Software Review

Microsoft FrontPage 97

by William LaMartin, Editor,
Tampa PC Users Group

FrontPage is made up of two complimentary applications: FrontPage Explorer and FrontPage Editor. FP Editor is used to create the HTML pages that make up your site, and FP Explorer maps the site you have created in either a folder view or a hyperlink view. A screen shot of the hyperlink view of part of the TPCUG Web site is on the next page. The whole site could not be presented in hyperlink view here since there are over 300 links alone in the "Links" folder.

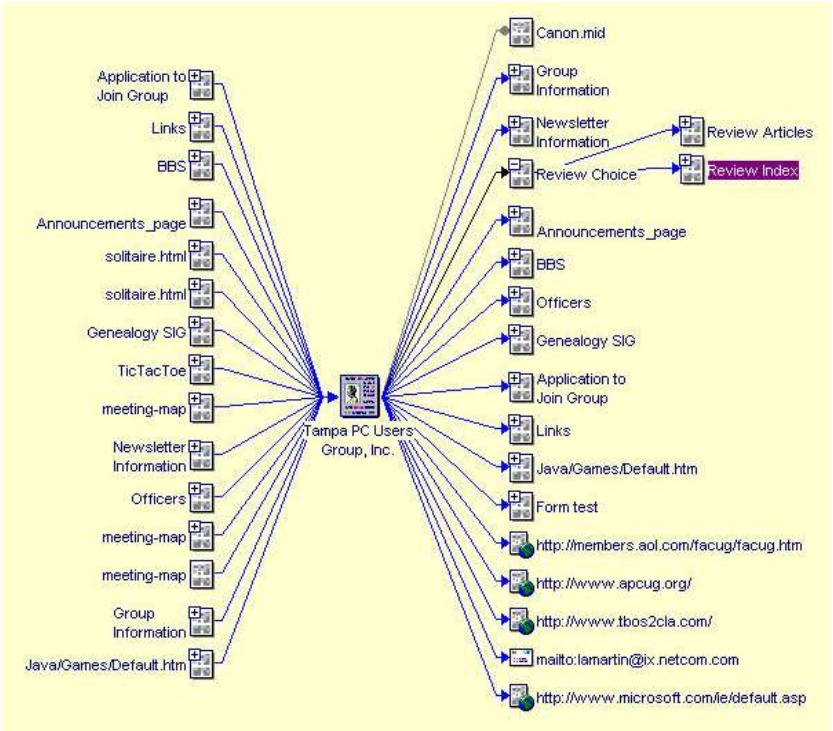
For the uninformed, a Web site on the World Wide Web is simply a collection of files on some computer (called a server) that is connected to the Internet. One of these files is designated as the home page. For example the TPCUG's Internet site is at the Internet address http://www.tbos2cla.com/tpcug/. tbos2cla is the name of the server we are on, and tpcug is the folder there containing our files. Within tpcug is the file welcome.html which is the HTML file you see when you first go to our site. That is the file labeled Tampa PC Users Group, Inc. on hyperlink view on the next page. The page labeled Genealogy SIG is the HTML page your browser goes to when you click on the Genealogy hypertext link on our home page.

FP Editor allows you to type in text, format it just as you would in a word processor to the extent the HTML rules allow, insert graphics (graphical formats other than GIF and JPEG are automatically converted), insert tables, and hypertext links to other files at your site or anywhere on the WWW. This is the standard stuff of an HTML editor; however, FP Editor provides for more. It simplifies the process of creating forms like the questionnaire (called forms test on the hyperlink view) at the TPCUG site and the creation of frames as in the online review page at the TPCUG site where the scrollable list of articles appears on the left part of the screen and the article being read on the right.

So far nothing has been mentioned that a dozen or more other HTML editors couldn't do. In fact I created all of the TPCUG site without an editor. I did it with Microsoft Word. I could have used Note Pad, but I wouldn't have had spell checking. Of course, to do this I was required to be familiar with the HTML codes to enter to accomplish things like the links, tables and inserted graphics. Using FP Editor you are spared the need for knowing HTML, since it is pretty much point and click.

But there is more, and this is where Front Page leaves the other editors behind. Front page is a unified approach to creating, publishing and maintaining a WEB site. First you use the FP Editor to create your home page and all the pages branching off of it; you use FP Explorer to create however many folders you need to contain and organize all of this on your computer. To allow real-time testing, your own Personal Web Server (PWS) software is supplied, so that when you connect to the Internet it is automatically running with an Internet address of whatever your Internet provider has temporarily provided you while you are online. The next time you sign on you will be provided with a slightly different address—however FrontPage always knows the current address of the PWS).

So, you have created your new Microsoft Front Page Web which is now stored in the PWS directory on your computer. You can test it there and fine tune it. In fact you can do more there than at most Internet Service Providers (ISP) because FrontPage will have installed the Microsoft FrontPage Server Extensions at your PWS. These extensions are necessary to utilize the full functionality of FrontPage. With these extensions on the server you can create more powerful WEB sites without bothering your ISP with things like password protection and saving form results. The presence of the extensions also allow you to use the discussion group wizard to create a FrontPage WEB site which is a discussion group. When someone visits this site they will be presented with a list of current topics from which they can read messages and post their own messages. I created such a discussion group on my PWS and while connected to the Internet gave my temporary address to several members of our group. They then went to the site, read the couple of messages I had already posted there and then left messages of their own. It's a really nice feature; however, it did seem to have a flaw in that a reply message did not always appear associated with the message to which it was replying.



Once you have your FP Web created and tested on your computer with the Personal Web Server, you are ready to put it on the Internet for the world to see. In a perfect world, you would simply choose the option to publish your FrontPage Web, and FrontPage would handle all the details of dialing up your ISP and using File Transferee Protocol (FTP) transmit all of your files to the proper place at the ISP, keeping the structure intact just as it was on the PWS on your computer. As you know the world is not perfect, and most likely your ISP will not be supporting the FrontPage Server Extensions for the free home pages they provide you for your $20 each month. For this you will have to buy one of their upgraded service plans. I know that my provider, NetCom, does not support the extensions with the free home page they provide.

(FrontPage.....Continued on page 7)

(FrontPage.....Continued from page 6)

But all is not lost, if, in trying to send your FrontPage Web to your ISP, FrontPage detects that the server extensions are not supported it invokes its Publishing Wizard to create a Web site for you at your ISP without the extra functionality that you would have if the server extensions were available. So you are back to having the type of Web site that could be created with most other HTML editors—with the added convenience of easier maintenance of the site, because, in the future when you want to update the site with any changes you had made, the publishing Wizard would automatically send only the files that you had made changes to. Unfortunately I (and a lot of others based on UseNet newsgroup messages) could not get the Publishing Wizard to post to my ISP. I also tried posting to our TPCUG site, which also doesn't support the FP Server extensions, but the Publishing Wizard balked at this also.

So, where do we stand? FrontPage is a good program. The Editor makes creating HTML pages almost as easy as using a word processor. The Explorer is very helpful in viewing the structure and maintaining your site. And the Personal Web Server provides you with your own temporary Internet site on your home computer where you can test everything out. And I am sure that now after reading above about the Discussion Group Web, many of you who have personal Web pages that your ISP is giving you for free would like put such a discussion group on some favorite topic of yours on your site. But until more ISPs support the FP Server Extensions, this discussion Web and much of the extra functionality of FrontPage will go wanting.

For me the program is worth having just for the ease of creating your pages with the Editor and then viewing the structure with Explorer, but I will for the time being have to continue relying on standard FTP to upload my files to my site, all the while keeping track of which files I have modified and which folders they go in.

The local price is about $130.◆

(Comments.....Continued from page 1)

so far is functioning flawlessly. My reading on all of this is that CD drive makers--at least the ones that Gateway uses--have not upgraded the quality of their drives to math the increase in speed. The drives are literally rattling themselves to death.

My next hardware failure occurred when I tried to use the HP IIIp laser printer which had been sitting unused for about 9 months. First it produced a foul odor, some sort of rubbery smell and refused to print with an error message concerning missing toner, an open door, or an inoperative fan. Repeatedly trying to get it to work finally produced a scan error message.

Since my son wanted to take it with him for the summer, I broke down and called Hewlett Packard's tech number for old products--$2.50/minute with a $25 maximum. That produced a tech representative who basically had me do the same sort of things I had just done. And much to my surprise, a print test finally worked, followed by the printing of a document sent from the computer. So it was worth the $25. Three days later when it came time to pack up the printer for travel, a final check produced the old error 52 again--failure to scan. This time I checked for local HP service. Calling CompUSA produced the explanation that some printers also functioned as scanners, and this part of the printer wasn't functioning. Let's try someplace else. At least the fellow at Computer City admitted he didn't know exactly what the scan error was, but he was sure they could fix it. The next name on the list from HP was ComuCom Systems here in Tampa. I was transferred to a technician who happened to be in (most of their work is done at client locations). He immediately explained what the scan error meant. It had to do with a scan motor not working, and this could usually be repaired by simply cleaning the corrosion from the terminals of the wires connecting the motor to a circuit board. All I had to do was remove the top of the printer. I did this plus removing about three layers of circuit boards to get at what I think were the correct terminals. No corrosion in sight, but I cleaned them

Lightning, So What!

by Fredrick Rea O'Keefe, Tampa PC Users Group

Working with electronics (35 years+), and being responsible for keeping them working no matter what, has given me an education. Sometimes it has been costly. Working with electrical engineers in power quality, including lightning and surge protection, gives me a daily view of how even large, technical corporations often can't distinguish between what is effective and what is not safe to use.

So, for my associates in the Tampa PC Users Group, here are a few tips. If your plug-in surge suppressor cost you less than $100, and it is more than a year old, it is probably at its life's end. If you bought it "retail," the same. The well known brand name devices offer minimal protection (don't believe the marketing hype on the specification sheet or the packaging) and should be replaced annually (every two years in low risk areas). Central Florida is "Lightning Alley," the area most high risk from lightning. How about an average 82 strokes per acre per year!

If you use such "consumer grade" protectors, unplug your computer equipment, including the phone wires, every time there is a storm. Lightning can easily cause damage to sensitive electronics if it hits two miles away! Unplug everything? Inconvenient? "I've never had a problem"? "It's got a 'lifetime' warranty, doesn't it"? "It has insurance"?

Using an ineffective and potentially unsafe suppressor is a matter of not having accurate information, not a matter of opinion. Even electrical engineers often have no access to accurate information, and are fooled by slick tricks of manufacturers. Ever heard the term "ringer"? Manufacturers often build a powerful suppressor just for public testing purposes, or build "tuned" suppressors for official testing purposes. You couldn't find one of those for sale anywhere. That's why, in our testing, we obtain suppressors off the shelf, or directly from the manufacturer's assembly line. We do the picking.

With proper training, and $100,000 in equipment, you could test suppressors, too. Realistically, you are at the mercy of your vendors, who know every bit as much about reliable, effective and safe surge suppression as you do. They've read the box label!

If you want reliable, effective and safe surge suppression for your home, or business, you will need to contact an industrial supplier or a lightning consultant such as, in Tampa: Bolt Lightning, Inc., Quality Electric Supply, Inc., Borrell Electric Company, or Power Support Engineering, Inc. (for which business I am a consultant). Don't expect proper protection from your electric utility. Expect to pay a minimum (uninstalled) of $700-1,200 for real surge protection, and a reasonable homeowner grade of lightning protection. There is no way around this. And, no, a UPS is not a surge protector, unless it is labeled with "UL 1449-2 listing pending; device submitted for testing on _____ (date)." The old UL-1449 listing is no longer valid. If a suppressor bears a label stating its "UL Grade __, Class __, Mode __," you have a reliable guide to its actual, real world performance. Get nothing less than a Grade A, Class 1, Mode 1 device.

In a nutshell, you have five choices:

1. Trust to luck, and allow your equipment to age rapidly;
2. Use low grade retail suppressors, and enjoy the same as #1, but with a short term better chance of surviving a large surge, once -- throw these suppressors away every year;
3. Use a high end "industrial" or "commercial" type protector supplied by an electric distributor, and improve your chances -- change these every five years, at the most;
4. Unplug everything with every storm;
5. If your equipment is valuable, or "mission critical," particularly if you must keep operating all the time, your only rational choice is to spend the money. You must protect every cable (data, comm, power)connected to your equipment, and the input to your UPS. Use no power cable longer than six feet long; and never use extension cords or power strips (every power cord must be plugged directly into a surge suppressor).

There is obviously far more to the subject than is presented here. I wrote this article so that you will have fewer illusions about what you rely on to protect your investment in computers, large screen TV's, ham radios, or high end stereos.

(Comments.....Continued from page 7)

anyway, put everything back together with only one left over screw, and expectantly tested the printer. It wasn't fixed. Possibly the motor itself is dead. So next week I'll take it in to CompuCom.

The software problems for the most part all result from installing Microsoft Internet Explorer 4.0—the developer's preview. It has some nice features, but my recommendation is to wait for future releases. After installing 4.0 I find that they did not implement the spell checker for email, the same for

Visual Labels (32-bit)

Create your own custom labels and business cards with Visual Labels for Windows. Drag and drop fields to add text, outline shapes, images (.wmf and .bmp formats) and serial numbers to your own custom-size labels, or choose from a database of over 200 Avery label and business card templates. Right-click mouse support gives you fast access to menus to change the properties of selected objects. Nifty features include a choice of label-component colors, and text rotation. Extensive online help further simplifies an already easy-to-use program. A 16-bit version is also available. The evaluation version limits you to 50 startups of the program. This is a minor update with unspecified changes.

HyperTerminal Private Edition

HyperTerminal Private Edition is a more powerful version of the terminal applet built into Win95 and NT 4.0, released freely by the same developer. It not only fixes some problems found in the Win95 release, it also adds more scripts, automatic redial on busy numbers, Zmodem crash recovery for resuming interrupted file transfers, and support for non-English alphanumeric characters. HyperTerminal PE also corrects some problems identified after the Windows 95 code freeze. It transfers files properly through direct cable connections, and enumerates country codes correctly even if more than one TAPI service provider is installed. Its character delay setting now throttles text sending even when pasting from the clipboard. It also fixes problems that occurred with certain printers, and subtle errors in Minitel terminal emulation. HyperTerminal PE allows faster, more reliable connections, along with some very useful features all at the right price -- free. New to version 3.0: A simple answer mode, the ability to remap the backspace and delete keys, enhancements to Telnet and the VT100 emulation, fixes for Shiva and other high speed serial connections, and enhancements to the install program. In addition, the VT100 emulator now supports host-controlled printing (sometimes called pass-through printing) and the user can also define the string that the emulator responds with when queried by a Telnet host.

Requirements
Modem and Windows 95

WnBrowse, Nigel Thomas

WnBrowse is a multi-function ASCII and Hex file viewer. Users can view any size file, including files within zip archives, and copy selections to the Clipboard. You can choose fonts and colors, specify your favorite editor, and easily access search and print functions and launch files. WnBrowse quickly browses an entire directory, file by file, at the click of an icon. The program runs as a standalone, or can be run from Explorer-type dialogs using a right mouse-click menu. This update adds support for ZIP files (PKZIP 2.04 required), user-defined editors for Hex and ASCII files, a repetitive 'find' function, and other enhancements and bug fixes.

Microsoft Access SIG — Canceled (temporarily we hope)

Lotus Notes SIG

This SIG meets every Thursday at Reflectone at 8:30 PM. It is a professional SIG focusing on Lotus Notes certification. Directions: Proceed west on Waters from N. Dale Mabry across the railroad tracks (which is about 1 and l/2 miles), take second left on Savarese (United Technologies bldg. is just beyond it). Proceed on Savarese until you reach the Reflectone bldg. Take the North door. If you need to ask directions, there is a security guard at the location. *Contact Mike Hodges at hodges@reflectone.com.*

Communications SIG

This SIG meets the first Monday of the month at 6 PM at the Reflectone Building. You must sign up to get on the list and to get by security. See the Lotus notes SIG for directions to Reflectone. *Contact Charles Howe: at 968-1207 or HOWE@INTNET NET*

Genealogy SIG

This SIG meets the second Monday of the month at 7:00 PM at the Museum of Science and Industry. *Contact Jenny Lind Olin at 960-5723 or Ford Bond at 987-6309 .*

being able to right click on a file link and download the file to your computer. IE 3.0 did not work properly with Acrobat 3.0 files; version 4.0 basically does not work at all with them. Finally, Java applets that I have been working with and which ran correctly when viewed with Internet Explorer 3.0 as the browser now fail to run when viewed with IE 4.0.

And other odd things that didn't happen before the installation of IE 4.0 seem to be occurring on my computer; things which can only be corrected by a reboot. Betas are bad enough but stay away from developer's previews. Ideally I would only run this beta software along with any programs I am writing on a separate computer. But who wants to drop back to the previous generation computer to do anything. ◆

MEMBERS HELP-LINE

The following phone list is provided for our Tampa PC Users Group members in an effort to establish local support for those frustrating times which we have all encountered while using our PC's. Please note that these are members that have volunteered to help you; treat them in a courteous manner. Be sure to ask if it is convenient for them to help you now, or if you should call another time. It would also be helpful to have your documentation and have it handy when you call. (Don 't expect help if your software is an illegal copy or you do not have documentation!) TPCUG is not responsible for the information or advice provided by volunteers. Volunteers may or may not be experts in the subject matter. You are on your own with any advice received. Be aware also that some of these volunteers may be consultants in their area of expertise. If you are interested in volunteering to answer members' questions, either leave a message on the BBS or fill in the forms provided for this purpose at the meetings.

PPI, Printer Wars and Hardware Support

by William LaMartin, Editor, Tampa PC Users Group

This month PPI is sending two Microsoft certified people to present a checklist for maximizing our computers and telling us how to plan for upgrades. Plan to bring pencil and paper for assigned exercises at the meeting.

Now, to fill in this empty space staring back at me, let me tell you about a very naughty printer. But before starting in on what is bad, I want to emphasize that I have three Hewlett Packard Printers here that have given very good service over the years. The HP IIIp has given reliable service for about five years. Unfortunately letting it sit idle during its sixth year caused a problem—possibly corrosion—that will need the services of the repair shop. But for the first five years there was absolutely no problem. The HP 855C also has performed as advertised for the year or two that I have had it. And the HP 4 Plus is simply superb, churning out its 600 dpi pages at the rate of 12 per minute. Of course it was considerably more expensive than the other two. Then there is the old Okidata Laser that a few years back cost almost as much to repair as it did to purchase—which at the time soured me on Okidata and printer repairs—but it is still working OK.

Now to the HP from Hell. It is the HP 5L, and ,thank God, belongs to someone else. Unfortunately that someone else is also someone for whom I provide computer help. The 5L is an inexpensive 600 dpi, four page per minute laser printer which produces nice looking output. However, it has a driver problem. The default driver is called the Host driver and is one of those drivers which provides a status window telling you all sorts of details about the printing job in progress. It also takes over your computer. One HP tech representative I spoke with described it as aggressive. I would describe it as very aggressive, since it

Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

SECRETARY'S REPORT & MINUTES OF MEETING June 11, 1997

Minutes and Comments by Merle Nicholson, Secretary, Tampa PC Users Group

We gathered in the computer lab at about 6:35PM, with our President, Connie Kincaid, moderating. We had a short discussion on our SIGs, and a presenter, Raye Jones, talked about a free Internet access service, followed by a brief discussion of a members' CD-ROM. Then an excellent presentation was given by Jim Lindsay from Pilgrim Software concluding at about 8:15 with the monthly door prize drawing.

Raye Jones, with a new service called Savenet offers a free Internet dial-in account. It allows 1 hour per day, including email, to a maximum of 30 hours per month. For $65 per year, their subscribers get 150 hours per month. The cost is borne by advertising subscribers. Ms. Jones gave a very animated, entertaining presentation, given the short time we had to offer. The company is based in Las Vegas. Contact them via modem at (813) 381-4030. To order via voice use (813) 381-6803. Visit their website at http://www.savenet813.com.

Jim Lindsay of Pilgrim Software, a Tampa based software company, gave a very good talk and computer slide presentation on their ISO 9000 software. This software is targeted at the mid-line and major corporations that want to invest in becoming ISO 9000 compliant. To better understand the product, a brief explanation of ISO 9000 is necessary. The International Standards Organization is an organization that is made up of representatives from member countries who work on establishing standards that are compatible with world-wide interests. It's kind of a voluntary rules committee. Now this isn't just the same bunch of people trying to set rules. It's a whole lot of working committees that have expertise in the field being addressed. So … ISO 9000 is a set of rules that says if you want to have your company compete in the world market, and you have processes that run your company or manufacture products or offer services, then you must document those processes in a standardized way. After investing in the time to do all this, then you contract to one of several companies that are authorized to certify you as being ISO 9000 compliant. And you must re-certify periodically.

Pilgrim Software offers a product that is used to document and control processes and stores that information in databases. It helps those that are interested in becoming certified to present the materials needed to the certifying company. So if you have a process in your company, you need to document the process to prove you do it well. There ... that being said, let's move on to the presentation itself. I hope you haven't tuned

GoldMine: "The Number One Rated Contact Manager"

by Bambi Bond, Tampa PC Users Group

Why you should look at Goldmine. Don't buy or upgrade another information management or communications software miracle until you have looked at Goldmine – it could save you time and money. This is not a premature release or a glimpse into the future – Goldmine is an up-and-running NOW-Time reality. You may already be using a variety of schedulers and databases to manage your time and keep track of your friends, family, and business contacts. Windows has enabled us to keep several of these programs open at a time, and with a few linked fields and clip-boarding, we have generally been able to move information around through our various calendars, PIM's — and database mailing and contact lists. Goldmine demonstrates that list-making and faxing and all that other organization and communications stuff can happen in one fat and happy program that's not terribly complicated nor horribly expensive.

Getting Started. Are we having fun yet? Not yet. The first task was to import ye olde database from Outlook into Goldmine. Goldmine has written documentation – two volumes that are logically organized, clearly written, and well illustrated. The documentation describes the processes, but ferreting out some of the necessary details requires digging. If the user doesn't accomplish the initial step of transferring old data, he will not use the program. I had already rehearsed this scenario a year ago (not a pleasurable memory) by having to bring the names, addresses and phone numbers from Schedule+ into Outlook.

Exporting the Database. My first step was to export from Schedule+ to DBase. Trying to recall the conventions of DBase III reminded me of trying to remember enough high school French to help my daughter with her studies – they didn't have the word for laundromat back in the olden days. So, headings of eight characters or less, no commas inside the fields, use tab-delimiters, you start to get the picture….

Importing the Database into Goldmine. Next is to import the .dbf file into Goldmine. Just correlate the field names, and slide right in? Not quite. Outlook has 2 address fields per record – business, home, and either can be designated as mailing address and the POB never has the same ZIP. I took advantage of the user-defined fields to create the second address fields, and after about the 5th trial import, practically despaired of ever accomplishing the Herculean import task -- please, Bill Gates, give me a stable to hose out next time! -- to include all phone and fax numbers, both home and office. So the database took a detour into a spreadsheet in Access, so that I could see the locations that Goldmine had alerted me of problems by record number. Well, for one, it seemed that the +1 that Schedule had put in front of the long-distance numbers was sending a message to Goldmine that it was importing an Excel file. Ooops! A few manual replacements resolved that tiny SNAFU. Now Goldmine was ready to go to work.

E-mail. Communications functionality is necessary in a contact manager. Goldmine has a wealth of links to ease Internet communications. It can message pagers, schedule faxes, queue and send email. I put the telephone dialer to work right away. It took some more reading to find the active link for e-mail buried in the Profile Folder. Once the protocols for your dial-up network are established, you can schedule your e-mail to be checked periodically. The counter only gives 99 minutes, so if you want to upload and check mail once or twice a day, it appears you will need to do it manually. If your contact has a Web site, you can enter it in the Profile Folder, and access it the same way.

Bells & Whistles. Goldmine is as fully loaded as a Lincoln Continental. It doesn't make coffee or walk the dog, but for the home-based or networked office there's not much else you could ask it to do for helping track your contacts. You can build a history of and plan a future for each contact with Automated Processes. For each phase of the contact development, the person or persons responsible have access to the history.

Scenario for a new contact. For example, say a contact browses to your widget homepage, signs the guest book. You retrieve his/her email response into your database. You have set up an automatic email action thanking them for their filling out your form and letting them know that you have attached an informational file in answer to their request. The response is triggered by a command to wait 2 hours after you have read the email. Follow-up by mail and/or phone is routed to and scheduled for the proper phone and mail people designated in your company. Completion of follow-up calls appears in the contact history showing the tracking of the client contact. And so on through the maze of marketing and sales.

About Goldmine on the WEB. If you jump on your favorite search engine and type in Goldmine, you will first go to a Jewelry sales site – and are almost immediately likely to be invited to look into an MLM company. Goldmine's address for product information is www.goldminesw.com on the Internet. You can download a demo version. Goldmine's email address is ready in your database with your newly installed software, so you can contact directly. From Goldmine's home pages, you can link to other companies' Websites that contain descriptions of Goldmine Software adaptations and Add-ons.

Add-ons, utilities and dynamic linking. Software programs to enhance Goldmine's capabilities, or utilities to dynamically link it to familiar and useful programs abound. Goldmine has a few of its own, like GoldSync, for updating data at multiple sites and for multiple hosts and users at predesignated sites. Since the name lends itself to play on words related to gold or mining, you can readily recognize most add-ons by their names

A lot of software for your money. I have spoken with ACT! (List, $199.00) and Telemagic (List, $500, Single user; $1300, Network) users who believe they have built their businesses with their contact manager software. Goldmine appears to have stepped ahead of these two popular programs by encompassing the most frequently needed information and communications functionalities within a single program, particularly in the internet compatibility. Goldmine (List, $295) may be installed as a network version or for a single user, and can be dynamically linked to your other programs.

Minuses. How do you take a plus and turn it into a minus? Say that you have a feature, and then make it invisible, or hard to do or find. According to the manual, the e-mail supports RTF, but when you arrive there, the editing tool bar doesn't give you color and font options. Right-button mouse functions are mixed with <F2>, and they don't seem to work with consistency. The On-line help in MSOffice lets you ask a question that launches a search on keywords. That would be useful in Goldmine, because I still might find the dog-walking function. In the meantime, Goldmine can fax the pizza order while Queenie and I enjoy each other's company. ◆

(Continued from page 2)
out on this because Jim gave a very interesting presentation. I haven't seen so much interest generated in the audience at any other presentation. Jim finally had to stop at 8:15, but there were people there that would have asked questions for another hour.

Pilgrim is an employee owned company in Tampa. They currently have 36 employees; many were just hired this year. They started with just 3 people 3-1/2 years ago. Their profitability in 1996 was 1.5 million dollars and they expect 3.5 million in 1997. This is from a program that costs just $500 per user. Of course, a company will need a lot of licenses, but still …. Also, I believe he said that all the employees are at least bilingual. His own second language is Japanese.

The demonstration was about just one of the six modules - the one on documents and controls. This module has an underlying database that stores documents. The formats of the documents are of your own choosing. The company using this sets up rules controlling the routing, security and approvals and publication of all the documents, and the software not only stores it but also presents the information about the documents in a non-database way. The information presented is about the process. It has reminders and even sends e-mail to people

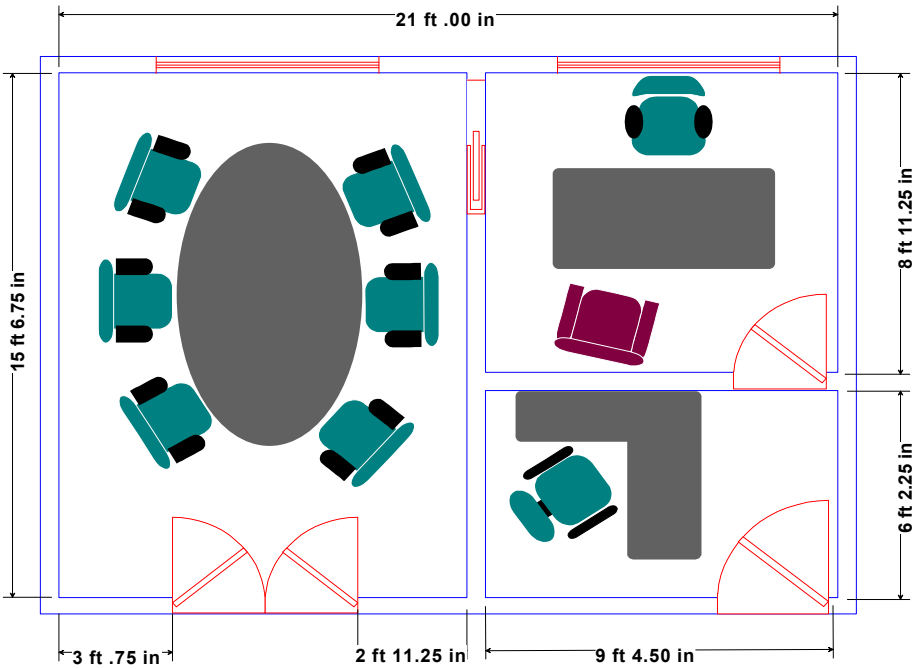
Software Review

Micrografx's Graphics Suite 2

by William LaMartin, Editor,
Tampa PC Users Group

In the August 1996 newsletter I wrote a laudatory review of Micrografx's ABC Graphics Suite. That review, without the accompanying graphics, is included in the "Online Reviews" section of our Web site. However, since it is more than six months old, the full color PDF version of the newsletter has been removed from the "newsletters" section.

Graphics Suite 2 is the 1997 version of that collection of programs. This suite of programs is designed to run in the 32 bit Windows 95 environment and to mesh with the Microsoft Office interface.



These programs are:

- Designer 7 is a Graphics creation program similar to Corel Draw.
- Flow Charter 7 is obviously a flow chart creator.
- Picture Publisher 7 is an image editing program.
- Simply 3D allows you to create animated 3D objects and 3D text.
- QuickSilver 3 uses Designer to create vector based graphical objects for the Web instead of the usual bitmapped images.
- Media Manager 7 manages your graphical files.

QuickSilver is the only new addition to the Suite, and the one most likely not to be used by the average user. So let's dispose of it first. I have used it to create interactive vector based graphics (which open much faster than their bitmapped counterparts) on Web pages. For example, when you click on a certain part of the graphic, an action is performed, say, the graphic changes colors. The one problem with QuickSilver, and the reason I haven't put such an example on the group's Web site is that the person viewing the Internet site must have downloaded and installed the ActiveX plugin or ActiveX control on his computer for all of this to work. When such facility is built into browses then I think it will be a more attractive tool for the average Internet surfer.

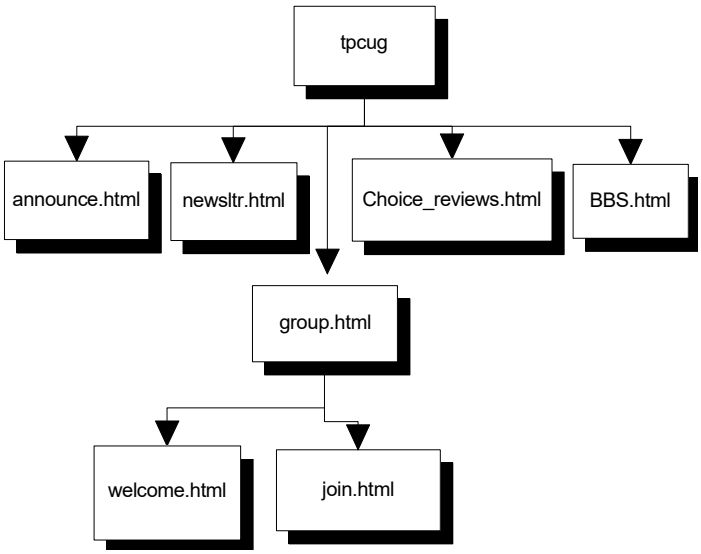
Back to the heart of the Suite. The first improvement I noticed was a fatter paper instruction manual (of course, there is extensive online help) for the programs and more clip art and graphics containing CDs. The manual, by taking you through a couple of projects for each of the programs, introduces you to many of the tools and capabilities of those programs.

Even though I have used **Designer** and Picture Publisher extensively over the past year, there is always more to learn. In my previous review I dwelt on the placement and manipulation of graphics and text on a Designer page, with the emphasis on being both creative and informative. The graphic on this page is an example of using Designer's architectural drawing abilities to create a scale drawing of an office plan. But there is more to the plan than can be shown on the page. Additionally each object in the drawing can be assigned properties, e.g., cost which the program then tracks as you add furniture, windows, etc. Now, if we all had downloaded the QuickSilver plugin from Micrografx for our browsers, then I could put this Designer drawing on our Web site. With a bit of work, I could, then, make it possible for you to change the color of and even the placement of the furniture by certain actions on your end.

One of the small improvements to Designer is much appreciated. When selecting a font for text, in the previous version only the font selected had its name displayed as it would appear. Now, when you display the font list, all the font names on the list are each displayed in the appropriate font. Of course, this would be time consuming on an old, slow computer. But, then, if you are doing much graphical work, you really don't want to be using an old, slow computer anyway. This brings us to the hardware recommendations: 486 DX or higher with 16 MB RAM and 200 MB free hard drive space; Windows 95 or NT.

To fine tune any graphical images you might want to use in

(Micrografx.....Continued on page 7)



(Micrografx.....Continued from page 6)

your Micrografx Designer project, you would use **Picture Publisher**. As I said in the August 1996 review, I use this program more than any other in the Suite. I use it to enlarge, reduce, or crop images; to change their type, e.g. from .TIF to .GIF; to remove an unwanted background and possibly add a new background; to make a picture brighter or darker; to repair damage or remove an unwanted spot. There is so much that can be done with this program.

As an example of what you can do, I spent 15 to 20 minutes scanning two photos into Picture Publisher and merging them to produce the wild turkey in an orange grove on the University of Tampa campus. The result—indeed all the newsletter—looks much better in color, so if you are reading this in the paper copy of the newsletter, download the Adobe Acrobat version of the newsletter from either our BBS or our Web site and see what I mean.

I really have done no more with **Simply 3D** than to see that it works as advertised. 3D graphics at the present are not of very much interest to me, but I am sure to others this program would be quite useful.

Flowcharter 7 is a major component of the suite. However, I don't understand what it has to do with graphics—except that a flow chart is, I suppose, a graphic. Anyway, I am glad they included it in the package, since it is quite a good program—if you need a flow chart program, and the Suite would probably not have been any cheaper without it. So I view it as a very nice freebie. Also, as I practice with the program, I am discovering I do have uses for it.

One use is in mapping Web sites. Micrografx has included a little WebCharter program that, upon being given a World Wide Web address, will go to the site and produce a listing of the pages there along with the internal and external links. And to provide a graphical representation of all of this, the WebCharter program turns this information over to Flowcharter, and we are presented with a flow chart of the Internet site showing the hierarchy of the pages and links there. The flow chart displayed above is a small portion of the chart created by the program for our TPCUG Web site.

After studying the examples in the manual, I must admit my awareness of the usefulness of flow charts has been greatly enhanced. Some different types of charts supported are:

- Standard flowchart
- Organization/family tree
- Cause-and-Effect chart
- Network chart
- Statistical process control charts
- Living FlowChart

The price of a competitive upgrade is $140. A regular purchase costs $360. For more information visit http://www.micrografx.com/ ◆

Computer Store Shopping Adventures

by Merle Nicholson, Secretary,
Tampa PC Users Group

This will be a departure from the usual review or computer techie stuff I do. The reason my subject is computer-related at all is that this adventure occurred in a so-called "computer superstore". I've given it enough time now that I can relate this with some degree of detachment, but look out, I may just get steamed up again. On with the tale.

My company has a corporate account at this store and purchasing is extended to employees, so usually I call our rep at the store, describe what I want, check on availability and price, which is what I did this time. I got a good price (doesn't always happen) on some video memory and ordered it. It wasn't in local stock, so I could check back or just go in in a couple of days, which we did. My experience is that often they don't know an item is in, even when it is, and we live close by, so we go in without calling.

If the item is in, the commercial desk will have it. My son, Matt, and I went there, stood in a short line, identified the item so they could look it up on the computer. He looked it up and said … "Hmmm .. well it's not here, but tell you what .. since it's an "upgrade item" check it out at the upgrade desk, it might have been received there, and we use separate databases and I can't access theirs. Give them this paper so they'll charge the right price." I should have seen it coming but didn't when he took a piece of scrap paper, wrote the stock number on it, the price and scribbled his initials. So off to the upgrade desk. Stood in a short line.

I gave this guy the paper, he looked it up, determined that he had it and while we waited, he rooted through some bins in the cabinet, went thru small packages to read labels and after some time came back with it in his hand. This guy says: "Go to the cashier, pay for it, bring the receipt back and I'll give you the memory". I said - "You've got to be kidding me." He said no - that's the way it must be done. I'm thinking here - why are they more trustworthy that I am? Will I pay for it and really get the memory afterwards? Well, sure I will. He handed the paper back to me. It occurs to Matt … why don't they have a cash register of their own at the upgrade desk? Why not indeed? Now we really have to stand in line! There's one register open and a line - not a big one, but enough of a wait to warrant opening another register - which is what finally happens when we get to our own cashier.

Do you think this tale is nearly over? What can happen now? Well, I handed this scrap of paper to her, she looked at it and walked away toward the upgrade desk without a word to us. By the way, in this store, the entrance is blocked off so the route to the upgrade desk from here is through the outside door and back in the inside door. Jeez. We watched her, somewhat mystified. She located our guy by showing this paper to all three back there, and then had a long conversation. About what, I can't imagine. I thought - say - being a trusted employee, she's there - would she bring the memory back with her and save me the trouble? No … she's in motion back to us, and she has nothing but the paper. Remember now - she's gone some time and has basically abandoned her customers that are standing there behind us, but the new register has opened up.

She comes back and asks us - "Who gave you this paper?" Well …. shoot … I'm thinking … if that was the problem, why didn't she ask me in the first place? So I pointed out the guy at the commercial desk (in the opposite direction from the upgrade desk) and described him so she wouldn't waste any more time. So she abandons us again! And everyone in line behind us! Comes back more quickly now, apparently satisfied, mentions that she didn't recognize the initials on the paper and had to verify that it was "OK".

OK .. are we done? But no. Keys in things, like my phone number. What do they do with my phone number? In case my cash is bad? Settle down now … don't get steamed. It's been a long wait, but it's nearly over with. No … it's not over .. she says in as large a voice as she can muster: "Password !" and waits - not too long because the password person is the lady running the register behind us. Guess what .. this lady abandons her customers to come over, puts a key in the register and keys in some numbers. Now what the hell is this about? Is our cashier not a trusted employee? What is accomplished by this? Does anyone know?

