePro Gold. It is simple to use - open any file and its application with a single keystroke or a click of the mouse. There is a demo version of XTreePro Gold 1.3 on Bits of Blue BBS - to download refer to filename: XTGDEMO.ZIP

Farewell to Someone Else

Reprinted from the Alaska Computer Society PC News

Our club was saddened this week to learn of the death of Someone Else.

Someone Else was one of our most devoted members, and his passing creates a vacancy that will be difficult to fill. He was with us for a long time and did more than his share of work.

Whenever there was a job to be done, a meeting to attend, an article to write, or the need to fill in for the SIG leader, one name was always mentioned: "Let Someone Else do it!" It was common knowledge that he was one of the most ardent supporters of our club.

Someone Else was a wonderful person - sometimes appearing to be superhuman, but a person can only do so much. If the truth were known, everyone expected too much from Someone Else. Now that Someone Else is gone, I wonder what we are going to do.

When you are asked to help out, please remember we can't depend on Someone Else anymore.

TAMPA IBM PC USERS GROUP

REPORT ON THE OCTOBER MEETING

by Betty Goodman ("bpg")

The Wednesday October 10 meeting of the IBM PC Users Group was held as usual at 6 P.M. in the architectually beautiful Lake Pointe One Building. There were 72 people present and the group appears to be growing by leaps and bounds. Its success is due to many factors, such as growing interest in computers in general and PC's in particular. Harvey Bruneau (president) presides the meeting in such a relaxed, informative, and humorous fashion that it merits applause and mention.

The announcement was that Digital Research would present Dr Dos 5.0 and that Delrina would show Perform. However both demos were cancelled at the last moment and quick improvisation created the following demos:

ED BUZZA demonstrated COREL DRAW by Corel Systems. This is an impressive illustration program. It features many fonts, free hand drawing, and text can be wrapped around curves. The format appears to be somewhat like PCPAINT, however this program appears to be far more powerful. The user gets a video tutorial along with the software, which ought to be extremely helpful. The program is definitely "user friendly" and should rank tops as an illustration tool.

After the intermission and refreshments STEVE SPEAIRS (vice-president) presented PCTOOLS 6. Now here is a program no computer-ite can do without. It is exactly what it's name indicates: THE tools for the PC! It is a large and powerful program and it's impossible to describe all its functions. It is mouse driven which makes it terribly handy. Talk about "user friendly"... it practically runs itself. There are "drop down" windows. The File window lets you highlight and choose everything you want to do with a file (but were not afraid to ask): copy, move, delete, edit, quick file review, etc., etc.,etc. The same is true for the Disk window. One of the handiest windows is named Special. It is! You can highlight and view a disk map, a file map, AND directory sort. With a click of the mouse button ... all your files are alphabetized. PCTOOLS also has the compress and diskfix features so important to "the health" of your computer.

***** ANNOUNCEMENTS *****

The IBM PC Users Group meets the second Wednesday of every month. Next meeting:

When: November 14, 1990
Time: 6:00 P.M.
Demo: XTreePRO Gold by ED KANT

The purpose of the PC User Group meetings is to inform all computer enthusiasts. The intent is to encourage, enlighten, and inform. The topics generally have something of interest for everyone. There are door prizes and refreshments.

NAMES in the NEWS: Ed Buzza AND Steve Spears

We are very fortunate and grateful to have two such gifted and dedicated members as ED BUZZA and STEVE SPEAIRS. At the October meeting ED BUZZA demonstrated Corel Draw for the group and STEVE SPEAIRS demonstrated PC Tools 6. We compliment and thank them both for selecting fine products to show and most of all for taking their efforts to share their knowledge of these products with us.

COMSPEC

This month's discussion will continue the topic we started last month -- the DOS environment. Last month we looked at the PATH and PROMPT commands. This month we will discuss the other two important environment variables: **SET** and **COMSPEC**.

In a very broad general sense, the term *environment* refers to a variety of background factors that affect the operation of DOS commands and applications. Among the factors that may comprise the environment at any given time are: the system date; the system time; the current directory; DOS file search path; the country settings; etc.

The DOS environment also may be thought of in a narrower sense, one more closely related to our everyday usage, as an area in memory set aside for the storage of certain variables that will be used by application programs. Normally, at least the current prompt, the current search path and the filespec of the command processor are stored there. Other variables that are used by your application programs also may be stored there with the use of the **SET** command. We will discuss the **SET** command along with **COMSPEC** and a few others in a moment.

The **SET** command lets you view the current contents of the environment and also lets you store new variables, change existing ones and delete no longer needed ones to save space. **SET** allows you to add any parameter to the environment, even if DOS doesn't recognize it. This is how you can establish values for parameters used by application programs.

The **COMSPEC** variable tells DOS where to find the command processor. This is a standard environment variable and is the only one that is absolutely necessary. Without it, DOS will not be able to find and reload the transient portion of **COMMAND.COM** if an application program has taken over that portion of memory.

Let's take a closer look at these *environment* variables along with a few examples. (Continued on page 5 - SET)

Manatee Hosts SunCoast Conference

October 20th, President HARVEY BRUNEAU and SysOp KEVAN SHERIDAN represented our group at the Suncoast Area Conference in Bradenton. The meeting was hosted by the Manatee PC Users Group.

The guest speakers JERRY SCHNEIDER and GENE BARLOW were introduced.

Jerry is the Secretary of the national Association of PC Users Groups and a prime mover. He is involved in all their activities and is also on the User Group Advisory Board of PC World Magazine.

Gene is IBM's corporate coordinator of IBM PC User Groups and manager of the IBM Personal Systems Technical Journal.

After the introductions and guest speakers the group broke for lunch returning to break into smaller function groups, e.g. program planning, newsletters, membership, etc.

After an hour or so the groups reassembled for a closing general meeting where plans for the next conference were discussed.

SET

internal DOS 2.0

Purpose: Sets one string of characters in the environment equal to another for later use in application programs.

Syntax: **SET [name=[string]]**
or **SET name=**
where: **name** is an environment variable name and **string** is a string of characters which is the value of name.

Comments: When DOS recognizes a **SET** command, it inserts the given name and its equivalent into a part of memory reserved for the environment. If the name already exists in the environment, it is replaced with the new setting.

If you specify just the name, **SET** removes any previous setting of that name from the environment. If you use the SET command without any arguments, DOS displays the current environment variables and their settings.

SET can also be a valuable addition to batch processing. You may use SET to define replaceable parameters by name instead of number. When doing so, you must enclose the variable name in **%** symbols in the batch file (see the examples which follow). This way you can change parameter names without editing each batch file if you use the same parameter in several batch files.

This last characteristic of **SET** is especially helpful in the **AUTOEXEC.BAT** file. You can set up your parameters and strings right when you boot up. You must exercise a little caution, however, because the size of the environment is finite and you may get an "Out of environment space" error message. If so, the environment must be enlarged with the **COMSPEC** variable (more on that later).

Examples: **SET FILE=taxes.86**
If you have a line in a batch file that reads "type %file%", the %file% parameter will be replaced with the filename "taxes.86".

SET INCLUDE=c:\inc
This command sets the string "include" to the value "c:\inc" until such time as you change it.

SET
The SET command by itself will display the current contents of the environment.

SET VAR=
This command will reset the variable "VAR" to a null value (or you may think of it as "zero") and release the space that VAR took up in the environment for another variable.

Note: **PATH, PROMPT** and **COMSPEC** do not need to be initialized with the **SET** command (in fact, in DOS 4.xx, you may NOT use SET to do so). They may be, and usually are, specified merely by starting the command line with the variable name; for instance:

PATH=C:\;C;\dos

(Continued on page 6 - COMSPEC)

COMSPEC internal DOS variable

Purpose: **COMSPEC** is a standard DOS environment variable that tells DOS where to find the command processor. For most of us, the command processor is **COMMAND.COM**.

Syntax: **COMSPEC=d:pathname\command_processor_name**
where: **d:** is the disk drive, **pathname** is the full path specification to the command processor and **command_processor_name** is the filename of the command processor.

Comments: The default value for **COMSPEC** is the drive and pathname of the command processor used to boot up.

COMMAND.COM itself has two "parts". One of these "parts" can be transient if an application program needs the memory to run. Normally **COMMAND.COM** loads the permanent "part" of itself in low memory and the transient "part" in high memory. It is this high memory "part" that can be overwritten by an application program. When you exit that application program and return to the operating system, perhaps to call up another application program, DOS needs to know where the original copy of **COMMAND.COM** is so that it can "reload" and be ready for your next command. As you can probably tell by now, without the **COMSPEC** variable in the environment, DOS will be unable to find its way to **COMMAND.COM** and will give you the dreaded error message:

Bad or missing command interpreter

Examples: **COMSPEC=C:\DOS\COMMAND.COM**
This setting tells DOS to look for a command processor named **COMMAND.COM** in the DOS subdirectory on drive C:.

Note: If you try to cram too many environment variables into the environment, or if your **PATH** and **PROMPT** commands are very long, you may get an "Out of environment space" error message. IF that should happen, and it probably will if you try to get fancy with your **PROMPT**, then you need to add a line to your **CONFIG.SYS** file as follows:

SHELL=C:\DOS\COMMAND.COM **/E:256** <

or more!

This line tells DOS that before it loads anything into memory, it must reserve more space than the default 160 bytes. The example above has reset it to 256 bytes. You could reset it to a maximum of 32768 bytes if you wished. As a practical matter, I would recommend a realistic upper limit of 1024 bytes. This should be more than enough for the average user. DOS recognizes the environment size in 16 byte "paragraphs". In versions of DOS prior to 3.2, the setting must be in 16-byte "paragraphs". From version 3.2+, the setting is in the actual number of bytes desired.Setting the number of bytes in the **SHELL** command in **CONFIG.SYS** to a number that is not a multiple of 16 will merely cause DOS to round it off to the next highest "paragraph".

I hope the foregoing discussion has stimulated your thinking. If you have any questions or comments, I can be reached on the Bits of Blue BBS or on Compuserve (71020,2722), GEnie (E.KANT), Delphi (EDKANT) or at P.O. Box 8326, Naples, Fl 33941. Thanks to **Ed Buzza** for his "proofing" of this column and thanks to you all out there for listening.

Nominations Continue

The Tampa IBM PC Users Group election for officers will be held at the December meeting, and nominations will continue in November. Several offices will be open for electios, including:

- President
- Vice President
- Secretary
- Treasurer
- Education
- Member at Large
- Membership Chairman

Appointed offices are:

- BBS SysOp
- Librarian
- Newsletter Editor
- Program Chairman.

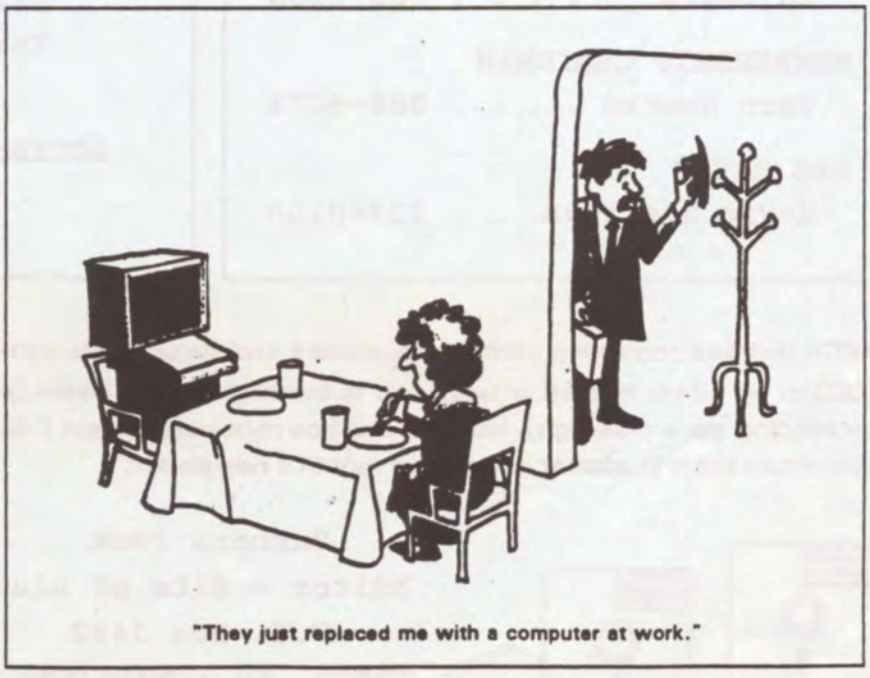
Individuals interested in becoming considered for an office (elected or appointed) should contact a member at or the November meeting. Nominations will be accepted from the floor at the meeting. Only members in good standing are eligible for office or to vote in the general elections.

Appointed positions will be filled by the elected as of January 1, 1991. All elected and appointed positions are for terms of one year, running January 1 to December 31.

Present nominations are:
President- Harvey Bruneau
Vice Pres- Steve Spears
Secretary- Edward Buzza
Education - Edward Kant

Expotech

On October 17th and 18th Tampa's Curtis Hixon Hall was the location of a recent Computer Show. This is a good place to visit to keep up with some of the new developments. Of course, because of the November Comdex in Las Vegas many of the newest products had not been unveiled, yet. This show featured many return vendors and a few new ones. There were also products that would not be seen in most computer shops. Many of the businesses offer show specials and lower prices for this event. If you are in the market for any computer products, this is an easy way to shop and make price comparisions under one roof. The next Expotech in our area is scheduled for March 18, 1991 at the St.Pete Bayfront Center.



Association of PC User Groups

Portions reprinted from Sarasota IBM PCUG NLetter

APCUG has no individual members as the members are PC User Groups. More user groups are joining every month. There are now more than 130 member user groups representing more than 200,000 computer users.

These user groups are in 38 different states, 3 provinces in Canada and 8 user groups in 6 other countries; the Soviet Union, Australia, New Zealand, England, Japan, & the Sultanate of Oman.

By far the greatest representation is from the state of California with 30 user groups. Florida has 12 user groups and New York has 9 user groups in the APCUG.

"They just replaced me with a computer at work."

WealthBuilder

by Money Magazine & Reality Technologies, Inc.

WealthBuilder is a financial goal visualizer using Stock Market & goal setting operations. WealthBuilder by Money Magazine is the only program where you can learn and understand everything about investing to increase your wealth. WealthBuilder uses a term called "asset allocation"-but that is all you'll need to know. After importing your Quicken and Stock data, the program will ask you a few questions, map you to an optimal financial strategy and pinpoint investments (mutual funds, stocks and bonds) for you to buy.

HAPPY HOLIDAYS

TAMPA IBM PC USERS GROUP

REPORT ON THE NOVEMBER MEETING

by Betty Goodman ("bpg")

Approximately 70 people attended the Wednesday November 14th meeting of the Tampa IBM PC Users Group, which took place in IBM's LAKE POINTE ONE Building. The group continues to grow in interest and popularity due to many factors among which are the professional manner in which the meetings are held and the demos which always appear to be of interest to all computer-ites.

Edward Kant presented XTREEPRO GOLD by Executive Systems, Inc., a program which manages the information on one's hard disk. The program was created by the XTree Company, a division of Executive Systems, Inc. Considering the fact that I still use XTREE version 2.0, the version I have dubbed "The Lean and Mean XTREE", I discovered that the new version XTREEPRO GOLD is certainly a most powerful program. It is a very comprehensive hard disk management program for one's PC. All of the information stored on one's hard disk can be seen and organized in a flash. Complicated DOS commands can be circumvented by single keystroke commands. As a matter of fact, a click of the mouse will enable the user to get to files faster, easier, and safer.

GATHER is a powerful new feature. It enables the user to copy or move a block of text from one file to another or to the printer. In the Application Menu one can go into such programs as Wordperfect simply by pointing to them with the mouse. Another new feature is the prune and graft, which enables one to move (or graft) an entire branch of a directory tree (including all subdirectories) to a different location on the directory tree.

A most amazing aspect is that XTREEPRO GOLD can be collapsed to a mere 7K of memory, thus not wasting any RAM when not in use. It is not possible to describe all the many aspects of this powerful program. A demo version of XTREEPRO GOLD 1.3 is available for downloading on Bits of Blue BBS. The filename is XTGDEMO.ZIP.

The usual break followed this demonstration, a time for all to exchange ideas and meet fellow computer-ites. Refreshments were served and then onward to the second half of the meeting.

Nominations were on the agenda. Officer elections will be held at the December meeting and nominations will continue until that time. Several offices will be open for elections. Roger Waters was nominated for Member-at-Large, Harvey Bruneau for President, Steve Spears for Vice President, Edward Kant for Education.

Ed Buzza gave a demonstration on The Best of Tech. Help by Computer Shopper magazine. It offers technical information for PC's. I regret to have missed this part of the meeting as it promised to be of great interest to all of us in computer-land.

COPY

THE HELP SCREEN

Edward J. Kant, P.E. Naples, Fl

XCOPY

This month we will discuss one of the most important and versatile of DOS' commands - **COPY**. We will also touch on a close cousin of the **COPY** command - **XCOPY**.

COPY can be used not only to duplicate files, but to rename, create, combine, print and move files to different directories or drives. The "move" is not really a copy property, but can be simulated in conjunction with the delete or erase commands (**DEL** and **ERASE**). Let's look at **COPY** in the format we have used for prior Help Screen columns:

COPY Internal DOS 1.0

Purpose: The **COPY** command is used to copy files or copy information from a file or device to another file or device.

Syntax: **COPY** [d:][path]filename[.ext] [d:][path]
Copy file with the same name.

Syntax: **COPY** [d:][path]filename[.ext] [d:][path]filename[.ext]
Copy file with the different names.

Syntax: **COPY** [d:][path]filename[.ext] + [d:][path]filename[.ext]...
[d:][path]filename[.ext]
Copy and combine files.

Options:

/A - Indicates this is an ASCII file.
/B - Indicates this is a binary file.
/V - Verify after copy. The **/V** option instructs DOS to verify that the data written to a file is accurate. This provides the same check as the **VERIFY ON** command, but is only effective for the duration of this **COPY** command.

Either option (**/A** or **/B**) takes effect on the file it is placed after and applies to all subsequent files on the command line until the opposite option is encountered. An option placed on a source filename instructs **COPY** how to interpret the file. The **/A** option placed on the destination file causes a Control-Z to be added to the end of the file, a **/B** option does not. The **/A** option is the default for all files unless specified otherwise. Wildcard characters (***** & **?** may be used in both the source & destination filenames.

COPY can be used to make a copy of a file using the source file name for the file copied. The command format shown below may be used to copy a file from another drive and/or directory to the current directory.

Example: **COPY** A:file1
This command copies the file **file1** from the default directory on drive A: to the current directory. *continued next page*

The next command format may be used to copy from the default disk drive to another disk, or between two different directories on the same disk. The destination filename could have been specified in the last parameter, but is assumed the same if not provided.

Example: **COPY** B:*.* \
This command copies all the files in the current directory on drive B: to the root directory of the current disk drive.

This next command can be used to make a copy of a file using a different file name for the file copied. The source and destination files may be in the same directory, or be in different directories or be in different directories of different drives.

Examples: **COPY** file1 file2
This command copies the file **file1** from the current directory to the file **file2** in the current directory.

COPY B:*.HLP *.DOC
This command copies all the files with a .HLP extension from the current directory on drive B: to the current directory on the current drive with the same filename but with a .DOC extension.

You may also copy to or from one of the known devices in the system. When copying to or from a device you must end the input with a Control-Z character to signify the end-of-file condition. This is a dandy way to create Batch Files!

Examples: **COPY CON** file1
Place all input from the keyboard into the file **file1** until the Control-Z character is encountered.

COPY file1 **PRN**
Copy the contents of **file1** to the printer connected to **LPT1:**

The next command is where one or more files are copied to one destination file, creating a larger file as a result. This is on example of the **COPY** command where the source and destination files may actually be the same file (with some limitations).

Examples: **COPY** file1+file2 file3
Copy the contents of **file1** and **file2** to **file3.**

COPY *.HLP+*.DOC info
Copy all files with file extensions .HLP & .DOC to the file named INFO.

COPY *.HLP+*.DOC *.TXT
Copy each file with a matching name and extension into a file with a .TXT extension. The files file1.HLP & file1.DOC would be combined into a file named file1.TXT.

COPY file1+,,
Change the date & time on **file1** to the current date & time. Commas indicate the end of the source file names. *continued next page*

Help Screen *continued*

Wildcards do not work. Files that are combined are usually text (or ASCII) files. This type of file is copied until an end-of-file marker (Control-Z) is found, rather than using the file size from the directory. When copying binary files such as .EXE and .COM files, the file must be copied until the full file is copied, regardless of how many Control-Z codes are detected. You must therefore provide a **/B** switch to **COPY**.

Examples:

COPY file1.BIN/B+file2.BIN/B file2.COM

The second /B is unnecessary because of the first /B.

COPY file1.TXT/A+file2.OBJ/B+file3.TXT/A file4.COM

Because of the /A for the text file file1.TXT a /B had to specified to correctly copy file2.OBJ. The second /A option was also required for file3.TXT to cancel the effect of the preceding /B. In this example file1.TXT, file2.OBJ and file3.TXT are combined to make file4.COM.

!WARNING!:

All **COPY** commands write OVER (on top of) the destination file. If a file already exists with the same destination path and filename, its contents are destroyed by the **COPY** operation without warning!

As I mentioned at the beginning of this column, **COPY** has a close "cousin" -- the **XCOPY** command. I call it a cousin because it is in the same family as **COPY**, but it behaves quite differently. When **COPY** performs its job, it acts on one file at a time. **XCOPY**, however, reads as many files into memory as possible before carrying out its job. In some ways this allows it to act much faster and to perform some interesting permutations on the files assigned to it to operate on. Let's look at **XCOPY** briefly. A detailed treatment would take more space than we have -- besides, it is always more fun to experiment when you are learning something new. **JUST BE CERTAIN THAT YOU HAVE BACKUP COPIES OF ALL THE FILES YOU ARE EXPERIMENTING WITH!!**

XCOPY external/transient DOS 3.2

Purpose: Copies files and optionally subdirectories of files to the specified drive.

Syntax: **XCOPY** source [dest][/A][/D:date][/E][/M][/P][/S][/V][/W]

Where:

source - is the name of the file(s) to be copied optionally preceded by a drive and/or path. Wildcards are permitted. A drive, path and/or filename must be specified.

dest - is the destination location, optionally preceded by a drive and/or path. Wildcards are permitted.

/A - copy only files with the archive bit set.

Help Screen *continued*

/D:date - copy only the files modified on or after the specified date.

/E - copies empty subdirectories, must be used with /S.

/M - copies only files with the archive bit set and clears the archive bit after a successful copy.

/P - prompts the user before copying each file.

/S - copies all non empty subdirectories and their associated files.

/V - performs read after write verification.

/W - waits for diskette change before copying.

Merry Christmas, Happy Chanukah and Season's Greetings. I hope the foregoing discussion has stimulated your thinking. If you have any suggestions, questions or comments, I can be reached on the Bits of Blue BBS or on Compuserve (71020,2722), GEnie (E.KANT), Delphi (EDKANT) or at P.O. Box 8326, Naples, Fl 33941. - **E.K.**

**** MEETINGS ****

The Tampa IBM PC Users Group meets the second Wednesday of every month.

Next meeting:

When: January 9, 1991
Time: 6:00 P.M.
Demo: *to be announced*

The purpose of the PC User Group meetings is to inform all computer enthusiasts. The intent is to encourage, enlighten, and inform. The topics generally have something of interest for everyone. There are door prizes and refreshments.

The Keyboard Prayer

Contributed by George Ciesek
Big Blue & Cousins Newsletter

Our program who art in memory,
Hello be thy name..

Thy operating system come,
Thy commands be done,
At the printer as it is on screen.

Give us this day our daily date,
And forgive us our I/O errors
As we forgive those whose
Logic circuits are faulty.

Lead us not into frustration,
And deliver us from surges.

For thine is the algorythm,
The application, and the solution,
Looping forever and ever.

Access to Bulletin Board,
Club Software Library,
Newsletter,
Store Discounts,
Raffle Eligibility

(ANY MEMBER WHO JOINED PRIOR TO OCTOBER, 1990, PLEASE NOTE YOUR FEES ARE DUE THIS MONTH.)

UPCOMMING SPEAKERS:

2/13/91 - LOTUS 1 2 3 - 3.1

3/13/91 - SOFTWARE PUBLISHING CORP.
Harvard Graphics

PRESIDENT'S COLUMN:

Well here it is January. 1990 was a good year, all my family and friends are enjoying good health. I was looking forward to getting some software for Christmas but I received a soft kitten (BEAU) instead. Santa must have misunderstood me, I guess. With four paws, BEAU can type on this keyboard but has not yet learn to spell.

Last year marked the beginning of a new era for our group, after two months of talks with IBM, they agreed to let us use their office space, hardware and personnel, allowing us to have better presentations. Members came forth and volunteered to help despite no pay and at times, no recognition for the work they do. The bulletin board got a much needed upgrade through donations and wheeling-dealing. Our diskette library was cleaned up and made manageable. An introductory set of diskettes was created to welcome and inform new members of the group's benefits. All of these have contributed positively towards our group and the increase in membership and attendance shows it. **To IBM and all of you volunteers a great big THANK YOU.**

1991 brings a challenge for me and the rest of the board members as we still have some organization to do in order to provide better and new services for the group and community. The re-electing or re-volunteering of the majority of the board members is by far a positive step in ensuring that the group moves forward with previously established ideas and goals. This year's board of directors represents individuals with talents and dedication. Frankly, I like them because they are down to earth people.

In closing, I hope the powers that be, have the wisdom to prevent war and create prosperity among all the people of our earth.

BLESSED ARE THE PEACE MAKERS FOR THEY SHALL INHERIT THE EARTH!

Harvey

* * 1991 ELECTED OFF.

LIBRARIAN:	Larry Anders	989-9119
BBS SYSOP:	Kevan Sheridan	237-0100
MEMBERSHIP:	Bill Fuller	832-0125

INVISIBLE 5.0 GRAPHICS

Some users of Wp 5.1 have experienced problems with the WPG graphics that came with WP 5.0. The figures come up blank when printed or viewed with 5.1.

The problem is that 5.1 handles colors differently than 5.0 did. Essentially, the graphics are translated to white lines on a white background. Kinda like a polar bear in a blizzard!

To change the graphic so you can see it, follow these steps:

1) Press [Graphics/Alt-f9], [1-Figure], and [1-Create].

2) Press [1-Filename] and enter the name of the WPG graphic.

3) Press [9-Edit] and [4-Invert]. The graphic should appear.

4) If you want to same the graphic in its new form, press [Save/F10] and give it a name. (or press [Enter] to keep the old one.)

5) Press [Exit/F7] once to get back to the "Figure; Edit" menu, or twice to get back to WordPerfect's main editing screen.

In some instances merely going to the "Figure: Edit", [9-Edit] screen and having 5.1 same the graphic [Save/f10] is enough. The original release of MGI's Picture Pack also exhibits this behavior (white on white).

TAMPA IBM PC USER'S GROUP
MINUTES OF 12/12/90 MEETING --

President Harvey Bruneau talked about:

IBM's announcement of their new XGA video standard. It's a step above super-VGA.

A new modem from Practical Peripherals. List price is $159 and only weights 3 ounces. Ideal for laptop computers.

Windows-3: there are about 3,500 bad upgrades in the hands of users. They are the 3.0A versions. Ask for version 3.0B although it is not out yet as of this date.

MS-DOS Version 5.0: Now in the hands of 5,000 beta testers. Scheduled for release by summer of 1991. It is said to incorporate a some of Central Point PCTOOLS utilities. It boasts a better editor (similar to the one in QuickBASIC). It also will have QuickBASIC. And it is said to use less memory than 4.x. It is due to be released in the first quarter of 1991.

Advanced Micro Devices was awarded monetary damages and rights to the 386 processor in an arbitration proceeding. Intel is challenging that award. In fact, Intel wants to prevent AMD from even using the term "386."

ELECTION RESULTS -

By acclamation, the following officers were elected:

President	Harvey Bruneau
Vice President	Steve Speairs
Treasurer	Bill Fuller
Member at Large	Roger Waters
Secretary	Ed Buzza
Education	Ed Kant

The other posts (Editor, Librarian, Membership, BBS Sysop) are filled by board appointment and will be announced later.

PRESENTATION -

Steve Speairs demonstrated Wealth Builder. This program from Reality Technologies, is sponsored by Money Magazine. It is part of the "Better Living Software Pack" and retails for $129 but can be obtained for less. The Pack also includes: Personal Lawyer, Grammitik 3, Form Maker, Floor Plan Layout, in addition to Wealth Builder.

In running Wealth Builder, Steve explained that it is a financial goal setting program and a method of achieving progress. By defining assets and liabilities and what your goals are, the program will help you achieve these goals. You can plan your investment strategy as being conservative or aggressive (low risk - low return, high risk - high return). It also takes inflation into account in its computations.

A nice thing about the program was the attention paid to incidental features. The program uses very clever graphics in it's approach. When planning education goals, the screen is a blackboard! And when working with assets and liabilities, the screen is a spiral notepad.

As always, Steve did an excellent job. Thanks, Steve.

PRIZE WINNERS -

50/50 - Bob Justice;
Q & A - Carl McFarland;
Antique Disk Drive - Bill Graham;
Surprise - N. Luke.

NEW MEMBERS -

Don L. Haas, Charles J. Garcia, Jia C. Huang, Carl D. McFarland

OTHER TOPICS -

Special Interest Groups -
Dependent upon the interest of the members, SIGs may be set up for DOS, Word Processing, Data Base, etc..

Questionnaire -
We will be canvassing the membership regarding their interests.

Newsletter Articles -
If you know of a good or bad piece of software or hardware, DO write it up for the Bits of Blue Newsletter. Sure would be nice to know that a certain product is a lemon just before you go out and buy it! Also, material for the newsletter doesn't have to be journalism or fancy writing, just your experience in your words is enough.

OPERATION DESERT SHIELD BBS LINK

Jean Prophet of the Prophets BBS in Arcadia, Fl (813) 675-8812 has a one way direct BBS link to Saudi Arabia.

The hook-up goes from Arcadia to Ft. Myers, to New York and finally to an American BBS Sysop six miles from the American command post in Saudi Arabia. The Sysops are working on a two way link so servicemen can send messages home as well.

To contact a serviceman in Saudi Arabia you will need their name, rank and soc. sec. number. Your message should be directed to: Operation Desert Shield and include the organization/unit of deployment as well as the aforementioned personal data.

This would be a unique way to send a message to a loved one serving 'Over There'.

Thanks to Charlotte County PC Users' Group for this information contained in their December, 1990 newsletter.

EDITORIAL COMMENT:

I was nominated, elected, appointed, volunteered and told by the President to put together a newsletter. Also I was instructed to **get it out before the next meeting**. Well if the U.S. Postal Service works as diligently as I did on this, you may get it before 1/9/91.

This is fun and I have enjoyed putting it together. They will get better. All of your comments, assistance and contributed articles will be greatly appreciated. This is **YOUR NEWSLETTER** so help me make it **the best it can be**. I have advised my supervisor that I will need more memory in my laser printer, if he expects a timely product. He said he would load it to the max, so here is hoping next month's letter will reach you well before the February meeting.

Marylee Bruneau

PRODUCT REVIEW

Product: Xircom pocket lan adapter.
Purpose: Connecting PCs which have no slots available for NICs
Cost: $400-675 dependent on adapter type you need
By: Harvey Bruneau

Our problem was simple. The support staff was constantly on the road with their laptops. These portables have no standard internal expansion slots to accommodate network interface cards (NIC this is just a board which permits communication with your network) or any other cards for that matter. This meant that when our support people came back from a road trip and they wanted to exchange files from their machine to our NOVELL network or vice versa they couldn't without access to another computer and that involved playing the diskette shuffle with someone else desktop which contained a 3.5" floppy.

So I ordered and received a new network adapter for use with our laptop computers. Xircom's pocket adapter is a small (5 oz, 5") external device that uses the parallel port of a PC to provide Ethernet, Token Ring, or ARCNET link with NOVELL, 3COM and many other network operating system. After reading the small manual (20 minutes), I installed the particular software drivers (2 files) needed to access our network and DOS. Well of course, it didn't work because I installed the software for the wrong version of DOS (my fault). I reinstalled and it worked fine. Overall, it took me 5 minutes to install, including the mistake, that's 1/4 the time it took me to read the manual. I give this adapter **"Two Snaps Up"** and I see in the January 15th issue of PC magazine that it received the **1990 TECHNICAL EXCELLENCE AWARD.**

THREE DOs AND A DON'T

by Dean Ewalt

Three DOS commands you can do from any DOS prompt (that's the thing that looks something like C:>\) are **SET, PATH** and **TREE | MORE.** Don't type **PROMPT.**

One of the questions someone wanted to know, was: "The book keeps referring to the DOS prompt, and I want to know if I got one with my computer, or is that extra?" Answer: one is included with every computer, but it changes, depending on which directory is the current directory.

Some DOS commands will display the current values when you type the command. Some will wipe out the current setting. This article is about some of each.

When your computer starts up, it automatically runs (or should run [call me if it doesn't]) a file called AUTOEXEC.BAT. That file should ask you for the time and date if you don't have a "clock" in your computer. If it asks you for the time and date and the values shown are always correct, you should remove the words DATE and TIME from your AUTOEXEC.BAT file.

Some of the **safe** commands are BUFFERS, DATE, FILES, SET, TIME, PATH, VER, and VOL.

BUFFERS and FILES show you how many DOS buffers and files were permanently allocated by your CONFIG.SYS when the computer started. Values too small cause problems, and too large values reduce the amount of memory available.

When you type TIME and DATE, the current setting will be shown. If you like the values you see, just press the ENTER key. Do it again to see that I speak truth.

SET shows you all the values that were saved in the Environment space by your AUTOEXEC.BAT file when the computer last started up (see June's article for more info) .

PATH shows you the value of the current PATH parameter. Unless you have an unusual program, it should be the same value as the one which AUTOEXEC.BAT furnished at startup time. Every time you type a command at the DOS prompt, DOS searches all the directories listed by PATH to try to find that program or command. If you type **asdfg** at the DOS prompt, DOS will search all of those directories trying to find an .EXE, .COM, or .BAT file with the name asdfg. DOS uses the PATH values to search for Programs, but not for searching for Data files.

VER will show you what version of DOS you are running.

VOL will show you the Volume Label of the current drive. It will also accept parameters, so you can get the Label name of a diskette by typing **VOL A:.** If the diskette has no Volume Label, you can give it one with the command **LABEL A: NOLABEL.** I label my re-formatted diskettes with the names 360K or 1200K.

TREE | MORE will show you which subdirectories are in each of your directories, one screen at a time (press space bar to continue). General rule: anytime a DOS command causes a list of items to scroll off the screen, run it a second time, followed by **| MORE.**

To kill any DOS command putting data to the screen (like TREE | MORE), or to kill a batch file, hold down the CTRL key and press the key labelled BREAK on the side of the key, typically the SCROLL LOCK key (depends on keyboard model).

DON'Ts

Do NOT type PROMPT. That will wipe out the current value of your prompt and it will become **C:** instead of **C:directory>** and you won't know what directory you are in. If yours always shows C:, call me for a computer tuneup. I charge reduced rates to Club members (and no travel charge, even to Englewood).

If you have any questions, call me. I may use your question as the basis for next month's article (no names mentioned).

THE THIEVIN'
(with deep apologies to E.A. Poe)

Oncet upon a midnight dreary,
I looked for games, something cheery.

Then it happened, what I'd feared,
Fer nabbin' programs, I get seared.

We think it won't, but it could happen,
There could come a tap, tap, tappin',

There could come a policeman rappin',
Rappin' at your castle door.

You will beg and plead "no malice",
"Just tryin' it out; 2 years allowed us."

Just to take a quick perusal,
Friends, they offer, so why refusal?

Time goes on, and it's so handy,
Not to pay, just use it. Dandy.

Honest, Judge, my motive's clear,
I was gonna buy. Soon. (next year!).

5/10/91 - Harvard Geographics 1.0 presented by Software Publishing Corp.

PRESIDENT'S COLUMN:

Well it looks like the editor and I will complete and survive the creation of our 2nd newsletter. We thought we knew *Wordperfect* prior to doing the newsletter. **WRONG!!** Each issue of **BOB** has been a learning experience for both of us and I am sure it has not ended. There is a major difference between creating individual letters and creating a newsletter. Presently it takes about 24 hours x 2 to create a Newsletter although if you ask Marylee (editor) she will tell you it could be done faster if I didn't help. **My hat off to those volunteers who create newsletters especially last years editor** Barbara Peck.

Last month I mentioned that **BEAU** (our new kitten) was trying to help input articles by running across the keyboard. **BEAU** has a new name now since we determined that she couldn't distinguish the difference between **BEAU** and **NO.** Its now **TATER** because she likes to play with a potato sack. This is her 3rd name since moving in with us. She has been watching a lot of TV and has undergone some personalty changes because of it. A couple of new cat names have been heard throughout the house from time to time. **Saddam** is one because she is a terror or **SCUD** because she acts misguided a lot.

Harvey P. Bruneau

Editorial Comment:

First I's like to say thanks to all who contributed articles, as you can see our little "BOB" is growing. Additional thanks to **Micro-Wise, Inc.** for the use of the hardware, software and paper used to create the newsletter.

Secondly, the President and I want all to know that any articles, comments, or implications concerning Desert Storm are our personal opinions and we do not imply these ideas as representative of the entire group. Although, we have mixed feelings about the war, **WE SUPPORT OUR TROOPS**.

I am sure all those servicemen/women would rather be here enjoying all the comforts we take for granted every day. But, it's out of their control and ours -- we feel we must support them. Those of you who agree, do what you can, prayers, letters and above all take pride in these brave people.

Secretary's Report

TAMPA IBM PC USER'S GROUP MINUTES OF 1/9/91 MEETING --

PRESIDENT'S REMARKS

a) Membership is now on an anniversary basis (based on the date that you joined) rather than on the old calendar year basis.

b) Our Bits of Blue newsletter is now being prepared using WordPerfect as the publishing program. The Editor would appreciate any and all public domain graphics. Also needed are articles from the members for the newsletter.

c) In response to a comment that some other clubs get more favored treatment from various vendors, it's because those clubs have more members that we do. Vendors are always looking for the greatest audience to spread the word about their products.

d) A presentation of Lotus 1-2-3 Ver 3.1 is scheduled for next month. In March, a representative from the Software Publishing Corp will present Harvard Graphics. Later in the year, Aston-Tate will discuss the merits of dBase IV.

e) Owners of Magellan (Lotus) are eligible to receive, for free, seven new file viewers. You will now be able to view Quattro, Wordperfect, Word for Windows, etc. documents while in Magellan.

f) MS-DOS 5.0, now in beta testing, is scheduled for release the first half of this year. It is said to have QuickBASIC, handle upper memory usage, and have some elements of PC-TOOLS.

g) Logitech has announced a new mouse. For left-handed people! Comments from the members revealed that the IBM mouse has a button to do the same thing; and that some software packages provide a left-handed facility.

h) We have a lot of good material on the Bulletin Board. Log on and check it out. We now have 120meg of disk space.

i) If you have any ideas for education classes or presentations, please get in touch with me (Harvey) or Ed Kant. We might consider a short session of about 15 minutes before the meeting starts. We have to talk to IBM about getting additional meeting space if there is enough interest in having classes on specific subjects. We do have some volunteers.

IBM PRESENTATION

Chris Mayer, our IBM compatriot, gave an excellent demonstration of OS-2 Ver 1.2 running on a 486-95 with an XGA monitor. The XGA video was awesome. Great color and the resolution was remarkable.

Chris had 8 to 9 windows open and zipped from one to the other with effortless ease. The power of the PC and of OS was very obvious in that a program in one window would continue to run while you were working on another program in another window.

Many of the terms unique to OS were defined, including "threads." In effect, programs are "threaded" when they run in the same application window. As an example, he used an animation program that had two eyeballs follow the cursor motion of the mouse; each eyeball was independently following the mouse cursor.

Also the term "concurrent processing" was clarified. A single processor machine, by definition, can only process one job at a time. What OS does, is prioritize the various jobs and gives control to each of them according to their priority. When a program is suspended, a "picture" of the machine (register contents, current memory address, flag settings, etc.) is stored with that program. Later, when the program is activated, the "picture" is used to restore the machine to be exactly as it was when it was suspended.

Because of time constraints, the Communication and Data Base Managers could not be demonstrated. Chris Mayer did an excellent job of presenting IBM's newest products. He knew the equipment, he knew the operating system, and he knew how to communicate. He deserves a "Well done" from all of us.

COMPUTER COMPASS MAGAZINE

Bradley Friedman distributed copies (gratis) of his new magazine. It is a directory of computer and business professionals in the Tampa Bay area. He is looking for feedback from computer users and would appreciate any information you can offer.

SECRETARY'S COMMENTS

If any of you are interested in the "mouse watcher" program, check out EYECON30.ZIP on our Bits of Blue BBS.

OPERATION DESERT STORM "Letters from Home"

GE Information Services is pleased to provide "Letters from Home" - a program to allow families and friends of loved ones serving with the U.S. Armed Forces in the Persian Gulf region to send FREE electronic mail messages via the GEnie Online Information Service.

Letters from Home, offered in cooperation with the U.S. Armed Forces, the Saudi American General Electric Company, GE Rents and Pitney Bowes Inc., allows individuals in the United States with access to a personal computer and modem to send personal messages to loved ones serving in the Persian Gulf region.

Letters will be sent electronically via GE Information Services' worldwide teleprocessing network to GE's local telecommunications facility in Saudi Arabia. The letters will be received and printed on computers and printers supplied by GE Rents. The mail will then be folded, inserted and sealed in envelopes using state-of-the-art equipment provided by Pitney Bowes. The letters will then be given to the U.S. Armed Forces for delivery to the designated serviceperson.

The GEnie service, one of the leading online information services, is available throughout the U.S., Canada, Japan, Germany, Austria and Switzerland via a local phone call. For further information about the GEnie service, please call GEnie Client Services at 1-800-638-9636.

OR, if you desire the full text of the above article you may download GENIE.TXT from the IBMPCUG BBS.

PRODUCT REVIEW

Product: LANtastic
Purpose: Local Area Network
Cost: $495. - 2 node Arcnet Starter Kit
$725. - 2 node Ethernet Starter Kit

By: Marylee Bruneau

Our problem was simple. My boss constantly wanted diskette copies of draft documents from my computer to review and edit on his computer. He looked into installing a Novell Network but found the cost prohibitive and a bit of an overkill for our needs. But our present method was inefficient and he was determined and tired of playing the diskette shuffle.

He ordered and had installed LANtastic NOS (***Network Operating System***) so he could utilize the documents on my computer and have access to the laser printer on my desk.

It features low memory requirement (13KB at the PC and 40KB on server) at an economical price, and has many of the great advantages of a local area network.

The Electronic Mail and LANtastic Chat, for on-screen, station-to-station communications will prove to be beneficial in an office environment where exchanging notes and memos is a way of life.

The January issue of **LAN magazine** in its Products of the Year article states "...no one in the entry-level network arena has a better product than LANtastic, Artisoft's speedy, low-cost, peer-to-peer network operating system."

Company: Artisoft
575 East River Rd.
Tucson, Arizona 85704

QUOTE OF THE WEEK:

To Sam Donaldson's statement to General Schwarzkopf on Prime Time Live Thursday evening: "You know General,.... you win this war you will be considered a hero." The General's reply: "No! Not me I won't be a hero, the **Troops** are the heroes."

COMPUTER BULLETIN BOARD SYSTEMS

Here's a list of over 80 local Computer Bulletin Boards. They provide us with entertainment, information and personal contact with others. Listings are sorted by computer type and max baud rate. Descriptive information includes:

"Up" date : the year the system was placed "online".

Software Capacity in MegaBytes (MB).

Hours of Operation if less than 24hrs.

Extended Access indicated by * in phone number.

"Tampa Area Boards" is distributed electronically and in printed form.

Production and distribution is funded by the system operators whose listings appear in blocked form. If you find TAB useful, your "Thank You" message to these SysOps will be appreciated.

SPELLCHECKERS

At the last meeting, one of the questions was, "What is wrong when I cannot use my spellchecker?"

Perhaps the best way to decide where the trouble lays is to put a DOS disk in drive A and bring the computer up with no special startup sequence.

Then try the spellchecker once more. If it works now, one of the commands you have in your autoexec.bat file may be the source of the trouble. If it still does not work, then it would be a good idea to put each of your original wordperfect disks in drive A and chkdsk them. Use chkdsk *.* on each of the disks.

Using a DOS startup disk is a good generic way to look for trouble. Running chkdsk *.* on all new program disks may help you in many situations.

Specifically with wordperfect, you might check to see if your CONFIG.SYS has files=20 statement. Also to be sure your expanded memory is not the trouble you may start wordperfect with the /ne option to prevent it from using expanded memory. Another check you can easily run is to go to DOS, then type wpinfo. This will list all the characteristics of your particular computer so if you want to know what type of CPU you have, 8088, 80286, 80386, etc, this will print it out for you. It will also give many other characteristics so you can tell the Wordperfect people just what you are using in your computer.

Service with a Smile:

REBOOT -

To repeatedly kick a faulty computer until it starts working.

CORE -

Remains of an Apple when all the bytes are gone.

THE HELP SCREEN

Edward J. Kant, P.E., Naples, FL

Well, here I am again! What with the holidays and all, I sort of lost track of time and didn't get a column in last month. To make up for that lapse, I would like to take this month and next month to discuss several of the so-called "small" DOS commands. These are **BREAK, CLS, DATE, LABEL, REName, SYS, TIME, TYPE, VER, VERIFY** and **VOL.**

For the purpose of our discussion, I am grouping these commands as follows:

BREAK Toggles the DOS keyboard interrupt on or off.
VERIFY Toggles the DOS file verify feature on or off.

DATE Allows checking or changing the system internal date.
TIME Allows checking or changing the system internal clock time.

LABEL Allows the user to "name" a disk.
VOL Allows the user to view the disk label.

REN Allows the user to rename files.
SYS Used exclusively for copying the system files to a disk during the format process.
CLS Allows the user to "erase" the monitor.
VER Shows the DOS version on the machine.
TYPE Allows the user to display *TEXT* files.

This month we will review the first three groups and next month we will finish them.

BREAK internal DOS 2.0

Purpose: The **BREAK** command is provided so that you can instruct DOS to check for an abort operation, either <Control-C> or <Control-Break>, whenever the running program uses a DOS function.

Syntax: **BREAK [ON | OFF]**

Where: **ON** is specified to activate **BREAK.**
OFF is specified to deactivate **BREAK.**
No parameter displays **BREAK's** current status.

As a rule, DOS checks the keyboard for a <Control-C> or a <Control-Break> key only when performing one of the following operations: Reading the keyboard, writing to the display, inputing or outputing to a serial port or outputing to a printer port.

Since some programs do not perform any of these operations, aborting these programs is not possible. However, DOS can be 'told' to check for the <Control-C> or <Control-Break> keys each time any DOS operation is performed. This option is controlled with the **BREAK** command.

Examples: **BREAK** Display **BREAK's** current setting.

BREAK ON Enable detection of a <Control-C> or <Control-Break> whenever a DOS function is invoked.

BREAK OFF Disable detection of <Control-C> or <Control-Break> whenever a DOS function is invoked, but aborting will still be possible during character I/O.

VERIFY internal DOS 2.0

Purpose: The **VERIFY** command is provided so that you can instruct DOS to verify that all disk writes have been performed successfully.

Syntax: **VERIFY [ON | OFF]**

The verify state remains unchanged until another **VERIFY** command is entered or the system is restarted. The normal (default) verify state is **OFF.** If the command is entered without parameters, DOS displays the current verify state and leaves it unchanged.

Verification may be enabled on a command by command basis; for example, by using **COPY** with the **/V** option.

Setting the verify state to **ON** causes all subsequent disk write operations to take longer than normal. This may not be too noticeable if you have a fixed disk but may appear to slow down a one or two floppy system.

(Continued on next page)

(Continued from previous page)

DATE	internal	DOS 1.0
TIME	internal	DOS 1.0

Purpose: The **DATE** command allows you to get, set or change the system date. The **TIME** command allows you to get, set or change the system time.

Syntax: **DATE** [mo-dd-yy] or **DATE** [mm/dd/yy]
TIME [hh:mm:ss.ff]

Where: For the **DATE** --
mo = Month from 1 to 12.
dd = Day from 1 to 31.
yy = Year from 80 to 99 or 1980 to 2099 (a leading 19 is assumed on a two digit entry).

For the **TIME** --
hh = Hour from 0 to 23.
mm = Minute from 0 to 59.
ss = Second from 0 to 59.
ff = fractions of a second from 00 to 99.

The system normally prompts you for the date and time when the system is started unless it finds an **AUTOEXEC.BAT** file. If you use an AT, your system date and time is maintained by a battery backed-up clock. If you use an XT or PC-class machine, add-on boards are available to automatically set the system date and time from a battery backed-up clock. This is done by adding the appropriate command for the board to your **AUTOEXEC.BAT** file. If your machine is not an AT class machine and you have no add-on board, you will need to manually set the date and time each time you boot your system. You should add the **DATE** and **TIME** commands to your **AUTOEXEC.BAT** file. Once the system is started the date and time do not need to be set again.

Entering either command without parameters displays the current setting and prompts for a new date or time. If the <Enter> key is pressed without supplying a new date or time, the date and time remain unchanged. You may supply the date or time on the command line when the command is entered or you can supply a new date or time when the prompt appears.

AT and higher class machines using DOS 3.0 or later can use the **DATE** and **TIME** commands to set their CMOS clocks. There is no longer a need for the setup diskette to do this.

NOTE: When using the **TIME** command, any unentered fields will be set to zero. The colon (:) must be used as a delimiter between fields.

LABEL external/transient MS-DOS 3.1 PC-DOS 3.0

Purpose: Change or delete the electronic label (name) of disk.

Syntax: **LABEL**[d:]

Previous to the existence of this command, the electronic label of a disk could only be entered when the disk was formatted and if the /V option was specified. The label is a 1 to 11 character name that takes up one entry in the root directory, but no disk space.

The following characters may NOT be used in a label:

* ? / \ | . , ; : + = < > [ ]

also spaces and tabs are not allowed.

VOL	internal	DOS 2.0

Purpose: The **VOL** command displays the volume label of the specified or current disk logical.

Syntax: **VOL** [d:]

If the disk drive is not specified, the current drive is assumed. The disk volume (name) can also be specified when a disk is formatted using the **FORMAT** command with a /V option. Alternatively, the **LABEL** command may be used.

Next month we will conclude the discussion of "small" DOS commands. As usual, if you have any questions, comments, complaints or other, please drop me a message on Bits of Blue, Compuserve (71020,2722), GEnie (E.KANT) or Delphi (EDKANT).

TAMPA IBM PC USER'S GROUP

VOL. 4 NO. 3 MARCH, 1991

MEETING
(2nd Wednesday every month)

DATE: March 13, 1991
TIME: 6:00 PM
PLACE: IBM CUSTOMER CENTER
LAKE POINTE ONE BUILDING
3109 W. Martin L. King Blvd.
Room 450

DIRECTIONS:

The Tampa IBM PC Users Group meets in the IBM's LAKE POINTE ONE Building across from Tampa Bay Mall one block east of Tampa Stadium.

The best entrance is on Martin Luther King Blvd. at the traffic light in front of Burdines. As you turn off Martin Luther King Blvd. you will see the LAKE POINTE ONE BUILDING on the left & parking on the right. Join us in ROOM 450 - 4th floor. **Guest please sign in.**

PRESENTATION:

3/13/91 - Object Vision
(A form based application development tool) To be presented by:
Borland International, Inc.

Refreshment Break

Open Discussion

Door Prize Raffle
SideKick (donated by
Borland International, Inc.

OUR HEROES!!

LET'S GIVE THE TROOPS A HAND.

UPCOMING SPEAKERS

4/13/91 - LOTUS 123 V3.1
presented by LOTUS CORP.

5/10/91 - Harvard Geographics 1.0
presented by Software Publishing Corp.

HAPPY SAINT PADDY'S DAY!

PRESIDENT'S COLUMN:

In the last 6 weeks I have attended 4 PC seminars covering Network Operating systems, Client Server Technology, SQL, Database Techniques, Windows, Downsizing and a bunch of other topics which are in the PC lime light these days. The cost ranged from free to $500 and the duration from 1/2 day to 2 days. While I learned something at each I must say that all were not as informative as I had hoped. Maybe I am expecting too much and some people will say **"You get what you pay for"**. I don't think so. Even if the seminar is free it will cost someone something. Each hour of a seminar represents an hour of lost time at the office. When someone has a seminar and states that experts in the field will be teaching or presenting, I expect to increase my knowledge or at least get some brain cells to think of possibilities within a product that I had not thought of. A couple of times I wondered what field the expert was from, left field, right field or a corn field. There are times when I have learned more from attendees than the experts.

Hopefully, if the seminar has a good expert it will be worth your time in the long run. But remember that shelling out dollars for a seminar may not be the investment you or your company planned for and is not a guarantee that you will walk away with more than you already knew. When all else fails **make the time** to teach yourself or get involved with others who have the same goals. Education in the PC world is a never ending process as long as **you** have the desire to learn.

Harvey P. Bruneau

Editorial Comment:

For those of you who contributed articles - fine job, keep them coming! Please, those of you who think you'd like to submit an article but aren't sure, or do not have access to send articles via the bulletin board - drop it in the mail in any form, (handwritten, typed, diskette) to: MICRO-WISE, Inc., P.O. Box 291097, Tampa, FL 33687 ATTN: Editor TIBMPCUG

It will be my intention to try to have something in the paper to interest all - the amateur to the expert. In fact I'll be putting things in here that I haven't the faintest idea what its about, but I know there are those of you who will soak it up like a sponge. For the less computer literate and those eager to learn (as myself) there will be very informative and enlightening articles.

On February 24, I requested a complimentary copy of WP5.1 from WordPerfect Corp. to be used by the club in publishing the newsletter. Good News! Only twelve days later it was delivered. Beginning with next month all future editions of our newsletter will be created with this donated copy of WP5.1. Thanks WordPerfect!

Again - members, Thank You for your input to our publication, any comments or suggestions are likewise appreciated.

Secretary's Report

TAMPA IBM PC USER'S GROUP MINUTES OF 2/13/91 MEETING --

PRESIDENT'S REMARKS

1) Borland is scheduled for March. The new Sidekick program will be presented as well as Object Vision - application programming based on forms.
2) Lotus (new 1-2-3) has been rescheduled for April.
3) Software Publishing (Harvard GeoGraphics) is scheduled for May.
4) We have new name tags. Blue tags indicate a paid-up member; white tags mean your membership dues are late. Note that the icon screen shows your membership due date.
5) Regular members no longer need to sign in.
6) Our new editor, Marylee Bruneau, was present.
7) Our BBS telephone number is 239-3704.
8) PKZIP and PKUNZIP can be used for other than BBS purposes. It's a handy tool to free up space on the hard drive by condensing seldom used files.
9) Thanks to Vern Semrad for reminding us that a complete list of Prodigy Jump Words is now on our BBS.
10) Visited the SoftWarehouse in Atlanta. It's the hardware and software equivalent of Home Depot. They also had Dell computers for sale. It was rumored that they were to open a store where Egghead used to be (Hillsborough and Dale Mabry area) but no date yet for a Tampa opening. The closest ones are in Atlanta and in Miami.
11) Since there was no "vendor door prize," the 50-50 drawing was canceled for this meeting.
12) According to a Hewlett-Packard survey, their PCs had the lowest failure rate - 4 per cent. IBM was second with 9% and Compaq was the lowest at 17%.
13) A 286 "notebook" PC was shown to illustrate just how small they are. Since so many OEMs (original equipment manufacturer), are making them, parts are hard to find.
14) A review of 7 tax programs was cited. Chip Soft ($75), Turbo Tax, and Tax Cut ($89) were rated among the best. When buying any of these packages, be sure you get the '91 version.
15) Does anyone want to donate a scanner to the club for use by the editor?

CAD PRESENTATION

John Fought, from DATAflex Systems, Tampa, spoke about the merits of EasyCAD2, FastCAD, and FastCAD3D - all Fifth Generation products. The program shown was FastCAD. EasyCAD is almost the same thing as FastCAD. FastCAD is the equivalent of AutoCAD level 9 and features full file exchange to and from AutoCAD. The main difference is that FastCAD provides an icon menu bar on the right side of the screen while EasyCAD relies on pull down menus. It is very easy to upgrade from EasyCAD to FastCAD.

Anyone with some drafting experience can learn EasyCAD in less than thirty hours. It requires 512k RAM and while it can run from two floppy disks, a hard drive is recommended. A math co-processor is not necessary (but is necessary for FastCAD). Some of the main features are:

- It can output to the top name word processors (WordPerfect, WordStar, etc.).
- Up to eight windows can be opened. This lets you keep zoom views of various parts of the main drawing for ready reference.
- It displays drawing status (size, elements, etc.) at all times.
- Can shell out to DOS.
- Calculates distances and areas. If a drawing element is stretched, dimensions are automatically readjusted.
- Allows up to 255 layers or overlay of the drawing and can hide layers.
- Allows tiling. e.g. If plotting a 20x30 inch drawing plan and plotter can only handle 11x17, program will break drawing into 4 parts that when printed can be pasted to form large drawing plan.
- Color bar on the left side of screen and function icons on the right side of the screen allow for quick selection of these elements.

All in all, the presentation was very well received. Thanks, John.

SECRETARY'S COMMENT

One of the most impressive things about this CAD package was the speed of redrawing the screen. No sooner than the zoom command was clicked, ZAP, there was the enlarged view. The multiple view feature is a nice touch also. It's nice to have the main drawing on the screen while working on an enlarged view of a part of the main drawing.

THE BULLETIN BOARD AND PKWARE

Our Sysop Kevan Sheridan shed some light on the dark goings on behind the Bits of Blue Bulletin Board. It was fascinating to hear Kevan explain some of the background activity related to a BBS. Such things as Sysop screens, local log-ons, modem protocols, etc., were logically handled and clearly explained. Great job, Kevan, thanks.

(Minutes...Continued on next page)

(Minutes...Continued from previous page)

In setting up a BBS, there are over 320 parameters that must be set up the Sysop. Further, some of them have additional parameters that must be set. Use of the Utility feature was demonstrated as was the "New Member" initial sign-on. The various protocols (x-modem, y-modem, z-modem, etc.) were discussed and analyzed; as were their merits and caveats.

We were reminded that Q-Modem is a telecom package, not a protocol. A run-through of Q-Modem's menu system showed some of that program's features.

Although batch uploads are not available, batch downloads are! To do this, at the prompt, type <D> <FILEA.ZIP> <FILEB.ZIP> <ENTER>. This will download the two files requested. Just be sure that a delimiter (a space or a comma) separates the filenames. Remember also that x-modem can't handle batch downloads.

How to send, receive, and read messages was explained as well as the one-line and the ANSI editors. To upload a prepared message, use your favorite ASCII editor to create a file with lines no more than 78 characters wide. Then at the BBS prompt (no ANSI editor), upload the prepared text file.

Kevan also demonstrated two of Philip Katz's software offerings: PKZIP and PKUNZIP. Almost all the files on our BBS are .ZIP formatted (we do have some text and .GIF files too). These programs are available in our library and on our BBS.

Kevan gave an excellent presentation. Again, thank you!

Club Members BBS:

The Tampa IBM PC User Group operates a full service 130 Mb, single-line 24-hour electronic BBS for Up- or Down-Loading. As a member you are invited to use the Board within the established BBS rules.

Phone: 239-3704

The first time you log-on to the BBS, you must establish your Password. You will then have limited access until access has been verified by the Sysop.

For assistance from SYSOP, Call Kevan Sheridan 237-0100

How to buy a personal laser printer

Five factors to consider before upscaling your output.

MILLIONS OF BUSINESS PEOPLE HAVE concluded that dot-matrix printers just don't do their prose justice. In 1990 alone, says market analyst Angele Boyd of International Data Corp., some 1.9 million laser printers were shipped to dealers; by 1994 annual sales will have doubled. "The laser printer has had a major impact on the quality of business documents." she adds.

Laser printers have won out as the quality standard for business communications thanks in part to a nonstop drop in cost over the past seven years. When Hewlett-Packard unveiled its first laser printer in 1984, it was priced at $3,495. Today HP's least expensive laser, the LaserJet IIP, lists at $1,495. The machines, which use a laser to create an image on a drum for transfer to paper, offer a huge variety of print-shop-caliber typefaces in a wide range of sizes. They also mix graphics and text easily.

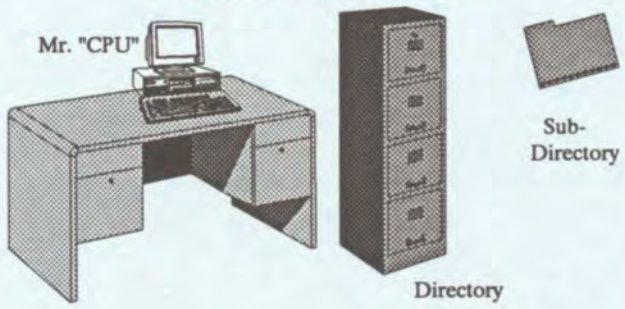
The newest category of lasers is the so-called personal printer, a term describing a smaller, cheaper and sometimes slower machine. List prices for personal printers range for $650 to over $3,000. Before you buy, here are the features you should consider:

■ **NUMBER OF BUILT-IN FONTS.** If you've got sophisticated desktop publishing or presentations in mind, you'll need a lot of resident (built-in) fonts. Otherwise, you'll lose time downloading additional fonts from software.

■ **PAPER TRAY.** The standard 50-sheet paper tray may frustrate you if you print huge reports. See if the printer has a second tray slot or ask your dealer if volume-feeding accessories (including a multiple-envelope feeder) are available.

■ **CARTRIDGE LIFE.** Most printers give you about 3,500 copies from a single toner cartridge (which can cost as much as $125). Make sure that cartridge replacement or refill is simple and clean.

■ **PRINT CAPABILITIES.** Can you print double-sided or sideways? What about addressing envelopes, the traditional failing of laser printers?



■ **PAGES PER MINUTE.** Four pages per minute tends to bog down productivity. Eight to 10 ppm is probably worth the extra cost.

The Computer Simplified

"An Original Story for the First-Time PC User"

by Michael Dodge - UCLA, PCUG, &
Los Angeles Computer Society

Inside your computer there lives a little man whose name is CPU (Central Processing Unit). Inside his house there is a light, a fan, a desk, a file cabinet, and at least one mail box.

You can communicate with CPU through a language called DOS (Disk Operating System). Like any other language (German or French or English), DOS has its own vocabulary and rules. You communicate with CPU by typing DOS commands on the keyboard and he repeats everything on the monitor screen.

The size of CPU's desk is equal to the amount of RAM (Ramdom Access Memory) your computer has. The bigger his desk, the more room CPU has to lay out papers and the more things he is able to work on at one time. So the size of his desk (or the amount of memory in the computer) is very important. If your computer has 640,000 (655,360 actual) bytes of memory (640 kilobytes or 640K), CPU's desk will be bigger than if you had only 128K of memory. A computer with one million bytes of memory (one megabyte or 1Mb) means that the CPU has a very large desk to work with.

All of the messages CPU handles are organized into units called files. There are basically two kinds of files: those that contain numbers or English-language information, called data files, and those that contain instructions to CPU written in programming language, called executable files, or programs. Generally speaking, the executable files enable CPU to write and manipulate the information contained in the data files.

CPU stores both kinds of files in a file cabinet called the hard disk drive. The bigger the storage capacity of the hard disk drive, the more file cabinet drawers CPU has to store things. A hard drive with twenty megabytes of storage gives CPU only twenty file drawers, whereas a hundred megabyte hard drive gives him one hundred drawers for storage. Through DOS commands typed in at the keyboard, you can tell CPU to take files out and what to do with them, as well as to put files away and where to put them. Just as real file cabinet drawers are organized and divided by folders, the hard disk is divided into directories (drawers) and subdirectories (folders).

CPU sits inside his house and waits for you to give him the commands. When you tell him to take out a program to work with, he finds it in one of the file cabinets, takes it out, puts it on his desk (loads it into RAM) and waits for your next command. When you start a new date file, you must give it a name so that CPU can find it the next time you want it. When you are finished working with a program and you tell CPU to put away all the data files the program has been using, he stores them back in the file cabinet. If, for some reason, you haven't told him to put away all the data files and you turn off the computer power switch, you have also turned off CPU's fan and light. CPU says, "It's too dark in here; I have no windows, so I will just sit and wait." Everything you were working on is still sitting on CPU's desk.

Then, when you turn the switch back on, the light comes on, and you can hear the fan come on, but the fan blows everything off CPU's desk. It is now just a pile of trash and CPU throws it away. This is why it is important to tell CPU to put away (save) all your data files whey you are finished with them; if you don;'t you won't have them anymore. CPU's mailbox (floppy drive), which can be different sizes (5.25" and 3.5"), allows you to give CPU new programs or information to work with, or to transfer information from CPU to someone else's CPU. Before you can tell CPU to write information on a floppy disk, it must be formatted.

When you tell CPU to format a disk, he prepares it to accept information by dividing it up into pie-shaped wedges, called sectors (usually eight or nine) and circular tracks, like groves on a record.)a high-density 5.25" disk has 96 tracks, while a low density disk has 48 tracks). CPU stores information in those tracks and sectors. The first sector on the first track is reserved for directory where CPU writes down the name of every file that is stored on the disk and its location(s) on which sectors and tracks it can be found). When you ask CPU to get something from that disk, he runs to the directory, reads it and knows just where to go to get the file. After your work is safely put away -- and you turn off the power switch -- CPU rests until you need his help once again.

In case you're asked, "What's a:

Modem?: Southern for "more of them."
GUI?: Theater floor.
Baud?: Lady of the evening.
Hot Link?: Onion covered sausage in a bun.
Terminal?: Said of a computer that is about to die.

Book Review: Word Perfect - Desktop Publishing In Style by Daniel Will-Harris.

Publisher: Peachpit Press, 1085 Keith Avenue, Berkeley, CA 94708, Retails for $23.95)

If you have a laser printer and use WordPerfect 5.x, get a copy of *Word Perfect - Desktop Publishing In Style* If you're at all interested in desktop publishing, or would just like to know more about WordPerfect, this book is definitely a "must have."

Some may find fault with the author's touches of humor but I liked them. It helps to break up some of the heavy stuff that's in the book. For instance, in the third chapter, *Follow My Example*, he writes: "One iron-clad guarantee: experimenting with these examples won't be as bad as having a root canal or passing a kidney stone". Then he tells you how to desktop publish a document, keystroke by keystroke.

In the *Macros/Soft Keyboard* chapter, he refers to one of the shortcuts as a "minor miracle." He's right! The shortcut, ALT-E (edit a code), lets you edit almost any WordPerfect code. Turn on Reveal Codes, place the cursor on the code, press ALT-E, and the macro figures out what menu you need for editing. After you're finished editing, the old code is removed by the macro. What a time saver! Best of all, the author tells how to create it as a stand alone macro.

In addition to a glossary and a list of recommended publications, he writes about several related software programs and hardware items. From the style of writing, it's obvious that these are user evaluations and not the parroting of advertisements. All in all, this book should be in the library of every WordPerfect user. (Contributed by: Ed Buzza)

Book Review: Waite Group's MasterC by Mitchell Waite, Stephen Prata & Rex Wollard

Publisher: Waite Group Press, 1990 - 231 pages
(4) 5.25" DS-DD Diskettes, MSRP $45.00

Hardware Requirements: PC Compatible, MS-DOS, 3.x+, 5.25" Drive, 384K RAM, HD w/ 2.2 Meg, Available, Mono/Color Monitor & Board

This book is a PC-Based, self-pacing instruction course for the learning of generic C. It covers all of the C fundamentals up to the new ANSI C standards and also covers some of the minor differences between UNIX and MS-DOS C implementations. The course is divided into 15 chapters and is estimated to require about 31 hours to complete all of the lessons.

The course uses the familiar example-question-answer format to teach the C fundamentals. The answer criteria appears to be based on some form of 'Natural Language' interface that picks out the salient points of the students response to compare against the proper answer.

The user interface is very well done and consequently very easy to use and navigate. The system starts out with the master menu and follows that with each chapter's submenu. Depending upon each chapter's scope there may or may not be sub-sub-menus.

The current position in the course is shown by the top status line showing student name, chapter and position in chapter. At the bottom of the screen are located the various navigation options available at the current position in the program. These may vary because at the question screens there is no choice but to answer the question!

The program also serves well as a refresher course or reference work on C. Each chapter has a review exam for its topic and the student can thus check his/her knowledge without going through the learning work if it is thought unnecessary. This would be a way to determine those areas of C learning that need to be refreshed. In terms of being a reference work, the Glossary navigation key allows one to highlight a particular topic in question and then can take the user to that portion of the course that deal with that topic. I found this book/course easy to use and an excellent course on the C Language. I would be somewhat hesitant to give this course to a complete computer novice because I think that one should have some experience in programming before moving into C, if only because of the inherent danger in C capabilities! I was disturbed by the number of errors that I found in the course of this course, ranging from spelling to incorrect answers and examples. However I have a low version number of the software, 1.12, and I presume that, with the errata list I am sending and the ones that have probably been sent by others, these authors will waste no time in correcting the software. The overall quality of this product makes the foregoing almost a certainty!

I love recommending quality products and this is definitely one of them. I would love to see these people issue a more advanced course as well and maybe one on C++ would not be out of question! One can only hope, but considering the number of other efforts that this firm have in the C area, I think that it is a worthwhile hope.

(Editor's Comment: Contributor not identified)

THE HELP SCREEN

Edward J. Kant, P.E., Naples, FL

Last month we had a look at several of DOS's "small" commands. This month we will look at some others. To refresh your memory, the commands were:

BREAK, VERIFY, DATE, TIME, LABEL, VOL,

RENname, SYS, CLS, VER, TYPE

The first six in the top row were discussed last month. This month we will review the last five.

CLS internal
DOS 2.0

Purpose: The **CLS** command clears the display screen and returns with the cursor in the top left corner of the screen (the home position). When using a color system, the foreground and background colors remain unchanged if they were set using one of the DOS functions, otherwise the colors are set to white (actually light grey) characters on a black background.

Syntax: **CLS**

Note: For proper operation of CLS it may be necessary to load the **ANSI.SYS** device driver. This is done with a statement in your **CONFIG.SYS** file such as:

DEVICE=C:\DOS\ANSI.SYS

provided that the file **ANSI.SYS** is in your DOS subdirectory.

REN (RENname)
internal DOS 1.0

Purpose: The **REN** command renames a file from one name to another. It is an abbreviation of the command **RENAME.**

Syntax: **REN** [d:][path]oldfilename[.ext] newfilename[.ext]
NOTE THE SPACE BETWEEN FILE NAMES

Only the first filename may have its disk drive and path specified. The second filename will use the same drive and path as is specified for the first (not the default drive and path). This means the **REN** command may only be used to rename files within the same subdirectory. Wildcards * and ? may be used in the filename and extension. DOS will not let you rename a file to a filename that already exists.

Examples: **REN** oldfile newfile
Rename the file oldfile to newfile in the current directory.

REN \WP*.DOC *.TXT
Rename all the files with extensions .DOC in the directory WP on the current disk to files with the extension .TXT.

Bug note for those of you who might still be using DOS Version 2.10 **REN** command:

If you try to rename a subdirectory rather than a file, the first file in the subdirectory is renamed to the file specified, and the directory you were trying to rename is not renamed. This action is performed whether or not the appropriate error message is generated.

SYS external/transient DOS 1.0

Purpose: The **SYS** command is used to transfer a copy of the DOS operating system files from the default drive to the specified disk drive.

Syntax: **SYS** d:

This command transfers the two hidden system files, **MSDOS.SYS** and **IO.SYS** or **IBMBIO.COM** and **IBMDOS.SYS** to the specified target disk.

The target drive must be completely empty or be formatted using the **/S** or **/B** options of the **FORMAT** command. DOS requires its startup files to be the first two directory entries in the root directory of the disk, and the file **IBMBIO.COM** must be contiguous, that is, unfragmented in noncontiguous clusters on the first track or cylinder of the disk.

TYPE internal DOS 1.0

Purpose: The **TYPE** command displays the contents of the specified file on the screen.
(Continued on next page)

(Continued from previous page)

Syntax: **TYPE** [d:][path]filename

If the drive or path are not specified, the default is assumed. The filename may NOT contain wildcards. The file is displayed as is except that Tab characters are expanded.

Examples: **TYPE** B:filename
Display the contents of the file "filename" on the diskette in drive B:.

TYPE file **>** **PRN**
Type the file named file from the current directory on the system printer.

TYPE file **|** **MORE**
Display the contents of the file "file" one screenful at a time.

VER internal DOS 2.0

Purpose: The **VER** command displays the version number of DOS your system is using.

Syntax: **VER**

This command can be an important assist if you are having trouble getting a program to run; especially if you install a program on a machine that you may not be used to using -- A LEGAL COPY. The program may run very well on one machine but not on another. This can sometimes be traced to the simple fact that older versions of DOS may not permit the program to run properly.

You may also find that a DOS command given on one machine works differently when given on another machine. Checking the version number with **VER** may be a "quick fix" for the proper syntax.

Well, that's it for another month. As always you may contact me with comments, questions, suggestions, complaints, etc. on Bits of Blue, Compuserve (71020,2722), GEnie (E.KANT), or DELPHI (EDKANT).

WORDPERFECT SHORTCUT

Customizing Footnote and Endnote Text

WordPerfect forces you to format footnote text one footnote at a time. Create the macros below to automate this time-consuming job:

1. To start recording, press **<Ctrl>-<F10>** on a blank *WordPerfect* screen.
2. Press **<Alt>-f** or **<Alt>-e** for footnotes or endnotes, then type **Footnote** or **Endnote**; press **<Enter>**.
3. Press **Ctrl>-<F7>**, **f** or **e**, then **c**.
4. Press **<Ctrl>-<F8>**, then choose base font, size, and appearance for all footnote text.
5. Press **<Ctrl>-<F10><F7>** to end recording.

Now, to insert a preformatted note, press **<Alt>-f** or **<Alt>-e**, type your text, and press **<F7>**.

(Reprinted from PCWorld 2/91)

* * * For Your Info * * *

We all know the acronym **WYSIWYG**. (What You See Is What You Get.)

Here's a new one for you - **WYSBYGI**. (What You See Before You Get It.) A capability of the future WordPerfect for Windows (to be released this year), which lets you preview all aspects of the font--including font type, size and appearance--before you change it in your document.

COMPUTER AIDED DESIGN AND SIMULATION FOR THE STUDENT ELECTRICAL ENGINEER AND ELECTRONICS HOBBYIST

Jeffrey May

Are you interested in learning how to use your computer to design and test electronic circuits and/or digital logic circuits? You say you are, but you can't afford the hundreds of dollars some commercial software packages cost. Then do I have the solution for you.

The answer is right here in our own backyard. The Department of Electrical Engineering at USF requires that its students learn several CAD programs. These programs can be purchased at the USF Textbook Center.

The programs are "Student Versions" of popular CAD programs used by engineers at universities and corporations throughout the U.S. These programs differ from the commercial product in that they are usually a "limited" version of the program; this means that the number of components, connections, type of analysis, etc. allowed by the program is not the same as in the commercial package.They range in cost from $30 to $50. Most are packaged with manual and disks together. The manuals assume that you already understand the theory and applications of the circuit you are trying to simulate.

The programs you will find at the USF Textbook Center that you may want to purchase are:

PROGRAM: SPICE - A Guide to Circuit Simulation & Analysis Using PSpice

USE: Used to simulate analog electronic circuits. Will perform DC SWEEP, SMALL-SIGNAL ANALYSIS, TRANSFER FUNCTION ANALYSIS, FREQUENCY RESPONSE, FEEDBACK CONTROL ANALYSIS, NOISE ANALYSIS , and TRANSIENT RESPONSE ANALYSIS.

PROS: Defacto standard in analog circuit simulation. User can define "macro" circuits. Will display results graphically on computer screen using a post processing program which is included or user can output to dot matrix printer. Post processor supports VGA.

CONS: User must write a "netlist" for the circuit using a separate ASCII editor, which is not provided. Comes with a limited number of transistor models in its library.

FORMAT: Only the manual is available from the textbook center, the manual does contain a card allowing you to obtain the software directly from the publisher. Software runs on IBM XT, AT, PS/2, and compatibles with MS-DOS 3.0 or higher and 512K RAM for two disk drive system or 640K for hard drive system.

PROGRAM: MICRO-CAP II

USE: Used to design and simulate analog electronic circuits. Will perform TRANSIENT, DC, AC, and FOURIER ANALYSIS.

PROS: Has a graphical user interface that allows the user to draw the schematic of the circuit on the computer screen. The program then compiles a "netlist" based upon what was drawn. Displays results of simulation on computer screen without changing to another program. Will print out schematic in two different sizes.

CONS: Does not support EGA or VGA.

FORMAT: Manual and program disks come bundled together. Manual includes a set of tutorials to follow which allow the user to become familiar with all the programs features. Will run on IBM XT, AT, PS/2, and compatibles with MS-DOS 3.0 or higher and 512K of RAM for two disk drive system, or 640K for hard drive system.

PROGRAM: MICRO-LOGIC II

USE: Used to design and simulate digital logical circuits.

PROS: Has same type of user interface as Micro-Cap II. Comes with a fairly large library of basic logic components. Allows user to build "macro" circuits. Simulation results can be outputed to screen or Epson compatible printer. Can print out schematic of circuit.

CONS: Does not support EGA or VGA graphics.

FORMAT: Manual and program disks come bundled together. Manual includes a set of tutorials. Will run on IBM XT, AT, PS/2, or compatibles with MS-DOS 3.0 or higher and 512K RAM for two disk drive system, or 640K for hard drive system. A Microsoft or compatible mouse is recommended, although the system will run without it.

If you decided to purchase any of the above software from the USF Textbook Center there are a few rules to follow:

1. You must pay in cash or by VISA or Master Card unless you are a currently enrolled student.

2. Please purchase the software after the first month of classes if possible, this will ensure the availability of the software and manuals for the students who will need it for classes that semester.

I hope that this article has given you some idea of the CAD software available to the Electrical Engineering students and electronics hobbyist. If you have any questions about any of the programs mentioned leave a message on the BBS and I will try to answer them or find out the answer for you.

TAMPA IBM PC USERS GROUP APPLICATION

Purpose: The Tampa IBM PC Users Group is a non-profit organization dedicated to serve the needs of the PC User - from the most technical of the techies to the simplest of the simple. Our purpose is to benefit ALL computer users, not only IBM and PC-compatible; our intent is to encourage, enlighten, and inform.

This information will be kept confidential. It will be used only for keeping accurate membership statistics.

FUTURE ARTICLES:
(to be continued)
"Desktop Publishing...for beginners" by Ed Buzza

This newsletter is published utilizing a complimentary issue of WordPerfect 5.1, generously contributed to our TIBMPCUG by **WordPerfect Corp.**

PRESIDENT'S COLUMN:

A first for our group. Beginning this month we will have a separate DOS session. This session will consist of 3 meetings spanning a minimum of 3 months. Classes will begin promptly at 5:45 PM in room 469 across from the main meeting room and end at 6:30 PM at which time you will rejoin the main meeting. This class is provided as a no-cost benefit for **members only** and is presently limited to the members who pre-registered at the last meeting. If enough members sign-up, this session will be offered again in July or August. To sign-up contact me or Ed Buzza. If enough interest is generated and we can keep our dedicated volunteer we will offer additional and higher level sessions. This session will be conducted by Ed Buzza. Ed has a unique way of deciphering high level computer stuff into information which we can all comprehend and digest. He, like the rest of us, does not get any reward for volunteering his time or efforts. An honest positive comment to a volunteer will go a long way to reassure that person that he/she is on the right track and that their efforts are appreciated. Even negative comments presented in a tactful method may turn in to something positive for that individual and the group. **Additional thanks to IBM for providing a classroom and equipment.**

SWAP MEET -

All of us have useful computer paraphernalia sitting around that we don't want to throw away and don't use. You surely have heard that one mans junk is another man's treasure. My wife will be the 1st to tell you that I have accumulated objects that I consider useful, one-of-a-kind things over the years and she would be happy to see as someone else's treasure. If you have items to sell trade or give away and you would like to partake in a computer swap meet, notify a board member of your interest. If enough people want to have it we will pursue this idea. As of now no official date, time or place has been set.

BBS ACESS

We have reduced BBS access to past due members. If you have noticed that you can no longer download files, you should contact Bill Fuller to renew your membership.

ANNOUNCING

OUR NEW MEMBERS!

BRANDENBURG, ROBERT
GRACE, PHILLIP
HARVARD, WILLIAM
LAW, DALE
MERRITT, BILLY
RIDGWAY, DON
SHAW, BETTY
RINK, DON (renewal - welcome back)

Welcome to our group, we are delighted to have each and everyone of you as a "TIBMPCUG" member!

Results of March Raffle
AND THE WINNERS ARE!

Sidekick . . . . . Ed.Buzza.and Dave Kintz
Box of diskettes . . . . . Philip Grace
Solar calculator . . Jerry Hannon.and Ron Scarcelli
Cash 50-50 . . . . . Gary Palmer

Our thanks to Borland for donating the two copies of Sidekick and Solar calculators and our thanks to Sunrise Computer Supplies for the box of diskettes.

Secretary's Report

TAMPA IBM PC USER'S GROUP MINUTES OF 3/13/91 MEETING --

There were about 65 members and guests in attendance. The President opened the meeting with the following items of interest:

- WordPerfect has more 800 help numbers than any other vendor. Perhaps that is one reason why they're tops in their field. One member said that WordPerfect has 560 people, full time, answering their technical support telephones.
- If any member did not get a newsletter, check with Harvey.
- Remember to turn in your name badge at the end of the meeting. Those things cost money, so don't take it home and lose it,
- We have received some complaints about "no credit" on articles submitted to the Bits of Blue Newsletter. Please - embed your name in the article; either as a byline or at the end.
- Dun and Bradstreet Software is hiring. They are looking for about eleven people: Technical Writer; Programmers with Clipper, dBase FoxPro experience; and sales people familiar with their products.
- We've gotten use to the word "downsizing" but now we have a new word: "rightsizing." Seems "downsizing" has bad connotations.
- We will start a class covering the fundamentals of DOS. It will consist of three sessions. Each of the 45 minute sessions will be held at 5:45 p.m. on the regular meeting night. Only members may attend (no guests, please).
- TEAC is now shipping 4meg floppy drives; they're in the $60-$70 price range. IBM is announcing PS 2's with 2.8meg floppy drives. There is also trade talk about a 20meg floppy whose price tag is around $250-$300 per copy. Remember, these are "list" prices.
- Seagate has announced a new hard drive with 2G byte capacity. That's 2 giga-bytes, or two million bytes of disk space.
- Microsoft is offering a new trackball device that clamps to the side of your keyboard.
- AMD won their court battle with INTEL regarding use of "386" in defining their computer chip. Microsoft, Apple and Hewlett-Packard are also involved in a court suit regarding the "look and feel" of Windows.
- For all intents and purposes, the future of PCs belongs to OS. While Windows is very popular, it is based on DOS with all of the limitations inherent in DOS.
- Quicken is a great program for home budgeting. It's easy to use and will handle your home accounting. (NOTE: Harvey said he can only speak of software from his own experience. He said that while there are other programs like Quicken, he hasn't used them and can only speak of those programs that he uses.)
- In responding to a question from the floor regarding tax preparation software, attention was drawn to the list of programs mentioned in last month's meeting (Turbo Tax, Tax Cut, etc.,). One of the members stated that AMTAX, a shareware program available on the BBS, is one of the best tax programs around.

BORLAND PRESENTATION - OBJECT VISION

David Printz and Shep Bostin introduced Object Vision. This is Borland's first product for Windows. This program was built for Windows from the ground up; it is not based on DOS. It is an end user application development tool. The next Windows product will be C++,
Borland's version of the popular programming language.

Object Vision creates data links to a variety of databases. It can also create its own database in dBase or Paradox format. There is no need to leave the program to create a database. It is a machine level, structured, object oriented, visual style of programming. The power user can create meta-applications. The small business owner can run a paper-less office. The large corporate or government entities can use this program as part of the corporate data system.

A form is the basic interface. Based on the data in the form, a decision tree (much like a logic chart) is created. Since this is a visual style of programming, taking advantage of the graphical user interface, there are no program language statements. At any point, a decision node can be inserted with branching to other nodes. For instance, assume the form contains data about branch offices, amount of gross sales, and population density. You can then select the branch offices (decision node based on location) to study; classify the amount of gross sales as to high, medium, low (decision node based on less-than, greater-than values); according to population density (another decision node); and determine relative ratings of the branch offices.

What kind of equipment is needed to run Object Vision? As stated earlier, the program runs under Windows. Object Vision needs Windows3 on a 286 PC with 2megs of memory. But the reality of Windows pretty near dictates a 386 with 4meg of memory. (Minutes...Continued on next page)

(Minutes...Continued from previous page)

The list price of this program is $495 but it will be available for a limited time at an introductory price of $99.95. A run-time version of Object Vision ($495) is needed to run created applications at an off-site location. The run-time version also needs Windows. The price for the run-time version is a one-time price and it can be copied as often as needed.

Shep Bostin did an excellent job of demonstrating Object Vision.

TRAINING SESSIONS

The first Training Session will be held on April 10, in Room 469. Attendance is limited to regular (paid-up) members. The items to be discussed include hard disk organization and directory structures. The session will start at 5:45 p.m. and will last about 40-45 minutes. You will miss the President's opening remarks but they will be in the next newsletter.

Club Members BBS:

The Tampa IBM PC User Group operates a full service 130 Mb, single-line 24-hour electronic BBS for file transfers and E-mail. As a member you are invited to use the Board within the established BBS rules.

Phone: 239-3704

The first time you log-on to the BBS, you must establish your Password and set-up. You will then have limited access until access has been verified by the Sysop.

For assistance from SYSOP, Call Kevan Sheridan 237-0100

ON BEING A GUEST
By Donald W. Patzsch

The Tampa IBM PC USERS GROUP is, as I understand it, a GUEST in the building.

Imagine that you came to work in the morning and something was not working. Would you want to know who was in the building last night?

How about if there were a lot of paper cups and napkins laying around?

If we are GUESTS, it seems logical that we would take special care to keep the room clean and not to tamper with any of the equipment. All of us appreciate the very nice place where we can hold the monthly meetings. I hope we are INVITED back each year, this seems to me to be a very very nice place.

Editorial Comment

I had the distinct pleasure of accompanying our illustrious president to the Florida Suncoast Regional PCUG Conference on Saturday 4/6/91. We almost missed it. I was involved in assembling this newsletter for delivery to the printer, and HPB came to me at 11:00 a.m. and asked: "Would you like to attend the conference in Bradenton with me? If so, we'll leave in 30 minutes." The meeting was extremely informative. For openers, an enthusiastic commentary on the upcoming Comdex-Spring, Atlanta seemed to peak the attendees interest. Next, Discussion Groups were set up for the following groups: Newsletters (This was worth the trip alone); Meetings and Meeting Programs; Special Interest Groups and Managing Groups and Personnel Relations.

Contributed articles were "few and far between" this month. I can only assume the lack of articles was due to a more pressing deadline for everyone - "April 15th". However, we do owe our thanks to Ed Buzza for the beginning of his Desktop Publishing mini book and will be looking forward to the future articles spanning multiple issues of "BOB" in the months ahead.

MLB

TEMPLATES

Save your document to be used as a template for future editions of your Little Newsletter. But before you do, you need to create/place the masthead as well as any desired headers and footers. The masthead would include the name of your publication, volume and number if used, date of issue, and perhaps your logo. In essence, place all the boiler plate (the material that will be the same in each issue) in the document, then save it.

If your DTP program provides styles, or style sheets, or master pages, these ARE your templates. By all means incorporate them into your work. They will save you considerable time and effort in your later projects. Some DTP programs allow style notes to be shown in imported text files.

PageMaker can be set up to read <subhead> in your document as being a subhead containing a specific font (typeface, style, and point size). First Publisher can handle font information furnished by Professional Write or First Choice. In WordPerfect, non-printing comments can be used to hold instructions. The use of styles for headlines in WordPerfect provides great flexibility in editing the final product.

Consider putting notes and instructions in your template that will be helpful when preparing the final document. These can then be removed prior to bringing in the text and graphics that will be your final product. Such aids can be particularly helpful when working with seldom used templates.

After saving, make the template file a read-only file. This way you're assured that you will not write over your template or master file.

Retrieve the template and immediately save it with a new filename. Choose a filename that will identify your project and help you remember its contents — now and six months from now. e.g. NEWS9101.DOC, YARDSALE.DOC, DTP-BOOK.PUB, etc..

To put it all together, prepare your text with your favorite word processor and decide on the graphics you're going to use. Now start up your DTP program. Retrieve the new file, place the graphics, turn on picture wrap, place the text, print it, show it around, and accept the applause. And if no one cheers, and you've gotten this far, — hey, give yourself a hand!

Last, the brand names and trademarks used in these articles are the property of their respective owners. Their names are used only to identify the products and to benefit the trademark owners with no intention of infringement of their trademarks.

INTRODUCTION

This is the first in a series of articles dedicated to Desktop Publishing. They will be printed in the same format as you see here. That is, two-up page format. Because many will want to know how this is done, the instructions are in this issue.

PROLOGUE

First, these articles are *not* meant as a criticism of anyone who edits or prepares a newsletter. Heaven knows, the job of being a newsletter editor is a thankless one at best. Those who actually volunteer to take on such a task, and for *no* pay or benefit of any kind and under severe schedules, deserve not only our thanks, but our respect and whole hearted support.

Second, the purpose of these articles is to act as a guide to those who wish to use desktop publishing and are hesitant to do so. It is also a contribution to the club for the benefits that I have received. Benefits from the vendor representatives whom the club provided and benefits from the various members. Vendors can only give you the promise, members give you the facts.

Last, information in these articles is published on an "as is" basis, without warranty of any kind. Neither the writer nor the publisher shall have any liability, loss or damage caused or alleged to be caused by this material.

THE LITTLE NEWSLETTER - How it was done

The outside, first and last, pages were printed on a laser printer using WordPerfect 5.1. The inside pages, 2 & 3, were printed on a 24 pin dot matrix printer using First Publisher 3.0.

Before we go on, we need to define some terms. A page is treated as a "logical" page because they're two of them on the "physical" page. So when you see the word "page", we're talking about the logical page. The actual sheet of paper will be referred to as the physical page. After the two physical pages were printed, these two master pages were then printed back-to-back on a copy machine.

Keys to be pressed will be shown within angle brackets. When you see <F7> it means press the F7 function key. Data to be typed will be shown within curly brackets. When you see {Two-Up}<enter> it means type "Two-Up" then press the enter key. O.K.? ok.

USING WordPerfect 5.1

The Labels feature was used to create a "two-up" page. Use a Landscape paper format and define that paper as having two full page labels. WordPerfect (WP) treats each label as a logical page. So, if you define headers and footers, each page (label) will have one. Ergo, the physical page (one piece of paper) will have two headers and two footers.

Start WP and be sure you select the correct printer, have a blank screen, and are at the top of the document. Now let's define the "Two-Up" paper size.

<Shift-F8> format <2> page <7> size <2> add
<9> other {Two-Up} <enter>
<1> size <2> landscape <3> font <2> land
<4> prompt <Y> yes
<5> location <M> manual <8> labels <Y> yes
<1> size {4.5} width <enter> {8} height <enter>
<2> number {2} cols <enter> {1} rows <enter>
<3> corner {.3} top <enter> {.5} left <enter>
<4> distance {1} col <enter> {0} row <enter>
<5> margin {0} <enter> {0} <enter> {0} <enter>
{.2} <enter>
<F7> <F7> <F7> {1} select <enter> <F7>

Just remember, WP page 1 is really your last page, page 4. WP page2 is your page 1; and WP pages 3 & 4 are your pages 2 & 3. It may help if you just type your page numbers on the first line, press <Ctrl-enter> to force a page break; and do the same for each of the pages.You can place headers, footers, page numbers, etc. in your mini newsletter, but you may want to suppress them for your first page (WP pg 2).

USING First Publisher 3.0

This is a "slippery" program. It is more difficult to control text flow than in some other DTP programs. You have to be rather exact in page layout and design. Also, since this program depends on menu selection, we need to show them between square brackets. So, when you see [define page], it means "Arrow down to Define Page" and <enter> or click with the mouse. O.K.? ok.

Enter First Publisher, be sure you have the right printer and a blank screen. <F2>, [define page], and set all margins to <.5> inches. Set paper size to US Letter <F3> Landscape <F7>, and accept <F1>.

<F2> [chose layout] and <PgDn> to [layout 10], an odd looking 4 column layout. <F2> and select column 1. <F3> and set width to <4.5> and height to <.6>, <F1> to accept. Select column 2, <F3> and set width to <4.5> and height to <.6>, <F1>. Select column 3, <F3> and set width to <4.5> and height to <6.9>, <F1>. Select column 4, <F3> and set width to <4.5> and height to <6.9>, <F1>. It may not be quite right; you may have to select a column and move it to its proper spot. Now you have a choice, <F2> to add this layout to your gallery, or <F1> to go to the main screen.

<Alt-A> <Alt-L> and look at the layout. Columns 1 and 2 (headers) should have three lines. Remember, these columns were set to .6" high. With 72pts per inch, these columns will hold one 36pt line or three 12pt lines. Try it. Position the cursor on column 1, left margin. Select a 24pt font and type the first heading line. Select a 12pt font and type the second heading line. To see the effect, <Alt-A>.

TAMPA IBM PC USERS GROUP APPLICATION

Purpose: The Tampa IBM PC Users Group is a non-profit organization dedicated to serve the needs of the PC User - from the most technical of the techies to the simplest of the simple. Our purpose is to benefit ALL computer users, not only IBM and PC-compatible; our intent is to encourage, enlighten, and inform.

This information will be kept confidential. It will be used only for keeping accurate membership statistics.

BITS OF BLUE

TAMPA IBM PC USER'S GROUP

VOL. 4 NO. 5 MAY, 1991

MEETING

(2nd Wednesday every month)

DATE: May 8, 1991
TIME: 6:00 PM
PLACE: IBM CUSTOMER CENTER
LAKE POINTE ONE BUILDING
3109 W. Martin L. King Blvd.
Room 450

DIRECTIONS:

The Tampa IBM PC Users Group meets in the IBM's LAKE POINTE ONE Building across from Tampa Bay Mall one block east of Tampa Stadium.

The best entrance is on Martin Luther King Blvd. at the traffic light in front of Burdines. As you turn off Martin Luther King Blvd. you will see the LAKE POINTE ONE BUILDING on the left & parking on the right. Join us in ROOM 450 - 4th floor. **Guest please sign in.**

PRESENTATION:

5/8/91 - **Managing Your Money V.7**
Steve Spears
Refreshment Break
Open Discussion - **Microsoft Ballpoint Mouse**
For Viewing - New **IBM Notebook 40SX**
Door Prize Raffle

* * DOS CLASS * *

REMINDER: **DOS** Part II (Ed Buzza, Instructor) will begin promptly at 5:45 PM in room 469 across from the main meeting room and end at 6:30 PM at which time you will rejoin the main meeting. This class is provided as a no-cost benefit for **members only** and is limited to the members who pre-registered.

UPCOMING SPEAKERS

6/12/91 - Harvard GeoGraphics 1.0 & Professional Write Plus
presented by Software Publishing Corp.
(Rescheduled from 5/8/91)

7/10/91 - Ashton-Tate

8/14/91 - Intel

New Members 2
Meeting Minutes 3
PCGEOS Ensemble 4
Logical Question & Solution 3-4
Desktop Publishing ..... *for beginners* (insert)
Bulletin Board Info 5
Hard Disk Trouble 5

PRESIDENT'S COLUMN:

Initial reports from the **1st DOS Class** have been very positive. All who attended gained knowledge and a better general understanding of DOS and PCs. If you missed registering for this 3 part series, you should register at the meeting or leave your name on the BBS attention **DOS Education.** While students are permitted to bring apples for the teacher, I'm sure Ed would rather hear a **THANK YOU** or **GOOD JOB.** Its a credit to our own Ed Buzza (Secretary) that there is a class. Additionally, as you read this newsletter you may notice that Ed contributes greatly to it. The editor and I have thought of renaming the newsletter from **Bits of Blue** to **Bits of Buzza.** OK maybe not.

In an effort to be less dependent on articles from a few members who contribute regularly and to broaden the scope of topics, we have joined the **Association of Personal Computer User Groups (APCUG).** The APCUG is an organization dedicated to fostering communications among and between personal computer user groups and establishing relationships between those user groups and software publishers and hardware manufacturers. As such, it operates as an information network between user group organizations. Our association with this group will result in an overall benefit to our group, not just the newsletter.

It seems like everything looks rosy, but I do have some bad news. Edward Kant has resigned as Education Director for personal reasons. Edward lived in Naples and joined our board of directors this year. We wish to best for Edward and hope that we can fulfill the ideas he brought for PC education. ■■■

Secretary's Report

TAMPA IBM PC USER'S GROUP MINUTES OF 4/10/91 MEETING --

There were about 70 members and guest in attendance. The president opened the meeting with the following items of interest:

- **50 MHz 486**-based PCs would be available by Comdex/Fall (MAY).
- IBM had on display their new portable PS/2 Laptop 40 SX for the members to test out.
- Many notebooks seem to be heavier than vendors announce. Compaq LTE 386/20, AST Premium Exec 386 SX/20, Altima NSX, Zeos Notebook 386, ALR Venture 16-386SX and TI Travelmate 3000 were a few mentioned.
- Logitech has announced that it to will have its own version of a ballpoint mouse (**Trackman Portable Mouse**) with a $169 list price available in July.

LOTUS 1-2-3 PRESENTATION

Bonnie Jacoboni from the Lotus corp. demonstrated the newest version, 3.1, of Lotus 1-2-3. Version 3.1 stresses a graphic approach to the use of spreadsheets. Lotus has a variety of 1-2-3 packages for different platforms (PC, Mac, mini and main frames). Regardless of platform, files and macros as well as the user interface will be compatible. The Lotus spreadsheet will look and operate pretty much the same no matter where it's run.

The new version has mouse support but the mouse is not mandatory. You can use the mouse or the familiar keyboard to navigate through 1-2-3. It also has 3-D capability in that multiple spreadsheets can be on the screen at the same time. The number of spreadsheets that can be shown is dependent upon the amount of RAM that is available to the program. While Version 2 can run on any PC, Version 3.1 is best used on a 286, or higher, with at least 1.5 to 2 meg of memory.

Although no 3-D graphics are available, there is considerable improvement in the graph modules. It can handle the drawing primitives (line, ellipsis, rectangle, polygon) and color lines and fills easily and quickly. A preview mode shows the page as it will look when printed. Also, at last, 1-2-3 has a built-in ability to print in landscape mode. Called "compression," the spreadsheet can be made to fit the page (within reason).

Thank you Ms. Jacoboni for a well delivered presentation. Also, thanks to the Lotus corporation for donating a copy of Magellan to our group.

SATELLITE TRACKING

One of our members, Robert Osband, showed TRAKSTAT; a program that displays the orbit tracks of various satellites. Bob explained that NASA tracks over 10,000 objects in space. Of course, some of that is debris - including a wrench, a camera, and one white glove!

He is a ham operator and talked about the 21 amateur radio satellites in orbit. He pointed out that five of the recent shuttle crew are also ham operators. With the appropriate data files, one can use the program to determine the proper adjustment of the antenna to communicate with one of these satellites. By tuning in to 145.550 MHz, you can listen to the MIR satellite.

Bob also commented on the speed of the PC that IBM allows us to use for presentations as compared to his computer. Graphics that were drawn in a few seconds took many minutes on his computer. Thank you Robert Osband for showing us still another use for PC computers - and doing a great job of explaining satellite radio. Thanks again. ■■■

A LOGICAL QUESTION
by Ed Buzza

Using computer hardware and software often requires more than ordinary skills and aptitudes. Often, your ability to analyze problems is dependent upon your logical ability. To test your logical and analytical skills, the following puzzle is offered:

Adam's wife gave him an XT for his birthday. Burt used his tax refund to buy a 486 PC. The single man who lives in the green house has an 80meg hard drive on his PC. As part of the divorce settlement, Dave kept his yellow house. The widower does not have a 40meg hard drive. The hard drive on the 286 is smaller that the one on the 386. The single man wants to upgrade the 80 meg hard drive on his 486. The man in the white house has no hard drive. The widower has a hard drive twice as large as the man with the 486. The man in the blue house has a faster PC than does the man in the yellow house. What kind of PC does Carl have?

(See Logical Solution. Page 4)

PCGEOS Ensemble
by Don Patzsch

Recently I had an opportunity to talk to the person who wrote PCGEOS. It is a GUI similar to Windows 3.0. The difference is that PCGEOS can run on any 512K IBM or Compatible. It does some amazing things. As an example of the power it has, IBM uses a runtime version in its PS 1 series.

PCGEOS uses the Motif interface from the OSF Group. The interface was designed by OSF for systems running UNIX. In fact, it is claimed that this was the program to be called "PM Lite".

The opening screen is unique. There is one window called "APPLIANCE LEVEL" which can be activated if you are a computer novice, like me. The other window is called "Professional Level" and it will bring up the program in a completely different form. One that contains very complex screens and all the bells and whistles.

At the Professional level, every part of the program appears, multitasking and windows type programs will run under this section.

Now, what is PCGEOS all about. I saw the whole thing displayed. It boggles the mind. For many years I have wanted to know why my old genuine IBM PC, 1982 vintage, and my 1984 Epson FX100 would not really do what I wanted. Do you remember the old BANNERS? They looked like a print made with children's blocks as the method of making the letters, now he has made use of the latest ANTI ALIASING Techniques, pioneered by EDSUN. You can produce letters of almost any type, and almost any size. My long wait is over, now I can produce a good news letter with a program that will not cost me anything. But I am getting ahead of my story.

PCGEOS is a group of several programs, GEOWRITE, GEODRAW, GEOMANAGER, GEODEX, GEOCOMM, BANNER, and a game called SOLITAIRE.

PCGEOS is compatible with over 300 Dot Matrix, INK JET, and Laser printers. The printing I saw which was done on a 9 pin Epson was to me the most spectacular demo I had ever seen. I asked what you would see on a PC Screen if you wanted to print something like that. Most interesting.

The PCGEOS COMM program supports 19200 baud rate, full or half echo, TTY, VT52, VT100, WYSE 50, ANSI, IBM 3101, and TV 1950. This looks to me like a useful comm program.

In order to keep this article short, I plan to stop here, and leave the multi-threading and multitasking description for an article for next month, if there is any interest.

Did you notice that IBM displayed its multimegabyte 3.5 inch floptical disk drive at the Comdex? The new equipment promises to be real interesting. ■■■

Editorial Comment: This article was submitted by Don for the April newsletter, and it was overlooked for that issue. Sorry Don, but here it is and keep them coming, Very Informative!

President's Comment: GeoWorks has given us an evaluation copy of GeoWorks Ensemble. Look for a product demonstration by one of our members in near future. Additionally coupons were sent to us for distribution to our members entitling the purchase of Ensemble for $50.00. Unfortunately, the coupons were sent 10 days prior to expiration. I will see if GeoWorks will extend April 30th deadline.

A LOGICAL SOLUTION
(Continued from Page 3)

Surely, you've seen this type of puzzle before. They're designed to wake up the old brain cells. Sometimes called "story puzzles" or "logic problems," they can be fun to solve. One way to solve them is to construct a "truth table." Note that there are four main objects (Adam, Burt, Carl, Dave) in the puzzle with a group of attributes. These attributes can be grouped as: marital status (single, married, divorced, widowed), color of house, etc..

As with all such puzzles, each of the attributes is an exclusive feature of the object. That is, if one object has one of the attributes, then none of the other objects has that attribute. By the same token, if one of the objects has one of the attributes, then that object does not have any of the other attributes. With these facts, you can now prepare a truth table. Using the puzzle in this issue, here is what part of the table would look like.

	ADAM	BURT	CARL	DAVE
Marital Status				
Single	N			
Married	Y	N	N	N
Divorced	N			
Widowed	N			

Since the puzzle said "Adam's wife ...," obviously Adam is married. Since Adam is married, then Burt, Carl, and Dave are NOT married. Conversely, Adam is NOT single, divorced, or widowed. Beginning to make sense? Good. Now finish the puzzle.
(SEE NEXT ISSUE)

There are thousands of fonts available for use. These are the fonts that you use in your personal computer programs. There are three types: 1) native (built-in) to your printer, 2) bit-mapped soft fonts, and 3) scalable (or outline) fonts. Each font is also concerned with character sets.

Character set means the number of characters supplied for a particular font, or more commonly, a font family. Sets vary in size from 94 (standard keyboard) to as many as 224 (ANSI) characters, or more.

The native fonts are the ones that are built into your printer. They're always there and ready to be used. Laser printers usually have a fixed 10 point, 12 pitch, typeface and an 8 point, 16 pitch, printer font. Some have a version of Times Roman and Helvetica built-in. A few may have as many as 35 fonts built into the printer. Dot matrix printers often have one or more 10 pitch typefaces (pica) and at least one with 12 pitch (elite).

Bit-mapped soft fonts, are as the name suggests, made up of individual bits that form a character based on a grid of 300x300 bits per inch. These fonts are software fonts, not hardware. As such, they must be downloaded from disk or RAM to the printer's memory. They can be bought as individual fonts or as font sets. Bit-mapped soft fonts can take up quite a bit of space on your disk. Soft fonts are almost always used only with laser or ink jet printers. There are some dot matrix printers that can download a soft font but that procedure is rare.

Scalable fonts come in two varieties: built-in and generated. Some laser printers have scalable, resident fonts stored within printer memory or in a cartridge inserted in the printer. By using resident fonts, printing is faster because there are no fonts to download.

A scalable font contains an outline of the character to be printed rather than a bit map image of the character. The size of the font can be scaled to any size within the limits of the printer or of the software application. Typically, point sizes range from 1 point to 999 points. A scalable font may need 50-60k of disk space or printer RAM; but that's all that's needed for all the point sizes you use. You do not need a separate font file for each point size in your document.

A font cartridge has built-in memory that contains either a family of scalable outline fonts or a family of bit mapped fonts. Bit mapped cartridges are limited to a set of point sizes; the scalable font cartridges offer almost unlimited point sizes. Either type of cartridge, because of its built-in RAM, reduces the need for printer memory or disk space. No need to download these fonts. ■

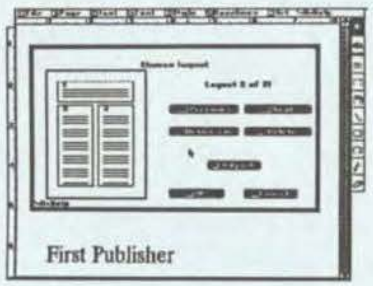
DESKTOP PUBLISHING - What it is

A DeskTop Publishing (DTP) program is not a word processor nor is it a graphics program. While it may have word processing qualities, they are usually limited. It may have some graphic features that permit you to draw lines, boxes, and circles, but that's about it. What it is, is a page layout program.

A DTP program permits you to arrange your text and graphics quickly, easily, and accurately. By having text and graphics in digital form, the DTP is far faster in allowing you to rearrange placement of these items than the old style method of creating a publication. The old way requires hours and hours to correct typos, change type faces and styles, relocate graphics and articles. Not to mention the heavy use of scissors, razor knives, and the glue pot.



A DTP program is concerned with the "look" of a page. Text and graphics are treated as blocks or frames to be placed on the page in such fashion as to catch and hold the reader's attention. They layout of

these blocks involves design. If it is pleasing, arresting, interesting, - then it's good design. If it is dull, boring, ugly, - then it's bad design. A good test of a DTP program is the ease and speed that it provides you in altering styles, size, and placement of these blocks so as to effect good design. ■

DESKTOP PUBLISHING - What it's for

The purpose of a publication is to communicate; and by communicating, to inform, persaude, or entertain. Don't let the format, fonts, and graphics get in the way of your communication. If the graphics overpower the page, different typefaces are used for each paragraph, and the format is wildly psychedelic — you don't have a publication, you have a mess!

One of the common applications for DTP programs is a newsletter. Others are: advertisements and flyers, books and manuals, pamphlets and brochures, catalogs, directories, price lists, menus, forms, and even correspondence. Correspondence? Correspondence! ■

First Publisher

SOME POPULAR DTP PROGRAMS

PageMaker (Aldus) and Ventura Publisher (Xerox) are recognized as the "top of the heap" when discussing DTP programs. PageMaker runs under Windows while Ventura uses the GEM environment. Both are very powerful and quite expensive.

First Publisher (Software Publishing), Express Publisher (Power Up Software), GEM Desktop Publisher (Digital Research), Finesse (Logitech), Avagio (Unison World) and Publish-It (Timeworks) are considered to be in the medium price category. Although not as powerful as PageMaker or Ventura, these are pretty good programs.

There are a variety of other (usually inexpensive) programs that claim to be DTP programs. They are quite limited in what they can do. Font selection is limited to a handful of proprietary typefaces and generally they use generic output device drivers (one size fits all).

Some word processors have so many features, they blur the line between word processing and desktop publishing. Consider such programs as WordPerfect (Wordperfect), Word for Windows (Microsoft), AMI Professional (Samna), WordStar (WordStar Int'l) and others. These will likely be more than adequate for occasional club or company newsletters. ■

FONTS vs TYPEFACES

Many people confuse fonts with typefaces. A font is one typeface of one size, one style and of one width. Therefore a line set in Times Roman (typeface), 12 point (size), normal (style), and medium (width) is one font. If another line is set the same way but uses italics (style), that is another font. And if still another line is set the same way but is 14 point (size), that's another font. So if a vendor says it is supplying 4 fonts, it could mean that you're getting normal, bold, italic, and bold italic of ONE face in ONE size! Be sure you're talking the same language when you're shopping for fonts.

There are hundreds of typefaces and you are probably familiar with some of them. Surely you have heard of Times Roman and Helvetica. Typefaces can be thought of as one of three different types: serif (with the fillets and curlicues), sans serif (sans means without), and exotic (anything other than the Times Roman or Helvetica kind). To avoid copyright infringement, many font vendors invent their own names for the various typefaces. Surprisingly, only the name of a typeface can be copyrighted, not the appearance or shape of the typeface. But don't worry, they tell you that it is their version of whatever copyrighted font they're selling.

Style generally describes the appearance of the font. Bold, italic, bold italic, and normal are all styles. Width refers to the stroke thickness of the typeface and varies from light, through medium (or normal), dark (or black), and extra black. Note, it is quite common to treat the width and style as a single element simply called style.

While most DTP fonts are proportional, there are also mono-spaced fonts. With proportional fonts, the amount of space any character occupies depends on the width of the character. e.g., the letter "i" takes up less space than the letter "W" would need. Mono-spaced fonts, also called fixed fonts, have the same amount of space for each and every character. Fixed fonts are further classified by pitch. Pitch refers to the number of characters per inch (cpi). Typewriter users commonly refer to Elite type (a 10pt font at 12 pitch) and Pica type (a 12pt font at 10 pitch).

By now you're saying you've learned more about fonts than you've ever wanted to know. But if you're serious about DTP, you will have to cope with fonts. ■

Each of the following lines is ONE font:

12pt Serif - normal
12pt Serif - bold
12pt Serif - italic
12pt Serif - bold/italic
12pt Sans Serif - normal
12pt Sans Serif - bold
12pt Sans Serif - italic
12pt Sans Serif - bold/italic

Hard Disk Trouble?
by Don Patzsch

Hardly anyone should BACK UP a hard disk. Not too many should run an OPTIMIZER program.

Who said that? Well, look around you. Many people have been complaining that they have to replace their hard disks lately so I thought I would say what I think.

When I started working with a Bulletin Board, I noticed that my disk drives were clicking on and off all the time. It finally dawned on me that I was actually testing the drives each day. So I bought the necessary memory and since that time I download to one ramdisk and unzip to another ram disk and I have never had a disk drive failure.

Now I have an ESDI 120 megabyte drive and I notice that when I optimize the disk the head is moving at lightning speed and so fast I can not follow it. Imagine what that does to the drive. Also when you BACK UP a hard drive it may take a long time and of
course the drive is working at breakneck speed, throwing that head around. So Why BACK UP?

If you think a little, you can set up
E:\WP51\LETTERS
then the only thing to back up is the LETTERS. Why back up the main file? You already have that. Suppose you have WINDOWS 3.0. Why back that up? You only need WIN.INI or any of the other files you modify. That backup will save you about 3 megabytes and lots of work for your hard disk. The same is true of most of the other work that the average person does. I use both EXCEL and QUATTRO. I back up only the files I work on. The same is true for PARADOX and C. Why back up all those main programs?

Find out how to set up a program with XCOPY. XCOPY will copy only those files that have been changed since the last backup. Imagine the time and work that your hard disk does not have to do
if you back up that way! Another thing. Sometimes it pays to back up to a ramdisk and then from there go to whatever you want to use for permanent storage.

If I had a small business, I would not buy a computer with a Hard Disk. I would buy a computer with two identical hard disks. Use one disk for your "backup" and make it identical to the other. Then if you come to work and the system does not respond, you can use a disk to bring it up in A: and then replace the bad disk without any fuss at all. This is not necessary for the average user.

Since I do not know which programs you use, I will tell you a little about Wordperfect. If you start the program with wp/r then part of the program goes into memory. Now that is going to make the program operate faster, but it is also going to use your hard disk less often. It is up to you to use your head and find ways and means to actually use your hard disk less often. That will extend its life and make you much happier.

One last note:
The new computers are coming out with space on the motherboard for up to 100 megs. Guess why this is. You will soon load most of your stuff into memory before you start using it. That will make the hard disk last longer, and give you much greater speed of operation. So all you have to do to make your disk last longer is to figure out how to make use of it in a more sensible way. ■■■

Club Members BBS:

The Tampa IBM PC User Group operates a full service 130 Mb, single-line 24-hour electronic BBS for file transfers and E-mail. As a member you are invited to use the Board within the established BBS rules.

Phone: 239-3704

The first time you log-on to the BBS, you must establish your Password and set-up. You will then have limited access until access has been verified by the Sysop.

BITS OF BLUE

TAMPA IBM PC USER'S GROUP

VOL. 4 NO. 6 JUNE, 1991

MEETING

(2nd Wednesday every month)

DATE: June 12, 1991
TIME: 6:00 PM
PLACE: IBM CUSTOMER CENTER
LAKE POINTE ONE BUILDING
3109 W. Martin L. King Blvd.
Room 450

DIRECTIONS:

The Tampa IBM PC Users Group meets in the IBM's LAKE POINTE ONE Building across from Tampa Bay Mall one block east of Tampa Stadium.

The best entrance is on Martin Luther King Blvd. at the traffic light in front of Burdines. As you turn off Martin Luther King Blvd. you will see the LAKE POINTE ONE BUILDING on the left & parking on the right. Join us in ROOM 450 - 4th floor. **Guest please sign in.**

PRESENTATION:

6/12/91 - **OPEN**
Harvard GeoGraphics 1.0 &
Professional Write Plus
(Canceled for this meeting and will be rescheduled)

Refreshment Break
Open Discussion -
Door Prize Raffle

* * DOS CLASS * *

REMINDER: DOS Part III (Ed Buzza, Instructor) will begin promptly at 5:45 PM in room 469 across from the main meeting room and end at 6:30 PM at which time you will rejoin the main meeting. This class is provided as a no-cost benefit for **members only** and is limited to the members who pre-registered.

UPCOMING SPEAKERS

7/10/91 - Ashton-Tate

8/14/91 - Intel

It's great to have you as new "TIBMPCUG" members!

Bits of Blue is published by the Tampa IBM PC Users' Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about IBM-PC and compatible personal computer systems to its members.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII file or in a commonly available word processor format, such as WordPerfect 5.1, on diskette to the editor at the address below or send it by modem to BBS (813)239-3704.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for non-profit use. Reprints must be unaltered; proper credit given and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

This newsletter was created with WordPerfect 5.1 donated by WordPerfect Corp. to TIBMPCUG for use by the editor.

Secretary's Report

TAMPA IBM PC USER'S GROUP
MINUTES OF 5/8/91 MEETING --

Harvey Bruneau was the sole speaker for the entire meeting. Software Publishing had to cancel its scheduled presentation on GeoGraphics. It is believed that the local representative had to attend a seminar about the new product that SPC is about to announce. Steve Speairs was to give a presentation but had to cancel at the last minute. Seems that Steve's company had a system crash on their mid-west server. What with air freighting new material and having to go to work at 4 in the morning, Steve has an interesting (?) career.

Harvey spoke about some recent product announcements. Some of the items were:

- Version 5 of DOS is scheduled for release in June. The upgrade price is $100.
- WordPerfect for Windows is due to be released in July. It will be called Version 6. The product was demonstrated at Harvey's office and Harvey said that it looks great. He also reported that anyone buying WordPerfect between 4/1/91 and until 30 days after the product release is announced, registered users can get an updated license from WordPerfect. It will cost $15 to get the update disk, $29 for the manual, and $19 for the work book -plus $5 for shipping and handling.
- MicroSoft's Trackball was shown. It attaches to the side of the keyboard. The trackball is package with its own case and several varieties of clamps to fit the side edge of keyboards. If you want to attach the trackball to a regular desktop PC, you need an extension cable since the supplied cable is rather short. The coiled cable is of an adequate length for laptops or portables. Logitech offers a similar device.
- Hewlett-Packard has lowered its price for the Desk Jet printer. They have announced the Laser Jet IIIP with a price of $1595; same 4 ppm as the IIP but with the new engine of the III model (resolution enhancement). For $1895, you can get the laser jet fax which routes fax material to the laser printer.
- Hewlett-Packard now offers a palm-top computer with Lotus built into it. The keyboard is very small and would be awkward for touch typists. But if you're only entering numbers into Lotus, it's adequate.

(Minutes continued on next page)

(Minutes continued...from previous page)

- Okidata has a new 24 pin printer being offered for $349.
- Tandy (Radio Shack) is allowing up to $500 for your old PC toward the purchase of certain new PCs that Tandy offers.
- Version 7 of PCTOOLS is now available. List price is $179; upgrade price will be $49 until July 1st. Until August 1st, anyone with a competing product will be able to get the new version for $59. It is said to have a Windows-like appearance. It will offer back-up through Windows, launch Window program applications, and protection or detection of over 600 computer viruses.
- Prodigy has been accused of accessing data on user machines. The Los Angeles District Attorney is checking this allegation. One of the members spoke about seeing some of his records in one of Prodigy's .DAT file.
- Virus problem. America On-Line distribution disks may be corrupted. One member reported that the virus seems to affect floppy disk behavior. He said that he couldn't copy files to a floppy disk. And that the middle half of his directory listing was gone. He reported the problem to America On-Line and they said they were not aware of it. He called 3 weeks later to check and again they said that they were not aware of the problem!
- Permission had been obtained extend the 4/30 deadline on the Geoworks coupons for another 10 days. These coupons enable a buyer to get the Geoworks Ensemble for $50, a tremendous saving compared to the list price. The street price is between 130-150 dollars.
- Comments on the working demo of Ami-Pro was solicited. A member reported that he was quite impressed with the features of this high-end word processor. It's easier to work with than the DOS version of WordPerfect. It can substitute as a desktop publishing program. He remarked that although there were virtually no instructions supplied, that it was quite intuitive - very user-friendly. He also said that, as with most Window applications, there is no UNinstall procedure. The working copy WILL comb the physical hard drive to find Windows. When it finds it, it installs itself into Windows. To uninstall it, you have to modify the various .INI files then remove the pertinent files.

LAP LINK Presentation:

Harvey demonstrated Version 3 of Lap Link; a software package that enables two PCs to be connected for file management. Both serial and parallel connector cables are supplied with the package. The software splits the screen and shows both the local and the remote machine. He noted that the ports on both machines must agree. And that parallel hookups were preferred for their speed as compared to serial transfers.

This program enables you to copy files to/from one PC to another when incompatible floppy drives are installed on the PCs. Harvey showed just how easy it was to copy and delete files on either the local or the remote machine. You do have to be careful and keep track of which part of the screen represents the local or the remote PC. He said that it took about 35-45 minutes to copy over 100 meg of data between 2 machines.

SECRETARY'S COMMENT:

Our president deserves a round of applause and our thanks for the great job he did at our last meeting. It was unfortunate that the scheduled speakers had to cancel. But as they say in the vernacular, "Stuff happens." So, Harvey had to carry the whole meeting by himself. He's always ready to fill-in if one of the scheduled speakers has to cancel; but to carry both ends speaks well of his willingness to help our users group. Thanks Harvey, for a job well done under trying circumstances. ■■■

PRESIDENT'S COLUMN:

We did it! The editor (Marylee) and I went to ***Hot-Lanta*** for **COMDEX/SPRING'91 & WINDOWS WORLD'91.** It was the 1st time either of us attended a national computer show. If general Schwarzkopf had been with us I am sure he would have called it the **mother of all computer shows.** The minimum entry fee was $75 a person for the entire week (exhibits only). For an additional $200 you could attend any of the 170 conferences/sessions during the week. We were fortunate that WordPerfect provided us with 2 free $75 passes. The **Association of Personal Computer User Groups, Inc.** (APCUG) also provided some. The evening of our arrival we attended a meeting with other user group representatives and a variety of software publishers and hardware manufacturers from around the country. The interactive discussion consisted of a user group/vendor liaison roundtable. Vendor Reps included **Borland International, Corel Systems Corp., IBM Corp., Logitech, Inc., Lotus Development Corp., Microsoft Corp., Pat Meier Assoc., PC World, Software Publishing Corp., and WordPerfect Corp.** Additional vendors, including some of the above, sponsored user group activities which took place during the week. These vendors included **Traveling Software, Asymetrix Corp. and Adobe Systems.** Our thanks to all these vendors for their involvement with user groups. All of these events in conjunction with Comdex made for a long, long day.

Our 1st day on the floor (Comdex) was monday morning. We rode an escalator down to the East Hall of the Georgia World Congress Center. As we rode down we could see the a lot of booths and the back of the hall but we could not see either end. This whole show was suppose to have around 900 exhibitors and 170 conferences, but it sure looked like 9,000. Mind you that at this point I didn't even realize that there was also a West Hall (Windows World) of the same magnitude that I couldn't see. Since the show, a lot of people have told me that its small compared to Comdex in Vegas. We were there till closing time and still had not covered the **floor** in its entirety.

Our 2nd day began by returning to Comdex and trying to rush through the exhibits we had not seen. Then it was off to Windows World. This was another hall of the same size connected by a corridor to the east hall. This was where all the **GEE WHIZ** stuff was. Multimedia (the combination of text, moving pictures and sound (voice, stereo/mono)) was the big thing. This technology is neat and not all that expensive, but I am not sure where it fits in for the masses other than education and presentations. I saw for the 1st time voice recognition software/hardware from IBM (**Voice Type**). It does work, although you must change your speech to a slower pace and it requires DOS 5.0. As I write this now I don't recall seeing DOS 5.0 anywhere during the show. Microsoft ,the largest exhibitor (2 acres MOL and 30-40 employees) had multiple booths within their area including two open theaters each seating approximately 50 people. I was impressed with their pen based system. It looked like an Etch-A-Sketch with a pen. This product is a computer without a keyboard consisting of only a screen, disk storage and operating system. It allows data entry via the user's handwriting (print). This product will be a hot product in the corporate world and will get us closer to a paperless society. WordPerfect and IBM seem to be a close second. Other interesting products included **INFRALINK.** This product allows you to use your printer without having to use printer cables. It communicates between printer and PC through infra-red. Boy, I could have used this past week when I installed 4 new PC printer cables each 40' or longer. A Far East conglomerate will surely buy this German company or snatch their technology.

After attending Comdex we came up with a few tips for potential attendees:

1. Pre-register. Avoid the last minute rush.
2. Design a who/what to see list. Its easy to miss the exhibits you want to see when there is so much to look at.
3. If possible get a hotel as close to convention. This eliminates driving in rush hour traffic, paying for parking if you can find any and getting lost due to one way streets. It takes less time to walk to a close hotel than to exit the parking lot with 5,000 other people.
4. Wear tennis shoes. Our dogs were killing us by lunch time of the 1st day.
5. Don't rush, take breaks.
6. Dress appropriately and comfortably. I wore a suit both days and it was comfortable except toward the end of the day carrying 10 lbs of paper materials. If you want exhibitors to take you seriously, dress seriously. A lot of exhibitors are there to make deals with dealers, resellers and distributors. If you look like your there to kick tires they may not talk to you or spend quality time with you. Comdex is a business event not a family show. As a matter of fact no one under 18 is admitted.
7. Take a carrying bag that is comfortable to carry with 1+ lbs of miscellaneous stuff that you will collect during each day. We saw people pulling luggage cart with boxes full of paper.
8. If your a non-smoker, be prepared for a lot of smoke. As big as the show was the smoke was bothersome. Atlanta in general seems to be the same.

I was disappointed that some vendors didn't have their own exhibits, Aston-Tate, Novell and 3Comm to mention a few. I would have liked to attend some of the 170 conferences available. We should have spent an extra day and taken our time, but it was our vacation and we were off to the mountains for 1 day before coming home. Well for rookies we did OK and with the help of APCUG (sysops) and the vendors supporting user groups we had a good time. ■■■

Harvey Bruneau

SOME THOUGHTS ON TECHNOLOGY

BY PHILIPPE KAHN

Copyright (c) 1991, APCUG, All Rights Reserved. Permission granted for reproduction in official publications of member organizations of the Association of PC User Groups.

As the information explosion progresses and computer technologies become more complex, User Groups will play an increasingly important role in communicating the benefits on these technologies. User Groups will also help bring about new technologies.

Leading edge software technology is the result of constant change and interaction -- interactive communication between the user and software developers. The more flexible and supportive the line of communication, the more we all benefit from the fruition of this technology. End users who are knowledgeable and vocal will serve to increase the overall standards in an industry that can only stand to gain from an informed and supportive user community.

Objects for the People.
At Borland, and at other leading software companies, object-oriented technology is the new cornerstone of software product development. Using object-oriented programming techniques, software developers can be even more effective in implementing ideas and suggestions made by end users.

Unlike traditional programming techniques, object-oriented programming permits the characterization of functions, data or instructions as "objects" which facilitates the design and implementation of software.

There are three aspects to Borland's object-oriented approach: object-oriented methodologies, object-oriented tools for programmers, and object-oriented user interfaces for end users.

Object-Oriented Methodologies.
Borland uses standard object-oriented programming techniques. These include the use of class libraries, which are clusters of objects and embedded objects, which combine instructions and data to be acted upon. The use of object-oriented programming techniques results in software that is reusable, reliable, extendable and more easily and efficiently developed.

Object-oriented methodologies have enabled Borland to create, maintain and evolve its core technologies. These core technologies, which can be characterized as standard reusable software components, are essentially a collection of objects that allow the company to employ common approaches to similar problems.

For example, one problem we heard of from User Groups and others was the need to upgrade hardware in order to run new, more functional versions of software. Subsequently, we developed VROOMM (Virtual Runtime Object-Oriented Memory Manager), a core technology which enables greater functionality to be added to products without the corresponding increase in memory requirements.

Objects for Programmers.
Object-oriented development tools are used by Borland programmers and sold by the company to outside developers. As one of the first software developers to provide object-oriented tools for Windows, we have the opportunity to create even more usable software for end users worldwide.

Objects for End Users.
I believe the benefits of object-oriented architecture should be available to end users as well as programmers, and Borland's unique background of developing applications products and programming tools can help us do just that. Using object-oriented architectures, users can manipulate components, or groups of objects, and create completely customized applications rather than having to rely solely upon already developed standalone applications such as databases and spreadsheets. Borland's ObjectVision is one of the first object-oriented end user programming tools for the Windows environment.

Objects also allow a consistent way for the user to interact with applications. For example, Borland has developed an object-oriented user conceptual model that is powerful yet intuitive. This reduces the number of steps and knowledge required of an end user, which in turn, makes applications products more intuitive and usable. This approach is becoming increasingly important as applications become more complex.

Software for the Future.
Software is designed to accommodate the acquisition, manipulation and delivery of information. The challenge is to improve this process. This is done through the design of better user interfaces, more usable product features and optimization of hardware.

We are all familiar with the level of frustration experienced when using a product that we don't understand, that is not intuitive or clearly documented. When we attempt to use a product to perform a task for which it was not intended, the level of frustration increases.

(Some Thoughts..Continued on next page)

(Some Thoughts..continued from previous page)

User groups evolved out of users' needs to resolve these frustrations, and to provide additional knowledge and support to keep pace with emerging technologies. This need continues today as products become even more complex and as operating environments change.

User groups have developed a voice in the marketplace and their suggestions are being implemented. Through education they assist users in making informed decisions about the technology they purchase and contribute to the industry by transitioning users to new software platforms.

Software developers, manufacturers, user groups and all others involved in furthering technology are responsible for making the industry as effective as possible. If we each do our part, the industry will prosper, we will all be on the leading edge of technology, and we all will reap its rewards.

Philippe Kahn is chairman, president and chief executive officer of Borland International. (TIBMPCUG Editor note: ...and a MAJOR contributor to the APCUG BBS, in hardware, software, and support.)

■■■

FILE COMPRESSION TERMS

FILE = The SINGLE name that identifies information on a disk drive. This information is either a program, text information, or supplemental data for a program.

FILE EXTRACTION = The process of recreating files that have been previously compressed.

FILE COMPRESSION = The process of reducing a file's size. This is sometimes referred to as data compressing.

LZH or ZIP FILE = The file that holds file information that has been reduced in size for better storage. It is sometimes called a compressed file or a library file. A ZIP file can be made up of one or more files compressed and stored together under one file name.

SELF EXTRACTING = A file with an EXE file extension that, when executed, creates files that were stored within. The contents is usually an executable program and it's documentation. This type of file is usually a ZIP file bundled with a program to automatically extract the original files.

Hard Drive Confusion?

Reprinted from 04/91 South Mountain UG The Journal

If you are confused about the different Hard Drives on the market, perhaps this article from JDR Microdevices will help:

HARD DISK SPECIFICATIONS AND TECHNICAL INFORMATION

ESDI (Enhanced Small Device Interface) refers to an interface standard designed for ultra-high speed data transfer. ESDI hard disk subsystems are designed with high-performance, high-reliability needs in mind. The encryption method used by most ESDI systems is NRZ (Non-Return to Zero) which eliminates the need for clock pulses, yielding up to 18.5 kilobytes per track and optimum read/write speeds.

MFM (Modified Frequency Modulation) is the most widely used method of encrypting data on the magnetic surface of a hard disk. The data is combined with clock pulses which insure the reliable reading of stored information. MFM hard disk systems can typically store about 8.5 kilobytes per track.

RLL (Run Length Limited) is another widely used technique for data encryption. Data is compressed by substituting repetitive strings of 1s and 0s with shorter identifiers. The resulting compression will yield about 13 kilobytes of data per track or an increase of up to 53%.

SCSI (Small Computer Systems Interface) is a standard interface bus designed to connect system components and peripherals. SCSI is attaining wide spread use in hard drive and network applications. SCSI hard drive systems tend towards high performance and capacity, but use standard data encryption techniques such as MFM or RLL.

IDE (Integrated Device Electronics) is a recent addition to the list of standard hard drive interfaces. Similar to SCSI, an IDE interface card in your system provides the proper bus and interface signals; the hard disk controller is actually part of the drive electronics attached to the hard disk. Again, several different methods of data encryption can be used with the IDE interface.

■■■

COMPUTER PREJUDICE

by Glen Stocking

Education is the natural enemy of prejudice. Everyone is aware of racial and religious prejudice, and since the industrial revolution, the world has known technology prejudice. Today, in a time of satellite communications, fax machines and photo copiers, computer prejudice has arrived. From Webster's New World Dictionary, "Prejudice implies a preconceived and unreasonable judgment or opinion, usually an unfavorable one marked by suspicion, fear, intolerance, or hatred." Computer prejudice inhibits creativity, promotes resource waste, limits productivity, and widens the gap students must jump to reach employment.

People are suspicious of computer users. Perhaps they think computer users are in league with the devil. Surly the demons lurking within a CPU are more terrifying and gruesome than any who issued from Pandora's box. The unmistakable odor of tar and sulfur wafts menacingly from the floppy drive doors, no moral person would toil for such a master.

Computer users do not claim sainthood, but in league with the devil? Computers can be addicting task masters, but most users can control the big red switch. Computer users are not slaves to electronic demons, that odor of tar and sulfur is probably just a ham and swiss on rye warming on the power supply.

Fear of the unknown compels people to be computer prejudice. The electronic wizardry of computers is beyond comprehension to most people. Computer programs are written with strange hieroglyphics that defy translation. Computers have a history of doing things that humans can not explain and often seem powerless to change.

The unknown is nothing to fear, it is a mystery to unravel. How much of the modern world does anyone fully understand? The internal combustion engine is a mystery to most people, but they drive cars everyday. A television set, a toaster and a toilet are found in most American homes, but how many know how they work? Computer users do not always know a lot about computers, but they can still develop a lot of skill with applications.

Programs are written with highly structured logic, and computers do exactly as the program instructs. Flaws in logic have led to bewildering errors, but humans created those flaws, and humans can correct them.

People are frustrated by computers, because a computer will unerringly do exactly as it is told to do. Inexperienced users often overlook their own errors, and are unable to control the computer. The disheartened user begins to feel dominated by the machine. To control their fear of losing control, people often become intolerant of the machine. Unable to master the computer the hapless user avoids the machine, declares it evil, and refuses to associate with those who employ the machine successfully.

Fear leads to anger, anger unresolved, becomes hatred. Throughout history people have feared races and religions different from their own. The hatred that resulted has destroyed uncounted lives. The evolution of humankind has been delayed unknown centuries by misunderstanding and distrust. Today, human enrichment is still impeded by people who refuse to grasp new technology and utilize its power to expand their horizons.

A young man gave up his city life and retreated to the north woods. One night he sharpened his ax and explained to a visitor that the ax had been good enough for the old timers, who respected the woods, and it was good enough for him. The young man's aged uncle spat into the fire when he declared, "Son, the old timers used axes 'cause that's what they had. Grandpa told me if he'd had a chain saw, he'd a used it!" Traditional methods are priceless as heritage, but they are not the best means of production. The right tool for the job saves effort, saves time, and produces better results.

Computer spreadsheet have liberated accountants and bookkeepers from the pure torture of updating reports. Architects and engineers can experiment painlessly using automated design programs. Word processors have opened the untapped universe of ideas formerly locked up in the minds of people with no other way to express themselves. No longer shackled by restrictions of form and mechanics, people can concentrate on content, knowing the machine will help organize the flow into a presentable paper.

To left handed writers, word processors are a godsend. Left handers usually learned and practiced writing on right handed desk that offered no support for the working hand. Pushing a pen across paper from left to right forces the left hand to plow through wet ink and blocks from view the words the writer has just written. These obstacles contribute to interruptions in the writers train of thought, making writing a difficult and painful chore.

With a little practice, the writer's fingers can fly across a keyboard recording thoughts as fast as they occur, before they can be lost to distractions or modified by reflection. The ease of electronic editing encourages writers to fine tune their presentation, rather than accepting second rate work to avoid painful revisions. Word processors create aesthetic results without wasting resources. Brainstorming, outlining, and rough composition is done without a single sheet of paper being consumed. Pens and pencils lie in desk drawers unused. Text can be manipulated on the page

(Computer Prejudice..continued on next page)

(Computer Prejudice...continued from previous page.)

to create traditional or dramatic reports. Only when the writer/editor is satisfied with the composition is the work submitted to the printer. Personal computer printers create pages unparalleled in excellence. The ideas and skills of the writer are laid bare for all to see. With the proper hardware and software, electronic creations can be transmitted and read without paper, reducing response time and increasing productivity.

Productivity is the key to successful business, so computers are proliferating in the work place. Students should be encouraged to become comfortable with computers. Teachers must create opportunities for students to practice computer skills, giving the students confidence with the tools they will be using after graduation. Many adult students finished their formal education before computers were common in the classroom. These people are trying to catch up and hang on. Educators must support these motivated students, not hinder them with insistence on traditional methods. In the near future, college campuses will be completely linked by computer. Students will create reports and upload them into the school's system. The teacher will be able to access the system from their office or home to read the reports. The student will then access the system to retrieve the graded report, complete with comments. For the traditionalist, the system can supply a hard copy.

Prejudice is an ugly emotion. Suspicion, fear and intolerance are characteristics of humankind's troubled past. Education is helping to eliminate religious and racial prejudice. Education must take the lead in promoting creativity, saving resources, increasing productivity and giving students skills needed in the job market, by eradicating computer prejudice.

THIS ONE WAS WRITTEN BECAUSE I WAS MAD, BUT I AM FEELING MUCH BETTER NOW!

A LOGICAL ANSWER

by Ed Buzza

As promised in the last issue, here is the complete truth table. Now when you see one of these puzzles in a magazine or elsewhere, grab a pencil and some paper, scratch a few lines for your table, and then amaze your friends and family and confound your boss and other enemies.

	Adam	Burt	Carl	Dave
Marital Status				
Single	N	Y	N	N
Married	Y	N	N	N
Divorced	N	N	N	Y
Widowed	N	N	Y	N
House				
Blue	N	N	Y	N
Green	N	Y	N	N
White	Y	N	N	N
Yellow	N	N	N	Y
PC				
XT	Y	N	N	N
286	N	N	N	Y
386	N	N	Y	N
486	N	Y	N	N
Hard Drive				
None	Y	N	N	N
40 meg	N	N	N	Y
80 meg	N	Y	N	N
160 meg	N	N	Y	N

Remember with programs that compress EXE files.

1. Always run the program against a COPY of the program. Never compress the original
2. Test the program immediately for every possible function. There are certain programs that will no longer work after being compressed. Also, if you are running under Windows, DESQview, or similar environment, the program might not act the same as if it were run from the DOS prompt.

paint/draw programs that can edit a scanned image. As always, beware of using copyrighted material.

Most paint/draw programs provide sample "clip art" images. Although covered by copyright, they can be used for personal or non-commercial purposes. The problem with clip art is size (it may not fit) and graphic file format.

Graphics are either in vector or raster format. Raster or bit-mapped graphics are built on a pixel by pixel basis. Vector graphics are built on an arithmetic formula. For instance, a line in a raster file is composed of a series of sequential pixels whose color is different than the background color. A line in a vector graphic is described by a formula (starting point, length, width, and ending point).

That is why a raster graphic is not easy to stretch or shrink. When a raster line is changed, pixels must be added or deleted from the line, usually resulting in jagged lines. When a vector line is changed, only the data in the formula is changed. Hence, vector graphics will retain their crisp resolution regardless of the changes made to the graphic. All CAD (Computer Assisted Design) programs use vector files (or it really isn't a CAD program).

Clip art or graphic files can be raster or vector files and are known by their file extensions. The following are the more common raster formats: .PCX, .PCC, .TIF, .IMG, .MSP, and .PIC (but not all .PIC files are .PIC files!).

Some of the common vector formats are: .CGM, .DXF, .DWG, .CDR, .EPS, and .WPG (but .WPG files can hold both raster and vector files). Almost all DTP programs will accept .PCX files.

If your DTP program provides for hiding graphics, do so; turn the feature on. Get into the habit of using place holders for graphics and then place the graphics as the final step of preparing the master document. It will speed up draft printing and screen redraws. ■

I'd rather be playing golf!

TEXT PREPARATION

Use your favorite word processor and save the output as ASCII, unless your DTP can import your word processor formatted files. If the DTP can accept your formatted text files, you can do a lot of DTP formatting ahead of time. Do include fonts, headlines, headers, footers, etc.. In fact, if you have one of the high-end word processors, you can use it as your DTP program.

Whatever you do, USE THE TAB KEY to indent paragraphs, DO NOT use spaces. When using proportional fonts, spaces won't always line up. This will present a ragged look to your final product.

Also, learn to single space between sentences. Yes, your typing teacher always taught you to place two spaces after a period ending a sentence. Just try to avoid that when preparing material for DTP purposes. Those extra spaces take up a lot of room in a published document.

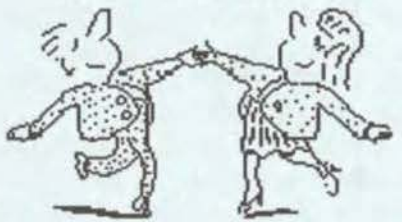
Do not use hyphenation or full justification (both margins flush). If your word processor has this feature, turn it off. When you bring text into the DTP program, then hyphenate or justify to suit the needs of your software and of your document.

Naturally, you will spell-check your text in your word processor or in a stand alone spell checker. It's a good idea to run it through a grammar checker if you have one. Otherwise, proof read your mock-up or, a better idea, have someone else proof it for you.

Keep your text at the eight grade level if you are writing any instructional material. The genius reader will understand and know what you want and will get the job done. Those with below average reading skills will follow your instructions to the letter; if your instructions are correct, the job will get done. Your biggest problem will be those people between the just cited extremes. They read, decide you don't know what you're talking about, or they "help" you get the job done. All you can do is to be as precise as possible. Break the job down into individual steps and describe what is to be done, and why, at each step in order to do the job. Adopt the cook book recipe method - a classic form of instruction.

Some restrictions do not apply when writing technical material. Of necessity, your work will be full of jargon and esoteric language. Also, your spell and grammar checkers may not be of much help. Do consider setting up a personal dictionary if your word processor's spell check provides for one. Here is one place where shop language and legalese may be necessary for you to communicate effectively. ■

FILLERS



Not every article ends at the end of a column or page. Sometimes you can adjust the leading. But be careful that the lines don't become so far apart as to make reading difficult. There is no law that says all columns must be even with the bottom of a page. If you're writing a book, then that's different.

So there will be a need to "fill out" a column; hence the word "fillers." You've all seen them in magazines and newspapers. Little snippets of trivia stuck here and there to even out the columns. Where do you get these fillers? Get a book of quotations, an almanac, a calendar of noted events, anecdotes, etc.. Do give credit for the source of any material, especially copyrighted material.

One pull quote every two or three pages is about the right ratio

"Pull quotes" or "read outs" can also be used as fillers. Pick up some important point being made in your text; show it in a different typeface, style, or size; then place it either in the column, between columns, or stretch it to span columns. All are effective. If your DTP program has the ability, shade the background of the pull quote. Just don't overdo it. One pull quote every two or three pages is about the right ratio. ■

"We've got Windows!"

TIME-OUTS

Every now and then, the reader needs a "time out." A chance to catch one's breath so to speak. These time-outs are nothing more than a convenient break while reading lengthy material. They can be cartoons, illustrations, graphics, one-liners, pull quotes, hints/tips, late news, remarks from the president or other officer, etc..

They are especially useful in newsletters and brochures. Use with caution in books or in instructional manuals. Never use them in instructional pamphlets. Much like fillers, time-outs can serve to stretch out the body of text to even up columns and pages. Time-outs should always be shown with a border unless it is a drawing or picture. ■

Excited wife called her husband at work. "I won the lottery, pack your clothes!" "Great!" he replied, "Summer or winter clothes?" She said, "All of them, I want you out of the house by six!"

GRAPHICS

There is NO need to have every graphic prepared and/or placed with the computer. You can, literally, cut and paste graphics into your prepared document. Now you know why they invented rubber cement. It is far easier to do your sketching with pencil and paper than it is with a paint or drawing program. All DTP programs provide for creating a "place holder" for a graphic to be pasted in manually. Use the appropriate DTP tool to draw an empty box whose dimensions are the size of the graphic that is to be included. To eliminate the shadow that sometimes occurs when copying a master page that has pasted graphics, paste in the graphic, then use a pen or pencil to draw a border around the graphic right where the shadow would occur. This way, you are not only hiding a flaw, you are enhancing the graphic with its own border.