So … We get the receipt and guess what … swing through the store outgoing door, back in the ingoing door … stand in line … Is this stupid or what? Do I ever want to buy anything here again? No. Stood in four damn lines to buy one small item.

So let's see what we can learn by this. Most of us work for companies. Maybe we aren't in retail. I'm not, but in a lot of ways my company is, because our revenue comes from the public. What's the objective? Mostly to process people out the door with a maximum number of purchases. In other words, exchange their money - as much of it as you can, and give good value in return so they'll come back and do it again. Is it to our mutual advantage to make this exchange as pleasant and expeditious as possible? You bet it is. ◆

Larry's Links
Recommended Shareware/Freeware

by Larry Anders, Librarian, Tampa PC Users Group

If you're reading this from the printed newsletter, type in the link address in the ***URL*** address area of your Internet browser exactly as you see it with NO spaces. If you have downloaded the ***.pdf*** file and are using Adobe Acrobat Reader ver. 3 the links are **hot**. (Just click on the link and you'll be taken there automatically.) I double-checked all these links and they worked at the time. (If you should have any trouble – call me. My number is listed in the front of the newsletter.)

RealPlayer (Progressive Networks, Inc.)
File Size: 1.1 MB
License: **Free**
RealPlayer allows you to enjoy streaming audio and video on networks and the Internet. It provides enhanced sound quality and newscast-quality video to systems with 28.8 modems or faster. The RealPlayer includes the Buffered Play feature for playing content that is encoded for higher bit rates than your connection provides.
Requirements: Windows 95/NT, 8MB RAM, 14.4 modem or faster
http://www.download.com/PC/Result/TitleDetail/0,4,0-29909,00.html

PhoneFree (Big Bits Software)
File Size: 237 KB
License: **Free**
Call anyone you want with PhoneFree, a browser plug-in for Netscape Navigator or Microsoft Internet Explorer. Compatible with existing phone programs like Netscape's CoolTalk and VocalTec's Internet Phone, PhoneFree offers a simple and fully integrated way to use your browser as a telephone. No one home? PhoneFree even allows you to leave voice mail for anyone who has an email address.
Requirements: Windows 95/NT, sound card, microphone, Netscape Navigator 2.0 or later or Microsoft Internet Explorer 3.0 or later
http://www.download.com/PC/Result/TitleDetail/0,4,0-29740,00.html

Acid Tetris (Dungeon Dwellers Design)
File Size: 1.2 MB
License: **Free**
Stack up blocks in this remake of the classic Tetris game. Your goal is to line the pieces up horizontally. Get rid of the lines before the blocks pile up to the top of the screen. This game features interesting sound effects and visuals, and Acid smileys are there to keep an eye on you throughout the game, and to comment on your gameplay.
Requirements: DOS 3.1
http://www.download.com/PC/Result/TitleDetail/0,4,0-29910,00.html

TopDesk v3.0b (Snadboy)
File Size: 110 KB
License: **Free**
How often have you had one or more applications running that have conspired to completely cover the desktop just when you needed to access something on the desktop, e.g. the Recycle Bin or the Internet icon??? Rather than continue enduring this frustration it's time you downloaded TopDesk. TopDesk adds an icon to the system area of the task bar that gives you complete access to everything on the desktop - system objects and files, including the display properties dialog. And best of all, TopDesk is freeware !!!
Requirements: Windows 95/NT
http://www.snadboy.com/topdesk.shtml ◆

(Continued from page 1)
will not coexist with another printer on the system. It also will not cooperate with a Zip drive or a network setup. So as long as you don't need any of these extras you might be OK. If you do want one of these features you must use the alternate driver for the 5L—the PCL driver. However, all is not perfect there either as a little history will show.

In setting up a new HP 200 mhz mmx Pentium computer with 32 MB RAM and a 4 GB hard drive by installing all the old programs and data from the previous machine, everything went fine until I came to what should have been easy—installing two printers on the system. The Canon bubble jet installed fine. Then I installed the HP 5L, and troubles began. As expected it set itself as the default printer, and indeed that is what I wanted it to be. I did not, however, expect it to change other settings for the Canon printer. For example, it changed the Canon to print not to LPT1 but to file. And after the installation, neither of the printers would print consistently. I tried all sorts of tweaking to the printer settings to no

avail.

I finally gave up and called HP support—no 800 number, but at least I didn't have to pay the $2.50/minute up to a $25 max. for old equipment support. After much checking and changing, the lady told me that I would do better to change to the PCL driver for the printer. First she had me click on the uninstall program for the Host driver (there is actually a program group for this HP printer driver), and after "uninstalling" it I added, in the usual Windows 95 fashion, a HP 5L PCL printer. She said that this driver should be better behaved. To make things work still better, we set the printer to not spool, to print RAW data, and about everything else she could think of to emasculate the printer. Well, at least both printers seemed to now be working in harmony.

But that didn't last. Next day, the computer's owner called to say that the HP 5L was printing very slowly—40 seconds per page on a multiple copy print. It was supposed to put out a page every 15 seconds. I came over and wasted a lot of time spinning my wheels: turned back on spooling, etc., but nothing worked. In desperation, I reloaded that aggressive Host driver, and we were off and running. My solution to the printer conflict problem was to unplug the Canon when booting the computer if the HP 5L was to be used and vice versa if the Canon was to be used. Not elegant, but it worked. Or at least it seemed to work. Next day, the HP 5L was sending error messages and printing correctly one time then not the next.

This couldn't last, so back to HP support on our dime. I got a different tech representative who seemed more knowledgeable than the other (who had told me she only knew about printers when I asked her about a computer BIOS setting that could affect the computer's parallel port). He was the one who said that the Host driver was aggressive and that the other tech representative possibly hadn't gone far enough in removing all traces of the Host driver. To do that he again had me run the Win 95 uninstall program, then we went to a DOS prompt and ran another uninstall program with two different switches, then we went to both the Windows directory and the Windows/System directory where we did two different wild card deletes in each directory on HP type files. After that he had me reinstall the PCL driver (the newest version I had gotten from the HP Internet site), and, as he promised, everything worked fine: 15 seconds per page printing and peace with the Canon printer.

That was a week ago. Yesterday I had a message on my answering machine that the 5L was back to printing 40 second pages. I called to check and had the individual list all the printer settings. They were the same as we had a week back. I am at a loss.

Do not buy a 5L. If you want to read others' problems with this printer do a usenet newsgroup search using DejaNews on the topic of "5L printer" AND "Problem" or some suitable variation. You will see that my 5L owner is not alone. I also wonder about the new 6L which is a replacement for the 5L.

My solution: Buy a more expensive printer like the HP 5. I still like production quality HP printers, but quite possibly HP has left something important out of the less costly home-use type of laser printer. If you do a lot of printing, your printer is almost as important as your computer.

By the way, I tried using a parallel port card to get an additional parallel port for the second printer, but the HP computer always produced an error message on boot—even though Win 95 seemed to like the card, and I was even able to print to both printers simultaneously. But who wants an error message on every startup, so it was back to the switch box (which is not what is causing all the problems). **Suggestions Welcome**. ◆

MEMBERS HELP-LINE

The following phone list is provided for our Tampa PC Users Group members in an effort to establish local support for those frustrating times which we have all encountered while using our PC's. Please note that these are members that have volunteered to help you; treat them in a courteous manner. Be sure to ask if it is convenient for them to help you now, or if you should call another time. It would also be helpful to have your documentation and have it handy when you call. (Don 't expect help if your software is an illegal copy or you do not have documentation!) TPCUG is not responsible for the information or advice provided by volunteers. Volunteers may or may not be experts in the subject matter. You are on your own with any advice received. Be aware also that some of these volunteers may be consultants in their area of expertise. If you are interested in volunteering to answer members' questions, either leave a message on the BBS or fill in the forms provided for this purpose at the meetings.

when they need reminding that they must take action to fulfill the rules you've set up.

Jim did discuss one other module that raised some interest. This part tracks calibration information on measurement equipment. I wasn't able to write down all the functional modules, sorry. It was a very entertaining presentation. Thanks, Jim for a very good program.

We had a whole bunch of miscellaneous things to give away as door prizes this month. Ken Boyd and Sue Puigdomenech both won Internet Connection software. Sheree Weisenberg, a T-shirt and software. Wil Goble - a game called Tracer, and Clark Evans - OS/2 Family Fun Pack. ◆

Bits of Blue

A Monthly Publication of the Tampa PC Users Group, Inc.

Vol. 10 No. 9 September 1997

Meeting

Internet Advertising Computer
September 10, 1997
6:00 PM
Museum of Science and Industry
4801 E Fowler Ave.

While doing the final proofreading of this newsletter, I was greatly saddened to learn of the death of John Meroth, a member of our group and the provider of our Internet site. John died of a heart attack on August 29.

John's generous contribution of the space on his Internet server for our web site made a valuable contribution to our group's visibility. Since John was the sole person responsible for the maintenance of his Internet service, our group needed to find a new location. Larry Anders has donated space for a temporary site. Other members are looking into other possible hosting sites. The new location is http://www.canx.com/tpcug/ .

Finally, due to the change in our Internet site, some of my comments below may no longer apply.

Automatically updating Web pages

by William LaMartin, Editor, Tampa PC Users Group

M. Bryce & Associates will demonstrate the **Internet Advertising Computer (IAC)** at the September meeting. As they describe it, the **IAC** is a complete turnkey solution for small and medium sized businesses that wish to promote their products through the World Wide Web. It is primarily aimed at companies who are not Internet savvy yet want to capitalize on this exciting new advertising

(Comments.....Continued on page 4)

The new TPCUG Internet address is http://www.canx.com/tpcug/ . At present this is a temporary address; however, it may become permanent. In any case, there will be a link there to any later location.

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members. Our mailing address is P. O. Box 3492, Tampa, FL 33601-3492.

However, for business concerning this newsletter, Bits of Blue, please contact the Editor, William LaMartin, at 821 S. Boulevard, Tampa, FL 33606-2904; 813-251-3817; lamartin@ix.netcom.com.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII, Microsoft Write, Microsoft Word, or Word Perfect file to the editor at 821 S. Boulevard, Tampa, Florida 33606-2904 or upload to the BBS (News section of FILES).

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

The use of trademarked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

SECRETARY'S REPORT & MINUTES OF MEETING August 13, 1997

Minutes and Comments by Merle Nicholson, Secretary, Tampa PC Users Group

President Connie Kincaid brought the meeting to order, did introductions and announcements; then introduced Dick Kellerman from *PowerQuest*, who gave us an excellent tutorial on hard drive organization and also the use of Partition Magic, their premier product. The meeting concluded with the door prize drawing. If you weren't there; you missed a very valuable, educational meeting!

Connie opened the meeting at 6:30 sharp after a half-hour "networking" period in the computer lab at MOSI. After officer introductions, Connie asked about visitors and discovered we had five this month. Two heard about us through our web site (way to go! webmaster William LaMartin), two from flyers at Barnes and Noble (and a Way to Go! To Bruce Register too!) and one as a guest of a member. (Sorry, I didn't get the member's name, but a GoodOnYa, whoever you are!)

Connie announced a new bulletin board for exchanging information, job posting and items for sale. This new BBS is a … board … where we pin things on, and it will be available every meeting. Thanks to helpful member Ken Boyd and for the direction signs too. Nice job, Ken!

In another announcement we will take comercial advertisements in the monthly newsletter at new inexpensive rates.

Dick Kellerman, of PowerQuest, is a former President of the Tampa Bay Computer Society and now does presentations in Florida. As you will see, he is a wealth of knowledge on this subject and knows his excellent product very well.

I have to say that I'm an owner of Partition Magic version 2, and have used it very successfully several times. I was looking forward to seeing what the latest version 3 does, and deciding if I should upgrade. I should, and I did.

To summarize the usefulness of this product, it is a tool that does a great many things for your hard drive; Reclaim wasted space on the drive through non-destructive partitioning; Includes Boot Manager to run multiple operating systems; and organize or reorganize or move your data. (BUT … if you are comfortable with DOS or Windows Defrag and Scandisk, and don't own a large drive and don't intend to at least for a while … you don't need this product.)

The program's main feature is managing multiple partitions

(Minutes.....Continued on page 3)

WebTurbo

by Larry Anders, Librarian,
Tampa PC Users Group

If you're like me, there's never enough time left in the day to "play" on my computer. I use my computer everyday in my work, but I still get enjoyment playing with it whenever possible. Obviously, one of the most popular things nowadays is the Internet, because of the vast amounts of FREE information there just for the taking. But the problem is that there is too much information and it's really difficult to sort through it all. Well, now there's a FREE utility out there to help you wade through all this information. It's called **WebTurbo,** and it's available for the downloading.

What is it? WebTurbo allows you to query six of the most popular search engines at once using "smart queries" to quickly bring back more relevant results than if you used each search engine directly. WebTurbo identifies results delivered by each search engine and removes duplicates from the list. You can click on an individual search result, enter a URL (Web site address), or select a bookmark, and WebTurbo uses its hypersketch outline technology, and it will rapidly deliver previews of the contents of the selected Web page. These previews are presented in an intuitive outline format and are not just hyperlink lists or the first few characters of the page like most other search utilities I've used, but meaningful summaries of the page.

WebTurbo allows you to quickly preview your findings, letting you see the contents and links of a page in outline format in a fraction of the time it takes to load the entire page. When you find what you want, double-click and the full page appears. It has a side by side preview frame and page view frame that lets you view your search results and previews at the same time you review your Web pages. Double-clicking on an item in the preview frame loads the underlying Web page in the page view frame. The preview frame is always visible as you view selected pages, so you don't lose your search results and previews, or forget which pages you've already seen. You can submit searches on related topics simultaneously. For example, a query about two sub-topics such as "money" and "more money" yields results for both, organized by sub-topic. (Bill Gates' name would probably come up several times in a search like that.) Your search results and previews are organized into topic folders with each folder containing search results and previews on the specific areas of interest to you. You can move between topic folders to quickly compare information between them. You can save the topic folders (with their search results and previews) and retrieve them later for further browsing.

System Requirements: Intel-based PC or 100% compatible, Windows 95 or Windows NT 4.0, Netscape Navigator 3.x or higher, or Microsoft Internet Explorer 3.x or higher; Disk Space: 4MB; Memory: 8M of RAM; Screen Resolution: At least 800 x 600 screen resolution recommended.

This software comes with a tutorial to get you up and running real quick. You really can't beat the cost!

http://www.webturbo.com ◆

(Minutes.....Continued from page 2)

on your drive. It will divide your drive to reduce your cluster size and thereby return up to 30% of your disk space back to you. It will readjust the partition sizes afterwards if needed, all non-destructively. It now handles Windows NT's NTFS, O/S2's HPFS and also the Windows 95 FAT32 format. It even will convert partitions from one format to another.

Dick described the structure of a hard drive better than anyone I've seen. He had slides that illustrated the terminology and structure; a drive can have up to four primary partitions, and only one can be active at a time, the others are hidden and are used for multiple operating systems. (I didn't know that!) You can then define one extended partition, and then define as many logical partitions inside the extended partition as you have drive letters available. Very simple.

Something else new is the ability to move software applications from one partition to another! That's a real accomplishment, and a very valuable one at that.

Dick demo'd the product on his own hard drive and showed us the good user interface, designed to do all this with an easily understood graphical interface. He then talked briefly about another product: DriveCopy. DriveCopy is used to … guess what … copy hard drives. It does that in a flawless manner so that you can then switch hard drives in your system and make the new one a primary drive, a fairly common need that just wasn't previously possible.

Dick then concluded and offered a special price on both products. He brought a box full of them and did some very brisk sales. Thanks to Dick Kellerman!

After the break, we held the door prize drawing. Bruce Regis-

Grabber

by Larry Anders, Librarian,
Tampa PC Users Group

Grab USENET news attachments the easy way.

Along with my review of WebTurbo, on page 3 in this newsletter, this is another review of a software package designed to make your sorting through vast amounts of data on the Internet much easier and faster. Another area of the Internet that is loaded with information is the USENET (the collection of newsgroups). One of the main problems with USENET is the proliferation of "spam". Spam is generally an article that does not belong in that group. It is anything from chain letters, to ads, to pornography and anything else unrelated and unsolicited. Well…. guess what? GRABBER has a way to handle that unwanted spam, but that's later.

What is GRABBER? Grabber is a tool to allow a user to easily collect attachments to USENET news articles without having to use a newsreader. Sounds, pictures, movies can be automatically *decoded* and stored without much effort. I have always had trouble decoding files. I installed this program, read the tutorial and was up and running it in less than five minutes. And, believe me, the USENET has never been one of my specialties.

The first time you run the program it asks you for your mail server name, which you get from your preferences section of your browser, and for your user name and password, if required for your server. Once the setup is complete, it then downloads the newsgroup headers, and, with a dual window setup of Newsgroup and Group, you can choose to download the entire group or just one article at a time. There is a different icon associated with different types of articles, i.e. attachments or text, complete multi-part or incomplete multi part. Just read through the list and click on the ones you want to receive. If it is a rather long list, just let it work in the background while you work away on something else.

As I mentioned previously, the biggest problem with the USENET is the spam. This reduces the enjoyment of USENET if you have to download 100 files to find 5 of what you want. GRABBER tries to address this by attempting to help you avoid the other 95 (and hence save connection time, which will make your fellow user happier if he/she can download his/her articles faster because you're not tying up the bandwidth, and so on).

The simplest way to avoid spam is once you find a piece you're not interested in, do not collect any articles from that person again. Simply clicking on the *Kill Person* button will add the author of the selected article to the exclude list. No articles will be collected from this author again. This is also good if the person posts articles or attachments that are not of interest to you. Sometimes, though, the better spammers post under a different name all the time. But they usually post from the same originating domain. GRABBER collects the origin of the mail (and this can't be faked by the sender) and puts it in the article list. Simply clicking the *Kill Site* button will exclude any articles from the selected articles origin. *But watch out for public ISP's as many people use them and they could also be "killed".*

GRABBER also logs details of each file or article downloaded. The user can then use the *Browse button* to show the Browse window. The browse window can be used to hunt down the senders and origins of already downloaded files or articles. The Kill Person or Kill Site button can then be pressed to avoid more spam from them.

GRABBER isn't free…but almost. This is Shareware at its finest and the registration fee is only $15. I don't think you could find an equal off the shelf for that price. The downloaded copy is complete but limited to 30 uses. And that is more than enough for you to decide that this is an indispensable tool. The primary requirement is access to a newsgroup. This software comes to us all the way from Australia but you'd never know it when you're online. Ain't the Internet GREAT!

For more information on Grabber, go to:
http://www.trontech.com.au/grabber and **enjoy!** ◆

(Comments.....Continued from page 1)

medium. The IAC offers a simple and cost-effective approach for advertising to a substantial marketplace. It consists of the computer, software, digital camera and an Internet site.

If the small businessman can use the IAC along with its digital camera and software to update the content and photos on his Web page automatically, why can't the TPCUG do something similar at ours? Are we computer experts, or not? Anyway, here is the plan as I conceived it.

Several members have voiced a desire for a TPCUG discussion group at our Internet site, which would be similar to the Main conference on our BBS where members read and leave messages. To those familiar with the Internet, it sounds a lot like a Usenet newsgroup, doesn't it. But to have a newsgroup someone would have to go through whatever procedure is required to get the OK for such a thing and then set it up. Thus, I don't envision that happening anytime soon. I often wonder, though,

Corex's CardScan 300 Plus

by Eric "The Viking" Hirtriter, Houston Area League of PC Users

Editors Note: The author contacted me after seeing the newsletters at our Internet site and asked if we accepted articles from members of other user groups. I said we did if we had room after using our own member's material. Well, this month we have room and are happy to have a guest writer.

Spend too much time after networking typing information from business cards into your contact manager program (e.g.., Goldmine 3.2)? Want to save a lot of time? I ran across this device with software that can reduce data entry by over half. This should increase a businessperson's, small or large, productivity.

A business card scanner and software combination should be: small, able to scan any business card, run as a Twain-compliant device, use a parallel port for the major compatibility, have a pass-through connector for the printer, and be extremely accurate in scanning in text to reduce manual typing.

The software should be able to do the following: rotate the card automatically to identify text, run an OCR program that will accurately identify the text and fields printed on the card in different fonts, save images to a database, save/export/import/transfer contacts to and from many different Contact Management programs, manually modify the text prior to transfer/export to a Contact Management program, export as comma-delimited ASCII format, zoom in on the business card images to verify text, scan many cards at once before running the OCR, customize database fields for entry, and provide a word/name search throughout the database.

Corex's CardScan 300 Plus: It can do ALL the items above and MORE! I connected the CardScan 300 to the parallel port on the computer and loaded the CardScan software. It was very easy! I then called up Goldmine for Windows 95, a great contact management program which I use, to be in the background. I inserted a business card into the scanner and it automatically started to scan. The image was saved automatically and asked if I wanted to do another before the OCR was run. The OCR feature records the characters in digital form into an electronic simulation of a good old desktop Rolodex, sorting the data by name, title, address, phone and fax numbers, even e-mail address. After checking the text for accuracy, which it was most of the time, I transferred it to Goldmine with only two problems: it didn't put the phone extensions and country addresses, other than the United States addresses, into their respective fields in Goldmine version 3.2. Corex is currently working on a solution. However, I very easily changed them manually and then transferred them. It also has the ability to transfer to over 25 different contact management programs and/or versions.

CardScan 300 Plus' additional features include: its own backup, drag and drop text, supports vCard and Twain standards, dialing capabilities with TAPI, smart zoom, password protection for each contact file and the ability to share contact files over a network, e-mail capabilities, ability to browse Web sites, synchronization of files to the latest update, and the software can be used by other scanners.

The ONLY other area to worry about is the ability to scan very specific types of cards. CardScan only has a problem with text printed on very dark or speckled paper, very small text or light printing, text printed in script or stylized typefaces, text embedded in logos or graphics, text printed diagonally, and text printed both vertically and horizontally on the same card. None of the other products can do this to date. This only affects ~15% or less of all cards.

Special Features:

- CardScan 300 Plus is a 32-bit application designed to run on Windows 95
- It takes advantage of advanced features in Windows 95 such as long file names, tabbed dialog boxes and OLE 2.0.
- CardScan requires a Windows compatible network that supports file and printer sharing,
- CardScan for Windows 3.1 requires a Hayes-compatible modem. CardScan for Windows 95 and Windows NT 4.0 requires a Telephony API (TAPI) compatible modem. (Most Hayes-compatible modems are also TAPI-compatible)

System requirements:

- Intel-compatible PC with a 486 or Pentium processor,
- Microsoft Windows 3.1, Windows 95, and Windows NT version 4.0,
- 8 MB of memory, 16 MB is recommended,
- 12 MB of free space on a local hard drive,
- When using Windows 3.1 as your operating system and having exactly 8MB of RAM in your computer, CardScan also requires a permanent swap file of at least 6MB.

(CardScan.....Continued on page 7)

(CardScan.....Continued from page 6)

The CardScan 300 Plus is very accurate! It even associates images of the cards with the computer records, giving you a fallback when the scanning process fails. CardScan 300 Plus is very good but needs a little more work on the card reading capabilities to make it GREAT! I have been told a new release to improve this will be available in August/September 1997!

To purchase this terrific device with software, call Corex at 1-800-942-6739 and mention "HAL50", to receive a HAL-PC discount, and you will only pay $249.00 plus shipping. If you just want the software, the HAL-PC price is $79.00 plus shipping.

Corex Technologies Corp., 130 Prospect Street, Cambridge, MA 02139, (617) 492-4200 , http://www.cardscan.com ◆

(Comments.....Continued from page 4)

what would happen if a group of individuals, like us, looked over the 15,000 to 20,000 Usenet newsgroups, found one that had little or no activity—I have seen many such—and sort of took it over. That is, the group just started posting their messages to it. I suppose someone somewhere started the thing and might object to all the off-topic messages; however, it appears that there are some newsgroups out there that are basically orphaned and are, thus, candidates for adoption—but not by us, since I hatched a different idea.

My idea is as follows. Most of you have probably seen, if not filled in, the survey I have at our web site. Such a survey form can easily be turned into a message posting device, where the first few input fields are for your name, date, subject, etc., and the last much larger input field is for your message. When you submit your message form, the data is put into a comma delimited text file on the server.

Now, all I need do is write a program that on a regular basis, say, every hour, will do the following:

- Connect to the Internet and, using File Transfer Protocol (FTP), retrieve this data file from our Internet site.
- Add the newest data to the older message data and turn all of the data into an HTML file that, when viewed with a browser, will display all the messages in order with the latest at the top.
- Again using FTP, send this HTML file up to our Internet Site to replace the older one there.

I am sure all you programmers already have the program written in your mind. Well, it has taken me a bit longer. First, I wrote a Visual Basic program to turn the message data into an HTML file. Here is what the data for a typical message looks like:

```
"William","LaMartin","lamartin@ix.netcom.
com","Yes","August 24, 1997","Setup","At
present I am updating this page manually.
I have to FTP to the¶
site, get the message data, then on my
home computer I run a program¶
to turn it into an HTML file, then FTP it
back to the Internet site.¶
¶
I will now try to write a program that
automates that process. Then we¶
can update the site every, say, 30 min-
utes. When I have done that we¶
can "beta" test it all with the other
members."¶
```

The main problem here is dealing with the carriage return symbol ¶, which could either represent the end of one message data packet or just a line break in the message field of a message data packet. But that's what programming is all about, and once that is figured out, the program yields the html code

```
<P>message  <B>9</B>
<P>From <B>William LaMartin</B><br>
At <B>lamartin@ix.netcom.com</B><br>
On <B>August 24, 1997</B><br>
Concerning <B>Setup</B>
<P>At present I am updating this page
manually.  I have to FTP to the<BR>site,
get the message data, then on my home
computer I run a program<BR>to turn it
into an HTML file, then FTP it back to
the Internet site.<BR><BR>I will now try
to write a program that automates that
process. Then we<BR>can update the site
every, say, 30 minutes. When I have done
that we<BR>can "beta" test it all with
the other members.
<P><hr align="left" width="80%">
```

And when your browser displays this, you see:

message **9**

From **William LaMartin**
At **lamartin@ix.netcom.com**
On **August 24, 1997**
Concerning **Setup**

At present I am updating this page manually. I have to FTP to the Site, get the message data, then on my home computer I run a program to turn it into an HTML file, then FTP it back to the Internet site.

Your Tax Dollars at Work for You

by Don Patzsch, Tampa PC Users Group

I want to tell you about how your tax dollars are used for extremely worthwhile projects. Often we hear of waste in government spending, but read this and then check it out on the Internet for yourself.

Back about thirty years ago, we were in the cold war period. DARPA, the Defense Advanced Research Projects Agency, started paying out grants for research in computer graphics and virtual reality.
DARPA has been awarding these grants for all these years. Why?

- To improve the military. For example improving all the instruments on a fighter plane dashboard.
- In order to accomplish that purpose, many little research grants must go to many companies! Why?

To understand this, I want you to think for a minute. FM radio operates at a frequency of 88 to 108 MHz. Now the CPU chips are operating at 300 MHz. 300 MHz antennas are very short, and so the wiring on a chip could be an antenna and radiate the energy into the air. The zeros and ones would not make it to the other end of the wire! Radiation is always present in small amounts so your computer cabinet is a shield against that, but you hear the radiation when your computer is very near a TV set that is on. So these things must be taken into consideration. This would be just **one of the grants - i.e. study the wiring on a microchip to reduce radiation of radio waves.**

The people who make motherboards use the technique of layers. To make wires go to each and every item on the motherboard without crossing another wire (creating a short circuit) they use four to five layers to make up the board. Now at 300 MHz they have to run the wires in a special way or they find that the wire is an antenna and it radiates the energy into the atmosphere, rather than moving the zero's and one's from the one end to the other of that wire! The people who design motherboards, CPU's and other computer components have to be very well trained, either at a university or on the job. **Another grant - determine the routing for wiring on a four or five layer circuit board to minimize radiation.**

Each of the following processes is improved because of grants for military needs, and of course the private industry people benefit from these military grants by using the processes developed by the military through DARPA.

- As the CPU becomes larger (more millions of transistors), the operating voltage becomes smaller, less than 3 volts now. They must reduce the voltage to keep the power expended down to reasonable values, especially for notebooks that are battery operated. There must be a "limit" somewhere, and by the time we reach that, someone will be making components from glass or some other material. IBM is right now researching the use of a solid cube of material to use it as a hard drive.

- Sometimes we need to stop and elevate our sights. At first we talked of 10 Mb (mega bit) Ethernet (network cards), now with financial help from DARPA we are thinking not of 100 Mb but 1 gigabit per second network cards. Without that infusion of cash, and the suggestion of major improvements, we could be stuck in one place (10 Mb) network cards for a long time.

- When you use telephone wires to interconnect the Internet, you can have electromagnetic interference. Lightning or "transients" can place a magnetic field around the wires and induce foreign voltage or "noise". One way around this is to use glass fibers to transmit the signals. Glass fibers are not affected by magnetic interference.

Now think for a minute. Which country leads in computers? Japan, Europe? No, the U.S. leads, and the reason is that the government starts out a research project, maybe for the military as DARPA does. Private industry picks up the ideas, and private industry adds more billions to the total amount spent on research. That is what has kept our country in the lead.

I will make this brief. In 1995, the Internet (NSFnet) backone was shut down and the Internet given to private operators who interconnected at a series of Network Access Points, "NAP's". That is our present INTERNET. The National Science Foundation then issued another contract to build a Very High Speed Backbone Network, VBNS. The goal is a 2 Gbps network. In other words, a separate NEW very FAST Internet is under construction right now. [WOW, isn't that something?]

Vocal-tec, the Internet telephone program was written in Israel. We don't have a monopoly on software writing, but most countries learned their skills here. Our U.S. companies have very large groups of programmers working all over the world. Scotland has many large groups of programmers working for

(Tax Dollars.....Continued on page 9)

(Tax Dollars.....Continued from page 8)

U.S. companies. So do Israel, Russia, and also India. Still, there is a real shortage of computer programmers. Maybe after the year 2000 problems are solved, things will slow down a little in this category.

Lets end this by saying that the ARPANET and the TCP/IP protocol developed by DARPA in the early 1970's has evolved into what we call the Internet!

What else has DARPA done?

- A disk drive gets a big boost in capacity by read/write arms fitted with microscopic inertial navigation arms that position the heads so accurately data can be packed many times more densely.

- Two million mirrors, each one-fifth the diameter of a human hair, are mounted on a memory chip and act as mobile digital switches. Each controls one pixel for large, high resolution displays. You see this at MOSI each month.

Want to see dozens more examples? Go to http://www.darpa.mil. ◆

(Comments.....Continued from page 7)

I will now try to write a program that automates that process. Then we can update the site every, say, 30 minutes. When I have done that we can "beta" test it all with the other members.

So far, so good. Next, to write a visual basic program to connect to the Internet and use FTP to download the message data and then to upload the completed HTML file after it has been generated. This cost me several hundred dollars since I had to upgrade from Visual Basic Professional 4 to Visual Basic Professional 5 to get the FTP programming ability.

As with any new programming tool, I made a few false starts, but I finally got my program up and running. And it was a real pleasure to watch as the program connected to the Internet, then to the tbos2cla.com server where our site is stored, downloaded the message date, created the HTML Message file and uploaded it back to tbos2cla,com. A quick check with my browser at the test page there (I have not provided a link to it yet since it is not yet ready for prime time, as you will momentarily read) revealed that everyting was working fine. And I went to bed happy.

As with all well constructed stories, you know that the next day brought disaster. And it did. The program would not FTP to the tbos2cla.com server and returned the message "HOST NOT FOUND". Some checking with the FTP component of the program revealed that it would not connect to any FTP server requiring a username and password—even though I programmed them according to the Visual Basic specifications—and in the same manner that had worked the night before with ftp.tbos2cla.com. The FTP component, however, worked perfectly with any FTP server that allowed an anonymous longon, like ftp.microsoft.com does, for example.

Believe me, I have pondered this problem a great deal to no avail, except for a lack of sleep and a headache. I am not even sure it is a Visual Basic problem . It may be a Windows 95 problem, since my son installed my program on his laptop running Windows NT Work Station, and it performed flawlesly. Oh, for a Visual Basic SIG with someone who knows the subject better than I. I have checked the Usenet Newsgroups, the Microsoft Knowledge Base and, of course, the Visual Basic help files and come up with nothing.

So, for the time being the TPCUG Discussion Group on the Internet will have to remain on hold. Updating it manually, while it only takes a couple of minutes, would be difficult for me to do at timely, regular intervals.

Now, you might ask why I am going to all this trouble when, as the possessor of Microsoft FrontPage, I have the ability to create such a discussion group using this program. Unfortunately there is one problem with this. To use a FrontPage created discussion group on an Internet server, the server needs to have what are called Microsoft FrontPage Extensions installed—and such extensions don't exist for OS/2 servers—and the tbos2cla.com server where our web site is located is such a server. The extensions, to the best of my knowledge, only exist for Microsoft 95, NT and UNIX servers.

I hope the above was not too specialized for most of you. It will give you some idea of how I spend my spare time. We all need a hobby, and programming is mine. With the Internet being the newest item to come along, it is only natural that we programmers have a turn at seeing what can be done with it. Right now, though, I have had to put all such attempts on hold so as to do a little toward my real occupation and also toward the completing of this newsletter. After I catch up on those two items and do a little work around the house, then I can return to the mystery of the inoperative password and username.

If you have been reading the newsletter regularly you will have noted that over the past year a reliable group of our members have been contributing articles. You could almost say we have a stable of writers. I am very appreciative of that, and I invite any other members out there who have tried a new piece of software or hardware to put your thoughts down in your computer and email them to me. ◆

Special Interest Groups

Microsoft Access SIG — Canceled (temporarily we hope)

Communications SIG

This SIG meets the first Monday of the month at 6 PM at the Reflectone Building. **Directions: Proceed west on Waters from N. Dale Mabry across the railroad tracks, about 1.5 miles, take second left on Savarese. Proceed on Savarese until you reach the Reflectone building. Use the north door.** You must sign up to get on the list and to get by security. *Contact Charles Howe: at 968-1207 or HOWE@INTNET NET*

Genealogy SIG

This SIG meets the second Monday of the month at 7:00 PM at the Museum of Science and Industry. *Contact Jenny Lind Olin at 960-5723 or Ford Bond at 987-6309 .*

Internet E-Mail for the UnConnected!!

by Merle Nicholson, Secretary, Tampa PC Users Group

Do you need Internet e-mail? Do you need more e-mail accounts in your family? Do you want it free of charge? It's here, it's good and it's free. It's called **JUNO**, and it really works well. It has some very minor disadvantages, but they provide good software and good service. I know eight or so people who are using it, including my spouse and oldest son, and I haven't heard one complaint. I've used it some and like it. It's not a substitute for full-blown Internet access, but if you just need Internet e-mail … it's terrific. I've been asked this question … can I send e-mail to someone that's not on JUNO? Yes. It's Internet e-mail just like any other. You send and receive to any e-mail account … anywhere. Here's how it works.

The company provides a very good small e-mail software package free of charge. They provide local access numbers - more than 400 all over the country. All you do is get the software from their Web site on the Internet or from a friend or from JUNO itself . They encourage you to redistribute the software to anyone as long as you give it away in its original form. The current version is 1.38, by the way, so you can check if you're giving away the latest version.

It's paid for by selling advertisements that every user sees whenever he uses the software. In my opinion, the advertisements are relatively unobtrusive. You may get one that you must clear out on startup, but it's just a mouse click and it's gone. Otherwise you see various adverts in the top quarter of the program. That's it .. no hardship.

The software is what's called an "offline mail reader". You click on a send/receive button and it dials the modem, sends all the outgoing mail you've composed, and checks for any incoming mail and then logs off and disconnects the modem. It also downloads all the advertisements it displays. But they're small and it goes quickly.

It manages multiple users. So each member of your family can have his or her own private account. When you start the software you select who you are (in the list of users) and (optionally) provide your password. It manages multiple inboxes and outboxes, one for each account. Also, you sign up online and even find out what your local access number is, identify your modem and a whole bunch of other ways to customize. You can arrange to send software to a friend within the program too by notifying JUNO through e-mail or calling them. They'll send a diskette!

You can send an e-mail message with your friend's name and full postal address (including zip code) to signup@juno.com. You can send as many names and addresses in a message as you like. They'll send you a reply to let you know your message has been received. OR Call 1-800-654-JUNO (1-800-654-5866) and give them your friend's name and full postal address (including zip code). They'd prefer e-mail, since that's the easiest way for them to handle a large volume of requests.

Now, some final observations about the program. It doesn't do file attachments. It doesn't use the Windows 95 modem configuration. It uses its own, just like you used to do with Windows 3.1. It does have what looks like a comprehensive list of modems. It installs for Windows 3.1 and Windows 95 from the same executable, so I suspect (I don't really know) that it's a Windows 3.1 application. But it has worked flawlessly for us. Obviously it must share the modem, and a modem does one thing at a time. My wife must check first to make sure the modem isn't connected to our Internet provider before she uses it. And yes, she can use our Internet account for mail, but she likes JUNO. It's HER mail.

(JUNO.....Continued on page 12)

MEMBERS HELP-LINE

The following phone list is provided for our Tampa PC Users Group members in an effort to establish local support for those frustrating times which we have all encountered while using our PC's. Please note that these are members that have volunteered to help you; treat them in a courteous manner. Be sure to ask if it is convenient for them to help you now, or if you should call another time. It would also be helpful to have your documentation and have it handy when you call. (Don 't expect help if your software is an illegal copy or you do not have documentation!) TPCUG is not responsible for the information or advice provided by volunteers. Volunteers may or may not be experts in the subject matter. You are on your own with any advice received. Be aware also that some of these volunteers may be consultants in their area of expertise. If you are interested in volunteering to answer members' questions, either leave a message on the BBS or fill in the forms provided for this purpose at the meetings.

Microsoft Internet Explorer 4.0 preview 2 & Office 97

by William LaMartin, Editor, Tampa PC Users Group

Partition Magic Come see a very useful product demonstrated this month. If you ever need to re-partition your hard drive and don't want to delete your data, this is the product for you. It certainly saved me from grief when I failed to remove a NTFS partition from the drive when I uninstalled Windows NT from a computer. There I was with Windows 95 now installed and no way to do anything with a good portion of the hard drive. FDISK was of no use, but Partition Magic did the job. They also have, I believe, a useful hard drive copy program. That should come in handy when you want to replace that 1 GB drive with a new 4 GB drive.

Internet Explorer 4 The more I make changes to my computer setup, the more I see why some people never make changes to their computer setup. I downloaded and installed the newest "preview" (not to be installed by the faint of heart) version of Microsoft's World Wide Web browser, Internet Explorer 4.0 preview 2. It is far more polished than preview 1; however, it is still probably not finished enough for those among us who can't tolerate a few things not working correctly. I will briefly give my impressions of the program and invite you to read the review of Netscape Communicator in this same issue. I can't make a comparison since I have not used the new Netscape program.

If you so choose, it can function as a shell for Windows 95, making changes in the way Windows Explorer functions and the appearance of your desktop. My choice was the standard Win 95 desktop and windows Explorer functioning as originally, except that I did customize one folder as an HTML page just to see what was going on. I wanted to keep the possibilities for problems at a minimum—remembering preview 1. Thus, I did not choose the active desktop,

Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

SECRETARY'S REPORT & MINUTES OF MEETING July 9, 1997

Minutes and Comments by Merle Nicholson, Secretary, Tampa PC Users Group

Mike Hodges brought the meeting to order, did introductions and SIG group announcements and some informal polls. Mark Cassetta and John Reis from *Productivity Point International* gave a talk on "Maximizing the Use of Your Computer". After the break, we held the door prize drawing and concluded about 8:40.

Mike Hodges, our Vice President filling in for the running-late-Connie-Kincaid did the welcome and introductions and SIG announcements. He then conducted some informal opinion polls to help out the board with information for future direction of the club.

Productivity Point International provides computer training services from five centers in Florida - Orlando and south -on a variety of subjects and products. From their catalog, they do 1 or 2 day sessions in desktop training … publishing, database, spreadsheets and word processing; and also longer - 5 day - Microsoft Technical training; operating systems, networking and application development. They have a very slick, impressive catalog that they handed out to everyone.

Mark Cassetta gave a PowerPoint-guided talk on "Maximizing the Use of Your Computer", discussing:

- PC configuration
- Key Components of a PC
- What you'll need in 3Q 1997 *(in the way of equipment)*
- What you want to do in 3 months, 6 months and 12 months and how to Achieve your Goals *(Get more training, of course!)*
- Put Magic in your Computer
- Questions

Mark, with John Ries helping out in the background, gave an interesting talk on the components and use of a computer, leading up to the training they provide. He unfortunately had to compress the training discussion to be very short. But there was some good interaction from the club members during the course of the presentation., where some of our computer-head members were quick to pick up on any incorrect piece of information regarding a particular processor. The meeting was stimulating. Thanks, Mark and John.

We had an eclectic selection of door prizes this month: Ford and Bambi Bond won CA Tax and CA Simply Money. Kevan Sheridan a CD Homicide game and Clark Evans, a Win Jack game. Roger Waters, Will Gobel and Ken Boyd won cups. ◆

COMDEX '97 in Atlanta

by Don Patzsch, Tampa PC Users Group

Editor's Note: Don sent this in for the July newsletter, but your editor misplaced it, so here it is one month later than it was meant to appear.

What would you see if you went to the Atlanta COMDEX in June of 1997?

We go to a motel at one of the four ends of the MARTA system. MARTA is a train that takes you from your motel to the COMDEX. It is a very smooth riding train. We think we save money and our sanity by staying out of town and it is great to have MARTA, a cheap way to get downtown in a hurry!

The first thing we noticed at the 1997 Atlanta COMDEX is that there were very few 3.5 inch floppies given out. At previous COMDEX there were many thousands of them given away. Now it is all CD ROM's. Do you want a CD ROM that gives you the ZD tests on your particular computer, comparing the speed of the Computer to a "standard"? Two CD ROM's are given to you at the ZD booth. Ziff Davis publishes PC Magazine and many others. The two disks are Winstone97 and Winbench97 and also 3D Winbench97. On the disks, they have the URL to go to for updates.

Would you like to understand what memory is all about? There are many booths with memory people inside. Want to know what interleaved memory is? Page mode memory? Row and column memory? WRAM? EDO RAM? Any questions can be answered by asking these people or letting them demonstrate their wares. Gold or tin plating, why? Get a few of their pamphlets on what memory is and does. Go to Rambus on the web if you want to see the new 665 MHz memory, You use 60 or 66 MHz in your latest computers.

The magazines So many magazines have booths at COMDEX you can't pick up a free copy of all of them. PCWeek, PC Magazine, and all the Reseller magazines are there. Don't pick up a copy of Computer Shopper early in the morning and carry it all day. Wait till you are ready to leave for the night.

The foreign companies Hong Kong, and most of the Asian companies have representatives in booths. They have literature on their countries and also how to sell to them through various means. They want to sell to you also. You can see motherboards and other boards and hardware that they sell, as well as their pricing schedules. Take home catalogs on anything you think you want next. Let me give you an example. Hitachi has a booth in each of the football field size rooms. One is on hardware; they have a complete line of monitors out for you to look at, and also computers. In the other section, they show their software booth. (Some people do not realize how much software is produced in other countries.) You see it here.

Have you been a beta tester for a few companies? I went to the **PowerQuest** booth and the man I saw recognized my name on my badge. He was the person I talked with via email during the testing of the Drive Copy program. You may be surprised at what they tell you about the company and what they have on tap next. Anyone can be a beta tester, you only need to know your limitations.

At previous COMDEX, they had lots of "girlies" dressed or not dressed, in costumes. There were less girlie shows at this COMDEX, but there were the usual number of people doing "magic tricks" One guy really mystified the audience. He had someone from the audience put on handcuffs and get into a trunk. During the show, he almost instantly was in the trunk and the man from the audience was out of the trunk. Most surprising! And of course, there were prizes given out. But the big one, a large combination surge suppressor and battery backup; you had to come back at 4 P.M. to win that.

Adobe has a booth. They really show you how to handle photos and what their software will do. I won a book at the end of the demo. Others win very expensive software after each demo.

Like to play miniature golf? Putt the ball into the hole and win a very neat folding umbrella or other prize.

Then there is the **Curtis Mathis** booth. I watched and talked with many of the people in this booth. They have a "Web TV" set up; in fact, they have maybe ten of them. Not one of the demonstrators could make it put email on the screen for me! For some reason, their system did not work at the show! You can go to any Curtis Mathis showroom here in Tampa and see it work, though.

Now for the real show. **Corel** has a booth. The screen size is about eight feet high and maybe twelve feet wide. The person who talks has a radio mike, and can move around while she tells you about Corel Draw7, and Corel WordPerfect version 8, and Quattro Pro, and Presentations, and Corel's Webmaster.

(COMDEX.....Continued on page 4)

(COMDEX.....Continued from page 3)
She makes up home pages while you watch, she shows you the latest and the greatest and you see just which keys to push to get that animation or the post card you want in Corel Draw etc. We watched this demo at least three times, because I wanted to learn the latest changes in Home Page construction and also in the WordPerfect manipulations. Mary Farrell sure knows how to key in the stuff to get the best out of Draw and WordPerfect and also the Internet package, Corel Webmaster. The demo was to be in Tampa downtown on June 19, I believe. Corel is always the hit of the COMDEX for me.

Laplink shows you how to use the Laplink program. They gave three 3.5 inch floppies with a complete copy of Laplink for WindowsNT to anyone that asks for one. It times out after a period of time.

IBM and others gave away a notebook computer.

USB, a new bus. It is called the **Universal Serial Bus**. It is on many of the new computers, and instead of having your keyboard and all the things like your external modem, monitor, etc-plugged into separate connectors on the back of your computer, you can daisy chain over a hundred items using this system. I have been watching it develop for about three years. Now it is here. You can get info from the Intel people who are here, or from many other companies who are in this same booth, and they all have literature for you. Perhaps this is the biggest single thing to hit your computer in years. Rambus is next.

I could go on for a long while, but maybe this will give you an inkling of what you can see and do at COMDEX, Atlanta. Next year it will be in Chicago. If there is anything you want to know about computers, this is the place to meet the people who design and build computers, and also the place to see and hear from your software manufacturer. They will tell you what you want to know. ◆

(Comments.....Continued from page 1)
which turns your formerly fixed Windows background wallpaper into an HTML page that, in addition to your old folders, can contain Java components, links, ActiveX controls, and other HTML pages.

One of the more ballyhooed features is the use of push technology to move information to you automatically. The idea is that you subscribe to a channel—a Web site that has been especially prepared to push its information at you at the specified times you set— e.g. when the content changes, or every two hours from 9:00 AM - 7:00 PM, or once a day. Microsoft provides a beginning list of such web sites with, I am sure, many more to follow. Three I found useful were the Wall Street Journal (not the full fee based online version), the New York Times, and MSNBC. It took we awhile to get used to my computer all of a sudden dialing out on the modem on its on initiative to look for updated content. You can, of course, subscribe to any Internet site in this way, but as best I can figure with the limited time I have to devote to this right now, you only update the immediate page you go to. With channels, however, the update goes as deep as necessary to get past the "headlines" and retrieve the whole story.

So, if you want a little computing excitement, go to http://www.Microsoft.com, find the free download site and have at it. You will first download a "starter" file of about .5 MB which, when run, will then download the actual 23 MB IE 4.0 preview 2 file. With my 28,800 modem connected at 26,400, I received this file in 4 hours, 20 minutes, and the installation went smoothly. This download includes much more than just the IE 4.0 browser and auxiliary mail and news group reader Outlook Express. Before listing the extras, just note that Outlook express provides the ability to add backgrounds, called stationary, to your email. It also permits embedded graphics and sounds. However, whether or not the recipient will be able to see any of

this will depend on the email program he is using. The newest Netscape seems to handle all such messages except for the embedded sound, which is done with a Microsoft only supported HTML command.

With this full download you will also get NetMeeting, which allows you to hold voice and video conferences, share software applications, chat, and share a whiteboard. You also get the Web page editing program WordPad (a scaled down version of FrontPage), the Web Publishing Wizard, NetShow 2.0 which allows you to stream multimedia across the Internet and intranets without eating up a lot of network bandwidth , Personal Web Server and a few other odds and ends. If you don't want all these extras you can get by with only about a 15 MB download.

Office 97 Wanting to take advantage of a good price on Microsoft Office Professional 97, I bought the CD and am now writing this in Word 97. And that introduced another problem: Microsoft Publisher 95, the version I have, will not use Word 97 as its auxiliary text editor; it wants Word 95 or Word 6. Another example of how a change causes problems. But this gave me the opportunity to experiment.

You may recall that when I started doing the newsletter, I did it

Software Review

Netscape Communicator

by Larry Anders, Librarian, Tampa PC Users Group

As in the past, with some of my articles, this is more of a summary of the good stuff than a full-blown review. Quite frankly, if I didn't think this was a good product I wouldn't waste your time or mine discussing it. Any of you that know me, know that I am an avid supporter of Microsoft and Microsoft products, because they have done more to make computing fun and enjoyable for me than anyone else out there…… until now.

Like most of you I wasn't an early user of the Internet. I started after the graphical user interface (GUI) came along. I tried them all in the beginning but settled on Microsoft's Internet Explorer (IE) primarily because it was feature-rich and designed to run specifically under Windows 95. And FREE! The one thing I never liked about IE was that the e-mail program was not purely integrated. It takes too long to start up and shut down e-mail in IE.

I recently began publishing web sites and learned that there is a difference in how each web browser displays a web page. So to make sure that the best possible displays of my web pages were presented I had to view my sites in the various browsers. During this process I started using the new Netscape Communicator and it has become my browser, or actually suite, of choice because it is a collection of software components for sharing, accessing, and communicating information via Intranets and the Internet.

Communicator Standard Edition now includes components for navigation (Navigator 4), e-mail (Messenger), discussion groups (Collabra), HTML authoring (Page Composer), dynamic information delivery (Netcaster) and real-time collaboration (Conferencing). *Communicator Professional Edition* also includes calendaring and scheduling (Calendar), IBM host communications, and Communicator management. Communicator runs on 16 platforms.

Navigator 4 is the cornerstone of Communicator. It has a new, user interface and new technology that makes browsing dynamic web content easier than ever. Navigator 4 comes pre-installed with the most popular multimedia plug-ins (small programs that add functionality to Navigator). SmartUpdate automatically configures and installs new multimedia plug-ins so they work right away without any user configuration. There are currently 154 plug-ins available. Access to favorite sites and Internet searches are just one-click away. With the initial release of version 4 there were security problems discovered, but Netscape immediately plugged the holes. Now Navigator includes open standards-based security features to protect information such as credit card numbers and personal financial data. Data encryption in Navigator 4 protects information as it is transmitted over the Internet. Navigator's tool bar can be customized to your individual preferences including bookmarks for marking favorite sites. There is a new Search button that links directly to a collection of the Internet's leading search engines.

Messenger is a full-featured application for sending and receiving e-mail over Intranets or the Internet. Messenger includes new message-management features that are powerful enough for corporate power-use but easy enough for individual novice use. Open standards-based features, such as mobile user support and online address searching, allow you to access your email from any location and find people anywhere on the Internet. I have two separate Internet accounts: GTE and AOL. I have no problem checking my GTE e-mail while in AOL and AOL Internet access runs terrific under Navigator. Messenger is fully integrated with Netscape Composer, allowing you to create e-mail messages that look like web pages, complete with graphic images - even Java applets. As with all other Communicator components, Messenger includes encryption to protect private communications. A fully integrated spelling checker helps eliminate spelling errors.

Collabra brings the benefits of newsgroups and online information exchange to workgroups, businesses, and corporations and can also be integrated with Internet newsgroups. It's as easy to use as e-mail. You can perform cross-discussion searches for relevant information. With Collabra's filters you can highlight certain postings and ignore others. You can also post forum messages with graphic images and Java Applets. Documents created in Composer's HTML editing environment can be displayed and viewed in Collabra.

Composer is an easy-to-use tool that makes creating HTML-based documents as easy as writing a memo with a word processor. Hypertext Markup Language (HTML) describes how words and images should be displayed on a web page or in an e-mail message. Like a word processor, Composer uses fonts, styles, paragraphs, and lists, and includes an integrated spelling checker. Composer can also publish, or upload, documents to an Internet document server with a single button click.

Netcaster dynamically (automatically) delivers Intranet and Internet information right to your desktop. With "push" capabilities Netcaster enables you to receive constant information updates in the background while you're working on something else. Customize how and when information is delivered to your desktop. Information is delivered in an of-

(Netscape.....Continued on page 7)

(Netscape.....Continued from page 6)
fline cache for faster display. You can "anchor" any web content to your desktop to create a "webtop" environment. Netcaster's offline download capabilities lets you download content and then view it when you're ready.

Conference is a real-time multimedia communications tool. Unlike email and newsgroup communications, which use "store-and-forward" technology, real-time communications happen simultaneously. A telephone conversation, for example, is a real-time communication, while a voicemail message is store-and-forward. With Conference, one or more users can hold a conference call, share a whiteboard, or conduct a text-based discussion as easily as you can send e-mail or read newsgroup postings. Full-duplex audio conferencing is supported. You can send and receive any kind of data, including files, text, and images, in real time. A shared whiteboard provides a central location for sharing images between users. Chat allows users to exchange text messages. File transfer lets you upload and download documents and applications during a conference. With Conference you can send voicemail messages to standard e-mail addresses in WAV voicemail standard.

Calendar (available in Netscape Communicator Professional Edition) is a heavy-duty calendaring and scheduling tool for the corporate environment. With Calendar, you can schedule meetings and reserve conference rooms or other resources, all in real time. Calendar can support more than 100,000 users and is accessible from any Communicator component menu. Keep calendars and schedules private. Access control allows users to specify user access to their personal calendars.

There are also various other assorted utilities included in the Professional Edition such as the ***IBM Host On-Demand*** component that was co-developed by IBM and Netscape that is a cross-platform, Java-based application that uses the industry-standard 3270 protocol to provide Communicator clients with Intranet or Internet access to IBM hosts. Also available is ***AutoAdmin***, which allows IS managers to centrally manage and update Communicator and manage the installation and configuration of client software.

The rest I won't bore you with at this time. Just let me reassure you that this software package can handle anything you can throw at it, and more than likely, it can handle a few things you haven't thought of yet. Requirements are Windows 95/NT, 16 MB of memory, 16 MB of disk space for base installation or 30 MB for all components. You can download a free, fully featured trial copy of version 4.01a from Netscape at: http://home.netscape.com/download/index.html. The software is free for all students, faculty, and staff at educational institutions, charitable nonprofit organizations, and public libraries. For the rest of us it costs only $59. ***Don't miss out on this one!*** ◆

SpinRite

Disk Diagnostic & Data Recovery – As Good as it Gets

By Fredrick Rea O'Keefe, Tampa PC Users Group

UP FRONT SUMMARY:
Product - SpinRite 4.01
Publisher - Gibson Research Corporation
Website: www.grc.com/default.htm
Class - Utility, Disk Drive Maintenance
PC requirements - 100% IBM Compatible PC (XT & up), 1 diskette drive, any DOS version 2.1+, any DOS formatted (12/16 bit) hard drive. Comes on 1 diskette
Street price - available from publisher for $93, or upgrade price $43 (plus tax in CA, s/h included)
Rating (0-10) - 10
Recommendation - This is "required" for all IBM PC owners.

In the "good old days," when we knew that floppy diskette and hard drive media were going to fail, taking data with them, and that this was a certainty; back when we had to "clean" our diskette drives regularly because the diskette media both rubbed off onto the drive heads and eventually "sandpapered" the heads into uselessness -- there came a rescuer. No, not Peter Norton. I refer to the noted columnist Steve Gibson and his SpinRite program.

Don't know the name? Shame on you! Then you don't know that the disk media scanning programs included with Windows (Scandisk), and programs such as Norton Utilities' surface test are light duty and not sufficient. Such programs will detect only the most gross disk media aberrations, often after the damage has been done to your precious data, or to as yet unused sectors. Or when the disk drive is ready to collapse.

Without discussing esoteric disk drive hardware and media technicalities, let me state that only one program can deep-test every bit on a hard drive or floppy diskette, checking for every possible form of weakness. SpinRite not only finds the already shot areas, but those which have weakened and will soon fail, or even those bits marked bad by other programs -- but which are actually good! On the old-time hard drive types (how soon we forget -- MFM, RLL, ESDI), SpinRite is able to test, restore and deep format an entire drive, while preserving or recovering the data. Head drift and fading away or migration of formatting data (track location, cluster and sector start/end location) and your precious data are no longer problems. On newer, huge capacity IDE and SCSI drives, as well as compressed drives, SpinRite works its magic, eliminating problems in advance, preventing drive media recording fail-

(SpinRite.....Continued on page 8)

(SpinRite.....Continued from page 7)
ures from occurring. Fortunately, newer media and mechanisms are greatly improved, with longer MTBF (mean time between failure), and on floppies, very little rub off or sandpapering of the drive heads.

Why use SpinRite if new drives are so good, when you already have a disk utility? Let me clinch the reasons for you by quoting from the small manual: "SpinRite reads and recovers all or most data from completely unreadable hard or floppy disks; Optimizes and resets improper sector interleaves; Renews critical low-level drive formats; … Verifies drive characteristics and setup parameters …" What that doesn't make clear is that various brands of disk drives use techniques to fool DOS into exceeding its limits on drive capacity. All IBM PC clones use DOS to format the drives. Drive mechanisms and DOS use Error Correction Code (ECC firmware on the drive) to account for what the drive or DOS thinks are errors, validly or not. SpinRite is unique in being able to eliminate results of erratic drive error correction schemes and DOS limitations by addressing the drive media directly at the register level. A drive would have to be far off the wall for it to not be completely accessible to SpinRite. Virtually all hard drive and floppy drive interfaces, data transfer, and operating technologies managed by DOS are automatically and effectively handled. SpinRite is unique. (Remember that your drives are FDisked and formatted by DOS in either a 12 or 16 bit FAT (File Allocation Table), regardless of "Windows" or other operating systems. DOS has an inherent limitation of 4.3 GB for a partition. SpinRite tests drives up to that capacity. The limitation is that of DOS, not SpinRite. No, SpinRite does not analyze the new 32 bit FAT, and won't until Microsoft releases Windows 97, and end-users can "upgrade.")

Another unique, "wow" reason to use SpinRite is that it can correct a damaged or incorrect BIOS drive setup parameter! SpinRite determines exactly what the true drive is, how it operates, and lets you know the most efficient parameters. Nobody but Steve Gibson has thought of such a "needed" program. Part of the accuracy is due to reading the actual drive, not relying on the BIOS report or Windows record. "So what?" Even without having been used on your machine, SpinRite can resurrect your hard drive when the BIOS collapses (such as when your power-loss CMOS batteries fail during a power outage), and you can't find the BIOS/CMOS data disk, or the paper records you always keep up to date and available. So it is that you have another potent tool in your arsenal for defending your vital data against the vagaries of mechanical and electronic "betrayal."

Technical users familiar with SpinRite 3.1 know that there are up to 22 individually-shifted test patterns which scrub (write and read) the daylights out of every widely spaced "data bit cell," guaranteeing that every possible media and head function performance factor is tested. Testing under version 3.1 takes hours, but is extremely effective in locating existing bad "spots," soon-to-become-bad spots, and data weakening or damage (including endangered data existing on those spots). Data is analyzed, restored, and moved to proven-safe locations.

When I used older versions of SpinRite for testing at the deepest level on a 486-66 DX with a 350 MB HD, it took overnight and then some before the drive was completely tested. Unfortunately, I don't have the time or an older computer (anymore) to compare various versions of SpinRite. I can tell you that on the 200 MHz Pentium, with a 2.5 GB HD, it took only three hours and 56 minutes (236 minutes) to complete the test! That's 10.6 MB/minute. I'll explain the speed improvement later. Oh yes -- not a defect was found on my hard drive. Nor could I find a defect on any of the floppies I tested, including some old 720 KB diskettes I hoped would challenge SpinRite. Oh, well. It takes four minutes to test a 720 KB floppy, and six minutes for a 1.44 KB diskette. Not bat at all for a thorough write/read rejuvenation of the media.

The excessive time that hard drive testing takes with older versions of SpinRite is one of two major problems. The other, more troublesome problem existing with version 3.1 is a "ping pong effect," that is, unwanted reaction of the drive mechanism's read/write electronics throughout the data channel when subjected to such massive test data flow. This causes, in some drives, some media regions to be erroneously marked bad, then good, and back and forth on subsequent testing. Data is nonetheless preserved. How could this last problem occur? A seemingly admirable quality of SpinRite 3.1 is an absolute intolerance of variation in data amplitude. But, such a variation is purposely forced by 3.1 from use of the long-period test patterns! Then the drive mechanism reacts. This is not an obvious problem, and came to light only with three years of extensive use of SpinRite by observant users and laboratory testing. Back to the drawing boards!

SpinRite 4 designer Steve Gibson rewrote the machine language program to incorporate available research and new and pending drive technologies. As much as I have been able to enthusiastically recommend that users rely on older versions of SpinRite, I can recommend to you version 4.01 even more. Both problems just mentioned have been eliminated. A new pattern testing approach called "short-period" creates the needed weak amplitude data signal for detecting fading media areas, while not interacting with the drive controller firmware. Bye, bye ping pong effect. But, is 4.01 notably faster? Yes. As much as ten times faster. Because short-period patterns are able to test every other data bit cell simultaneously, two patterns alone suffice where twenty two used to be needed! Now, only one "level" of surface evaluation is required to deep scrub the disk media.

(SpinRite.....Continued on page 9)

(SpinRite.....Continued from page 8)
While users have an option of five test parameters (as opposed to the previous seven), the first three use only DOS' pattern testing, the fourth and fifth use Gibson's test pattern. The reason for a choice is that users need to frequently do a quickie "disk scan" with pre-selected actions in case of problems with data: 1) examine the surface (read); 2) recover weak or damaged data (read and, as needed, move data); 3) refresh the surface (all the previous plus write to and read every sector). These three are better in quality than Windows based disk scanning, in my opinion, because they directly address the drives. For the complete testing, using the short-period patterns, levels four and five do all that level three does, plus: 4) locate surface defects not apparent to DOS or the hard drive's limited Error Correction Code (ECC) of 11 bits (SpinRite can read and correct up to "510 bytes out of 512"), and 5) restore to use perfectly good sectors wrongly marked bad by DOS or the hard drive itself.

All that might seem confusing to some readers, but more technical users should be aware of the improvements.

A couple of other points. "DynaStat Data Recovery" is so effective at reading data from a defective drive, and subjecting the unclear portions of data to statistical analysis that almost all data can be recovered intact. By matching known characteristics of a disk drive with the readable or "not readable" data, comparing the subtle variations in magnetic flux of the "on/off" bits on a track, and being able to determine the true location of a track, SpinRite allows DynaStat to reconstruct almost all the otherwise "lost" data. That's as close to a miracle as one can get. This applies to both hard and floppy drives. Do you have an old floppy with archival data you wish you could use, but can't?

In using every version of SpinRite to test or recover a hard drive, one must always boot from a bare floppy, because SpinRite works directly on the drive without intermediate programs. Other drivers and background software would interfere. New with SpinRite 4.0, to test a floppy, you may run from Windows 95 using the "Exclusive DOS Mode" without requiring a clean boot from a floppy. The SpinRite "pif" program (desktop icon) will close all running programs (except comm programs which you must first manually close) and remove Windows, then move to the exclusive DOS mode, run SpinRite (you must select the floppy drive to test) and, when done, warm boot Windows for you.

As it operates, SpinRite documents all of its work and findings, including an extensive and accurate analysis of your disk drives and partitions and locations of any unresolved data problems for your bit-by-bit correction, tests the RAM and drive hardware every time SpinRite is started, and writes a "fingerprint" with pertinent data of recent tests. This valuable record is also a time-saver whenever you run SpinRite; no need to redo the extensive drive tests.

There is too much more to cover in this article! Be encouraged to visit the website for all the minute details of what SpinRite can do. You will be amazed and delighted with all the benefits of faithfully using SpinRite to protect your data! A completely effective defensive product, like SpinRite or Zero Surge Suppressors, is so "boring" that you might forget how potent and necessary it is. However, if you, too, are a semi-techie, you will appreciate the fully detailed, live-action screen reports SpinRite shows on the screen and records for your next run (or in case of interruption).

The 4.0 manual contains an error on page three. "Data Recovery 'Aggression' Control" is not implemented yet. I found no other documentation error.

That overview of SpinRite should be more than enough to convince anyone that SpinRite 4.01 is more than valuable, it is a necessity. To frost the cake, this summary: SpinRite can prevent data problems due to unreliable media, recover virtually all data from failed media, rejuvenate and maintain your hard and floppy drives. It's fast and easy to use, the help file is extensive and completely detailed with technical explanations anyone can understand. "SpinRite is a complete, ready-to-run, data recovery and disk repair system." There is no other comparable program, not by miles. If you don't buy it, when you have the inevitable problem I will be more than pleased to assist you with a copy of SpinRite, which I will sell to you, and charge you for my time in recovering your data! (Please don't take this seriously -- I'm not available for technical support.)

A bonus demo program included with SpinRite is ChromaZone™, Steve Gibson's "World's only animated, virtual reality, interactive, screen saver construction set." Written in machine language, it is far tinier than After Dark and similar programs, yet includes far more presentations. It can even capture screens. The demo is a neat "ad" for the $19.95 program. Replace the static or dreary screensavers you are using.

As ever, wishing you safe and enjoyable computing,
Rick O'Keefe ◆

Microsoft Access SIG — Canceled (temporarily we hope)

Communications SIG

This SIG meets the first Monday of the month at 6 PM at the Reflectone Building. **Directions: Proceed west on Waters from N. Dale Mabry across the railroad tracks, about 1.5 miles, take second left on Savarese. Proceed on Savarese until you reach the Reflectone building. Use the north door.** You must sign up to get on the list and to get by security. *Contact Charles Howe: at 968-1207 or HOWE@INTNET NET*

Genealogy SIG

This SIG meets the second Monday of the month at 7:00 PM at the Museum of Science and Industry. *Contact Jenny Lind Olin at 960-5723 or Ford Bond at 987-6309 .*

Book Review:
Internet Service Providers, July/August 1997

Published by: Boardwatch Magazine

by Don Patzsch, Tampa PC users Group

This book arrived today, and I am very surprised at the depth of information about the Internet provided here. The introduction is written by Jack Rickard. Jack is one of the most knowledgeable people I know on the subjects of bulletin boards, telephone company information, the Internet, and computers in general.

The introduction tells you a little about what you will see in the book. To start, there is a story on the Architecture of the Internet. This is not a brief section; it goes into great detail as to what it is that makes up the Internet. A "backbone" is thoroughly explained. (A backbone is the wiring that interconnects everyone around the world by wires, wireless, glass fiber, and/or satellite.) You may have wondered how so many people can be on the Internet all around the world, yet your connection to any one computer on the Internet will be private and your download proceeds with no interference. (Ideally.) This section of the book describes how this is accomplished. What Jack did is to have 27 cities set up to call each of many backbones and download programs to determine a means of comparing these backbones as far as how reliable they are and how fast the download took place. This was not done in one location by one computer on one Internet Service Provider.

Now Jack goes to a monumental work. He provides you with the story on MCI, AT&T, Sprint, BBN, UUNET, and so many others you will have to read for a long time. The stories fill you in on the start of the Internet, the companies that provide the circuits your data goes through, and the maps that show you exactly who has long line connections all over the world. In other words, you can better understand what is meant when people tell you your data from your keyboard goes all over the country to get from one place to another. Now Jack lets you in on the tremendous knowledge he has about computers. He begins to tell you how to set up a dialup connection to the Internet using your computer. This is a long description and it is worth reading if you want to know just how these things are accomplished. Next, Jack tells you in great detail how to configure Windows95 on your computer. A complete story on how you can set up Windows95, with all of the pictures showing you the screens you will see on your monitor is included. This part of the book is worth the cost of the whole book, for those who do not really understand how to set Windows95 up.

The last section of the book gives you a list of all the Internet Service Providers, complete with telephone numbers and details of how each provider is connected. This will tell you why some ISP's are not as reliable as others. You can learn a lot simply by reading this book, if you want to know how the Internet works, who provides what connections, and how it all started and has grown. But that is not all. It tells you what is coming up. There is no way I can give you a real description of all this!
The book is called *Internet Service Providers* and sells for $9.95 at Barnes and Noble and many computer book places. ◆

in Microsoft Word—probably Word 6. But there was always a problem with the flow of text from one part of the document to another place in the document. Word could only easily continue onto the next page. Switching to Microsoft Publisher solved that problem, and, as noted, I could still take advantage of the superior editing power of Word. Well, Word 97 will now allow you to flow text too by the use text boxes—the same method Publisher uses. Unfortunately it does not provide the automatic little message: "Continued on page….." as Publisher does. Anyway, I got bold and decided to do this month's newsletter in Word 97. But I soon encountered an-

MEMBERS HELP-LINE

The following phone list is provided for our Tampa PC Users Group members in an effort to establish local support for those frustrating times which we have all encountered while using our PC's. Please note that these are members that have volunteered to help you; treat them in a courteous manner. Be sure to ask if it is convenient for them to help you now, or if you should call another time. It would also be helpful to have your documentation and have it handy when you call. (Don 't expect help if your software is an illegal copy or you do not have documentation!) TPCUG is not responsible for the information or advice provided by volunteers. Volunteers may or may not be experts in the subject matter. You are on your own with any advice received. Be aware also that some of these volunteers may be consultants in their area of expertise. If you are interested in volunteering to answer members' questions, either leave a message on the BBS or fill in the forms provided for this purpose at the meetings.

other obstacle that I could find no way around: Using text boxes I can find no way to flow the text around graphics. If I want the text to flow around graphics it appears that the text can't be in a text box—even if the graphic is in the text box. Perhaps I am missing something, but I don't think so. Well, if Word did everything Publisher did we wouldn't need Publisher, but it came so close—just one little feature short.

I am not going to give up text easily wrapped around graphics, and I can't live without the text flow allowed by the use of text boxes—all things provided by Publisher. I also want the text editing capabilities of Word. So, by buying Word 97, it looks like I have also committed myself to Publisher 97. And , indeed, from this paragraph on I am using Publisher 97 and Word 97 to do the newsletter . I had the newsletter 80% completed in Word 97 when I discovered the graphics problem with text boxes. So now I must take a little time to bring everything back into Publisher 97. Don't get me wrong: Word 97 will wrap text around graphics—just not if the text is in a text box. If any one can make text wrap around a graphic inside a text box I would love to hear about it ◆

TPCUG Discussion Group, Video Capture & Speech Recognition

by William LaMartin, Editor, Tampa PC Users Group

Well, I have quite a few things that I can write about this month, which is good, since as I start this I am short an article or two for this month's newsletter. So, the rule is: If you don't want to read my material you should either contribute an article or encourage another member to contribute.

Wil Gobel's video capture presentation at the September meeting got me to thinking about such things. I have never been much interested in moving photography or videos, even though I have done a lot with still photography over the years: taking the photos, processing the film, making the prints myself, and, in recent years, scanning the prints into the computer and manipulating them with the digital software. But there have been times when I would have liked to capture something from the TV or a video.

The Rebirth of an Old Computer An opportunity to do this arose this past week when my wife said that she would like to have a permanent computer set up that she could use for word processing when I am monopolizing the Gateway Pentium and my daughter is using her 486 no-name clone and the 486 laptop was the only thing left over. Well. there was the old Gateway 386, which had been such a faithful workhorse in the past. It was gathering dust in a corner; its monitor had been sent off to college with my son to be used as an auxiliary monitor for his laptop, but there was another usable monitor in the garage. So why not bring it back to life? It had 16 MB of RAM, and almost 2 GB of hard drive space. All that it lacked was speed, but you don't really need that for many PC applications—certainly not for word processing: although, I

(Comments.....Continued on page 4)

November 12: MindSpring, an Internet access provider, will do the presentation.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

SECRETARY'S REPORT & MINUTES OF MEETING September 10, 1997

Minutes and Comments by Merle Nicholson, Secretary, Tampa PC Users Group

The scheduled presentation for September had to be canceled, so Wil Goble generously volunteered to fill in with a graphics and video demonstration.

William LaMartin, our newsletter editor and webmaster opened the meeting with an explanation of the new web site generously donated by fellow club member Larry Anders. Also he gave us a description of the two development products available from Microsoft on their web site - MS Voice and MS Dictation - described later in this newsletter.

President Connie Kincaid took over with introductions of the officers. Also, Connie announced that William LaMartin is tentatively giving an Internet demo at the next Comm SIG meeting - the first week of October. **Editor's Note: The Comm SIG will not be held due to the unavailability of the usual site this month.**

Connie welcomed three visitors, one guest of Don Patzsch and two visitors from the MOSI Genealogy group.

Connie outlined the coming meeting programs as:
October - Brainchild BCD Computers - new hardware
November - Mindspring, an Internet provider
December - Tentatively, a presentation of Win 95 tips
January - working on this one
February - Corel

Connie did an informal survey of the people present on Internet providers. One thing was evident - that we universally use the Internet.

William returned to the front and went on-line showing our web site and then showed the new discussion group section on our site. He demonstrated how you add a subject and also how to post a response.

Wil Goble then took over with his own personal computer. He has a video capture board and a camcorder as a video input device. Using a nice collection of graphics editing software, he gave us a very informative view of what can be done with graphic captures. Using the camera, he captured portions of the room and then edited the files using Micrografx's Photo magic. He edited out areas of the room using cloning and then showed us a wide variety of special effects. Finally, he captured a nice photograph of a boat of fish from a member. Then

Sony's Digital Mavica®
(floppy disk camera)

by Larry Anders, Librarian,
Tampa PC Users Group

Just in case you don't know, it's possible to have Christmas in September, at least at my house. Only, Santa has a remarkable resemblance to the Sony Corp. this year. I had been saving up my change ever since I saw my first digital camera. I even purchased one a while back in a moment of weakness, but quickly returned it when I saw the poor quality of the picture, both on the PC and in print. I also wasn't real comfortable having to connect the camera to my parallel port so the pictures could be imported into my PC. (My parallel port already has a Zip drive hooked to it.) And the biggest negative thing I find with today's digital camera is the limited number of photos you can take unless you purchase a camera that uses those expensive flash memory cards. Then came along Saint Sony (Nicholas) and released a camera that took care of all of my dislikes at one time.

The new Mavica still camera records images on a standard 3.5" floppy inside the camera so you can utilize your pictures on virtually any PC at any time. Each diskette can hold up to 20 high resolution or up to 40 standard resolution images in 24-bit 640 x 480 (VGA) JPEG format. The Mavica is compatible with Windows 3.1/95/NT or Mac OS 7.5. There are no drivers, new interfaces to learn or cables to hassle with. You can use whatever graphics program you are used to. JPEG is recognized by most modern-day graphic programs like Paint Shop Pro and other software made by Adobe, Micrografx, etc. Or you can use ArcSoft™ PhotoStudio™ software that comes with the Mavica for creative options to manipulate images, add text and change backgrounds. The printed pictures on my HP color printer are excellent.

Mavica comes in two styles; fixed lens (MVC-FD5) and 10x power zoom (MVC-FD7). (*I got the zoom*). There are real camera features like allowing you to shoot an object as little as 1 cm away. It also has auto or manual focus, auto-iris, 1/60 to 1/4000 second shutter speeds, white balance, built-in flash (usually not needed) and a self time (so you can get in the picture too). There are also five auto macro functions such as portrait, landscape, beach/ski, sports and sunset/moon. The camera automatically adjusts itself depending on the setting. The MVC-FD7 also features picture effects, which add digital effects to images automatically. By selecting picture effects, you can enjoy effects such as *monotone, negative, art, pastel and sepia* without having to purchase another paint software.

The camera operates off Sony's lithium-ion rechargeable battery that allows up to 500 continuous shots with a single charge and that also powers a 2.5" color LCD screen for composing, monitoring and playback. This means that you can shoot enough images to fill up to 25 floppy disks (high resolution) with one battery. Mavica incorporates the same technology as the Sony Handycam® camcorders, which allows for low power consumption.

You can view images that have already been taken on a multi-image screen on the LCD panel; this allows for easy search and selection of desired images that can be protected and/or deleted while the diskette is still in the camera. When you get the set of photos you want, just remove the diskette from the camera and insert it into your PC. It really is as easy as that! I can't say enough about this camera. It is ***everything*** I had been waiting for ***and more!*** And my wife loves it too. She teaches commercial floral design and marketing and wanted the ability to take pictures of her students' work and give them instant feedback. Now she has that ability. See!

If you would like the full specifications on both cameras go to http://www.sel.sony.com/SEL/consumer/mavica/ and get all the information needed to make an educated wish list for Christmas. Heck… Halloween and Thanksgiving come before Christmas. Then again, Christmas comes in September too, doesn't it?!