Paint and draw programs do have their uses but there are other resources that can be used. Books and collections of non-copyrighted material containing virtually any graphic to suit your needs are available. Use them. Dover Publications has a variety of clip art books that fit this need. Such resources are especially valuable to anyone with a scanner. After you scan the graphic, then use one of the

BITS OF BLUE

TAMPA IBM PC USER'S GROUP

VOL. 4 NO. 7 July, 1991

MEETING
(2nd Wednesday every month)

DATE: July 10, 1991
TIME: 6:00 PM
PLACE: IBM CUSTOMER CENTER
LAKE POINTE ONE BUILDING
3109 W. Martin L. King Blvd.
Room 450

DIRECTIONS:

The Tampa IBM PC Users Group meets in the IBM's LAKE POINTE ONE Building across from Tampa Bay Mall one block east of Tampa Stadium.

The best entrance is on Martin Luther King Blvd. at the traffic light in front of Burdines. As you turn off Martin Luther King Blvd. you will see the LAKE POINTE ONE BUILDING on the left & parking on the right. Join us in ROOM 450 - 4th floor. **Guest please sign in.**

PRESENTATION:

7/10/91- **IBM** OS/2 2.0 (Presented by **IBM**)

Refreshment Break

IBM DOS 5.0 (Presented by **IBM**)

It's great to have you as new "TIBMPCUG" members!

Bits of Blue is published by the Tampa IBM PC Users' Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about IBM-PC and compatible personal computer systems to its members.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII file or in a commonly available word processor format, such as WordPerfect 5.1, on diskette to the editor at the address below or send it by modem to BBS (813)239-3704.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for non-profit use. Reprints must be unaltered; proper credit given and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

This newsletter was created with WordPerfect 5.1 donated by WordPerfect Corp. to TIBMPCUG for use by the editor.

Secretary's Report

TAMPA IBM PC USER'S GROUP
MINUTES OF 6/12/91 MEETING --

PRESIDENT'S REMARKS

Harvey Bruneau informed the members of the latest developments in PC software and hardware. Some of the items he mentioned are:

- IBM will give a presentation next month of OS Version 2 and of IBM DOS Version 5.
- Caution - You can't install Version 5 of IBM's DOS into a PC that now has MS-DOS (Version 4 or earlier).
- Ashton Tate was scheduled to give a presentation at our July meeting but it has been canceled.
- The merits and handling characteristics of trackball and mouse devices were discussed.
- Intel has announced a delay until the 4th quarter of the availability of their 50 mhz 486 chip.
- Dell Computers has cut prices on some of their equipment. A 386SX with 1 meg RAM, a floppy drive, 40 meg IDE hard drive, 16 bit super VGA board, and a VGA monitor for less than $2,000.00.
- Western Digital is now shipping 2.5 inch hard drives. These are primarily intended for OEM sources of portable and notebook computers.
- GeoWorks and Quarterdeck are merging. Could present a bit of competition to Microsoft Windows.
- One of our members recommended the program LIST.SHO that can be found on the Sunshine BBS. It's a demonstration of how to use the LIST program (ver 7.5). He said it runs about 15 minutes and is a very good demonstration.
- A member remarked that the Window Resource Kit from Microsoft was a very good offer (total cost about $20). It contains an icon draw program, screen blankers, system information module, and the Productivity Package.

ATLANTA COMDEX

Harvey spoke at some length about the Comdex event that he and his wife attended.

- He was very impressed with the size of the exhibit space, the number of sessions, and the number of attendees (over 60,000). He said that it's impossible to attend all of the sessions because there are so many of them. He recommends comfortable shoes (you'll do a lot of walking) and being organized. Decide what you want to see and hear before you get there.

(Minutes continued on next page)

(Minutes continued...from previous page)

- While the exhibit hall was huge, there was another building across the street hosting the Windows exhibition that was just as big. Harvey said that some of the exhibits took up as much space as his whole house!
- IBM showed their voice recognition computer. You have to talk slow but it does have a vocabulary of about 7,000 words.

OPEN DISCUSSION
Harvey demonstrated the use of some of his favorite utilities. As a LAN manager, he carries these as part of his "toolkit."

SWEEP: Can be used to perform a DOS operation across directories.
e.g., SWEEP DEL *.BAK

WHEREIS: Searches across all directories for the named file and shows the full path of each file found.

FFM: A utility that shows two directories side by side. Sometimes called 2DIR on some BBSs.

TXT2COM: Converts a text file to a .COM file. Useful in batch jobs.

PKLITE: Compresses .EXE files - usually about 50% reduction.

LIST: Latest version is 7.5I. It's more than a text viewer utility.

He also demonstrated a data base utility that can look at records, sort them, and display selected fields.

A member of the group also showed his "toolkit" of favorite utilities. While most members were familiar with some of them, his demonstration of LIST showed how versatile this program can be. ■■■

MINI BOOK REVIEW: *by Tom Schroeppel*

"Lingo", by Jim Menick, is a new book about an artificial intelligence program that grows from an Apple IIG to eventually take over the United States. It's humorous, mostly believable, and highly entertaining, especially for anyone interested in computers. The book is available at local branches of the Tampa Public Library; if it's not in you can put dibs on the next available copy anywhere in town through the library's new system-wide reserve policy. ■■■

PROGRAMMER'S PUZZLE
By: Tom Cone, Jr.

Assume the existence of a hotel that has 500 rooms.

Assume further that 500 guests show up one day to inspect the rooms one after the other, according to the following sequence:

The first guest visits all the rooms and opens all the doors.

The second guest visits every other room and closes each door.

(at this point half of the doors are open and half are closed...)

The third guest visits every third room. If the door is open he closes it. If it was closed, he opens it.

The fourth guest visits every fourth room. If a door is open when it is visited it gets closed. If a door is closed when it is visited it gets opened.

This sequence continues, until the 500th guest visits the 500th room. If that door is open it gets closed. If it is closed it gets opened.

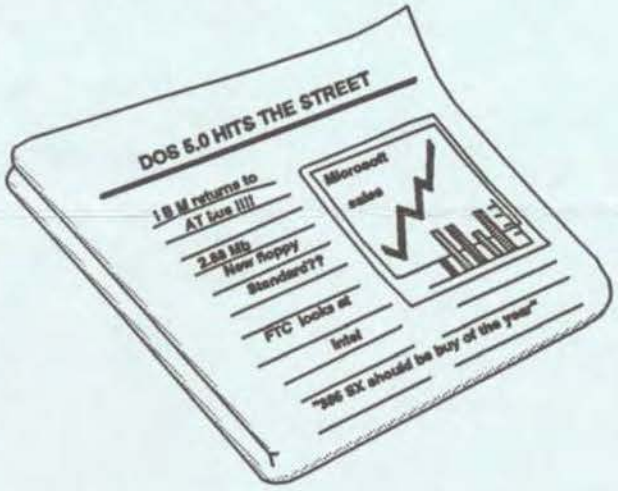
After the 500th guest visited the last room, how many doors remain open, and how many remain closed? ■■■
(Answer next month)

Club Members BBS:

The Tampa IBM PC User Group operates a full service 130 Mb, single-line 24-hour electronic BBS for file transfers and E-mail. As a member you are invited to use the Board within the established BBS rules.

Phone: 239-3704

The first time you log-on to the BBS, you must establish your Password and set-up. You will then have limited access until access has been verified by the Sysop.



For assistance from SYSOP,
Call Kevan Sheridan 237-0100

PRESIDENT'S COLUMN:

Well events during the closing of the 1st half of the 1991 sure were dramatic.

1. **DOS 5.0 upgrade hits the street.**
IBM and MS DOS 5.0 is available at your local vendor. Street price was around $39 (list $99.95) at Workplace and Egghead. This price is effective for a limited time. For an additional $9 (List $14.95), you could buy **UPGRADING TO MS-DOS 5** by QUE Corp. You may not need this book but I have always found this publisher to present information with more detail than other publishers including the original vendor manuals. Microsoft had over 7,000 beta sites for this product so it should not have any major flaws as it predecessor had. However, there are minor bugs beginning to emerge, some of which are not Microsoft fault. Any information on **5.0** bugs would be appreciated.

I have replaced my MS DOS 3.1 with the 5.0 version on the 286 PC. The 8088 will keep DOS 3.1. The installation required about 4 hours. Mainly due to backing up 2 partitioned 40Mb drives, removing the partitions, reformatting the drives and copying the software back to the drives. My paths and batch files also had to modified to reflect the elimination of the E: and F: drives. Users with partitioned drives have the option to keep them that way. I chose not to. I have not used any of the new features yet. Presently we are sticking to the old fashion DOS prompt. There is nothing worse than getting caught up in new technology and not being able to produce a newsletter. After the newsletter and 384k more of memory chips we will challenge the new features.

If you are one of the 50 million+ users of DOS 4.0x or prior, you may want to consider the upgrade. Please be aware that this **DOS 5.0** release is of a greater benefit to owners of 286 PCs and above.

Note - Our own Frederick Kyle has written an in depth article on **DOS 5.0** for this months newsletter.

2. **IBM unveils 3 new AT-BUS 20MHz 386SX based PS/2s.**
It looks like ***If you can't beat them, join them*** and add a little spice. I could not believe my eyes when I read that IBM had 4 new PS/2s (mdls 57SX, 40SX, 35SX & 35LS), the latter 3 of which are **based on the old AT bus.** If you have an MCA bus machine don't panic, **YET.** IBM has supposedly done this to regain market share from the clone makers. Time will tell if this is true and it works. To add a little fuel to the fire these machines have an option which even I like. A 2.88Mb floppy. The non-AT class machine (57SX) comes standard with this drive. It should not be to long before other vendors follow suit.

3. **Intel being reviewed by the FTC.**
The Federal Trade Commission has included Intel in its review of mircocomputer companies allegedly performing unfair business practices. Advanced Micro Devices, Inc. **(AMD)** along with other companies have accused Intel of hitting below the belt. Intel now joins Microsoft under the governments magnifying glass.

Prices have begun to significantly drop on math co-processors. Look for the 286, 386 and 486 processors to also drop. These drops will further reduce the cost of PCs. The 386SX should be a great buy during the next 6 months.

If you are looking to buy a PC this year I would start looking at the 386SX or higher product line. This processor should have a technology life of 2-3 years. In the past I was recommending a 286 12MHz but advancements in software and price reductions of hardware during the last year have made the 386SX machines the best buy. Be aware that not all PCs are the same. There are some rotten apples out there. Talk to your fellow computer users before you sign.

There is no reason why you should pay more than $2000 for a good clone desktop 386SX 20MHz with the following: MS DOS 5.0/Windows 3.0/4Mb RAM/80Mb 17ms drive/VGA Color monitor/Mouse/1.2 & 1.44 Floppies/32k cache RAM.

The rest of the year should prove to be even more exciting. Look for 486 50MHz PCs to be available from multiple vendors, OS/2 2.0 to give Microsoft a headache, mergers and acquisitions from strange bedfellows to fight the dominating role of Microsoft. Additionally, the release of even greater products for the Microsoft Windows arena including; Wordperfect 6.0, Harvard Graphics and a couple of dBASE languages (finally).■■■

Harvey Bruneau

Software Review: "The Creator" (v.6.0)

By: Tom Cone

"The Creator" is a program that writes BASIC programs to perform database management functions and generate reports. It is what is known as a "program generator". The output is a program written in BASIC. You need MicroSoft QuickBasic (version 4.5 or higher) or Microsoft BASIC 6.0 (or higher) to compile or run the programs that are produced by "The Creator".

In my judgment, his program is not for beginners. It is quite flexible, and has surprising depth. I judge it to be of great use to intermediate or advanced programmers, particularly those familiar with QuickBasic, already. According to the author, an intermediate level BASIC programmer should be capable of creating data entry and update programs, together with simple report programs within an hour or two of installing "The Creator". My own experience indicates that generating the programs that actually manage the database (by adding, editing or deleting records) is relatively straight forward and simple. On the other hand, generating the programs which produce printed reports is considerably more complex and time consuming.

The database programs that are generated by "The Creator" use "fixed length" records in their data files. The data file is composed of "records", which, in turn, are composed of "fields" representing discrete chunks of related information. For example, you could very easily generate a name and address database, which stores each person's name, address, phone number and zip code in a single record; utilizing individual fields to hold the name, the address, the city, the state, the zip code, and the phone number.

Such a database is often referred to as a "flat file" database, since all of the data relevant to the particular application is contained in a single file.

In addition to supporting a flat file system, "The Creator" permits individual fields in a record to be "linked" to related files, thereby giving the resulting application a "relational capability". For example, if you wanted to record the names of family members for each person in your name and address file, you could link the name of each person in your database to a separate file which contains only the names of that person's family members. This saves a lot of disk storage space, since it is not necessary to enter each family member in the main name and address file, nor is it necessary to add separate fields to the name and address record to record family member names, along with the primary name. Since unused fields in fixed length records consume just as much disk space as fields that are completely filled in, a linking system such as this saves a lot of data storage area on disk. With such a system, as you read through the main database file, you can also read any related dependent records in the linked file.

Key fields within the database are also supported. Indexes based upon them are kept current automatically as records are added, edited or deleted. Searches utilizing the key fields are virtually instantaneous.

Password protection is supported.

Specific edit constraints can be imposed on any field in a record. For example, using simple codes you can force all user input for particular fields into uppercase letters; or lowercase letters; or limit to Y/N or T/F. You can designate specific fields to be "mandatory", i.e. fields that must be filled in before a record can be added to the file; and you can limit user input to numeric data, only. Other edit restrictions are also possible, though I won't take the trouble to list them all here.

Calculated fields are supported within the program. This makes it possible to make the contents of one field equal the sum or difference of other fields, so that the calculated field will automatically be filled in as records are added to the file. "The Creator" enables you to design your own formula for the calculated field. You are not limited to sums or differences.

Extended edits are supported for individual fields within each record. This makes it possible to validate user supplied information against another disk file, for example. This helps assure better integrity within the resulting database, since keyboard errors can be trapped & corrected as the data is being entered.

The resulting program code is easy to operate by the end-user. The routines for viewing, adding, editing and deleting records are simple and flexible. You can write your own "help" file, that becomes available to the user simply by pressing the F1 key. The database can be viewed "in order" based on any selected key, or any selected group of key fields. "Browsing" through the file, one record at a time, is a snap. Searching for individual records, (or groups of records) is easy, yet powerful. Searches based on values in multiple "keys" is supported, for example.

It's been my experience that most people find that however nice it may be to have quick access "on screen" to your data, simply viewing the data on disk is not enough for most applications. Instead, people need an easy way to be able to generate written reports summarizing all or parts of the information contained in the data file. "The Creator" package includes a related program called "The Reporter". This program generates BASIC report programs that you custom design for yourself using a pre-defined set of command words or phrases.

(Continued on next page.)

(Creator..continued from previous page.)

These commands function essentially as "macro's" that enable "The Reporter" to translate your report design into the actual BASIC code, itself.

The process requires you to create a text file defining the heading, the body, and the footing for your desired report. In the body of the report, you can include specifications for subtotals or totals on any numeric field. You may insert selection or exclusion criteria within the body of the report in order to limit the printed report to particular groups of records.

A powerful sorting utility is also included within the package. This is useful because it permits data in your reports to be sorted in virtually any order that you may desire.

"The Reporter" is not limited to simple columnar table-like reports. You can design multi-line reports easily, as well. This makes it a snap to generate mailing labels, for example.

As mentioned at the top, I found the report capabilities to be more difficult to grasp and understand than was true for the generation of the database management program, itself. In several instances I have had to "hand-craft" refinements in the BASIC code to achieve the desired reports.

The process for developing stand-alone EXE files works as follows:

A. For the Data Entry Programs:

STEP 1 - Define a data dictionary for your database. In this step, you select names for each field within the record, decide what length each field should occupy within the record, and assign any edit restrictions desired.

STEP 2 - Draw the data input/edit screen. This is done by simply drawing your desired screen with any text editor. The screen may be revised or redrawn at any time, without having to generate new code or re-compile it. (A very nice touch!)

STEP 3 - Run "The Creator" to create a BASIC program file.

STEP 4 - Compile the BASIC file to an OBJ file using QuickBasic.

STEP 5 - Link the OBJ file with QuickBasic libraries and a special Creator library to create the desired EXE file. The resulting EXE file can be distributed and run by end-users without QuickBasic or "The Creator".

B. For the Report programs:

STEP 1 - Define the format of the desired report using special command words and phrases. This is done with any simple text editor. (Incidentally, a text editor is included within "The Creator" for convenience.)

STEP 2 - Run "The Reporter" to create a BASIC program file that will generate the hardcopy report you desire.

STEP 3 - Compile the BASIC file to an OBJ file under QuickBasic.

STEP 4 - Link the OBJ file with QuickBasic libraries and a special "Creator" library to create the desired EXE file.

If all of this sounds complicated, relax. The program includes a utility which enables you to perform these steps in series, by simply selecting menu items off a list. If you prefer, you can step outside of the menu system and perform any "step" manually.

MINI BOOK REVIEW:
By: Hugh Bayless (Monterey Bay User Group)

"WordPerfect Power Pack"

QUE Books, the computer book division of Macmillan, has just published WordPerfect Power Pack, by Ralph Blodgett, a magazine editor and author of 15 books. He is also one of seven sysops on the WordPerfect Support Group forum on CompuServe who answer questions about WordPerfect from users around the world.

The book is a compendium of office-writing techniques with WordPerfect -- general correspondence, printing envelopes and labels, creating reports, specialized documents, and legal documents. It also briefly covers desktop publishing.

WordPerfect Power Pack includes a self-installing 360K disk packed with samples, macros, styles, templates, forms, letters, merge files, and supporting documents described in the book.

For any business office that is using WordPerfect, this should be the handbook for every clerk and secretary to have within easy reach. It is the most comprehensive book on WordPerfect office writing techniques I have yet seen. $39.95 at your favorite bookstore with disk.

MS-DOS 5.0: NEW & REVISED COMMANDS, DEVICE DRIVERS AND SWITCHES

by Frederick D. Kyle

Microsoft's DOS version 5.0 contains a number of new programs and device drivers, as well as several new "switches" for commands, device drivers and programs from prior versions. This document is designed primarily for those DOS 3.3 users who decided not to upgrade to version 4.01, but who may be interested in the version 5.0 upgrade; it briefly summarizes the changes in relation to versions 3.3 (which is used as the "base") and 4.01. It does not cover any "installation" programs (other than EXPAND.EXE)[1] or the various "compatibility" programs and drivers[2] which come with DOS 5.0; also excluded are the "batch" commands, which have not changed between these three versions (other than their inclusion in 5.0's HELP system). The following symbols are used in the tables below:

*	means:	"the switches for this command or device have not changed from the prior version"
◂▸	means:	"the range of values for some switches has changed in this version"
N/A	means:	"this command or device was not included in this version"
NEW	means:	"this command or device was added in this version"
NEW SWITCH	means:	"one or more switches, parameters or sub-commands has been added or deleted in this version"
REMOVED	means:	"this command no longer is part of DOS"
REPLACED	means:	"this program was replaced by a substantially different program with a different name"

For purposes of comparison, the command or device name appearing in the left-most column is the name used in the earliest of the three versions in which the command or device appeared.

Configuration Commands

These commands are used in the CONFIG.SYS file; they execute when the computer boots.

	ver. 3.3	ver. 4.01	ver. 5.0	Comment
BREAK		*	*	
BUFFERS		NEW SWITCH: adds "m" and /x	**NEW SWITCH**: drops /x	▸"m" should not be used with SMARTDRV
COUNTRY		◂▸ [adds 4 countries]	◂▸ [drops support for some countries, adds others]	
DEVICE		*	*	

---

1 These are SETUP.EXE, HDBKUP.EXE, DELOLDOS.EXE, UNINSTAL.EXE and HDRSTORE.EXE.

2 MS-DOS 5.0 includes a variety of device drivers and programs for compatibility purposes. These include DMDRVR.BIN and XBIOS.OVL (for drives partitioned with OnTrack's Disk Manager), SSTOR.SYS (for drives partitioned with SpeedStor), MSHERC.COM (Hercules graphics driver), CV.COM (to load certain versions of CODEVIEW), WINA20.386 (for WINDOWS), and a number of network drivers (NET5.COM, IPX.OBJ and TBMI2.COM for NOVELL networks; NET.EXE, NETBEUI.DOS, NETWKSTA.EXE, REDIR.EXE, and SETNAME.EXE for other network systems).

DEVICEHIGH	N/A	N/A	**NEW**: uses size=??	▸loads device drivers into UMB area; for 80286 [some] and up with extended memory
DOS	N/A	N/A	**NEW**: uses [high | low], [umb | noumb]	▸loads DOS into HMA, enables DEVICEHIGH; for 80286 and up with extended memory
DRIVPARM		NEW SWITCH: adds /i	*	
		◂▸ [drops "f:3", "f:4" (for 8" FD)]	◂▸ [adds "f:9" for 2.88 MB floppies]	
FBCS		*	**NEW SWITCH**: drops "y" parameter	
FILES		*	*	
INSTALL	N/A	NEW	*	▸used for FASTOPEN, KEYB, NSLFUNC, SHARE
LASTDRIVE		*	*	
REM	N/A	NEW	*	▸used to add comments to CONFIG.SYS
SHELL		*	*	
STACKS		*	*	
SWITCHES	N/A	N/A	**NEW**: uses /k /w	▸make an enhanced KB act like standard KB with /k

Device Drivers

These programs enable the operating system to interact with certain types of hardware "devices" (including memory and mouse devices). All are loaded in the CONFIG.SYS file; EMM386 and SETVER can be executed at the command line after booting, but only if previously loaded.

	ver. 3.3	ver. 4.01	ver. 5.0	Comment
ANSI.SYS		NEW SWITCH: adds /k, /l, /x	**NEW SWITCH**: drops /l, adds /s	▸use /k when "switches=/k" is used
		◂▸ [revises graphics set]	◂▸ [revises graphics set]	
DISPLAY.SYS		*	◂▸ [adds Slavic support + default "sub-font" values]	
DRIVER.SYS		NEW SWITCH: drops /n	*	
		◂▸ [drops "f:3 to f:6" (8" FD; HD, tape)]	◂▸ [adds "f:9" and "s:36" for 2.88 MB floppies]	
EGA.SYS	N/A	N/A	**NEW**	▸to swap tasks in DOSSHELL with EGA monitor
EMM386.SYS	N/A	NEW: uses [size] x:??-?? M?	**REPLACED**: now EMM386.EXE	▸expanded & HMA memory manager (for 80386 up)
			NEW SWITCH: adds 11 new switches plus 3 alternates	
HIMEM.SYS	N/A	NEW: uses /HMAMIN= /NUMHANDLES=		**NEW SWITCH**: adds 5 new switches ▸extended memory manager; for 80286 and up with extended memory
PRINTER.SYS		*	◂▸ [adds Slavic support]	
RAMDRIVE.SYS		*	*	
SETVER.EXE	N/A	N/A	**NEW**	▸loads "DOS version table" into memory
SMARTDRV.SYS	N/A	NEW: uses [size] /a	**NEW SWITCH**: adds /p, "MinCacheSize"	▸loads into expanded memory with /a
XMA2EMS.SYS	N/A	NEW	**REMOVED**	

Internal Commands

The "internal" commands are built into the COMMAND.COM command interpreter.

	ver. 3.3	ver. 4.01	ver. 5.0	Comment
BREAK		*	*	
CHCP		*	◂▸ [adds Slavic support]	
CHDIR [CD]		*	*	
CLS		*	*	▸clears 43/50 lines if MODE CON was set
COPY		*	*	
CTTY		*	*	

DATE		*	◂▸ [max. year = 2099]	
DEL [ERASE]		NEW SWITCH: adds /p	*	▸DOS asks before deleting with /p
DIR		*	**NEW SWITCH**: adds /a:??, /o:?, /s, /b, /l	▸select attribute types, sort order; include subdirs; can save options using SET DIRCMD=??
EXIT		*	*	
LOADHIGH [LH]	N/A	N/A	**NEW**	▸loads programs into UMB area; for 80286 [some] and up with extended memory
MKDIR [MD]		*	*	
PATH		*	*	
PROMPT		*	*	
RENAME [REN]		*	*	
RMDIR [RD]		*	*	
SET		*	*	
TIME		*	**NEW SWITCH**: adds [a | p]	▸can use 12-hour clock to set time
TRUENAME	N/A	NEW	*	▸remains an undocumented command!
TYPE		*	*	
VER		*	*	
VERIFY		*	*	
VOL		*	*	

External Commands (Programs)

The "external" commands are not part of the COMMAND.COM command interpreter; rather, they are separate programs (files).

	ver. 3.3	ver. 4.01	ver. 5.0	Comment
APPEND.EXE		NEW SWITCH: adds /x:?? /path:??	*	
ASSIGN.COM		*	**NEW SWITCH**: adds /status	
ATTRIB.EXE		*	**NEW SWITCH**: adds +/-h, +/-s	▸change hidden, system attributes
BACKUP.EXE		NEW SWITCH: /f:?? replaces /f	◂▸ [adds "f:2880" for 2.88 MB floppies]	
CHKDSK.EXE		*	*	
COMMAND.COM		*	**NEW SWITCH**: adds /msg	
COMP.EXE		*	**NEW SWITCH**: adds /a, /c, /d, /l, /n=??	▸case insensitive comparisons with /c
DEBUG.EXE		NEW SWITCH: adds P, XA, XD, XM, XS	**NEW SWITCH**: adds internal ? sub-command	▸access "help" from within DEBUG with ?
DISKCOMP.COM		*	*	
DISKCOPY.COM		*	**NEW SWITCH**: adds /v	
DOSKEY.COM	N/A	N/A	**NEW**: uses /bufsize=? /history /[insert | overstrike] /macros /reinstall	▸command-line history; macro capability; new ALT-F7, F8, F9, ALT-F10 functions
EDIT.COM	N/A	N/A	**NEW**: uses /b /g /h /nohi	▸needs QBASIC.EXE to run
EDLIN.EXE		*	**NEW SWITCH**: adds /b	▸edit in binary mode with /b
EXE2BIN.EXE		*	*	
EXPAND.EXE	N/A	N/A	**NEW**	▸decompresses original DOS program files
FASTOPEN.EXE		NEW SWITCH: adds "m", /x	**NEW SWITCH**: drops "m"	▸loads cache into expanded memory with /x
FC.EXE		*	*	
FDISK.EXE	[max. size=32MB]	[max. partition size=2GB]	*	
FILESYS.EXE	N/A	NEW	**REMOVED**	
FIND.EXE		*	**NEW SWITCH**: adds /i	▸case insensitive searches with /i

FORMAT.COM		NEW SWITCH: /f:??	◂▸ [adds "f:2880" for 2.88 MB floppies] **NEW SWITCH**: adds /q /u	▸specify diskette size with /f:?? ▸unconditional (old style) format with /u; zero out FAT and root directory only with /q; default "format" is modified form of /q
GRAFTABL.COM		NEW SWITCH: adds ?	**NEW SWITCH**: drops ? ◂▸ [add Slavic support]	▸regular "help" switch for all commands is /?
GRAPHICS.COM		NEW SWITCH: drops /p=, adds /pb ◂▸ [drops one printer, adds one]	* ◂▸ [adds 10 printer types]	
GWBASIC.EXE		*	**REPLACED**: now QBASIC.EXE	▸full-screen editor
HELP.EXE	N/A	N/A	**NEW**	▸access via "HELP [cmd]" or "[cmd] /?"; covers all internal, external & batch commands
IFSFUNC.EXE	N/A	NEW	**REMOVED**	
JOIN.EXE		◂▸ [disables 3 more commands]	◂▸ [disables 2 more commands for JOINed drives]	▸disabled commands: ASSIGN, BACKUP, CHKDSK, DISKCOMP, DISKCOPY, FDISK, FORMAT, LABEL, MIRROR, RECOVER, RESTORE, SYS
KEYB.COM		NEW SWITCH: adds /ID:? ◂▸ [adds Fr-Canadian support]	**NEW SWITCH**: adds /e ◂▸ [adds 5 language types]	
LABEL.EXE		*	*	
LINK.EXE		*	**REMOVED**	
LOADFIX.COM	N/A	N/A	**NEW**	▸loads a program above 64KB; documented briefly in "GETTING STARTED"
MEM.EXE	N/A	NEW: uses /debug /program	**NEW SWITCH**: adds /classify	▸lists programs, devices and total memory
MIRROR.COM	N/A	N/A	**NEW**: uses /1 /partn /t /u	▸saves data for use by UNDELETE and UNFORMAT [licensed from Central Point Software]
MODE.COM				
[ALL]	N/A	NEW SWITCH: adds /status	*	
CON		NEW SWITCH: adds cols=?, lines=?	*	▸supports 25, 43 & 50 lines per screen
LPT?		NEW SWITCH: retry=? replaces "p"	◂▸ [adds "retry=p"]	
COM?		NEW SWITCH: retry=? replaces "p"	◂▸ [adds "retry=p"]	
KEYB	N/A	NEW: uses rate=? delay=?	*	▸adjusts "typematic" rate
CODEPAGE		*	◂▸ [adds Slavic support]	
MORE.COM		*	*	
NLSFUNC.EXE		*	*	
PRINT.EXE		*	*	
RECOVER.EXE		*	*	
REPLACE.EXE		NEW SWITCH: adds /u	*	▸replace only older files with /u
RESTORE.EXE		*	**NEW SWITCH**: adds /d	▸display files, w/o restoring, with /d
SELECT.EXE		*	**REMOVED**	
SHARE.EXE		*	*	▸no longer auto-loads with large drives
SHELLB.COM	N/A	NEW	**REPLACED**: now DOSSHELL.COM and DOSSHELL.EXE	▸swaps between applications via DOSSWAP.EXE
SORT.EXE		*	*	
SUBST.EXE		◂▸ [disables 3 more commands]	◂▸ [disables 2 more commands for SUBSTituted drives]	▸disabled commands: ASSIGN, BACKUP, CHKDSK, DISKCOMP, DISKCOPY, FDISK, FORMAT, LABEL, MIRROR, RECOVER, RESTORE, SYS
SYS.COM		*	*	
TREE.COM		NEW SWITCH: add /a	*	▸display links in text mode with /a
UNDELETE.EXE	N/A	N/A	**NEW**: uses /[dos | dt] /[list | all]	▸restores files deleted with DEL or ERASE [licensed from Central Point Software]
UNFORMAT.COM	N/A	N/A	**NEW**: uses /j /l /p /partn /test /u	▸[licensed from Central Point Software]

TAMPA IBM PC USERS GROUP APPLICATION

Purpose: The Tampa IBM PC Users Group is a non-profit organization dedicated to serve the needs of the PC User - from the most technical of the techies to the simplest of the simple. Our purpose is to benefit ALL computer users, not only IBM and PC-compatible; our intent is to encourage, enlighten, and inform.

This information will be kept confidential. It will be used only for keeping accurate membership statistics.

BITS OF BLUE

TAMPA IBM PC USER'S GROUP

VOL. 4 NO. 8 August, 1991

MEETING

(2nd Wednesday every month)

DATE: August 14, 1991
TIME: 6:00 PM
PLACE: IBM CUSTOMER CENTER
LAKE POINTE ONE BUILDING
3109 W. Martin L. King Blvd.
Room 450

DIRECTIONS:

The Tampa IBM PC Users Group meets in the IBM's LAKE POINTE ONE Building across from Tampa Bay Mall one block east of Tampa Stadium.

The best entrance is on Martin Luther King Blvd. at the traffic light in front of Burdines. As you turn off Martin Luther King Blvd. you will see the LAKE POINTE ONE BUILDING on the left & parking on the right. Join us in ROOM 450 - 4th floor. **Guest please sign in.**

PRESENTATION:

8/14/91- **INTEL** (Presentation of **INTEL** products including 486 technology)

Refreshment Break
Open Discussion
Door Prize Raffle

* * * *Tuesday, Aug. 13, 1991* * * *

7:00 - 9:00+ Presentation by Bill Gates for a special engagement at Ruth Eckerd Hall. (Invitations are being extended to the Greater Tampa Bay area. Doors open at 6:00 p.m.)

This newsletter was created with WordPerfect 5.1 donated by WordPerfect Corp. to TIBMPCUG for use by the editor.

Secretary's Report

TAMPA IBM PC USER'S GROUP
MINUTES OF 7/10/91 MEETING --

PRESIDENT'S REMARKS

■ Version 5 of MicroSoft DOS was a lively topic. At least half of the members in attendance have the new version. Do read the various text files in the new version, especially the notes on applications. For a short while, Egghead and WorkPlace are offering this new version at a big discount. IMPORTANT - Do create a Boot Disk first.

■ IBM and Apple are now working together; seems to be Them vs Microsoft and Intel. Apple will provide the software applications; IBM will provide the operating system; and Motorola will provide the computer chips.

■ "Vaporware" and hardware "pronouncements" tend to drive everybody crazy. No sooner is one upgrade announced to be released at a future date, than the one beyond that is also announced. Case in point: the 486 50mhz chip and the 586 chip announced at almost the same time. The corporate world cannot, and will not, wait; it will go with what's available when needed.

■ You can buy the OS/2 version 1.3 for less than a hundred dollars if you already own IBM DOS. You then get version 2 for free when it's available. Else, you can buy version 2 for an estimated $150 when it comes out.

■ Computerland (national) withdrew some local area franchise licences. Comment from the floor was that the local owner shut down the ones that he owned because he's in some financial bind - his bank withdrew his loans.

■ It's official - Borland has purchased Ashton-Tate. IBM seems to look with favor upon Borland. Should be an interesting summer.

■ IBM and Sieman (Germany) have joined in building 16 megabyte memory chips. Seems to be an effort to reduce dependency upon Japanese suppliers.

■ IBM BBS - access now available to members of user groups. It'll cost you a long distance call to log on to this BBS based in Atlanta. The data phone line is: 404-835-6600. Public domain files are on line as well as information about IBM hardware and software.

OS/2 VERSION 2

Our IBM host and guardian, Chris Mayer, demonstrated a beta version of IBM's latest OS/2 2.0 offering. OS/2 can run Windows and DOS applications in a multi-tasking environment. While Chris had a few OS applications on the test computer, he had a lot of DOS applications - and ran

(Minutes continued on next page)

(Minutes continued from previous page)

them like a charm! It was really something to see. Bouncing back and forth between DOS applications without losing a beat.

OS/2 can give almost 620k RAM to each DOS application. You can run Windows in each "virtual" machine and you can have as many virtual machines as you want.

To demonstrate the versatility of OS/2, Prodigy (an on-line service) was started, then WordPerfect and Lotus 1-2-3 were fired-up. While using Prodigy, WordPerfect and Lotus were still running in the background (a little slower, but running). Chris then brought up another DOS program (Meta Stock Professional) and flipped back and forth from the stock report section of Prodigy to the Meta Stock program. As if that weren't impressive enough, he also brought in Flight Simulator and an OS/2 word processor (DeScribe)!

Chris then showed how easy it was to "cut" an object from the Flight Simulator graphic screen (part of a building) and paste it into DeScribe. He said that this procedure works both ways OS/2 to DOS and DOS to OS/2. Flipping back to Prodigy, the news item aboutBorland acquiring Ashton-Tate was brought to the screen. He then brought up Windows 3 to show how easily OS can run many diverse applications. (NOTE: It was difficult to count all the different jobs that Chris was running but I counted ten (10) applications that were open at one time.) The great thing about OS/2 is that it sets up a virtual machine for each application. Now when an application crashes, only that particular virtual machine crashes, the rest of the system is still running. Contrast this multi-tasking methodology with that of Windows: when one Window job crashes, everything must be rebooted.

OS/2 version 2 will include Windows 3 and it emulates DOS 4.0. It will be offered in two versions. The Standard Edition will take up 15meg of space on the hard drive and is intended for single users. The Extended Edition needs 25meg of hard drive real estate and is intended for LAN setups and large relational data base managers. It is believed that the new version will be announced before the fall COMDEX, probably by October. OS/2 is a whole new ball game.

» It makes full use of the 32 bit features of the 386 and higher PCs.
» Has enhanced functions for DOS
» I/O bus makes no difference
» Processor path must be 32 bits
» Uses flat 512 megabyte address space

Memory is divided into 4k pages that can be flipped in and out of the hard drive. It can handle a virtual memory size of 512 megabytes by using a hard drive to simulate actual memory. The flat addressing scheme equates the memory address to the actual address on the hard drive via 4k pages. And while it is stated that up to 16 windowed full screens are available for DOS applications, as many as over 200 have been run.

Once again, Chris has come through with flying colors. He was asked to give this presentation on rather short notice. Plus, he was running a beta version of the new software and had not seen the manual for the new version. Can you imagaine the kind of show he could put on after reading the manual and working with the release version? Thank you Chris for a great job and an excellent preview of OS/2 and the future of personal computers.

MOUSEMAN

Hardware Review by Hugh Bayless (Monterey Bay User Group)

Logitech has done it again! Their Series 9 Mouse was one of the best, but the new high-resolution, three-button MouseMan is even better -- in many ways.

Not only does it give you 400-dots-per-inch resolution, its ergonomic design fits the hand like no other mouse on the market. MouseMan is about 30 percent larger than the Microsoft Mouse and is shaped in right- and left-hand versions. I thought the earlier version was a satisfactory fit in my hand, but this new mouse feels as though it was custom made just for me.

MouseMan is compatible with Microsoft's Mouse and Windows 3.0. It works with IBM PC, XT, AT, PS/2 and compatibles. It comes with its own software, including Control Panel and GoMenu. It will do everything you would expect a mouse to do.

Most of all, however, MouseMan will reduce hand fatigue for those who use a mouse a lot. PC/COMPUTING magazine tested MouseMan against the Microsoft Mouse and Logitech's earlier Series 9 mouse and reported that MouseMan won hands-down over the competition for lasting comfort and ease of use for extended periods.

The version we tested was connected to our computer with a cord, but MouseMan is also available in a radio-controlled cordless mouse that has the same ergonomic design. It costs more, but if the connecting cord gets in your way, don't hesitate to select it.

If you are a regular mouse-user, you couldn't make a better choice than any of Logitech's new ergonomic MouseMan models.

■■■

Scanner is bundled with Ansel Software

Scanman & Ansel

Logitech Model 256 Gray Scale Scanner and Image Editing for Windows

by Mike Janda, Madison PCUG,

One thing that caught my eye at Comdex last Fall was a new scanner from Logitech. Shortly after I got back from the show, Rod McKenzie came by with a Scanman 256 for evaluation. It would only cost me a review in "Bits & PC's," so I decided to take him up on it.

Hardware

Inside the box are (1) the scanner with a six-foot cord, (2) a half-size card that goes into a 16-bit slot [an 8-bit slot works too], (3) three diskettes and (4) two manuals; a "Scanman User's Manual" and an "Ansel Image Editing Software Manual."

The scanner itself looks a lot like the other scanners Logitech sells (see Figure 1, which was blatantly scanned from the manual!). It has three switches and dials that control the "look" of the scanned image. The Image Mode switch has four settings: 256, 64, 16 and B/W. The 256, 64 or 16 determines how many shades of gray to incorporate into the final image. B/W is for "line art."

The Resolution switch has four options: 1, 2, 3 and 4 for 100, 200, 300 and 400 dots per inch (dpi). 300/400 dpi are good for line art, while 100/200 dpi are good for gray-scale images. A 4" x 4" 400 dpi 256 gray-shade image can be over 1 megabyte in size!

Finally, the Contrast dial controls how much of the original is "picked up." I spent a lot of time rolling that dial to come up with the best images. My only major gripe with the product is the lack of any markings on the dial (except for a notch marking the center position). It was very difficult to be changing types of originals and not having a convenient way to remember what setting was best for a given type of original — let's see here, 1/8 turn right for "PC Magazine" scans, 1/4 turn left for the family photos....

The scanner indicator light tells you if you're scanning at a speed that maintains all the details. It stays green when you're scanning at a good speed and flashes red when you go too fast. If you get too many red flashes, the software will inform you that the image may have lost some resolution.

The scan button tells the software to start collecting data. Press it and everything the scanner rolls over gets put into the image.

Installation

Installing the card is easy, just pop it into an empty slot. There are eight dip-switches on the card (accessible from outside the computer!) that come preset with the factory default address. If you have some other hardware devices that might use the same port address that the Scanman uses, you can select another address.

Installing the scanner is even easier; just plug it into the hole on the card! The plug is a little like a keyboard plug, but a different size — so you can't confuse them. There is even an arrow that points to the "topside" of the card, but the manual doesn't mention that.

Once the hardware is in place, you can install the software. It comes on 5¼" 360K diskettes but if you have a PS/2, or absolutely have to have 3½" diskettes, you can send in the card on the manual's back page for two 720K diskettes at no charge.(Continued on next page)

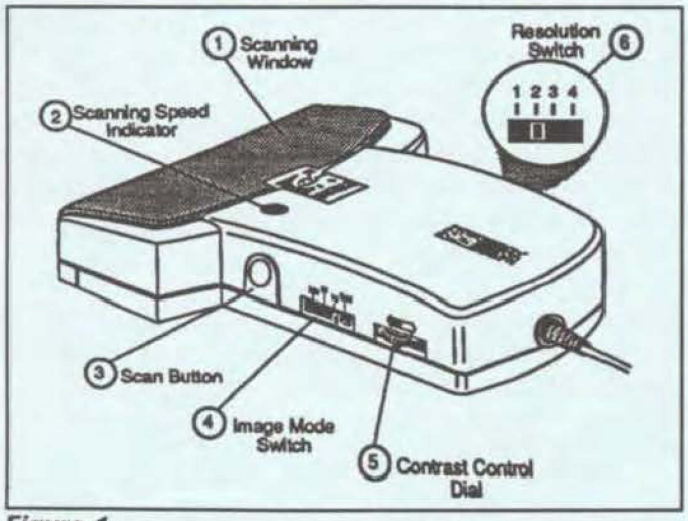

Figure 1

First, install the "ScanMate" software. Pop the diskette in drive A:, change to drive A: and type SCANINST. The menu-driven program will walk you through the installation with the usual configuration questions. It puts 275K of files on the hard disk and offers to change your CONFIG.SYS to put the scanner device driver in. If you say NO to the change, it tells you what line you should add. I like that! Since I have such a "hard disk space problem" these days, I was able to move the 10K driver file to my "SYSSTUFF" directory, add the appropriate line to CONFIG.SYS and delete the rest of the files. The scanner .SYS file LOADHIs with QEMM just fine. Now reboot the computer to "activate" the scanner.

Another file included is a SCAN.EXE that allows you to do scans from the DOS prompt. It is rather limited in what it can do. You have to specify all the parameters on the command line — there are no menus or options in the program. Parameters include the file name and extension (.PCX, .IMG or .TIF — default) and the width and length of the scanning area (4.1" x 20" is the default). You can see what you scanned on the screen, but you can't do any editing. All you can do is save the file or rescan the image.

Ansel

In order to install and use Ansel, you have to have Windows running. It proceeds to copy 700K of files to your hard disk. I quickly deleted the two "example" files for a total cost of 500K. Not bad for software these days.

The Ansel Image Editing program looks like any other Windows program — ah, the power of a common user interface (CUI!). The menu bar choices are File, Edit, View, Tools, Image, Transform, Scan and Help. I'll be working backwards on this list as I go through the features. The Help file is 110K and covers everything in the manual, and more!

Scan has only three options: Setup, Scan and Rescan. Setup opens another window that allows you to set the scan width, calibrate the scanner using a Kodak Gray calibration sheet provided, and to decide whether you want the image displayed on the screen as you scan. Scan does just what it says; it activates the scanner and generates the image. Rescan will allow you to immediately redo the scan if it looks bad or you went too fast.

Transform allows you to flip the image (or any part of it) horizontally or vertically, rotate 90 degrees to the left or right and change the "scale" of any selected area. The last option is Deskew, which is used to straighten out the image. Often, when scanning, you don't get the scanner perfectly vertical. Just select Deskew, draw a line that should be perfectly horizontal or vertical and presto, the entire image is adjusted. I seem to use that option a lot!

Image lets you change the look of the image or any part of it. You can lighten or darken the image by 20 gray shades. You can "smooth" the image by averaging neighboring pixels, "sharpen" it by increasing the difference between gray levels of neighboring pixels, or "equalize" it by making the lightest pixels white, the darkest pixels black and evenly distribute the remaining pixels in between. The "threshold" option converts the image to black and white while "negative" inverts white and black.

Tools offers the options for when you are doing some fine tune editing of the image. You can select the shape and size of the editing tool, called a brush (round, square or short lines), whether you want to lighten, darken or replace the area where you use the brush and the style of any lines you want to draw.

View allows you to set the size of the image on the screen. You can have it "fit in the window," actual size, or zoom in or out (50%, 100%, 200%, 400% and 800% of actual size). You can also decide whether to display or hide a tool box, palette, brightness and contrast controls, and a ruler — more on these later.

Edit has the Undo (and a Redo if you Undo!), and the

(Continued on next page)

(Continued from previous page)

usual Cut, Copy, Paste, Clear and Crop. There is a Stitch to allow you to "glue" two images together to make a larger image — useful if the item you are scanning is more that 4" wide — just scan it in two parts and stitch them together. You can also save and restore the "setup," which allows control over how images are stored and pasted. You can even paste and stitch directly from a scan, without having to go through a file or the clipboard.

File has the usual New, Open, Close, Save and Save As, the Print and Printer Setup options, Preferences (inches, cm., picas, etc., and whether you want color or black and white — B/W is recommended by me!). File formats supported are TIFF, TIFF CCITT, TIFF Uncompressed, PCX, EPS (for saving only — it can't read postscript files!) and BMP (for Windows wallpaper!). The data type can be 256 Gray Shades, 16 Gray Shades, Dither, Error diffusion and Line art.

Perhaps now is the time to discuss some of the data types. 256 and 64 Gray Scales are stored as 8-bits/pixel, 16 Gray Scales is stored as 4-bits/pixel and Line art is 1-bit/pixel. Combined with the resolution (100 to 400 dots (pixels)/inch) this determines the file size. The Gray scale files will not print on an HP-LaserJet — you need a postscript or Linotronic printer. You have to select Dither (digital halftoning by varying patterns of black and white dots to simulate gray) or Error diffusion (digital halftoning by distributing or scattering dots to simulate gray). I haven't seen any major difference between these two on the LaserJet.

The last items of interest are the "tools" — not to be confused with the Tools menu item listed above. The three windows that can be shown or hidden are the Toolbox, Brightness & Contrast and the Gray Palette.

The Toolbox has a "rectangle" for selecting any part of the image for action, a freehand "drawing" selector (provides the same function as the rectangle, except that it can be any shape), a "line-drawing" option (click on point A, drag the cursor to point B and release), a "pencil" (to draw lines free-hand), an "eraser" (to "erase" what is under it), a "brush" (that will lighten, darken or replace what is under it), a "magnifying glass" (zoom in on the image where it is clicked), and a "hand" (used to move the image around on the screen).

The Brightness & Contrast window allows you to lighten or darken the image, or area selected, by up to 20%.

The Gray Palette window is interesting. It offers a range of gray shades that can be used to touch-up images. Just click on the shade you want and the brush will be that shade. Even better is if you click in a little window inside the Palette window, you can then go to any place in the image and click again. The brush will then be that color. Nice for getting the gray shade just right when touching-up an image.

That covers just about all the options in Ansel. This is not a program for creating images, but can be used to modify any file, either scanned, or created in another manner. I found it to be extremely easy to use, and rather bug free.

The Scanman 256 is available from: Logitech Inc. 6505 Kaiser Drive Fremont, CA 94555 Phone: (415) 795-8500

List Price is $499.

MINI BOOK REVIEW:

By: Hugh Bayless (Monterey Bay User Group)

"Desktop Publishing With WordPerfect"

If you want to go into serious desktop publishing, you really need a program like Ventura or Pagemaker, but if you already have WordPerfect 5.1, you'll be amazed how much desktop publishing you can do with it.

Ventana Press has just released the second edition of Roger C. Parker's book, Desktop Publishing With WordPerfect. It will be invaluable for any owner of WordPerfect who aspires to do even limited desktop publishing. What this book tells you is pretty much already in the WordPerfect manual, but it is certainly not there in the easy-to-read and easy-to-find form of this book.

The author is owner and president of an advertising and marketing consulting firm in New Hampshire and has written several other books on desktop publishing. He knows his subject and how to convey it to the reader. The result is a very informative and readable book.

If you have been wondering just how much desktop publishing you really can do with WordPerfect, here's the way to find out -- read Roger C. Parker's book. It's $21.95 from your favorite bookstore or from the publisher.

■■■

PRESIDENT'S COLUMN:

Help! We need someone to be the group's secretary through the end of the year. Presently Ed Buzza is performing this function in addition to a myriad of other things (DOS classes, Monthly newsletter articles, presentations and general involvement in each meeting). Ed will move into the open education position where members can get a greater benefit from his wisdom and educational abilities. If interested, please notify me at 932-6745 or leave a message on the BBS.

Due to newsletter budget constrains we were not able to include Frederick D. Kyle's list of documented problems & solutions for MS DOS 5.0 in the newsletter. This 5 page document will be available at the meeting upon request for members.

Last month I said there would be some mergers and acquisitions happening during the second half of the year. At that time I didn't know it would happen within a month. A brief recap: IBM and Apple get together to hammer out agreements to allow each other to share their technologies. Then we have Borland slapping down $440 million for Ashton-Tate. **NOTE.**(This acquisition is not a done deal. A shareholder suit has been filed against both companies alleging that the terms of the merger are inadequate). I think the shareholders should take the money and run. There seems to be some investors that say Borland paid too much. The latest is the $80 million acquisition of **Digital Research Inc.** (owners of DR DOS 5.0 & CPM) by **Novell.** Novell wants to create a network version of **DOS.** MS DOS 5.0 was supposed to be more friendly with the Novell network operating system. It wasn't and now Novell has decided to take on Microsoft and provide users with integrated software that combines DR DOS 6.0 with client network software. At this rate there will only be 3-4 major players by the mid-nineties.

Unfortunately all these changes will make PC life tougher for us. At some point next year we could have four operating systems **DOS 5.0, DR DOS 6.0, OS/2 2.0** and the **PINK OS** from the IBM & Apple, to choose from. ■■■

Harvey Bruneau

PROGRAMMER'S PUZZLE ANSWER

By: Tom Cone, Jr.

The solution to the July '91 puzzle is:

22 doors will be open;
478 doors will be closed.

Here's the list of open doors:

1,4,9,16,25,36,49,64,81,100,121,144,
169,196,225,256,289,324,361,400,441,484

****

Here's the source code for my solution:

```
        'Puzzle1.bas ---> solution (QuickBASIC 4.5)
        '   by T.Cone,Jr.   7/16/91
DEFINT A-Z
DIM room(500) AS INTEGER
        'Establish 500 element array.
        'By default QuickBasic fills array w/zero's.
        'I choose to let Zero = a closed door.
        '          and  One  = an open one.
opendoors = 0
        'initialize variable to hold count of open
        '   doors.
FOR guest = 1 TO 500
        'use for/next loop for each guest

FOR door = guest TO 500 STEP guest
        'use for/next loop to visit
        'each door.  Begin w/door that
        'has same number as guest. Then
        'use STEP to skip doors that
        'are not visited.
IF room(door) = 0 THEN
room(door) = 1    'door was closed, so open it.
opendoors = opendoors + 1
        'accumulate count of open doors.
ELSE
room(door) = 0    'door was open, so close it.
opendoors = opendoors - 1
        'reduce count of open doors
END IF
NEXT door
NEXT guest
closeddoors = 500 - opendoors
        'figure closed door count
        'Now display the solution on screen
CLS
LOCATE 1, 1
PRINT "Open:", "Total Open:" + STR$(opendoors),
"Closed: " + STR$(closeddoors)
FOR door = 1 TO 500
IF room(door) = 1 THEN
PRINT door
END IF
NEXT door
SLEEP 10
CLS             END
```

SCANNING PROGRAMS AND TIPS

by: David Pond, Phoenix PCUG

If you are heavily into desktop publishing you most likely have a scanner or you might be thinking about buying one. I use my scanner almost everyday and it has proven to be a wise investment. The scanner I use is a Hewlett Packard ScanJet Plus, this is a very versatile flatbed greyscale scanner.

I use a variety of programs to work with the scanner, depending on the type of original artwork and the type of graphic file that I need to end up with. The main program that I use to scan graphics is HP's **Scanning Gallery Plus**. This program allows you to scan both line art (black and white images consisting of lines) and greyscale images (for photographs). Scanning Gallery Plus lets you save the images that you have scanned in a variety of graphic formats. I generally use .PCX for line art and .TIF for greyscale images. Scanning Gallery Plus has a module that will let you edit the image that you have scanned before you save it to a file.

PC Paintbrush is another program that I use to edit .PCX files. For greyscale image editing, a program like **Picture Publisher, Photo Styler** or **Publisher's Paintbrush** will allow you to do electronic photo retouching. You can achieve interesting effects or simple clean up a greyscale image.

Scanners always produce bitmapped, or pixel images. Many programs work well with these types of images, but there are times that you want to have a **vector** image. A vector image can be changed in size without any loss in picture quality. A vector image is stored as a series mathematical formulas describing the lines that make up the image. A bitmapped image is stored as a series of dots. When you change the size of a bitmapped image, you usually see the results of **aliasing**. This is the unwanted stair step effect that appears on diagonal lines.

CorelTrace is one of the best bitmapped to vector image conversion programs on the market. While it will not produce a perfect vector image of a bitmapped picture, it can save a lot of time. CorelTrace saves files in a .EPS (Encapsulated PostScript) format. CorelTrace is part of the package that you get when you buy CorelDraw.

CorelDraw is a very powerful yet easy to use drawing program. You can create pictures from scratch, or import other vector images, including .EPS files created by CorelTrace. CorelDraw will also allow you to import bitmapped images, but you can only resize these images. Still, it is sometimes very useful to combine a vector and a bitmapped image to create a picture.

OCR (Optical Character Recognition) is yet a third way to use your scanner. Rather than retyping text for a project you are working on, you can scan in the pages with an OCR program, and have that program convert the images into regular text files. The program that I use is **Read Right**. While none of the OCR programs are 100% accurate, they can be real time savers.

Tips for Scanning

The biggest problem that happen when scanning an image is **skew**. Skew occurs when straight lines in the original image show up in crooked in the scanned image. This is one of the times that you can notice aliasing. To fix this problem take the artwork line it up with a T-Square and trim the top of the page parallel with the straight lines in the original image. This will allow you to line up the top of the page with the top margin of the scanner and avoid the problem of skew.

Line art is the easiest type of image to work with. Always scan objects such as line art at the same resolution (dots per inch) as your printer; this gives the clearest reproduction.It is good to know what size a pixel image will be used at. If the original image is small and needs to be enlarged, you can use the settings in your scanning software to achieve this. If you try to enlarge the image after it has been scanned you will notice the aliasing effect, described above.

The best rule of thumb is to have a clear, moderately sized original image. You can usually reduce the size of the image, when working in another program, with out much loss of picture quality. The light and contrast settings in your scanning software can be used to enhance or remove any thin lines in the original graphic image.

Converting a bitmapped image to a vector image with a program like CorelTrace, will allow you to resize your picture without loss of quality. This extra step takes extra time and the vector image may have to be cleaned up in a program like CorelDraw. This conversion works best on small to medium sized line art that is not too complex.

If the scanned image has a lot of fine detail, is a greyscale image or is quite large, you are usually better off leaving the image as a bitmap.

Greyscale scanning is time consuming. I haven't really found any way around this. The larger the image, the longer time it takes to scan it, the longer time it takes to print it, and the larger the saved file size is on your hard disk.

(Continued on next page)

one above the other. The "X" design (one in the center and in each corner) is effective with small graphics. The "diagonal" design (one in the upper corner, one in the opposite lower corner - optional, center) is also good. Remember: pull quotes and text boxes are considered to be graphics!

Consider overlapping pictures or letting part of the graphic project beyond the normal frame. Such techniques add visual interest and draw the reader's eye back for a second look. Use the overlap method to cover the parts of the underlying graphic that are not needed or are not wanted. Letting part of the graphic project beyond the frame helps to ease the rather stilted look of having all graphics within bordered frames. ■

LAYOUT AND DESIGN - Advertisements

When working on informational pamphlets, simplicity is the rule. A sans serif typeface for headings and a serif face for text is sufficient. Keep the reading level down at the 8th grade to ensure compliance with the instructions. Line art graphics are preferred rather than photographs (photos can present a problem when copying).

Your client will pretty much dictate what is needed for a flyer, brochure, or informational pamphlet. Most times, you will be given a copy of what has been used in the past. Ask the advertiser for camera ready copy (black and white) to be placed in your newsletter. Consider using business cards as the copy.

When working with advertisements, you are much freer to use a variety of typefaces. Placement of text and graphics is limited only by your imagination and the purpose of the document. Since the document is intended to grab and hold the reader's interest, you have a pretty good excuse to use some of those exotic fonts in your skitty eight million font collection.

Advertisements, more that any other publication, need white space. Any ad that is filled with wall-to-wall text looks too "busy"; it will not be read; and it will be thrown away. The idea is to grab the reader's attention and lead the eye to the message. Ads exemplify the adage, "the medium is the message."

Avoid having all design elements (text blocks, graphics) of the same size. Resize the text blocks, crop the graphics, or add white space to create contrast and eye appeal. If you have to use two elements of the same size, avoid putting them side by side or one atop the other.

Adopt the "kis-kis" philosophy (Keep It Short, Keep It Simple). One effective design is to put equal sized graphics at opposite corners with the ad copy in the middle. The eye, and the mind, is captured by the first graphic and, in going to the other, is interrupted by the copy. Ergo, the eye pauses and reads the copy. Then, invariably, the eye looks at the ad again, as a whole, and the mind is more apt to remember the message. Again, look at what others have done; then adopt what is good into your sense of style and design. ■

LAYOUT AND DESIGN - General

It is as difficult to define "good design" as it is to define a "good cup of coffee." What is pleasing to some is hideous to others. Take some time and look at your newspaper or your favorite magazine. Examine the "freebie" flyers and brochures that many copy centers use to advertise their businesses. Note how they position pictures (graphics) in relation to columns, text, and page position. See if you can spot the kind of typeface used and their different styles. See how they use style to emphasize headlines and subheadlines. Look for pull quotes and fillers. Notice the manner in which they are used and where they are placed.

There are a few general rules pertinent to good style. Do limit the number of typefaces (typefaces, not fonts) in the document. Use size and style for emphasis and to create contrast. Just because you have skitty eight million fonts doesn't mean you have to use all of them every time you create a document. In fact, you'll find that most of your work will be done with just two typefaces: serif (Times Roman) and sans serif (Helvetica). Or some version of these two commonly used typefaces.

If the final output is to an impact printer, there are other things to keep in mind. Use the native font of the printer; it will deliver the best that it can do. Avoid using large fonts because some DTP and font

generator programs will create them as a bit-mapped graphic to be printed. Printing graphics does slow down print speed. If your DTP program can use the highest resolution of your printer and your printer can handle 300 dpi (dots per inch), then you can expect good results. But if your DTP program outputs graphics at less than 200 dpi, expect to see jagged output.

Whatever fonts are used, they should be in harmony with each other and with the publication. You wouldn't use a script font for instructional material nor would you use 36 point Cooper Black for body text (if you do, send me a copy). Again, look at other publications and note what seems "right" to you. Be careful though, if you think it's all wrong, it may be that your sense of good design needs polishing. ■

LAYOUT AND DESIGN - Newsletters

The banner or masthead of a newsletter is the first thing to be created. It should serve to identify the newsletter and its contents. Whatever you decide upon, be sure that it is the same in every issue (except for issue number and date - if used). This is to ensure reader recognition and identification. They see the banner and know immediately that it's your newsletter and have a fair idea of the articles within.

Some refer to the banner as the masthead. Really, the masthead shows the names of the people responsible for the publication. Look at the editorial page of your newspaper or of your favorite magazine. You'll find the names of editors, writers, publisher name and address, and data about submissions and subscriptions — this is the masthead.

Don't worry about the need for a large font file just to print the 48 or 72 point name of your newsletter. Some font generators can create a customized font holding only the actual letters used rather than an entire set. But there's a better way. *Use one of the fonts in your paint or draw program to create the name,* even some of the headlines, and save it as a graphic in a format and resolution that your DTP can handle. STOP. Read that again. It can save a lot of sweat, blood, and tears.

Go see that friend of yours with the laser printer and the super-duper programs. Ask your friend to create a front page for you. Take this "friendly user" page to your local copy center (*not* the OFFICE!) and run off a bunch of copies. Voila! Your own custom stationery.

To stress certain words within body text, use italics or underline. Underlines are used if no italic style is available. Italics are generally used for continuation notices, enclosed in parentheses, and should be two points smaller that the body text point size. Don't put too many "continued" articles on a page. While they can't always be avoided, a little planning will ease this problem.

Italics are an effective style for headlines whose point size should be 4 to 6 points larger than that used for

body text. Quite often Helvetica italic will be used, in varying sizes, for all headlines and normal Times Roman will be used for body text. Also use the bold style for stress within body text. Bold style in the same point size as body text can be used as paragraph headings.

If you want an article to end at the bottom of a column or page, consider adjusting the leading (space between lines) or the kerning (space between characters), if your DTP has these features. If not, add or delete some words or lines or use fillers to "even out" the material. Sometimes, adding one point of leading is sufficient. Another solution is to use a larger point size for the body text or for the headlines. If only one line is needed, place or draw a line to signify both the end of the article and as a filler.

Do use some type of small graphic to end the article or story. It can be the small block in the extended ASCII character set (ALT-254), a miniature logo, or other small graphic. This technique is especially effective when the article ends at the bottom of a page. Many people find it disconcerting to reach the end of an article without realizing it. How often have you reached the bottom of a page, turned to the next page to find an advertisement, gone to the next page, and only then to find that you had reached the end way back there?

Avoid having side by side columnar headlines. It is far better to have the article or story placed in two columns with the headline spanning both columns. Then place the next article or story beneath the first.

The first page of a newsletter should have a table of contents or index, especially if it contains more than five or six pages. The index is best placed in a separate column or in a box. For a club paper, an agenda and a meeting notice (date, place and time - perhaps a map) is a necessity. Without this, club members will fail to attend and the club will fade away. 'Course this is one way of getting out of editing a newsletter.

Whether you use full justification (body text lines are flush at the left and right margins) for your print lines is a matter of personal preference. Full justification is almost mandatory for books. Ragged right (only left margin is flush) is commonly used in correspondence, many newsletters, and instructional material. Ragged left (only right margin is flush) is rarely used; some people set up chapter and title pages in this fashion. ■

LAYOUT AND DESIGN - Graphics

For beginners, there is one rule — don't go hog wild. Use graphics where needed to illustrate a point in the article or document. Of course, casual newsletters are granted more leeway than would be given to other documents.

Graphics should be placed so that the page has a "balanced" look. If more than one graphic is placed on a page, they should be of the same size — especially if they are placed

(Continued from previous page)
Programs such as Ventura Publisher allow you to modify the image before you print it out. You can adjust the number of lines per inch, the screen angle and the dot pattern.

When scanning photographs the controls that your scanning program gives you become very important. You may need to adjust the resolution, the contrast, the brightness, the picture size or shades of grey that you are working with. Some scanners have a fixed number of grey shades while other scanners are adjustable. Common grey scales range from 32 to 256 shades of grey.

When scanning a greyscale image the resolution that you scan at will make a dramatic difference on the size of the file you end up saving. Scanning an image at 300 dpi (dots per inch) or higher may result in a dark image. In greyscale more isn't always better. A good rule of thumb is to scan a greyscale image at 150 dpi and use a higher number of grey shades to get more detail in your final image. The best advice that I can offer about greyscale scanning is to experiment with different settings and keep a record of your results.

OCR scanning is relatively easy. Try to avoid light type and hard to read characters, such as those printed on some dot matrix printers. Scanning typewritten pages works out fairly well.

There is more to scanning than you might think. It takes a combination of programs to fully utilize a scanner. The best advice that I can give you is to practice and become familiar with what the different programs can do for you!

STATE OF THE SOVIET SOFTWARE MARKET

by: Esther Schindler

One of the user group officers in attendance at the recent Borland User Group Retreat [See Beating a Retreat, page 4, Ed.] was Andrey Zotov. Andrey is president of BORUGA, the Borland User Group Association, in Moscow. He gave a fascinating presentation describing the state of the computer industry in the USSR. I want to share some of his remarks with you.

PCS IN THE USSR

There are only one or two million PCs in the entire Soviet Union. Less than one percent of these are Macintosh. Most of those computers are XT or 286 class machines, the kind of machines we in the US consider out-of-date. Those Soviet PCs, however, are far from idle. The average PC is shared by six to eight professional software specialists, (what the Soviets call programmers).

As you might have heard, there is an incredible problem with software piracy in the USSR. They have been brought up to believe in the idea that everything is shared, so the concept of intellectual property is very foreign. In fact, only now is legislation beginning to appear that would make the copying of software an illegal act.

There are only two or three US companies trying to make a significant dent in the USSR market, of which Borland is naturally one. (I'm sure we'd never have heard this talk otherwise.) Nonetheless actual software sales are only in the thousands, not the tens of thousands. Part of this has to do with software pricing.

DISKETTE FOR DINNER?

At first glance, the price of software in the US and in the USSR seems to be roughly equivalent. The problem is that the formal (exchange rate) of thirty rubles to the US dollar is not accurate; it's more like ten to the dollar.

Their whole economy is very different from ours. For instance, the average monthly salary is 400 rubles; for a software professional, the average salary is 1000 rubles. The cost of a single software package is perhaps 800 rubles, clearly unaffordable for most.

The comparison that I found most striking is this one: you can get a good dinner in Moscow for 30 rubles. But a single 3<$E1/2> inch diskette (not a box of ten) costs 30 rubles.

BUG REPORT

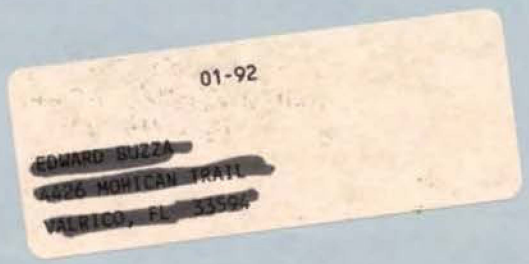
by: Harvey Bruneau

PC Tools 7.0

1. Looses and corrupts data *running the compress program.*
2. Cannot run in graphics mode *using some vendors VGA adapters.*
3. Rejects floppies *during backup.*
4. Freezes PC *running backup on hardisk or running undelete program.*

Look for maintenance release in September.

Norton Utilities 6.0



1. Freezes PC; FAT and boot sectors destroyed *using Norton speed disk with DOS 5.0 Fastopen.*
2. Freezes PC; corrupts Windows files *running Norton Cache with Desqview, QEMM or Windows.*
3. Operation aborted, system reboots *when copying files to or from 360k floppies when Norton Cache installed.*

Look for maintenance release 6.01 in next few weeks.

BITS OF BLUE

TAMPA IBM PC USER'S GROUP

VOL. 4 NO. 9 September, 1991

MEETING

(2nd Wednesday every month)

DATE: September 11, 1991
TIME: 6:00 PM
PLACE: IBM CUSTOMER CENTER
LAKE POINTE ONE BUILDING
3109 W. Martin L. King Blvd.
Room 450

DIRECTIONS:

The Tampa IBM PC Users Group meets in the IBM's LAKE POINTE ONE Building across from Tampa Bay Mall one block east of Tampa Stadium.

The best entrance is on Martin Luther King Blvd. at the traffic light in front of Burdines. As you turn North off Martin Luther King Blvd. you will see the LAKE POINTE ONE BUILDING on the left & parking on the right. Join us in ROOM 450 - 4th floor. **Guest please sign in.**

EDITORIAL COMMENT:

Included in this issue is Vol. 1 Num. 4 and 6 of Ed Buzza's Desktop Publishing Articles. We (editor & staff) did not include Ed's insert in the July newsletter, and in August we really goofed by inserting Num. 5. So now you have his complete booklet and I know you all join me in extending gratitude to Ed for sharing his expertise in the desktop publishing field with us. Thanks Ed, this Bud's for you, OOPS I mean this BOB's for you..!!! GREAT JOB!

■■■

Bits of Blue is published by the Tampa IBM PC Users' Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about IBM-PC and compatible personal computer systems to its members.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII file or in a commonly available word processor format, such as WordPerfect 5.1, on diskette to the editor at the address below or send it by modem to BBS (813)239-3704.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for non-profit use. Reprints must be unaltered; proper credit given and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

This newsletter was created with WordPerfect 5.1 donated by WordPerfect Corp. to TIBMPCUG for use by the editor.

Secretary's Report

TAMPA IBM PC USER'S GROUP
MINUTES OF 8/14/91 MEETING --

Harvey called the meeting to order at 6 o'clock and discussed the following:

» There were about 2,000 people at the special Pinellas User Group meeting at Eckerd Hall to hear Bill Gates, CEO of MicroSoft. He stated that software should be easier to use; that users shouldn't have to worry about CONFIG.SYS and AUTOEXEC.BAT files. He also demonstrated Visual Basic and believe it or not, Windows crashed while he was running the demo.

» Northgate shipped some computers with AMD chips instead of Intel chips. It is now making replacements to those customers who complain of the switch. Bad thing was that Northgate didn't say anything about using AMD chips.

» Bug report - Norton will ship version 6.01 to all registered users to correct version 6.0 that had some bugs in it. PC Tools will send a fix to all those who call! Seems to be a lot of confusion here; one report says PC Tools will ship free and Norton won't and vice versa.

» Apologies for omitting the July insert of "Desktop Publishing". It will be issued with the next Bits of Blue newsletter.

» Harvey brought in a new gadget. A 9600 fax, 2400 modem that was about the size of an audio cassette. A graphic illustration of how small computer components are getting to be.

» In spite of DOS 5.0 and Windows 3, one member had just installed DR-DOS and GeoWorks Ensemble — then went to the Bill Gates show!

» There are questions about the OS/2 release date. IBM says "end of the year"; the media says "early next year"; and Gates says "ahh."

» Novell bought Digital Research (DR DOS). MicroSoft flopped on their version of networking. IBM will market Novell. By the end of '92, this should all be very confusing.

» The phonetic pronunciation of PKUNZIP is not PUNKZIP.

» We need a volunteer for the Secretary position.

INTEL Presentation

We were treated to an excellent presentation by three representatives of the Intel Corporation. Their company's goal is to bring to the end user the best of Intel technology.

The MCP (math co-processor) runs with any CPU chip, Intel or any other. The further development of the MCP is that there will be only one 287 and one 387 regardless of the speed of the 286/386 CPU.

(Minutes continued on next page)

(Minutes continued)

The Above Board memory card is compatible with the IBM PC, XT, AT, PS/2 and compatible computers. It's compatible with any memory standard and carries a five year guarantee.

A snap-in 386 is available for IBM and certain specific computers. Just take out the 286 and snap in a 386 CPU. It is not for all computers because of differences in mother board design. The retail price is under $500.

Their 9600EX modem was first shipped in September, 1990. They expect that 45% of all modems will be 9600 by the end of 1992. The board has no jumpers or switches to worry about; its all handled through software. A custom copy of CrossTalk software is furnished with the board. It retails for under $800.00 for the PC.

The SatisFAXtion board retails for $499 and is the "easiest way to send a fax." It has Windows support, can use EMS storage, and is furnished with an Epson FX85 print driver. It has ports for a FAX, a modem and a scanner (Logitech). It is set up to use the LPT3 port, not a COM port.

Code Builder was also discussed. This is a C language compiler for 386/486 programs. One box - 32 bit compiler, MicroSoft compatible library, 32 bit debugger, royalty free, and 32 bit DOS extenders.

They also talked about Intel's "second wave" products. Harking to the customers complaint that there is too much change, too many choices, Intel is designing CPUs that will be good through 2001. Their drive is to have a processor that will handle one instruction per clock tick. The new CPUs will be modular with upgrade sockets - just pop out the old and drop in a new chip. A future chip, Micro 2000, will have 100 million transistors, be a one inch cube, speed of 250 Mhz, run 2 billion instructions/second, and have four CPUs running at once.

Overall, this was one of the most interesting presentations we've had. Thanks to Intel for making these very knowledgeable people available to us. They did an excellent job in describing their company's products and future developments. Also thanks to Intel for their generous donation of an Above Board Plus card.■■■

THE WINNERS ARE:

QUE Book 'MS-DOS Quick Reference' - Bill Fuller
QUE Book 'Upgrading to MS-DOS 5.0' - Don Patzsch
Refreshment package - Russ Stepp
TGE Conference Call - Steve Speairs, Gary Kueppers, Harvey Bruneau, Jeff May
Intel Above Board Plus - Bill Fuller
50/50 - Jim Clark

PRESIDENT'S COLUMN:

For those of you who missed the last meeting, you missed an education and a lot of prizes. Intel sent in 3 of their best people to educate us with their presentations and information on some of their products. I didn't even know Intel was in the software business (***Intel 386/486 C Code Builder Kit***). I still can't believe I didn't win that memory board (Above Board Plus. $399 retail.) they donated.

I saw Bill Gates for the 1st time on August 13th. I admit I was not a fan, but the man did seem very humble and down to earth during his presentation. It was hard to believe that the 4 billion dollar man was in the Tampa Bay area for a presentation sponsored by a user group (Pinellas IBM PC Users' Group), much less the same room as me, at no cost. Here was a young man who has the power to control my PC career. Sure I had to listen to all that sales hype about Microsoft, but it wasn't that bad. After a while I felt that if he could take the time from his schedule to talk to 2,000+ users, I could at least give him some of my unbiased personal time. He said all the things people wanted to hear but in reality said nothing that I haven't heard the average user say. **"PCs should be easier to use"** was a mild understatement. His goals and objectives were simple while in fact arduous in accomplishing. In all, Bill Gates earned a little more of my respect that evening.

Ok have it your way. I just read that IBM will make their own 20 MHz 386SX chip for the PS/2 by year end. It is based on the Intel chip and will add to the players already in the game. Let me see that's Intel, AMD and IBM that will now build 386 chips. Of course the IBM chip will be better than the original but yet different. Last month, I wrote that in 1992 the process for picking an operating system would be tougher for PC users. It now seems that with the 386 being the de facto standard through the mid nineties there will be an additional choice (386-chip maker) to be made by users. Personally, I still prefer mine from Chips A'hoy with milk.

Its been a while since Ed Buzza completed the DOS classes. We are now ready to start again. But we need to hear it from you. If you would like to enroll in this 3 part session, please notify us on the BBS or during the September meeting.

Another fine vendor (MacMillan Computer Publishing) has offered their product to our members at a 20% discount. These include QUE, SAMS, New Riders Publishing, and Hayden Books. This vendor produces, in my opinion, the best computer reference books available. ■■■

Harvey Bruneau

LIVING IN THE COMPUTER AGE

By: Tom Petrocelli, Buffalo IBM Users Group, APCUG

Eating Disks, Crunching Numbers and other Culinary Delights.

I've always been amazed by the connections that have been made between computers and food. It seems that those responsible for coining new phrases for the computer world have some sort of electronic oral fixation or food fetish. Food-oriented words have always seemed to find their way into the computer lexicon. Let's examine a few of these.

One of the earliest examples of culinary computerese is the phrase number crunching. We all know what is meant by this, of course. To do calculations. What has that to do with crunching. When my computer needs to do some vast mathematical process, I don't hear any loud chewing noises! I don't hear anything at all. It's not like crumbs come out of the disk drive. It would scare the heck out of me if it did.

Crunching is also a bit of a misnomer anyway. It implies taking something large and whole, and reducing it to smaller components (and swallowing), but a lot of what we call number crunching is just the opposite! We do calculations to make many smaller numbers into much larger ones. This isn't anything like crunching. Perhaps my angst over this comes from the suggestion inherent in the word crunching that my data is the electronic equivalent of potato chips. Maybe I'm being self-centered, but my precious information seems a bit more important to me then that.

Another favorite of mine is eating disks. Now I will agree that floppy disk drives have been known to go awry and cause severe damage to floppy disks, even to the point of physical damage, but eating them? If I though for one moment that my floppy drive had the capacity to eat anything, I'd keep my fingers very far away. What do you say to a drive that is in the process of consuming a disk, please don't eat with your door open? And this brings up another important question. Do you clean your drive with dental floss, or is brushing enough? A drive might fold, spindle or even mutilate a floppy, but eat it, never!

My personal favorite is being told that an application consumes RAM. Does it eat male sheep? Or even worse, is it right now munching away at the memory chips in my computer, until they are all gone. What then? Will the computer let out a satisfied belch and then demand more RAM? I don't know, but a word like consume denotes using something up for good and then leaving little droppings to clean up later. And if that's not a little scary, I don't know what is.

The most famous food words associated with computers are, of course, byte (pronounced bite, like we wouldn't figure it out!), and it's cousins bit and nibble. In this case this is an interesting analogy. Small pieces of data being byte-sized (I can hear the groans out there for that one). I think that the first person to use these terms must have been up just a little too late, and had just a few cups of coffee too much. They were getting punchy and thought that this would sound hysterical. They were wrong.

Now, I will admit that in many cases the words and phrases applied to computers are just adaptations of common phrases like it cooks (which is something I'd like to see. Imagine if you could cook with these things. Some hackers would NEVER leave their computers), but for others there is no excuse. By far the worst offenders are those derived from acronyms. Like gooey (spelled GUI). How appealing is it to know that your computer now has a gooey interface. What are you supposed to do with it, eat it or just get it all over your fingers and shirt. It makes it sound like interfaces like Windows are made of caramel or toffee (which some people, who hate Windows, might say is true).

I don't know why there is this fascination with food-oriented terminology in computers. Perhaps it's because people who had traumatic experiences with food go into the computer field (I call this the Freudian View), or maybe food is on their minds because they don't get to eat enough being stuck in front of their systems all day . Whatever the reason, just remember that anything that consumes RAM voraciously, crunches on numbers, and eats disks should be kept away from the children. Especially if you haven't fed the darn thing in awhile. And getting a leash for it might not be a bad idea either. Think about it next time you slip in a floppy and hear that drive start whirring. ■■■

Next Time : MS-DOS - The operating system from Hell!!

If it weren't

for the last minute

nothing

would get done!

ADDRESS BOOK PLUS 3.0

Software Review By: Earl Selby

All we were looking for was a nice little program that addressed envelopes and printed a return address. Address Book Plus 3.0 met that need--and then some.

Address Book Plus, from Power Up of San Mateo, is an unpretentious data base for filing names, addresses, phone numbers and even birthdays. You can also attach an automatically time-stamped note to each name.

Installation is no more trouble than creating an AB3 sub-directory and then copying the program disk's files to it. As early as page 8, the manual suggests you "jump in and start working with it".

You begin with a name screen for listing the data, including up to four 'phone numbers. Each entry in the file is automatically updated to note the last time you edited it. Power Up says you can have 1,800 names in each file, with the number of files limited only by computer capacity.

Typically, you can print the data in a pocket-sized directory; the appropriate paper and spiral wire binder come with AB3. Some people like these directories; we once had one with another program but with the constant changes it was rarely up to date. Adding changes by hand made it look like a thousand chickens had been scratching in it. We finally threw the thing out.

AB3's database can be a dialer. The program, however, is not memory resident so if the urge to call somebody comes when you're working on another program, it's quicker to let your fingers make the call. On the other hand, AB3 doesn't forget a number.

About the envelopes: AB3 does a very competent job; it will output to something like 200 laser, inkjet and dot matrix printers. AB3 also does labels and Rolodex cards. It is functional on any IBM or compatible, with 512K of RAM required.

Within its boundaries, AB3 has one big trump: It works, and without fuss. ■■■

KEY PUBLISHER

Product Review By: Ed Buzza

KEY PUBLISHER is a desktop publishing program from SoftKey Software Products, Inc.. The package operates under a run time version of GEM (Graphic Environment Manager - an operating system interface from Digital Research). It needs a PC with 512k RAM or more, two floppy drives or a hard drive, graphic card (640k RAM if Herc, EGA or VGA), a mouse (recommended but not needed), Laser or Epson (9 or 24 pin) compatible printer. It is not copy protected.

Imports GEM, PCX, IMG or Lotus PIC graphics; and output from WordPerfect, MS Word, WordStar, and others as well as ASCII. Provides drawing primitives (line, rectangle, ovals, etc.), built-in word processor with search and replace, master pages (style sheets), paragraph styles, headers and footers, Ventura-like frames to hold text or graphics, and a host of common desktop publishing features. As an introduction to desktop publishing, it is an excellent program.

Key for key, it is said to be identical to version 1.2 of *Publish It* which has a street price of about $140. But you can buy *KEY PUBLISHER* for $9.90 plus $4.50 (shipping and handling). That's right, DTP software for less than sixteen dollars, delivered! This has to qualify as the Best Value award of the year. To get your copy, call DAK Industries at 1-800-325-0800 and ask for item 5919 (have your VISA, MC or AE credit card handy). Their mailing address is: DAK Industries Inc., 8200 Remmet Ave., Canoga Park, CA 91304-4182.

If you're hesitant about dealing with a mail order firm, don't be with this one. Why? About six weeks after the package was delivered, I got another package from DAK. I hadn't ordered anything, hadn't called tech support, -- nothing. Inside this second package was a letter that apologized for the wrong and some missing material in the initial shipment! The new shipment had an updated manual, users guide, design template disks and manual, and a quick reference card. That a vendor would go to all this trouble for a ten dollar package is almost unbelievable. For my money, DAK is a class act. ■■■

PROGRAMMER'S PUZZLE

By: Tom Cone

A million people live on an island in the South Pacific. The king of the island decides to distribute his wealth to all his subjects. While this sounds incredibly foolish, the king made it interesting by giving $1 to the first person. The next 2 people each got $2. The next 3 people each got $3, and so on. How much did the millionth person receive? How much money was given away, altogether?

(Answer next month)

Training Wheels for Windows
- THE MICROSOFT PRODUCTIVITY PACK -
By: Bruce Mayer BUFFALO BIBMUG

For those who are bewildered or intimidated by the sweeping changes forced by their new Windows applications, Microsoft offers Productivity Pack for Windows, a happy combination of classroom and toolbox for the GUI novice. Once installed (oddly enough, outside Windows), the program leads its user through a series of interactive tutorials which explore the basic maneuvers available within Program Manager and File Manager, and how they can be used to organize, well, files and programs. There is no documentation to not read; the program installs itself from the DOS prompt, leaving behind two new Program Groups: Productivity Pack and Troubleshooter Tools.

Within Productivity Pack are Learning Windows (the tutorials), Quick Troubleshooter and Working Smarter; the latter two are expanded help files. But, the heart of the set is contained in Learning Windows. Five familiar characters from history or literature (A. Einstein, R. Hood, S. Holmes, an unnamed Wizard and Cleopatra) demonstrate the skills needed to navigate Windows, using simple stories to make their point: Einstein teaches Win- dows Essentials, while Hood helps with Managing Your Files. Frankly, this stuff gets a bit long after a while, and the snail- like pace that my 12 mHz 286 painted the graphics didn't help. As always, however, the careful student is rewarded: all lessons allow hands-on practice (and are very forgiving of errors), the lessons can be stopped at any time, and, once learned, the logic of the system should begin to shine through.

The remainder of the program is contained in the help files mentioned before, and the second Program Group, Troubleshooter Tools. Although this group is meant to be used with the help files, it may very well remain on the student's hard drive long after the tutorials are discarded. It contains File Manager, PIF Editor, Control Panel, and four sessions of the Windows Notebook editor, one each for AUTOEXEC.BAT, CONFIG.SYS, SYSTEM.INI and WIN.INI. Thus, with the ability to easily edit the critical configuration files, and the troubleshooting tips and hints in the help files, such problems as slow- running DOS programs or recalcitrant printers can be tackled and solved. Of course, the computer can be rendered unbootable, too, by careless editing of .INI files and the like - perhaps a sixth character, a demon who stalks those who don't back up essential files before experimenting, should be introduced in the tutorials.

There are a few small complaints - the tutorial program takes over the computer, allowing nothing else to run (although the help files can be kept on line), and the whole Pack occupies a rather hefty 2,139,975 bytes on the hard drive, but it is far and away the easiest way to learn Windows. It will be especially attractive to those who are starting with Windows on their first computer, since it is both friendly and easy. Once the tutorials are out-grown, the help and troubleshooting sections will still remain useful as additions to the system bring their inevitable problems. Recommended strongly for the Windows neophyte or intermediate user; experts will probably stick to their own tried-and-true methodology (fumbling around).

Productivity Pack for Windows carries a list price of $59.95, but is available at competitive pricing at a variety of retail outlets. ■■■ [Reprinted from Buffalo BIBMUG Newsletter - May 1991 via APCUG.]

ARC & ZIPPING HELP
By: Penni Dahl (APCUG BBS)

Those of you who are new to telecommunicating probably have downloaded a program that required either unarchiving or unzipping. Both methods are used to make the files smaller to decrease downloading time, and contain more than one file.
You can easily recognize an archived file by its extension. A zipped file will have an extension of "zip" and an archived file will have an "arc" extension.
Two utilities are required to unarchive or unzip a file: PKXARC for archives and PKUNZIP for zipped files. Both utilities are available on the Carencro bulletin board. They are made executable by typing the file name -- they "explode" themselves. It is preferable to have these utilities in either your path statement directory or in the directory or disk you will be using to unarchive them. (To determine the path on your hard drive, type "path" at the DOS prompt. If no path statement is present, you will see "path = ". To set a path statement, edit your autoexec.bat file to include one by typing a statement: "path=(name of directory).)

Once you have installed the utilities and the file to be exploded, type PKXARC (name of file, such as MYFILE.ARC) and enter for archived files or PKUNZIP (name of file, such as MYFILE.ZIP) and enter for zipped files.

The files will then be exploded for regular DOS use. Files with an extension of EXT or COM can be used by typing their name (i.e. a file named MYFILE.EXT would be accessed by typing MYFILE enter). Files with a BAS extension require Basic. Other files likely to be found in an archive files are variation of the read.me theme, such as readme., readme.txt, etc. These files can be printed or looked at on screen via the type command or a shareware utility such as browse. The readme type files usually give you an overview of the program you have downloaded and "quick start" tips. The last type of file with have a TXT or DOC extension and are usually contain more extensive documentation on your program. ■■■

TAMPA IBM PC USERS GROUP APPLICATION

Purpose: The Tampa IBM PC Users Group is a non-profit organization dedicated to serve the needs of the PC User - from the most technical of the techies to the simplest of the simple. Our purpose is to benefit ALL computer users, not only IBM and PC-compatible; our intent is to encourage, enlighten, and inform.

This information will be kept confidential. It will be used only for keeping accurate membership statistics.

BITS OF BLUE

TAMPA IBM PC USER'S GROUP

VOL. 4 NO. 10 October, 1991

MEETING

(2nd Wednesday every month)

DATE: October 9, 1991
TIME: 6:00 PM
PLACE: IBM CUSTOMER CENTER
LAKE POINTE ONE BUILDING
3109 W. Martin L. King Blvd.
Room 450

DIRECTIONS:

The Tampa IBM PC Users Group meets in the IBM's LAKE POINTE ONE Building across from Tampa Bay Mall one block east of Tampa Stadium.

The best entrance is on Martin Luther King Blvd. at the traffic light in front of Burdines. As you turn North off Martin Luther King Blvd. you will see the LAKE POINTE ONE BUILDING on the left & parking on the right. Join us in ROOM 450 - 4th floor. **Guest please sign in.**

PRESENTATION:

10/9/91- *IBM MultiMedia*
Presented by **IBM**

Refreshment Break
Open Discussion
Door Prize Raffle

(NOTE: DOS CLASS - by Ed Buzza
begins at 5:45 in Room 436)

EXPOTECH

October 10, 11, and 12, 1991

EXPOTECH **is a computer/business equipment and business services tradeshow comming to our area: at the New Tampa Convention Center across from Harbour Island in downtown Tampa.**

EDITORIAL COMMENT:

Members - I urge you to contribute ANYTHING, in the way of material for the newsletter - articles, product reviews, suggestions for a better publication. Believe me you won't offend the staff. We would be so delighted to receive your input. Don't you feel this is YOUR paper? WELL, how about it, let us hear from you. If you do not have access to a modem, simply mail any of your articles or disk to me at: 9402 Hidden Ridge Place, Tampa, Florida 33637.

■■■

Bits of Blue is published by the Tampa IBM PC Users' Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about IBM-PC and compatible personal computer systems to its members.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII file or in a commonly available word processor format, such as WordPerfect 5.1, on diskette to the editor at the address below or send it by modem to BBS (813)239-3704.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for non-profit use. Reprints must be unaltered; proper credit given and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

News and information provided by the BPS News Service is preceded by (BPS). BPS NEWS SERVICE is copyright (C) 1991, by BBS PRESS SERVICE, INC., 8125 S.W. 21st Street, Topeka, KS 66615; 913/478-3157 (voice) and 913/478-9239 (data).

This newsletter was created with WordPerfect 5.1 donated by WordPerfect Corp. to TIBMPCUG for use by the editor.

Secretary's Report

TAMPA IBM PC USER'S GROUP
MINUTES OF 9/11/91 MEETING --

... INTEL is having trouble with their 486-50 chip and has stopped making them. The problem crops up when used with AUTOCAD. Dell and IBM are still shipping PCs with their version of the chip. INTEL is also being sued by AMD about the use of the name "386" for their chip.

... Bits of Blue delivery date has been decided by majority vote. The Editor will make every effort to have the newsletters in the hands of the members about 7-10 days before the meeting date. The question was raised because some members are not attending and it was thought that later delivery would serve as a reminder to attend the meeting.

... Marylee Bruneau, Bits of Blue Editor, was roundly applauded by the members in recognition of her outstanding efforts in preparing the newsletter.

... Training sessions on DOS Fundamentals (same as last time) will be given again. The three session course is scheduled to begin with the October meeting. Course time will be from 5:45 to 6:30 p.m.. Watch the BBS and the newsletter for confirmation of this course. You do not need prior registration to attend. The first session will cover PKWARE (PKZIP and PKUNZIP) and a DOS tutorial program.

... Secretary duties will be shared by Charles Howe, Jim Clark, and Ed Buzza.

... DOS 5.0 problems and solutions has been documented by Fred Kyle in a WordPerfect formatted file available on the BBS. Since this is a five page document, it was not placed in the newsletter because it would raise the price of postage. Some copies are available at the meeting for those who are interested.

... DOS 5.0 seems to be the predominant operating system for the majority of group members. AND they're pleased with it! Perhaps the most significant feature is the improved shell, provision for using a mouse, the DOSKEY utility, and the undelete and other file utilities licensed from Central Point Software (PC TOOLS). It also allows task swapping but that is a s-l-o-w procedure.

... PACE has a pretty good buy for a fax (4800 baud), modem (2400 baud) circuit board - just $99.00.

... DR DOS 6.0 will be available soon and will feature disk compression. This feature could double disk capacity.

... Harvey (The President) expressed regrets that he couldn/t bring us the latest news about PC technology. He has been quite busy and just couldn't find the time to cull these most interesting tidbits from the various trade publications.

(Minutes continued)

SOFTWARE PUBLISHING CORPORATION PRESENTATION

Linda Confer demonstrated the DOS version (3.0) and the alpha copy of the Windows version of Harvard Graphics. This is not to be confused with the 2.3 ver for DOS which is still being marketed as a separate package. Since the 3.0 ver requires a 286 PC, or higher, it is not considered to be an upgrade to the 2.3 version.

76 Registered users of ver 2.3 can get ver 3.0 for $125.00. If you have ver 3.0, you will be able to get the Windows version for $50.00 when it is released sometime between this winter.

The new package includes a completely rewritten draw module (old Draw Partner accessory); it provides for macros and the ability to add eight additional programs to be launched from the main menu. The Chart Gallery brings up chart templates (pie, bar, 3-D, line, etc.) that make building a presentation fast and easy. You can create your own templates and add them to the Gallery.

The Intelligent Charting concept allows for adjusting the font size to make the text fit the chart. It uses Bitstream scaleable fonts for this purpose. It can also be used to prepare speaker notes.

Up to 210 boxes can be shown in organization charts. Also, it is very easy to select/create a subordinate from the master chart. Of course, such attributes as foreground and background colors and graphics are easily handled. Further, these attributes can be carried across chart lines.

The new draw module is quite impressive. Especially the Status Box which shows the element currently being used. There are over 500 symbols (coins, arrows, currency symbols, trees, etc.) that can be animated or used as fade symbols. There are 32 palettes, each with 64 colors, besides the customization that lets you select your own colors.

In the area of animation, one image can be evolved into another; arrows can fly to a target graphic; bar graphs can use a plant symbol that grows to represent the bar value - all this in addition to various wipes and dissolves.

One nice feature is the use of "hidden" buttons that can be mouse selected to jump to another chart rather than follow the scheduled order of presentation. The Presentation module includes 17 different backgrounds (clouds, trees, planets, etc.) or you can create your own.

Linda also demonstrated the alpha version of Harvard Graphics for Windows. That the program is pretty solid was proved by the fact that it ran without ever "locking up." The DLL (dynamic link library) feature was well shown with an EXCEL spreadsheet serving as the base for one of the presentation charts.

GeoGraphics is a mapping program. Showing such items as counties, zip codes are done with ease. The Pentagon used this package for some of its TV presentations of the Desert Storm operation.

Software Publishing Corporation has been long known for its very "user friendly" PFS series of programs for the home and small business user. Recently, the company decided to get more involved with the corporate environment and sold the PFS series to Spinnaker Software.

THANKS:

Special thanks to the Software Publishing Corporation for their generous donation to the group of copies of Professional File, Professional Write, and Harvard Graphics. And a very special "Thank You" to Linda Confer for her excellent presentation.

THE WINNERS:

Harvard Graphics - Ron Mirth
Professional File - Ben Benedict
Professional Write - Ed Buzza
50-50 - Dee Gabbard

■■■

BORLAND, ASHTON-TATE FILE ADDITIONAL INFORMATION ON MERGER

(BPS) -- Borland International Inc. and Ashton-Tate Corp. reported that, in connection with Borland's pending acquisition of Ashton-Tate, they have filed additional information with the Department of Justice under the Hart-Scott- Rodino Antitrust Improvements Act of 1976.

Borland and Ashton-Tate believe that the information substantially complies with the Department of Justice's request for additional information.

Borland and Ashton-Tate intend to consummate the acquisition as promptly as practicable after the requisite stockholder approvals have been obtained and all other conditions to the acquisition have been satisfied or waived. Meetings of the stockholders of Borland and Ashton-Tate have been scheduled for Sept. 24.

As previously announced, Borland and Ashton-Tate have entered into a merger agreement providing that Borland will acquire Ashton-Tate and Ashton-Tate shareholders will receive, for each of their Ashton-Tate shares, Borland shares with a market value of $17.50, but no more than 0.398 nor less than 0.346 Borland shares per Ashton-Tate share.

■■■

If you are not the lead dog

The view never changes!

PRESIDENT'S COLUMN:

Heeeeeeeeeeeesss Back.

After a small break, our own Ed Buzza is back to teach you DOS. This 3 month session will begin at 5:45 PM in room 436 across from main meeting room. If your looking to understand the basics of DOS this is a must class for you. The instructor is a genuine educator.

Well IBM has finally accepted that downsizing is the future. This historical moment was brought on in September when IBM announced over 100 hardware and software products to help its customers create distributed computer systems (big words for Local Area Network). I am sure that the acceptance by IBM of the rightsizing facts has put lumps in the throats of many an MIS professional. I personally experienced the feeling in the mid 80s as a DP manager. My thoughts from a decade ago **'MARCH or DIE'** are probably the same as those of IBMs today. Most of you know that I was born in France where that saying is an old French Foreign Legion saying which basically means **march forward or be left behind to die.** It was easy for me then to see the potential of the PC and the future of computing. It was difficult to accept that I would have to reeducate myself to understand this new technology. It took a long time, $3,000.+ investment in a new IBM PC with 2 floppies and the **Tampa IBM PC User Group,** but I did come to terms with this future technology. Mind you I have never mastered the PC because its environment is constantly changing. To master the PC you must not look into the future, and close your mind to consistent change. Unfortunately these thoughts will not allow you to go forward in life, but will freeze you in time like a dinosaur. I don't believe it makes a difference whether you are a DP professional or end user, you will need to keep up with some change or get left behind. Even kids these days want more than a PC XT with CGA, a 10Mb harddisk and flight simulator.

Like IBM, I too have decided to prepare for rightsizing. This weekend I began to recycle those old mainframe and mini software manuals that I have accumulated since 1974 when I began my DP career. I often thought that I might need them again if I had to go back to those environments. Luckily I didn't have to. I didn't realize how much of that stuff I worked with and have since forgotten. You know there were some weird names back then too like VOLLIE, VOICE, THE LIBRARIAN, EASYTRIEVE and VSE POWER to mention a few. Those manuals were ugly compared to the PC manuals of today. All of this makes me wonder where we will be in another 18 years. Will we be throwing away all the information from the past 18 years. Will Windows, DOS, OS/2, the 486 processor, hardisks and VGA be relegated to a faint memory. Probably.

Harvey Bruneau

LIVING IN THE COMPUTER AGE
By: Tom Petrocelli, Buffalo IBM Users Group, APCUG

MS-DOS : The Operating System from HELL!

Who among us remembers the first time we saw a computer novice type the word FORMAT without any parameters? Back in the old days (that's before DOS 3.0) it usually meant that you could either start shrieking wildly and running toward the person who was typing that fateful command, or you could just hang your head and resign yourself to the inevitable destruction about to take place. Anyone who has ever been in this situation knows that the first approach was futile. The ENTER key was always hit before you could do anything about it, so you usually went looking for the backup disks immediately. Of course THERE WEREN'T ANY. No one made backups of anything. "It's such a pain", people would whine. This, inevitably, led to much wailing and gnashing of teeth. And why is this? What has brought us all to such a calamity time after time? Why, MS-DOS, the operating system from Hell of course!

DOS was designed as the operating system for the original IBM-PC. Since PC stands for Personal Computer, so one might assume that the OS was designed to be used by people, normal people. But, to quote James Brown "HA!". From the beginning DOS has had more landmines, blind alleys and traps then you could imagine. While things are improving, it is still pretty deadly. Most of the revisions to DOS have centered on new features and more power, but very little has been done about making it safe. DOS 5.0 is promised to fix some of this, but I'm not holding my breath. Windows is supposed to insulate us from disaster, by placing a wall in front of DOS, but it has only replaced one set of pitfalls with another. If it weren't for special programs like the Norton Utilities, the suicide rate amongst corporate PC support people would probably be double what it is.

Some DOS commands are written in such a way that they can only be described as "loaded". I don't mean loaded with features, but loaded like a gun. They either lack basic protection from common, understandable mistakes, or contain options that can cause disaster. The worst are, of course, FORMAT and FDISK. As we all know, FORMAT prepares a disk so that it works properly with the DOS file system (such as it is). This is very useful, but as the above example illustrates, dangerous as a hungry tiger. In one fell swoop, you can destroy EVERYTHING. Now I will admit that in later versions of DOS certain protections are built in, like asking you if you really want to do this to yourself when you are about to format your hard disk, but it's still way too easy to hit the wrong key and KABOOM! It's all gone.

(Living ...continued on next page)

(Living ....continued)

FORMAT is sort of the nuclear missile of the DOS world. Push one wrong button and it's all over.

FISK is not much better. It partitions and prepares your disk for FORMAT. Using this unwisely has about the same effect as FORMAT. These are dangerous to have around. Why Microsoft didn't just make two versions of FORMAT, one of which would only do floppies, is beyond me. They could have left FORMAT (hard disk) and FISK on the master disks and made the world safe for end-users. But Nooooo! They had to make it nice and easy for you to rain total destruction down upon your system. Nice guys.

This lack of controls shows up again and again. For example, DEL or ERASE. At the very least it could prompt you for individual deletes when using wildcards. Microsoft waited until version 4.0 (that's 10 years folks!) to put in an option to do so, but it's not the default. The default should be to prompt you, and the option should be to override that. And then to have no way to recover an accidently deleted file is just plain rude. There shouldn't be a reason for the Norton Utilities Undelete

program. DOS should already have it. The COPY command is no better. Would it have hurt the designers of DOS to check the target path to see if the file is already there and then prompt you as to whether to overwrite it or not? And what excuse do these guys have for not putting them in by now. What?? They didn't know? Get real!

DOS is chock full of missing features. A decent backup/restore program would have been nice. This seems like a very basic function for an operating system. There is not another OS in the world of any consequence that doesn't include something to help backup data. The BACKUP and RESTORE commands are woefully inadequate. The descriptions of these commands read like VCR instructions and the logic needed to operate them is as cryptic as Egyptian hieroglyphics. There are better shareware backup and restores programs then these. And BACKUP and RESTORE were an afterthought. The original DOS 1.0 didn't even come with them. Talk about being asleep at the wheel. If backing up and restoring were made painless, more people would bother to backup their data, which would please PC support types to no end, not to mention those whose hard disk has gone west on them.

There are so many holes in DOS that you can fall into that there simply isn't enough room to list them all. The ones I've talked about are only the tip of the iceberg. Commands like CHKDSK can be made to mess up directories. Improper use of pipe and redirection characters (| > <) can mess up files or hang your system. Anyone who has piped a file to a nonexistent device (like an LPT3 for example), or redirected output to an already existing file can attest to the amount of damage one is capable of with these little buggers. All of these are nothing in comparison with what an application can do.

If a decent programmers' toolkit and system interface was available to DOS programmers, many nasty bits of programming would never have occurred. Giving programmers, even responsible ones, the kind of low-level access to the hardware that DOS allows is dangerous. I'm sure that everyone has a "the darn program messed up my disk" story. That's not surprising considering the amount of access, hence the amount of damage, that a programmer has to the guts of DOS. When Bill Gates and company wrote DOS, you'd think that they assumed that no one but themselves would ever want to write any programs for it. What they created was a hackers delight. A system with so many back doors, that it practically says "go ahead, take your best shot".

DOS is not the worst operating system ever designed. It gets us where we want to go, so to speak, and is not particularly complicated. It has a flexibility that allows for quite a bit of ... shall we say creative ... programming. Still the landmines could be more noticeable and the pits a tad less deep. That may be the reason for Windows(not that it works that way), to help protect us from DOS. Sort of like a software version of the Patriot missile. We can only hope that in the future we can finally be safe in our own home computers. In the meantime DOS gives guys like Peter Norton something to do for a living.

■■■

COMPUADD COMPLETES 100TH RETAIL STORE

(BPS) -- The CompuAdd Corp. has opened a new store in Corpus Christi, TX -- its 100th computer retail store.

CompuAdd, which designs, manufactures, markets and supports a broad line of personal computers, launched an aggressive retail expansion in June, opening stores in small, medium and large markets at the rate of two per week. Plans call for CompuAdd to have a total of about 120 stores by year end and about 200 by the end of 1992.

CompuAdd selects markets for its retail stores based on a variety of marketing research data, including the installed base of PCs and the number of the company's mail order customers.

The company sells and supports more than 2,000 PC-related products, ranging from peripheral equipment such as printers and monitors to hundreds of software titles and supplies.

■■■

Product Review -

PROCOMM PLUS 2.0
By: Jim McCollum

Are you one of the many folks out there who own a MODEM but have never used it? Why not? You undoubtedly have applications that have a telecommunications feature-- PC Tools, high-end word processors, integrated applications and the like. At last count, I have at least 8 such applications with this feature, none of which I use. The reason usually is that it is too much trouble to figure out how to use this feature and, when you do, you find that it does little more than connect you to the other computer, leaving you to figure out what to do next on your own.

Fortunately, there are several top-notch dedicated communications programs available on the market today that make using your modem an enjoyable and exciting adventure! The "Cadillac" of these, in my opinion, is ProComm Plus 2.0, by DataStorm Technologies, Inc. For a general purpose communications program that will literally make your modem sit up and beg, this product is hard to beat!

This program runs on any IBM PC or compatible with at least 192K of available RAM, running MS-DOS or PC-DOS version 2.0 or better. Virtually any modem-- Hayes compatible or not-- and any monitor capable of displaying graphics will do. Indeed, you do not even require a hard drive, since the basic program is small enough to run from a floppy disk! In other words, this program is available to virtually anyone with an IBM compatible computer! How many of the new entries coming onto the software market today can make that claim?

Needless to say, the first thing one is concerned with upon opening the shrink wrap, is how to get this new toy installed, up and running. This is accomplished by PCINSTAL, which will, to a large extent, automatically determine the correct settings required to install or upgrade PC Plus on your system. If you are merely upgrading from an earlier version of PC Plus, all the customizations of the earlier version, including even your color scheme, become part of your new system. Although the installation procedure will modify your CONFIG.SYS and AUTOEXEC.BAT files for you, it, at least, gives you the option to say, "NO," should this not be to your liking. It lets you know what it wants to do to these files and why. Since, however, there are a number of ways to skin the proverbial cat, it is important that you have the option to do it your way rather than theirs. Too many software publishers forget this!

For you who have version 1.1B or earlier, there are some nifty new features that have been added:

* There is full 132 column support with larger screen displays for EGA/VGA systems.
* The script language, discussed in more detail later in this article, has nearly 100 new commands. Additionally, the first time any script file is run, it is compiled for faster execution, greater security and smaller size.
* It supports Microsoft-compatible mice, newer protocols like ZModem (15 all totaled) and 33 terminal emulations.
* The new File Name Clipboard allows you to "cut" file names from a BBS listing which may be of interest and then "paste" the same in the downloading routine. This eliminates the hassle of copying down all of the interesting files that are listed on a BBS on scratch paper for a later keyboard entry to download.

Basically, ProComm is set up to allow easy, uncomplicated and intuitive access to another computer from yours. A typical session starts, after ProComm is called up, by typing an ALT-D. This brings up the directory of all the entries you have made of the computers (usually computer bulletin boards or BBSs) that you normally call. The menu prompts you to select, modify or create an entry. Once your selection has been made and the ENTER key struck, ProComm takes over, dialing the phone number of the computer you wish to reach and signaling you when the connection is established. At this point, the program on the remote computer, particularly if it is a BBS, pretty much takes over-- but not entirely. For instance, you are typically asked for your name and password, calling for further entry by you. If you have taken advantage of ProComm's script language, all of this will be done for you automatically!

Two of the nifty new additions to PC Plus are its pull-down window menus and its mouse support. You can literally run the whole session on a BBS with the mouse and the pull-down menus, address the menus from the keyboard or disregard the menus altogether and utilize the old familiar keyboard commands - all with equal ease!

The more exotic features of PC Plus do not have to be addressed by you before you can start calling BBSs. They can be learned at your leisure, one by one, as you need or desire them. Should you be into programming, ProComm includes an entire manual dedicated to its Aspect script language, which shares many features with the popular C programming language. However, you do NOT have to be a programmer to take advantage of script file automation. For instance, you can ask ProComm to "listen in" on your logon activities as you call up your favorite BBS. With some editing and a little common sense, you will find that an Aspect file has been created for you which can now be compiled automatically by ProComm into an efficient script file logon procedure, relieving you of typing your name, password and other routine and sometime tedious entries required by the host system you have called. This is particularly useful when the system you are logging onto is relatively inefficient and puts you through gauntlet of keystroke entries just to get to where you want to go.

(PROCOMM PLUS continued on next page)

(PROCOMM PLUS continued...)

PC Plus passes the "don't bother me with the manual" test with flying colors, while providing you with manuals that are nonetheless useful and easy to use. It even has online help with manual references-- a nice added feature. Technical support is available by telephone or on CompuServe. Since the program is so easy to use and the manual so readable, I doubt very much that you will have much reason to avail yourself of this support, however.

Although the manual is extremely easy to read and understand, it really is not needed until you are ready to try the more sophisticated and exotic features of PC Plus. For those of you who have always wondered what the differences are between protocols like XModem, Kermit, YModem, Modem7, C-Link, ZModem, etc. or even what one is, the manual goes into great detail explaining these. If you do get into trouble, the appendix contains numerous "Common Questions" that should be able to troubleshoot your problem. For those or you of a more technical bent, the manual is replete with such information. In my opinion, this is one of the best written user manuals I have seen that is supplied with an application.

PC Plus does have some weak points. Among them are the fact that it still does not allow you to set a default upload directory. Further, I find that the script files written for logging onto a BBS tend to be unreliable; that is, sometimes, for no apparent reason, they do not work or will go just so far into the logon routine and stop. The same script file will often work on one computer, but not on another.

My general impression of ProComm Plus 2.0, is that it is a very powerful, extremely easy to use telecommunications program. If this is not enough to convince you to run out and buy the program, a fully functional shareware version, albeit with fewer features, is available on many bulletin boards to give you an opportunity to try out the basic program before buying its commercial big brother! If you like the shareware version, you will love ProComm Plus 2.0!

List Price - $119 --- Street Price - $59-$89

SOLUTION TO PUZZLE #2

By: T. Cone, Jr.

```
'Key to this solution:
'  Each person's gift matches that person's "group number".
'     Number of people in each group matches "group number",too.

'First calculate total gifts and number of people in "complete" groups
   groupnumber& = 0      'suffix "&" denotes long integer variable
   totalpersons& = 0
   totalgifts& = 0

   DO
    IF totalpersons& + groupnumber& >= 1000000 THEN
      EXIT DO  'exit loop just before last group receives gifts.
    ELSE
     'otherwise, compute gifts to all groups before the last one.
     groupnumber& = groupnumber& + 1
     totalpersons& = totalpersons& + groupnumber&
     totalgifts& = totalgifts& + (groupnumber&) ^ 2
    END IF
   LOOP      'DO/LOOP continues til exit condition is true.
'determine number of people and gift total to the last group
     lastgroupsize& = 1000000 - totalpersons&

     finalgift& = groupnumber& + 1  'this is size of gift going
                                    'to the millionth person.
'determine combined total gifts
     totalgifts& = totalgifts& + (lastgroupsize& * finalgift&)

'display solution
   CLS
   PRINT "Total persons: ";
   PRINT USING "###,###,###"; totalpersons& + lastgroupsize&
   PRINT "The millionth person received ";
   PRINT USING "$###,###"; finalgift&
   PRINT "The total distributed was ";
   PRINT USING "$###,###,###"; totalgifts&
     END
```

Here's Puzzle #3

By Tom Cone

Assume that a mosquito can circle a building in exactly 4 minutes, while a fly takes 6 minutes to make the same trip. Nevertheless, the fly and mosquito decide one day to race each other around the building. They start from the same position, and at the same time.

Can you write a program to determine how long (in seconds) it will take the mosquito to catch up to the fly ? i.e. how long before the fly is "lapped" ? Here's the catch: you may not use simultaneous algebraic equations, nor may you use math functions other than addition or multiplication. You may use any relational operator you wish (i.e. "=", ">", "<", etc.). Good luck.

TAMPA IBM PC USERS GROUP APPLICATION

Purpose: The Tampa IBM PC Users Group is a non-profit organization dedicated to serve the needs of the PC User - from the most technical of the techies to the simplest of the simple. Our purpose is to benefit ALL computer users, not only IBM and PC-compatible; our intent is to encourage, enlighten, and inform.

This information will be kept confidential. It will be used only for keeping accurate membership statistics.

BITS OF BLUE

TAMPA IBM PC USER'S GROUP

VOL. 4 NO. 11 November, 1991

MEETING

(2nd Wednesday every month)

DATE: November 13, 1991
TIME: 6:00 PM
PLACE: IBM CUSTOMER CENTER
LAKE POINTE ONE BUILDING
3109 W. Martin L. King Blvd.
Room 450

DIRECTIONS:

The Tampa IBM PC Users Group meets in the IBM's LAKE POINTE ONE Building across from Tampa Bay Mall one block east of Tampa Stadium.

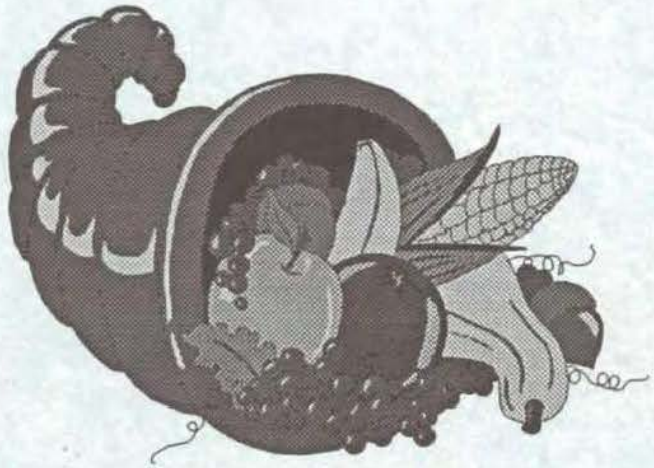
The best entrance is on Martin Luther King Blvd. at the traffic light in front of Burdines. As you turn North off Martin Luther King Blvd. you will see the LAKE POINTE ONE BUILDING on the left & parking on the right. Join us in ROOM 450 - 4th floor. **Guest please sign in.**

PRESENTATION:

11/13/91- KEY PUBLISHER
(Desk Top Publishing)
Presented by Ed Buzza

NOMINATION OF OFFICERS

Refreshment Break
Open Discussion
Door Prize Raffle



NOTE: DOS CLASS - by Ed Buzza

begins at 5:45 in Room 436

Secretary's Report

TAMPA IBM PC USER'S GROUP
MINUTES OF 10/9/91 MEETING --

IBM MULTIMEDIA PRESENTATION

George Johnson from the Orlando office of IBM gave a stunning presentation of IBM's multimedia software and hardware. With video, sound, computer graphics and special effects, we were treated to a brilliant display of multimedia communication. The supporting products include microchannel PS/2, M-Motion, Audio Visual Connection, Action Media, touch screen display window, and the Audio Visual Connection software system.

The AVC (Audio Visual Connection) authoring and presentation system provides for the incorporation and control of text, graphics, animation, live or prerecorded video/audio and special effects (screen wipes, fades, and dissolves). While the AVC requires a Micro Channel computer for creating a presentation, the actual presentation may be run on any DOS computer. Although it can be run a slower PC, a 386 or better is recommended.

Central to the AVC authoring process are the M-Audio Capture and Playback Adaptor and M-Video Capture Adapter boards. The AVC system also supports the M-Motion Video Adapter board. These boards convert the various analog signals to digital signals that are stored as digital data files. Once they are stored as data files, they can be edited using commonly known techniques. e.g. Rotate, resize, cut-and-paste, graphic and text overlays, etc..

The M-Motion Video Adapter and its control program can display live motion video, still video, and VGA graphics at the same time. Up to three video input devices (VCR, camera, CD, cable signal, laser disk, etc.) can be accommodated. Up to four audio inputs and two outputs are all selectable via software control.

As a tool for education, training, sales, promotions, IBM has a rich supply of hardware and software to get the job done. Multi Media would seem to serve a vital need in many communication areas.

Mr. George Johnson was very impressive in his delivery and in answering questions that were raised during his session. Thank you Mr. Johnson for an excellent presentation and for being so forbearing with our questions.

■■■

PRESIDENT'S COLUMN:

Well we are bearing down on the end of yet another year. As usual this means elections at our December meeting, so lets get those nominations in for the 1992 officers. Many of you (83 to be exact) will need to renew your membership for another year. Your renewal date is printed on your mailing label. If it has 01-92, your membership will expire at the end of December 1991. Additionally, your label will have ***last one*** printed on it. Please do not wait until the last minute to renew your membership. Memberships have a one year duration from the time you join.

Now is the time to start looking for that computer related Christmas gift before its to late. An added holiday bonus for us this year will be the addition of **COMP USA**, the Home Depot of computer stuff, to Tampa. This store is being constructed at the corner of Hillsborough & Dale Mabry in the strip mall where Fridays is located. I have been watching the store being prepared and I think it will be open this year in time for the holiday spree. **If you have exact information about the opening of this store please notify me.**

I would like to share a couple of events, thoughts and comments that have cropped up since our last meeting.

● **If we can get a new generation of processors every year, why can't someone build a PC that is smart enough to changes its own clock for daylight saving time?**

● **Its with regret and joy that I welcome the changes Compaq Corporation is implementing.**
This month Compaq dropped from the ranks of PC innovator to join those of the PC followers. After posting a $70 million loss Compaq fired the old captain and put in place a new one. While other companies in the past have experienced greater losses, they either modified their course slightly or stayed true to the original course, but they kept the same captain. My joy comes from the fact that Compaq will now drop prices to compete with the clones. This in turn will make clone makers like Northgate, Gateway, Dell and others drop their pricing. As we (Marylee and I) are in the market for a new PC this year, the price drop looks better every day. The price reduction will allow us to purchase the PC we want instead of the PC we can afford. That will amount to a 486 33mhz for around $2500. My regret is that we will lose a company that has established itself as an innovator and has helped push IBM along with its own innovations. Time will tell if Compaq chose the right course, *to sell PCs based on price not technology*. Hopefully IBM will continue to be an innovator despite its own problems of being competitive in the PC world. If IBM bows out I am sure the Orient will step in to fill the void.

Harvey Bruneau

The Small, the Quick, the Deft, and the Clever Shall Inherit the Personal Computer Industry

by Steve Gibson

APCUG Industry Commentary Subscription Series Column #8:

Copyright (c) 1991, APCUG, All Rights Reserved. Permission granted for reproduction in official publications of member organizations of the Association of PC User Groups.

My God! Borland is purchasing Ashton-Tate, Novell is buying Digital Research, and old stoic and stodgy big blue IBM is talking seriously about co-developing major new personal computer technologies in conjunction with Apple Computer's crazies from Cupertino. What's going on? What's happening to our once-quaint little personal computer industry? Are things REALLY changing as much as they appear, or is all this just a coincidental timing of seemingly unrelated events?

Not so very long ago this was a peaceful little industry which rewarded hard work and dedication with fame, financing and Ferarri's. Today we seem to be witnessing many signs that our simple work-ethic based business is being reshaped by giant lumbering corporations who care far less about US than they do about their own short-term shareholder reports. Venture Capital financiers now expect to see an established track record before they'll belly up to risk their past windfall winnings. So can the small guy with that "next" great idea still compete, or has the playing field become the exclusive territory of the mega-monolithic multinational monsters? Has all the fun and frolic left the PC business forever, or are there still some gleaming opportunities? Although we're not at the helm of Borland, Novell, IBM, or Apple, let's see if we can't look more closely behind the scenes at what's been happening.

Borland has purchased Ashton-Tate. So what. Ashton-Tate, once the king of the PC databases, has fallen so far from its high and mighty leadership throne that inertia alone has been responsible for its continuing survival during the past several years. Compared to any of the hot alternatives such as Paradox or FoxPro, "real" Ashton-Tate dBase is slow, crippled, incapable, and inadequate. Are YOU still using it? Nope. Ashton-Tate is hardly a company brimming over with hot new technology. In fact they're not brimming over with anything except stale and befuddled management. When too much money is made too quickly and too easily, as certainly happened during Ashton-Tate's phenomenal early start-up years, a company never has the need to develop the means to survive when technology inevitably catches up and glides smoothly past. Ashton-Tate was simply in the right place at the right time and never had anything more than a bit of early luck to offer the world.

(The Small ..... continued on next page.)

(The Small ..... continued.)

So what does Borland see in Ashton-Tate? Well, Borland is presently quite fat and happy over its many recent well-deserved successes with Paradox (which it acquired from Ansa) and its Turbo languages. But Borland is probably quite worried over the many recent rumors it's been hearing. If you've been keeping your ear tuned to the pulse of the industry you might have heard that the powerful BASIC-like macro language underneath Microsoft's Word For Windows actually CAME from the database group within Microsoft. Database group? Yes.

The database group!
So my personal guess is that Borland's crafty old Philippe Kahn has caught wind of the power of Microsoft's forthcoming Windows database product and wants to shore-up his own corporate database market share before Microsoft releases its long-rumored (and long awaited) database product. Given Microsoft's well- deserved recent grand slam successes with Windows, Word for Windows, Excel, and Visual Basic, I can certainly understand Philippe's concern. However, $440 million is a hefty price to pay for "insurance," when you're buying a technologically bankrupt dried out husk of a former company. But hey, since he's got the money from Turbo language and Paradox sales, what's a few hundred million dollars or so exchanged to purchase a former industry adversary?

Then we have networking giant Novell, which is currently in the process of acquiring Digital Research, the original authors of CP/M. You may remember that Digital Research is the company that once told IBM that they had no interest in providing an operating system for IBM's new personal computer, and the people who told the founders of Ventura Software that there was no future in desktop publishing. Well, as a consequence of such sound business decisions, DRI has recently been looking (desperately) for a big suitor to help it get seriously re-launched in the world.

Well, along came Novell, freshly disappointed after getting all tangled up with it's pre-nuptial agreement with Lotus and then unable to complete its marriage vows. At this point, Novell knew that it HAD to buy SOMETHING in order to broaden its offerings and leverage itself into becoming more of a major player ... and stumbled upon DRI. Now, rather than having to continually shoe-horn its aging network interface solutions on top of a never-quite-cooperating foreign operating system (MS-DOS), this purchase of Digital Research would allow Novell to control and evolve its own DOS-compatible operating system. So after its brief and abortive pre-martial spat with Lotus, Novell went looking for a smaller partner that it could absorb and dominate completely. Judging from DRI's DR DOS 5.0 operating system, Novell's purchase of Digital Research will probably lead to a provocative alternative to DOS (even for many non-network users) ... as well as to additional confusion in the already-confused DOS marketplace.

This bring us to perhaps the least likely pair of all: IBM and Apple! These two turkeys have now "teamed up" to co-develop new operating systems and hardware platforms. At this early stage of their relationship it's not yet clear whether the best comparison could be made to Laurel and Hardy, Jekyll and Hyde, Lucy and Ricky, or Fred and Ethel, only time reveals such deep truths (stay tuned), but one thing's certain: We're in for some major league fun times as we watch the kids who order out for pizza trying to express themselves to the blue suits who make reservations!

What's this IBM/Apple deal all about? It boils down quickly to a clear-cut attempt to create an alternative to the current low-cost defacto standard Intel-based clone PCs which are cheerfully running Microsoft DOS and Microsoft Windows. IBM is understandably more than a trifle miffed that it lost "its" entire PC business (and most of its profitability) to every other lower-priced clone maker in the world, while Apple is upset that people who don't work in Cupertino were able to figure out how to develop effective multitasking windowing user interfaces. Since suing everyone in sight didn't help Apple, perhaps teaming up with a past arch enemy will do the trick. Oh yeah, sure thing.

Independent of the outcome of all these lumbering movements, there can be little doubt that giant forces are now being brought to bear upon the personal computer industry ... and we've all been left smack dab in the middle of it. While we've been cheerfully upgrading our machines from 360k floppies to 80 megabyte hard disks and from 640K, 4.77 Megahertz, 8088's to 4 megabyte, 25 Mhz, 80386's, the industry has been evolving into big bucks, big business, and no nonsense. No one would argue that at least part of what we're seeing is the result of the gradual and eventual maturation of the industry. So as the stakes rise, companies like Borland purchase huge chunks of "what-if" insurance, while Novell purchases "us-too" insurance, and IBM and Apple team up in a vain and desperate attempt to rewrite the rules of the entire game after it's almost been won by the other team.

In my view, what's REALLY happening is that the large companies which have been willfully, deliberately, and gleefully extorting profits from the industry during its early, juicy, pubescent period are now finding themselves in trouble. You can almost hear these greedy giants saying: "Gee, what do you know, it's not so easy anymore to make money from all those poor suckers!" Hmmmmm... "In fact, most of the poor suckers seem to have already figured out how to do what they wanted to ... which is what WE had hoped to charge them many more thousands of dollars to do." Hmmmmm... "We'd better go out and buy some other company that's doing better than us!"

(The Small ..... continued on next page.)

(The Small ..... continued.)

To these lumbering giants I say: "Good riddance." The small, the quick, the deft and the clever shall inherit the PERSONAL computer industry from those who would try to turn it into a massive corporate resource. Just say no thanks.

Steve Gibson is president and founder of Gibson Research Corporation and a popular columnist and contributing editor for InfoWorld magazine. In his TechTalk column in InfoWorld, Steve addresses a wide variety of technical issues, from his infamous ideal computer -- "Steve's Dream Machine" -- to discussions of the latest and greatest in hardware and software technology. Steve is the author of SpinRite, a hard disk low-level reformatting utility and FlickerFree, a TSR which increases screen display speed and eliminates the annoying flicker present in IBM's original CGA displays.

■■■

WORDPERFECT TIPS AND TRICKS
By: Read Gilgen, Madison PC Users Group

This column is dedicated to the proposition that not all WordPerfect enthusiasts are created equal. These "tips" and "tricks" come from a variety of sources, including WordPerfect Corporation, other users, and even the WordPerfect reference manual (imagine that!) Each month we will share a few ideas that just might make life easier for you. Who knows, you might even be able to impress your co-workers with your WPSF (WordPerfect savoir faire).

Editing (Part I)

Number 1: Finding your place.

Have you ever been editing, and instead of hitting the Del key, you miss and hit PgDn? Now where was I? You laboriously cursor back through your document trying to locate your lost place. Even worse, you're working on a 35 page document, somewhere in the middle, and you hit Home twice before pressing the down cursor key. Yikes, where was I!

A feature that few know about, but which has been in WP since version 4.2, is the ability to return to your most recent cursor position. This saves my skin at least daily. First you need to know what key combination is GoTo: Ctrl-Home usually gives the prompt "Go to" and waits for you to enter a number (which page you want to go to) or a letter (go to the next occurrence of that letter.

Now the fun (and useful) part. Pressing GoTo *twice* (Ctrl-Home, Ctrl-Home) permits you to return to the most recent cursor position. For example, if you are in the middle of a paragraph and accidentally press PgDn, losing your place on the screen, pressing Ctrl-Home, Ctrl-Home returns you exactly where you were. Be careful not to move the cursor before using the double GoTo or your place will have been "lost" and you'll have find your place the old fashioned way.

Number 2: Measurements

One of the more powerful features of WordPerfect, since version 5.0, is its ability to use precise measurements for tabs, margins, advance codes, and more. Going to Setup (Shift-F1), Environment, Units of Measurment, you find that you can tell WordPerfect to measure things in:

" = inches
i = inches
c = centimeters
p = points
w = 1200ths of an inch
u = WordPerfect 4.2 Units (Lines/Columns)

The default, of course, is inches, which for most of us is a pretty easy method of measuring (e.g. 1" margins, 1/2" tabs, etc) However, most of us are pretty bad at math, never having learned how to convert fractions to decimals (Mrs. Magruder said I'd have to know these some day!) Turning 1/2" into .5" is no big deal, but 3/16"? Just try finding a ruler with inches divided into decimal portions!

Now, in version 5.1, all you have to do is measure with your ruler, find the fraction (e.g. 3/16"), and then when asked for the measurement simply enter 3/16. WordPerfect will do the rest, converting that to 0.188". Likewise, if you know your measurement in points (72 points equals one inch) just enter the points followed by a "p" and WordPerfect makes the conversion (e.g. 12p is converted to 0.168").

Number 3: Deleting words

Here's one you probably know already (yeah, you knew but just forgot): You can delete a word at a time by positioning the cursor anywhere on the word and pressing Ctrl-Backspace. This also deletes the space and any punctuation up to the beginning of the next word. This is a quick way to get rid of a phrase or even more without blocking first and then deleting.

More on editing next month...

■■■

Editorial Comment:

This is the first in a series of six articles titled **WORDPERFECT TIPS AND TRICKS** *By: Read Gilgen, Madison PC Users Group*. These articles are available to our group by the Association of PC User Group bulletin board service. I hope you will find them informative and helpful.

Product Review:

RightWriter and Grammatik for Windows

By: Dana Trout, GDTPUG

Que's RightWriter ver 4.0

Whenever I get new software, I do five things: I write-protect the master disks, make copies of the disks, write-protect the copies, scan the manual, and read any read-me files. I was surprised the read-me file tells the user the install program is licensed from Knowledge Dynamics Corporation and may only be used for installing RightWriter. There is nothing wrong with this, but it sure looks odd to find this license in a file where you expect to find the latest information about the program instead of printed on the license agreement.

My second surprise came when I tried to install RightWriter. It turns out that after RightWriter asks for your name it modifies the install disk. It failed in my case, because I had write-protected the disk. Neither this nor the read-me file license are significant problems, but made me wonder if I would like the program. As it turned out, my concern was unjustified.

During installation RightWriter asks you to select which word processor you are going to use. I bounce around so much<197>ASCII from the Norton Editor, WordPerfect 5.1, Word 5.5, WinWord, Windows Write, etc., that being faced with choosing just one is dismaying. It turns out this limitation is much more apparent than real: RightWriter lets you switch word processors at any time, and also does a creditable job of automatically determining what word processor was used to create the file, even if you don't know.

One thing I appreciate about RightWriter is their 30-day guarantee. If you are not satisfied you can send it back for full refund. I have not tried out their guarantee because I find the product well worth keeping. But the money-back guarantee is appreciated: it's nice to know that Que has enough faith in their product that I don't have to chance getting stuck with another piece of shelfware. I tested RightWriter on the Figure Exercises article that appeared in the June issue of GolPub. I really like the fact that RightWriter is not confused by the Ventura Publisher paragraph tags and character attribute overrides that appear in the file. I have always been frustrated when I tried to use MS Word's spell-checker on VP text files because it trips up on the tags and attribute overrides. It is instructive to look at RightWriter's comments, and it made several suggestions that were appropriate. However, the vast majority are inappropriate, and would greatly weaken the article (or make it unintelligible) if they were followed blindly.

The summary information indicated the article required an 11th grade education for the reader, the writing was as weak as it could get (0 on a scale of 0 to 1), neither excessively terse nor wordy, and finally RightWriter judged the article to be unduly negative and filled with jargon. The jargon complaint is expected, since the article is a tutorial. I didn't think it was very negative, though.

The first time I let RightWriter scan the article I used the default settings of general Public and General Business writing style.

The second scan, with the settings set to College Education and Technical Report or Article showed the same level of reader education needed, but the strength index was much better: 0.27. The other readings were unchanged. The reason the strength index improved is that RightWriter looks at how many comments it makes and reduces the strength index as the number of comments increases. By selecting college-level readers, RightWriter found fewer sentences that were too complex for the intended reader. I shouldn't gloat though, because a reading of 0.27 is still far below the recommended strength level of 0.8!

One of RightWriter's features is that you can request a list of all the words used in the file, and how many times each word was used. This is an excellent poor-man's way of generating a list of words to be considered for an index: rarely-used words typically are the ones that the reader would like to find again. Common words tend to be well-known. Of course, this is only a generality, and each word should be looked at to determine the appropriateness of including it in the index. (Amusing note: one of the most common words in technical papers is <MI>fig<D>. After a moment you realize that it isn't the fruit that is so popular, but the abbreviation for <MI>figure.<D>

Grammatik for Windows

This product is designed to work with Windows 3.0, and so is convenient to use with WinWord and other Windows-based editors. Of course, it will check files created by non-Windows editors as well.

The installation is pretty straight-forward (for instance, it doesn't write on the master disk). Unfortunately, the installation program does not automatically add the Grammatik icons to your desktop. However, the manual gives clear instructions so you can add the icons manually. It takes only a few minutes to do, but it seems to be an unfortunate oversight.

Many of the features are similar to what is found in RightWriter<197>a large number of editors and word

I was surprised the read-me file tells the user the install program is licensed from Knowledge Dynamics Corporation and may only be used for installing RightWriter. There is nothing wrong with this, but it sure looks odd to find this license in a file where you expect to find the latest information about the program instead of printed on the license agreement.

My second surprise came when I tried to install RightWriter. It turns out that after RightWriter asks for your name it modifies the install disk. It failed in my case, because I had write-protected the disk. Neither this nor the read-me file license are significant problems, but made me wonder if I would like the program. As it turned out, my concern was unjustified.

During installation RightWriter asks you to select which word processor you are going to use. I bounce around so much<197>ASCII from the Norton Editor, WordPerfect 5.1, Word 5.5, WinWord, Windows Write, etc., that being faced with choosing just one is dismaying. It turns out this limitation is much more apparent than real: RightWriter lets you switch word processors at any time, and also does a creditable job of automatically determining what word processor was used to create the file, even if you don't know.

One thing I appreciate about RightWriter is their 30-day guarantee. If you are not satisfied you can send it back for full refund. I have not tried out their guarantee because I find the product well worth keeping. But the money-back guarantee is appreciated: it's nice to know that Que has enough faith in their product that I don't have to chance getting stuck with another piece of shelfware. I tested RightWriter on the Figure Exercises article that appeared in the June issue of GolPub. I really like the fact that RightWriter is not confused by the Ventura Publisher paragraph tags and character attribute overrides that appear in the file. I have always been frustrated when I tried to use MS Word's spell-checker on VP text files because it trips up on the tags and attribute overrides. It is instructive to look at RightWriter's comments, and it made several suggestions that were appropriate. However, the vast majority are inappropriate, and would greatly weaken the article (or make it unintelligible) if they were followed blindly.

The summary information indicated the article required an 11th grade education for the reader, the writing was as weak as it could get (0 on a scale of 0 to 1), neither excessively terse nor wordy, and finally RightWriter judged the article to be unduly negative and filled with jargon. The jargon complaint is expected, since the article is a tutorial. I didn't think it was very negative, though.

The first time I let RightWriter scan the article I used the default settings of general Public and General Business writing style.

The second scan, with the settings set to College Education and Technical Report or Article showed the same level of reader education needed, but the strength index was much better: 0.27. The other readings were unchanged. The reason the strength index improved is that RightWriter looks at how many comments it makes and reduces the strength index as the number of comments increases. By selecting college-level readers, RightWriter found fewer sentences that were too complex for the intended reader. I shouldn't gloat though, because a reading of 0.27 is still far below the recommended strength level of 0.8!

One of RightWriter's features is that you can request a list of all the words used in the file, and how many times each word was used. This is an excellent poor-man's way of generating a list of words to be considered for an index: rarely-used words typically are the ones that the reader would like to find again. Common words tend to be well-known. Of course, this is only a generality, and each word should be looked at to determine the appropriateness of including it in the index. (Amusing note: one of the most common words in technical papers is <MI>fig<D>. After a moment you realize that it isn't the fruit that is so popular, but the abbreviation for <MI>figure.<D>

Grammatik for Windows

This product is designed to work with Windows 3.0, and so is convenient to use with WinWord and other Windows-based editors. Of course, it will check files created by non-Windows editors as well.

The installation is pretty straight-forward (for instance, it doesn't write on the master disk). Unfortunately, the installation program does not automatically add the Grammatik icons to your desktop. However, the manual gives clear instructions so you can add the icons manually. It takes only a few minutes to do, but it seems to be an unfortunate oversight.

Many of the features are similar to what is found in RightWriter<197>a large number of editors and word

(RightWriter.... continued on next page

(RightWriter.....continued.)

processors are supported, summary information about reading difficulty, etc., is available, and so on. One of the distinctions is Grammatik allows you to work on the file in an interactive mode, looking at each problem area in turn and editing it on the fly. This can be useful, especially if you want to accept the suggested change: all you have to do is click on the ACCEPT button. If you want to make more far-reaching changes, the interactive mode is inadequate because it gives you access to only a few lines of text.

Grammatik's interactive mode can be quite entertaining as well as educational. However, sometimes Grammatik's comments are far better at creating FUD (fear, uncertainty, doubt) than helping you write better. For instance, when Grammatik came to the phrase <MI>whether it be a drawing,...<D>, it complained that I was using the incorrect verb form. Grammatik's dialog box said "The word 'it' and the infinitive form 'be' may be used incorrectly together. You may need a form of 'be' that agrees with 'it'.

I wanted something more concrete than the <169>mays<170>, so I clicked on the ? button for more detailed information. This time I got the following message:
RULE: Use the correct form of a verb.

EXPLANATION: The preposition "of" cannot substitute for the helping verb "have," even though they may sound similar when you speak. Another common example of a misused verb form is adding "ize" to a noun to make it a verb (e.g., prioritize). This should be avoided.

EXAMPLE:<R>
INSTEAD OF: He couldn't of done it.<R>
USE: He couldn't have done it.

I agree I should use the correct verb form, but I don't see how the explanation and example even address the phrase <MI>it be,<D> or what is wrong with it.

Another distinction is that Grammatik, when told to create a list of used words with the least-used words first, makes the list in a nice printer-ready tabular format. Looks pretty, but I find it harder to scan for candidates to be included in an index than RightWriter's list. The reason I like RightWriter's list better is because the words are listed vertically, like a phone book or dictionary. Grammatik's reads left to right, which I cannot scan as quickly or accurately.

Grammatik is not as benign as RightWriter about VP coding that appears in a file. For instance, I have a tag named 2 COL SUBHEAD, and Grammatik saw the COL and suggested that I not abbreviate COLUMN. Grammatik also converted the <<MI>> coding (VP's text attribute override to specify Medium Italic) to a high-order ASCII character. All of this, even though I had clicked the box specifying that the file has VP coding. RightWriter seemed to have less trouble with VP coding, although it would look at a phrase like <169>bar <<MI>>none<<D>>.<170> and complain that there is a space before punctuation. What happened, of course, is that RightWriter ignored anything it did not understand, so the <169><<MI>>none<<D>><170> is dropped out, leaving RightWriter looking at <169>bar .<170> Grammatik also has this problem, so there is no advantage there.

Which is Best?

So which is best? Beats me<197>I use both. If I am already in Windows I often use Grammatik because it has a nice interactive mode and lets me stay in Windows. On the other hand, if I am in DOS, or want a word frequency list, I use RightWriter. I added a an icon to my Windows desktop for RightWriter so I can access it from Windows whenever I want to. The primary operational difference between the two products is Grammatik can be run in an interactive mode which allows you to deal with each problem area of the text as it is found, as well as a batch mode that marks all the problem areas so you can resolve them later while working with your favorite editor or word processor. RightWriter has only a batch mode, but with an interesting fillip<197>you can set it up as a TSR and run it from inside your word processor. If you are using a DOS-based word processor, (as contrasted to Windows-based), this is a wonderful feature.

Product Review:

Outside In

By: Olaf Meding, Madison PC User's Group
Reprinted from 09/91 BITS & PC's, Madison PC User's Group

How often when using your favorite word processor to create a report due in an hour do you wish you could import information from other documents stored on your disk without re-typing a single word?

OUTSIDE IN lets you do just that and more. You can exchange information between virtually any word processor, database and spreadsheet. Let's say you want to impress your boss by combining the project results she has stored in E-mail logs, dBASE IV, Lotus 1-2-3, Microsoft Word files, etc. Just use your favorite word processor, such as WordPerfect, version 5.1, and begin writing. When you need to import information, pop up Outside In by pressing Ctrl-I, select the file and the text you want to import, and voila, no need to re-type anything.

(Outside....continued on next page.)

(Outside....continued.)

Besides copying information between applications, Outside In is also a very useful file browser. When using Outside In there is no need to fire up Paradox, Excel or Framework and wait until the program is loaded just because you merely want to read a certain file.

Also, very useful is the search feature. If you don't remember the file name (I never do, anyway) Outside In can search a single file or a whole directory for key words to help you find the information you want to look at or copy.

It is recommended that once you have Outside In installed on your hard drive that you quickly go through the tutorial as described in the manual. The tutorial is very easy to follow and sample screens are displayed in the user's guide. The tutorial guides you easily through 5 application examples of importing data: a word processor file or a spreadsheet into a WordPerfect table, a comma delimited format, a WordPerfect mail merge, and how to copy non-contiguous data. After completing the tutorial, which takes about 25 minutes, I felt very comfortable using Outside In without ever needing to refer back to the user's guide.

Also, very impressive is the available on-lint HELP. Displayed st the bottom of the screen are the function key assignments. By holding down the control key, the HELP is toggled to display the control key assignments. The F1 key puts you into the online HELP menu. As I mentioned earlier, there is very little need to dig out the user's guide, except to go through the tutorial.

Here is how it works. Outside In is a so called TSR program. This group of programs get their name from using a feature of the DOS operating system called TSR, Terminate and Stay Resident. As the name implies, these programs stay in memory after the user exits.

One of the very first TSR programs was SideKick by Borland. Actually, Outside In has many similarities to SideKick. After popping up Outside3 In and marking the text to be copied, Outside In imports this information by faking the key strokes necessary to type the marked text into your word processor. SideKick uses this same method, but what makes Outside In shine is that it knows how to display any file and how to import into any application, while SideKick is limited to ASCII (straight text) files only.

By the way, if your word processor is not listed among the over 60 predefined applications, you can define your own or change pre-existing ones. For example, you can change the key stroke Outside In should fake if it encounters the tab key.

I tested Outside In, version 2.0, for few weeks and did not find any major bugs. I even imported the entire PCUGDATE.DIR file (an ASCII text file 530K bytes long) into a WordPerfect document. It took a little while, but it worked flawlessly!

Outside In only uses a little less than 9K of RAM (memory). This makes it possible to have Outside In always loaded without losing precious RAM, which is desperately needed by many programs, such as FoxBase. Outside In can be very easily un-installed by hitting Ctrl-F10, provided no other TSR was loaded after Outside In was. There is no need to reboot, as there is with many other TSRs, and Outside In also will work on a network.

I run Desqview (a multi-tasking program, somewhat like Windows) on my AST-286. I recommend writing a small batch file, so that Outside In gets loaded before your word processor or database, etc. If you use Outside In as a file browser, a window with only 112K of memory is enough to run it. Outside In uses BIOS calls to write to the screen. This is necessary in order for Desqview to multi-task Outside In. After installation, the size of the Outside In directory is 746K. This includes all the sample files to run the tutorial.

Is Outside In just another occasional helpful utility? Nein! How much can you type in 30 minutes? This is the amount of time it takes to install Outside In and to go through the tutorial. Just tell your boss or spouse how productive you could be. The price of Outside In will pay for itself within days. Outside In is a "must have" program. Once you complete the tutorial you will be as hooked as I am on this helpful utility. I recommend Outside In to everyone who uses a word processor, database, spreadsheet or any combination of the three.