I give Sony's Digital Mavica®

◆

Software Review

Drive Copy from PowerQuest

by Don Patzsch, Tampa PC Users Group

Drive Copy is intended for those people who want to upgrade to a larger hard drive, now that hard drive costs have come down. Another thing, if you buy a computer loaded with Windows95 and other software but no backup disks came with the computer, you can copy your hard drive before you accidentally delete anything or have a crash of some kind. This copy process is fast and easy. Small businesses may want a second copy of their drives to store in another location in case of fire, etc. So when you put in a larger hard drive, just put the old one in a safe place. The advantage to this method is that in case a disk freezes, the old one can be reinstalled in minutes, and the business is back in full operation. Of course this is true for any individual user as well.

I was a beta tester for the Drive Copy program, and I became familiar with the people at PowerQuest. So let me begin this review by saying that you may get on the Internet at any time and go to *http://www.powerquest.com* to get an answer that you can easily understand from their support people. They will answer questions within a day or two via email, give you plain written instructions to solve your problem, and, in the process, tell you a little more about the program. Partition Magic version 3.0 is the program that sold me on the PowerQuest company. It costs about $39. Highly recommended.

Drive Copy will "diskcopy" one hard drive to a hard drive of the same size or larger. If you decide to upgrade to a larger hard disk now that the prices have fallen, you have a choice. You can go the long way, back up the hard disk, partition and format the new hard drive, reinstall the operating system and applications, and finally, restore the data. All this takes time. Lots of time.

There is a second way. You can buy Drive Copy for a little over $20 and then the process is much easier. First, install your old hard disk as the slave. Be sure to set the jumper settings on your old hard drive to "slave". You then install your new disk, equal in size or larger than your original disk, as the Primary or Master disk in a two hard drive computer. Settings on your new hard disk will be described in the instructions.

Now you are ready to go. Insert the 3.5 inch floppy, and type A:\PQDC. Now just wait and watch. It took me only a few minutes to copy a 2.1 gigabyte Maxtor hard disk.

Here are a few ideas and suggestions.

There are several ways to find out how to place each hard disk within your computer.

- Find a friend in the User Group who has done this many times. He will help you.
- Go to the manual that came with your computer, it should show you everything you need to know.
- Go to Barnes and Noble or maybe to the public library. Find a good book on upgrading your computer.

The appendix A in the Drive Copy manual lists the common Maxtor and Western Digital jumper settings. If this is not sufficient, then in the same appendix they list the companies that manufacture hard disks and the URL's and some email addresses, 800 telephone numbers, etc. so that you can easily get the information you may need.

Drive Copy copies all versions of Windows95, WindowsNT, Windows 3.x, DOS, and OS2 including FAT, FAT32, NTFS, and HPFS partition types. It works with EIDE, IDE, SCSI drives. It works with Stacker and/or Drivespace. Linux and Unix will be copied but not expanded or otherwise supported. You will want to have at least 5 megabytes of space within each FAT partition so that Drive Copy can expand the partitions during the copying process.

A computer BIOS made before 1994 is not likely to support the EIDE standard. It cannot handle hard disks larger than 504 MB. New hard drives larger than 504 MB typically include software such as OnTrack disk manager or similar products to let computers see larger hard drives.

Yes, I have copied the hard drive and put the copy in another computer to try it. It works fine, but your software license may be for one copy on one computer. You need to check that; read your software license.

PowerQuest Corporation 1083 North State Street, Orem, Utah 84057, 1-800-379-2566 ◆

do appreciate my 166 MHz machines speed when it comes to repaginating a 350 page Word document with an index.

Video Capture Once I had the 386 set up and running, having removed many of the programs that were still on the drive but either were no longer of interest or could be much better run on the newer machine, I got to thinking again. The computer was in the same room with all our audiovisual items and there was a video capture card upstairs in my son's desk that wasn't being used for anything. Since it had been given to him as part of a programming job, I didn't expect much, but it

Microsoft Dictation & Voice

by William LaMartin, Editor,
Tampa PC Users Group

As I mentioned in my Comments article starting on page one, my WWW ramblings led me to a Microsoft speech recognition research site where you may download two programs which do quite good jobs at discrete speech recognition. First, go to http://www.research.microsoft.com/research/srg/srproject.htm and read the overview of speech recognition. Then go to http://www.research.microsoft.com/research/srg/install.htm#MSDict to download **Microsoft Dictation**. Click on the *link "Download Microsoft Dictation Research Demonstration",* and 11 MB later you have got it. To get **Microsoft Voice**, go further down the page and click on the *link "Download Microsoft Speech SDK 3.0 Suite (includes TTS and CNC engines)"*. It is only a little over 11 MB, although it claims to be 13 MB. When you install the SDK, Microsoft Voice will also be installed. I couldn't find a way of getting Microsoft Voice alone.

To run either of these programs, you will need Windows 95 or NT, a Pentium 90 or better, 16 MB of RAM for 95 or 24 MB for NT, 16 bit sound card or better, quality microphone, and speakers. The requirements for the new continuous speech recognition programs, **ViaVoice** from IBM and ***NaturallySpeaking*** from Dragon Systems have more stringent requirements. Note that these Microsoft programs recognize discrete speech (short pause between words), not continuous speech which is certainly better--if it works.

Both Larry Anders and I have had fairly good results using these two programs. A couple of other people who tried them at our suggestion have not fared as well. I think, however, their problems are hardware related. Both individuals had 8 bit sound cards, which doesn't meet the requirements. Additionally, a good microphone is essential.

Microsoft Dictation transforms the words you speak into text in your computer. You may either work with what is called the dictation pad or have Microsoft Dictation place the text directly into any Windows program that allows text input, e.g. your favorite word processor.

When you first start Microsoft Dictation, you will be asked if you wish to train for awhile. There are a number of different training sessions available, each lasting perhaps ten minutes. Of course, the more you train, the better the program will do. As yet, I have done only about four training sessions, and the program is working quite well. In addition to the training, the program learns your voice as you work from the corrections you make as you are dictating. If you make a mistake you can say "cross out" and the program will erase the last word. You then can repeat the word; if the program still gets the word wrong, you may select the correct word from the corrections window which is a list of alternate words to the one the program selected. For example, if the correct word is the third one listed, you would say "choose three". If the correct word is not listed in the correction window, then you can highlight the word with the mouse, the program will then pronounce the word, and you may type in the correct word. Supposedly the program then learns the correct spelling to go with that sound.

What I find hard to do when using this program is to keep talking and not pause so long between each word. The program will actually keep up with you about as fast as you can speak if you can get used to speaking fast with pauses between each word. In fact, sometimes I think it does better when you keep going without looking at what is happening on the screen and not worrying about making corrections as you go. This, of course, works well when you can use your hands to move a mouse to make the corrections later. Obviously this method of correction will not work so well if you can't do that and must rely on voice navigation of the document.

In addition to words, you may insert punctuation by saying the appropriate command. For example to get a semi-colon you just say the command "semi-colon". To get a period, you say "period", etc. A sampling of the list of built in commands, as well as glossary items, is shown below. Additionally, you may create your own glossary items by saying the text and then typing in what you want printed when you say that particular text. For example, you could say "my telephone" and have it type in 813-222-7777, if that was indeed your number.

By the way, the above three paragraphs beginning with "When you first start..." were done solely with Microsoft Dictation. It took 12 minutes. That time included making minor corrections and "think what to say time". I suppose a much better test of speed would be to read in something I had already written out. Then I wouldn't be pausing to think of my next sentence.

Here is a sampling of the built in commands:

- Cross-out - Deletes the last word.
- Capitalize-that - Capitalizes the previous word.
- Capitalize - Capitalizes the next word spoken.
- Go-back-one through Go-back-nine - Moves the cursor back several words.
- Hide-window - Hides the correction window.
- Today's-date - Types in the current date.

Here is a sampling of the built-in glossary entries:

- Bullet-text - Enters a new-line and then a bullet item.
- Indent-paragraph - Enters two new lines and then a tab to

(Speech.....Continued on page 7)

(Speech.....Continued from page 6)

indent the paragraph.

- Indent-text - Enters a tab to indent the text.
- New-paragraph - Enters two new lines.

Using your voice for dictation alone is not enough if you really want to get away from the keyboard. You need to be able to start programs, open and close windows, switch between running programs, open files, bring up WWW sites, and simply move the cursor around the screen. All of this is the function of Microsoft Voice. In theory—and in practice as I found out—with this program you can run your computer with only your voice.

Simply by speaking you can **start programs** [*start running <program name>*]; **move the cursor** on the screen [*move<direction>*]; **select text** [*select line*]; **delete text** [*delete selection*] or even programs (very scary—while in Windows Explorer with the Quicken directory selected you mistakenly say "delete Quicken"—Thank goodness for the recycle bin and the **Undo** command); **switch between running programs** [*switch to <program>*]; **cascade all windows** [*cascade all windows*]; **copy selection** [*copy selection*]; **go to any web site** that is in your Favorites Folder [*go to <name, e.g. Tampa PC Users Group>*]; **bring up any folder** [*bring up <name>*]; have the program **read to you any selected text** [*read selection*]; **tell you the time or date** [*tell me the time (date)*]; and finally **undo** the previous action [*undo*]. There are many more commands, which I will leave for you to find after you download and run the program.

Microsoft Dictation and Microsoft Voice obviously will work together; however, they can't be listening simultaneously. You can start Microsoft Dictation from Voice. However, when you do this Microsoft Voice goes into its "not listening mode", and I haven't as yet figured out how to wake up Microsoft Voice when I am finished with the dictation. I am sure there is a way. ◆

(Comments.....Continued from page 4)

turned out to be a pretty good card—at least as far as I could tell. I installed it, hooked up a long video cable to the back of the TV, and I was in the video capture business. For the details, see my ComputerEyesRT article on page 8. If you want to learn about the latest and best in digital cameras see Larry Anders' article on his new camera on page three.

Speech Recognition I am sure all of us are intrigued to some degree about the prospects of simply telling our computers what to do and having it done. No more typing—a convenience for most of us—a necessity for an unfortunate few. Well, if you were in the group several years back, you possibly saw the demonstration we had on speech recognition software. As I recall, that demonstration was not without problems, which were explained as due to a lack of training time. See, you have to train these programs. Since then I have been following developments in the computer press concerning such programs. Some time back IBM with the release of Warp 4 included a speech recognition component where you could use voice commands to tell the computer what to do. The only demonstration I saw of that was, again, far from impressive.

Since then much work apparently has been done, the computers have gotten faster, and several companies including IBM, Dragon Systems, and Kurzweil have come out with new products priced to move at $50 - $200 (the original products were close to $1,000 several years back). Additionally, some claim to recognize continuous speech as compared to discrete speech (a pause between words). I have read mostly positive reviews of these products, but I have also received first hand reports from people who returned them as not worth the money. Since I haven't personally tried them, I can't comment, except to note that there are a lot of variables in speech recognition. You need a good microphone, the correct type of sound card, and a fairly fast computer with a lot of memory. I have heard of cases with two different people with basically the same computer setup who got widely varying results. The operative phrase here is "basically the same". A poor quality microphone can short-circuit the whole process, for example.

In cruising around the Internet I came across a sort of hidden Microsoft site devoted to research. Some of the titles of papers available there reminded me of the titles of mathematics and physics papers you see in professional journals ("Some initial results on P-normed quadratic bipolar forms" sounds about typical). And this location led me to the Speech Recognition research location. There you can download demonstrations of what Microsoft has been testing in discrete (as opposed to continuous) speech recognition. The two programs I downloaded were Microsoft Dictation and Microsoft Voice. Except to get Microsoft Voice you have to download the entire Speech SDK. Each of these downloads is a little over

Hardware Review

ComputerEyes/RT Video Capture

by William LaMartin, Editor,
Tampa PC Users Group

As I mentioned in my comments that begin on page one, we had an unused computer and video capture card around the house, so I installed the card in the computer, set it up in the room with our TV, and connected the TV and card with a standard video cable. The card is a ComputerEyes/RT card made by Digital Vision, Inc. I suppose the RT stands for real time. It is described as a conflict-free real-time color video frame grabber. The card can grab single frames in a resolution of 512 x 512 in 256 or 24 bit color, or it can capture six frames/sec at a resolution of 320 x 240. This card is probably two to three years old, but is still sold by the company at a list price of $319, along with four other video capture cards, some with more advanced features and some with less. You will pay more for finer resolution and more frames per second in the action capture. The Digital Visons web site is http://www.digvis.com.

Before using the card I went to the Web site and downloaded the latest interface software for Win 3.1/Win95. After installing it I noted that it was probably the same software that has been in use for some time. But I have no complaints since everything worked fine, with the only shortcoming being that you can't use long file names to save your captures since the program is really a Win 3.1 program.

Using the software and making the captures are quite simple. With the software running and the capture card connected to your TV, VCR, or camcorder, you see in a small preview window on your computer whatever is being displayed or produced by these video sources. The preview image was degraded somewhat in quality on my computer screen, but recall that I was doing this with an old 386 and a monitor not in the peak of condition. However, when you actually capture a frame, the results are quite good.

So how does this work? The capture card has enough memory and speed so that it can capture and store a new image 15 times each second. When you do a capture you get whatever image happens to be in that memory at the time of capture, but with 15 captures each second you should get exactly what you want.

The software is about as easy to use as it can get. When you run the program, you are presented with the preview window where you watch a copy of what is showing on your TV, for example. You can use the preview options to modify the color, brightness, contrast, etc. of this preview image. Again, the quality of the preview will depend on your video card (not the video capture card), the monitor, and the color pallet that Windows is using. (That is why it is suggested that you close other programs when doing a capture, since they may affect what color pallet is being used by Windows.) When you see something you would like to capture, you simply click on the capture button, and you have got it. You are then presented with a 512 x 512 captured image on your monitor, which is much larger and of much better quality than was the preview image. If you wish, instead of capturing single frames you can make your own video for Windows by using the capture mode where you capture six frames/sec. to make your own .AVI file. However, since I am basically a still photographer, I didn't use this option. Also, this option would probably work better on a faster computer than the old 386—even though it fit the specifications.

To show you how easy the video capture is, I include a capture of me done by my 12 year old daughter using a camcorder in our home. I apologize for the quality of the subject. Additionally, don't expect the quality of a camcorder capture to match the quality of the results from a good digital camera like Larry Anders describes in his article on page 3. And certainly don't expect it to match the quality of a scanned in photo.

SuperDisk™ LS-120

by Larry Anders, Librarian, Tampa PC Users Group

In today's GUI (*graphical user interface*) computing world the one thing certain is that the files and programs keep getting larger. Fortunately, because of supply and demand, hard drive storage now comes in gigabytes instead of just kilobytes and is a lot less expensive then a couple of years ago. The one thing that hadn't kept up with the times was the floppy disk ….. until now. Now you can exchange your 1.44Mb floppy (or add to your PC) a floppy disk drive that can hold 83 times the amount of a standard 1.44Mb floppy and still use your old 1.44Mb or 720k floppies.

The current "in" tool for mass floppy storage is the **ZIP** drive, which holds 100 megabytes of data. The new **SuperDisk™ LS-120** made by **Imation**, a division of **3M**, as the name indicates holds 120 megabytes. Several manufacturers make the drive in either internal or external models and the new 120Mb floppy works in any of the drives. I purchased an internal version and the transfer rate is about five times faster than a normal floppy. I wasn't sure how it would work so I didn't replace my factory-installed 3.5" disk drive. I just added the new drive to my existing system. And because I don't have a space problem in my PC I'll probably just leave the original floppy installed.

The new SuperDisks look, feel and work just like conventional diskettes, unlike the ZIP diskettes, and, as I said before, the new drives are compatible with your old 3.5" diskettes. ***(NOTE: The new LS-120 floppies ARE NOT compatible with your standard 3.5" drive.)*** The SuperDisk diskette has a read/write latch just like a conventional diskette so it is write-protectable. You can easily protect your work from being overwritten. If you do mobile computing, you will be able to get the benefits of 120 megabytes of removable storage without having to carry an extra drive or giving up your ability to read your old disks. Shortly the new 120Mb drives will be available for notebooks, too.

For your information, the LS-120 technology (LS stands for laser servo) uses a unique manufacturing process to increase the data track density on a 3.5" diskette from 135 tracks per inch (tpi) to 2490 tpi. You can easily see why you can store so much more data on one floppy.

The new LS-120 external super drive requires no internal installation at all (it's as easy to hook up as a printer) and gives you the added benefit of portability between different computers, so you can use it at work and take it home to transport your files and projects without hauling around your entire computer. Most IBM-compatible PC computers can be upgraded with internal LS-120 drives. As I mentioned before there are now a variety of products on the market so you have choices about how to upgrade your machine. I had no problem installing the new internal drive myself but if you are not as confident you can get it installed at a retail store for a modest charge. Current street price for the drive unit ranges from $175 to $200, with as much as a $50 factory rebate available at some local stores. The price on the diskettes range from $15 to $20 depending on the quantity purchased.

It seems that our computer technology is changing at the speed of light (laser light). Finally, the old floppy disk has caught up! ◆

(Comments.....Continued from page 7)

11MB and are, of course, free.

Microsoft Dictation is just what you would think it is. It turns your voice into text in any document that you want it in. The Microsoft Voice program allows you to control your computer with voice commands. Commands like "Start running Word for Windows", "Switch to Micrografx Picture Publisher", "Close window", "Read selected text", "Move up", Press OK". So, theoretically, someone, using these two programs could do pretty much anything on their computer they wanted with only their voice—and a lot of patience. See the article on page 6 about speech recognition for the details.

TPCUG Discussion Group You will recall that in my comments in last month's newsletter I was attempting to write a Visual Basic program that would update Web pages automatically so as to give our group a discussion group at our old Web site. But at press time I was having problems with using FTP to a secure site in Visual Basic. Well, that problem is solved. Microsoft caused the problem when they supplied a service pack that corrected some problems in the original release of Visual Basic 5. Unfortunately, the service pack also introduced the problem I was having with the FTP component of VB. The solution was to load in the old version of the FTP component. With this, everything worked as it should.

However, since we had moved our site there was no need for my kludge of a discussion group. The new location at *http://*

Microsoft Access SIG — Canceled (temporarily we hope)

Communications SIG

This SIG meets the first Monday of the month at 6 PM at the Reflectone Building. **Directions: Proceed west on Waters from N. Dale Mabry across the railroad tracks, about 1.5 miles, take second left on Savarese. Proceed on Savarese until you reach the Reflectone building. Use the north door.** You must sign up to get on the list and to get by security. *Contact Charles Howe: at 968-1207 or HOWE@INTNET NET*

Genealogy SIG

This SIG meets the second Monday of the month at 7:00 PM at the Museum of Science and Industry. *Contact Jenny Lind Olin at 960-5723 or Ford Bond at 987-6309 .*

Clipbook

by Emelie Jurado, Tampa PC Users Group

I got this informational jewel while reading Frank Ruiz's column in the Business & Finance section of the June 16, 1997 Tampa Tribune.

After you have placed something on your Clipboard, have you ever felt frustrated that you couldn't keep that text, graphic, etc. because the next copy you made to the Clipboard (of course, before turning off your computer) would automatically delete the previous entry?

Well here is some good news. In an obscure region in Windows 95, there lives another program called CLIPBOOK which enables you to save clippings from Clipboard in order to reuse them.

If you're still interested, follow these simple instructions: From the Windows 95 CD-ROM, click on Add/Remove Software. Go into the Windows Setup tab and click Have Disk. Click Browse and click your way to d:\Other\Clipboard. (Note that "d:" is the drive letter for the CD-ROM. If your CD-ROM drive uses another letter, use that one instead.)

Get to the file "clipbook.inf", click OK twice. Now check Clipbook viewer and Install. After Clipbook is installed, you can find the program under the Accessories folder in Windows 95.

Are you still having fun? You might even like to make a shortcut of the program icon using Windows Explorer and placing that shortcut on the Desktop so it will be easier for you to start the program.

There's more! Would you like the program to start up automatically when you turn on your computer? Then drag a copy of the shortcut into the Start Up icon. You'll find the Startup icon under Programs in Windows Explorer. Drag a copy of the shortcut over the StartUp icon and let go of the mouse button. Voila! It will be copied there automatically.

There are many reasons to keep copies of Clipboard clippings. You might want to keep a paragraph in order to repeat it in e-mail replies and it's handy to use Clipbook to cut and paste the paragraph instead of retyping it each time.

You might also like to save clippings from several sources, when visiting some sites on the Internet. The use of Clipbook is endless, not to mention also saving addresses, telephone numbers and e-mail addresses.....Enjoy!!! ◆

(Comments.....Continued from page 9)

www.canx.com/tpcug/ was on a Unix server that supported Microsoft FrontPage extensions, so I had a discussion group available which FrontPage created for me with basically no effort on my part. The discussion group is up and running, and it is the second option on our home page. I encourage you to use it.

Now that I have dabbled in updating Web pages automatically and video capture, I am getting another idea: The TPCUG LIVE VIDEO CAM. Stay tuned. ◆

AOL, NetCom, and WebCams

by William LaMartin, Editor, Tampa PC Users Group

AOL and NetCom If American Online sneezes, the world knows about it the next day. Anytime the slightest thing goes wrong with their service, it is front-page news, and the lawyers begin preparing their class action suits. I don't know if anyone will sue because they were not able to traffic in email from AOL for several hours yesterday, but I do know that their two hour total outage and three to four hour email blackout made the news section of *The Tampa Tribune.*

But for those of us using other Internet providers, nobody cares. My provider NetCom (600,000 subscribers vs. AOL's 9,000,000 subscribers) has been giving me and three other NetCom subscribers whom I know here in Tampa pretty uneven service for the past seven to ten days. And I assume everyone else using the service in the area has been having problems. There was one day that connecting in a useful way was impossible. I say "in a useful way" because with persistence you could connect. My computer would tell me I was connected and at what speed. But I couldn't do anything. No WWW, no email, no FTP, and no newsgroups. How do I know I was really connected to the Internet if I couldn't do any of these things? Well, I could do a Ping or a Trace Route. For example, I could do a Trace Route on microsoft.com and would be told the numerical address of the site and shown how many steps and the time it took to reach microsoft.com.

For those who aren't familiar with this, if you are running under Win 95, while connected to the Internet, go to the DOS prompt, type tracert microsoft.com and press enter, and you will be presented with such information. To see the

SECRETARY'S REPORT & MINUTES OF MEETING October 10, 1997

Minutes and Comments by Merle Nicholson, Secretary, Tampa PC Users Group

Robert Armstrong from BCD Computers gave a very entertaining and informative talk on the direction of personal computers. BCD also donated very generous items for the door prizes.

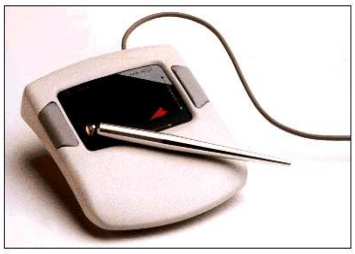
Starting a little late - we had more time for conversation and networking this meeting - Connie opened the meeting welcoming two visitors. Ed Buzza, a very long term member was attending also. It was very good to see Ed. The SIG announcements were next, with Ford talking about the genealogy SIG and Charles Howe about the Communications SIG.

Bruce Register - member at large - gave a summary of the nominations for office for next year's positions and encouraged all who have the time or inclination to serve to speak out and nominate themselves.

Robert Armstrong from BCD Computers was introduced. He covered a very wide range of topics on personal computers. I will not attempt to cover all, but just a few highlights are: They are offering a 10% discount on purchases for club members. You'll need your membership card. Don't forget. BCD now has a fully stocked download section on the internet, with an extensive drivers section. Also they have an on-line catalog ordering section on the internet. You place the order; it's faxed to a salesman at BCD for later pickup at the store.

He talked about processors next, covering the AMD 5x86-133, and the AMD K6 - "Fastest windows processor today" - Uncle Tom's Hardware Guide. Pentium II, how it's configured and the need for a special box including 32K cache. 168 DIMM 10ns memory, universal serial bus, DVD CDROM, Windows 98 and Intel TX chipsets were all covered - a lot of ground for an hour.

BCD is located across from University Mall; 1911 East Fowler Avenue in Tampa. (813) 631-0100 and in Clearwater 23486 US HWY 19 North. (813) 712-0515. They are also on the Internet at http://www.bcd.net. Thanks Robert!



There was a real bounty on door prizes this month including two $50 gift certificates and much more from BCD. And on top of that, the club took in $50 in door prize ticket sales! The winners were:
Mary Sheridan $50 certificate; Roger Waters $50 certificate;

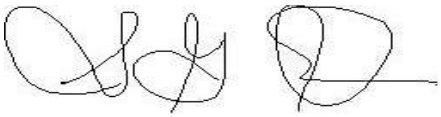
Hardware Review

POWER CAT Touchpad

by Larry Anders, Librarian, Tampa PC Users Group

I recently received some bad news from my neurologist. It seems the tingling that started in both my hands several years ago has grown into a classic case of severe "carpal tunnel syndrome." I am writing this now in hopes that some of you may wake up a little sooner than I did if you hear my story. I always thought it was a circulation problem and that it would go away someday. Well, it will, hopefully, after November 14th when I have orthoscopic surgery to open up the tunnels of crushed nerves in my wrists and one of my fingers. And no, it was not diagnosed as repetitive stress syndrome caused by my computer use. The computer use probably aggravates it but it was not the cause. The culprit is more than likely all the football and rough-house sports I played when I was younger. Just think about it; every time you fall on the ground what do you catch yourself with?…. your wrists.



It all started with my hands going to sleep at various times like driving, mowing the yard, eating, writing, etc., etc., etc. Sound familiar? It's amazing how many people I have talked to who have experienced the exact same thing and have done the same thing about it … Nothing! Well, after a battery of sometimes painful tests at my neurologist's office he sent me to an orthopedic surgeon and according to her, I should have done something about it … much sooner! Because of my delay they cannot guarantee full recovery. The only reason I finally went to the doctor was because my hands began to hurt instead of just going to sleep. So, what I'm getting at is, if you are experiencing any of these symptoms ***GO TO THE DOCTOR, NOW!***

When I visited the surgeon, and she learned of my extreme computer use, she advised me to immediately begin using a *touchpad* because it would reduce the stress on the nerves in my right hand (much more than a mouse does), and the right hand is the worst of the two (and the one being operated on first.) She guaranteed that I would not be able to use the mouse for the first few days after surgery. It may take me a while to get to the doctor but I listen once I get there, especially if it's going to affect my computer use. So, I made my appointment for surgery, which will be a follow-up story I'm sure, and began my search for the perfect touchpad. I wouldn't go as far as declaring that I have found the perfect touchpad, but I found a good one. And, so as not to waste a good case of carpal tunnel syndrome, here's my review of ***Cirque's POWER CAT Touchpad.***

I immediately left the doctor's office and headed for the I-way (Internet) and began my search for a touchpad. Why did I decide on the Power Cat? Simple, the Cirque Power Cat was recently awarded *Windows Sources Magazine's* "Stellar Award" for November 1997, and I am an avid reader of *Windows Sources*.

The Power Cat is Cirque's top-of-the-line touchpad. They also make two other, smaller, less expensive touchpads, The *Easy Cat* and The *Smart Cat*, but neither have all the features that the Power Cat has, which are provided by the Cirque driver included and are:

- **Sign** Signature tool and software accept your signature as a graphic for placement into any compatible application. Just double-tap on an icon on the Windows system tray and your screen will display a window resembling the touchpad surface. Use the special "GlidePen" provided to sign your name in real-time and paste it into the document. (It's not quite as easy as it sounds – it took a little practice to duplicate my signature. But the printed quality of the signature was excellent. You can see it below.)

- **Surf** Internet navigation buttons ("back" and "forward") are operable in Microsoft Internet Explorer and Netscape Navigator. Glide your finger along the upper edge of the touchpad to activate page back and forward surf. The surfing area is labeled on the touchpad surface. Each 1/8-inch movement will activate a page change.

- **Scroll** Horizontal and vertical scroll commands are operable in most Microsoft Office 97 applications and many non-97 applications such as Corel WordPerfect Suite 8 and Lotus Word Pro 97. Just glide your finger along the right and bottom edges of the touchpad to activate up/down or sideways scrolling. The Scroll areas are labeled on the touchpad surface.

FACUG's Sarasota Meeting

by Don Patzsch, Tampa PC Users Group

On October 13, 1997, my wife and I attended the Florida Association of Computer User Groups (FACUG) meeting in Sarasota.

Not long after registration we broke into groups for discussion. I picked the membership group. Here are some of the things I learned.

The women from the Women's PC Users Group told us they charge $2 per year for their SIGS. They charge visitors $1 to come to the regular meetings. For that $1 the visitor gets a red ticket, a copy of the newsletter and entrance to the meeting. The regular members are given a blue ticket. The tickets are for raffles at the end of the meeting. This group has about 250 members, and about 125 to 200 attend each meeting in Venice, depending on the time of the year.

Sarasota has about 1,060 members, and they sell their membership lists for $110.00; they sell four or five lists per year. Sarasota has two or three members sitting at tables each meeting, and as each member comes into the meeting he goes to one of these tables and gives his "number" on his bar code to the database entry person. They then draw their prizes at the end of the meeting with a randomly generated number from those numbers, ensuring that they will only call numbers of those who are there at the meeting. Their SIGS are held at a vocational school, and members pay $7.50 per year for the SIGs. Members donate time to the school.

The Hilton Head UG of S.C. does an interesting thing. They have the members present put their membership cards into a hat for the prize drawing. That is the way they get their cards back, to keep them safe until the next meeting!

Lakeland sets up a table at Computer City to hand out literature about their User Group, and they get many new members that way. They average 60 to 80 per meeting. They also send one of their members to Computer City to buy lots of those items that cost maybe ten or twenty dollars, but they get all their money back by giving them out as prizes (for which people have contributed for tickets) after the meeting!

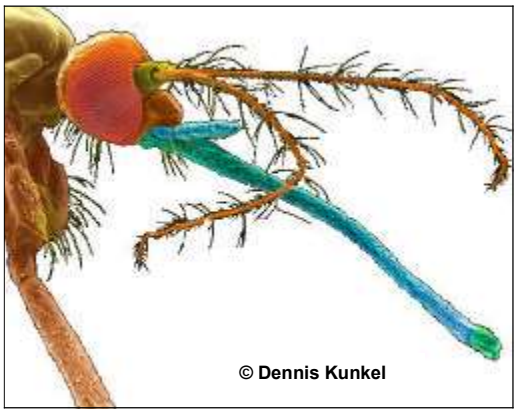
Jacksonville has about 350 members and 100 to 175 at a meeting. The Pinellas group now has about 1,400 members and about 100 expirations and applications or renewals per month. Manatee County has about 600 members and about 300 at each meeting.

The Women's PCUG had received a $10,000 grant. Joan Dineen, who had applied for the grant happened to be sitting across the table from us at lunch. The grant is for new equipment for the Women's PC Users Group. My guess is that the first item they will buy is a new projector with the Texas Instruments mirror chip. It was two or three years ago that Roger F. Meissner of the Sun City Center group told us how they had applied for and received grants. They have had their $10,000 projector for years now.

In the afternoon, Rick Rogers of COMCAST demonstrated Cable Modems on the large screen. His talk was very interesting because he could bring up the Internet and show us how fast he could get some screens. Of course it can't bring up a server that is down. Cable Modem connections are available in and near Sarasota and the cost is $150 to install and $39.50 per month if you have COMCAST TV cable connections.

After that, we broke into groups, and I attended the Web group. Various people described their experiences making up and maintaining their sites.

Mr VanDerWeele introduced me to Joan Brown, President of the Pinellas Group. I believe he wanted me to repeat the story of Jim Leonard, a retired minister, who started the Pinellas User Group. Jim Leonard belonged to the USF and the Tampa Computer User Groups back around 1982. The Tampa IBM PC User Group met in the downtown Tampa public library when the group started. Jim was standing on the roof of the Library when he told me he was going to start a Computer User Group in Pinellas County where he lived. We were on the roof next to the Planetarium like area, which is where we were meeting at that time. I told Jim I was his FIRST MEMBER. Jim Leonard started the group and I have most of the copies of the newsletters since March, 1984. Apparently Jim wrote the newsletter himself for most of the first issues. The group met at the Fortune Federal Building on East Bay Drive, just a few doors west of U.S. 19, Jim says in the March newsletter.



How did the FACUG get started? It was 1990, and Gary Schweinshaupt of Sarasota wrote to several of us and asked if we would like to go to Sarasota for a day and break into groups so that the Presidents and the Newsletter Editors etc. could talk about their problems. My guess is that the response was so high at that time because people wanted to know how other groups were getting good programs for their meetings. On July 28, 1990, 38 people showed up for the day. The meeting was so successful that further meetings were scheduled regularly. I have attended each meeting since that time. Also, Mike Ungerman of Orlando made a similar meeting each year in Orlando a real interesting affair. Due to Mike Ungerman, the meetings evolved into the FACUG. He did a tremendous amount of work to make the meetings interesting and to provide prizes from various vendors at each meeting. He also found ways to get the vendors to defray some of the costs. Slowly, the various groups around the State volunteered to take the fall meeting, but the spring meeting has been held in

Software Review

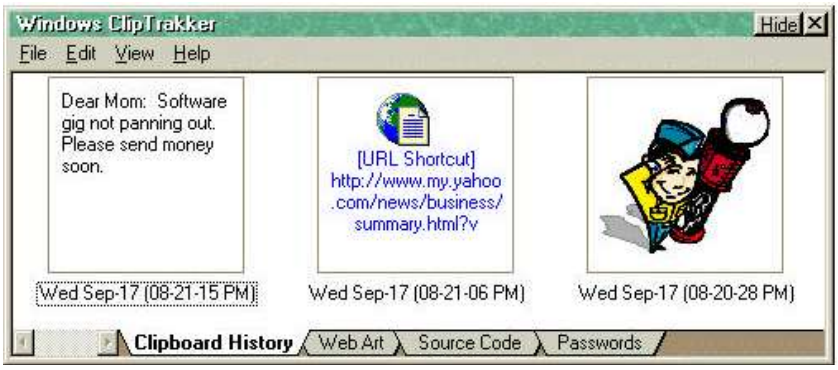
Clip Tracker

byLarry Anders, Librarian, Tampa PC Users Group

Anyone that has used Windows for a while, either 3.1 or 95, is familiar with the clipboard utility included. But, you also learned in a hurry that with the clipboard it's ***FIFO*** "first in – first out." It retains only what you copy until you copy the next clip. Last month Emelie Jurado told us about ClipBook, a utility that Microsoft hid on its Windows95 CD that will save your clippings as you go. But ClipBook is limited to cutting and pasting in an almost ASCII text format. I mean, if you copy text from a formatted document, when it is pasted into a new document all formatting is lost. Granted that's still a lot easier than typing the text all over again. Well, now you can have your cake and eat it, too, and a glass of milk (metamorphically speaking).

Silicon Prairie Software has developed a program, ***ClipTrakker,*** which, like ClipBook, automatically maintains a history of data that has been placed on your clipboard. But that's just about where it ends. *ClipTrakker* remembers as many items as you specify. Every time data is copied to the clipboard, *ClipTrakker* takes a snapshot of it and creates a thumbnail image, storing it on the 'Clipboard History' page. You do not have to save these snapshots, as they are saved as soon as they are created. With this thumbnail, you can easily find the data you need at a later time. You can create new pages at any time to organize snapshots for long-term safekeeping and easy access.

The main window of *ClipTrakker* is hidden so as not to obscure your work, but you can unhide the main window by a hotkey combination or by double-clicking on the *ClipTrakker* tray icon next to the clock.



There are also other view and access options left up to the user.

As I mentioned earlier, with *ClipTrakker* installed, all items that you cut or copy are retained and stored as 'Clipboard Snapshots' on the 'Clipboard History' page. To make locating the data you copied yesterday or last week a lot easier, *ClipTrakker* generates a Thumbnail, which is a small bitmap image of what the original data looks like. And one of the neatest and most useful tools is the text editor. When you right-click on a text thumbnail, like the one in the largest graphic reproduced on this page, and choose Edit Text…up pops *ClipTrakker's* text editor for you to add, delete or change the text however you see fit. You can even combine text from different snapshots to make one clip to paste into your document. *ClipTrakker* also retains all special formatting such as, font size, color and style, etc.

You can use *ClipTrakker* to exchange data with other *ClipTrakker* users. For example; by copying a graphic file generated in an application on one computer to the clipboard, and sending the snapshot to another computer via e-mail or a company network, the recipient, who must also use *ClipTrakker*, can paste that graphic file into his document even though he does not have the required application. If the recipient user should install that graphics application at some later date he would then be able to manipulate (edit) the graphic file in its native form, since *ClipTrakker* snapshots preserve the native data structures, even on systems where the application is not available.

As also mentioned earlier, *ClipTrakker* snapshots are organized into *ClipTrakker* Pages. All original clips are deposited into the "Clipboard History" page. Additional pages can be created and deleted by the user and thumbnails can be dragged and dropped between pages to more easily organize your clips. This is a great way to file and collect art and backgrounds borrowed from the Internet. The files can then be exported to a permanent storage location.

I have been using another shareware program with similar abilities to Microsoft's ClipBook for years but *ClipTrakker* is a keeper. Isn't shareware grand! The cost is $25, and you can learn more about it at http://www.ClipTrakker.com/cliptrak.htm . ◆

Give your PC — and yourself — a Christmas Present

by Merle Nicholson, Treasurer, Tampa PC Users Group

Here are just a few Christmas ideas and some new things that have caught my own attention recently. Some of these are on my own list to buy.

Sony Mavica digital camera. See Larry Anders' article about this in the last newsletter. What an outstanding idea: putting the files in JPEG format on floppy drives! Now, a serious photographer wouldn't use this because of the low resolution (compared to film), but if you're going to present pictures on a PC or even a TV set, 640x480 is just great. Remember, no film development costs, and you can set up electronic slide shows and albums; shoot a lot and discard what you don't need. Combined with a recordable CD unit for long term storage on CD, what more would you want? (http://www.sel.sony.com/SEL/consumer/mavica/wgreat.html)

Xerox "Document HomeCentre" This is a combination color inkjet printer and scanner. Kind of like those "all-in-one" home office units, except without the FAX, and much cheaper. It is a compact 600x600dpi printer with a detachable 24bit color scanner that sits on top. So it's a scanner, printer and copier in one. It includes OCR software too. Combined with your own modem and FAX software, you've got a complete FAX also. Office Depot is advertising this at $399, $100 off list. (http://www.xerox.com/products/dhc/index.htm)

Imation Portable LS120 disk This is the best competition to the zip drive I've seen. See Larry's other article last month. Office Depot has the parallel interface unit at $200 less a $70 rebate right now, making it slightly less than a Zip drive. Now, while I don't know which way the industry is going, LS120 or Zip drives, it's clear that 3-1/2 floppies are inadequate, and that there's a consumer interest in replacing them, and my own personal observation is that you'll find more internal LS120's than internal Zip drives, largely due to Compaq's offering it standard in some machines and optional in all others. I've seen many other ads for PC's offering one or the other as optional. I do need a portable drive, and I've been waiting, hoping that an LS120 would become available. Here it is. (http://www.imation.com/dsp/ls120/index.html)

Other stuff to improve your life at the PC:

New modem Real bargains can be had on 33.6 and 28.8 baud modems because everyone is pushing 56KB right now. Many services do not support 56KB because the standards have not been established. My own service, GTE is one of those. I don't think I will ever have a 56KB modem, because I'm (optimistically) waiting for cable modem from TimeWarner. If you're still plodding along at 14.4, you deserve a break.

Cable modem Blinding internet speed for only $40 a month! I can't wait. I've talked to one user who lives in Northdale who has this, and there just isn't any downside. Check out www.timewarnercable.com.

More memory Windows 95 needs 16MB to run well, and if you have less than that, there isn't a single upgrade that will do more for you than more memory. Go to 24 or 32MB if you can afford it; you won't be sorry. Prices are back down now to $60 for 16MB, $30 for 8MB. Check out the available SIMM slots in your computer before you haul it off to COMP-USA or BCB though.

Disk drives are at the lowest they've ever been, and there's no end in sight. You can get a 3.2Gig drive on sale for less than $200. If you have a 486, and an I/O card that you can replace, consider replacing it with a newer EIDE card. This will allow you to handle your large drive without a software patch like Disk Manager. Avoid disk managers if you can. Office Depot usually has EIDE cards for the lowest price. And while you're at it check out Wal-Mart for computer parts.

Monitors If you're still using that 14" monitor left over from your old 386, it's time to upgrade to a 15" or 17". You don't have to pay more than $350 (15") and $650 (17") for one, because that's the suggested retail for the Sony monitors, and there are plenty of cheaper ones. You can get Sampos for $249 and $429 at the low price end. The best way to select one is to first go to www.winmag.com and especially to www.pcmag.com and check out their shopping guides, then go to a store and look at them, compare to other brands and pick one that is best suited to you.

Processor upgrades One of the best-kept secrets in the 486 upgrade world is the AMD 5x86-133 processor. This little gem will make your 486 perform on a par with a Pentium 60. It is very compatible with almost all 486 systems when it is supplied with a voltage adapter. It's commonly sold as a "stack" consisting of a voltage adapter, cpu and cooling fan

(Christmas.....Continued on page 8)

(Christmas.....Continued from page 7)
for around $120. There are two things that will prevent you from using it; since it's a 3-unit stack it's tall, so if a drive unit or something is above it in the case, it may not be physically possible. And the motherboard must be set at 33mhz. It already is if you now have a 33 or 66 processor, but if you have a 25 or 50, the motherboard must be settable to 33. I've heard that AMD has discontinued the manufacture of this processor, but I know it's still available from existing stock and that the price is steadily rising.

If you have a "generic" standard 486, the prices on upgrades to pentium class just cannot be lower with the competition from AMD and Cyrix. They're both making very fast processors that fit in standard Pentium sockets and use MMX. The AMD K6 processor uses techniques from Pentium Pro processors that make its performance the very fastest available. Right now the K6-200 is very inexpensive, with the K6-233 almost $200 more due to shortages. Complete rebuild to a K6-200 runs $400 to $800 depending on if you need all new memory or hard drive.

And look at UPS!! Wow .. the prices on Uninterruptable Power Supplies are rock bottom! There's no excuse now. For $120 to $160 (get a 400 or 450VA if you can, but get a 280VA UPS at the minimum), you get superior surge protection, a $25,000 policy against damage, and battery backup to boot. The ones I've seen lately have two banks of outlets, one for battery backup and one for just surge protection. You don't need the monitor on battery backup (unless you have the capacity), but you do need surge protection. And don't forget the telephone line! People lose modems all the time from current coming in on the telephone line. One more thing to mention, the inexpensive surge protection strips. They just don't cut it. You'll spend $50 or more for a decent one.

There are many other things to mention: Color scanners have finally become affordable, Color printers are becoming confusing. (How many models does HP make anyway?). Epson, Cannon and Lexmark are in there trying to beat up HP in the inkjet wars and doing a good job of it. ◆

(Comments.....Continued from page 1)
route taken to our web site, type tracert canx.com. You can also Ping a site to test average response time. To check on Microsoft, at the DOS prompt type ping microsoft.com and press enter. The reason I have you do all of this from a DOS prompt instead of simply typing it in the Start|Run text box that Win 95 provides is that if you do this, you will see the same information, but it will disappear as soon as it is finished presenting. With the DOS approach the information stays on the screen.

Getting back to NetCom, different days would produce varying problems. Some days I would need to try back several times over a three hour period before I could connect. The time of day didn't seem to make a difference. At other times, I could connect and browse the WWW, but the email server was not available. Some times I could connect, but again no WWW, no email—nothing. However, on hanging up and reconnecting, everything worked fine. You get the idea.

Calls to NetCom's 800 number always produced a busy signal. The other three NetCom subscribers were having similar problems. But no mention in the press. AOL is down for two hours, and that is news, but NetCom on the blink for over a week (at least for four of us in Tampa) and no mention.

While all these problems were occurring, I received a press release form NetCom concerning their merger with ICG Communications. They assured me that I was a valued customer and that I would "continue to receive the same high quality Internet service that we've always provided, with no change in the way you access or use your current service." I do appreciate the service they have provided me for quite a long time at what is probably a money-losing rate for them of $19.95 each month. But if things don't improve I may be forced to sign on to some other provider and let them lose money on me at $19.95 a month. If you are a heavy Internet user, $19.95 does not cover the provider's cost of providing service to you. They hope to make up the loss from those subscribers who use their service very little.

After writing this, I receivied an answer to one of my email inquires to NetCom. They said that they were aware of a problem with the Tampa POP server and were working on it.

WebCams In last month's newsletter I described how I took an old, unused computer, put a video capture card in it and had some fun bringing TV images and video camcorder images into the computer. And that got me to thinking about these WebCams you see around the Internet.

You know the kind of site I am talking about. The ones offering an image of New York City, Hong Kong, or even Tampa that is updated periodically—as frequently as several times each minute at some sites. And city skylines are not the only subjects that are available. You can also view someone's office, their aquarium, even their refrigerator door (although this site turned out to be a hoax in that it was not really being updated—how would you know, since the door doesn't change). All of this originated with someone's idea several years back to focus a video camera on the coffee pot in some laboratory at Cambridge University in England, to capture the image at

(Comments.....Continued on page 9)

(Comments.....Continued from page 8)
regular intervals, and to then make it available on the laboratory's computer network. That way the workers could just sit at their desks and easily check to see when a fresh pot had been made. Oh, the ingenuity of man.

I am really a fan of these WebCams and have included a page of them at our web site. There you are presented with 16 thumbnails of current images from around the world: four from Florida, four from the rest of the USA, and eight from the World. They basically follow the path of the sun (for all of us who believe the earth stands still and the sun moves around it). So, if the WebCams are working, when it is daylight at the Tampa camera, it should be dark at the Japanese one. This, as you may have noted, is not always the case. These cameras are apparently a low priority at many of their locations, and if they malfunction, you may see the same image for several days. If you click on one of the thumbnails, say, the Chicago one, you will be taken to an Internet site displaying a larger version of the image, and in this case, several more images from around downtown Chicago.

If you like what you see at our WebCam page, you can then check out the following listings of WebCams around the world (see other listings under the Internet category on the links page at our web site). **Live Cam Worldwide I** http://www.rt66.com/~ozone/cam.htm, **Live Cam Worldwide II** http://www.rt66.com/~ozone/cam2.htm, and **World Map of live WWW Cameras** http://dove.mtx.net.au/~punky/World.html . You will quickly see that there is a correlation between technological development of a country and the density of WebCams. Germany has a lot of them, but I have yet to find one for India. Pakistan has one, but it is unreliable.

Now, back to my old computer, its video capture card and my camcorder. What more do I need to set up my own web camera? I need an Internet site and some software to capture the image on a regular basis and transfer it to my Internet site. Those at last month's regular meeting saw my first, feeble attempt at such a setup.

Since our meeting would occur at night, I had a problem of a subject for the camera. I thought about the pet rabbit in a cage in the back yard. Although he would provide some action, it was too dark for that; the street out front was dark also with little traffic. I needed something that would change, so I gave up on the camera and let the TV provide the video input. The Visual Basic software I wrote captured an image from the TV once a minute and transferred it over a local network to another computer connected to the Internet. On this computer the image was converted from .BMP to .JPG and saved to a file name used by an image on an HTML page. At the meeting, I accessed this page on the Internet and projected it onto the screen. In this manner those at the meeting were able to "watch" the TV at my home. When I left the house, the TV was tuned to the local PBS station. Apparently that was changed, since what we saw at the meeting, as some of you noted, was not regular PBS fare.

As those in attendance will remember, the quality of the images was quite poor. The main reason for this was my capture of them in 8 bit color. The video projector at the meeting then amplified the problem. Since then I have refined the setup so that the image is now captured in 24 bit color; thus, the image quality is much improved. I also managed to capture it as .JPG, thus, avoiding a conversion so as to be usable on the Internet. (For those of you not familiar with creating WWW pages, you can only use .GIF or .JPG graphic files—no .BMP files allowed.)

So, what keeps me from having my own live WebCam if I have basically solved all the technical problems? It is that pesky Internet connection problem. You see, I don't really have a permanent Internet connection. When I did the demonstration at the meeting I was just using the temporary Internet address my computer has while it is connected to the Internet (it is running Microsoft's Personal Web Server software). As soon as I sign off (or my provider kicks me off) and I sign back on, I will have a different address—and no one would know where to find my WebCam. Additionally, I don't feel right about simply leaving my computer connected to the Internet for hours on end, since I am sure my provider didn't have that in mind when they gave me unlimited access for $19.95/month. And even if they didn't object—which I am sure they do—the connection would get broken due to technical problems at some point, and, when I reconnected, I would have a different Internet address.

There are two solutions to the above problem. First, I can pay a lot of money and get a permanent Internet connection at my home. If you have looked into this, you know how expensive this can be—hundreds of dollars each month. Second, since my Internet provider provides me with a small home page site that has a permanent address on their server, I could use that as follows: Put the captured image there on a page and write a program to automatically update it at regular intervals by uploading the updated image from my home computer to their server using FTP. In fact, I have done this. Unfortunately there is a problem. The image file is about 60KB; thus, 10 uploads of this file would equal 600KB, and my provider only allows 750KB worth of uploads each month after I get the free site up and running. To update the file only once each hour in a 30 day month would require 60 KB x 24 x 30 = 43,200KB of transfers. You have to pay a good bit of money to be allowed a transfer rate that would handle that. As they say, "You get what you pay for." So, right now I am not getting much. ◆

Special Interest Groups

Microsoft Access SIG — Canceled (temporarily we hope)

Communications SIG

This SIG meets the first Monday of the month at 6 PM at the Reflectone Building. **Directions: Proceed west on Waters from N. Dale Mabry across the railroad tracks, about 1.5 miles, take second left on Savarese. Proceed on Savarese until you reach the Reflectone building. Use the north door.** You must sign up to get on the list and to get by security. *Contact Charles Howe: at 968-1207 or HOWE@INTNET NET*

Genealogy SIG

This SIG meets the second Monday of the month at 7:00 PM at the Museum of Science and Industry. *Contact Jenny Lind Olin at 960-5723 or Ford Bond at 987-6309 .*

(Power Cat.....Continued from page 3)

- **Zoom** Magnification feature is operable in most 97 applications. Glide your finger along the left edge of the touchpad to activate zoom in/out. The Zoom area is not labeled on the touchpad surface; feature requires compatible applications.

To click, all you have to do is lightly and quickly tap the surface of the pad once. To double-click, rapidly tap twice. There is a Right Tap Zone in the upper right corner that takes the place of right-clicking in Windows applications. To drag, draw or highlight, double-tap and hold your finger down on the second tap. If you reach the end of the pad while dragging, just lift and reposition your finger when you reach the textured edge of the pad. Sounds, custom speed, sensitivity, and orientation are just a few of the adjustable settings provided by the Cirque driver.

System Requirements

Power Cat works with any standard mouse driver, but to get the extra features mentioned above, you need to install the Cirque driver. Also, to use the touchpad you will need:

IBM PC-compatible desktop, laptop, notebook or subnotebook computer
Available serial or PS/2 port
One of these operating systems:
DOS 3.3 or above; Windows® 3.1 or above; Windows® 95; Windows NT®
To use the advanced software features such as surfing, signing and scrolling, you will need a Windows 95 operating system.

Physical Specifications

5.5 in. long x 4.4 in. wide x 1 in. deep
6-ft. serial cable (6 in. PS/2 adapter included)
Two mechanical buttons; one virtual button

No contact pressure required; sensitivity adjustable with driver

The Power Cat has a very comfortable feel. The touchpad is mounted on a case that slopes gently onto a foam wrist pad, creating a cushioned frame for your hand to rest on. Because of Cirque's GlidePoint technology, the touchpad senses your finger's movements without pressure or direct contact, allowing the touchpad to respond to your lightest of touches. I had tried other touchpads in the past but none came up to the standards of the Power Cat.

If there is a downside to touch pads in general it's that they require a bit of practice and patience. Once I got past that awkward stage, though, the Power Cat offered enough options and comfort, for me anyway, to put my mouse on the shelf. The computer super-stores list the Power Cat for $79. ◆

Merle Nicholson discovered this ad. The ad states that you can store up to 40 photos per disk. Merle wonders, "How many more do you think you could store if you inserted the disk correctly?"

MEMBERS HELP-LINE

The following phone list is provided for our Tampa PC Users Group members in an effort to establish local support for those frustrating times which we have all encountered while using our PC's. Please note that these are members that have volunteered to help you; treat them in a courteous manner. Be sure to ask if it is convenient for them to help you now, or if you should call another time. It would also be helpful to have your documentation and have it handy when you call. (Don 't expect help if your software is an illegal copy or you do not have documentation!) TPCUG is not responsible for the information or advice provided by volunteers. Volunteers may or may not be experts in the subject matter. You are on your own with any advice received. Be aware also that some of these volunteers may be consultants in their area of expertise. If you are interested in volunteering to answer members' questions, either leave a message on the BBS or fill in the forms provided for this purpose at the meetings.

Chat and Sharing an Internet Connection

by William LaMartin, Editor, Tampa PC Users Group

The TPCUG Chat

The TPCUG Chat page as been up and running at our Web site for a little over a week as I write this. You access it by taking the second link on our home page at http://www.canx.com/tpcug/ . The first evening we used it I phoned around to make sure we had a few participants and they called others. Somewhere between 12 and 16 chatters showed up between 9:00 PM and 10 PM that evening and it was a mad house with messages flying back and forth so fast that it was practically impossible to keep track of what was going on. Additionally, individuals would open a private chat with you, and you then had to try to follow the main chat and simultaneously carry on a conversation in the private one.

In the following days, we would sometimes have two or three, sometimes none, and when I called around again, 12. So the success of the chat seems to depend on guaranteeing that you will have a group gathered at a fixed time. However, I must admit, that as a single individual, you can get a lot more information exchanged if you have fewer people whose messages you must try to follow. We have been saying that if anyone is interested in chatting they should show up at 9:00 PM or a little after to see if anyone else is on.

Perhaps as time passes, we will be able to organize chats at specific times, hosted by specific people and devoted to a narrow range of topics. But right now it is a free for all. Of course, there is nothing to keep any of you from organizing a chat. All you have to do is send email to the potential participants

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

SECRETARY'S REPORT & MINUTES OF MEETING November 12 1997

Minutes and Comments by Merle Nicholson, Secretary, Tampa PC Users Group

After a normal start, the meeting this week went a bit awry when it was decided that our presenter wasn't going to appear. Some members stepped in with some last minute improvisations to save the day and concluded with the door prize drawing.

President Connie Kincaid opened the meeting with officer introductions and information on the club for the benefit of our seven visitors.

SIG leader summaries were next, led by Ford Bond explaining the Genealogy SIG, followed by Charles Howe, Communications SIG.

Bruce Register, as member at large, introduced the current nominations for the upcoming elections. Elections are being held at the December meeting. The current nominations are; Merle Nicholson, president; Mike Hodges, vice president; Kevan Sheridan, Secretary; Jenny Lind Olin, treasurer and Bruce Register, member at large. Connie again asked for other nominations or for anyone that may like to volunteer.

Don Patzsch discussed his current plans to hold Internet Web page HTML classes at 6:00 to 6:30 before the meetings. Eight or so people were interested after a request for hands.

It was about here that concern that Mindspring, an Internet provider, was not going to attend. (As it turns out, they were frantically trying to locate us. They were very apologetic about the missed opportunity.)

Mary Sheridan, our program coordinator, mentioned the current negotiations for a voice recognition company to come in with a presentation, possibly in April.

Ford Bond, MOSI coordinator, and Don Patzsch nicely filled the time with a good demonstration of Internet search services and tips on locating what you're looking for.

The evening concluded with the door prize drawing. Ed Buzza won a copy of Live Pix; Vince McCoy, Jump Start Preschool; Roger Waters an OS/2 Watch; Mary Sheridan, a drinking cup and Michaline Ostrawski, Managing Your Money. ◆

Software Review

American Greetings CreataCard PLUS 2

by Larry Anders, Librarian, Tampa PC Users Group

MICROGRAFX

As the holiday season fast approaches so does the greeting card season. If you're like me and have a pretty extensive card list, you have to get started early to make sure you get them all sent. For years now, I have created my own cards using various programs. Back in the beginning they were done in black and white on an old dot-matrix printer, then on a black and white laser printer, then a few years ago I began using the HP DeskJet printers. A few years back, when I got my scanner, I started adding family photos. This year I'm using my digital camera to add really fresh photos and maybe several different ones. Each year it becomes more difficult to outdo the year before. And with the cost of postage it becomes a costly venture before it's all over.

During the past year the Internet has doubled in popularity, and most of my friend have an email address. If I could just come up with a way to email my Christmas cards this season .. well… wouldn't you know it… along comes Micrografx with CreataCard Plus 2 and provides a way to do everything I want to do: create quality cards, add my own photos and email my cards to friends with email accounts to save on postage.

Some of the features are:

- Over 7,000 projects and designs
- Over 3,500 unique greeting cards, invitations & announcements with thousands of greeting card verse messages included, ranging from sentimental to short & sweet to humorous
- Create your own personalized gift tags, labels and business cards
- Envelope printing capability including designs to print on your envelopes
- Over 3,500 artistic designs & clip art
- Choose a specially designed Add-A-Photo™ card or add your favorite photo to any card or project.

Now it's easier than ever to directly import and edit your photos from a scanner or digital camera. You can even import your photos using one of many formats such as FlashPix (FPX), BMP, JPG, PCD (Kodak Photo CD), PCX, TGA or WMF.

Creative Workshop™ lets you add your own personal touches.

You can quickly and easily create personalized cards and projects for just about everyone – from adults to kids. With the easy-to-use drawing and editing tools included, they're as much fun to make as they are to receive!

- Choose from 3 great delivery methods
- Print your cards at home and send USPS
- Send your cards electronically via email
- Use Personal Delivery and have American Greetings print your cards for you and deliver them on time, every time
- 50 Greeting card fonts included
- The Forget-Me-Not™ Reminder system features an easy-to-read monthly calendar, an address book to enter names, birthdays and more, as well as a reminder system to help you keep track of personal and special event information for individuals and for the whole family. Each time the computer is turned on, a reminder about important occasions is displayed on a pop-up window. Also, use your address book to print envelopes and labels too.
- There are assorted themed variety packs that can also be purchased directly from Micrografx for under $15 per collection.
- Over 40 screen savers

Also new is ***American Greetings CreataCard Gold™ 2*** (Carlton Cards® Gold™ 2) which includes all the contents and functionality of CreataCard Plus 2, with the addition of:

- Over 1,000 greeting cards, a total of 4,500 cards
- 2,000 additional artistic designs and clip art, a total of 5,500
- 50 NEW fonts, a total of 100
- Additional screen savers, a total of 50
- An assortment of specialty paper samples is also included in the box

I've used many different programs to produce my greeting cards in the past but none have ever lived up to the standard and quality of these American Greeting Cards by Micrografx. CreateaCard Plus 2 lists for under $30 while CreateaCard Gold 2 lists at under $50. This software package needs to be added to your collection! ◆

Product Summary

HP DeskJet 1000C printer

by Larry Anders, Librarian,
Tampa PC Users Group

If you haven't entered the world of color printing there's never been a better time. If you have and want more options, there's never been a better time either. At current count, Hewlett Packard, the makers of the world's most widely used laser printers, has 20 models of color DeskJet printers available, but that's just today. By tomorrow there could be a couple more. It used to be that only one or two new printers were released each year, but not anymore. I'm on my third HP DeskJet (HPDJ) and the latest is a doozy. Strangely enough, I have paid the exact same amount every time but I keep getting more options with each new printer.

My first HPDJ was a 500 Series, which I purchased about 4 or 5 years ago, is still being used by my daughter and has never been serviced. My second, an 800 Series, is currently being used by my wife and has never been serviced either. There was some kind of paper feed problem when we first got the second one a couple of years ago, but I didn't realize it until HP sent a kit to fix the problem. Recently I purchased a new 1000 Series, and is it ever loaded with features! One thing about the HPDJ printers that eliminates the need for servicing is that when you change the ink cartridges you also change the print heads. All three of my HPDJ printers use two cartridges. One for black and one for color. The cartridges run from $25 to $30 each but they last and last.

With the HPDJ 1000C you can print any size document, from 4 x 6 inch postcards to 11 x 17 inch posters. It even accepts oversized 13 x 19 inch media for full-bleed design documents (no margins). Plus, it handles virtually every media type, from postcards, labels and transparencies to envelopes, banners and specialty papers, even poster board.

Hewlett Packard's RealLife Imaging System ColorSmart delivers super sharp blacks, excellent colors and photo-quality images automatically. And built into the new exclusive printer driver are software features such as HP ZoomSmart, billboard and booklet printing, letting you can create a full range of high-impact business documents with ease. The HP DeskJet 1000C is the flexible, business color printer that does it all at home, too.

Review of Features

- Prints media from 4 x 6 in. to 11 x 17 in. and just about anything in between
- Three easy-to-use media input paths, including a straight-through paper path from the rear for thicker media
- Create brochures, transparencies, oversize documents, banners and labels
- HP's exclusive software provides a range of special 11 x 17 in. printing features
- HP ZoomSmart scaling technology - easily reduce or enlarge your work at the touch of a button
- Billboard printing lets you tile all the way up to 4 x 4-foot posters
- Booklet printing - create professional-looking brochures with the automatic booklet printing function, plus mirrored printing, banner printing, manual duplexing and handouts
- Special CD-ROM and media kits let you create professional-looking documents
- Fast printing - up to 6 pages per minute black, 3.5 pages per minute color
- HP's Resolution Enhancement Technology (REt) for crisp black text at 600 dpi
- Photo-quality color at 600 dpi with Color Resolution Enhancement Technology (C-REt)
- True-to-life images with HP's RealLife Imaging System
- Custom engineered for printing in Microsoft ® Windows ® 3.1x and Windows ® 95
- MS-DOS ® printing through Microsoft Windows

Hewlett Packard says it's good for about 20,000 hours. I say it's better than that. It retails for slightly under $500 at any of your super stores. It's too big for a stocking stuffer but it would fit under the tree nicely, and no one would be disappointed with this gift from Santa. ◆

(Comments.....Continued from page 1)

telling them when and where to meet. You could have someone meet you for a private chat where only you two would see the messages going back and forth.

Chat is real time. It is not like our Discussion Group. In the Discussion Group the message you post remains after you post it. With the chat, when the last participant signs off everything disappears. So a chat needs live bodies. That is why you need a scheduled time to meet.

Now for a little technical information. Most chat programs require you to have chat software on your computer. This chat requires only that you have a Java enabled browser. It consists of a Java program running on the server where our

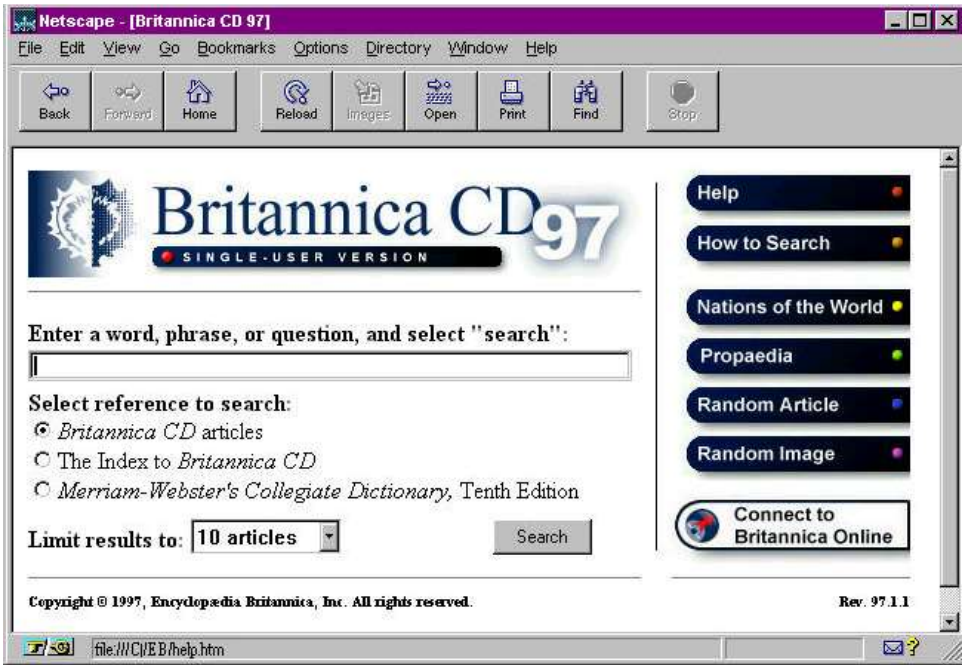
Software Review

Encyclopedia Britannica 1997

by William LaMartin, Editor,
Tampa PC Users Group



First, I should point out that there are two versions of this encyclopedia available, the version I am going to review and the other called *Encyclopedia Britannica 1998*. The 1997 version is a one CD, text-based program containing the entire text of the 32 volume print set. The Britannica '98 CD is a two CD multimedia edition of the same encyclopedia. So, roughly speaking, with the '97 edition you get all the text of the printed edition plus a limited number of maps and pictures, and with the '98 edition you get this plus all the multimedia bells and whistles of a program like Microsoft's Encarta (but with much more textual content than Encarta).

Second, a little background. Everyone is familiar with the *Encyclopedia Britannica*. Quite possibly when you were growing up it was the encyclopedia your parents couldn't afford to buy, and you ended up with *World Book Encyclopedia* or another cheaper publication. Britannica was the standard by which all others were judged—and for scholarly articles and scope all the others fell short. But something happened on the way to the computer revolution: Britannica (and their owners the University of Chicago) got caught napping and sorely misjudged their market. They chose to stick with their paper product while the lesser publications like Grollier, Compton and the new kid on the block, Microsoft with *Encarta,* began selling their $49 -$99 CD based products. Never to worry, they thought, the real scholars and caring parents would continue rely on Britannica with its $1,000 plus product. They were very wrong—and they about went out of business.

Even after they committed to putting out a CD version, they were still out of touch. In 1996 they dropped door to door sales and announced a subscription fee of $150 per year for individual access to Britannica (where you accessed the encyclopedia online) with special site licenses to universities and other institutions for this service and—get this--charged $995 for the CD-ROM version. Also, somewhere along the line, a group of private investors bought the company in the hopes of reviving it.

Well, as an example of what competition will do, a year and a half later you can get the full textual content of Britannica in the '97 CD for $85 and with the additional multimedia additions in the '98 CD for $125. Oh, if you are interested, you can still get the printed version—without the door to door salesman (I think you had to ask them to come to your home; they didn't just show up unannounced like the other encyclopedia companies)—for a mere $1,500.

Now to *Encyclopedia Britannica CD 1997 Edition*. A CD based encyclopedia is simply a collection of articles with hyperlinks linking them and—most importantly—a powerful search feature. If you use the Internet, you will be right at home with the '97 version of Britannica. When you start the program, it first fires up Netscape Navigator (Version 2.0 comes on the CD, but you have the option of using any other version you may have on your computer). And your Britannica home page looks like the graphic on this page.

So, you Netscape Navigator devotees will be right at home. Unfortunately for us Microsoft Internet Explorer users, there seems no way to use that browser in place of the Netscape one. Believe me, I tried, but they have done some things in the Win 95 registry that I cannot get around. They appear to have defined a new protocol called EB—just like the familiar protocols HTTP, FTP, etc—that Internet Explorer doesn't understand. But, if Bill Gates' *Encarta*, with a little help from the other CD encyclopedias, had just about destroyed your product, you probably would fall into the Netscape camp, too.

What sets any version of Britannica apart from its competition is the quality and scope of its articles. Given that you have good content, the next thing you need is a good search feature.

(Britannica.....Continued on page 7)

(Britannica.....Continued from page 6)
The Britannica CD supports natural-language searching as well as Boolean searching. Natural-language searching allows you to enter a question exactly as it comes to mind (e.g., "what is the riddle of the sphinx?"). Boolean searching uses uppercase operators such as AND, OR, NOT, and ADJ to link search terms together (e.g., "relativity AND Einstein").

As to the content of the CD as compared with the print edition, here is a quote from the Britannica CD FAQ:

"The article database of Britannica CD is created from the same knowledge base as the New Encyclopædia Britannica, 15th edition, but differs from the print set in a few significant ways. Title cross-references (such as "Clemens, Samuel Langhorne: see Twain, Mark."), which are useful to the print reader, are unnecessary in an electronic product that is accessed through full-text searching, so they have been eliminated. Because there are different space restrictions for a CD than for a print book, many articles in Britannica CD are longer and more detailed than their print counterparts.

Related entries gathered together under broad titles in the print Macropædia for ease in consultation (such as the print article Beverage Production) have been restructured into smaller articles (such as Beer, Wine, Coffee, Tea, Soft Drinks, and Distilled Spirits) for easier retrievability in Britannica CD. And, of course, Britannica CD contains more than 2,000 new articles not included in print."

So it looks like everything and more is there. Just don't expect any multimedia glitz. No AVI files of frogs being dissected here. For that you will have to buy the Britannica '98 multimedia CD version or one of the competitors.

Additionally, you have *Merriam-Webster's Collegiate Dictionary* at your fingertips. And, for a trial period, you can investigate the additional information in Britannica Online.

For anyone who understands a browser, the program's navigation is trivial, and, as expected, the textual content is superior to that of the competition. This is a college student and adult encyclopedia. However, there is one potential problem with the installation. When you are given the choice of selecting a folder in which to install the program on your hard drive, it is best to choose the default of, I think, C:\EB. For, if you, like many of us Windows 95 users, choose to put it in something like C:\Program Files\EB, you are going to have problems. The program will run, but you will not be able to do a search. The reason for this is that many non-Windows 95 programs have a problem with paths containing spaces like the one above. Thus the program can't find its files. It took me awhile to figure this one out.

I got an offer through the mail from Britannica for Britannica '97 for $99 and Britannica '98 for $150. By the time I got around to phoning them in October, the Britannica '97 was $85 and the Britannica '98 was $125. I feel, though, that they are phasing out the text based '97 version, since when I went to their WWW site at http://www.eb.com/ I only saw mention of the Britannica '98 multimedia version. However, I just checked, and ithe 1997 version is still for sale. So if you would like to get the 1997 version for $85 you may call 1-800-747-8503. Just think, in 1995 they were charging $995 for the 1995 version of this CD.

This is a Windows 3.1 program and will run on a minimal setup, whereas the 1998 multimedia version prefers a Pentium. ◆

(Comments.....Continued from page 4)
Web site is located and a Java applet that is download to your computer each time you go to the chat page. The applet does all the work on your end. As a point of information, the Java games we have at our Web site (Rubik's Cube, Tic Tac Toe, etc.) are Java applets.

Sharing an Internet Connection

Ever since I networked two of the computers in my home I have been thinking about the possibility of giving one Internet access through the other one. Well, I have finally accomplished that at no cost to me.

First, some networking background. Several months back in this newsletter Merle Nicholson described how to create a peer to peer Windows 95 network with two computers. In a nutshell, you put a network card in each computer running Windows 95, connect them with 10 Base T network cable with a crossover cable joining one end of the network cable to one of the computers so as to "turn what is a send signal on one computer into a receive on the other". Windows networking and the setup details that Merle supplied did the rest. I added an additional twist to my setup. Instead of using a crossover cable, I add a network hub to the system with each computer connected to the hub instead of to each other. With the hub I can add additional computers to the network, as I just did when my son brought his laptop home with him from college. Later, perhaps, I can add my daughter's computer to the network, but network cable is expensive and her computer would require a long run of cable to the upstairs.

My son's short visit prompted me to think again about con-

(Comments.....Continued on page 8)

(Comments.....Continued from page 7)
necting other computers to the Internet through the modem in my main computer. His laptop had a network card for use at the university but no modem, so he couldn't connect to check on his email or browse the Web using his computer from our house. We talked about the problem for awhile. I said that I recalled some Usenet newsgroup message I had read once that dealt with the problem, but I couldn't recall or find the details. He had the idea of using Virtual Private Networking (VPN). VPN is a new feature added to Windows 95 if you download the latest version of Microsoft Dial-Up Networking. i believe that this would have worked if my main computer were running Windows NT, but it operates under 95 which will let a 95 computer only be a VPN client—not a VPN server.

So, another solution was called for. Now, what do I do when I need an answer to a computer question? I go to the DejaNews link in the Internet Search category of the Links page at our Web site. DejaNews searches the Usenet newsgroups for the keywords you enter. I forget what words I entered, but they were something like, "two computers one modem Internet". That produced a list of relevant (and not so relevant) articles. Several of them mentioned a program called WinGate but didn't tell me where to get it.

My next step was to go to the ZDNet Software link under the Computer Software category at our Links page. Once at ZDNet, I entered WinGate in the search, and bingo! I had it. The description was as follows:

> *WinGate is a multiple proxy server for LANs enabling connection to the Internet through a single controlled server. Instead of needing to set many computers up to access the Internet, WinGate can be set up on a single machine and provide a medium for any networked PC not connected directly to the internet to access information including FTP, Telnet and the WEB . Cost effectiveness is evident since only one account to an on-line service is necessary to enable several users at a location to use the connection.*

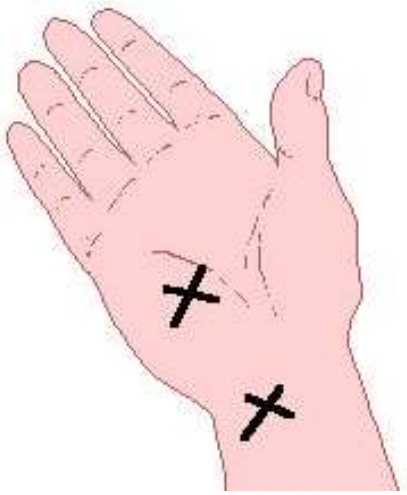
It was just what I needed, and is free for use with two computers (with the one connected to the Internet acting as a proxy server for the other). Money, however, is required for the key that will allow you to connect more than two. Following a 1.3 MB download, an installation of WinGate on the computer connected to the Internet, an assignment of local IP address for all the computers on the network, and the configuring of the browsers on the computers not connected to the Internet so that they access the Internet and mail servers through the proxy server instead of directly, we were up and running. By the way, you assign the local IP address as follows: 192,168.0.1 is assigned to the proxy server, 192.168.0.2 to the next, 192,168.0.3 to the third and so on. In theory, it appears that you could connect 255 computers this way going up to 192.168.0.255. Of course, you would need one heck of an Internet connection and computer serving as your proxy server if you were to do this.

In our simple case we had three computers connected. Wait a minute, you say. I thought you said you had to pay if you connected more than two computers? That is almost correct, we can connect three computers this way—two computers connected to the proxy serving computer—we just can't access the Internet using more than one of the extra ones at a time. If you try to access Web pages from both of the auxiliary computers at the same time you get a message that there are too many computers connected.

This was just what I needed. While my son was checking his email (using his university mail server and not the one for my account) or downloading a file from the Internet on his laptop, I could be reading the Wall Street Journal online or taking part in the TPCUG Chat I spoke of earlier.

And that brings up the only shortcoming of the program I have found so far. You can not use the TPCUG chat feature from one of the networked computers. I am not sure why. It is not a Java problem, since you can play the Java games at our Internet site with the networked computers. It must have something to do with the way the downloaded chat applet communicates with the Java program running the chat at the TPCUG site. I also suspect, but have not verified, that programs like Microsoft NetMeeting would not work from one of the auxiliary computers. But what does work is great. From the second computer in another part of the house I can now share the Internet connection of the computer I am writing this on for email, Web browsing and FTP.

Of course, the more computers you add and try to access the Internet simultaneously with, the slower things will go. The problem here is not really with the computer that is acting as the proxy server if it has any sort of up to date speed and memory. The problem will be your bandwidth—that is, the speed of your Internet connection. In what we were doing, I noticed no problem in working with my 28,800 connection. However, just think what you could do with that cable modem connection we are all supposed to have in the future. You could have a computer in every room of the house accessing the Internet simultaneously over just one Internet account. Why you would want to do that, I don't know, but you could.



One thing you don't get with all this is more than one email account. You can do email from all the separate computers, but, unless you already have different accounts they are still working under the same account as the proxy server. I am at this time a little vague on this point.

If you would like to download a free one user (two computer)

Surgery Review (Carpal Tunnel Syndrome)

by Larry Anders, Librarian, Tampa PC Users Group

Anyone that read my review of Cirque's Power Cat touch pad in last month's newsletter is aware that I had surgery scheduled on my right hand. Because so many people whom I have spoken with about my Carpal Tunnel Syndrome have the same symptoms I have, I thought I might share my experiences, without going through all the gory details. My hope is that they and you, if you have similar symptoms, will get it taken care of a lot sooner than I did.