Outside In ver. 2.0, was concocted by:
Systems Compatibility Corporation
401 N. Wabash, Suite 600
Chicago, IL 60611
(312) 329-0700 - Sales

'SOLUTION TO PUZZLE 3
'By: T. Cone, Jr.
'11/3/91
'
'ANSWER:  It takes 720 seconds for the
'         mosquito to catch the fly.
'         -  Mosquito circles 3 times.
'         -  Fly circles only 2 times.
'
'SOLUTION:
'measure position using 360 degree imaginary circle.
' - mosquito moves 1.5 degrees every second.
' - fly moves 1.0 degrees every second.
' - reset position after each bug finishes a circle.
' - track lapsed time, til both fly & mosquito are in
'       the same position on the circle.
' - advance fly & mosquito to their positions after 1 sec
'       of flight, to start the solution cranking.
CLS
MosquitoPosition = 1.5
FlyPosition = 1
MosquitoFlightTime = 1
FlyFlightTime = 1
MosquitoLaps = 0
FlyLaps = 0
TotalTime = 1

DO
  MosquitoPosition = 1.5 * MosquitoFlightTime
  IF MosquitoPosition = 360 THEN
    MosquitoFlightTime = 0
    MosquitoPosition = 0
    MosquitoLaps = MosquitoLaps + 1
  END IF

  FlyPosition = FlyFlightTime
  IF FlyPosition = 360 THEN
    FlyFlightTime = 0
    FlyPosition = 0
    FlyLaps = FlyLaps + 1
  END IF

  IF MosquitoPosition = FlyPosition THEN
    EXIT DO
  ELSE
    TotalTime = TotalTime + 1
    MosquitoFlightTime = MosquitoFlightTime + 1
    FlyFlightTime = FlyFlightTime + 1
  END IF
LOOP

PRINT
PRINT "Total lapsed time: " + STR$(TotalTime) + "
seconds."
PRINT "Mosquito lapped bldg " + STR$(MosquitoLaps) +
" times."
PRINT "Fly lapped bldg " + STR$(FlyLaps) + " times."
END
```

Here's Puzzle #4:

An exercise involving strings of characters, and integers:

What value of "N" permits the following 6 digit number to be evenly divided by 99 ?

5N4,0NN

Good luck !

Association of PC User Group's Ten Biggest Lies in Computing:

by: Steve Bass

10. Your update is in the mail.
9. Tech support will get back to you.
8. Sure it'll work with your hardware.
7. No, we won't be serving fried mushrooms at Comdex.
6. It crashed your stystem? That's surprising-it's never happened to anyone else before.
5. Sure it'll work with your software.
4. Ashton-Tate? No, we'd never consider buying them.
3. Spencer the Cat party? Never heard of it.
2. No, the product works fine. This is only a maintenance release.
1. This will only take a minute.

BITS OF BLUE

TAMPA IBM PC USER'S GROUP

VOL. 4 NO. 12., 1991 December, 1991

MEETING

(2nd Wednesday every month)

DATE: December 11, 1991
TIME: 6:00 PM
PLACE: IBM CUSTOMER CENTER
LAKE POINTE ONE BUILDING
3109 W. Martin L. King Blvd.
Room 450

DIRECTIONS:

The Tampa IBM PC Users Group meets in the IBM's LAKE POINTE ONE Building across from Tampa Bay Mall one block east of Tampa Stadium.

The best entrance is on Martin Luther King Blvd. at the traffic light in front of Burdines. As you turn North off Martin Luther King Blvd. you will see the LAKE POINTE ONE BUILDING on the left & parking on the right. Join us in ROOM 450 - 4th floor. **Guest please sign in.**

Secretary's Report

TAMPA IBM PC USER'S GROUP
MINUTES OF 11/13/91 MEETING --

(I did not join the meeting until the DOS class ended at 6:30 PM; what happened at the meeting prior to that time is unknown.)

In his typically thorough fashion, our President brought to the meeting much information relating to developments in the PC world that he had com across since the last meeting. Among those items were:

* A brief discussion of EXPOTECH recently conducted at the new convention center in Tampa. One could see some of the latest developments in PC hardware there, as well as find some very good buys. Harvey cautioned, however, that some of the vendors at such as EXPOTECH may not be from the local area and you might be hard pressed to get follow-on support in such instances.

* A new book store, "Book Shop", had opened across form University Square Mall. It is apparently a warehouse kind of store with a very good selection in the computer field, as well as discount pricing. Harvey reported that there appeared to be no organization in shelving the books and he therefore had some difficulty in locating selections. A good place to buy from a price standpoint.

* Harvey reported that the long awaited Comp USA computer store should be opened before the end of the year. It is being set up on Hillsborough between Himes and Dale Mabry. Visitors to there other store locations in Miami and Atlanta, among others, have made glowing remarks about these stores - especially low pricing. It will be a welcome addition to our sources. A word of caution: This is strictly a discount operation in a warehouse environment where you pretty much have to know what you want when you go in. It has rock bottom prices and service in commensurate.

* A new upgrade to Laplink is now available.

* The Far Side has come out with a personal information manager (PIM) program. One "advantage?" of this program over other PIMs is that it adds Far Side humor. On the other hand, some report utility shortcomings in this program compared to other PIMs. Look it over to be sure it does what you want before you put your money on the line.

* Harvey reported that Intel and IBM have joined together in a collaborative effort in computer chip development. Some discussion followed as to why, with a wide range of whys expressed. We will just have to wait and see. One thing for sure, though, is that both firms believe it in their best interest.

(Minutes continued on next page)

Minutes continued...)
HELP NEEDED:

Our club has grown to about 160 members now. Though this is some short of the 200 goal Harvey had set for 1991, we have grown a great deal. The workload had also grown a great deal and more member support and help is needed. The elected officers cannot continue to carry the entire load by themselves. Some very good improvements have been made to date in serving the needs of our members and we want to continue to improve and expand. Here are some of the things YOU can do to help:

* Make yourself available to serve as an officer with the club - and it is not to late to do so for the coming year; elections are at the December meeting. If you can't do that, make yourself available to assist.

* Provide articles for the Newsletter. If you come across information of general interest to the membership, submit it for the newsletter. Write a review of one of the programs you have and submit it. If you hear of or have developed some useful utility or technique which has been beneficial to you, submit an input to the newsletter. You know, our newsletter is a bit like a computer - no input, no output. Please help.

* We would like to expand areas of instruction to include word processing, data base, spreadsheet, communications, DTP, etc. BUT, we need people willing to conduct classes on these subjects. To date we have held two classes on DOS (the second in progress now), both of which have been conducted by Ed Buzza, our workhorse who also provides newsletter articles, program review presentations at our meetings, etc., etc.; he is doing far more than his share now. Come on people, share your expertise with your fellow club members. Contact Ed Buzza or Harvey Bruneau.

* We would like to get involved, as a club, in community service - give something back to the community. We need your thoughts on how we might do that.

NOMINATIONS: The President opened the floor to nominations for the elected positions in the club to serve during 1992. The following nominations were made:

President	Harvey Bruneau
Vice President	Steve Speairs
Treasurer	Bill Fuller
Education	Ed Buzza
Member At Large	Roger Waters
Secretary	
(Co-secretary	Jim Clark
(Co-secretary)	Charles Howe

Elections will be held at the December meeting. Nominations will be open until the time of the elections. Come on now, be prepared to make your nominations at the December meeting, or better still, volunteer yourself for one of these positions.

COMING PRESENTATIONS: The President reported that the following lineup had been completed for guest presentations:

DECEMBER - Microsoft Visual Basic, MS Works, MS Money, MS Publisher.

JANUARY - Word Perfect for Windows

FEBRUARY - Corel Draw

PROGRAM REVIEW: Following a break, our own Ed Buzza gave a review of Soft Key's Key Publisher. This is a DTP program which is identical to Timeworks' Publish It 1.2. DAK (a California based electronics mail order firm with which most of us are familiar) made a deal with Timeworks for a license to sell Publish It 1.2 under a different name and with different documentation; Timeworks had developed version 2.0, which is now on the market.

Key Publisher (KP) is a very flexible low-end DTP program. It has a lot to offer, especially for the price, and makes an excellent entry level DTP program. I say entry level recognizing that this program could well serve all of your DTP needs. On the other hand, the low end programs cannot compare in power and flexibility with the high end DTP programs like Pagemaker.

KP is not word a processor, but it has a word processor capability so that text can be entered from the keyboard into the program without difficulty. You are our of luck on spell check and thesaurus, though. Similarly, KP is not a graphics draw program, but it does have a limited draw capability. Among the features of Key Publisher are:

* Imports ASCII text files as well as files in the format of several of the major word processing programs.
* Imports graphics in several formats, including TIFF, PCX, GEM, IMG and EPS.
* Ability to create and retain "style" (master) sheets which saves much time on repeat publications.
* All low end DTPs are memory hogs in that they handle both graphics and text as bit maps. But, KP makes better use of conventional memory than some other low enders. The program does not use extended memory.
* The program will handle about 30 pages at one time, but I think you would run out of memory before that time is you use many graphics.
* The program is slow on the slower computers if you edit text or alter pages toward the beginning of a multiple page

(Minutes Continued on next page)

(Minutes Continued...)

document because of the redraw time. However, redraw time can be reduced by hiding all graphics.

* Hands pages from 3.75 X 6.5" to 8.5 X 14", with several sizes in between, landscape or portrait.

* Flexible column guides, with up to six columns allowed.

* Has six fonts, two of which can be sized in increments form 7 to 60 points; the other four offer only two sizes 15 (or 16) or 30 points. All of the standard styles are available, but only light is available in text effects.

* Graphics and text frames can be moved anywhere on a page, but cannot be rotated, flipped or distorted in any way.

* The "Help" available in the program is fairly good, but it is not location sensitive; that is, when you ask for help you are offered a help index form which you choose area of help you want. And, you cannot obtain help when you are in a dialog box.

And, so on. Ed gave an excellent presentation of Key Publisher, but space here precludes giving further detail. Tough limited compared to the high enders, it is a nice program and fairly easy to learn. He clearly showed that you get a lot of bang for the buck with this package which can be had from DAK for a mere $9.90, plus $4.50 S&H. If you are interested, here's the contact:

HARD DRIVE CLUSTERS

By: Ed Buzza

The smallest area of disk that DOS can handle is a sector - 512 bytes. But DOS doesn't allocate disk space based on sectors, it allocates clusters. Clusters consist of several sectors depending upon the DOS version being used and the size of the hard drive. The smallest cluster on a hard drive is four sectors or 2048 bytes. When you write a 1k file, DOS uses 2k of space on the hard drive for that file. If your file size is 2050 bytes, DOS needs two clusters or 4096 bytes for that file.

Until version 4, 32 meg was the most that DOS could handle. But you could set up the physical hard drive as two or more logical hard drives. This way, DOS could handle a physical hard drive of 40 meg if it was partitioned as two logical drives each having 20 meg of space. DOS treated the logical drives as though each was a separate hard drive.

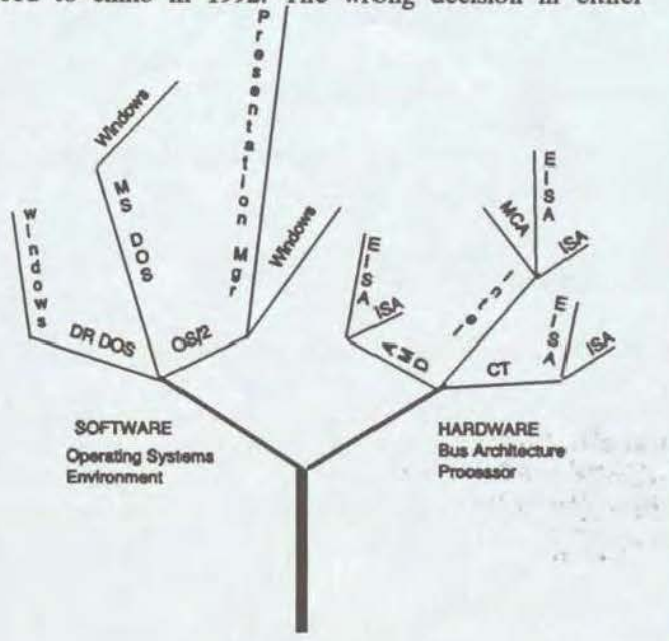
With version 4 and 5, the 32 meg barrier does not exist. Instead, a new problem arises - cluster size. Because of the way DOS sets up the File Allocation Table and its addressing scheme, cluster size varies as shown below:

DRIVE SIZE	CLUSTER SIZE
All versions	
16 meg or less	4k
Through ver 3.3	
16+ to 32 meg	2k
Ver 4 and 5	
16+ to 128 meg	2k
128+ to 256 meg	4k
256+ to 512 meg	8k
512+ to 1024 meg	16k

If your 40 meg hard drive is partitioned as 30 and 10 meg drives, that 10 meg drive has a lot of wasted space in its files. The same is true if your 200 meg hard drive is set up as a single drive. Sure, DOS ver 4 and 5 can handle it but each cluster is now given 4k of valuable real estate on the hard drive.

■■■

EDITORIAL COMMENT:



It has been one year and this is my twelfth publication of Bits of Blue. My thanks to all of you who contributed articles throughout the year. We've grown from 7 to 10 pages as the year progressed. I also thank you for your compliments and encouragement, it all makes it worth while. Keep up the good work and as always I do appreciate the feedback - be it praise or constructive criticism. You are a great group and I hope the information contained in BOB is in the most part helpful and informative to you. It's been a fun year, I can only hope it will get even better, if I should be appointed, elected, selected to be your editor for another year. Merry Christmas and a Happy New Year to you all.

Marylee Bruneau

PRESIDENT'S COLUMN:

Well another year is coming to a close. Voting for our 1992 officers will take place after the main presentation by **Microsoft** . Please be sure to make your nominations prior to that time. Present nominations are listed in the **Secretary's Report** column.

It certainly was an exciting year in the PC world. Next year may not see as many lawsuits, mergers or innovations since many companies have been swallowed up by bigger ones or just plain went out of business. However, endusers will have some serious decisions to make about hardware and software selections in the coming year. Hardware decisions will be mainly based on the processor manufacturer (**Intel, AMD, CT, or Whirlpool**) and the bus architecture (**ISA, EISA, Microchannel** or **Greyhound**). The ever growing list of non-standard standards is the main reason for falling hardware prices which should continue to drop through the 1st quarter of 1992. In the software arena, the decision will be among operating systems and environment. Please remember that Windows 3.0, **the present environment leader**, is just a shell which executes other programs. Windows 3.0 does require an operating system (DOS 3.1 or higher) before it can be used. The major battle of the year should be between IBM (**OS/2 2.0**) and Microsoft (**Windows 3.0**). IBM has a real challenge ahead of itself to overcome the head start which Microsoft has. It will take some fancy marketing by IBM for **OS/2** to establish even a foothold in the PC arena. Additionally, **DR DOS 6.0** (Digital Research, owned by Novell) could add to the fight against Microsoft dominance. Below is the tree we will need to climb in 1992. The wrong decision in either hardware or software could put you on the wrong branch. Hopefully as a group we can help each other determine which branch is best suited per individual. Unfortunately, I believe that one branch will not be the answer for everyone. Each member may have different requirements of a PC and only a specific branch may provide the desired results. However, the common denominator between all of us is that we do use a PC.

1992 Decision Tree. HPB

Last meeting I mentioned that I had ordered, from Gateway 2000 (mail order), a 486 33Mhz PC on the 11th of November. This was the 1st time I had used a mail order company. The PC cost $2645 + $95 for shipping for a total of $2740. The price included a tower case, 4Mb RAM, 1.2MB & 1.44MB Floppies, 16bit VGA board with 1MB, 14" color crystal scan monitor, 120Mb HD, Microsoft mouse, MS DOS 5.0 and Microsoft Windows 3.0. *This 486 machine is still cheaper than my original IBM PC that I purchased in 1984.* The day after placing the order I faxed a confirmation letter to my Gateway salesman. The letter confirmed the product I ordered along with detail about possible refund, price guaranty, service and support as it was presented to me. I don't mind telling you that was a lot of money and at 1st I was concerned. However, after reading reviews of Gateway products, seeing the Dun & Bradstreet rating of Gateway 2000, and hearing favorable comments from existing Gateway users within our user group, most of my concerns went away. Gateway promised that my PC would arrive in three weeks, which placed delivery around the 1st week of December. In actuality the PC was delivered in 11 days. The PC booted the 1st time and brought me into Microsoft Windows. Of course Gateway loaded DOS 5.0 and Windows 3.0 before shipping. So far this has been a pleasant experience. The main reason for getting the PC was to get into the Windows environment and yet still have the option of installing OS/2 2.0 when it arrives. After copying all my data from my old PC, I loaded three new Windows product which I have never used. These included Corel Draw, Perform Pro and Wordperfect. It wasn't long before that 120MB drive was full. I decided to install Stacker V2.0 compression software to increase the drive capacity. In all, my disk space doubled to 240MB for a cost of only $89 additional dollars. The only other problem I can see is that running Windows programs on a 14" screen is hard on the eyes. This is mainly due to the fact that data is displayed smaller than on a text based system.

My comments are not meant as an endorsement for Gateway 2000 products or that you should buy a 486 PC. You should determine your needs, budget and vendor comfort factor before you purchase.

From Marylee and I, we wish you and yours the best for the holidays and the coming new year.

Harvey Bruneau

WORDPERFECT TIPS AND TRICKS
By: Read Gilgen, Madison PC Users Group

Editing (Part II)

Number 4: Easy blocking.

Anyone who does more than casual editing knows about the Block key (Alt-F4, or F12 if you have the enhance keyboard). You position your cursor at the beginning of a block of text, turn on Block, and move your cursor to the end of the block. You can then perform a myriad of miracles to the highlighted text, including: bolding, underlining, deleting, moving, copying, spell checking, printing, saving, protecting, upper or lower casing, searching, and more.

However, unless you have a speedy computer (and not all of us do), then moving the cursor character by character or line by line can be rather tedious. Here's how to make this task easier:

After turning on Block, you can press the Spacebar to highlight (block) the next word (the cursor actually moves to the next space it finds); or press the period to define highlight an entire sentence (cursor moves to the next period), or ENTER to highlight to the end of the paragraph (cursor moves to the next Hard Return).

Now blocking and moving paragraphs becomes quite simple, especially in conjunction with the next trick.

Number 5: Shortcut moving and copying.

You all probably learned how to move (cut and paste) by blocking, then pressing Ctrl-F4, **Block**, **Move**, repositioning the cursor, and the pressing Ctrl-F4, **Retrieve**, **Block**.

OK, so you're new to WordPerfect and never knew we used to have to use the above sequence to cut and paste. You probably noticed the prompt "Move cursor; press **Enter** to retrieve." at the bottom, so you just moved to where you wanted to paste and hit Enter.

Well now you can eliminate a couple more of the steps. If you have an enhanced interface keyboard (most AT-style or newer keyboards work; you don't need the new IBM enhanced keyboard), you can press Ctrl-INS to copy a highlighted block (this replaces Ctrl-F4, **Block**, **Copy**) or Ctrl-DEL to move a highlighted block (this replaces Ctrl-F4, **Block**, **Move**).

Note: Don't try to get fancy. You do *not* have to select the ENHANCED keyboard layout to use these shortcut keys.

Unless... if this does *not* work, you probably have an older computer. You'll probably use this to convince the boss to buy you a new one! But there actually *is* a way around this, if you want to learn about macros and keyboard layouts: you can assign the old-fashioned steps to Ctrl-Ins and Ctrl-Del. Then you *do* have to select that keyboard definition in order to use this shortcut.

Number 6: Cursoring by Paragraphs

While we're on the subject of enhanced keyboards (the AT-type, not the IBM monstrosities). You can now also move your cursor up or down a paragraph at a time by simply pressing Ctrl and hitting the up cursor or down cursor keys. Again, if this doesn't work on your computer (some portables can't do this), then add that to your list of reasons why you have to sell one of the kids in order to get your new computer.

More on editing next month...

Product Reviews:

The Game Room

By: Tom Petrocelli, Buffalo IBM Users Group, APCUG

The Holiday Shopping Awards for 1991.

What does the serious gamer want this coming holiday season? That's a very good question. With so many great games out on the market, a lot depends on how much money you have to spend. In general game prices fall into three categories, cheap, normal and only for those who can afford to appear on Lifestyles of the Rich and Famous. The first two price ranges are in a sense, somewhat arbitrary. Something is cheap is you can afford it without thinking about it. To a five year old with a 50 cents a week allowance, a candy bar is an expensive item. In the case of computer games, it's probably safe to say that if the game is under $20, it can be considered inexpensive. The normal range runs up to about $55. After that it's pricey and should be something special. So what looks like a good buy in each of these?

The envelope please . . .

In the cheap category, the winner is Monty Python's Flying Circus - The Gamefor $14.95. This is one of the most original, thoroughly hilarious, totally fun games ever created. As for play, it's not all that exciting, being in many ways just another arcade game, but who cares! It's chock full of references to the TV program and it hardly matters that you've seen this type of game before. It's like playing in a Terry Gilliam cartoon (for those of you who are not familiar with him, he was a member of the famous comedy troupe and the group's cartoonist). It is surreal, strange, weird and FUN, FUN, FUN! The problem with it is that if you are not a fan of the original TV program a lot of the game won't make sense to you, or seem particularly amusing. If you hated the program, you'll HATE the game. But if you loved it, like so many did, then run . . . don't silly walk . . . right out and get this game.

A partial lineup of what's in store for you is: falling dead parrots, cheese shop humor, Mr. DP Gumby, The Spanish Inquisition (I bet you didn't expect that), hedgehogs, half-a-bee's, exploding kittens, spam spam spam spam eggs sausage spam spam baked beans spam spam spam and spam, an argument, how to identify trees from a long distance and other overt acts of insanity. A must for the Monty Python fans in the family.

In the category of normal priced games, the winner, hands down is Harpoon. Previously reviewed in these pages, Harpoon falls toward the top of the price list for this category, is a over a year old, and is still one of the best games around. With its many add-ons and expansion sets, the true simulation wargamer will go ga-ga over this. The detail is outstanding, the play exciting and the action realistic. Look for a Middle East/Persian Gulf battleset this holiday season. At the time of the release of the last battleset they promised that it was forthcoming. Finally, in the so-expensive-I-need-to-mortgage-the-house category is (ta-da) Mother Goose by Sierra On-Line. First a confession. I've never actually played this one. All indications are that it is a truly fabulous game, with wonderful graphics, realistic sound (in fact there are no printed messages, the program just talks to you), and an imaginative theme. Based on the nursery rhymes, this is the type of software that kids can play and adults can enjoy. It lists for $59.95. But wait! That's not so much. No it isn't, unless you take into account the fact that it only comes on a CD-ROM. If you've got the player, then it's with in the normal range, but since most of us don't yet, the additional $400 to $500 for the CD- ROM player sure makes this an expensive toy. Mother Goose as well as the CD-ROM version of Kings Quest represent the future in games software. Programs so huge that they need to be run from a CD-ROM (which also makes them hard to copy) employing multimedia techniques to bring to the computer user something beyond the limits of a normal gaming experience.

Product Review:

Norton Utilities 6.0

By: Tom Petrocelli, Buffalo IBM Users Group, APCUG

Usually when a software company upgrades a product these days, mostly what is added to the original software is just "bells and whistles." They usually leave the real changes to a new product that they can then charge much more money for. This is a strategy driven by market forces and not new technology. Thus when one sees a rapid series of upgrades in a product or product line, one assumes that there is probably nothing spectacular, and that they should consider waiting for a few revisions to go by before getting the latest and greatest. This is certainly not the case with the newest Norton offering from Symantec, the Norton Utilities 6.0.

When you first install the new NU 6.0, it is not all that impressive. The installation program does give you more control over what you wish to install and what you don't. The new interface is graphical (and Windows compliant) which is nice, but nothing to get excited about. In fact the first impression is reminiscent of the line from The History of the World Part I where Dom Deluise, as a Roman emperor looks over an alabaster bathtub and says <169>Nice. Nice. Not thrilling, but nice. This is very deceptive. What is really new about NU 6.0 is horsepower.

(Norton....continued on next page)

(Norton ...continued)

What is most amazing about the new Norton Utilities is how fast it is. It feels as if all the utilities now run at warp speed. The most noticeable effect is in the Speed Disk disk optimizer program. This is not surprising, considering that this program is the most susceptible to changes in performance speed. Other utilities like the Disk Editor usually run at a human's pace, but the Speed Disk is on its own. How fast is it? Previously, it took almost 30 minutes to do a full optimization on a 40 megabyte drive that was about 60% full. It now takes around a minute and a half. That's around 20 times faster. This of course means that you are more apt to optimize your disk, thereby gaining increased operating performance on a regular basis.

The other programs that comprise the Norton Utilities have also been given performance increases as well. Disk Doctor, Safe Format, and the Disk Tools all work at a faster rate then they did before. The differences are not as large as they are for Speed Disk, but are noticeable. The one exception to this is the Norton Change Directory. While they have added many new functions to it, such as the ability to prune and graft whole branches on your disk tree, it seems to be much slower. The trade off is well worth it, when you consider that it is not really so much a disk changing utility as a disk tree maintenance one.

The new Norton Utilities is in many ways smaller, using much less system resources as did its predecessor. Most of the programs are in a compressed format, in much the same way as a PKLITE compressed program is, although not in PKLITE format, and hence take up less disk space. Even with all the new utilities added in this release, the amount of hard disk space is the same as release 5.0. You have the option of expanding the programs to full size, but why would you want to? There is no noticeable delay when loading programs on a 286 machine, and on a 386 or better machine it would be downright silly to expand the programs out.

The memory usage of the Norton Utilities is also less than previous releases. This is true in an absolute sense (programs simply occupy less memory then they used to) and many portions of the utilities can be loaded into upper memory blocks or extended memory if a system is capable of it. This of course means it takes advantage of all the new features of DOS 5.0, as well as memory managers like QEMM-386 to make its use of conventional memory as small as possible. For those who don't have a 386, or DOS 5.0, there is no need to fret. The overhead on conventional memory is less anyway, but the Norton Utilities will do certain neat tricks to reduce its use of memory. For example the NDOS shell (a COMMAND.COM replacement) will swap out over 80K of itself to disk if the proper extended memory manager, or upper memory blocks manager, is not available.

Probably the best part of the new utilities is the NDOS shell. This is a COMMAND.COM replacement that can be used as your primary shell, that is loaded using the SHELL= command in a CONFIG.SYS file, or as a secondary command processor from the command line. Its use of conventional memory is actually <B>less than COMMAND-.COM yet it has many more functions. The NDOS command processor enhances almost every DOS command and adds a whole bunch of new ones. The great thing about NDOS is that it makes many of those utilities that you have clogging your disk, or loaded as TSRs, obsolete. For example, the command line is fully editable and maintains a history that allows you to recall any command that you've typed in from the command line. This eliminates the need for TSR utilities like CED which do the same thing, but require the use of conventional memory. Commands like FREE (which tells you how much disk space you have, have used, and have left) and MEMORY (which tells you similar information about memory) both take the place of many shareware utilities. POPD and PUSHD, do the same thing as the shareware utilities POPDIR and PUSHDIR, except that they require no TSR program and allow you to view and clear the directory stack. New batch file commands and enhancements, a file browser and a change directory AND drive command (CDD) are just some of the enhancements made to the DOS command line with NDOS. In addition, many DOS commands that are usually utility programs on disk like ATTRIB, are now internal commands. This makes them faster and eliminates the need to have these programs on your disk.

By now it may have occurred to some people that the new DOS 5.0 provides many of these same functions, such as enhanced commands, a command line editor and a command history. This is all true, but NDOS does it better. For example, in order to have those command line editing and history features in DOS 5.0, you must load a TSR program. This eats up RAM. Everyone seems to forget that as Extended RAM and High Memory finally become useful, they will experience the same RAM cram problems that you have in conventional memory (up to 640K). If it can be packed into a smaller case, then in the end it's better. Besides NDOS gives you these features without going to DOS 5.0 at all! If you haven't gotten around to upgrading your version of DOS, NDOS will provide you with many of the same, if not more, functions.

Another nice feature of this release is not what's new, but what's old. Many people were annoyed that most of the command line-oriented commands like LP (line printer) and TS (Time Stamp) were eliminated with the Norton Utilities 5.0 release. While they did become available later, you had to send for them separately. There really was no reason to

(Norton....continued on next page)

(Norton ...continued)

eliminate them in the first place, and Symantec must have realized that, because they are back and in some cases improved for 6.0. Directory Sort, for example, is now revamped to give you a graphical interface if you choose not to use the command line options. The FILE FIND and FILE LOCATE programs are similar, but if you wish a non-graphical interface, you now have a choice.

In fact, many of the programs have enhanced command line parameters. This makes them much more useful in batch files, or to those people who need or prefer to use a command line interface instead of a graphical one. It is in this that Symantec most clearly recognizes that not everyone wants a graphical interface, or that such an interface is not always the most expedient method to work with.

While it's easy to get caught up in all the new features, and the better use of memory and disk space, one tends to forget to appreciate the little things that make any software package a useful thing. At the top of the list is documentation which can often decide whether someone really gets any use out of a piece of software or not. In this case, the documentation is clear, concise, and well organized. In addition to the User's Guide and Disk Explorer booklets that came with previous versions (the latter of which belongs on everyone's desk), there is the NDOS manual and an expanded Command Line User's Guide. The former tells you everything you want to know about NDOS and in many ways is a better DOS manual then the one that probably came with your computer. It's a great desk reference. The latter lists all the utilities that can be run from the command line, including explanations of what they do and all of their parameters. Also included in this are condensed versions of all the NDOS commands.

Another oft overlooked feature is good context sensitive help. Norton Utilities 6.0 allows you to get help while in any of the Utilities, as well as the NORTON program (used to launch programs if you don't wish to do so from a command line) and in NDOS. The NDOS one is the best, allowing you to type NHELP or HELP from the command line, or just hit the F1 key. Also if you have a command at the command line and hit F1, help on that specific command will pop up. Help is available from yet another source as well. Each command and Norton Utility program will type out a help information when given a /? parameter. This, incidentally is the same parameter used for getting help from DOS 5.0 commands. It's hard to get lost in the Norton Utilities.

While there have been vast improvements to the Norton Utilities, there are still a few, somewhat annoying traits that haven't been dealt with. For example, SYSINFO hasn't changed much and still gives benchmarks in Norton Units (whatever they are) which doesn't help when trying to make comparisons. While one can debate the various benchmarks that are currently in use like Whetstones or MIPS, these at least are standards and can be used for comparative information. Erase Protect (which used to be called File Protect) still creates a trash directory which uses up disk space and Norton Change Directory continues to have a problem with path names starting at the root directory. In most cases if you wish to go immediately to a directory, you need only provide part of the name to NCC. For example if you want to go to \COMM\DOWNLOAD, you only need to type NCC DOWN and it will immediately find the nearest directory that contains the letters DOWN. Now, say you wanted to go to \LOTUS, and typed NCC \LOT or even NCC \LOTUS, you wouldn't end up in \LOTUS like you might expect, but in the root directory instead. In fact whenever you start a path name with a \, you end up in the root directory. This is an annoyance that should be fixed.

The latest version of the Norton Utilities is fast, easy to use and powerful. It does precisely what it means to do, give you the tools to manage, maintain and fix disks and disk problems. Symantec has clearly listened to its customers and has added the kind of functions and features they want. While not quite perfect, the <MI>Norton Utilities 6.0 goes a long way towards putting the power needed to handle disk management into the hands of everyone who needs it. This is a sure bet.

■■■

Book Review:
By: Hugh Bayless, Monterey Bay User Group

THE PC USER'S GUIDE
Nick Anis & Craig Menefee

This is another of the DVORAK Osborne/McGraw-Hill books that was not written by John Dvorak, but that is certainly nothing against it. Written for the novice PC user who wants to become more expert in using his/her computer, this book achieves its goal admirably. My only regret about The PC User's Guide is that it wasn't available when I was going through the often painful process of learning this material on my own.

From Chapter 1, where you will learn about what computers do, through chapters on DOS shells and utility programs, to troubleshooting your computer when you encounter a problem, this book covers the field. There is a good chapter on advanced DOS and batch file techniques, and there is even a chapter on how to get started in BASIC.

If you only want to know how to run the applications you use, you won't need this book. On the other hand, if you want to learn how your computer works and how to get the most out of it, this would be an invaluable addition to your bookshelf. 725 pages for $29.95 at your favorite computer bookstore.

CIVILIANS

By: Ed Buzza

The Armed Forces tend to regard themselves as members of a unique community. And they often call the rest of the world "civilians". So it is with some computer people. They speak an alien language and know about strange things like PCs, GUIs, RAM and so on. Those who are not computer literate are, in their eyes, civilians. Hence it is not unusual that a PC user and a civilian will, at times, fail to communicate. I imagine some conversations might be like:

Q. Which PC Tools are you using?
A. Just a pair of long nose pliers and a small screw driver.
Q. Do you use Norton Utilities?
A. Nah, we're hooked into TECO.
Q. How many drives d'ya have?
A. Two - a hook and a slice.
Q. Why are you xeroxing that disk?
A. 'Cause the boss said, Do a disk copy'.
Q. Why do you want to take the disk out of its jacket?
A. You said to erase it and it's hard to do in that little window.
Q. Where did the map maker keep all his disk files?
A. In the route directory.
Q. How many meg for this program?
A. One if by LAN, two if by C.
Q. Is this a Basic program?
A. Oh no, it's *real* complicated.
Q. Why did you kick the computer?
A. You said 'Boot it'.
Q. Have you ever ZIPped any files?
A. No, but I've zapped a few.
Q. Why did you choose FoxPro?
A. I'm not going to dBASE *my* files.
Q. Why do you want to put the computer in reverse?
A. How else do you back it up?
Q. What database did you install for that pair of doctors in the new clinic?
A. What else - PARADOX.

■■■

MURPHY'S PROGRAMMERS LAWS

On BBS by: Larry Anders

Brook's Law - Adding manpower to a late software project makes it later.

Dijkstra's Law of Programming Inertia - If you don't know what your program is supposed to do, you'd better not start writing it.

First Maxim of Computers - To err is human, but to really screw things up requires a computer.

Gallois's Revelation - If you put tomfoolery into a computer, nothing comes back out but tomfoolery. But this tomfoolery, having passed through a very expensive machine, is somehow ennobled, and no one dares to criticize it.

Corollary - An expert is a person who avoids the small errors while sweeping on to the Grand Fallacy.

Product Review:
By: Thomas H. Cramer

Chuck Yeagers: Air Combat ** 1/2 Local Price $41.99

Chuck Yeagers AC is a far better than his AFT series. The thing that really drew my attention was that you could fly historical missions (from WWII, Korea, And Vietnam). Also the graphics are about 80% better, the player interface has a "more natural" feel, the game allows more "options" than his AFT series also, and lastly it offers a way to CREATE your missions, and you can fly anything from a P-51 (they are in all of his games) to a MIG-21 and about 10 other machines in between. To give you an idea how easy this game is to use, without any documentation I had it setup in 5 Min., and I was a "PRO" within an hour. In summary I think this flight simulator is one of the best ever produced.

BITS OF BLUE

TAMPA IBM PC USER'S GROUP

VOL. 5 NO. 1., 1992 January, 1992

MEETING

(2nd Wednesday every month)

DATE: January 8, 1992
TIME: 6:00 PM
PLACE: IBM CUSTOMER CENTER
LAKE POINTE ONE BUILDING
3109 W. Martin L. King Blvd.
Room 450

DIRECTIONS:

The Tampa IBM PC Users Group meets in the IBM's LAKE POINTE ONE Building across from Tampa Bay Mall one block east of Tampa Stadium.

The best entrance is on Martin Luther King Blvd. at the traffic light in front of Burdines. As you turn North off Martin Luther King Blvd. you will see the LAKE POINTE ONE BUILDING on the left & parking on the right. Join us in ROOM 450 - 4th floor. **Guest please sign in.**

Secretary's Report

TAMPA IBM PC USER'S GROUP
MINUTES OF 12/11/91 MEETING --

There was the customary announcement of upgrades. Windows 3.2 is in early beta testing. It is not a 100% certainty that the Bordland - Ashton-Tate merger will be permitted by the FTC.

Kirk Covert of Microsoft demoed three recent Microsoft releases destined for home and small business use.

Microsoft Money - Write checks, track expenses, create budgets, organize your assets and plan your financial future ($48). **(This product won by Tom Cone)**

Microsoft Publisher - Inexpensive desktop publishing with features found in higher priced packages. Use to designed flyers and newsletters $138.

Microsoft Works - A combination of important business tools including word processing, spreadsheet analysis, database management, charting and drawing. $138.

Although Visual Basic was on the agenda, it was postponed due to Kirk's time constraints. The majority of the attending membership really wanted to see this product and asked Kirk to come back at a later time for a demo.

Elections; the entire slate was voted in without balloting for individual office. Ed Buzza left the position of Secretary to fill the position of Education. Jim Clark and Charles Howe will share the position of secretary.

The president (Harvey) announced that he was working cooperatively with a New York publishing company, which contacted him, to get exceptional subscription rates for computer magazine subscriptions. Harvey has concerns and apprehensions about telling members to send money to a company he is not familiar with. He is researching the company to make sure its legit. Following is a sample of 1 year rates for some of the magazines available.

Byte	9.00
PC computing	9.00
PC Magazine	17.00
PC Novice	8.00
PC World	10.00

There was a short discussion of ink jet printers. It was noted that it is possible to buy a HP color ink jet printer for something in the $700's and a B&W printer for something like $400. These printers produce the same quality of a 300 DPI laser printer at half the speed. Some members mentioned that the cost per page was greater than a matrix.

There was a short Q&A session. The perennial questions, How much memory do you need to run Windows? was brought up. Answer: as a practical matter, 4mb but the more the better. What size monitor do you need for working with text (word processing) under Windows? Answer: at least 16".

The importance of renewing membership subscriptions was emphasized. If your subscription runs out, as printed on the mailing date, you will not receive a copy of the newsletter in the mail. The labels on the newsletter contain a date representing the date your membership is no longer valid. You should renew prior to that month.

■■■

GOLUB'S LAWS OF COMPUTERDOM
(Larry Anders)

1. Fuzzy project objectives are used to avoid the embarrassment of estimating the corresponding costs.

2. A carelessly planned project takes three times longer to complete than expected; if carefully planned, it will take only twice as long.

3. The effort required to correct course increases geometrically with time.

4. Project teams detest weekly progress reporting because it so vividly manifests their lack of progress.

■■■

Best wishes in the New Year.

PRODUCT REVIEWS:

PARADOX SE *By: Jeff Hansman (Copyright(c) 1992 by the Monterey Bay Users Group-PC.)*

As a long time fan and user of Borland's outstanding database management system (DBMS) Paradox, I thought that a scaled-down version of the program sounded like a great idea. After all, the full-blown version of Paradox 3.5 packs a lot of power, probably more than the average use really needs. Consequently, when I installed Paradox SE on my computer, I expected to find an old friend with a few bells and whistles removed. As it turns out, I was only half right.

My first surprise came when I opened the box and found not the excellent documentation normally provided by Borland, but a book by Sybex, a publisher of fine computer related material. What surprised me more than the inclusion of a Sybex book was its title, "The ABCs of Paradox." Not Paradox 3.5, the current version, but Paradox, as in "not the current version." This raised my antennae high enough to take a look at the files I had installed, and lo and behold what did I find? Nothing less (or more) than the files for Paradox 3.0! "Ah ha" I cried, congratulating myself on what I imagined to be a nifty bit of detective work. I began to mumble insults directed at Borland under my breath, sure I had uncovered some sinister plot to deceive an unsuspecting public while reaping vast fortunes. Finally, I paused, sat back and took stock of what Borland has really done.

What the buyer of Paradox SE (for Special Edition) gets is not a mini Paradox 3.5, but a version of the previous edition (3.0) without network support, the Personal Programmer (an application generator) or the Data Entry Toolkit (a development aid for fancy data entry routines). Is this bad? Some kind of ripoff? Hardly. The truth is, most end users who require a relational system would probably not need or use these excluded tools. I actually like the idea of having the "essential" Paradox without being charged for all the other modules. With Paradox SE, you can still manipulate your data as you would with version 3.5, query by example (the strong suit of Paradox), create forms and reports, and even write and execute PAL code. You just have to do it with version 3.0, which is still a nimble product. The difference between the two versions lies mainly in the latter's ability to use memory more efficiently, and this usually comes into play with large databases.

So, does it make sense to buy this version of Paradox? I think so, unless your needs take you into the realm of sophisticated application development or running on a network. What I do wish is that Borland had been a little more up front by letting prospective buyers know exactly what they're getting. As it is, the unsuspecting have every reason to believe the box contains "Paradox 3.5 Jr." Yet, even though this is not the case, what the buyer does get is well worth the street price ($75-$80) and will probably be all the DBMS they will ever need. Borland International can be reached at (408) 438-5300. ■■■

PRESIDENT'S COLUMN:

Well another year (1992) to make our group bigger and better. It seems like I said this the last 3 or 4 years. As usual, I am not sure if your vote for me is one of **'hey Harvey your doing a good job as president and we want you to continue'** or **'well he is the only nomination so we better vote for him'.** As for the other officers, I am personally really happy to see them come back for another year. These people: Ed Buzza, Larry Anders, Kevan Sheridan, Roger Waters, Marylee Bruneau, Bill Fuller and Steve Spears are the glue and nucleus of our group. Without their behind the scene help I could not do my job and the group would flounder. Of course we welcome the new kids, Jim Clark and Charles Howe for 92. Additionally, a big thank you to IBM and Chris Mayer for the help and resources they have provided. IBM has taken some of the worries and problems we have experienced in the past away. In all, you are provided with the best available resources for a volunteer non-profit group. If you think they are doing a good job, please take a minute out of your time to tell them so. A sincere recognition from a fellow PC user can keep us going for a while. At times we are frustrated by the lack of any feedback from members, whether it be positive or negative. While not our intention, we were the best kept secret in Tampa. We have begun with a more aggressive exposure campaign to make our group known. In 1991, we finally created a handout/brochure to explain our group and its benefit. These can be found in retail stores like Sunrise Computer Supplies, Software Etc., The Computer Factory and CompuAdd. Its only a start, and we will add more, but we still need your help. Last meeting several of you wanted those flyers to pass out, look for them at the January meeting. My membership goal for this year is pretty high but yet attainable.

1. Membership by 12/31/92 to 300.
2. Create Special Interest Groups (SIG) for:
   a. Wordprocessing b. Database
   c. Spreadsheet d. Windows
3. 9600 baud BBS

The first two goals will be easily accomplished with your help. Take and distribute flyers to interested friends or companies. Let a board member know of stores willing to distribute our flyers. If you feel others could benefit from your knowledge, volunteer to lead a SIG group. I have mentioned some SIG groups above, but our group is not limited to only those. SIGs do not need to meet on a regular basis, but they should have an accountable leader.

As our membership increases so will our rewards. The more members the more experience we bring into our fold to share. The more local authors of articles we can add to our newsletter and the more volunteers we can get to enhance our group beyond what we know have. There is a lot that we can do to help ourselves, but it will require the general help of you our members. Do not put the entire future of our group growth in the board members hands. **Help us get bigger and better.**

1992 should be the year of a major battle. IBM vs Microsoft. Should IBM and Microsoft ship their new products, Windows 3.1 and OS/2 2.0 in the 1st quarter it will be something to see. If you got the horsepower (386+), the product works as advertised and the price is under $99, OS/2 0 will be a great operating system. Microsoft will need to add more than fixes to its Window product to keep IBM at bay. Even if IBM gave away OS/2 in 92 it surely won't unseat Windows. However in 93 the tide could turn. Remember Window requires and operating system (DOS, OS/2 ...) to run.

Harvey P. Bruneau

■■■

IBM TRIPLES SPEED OF TRANSISTOR FOR LOW-POWER COMPUTERS

(BPS) -- IBM researchers said they have more than tripled the speed of a kind of transistor that could power high-performance, low-power computers.

The new transistor operates at a maximum frequency of 20 billion cycles each second.

The scientists described their new transistor -- which makes use of a novel design and a promising new material -- at the International Electron Devices Meeting (IEDM) in Washington, D.C.

The transistor is known as a "lateral bipolar" transistor because it conducts charge horizontally and uses both positively and negatively charged particles to carry electrical current.

The scientists said the transistor's speed improvement stems from its particularly innovative lateral design, which decreases capacitance and resistance, electrical forces that slow current. The transistor's low-power requirements are enhanced by its fabrication from a promising material known as silicon-on-insulator, rather than from pure silicon.

Because the experimental transistor runs at high speed while consuming a relatively low amount of power, it could be applied in the future to computers that are both very fast and compact. And because the new transistor is compatible with transistors widely used today, it could be integrated easily into computer chips that maintain both power and speed advantages.

The development of the fast new transistor brings the speed of power-saving lateral transistors close to the speedier but power-consuming vertical transistors. Because the low-power lateral transistors generate less heat, the chip designers can pack more of them on a single chip, bringing the speed of larger computers to smaller machines.

■■■

QUATTRO PRO SPECIAL EDITION

By: Lee Keely

Quattro Pro Special Edition (QPROSE) is smaller, quicker and cheaper than Quattro Pro Version 3.01 (QPRO3). It may be all you need to do your spreadsheet work. In general, QPROSE is a reissued package of version 2.0, but there are some differences.

I directly compared all features of the two programs by displaying both on the screen at the same time using DesqView. I also used large macros developed in QPRO3 to test QPROSE. My goal was to compare QPROSE with QPRO3 to determine the advantages and disadvantages of each.

First let's look at the advantages of QPROSE.

With each program in character based mode, QPROSE loads into your computer in less than half the time of QPRO3. Macros are completed faster in QPROSE. QPRO3 WYSIWYG takes about 3 times as long to load as QPROSE. Also, with my large macros, QPRO3 in WYSIWYG required about 2 to 3 times as long as QPROSE to execute. QPROSE occupies about 3.0MB of hard disk space while QPRO3 occupies 3.8MB.

QPROSE retains all of the multi-page consolidation technology, spreadsheet publishing, built-in draw package, and Lotus 1-2-3 compatibility (although not the 1-2-3 menus). Its electronic slide show feature and automatic font-building add graphic presentation capabilities yet to be found in any other PC spreadsheet.

QPROSE comes with a totally revised instruction manual which is simpler and friendlier, than QPRO3 manuals. I believe this manual would be easier for someone new to spreadsheets and classroom students. It is not as complete as the QPRO3 manuals and not as convenient a reference manual.

Now, let's look at what you are missing in QPROSE that might be required in your work. Comparing the pull down menus reveals the following:

/File Utilities DOS: QPROSE exits to DOS and requires "EXIT" back into QPROSE while QPRO3 retains control and a mere Escape key returns to the Quattro Worksheet.

/Edit are all the same

/Style: you can reset block (column) width but not block (column) height. Fewer Fonts are available, but there are many.

/Graph: all first level are the same

/Graph Overall: does not have "drop Shadow"

/Graph Name Display: there is no Auto Save Feature. Graph buttons to switch graphs still work, but the auto save feature is missing)

/Graph Name Slide provides slide show capability but no sound or transition effects.

/Print: No multiple Copies
No Print to Fit

/Options Hardware: shows Memory/EMS for start, but not remaining available or the ability to reserve EMS. Also there is no Mouse button assignment feature in this menu.

/Options Display: No WYSIWYG or scaling. Many of the same display options are available, but whichever you select is not shown on the menu.

/Options Startup MenuTree: only Q1 and Quattro options (no Lotus 1-2-3)
In summary, QPROSE does not include the alternate menus for 1-2-3 and is not networkable. QPROSE does not include WYSIWYG display; graphics printing support of Print-to-Fit, Percent Scaling, Banner output, HPLaserJet III's scaleable fonts; nor sound effects or transitions for slide shows. Documentation is a single manual (compared to the full product's 3 manual set), designed more for beginning users.

However, QPROSE is less expensive, smaller and faster than QPRO3. QPROSE should be the choice for slower and older computers. If the added features in QPRO3 are not required for your work, the faster QPROSE should be selected.

I believe that Borland will have a winner QPROSE. When I compare QPRO3 enhanced features with my requirements, I find that the only feature I would miss in switching from QPRO3 back to QPROSE would be the "Print to Fit".

If you are not a QPRO user, or you are involved in teaching spreadsheets, QPROSE may be ideal for you. At a list price on only $69.95 compared to the QPRO3 List price of $495 or a shift from a competitive spreadsheet of $129.95, QPROSE is a great deal. Be aware, that Borland is still offering QPRO3 at $99.95 under certain conditions. Call 1-800-331-0877 for ordering information.

MAXIMIZER LITE

Contact Management and Book Making

By: Rod McKenzie, Contributing Editor, Madison PC User's Group (Copyright 1992 by Madison PC User's Group, published in the January 1992 Bits & PC's, a publication of the Madison PC User's Group.)

Maximizer Lite, from Richmond Technologies, is a contact management program that can be operated on a PC without a hard drive. All it requires, in its most spartan form, is one 720K diskette drive. It is the lean, entry-level version of their pace-setting contact management product for single users and networks, called The Maximizer.

Contact management is an emerging application that has gained wide acceptance and can be useful to sales personnel, service-oriented organizations, and volunteer groups. It could prove its worth almost anywhere people need to be able to add current data to previous information, or maintain addresses and phone numbers about individuals or businesses. Users who take a laptop or notebook PC on the road could use it very effectively to schedule and plan an appointment schedule, make lists for follow up, and generally stay on top of the paperwork.

Contact management software is essentially a customized database application that requires consistent input to keep it up to date. It's not really for everybody. Most of the features in contact management software, such as Maximizer Lite, assume that the computer will be your constant companion, or at least at an accessible place where you will frequently touch base. It can give the user a "hot list" of things to do, show a day-at-a-glance calendar of upcoming events, dial the phone, and much more. It works this way only so long as the input is current and complete.

As a database, Maximizer Lite requires input of information about the people, companies or activities to be included. This usually starts with information such as names, addresses, zip codes, phone numbers, position descriptions, and other pertinent details. Maximizer Lite also allows notes and a chronological record of contacts to be entered. Each time a new contact is made, it too is added to the history. Future dates for follow up, or other commitments, can then be added to the calendar. Selective printouts can focus the user's attention, helping decide what to do next.

Relating Information

The strength of a database is in its ability to relate information about the entries, the people, within the database. This can often be as simple as ranking in ascending or descending order, or by grouping together entries with matching fields.

Maximizer Lite makes the task easy, offering predefined lists of column headings and the option to customize headings, if desired. Maximizer Lite makes it possible to generate form letters, a feature some may object to on principle alone, but a useful feature, nonetheless. As a mail merge file, it can be saved in several formats so that it can be used in MS-Word,

WordPerfect, WordStar, or other word processors accepting ASCII character-delimited text files. As an alternate approach, a letter may be imported into Maximizer Lite if it is in an ASCII text file. Automatic dialing is supported by the program. If a modem is attached, the user needs to make sure that Maximizer knows where to find it by having the communications settings. That's found in the Utilities menu under User Defaults.

In the Advanced Options, Maximizer Lite gives the user the opportunity to rename the fields in the database. This would be appropriate for using Maximizer Lite to organize the members of a church, Scout troop, fraternal organization, or even members of a band, barbershop chorus, EMS, or military reserve unit. Fields could be renamed for Rank, Specialty, Patrol, Section, Instrument, or duty assignments.

Making Book

Included with Maximizer Lite is a copy of "Books, Cards, and Labels," a program for printing from the database file. Books, Cards, and Labels is a product of Useful Software, of Calabasas, California, which is also available as an independent program for printing from database or text files. It give users the option to print large and small format pocket address books, calendar pages, Rolodex cards, envelopes, and mailing labels. These formats are supported on dot matrix and laser printers.

The book pages can be printed in several sizes for DayTimer, Filo-Fax, Running Mate, Little Black Book, and Franklin Time Management binders. The sizes range from a 3"x5" format up to a full 8.5"x11" page. Books, Cards, and Labels supports HP LaserJet fonts, cartridges, and Bitstream downloadable soft fonts. Records may be selected from the database so that customized pages of addresses or a day's activities can be created. Perforated pages with pre-punched holes are available from Useful Software to make it easy to add the output of Books, Cards, and Labels to existing ring binders.

Richmond Technologies recently announced a price reduction for Maximizer Lite. It is now priced at $79.95, and is a product of:

Richmond Technologies & Software, Inc. 6400 Roberts Street, Suite 420 Burnaby, BC V5G 4C9 Canada (604) 299-2121 (604) 299-6743 (FAX)

'PUZZLE #4 SOLUTION

By: T.Cone,Jr.

```
'
'Answer: N = 9
'Proof : 5N4,0NN becomes 594,099
'       594,099 / 99 = 6001
'Solution is found by plugging all possible integer values
' into the string, converting the string to numeric value,
' and testing to see if that value can be divided by 99
' without leaving a remainder

Begin$ = "5N40NN"
FOR N = 1 TO 9
  answer$ = MID$(Begin$, 1, 1) + LTRIM$(STR$(N)) +;
            MID$(Begin$, 3, 2) + LTRIM$(STR$(N)) +;
            LTRIM$(STR$(N))

  'the MID$ function cuts substrings out of Begin$
  'the STR$ function converts numeric values to character
  '  strings.
  'the LTRIM$ function removes leading blanks

  'now test Answer$ to see if current value of N works:

  IF VAL(answer$) / 99 = INT(VAL(answer$) / 99) THEN
     'the VAL function converts a string of characters
     '   into numeric values.
     'the INT function returns the largest integer
     '   that is less than or equal to the actual numeric
     '   value.  If there is no remainder we have our
     '   answer.
     CLS
     PRINT : PRINT
     PRINT "The answer is : " + LTRIM$(STR$(N))
     PRINT "The number is : " + MID$(answer$,1,3) + ","
+;
           MID$(answer$, 4, 3)
  ELSE
     'there is a remainder, so test next integer
  END IF
NEXT N
END
```

■■■

Puzzle #5

By: T.Cone,Jr.

The children in a family returned home on Halloween night, after their "trick or treat" expedition in the neighborhood.

Before going to bed, they put all their jelly beans in a common pile for division into equal shares the next morning.

During the night one child gets up, separates the pile into equal stacks (one for each child), with one left over (that is immediately eaten!). The child removes one of the stacks and hides it. All remaining stacks are pushed back together into a new common pile. This child is followed in turn by all the other children, one at a time. Each child does exactly the same thing. (If these kids sound hyper, just remember they ate a lot of sugar before retiring for the night!).

Next morning the remaining jelly beans are divided equally with one remaining jelly bean going to the family dog.

If there are 5 children in the family, what's the least number of jelly beans they could have begun with ? How many jelly beans are distributed to each child in the morning ?

■■■

WIN/TV ADD-IN CARD LETS TV VIDEO DISPLAY IN WINDOWS 3.0 ENVIRONMENT

(BPS) -- Hauppauge Computer Works, Inc. has introduced a PC add-in card that lets standard (TV) video appear inside a movable, resizable VGA display window in the Windows 3.0 graphical environment.

Menus in that window let users adjust color saturation, hue, RGB balance, brightness and contrast; frame-grab; and select among three NTSC or PAL video sources (camera, VCR, videodisc, etc.).

Win/TV is available for $495. Win/TV provides a pass-through connection between a computer's VGA card and monitor, and inserts the video picture there. This eliminates the problem of computer system bus and memory speeds being too slow to display full-motion images in real time. The card communicates with its companion software to determine the size and position of the on-screen window, and whether the image that will occupy it should be the full-screen video or a zoom-in image of a selected area.

The frame grabber can work as a simple "freeze frame" utility or store frames in Windows Paintbrush (.BMP), IBM Motion and Targa formats.

"We foresee a lot of applications for this in security, quality control and law enforcement," said Ken Plotkin, Hauppauge vice president of Marketing. "Stockbrokers can watch CNN while they work and anticipate how news will effect the markets. Insurance offices can watch adjuster-shot tapes of incident sites while working on claims records. And I'm sure more than a few users will be watching ball games or favorite tapes."

For applications involving as many as six video inputs, two Win/TV cards can coexist on a system. Minimum requirements include Windows 3.0, a VGA adapter and monitor, and an available ISA 16-bit slot. Contact: Hauppauge Computer Works, Inc., 91 Cabot Court, Hauppauge, NY 11788; 516/434-1600.

WORDPERFECT TIPS AND TRICKS
By: Read Gilgen, Madison PC Users Group

Editing (Part III)
Number 7: Interrupting Move/Copy

As we mentioned last time, WP's new "paste" procedure (Move cursor; press Enter to retrieve.) is fast and easy. But sometimes you simply aren't ready yet to paste your text, but you can't edit (e.g. add a hard return) without dropping your text wherever you happen to be.

If you want to remove the message, "Move cursor; press **Enter** to retrieve," (i.e. suspend the move/copy process) press Cancel (F1). The text can later be retrieved by pressing Move (Ctrl-F4) and choosing **Retrieve**, then **Block**.

Number 8: A Paste Shortcut

Whenever you move or copy a block of text, it is saved in a "buffer" of your computer's memory for later retrieval. If you move or copy something else, or exit WordPerfect, that text is lost. But until you do so, the text is there even after you "paste" it.

If you think of the "buffer" as being a file that has no name, you can quickly and easily retrieve the text by pressing Retrieve (Shift-F10) and then without giving a name, simply press **Enter**. This works in place of Ctrl-F4, **Retrieve**, **Block**, and can be used over and over again to replicate a block of text in several locations.

Number 9: Changing the Size of Reveal Codes

Some of you out there are real "Reveal Codes" fanatics. In fact, you even do all of your editing while in reveal codes. I guess there's something reassuring about seeing everything, although the cluttered screen drives me nuts (OK, so I'm already there!)

A nice compromise would be to be able to have a nice large editing area, and a smaller reveal codes area. With version 5.1 you can do just that.

If you want to change the size of Reveal Codes for a single editing session, press Reveal Codes (ALT-F3), then Screen (Ctrl-F3), Window, and then enter the number of lines to be reserved for normal text. The Reveal Codes section of the screen will take up the remaining space. Instead of entering a number, moving the up or down cursors will expand or shrink the windows to your taste. Then just press Enter when you are satisfied. If you shrink the reveal codes window to just one line, you will see only *one* character or code (the one your cursor is on).

To change the size of Reveal Codes permanently, press Setup (Shift-F1), choose **Display**, **Edit-Screen Options**, then **Reveal Codes Window Size**. If you enter **1** for one line, only the *current* code or character will appear in the Reveal Codes screen.

Number 10: Last Editing Tip (hooray...)

If you have an EGA or VGA monitor, a Hercules card, or other selected graphics card, you may be able to change the number of lines and characters that can be displayed on the screen at one time. To do so, press Setup (Shift-F1), choose **Display**, then **Text Screen Type**. Be sure to select the type of display adapter you actually have (you can't get a silk purse from a sow's ear, or VGA resolution from an EGA adapter). Then from the options, select a different setting for number of lines and horizontal characters.

If you get completely messed up, you can always select "Auto-select" to get back to what WordPerfect sees in your computer.
How about we change the subject next month and talk about fonts and characters?

■■■

Editorial Comment:
This is the third in a series of six articles titled **WORDPERFECT TIPS AND TRICKS** *By: Read Gilgen, Madison PC Users Group*. These articles are available to our group by the Association of PC User Group bulletin board service.

LAWS OF COMPUTER PROGRAMMING *(Larry Anders)*

1. Any given program, when running, is obsolete.

2. Any given program costs more and takes longer.

3. If a program is useful, it will have to be changed.

4. If a program is useless, it will have to be documented.

5. Any given program will expand to fill all available memory.

6. The value of a program is proportional to the weight of its output.

7. Program complexity grows until it exceeds the capability of the programmer who must maintain it.

8. Make it possible for programmers to write programs in English, and you will discover that programmers cannot write in English.

9. Software is hard. Hardware is soft. It is economically more feasible to build a computer than to program it.

10. An operating system is a feeble attempt to include what was overlooked in the design of a programming language.

Happy Valentines Day!

*** * 1992 OFFICERS * ***

PRESIDENT: Harvey Bruneau 932-6745
VICE PRES.: Steve Speairs 875-1095
TREASURER: Bill Fuller 832-0125
MEMBER AT LARGE: Roger Waters 276-1019
SECRETARY:
(Co-Secretary) Jim Clark
(Co-Secretary) Charles Howe
EDUCATION: Ed Buzza 685-5898

APPOINTED (*Volunteers*)
EDITOR: Marylee Bruneau 932-6745
LIBRARIAN: Larry Anders 989-9119
BBS SYSOP: Kevan Sheridan 237-0100
MEMBERSHIP: Bill Fuller 832-0125

DOOR PRIZE WINNERS:

Money Matters	Joe Thomas
Winconnect	Eduardo Ramos
50/50 ($26)	Don Patzsch

Bits of Blue is published by the Tampa IBM PC Users' Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about IBM-PC and compatible personal computer systems to its members.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII file or in a commonly available word processor format, such as WordPerfect 5.1, on diskette to the editor at 9402 Hidden Ridge Place, Tampa, Florida 33637 or send it by modem to BBS (813)239-3704.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for non-profit use. Reprints must be unaltered; proper credit given and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

"Member, Association of PC User Groups" (APCUG).

This newsletter was created with WordPerfect 5.1 donated by WordPerfect Corp. to TIBMPCUG for use by the editor.

Secretary's Report

TAMPA IBM PC USER'S GROUP
MINUTES OF 1/8/92 MEETING --

The President, Harvey Bruneau, opened the meeting at approximately 6 PM. He introduced the officers elected at the December meeting who will serve ;thru 1992. They are:

President	Harvey Bruneau
Vice President	Steve Speairs
Treasurer	Bill Fuller
Education Director	Ed Buzza
Member At Large	Roger Waters
Co-Secretaries	Jim Clark & Charles Howe

CLUB NEWS:

* Harvey announced that the Word Perfect folks could not make this meeting and they have been rescheduled for March. Meanwhile, our own illustrious Education Director, Ed Buzza, would fill in with a presentation on Professional Write for DOS.

* The President emphasized one of the most important functions of our club - computer education for our members and the need to get going on SIGs. The pressing need here is for knowledgeable volunteers to make themselves available to lead SIGs covering the more significant software on which they are proficient. COME ON, MEMBERS! There is a lot of talent in this club. Share your knowledge with others! VOLUNTEER TO LEAD A SIG! And, give a presentation on the software to the club! (Note: A presentation to the club would be an excellent introduction to your SIG.)

* In pursuit of the goal of achieving 300 members, Harvey informed us that he was placing our flyers at strategic retail outlets that would allow same. And in response to queries last month, flyers were available for members to spread around as well.

* In response to a question about tax software for 1991, the membership was informed that the shareware program AMTAX91 was now on our BBS. One member also advised of a freeware spreadsheet template that was available on other BBSs and should be on ours in the near future. If interested, keep your eye out for 91fm1040. Reportedly, this freebee will work on most major spreadsheets (I know it will work on Lotus and Quatro Pro; apparently others as well).

INDUSTRY NEWS:

* The President reported that one rater of computer suppliers has rated Gateway as #1 overall. Others in our group commented on Gateway - all of which was very

(Minutes continued on next page.)

(Minutes continued...)
favorable. This is not by way of a commercial, rather it is one of the functions of this club - to make all members aware of suppliers who have good products and services at reasonable prices.

* It was reported that the Comp USA store at Himes and Hillsborough was to make a soft opening on 11 January, with a Grand Opening to be sometime later.

* A few problems have been reported with Microsoft Word 2.0 for Windows - mostly with the spell checker, grammar checker and MACRO functions. There was a brief discussion of some of the problems, but I was unable to catch the comments. Be Aware!

* Windows 3.1 reportedly is due out in April. If interested, start looking about that time. As an aside, one member reported a RUMOR, I emphasize RUMOR, that Windows 3.1 had deliberately been designed to not work with DRDOS. DRDOS users might want to investigate before buying. And we all should be concerned IF this rumor is true and reconsider Microsoft as a whole and the implications such an action would have for the industry. Let's hope it is false!

* Harvey reported that the early copies of OS/2 Ver 2.0 are out to selected users. But, all of its features have not been Beta tested, though IBM indicates that Ver 2.0 has been tested in-house. General release to the public is now scheduled for the end of March. We'll see then whether or not that will lead to the software battle of the century.

* Intel is reportedly out of the 386 microchip business since there is too much competition and too little money in it, and is now pushing 486 and higher chips. Many expect a rather large decline in prices to take place over the next year.

* Following a break, Harvey shared a few comments on language translators. He related that he had received French Assistant from Santa Claus and he was pleasantly surprised and reported that it was pretty good for a $49 program. Though it will not make coherent translations for every bit of our personal English, it does a fairly good job on proper English. Check it out (also available in Spanish, German & Italian) if you need a translator.

PROGRAM REVIEW: Professional Write for DOS

In typical fashion, Ed Buzza gave an excellent comprehensive presentation on PFS: Professional Write, now owned and published by Spinnaker Software Corp.

Ed reported that PW is installed simply by copying the program files to the desired directory - no "install" program is involved. The program requires 512K of RAM an 8088 or higher. It works best with a hard drive, but will work with two floppies - though you may do a bit of swapping and it will be quite a bit slower when disk access is involved.

Among the features of PW are:

* Has built in grammar and spell checkers.

* Has a built in address book feature which accepts ASCII delimited files from databases. This allows, of course, merging form or standard letters with a mailing list.

* Setup for the program is very easy and it has excellent printer support, including an extensive list of supported printers and an unlisted printer option, and a control code option for lasers.

* Keyboard MACROs.

* Very good on-line help.

* In contrast to some word processors, PW has toggle choice of insert/overwrite.

* Shows the percentage of memory used of that available for documents. Capacity of the program varies with memory available, but it has relatively good capacity - with only 512K conventional RAM the program will hold about 70 pages; with upper memory, about 85 pages.

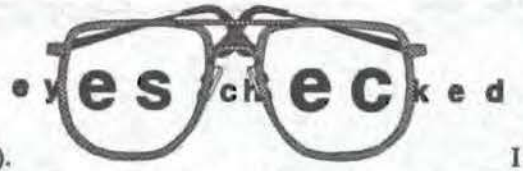
* Excellent controls, including blocking (including rectangular/column), line/box drawing, maneuvering on the page and throughout the document, print and save in pieces, are but a few.

* It is mouse supported, and includes a calculator.

This is a pretty good program, but you should note that this is strictly a word processor; today we see many "word processors" which are closer to DTPs than WPs. This is not one of those. It does support multi-column formats , however. But, it does not support graphics - except for charts produced in PFS programs - such as First Choice and PFS Window Works.

One other note about this program - there is little similar between it and Professional Write for Windows. The latter is a much more powerful program and includes many DTP features, including graphics handling. When asked about relative value, Ed indicated that in today's environment that the $149 price for PW for DOS was a little high and that for a few more bucks you could get a more powerful program (e.g., WP 5.1).

Having given you this brief summary of the extensive review that Ed gave us, all that is left is to say, "Thanks, Ed, for your typical super presentation. We all appreciate the presentation and all of the effort you put into it."



Copyright Laws: After the presentation a discussion of copyright laws developed. It was noted that some businesses and private individuals are rather loose with regard to the proprietary rights of others - passing around copyrighted software. We might all do well to review refresh ourselves and reread the license agreement for copyrighted software we hold. The very beginning of one PFS program I hold, for example, says "This Software is licensed, not sold to you by Spinnaker..... owner of the product.... for use only under the terms of this License..." We all should know and adhere to the copyright laws.

■■■

PRESIDENT'S COLUMN:

Could it be! Since I have started to use Windows (December) I have mentioned on several occasions that word processing (I use WordPerfect for Windows) was a little hard to read on my 14" NEC Multisync 3D screen. I then went on to say that I would recommend a 16" monitor for those who do a lot of word processing or text work within the Windows environment. Of course if you use a point size larger than 12 its not as much a problem. However, our newsletter is 10 point and believe me it's not easy to spot blanks between words much less punctuation. Well last meeting a fellow member came to me during the break and suggested another possible solution. He had stated that he had a similar problem and that he had solved it with this change. Now I am not sure if he was playing on the fact that I had just turned 40 or what, but he suggested that I might want to think about getting my eyes checked. At first I was flabbergasted, then I realized that what he said made sense and it could also be cheaper than buying a $1000. monitor. **Sometimes we need someone to help us focus on the problems which we overlook.** I had only looked at the quick but expensive resolution not the possible problem

(MAYBE). I am not sure if my vision is bad and I have not yet made an eye appointment, but its now a constant thought in my head every time I use Windows software.

This months meeting should be interesting for every one. **Corel Draw,** the #1 Windows PC graphics package, will be demoed by Corel Systems Corp. Additionally, our own Donald Patzch will show you how to use **Amtax** for preparing your 91 taxes.

Finally, COMPUSA (3617 West Hillsborough, ph (813) 877-5560) has opened up. As mentioned last meeting this super store of computer stuff is here in our own back yard. Although their soft open was a day late it was worth the wait. Some of your fellow members have already made purchases there or at least went in for a look and see. I talked to the general manager to see if we could leave our brochures somewhere in their store where customers could see them and pick them up, but was told that company policy did not permit them to do this. This is the same policy that Egghead has. At times it irritates me that these companies will not work with **Non-profit groups** for the educational benefit of the community. Overall prices seem good, but like a flea market you better be an informed shopper before you lay down that charge card or cold cash. They have hardware and software for IBM compatibles and Apple. Additionally, for a small fee they have classes. Their policy on software is different than some stores so before you rip off that cellophane make sure it the right product for you.

I have just returned from a personal trip to France. Once again I am amazed at the technology implemented by the government and used by the public. At first I was not too amused that the phone booths on the street would not take cold cash. I was lost and could not call relatives (**help I've fallen and I can't get up** feeling) for direction. Paris is not fun when your lost, its 20 degrees and your used to Florida climate. I imagine the same applies for New York. It turns out that the old outside phone booths in France were vandalized so much that they were replaced with ones that only use a type of card similar to a credit card. These cards contain a computer chip which contains a beginning monetary value of say $20. It can be purchased at any of the tobacco stores (stamps too) for a nominal value. As you insert this card in the phone it displays the balance remaining on the card. As you use it to make phone calls the phone system automatically deducts the amount from the card. When you have exhausted the amount on the card you just purchase another one. These phones only take this card they do not use credit cards (yet). Pay phones can still be found inside stores. Plans are on the board for implementing this feature into parking meters and garages. How often have you put 1 hours worth of money into a meter only to use it for 15 minutes. Well this card would only deduct the amount of time you actually used not the time you thought you needed. Another neat piece of technology is a chip which is stuck to your car windshield. This chip is used to charge your bank account as you drive through an interstate toll booth. This eliminates the need for cash and allows you to go through the toll at a faster pace 15-20 MPH. Unlike the phone booths, the toll accepts cash and a french credit card (**CART BLUE**).

WordPerfect has a new magazine for WordPerfect for Windows. They now have magazine for their DOS (*WordPerfect the Magazine*) and Windows (*WordPerfect for Windows Magazine*) word processors. Either of these magazines can be purchased at a special user group rate. WordPerfect will reduce the subscription cost by $8 from the regular cost of $24. To be eligible for this discount, please write to: **Wordperfect Publishing Corporation**

From Presentation Graphics to Desktop Information Systems: The Challenge of Adding Real Value to Software

By: *Fred Gibbons*

APCUG Industry Commentary Subscription Series, Column #10
(NorthWest Arkansas Microcomputer User Group, Springdale, Arkansas)
Copyright (c) 1991, APCUG, All Rights Reserved. Permission granted for reproduction in official publications of member organizations of the Association of PC User Groups.

It's interesting to look back through the years at how personal computer users' expectations have changed. Like all products of its time, Software Publishing Corporation's first product, pfs:File, was completely primitive in comparison to later filing products. However, users were able to overlook things like clumsy commands and poor documentation because despite the problems, these products allowed users to do things never before possible. Products like pfs:File brought real value to users by letting them use the computer to replace manual systems such as rolodexes and paper-based files.

Since those early days, users have continued to look for value in the products they buy. It has been the job of software companies to understand exactly what constitutes real value for the end user. It's a challenging job because the definition of value continues to evolve and change as users' needs and expectations become more sophisticated. This is where we at Software Publishing see user groups as playing a critical role. With ongoing support and feedback from the user group community, we're able to better understand the true computing needs of the end user.

Let's take a brief look at how the user group community has influenced the PC industry in the past. In the mid-1980s we learned from end users that what they truly valued was power. The failure of the PCjr drove this point home to all of us in the industry. Personal computer hardware and software companies responded with products that provided depth of functionality and performance to meet the user's need for power. For example, at Software Publishing, this move toward power was the catalyst for developing Harvard Graphics. Our objective was, and continues to be, to provide users with the best presentation software tool and enhance that product over time with additional capabilities that extend the value of the product.

In the 1990s, users still want software that gives real value. They want the best package for the job and they want to know that software vendors will support and continue to enhance their products. Users have invested a tremendous amount of time and money in data collection, yet they know there must be ways to make the data more usable. Value today lies in helping users go beyond the individual software package, and make the most of their overall investment. We need to provide simple tools that allow users to leverage their existing data and applications rather than expecting them to start fresh with each advance of technology.

The personal computer has become an increasingly important strategic tools for all of us. To make the most of this tool, users will need to be able to access and combine data from a wide range of data sources; view and present information in graphic, tabular, multimedia and other visual formats; dynamically analyze trends and exceptions; and route, broadcast, and deliver that information effectively.

For example, an advertising agency executive preparing a client presentation might want to take data from an outside source, such as Nielsen, and combine it with client sales data and other strategic data sources to perform various analyses and projections. In order to sell his or her client on a new advertising program, the advertising executive might develop a graphic presentation that includes multimedia clips of competitors' ads and rough ideas for the new campaign. Used this way, the computer can be an invaluable tool for collecting, analyzing and presenting information.

At Software Publishing, we've identified an emerging personal computer software category called Desktop Information Systems (DIS). DIS will combine all of these capabilities and provide the user with a means to interact directly with a wealth of information sources. By giving the user access to this information, we provide the means to make better business decisions, something of true value in today's environment.

Because of the emphasis on combining data from many sources, DIS might be easily confused with Executive Information Systems (EIS). However, the key difference between the two is that DIS focuses on end users, giving them direct access to staged data and allowing them to manipulate that data according to their own needs. In contrast, the typical EIS is a large-scale system, developed by a corporate MIS group and intended to allow executives to view specific information. An EIS has well-defined parameters and does not allow the user to move freely outside those parameters. While EIS has its place, we are hearing that most

users are eager to move toward computing environments that give them more responsibility and flexibility in accessing and presenting data.

To illustrate what will be possible with DIS, we've developed a concept we call the on-line briefing book. These briefing books could cover a wide range of topics, from financial figures to competitive tracking. As an example of how the briefing book concept might be applied, say a sales manager receives a monthly briefing book that includes revenue by region. He notices that the figures for the western region are much higher than the previous month, and is curious about the reason for the improvement. By clicking on an icon, the manager has access to a voice-annotated document from the western region account representative describing the results of a recent sales promotion. This would be a vast improvement over the hardcopy reports that have been so prevalent in business. As networked environments proliferate, applications like the on-line briefing book will become commonplace.

Users are telling us that the time is right for DIS for two reasons. One, we have an increasing number of data sources that users rely on and want to continue to leverage. At the same time, the use of visual information -- graphics, animation, audio and video, etc. -- is on the rise. DIS is the logical extension of both of these trends and combines the two into a powerful resource for the user.

But even if the time is right, no individual vendor alone can make Desktop Information Systems a reality. It will depend on establishing partnerships with vendors and customers, and on developing standards that allow products to work together. And the technology will only work if it is firmly grounded in a clear understanding of what the user wants and needs. This requires an ongoing dialogue between vendors and the user community.

At Software Publishing, we believe that the user group community will play a critical role in the future success of DIS. In order to maintain ongoing dialogue with user groups, we've initiated a number of programs where we share plans for products and solicit user input and feedback. User group members also give us insight into their individual computing needs. We believe this dialogue is critical to our mutual success.

Years of experience in the computer business have taught me that, for the most part, users respond to evolution, not revolution. It's time for personal computer hardware and software vendors to work together to build upon the strong foundation we've established, and to bring real value to the end user -- value on the user's terms, not only our own.

Fred Gibbons is president and CEO of Software Publishing Corporation (SPC). As co-founder of SPC in 1980, Gibbons quickly established the company as a provider of powerful yet easy-to-use products with its pfs: series products for the emerging IBM PC market. Widely acknowledged for his industry expertise, he developed the company into a market leader with multiple product lines sold around the world. Today, SPC develops and markets a wide-range of decision-critical software for accessing and presenting information, including the market-leading Professional and Harvard series, the recently introduced InfoAlliance products, and Superbase, a leading Windows database product.

■■■

WORDPERFECT TIPS AND TRICKS

By: Read Gilgen, Madison PC Users Group

Editing (Part IV)

This column is dedicated to the proposition that not all WordPerfect enthusiasts are created equal. These "tips" and "tricks" come from a variety of sources, including WordPerfect Corporation, other users, and even the WordPerfect reference manual (imagine that!) Each month we will share a few ideas that just might make life easier for you. Who knows, you might even be able to impress your co-workers with your WPSF (WordPerfect savoir faire).

FONTS & CHARACTERS I

Number 11: Fancy fonts even on your dot matrix printer

Most of us, even those with laser printers, often wish we could afford special fonts, or even that special printer that would let us make large (i.e. headline sized) fonts. If we could do that and have them look nice also, that we be heavenly. Guess what? You can! Even on your dot matrix printer.

First, we need to talk a bit about fonts. A "font" is another term for a "type face" or "type style", but it also refers to the size and other characteristics. For example, a fairly standard printer font is "Courier", a fixed pitch font (meaning a fixed number of characters per inch, usually twelve) that looks a lot like a regular pica typewriter. But the bold variation of Courier is another font, as are the italics and bold italics versions.

The fancier fonts we associate with laser printers include proportionally space fonts, meaning that "fatter" letters such as "a" or "x" get more space on the line than do the "skinny" ones like "i" or "l". These fonts have a more typeset look, and usually are measured in "points", usually referring to the height of the characters. Seventy-two points equals one inch, and a proportional font that would be roughly equivalent in size to the courier type style would be twelve points.

(WP tips...continued on next page.)

(WP tips..continued.)

Two of the more common fancy fonts are the "Times Roman" or "serif"-type fonts (the letters have little appendages at the ends of the lines), and the "Helvetica" or "sans-serif"-type fonts that have straight, unadorned lines.

Now, if you are lucky, you already have a set of basic fonts that you can load into your printer. If you're real lucky, you have a printer that lets you choose any size you want from among the available type styles. For the rest of us, we're now going to find out how to live like the other half!

Have you ever wondered what earthly good WP5.1's Equation Editor could ever be? Well believe it or not you can use the equation editor to create headline-type titles with Courier, Times Roman, or Helvetica style fonts.

- First, select the font (Ctrl-F8, Base Font) closest to the *type* style you want (Courier, Times Roman, or Helvetica). Prestige elite is closest to Times Roman, for example.
- Second, select the Equation Options (Alt-F9, Equation, Options, **Enter**).
- Third, create an equation box (Alt-F9, Equation, Create, Edit). Create the headline you want and press F9 to view the results. Words you type in will appear in italics. For non-italic words, place the word "func" before each word. Use the tilde (~) to provide spacing). For example:

The~ Better~ Letter (italics)
func The~ func Better~ func Letter (normal)

- Fourth, while still in the Equation editor, go to Setup (Shift-F1), select Graphical Font Size, Set Point Size, and enter the size you wish (72 points equals one inch in height).
- Fifth, exit the Equation Editor. The resulting Equation Box can be moved, sized, etc., just like any other graphics box.
- Finally, remember to set graphics quality to "High" when printing (Shift-F7, Graphics, High) so the font will look as crisp as possible.

Here's what the result can look like:

The Better Letter

Remember if you changed your font to something other than the text of your document you will have to change back to your original font right after the Equation Box.

Next time we'll talk more about creating and using special characters and symbols.

Editorial Comment:

This is the fourth in a series of six articles titled **WORDPERFECT TIPS AND TRICKS** *By: Read Gilgen, Madison PC Users Group*. These articles are available to our group by the Association of PC User Group bulletin board service.

'Puzzle #5 - Solution

By: Tom Cone

```
'Answer: the puzzle has more than one solution.  Here is
'       the answer for the smallest possible pile of
'       jelly beans:
'             each child gets 1023 jelly beans at the end;
'             the minimum number of jelly beans in the
'             original pile is 15,621.

'Solution is based on working backwards.
'       After the last child removed part of the
'       original pile, the number left equals
'       5 * LastShare + 1, where LastShare is
'       the final number going to each child, and
'       the 1 is the jelly bean going to the dog.
'
'       The last pile represents the sum of 4
'       equal portions, since the 5th portion
'       is removed by the last child, before
'       pushing the beans together again.

DEFINT A-Z
CLS
LastShare = 1     'start with 1, and then increment
                  'and test for solution

OuterLoop:        'increment bean count, til you hit
                  'first number that works

SinglePile = LastShare
N = 0             'counter to increment for each child
InnerLoop:        'loop for each child
IF ((5 * SinglePile) + 1) / 4 = INT(((5 * SinglePile) + 1) / 4)
THEN
  N = N + 1
  SinglePile = ((5 * SinglePile) + 1) / 4
  IF N = 5 THEN
    GOTO solution
  ELSE
    GOTO InnerLoop
  END IF
ELSE
  LastShare = LastShare + 1
  GOTO OuterLoop
END IF

solution:
CLS
PRINT "The least number of jelly beans is : " + STR$((5 *
SinglePile + 1))
PRINT
PRINT "At the end, each child gets: " + STR$(LastShare)
END
```

Puzzle #6

- Adapted from puzzle originally published in "Creative Computing" Vol.1, #5 (May-June, 1975)

Mr. Jones went to the bank to cash his paycheck. The teller made a mistake and gave him dollars for cents, and cents for dollars. Mr. Jones didn't notice anything wrong and decided to go shopping. He bought a candy bar for 35 cents and then noticed the bank teller's error.

If he had no other money when he cashed his check, and he had exactly twice as much money as the check after buying the candy bar, what was the exact amount of his paycheck ? (You may assume it was less than $100).

The One (and only) i486

By: Peter Norris, DDS
Reprinted from 01/92 HAL-PC Journal of the Houston Area League of PC Users (Available on the APCUG BBS in NWA-MCUG 01/92 Newsletter Article (NorthWest Arkansas Microcomputer User Group, Springdale, Arkansas)

This article will eliminate any confusion you may have about the many forms of Intel's popular i486 chips. It is really very easy to understand, since I have strong reason to suspect that Intel is producing only one form of the 486 chip; the one which we know as the 33 MHz 486DX. It is packaged many different ways, in order to competitively fill niches created by 386 variants.

Begin by considering that, although supplies of the 486 chips are short, Intel claims to be producing 5 or 6 variants already. That's like Rolls Royce offering 20 different models! Not impossible, just not believable. If we examine these chips closely, however, they all look suspiciously alike.

We can start by looking at the simple case of the 487SX chip. It is no secret that this unique coprocessor contains a 486DX. It probably was supposed to be a secret, however. Getting people to buy two expensive 486 chips for one "inexpensive" 486SX computer is the real secret. After plugging in the 487SX, you must leave the original 486SX in place. Apparently it does nothing but waste power, yet the 487SX won't run unless it stays.

Since I'm on the subject, let's examine the lowly 486SX. The single available model of 486SX is rated at 20 MHz, yet it runs so well at 25 MHz that fully half the manufacturers just go ahead and clock their motherboards at that speed. What's more, 486SX chips tested at 33 MHz run just fine, according to Axik president Roger Liao, a motherboard manufacturer quoted in Computer Shopper.

The 486SX is in a different package from the 486DX, however. Is it to save money with cheaper PC packaging? No, it is because a pin-compatible socket would probably reveal that the floating-point coprocessor (FPU) works, if Intel hooked up the pins. Does anyone really think that Intel would create an entire second assembly line to make a slower 486 with a blank space where the FPU goes? Has anyone looked at that spot on a 486SX? Take my word for it, it doesn't say "RENT THIS SPACE."

I know that a lot of people have speculated that Intel is marketing 486DX's that failed the FPU testing, but that doesn't wash. Chip defects occur all over the chip, so the number of 486 chips faulted only in the FPU would be too small and unpredictable to ship. That number would also diminish as quality control tightened up; not a good marketing goal. Instead, 486 chip yield is probably a lot better than we are led to believe. Intel also states that they are not selling defective 486DX's as 486SX's. Could it be because they are selling working DX's as SX's?

Now we come to the 486DX in its 25 and 33 MHz flavors. Soon there will be a 50 MHz model as well. You will note that Intel is using an old car manufacturer's trick here: In the first model year, introduce your sports car with a four- cylinder engine. This will rope in the suckers who just have to have the newest model. Next, introduce a six-cylinder option for the smarter buyers who are waiting for a better value. By the time you finally drop in the V-8, you will get the enthusiasts plus your own early birds, who are selling their 4-bangers to get the real sports car. They never learn!

Now consider that Intel doesn't have to add cylinders here. The silicon on the 50 MHz is the same as on the 25 MHz. It HAS to be, to run the same way. Intel will warn you that running chips faster than their rated speed will cause increased heat. They are correct about the heat. Running a 25 MHz 486 chip at 33 MHz makes it run hot; exactly as hot as a 33 MHz 486 chip running at 33 MHz! Did you think Intel used a shinier silicon, or some different, "cooler" circuits? They would like you to think so. Intel also warns that chip life will be shortened at high speeds. That may be, but when was the last time you wore out the CPU in your system?

MYSTERIOUS INTEL Although Intel wants it to seem mysterious and difficult to fabricate "faster" chips, they cannot be made much different and still run like a 486. Most of the research seems to involve making heat retaining ceramic packaging for the slower speed chips, so that they will heat up and fail at higher, hotter speeds!

We know that the third-party ICECAP chip refrigerator will allow CPUs to run much faster than rated speed, so why don't 486 chips have at least a heat-sink on the package? Because the packaging is all they can use to really control heat, and keeping heat is what makes chips fail. One version of the slow 486SX is even in a meltable plastic package. It will not surprise me if the 50 MHz chip does have a heatsink, but they are probably saving that for the 75 MHz and 100 MHz versions of the same chip.

Let me now address Intel's upcoming "double clutch" models, which ostensibly will run internally at twice the motherboard speed, giving 66

MHz and 100 MHz chips (sort of). I have only heard of these creatures from Intel PR flacks. No human has seen one, and I predict that we may never see one. If we do, it might finally represent a new and truly different variant of the chip with multiple personalities, the i486.

(The One cont.. next page.)

(The One cont..)
If you can't believe Intel would pull something like this, just remember the Intel announcement in Infoworld a few months ago, that the upcoming i586 would be sold only as one version, with all extra features crippled. As each customer decided to "add" a feature like caching, he/she would send money straight to Intel, who would then supply a password to "unlock" the feature. This idea was so universally condemned by manufacturers that Intel immediately claimed it was a rumor.

Intel has a vision of the hardware biz that reminds me of Microsoft's vision of the software biz (and the KGB's vision of Russia). If they thought it would stop AMD's 40 MHz 386, they would probably sell their 50 MHz 486 packaged as a 50 MHz 386!
Think about it!

■■■

APCUG -- Perhaps you noticed on the second page of Bits of Blue, in very small type, "Member, Association of PC User Groups." The Association of PC User Groups (APCUG) is a collection of 200+ user groups in the U.S. and ten foreign countries, representing a total of over 250,000 members.

Our user group pays $25 a year to belong to this fine association and we receive many times this in return. This association's purpose is not to provide services directly to individual user group members, but to support the officers and leaders of the user group.

The support comes in many forms. The Association has a BBS called GLOBALNET located in Scotts Valley, CA, with nodes in five foreign countries including the Soviet Union. Through this medium, officers can exchange ideas with free access through Tymenet.

At Spring and Fall Comdex, a summit meeting is held of user group officers. Here again, ideas are exchanged through seminars, roundtable discussions, and vendor presentations.

The Association maintains excellent contact with the major vendors, who pay for much of the Association's expenses.

The major benefits to the Tampa IBM PC Users Group? The ability to develop closer ties with the user group coordinators of the major vendors; the ability to participate in group purchases; and the privilege of learning from other user groups the things that they have found that make their user group better for their members.

TOOLBOOK 1.5

By: Karen Ohland

With the arrival of Windows, customers rejoiced. Programmers broke down and cried. From the early days of a simple "Hello World", Windows introduced the era of hundreds of lines just to start and close the window and print out a line. Suddenly programming became more work than fun. Toolmakers have rushed to fill the gap, bringing object-oriented and graphical based tools to the desktop. Many of these tools are aimed at the sophisticated developer working on several man-year projects (and with budgets to match), others at the end-user with no programming experience. Asymetrix has positioned Toolbook solidly in the middle: simple enough that the end user can use, yet with enough power to satisfy the knowledgeable programmer. Toolbook is supplied with a series of templates and several complete applications as a starting point. Although each application on its own would not justify the price and could be duplicated through shareware and freeware options, each application can be used a starting point for prototyping a new project.

Installing Toolbook preceded quite smoothly. After ensuring that enough space was available and checking of the options that I wished installed, I was prompted for each diskette and a graphical representation of the progress was shown. Quickly deciding to ignore the manuals, I jumped into the Tutorial. Unlike some other products on the market, the Tutorial is very detailed and provides a lot of in-depth information. After the Tutorial, more advanced lessons are available to learn more of the programming techniques required for complete applications. I spent several afternoons working through the lessons and practicing these new (to me) techniques; others may require more or less time depending on their requirements and previous levels of experience with programming, objects and the Windows environment.

After the Tutorial, I decided to go through the manuals. With both a Programmer's Manual and a Reference Manual, there are over 1,000 pages of tightly packed information. Even the quick reference is larger than some manuals I've seen. With a basic grasp of what I wanted to do, I pulled up one of the templates supplied for an invoice form and tried to set up a simple book. With only a single reference to locking the columns, I never did determine exactly how one should set up a spreadsheet type of entry form, where the user could quickly enter the information required to process a simple invoice, containing Quantity, Description and Amount fields. Every time a [RETURN] key was pressed, a new line in the current column was created. Using the [TAB] key jumped to the last position of the next column, not the same line as the current column. Searching through both manuals yielded no further insight and not on application supplied (only the one template) had this type of data entry; maybe the two are related. I believe this can be made to work, but it will require more effort than most Toolbook users may want to expend.

Backing off from the first project, I brought up a sample application. This went very smoothly. I copied fields similar to those I wanted to the new locations and renamed them and expanded or contracted them and changed from single line to multi-line as required. Within and hour I had a complete application finished. Picking a simpler project and one more people seem to want, I then pulled up a new template and designed a Recipe tracking book. The results are shown in the accompanying picture. Within an easy afternoon I had the basic shell completed, accompanied by clip-art from the collection supplied with Toolbook. Since searching is built in to the system and the template supplied the required buttons to move back and forth within the database, my prototype was complete. Further work might be required to incorporate
(ToolBook 1.5 cont....next page.)

(ToolBook cont...)

more sophisticated features, such as automatic keyword creation, but for many this would be optional. The best part is that this simple book can be used as a new template to generate more sophisticated applications, such as text databases and abstract tracking databases.

Although I did try out the sample applications that used DLL support, I didn't try to create any new ones on my own. The manual details the steps involved in adding support for any third-party DLL for which one has the documentation. This facility should enable the programmer to handle any project required. Building stand-alone projects requires a developer's kit, available separately from Asymetrix; this kit allows unlimited distribution of a run-time system and allows the Author level (used only during development) to be removed from the distributed code. Without the developer's kit, the Author level can still be passworded to prevent changes by end-users; this method is being used by many shareware programmers for distributing their applications.

Whether you are just beginning or a sophisticated programmer, Toolbook should provide the tools you need to get the job done. Toolbook 1.5 is available from many mail order sources and directly from Asymetrix Corporation, 110 - 110th Avenue NE Suite 717, Bellevue, Washington 98004. D From The PC Register, ETPCUG.

■■■

F.Y.I.

Artificial Intelligence: The amazing, human-like ability of a computer program to understand that the letter y means "yes" and the letter n means "no."

Electronic Mail: A communications system with built-in delays and errors designed to emulate those of the United States Postal Service.

C-py Pr-t-ct--n: An obscenity unfit to print and fast disappearing from common parlance.

Turbo Card: A device that increases an older-model computer's speed almost enough to compensate for the time wasted in getting it to work.

Laser Printer: A xerographic copying machine with additional malfunctioning parts.

Workstation: A computer or terminal slavishly linked to a mainframe that does not offer game programs.

RISC: The gamble that a computer directly compatible with nothing else on the planet may actually have decent software written for it someday.

AUTOEXEC.BAT: A sturdy aluminum or wooden shaft used to coax AT hard disks into performing properly.

Plotter: A terroristic hypodermic device used to inject graphic representations of boring data into boring meetings.

Clone: One of the many advanced-technology computers IBM is beginning to wish it had built.

CD-ROM: An optical device with storage sufficient to hold billions of predictions claiming it will revolutionize the information industry.

Nine Ways To Kill Any Organization

Reprinted from the Consultants Forum on CompuServe, via The 08/91 Virginia PC Newsletter, Richmond PCUG

1. Don't participate beyond paying your dues (let "them" handle things), then complain that members have no voice in the management of the organization.
2. Decline all committee appointments and offices (because you're too busy and your time is too important), then offer vociferous advice on how they should do things.
3. If appointed to a committee, don't work (it's a courtesy appointment) and then complain that the organization has stagnated.
4. If you attend meetings, don't initiate new ideas ... and then play "devil's advocate" to those ideas submitted by others.
5. Don't rush to pay your dues (they're too high anyway), then complain about the lack of quality or sparce number of services offered.
6. Don't encourage others to become members (that's selling!), then complain that the membership is not growing.
7. Don't read the newsletter or other communications (they're not important), then complain that you're not kept informed.
8. Don't volunteer your talents (that's ego fulfillment), then complain that you 're never asked, never appreciated, and never recognized as the "expert" you obviously are.
9. Have faith in no one and nothing; don't take any chances on untried procedures (after all, you're not a gambler). Let someone else put their reputation on the line and take the risks, then be sure to enjoy the benefits that result from another's leap of faith. AND IF BY CHANCE the group grows in spite of your contributions, grasp every opportunity to tell the youngsters how tough it was; how hard you worked "in the old days" to bring the group to its present level of success.

BITS OF BLUE

TAMPA IBM PC USER'S GROUP

VOL. 5 NO. 3., 1992 March, 1992

MEETING

(2nd Wednesday every month)

DATE: March 11, 1992
TIME: 6:00 PM
PLACE: IBM CUSTOMER CENTER
LAKE POINTE ONE BUILDING
3109 W. Martin L. King Blvd.
Room 450
DIRECTIONS:

The Tampa IBM PC Users Group meets in the IBM's LAKE POINTE ONE Building across from Tampa Bay Mall one block east of Tampa Stadium.

The best entrance is on Martin Luther King Blvd. at the traffic light in front of Burdines. As you turn North off Martin Luther King Blvd. you will see the LAKE POINTE ONE BUILDING on the left & parking on the right. Join us in ROOM 450 - 4th floor. **Guest please sign in.**

Secretary's Report

TAMPA IBM PC USER'S GROUP
MINUTES OF 2/12/92 MEETING --

Once upon a time there was a ....

No, that's not right. Let's see. Oh, yes! The meeting began approximately on time, but something seemed different and it took a while for me to figure out what. But, then my 486/50 mind figured it our after just a few NS's - Harvey, our President, was not there. Instead, our distinguished Director of Education, Ed Buzza, was filling in for our eminent Vice President, Steve Speairs, who was to fill in for Harvey who was out in Arizona on what Ed reported as a "well deserved vacation".

In any case, Ed opened the meeting and carried the first few minutes. Steve then took over and conducted the remainder of the meeting. Here is a summary of what transpired (please remember that I do not hear well - I may not have heard it all):

CLUB NEWS:

* Ed reminded everyone that the January newsletter has some good info in it on how to use the equation editor to make large print.

* Ed noted that WP 5.1 is scheduled in to make a presentation on WP 5.1 for Windows at our meeting in March. he also pointed out that the current issue of PC Magazine has a review on the most popular mid- to upper-end word processors. In that review PC Mag rated Word For Windows and Ami Pro above WP 5.1. Those contemplating an upper-end WP might want to read that article first.

INDUSTRY NEWS:

* Steve reported from one source that Intel wants to create a new bus standard which is completely open. Intel feels that the current standards are not adequate for the 486/50 Mhz chip.

* Apparently there are several chip producers that are developing a 'doubling chip' to double the internal speed of the 486 chip. Since this would only directly affect internal speed, it is anticipated that the doubling chip would result in about a 50% increase in throughput speed.

* In the chip area, Northgate has combined their chip development with development of mechanism for the boards which would permit very easy installation and removal of the chips. From a user standpoint, this sounds very good - but I suspect that if it works out that it might have a substantial impact on the cost of the boards on which that technology is included.

* Steve cited several examples to illustrate the declining prices in the computer field, noting that it is a user's market and will likely continue to be for the foreseeable future.

* Steve noted that the Gateway 486/33 had been selected as the Best Hardware of the year and DOS 5.0 as the Best Software of the Year - for 1991, of course.

PROGRAM REVIEW:

CorelDRAW

Steve introduced Leslie C. Dort of Corel Systems Corp who would give us a demo of CorelDRAW. Leslie began by noting that she had provided a number of different informational/promotional materials for those interested, including quite a few demo disks. Leslie emphasized that while there are a few special versions of CorelDRAW (OS/2 PM, UNIX OSF?Motif, and UNIX OPEN LOOK), the program most of us we are likely to be interested in and the one she would demonstrate requires Microsoft Windows. She then proceeded to outline the current and near-term future of CorelDRAW. The last major release was version 2.0. A maintenance release (2.01) was also out and all owners of 2.0 should have received the 2.01 release free of charge. Version 3.0 was in the works and should be released before the end of 1992. Corel would be marketing a 'Blockbuster Bundle' which would include:

- CorelDRAW & and CD ROM
- An internal CD ROM driver
- An interface kit (with an 8 bit SCSI)

Leslie made a point of informing us that the SCSI in the Corel package would be the first true interface, and it would be capable of supporting 7 external devices. When the bundle would be available was not clear.

The bundle would include 10,000 pieces of clip art, 200 fonts, Art Show 91, and would be usable in 5 languages. The bundle list price will be $1295 for new CorelDRAW purchasers and $595 for upgrades. An external CD ROM driver could be had - and that is recommended to save a slot - for an additional $100. A 16 bit SCSI can also be had for an additional $100. The SCSI will also be available as a separate item for $195 for the 8 bit version, and $300 for the 16 bit variety. But Leslie pointed out that CorelDRAW is not really in the business of make nor marketing hardware - they are and intend to continue as a software company.

In getting to the demo, Leslie noted that CorelDRA rated in its niche and that it is excellent for presen graphics, supporting word processors with graphics and specia effects, and for DTP. She reported amazement at the variety of uses that have been found for the program, including engraving.

Leslie is very knowledgeable on CorelDRAW and proceeded to give a very comprehensive and very quick demo of a very powerful program (the 2.01 maintenance version). I could not even hope to put into text what I saw her demonstrate of the program. In short, I can't imagine anything that one might want to do with text or graphics that CorelDRAW can't do - and she made it look very easy. It gives super control of text (with a supply of 150 fonts in the normal package as a foundation, or you can import with ASCII or from most major word processors), and almost unlimited control of graphics - and the capability to make text graphics which then gives phenomenal control of text. Mirror, skew, size, curve, swirl, extrude, bend, fan, rotate at any angle, stretch, etc., etc., etc, is a short list of the many special effects things you can do - and any combination thereof.

It supports (imports and/or exports) EPS, Windows Metafiles, BMP, CGM, GEM, DXF, WPG, TIFF, PCX, PIC, PIF, Video Show, SCODL, HPGL, and the .Ai format for Adobe Illustrator file formats. Included with the standard package are 3300 symbols and 700 pieces of high-quality art. Of course, with CorelDRAW you can make your own symbols and graphics. It includes three standalone utilities:

- CorelTRACE, which convert bitmaps to vector.
- Mosiac, which is a visual file manager as well as a powerful batch printing, importing and exporting utility.
- WFNBOSS, which is a font import/export utility that convert fonts from major vendors to CorelDRAW .WFN format.

If you get the impression that I was impressed with the program, you're right - it is the best drawing/graphics/special effects program I have seen, bar none.

After the presentation Leslie passed out quite a few prizes as part of a question and answer period. Included were several mouse pads and a SCSI manual. All of the winners of these prizes did not provide their names to me, so I know only a few, who are:

Ruth Radlein	SCSI Manual
Brad Krantz	Mouse Pad
Floyd Thrower	Mouse Pad
Bert Karpinski	Mouse Pad

CorelDRAW requires a 286 or better machine, hard drive with at least 8-10 meg for the program, an EGA or better

display, any printer supported by Windows, and Microsoft Windows. I suspect, however, that the program might be a little slow on the 286.

To Lesley (and Corel Systems Corp) we give you a very BIG "Thank You" for a superb demonstration of a super program - and for all of the goodies you provided. We are indebted.

AM-TAX91

Following Leslie's demo of CorelDRAW, our own Don Patzsch gave a review of the Shareware program AM-TAX91. This program is available on our own and the Sunshine BBS as AM-TAX91A.zip.

It is quite a nice little program, is relatively easy to use and is fairly well documented. It will work on just about any IBM compatible computer that has 320K of usable RAM, any monitor, and just about any IBM or Epson (or compatible) printer. It will work with floppies, but a hard drive is best.

The version downloaded from the board supports the 1040 and Schedules A, B, C, D, D1, E1, E2, F, R and SE, as well as W-2s. The program completes prints all of the forms in a form acceptable to the IRS, except for the 1040 form - the data for which has to be copied to the IRS form. Registration cost $20 for which you get printed documentation and additional capability, including printing of the 1040 in a form acceptable to the IRS.

There are also more capable versions available to deal with more complicated returns - each with a modestly higher registration fee. However, for those whose tax return needs do not extend much beyond the forms supported by the basic program, this seems to be an excellent and relatively inexpensive way to go. (Of course, the freebee 92FM1040.ZIP, for use with Lotus 123 or Quatro Pro, is also available.)

Thanks, Don, for an excellent presentation and introducing us to this program.

AND THE WINNER IS:

After the presentations, Steve began the drawings, using our lovely guest presenter, Leslie, to good advantage. She drew the following lucky names:

Kevan Sheridan	CorelDRAW
William Fuller	IFX Business Expense Report Pgm
Al Anderson	50/50 ($62)

CONGRATULATIONS! We are happy for you - and a bit jealous, as well.■■■

EZCos mos 3.0

Software Review

By: Hugh Bayless, MontereyBay Usr Group

That slick and beautiful program, EZCosmos, has now been updated and improved in the latest version 3.0. When I reviewed version 1.0 a year ago, I was impressed. This new version is much, much better, and I'm even more impressed.

EZCosmos lets you view the sky of earth from any point on the globe at any time and date you choose, from 4000 BC to 9999 AD. Want to see what the sky looked like for Columbus, as he landed on Watling Island on October 12, 1492? As long as you can figure out the latitude and longitude of the spot you want to view from, it's easy. Just set the location and the date and time and the sky appears on your screen.

While the manual is rather brief, it gives you all you need to get started, and after that everything is at your fingertips within EZCosmos itself. Version 1.0 depended on cursor keys to control it, but V 3.0 supports a mouse, which makes moving around the sky much easier and faster. It is very easy to imagine yourself in the Starship Enterprise as you zoom around this star-filled cosmos. I was captivated.

While EZCosmos will run on any computer with a hard disk and 512K of memory, it works best on a VGA system. As a bonus, there are some beautiful photographs of planets, galaxies, nebulae, and star clusters, that can only be viewed with a VGA system. To get the best view of these pictures, look at them in a darkened room from about five or six feet away from the monitor. Up close, the pictures are a bit grainy. From a distance, they are spectacular.

EXCosmos is a beautiful program for anyone interested in the heavens. For more info, call Future Trends, Inc, at (800)869-3279.

UPDATE ANYONE???

VERSION 1.0: Buggier than Maine in June; eats data.

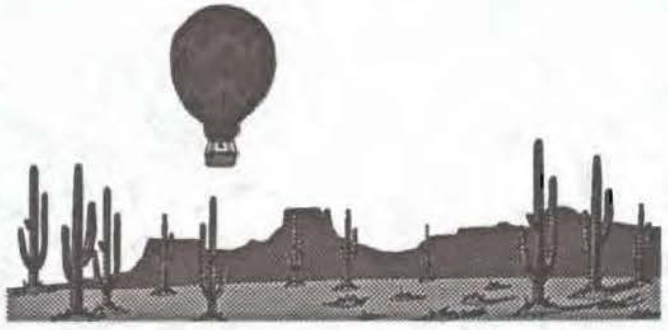
VERSION 1.1: Eats data only occasionally, upgrade free to avoid litigation by disgruntled users of version 1.0.

VERSION 2.0: The version originally planned as the first release (except for a couple of data-eating bugs that just won't seem to go away), no free upgrades or the company would go bankrupt.

VERSION 3.0: The revision in the works when the company goes bankrupt.

PRESIDENT'S COLUMN:

It was with regret that Marylee and I missed the February meeting. It was a record breaking attendance (100+). We use Corel Draw and really wanted to see the presentation by Lesley Dort of Corel Systems Corporation. It was the 1st meeting in a long time that I missed. However, I must say the 10 day business/vacation trip to Tuscon, Arizona was fantastic. I along with 250 other select Dun & Bradstreet Software (DBS) employees (plus spouses) were sent to Tuscon for a business symposium and awards ceremonies as a reward for our achievments in leadership and dedication to the company. Its not often that I blow my own horn -- but after three years at DBS, the company and my bosses expressed their appreciation by sending me and Marylee to Tuscon. **THANKS DBS.** Our adventures included hot air ballooning, horseback and mountain bike riding, snow skiing and many other fun things. I would recommend you visit Tuscon if just for the scenic beauty of the land surrounding it. We had 10 days without seeing or talking PCs until our plane ride home. These two businessmen (a 20 year old PC guru and 45 year old business exec) were sitting across the aisle from me and began talking about Novell networks. I wanted to jump into this conversation like jumping into a pool after mowing a lawn for 10 days in July. But I just sat back and listen. The kid knew his stuff and was sharing it with the older executive who was also impressed. Then it got worse. This kid pulls out a Leading Edge portable with a monster trackball and begins demonstrating windows. After 10 days without, I was beginning to experience the PC DTs. This kid was pumped up and smart. Once again the executive was impressed. Finally it was the big exec's turn. He reach up and brought down his own Laptop, a new IBM. The kid was impressed. The exec demoed a package but the kid was more impressed with the literature. I was really in trouble now, 2 laptops across the aisle and I couldn't touch either one. I felt a sharp pain in my side, it was Marylee elbowing me and telling me to wipe the drool of my face and fasten my seatbelt for our arrival home. As we landed I looked over to my left and these guys were still pounding away on the IBM. I guess the stewardess thought he was flying the plane from his seat because they didn't make him put the laptop under the seat or fold his tray up. It makes me feel good to see young people using and understanding the PC technology of today. We need more of them.



The dreaded Michelangelo virus has come and gone. To date I don't personally know of anyone getting hit by it. Of course you must keep in mind that corporations which were attacked would try to keep it quiet. Others may have disinfected the virus before March 6th. I am not sure how this got so blown out of proportion. I suspect the news media was involved and frankly they gave bulletins boards and IBM PCs a bad rap. Even if unintentional, their broadcast seem more gossip and opinions by PC illiterates than hard facts. Viruses are here to stay and the media crying **WOLF, WOLF, WOLF** did not help. Hackers like terrorist, live for media attention and they got a gold plate full this time. Free advertising and sales occurred for antivirus software companies but I am not sure at whose cost. It is becoming a hallway conjecture that a company could create, spread and later sell the antivirus for huge profits. Practice safe computing check your PC for viruses. Shareware and public domain products are available at little or no cost.

Great news! One of our members has come forth to volunteer his time to our group. Tom Cone, the contributor of the many puzzles in our newsletter, will perform the task of welcoming visitors and helping new members into our group. I have been told on several occasion that we do not do a proper job of making visitors welcomed or informing new members of the goings on and who's who within our group. Tom will also be reviewing popular shareware products as they come along and either write basic reviews for the newsletter or demoing them at meetings. He has also expressed interest in having classes in basic BASIC and PASCAL. The when and where of these classes have yet to be determined. Please join me in welcoming Tom to the board.

We still need more dedicated volunteers. Contact me if you are interested and can help our group (932-6745).

Our second bit of good news is that we have been in contact with Telmar Associates. This company can provide our members with computer publications at a reduced price (see table 1 on the following page). I am pursuing another company which also has good pricing.

American Heritage On-Line-- Dictionary Enough?

February 1992 LILYPAD - Copyright 1992 all rights reserved, FROG Computer Society, Rochester, NY - Released for non-commercial publication only.

Definitions Plus! from WordScience Corp. is an electronic version of the American Heritage Dictionary. Definitions Plus! effortlessly brings over 115,000 words, word forms and phrases to the fingertips of the online user. All functions are accessed quickly using 3 primary hotkeys and drop-down menus. Word displays contain the traditional dictionary elements including usage examples, parts of speech, synonyms, etc.

How it works: Definitions Plus! can be run as TSR (Terminate and Stay Ready) program, or from a command line.

If you are in the Definitions Plus! directory, or the directory is in your path statement, you can request information about a word from the DOS command line without loading the program into memory. To access a definition, just type "DEF" {word to be defined} <enter>.

As a TSR program, Definitions Plus! may be run in any one of 3 memory-resident modes:

1) if you can spare 98K of memory, Definitions Plus! will load fully into memory and run with maximum speed;

2) as a TSR occupying 4K memory while swapping the rest of the program to the hard disk to be called back to memory when needed. This may be handy when you have larger application programs occupying your RAM memory;

3) as 4K TSR swapping the remaining program element to expanded memory. All of these options may be selected by simple slash commands. The manual instructs you to un-install any memory-resident programs loaded after Definitions Plus! was loaded. If you don't, your keyboard may lock and you will have to re-boot your computer. Definitions Plus! did also interfere occasionally with loading my DOS shell (Elftree). I had to load Elftree twice a couple of times to get it to load.

Once Definitions Plus! is loaded, you have several options. You may simply place your cursor upon a word or phrase to be defined and press Alt-D or Alt-W respectively to call forth a definition. Fast and simple. (The definition will appear in an "information" window away from your cursor and present text.)

Now curiosity might have you wondering how you indicate a phrase in the midst of copious text. You use "phrase capture". Place your cursor at the first word of the phrase and hit the hotkey. A small window will appear with only the word at the cursor in it. You then simply press "+" or "-" to add words to finish the phrase, or subtract words if you get

carried away and go beyond the length of the desired phrase. After capturing the phrase just <enter> and {Wa- la!} a window appears.

This function will only retrieve phrases that appear as main entries in the dictionary, such as "a la carte," "sweat shirt", etc. The phrase size is limited to 8-10 words but you won't need any more than that- I found that many of the phrases I searched for were not available. I guess I'll have to wait for the new unabridged version and buy a new hard disk!

Your second option in memory-resident mode is to call forth the Main Menu (another simple hotkey). The main menu consists of 5 drop-down menus. {"Help", "Setups", "Look Up", "Uninstall", and "Quit".}

HELP- when activated a very simple window drops down with a list of all the hotkey options of the menu. The help menu is short and sweet, but I guess there is not much to be said.
SETUPS- allows you to change the configuration of hotkeys (in case they conflict with other application program commands), change colors of menu and windows (limited options), and word processors may be chosen (out of a list of about 15 popular) to enhance Definitions Plus! functioning within your word processor. I chose "other" and Definitions Plus! worked fine with Visual Display Editor (VDE).
LOOK UP - provides hotkey options to look up a word at the cursor, a phrase at the cursor (using phrase capture) or an option to manually enter a word or phrase.
UNINSTALL - allows you to disable hotkeys, or to remove Definitions Plus! from its residence in memory. The manual instructs you to only uninstall Definitions Plus! from memory at a command line or after shelling to DOS from an application program.
QUIT- I'll let you guess this one. This function does not remove Definitions Plus! as a TSR.

Definitions Plus! even allows you to gain further clarification of a definition, by defining the words within the information window. Just move the cursor to the word and <enter>. A new window with info on that word will appear, if Definitions Plus! has it. You may continue this process indefinitely. By pressing <Esc> Definitions Plus! will work its way back through the path of the last four definitions you have chosen.

If Definitions Plus! does not find the exact entry that you have requested, a "Suggestions Window" will appear with a list of words similar to your entry. Simply highlight any entry in the list that satisfies your search. In some cases, the words you chose may not have any similar words and the Suggestion Window will say "none". Oh well, there is always that archaic option of dusting off the old family dictionary!
INSTALLATION- Simple. Just type "install" and the rest is menu driven with clear instructions. (There is no obligatory changes made to autoexec.bat.)

The software comes with a clearly written 50-page manual that explains installation options, operation procedures (including operations in conjunction with 14 popular word processors), and a brief Trouble-Shooting guide.

I found the program easily workable. I used it within my word processor (VDE 1.6) and within the ONLINE Bible. I have not yet had much serious use for it but can see its usefulness for students, writers, or anyone else who cares to quickly access a brief online definition.

Strengths for this program includes ease of use, and speed. Weaknesses might include the abridged size of the dictionary (although small size can be a virtue), the brevity of some definitions, and the potential TSR interference with other programs. But overall, I liked Definitions Plus! once I got used to its idiosyncrasies revolving around un-installation. This program provides quite powerful, easy, online-dictionary access.

SYSTEM REQUIREMENTS- IBM compatible; DOS 2.0 or higher; 100 K of available RAM, although only 4 K is used; and a hard disk with 2.5 MB of available storage. Definitions Plus! is available through some local software dealers for about $80.

GLOSSARY:

Hotkey- functions that can be elicited by pressing a single keyboard key.

TSR (Terminate and Stay Ready) program: A program that will run simultaneously with other programs, such as application programs, in the higher portions of your computer's memory. (Sometimes TSRs will interfere with each other or application programs, especially graphics programs.) Slash commands- usually single letter commands enters after an executable program that modifies the working of that program. For example, "DEF /s" will load Definitions Plus! to work as a 4K TSR. "/s" is the slash command.

Swapping- when elements of a program are stored outside of RAM memory (in expanded memory or the hard disk, for example) These program elements are "swapped" when needed by other program elements in RAM.

Humor.txt

TIBMPCUG BBS

Hard Disk: A device that allows users to delete vast quantities of data with simple mnemonic commands.
Mouse: A peripheral originally christened "vermiform appendix" because of its functional resemblance, renamed for its appropriateness as a cat toy.
Printer: An electromechanical paper-shredding device.
Modem: A peripheral used in the unsuccessful attempt to get two computers to communicate with each other.
Network: An electronic means of allowing more than one person at a time to corrupt, trash, or otherwise cause permanent damage to useful information.
Documentation: A perplexing linen-bound accessory resorted to only in situations of dire need when friends and dealers are unavailable, usually employed solely as a decorative bookend.

WORDPERFECT TIPS AND TRICKS

By: Read Gilgen
Madison PC Users Group

This column is dedicated to the proposition that not all WordPerfect enthusiasts are created equal. These "tips" and "tricks" come from a variety of sources, including WordPerfect Corporation, other users, and even the WordPerfect reference manual (imagine that!) Each month we will share a few ideas that just might make life easier for you. Who knows, you might even be able to impress your co-workers with your WPSF (WordPerfect savoir faire).

THIS MONTH'S FREEBIE

Here's a little extra "freebie": the next time you're working with WordPerfect, notice the number next to "Pos" on the status line. It will reflect the character attributes at your *exact* cursor location. This makes it easier to edit without having Reveal Codes on.

For example, if your cursor is to the right of a [BOLD] code, the number will be bolded, but if it is outside the pair of [BOLD][bold] codes, the number will be normal. The same goes for underlining and other attributes.

[BOLD]cursor[bold] will show: **Pos 4.5"**
cursor[BOLD][bold] will show: **Pos 4.5"**

FONTS & CHARACTERS II

Number 12: Bullet Characters

Bullets rather than dashes add pizazz to lists in your documents. For example:

-- dashed items
-- plain looking text

Becomes:

- bullet items
- classier looking text

While there are complicated ways of getting bullets in WordPerfect, the simple way is simply to hold down the Alt key, and press the "7" key *on the numeric key pad* (not on the numbers across the top of the keyboard). When you release the Alt key you get a nice little bullet. If you the press F4 (Indent), your "item" will be nicely set-off paragraph of text:

- Bullets are easy to create, by pressing Alt and "7" on the numeric keypad

Number 13: Special icons (and other characters)

If you've ever browsed through the appendices of the WordPerfect Reference manual undoubtedly you've seen the list of foreign, scientific, and other special characters. Perhaps you didn't know that WordPerfect 5.1 can print any of these characters, even if your printer doesn't normally include them in its character sets. (Sorry, but daisy wheel printers can't do this.)

So the trick is to get the characters into your document, and then WordPerfect will do the rest.

The method is called "Compose", and no, it isn't what you take after a particularly frustrating session at the keyboard.

First, you identify the character you want to use, for example, the hand pointing to the right, which is character number 21 in character set number 5.

Next you position your cursor where you want the character and press Ctrl-2 (*not* F-2). Nothing happens. Type "5" (nothing happens), type a comma (nothing happens), type "21" (nothing happens), and then press Enter. A small square filled box appears on the screen. This is WordPerfect's way of telling you a special character will be printed in that location, but that it can't display the character on the screen because your IBM (or compatible) doesn't have that character in its video character display set.

Press Reveal Codes (Alt-F3) and move your cursor to the character. The little box expands to reveal: [■:5,21], meaning the box represent the hand pointing right that you so desperately want.

If you now go to Print (Shift-F7), View, you will see the tiny hand pointing in the right direction. Since it is so small, you might want to block the character, press Ctrl-F8, Size, Extra Large, and then Print View again to see the better looking hand:

☞ Now doesn't this look even better than the crummy little bullets we learned about in tip number 12?

Next time we'll talk about some shortcut methods for Compose.■■■

User Groups: "Information at Your Fingertips"

By: Bill Gates

Copyright 1992, APCUG, AllRights Reserved
Permission granted for reproduction in official publications of member organizations of the Association of PC User Groups.

In ten years, the personal computer has evolved very rapidly -- from an interesting technical niche to the center of personal productivity in many businesses. In the next ten years, it will evolve into an information appliance that spans the office, the traveling worker, and the home. All applications will be inherently "groupware" with the work of many individuals becoming tightly integrated; at the same time individuals will have the flexibility to travel and work off-line and plug in as necessary. Applications themselves will have many interchangeable parts. The computer workday will focus not on the applications being loaded but on the documents themselves that users want to create.

We at Microsoft call this vision of the future "Information at Your Fingertips." It's the idea that people will be able to treat all data, whether local or remote, whether text or graphics or sound or video, as just data; or perhaps more appropriately, as information -- data that can be usefully manipulated, evaluated, analyzed, organized, and ultimately, made sense of and acted upon. This vision also assumes that applications become more content-oriented.

Today's applications are mostly tools -- word processors let you create documents, spreadsheets let you calculate figures, but you have to supply the words and figures yourself. "Content" applications will be rich in data of many types, focusing on education, training, entertainment -- certainly there will be a cross-over between the PC and current game software, only with much greater sophistication.

Two interesting things will happen: The PC will become the central window through which employees will access worldwide corporate data, and the PC will also become more personal. More corporate and more personal at the same time? Yes. Ease of use and intuitive behavior are a necessity for any product going into the home; they are also a necessity to create order out of the huge mass of corporate data confronting people at work.

How do we get there from here?

First, microprocessor technology must continue to advance, as it has, at a fairly constant rate. (Over the last decade, a doubling of power every two years or so has been realized.) There is every reason to believe this will continue. For example, in 1986, the 16 Mhz 80386 was state-of-the-art. After two years, the speed was up to 33 Mhz. In 1989, the 80486 was introduced, with more processing power and a clock speed of 25 Mhz -- and 50 Mhz versions were introduced in 1991. By the end of 1992, the new Intel chip and MIPS R4000 chip will more than double processing power and speed again. PC systems will have gone from less than 1 MIPS (Millions-of-Instructions-Per-Second) of computing power a few years ago, to more than 50 MIPS on the desktop.

Similar advances are occurring in related areas of technology. Within a few years, desktop screens will handle 2048X2048 resolution; notepad-sized machines will be at 1280x1024; and wallet -sized PCs will have displays comparable to the 640x480 standard of today. Soon there will be low-cost, small for-factor 400 MB hard drives, Cheap, removable optical storage devices will provide even grater storage. Wireless networks will provide 10 megabits per second of data transmission, and fiber networks will handle 100 megabits per second. All this means that more information, and more kinds of information, can be utilized via PC technology. The data will encompass such things as: Music and sound effects, speech, 3-D graphics, photo-realistic images, motion video and animation. And PCs will have the capability to respond to input via scanners/OCRs, voice, gestures with figures and pens, and even natural language through any of these media. Microsoft is investing heavily in research into all of these areas.

Our systems strategy is to put in place, via *Windows*, a scaleable architecture that allows applications, hence users, to take advantage of all this data. We want to evolve the user interface of *Windows* to take advantage of new approaches to input and output, to allow better application integration and usability, while at the same time providing more and more power under the hood. Advanced systems services will be available through *Windows* NT and new versions of *Windows* on MS-DOS. We've enumerated our goals for the last year: More object orientation such as drag-and-drop capabilities and application integration with OLE; and better security and messaging services, sophisticated directory services, and so on under NT.

Windows is being systematically evolved to work on systems ranging from low-powered, portable, penbased systems to high-performance servers. This means users will have a standard platform supporting a large number of applications, and developers can get the most return on their investment in new products.

"Information At Your Fingertips" is a vision Microsoft has been articulating, but it is not a vision that Microsoft can implement by itself. The same community of users and developers that grew up around MS-DOS is now creating a critical mass for *Windows*. Users are seeing more and more products become available under *Windows*, and software developers are seeing more and more customers for *Windows* products, so they are encouraged to build more, thus attracting more users. This self-sustaining market cycle that began with MS-DOS is now encompassing *Windows*. And it encompasses, too, all the hardware developers and software developers and user communities of the PC world.

User groups will have an enormous role to play as the industry makes the transition to all these new capabilities, just as user groups did in the original move from pen and paper to PCs. The impact can be even greater, since the user community is highly organized today, rather than starting from scratch as it did in the late 1970s and early 1980s.

Microsoft has worked with a variety of user groups almost

from the start. The early ones intended to be highly technical. Today, user group members span that gamut from C++ guru to novice office worker. User groups have provided both formal and informal feedback on many Microsoft products, both systems and applications. Several SIGs have participated *en bloc* in our beta programs (One of the favorites was a program in which we paid user group members cash for every new bug they found. It proved a strong incentive for hackers to pound on our product.)

When I and other Microsoft executives speak at user groups, we get direct feedback--direct, and often quite vocal feedback!--on products and programs. Because of their nature, whether they are technical or not, user group participants tend to be on the leading edge--they might say, bleeding edge--of the user community, and they are not hesitant to speak out. We often make announcements at user groups as a way of honoring, if you will, the user group role as the voice of the user. Information that comes back to us from user groups is fed to our people in product development. We have placed a lot of emphasis on usability at Microsoft in the last year, as one example, and a lot of input has come from user communities and user focus groups.

More important than helping vendors design better products, though, user groups will remain a primary source of information and knowledge for the user community. As the desktop and home uses of computers rapidly expand in the next decade, the simplification of the user interface will be partly neutralized by the expansion of the market to include individuals with less and less computer savvy than PC users of today. Through meetings, SIGs, newsletters, electronic bulletin boards--and no doubt through innovative uses of some of the advanced technology mentioned here--user groups will continue to be a place where individuals can help one another, and teach one another, about exciting new "stuff".

No matter how good the products or technologies, change is always more difficult than stasis; no matter how much support a vendor provides, there are always questions that only other users with similar experiences can easily answer. There will remain in the PC industry for decades a need to pass on certain "folklore" and commonlaw" about technical matters that cannot be transmitted any better way than person-to-person. It is "Information at Your Fingertips" in the most personal sense, and user groups are the best forum in which it can occur.

William H. (Bill) Gates, III is chairman and chief executive officer of Microsoft Corporation.

'Puzzle #6 Solution

```
' By: T. Cone 2/21/92
'
'Paycheck was for $21.43.  $43.21 was received.
'  $.35 was spent, leaving $42.86 on hand when
'  mistake was discovered.