It all started several years ago when my hands started getting numb doing various tasks such as mowing the yard, driving the car, eating, writing, typing…. I think you get the picture. Both hands started at the same time, which in some way made it more acceptable for me to deal with, so I let it go on for years. It finally became a problem sleeping through the night when my hands began going to sleep all the way up to my elbows. I finally had had enough, so I went to a neurologist who diagnosed me with "*classic carpal tunnel syndrome*." He explained that this is caused when the tunnel in the wrist that wraps the nerves together as they travel from the arm to the hand becomes injured and swells causing the nerves to be pinched, thereby causing the numbness. The neurologist recommended I try the wrist braces for a couple of months but also said they probably would not help because I had waited so long. He was correct. You see, the cure for this, if any, is early detection and complete rest of the stress points in the wrists to allow the swelling to go down. I don't think waiting five years constitutes early detection.

Well, the neurologist recommended an orthopedic surgeon and she recommended the surgery. The only choice was which hand first? We settled on the dominant hand first and I see now why that was probably the best case scenario. After getting through the right hand recovery the left hand should be a snap. For example, just for kicks, try going just 24 hours WITHOUT using your dominant hand for *anything*! Now multiply that by a couple of weeks. There are a couple of personal hygiene maneuvers that are real chores. My wife, Debbie, is a sweet, helpful person who was by my side the whole way. But there are just some things I won't ask her to do. (Enough on that - after all I did say I wouldn't get into the gory stuff.)

The surgery is outpatient surgery and the actual surgery takes about an hour. I walked into the hospital at 12:30 PM and "walked" out at 4:45 PM. No wheel chair required. The rest of the time was pre-op and just waiting to leave.

I was given a choice of two types of anesthesia; either being put under totally or a nerve block in the armpit with twilight sleep during surgery. I went with the nerve block because there was no danger from the anesthetic and no real recovery time and my surgeon also recommended it. There was never really any pain other than a feeling like hitting your "funny-bone" during the nerve block. (I never really understood where that terminology came from. If anything, it isn't funny.) I actually never felt a thing until the next morning when there was some discomfort. As mentioned earlier, the hardest thing was NOT using my hand for the ten days. My hand was placed into a soft cast and left that way for the ten days. When the stitches and cast were removed on the 11th day I found that I had two small incisions approximately where the "X's" are on the graphic above. (I actually had two other incisions but that was because I also had my ring finger and thumb operated on for what is called "trigger-finger", which is carpal tunnel damage on a smaller scale at the joints.) I was then told that everything looked fine, was given some hand exercises to do to avoid physical therapy, and told to come back in thirty days. That's it!

Had it not been for the extra two fingers that were also operated on I would consider myself, now on day fourteen after the surgery, at least 75% recovered and my right hand HAS NOT gone to sleep since the surgery. I am actually looking forward to the surgery on my left hand in a couple of months. It has been overworked the last few days and has been in a lot of pain. Always before I had the other hand to swap off with when the numbness began. I failed to mention above that, with a good case of carpal tunnel syndrome, when the numbness leaves the pain begins. One down, one-to-go.

If you're like so many of the people I have spoken with that have similar symptoms, please have it looked into as soon as possible. It WON'T go away unless you do something about it and the sooner the better. I'll give you my hand on that.

By the way, the Cirque Power Cat touch pad is one fine piece of hardware. It would make an excellent stocking stuffer. ◆

Special Interest Groups

Communications SIG

This SIG meets the first Monday of the month at 6 PM at the Reflectone Building. **Directions: Proceed west on Waters from N. Dale Mabry across the railroad tracks, about 1.5 miles, take second left on Savarese. Proceed on Savarese until you reach the Reflectone building. Use the north door.** You must sign up to get on the list and to get by security. *Contact Charles Howe: at 968-1207 or HOWE@INTNET NET*

Genealogy SIG

This SIG meets the second Monday of the month at 7:00 PM at the Museum of Science and Industry. *Contact Jenny Lind Olin at 960-5723 or Ford Bond at 987-6309 .*

Software Review

Drive Image

by Don Patzsch, Tampa PC Users Group

If you own a computer, and you plan to really use it, you need two utility programs. One is Partition Magic, and the other is Drive Image. With these two programs, you may change your partitions at any time without being concerned about losing data, and you may do fantastic copying from one hard disk to another, or to the same hard disk, or to floppies. This means easy backups with this program. You can produce compressed backups, or exact image backups easily. I do not use tape backups because these programs provide much faster results, and instant replay.

The program Drive Image is one of the most interesting that I know of.

When I decided to test out my copy, I used Partition Magic to make a new logical drive G: from my H: drive and a new logical drive I: from my F: drive. I then filled the G: drive with several programs, and then used the Drive Image program to copy all that to the I: drive.

It takes only a few seconds, and you have copied bit by bit, the G: drive to the I: drive. An exact copy. This means you can copy an operating system and all the various files that make up the system, plus all the data and programs you may have on that disk. These copies are exact, so if you have two computers, you may have exactly the same hard disk programs on each of them.

You could do the same and copy only a partition, copying it to a partition on another disk, or for that matter, to another partition on the same disk. Drive Image is a very flexible program, fun to use because it is user friendly, and fast. Drive Image works with FAT, FAT32, NTFS, and HPFS. If you want to buy a new larger hard disk, Drive Image will transfer from your old hard disk, without losing a single byte. Drive Image copies only used sectors! Drive Image will copy to a floppy drive, a second hard drive, a network drive, and a removable storage drive, such as a ZIP drive, JAZZ drive, or CD ROM. So, if you buy a new computer, get a removable drive, and your backup problems are then fast and simply accomplished.

Drive Mapper is a utility that comes with the program. It allows you to change drive letters on occasion. Magic Mover is another utility that comes with the program. It allows you to move applications from one partition to another. The PowerQuest Company has always answered questions that I send by email in a day or two. They really give you answers you can understand and use.

The manual requires a bit of study, but it contains a wealth of hard disk information.

Note: We no longer need Drive Copy by PowerQuest. It was intended to copy an entire hard disk to another hard disk, the same size or larger. It did not permit copying of partitions. Partition Magic version 3.0 could be used for copying partitions, but Drive Image is a newer program and is preferred for all copying—partitions and entire disks.

I think you can see that I recommend Drive Image and Partition Magic highly. Street price of Drive Magic is about $45. Your PowerQuest presenter will usually give User Groups a nice discount on all PowerQuest programs.

MEMBERS HELP-LINE

The following phone list is provided for our Tampa PC Users Group members in an effort to establish local support for those frustrating times which we have all encountered while using our PC's. Please note that these are members that have volunteered to help you; treat them in a courteous manner. Be sure to ask if it is convenient for them to help you now, or if you should call another time. It would also be helpful to have your documentation and have it handy when you call. (Don 't expect help if your software is an illegal copy or you do not have documentation!) TPCUG is not responsible for the information or advice provided by volunteers. Volunteers may or may not be experts in the subject matter. You are on your own with any advice received. Be aware also that some of these volunteers may be consultants in their area of expertise. If you are interested in volunteering to answer members' questions, either leave a message on the BBS or fill in the forms provided for this purpose at the meetings.

NOTICE

If you have an interest in learning how to write a simple home page and how to upload it to a server, come to the meeting room at 6:00 PM. December 10. Don Patzsch will talk about TAGS, and the handout will show you how to write a simple home page, and you will be given a copy of actual HTML code you can change to put in your own name, etc.

This is the time between 6:00 and 6:30 that the early arrivals use to network before the actual meeting starts.

An Abundance of help

by William LaMartin, Editor, Tampa PC Users Group

Things must be changing at the TPCUG. When I requested that members—those whom I was able to contact via email—provide some articles for this month's newsletter, since I, as is not unusual, was looking at a lot of blank pages, I got more than I bargained for. Usually such a request would produce perhaps one short article. This request produced more than the newsletter can hold. So next month I will not have to start from zero. Thanks very much to all who volunteered material. In addition to the reviews you will see in this newsletter, both delivered and promised articles also came from Tim Condon, Tom Cone, Don Patzsch, Charles Howe, and Bruce Register. As I said in my request, "It is a group newsletter, so we need a group effort."

The move to MOSI is a chance to revitalize our group. I know this sounds trite, but from my experience the more you put into the group, the more you will get out of it. It can be as little as showing up for the networking session we have at the beginning of each meeting. There you can share computer problems and solutions with other members and visitors.

So what is new? Well, I have a new niece in Maryland, and my brother-in-law had delivered photos to my computer within six hours using one hour photo processing, his color scanner, and the Internet. I suppose that if he had had a digital camera and laptop in the hospital room we could have gotten them almost immediately.

Finally, check out the Street Cam photo on page 5 to see what else the Internet delivered to my computer in February. ◆

Since the bulk mail section of the Post Office misplaced one tray of newsletters, those with zip code prefix 336 received the February newsletter about 10 days late. We are sorry for the inconvenience.

The use of trademarked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if ithey are not received on time.

Members may insert non-commercial ads at no charge with the following imitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

SECRETARY'S REPORT & MINUTES OF MEETING February 12, 1997

Minutes and Comments by Merle Nicholson, Secretary

Most members appeared at the usual 6:00PM time, gathered in the large lobby, and then moved to the outside tables until the room was available at 6:30. Ford Bond unlocked an outside "side" door and escorted us to a lab room with about 16 PC's. We brought more chairs in to get the crowd into the room. Ford assured us that there were other, larger rooms available that we could use if needed.

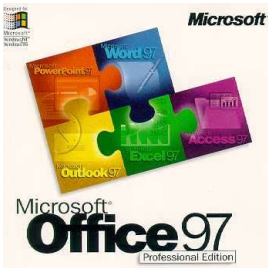
The following SIG information was presented:

Communications The next meeting's topics are going to be Internet Relay Chat, FTP and Newsgroups, UNIX Shell accounts.

Genealogy Jenny announced the next meeting was going to be at Charles Doll's house in conjunction with a local genealogy club. Jenny briefly described the purpose of the group for the newcomers' information. Some discussion followed describing the classes offered at MOSI.

MS Access Connie announced that due to conflicts in schedule she will no longer be able to head up the Access SIG. Connie apologized for the short notice and announced the job was open and needs to be filled for the SIG to continue.

At 7:00 Connie welcomed the new members and described the dues. There were 11 guests in attendance. Ford Bond described the basic rules of the house and the museum and lab facilities.



For the monthly presentation, Vice President Mike Hodges brought an abbreviated version of an earlier presentation he did for the Young Astronauts. He began with a description of the technology. Mike brought the presentation on a CD-ROM made at his workplace. It covered a wide variety of subjects; for instance, graphics captures about the workings of inner ears were made from an Internet site and drew from Mike's own knowledge of the effects of motion on astronauts. It concluded with a series of stunning photos taken from space and also artists renditions of the future space station.

After a break, the door prize drawings were made. Ed Bryan won a computer dictionary, and Ken Boyd won the Quicken Financial Planner.

Thanks for a good meeting, Connie .. and especially to Mike for an outstanding presentation. ◆

SOFTWARE SUMMARY

Microsoft Office 97 Professional

by Larry Anders, Librarian
Tampa PC Users Group

I'm not calling this a review, although in some ways it is. It's actually more like a summary. I'm also not going to waste my time or yours by trying to compare this to some other integrated package. I'll say it up front and get it over with. This has got to be one of the **BEST** software packages ever written. Although I purchased it as an upgrade to my Office 95 Professional Suite, it is definitely more than the standard upgrade that comes out every year just so the software manufacturer can get a few more bucks out of you. This time Microsoft listened. If you have been looking for a reason to step up to Windows 95, **you have one now!**

What's new?
There is a much tighter integration between all Office applications that creates a more organized and unified workspace:

- Microsoft Outlook - Provides an integrated desktop where you can organize and manage your e-mail, calendar, contacts, tasks, and files (All in one place)
- AutoJournal - Logs Outlook communications and Microsoft Office application activities
- Address book integration - Stores your address book contacts in one location for easy access from any Office application (You'll know where that address or phone number is when you need it)
- Multiple views - Allows you to view information in any Outlook folder by icon, table, card, timeline, or calendar, or to customize your own view
- Complete portable solution - Takes your Outlook information with you by way of paper planner, laptop computer, personal data assistant, or Timex® DataLink watch
- Office Binder - Stores all your files for a project in one place-you can even add common headers and footers so they look and print like one document

You can now get connected with Internet-ready software that enhances and flows through the entire package:

- Adding Hyperlinks - Creates live links to a file or site automatically when you type the URL or UNC address (Instead of just giving someone an address, with this you show them how to get there)
- ActiveWeb - Allows you to author and view documents in their native format on your corporate intranet or the Internet
- Full-text searching - Enables you to find information on your network quickly and easily
- Web toolbar - Brings the navigational and searching tools of the Web to your Office applications
- Save as HTML in Word, Microsoft Excel, Microsoft Access, and PowerPoint® - Saves your Office documents into HTML format with the click of a button for posting to the Internet or corporate intranets (You have no idea how useful this is. Web page creation just got a lot easier)
- Web templates in Word - Provides custom templates to design great looking Web pages (Like I said, web page creation just got a lot easier)
- Document Versioning in Word - Tracks and stores all previous versions of your document in one file (Never wish again that you would have kept that original)
- Web Queries in Microsoft Excel - Pull real-time information from Web sites directly into your worksheet (Why re-type when it's already in print)
- Publish To The Web in Microsoft Access - Converts your data or reports to HTML so you can create dynamic, interactive database pages and share them across a company intranet or the World Wide Web
- Save to URL in Microsoft Excel - Allows you to save to a Web server by simply specifying the URL address (Automatically update your date on your web page)
- PowerPoint Animation Player for ActiveX™ - Lets you publish presentations to the Internet as a Web page with animation and narration (Web page creation not only got easier but no one will know that a pro didn't do it)

Personalize your desktop and get ready for some intelligent software.

- Office Assistant - Provides interactive advice, help, and tips to help you learn as you work, and it's completely customizable so you can choose the Assistant and the options that best suit the way you work (This is not only informative but darn cute too)
- Grammar Check and Spell It in Word - Proofread your documents for spelling and grammatical errors as you type, and correct errors with one click of the right mouse button (If you send a document out with an error now you'll have to do it on purpose)
- Enhanced AutoCorrect in Word - Corrects common multiple-word typographical and grammatical errors, fixes capitalization mistakes, and creates handy shortcuts for frequently used text and graphics (and it really works)
- Natural language formulas in Microsoft Excel - Allows you to use your own terminology when building formulas (Not a mathematician – no need to be now)

(Office.....Continued on page 4)

(Office.....Continued from page 3)

- Multiple Undo in Microsoft Excel - Allows you to undo multiple commands (I've wanted this for years)
- AutoPreview in Outlook - Lets you view the first three lines of each e-mail message (Make short work of the spam without having to read the entire e-mail)
- IntelliMouse support in Office 97 applications - Takes advantage of the IntelliMouse Wheel for enhanced navigation, close-up viewing, and panning left and right and scrolling (This is sold separately or in a package deal with Office 97 – Sure beats running that slide bar up and down)
- OfficeArt - Gives you drawing tools to easily design sophisticated 3-D effects, shadows, multicolored fills, textures, and Bezier curves (This is one of my favorites – I leave it turned on all the time)
- Images and fonts on CD-ROM - Includes approximately 3,000 clip-art images and 150 fonts (More than you'll ever need)

Word 97 simplifies common word-processing tasks with built-in intelligence by recognizing what you want to do. The new Letter Wizard structures your letter and adds dates and other information, so you can focus on the content instead of correctness. Word 97 suggests layouts and styles and will even insert addresses using your contact information from Microsoft Outlook™ 97 or another compatible application. With Grammar Check and Spell It you can proofread for errors in grammar and spelling as you type, so you can be confident that your writing is correct to the smallest detail. The interactive Office Assistant is always ready with instant answers, tips, and shortcuts while you work. It'll make learning or upgrading to Word 97 easy for novices or the experienced word-processing person. And Word 97 allows you to quickly convert any document into HTML format for the Web! You can even import, edit, and save HTML files directly to Internet servers. Also, Word 97 gives you powerful tools for collaboration, with easy-to-use features that let everyone write, review, and edit documents as a team. And don't forget my favorite. Design impressive graphics with 3-D effects, fills, and animated text using the new OfficeArt drawing tools.

Microsoft Excel 97 is a comprehensive and intuitive spreadsheet program. Whether you're a novice or expert, Excel 97 is more discoverable and usable than any spreadsheet I have ever used, and I have used spreadsheets now for over 12 years. It just makes it easier to turn your numbers into answers. Formula creation has never been easier with the new natural language formulas that let you build equations using your own terminology instead of cell coordinates. And you don't have to worry about being so precise because Formula AutoCorrect will intelligently fix common equation errors on the fly. You can create charts easier than ever with the enhanced ChartWizard. As with Word 97, team members can now collaborate simultaneously on a single shared workbook. And you can easily keep track of when changes were made and by whom. You can also convert your files to HTML format for the Internet with the click of a button—no coding necessary!

Whether you're conducting an informal meeting, presenting to a large audience, or delivering your message over the Internet, with **Microsoft PowerPoint 97** presentation graphics program you will be able to quickly and easily create professional-looking presentations. PowerPoint 97 has new professionally designed templates, a step-by-step wizard to generate content, plus PowerPoint Central's links to additional tips, content, and multimedia effects. You can also use the new Microsoft OfficeArt text and drawing effects to bring your data to life. Plus, you can create dynamic presentations easily with new, improved multimedia features including sounds, movies, and pictures from the Clip Gallery. This seems like an easy way to turn your work into animated advertisements, banners, or presentations for attention-getting World Wide Web pages. Not only can you publish your ideas, but also you can include image maps, links to other Web pages, and even narration in your Web page.

Microsoft Access 97 is relational database management system that easily integrates data from spreadsheets and other databases or turns raw data into answers with tools that help even first-time users get up and running quickly. The Database Wizard automatically builds any one of more than 20 custom databases in minutes to help you get started fast. And the Table Analyzer Wizard intelligently finds the underlying structure in a flat-file list and transforms it into related tables so you can immediately harness the power of a relational database-even if you don't understand relational database systems. With Access 97 it's easy to share up-to-date information with others, regardless of where they are. The Publish To The Web Wizard lets you share dynamic or static database information across the Internet almost instantly. And the Import/Export Wizard walks you step-by-step through the process of converting data to and from a variety of popular data formats. Along with the enhanced 32-bit performance, the Performance Analyzer Wizard automatically recommends the best way to create a well-organized, more responsive database. Whether you are a first-time user or a database expert, Access 97 can manage all your data.

Bookshelf® Basics for Office 97, Professional Edition, on CD-ROM contains the Bookshelf Basics reference library for quick access to the reference tools you need most. Included in Bookshelf Basics are The American Heritage® Dictionary, The Original Roget's Thesaurus, and The Columbia Dictionary of Quotations. All of these are directly accessible with a click of the mouse while you are inside your documents.

Office 97 also now contains **Microsoft Outlook 97**, an easy to use desktop information manager that organizes and manages all your e-mail, calendar, contacts, tasks, and files, all in

Software Review

MS Flight Simulator for Windows 95

by Wil Goble, Treasurer, Tampa PC users Group

Well, after having a few problems getting the program installed on my computer (this turned into a trip to the Internet for some Microsoft frequently asked questions and answers) the program installation went along just fine.

Turns out that you must have the 32 bit drivers for the CD-ROM installation to succeed as your computer cannot handle the long file names on the CD, so it just kept getting errors at the same place on the installation. You could click on ignore and the installation would continue but the program would not run.

I have the old version of the Flight Simulator for Windows. It's pretty good for learning to fly a plane and the graphics are just O.K.—not spectacular. Now the new version for Win 95 is a whole different ball game.

My computer is pretty fast and the video card is very fast, so I can turn on maximum resolution for the display and it looks almost picture like, certainly as if you were looking out of a window from a plane flying at over 1,000 feet.

You have a choice of about 5 different airplanes so if you master one of them you can switch to a different one while still maintaining the same position in the sky. Now this can be risky because if you switch to the glider while going too fast (like from the Lear jet) you could get into trouble real fast because gliders were not meant to go 300 mph. But you can't get hurt in this simulation because you can just start over again.

The plane choices are a Cessna 182 RG (looks like a Piper cub to me), a Sopwith Camel WW1 biplane, Lear Jet35A, a Schwietzer and 2 new planes: the Boeing 737-400 and the aerobatic Extra 300S.

Now this program is not a shoot'em up, but a leisure game of flying around and looking at the scenery, or flying to a destination on the map and just seeing if you can do it. Or just learning about how planes fly and learning to fly them.

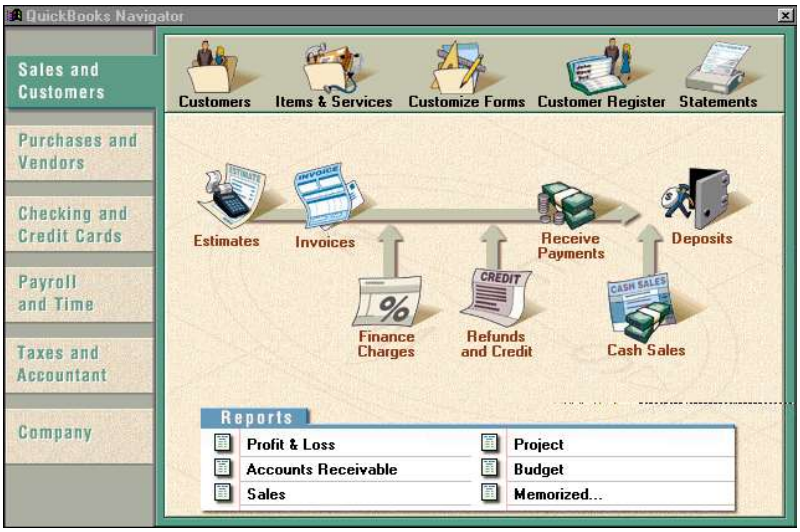
They have training situations that you can select, or it will ran-

domly pick a course for you to fly to the destination that the program has chosen.

There are more 3D cities on this CD including San Francisco, London, Tokyo, New York City, Paris, Chicago, Seattle and many more. Also included are more than 300 airports and landmarks like the Taj Mahal in India and Big Ben in London.

Built in is a virtual pilot that will instruct and guide you through all of the steps of the flight. The virtual pilot will have you flying within seconds of loading the program. Also, you can set the time of the day and the weather that you'll be flying in. This program has so many things to do in it that you will probably never get to the point of saying that this is the same old thing over and over again. There are just too many variables so that each flight you embark upon will be fun and different. So you've been flying and you just crashed on a landing? Well just play it back on the flight recorder that will run the last 50 seconds or so of your perfect landing to see what went wrong. You also can view the plane that you are flying from: a tower view, a rear view from outside the plane, a side view, or a front view. You can also set the distance that the view is from the plane.

I like the way that the newer programs are being written where you can change so many of the parameters to the program instead of just using what the programmer thinks that you'll like. Very customizable to the way that you want to see or play the game. Microsoft says that this program will run on a 486dx66 with 8 MG RAM, but I sold my dx66 so I can't confirm that. They recommend that you have 16 MG, a Pentium, sound card, double speed CD, a fast video card, a joystick and at least 40 MG free on your hard drive. I think that the program sells for around $50 and I would recommend this to anyone who would like to try their hand at flying without getting air sick. ◆



SOFTWARE REVIEW

QuickBooks Pro for 97 (Version 5.0)

by Fredrick Rea O'Keefe, Tampa PC Users Group*

UP FRONT SUMMARY: For the Mom & Pop, small business, or in-home business, probably the best, most comprehensive, easy to use bookkeeping program available. Macintosh, Windows 95 & 3.1, CD-ROM or diskettes.

Intuit's evolving Quicken™ programs have been the continual leader in easy to use, personal and business bookkeeping software. If you can keep a checkbook, you can use QuickBooks Pro (QBP). This will not be a technical review, but is intended to give you a view into the richness of QBP, applicable to almost all small businesses. The best news about QBP, to me, is that I can forget double-entry bookkeeping and difficult accounts setup. Double-entry work is automatically done by the QBP. If you need a more sophisticated package, Peachtree accounting is strongly recommended.

The first premise of QBP is simply entering payments by typing onto the form of a check. My preference, however, is using the check register form for entering transactions. Either way, one of several automated benefits is that QBP monitors your typing, and looks for previously entered types of transactions and account names for laborsaving fill-in-the-blanks. You can choose to include or exclude accounts in this. If you have a salary or regular source of income, or you have routine, periodic payments such as rent, you could automate them. When you complete each transaction, your immediate checking balance is shown, and you are ready for the next transaction. Quick and easy.

Deposits are handled the same way. In both pay or receive functions, you choose the appropriate credit or debit account(s) to apply the cash flow to, without having to know what "credit" or "debit" means in accounting terms! Yes, you may split transactions between accounts, such as splitting a credit card payment between charges for clothes, car, food, entertainment, inventory, and yanked teeth. Taxable and nontaxable categories may be designated, too.

All desired, user selectable shortcuts are included, such as bulk or individual check printing, or designation of a check as having been written manually; maintaining and printing payee addresses (mail merge); keeping the register "in order" by date and transaction number; straightforward register balancing with your bank statement - or electronically, if you "bank by modem." You can designate automatic bank payments (bank generated and mailed checks) which are tracked and recorded, with due notice to you. No more "forgetting" repetitive payments ("What overdue payment? Where did I put the invoice?" "Don't tell me we have to pay that bill now!!!") or manually processing the same monthly bills. Those are some of the basics everyone needs for enhancing profits. A valuable feature for "power users" are the keyboard shortcuts.

But there is much more for businesses of many types, each with an alterable, pre-designated chart of accounts, and a useful bookkeeping reference guide for your chosen form of business (franchise, subcontractor, writer, property management, etc.). The reference, a help file which is printable, is useful as a primer.

More expected benefits for a business are seeing, numerically or in a multitude of charts: where your finances are now; how you have been doing month-to-month in receivables; which collectible invoices are behind; whom you forgot to invoice; what automatic payments, by you, are upcoming; what discount does this customer get.

UNEXPECTED AMENITIES: using account numbers with account names, not instead of names; entering transactions of almost every type on what appears on the screen as simple paper forms pertinent to each transaction (no complex "where do I post this?"); automatic customer sales tax rates, applicable to varying jurisdictions; keeps personal finances off the business reports (note that QBP is a business program, and you would want to use the separate Quicken personal finance program simultaneously); print your bank deposit slips as your bank prefers.

Depending on your business needs, you can easily design and modify invoices and statements for your clients. A logo can be imported, and the typefaces are selectable. Billing and payment details are automatically filled in. Results are professional, making you look as good as you ought. Time saving ease like this is evident throughout QBP.

(Quick.....Continued on page 8)

(Quick.....Continued from page 7)

REPORTS! There are more than 100 graphs and reports immediately available for you. You can see how your sales reps are doing; how your purchases are flowing; what your inventory valuation is; who your best and worst customers are; cash flow forecasting; payroll liability .... Sounds like a real business, doesn't it? These reports are thorough, although you might want more, or different. But there is enough beef here to satisfy the needs of most small businesses.

How would you like to automatically reconcile both your bank balances and credit card transactions at will, simply by dialing up your bank (if offered, or by your transferring your business to an on-line bank. Fees are charged for this.)? You can do it with QBP! This is up-to-the-minute bookkeeping.

Yes, you can easily edit the books if you find data-entry errors, or need to revise debit and credit accounts. A clear audit trail is kept. And, the program can grow with your business.

For many businesses, it still seems too difficult or time consuming to learn how to implement some form of practical time tracking, contact management, or project management. QBP has your solution. By being integrated in one program with your accounting, all the fundamental business functions are made more efficient, far more accurate, more quick to finish and analyze. You get superior control over your business, and that might mean the difference between an unexpected catastrophe, or profitable success.

Is QBP easy to learn and use? No! But, it is easier and more straightforward, while being more comprehensive and approachable than other accounting packages I've looked at. QBP isn't "easy" to learn, any more than is any other complex program, of any type. Knowing this, Intuit provides a tutorial which, step-by-step, covers the basics, along with extensive, context sensitive help, and a well organized, clear, printed manual. You have 30 days free telephone support, so beat QBP to death within that time frame. There is an on-line web site, too, with useful FAQ's. These can be printed, and themselves are a good tutorial. Http://www.intuit.com/quickbooks/ is the URL.

To emphasize a point, when you set up QBP, you choose which modules and accounts to include and exclude. You may always amend your choices as time passes. This is a vital utility. And.,how about tying in the number one selling and rated tax program - TurboTax™, and analyzing upcoming possible tax liabilities, so you can adjust for them? QBP is ready.

QBP on CD-ROM offers more information than the diskette version, including extensive business advice and legal articles. You should find several of the worksheets useful. Installing is so much easier, too.

QBP also offers more "books" to keep than does QuickBooks alone. Comprehensive job estimating, time tracking, and automated job costing are added. Too many business which could benefit from any of these modules just don't realize it, or haven't found it convenient enough to implement. No more. Indeed, QBP version 5.0 includes enough new functions and reports, and simple integration of all the books your business needs to make it worth upgrading.

IN CLOSING, there are far too many rewards in QBP for almost all small businesses, from service, to professional, to manufacturing, to franchise, to subcontracting, restaurant, accountant, repair shop, etc. to not computerize your bookkeeping. Because most accountants use QB, it is another money and time saver for you both to automate the interaction with the special module included in QBP. QBP is highly recommended by the author. So much so that, if you don't have a CD-ROM yet, QBP is a compelling reason to buy one now.

Intuit is located at P.O. Box 7850, Mountain View CA 94039-7850. Online banking and payment may be reached at 888-245-3279. The author of this review is not affiliated with Intuit, nor is he available for technical support or bookkeeping advice.

Hardware Review

Hauppauge WinCast/TV dbx PCI

by Merle Nicholson, Secretary,
Tampa PC Users Group

Win/TV is a device to allow you to have a TV set on your PC screen. It works well, and once you're past the initial horror of the idea - (you go to your PC to avoid TV don't you?) - it has its uses. Right now I'm watching PBS's News Hour as I write this, proving I can walk and chew gum at the same time!

It's perched right now in the upper right hand corner of the screen. It's adjusted to about 2-1/2 x1-3/4 on my 17" screen, with the sound turned down .. not low, but lower than average so it's not too distracting, and high enough so that when a subject comes up that I'm interested in, I will be aware of it. My computer's performance is absolutely not affected. It's a P166+, but you won't notice it on a Pentium 90 either.

This is a picture of my desktop with the TV sized as I like it. It saves two screen positions. One with a small border as you see it, and one with a tool bar and menu. Both are sizeable and moveable. A right-hand mouse click very quickly switches between the two views. Actually, it has a third mode - TV Mode - that uses up all of your screen with the TV picture set at its maximum size - 640x480. Here's the second mode:

And for the third mode .. my computer locked up. Try again, same thing. Well, I don't use it anyway. But you can see the pitfalls. This is the only bad thing I've experienced. You may consider it serious. I don't, because my document is saved automatically very frequently.

Ok, now I'm revising this three days later, with the problem fixed. I just had to read the read-me file and found two suggestions. The first was a program that changed the registry in a way that affects the way that the VGA drivers work. It eliminates closed captioning in the process, though. The other fix is specifically for my S3 Trio video card, a program that must run from the autoexec.bat. That fixed the lockup problems as it suggested, and I was able to use the "Full TV mode". I'm running my resolution at 1024x768. The largest resolution that the TV will run at is 640x480, so even in full TV mode the picture will not take up all the monitor space. However, if I were to change my resolution to 640x480, I'd have a very expensive TV, and no computer at all.

Win/TV has good controls, 125 channels for cable, and a huge number of formats to suit; a number of countries, Japanese, Canadian and French standards, and a whole lot of formats I don't care to understand. Mine is set to USA-CATV and NTSC(M). Initially, you do a scan so that it can collect a list of channels available. You can edit this list easily. It has volume controls, audio settings, Brightness, Saturation, Contrast and Hue. Audio can be set to Mono, Stereo and SAP. There is a mixer list to tell it which input port on your sound card is used. It has Always-On-Top so that it cannot be covered up. It has a capture button to copy to the clipboard and channel up-down buttons.

Now for the requirements. Forget 486, think Pentium 90 minimum. Here's the list:

1) PC with a PCI bus. That means a Pentium, and obviously an open PCI slot.
2) Windows 95 (also with up-to-date Direct Draw software available free)
3) Sound card (with an open line input jack)
4) CD-ROM (although it says so, you don't really need a CD-ROM)
5) A VGA card meeting specifications - more later.

Here's some info from the box that describes the details well. "WinCast/TV digitizes live video from either the built-in 125 channel cable TV tuner or an external video-input source using high-quality 4:2:2 video sampling. The digitized video is sent over the PCI bus in your PC into the memory of your VGA display adapter. This allows the digitized video to move efficiently, and takes a fraction of the available bandwidth of the PCI bus."

Now, here are more catches - the video card requirements. Not all video cards will work. The box lists five, and advises that you check their internet site for a complete list of certified cards. My own card was on the list - an S3 Trio 64+. It's selling for about $90 in its 2M form. Now there's more … I want my computer resolution at 1280x1024. The TV looks terrible. There are just red outlines. The problem? Well, at 1280x1024 the best my card will do is 256 colors, and it just won't work. Sometimes I set it at 1152x864. Guess what ... 256 colors. So at the moment I have it set to 1024x768 x 65,000 colors. I can live with it for a while, but I'm getting a memory upgrade

Microsoft Access SIG — Canceled (temporarily we hope)

This SIG Meets on the 3rd Thursday of the month at 6:00 PM at the Reflectone Building. Directions: Proceed west on Waters from N. Dale Mabry across the railroad tracks (which is about 1 and l/2 miles), take second left on Savarese (United Technologies bldg. is just beyond it). Proceed on Savarese until you reach the Reflectone bldg. Take the North door. If you need to ask directions, there is a security guard at the location. PLEASE SIGN IN WITH A SIG LEADER.
For more information call Connie Kincaid - 661-8185 - Leave a Message.

Communications SIG

This SIG meets the first Monday of the month at 6 PM at the Reflectone Building. You must sign up to get on the list and to get by security. See Microsoft Access SIG for directions to Reflectone. *Contact Charles Howe: at 968-1207 or HOWE@INTNET NET*

Genealogy SIG

This SIG meets the third Wednesday of the month at 7:00 PM at a member's home. *Contact SIG Leader Jenny Lind Olin at 960-5723 for directions and RSVP.*

(Office .....Continued from page 4)
one place.

Specifications
To use Microsoft Office 97, you need:

- Personal or multimedia computer with a 486 or higher processor
- Microsoft Windows 95 operating system or Microsoft Windows NT® Workstation 3.51 Service Pack 5 or later (will not run on earlier versions)
- For use on Windows 95: 8 MB of memory required to run applications individually (12 MB required to run Microsoft Access); more memory may be required to run additional applications simultaneously
- For use on Windows NT Workstation: 16 MB of memory required to run applications individually; more memory may be required to run additional applications simultaneously
- Office Standard hard-disk space required: 60–167 MB; approximately 102 MB required for typical installation, depending on configuration (use the Office Upgrade Wizard during setup to maximize free disk space)
- Office Professional hard-disk space required: 73–191 MB; approximately 121 MB required for typical installation, depending on configuration (use the Office Upgrade Wizard during setup to maximize free disk space)
- CD-ROM drive (3.5" high-density disks available free of charge through in-box coupon; CD-ROM contains additional items such as Microsoft Internet Explorer, extra clip art, fonts, .avi files, and sounds not available on 3.5" disks)
- VGA or higher-resolution video adapter (Super VGA, 256-color recommended)
- Microsoft Mouse, Microsoft IntelliMouse, or compatible pointing device

Microsoft Office 97 makes it easy to get the results you want. Office 97 is an intelligent, personalized software package that will work the way you do, so you can achieve what you want, quicker and easier than you ever thought you could. If it starts getting tough, Advanced Help will guide you through the most difficult tasks, while state-of-the-art wizards and other features help you get it done the way you want it done. Oh yes, it also comes with a 700-page paper manual that is done quite well. There is also a Standard Edition that comes with Microsoft Word 97, Microsoft Excel 97, Microsoft PowerPoint® 97, and Microsoft Outlook™ 97, omitting Access 97 and Bookshelf Basics 97.

Yes, I like it!

If you'd like to see an on-line multimedia demonstration of all the features mentioned above go to:
http://204.203.124.10/office/autodemo/default.aspon the World Wide Web.

Microsoft Corporation **http://www.microsoft.com**
Pricing varies depending on Edition and/or if upgrading.

(Some of the above information came from various locations on the Web. The comments are my own.) ◆

($50) for my card. It's that cheap because it uses slower EDO DRAM. That'll fix it and I can go back to 1280 like I like it.

Well … don't scoff ! That's why I bought a 17" monitor ! If you still have your 17" monitor set to VGA or SuperVGA, you should give the monitor to a needy person (a monitor-deprived person) and go back to a 15" monitor. I'm constantly amazed at the number of people I find who don't know what screen resolution is!!

The Hauppauge internet site is very good, with the latest full versions of their software on line. (Don't download the Beta software .. you'll regret it - I did). *Www.hauppauge.com*

Hauppauge WinCast/TV dbx Model 401. $149 locally. Not bad. ◆

Some Notes and Observations From FACUG

by Connie Kincaid, President, Tampa PC Users Group

I want to thank our group for sending me to the Florida Association of Computer Users Groups' Winter Conference in Orlando. The conference started on Friday night, January 17th and ran through Sunday afternoon. I am also very, very grateful that Margaret Petro and Mary Sheridan were able to attend with me. As many of you know, the Florida Association of User Groups, Inc. (FACUG) is a private, non-profit organization whose sole purpose is to help local PC users groups such as ours. There are member groups all over the state of Florida. If the vendors are to be believed, we are one of the best organized groups in the country. FACUG sponsors a winter conference and a summer conference. Their conferences are very worthwhile. FACUG is available on the Internet through a link from our home page.

The conference schedule

The conference offered more than any one person could handle - one of the many reasons I was so glad to have Mary and Margaret with me. We drove over Friday afternoon and arrived just in time to check into our hotel room before the 6PM conference registration. After registering, we were treated to an Italian style dinner by Adobe. They supplied not only magnificent food, but also a display of their products and a representative to talk to us. All of the meals were supplied by vendors who fed us something sumptuous. Most

(FACUG.....Continued on page 4)

Starting February 12, 1997, we will meet at the Museum of Science & Industry, 4801 E. Fowler Ave. First, we meet in the lobby for networking at 6:00 and then move to the meeting room at 6:30.

* * 1997 OFFICERS * *

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members. Our mailing address is P. O. Box 3492, Tampa, FL 33601-3492.