DEFINT A-Z
 'trick is to state the known information
 '  in algebraic form, then test all possible
 '  values to see what solves the equation.
 'we know: paycheck = (100 * Dollars) + Cents
 'we know: cashreceived  = (100 * Cents) + Dollars
 'we know: cashreceived - 35 = 2 * paycheck
 'so: cashreceived = 2 * paycheck + 35
 'so: 100 * Cents + Dollars = (2 * paycheck) + 35
 'so: 100 * Cents + Dollars = 2((100 * Dollars)  + Cents) +
35
 'so: 100 * Cents + Dollars = (200 * Dollars) + (2 * Cents)
+ 35
 'so: 98 * Cents - 35 = 199 * Dollars
 'solution:  look for a value that satisfies this
 '          equation, by trial and error.  Start
 '          with one cent, work up to $100 or
 '          til answer is found
 CLS
 Paycheck = 1   'Paycheck expressed in cents
 DO WHILE Paycheck < 10000
   'Loop to test values from 1 to 10000
   Cents = Paycheck MOD 100
   Dollars = INT(Paycheck / 100)
   IF (98 * Cents) - 35 = 199 * Dollars THEN
     ' Puzzle solved, paycheck is correct
     '   so print solution
     LOCATE 6, 5
     PRINT "The paycheck was $";
     PRINT STR$(INT(Paycheck / 100));
     PRINT "." + LTRIM$(STR$(Paycheck MOD 100))
     END
   ELSE
     ' Paycheck will not solve equation
     LOCATE 4, 5
     PRINT "It was not ";
     PRINT LTRIM$(STR$(Paycheck)); " cents."
     Paycheck = Paycheck + 1
   END IF
 LOOP
```

Puzzle 7

- adapted from Creative Computing Magazine, 1975

How many oranges are in the grocery, when 1/4th of them, 1/5th of them, and 1/6th of them add up to 148 ? (This time, no multiplication is allowed!)

■■■

Win3, DOS Apps, and PIFs

By: Pete Moore

February 1992 LILYPAD - Copyright 1992 all rights reserved, FROG Computer Society, Rochester, NY -

This month let's talk about using Windows with DOS programs, since almost none of us can afford to scrap all our DOS programs and buy nifty new Windows replacements and upgrades. And frankly, even if we could, most of us have certain programs that we're just plain used to, or that do a certain job for us in a way that we aren't ready to discard yet.

At this point, I want to remind you of something I said last month: if what you really want to do is multitask DOS programs, there are better ways to do it. I've been experimenting with Quarterdeck's DESQview 386, and it can multitask DOS programs six ways from Sunday, with speed, precision, and nary a crash. And there are task-switchers (multitasker-wannabees like Back&Forth) galore on BBSs all over the place. In fact, if you bought the DOS 5.0 upgrade from Microsoft, you've got a task-switcher right there in DOSSHELL. (Leave me a note on the Frogpond if you'd like to know more.)

There are lots of ways to run DOS programs from inside Windows. The most obvious, though probably not the best, is to start up File Manager, use the mouse to select the drive and directory of your DOS program, and double-click on the filename. This will start it up in full-screen mode. In many or most cases, this method works with no troubles beyond the fact that File Manager itself is ugly, slow, and non-intuitive. Of course, if your chosen program is a big graphics application, especially one that needs expanded memory, it may not start up at all this way, or it may send your Windows session down in flames. (Can you say "Unrecoverable Application Error")?

You can also run a DOS program by clicking on [File] [Run] and then typing in the appropriate drive:\directory\filename, and pressing [Enter] or clicking on [OK].

But probably the best way to do it is by using a PIF (Program Information File) to start the program. PIFs tell Windows if the DOS program has any special needs for system resources, Open]such as whether it needs to use a COM port. If Windows automatically installed any DOS applications for you when you installed Windows, it may have created PIFs for some of them. Also, lots of DOS programs come with a pre-written PIF included in the package. (In fact, any time Windows runs a DOS program without a specific PIF, if uses its own generic PIF, _DEFAULT.PIF).

If you want to create or change a PIF, (for instance you want to make a program run in a window instead of full-screen), start up the PIF Editor in your Accessories Group. To change a PIF, click on [File] [Open] and then double-click on the PIF you want to change. To create a new PIF, just fill in the information in the dialog box, then click on [File] [Save As] and give it a name.

Besides the obvious things like the program's name and location, the two things you're most likely to want to change are whether the program runs Full Screen or Windowed, and whether its execution is Background or Exclusive.

If you choose Full Screen, your DOS application will look as if you had started it from the C: prompt, and you will be able to use a mouse in it if you usually did. If you choose Windowed, you lose your mouse, which now belongs to Windows. Also, the display will slow and jerky on most machines, because Windows must continually translate the text-mode display to its appropriately scaled graphical look-alike.

If you choose Background, your DOS program will keep executing after you switch to another program, so you could download files with ProComm in the background while you write a letter with Windows Write in the foreground. This works whether your DOS program is in its own window, or temporarily invisible in Full Screen mode. If you choose Exclusive, your program will stop executing when you switch out of its (Full Screen or Windowed) window.

As for the Advanced options available when you start PIF Editor in 386 Enhanced mode, the only thing most of us need to know is that our applications will run faster if we turn OFF all the Monitor Ports choices, except for comm programs. ■■■

BITS OF BLUE

TAMPA IBM PC USER'S GROUP

VOL. 5 NO. 5 May, 1992

MEETING

(2nd Wednesday every month)

DATE: May 13, 1992
TIME: 6:00 PM
PLACE: IBM CUSTOMER CENTER
LAKE POINTE ONE BUILDING
3109 W. Martin L. King Blvd.
Room 450
DIRECTIONS:

The Tampa IBM PC Users Group meets in the IBM's LAKE POINTE ONE Building across from Tampa Bay Mall one block east of Tampa Stadium.

The best entrance is on Martin Luther King Blvd. at the traffic light in front of Burdines. As you turn North off Martin Luther King Blvd. you will see the LAKE POINTE ONE BUILDING on the left & parking on the right. Join us in ROOM 450 - 4th floor. **Guest please sign in.**

Secretary's Report

TAMPA IBM PC USER'S GROUP
MINUTES OF 1/8/92 MEETING --

!! Harvey's opening remarks centered almost entirely on the just released Version 3.1 of Microsoft Windows. Several computer stores in the area were offering the upgrade and the complete package at bargain prices. Sad to say, but these low prices were for a limited time only. Installing the upgrade takes about 20 minutes on a 386. It takes only about 6 minutes to install as a new package.

!! Big feature is that it's fast. It loads faster, prints faster and the file manager is even faster. Another big feature is True Type, the on-the-fly font generator built into Win31. True Type does work with WordPerfect for Windows which could not access the Win fonts in the prior version.

!! There are two installation modes: express (which loads everything and needs about 11 meg on the hard drive) and custom which lets you choose the modules that you want installed. There was no problem in installing the new version over the old version. It is not a good idea to install the new version as a second copy in another directory; there may be conflicts in references to the old files. Still no relief for UNinstalling Window applications.

!! There is now a "Start Up" Group (old Load and Run options) that makes it easier to set up your Window sessions. Also, you can use Control-drag to drag a *copy* of the icon to a new location. The Control Panel now provides for adjusting Window boxes *and* font sizes. You can shrink a DOS window to about a fourth of it's full screen size and still read the text.

!! The latest version of OS/2 id due by the end of this month. To install the whole kit and caboodle will take about 30 meg of space on the hard drive.

!! On behalf of the User Group, thanks to ROBCO of Lutz for this evening's presentations. Should any of you be interested in their services, (813) 949-7686 is their office phone and (813) 949-7784 is their fax number.

LANtastic Presentation

David Gallagher of ROBCO, Lutz, described the benefits of LANtastic; rated as the number one peer-to-peer network package. This program makes the productive power of a full-featured LAN (Local Area Network) available at an economic price to, typically, small business users. It allows for

(Continued on next page)

(Continued from previous page)

resource sharing (printers, disk storage, FAX, modems, CD-ROMs, etc.) without the need for a dedicated server machine. Any work station can act as the server.

Security levels, audit trails, and passwords are easily established or changed. Various services or accesses are easily enabled or disabled for any station. In fact, log in can be restricted to a particular period of time and/or a particular day.

Also, in a small network, ROBCO can set up the system so that a LAN manager is really not needed. Of course, as the number of work stations increases, so does the need for a LAN manager. One of the latest features is that of voice support. Hardware requirements are rather modes: 13k per station and 40k per file server. It can use the common network adapters such as Ethernet, ARCnet, Token Ring and LANtastic.

Right Hand Man II Presentation

Gerry Roberts, also of ROBCO, demonstrated Right Hand Man which is available from the Futurus corporation. This is the new, commercial version of the old shareware program. Many new features have been added to make this product a very desirable addition to a LAN system.

It is a TSR (Temporary, Stay Resident) program that occupies only 4-6k of memory. In of itself, it is a revolutionary network E-Mail, scheduling, fax and phone message center. One nice feature is the Scan module which will determine the first available time slot for a meeting of selected individuals. The scheduler module can keep track of individuals as well as teams or work groups. The data file, dBase compatible, is like a free form Rolodex file; making it easy to set up records in the various files.

Right Hand Man Remote provides the ability to dial in from one PC to another. Usually, one station of the LAN would be set up to wait for remote call-ins. Then uploads/downloads of E-Mail and phone messages can be sent/received in full duplex mode.

The cost is under $500 for a five user setup.

Multitasking: A clever method of simultaneously slowing down the multitude of computer programs that insist on running too fast.

Encryption: A powerful algorithmic encoding technique employed in the creation of computer manuals.

Desktop Publishing: A system of software and hardware enabling users to create documents with a cornucopia of typefaces and graphics and the intellectual content of a Formica slab; often used in conjunction with encryption.

High Resolution: Having nothing to do with graphics on an IBM-compatible microcomputers.

QEDIT - a brief overview

By: Tom Cone

QEDIT is a shareware text editor from SemWare. It is small, fast, and powerful.

What is a text editor ?

Text editors are specialized word processing programs that are designed to work only with ASCII text. These are text files composed entirely of characters, numbers, and punction marks that are represented using ASCII codes. Since the capability of reading and writing ASCII codes is so widespread, these text files are almost universally "accessible" by other word processing programs, text editors, and programming languages.

How is it different from a word processor ?

Features necessary to create a finished document suitable for publication are omitted intentionally. For example, in QEDIT, the following word processing features are not supported:

spellchecking/thesaurus
justification of lines (although line centering is supported)
proportional printing
multiple fonts
multiple printers
multiple columns
document outlining
document conversion

Well, why would you want to use QEDIT ?

QEDIT was designed for fast operation, ease of use, and compact program size. Even though it has too many features to list in this article, it uses less than 60K of disk space. (Compare that to your favorite word processor and I guarantee you'll be surprised !)

Because it's small, it is well suited to portable computers. Also, it's small enough to store on the same floppy disk that you keep your text files on. This makes it possible to take your files and the program with you to another computer very easily.

I have been particularly impressed with its speed. It seems especially fast loading and saving files on disk. Its search/replace functions work like lightning.

Editing commands and cursor control keys seem to emulate the Wordstar command set by default. These can be changed to suit your own tastes if you wish.

(Continued on next page)

(Continued from previous page)

QEDIT is customizable. It can be set up the way you like. You have control over the meaning of all special keys on the keyboard, colors, screen appearance and many other options.

QEDIT will handle files as large as your computer's memory will allow. All text files are created and edited in memory. The program does not swap portions to disk, as other portions are created.

QEDIT allows multi-file editing, and will let you split the screen into separate "windows". You can put one file in each "window" and cut & paste between files. While only 8 "windows" are supported, your ability to load multiple files is limited only by your computer's available memory.

QEDIT supports limited line and box drawing capabilities. It also has a powerful set of "macro" commands that seem to allow you to "automate" repetitive tasks. (I haven't used the macro functions, yet.)

QEDIT supports automatic "word-wrap" at the end of lines, if you wish. It will also "re-format" paragraphs of text for you. This makes it suitable for everyday use as a "quick and dirty" word processor.

Last, but not least, QEDIT comes with very complete documentation of program operation and customization. The evaluation copy does not, unfortunately, contain an index. But, I can see why. The documentation file, alone, is over 250,000 bytes long.

What is "shareware" ?

QEDIT is distributed as "shareware". This means that the publisher authorizes you to try the program for free, for up to 30 days, to see if you find it suitable and worth purchasing. If you want to keep using it (legitimately) you are required to register with the publisher, by paying a fee. The single user license costs $54.95. This will get you the latest version, (and inexpensive upgrades later on), a spiral-bound indexed manual, and free technical support. SemWare has its own BBS, and participates in a user-support Forum on CompuServe.

An evaluation copy of the program (with documentation) is available on-line on the Bits O Blue Bulletin Board. Download the file called "QEDIT215.ZIP".

PRESIDENT'S COLUMN:

This month I had writers block. While the editor (Marylee) had the newsletter finished a week early, I couldn't get my thoughts collected enough to write more than a paragraph. I had nothing. **Then** my NEC monitor lens arrived. If you have attended the last meetings or have read some of the previous newsletters you know my beef. I don't want to drag this story on but suffice it to say that I am disappointed with their product the NEC 4FG and now their optional NEC monitor lens. I can't see where the lens has reduced the glare. Because of the glare, I would not buy this monitor again or any of the NEC FG series Multisync monitors. This is only my opinion.

Hey Harvey enough with NEC already!

OK lets move on to Windows 3.1. Last month we discussed this product with a general feeling that all in all this is a really good upgrade, especially if you get for $32. I still believe that, and I am now leaning more towards Windows products than DOS even though some glitches still appear from time to time. Most big software companies are spending more of their money and time on developing Windows products than DOS ones. However DOS software is still outselling Windows software. Lets face it software companies just like any company is in business to make money and the money to be made is in the hot Windows platform for now and the immediate future. Don't be swayed from your software or environment just because you hear a lot of people talking Windows. Only you can determine if you need Windows. No matter what anyone tells you there is a learning curve required for Windows just like any other product including each Windows product. Additionally, efficient Windows processing requires a healthy hardware appetite. There are other software alternatives like Geoworks, Desqview and even OS/2 2.0 ($149 at CompUSA) to mention a few. If you want to get radical buy an Apple.

All this stuff can be confusing and costly. I would urge you to ask a lot of questions before you begin investing your time and money. Meetings are a place to talk to vendors and your fellow members. We have a lot of members with diversified knowledge among our ranks that may be able to help you **if only you ask.** The BBS is another source where you can post questions.

While we are on the subject of BBS. The officers of our group, through the efforts of our SYSOP Kevan Sheridan, has decided to add Fidonet Echomail as another membership benefit. At a minimal monthly expense to the group, Fidonet will allow you to post questions through the BBS for specific ECHOES (topics) like Windows, Novell, shareware, viruses, DOS, OS/2 ,to mention a few. Your messages will be viewed nationally by fellow PC users through a network of BBSs. These are just some of the basics of FIDONET. Kevan is in the process of organizing a presentation for the near future. Access to Fidonet is presently available on our BBS as a test basis. We have not determined which echoes, from the several hundred available, we will be choose.

In closing I would like to share a realization I had recently. I for one get caught up in technology at times. I am always thinking of the potential and possibilities of combining or mixing software and hardware to produce results. The results may be a computer generated letter, memo, database, graphics or whatever. With all the geewhiz stuff available we can computer generate anything. *However, certain things are sometimes easier, faster or better received when done the old fashion way.* What I mean is that sometimes it may be better to hand write that letter or memo, physically talk to someone face to face or even draw a picture when needed. Lets not always replace our ***personal*** capabilities with those of in-***personal*** computers.

Harvey Bruneau

Save Yer Fanny Disk

by Mike Springer
Ocipug

A bootable floppy disk is a MUST for each and every computer so the user can recover in case of computer and/or hard disk failure or accidental reformatting! This SYFD is customized for each particular computer because NO two supposedly identical computers are truly identical. The "emergency" disk must be kept up-to-date, especially if any changes are made in your hardware or software!

The SYFD must be of the size and type to be bootable in A: drive, the first drive that the computer's internal system looks at for boot data when first turned on. It must contain:

System files, e.g. MSDOS.SYS, IO.SYS, and COMMAND.COM, that are identical to those on the specific computer in use. These files should be copied to the SYFD when the specific computer is running properly. It is too late when the computer crashes.

A copy of the computer's CONFIG.SYS file that has been edited to reference pertinent drives and directories. For example, DEVICE=lines should reference A: drive rather than C: drive, inasmuch as you will be using the SYFD because you cannot access C: drive.

Desktop Publishing Under Windows Focus on Pagemaker 4.0

Review by: Meg Hamel, Madison PC User's Group

If you need to design a flyer, publish a newsletter, or even write a simple business letter, you now have more software choices than ever. The Windows operating environment has had a profound effect on computer publishing -- word processing and DTP programs are growing closer, sharing more features, and accomplishing many of the same tasks.

In a past issue of "Bits & PC's," Rod McKenzie reviewed Ami Pro 2.0, one of my favorite programs. Like the other word processing programs available for Windows, it is loaded with layout features, graphics import capabilities, drawing and charting tools, and other enhancements that allow you to design fairly complex documents with a minimum effort. This is a far cry from the older, text-only word processors, where just setting three columns on a page was a major achievement.

Just as word processors are moving into the realm of DTP, companies that produce publishing software are adding more features to compete with the word processors. I expect this is motivated by the bottom line as much as anything -- usually the price difference between these two types of programs is significant, with DTP being the higher priced product.

For example, Ventura Publisher, a program that has been around for years on the PC, will soon be releasing version 4.0 of their product for Windows. Only now will it include a spell checker and a search-and-replace function -- features that are included in the most basic word processors.

No doubt the marketing experts at Ventura Software, Inc., realized that many people could buy a word processor to accomplish their tasks, and save money.

Ventura's main competitor is still Pagemaker, now also in version 4.0. I've
seen lots of page space dedicated to resolving the question: "Which package should I buy, Pagemaker or Ventura?" To be honest, there are very few things that one package can do that the other one can't. I expect the differences between them will lessen when Ventura 4.0 is released.

Pagemaker is a terrific program. It is versatile, filled with features, and can be used to produce the simplest flyer or the most complex multi-page document. Like other DTP programs, its main purpose is to bring together text and graphics on a page. This is accomplished by importing files and establishing areas on the page where each element is supposed to go. Using a mouse, you can move or resize these areas (frames) while everything is displayed on the screen. Aldus has bundled Adobe Type Manager with Pagemaker to help display typefaces accurately, too.

One of Pagemaker's best improvements is the Story Editor. This is a separate window that pops up over your working document window. It displays your document in a text-only format so that it is easy to read and easy to edit. Certain features become available when working in this Story Editor, such as the spell checker and the search-and-replace commands. You can search-and-replace text and text formats, so you can change all instances of one font to another, or replace one style of paragraph with another.

You can cut and paste between different Story windows. For many people it is easier to make editing changes while in Story mode, especially because it has a word processing feel. Non-printing characters are displayed as symbols, so you can still keep track of tabs, carriage returns, index entries, etc. Style tags are also displayed.

If you are importing a document rather than creating the text from scratch, Pagemaker supports a wide variety of word processing formats. During the installation process you can selectively choose which text filters will be available. Pagemaker loads these filters when you start the program, and each one takes memory space -- so choose only those you'll think you need. You can always go back and add others or remove ones you never use.

Pagemaker has also boosted its graphics support in this version by including 24-bit TIFF and EPS images among the formats it can import. You can place graphics in a frame anywhere on the page or use their new inline graphics feature. This allows you to link a frame holding a graphic with a particular chunk of text -- the frame will stay with the text no matter where on the page it falls.

A particularly powerful Windows feature has been implemented in this version, too. You can "link" together the text and graphics files that compose your document so Pagemaker knows when one has been changed.

For example, you have created a sales chart using Harvard Graphics for Windows and included it in a Pagemaker document. If you change the information in the original chart, Pagemaker can determine that the file is newer than the one you had originally imported, and will ask you if you want to use the newer chart, or you can set it to do this automatically. This is helpful if your documents are accessed by several people -- you can keep track of when each file was placed in your publication and when it was last modified.

Pagemaker has lots of typographic controls available to manipulate your text, including 90-degree increment text rotation. You can stretch or expand text characters in a range of 5 to 250 percent of the original letters to make wide, fat characters or tall, skinny ones. There are also controls for

(Continued on next page)

(Continued from previous page)
kerning and tracking -- adjusting the space in between letters. Type sizes range from 4 to 650 points in increments of 1/10 of

a point. If "point" measurement isn't a familiar term to you, just be assured that you can adjust the size of your letters in very tiny amounts.

In the past, Pagemaker has always been known as the "one-page layout" program. Earlier versions didn't have features built in to simply manage multi-page documents. Version 4.0 has table of contents and index generators, automatic page numbering, and can handle up to 999 pages per document.

One new feature that I am not impressed with is the Table Editor. This is a separate program with its own icon in Windows. You can import Lotus and Excel information into the Table Editor (or just type in your own data). So far so good. The "bug" comes when applying a text attribute, such as superscript, to part of a cell in a table. The whole cell gets superscripted. If you are building only very basic tables of information then this may not be a problem. But if you want to italicize part of a cell, or change one character to a different font, you'll have to apply that change to all the data in that cell.

With a package as complex as this one, I have to resist the temptation to list every feature. That would fill the entire newsletter! If you are in the market for a page-layout program, remember that you now have lots of options, so you are sure to find software that will do the job. The first step is to try to identify what features you know you have to have, such as support for a particular word processing program, or the ability to create complex tables. If you have a low budget, look at any of the new Windows word processors. If you can spare the cash, and want to find a program rich in typographic and layout options, look at Pagemaker 4.0 or the upcoming Ventura 4.0 (we will review it when it is available). Both of these programs, when coupled with a font scaling program like Adobe Type Manager, will allow you to create the church newsletter, company report, or promotional brochure of your dreams.

If you choose Pagemaker, you've made a great selection. To help you get started, look for the PC edition of the "Pagemaker 4: Visual Quickstart Guide" book. Published by Peachpit Press, this Pagemaker tutorial is unique in that it uses screen shots and figure captions to describe how to use Pagemaker's features. No tedious text to wade through -- the Visual Quickstart Guide deals specifically with menus, dialog boxes, and screen shots. It is easy to follow, well-written, and handy to use as a reference after you've mastered the basics. Need to place and resize a graphic? Just follow the steps on page 78. Can't remember how to do a search-and-replace? Look on page 49.

I think this line of books are great for both beginners and people used to computers. Beginners can follow along with the pictures -- experts can flip right to the section they need. Be sure to look at these Visual Quickstart Guides when you next need a boost learning a software program.

Pagemaker 4.0 is available from:
Aldus Corporation
411 First Avenue South
Seattle, WA 98104-2871
(206) 622-5500

Computer Compulsion

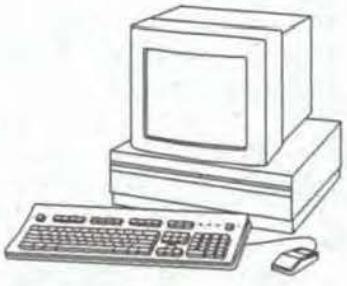
By: Alguien Desconcertado

Why do we spend so much valuable time constantly upgrading to the new versions of software--thereby reducing considerably our time to get some actual work done?

Especially when the old version worked perfectly well for the things we normally do?

We rediscover, after going through the pain of yet another learning cycle--we've merely learned new features which we will promptly forget, because we have no occasion to use them.

Why do we keep doing it?



Is it the challenge to stay abreast of new technology, keep up with the cognoscenti, be able to talk the new language about the exciting new features?

Is it a kind of time-killer enjoyment, with no real utility, like figuring out certain very sophisticated crossword puzzles?

Do we do it to impress our associates? Or to prove ourselves, somehow?

Or do we just get fascinated with software, and have a compulsion to make it tick?

BOOK REVIEW -

Q&A in 10 Minutes Flat!

Book review by: Gary W. Wodka, Madison PC User's Group

Be an expert operator in Q&A in only 10 minutes! Guaranteed! Have I got a deal for you! ...well, not exactly, but pretty darn close!

Symantec Corporation's Q&A, a database and word processor built for business, is a powerful business tool. It can also be quite overwhelming to learn. But take it a chunk at a time, and it's a piece of cake. That's the premise behind a new book published by SAMS Publishing. 10 Minute Guide to Q&A will actually take you substantially more than 10 minutes to complete (more like 4 hours), but it won't seem bad at all. And when you've completed the tutorial, you'll have had the cook's tour of one of the most powerful business tools around for DOS.

10 Minute Guide to Q&A offers a new approach to learning. You'll experience Q&A's integrated program in short, bite-sized lessons. Through short, goal-oriented lessons, you will be able to get up to speed quickly, doing the things you need to have done, without spending hours learning all the esoteric capabilities of the program (and there are a bunch of them!).

The entire book is only 150 pages from cover to cover, but those 150 pages are jam-packed with illustrations, short-cuts, tips and hints to get you up and running in a hurry. It is designed for the beginning Q&A user. Nothing in this book is difficult, and although most users will want to start at the beginning and progress through the lessons sequentially, the lessons can be completed in any order. Each lesson is designed to take 10 minutes or less (hence the title!), and each lesson takes just one aspect of the program and introduces the user to it.

The 23 lessons are each titled with the end goal in mind. For example, if you need to create a form, you can skip right to lesson 3 (Creating a Simple Form), where in 9 pages you'll have the basics of form creation. If you need a set of mailing labels, lesson 22 (Printing Mailing Labels) can show you how to design the proper template, and lesson 23 (Merging Data With Text) will teach you how to use the mail-merge features built into the Q&A program. Get the picture?

And even though the book is basically pretty easy to follow, there are still places in the Q&A program that can cause confusion and problems. These places are highlighted in the book with a "Panic Button" icon which states the common problem and its solution.

Every chapter is arranged in the same basic format: The first thing after the title is the goal of the chapter. After running through the exercises, you should have the basic knowledge necessary to complete the initial goal. Let's take a look at one of the chapters to see what we're talking about.

Lesson 3 is titled: "Creating a Simple Form." The goal of this chapter is then stated: "In this lesson you'll learn to create a simple form that you can use to build a database." The various chapters within each lesson each have their own headings, from Planning Your Form, through The Form Design Screen, Designing the Form, Specifying Information Types for Fields, all the way to Global Formatting Options.

Every screen is illustrated every step of the way, and trouble spots are highlighted with the "Panic Button" mentioned above. Following the "Global Formatting Options" chapter, the intended result of the lesson is restated: "In this lesson, you've learned the basic steps required to design a database form. Changing a design is covered in Lesson 9. In the next lesson, you'll enter information in a database."

It's the old teacher's rule: Tell 'em what you're gonna teach 'em; then teach 'em; then tell 'em what you taught 'em. And it still works! I found the book to be easy to follow. And though it is truly only a beginner's guide to Q&A, it doesn't purport to be anything else. It does what it says it will do. In a series of 10 minute lessons you'll have the basics of what can be a complicated program. It's not THE DEFINITIVE GUIDE TO Q&A (that's a different SAMS publication titled Q&A In Business), but it's a great place to start your exploration of Q&A.

10 Minute Guide to Q&A has a retail price of $9.95 and is available at several area bookstores. It is a product of: SAMS McMillan Computer Publishing 11711 North College Carmel, IN 46032

PRODUCT REVIEW -

ACCPAC Simply Accounting for Windows

By: David Jensen, Madison PC User's Group

What happens if you have a small business and haven't got your books in order? One common response is to hire an accountant to set up a system and tell you how to work it. No doubt the accountant knows what has to be done. Maybe your accountant will help you customize the accounts the way you need them customized. Will a general ledger be enough, or will you need to set up subsidiary ledgers? The accountant will help you.

Maybe you need to get better information about your projects. Are you really making money on your bids? Accountants can help with cost accounting, too. Maybe you want all of that, but have more time than money. Skip the accountant. Try ACCPAC Simply Accounting.

Any company that needs to process payroll, account for sales and receipts, receivables and payables, assets and depreciation, profits, track customers and suppliers, and know what's going on in the company, needs an accounting system. This program is not for a multimillion dollar enterprise. It's not for companies that need tight controls, such as purchase orders and verification, or any company that needs a professional accountant to set up the system -- they probably have a customized accounting system in place already. Most of the companies that could benefit from ACCPAC Simply Accounting are still running manual systems.

It is not a hard process to set up a robust, informative accounting system, but it does take time. Plan on spending a full day setting up your system. If your needs are complicated, plan on spending more time. Don't be put off by that investment in time, though. The time will be well spent. The first step is to know where you are.

If you already have a well designed accounting package, manual or electronic, your books are current, and you have just closed the books on a year, setting up this system is a breeze. You just have to learn how to use ACCPAC Simply Accounting and copy the account names and their current values into the package and you're off. Simply Accounting will allow you to directly convert files from ACCPAC Simply Accounting for DOS.

If you don't have a good accounting system, and I would guess that the majority of buyers of this package don't, you have to define accounts. Defining accounts and the system that you need for your business may seem like tedious work, and it can be, but you will gain benefits in the long run. CA seems to understand its market well here. Along with the well organized User's Guide, they have provided an Accounting Manual. While I wouldn't try sitting for the CPA exam after reading through it, the manual offers a clear description of a balance sheet and changes in equity. It tells you how to record transactions and how these change a balance sheet. It describes how to make adjustments to previous entries, how to close the books and why you might want a subsidiary ledger. If you didn't know, it explains the differences between a journal and a ledger and how they depend on each other.

The Accounting Manual also describes four special types of accounting that can be difficult to set up: accounting for payables and receivables, payroll accounting, inventory accounting, and cost accounting. After all, if you can't do the last one, you won't be doing the rest of them for long.

By now, the rookie accountant has shot a good part of the morning figuring out what accounting is, her head swimming in unfamiliar detail. The computer hasn't been turned on yet, and the User's Guide is about five times as thick as the Accounting Manual. Don't despair, just start out at the beginning of the User's Manual.

Like all Windows software that I have seen, installation is straightforward. Start your windows session and run the setup program from the floppies. It installs quickly, offers demonstration data and won't let you enter the simplest transaction for your own accounts. It doesn't know what accounts you have. That's why you had to define your accounts. Accounting packages don't have a bunch of predefined accounts that you have to shoehorn your data into. They don't know the value of the accounts at the beginning of your use of them. All of that data has to be populated into the system.

If you are unsure how ACCPAC Simply Accounting works, there is a quick tutorial at the beginning of the book. If you need a more extensive understanding of how an accounting system works and how ACCPAC Simply Accounting works in particular, there are 27 exercises in an appendix that takes you through the entire program. Once you feel comfortable with the program, it is time to create your own company file. You may copy from a template or start from scratch, depending on your accounting needs. Next comes the most important, if possibly tedious part of the program, setting up the system for operation. Each step is covered in clear detail, both in the manual and on line. Now that you've actually defined the accounts and relationships, you have an accounting system.

Once you have an accounting system, the rest is bookkeeping. The better the system you set up, the more informative it can be to you. The bookkeeping is necessary to allow you to get the information needed to understand the business better, pay

(Continued on next page)

(Continued from previous page)

your staff well, keep the government happy and prosper. Entering transactions is simple. Since this is double entry accounting, each transaction requires two entries, one to a debit, one to a credit. Each entry must be to an account with the associated account number. If you forgot the account number, that's no problem. You can query a list of accounts available for that entry and select the one that you consider appropriate.

The accounting system will allow you to create a couple of dozen reports that are able to provide you with the information you need to understand your business results, track them and tell the government what it insists on knowing about them. The reports cover all areas of cost, government and financial accounting.

I found that the entire program was easy to use, follows the Windows standard interface, and offers excellent on line help. Simply Accounting is simple accounting. It is not a top of the line, highly customizable accounting system. CA will gladly sell you a high level accounting program on the operating system of your choice, but if you need a basic Windows accounting package that provides a good level of reporting for a reasonable price (advertised for less than $140), ACCPAC Simply Accounting will fill the bill.

Picture Wizard

Review by: Gary W. Wodka, Madison PC User's Group

"Wow, Dad, this is great!" My 10 year old daughter gives Picture Wizard an enthusiastic "Thumbs Up!" Computer Support Corporation has come up with a unique approach to marketing its Arts & Letters graphics editing program: They have released 4 versions of A&L aimed at 4 different markets. No matter which version you have, you can upgrade to the next higher version or skip all the way to the $495 (retail) full blown Arts & Letters program simply by paying the difference in the prices of the programs.

The first (lowest level) of the programs is called Picture Wizard: Arts and Letters For Kids of All Ages. And while this program is obviously aimed at the kids in your family, you, too, can have a ball with the program. My daughter had been used to using the old standby: Microsoft PaintBrush. We got the first version some 5 years ago, and she literally grew up drawing pictures with the program. She then progressed to Print Shop, then The New Print Shop. She's 10 now, and much more discriminating than she used to be. She began to complain about the "jaggies." Enter Picture Wizard.

Designed to work within Windows 3.0, Picture Wizard was a breeze to install. It is not, however, a lightweight when it comes to hard disk space. With the clip art libraries installed, it ate up almost 6.5 Mb. That's a bunch, when talking about "entry level" programs. Once I got the program installed, I called my daughter over. She'd never been inside Windows, but was anxious to try out this new program, based on the "All About...." instruction manual with its clip art and profuse illustrations. This was the impetus she needed to WANT to learn about Windows. After walking her through the basics of what Windows does and how to get into it, she was ready to explore on her own.

She took the softcover manual (roughly 80 pages, all totalled) and set to work discovering what Picture Windows is all about. And it is about plenty! Using a standard Windows interface, the File, Edit, Draw, Arrange, View and Help categories on the menu bar each provide the standard Windows drop-down choices. There is a tool bar along the left hand side of the screen which gives access to 90% of all the actions the average user will be likely to need. From the tool bar you can access the clip-art libraries, symbol libraries, text and rotation tools, magnifying glass and duplication (copy) tool. You can select type style, color, fill style and line style from the same tool bar. The only drawing tools are a line tool and a curve tool.

If you are used to other drawing programs, you'll immediately notice the absence of circle and box tools. If you need to draw circles, boxes, or any one of several hundred other shapes (including just about every variety of snowflake you've ever seen) you can import the shape from the symbol library. After importing the basic shape you can bend, move, flip, stretch, shade, size, color, rotate or perform any combination of the above on the basic shape. And a combination of shapes and clip-art can be "layered" to create a virtually limitless number of graphics.

A 1000-symbol library and a 1000-image clip-art library provide a vast assortment of ready-made artwork with which to start your experimentation. And we're not talking your basic .PCX graphics here. We're talking high-quality vector-based graphics with none of the "jaggies" you've come to know and expect when working with bit-mapped images. This is high-quality stuff, Maynard!

Adding text to any page is simply a matter of choosing the type style from those included with the program (it uses its own, rather than those installed in Windows), type size,

(Continued on next page)

(Continued from previous page)

alignment you want (in order to choose an alignment, there must be more than one line of text typed), and typing your text. Text is typed into an "Enter/Edit Words" window. When you've typed in the text you want, the "add" button is clicked on, and the text appears on the page. It can then be moved, rotated, italicized, etc., just like any symbol described above.

If you've ever worked with the "old-fashioned" draw programs, you know how frustrating it can be to draw a curved line using the freehand drawing tool. It's almost like trying to draw a circle with the old Etch-A-Sketch! Picture Wizard has a curve tool that, when chosen, will take the quasi-curve you actually drew and smooth it out automatically to follow the curved path you drew. For kids, this tool is the berries!

While drawing and adding text to pages is neat, Picture Wizard has a lot more to offer. If your kids are in school, this program can help them improve their grades (That's something I've been trying to do for years!) by helping them make their reports sing! Picture Wizard has charting tools that can turn numbers into pictures and graphs. Bar charts, line charts and pie charts are easy to create, and the tutorial was basic enough for my 10 year old daughter Leigh to understand. Adding graphics to charts makes them come alive.

But that's not all! Greeting cards (with templates), banners, mazes and other fun projects are contained in a "Projects and Activities" section of Picture Wizard. We're not talking the typical greeting cards you're used to creating with Print Shop, either! Again, these are vector-based graphics and scalable fonts. When printed on fancy paper stock, they rival what you might find in many card stores. You've already sent 6 cards to everybody you've ever known? How about designing some Christmas ornaments or coloring pages? If that doesn't trip your trigger, how about calendars or door signs? You know what I'm talking about... those goofy signs that hotels use to hang on the doorknob to let someone know you're busy inside? Templates are included for these and other fun activities.

Oh, I forgot to mention one thing. When you're ready to print your artwork or activities, you'd better have a good book handy. This program prints S-L-O-W!!! And I'm not talking slowER than many programs. I'm talking slowEST!! I'm running Picture Wizard on a 386SX-16 with 4 Mb RAM. My printer is an HP IIP with 4.5 Mb of on-board memory. IT DOESN'T MATTER! When my daughter first began experimenting with the program, she thought the computer was broken. So did I. Now that we know how slow it is, we plan ahead. She's up to page 763 in War and Peace!

Picture Wizard is a great activity program. But even more impressive to me than its graphics and drawing capabilities is the fact that it actually interested my kids enough to want to learn about Windows. They actually read the manual for Picture Wizard cover to cover! I don't think I've ever read a manual cover to cover! Now my daughter is helping ME with the program. And we've got doorknob hangers on all our doors throughout the house!

Picture Wizard retails for $49.95. It is a product of:
Computer Support Corporation

(Continued from page 5)

An AUTOEXEC.BAT file that has been edited to assure that pertinent directories and files required for start-up are accessible, as with the edited version of CONFIG.SYS. Edit or delete all non-mandatory lines, such as those that deal with applications, the PROMPT and the PATH.

Selected DOS files, such as CHKDSK, FDISK, FORMAT, DISKCOPY and others that you deem essential in case the files are not accessible from the hard drive.

Selected device drivers essential for start-up.

CMOS data that describes the hardware in your computer's system.

The CMOS set-up data may be displayed on many current AT-type and advanced computers by pressing CTRL-ALT-ESC or CTRL-ALT-S. Other computers can use a utility (e.g. Norton's) or DEBUG to display CMOS data.

Most recent versions of virus detection and correction files should be available for use.

The SYFD should be verified by using it to boot. It should be saved, write protected, and stored in a safe place--with hope that you never have to use it.

TAMPA IBM PC USER'S GROUP

VOL. 5 NO. 4 April, 1992

MEETING

(2nd Wednesday every month)

DATE: April 8, 1992
TIME: 6:00 PM
PLACE: IBM CUSTOMER CENTER
LAKE POINTE ONE BUILDING
3109 W. Martin L. King Blvd.
Room 450
DIRECTIONS:

The Tampa IBM PC Users Group meets in the IBM's LAKE POINTE ONE Building across from Tampa Bay Mall one block east of Tampa Stadium.

The best entrance is on Martin Luther King Blvd. at the traffic light in front of Burdines. As you turn North off Martin Luther King Blvd. you will see the LAKE POINTE ONE BUILDING on the left & parking on the right. Join us in ROOM 450 - 4th floor. **Guest please sign in.**

PRESIDENT'S COLUMN:

Ok lets all get strapped in. The roller coaster is a fixing to start. Just as I was preparing for the OS/2 vs Windows 3.1 battle someone pulled the rug out from under me. First I am told, and later read that the parent company I work for, Dun & Bradstreet, is considering buying Lotus Corporation. Ok that's pretty major stuff by itself but it didn't stop there. Next I read where Novell is looking to merge or buy Software Publishing Corporation (SPC) ,the makers of Harvard Graphics. Now fact or fiction I am still trying to figure out both of these deals. Finally, the knockout punch, Microsoft buying Fox Software for 175 million. This deal seams to be fact and will probably be a done deal within the next couple of months. If you are an xBASE user, the last deal will be very important to you. Microsoft after many years of trying to create their own database product has opted to buy a very good and established product. My understanding is that Microsoft will not stop working on their own product yet. Microsoft is now aiming squarely at Borland International's dBASE. Foxpro by itself is a very good and extremely fast database language. If Microsoft does the right things to Foxpro to evolve it into the Windows environment it will be a powerhouse. The race to the Windows database arena and market share between Borland and Microsoft should benefit all xBASE users. These two giants will not be the first to market a Windows database product. Companies like Software Publishing Corporation (Superbase 4), Computer Associates (dBFast) to mention a few, are already there. It will take a couple of new releases to see if Microsoft can convert Foxpro from a prince to a king, or court jester. Borland has a fight on its hands, first to regain the trust of previous dBASE users which still have a bad taste from the original release of dBASE IV and now the entry of Microsoft into the jousting contest.

On April 6th Mr. Bill (Gates) will once again do his magic. He will introduce the long awaited release of Windows 3.1 at Comdex Windows World. His presentation will be shown via satellite around the country. If all goes well I will see it at the Hyatt in Tampa. Anyway if you have Windows already, start saving that upgrade money (around $49.00). This product will be shown by Microsoft at our June meeting.

OS/2 2.0 has been released to BIG corporate land via BBS and other electronic means. To date I have only heard from beta sites. The product has not been seen on any shelves. I

(Continued on next page)

(Continued from previous page)
read that IBM is thinking about $49.00 for the product. At this time I am not sure if that is for an upgrade or anyone who has DOS or what. If you plan on getting and installing the full works of OS/2 2.0 make sure you've got 30Mb of disk available, at least a 386 20Mhz with 4Mb of RAM as a minimum.

If you have been waiting for a notebook with great color, I saw one. CompUSA recently had an open house for corporate types to meet vendors and kick the tires of their products. Vendors included Symantec (the Norton people), Dell Computer, NEC, WordPerfect and others. NEC had on display their new NEC Ultralite SL/25C. Its one of the few color notebooks which uses an active matrix thin film transistor display. That's a mouthful. Basically it means that each screen pixel is controlled by its own transistor. This produces a sharper focus and brighter colors than passive matrix screens. The list price of the notebook is under $6000. If you are interested in buying one good luck. CompUSA does not have any in stock.

Sometime back I shared my opinion about the use of 14" monitors with Window wordprocessing software. I stated that the text was to small to read. Well I have an update on this continuing saga. I recently upgraded my discontinued 14" NEC 3D monitor to a 15" NEC 4FG monitor. At first I was very pleased. This monitor has a new color system which you can set, reduced ELF, VLF and magnetic field (Marylee says all that stuff is good for me). However, NEC decided to discontinue applying the anti-glare coating found on its previous monitors. To date this has produced the 1st computer related problem to my body since starting in this field in 1974. I now have a good case of eye strain which I attribute to the complete reflection of myself (scary) and everything behind me outside the building. I talked to the NEC rep at CompUSA about the problem and asked why they had decided to remove the anti-glare coating. In a nutshell he stated that the market had asked for that feature or lack thereof and that my problem may be an individual one (ouch). While talking to him I noticed that the 4FG monitor he was demoing had a NEC anti-glare screen attached. Of course its no longer called that, its now called a NEC MultiSync monitor lens and retails for $79-$199 depending on which of their monitors you have. As I stood there still smarting from the NEC reps comment that it may be an individual problem, two individuals came up pointing to the NEC 4FG monitor. A young man in his twenties and an older man in his late forties. The young man said "see that's what I need to prevent my eyestrain", well I can tell you my poor eyes lit up when I heard that. I talked to them and explained that I now suffered from the same problem and that I felt that NEC was nickel and diming us by making us buy their product (monitor lens) to prevent this. I confronted the NEC rep who overheard this conversation "Must be another case of an individual problem!" I said. **NOT!** I have ordered the NEC monitor lens to see if the eyestrain goes away or if I should bring back the 14" NEC 3D. Presently, I am highly disappointed with the new NEC monitors. Of course this is my story and 1st hand opinion. I couldn't help notice that other opinions are different, PC Magazine (January 14th issue) selected the NEC FG series as one of the Best of 1991 products, PC WORLD (December 1991 issue) rated the 4FG as a BEST BUY for a Windows monitor, PC/Computing (December 1991 issue) selected the NEC 5FG as one of their 1991 MVP and lastly in the April 14th issue of PC Magazine, John C. Dvorak makes the comment about the NEC 4FG that "I can't recommend this monitor enough" in his Inside Track column. Maybe its just me and one other end-user but this has the smell of the initial dBASE IV 1.0 recommendations and great initial reviews by the press several years back. I wonder where the human factor of an end user comes to play in all these press opinions.

Look for the continuing monitor saga in the future.

Harvey Bruneau

Humor.txt

TIBMPCUG BBS

Service: Cursory examination, followed by the utterance of the phrase, "It can't be ours" and either of the words "hardware" or "software."

Support: The mailing of advertising literature to customers who have returned a registration card.

Alpha Test Version: Too buggy to be released to the paying public.

Beta Test Version: Still too buggy to be released.

Release Version: Alternate pronunciation of "beta test version."

Enhanced: Less awful in some ways than the previous model, and less likely to work as expected.

Convertible: Transformable from a second-rate computer to a first-rate doorstop or paperweight. (Lexicoginal note: replaces the term "junior.")

Upgraded: Didn't work the first time.

Upgraded and Improved: Didn't work the second time.

Copy Protection: (1) A clever method of preventing incompetent pirates from stealing software and legitimate customers from using it; (2) a means of distinguishing honest users from thieves by preventing larceny by the former but not by the latter.

Warranty: An unconditional guarantee that the program purchased is actually included on the disk in the box.

BOOK REPORTS:

Troubleshooting Your PC

Book review By: Mike Janda, Madison PC User's Group

So what do you do when your computer stops working? Call someone in the user group, take it back to the store where you bought it (a little difficult if it's a mail-order clone), or throw it away and buy a new one?

A good place to start is with M&T Books' Troubleshooting Your PC. Written by Jim Aspinwall, Rory Burke, and Mike Todd, this 500-page "manual" provides solutions for over 136 common PC problems. Everything from no lights, fan noise or beeps (solution: check the power source) to recovering deleted files (with Norton).

Individual chapters cover PC internals, configuration, memory, math coprocessor, user interface (includes Windows and DESQview), monitors, printers, pointers (mouse, etc.), disk drives, serial communications, and my favorite, "really weird things."

Each topic is introduced with a non-overly-technical description of how it works, and is followed by a number of common problems that can be encountered. It lists different "symptoms" that may be present, discusses what may cause them, and most importantly, tells you what can be done to correct the problem.
There are also chapters on user maintenance, getting the most from technical support, and using diagnostic and utility software. User maintenance is more than just cleaning the PC (which needn't be done often). Their check-list matches mine rather closely.

Keep a bootable disk handy so you can start the computer without the hard drive (useful for hard disk failures and virus infections); make regular backups (oh sure!); keep good records of the system (like what is connected to each port, the interrupts and ports the hardware uses, the contents of the CMOS, etc.); and use care when installing new software (copy the AUTOEXEC and CONFIG files to another location before beginning installation). Do this and you can easily eliminate 90 percent of the common PC problems.

The appendix is very extensive. Included are detailed memory and port maps, IRQ assignments, keyboard codes, complete ASCII character chart, list of video modes and color codes, hard drive tables for common BIOS, error codes, cabling diagrams, and a list of user groups worldwide (the MPCUG is in it!).

There is also a glossary of computer buzz-words and a bibliography of books to "learn more about your PC." A companion diskette can be purchased for $15 and has a several popular shareware programs, all of which can also be downloaded from the MPCUG BBS.

The subtitle for the book is: "The complete, hands-on guide to upgrading and maintaining your PC." If you read through this book, you will have a good understanding of how a PC works, and more importantly, why it sometimes doesn't. It can also help you make the "right" decisions when it comes time to buy replacement parts (an upgrade!).

Troubleshooting Your PC, by Jim Aspinwall, Rory Burke, and Mike Todd, is priced at $26.95 and is available at bookstores everywhere.

Upgrading PCs

By: Bud and Alex Aaron

Book Review By: Hugh Bayless, Monterey Bay User Group

If you're like me, you have often thought about upgrading your present PC in one way or another. If you have a 286, you wonder about upgrading to a 386SX or full 386. Even if you already own a 386/33, you wonder about upgrading to a 486. And, of course, there are always things to add to the existing computer, such as more RAM, larger capacity disk drives, and peripherals like scanners and tape drives. If you have, here's the book for both of us.

If you ever wished your PC was faster, more powerful, or had greater capabilities, this book from Osborne/McGraw-Hill tells you how you can achieve it for yourself. Aside from upgrading, this is a clear and lucid explanation of how the parts of a computer fits together and do their work. Before you start on any upgrade, invest $19.95 in Upgrading PCs and save yourself a lot of time, trouble and money.

Effect of Airport Security on Diskettes and Disk Failure on Foreign Computers

By: Carl Tenning and Donald Mendroke

The following discussion took place on the TOGGLE BBS in February 1992:

From: Carl Tenning
To: ALL USERS
About: Effect of Airport Security on Diskettes

Taking Diskettes Through Airport Security

I have been warned by computer users who say that the airport security machines will erase or otherwise damage diskettes. Some say it is the carry-on x-ray screening that will destroy a diskette and others say it is the walk-through metal detector. One time I carried a 3.5 inch diskette through the walk-through, but it was not harmed. Recently, I had occasion to carry a 3.5 inch, 720K diskette to London, England. This time I carried the diskette in my carry-on case which, of course, had to be put through the X-ray screening. The diskette contained an EXE file of an airplane simulator which I wanted to demonstrate to the Civil Aeronautical Authorities. Since this was a government facility the diskette had to be screened for viruses before being allowed onto their computers. It passed the virus check okay, but they said the diskette was empty. Upon doing a DIR on their DOS machine, it said "File not found". At first I suspected the airport security screening. However, if the X-ray screening was the cause of the problem, how could the diskette be read at all (wouldn't it become unformatted)? Apparently their DOS machine at least recognized the diskette, but couldn't find any files. Needless to say, I wasn't able to demonstrate the simulation program.

Later, I wondered if the virus screening had inadvertently erased the file. I wasn't able to find out until I got back home. I carried the diskette back home the same way, in my carry-on case. Since I combined the business trip with a week's vacation, this involved a total of four airport check-ins and the resultant X-ray security screenings. When I checked the diskette on my own machine after returning home, the EXE file was still there and the diskette worked perfectly! I can't explain why the English DOS machine (it was an Apricot) couldn't or wouldn't recognize my file. Is it possible that they have some sort of virus protection that doesn't recognize foreign EXE or COM files? Next time I'll try giving it with a different extension. Since, in this case, the EXE file was the only file on the diskette, I don't know if it would have recognized non-EXE or non-COM files. Or could they be operating a version of DOS that is incompatible with the one I use (DOS 5.0)? I have formatted any number of diskettes that have been successfully read on other machines. I'd appreciate any ideas.

(Continued on next page)

(Continued from previous page)

From: Donald Mendroke
To: Carl Tenning
About: Effect of Airport Security on Diskettes

Well, I can't comment meaningfully on the British Apricot computer's DOS, but I can say, absolutely, that airport X-rays will have no effect on your diskette's stored information.

However, the walk-through metal detector can erase or scramble your data! The metal detector produces a magnetic field, much like a bulk tape eraser, and should be considered extremely hazardous to your diskettes health!

In fact, the X-ray machine is heavily shielded, and emits only X-rays (which are really a form of light). Your diskettes and laptop computer will actually be much safer if they're run through the protective shielding of the X-ray machine.

It is one of the most popular myths that airport X-ray machines will wreak havoc on your data, or even on a laptop's EPROM. Nothing could be further from the truth. EPROMs are erased by direct exposure to intense light in the ultraviolet spectrum. An EPROM requires exposure to a 12,000 uw/cm2 ultraviolet light at a wavelength of 2,537 Angstroms for at least 15 minutes at a distance of 1 inch.

An airport security X-ray machine is 1,000-10,000 wavelengths off, and is nowhere near the strength, duration, or distance required for erasure.

Ironically, those very same circuit boards are X-rayed by the manufacturer during inspection for quality control!

There are still people who get nervous when taking their laptop computers (with hard drive and diskettes) through the airport's X-ray machine, yet think nothing of carrying them through the metal detector, which would actually make a very nice degaussing coil.

One computer expert ran an interesting test. He put his primary boot disk through the X-ray machines in various airports for over two years, averaging two to three passed a week. After putting his equipment and disks through the X-ray machines over 100 times, he found that the same disk still boots any system, and he has never reformatted it. He also owns several portables with hard disks, and has one that has been through X-Ray machines every week for more than two years. He reports that he actually prefers to pass the equipment through the X-Ray machine because it offers the best protection from the magnetic fields produced by the metal detector.

Do your data a favor, let the airport X-Ray it to their heart's content.

From: Carl Tenning
To: Donald Mendroke
About: Effect of Airport Security on Diskettes

I concluded the same on the x-ray, i. e., that it did not damage my diskette, but neither did the walk through sensor affect another diskette. But I suppose some may be stronger than others and maybe be set at different intensities at different times (notice how sometimes they always seem to beep people and at other times hardly ever?). I agree that its probably better to be safe and don't carry diskettes or portables through the walk-through detectors. Go through the x-ray instead.

From: Donald Mendroke
To: Carl Tenning
About: Effect of Airport Security on Diskettes

Yes, your data can probably survive several walks through the metal detector. Although the diskette still functions, it may possibly have sustained some magnetic "damage" on the way through. Let me give a more clear example.

We've all heard about the dangers of putting our diskettes near a video monitor, especially a color monitor. But, we are rarely told the reason why. When a color monitor is turned on, there is a strong demagnetizing effect that occurs around the edges of the CRT. Diskettes should be kept at least one foot away from the monitor during this power cycle. The reason is that this de-magnetizing field will attempt to "wash away" the data on the diskettes too. What we are seldom told is that this effect on our data is cumulative and permanent.

Since many people don't immediately notice this effect, they tend to think that the warnings were overly cautious. What we may not realize is that our data's weakened magnetic domains will fail sooner rather than later because of this "abuse". I would guess that the airport's metal detector's effect would be similar, in the sense that the effect on data would be permanent and cumulative.

My recommendation would be to immediately copy any important disks that you suspect have been "abused" by magnetic fields, then re-format them and re-copy the original data back onto them. I have only recently been made aware of a color CRT's gradual and cumulative de-magnetizing effects, and now take special precautions to make sure my disks are out of its range during power on/off cycles

I've always considered myself to be careful with my diskettes, yet I'm finding new ways to be even more careful, because I didn't realize that my data could be slowly corrupted over a period of time. Like most users, I figured "as long as the data is still there, it's 100% good", not realizing that one day it may go "poof" with no apparent direct cause.

(Continued on next page)

(Continued from previous page)
I have a feeling that the airport's metal detector may also have a similar magnetic weakening effect, that slowly, over a period of time, will cause the signal on the diskette to be partially erased (weakened). It would be interesting to test this by having someone stand for a period of time in a metal detector, rather than just walking through. I wonder how long it would take for a diskette to be erased that way?

Editor's comments: My AT clone is a desktop model with the color monitor placed on top of the computer case. I often leave diskettes lying on top of my PC case, about two and a half inches below my color monitor. According to Donald Mendroke's advice, that is a bad practice. Of course, my "A" drive is just below that, about 3 inches below the monitor, so is poorly placed also, unless the disk drive casing shields the disks from damage due to the color monitor. My machine is about five years old and I have experienced no problems of that type with my diskettes yet.

My guess as to why the English machine couldn't find Carl's program is that for some reason the English machine's set up (BIOS-ROM) couldn't find the File Allocation Table (FAT) which the DIR command reads, and not finding it, listed no files on the disk. Another suggestion from the February meeting: You may have formatted your double density diskette on a high density drive laying down narrower tracks that the English machine could not read...but read on.

Postscript:
From: Carl Tenning
To: ALL USERS
About: Corrupted Diskette, Airport Security?

The problem I had of not being able to read my 3.5 inch 720K diskette on another computer may have been caused by a corrupted directory structure. The diskette appeared normal to my PC clone using DOS 5.0, but gave a "File not found" error when I tried to use the diskette on the other computer. The other computer was an Apricot running DOS, but I don't know what version of DOS. I decided to use PC Tools DISKFIX to examine the offending diskette. It reported that something was corrupted in the directory structure and went on to fix it. [The message was something like: "May not work with all versions of DOS"] I guess I'll never know whether the airport security screening caused the error or not. Now, before I take another diskette on a trip I will first use DISKFIX to make sure that it contains no directory or boot track errors. One note of interest is that that particular diskette was not formatted on my computer, but on an old Compaq computer that had an early 3.5 disk drive, so maybe that was the culprit.

SOFTWARE REVIEWS:

Harvard Draw for Windows

Review By: Bob Norton, Madison PC User's Group

Software Publishing Corporation has recently released its drawing program for Windows, Harvard Draw. A drawing program is different from a painting program, although both kinds of programs work with images. Whereas a paint program treats colors as paint that is applied onto a canvas, a draw program treats pictures as if they were made of many colored paper cut-outs. This way of working lets you go back into a picture, and change things that you don't like, while leaving the parts you do like alone.

The thing which impressed me right away with Harvard Draw was the speed, especially in handling very large drawings. For example, a picture of the starship Enterprise, stored in a 269K bytes file, took only 15 seconds to draw on a 486. There must be thousands of little shapes in that drawing! Speed in a draw program is very important, as you will want the picture to redraw itself every time you make a change. Waiting around for slow drawing to complete could quickly get irritating.

Of course, you can use the outline mode for an image, which is even faster. But I preferred to use the preview mode, so that I could see the full color of the finished images as I was working on them. Using a computer is more satisfying when you can see exactly how your work is progressing as you do it. This way, you can avoid the big mistakes, and having to erase and redo a lot of work unnecessarily.

On the other hand, installing Harvard draw was not so fast. I chose the full install, and even with a fast computer, it took about a half hour to decompress and load all the files and clip art. I estimate that there were a little under 30 MB of files expanded onto my disk during installation, so you better have some space free to load this package. A collection of 47 Bitstream fonts is also added to your disk as you load Harvard Draw. These fonts are the ones available to you to add as text in your drawings, and not the normal Windows fonts. The fonts chosen for you seem to be a good selection for normal use, but I was disappointed that I could not easily find out how to add more.

I tried Harvard draw in both normal VGA mode, and also in a 32K color mode. In both cases, Harvard Draw was reliable, and did not crash, even with my attempts to do things in what were undoubtedly unexpected ways. I did notice that the icon for Harvard Draw blanched out in 32K color mode, as did several other programs' icons. I would chalk this up to being a fluke in the operation of Windows 3.0 and not a problem with Harvard Graphics.

(Continued on next page)

(Continued from previous page)
The clip art package is large, and the symbols are many and well done. I like the little thumbnail sketch that you get as you select each one before you load it. This allowed me to quickly look through hundreds of images to get the one I was seeking. With all these sources of clip art and symbols available, even I can put together an drawing with some meaning. Drop in a few images, size them, add some text and a background if you like. The tutorial that comes in the Learning Guide walks you through eleven lessons to show you how to do all these things and more.

Harvard Draw will let you work on more than one picture at a time, through the use of the Window menu choice. This is a little awkward, as you cannot make a new second window through the file/new menu command. The ability to work on two drawings at once is especially nice if you are lifting, er ah, recycling, part of previously done pictures. Because Harvard Draw can import images from eleven different vector formats, and has a good autotracing ability, you can use parts of pictures from a wide range of other sources not included in the package.

The color selection bar at the top is a very nice feature. It holds 150 colors at a time, and you can pick a group of colors from a set of twelve predefined palettes. If none of these palettes suits your need, you can define your own as well. You can choose your color model too when you define your own colors. Also found on the color bar are a few textures and color fill effects. For example, in the earth palette there was a fish texture and several tree textures, as well as some earth tone graded fills. This grouping of colors and textures is very convenient.

For beginners like me, there is a built in dynamic help bar at the bottom of the edit area. This is called the information bar, and it tells you in a single line the function of each control as you put the cursor over it. If you get so experienced enough that you no longer need this kind of crutch, you can turn it off and reclaim some additional drawing area. The same idea applies to the coordinate bar, which is just above the color bar. If you do not want that information, you can turn it off and boost your drawing area also.

The tools form a third strip along the left edge of the drawing area. Many of the tools can be customized, and this can be done by just double-clicking on the tool. The tool strip does not automatically change size, so that if you run Harvard Draw at less than full-screen, you may lose access to some tools. Of course there are also scroll bars as needed in both dimensions, which will let you work with drawings bigger than the viewable area.

There are so many features that I have not begun to list them all. This is a very powerful program, and you should allow some time to learn the features that you will want to use. From my comparisons with other draw packages on the market, I would say that Harvard Draw as powerful or more powerful than any other Windows drawing program, and it does it at a lower price than the other comparable programs. Some of the features that are most important are:

- Capacity for 99 layers of drawing.
- Three varieties of zoom.
- Easily changed Bezier curves.
- On-line glossary and context sensitive help.
- 18 types of tools.
- Multiple levels of undo and redo.
- Handles drawings too big to fit in memory.
- Autotrace of color or black and white bitmaps.
- Many special effects.

Harvard Draw for Windows also has the ability to work with images from the popular Harvard Graphics program, which is DOS based. It can import CH3 and SY3 files, among the many other formats.

Harvard Draw seems to be a very good value to me, considering the price and the performance. I believe that a competitive upgrade price is available, which would allow you to upgrade from a DOS or Windows drawing program you already own to Harvard Draw.

The list price for Harvard Draw is $595 and is available from:

SuperPrint
Souped-Up Windows Printing

Review By: Meg Hamel, Madison PC User's Group

It's a printer driver! No, it's a print spooler! No, it's an on-the-fly font scaler! SuperPrint is indeed all three things -- a super-duper Windows printing package that improves your printing options through three separate utilities.

There are several programs that have broken down barriers when it comes to printing within Windows. SuperPrint's printer drivers, spooler, and type scaler work together to speed up your printing and increase your flexibility.

For starters, Zenographics includes printer drivers for several kinds of non-Postscript printers. These "SuperDrivers" appear in the Control Panel/Printer menu just like any other installed printer. Version 2.0 of Super-Print includes drivers for HP
(Continued on next page)

(Continued from previous page)
LaserJets and compatibles, HP Deskjets, HP Paintjets, Canon LBP laser printers, and most 9- and 24-pin dot-matrix printers. Also included are metafile drivers for output on remote devices such as a service bureau's film recorder, and a bitmap driver that creates a Targa, TIFF, or BMP bitmap file from the document pages.

These drivers offer you more choices than standard Windows drivers. These choices include generating pages in reverse order (last page first) and "draft" printing that utilizes some printers' lower resolution to produce faster output (such as printing at 150 dpi on an HP laser). You are also given three multitasking options that control the rate at which the SuperDriver allows other Windows programs to function and how often it checks the status of Abort, Pause, or Stop buttons. You can experiment with this setting to fit your particular use requirements.

SuperDrivers also improve the look of graphics printing by offering several dithering patterns and gray levels to print color or gray-scale graphics on black-and-white printers. I thought it did a good job, especially on dot-matrix printers, which could only print smudgy images before. SuperQueue is a print spooler that replaces Windows' Print Manager.

SuperQueue is more efficient, and allows you to return to your work faster. You can also use the metafile driver described above to save your printing projects as files to be printed later. SuperQueue has a job list to which you can add these file names and run a big batch file. I found this useful when doing merge printing letters -- I just queued up the saved files before I went home for the night.

If you have SuperQueue running and minimized to an icon, it will automatically print in the background. I found that using SuperQueue with Ami Pro returned control of the cursor back to me faster than regular Windows printing.

The third utility in this package is SuperText, a font scaler similar to Adobe Type Manager. It uses scalable outlines to display screen fonts accurately, and also prints crisp type on non-Postscript printers.

One of my favorite things about working in the Windows environment is that everyone can get great-looking type, no matter what the printer. Using a font scaler, such as ATM or SuperText, allows you to have scalable fonts and WYSIWYG screen representation of those fonts. SuperText has several advantages over ATM, especially because it supports several font formats. Whereas ATM only accepts Type 1 PostScript fonts, SuperText lets you install Type 1, Intellifont, Nimbus Q, Bitstream Fontware, Bitstream Facelift (Speedo), or HP softfonts (.SFP, not scalable).

Support of all these fonts gives you maximum flexibility. I have Speedo fonts from one software package, a few Intellifonts from another, and dozens of Type 1 fonts. I can install and use all of them on any document, on any printer. The SuperPrint package itself comes supplied with many typefaces (Times, Sans, Sans Narrow, Courier, Symbol, Dingbats, Avant Garde, Century Schoolbook, Palatino, Bookman, Zapf Chancery, and Bitstream Charter). This is enough to snazz up any document!

Another neat feature of SuperText is that you can change the name of any font that is installed. Why is this useful? Many typefaces are identical but are given different names. For example, the Palatino fonts included with this program are actually called Palermo, for copyright reasons. I can easily change this back to the more recognizable name. Or perhaps I've installed ITC Garamond, and want to dump the ITC part, so that I can find it in the alphabetical order I expect. This feature also lets you confirm that four weights of a font (regular, italic, bold, and bold italic) are accessible under one font menu name, instead of being all listed separately.

All in all, I found SuperPrint to be useful and speedy. If you do a lot of Windows printing and you don't have convenient coffee breaks for when your job is running, try SuperPrint. It can be found for about $129 from mail order sources -- for a set of enhanced printer drivers, a print spooler, a type scaler that supports lots of file formats, PLUS several typefaces to get you started... it's a SuperDeal!

Taking a Trip, But Not a Fall
Keep That Notebook Running With Traveling Software

Review By: Rod McKenzie, Contributing Editor, Madison PC User's Group

Traveling Software has carefully focussed their attention on the needs of users who take their computing power away from the home -- those of us who hit the road and leave behind the office based "main machine." Laptop and notebook users are very likely using one of Traveling Software's (TSI) products already. Many OEMs advise their customers to never leave home without it.
(Continued on next page)

(Continued from previous page)
This review covers three recent upgrades that TSI has delivered. One is the PC-to-laptop link for transferring data, one is for the laptop or notebook itself, and the last one ties in the PC to a pocket organizer, Casio's B.O.S.S.

LapLink Pro

The flagship of the TSI fleet is LapLink Pro. It gives the user the means, by serial or parallel cable connection, to exchange files from one computer to another. If the "other" machine is farther away, connect with a modem and make the transfer to and from the remote location. The data transfer capability is enhanced over prior versions of LapLink by the introduction of new "core code" technology -- which TSI terms a "Universal Communications Object," and the development team code-named it "Blackbird." The approach makes the transfers occur independent of the hardware being used.

LapLink Pro is not a Windows 3.0 application. It's solid DOS, but it is Windows aware and comes with .PIF and .ICO files. It will reside very happily on your Windows Desktop and look like it belongs there.

Once the connection is made between the two machines, whether it's by modem or a cable across the table, the transfers can begin. The user has the choice of file-by-file transfers, updating just selected files, or a two way transfer where the files with the latest date and time stamps are copied over the older versions of the files regardless of which drive has the latest file. TSI has improved the transfer rates by compressing the files before the transfer begins.

Once Laplink is installed on both machines, the local drive and directory information will be displayed on the left side of the screen, and information about the remote machine will be displayed on the right side.

The cabling supplied with the program handles both parallel connections, between printer ports (LPT1), or between serial ports (COM1-4). In the case of the serial cable, each end is equipped with a 9-pin and a 25-pin connector. The cables are lighter and longer, now eight feet in length.

Battery Watch Pro

Users will find this second TSI product especially helpful when they're on the go and spending a lot of time on the ni-cad batteries. Notebook PCs powered by these batteries have a limited running time, and it's very easy to work longer than you thought, and find that the machine is ready to pack it in. Battery Watch Pro helps by keeping track of battery use and warns the user when the end is near. It's a good way to avoid nasty surprises.

Like it or not, notebooks and laptops have always been designed with the trade-off between weight and size and hours of battery life. The back-lit screen, the drives, and the CPU itself all draw power, as does an internal modem, if one is in use.

TSI frankly calls Battery Watch Pro a software solution to a hardware problem. BW does this by first learning the expected life of a fully charged battery for the specific model of laptop or notebook where it's installed. It deducts from this inventory of "energy" the amount consumed by each peripheral and the CPU itself, using a mathematical model. When the "balance on hand" is only sufficient to cover another 30 minutes of operation, the first of several alarms goes off. There are 15 and five minute alarms, too, but that might be calling it too close. Remember this is a calculation of the remaining battery life, not a direct measure. Sorry, batteries don't have dipsticks to read.

Battery Watch Pro supports Windows, as well as DOS, and is installed to a RAM disk or to a hard disk. It won't run from a floppy alone. BW supports a wide range of laptops and notebook machines, from Amstrad to ZEOS. Even unlisted brands can benefit from Battery Watch Pro when the user teaches the program what the system has and uses. It's a trial and error process adjusting the rate of drain and the endpoints. A little patience and persistence is needed to get the most from the program.

BW can show the user the remaining time estimate in a small window in the upper right corner of the screen, or in the minimized icon if it's running in Windows. The icon is active, displaying an animated gas gauge, and below it is a digital display of the time remaining.

PC Link Plus

The last program from TSI is PC-Link Plus, a program that makes the connection between the PC and the Casio B.O.S.S. The B.O.S.S. is a pocket organizer that is usually equipped with 64K of memory for storing names, addresses, phone numbers, memos, and other information. It can be very handy. I've used one for over two years and find it's a useful tool, but there are a few problems. One is the small size of the keyboard. It may be fine for the occasional entry of a few lines of data, but not for long lists of names and numbers. It's too easy to hit the wrong key, or not press correctly and leave out a character. Also, there's no direct method of printout.

So that's the problem. Now what's the solution? PC-Link Plus, a program that formats and transfers data between the organizer and the PC. It offers several data input options and printing options to the user. The link is a small plug cord unit which runs between the serial port of the PC and the small phono socket on the side of the B.O.S.S. If anyone's been

(Continued on next page)

(Continued from previous page)
reluctant to use an organizer because they didn't want the tedium of manually keying lots of data, this is the answer.

I've used the original PC Link, between the Radio Shack version of the B.O.S.S. and an old NEC Multispeed laptop -- dual floppies all the way. The new PC-Link Plus is faster and the data entry screens are improved. The program runs faster and there's the option to select and limit the entries to be transferred or printed. Over all, there's a lot of time saved. Earlier versions of PCL would generate duplicate records if a file was loaded a second time after editing the entries. The user would then have to manually delete entries, a tedious process. PCLP avoids this by automatically deleting the duplicates.

The custom printing option allows the user to select isolated records to be grouped together to make special paper based lists. It's almost as easy as laying the organizer on the photocopier!

Another improvement in PCLP is the ability to mark records to be deleted or edited. This is especially handy when making changes to the calendar schedule or the telephone list. The scheduler can copy recurring events -- for example, a user group meeting that happens every second Wednesday of the month. But wait, sometimes it's at 7:00 p.m. and sometimes at 8:00 p.m. No problem! Go in and edit the "odd" meetings that don't fit the general rule.

If this is what Bill Gates, at Microsoft, means by having "Information at Your Fingertips," he's got some allies over at Traveling Software. They're making it possible to share data between these electronic storehouses of information, keeping the hardware from running out of power and letting the users put a little of that data from their PC right into the shirt pocket.

The pricing on these Traveling Software products is:
LapLink Pro - $169.95 (upgrade $59.95)
Battery Watch Pro - $49.95 (upgrade $19.95)
PC Link Plus - $129.95 (for upgrades call TSI)

Micro-Phone II for Windows V 1.0

A Review By: David Bradshaw, NWA-MCUG - NorthWest Arkansas Microcomputer User Group, Springdale, Arkansas

Introduction -
The setup program provided with Micro-Phone II for Windows made installation easy. Less than one megabyte of hard disk space was required. Evaluation of this program did not require much time. I encountered no functional problems with Micro-Phone for Windows.

My two main expectations for a communication program running under Windows were that it multitask and provide graphical capabilities. At first I was disheartened by the lack of ANSI capabilities. This made communication sessions seem colorless and more difficult to follow. However, the multitasking worked very well and was well supported with script capabilities. I was able to upload, download, and logon in the background while working with other programs. The documentation is very thorough in explaining the capabilities of the program.

Recording Scripts -
I used the script record function which is called "watch me" to automate my logon to various BBS's. This feature allows easy automation of almost any repetitive telecommunication task without having to be knowledgable in a script programming language. It was only necessary to manually go through the logon while the "watch me" feature recorded the script automatically. I assigned these logon scripts to buttons along a button bar at the bottom of the screen. I was then able to log onto any of the BBS's with a single click of my mouse and then switch to a different program till the logon was completed.

Transfer Protocols -
The upload\download protocols available are sparce. The lack of Zmodem transfer protocol is to me a big drawback. Only Xmodem and Ymodem are provided. However, I've read that version 2 corrects this problem by adding Zmodem to the protocols.

Conclusions -
Micro-Phone II provides some excellent script capabilities which support the multi-tasking capabilities of Windows well. Scripts for Compuserve, a mini BBS, and other functions are provided. If your goal is to automate and multi-task then Micro-Phone is a good choice. However, if you want a more graphical interface I suggest you look at Wincomm or Unicom. Micro-Phone is a competent program with all the essentials.

Secretary's Report

TAMPA IBM PC USER'S GROUP
MINUTES OF 5/13/92 MEETING --

WOWeee!!! Those who did not make this meeting missed another mighty good one. And as much as I hate to say it, I guess I must give credit where credit is due - That we have such good meetings is in very large measure due to the time and effort our illustrious puts into our club. He arranges for our guest speakers, does a good bit of research to bring to us the latest developments in the computer world - much of which I, for example, would not receive otherwise at all, coordinates for our facilities, and so on. Those of us who benefit from our club would do well to give "Old Harv" a "Thanks, Pres. I really appreciate all you do for our club." I do so publicly, here and now!! Thanks, Pres. I really do appreciate all you do for our club. It means a great deal to me.

Speaking of our Pres, everyone was waiting and watching as the hour approached 6 PM, wondering when and if the meeting would begin. The excitement and tension grew as the little hand reached 6 and the big hand reached 12. And then, in comes our Pres in shining armor on his white steed, just in the nick of time - and the meeting commenced only about 5 minutes late. (Harvey and his steed had been held up by a horse jam at the feeding trough. He then proceeded in his inimitable style to lead us through another very good meeting.

INDUSTRY NEWS

Among the several industry news items brought to the meeting were:

-- Harvey reported that a Windows Resource Manual that was out for Windows 3.1 was a very good book and could be had for about $18 - for those who might be interested in Windows at that depth.

-- CorelDraw is expected to come out with version 3 of that program sometime this summer. If you have your eyes out for this one, you might consider waiting a little while.

-- Word Perfect for Windows apparently has had a few problems. Well, there is a fix available now. If you are having a problem with that program that you can't fix, a maintenance upgrade is available from the Word Perfect Corp for about $15 to cover shipping and handling. If you fit this criteria, give them a call. And, it is rumored that Word Perfect Ver. 6.0 will be out in a few months.

(Continued on next page)

(Continued from previous page)

-- Also in the rumor category - Microsoft is now working on DOS 6.0 and that the 6.0 version will include Stacker. (See Commentary below.)

-- Harvey reported that Wired for Sound PRO for Windows was available at Comp USA for about $20. He thought it a pretty neat program, which included over 100 sounds and could be programmed to make just about any sound desired at just about any computer event desired; the sounds are editable and the volume adjustable. The program does not include a drive for Windows, but one is available on the BOB BBS under the name of SPEAKER.EXE (a self extracting program).

And then Harvey introduced our first guest speaker.

PROGRAM REVIEWS

Norton Desktop For Windows

Randy Johnston, the Corporate Account Rep for this area for Symantec Corporation, was on hand to give us a rundown on Norton Desktop for Windows. Before giving us a review of the program, he answered a few of the always asked questions, like: Yes, Norton Desktop Ver 2.0 (the latest) is compatible with Windows 3.1; it uses about 6 meg of hard disk space, including about 3 meg of help files (which could be removed if you do not need them); and the MSRP is $149, but he gave our club quite a few coupons which allow purchase of the program from Symantec for $69 - good until 13 June 1992.

Randy stated that Norton Desktop combined Windows Progman, file Manager, Print Manager and Task Manager onto a desktop, and provided the capability to customize the desktop to just about any configuration one might desire, bringing in just about any of the Windows programs onto the desktop. It expands on Windows 3.1 capabilities with some very helpful enhancements, such as:

-- Setting up individual files on the desktop as a button so that clicking on that file button will load the program that generated the file, with that file loaded into the program. You can also drop the file on a different program (which must be capable of working with the file, of course) and desktop will start that program.

-- Has provisions for up to 14 buttons on a button bar, giving you 14 "button ready" macros to simplify operations. The buttons can be created/changed quickly and easily.

-- Desktop has an excellent file viewer capability (including a wide variety of graphic formats) which has 75 different filters/viewers. It has the capability to view 2 files simultaneously. And, it has a search feature, but does not yet include a cut and paste capability.

-- Desktop has a Launch Manager/List which gives the ability to quickly call on selected (your choice) utilities while continuing to work in an application. One example Randy used was you find yourself in an application with need to save something to floppy, but you don't have a formatted floppy available. What else, click your Launch Manager and select format and Walla! - there is your formatted floppy without leaving your application.

-- Allows the movement of entire tree segments from one drive to another with the simple click, move and drop action with the mouse, a nice feature indeed for those occasions when major restructuring of disks take place.

-- Norton Desktop has many other nice features, including some of the utilities for Norton Utilities, such as: Key Finder, a screen saver with several options, Smart Unerase, a shredder , Disk Doctor (though not as elaborate as in Norton Utilities), Backup (which can restore from DOS), an antivirus capability, Timeline For Windows, and PC Anywhere.

There were too many features for me to keep up with, but the foregoing list gives you a feel that this is a very nice program with many very nice features. And Randy did a super job of giving us an overview of the program and answering questions from the audience.

To Randy Johnston and Symantec - a VERY BIG THANK YOU for a job VERY WELL DONE and for the programs donated.

EASYCAD2

After the break, John Fought of Data Flex gave us a rundown on EASYCAD2. (John is the Florida dealer for EASYCAD/FASTCAD programs.) CAD, I believe, stands for computer aided design/graphics.

EASYCAD is a simplified variation of FASTCAD and is designed for those with design/drawing needs somewhat simpler than design engineers, such as floor plans - though the program is certainly more powerful than that. It lists for $199, but John stated that any of our members could purchase the program from him for $179 (he doesn't have much margin to work with). In contrast, the 2D version of FASTCAD lists for $795, the 3D version for $2995. So, we are talking about some very powerful and rather expensive software. I have little knowledge of CAD software and have no idea of pricing. I am led to believe, however, that these are very competitive prices.

(Continued on next page)

(Continued from previous page)

EASYCAD2 requires 512K of RAM, but 1 meg is desirable. It will work on an XT, but the better the computer, the faster the program. A math coprocessor is not required but the program will use it if available. It is reportedly faster than AUTOCAD, a competitor I believe.

EASYCAD is an impressive program. It draws in real world increments/values, which are settable by the user, and will quickly convert drawings to measurements other than those in which a drawing was made (e.g., SAE, CM, English, pixels, etc.). And, it really does do the conversion quickly. It has a wide open screen with pull down menus. John demonstrated several features of the program and I, for one, thought it a very nice program.

John then went on to give a very brief overview of some of FASTCAD features. If you like EASYCAD, you'll really like FASTCAD. It offers multiple windows (up to five I believe) giving different views of a drawing. And drawing can be done across views allowing for greater speed and accuracy. I am too much of a layman with CAD to do John/'s presentation and the programs justice. They were all impressive programs and I would suggest that if you are into CAD, that you give these programs a look.

To John Fought, a VERY BIG THANK YOU for a very good job.

AND THE WINNER IS

Due to the generosity of Symantec, three programs were available as door prizes, along with the 50/50 cash drawing. Those among us to have the good fortune to win are as follows:

Parker Monroe -- Norton Desktop for Windows
Gary Palmea -- Norton AntiVirus
Emelie Jurado -- Norton GamePack
Ruth a. Radlin -- 50/50 ($46)

COMMENTARY

Well, I don't know quite where to begin. My subject is software in general and Microsoft in particular. In general, there is just too much good software out there and there are those of us who want it all. The problem is that never my wallet nor my hard disk will allow me to have it all - not even very much of it. So you try to pick and choose. I try, but sure as heck as soon as I commit myself I am sure to come across something else that has one or more better features, or the same software company will come out with an upgrade for the very product I bought. More bucks!! We hear and see about the new products of many of the major software companies at our User Group meetings, and many have capabilities that you don't have and could sure put to good use. And you ask some of your fellow users about some of the programs and you are almost certain to come up with conflicting views - WP 5.1 has it all over Word for Windows, and I wouldn't be caught dead with Word on my computer; the next person takes just the opposite view. I do not have unlimited resources as some of my compatriots apparently have and I must try to constrain my outlay for computer goodies (my boss tells me). What do you do? I , and perhaps others, would be interested in how you deal with the constant improvement of software products and the great variety available for any given purpose. How about some input for the newsletter on this subject!!

As to Microsoft in particular. I am getting the impression that they are trying to make it very difficult for many of its software competitors - and me in the process. I had Windows 3.0. I acquired Powerpak for Windows as a font source and printer driver. Then Word for Windows came out. Aha! Powerpak for Windows won't work with Word. So upgrade Powerpak. Then, Powerpak upgrade wasn't even settled in on my hard drive when Windows 3.1 came out. It included True Type. And what do you know - the Powerpak I just loaded won't work with Windows 3.1. Another upgrade. What's more, Bitstream Facelift and Adobe, both of which I had, won't work with Windows 3.1. More upgrades? No, Bitstream wants $40 and Adobe wants $30. I'll settle for Powerpak - while I had to pay $6 for the Word for Windows upgrade, I am paying nothing for the Win 3.1 upgrade. A pat on the back for Atech software. But that is not my point. Doesn't Microsoft talk with anyone else? Are they trying to run a lot of others out of business? Do they have any consideration for the users other than their wallet? One of our guests tonight mentioned it might be time for Microsoft to have a comeuppance. Can IBM do it with OS2/2.0? I don't know, though I have druthers. But I do feel like Microsoft is taking advantage of me. What do you think?

Co-Secretary - Jim Clark

■■■

WINDOWS KEY COMMANDS

By: Jim Karsjens, North Orange County Computer Club

Windows may be graphics and mouse oriented, but to move around between applications, you need to know the following Non-letter and Non-function keycontrol codes:

Alt Tab	Toggles between applications
Alt ESC	Switches to next application
Ctrl ESC	Displays task list
Alt Space	S\Displays application Control Menu
Alt End	Toggles in & out of Windows
Shft f4	Tiles the open Windows
Shft f5	Cascades the open Windows
Ctl f4	Closes active window
Alt f4	Exists Windows

PRESIDENT'S COLUMN:

Thanks Jim. For those of you who read the minutes of the May meeting, please believe me when I tell you that I didn't pay Jim any money to write that about me. However, I appreciate the good words from Jim and others about me and our group. Just remember that our group exist solely on the dedication of a small group of volunteers of which I am only one. A sincere attaboy to a board member is one of the few rewards he or she gets for contributing their time into our group.

If you missed the May meeting, well you lost. We had two vendor sessions. Randy Johnston of Symantec (you know, those people who bought Norton out) did a bang-up job! The total amount of money collected ($98) for the raffle was the largest I can remember. That speaks a lot for the Symantec products that were donated. Unfortunately, my three bucks didn't win that Norton Desktop for Windows or half of the collected money. Well maybe next month. Our second presentation by John Fought of Dataflex (St. Pete) covered three CAD programs. It was slick to look at the model of a house from the outside and then go inside the house to look out. Of course this was the high end 3D product, but it was neat.

That May meeting was mighty long and I will try not to schedule two vendors at the same time in order that we can all get home at a reasonable time.

The June meeting should be a dandy! Kirk Covert of Microsoft will demo Windows 3.1 and Visual Basic. This is a must see presentation if you are new to the Windows environment or Visual Basic programming language. While I am sure Kirk will field questions, please realize that he is here to demo these programs not to replace the Microsoft support department.

As I mentioned at the last meeting, the management of the building (not IBM) has done away with the security guard to the building. This means that if you are late there is a good chance that you may not get in. Be on time.

Over the last three meetings I have noticed more noise than usual during our meetings. This noise is usually from conversations in the audience. While no one has complained I feel that I must speak up before this gets out of hand. I personally find it irritating and embarrassing. Please respect the others around you who are trying to listen to the presentation and to the spokesperson providing us with their personal time. If you must carry on a loud lengthy conversation use the hallway or wait until the break.

Wordprocessing in Windows on a 14" screen, **revisited.**

Also mentioned at the last meeting, Wordperfect has released an update to Wordperfect for Windows. Of the several new features, there is one that alleviates that eye squinting that I have been whining about for the last several months. Its the new ZOOM feature. This feature allows you to zoom the document in and out to your liking. This means that your 10 point text can look bigger by zooming to 150% or the max of 400%. The latter is a bit much but 150% is easy on the eyeballs. Maybe when I get my new bifocals I can go back to the standard 100%.

Since we are on the subject of wordprocessing and Wordperfect, we are planning on offering the famous Ed Buzza Wordperfect classes again. At our last board meeting the general feeling was that these classes should be offered the same night and time of the general meeting. The class would last approximately 1 hour and rejoin the general meeting during its break and after the vendor presentation. If you have questions, concerns or opinions about the class bring them up at the general meeting or leave a message for me or Ed Buzza on the BBS.

Harvey Bruneau

Voodoo DOS

Book Review by: Hugh Bayless
Monterey Bay Users Group - PC

We've heard of Voodoo Economics, but Voodoo DOS? Well, this is the first in a new series of Voodoo books being published by Ventana Press. The idea is that each will offer a bag of "magic tricks" on a particular subject.

Voodoo DOS, by Kay Yarborough Nelson, does just that with MS/PC DOS versions up through 5.0. For example, edit your CONFIG.SYS file to replace your present prompt, which is probably "prompt pg", with "prompt pg $e[7m" and your prompt will appear in reverse video.

Some other tips: XCOPY is faster than COPY. You can use XCOPY to copy files by date. For example, "xcopy *.* a:/d:01-16-92 /s" which will copy all files modified after 1-16-92, including any files in subdirectories.

There is an excellent section of tips and tricks for managing your computer's memory, getting the most out of your drives, using your AUTOEXEC.BAT file, and more. It is the kind of book I wish I had had access to a few years back. Unless you are an expert with DOS and computers, Voodoo DOS can be a goldmine of knowledge.

The book sells for $19.95, but Ventana Press is offering the book to members of established user groups for $12.00, including shipping, until June 15, 1992. Call 919/942-0220 or FAX 919/942-1140, and identify your user group affiliation.

BOOK REVIEW -

By Hugh Bayless
Monterey Users Group - PC

Guide to Notebook & Laptop Computers
By: Bill Howard

Ziff-Davis, the publisher of PC Magazine, is now in the book publishing business. Their recent book offerings are extensions of material that has appeared in PC Magazine, and are similar to the magazine articles in subject matter and clarity but, of course, cover a subject in much greater depth.

The Guide to Notebook & Laptop Computers, their latest offering, is a good investment for anyone considering the purchase of a laptop computer. It is not a catalog of what's on the market today. Rather, it guides the buyer in making the decision on what to look for and what to buy. It starts with the question of what size and weight you should pick, and goes on to consider performance. This book helps you consider all of the uses to which you might put a laptop computer and guides you in making your choices.

Laptops have the advantage of small size and light weight, but they have their disadvantages too. Before you buy a small computer, there are many questions you need to ask yourself. Is your portable going to be your only computer or your second computer? How much storage do you need? What type of screen do you need? How much can you afford to pay? All these questions and more are considered carefully, leading the reader into making a wise and well-considered decision when the time comes to make the purchase of a portable computer.

This book comes with a disk filled with utilities that can be useful both on a desktop and a laptop computer. The 416-page book, with the disk, sells for $29.95. If you are considering the purchase of a laptop computer, this will be money well spent.

Tampa IBM PC User Group is a proud member of Association of PC User Groups and we appreciate the support it gives to the officers and leaders of our group.

QSORT - an overview

By: Tom Cone

QSORT is a DOS text file sorting utility. This overview is based on Version 4.03 of the program (the same version currently available from the Bits O'Blue Bulletin Board System).

What is a sorting utility ?

A sorting utility is a special software program designed to quickly and easily "sort" text into alphabetic (or reverse alphabetic) order.

Why would I use one ?

It can rearrange text file lists that you are keeping with your word processor. This means you don't have to try to keep the list "in order" by hand. You can simply add new text at the end of your file, and "sort it" later on.

If it supports multiple sort levels, then the program can rearrange your text list in logical groupings that are easier to work with.

Features of this program ?

QSORT is very powerful and flexible.

It handles:

- fixed-length "records" or
- variable-length "records"
- based on single lines of text, or
- using delimiter characters, or
- special multi-line "records".

It can handle up to 30 sort levels, using "keys" that you provide to identify portions of each "record" that you want to sort with.

For example, you can sort multi-line mailing address labels, or lengthy lists arranged with individual "records" on separate lines.

Limitations ?

Requires text file to be in ASCII format. Does not support WordPerfect 5.x files directly, for example.

The "structure" of your text file must be "regular". You must set up the text file using a "pattern" that does not vary from entry to entry. For example, you can't mix fixed-length records with variable-length records in the same file. QSORT

(Continued on next page)

(Continued from previous page)

assumes the internal structure of your entries will be the same from record to record.
This is not unique to QSORT. Other sort programs have the same limitation.

QSORT is driven by a "command line" that you must type in. This is somewhat complex and is harder to use than selecting options from a menu would be. The command line includes the name of the input and output files, all sort keys, and other information the program needs to do its work with your particular file.

Here's an example of a three record list that I want to sort in order based on date, and filename:

```
08/11/87    TURBO-C.ZIP      6
01/10/87    BUSTHINGS.ZIP    5
08/23/85    KERMIT.ZIP       5
```

The command line syntax would be:

```
QSORT infile outfile /7:2/1:2/4:2/14:12
  where "infile" = source file
        "outfile" = output file
        /7:2 = year
        /1:2 = month
        /4:2 = day
        /14:12 = filename
```

That's a lot of work, and there is much room for error. Wouldn't make sense on such a small file. But what if you had a list that had 2 or 3 thousand entries in it ?

QSORT is distributed as shareware. It is available on the Bits O' Blue BBS for evaluation only. If you try it and use it, please register it with the publisher. The fee for non-commercial use is $20 for a single computer. Commercial registration is $35 for the first machine.

QSORT is distributed by:

System Enhancement Associates,
Inc. 21 New Street,
Wayne, NJ 07470.

F.Y.I.:::

Spreadsheet: A program that gives the user quick and easy access to a wide variety of highly detailed reports based on highly inaccurate assumptions.

Business Graphics: Popular with managers who understand neither decimals, fractions, percentages, Roman numerals, but have more than a passing acquaintance with pies and bars.

Se Habla Español:
Learn to Speak Spanish

Review by: Gary W. Wodka, Madison PC User's Group

So, you've never been to Mexico. You've got no desire to go to Spain. South America is beyond the budget. But you just love the way those Spanish words flow off some peoples' tongues. What's a fella to do?

HyperGlot Software Company has the answer: CD-ROM based "Learn To Speak Spanish." This $99 multimedia program can actually teach an old guy like me new tricks. And they do it just like Herr Poljak taught me German in High School: read it in English, see it in the native language, hear it in the native language, practice it in the native language, write it, say it again, repeat it, test it. The method worked then (some 25-30 years ago) and it works today.

The program itself comes on two CDs. The first is the lessons, tutorial and text that will eventually be copied to your hard disk. The second is filled with "natives" speaking the language. This program requires at least a basic MPC-standard setup. That means a minimum of a 286-based machine, 2 MB RAM, 16 MHz or better CPU speed, Microsoft Windows 3.0 or 3.1, a sound board (many are supported), and Microsoft's Multimedia Extensions. If you have Windows 3.1, the Multimedia Extensions are included in Windows. If you're still using 3.0, you'll need to go out and buy the extensions.

Installation is simply a matter of installing the "shell" through Windows, where a separate program group is created which contains an Overview, Lessons, Toolbook, Listen, Review and Explore buttons. The program contains a series of 30 "chapters," broken up into a total of some 85 lessons. The total text of the program would eat up even the most generous hard disk, so the documentation recommends loading only a few lessons at a time, then as you progress, replace the old lessons with the new.

The documentation included with the program is sparse, but sufficient to get you started. The program on disk is fairly intuitive and I really didn't have to resort to the manual after installation. I did have one question I couldn't find the answer to. I called the company, was greeted immediately (in English), and got my question answered fast and right the first time. It was quite a novel experience! Their phone support would have to get an A+!

How does this program teach Spanish? Very well, would have to be my answer. When I learned my first "second language" so many years ago, it was a matter of learning a few words of vocabulary, then integrating them into sentences, learning grammar on the side. HyperGlot has taken a somewhat different approach: Contextual Teaching. What that means is that you learn to speak Spanish in situations you're likely to find yourself if you ever do decide to go to Mexico, Spain or South America.

Each lesson starts with a screen describing a certain situation. For example, you are in an airport and need to get some coney changed from real money into pesos. The text is available both in English and in Spanish. When you are ready to learn how to say what's on the screen, the CD-voice disk has natives speaking the text lines for you. If you're not sure what the guy said, you can replay individual sentences by clicking on them with the mouse. This enables you to practice, practice, practice until you get it right and are comfortable with the way its supposed to sound.

Oh, you think you've got that lesson learned, huh? Well, let's find out. After you're comfortable with any lesson, there's a test. The same text you just learned is typed to the screen with several key words missing. You are to type in the missing elements. Even better, if your sound board is equipped with a microphone, you can record your Spanish and compare it to the real thing, listening to your pronunciation and then the natives. All in all, a great way to learn what you need to know to get by in a foreign country.

Ok, you've passed the above test and are feeling pretty cocky. Well it's not over yet. There's another part to the examination. The computer will ask several questions in Spanish, and you are to answer by typing in the correct answers. This is where the rubber hits the road. Simply memorizing and repeating things may teach rote. This exercise tests your comprehension. And the sentences are graded on their completeness (complete sentences) and their grammar. This is even tougher than Herr Poljak!

Within each lesson are the "underlying rules and things you need to know" about grammar, parts of speech, definitions etc. No Spanish teacher would be worth her salt without the opportunity rap a few students across the knuckles for misspelled words, improperly placed articles, and verbs which don't agree with their subjects. Even in this area, HyperGlot comes through. But take heart, the chastisement is gentle.

As a bonus, you can take your tutor with you when you travel. Well, almost. You can take the second CD and listen to it on any CD player. This gives another opportunity to "get it right."

HyperGlot may have a winner with this CD. I like the approach to teaching: situational. I like the opportunity to hear the language spoken the way it's supposed to be spoken. I like the opportunity to review a lesson as often as I want to. I like the chance to stick out my tongue at the teacher without getting my knuckles rapped.

Software Review

By: Jeff Hansman
Monterey Bay Users Group - PC

hDC Power Launcher

Power Launcher for hDC Corp. is one in a seemingly vast array of Windows utilities recently flooding the market. With the rising popularity of Windows 3.0, it seems everybody and their brother is marketing the indispensable Windows utility. Many of these programs have an initial "gee whiz" appeal, but the prudent software buyer must be careful when choosing such programs. In choosing, users can select from software that falls roughly into two categories: programs that serve as useful adjuncts to Windows, or utilities that are redundant, superfluous or just plain unnecessary.

Power Launcher is a complex program that seems to qualify for both categories, providing both tools that are genuinely functional and attempting to add a layer of usefulness already available within Windows. Essentially, Power Launcher gives the user access to "enhanced commands," roughly the Windows equivalent of such DOS command line add-ons as PCED, 4DOS and the like. When used to its full extent, Power Launcher gives users an astonishing amount of control over how they start their applications. Billed as a tool for "power users," Power Launcher offers several utilities that take Windows users well beyond the simple double-click that starts their favorite program. Command line parameters, filenames and switches can all be passed to an application at startup.

The program is easy to install, and by itself requires far less RAM (75K) than its closest rival, Norton Desktop for Windows (275K).

Power Launcher conveniently replaces the control menu in all open windows with a little red box reading "hDC," so it can be readily accessed by a mouse click or pressing Alt-Spacebar. When installed, the program makes available enhanced commands in any one of six ways: a run box, mouse macros, keyboard macros, a toolbox, menus, and a scheduler. You can preset the size of any launched window, as well as its on-screen position.

Power Launcher gives users an astonishing amount of control over how they start their applications.

One particularly nice feature is the ability to prompt for filenames or a text string. With its caption and icon control, Power Launcher lets you control how DOS applications will appear on the desktop. In addition to all these launching options, the program has a "big desktop" capability that provides as many as 8 by 8 screens in real size. You can launch your applications anywhere on this grid, and switch between them with a keypress. This "virtual desktop" can go a long way in reducing screen clutter when you have several maximized applications open.

With the program come three separate MicroApps: Power Keyboard, a keyboard remapping utility; Power Mouse, which gives your two or three button mouse much more usefulness to its right and/or middle button; and Power Toolbox, a customizable toolbar creator that "floats" about the screen, ready to execute macros or enhanced commands.

All in all, Power Launcher is an impressive suite of tools for Windows users. What I found myself resisting was the learning curve these powerful utilities present. Personally, I have opted for the simpler approach that the Windows Recorder provides. I launch my spreadsheet with a Ctrl-E, or my word processor with a Ctrl-W. While these macros do not begin to give me the minute control Power Launcher can, they still do the job and are quickly learned and setup.

If you feel Microsoft has left out a degree of control you wish you had in Windows, or just like tinkering with feature-rich utilities, Power Launcher is for you. Be prepared, however, to spend some time learning the intricacies of the many options available to you.

Power Launcher retails for $99.00, and hDC Computer Corp. can be reached at (800) 321-4606

Software Review

Monterey Bay Users Group - PC

Hijaak 2.02

It takes a bit of learning, but once you climb that hurdle, it's a fantastic program. Hijaak 2.02 does two things: it is a screen-capture utility, and it is a graphics conversion utility, and does both of them extremely well.

When you first load Hijaak, you will need to configure it to your computer. After that, it will remember the settings and always be ready for you. To capture a screen, you only have to go to the Hijaak directory and type LOADRPM, which loads the Resident Process Manager. Then go to the screen you want to capture, press the "hot key" combination. You then have a choice. You can use Hijaak's "Quick Capture" feature and capture the file in .IGF format. Or, you can capture the file in just about any graphics format you choose, from .TIF and .PIX to .WPG, but that takes a little longer.

If you captured the screen in .IGF format, you can use the Convert feature of Hijaak and convert the .IGF file to any format you want. If you are a WordPerfect user, you can convert the file to .WPG and include it in your WordPerfect document. If you use any of the graphics applications that prefer .TIF files, you can convert to that. The list of available conversions is much too long to list here. And, of course, you can convert the other way as well, from .TIF to .WPG, or .PIC to .PCX. You name it and you get it. If you screen-capture text, you can convert the text to ASCII. You can even capture screens from inside Windows 3.0.

Hijaak 2.02 is great, but it is not perfect. There are flaws, but they are flaws you can work around. Hijaak 2.02 works perfectly with IBM or Hercules monochrome systems, but it only works with a limited number of VGA cards. Be sure you have a correct one, or you will have problems. Also,

(Continued on next page)

(Continued from previous page)
you cannot use Hijaak 2.02 with certain memory managers like EMM386.SYS. That problem is easy to overcome by doing a "clean boot" without loading any TSRs when you plan to use Hijaak. Finally, while the documentation is complete, it is sometimes hard to follow. However, if you have problems, they have an 800 number for tech support and their support staff are very helpful. All things considered, it is the best screen capture and graphics conversion utility around, and I couldn't get along without it. Retail price is $199, and the street price is about $140. For further information, call Inset Systems at 1-800-828-8088.

LetrTuck and Type Control

Two Windows Type Utilities

Review by: Meg Hamel, Madison PC User's Group

A wonderful thing about the Windows environment is how useful it can be for working with typefaces. With the addition of Adobe Type Manager (ATM) or similar product (or with TrueType in the 3.1 update to Windows), typefaces are rendered cleanly and accurately on the screen. Several utilities have been written to allow the aspiring desktop publisher to manipulate typeface outlines to suit the particular job at hand.

I looked at two such programs recently: LetrTuck and Type Control. LetrTuck is a fast and easy kerning manager. Type Control lets you create and apply special effects to type, then save it as a graphics file. Both require Windows with ATM installed.

Some of you might be thinking you spotted a typo in the previous paragraph -- no, "kerning" is the word that described adjusting the amount of space between individual letters when they are printed. For example, picture the capital letters "A" and "V" printed side by side. When they aren't kerned, there is too much space between their angled sides. Kerning reduces that space and makes the word look better.

Using any Type 1 font installed in Windows, you can adjust the amount of space between any two characters. A large representation of the character pair appears in a dialog box on the screen -- you use the mouse to pull one character closer to or away from the other. LetrTuck displays the pair in a few different sizes so you can see what the pair will look like as you kern the characters. The measurements are saved in the .PFM file, and you can also save the measurements as a file that can be loaded in with a different typeface.

Okay, I realize that most people won't need to run to the phone and order LetrTuck. LetrTuck is an example of a program that is written to serve a very specific niche in the market. Graphic designers and desktop publishers will find this product useful. I find it perfect for adjusting the many public domain typefaces I pick up off the bulletin boards. I also create my own typefaces using Publisher's Typefoundry (by Z-Soft) and use LetrTuck to fine-tune the kerning on those typefaces for a professional look. There are actually two separate programs that come in the package: a regular version for editing normal Windows-installed fonts, and a version that works with Ventura Publisher's width files.

I'm pleased by a product that is easy to use and does what it says -- thumbs up for LetrTuck.

The other product I tried was a real let-down. Type Control is a utility that creates .EPS files out of your typefaces which you can import into word processing and DTP packages. You can combine different typefaces, different sizes, etc. in the image. You can also wrap text in a circle or in a spiral. It was these features that drew me to the product.

I also use CorelDraw, and it is natural to compare the features of Type Control with the type effects possible using Corel. As I stated, Type Control lets you place letters in various typestyles and sizes and save the whole thing as an .EPS file. I'm not entirely sure why the product has been released, since it doesn't do anything that a drawing program can't do, and it's not fast or convenient enough to replace a drawing program.

I found it slow and cumbersome. The documentation recommends a math coprocessor for best performance -- this is a utility for creating fancy type, not a CADD program! The basic type effects don't work all that smoothly. You type in your words, then you can change the characteristics of individual letters, such as condensing or slanting the letter. Most of these basic changes can be accomplished by any decent Windows word processor or DTP program, and you can certainly do this using CorelDraw's Node Tool.

It has a feature that wraps text in a circle or in a spiral. But you can't use an ellipse, or an irregular shape, so that rules out many design options. You tell Type Control what the radius of your circle is, and it wraps the text automatically. I prefer Corel's technique of letting you adjust the letters to fit even after they've been wrapped for the best possible look. And I like using ellipses and other shapes, which rules Type Control out.

There is a rather unique feature that lets you fit a line of text to a given length. This can be used to create headlines that exactly fit the width of the columns. You type in the words, set the size of the line to be whatever measurement you need, then press a function key. It adjusts the size and width of the letters to fit the line.

You can print out a sample of your design, but it can only be exported as an .EPS file. I don't use a Postscript printer, so
(Continued on next page)

(Continued from previous page)

to use any of my design I had to first import them into Corel, then export them as a .PCX file to use with Ventura. If you are looking for a program to create special type effects, I can't recommend Type Control. A much better choice would be a product like TypeAlign (by Adobe) or a full-blown drawing package like Corel. There just aren't enough interesting options available in Type Control, and the program itself is awkward to use.

LetrTuck is a product of:
Edco Services, Inc.
12410 North Dale Mabry Highway
Tampa, FL 33618
(800) 523-8973

Type Control is a product of:
Filmotype Corporation
2000 Lehigh Avenue
Glenview, IL 60025
(708) 998-0871

Font Manager

By: Steven Friedman
Sacramento PC Users Group
Reprinted from April 1992 Issue of Sacra Blue

Ever since Adobe released ATM for the Macintosh and Windows, Type 1 fonts have been proliferating on BBSs, Shareware bins, and packages bundled with programs. If you own programs such as CorelDraw, More Fonts, or SoftType, you can create an endless number of ATM Type 1 fonts,

Therein lies the problem. Before long, you have a hard disk full of fonts, and a real memory hog, Each time you load a font, it steals from your system performance, In addition, Windows limits the number of fonts that can be accessed on any given port to about 120-150.

You could have ATM remove an unneeded font from your system, but you would have to reinstate it whenever you wanted it, Moreover, ATM's Control Panel permits you to specify only one source for your fonts, There is no way to off-load some fonts to a floppy diskette and keep others on your hard disk - that is, until Font Manager came along.

Font Manager is the remarkable work of Dennis Harrington. It provides a way to designate groups of fonts, called font packs, and load them selectively as needed, It automatically updates your ATM.INI and WIN.INI files to reflect the font pack you've selected, If you store ATM fonts in multiple directories, it will search all specified directories to update the master font list.

Creating a Master Font List -

Installing Font Manager is easy. You are asked which drives on your hard disk to search for Type 1 soft fonts. It then updates a master list, which remembers the name of the font and where it resides.

If it encounters font names or PFB files without a corresponding PFM file installed, it lists them and forces them to Printer Resident status for you. It does not load them, however, because doing so would cause the annoying "ATM and Postscript Fonts do not match" message.

It also tests for duplicate .PFM files, which often cause problems because ATM encounters identical font files listed as separate softfonts. If it encounters a duplicate, it simply stops the installation process and prints a list of the offending font files, which can then be removed from your directory.

If you've added new fonts since the last time you used Font Manager, you should use the update feature. Font Manager then rescans your designated directory to update the master list. If you use a PostScript printer or download fonts before starting Windows, FM needs to know which fonts are resident, and it indicates this on the Master Font List.

Creating a Fontpak -

A Font Pack is a package of fonts that you designate by name. For example, I have a standard font pack that contains all the fonts I use on an everyday basis. I also have a decorative font pack that contains some more exotic fonts, which I may use on a brochure, and a font pack that contains a selection of symbol and dingbat fonts.

To create a font pack, you simply double-click the font name from the master list. Font Manager then adds that font to that font pack.

To use the font pack, choose "Change Installed Fonts" from the main menu and select one or more font packs to install. Font Manager updates WIN.INI and ATM.INI with the new information. After changing fonts, Windows needs to be restarted, so you must first close any open windows. Font Manager warns you before doing this, and gives you a chance to back out of the operation.

Font Manager provides safety features to prevent you from forgetting resident printer fonts or fonts needed by certain programs (such as Freelance for Windows). You can exclude these fonts from changes to the .INI files.

The current version, Font Manager 2.0, is available on CompuServe, in Library 6 of the DTP forum and in the Windows forum.

Here's the best news: This program is free. It is written entirely in Visual Basic and requires you to have the runtime library VBRUN100.DLL installed in your Windows or System directory.

A Monthly Publication of the

Tampa IBM PC User's Group

BITS of BLUE

VOL. 5 NO. 6 July, 1992

MEETING
(2nd Wednesday every month)

DATE: July 8, 1992
TIME: 6:00 PM
PLACE: IBM CUSTOMER CENTER
LAKE POINTE ONE BUILDING
3109 W. Martin L. King Blvd.
Room 450
DIRECTIONS:

The Tampa IBM PC Users Group meets in the IBM's LAKE POINTE ONE Building across from Tampa Bay Mall one block east of Tampa Stadium.

The best entrance is on Martin Luther King Blvd. at the traffic light in front of Burdines. As you turn North off Martin Luther King Blvd. you will see the LAKE POINTE ONE BUILDING on the left & parking on the right. Join us in ROOM 450 - 4th floor. **Guest please sign in.**

Bits of Blue is published by the Tampa IBM PC Users' Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about IBM-PC and compatible personal computer systems to its members.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII file or in a commonly available word processor format, such as WordPerfect 5.1, on diskette to the editor at 9402 Hidden Ridge Place, Tampa, Florida 33637 or send it by modem to BBS (813)239-3704.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for non-profit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

Commercial advertisements will be accepted at the following rates:

	1 month	3 months	6 months
Full Page	$60.00	$162.00	288.00
Half Page	$40.00	$108.00	$192.00
Quarter Page	$22.00	$60.00	$106.00
Eight Page	$12.00	$33.00	$58.00
Business Card	$10.00	$27.00	$48.00

All advertisements must be prepaid by check payable to TIBMPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if it is not received on time. Those wishing to place ads are to contact the Editor for space availability and for further information.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor.

This newsletter was created with WordPerfect for Windows donated by WordPerfect Corp. to TIBMPCUG for use by the editor.

Secretary's Report

TAMPA IBM USER'S GROUP
MINUTES OF 6/10/92 –

Well, we had another good meeting. But, I'm sure I will hear many sighs of relieve when I tell you that you won't have to read here about the meeting as much as you normally would. You see, the day after the meeting the index finger of my left hand and a radial saw had an encounter – and my finger lost. No sympathy, please; there has been no great loss – a few hundred $s in emergency room charges, a great deal of inconvenience, and a relatively short report of the last meeting. Don't worry, though, I will be back in usual, verbose form for the next report.

Another difference in this report is that it is not an accurate account of what transpired at the meeting – the program presentations were made at the very beginning of the meeting, followed by news and discussion, instead of the usual opposite sequence. This report is in the normal sequencing.

CLUB NEWS:

Harvey mentioned recent developments with several popular programs:

- Procom for Windows is now shipping – and it is getting high marks from industry media.
- Word Perfect for Windows maintenance upgrade is available. Call their 800 number if you are eligible. Cost is S & H, not more than $15, and if you complain of a specific major bug giving you a problem with your current version, you may not have to pay the S & H.
- Harvard Graphics for Windows maintenance upgrade is now available for $15. While I didn't hear specific mention, presumably you can call the HG people for the upgrade.

There was general discussion of upgrading the Bits of Blue BBS with a faster modem. Harvey pointed out that the biggest problem is $$$! We would gladly upgrade to 9600 baud – if someone would donate the modem or the money for same. This is the same problem with other desirable BBS upgrades – like storage space; it is very limited, and we wouldn't have as much as we have were it not for the generosity of our VP, Steve Spears, who donated two 65 MB drives (for which our gratitude has never been publicly expressed – "Steve, we really appreciate your gift of the hard drives. It has helped make Bits of Blue more usable for us all, and we appreciate it very much. Thank you!"). If the club is to buy another modem, it is Harvey's view that we should get the 14,400 baud modem. Whichever, the club needs more funds to make such expenditures. Possible sources include: Donations, obtaining more members, selling advertizing for the newsletter. What are your thoughts?

(Continued on next page)

(Continued from previous page)
A member suggested that we may save money by eliminating our club financed refreshments for break time at the meetings. A vote was taken and the overwhelming majority were in favor of doing away with the refreshments. And so it is! Do not plan on a snack at the next meeting – it won't be there. (See Commentary below.)

Harvey announced that planning was underway for another Word Perfect for DOS class to be given by our Education Director, Ed Buzza. In response to a question raised by our Pres about class frequency and timing, the consensus seemed to be to have the classes every Wednesday evening, except our regular meeting night, from 6-7 PM. Chris, our IBM baby-sitter, indicated that would be OK from IBM's standpoint. Planning for the class will likely be completed at the next board meeting (6/24). More info will follow – watch the BBS.

Harvey announced that the following presentations will be made at the next meeting:

- GeoWorks Pro, to be reviewed by our own Tom Cone. Some say that this program is better than Windows. It is a GUI. I have GeoWorks and it is a nice program. BUT, it is similar to Windows in that it runs only programs tailored for it – and there aren't many of those I am aware of – or shell to DOS where multitasking is not available. One big advantage is that it will work on just about any computer – from an XT up. I am looking forward with great anticipation to Tom's review of the Pro version.
- Our SYSOPs, Kevan Sheridan, is going to update us on using our BBS and the new features/capabilities that have been added recently. I need this very much – I hear comments at the meetings about BBS features about which I know nothing. I look forward to Kevan presentation as well. I think our next meeting may well turn out to be one of the best yet. I would suggest that you not miss this one.

PROGRAM PRESENTATIONS

Windows 3.1

Kirk Covert, Regional Sales Rep for Microsoft, was on hand to give a quick review of Windows 3.1. Kirk's review assumed knowledge of Windows 3.0 and he touched on only some of the changes that were made in 3.1. Kirk noted that there are over 1500 changes in 3.1, and he would touch on only a few of them.

Probably the most significant change is that 3.1 is a lot faster (3 - 4 times faster) in all operations than 3.0, including printing. That is a very welcome improvement to all Windows users. Other significant improvements include:

- Object Linking & Embedding (OLE)
- Alt+Tab program selection
- Scalable outline TrueType fonts (including 13 fonts) and driver that gives WYSIWYG on the screen and high quality print. (Kirk states that TTF saves disk space. Maybe so when compared to fonts for laser printers, or bitmapped fonts, but I do not find that is necessarily true when compared to Adobe Type I or Atech's Fastfonts).
- Has come a long way toward eliminating the infamous UAE'S OF 3.0. You still have unrecoverable application errors, but there is usually some explanation and you no longer have to restart Windows – you are presented with choices: Returning to the application, closing the offending application, or restarting Windows. This gives you the opportunity to perhaps be able to save data in the offending application, and usually avoids the need to close down other applications.
- File Manager has been greatly enhanced and now includes drag & drop capability to copy, move, delete, and print files, and activity programs loaded with any file generated by that application.
- Includes a good tutorial
- Includes quite a few more Icons, as well as a better and easier to use Icon viewer

Kirk noted that a Technical Resource Kit, which includes some neat programs – such as Smartdrive Monitor, System Monitor and a Graphics Viewer (all popular formats) – was available from Microsoft for $20, including S & H. They looked like nice-to-have programs. If interested, call 1-800-426-9400.

Kirk also mentioned that the 32 bit Win NT was on the way without any clue as to timing.

Microsoft Visual Basic:

Kirk continued with his presentation with a brief review of Visual Basic. I am not into programming in any form, so much of what was presented and discussed was beyond me. Here are some impressions I was left with: It is a Windows program and anything written with Visual Basic is compatible with Windows. The program was developed with the user in mind – that is, it is user oriented; Kirk indicated that it was easier than "C." The program includes an Icon maker/editor. Kirk indicated that some knowledge of Basic programming is needed, but not nearly as much as before Visual Basic.

To Kirk and Microsoft, a BIG THANKS for a job well done and for the donation go a copy of Visual Basic.

OVERDUE THANKS:

We have several "unsung heroes" among us that work behind the scenes for our benefit. I think it more than appropriate that at least once in a while we acknowledge their contributions for our benefit and give them a bit of thanks. One was appropriately mentioned by one of our members at the meeting:

- Marylee Bruneau, our Newsletter Editor, who has not only given a lot of time and effort to putting out an informative and interesting newsletter, but she has done an outstanding job in doing so. As our member said at the meeting, she produces a very professional product. And, she continues to make it even better. Marylee, THANK YOU. We really appreciate your efforts and a SUPER job!!

(Continued on next page)

(Continued from previous page)

■ The other is Chris, our IBM baby-sitter. Chris gives us a lot of time and effort, and most of us aren't aware of any of it. We just take his effort and product for granted – we come to the meeting in some very nice facilities, computers , projectors and whatever else all set up for use, and things just sort of click along smoothly. Well, it is not all by accident – Chris makes a very big contribution to make it happen that way. We owe IBM a very big thanks you for use of their facilities, and a similar very big thank you to Chris for all he does in the background to make our meetings so enjoyable and productive. THANK YOU CHRIS and IBM!! We really appreciate all you do for our benefit.

AND THE WINNER IS:

Four software prizes were given away to lucky members with raffle tickets. Microsoft donated Visual Basic. The other three programs were games, the donor of which I am not aware. And there was a nice 50-50 prize. THE LUCKY WINNERS ARE:

Microsoft Visual Basic ..... Ran Weinberg
Miniature Golf ..... John Walden
Hill Street Blues ..... Chuck Bowasox
Tie Break ..... Barry Yocum
50-50 ($51) ..... Richard Pope

COMMENTARY:

Those members present at this meeting voted to eliminate the club-financed refreshments that have been provided during break time. I usually enjoy a cookie or two, and the lines are always long with people waiting their turn at the goodies. Yet, when it came time to vote whether or not to keep the goodies, the vote was overwhelmingly NO! Why?

I voted against the refreshments. My reasons were many fold:

■ We make a big mess, with goodies often scattered all over the floors. Someone has to clean that up – guess who, the club volunteers and our host, IBM.

■ Secondly, the money the club spends on the refreshments could be used to help finance some much needed equipment.

■ Then, too, we have been consuming 30 minutes or more in break time, principally because it takes a long time for everyone to get through the line. I would rather see that time used for productive purposes (the business at hand, that is) and the meeting be a little shorter in duration. I wouldn't want any less coverage at the meetings, but I would like to see them a little shorter. And, I think we need a rest room and stretch break, but it needn't be as long as the break we have been having. I know there are some who come directly from work and except for the snacks at the meeting, get nothing to eat until they get home. I hope they can find another source for a tide-me-over. I think the pluses of eliminating the refreshments at the meetings overwhelming the minuses. What do you think?

FIDO Terminology

ADDRESS Each system that is connected to the FIDO system has a node address. An address is based on a geographical area broken down by a ZONE, REGION, NETWORK, NODE, and POINT. Zone 1 is North America. Region 18 the southeast (not used normally), Tampa is network 377, and Bits of Blue BBS is node 32. A point would be a system that depends on 1:377/32.0 for all of its mail. There are currently no points for Bits of Blue.

ECHOMAIL is usually carried in "conferences" that pertain to specific topics like OS/2, Windows, Alternative Lifestyles, etc. Echomail is sent to every system carrying the conference so there is no need to know any network addresses. Bits of Blue carries 11 echomail areas and may be "Joined" from the main menu.

FREQ This is short for the term "File Request." This is a feature used by mailer programs to quickly request files from other listed nodes. Bits of Blue is currently able to request files from other systems and handle file requests also. However, there is no feature to allow BBS callers access to this feature directly.

FRONT END/MAILER This is a type of program that answers the modem call and decides if it is another mailer calling or a BBS caller. If the call is from a mailer the systems will transfer mail. If the system answers a call and it decides a mailer is not calling then control is passed on to the BBS. You may speed this process up by pressing the <ESCAPE> key twice when you see the mailer message.

MODERATOR One requirement of FIDO is that each echomail area has a moderator that controls what happens in the conference. This person maintains a list of requirements and rules for access to the area. The rules are usually posted at least once a month in each area. Please read the rules of an area before leaving any messages.

NETMAIL is usually person to person direct mail that may be "routed" through other systems. To send NETMAIL you must know the name and network address of the intended receiver. Netmail is currently not available to Bits of Blue callers as this involves long distance calls (usually).

Editorial Comment: The upcoming presentation by our SYSOP, Kevan Sheridan will include specific information on utilizing the features implemented on our BBS (FIDO System). Additionally, there will not be a **President's Column** for this issue of ***Bits of Blue*** due to Harvey's career obligations this month.

Information and Society

By: Levon Amdilyan

APCUG Industry Commentary Subscription Series Column #14. *Copyright (c) 1992, APCUG, All Rights Reserved. Permission granted for reproduction in official publications of member organizations of the Association of PC User Groups.*

This modern age has often been called the information technology age. In the last few years, information has become a major commodity – having significant value in our society. As a result, it's easy to see that the larger the information sector of a state, the richer it is and vice versa. In most of the advanced countries, up to 70 percent of their economy is now information-related. The people who comprise this industry produce information, knowledge, the technology to process it, and provide information services.

All information results from contact, interaction and cohesion between people. The more interactions and the more flexible and complex they are, the better the ability of society to adjust to changes, to evolve and to move faster toward progress.

The former USSR was an excellent example of a society with a minimum level of information flexibility. Its pyramidal (or centralized) type of economic structure left very little room for deviation from content of information. And, all of its information was derived from the upper levels in the hierarchy (the State). All links between the givers of the information and its receivers were mainly vertical. The horizontal ties or free flow of information between the elements of the pyramid were minimal.

As a result, the Soviet society has always shown very poor results in achieving a functional economy, extending its societal reforms or efforts to its people, and the ability to adjust to external changes.

In his theory of non-equilibrium thermodynamics, Ilya Prygogine, the Belgium Nobel Prize winner, proved that these types of systems cannot exist very long. The entropy in them increases and they disintegrate step by step.

It's a very simple rule: Any revolution (or counter-revolution) starts with an attempt to control the sources of information, particularly the mass media such as press, television and radio. In my country – the newly formed Commonwealth of Independent States, this has always been the case. And, it was particularly true during the recent attempted E-mail technology was also extremely important for international communication. coup in August 1991, when the putschists acted according to this classical model.

> ☎ "E-mail technology was also extremely important for international communication."

As their first official acts, the coup leaders took immediate control of the State-controlled television and radio stations and press to broadcast and publish announcements of the "orderly transition in government" due to the "illness and incapacitation" of Soviet President Mikhail Gorbachev.

Unfortunately for these putschists – and fortunately for the people of the then-Soviet republics – the traditional Soviet power structure represented by these communist hard-liners had already lost its rigid control over the flow of information. This was due largely to the rise of personal computing and microprocessor-controlled electronics equipment in the Soviet Union. With the introduction of personal computers, fax machines and telephones in the Soviet Union in recent years, a new communications network was created. This became abundantly clear in the first hours of the coup. Despite the coup leaders' attempts to shut off all access to information, the Soviet people were immediately informed about the true state of affairs through this extensive computer network of people to people communications.

And that was the magic of the situation. While the coup leaders were seizing control of the traditional methods of communication, they had been oblivious to the real revolution that had been undertaken by the Soviet people during the past few years – the creation of alternative sources of information brought about by microprocessor and information technology. The old pyramid structure of vertical information flow – one which could easily be controlled by the State – was no more and had been replaced by horizontal ties which went from individual to individual. Instead of a one to many relationship (where the State was the one and the people the many), communications had evolved into a many to many relationship (people to people)!

Because of their ignorance of modern information technologies, the putschists never perceived the multiple alternative possibilities for people who had already sensed the freedom to exchange (send and receive) information. The role that telecommunications and personal computers played in that attempted August coup has been related many times, particularly by Western and American journalists. With computerized electronic mail (e-mail) and facsimile (fax) machines, the complete text of all of Russian President Boris Yeltsin's decrees in opposition to the coup were transmitted through telephone lines to all parts of the Soviet Union. Similarly, hundreds of independent pro-democracy computer users transmitted a continuous stream of information on anti-coup activities from city to city and Republic to Republic

(Continued on next page)

(Continued from previous page).

Thousands of users of Relcom (an Internet network in the USSR) actually became an alternative system of mass media.

E-mail technology was also extremely important for international communication. Thanks to our many friends in the West, information about coup events and anti- coup activities were reported by Western journalists to their home countries and relayed via a variety of e-mail networks to computer users throughout the Soviet Union. And we, in turn, provided live reports from the streets and villages on the latest news about the current situation that were similarly relayed back to the West and throughout our country. MCI Mail, CompuServe, AppleLink, the APCUG GLOBALNET BBS and the San Francisco-Moscow Teleport were just some of the many vital communications links that were so very helpful in those chaotic days.

In addition to their widespread use in telecommunications,personalcomputers were also the primary means by which anti-coup materials (including official Russian government decrees) were published. With a clone IBM-compatible personal computer, aides to Russian President Yeltsin published their official decrees in opposition to the coup as well as hourly reports detailing the peoples' efforts to resist the coup and bring democracy to the Soviet Union. (For the technophiles, the decrees were created in Microsoft Windows Write and published using Aldus' PageMaker desktop publishing software.)

As of the beginning of 1992, the Union of Soviet Socialist Republics (U.S.S.R.) had been dismantled and replaced with a Commonwealth of Independent States (C.I.S.) comprising eleven of the former Soviet republics. We have dismantled (or destroyed) the centralized pyramid and are trying to replace it with a market- driven economy. But, just as we have destroyed one system and have not yet built its replacement, the result is a bitter, but natural, further aggravation of an already difficult situation. This is a small price to pay for our move to a more efficient and truly democratic society.

Information technologies continue to play a very positive and important role in this very difficult transition period. The hardware and software market is the most stable and fastest growing sector of our economy. Telecommunications also continues to play a very important role in information exchange between the former Soviet Republics. (As some of them are now introducing changes to their postal and/or money systems, the e-mail or fax communication has become the single, most reliable communication channel between, for example, the Baltic republics and Moscow.)

At the International Computer Club, we firmly believe that the information exchange will continue to play a vital role in building the information technology market in Russia and other independent states in:

- Educating decision-makers, developers and end-users;
- Preparing the market for new technologies; and
- Providing feed-back from users to improve their access to – and use of – the technology. We are proud to be engaged in this information exchange between the East and the West. We do it through our annual International Computer Forums and Exhibitions, publishing activities, and through the establishment and support of user groups. Hopefully soon, many more of our users will be able to join the worldwide GLOBALNET family and participate in the free exchange of information and ideas between freedom-loving people.

Who could have predicted the dramatic changes that the information technology age would bring to Eastern Europe and the Soviet Union? After all, I, my parents and their parents' parents grew up in a totalitarian communist state with little hope for a different future. And yet, today, because of a mechanical device called the personal computer – and the spirit of the Russian people – my children and my children's children will be able to live out their lives in a democratic society, full of hopes, dreams and opportunities. This information technology age is, indeed, a truly exciting time in which to live!

Levon Amdilyan is founding Director-General of the International Computer Club (ICC) in Moscow, Russia. The ICC has been influential in providing computer information and access to the Soviet people. Through its educational activities and International Computer Forum (ICF) conference and exposition, the ICC has brought Western computer technology to the Soviet citizenry and enabled Soviet programmers to interact with their counterparts in the West.

"How to Back Up your PC"

Obtain a copy for $9.00 (Special Rate for User Group Members). This is a very helpful book with "How 2's" for the following:

- Use of DOS commands to Backup and Restore your hard disk.
- Use of 4 most popular back up utilities.
- Use of tape back-ups.
- Network back-ups.
- Designing fast and dependable backups.

If you are interested, see the book on display at the next meeting and pick up an order form.

SOFTWARE REVIEWS:

Microsoft Visual BASIC

Review by Michael L. Wolk
Reprinted from Blue Notes, San Francisco PCUG

Visual BASIC is a program with which you can create graphical applications without having to use programming language to write code. You can establish links and exchange data with other applications, and even import custom routines written in other languages.

When I saw the simplified demonstration of the program at the SFPCUG general meeting, several months ago, it looked like great fun and easy as pie, but I did not yet have Windows 3.0, so that was that. Since then, this novice but steady PC user has also become a novice Windows 3.0 user. So, when I saw the Visual BASIC package available for a review, I jumped at the chance. I thought it would be a cinch, and I'd have the review ready in two months, for sure. Not exactly so. At first, I was terribly discouraged. I was sure I had bitten off much more than I could chew. But, after a while, I realized that a novice can learn this program. It's just a matter of putting in some time and effort. I'm still learning, but I'm more optimistic. However, although you may not need to know a programming language to learn Visual BASIC, it is clear to me that an understanding of programming makes learning and using the program a lot easier.

With Visual BASIC, you can produce all kinds of graphical (Windows-type) applications, which are easy and fun for a user to run, such as custom Windows applications to store and recall information, user-friendly "front-ends" for other applications (e.g., forms for entering information to a database), password-protected security systems, etc.

You should start with a blank window, or form, to which you add controls, which can receive user input or display output. These include labels, text, dialogs, check boxes, command buttons, etc. You can use the color palette to give fore- and background colors to the form, controls, or groups of controls and add icons from Visual BASIC or import graphics from other applications. You can also design drop-down menus, which allow you to group your commands. Next, you set properties of the controls and initial values, such as captions, size, position, name, etc.

All applications created by Visual BASIC are "event driven", that is, they respond to a specific event, such as the click of a button by the user, DDE (dynamic data exchange), or having reached a specific time. To make the application respond in a particular way to a particular event, you attach code, called an event procedure, to your forms and controls. This code includes the object name (the name of the control), the event name (e.g., click, list, etc.), and one or more statements about the procedure. The language in which one writes the code is easy to use and contains many features from Microsoft QuickBASIC and the Microsoft Professional BASIC Compiler, such as If...Then...Else blocks, loops, numerous math and string functions, and eight data types. You can review your code quickly with automatic syntax-checking, debugging tools, and immediate windows, which let you try out a line of code or check a variable before you change a procedure.

This program is lots of fun, an interesting way for a novice to get some concept of programming, and a great way to produce good-looking graphical applications. Visual BASIC is a product of Microsoft Corporation, One Microsoft Way, Redmond, WA 98052-6399.

Editorial Comment: Due to the fact that the Microsoft Visual Basic presentation at our June meeting was shorter than anticipated, we are including the above review in hopes it will provide you with additional information.

PrintCache V 3.0

A Review by Bill Shook, NWA-MCUG
NWA-MCUG 06/92 NewsLetter Article
Rt 4 Box 376 Springdale, AR 72762-9307

"The Lightning Fast Print Buffer"

That's the way LaserTools refers to their latest version of PrintCache–and it's no wonder. It's the fastest print cache I've used. The keyboard is returned almost instantaneously, depending on what is printing. As an example, I print the newsletter by printing to a postscript file and then actually printing to the laser using GoScript, a postscript emulator. The print file normally runs from 150K to 200K and the keyboard is returned in less than a minute, once GoScript converts the file. For those of you that remember my review on LaserTools Fonts On The Fly in the April newsletter, I mentioned printing the newsletter directly from WordPerfect, which I did with that issue (the majority of it). That is the fastest method of printing–Fonts On The Fly with PrintCache. But since Fonts On The Fly won't handle reverse print (white on black) nor curved text, I need GoScript. Hope no one is confused.

Speed quotes on PrintCache V 3.0 from the "Professionals" go like this:

1) "You should supplement or replace the Windows Print Manager with LaserTools Corp.'s $149 PrintCache, which is really the best print spooler on the market." –Edward Mendelson, PC Magazine

2) "All in all, PrintCache is one of the most satisfactory programs I've ever used... For me PrintCache falls into that category of programs I can't imagine doing without."–Jim Seymour, PC Productivity Bible

(Continued on next page)

(Continued from previous page)
3) "Dump your old spooler. PrintCache does the job right." --Mike Falkner, PC Computing

Literature with PrintCache quotes the following:
1) "Time a 386/33 MHz PC is tied up to print 500 labels from Paradox 3.5 to a Panasonic KXP-1124 dot matrix printer: 18 seconds with PrintCache; 11 minutes 10 seconds without PrintCache."

2) "Time a 386/33 MHz PC is tied up to print a 7 page mixed graphics and text job from Excel to a PostScript printer in Windows 3.0: 8 seconds with PrintCache; 1 minute 15 seconds with Print Manager.

I first starting using PrintCache with version 2.0 several years ago. What attracted me to it then was its "Optimization" feature, which eliminates sending the "white space" to a laser printer, allowing printing a full page of graphics with only 512K printer memory (99% of the time). (That's when an extra meg of printer memory costs $320. I've since added that extra meg and don't need the optimization feature, but I still use PrintCache).

Installation is as easy as it gets--type INSTALL at the A: (or B:) prompt and answer a few questions on where to put the program, where to put the buffer, and what size buffer you want, plus a few others like which port (LPT?), etc. As you can gather from the above, the buffer can be in RAM, extended or expanded memory, RAM disk, or hard disk. Size is unlimited depending on available space of where you put it and your needs (size of files). Memory required for the program can be as little as 6K and up to 17K, depending on whether or not you want the pop up menu or the optimization feature (you can have either, both, or neither). The pop up menu allows the toggling of the optimization feature, shows the settings selected such as buffer size and location, as well as the percent of buffer being used at any point in time. It is popped up with a hot key (Alt-Z by default, but is changeable).

Also, when configured for disk buffering, PrintCache transfers blocks of data to and from the disk. Block size can be changed to increase buffering performance; the larger the size, the better the performance.

As noted above, it is RAM resident, operates transparently, supports all printers and plotters, and works with DOS or Windows 3.0 or 3.1.

Last but not least, it comes with a well-done comprehensive users guide of 134 pages and promotional literature saying "The Iron Horse Steams On!" and a picture of a locomotive bearing down on a PC user tied to the track with the caption "Hideous Deadlines Bearing Down On You?", and, Oh Yes, it is complete with a train whistle that actually sounds like a locomotive whistle. I'll bring it to the meeting and let you decide (bring cotton for your ears).

Requires IBM PC, AT, PS/2 (or compatibles) with DOS 2.1 or higher.

Now, listen to this: It lists for $149, but members can pick up coupons at the meeting for HALF OFF! That's $75! (for User Group members only). At this price, you can't afford to be without it.

The Writer's Toolkit

A Review by: Stephen P. Byers,
NWA-MCUG 06/92 NewsLetter Article
Rt 4 Box 376 Springdale, AR 72762-9307 NWA-MCUG

This program is a summary of a variety of reference books dealing with the English language. If one does not own reference books, or does not have access to them, or does not like to use them then this program is a good alternative.

I tested the GRAMMAR section on several of my letters and articles. It acted as a good proof reader leaving me the choice of accepting the suggested changes or not. It found my spelling errors, allowing me the option of leaving them as written or letting the program correct them. If I used a word non existent in the program vocabulary, it simply identified it. I think this portion of the program is useful to all writers except possibly the accomplished grammarian.

The uses of the remainder of the program features are questionable in my mind. In my opinion the serious author would prefer reference books. Either the business letter/report writer or the casual letter writer would not be inclined to use the features at all. They include a word dictionary, a dictionary of common knowledge, a thesaurus, dictionary of quotations, and an abbreviation program. After all, how often in your day to day activities do you actually use reference books of this nature? My word program includes a thesaurus and a spelling dictionary – that's all I need.

When I say the program features are questionable, I do not mean to say they are not good; I am merely saying that I do not believe that one would use them enough to justify the cost. The programmer is to be commended for getting so much into the program.

Systems Compatibility Corporation, 401 N. Wabash Suite 600, Chicago, IL, (312) 329-0700

Stockwatch 6.0

Software Review by Jerry Abbanat
Monterey Bay Users Group - PC

Stockwatch 6.0 is a powerful program that can download great amounts of stock market data from Prodigy. Version 6.0 is the latest example written by Robert Huff (Prodigy #KWPK85A).

There are many sources of stock market data available to download into personal computers. A few examples are CompuServe, DialData, and Dow-Jones. Most of these services have a quite high downloading fee in addition to monthly maintenance charges. Prodigy has no downloading fees and requires only the normal monthly charge and, of course, is available to most of us via local phone numbers. The trick here is to get the information downloaded from Prodigy into a file format that can be used by the various computer stock market programs (Chartpro, Quicken, MYM, Metastock) or into a spreadsheet (Lotus or QuattroPro). Stockwatch will automatically download data requested directly into most common charting programs. It will also create comma-delimited Lotus compatible files for importing into spreadsheets.

The manual provided (via diskette), takes you through installation with minimal problems. It is VERY important to follow the directions exactly as presented. Leaving out a number or a space will leave you wondering "why isn't this working." If you do have problems that cannot be solved by digging into the manual, Mr. Huff provides support right through Prodigy's Money Talk bulletin board under "Other Investments."

Once installed, the power of Stockwatch is apparent. One can download hundreds of pieces of information about the general stock and commodity markets as well as unlimited numbers of stock quotes including opening, high, low, close and volume. A fine feature allows you to create a directory of your portfolio and have prices updated with every download. By creating a downloader diskette and using an external timer, your computer can be turned on at a certain time, call Prodigy, download your stock information, update your charting program, create your spreadsheet .PRN files, and turn your computer off. For those of us who leave our computer on all the time, there is a little program included called "Offat" which reboots at a certain time selected, and executes the downloader diskette. This is a slick way of arriving home from work and have a lot of market information ready for your viewing.

With a little imagination, the possibilities are endless. For instance, I have a great shareware program called Playback 1.9 installed on my hard drive. Playback is a keystroke recorder which also includes an automatic timer feature. Instead of using a re-boot diskette, I have Playback execute a command each week-day at 4:30 P.M. which goes into Stockwatch, calls Prodigy, downloads my quotes and market information, updates my Chartpro program, leaves Stockwatch, goes into Quattro Pro, executes a macro which creates a line of daily data I use, takes that data line and puts it into my final spreadsheet and updates my daily graphs. When I get home from work, my computer is in my Quattro spreadsheet ready to view my graphs which are up to date through the market close.

Stockwatch requires another Prodigy utility called ProUtil 5.0 to operate properly. ProUtil loads before Prodigy and can operate entirely on its own. This program allows the creation of macros which can be used in Prodigy to quickly JUMP to areas you desire. It also allows downloading of information to files as well as to printers and does some other interesting things within Prodigy. The cost of Stockwatch is around $50 and ProUtil sells for about $20. These two programs are well worth the costs for those interested in accurate market data.

One disadvantage, perhaps, is that Prodigy does not provide any historical market data. You can only get the information for the current day. There are many sources of historic data that one can use if required and pay for that information when needed. There are also a couple of BBS's which provide historic data. I will be glad to provide that information to anyone on a one-to-one basis by E-mail to me on Prodigy #KGPC10A.

WordPerfect Class

The four session WP class by Ed Buzza will be repeated starting in September. The classes will be held on the regular meeting night. The class will run from 5:45 to 6:30 p.m. Those who plan to attend, please be prompt.

The 1st (Sept) will be an intro to WordPerfect and the use of the Alt-E (Edit a code) macro. The 2nd (Oct) will cover writing, blocking and editing text. The 3rd (Nov) will discuss the table feature. And the last (Dec), will address graphics.

Quicken for Windows

Software Review by Bill Hyler, MBUG

Quicken for Windows is a similar but not exact version of their current popular DOS version 5.0, reviewed on the previous page. I have used every version from Quicken II and have found them all easy and interesting programs able to maintain a running checkbook balance. You can have as many different 'checkbooks' as you want, and, of course, they don't really have to be checkbooks, just different accounts. In turn, you are able to print a number of different reports for home, business or income tax reporting.

The Windows version closely follows the DOS version in general form, keystrokes and the way files are stored and accessed. In Windows you can size the screen as needed, whereas, with the DOS version you use the total screen. There is a familiar icon bar that allows quick access to most common functions.

If you always write your own checks, then Quicken can simply act as a check register. Or you can print checks with a dot matrix or laser printers. In the Windows version, every check you write can be memorized and a similar check never needs to be completely re-written again. All you need do is type in the first part of a memorized transaction, press <Enter> and Quicken searches for the previous transaction, and brings it to the screen for you. Just adjust the date or what ever part of the transaction is different and print it out, since you can recall all transactions and repeat them over and over. This is great for utility bills, rent or mortgage payments or other re-occurring transactions. Intuit can supply you with a number of different priced-right pre-printed checks suitable to use with their programs.

Quicken may be used with Check-Free, an electronic check-writing service. This allows you to send your transaction via a modem to Check-Free's payment center. Check-Free then makes the payment, debits your checking account and provides a monthly statement. Saves stamps, envelopes, but there are fees.

This version uses a mouse which allows you to scan quickly for completed transactions back to the beginning of the file if necessary. The mouse can be used to select from a list of memorized transactions, categories or payees. With categories (Quicken provides a starter set or you can choose your own) you have great command of later on finding out where the money went. Among your category list might be your paycheck, interest income, Social Security check or any other income. Expense categories might include: rent, medical, mortgage, utilities, and the like. Using categories already set up in the program helps to reduce the amount of typing needed with every transaction.

The Intuit system for clearing and balancing the check register is quite straight forward and easy to use. Also, Intuit provides an excellent reference book, and there are a number of after market books available to assist the beginner to get started. However, any person with just the bare minimum of Windows experience should be able to load and have the program up and running in perhaps, say a half hour to an hour.

The few drawbacks might be the inability to change the screen fonts. The size of the default font allows you to see lots of entries, but you may have to squint to read your entries.

The Windows update from DOS 4.0 is not quite the same as the DOS 5.0 version. And once you have upgraded from say, 4.0, you cannot go back. Had I know this ahead of time, I might have put my Windows version in a separate file and not into 4.0.

For those who enjoy using Windows and have the DOS version I highly recommend the Windows version. If you have the 5.0 version, it and the windows version are compatible. Switch back and forth as you wish.

Perhaps the best part of this program is the price. It lists for $49.00 but the usual street price gets down to $25 or $30. Quicken is a product of Intuit, P.O. Box 3014, Menlo Park, CA 94026.

REMark

By: Scott Wallace
Oklahoma City IBM PC Users Group
March 1992 "Monitor",

"Get a life...and a computer".

Your XT is no longer a computer. It's time to redefine the word "computer," and under the new guidelines you don't own one. If you have a Commodore or anything made by Atari, you don't own a computer. Macintosh SEs and IIs are computers, but not the Mac Plus. The Radio Shack Color Computer is not, nor is the original Compaq Portable. The Timex Sinclair certainly is not a computer.

This may seem harsh; after all, your dealer sold you a box labeled "computer." Perhaps at the time it was a computer. The word computer has been overbilled and overused. It has outlived its ability to be definitive of machines that process information in the way that persons need it processed by something called a computer.

A great amount of the hardware billed today as "computers" barely offer more features or software capability than a Nintendo set. Many companies are able to offer outrageous deals to unknowing customers by bundling these crippled machines with shareware software and calling it "a complete computer solution." It's time to stop this charade by educating first-time users in the difference between computers and monoputers.

(Continued on next page)

(Continued from previous page)

Monoputers are machines that are capable of only one task at a time without serious degradation of user function. Many would say that it's possible to use DesqView or Windows on an XT and get more than one task processing, but few people would do it all day every day and enjoy it. A monoputer is a slave machine dedicated to doing one thing at a time. That one thing can change according to the user's needs, but a monoputer does only one thing at a time.

This is not to say that monoputers don't have real use. Dedicated word processors are monoputers; so are some of the more advanced typewriters. If you need a communications gateway or a print server for a network, monoputers are perfect. They can easily be dedicated to any single task that requires processing without interruption. If all you want to do is word processing, buy a monoputer; just keep in mind that you'll have to buy another machine when your needs change.
Rules of thumb: Nothing with an 8088, 8086 or 68000 processor is a computer. Anything that comes bundled with CP/M is not a computer. If it can't run Windows v3.1, OS/2 v2.0, Unix, Netware or Multifinder on it, it's probably a monoputer.

Here then is the new processing capabilities hierarchy, from least to most: pen and paper, abacus, slide rule, hand-held calculator, hand-held electronic scheduler, Nintendo-type system, monoputer, microcomputer, workstation, minicomputer, mainframe and super computer.

If you've just realized you own a monoputer and you're happy with it, continue to be happy. Don't be resentful when new software for computers won't run on your monoputer. Just as you wouldn't expect to run WordPerfect on your Nintendo, you shouldn't expect that WordPerfect for Windows will run on your monoputer.

As a monoputer owner, you are part of a growing class. Because this redefinition of the word computer is now tied to user functionality based on software processing capabilities, machines that are computers today could someday become monoputers. This should cause 80286-based computers to become monoputers within the next three years.

There are products designed just to operate on monoputers. Borland's Quattro spreadsheet package is made to run on 8088-based monoputers. Lotus also has a version of their spreadsheet product just for 640k or less monoputers. A great deal of the shareware software available is designed for monoputers with the intent of making them easier and more interesting to use.

It's not often that a word's usage becomes so mangled that it requires redefinition. This is an industry of change. Every so often reevaluation is necessary to insure that the needs and expectations of the user are being meet. The consumer must not be led into the purchase of a computer when a monoputer will suffice, and no user should be stuck with a limited-capability monoputer if their needs clearly require a computer. By taking the time to explain the difference to your customers and your associates you'll spare them both headaches and money.

Mr. Wallace is a Programmer Analyst for McDonnell Douglas and likes to coin words in his spare time.

F.Y.I.

Database Manager: A program that allows the user to manipulate data in every conceivable way except the absolutely essential one he or she conceives of the day after entering 20 megabytes of raw information.

Project Manager: Software for generating fantasy scenarios of amazing optimism; proven in computer firms, where it is extremely successful at scheduling advertising campaigns for unavailable products.

All advertisements must be prepaid by check payable to TIBMPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if it is not received on time.

Members may insert non-commercial ads at no charge, with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, Marylee Bruneau at (813) 932-6745, for space availability and for further information.

This newsletter was created with WordPerfect for Windows donated by WordPerfect Corp. to TIBMPCUG for use by the editor.

Secretary's Report

TAMPA IBM USER'S GROUP
MINUTES OF 7/8/92 --

This meeting proved that we can improvise when we do not have a scheduled vendor presentation. We did it all in-house this time, and it was a very good, interesting and worthwhile meeting -- in very large measure due to the effort and talents of Tom Cone, who gave an excellent rundown on GeoWorks Pro, and our SYSOP, Kevan Sheridan, who gave a rundown on the FIDO Net of which our Bits of Blue BBS is now a part. And, there was a large number of members and guests on hand to take advantage of the opportunity. If you weren't there, you missed another good one. If you are not a 'regular' at the meetings, a bit of advice -- you really should be, because every meeting is interesting and packed with useful info.

CLUB NEWS:
Harvey opened the meeting noting the "new look" of the newsletter and soliciting views on same. The response was an approving round of applause. Good work Mary Lee (and helper Harvey).

- Harvey also noted that newsletter volume was at a breakpoint -- 200 copies for mail distribution. That is the breakpoint for non-profit mail status (which takes time to arrange) and that the logistics of handling the increasing volume is becoming something of a burden for he and the editor to handle by themselves -- in addition to their other club obligations. Be prepared for some changes in the not-too-distant future, and to make yourself available to help if you can.

- Harvey pointed out that non-current addresses cost the club $$, and deny the affected party the newsletter. Please keep your address on record with the club current. When your address changes, send a change of address to the address shown on the front of this newsletter -- PLEASE!

Our Prez summarized a decision taken at the last meeting to end club-financed refreshments at our regular meetings to make funds available for club needs. Later in the meeting we returned to this subject with a different twist. The funds for the refreshments came from 50% of the proceeds of the sale of 'raffle' tickets at our meetings. The other 50% of the proceeds have been given away as one of the raffle prizes. The idea of also retaining this 50% to finance club needs (e.g., a new modem, etc.) was offered as a proposal. Discussion and a vote on this were deferred due to the late hour, but will likely be presented again at the next meeting.

Harvey announced that our Education Director, Ed Buzza, would begin a 4-class series on Word Perfect 5.1 for DOS at 5:45 PM -- 45 minutes before our regular meeting on Sept. 9. The 2nd and subsequent classes will be held at the same time on our regular meeting nights for Oct., Nov. & Dec.

(Continued on next page)

(Continued from previous page)
Each class will be 45 minutes long and will dismiss at 6:30 to rejoin the regular meeting in time for any program reviews that may be scheduled.

- Four 45 minute classes is not, of course, enough time to cover a sophisticated program like Word Perfect in great depth. But, I caution you to not let this be a deterrence to your taking advantage of this opportunity. ED IS GOOD and will cover a lot of ground in a short time -- plus, it will be a good opportunity to ask questions.

PROGRAM PRESENTATIONS:

GeoWorks Pro

Our own Tom Cone is an attorney and uses GeoWorks Pro as his 'desktop' and he finds it meets his needs very well. Tom decided a rundown of the program at one of our meetings might prove beneficial to others. This meeting was the time -- and he gave an excellent rundown of the program, including the following:

- It has an environment much like MS Windows, with many of the same kinds of features as Windows. (I believe it is easier to use than Windows.)

- One big advantage is that the program will work on an XT. It requires a minimum of 512K RAM (likes 640K), DOS 2.1 or higher, and needs about 7 MB of hard disk space. It will work with just about any monitor, including monochrome and CGA (which gives B&W picture).

- Another good benefit is that some users report laser quality print from a 9-pin dot matrix printer. (I have a 24-pin DM and I do get very good quality out of GeoWorks 1.2, but it is no better that I get from Windows 3.1, Adobe, Powerpak, or Bitstream Facelift, all of which are very good quality.)

- The program provides three levels of use: Beginner, Intermediate, and Advanced:

- The BEGINNER level is limited to the desktop features: An excellent planner/scheduler, address book, calculator, note pad/text editor, and a solitaire game and a banner maker.

- The INTERMEDIATE level provides the forgoing, plus GeoWrite word processor, GeoDraw drawing program, a scrapbook, and immediate access to DOS at all times. Applications are available thru icons for all documents stored on disk. This level of GeoWorks Pro is locked into a document sub directory of Geos where documents are stored. Each document is represented by an icon on the screen. Double clicking any document icon will load the application that generated the document, with that document loaded into the application. This level makes available a 'waste basket' into which you can move files, individual and up to and including entire directories -- a convenient feature of file maintenance. Another nice feature is capability to store additional info about your individual files, including up to 200+ characters of notes (similar to high end word processors). It also provides the capability to group/ungroup files/objects for manipulation, a formatting capability, and file management.

- The ADVANCED level provides all of the above. However, instead of being locked into a document directory, a desktop is used, with all applications represented by icons. The desktop is called Geo Manager and is similar in nature to Windows managers. Applications, other than those mentioned above, which appear on the desktop include: Gao Com; a nice, flexible communications program; and a realities kind of address book with links to Gao Com and the Planner.

- GeoWorks Pro can be bundled with Quattro Pro SE, a scaled down, but still powerful version of Quattro Pro. Quattro Pro SE is not a GeoWorks application, but GeoWorks Pro has been designed to allow importing from Quattro Pro SE spreadsheets whatever info you may require.

- GeoWrite is somewhat more powerful the WinWrite in that GeoWrite allows use of columns -- up to 4. GeoWrite accepts files only in ASCII or GeoWrite. GeoWrite will import a wide variety of graphics, but it does not wrap text around graphics -- you can have no text that is not a part of the graphic on the same lines as the graphic.

- Other nice features of GeoWorks Pro include: A special viewer that allows looking at prospective cut/paste imports into GeoWorks applications; GeoWorks Pro allows shutting down with applications running and files loaded into those applications; it will be returned to that same configuration at next start-up. Another nice feature is the cost; some at the meeting reported purchasing the program for as little as $59. That is cheap. Thanks, Tom, for a super presentation. I have GeoWorks 1.2 and like the program very well, and GeoWorks Pro is a good improvement over that. The biggest problem I have is that, like Windows, it does not have powerful enough built-in programs -- word processors, DTPs, etc. - to meet my needs. Unlike Windows, however, there are no major applications on the market written for GeoWorks Pro. Hence, you are limited to the internal features of GeoWorks Pro and shelling out to DOS to use other applications.

FIDO Net

Kevan Sheridan, our Bits of Blue BBS SYSOP, gave an excellent rundown of the FIDO Net system that our BBS recently joined. A layman's definition of FIDO Net is 'a worldwide message network' that allows the exchange of message between any subscribing BBS anywhere in the world. At present, there are some 17,000 nodes on the FIDO Net. It is a real bargain for us -- costing only $3.50 per month for the 10 ECHOs we have subscribed for:

Desqview	Shareware
Novell	QModem
Windows	ZModem
Virus	OS/2
WordPerfect	Disney

Each ECHO on our BBS is limited to the 500 most recent messages. Thus, there are some 5,000 FIDO Net messages on our BBS at all times. That is a LOT of reading. Hence, you are asked to select only those conferences (ECHOs) you are most interested in and download for subsequent leisure reading, rather than tie

(Continued on next page)

(Continued from previous page)
up the BBS reading the messages. It should be noted that the Net is designed for the exchange of messages between BBSs and not messages among members of the same BBS; Bits of Blue members sending messages to other BOB members should use the main conference message feature.

For turbo log-on to the BBS, type: (*first name*) (space) (*last name*) (space) (*password*) (space) (/). That will get you to the main menu where you then select Join Conferences. You may then select any conference you desire, with the FIDO Net conferences listed as Public Conferences. M gets you to the QWK mail door. The first time, you must select the compression system you will use (e.g., ZIP) and the conferences you are interested in downloading; these can be changed later if desired. The BBS will keep track of the conferences you select and the messages you down load so that the next time you download, only those messages added since your last download of that conference will be downloaded.

You may read the messages on the BBS, but that is not practical and really limits the utility of the BBS for all members. You are asked to download those FIDO Net conferences you are interested in -- it takes a lot less time to download than to read, and you can then read at your leisure. But, you will need an off-line mail reader. The BBS has at least two available: OLX-TD.EXE for use with DOS, and WINQ200.ZIP for use with Windows. (I believe both have essentially the same features, but I will mention only OLX which Kevan described.)

When you first crank up OLX (Off-Line Express), you must configure the program to your computer, identifying such as your upload directory, down load directory, etc. It is suggested that you set the FIDO Tagline to 'Yes'. OLX will then allow you to read all messages or selectively read, to print all or selectively print, and/or to save all or individual messages. It is reported to be a nice and easy to use program and should meet all your needs in dealing with FIDO Net downloads.

Kevan, you did a super job. I haven't used this new feature yet, but I believe I can do so with confidence after having benefit of you review of the system. Thanks much, from all of us.

AND THE WINNER IS:
The following had the good fortune of winning some very nice prizes:

GeoWorks Pro	Emelie Jurado
Diskette Manager	Calvin Johnson
Box 3½" diskettes	Ruth Redlein
How To Backup Your PC	Bill White & Roger Waters

COMMENTARY:

I recently ordered OS2/2.0 from a Massachusetts mail order firm, Corporate Software. I received the program after some justifiable delay, due mostly to the need to send in proof of ownership for upgrade price purposes. I had anxiously awaited marketing of OS2/2.0 after having seen a couple of demos of the program and reading several articles describing the program.

After receiving the program, I used a good bit a scarce 'spare time' to read the documentation. I was interested in all of the documentation, especially loading and start-up, with a particular interest in compatibility. I learned much, including that compatibility info was contained in files on the disks -- not much help until I loaded the program. I learned, among other things, that the program included Windows 3.0 and not 3.1. Since 3.1 is a great improvement over 3.0, I wanted to know if OS2 was compatible with Win 3.1. I also had some other technical questions.

So, I called Tech Support at IBM. I learned that OS2 was not compatible with Win 3.1. During the course of the conversation, I mentioned disk compression programs. At that point I was also informed that OS2 was not compatible with any disk compression programs on the market (Stacker, SuperStor, DoubleDisk), and would not recognize the compressed disks. These factors made OS2/2.0 unsuitable for me.

At that point, I looked at the return documentation from Corporate Software. Among other things, it said it would accept return of only unopened or damaged products. That left me out. I should have read the company's documentation before I opened, you say! It wouldn't have made any difference. I had no reason to believe that I would not want the software -- I had no indication on the surface that the program was not compatible with my setup (to the contrary, compatibility data is imbedded in the program), or contained features I would not want (e.g., Windows 3.0).

So, what are the options: (1) Send in to the producer of any software you have an interest in your complete setup to ascertain compatibility; (2) Buy the software and be stuck with any that you cannot use; (3) Don't buy software from a source that will not permit legitimate returns, including incompatible software. The latter is now my practice, along with complaints to the companies involved in this exercise. I would suggest that all software purchasers give similar thought regarding their purchases. WHAT DO YOU THINK?

President's Column :

Ok I am back. In case you didn't notice, there was no president column in last months newsletter. Once a year we at the Tampa Dun & Bradstreet Software office put on a conference for our customers. For a handful of our staff, including myself, this is the equivalent of setting up and preparing for Comdex, but on a smaller scale. For a good 6-8 weeks our focus consist of only one thing 'THE CONFERENCE'. This was my 3rd year participating and once again I found myself spending a lot of hours including weekends preparing. Well the conference is over and I have almost recovered. For the last two weeks the last thing I wanted to see was my home PC. However I now find myself typing this column, I guess I have survived another year.

Now that I am back to earth lets talk about our group. First I want to thank Tom and Kevan for two excellent presentations. Their presentations on GeoWorks Pro and FIDO Net were extremely informative. No matter how much you know a product, when you prepare to educate others you find yourself learning new things about that product. Not only did Tom and Kevan educate us, but I believe they also added knowledge to their existing expertise in each product. I also was extremely pleased to see the large attendance. This was very reassuring considering we had no big name vendor presenting.

A topic that the board has been discussing is how to get you, the member, to participate in product reviews. We are now receiving DOS and Windows products from vendors for our review. The products are ours to keep. However, each vendor ask that we publish a review or show the product at one of our general meetings. The vendors only ask for a fair and impartial review. With this in mind we will be taking names of those of you interested in either presenting a product at a general meeting or writing a review for the newsletter. You will pick the product you wish to review from a prepared list of available products. Reviewers will be selected by the board based on a criteria which has yet to be determined. Once selected you will be loaned the product without the registration and allowed at least 60 days or a number of days selected by the board to review the product to prepare your review. Upon completion of your review you will be given the registration of the product you review and the product will be yours. If you have not properly reviewed the product within the predetermined time you will be asked to give the complete product back to the group. The exact procedures to implement a review process have not yet been finalized by the board but we are very close.

It is our goal to find individuals who can provide an unbiased review of products in a timely manner which will benefit our general membership. Should you have any questions or suggestions on this process please notify me or any board member.

This newsletter contains another 1st for old ***BOB***. You will find that it contains the 1st business add ever. While it is not our intent to turn this newsletter into *Computer Shopper* the realities are that the newsletter represents the largest monthly expense to our group at approximately 90¢ an issue (200 copies) and monies collected that can offset this cost are welcomed. We need a little more organization and about 40 new members to go to bulk mailing on a regular monthly basis. This would drop our unit price some. An additional avenue is to take advantage of postal rates provided to qualified non profit groups. Presently we do not completely qualify. However, before year end we should be able to meet the U.S. Postal Service requirements for this discount. Marylee has completed, subject to approval by the board, an advertising rate brochure which will be sent out to local and national vendors. Anyone wishing a copy of this brochure should contact the Editor, Marylee Bruneau, at (813) 932-6745 or the BBS.

As you have noticed, the newsletter has a new look. This is the second issue produced using WordPerfect for Windows, Corel Draw 3.0 and Windows 3.1. It wasn't all fun initially but the end results were worth it. Marylee plans on entering our newsletter in the BIX newsletter contest in the *UP to 12 pages* class. Winners receive a plaque and a postscript cartridge from Pacific Data. I personally would be happy with the pride of winning out over 270 other newsletter from around the world including 42 states and nine countries combining for a total of over 300,000 members. User groups from around the world associated with the Association of Personal User Groups (APCUG) enter this yearly contest. Categories include:

Best Graphic Design
Best Feature Articles
Best Coverage of Group Activities
Best Columnist
Best Publication

We would like our newsletter to represent our group. This is sometimes difficult when we have to incorporate so many articles from other groups. We are making progress and the quantity and quality of articles reflect our growth and contributions from our members. We still have some distance to cover. Read the article by Ed Buzza **Writing Product Reviews** in this issue and challenge yourself to write at least one review this year on a new product you have acquired. It can be any product including shareware or public domain. We all need to hear and read the information or opinion you have about a product. The newsletter will win based on the efforts of the group. **GOOD LUCK BOB.**

In closing please remember that our own Ed Buzza will once again be teaching his WordPerfect class starting in September.

Harvey Bruneau

CorelDraw Version 3.0

A review by: Ian Simpson, Milwaukee PCUG

CorelDRAW, one of the most powerful graphics programs available for Windows on the PC, has just gotten a major upgrade. Version 3.0 is truly a complete graphics package. In addition to the Draw program many of us are familiar with, several new programs have been added to create a suite of tools in one application package.

New in Version Three are Corel PHOTO-PAINT, Corel SHOW, and Corel CHART. The two other units included are the familiar Corel TRACE and Corel MOSAIC.

Starting with CorelDRAW itself we now find several major improvements. Most important is the ability to now edit in preview mode. This way you can see fills and line characteristics as well as stacking order on the screen as you work with the individual elements. Two other major improvements are the introduction of layers for complex or multi-purpose drawings, and the use of True Type fonts rather than the proprietary *.WFN fonts of yore.

Layering now gives us several default layers, including a standard drawing layer and a "guides" layer, which will not print but will help with laying out elements of a drawing. Layers can be added as needed. A special menu box called a "roll-up window" is used by six major functions. One of these windows controls the layers. Each layer can be renamed and moved to a different location in the overall order of the drawing. Each layer can also be hidden, given a default color or characteristic as desired.

CorelDRAW will still utilize WFN fonts if you wish, just point it in the correct direction of all those customized or converted fonts. The program still uses the WFN format for the symbols libraries also. Adobe Type 1 style fonts are also available. Rather than the WFN Boss utility used in previous versions, CorelDRAW now directly converts to Type 1 or True Type fonts from the Export command in the File menu, meaning your can use Corel to convert from one to the other. (I haven't done this yet, but it looks like this process is done one character at a time, so this could be time consuming. A special offer for Font Monger is included with the package, which will do this conversion and more.)

Other welcome changes include much easier techniques for fitting text to a path, creating 3-D objects and changing their positioning and apparent lighting source. The blend function has also been improved with editable blend-along-a-path, rainbow fills and other gee-whiz options.

Corel CHART will take data entered directly or imported from most spreadsheets and create a seemingly endless variety of charts and graphic effects. The functionality is similar to DRAW, so users will be quickly up to speed.

Corel PHOTO-PAINT will be instantly familiar to anyone used to Z-Soft's Publisher's Paintbrush or Photo Finish, as PHOTO-PAINT is a licensed version of this with some Corel touches added. So far all that I have found to be different or missing is the option to scan directly from the program. With this package you will still need a separate scanning program.

Corel SHOW is a presentation package that can tie it all together for business or educational display. Making full use of OLE, SHOW will use DRAW, PHOTO-PAINT, and CHART files, all placed on a common background slide, if you wish. SHOW can also control the time each slide is on the screen, the transition effect and can even include *.FLI animated sequences from Autodesk Animator.

Corel MOSAIC is a graphic library utility which can show and print thumbnails of many different types of graphic files, and Corel TRACE will convert bit-mapped images in the vector drawn images, either singly or in batches.

The whole package comes with some nifty extras, including all six programs, 256 typefaces and 12,000 pieces of clip art on a CD-ROM disk. If you install from the floppies, the number of clip art samples, SHOW, CHART and PHOTO-PAINT samples are cut back and the typefaces are down to a mere(!) 153. Also included is a 400 page catalog of type styles, clip art and sample files, a multi-purpose ruler/template, a coupon book for related products, a wall chart of type styles, a one hour introductory videotape and an 800 page manual.

The User's Guide is perhaps the most disappointing aspect of the entire package. The MOSAIC module isn't even covered. Instead you are referred to on-line help. Subjects covered, are generally informative, but the proofing of the book itself is quite poor. Only a quarter-way into the book several errors are found only by the contradictions involved or from prior knowledge of the program. A major saving grace however, is that now all of these units have on-line help, which seems to be very well done. (Continued on next page)

(Continued from previous page)

If you choose to install all units and all the samples available from the floppies, be prepared to give up 29 megabytes of hard disk space. On a dollar per megabyte basis, this has to be the bargain of the year! With a $595 list price, a street price in the mid $400s and the usual upgrade offers, this package really is a bargain and I recommend it highly.

■■■

WRITING PRODUCT REVIEWS - Ed Buzza

Some people claim that they can't write. They don't mean that they're illiterate or not physically capable of writing; they're saying that they don't know how to put their thoughts down on paper. They say that they don't know the format or style to use. Or they fear possible embarrassment or being made fun of for using poor grammar or for not using high-falutin' words.

To all this, I say *censored*!! If you can talk, if you can think, if you can type -- you can write! Blessed be the person who writes at the eight grade school level. The intelligent will recognize the intent and applaud the effort. The less literate will at least understand what has been written. Those who would look down their noses and adopt a patronizing air are to be pitied, not scorned.

For example, someone might say 'An expository evaluation of the intrinsic merit of this laudatory mechanism refutes beneficial acquisition.' I'd rather see that someone say 'It ain't worth didley.' Anyone can use "big" words; all you need is a dictionary. What is needed are words that give information, that convey thoughts, and are readily understood by almost all people. There will always be exceptions but there's nothing you can do about that.

So, for those of you who would like to write a review of a product, but "don't know how to write," the following outline is meant to help you, to guide you in writing an article for the newsletter. Don't need to be fancy, just the facts as you know them and as you say them!

Title and author:
PRODUCT REVIEW (use this as your title or headline). by (enter your name).

Product name (start of first paragraph):
Enter name of product. Is it a high, medium, low level type? What kind of product is it (type of software or hardware: word processor, paint program, modem, scanner, etc)?

Description or purpose (2nd paragraph):
Describe what it does. Abstract from package hype but your definition is preferred. Briefly describe it's features or modules.

Installation and use (3rd paragraph):
How easy is it to install? Custom install or must install everything? Do you need to delete old version? Tell of any problems when you installed.

If upgrade, is it faster, better, how? Is new version more complex? Do you need or like the new features? Describe the documentation - complete, good, lousy, good/poor examples, good/poor graphics.

What do you like about it? What do you dislike? How does it compare to other similar products that you own or have used?

Requirements:
How much RAM, conventional, expanded, or extended? How much space on Hard Drive - minimum and maximum? Any special needs like SVGA, mouse, modem, CD-ROM, sound board, adaptor boards.

Can it be used on 8088, 80286, 80326+? What version of DOS does it need? Is it Windows only and which version? Where there any surprises that the product package did not mention?

Product data: Product name and version
Manufacturer's name
List price
Street price and source

Using the above guidelines, try to keep the article at about 500 - 700 words or about one page. It's really not that difficult at all. And if you need help, write a rough draft and ask the Editor or me to review it for you. We'll be glad to help. ■■■

Adobe Illustrator 4.0

By: Ash Nallawalla, APCUG

I last reviewed Adobe Illustrator version 1.0 some years ago and lost contact with the program until I joined the tail end of the beta program for version 4.0 (AI4). I am no artist but I have had to help illustrate Unisys manuals with another package for three years. Several PC Update (Melbourne PCUG) covers and articles have featured some of my work. I used modified clip art and scanned images in such work, so my report will not have an artist's viewpoint. I have taken the approach of a technical writer with no art department support, who needs to rely on clip art to get the job done easily. This explanation is relevant.

AI4 is a professional design tool for artists, desktop publishers and technical illustrators. You can edit color and black-and-white images with it, be they geometric shapes or freehand work. AI4 is a "draw" tool, not a "paint" tool-you can modify its output at any stage, such as resizing or reshaping a line or circle.

You cannot do this easily with a paint package such as PC Paintbrush. Note, however, that AI uses the term "paint" to mean assigning colors to its art objects.

Requirements:
The days of the 80286 and lesser CPUs are over, at least in business situations where you need to use Windows. Consider the following minimum requirements:

- 80386- or 80486-based computer
- 4 MB RAM
- Hard drive with 12 MB free and one high-density floppy
- DOS 3.1, Windows 3.0 or later
- VGA, Super VGA, 16- or 24-bit display supported by
- PostScript or other printer supported by Windows

Main Features:
The full list of features would take several pages, so I will list the new or significant features:

- Drawing Tools. A wide range of tools enable you to draw lines, precision curves, rectangles; blend and transform objects, and the like.
- Text Tools. You can import text from a file; key it from within AI4; manipulate text to any shape or wrap it along any path.
- Editing in Preview Mode. Until recently, many such programs made you edit in wireframe mode and you could not edit in preview mode. AI4 now enables you to edit in either mode.
- Graphing Capability. If the simple bar graphs and pie charts in your spreadsheet program look boring, you can jazz them up in AI4.
- Enhanced Color Support. AI4 supports 16- and 24-bit color and popular color interchange formats such as PANTONE, FOCOLTONE, TOYO and TRUMATCH.
- Context-Sensitive Help. Pressing F1 gives you context-sensitive help at any time. This supplements a fully-indexed, comprehensive online help. With my background of having used CorelDRAW!, Harvard Draw and Arts & Letters, I found I didn't need to refer to the manuals except for detailed information.
- Optimized for 386. I have a "slow" 80386/33 system, with just a 256 kB VGA card; yet I found AI4 fast to use. That is because the code has been optimized for the i386 processor.
- Documentation. I consider the AI manuals to be one of the best in the industry-not only are they easy to use but they employ good design principles. The Beyond the Basics booklet is a prime example of that.
- Macintosh Compatibility. AI has been available on the Macintosh for more time than it has on the PC platform. AI4 files may be shared with the Mac and NeXT.

Packaging:
AI4 comes with the following extras, in addition to the software:

- Tutorial guide and sample files
- User Guide
- Color Guide
- Beyond the Basics guide
- Adobe Separator
- Adobe Type Manager (ATM) 17 families (40 fonts) of Adobe Type 1 typefaces
- Adobe TypeAlign
- Clip Art and Symbols
- Quick-Reference cards
- Free technical support and free upgrades for 90 days

In Use:
Installing the software was painless. The User Guide made it easy to understand concepts that I knew by other names. For example, I thought one couldn't import EPS, PCX, BMP etc but I found the command was called Place Art. The Import command is reserved for line art, I see.

The set of tools is comprehensive enough for my purposes as I tend to work with simple objects such as text, boxes, arrows and the like. The 17 new faces didn't matter much to me as I had most of them under other names in other packages. I like to modify clip art so that it no longer looks like something the readers will have seen elsewhere. Sure enough, it was quite easy to do so, again a matter of learning new terms. The amount of supplied clip art is a pittance, compared to, say, CorelDRAW! but then AI has never been aimed at the person who relies heavily on it. What I do like is the small selection of borders, which come in handy for designing certificates.

Adobe Type Manager 2.02:
If you have certain Windows applications then you might have multiple copies of this font generation and display utility. The main difference is in the fonts that come with each bundle. For instance, the stand-alone ATM gives you fonts that you already have on a PostScript printer anyway, but the one supplied, say, with Lotus 1-2-3 for Windows provides several display ones. Similarly, the 17 new faces

(Continued on next page)

(Continued from previous page)
include Symbol, Helvetica, Courier, and Times; but they also include Carta, Berthold City, Copperplate Gothic, Adobe Garamond, Gill Sans, Goudy Text, Madrone, Poplar, Berthold Script, Stencil, Tekton, Willow, and Adobe Wood Type Ornaments 2. AI4 requires that ATM is installed before you can install the former.

Adobe TypeAlign:
Adobe TypeAlign is a free-standing utility that enables you to place text from Adobe or other Type 1 fonts along any path. You can make special effects such as twist, rotate, reverse and color text. The results can be exported to AI or other programs.

Adobe Separator 2.1:
The manual for this program is called Color Guide-it had me worried briefly-RTFM has a lot going for it! This program is strictly for those who need to work in color; it provides separations in CMYK (cyan, magenta, yellow, and black) or in custom colors, which includes the PANTONE Matching System (PMS). The manual (like the rest) doesn't assume prior knowledge, so you can learn as you go.

Conclusion:
The Macintosh compatibility aspect certainly makes AI4 a prime contender in a PC-Mac or PC-NeXT environment. I like its speed, even on a 386. I would have preferred TypeAlign and Separator to be part of the main AI package, even if they were made OLE clients, although I imagine that Windows 3.0 compatibility was a design objective. As I have used another leading package for some years and support it at work, I didn't see enough in AI4 to make me switch completely. Nonetheless, I would gladly use it to do the kind of business illustrations that I do, and not miss the extra features of my present package. Its small size in terms of disk usage also is a consideration for many who don't have a spare 30 MB. I certainly recommend AI4.
Adobe Streamline 3.0

Adobe Streamline 3.0 (SL3) is a superb tracing tool. It is sold separately, although it was supplied free with Adobe Illustrator version 4.0 (AI4) for a limited time. With SL3 you can take a gray-scale, color, or black-and-white bitmapped image, such as a scanned logo, and create an AI-compatible drawing in color or black-and-white. Not only does this give you a sharper image but the size of the file is smaller. Although AI4 contains an Autotrace tool, it is only suited to very simple images.

Requirements:
- 80286 or better CPU
- 2 MB RAM (4 MB for color work)
- Hard drive with 3 MB free and one high-density floppy drive
- DOS 3.1, Windows 3.0 or later
- VGA, Super VGA, 16- or 24-bit display supported by Windows
- Images to be traced must be PCX, PNT, or TIFF; 8-bit gray-scale, not halftones; up to 24-bit color

In Use:
What impressed me was the availability in the program to choose between three tracing options:

- Outline. Where an image has lines of varying thicknesses, this is the best option.
- Centerline. Where the image has lines of equal thickness, or you want to achieve that effect, this is the correct choice.
- Line Recognition. An image comprising straight lines, such as a form, is best traced with this option.

Most tracing programs previously omitted the Line Recognition option. If you have scanned an image with a straight line you will know how difficult it is to get the line straight. This option overcomes that problem. Furthermore, in SL3 you can combine two options: an image containing both curves and lines needs both Line Recognition and Outline (or Centerline) options.

Modifying the Image:
If you need to trace an image that has white lines or curves on a black background, then you can reverse the image before tracing it. You don't have to trace an entire image if you only want a part of it-there are tools like the "Magic Wand," which enables you to choose an area based on the color similarity of adjacent pixels. The "Lasso" tool enables you to specify the area to be scanned. The "Swatch" tool enables you to apply a chosen color to another part of the image-either touch up a damaged area or change the color of that area.

Converting the Image:
Having chosen the conversion options and the area to be traced, you choose the "Convert" option and sit back. There are numerous fine-tuning options available to get the optimum result, and you will not be displeased with the results. For example, you can "posterize" a gray-scale image into a striking trace using just a few colors. The resulting AI-format image can be further touched up within SL3 or sent to AI4 for complex manipulation. You can also export the image into other formats such as DRW, DXF, CGM, PLT and WMF.

Conclusion:
I heartily recommend Adobe Streamline 3.0 even if you don't plan to use AI4. Its speed and flexibility make it easy to use by anyone who can use a scanner. It is an excellent tracing tool.

Availability:
AI4 and SL3 were kindly supplied by Adobe Systems Inc, PO Box 7900, Mountain View, CA 94039-4400. The list prices are as follows: AI4: $695; SL3: $195 and upgrades: $49.

USA bring home the Olympic Gold!

WordPerfect via ViaGrafix Video

Review by: Phil Saunders, Madison PC User's Group

With the hoards of computer users emerging, and no one having time to read those pesky manuals, videotape is emerging as a viable teaching method for computer applications. Especially those busy yups on a tight schedule appreciate its flexibility.

ViaGrafix of Pryor, Oklahoma (yes, the Pryor, Oklahoma) offers up a huge range of today's most popular applications, including a hefty nine volumes on WordPerfect. Windows, DOS, PC's, PC Tools, and Norton Utilities are covered in General. Word Processing also includes WP for Windows, Word for Windows, Word, Professional Write, RightWriter, Grammatik, and Correct Grammer. I can't believe they forgot WordStar..

Other categories covered rather thoroughly are Desktop Publishing and Graphics, Spreadsheet, CAD, Programming, Accounting, and Database. All are representative of the leading commercial packages and feature a variety of approaches to the more popular applications, such as WP. I started with four of the WordPerfect volumes available: Learning WP, Journey Through WP - Introduction, Journey Through WP - Advanced, and WP 5.1 Secrets/Timesavers. WP 5.1 for Desktop Publishing, WP 5.1 and your Laser Printer, WP 5.1 for the Office, Customizing WP 5.1 and Quick Start to WP for Windows are the other titles. Because of their length and depth, I am going to cover two this month, and two next.

Learning WP is the logical first lesson, and assumes little or no computer skills. I was annoyed by the two minutes of dance/elevator music backing an extended ViaGrafix plug at the beginning of the tape -- if you can see it, they have the cash, right? Given the basic nature of the instruction, I also thought it potentially confusing to have a generic overview of lessons featuring Windows and Lotus screens in this lesson. We then meet our scrubbed hosts, Kirk Gordney and Katherine Sparks, who are bland but effective.

We have a generic hello, followed by a review of the actual program disks included with the program, and a brief explanation of what each is. Next is a terse tutorial on disks, and we begin to load the program for the first time. * First plug: Customizing WP.

The lesson is geared toward hard disk users and ignores those using two floppies, as well it should. The loading wisely sticks to the standard full installation, pausing to explain what each of the steps is, explaining what is happening on the screen, and reminding us to be patient as we wait for the files to be unpacked and loaded. * Second plug: WP for DTP.

Included in this presentation is the caution to back up the original disks and store both sets safely. Although they mention adding WP to the path, they neglect to cover not having the capability to open enough files in the CONFIG.SYS causing loading problems. They then cover loading the printer drivers and registering your copy for reference when calling WP Technical Support. They don't mention that number, or where to find it.

Now we begin. They would have you change to the WP51 directory installed by the program to initiate loading, despite its being in the path. I would like that explained here, as well as establishing a file directory rather than having one's program files mucked up with ordinary text files.

"Clean screen" and the Doc 1 Pg 1 Ln 1" Pos 1" indicators are mentioned, although Doc 1 is not explained. They note the change to "POS" when Caps Lock is engaged, and explain the toggle. It goes on in this vein, giving thorough, meticulous explanations of all the basic keys and functions. It pauses for a Review, one of the many included, to remind us that word processing is not like using a typewriter.

In our first section, we only covered the basic keys, and F10 in combination with Shift (Retrieve). We now move on the Function Keys with printing being the first exercise. This is where the enclosed floppies, in both sizes, come into play. After printing, we save the file under another filename and move on to listing files. "When pressing F5, the path c:\WP51*.* should appear in the lower left-hand corner." True, but what if it doesn't? As attentive to detail as they were earlier, a little more explanation here might help. Our review this time covers Print, Save, Name, List, and Retrieve.

Next comes The Look. Block move, block copy, and block delete are covered, although block append is ignored. Restore and undelete are mentioned, teaching even me that deletions three back are saved -- I had thought two. Underline and bold are mentioned, but it shows Page Centering and neglects to mention it won't show visually without engaging the preview screen; another anomaly in a generally informative introduction. We review without mentioning the preview screen. If that isn't an integral part of "The Look," what is?

Now we do some of the basic formatting, including Line Spacing, Margins T B L R, and a tour of the Format Menu, without explanation. * Third plug: Journey AND Customize.

Our next venture is into Spell, Thesaurus, Search, and Replace. It's good that they point out spell checking will not catch correctly spelled words out of context, e.g., form and from. When explaining search and replace, they give the tip that it can be used to cut typing time by replacing a word after the fact, such as replacing the initials MG after typing the document with Madison PC Users Group. This is a great tip, but isn't it early for someone who just loaded the program forty minutes ago?

When telling viewers how to access the Help menu we are carefully cautioned; "Of course, the help key is no substitute for watching the ViaGrafix tapes!" Thank you for that pearl. Help coverage is good, showing the templates, index listing, and hot keying. The tape wraps up with practice and "polishing" the document using the skills covered; they ask you to underline and italicize one phrase -- real polish! We then get the credits and are

(Continued on next page)

(Continued from previous page)

done after sixty-nine minutes. I would deduct five for introduction and credits, but it's still a packed hour plus.

I whined about this and that, but this is a good intro to someone starting out. My wife, who has used WP like a typewriter for over a year, thought it was wonderful. She was eager to share her use of new skills learned from the tape after one viewing. Interestingly, I couldn't impart the same knowledge over a much longer time -- something about consider the source....

Our second tape was Journey through WordPerfect Introduction. I would have expected this to pick up where the other left off, especially after their insistence on rewinding segments for comprehension. I would then infer that this tape is meant as a stand-alone for those just starting WP, but not those uninitiated to the PC.

Again the tape starts with the three minute introduction. This tape starts awkwardly, with an assumption that you need help starting the program, then directing you to the arrow keys without saying what they are. Then the pulldown menus are displayed, but not explained or utilized. We then hit F7 for a clear screen, saying "no" twice without explaining that the first is for saving, the second exiting. We then have a brief tour of the 101 keyboard, ignoring the 85. They also mention arrow keys being in the number keypad without saying why. Finally, in the demonstration of using floppy drive files, they show a 3.5" drive without mentioning a 5.25" -- this could be confusing to the true novitiate. Having kvetched this much, please be assured it is much better from here out.

We start with a basic tour of the keyboard and computer. Review mentions the toggle, F1-undelete, spell check and thesaurus. Now it starts to pick up with the demonstration of reveal codes and how to work within that screen. We are walked through entering text in code, adding code to existing text, and a plug for Advanced.

The printing session in this module is more intensive, introducing the view document screen, and explaining sizing the screen. I feel they should mention using page up/down for viewing larger documents here. We then go to the actual printer control menu with a selective tour. If they are not going to cover specific menu items, they might mention why, or use this opportunity for one of their plugs. We are shown how to select a printer, but not how to print selected pages, or draft mode. We do learn how to print directly from the file listings.

These tapes are informative, thorough, always available, and received far better by the less curmudgeonly. I would recommend the vendor for their other series based on my exposure to their WordPerfect efforts. These tapes are $49.95 each and are available by calling 1-800-ViaGraf. The people I talked to were knowledgeable and responsive.
ViaGrafix 31 S. Adair Pryor, OK 74361 (800) 842-4723

Byte Magazine Subscription Discount:
McGraw-Hill has supplied our group with Special Discount Rates for New and Renewal subscriptions for this magazine. The regular rate is $29.95 yearly, the special rate to User Group Members is $19.95. See Marylee or Harvey at the August meeting for a prepaid order form if you wish to take advantage of this substantial savings.

CorelDRAW rebates are available for our members. A $50.00 on first time purchase or a $20.00 rebate on upgrade. Contact Marylee or Harvey to receive your rebate seal.

PrintCache half-off Coupons: Last month we had a review in the Bits of Blue on this RAM-resident utility that allows you to buffer any print job to the buffer type of your choice. Any members interested in this software coupon see Marylee or Harvey. (list $149.00 with coupon $75.00).

Announcement from ARTISOFT:

Artisoft has notified all Users Groups in the US of their free summer and fall seminars. We are passing the information on to you that they will be visiting Tampa on October 29-30.

Artisoft Business Development Group representatives will present "Networking Made Simple" to explain the benefits of networking, especially with the LANtastic Network Operating System, the peer-to-peer world leader.

For more sophisticated LAN devotees, the presenters will demonstrate and explore Artisoft's revolutionary products for multimedia and voice. They will introduce the new LANtastic for Macintosh network utility and tell you all about the Central Station connectivity processor, the ultimate network connection for notebooks, printers and modems.

Call 1-800-TINY RAM for more details.

A Monthly Publication of the

Tampa IBM PC User's Group

BITS of BLUE

VOL. 5 NO. 9 September , 1992

MEETING
(2nd Wednesday every month)

DATE: September 9, 1992
TIME: 6:00 PM
PLACE: IBM CUSTOMER CENTER
LAKE POINTE ONE BUILDING
3109 W. Martin L. King Blvd.
Room 450

DIRECTIONS:

The Tampa IBM PC Users Group meets in the IBM's LAKE POINTE ONE Building across from Tampa Bay Mall one block east of Tampa Stadium.

The best entrance is on Martin Luther King Blvd. at the traffic light in front of Burdines. As you turn North off Martin Luther King Blvd. you will see the LAKE POINTE ONE BUILDING on the left & parking on the right. Join us in ROOM 450 - 4th floor. **Guest please sign in.**

Bits of Blue is published by the Tampa IBM PC Users' Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about IBM-PC and compatible personal computer systems to its members.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII file or in a commonly available word processor format, such as WordPerfect 5.1, on diskette to the editor at 9402 Hidden Ridge Place, Tampa, Florida 33637 or send it by modem to BBS (813)239-3704.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for non-profit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

Commercial advertisements will be accepted at the following rates:

	1 month	3 months	6 months
Full Page	$60.00	$162.00	288.00
Half Page	$40.00	$108.00	$192.00
Quarter Page	$22.00	$60.00	$106.00
Eight Page	$12.00	$33.00	$58.00
Business Card	$10.00	$27.00	$48.00

All advertisements must be prepaid by check payable to TIBMPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if it is not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, Marylee Bruneau at (813) 932-6745, for space availability and for further information.

This newsletter was created with WordPerfect for Windows donated by WordPerfect Corp. to TIBMPCUG for use by the editor.

Secretary's Report

TAMPA IBM USER'S GROUP
MINUTES OF 8/12/92 --

The focus of this meeting was on IBM's OS/2 Version 2.0 and there was a good turnout to learn what they could about the program. While a few other subjects were discussed, the presentation of OS/2 and the before & after discussion of same occupied about 90% of the evening. Things moved a bit fast for this hard-of-hearing reporter, so I am sure that I will only scratch the surface of what transpired -- another reason you should all turnout for these always interesting and worthwhile meetings.

CLUB NEWS

Harvey reminded all present of the Word Perfect 5.1 for DOS classes that are to start next month and continue fo the subsequent three months. They will convene on our regular meeting nights at 5:45. They will be conducted by our own inimitable Ed Buzza. An excellent opportunity for those interested. Please be on time -- Ed has a lot of ground to cover in a short time.

Our Prez informed us that our Board is considering trying to start a SIG for communications -- using a modem and a BBS. A good bit of interest was evident from those present and Don Patzsch, who has been CO-SYSOP and technical answer man for the large Sunshine BBS for a number of years, agreed to lead the SIG. It appears another very worthwhile and productive project is about to get underway. Watch for more info on this.

The president of the Tampa Bay OS/2 User Group was present and invited all interested in OS/2 to join their group which meets from 3-5 PM on the 4th Monday of the month. The next meeting is August 24. The meetings are held at the same place as ours -- room 450 of the Lake Pointe One building (IBM facilities). The group focuses exclusively on OS/2 with a view toward exploring and learning about the many features of OS/2, and to solve user problems with same. For more information, call the group coordinator, Joe Poston, at (813)343-3488. If you are an OS/2 fan, give it a shot.

Steven Woas, the author of a new book Learning DOS: A Beginners Guide, was on hand. He noted that his new book is a basic treatment of DOS designed specifically for new computer users and is written in easy-to-understand language. It retails for $14.95, but he is making it available to all of our members at 40% off -- or $9.

George Pollak of Computers and More was also on hand. George announced that he would make available an internal 14.4 modem w/FAX capability to all members for $229. And, if 10 or

(Continued on next page)

(Continued from previous page)
more of the modems were purchased by club members, he would donate one to the club for its use. If you are interested, George can be reached at 254-2810 or 251-6833.

INDUSTRY NEWS - Harvey covered quite a few notes of interest from industry news, with several additional contributions from those present. I was able to take sporadic notes on, some, including the following items:

Microsoft is getting into the sound card business and reportedly will have one on the market by the end of the year. The reported reason is that it will be a means for Microsoft to help push Windows. If that is true, we could expect very competitive pricing on their card. Those considering buying a sound card might want to wait awhile.

QMS (I believe I heard) is coming out with a 32 page/minute -- I repeat, 32 page/minute --laser printer. Hey, that is fast! I think I also heard a price of something like $2995 for the machine.

Several of the chip/computer manufacturers are coming out with a 68 MHz line of chips/computers. And, I guess we are still scratching the surface, with much more powerful and faster chips/machines on the horizon.

An upgrade for Harvard graphics was report in the BOB newsletter just a couple of months ago. Well, still another upgrade for Harvard Graphics is out. Wow! (Such rapid changes are not restricted to Harvard Graphics, however.)

PROGRAM PRESENTATION:

We were fortunate to have Chris Mayers, our IBM representative, on hand to give us a presentation on IBM's OS/2 Ver. 2.0. I am not about to try to cover all that Chris showed us and the many features he pointed out about the program -- it is much too powerful and feature-loaded to do that. Some compare OS/2 with Microsoft Windows -- and to the extent that they both use windows and have graphic interface, and allow multitasking, and have a few other similarities, a comparison can be made. But in reality, comparing OS/2 and Windows is an apple/orange comparison. First off, OS/2 is an operating system, just as DOS and UNIX are operating systems. Windows is not -- it is based on and must have the operating system DOS, and it is subject to the limitations of DOS. Among the many features and capabilities of the OS/2 (Ver. 2.0) program are:

OS/2 includes and will run DOS and Windows and any applications made for them, as well as its own operating system and applications.

OS/2 supports true 32-bit processing, multi-threading and will allow up to 240 (yes, two-hundred, forty) virtual DOS windows. That is to say, up to 240 different programs could be ran at the same time -- with any mix of DOS, Windows and OS/2 programs.

It would seem that OS/2 gives almost total control of all facets of the environment and desktop, including detailed control of settings for each program and the memory allocated for its use.

It includes a mini-database program and a mini-spreadsheet program which can handle small needs, but neither compares to dB IV or Quatro Pro. It also includes an editor, but does not include a word processor.

The installation program allows considerable latitude in which portions of the program you may load -- or not load. Hence, features loaded and HD space requirements can pretty much be tailored to meet your needs.

OS/2 may be shut down with programs operating and it will load to that same configuration when next started.

At installation you can configure your computer as exclusively using the OS/2 operating system; as dual boot where the computer will boot using the same operating system used when last shut down, but will allow you to select the alternative system (OS/2 or DOS) and then reboot; or to make the choice of operating system during start-up each time you start the computer. When in the DOS mode, only DOS supported operations are available to you. When in OS/, all DOS/Windows/OS/2 operations are available. I believe the main reason the DOS-only option is included is because there are a very few programs that will operate only in a pure DOS environment.

One would think that the documentation for such a powerful program would be quite extensive -- and it is. Except, it is not in written form. The written documentation is rather limited, covering primarily installation and information affecting that activity. Program documentation is loaded onto the computer is available on line -- and it is very comprehensive and accessible -- with excellent cross-referencing. The index, for example, allows a search feature for any subject and will report all locations where info on that subject can be found -- and you can switch immediately to any one of the them.

On-line help is super and includes a glossary, a command reference and a tutorial.

Chris covered many other aspects and capabilities of the program, in spite of a glitch which interrupted things, but I did not get notes on them all. It is a super-powerful program and worth consideration by all, including Windows users. It is not all peaches and cream at this point however. There are a few bugs still, one of which showed up tonight, but IBM is working hard and fast to solve them all. And OS/2 Ver. 2.0 includes Windows 3.0, not 3.1, and OS/2 does not recognize disk space controlled by compression programs like Stacker and Super Stor. But most of these drawbacks will be corrected with an upgrade expected before the end of the year, that rumor has it will be free to Ver. 2.0 owners.

(Continued on next page)

(Continued from previous page)
We understand that the producers of Stacker and Super Stor (and presumable the others) will soon have products on the market that will work with OS/2. It is also rumored that Stacker may be included with the OS/2 upgrade -- but I emphasize that that is RUMOR.

Chris reported that requirements to run OS/2 Ver. 2.0 are: 386SX or better; 4 meg of RAM minimum (will operate, but not well), 6 meg gives much improved performance, and 8 meg better still; and a 60 meg hard disk. Loading the complete package takes about 30 meg of HD space. Minimum load takes about 15 meg of space, while a standard loading would take something on the order of 20 meg. Printer driver support is very comprehensive, with 5 HD floppies full of printer drivers supporting just about any printer that is IBM compatible. Video driver support is not as good and OS/2 has drivers only up to standard VGA (8514 mode), and it appears that IBM is going to rely on the many manufacturers of video cards to develop their own drivers.

OS/2 is available at just about any software outlet, or can be purchased from IBM direct (1-800-3IBMOS2). The $49 Windows-upgrade introductory price ended July 31. The Windows-upgrade price is now $79, but one of those present at the meeting stated that a $16 rebate is available (but how and where you can get the rebate, I do not know).

Chris (and IBM), a BIG THANK YOU for the program you donated and for a job very well done, in spite of the computer glitch. You have a very powerful and useful program.

AND THE WINNER IS:
The following members were lucky enough to have a winning ticket at the drawing and won some very nice prizes, with one member winning two prizes:

PCRX (Virus Pgm)	George Pollak
Learning DOS (Book)	D. A. Clary
Turbo C++	Kevan Sheridan
OS/2 Ver. 2.0	D. A. Clary
50/50 ($37)	Charles Howe

(You know, there is something suspicious here. I bought the winning tickets at the meeting, but I didn't win anything. It has been that way for some time. I think I will ask or a congressional investigation. You people had best be a little nicer to me!)

☹☹☹

Private Help for Windows or ...
Cheating at Mine Sweeper

By: Ed Buzza

The August issue (V11 N14) of PC magazine discussed some of the secrets in Windows 3.1. But there's another that they didn't mention. I found it in the Windows Conference on our BBS. It tells you how to cheat in Minesweeper.

"Fire up Windows and be sure that you have a dark Desktop. Run MineSweeper and be sure the upper left hand corner of the screen is clear - no menus, windows, etc.. Place mouse cursor in MineSweeper's playing area and type XYZZY. Hold down Shift key while moving cursor around the board area. A single white pixel will show in the upper left corner when the cursor is over a 'safe' square. The pixel dot will not show when the cursor is over a square containing a mine."

Most of us won't remember the procedure the next time we play the game. And who keeps a copy of Bits of Blue at all times beside the computer? So, let's make our own Help file.

In any Windows application, click [Help], click [Contents] or any other menu item, click [Edit] in Help screen, click [Annotate]. Now enter your *own* help file - your snippet of information. Then click [Save]. Windows will save your annotation *and* will put a paper clip icon on the Help screen - look under the [Contents] field. Click the [paper clip] and -voila- your own private help notes.

■■■

Virus Alert

From the Central Iowa Computer User (Des Moines) and the GTBBS, via Quad-Cities Computer Society

Here are a few viruses that have been recently described. Some may already be extinct, and others will be soon, we hope!

George Bush virus - Doesn't do anything, but you can't get rid of it until November.

Ted Kennedy virus - Crashes your computer but denies it ever happened.

Warren Commission virus - Won't allow you to open your files for 75 years.

Jerry Brown virus - Blanks your screen and begins flashing an 800 number.

David Duke virus - Makes your screen go completely white.

Congress virus - Overdraws your disk space.

Paul Tsongas virus - Pops up on December 25 and says "I'm not Santa Claus."

Pat Buchanan virus - Shifts all output to the extreme right of the screen.

Dan Quayle virus - Forces your computer to play "PGA TOUR" from 10 a.m. to 4 p.m., six days a week.

Bill Clinton virus - This virus mutates from region to region. We're not sure what it does.

H. Ross Perot virus - Same as the Jerry Brown virus, only nicer fonts and it appears to have a lot more money put into its development.

Richard Nixon virus - a/k/a the "Tricky Dick virus," you can wipe it out, but it always makes a comeback.

■■■

THE EXPANDING UNIVERSE -- MODEMS AND YOU

By: Deb Suran
reprinted from Shades of Blue, the newsletter of the Downeast Computer Society, Deer Isle, Maine

For years, Esther Schindler (a founder of the Downeast Computer Society) has been telling me I should have a modem, and for years my response has been that if I got a modem my phone bill would go through the roof. A couple of months ago, Esther gave me a modem. We were both right.

A modem is a device that allows you to communicate, via the telephone line, with other people who also have modems (and computers). It's a simple concept with complex and far-reaching implications. Have you seen the movie "Cry Freedom?" A significant portion of that movie (based on a true story) was devoted to Donald Woods' flight from South Africa, smuggling the manuscript of his book about Steve Biko out of the country with him. The manuscript filled a satchel. The whole book probably would have fit on one or two high-density floppy disks. At 9600 "baud" (a relatively fast modem information transfer rate), he could have sent his entire manuscript out of the country, via telephone, in an hour or two. Or smuggled it out on his person, on one or two 3.5" floppies, and then sent it by modem to the rest of the world by simply posting the file on a computer bulletin board. Think of the impact of the fax machine on the pro-democracy movement in China, or of the computer and Aldus Pagemaker in getting out the news about the coup attempt in the former USSR, or the dissemination of the videotape of the Rodney King beating, and you will begin to see just how powerful this communication medium could be.

The implications are personal as well as political. A number of romances have blossomed on-line, and there are many couples who have met this way and have gone on to get married. When you communicate by modem you don't get any visual clues about the person you're communicating with. Are they young or old? Fat or skinny? Differently abled? Male or female (some names are less revealing of this fact than others)? People of color? Unless they tell you, you won't know. When you do find out that the person you've become friendly with on-line is not who/what you expected, it certainly forces you to examine your stereotypes -- you know, the ones you thought you didn't have. Modems are a great equalizer, as, by their very nature, they level the playing field. You may be deaf, or in a wheelchair, but you're just as able as anyone else on-line.

When the modem arrived I joined CompuServe, one of the biggest BBSs in the world. A BBS is a computer bulletin board system. You have to pick up a lot of acronyms when you get into modems -- I'll introduce you to some of the most essential in the course of this article. CompuServe is divided into Forums, each Forum devoted to one subject. Each Forum is subdivided into Sections that deal more specifically with different aspects of the Forum topic. There are thousands of Forums, from Astronomy to Zenographics. Some are basically "clubs" where people with a common interest get together to discuss that interest. Other Forums are run by hardware and software vendors, and provide an opportunity for users of these products to get help in using them, provide the vendors with important feedback on their products, and give users and "sysops" (system operators, the people who run the forums) a chance to work together to improve the vendor's product and the user's productivity. BTW (by the way), most Forums have a Section devoted simply to chatting.

I joined several Forums right away, including MIDI/Music, Crafts, Broadcast Professionals, Science Fiction, and TAPCIS. It was easy to do and I felt very welcome on all of them. Each Forum has its own distinct personality and some are more fun than others. Both Forum members and sysops are very welcoming to "newbies" and willing to give lots of advice to help new members become more proficient at navigating through CompuServe, and taking advantage of what it has to offer. With one exception, my participation on the Forums is purely recreational. The exception is Crafts Forum.

I build hammered dulcimers for a living. The Woodworking Section on the Crafts Forum is very active and full of knowledgeable people who are more than willing to share their ideas and expertise. Living here on Deer Isle as I do I'm isolated from the rest of the instrument building world. Generally I only meet people who share my interest at folk festivals. On Crafts Forum, even though I'm the only full-time instrument builder I've picked up tips and suggestions and help that I couldn't find in a year's worth of festivals. Forum members are helping me locate and purchase hard-to-find woods (even going to lumber yards and picking it out for me), suggesting new finishing techniques and substances, and even writing programs to help me use my database more effectively. I am able to reciprocate by providing information about musical instruments and music, sending people recordings, and posting information about folk festivals that have a crafts component where the other members of the Forum might be able to sell what they make. In addition, I have been asked to head up a special Section on building musical instruments for the month of September.

Sounds inviting, eh? So, what do you need to get on-line? Well, first you need a modem.

Product Review -- Hayes V-Series ULTRA Smartmodem 9600 ($669 mail order) Hayes Microcomputer is THE standard in communications hardware. Just as all PCs must be "100% IBM compatible," so must all modems be "100% Hayes compatible." The documentation that comes with the Hayes modem does a good job of explaining how a modem works. Briefly, telephone lines transmit information by using audio tones. This method of information transfer is called "analog." Computers work with information in a digital format. Modems convert information from digital to analog and back, MOdulate and DEModulate, hence the name modem.

The Hayes ULTRA is a 9600 baud modem. "Baud" refers to the data transfer rate, and

(Continued on next page)

(Continued from previous page)
9600 is relatively fast. There are many modems on the market that send data at 2400 baud. Buying a 2400 baud modem is something like buying a PC XT. You can probably get a good price on one, but not only is it already obsolete, it won't save you any money in the long run. That's because you pay for connect time to many BBSs, and data transfer at 2400 baud takes almost four times as long as data transfer at 9600 baud. Figure in your phone bill (especially here on Deer Isle where *no* call is a local call) and that adds up quickly. You need to be careful when shopping for a fax/modem combination too, because many products advertised as "9600 baud fax/modem" are a 9600 baud fax and a 2400 baud modem.

Well, what can you say about hardware that works? Not much. The first modem developed a problem that acted like a loose connection. I'm inclined to suspect the fluctuations in household current that we experience so frequently on Deer Isle as the culprit here. Hayes replaced the modem promptly. The only thing I had to compare the Hayes to was the modem Esther sent me (which I only had for a couple of weeks before the Hayes arrived). Let me tell you that, compared to 2400 baud, this modem is FAST! It's also the Hayes top-of-the-line product -- kind of makes me wish I'd been using an inferior modem for a few years so I could *really* appreciate it. Instead, I now take excellence for granted. The accompanying documentation is thorough and well- written, and a copy of Smartcom EZ communications software is enclosed as well so all you need is a cable to connect the modem to your computer and you're ready to go. The Hayes ULTRA Smartmodem, in conjunction with their software, is capable of making a connection with a BBS without your having to know things like parity, stop bits, and all the other stuff that a neophyte like me had no idea about. That's what makes it a "smartmodem," I guess. For sure it's smarter than I am.

If you want to join the CompuServe Information Service (CIS) there are several programs available specifically for navigating through CIS, including TAPCIS.

Product Review -- TAPCIS
(shareware, $79)

TAPCIS was the first communications software I tried -- Esther sent me a copy with the modem. TAPCIS was written by Howard Benner and is now in version 5.4. Howard died of skin cancer two years ago but other people are continuing to upgrade the program. The money earned by the TAPCIS Forum on CompuServe is being donated to a memorial fund in Howard's name that supports research into skin cancer. To date about $32,000 has been donated.

To understand how TAPCIS works you need to know how CompuServe stores messages. When you post a message on a Forum you give it a title. CompuServe lists the titles of the messages and you can scroll through the titles and decide which messages you want to read. Say I want to tell everyone on the Crafts Forum about a folk festival in Boston. I would give the message a title like "Boston Folk Festival." Then, people in the Boston area or those interested in folk music are likely to check out the message. Now, you are paying by the minute for connect time to CIS, plus your phone bill if you don't live in an area with a local CIS phone number. What TAPCIS does is automate the process to bring your connect time down. You can tell TAPCIS to go to the Forums you frequent and pick up all the message "headers" (as the message titles are called) from those Forum Sections you are interested in. So I set up TAPCIS to go to the Crafts Forum and pick up the message headers from the Woodworking Section because I'm not interested in the other Sections. TAPCIS does so, and then hangs up the phone. This process takes only a couple of minutes -- much faster than if I was collecting them "by hand." Then, I read through the headers off-line (no connect charge), mark those headers I'm interested in, and call back. TAPCIS quickly collects the messages I want to read and saves them to my hard disk, then hangs up again, and I can read them at my leisure. Responding to the messages is also automated, so I can write my replies off-line and upload them later. While you end up calling CIS two or three times every "session," each call lasts only a minute or two. Just imagine how long you'd spend if you had to read 20 messages on-line, and wanted to write replies to five of them. You can see how much money TAPCIS would save you. Of course, this is false economy because what TAPCIS *really* allows you to do is spend much more time on CIS because eacheh session costs less than it would otherwise.

I have at this point tried six communications programs. Granted that TAPCIS was written specifically for CompuServe so there's a lot it doesn't have to do; I still found it to be the easiest and most intuitive program of the six by far, with excellent documentation. There is a TAPCIS Forum on CompuServe (of course) and anything I wasn't able to figure out in the beginning was quickly dealt with by leaving a message on the Forum, which was answered within hours by a sysop. A terrific program, IMHO (in my humble opinion).

CompuServe isn't the only BBS where I'm spending time. The Association of PC Users Groups (APCUG) maintains a BBS called GlobalNet in a closet at Borland. The Downeast Computer Society is a member of the APCUG and as such all DCS officers are entitled to free connect time on GlobalNet. We can contact hardware and software manufacturers through the BBS and get them to send representatives to do meetings for us, leave messages for other user groups and their officers, and participate in the weekly conferences. As program chair of the Downeast Computer Society, I can join in the weekly Program Chair's Conference and share information about meetings we've had with other program chairs all over the country, and get similar information from them. We tell each other who does a good job and who doesn't, swap contact names and phone numbers, and send each other our newsletters. In order to get through to GlobalNet I had to learn to use another communications program.

Product Review -- Smartcom III
($199 list) I was both pleased and relieved to read an introduction to an article about communications software in PC Magazine this week that complained about how difficult such programs are to use. I was

(Continued on next page)

(Continued from previous page)

really starting to feel like an idiot. Before I got Smartcom III I didn't get anywhere with any of the shareware programs I tried: Procomm, Telix, and Unicom. Well, maybe I shouldn't count Unicom. It's a Windows program, so of course all it did was crash. Some hand-holding definitely would have been most helpful as I had absolutely no idea what I was doing. Part of the problem is a lack of standardization among modems, but part of it is also my inexperience and my disinclination to read manuals. Communications software is, for the most part, anti-intuitive. Smartcom III is a Hayes product designed for use with Hayes and Hayes-compatible modems. There is a reduced command set option for non-Hayes modems that do not completely or correctly implement the Hayes Standard AT Command Set. The program interface allows the use of both keyboard and mouse. TTY and ANSI terminal emulation are supported, as are several different X-, Y- , and ZMODEM standards. The program also provides a scripting language called SCOPE, but I never got that far. The screen set- up is a layered group of menus -- click on your choice and move to the next menu layer. It's pretty inefficient.

I suppose I'd have to characterize this program as the best of a bad lot. Since I didn't know anything when I started, the array of choices for setting up each option was overwhelming. In addition I found I had to set too many of these options too often. For instance, the default for disk capture is "off." But, I want disk capture "on" every time I call GlobalNet because I only call in for the Program Chair's Conference, and I want to be able to browse through the conference later to write down any names and phone numbers. The program automatically returns disk capture to "off," so I have to remember to turn disk capture "on" every time I call into GlobalNet, and that's very annoying. Setting up for a new connection is the same -- I have to start from their defaults, not mine. That means I have to do things like set COM2 (the default is COM1) every time I enter a number in the phone book. And the phone book is set up in two sections for some unfathomable reason, which means you have to select each activity twice, under two different menus.

Considering how many defaults need to be set/reset, this whole process becomes very annoying and time-consuming. If I'd had a lot of BBSs to enter instead of just three or four it would get very old very fast. Having said that, let me repeat that for all its faults, Smartcom III is the best of the general communications programs I tried. It was the only one with which I actually got far enough to make a call and get through to a BBS. The documentation doesn't help a beginner like me all that much, and the one problem that really stopped me wasn't one I could solve by using their manual. Without getting technical, there were two linefeed settings that could be set at either "yes" or "no." The documentation says to try setting one to "yes," and if that doesn't work to set the other to "yes," but doesn't tell you that the problem can be corrected only if the first is set back to "no." Two "yes" settings and you're dead in the water. It took a call to tech support to get that straightened out. Tech support was very knowledgeable and my question was answered promptly. Hayes offers free unlimited tech support during business hours on weekdays, and a 24-hour BBS. Connecting with their BBS is the first lesson in the manual, and their BBS information is set up for you when you install the program.

Let me wrap this up by saying that everyone should have a modem, and every modem neophyte would benefit from a bit of hand-holding. If you have a modem-literate friend, invite him/her over for dinner and ask for some help getting started. There's something for everyone on a BBS somewhere, whether you're looking for recreation or want to enhance your productivity. No matter what you're interested in, a modem will expand your universe, introduce you to new friends, and challenge you intellectually. Oh and BTW, thanks for the modem, Esther!

Software Reviews:

WordPerfect Works

Review by: Olaf Meding, Madison PC User's Group

WordPerfect Works is a new product by WordPerfect Corporation. It is a combination of six single programs and a few supporting utilities. The six programs are a shell (see below), LetterPerfect, a spreadsheet, a graphics editor, a database, and a communications program.

WordPerfect Works is designed for busy people. For example, managers who frequently need to create documents consisting of both text and graphics, or laptop users who will appreciate the compact hard disk requirements and the communications program. WordPerfect Works' list price of $159 makes it a bargain for everyone who does not need, or want, all the bells and whistles of more sophisticated software packages, such as WordPerfect, DrawPerfect, and Lotus' 1-2-3 spreadsheet.

The installation of WordPerfect Works is easy. You just insert the disks and answer a few very basic questions. Once installed, the command "WW" will start the WordPerfect Works shell.

All five applications programs can be run outside the shell (standalone) except for the communications program. A mouse is supported in all applications, including the shell.

A shell is a piece of software which provides a set of menus. From this menu the user can select and launch an application. The shell offers a number of convenient features. The user can customize the shell by adding more programs to be launched by a single keystroke. The shell macro capability executes a pre-recorded sequence of keystrokes. Macros are nice because a single keystroke executes any large number of keystrokes. This saves time and keystroke sequences do not have be memorized.

(Continued on next page)

(Continued from previous page)
Another powerful feature of the shell is the clipboard. The clipboard makes it possible to copy information between the various programs within the shell.

The most powerful feature of the shell is the task swapper. Please read the sidebar, "Task Swapper versus Multitasking," for an explanation of how a task swapper works. The shell (task swapper) allows you move freely between all programs. For example, you don't have to Save and Exit out of LetterPerfect and launch the spreadsheet to look up some information, and then exit the spreadsheet and restart LetterPerfect.

LetterPerfect is a scaled-down version of the WordPerfect word processor. The reviewed version is compatible with WordPerfect versions 5.0 and 5.1. A utility program included with WordPerfect Works can convert a number of popular text file formats so that LetterPerfect can read them. Since I use WordPerfect regularly, I decided to write this review using LetterPerfect to see if I would miss any of the Wordperfect features, and I did not.

The WordPerfect Works spreadsheet lets you create worksheets on anything from household budgets to scientific data crunching. It has more than 100 built-in functions to calculate statistics. The spreadsheet data files can also be saved in LetterPerfect, DOS text, or Lotus 1-2-3 formats. In addition, you can graph your worksheets and then use those graphs on their own or inside LetterPerfect documents.

The graphics editor is a powerful tool designed to enhance or create your own graphic images. It is easy to include graphic images in LetterPerfect documents. The graphics editor also lets you enhance the graphs created by the spreadsheet or the 30 images supplied with WordPerfect Works.

Furthermore, you can use a utility called Grab, which lets you capture graphic screens created by any other program. It saves these images to a disk file. Another utility lets you convert many commonly used graphics file formats to the WordPerfect WPG format. The Graphics Convert utility supports DXF, PCX, TIFF, CGM, HPGL, and PIC, to name a few.

The WordPerfect database helps you to organize large amounts of data. The shell includes three sample databases, an address book, note cards, and an inventory. These three database applications are good examples of what a database can do and how it is set up.

Last but not least, WordPerfect Works includes a communications program. Right after I installed WordPerfect Works, I logged into the Madison PC User's Group Bulletin Board System using this communications program. My objective was to download a file without reading any documentation. And, voila, no problem! I was even more surprised to see that the communications program included the Zmodem protocol. I then studied the documentation and found that the communications program was actually written by a company called MagicSoft and is based on their MTEZ software. The communications program includes many of the features found in standalone communications programs, such as terminal emulations, 10 different protocols, dialing directory, screen capture, etc. A large number of modems are also supported.

I tested WordPerfect Works running under DOS version 5.0 using my Diversified Systems 486/25 MHz PC without encountering any problem. Everything also worked fine under Quarterdeck's multitasking environment, DESQview.

I really liked WordPerfect Works. It lets you create flashy documents easily, includes great on-line help, and has the look and feel of other WordPerfect products. And it contains all of the features WordPerfect Corp. is so famous for, such as extensive printer support, great customer service support, excellent documentation, and best of all Works works.

WordPerfect Works requires at least 4 MB of hard disk space and 400K of memory. Its list price is $159. For more information, contact:

WorkPerfect Corporation
1555 N. Technology Way
Orem, Utah 84057
(800) 321-3512

- - - -

Multitasking versus Task Swapping

A task swapper does what the name implies. It swaps tasks in and out of memory. A task (program) may be swapped out to either the hard disk (slow) or to storage memory (almost instantaneous). A program is suspended (stopped) for the duration of being swapped out.

After the current program is swapped out the task swapper loads into memory another program for execution. If there is enough storage memory (usually memory above 1 MB), swapping programs is almost instantaneous, allowing the user to quickly switch between applications. Task swappers make a lot of sense for applications such as word processors because the word processor is idle in the background anyway.

The key difference between a task swapper and a multitasking program is that a multitasker enables a program to keep running in the background. Multitasker programs are essential for running a communications program while transferring files in the background.

Examples of task swappers are presented by the WordPerfect Works shell, the DOS version 5.0 shell, Software Carousel, and a shareware product called Back & Forth. Examples of multitasking programs include Microsoft Windows, OS/2, and DESQview.

Editorial Comment:
There will not be a President's Column this month, due to more pressing career obligations. Harvey will be hard at work this Labor Day week-end. He will also, not have the opportunity to engage in his most recent learned recreational activity -- Windsurfing!

dBASE IV Release 1.5

Review by: David Jensen, Madison PC User's Group

If dBASE IV hadn't had problems since Ashton-Tate started working on it, Borland wouldn't have been able to buy Ashton-Tate for the price they did. Ashton-Tate would still be at the top of the heap without any fear of anyone else. Unfortunately, while companies like FoxBase were able to produce new programs that used the dBASE language with execution that was faster and extensions that made it easier to run, Ashton-Tate's answer was to sue, not to improve.

When dBASE IV release 1.0 came out late, it was big, slow, and buggy. Release 1.1 was a major improvement, but by then the damage had been done. Most customers would rather not have to try a new product, no matter how similar it might be to the one they are using, but if the original product's upgrade is bad enough, people will bail out. People did. Now, here is the challenge: Can Borland keep dBASE from going the way of WordStar, a product now more important for its history than its current value?

As a release upgrade from 1.1, dBASE IV 1.5 offers a number of nice features that many developers would find valuable. dBASE IV Release 1.5 is Borland's first shot at saving dBASE. They did a pretty good job. Borland added a number of language extensions, added a group of low-level file I/O functions, improved execution, added mouse support, added features and improved configurability to the control center and additional file format import/export support.

I assume that no one still uses release 1.0. Considering the problems people had with it, Ashton-Tate must have made sure that everyone was upgraded to release 1.1.

For dBASE users of older releases of the product, especially dBASE III+, it's probably time to change your dBASE. For those who don't want to use the dot prompt, the control center isan excellent environment for developing applications. Along with the control center, there is an integrated application generator that creates dBASE code. There is solid multi-user network support, transactions with rollbacks, SQL (Structured Query Language) support, multi-table QBE (query by example), conditional indexes and more. Well, that's fine, but I'm sure that Borland has made their best effort to sell current owners of older releases of dBASE on the merits of dBASE IV release 1.5. What can new users or users of competitive products expect from dBASE IV?

First, they can expect to use a product that is highly compatible with the most common database language in PCs: the dBase or xBase language. New users will appreciate this since they will be able to find more books, more power users, and more advice columns that have been written about this language than any other. With a product as complicated as a database management system, it is very helpful to have as many experienced people around as possible. Along with the language, new extensions have been added that provide further power to users who will be working in the dBASE IV environment only. Compiler switches are now available to allow compiled code to reflect the different environments that the application may be run in.

Second, they can expect to use the product the way they want. The program runs in three modes: command line (the dot prompt), SQL (a different command line mode that is compatible with IBM's mainframe DBMS, DB2, among others), and control center. The command line mode can be interactive or can be used to run programs that have been written using any ASCII editor (one is included in the package). The SQL mode is similar to the dot prompt, but it interprets the commands differently to use the pseudo-standard SQL. Some dBase commands cannot be used in SQL mode, either because they conflict with SQL, or because there is an SQL statement that will do the job.

The control center mode offers a fully interactive development system. The user can use the control center to do something, such as create a file, add records, change records, ask a question about the information in the files or other ad hoc use, or the user can develop an entire application by creating all of the files, all of the data forms, all of the reports and the menus required for an integrated application. Each part of the application is created modularly, so each part can be used for other applications. As these modules are added, even ad hoc users may find that they have developed an application before they knew they were doing so.

The control center mode is the mode that most new users are likely to want to start in. The control center has excellent help facilities, good menus, and, with the help of the application generator, allows users to take advantage of the power of the language. On the other hand, I would guess that most experienced programmers would rather use the dot prompt to get a program written. They just don't need the hand-holding that is provided by the control center. I would consider this combination of excellent support for new users along with freedom for the experienced developer to be a necessary capability for this kind of a development environment.

Third, they can expect to be frustrated by the lack of a proper compiler. Whether the programs have been developed from the command line or the control center, these programs can be compiled to an intermediate object code that runs substantially faster than the uncompiled code can be interpreted. Borland cheerfully offers to sell a runtime compiler to those who want to run their applications on machines that don't have dBASE IV on them. This is nonsense. For the same price or less, you can buy a professional-level language compiler or DBMS that compiles to source code and has no runtime license or limitations. Since this product is aimed at both major applications developers and the more casual users of databases, the value of the product to applications developers is limited substantially by the lack of this capability.

Users will find that the product is easy to install, offers a lot of configuration

(Continued on next page)

(Continued from previous page)
possibilities, allows multiple users to select configurations, provides excellent security options and has the network and network administrator in mind. The manuals are clear and easy to use. Not only do they cover the actual operation of the program, but they also describe some effective basics of using a relational database manager.

dBASE IV is a relational database management system. It understands that relations can be defined among fields of different files, so the files can be smaller, and redundant data need not be keep in each record. This is particularly valuable for those who have to keep the same piece of information for a variety of reasons. If that piece of information can be kept once and pointed to, there will be better data integrity (the piece of information is correct [or incorrect] everywhere) than if that information is actually kept in a number of places, as a flat file system requires. It is much easier to forget to change information in one place, if it is kept in many places.

While users can use dBASE IV or any other relational database manager as a flat-file system, and that is a good way to use it at the beginning to learn the product, if they continue to do so, they have bought a Ferrari for a school zone. dBASE IV works well as a relational database manager.

While there is PostScript and other laser printer support, there is really only support for monospace fonts, so the value of this printer support is minimal. Considering that it was easy for a copywriter to identify parts of the report development as WYSIWYG (on a character mode screen) -- what you see is Courier and what you get is Courier. As Henry Ford might have said, "Any font you want, as long as it's Courier."

The last time I used dBASE, it was dBASE III+ and I'm quite happily impressed with the improvements that I've seen in the product between then and now. I was especially impressed by the changes that were available in the control center, changes that made it easy for casual users to use dBASE at its best. While I can say that dBASE IV release 1.5 is a major improvement from dBASE III+, I can't say that it has managed to continue to outpace the competition. FoxPro, in particular, has been doing its best to be the best xBase DBMS. With the added resources of Microsoft behind it, FoxPro will continue to give dBASE IV a run for its money. Still, this release shows that Borland didn't just buy Ashton-Tate for its mailing list.

FINALLY PROCOMM PLUS FOR WINDOWS

Madison PC User's Group

Procomm Plus,the most popular communications software,was designed to take advantage of the capabilities of Windows better than any other communications package. Here's the program with all the features. When you use it,you'll be amazed at how much it can do.

Procomm Plus for Window's ease of use does not decrease it's flexibility. Procomm Plus provides a complete popup dialing directory, you can convert your DOS Procomm directories and adjust file protocol to terminal-key mapping. Plus,dialing directory setting may be customized for each entry. Once you've highlighted several directory entries,just click on dial, and Procomm Plus will dial each number in order. Another convenient feature for those using large dialing directories is the Find command,which can locate a specific text string in any field of any entry.

The terminal window has ample amount of options,more than 20 different emulations are supported. Procomm Plus for Windows can run full-screen mainframe applications by using your PC as a remote terminal. Supports some of the well-known Video display terminals: Ansi BBS, IBM PC, Data general, ADDS, AT&T, DEC, Televideo and WYSE to name a few. Along the top of the terminal window you will find several controls called the ACTION BAR. These ACTION BAR are call the control center. It offers the most commonly-used functions from the menu as icons,these icons operate identically to the menu, but are far more convenient to used. You can get on-line quickly by using the ACTION BAR'S Rapid Dial feature.

Procomm Plus for Window's basic protocol options rise above those of any other communications package. The protocol setup allows you to select from one of eleven file transfer protocols,including Zmodem (my favorite),CompuServe B+(designed for fast,capable and automatic file transfers with the CompuServe information service),and Kermit(useful for file transfers to and from mainframe and minicomputers. Procomm Plus for Windows also includes standard Kermit. For compuServe member, Procomm Plus can show graphics such as CompuServe weather maps as you download them. Procomm Plus operates at baud rates from 300 to 115,200. Line settings include space,even,odd,mark or no parity and 7 or 8 data bits. Well,what more can you asked for in a communication package?

Last but not least,some of the most impressive features are the script capabilities. Full support for Dynamic data exchange (DDE) is available through the script language.

System Requirements:

I. IBM AT,PS/2 or compatible capable of running Microsoft Windows 3.0 or higher in standard or enhanced mode. II. A hard disk
III. EGA, VGA OR higher resolution video graphics card
IV. Mouse recommended.

GRADE GUIDE
Version 4.0

By: Jon Kane, program author and Madison PC User's Group member

GRADE GUIDE version 4.0 is a shareware gradebook program designed to give teachers an easy way to enter, print, and analyze students' grades. The program will store students' names, IDs, section numbers, grades, and text information. It has a wide variety of convenient report formats, including grade reports, statistical analyses, class lists of grades and averages, and form letters. It has a DEFAULT menu allowing you to tailor the program to your needs. Although most users can use GRADE GUIDE without any assistance, the program comes with an extensive 100 pages of easy-to-follow documentation and an on-line help facility.

Although you could use a traditional paper gradebook or even a spreadsheet program to store your students' grades, GRADE GUIDE has many features to make your work easier. Users describe the benefits of being able to hand students lists of their grades and averages periodically, to demonstrate to students how their grades would change if incomplete work were handed in, to post class lists of grades and averages, and, of course, to calculate final grades with a minimum of effort.

Strengths of the program include: a quick-access menu system; ability to easily edit previously entered data; separation of grades into categories such as Exam, Quiz, Homework, and Attendance; recording NONE grades for work that is not yet complete; supplying statistical reports and graphs of the students' performance; writing letters that include information about students and grades; and selecting students who match a given set of criteria.

I released the previous version, GRADE GUIDE version 3.00, in 1988. Now I have implemented four years worth of new ideas, and the program has been greatly improved. In this latest version, I increased the program's
flexibility, reduced the number of keystrokes necessary to operate it, added mouse control, eliminated needless restrictions, and made the program more useful to elementary school teachers.

One new feature lets you select students based on any criteria. For example, you can select all students receiving a low grade on a test or having a low average on their homework grades. All reporting and grade entry features can be restricted to the selected students so that those students can receive special attention. GRADE GUIDE now lets you separate grades into grading periods (up to 10). For example, if you teach a class that runs for six marking periods, grades for each of the periods can be viewed separately. At the end of one marking period, you would tell the program to begin a new marking period. As a result, all of the previously entered grades would be hidden. You can choose to view grades from any of the marking periods or set a switch and view all the grades from all the grade periods together.

The DEFAULT menu, which has always allowed you to tailor the program to your own needs, has been expanded. Many input quantities, from the maximum values of test grades to the location of students' name fields on text files, can be specified. You can also select your own screen colors. Different DEFAULT menu settings can be saved to disk so that settings can be changed from class to class.

A major change in GRADE GUIDE is an improved menu system. Most menus contain switches which allow you to tailor operations to your needs. Once set, those switches are saved and need not be reset. The menus have been standardized so that the Enter key begins processing and the Esc key terminates it. It is easier to enter and view information since the user can now use the cursor and editing keys to go forward and backward through the data rather than just proceed in one direction as before.

GRADE GUIDE version 3.00 provided three grading formats. Version 4.0 has eight, including letter grades, number grades (with zero, one, or two decimal place numbers), and word grades. With word grades, the user can enter a list of up to 10 six-character words which can be assigned as grades. For example, if you wish to store attendance records, the word list could be Absent, Tardy, and Present. The old limit of 10 grade categories in any class has been expanded to 30. Now even elementary school teachers who traditionally need many categories (Reading Quiz, Reading Test, Math Homework, Spelling Test, and so forth) can keep all of their grading information in one class file. Now you can enter up to 6000 grades for each student, a limit well beyond the needs of most teachers.

NONE grades, which are used to signify work that is not yet complete, now come in five kinds. You get to choose how those NONE grades are displayed and whether each should be evaluated as a zero grade, be ignored, or be left optional.

GRADE GUIDE version 3.00 was able to generate a new grade based on an

Bits of Blue is published by the Tampa IBM PC Users' Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about IBM-PC and compatible personal computer systems to its members.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII file or in a commonly available word processor format, such as WordPerfect 5.1, on diskette to the editor at 9402 Hidden Ridge Place, Tampa, Florida 33637 or send it by modem to BBS (813)239-3704.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for non-profit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

Commercial advertisements will be accepted at the following rates:

	1 month	3 months	6 months
Full Page	$60.00	$162.00	288.00
Half Page	$40.00	$108.00	$192.00
Quarter Page	$22.00	$60.00	$106.00
Eight Page	$12.00	$33.00	$58.00
Business Card	$10.00	$27.00	$48.00

All advertisements must be prepaid by check payable to TIBMPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if it is not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, Marylee Bruneau at (813) 932-6745, for space availability and for further information.

This newsletter was created with WordPerfect for Windows donated by WordPerfect Corp. to TIBMPCUG for use by the editor.

Secretary's Report

TAMPA IBM USER'S GROUP
MINUTES OF 9/9/92 --

As I sat waiting for the "starting gavel', I noted the gathering of the clan in the very nice facilities IBM makes available to our group and thought how fortunate we are. In addition to these super facilities, we always have a professional presentation of current software by industry reps and/or one of our own, we have a willing source of help with any computer problems we might have, we have access to some excellent training and education in SIGs, we can keep up to date on the most important industry developments, etc., etc., and we get to meet and mingle with some very nice people. And there are always several valuable raffle prizes given away to some lucky members. We always have a nice turnout for our meetings, yet there are many who are members of our group that never attend the meetings. I wonder if they know what they are missing.

☞ CLUB NEWS:

Our Prez informed us of the current SIG on Word Perfect 5.1 for DOS which was holding one of its classes at the time, and announced that the SIG on Modems & Using the BBS would be held next month -- time and date to be announced. All interested in this group were asked to put their name and phone number on a list -- these folks would be contacted by Don Patzsch with the time and place for the SIG. Don Patzsch, a Co-SYSOP for the large Sunshine BBS and an expert in this area, will head up this SIG. Judging from the line of folks waiting to put their name on the list, it is going to be a nice group.

Kevan Sheridan, our BOB SYSOP announced that he had ordered our new 14,400 baud modem for the BBS. A 6-8 week deliver is involved, so Kevan is looking toward a Nov/Dec operational date. Club objectives down stream are to add another phone line to the BBS, upgrade the computer to 386 level, and add storage capacity. We have come a long way, baby, with Kevan's able efforts -- and we are going a lot further in the future.

☞ INDUSTRY NEWS:

Harvey informed us of a number of developments in the industry, on only a few of which I was able to get notes.

IBM will be coming out with their new gaggle of PCs next month, including a couple with ISA. A significant part of the announcement is that they will be marketed through national retail outlets, such as Work Place.

New/relocated computer stores:

- CompuAdd has relocated from its former Fowler location to one on west Hillsborough, west of Dale Mabry, in the same complex as the Sports Authority. (Continued on next page)

(Continued on next page)

▸ A new computer superstore, Computer City, will be going in on Dale Mabry between Kennedy and Cypress.

It appears that at least one company is coming out with a laptop computer that will have a bubble jet printer as an integral part. Harvey observed that that could be a problem -- if you have to have the printer repaired, you would also lose use of the computer. Looks that could be handy for the traveler, though.

Software Upgrades:

▸ MS Money 2.0 will be out next month.

▸ A new upgrade for Quicken for DOS is on the way. A free upgrade for the Windows version is also out, but you have to ask for it -- so, if you own Quicken for Windows, best get on the phone and make a call to the Quicken folks.

▸ FoxPro for DOS and a Windows BETA version should be released in October.

▸ The second interim release (2.0b) for MS Word for Windows will be coming out soon.

Still in the software area, the Aldus Corp is perhaps the first major software producer to announce that it will not develop a 32-bit version of Pagemaker for IBM's OS2/2.0.

It has been reported that the new Xtree for Windows has some problems. I did not catch all the info, but did hear mention of SuperStor. Check it out before you buy.

Harvey noted that in one of the publications he reviews it had been reported that Windows software now outsells software for DOS. (Think about that just a little bit.)

Speaking of Windows, Harvey observed what could be a very risky situation. In the interest of conserving $$$$ in a multi-computer situation to network and install Windows on the central computer. That's fine, BUT -- what if the central computer goes down? If you are using Windows programs, what do you do???

☛ PROGRAM PRESENTATION

We were again blessed with the expertise and talents of John Johanasmeyer of Word Perfect Corporation, this time to give us a rundown on WP's Presentation program, version 2.0. This was the second Beta version for DOS. A Windows version will be forthcoming later. Its direct competitors are other upper end graphics and presentation programs -- CorelDraw, Applause, Harvard Graphics, to name a few. WP believes that their Presentation package is superior to those of all of their competitors.

It appears to be a super program, but I am not into that kind of software and am not in a position to judge one way or another. I do know that I would like to have some of the capabilites I observed. It seemed capable of doing just about anything I could think that anyone would want to do in the way of preparing a computer presentation -- and do it easily and well. Some of the features I noted are:

Willl produce and handle (import and export) both bitmapped and vector based graphics, and the listing of supported graphics formats is extensive.

Includes a bitmap editor that allows editing of bitmapped graphics in fine detail.

Allows manipulating both text and graphics in just about any manner one could imagine.

Includes a WP 5.1 spell checker.

Includes a "John Madden" draw capability -- you know, redraw the play on a rerun of the play

Supports .WAV and .MID, and includes hundreds of .MID files and the capability to create .WAV. While it will use the computer sound system, a sound card is certainly desirable to take advantage of this feature.

Automated or manual presentation of slides shows, and one can quickly and easily reorganize a presentation.

The output of the program can be transported to and used from another computer via floppy. The other computer need not have Presentation loaded, for the runtime program Presentation will load onto the floppy along with the output will allow presentation with the other computer. Interestingly, the file size for per slide seems very small indeed, and the runtime package is only about 75K. So, a single 1.4 Mb floppy would hold a very large presentation. Runtime does not give the capability to modify the presentation, however, so the presentation you take in this mannher is the only presentation you can give.

Includes over 1000 pieces of clip art.

I don't recall any mention of supported text formats, but I did note that Presentation 2.0 would accept directly text input from any version on WP 5.1.

I don't recall any mention of equipment requirements beyond needing about 15 Mb of hard disk space. Just as with any graphics package, the faster your computer the better off you are. While Presentation may run on a 286, I would guess that you would want a 386 or better, or you may be twiddling your thumbs a good bit. I believe John was using a 386/40 laptop on which the program ran very well. The retail price is set at $495, and no clues were available about expected street price.

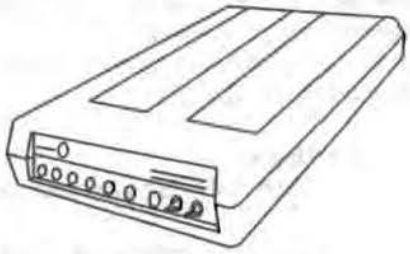
John did a great job of presenting what appears a super program, and I haven't done justice to either. Many thanks, John (and Word Perfect) for an entertaining and informative presentation (and all the goodies, of course) -- another Word Perfect job VERY WELL DONE!!

☛ AND THE WINNERS ARE:

With the generosity of WP Corp and GeoWorks, there were quite a few raffle prizes this meeting, and the lucky winners are:

WP Cap . . . . . William Coleman
" . . . . . Martin Miller
" . . . . . Kevan Sheridan
" . . . . . Roger Waters
WP Shirt . . . . . Larry Anders
" . . . . . Susan Atwood
Box 3.5" disks . . . . . Larry Anders
WP Graphics Lib . Roger Eggleston
GeoWorksPro . . . . . Cheryl Pett
Money Matters . . . . . Larry Anders
50/50 ($36) . . . . . Chuck Hines

▪▪▪



PRESIDENT'S COLUMN:

Politics are in the air. The other day in Tampa I was talking to president Bush, no it wasn't a 900 number, it was real. A couple of days later, I almost got run over in Hartford Connecticut by Senator Gore's motorcade. I chased it down to the Sheraton to see if I could get a glimpse of the man. I only saw the Governor of Connecticut waiting for Senator Gore to begin his speech. Ok by now I have either got your interest or your going back to the 1st page to make sure you are reading the Bits of Blue newsletter. You are probably wondering, what political party is Harvey for and why is he pushing politics when he should be pushing PC information.

Well let me clear the air. This is not a political paper or endorsement for any party or platform. However, President Bush really impressed me that week. You see his staff invited Marylee and I to a VIP get together where it was reported that Mayor Sandy Freedman would make an appearance. She wasn't there, some last minute problems I guess. However, Marylee and I were introduced to President Bush. Oh I forgot to mention that the President I am referring to is President Alan Bush of Computer City, the new computer super store in town. Anyway, Mr Bush and I talked about his new store and the user group. I wanted to know if Computer City supported user groups. He gave me a resounding yes and mentioned a couple of groups around the country that they supported. Oh course this was the answer I wanted. Other companies in the bay area will not even let us place our flyers in their stores because, ***"its corporate policy"***. With the turbulence and decreasing profit margins in the PC industry one would think that these companies would embrace and support non-profit organizations such as user groups to help them through these economic times. Small and large companies such as IBM, Sunrise Computer Supplies and Hardware, Wordperfect. Software Publishing, Symantec, Corel Systems, Polaris Software, Power Up Software, LaserTools, Softac, Custom Computing and many others see the wisdom in supporting our group by donating their products, time and/or resources to us in return for goodwill, exposure and marketing at a cost effective price. These companies and others look at us as an extension of their marketing and research departments, not as a bunch of hackers in a back room copying as much software as we can for illegal distribution.

Please join me in welcoming Computer City to Tampa and as an addition to the **Friends of the Users Group**. Their store is located on Dale Mabry just South of the interstate. If you have not been to this new store you may be missing out. The staff is large and friendly and there is a huge inventory of software and hardware for PC compatibles and Macs. It was good to see a lot of members during my five (to date) visits. One member suggested I get a life after seeing me two days in a row at this store and one day at Expotech. It is not that I have to get a fix of PC paraphernalia to keep me going, it's that I have a mission to place and distribute those 1000 green flyers at these places and to promote our group to as many people as I can to build up our membership. The grand opening of Computer City was a major opportunity for our group. Also Sunrise Computer Supplies and Hardware distributed flyers at ExpoTech for us. Thanks Gene for your help and contributions to the group. Additionally, I want to thank my wife Marylee, your editor, for her support and understanding of my mission and the ever ongoing process of keeping up with PC technology which keeps me up late at night and at work more hours than I should be.

While on the topic of politics, elections for our group are around the corner (December to be exact). **It is now time for you to start thinking about nominations for the 1993 officers. Elected positions include President, Vice President, Treasurer, Member at Large and Secretary.** The rest of the board consist of volunteers. ***We never have enough volunteers.*** Additionally, we need Special Interest Group leaders (SIG). This does not mean you have to know everything about a product, but that you are willing to be responsible to run the meeting in an orderly fashion. You can let others share their knowledge and talk. I would like to see a Windows and DOS SIG. Marylee pointed out to me that one of the bay area user groups was forming a Woflenstein SIG. I may have to join that group to figure out where all the big guns are to shoot that big guy on the last floor. I have been there twice and I can't bump him off.

Coming Soon to BBS
14.4k baud

Four of our board members (Kevan, Bill, Marylee and I) attended the Florida Suncoast Regional PC User Group Conference in Brandenton on October 3rd. In attendance were 65-75 board members or representatives mainly from groups around central Florida representing 5000+ members. Representatives came from as far as Jackonsville and the space coast. This group is focused on the sharing of information among user group officers and board members to run an effective user group. It is always informative to hear how other user groups are run. You also realize that most groups do not have enough volunteers and rely on a handful of core volunteers to keep the group interesting and active. At the conference, groups are formed to discuss operations and techniques for newsletter, BBS, arketing, SIG participation,Membership building, Vendor presentations and many other topics.

Harvey Bruneau

Welcoming the Era of the PC as a "Commodity"

APCUG Industry Commentary Subscription Series Article #18

By: Rick Inatome

Copyright (c) 1992, APCUG, All Rights Reserved.

Permission granted for reproduction in official publications of member organizations of the Association of PC User Groups.

As another round of personal computer price wars rocks the industry, it seems as though computer buyers are no longer shopping for brand names or a particular manufacturer. Analysts have observed that computer buyers aren't looking for an IBM or a Compaq they're looking for a 486 PC-compatible with four megabytes of RAM (random access memory) and an 80 meg hard drive or maybe for a 386 AT with SVGA. And, regardless of brand name, they're shopping for the lowest price system that meets their specifications.

How Fast Food Gained More Brand Equity Than the PC

This is the beginning of a new chapter in the development of the PC industry, as it matures and adapts a new outlook. Some analysts proclaim that the PC has become a "mere commodity," a "negative development" for the industry. They believe that, as a commodity, the PC's only value is its price. Therefore, major growth will come only for those that offer cut-rate and discount prices.

In some cases, the analysts look like they're right. Let's face it, McDonald's has more brand equity in its french fries than IBM has in its PCs. How does someone who repackages a potato gain more brand equity than a major PC manufacturer? By building a strong customer focus and defining its products in terms of customer needs. McDonald's knew it was dealing in commodities when it started. So it focused on things that would make the customer turn to McDonald's over others: fast, dependable service and a consistent, high-quality product delivered at every location, every time. How many reseller chains can make the same claim?

"The computer industry has been so wrapped up in its own technological advances it has forgotten the importance of its real focus: productivity."

Growth Potential for the PC as a Commodity

The first step in regaining brand equity for the PC, is to welcome the era of the PC as a commodity. While some may see this as a negative turning point for the PC, it really is a positive stimulus because it forces the PC industry to turn away from its inward focus to take a look at the real world and its customers. By admitting that the PC can no longer be marketed as new, unique or novel, we will learn what other industries have known for many years. It's a commodity. And as manufacturers and resellers of commodities, we can no longer dictate what technologies our customers may or may not want. It's time the industry listened to customers.

Once our industry focuses more truly on the customer -- just as premier brand names like Crest and McDonald's have focused on their customers -- we will be better equipped to differentiate value-added formulas for this new commodity era. Also, when I talk about adding value to the PC commodity, I'm not talking about the "value-added" catch phrase the industry has been using for years. We've had "value-added" resellers and "value-added" this and that for years. But we've never really added the value that creates an unique and consistent image to the customers we serve.

We've spent a great deal of time introducing PCs and software as "tools" for incremental productivity improvements -- but we've never delivered the full-scale productivity improvements that we promised. Today, the United States has more than 70 million computers in use, yet we have only managed to upgrade productivity in tiny steps of 10 or maybe 20 percent at a time. Since 1970, computer use and power has increased a thousandfold, but we certainly haven't seen similar returns in productivity. Why? Perhaps the industry has not taken the time to evaluate the real needs of its customers.

The computer industry has been so wrapped up in its own technological advances it has forgotten the importance of its real focus: productivity. It has conspired to tell customers what they want instead of taking the time to find out what they need. The industry has spent a lot of time developing all kinds of "value-added" features that it has told customers they need, slight augmentations in spreadsheet and word processing programs, larger hard drives and increased RAM capabilities. With these "tools" the industry has managed to help its customers gradually make incremental gains in productivity. The problem is the gains have been just incremental -- not incredible.

What the industry hasn't done, however, is focus its products and systems on what the customer really needs: to redefine work flow and business processes for major gains in competitiveness. Instead of automating the same old tasks and processes, the industry needs to re-think the processes in place and enable new ones with technology. By re-engineering work flow patterns and processes, the computer industry can develop added efficiencies and productivity increases for its customers that could never be imagined using simple task automation. Instead of seeing the 10 to 20 percent gains that task automation offers, industry customers could see gains of 50 percent, 100 percent or more through re-engineering their work flow patterns. They'll gain more than a productivity increase -- they'll gain competitiveness.

This is where the computer industry can build its brand equity. Like McDonald's, we need to look closely at our customers and find

(Continued on next page)

(Continued from previous page)
out how to repackage our products to meet their needs better than anyone else. Like the raw potatoes that McDonald's uses for french fries, our PCs must be repackaged and redefined in terms of customer benefit consistently delivered every time. In the computer industry, that mean rethinking our work processes in terms of competitiveness. And it means positioning the PC as more than "task automator," but instead as the means by which a company can rethink its operations for competitiveness in an increasingly competitive world market.

What this Means to the Computer Reseller

The dedicated traditional computer reseller will play a major role in the process. As a direct link to the PC customer, the dedicated reseller is particularly equipped to focus on business operations and provide the customer with an incredible return on investment: worldwide competitiveness. This challenge is one that extends to the computer manufacturer, the reseller and the customer.

By working together, specialty resellers and their customers can analyze needs and define new processes. By focusing on the customer's entire business operation -- instead of just a few tasks to be automated ---the reseller/customer partnership can deliver what the computer industry has long promised but failed to deliver: total solutions for productivity, efficiency and competitiveness. This kind of customerpartnership will enable reseller to do more than come up with a few quick fixes; it will enable them to develop solutions that take into account the entire work flow process and how it can be modified for even greater efficiency.

That's how resellers can build more equity for the computer industry. It's the kind of value that can't be obtained without dedicated support and partnership with the customer. It's the difference that will distinguish the computer industry and re-establish our lost brand equity; it's the difference that will add value to the PC commodity; and its the difference that will keep the computer industry healthy and strong for years to come.

Rick Inatome is chairman of InaCom Corporation, which markets personal computers and related support to customers in 50 states through ValCom and Inacomp Computer Centers. In 1991, Mr. Inatome masterminded the merger between his company, Inacomp Computer Centers, and ValCom, Inc. to create InaCom, now one of the largest computer resellers in the industry. The InaCom channel also includes system integrators, value-added resellers and other specialized providers of computer systems and support. He had previously grown Computer Mart, Inc., which he founded in 1976, from a small storefront operation to a multi-million dollar corporation. Mr. Inatome has been named one of the "Most Influential Executives" in the microcomputer industry by Computer Reseller News every year since 1983.

Product Review :

ASCII PRINT PRO v1.05

By: Larry Anders

ACSII PRINT PRO is a companion program to your HP Laserjet compatible laser printer that allows you to use the technical features of your printer with all standard ASCII text files.

The program supports 4 different sized paper trays while letting you select 432 different CUSTOM paper or BOOKLET sizes. The program contains 30 DUTCH and SWISS fonts. With **APP** you can print 1UP, 2UP, 4UP, 6UP, and BOOKLETS in portrait or landscape mode. Larger page sizes can utilize your printer's built-in fonts. APP allows up to 20 different predefined program setups.

With **APP** you can print BOOKLETS from 4.25" x 5.25" to 8.5" x 11", Portrait and landscape, print or re-print any single sheet from an ASCII text file, print or re-print any single sheet from a BOOKLET, print a BOOKLET cover only or print a BOOKLET without a cover...allowing you to design your own cover.

With **APP** you can have programmable HEADER lines which can appear on your first page or every page and print back sides of pages with normal or reverse collation.

This program is EXCELLENT for printing all those document files that come with SHAREWARE programs and allows you to save large amounts of paper while doing so. A file that would normally take 50 pages to print can be printed using only 5 sheets of paper. The OUTSTANDING feature of this program is being able to print BOOKLETS using both sides of the paper and will page numbering each for you.

Installation is simple; just copy all the files into their own sub-directory or run the program from a floppy. There is a complete GUI (Graphic User Interface) menu system that is very easy to understand. The SHAREWARE version is completely operational with only a small delay upon quiting, asking you to register the program.

APP requires a 100% IBM compatible computer, (8088, 80286 80386+?), DOS 3.3 or higher, 160k of free memory, EGA or VGA graphics adapter, and beginner's or better knowledge of your laser printer. The printer must be HP compatible (NOT POSTSCRIPT) but HP PCL LEVEL IV compatible. Keyboard is optional but a MOUSE is preferred.

There is minimal documentation included with both the SHAREWARE version and REGISTERED version, but the friendly graphic menu shell is more than adequate to have the novice computer user up and running in only minutes.

Product Review:

On the Road with Windows The AST Premium EXEC 386SX

Review by Rod McKenzie, Contributing Editor, Madison PC User's Group

Looking at a notebook computer? Do you think that there are times that your desk ought to have wheels on it? Or even wings? Dreaming about unfettered computing can be a lot of fun. Shopping for it can be a frustrating experience. The AST Premium Exec 386/25 Color deserves a close look. Well made and loaded with features, it means having Windows with you on the road with few, if any, concessions.

Prices for notebooks have always been priced at a premium when compared to desk-bound machines with essentially the same features. Since the prices of PCs generally have dropped significantly, this might be a good time to look again at the equipment you thought was too expensive just six months or a year ago. With the most recent price cuts, it now might be a lot more affordable. Fortunately, the computing power that a given dollar will buy today is more than ever before. Windows programs place more of a demand on the hardware, so the new entry level is probably higher than where users started when they bought that first desktop machine.

When I started using Windows I stopped using my old laptop. It just didn't have the horsepower that Windows needed. All that has changed since I had the chance to try out a notebook-sized PC, the AST Premium Exec 386SX/25 Color. The Exec is a well-crafted piece of equipment that meets the challenges that Windows and portable computing puts on the hardware. It's not an entry-level notebook, and equipped with an internal fax/modem, a price was paid for convenience. I think it's worth it for several reasons. The most obvious is the fact that my computer investment can now keep up with me. When I move around, it can follow me, and when I want to get to work on a project, the machine I have along is every bit as capable as the machine I left at home on the desk.

Looking back, it's clear why the old iron wasn't equal to the task of running Windows. It was based on an 8086 chip, 640K of RAM, and dual floppies. There was no way to expand RAM and the cost of a hard drive conversion was over $1000. It ran at a respectable 9 MHz, but even loading large DOS programs crawled. This old horse was not going to run Windows, not even on a dare! Having run Windows on a notebook, I'm not looking back. The Exec has a 386SX chip, 4 MB of RAM, and an 80 MB hard disk that's further enhanced with a copy of Stacker which effectively makes it a 150 MB drive.

Windows 3.1 loaded very easily onto the notebook and the hard drive wasn't even breathing hard when I started to load the applications. Since I'd be plugging into a printer only once in a while, I loaded only one printer driver. I moved into the Control Panel, clicked on the 386 Enhanced icon, and made a permanent swap file. Windows thought that 11.7 MB was a good number, and who was I to argue? This was actually going smoother than when I loaded Windows 3.1 over 3.0 on my desktop machine.

For the applications, I decided to start with the Lotus SmartSuite for Windows. First I loaded Ami Pro, my favorite Windows word processor. Installation went by the book. It included Adobe Type Manager, so I knew that I would be able to add some favorite PostScript fonts that weren't included with any of the basic programs. Still no problems. The next program to load was 1-2-3 for Windows. It loaded without a hitch; I upgraded with the version 1.1 diskette that was included, and then added the SmartPack disk I picked up at Lotus World. I was interested in the SmartFill feature that figures out sequences for numbers, months, days of the week, and that sort of stuff.

The next application to be loaded was Freelance Graphics for Windows. This is a presentation graphics package that really brings out the best in a color notebook. Freelance gives the user a head start on generating a good-looking presentation, by providing SmartMasters. These are predesigned style sheets that match good contrasting colors, suitable typefaces, and pleasing layout on the screen. Getting a screen show ready for presentation is almost painless. Previewing is fun, watching the special effects like fades, wipes, louvers, and merging lines of text and data on the screen. This really shows off the bright readable LCD panel of the Premium Exec. Several people can stand around the machine and comfortably look at a clear screen image.

Although I wouldn't be tied into a printer most of the time I am on the road, I know I'll still want to generate some output, so I added WinFAX Pro, from Delrina. It's been the most reliable fax software I've used. Sit down with the notebook plugged into a phone line and you're ready to deliver fax messages, complete with TrueType or ATM fonts, imported graphics, headers, footers, and an optional cover page. Users can easily create a custom graphic cover page using their Windows word processor or a paint program, and then send the file to WinFAX for printing. Instead of sending it to a phone number, the output is saved to file. Now the saved file can be used as the cover page graphics file. There's even auto-dialing to groups, as well as to individuals. Delrina has recently added DOSFax to their line. Users who need to fax from a non-Windows application can have the same convenient performance. If your DOS application can print to an Epson printer or to an HP LJ-II, DOSFax will grab the output and send it out as a fax.

Data communications was the next thing to consider, and the choice was obvious. Datastorm Technologies started delivering ProComm Plus for Windows late this spring, and I needed a place to try it out. It's the successor to WinComm, a favorite of mine since the days of Windows 3.0. The timing was perfect and the hard disk wasn't even close to full. Now I hit some rough sledding. ProComm couldn't find the modem. Finally, I had to do the one thing that I had avoided. I had to read the manual! It turns out that in order to conserve power, the default status is for the

(Continued on next page)

(Continued from previous page)
modem to be disabled. It gets awakened by a .COM program called ASTMODEM. The user enters ASTMODEM ON, or puts that line into a batch file, and then loads the communications program. The other choice is to turn it on in the configuration setup program. I turned it on and left it on. I just have to be aware that it's going to put a little more demand on the battery.

Once the modem was turned on, ProComm Plus installed with no problems and I was dialing into the BBS and getting a busy signal. Situation normal... Actually, I was pleased to see that the modem sensed the busy signal and started the redial delay. My only complaint with ProComm Plus is that they have chosen a fairly small font for their screen and put it into a window that is a good deal smaller than the display. On a notebook PC, type easily gets too small to read comfortably. It's just plain too hard on the eyes. Skip the big frame and make the font bigger.

The Exec doesn't come with a pointing device, so I looked around for something I thought would be convenient. I tend to cut the time too close sometimes, so when I'm packing up to go it looks a little like a bookie's joint being raided. I chose a Microsoft Ballpoint, which clamps to the side of the keyboard and is not a problem to pack when it was time to hit the road. The software includes a program to set the sensitivity, the speed, and the button functions. I ran for a few minutes and realized that the cursor could very easily hide from me. Windows has a cure for that. I turned on the "mouse tracks" feature, so it's easier to follow and to find. I can't close the cover all the way with the Ballpoint clamped on the keyboard, but I can pick up the unit in one piece. A mouse would be a lot more awkward to set up shop and move around, so I prefer the Ballpoint.

The hard disk wasn't full yet, but just to keep the swap file from feeling cramped, I added Stacker 2.0. This is the software only version of the product. Considering the fact that Stacker moves just about all the data on a hard disk into one huge compressed file, I was prepared for an extended session waiting for the STAC_VOL to be created and for all the files to be transferred. It really wasn't that bad. The installation program takes the user through the process smoothly. In this case there were some fragmented files, so it bailed out the first time and told me to run the DOS program CHKDSK and clear up the fragments before Stacker wrote over them. The installation program also saw that there was a permanent Windows swap file and left enough uncompressed disk space so that I could recreate it after Stacker was installed. The next time Windows loaded, it announced, with a warning box, that the swap file was not found and I should recreate it.

While Stacker was doing its installation, I read up on how it works. It uses a compression algorithm to pack the data closer together on the disk, and it creates and then refers to tokens, sort of like code patterns, to save space. This is a loss-less compression method, so file integrity is supposed to be very secure. There's a hardware board for desktop machines that can run even faster than the software-only version. Anyone running Windows and a few applications begins to feel the empty disk space practically evaporate as the software loads. Stacker makes the drive hold a lot more. Loading Windows and its applications from the "Stacked" drive is actually a little faster than the original un-Stacked drive. Not a lot, but it was never very slow in the first place.

Using the keyboard was a little frustrating at first. The keyboard layout is compact. That's a good news, bad news story. For general typing of text, I actually made fewer errors with the Exec than I do with my desktop machine's 101 key standard keyboard. The feel of the keys is definite and they release quickly. The right side shift key is too small for my liking. I will often overshoot it and hit the cursor-up arrow key. When this happens I have to really hunt around for the cursor, and it can be a disaster when you are typing in "typeover" mode. Besides using the cursor keys, I often navigate with the Home, End, Insert, and Delete keys. They're together on a 101 key keyboard, but on the Exec, the Home and End keys are on the top row, and the Insert and Delete are on the bottom row. The spacing of the keys is good for my medium-sized hands. I didn't find that my fingers were in the way of each other while typing.

Battery power will run the Exec for about three hours. That's pretty good for a notebook. Remember that they're trying to keep it small and light. Batteries are usually taken for granted and, unfortunately, some designers treat them like ballast. Many times the three hours is not long enough for my working habits. Given the interruptions that occur, I need to stop and shut off the machine or plug into the AC, right from the start. The hard drive will power down and save power, but the screen still draws its share. The screen saver is handy, but I haven't really noticed a lot more battery time as a result of using it.

What did I want in a notebook that I didn't get with the Exec? First there's the keyboard layout I mentioned earlier. Then there's the small carrying case. I'd like it to have more room for the power supply and space for the Ballpoint or a mouse -- a notch molded into the side of the case that would attach the Ballpoint directly, so the clamping bracket could be left at home. I consider that the Ballpoint is a regular accessory. Why not make the physical attachment point also provide the electrical connection to the serial port? It would eliminate the dangling cord and extra hassle of plugging in the cord every time the machine is unpacked. For a scanner, I'd like to have at least one slot for a half-height card. WAIT! Yes, I know that it wouldn't be a notebook size for long if I add too many more options.

It would be nice to be able to recharge the battery while the notebook and the power supply are still in the carrying case. A little extra space in the case, and another zipper at the back would give the user access to the AC cord.

In the case of the Premium Exec, the fax/modem is a Megahertz unit with 2400 bps data rate, and Class II, 9600 bps Group III fax send and receive capability. WinFAX Pro, as well as DOSFax, will work on the AST Exec equipped with the Megahertz unit or on an external fax/modem connected to the COMPORT, provided it's using the Sierra SendFax chipset or other Class I/II hardware.

What does the Premium Exec 386/25 Color cost? As tested with 4 MB of RAM, 80 MB hard drive, and color screen, it lists

(Continued on next page)

(Continued from previous page)

for $3595. The optional Class II Send/Receive modem adds another $499, putting the total price at $4200. The Ballpoint and the applications software would push it to just about $5000. Give up some of the features or options and the price comes down. Another ploy is to wait for a little of the dust to settle in the most recent PC price wars.

Any user who must take a PC on the road and wants to have almost all of the comforts of home should give the Premium Exec PC a very close look. AST paid a lot of attention to details and has designed a very durable, portable machine. It's easy to set up and quickly becomes comfortable to use. I found that I often used it at home, getting it out of its carrying case, in preference to my desktop machine.

The AST Premium Exec 386SX/25 Color is a product of:

Book review:

101 Windows Tips & Tricks

By: Rod McKenzie, Contributing Editor, Madison PC User's Group

101 Windows Tips & Tricks takes a little less structured approach. There are chapter headings like Blast Off, Prints Charming, and Fun and Functional. The authors have put most of their energies into showing the user how to cut through the unnecessary extras. They show how to run a streamlined Windows that will have no opening MS flag-waving logo (start Windows with win :, that is win (space) (colon). They remind users that dispensing with wallpaper will free up system resources. OK, so if you have limited RAM, and who doesn't, skip the wallpaper.

In the section on printing, the authors devote a fair portion of the space to PostScript printers, which are still, unfortunately, a tiny minority of the printers attached to PCs running Windows. There's even a tip for those fortunate few who have a Linotronics at their disposal. Not a single word for the huddled masses that use a dot-matrix printers with their systems. There are good suggestions for improving the speed of printing by downloading the fonts that you plan to use before sending any print jobs to a laser printer. Not a word though about TrueType fonts or downloading Intellifonts to the HP-LaserJet III.

The book highlights many topics in the Custom Made Windows chapter. Unfortunately they hit some of them so lightly that it does the user little good. Some are product recommendations, without any critical review. Is this a tip or just a cheap trick? In the chapter on Optimizing Your System, for example, the user will find the table of shortcut key combinations is buried on page 121. It belongs much earlier in the book. They got off to a good start with the Blast Off, which gives the user a pretty good grounding in the File Manager. The information about faxing documents from Windows is only a half page of text that tries to cover scanning and OCR, and finally tells the user that the best buy in fax-modems is Intel's $399 SatisFAXtion board. Well, that's excellent hardware, but not everybody's best buy. There are too many factors to dispose of the topic so quickly.

Another example where 101 Tips takes a rather breezy approach is the one about setting up a permanent swap file. The authors tell the user where to find the 386 Enhanced icon in the Control Panel, but they merely say to use the recommended settings or to "enter your own specifications." Users need to know more about the factors concerning swap file size. The authors only offer the comment that swap files will take away disk space from applications. True enough, but they fail to mention that the size of the swap file affects how well Windows will execute programs, and especially how well it will multitask. The authors could enlighten users to the trade-off that they need to make if they would acknowledge that the hard disk is a shared resource.

Having made numerous recommendations for third-party products, commercial and shareware, the authors fail to give any addresses or phone numbers interested readers can contact about these good ideas. Too bad, because most users buy these books precisely because they don't have a Rolodex full of contact names and numbers.

101 Windows Tips and Tricks is priced at 12.95, and is published by:

Do you do Windows?..

Across:

1. A graphics file format in which images are represented as a series of dots called pixels.
2. Press and hold down the left mouse button while moving the mouse.
3. Located on the main input device of a PC.
4. A list of commands that can be applied to the active window or application.
5. Arrangement of windows that overlap each other on the desktop.
6. Arrangement of all open windows that do not overlap on the desktop.
7. Features of a software application.

Down:

1. A variable, constant, or expression required by a command or function.
2. To start an application, or to create a new document window.
3. A setting, value or automatic response.
4. A minaturized graphic representation of an application or window.
5. To increase or decrease space between characters.

Book review :

Winning

By: Bob Norton,
Madison PC User's Group, P.O. Box 2598, Madison, WI 53701.

John Hedtke subtitles his book "The Awesome & Amazing Book of Windows Games Tips, Traps, and Sneaky Tricks." I would probably call this book gnarly rather than awesome, but the author's point is well taken, as his book is all about Microsoft's games for Windows. As all Windows users know, Microsoft included a couple of gamelets along with Windows. What may be news to you is that it has also sold several collections of games that they call Entertainment Packs. All totaled, twenty six different games are explained in detail in this book.

The book leads off with an explanation of the basics. How to move a mouse, what is a pointer, how to install the games. This section is very elementary, and unless you are totally new to Windows, you can safely skip this section. Luckily, the remaining sections have a lot more of interest.

Naturally, the first section, Part 1, deals with the games delivered with Windows 3. Solitaire has been described as the most thoroughly tested Windows program in existence. Reversi is a popular board game, played on an eight by eight grid. Reversi and Solitaire are both explained in detail, strategy is discussed, and even sneaky tricks are revealed. (Did you know there is a way to deal a single card from the deck when dealing by threes? Uh huh, I thought not!)

Part 2 tackles the Volume One Entertainment Pack, which has eight separate games included in it. Tetris is very well known from the many DOS versions, and it is only a little different here under Windows. Taipei, very similar to the program Shanghai, is another very addictive mouse-skill builder. One game, IdleWild, is even a screen saver, but I'm not sure how to get a high score with this one, even after reading the chapter from beginning to end. If the original solitaire game wasn't to your liking, two additional solitaire games, Golf and Cruel, are in this pack.

Minesweeper challenges you to walk your way around in a minefield with a non-directional metal detector. Minesweeper is perhaps my favorite of this pack of games, as it is a blend of logic and speed, with just a dash of luck. The pack also includes a peg-jumping puzzle, and a version of three dimensional Tic-Tac-Toe. Each game is covered completely, and the sneaky tricks are very sneaky, I assure you. Obviously, some of the programmers of

(Continued on next page)

(Continued from previous page)
these games buried a few goodies to stun their friends with, and now you can be in on the secrets, too.

Parts 3 and 4 explore Volume Two and Volume Three Entertainment Packs, respectively. I do not have these Entertainment Packs, so I was not able to test the information out for hours and hours like I did with Part 2. All the games are covered in the same way, with a lot of attention to detail on how to play, strategy, tips, and sneaky stuff. Part 3 covers FreeCell, Jigsawed, PipeDream, Rattler Race, Rodent's Revenge, Stones, Tut's Tomb, and a second version of IdleWild. Part 4 covers Fuji Golf, a third version of IdleWild, Klotski, Life Genesis, Ski Free, TetraVex, TriPeaks, and WordZap. Now don't let me hear anybody complain that there's nothing to do, OK?

This book really covers the subject, from how to work the mouse to arcane cheat features. If you are a Windows game maven, you ought to give this book a look.

Book review: The Essential Guide to MS-DOS 5 Programming

By: Mike Janda, Madison PC User's Group

At a recent Programming Languages SIG meeting I was showing some arcane system functions available toprogrammers. The demo included what to load into the registers, what interrupts to issue, and what to expectupon return. The examples were written in assembler and, of course, someone asked how to access thosefunctions using C. I gave a very brief reply that "there are int86 and intdos functions available; see your manual." A better answer would have been to "get a copy of Peter G. Aitken's new book, The Essential Guide to MS-DOS 5 Programming."

Published by Microsoft Press (yes, THE DOS people), its 400 pages provide everything you need to know to make system calls directly from your C and Basic programs. There are numerous examples in both languages and a companion disk can be purchased ($19.95+tax, shipping, etc.) so you don't have to key them in yourself. And you get a copyright release so you can use the example code in your own programs.

The book is listed as an intermediate-level tutorial, and I won't disagree with that assessment. The first two chapters cover the basics of DOS, BIOS, CPU registers, memory addressing, etc. It should only be considered as a review and you'll probably need a more detailed reference if you're just getting started in low-level programming.

The next two chapters examine the functions used to issue interrupts in Basic and C, respectively. Never figured out how to use INTERRUPTX or int86x? You'll find a detailed explanation here, along with the data structures required and a step-by-step look at the operation of the functions. Sure beats what they put in the manuals.

This is followed by individual chapters that examine many of the function calls available. Each chapter is devoted to a particular function type.

There is a chapter on the BIOS and DOS keyboard functions, and more importantly, getting keyboard status information. This allows you to get input directly from the user. Most compilers offer pretty good input support, but this could come in handy for making sure you're not getting "redirected input."

The chapter on mouse programming takes up a large chunk of the book. Since most languages offer very little support for mouse functions, you can use this to add mouse support to your programs. The examples examine both graphics and text mode mouse programming.

The chapter on screen displays covers the basic BIOS and DOS services, including ANSI support. There is also n example program that determines what type of display adapter is installed.

Three chapters on disk services examine the basics, files and records, and disk management and directories. Both the FCB (File Control Blocks) and "Handle" functions are examined in detail.

The chapter on serial and parallel port access covers the I/O functions available, which are rather limited. A chapter on memory management includes the DOS allocate, release and resize low memory functions and a section on using expanded memory. There is less than one page about extended memory use. The final chapter looks at the miscellaneous services -- date, time, error handling and equipment installed.

Each chapter closes with a detailed listing of all the services covered, including what to put in each CPU register, what is returned, and important notes and limitations (if any).

The only thing missing? The detailed listing for the "get DOS version" function. This is the function used to show how INTERRUPTX and intdos work.

I would recommend this book to anyone interested in learning more about low-level system programming.

The Essential Guide to MS-DOS 5 Programming, by Peter G. Aitken, ISBN 1-55615-471-2, $24.95.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII file or in a commonly available word processor format, such as WordPerfect 5.1, on diskette to the editor at 9402 Hidden Ridge Place, Tampa, Florida 33637 or send it by modem to BBS (813)239-3704.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for non-profit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

Commercial advertisements will be accepted at the following rates:

	1 month	3 months	6 months
Full Page	$60.00	$162.00	288.00
Half Page	$40.00	$108.00	$192.00
Quarter Page	$22.00	$60.00	$106.00
Eight Page	$12.00	$33.00	$58.00
Business Card	$10.00	$27.00	$48.00

All advertisements must be prepaid by check payable to TIBMPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if it is not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, Marylee Bruneau at (813) 932-6745, for space availability and for further information.

This newsletter was created with WordPerfect for Windows donated by WordPerfect Corp. to TIBMPCUG for use by the editor.

PRESIDENT'S COLUMN:

Without getting into politics too much, you may have noticed that the country has a new president elect. I don't know about you but I am glad that the air waves have returned to normal. All those commercials, debates and mud slinging attacks on each other started really getting old after a while. Hey by the way, nominations are being accepted for the 1993 officers and I guarantee the campaign will be fast and clean. I forgot to open the floor for nominations at last months meeting. You can make nominations for the following positions, President, Vice-President, Treasurer Member at Large and Treasurer through the mail, BBS or at the next two meetings. These nominations, as well as the elections are important to the future of our group. Elections will be held during the December meeting and should last a whole 15-20 minutes.

Once again our members did a complete night of talking, presenting and two way communicating. Don Patchz's presentation on modems covered the technical and rudimentary ins and outs of modems. Thanks Don. The second part of the presentation, done by Kevan and myself, covered the use of our Bulletin Board System (BBS), **online and live.** I actually had fun talking and explaining the BBS while Kevan navigated around the BBS through the keyboard, and also explained the BBS. I also learned, as I believe you did, how to use features of the BBS of which I was not aware. The open forum between you, the audience, and Kevan and myself was great.

Of course our own Director of Education, Ed Buzza, conducted the second class, of a four part series, on WordPerfect for DOS. The November class will cover one of my favorite WordPerfect features, Tables. The crossword puzzle in last months newsletter was built with this feature.

One of our members has volunteered to head a Windows Special Interest Group (SIG). The time, location and hardware/software resources have yet to be determined. If you would like to join this group please leave me a message at (813) 932-6745 or on the BBS. SIG groups are for members only and are free. If you would like to run your own SIG please let me know.

Please notice that board members, Tom Cone and Larry Anders, are setting examples by writing articles for the newsletter. We need additional articles contributed by the other 200+ members. They can be about new products you have acquired, tips & techniques or whatever information you feel is informative to the group.

Due to a timing conflict, Software Publishing will not be presenting at our November meeting. I am in the process of rescheduling the presentation of SuperBase 4 (Windows database). However, we will be **giving away a complete copy of SuperBase 4** at the meeting to one of you lucky members.

Fortunately, Microsoft has accepted my invitation on short notice to present some of their current and brand new Multimedia products. These product will include Cinemania, Word/Bookshelf for Windows, Beethoven and discussion of multimedia extension and

(Continued on next page)

(Continued from previous page)
support under Windows. A new Windows extension, Video for Windows, that lets Windows users play video on a PC without additional hardware may also be presented.

We are still waiting on that new 14.4k modem from US Robotics that we purchased a while back. Indications are that it will be installed this year.

Friday the 13th is closing in on us. More than half a dozen viruses are suppose to expose themselves (eek) on Friday. You can protect yourself by downloading McAfee's antivirus from our BBS and running it on your system or buying a commercial product and installing it. Also remember that anti-virus software does not look inside compressed files such as ZIP files. It is possible to scan the EXE and COM files on your hard disk without finding a single virus. However a virus may be attached inside a compressed file and when uncompressed it becomes active. **Make Backups of your most important data.**

Harvey Bruneau

MS PowerPoint 3.0

By: Mark Bradish
(Reprinted from Bits 'N Bytes, the newsletter of the Pentagon PC User Group, Nov 92)

For those of you who have ever had to create briefing charts and slides, the PC has made life a lot easier. Without telling my age, I can remember back in the "good old days" of having to create briefings and charts using a Leroy Lettering Device and plenty of chart pak tape. Not only were the results frequently unsuitable, there were always the times when the information being presented had to be changed at the last minute, necessitating a complete redo of the job. I ended up spending more time worrying whether the presentation was "pretty" rather than what the contents of the presentation were.

The arrival of the PC has changed all of this. With desktop publishing, powerful word processing software and more importantly, the recently introduced specialized presentation programs, practically anyone can produce a professional looking briefing in a very short time. Of course, while a presentation program can make your charts pleasing to the eye, the content still has to have substance. Presentation software allows you to focus on the content of your presentation rather than the ascetics.

PowerPoint Ver 3.0 is Microsoft's latest version in this specialized presentation program field. Powerpoint has to be used in conjunction with Windows 3.1 which means that the WYSIWYG and the Windows interface is one of its strong points. You also get the benefits of "OLE and DDE" that allows object linking with other Windows based programs. In addition you get an 22 TrueType adjustable fonts. With the advent of TrueType fonts I imagine the folks at Adobe and Bitstream are looking over their shoulder wondering what Microsoft is going to do next. I predict that in the not to distant future, as additional True Type fonts are added, the need for font cartridges, type managers will be reduced.

Installation was, as with all windows products, simple and fairly straightforward. Simply put the disk in and run the setup program through the Windows Program Manager. After a few minutes, another of Bob Jaynes "gorilla" programs was installed. Using the full installation process, Powerpoint will add a little more than 10 MB's to your already overburdened hard drive. However, using the custom installation option, this can be cut down to 6 or 7 MB's depending on the options you need.

PowerPoint comes with clip art and predetermined templates for just about any type of presentation. The clip art library, while not as extensive as I would have liked, still had quite a few useful graphics. When installing, I copied the clip art from my previous version of PowerPoint, so I doubled the amount of clip art I have available. Graphics can also be imported from other applications using the Windows Clipboard or directly using ADI, BMP, CGM, DXE, DRW, EPS, HPGL, Lotus PIC, Mac Pict, PCX, TIFF 5.0, WMF, or WPG, which covers just about every graphics format available

According to Microsoft, one of the benefits of PowerPoint is that it is easy to use and the average person can create an acceptable presentation in a short period of time. PowerPoint has several "views" from which you can work. One view is the slide view in which you work directly on the slide itself. In this mode you can actually see how your presentation will look. Another way to work on a chart is through the "outline view" that allows you to see your entire presentation in outline form. This view (which is faster) allows you to concentrate on your content rather than graphics and is a major additional feature not found in previous versions. You can switch between views, that is, you can work chart 1 in the slide view and then switch to outline view for the next chart. PowerPoint utilizes the ever present Microsoft "Toolbar" to make it easy to change fonts, cut & paste etc. Also there's a built in graphing fool which can be used to produce simple charts without going into a spreadsheet program. Additionally, if you have charts produced by Excel or Lotus 1,2,3, these can be imported directly into the presentation and linked dynamically so if any changes which are made to the original chart are undated in the PowerPoint chart.

After a basic presentation has been made, then comes the fun part. If you want to dress up your presentation, Microsoft has included over 150 templates you can add to your presentation. By selecting and adding a template, your presentation can instantly take on a professional appearance complete with colors, graphics, etc. If you don't like a particular way a presentation looks, then simply change to another template. A slide sorter is also part of the program. It allows you to view miniatures of your slides and the order of the slides can be rearranged by clicking and dragging.

(Continued on next page)

(Continued from previous page)

Output is available through 35mm slides, laser printer, overheads and electronic slide show. One of the things I really like about the program was the ability to print speakers notes on a slide. Besides printing the slide, it will also print a "notes slide" which has a small version of the slide as well as explanatory notes on the slide. This can be used as briefer notes or as supplemental data not included on the basic slide.

A couple of new features allow you to build slides; that is, apply animated bullet effects, and dim previous points to focus your audience's attention. Also new in this version is the ability to apply transitional effects like fade outs between slides. Another innovation is a "viewer" which Microsoft has included which allows you to copy your presentation and show it on another computer even if the other computer doesn't have PowerPoint installed! Great! You can walk in your boss's office or who ever you want to show the presentation and show it on their computer. You need to make sure, however, the boss has Windows 3.1 installed on his machine or the viewer won't work. Now, tell me those folks in Redmon, Washington aren't thinking ahead.

One of the things I gauge software by is how good the documentation is. Microsoft has not been, by any means, my favorite software publisher because in the past, you needed to have the IQ of a rocket scientist to read and understand their documentation. That's why my book shelf at home is loaded with "Que" books, which explain in simple language what the user guide should have said. Well, Microsoft must have heard my plea, because their documentation is quite good. The user manual has a 13 part tutorial that, if you spend an hour or two completing, will give you the ability to create a professional looking presentation.

What is fun with the program is experimenting with different templates and color schemes to change the look of your presentation.

Now, that I have extolled the virtues of PowerPoint and Microsoft, there are several things you need to consider for the program. While the book says that the program needs a PC using a 286 or higher with 2MB of memory, I am here to tell you that I had a 386/33 with 4MB and there were times when it ran S-L-O-W. I have since added 4MB and things really speeded up.

I also recommend that you get the biggest, fastest HD you can afford. When you're running Windows, there is a tremendous amount of disk activity taking place. Of course, this is the penalty you have to pay when working with Windows programs.

In summary; PowerPoint is a powerhouse of a presentation program, which is easy to use and allows the average user the ability to produce outstanding presentations in a short time. The downside is that you have to have the proper system in order to run Windows based programs.

Product Review:

LASER PRINTER ENVELOPE v1.05

By: Larry Anders, Librarian
Tampa IBMPC Users Group

Last Month I reviewed ASCII PRINT PRO v1.05 from ETS Inc. Well, when I registered APP105, ETS Inc. was kind enough to send me a copy of LPE v1.05 to try out. It seems to me that they have another winner.

LASER PRINTER ENVELOPE is also a companion program to your laser printer that allows you to print envelopes on your laser printer.

LPE105 comes with two different fonts but ETS Inc. has there own Free Public Access BBS where you can download a public domain (no-charge) file that contains 28 Landscape fonts that can be used with their programs.

LPE will print return addresses of your choice (up to 6 lines) and will fetch destination addresses (also up to 6 lines) from a data base provided with the program

LPE also gives you a choice to automatically print both FIM mail codes (the large one at the top) and POSTNET mail codes (the small one at the bottom), making for a real official-looking letter.

Probably the most unique thing about LPE is that it comes ready to print all the standard size envelopes but it also lets you specify most any other size envelope through one of its menu options.

Installation is simple; just copy all the files into their own sub-directory or run the program from a floppy. There is a complete GUI (Graphic User Interface) menu system that is very easy to understand. The SHAREWARE version is completely operational with only a small delay upon quitting, asking you to register the program for only $9.95.

LPE requires a 100% IBM compatible computer, (8088-386+?), DOS 3.3 or higher, 160k of free memory, EGA or VGA graphics adaptor, and beginner's or better knowledge of your HP compatible printer (not POSTSCRIPT) but HP PCL LEVEL IV with 40k printer memory available (for downloading a 19k font). Keyboard is optional but a MOUSE is preferred.

There is minimal documentation included but the user friendly graphic menu is more than adequate to have the novice computer user up and running in only minutes.

Editorial Comment: I did not receive a transcription of the October meeting minutes to insert in this newsletter. Our Secretary, Jim Clark was unable to attend that meeting. WE (B.O.B staff) **need a volunteer** to take the minutes at the 11/11/92 meeting, as Jim will again be unable to attend. We wish you well Jim, hurry back, we miss your excellent reporting.

Software Review:
FastLynx 2.0 vs LapLink Pro

By: Dana Trout, GDTPUG

I have been using Traveling Software's LapLink Pro consistently for six months now, and have always loved it. But one thing that has bothered me is its sheer size: it requires 437,760 bytes of free RAM to run and over 300 Kbytes of disk space. So when I was offered the opportunity to look at Rupp's FastLynx 2.0 I jumped at the chance to see what LapLink's competition is doing.

The first thing I noticed is that FastLynx includes both the parallel and serial cables, drivers for Windows 3.0 and 3.1 which allow the DOS version to be operated from Windows, and drivers for disk and printer sharing. To equal these features with Traveling Software's product line, you would have to combine LapLink Pro and portions of DeskLink and WinConnect (although in LapLink's case, you would have the extra functionality of LE, the LapLink Editor from LLPro, the Talk Box from DeskLink which allows you to send messages between computers, and several other functions).

The second thing I noticed is that FastLynx requires only 250 Kbytes of RAM, a little over half of LLPro's 437,760. This was looking decidedly promising.

Upon opening the package I found that the disks (both 360K 5.25 " and 720K 3.5") had been slipped into the manual, and the whole works spilled out onto the floor. Oops. (LLpro's box has a nicely formed pocket which holds the disks safely until you explicitly remove them.) And the FastLynx disks are not write-protected (I think master disks should always be write-protected by the manufacturer). Yeah, I know, the manual tells you to write-protect the disks. But some of my clients are either too lazy to do so, or too computer illiterate to realize that a 3.5" disk is write-protected by uncovering the hole, while the 5.25" is write-protected by covering the notch. The manual is mercifully brief (but cogent), has a table of contents but no index. You can see by the seriousness of these faults how hard I had to look to find something to complain about.

I installed FastLynx on an aging 286 with no problems at all. I hooked up the serial cable from the 286 to my Poqet and uploaded a copy to it by following the on-screen instructions. The same basic approach is used by both FastLynx and LLPro you type in the following two DOS commands on the receiving machine:

```
MODE COM1:2400,n,8,1,p
CTTY COM1
```

FastLynx displayed on both machines the file being transferred, how much had been transferred, and how much was left to do. The process was fast and painless. I did have a momentary panic, though, when the transfer was complete. Both machines said the transfer completed without error, but the sending machine complained that there was nothing connected to it and I should check the cable or the remote machine. The answer, of course, was that the files had been transferred, but I still needed to actually run the program on the remote machine. This is one place where I think LLPro is nicer, because it automatically starts up the program on the remote machine when the transfer is complete. One other hiccough occurred when I repeated the process for both FastLynx and LLPro: I accidently logged onto a full drive before starting the upload. The result in each case was an error message stating the upload was unsuccessful, but with no indication of why. I consider this to be a failure in both programs. One small advantage to FastLynx is that when it experiences a failure it gives an error number (undocumented, of course) and displays the phone number of their tech support hotline. I like this, because of course you are out somewhere without your manual. Rupp (FastLynx) has learned from FedEx and Iomega (Bernoulli Box) to plaster the phone number everywhere, so the user does not have to look for it. However, unlike FedEx and Iomega, the Rupp number is not toll-free.

The upload consists of three files: FX.EXE, which is the program itself, FX.HLP, the help file, and GUIDE.FX, which is the whole manual. FX.EXE is 111,218 bytes, FX.HLP is 20,086 bytes, and GUIDE.FX is 53,694 bytes. I immediately deleted GUIDE.FX on the Poqet, and have a file transfer program that takes up less than 132 Kbytes disk space, significantly less than LLPro's 222,370 for the program and 96,470 for the help file. FastLynx has three modes of operation: the familiar split-screen, where the files of the local machine are listed on the left and the files of the remote are listed on the right; Form Mode, which lets you build scripts or macros which can be used directly from FastLynx or incorporated into batch files; and Command Mode, which lets you execute DOS commands and batch files from FastLynx. One feature I especially like about FastLynx is the split-screen mode can be set to look at two drives or directories on the local machine, so you can use it in place of a shell like Xtree. The split-screen mode is quite powerful, with the capability to sort by name, date, size, or extension in ascending or descending order, as well as copy or delete files and directories. You can also use it to create directories or view text files. This means one less program to learn and fill up disk space.

There are some operational differences between FastLynx and LLPro. In LLPro, you select individual files by pressing the space bar, while in FastLynx you use the F5 key. Personally, I like the space bar better because it is so much easier to get to, especially if you are used to function keys in one location and working on a machine with them in another. So far, the space bar has stayed pretty much in one spot in all the keyboard variations.

FastLynx allows you to send only newer versions of files to the target (remote) computer, which precludes the possibility of replacing an updated file with a previous version. This is not quite the same as LLPro's synchronize function, which replaces older files on both machines with the most recent ones. Another nicety of LLPro is that it compares the date and time of the two machines, and if they differ by more than five minutes, pops up a little box telling you about it, and lets you set both machines to the local date and time, remote date and time, or leave both alone.

One feature LLPro has is that it will upload through a modem to a remote machine. I must confess this is a feature I have never had to use.

(Continued on next page)

(Continued from previous page)

The serial cables that come with FastLynx and LLPro are the same length (8' between DB-25 connectors, 10' between DB-9 connectors) and both have both 9 and 25-pin D connectors on each end. However, the one that comes with LLPro is smaller in diameter, more flexible, and lighter (8.5 oz vs FastLynx 10 oz), important considerations for people who have carry all this junque with them. LLPro's cable is also better made, with the jackscrews easily retractable so when you plug it in the screws do not get in the way. I was able to clean out the excess plastic that was interfering with the jackscrews on the FastLynx cable, but that took some time and it still isn't

Software Review:
MATH BLAST PLUS

By: Margaret Thompson
(Reprinted from Bits 'N Bytes, the newsletter of the Pentagon PC User Group, Oct 92)

I know that I am not the only club member with school aged children in my life, so I thought I'd write about a software package for children... Math Blaster Plus. The program is a successful cross between an arcade type game and a learning tool. It has a combination of graphics and sound that will hold the interest of even the most fidgety child while they learn essential math facts and problem solving skills in spite of themselves! "Blasternaut" and his friend "Spot," a robot, travel through space making the universe a better and cleaner place (making any place cleaner is a radical educational idea for children to learn as well!) Via problem solving, the child helps these two build a rocket ship that can travel the galaxies seeking out "trash aliens" who dump litter everywhere but in the trashcan (this is a concept most children already understand). Blasternaut and Spot continue their journey to a space recycling center where trashcanned numbers are recycled using math concepts. Lastly, with the child's assistance, Blasternaut defends his space station from the villainous "trash aliens".

The child works at his/her own pace and can work on addition, subtraction, multiplication, division, fractions, decimals, and percents at all levels of elementary school. The work is fun and totally non-stressful for "math shy" children. There are 750 math facts grouped into 30 levels of difficulty. The child is encouraged to develop problem solving strategies, to make decisions, and to see the relationship between decision and outcome while helping Blasternaut and Spot. The program can keep track of the child's progress, and records can be saved and printed out for future use. A certificate can be printed out as an award when the child masters their math facts.

To keep things challenging, the program can be customized for more specific math needs. The "Editor" allows you to enter your own math problems, and if you choose, you can enter the child's name in word problems to make things more interesting for them. The "Test Maker" allows you to crate and print your own tests to determine either a starting level, or to determine whether the facts have really been mastered. Two metro area supermarket promotions of free computers and software for schools for cash register tapes allowed my children's elementary school to get this software. The children liked using it so much, that we bought a copy at our local computer store for about $30.00. The software comes in either MS-DOS or Macintosh versions and was created by Davidson & Associates, Inc., Torrence, California. They list two "800" telephone numbers: (800) 545-7677, Sales, and (800) 556-6141, Customer Service.

■■■

Shareware Review:
JOT-IT6

Reviewed by: Tom Cone
Tampa IBM PC Users Group

JOT-IT6 is a memory resident DOS scratchpad for notes and text. It works quickly and simply, and is easy to install. I've tested it on '386 and '286 systems, with VGA and CGA graphics adapters, and with MS-DOS 5.0 and DR-DOS 6.0. It works fine in each of these environments.

As is true for other DOS TSR programs, once you have "loaded" JOT-IT6, it is "activated" by pressing a "hot-key". This will automatically suspend whatever program you may have been running at the time, and will then display a completely blank screen for your notes or text. When you exit JOT-IT6, your previous program is restored right where you left off.

"Loading" JOT-IT6 is easy. You simply type the program's name at the command line. This can be done by hand, but it's probably better to add a line to your AUTOEXEC.BAT file, so that the program is loaded automatically whenever you startup your system.

JOT-IT6 will use about 15,840 bytes of main memory in its default configuration. This includes room for 5 sheets of text, each of which is 54 lines long. If you don't want this much space for notes, you can easily alter the startup configuration. It will use only 7,840 bytes of main memory if you set it up to use only 1 sheet for text.

The editor is simple and straightforward. You move around the page with the cursor keys, and PgUp and PgDn move you from sheet to sheet. Automatic word-wrap for new text is a nice feature. You can delete lines or sheets with a single key stroke, otherwise you use the DELETE key or the BACKSPACE key to remove unwanted text.

Text that you write in the scratchpad is stored in main memory and will be lost when you turn off the computer. The program allows you to save your scratchpad to disk, and the scratchpad will be retrieved automatically the next time you "load" the program. Your text will be saved in ASCII format, and can be "read" by other word processors and programs. You can also print the scratchpad whenever you want.

In addition to adjusting the number of sheets available in the scratchpad, JOT-IT6 allows you to set or change the "hot-key" you want to use, and you can also specify the particular filename you wish to use for storing the scratchpad on disk.

(Continued on next page)

(Continued from previous page)
In order to keep the size of the program small certain compromises were made. The editor lacks sophisticated cursor movement controls, so you can't jump from word to word, or from screen to screen easily. Margins, page lengths, and line-spacing cannot be adjusted. JOT-IT6 is not a "clip board". You can't "cut" text out of one application, and then "paste" it into other applications. There is no on-line help, and error-handling is minimal. You can't print individual sheets , instead, the entire scratchpad is printed at once. Nevertheless, I found these to be reasonable design choices. I much prefer keeping the program small. It's a scratchpad after all, not a word processor!

If you are working in DOS, and would like to have an on-line scratchpad, that's always a keystroke away, give JOT-IT6 a look. It's available for evaluation on our club's bulletin board. Download a file called "JOT-IT6.ZIP". If you use the program, remember to register it with the publisher. The registration fee is $10.00.

For more information on JOT-IT6, contact its publisher:

Hardware Review:
Bernoulli Transportable 90

By: Alfred Chan, DDS
Greater South Bay UG, November 1992
(By way of editor of Blinkin Cursor, Milwaukee IBM PC Users Group, November, 1992)

If you are thinking of buying another hard disk for lack of hard disk memory space, consider a Bernoulli Transportable 90 from IOMega. After having watched IOMega's Linda Darlon demonstrate to the GS-BUG members the pros and cons of the removable portable hard disk, I thought I would buy one. And here is what I found.

Upon purchasing you have to decide how you will connect your Bernoulli to your computer. I learned there were two ways to connect the Transportable 90:

1) With a SCSI (pronounced Scuzzi) card in the expansion slot and,
2) with an adaptor to your parallel port.

If you purchase the sample kit for $820, you get either the SCSI or the adaptor for the parallel port. The price is now cheaper. I saw it advertised for $595. I got the SCSI and bought the parallel adaptor for about $150. If you have more than one computer it would be wise to have the parallel adaptor. You have to format your bernoulli diskette before use, easier than formatting DOS floppies.

I enjoy using the Bernoulli for many reasons. I like the idea that I can remove 90 megs whenever it is full and replace it with another empty 90 megs. The disks can be purchased for $145 each. Also, if you use Stacker for Bernoulli v. 2.02 on the disk, you will then have 180 megs on each disk or double the 90 megs. Stacker compresses all the files on the drive and decompresses them on the fly. Stacker is transparent, you don't even know it is there. What's nice about using Stacker here, is that the disk carries its own second partition as one drive. Usually in using stacker, two partitions or drives are made. With so much storage, you can easily carry around all your programs on two 180 meg diskettes.

I like to use Stacker for my Bernoulli diskettes and leave my 120 megs of conventional hard disk alone because I dislike making too many drives. Stacker makes two drives for every one on the conventional hard disk and I have an 80 and 40 meg on C: and D: drives. Stacker on the Bernoulli, can also be used on a computer that does not have the Stacker driver in the CONFIG.SYS. When you call upon your Bernoulli that has a Stacker diskette, you just type "Stacker" and the drive ("stacker e:"). The diskette will then perform as a regular Bernoulli hard disk. Thus you don't have to make all of your Bernoulli's a Stacker drive.

The Bernoulli does not get involved with your CD ROM drive. It just moves the CD ROM drive to the next letter. If your Bernoulli is after your hard drive C:, it will be D: and your CD ROM will be E:. If you have stacker on your Bernoulli then there will not be an E: drive and your CD ROM will be your F: drive.

Installing new programs can be fun with the Bernoulli. You can either place the old program on the Bernoulli as a backup in case you have problems with the new program. You can then replace the old one in a matter of minutes. No hassle with lots of copying backup floppy disks. Also, you can try out or run your new programs on your Bernoulli and leave it there. You can accumulate programs that you do not use frequently but would like instant access to.

With the new Oaddos utility programs, you can put the Bernoulli to sleep and activate it only when you call on it. That saves wear and tear on the drive.

I would strongly recommend the purchase of the Bernoulli Transportable 90 if you have storage limitations.

Book Review:
The Gray Book

By: Michael Véronneau
Vancouver PCUG, July 1992
(By way of the editor of Blinkin Cursor, Milwaukee IBM PC Users Group, November, 1992)

It was Henry Ford, I believe, who once said about his care, the model "T", that you could have it in any colour you wanted -- as long as the colour you wanted was black. For the majority of personal computer users, this statement could well apply to our printout. We may create our masterpieces (documents, charts, graphs and images) and glory in the fine colours that our monitors produce, but when it comes time to put it on paper, the majority of us look at black ink on white paper. The authors of "The Gray Book: Designing in Black and White on Your Computer would not have you despair though: they have some useful suggestions.

Black ink does not have to be boring. Just flipping through the book gives a good indication of the visual impact that black and white (and shades of gray) can achieve.
(Continued on next page)

(Continued from previous page)
Even the book cover provides its own advertising. A tasteful collection of muted shades of gray with strongly contrasting black and white text for the book title and subtitle (with just a spot of colour for the publisher: Ventana Press) makes a very pleasant and eye-catching design.

The book is organized into six chapters. Chapters one (Contrast) and two (Put it in Black and White) introduce the use of contrast (e.g. size, weight, shape, texture) and reverses (e.g. white text on a black background). One of the first things you notice as you start reading this book is the extensive use of examples. In fact the explanation of a particular design concept usually takes up a quarter of the page and is accompanied by a multitude of examples (that can stretch over the next few pages) to reinforce the concept being presented. Are the explanations too short? Not really. They are easy to read and make their point clearly. The following excerpt about value contrast is a good example:

"The most common sort of contrast is simply that of light and dark. When you expand your range of value, or tonal, contrast by introducing actual shades of gray into an otherwise black-and-white document, you get the benefit of yet more "colour." However, it's technically possible to create a "gray" page without using any gray at all. The type ... creates a gray shade against the white paper, which becomes more obvious if you squint at the page. By selectively changing the face, the style (bold, italic and so on), line spacing, the case (all caps, uppercase and lowercase, small caps) or word and letter spacing, you can create a layout that is easier to read than its text-intensive counterpart."

The two and one-half pages of examples that accompany this explanation amply illustrate how you can use these ideas in your own documents -- whether you are using a word processor or a desktop publishing program.

Chapters three (Playing with Gray), four (Light and Shading), and five (Scans and Beyond) concentrate on using solid grays, graduated grays, 3-D designs, lighting effects and gray-level scans to improve your own designs. Three chapters continue to provide useful tips and techniques and multiple examples to visually make their points. Of particular interest to me was chapter five which provides useful advice and information for integrating scanned photographs or images into a document.

Chapter six, called "The Gray Gallery" is a collection of images, text designs, logos and other illustrations that can serve as a source of ideas for your projects. Short descriptions accompany each example in this chapter pointing out highlights and explaining the technique used to produce the example.

Although I have had the book for several months, I did not actually put it to use until recently. When I first received the book (purchased through the Small Computer Book Club) I browsed through the six chapters (208 pages) and admired the design techniques, hints and examples. Then it was shelved along with my other desktop publishing books and might well have languished there except for a problem that I encountered at work. A guide that I was working on lacked visual appeal. I had the words and even some images that I wanted, but it just didn't catch the eye or invite the reader "read on." To make a long story short, "The Gray Book" provided some much needed inspiration. Since then, I have gone through the book a few more times and feel that I will be better prepared for my next publishing project.

I believe that "The Gray Book" is a worthwhile reference and idea book for anyone who wants to improve the visual impact of their documents (or images) while working with black, white and shades of gray. Each chapter focus' on a interesting topic and provides enough detail to fully explain the concepts without undue use of technical terms. Technical terms are defined the first time they are used in the text, which is useful, however, the book could be improved by including a glossary of technical terms as an appendix for those times that you encounter a term and cannot remember the definition or location in the text where the term was used first.

Overall, because of its sparing but effective use of words, and its lavish use of illustrations, this book is highly recommended.

Note: My apologies to any die-hard Canadian "english" spellers out there. Although I would have preferred to use "grey" in the article, I choose to use the american spelling "gray" for consistency with the book title. Only in Canada you say, pity!

The Gray Book: Designing in Black & White on Your Computer. Michael Gosney. Ventana Press, Inc. 1990. ISBN 0-940087-50-2208 pages w/index.

Software Review:
Links 386 Pro

By: Peter Swanson
The Buffalo PCUG, October 1992
(By way of the editor of Blinkin Cursor, Milwaukee IBM PC Users Group, November, 1992)

If you've played Links, the golf game from Access Software, you'll know how good Links 386 Pro is when I say it's like the difference between Start Trek on a CP/M machine and Leisure Suit Larry on a 386. The only problem is that you may have to add so much to your system that playing the simulation may cost as much as playing a round at Pebble Beach, green fees and all.

Yes, unfortunately, you must have a 386SX (at least), along with 2mb of RAM, a super-VGA card and corresponding monitor to get the benefit of this singular advance in sports games. You want more? You supply more: like a 386-33 and 8mb.

Fortunately, however, it's worth it, and will be even more so in the middle of February when you've gone three months without putting palm to putter! Simply put, this is the closest thing to real golf I've seen on a computer, so much so that it makes me wonder what magic programmers are going to have to conjure when CD-ROM-based interactive games take the stage: this is a tough act to follow!

However, now is now, and Links 386 Pro is here and I've got a review to write. The original Links was an outstanding job,

(Continued on next page)

(Continued from previous page)
incorporating graphics capabilities and sound (if you dare use that term in the same sentence as "PC") that were head and shoulders above most anything else I had seen or heard. Today, Links 386 Pro is almost as far ahead of the original Links as that program was ahead of its time.

Safe bet: the first thing you'll appreciate about Links 386 Pro is the graphics. Sure, the title screen is great, either a shot of the third hole at Hawaii's Mauna Kea or the fifth at the lighthouse in Point Pierce. But they don't stop here. The course literally builds up as you watch: in the distance a waterline; then in front of that a line of moored yachts; next the golf condos, and finally the trees that are designed to keep your busted window bill at a minimum. Then the details on the course start to appear: clumps of bushes, rough, fairway, and greens, here a golf cart, there a ball-washer, a cart path, a sand trap. And finally there you are in the blue shirt you decided you want to wear from a selection of eight different colors. Her choice? Sure! Women both play golf and enjoy PC games, you know. You can play Links 386 Pro against yourself in a twosome or foursome, playing for all players, or you can get a bunch of golfing buddies together and have a knockout tournament of your own.

Ready to tee off? Select your club from the full complement of 13 clubs in your bag, deciding whether you want to take the one the automatic caddy feature recommends or not. You address the ball, step back for a practice swing to check for the feel of things, and swing away! What's neat now? You can even see the folds of your trousers move as you come back to swing!

Here's where the game get frighteningly realistic. You know that nice little "plink" that tells you you've put the sweet spot on your driver onto the sweet spot on the ball? It was there, that, and a whole lot of even more advanced sounds come out of the PC's two-inch no-fi speaker when you're playing Links 386 Pro.

And when you watch the ball arch up into a cloud-strewn blue sky (you can also follow its shadow on the course below) and it lands right close to the pin you get a nice little round of applause and a "Great shot" accolade from your partner. (Eat your heart out, Tom Watson!) Now carefully sink your nine-foot putt, hear that delicious echoing sound as the ball rolls around the hole, and once again enjoy that heart-warming applause from a gathered crowd. And that's only for starters: think what it'll be like when you install a Sound Blaster card or any of the other Links 386 Pro courses.

Fundamentally, the courses look real because they are real. Access Software's staffer go out and photograph and videotape and measure all the details of every course they offer. Every tree shows up where it really is (at least until an ice storm). Every water hole (where you can see your last ball splashdown if you don't time your swing properly) is right there. The half-mil condos that frame so many great courses nowadays are there -- right behind the correct bushes. It's absolutely uncanny if you've ever been on one of the courses they offer.

Another reason Links 386 Pro will keep you engaged is the fact that there are so many courses to play! The shrink-wrapped package includes Harbour Town, and Arizona's Troon North (which features cactus and sand between the fairways), Torrey Pines (San Diego), Bountiful (Links 386 Pro's home course in Utah), Firestone (Akron), North Carolina's Pinehurst, Dorado Beach (Puerto Rico) and Texas' Barton Creek. If you have the original Links courses, you can convert them to 386 Pro format with an included utility, or you can wait until Access redeems its promise to reissue all the original courses in high-resolution versions. When Access will make it possible to play Pebble Beach or Augusta National, they don't say, but if it can be done, expect it. Any course should be proud to be included in a game this good.

One last thing: if you want to play a really competitive game you will soon be able to get on the Computer Sports Network and play against other Links golfers across the country with your modem -- more on that another time.

ELECTION OF OFFICERS FOR 1993:

Its that time again. Time for you to nominate member individuals for the positions of: President, Vice President, Treasurer, Member at Large and Secretary. For your convenience you may clip the following form and drop it in the election box at the next two meetings or mail to our PO Box.

Elections will be held during our December 9th meeting.

My Nominees are:

President:

.....

Vice President

.....

Treasurer:

.....

Secretary:

.....

Member at Large:

Hardware Review:

The Toshiba T4400SX Notebook Computer

By: Fred Kolbrener
(Reprinted from Bits 'N Bytes, the newsletter of the Pentagon PC User Group, Nov 92)

Recently, I had the opportunity to use a new Toshiba T4400SX computer for a couple of weeks. This notebook computer weighs less han 7.5 pounds, but rivals the performance of much larger desktop systems. Powered by an Intel 486SX computer chip running at 25 MHz, this is a really fast machine which runs at 34 times the speed f an XT computer according to Norton's System Index program. The access time for the 80 Megabyte hard disk is not as fast as some of the desktop machines, but much faster than operations with only floppy disks. In order to save the battery, the computer shuts down the hard disk when it is not used for a period of time as well as the screen if you don't touch a key for over 2 minutes. These are handy features for extending the battery life.

I had no trouble with the keyboard after getting used to the key locations, but then again my hands are not too large. One of the most disconcerting things about notebooks and laptops in general, is that each manufacturer's keyboard is a little different and definitely different from the desktop 101 key keyboards. This translates to a real hunt and find situation when you start out on one of these machines, but I picked it up fast and did not have too much trouble. An annoyance is that the numeric keypad is under the regular keyboard and is accessed with a numeric shift key (NUMLOCK). When using it, you do not have access to the letters without freeing the numeric lock. This is a problem common to almost ALL notebook computers. Function keys were easy to access and quick to learn.

The screen on the machine I tested was really crisp and featured 16 gray scales. Several other designs are available to include a new color display. The Toshiba demo that came on the machine was a roller coaster that carried the features along and it appeared to have real depth. I also had the opportunity to use this machine with a Super VGA monitor. With the monitor plugged in, the notebook recognized it and blanked its own screen using the VGA monitor with no intervention needed on my part. The image was everything you'd want for operation in the office environment.

The life on the battery is rated at 3 to 3.5 hours. I really did not get a chance to fully test it out, but the there is an on board warning system you can enable to warn you of the battery status. It is easily accessed by a combination of keys and when the battery is really low, it will sound an alarm if you want. Battery life will of course, depend on the use to which the machine is put. The more you access the disk, the more drain on the battery. Also, it will depend on whether you charge it fully and properly. A convenient feature of this machine is that you can set it up to maintain the data stored in the memory. If you do, it appears to jump to life when it's turned on, but the price you pay is a slow drain on the battery . Toshiba makes an optional docking station for office use. It allows you to slip the computer into a slot and use it with a full size monitor and a power supply in the docking station. The connector for this station is in the rear of the machine and makes all of the connections.

All in all, this was a powerful computer for its size and weight. I'm not sure I want to carry it around all day, but it certainly beats trying to take a desktop computer with you.

Bits of Blue is published by the Tampa IBM PC Users' Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about IBM-PC and compatible personal computer systems to its members.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII file or in a commonly available word processor format, such as WordPerfect 5.1, on diskette to the editor at 9402 Hidden Ridge Place, Tampa, Florida 33637 or send it by modem to BBS (813)239-3704.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for non-profit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

Commercial advertisements will be accepted at the following rates:

	1 month	3 months	6 months
Full Page	$60.00	$162.00	288.00
Half Page	$40.00	$108.00	$192.00
Quarter Page	$22.00	$60.00	$106.00
Eight Page	$12.00	$33.00	$58.00
Business Card	$10.00	$27.00	$48.00

All advertisements must be prepaid by check payable to TIBMPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if it is not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, Marylee Bruneau at (813) 932-6745, for space availability and for further information.

This newsletter was created with WordPerfect for Windows donated by WordPerfect Corp. to TIBMPCUG for use by the editor.

Secretary's Report

TAMPA IBM USER'S GROUP
MINUTES OF 11/11/92 --

As the witching hour approached, I noted a nice group had arrived to attend the BOB meeting, and the room was a beehive of activity -- numerous small groups talking and picking each others brain, and Don Patzsch conducting his second of seven classes on modems with quite a few folks participating in the class. Off in another room, Ed was conducting the third in a series of four classes on WP 5.1 for DOS. I miss the BOB meetings only when I have no other choice, for even the time before the meeting starts is productive and interesting. This night was no exception.

And then, our illustrious President called the meeting to order.

CLUB NEWS:

* WP 5.1 Class - The fourth and final class in this series will be held same time (5:30 PM), same place (IBM Bldg) on 9 December, just before the regular BOB meeting.

* Don's second modem class was held in the regular BOB meeting room this time because of a conflict with the ongoing WP 5.1 class, and the modem class had to be cut short when the BOB meeting began. The third class will be delayed until January, and that and subsequent classes will have use of a private room and benefit of the planned 45 minute duration. Don has laid out instructions for a total of seven classes. He is providing in-depth instruction, complete with handouts for both present and future reference.

* Harvey announced that a member had volunteered to lead a SIG on Windows. A show-of-hands survey of those present indicated ample interest in the SIG. The problem now is arranging facilities. Harvey indicated that he would try to arrange same, hopefully in time for a January start for the SIG. More info will be forthcoming.

* Harvey cautioned that a virus reportedly in circulation is triggered to strike on Friday the 13th.

* Windows users are well aware that programs installed in Windows make changes during installation in various Windows files/directories. At one time or another, these hackers are faced with the problem of deleting one of these programs. Unless you have retained a copy of all the .INI files and a pre-installation directory listing, there is no way to know just what changes were made with the installation of that program. On the BOB BBS is a program known as In Control that an the answer to that problem. In Control will record in an .WRI (Windows Write) file all changes made by installation of individual programs in Windows.

(Continued on next page)

(Continued from previous page)

When one decides to delete a program installed in Windows, you need only view the .WRI file to determine what changes need to made to completely eliminate the program from all Windows files/directories. The only gimmick is that you have to have used In Control when you installed the program in Windows -- that is to say, In Control is not retroactive.

* Presentation planned for the DECEMBER MEETING is MS WORK GROUP For WINDOWS. This is networking program which ties individual PCs together without the need of servers, LANs, etc.,but it is compatible with these as well. Looks like a nice program that will likely be hot in the work/business world.

INDUSTRY NEWS

* Harvey reported that a PC Magazine book, DOS 5.0 Memory Management, was very interesting and worthwhile for anyone interested in getting more memory out of his computer. In includes some ten utilities on disk which help identify available memory and obtain use of same.

* A parallel to the foregoing, DOS 6.0 is expected to be released in the 1st quarter of 1993. Reportedly, it will include Stacker and better memory management. Whether it will be as much of an improvement over 5.0 as 5.0 was over its predecessors remains to be seen.

* MS database program for Windows, called Access, is now being released. It is reportedly a very nice program. It will have an introductory price through 31 January of an amazing $99; amazing because this is a high- end program that will list for $695 after Jan 31. (Looks like MS wants to get lots of copies in use.) I have seen some of the advertizing literature on the program and it truly looks like a 'goodie'! Kirk Covert says that MS Foxpro has been the fastest (and best) on the market to date, and that Access is even better.

* We previously reported that MS has said that it is getting into hardware only as needed to push its software products. That was said at the time they came out with a sound card to push and take advantage of the new MIDI capabilities of Windows 3.1. Now, MS is coming out with a card for use with HP printers to speed up printing. One could say that this is an effort to offset the notoriously slow printing cycle in Windows. Come on, now!

* MS Windows NT Beta version is now available from MS for $59. We are told that you need 12 MB of memory and a CD ROM to make use of the program. Anyone interested should call MS.

* Western Digital has come out with a chip that will check your computer for viruses. Interesting, but not enough info is yet available. Like, how do you update the chip for new viruses?

* The last issue of PC Computing should be of interest to Windows users -- it contains 172 pages of goodies about getting the most from Windows. If you are a Windows user, you might want to check it out.

PROGRAM PRESENTATION - MICROSOFT MULTIMEDIA

On hand to give us a brief rundown on some Microsoft Multimedia goodies was the inimitable Kirk Covert, Regional Sales Rep for Microsoft, a welcome and well-known personality at BOB. Kirk reported that MS had many things going in the multimedia area and that he would touch on only a few. He noted that multimedia is very useful in the worlds of education, business and entertainment - personal and otherwise. Multimedia requires a sound card and a CD ROM. Among the things MS is producing are:

First, MS is coming out with a new sound card. It is a 16 bit, 5 channel card -- it will handle 5 channels of sound simultaneously. It would be Bus compliant, but not MPC compliant -- but could be made so as an option. He wasn't sure about the price, but thought it would be on the order of $295 list.

As a corollary, Kirk pointed out that sound on computers involves huge files. Computer speed is important, of course, to hand the large files. Also very important is the capability of the CD ROMs -- not matter how fast your computer is, if your CD ROM is slow, multimedia will be slow. He suggested checking thruput and transfer rates, and insure that it meets MPC specs.

BEETHOVEN: This was the first MS multimedia disk reviewed. It contains Beethoven's complete 9th Symphony and, among other things, in depth info on the life and times of Beethoven and the 9th Symphony. It allows random access via menu to any part of the music. It sounded great using, according to Kirk, run-of-the-mill speakers. If a price was mentioned, I did not hear it.

CINEMANIA: This disk contains data on some 19,000 movie titles and 3,000 people, including actors, directors, etc. It has considerable detail on the movies, the stories, the studios,and people involved, including their voices. It, too, is easy to use and provides quick, easy access to any of the data it contains. In answer to a question of keeping current in the field, Kirk reported that updates would be available from time to time. List price is $79.95.

BOOK SHELF/BOOKSHELF FOR WORD: This disk comes as a stand alone, and bundled with Word for Windows, which provides for direct access from the Word program or the desktop. Bookshelf includes seven or eight books; I didn't get all the titles. It does include quotations, including voices; a thesaurus; a dictionary; a 16- book encyclopedia (going to 26 books with the next release) with oral instructions; a world atlas, complete with flags and national anthems; and a world almanac. It seemed to be a very, very nice package. Kirk reported list price as $295

(Continued on next page)

(Continued from previous page)

for Book Shelf, and $595 when bundled with Word for Windows. All the packages were very impressive and Kirk did -- as usual -- a super job of presenting them to us. Many thanks, Kirk and Microsoft, for some really nice programs and a job very well done.

AND THE WINNERS ARE:

With the generosity of several, including Sunrise ComputerSupplies & Parts , a member or two and the creators of SuperBase 4, there were a number of nice raffle prizes this meeting, and the lucky winners are:

Superbase 4	Dave Williams
Computer Games:	
Days of Thunder	Martin Miller
Weltris	Wilfred LaForese
Clue	Wayne Laurentes
Tetris	Jim Clark
Computer book	E. Kaestner
Cmptr Magazines	Dave Williams
Disk Clng Kit	Herb Atwood
	Joe Esposito
Mouse Pad/Hldr	Joe Esposito
50/50 ($45)	Bill White

Congratulations You Lucky People!

PRESIDENT'S COLUMN:

Its here! If you have accessed the BBS lately and you have a high speed modem you may have noticed a faster speed. Yes that's right our new 14.4 bps Courier modem has finally arrived and been installed by Kevan.

Another year is closing and as I look over our accomplishments of 1992 I feel pretty good. We had a group of volunteers dedicated to the group and working together. As always we need more volunteers to help in certain areas. Our newsletter, WordPerfect and DOS classes are better than a year ago. We now have new member diskettes to help new members get started with their PC and our group, a flyer describing our group and an online information system (FIDO Net) which provides you with more information than you ever dreamed about. We have raffled off more computer related items than ever before. The raffles are only possible by the donations of companies and individuals who support us. Our dues have not increased for over five years. I am glad to say that the board has elected not to raise them for 1993. We will however be adding a family membership for those of you who wish to provide our services to your family.

However looking at the 1992 goals I wrote in my presidents column of the January Newsletter I can't help but feel we could have done better. After 11 months only one of the three goals was achieved, the modem. I set a goal of 300 members by 1992 year end and we are 80+ short. I believe this is attributable to a lack of an official marketing and public relations person working to promote our group in the Tampa Bay Area. In addition we need to work harder at getting existing members to renew their membership. Additionally, I wanted to establish Special Interest Groups (SIGs) in Word Processing, Database, Spreadsheets and Windows. We just recently have had a couple of members come forward to head some of these groups, the logistics of where, when and software\hardware have not yet been finalized but should be in place in 1993.

As you may know Marylee and I went to Comdex in Las Vegas along with approximately 130,000 other folks. Of the 130k were 300+ representing over 100 user groups world wide. Members from as far away as Moscow, Russia and Melbourne, Australia were in attendance.

Without making it sound like an Oscar acceptance speech I want to thank some organizations for making this exciting trip possible. Of course my company, Dun & Bradstreet Software, for sending me to keep abreast and informed of current and new technology. The Association of PC User Groups (APCUG) for organizing all the breakfast, luncheon, receptions and availability of hotel accommodations for the 300+ members of APCUG in attendance. These scheduled events were financed by major companies in the PC industry who support user groups including **Adobe Systems Inc., Addus Corp., Borland International, Corel Corp, IBM Corp, Intuit Inc., Intel Corp., Logitech Inc., Microsoft Corp., PC World, Software Publishing Corp., Stac Electronics, Symantec Corp., Word Perfect Corp.** just to mention a few. These activities were attended and chaired by some of the key movers and shakers in the PC business. Bill Gates once again impressed me as a no-nonsense man with a mission. Unlike many which hold his title, he is in touch with what is going on in his company and the industry he dominates. I also admire him for his association with the APCUG. During our evening reception he announced that he would take any and all questions from the 100+ user groups officers in attendance. At the end of the reception Bill Gates was raffled off to a user group for a 1993 appearance. The lucky winner was a Florida group. No it was not ours but that of the Central Florida Computer Society. Philippe Kahn also spoke to our group and showed that he had a sense of humor and was a down to earth type of guy.

Special thanks to the **Interface Group** for providing Marylee and I press badges/passes. The credentials proved to be extremely useful for providing us access to public relation personnel, one-on-one presentations and many other amenities which we would not have gotten as a regular visitor to Comdex.

As for Comdex, it was great but short, if you call 4 1/2 days short. I could have used two more days to walk the seven COMDEX sites with over 2,000 exhibiting companies. Four things stood out over the rest Windows software from everybody, the new pentium processor (586) from Intel, the term *objects* used by many companies to refer to parts of their software although it had nothing to do with Object Oriented Programming and Multimedia.

In closing the 92 year I want to wish all of you the best for the holidays and a Joyous New Year.

Harvey Bruneau

Happy Holidays

Created by
Ed Buzza

Used WordPerfect 5.1 (DOS),
MoreFont font generator,
Printed on HP LaserJet III.

As the Holidays come rolling round,
We give thanks for the love we've found,
For all our friends and families too,
We wish these gifts are given you.

Happiness and Good Health,
A Long Life and Much Wealth,
A Warm House and Good Cheer,
Friends and Family always near.

MAKE YOUR OWN GREETING CARDS

by Ed Buzza

As you can see from the other side, you can make your own greeting cards, invitations, notes, etc.. While the sample was printed on an HP LaserJet III, you can use any printer. The instructions given here are for the DOS ver of WordPerfect 5.1.

Dot Matrix Printer:

At a blank screen, set L/R Margins to 0.0", 0.5" and the T/B Margins to 6.0", 0.5". Set the Graphic User Box Option to set all border spacing to zero. Create 4 User Boxes; each is Page Anchored, Size = 3.5" W x 4.5" H; Wrap = No.

Place a Hard Page return between Box 3 and 4. Your Doc should look like the figures below:

Pg 1 User Box 1 Back of Card Vert = 6.0" Horz = Mar, L	Pg 1 User Box 2 Front of Card Vert = 6.0" Horz = Mar, R

[HPg]

Pg 2 User Box 3 Inside Left pg Vert = 6.0" Horz = Mar, L	Pg 2 User Box 4 Inside Right pg Vert = 6.0" Horz = Mar, R

Note that when you Set Position for the Horz placement, you use the Margin setting of Right or Left, do NOT use an offset measured in inches. Check View Doc and if satisfied, save Doc as MT-CARD.DMP (or whatever); go to DOS and make it "Rd only".

Enter text/graphics in User Boxes. Position paper so top edge is at print head. Print Page 1 (back and front of card). Remove paper from printer, rotate paper 180 degrees (all printing is on same side of paper) and place back in printer. Print Page 2 (inside pages of card). Fold into obvious quarters. Voila, your own creation.

It will look weird in View Doc, but it should print okay (less'n your printer is a whole lot different from my 24 pin printer).

HP LaserJet III

Since the HP3 can rotate text, the card is printed in one pass.

At a blank screen, set all margins to 0.5". Set the Graphic User Box Option to set all border spacing to zero. Create 4 User Boxes; each as Page Anchored, Size = 3.5" W x 4.5" H; Wrap = No.

Edit User Box 1 (Front of cd) and Set Position at Vert 6", Horz 4.5". Edit Box 2 (inside left) and Set Position at V .5" H 4.75". Set Position of Box 3 (inside right) at V .5" H .5". Box 4 (back cover) V 6" H .5". (Save as rd-only template.) Dump text/graphic into boxes. Be sure to *rotate* boxes 2 & 3. Chk View Doc. Print.

WordPerfect assigns Box numbers sequentially. Since it is more logical to start with the Front of the card, then proceed to the inside pages and end up at the Back of the card, the Boxes are positioned as shown below:

User Box 3 Inside Right pg Vert = 0.5" Horz = 0.5"	User Box 2 Inside Left pg Vert = 0.5" Horz = 4.75"
User Box 4 Back Cover Vert = 6.0" Horz = 0.5"	User Box 1 Front Cover Vert = 6.0" Horz = 4.75

Try it. Amaze and astound your friends and family.

Game Review

A-Train

Review by: Dave Batz,
Madison PC User's Group

My heart is warm with the friends I make,
And better friends I'll not be knowing;
Yet there isn't a train I wouldn't take,
No matter where it is going.
-Edna St. Vincent Millay

WARNING: The Software Surgeon General has determined that giving A-Train to a railroad hobbyist can cause serious damage to his or her marriage, employment, and social life.

A-Train is the ultimate PC game for wanna-be railroad engineers.

The Package

The package includes both 3.5" (three 720K disks) and 5.25" (six 360K disks), as well as a 133-page manual. In addition to the standard program reference material that one would hope to find in a manual, the documentation also includes facts, fables, and famous quotes about trains and train history in the U.S. To use A-Train, you need an IBM compatible PC with a hard disk, DOS 3.1 or better, and an EGA or VGA display. The PC should have 640K memory, and should run at 10 MHz (PC-AT Class) or better.

Installation of A-Train is fast and easy (the way it should be). Program files will consume a little over half a megabyte of hard disk space, and each game that is saved requires 62K.

The Interface

The program documentation recommends the use of a mouse, although it is not absolutely necessary. I used the game with and without a mouse, and I found that as the game went on and the simulation became more complex, using cursor keys instead of the mouse was painfully slow. Almost all menu selections, laying track, building apartments, buying trains, etc., can be accomplished by pointing and clicking with the mouse. A-Train supports the use of AdLib, Sound Blaster, SoundMaster, Roland MT-32, and Tandy sound boards. For those of us without such sophisticated equipment, the internal PC speaker can also be used. The sound support is fine, but I wouldn't go out and buy a sound board just for this game.

The Game

If you want to be able to plop down in front of your computer for 10 minutes and blast away space invaders, race a car, or shoot a quick round of golf before dinner, A-Train is not the game for you. A-Train is a simulation game consisting of three interdependent aspects:

* designing and managing a rail system to transport passengers and freight;
* building one or more cities (apartments, factories, leased buildings, etc.) and their transportation infrastructure;
* playing a high stakes financial game by being involved in the stock market, and buying and selling real estate.

Managing each of these aspects (simultaneously) is the triple challenge of A-Train. A successful A-Train game is the result of careful planning and thought.

I recommend that new users read through the entire manual (yes, I know, ALL 133 pages) before beginning play. The complexities of the game make it virtually impossible to just sit down and play it without knowing what is going on. After reading the manual, it would be a good idea to go through the tutorial that is included in the manual.

The game has nine different scenarios included, and the rest is up to you, the owner of the railroad company. The object of the game is to build cities, run efficient rail lines, and make money doing it. The game is over and you lose if you run out of money, can't pay your taxes, or can't repay your loans to the bank. The game is also over and you win when you earn $50 million and receive a key to the city. I have lost more games (many) than I have won (none).

It took me a while to figure out some of the intricacies of laying track, train scheduling, and switch changing. I did not find much on-line help, so I spent some time in the manual and much time experimenting. I found myself playing A-Train for hours at a stretch, always wanting to make a little change here or there and see how that would affect my railroad's cash flow, the city's population, or the number of passengers on a particular train. I think that is one if the goals of the game -- to promote constructive thought and wise urban development.

The Bottom Line

A-Train is a game, but A-Train requires a substantial amount of mental effort, and quite a bit of time. If the concerns of worrying about the gains and losses of a fictional stock market and urban development are not for you, maybe you should consider getting Tetris instead. But, if you want a challenge that will take more than a day (or even a week) to master, A-Train may be for you. I think A-Train is best suited for the railroad enthusiast whose dreams are filled with thoughts of Casey Jones and good ol' Engine No. 9.

Price and Support

The retail price of A-Train is $69. Egghead or WaldenSoft will sell it for around $49. The lowest price I found was in the high-volume mail-order house channel, where A-Train is priced at $37. Maxis offers free technical support via a toll call to California, and America On-Line (Maxis), CompuServe (71435,276), GEnie (Maxis), and AppleLink (D4459).

Software Review

PC COOKBOOK

While there are several "recipe" database programs already on the market, PC COOKBOOK, a relatively new kid on the block, just might be The Best Recipe Program in the World!

It's definitely a GREAT CHRISTMAS GIFT IDEA! - Hint, hint dad!

PC COOKBOOK is extremely easy to use - virtually every feature is accessible from the opening screen. But don't be misled by this - PC COOKBOOK has many POWERFUL features, such as:

It comes with an assortment of 250 recipes already loaded. Plus, you can easily enter your own - up to a total of ONE BILLION recipes (limited only by disk space). You can also edit any portion of or remove any recipe you want quickly and easily.

There's also a very complete reference section, just one keystroke away, that instantly provides you such things as an oven temperature chart, a comprehensive table of common food equivalents, an equivalent measurements table, detailed nutritional values plus vitamin and mineral contents for over 300 common ingredients, a handy substitutions table, a procedural hints and tips database with numerous entries, a yields of fruits chart, and a glossary of cooking and food terminology with over 200 entries. This information alone could fill a book costing as much as this program - and it's all right at your fingertips in PC COOKBOOK.

It's exciting to use - with popup shadowed dialogue boxes, exploding and imploding boxes, hot keys, and sound effects.

A slick "tagging" and un-tagging feature lets you "mark" and un-mark as many recipes as you want by simply highlighting the recipe name and pressing the space bar.

When you're ready to go grocery shopping, PC COOKBOOK will print a detailed Shopping List with every ingredient from every "tagged" recipe - complete with the name of the recipe each ingredient is needed for.

The printing capabilities of PC COOKBOOK are superb - you can either print one recipe or all of them at once, either on paper or on 3" x 5" index cards. You can also print either one reference topic or all of them at once.

There is a convenient feature for backing up your data files to floppy disk that automatically compresses (squeezes) your data to make it fit on as few floppy disks as possible - in most cases, just one floppy disk is all that's needed.

If you ever need to restore your data from floppy disks, there's a built-in feature for that too. This will automatically "un-squeeze" your floppy disk data and put it back into PC COOKBOOK in just a few seconds. Another feature lets you automatically "refresh" (compress, re-index, etc.) all your PC COOKBOOK data files at any time with just one keystroke.

There is also a feature for importing (adding) new recipes from purchased recipes on disks which will add over 100 new recipes per minute to PC COOKBOOK.

Two other powerful features will either list recipes which contain ingredients you specify (as in what you might have in your refrigerator) or, for people on restricted diets, you can list recipes which DON'T contain certain ingredients you specify.

Finding any particular recipe or reference topic is a breeze - you can alphabetize recipes by recipe name or by category with just one keystroke. There's also a "Speed Search" lookup feature that, if you already know the name of the recipe you want, will find it in less than 2 seconds.

You can duplicate any recipe with just one keystroke - no retyping is ever needed. For example, you might want one copy of a recipe for making 4 servings and another copy for making 6 servings, or whatever. Rather than entering the same recipe again with different ingredient quantities (that's how other recipe programs work) and different cooking times, you just press the F8 key and a duplicate copy is instantly created for you. Then, you can simply edit the copy and make just the changes you want. You can do this over and over - making as many variations on a single recipe as you want.

PC COOKBOOK requires an IBM PC or 100% compatible with a hard disk, and an Epson-compatible (most printers are) printer.

PC COOKBOOK sells for $34.95 and comes complete with a simple Install program, an easy to understand User's Guide, and the program itself on both 3.5" and 5.25" size disks.

Additional sets of recipes are available for $20 per 100 by category (Chinese, Italian, Seafood, Desserts, etc.)

Product Review:

FotoMan from Logitech

Digital Photography, Direct to the PC, but With Limited Resolution

Review by Rod McKenzie, Contributing Editor, Madison PC User's Group

FotoMan is one of the first digital cameras for the PC, capturing photographic images and bringing them in through the serial port. Logitech is breaking new ground with this product and they've done all that they can to support it with excellent image editing software, FotoTouch. If there's any disappointment, it's in the limited resolution that the digital camera can deliver. It all depends on your own expectations as to what a picture needs to be.

For nearly a century, since the Eastman Kodak Company made taking pictures an easy and even a stylish pastime with "you push the button and we do the

rest," we've taken photography for granted. Every innovation in optics and photosensitive materials resulted in sharper images, truer colors, and higher speeds for taking pictures in available light. Electronic imaging has taken the form of video cameras recording onto magnetic tapes, laser disks, and even high resolution satellite pictures being beamed back from space transmitted on radio frequencies. The FotoMan joins this parade of photographic inventions that can record a landscape in panorama or the first hesitant steps of an infant.

The FotoMan digital camera comes equipped with a fixed focus 8.5 mm lens, equivalent to a "normal" 55 mm lens on a 35 mm camera, and an internal electronic flash. There's also a neutral density filter for use in bright, i.e. outdoor, conditions. It's compact, weighing about 10 oz., and easily fits into a jacket pocket or handbag. The nickel-cadmium batteries will hold images in memory for a few days. Logitech recommends that users get the camera back onto charge and download their pictures often. This is not the camera to take to Outward Bound. They suggest a charger cord for the cigarette lighter socket of a car if the time away from "home base" is unpredictably long.

The camera communicates with the computer by way of a base unit that receives electrical power from a small transformer power supply and feeds the digital data through a cable connected to one of the computer's COMPORTs. The data transfer rate can be set up to send pictures as fast as possible, as high as 115K baud. The user may have to edit a line in the WIN.INI file to prevent a loss of data because the transfer rate is too high for the serial port hardware.

The FotoMan software can be installed independently or it can be made to operate as a part of FotoTouch, a Windows application for image editing and printing. In keeping with Logitech's commitment to an industry standard for imaging devices, FotoMan is a TWAIN source. This means that, provided there's the necessary compatibility, the camera could output to other software that meets the TWAIN standard. Several new fax programs include TWAIN sources as an input. One of these, Delrina's WinFAX Pro version 3, has an announced shipping date.

The image the camera generates when the shutter clicks is 376x240 pixels in 256 shades of gray. The resolution is effectively 75 dpi if the picture is enlarged to 5"x3.5". There's a capacity for 32 pictures, so users copying a whole roll of pictures will need to have several megabytes of hard disk space, even if the pictures are saved in a compressed file format such as TIFF. While they're still in the camera, the images are stored in DRAM until they're cleared or the power is lost. Keep those batteries charged! When viewing and saving images, the FotoMan software displays the battery's charge status with a small battery icon at the bottom of the screen.

I was generally pleased with the image quality when I could reshoot a picture, but frustrated with the poor results I got when I took FotoMan on the road. If the conditions aren't pretty well controlled, the picture quality will suffer. Cropping and enlarging really exaggerate the limitation of the image resolution. The user needs to move in close and keep the lighting conditions even. Dark backgrounds look pretty muddy and the patterns that are used with the printer to simulate a grey scale can distract from the foreground image.

Our family albums include tin types taken before the civil war and sepia toned prints from the late 1880s and 1890s. There are pictures there from early Kodak box cameras, folding cameras and 1950s Brownies. The pictures that are memorable are the sharp ones. The ones of people show best what's important about a picture. Their eyes are sharp, as are the lines of the nose and mouth, the brow, the cheek, and the chin. The same lines that we see in our children's faces. I'm not ready to put digital photos into the album yet. Those images still look rough. They need more resolution. It might take a larger, high-resolution photo-sensitive array and more memory. Add it as an accessory back to an existing 35 mm camera. Use the good optics, get more control over the image field, and immediately save the images to a WORM drive or a high-capacity magnetic cartridge.

Being used to the horizontal profile of a 35 mm camera, it felt very awkward at first to hold the FotoMan with it's vertical format. After a several shooting sessions, it became more familiar. I realize how unconscious and automatic handling a familiar camera had become. Holding the FotoMan is like picking up a Princess telephone by the mouthpiece and pointing the earpiece at the subject to be photographed. The view finder is above the lens and to the left. The electronic flash, good to about eight feet, is above and to the right. The shutter release is below the lens on the front of the camera, in the middle. It's intended to be pressed by the forefinger of either hand. Holding the camera steady and level is no problem, most of the weight seems to be towards the base of the body where the hands hold it.

The nickel-cadmium batteries are permanently installed in the FotoMan. Unfortunately this means that if they fail to operate correctly, the unit is useless until the camera can be returned to Logitech for them to replace the batteries. In the long run, keeping the batteries removable makes the camera more acceptable in markets where ni-cad batteries have been targeted as environmental problems. The EEC countries have already enacted legislation that requires ni-cads to be removable from portable equipment and consumer products.

Logitech has given users an affordable new "imaging" accessory to directly delivery photographs to the PC. It's just about as instant as it can get, short of a video camera linked to a multimedia application. FotoMan is a logical extension of the scanner product line for which Logitech is known. It's a leap in image acquisition technology. The camera's "film" is a photosensitive array that yields its information for storage in the DRAM memory and then can be re-exposed again and again. This system of imaging delivers the photograph without consuming any chemicals, film, or special photosensitive paper. Nor does it require any darkroom to process the pictures. These images will have as much archival permanence as their magnetic or optical storage medium will allow. Printed out on paper, the images will last as long as a laser or inkjet printout.

FotoMan is priced at $799 and is a product of: Logitech 6505 Kaiser Drive Fremont, CA 94555 (501) 795-8500 (501) 792-8901 (fax) (800) 245-0000 (faxback)

Software Review:

Button Cube for WordPerfect for Windows

Review by :Gary W. Wodka, Madison PC User's Group

In the beginning, Microsoft created Windows 3.0. On the second day, Microsoft created Word for Windows. On the third day, Microsoft added the Button Bar. By the sixth day, WordPerfect looked at what was happening in the GUI world of Windows and deposited WordPerfect for Windows (WP-Win) on the earth, and it was good.

But there's always someone out there trying to build a better mouse trap, and Software Workshop may have accomplished that task with Button Cube for WordPerfect for Windows. WP-Win is a "nice" program. It has all the features of the DOS version, with the added "niceness" of GUI and button bars. But there are some strict limitations as to what can go on the button bar and how many buttons may be on the screen at one time (and where on the screen those buttons will appear). Not with Button Cube (BC).

This little utility is so simple that the entire manual (which includes full installation instructions, a complete reference section, a zillion illustrations and lots of white space) takes up only 50 pages. And they had to stretch to get that many pages. BC installs itself in your WordPerfect for Windows directory. The sample cube files are installed in the WP-Win macro directory. The Install program sniffs out where those directories are, without any help from the user! And if you ever need to uninstall Button Cube (though I can't imagine why you'd want to!), Software Workshop has included an Uninstall program that removes all the Button Cube program files from your hard disk, deletes Button Cube statements from all WPWIN.INI files, and deletes all Button Cube .CBE files. You end up with a "clean" hard disk, without all the hassle! Once installed, BC automatically loads when you start WP-Win. WP-Win may take an extra 2-3 seconds to boot up, but the wait will be well worth the extra time. (What could you do in 2-3 seconds anyway?)

Once started, WP-Win will have an additional feature: a cube with functions attached. A cube can consist of one to four sides, and each side can have up to 32 function buttons. Thus, you can have up to 128 functions available at the touch of an icon. And you can choose from over 500 total WordPerfect for Windows functions, many of which are not available from the standard WP-Win pull-down menus! No longer will you have to memorize commands or use drop-down menus. Just about any command you can think of can be added to the cube.

You won't need to use the clunky WP-Win button bar. The BC can be moved anywhere on the screen. It is a floating toolbox. It can take the shape of a cube or a strip, and you have total control over its configuration. If you need the full screen for some reason, the cube can be minimized. Using the cube is so intuitive that the hardest part of BC is determining what features you want access to.

Well, that's not entirely true. The hardest part is figuring out what all those icons mean. But Software Workshop makes that easier, too. Anytime the mouse passes over an icon, the function of that icon is displayed at the bottom of the screen. It's really hard to make a mistake with BC!

Configuring the Button Cube is a breeze. It's simply a matter of telling the program how many rows, columns and sides you want, then clicking on the functions you want, arranging them in the spaces you want, and saving the button.

Searching through all the options available is easy because all buttons are arranged according to related functions. There are Text options, Layout/Font options (and you can have separate buttons representing specific fonts for easy formatting), Graphics options (which can include any graphics-related function), System options (print, spell, ruler, file functions, help, etc.), Special Characters options (such as the copyright or trademark symbol, or any special character in any WP-Win or TrueType font family), and Macros options (to which you can assign your own macros).

Total flexibility and total control explain in a nutshell what you'll get with Button Cube. If you've got a question or problem, you can get it handled by fax, on CompuServe, or by phone call directly to the company. There is no charge for the help, other than the long-distance call.

I tried to find something wrong with this program, but couldn't. Its ease of installation, ease of use, and ease of understanding stand out in the industry. I hope we'll see more of this type of program in the future!

Button Cube for WordPerfect for Windows retails for $89.95 and is a product of: Software Workshop, Inc. 170 S. Mountain Way Dr., Suite 114 Orem, UT 84058 (801) 224-6865 (801) 224-8121 (fax)

Software Review:

WELCOME TO THE TAX SEASON

By Ray Miller

No! I'm not jumping the gun. In their wisdom ??? our representatives in Washington DC passed the Tax Extension Act of 1991. This foolishness is just beginning to take effect. The contents of this little tome are now being enforced by the IRS, changing some of the rules for filing estimated tax payments. Now many of us are confronted with calculating income on a quarterly basis in order to conform with the new estimated tax payment rules. Isn't that just great?

Also the reason I'm promoting this program in November is that the tax planning features, of the following program, may allow you to make some financial decisions before the year's end, and possibly assuage the tax bite.

It is predicted that 2 million more taxpayers will join the ranks of those having to comply with the new estimated tax payment rules. So, it may behoove you to check into the possibility -- YOU MAY BE ONE OF THEM. To make this compliance somewhat less onerous, our tax preparation friends at ChipSoft, Inc. have produced a new program "TurboTax Personal Tax Planner." It won't find the money for you; but it will make the calculating of these estimated payments easier and provide a five year (1991 through 1995) planning schedule to help keep you out of the IRS' scrutiny.

How Does It Work?

PTP (Personal Tax Planner) computes your modified adjusted gross income to determine if you are affected by the new rules. If you qualify, it provides an adjusted estimated tax payment rate and schedule using either regular or annualized calculations of your tax liability. Then it will print a schedule of payments and the minimum quarterly estimated tax vouchers for you to send with your payments. If your income varies, PTP allows amended estimates by quarter. Neat!

Features

This is a powerful tax forecasting and analysis program that will evaluate the tax and income effect of many situations, from retirement to liquidation of a 401K plan. You can calculate up to five different scenarios for each of five years to determined what is best for your financial health. Information generated by PTP can be integrated with TurboTax for Windows (a new offering this year) and MacIntax Personal, 1040 programs.

If you feel the need to change your W4 (Employee Withholding) or W5 (Earned Credit Advance Payment) forms that you provide your employer; PTP will print these for you. This will allow more accurate planning of withholding amounts. Better to have the money in your savings account earning interest (such as it is, now!) than have it in Uncle Sugar's hands.

As with all ChipSoft programs, the user is presented with various abilities that mitigates use and makes the task of giving away money less distressing. You can "Consult" for context sensitive help -- written in plain language. There are verbatim IRS instructions provided; but you have to be a masochist to want to use these.

Cross-Reference Help shows where a given number flows from during a calculation. You can override any PTP calculated figure; but, be careful here. The IRS doesn't like it when their slave labor makes mistakes. Help for Forms and Menus explains the workings of these features. It describes the uses and benefits of the menus and the purpose of any form, schedule, and worksheet it uses.

You can copy information from one alternative to any of the other four to produce "What If" scenarios. Each alternative provides a new five year plan. This allows comparison of the same line item in all five alternatives that are supplied.

Usage

You start out like all of the TurboTax programs with a Personal Information Worksheet. You can supply the29 required data or import it from last years TurboTax 1040 return. These facts include name, social security number, address, etc., and all the forms of income you've had for 1991, and 1992 to date.

One little attribute of this program indicates ChipSoft's attention to detail. You are asked your birth date -- the program calculates your age and files it away. If you reach age 65 during the five year window supported by this program, it will automatically add one more exemption, for your age, to the calculations. I Like That!

You have worksheets for: Wages & Salaries, Capital Gains, Itemized Deductions, Business Income/Loss, IRA contributions, and Self Employed income/loss. If you have rental property a worksheet is provided for this also.

After you have completed entering the required data you can run up to five alternatives with assumptions of how your income may rise or fall, and in what areas these changes will occur. The "Main Summary Worksheet" will compile these options to assist you in planning your financial future.

As I said, you may not need this; but who knows what little traps our tax mongers have laid in wait for us? $50.00 may be all that is needed to keep from being slapped with a hefty fine for non-compliance.

All this is supplied for $49.95 from: ChipSoft, Inc. -- Order Dept. -- 6330 Nancy Ridge Dr. -- Suite 103 -- San Diego, CA 92121 -- ph.619/453-8722.

System Requirements:
For the Mac version -- Macintosh Plus or higher with one floppy and one hard drive, one meg RAM and System 6.0 or above. DOS and Windows version -- IBM or compatible with DOS 3.0 or higher, 640K RAM one floppy and a hard disk. Windows users need version 3.0 or higher and 2megs. RAM. (Ha! go for 4megs. and version 3.1 ■■■

MEMBERSHIP BENEFITS:

BITS of BLUE

VOL. 6 NO. 1 January, 1993

MEETING
(2nd Wednesday every month)

DATE: January 13, 1993
TIME: 6:00 PM
PLACE: IBM CUSTOMER CENTER
LAKE POINTE ONE BUILDING
3109 W. Martin L. King Blvd.
Room 450
DIRECTIONS:

The Tampa IBM PC Users Group meets in the IBM's LAKE POINTE ONE Building across from Tampa Bay Mall one block east of Tampa Stadium.

The best entrance is on Martin Luther King Blvd. at the traffic light in front of Burdines. As you turn North off Martin Luther King Blvd. you will see the LAKE POINTE ONE BUILDING on the left & parking on the right. Join us in ROOM 450 - 4th floor. **Guest please sign in.**

JANUARY AGENDA:
1/13/93

6:00 PM - opening remarks

6:30 PM - Demo by
Kathryn Nakib
of: PRODIGY
Interactive Personal Service

7:30 PM - Break

7:45 PM - Open Discussion

Door Prize Raffle -

Bits of Blue is published by the Tampa IBM PC Users' Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about IBM-PC and compatible personal computer systems to its members.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII file or in a commonly available word processor format, such as WordPerfect 5.1, on diskette to the editor at 9402 Hidden Ridge Place, Tampa, Florida 33637 or send it by modem to BBS (813)239-3704.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for non-profit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

Commercial advertisements will be accepted at the following rates:

	1 month	3 months	6 months
Full Page	$60.00	$162.00	288.00
Half Page	$40.00	$108.00	$192.00
Quarter Page	$22.00	$60.00	$106.00
Eight Page	$12.00	$33.00	$58.00
Business Card	$10.00	$27.00	$48.00

All advertisements must be prepaid by check payable to TIBMPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if it is not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, Marylee Bruneau at (813) 932-6745, for space availability and for further information.

This newsletter was created with WordPerfect for Windows donated by WordPerfect Corp. to TIBMPCUG for use by the editor.

Intel SatisFAXtion/400

Combining Group III Fax and 14,400 bps Data Modem

Review by: Rod McKenzie, Contributing Editor, Madison PC User's Group

Intel has expanded their line of fax/modems by combining the best features of the original SatisFAXtion board with the high performance data transfer of a top-rated high-speed modem, their Model 14.4EX. It has error correction and data compression built into the hardware. The earlier version of SatisFAXtion included an error-correcting 2400 bps modem. While it gave respectable transfer rates, the new SatisFAXtion/400 leaves it in the dust. Speed isn't the only advantage users will notice. Intel uses sophisticated setup software that makes adding their fax/modem to a PC system as trouble-free as any hardware change can be. If the budget prevents choosing this top-of-the-line model, Intel offers two other fax/modems that may be the right choice. Software is provided for data communications and fax transmissions using DOS as well as Windows. The enhanced Windows software, FAXability Plus/OCR, gives the user a powerful utility to convert image files into text files, including virtually all of the popular word processor formats for DOS and Windows. Any user who's looking for terrific transfer rates and really convenient faxing should consider the Intel SatisFAXtion/400.

The 400 is the top-of-the-line fax/modem from Intel. The high marks it receives for performance are due, in large part to the error-correcting, high-speed modem and the 80186 coprocessor that handles the background fax reception so effectively. The SatisFAXtion/200 includes this powerful fax support, but offers a 2400 bps modem instead. V.42bis data compression increases the effective transfer rate to 9600 bps, so it's still a pretty hot package. The SatisFAXtion/100 is a much more basic unit. While it will send faxes at 9600 bps, it will receive at 4800. The data modem is not error correcting and there is no data compression, so 2400 bps is exactly what you get. All three of these models are CAS devices and support the FAXability software. In addition, the Model 100 is compatible with the Class I protocol, which means that it is compatible with even more third-party software for faxing.

The heart of the 400 is a data modem that is the equivalent of the Intel 14.4EX. It can soar to throughput speeds as great as 57,600 bps, giving transfer rates of 2200+ bytes/sec. Sometimes this can be too much of a good thing. At one point I was able to virtually reset the system. I learned that interrupt traffic can be the makings of a system crash. This modem has speed that just won't stop. The user may have to pull in the reins a little to keep things stable. To avoid problems, it was necessary to limit the speed of the unit to 19,200. During an upload that was cruising along at more than 2200 bps, the 386SX computer I was using abruptly went back to the BIOS power on self test (POST) and started checking RAM -- bang, right out of Windows, right out

(Continued on next page)

(Continued from previous page)

of DOS, right off the cliff! Others had warned me to be careful at the high transfer rates, but I had no idea that it would blow the doors off.

This was a little unnerving, but adjusting the software settings in Procomm Plus for Windows took care of it. Files have grown steadily larger on the BBS's file system and downloading takes so long at 2400 baud that I had just about given up on browsing and trying out new programs, but not anymore. At 14,400, and effectively running at even higher speeds, downloading is no longer frustrating. The stable rates are typically in the range of 1170-1550 bps.

The SatisFAXtion/400 is a CAS/DCA compliant fax/modem. There is a growing list of third-party software that works with the SatisFAXtion, including WinFAX from Delrina, and FAXit for Windows. Initially, I ran the original SatisFAXtion Board using WinFAX and didn't miss a beat when I made the conversion to the 400. Intel has made the upgrade as effortless as possible.

Intel makes sure that some very good software is supplied with the modem. Besides the utility disks for setup, the user gets DCA's CrossTalk Communicator for DOS data communications. To run the fax features from DOS, Intel provides a program called FAX, and a capture style program called FAXPOP. It's a memory resident program that will intercept the output that a DOS application sends to a printer port. It redirects it to the fax/modem and gives the user the opportunity to identify the receiver, dial the number, and add a cover sheet to the transmission. The user enables FAXPOP with the use of a hotkey combination. It moves into action when the document is printed to the LPT port. Instead of reaching the printer, FAXPOP creates an image file and starts the process of identifying the sender, receiver, the number to call, and any other files to be included in the fax.

Their Windows fax software is called FAXability for Windows. It operates the board as a printer driver. This program comes in several versions, starting with a simple, send-only version, included free with the card. Then there's a full-featured send/receive version, and finally a send/receive/OCR program. Each of these latter programs is sold separately.

FAXability, promises WYPIWYF (what you print is what you fax). The basic software acts as a printer driver so the user is free to select the fax/modem after the Windows document is completed, the spreadsheet is recalculated, or the graphics are finished. Now that the fax is sent, if a hard copy is needed for your own records, go to the File menu, select Printer Setup, and change the selected printer. Print out the paper version and save the file. Fax phone numbers can be stored in a phone book and even groups of numbers can be called in sequence for a sort of broadcast mode of transmission.

FAXability Plus and Plus/OCR are offered by Intel for more advanced use of the SatisFAXtion board. There's receive capability in the Plus version using a TSR program that exploits the coprocessor found on the 400. At the top level, there's even OCR for interpreting the image that you've received. A fax can be saved as an image or converted by OCR into a text file. Image files can be retransmitted as part of another fax. The text file can also be incorporated into other word processors.

OCR, or Optical Character Recognition, identifies the characters that appear in the image and create an ASCII or word processing file for the user to edit. While it's far from perfect, it's a lot better than retyping everything in the image file. Beside the ASCII format, FAXability will generate the text in virtually any word processing document format. In that case, it tries to identify the type size, and italic or bold typeface features. In several test transmissions, I found that the error rate was fairly high when it tried to read fancy typefaces. FAXability Plus/OCR gave some pretty hilarious spellings for words, especially when the original was in a closely spaced, serif typeface like Times Roman Condensed. It got a little better when the sending fax machine was set for fine resolution.

The best OCR performance, whole sentences without any errors, came when a document was all one point size, using the Lucida FAX or Courier typefaces. Ironically, in all documents tested, the numbers came out correctly recognized, no matter what size or typeface of the original. "5" and "S" were never confused, nor were the numeral one and the lower case "L" mixed up either. Pretty clever, this software.

The following formats are supported by FAXability Plus/OCR. Image files: CAS PCX (ZSoft Image - single page), CAS DCX (ZSoft Image - multi-page), TIFF (no compression), and TIFF (Group III compression). Text files: Ami Pro (.SAM), ASCII, ASCII (database), ASCII (decolumnized), Display Write, EBCDIC, Enable, Excel (.XLS), Framework III, IBM Writing Assistant, Interleaf, Lotus 1-2-3 (.WK1), Lotus Manuscript, MS Word, MS Word/Windows RTF, MS Write, MultiMate, Office Writer, PageMaker/MS Word, PCA, PeachText, PFS: First Choice, PFS: Write, PFS: Write Professional, Q&A Write, Quattro, SAMNA Word IV, Ventura/MS Word, VolksWriter, WordPerfect (4.1, 4.2, 5.0, 5.1), WordStar, and XyWrite.

Needless to say, most word processor users will be able to find a format that will work. They should plan on editing the converted file, and plan for some chuckles along the way. As in the case of the original SatisFAXtion board, the Model 400 has a scanner port for the Intel/Logitech 256 gray scale scanner. It's a high-resolution, hand-held device that can read up to 400 dpi and 256 shades of gray in a scanned image. Images from the scanner, like those from the fax, can be OCR'd. It needs its own base address and interrupt assigned, which the Setup program does very well. It also requires a TSR to be added to the CONFIG.SYS file. It's a device driver provided by Intel, very similar to the Logitech driver but different enough that only the Intel version of it works. The Model 256 scanner is a hand-held, half-page scanner. That may be a limitation to some extent, but software such as Logitech's FotoTouch, with AutoStitch, can join together several strips of an image taken in succession. That will

(Continued on next page)

(Continued from previous page)
make a respectable page for the program to handle.

Documentation for the SatisFAXtion/400 and related software is excellent. There is a separate manual for the 14.4 high-speed data modem and a handy reference card that lists the extended AT command set the modem supports. The fax features, including the setup utilities, are covered in another manual, which also includes the FAXPOP program, the general FAX software, the TSRs, and the CAS manager programs.

Editor's Note: The original SatisFAXtion Board was reviewed by the author in the October 1991 issue of Bits & PC's.

The Intel SatisFAXtion/400 is priced at $499 and is a product of:

PhotoFinish

By ZSoft Image Editing in Windows

Review by Meg Hamel, Madison PC User's Group

ZSoft, maker of PC Paintbrush, has introduced a new image-editing program for the Windows environment. While not meant to replace the poplar PC Paintbrush program, PhotoFinish provides users with a low-priced tool for scanning and editing picture files. Although I'm not an expert at handling color images (I'm still not sure what gamma correction means!), I use two similar products on a regular basis: ZSoft's original PC Paintbrush IV+ for DOS, and U-Lead's PhotoStyler (now supported and sold by Aldus).

PhotoFinish fills a niche somewhere between Windows Paint and a higher priced program like PC Paintbrush for Windows. It is equipped with basic drawing tools, plus filters and effects for fine-tuning your pictures. A scanning module supports a number of different scanners. What it lacks are what might be considered "professional" features, such as performing color separations.

I installed PhotoFinish without much fuss. If you have a scanner, there is a separate installation guide that helps you choose the necessary settings for your scanner driver. I had to make a change to my CONFIG.SYS file so that PhotoFinish could recognize my scanner. I'm lucky enough to have a Microtek 600Z color scanner in my office, so that's what I used. This scanner is capable of 600 dpi, but PhotoFinish could only provide settings for 300 dpi and below.

When scanning, you can do a Preview scan that will give you a very low resolution version of your picture. Using this model, you can select just the area you wish to scan, by means of either an adjustable marquee frame over the Preview, or by numerical input boxes that let you specify exact coordinates. Depending on your scanner, you can scan in B&W line art, B&W halftone, gray scale, or 24-bit color. I wish there was a setting for 256-color scanning, since that is the color format most commonly used for computer images. You can convert 24-bit images to 256 color, but that requires an extra step.

Once you have your image, either scanned or imported, you have a number of different editing options available to you. PhotoFinish has a number of filters that can be applied to all or part of the image, such as sharpen, blend, brightness, contrast, etc. Some of these filters are also available as tools in the tool bar. For example, selecting the Tint tool lets you apply a colored tint to certain areas of your image, instead of the whole picture.

There are also regular drawing tools that create rectangles, ellipses, or text on your image. One thing to remember is that this paint program is not the same as a drawing program. The difference is that once you have created a circle on screen, you cannot adjust the size and shape by moving that object's handles, which is possible with a drawing program. A paint program lays down colored pixels in the shape or pattern dictated by the tool. The shape becomes part of the image and cannot be edited separately. This is standard with any paint program.

Text can be any Windows-installed typeface, including TrueType, ATM, or Facelift. As with rectangles and ellipses, PhotoFinish creates a colored representation of the type on your picture -- once in place it cannot be edited as text anymore.

There are other tools that provide special drawing effects. The Paint Roller tool fills an enclosed area with a solid color, a gradient fill, or with a repeating tile pattern that you choose. The Airbrush tool works like a soft paintbrush. You can control the amount of "paint flow," transparency, and other options to create your own custom airbrush.

One limitation is that many of these tools do not work on 256-color pictures. I don't know why this problem exists, since so many people have not yet purchased hi-color or 24-bit monitors, and would, therefore, still be limited to 256 colors. You must convert your image to 24-bit color (or to gray scale if you are working on a B&W picture) before you can use some of these tools. However, this problem also exists in PhotoStyler, so perhaps it is a limitation in Windows.

In a recent issue of PC Magazine (Sept. 29, 1992), PhotoFinish was an Editor's Choice in a roundup of image-editing programs. Part of the reason was the low price. Dollar for dollar, PhotoFinish includes many of the features and toolsthat the higher priced programs have. PC Magazine even rated it higher that ZSoft's more expensive PC Paintbrush. If you want a program to provide a good range of image-editing controls, and you don't need any of the high-end color publishing features, try PhotoFinish.

PhotoFinish list price is $199 and is a product of:

ZSoft Corporation
450 Franklin Road, Suite 100
Marietta, GA 30067

Publisher's Paintbrush 2.02

By ZSoft

Review by: Rodney Schreiner, Madison PC User's Group

Publisher's Paintbrush is the nominal flagship of ZSoft Corporation's fleet of paint programs. Other members of the fleet include PC Paintbrush for DOS and PhotoFinish for Windows. Publisher's Paintbrush was originally a DOS-based program, but with the appearance of version 2.0 in 1991, it made the move to Windows. The current version 2.02 is a minor revision that appeared in April 1992 to fix bugs and add a few minor features.

ZSoft is among the originators of paint programs for MS-DOS computers, and they are the source of the paint programs that have accompanied several versions of Microsoft Windows. For these reasons, the file format created by ZSoft for bit-mapped images, namely PCX format, is a universal standard, accepted by virtually all paint and draw programs for the PC.

A paint program works with images composed of dots. Each dot (picture element or pixel) is independent of the other dots in the image. Although a human viewer may be able to recognize figures, such as squares, circles, and lines, in the image, a paint program cannot. A paint program deals with the image only as a collection of independent pixels. Although most paint programs can create figures, such as squares or lines, once these figures have been created in the image, they lose their identity. The squares, circles, and lines produced by a paint program cannot be modified as squares, circles, or lines. They cannot be moved or resized, except by modifying the individual pixels that compose them. The inability of paint programs to modify figures in an image distinguishes them from drawing programs, which deal with images as a collection of figures. The squares, circles, and lines created with a drawing program retain their identities, and the drawing program can move or resize them.

Images created by a drawing program are more easily modified than those created by a paint program. This situation suggests that a paint program is less functional than a drawing program. Such would be the case if the only source of computer images were paint or draw programs. However, many images used with computers originate outside the computer. Many images start as photographs that can be scanned, or as video that can be captured from a camera or VCR. The cameras that create photographic or video images are, in a way, like paint programs. They do not recognize individual objects, but create images as a collection of colored dots. Therefore, when the images created by cameras are translated into computer form, the images are in the format of paint program images. Paint programs are able to modify the images obtained from cameras, and in this area lies their greatest utility.

Publisher's Paintbrush can acquire images from scanners or from video grabbers. For scanners, Publisher's Paintbrush comes with a calibration card. It contains an array of squares of various shades of gray. The scanner is calibrated by scanning this card and selecting Calibrate from one of the program menus. The program automatically adjusts the scanned image to agree with the known shades on the card. This adjustment is then performed on all subsequent images from the scanner. A printer can also be calibrated by printing the scanned image and running the printout through the scanner. By this process, a reasonably good printed copy of a scanned image is assured.

I tried both a hand scanner (Logitech ScanMan 256) and a flatbed scanner (Hewlett-Packard ScanJet IIC) with Publisher's Paintbrush. A good image from the hand scanner was quite difficult to obtain; most images contained spurious lines or gaps, or were badly skewed. (By comparison, the software that comes with the hand scanner gives excellent results with little effort. To use Publisher's Paintbrush to edit an image obtained from a hand scanner, I recommend using the software that accompanies the hand scanner to obtain the image, saving the image in PCX format, and loading the saved image into Publisher's Paintbrush.) However, Publisher's Paintbrush worked flawlessly with the flatbed scanner, giving 24-bit color, 256 gray, and black and white images. The image can be prescanned to obtain a rough image, and the desired area can be framed on the prescanned image. Publisher's Paintbrush supports most popular flatbed and hand scanners, and some video grabbers. However, the complete list of supported hardware is not listed on the box, in the manual, or in a text file on the program disks. The complete list appears only during the installation of the program. Make sure the dealer guarantees that this program works with your hardware before buying it.

Publisher's Paintbrush has a wide assortment of tools with which an image can be altered. These include display tools that affect how the image is displayed on the screen, selection tools that allow sections of the image to be isolated from the rest of the image, drawing tools for adding, changing, or removing portions of the image, special effects tools to add patterns to the image, and retouching tools that change the brightness, contrast, and sharpness of the image. The display tools allow Publisher's Paintbrush to show several copies of an image simultaneously. Each copy can be displayed at a different magnification. The Zoom tool magnifies or reduces a displayed image, the Hand tool moves the portion of the image displayed, and the Locator tool forces all displayed copies of an image to show the same portion of the image.

Among the drawing tools are those for creating figures such as rectangles, ellipses, and lines. Also included are tools for simple modifications, such as a paintbrush that applies a selected color to a small area, an eraser that removes all color from a small area, and a color eraser that in a small area changes pixels of one color to another color. For these tools, the size and shape of the affected area can be selected. However, the program does not indicate on the screen the size or shape of the area to be affected before the tool is used. This is a very serious problem, which makes using these tools quite difficult. The only way to determine what will be drawn or erased is to actually draw or erase. Fortunately, Publisher's Paintbrush has an undo tool, which reverses the last change to the image. However, trying and undoing until

(Continued on next page)

(Continued from previous page)
the desired result is obtained is most inefficient. The text tool adds letters and digits to the image. Publisher's Paintbrush comes with several bitmapped and outline fonts that can be used to add text to an image. However, the program does not take advantage of the TrueType fonts that Windows 3.1 supports. An eyedropper tool allows a particular color to be selected from the image, so that color can be applied or modified with the other drawing tools.

The retouching tools distinguish Publisher's Paintbrush from low-end paint programs. The contrast tool increases contrast by fading pale colors and darkening deeper colors. The brightness tool increases the brightness of all colors. The tint tool mixes a selected color with the colors in the image, rather like covering the image with a tinted glass. The blend tool averages the colors in a selected area, while the smudge tool randomly moves the pixels around in a selected area. All of these tools can be applied to the whole image, to a selected rectangle, or freehand, by selecting the shape and size of the tool and moving it over the image. These freehand tools, like the drawing tools, do not indicate on the screen the area of the image to be affected, making them difficult to use.

A variety of other effects can be applied to the entire image or rectangular portions of the image. Spots of various sizes can be removed, detail can be enhanced, or a mosaic effect can be applied. The image can be rotated, but only in multiples of 90 degrees. A color image can be separated into its three color components: red, green, and blue.

The manual is in five sections: Introduction (16 pages), Getting Started (60 pages), Tutorials (54 pages), Menus (88 pages), and Reference (40 pages). Introduction deals with installation, system requirements, memory usage, scanner and printer calibration, and file types. Getting Started describes each of the tools, with step-by-step instructions in their use. Tutorials covers the basics of creating a new image with the drawing tools, and retouching and enhancing supplied images. The Menus section is the reference section, describing the functions of the menu selections. The Reference section is actually a description of miscellaneous features and auxiliary files that accompany Publisher's Paintbrush, such as fonts and scanner drivers. The manual is clear and written to be understood by a novice to image editing. Technical terms are used sparingly and are defined when they are used. This manual would not serve as a text for someone interested in learning the jargon of image processing, for terms such as hue, saturation, and chroma are avoided.

If Publisher's Paintbrush were the only high-end paint program available, it could be recommended, for it is capable of both simple and complex image editing. However, by comparison to other paint programs, it leaves much to be desired. ZSoft's own PhotoFinish has much more usable tools (they do indicate the area they will affect) and only slightly fewer capabilities for a much lower price. Micrographix Picture Publisher has superior capabilities and more functional tools (although they are implemented differently) for a similar price. Publisher's Paintbrush is old and has been improved upon in other programs. For these reasons, I'd recommend looking elsewhere for a paint program.

DosFax PRO

Review by Sandy Dickson, Madison PC User's Group

Do you like software that lets you rip off the shrink wrap, do a mindless install, and klutz around intuitively to get some reasonable results before getting to the "read the manual" stage? Me, too! While DosFax PRO by Delrina isn't quite that easy, it does deliver what it promises ... a convenient way to fax documents from within DOS applications and receive faxes on your computer without interrupting your work. Quite an improvement over the cumbersome fax software usually packaged with fax/modems!

Installation and Setup

The installation process was automatic until it reached the Fax/Modem Setup stage. At that point, the choices became myriad and the manual became necessary. With all the parameters that required setting, I assumed (incorrectly, as such things go) that DosFax was creating a custom initialization string to reflect the modem setup choices. Wrong. You're on your own with your particular modem. This got to be a bit troublesome as my fax/modem is a Zoom 14.4 (V.32bis) and, according to Delrina's technical support, the newfound popularity of fast modems was unanticipated at the time of DosFax PRO's initial release (5/92).

DosFax uses whatever extended (XMS) or expanded (EMS) memory it can find for swapping and optimizing its performance, though either option can be disabled. Hotkeys for invoking capture and fax capabilities while in a DOS application can be customized to avoid possible conflicts with other hotkeys or macros. Screen status messages can display call progress when you are sending or receiving a fax while working in DOS or in any DOS application.

The heart of DosFax's convenience is that its document capture works like a printer driver and can emulate either a HP LaserJet IIP or Epson FX85 printer. DosFax uses these emulations to print the document to a buffer (when the "capture" hotkey is invoked) where it is held until another hotkey combination converts it to a fax image file for sending. Normal printing, to the physically attached printing device, is blocked during that time.

Two TSRs are required for DosFax operation. FAXCOM is the communication TSR that operates the faxing and conversion (from document to fax image file) process, phone book(s) and modem. FAXCAP captures documents (via hotkeys) for faxing from within DOS applications. The combination occupies a total of 70K and can be loaded into high memory with

(Continued on next page)

(Continued from previous page)

DOS 5.0 While the manual had the instructions backwards, accompanying Release Notes noted that the sequence in which the TSRs are loaded into memory (and unloaded) is crucial.

Although DosFax willingly alters your AUTOEXEC.BAT and PATH statement for autoload at boot, I chose "not" in favor of batch files to load/unload the two required TSRs when desired. This seemed necessary since I use other communication TSRs and DosFax's Release Notes warn against such co-residency. It's also a good idea to unload the DosFax TSRs before using your regular communications program. I didn't and was shocked when my 14.4 modem was slowed to 500-600 cps for a large file transfer on a MPCUG BBS call.

Sending

sing pop-up menus and graphic dialog boxes, DosFax provides two methods of sending a fax: from any DOS application and from the DosFax PRO Administrator. Sending from the Administrator is best suited for brief fax messages "on the fly." You can type or insert a short text (ASCII) block into a predefined cover page and, optionally, attach other previously saved fax files. For more extensive efforts, generate a fax of the document in your current DOS application such as word processing, desktop publishing, forms, spreadsheet or database. A cover page and previously saved fax files can also be added ... and see it all via the Image Viewer before sending!

Through the Administrator, DosFax can also schedule delayed fax transmissions for any time/date specified and keep a comprehensive log (view on screen or print) of the details of all faxes sent or received. Each phone book can handle more fax numbers than people I know with faxes (up to 1,000), and are easy to set up. Broadcast groups can be defined for sending the same fax to a number of different people.

Once setup was complete <whew>, I happily began faxing from WordPerfect 5.1 to the fax machine on my second phone line. (This is the fun part.) Prepare a document, invoke the hotkey combination for "capturing" the document (Ctrl-Shift-C), and use WordPerfect's normal keystrokes to "print" the page to the defined HP LaserJet IIP. Once "capture printed" in this manner, invoke another hotkey combo (Ctrl-Shift-F) to activate the fax dialog box for converting to a fax image file and fax transmission.

A pop-up window lets you choose a destination from your defined phone book list (or manually enter one), schedule the time for sending the fax (immediately or any date/time you choose), choose high or low fax printing resolution, attach other files (provided you've had the forethought to save them as fax image files via the "capture print" and conversion process), and even type a cover page on the fly. You can fax many different documents from several DOS applications and combine them all into one fax transmission. Press the "send" button and it's on its way! Meanwhile, you can watch its progress via messages that appear in the upper right corner of your regular application screen -- and continue to work on another document.

This worked so slick that I nearly ran out of fax paper before I remembered to try it from other programs. The DosFax box touts its ability to fax directly from any DOS application, including WordPerfect, Lotus 1-2-3, Microsoft Word, Q&A, ad inf. It didn't say a word about two of my favorites (outside of WordPerfect, that is), PFS Professional Write and Professional File. Since the capture process is essentially a bogus printer, the DosFax manual (by now well-thumbed) suggests assigning the "capture printer" to a different parallel port than the one you use for actual printing. Thus, by selecting LPT2 as the Print Capture port, you need only switch printer ports within your application to change between actual printing and capturing for fax. Seemed logical (and worked dandy in WordPerfect), but didn't work with the PFS programs. They recognized that LPT2 didn't REALLY exist and refused to print to it.

Delrina tech support disagreed with the manual's setup suggestion and said that it seemed to work better to specify the "capture printer" on LPT1 since the process of "capturing" blocked actual printing to the physical printer while invoked. Tech support was right. (I knew there was some benefit to not reading manuals!) Once this problem was solved, faxing even worked from PrintShop (albeit slowly) and my accounting program.

The most fun I had with DosFax was with the customizable cover page feature. The top four inches of a fax transmittal constitute a blank canvas for clip art, logo or wit created in any DOS application and converted to a fax image file. DosFax allows you to choose from your logo file each time you use a cover page. Depending upon how you define your default cover page, DosFax will also automatically nab recipient name and sender name from entries in other dialog boxes, and time/date from your computer settings, and insert them in the appropriate places on the printed cover page.

The only annoying idiosyncracy I found in DosFax was its reporting of a transmission error as the final status of each fax sent. It always sent all the pages -- and they were all received properly -- but DosFax insisted on reporting "Transmission Error 48" in the report log and in the Display Call Progress box. When I finally got through to Delrina's technical support, they were most accommodating, but couldn't explain it. It seems my ubiquitous "error 48" wasn't on their list of possible error codes. I tried all their suggestions for modem tweaking to no avail. I also downloaded (and ran) a maintenance upgrade patch file (8/92 release) meant to accommodate the new 14.4 modems from their tech support BBS in Toronto. Still no change. At this writing, "Transmission Error 48" is still the logged status of all faxes I send with DosFax, but it neither affects nor reflects the actual success of the transmission. It's just annoying and may be specific to my Zoom 14.4 modem.

Receiving

Receipt of incoming faxes requires a send/receive fax/modem and a few more choices. In the default automatic reception mode, DosFax can receive faxes completely in the background (you must periodically check its Administrator for newly received faxes), notify you when a fax is received, or print incoming faxes immediately upon receipt. Enabling the Display Call Progress option (initial setup) shows fax receive messages in the corner of the screen in DOS applications without interrupting your work.(Continued on next page)

(Continued from previous page)

After receipt, faxes can be viewed (zoom in and out), rotated (if sent upside down), saved to PCX or TIFF image file formats for further modification in other applications, or converted to a transmit file to send them again. Received fax images can also be converted into editable text by using any optical character recognition (OCR) software for DOS (this capability already incorporated into the soon-to-be-released upgrade to WinFax PRO). While the printer output of incoming faxes didn't seem as crisp as on a dedicated fax, it was readable and quite acceptable.

Compatibility

As a DOS user who'd still rather fight than switch (entirely to Windows, that is), I found DosFax addicting and fun to use once configured correctly. Windows users would likely prefer its older sister, WinFax PRO. The two programs look and work very much alike and can share the same logs, phone books and fax image files on systems where both programs exist. It is NOT recommended you use DosFax PRO for sending or receiving faxes in the DOS window in Windows.

DosFax PRO supports most popular Class 1, Class 2, and Sendfax (for sending faxes only) modems/boards and can receive faxes from any Group 3 fax machine or fax board. It requires 640K memory, at least 2.5 MB of hard disk space, MS-DOS 3.I or higher, and is Microsoft mouse compatible. Supported graphics include Hercules, CGA text mode, EGA, VGA, and higher.

DosFax PRO list price is $79 (street price is about $50) and is from:

Windows

Pete Moore, LILYPAD

WINDOWS' "AUTOEXEC" FILE

This month and next, I'm going to go through WIN.INI from top to bottom, and tell you lots of the things that are specified there, and what changes you can make in many of them. I won't have room for all that information in a single column, so if this information doesn't interest you, next month's column will bore you, too. Be warned.

While SYSTEM.INI serves as a sort of Windows CONFIG.SYS file, specifying the names (and if necessary the locations) of every driver that Windows needs on startup, WIN.INI acts rather like an AUTOEXEC.BAT file, doing the Windows equivalent of a lot of DOS "SET VariableName=Value" statements. In your AUTOEXEC.BAT file, those "SET" statements put information into the DOS environment, where any program can look it up as needed. For instance, Procomm Plus likes to set a PCPLUS environment variable to tell Procomm where its files are, ie "SET PCPLUS=C:\PCPLUS".

Well, in WIN.INI there are sections that make similar, but much more detailed, information available to all your Windows apps. Windows sets up about 18 sections of its own information, and on top of that, many annoyingly pushy Windows apps insert their own new sections, rather than politely writing their own INI files. The sections created by Windows are as follows: [colors],[compatibility],[desktop],[devices], [embedding],[extensions], [fonts], [fontSubstitutes], [intl], [mci extensions] [network],[ports],[printerPorts],[programs], [sounds],[TrueType], [Windows], and [Windows Help]. I'm not going to try to explain every one in detail, because I expect you know or can figure out what most of them are for, but for any that seem particularly obtuse, I'll give a thumbnail sketch. And now without further ado, let's look at an alphabetized list of the first nine sections that Windows itself writes; [colors] through intl].

[colors]

This section is ordinarily written and modified through the Control Panel, and there's not much likelihood that you would want to modify it manually. It contains a list of Windows' screen display components, followed by numerical parameters giving each component's Red, Green, and Blue values, on a scale from 0 to 255. Entries look like this: "COMPONENT=R G B".

[compatibility]

This section deals with "patching" minor incompatibilities between Windows 3.0 and 3.1. Each line is merely the name of an application, followed by a hexadecimal value, like "CHARISMA=0X2000". Whether you have the particular application on your system or not, Microsoft warns that you shouldn't manually alter any entries in this section.

[desktop]

Again, many entries in this section are commonly altered through the Control Panel, though some entries are only entered and changed manually. Here are the entries in alphabetical order:

"GridGranularity=#"

This one is set through the Control Panel. In this entry, "#" is a number from zero to 49, with a default of zero. Granularity, as I mentioned in my October '92 column, gives your desktop a kind of "snap-to-grid" option, letting you specify how coarse or fine you want the invisible grid to be. Each number above zero increases the coarseness by eight pixels.

"IconSpacing=#"

Control Panel again . . . In my September '92 column, I told you about the five icon-oriented entries possible. This one sets the horizontal spacing, and has a default of 77.

"IconTitleFaceName=font name"

(Continued on next page)

(Continued from previous page)

This one has a default of MS Sans Serif, and can only be changed manually.

"IconTitleSize=#"

Another manual entry, and sets the point size for icon titles. The default is eight points.

"IconTitleWrap=#"

This is accessed through the Control Panel, and can only take two values -- zero, or its default of one, which wraps long titles to as many as three lines.

"IconVerticalSpacing=#"

Manual again, this setting is the one Windows uses whenever you use the Arrange Icons command. Its default depends on the IconTitleSize setting and the display driver.

"Pattern=b1 b2 b3 b4 b5 b6 b7 b8"

This is a Control Panel job, and fills your screen with any 8 x 8-pixel bitmap. Its default is None, and if you want, you can click on "Edit Pattern" and create one of your own.

"TileWallpaper=#"

Control Panel again, this takes a one or zero, default zero.

"Wallpaper=BMP-filename"

The default for this Control Panel selection is None, but you can set it to any image that's in Paintbrush's .BMP format. If the image isn't in your Windows directory, just type in its entire pathname.

"WallpaperOriginX=#"
"WallpaperOriginY=#"

These are manual entries, which default to zero. If you change the values, your wallpaper's top left corner will be moved that number of pixels to the right or down.

[devices]

This is another section that was included just to maintain compatibility with pre-3.1 Windows, in this case 2.x. Again, alter or delete anything here at your peril, because pre-3.1 applications might look for information here. The format here is "DEVICE=driver,port [port, port...]"

[embedding]

This section duplicates information found in the REG.DAT registration database, defining classes of objects that can be embedded in OLE client programs. Again, it's here for apps that don't assume you're using Windows 3.1, so don't alter anything here. The entries look like this: "ExcelWorksheet=Microsoft Excel Worksheet, Microsoft Excel Worksheet, C:\EXCEL".

[extensions]

You can modify these by using the File Associate command in File Manager, or you can edit them manually. These entries tell Windows what application to launch when you double-click on a data file. The syntax is "EXT=PROGNAME.EXE ^.EXT", as in "ini=notepad.exe ^.ini". This section can have a bazillion entries, and lots of installation programs modify it, so why should you be any different? Personally, I always make sure that any program specified that's not in my Windows directory has the full pathname included, like "txt=C:\WIN31\NDW\deskedit.exe ^.txt". This means thatWindows won't have to search my PATH looking for DeskEdit.

One note here -- this information is PARTIALLY duplicated in REG.DAT, and if the entry in REG.DAT differs from this one, REG.DAT's data gets used. Therefore, it's safest, or least frustrating, to actually use the File Associate command, which updates both entries for you.

[fonts]

This section contains the names of all of the screen fonts that were either included with Windows, or were installed via the Control Panel's Fonts selection.

[fontSubstitutes]

This section can only be updated manually, and it contains a list of the fonts you want Windows to use when a program calls for the old Helv, Tms Rmn, Times, or Helvetica. The default substitutions use, in order, MS Sans Serif, MS Serif, Times New Roman, and Arial. MS Serif and MS Sans Serif are bit-mapped fonts, while the others are TrueType fonts.

[intl]

This is a biggie, with lots of possible entries, so I'm going to skim over it. Even I'm not fascinated in the minutiae of ALL this stuff. The basic purpose of this entire section, accessed through the Control Panel, is to tell Windows your personal preferences for how numbers, dates, and times should be displayed. In the interest of brevity, I'll just list the entries alphabetically, with their default values. When I list values like "0 | 1", that means "either zero or one." Here goes:

"iCountry=#" (default = 1, for USA). "iCurrDigits=#" (default = 2, for Currency decimal places). "iCurrency=#" (default = 0, for Currency symbol position -- 0 = before the value). "iDate=0 |1 | 2" (default depends on the sCountry setting). "iDigits=#" (default = 2, number of decimal places). "iLZero=0 | 1" (default = 0, 1 = display leading zeros). "iMeasure=0 | 1" (default = 1, 0 = metric, 1 = English). "iNegCurr=#" (default = 0 to display negative values in parentheses). "iTime=0 | 1" (default = 0 for 12-hour clock). "iTLZero=0 | 1" (default = 0, 1 = displayleading zero in time values). "s1159=string" (default = "AM", characters to display for a.m. times). "s2359=string" (default = "PM", characters to display for p.m. times). "sCountry=string" (default = "United States"). "sCurrency=string" (default = "$"). "sDecimal=string" (default = ".", specifies decimal separator). "sLanguage=string" (default = "enu" for U.S. English). "sLis=string" (default = "," for punctuation to separate items in a list). "sLongDate=format" (default = "dddd, MMMM dd, yyyy" for long date format). "sShortDate=format" (default = "M/d/yy"

(Continued on next page)

(Continued from previous page)

for short date format). "sThousand=string" (default = "," for thousands separator). "sTime=string" (default = ":" for time separator).

Well, that takes us halfway through the 18 sections in a default WIN.INI file, and tells us more than we want to know about what it's all there for. Pay particular attention to the items where I specifically warned against tampering. As I said, most of the "no-tamper" sections were included just to make pre-Windows 3.1 programs work acceptably with the latest andgreatest version of the GUI we all love to hate. So be careful, boys and girls. It's a jungle in there. See you next month . . .

- Pete

New Membership Category.

A family can now join our group for just $30.00. Family memberships receive the same privileges as single membership(Exceptions: One election vote per family and one newsletter mailed to head of household) Of course a single membership is still available for $20.00.

Tampa IBM PC User's Group
P.O. Box 3492
Tampa, Florida 33601-3492

MODEM CLASS:

The Modem class by Ed Patzsch is to be held on the regular meeting night. The class will run from 5:45 to 6:30 p.m. (Room behind and left of the reception area) Please be Prompt!

WELCOME NEW MEMBERS:

BITS of BLUE

VOL. 6 NO. 2 February, 1993

MEETING
(2nd Wednesday every month)

DATE: February 10, 1993
TIME: 6:00 PM
PLACE: IBM CUSTOMER CENTER
LAKE POINTE ONE BUILDING
3109 W. Martin L. King Blvd.
Room 450
DIRECTIONS:

The Tampa IBM PC Users Group meets in the IBM's LAKE POINTE ONE Building across from Tampa Bay Mall one block east of Tampa Stadium.

The best entrance is on Martin Luther King Blvd. at the traffic light in front of Burdines. As you turn North off Martin Luther King Blvd. you will see the LAKE POINTE ONE BUILDING on the left & parking on the right. Join us in ROOM 450 - 4th floor. **Guest please sign in.**

FEBRUARY AGENDA:

2/10/93

6:00 PM - opening remarks

6:30 PM - Demo by Corel Corp. of:

CorelDRAW

Illustrating, Charting, Photo & Bitmap Editing and Presentations.

7:30 PM - Break
7:45 PM - Open Discussion
Door Prize Raffle -
CorelDRAW
& Miscellaneous Items

Bits of Blue is published by the Tampa IBM PC Users' Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about IBM-PC and compatible personal computer systems to its members.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII file or in a commonly available word processor format, such as WordPerfect 5.1, on diskette to the editor at 9402 Hidden Ridge Place, Tampa, Florida 33637 or send it by modem to BBS (813)239-3704.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for non-profit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

Commercial advertisements will be accepted at the following rates:

	1 month	3 months	6 months
Full Page	$60.00	$162.00	$288.00
Half Page	$40.00	$108.00	$192.00
Quarter Page	$22.00	$60.00	$106.00
Eight Page	$12.00	$33.00	$58.00
Business Card	$10.00	$27.00	$48.00

All advertisements must be prepaid by check payable to TIBMPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if it is not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, Marylee Bruneau at (813) 932-6745, for space availability and for further information.

This newsletter was created with WordPerfect for Windows donated by WordPerfect Corp. to TIBMPCUG for use by the editor.

SECRETARY'S REPORT

Minutes of meeting - 01/13/93

By: Ed Buzza

Instead of Jim Clark's scintillating coverage of what transpired at our UserGroup meeting, I did the best I could to record the proceedings. There were many topics of discussion and my 2k scratch pad memory barely coped with what went on. In another room, Don Patzsch conveyed some of his vast knowledge of modems to a group of interested, and appreciative, club members -- more classes to follow. Our indefatigable President called the meeting to order and spoke on a variety of subjects.

CLUB NEWS

- Membership annual dues. $20 for a single membership; $30 for a family membership.

- New membership benefit. A free raffle ticket will be given for each new membership or renewal taken at the regular meeting. For family membership, only the primary member (head of household) will receive a free raffle ticket.

- New computer. Through the very generous kindness of one of our members, who remains anonymous, the BBS now has a brand new 486-33DX Gateway computer. Also, our BBS is now equipped with a 14.4k bps modem. We are in the process of acquiring Desqview so that the Sysop can do some multi-tasking instead of having to wait in line to do some work on the system.

- Guests. Please tell your guests to PRINT their name and address when they "sign in" at the door. We send a sample newsletter to all guests but we do need a legible name and address for mailing.

- Christmas presents. Santa was good to our President this year. He got a Pro Audio Spectrum 16 sound board, with speakers. Prices for the sound board at various dealers in town vary quite a bit. Highest was $239 and lowest (WorkPlace) was $197.

  Harvey also shared with us his opinions and comments on The Video Blaster board which he is testing for his employer. The Video Blaster board not only shows TV on the computer monitor, it can also capture video images and save them to disk. But video capture takes up a LOT of space on the hard drive. Ten seconds of 8 bit color needs over 9 meg - and that is without sound!

  The video board is about $400 locally but only around $320 mail order. Our Prez had a bit of trouble with these boards. What he thought was hardware or software failure was really due to one speaker being bad and one of the video jacks not working.(Continued on next page)

(Continued from previous page)

- Business news. Everex has filed for Chapter 11. In contrast, IBM is doing good with Value Point and with PS/1 computers. IBM now offers a 3 year warranty.

- Software news. EXCEL Ver 4 is really nice, Harvey was impressed with the new features. PageMaker Ver 5 is now available. Approach is a very good data base, user friendly, and easy to learn.

- Stacker. Version 3 is now shipping. Harvey had no problem with installing or using this package but others have reported trouble. The new version lets you stack across floppies. Best of all, Stacker is on the floppy so you can run it from there on a PC that doesn't have Stacker.

- PKWare. The new version of PKWare is now on the BBS. It does a better job on compression. One 400k file was compressed an additional 60k. There have been problems reported using this version with OS/2, Desqview, and with QuarterDeck - from losing UMBs to system being rebooted. Also, Norton AV needs an update (it gives a false virus reading).

- Membership benefits.
  1) A monthly meeting on the second Wednesday of the month. The meeting place is the IBM Customer Center, Lake Pointe One Bldg., 3109 W. Martin L. King Blvd., Room 450.
  2) 24 hour, 7 day access to Bits of Blue Bulletin Board.
  3) Monthly Bits of Blue Newsletter
  4) Hardware/software demonstrations or presentations by vendors of major corporations of by User Group members.
  5) Donated software/hardware and 50/50 pool given away based on raffle drawing at the meeting.
  6) Library of shareware and vendor demonstration programs for copying.
  7) Various educational classes. e.g. Modems, BBS, WordPerfect, DOS, etc..
  8) Discounts at Sunrise Computer Supplies.

- Games. "Wolfenstein" is now passe. "Catacomb Abyss" is the latest thing. Also, "Heaven and Earth" is supposed to be THE game. As one member said, "It'll take you a year!"

PRODIGY

Kathryn Nakib, a Senior Marketing Representative from Prodigy Services Co., demonstrated some of the new features of Prodigy (R).

It is the largest on-line service of its kind with over two million members. Prodigy can be described as sort of like cable TV for personal computers. Over 850 services are available for the base subscription of $14.95 on a monthly basis. A yearly subscription averages out to about $12.95 per month. Subscription covers up to 6 members in a household.

There are a variety of Custom Choices that are available but at additional cost. However, you are told in advance that a particular service is an additional cost item before you enter that service.

9600 baud is available ($2/month) in a number of cities and is being expanded to other cities almost daily. The high light screen has been redesigned and can be customized. Auto log-on is available and you can change your password. A version for Windows is due later this year.

BillPay USA is an added fee Custom Choice that lets you pay your bills through your checking account. The fee is $9.95/mo for up to 30 transactions. Another Custom Choice is the Strategic Investor that shows information about stocks and mutual funds. Data such as quarterly and annual income, dividends, quick and current ratios, balance sheet, performance, etc.. is shown and can be downloaded to your printer or popular spreadsheet, database or word processing programs. Information on stocks incurs about a 15 minute delay.

There is no shareware download except through the ZIFFnet service. For an added fee of $7.50/hour, and a 4 cent/minute surcharge for 9600 baud, you can access PC Magazine, Computer Shopper and PC Computing.

The basic service has a lot of topics for almost every taste. The over 400 bulletin boards cover such topics as art, computers, education, food and wine, games, religion, seniors, sports, and travel. EAASY SABRE helps you find information about airline flights, schedules, amenities, and you can book a flight and even rent a car and make hotel reservations from your personal computer.

Electronic mail is available and is limited to 30 messages. After that, a fee of 25 cents is charged for each message. E-Mail is held for you for up to two weeks. At this time, all messaging is done on-line; there is no facility to write, spell check and compose your messages off-line.

PRESIDENT'S COLUMN:

A couple of members mentioned that they missed my Presidents Column in last month's newsletter. Thank you for noticing and stating so. Simply put, I was recouping from 1992 and the holidays which always includes **Food, Family and Fun.** These are my favorite 'F' words. Of course there is one that I don't like, **'Financial debt'** which is incurred during the holidays, then comes to visit me a couple of months later. Marylee always says it's better to give than to receive so I always make sure that I give myself something during the holidays. I am sure that's what CompUSA also thinks when they **give** me a bill for stuff I purchased for the holidays on my charge card. I certainly hope that the Holidays and Santa were good to each of you and your families.

At our December meeting I announced that one of our members had donated a computer to our group. The computer was a Gateway 486. This system has replaced our old 286 BBS PC which required TLC on a regular basis from Kevan to maintain its daily operation. Additionally, the 286 did not have expansion capability for future growth of the BBS without a premium investment. The board felt that it was not in the groups best interest to invest money into the 286. We had decided that the minimum system we needed was a 386/mhz with 4Mb of RAM and 120HD. All we needed was a generous donation from a vendor or more money in our bank account to acquire this PC. Neither occured or would occur in a timely matter. However, out of the blue a PC showed up donated by an anonymous member. To date I am not sure who donated this system. Could it be Mr. or Mrs. Claus or even one of Santas helpers? I don't now but the donation has revived my belief in Santa. I think he or she has retired in Tampa from the North Pole and is a member of group. Anyway, whoever you are, on behalf of our group I wanted to say -

THANK YOU !

The elections are over. **Hooray!** Now we have a new president and an old president. The country elected Mr. Cinton as our new president and the user group elected me as the old president. This will be my 5th year as president. **Trivia Question:** who has been on the board longer than me? I never thought in 1988 when I was first elected that I would do it beyond one year. Well every year it gets better. I certainly would not have done it if we didn't have a staff of dedicated volunteers. Look at the names under the officers section, seek these people out during a meeting or get on the BBS and tell them THANKS. They are the ones making this all possible. We have a new Vice-President this year. Tom Cone has been in charge of membership relations in the past. He will continue in that capacity in addition to his new position. Additionally, members are slowly coming forward and volunteering their services. We are extremely fortunate to have a good group of volunteers. Please join me in welcoming back Tom, Bill, Roger, Jim, Ed, Marylee, Larry, Kevan for 1993. Oh course we welcome and need more volunteers.

My goals for this year: 300+ membership, bulk mailing, formal Special Interest Groups (SIGs) including Windows, OS/2, DOS, word processing & spreadsheets. Other SIGs will be started as we get volunteers to run them. Additionally, we will implement a process for members to acquire free software based on a written review of the product. Vendors are willing to give us full working evaluation copies of software to our group based on a written review. The board will implement procedures for this process soon. Presently our inventory of reviewable software includes:

- Lotus Organizer for Windows - Personal Information Manager by Lotus Development Corp.
- FASTLYNX - File Transfer System by Rupp Technology Corp.
- Adobe Type Set - Software Fonts by Adobe Systems Inc.
- Star Trek the Screen Saver for Windows by Berkeley Systems
- Express Publisher for Windows - Desktop Publishing w/ Text Appeal - Logo builder by Power Up Software Corp.
- KUI - Keyboard User Interface for Windows by Softac Corp.

(Continued on next page)

(Continued from previous page)
If you are interested in reviewing products please contact me in order that I may add you to our list. Reviewers will need to meet the qualifications specified in the procedures written by the board before any software is handed out for review.

Last year I stated that in 1992 there would be a battle between IBM and Microsoft and their respective 32 bit operating systems. Windows NT and OS/2 were going to duke it out. It never happened because NT didn't ship. Now rumors are that Microsoft will ship a subset of NT just to get it to market in order to prevent IBM from slowly building an OS/2 following. While these two giants have been battling with their marketing machines, Novell purchased the rights to UNIX. It will be interesting to see if this group turns into the *Three Amigos, Three Stooges, Three Little Pigs or just Three's a Crowd*. Meanwhile the classic old DOS is fixing to be upgraded. If this OS is as good as DOS 5.0 was, bring it on Microsoft! As Ray Charles would say, *YOU GOT THE RIGHT ONE BAAAABY. UNH UH*. DOS still works for the masses and Mr. Bill (Gates) knows there is still money in it.

Harvey P. Bruneau

What's new :

Andrew J. Gnoza, III

IDG Books has just published the **"PC World Excel 4 for Windows Handbook"** by John Walkenbach and David Maguiness. This 1456 page bible to Excel 4.0 is a complete reference and tutorial to Excel 4.0, with hundreds of tips, tricks, shortcuts, and real world applications. It is an ideal resource for beginners to experts who need to learn the basics and move on to more advanced commands, features and functions of this powerful spreadsheet program. Included in the book is a 32 page Quick Reference booklet which provides users with a handy access to the most common Excel functions. The book is now available in book stores and retails for $29.95

WordPerfect News...

Ed Buzza, Tampa IBM PCUG

WordPerfect PresentationsThe winter issue of WordPerfect Report© has some interesting news. WP Presentations (was DrawPerfect) began shipping Nov. '92. For the first 90 days, they will give away a Sound Blaster board with the retail package. Use it to play the 100 MIDI files included with Presentation. The free sound board is *not* good with any upgrades. If you bought DrawPerfect between 6/23/92 and 30 days after release of Presentations, you can get Presentations free. If prior to 6/23/92, $99 is upgrade price.

WordPerfect for Windows Ver 5.2

The new version is shipping this quarter and orders are being accepted now. $39.95 (not including shipping, tax, etc.) to upgrade from Ver 5.1, FREE if you purchased full retail package between 10/1/92 and 30 days after WP5.2 ships.

- **Grammatik 5** is included and available from a pull-down menu.
- **Adobe Type Manager** with some fonts created just for WP.
- **New Macros** like the Pleading and Replace macros.
- **New Button Bars** that can be edited or create your own.
- **QuickFinder** offers fast indexing and text retrieval.
- **Mail-enabled** offers improved e-mail capability.
- **OLE** support is now provided.
- **QuickMenu** lets you get to edit options w/o using menus.
- Other enhancements are in installation and in using Windows print drivers - no more "Updating Printer Info" messages!

WordPerfect (DOS)

There is no *official* word on the next upgrade to WordPerfect 5.1 for DOS. Lots of rumors though that version 6.0 will be out around the middle of 1993. However, this is only speculation and you should not base your plans to acquire WordPerfect on rumor.

■ ■ ■

Software Review: Publish It! for Windows, Version 3.0

Review By: Jim Clark, Tampa IBM PCUG

What It Is: Publish It!, as the name implies, is a desktop publishing program by Timeworks, Inc. It has been a competitor in the low end of the DTP software market for quite some time now with its DOS versions. The Windows version is very similar to the DOS versions I have used, but it is more powerful because of the Windows environment and because of new capabilities that have been added -- like Power Text. Those who have used the DOS versions should have no trouble transitioning to the Windows version. For all others, there will be a bit of learning for you to do; I have not seen two DTPs that are all that similar in mechanics of operation.

The book says that you can run through the exercises provided and produce a document in an hour, but it takes just a little longer to become proficient -- like several self-generated documents. :

Features: Publish It! for Windows is more than an entry level program as some might think from its street price. Actually, it is a rather powerful program with many nice features. It has almost unlimited layout options and has the capability to handle up to 999 pages in one document. Some of the features included are:

A word processor with a 96,000-word spell checker;

Power Text which provides the capability to fill text and/or backgrounds with different patterns; mirror, shadow and rotate text; curve text in a limited number of given circular shapes -- similar to Word Art in MS Word for Windows; and skew (slant) text. Text created in Power Text is the only text that can be rotated in the program. Note, however, that Power Text works only with Adobe fonts. If you do not load Adobe and Adobe fonts, you lose Power Text and the ability to create

(Continued on next page)

(Continued from previous page)
special text effects from within Publish It!. You still have the Windows clipboard, however, to import from other programs.

An increasingly popular tool bar with several of the most frequently used commands represented. The tools on the tool bar change with changes in working mode (frame, text, paragraph, & graphics). The tool bar is otherwise fixed and cannot be changed by the user.

A master page option that can speed page layout throughout a document, and paragraph styles which makes text formatting/reformatting much easier and quicker.

Automatic text runaround of any text or graphic frame, and each instance can be tailored to the shape of the text or graphic contained in the frame if you desire, though the mechanics of doing so are a bit more cumbersome than I would like; and automatic bulleting.

Key Pad which provides ready access to the non-keyboard characters in fonts with complete character sets. Key Pad is available to other Windows programs through an icon installed in Program Manager at the time of program installation.

A selectable and adjustable automatic save feature, or a warning to save if desired -- though the warning beep can be a bit trying at times.

A built-in drawing capability for boxes (with or without rounded corners), circles and ovals, lines, polygons & freehand. You can fill and tint all of it, but there is no paint capability.

Capability to edit scanned images and some of the bitmap graphic formats.

Imports text from MS Works, MS Word (Windows & DOS), WP 4 & 5, Word Star, Windows Write, and RTF, DCA/RTF, and ASCII formats; and imports the following graphic formats: .SLD, .IMG, .LBM, .EPS, .GEM, .CGM, .PIC, .PCX, .TIF, .BMP, & .WMF. Of course, anything that can be copied to the clipboard can be pasted into Publish It!

Other Goodies included with the program are:

150 graphics, mostly .TIF & a few .CGM, separated into 8 different categories; and 100, yes 100, layout templates covering just about any kind of document you might want to create -- ads, invitations, reports, newsletters, and so on -- if any will suit your specific needs.

Adobe Type Manager for Windows (V. 2.02) with 25 fonts. So, if you don't have but always wanted Adobe, here is a chance to get it. Those with Adobe already might find a font or two they don't already have.

Purchase of Publish It! for Windows also entitles the purchaser to acquire (from Timeworks) SoftKey's Key Draw Plus for Windows program (version unknown) for $9.95 S&H. Key Draw, a free-form illustrator, is reputed to have rather powerful text and graphics manipulation capabilities -- skew, stretch, blend shapes, rotate, mirror, shade, fill, etc. It adds an additional 36 scalable fonts and 500 'professional drawings' to the package. I suspect that Timeworks includes it with Publish It! not only as an incentive to buy Publish It!, but to help make up for some of the more sophisticated text and graphics manipulation capabilities not built into Publish It! If Key Draw is as reputed, then the Publish It!/Key Draw combination is indeed quite a powerful package.

Documentation for the program is adequate and straight forward, and includes what is becoming the standard -- a quick start document (or in this case, "Getting Started") and a user reference document. The Getting Started section includes installation, and several exercises to familiarize you with the program and its capabilities. But there is no software tutorial. The Reference Guide gives more definitive information. On-line help is comprehensive, but is not context sensitive; one has to select the help needed from an index.

Requirements for the program are: A 286 machine or better; 2 MB RAM; a hard drive and at least one floppy with a minimum capacity of 720K (comes with 5.25" & 3.5" diskettes); DOS 3.1 or later; Windows 3.0 or later operating in standard or enhanced mode (the program will not even install in real mode); just about any video, including mono, except CGA; and a mouse. The manual says a minimum of 3.5 MB is need for the program and 2 MB for Adobe. I loaded everything and used over 7 MB of space in the process. But that includes about 2.2 MB for clipart and 1.8 MB for layout templates, both of which the average person could pare down considerably.

Installation is simple and clear cut. The program is installed through ProgMan, of course. You make choices about what portions to install and where to place those portions selected, and then you just sit back, watch and swap disks (seven 5¼" floppies, or five 3½", including Adobe). I have a 386DX/25 w/8 MB RAM, 5¼" HD floppies, 28ms RLL hard drives, and SuperStor disk compression. Loading the entire package took me about 30 minutes -- quite a long time. Improvements in your setup over mine should reduce installation time very substantially.

My View: While the distinction between high and low end DTPs is not nearly as sharp as it used to be, an old hat at DTP would not consider this a high-end DTP program. Yet, Publish It! for Windows is a powerful and very functional DTP, especially when combined with Key Draw. It has many nice and useful features. One I particularly like is the ability to import text and graphics into the program at the beginning of a project and have them ready for subsequent instant placement into the document at a later time of choice with a simple click of a button; I have seen no other DTP with that feature. Another is a two-page view with edit capability. Still another is the option to control which sides of a frame will print.

There are also a number on improvements I would like to see: An on-line comprehensive tutorial to make learning the program easier and quicker; more powerful character/line/paragraph spacing capabilities, especially character spacing which is now limited to kerning between two characters at a time; modify the need to create a frame for each and every text/graphic/drawing/line item to be placed into a document because this is time consuming and clutters the screen with boxes; ability to rotate text and flip graphics within the program itself; expand the tool box and make it editable; expand the capability of Power text to include

(Continued on next page)

(Continued from previous page)

mixing text and graphics (imported and created), provide greater flexibility in manipulating text (on curve, slant, rotate, skew, stretch, distort etc.), and allow use of other than Adobe fonts -- at least TTFs.

With a street price of about $73 for Publish It! for Windows and $9.95 S & H for Key Draw for Windows, I think the package is a pretty good buy. If Key Draw is as reputed, the package should satisfy some fairly sophisticated DTP needs -- especially if you have trouble with the BIG BUCKS required to buy one of the high-end DTP programs. It is certainly worth looking at.

ENVELOPE MACRO

WordPerfect 5.1 (DOS)
By: Ed Buzza

WordPerfect supplies a macro that will automatically print an address on an envelope for you. It's the Ctrl-E macro on the MACRO Keyboard. But since few of us use that keyboard, there is another way to use that macro — *move it*. You can have it as a stand-alone macro or remap your keyboard so that you can call up the macro with an ALT or CTRL letter combination.

How to move the macro: Keys to press are shown between < > brackets.

1) **<Shift-F1>**, **<5>** Keyboard, (**<DnAr>** to MACROS), **<7>** Edit, (**<DnAr>** to Ctrl-E), **<6>** Save, (at prompt, enter **<ENV>**), **<F7>**, (highlight your keyboard), **<1>** Select, **<F7>** Exit.
2) This will create a file named ENV.WPM and will be located where your other macros are stored. You don't *have* to call it ENV, name it what you will.

The way it works:

1) With your document (with an address) on the main screen, call up the envelope macro **<Alt-F10>**, **<ENV>**.
2) If the address is not already blocked, it asks that you do so. (It places [Math On][Math Off] codes as a marker.)
3) It selects a "macro env - Wide" paper form. If it does not exist, the macro creates it (it can be edited).
4) It positions the cursor at the top of the document and creates a new page. This new page is the "envelope." The blocked text (the address) is moved to this new page.
5) If the printer is ready, the envelope is printed. If not, WordPerfect will stack the printer job and prompt you to print the envelope.

Remap your keyboard

1) To play it safe, we'll set up a Test Keyboard file. **<Shift-F1>**, **<5>** Keyboard, (highlight your keyboard), **<5>** Copy, (at prompt, enter **<TEST>**), **<F7>**.
2) Stop. You have just copied your keyboard file to another keyboard file called TEST.WPK. We will experiment with the TEST.WPK, not your keyboard file. You can delete the TEST.WPK anytime that you want to. Now let's modify the TEST keyboard.
3) **<Shift-F1>**,**<5>** Keyboard,(highlight TEST keyboard), **<7>** Edit, **<7>** Retrieve, (at Key prompt, enter **<Alt-N>**), (at Macro prompt, enter **<ENV>**), **<F7>**, **<1>** Select, **<F7>**.
4) You have just copied the stand-alone macro ENV.WPM file to your TEST.WPK keyboard file. This means that you can delete the ENV.WPM file; select the TEST keyboard and use the Alt-N keystrokes to print an envelope.
5) You can remap any other macro file (those with an extension of .WPM) to your new TEST keyboard. Just follow the instructions in step 3) above (remember to use different Alt-letter keystrokes). And if you like the new keyboard, rename it or copy it to a new keyboard filename! Then use it as YOUR keyboard.

Book Review: Memory Management for All of Us

Book review by: Mike Janda, Madison PC User's Group

Recently, there were several message threads on the BBS concerning PC memorymanagement, and it even came up at the New Users SIG meeting. Only a fewyears ago, the important thing was to have 640K of RAM and most discussions centered on squeezing every possible byte from the operating system and TSRs. Today, many users are getting systems with 2, 4, or more MB of RAM. Now the questions center on how to make the best use of that RAM.

Memory Management for All of Us, by John M. Goodman, answers just about everyquestion that can be asked. The only caveat is that the book is over 1,100 pages! Like I said, memory management isn't what it used to be. However, the book is written in a clear and concise manner, is well organized, and makes for some fascinating reading. It's geared toward users with systems running DOS 5.0 and Windows 3.1. OS/2 is NOT covered since OS/2 has its own way to manage memory.

In this short review, I cannot even touch on the major topics covered in the book. What I can do is recommend it for anyone interested in making better use of their computer memory. It can also be extremely useful to someone who is considering an upgrade, whether it be adding to an existing system or purchasing a more powerful one. Now you can really know what you are buying (imagine asking the salesperson if the memory cache is fully-associative, set-associative, or direct mapping, and knowing what it means!).

Dr. Goodman classifies PCs into six "classes" (8088/86, 8086/88 with EMS memory board, 286, 286 with EMS

(Continued on next page)

(Continued from previous page)
memory board, 386SX, and 386DX/486). As each topic is discussed throughout the book, the options are spelled out for each class of PC.

The book is recommended by the publisher for "intermediate" users, although beginners can use it to learn more about their computers, and experts will find it a useful reference text. The index is over 40 pages and is very complete. I spent a lot of time using it to track down quite a few topics. It is $30 well spent and can easily pay for itself if you make a buying decision based on what you learned. I give this book two thumbs up!

Memory Management for All of US By: John M. Goodman, PhD. ISBN 0-672-27366-7,lists for $29.95, and is available at bookstores everywhere. It is published by: Sams Prentice Hall Computer Publishing ,11711 N. College Ave. Carmel, IN 46032 (800) 428-5331 (800) 448-3804 (fax)

■■■

What if PCs Were Sold Like Corn Flakes?

By: Brian D. Galloway, Contributing Editor, Columbus Computer Society, December 1992

I think most PC-related advertisements are dull and uninspired. The vendors dutifully inform us that their products are better and cheaper than the competition (lately, its has been mostly the latter). Next comes the inevitable shower of carefully crafted specifications and statistics. Maybe there are a few pictures of attractive people using the product, but otherwise it's pretty bland. If you doubt this assertion, I invite you to open any PC magazine and discover the disappointing truth for yourself.

The wildly inventive creativity that has characterized other branches of American advertising has yet to make significant inroads in the computer business. Why is this? Is it because PC buyers are perceived to be fundamentally different from people who purchase other products? Unlikely. We PC users also buy and use lots of other products. I strongly suspect our tastes in products (and advertising) aren't particularly unusual.

Could the difference have something to do with the PC as a product? This makes a little more sense, but it fails to explain why some other highly technical products (like performance automobiles, for example) have great ads. Maybe vendors think the PC is a business tool and want to market it in a very serious manner. Whatever the reason, I thinks it's time for the industry to lighten up. We can have a little fun and still get the job done.

To see what's possible, we need only look at how other products have been successfully marketed. I would think durability would be an important attribute to demonstrate for any portable product. Why not hire one of John Cameron Swazey's descendants to drag the Frobnitz SLG notebook PC behind a speedboat for a couple of nautical miles? Better yet, we could loan it to the gorilla which Samsonite hired to test the strength of its luggage. This would certainly eliminate any questions about the product's construction.

If consumers can be convinced that things like cars, beer, toothpaste, and shampoo are sexy, why not computers? Picture this scene: A man and a woman are sitting together on an airline flight. They obviously didn't know each other before they boarded the plane. They make small talk for a few moments. The woman asks the man about his current project. He pulls a HyperSloB notebook from beneath the seat. The woman displays a broad smile as she removes an identical machine from her briefcase and comments "Well, you certainly know quality." Fade to the pair walking together in a distant airport parking lot ... If this approach won't sell, I hear the Swedish Bikini Team is available.

Even if you can't entice customers to buy a product, sometimes they can be frightened into doing so. An example is the old ad for Wisk detergent which implied that if one didn't religiously buy and use the product, they would suffer endless ridicule due to a horrible affliction know as "Ring Around the Collar." A worse fate can hardly be imagined. This principle can be applied to the PC market. Consider presentation graphics software. The sketch goes something like this: A junior staffer is charged with making a big presentation before the board of directors. He does his best, but without SuperBuffoonGraff 3.6 for Windows, his overheads look like they were prepared by Mrs. Johnson's morning kindergarten class armed with fat purple crayons. The board laughs, hoots, and howls without mercy. The portly chairman has to be helped back to his office after completely loosing all control. The scene closes with our here back at his desk, slowly placing items into a cardboard box and muttering "I shoulda used SuperBaffoonGraff 3.6 for Windows ... " Now that's effective. If these tried and true advertising techniques fail, there is always sheer idiocy. This is the school of thought which brought us the Tidy Bowl man in a boat floating in the toilet tank of some poor unsuspecting housewife (I always wanted the people in the ads to flush). Nothing, however, can match the insanity of the Ajax knight featured in mid-60s television commercials. Here's a guy wearing shining armor from head to toe, carrying a jousting lance, riding a white horse down a suburban street, and screaming "Stronger than dirt." They have a place for people like that.

An anti-virus software package could be sold this way. Picture a small collection of plumber types (assorted shapes and sizes) standing together and singing:

"Computer Rooter, you're at risk,
Keep that virus off your disk."

The opportunities are endless. My guess is once one vendor successfully breaks out of the established pattern, many other will follow. It can't happen soon enough for me.

PrimeType

From LaserTools

Using PostScript Typefaces With DOS WordPerfect

Review by: Rod McKenzie, Contributing Editor, Madison PC User's Group

Maybe this is the case with you. You'd like better looking typefaces than theones in your printer, but you're not ready to work in Windows and a new laser printer is out of the question. You don't need to envy the Windows word processors any more. Any PostScript Type 1 typeface can be used with WordPerfect for DOS simply by adding PrimeType from LaserTools. You don't need a PostScript printer. In fact, it doesn't require that you use a laser printer at all.

It really is a simple task to load PrimeType and get it running with WordPerfect. The setup program moves the user through a very straightforward process of installation, starting with selection of the directories where PrimeType will reside and where it can find the font files that it will need. The PostScript Type 1 files are scaleable so it doesn't use a lot of hard disk space to hold a large selection of typefaces.

Besides WordPerfect 5.0/5.1 for DOS, PrimeType works with LetterPerfect 1.0, PlanPerfect 5.0/5.1, WordPerfect Works 1.0, and WordPerfect for Windows 5.1. To support the Windows version, PrimeType includes a copy of Adobe Type Manager. There are 13 fonts supplied with the software to get the user started. Many sources exist for PostScript fonts: Adobe, Image Club, The Monotype Library, other third-party vendors, the user group BBS, shareware authors, and even freeware.

PrimeType's installation program, PTINSTAL will add several printer driver files for WordPerfect. It's necessary to have selected one of these special printer drivers first, before trying to include the fonts into a document. There are printer drivers for dot matrix, inkjet, and laser printers. In the case of laser printers, the program will ask the user to identify how much memory the printer has installed. During the setup of the printer driver, the user will have to identify the drive and directory where the PostScript files will be found. After selecting a printer, select the Edit option, and then press C for cartridges and fonts.

Using WordPerfect with PrimeType is a simple matter. Start the program by typing PTWP. This will start PrimeType and WordPerfect at the same time. To get at the fonts and choose one of these special typefaces that's going to catch lots of attention, press Ctrl-F8 for Fonts, and F for Base Font. A list of the fonts that have been loaded in PrimeType should appear. Highlight one from this list and then enter a point size to get started.

LaserTools has made it as easy as possible for the WordPerfect user to enjoy the direct access to fonts that the GUI word processors have at hand. They've included a keyboard definition file called Quick Keys, which gives the control key combinations that really speed up the management of typeface appearance. The keyboard definition is selected in the Shift-F1 Setup screen, under the Keyboard Layout choice. Here are some of the key combinations: ctrl-b (bold), ctrl-c (center), ctrl-f (base font), ctrl-i (italics), ctrl-u (underline), ctrl-[(open double quote), ctrl-] (close double quote), ctrl-r (round bullet), ctrl-m (special characters menu). Wait a minute! All this action with the Control key? Did somebody from WordStar just sneak in the side door?

Users who find that changing from their DOS-based version of WordPerfect is just too much trouble, but still want the graphical typefaces that PostScript can offer, should take a serious look at PrimeType from LaserTools.

PrimeType is priced at $99 and is from:

Tested by Don Hage

Manufacturer: Altra 520 West Cedar St., Rawlins, WY 82301 800-726-6153 Size: height .875", length and width 5.75" weight 9 ounces, cable length 6.83 feet. Connector: 25 pin Serial, 9 volt external power supply. Software Included: Self installation/Test program, 100% Microsoft Mouse Compatible, Windows 3.xx drivers, ADI Autodesk drivers. System Requirements: IBM PC, XT, AT, PS/2 or compatible.

"Build a better mouse trap, and the world will beat a path to your door." If this is true, then Interstate 80 and US 287 will be busy going to Altra in Rawlins, Wyoming. Felix is a unique type of mouse which remains in the same position on your desk. It was considered "Best of Show" in the fall Rocky Mountain Computer Conference. Because of its fixed electronic design, it is the mouse used by astronauts in spacecraft under zero gravity.

Felix is a 1.5 inch square mouse in an electronically "caged" 5.75 inch platform. It is controlled by finger motion similar to that of holding a pencil, holding the handle between the thumb and the middle finger. Total coverage of the screen can be made by slightly over a one inch movement. Your forearm can therefore rest comfortably on your desk, while your fingers control the movement. I use Felix set relatively far back and use my old mouse pad as a rest for my forearm.

While the motion of Felix is just over 1 square inch, it can handle screens from 9 inches up to screens as large as 40 inches in each axis. At startup, you touch the top, left side, bottom, and right side (or any sequence that touches all edges of Felix) which then corresponds to the four edges of the screen. The mouse is dynamically controlled. A fast motion provides quick movement around the screen. A slow movement allows finer control. Some suggest using the index, middle and ring fingers for slow accurate movement. You have to get used to these

(Continued on next page)

(Continued from previous page)

movements. Going from a mouse to Felix has been compared to going from a pick-up to a high performance race car. T here are two mouse buttons on the top of the handle. The longer button corresponds to MicroSoft's left button (the one used most) while the smaller button insert corresponds to the right button. I like Felix's action in "double clicking" the mouse in GEM's vector Artline drawing program for drawing curves than the common ball mouse. It seemed that I always jerked my arm while double clicking with a regular mouse so that instead of framing the drawn curve, it drew another unwanted line. While this still occurs with Felix, it occurs with less frequency. Altra's manual and its 7/15/92 README release notes had instructions for keyboard emulation using the left or right alt keys on the newer style keyboards. However, they wouldn't work for me. I dialed Altra's 800 technical help number and found they had abandoned this feature because "there wasn't too much demand for it." Personally, I think abandonment of this feature was unfortunate because it could have eliminated the movement problem I have with Artline. (Of course, programmers could have used the little used the little used right button instead of a double clicking operation.)

Other programs which could use a mouse worked well with the two-button Felix with the exception of MicroSoft's "FLIGHT SIMULATOR" which acts erratically. Altra's technical assistance indicated that they probably would have to make a separate driver for "FLIGHT SIMULATOR." They have a special mouse driver for Windows which worked fine in all my programs including Micrografx's Windows Draw. Felix also has a separate driver "FLXADI.EXE" for AutoCad.

Settings for Felix can be adjusted by ASCII editing of their MOUSE.INI file for permanent changes or through DOS command options. There is a four level sensitivity option from 1 to 100: FELIX /S# (sets both horizontal and vertical sensitivity, /H sets horizontal sensitivity, /V sets vertical sensitivity or /D sets sensitivity of the double speed threshold. These work with relative or "mickey-based" applications such as Word Perfect's version 5.1. They do not affect pixel-based mouse operations where Felix works in the absolute mode.It also has 3 acceleration profiles plus an unaccelerated profile, an option which enables or disables a locked cursor for applications which change the mouse cursor, a cursor delay option for slow LCD displays in Laptops, and options which can change pointer size and colors.

The serial Felix was easy to install once I found a nine pin to 25 pin serial adaptor which would work. The first was just an adapter plug, which worked but did not allow the plugging in of a parallel outlet to one of my printers. I searched over Boulder for a short 3-6" adapter cord, but had to settle for a light 6 foot adapter cord. Retailers should stock short cords if they sell Felix. While Altra has an attractive Felix Users Manual, it is outdated (1991) and practically useless. Neither the manual nor the 7/15/92 README release indicated what the two buttons represented. You had to find out through their FTEST.EXE program included on disk.

In conclusion, I like Felix very much with a four star rating. I would recommend it to anyone. Its dynamic response to finger motion provides a fast or slow pointer control. For those who make considerable use of the mouse, its quick response allows you to get more work done while resting your arm. Its ergonomic design can help reduce Carpal Tunnel Syndrome. It takes little space and its fixed base not only allows you to keep your eye on the screen but probably is more durable because it does not pick up the dust and particles which a mouse with a ball can gather.

Only those who attempt the absurd, can achieve the impossible!

MOORE WINDOWS!

By: Pete Moore, FROG
Computer Society, Rochester, NY -

This bulletin just handed me, ladies and gentlemen . . . According to highly placed sources in Silicon Valley, all of the personal computer hardware and software presently in use throughout America is obsolete and useless. Users are urged to donate all such items to the non-profit institutions of their choice, and to immediately purchase replacement systems and complete software suites, which will enable them to function minimally until such time as adequate equipment and programs become available.

The suggested minimum hardware configuration is as follows: a full-size, eight-bay tower case; 300W power supply; 486DX2-66MHz local-bus EISA motherboard with 64MB of 60ns DRAM; 20" or larger non-interlaced color monitor, capable of 1280 by 1024 pixels; a local-bus SVGA GUI accelerator video card with 4MB of linear-addressed VRAM; a 1.2GB 10ns SCSI-2 hard disk, with a local-bus controller and 16MB of on-board cache memory; a dual-speed CD ROM drive; a stereo sound card capable of 16-bit, 44.1K/sec sampling, with a MIDI interface; a gigabyte tape drive for backups; and a 132-key keyboard with built-in calculator and trackball.

While an operating system capable of fully utilizing these machines' capabilities is not yet available, Microsoft Corp. promises that it will be shipping Windows NT "Real Soon Now," with many multi-threaded 32-bit applications slated to ship "Real Soon After That." Until such time as these are available, users are urged to purchase MS-DOS 5.0, Windows 3.1, and every other program that Microsoft sells. Users are assured that while these applications may contain some minor, unavoidable limitations, the forthcoming 32-bit versions will solve all of these problems, and will be available for truly nominal upgrade costs, estimated to be no higher than $199 per product. Please stay tuned to this station for further bulletins.(Continued on next page)

(Continued from previous page)

Okay, I didn't really get that bulletin handed to me. I sort of figured it out for myself, by reading between the lines of the product reviews, announcements, and ads currently inundating every PC-oriented magazine I see.

For instance, Intel's "not-a-586" P5 processor (also to be released Real Soon Now) has a 64-bit internal bus. Ouch, babe! Apparently this latest wonder is going to be what you might actually call a "686SX," to tide us over until "true" 64-bit processors become available. Forget your 486s, and don't even admit you still own a 386. 286? 8088? Aren't they some kind of fossils or something? Didn't they use vacuum tubes for memory?

I'm going to admit something to you. I write about the latest and greatest software, specializing in Windows, yet I actually do most of my word processing on an 8MHz XT with a 20MB hard disk. I use the Norton Editor most of the time.

All right, I admit that I own and regularly use a 286 and a 386, and I really DO like Windows, but my point is that for most of the stuff I REALLY do, an XT is (gag!) adequate. There, I've said it!

Ever feel like a second-class citizen of PC Land? Or maybe third- or fourth-class? Frustrating as it may be, my company forces almost all of its office-type employees to scrape by with XTs, most with true-blue IBM monochrome or CGA displays. Their major foray into high-tech, besides a 386SX to run AutoCAD, is to upgrade their software to the latest versions of the applicable DOS programs -- Word Perfect 5.1, Quattro Pro 4.0, DOS 5.0 . . . You get the picture. And I'm sure they're only doing that because they're afraid some disgruntled employee might blow them in for using unlicensed copies of some five-year-old programs.

There's a lot of pressure now on the people who must make the hard decisions about buying PCs and software for themselves and their companies. I can't remember a time when there has been more emphasis on PC performance, or when more companies were marketing their products as the best stopgap until the Real Thing gets here.

Now I know that's not actually what the ads say, but how many ads have YOU read that contain the words "upward-compatible"? Intel has based an entire (reasonably successful) ad campaign on the Overdrive Socket in 486 motherboards, focussing attention on the motherboard's ability to accept anything from a 487SX to a 486DX2 to a "not-a-586!" P5. When Windows 3.1 came out, and increasingly since, we've been hearing how great Windows NT is going to be. It reminds me of all the products that have come out over the years touting themselves as "New and Improved," prompting some of us to ask, "What were we using before? Old and Crummy?"

I spend a lot of time (okay, a ridiculous amount of time) looking for new ways to tweak my hardware and software for greater speed and ease of use. (Or is that "ease-of-use"? It's one of those phrases that's on its way to becoming a single, hyphenated word, through sheer overuse.)

I do that for two reasons. First because I, like most of us, can't afford the hardware I'd REALLY like; and second, just because it entertains me. Some people spend hours playing PC games, or even subscribe to the Sierra Online Network, so they can play King's Quest and Blackjack with people in other cities, while never leaving their living rooms. But for me, the whole durn thing is the neatest playground ever devised by the mind of man.

Before Windows 3.0 came along, when Windows was just a cute but AMAZINGLY slow DOS menu program, I got my jollies optimizing memory usage with QEMM, and playing with disk caches and RAM disks, using DOS software exclusively. But since Windows 3.x, the sheer number of ways I can tweak and tweeze has risen exponentially! Now, besides caches and RAM disks, there are fonts, wallpaper, ProgMan and FileMan replacements and enhancers, Windows programming tools, and three bazillion other things to twiddle with. I'm in my glory.

Now as a (sort of unintentional) side-effect of this obsession, I have accidentally learned some genuinely useful things about memory and disk optimization, setup and "EezOfUse" tricks, and a couple hundred other miscellaneous factoids. I've been able to give helpful advice to people about this stuff, and some of the people are technically very competent themselves. They simply haven't got the time (or obsessiveness) to plow into this stuff to the degree that I do.

And that brings me (by an exceedingly circuitous route) to my main point. Namely, that while it is more true now than ever before in the history of the world, that the tools you buy today will be semi-obsolete in six (okay, three) months, you can still get years of good use out of them. Just because you can't spring for enough silicon to run Windows NT doesn't mean that you can't do the things you ACTUALLY NEED to do on a 386SX (or even *urk!* an XT) running Windows 3.1, or GeoWorks, or DESQview, or the DOS 5 Shell task-switcher, or (dare we say it?) the C:\> prompt.

What, you may be wondering, is all this drivel doing in a Windows column? Well, I just realized ("Earth to Pete . . .") that like most or all of the people who spend lots of time reading, thinking, and writing about Windows (or PCs in general), I more or less by definition spend my time scrutinizing individual trees, while remaining blissfully ignorant that such a thing as a "forest" might exist.

In other words, it's too easy to get caught up in the latest and greatest vaporware, never stopping to consider that to most computer users, the point of the whole thing is to get some work done. Most of you really care about getting that report written, or those numbers crunched, and don't give two hoots about whether your Windows setup is optimal -- you just don't want to see "General Protection Fault" pop up over that spreadsheet at ten minutes to five.

And I say, more power to ya. You want your stuff to work, and I want it to work better. And when you see that GPF pop up, you give me a call. Meanwhile, I'll just keep on diving into the latest Windows issues month after month, and you just keep on actually getting your work done on whatever hardware and software you REALLY use, and Intel and Microsoft will keep on trying to convince us that everything we own is Old and

(Continued on next page)

(Continued from previous page)

Crummy. But we'll get our work done anyway... Or you will. Me, I'm gonna go crash my hard disk again, and reinstall forty-'leven pieces of Windows software. Then there's this great new Windows shell I wanna try . . . Pete

Tampa IBM PC User's Group

BITS of BLUE

VOL. 6 NO. 3 **March, 1993**

MEETING
(2nd Wednesday every month)

DATE: March 10, 1993
TIME: 6:00 PM
PLACE: IBM CUSTOMER CENTER
LAKE POINTE ONE BUILDING
3109 W. Martin L. King Blvd.
Room 450
DIRECTIONS:

The Tampa IBM PC Users Group meets in the IBM's LAKE POINTE ONE Building across from Tampa Bay Mall one block east of Tampa Stadium.

The best entrance is on Martin Luther King Blvd. at the traffic light in front of Burdines. As you turn North off Martin Luther King Blvd. you will see the LAKE POINTE ONE BUILDING on the left & parking on the right. Join us in ROOM 450 - 4th floor. **Guest please sign in.**

MARCH AGENDA:
3/10/93

6:00 PM - opening remarks

6:30 PM - Demo by Lotus Corp. of:

IMPROV for Windows
The first dynamic spreadsheet for Windows

7:30 PM - Break
7:45 PM - Open Discussion
Door Prize Raffle -
Lotus Ami Pro *for Windows*
Lotus 1-2-3 *for Windows*
Freelance Graphics *for Windows*
Lotus Organizer *for Windows*
& Miscellaneous Items

Bits of Blue is published by the Tampa IBM PC Users' Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about IBM-PC and compatible personal computer systems to its members.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII file or in a commonly available word processor format, such as WordPerfect 5.1, on diskette to the editor at 9402 Hidden Ridge Place, Tampa, Florida 33637 or send it by modem to BBS (813)239-3704.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for non-profit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

Commercial advertisements will be accepted at the following rates:

	1 month	3 months	6 months
Full Page	$60.00	$162.00	288.00
Half Page	$40.00	$108.00	$192.00
Quarter Page	$22.00	$60.00	$106.00
Eight Page	$12.00	$33.00	$58.00
Business Card	$10.00	$27.00	$48.00

All advertisements must be prepaid by check payable to TIBMPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if it is not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, Marylee Bruneau at (813) 985-3338, for space availability and for further information.

This newsletter was created with WordPerfect for Windows donated by WordPerfect Corp. to TIBMPCUG for use by the editor.

SECRETARY'S REPORT

MINUTES OF 2/10/93 MEETING
By: Jim Clark

WOWeee!!! If you were not at this meeting, you missed a REALLY GOOD ONE!!. Corel Corporation was good enough to send a lovely and efficient rep to give us a presentation on CorelDraw. And we had a big turnout, with many guests. Don Patzsch and Kevan Sheridan were conducting their very popular modem class in another room, while our user group meeting room began to fill. By the time our meeting started shortly after 6 PM, the room was just about full. The folks attending the modem class found few seats left when their class let out at 6:30, and some had to stand or sit on the floor. But, it was well worth the inconvenience.

CorelDraw is a large and powerful program, and it takes considerable time to just touch on its capabilities. Our illustrious Prez wisely chose to keep other normal meeting activities to a minimum to allow as much time as possible for the presentation.

INDUSTRY/CLUB NEWS

□ Word Perfect 5.2 is on the market; one member reported that at the $34 upgrade price it is an excellent bargain, especially since it includes Adobe Type Manager 2.5. WP 6.0 is expected to be available this Summer.

□ Pagemaker 5.0 will be on the street soon and the reviews of the program have been very good.

□ MS DOS 6.0 should be out in a couple of months. It will include a compression program that some believe is very similar to Stacker, the creators of which are suing Microsoft.

□ Gateway continues to be a leader in computer sales, but many report their sales are growing faster than their capability to provide technical support. Some report that it is very hard just to get through to them, and with their taped leave-a-message answering facility, it is harder to be able to talk with anyone. But, it is also reported that when you finally get to talk to a human, you are given excellent service. Gateway says it is working on the problem and is adding many new support lines and some 75 additional tech support personnel. Look for tech support at Gateway to improve.

□ Harvey reported that a premier issue of PC Novice magazine is available at many of the computer stores -- like Comp USA, Work Place, Office Depot, Computer City -- that contains a lot of basic PC info. It is free at Comp USA (and probably at all the locations) and is a worthwhile pickup.

(Continued on next page)

(Continued from previous page)

□ The vendor presentation scheduled for March is Lotus SmartSuites.

PRESENTATION -- CorelDraw

Corel Corporation was kind enough to send a knowledgeable and professional representative -- Denise Zutrauen -- to give a presentation of CorelDraw 3.0 to our User Group. And the turnout for the presentation -- like the program -- was quite good.

CorelDraw 3.0 is a Windows program. I have never used CorelDraw nor any other similar graphics package, so I have no basis for comparison. As CorelDraw users already know -- it is a very powerful program and it seemed to me that it can do just about anything that one might want to do in the way of creating graphics and presentation . I can't imagine anything one might want to do with text, for example, that this program will not do -- bearing in mind, of course, that CorelDraw is a graphics package, not a word processor (though it does include spellcheck, hyphenation, columns, a thesaurus, and other word processing features). As Denise noted, she could spend days covering all the features of the program; I do not propose to even cover the highlights of this very powerful program in the limited space of this newsletter.

Denise stated that CorelDraw consisted of 12 applications, and it does. From a user standpoint , however, I would say it has four major applications -- Draw, Chart, Photo-Paint and Show for illustration, charting, bitmap editing, and presentations -- with the other 8 applications supporting these majors. The other 8 include: CorelTrace, which allows bitmap graphics (photos, etc) to be converted to vector graphics; CorelMosiac, a visual file manager which gives the capability to preview application files, view Kodak Photo CDs, print catalogs of artwork and Draw files; Capture, which allows the capture of anything created in CorelDraw and export as a .WMF; and Show Run-time, which gives the capability to run presentations on computers that do not have CorelDraw installed.

Version 3.0 uses TrueType fonts, but will support the proprietary fonts used in the previous CorelDraw versions. It imports text from all the major word processors, and PCX, TIF, BMP, AI (EPS), GEM, PIC, HPGL, CGM, PIF (GDF), PICT, WMF, GIF and TGA graphic formats. It will export in these same formats as well as EPS, SCODL, WPG, and TTF. It will export in color and greyscale, with user definable resolution, and it has a 24-bit color capabilityy. CorelDraw includes over 150 hinted True Type fonts, over 4500 clipart images and symbols, and a host of templates, bitmaps and special effects. A bonus CD that comes with the package includes 250+ True Type fonts and 12000 clipart images and symbols, along with more templates, animation flics and CorelPaint samples. It is also network ready.

The program appears to be well connected with consistent and intuitive interfaces, and appears to be relatively easy to learn. It uses roll-up menus throughout, and reportedly includes excellent context senitive on-line help. And, it supports OLE, DDE and MDI.

The program requires Windows, of course, and it will reportedly run on a 286, but I suspect it would be quite slow. A minimum of 4 MB of RAM is required, but here again, the more the better. A minimum loading of the program would take up 12 MB of hard disk space, while an installation with all the bells and whistle would consume 30 MBs. If you load it on a machine using Windows 3.0, then you must have Adobe TM 2.0, which is not included with the CorelDraw package. A mouse or tablet is required, as is VGA or better video.

One in the audience asked about any problems of compatibility betweeen CorelDraw and compression programs such as Stacker. Denise responded that they had received some calls reporting varying problems, but there had been nothing consistent in the problems, not out of line with problems reported with other interfaces. Others in the audience reported no problems in using CorelDraw with Stacker.

Denise stated that Corel was expanding its technical support and training in several ways, including providing more fax and mail support, and training on CorelDraw at outlets throughout the country, as is now provided at Comp USA in Tampa.

The CorelDraw graphics package lists for $595, but is available at local outlets for $395. I do not take those numbers lightly, but there sure is a lot of capability in the package.

Denise and Corel, a great big THANK YOU for a super presentation of a super powerful program, and for Corel goodies you left with us. We are more enlightened on and impressed by your program -- CorelDraw 3.0.

AND THE WINNER IS

Thanks to the generosity of Corel Corporation, Powerup Software, and Sunrise Computer, along with the 50/50 cash drawing, there were some very nice raffle prizes. Those among us to have the good fortune to win are as follows:

Ron Mipth	Copy holder/Disk cleaner
Ana Elliot	Corel ArtShow 3
Joe Esposito	Corel ArtShow 3
D. Gaigano	Express Publisher
John Witmer	Corel SCSI Software
Philip Tyrgansk	CorelDraw 3.0
Mel Flynn	50/50 ($93)

the meeting adjourned at about 8:40 PM

•••

"Forgive your enemies,
but never forget their names."

John F. Kennedy

President's Column:

A great big thanks to Corel Corporation for sending Denise Zutrauen to show us why their software, Corel Draw, is number one. As the 110+ in attendance saw Corel Draw has a lot of power and is now bundled with paint and chart software. See the Secretary report for additional info. Our appreciation also goes to Corel for providing the many raffle products. If you didn't win anything at the last meeting, come this month for even a bigger software raffle. We will raffle at least five Lotus software products including Ami Pro. While our last meeting was exceptional, it was unfortunate that events in the Tampa Bay Area against tourist did not give Denise a true feeling of our southern hospitality.

Those of you in attendance may have noticed that there was only standing room at the last meeting. It is becoming more obvious that our growth is beginning to tax the facilities which IBM generously (FREE) provides our group. The Board is in the process of looking for an alternate facility to run our general meeting and classes. We are looking for a site within the same area which will allow seating for 300. Additionally, the location must have additional breakout rooms where we can hold our educational classes. Other issues include hardware, such as computers and projection equipment which we need for presentations. The proper hardware would cost our group around $5000 if we were to buy it. However, some facilities, such as high schools and HCC, have computer labs which may be able to provide us with this equipment. We have talked to Jesuit High School and are presently talking to HCC. It will be difficult to find a gracious host, like IBM, that will provide the space and equipment free of charge. Nonetheless, the board will take the challenge to move forward and find the best facilities we can at a minimal cost to the group. If you know of a place that may fulfill some of the above needs, please contact me or one of the board members. The same applies if you or your company has equipment the group could use for meetings.

Since the holidays I have traveled a couple of times out of state on business. Generally the flights can be unproductive time. However, I look forward to those trips and that time because its the only time I can read a good computer book or couple of magazines cover to cover. Stuck in a terminal between flights, no problem, pull out a memory management book, a highlighter and get a better understanding of how to tweak those memory chips. A memory chip is a terrible thing to waste, especially if you are running Windows. Take a computer book with you next time you take a flight. The FAA is taking a second look at computer use on airplanes. We might be relegated to reading about computers instead of using them during a flight. Personally I would like to see the FAA spending more time on correcting the "fast food drive-thru" audio system installed in every plane instead of worrying about real high tech stuff like Game Boys and computers.

In closing I would like to make everyone aware that some hardware vendors (video card manufacturers) have been put on notice for creating video device drivers which are designed to enhance their benchmark performance under Winbench and Wintach test. These video drivers contain code that specifically recognizes that it is being benchmarked. This results in above normal performance ratings. Steve Gibson, developer of SpinRite and president of Gibson Research, has put these vendors on notice. While no specific companies have been mentioned, Steve will name those vendors which choose to continue this process on beyond May 1st. It is hard enough to pick good products from top manufacturers without them skewing benchmarks to fool us. Shame on them for using these tactics and HOORAY for watchdogs like Steve.

Harvey Bruneau

Font Software Review:

The Flintstones Font Pack
A TrueType Font for Windows 3.1
By Bitstream Li'l Bits

By: Billy Birdwell, Pentagon PC User Group

Being a journalist by training and an ameteur typographer by avocation, I jumped at the chance to review The Flintstones Font Pack. (Besides, I considered it a good trade from Enable that I originally won as a PPCUG door prize recently.) I had just loaded Windows 3.1 and I was eager to try TrueType fonts.

As I expected loading the program is a snap in Windows. Put the disk in a drive and double click on "Control Panel" then double click "Fonts" and "Add." Follow the window dialog box and within moments you have five new fonts added to those resident in Windows 3.1.

My 12-year-old daughter can do this! (She's a real Windows fan.) In fact she was the first to try out the new fonts with a quick letter to her friend in Colorado. By using the resident Windows Write she composed a letter in minutes and added highlights from the Flintstones typeface.

Granted, I wouldn't compose a letter to the chief of staff using the decorative typefaces such as Flintstones, Bedrock or Impress, but they are nice to have for the occasional family newsletter. They are useful for cute invitations and other light-hearted writing. Be aware that the Flintstones characters are copyrighted so legally you're only allowed to use them for personal, non-commercial use or for writing glowing reviews of their product.

As with all TrueType fonts, all five typefaces in the pack are fully scalable and appear on my screen just as they print, even on my little dot-matrix printer. This is a real delight for this Pulitzer-prize-winner-wannabe.

I just wish I had installed all this before our Christmas family newsletter. Hmmm, maybe an Easter newsletter is in order....•••

COMDEX/Spring - WINDOWS WORLD TO HOST 1,000 Exhibitors, 75,000+ ATTENDEES

IBM's Cannavino - Microsoft's Gates to Keynote

NEEDHAM, Mass, Feb. 23, The 13th Annual COMDEX/Spring and 3rd annual WINDOWS WORLD, produced concurrently in Atlanta, May 24-27, are poised as strong launching pads for major product introductions from key industry vendors.

"A dynamic new industry is emerging which focuses on individual technologies such as network computing, imaging and multimedia," said Sheldon G. Adelson, CEO of The Interface Group. "These two shows may prove to be the most significant showcases of technology in 1993.

One of the highlights in Atlanta will be Microsoft Corporation's rollout of Windows NT, the company's long awaited 32-bit operating systems with strong network computing capabilities. Bill Gates, CEO of Micorsoft Corporation will keynote WINDOWS WORLD, Monday, May 24 at 9 a.m. On Tuesday, May 25, Robert Palmer, CEO of Digital Equipment Corp. will deliver the CEO Perspective at 9 a.m.

COMDEX/Spring will be keynoted by James Cannavino, senior vice president and general manager, IBM Personal Systems on Monday, May 24 at 1 p.m. The CEO Perspective will feature Jim Manzi, CEO, Lotus Development Corp. on Tuesday 25 at 1 p.m. Adelson predicted that attendance would exceed last year's record of more than 75,000 attendees, including some 5,000 delegates from 70 countries.

The exhibit floors will once again feature more than 1,000 exhibitors including hundreds of companies that will participate in Showcases, which are dedicated areas on the exhibit floor highlighting today's hottest technologies. Both events offer comprehensive educational programs that directly support the Showcases.

COMDEX/Spring features Showcases for: Network Computing, Multimedia, Mobile Computing, UNIX/Open Systems, Office Systems and OEM Sources. WINDOWS WORLD Showcases include: NetworkComputing, Multimedia and Mobile Computing. COMDEX/Spring's conference offers 70 sessions and is divided into six programs that will focus on network computing, office technology, open systems, imaging, UNIX, OEM components and international markets. A major presentation on the North America Free Trade Agreement (NAFTA) is also scheduled.

The WINDOWS WORLD conference features 50 seminars and is divided into three programs: Corporate Computing, Windows Developers Program and the Windows Channel. Seminars will address technology management, network computing, multimedia, software developers strategies and Windows technical support. In addition, Microsoft will offer to all attendees, free Windows NT Workshops on Wednesday, May 26.

COMDEX/Spring has once again been certified by the U.S. Department of Commerce for participation in its Foreign Buyer Program. Officials will be available on-site in the International Business Center to facilitate contacts between U.S. companies and overseas delegates.

Editorial Comment: Any member desiring additional information regarding COMDEX/Spring '93 may contact Marylee or harvey at 985-3338. We have a few pre-registration forms, which contain program fees and rates on various accommodations in Atlanta.

Software review:

R&R Report Writer for xBase ver 5.0

By: Lee Keely, MBUG

Do you want to want to produce slick, professional reports from your database or spreadsheet files? Have you been frustrated by the limitations or difficulty of making your reports look exactly as you wish when using the report writers included in your basic database or spreadsheet packages? Is your business using programs which store your data in different formats such as dBase, Paradox,WQ1, etc., and you want to bring these data all together in one report? If the answer to any of these questions is yes, you need to look into a report writer.

More than a dozen companies have created specialized report writers to enable you to produce high quality reports from multiple database formats without programming. So, there must be a need for this by many people.

One of the leaders in this field is Concentric Data Systems R&R Report Writer. I reviewed version 4.0 of R&R for dBase in the June 1992 issue of this newsletter. Please refer to that review for additional ideas on why you should use this program.

Version 5.0 includes some very useful enhancements. There are the normal additions of new printer drivers, improved memory management and improved installation procedures, but there are also new features which increase the utility of the program. The following features are listed in order of value to me as a user.

Stand-Alone Locking Changes. In previous versions, stand-alone users whose systems failed or who turned off their computers while running R&R had to unlock their serial numbers using RRUSERS. With version 5.0, users will no longer be "locked out" if their systems fail when R&R is running.

(Continued on next page)

(Continued from previous page)

Export to Database and Worksheet Files. In my programs using 4.0, I frequently need to write a report to ASCII then import the ASCII format into a dBase file. Now R&R can write directly to a .DBF file and bypass the ASCII step. This is a helpful improvement, but you can only write or overwrite a .DBF file and cannot append from R&R. Also, although you can write to .WK1 and WQ1 files, you cannot import or develop reports from the spreadsheet files. I'm confident that this will come in future versions.

Runtime - RI_Query and RI_Preview. Runtime remains a unique strength of R&R. It will run previously designed R&R reports from the DOS prompt, a DOS batch file, or from within database programs. Previously, runtime would immediately run the report without the ability to change the query or preview it to verify everything looked good. Now you can set up Runtime to allow you to edit the Query and/or display the preview screen before printing the report.

Added Functions. R&R has many functions available above and beyond those available in dBase. Version 5.0 has added 12 more new functions, including 4 lookup functions which can be used to manipulate the database to broaden the information in the report.

Data Dictionary. You can now build a data dictionary which contains descriptive information about the database fields used in reports. When the user highlights a field, information will pop-up describing the contents of the field.

Mouse. The mouse capability has been added with version 5.0. You can use it to point to fields, scroll reports and perform other R&R operations. This first mouse implementation is a step in the right direction, but will certainly be improved over time. For example, each field must be clicked on individually to mark for a move, delete, etc. Ideally and consistent with most mousable programs, you should be able to hold down a mouse button and mark several fields by dragging the mouse.

Overall, Concentric has produced excellent enhancements to an already valuable product. Anyone wanting to generate reports better and easier than can be done from his xBase programs should seriously look into this program.

R&R is produced by Concentric Data Systems, Inc. 110 Turnpike Road, Westborough, MA 01581. Telephone (508)366-1122 or (800)325-9031.

Product Review:

Chinon FZ-358, 3.5 4MB Floppy Disk Drive

Pentagon PC User Group

Hardware: 3.5 floppy disk drive
Controller card
Drive interface cable
Software: None required

Test Platform Hardware: 486/33MHZ, 8MB RAM, 2 IDE hard disks, 5.25 HD floppy, 3.5 HD floppy, SVGA monitor, SCSI CD-ROM, Lantastic network,
Software: OS/2 2.0, Windows 3.0/3.1, DOS 5.0

The floppy drive came with documentation, but the controller card documentation was not passed along with the card. There are 16 DIP switches on the controller card 12 of which were set through trial and error, the other 4 were left to their default settings. These 12 DIP switches are used for setting the type and number of floppy drives attached to the controller, 3 switches per drive for 4 possible drives.

The physical installation of the drive went smooth. A mounting kit was required to install the drive in a 5.25" half hight drive bay (I had the kit on hand). I added the drive to the system as a third floppy drive. I had to edit my AUTOEXEC.BAT and CONFIG.SYS to reflect the first hard drive as D.

When the computer boots, the controller card BIOS displays the type of floppy drives that the DIP switches are currently set for. I did not have to change the CMOS setup, the controller card overrides those settings for the floppy drives.

Once the controller card was properly configured, I booted the OS/2 operating system to check its compatibility. Once in the work place shell, I clicked on the drive icon and selected format. 2.88 was now added to the scroll box as the default density. I formatted several disks, at all three densities (DD, HD, ED), and did various read/write operations all without error. I performed the same operations in DOS and Windows 3.1 and the drive performed flawlessly. Windows 3.0 has no problem reading and writing to a 2.88 floppy, but it can't format it.

Although the drive works well, the ED floppy disks are still to expensive to make them economical. You might be better off investing in a 21MB floptical drive instead. The floptical disks are cheaper per megabyte ($19 per 21MB disk, 90¢ per meg) and are sold individualy. I have only seen the EDs sold in boxes of ten for $80 ($8 per 2.88MB disk, $2.77 per meg).

Software Review:

Norton Commander for OS/2

By: Bob Shanteau, MBUG

When I was exclusively a DOS user, I used Norton Commander often. NC's main feature is that it can show directories in two panels. Copying and moving files between panels is easy. I also found NC's menu useful, as well as the ability to associate a program name with a filenaeme extension.

I now have OS/2 installed as the operating system on my computer, so when Frank Murphy told me about Symantec's announcement at COMDEX that Norton Commander for OS/2 was being released, I was anxious to try it. As I was arranging for a representative from Symantec to demonstrate NC for OS/2 at the March MBUG meeting, I managed to talk my way into a demonstration copy of it for this review.

NC for OS/2 was easy to install. It installed into a folder of its own containing Norton Commander, The Norton User Menu, and the Readme file. I created a shadow of NC on my desktop for regular use. I fired it up and saw the familiar two screens with most of the same menu items above and below. The OS/2 version has more menu items than the DOS version, including sort by name and sort by extension, font and refresh.

NC supports some of the Presentation Manager functions. (PM is OS/2's GUI.) It supports drag and drop of files and directories between panels as well as between the desktop and the panels. It handles both the FAT and HPFS file systems.

In other ways NC for OS/2 does not act like a program written for Presentation Manager. Programs that are designed for the OS/2 PM are supposed to be able to use any of the ATM fonts that have been added to the system. Unfortunately, NC for OS/2 does not support this feature. Similarly, NC for OS/2 does not support changing the colors of the panels with the color palette within OS/2. This wouldn't be a major problem except that the window is bright yellow, and the box indicating the current item is a dotted dark yellow line that is difficult to see. I find it impossible to change these colors.

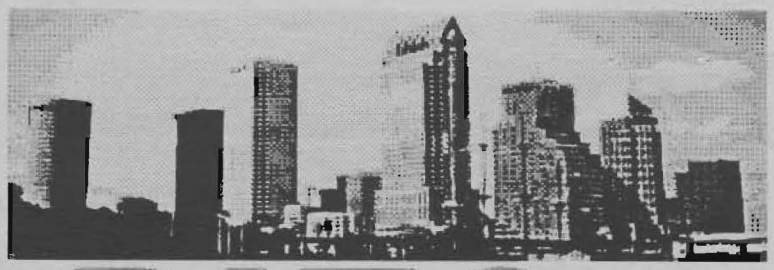
The most common procedure in NC involves moving or copying files between panels. If you're using a mouse, you'll probably prefer using the OS/2 method of marking files over NC's default way, which is more suited to keyboard use.

Under a multitasking system such as OS/2, it is possible to create or delete files or directories in another window. For some reason, NC requires you to refresh the appropriate panel before it shows you the changes. Of course, this can get you in a lot of trouble when the listing in the panel does not match the directory structure on the disk. Why Symantec programmed NC this way is a mystery to me; OS/2's desktop always keeps the contents of every folder up to date, regardless of what program alters them. That is one of the nice features of a multitasking operating system; several processes can run simultaneously while interacting with each other.

An attractive feature of NC for DOS is that it shows a command line near the bottom of the screen, and has some nifty ways of entering filenames on the command line by selecting the name in the panel and typing a couple of keystrokes. It saves a lot of typing and lessens the chance for mistyping commands. NC for OS/2 lacks this feature. Instead, it has options to run OS/2 or DOS windows, but there is no way to recall the filename that was selected before opening the window. A shame.

Both the DOS and OS/2 versions of NC have a "find file" option. I found an anomaly as I was testing it, though. On successive searches through my hard disk for a nonexisting filename, NC's file finder took increasingly longer to finish. I've seen OS/2 bog down before as I switch between programs, but this is the first time I've seen it happen with a single program. Most likely this is a problem with OS/2 rather than NC.

The individual user will see no use for the menu program in NC for OS/2. The OS/2 desktop works just fine. The Symantec literature says that a network administrator can protect a user's menu against modification by the user.



All in all, NC for OS/2 appears not to be ready for prime time. There are many other little features that are not quite right, such as a poor viewer, inability to drag from the find file window to the desktop, lack of executable extensions, and the limited ability of the command processors. Still, I find myself using it often, since it is a more convenient file manager than the native OS/2.

The Norton Commander for OS/2 is available from Symantec Corporation, 10201 Torre Avenue, Cupertino, CA 95014-2132, or phone (800) 441-7234. MSRP is $149. Symantec offers a 60-day money back guarantee. If you are dissatisfied with NC for OS/2, you may return it to your dealer within 60 days for a full refund. It occupies about ½Meg of hard disk space.

Mark Twain

A Monthly Publication of the

Tampa IBM PC User's Group

BITS of BLUE

VOL. 6 NO. 4 April, 1993

MEETING
(2nd Wednesday every month)

DATE: April 14, 1993
TIME: 6:00 PM
PLACE: IBM CUSTOMER CENTER
LAKE POINTE ONE BUILDING
3109 W. Martin L. King Blvd.
Room 450
DIRECTIONS:

The Tampa IBM PC Users Group meets in the IBM's LAKE POINTE ONE Building across from Tampa Bay Mall one block east of Tampa Stadium.

The best entrance is on Martin Luther King Blvd. at the traffic light in front of Burdines. As you turn North off Martin Luther King Blvd. you will see the LAKE POINTE ONE BUILDING on the left & parking on the right. Join us in ROOM 450 - 4th floor. **Guest please sign in.**

APRIL AGENDA:
4/14/93

6:00 PM - opening remarks

6:30 PM -
Demo by: SOFTWARE PUBLISHING CORPORATION of:

SUPERBASE

7:30 PM - Break
7:45 PM - Open Discussion
Door Prize Raffle -

& Miscellaneous Items

INSIDE THIS ISSUE

1993 Officers 2
Advertising Rates 2
Secretary's Report 3/93 Meeting 2-4

BBS SYSOP:	Kevan Sheridan	237-0100
MEMBERSHIP:	Bill Fuller	832-0799
MEMBERSHIP DIRECTOR:	Tom Cone	223-3888

Bits of Blue is published by the Tampa IBM PC Users' Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about IBM-PC and compatible personal computer systems to its members.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII file or in a commonly available word processor format, such as WordPerfect 5.1, on diskette to the editor at 9402 Hidden Ridge Place, Tampa, Florida 33637 or send it by modem to BBS (813)239-3704.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for non-profit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

Commercial advertisements will be accepted at the following rates:

	1 month	3 months	6 months
Full Page	$60.00	$162.00	288.00
Half Page	$40.00	$108.00	$192.00
Quarter Page	$22.00	$60.00	$106.00
Eight Page	$12.00	$33.00	$58.00
Business Card	$10.00	$27.00	$48.00

All advertisements must be prepaid by check payable to TIBMPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if it is not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, Marylee Bruneau at (813) 985-3338, for space availability and for further information.

This newsletter was created with WordPerfect for Windows donated by WordPerfect Corp. to TIBMPCUG for use by the editor.

Secretary's Report

MINUTES OF 3/10/93 MEETING

By: Jim Clark

I must say at the outset that our Prez, Harvey Bruneau, is doing a great job. I thought it was another great meeting!!

That the meetings are always enjoyable and productive is in large measure due to the efforts of our Prez. It seems that Harvey always has arranged a super presentation either by a major vendor, and/or by one of our own, on a new program and/or one of current interest to our group. And he brings many items of interest from the industry to us each month. Behind the scenes as well, he pushes to make our group ever better. He receives support from a small, but great group of people who serve in some official capacity in our group: Marylee Bruneau, our editor, who puts together a super newsletter; Tom Cone, our VP, who most know as a pleasant and helpful greeter at our regular meetings, but who also helps in so many behind-the-scene ways; Kevan Sheridan, our SYSOPs, which is a time consuming and challenging task, has done a great job maintaining, improving and expanding our BBS; Bill (William) Fuller, our treasurer, who has done a super job taking care of the group's finances and books, and is so helpful in many other ways. Good luck Bill you will be missed; Roger Waters, our Member At Large, who does what needs to be done; Ed Buzza, Education Director, who helps us all learn more in classes he conducts or arranges, and on a person-to-person basis any time, any where; Larry Anders, our librarian, who not only does a great job of maintaining our software files, but he contributes to our group in so many creative and helpful, but unsung ways.

It is due to the efforts of these folks that our group continues to produce a useful and enjoyable product, and continues to grow. It takes a lot of time and effort on their part -- and I, for one, REALLY APPRECIATE IT. Don Patzsch, an active member, is currently doing a bang-up job with a comprehensive modem/BBS class that he has been conducting. (I have wanted to take advantage of that class, but other responsibilities have taken priority so far.) Arranging and conducting this class has taken a good bit of Don's time and effort -- the classes just don't happen automatically. A GREAT BIG THANKS to all of you!!

INDUSTRY/CLUB NEWS

In the rather limited time available for general discussion -- the meeting had started a little late and time was needed for the rather large program that was to be reviewed -- a number of items of interest were bought up, including:

- There was a discussion about discounts provided to members by CompUSA. See the President's column for additional information.

(Continued on next page.)

(Continued from previous page.)

• Harvey reported that his organization (a Dun & Bradstreet company that provides Human Resource and Financial applications to corporate clients) is now using Microsoft's WorkGroup for Windows and it is proving very helpful for them. It is an addition to their network system and is used primarily for internal communications and exchange of data. If you have a multiple-computer office, you may want to investigate the program and what it might do for you.

• There was considerable discussion of Stacker 3.0, started by one who reported a number of difficulties, including compatibility and other computer problems. However, there were no other problems reported from the many other Stacker users among those present. Harvey reported problems with decompressing a drive, a new feature with Stacker 3.0. I run SuperStorPro, which also includes the decompress feature, rather than Stacker.. I note in my manuals that the decompression works only with drives compressed by the program, inferring that drives compressed with earlier versions cannot be decompressed with SuperStorPro -- but I haven't tried it. That may be the case with Stacker 3.0 as well. A question was raised about the impact of compression on speed. The answer was that there appeared to be no discernible degradation for normal operations; while decompression does take time, that time is offset by the smaller size of files that have to be read and written. One reported the only noticeable degradation was in the time required to load programs -- it takes considerably longer to load the larger, complicated programs, such as R-Base. There seemed to be consensus among those who spoke that they were reasonably happy with their drive compression program.

PRESENTATION -- Improv For Windows

Lotus Corporation was good enough to send to us a knowledgeable representative, John O'loughlin, to give us a preview of Lotus's new program , Improv For Windows. I must tell you at the outset that I am not an expert on spreadsheets; my experience is limited to use of a 6 x 6 matrix a couple of times.

They term Improv their new 'Dynamic Spreadsheet for Windows' with 'Functionality Beyond Traditional Spreadsheets.' Though John really tried to explain to me what they meant by dynamic, I can't describe to you what they mean by dynamic. My copy of Webster dictionary says dynamic is, "..full of force and energy; active; potent." I would have to agree with that definition as a description of Improv. It is a very powerful program that appears to be quite user friendly (that is probably what they mean with 'intuitive'). John whipped up new spreadsheets in just a few moments; manipulated with ease the data in just about every way one could imagine, including responses to questions from the floor, 'can you do thus and so?'; and created almost instantaneous charts. Among the many features of the program that give it "Functionality Beyond Traditional Spreadsheets" are:

• Dynamic viewing that lets you rearrange and edit data instantly with drag and drop; a hide, show, collapse and expand capability; and switch from flat to 3-D multi-page mode.

• User defined English language formulas which are stored separate from the data and can be applied to many cells at once -- being much like styles in a word processor, it makes for much easier creation and editing. And the formulas are very easy to create -- a few selections using the mouse and Walla, there it is.

• Multi-dimensional Spreadsheet modeling with the capability to analyze up to 12 categories of data, each of which can have up to 63,999 items, and allows linking and saving up to 100 worksheets in a single file.

• Innovative user interface with a floating panel that lets you instantly view and set colors, fills, line and text styles; edit and drag & drop any object on screen; right button Quick Menus; smart fill of familiar worksheet categories (years, months, dates, etc.); SmartIcons for common Improv commands; status bar that provides quick access to fonts, formats, styles and other basic attributes.

• Flexible formatting/printing/reporting; includes Adobe Type Manager, with 13 scalable fonts, and uses TrueType fonts as well; print preview to verify page layout and appearance; complete page setup formatting, including headers and footers; portrait, landscape, fit-to-page and scalable printing options.

• Develop applications with state-of-the-art tools including LotusScript scripting language; record and playback scripts which can be edited and attached to icons or presentation objects; Application Programming Interface (API) toolkit; and Lotus Dialog editor to create custom user interfaces to Script programs.

• Supports DDE and OLE client and server for smooth integration with other Windows applications, and it reads/writes WK1, WK3, XLS(4.0) data, formulas, numeric formats and styles.

• Professional creation of graphics quickly and easily, selecting a range of data, pick a graph type from over 20 major chart and graph types, including 3-D bar and pie charts, rotate 3-Ds for the best angle, create and print multi-page presentations, hot link multiple charts and worksheet tables, and annotate presentations with text, images, other drawings and OLE objects.

• It is reported (and appears to be) relatively easy to learn. In addition to context-sensitive menus and Quick Menus, and the simplicity and ease of creating and editing/manipulating spreadsheets, it also has context-sensitive help and an "Exploring Improv" quick-start guide.

Hardware/software requirements for the program are: 386SX/20-class or higher computer (with 33 Mhz desired), Windowscompatible displays (VGA resolution desired) and printers, 4 MB RAM minimum (with 6 desired), Windows-supported mouse, Windows 3.1 or later, and 10 MB of hard disk space. (Continued on next page)

(Continued from previous page.)

What does this wonderful package cost? List is $495, but there is a special introductory price of $99 that will be good until May 31. As a limited special, John is making available to members present at the presentation a copy of Improv for $49 using a limited number of controlled coupons he is providing our Prez (members present had to sign-up for this offer); the coupons will be available at the next meeting.. Those members not present at the meeting should watch the BBS, or check with an officer at the next meeting to ascertain if the $49 offer has been extended to all members desiring a copy.

To Lotus Corp and John O'Loughlin, thanks for a wonderful presentation of a great program, and for your generosity with the programs and the special pricing for Improv. It looks like to us that you have another winner.

AND THE WINNER IS

Thanks to the generosity of Lotus Corporation and Sunrise Computer, along with the 50/50 cash drawing, there were some very nice raffle prizes. Those among us to have the good fortune to win are as follows:

William Coleman	Disk cleaner & Mouse Pad
M.M. Marteny	Lotus Organizer (2)
David Geiger	Lotus Organizer
Ed Buzza	Lotus Organizer
Luis Vergara	Lotus 1-2-3
Kevan Sheridan	Lotus 1-2-3
Kit Kelley	Lotus Freelance Plus
John Waldon	Lotus Ami Pro
Ed Buzza	50/50 ($85)

the meeting adjourned at about 8:40 PM

According to the German magazine Der Spiegel:

From 10/92 Calgary PC User Society Cowboy Blue

A software company sends demo-disks to computer fanatics. The unsuspecting recipient runs the disk on his or her computer. While the disk is running the demonstration of the software, it is programmed to search the computer for pirated software. As soon as it suspects anything, the program offers a printed dialogue or manual. To order, one is asked to print out a coupon which needs to be sent off. Unfortunately, what arrives in return is not a printed manual but the police. The manufacturer hopes to prevent piracy. [Translated by Helga Beam]

PRESIDENT'S COLUMN

I have good news and bad news representing events that will have an effect our group.

☹

The bad news is that we are losing our treasurer, William (Bill) Fuller. Circumstances within Bill's company necessitate his relocating to Jacksonville Florida. Bill has been on our board of directors for over 5 years and has managed several different positions during his tenure. He has volunteered his time and has been on our board longer than anyone in the history of our group. Please join me in wishing Bill the best. His dedication and contribution to the group will be missed.

☺ Now for some good news. Tom Cone, our Vice President, has volunteered to take on the additional role as interim Treasurer until a permanent solution can be implemented.

Our thanks to John O'Loughlin of Lotus Development Corporation for demonstrating *Improv for Windows*. John proved that the big buzzword du jour, *re-engineering*, does not apply to Improv. Improv in no way looks like the old *Lotus 123 of yesteryear. "This is not your fathers Oldsmobile"*.It is a completely new and bold approach to spreadsheet software within the Windows arena. Hats off to Lotus for going beyond the norm and adding power, functionality, fun, beauty and English commands to number crunching. I heard several positive remarks during the presentation from members. Some even said they did not want to wait for their coupons to purchase Improv. Of course if you were not there, your loss. Not only did you miss a great presentation but you missed out on over a $1000 worth of giveaways donated by Lotus, IBM and Sunrise Computer Supplies & Parts. Additionally, all members in attendance became eligible to buy Improv for $49.

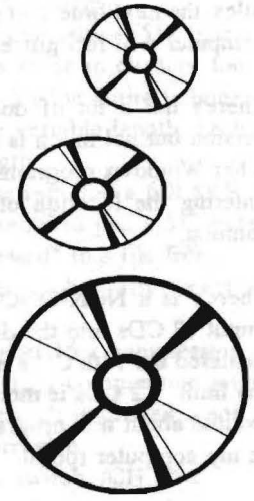
On a side note but related to Lotus, I wrote my article this month using Ami Pro for Windows 3.0. This is not meant as an in depth review of Ami Pro but my initial first impressions. This product was donated to the editor (Marylee) by Lotus, for consideration as a possible replacement of WordPerfect for producing our newsletter. Ami Pro has one of the best quick on line tutorials that I have ever seen. While it is not meant as a replacement for the manual it does provide you with a good understanding of the power and flexibility of Ami Pro. This product like Improv uses features which I have not seen in other Windows products. Specifically pull up menus. Yes that's right Ami Pro and Improv have the standard pull down menus form the top of the screen in addition to pull up menus from the bottom. While it will be some

(Continued on next page.)

(Continued from previous page.)
time before determining whether pull up menus become a Windows standard, it surely will be a Lotus one. We were hopping to produce the April newsletter in Ami Pro but we encountered problems when trying to import last months newsletter as a starting point. As of this writing we have not determined the cause of the problem and have decided to use WordPerfect for Windows 5.2 for this issue. We will resume the test in hope that we can produce the next newsletter in Ami Pro.

😐 At the last meeting some members mentioned that they had been given discounts on items at CompUSA. These statements caught me off guard. When CompUSA first moved into town I talked to them about involvement with our user group. At that time I got a warm reception but no cigar, not even permission to place our flyers in their store. On the other hand, when Computer City came to town and were more than willing to accommodate our group. Subsequently and since the Corel general meeting, these issues have changed. We can now place our brochures in the store. Insofar as the discount, I talked to my corporate sales representative, Ryan Andrew to verify the details. It was expressed to me that there was not an official commitment between CompUSA and our group. However, CompUSA may entertain the idea of coming out to our group and making an official presentation and offer. In the meantime and unofficially you can try to use your membership card to get a discount. Keep in mind that all items may not be discounted and that you must go to corporate pickup with your item(s) to get your price and then go to the regular register to pay for them. I must say that I did try this and it worked. I received a $4 discount off of *Comanche Maximum Overkill.* This is a great game although my patience was tested with tech support and the cumbersome setup procedures initially. While I am not a game freak this game has replaced Wolfenstein on my PC. This is a great tension reliever. Thanks to our SYSOP for recommending it to me.

This months issue includes free tickets for EXPOTECH BUSINESS EXPO at the Bayfront Center in St. Pete to be held May 12 & 13 from 12PM to 7PM. Tickets will be included in the newsletter later this year for the Tampa show.



In closing please join me in welcoming Software Trader of Florida to the Tampa Bay area. They produce a publication, *Software Trader*, to promote information exchange among those of us that use microcomputers. Copies of the first edition were delivered and available at our last meeting.

Harvey Bruneau

Product Review:

CD Tray for Windows

By: Larry Anders, Librarian
Tampa IBM PC Users Gruop

CD Tray is a Compact Disk Audio Player and Audio Compact Disk Database program for Windows. CD Tray combines the look and feel of a real CD Player with an easy, but powerful means of storing and categorizing disks into a Compact Disk Library. This just may be the best Shareware or Commercial Audio Compact Disk player for Windows on the market.

CD Tray provides these outstanding features for a low Shareware price:

---

* Compact Disk Artist/Title recognition after input into the CD Library.
* Stores Song Titles and Compact Disk time information.
* Track Programming.
* Shuffle Play
* Save a favorite track program for each disk in your CD Library.
* Fast Forward / Rewind / Cueing.
* Segment Play to play a fixed length passage while recording.
* Track Repeat.
* Disk Repeat.
* CD Library capacity of over 2 billion Compact Disks with multiple sort keys.
* CD Library filtering by categories of music in the CD Library.
* Store dollar value and purchase information for each Compact Disk in your CD Library.
* Disk Library summary and statistics.
* Disk Libray exporting capability.
* Ability to run other user-defined Windows programs from CD Tray.
* Custom 3-D look which mimicks a real CD player.
* Animated graphics diversion windows for greater music enjoyment.
* Real-time digital readouts of track number, track length, number of tracks, duration, time remaining, etc.
* All the controls of a real CD player (Play, Stop, Pause, Skip etc.)
* Complete Windows Help file.
* The author's firm commitment to future improvements and added features as well as free customer support for registered users.

(Continued on next page.)

(Continued from previous page.)
If you currently have a sound card and CD-ROM drive you need nothing further to enjoy listening to your favorite music CDs while working in Windows. And what's really neat, after you enter the information about the disk once, such as artist, CD title and song titles, the next time you put that same CD into the ROM drive your computer will recognize it and list all the info automatically.

There's not a lot of documentation included in the unregistered version but not much is really needed. Installation is as with most other Windows programs through the FILES - NEW command and entering the location of the .EXE file. After that you're up and running.

There's is a NON-DOCUMENTED catch though. You can only imput 12 CDs into the database in the unregistered version. When I entered the 13th CD a message popped up and told me that 12 was the limit. 12 CDs is more than enough to get your attention. I was excited about this program and I already have an audio CD player in my computer room!

The registration fee is $29.00, plus $3 for shipping and handling.

Please be advised that credit cards cannot be accepted.

Checks/cash/money orders ONLY, please!

With registration you will receive:
- The fully functional version of the LATEST CD Tray program and help files on your choice of disk format (5.25 or 3.5 disks).
- Unlimited Technical Support.
- Free or minimal cost upgrades for major program revisions.

You may register CD Tray in the following way:

By mail with check, cash or money order to:

JenJen Software
7 Kettering Lane
Hampton, Va 23666

Software Review : TrueEffects for Windows

By: Bing Perry, MBUG

TrueEffects for Windows provides a simple way to spruce up your documents by creating special font effects using your existing TrueType fonts. The utility lets you insert a fill pattern for each font, choose from several outlines and shadows effects including 3D, and provides a choice of backgrounds if desired. TrueEffects supports all printers except Postscript printers.

You'll need about 500K of free disk space and a 286 or better computer running Windows 3.1 to install TrueEffects for Windows. Installation is a breeze and, when finished, you can immediately begin creating a series of fonts with only your imagination as a limitation. To create a special effect font, merely highlight the font and indicate what fill pattern, outline, shadow, and background effect you wish from a series of effects provided. As you make your selection, you can immediately view how the effect will appear.

The fonts you create and install in Windows can then be used just like a normal TrueType font in any application running under Windows 3.1 The effects you see in the title were done using Pagemaker 4.0. If you are running short of disk space, the special effects font can just as easily be removed and recreated when and if you need it again. This is a neat program, and I highly recommend it.

Suggested retail price for TrueEffects for Windows is $59.95. It is produced by:
MicroLogic Software
1351 Ocean Ave.
Emeryville, CA 94608-1128
telephone: (510) 652-5464, FAX (510) 652-5040.

Book Review: Business Software Companion

By: Hugh Bayless

Tom Badgett and Corey Sandler have collaborated on this Wiley book for the non-technical person who has to use a variety of business software. Instead of going into depth on a single program, the authors have provided a reference guide to Ami Pro, dBase, DOS, Excel, FoxPro, Lotus 1-2-3, Microsoft Word, Aldus PageMaker, Paradox, ProComm Plus, Quattro Pro, Smartcom, Windows, and WordPerfect.

It gives task-oriented guidance for someone who has to use one of these applications for everyday tasks. An interesting and probably very useful concept. Instead of searching an entire manual to learn how to write and print a letter in WordPerfect, look in this book and learn how in a few simple pages. It lacks depth, but that will be a plus for the many people whose needs are limited.

$22.95 from John Wiley & Sons, Inc. at 1-800-CALL-WILEY, or at your favorite computer book store.

■■■

The Truth About DOS 6.0 Compression Ratios

Can You Trust DIR/C?

by Doug Lowe

As its name implies, DoubleSpace can effectively double the capacity of your disk drive by compressing your files. For DOS 6.0, Microsoft added the /C switch to the DIR command to report the compression ratio for files stored on compressed drives. But the first time you use the DIR command's new /C switch, you'll probably be surprised to see that it reports 16:1 compression ratios for many files. After seeing so many files compressed 16:1, you might wonder why Microsoft didn't call DoubleSpace HextupleSpace instead.

Are these 16:1 compression ratios exaggerated, or does DoubleSpace really squeeze these files down to one-sixteenth of the space required by the uncompressed files?

A simple experiment will shed a little light on this question. If you've installed DoubleSpace, create a one byte file named ONE-BYTE.TXT on a compressed volume. To do that, enter this command:

COPY CON ONEBYTE.TXT

Then, press the space bar once to ad a space to the file and press Ctrl-Z to signal the end of the file. If you then type DIR ONE-BYTE.TXT, you'll see that the file contains just one byte.

It's impossible to compress one byte of data, right? Wrong. Type DIR ONEBYTE.TXT /C and you'll see that DoubleSpace says it compressed this file 16:1. What gives?

When you use the DIR/C command, your first assumption will naturally be that the reported compression ratio represents the degree to which DoubleSpace was able to compress each file's date. But the compression ratio displayed by DIR/C isn't based on the degree to which the file's data can be compressed. Instead, it reflects the amount of total disk space saved by compressing the file and storing it on a DoubleSpace volume rather than on an uncompressed volume.

The extraordinary compression ratios reported for some files are not due to compression at all, but rather to the fact that DoubleSpace uses a more efficient method to allocate space to files. Simply put, DoubleSpace volumes are not tied to the notion of "clusters," or "allocation units," the way uncompressed DOS volumes are.

When DOS stores a file on an uncompressed volume, it allocates disk space to the file in increments of whole clusters. The size of each cluster depends on the size of the disk drive. For most disk drives, the cluster size is 2KB or 4KB. For large disk drives (up to 512MB), the cluster size is 8KB. Suppose, for the sake of argument, that you have a 512MB disk with 8KB clusters. The smallest file you can create on this drive will use 8KB of disk space, even if the file contains only one byte of data. That's because DOS allocates space to your files one cluster at a time.

DoubleSpace uses a different allocation strategy. DoubleSpace allocates space to your files one sector (512 bytes) at a time. Actually, DoubleSpace allocates space in clusters, too. But instead of using the same cluster size for the entire volume, the clusters on a DoubleSpace volume are variable-length. Each cluster can be from 1 to 16 sectors in length.

The same one-byte file that would have required a full 8KB cluster on an uncompressed volume now requires just a 512-byte cluster. As a result, DoubleSpace "compressed" this file from 8KB to 512 bytes--that's 16:1--even though it obviously wasn't able to compress the data at all.

If you'll look closer at the files that report 16:1 compression, you'll see that they're all small files. The 16:1 compression ratio reported for these files is due to DoubleSpace's improved space allocation rather than to actual data compression.

The DIR command has a lesser-known switch, /CH, that reports the compression ratio based on the cluster size of the host volume rather than the cluster size of the DoubleSpace volume. If the host volume has a smaller cluster size, the /CH switch will report smaller compression ratios for small files. For example, if the host volume has a cluster size of 4KB, small files will show an 8:1 compression ratio instead of 16:1.

Does DIR/CH report a more accurate and fair compression ratio than DIR /C? That depends on your point of view. The ratio reported by DIR /CH lets you see how much space you're saving by using DoubleSpace. For example, your 1-byte file would have required one 4KB cluster on a 200MB uncompressed drive. When you DoubleSpace that drive, it requires only 512 bytes. So the compression ratio of 8:1 is fair. On the other hand, since DoubleSpace lets you store 400MB or more of data on a 200MB drive, it's not unreasonable to base the compression ration on 8KB clusters, since 8KB clusters would be required to support a 400MB uncompressed drive.

The point is that neither DIR/C or DIR/CH report the compression ratio the way you would expect. Unfortunately, there is currently no way to find out the actual degree of compression achieved on your date. We can only hope that Central Point, Symantec, and others are working overtime on it!

Doug Lowe is the author of numerous computer books, including The Only DOS Book You'll Ever Need (Second Edition), published by Mike Murach & Associates, Inc. (1-800-221-5528)

Shareware, Public Domain, & Freeware Software

By: Bill Quinn, Pinellas IBM PCUG - Bits & Bytes
Clearwater, FL

Freely distributed software has been available since the first days of the personal computer. In the last five years this concept has evolved into an alternate to commercial software. My definitions of the software distribution market may help the novice computer users to have an understanding of the terms that are in use today.

PUBLIC DOMAIN

Public domain software has been released completely to the public, and the author retains no legal rights to it. The programmer may not want to market the program, or he may feel that the effort was not sufficient to justify any price. Whatever the reason; however, the key is that the author has given up all rights, and anyone may use the software and may pass it on to others. The way to tell if you have public domain software is to look for a copyright notice. If there is no such notice, you have public domain software.

SHAREWARE

Shareware authors, unlike public domain authors, hold copyrights on their programs. The Shareware programmer's software is protected by U. S. and international copyright laws, as is commercial software. Shareware, however, unlike its commercial counterpart, may be copied freely and passed on to others. Like commercial software Shareware is a "FOR-SALE" product.

Shareware authors request that people who try their software and decide to use it send a registration fee to the author. This registration fee is the equivalent to purchasing the software. For this registration fee authors may offer a wide variety of services - including printed manuals, disks, advance versions, and telephone support. Some companies also offer free updates.
The most important benefit of registration is that you receive a legal license to continue using the software. I should like to think that Shareware is a method of distribution of commercial software. In short - try it; and if you continue to use it, send the requested fee to the program's author.

FREEWARE

Freeware holds a place between public domain software and Shareware. The author has retained the rights by exercising the copyright law, but he does not require any fee for continued use of the software. Some authors may request a small contribution if you use the program, but these contributions are not required. With Freeware you may find restrictions on the distribution of the program. While some authors will not allow you to charge for their program when it is distributed, other authors will place a dollar limit for copying and distributing their programs.

STANDARDS Are there any standards? For public domain and Freeware, not really. Many Shareware authors, on the other hand, have become part of the Association of Shareware Professionals, ASP, which is dedicated to the establishment of recognized standards for Shareware programs and for their companies. Not all authors belong to ASP; but as more authors join, Shareware standards have become more universally followed.

DISTRIBUTION METHODS There are four common methods of obtaining freely distributed software: from a friend, from a user group, from a disk vendor, and from a bulletin board.

Friends. The rules associated with freely distributed software generally allow users to make copies for others. If you have a friend with this type of software, you may make a copy the software. Because it is easy to copy software, please make certain that the program you are copying belongs to one of the freely distributed software classes, and that it is not commercial software. It is illegal to copy commercial software. One of the benefits of freely distributed software is that you can try it before buying it to decide if the program meets your needs. With commercial software you have to buy it before trying it. This means your decision must be based on what others have said about the program rather than on your own experiences with it.

Users Groups This is one of the most popular ways of getting freely distributed software, because a wide variety of programs can be obtained, and in some cases you can associate with other members who are able to teach you how to use them. If the user group charges a fee for disk copying, you must remember that the fee is a copying fee. It is not part of the author's registration fee. Our complete disk copying library is on the club's Bulletin Board Service (BBS).

Disk Vendor . A disk vendor operates a business of copying disks for a specified charge per disk. Almost all disk vendors issue some type of disk catalog from which you select those program disk which you want to buy. Remember that the fees you pay to the disk vendor are fees for the copying and for the mailing of the disks you have ordered. Here again, the author of the program does not receive the money you paid to the disk vendor. There is one disk vendor who has made arrangements with several Shareware authors to accept registration fees for the author's program. The name of this disk vendor is:

The Public (Software) Library PO Box 35705 Houston, TX 77235-5705 Orders: (800) 242-4775 (On a personal note, I have found the PSL to be the best disk vendor in the country.)

Bulletin Board Ssystem (BBS) . BBSs require the user to have a device known as a modem. A modem allows one computer to talk to another computer over standard phone lines. There are literally

(Continued on next page.)

(Continued from previous page.)
thousands of BBS's around the world where you can download freely distributed programs. Our club has a 4 node (4 telephone lines) BBS which contains over 6,000 files. Our club's BBS is rather small compared to other BBS's in the country. Please remember that it is illegal to download any commercial software from a BBS.

As an alternate to a local BBS, there are a number of Information On-line Services. These are a form of national bulletin board where users are able to access services like those found on local boards. Many of these On-line Services offer hundreds of thousands of freely distributed software programs.

In summary, the world of freely-distributed software can be anything you want it to be. If you want to get a modem and plunge into the many bulletin board systems around the country, that is certainly one option. If, on the other hand, you want to sit back, browse through a nicely printed catalog and pick and choose, that option is also available. The very best part of these options is that all of this software is on a Try-Before-You-Buy basis, totally unlike any software you might obtain through a store or from mail order. One last item: there are computer viruses everywhere. In most cases every effort is made so that software is provided from the source virus free. Our BBS checks all files placed on the BBS for viruses before they can be downloaded to you. That is not always the case when you are provided a copy from an unknown or unintending source. So, please practice safe computer procedures when you are introducing new disks to your computer. Be Prepared. Enjoy!

Book Reviews:

Microsoft Access Inside & Out and Paradox For Windows Made Easy

By: Ed West, MBUG

Well, have you joined in with the hype over which database program for the windows environment is the best? The heavy hitters, Microsoft and Borland Intl. would certainly like you to. With the recent releases of Microsoft Access at approx. $99, and Paradox for Windows at approx. $139, these vendors have thrown the carrot out for you to nibble. Of course that's just good business, if you bite, you're probably locked into the long haul for the numerous updates sure to follow, making them more money. Isn't that what they are there for?

Just for the sake of argument, I'll throw in my two bits and vote for Paradox because I personally found it easier to use, more friendly... to say. However, on the other hand, Access has more options in designing the final report printout, and don't forget the macros, can't live without them. On second thought, maybe I should withdraw my two bits and invite you to find out for yourself which is best for your particular needs, if you've a mind to.

There are two new books out on the market, both published by Osborne-Mc Graw Hill, separately dealing with these new database programs. The first one, Microsoft Access Inside & Out, written by Mary Campbell, sells for $27.95, with 707 pages, and the second one, Paradox For Windows Made Easy, written by Edward Jones, sells for $19.95, with 430 pages.

Now what do you get with these books? Both have the customary table of contents, and index, and both have sections on using their respective product in a network environment. However that's about as far as the similarities go, they both have strong points and weak points, here goes--

I found the Paradox book easy to read and follow. The book is designed for you to read and work through while at the computer. The author starts the book out by discussing databases, what they are and what their designs should be, then goes into actual data entry. Here's where you begin to follow along with the book, actually making the data entries, and subsequently manipulating this data through various exercises as you continue. The strong point of the book is the printing format, with black for general text, and a light blue for paragraph and topic headings, tips, and embedded text with special meaning.

There are lots of graphic screen displays to explain processes, once again using a two-tone blue with black color scheme to depict the screens. You say, "What's type color and format got to do with it?" Take a look for yourself, it is surprising how much easier it is to read this type of book, compared to the normal black on white format of most publications.

The book is intended for the beginner and intermediate user, and does its intended job well. You will be taught how to enter and edit data, perform queries, create and use custom forms for both screen display and report printouts, as well as how to import/export data from/to various other programs. However, you will not find any documentation on Objectpal, the full-featured, visual programming language that you can use to automate your work within Paradox. The author also includes a 30 page appendix, "A Guide To Windows." I would have preferred that this section have been deleted, and Objectpal information put in its place. I recommend the book for beginners, but not as a reference book on Paradox. Take a look for yourself at your local book store, this may be just the book you're looking for if you are new to Paradox for Windows.

Microsoft Access Inside & Out is written in the traditional black on white format, making the sparse number of screen depiction's difficult to read (or maybe it's just my failing eye sight). The first

(Continued on next page.)

(Continued from previous page.)
approx. 50 pages of the book deal with databases, and all of the considerations you should make when designing one. The author does a really good job in this discussion, you might say it's a mini tutorial on database construction. The book itself is designed more in the format of a traditional school text book, but is very thorough in its discussion of all aspects of Access. Sections cover data entry/editing, importing/exporting data, queries, customized forms for screen and printed reports, using expressions, and using multiple tables in reports and forms. In addition to a section on networking, the author extensively covers the use of macros, creating sophisticated queries using multiple tables, report generation using FormWizard and ReportWizard, and how to use Access Basic, the programming language for applications development in Access. Any level of user will find useful information in this publication. If you want a general reference book for Access, take a look at this one.

■■■

HARVARD GRAPHICS DESIGN COMPANION - WINDOWS EDITION

Reviewed by: Shirley Neese,
BUG BYTES, Bisbee User's Group, Bisbee, AZ

Design skills are essential to achieve real communication with an audience, point out authors Margaret Rabb and Chris Potter. Their book Harvard Graphics Design Companion Windows Edition teaches users the power of dynamic design.

Using Harvard Graphics' sophisticated graphic features, the authors demonstrate how to produce professional quality graphics through real world applications and step- by-step procedures. The book's easy narrative style coupled with dozens of color and black-and-white illustrations offers tips, examples and advise for Harvard Graphics users at all levels.

The first section of the book, "Design Consultant," examines creating dynamic presentations by probing the essentials of typography, graphic elements, organization and design.

The authors help the user to devise both organizational and visual styles. The "Questions of Style" aid in the decision of which important presentation attributes are to be interpreted visually. Once this is determined, then the "behind the scenes" work can begin. Production tips and examples of visual style alignment, layout, color palettes and background treatments, as well as a whole chapter devoted to the descriptions of and recommendations for using different typefaces, are very useful.

The chapter "Anatomy of a Presentation Graphic" details the basic graphic types and their usage based on the most important point to be conveyed: the comparison, the trend, the variation, the motive. Other chapters lead the user through the procedures for designing and creating text frames, tables, two- and three-dimensional charts and graphs while introducing Harvard Graphics' new production environment.

For example, users accustom the Harvard Graphics 3.0 AutoBuild feature do not have that option in the Windows version. However, by using the Slide Sorter and Outliner features, this "build text sequence" technique can be accomplished painlessly.

Section Two, "Presentation Graphics," illustrates the design fundamentals in action, design do's and don'ts and frame makeovers. "Great Presentations" offers six different presentations complete with illustrations■ScreenShow, overheads to go, slide show, HyperShow, video projector and overhead presentations. These are drawn from fictional, though plausible, scenarios. Each has accompanying production or presentation tips.

Once a presentation is put together, it is vitally important to proof it all together for any problems of inconsistency or visual difficulties. These are easy to overlook when concentrating on each individual frame. The chapter on "Design Do's and Don'ts" has an excellent detailed checklist and a few words of warning that will save the user both time and frustration.

The most engaging element of this book are the frame makeovers. Many Harvard Graphics users are familiar with the Chart Gallery a collection of specially designed sample charts that can be edited to create new charts. This feature can be a "life-saver" when pressed for time and/or a lack of creative "juices." But you can pick out a standard Harvard Graphics frame from a mile away. However, these standard formats can be transformed with some tweaking and a little imagination to improve the appearance and effectiveness of frames. The makeovers section has step-by-step modifications and before-and-after design examples.

The book is rounded out with a glossary, reading list and comprehensive index.

Harvard Graphics Design Companion Windows Edition is well written, nicely organized and complimented with many illustrations, examples and practical applications. Every Harvard Graphics user is in the communication business. Harvard Graphics Design Companion gives the user the needed tools to express information clearly, concisely and persuasively while offering inspiration.

The thought occurred while reviewing this book that some of these great designs should be put on diskette for the user. Sure enough, on the last page there is an order form for the Harvard Graphics Design Companion Windows Edition Diskette. Included on the disk are charts from the book's "Great Presentations" and "Frame Makeovers" chapters, templates for a variety of chart formats, sample grids, and examples of charts using specifically developed color palettes. The disk is available from Ventana Press for $39.95 plus $3.60 UPS shipping.

Harvard Graphics Design Companion Windows Edition is available at $23.95 plus $4.50 shipping from:

Ventana Press
P.O. Box 2468
Chapel Hill, NC 27515
919/942-0220; FAX 800/877-7955

Shirley Neese teaches Harvard Graphics, among other things at Cochise College in Sierra Vista, AZ.

Installing Windows 3.1

By Hugh Bayless, MBUG

The installation of Windows 3.1 is about as easy as any software you can find. However, there are some potential problems you should be aware of, in order to avoid them. The first concern is any memory-resident (TSR programs) that may be loaded at the time o installation. Some of those TSRs that may interfere with the installation of Windows are actually contained in DOS and installed by your AUTOEXEC.BAT and CONFIG.SYS files. Among these are APPEND, FASTOPEN, GRAPHICS, JOIN, and PRINT. That's why it is safest to "clean boot" your system before installing Windows.

If you want to read the lengthy list TSRs and drivers that can cause problems in the installation or running of Windows, look at the file SETUP.INF. You will only find it on your Windows installation disk because it is not copied into your \WINDOWS directory during installation on your hard disk. SETUP.INF is a long file, written in ASCII, so you will have to search for the section you want, which has the heading:

Known TSRs and drivers which may result in a hang or crash during execution of Setup or Windows. To "clean boot" your system, make up a disk that fits in your A: drive by formatting it with the /S switch, which installs the system files on it, then copy your COMMAND.COM file to the disk. Put this disk in your A: drive and reboot (restart) your computer. In this way, there will not be any TSRs to interfere with the installation of Windows.

Among the TSRs that can cause problems, even after installation, are:

DESKTOP.EXE - Part of PC Tools Deluxe
PYRO.EXE - PYRO! Screen Saver
SK2.EXE - SideKick version 2.0
VACCINE.EXE - Vaccine Antivirus Program

Software that is written for Windows us usually free of conflicts, but many older DOS programs can cause problems. The good news is that during installation, Windows checks your AUTOEXEC.BAT file and removes TSRs that it knows will cause trouble. Nevertheless, it is a wise precaution to clean boot before installing Windows.

Bits of Blue is published by the Tampa IBM PC Users' Group, Inc., a State of Florida registered nonprofit corporation, to provide educational information about IBMPC and compatible personal computer systems to its members.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII file or in a commonly available word processor format, such as WordPerfect 5.1, on diskette to the editor at 9402 Hidden Ridge Place, Tampa, Florida 33637 or send it by modem to BBS (813)239-3704.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

Commercial advertisements will be accepted at the following rates:

	1 month	3 months	6 months
Full Page	$60.00	$162.00	288.00
Half Page	$40.00	$108.00	$192.00
Quarter Page	$22.00	$60.00	$106.00
Eight Page	$12.00	$33.00	$58.00
Business Card	$10.00	$27.00	$48.00

All advertisements must be prepaid by check payable to TIBMPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if it is not received on time.

Members may insert noncommercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, Marylee Bruneau at (813) 985-3338, for space availability and for further information.

This newsletter was created with Ami Pro for Windows donated by Lotus Corp. to TIBMPCUG for use by the editor.

Secretary's Report

MINUTES OF 4/14/93 MEETING

By: Jim Clark

The meeting began just a few moments late (at 6:10, to be precise), but it was another good meeting, with quite a nice group in attendance. In addition to a vendor review of an impressive software program, there were some very interesting discussions on items of interest to a great many of us. Once again, our meeting was guided by the astute leadership of our illustrious Prez, Harvey Bruneau.

INDUSTRY/CLUB NEWS

Quite a few items of interest were discussed during the meeting, including:

That Comp USA is unofficially allowing discounts for members of our group on many items purchased at Comp USA was confirmed by our Prez. A discount is not given on all items, especially low cost items (e.g., DOS 6 Upgrade, floppy disks). However, the savings can be rather substantial on other items; one member received a 20% on a $50 hardware item, for example. On more expensive items, members have reported $40 or more savings. To receive the corporate discount, take your purchases to the Corporate Desk and show your User Group membership card.

There was considerable discussion of DOS 6.0, with varying opinions from our membership. Harvey introduced the subject, reporting general satisfaction with all DOS 6.0 features used thus far by him at Dun & Bradstreet, including MemMaker, AntiVirus, and optional boot. He had not yet used DoubleSpace.

* Most indicated that DOS 6.0 was easy to load and they had no troubles in doing so. A couple of others reported some problem in loading and setting it up. All felt that documentation left something to be desired, with the manual provided containing little to no technical info.

* Most comments about MemMaker were along the lines that it was not quite as good as the stand-alone memory managers at ferreting out more memory, but that it was a good alternative for those who do not need the last byte of memory and who do not want to pay the price of the stand-alone products. And, it certainly simplified the task of making upper memory available and loading TSRs in same.

* The DoubleSpace feature generated the most divergent opinions. Several reported problems, including some boot prolems which appeared after installing DoubleSpace. One with a CD-ROM, loading the driver in upper memory, reported booting problems following installation of DoubleSpace. Some reported the compression ratio not as

(Continued on next page.)

(Continued from previous page.)

good as with Stacker. Others reported does not allow compressed drives to be decompressed -- as the stand-alone products do.

* Few commented on the AntiVirus reported that the built-in antivirus was making his job somewhat easier, and liked the feature thus far.

* All those who had used the Optional Boot feature seemed to like it quite well. Some of those who had experienced boot problems reported that the AllBoot switch solved their boot problem. The ability to select a clean boot from the hard drive was viewed as a very welcome improvement by all who had experienced booting problems -- negating the need to boot from floppy.

A review of DOS 6.0, and all of its features, sometime in the not-to-distant future would be welcome by all DOS 6.0 users, followed by a seminar to discuss problems experienced and solutions found.

PRESENTATION -- SuperBase

Software Publishing Corporation was good enough to send to us a knowledgeable representative, Paul Tondera, Corporate Account Manager, to give us a preview of their program, SuperBase, Version 2.0 -- a fully relational database program for Windows. Paul noted that SuperBase is not something new on the market or in Windows, but that it has been around managing data *in Windows* for over eight years. Hence, it is not something new with a lot of bugs, as is the case with the new programs now on the market; it has evolved as a well founded, sound and very powerful database program. I am not knowledgeable on databases and have no basis for comparison, but I can say that SuperBase certainly appeared to me to be very powerful, functional and easy to use.

Among the many features Paul reported and/or demonstrated are: A forms generating capability; Quick Reporting feature which produces reports in detail; easy setup and modification of all reports, and forms; drag and drop editing; provides for query by example; allows up to 999 indexes per file; provides full multi-media support; imports and integrates sound and video files into SuperBase; uses built-in procedural language; provides automatic recording of macros and can use basic macros and those created in "C"; imports from all the major dB programs as well as ASCII, and exports in most of the same formats; the forms creator uses predefined fields which simplifies forms creation; includes the capability for merging of mail and label files, and SB allows merging of 2 databases. SuperBase is also network ready.

In some respects, SuperBase 2.0 is the least demanding for hardware capabilities of any of the major DB programs. It will load into and work in a 286 machine, for example. A VGA monitor is required, as is 1 MB of RAM, though 2 MBs of RAM is recommended. And, 7 MB of hard disk space is required.

SuperBase 2.0 carries a list price of $795, but has a street price in the range of $500-550. If you already own a previous version of SuperBase, the upgrade price is $149. Those using other DB programs can purchase a SuperBase competitive upgrade for $199.

Many thanks to Software Publishing Corporation and Paul Tondera for an excellent presentation of a great BB program, and for your very generous software contributions.

AND THE WINNER IS

Thanks to the generosity of Software Publishing Corporation and Sunrise Computer, along with the 50/50 cash drawing, there were some very nice raffle prizes. In addition, Sunrise Computer donated quite a number of computer items that were distributed to those who could use them, including printer ribbons, covers, and static guards; these items are not reflected here. Those among us to have the good fortune to win are as follows:

Larry Anders	Disk cleaner & Mouse Pad
Herbert Atwood	Mouse Pad
Jim Clark	Mouse Pad
Gene Wade	T Shirt
Bill White	Computer Lock
Parker Monroe	Fanny Pak
Kevan Sheridan	Harvard Graphics for Windows
Luis Vergara	Harvard Graphics 3.0
Tom Cone	SuperBase 2.0
Gene Wade	50/50 ($50)

the meeting adjourned at about 9:00 PM

♦♦♦♦♦

PRIVATE MESSAGES

From: SYSOP
To: ALL
Just a note about private messages....

There is no such thing on a BBS. Remember that anyone who has sysop access can reach each and every message on the system. No limits. What this means is that when you send a private message to another person, that person AND the SysOp can read it. More importantly, ONLY the sender, receiver and the SysOp can read the message. If the message is to the SysOp then only two people can read it.

I get a LOT of GOOD questions in private mail that I feel would be better off as public mail. Remember, there are other people out there that may just have the same question as you do! Don't be afraid to leave your mail/questions as public. If nothing else other people will see what is going on and may learn something!

(EDITORIAL COMMENT: Most of you BBS users probably noticed Kevan's comment above on the board, however for those of you that didn't catch it, we felt it was worth noting here.)

♦♦♦♦♦

PRESIDENT' COLUMN

Some of my opening remarks last month covered MS DOS 6.0. Additionally, some of the pioneer members, those who take a chance on new technology before the majority do, voiced their experiences with parts of DOS 6.0. I like those meetings where the membership participates and shares their knowledge with the rest of us. With that in mind, the May meeting will be presented by board members. The first presentation, **DOS 6.0,** will be by Larry Anders and I. While we do not attest to being experts in the new product, we will show some of its the new features. This will be an open forum type presentation where everyone can contribute during the presentation. Secondly, Ed Buzza will demonstrate some of the shareware software which is included on new member diskettes or can be downloaded from the BBS. Lastly, and if time permits Kevan Sheridan will review the new Qmodem communication software. This meeting will surely cover something of interest for everyone. The raffle will include a copy of Mircosoft Access and a DOS 6.0 upgrade.

My thanks to Software Publishing Corp. and Sunrise Computer Supplies & Parts for their generous contributions to our April raffle.

This month Hot-Lanta will host yet another Comdex. Once again I will be stalking the halls of this show in the search of NT with hundreds if not thousands of other tech weenies and propellers heads. Of course the majority of attendees are normal computer users. The basic goal is simply to seek what current technology and information is available today to facilitate our needs and of those we represent. This to me is gold dust. Its valuable but has only a short life span before its gone. But like a prospector you have to pan the river often to find those rare nuggets of technology on which to base the future. To find those rare items is the ultimate goal, but you must be wary of fools gold for it is also abundant.

Back in the mid eighties I thought I bought into NT (New Technology) that would last a lifetime. I was wrong. My IBM PC/XT was outdated in less than two years and now sits in a closet holding up the outside wall of our house. I keep telling Marylee that it will come back in style, like my bell bottom pants and wide neck ties which are also in a closet. In the late eighties I once again bought into NT. That Samsung 286 lasted only a couple of years before being passed on to my step-son. He uses it for writing his college papers and keeping track of his finances. In January of 92 we bought our third PC. This monster 486/33 was surely going to meet our needs well into the future I thought. Of course that was until I installed 6 Compaq 486/66Mhz systems at work.

Okay so by now you get the message and no we are not buying a 66Mhz or a Pentium PC. I misunderstood the NT acronym back in the eighties. It didn't and doesn't mean New Technology. It stands for *Never-ending Technology*. Of course I was also a bit off on the statement *The only constant is change*. I thought that came from a new parent changing diapers until I switch my career from mainframes to PCs. Anyway, for those of you waiting to buy that first or final state-of-the-art PC that will take you into the year 2000, good luck. By then the Pentium will be long retired and getting nominated into the PC Hall of Fame. The current model will not even resemble a PC. I am not sure what we will do with our extinct diskettes and modems. They will be radical and in time be replaced by NT. Ah Comdex show me the nuggets.

Harvey Bruneau

Making Mouse Double Clicking Easier

On APCUG BBS by Saginaw Valley Computer Association

Reprinted with permission from the: OXKO Press - Volume 1, No 6 OXKO Corporation, P O Box 6674, Annapolis, Maryland 21401

There are two parameters that are in effect that control how the mouse double click feature works. One is the double click speed that is under the mouse dialogue box in the control panel. The second parameter has to do with the number of pixels the mouse can move while a double click action is going on. All of us believe that when we double click the mouse, that we are not moving the mouse at all. However, the reality is, we are moving the mouse just a little bit. If this little bit is greater than the distance that is defined as the limit of the double click distance, then Windows is understanding your double click to be two single clicks at two different locations. In order to make double clicking easier, it is often best to increase the double click height and double click width specifications in the WIN.INI file. The way to do this is to edit your WIN.INI file utilizing either notepad or the system editor. Under the line that says "DoubleClickSpeed=999", where 999 is some number, insert the following two lines:

DoubleClickHeight = 8
DoubleClickWidth = 8

Save this update, then exit Windows, and restart Windows. At this point, your double clicking should be easier than it was in the past. If you are still having difficulties, you can change the 8 to a higher number (multiples of 4), like 12 or 16.

Also remember, that the double click speed needs to e set in such a way that when you double click, the test box converts from regular video to reverse video, and from reverse video to regular video for each time you double click. Moving the double-click speed slower makes this easier. Moving it faster requires that you double click faster.

If you specify your double click height, your double click width, and your double click speed, you should be able to get a combination that makes your mouse double clicking comfortable.

Walter Mitty's Excellent Plane Rides

Review by: Stephen Talmadge
Flight Assignment: ATP Version 3

Flight Assignment: ATP is not a game; it is simulation software. For those of you who know Microsoft's Flight Simulator (which was itself originally developed by subLogic), Flight Assignment: ATP provides visual and instrument commercial airliner operations training in a simulated environment which conforms to FAA approved procedures, adaptive software simulator interaction; and flight assignments which can be flown in a structured, semistructured or freestyle mode, depending upon the desires of the simulator pilot.

The initials ATP stand for Airline Transport Pilot, the FAA designation for licensed drivers of heavy, multiengine aircraft. In Flight Assignment: ATP there is a structured training program consisting of 96 preplanned flights or 'trips' which become gradually more challenging as the simulator pilot moves more deeply into the program.

And, as if all that wasn't enough, Flight Assignment: ATP runs just fine on a 'fairly zippy' ATclass system. I reviewed the product on a 286 clone that benchmarks at about 17 MHz running DOS 5.0 in 4 Mb of 80 ns memory and a moderate speed IDE hard drive. Sometimes the frame rate appeared a touch slow particularly on short final approach with low ceilings and some stinky crosswinds; but nonetheless that class of system will handle Flight Assignment: ATP adequately.

[SubLogic says the software will run on an XTclass machine; and I have no doubt that it will. But running Flight Assignment: ATP on any processor rated below 15 Mhz may frustrate and perhaps annoy the user; and I also recommend a [preferably VGA] color monitor which is not "necessary" but nice to have when trying to keep track of all of the stuff that comes at you on the screen.

Move up to at least a 386/33 with 2+ Mb of fairly fast memory and things will always appear smooth on the monitor. If you want to hear interactive voice communications with the FAA folks, add a SoundBlaster or AdLib board. Otherwise, the audio support is limited to surprisingly realistic flight sounds played through your PC's speaker and the FAA communications are displayed in text for you at the top of the monitor.]

You can run Flight Assignment: ATP using just the computer's keyboard; but the software also supports [and I highly recommend] use of a pointing device [a trackball will probably work better than a mouse] and joystick. If you really want to get into this simulator, you can add a device called Flight Controls I which plugs into a game adapter and includes an actual control yoke, flap switch, throttle and gear switch. Add a set of optional rudder pedals and, except for the physical sensations that you can only experience in flight, it truly is just like being there.

Flight trips made 'on the record' are rated for safety, airmanship and overall skill; and individual trip ratings are accumulated in a logbook which is maintained for each ATP rating candidate by the simulation program. The preplanned trips may also be made in Single Flight Mode ('off the record') so that one may practice the flight before the electronic 'FAA inspector' sits along side. In addition, the simulator pilot can design and fly a trip between any two airports included in the Flight Assignment: ATP world; and the software will interact properly from start to finish just as though the trip was one of those in the structured training program.

Aircraft provided by Flight Assignment: ATP are the Boeing 737250, Airbus A320150, the Boeing 767250, the Boeing 747350 and [for all you barnstormers] the Shorts 360. In what I construed as an oddly jingoist move, only the Boeing aircraft are included in the structured training program; and flight characteristics of the A320 and the Shorts 360 are left to the student to discover outside the formal training program. I found the A320 a dream to fly and the Shorts 360 can deliver some truly spectacular [albeit noisy] short field takeoff and landing performance. Cockpit design and sound effects are varied with each aircraft; and closely resemble their truelife counterparts.

Instrument support includes the standard commercial airliner panel Airspeed Indicator, Attitude Direction Indicator, Automatic Direction Finder, Artificial Horizon, Pressure Altimeter, Radio Altimeter, Heading Indicator, Vertical Speed Indicator, Horizontal Situation Indicator, Radio Magnetic Indicator, Transponder, two Communications and two VOR/ILS Navigation Radios [with Distance Measuring Equipment]; as well an XBand color radar screen and assorted indicators, gauges, dials and lights. Automatic Terminal Information Service, enroute Flight Service Station briefings and twoway radio communications are also provided.

There is an autopilot which can be engaged to hold altitude and heading; and also coupled to track radio navigation aids such as Visual Omnirange Receivers and [very helpful during a final instrument approach] the localizer beam of an Instrument Landing System. [You're on your own riding the glide slope...] All aircraft other than the 737 provide an Inertial Reference System which you can use to define up to four geographic waypoints that can be flown to in the sequence of your choice.

The software includes a demo ride; and a broad range of Boeing 737 lessons each of which focuses on development of one flight skill set. The demo ride has imbedded, intentional mistakes allowing the novice simulator pilot to sit back and watch what happens when the errors made during the demonstration are and are not corrected. Deploy the flaps at too great a speed and your flight score gets 'derated'; let the nose get too high or don't maintain your climb during departure, same story. Get going too low and too slow on final and you will not only get derated; but you will spend what may seem like therestofyour naturallife pouring on lots and lots of power to get proper control of the airplane back. Continue an approach after you are instructed to

(Continued on next page.)

(Continued from previous page.)
go around even when everything looks absolutely super to you and you will pay the price in rating point deductions.

Included with the wellwritten and very complete manual are instrument approach plates and airport diagrams [by JeppesonSanderson, Inc.] for 26 primary airports within the continental United States; and two high altitude enroute charts providing detailed information regarding the FAA's Victor airway system. The structured instruction program is based upon flights between the primary airports using the Victor airways and these published instrument approaches.

There is also a listing of over 330 additional airports each complete with geographic coordinates everyone of which has at least one runway long enough to accommodate the Shorts 360. If you like, you can plan and execute your own flight plans between any of these airports using the Inertial Reference System entering the various airport coordinates as waypoints.

Now, every once in a while, things get strange. Sometimes [but rarely] during a structured flight assignment, when everything seems normal and all appears to be going according to plan, you will start to get messages from the FAA telling you to hold a heading that will take you off the airway which your flight plan calls for you to follow.

After that kind of occurrence, two things generally happen: either the simulation starts nagging at you about being off the airway and simultaneously tells you to hold the heading which will keep you off the airway; or it just kind of lets you fly off into never neverland and burn up all of your remaining fuel while ignoring any of your requests for guidance or assistance.

In both situations, asking for radar vectors or a new clearance doesn't seem to help even though the simulator does have full capability to issue a new clearance and/or provide vectors to get you back on track. [As Paul Newman once said in Cool Hand Luke, what we have here is a failure to communicate.] In my experience if you fly the same flight assignment again this 'strange' situation will normally not repeat itself.

For instance, during one apparently normal trip from St. Pete to Atlanta, the simulator turned me around at the Tallahassee VOR and headed me back toward St. Pete with no explanation whatsoever. After flying 150 miles back in the 'wrong direction' with no response from the FAA to my continued requests for a updated clearance and/or radar vectors, I terminated the flight. When I reran the trip again, everything went normally from start to finish. All things considered it is probably best to remember that this is a highly complex, interactive software package; and an occurrence like this should be viewed as a minor software bug and not the manner in which the FAA normally operates. [At least we can all hope that is an accurate assessment.....]

If you like flying or want to fly like Walter Mitty, Flight Assignment: ATP is a real kick in the pants. If you want to get an accurate appreciation for the demanding world of the person who is driving your next commercial airline flight, get yourself a copy of Flight Assignment: ATP. This is a very exciting simulator package that will challenge and entertain you for a long, long time. I really like it! Can you tell? (SubLOGIC, 501 Kenyon Road, Champaign, Illinois)
Recent Street Price: $49.99 @ Egghead Software
Special thanks to Norm Olsen, Vice President of Marketing at subLogic. Norm was kind enough to replace our nonfunctioning Beta evaluation copy of Flight Assignment: ATP with a brand new set of program disks and full set of documentation. Thanks, Norm, you've made one old hanger dog real happy.

Author Information: Stephen Talmadge is a licensed pilot with over 200 hours of flight time in single engine aircraft. He has had extensive commercial flight training, has shot more than a few instrument approaches, and done lots of cross country flying in 'real' airplanes. Steve has also used and loved Microsoft's Flight Simulator for many years and, more recently, the addon product called Aircraft and Scenery Designer; having used them as placebos to salve his aerial soul when actual pilot time became too expensive for him to continue.

♦♦♦♦♦

Mouse Maintenance

By: Robert Morris, Pentagon PC User Group

Do you feel like beating your mouse against the desk instead of moving it gracefully along its own personalized pad? When your mouse starts skipping, operating erratically, or not at all, it's time to take action. The first step to restore some semblance of normalcy is to clean the mouse as outlined below.

You can clean the ball and the rollers the ball contacts inside the well in which the ball resides with some denatured alcohol and cotton swabs. Be advised this may not help, as dirt on the ball is only part of the problem. The rest of the problem is inside the mouse, behind the covers that warn you will void your warranty if you mess with it. If your mouse is out of warranty, or you're in a pinch (. . .ever try to use Windows without a mouse?) and have to get back to work, then use this procedure to restore your mouse.

CAUTION: DENATURED ALCOHOL IS EXTREMELY FLAMMABLE AND HIGHLY POISONOUS. DO NOT USE NEAR FIRE, FLAME, OR WHILE SMOKING. USE ALL PRECAUTIONS NECESSARY TO ENSURE THE SAFETY OF YOURSELF AND OTHERS. STORE UNUSED PORTION

(Continued on next page.)

(Continued from previous page.)

IN ITS ORIGINAL TIGHTLY-CAPPED CONTAINER AWAY FROM PETS AND CHILDREN (U.S. AIR FORCE).

First step - find some denatured alcohol, some clean cotton swabs, and a clean, dry lint-free rag. Then, after disconnecting the mouse from the computer, roll the little fella over so you can inspect his belly. You will probably find a circular locking plate holding the ball in place. This plate can usually be removed by either sliding it toward one end, or rotating it either left or right until the lock is opened. When this retaining plate is loose, cup your hand over the plate, roll your hand and the mouse over, and the plate and ball will drop into your palm. Use the alcohol and swabs to thoroughly clean the ball of dirt, grease and whatever else (coffee, soda, mayonnaise and mustard) that your mouse has ingested. Use some alcohol on a swab to clean the little plastic rollers inside the ball well. Be gentle here. If you use too much pressure, you won't need the rest of these cleaning procedures, just the recommendation for a new mouse. Be sure to rotate the rollers to clean its entire contact surface.

After you have cleaned the ball and the rollers, you need to use the lint-free rag to wipe the residue of the alcohol from all surfaces. This is the part where most people will try to cut corners. It is not the hardest part of the procedure, but very a necessary one.

After you have finished buffing the residue off the ball and the rollers, drop the ball back into its well and replace the retaining plate. Reconnect the plug to the computer, and test your work. You should notice a considerable improvement in the operation.

Part of the problem with mice is an inherent design deficiency. The ball rolls on a dirty desk or mouse pad, picking up dust and dirt mixed with skin oils, smokers residue (of course, not in the Pentagon), coffee, tea, and whatever else you have consumed at your desk. As the ball rolls, it can throw these minute particles past the rollers that contact the ball, up inside the body of the mouse. Here it can stick to the thin Mylar disks that have concentric copper rings plated onto them. These copper rings contact minute spring fingers. When dust and dirt lodge between the tiny fingers and the concentric rings, your mouse won't work. No cause for alarm. If you are even minimally mechanically inclined, you can successfully perform open mouse surgery.

WARNING: If your mouse is still under warranty, you will probably void that warranty by peeling or removing the label.

As before, remove the mouse from the computer, and the ball from the mouse. Now inspect the belly to find the small screws or plastic locking clips that hold the top of your mouse (the part with the buttons) to the bottom of the mouse. If you don't find them exposed, you may have to remove a label. If you still have it, check the documentation which came with your mouse to see if any cleaning or disassembly instructions were included.

OK - now that you are inside the mouse - You should find two thin circular disks mounted on shafts connected to the rollers that protrude into the ball well. On one side of each disk are plated copper rings that contact up to four tiny springs. DonÆt try to move the springs or bend them to increase pressure. As a matter of safety, try not to touch them, either.

Changing the pressure of one spring affects the pressure of the others. If all springs don't contact the rings with the same pressure, your mouse will probably not work correctly again!

Tilt your mouse so that you can put a drop of alcohol on one of the disks, then spin the disk by turning the roller in the ball well. This will distribute the alcohol under the spring contacts. Roll the rollers in both directions to clear any dust or particles of dirt that may be trapped under the springs. Now, while the alcohol is still wet , very gently clean the alcohol from the disk with a cotton swab. Do not use much pressure that will cause the disk to flex. After you have removed the alcohol, use a clean (emphasize clean) dry swab to remove as much of the alcohol residue from the disk as possible, spinning the roller to reach all of the areas covered with copper. Again, use a very light touch, and avoid touching the springs!

When the first disk is clean, repeat all steps for the other disk. Don't forget the precautions!

After you have finished cleaning, inspect the disks thoroughly, checking for a warped disk, bent springs, bits of lint from the cotton swab, etc. When you're satisfied that all is well, reassemble the mouse, reversing whatever steps were required to open the little rascal.

You're almost finished - but not quite. Before you go slamming your newly cleaned mouse down for a test run, take a close look at the mouse pad. Would you let your kids play on a carpet that dirty? I think not! Take that scuzzy thing to the sink and wash it thoroughly with a mild detergent and warm water, be certain to rinse it thoroughly (soap left in the pad will attract moisture which will trap dust and dirt that your mouse can pick up). After it's dry, you're ready to check your refurbished mouse. Good luck.

FOR SALE:

Bordland Turbo Pascal 6.0 and **Microsoft BASIC 7.1** for DOS systems; these include all original disks and manuals. Asking $50 each, plus shipping costs. Will separate. Tom Cone, 223-3888 or leave message on Bits of Blue BBS.

Software Review :

THE KNOWLEDGE ADVENTURE SERIES

By Sue Taskey, Sarasota IBM-PC User's Group, Inc.

As a mother of three school-age children and computer lab instructor for more than 1000 children, I am constantly searching for exciting software programs. I recently found some of the most interesting and innovative learning programs that I have come across in a long time. Most of you software buffs are familiar with Lotus Magellan. Mainly responsible for this masterpiece is a gentleman by the name of Dan Gross...programmer extraordinaire. Mr. Gross has embarked on a new tack for his talents in the way of adventuresome learning programs which appeal to children from 6 to 60. They are designed to make learning fun and exciting, and are collectively and appropriately called the Knowledge Adventure Series.

Children of all ages like to be in control, even at the computer keyboard. With these new software by Knowledge Adventure, they are. These are all large programs which require from 5-8Mb of space, sound, and VGA graphics.

Science Adventure is the first of three I previewed. It is a highly informative program in which the user is responsible for his own destiny. They choose the era to explore from the timeline on the main menu. This main screen has a series of buttons representing different science categories, from life science to the history of computers. Clicking on the "Books" button the user can research a variety of subjects. There is no way to look up information on topics other than what is listed. The quiz was my specific area of interest. I need the variety of questions but would have liked the capability to type in answers or have more than one player, similar to a jeopardy game format.

After numerous hours of exploring Science Adventure I moved on to what soon became my favorite...Dinosaur Adventure. Those big, loud prehistoric beasts are so real looking, the children become captivated. The sounds coming through my Tandy Sensation are so realistic, you can easily imagine what it was like to have lived during the dinosaur age. I found Dinosaur Adventure very appropriate for use with children from second grade up. The main menu is different from the other two members of the Adventure Series. It has five different games. One of these is a naming game. Given the name, you must match it to the dinosaur. Another naming game shows you the dinosaur and you must match it to the name. With both games, if you select the wrong answer, the program suggests the correct one.

Another favorite with first and second graders was the Storybook. You read a story aloud and the screen pages change so the children can read along. The most unique game is an animated filmstrip where you can watch the lifestyles of five different dinosaurs in their natural habitat, eating, fighting, and making noise. The adventure game is like the Science Adventure where the user can explore a variety of facts about dinosaurs.

The third program by the same publisher is titled, Space Adventure. The installation is the same on all three, very easy. Movement is accomplished via the mouse, and exit is evident on the main screen of each. Space Adventure explores space from the Solar System to NASA and the Moon. Space Adventure was more popular among the older children.

When I asked a group of fourth graders what they thought about these programs their comments just summed it all up...

- "Wow, there's just so much to do!"
- "It's so awesome, are you sure it's not a CD-ROM program."
- " Listen to those dinosaurs, I bet that's what they really sounded like."

Children need to be always learning, but it's wonderful and painless when they don't know they are. The graphics and sound on all of these programs make them well worth the bargain $30-$50 range they are in.

Software Review :

Approach 2.0

By : Pete Sloan, Sarasota IBM-PC User's Group

Would you like a database that is simple for the novice to set up and use, yet is powerful enough to access data from up to 10 different databases simultaneously, in different formats, even over a network? Would you like to be able to use all your True Type and Type 1 fonts, and colors in your reports? How about being able to store not only words, but pictures, sounds, video, charts, whole documents and spreadsheets? Yes, you can do all this and much more with Approach 2.0.

Ever since first hearing about databases that would let me store information not only in words but also pictures, I've been wanting to try a Windows database. Like many of you, I don't have enough time to learn yet another programming language. So when the opportunity came to try Approach, an "easy-to-use database with absolutely no programming necessary" I jumped. My immediate goal was to take an existing collection from the spreadsheet I was storing it on and move it into Approach. Then, add pictures of each item. As I called up a particular item, I would not only have information such as price, quantity, name, but also a picture of it.

First, some information on the program. Required is a 286 or better, Windows 3.0 or higher and at last 2 megabytes of ram. I would recommend a 386 and 4 megabytes of ram for acceptable speed especially if using graphics. Installation is very straightforward and I was happy to find it just takes up a bit over 2.5Mb of disk space. The documentation consists of a tutorial and a reference manual. I'd recommend that you spend the time to do the tutorial, this program has many features that you'll miss if you don't. The tutorial takes you through some sample databases and shows you how to start, modify, and add

(Continued on next page.)

(Continued from previous page.)
to a database. I tried customer service several times and they were very helpful, and knowledgeable. Best of all, there was no long wait, on hold, like I've had with some support.

After going through the tutorial I was eager to start building my own database. Approach walks you through the process, first you name the field, then, by clicking on the choices, define each field. There are ten different field types to choose from. One, the picture plus field, allows you to store graphics, sounds, whole documents or spreadsheets. There are also many conditions that you can apply to a field by just clicking on a selection in a dialog box. As Approach can use several different file formats such as dBASE, Paradox, FoxPro, and Oracle, some differences in field rules do appear, but the "context sensitive help" makes it easy. Once you have defined the fields, Approach puts you right into design mode. Here you can move, color, or box the fields. You can also change the type to any True Type or Type 1 typeface. By simply selecting from the menu or icon bar, graphics, boxes and buttons can be added to dress up your form. You can also add titles and descriptive text. The look or form of the display is stored in a format they call a view and does not affect your data. Many different views can be created to access the same data. Once you have the design the way you want it you just click on the view icon to move from design and begin entering your data.

In my case, I have my business logo appearing at the top of each form, and a block for a picture of each item in the upper right corner. I scanned a picture of each item, cleaned it up in Corel Photo Paint then, using the clipboard, placed a graphic into each record. As Approach supports OLE, you can just double click on the graphic and your paint program will launch, you can make any necessary changes and then return to Approach. Any time you can switch back to design and modify your form without losing or changing any of your data.

Reports are easy to construct. From the design menu you just place the fields across the form as you want them. Using the style menu you can modify the look of the report. Totals, footers etc. can be added without programming by selecting from menus.

Approach also supports mailing labels, with different Avery formats preprogrammed. Form letters are also easy to do.

This program can be used as a front end or access to already existing database files. It can combine information from different file structures onto the same form, and allow you to view and add to it. As it is network compatible, it would make a great information system for executives that need access to repetitive data. You could set up the views for them and add buttons that, when clicked, would cause a macro to update the information. All this without knowing any programming. Approach also comes with some prepared templates that are easily customized. They include budgeting, contact management, inventory management, invoicing payroll and many more.

This program that lists for $399.00 and is available on the street for $249.00. It can be ordered by any user group member for $99.00 by calling (800) APPROACH. Approach is a relational database that is easy enough for the novice yet powerful enough for the computer expert. It allows you to have power without programming.

Labels in WordPerfect

By: Collette McManus
Hard-Copy: The Journal of the Chicago Computer Society

The first thing you should know is that WordPerfect Corporation ships a lot of great macros and other goodies with WordPerfect. One of those great macros is the LABELS.WPM macro. This macro is used to set up label paper size definitions for use with Avery Labels and other labels. It also has other uses which I'll explain later.

To use the macro press ALT-F10, type LABELS and press ENTER. This invokes the LABELS macro. A box listing all the Avery labels pops up on the screen. Scroll down until the label type you want is highlighted and press ENTER. You will see a "Please Wait" prompt and then a "Building List" prompt. Next, you will be asked for the label form's location "Continuous, Bin or Manual". Follow the prompts for "Bin #" or "Prompt for Manual Feed Y/N" if you chose either of those options. Again you will see the "Building List" prompt and then another prompt that asks "Insert Label Definition in Document Initial Codes? Y/N." If you are setting up this paper size/type to use with the current document, press Y for yes. If you are setting up this paper size/type for later use, press N for no. Whether you answer Yes or No to that prompt, WP will place the paper size in Shift-F8, Paper Size/Type for future use.

Remember, you only need to run the macro once to set up any specific label definition. Then, every time you want to use one of your labels paper size/types that you have set up, you will need to pick it from Shift-F8, Paper Size/Type. This set up procedure also automatically sets up inside and outside margins for your labels. These margins can be changed, but you probably will not find that necessary. You may see a message that says the "Label's margins were increased due to the printer's minimum margins." Don't worry about the message, some printers have minimum margins for their "no print" zones.

Ok, you have a labels paper size/type set up, now let's use it. If you are not at a blank document screen (you can use the following steps on an existing document), go to the top of the document before all codes by pressing Home, Home, Home and the Up arrow. Press Shift-F8, Paper Size/Type for a list of all your paper size/types. Home, Home, Up to the top of the list (some of your list may scroll off the top of the screen). You should see your labels paper sizes that have been previously set up using the LABELS macro. On the left side of each entry, you will see the size of each label and its Avery number (found on the label's package in big numbers). On the right side of each entry, you will see some numbers. These numbers give you the sheet's dimensions in labels. (Continued on next page)

(Continued from previous page)

This dimension such as 2x5 or 3x10 is the number of columns (first number) by the number of rows (second number) on each sheet of labels. Highlight the entry for the labels you wish to use and press ENTER, then press F7 to get back to your document. If you look in reveal codes, you will see the code for the labels you have chosen. This should be the first code in the document to work properly.

Working with labels can be a little intimidating for a new user. If you have your brain working in the right direction, it's really very easy! Think of the labels as a sheet (not page) of many pages (labels) on that sheet. If you think in the "sheet of many pages" terms, it will make working with and printing labels easy, and it is. You have your paper size/type code in your document and your are thinking "sheet of many pages," so now let's enter some information for our labels. Since, WordPerfect has already set up the margins for you, all you need to do is to start typing. Type the address for your first label. Instead of putting a Hard Return code at the end of the last line, put a Hard Page (Ctrl-Enter). Sheet of many pages! Your status line now says Page 2. Type your second address for the second label and Hard Page at the end of the last line. Sheet of many pages! Keep going. Each label is its own "page." Now if you don't trust me, you can view your document to check it out (Shift-F7,View document). I suggest that you wait until you have typed quite a few labels to get the full effect. Pretty amazing, huh? Give me those old WordPerfect Corporation "Oooh!"s and "Ahhh!"s.

Ok, now you're finished and are ready to print your labels. Remember, "sheet of many pages"? To print properly, either print the full document (Shift-F7, Full) or print multiple pages. To print multiple pages, press Shift-F7, Multiple pages, and enter the "page" numbers of the labels you want to print 10-12 will print labels 10, 11, and 12. Be aware that printing these labels will the Multiple pages option will print at the top of the sheet, not necessarily in label positions 10, 11 and 12 on the sheet of labels.

Any document that is a list of clients can easily be changed into a name-per-page document by using WordPerfect's Search and Replace feature. If the document was set up with a double hard return between entries, search for the two Hard Returns and replace them with a Hard Page. You can use any name-per-page document to print different types of labels (yes, even envelopes) by simply picking the desired paper size/type. Changing the paper size/type code changes the structure of the printout. I use a labels document as a primary merge file to merge with the WPSIG membership list. This creates the address labels for the postcards for the meeting notices. If I were to delete the labels paper size/type and insert an envelope paper size/type, I would have an envelope document. When using a merge format, you could use the same secondary file to merge with an envelope primary file. This multiple use idea maximizes your WordPerfect power. The same WPSIG secondary file used to create the postcard labels is also used to create the sign-in sheets. I have a primary file set up for the sign-in sheets.

You're all straight with creating and printing labels, right? And, it's so easy that you're bored! Ok, let's get creative! You can use labels to create your own labels paper size/types to suit your needs. The brochure I created for the South Suburban WPSIG used a Tri-Fold Brochure*Portrait paper size/type that I created. At the SIG meetings I gave a handout with instructions on how to create a Tri-Fold Brochure*Landscape paper size/type. I have also created paper size/types for Business Cards and a Greeting Card (just like PrintShop's greeting cards). This greeting card is set up as a sheet of 4 labels (2 x 2). When printed, you fold the paper in half horizontally and then in half again vertically.

To create a Greeting Card paper size/type, start by pressing Shift-F8, Paper Size/Type, Add (Create), Other. Now, type the name you want to appear in the Paper Size/type list "GREETING CARD" will do just fine. The screen that appears now is used to define your greeting card format. Paper Size is 8.5 x 11, and that's correct. You could change this to 11 x 8.5 or whatever you want. Type is the name you give to this paper size/type definition. Prompt to Load (yes or no) is asking you for information on whether you want the printer to stop and ask you to load the paper. Location tells the printer where to find the paper (bin number, continuous or manual). Double Sided Printing is self explanatory. Binding Edge is used only when binding your document. You probably don't need to worry about Text Adjustment, but Labels is important. Labels (yes or no) needs to be set to yes for your greeting card. When you answer yes, you are given another screen that contains labels parameters for this labels paper size/type definition. Labels Size asks for the widt hand height of the labels. For your greeting card type (portrait) the width should be 4.25 and the height should be 5.5. Number of Labels should be 2 columns and 2 rows. For Top Left Corner, top is 0", and left is also 0". Distance Between Labels is 0" for columns and 0" for rows. The Label Margins would be the top/bottom and left/right margins for each label. Set all margins equally to .25", .3" or .5". Press F7 to accept all settings and exit creating the paper size/type.

To use your newly created greeting card paper size, pick it. Create a graphic on page 1 (see the WordPerfect Manual for specifics). Set the graphic to be a page graphic that is full page and horizontally position it fully between the margins. Edit this graphic and rotate it 180 degrees. Hard Page twice to page 4 and enter your inside message. If you Center Page and Center Justification, your inside message will be dead centered on the inside. These are basic instructions that I hope will get you started in using labels in creative ways.

Remember that any Paper Size/Types that you create, are created for the current printer. If you take the document to another printer without the document's Paper Size/Type existing for that printer, it will print weird. Be sure to create the Paper Size/Type for all your printers (at home and at work if you intend to share documents).

So be creative and make your computing easier. Let WordPerfect help you make your computer a slave to you, not the other way around.

Author Information: Collette McManus is well known to ChicagoComputer Society members as our tireless WordPerfect SIG Coordinator.

Competitive Upgrades

By: Harold A. Driscoll,
Hard-Copy: The Journal of the Chicago Computer Society

Buying computer software is quite easy. Once you figure out what you want, you just go out and buy it, right? Makes sense, but first let's take a look at excerpts from an advertisement I received in the mail today.

WordPerfect 5.2 for Windows Upgrade Kit$35.95
WordPerfect 5.2 for Windows Competitive Update$99.00
WordPerfect 5.2 for Windows Live Tradeup$79.95
WordPerfect 5.2 for Windows Full Version$289.95

Since this product has a suggested retail price of $495, this is quite a range of prices.

Reading the fine print, we see that the "Upgrade Kit" is limited to registered users of WordPerfect 5.1 for Windows, and the "Live Tradeup" to registered users of any previous version of WordPerfect for DOS. That gives us a choice between $99 and $289.95. So the question is, what is a "Competitive Upgrade?"

When software companies want to increase market share, many of them offer "Competitive Upgrades." These "Updates" are actually full versions of the product, usually without a fancy package wrapper. They are offered to users of similar products, typically at a third or less of the price of the full product.

Okay, but how do you qualify for one of these deals? You need to have a competitor's product., and provide acceptable proof. Each offer has its own list of products; such as our example, which will accept "any DOS or Windows word processor with a suggested retail price of $395 or more." Some offers are quite specific, with a list of qualifying products; others accept any product of a general category.

What kind of proof is acceptable? Again, this depends on the offer. Most common is the title page from the user's manual. Some offers require the original page, others will accept a fax or photocopy. Sometimes the master disk, or one of the distribution disks is needed. Occasionally a simple statement that you own such a product will suffice. Read the fine print on the offer.

If you already have a competitive product, then you are all set. If you don't, look again at the products you have on your shelf. Maybe you got a program bundled with your computer which qualifies. Don't worry about an ancient version, either, unless the offer insists on the current one. Although a few offers are particular, many are quite loose about what qualifies. You might also find something at a garage or rummage sale which qualifies.

What are other ways to save money buying software? Make sure that you send in your registration cards. Some companies, such as Borland, frequently offer their customers the competitive upgrade price, even those who own entirely different products. Another approach sometimes works when a company has both a special individual editions and a more expensive professional edition. Sometimes you can buy an update to the professional edition, and save money on the total cost.

You might also call the company, many have toll-free 800 numbers, and ask for a demo disk of the product. Frequently they will include some kind of special offer. Also watch for new product releases; sometimes the introductory price is much lower for the first few months. Also watch for bundle deals, sometimes you can save big bucks even if you don't want the other product.

The software companies play these games for their benefit; you might as well make the most of them for yours. I'm told that when Microsoft announced their new Microsoft C/C++ 7.0 product at a software developer's conference, Borland had a trick up their sleeve. Borland brought a truckload of an obsolete version of their compiler, and gave them out to participants; suddenly everyone could buy the Microsoft product at the lower price.

Oh, yes, lest I forget; when you do decide to update, check out the price from local software stores. Sometimes their price is ten or twenty dollars less then directly from the vendor, plus you save shipping costs.

Bits of Blue is published by the Tampa IBM PC Users' Group, Inc., a State of Florida registered nonprofit corporation, to provide educational information about IBMPC and compatible personal computer systems to its members.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII file or in a commonly available word processor format, such as WordPerfect 5.1, on diskette to the editor at 9402 Hidden Ridge Place, Tampa, Florida 33637 or send it by modem to BBS (813)239-3704.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

Commercial advertisements will be accepted at the following rates:

	1 month	3 months	6 months
Full Page	$60.00	$162.00	288.00
Half Page	$40.00	$108.00	$192.00
Quarter Page	$22.00	$60.00	$106.00
Eight Page	$12.00	$33.00	$58.00
Business Card	$10.00	$27.00	$48.00

All advertisements must be prepaid by check payable to TIBMPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if it is not received on time.

Members may insert noncommercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, Marylee Bruneau at (813) 985-3338, for space availability and for further information.

This newsletter was created with Ami Pro for Windows donated by Lotus Corp. to TIBMPCUG for use by the editor.

Secretary's Report

MINUTES OF 5/12/93 MEETING and PERSONAL COMMENTS

By: Jim Clark

The meeting began just a few moments late at 6:20, the delay due to "mechanical problems" (had some difficulty getting the NT [new technology] to work). But, it was yet another good meeting, with quite a nice group in attendance. This meeting was particularly interesting because the subject was current and interesting to just about everybody who uses an IBM compatible computer -- the new operating system, DOS 6.0 -- and because it was an "open forum" type of a session, lead by our astute Prez, Harvey Bruneau. Harvey was to be ably assisted by our talented librarian, Larry Anders, but work demands arose which prevented Larry from making the meeting. Like the legendary knight in shining armor, atop a large white steed, Harv carried the evening by himself.

INDUSTRY/CLUB NEWS: Since NT had delayed start of the meeting, and there is a lot in DOS 6.0 to discuss, industry and club news were omitted.

PRESENTATION -- MS-DOS 6.0

No formal presentation was prepared nor intended since this was to be a forum, or seminar type of treatment of DOS 6.0. Harvey guided the discussion by introducing the major changes in MS-DOS 6.0 compared to DOS 5.0, and giving a brief review of each: Double Space, Anti-virus, MemMaker and the changes to the MEM command, Backup, Defrag, InterLink and selective boot. Installation was also discussed, as were some upgrades of 5.0 features, such as UNDELETE, and some new commands, such as DELDIR, MOVE, and NUMLOCK.

Documentation: The documentation in the manual with the upgrade version is a little sparse and is not nearly as complete as the DOS 5.0 manual; it focuses principally on the changes that have been made from the 5.0 version. (Apparently no one was aware of the documentation that comes with the full version of DOS 6.0, for no one spoke on that subject.). For upgrading to DOS 6.0, then, one should hang onto the manual that came with DOS 5.0.

On-line help is quite extensive, however, and one need only type the command at the DOS prompt followed by /? and a help screen appears revealing the hows and whats of the command. Alternatively, type help at the DOS prompt and a screen showing all DOS commands appear, double click on any you're interested in and, walla, the info appears.

Installation: There were a number present who reported varying levels of difficulty, some requiring some changes to their boot files before satisfactory installation and operation could be achieved. However, I personally had no difficulties installing DOS 6.0 and it seemed that most present who were using DOS 6.0 had no difficulty. Installation instructions seemed adequate for the most part. Rumor had

(Continued on next page)

(Continued from previous page.)

it that one must have DOS 5.0 installed to be able to install the DOS 6.0 upgrade. However, the instructions indicate that one must have only a previous version of DOS to install the upgrade to DOS 6.0. That is logical since a disk partitioned and formatted by an IBM-compatible DOS is required in the first instance. But one need not have a complete installation of any previous version of DOS to install DOS 6.0 -- it is enough to have a DOS partitioned and formatted disk. The earliest reported version of DOS to which the DOS 6.0 upgrade has been applied by those present was DOS 3.0.

Double Space: For most, Double Space was fairly easy to install -- and it works as advertised. It appears that it is not as efficient at compression, nor does it have some of the features of the better stand-alone products (i.e., Stacker), but it does do a fairly good job, simply. One big advantage is that it loads before anything else and no statements in CONFIG.SYS is required, and except for those needing and uncompressed area for Windows swap, all files (including boot files, such as HIMEM, tec.) may be compressed. The degree of compression using any existing compression program varies with the type of files being compressed -- ZIP files almost none, spreadsheets a lot. So, the terminology of doubling disk space that they all use must be taken with a grain of salt. Articles have reported an average disk compression using Double Space at between 1.6-1.8 to I.

I do not use DSpace, but I tried it on a new disk I was installing. It compressed at about the same degree as SuperStor PRO. Most articles I have read give Stacker a little better compression ratio. I didn't stick with DSpace because it creates another uncompressed drive with a minimum size of 200K for every compressed drive (or partition) compressed. I run one uncompressed and three compressed partitions. DSpace therefore created an additional 3 drives - one for each compressed partition - giving me 7 drives to deal with in all matters relating to drives. Another feature I did not like is that DSpace does not make provisions for decompression, as do both SS Pro and Stacker -- though some report that decompression is so difficult at this point that it is not really a valuable feature. Access to DSpace once installed is limited to DOS; an interface with Windows is not yet a part of the program.

There have been quite a few reports in the news since DOS 6.0 release, indicating a lot of difficulties have been encountered with DOS 6.0, including DSpace. A couple of folks at the meeting also reported difficulty with DSpace -- trouble resulting in loss of data. Microsoft says that there are 3 million copies of DOS 6 out now and they have received only about 1% of that many calls, and a lot less than that which involved anything significant. Still, there have been some serious problems; problems which will no doubt be corrected in the not-too-distant future.

Anti-virus: This is a welcome addition to DOS, especially for those who haven't purchased anti-virus protection. It can be installed in both DOS and Windows. It includes detection and correction of 800 viruses, and includes 2 upgrade coupons for $9.95 each. What will happen after that is not known now, but some form of upgrade will likely be continued -- as they all do. This feature can be installed as a TSR, but to install all of its protections (features) takes about 46K of memory (23K of conventional and 23K of upper), a fairly high price. Two cautions were noted: Don't have the anti-virus program TSR when installing new programs on your computer; and be very careful about using the auto correction of detected viruses feature because some false alarms occur with some types of files in some circumstances, and you could lose files.

MemMaker: Another welcome new feature for DOS, especially for those who don't already use another stand-alone memory management program, like QEMM. This feature is also easy to use. It can be installed at the time of installing DOS 6.0, or at a later time. Though not as efficient at rooting out all of the unused memory and managing memory as the top stand-alone memory management programs, it does a fairly respectable job finding and using unused memory, and auto loading into upper memory. And, it is very easy to use. If you don't already own a memory management program, or don't want to invest the bucks in one, this is certainly a good alternative.

Backup: Previous versions of DOS have included a backup capability. The major difference here is that this is a full blown menued program, and it allows for compression of the backup files. It also provides for a range of backup -- from complete, down to a single file, all of which can be selected by the user. This, too, can be installed for DOS, or Windows, or both. It is a good improvement, but here too, it is not as comprehensive nor as efficient as the top stand-alone programs on the market. Again, for those who don't now own a backup program, it is a very welcome addition.

An article in a local industry paper stated that this feature would only backup to floppy drives. That is difficult to believe. The manual is silent about to the types of devices one can backup to, but a member present noted that the only device he has been unable to use is a tape drive.

Defrag: A fairly fast and easy to use addition to DOS. Some reported it not as fast as the better disk/file maintenance programs. Defrag doesn't have all of the capabilities of Norton Disk Doctor or PC Tools, of course, but I have found it as good at defragging for my simple purposes as the other programs I have used, including earlier versions of NDD. Defrag is available only at the DOS prompt, and shouldn't be ran at the DOS prompt through Windows.

InterLink: InterLink does the same thing LapLink does -- connect 2 computers together and allow the interchange of files/info between the two. It does not include cables, as LapLink does, and some report it is more cumbersome to use. Nevertheless, for those without LapLink or similar program, it provides an otherwise missing capability. This feature is available form the DOS prompt.

Selective Boot: A very welcome feature by all DOS users who boot from hard drives. This feature is too sophisticated to go into here in detail. Suffice here to say that it allows for a clean boot from the hard drive in event of some

(Continued on next page)

(Continued from previous page)

configuration problem which prevents a normal boot -- in effect eliminating the requirement of the past to boot from a floppy in similar circumstances. (This does not mean you shouldn't keep a bootable floppy, though.) This feature also allows one to boot in any configuration desired by selecting desired options during the boot process. It doesn't happen automatically, however; these capabilities must be setup, except for the clean boot which requires only pressing F5 at the appropriate time.

New/Modified Commands:

Undelete: An undelete capability was available with DOS 5. DOS 6 has expanded a great deal on that capability and developed a menued program which can be installed in DOS, Windows, or both at installation time . It provides for three levels of undelete: Sentry, Tracker & Standard. Sentry & Tracker levels use disk space to store the files or information about the files which will not be overwritten and thereby removed from recovery, as with the previous undelete command and with the DOS 6 Standard level of undelete. The old undelete command is still available at the DOS prompt as well.

Move: Another welcome, but dangerous, addition to DOS. The MOVE command allows for moving individual files and up to and including complete directories -- replacing the old individual files copy/delete method. It is very easy to use. That combined with the magnitude of action that can be involved makes it a command that should be employed with great care

NumLock: Another very welcome addition, especially for those of us with an older machine which does not have provisions in CMOS for configuring NumLock. NumLock can be turned on or off at the DOS prompt, or as a command in CONFIG.SYS.

SmartDrive: I believe this program has been "upgraded", but it functions remain essentially the same as with DOS 5. One word of caution came up at the meeting: If using the Double Buffer feature of Smart Drive, be sure to allow sufficient time when shutting down for the data in the buffers to be written to disk; some have lost data when they haven't allowed sufficient time for the write before turning their machine off. How much is sufficient, I don't know, but I would allow several seconds as a minimum.

Delete Directory: Also a long-wanted capability, DELDIR allows for deleting directories without first having to empty the directory of all files and subs. It., too, is a dangerous command and should be used very cautiously.

In summary, DOS 6.0 provides some very nice additions to DOS 5.0, but some believe that it should have been given a 5.* designation rather than a full number change which signifies a fundamental change, as opposed to added bells & whistles. It has a lot of new and welcome additions, however, especially for those who don't now have similar capabilities in utilities from other vendors. It is a large capability for not too many bucks, especially the upgrade version. Some problems have cropped up with some of the new features; apparently, the more sophisticated the configuration and/or operation, the more likely one is to encounter any problems. I, for one, however, running a home computer 386/25, with multiple hard drives, modem, scanner, 3 printers, Windows 3.1, and a host of Windows and DOS software of all varieties, have had no (zero, that is) problems with DOS 6.0. And, I am confident that Microsoft is working very hard and fast to come up with answers to all problems encountered so far.

THANKS MUCH, HARVEY, for an excellent job of guiding us through as much of DOS 6 as time would allow. It was a productive session!!

AND THE WINNER IS

Thanks to the generosity of Microsoft (who donated a copy of Access) and your User Group (who donated a copy of DOS 6.0), along with the 50/50 cash drawing, there were some very nice raffle prizes. Those among us to have the good fortune to win are as follows:

Kit Kelley	MS Access
Donald Houston	DOS 6.0
Mike Diaz	Mouse Pad
Kevan Sheridan	50/50 ($52)

the meeting adjourned at about 8:45 PM

WELCOME NEW MEMBERS:

Preston Goossen
Stephen Layton
Joe Zamrin

We are glad you joined our group!

Editorial Comment:

There is not a **President's Column** in this issue, as Harvey is still "catching-up" after COMDEX. However next month, look for his full report on his trip to Atlanta for Spring COMDEX. Some of you may have noticed Don Patzsch's report on the BBS of his excursion to view the latest in computer technology. Thanks for sharing your experiences with us Don.

Software Review:

True Type for Word Perfect

Version 2.1, by Laser Tools

Review By: Jim Clark
Tampa IBM PC User's Group

What It Is: True Type for Word Perfect (by Laser Tools) is a font pack, of course -- but it is a good bit more than that: It also includes a special effects capability; it works in both DOS and Windows; and it works with a variety of Word Perfect Corporation programs -- Word Perfect (WP) for DOS versions 5.0 & 5.1, WP for Windows versions 5.1 & 5.2, Letter Perfect 1.0 or later, Word Perfect Works 1.0, and Plan Perfect 5.0 & 5.1. The true type fonts may be loaded into and used by Windows 3.1 (or later), but one of the foregoing WP programs must be loaded to use the special effect and other capabilities of this Laser Tools program.

Features: True Type for Word Perfect includes::
101 true type fonts , including several 'standard' serifs and san serifs, and a host of fonts from four other font groups -- Kid Bag, Lazy Dog Foundry, Image Club, and Attitude, Inc. Fonts included are KidType, Big Black, Berliner, Mississippi, Archetectura, Banco, BeeBopp, Bodoni Poster, Castle, Comic Book II, Fractur, Jazz Poster, Mistral, New York Engraved, Rock-A-Billy, Salto, Bones, Chill, Eggroll, Elf, Horror, Vanilla Shadow, and Zap, to name a few. Perhaps you can tell be these names the wide variety available in this package. You choose the fonts you want to load;

For use in the WP programs, 12 special effects, including outline, shadow, gray shading, and 9 fill patterns, all of which can be applied singly or in combinations to any of the 101 fonts;

Printer drivers which must be used to take advantage of the special effects and other features of the program. Many report that these drivers are superior to the Windows drivers;

A Windows interface and network compatibility;

Support for most of the popular dot matrix, inkjet and laser printers.

Installation is simple and clear cut. Documentation covers very well installation in the variety of circumstances in which the program can be used: DOS-only, Windows-only, DOS and Windows, fonts only, network, etc. And, installation is fairly simple, quick and clear cut. The documentation as well as on-line help will provide answers to most problems one is likely to encounter. You begin by call up in DOS the installation program -- TTINSTAL -- then follow the prompts. You will have an opportunity to tell TTINSTAL which (or all) of the fonts you want to load.
After installation a batch file is used to start the WP program and TT for WP at the same time. You may also start both using the TTWP command at the DOS prompt without using a batch file. The WP programs may also by used without TT for WP, if desired. Windows will be set up similarly to start the WP program with TT for WP.

Requirements: Laser Tools says that the program will work with a PC (or better), but I have difficulty imagining anyone using the program with less than an AT because of speed.

DOS version 3.1 or above.

One of the WP programs listed above to use all of the programs capabilities, or Windows 3.1 (or above) to use only the true type fonts.

At least 3 MB of hard disk space for the program and a base set of 14 Monotype typefaces. With all of the 101 typefaces that come with the package loaded, about 7 MB of space is needed. an additional 1.5 MB of free space is needed to process dot matrix or inkjet print jobs -- if you use printers from either of those groups.

640K of conventional memory, with at least 560K available. TT for WP likes and uses EMS memory for smoother and faster operation

Costs; The program lists for $79.95, but Laser Tools had a $24.95 special for user groups going until mid-May. I have not seen the program in any of the software retail outlets yet, so it is apparently not widely available and I have no idea of 'street' price. But, the special price for user group members could be extended -- if you are interested, call Laser Tools; it might be worthwhile.

My View: This is a very nice package, especially for DOS WP users -- it provides a large and excellent collection of true type fonts, with a special effects capability. In that context, it seems to me that the program is worth its likely street price. I would have trouble using the program in DOS, however, because I have become accustomed to WYSIWYG -- which this does not give you. For Windows users, there is a lot of competition out there, especially in the special effects area. This is worth a look-see, however, and it does have very nice fonts. If you are a font nut, the fonts alone are worth the 'special price for user groups' -- if it still available. LASER TOOLS Corporation, 1250 45th Street, Suite 100, Emeryville, CA 94608, 1-(510)-420-8777 (Sales) , 1-(510)-420-1319 (Tech Suprt)

The Association of PC User Groups

By: John Hoover
SCPCUG Representative to APCUG

Most all members of the Space Coast PC Users Group (SCPCUG) know that our organization is charter member of the Association of PC User Groups (APCUG) -- we say so each month on the front page, in the upper left portion of the newsletter banner. But how many know any of the specifics f the APCUG? What principles does the APCUG operate under? What about APCUG's mission? How many user groups are members? How many actual users do they represent? And, most importantly for each individual member of the SCPCUG, what benefits do I personally glean by my membership in the APCUG?

The Association of PC User Groups was, according to my records, officially formed using the APCUG title in May of 1988. It was in February 1989, during the formation period of APCUG, that the Space Coast PC Users Group became a charter member of the Association. Presently the APCUG membership includes 327 user groups from 45 states in the United States and eight other countries: Australia, Canada, Germany, Great Britain, Japan, the Saltanate of Oman, New Zealand and Russia. These 327 user groups represent over 300,000 individual users.

APCUG Principles

The following principles are used as a guide in the operations of the APCUG. These principles have evolved from APCUG's inception and were recently adopted by APCUG's Board of Directors as basic principles. These principles were taken from ***Reports***, a report for PC User Group Officers from the Association of PC User Groups, January 1993, Volume 4, Issue 1.

APCUG is a service organization, not a government.

User groups choose to take advantage of our services or not as they choose; we do not tell our member groups (the "customers" of APCUG) what to do. Although our mission is to support all user groups and our membership is open to all, our primary focus and responsibility must be to first serve those groups who have chosen to become members of APCUG.

APCUG serves the user group community; user groups are not servants of APCUG.

As an organization, APCUG is not as important as the user groups is serves. ***The individual user group is the purpose for which APCUG was founded.*** As such, it must remain our number one priority. APCUG officers, directors and volunteers in their official APCUG roles, do not themselves represent user groups. The promotion of APCUG or APCUG individuals should never overshadow the individual user groups and the user group community at large.

APCUG is an association of user groups; it is NOT a user group.

We serve our member groups as groups, working through the designated representatives and other officer of our member groups. We do not have individuals as members, and our activities are designed to help member groups help their users, not to help users directly. APCUG does not contact individual members of its member groups nor provide services for such individuals.

APCUG does not intervene in the internal affairs of its member groups or other.

Other than a determination whether a user group meets the organizational criteria to be a regular or associate member, we do not "police" or comment on the activities of member groups or others. Our programs may contain advice on what has worked and failed in various situations, but whether a group chooses to follow such advice or not is entirely up to it. APCUG communications with members user groups flow through the member group's designated representative and its other officers.

APCUG facilitates direct communication between member groups and computer vendors.

APCUG sponsors events and provides information on member groups, but does not insist on staying in the loop between user groups and in the loop between user groups and vendors. Once the contact is made, APCUG steps back and encourages both sides to continue the dialogue without APCUG involvement APCUG officials individually and APCUG programs collectively, may contain advice about successes and failures in previous contacts between user groups and vendors, but APCUG does not insist that such advice be followed.

APCUG is open to all user groups, regardless of platform or operating system.

The "personal computer" in APCUG does not mean IBM-compatible. APCUG is open to all non-profit, independent user groups whose focus is the individual computer user of a desktop, laptop, handheld or other such personal microcomputer-based machine. It is important that all APCUG programs and activities keep the multi-platform and multi-operating system needs of its member user groups in mind.

(Continued on next page.)

(Continued from previous page.)
Diversity has been and will continue to be -- the strength of the user group movement and APCUG must provide an environment where such diversity can continue to thrive.

APCUG does not discriminate among its member groups.

Each APCUG-member user group is an equal partner in the association. Except for purposes of membership determination (regular or associate), APCUG does not otherwise categorize or evaluate user groups by size, membership or activities. In no case does APCUG "filter" contacts between vendors and user groups. APCUG provides user group information to all vendors that ask and provides opportunities to sponsor events to all vendors that express interest. Except in very special circumstances, APCUG provides such information as a complete set and invites all groups to APCUG-sponsored events (some limited-size events may be allocated on an earliest-to-reply basis).

APCUG maintains its independence from the computer industry vendors that help sponsor its activities.

To the greatest extent feasible, APCUG tries to be even-handed in working with all computer industry vendors that want to work with computer user groups. Even-handed includes avoiding the endorsement of products and placing APCUG concentration on the user group programs of such vendors, rather than their products. Even-handed also includes being balanced between the vendors that have been very supportive for a long time and those that might want to start or expand user group programs.

APCUG attempts to minimize the cost of participation in APCUG activities and events by its member user groups.

Because most of our members user groups are non-profit, all-volunteer organizations, it is important that APCUG not over-burden its member user groups through continued assessment of fees. (The current annual fee is $25.) Wherever possible, any costs and expenses associated with APCUG events and activities should be offset through the contributions of sponsoring vendors and others. By keeping fees reasonable and affordable, we will be able to guarantee a more widespread representation and participation by APCUG-member user groups.

Mission Statement

The mission statement of APCUG is to:

* encourage, promote and enable communication and the exchange of information among personal computer user groups;

* assist user groups in the fulfillment of their educational and charitable missions and other activities that support those missions;

* promote the awareness of the value of user groups to the community and the computer industry, and

* facilitate communication among user groups, the community and the computer industry.

How Do Members Benefit ?

The SCPCUG member benefits in many ways from our organization participating as a member of the APCUG. Many of the featured speakers for our monthly meetings, as well as the door prizes and programs for review, have been a direct result of our affiliation with the APCUG. Most of the discounts that our group receives on software comes from vendors with whom we have made contact through the APCUG.

Last year the APCUG did a user group demographic study, which was sponsored by Lotus Development Corporation, Intel Corporation and IBM Corporation, and additional support from Borland International Corporation and the Association of Shareware Professionals. This study reinforced what many have been saying all along; that user group members have a significant impact on the computer industry.

Typical PC User

A summary of the results of the demographic study produced some interesting results about the typical personal computer user. Some facts and figures regarding the characteristic of the average user are:

* He/she is 48.3 years old.
* Earns $63,181 in household income.
* 12.9% are female
* 87.1% are male
* 69.4% have a college degree
* 81.7% are employed/self-employed
* 14.5% are retired
* 78.1% are employed in a non-computer related industry
* 21.9% work in a computer industry
* 28.3% are either the Chairman, President or Owner of the business in which they work.
* 33.7% are employed as part of the professional staff
* Spends 26.2 hours on the PC each week
* Owns 2.0 computers
* Paid $4,789 for the home computer system
* Works on a $6,834 computer system at place of work.

The typical configuration of the PC used:

* 80386
* 1 to 4 megabytes of RAM
* 40+ megabyte hard drive
* VGA monitor
* 2400 baud modem
* DOS without Windows (surprise?)

Software competence (top five):

* Wordprocessing 96.2% knowledgeable or better.
* Utility programs 88.8% knowledgeable or better

(Continued on next page.)

(Continued from previous page.)

* Spreadsheet programs 84.8% knowledgeable or better.
* Database programs 80.0% knowledgeable or better
* Communication programs 83.5% knowledgeable or better.

:-) Smileys, They're Here To Stay

Reprinted from the April 1993 issue of KIPCUG, the newsletter of the Kentucky-Indiana PC Users Group, Louisville, KY. Reprinted with permission from the World Monitor.

Most everyone who has logged onto TFD, CompuServe, or Internet have seen some SMILEYs, those little sideways faces that add flavor or take any sting out of remarks on occasion. These have got so much notice that The World Monitor, a monthly world news magazine, recently published a list of SMILEYs which *may* come from a Purdue network. If you recognize old friends, SMILE, If they're new, ENJOY them.

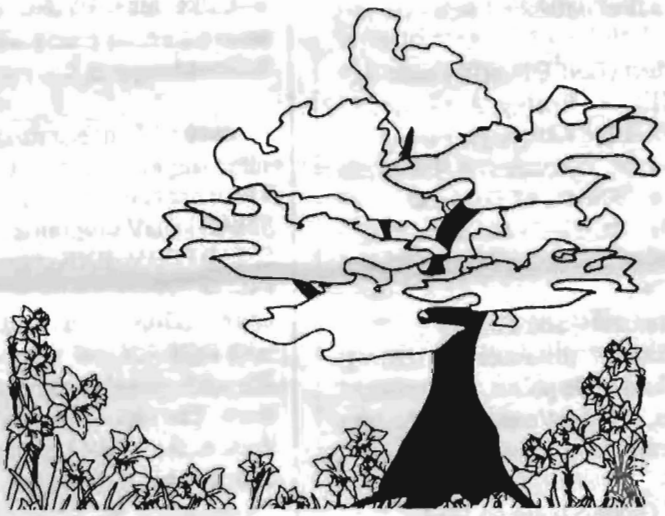
:-)	The generic Smiley, follows a joke or sarcasm.
;-)	Winky smiley; (don't hit me for what I said).
:-(	Writer unhappy about something.
:-	User made a devilish remark.
:-0	Wow!
|:-D	Ho, Ho, Ho.
:-O	Uh oh (dismay).
:-P	Nyah, Nyah.
:-[	Real downer statement.
:-D	Said with a smile.
:-Y	Said aside.
:-/	Skeptical.
B:-)	Sunglasses on head.
:-{}	User wears lipstick.
{:-)	User wears toupee.
}:-(	Toupee in updraft.
:-#	Users wears braces (suspenders?)
:-C	Writer really unhappy.
:-&	User tongue -tied.
:-X	User's lips are sealed. (Program chairman under NDA)
|-I	User is asleep.
[:-$	Using Virtual Reality.
-}	Too long looking at the tube.
:-***	Drooling over new software.

Make up your own SMILEYs as you go: X:-|) for instance, or [8=I/O

The following is a list of software available to interested members for review:

Fastlynx
KUI (Keyboard user interface for Windows)
Links-386 (golf game)
Amazon (game)
Express Publisher w/Text Appeal
Borland - ObjectVision 2.0
Borland - Quatro Pro for Windows

Please contact Harvey or Marylee @ 985-3338 to obtain this software and sign the review agreement.



Software Review

AUTODESK HOME SERIES LANDSCAPE

By Ken Lille, Sarasota IBMPC User's Group, Inc.,

Landscape is a slick drawing/CAD (computer assisted design) program that will work on IBM PC's or compatible clones. The install directions were clear; the installation easy.

The program rates an A plus for the finished detailed Landscape drawings. They are beautiful. I planned landscaping for our new 12' X 34' privacy courtyard. The drawing of the plants, trees, and shrubs surrounding and within these garden walls, the 6' high wrought iron gate, the windows and French doors looking into the courtyard all were neat and accurate in both placement and scale. I was able to test several designs with different planting area layouts and various sized plants and trees within each design. I spent much time reviewing the formal and contemporary designs. Each plan could be viewed from the top down, a "bird's eye" view or in a vertical "front view" which showed the height of the plants in relation to the wall, French doors and courtyard gate. The program illustrated where my existing sprinkler system missed watering two large spaces within the courtyard where there would be plantings. Two new sprinkler heads will be provided in the appropriate areas as a result of this planning.

The general guidance on planning a yard was useful. After reviewing the principles to follow for a good Landscape, such as: balance, proportion, order, variety, unity and seclusion, I concluded that good Landscape design is an art form that relies heavily on personal preference. The program didn't tell me which design was best but it allowed me to play with a variety of options, before I made a decision. I liked that.

The final drawing can be in any scale. However, the program suggested the most common, 1/4th inch or 1/8th inch scale used by the professional designers. The program also included advice on various play areas with graphic symbols from kid's swing set to an adult's tennis court. The feature, "shopper" provided a quick summary of the plants and trees in the plan and a summary of the estimated costs which I added for each plant. This was an eye opener. It caused me to revise the drawing with fewer shrubs and larger plants which gave the desired effect but left a few coins in my pocket. I appreciated this feature even though I had to repeat the drawing process.

The symbols are wonderfulùcrisp, clear and understandable. Doors and windows, trees and shrubs, fences and walls, stepping stones, measurements and ground surfaces all enhanced the drawings. I wonder why the authors elected to use only word choices as, deciduous a, b and c or evergreen a, b, and c on the pull down menus and in their handy quick reference card. These word choices alone did not provide as much useful information as their symbols. A choice with word and symbol would have saved a lot of flipping though the book and would have made the program more intuitive.

Landscape rates a C minus for the torturous process one most endure to get to these wonderful drawings. I found myself reading the first 85 pages of the manual, an unheard of prerequisite for a guy on the fast track with drawing programs and clip art and accustomed to working GUI icons to the max. Sure the software has pull down menus, neat options and very nice graphics but the jargon often got in the way. I had to refer to the book's definitions, examples and drawings repeatedly in order to understand how to use these features. For example, terms like "snap" and "dimension" have precise meanings and special instructions to get the desired effects. Some features such as " trim/extend" often produced the opposite effect until they were repeated frequently. Other features appeared to be interchangeable as "swap" and "flip 180" but in reality each has a specific function. When I was learning the program I mistakenly used these features interchangeably. Sometimes I did get the desired effect which then left me confused about the proper use of the feature. The authors cautioned the reader that Landscape will require practice, practice, practice. They are very correct and very understated in their advice. If you want excellent results and are willing to put in the time to learn this program, Landscape is for you. If you lack patience this program is not for you.

Was the time and effort worth the result? Yes. My wife and I look forward to enjoyable hours of relaxation in our contemporary design courtyard for many years. Would I use the program again? Yes, because I already went up this learning curve and I really like the final results.

The program consisted of 149 files and used 1,461,631 bytes of memory in my computer. Landscape is unusual for a new software program because it can operate on PC systems ranging from old and minimal to new and powerful. It requires an IBM PC, XT, AT, PS1, PS/2 or 100% compatible. 640 K RAM with 3.0 DOS or higher, one hard drive a graphics card (Hercules color, monochrome, MCGA, CGA, EGA, or VGA one floppy drive, a printer (Epson dot matrix or 100 % compatible or HP LaserJet or 100% compatible) and a mouse. The street price is about $49.00.

Software Review

PC GLOBE 5.0

By Stacy Gau

PC Globe is exactly what it says it is, a globe or atlas for your PC. It includes a variety of different maps and graphs. One is regional maps. This includes North and South America, Europe, Africa and the Middle East. Another is country maps. PC Globe includes 208 countries including the newly emerged nations of Eastern Europe; point-and-shoot capability that allows you to call up specific facts about different countries just by moving the crosshairs on the map; the ability to compare statistics of world groups or to rank countries in comparison charts in ascending, descending or alphabetical order; Finally group maps, which includes ALADI (Latin American Integrated Association), CIS (Commonwealth of Independent States), NATO (North Atlantic Treaty Organization), UN (United Nations), and many more.

PC Globe has many different kinds of database categories such as:
Population, Gross National Product (GNP), Health Statistics, Imports/Exports, Government, History, Energy, Agricultural Production, Climate, Age Distribution, Language, Ethnic Groups, Religions, City Information, Resources, Agriculture, Industries, Culture & Tourism, Education, Mining and Quarrying, and Manufacturing Goods. That's not all! It has other information on countries which includes Country Flags, National Anthems, Telephone, Telex, and HAM radio codes, Travel, Visa, and Health Requirements, and Tourist Attractions. PC Globe 5.0 also features distances and bearings between major cities or latitude/longitude points, automatic currency conversions, time zones, standard/metric toggle, data export, screen saving in PCX format, and printer output.

The system requirements for PC Globe 5.0 are an IBM PC/XT/AT/PS2 compatibles, a minimum of 640Kb RAM, a floppy or hard drive, and DOS 2.0+. It supports Hercules monochrome, CGA, EGA, VGA, and Tandy 16-color MCGA displays. Other optional hardware it supports are Kodak, Toshiba, IBM, HP Printers, Epson, Citizen, and many others.

The installation process was very simple and didn't take but five minutes. PC Globe 5.0 comes in two 720 megabyte 3 1/2" disks and in four 360 megabyte 5 1/4" disks. I think that this is an excellent program for children in school. I found PC GLOBE 5.0's street price of about $40.00 and I think it is truly worth it.

[REVIEW EDITOR'S NOTE: How better to review a program aimed at students of all ages than to let our 14 year old reviewer, Stacy Gau, get a crack at it. As usual, he did the job well. If Stacy says it's good for school kids...you can bet your bippy, it's good for school kids!].

•••••

Are You using Smartdrv?

By Ed Hughes, SCPCUG Newsletter

Most Windows users are. I am. When I installed Managing your Money, I found the following paragraph in the README.DOC file on the installation diskette.

"Attention Disk Cache Users! Be Cautious of Delayed Write Caching.

Delayed write caching can cause you to lose data! We recommend that you configure your disk cache to cache only the disk reads and not the disk writes. Microsoft Windows v. 3.1 has a new version of the SmartDrive disk cache that now caches disk writes. To disable SmartDrive's write caching, add a space and a C (or whatever disk for which you want to disable write-back caching) to the end of the SMARTDRV.EXE statement in your AUTOEXEC.BAT file. The statement with these changes would look like this C:\WINDOWS\SMARTDRV.EXE C. If you need assistance with configuring your disk cache please call their technical support."

Beware

There are two SMARTDRV programs. SMARTDRV. EXE comes with Windows. SMARTDRV. SYS comes with DOS 4.X and %.0 They are probably not the same. The descriptions of them in the books I have indicate that they are not the same.

How do you like them apples? I lost one month's worth of data input to my financial database earlier this year.

SMARTDRV. SYS goes in your CONFIG.SYS file and it appears that it does what it does and you have limited control over that, I do not know whether it has the problem with the delayed writing of cached data.

SMARTDRV. EXE goes in the AUTOEXEC.BAT file, as indicated above. The WINDOWS 3.1 User's Guide describes it on Pages 538 through 541. I had not read those pages before today! Well, why should I? Yeah! Right!

At the bottom of page 540 is the following paragraph:

Caution Check that SMARTDrive has completed all write-caching before you turn off your computer. (There is no way to chick this! Ed) To make sure this has happened, type smartdrv/c at the MS-DOS prompt. After all disk activity has stopped, you can safely turn off your computer.

How do you like them apples? I lost one month's worth of date input to my financial database earlier this year. I have never had

(Continued on next page.)

(Continued from previous page.)
that happen before. I have great faith in the computers and their software, so I naturally assumed that I had done something wrong--forgotten to save the file--when I quit the program that day. I have used this program for nine years and never lost data before! I also lost an entire chapter of the DOS for New Users book. I blamed Legacy! My wife has made similar complaints--lost two pages of a document, several entries in her genealogical program--which, of course, I pooh poohed!
Solutions

I can see two ways to solve this problem. Both are described above. Both may not work for you. Here are some things to think about.

The Managing Your Money fix is to change the line in your AUTOEXEC.BAT file so your computer does not cache the data it is told to write. That should work okay, but with an overall penalty in operating efficiency. Normally, the cache program saves the date you want written to the hard disk (it does not cache the data to the diskettes, ever) until it senses that there is not a high demand on the hard disk and then it writes the data. I'd opt for a little inefficiency rather than lost data any day!

If you want to trust your memory, you can use the Windows approach and type the command at the DOS prompt just before you turn your computer off. I don't rust myself to do that. However, if you call your application programs with batch files you could use the Windows approach and put that command in the batch file so the buffer is flushed just after you exit the application program. Simply put the command on the lien after the one that calls your application program. DOS for New Users students who use the GO.BAT file should put it on the line after the ":end" label.

I call Windows from a batch file, so both solutions will work for me. If you call Windows by simply typing "WIN" at the DOS prompt, you will need to use the Managing Your Money fix, or work out another way.

That should be worth an article in the newsletter!

BRING A FRIEND:

Next meeting, bring a friend. Let them see first-hand what you already know: That the Tampa IBM PC User's Group is the best computer resource they'll ever find for 5 ¢ a day!

CorelDRAW! DooDad Uncovered

By: Richard L. Whitney

I'm not sure if I'm the first to find this DooDad or not and I'm going to be embarrassed if I'm not, but here it is.

Start up CorelDRAW! 3.0 in the usual manner, open the Help dialogue box and then click on About CorelDRAW! Now, press the SHIFT and CTRL keys simultaneously while you doubleclick on the Corel Balloon icon in the upper left corner of the dialogue box. The box will immediately expand and empty its contents except for the Corel Balloon which now sits at the bottom of the box.

Now comes the cute part! The balloon will just sit there until you click the left button on your mouse causing the hot air balloon's propane jets to "fire". The balloon will slowly begin to rise with a banner in tow listing the names of the individuals on the CorelDRAW! 3.0 development team. (If you don't keep the mouse button depressed, or press it periodically, the balloon begins to descend toward the bottom of the dialogue box.)

I'm sure the other icon in the About dialogue box also has some secret but I haven't figured it out.

Author Information: Dick Whitney is the Senior Editor of HardCopy, the Journal of the Chicago Computer Society. He found this little gem while exploring the copy of CorelDRAW! 3.0 donated to HardCopy by Corel Corporation.

◆◆◆◆◆

When you're old, and tired and suspicious
And plagued with doubt, you'll still
hear the world calling you.

You'll wish with all your heart you'd
taken the time to listen to it,
And you'll be filled with regret
or maybe not!

Unknown

Don't miss the meeting June 9.
SPC Software Publishing will demonstrate:

Harvard Graphics
for Windows

- ❑ Dynamic data connectivity
- ❑ Superior enhancement tools
- ❑ Extensive charting selection
- ❑ Sophisticated drawing/editing tools
- ❑ Dramatic colors and fills
- ❑ Easy text management
- ❑ Multimedia sound & video

MEMBERSHIP BENEFITS:

BITS OF BLUE BULLETIN BOARD
operating @ 14,400 baud modem.

BITS of BLUE

Vol. 6 No. 7 July, 1993

MEETING

(2nd Wednesday every month)

DATE: July 14, 1993
TIME: 6:00 PM
PLACE: IBM CUSTOMER CENTER
LAKE POINTE ONE BUILDING
3109 W. Martin L. King Blvd.
Room 450
DIRECTIONS:

The Tampa IBM PC Users Group meets in the IBM's LAKE POINTE ONE Building across from Tampa Bay Mall one block east of Tampa Stadium.

The best entrance is on Martin Luther King Blvd. at the traffic light in front of Burdines. As you turn North off Martin Luther King Blvd. you will see the LAKE POINTE ONE BUILDING on the left & parking on the right. Join us in ROOM 450 - 4th floor. **Guest please sign in.**

JULY AGENDA:

7/14/93

6:00 PM - opening remarks
6:30 PM -

JetForm

Form software for DOS & Windows

Demo by Randy Hippe of
JetForm Corp.

Bits of Blue is published by the Tampa IBM PC Users' Group, Inc., a State of Florida registered nonprofit corporation, to provide educational information about IBMPC and compatible personal computer systems to its members.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII file or in a commonly available word processor format, such as WordPerfect 5.1, on diskette to the editor at 9402 Hidden Ridge Place, Tampa, Florida 33637 or send it by modem to BBS (813)239-3704.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

Commercial advertisements will be accepted at the following rates:

	1 month	3 months	6 months
Full Page	$60.00	$162.00	288.00
Half Page	$40.00	$108.00	$192.00
Quarter Page	$22.00	$60.00	$106.00
Eight Page	$12.00	$33.00	$58.00
Business Card	$10.00	$27.00	$48.00

All advertisements must be prepaid by check payable to TIBMPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if it is not received on time.

Members may insert noncommercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, Marylee Bruneau at (813) 985-3338, for space availability and for further information.

This newsletter is produced with Ami Pro for Windows and CorelDraw for Windows, utilizing CorelDraw's extensive CD Rom clipart library.

Secretary's Report

MINUTES OF 6/9/93 MEETING and PERSONAL COMMENTS

By: Jim Clark

The meeting began just about on time, with our eminent Vice Prez, Tom Cone, our distinguished Prez, Harvey Bruneau, was unable to attend do to business commitments. Tom introduced the User Group to the visitors present and laid out the general flow of the meeting for the evening a demonstration of Harvard Graphics, followed by a short break, a question and answer session, closing with a raffle of some very nice software.

PRESENTATION HARVARD GRAPHICS FOR WINDOWS:

SPC Software Publishing Company was kind enough to make one of their finest employees, Linda Confer, available for demonstration of Harvard Graphics for Windows. Linda noted that Harvard Graphics was the pioneer of business presentation software back in 1986, and in their judgment, is still the best and most complete on the market. Linda's demonstration of the program clearly showed that is a very powerful program. The features and capabilities of the program are far too extensive to cover in this brief space, but includes the following:

❑ An extensive chart gallery of preformatted title, bullet, table and organization charts, and an almost limitless number of data charts which include the capability for data analysis and keyword formulas in spreadsheet data form.

❑ Intuitive presentation creation, with WYSIWYG Slide Editor and a textbased Outliner which allow very easy organization of presentations and draganddrop changes to slides.

❑ A host of styles for a professional look, and the capability to create your own styles, all of which can be applied with ease.

❑ Harvard Graphics' Multimedia HyperShow, combined with a Launch Application feature, allows creation of interactive presentations with sound, music and animation, with the ability to immediately move to backup charts or other DOS or Windows supporting programs when questions arise. DDE support permits keeping the charts in presentations up to date with last minute changes.

❑ Sophisticated, but easy to use, drawing tools and capability, along with unlimited control of color; numerous color palettes are supplied, along with the capability to modify them and/or create as many color palettes as desired.

❑ Support for major network software, including 3Com+ Share, Novell, IBM PC LAN, Banyan Vines, MS & IBM OS/2 LAN Manager/Server.

(Continued on next page.)

(Continued from previous page.)

❑ Supports all output devices supported by Windows 3.0 and above.

❑ Supports Bitstream Speedo font technology (several fonts of which are included), Bitstream Facelift, and Adobe Type Manager.

❑ Imports directly WK1, WK2, WK3, XCS, PCX, TIFF, BMP, CGM, DRW, WMF, PCC, WPG, PICT, and PICT2 file formats, and exports in PCX, TIFF, BMP, WMF, CGM, EPS, WPG, PICT, AND PICT2. the program also reads Harvard Graphics 2.3 and 3.0 files, and writes in HG 3.0.

Extensive, context sensitive online help, which makes answers available wherever you are in the program. In the help context, purchase of any version of Harvard Graphics (including current owners) brings with it a unique service from SPC the Advisor, which will help you put together your presentations if you so desire. Especially for those new to the game, this could be a very valuable service.

Hardware requirements are a 386based computer with 4 MB RAM and 18 MB of hard disk space (with all options installed). A VGA monitor and a mouse or tablet. I am not knowledgeable on presentation software and have never used HG for Windows. I have used HG 3.0 (DOS), however, a few times. I have noted that when making a sophisticated drawing in HG 3.0, the program is very slow on a 386SX/25 with 4 MB RAM. The problem seemed to be in redrawing on the screen. For simple drawings, no problems, but if you intend to use HG 3.0 (DOS) for complex drawings, I suggest that you do so with a 486level machine. Harvard Graphics for Windows may be a good bit faster in similar circumstances, but I would want to know one way or the other if I was using a 386.

The retail price of HG for Windows was not mentioned, but I note the street price is on the order of $370. Shopping around may save you some $$$.

To SPC and Linda, we thank you very much for an excellent demonstration. Harvard Graphics for Windows is a very powerful and impressive package. And the demo disks of Harvard Graphics you gave to all our members present desiring a copy is much appreciated and will give our people a chance to look the programs over on their own machines. And, finally, thank you very much for the copies of Harvard Graphics 3.0 and Harvard Graphics for Windows you donated to our User Group.

AND THE WINNER IS:

Thanks to the generosity of Software Publishing Company (who donated two copies of Harvard Graphics), Borland International (who donated QuatroPro for Windows) and IBM (who donated a copy of OS2), along with the 50/50 cash drawing, there were some very nice raffle prizes. Those among us to have the good fortune to win are as follows:

W. F. Martin	Harvard Graphics 3.0
Will Goble	Harvard Graphics/Windows
Jeanluc Burle	QuatroPro/Windows
Phillip Ficarrotta	OS/2
Renate Marsh	50/50 ($43)

The meeting adjourned at about 7:35 PM

♦♦♦♦♦

WELCOME NEW MEMBERS:

David Fisher
Gary Robinson
Rene J. Salcedo
Mark Whitaker

We are happy you joined our group!

FRIENDS OF THE USER GROUP:

We acknowledge the following local firms for their support:

IBM
Sunrise Computer Supplies & Parts
PC Warehouse
Custom Computer Wholesale
Computer City
Software Review

We also acknowledge the following national software vendors for their excellent demonstrations and contributions of evaluation software to our group:

Access Software
Borland
Corel Systems
GeoWorks
Intuit, Inc.
Lotus Corp.
MicroSoft
Software Publishing Corp.
Symantec
Traveling Software
WordPerfect Corp.

PRESIDENT'S COLUMN:

I was unable to attend our last meeting due to business commitments. I want to thank our VP, Tom Cone, for stepping up to fill the void. Since I did not write a president column last month and I missed the meeting, I will write a larger than normal column this month. I bet you thought I would spare you. Wrong!

DOS 6.0 DoubleSpace:

20 minutes! For those of you at the DOS 6.0 meeting, 20 minutes represents the time it took DOS 6.0 double space to compress my 486/25mhz PC's 209Mb hard drive with about 40 Mb of data on it. If you remember I closed the DOS 6.0 presentation by starting DoubleSpace on the PC. During the process I rebooted and restarted the process several times to experience that ***what if feeling*** . Its the same feeling I have about winning the state lottery. I do not recommend rebooting your PC during the DoubleSpace process unless you feel lucky! During the process we saw different estimates of time displayed by DOS 6.0 as it tried to calculated the total amount of time it would take to complete the compression process. The time varied between one and two hours. Since our meeting ran late we decided that we would not sit around past 10 PM to see it finish. At that point I powered down the system with DoubleSpace running. Once I got home I turned the PC back on and started the process again. When I checked the PC a half-hour later during a TV commercial break the job had completed. AMAZING! On the screen was a message displaying the process was complete and the time it took. At this point I was baffled, why did it display to us one to two hours and run in 20 minutes at my house. Well there are several reason I imagine but the one I like is AI (Artificial Intelligence). In retrospect DoubleSpace knew the exact time it would finish. It based this time not on the file types and megabytes to compress but the fact that the membership were ready to go home. It knew it would not complete during our regular meeting and it knew the time it took for me to drive home and restart the procedure. In reality AI knew it would take between one and two hours to complete. OK so maybe I'm stretching it a bit with the AI stuff. It did complete in 20 minutes. However, the process to remove DoubleSpace was even a bigger challenge. It took the better part of half a Saturday to remove DoubleSpace without losing any data. Prior to starting the rebuild process I could've sworn I heard Clint's (Dirty Harry) voice "*You feel lucky punk?*" in our house. While I use DOS 6.0 and it is a good product, I personally do not recommend the use of DoubleSpace at this time. Microsoft reports DOS 6.0 sales in excess of 4 million copies. Microsoft says 2 percent of DOS 6.0 customer support callers believed they had experienced a loss of data. However, support technicians were able to help most customers reconstruct or salvage their data. The results were that only .5 percent of customers lost data. That may seem like Microsoft did a good job, but .5 percent represents 20,000 customers with some kind of data loss. Those numbers sure bring back the sound of Clint's voice.

Prior to starting the rebuild process, I could've sworn I heard Clint's (Dirty Harry) voice:
"You feel lucky punk?"

COMDEX:

Comdex really consist of two parts. One is Comdex "*The Worlds #1 Computer and Communications Marketplace for Resellers and Corporate Decision Makers*" and Windows World "*The Official Conference and Exposition for Windows Computing*". Several vendors and products drew the attention of large crowds. WordPerfect 6.0 for DOS appeared to garner the biggest crowds in each of its theater type presentation. Microsoft also had big crowds attend its continuous hands on session of Visual Basic 3.0. This product will be the hot product for the masses. It's ease of use, power and great flexibility will allow non-programmers to create almost anything. Windows NT with third party products running on it were displayed in one of the Microsoft areas while IBM had a similar area for its OS/2 2.1 offering. Microsoft seemed to garner more interest. Intel also drew a big crowd with their Pentium show.

One last thing I noticed was the broad availability of green PCs and periperhals. No these are not items which are available to those suffering from the incredible Hulk syndrome. This is a futuristic move for saving our planet and ourselves by changing certain facets of PCs and peripherals. They include power management, comsumables and personal health.

The typical 8 hour use of a PC consumes $35 dollars a year while the 24 hour use of the same PC cost $105. The average PC consumes 162 watts while the IBM green PC will consume 36 watts. If current trends continue, the EPA estimates that PCs will represent 10 percent of the energy used. The EPA estimates that a monitor is only looked at 20 percent of its power on time. Even screen savers are accused of using 20 percent more power than a blank screen. The future PC and peripheral will monitor themselves and reduce their power appetites when not in use.

We waste more paper than ever before.. Businesses consume 775 billion pages of paper a year. How many of us; copy a fax when we first receive it. copy or print to single sided paper when we can print it double sided, print that document several times before we get that just right printout. The technology to view Faxes from your PC is here as is the capability to print double sided copies. Many software packages include a preview mode or WYSIWYG to show you what a page of printed text will look like before you print it. Email software systems are abundant to reduce the paper flow which chokes many companies. Many vendors at Comdex promoted their products as Green enabled.

Our health is another issue. Ergonomics and electromagnetic emission are important issues today. We are spending more of our time with our computers than ever before. At one point PCs were used for business at work. As prices drop PCs are invading our homes as education, game and auxiliary work machines. Mice, more so than keyboards, are evolving as ergonomic or as I

(Continued on next page.)

(Continued from previous page.)

would say hand friendly. The Swedish National Board for Measurement and Testing has provided a standard (MPR II) for monitors producing electromagnetic emission. Several vendors had monitors that would go in sleep mode when not in use. and most said they adhered to the MPR II standard.

The EPA has created a program which will discourage waste. President Clinton has mandated that in the near future vendors wishing to sell PCs to the government will have to meet guidelines stated by the EPA stated In the near future. Once in place PCs purchased by the Federal government will need to meet the guidelines of this program

I saw one thing that I never in my wildest dreams expected to see. The weirdness kicked in as I realized that an IBMer in a polo shirt was demonstrating to me IBM DOS 6.0 (not available yet) on a **CompuAdd** and **Gateway** PC. Way to go IBM. Speaking of Gateway, their systems were prevalent throughout Comdex and used by most of the big companies for demonstration purposes.

In all the Green idea is a good one. Time will tell if its a fad or the norm. I hope the EPA can do a better with their new program than they have with safety and mileage estimates for cars.

Of course I saw the product we have all been waiting for. Soft Karaoke for Windows. You know there is an Elvis, Elton, Tina or James Brown in you wanting to come out and sing. Maybe you just want to be a DJ. Well for $49.95 you can turn your PC into a Karaoke machine. I know that's what I want to do with my $4000 PC (NOT). If you are tired of cool screen savers to entertain you and your friends, you can call 1-800-363-TUNE to purchase it. I believe I also saw it or a similar product recently at COMP USA. This is got to be better than Mr. Microphone.

COMPUSA:

In the on again off again issue of discounts provided to our general membership by COMPUSA, please note that our group no longer recieves a discount. I had a lengthy meeting with the Corporate Sales Manager responsible for providing this benefit to other groups. Without going into much detail suffice it to say that COMPUSA has determined that discounts provided to user groups has not proved to be a profitable or positive venture.

New Space:

As discussed last month and prior months, we are still in the process of looking for a bigger space to have our meetings. Some locations have been mentioned and researched without any selection. While downtown has not been eliminated, parking and security issues have raised concerns of relocating general meetings there. Any suggestions are welcomed for a facility that would hold several hundred people. If anyone has the facilities to run Special Interest Groups please notify a board member or contact me. The board will continue to research these issues.

Harvey P. Bruneau

Hardware Review:
A Bernoulli Experience

By :Alford Poole, Tampa IBM PC User's Group

20MB of our 30MB hard drive were occupied when we started considering Windows and Windows programs. We needed a new hard drive, but how big? An Iomega drive with removable disks seemed ideal because additional disks could be purchased cheaper than adding another hard drive. I also liked the removable 90MB disk because serious software could be put on one disk and games and noncritical software could be put on another. Hard Drives International had the best price and a good reputation so we called in an order.

The drive came with installation hardware, SCSI card, cables, manuals, OAD (Open Architecture Drivers), Stacker 2.0 and two 90MB disks. After plugging it in to make sure it worked a backup of the hard drive was made using the OAD utility software.

An XT case housed our computer and with two floppies and a full height hard drive there was no room for another drive. I Stacked the hard drive and carried on until we could buy a tower case. Caution: if you have a drive bay that does not need rails be careful when sliding the Iomega drive into position, the foil on the sides of the drive is fragile.

In the mean time new software had been added to the hard drive and many files updated, so another Disk Copy was attempted. At 93% complete the transfer stopped. Hum, so another attempt was made, this time using Append. Same result - stopped at 93%. The OAD, Direct Access, and some root directory files were not copied. No problem, after copying the missing files to the Iomega disk I thought it was ready to boot up. I wanted to boot from the Bernoulli and use the 30MB hard drive as an overflow drive to hold downloaded files. The CMOS was changed so the Iomega would be the C: drive (I wasn't sure how to describe the Iomega in terms of cylinders, sectors and such so I left it blank) and the hard drive would be the D:. Did not work.

A call to Iomega revealed that the BIOS on the SCSI card will boot the 90 Pro if no other drives are attached or the 90 Pro can be the D: drive. Or when DOS 6.0 comes out it might fix it so a removable medium drive could be the C: drive and other drives could still function or if the hard drive was also a SCSI then the Bernoulli could be designated as the C drive. Or if you have an Amiga . . .

With the hard drive disconnected another attempt was made to boot from the Bernoulli. "Insert DOS disk in drive A:". Another call to Iomega - I needed to format the disk to get the system files in place. Ok, the quickie format only takes about 8 seconds while the regular takes about 12 minutes. This time I tried it out before doing another Disk Copy. It worked! Computers are so wonderful!

(Continued on next page.)

(Continued from previous page.)
Features of the Bernoulli:

Data security - disks can be removed and put in safe location and if the drive malfunctions the data is not lost.

Using Stacker the 90MB disks become 180MB and being removeable makes the drive expandable as the need arrives.

Disk is locked in place when power is switched off, but can be removed manually. The disk can also be locked in place using the OAD software. This is necessary for a Windows temporary swap file.

Write protect on the disks is similar to a 3.5" floppy but the disk does not slide all the way in the drive - about an inch sticks out of the front of the drive.

The drive goes to "sleep" after a time of inactivity (about 20 minutes). No head parking worries due to disk falling away from head on power down.

Disk #2 has about 50MB of shareware, games and demos, quite a variety - with a menu.

Iomega Tech people are helpful and easy to reach with an 800 number.

How much do they cost? The HDI price is $499 for all the items listed above. Computer City has an Iomega external 90 PC Powered drive with different software for the same price. 90MB disks are also available there for $159.

Trade up is also available through Iomega. To trade in my 90 for an internal 150MB drive it would cost $499. Previous upgrades, such as 44MB to 90MB, could only read the smaller sized disks so data could be transferred while the 150MB drive will read and write to 90MB disks and 150MB disks. Nice improvement.

So, if you chose the Bernoulli experience be sure to format that disk and include the system files if you think you might want to boot from it.

Software Review:
Star Trek Beams Into Your PC

By: Merle Nicholson, TIBMPCUG

In the past, screen savers consisted of random patterns moving about the screen to prevent image burn-in. They serve their purpose, but average screen savers do not entertain. While Windows is not being used, we should at least keep it busy and attractive.

The **Star Trek Screen Saver** accomplishes the main purpose of standard screen savers, and more. Unlike others, the **Star Trek Screen Saver** is so amusing, that it compels people to activate it, sit back, and enjoy a hunk of the **Star Trek** experience (Computrekker).

When the After Dark control panel is activated, it presents you with a lengthy list of different procedures to save your screen from certain peril. This list includes Tribbles, the Tholian Web, the Final Exam, different technical files, and even Mr. Spock can mess with your desktop. Some of these advanced savers allow you to leave your desktop showing accompanied by the saver. For example, if "Spock" is selected, the saver can be ordered not to clear the screen to black. This results in Mr. Spock beaming around your desktop inspecting, disintegrating with a phaser, and saying the usual things like "Fascinating" or "Most illogical".

Another feature that distinguishes the **Star Trek Screen Saver** from others, is the use of sound. Many quotes, computer beeps, mood music, apply great effect to the saver. Unfortunately, its lack of .WAV files prevent having any more fun with the multitude of sound.

For any **Star Trek** trivia buffs, the "Final Exam" may be selected. The "Final Exam" is a multiple choice test that examines your knowledge of all seventy-nine episodes. Sound may be added to dramatize any correct or incorrect answers.

If a favorite saver cannot be determined, the Multimodule and Randomizer can solve the problem. The Multimodule can be customized to show many different savers simultaneously in their own space on the screen. If the Multimodule causes the screen to look too busy, then the Randomizer is the solution. The Randomizer allows the user to select a few or all of the savers to be shown in order or shuffled for a specified amount of time each. These two features are pretty nifty, but use an enormous amount of memory.

If your computer has a dearth of memory due to Windows' massive appetite, there are a few basic savers that do not need much to run. Also, the **Star Trek Screen Saver** features the Wall Zapper. The Wall Zapper allows any image shown by the saver at any given moment to be created and saved into a .BMP wall paper file.

As far as requirements are concerned, the screen saver is not very flexible. It requires Windows 3.0 or higher, 2 MB memory (although 4+ is suggested for the Multimodule and Randomizer), and VGA or better. It supports all After Dark displays and the Sound Blaster. Additional **Star Trek** .WAV files can be purchased and added. Your monitor will live long and prosper with the **Star Trek Screen Saver!**

◆◆◆◆

The Promise of the 90s

By: James A. Cannavino

Operating a business in the global 90s is far more complex than it was in the 70s, for most industries. Certainly this is true for the computer industry, which has grown more than 10 times since 1970 and where participation has increased more than 20 times. Back then a handful of companies delivered all parts of a system, including the service. Today, our industry has de-integrated into many specialized niches with providers who offer just microprocessors, just application software or just services.

Over this same period of time, technology has been improving at an annual rate of some 25 percent. Microprocessors are now as fast as the most powerful mainframes of the 70s and getting faster every 12 to 18 months. Tiny diskettes store as much information as these room-sized computer and character-based screens have been replaced by colorful 3-D graphics. Yet these leaps in technology have not increased worker productivity in a corresponding way.

The reality is that computers are still not that easy to use and building new, exciting software applications is an often laborious, time-consuming process.

Things are changing though. In large part because customers are demanding more from our industry. They no longer have the time or the resources to gather multiple pieces, from multiple vendors and put them together. They not only expect technology to increase productivity, but they want it in a way that will help them manage their businesses better. Companies today are more concerned with honing a competitive edge, and that often requires the application of new technologies.

In this decade, the challenge for our industry is to help businesses make substantive leaps in productivity. There are three key technologies that will pave the way; microprocessors, reusable code and communications.

Today's more powerful microprocessors are creating the ability to make much richer user interfaces, like handwriting and voice recognition on the desktop.

Reusable programming -- also known as Object Technology -- will break the logjam of application software. The ability to reuse blocks of code to piece together entirely new applications will improve programmer productivity two orders of magnitude.

Also, the ability to communicate ubiquitously will explode and give workers a seamless connection between anyone, at any point in an enterprise, anywhere in the world. As communication technology improves and computer technology becomes more portable, computer systems and networks will fade into the background, allowing businesses to concentrate on turning a profit rather than maintaining administrative systems.

Together, the microprocessor, the ability to replace major segments of software and low-cost, high-bandwidth communications will lead to a new order.

The best part of this new order is that the mechanics like microprocessors, application programming and communications will be invisible to the worker thanks in large part to multimedia. Today you need to learn to type on a keyboard to run most business applications. With multimedia there will be no reason not to talk to your computer! And no reason why it shouldn't talk back! In the near future, workers will be able to see full motion images, send video clips instead of e-mail messages and videoconference, in full-motion and full-color, right from their desk.

In addition, applications will no longer be stand-alone, text-based business tools. Multimedia applications that take advantage of advances in bandwidth will change the way individuals work. Entire industries will have the power to transform the way they do business.

For example, IBM's recently introduced Fireworks Partners is founded on the concept of helping companies transform their approach to business. Fireworks Partners is a separate unit of Personal Systems that will draw upon the resources of the IBM Company to promote the development of advanced multimedia applications and services through partnerships with others within and outside our industry.

One of its first ventures is with a real estate company in Boston called Homeview. With a multimedia approach to selling houses, Homeview allows people to tour through a set of digitized pictures of homes in the broker's office instead of driving around the community. Customers won't have to leave until they preview a house that meets enough of their requirements to make it worth the trip.

Homeview's next step is to offer geographic information systems (GIS) to allow potential buyers to put an overlay on a house they are interested in to get information about the neighborhood, its topology, its school systems, its taxing rates, demographics, whatever. Soon, with more advanced multimedia technology, customers will be able to view the inside, and so, with virtual reality, if they want to see what the sun looks like in the living room in the summer at four in the afternoon, they can.

This is just one of the many examples of how emerging technologies will enhance the business process instead of just keeping track of it. In the past, our expectations for technology to dramatically change the way we do business may have been a little lofty, but the technology is catching up and it is about to deliver more than we could have imagined.

(Continued on next page.)

(Continued from previous page.)

James A. Cannavino is IBM Senior Vice President and General Manager Personal Systems. He has held numerous management and executive positions within IBM Corporation. Currently Mr. Cannavino oversees four PS business units: Personal Software Products, which is responsible for development and brand marketing of operating systems and LAN software; Advanced Workstations and Systems, which develops RS/6000 and AIX; IBM Personal Computer Company, a separate operating unit of Personal Systems' line of business responsible for development, manufacturing, distribution and brand marketing of IBM PC's worldwide; and Entry Systems Technology, which creates new subsystems and technology for personal computers and workstations.

Hardware Review:
FAN CARD II

By: Robert Morris, Bits 'N Bytes,
Pentagon PC User Group.

PC users can measure their enemies in degrees. Degrees Fahrenheit, that is. Today's line of PCs, stuffed to the gills with heat generating CPU chips, cards, extra hard drives and other components can often be classified as small space heaters with video screens. As technology continues to pack more components into smaller and tighter configurations, temperatures can soar. Installing additional cards impedes air movement from the fan in your power supply, compounding the problem. Besides destroying your chips, heat can cause your mother board to delaminate. If that happens, you have no choice but to replace it, at considerable cost.

There are several things you can do to relieve heat stress associated with today's technology. All are simple to accomplish and free, except investment of your time.

Minimize heat buildup by not stacking magazines, books or papers on top of the PC. Paper is an excellent insulator, and will act like a blanket, holding in power and performance robbing heat.

Position your PC with a minimum of two inches of clearance on all sides and on top. Placing your monitor on top of the PC is OK, but alongside it is better.

Once a year, open the case, and using a soft brush, carefully loosen dust accumulated on the surface of cards and the mother board. Take care to ensure you donÆt damage any components.

After you have loosened the dirt and dust, blow or vacuum it away (Blowing is much more efficient than vacuuming). You can purchase a can of dry compressed air for a few dollars at computer and camera stores. Look everything over carefully while the cover is off. The heating and cooling cycles your computer experiences through normal on/off cycles cause different materials to expand and contract at different rates. This allows chips and cables to loosen over time. Press gently on all cards, chips in sockets, and cable connectors to seat them fully. Look carefully at the mother board, especially on the back side of the area where your CPU resides. Discoloration suggests a need for extra cooling. Should you see small white dots, (called measling) this is an area damaged by excessive heat with possible delamination. If you are not already having problems, you definitely will - SOON!. This is most prevalent on lower quality mother boards. These boards are made with thinner, often inferior materials, in an environment where quality control is less important than number of boards produced.

If you have a 486-50MHz machine, it is imperative that you have additional cooling, as it generates a tremendous amount of heat. A 50MHz CPU can destroy itself through its own operating temperatures.

The above steps will greatly reduce the chances of heat related failures. For added insurance, purchase and install a FanCard I or FanCard II. Available with one or two fans mounted on a half-length or full-length board, it slips easily into any available 8, 16, or 32 bit slot. My FanCard II board was just a tad long for my slot, (or my slot was just a tad too short for the FanCard), requiring me to file the end of the board to allow a proper fit. This was frustrating, but within my means to modify. Place the FanCard in a slot as close to the CPU chip as possible. The FanCard is thin, and fits nicely between other installed cards.

After I installed the FanCard II, I fired up my computer without the cover. The fans were almost totally silent! There was an impressive, reassuring breeze circulating throughout the chassis. After I reinstalled the computers' cover, I could not hear the fans at all. Now, when I place my hand on top of the computer case, I feel no heat at all. It must be working!

Benefits of installing a FanCard are:

- Cools the entire chassis, including hard drives, boards, and even the power supply, not just the CPU chip. Cooling air circulates throughout the computer. T.S. MICROTECH claims a 65 degree decrease in operating temperature.
- Does not block any slots, other than the one in which it is installed. CPU mounted fans and heat sinks block up to three slots due to their height, and only cool the CPU chip.
- Quiet operation. "Silence is golden." When concentrating on a task, eliminating background noises is important. FanCard does not add any noise.
- FanCard I ($79.95) has one fan, mounted on a half-length card, FanCard II ($99.95) has two fans on a full length card.
- FanCard draws only 2.4 watts per fan from the slot in which it is installed, and does not require an adapter from the power supply.
- FanCards were tested in over 500 PCs during Operation Desert Storm. The Saudi Desert qualifies as a hostile environment for PCs. However, T. S. MICROTECH fails to mention in their ad if any (or how many) PCs with FanCards installed failed, or a comparison of failure rates with PCs in which no auxiliary cooling devices were installed. This is the type of advertising that we all can do without - fantastic claims, no proof! Give us facts- if your product is worthy, as I think FanCard is, we'll buy it. T.S. MICROTECH, 20818 Higgins Ct., Torrance, CA, 90501 (800) 959-9419

TEN RULES FOR HIGH SPEED MODEMS

By: Bruce Carson, Tulsa Computer Society

1. 14,400 bps modems must connect to computer at 19,200 bps or faster.
2. 16450 UART chips on your IO card can only handle 19,200 bps modem communications.
3. 16550 UART chips can handle up to 57,600 bps depending on computer and modem.
4. Two active devices cannot share the same interrupt request (IRQ). Com 1 and com 3 are both on IRQ 4; com 2 and com 4 are both on IRQ 3.
5. Serial ports must be configured consecutively, com 1, com 2, com 3, NOT com 1, com 2, com 4.
6. You must not have two of any com. port, such as two serial 1 ports or two serial 2 ports.
7. When in your communications program in terminal mode, you must be able to type "AT" and get a response "OK" from your modem - every time! This should occur even without a telephone line connected to your modem.
8. Modems are like computers in some respects. When they are turned off they lose the active configuration, and when turned back on they must restore an operating configuration into active ram. ATZ as an initialization string will restore whatever you have saved in NVRAM.
9. File transfer problems are often caused by a software or setup problem. If your modem dials and connects but will not transfer files, check your communications program setup.
10. If you are running a Windows communications program, it is important to have your ports set at the proper speed in that program AND in the Windows control panel under ports.

♦♦♦♦

MODEM PROTOCOL SUMMARY

By: Bruce Carson , Tulsa Computer Society

There are four classes of protocols associated with modems:

1. MODULATION PROTOCOLS.

Computers store and process data as ones and zeros (bits), while telephones can only handle information as sounds. A modem converts (modulates) the computer data in to sounds and transmits them over a telephone line to a remote modem. The remote modem then converts (demodulates) the signal back to ones and zeros for the remote computer to process. The word modem comes from MOdulator/DEModulator. There are several protocols that are used in the modulation process. V.21 and Bell 103 for 300 bps, V.22 and Bell 212A for 1200 bps, V.22bis for 2400 bps, V.32 for 9600 bps, and V.32bis for 14,400 bps.

2. ERROR CONTROL PROTOCOLS.

The error control process can be accomplished by software or by hardware. The newer high speed modems come with built in hardware error control, so that when connected to another similar modem errors are detected and corrected by the two modems without involving the computers. There are two error control protocols in common use today. They are V.42/LAPM and MNP.

3. DATA COMPRESSION PROTOCOLS.

Data can be sent faster if it is smaller, so a high percentage of the data transmitted today is compressed. Most Bulletin Board Systems (BBS's) have their files stored in a compressed (usually ZIPped) condition. but other systems may wish to transfer files as is without compressing them. In this case, modern modems can compress the data on the fly and uncompress at the receiving end. There are two hardware data compression protocols in common use today. They are MNP-5 and V.42 bis. MNP-5 will try to compress a file that is already compressed, so will slow down the file transfer, while V.42 bis is smart enough to not attempt compression on a ZIP file.

4. FILE TRANSFER PROTOCOLS.

To a modem data is data. It doesn't know or care whether the data is from the keyboard as you type, or streaming from the hard drive. It also does not know what a file is, it is all just data. For that reason file transfer protocols are necessary. Xmodem is probably the most widely known and also is the slowest. Ymodem is a little faster, and Zmodem is the fastest of the error correcting file transfer protocols. Ymodem-G and I-modem are very fast but only work with error correcting modems and do no error correction. Using Zmodem with an error correcting modem results in a little redundancy since hardware and software are both doing error correction, but the loss in efficiency is only about three to five per cent, and Zmodem's crash recovery capability may be worth that small penalty. If a long file transfer in Zmodem is interrupted, it can be resumed from the break point without starting over at the beginning.

Customizing Toolbars in Microsoft Excel

Toolbars were first created in Microsoft Excel to provide easy access to common spreadsheet commands and functions. The seven toolbars built into Microsoft Excel were developed through extensive customer research that identified common tasks in basic spreadsheet activity areas, such as charting, writing macros, and drawing. Microsoft Excel toolbars are extremely flexible and can be easily customized--you can even build your own toolbars by using the standard tools in Microsoft Excel or tools you have created yourself.

Creating a toolbar:

1. Point the mouse cursor at the standard toolbar and click the right mouse button to access the short-cut menu. Then select Customize.
2. In the Customize dialog box, select the file category, and then drag the tool that has the floppy disk on it onto your worksheet. You can add additional tools to your new toolbar, or move tools between toolbars, simply by dragging them while the Customize dialog box is displayed.

(Continued on next page.)

(Continued from previous page.)

Creating a custom tool:

1. From the Toolbar Customize dialog box, select the Custom category and drag a custom tool onto your worksheet.
2. Microsoft Excel prompts you to enter a macro. Or, if you want, you can have Excel record a macro for you: select the Record button and click OK.
3. Step through a common task that you perform in Microsoft Excel. For example, select the Format menu, then Font, and then Arialr, regular, 12 point. Then select the Halt Macro tool (on the macro toolbar). You've just created your own custom tool. You can use this tool to format cell ranges in the Arial font, 12 point.

Custom tool faces:

You can create custom tool faces in any draw program. After creating a tool face, copy it to the Windows Clipboard, and then paste it onto a tool while the Customize dialog box is displayed. Positioning toolbars You can position a toolbar at any place on the worksheet, or even anchor it at the top, bottom, or sides of the sheet. To do this, simply point the mouse cursor at the toolbar, holding down the left mouse button to drag the toolbar.

Concise Guide to MS-DOS® Batch Files

Bestselling Guide to Creating and Using Timesaving Batch Files Now Covers MS-DOS Through Version 6

A handy new guide from Microsoft Press takes the mystery out of the batch file language and shows MS-DOS version 6 users how to make batch files more interactive.

The CONCISE GUIDE TO MS-DOS BATCH FILES by Kris Jamsa shows readers how to create, save, and run batch files. Batch files save time, reduce keystrokes and errors, simplify the execution of difficult commands, and can be used again and again. No additional software is needed and no programming experience is necessary. This book and a computer running the MS-DOS operating system is all that's needed.

Readers already familiar with batch files will want to turn to this convenient guide to help them enhance their batch files with more advanced commands as well as those commands introduced by MS-DOS 6. They'll learn how to:

Use the new CHOICE command to make batch files interactive
Create icons that will run batch files from within the Microsoft® Windows® operating system
Use ANSI.SYS to make screen displays more colorful
Use the DEBUG command to create simple programs that enhance batch-file capabilities

In addition, CONCISE GUIDE TO MS-DOS BATCH FILES shows readers how to create macro definitions using the DOSKEY command. For users of MS-DOS 5 (or later), an understanding of the DOSKEY command will make them immediately more productive. An annotated table of contents and a comprehensive index help readers quickly locate information on any topic in the book.

Kris Jamsa is the author of more than 40 computer books covering a wide range of topics. His other titles from Microsoft Press include *Concise Guide to Microsoft Windows 3.1* and *Concise Guide to Windows for Workgroups.*

Microsoft Press is the book division of Microsoft Corporation and the leading publisher of quality computer books about Microsoft products. More than 10 million users at all skill levels rely on a complete line of Microsoft Press® books to make learning and using software easier. Titles ranging from streamlined tutorials for first-time computer users to technical references for professional programmers are distributed to book and software retailers worldwide. Consumers in the United States can also order directly from the publisher at 1-800-MSPRESS.

Founded in 1975, Microsoft (NASDAQ "MSFT") is the worldwide leader in software for personal computers. The company offers a wide range of products and services for business and personal use, each designed with the mission of making it easier and more enjoyable for people to take advantage of the full power of personal computing every day.

Microsoft, Microsoft Press and MS-DOS are registered trademarks and Windows is a trademark of Microsoft Corporation.

Concise Guide to MS-DOS" Batch Files by Kris Jamsa 224 pages, $12.95, ISBN: 1-55615-549-2, Pub. Date: June 8, 1993

We have software for review!

The following is a list of software available to interested members for review:

Fastlynx
KUI (Keyboard user interface for Windows)
Links-386 (golf game)
Fidelity On-Line Xpress (Direct line to Wall Street)
GeoWorks - Ensemble 2.0 (Includes: GeoWrite, DeoDraw, GeoCalc & GeoFile)
PrintCache (Doubles Windows & Dos print speed)
Adobe Type Set (30 scalable typefaces)

On the following page is a copy of TIBMPCUG's Agreement for Software Reviews. Contact Harvey Bruneau @ 985-3338 to obtain the software, sign the review Agreement and receive a Reviewer's Guide for writing your review article for the Bits of Blue.

A Monthly Publication of the

Tampa IBM PC User's Group

BITS of BLUE

Vol. 6 No. 8 August, 1993

MEETING

(2nd Wednesday every month)

DATE: August 11, 1993
TIME: 6:00 PM
PLACE: IBM CUSTOMER CENTER
LAKE POINTE ONE BUILDING
3109 W. Martin L. King Blvd.
Room 450
DIRECTIONS:

The Tampa IBM PC Users Group meets in the IBM's LAKE POINTE ONE Building across from Tampa Bay Mall one block east of Tampa Stadium.

The best entrance is on Martin Luther King Blvd. at the traffic light in front of Burdines. As you turn North off Martin Luther King Blvd. you will see the LAKE POINTE ONE BUILDING on the left & parking on the right. Join us in ROOM 450 - 4th floor. **Guest please sign in.**

AUGUST AGENDA:

8/11/93

6:00 PM - opening remarks
6:30 PM -

WordPerfect 6.0 for DOS

Demo by **WordPerfect Corp.**

7:30 PM - Break
7:45 PM - Open Discussion
Door Prize Raffle -
ACCESS -Microsoft
(Relational Database Management System for Windows)
and Miscellaneous items

MEMBERSHIP DIRECTOR:	Tom Cone	223-3888

Bits of Blue is published by the Tampa IBM PC Users' Group, Inc., a State of Florida registered nonprofit corporation, to provide educational information about IBM PC's and compatible personal computer systems to its members.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII file or in a commonly available word processor format, such as WordPerfect 5.1, on diskette to the editor at 9402 Hidden Ridge Place, Tampa, Florida 33637 or send it by modem to BBS (813)239-3704.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

Commercial advertisements will be accepted at the following rates:

	1 month	3 months	6 months
Full Page	$60.00	$162.00	288.00
Half Page	$40.00	$108.00	$192.00
Quarter Page	$22.00	$60.00	$106.00
Eight Page	$12.00	$33.00	$58.00
Business Card	$10.00	$27.00	$48.00

All advertisements must be prepaid by check payable to TIBMPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if it is not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, Marylee Bruneau at (813) 985-3338, for space availability and for further information.

This newsletter was created with Ami Pro for Windows donated by Lotus Corp. to TIBMPCUG for use by the editor.

Secretary's Report

MINUTES OF 7/14/93 MEETING
and PERSONAL COMMENTS
By: Jim Clark

He's Back!! Yes, our illustrious Prez, Harvey Bruneau, is back and chaired our meeting. While Harvey seemed glad to be back in the saddle again, the timing of our meeting was again not the most opportune for him and Marylee it was their 10th wedding anniversary. Notwithstanding, they shared some of their precious time with us on this special day for them. And after presenting Marylee with a dozen lovely roses, Harvey proceeded with our meeting, announcing that he had every intention of having a short meeting and then taking his lovely spouse to a special place in celebration of the special occasion. (Check the time of adjournment to see how successful Harvey was at meeting his timing objective.) Harvey then launched into the meeting in our regular format.

INDUSTRY/CLUB NEWS

A member of our group had told Harvey in the past they would be willing to lead a special interest group (SIG) on OS2. Several at the meeting indicated they would like to participate in an OS2 special interest group. Harvey announced that he would try to arrange a SIG to begin at 5:30 on our regular meeting night in September. Further details will be provided at our next meeting and in the next newsletter.

Software presentation objectives for the next few months are:

August	Word Perfect 6.0 (DOS)
September	Windows NT (If released by that time)
October	CorelDraw 4.0
Not-too-distant future	IBM's OS2, Ver. 2.1

Harvey had read several reports of problems being encountered with CorelDraw 4.0. An interim maintenance release should be available in a couple of weeks. To obtain one, call CorelDraw at 1-800-836-3729.

Harvey related briefly some of his experiences at Comdex in Atlanta. He noted that the Comdex in Atlanta is considerably smaller than the Las Vegas Comdex, but that it is still a very worthwhile gathering to attend and one will see at both more computer related hardware and software innovations than can be seen at any other location in the world. Harvey recommend attending either if you can, giving priority to the large Comdex at Las Vegas if a choice is available.

Microsoft has announced their intention to make MS Visual Basic the macro language of MS Word, MS Access, and Excel; one could expect that it will end up as the macro language in all of MS software products.

(Continued on next page.)

(Continued from previous page.)

MS Access 1.1 maintenance upgrade is out. It can be purchased from MS directly for $19.95, or call MS for a coupon which will allow purchase from local retailers for $14.95.

It was reported that anyone interested in Superbase, a high-end database program reviewed just a couple of months ago in this newsletter, could be obtained from Software Publishing Corp. for $99 IF you mention one of its competitors.

Harvey informed all that a program he recently acquired, called Romaterial I believe, is a neat fun kind of utility ROM. It includes about 500 icons, and a calculator with voice answers in any one of 5 different voices. Plus several other features, all for a street price of $17.

PRESENTATION JetForm 3.1

The JetForm Corporation was kind enough to make their Regional Sales Manager, Randy Hippe, available for a presentation on their software program, JetForm 3.1 for Windows. Randy related a shaggy dog story of how the twain shall never meet the result being that the material he had expected to have for all present about their program was not available; it was floating around the UPS system and/or several hotels. In introducing the program, Randy noted that they have versions for DOS, Windows, Macintosh, and were working on OS2.

This program is much different than I had expected. I have used a 'forms' program with which one could create a variety of custom forms. Well, JetForm does that, from the simplest to the most complex, quickly and easily. But it does so much more, and it is this part where the program really shines, and which makes this program so much different than the 'forms' program I had used.

JetForm is a very powerful forms program. It really comes in two packages JetForm Filler, which is principally a filler program, and JetForm Design, which includes JetForm Filler and Design as well. JetForm is clearly designed to meet the needs of businesses/organizations that deal with many different people and/or things. Randy showed and informed us about so much I could not keep up with my notes, but I was impressed that it could create just about any form one would need (invoice, order, etc.) and then fill them in with speed and intelligence. Some of the many features include:

* Import directly from just about any major software; you need only tell the program once where to get the desired data. And, it can import data from several sources for the same form. JetForm also includes a database capability of its own.

* The version demonstrated had an excellent graphical interface, complete with button bar and a huge number of icons (macros) with which to customize to suit individual needs

* Easily built in intelligence in the forms to perform whatever calculations may be needed automatically.

* Built in automatic address book.

* Allows creation of forms in JetForm from scanned images which can be quickly converted to JetForm forms, complete with intelligence, etc.

* Capability to transmit output via paper or electronic means, such as E-Mail another step toward a "paperless" world.

The requirements for JetForm are minimal. The DOS version requires only that you have 640K of RAM, for example. There appear to be no requirements peculiar to JetForm. If you use the Windows version, if you have the capability to run Windows, you have the capability to run JetForm. Unfortunately, Randy didn't mention how much disk space was required for the program, and since no literature was available at the meeting, that kind of information is not available to us at this time.

JetForm Filler lists for $129, and JetForm Design lists for $495; street prices (usually special order) run about $93 and $328, respectively. Why buy the filler without the design capability?, one might ask. Several reason are possible: You have need for several filler programs, but need only one design package, is one. Another is, JetForm offers form design services as well as on-site consultation services, and training if needed.

Randy covered many aspects of the program beyond this brief accounting. I can't cover them all here. It is clearly a very powerful and useful program for those needing that kind of capability. And, for those that do, it would appear that JetForm is a program worthy of further investigation.

A BIG thanks to JetForm and Randy Hippe for a fine presentation on an excellent program, and for the copy donated for our use.

AND THE WINNER IS

Thanks to the generosity of JetForm Corporation , Lotus Corporation, Borland and Sunrise Computer (who donated several maintenance items) along with the 50/50 cash drawing, there were some very nice raffle prizes. Those among us to have the good fortune to win are as follows:

Roger Waters	JetForm Design 3.1
W.F. LaMartin	Lotus Organizer
Russ Stepp	Object Vision 2.0
Preston Goossen	OS2 Book
Russ Stepp	Sunrise Mx Package
Preston Goossen	50/50 ($48)

The meeting adjourned at close to 9 PM; good work, Harvey.

WELCOME NEW MEMBERS:

Diana L. Sillence
Mark Staley

Editorial Comment:

There is not a **President's Column** in this issue, as Harvey is still recovering after a working conference in Sanibel. However next month, look for his usual column and I'm sure he'll share some of his experiences with you.

This will also be a somewhat abbreviated and definitely late newsletter this month as I (the editor) went with Harvey on his trip to Sanibel. I did not take my computer and printer with me to work on the newsletter. I guess I should be severely scolded as there was an abundance of computers at the resort where we stayed, somehow I never got around to the Bits of Blue. I hope you'll forgive me this time. Maybe we need a relief editor?

Software Review

SOFTWARE REVIEW: ENSEMBLE 2.0

By: Jerry Osterweil, TIBMPCUG

ENSEMBLE 2.0 is what the manufacturers call a "monster upgrade" to GeoWorks and its first upgrade Ensemble I.0. It can also be utilized as the total package for new users. It contains all the user friendly categories of software that regular users of GeoWorks have been using so comfortably. (Familiarity with the earlier versions makes it much easier to use Ensemble 2.0.) In addition it now has a full functioning spread sheet and data base called respectively GeoCalc and GeoFile plus a more sophisticated calculator as well as a host of additional features and refinements, that are so extensive that only some of them can be documented below.

Installation:
There are three options for installations. You can install and keep the early version, you can upgrade to completely replace the earlier version or you can execute a new installation on a new computer. I chose to install and keep my old version as a backup until I was fully comfortable with the new version. (This has been helpful when I want to do something fast and I was still not familiar enough with all the new features of the new program.) This installation option required that I do some "house-sweeping" since it utilizes 20 Mb of free hard drive space. (Incidentally, there is a warning in the trouble shooting guide that disk compression software can interfere with the installation process.)

I was able to install this directly from GeoWorks using the A drive icon to enter the first disk. There are seven disks for installing this. All went smoothly except one point after the disks were installed when my mouse pointer on the screen was stuck and I had to go back and reconfirm its configuration. Incidentally, it is no surprise to old hands but might be to new hands, that you have to be prepared in the later stages of the installation process to specify the configuration of your printer, your mouse and your ports in order for the installation to be completed. So have these on hand before you begin. After installation Loader.Exe is needed to access Ensemble 2.0 from Dos 5.

Functions:
Functions that previously required dropdown menus can now also be accessed by the many additional icons that have been added to this version. For example, you can access the type size and style now from the icons. There are many more drawing tools now available and they can also be accessed directly from the icons Additional desk top publishing capabilities are included since you can now specify a number of columns and you can make sophisticated use of box arrangements, drawing tools and text to modify page makeup. Bit modification of drawings are also now available. Of course with the new version you can easily copy and paste spreadsheets and data base information right into the text.

This version has also added a thesaurus to the earlier versions. It also has a more automatic option on the spell checker than before. It gives you three types of controls for many functions key combinations, the menu, and the icons. It also gives you a variety of additional ways of identifying text for manipulation and for moving around from one part of the protocol to another. It also enables you to import and export different file formats from other programs.

A very interesting feature on the version is the use of templates that can preserve styles for future use. They gives you some examples of this such as a two column newsletter with a banner, headlines and sub headings as well as a an invoice statement. You can also create and preserve your own templates.

In recognition of the many added features in this version GeoWorks has divided its presentation in the manuals and its recommended use of the computer to up to four levels of difficult so that new users can more gradually accommodate themselves to the increasing complexity of operating this program.

Possible Problems:
I had two sets of problems with this version. The first is that it takes time to get used to the many new icons in this version. Some of them are the familiar ones from earlier version but all of them now have been made much smaller in order to

(Continued on next page.)

(Continued from previous page.)
accommodate the larger array of icons that are included. This makes them much harder to read. The writing on the help displays are also much smaller and harder to read (except that some help screens can be enlarged.)

Another problem is that it appeared that Ensemble 2.0 operated much more slowly than the earlier versions. I thought perhaps this was because I now had only 15,409,152 bits available on the hard drive of my 286 computer after this installation. It is possible that when I remove some more programs from the had disk and relinquish the original GeoWorks which I retained that this problem may improve.

Documentation and Product Support:
Two users guides are supplied, a Book 1 and Book 2. They also have a new trouble shooters guide that can spot and correct difficulties in installation and operations

They have a 24 hour automated support system for fax, voice and BBS that has a 520 area code. It also has a technical support system that operates with on $1 a minute 900 area code from 9:00 to 3:00 PST Monday to Friday.

The GeoWorks warranty provides that if you are not fully satisfied with the software for any reason within 30 days from the date of purchase you may return the complete product for a full product refund. (less shipping and handling).

Overall Evaluation:
Despite some of the 'growing pains" created by the miniaturized icons, increased capabilities and inevitable complications, I think is a very powerful addition to the GeoWorks armamentarium. I am intrigued to get past the initial phase and have a chance to utilize fully the intriguing new capabilities it provides.

GeoWorks Ensemble 2.0 $199.99 (Suggested retail price)
2150 Shattuck Ave. Berkeley, CA 94704 (415) 6440883

Internet

By: Jim Thomas, TIBMPCUG

Internet is a world-wide cyberspace community that is made up of many diverse networks. I think the best approach to explain Internet is to talk about its origin.

In the early 70's packet switching technology, along with TCP/IP (transmission control protocol and internet protocol), allowed different packet switching networks to communicate with each other without the host computers having to know anything about each other. The Department of Defense declared TCP/IP as the standard for military use. In the early 80's the National Science Foundation introduced the NSFNET to Internet and it became a major backbone of Internet. Internet was then made up of different networks such as NASA, ARPA, NSF, DISA, and DOE. Today Internet connects over 9,000 sub-networks and ten million users and it's growing bigger. Eventually different networks from all over the world hookup together, because if you hook into just one of these networks, you have access to all of them. And in their turn, they all have access to you.

Due to this growth and expansion, your pathways to people change quite often. I regularly send e-mail to my cousin in Australia. For years my messages would be sent from host computer to host computer (Florida to California) to end up in Berkeley, then transmitted to a satellite to Sidney, from where it would wander across Australia and end up in Orange with my cousin. I am based at USF and one day my message started going to NASA, then to a satellite to Australia. Now my message reaches my cousin's mailbox in about 30 seconds instead of six minutes. How did my cousin and I get access to Internet? We began communicating as students, and we now both work in the education field, so our access has always been through our respective universities. The two mailboxes I use are jpthomas@cfrvm and jpthomas@cfrvm.usf.edu. By using these "addresses" anyone in the world with e-mail capabilities can get in touch with me. Fidonet has hooks into Internet and you can send e-mail to someone if you know their address.

When Internet was being formed, the operating system of choice was Unix. There are four basic functions in the Internet Unix environment that open up the Internet world to computer users. They are FTP (file transfer protocol), MAIL, TELNET, and USENET NEWS. USENET is a group of conferences made up of messages that you access and post by the use of UUCP--a UNIX utility program. There are now programs for every type of computer that will give you access to USENET if you have access to Internet. TELNET is a program that allows you to logon to another host and read text files, do directory searches, and play games but generally you can not download files. MAIL is a UNIX program that creates domain names and controls the host computers tracking of all the people, places, and messages. FTP stands for file transfer protocol, but it is really a program that allows you to logon to a host computer anywhere in the world (as long as it is connected to Internet) and download files of interest.

In 1991 the High Performance Computing Act was introduced by then Senator Al Gore. This Act has committed the Federal Government to spend three billion dollars over the next five years to transform Internet into the National Research and Education Network (NREN). So far AT&T has been granted 12 million to maintain a directory of NREN, build a database server and provide training services to other networks.
CERFNet (General Atomic Project) will establish a reference center called INTERNIC, which will provide online, print, and CD-ROM training and documentation. At present Internet-based businesses include software development, search and retrieval systems, publishing ventures, document delivery, and electronic bulletin boards such as Bix, America On-Line, Delphi, and Compuserve.

I'm afraid I got a little long winded, but it is a complex subject. If there is an interest I will expound some more on the subject.

Writing Solid Code
by Steve Maguire
288 pages, $24.95
ISBN: 1-55615-551-4
Pub. Date: May 31, 1993

Writing Solid Code

Microsoft's Techniques for Developing Bug-Free Programs

If the developers give responsibility for finding bugs to the testers,the users of the product will find 40 percent of the bugs.

From the Foreword by David M. Moore
Director of Development, Microsoft Corporation

In WRITING SOLID CODE from Microsoft Press, author Steve Maguire shows programmers how to take back the responsibility for writing bug-free source code. Maguire doesn't expect programmers to write flawless code every time they sit in front of the keyboard. But he does believe that programmers who follow the guidelines in WRITING SOLID CODE can make progress toward keeping bugs out of the master sources-before their code goes to Testing.

As a top Microsoft developer and source code troubleshooter for Microsoft, Maguire knows what he is talking about. He has seen firsthand that with the growing complexity of software and the associated climb in bug rates programmers must produce bug-free code much earlier in the development cycle if products are to ship on time-or at all. He is convinced that the key to writing bug-free code is to become more aware of how bugs come about.

The guidelines in WRITING SOLID CODE are the result of programmers regularly asking themselves

> How could I have *automatically* detected this bug?
> How could I have *prevented* this bug?

Maguire focuses on little-known, hard-won techniques for writing code, techniques that don't turn up in textbooks or in programming courses. And he draws candidly on his experiences at Microsoft for cases in point-both good and bad. The result is practical, lively instruction in how to achieve "a nearly shippable product every day."

Entertaining, anecdotal chapters describe

- Increasing the number of bugs that can be detected automatically
- Using debugging assertion statements and debug-only backup algorithms
- Using subsystem integrity checks
- Stepping through code with an appropriate focus
- Writing easily validated functions that minimize the amount of error handling code that must be written
- Exchanging risky practices for comparably efficient but safer alternatives
- Avoiding the seemingly innocuous, most treacherous coding practices
- Developing the essential attitudes and habits

Each chapter contains points for quick review and exercises that push the programmer beyond the chapter. Appendixes contain checklists for a variety of coding situations, a useful linked-list version of memory logging routines discussed in the book, and full answers to the questions posed at the ends of the chapters. An annotated table of contents and a comprehensive index help readers quickly locate information on any topic in the book.

Steve Maguire has been programming professionally for 17 years. He worked on Microsoft Excel for the Macintosh and led the development of Microsoft's Intel® processor-hosted MC680x0 cross-development system for the Macintosh. He was the driving force behind Microsoft's switch to a cross-platform shared code strategy in its applications development and is perhaps best known in the company for his efforts to increase the utility and quality of shared code libraries. WRITING SOLID CODE is the first of several books he is writing to give programmers practical guidelines for developing professional, high-quality software.

Microsoft Press is the book division of Microsoft Corporation and the leading publisher of quality computer books about programming and Microsoft development tools. More than 10 million users at all skill levels rely on a complete line of Microsoft Press® books to make developing, learning, and using software easier. Titles ranging from streamlined tutorials for first-time computer users to technical references and advanced development books for professional programmers are distributed to book and software retailers worldwide. Consumers in the United States can also order directly from the publisher at 1-800-MSPRESS.

Founded in 1975, Microsoft (NASDAQ "MSFT") is the worldwide leader in software for personal computers. The company offers a wide range of products and services for business and personal use, each designed with the mission of making it easier and more enjoyable for people to take advantage of the full power of personal computing every day.

Tampa PC Users Group, Inc.

BITS of BLUE

Vol. 6 No. 9 September, 1993

MEETING

(2nd Wednesday every month)

DATE: September 8, 1993
TIME: 6:00 PM
PLACE: IBM CUSTOMER CENTER
LAKE POINTE ONE BUILDING
3109 W. Martin L. King Blvd.
Room 450

DIRECTIONS:

The Tampa IBM PC Users Group meets in the IBM's LAKE POINTE ONE Building across from Tampa Bay Mall one block east of Tampa Stadium.

The best entrance is on Martin Luther King Blvd. at the traffic light in front of Burdines. As you turn North off Martin Luther King Blvd. you will see the LAKE POINTE ONE BUILDING on the left & parking on the right. Join us in ROOM 450 - 4th floor. **Guest please sign in.**

SEPTEMBER 8TH AGENDA:

6:00 PM - opening remarks
6:30 PM -

Windows NT

Microsoft's "New Technology" for Windows
-- a heavy duty, 32 bit operating system,
Demo by: John Jenner,
Sr. Systems Engineer, Microsoft Corp.

7:30 PM - Break
7:45 PM - Open Discussion

MEMBERSHIP DIRECTOR:	Tom Cone	224-9052

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII file or in a commonly available word processor format, such as WordPerfect 5.2, or Ami Pro 3.0 on diskette to the editor at 9402 Hidden Ridge Place, Tampa, Florida 33637 or send it by modem to BBS (813)239-3704.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

Commercial advertisements will be accepted at the following rates:

	1 month	3 months	6 months
Full Page	$60.00	$162.00	288.00
Half Page	$40.00	$108.00	$192.00
Quarter Page	$22.00	$60.00	$106.00
Eight Page	$12.00	$33.00	$58.00
Business Card	$10.00	$27.00	$48.00

All advertisements must be prepaid by check payable to TPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if it is not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, Marylee Bruneau at (813) 985-3338, for space availability and for further information.

This newsletter is created with Ami Pro for Windows from Lotus Corp. and Corel Draw from Corel systems.

Secretary's Report

MINUTES OF 8/11/93 MEETING and PERSONAL COMMENTS

By: Jim Clark

Another BIGGIE!! Yes, if you weren't at this meeting, you missed another biggie. We had a presentation on one version of probably the most widely used word processor -- Word Perfect 6.0 (DOS) -- made by the inimitable John Johannesmeyer who has a special knack of getting across a lot of info in a very enjoyable way. And, we had a vote on our Articles of Incorporation (AOI) to change the name of our group. Although we had a good crowd, it was not the wall-to-wall crowd I had expected for this event. It was a productive and enjoyable evening.

CLUB NEWS

* Name Change: Harvey explained the several reasons the Board of Directors (BOD) felt that a change in our name was necessary: 1) Our name is so similar to other groups in our area that we are often mistaken for them; 2) Our present name incorrectly implies that only persons using true IBM PCs are eligible, whereas in reality we are open to users of any PC (as well as those that don't use computers at all, but have an interest in them); 3)Because of the similarity of names, some distributions from the computer industry intended for our group is often sent to one of the other groups; 4) We are applying for non-profit status with the IRS and it is important that our name reflect our true situation -- membership in our group is not limited to a select group of people, but is open to all.

The BOD had agreed upon and proposed to the membership that our name be changed to "Tampa PC Users Group". There were other ideas proposed from the floor during discussion, but in the end it was agreed that this name would probably meet our needs the best; it reflects our openness, and at the same time would also help keep our established identity in the industry. A motion to change our name to "Tampa PC Users Group" was made and seconded. A vote was held and the motion carried without opposition.

* Financial Reports: A motion was made to incorporate into our newsletter a financial report to let members know what our financial status is. The motion did not specify a time table for such reports. It was noted that financial reports are available for review by any and all of our members at all of our meetings, and that for such reports to be included in the newsletter frequently would consume valuable space and create additional work on the volunteers serving the organization. Considerable discussion ensued as to the need for such reports and if needed, the frequency of them. An amended motion was proposed to publish a financial statement, consisting of an Income Statement and a Balance Sheet, during the first quarter of the calendar year with an as of date of the last day of the previous year. The motion was seconded, and carried without opposition.

(Continued on next page.)

(Continued from previous page.)
INDUSTRY NEWS

* CorelDraw Update: A number of bugs have shown up in the recently released CorelDraw 4.0. To rectify most of these problems, CorelDraw has developed and is distributing a free update. If you are an owner of CorelDraw and have registered, you should receive your update automatically. If you have not registered, you will have to call CorelDraw at 1-800-836-DRAW to get your update.

* Word Perfect for OS/2: Word Perfect Corp says they are now shipping this version of WP.

* Stacker/Novell Agreement: An agreement has been reached that will incorporate Stacker software in future releases of Novell and DR-DOS. Inasmuch as Stacker seems to be the most popular disk compression software, this agreement will no doubt expand Stacker's share of the disk-compression market and should enhance the value of Novell and DR-DOS programs.

PRESENTATION -- Word Perfect 6.0 (DOS)

John Johannesmeyer, area manager for Word Perfect Corporation, was on hand to give an overview presentation of WP 6.0 (DOS). It is a very powerful program and no one could review all of its features in the limited time available, but John did cover a bunch of them -- and I shall be even more brief here.

To start with, WP 6.0 is very similar in many ways with WP 5.1 -- that is, is does all of the things 5.1 does (plus a bunch) and those things can be accomplished in pretty much the same way as 5.1 if one so desires Some of the key combinations are different, but if one uses phonetics they are very much the same. WP 6.0 can be operated in a variety of ways, from a clean screen that would remind you of all of the earlier versions of WP, through pull down menus on the screen, to a Windows like operation, complete with user-definable tool bars. One does not have some of the capabilities with 6.0 (DOS) that are available in Windows, such as DDE, but it appears to offer all other benefits of a Windows-like graphical interface. Like Windows, WP 6.0 makes use of all extended and expanded memory installed on the computer and otherwise available for use.

Among the major capabilities offered in WP 6.0 ia a very capable spreadsheet built right in. This spreadsheet provides over 100 functions, including all of the ones used most often by most spreadsheet users. And the spreadsheet is indeed very nice. Also included is an efficient send-fax capability so that one can send faxes from within WP 6.0 (the host computer must, of course, otherwise have a fax capability). And, the desktop publishing capability of WP 6.0's recent predecessors is still available -- but it has been enhanced and made more powerful than ever. Among the many other features of WP 6.0 are:

MS Access 1.1 maintenance upgrade is out. It can be purchased from MS directly for $19.95, or call MS for a coupon which will allow purchase from local retailers for $14.95.

* WP 6.0 can be operated in text or graphics modes; text mode takes less memory and looks much like WP 5.1 on the screen; and graphics mode which takes more memory and runs more slowly, but gives full benefit of the graphical interface (i.e., WYSIWYG).

* Up to nine documents can be opened and working at one time. This makes transfering information between several documents (up to nine) very easy.

* Word processing has been enhanced with features such as Grammatik V grammar checker now built in, and drag and drop editing of text. And, 6.0 will import from all of the popular major word processors.

* Provides a conversion macro to convert on the fly documents from previous versions of WP.

* Macros from WP 5.1 are convertable and creation of macros is easier.

* A comprehensive and detailed table creation and control capability - a very powerful and versatile feature. One can create and modify a table structure in just about any way I can imagine with just clicks of a button, and embed formulas as desired.

* Good control of graphics compared to other word processors, including scaling and drag-and-drop moving. It also allows the choice of block wrap of text around graphics, or contour wrap with a click of a mouse button. The program will import some 15 different graphics formats, including all of the most popular.

* Another feature that is particularly 'nice' is the Watermark. One may import a graphic in any of the 15 formats supported and make it a "watermark" -- a graphic that is printed lightly to become a background to any printed document.

* Enhanced, powerful desk top capabilities, including easily set up and controlled column layouts, with any combination of single and multiples allowed on the same page. Automatic text flow between columns and balanced columns are available.

* Some of the other features are: Extensive documentation and context-sensitive on line help; drag-and-drop text editing; spell checker; thumbnail preview of up to 32 pages at one time; document length limited only by space; envelope printing, with bar-code capability; hypertext (electronic referencing for documentation); supports full color printing; embed sound in any place desired in a document, with the sound becoming a part of the document file (assumes a sound capability built into the computer); uses Adobe and Bitstream Speedo fonts, with third party software providing True type capability as well; and many, many more.

Requirements: John says that WP 6.0 (DOS) will run in text mode on a 286 machine. A 386 with 2 MB of RAM will allow operation in text or graphics modes; more RAM will give faster operation. (A 486SX25 laptop was used for the demo and it

(Continued on next page.)

(Continued from previous page.)
worked very well.) The program needs about 420K of free RAM, after all TSRs are loaded. A minimum load of the program of the program uses about 7 MB of hard disk space -- loading all features takes about 14 MB.

Costs: List price of the program is $495. Upgrade from WP 5.1 lists at $129.95, but has a street price of around $89. A competitive upgrade is available for a little more, but one must be upgrading from a competitive program with a list price of at least $395.

Word Perfect Corp is implementing a program called Easy Move. This program will allow a purchaser of WP 6.0 (DOS) to obtain the software for the Windows version for $29.95, or $59.95 for the program with complete documentation. This "Easy Move" applies to lateral versions and/or earlier versions, but not to later versions; that is, a 6.0 licensee could Easy Move on any 6.0 versions (Windows, DOS or OS/2), or any 5.X versions, but could not do the same on 6.1 or later. John emphasized that one is not purchasing additional license, but is only expanding an existing license. Hence, if one owned a license for one program and Easy Moved on another, and subsequently gave or sold one version, that person will have sold or given away his license for both versions.

Word Perfect Corporation and John Johannesmeyer, many thanks for an excellent presentation of your very powerful new version of Word Perfect for DOS. It is truly an impressive and powerful program, and John, your presentation was both informative and entertaining, as usual.. MANY THANKS!

AND THE WINNER IS
Thanks to the generosity of Microsoft Corporation (who donated a copy of Microsoft Access), our own Sunshine Computer (who donated several peripheral items), and Word Perfect Corporation (who donated several WP T-shirts), along with the 50/50 cash drawing, there were some very nice raffle prizes. Those among us to have the good fortune to win are as follows:

Jerry Inman	WP T-shirt
Ed Buzza	WP T-shirt
George Pollak	WP T-shirt
Melvin Flynn	WP T-shirt
Kevan Sheridan	3.5" disk case & 25 diskettes
Frank Gallio	FD cleaning kits
Phillip P. Ficarrotta	Mouse Pad
R. A. Friedel	Microsoft Access
Don Keeney	50/50 ($54)

The meeting adjourned at about 9:10 PM

PRESIDENT'S COLUMN:

Its official! At our last meeting the majority of members in attendance voted to accept the new name proposed by the board. Since that time the state of Florida has approved and registered our new name. We are now officially known as the ***Tampa PC Users Group, Inc.*** The name was changed for several reasons:

1. Distinguish ourselves from IBM's own Tampa user group.
2. Prevent the confusion of potential members that we are an IBM PC only group. This also will help us in attaining a 503(c)(3) (Non-Profit) status with the government.
3. Use a legal corporate name. Our old name was *Tampa IBM Users Group, Inc.* but somewhere in the eighties the name was modified unofficially and PC was inserted.

One other change that was voted on and will be implemented is the printing of the groups financial information. This will be printed in the newsletter once every year within the first quarter.

As you are aware we have been looking for a larger space to hold our meetings for quite some time. In past meetings and newsletters I have asked for your help in locating or suggesting a new meeting place. However a site was never proposed that met our requirements. Recently Marylee, our editor, assumed the responsibility of contacting over 40 locations and has found two possible sites. These sites were discussed at our August board meeting and one has been designated as the most promising. Before the board commits to this site we would like to hear your thoughts and other specific recommendations you may have. Our goal is to move our meetings by the beginning of 1994. The location is the Ybor HCC campus. The facilities would provide seats for 195. Our cost would be minimal. The down side is that we would need to furnish our own computer and projection equipment for each meeting. From reviewing the other sites with Marylee it seems that we will need to furnish this equipment no matter where we go. This is a second issue that we will review in the months to come but for now the new meeting space has priority.

During the last several years board members of local PC user groups have been attending the *Suncoast Regional PC User Group* meetings to share ideas on running user groups. Originally these meetings were focused at local groups. However over the years board members from Jacksonville, Lake Wales and other Florida groups have participated in the Suncoast Regional PCUG meetings. With that in mind several influential board members of some of these user groups suggested that the meetings be opened to all PC user groups. This would include any hardware platform ie; IBM & compatibles, Apple, Commodore TI, ... whatever. No matter what platform or operating system a user group is based on they share the same issues. Issues such as membership, newsletter, vendor presentations, advertising, Special Interest Groups and volunteers to run the group are but a few concerns to running a successful group. It has been decided that an organization would be created for Florida PC user groups. This group is officially known as the *Florida Association of Computer User Groups*. By now you are wondering why am I taking white space to inform you of all of this information. To date 20 user groups have joined. I, along with six others representing various Florida groups, have been elected to the Board of Directors of this group. This association should provide a benefit to all member groups including ours. If you know of PC user groups who wish to join the FACUG please have them contact me.

Harvey Bruneau

Product Review:

Lotus® 1-2-3 Release 4 SPREADSHEET FOR WINDOWS

By: Larry Anders, Librarian
Tampa PC User's Group

Background:
First, let me tell you that I have been an avid Lotus® 1-2-3 (DOS platform) user for several years. I ***am not*** a user of any other spreadsheet program, such as Quatro Pro® or Excel®, so this review will not compare one spreadsheet against another. I tried the initial Microsoft® Windows version of Lotus 1-2-3 release 1.1 but could not get excited about learning a new procedure to do something that was already second nature to me. I found myself continually reverting back to the DOS version, especially once Lotus developed WYSIWYG (What You See Is What You Get)for the DOS release 2.3 of Lotus 1-2-3. When Lotus 1-2-3 release 2.4 for DOS was introduced, I tried it, liked it and finally gave up on Lotus 1-2-3 release 1.1 for Windows.

I had read a couple of reviews on Lotus 1-2-3 release 4 (**1-2-3r4** from now on) for Windows, which both were positive, but I wasn't willing to invest another $100(or so) in upgrade costs for something I probably would not use anyway. But, recently I purchased a new 486/66 and have become a much more frequent user of Windows and other Window based programs. So, when I was offered an opportunity to evaluate Lotus' latest release for Windows, without spending my money first, I accepted, and I'm glad I did!

System Requirements: (on a stand-alone PC or on a network)

* An 80286, 80386, or 80486-based PC certified for use with Microsoft Windows 3.0 of later.
* A color or grayscale EGA, VGA or IBM® 8514 monitor.
* A mouse (although they say it is not required, to get the full potential of all the new features it is strongly recommended).
* Microsoft Windows 3.0 or later.
* DOS 3.30 or later.
* 4 megabytes(MB) of random access memory (RAM); use on an 80286-based PC may require more RAM. A 2MB or more swap file is recommended in 386 enhanced mode.
* A max of 13MB of available disk space on a stand-alone PC; 7.5MB or more on a laptop; 16MB on a network server; and 150 kilobytes (K) on a network node. The Guided Tour requires Windows 3.1 and 3.3MB of additional disk space.

(Continued on page 6)

(Continued from page. 5)

(I installed the program on my 386/25 notebook with 4MB of RAM and 120MB hard drive. Installation went as expected.)

Upon opening the package there were several coupons included for various products such as:

* Adobe Type Manager® (ATM).
* A free upgrade from Lotus that will allow programs such as AMI Pro®, Freelance® or Improv® for Windows (all Lotus products) the ability to access and use the new .WK4 file format created by Lotus 1-2-3r4.
* A list of various reference materials such as texts, books or videos.
* A free issue of ***1-2-3 for Windows Report.***
* A free introductory membership to Compuserve®.
* Info of ordering a program called DataLens®, a program that will allow 1-2-3r4 to access data, no matter what the platform, program or operating system.
* A risk-free trial issue of PCWorld Magazine, Lotus edition.

Installation:

As with most Window-based programs the installation was straight forward from the Program Manager by choosing File Run then type *A:install* in the Command Line text box, choose OK, after the next introductory screen choose OK again and then choose the installation you want: Default Install, Customized Install or Install for Laptops. There is more than ample instructions during the installation process for it to be error free, even to the PC novice. Although all the fonts that you already have installed in Windows are available in 123r4 the installation procedure also gives you a choice to install Adobe Type Manager (ATM), which will install a selection of Type 1 fonts and the ATM Control Program.

NOTE: I would suggest if you are a first time user of Lotus 1-2-3 that you use the Default Install option and install everything, including the Animated Guided Tour. You can always go back and remove the extra files later when you are more familar with Lotus. I had limited space on my laptop and chose a different route. I did install the Evaluation Guide Sample Files that gave me hands-on activities to introduce me to the new features and new ways to access the old features of Lotus 1-2-3.

New Features:

* Choose from a much more streamlined, logical menu structure and well-organized dialog boxes.

* New tool bars offer many shortcuts with intuitive SmartIcons and a dynamic status bar at the bottom of the worksheet that is actually a mini-menu system that allows you to change several features of the current selection, such as font or numeric format. There are several tool bars available but not all are visible at the same time, which sometimes caused me to have to look for my option. I'm sure with a little experience this won't be much of a problem. (The *"classic"* 1-2-3 slash-key menus are still available, but I only used it once to see if it still worked!)
* There is now a pop-up quick menu with the most frequently used commands for the current selection.

* Enter and edit text directly in a cell by just a simple double click of the mouse.

* Copy and move data by dragging it with the mouse. After highlighting a cell or a range of cells, when the cursor is moved to the border of the highlighted area the pointer changes to a small hand. When the left mouse button is depressed the hand closes as if it has grasped your current selection and opens to release your selection when the mouse button is released. Cute, and effective! The pointer also changes shape to let you know if a click will select a cell, graph, line, etc. You can now select an entire column or row by clicking on its respective column letter or row number. You can also select discontiguous ranges by using combinations of mouse and keyboard keys. Both right and left buttons of the mouse have been standardized in 123r4.

* Open and work on several worksheets **(3D)** at once and navigate through these worksheets by the use of named tabs, similar to file folders, which are visible at the top of the worksheet. Capability to still read and write previous Lotus 1-2-3 file formats ie., .WK1 and .WK3 are included in 123r4.

* Create multiple versions of data ranges that can vary independently, combine or share data concurrently with other ranges.

* Share data with Object Linking and Embedding (OLE), Dynamic Data Exchange (DLL), and electronic mail (E-mail).

* Style your data with many more fonts, 256 colors and 64 fill patterns. Align all cell entries, not just labels, wrap text with a cell, and a ***first*** for spreadsheets, you can ***rotate*** entries within the cells.

* Create and edit charts overlaid directly on your worksheet.

* Although this new release can run all the old *macros* there are over 250 new macro commands added. Macros are no longer key-stroke oriented. Instead, new commands such as {MENU-CREATE} to modify the menu bar, are recorded in a special Transcript window, where they can be tested, edited and then pasted into the worksheet.

* Jump to any named range using the new *Navigator.*

* *Date Query Assistant* will build database queries graphically, eliminating criteria ranges.

* 120 @functions have been added, bringing the total to over 200, all accessible from the new *@Function pull-down.*

* *Version Manager* allows the sharing of *what-if* scenarios across a network, providing an audit trail by stamping each new version with the author's network, E-mail, date and time of entry.

(Continued on next page.)

(Continued from previous page.)

Summary:

I think Lotus has become a full-fledged contender in the Windows spreadsheet market with the release of 123r4. It is no longer a DOS spreadsheet made-over to run under Windows. Now with an improved interface, Version Manager, database query tools, 3-D worksheets, enhanced charting, quick menus, and SmartIcons this program has been designed for both the experienced spreadsheet user as well as the everyday user of Windows wondering what they could do with a spreadsheet program. Invest in **Lotus 1-2-3 Release 4** and I think you'll be pleasantly surprised. I was!

Pricing:

Suggested Retail Price $495, Upgrade $129
(Look around....you can beat these prices!)

Business Insight: Like Having an MBA on a Disk

Reprinted by permission of PC World from Volume 11, Number 9, Copyright @ 1993

Business Insight offers the counsel of business experts to help you run your business or start an enterprise. It first interviews you about your company, then searches its reservoir of business management knowledge and strategy to analyze your firm and suggest improvements.

Business Insight's designers, both with management backgrounds, constructed the program's knowledge base using the work of 35 business experts, including Harvard economics professor Michael Porter.

An outline format makes this Windows program easy to use and understand. You start by answering questions about strategic business areas such as personnel, product benefits, buyer objectives, and the competition. You don't need to have a degree to answer the questions-terms are defined, and most questions are either multiple choice or scaled. Some require financial data, such as projected startup expenses, and you can use Business Insight's integrated spreadsheet, or import data in WKS format.

Once you're done, the program generates several reports. Business Insight acts as a critical outside adviser in its ôscore cardö report, which rates your enterprise's chances for success in key areas such as product positioning, competition, and profit potential. It gives an assertion rating from 1 to 100 for each area. The program lists the factors that contribute to each rating, so you can review its logic. Business Insight then offers recommendations for improvement and points out inconsistencies in your strategy.

A top ten list shows the ten strongest and ten weakest aspects of your business strategy. Again, each rating is explained. Another helpful feature shows the pros and cons of whatif scenarios, such as ôWhat if I enter the market early?ö A written critique of your strategy combines this information and can frame a formal business plan.

Business Insight can not only help you start a business but develop new strategies as your product and market change.

Laurianne McLaughlin

Business Insight {windows}This Windows program uses a knowledge base of business rules and theory to analyze ventures and offer suggestions.

That's a nice macro you wrote, Too bad Lotus now owns it.

By Ed Foster

Copyright 1993, by InfoWorld Publishing Corp., a subsidiary of IDG Communications, Inc. Reprinted by permission from InfoWorld, 155 Bovet Road, San Mateo, CA 94402. Further reproduction is prohibited.

Like many of you, I've always disliked the "look-and-feel" copyright infringement lawsuits that have plagued the software industry. But whether company X gets a legal judgment against company Y doesn't affect me directly, so I've never gotten overly excited about these cases.

I'm getting overly excited now. Downright angry, in fact.

What set me off is the recent ruling in the Lotus-Borland lawsuit that found Quattro Pro's macro key reader a violation of Lotus' intellectual property rights because it allows Quattro Pro to execute 1-2-3 macros. That ruling finally brought home to me the underlying nature of these lawsuits. The party whose intellectual property rights are being violated here is not a software vendor at all, but the user -- you and me.

Think about it. You, as a user of 1-2-3, may have developed a number of macros over the years for your organization that are part of the way you do business. They're your macros, your intellectual property, not Lotus'.

The Lotus position (if you'll pardon the expression) is that if you decide another spreadsheet program offers you something that 1-2-3 doesn't, you shouldn't be able to run those macros on it. You must rewrite them to run on the new program.

At least in this case, Borland advocates a legal environment that allows programs to have features compatible with de facto standards. Users can still have a choice of products down the road without abandoning their own intellectual investment in the programs they've been using.

It's pretty clear that Borland's model is the better one for users. And it's also easy to dismiss the argument that the vendor's incentive to innovate is stifled in a system that allows compatibility with existing market standards. In the real world, it works the other way around. A vendor is rarely going to have a standard worth cloning without having already made a killing, as Lotus did with 1-2-3. And a vendor focused on defending its intellectual property rights is likely to fall behind in bringing new innovations, as Lotus also did with 1-2-3.

(Continued on next page.)

(Continued from previous page.)
Keep in mind these look-and-feel lawsuits aren't over the fundamental technologies and performance capabilities that made a product like 1-2-3 successful. They are about aspects of the program that became important only because the product did become a standard and people like you and me invested our time in learning how to use them.

It's relatively easy to see how look-and-feel lawsuits violate your intellectual property rights in a case like this, where a language you use for development is involved. I think, however, your rights are also under attack in the lawsuits involving other program elements, such as command interfaces. Lotus has already gotten rulings against Borland, and Paperback Software before that, over the use of its 1-2-3 slash command interface, forcing Borland to pull that capability from Quattro Pro. (I'm not sure why Lotus hasn't taken on Microsoft's Excel, but I suspect it's fundamentally the syndrome of a bully not wanting to mess with a bigger bully.)

Yet a user's ability to work more quickly with the familiar slash commands is due again to your efforts, not Lotus'. Nothing was terribly innovative about the slash command interface over many other programs that existed when 1-2-3's was introduced; WordStar had already proven the basic concept. What made 1-2-3's command interface worth cloning was the skill 1-2-3 users had developed with it over the years. Shouldn't that be considered the user's intellectual property, too?

So what do we do about it? It's clear that the patent and copyright laws are a complete anachronism for this industry. Waiting for inspired legislation to clear up the mess is a pipe dream. And, judging by this latest ruling, hoping for precedent-setting wisdom in the interpretation of the laws is probably just as futile.

The only time you get to be judge and jury of these vendors is when you buy products, so it might be wise to take a company's track record on these issues into account at that time. It's probably not relevant now to worry about Lotus' behavior when buying your next spreadsheet, as they've already lost a lot of their leadership position there. But what about Notes? How much of your company's energies should be put into a development environment whose publisher, on precedent at least, will try to keep it closed? It would be an interesting question to put to your Lotus sales representative.

The Peter Norton PC Programmer's Bible
by Peter Norton, Peter Aitken, and Richard Wilton
632 pages, $29.95
ISBN: 1-55615-555-7
Pub. Date: June 1, 1993

The Peter Norton PC Programmer's Bible

The Ultimate Reference to the IBM" PC and Compatible Hardware and Systems Software

A Peter Norton book without his picture on the cover! At first glance that's what THE PETER NORTON PC PROGRAMMER'S BIBLE from Microsoft Press seems to be missing. However a closer examination of the revised bestselling computer book classic does indeed reveal a likeness of the software industry legend without shirtsleeves rolled up and arms folded!

Peter Norton's trademark pose was first seen on THE PETER NORTON PROGRAMMER'S GUIDE TO THE IBM PC in 1984. It quickly became the symbol for a youthful industry. Computers were about to change the world, and The Norton Guide became the primary reference for thousands of pioneering enthusiasts, students, and programmers. It was the first readable introduction to the technical underpinnings of the PC and was hailed as a valuable reference for anyone curious about how the PC works. More than a half million copies were sold through the first two editions.

Today the completely updated edition of this landmark book is back, better than ever. It provides fresh information for a whole new generation of computer enthusiasts eager to master the concepts of PC programming. And as was true of previous editions, it's not only for programmers. Anyone who is involved in or needs to understand the inner workings of the Intel® microprocessor-based family of microcomputers will be able to use this book as a handy guide. Readers get detailed reference information as well as an overview of the philosophies, ideas, and techniques behind developing modern, high-performance PC software. One look inside explains why many of today's most prominent computer industry figures credit this book for sparking their interest in the computer age. Complete coverage includes:

HardwareReaders get a detailed description of the anatomy and function of each hardware component as well as information on the architecture, design philosophy, and interoperability of microprocessors and bus technologies, including the Intel Pentium® microprocessor and ISA, EISA, and Micro Channel bus technology.

Operating Systems The authors take the readers from the fundamentals to the important details about the latest and most widely used operating systems, including information on BIOS and MS-DOS® services, user interfaces, message-driven architecture, and more. MS-DOS 6, Microsoft® Windows® 3.1, Windows NT,® and OS/2® operating systems are covered.

(Continued on next page.)

(Continued from previous page.)

Program Development Proven programming methods and techniques from seasoned experts are combined with an overview of four major programming languages and other powerful programming tools.

Reference Includes a BIOS function summary, an MS-DOS function summary, and information on hexadecimal arithmetic and ASCII characters. An annotated table of contents and a comprehensive index help readers quickly locate information on any topic in the book.

Peter Norton started his computer software career with an "undelete" program that would recover computer files that had been inadvertently erased. That became the core for the Norton Utilities,® the flagship product of Peter Norton Computing, now a part of Symantec Corporation. His books have been read by millions of computer users and programmers.

Co-author Peter Aitken has written extensively about computer hardware and software, with more than 60 articles and 14 books to his credit, including *The Essential Guide to MS-DOS 5 Programming* and the *Microsoft Guide to Visual Basic® for MS-DOS*, from Microsoft Press, and the bestseller *Teach Yourself C in 21 Days*.

Co-author Richard Wilton has written about IBM® PC and PS/2® programming for several different magazines and is the author of *Programmer's Guide to PC and PS/2 Video Systems* and *Microsoft Windows 3 Developer's Workshop*, from Microsoft Press.

THE PETER NORTON PC PROGRAMMER'S BIBLE is the first book in the Microsoft Press Programming Classics series. Programming Classics are thoroughly updated editions of milestone books that have had a significant impact on the art and science of software development. Each book in this series continues to be as relevant today as the day it was first published. Look for the Programming Classic emblem.

Microsoft Press is the book division of Microsoft Corporation and the leading publisher of quality computer books about Microsoft products. More than 10 million users at all skill levels rely on a complete line of Microsoft Press® books to make learning and using software easier. Titles ranging from streamlined tutorials for first-time computer users to technical references for professional programmers are distributed to book and software retailers worldwide. Consumers in the United States can also order directly from the publisher at 1-800-MSPRESS.

Founded in 1975, Microsoft (NASDAQ "MSFT") is the worldwide leader in software for personal computers. The company offers a wide range of products and services for business and personal use, each designed with the mission of making it easier and more enjoyable for people to take advantage of the full power of personal computing every day.

Microsoft, Microsoft Press, and MS-DOS are registered trademarks and Visual Basic, Windows, and Windows NT are trademarks of Microsoft Corporation. IBM, OS/2, and PS/2 are registered trademarks of International Business Machines Corporation. Intel is a registered trademark and Pentium is a trademark of Intel Corporation. Norton Utilities is a registered trademark of Peter Norton Computing.

A Convenient Way to Switch Between Video Resolutions

Reprinted by permission of PC World from Volume 11, Number 9, Copyright @ 1993

For most users, Windows is full of hassles. Here are two of them: Although your video card may support several resolutions (640 by 480, 800 by 600, 1024 by 768, and so on), you can't conveniently switch between them. And when you load Windows, it doesn't bring you back to where you were when you exited. Programs by Binar Graphics, AnyView and Fantastic Recall attempt to solve these problems.

AnyView checks out your hardware at installation, then lets you change your video driver-and with it your resolution-on the fly. If you've been working at 1024 by 768, and you decide you'd prefer to work in 800 by 600, just click the appropriate icon and there you are, without exiting Windows or closing any applications.

What happens if you pick a resolution that doesn't really work with your hardware, and you're left with a blank or unreadable screen? You hot-key back to the previous resolution.

Also, the program rewrites SYSTEM.INI when you change the resolution, so you can always edit it back in DOS.

You can also associate resolutions with applications. You can, for instance, assign 1024 by 768 to Quattro Pro, where you need to see a large worksheet, and 640 by 480 to Ami Pro, where you want large letters. As you move from one app to another, your resolution changes.

AnyView sports a few other useful features. You can turn the screen into a scrollable window on a giant virtual desktop. And if you ever thought that those rulers in design-oriented programs looked wrong, AnyView lets you set the number of pixels that equate an inch. You can define this setting-while holding a physical ruler up to your screen-for each resolution your system supports.

If you like to start work each morning where you left off the night before, Fantastic Recall is worth considering. When you exit Windows through Fantastic Recall, it copies memory to a disk file; when you run the command-line program in DOS, it restores from the file to memory, returning you to Windows with your apps running and your data files up, exactly as you left off. That's a lot more energy efficient than keeping your system on all night. The program also has an autosave feature to copy memory to disk.

Lincoln Spector

GAME REVIEW:
AMAZON
Guardians of Eden
By: David Burch, TPCUG

If detailed adventure games intrigue you, then you will probably enjoy Access's Amazon. If you don't like detail and having to keep track of a story line then you may find Amazon too complex to be considered enjoyable. Amazon is a long adventure game in which the choices you make determine your fate.

Before the details about the game, I will give you the technical information. The manual suggests as minimum hardware a 285/12mhz CPU, this would be almost impossible; I used a 486/33Mhz and found some of the scenes relatively slow. Amazon is an enormous game, mostly because of its graphics. It has many sections with video like animated graphics. With setup it has 7 disks and requires 9.3MB. The installation is pretty simple and has really interesting trivia about the Amazon region. There was only one area that I ran into trouble, setting up the sound driver. This procedure was really confusing and I never quite figured it out. Except for this, the installation went quite smoothly, but be prepared to eat up all that hard disk space.

The game is written in a story fashion; there are fourteen chapters. The player is allowed to make choices, and as these choices are made correctly then the player can move on to other choices. The story is based on a character named Jason whose older brother has disappeared in the Amazon forests. The object is to find his brother and solve the mystery of his disappearance.

There are a variety of different screens that the player will encounter. Some of the screens are first person scenes in which the player sees through Jason's eyes. There is a portion of the screen that is divided into command icons. These icons allow Jason to pick up things (i.e. keys, weapons, etc.) , look at things, move things and a few other important tasks. These icons are used throughout the game. There are also third person scenes in which the player can see Jason. The command icons are used the same way in these scenes. The third main type of action screen is the Automatic Sequence in which the player sits back and watches. These are especially important for obtaining background information about the story line. There is also an inventory screen that can be chosen from the command line that shows all the objects Jason has acquired.

At the first I found the game quite difficult to play, until I started using the on-line help. There is a help icon that can be chosen in most of the scenes. This icon gives hints for most of the objects and scenes. This actually makes the game quite easy.

There are a few things to remember if Amazon sounds interesting to you and you decide to get it: Save your game often and make sure you've gotten all the objects you need for further chapters or you'll be stuck up the river without a paddle, literally!

SOFTWARE REVIEW:
BRAVO
By: Andrew J. Gnoza, III

Alpha Software is out to make a big dent in the presentation graphics software market with its new program called BRAVO.

With a projected street price well under $100. Bravo comes with all the bells and whistles the high priced big boys have and is very easy to use. Bravo is state of the art presentation graphics running with Windows. Bravo is a step ahead of the others in the race because of the new graphics technology that allows you to easily produce more dramatic results.

In addition to new technology Bravo has the normal capabilities including; an outliner, style sheets, drawing tools, speaker notes, OLE and DDE support, multimedia support, a runtime module for distributing slide shows. Bravo also has capabilities usually associated with illustration programs such as: Bezier curve editing, scaleable type from Bitstream, type manipulation, shape and color blends, rotate and skew, and variable zoom.

Finally new features due to the new technology include: intelligent clip art, business graphs with intelligently scaled pictures to represent data, and graphical control of other Windows applications. Extensive context-sensitive help makes it easy for casual users to produce quick word charts and graphs and provides a smooth transition to the more advanced features required by experienced users.

Alpha Software has been a leader in the database market with its Alpha 4 product will soon be known for its Windows graphic presentation product

Tampa PC Users Group, Inc.

BITS of BLUE

Vol. 6 No. 10 October, 1993

MEETING

(2nd Wednesday every month)

DATE: October 13, 1993
TIME: 6:00 PM
PLACE: IBM CUSTOMER CENTER
LAKE POINTE ONE BUILDING
3109 W. Martin L. King Blvd.
Room 450
DIRECTIONS:

The Tampa IBM PC Users Group meets in the IBM's LAKE POINTE ONE Building across from Tampa Bay Mall one block east of Tampa Stadium.

The best entrance is on Martin Luther King Blvd. at the traffic light in front of Burdines. As you turn North off Martin Luther King Blvd. you will see the LAKE POINTE ONE BUILDING on the left & parking on the right. Join us in ROOM 450 - 4th floor. **Guest please sign in.**

OCTOBER 13TH AGENDA:

6:00 PM - opening remarks
6:30 PM -

OS/2 2.1

IBM's all-in-one operating system supporting DOS, Windows™ and OS/2 software running side-by-side.

Demo by: Dennis Harrison,
of IBM, Corp.

7:30 PM - Break
7:45 PM - Open Discussion
Door Prize Raffle -

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII file or in a commonly available word processor format, such as WordPerfect 5.2, or Ami Pro 3.0 on diskette to the editor at 9402 Hidden Ridge Place, Tampa, Florida 33637 or send it by modem to BBS (813)239-3704.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

Commercial advertisements will be accepted at the following rates:

	1 month	3 months	6 months
Full Page	$60.00	$162.00	288.00
Half Page	$40.00	$108.00	$192.00
Quarter Page	$22.00	$60.00	$106.00
Eight Page	$12.00	$33.00	$58.00
Business Card	$10.00	$27.00	$48.00

All advertisements must be prepaid by check payable to TPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if it is not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, Marylee Bruneau at (813) 985-3338, for space availability and for further information.

This newsletter is created with Ami Pro for Windows from Lotus Corp. and Corel Draw from Corel systems.

Secretary's Report

MINUTES OF 9/8/93 MEETING and PERSONAL COMMENTS

By: Jim Clark

Must be because the new school year has started the number attending this meeting was down a good bit from our normal group, in spite of the fact that we were having a Microsoft presentation on their Windows NT program. Those that were there learned about a great program.

CLUB NEWS

➔ New Meeting Location: This was the most important item discussed in club news area. Recognizing that we have overflow crowds on occasion and that the space crunch is inhibiting growth of the group, the Board of Directors (BOD) has been discussing and investigating potential new locations for our meetings for several months. During the last few weeks Marylee Bruneau, our newsletter editor, has aggressively searched for a new location. Having investigated a very long list of potential locations, Marylee was successful in identifying two that had reasonable prospects adequate space, a willing host, and a price we could afford. The best of the two is the Ybor City campus of HCC. Our Prez, Harvey Bruneau, brought these circumstances to the floor and solicited reaction from the members present. Several commented, all favorable, with at least two who had attended that campus noting that it is an excellent location with outstanding security. With that, Harvey indicated that the site would be visited and the specifics of the facility would be explored in greater detail. If suitable, his objective date for moving is in time for the February meeting. More at the October general meeting.

INDUSTRY NEWS

➔ MS DOS Upgrade: MS has version 6.2 of DOS in the works, to be released in the not-too-distant future. It will no doubt minimize some of the problems that have been reported with Double Space, as well as provide improvements in other areas.

➔ New SmartDrive: Quite a few folks have reported loss of data on shut down when using SMARTDRV in read/write mode. That is reportedly because SMARTDRV may not write to disk for several seconds and those shutting down quickly do so some times before SMARTDRV has written to disk. An update of SMARTDRV.EXE is now available on CServ as well as other locations. This version corrects the delayed write problem at shutdown.

➔ Windows Replacement: Industry news has it that MS now has in Beta testing (or Alpha, depending on which report you read) a program that will be a replacement for Windows. Called Chicago, this program will be much more powerful than Windows and will replace DOS, Windows and Windows for Workgroups.

➔ Computer Training: Working with computers in the business world and a wide variety of software, Harvey

(Continued on next page.)

(Continued from previous page.)
reported on his experience with one source of computer training his firm uses Executrain. Without going into much detail which might be construed as a "plug" for Executrain, Harvey reported that the folks there are well qualified, do a great job of instructing, and provide follow-on support. If you need training on any of the many major software programs Executrain provides instruction on, that firm is certainly worthy of your consideration.

PRESENTATION MS Windows NT 3.1

We were fortunate to have John Jenner, Senior Systems Engineer (Florida) for Microsoft Corporation, join us and give a presentation of Windows NT. He gave a very enlightening presentation. Especially in the early portion of the review of Windows NT, I felt a bit like a fish out of water because I had absolutely no knowledge of networking and client server systems. By the time John had finished, he had convinced me that it was a super program for network/client server systems.

There are two versions of the package Windows NT and Windows NT Advanced Server. The basic differences between the two center on the size of operations each will support. NT, for example will support two processors , while NT Advanced will support four processors and is an unlimited server. It will also support Mac systems. Both versions are very powerful and loaded with features, only a few of which I made decipherable notes on:

➔ Compatible with x86based, RISCbased and SMP systems and expanding.

➔ Compatible with a host of networking options: IBM LAN Server, MS LAN Manager, MS Workgroup for Windows, and TCP/IP networks; and with Banyan Vines, DEC Pathworks, IBM SNA networks and Novell NetWare with some additional software.

➔ Compatible with a number of "operating systems": MS DOS, Windows, 32bit Windows, POSIX and OS/2.

➔ Consistent with appearance and functioning of Windows and Windows for Workgroups, and John says that users of these programs are already 80% of the way toward using Windows NT. However, NT has included a feature not now in the other Windows programs, but which we have found so useful in others a tool bar which provides direct click access to a host of commands.

➔ A true preemptive multitasking environment

➔ Provides an 'application interface' and 'provider interface' which, among other things, permits otherwise incompatible components to communicate, and it isolates each application so that trouble with one has no direct effect on the others.

➔ Recognizes and works with FAT, OS/2 and NTFX formatting/filing systems.

➔ Provides a spectrum of 'personal' and 'common' security options that are easy to set up, with centralized control of user profiles and actions, which are applied at user logon.

➔ Supports up to 2 gigabytes of virtual memory, provides power failure protection with uninterruptible power support, and includes builtin backup.

Requirements to use Windows NT on an x86based system are: At least a 386 computer; will operate with 8 MB RAM, but at least 12 MB RAM is recommended; one HD floppy disk drive; at least 40 MB hard disk space for minimum loading and 80 MB of space for full loading, plus paging space of at least 2 MB, with recommended paging space twice the installed RAM; and VGA, Super VGA or other graphics adapter compatible with Windows NT. A RISCbased system needs more RAM and hard disk space, plus a CDROM drive.

Costs: Windows NT lists for $495, with a $295 upgrade price tag.. Windows NT Advanced lists for $1995. No street pricing was available to this writer.

Many thanks to Microsoft Corporation and John for a great presentation and giving us a looksee at what appears to be a super client server capability, and for the programs you donated to our group. It is all very much appreciated.

AND THE WINNER IS

Thanks to the generosity of Microsoft Corporation (who donated a copy of Microsoft Windows NT and a copy of Windows for Workgroups), our illustrious Prez who secured some other goodies for us during his travels, along with the 50/50 cash drawing, there were some very nice raffle prizes. Those among us to have the good fortune to win are as follows:

M. Kapalas	MS Windows NT
Martin Miller	MS Windows for Workgroups
Steve Hess	Windows NT book
???	Windows NT book
Phillip Ficarrotta	Shirt
M. Kapalas	Cap (times 2)
Jay Reese	50/50 ($58)

The meeting adjourned at about 8:45 PM

♦♦♦♦♦

FRIENDS OF THE USER GROUP:

We acknowledge the following firms for their support

- **CompUSA** ♦ **IBM** ♦ **PC Warehouse**
- **Software Review** ♦ **Custom Computer Wholesale**
- **Staples** ♦ **Sunrise Computer Supplies & Parts**

We also acknowledge the following national software vendors for their excellent demonstrations and contributions of evaluation software to our group:

- **Access Software**
- **Borland**
- **Corel Systems**
- **GeoWorks**
- **WordPerfect**
- **Microsoft**
- **Lotus Corp.**
- **Symantec**
- **Traveling Software**
- **Software Publishing Corp.**

PRESIDENT'S COLUMN:

By: Harvey Bruneau

OUTSTANDING! On September 28th, IBM had their OS/2 exhibition at the Tampa Convention Center. Brad Brown of IBM made an offer to our group that I could not refuse. Free space for us to promote our group during the show. I must say IBM provided with us with 1st class treatment. My thanks to Brad and IBM for their hospitality and generosity. Of course there was a couple of key issues that needed attention. No one to staff the table, no literature to hand out and no sign or banner. Fortunately, and once again, the officers of our group stood up to the challenge. A major thank you to Marylee, our editor, who created a sign, advertising rate brochures, new user group brochures, a Harvard Graphics presentation and attended the table the entire day. My thanks also go to Jim Clark (Secretary), Tom Cone (VP) for donating their time to manning the table during the course of the day. Without the commitment from these volunteers we wouldn't have been able to promote our group at this event. A sincere thank you to each of them. I wish I could give each one a Pentium PC for their unselfish contribution.

IT MAKES ME PROUD! Another round of applause should go the authors of this months newsletter articles. Take a look at the names above the articles in this newsletter. Yes that's right, they are our own members, except for the PC World 11/93 articles on page 13. In fact we had so many articles written for this months newsletter that we could not put them all in. They will be placed in following newsletters. It's great not to be dependent entirely on outside authors. Any member that would like to write articles for the newsletter please contact Marylee at 985-3338. These articles can be from your own personal experience with hardware\software\books or from a product that we have available for review. See page five for a list of current review items. Remember if you check out an item from the list and you write a review on time, the product is yours FREE. You must contact Marylee, meet the minimum product requirement and sign a form to get the item for review.

HELLO CAN YOU HELP ME PLEASE! Read the PC trade journals lately? "*toll-free technical assistance is for the most part being replaced with calls charged on a toll, per-minute, per-incident, or per-year basis*" PCWEEK September 27, 1993 issue. Microsoft, Borland and Lotus are but three vendors that have decided to implement new "fee" support programs. Look for more companies to follow as the price of software drops. Of course vendors will still provide you access to their Compuserve forums, bulettin board and fax-back services as before, but a request for a support technician, that's another matter. Time to setup Quicken with another expense item. The cost of developing and supporting software can no longer be covered by the sales of the product. We all like a low price of $50 to $99 for software. Vendors however can't make money at those prices. That is why they are implementing these new policies. While I understand the WHY, as a private end-user I can't afford to pay for support calls on a regular basis. Can you? I don't want to pay for a vendor's mistake. Sure there are times when I am stumped by a product. However, if vendors had better and more real world tutorials, better online help, better manuals and clean debugged products maybe we would not need to call for support as much. If vendors put more effort into their products and lengthen the product development cycle it surely could reduce the need for support. I realize this is not what they teach in marketing 101 but vendors must be prepared to pay the price if they ship a product with deficiencies. Initial release of products like MS DOS 6.0, Corel 3.0, Corel 4.0 and Packrat 5.0 are examples of products that were not ready for prime time but shipped anyway. Interim releases to all these products are either being created or have shipped to correct ideocencracies. But hey the marketing people are happy. The product shipped on time or beat the competitions product to the street, but at what cost to product and vendor loyalty by the end user. Sure its more difficult to test a product today than yesteryear but that should not be an excuse and we should not be asked to pay for finding the undocumented features of a product. Even WordPerfect has had some problems but they provide unusually good free phone support and free interim upgrades. Presently, they are going to stick with that kind of support policy. I CAN DEAL WITH THAT.

Wow, I must of struck a nerve during the writing of the above paragraph. Lets see why did I begin this issue? Oh yes, to announce that we have started our own **Members Help-Line.** This issue was brought up at the last board meeting and several officers volunteered to help with products and areas they were farmiliar with. No volunteer claims to be an expert! Any member wishing to share their PC knowledge, even products already being supported, with other members should contact the editor in order that we can post it in the newsletter and the BBS. This is a good way of providing basic support to each other. Of course we also have messaging and FIDO Net on the BBS where you can ask questions related to specific items.

WE NEED YOUR HELP! We will be moving in February to a larger facility located on the HCC Ybor campus. The facility will seat well over 200 members and guest. However, we need to provide our own video and computer equipment. We presently have neither and not enough money to purchase either. Several money making ventures have been discussed during our board meetings including a garage sale, raising membership fees and the sale of coupon books. At this time we have no plans to raise the membership dues. However, we will be bringing coupons books for sale at the next meeting for you to purchase. See the last page for information about these coupon books. Also, we would like to hear some suggestions you may have on how we can raise the money or get the equipment needed. If you know where we can borrow, rent or inherit a good color VGA projection panel, 486 computer or how we can raise the money please contact any of the officers.

Software Review:
Print Cache Version 3.1

Review By: Jim Clark, Tampa PC Users Group

What It Is: As you might expect from its name, Print Cache, by Laser Tools, is a print spooler for both DOS and Windows. But. it is also a good deal more than a print spooler. Laser Tools advertises that it speeds up the actual printing, that it replaces Print Manager in Windows, and provides drag and drop printing in Windows. And it does all that, and then some.

Other Features: Its features include:

* Works with ANY printer and any IBM-compatible computer.
* Provides real time printing status data on screen, including progress expressed as kilo-bytes of the print job remaining.
* Provides voice error messages in Windows 3.I, a selectable feature which can be turned off as well.
* Gives control of the printer during a print job in Windows, and selectably offers the same control in DOS at the cost of about 12K additional RAM. This allows you to suspend, resume or cancel the printing job, eject a page, or turn HP LaserJet optimization on/off.
* Supports the advanced features of the HP LaserJet 4.
* Provides an optimization feature to speed up graphics printing on HP Laserjet printers, and solves the Error 20 problem caused by graphics that are too large to fit in the printers memory.
* Supports multiple printer ports (LPT 1 & 2, and your COM ports) and multiple printing jobs on each, and more than one printer can be connected to each port. But, each port used requires a loading of Print Cache. In other words, if you wish to run printers from LPT 1 & 2, Print cache must be loaded into memory twice, one for each port.
* Supports loading high - as many copies as you wish to load and have memory for, each of which can be loaded into memory automatically by the AUTOEXEC.BAT, or at the DOS prompt; it can be loaded high only at boot, of course.
* A range of selectable buffer options, both size and location. EMS, XMS, RAM disk, conventional memory, or your hard drive may be chosen. RAM is the fastest, of course, but few of us have memory we would want to allocate as a buffer. The hard drive is the best option for most; assuming a reasonably fast hard drive, the cost in performance is fairly small.
* Provides its own interrupt drivers, and alternate drivers in the event that standard interrupts for your printer ports are not available.

What Print Cache Won't Do: Print Cache will do a lot of things for you, some of which I relate below, but there are a number of things it can't do. First, Print Cache will speed up the printing job by accepting the printing instructions of your software as fast as that software can output the data, and it will

(Continued on next page.)

(Continued from previous page.)
feed the printing instructions to the printer as fast as it can take instructions. And Print Cache reportedly y employs very efficient routines which also helps. But, Print Cache cannot make your application faster, nor can it make the mechanical operation of your printer or its manipulation of data any faster. Those things are fixed -- if your application is slow and/or if your printer is slow, they will continue to be slow even with Print Cache, just not quite as slow overall with Print cache in between.

What Print Cache Does For Me: I have a 386DX/40 w/128K external cache, 8 MB RAM, Hercules monographics adapter with mono monitor, and 2 IDE hard drives. I use a Panasonic KX-P 1124 dot matrix printer and a Okidata OL 400 LED printer. I ran several comparisons, with emphasis on my slower printing desk top publishing programs. In these tests I noted some, but relatively a small improvement in the overall speed of printing using Print Cache in DOS. But that is not as important to me as how soon the computer is available for other things. Here, Print Cache did very well.

Using Express Publisher (notoriously slow in outputting printing) in DOS, Print Ccache turned the computer back to me for other use as soon as Express Publisher finished outputting the print job -- fully 70% sooner than normal (normal being normal for my printer). Dot matrix printers are usually the slowest printers at letter quality speeds, and Print Cache pays off biggest with these printers. But the time savings with laser printers is also significant -- and worth while. And the payoff in time savings is also bigger in DOS than in Windows; without Print Cache or other spooler DOS ties up the computer until the print job is nearly complete, while Windows' Print Manager is a spooler of sorts that accepts the print job and then turns a portion of the computer back to you. With simpler printing jobs from a word processor, Print cache releases the computer back to you in just a few seconds, while it takes over and handles the printing job in the background.

Print Cache is also a very useful tool in Windows. Again using Express Publisher (for Windows this time), printing a complex one page documents without Print Manager or Print Cache is essentially the same as in DOS -- the computer is tied up until the last of the printing instructions have been sent to the printer's buffer. The time until releasing the computer back to me was about the same when using Print Manager or Print Cache. I noted two significant differences, however: When Print cache released the computer, the computer was as responsive to my commands as if nothing else was happening, while Print Manager tied up so much of the computer time that all other operations are slowed substantially. And, Print Cache finished the printing job 25% sooner than Print Manager. In contrast to the instructions in the Print Cache manual to turn Print Manager off, I found using Print Manager and Print Cache together to be even better -- the computer was released to me in about 35% less time, and the print job was finished in 5-10% less time than using Print Cache alone.

I have found the capability to operate more than one printer at a time useful as well. On one occasion, I began a printing job from a Windows program, then logged onto Prodigy and downloaded a printing task to another printer, and then went to another area of Prodigy and did my thing while both printers executed their assigned printing job -- and I still saw no degradation in the computer nor the printing operations.

My experience with Print Cache has not been without problems; not serious problems, but problems nonetheless. Laser Tools Tech Support has been good helping solve them. One problem is a hardware jumper problem I have to correct. The other problem centers around Print Cache advanced settings to reduce the RAM it uses from almost 24K to 9K, which is in the ball park of advertised.

Installation: Installation of Print Cache is easy and quick, taking me only a few moments. And there is little to do beyond selecting the storage directory for program files (which must be in the path statement) and the Print Cache settings you desire. Print cache will install itself in the AUTOEXEC.BAT file for loading, but you will likely have to relocate the statement so that it is the last TSR loaded; this is a must to able to unload Print cache without modifying the AUTOEXEC.BAT file and rebooting. More than one copy of Print Cache can be loaded automatically via the AUTOEXEC.BAT file if you use plan to use more than one printer port. Besides being automatic, the advantage of loading in the AUTOEXEC.BAT file is that all copies loaded can be loaded high.

Documentation: The owners manual is comprehensive and clear regarding loading and use of Print Cache, though in some minor instances it is not consistent (i.e., memory used by Print Cache). The program includes pretty good on-line help as well. Laser Tools also provides toll-free technical support.

Requirements for Print Cache are minimal: Any IBM-compatible PC, DOS 2.1 or above, 7-20 MB of DOS memory (according to the manual, but see Two Unresolved Problems above), and 640K of free disk space (program files occupy 750K in my installation). Though not specified as a requiement, it seem to me that satisfactory performance would demand additional hard disk space for use as a buffer -- somewhere between 32K and infinity; the manual recommends at least 32K for less than 10 pages of plain DOS text, to at least

((Continued from previous page.)
1 MB for Windows or DTP printing, to 1-2 MB for graphics, and up to 4 MB for large/complicated print jobs. I chose 4 MB because I have ample disk space and I have some rather large DTP printing jobs.

Cost: I do not know the list price of Print Cache, and the street price varies considerably. I have seen street prices ranging from $29.99 to over $45. So shop a bit for the best price.

My View: There may be other programs that do as good a job as Print Cache, but I am not aware of them. I do know, however, that I like Print Cache and what it does for me, and I think it worth the $30 street price. For additional information, contact:

Laser Tools, 1250 45th Street, Suite 100, Emeryville, CA 94608, 1-800-767-8004

Software Review:

Quattro Pro For Windows

By: Donald W. Patzsch, TAMPA PC Users Group

Startup: Installing the program is simplicity in itself, just put the first disk into the A: drive and let the program do its thing. Once you bring up the program it is very easy to use. I imported some spreadsheets and edited them before I read any of the manuals. Normally, I read the manuals of any new program three times. The first to get an idea of what it contains and where. The second time through, I get the idea of what they are talking about, and I make notes of where everything is. By the third reading, I am familiar with what they are trying to tell you.

Features: Borland is using the ObjectOriented approach. Once you have made up a program module, there is no need to always go back and start over, you can just use the modules in various ways. Most other companies are beginning to recognize the importance of this process, and they are using it in their programs just as Borland does.

When Quattro Pro for Windows comes up, you see what looks like a standard spreadsheet grid. However, on closer inspection you notice a series of tabs along the bottom. These are a real advantage. You can click on a tab and bring out another spreadsheet, then tile the windows and see how you want to exchange data between them. There is a speed bar that allows fast moves between sheets. You can easily link or consolidate the sheets, or simply view them.

If you want the name of each spreadsheet at the bottom tabs, it is easy to set this up. Just click the right button on the A tab and write in the name of that spreadsheet. You can do this with all of the tabs, so you can easily switch between your spreadsheets.

Borland deserves kudos for its ability to support the file formats of all its competitors.

Borland includes a library function, which allows you to make worksheet macros available to all the files in memory. Also at the back of the notebook, on a special graphs page, QPW stores icons for all the graphs you create, also any custom dialog boxes and/or slideshows.

Borland includes a neat function. Click your right mouse button on any option or text or data within the program and you get some fantastic options.

Quattro Pro provides a data access feature called Database Desktop. DD is really a front end to the Paradox engine, which ships with Quattro Pro. So all the data access, client server, and data integrity features of Paradox come with it.

Slide Shows: One of the extra's this program contains is the slide show. By clicking on the Speedtab, you go to the last page which is the GRAPHS page. From this point you can set up a slide show with text, pictures, graphs, or whatever. This process is very easy and straightforward. I made up three simple presentations in a few minutes, and tried the click of the left mouse button to move forward and the right button to return to the last slide. The slide shows can have special effects like wipes to simulate turning a page, or dissolves (fade in / fade out).

Conclusion: Years ago, I bought Quattro Pro for DOS. I have used it regularly since, but at that time, I could not have imagined the ease of use, and the many features that this program, QPW has. QPW works very well under OS/2 version 2.1, and that is where I will be using it from now on.

Software Review:

Adobe Type Set - Value Pack

Review by: Alford Poole, TAMPA PC Users Group

When you switch to different software it takes time to discover all the features of the new package. I'm thankful for this opportunity to work with, and thus learn more about, the Adobe Type Manager (ATM), which came with WordPerfect 5.2 for Windows, and hope that this review might help others too.

What are scalable fonts all about? Instead of each letter that you type being the same uniform size throughout your document you can vary the size of the type of a whole paragraph, a word or even each letter of a word. You can start as small as 6 points and go as large as 72 points, depending on the font and application.

Font sizes from 6 points to

72 points

Some true type font packages are, well, plain compared to the Adobe Type Set package. Others may list more fonts but some may be the same font with different attributes such as bold, italic or bold italic. I like the variety of the Adobe Value Pack - each font is unique. You get 17 decorative headlines, 5 texts, 5 scripts and 3 ornaments & symbols and the front cover of the box opens to reveal examples of the different type faces.

A Quick Installation Card included with the package gives instructions for installing the whole package or just the fonts.

OS/2 1.3 or greater also comes with ATM. If you don't already have ATM installed then install it through Windows using either the Files - Run - a:\install or the Windows File Manager to locate the INSTALL.EXE program on the floppy. You must exit to DOS (but not by using the DOS Prompt button) and restart Windows to use the ATM program. Also, when new fonts are added, Windows must be restarted to use the new fonts. ATM will take advantage of pre-built (soft) fonts or resident fonts (cartridge fonts or fonts built into the printer) if they are available if you select the "Use Pre-built or Resident Bitmap

(Continued on next page.)

(Continued from previous page.)
Fonts" checkbox in the ATM Control Panel. This will reduce the amount of printer memory used and may improve performance.

My first problem came in trying to get the fonts to show up in WordPerfect 5.2 for Windows. They were accessible in Windows Write but would not show up in the fonts menu of WordPerfect. Documentation for the ATM said to reselect the printer. What it should say is "select Windows Printer Driver instead of the WordPerfect Printer Driver in the Select Printer menu if the Adobe fonts don't show up." Further digging in the WP Reference tome mentioned that WP Printer Drivers would work with ATM if you have MoreFonts or Prime Type. Isn't that nice?

The Readme file lists several programs that will not work with ATM such as CorelDraw 2.0 and earlier and Harvard Draw 1.0. Others are listed as having limitations, mainly using the type as graphics. There is no mention that ATM supports font embedding.

ATM loads all the fonts you have installed when you start Windows, so if you want to get to Windows faster, unload some less used fonts.

For the print test I used 48 Point type so irregularity or "jaggyness" would be more noticeable. AG Old Style and Blackoak, from Adobe, and Arial Italic and MurryHill fonts that came with WordPerfect, were used with a NEC P2200 24 pin dot matrix printer. Results were interesting. With ATM all printed fonts looked nice. Without ATM AG Old Style turned to regular Arial and Blackoak turned to a less bold type. MurryHill literally turned into Greek using Greek symbols for most of the letters. Italic Arial and Courier remained unchanged. "Jaggyness" of the letters was not much different with or without ATM. Hard copy looked much better than what you see displayed on the screen. Turning ATM on and off takes some time as the printer info is updated each time. Without ATM the Adobe fonts disappear from the font menu.

How do you get the nifty fonts into your document? Unless you want your text to look like a roller coaster ride, changing the type is quite easy. Using the Character button in Windows Write, you can change fonts and size of the letters. Using Reduce Font and Enlarge Font the type can be changed to the next size down or up quickly. In WordPerfect, using the ruler from the View selection, makes changing fonts and sizes fairly quick also.

If you do any kind of newsletter, Christmas letter, or write letters to your member of Congress, these fonts could put more zip in your message. Unleash that creative genius - get scalable!

Contents:
* Adobe Type Manager software v 2.02
* 30 typefaces
* Quick Install card and User Guide booklet
* Discount coupon and catalog for more type

Requirements:
* Windows 3.x or OS/2 1.3 or greater
* 286,386 or 486
* 1 MB RAM (2 recommended) for Windows
* 4 MB RAM (6 recommended) for OS/2
* Hard disk and one HD floppy drive (uses about 1 MB of disk space)

Printers supported:
* PostScript and HP LaserJet Printers
* Dot matrix and inkjet printers
* All other output devices supported by Windows and OS/2

Compatibility:
* Nearly all Windows 3.x and OS/2 1.3 or greater applications
* DOS applications: MS Word 5.0 or greater, Ventura Publisher 2.0

or greater, WordPerfect 5.0 or greater(DOS installation utilities available through enclosed fulfilment card)

Adobe Type Set Value Pack is available at Egghead Software for $39 (before CUE). You can contact Adobe Systems Inc. at 1585 Charleston Road, P. O. Box 7900, Mountain View, CA 94039-7900 1-800-83-FONTS (833-6687)

Software Review:
askSam for DOS

By: Tom Cone, VP & Treas., Tampa PC Users Group

Overview: This is a review of the latest DOS version of ***askSam*** (vers. 5.11). ***askSam*** is a freeform database that is designed to let you organize large amounts of data and text. It handles both structured data and unstructured "freeform" text. In this context, "structured data" means data organized in records that contain fixed fields, such as is commonly found in dBase, Paradox, Alpha4, PC-File, or Q&A.)

askSam does not use field types, such as numeric, floating-point, and text. Instead, ***askSam*** permits any type of data in any field. ***askSam*** automatically senses the data type and handles the data appropriately. With ***askSam***, there are no mandatory fields. You can create records and documents containing any kind of information, and then retrieve them using special formatting commands to create meaningful structures as desired.

Its designers seem to intend that ***askSam*** be "easy to use", and yet offer the unique capability of handling structured and unstructured information within the same data file. This permits ***askSam*** to be used as an information manager so that you could use it in the office to record unstructured notes, phone numbers, addresses, and any other thoughts or "brainstorms" that may come to mind randomly throughout the course of the day. ***askSam*** permits this information to be easily retrieved, sorted and printed later on. You need not be aware of the traditional complexities in database programming. ***askSam*** may also be used on larger projects to record research notes, journal abstracts, magazine articles, transcriptions of meetings, random notes from telephone conversations and any other stray thoughts or creative ideas. These could all be maintained in a single "project" data file and then sorted and retrieved in manageable fashion later on.

I see applications in my law firm where ***askSam*** could be used to collect documents or deposition transcripts in a single case. I could then search through them quickly and

(Continued on next page.)

(Continued from previous page.)
easily to spot inconsistencies, or to arrange narrative descriptions chronologically. Sometimes it would be useful to simply and easily look at what different witnesses would have to say about the same topic. These would be difficult tasks with conventional word processors or database programs. However, since ***askSam*** can deal with unstructured text it should be able to do it with little difficulty. Similar applications might make sense for journalists, students, and investigators.

Requirements: ***askSam*** will run on an IBM PC, XT, AT, PS/2 or compatible with at least 384k of system memory. It will work with either diskette or hard disk systems and with monochrome, CGA, EGA or VGA monitors. ***askSam*** can be supplied on either 5 1/4 or 3.5 inch diskettes. It requires PC-DOS or MS/DOS 2.0 or higher.

These requirements make ***askSam*** a series contender for laptop or portable computer systems. Do I see a laptop in my future? ... in the courtroom? Could be!

Installation: I tested ***askSam*** on a Gateway/2000 desktop system (386SX running at 20 mhz under MS-DOS 5.0) and had no difficulty installing the software on my hard disk. The install routine permits the user to designate alternate drive and directory destinations, but will install the system in an ***askSam*** subdirectory on the "C" drive by default. The installation routines do not automatically reconfigure your config.sys or autoexec.bat files.

Documentation and Support: The program arrives with a "getting started" tutorial that walks you through many of the primary, commonly used, functions. It also includes two larger books. The first is a "User's Guide" describing key ***askSam*** concepts and functions. It is intended to be used as a general reference and is designed to be read by topic. For example, Chapter 4 deals with data entry, Chapter 5 importing and exporting data, and Chapter 6, retrieving data. Each chapter in the User's Guide contains a section of "troubleshooting tips" that illustrate solutions to frequently asked questions about the product.

The second book is a comprehensive reference guide, arranging all ***askSam*** commands, functions, operators and other features in alphabetic order for convenient reference.

Equally as important, the program incorporates a very fast and comprehensive "context-sensitive" help system that is always available by simply pressing function key "F1". I found this feature of the package particularly useful.

Technical support is available directly from the publisher for the cost of a long distance call to Perry, Florida. In addition, an electronic bulletin board service is available in Perry, providing 24 hour access to the tech support department.

Does *askSam* Achieve Its Stated Purpose? For the most part ***askSam*** does an excellent job of accomplishing its goal.

Most of my personal experience with database management programs are with programs like PC-File, Alpha4, dBaseIII+, and so forth. Except for those notorious "memo" fields, these programs use a fixed length format for each record in a datafile. The record is the basic building block for storing data. Within each fixed length record you create "subsets" called "fields". These programs require the user to predict the type and length of the data intended to be stored in each field within each record. This takes considerable planning and foresight, often requiring the "user" to adapt to the program, instead of the other way around. If you use fields that are too long for most of your data, you wind up wasting space on your hard disk. On the other hand, if your data is too long to fit within the field width you have allocated, the excess portion is simply lost when it is truncated to fit within its predesigned field.

In sharp contrast, I found the data input and data import features of ***askSam*** to be extremely easy to use. It was a pleasure not to have to worry about field structures!

For ***askSam***, records are also a basic building block within a data file. However, ***askSam*** does not require you to pre-design a fixed structure within each record. Records can hold any type of data, in any order, so long as the overall length of a record doesn't exceed 20 lines (80 characters wide) in length.

askSam stores your data using a proprietary file format. You retrieve the data by typing "queries". The ***askSam*** search engine then uses your query to retrieve data corresponding to your search request and displays it on screen. This retrieval system works extraordinarily fast. I was impressed with overall speed of operation throughout.

Information retrieved from an ***askSam*** file can be sent to the printer instead of the screen, and can be stored on disk in a separate file, if you wish.

The retrieval commands are especially flexible and powerful. You can retrieve information based on a combination of a word or a symbol appearing in a record or document. You can use wildcards to locate parts of a word or symbol. The program supports boolean logic and you can locate data using proximity searches if you wish.

I found it is not necessary to spend a lot of time framing precise queries. Instead, the program operates so quickly it is very easy to start with a general query and then refine it until the desired information is retrieved, alone.

Major Features: The program is completely menu driven. Selections are made by moving the highlight bar (using the arrow keys) or by pressing the key that corresponds to the first letter of the menu item, itself. I found this method of "navigating" to be very fast and easy to use. However, the program presents so many options that initially I was a bit bewildered by all the choices. After using the program for awhile I realized that the vast majority of these "optional settings" would be useful infrequently. The default settings did a good job for me during my testing.

The search and retrieval system is based on the user typing in a query using wildcards and boolean operators.

Retrieval Examples:

Query: sail*

Retrieves all records that contain words beginning with the letters "sail", i.e. sails, sailing, and sailboat.(Continued on next page.)

(Continued from previous page.)

Query: ad {AND} Boston {OR} Miami

Retrieves all records that contain "ad" and "Boston"... or that contain the word "Miami". (***askSam*** processes queries from left to right...)

Query: FL {NOT} Tampa

Retrieves all records that contain the word "FL" except for those that also contain the word "Tampa".

Query: Robinson {SHOW :S Witmer}

Retrieves all records in which "Robinson" and "Witmer" are in the same sentence in the same record.

Query: blue {NOT} green

Retrieves all records that contain "blue", unless a record also includes the word "green".

I found the retrieval system very easy to operate, and very fast.

askSam also includes a comprehensive set of "formatting commands" that enable you to control the format of the records retrieved by your query. These were more complicated and presented a greater difficulty for me. I especially had trouble formatting output for the printer.

askSam requires that query and formatting commands be combined together. The displayed results are then automatically formatted to match the formatting commands incorporated within the search request.

askSam limits the query and format command line to a string of 80 characters. If a longer search or format command is required, ***askSam*** supports "batching" the commands collectively. These batch commands are stored in a "program record" that can be retrieved and executed independently later on. This process is similar to building a DOS batch file or utilizing the macro programming language in WordPerfect or Lotus 1-2-3. If you are comfortable with this level of programming, you should have little difficulty in adapting to the ***askSam*** approach.

Programming Examples:

```
:client
{SORT :L NAME[}
NAME[ {COLUMN 40} PH#[
```

Results in a two column table displayed on screen. The contents of the "NAME[" field will appear in the first column, sorted on the "last" word in the field. The contents of the "PH#[" field appear, beginning at column 40.

Note: NAME[and PH#[are examples of "explicit" fields, supported by ***askSam***. These are actually stored in the individual records along with the data, and are useful in providing "structure" to unstructured text, if you need to. A typical record might be:

```
DATE[          ]
NAME[                    ]
ADD1[                    ]
ADD2[                    ]
CITY[                    ]  STATE[      ]
ZIP[           ]
PH#[                   ]
```

These explicit field names can be added to a record at any time, and do not have to be "declared" in advance.

```
:total1
{SORT :L AGENT[}
{BREAK :20 AGENT[ JUSTIFY 30 TOTAL :C $}
```

Results in a list of agents sorted alphabetically by last name. Will contain subtotals for each agent, based on the "implied" field "$" appearing in each record. The subtotals will be right justified in column 30, and the :C modifier means that the results will include commas where appropriate. A grand total will appear at the bottom of the report.

Note: an implied field is one word. The first character or characters of a word appearing in a record can be treated as the "name" of a field. The last part of the same word is treated as the "value" of the field. i.e. "$350.75" can be broken down into two components. The "$" can be the field's "name", and "350.75" the field's "value". This is a very powerful and flexible capability.

In these examples, ":client" and ":total1" are each the names of separate programs. These would be stored as separate records inside the data file itself and "run" from ***askSam***'s main menu, or via "Hypertext" mode.

askSam also incorporates a "Hypertext" capability. In "Hypertext mode" you can move the cursor over a word that may have been retrieved in an initial search but maybe isn't part of your original query. Then, when you press the ENTER key ***askSam*** will find every other occurrence of that word either in the active file, or at your option, in all files in the ***askSam*** directory. In addition, "Hypertext mode" permits the creation of "point and shoot" menus that you might design for easy navigation or to produce regularly recurring reports. What I found to be unique is that this "Hypertext" capability does not require specification of explicit "Hypertext" links between the data in your file. ***askSam*** automatically creates intrinsic links between all text in the file.

Limitations: ***askSam*** can import and export only ASCII or ***askSam*** files. If you need to import data from another file format, you might contact the publisher. It offers an "insert" utility that would convert dBase, comma delimited, and fixed file formats into forms suitable for importing into ***askSam***.

The DOS version of ***askSam*** does not directly support the use of a mouse. This was not as large problem as I anticipated since the menu driven system works very quickly

(Continued on next page.)

(Continued from previous page.).
and easily. If you feel you need to use the mouse, a separate utility program must be obtained from MicroSoft Corporation and then executed prior to loading ***askSam***.

The program does not support relational data base structures. It basically functions utilizing a flat file paradigm; however, retrieval commands are available which permit you to query other ***askSam*** files from within the current file, thereby imitating to a certain degree the classic relational capabilities of products like dBase and Paradox. The absence of a true relational capability means that there is a tendency to repeat data within multiple records of an individual file. This repetitious storage of the same data would be regarded by some as inefficient use of hard disk storage space. My experience thus far indicates that this repetition in the data does not degrade performance to an appreciable degree. Furthermore, ***askSam*** files seem to be somewhat smaller than their ASCII equivalents already.

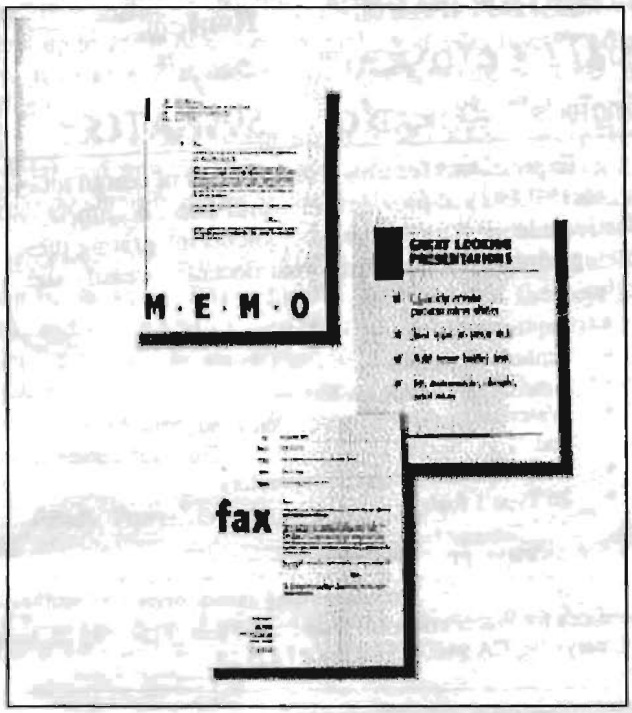
The DOS version can be run as a non-Windows program within a window provided you are running Windows in 386 enhanced mode. In this configuration, your computer must be an 80386-based system with at least 2 megabytes of RAM. If you are running Windows in real or standard mode, you can only run ***askSam*** in a full screen display. You are not able to run it in a window. Systems that are not based on an Intel 80386 can only run Windows 3.0 and 3.1 in real or standard modes.

askSam systems published its first Windows version of the product in May of 1993. ***askSam*** for Windows 1.0 carries a suggested retail price of $395. Since I am not running Windows, I have not had an opportunity to test the Windows version of ***askSam***. The publisher indicates that the Windows version will run on Windows 3.1 and requires 2 megabytes of disk space and 4 megabytes of RAM.

Options: The publisher offers a developer edition as well as a network edition of the program. The version I evaluated was the single user version.

Summary: I found ***askSam*** to be very fast, and easy to use, especially for data input and import functions. The retrieval system is extraordinarily fast, flexible and powerful. In contrast, I had some difficulty "catching on" to the formatting commands controlling the appearance of my printed output. I am inclined to believe that this may be more a matter of a "sore nose" bumping in to the "learning curve" than anything else.

If you have need to deal with "structured" data and freeform text, you should check ***askSam*** out, especially if you are willing to invest the time required to learn the retrieval and formatting commands.



askSam is published by: Seaside Software, Inc., Post Office Box 1428, Perry, Florida 32347 Sales: 1-800-800-1997
Tech Support: 904-584-6590, BBS: 904-584-5413
The suggested retail price is $395 for the single user version.

Product Review: Express Docs for WordPerfect® 6.0

By: Larry Anders, Librarian, Tampa PC Users Group

ExpressDocs is an automated document design and production tool for WordPerfect novices and experts alike that makes the time-consuming production of daily business documents much easier, faster and more professional. You get 44 prefabricated document designs including:

- Memos and Faxes
- Letters and Reports
- Calendars and Day Planners
- Invitations and Awards
- Self-calculating Expense Reports and Invoices

and more, that are stored in ready-to-use templates.

During installation ExpressDocs asks you for your personal information such as name, address, phone number, company name, etc. Then to activate ExpressDocs, just pick "New " in the WordPerfect File Menu and select the pre-designed document and fill in the blanks as you're prompted. ExpressDocs automatically produces a complete document with all your particulars included automatically. All you have to do is add the words!

OR, ExpressDocs is also a powerful office automation aid that lets you turn any WordPerfect file into a design template. You can automate all your office document production

(Continued on next page.)

(Continued from previous page.)

based on templates you create yourself. ExpressDocs can be used in a corporate or large office environment with ExpressDocs' full support for all major networks.

ExpressDocs features a complete set of design tools and shortcuts that lets you provide and WordPerfect document with a professional look. You'll have no problems integrating these following advanced features into your documents easily and quickly:

- Pop-up prompts
- Embedded macros
- A selection of page borders
- Watermarks (like "Draft", "Confidential" and "Top Secret")
- Drop caps and paragraph separators
- 20 Type 1 fonts

TRY IT - YOU'LL LIKE IT..... LA

ExpressDocs for WordPerfect 6.0 from LaserTools, 1250 45th St, Suite 100, Emeryville, CA 94608, List Price $39.95

NEC and IBM Roll Out Budget 486 Desktops

The same money that bought a no-name 486 clone last year now buys a feature-rich system from top-tier vendors such as NEC and IBM. NEC has added local bus video, power management, and Pentium OverDrive sockets to its Ready and PowerMate PCs, with prices starting at around $1000. IBM has added low-priced models—albeit with graphics and upgrade compromises—to its ValuePoint line, with prices starting at $1090.

NEC Adds Features

While NEC's Ready line targets small business and home-office users, its pricier PowerMate family is geared toward corporate buyers. The two lines use identical components and offer one year of on-site service, but the PowerMates come with a two-year parts and service warranty. To make Ready systems easy to get started, NEC includes a setup video and a preloaded software suite with PFS:WindowWorks 2.0, Delrina WinFax Lite, and one-month trial memberships to CompuServe and America Online.

NEC's revamped Ready and PowerMate systems offer performance enhancements also found in the company's high-end Image line, including local bus video and NEC's OptiBus I/O technology, which speeds up hard drive access time. An improved graphics subsystem supports 256 colors at 1024 by 768 resolution, or 16 million colors at 640 by 480 resolution.

Speed demons will appreciate the 238-pin ZIF socket for Intel's Pentium OverDrive chip, scheduled for release next year. Each system comes with 4MB of RAM (expandable to 36MB), a socket for an optional 256K secondary cache, three open ISA slots, and one open drive bay, accessible from the unit's front. NEC's new systems meet EPA Energy Star Level 1 guidelines, which means PC and monitor power down to under 30 watts each after a user-defined time period.

With a 25-MHz 486SX, 4MB RAM, and a 170MB hard drive, the Ready 425es costs $999. (Add $355 for a 14-inch SVGA monitor with .28mm dot pitch.) The Ready 433es and 466es include an internal 2400/ 9600 data/fax-modem and Ready Remote—support software that allows NEC technicians to dial into your PC to solve problems. With a 210MB hard drive but no monitor, the Ready 433es (486SX-33) costs $1299; the Ready 466es (486DX2-66) with a 250MB hard drive is $1899.

The $1049 PowerMate 425es (486SX-25) and $1425 PowerMate 433es (486DX-33) come with a 170MB hard drive. The PowerMate 466es (486DX2-66) with a 170MB hard drive costs $1845. The monitor is extra.

IBM's New ValuePoints

While NEC brings high performance features to its entry level lines, IBM takes a different approach: adding new machines to the low end of its ValuePoint line. These PCs—the ValuePoint Si series—cut $70 to $120 off standard ValuePoint series prices by reducing graphics power and upgradability.

While the ValuePoint Si systems feature VESA local bus on the motherboard, they don't include an available VL-bus slot. The Si's use inferior graphics accelerators and come with 512K DRAM, upgradable to only 1MB (rather than the 2MB of earlier ValuePoints). 1MB limits you to a maximum of 256 colors at 1024 by 768 resolution; with 2MB you get 64,000 colors.

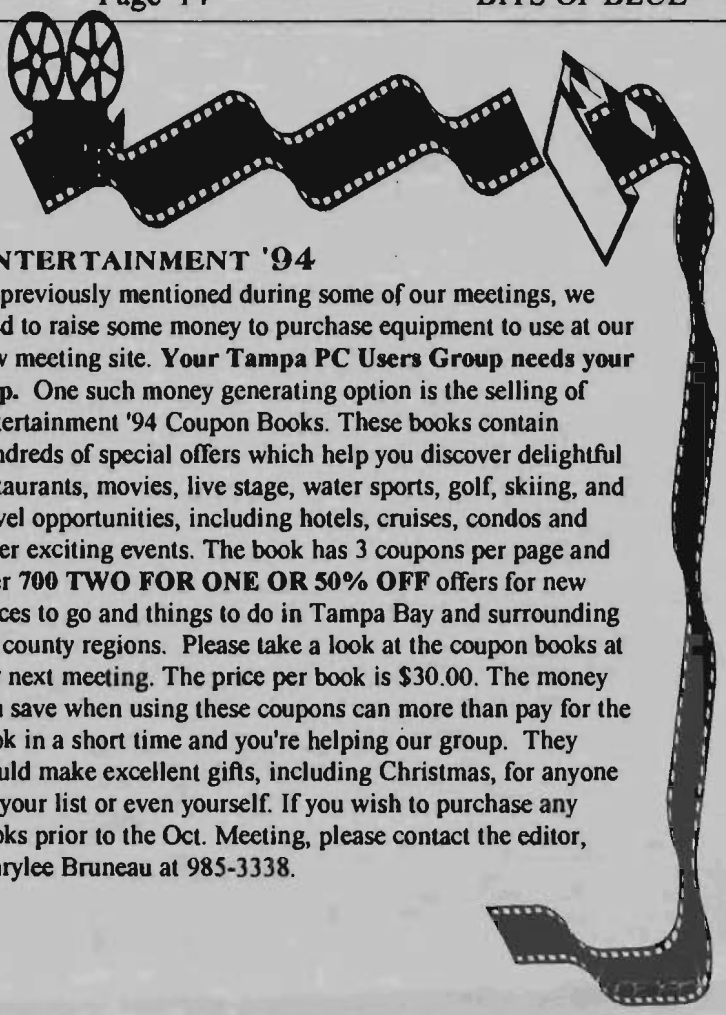
Other compromises abound. The ValuePoint 425SX/Si does not offer an optional secondary cache or a Pentium OverDrive socket. And while the ValuePoint 433DX/Si does accept up to 256K of secondary cache and a Pentium OverDrive chip, it lacks a ZIF socket, making upgrading the CPU more difficult.

All the Si's accept up to 64MB RAM, (using 16MB SIMMs) and provide three open ISA slots and one open drive bay, as do small-footprint ValuePoints. The 425SX/Si includes a 25-MHz 486SX processor, 4MB RAM, a 120MB hard drive, and an IBM basic keyboard for $1090. The basic keyboard uses the same frame as an IBM enhanced keyboard, but the keys don't click, and felt mushy. If you do a lot of typing, the IBM basic keyboard may not be worth the $40 savings.

These prices don't include monitors, so add an extra $379 for a 14-inch SVGA monitor with .28mm dot pitch.

—Laurianne McLaughlin

NEC Ready, PowerMate; IBM ValuePoint Si



NEC adds features to its low-end PCs; IBM cuts prices and features. List prices (without monitors): approximately $1000 to $2000

Rich and Retired 1.1

Reprinted by permission of PC World from Volume 11, Number 11, Copyright @ 1993.

Retirement: We all yearn for it, but we don't always devote the time—and money—to make our golden years relatively worry-free. Now you can quit procrastinating and start planning. Rich and Retired is a DOS and Windows retirement planning package that targets the graying Baby Boom generation. Rich and Retired helps you create a personalized retirement strategy based on your lifestyle and financial situation. You specify such variables as desired age of retirement, life expectancy, rates of inflation, and expected income sources. You can design budgets for specific financial objectives, such as paying for a child's college education. Using what-if calculations, you can test the viability of financial scenarios. Rich and Retired imports budget and asset data from Quicken and Managing Your Money. The DOS and Windows versions each sell for $59.95.

DataTech Software, 800/556-7526, 717/ 652-4344, 717/652-3222.

ENTERTAINMENT '94

As previously mentioned during some of our meetings, we need to raise some money to purchase equipment to use at our new meeting site. **Your Tampa PC Users Group needs your help.** One such money generating option is the selling of Entertainment '94 Coupon Books. These books contain hundreds of special offers which help you discover delightful restaurants, movies, live stage, water sports, golf, skiing, and travel opportunities, including hotels, cruises, condos and other exciting events. The book has 3 coupons per page and over **700 TWO FOR ONE OR 50% OFF** offers for new places to go and things to do in Tampa Bay and surrounding six county regions. Please take a look at the coupon books at our next meeting. The price per book is $30.00. The money you save when using these coupons can more than pay for the book in a short time and you're helping our group. They would make excellent gifts, including Christmas, for anyone on your list or even yourself. If you wish to purchase any books prior to the Oct. Meeting, please contact the editor, Marylee Bruneau at 985-3338.

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII file or in a commonly available word processor format, such as WordPerfect 5.2, or Ami Pro 3.0 on diskette to the editor at 9402 Hidden Ridge Place, Tampa, Florida 33637 or send it by modem to BBS (813)239-3704.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

Commercial advertisements will be accepted at the following rates:

	1 month	3 months	6 months
Full Page	$60.00	$162.00	288.00
Half Page	$40.00	$108.00	$192.00
Quarter Page	$22.00	$60.00	$106.00
Eight Page	$12.00	$33.00	$58.00
Business Card	$10.00	$27.00	$48.00

All advertisements must be prepaid by check payable to TPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if it is not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, Marylee Bruneau at (813) 985-3338, for space availability and for further information.

This newsletter is created with Ami Pro for Windows from Lotus Corp. and Corel Draw from Corel systems.

Secretary's Report

MINUTES OF 10/13/93 MEETING and PERSONAL COMMENTS

By: Jim Clark

HE DID IT AGAIN ! I'm not sure how he does it, but our Prez arranged another biggie -- and that's what we had, ANOTHER BIGGIE! It was a great meeting, with the focal point being an IBM presentation on OS/2, Ver. 2.1, and we had a good crowd to enjoy and benefit from the evening.

Having assumed the duties of manning the door, I missed the first 20 minutes of the meeting, and therefore missed a good bit of club and industry news Harvey discussed -- but I didn't miss it all.

CLUB NEWS

➪ Software Reviews: Harvey informed all that the newsletter listed vendor products (mostly software at present) our group had received for review. All members are eligible to participate. The individual benefits because he not only learns new products, but acquires ownership by completing a good review. The group benefits by becoming informed on the latest software. Harvey noted that timely submission of a review on what has now become a perishable product is essential, and those members wanting to participate in the review program must be willing to provide a comprehensive and honest review of the product not later than the agreed time. All members are invited and encouraged to participate. Those desiring to do so should contact Marylee Bruneau, Newsletter Editor.

➪ Education & Information - Principal User Group Purpose: Yes, that is the primary purpose and function of our user group -- informing and educating all of our members on all aspects of using a PC and related soft/hardware, and of new developments in the industry. We accomplish that purpose in a number of ways --through the newsletter, exchanging information at our meetings, vendor and in-house presentations, SIGs, etc. We are adding a new way to this list, and would like to add another:

• Help Line: the last newsletter began implementation of our newest effort -- a "help line". The help-line is a listing of members willing to help other members who might need help with specific software or hardware products. The persons listed need only have a working knowledge of the products and need not be "experts" on the products they are willing to support. All members are encouraged to participate -- since we all need help from time to time, the more we have to help through the help line, the better off we will all be. Those willing to join in should post a note to Marylee Bruneau on the BBS, by telephone, at a meeting, or by mail at the address on the newsletter.

• Tips & Techniques: Harvey suggested we start a section in our newsletter devoted to this subject -- a place where members could share with others in our group hints and tips they have uncovered that they have found helpful in using a particular piece of soft/hardware. We have seen these helpful bits of info in other newsletters and computer related publications. With inputs from all of our members, a tips & techniques section in our newslettershould

(Continued on next page.)

prove very helpful for all of us. Submit your inputs to Marylee Bruneau (or any group officer) via the BBS, or as above.

➪ Fund Raising Ideas: While firm decisions have not yet been made, your Board of Directors have been working toward finding a new meeting location to better accommodate our growing membership. Any relocation will likely require our group to own or rent most, if not all of the computer equipment now being graciously provided by IBM for our use at our general meetings. Yes, we are talking $$$$$ -- and quite a few, at that. We need your ideas and suggestions on ways to raise the funds we will need -- and we need to raise those funds rather quickly inasmuch as we will probably relocate early next year. PULEEEZZEE give your ideas and suggestions to any of the officers listed on page 2 of the newsletter, or message one of them on the BBS.

➪ Up Coming Presentations: Harvey has lined up some more big guns in coming months, including some of our own: Off-line Express and BBS operations in Nov, Computer Associates in Dec, Word Perfect on WP 6.0 in Feb, and CorelDraw in Mar are among them. They are all good -- and beneficial. Don't miss a single one if you can help it; I have found them all interesting and rewarding.

PRESENTATION -- IBM's OS/2, Ver. 2.1

We were fortunate to have Dennis Harison, an expert with IBM on OS2, join us and give a presentation of IBM's OS/2, Ver. 2.1. He gave an excellent presentation on their newest version of their software package, Version 2.1. It is large and very powerful package. An overview of such a program is the most that we could expect in the time available, and Dennis did that superbly well. Just listing the features would take pages, but here are a few of them:

➪ Breaks the DOS 640K barrier. DOS has been the most widely used platform for PC for many years now, and we have been confronted with that conventional memory barrier all that time. OS2 eliminates that barrier and makes all of available RAM and most of the available hard disk space available for use as RAM.

➪ Provides true 32-bit capability, and the list of software being written to take advantage of that capability is growing.

➪ Full preemptive multitasking/multi-threading, with full speed for each. Memory is allocated to programs on the basis of need, up to the limit of RAM and disk space. If one has enough RAM and disk space, OS/2 will support up to 240 DOS sessions, with each allocated a full measure of memory and operating at the same time.

➪ Will operate DOS, Windows 3.1 and OS/2 programs simultaneously in any mix, with the capability to copy information between them all, and provides DDE between Windows and OS/2 applications.

➪ Uses IBM's System Object Model and is truly object oriented.

➪ Fully supports DOS and Windows 3.1 applications and eliminates the need for DOS and Windows, though those systems may be retained if desired.

➪ Can eliminate the current problem of often having to shut down Windows and all Windows applications because of a GPF in one. In fact, IBM recommends that a Windows window be opened for each Windows application you start so that any GPF will cause a problem for only the application in which the GPF occurs.

➪ Uses the High Performance File System which is faster than the FAT system and provides other benefits, such as a maximum of 250 character file name. One problem here at present is that if one uses more than the traditional 8.3 character file name, DOS based systems will not recognize the file.

➪ Includes REXX programming language and the capability to write and modify applications.

➪ Provides full multimedia support, and provides software-only sound and video. It uses three threads to synchronize sound and video. Dennis demonstrated some of the capabilities of OS/2, overall and multimedia in particular, when he operated two multimedia windows simultaneously while running several other applications at the same time, all of which operated at full speed. And, OS/2 includes the tools needed to write Ultimedia applications.

➪ Supports and uses True Type and Adobe Type I fonts.

That scratches the surface of its many features. Well, what does it take to use all that power? Start with a 386, preferably with a 40 MHz board, though a slower board may be used. OS/2 will operate with 4 MB of RAM, but 8 MB or more is recommended. Hard disk space between 15 and 30 MB, depending on the features you load. It provides support for just about any popular monitor or printer.

And what does It cost? OS/2 lists for $149, with a $99 tag for a DOS/Widows upgrade -- and that includes just about everyone. You can find street prices several dollars less. For the kind of power you get, that is a pretty darned good buy.

One member raised a question of how to determine compatibility with OS/2. Dennis gave a number of sources and way to determine that, including the IBM forum on Compu-Serv, the IBM BBS, and contacting IBM directly. A side bit of info, recognizing that many people are now using disk compression programs: The only compression program that I have heard of so far that supports OS/2 is Stacker. There may be others, but I know of some that do not. Check it out.

To IBM, MANY THANKS for lending us Dennis and for the programs you donated -- you have been very good to use right along. And, Dennis you gave a superb overview of a super program and we are in your debt. THANKS MUCH!

AND THE WINNER IS:

Thanks to the generosity of IBM (who donated 5 copies of OS/2, Ver. 2.1), our illustrious Prez who secured some other goodies for us during his travels, along with the 50/50 cash drawing, there were some very nice raffle prizes. Those among us to have the good fortune to win are include:

D.A. Clary	OS/2, Ver. 2.1
C. Kincaid	OS/2, Ver. 2.1
Wil Goble	OS/2, Ver. 2.1
Jim King	OS/2, Ver. 2.1
Steven Atran	OS/2, Ver. 2.1
M.N. Martinez	Fastlynks 2 software
Gary Peterson	Mentor Notes
Tom Hoffe	$81

In addition, 5 folks won T-shirts, 3 folks won computer City mouse pads, and 10 folks won a book on OS/2. Add all of that up and you come up with some 26 door prizes. WOW !

The meeting adjourned at about 9:20 PM. ◆◆◆◆

PRESIDENT'S COLUMN:

By: Harvey Bruneau

Yes it's that time again! Time for nomination of your 1994 officers. The positions include President, Vice-President, Treasurer and Secretary. Just as important are the volunteer positions. These are volunteers approved or appointed by the elected officers. They include Member at Large, Editor, SYSOP, Membership Director, Education Director and Librarian. Of course we need additional volunteers to help out in the areas of public relations, marketing, corporate accounting, SIG (Special Interest Group) leaders and the members help line. If you know of someone that would make a good elected officer, nominate them either through the mail, BBS or at the November or December meetings. You can even nominate yourself for any of the four positions. If you want to help out as a volunteer in any area please notify an officer.

My thanks to Dennis Harrison and Brad Brown of IBM for a great presentation. Dennis showed enthusiasm and a strong dedication to the OS/2 product. His product knowledge and the capability to demonstrate it was exceptional.

If you want to learn more about the use of the BBS, the off-line mail reader from Mustang Software and modem basics, come to the November meeting. Our SYSOP, Kevan Sheridan, will demonstrate all of these features in an open forum environment.

WordPerfect has joined the ranks of companies implementing a fee for support policy. Although this applies to corporations, free support will still be available to individuals.

Several good ideas were presented to me for collecting funds to purchase equipment needed for presentations. Currently we are selling coupon books (entertainment '94) to generate some funds. You do not have to wait until '94 to use them, you can start using them immediately and the are good until Dec. '94. The coupon books allow you to save up to 50% at restaurants, hotels, special events and more. This includes discounts for car rental, airline tickets, movie tickets, golfing, bowling, dry cleaning and enough other items to fill several pages of this newsletter. With the coupons you can more than recoup your $30 investment in a very short time. You can make good use of these books during the holidays with your family and friends. Frankly if you're not interested in saving money these coupon books may not be for you. However, you can buy the books for gifts to others. If you would like to buy some of these books, bring your checks or cash to the next meeting. You can also call Marylee at 985-3338 to order books. Part of the proceeds of these books are going back into our group. If the coupon books are not for you, then how about bringing some of your friends to our meeting and getting them signed up as members.

A big thanks to those of you who volunteered your time to help fellow members through the membership help line.

FRIENDS OF THE USER GROUP:

We acknowledge the following firms for their support

- **Computer City** ◆ **CompUSA** ◆ **IBM**
- **PC Warehouse** ◆ **Software Review** ◆ **Staples**
- **Custom Computer Wholesale** ◆ **ExecuTrain**
- **Sunrise Computer Supplies & Parts**

We also acknowledge the following national software vendors for their excellent demonstrations and contributions of evaluation software to our group:

- **Access Software**
- **Borland**
- **Corel Systems**
- **GeoWorks**
- **WordPerfect**
- **Microsoft**
- **Lotus Corp.**
- **Symantec**
- **Traveling Software**
- **Software Publishing Corp.**

Software Review:

SuperStor PRO Version 1.01

Review By: Jim Clark, Tampa PC Users Group

What It Is: SuperStor PRO (SStorPro used hereafter) is, as the name implies, a disk compression program by AddStor Inc. It has been a competitor in that software niche for some time, competing with other well known disk compression utilities, such as Stacker, Double Disk and now DOS 6.0. SStorPro is the Windows version of the utility and has been around about a year now. SuperStor (SStor) is the DOS version, which has been around for several years. Functionally, there is little difference between the DOS and Windows versions except for the interface features of the Windows version. Hence, if you are familiar with the DOS version, you will have no difficulty using the Windows version; you will have to adjust a bit, though, in a couple of areas discussed later in this review where WYSI not WYG.

Compression Ratios & Speed: All of the compression programs talk in general terms about doubling capacity, but compression ratios really depend on the kinds of files being compressed. Data base files can be compressed by a factor of as much as 8, while ZIP files can't be compressed further, with .EXE, .TXT and all of the other types of files falling somewhere in between these two extremes of compressibility. I have 3 compressed logical drives, with actual compression ratios of: 1.51, 1.71 and 2.11 only one drive achieving the touted double capacity. My ratios result from a lot of ZIP files on the lowestratio drive, a lot of compressed .TIF files on the middleratio, and mostly programs with a lot of True Type fonts

(Continued on next page.)

(Continued from previous page.)

on the best drive. I store very little of my program output files on hard drives; thus, my compression ratios are fairly low on average. If you store text files, database files and other output files on your hard disk, you are sure to have higher compression ratios than I.

I have not used other compression programs, so I do not have a good basis for comparison. However, I was changing hard drives about the time DOS 6.0 was first released. In the process of changing over, I took the opportunity to load DOS 6.0 and try its Double Space utility on one drive. I then reformatted and reloaded that drive (because Double Space does not provide for uncompressing) and installed SStorPro. The compression ratios on that drive were almost identical. Most articles I have read of tests of SStorPro and other compression utilities show a somewhat better compression ratio for SStorPro's most popular competitors. SStorPro is also shown as slower than the best at initial disk compression. On the other hand, some of these test also compared speed of normal computer operations, and SStorPro showed a somewhat faster speed in normal operations than the others. One must make a choice, then, which is most important in circumstances one is likely to encounter now and in the future. If you are running a 486/66, relative times and speeds of the compression programs pale in significance, but if you are running a 286/10 they become much more noticeable and loom larger in importance.

Many reports I have read by the "experts" indicate that disk compression programs can actually improve the speed of computer operation. The rationale here is that the slowest operation on the computer is reading/writing to disk. The compression programs reduce the size of the files and while compression/decompression of files takes time, that time can be more than offset by the reduced size of the read/write. As a practical matter, I have not noted a degradation nor improvement in speed of operation resulting from using SStorPro. I have ran it on a 386DX/25 without motherboard cache, and with a 386DX/40 with 128K cache. Where I do notice an impact on speed is in loading programs to the hard drives here the loading time is increased significantly. But then, one does not load programs all the time. Reports do indicate that the slower the computer, the more one is likely to see some degradation of operations as a result of disk compression.

Features:

In addition to the features mentioned elsewhere in this review, SStorPro offers:

Transparent operations once installed and will not affect the way you use your computer.

A recompression utility that will improve compression after initial installation by about 10%., and sometimes up to 25% depending on the types of files involved

Support for Windows swap file without necessity to create a separate uncompressed drive.

Loading about 80% or more of its driver in upper memory, leaving only about a 10K or less footprint in conventional memory.

It does not create a separate disk identifier especially for a SStor PRO disk. Some compression programs assign a drive letter for the DOS drive and one for the SStor PRO drive created on the DOS drive. For example, I run 3 compressed logical compressed drives and 1 uncompressed drive. One compression program created a total of 7 drives that I had to deal with, 3 of which were unusable DOS drives, while with SStor PRO I have only the 4 drives I actually use.

Universal Data Exchange (UDE) support for removable storage media (floppies, Flopticals, Syquest and Bernoulli) that can be read and written to in computers that do not use SStorPro.

Utilities available in both DOS and Windows, though the Windows utilities are limited to information, and preparing and mounting disks; disks maintenance can only be accomplished from the DOS utilities.

Utilities to shrink and expand compressed disks, but expand is functional only on compressed disks that have previously been shrunk. That also means that a compressed disk cannot be expanded beyond its original compressed size.

Selectable compression ratios that are used only for estimating remaining usable disk space. This is often a confusing area. The program compresses in the same manner all the time regardless of the compression ratio you select, but uses a standard compression ratio (2:1) for estimating remaining usable disk space unless you tell it at the time of compressing any given disk to use a higher ratio (up to 8:1). The average user will want to use the standard 2:1.

An "uninstall" utility. When invoked, it defrags the disk in question, shrinks the compressed area to a minimum, copies files from the compressed area to the uncompressed area, shrinks, and so on. However, one must have a large amount of unused space on the disk to begin with or there will not be enough space to decompress the entire compressed disk, the amount of space depending directly on the actual compression ratio of the disk. The manual advises to backup your files prior to using this utility.

As a bonus, Optibase's JPEG & MPEG Image Compression program is included as a separate program. This Windows program allows compressing 824 bit color and greyscale images by up to 95%

Things It Won't Do:

One should be aware that there are limitations with the program and things it will not do. Among them are:

Disks compressed by other compression utilities cannot be converted to SuperStor disks.

As noted above, SStorPro uses a standard or userselected ratio for estimating remaining usable disk space instead of projecting on the basis of the actual ratio of the existing compressed area. In my case, this means that the remaining space figures shown by the program are high. The only way I can get a realistic estimate is to apply the compression ratio of existing compressed files on any given drive to the actual unused physical space on that drive. The unused space figures you see at the DOS prompt (i.e., with DIR or CHKDSK commands) are even more distorted. The unused physical area of one of my logical drives is 24.5 MB, for example. Using the existing compression ratio for the files on that disk, that unused space would hold 41.6 MB. SStor Pro, however, shows 49 MB available, while DOS shows a whopping 62.7 MB of space available. (Continued on next page.)

(Continued from previous page.)

SStor Pro is not compatible with some software, partially or totally. Among those are nonMS/PC versions of DOS, which require some special treatment when using SStor PRO. More significant is that it is incompatible with OS/2. And, still more important, the manual says that SStor PRO is incompatible with a number of utilities in Norton Utilities (including Speedisk and NDD, both of which I have used on SStor drives without difficulty) and PC Tools Deluxe. You should check the incompatibilities (several pages in the manual) and/or with AddStor to see if they would have any affect on your computer.

Installation:

Installation seemed fairly easy, though the documentation was confusing at first. While SStorPro is labeled as a Windows Program, the program is actually installed from the DOS prompt and the manual states in one place that it may be used on a DOSonly computer. I installed it when Windows was not loaded on my computer and it worked just fine in DOS. In fact, most of the major utilities must be used from the DOS prompt. It would seem, then, that SStorPro is the DOS program with Windows interface supplements.

It comes on one 3.5" DD or one 5.25" HD floppy. During the installation process, you will be given the opportunity to compress any or all of , but compression may take place later if desired. Installation of the program is fast, but compressing the disks could take some time, depending on the volume of files to be compressed and the speed of the computer and hard drives. The program automatically defrags the files when converting and compressing a DOS drive to a SStor drive; this accounts for some of the time required for initial compression. The installation program automatically makes entries in the CONFIG.SYS file to load SStor Pro at boot, but you will have to install whatever switches you desire yourself.

Documentation: There is adequate documentation, but I did not find it easy to read and comprehend at first. In fact, it has much about switches and keyboard/AUTOEXEC.BAT commands that one is not likely to use in normal use. However, if there is anything about your computer that may require some adjustment to SStor Pro, or if you do not want one or more of the default features of the program, you will have to wade into the documentation about switches. I do not compress floppies, for example; this requires two /NOAUTO statements on the SStor driver line of the CONFIG.SYS. If these circumstances do not apply to you, then you can do just fine reading only that pertaining to installation (which is automated) and what the commands in the dropdown menus do. Help is also available online in the DOS utilities and the Windows utility.

Requirements for the program are: Any IBM PC or compatible with at least 640K of conventional memory, with 512K available after DOS is loaded. (This doesn't seem very realistic. SStorPro uses about 50K of memory for itself which would reduce the available conventional memory in a computer that cannot use upper memory to an unacceptably low level.) MS/PC DOS 3.2 or later, or DR DOS 5.0 or later. At least one floppy, and a hard disk with at least 2 MB of space available. The manual mentions nothing about monitor. I still use a Hercules monographics card for my amber monitor. Works fine, except I do not see the entire screen when using the Windows utilities; inconvenient, but not unworkable.

Cost: The list price of SStorPro is $149.95. As with most software, the street price is considerably lower. I have seen it advertised in flyers and catalogs for as low as $49.95. So shop around for the best price.

My View: I would like to see some of the shortcomings mentioned above corrected, of course. But overall, the program has done the job for me. I have contacted AddStor technical support a few times and have had reasonably good support from them. At its relatively low street price, SStor Pro is a pretty good buy and certainly worth consideration if you are looking for a disk compression program.

Software Review:

STACKER 3.1 FOR WINDOWS & MS-DOS 6.0

By: Floyd Thrower, Tampa PC User's Group

REQUIREMENTS:

Stacker 3.1 for Windows & DOS is specifically designed to work with MS-DOS 6. MS-DOS must be running on your system to use this version of Stacker.

640 KB RAM for installation.

For resident Stacker Device driver after installation:

44 KB RAM without EMS.

26 KB RAM with EMS.

At least 2.9 MB on hard disk to load SETUP.

EXCELLENT COMPRESSION PROGRAM

Stacker safely doubles your disk capacity. The compression is now being embraced by the operating system manufacturers and it is easier than ever to compress files on your system. With Stacker 3.1, you get all of the superior benefits of Stacker, plus complete integration with the operating system. *If you have DoubleSpace drives, Stacker automatically converts for you.*

INSTALLATION:

The installation of Stacker 3.1 can be installed from DOS or from Windows. The installation from Windows was straight forward. Documentation was very clear on both the source diskette envelope and in the Stacker 3.1 Supplement for MS-DOS 6 manual. The User Guide that is in the package is the same as for Stacker 3.0.

I had used Stacker 2.0 prior to installing MS-DOS 6.0. I backed up my hard disk on tape, reformatted the hard disk, and installed MS-DOS 6.0 complete with DoubleSpace and MemMaker. 25% of the free space on my hard disk was no longer available.

My system is a 486-DX, 8 meg RAM, 110 meg hard drive, 2 HD floppy drives, and 1 CD-ROM drive. Display is VGA.

(Continued on next page.)

(Continued from previous page.)

BEFORE Stacker 3.1 installation,
Specifications were:

Bytes-total disk	211,525,632
Bytes-3 hidden files	90,112
Bytes-143 Dir.	1,187,840
Bytes-4,607 user file	186,818,560
Bytes-available disk	23,429,120
Bytes-ea. alloc. unit	3,192
Total alloc. units	31,004
Available alloc.units	3,043

AFTER Stacker 3.1 installation,
Specifications were:

Bytes-total disk	207,773,696
Bytes-4 hidden files	147,456
Bytes-144 Dir.	1 ,196,032
Bytes-4,665 user file	189,865,984
Bytes-available disk	16,564,224
Bytes-ea. alloc. unit	3,192
Total alloc. units	31,004
Available alloc.units	7,663

After Stacker 3.1 completes DoubleSpace conversion, Recompression by using "Restack" allows the best and safest data compression possible.

While it is not necessary to Restack, extra safety and typically an increase in compression of 10% or more is possible.
AFTER "Restack",
Specifications were:

Bytes-total disk	225,771,520
Bytes-4 hidden files	147,456
Bytes-144 directories	1,196,032
Bytes-4667 user files	189,882,360
Bytes-available disk	34,545,664
Bytes-ea. alloc. unit	8,198
Total alloc. units	31,004
Available alloc.units	7,661

The increase on my system was 17,981,440 bytes available.

WHAT IS NEW IN STACKER 3.1?
FULLY INTEGRATES INTO THE OPERATING SYSTEM.

When you start computer, Stacker loads first as an integral part of the operating system.

Prior to MS-DOS 6, system would read hidden operating system files and then look for and process its configuration files, CONFIG.SYS and AUTOEXEC.BAT. Stacker's setup modified these files so the computer could access the compressed data on the hard disk. For safety reasons, these files were stored in two places -- on the uncompressed boot drive and on the compressed Stacker drive.

Now, with Stacker's complete integration into the operating system, when you start your computer, DOS looks for a Stacker-aware file called DBLSPACE.BIN. This file looks in root directory of the startup drive for a hidden configuration file called STACKER.INI. Once this file is detected, the system loads and puts Stacker in place. This happens before DOS reads CONFIG.SYS and AUTOEXEC.BAT files. There is no need to keep duplicate copies of these files.

AUTOMATICALLY CONVERTS DoubleSpace DRIVES & CHECKS FOR SAFETY.

Stacker automatically converts any existing, mounted DoubleSpace drives to Stacker drives during Setup. During conversion, Stacker can run a base level safety check of any existing data. And, you can Restack to add full Stacker safety to all data.

Any new data automatically gets the full safety advantage of Stacker.

USES STANDARD DOS COMMANDS.

On Stacker drives, you can use common MS-DOS commands to receive compression information, i.e.: DIR, CHKDSK, DEFRAG.

PROVIDES A NEW, MENU-DRIVEN STACKER OPTIMIZER.

The new Stacker OPTIMIZER provides menu-driven choices for selecting the drive, optimizing type, and sort order.

It defragments and organizes the Stacker drive for optimal performance.

ADDS STACKER INFORMATION TO WINDOWS FILE MANAGER.

Setup adds the Stacker menu to the File Manager.
A pull-down menu enables a selection of:

FILE INFO - to view compression information.
DISK INFO - to display the kilobytes used and free for the entire disk.

PRODUCT SUPPORT

CompuServe to exchange ideas & information with other users. Bulletin Board for product information and answers to frequently asked questions. STACFAX for up-to-date "tech-notes" on various subjects. Phone calls are toll calls to Technical Support 8-5 PST.

PRICING:

Upgrade is about $20.00/ New User street price, $89.00
Stacker 3.1 is a product of: STAC ELECTRONICS, 5993 AVENIDA ENCINAS, CARLSBAD, CA 92008

REMINDER:
ENTERTAINMENT '94 BOOKS WILL BE SOLD AT THE NEXT MEETING. THEY ARE $30 AND MAKE EXCELLENT GIFTS FOR CHRISTMAS OR ANYTIME. HELP SUPPORT YOUR GROUP, BUY ONE OR MORE AND SAVE, SAVE, SAVE, WHEN YOU DINE OUT, FAST FOOD, MOVIES, BOWLING, GOLF, CLEANERS, CAR WASH, ETC.....!

GAME REVIEW:

LINKS 386 PRO - VIRTUAL GOLF

By: Matt Nicholson, Tampa PC Users Group

LINKS 386 PRO is as almost as realistic as playing the game. The only difference between the two is that with LINKS 386 PRO, you can't smell the grass, and you can't play "polo golf" with your buddies on the carts. On the other hand, you don't have to wait your turn to play on the hole, and you don't have to get up at six-thirty Sunday morning to beat the other hundred people waiting to play. Oh, yeah, you also have to mix your own drinks, when playing LINKS 386 PRO.

What does make this game worth buying is that you area puppet master, controlling some miserable sot while you're in your air-conditioned office, sipping on an iced tea. Links 386 pro boasts SVGA graphics with full animation of all shots made. You can rotate your puppet 360 degrees, and the program will calculate all the scenery, according to your position, and how far to the left or right of the flag you're facing. To further increase the visual stimulus, LINKS 386 PRO features custom display configuration. This allows you to choose what views you want to be displayed i.e.: Lie view, Green view, Map, and the Score Card can be displayed at once, as well as a few other views, but no more than four at a time. Also, there are forward and reverse replay cameras, and spectacularly luck shots can be recorded, saved and replayed for your personal pleasure.

LINKS 386 PRO supports Sound Biaster, Sound Biaster Pro, and Ad Lib, with a full complement of sound effects, nature sounds, and in-flight and postshot commentaries.

In addition, the Harbour Town golf course is packaged along with LINKS 386 PRO, which is, on a difficulty scale of one to ten, it's about an eight. Many other popular championship golf courses are available from fourteen to eighteen dollars, depending on where you go. The Innesbrook course in Tarpon Springs, Florida was put on the shelves around the end of September. If you already have the old version of LINKS, don't throw the old courses out because a conversion utility is also in the LINKS 386 PRO package. Most of the courses were designed for the original LINKS, but are compatible with LINKS 386 PRO and even MICROSOFT GOLF. All courses can be accessed one hole at a time, to be used for practice. Previously recorded players, which are included with each new LINKS 386 PRO course (but not on the original courses) or recordings of your games, can be used as additional players at any time.

The equipment LINKS 386 PRO requires is a 386/16mhz CPU or higher, 2 MB RAM, 18 MB hard disk space, about 5 MB for each additional course, mouse, SVGA graphics card (VESA compatible) capable of at least 640x400 in 256 colors. A 386/33 or higher, 8 MB of RAM, and 1024x768 resolution is definitely recommended.

LINKS 386 PRO is the best golf simulation on the market and is a definite must-buy, even for the people who still prefer to sweat it out on a real course.

Software Reveiw:

Lotus Organizer 1.0

By: Steve Hess, Tampa PC Users Group

Intro and Disclaimer

This is a review of the kinds of computer based "personal information managers" (PIM) I have available, and how they may be used to operate on the computer desktop, or in the Filofax © or Dayrunner © portable book format. I should point out, for a long time I avoided simple computerized checkbook record keeping, as it seemed to me that the most appropriate technology to balance a checking account is a pencil and the record book supplied. As the computer personal finance systems became able to handle more accounts, track investments, and export data to tax software, the benefits became worth the extra work. This is the yardstick I would like to use with the PIMs' reviewed here. Are the benefits worth the extra hassle? What information would you need to choose a PIM? And would you buy a used car from this Author?

Purposes of PIMs

The usual purpose is to keep some kind of personal records, and access them at work, to do your job. From this basic idea, come the major divisions in PIM types.

Single Use Applications -

For example, telephone dialers abound. I have used the Metz Phone © shareware appiication, for its simple interface and rugged modem acquisition. This program allows storage of some address information, keeps track of the last time and date you called each number, and allows notes on each phone number listed. Its drawbacks include crude control of printout, and no export of the notes, although it will put out the names and numbers into a Sidekick file. Also, no import functions. Merging with another file simply doubles duplicate entries. This is a problem if you intend to merge an "Office" and "Laptop" phone list. Most single use applications are awkward if you ever build them up, then try to export the data to another program format.

Integrated Function Applications -

The Granddaddy of this category for DOS is Borlands Sidekick©, which combines the Address book with Calendar functions. It also includes a memo writer, that uses the computer as a typewriter, does simple mail merge, and a phone list that will dial a number from a listing. Its advantages include a calendar merge feature that allows multiple files to be kept, and merged without doubling up entries. It's disadvantages are mostly because its a DOS app, and the popup feature won't work in Windows©. The version I have, 2.0, is networkable.

Database Applications -

Many people found that there were functions that were needed in their personal PIM, that were not supplied by the vendor. Users had fields labeled "something" and had to remember that field is for "something Else". Frustration led to

(Continued on next page.)

(Continued from previous page.)

people designing their own database structures, using flat files like Q and A©, or relational databases like Microsoft Access©[1]. Their success is related to the skills of the users.

Special Purpose Applications -

Some applications have great use for particular professions. Sales staff can readily use a "contact manager" to help coordinate a telephone presence, like the "tickler" system of personal reminders. Names are kept with phone numbers, subjects last discussed, appointments, and even the names of customers' children can be recorded, for that impersonally personal touch. Most integrated applications can track this kind of information, to some degree.

I will explain the Lotus Organizer© in detail. It installed fine, using about 1.5 MB of disk space, and some of that I cut down to about 1 MB for a laptop application, by removing the tutorial. I even cut the help files, (*.HLP) as I really need the space. The interface on screen is similar to a Dayrunner© book, with some Icons, Smart or not. There is the advantage of having multiple sections, if for example, you need two calendars. There is an Address book, that contains phone number records, and a phone log that can be used to note phone calls incoming or outgoing. The only thing I thought was odd, was the dialing is done by drag and drop, or cutting and pasting the phone number into the dialing dialog box. Other applications work by simply pressing a button marked "Dial". The planner section won't win raves if you use something like TimeLine©, but is adequate if you want to schedule vacations or trips in a graphic calendar "Year at a Glance". There is an anniversary section, that rolls over from year to year, but they ought to include an alarm function, for guys like me that cannot remember my wife's birthday. The ToDo section is linked with the calendar so that items roll from day to day until they get marked as complete.

Printing is in the typical calendar layouts for Dayrunner, Filofax, etc, which is awkward on tractor feed paper. (The paper size does not match) I bought a paper punch, that (sort of) lines up with the six clip notebook. It will punch the calendar pages, and phone number lists I print out. I hate the scissors work involved, so perhaps the answer is to buy a Dayrunner© in a three hole size.

I am not a typical PIM user, as I do not sit at a desk and work with a computer on all the time. Alarm functions, and appointments are of little use to me, as most of my work is done from a laptop, only on when I am actually doing something on it. The Lotus Organizer© contains a neat appointment control, that has a gauge on it that meters the time assigned, as you drag it longer. I can see the ease of use if you have to enter daily appointments. The reason I need to have a PIM is that I bill hourly for my contracting work, and buy parts and equipment from a large list of obscure suppliers I have gathered over the years. For this reason, the features I concentrated on involve importing and exporting the address and calendar information.

In this case, I was pleasantly surprised at the sophistication of the database management of the Lotus Organizer©. There is a utility that compacts the database, by removing deleted links and records, included with it. Import and export are in a Comma-Seperated-Value format, with a field linker that can re-assign the field orders, and not worry about empty fields.

I was using the Windows applet Calendar, for saving my billable time, and the Metz Phones© application for saving my phone number info. Other stuff was saved in a Works for Windows© flat file database, with more stuff in a Microsoft Access© database. I simplified this kind of thing, by combining the information into a single Organizer, and an Access database for more complete info, exportable into the Organizer.

To convert the Calendar applet files into something usable was a trick I would not like to play very often. You need to set the applet printing to a file with the connect feature in the printer control panel, and then take the print output file into a series of passes of "search and replace" to produce a comma-seperated-value (CSV) file. A CSV file has the fields separated by a comma, and the records separated by a carriage return. I did about 300 date records in a couple of hours, and imported that into an Access table, then appended the Metz Phones and the Works for Windows data into the same table, deleted as needed, and exported as a CSV file. The Lotus Organizer was able to use it's import feature to place the Date in the Date field, Name in the Name field, etc. As I enter new information, I will export the file from the Organizer the same way, and pick it up in the Access application that is my invoicing system. I wish there was a way to export only the records between a couple of dates, but it is quite simple to delete the unwanted records from a temporary table, before merging into the main Access table.

Conclusion: A PIM is only good if it can save time, save typing multiple entries, or enable lookup of information better than a paper record system. I had built several small uses, and wanted to integrate them into a space and cost efficient filing system, which the Organizer seems to fulfil. I would recommend sticking with smaller, easier to use specialized applications, until the stuff you need to save or the types of information grows to the point of "jumping past" the simple integrated applications. At that point, save yourself the trouble to learn and buy the software you will outgrow, and cannot re-configure. You could then get something with some real database power, as a master filing system, and something with an importable, easy to use front end like the Lotus Organizer©.

(See Products Comparison Table on next page.)

[1] Yes, I realize pure relational database users will not consider Access© truly relational. I am just not very pure.

Application	Features	Ease of Use	Import/Export	Change of Structure	Equipment Needed
AnyTime© from Individual Software	Calendar, Appointments, Planner, print to portable planner books. Good print quality	Fair, but not for use with some laptops. Color scheme not suitable for VGA mono LCD displays, company disinterested in assisting. Offered me my money back.	None	None	DOS- 640 K (Uses a lot, so not too many drivers allowed.) Says Windows Freindly, but UAE'd mine.
Sidekick© Ver 2.0 from Borland	Calendar, Appointments, Planner, Print to portable planner books, Phone lists, Memo writer, Mail Merge.	Good, unexciting stable performer.	None	None	DOS - 640K (Has a pop-up resident module, but won't pop up safely over everything)
Microsoft Access©	Anything you can build, and excellent methods to import info from another app. Access 3.1 comes with a sample PIM from a vendor, that has many features.	Requires actually building the app. I use a "calendar to invoice" application, where I track billable time, then print a report that is in the typical invoice form. I had been using the Windows Calendar on the Laptop, to record the data, and then reenter on the desktop unit.	All the usual forms of file and table import, CSV, Fixed length, DBIII, DBIV, SQL, BTRIVE, Foxpro, Lotus, etc.	All kinds of changes can be added if you need to later.	Windows 3.X in enhanced mode, and at least 14 MB disk space recommended. Any Windows printer and monitor, Mouse
Metz © Phones	Phone list, notes and phone log features.	Works well, and has agressive modem control. Easy use.	Exports Sidekick© format.	None	Windows 3.X in either standard or enhanced mode.
Lotus © Organizer	Phone/Address book,w/log. ToDo list, Anniversary and Calendar with alarms, notepad.	Many features, needs time to learn to operate, but not nearly as much as Access©, where you are building the applications.	Imports and exports CSV, with a field assignment that is flexible.	Some, you can add multiples of it's internal use types.	Windows 3.X in enhanced mode, 1.4 MB. Windows monitor, printer and mouse.

The Norton Commander 4.0: A Great Toolbox

Reprinted by permission of PC World from Volume II, Number 11, Copyright @ 1993.

If you wish you had all your utility programs for file and directory management, file compression and decompression, graphics viewing, and even text editing in one spot, version 4.0 of The Norton Commander may be what you're looking for. This release includes a raft of new and enhanced capabilities that simplify many tasks.

You have plenty of low-level power, control for advanced activities, and a friendlier DOS interface. The list of new features for version 4.0 is long. Copy, move, or delete entire directories in one swoop, including any subdirectories with files. Transfer files and/or directories from one system (with The Norton Commander installed) to another (that doesn't have to have The Norton Commander) by using the machines' serial or parallel ports. Search for specified text in Find File and get system and memory information with a point and click.

You also can use Norton Mail for MCI Mail sessions. Set up your account number, telephone and modem parameters, and address book. Prepare messages, log onto MCI Mail, and Norton Mail sends your messages and receives any mail waiting for you. I found the View function especially handy for looking at image files. No more fiddling with PC Paintbrush to view PCX and BMP files. Use the Tree function to select the directory and file, and click View.

Version 4.0 of The Norton Commander lists for $99. The main thing to remember is that you're not buying a single extraordinary feature. The considerable advantage of The Norton Commander is the sum of its parts: You get easy access to a broad selection of well-integrated tools and utilities.

—Gene Smarte

Norton Commander 4.0 - Be more efficient in your DOS environment with this feature-rich DOS shell and utility program.
Symantec 800/441-7234, 408/252-3570, 408/255-3344 (fax) List price: $99

WELCOME NEW MEMBERS:

Ellen Rogers

We are very happy to have you as members!

Advertisements in the *Bits of Blue* are another source of revenue for our group. If you work for a company that could possibly benefit from an ad placed in the newsletter, please bring the rates (inside cover) to the attention of your marketing manager. Remember the Bits of Blue advertising reaches 250+ users with purchasing power.

When you ask for advice, people know nothing, but when you try to tell them something, they know it all!

BETA TESTERS NEEDED...

...for a to-be-marketed Windows 3.1 product. This product is a generic knowledge evaluation ("quizzing") mechanism, which can be run either from a configuration program, or remotely from a CBT program using DDE.

I NEED PEOPLE WHO KICK DOGS AND MAKE BABIES CRY! If this thing can be broken, I want to find out about it yesterday.

SPECIFICALLY: You will be testing components of Version 2 of the Marc Staley Software Lab Quiz Engine. Components ready for immediate testing are: the quiz configuration program; the quiz engine; the tutorial.

Persons helping me will receive (free) the final product; the Quiz Developer's Kit; and "special interest" quizzes if you want them: USAF: PFE-92. Boaters, skippers; several (call).

Min machine 386DX-25 w/4MB, VGA, 2MB HD space, Contact Marc Staley, (813) 634-4675

MEMBERS HELP-LINE

The following phone list is provided for our **Tampa PC Users Group** members in an effort to establish local support for those frustrating times which we have all encountered while using our PC's. Please note that these are members that have volunteered to help you, treat them in a courteous manner. Be sure to ask if it is convenient for them to help you now, or if you should call another time. It would also be helpful to have your documentation and have it handy when you call. *(Don't expect help if your software is an illegal copy or you do not have documentation!)* **TPCUG** is not responsible for the information or advice provided by volunteers. Volunteers may or may not be experts in the subject matter. You are on your own with any advice received. Be aware also that some of these volunteers may be consultants in their area of expertise. If you are interested in volunteering to answer members questions, either leave a message on the BBS or fill in the forms provided for this purpose at the meetings.

A Monthly Publication of the

Tampa PC Users Group, Inc.

BITS of BLUE

Vol. 6 No. 12 December, 1993

MEETING

(2nd Wednesday every month)

DATE: December 8, 1993
TIME: 6:00 PM
PLACE: IBM CUSTOMER CENTER
LAKE POINTE ONE BUILDING
3109 W. Martin L. King Blvd.
Room 450
DIRECTIONS:

The Tampa IBM PC Users Group meets in the IBM's LAKE POINTE ONE Building across from Tampa Bay Mall one block east of Tampa Stadium.

The best entrance is on Martin Luther King Blvd. at the traffic light in front of Burdines. As you turn North off Martin Luther King Blvd. you will see the LAKE POINTE ONE BUILDING on the left & parking on the right. Join us in ROOM 450 - 4th floor. **Guest please sign in.**

DECEMBER 8TH AGENDA:

6:00 PM - opening remarks
6:30 PM -
askSam for Windows
-free form database, makes managing information as easy as using a wordprocessor.

Demo by: Phil Schnyder, President of askSam Systems

7:30 PM - Break
7:45 PM - Open Discussion
Door Prize Raffle -
askSam for DOS & |Windows
and Miscellaneous items

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII file or in a commonly available word processor format, such as WordPerfect 5.2, or Ami Pro 3.0 on diskette to the editor at 9402 Hidden Ridge Place, Tampa, Florida 33637 or send it by modem to BBS (813)239-3704.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

Commercial advertisements will be accepted at the following rates:

	1 month	3 months	6 months
Full Page	$60.00	$162.00	288.00
Half Page	$40.00	$108.00	$192.00
Quarter Page	$22.00	$60.00	$106.00
Eight Page	$12.00	$33.00	$58.00
Business Card	$10.00	$27.00	$48.00

All advertisements must be prepaid by check payable to TPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if it is not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, Marylee Bruneau at (813) 985-3338, for space availability and for further information.

This newsletter is created with Ami Pro for Windows from Lotus Corp. and Corel Draw from Corel systems.

Secretary's Report

MINUTES OF 11/10/93 MEETING
and PERSONAL COMMENTS
By: Jim Clark

'Twas an interesting and informative evening. It was unfortunate that the turnout for the meeting was relatively small. It may be because no vendor presentations were to be given. If that is the reason, those that have that as a criteria are, in my judgment missing the boat. Oh, I most often enjoy and benefit from vendor presentations and look forward to them, but I learn a lot more every day useful information, on average, from presentations from members of our own group. Their presentations are more from a user's standpoint and cover subjects I have a direct and continuing interest in. Often, as was the case at this meeting, there is more time for exchanges of problems/solutions, techniques, tips, etc., among our own group. That is the real reason I joined the group. Plus, we had some important user group business needing attention.

CLUB NEWS

⇨ Nominations: Our illustrious Prez stressed the need for members to help the user group by volunteering to undertake and expand the activities of the group to the benefit of us all, either as elected or appointed officers, as SIG organizers, to help develop and implement ideas to raise funds for our impending move, or in many other ways help make this an ever improving user group. He noted that most of the Board of Directors had served for a number of years. Our Articles of Incorporation and present By Laws provide for four officers elected by the membership President, Vice president, Treasurer, and Secretary with all other officers appointed by the elected officers presently Director of Education, Editor, Librarian, SYSOP, and Membership Director from volunteers for those positions. Tom Cone carries a very heavy load for our group and now occupies three positions Vice President, Treasurer and Membership Director because no others would volunteer to fill them. He would like to trim his load by at least one position VP, noting that the present situation limits the breadth of the BOD by two views. Our group can be no better than what we as members put into it. You know, GIGO. Sooooo, PULLLEEEEZZZZ make yourself available for any of these positions and in any other ways that could be useful to the group.

The following nominations were submitted:

President	Harvey Bruneau (incumbent)
Vice President	Michaline Ostrowski
	Don Patzsch
	Al Poole
Treasurer	Tom Cone (incumbent)
Secretary	Jim Clark (incumbent)

The December meeting is a VERY IMPORTANT MEETING Election of officers. Nominations will be open until the election begins. Nominations may be submitted by the BBS, by mail to one of the present officers, or in person at the next meeting. If you are interested in serving in one of the elected positions, YOU MAY NOMINATE YOURSELF and you are encouraged to do so. If you will help in any other way, please contact one of the officers. (Continued on next page.)

(Continued from previous page.)