However, for business concerning this newsletter, Bits of Blue, please contact the Editor, William LaMartin, at 821 S. Boulevard, Tampa, FL 33606-2904; 813-251-3817; lamartin@ix.netcom.com.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII, Microsoft Write, Microsoft Word, or Word Perfect file to the editor at 821 S. Boulevard, Tampa, Florida 33606-2904 or upload to the BBS (News section of FILES).

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

The use of trademarked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if ithey are not received on time.

Members may insert non-commercial ads at no charge with the following imitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

SECRETARY'S REPORT & MINUTES OF MEETING January 1997

Minutes and Comments by Bruce Register, Secretary

Networking began at 6 PM. The meeting was called to order at 6:30 by President Connie Kincaid. She extended a welcome to new members and visitors.

Election The election was held. The following were elected for the 1997 term.

Officers:

President	Connie Kincaid
Vice President	Michael Hodges
Secretary	Merle Nicholson
Treasurer	Wil Goble
Member at Large	Bruce Register

Appointed positions:

Editor	William LaMartin
Librarian	Larry Anders
SYSOPS	Mary Sheridan
Program Chairman	Margaret Petro

SIG Leaders:
Jenny Olin
Charles Howe
Connie Kincaid

Public Relations: Ken Boyd

Ken Boyd volunteered to help Bruce Register in distributing the tri-fold on TPCUG.

Meeting Connie reported that the swap meet donations were just over $100 net to the group to help defray costs of TPCUG.

Connie reported that the February meeting networking is dedicated to employers and prospective employees getting together. She asked that we pass the word to ANYONE (Employers and Employees) who would like to use this time to make connections.

Presentation Since the announced presentation of Turbo Tax fell through, William LaMartin, on short notice, presented a program on Microsoft Visual Basic 4.0. It comes in two versions: the Standard Edition and the Professional Edition. William used the Professional Edition.

Visual Basic is a program that you use to write Windows pro-

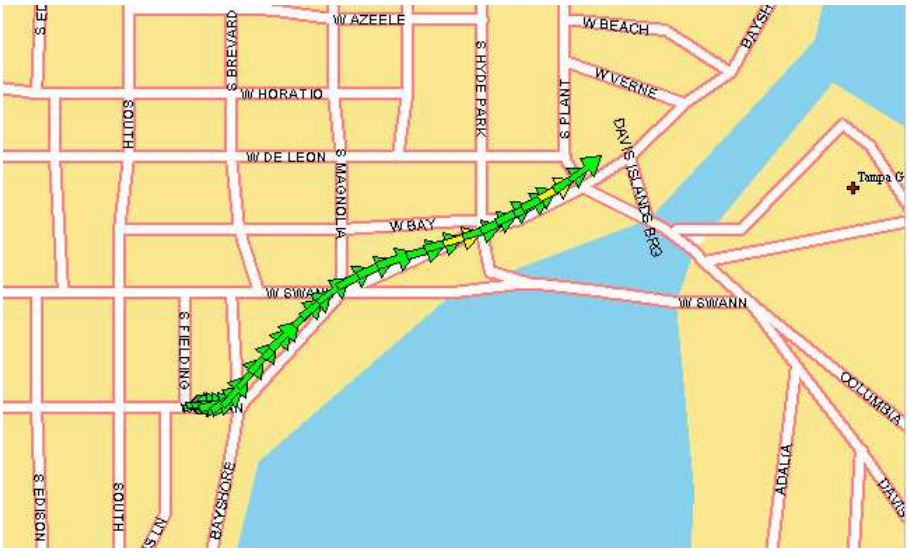
Product Review

Tripmate:
GPS Navagation from Delorme

by William LaMartin, Editor
Tampa PC Users Group

In the December 1996 Newsletter, Larry Anders reviewed *Street Atlas USA Version 4.0* from Delorme. One of the features mentioned for this CD based Windows 95 mapping program was the ability to be used in conjunction with a global positioning device.

With the small yellow GPS receiver pictured above placed on your car's dashboard and connected to the serial port of your laptop computer, and with Street Atlas USA Ver. 4.0 running on that computer, you can see exactly where in the USA you are. And it is accurate. The guaranteed accuracy is 100 meters horizontally and 156 meters vertically. It can also tell you the time to 340 nanoseconds accuracy. All of this 95% of the time. If the Department of Defense would allow it, the accuracy would be considerably better. However, in practice, I have found the errors to usually be considerably less than those above.



Everyone to whom I have demonstrated the device has been impressed. When we first got the device my son was home with his laptop which has a CD drive. So all we had to do was put the Street Atlas CD in the drive, connect the GPS receiver to the serial port and go for a drive. It takes several minutes for the unit to find enough satellites (it needs at least three) to do its thing. So after as long as three minutes you all of a sudden see the map changing to your location and a round dot at the unit's determination of your present position. We were all amazed as we watched our path on the computer screen as I drove around Hyde Park and then over the bridge to Davis Islands. The data must have been really good this first time, since it usually put us right in the middle of the street on the map. On other trials it has shown me driving a little off Bayshore Blvd. and in the bay or sometimes in people's yards. However, I can recall only once when it located me closer to another street than the one I was actually on.

After my son went back to college I had to figure how to use the unit with my non-CD equipped laptop. Street Atlas, however, provides for that by explaining how to do a remote installation of the program on the laptop and then how to selectively export map data to the laptop. To install the program on the laptop you will need to establish a cable connection between the laptop and another computer which has Street Atlas installed. I used the direct cable connection program available under Windows 95 and a "LapLink" style parallel cable between the two computers' parallel ports. After getting the program installed on the laptop, I then exported map data for only those counties in Florida through which I thought I would be driving. It only took about 6 MB to export data for four counties. Later I got the idea of installing the program and data on an Iomega Zip drive attached to the laptop. When I did that, the entire state of Florida took up 29 MB. So it looks like you could get three states on each Zip disk. However, you may get more if the states take up less room than did Florida.

If you are hard pressed for entertainment you can make a log of your trip and play it back later, either at real-time speed or 10x or 100x speed. I did this on a 140 mile trip I took, and the log was about 500KB in size. See the small map below for the log of a short trip along Bayshore Blvd. near Tampa General Hospital in Tampa.

When you are moving the arrows are spaced in direct relation to your speed. If I had been going 60 mph, the arrows on the map would not have touched . When you stop, you get a round dot, and when the data is poor (if you go under an overpass, or heavy tree coverage) the arrow turns yellow from

Software Review

Tuneland from 7th Level

Review by Fred Buss, Tampa PC Users Group

Tuneland is designed for children of all ages. Children explore Tuneland and learn basic computer skills. Parents and Grandparents alike laugh at the funny gags and jokes. My Grandson is six years old and enjoys every aspect of the cartoon. Each scene in Tuneland contains a musical cartoon for the child to view. You can choose to watch the cartoon or you can interrupt its play anytime.

Lil' Howie is on hand to help you explore Tuneland and show you how to move around and what to do by clicking on objects. It's funny to watch and hear the sounds of the cartoon characters. You need to click on all of the objects to see and hear what they do and how it affects every scene.

Tuneland is truly an adventure with many things to see and hear, and, if you should get tired of viewing any of the scenes, you can click the hat on the bottom right hand corner of the screen. Come and go through each of the areas, but leave when you tire of the search.

Don't forget to look in the barnyard, farmhouse, barn, grandma's house, train station, valley and enjoy the music from the jukebox.

Tuneland is a remarkable tool for children (ages 3 - 6).

Every scene in Tuneland is an adventure in itself. If you have a favorite song you can journey back to the scene that it is in and play it again and again. As you travel through Tuneland don't forget to look for Lil' Howie and Jack and Jill in each scene. In the barnyard you can see all the exciting places in Tuneland that you can visit. Explore the barnyard before you begin another adventure. You can play hide and seek in the barnyard, don't forget to look high and low. If you would like to hear old MacDonald had a farm again maybe old MacDonald could help. There is also a farmhouse to explore. Songs in the scene are the three blind mice, Polly put the kettle on, I'm a little tea pot, patty cake, hot cross buns, hickory dickory dock, and many more tunes. There's also a pond scene, Grandma's house, mountain scene, train station, and valley scene. Just keep clicking along.

The company's WWW URL is http://www.7thlevel.com ◆

(FACUG.....Continued from page 1)

of them also provided a speaker who shared the latest technology from their company. Saturday we had breakfast with Symantec, lunch with Intuit and Parsons and dinner with Microsoft. Sunday we had breakfast with Broderbund and lunch with Micrografx. I felt like royalty after so much pampering.

Vendors

The vendors sent their best presenters who put on new demos with each meal. The demos were great. The presenters attended the whole weekend conference. It made the whole thing more enjoyable to watch them banter among themselves as rivals showed their wares. All of them were very professional about teasing one another which made it a lot of fun.

Adobe told us about their user group relations program. They have a vendor web site for user groups to contact them. Symantec talked about PCHandyman and their special offer to user groups (I'll have to see what the board wants to do with this one - more later). Parsons (an Intuit company) and Intuit each sent a speaker. So we had the brothers McKatz (not real brothers - more like the 'Blues Brothers') who did a demo on the Atomic Clock. We saw Microsoft's newly released Office '97 Professional. Broderbund showed us the new Print Shop Deluxe III. Finally, Micrografx showed off their Flow Charter (no longer called ABC Flow Charter) and the American Greeting Card program.

The vendors were very informative and entertaining. Many of them have deals available for members of user groups. The vendors were also very generous in donating a stage full (and I do mean 4 cafeteria tables piled high) of software and hardware. These were all made available to user groups for door prizes and reviews and will be available in the coming months. Some of the readers may be wondering why vendors would go to so much trouble. It's simple. All of the major software and hardware vendors realize that user groups are the 'grass root' movement of technology. We are the only viable link to the market place that most vendors have. Unlike any other product, technology vendors have to try and convince people to buy things unlike anything they have ever seen before. Think about it. If you were buying a car, you have probably driven cars for years and perhaps owned other cars before. You have some knowledge of the features and potential capabilities of a car. All a car manufacturer has to do is compare their car to what you already know. The technology vendor has to educate you before he or she can tell you about their product. That's where the user groups come in. We are very important to them. All they ask in return, use their product and spread the word. They don't ask anyone to sing unfounded praises. (I just spent a whole weekend with a bunch of them and they really don't want us to say things that aren't true!!) They want us to tell others about our experience with

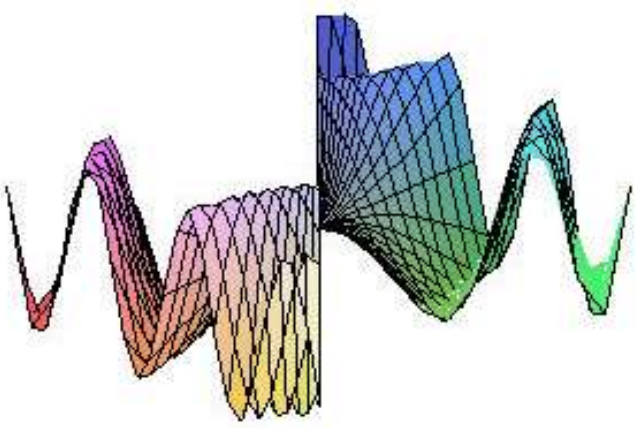
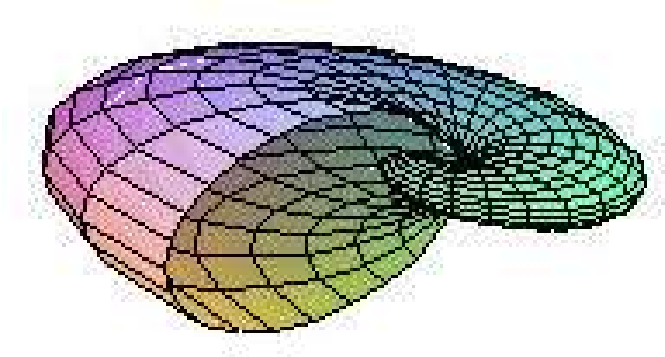
Maple V



Review by William LaMartin, Editor, Tampa PC Users Group



Got a spare $995 plus tax, then I have the program for you. It's *Maple V*, *Release 4* from The Symbolic Computation Group, a research group in the Department of Computer Science at the University of Waterloo in Canada. To quote their own words:

> *Maple V is a powerful mathematical problem-solving and visualization system used world-wide in education, research, and industry. Its principal strength is its symbolic problem solving algorithms. Unlike conventional math software, which can only work with floating-point numbers, Maple V can solve problems involving formal mathematical definitions and return answers as mathematical objects. Derived from over a decade of world-class R&D and customer service, Maple V Release 4 provides all the right tools for users in education, research, and industry.*

Boy, if I had this program thirty years ago Calculus would have been a breeze, not to mention linear algebra and differential equations. Well, students today not only have the good fortune to have such a program available, most, I suspect, have access to included in the price of their tuition. Most Universities give their students access to *Maple V* or its chief competitor, *Mathematica* from Wolfram Research (http://www.wolfram.com), on the university server.

Actually you have had access to this program for several months. You just don't check out those WWW links that I put in the newsletter and on the Links page of our WWW site. There is a link at our Web site listed under Science to the page of a Canadian mathematician, Peter Borwein, and in the left frame of that page there is a link listed as Maple. If you followed that link you would be presented with a simple Maple input form. I now have a more direct link to a Maple input form at
http://www.cecm.sfu.ca/projects/OMP/nmpform.html.

When you go to this site you are presented with an input box like the one on our Computer survey form at our WWW site. If you know what to enter, you will be amazed at the results.

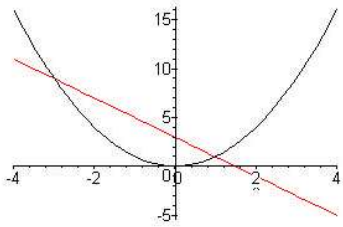
Before I explain how to get to the help menus, allow me the following examples:

Enter *plot3d(sin(x*y),x=-Pi..Pi,y=-x..x);* and you get the 3D plot (in color on the screen) in the previous column. Be patient; it will take a few moments for the graph to get to your computer. You can then save it with a right click —at least that's the way Microsoft Internet Explorer works.

Another nice 3D graph, pictured above, is gotten by entering; *plot3d((1.3)^x * sin(y),x=-1..2*Pi,y=0..Pi,coords=spherical,style=patch);*

All of you old Calculus students, recall finding anti-derivatives, or by another name indefinite integrals. Can you still integrate x*sin(x)? Well, Maple V can. Entering the line *Int(x*sin(x),x); yields sin(x) - x*cos(x).*

Maple V handles all the usual algebraic manipulations like finding roots of polynomials. Enter *roots(x^2-9);* and you get [[-3,1],[3,1]], which is Maple's way of telling you that -3 and 3 are each single roots of the polynomial x^2 -9, which you can easily check by substituting them in for x.



So now that we know that plot does graphs and Int does integrals and roots does roots, how do we find the syntax for these procedures and the many more procedures that we don't even know about yet? We invoke Maple V's help. To get a list of help topics enter *?library[index].* This will produce a long list of procedures. Note: *?index[library]* seems to give the same list. And you sort of can guess what they do by their abbreviations. To get detailed help on a particular one, like Int, for example, we would next enter ?Int.

A note: Each time before entering a new item in the Maple input box, it is best to use your browser's back feature to go to the first instance of the input box and then clear that box, then enter your new request. Also note that all entries other than

(Maple.....Continued on page 7)

(Maple.....Continued from page 6)
for help end in a semicolon. I suggest that you first start by simply copying the examples at the end of each help topic. For example, to try plotting, enter ?plot to get the plotting help, then choose one of the examples at the end of the help message to paste into the input box.

Let's do one more example of a common algebraic problem. First we graph the two equations y = x^2 and y = -2*x+3 using the Maple instruction *plot({x^2,-2*x+3},x=-4..4);* to get:

This simple two dimensional plot is not nearly as exciting as the previous two three dimensional plots, is it? Now, if you recall your basic mathematics, you know that your teacher would want to know at what x (horizontal) coordinates the two graphs intersected. Well, that is simple. Having Maple calculate we get *solve(x^2=-2*x+3,x);* yields x = -3 and x = 1 as the solutions.

Give it a try. My examples have been quite trivial compared to what the program can do, but I think I know my audience. Isn't it remarkable that you can do all of this mathematics via the Internet on a computer in Canada.

In closing I note that USF uses *Maple V*. Check the site *http://curiac.acomp.usf.edu/math/maple/* to see that a student at USF can buy a full version for only $19.95. Doesn't seem fair, does it. Of course, with USF's low tuition of $62.55/semester hour, a three hour course is less than $200. So sign up for your course and save around $800 on the price of the program. However, after reading the newsgroup *sci.math.symbolic (devoted to programs like Maple)*, I think the USF statement that the student version is the full version may not be correct. Anyway, it would still be a super bargain.

You can go to the USF site *http://curiac.acomp.usf.edu/math/maple/learn_maple.html* for help in learning Maple. If you want to use the USF tutorials with the Canadian provided interface above, you should open two separate pages in your web browser where you can bounce back and forth. I challenge USF to provide us a user interface on the Internet as the people in Canada have done.

A good site for information on Maple is at Indiana University *http://www.indiana.edu/~statmath/math/maple/*. To buy the program go to *http://www.maplesoft.com/* ◆

(FACUG.....Continued from page 4)
their technology in our own words. That's all. It broadens the educated consumer base for them and helps them develop stuff we like. It's an important part of the feedback loop to them.

Workshops

The meals and the vendors were wonderful and entertaining but there's more. That's right, much more. When we weren't eating there were no less than 3 simultaneous workshops for attendees. Each workshop was conducted by someone who has been an active leader in one of the member groups and demonstrated success in the area of their workshop. Most workshops used an open discussion format that allowed maximum participation. Margaret, Mary and I tried to 'divide and conquer' by each attending different sessions. Mary attended sessions relating to her position as BBS Sysop, Margaret attended program oriented sessions and I attended business/financial sessions. Each of us came away with the same general feeling that all is for naught if it doesn't serve our members. It may seem difficult to imagine 150 people gathering in Orlando for a weekend, forsaking Mickey to lock themselves into ballrooms to try and figure out what people want from a users group, but that's it in a nutshell. The logic goes something like this: It takes people to make a group. It takes something of value to people to bring them together (a moving target at best). It takes time, effort and, alas, money to put something together of value to people. It takes people to come up with time, effort and money. In short, all is lost without membership that participates in some manner or another.

It's easy to list the tangible benefits the group can offer its members. The newsletter offers information about new technologies that is written by your peers so it is easier to read and relate to individual situations. The BBS offers local E-mail, conferences with other people who share similar interests around the world and files and programs to download (and you don't get nearly as many busy signals as the Internet). The meetings offer a place for people to meet, ask questions, learn and be entertained. The difficulty is listing the intangible benefits. I have met more clean-living, wholesome, happy-to-be-alive people through users groups. I don't have to profess anything. I don't have to know anyone to join. I have met people from every industry and walk of life as their peer. I can be a novice in something one minute asking questions without feeling 'stupid' because the next minute I find I am the one who knows the answer to another question. I laugh and enjoy the company of my fellow man every time. I find a potent source of hope for humankind that I don't find in the media. How can I describe those benefits in a membership brochure? I can't. I don't make them happen for people and I can't promise them to anyone. I can only provide a

(FACUG.....Continued on page 12)

(Minutes.....Continued from page 2)
grams. It is also the basis for the macro languages of other Microsoft applications, e.g., Word and Excel. He demonstrated how you construct a simple Windows program based on a single form (Window) which he populated with text boxes, a picture box, labels, and a command button, all gotten from the Custom Control Tool Box on the left side of his screen. He then showed how you associate basic code with each of these custom controls, for example, what programming code is executed when the command button is clicked. His first example alternated photos of the former and current president of the TPCUG in the picture box when the command button was pressed. He emphasized that Visual Basic is an event oriented programming language (click on a button and something happens).

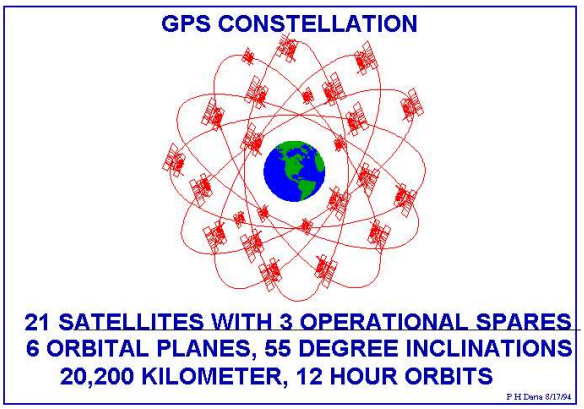
William showed us some of his programs:

- A BBS access dialing program allowing you to dial into and read messages on our BBS.
- A grocery shopping program in which you select the items from an alphabetical list of several hundred, then select the store in which you wish to shop. The program then puts the items you chose in the order you will find them in that particular store. You, of course, have the ability to edit the store order. That program was very interesting and unique as only William could do it.
- He created a program that opened a Microsoft Access database in order to make changes to the database. He stated that one of the prime uses of Visual Basic 4.0 seems to be aimed at working with databases.
- He created a program in Visual Basic which allowed him to measure fuel in a cylindrical tank which was buried on its side underground. Note that when the tank is on its side, the bottom inch measured on the ruler will contain less volume than another inch nearer to the widest point in the tank. This program used text boxes to input the various radii and lengths, a list box to display the different volumes for different depths, and a command button to start the program running.

After the Visual Basic demonstration, William illustrated the connection of two computers with a LapLink style cable between the two parallel ports. He then used the Direct Cable Connection feature of Windows 95 to transfer files between the two computers. It was pointed out by Don Patzsch that this could also be accomplished in DOS 6.0 using the Interlink and Interserve programs available in DOS 6.0

No door prize drawing was held tonight. The meeting was adjourned. ◆

Format Your 3½ Floppy From 1.45 to 1.9 MB



by Bruce Register, Tampa PC Users Group

Occasionally we have need for a disk to be formatted so as to receive a file with more than 1.45 MB. Most know that the Windows 95 3 ½ floppies are recorded on 1.7 MB disks. Some say that Microsoft did this to keep people from sharing their disks with others by letting them copy the original disks. That is another ethics story. I ran into the problem when COMPAQ directed me to their web site to download a file containing a "disk manager" program so that I could restart my 386 computer. My problem was that the COMPAQ file contained 1.512 MB zipped and 1.537 MB unzipped. I could not copy the file from my 486 to a 3 ½ disk that I needed to boot my crashed system.

I stumbled upon a file on our very own Tampa PC Users Group library. The file is named "**2 M.Zip**" I downloaded the file into my 486. I found that it will not run in Windows or Window 95. I "shut down" my W95. The window gave one of several choices before turning off the computer. The correct choice is shut down and restart in DOS...that way Windows 95 is nowhere around on the reboot. When the system rebooted in DOS, I unzipped the 2M.ZIP file.

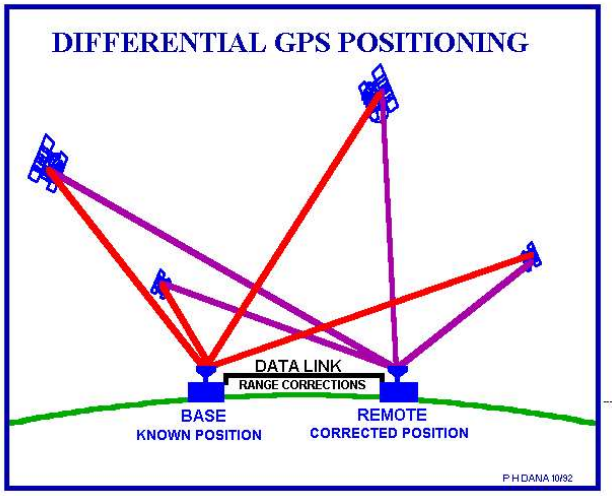
I created a directory named 2M on my C: drive. I unzipped the 2M.ZIP program to C:\2M. The unzipping created four unzipped files in the "2M" directory. I then changed to the 2M directory containing the four files. After this I typed the command as C:\2M>"2M/?" to get help information and instructions. I printed that file so that I could study the hard copy...I sometimes do not remember what I read and need a reference. I typed "2M/ML" after the prompt C:\2M>. I just followed instructions. Once I formatted my 1.45 MB disk to 1.9 MB with the 2M program, I copied the COMPAQ file from my 486 "download" path to the a: drive. I then put the newly formatted disk with the copied file in my 386, turned on the machine and was up and running.

PS. I got into the dilemma by deciding that I wanted to reformat the "H" drive on my 386. What I did not know is that COMPAQ had set up the 386 to operate with an H drive and a C drive. The H stands for Host. My DOS and Windows 3.1 programs were on my C drive. I did not know that the computer started with the H (Host) drive and swapped to the C drive as needed. When I reformatted the H drive, I wiped out all start up files. ◆

(Tripmate.....Continued from page 3)

green. There is an additional screen you can bring up which will indicate your longitude, latitude, speed, and direction. The speed was always within one mile per hour of what my speedometer indicated. And, as best I could calculate, the data is updated on the computer every five seconds. So at 60 mph the map is always going to be a little behind your actual location.

Since the battery on a laptop is rarely good for more than two hours under such usage, what do you do on longer trips? Merle Nicholson suggested I get an inverter, a device that changes DC current to AC. Then I could simply plug the computer's charger into it. I had never seen a small version of these things, only the larger ones used in travel homes to power TV's, etc. However, CompUSA had just what I need; a fairly small unit putting out 140 watts and capable of 300 watt peaks costing $59. It , thus, has enough additional capacity to run the Zip drive and some other small device.



The Tripmate and Street Atlas USA 4.0 may be purchased for $159 from COMPUSA. Or you can buy the Tripmate GPS unit separately from Delorme for $129 if you already have the Street Atlas USA CD. The total package is $149 from Delorme, but I assume shipping would bring the price up close to the local price.

What is GPS? To conclude let's look a minute at how the Tripmate gets its information. The Global Positioning System (GPS) is a constellation of 24 satellites (21 navigational and 3 spares) that orbit the earth in 12 hour orbits. The system is funded and controlled by the US Department of Defense. The Russians have a similar system. The Monitor facility for the satellites is located at Falcon Air Force Base in Colorado. This monitor facility computes orbital data and clock data and sends it to the orbiting satellites. The satellites send a subset of this data to the ground GPS units (like the Tripmate) via radio signals.

In theory, the Tripmate determines its distance from a particular satellite by the time it takes to receive signals from the satellite. Using this distance and the location of the satellite (based on the satellite's identity code), the Tripmate now knows it is located somewhere on a sphere a certain distance from this satellite. With the same information from two more satellites, it then knows exactly where it is by intersecting the three spheres. In practice, however, it takes four or more satellites to do this due to inaccuracies in the data.

As mentioned above, the Department of Defense intentionally degrades the data it provides for civilian use. For military and other authorized users there are receivers which have a guaranteed accuracy of 22 meters horizontal, 27.7 meters vertical, and 100 nanosecond time accuracy. And this can be much improved upon by setting up fixed receivers at known locations (the latitude, longitude and elevation of which have already been precisely calculated) and then comparing the satellite data at these locations with the known data and simultaneously transmitting the correction factors to the nearby receiver in the field so that it can make the corrections to the incoming satellite data. This more accurate method, Differential GPS Positioning, is being employed by the Coast Guard in marine navigation by the installation of both receiving and transmitting stations at fixed latitudes and longitudes. Boats with special GPS units then can make corrections to the data they receive based on the correction factors they are also receiving from these stations.

For a very good and detailed explanation of GPS and the location where I got the two graphics on this page, go to the WWW site *http://wwwhost.cc.utexas.edu/ftp/pub/grg/gcraft/notes/gps/gps.html* maintained by Peter H. Dana of the University of Texas Geography Department. A Usenet newsgroup devoted to GPS is sci.geo.satellite-nav. And you thought geography was a dead subject, dealing only with place names. ◆

Special Interest Groups

Microsoft Access SIG

This SIG Meets on the 3rd Thursday of the month at 6:00 PM at the Reflectone Building. Directions: Proceed west on Waters from N. Dale Mabry across the railroad tracks (which is about 1 and l/2 miles), take second left on Savarese (United Technologies bldg. is just beyond it). Proceed on Savarese until you reach the Reflectone bldg. Take the North door. If you need to ask directions, there is a security guard at the location. PLEASE SIGN IN WITH A SIG LEADER.
For more information call Connie Kincaid - 661-8185 - Leave a Message.

Communications SIG

This SIG meets the first Monday of the month at 6 PM at the Reflectone Building. You must sign up to get on the list and to get by security. See Microsoft Access SIG for directions to Reflectone. *Contact Charles Howe: at 968-1207 or HOWE@INTNET NET*

Genealogy SIG

This SIG meets the third Wednesday of the month at 7:00 PM at a member's home. *Contact SIG Leader Jenny Lind Olin at 960-5723 for directions and RSVP.*

A Slight Problem in Communication

A member of our group recently sent the following message to a Korean company. The company is to be commended for responding to his request for help, since not all computer companies do. However, the individual responding obviously did not understand the structure of the English language—and probably not even the request.

Now, this is not an attempt to poke fun at the company representative, since not only do I not speak Korean, I don't think I even know a single word in that language, and I feel that all those outside our borders who take time to learn English as an additional language are to be commended. But it has been a slow news month, so I offer you the following:

The Question:

Under some CD-ROM titles, such as Diablo by Blizzard Entertainment, the CD-ROM drive will read sporadically and eventually lock up the game. I still have not figured out what the problem is, the game works fine under Windows 95 but not NT 4. Do you have a driver more recent than the one that's installed with NT 4?

So the person was only asking : ***Do you have a new driver for Windows NT?***

The Response:

Dear sir / ma'am. How are you ?
Thank you for your E-MAIL.

If you have nothing to do with the win'95 then cd-rom drive is not problem. Because It is below the problem.

First : The problem you set would be caused by the interference between device drivers of WIN'95 and DOS.

Second : The most problem of data CD'S of itself. If you are using the abnormal CD ,and then the cd-rom will does not recognized. For Example : scrach on the Cd, unfit of Cd size, finger print by someone and illegal reproduct CD.

Third : Would you try to SMARTDRV.EXE file delete. and your using the data CD, PC configuration send to our E-MAIL get in touch with again and only the speed of audio cd is single speed to spin, video cd is dual speed to turnig. But the data cd is depend on cd-rom speed performance so then if 8X speed of cd-rom and the data access is more than quickly.

The cd-rom of (*company name)* , what happen the error contain of data cd then 8x speed spin to 2x speed down If it not read contain file of cd , CDR101 error messae display Other cd-rom is nothing this like control function. Therefore this case is not problem of the cd-rom running.

best regard ◆

MEMBERS HELP-LINE

The following phone list is provided for our Tampa PC Users Group members in an effort to establish local support for those frustrating times which we have all encountered while using our PC's. Please note that these are members that have volunteered to help you; treat them in a courteous manner. Be sure to ask if it is convenient for them to help you now, or if you should call another time. It would also be helpful to have your documentation and have it handy when you call. (Don 't expect help if your software is an illegal copy or you do not have documentation!) TPCUG is not responsible for the information or advice provided by volunteers. Volunteers may or may not be experts in the subject matter. You are on your own with any advice received. Be aware also that some of these volunteers may be consultants in their area ofexpertise. If you are interested in volunteering to answer members' questions, either leave a message on the BBS or fill in the forms provided for this purpose at the meetings.

Starting this month, our meeting room at MOSI has changed.

We will follow the computer lab to its new location in the new wing of MOSI. Enter the main lobby, take the stairs to the second floor, then turn left and proceed to the computer lab. Someone should be available to direct you.

President's Message

by Merle Nicholson, President, Tampa PC Users Group

We have a new year upon us, a (kind of) new officer lineup, a relocated meeting place and some acknowledgments to make.

First I would like to extend a heartfelt thanks to Connie Kincaid for serving as President for the past two years. Connie brought friendliness and perceptiveness to the job. She has changed the job description for President of TPCUG for a long time to come. Having served on the board for a year myself, I've observed her dedication and experience on the job, and, believe me, it has been exemplary. On behalf of the members of TPCUG: Thanks, Connie.

Wil Gobel is also leaving us as outgoing treasurer, having held the job for two years. Wil will be missed. Thanks for a job well done, Wil.

Kevan Sheridan and Jenny Lind Olin will be serving as Secretary and Treasurer, replacing myself and Wil in those positions. Kevan and Jenny have been participating on the board as past BBS Sysop and Genealogy SIG leader, respectively,

(President.....Continued on page 3)

February 10: Corel will demonstrate their Internet Web design products & update us on their other titles. Visit the chat page & the discussion group page at our Internet site http://www.canx.com/tpcug/ .

* * OFFICERS * *
PRESIDENT: Merle Nicholson (MerleNic@gte.net) 879-3602
VICE PRES : Mike Hodges (hodges@reflectone.com) 962-2114
TREASURER: Jenny Lind Olin (jlolin@juno.com) 960-5723
MEMBER AT LARGE: Bruce Register (bregis@gte.net) 968-8170
SECRETARY: Kevan Sherican
(kevan_sheridan@interealty.com) 988-6480
APPOINTED (Volunteers)
EDITOR: William LaMartin (lamartin@ix.netcom.com) 251-3817
LIBRARIAN: Larry Anders (lga696@aol.com) 989-9119

SECRETARY'S REPORT & MINUTES OF MEETING December 10, 1997

Minutes and Comments by Merle Nicholson, Secretary '97, Tampa PC Users Group

The pre-meeting HTML class started at 6:00, followed by introductions and announcements. TPCUG Officer nominations and elections followed. A very informative talk on the Roadrunner Internet service by Time Warner was next and the meeting was concluded with the doorprize drawing.

A pre-meeting tutorial on HTML was conducted by member Don Patzsch from 6:00 to 6:30. As expected, Don presented a very concise, informative session. A large group of members and guests attended the session. This is to be a monthly feature, and if you're even remotely interested in the subject you can't help but learn something about the Internet and how it works.

Connie opened with SIG Announcements. The Comm SIG was spoken for by Charles Howe and the Geneology SIG by Ford Bond.

Starting in December, the meeting room will be in a different location. It will be in the new wing on the second floor gallery above the main lobby. This should make us easier to find.

Connie briefly mentioned upcoming events such as a possible job fair in the spring in conjunction with MOSI. Also the FACUG is conducting a web page contest and a judge is needed to serve for a limited time to look at the contested web pages. Also intentions are to bring in tax preparation software for demo starting in January for a couple of months.

The officer elections for 1998 came next. The following people were nominated and duly elected to serve in 1998:

- Merle Nicholson, President
- Mike Hodges, Vice President
- Kevan Sheridan, Secretary
- Jenny Lind Olin, Treasurer
- Bruce Register, Member at Large

A very informative talk on the Roadrunner Internet service was next. A representative of Time Warner, Jason Wells, assisted by Ty Abrahams of Groupware International gave an outstanding talk on the cable modem system being installed throughout most of Hillsborough and Pinellas Counties. There was just too much data given during the talk for me to be able to do it justice here.

They are a complete Internet Service Provider (ISP), offering

(Minutes.....Continued on page 10)

(President.....Continued from page 1)
for some time, so they both bring a lot of experience to the job.

Mike Hodges and Bruce Register are continuing in their positions as Vice President and Member at Large. Mike and Bruce both have the past year's experience on the job, and Bruce has several more years as past Secretary.

Ford Bond, Larry Anders, Charles Howe, Mary Sheridan and William LaMartin have all agreed to continue as: MOSI Liaison, Librarian, Comm SIG Chairman, Programs Coordinator/BBS Sysop and Newsletter/Web Editor, respectively.

So it's a good, experienced group of people, all fun to be with, so I know we're going to enjoy the year at the helm.

If it seems that we're playing musical chairs with the board positions, that would be right. What we're actually doing is reducing our total number of board persons by two with the loss of Connie and Wil. My personal preference would be to bring in at least a couple of new people each year. It was not to be. Bruce did an excellent job pleading for other members to fill positions--with no success. So it's on my personal agenda to take a new approach to solicit help for next year. I'll start right now with this: **The board meeting is open to all members. We meet at Reflectone at 6:00PM on the Thursday prior to the Wednesday meeting.** ***ALL MEMBERS ARE WELCOME and NEEDED.*** If you think you can serve in some capacity during the following year, come to the meeting and participate, and maybe scope out your next job, or just help out. Contact Mike Hodges first to get on the Reflectone security list.

Finally, just a couple of acknowledgments; ***A very special thanks to Don Patzsch*** for conducting the HTML class and for bringing his special knowledge to each meeting and for his willingness to serve in any way he can.

MOSI, through Ford Bond, has provided the facilities without which we cannot exist. Ford came though for us and continues on our behalf.

And thanks to Mary Sheridan who has brought a renewed enthusiasm to scheduling our monthly programs. The quality of the programs is evident. She volunteered for the job when it was needed and is serving very effectively in the #1 most important job in the club. The OTHER #1 most important job is .the newsletter/web editor. William LaMartin has brought the quality of the newsletter to an all time high. William really cares deeply about the club in general and about the newsletter and web site in particular. They're both "award winners" in my book. And not forgetting Larry Anders, whose humor, interest, experience and especially newsletter articles have been invaluable to us for many years.

Thanks, and I'll see you at the next meeting. Merle ◆

Comments

by William LaMartin, Editor, Tampa PC users Group

Several months back I upgraded to the newest versions of two of the more expensive programs that I use: Visual Basic Professional and Microsoft Office Professional. With some searching I found the new versions at fairly reasonable prices—when compared to the highest asking price out there. More recently I upgraded three programs I have been using for years, programs which, I think, are the best in their respective categories—and which all three taken together don't cost as much to upgrade as one of the first two programs mentioned. They are Delorme's Street Atlas 5.0, Broderbund's Family tree Maker 4.0, and Intuit's Quicken 98. (The latter was actually a Christmas gift from my son.) I have the deluxe version of Quicken, the non-deluxe version of Family Tree Maker, and the only version of Street Atlas.

I have been using these programs for years, starting with the DOS versions of Quicken and Family Tree Maker since in the beginning that was all that existed. I immediately jumped to their Windows versions when they were first offered and have watched them improve with each new version. Occasionally I skip an upgrade for Family Tree Maker and Quicken. For example, my previous Quicken was version 4; the new one is Quicken 98 with versions 5 and 6 for Windows in between. For Street Atlas, though, I have purchased each new version since each one has been such a major step over the previous one. Version 5.0 combines the mapping features of version 4.0 with the trip planning features of Deloreme's *Map and Go* program. So, now, I have two programs for the price of one, and there are plenty of new features to boot.

The one new feature common to all three programs is their integration of the Internet. Each has a menu button to click on to connect to the Internet to access financial data in the case of Quicken, genealogical data for Family Tree Maker, and travel information like new road construction in the case of Street Atlas. As space needs filling in the newsletter I will write about these programs. Luckily I don't need to use all three this issue.

For the past six months I have been struggling with space on my 18 month old computer's 2.5 GB hard drive. I aggressively delete programs and files that I no longer need; I save to ZIP disks those files that I use only rarely. I empty my browser's cache regularly as well as the Windows Temp folder. But none of this seems to stop the steady diminution of free space on my hard drive. When my son loaded Riven with the 150 MB of files that it installs, things really got tight.

Software Review

Grolier Multimedia Encyclopedia

by Larry Anders, Librarian, Tampa PC Users Group

To start out the New Year differently, I thought I would do something new myself…. re-review a product for the third time. I first reviewed the original issue of Grolier Multimedia Encyclopedia (***GME***) in 1994, then again in 1996. With each new issue it keeps getting better and bigger. Now, the Deluxe Edition comes with two CDs full of interactive information. Considering each CD can hold up to 680 megabytes of data. You do the math. It's loaded. The 1998 edition works with both Windows 3.1 and 95, but if you're not using Windows 95 yet, quit waiting. You're only depriving yourself of a much more enjoyable time between you and your computer.

When ***GME*** is first installed, Apple's Quick Time movie player is installed and you are given a chance to register on-line. If you register on-line you are then given the opportunity to install 36 new *free* fonts. After that you're ready to start an interactive, learning-by-doing experience you, and/or your children, are sure to enjoy. Grolier has been doing this for over 100 years, and I believe they continue that tradition with ***GME*** 1998.

The initial screen gives you an immediate opportunity to tour what's available in ***GME,*** or you can dive right in and explore yesterday and today on your own with help usually just a click away. The 1998 edition of ***GME*** has:

- Over 35,000 articles, including 1,100 new and 4,200 updated articles.
- Over 15,000 images, including 3,700 new pictures.
- 31 Guided Tours that guide you through specific topics with related sights, sounds and articles.
- 1,200 geopolitical, historical and thematic maps that include multimedia features.
- 400 points of interest.
- Over 15 hours of sound.
- 10 custom interfaces.
- 1996-97 Yearbook, including multimedia video coverage, current events, chronology of events, and photos of the month for '96-97.
- On-line Knowledge Explorer that includes the Grolier Internet Index of related sites, links from ***GME*** articles to two additional Grolier encyclopedias on-line, Encyclopedia Americana and The New Book of Knowledge and monthly updates that mean your articles are never really out-of-date.
- The American Heritage College Dictionary, available by just clicking on a word or just typing in the word for a definition.
- Drill-Down Atlases link map to map allowing you to drill down to smaller and smaller geographical areas, to points of interest photographs and related articles. You can also change from geopolitical to thematic to historical maps of the same area.
- Multiplex Videos create a multimedia learning experience by combining all the videos on a given topic on a single screen.
- Interactive Timelines allow you to explore the relationships between events in world history by knowing what was happening in one part of the world while something else was happening elsewhere.
- Free Activity Book developed with teachers and other education experts provides fun family projects to help you become familiar with the many features of GME.

Whether you just got your first computer this Christmas or you're an old pro at computing, I don't think you can go wrong with Grolier's Multimedia Encyclopedia for 1998. In either case you'll find ***GME*** easy to install, understand and use. ***GME*** makes learning come to life with exciting and innovative features. The easy-to-use interactive modules let you explore the world in all its geographic, scientific, artistic, and cultural wonder. And under Windows you're always just a click away from your word processor.

List price is under $50 with a $20 mail-in rebate if you are a previous owner of ***GME***, *Microsoft Encarta*, *Compton's Interactive Encyclopedia, IBM World Book* or *Encyclopedia Britannica* and if you purchase by June 30, 1998. You can find out more about ***GME*** at http://www.grolier.com. ◆

SOFTWARE AVAILABLE FOR REVIEW

1. **Mixman Studio** - Mixman Technologies -Mixing studio where you can load up to 16 tracks of digital sound, mix, them and perform them in real time - Win95, Pentium & CD required.
2. **G-NOME** - 7th Level - Pilot more than 20 different mechanized vehicles in war action - Win95, Pentium 90, 16 MB RAM & 4X CD required (13+)
3. **HELI COPS** - 7th Level - Helicopter war game simulation - Win95, Pentium 100, 8MB RAM, 4X CD
4. **Magic Cap** - General Magic - Organize all your communications: email, fax, etc. - Windows 95 CD
5. **How Would You Survive?** - Grolier - Multimedia Adventure (ages 7-12) - Windows CD
6. **Space Adventure**- Knowledge Adventure - up to the moment exploration of outer space (8-adult)
7. **Aviation Adventure** - Knowledge Adventure - complete world of flying (8-adult)

Hardware Review

UMAX Astra 1200S Scanner

by Merle Nicholson, President,
Tampa PC Users Group

Well, I just had to buy a scanner after many years of price checking. You may have noticed that the prices, while going down steadily, took a nosedive just before Christmas. This one, a 600x1200 dpi model was priced at $249, and the model 610 at 300x600 dpi was priced at $119 and for a day or so, had a rebate bringing it down to $99. But I took at look at the 600x1200 for $250 and didn't give the other a second thought. I should maybe have given it a second thought, but more on this later.

As for the hardware, it's a scanner. What more can I say except that it is SCSI, and it has a lid, being a 8 1/2 x 14 flatbed, and it scans. The proof is in the software!

The attraction that it had over the 610 was the SCSI interface card. I really didn't want to add another parallel cable to an already tight, crowded mess of cables, and was also reluctant because of stories of printing issues and operating with the LS120 or ZIP drive I was planning to put there too. So - unless you already have SCSI installed - you have to open your computer and install the 8-bit card in an ISA slot. Windows 95 does not recognize the card at all. There are no settings on the card or in software. It just does not exist as far as the operating system is concerned, but it works. The techie part of me hates that, but what the hey. The installation instructions are very clear and easy for anyone to follow. That's the hardware part of the review.

When it comes to scanners, software is probably more important than hardware, and this one really is not bad. The biggest complaint that I have is with the documentation. There's nothing I can find that gives a really clear picture of the overall functions of the software and how they fit together. I have it mostly figured out, but not all. There are two good manuals in Acrobat format, one on the main program called Presto PageManager and one on the TWAIN device called VistaScan. PageManager is the central program, and I'll start there after I cover the three utility programs: Copier, AutoScan Setup and Scanner Test.

Copier is just wonderful. You just start Copier, put a document in the scanner, select the number of copies, and hit the start button. It's like a real copier, except slower. In 30 seconds the printer starts, so on my old Deskjet it's a full two minutes from start to finish, but, to be fair, the printer time is ¾ of that and you can be scanning more while the printer prints. Copier's control panel has several controls like reduction from 1% to 200% and other controls making it more versatile than a standard Xerographic copier. Copier is a nice bonus as far as I'm concerned; not having expected it. I find I use it a lot, and my family does too. And don't forget that your FAX, if you have a FAX modem, is a printer device too, making it easy to FAX out anything on paper.

The other two utilities, Autoscan Setup and Scanner are for setup and testing. They do a good job, but you don't use them unless you have trouble with the interface. I did not.

Now to PageManager. It's a kind of a "shell" to use a software term, a kind of a manager for all the scanning you may want to do. You don't have to use it all the time (except for OCR), but it's a neat concept, and after I figured out what it did, I use it all the time except for copying.

First let's review a scanner term - TWAIN. It's a standardized interfacing system that allows many different software applications to access one or more input devices. In our case just one: a scanner. You may have noticed in Paintshop Pro a menu item called "Acquire". All graphics programs will have it. (I was surprised that Microsoft PowerPoint doesn't, that I could find.) The menu item Acquire in such a program will start up the registered TWAIN-compliant device - in our case, a program called VistaScan. With VistaScan, you do the actual scanning, and then when done, VistaScan "hands" the result to the program!

Now back to PageManager. PageManager uses the Acquire in its tool menu to get more scanned documents or pictures and stacks them up as small thumbnail pictures side by side. So you can manage all the scanned images you have from here. Delete them as needed or pass them onto other programs. PageManager has an application toolbar at its bottom to designate all the apps that you may want to pass images onto. The bar is customizable, but the basic list contains e-mail, FAX, Print, PageType, PageImage and Notepad. I removed Notepad and replaced it with Microsoft Word, and then added Paintshop Pro and PhotoDeluxe. So after scanning in the image and after it appears as a thumbnail picture, you simply drag the thumbnail image to the Application button of your choice. Now, associated with each application program is a

(Scanner.....Continued on page 7)

(Scanner.....Continued from page 6)
selection of image type. The image types are Bitmapped (.BMP), PCX (.PCX), TIFF (.TIF) and ASCII Text. In the case of MS Word (and notepad before I deleted it), I selected ASCII text. So guess what happens when you drag an image to Word? It does OCR on the image! (OCR=Optical Character Recognition). Converts it to text. And I must say it's fast and fairly accurate, too. Now that's a subjective opinion, of course. I really didn't do testing of its accuracy. And its having OCR was the reason I put MS Word on the App bar. Notepad doesn't have a spell checker. And all OCR needs a spell checker to find the words it messes up, and this OCR just doesn't have it. I'm sure I'd be happier with one of several good OCR software programs; I've used them and like them, but …. this one comes with the package and I didn't spend the extra $80 or so. I'll stick with this until I have some large difficult OCR'ing to do.

Two other apps are supplied, PageImage for image editing and PageType for forms conversion. I'll have to skip over PageType. The help for it is abysmal, consisting of a definition of each menu item. PageImage's help is the same, but at least I know what an image editor does, and the functions are strikingly similar to Paintshop Pro, the popular shareware program, so I was comfortable with it. But I've decided that PaintShop Pro has more functions, so I've stopped using PageImage, and I'll probably delete it from my system. But in fairness, PageImage isn't bad, and isn't hard to use, and for basic cropping, resizing, color adjustments and such and if the limited output formats (.JPG, .PCD, .PCX, .TGA and .TIF) are adequate (where's .GIF?), then it'll work well.

Neither PaintShop Pro nor PageImage is good for photo editing, and they weren't really designed for it. For detailed photo editing, I used Adobe PhotoDeluxe. I won it as a doorprize long ago and didn't take it out of the box until I got the scanner. I clipped the background out of a photo and then pasted in a graduated blue background for my personal website. Nice.

When "Acquiring" images into any application, the VistaScan software is as easy to use as any I've seen, and it is better than the software that comes with the Hewlett-Packard scanners I am familiar with. It gives a range of adjustments and histograms that would take some study to be able to use them effectively, but that's true of Paintshop Pro, too. Fortunately, you can take the defaults and do very well. Some obvious functions are for contrast and brightness that you may want to use most of the time, and, at the worst, you just keep scanning and adjusting until you get what you want.

Now to the problems and overall observations. I really didn't have any problems except in my own expectations. I discovered that to use what I paid for (not much money at that) I need more … memory, hard drive and printer. On a scanner that I paid extra money for to get 600x1200 dpi, guess what? … I'm scanning at 300 dpi. Why? My 32MB of system memory isn't enough for really high resolutions scans. I can do a standard photo at 1200x1200 and then if I close all other apps down I can edit it. And the hard drive space! It apparently uses a lot of temporary disk space, so I had to uninstall it and reinstall on another drive where I had more room. But the detail! Zoom in! Wow! A lot of detail. It looks like nothing on the photo is lost!

I never thought that I'd see an "out of memory" error on my system, but I had it within 10 minutes of installing the scanner. Am I really disappointed? No. 300dpi is quite enough for most purposes, and I really didn't know that. So, could I have bought the 300x600 and saved $100? Yes, but I wouldn't have gotten the SCSI interface with that model as far as I could tell. I'm still happy with it, and I can always add another 32MB of RAM, can't I? But it'll have to wait for a new photo-quality printer.

UMAX Technologies Inc., 3561 Gateway Blvd. , Fremont CA 94538, (510) 651-4000
http://www.umax.com
About $250 is the street price. ◆

(Comments.....Continued from page 3)
The solution, of course, was to add a second hard drive, and I finally gave in and bought a 5.1 GB Western Digital drive for $279. And this brought back memories of past hard drives: My first two IBM compatible computers and 120 MB and 75 MB drives. I don't recall the prices of those drives, but I do recall the next hard drive I purchased. It was a 350 MB drive which cost $350--a price which at the time seemed like a real bargain. At that $1/MB price, my new 5.1 GB drive would cost $5,100. What a price reduction we have seen. Similar reductions have occurred in memory. The first memory I ever bought was 64 KB for an Apple IIe in 1983. I think it cost $200 - $250. I believe the first memory I bought for an IBM compatible was over $60/MB, and now you can get 32 MB for around $60.

Now the same dynamic seems to be at work on the complete computer system with the advent of quite loaded computers for under $1,000. But buyer beware! Due to some of them having at most one expansion slot, many of these bargain

Software Review

Street Atlas USA 5.0 from Delorme

by William LaMartin, Editor,
Tampa PC Users Group

As I mentioned in my Comments article earlier, this is a program of which I have purchased every version starting with version 1.0. And every update has been more than worth the fairly modest price of updating. This update combines Delorme's *Map and Go* trip route planning program into the Street Atlas program. So now, in addition to viewing maps from every location in the US, you can also plan a trip to any US location, having the program calculate the shortest, quickest, most scenic, etc. route for you. It will also list the points of interest along the way and print out a AAA-type routing booklet of maps to take on your trip.

If you have a laptop with a CD drive, you won't even need to print out anyting, since you can view the map data on the laptop as you drive. Additionally, if you purchase the Delorme global positioning device called *Tripmate*, which I reviewed in the February 1997 newsletter, you can let the computer guide you on your journey—even letting it tell you where to turn or take a different highway if your laptop has a sound card.

I recently tried out this last feature on a 140 mile trip. The only problem I encountered was the low volume of the laptop's sound. If there was a lot of noise in the car at the time the computer decided to advise you of an upcoming route change you might miss it. In addition to mapping out your trip and guiding you along it with audio instructions, you can also have the program display points of interest and businesses with their phone numbers along your route. I don't know how the particular businesses get into the database, since some obvious candidates were omitted and some obscure ones were included.

If you desire you can have it tell you the entire route. While using the global position, you are presented with a split screen with a list of different roads you will take, how many miles and the estimated time needed in the left frame and the map with your current position in the right frame. It is something that you only want to take quick glances at while you are driving. This was not a problem on this trip since there were two of us in the car, and the passenger could navigate with the computer.

When I first started with Delorme's Map and Go, in making trip plans you were required to start and end trips at major locations. Now you can start and end a trip at any point on the map. There are now a lot more points of interest, public buildings, churches, etc. denoted on the maps than in the past. Of course, you can turn off this feature if it clutters your screen, as I did in the screen capture at the end of the article. As usual, you can find locations based on address, zip code and phone extension as in the past. And, as before, at any point you click you will be given the longitude and latitude.

You can connect to the Internet to download current road work notices. For example, I noted that there was a warning of a slowdown on Hillsborough Avenue in Tampa due to work on the bridge over the Hillsborough River. You can also download Coast Guard information on public marine aids to navigation along the coasts and information regarding the location of nuclear power plants and dams for some reason I cannot fathom. I assume that the available information here will increase with time. For example, all you speeders will probably eventually be able to find the locations of the latest speed traps.

It is a great program that just gets better with every new version. In addition to the major additions, there are the minor ones that improve the appearance of the program on your screen and the way you interact with it.

Some of the new features in Delorme's own words are:

- **Address-to-Address Routing** DeLorme's extraordinary map detail enhanced with address-to-address routing
- **Over 2 Million Points of Interest** Find restaurants, hotels, gas stations and lots of fun things to do along the way
- **GPS Voice Navigation** When using the GPS feature, Street Atlas USA 5.0 talks to you as you travel, telling you how far it is to your next turn, what road you're on and how far it is to the end of your journey
- **PalmPilot PDA Support** Plan a route and send your directions to a 3Comâ PalmPilotä to carry with you
- **Enhanced GPS Features** Automatic panning, automatic logging, automatic tracking, GPS map features, change symbol size, monitor satellites and more
- **Prefer/Avoid Roads** Select or avoid certain roads in your route
- **Edit Roads** Assign characteristics to roads (e.g., one way, no left turn, etc.) that are incorporated into the routing
- **Automatic On-line Updates** With an Internet connection, on-line information for weather, road construction, upcoming events and other points of interest automatically appears on your maps as you pan
- **On-line Gazetteer** Direct Internet access to hundreds of city Web pages for more detailed regional information
- **Attractions Web Sites** Direct Internet access to up-to-date information for points of interest

Software Review

Quicken Deluxe 98 from Intuit

by William LaMartin, Editor,
Tampa PC Users Group

Quicken is another program that I have been with since almost day 1 in personal computer time. I started with the DOS version, switched to the first Windows version when it came out, and have updated to about every other successive version. You know that the program must have served me well all these years or I wouldn't have stayed with it. I can remember only one time I had some trouble with it. That was when converting data for the DOS to Windows upgrade or from the Windows 1 version to the next Windows version. In the conversion, some of my splits (the different lines you can break a transaction into if you want to specify the separate items, for example, that make up a single deposit) had the correct amounts but incorrect descriptions. Since this concerned only a few entries and they were several years old and the amounts were correct, I didn't worry too much about it. But that was the only time I have had cause to really complain about Quicken.

Of course, Quicken is much more now than a simple checking register. It is a place to track anything financial in your life. Most of what Quicken has added (at least for the deluxe versions) starting with version 4, I believe, are the investment features that I really don't use. I mainly use it to track the disappearance of my money instead of its growth. My accounts and different categories of expenses (and a few categories of income) easily reach 50 in number. Just think, before the personal computer and Quicken none of this would be possible. It is another example of how the personal computer has made us more productive. Now I track 50 different items, where as in the past I only struggled to balance my checkbook and a few savings vehicles with pencil and paper.

Seriously, Quicken has been a bookkeeping life saver for me. A couple of years back I let it take over more of my life when I ordered sheets of checks to feed into my laser printer so that Quicken could not only record my expenses, it could also pay my bills. This way, I save time by letting Quicken print the check and record it in my checking register at the same time.

But, enough of how wonderful Quicken has been in the past. What is new for Quicken 98? Well, as might be expected, there is more of a tilt toward the Internet. You can now get all sorts of investment and other financial information from the Quicken site. If you use any of the online brokers like Charles Schwab & Co.., E*TRADE , Fidelity Investments or Waterhouse Securities, they will let you interface with them directly from the program. And in the works is the ability to download all of your credit card data (recent charges, etc.) directly into your Quicken credit card register for card issuers that team up with Quicken. This is intended to keep you from having to input this data yourself, but, to me, if you don't enter it yourself you have no check on whether the charges when you get them are valid.

Of course, they also are forging alliances with various banks to allow you to do online banking using Quicken and connecting to these banks over the Internet. Local banks that I saw listed were Barnett and Sun. Of course, Barnett is about to be gobbled up by NCNB, so that may no longer be available since NCNB was not on the list.

Banking is definitely moving to the Internet. But the problem, as I see it right now, is that we are getting many different groupings of banks, using different software, so that at this point services like those Quicken is offering will only be of use to a select few of us potiental Quicken and Internet users. If my bank or credit card company is not allied with Quicken, then all bets are off. Additionally, many banks, like Barnett, want to charge you about $10 /month for accessing your account via the Internet. I think it should be free, since such service is keeping me out of their buildings and away from their human tellers. And indeed some banks offer such services free. Huntington Bank, for example, offers free Internet access to your account with them via a secure Internet server if your browser is Java enabled, as Microsoft Internet Explorer and Netscape Navigator are. So Quicken gets cut out of deals like this one, and my bet is that this is the direction banks will go in the future (although they may offer some sort of Quicken compatible download of your transactions).

Other than access to financial information on the Internet and more investment help, what else do you get with this new version? Since I skipped two versions before this upgrade, I cannot say what is completely new, but to me the most noticeable changes involved the "small" things. It is now just a lot easier to move around my different accounts in Quicken. The appearance of the program on the screen is more pleasing, and they seem to get more information and options presented in the same space than in the past.

When I open the program I am presented with a week's worth

Special Interest Groups

Communications SIG

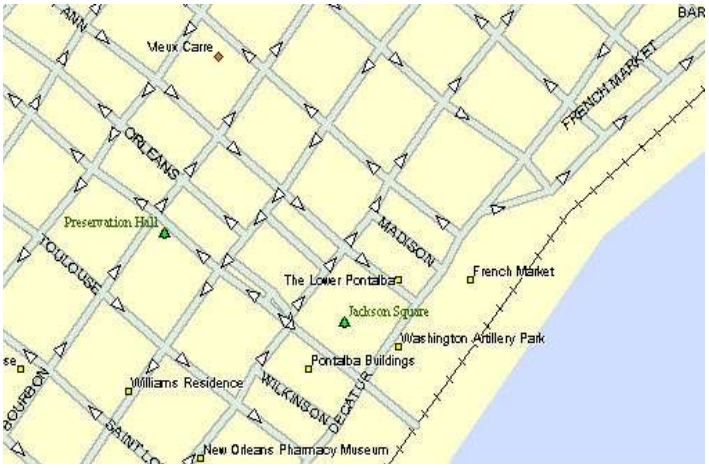
This SIG meets the first Monday of the month at 6 PM at the Reflectone Building. **Directions: Proceed west on Waters from N. Dale Mabry across the railroad tracks, about 1.5 miles; take second left on Savarese. Proceed on Savarese until you reach the Reflectone building. Use the north door.** You must sign up to get on the list and to get by security. *Contact Charles Howe: at 968-1207 or HOWE@INTNET NET*

Genealogy SIG

This SIG meets the second Monday of the month at 7:00 PM at the Museum of Science and Industry. *Contact Jenny Lind Olin at 960-5723 or Ford Bond at 987-6309 .*

(Minutes.....Continued from page 2)
approximately 27MB/sec at the modem for $39.95/month for current cable subscribers after an installation cost of $99.95.

The installation of the necessary infrastructure to offer all of the Time Warner system in the two counties is still ongoing. They look for completion of that by June 15th, 1998. The City of Tampa area will start at the first of the year and be completed to South Tampa in March or April.



As an ISP, they are offering added services: 5MB for personal web sites, up to 5 e-mail addresses etc. The equipment installed, including an Ethernet card installed in your PC, is owned and maintained by Time Warner. It consists of the Ethernet card, cable modem and cabling, and a new dedicated cable run into your house. There is a discount offered to all TPCUG members reducing the installation cost to $49.95. Contact Jason Wells at jason@timewarnercable.com.

The door prize drawing followed after a short break. Roger Waters won a hat and software. Micrografx Greetingcard Gold was won by John Weber, and Janet Bowersox received a Tee shirt; Vince McCoy won a mouse pad; and Warren Fuss, Larry Anders and Merle Nicholson received Time Warner hats. ◆

(Comments.....Continued from page 7)
computers cannot be upgraded. Even laptops are rapidly delining in price. It is amazing what you can now get for less than $2,000 in a name-brand laptop (the only type to have). ◆

(Atlas.....Continued from page 8)
- **Reservations** Make on-line reservations for hotel accommodations, airline tickets, car rentals, etc.
- **Training Card Tutorials** Easy-to-use tutorials coach you step-by-step as you learn about Street Atlas USA 5.0's many features
- **Travel Package** Printing options include Summary, Directions, North Up Map, Detailed Maps and Travel Plan - everything you need to keep you informed as you travel
- **Weather Almanac** Weather statistics for 341 places in the United States
- **Radio Listings** Listings of AM and FM radio stations and their formats throughout the United States
- **Exit Services** Comprehensive listings of available services at US interstate highway exits
- **Avoid Areas** in Routing Avoid specific geographic areas, such as cities with heavy traffic congestion or major road construction

It is a great program even if you don't have a laptop to take it on the road. But it really comes into its own on a color laptop with sound and CD ROM to which you have attached the Delorme Tripmate GPS unit. Pop in the disk and hit the road. You will never get lost again. ◆

of bills to be paid or scheduled deposits to be made. That way I know what lies ahead and hopefully I won't miss any payments this way. On my right I have tabs that list the various account registers that are open, and this allows me to move between them easily—a big improvement over older versions. In brief, it just has a more polished look than past versions—not that there was anything really bad about the previous versions. Of course, there is extensive help, including tutorials. Finally, this version also takes you on the Internet (again) to a Quicken site, which allows you to search for the best car insurance rate or home mortgage deal. It also allows you to do minimal tax planning.

Quicken Deluxe sells for around $59 with a $20 rebate for previous Quicken owners. If you are happy with the basic Quicken package, which omits much of the investment material and tax planning material but really does everything that I want out of the package, you can probably get that for around $20. ◆

President's Message

By Merle Nicholson, President, Tampa PC Users Group

I have very important news to convey to all club members. Due to the low traffic on the BBS, the TPCUG BBS has been closed down by decision of the board of directors. The BBS is a very vital part of our history and was a club mainstay for a good many years. I can recall in years past that, even if you didn't know much about the club itself, if you were interested in computers, you knew that the Bits-of-Blue BBS was top-notch. The quality of the BBS was the result of two club members - Kevan and Mary Sheridan.

There isn't any way that we can repay Mary and Kevan for all the literally thousands of hours they've devoted to running the BBS all these years. It's been a selfless dedication to something they fervently believed in. So the Sheridans are due our most heartfelt thanks. They can certainly rest assured that they have made an impact on the quality of the Tampa Bay area. ◆

The END of the BBS, an end of an ERA?

By Kevan Sheridan, Secretary, Tampa PC Users Group

The more things change, the more they stay the same. Quality and Quantity are the things that really change. When I started calling the BBS, I thought it was this huge computer in some big room where the high guru of computers sat in his big chair controlling everything that happened in the world. I know others who have had this same thought. I was literally startled when I saw it for the

However, for business concerning this newsletter, Bits of Blue, please contact the Editor, William LaMartin, at 821 S. Boulevard, Tampa, FL 33606-2904; 813-251-3817; lamartin@ix.netcom.com.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII, Microsoft Write, Microsoft Word, or Word Perfect file to the editor at 821 South Blvd., Tampa, Florida 33606-2904 or to lamartin@ix.netcom.com.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

The use of trademarked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

SECRETARY'S REPORT & MINUTES OF MEETING February 11, 1998

Minutes and Comments by Kevan Sheridan, Secretary, Tampa PC Users Group

The pre-meeting Turbo Tax demonstration was canceled. Introductions and announcements began at 6:10 pm. Merle announced the closure of the BBS, and William gave a quick demo of the club web pages. The Corel demonstration began at 6:35 and lasted until 8:00. Following a short break the meeting concluded with the door prize drawing. The amount brought in from ticket sales was $112.00.

The Tampa PC Users Group BBS opened for business during August of 1986, and there have been quite a few changes since then. One of the biggest changes to bulletin board system usage has been the growth of the Internet, and with this growth a big decline in BBS activity has made it impractical to continue. The local fidonet feed for message echoes will stop on Feb 20. The final day of BBS operation is scheduled to be March 1, 1998.

The Corel demonstration was presented by Sussane Gramann, Product Specialist for Corel Corporation, and John Torres, Corel Corp./Mindshare representative for the Tampa bay area. The first program presented by Sussane was WebMaster Suite, a complete solution for web site creation. The suite contains Web.Designer, Web.SiteManager, Web.Photo Paint, Web.Draw, Web.Move, Web.World, Web.Data, O'Reilly's Website v1.1, Netscape Navigator 3.0, 7500 internet ready clipart images, and free 30-day web site hosting service. Minimum system requirements: PC 486 DX/66 or higher, Windows 95 or Windows NT 3.51 or higher, 2X CD-ROM drive, 16 MB RAM, VGA monitor, mouse or tablet.

Web Designer can handle up to five pages simultaneously and has 222 templates. Web pages can be setup in just minutes. Web site management allows management of local sites, remote sites, and even sub sites. It automatically updates links, detects and reports broken links and orphan files. Photo Paint 7 technology lets you quickly create or edit wonderful images with quite a few fancy options thrown in. With 3D VRML (Virtual Reality Modeling Language) you can design 3D images and even use animation! Image file formats used include both GIF and J-Peg. If you have stored information to display, tables with up to 100 by 100 elements allow you to publish your database information quickly and easily. Finally, of course, you can use Netscape Navigator to view your pages as they would appear on the web.

Just to show us what could be done with Web.World, Sussane

Comments: Corel, Virtual Reality, and Visual Basic

By William LaMartin, Editor,
Tampa PC Users Group

Before anything else, allow me to invite you to check out the new online version of this newsletter (take the fourth link on our home page). In the past, I had been posting an Adobe Acrobat version of each newsletter at our web site. If you downloaded it and viewed it with the Acrobat reader, you were presented with a true, in color, copy of the newsletter with hot links. However, I got the feeling that not many took the time to do this since it involved the download. So, I decided to try to create an online HTML version--I was already reproducing the main articles in HTML format in the "Online Reviews" section. This just added a bit more work, and it turned out to be easier and consumed less hard disk space than I had originally thought.

Corel's Web.World Virtual Reality Program

As usual, Corel gave us a stellar presentation of outstanding products. They were also generous with the door prizes (see photo at right) and the special user group pricing on their major products. I and each of the individuals on either side of me took advantage of the offer on Corel Draw 8 and the WebMaster Suite. And I noticed many others filling out the order forms that were passed around. In a little over three weeks I had a nice fat box from Corel sitting at my door--much sooner than promised--but too late for a review in the newsletter. However, part of one of the products intrigued me, and I just had to give it a try: Corel Web.World

I first installed Corel Draw 8. That took about 225 MB of that new 5.1 GB second drive I wrote about adding last month. Then WebMaster Suite took around another 100 MB. It's a good thing I got the drive. I remembered enough of an earlier version of Corel Draw to whip out a birthday card for someone in a short time. I haven't used Corel Draw in some time, since I have been using a newer version Micrografx's similar product for the past several years. I plan on using both now so as to compare the two programs.

After installing the WebMaster Suite, I took a quick look at the features of the main program Corel Web.Designer to get the feel of it and then quickly moved on to Corel Web.World, the virtual reality creation program. This program and several of the other lesser programs in the Suite must not be true Windows 95 programs since they don't support long file names. Corel Draw 8 and Web.Designer are Windows 95 programs.

During the Corel presentation, the presenter did not actually build a Virtual Reality (VR) project; she used one that had been created earlier just to show what the results of using the program could be. Actually constructing such a VR world would take too much time for a brief presentation.

Corel is always very generous with door prizes. Here I am wearing mine.

In using the program, you basically choose a level on which you want to work, say, 0 to 3 units. Here you create your rooms and other rectangular objects--a room is just a rectangular object with the inside cut out. You can then apply color to the walls and "hang" objects on the walls. These objects on the walls can then be given properties such that when a visitor to your virtual world double clicks on the object they may see a text message, hear a MIDI music file being played, be sent to another site on the Internet, or transported to another virtual world you have created.

If I have created a room or collection of rooms on level 0 - 3, then I could change to level 3.5 - 6.5 and create a second floor above the one I just created. I haven't found a good way to move from a first floor to the second floor. Right now one just moves up through the air from the first to the second floors. I suppose you could create two different VR worlds with one the first floor of the building and the second world being the second floor. Then a double click on the stairs, for example, could take you from one floor to the next. I have had only one day to work on the program before writing this article, but to see an example of what can be accomplished, go to the site http://www.canx.com/tpcug/communications_sig/virtual/world3/mosi.htm . It is hidden away at our web site in the Announcements section under the Communications/Internet SIG. To view the VR world, your browser will have to have VMRL viewing capability installed. Both Netscape and Microsoft Browsers provide add-ons for this. You mayor may not have this feature installed. If your browser has this ability installed, when you go to the above site you will see my version of the MOSI floor plan. See if you can find the man at the computer in the computer lab upstairs. To get upstairs you just sort of walk through the air at present. Later, I will make this more realistic with you going to the stairs then double clicking or something to be transported to the second level.

Just like there is a Hyper Text Markup Language (HTML) for writing the code for a web page, there is a Virtual Reality Markup Language (VRML) for creating VR objects. Both produce text files with associated graphic files for whatever pic-

(Comments.....Continued on page 6)

(BBS.....Continued from page 1)
first time. Just a little thing sitting in the corner with nothing more than a monitor, keyboard, and modem connected. The sysop was no longer bigger than life, not much different from anyone else, and was just interested in computers. The BBS was nothing more than a program and a modem. A web page is nothing more than a text file that is sent over communications lines to your browser.

Today web sites just about replace the BBS. A web site can be located on big computers in big rooms with high gurus running them… AND a web site could work on YOUR computer too. With a BBS you could get the latest printer drivers or text formatting program, and the files could have been released just last week (more often it was a few months ago). Today a trip to the web page of the developer can net a driver that was released just 10 minutes ago. Messaging, a big part of a BBS (where valuable information is passed along), is now replaced by Usenet newsgroups. Games, a big portion of BBS doors, can now be found everywhere. Some support hundreds of people playing at once.

All of the functions of a BBS are replaced. Chat, messaging, games, files, bulletins, e-mail, and even individual color preferences are handled on the "net" (or by your browser). "How do I go to the FILES area of your BBS, I use O-A-5 on my favorite BBS?" is a question I was asked once. The answer was "F" on our system but the question highlights something. Today a "link" is a link. You move the mouse and push a button. Just like the BBS 'How do I' question, though, someone probably told you that a colored underline was a link. Today links work the same from site to site.

Quality. A fidonet message area usually contained some off-topic messages such as which side of the bay was better. Today it is just as common to see messages titled 'Windows Lockups' while the contents are about what color a particular beer label had before it changed.

Quantity. With a BBS there was a sense of community, you knew most of the people visiting. Today the Internet covers the world. It seems a little less intimate but you have access to more information than anyone could handle in a lifetime.

End of an ERA? I don't think so….it just looks a little different. ◆

The History of the Bits of Blue RBBS

By Kevan Sheridan, Secretary, Tampa PC Users Group

Sometime during August of 1986, Rodney Brewer of Excellence Computers and then president of the Tampa IBM PC Users Group Inc. started a club electronic Bulletin Board System (BBS). Back then bulletin boards, just becoming popular, all had names that tried to give an idea of what the system was about. The IBM PC was quite the computer in those days, and the nickname for IBM was "Big Blue". So, the name of the club newsletter, Bits of Blue, was used for the BBS. The purpose was to give members a place to trade valuable information and prospective members a place to find out more about the group. We will not talk about what some callers thought about a name with 'blue' in it.

This original system had some very fancy items for those days. A messaging area allowed questions, answers, and general comments to be posted or read by any caller. Bulletins allowed the System Operator (Sys-Op) to give callers a standard set of information on request. Items such as how to join the group or what the next meeting would be about were placed in bulletins. A Files area, a standard part of most BBSes, kept the latest version of your favorite shareware game. If your communication program included the X-Modem transfer protocol, downloading files took place at the (amazing for the time) speed of 1200 baud (1200 bps or 120 characters per second). Let's not talk about how long it took to download big files, okay?

Games were big then too, so one was installed on the BBS. Games were so popular people wrote them to be played online, using a function called 'DOORS'. This allowed players to compete for the best scores or just offered something to do for awhile. Another function was called PC-Pursuit, which allowed callers to 'connect' to other systems. Word of mouth and an advertisement on other boards was the way callers found out about any BBS. After a short time Rodney brought his brother Daniel in to help him. Daniel eventually took over all operation of the BBS and worked very hard until mid 1988 when Excellence could no longer support the system.

After two years of operation, volunteers to operate the BBS were called for. Three people, perhaps more, spoke up: Vern Semrad a very capable computer expert, Harvey Bruneau of Dun and Bradstreet, and Kevan Sheridan of Realtron. Kevan, being two months on a new job, offered to keep the BBS at his place of work. His company let the system take up desk space and connected it to a 5kv UPS. The public access of an office must have helped as Kevan was picked to be the next BBS Sys-Op.

SOFTWARE AVAILABLE FOR REVIEW

1. **GoldMine 4.0** - GoldMine Software -Number one rated workgroup contact manager - Win95, 16 MB, 486 & CD required.
2. **G-NOME** - 7th Level - Pilot more than 20 different mechanized vehicles in war action - Win95, Pentium 90, 16 MB RAM & 4X CD required (13+)
3. **HELI COPS** - 7th Level - Helicopter war game simulation - Win95, Pentium 100, 8MB RAM, 4X CD
4. **Magic Cap** - General Magic - Organize all your communications: email, fax, etc. - Windows 95 CD
5. **How Would You Survive?** - Grolier - Multimedia Adventure (ages 7-12) - Windows CD
6. **Aviation Adventure** - Knowledge Adventure - complete world of flying (8-adult)

(Call 251-3817 for information on review software)

Windows 9(x)

By Larry Anders, Librarian,
Tampa PC Users Group

Later this year, as Windows 95 reaches its third birthday, a new release of Windows is to be unveiled. While some are calling it Windows 98, word is that it will be called Windows version 9(something). I have not given this latest version a trial run, even though I have had a couple of offers, because my system is running just fine with 95. But, I have read a lot about it since it has gone into BETA, and as I sit in a hotel room on the other coast of Florida, reading an e-mail from William saying he needs my article for this month's newsletter, I thought I'd pass on some of what I've learned to you.

It apparently will not be as major a design change as from 3.1 to 95, but it's touted to be more than just an upgrade. The bright spot in my mind is that it will actually save disk space. Included in this latest release from Redmond is the new Drive Converter utility that will convert your old Win95's inefficient file allocation table (FAT 16) to the more efficient FAT32 that reclaims wasted disk space. A full installation of Win 9(x) over Win95 takes approximately 70 megabytes but frees up over 150 megabytes after running Drive Converter.. That's quite a diet for your hard drive.

One neat feature is the ability to run two PCI display adapters and two monitors on a single PC. Why would you want to do this? You could run your e-mail program continuously on one monitor and run your desktop normally on another monitor:

Some other new features included are:

- Better plug and play management
- System File Checker and Windows Tune-Up
- Windows Update, a web-based wizard that analyzes your PC and automatically recommends updates to download such as patches and drivers
- Improved disk cache and memory management
- Over 1,200 new drivers including ones for DVD and USB
- Explorer 4, which has already been released, provides a choice for a different desktop view, one based more on the web, called Active Desktop
- Outlook Express, Personal Webserver, Task Scheduler, Net Meeting and a new version of Backup have also been added.

This isn't all of the new features but it's a majority of them. The RAM requirement is between 12 MB to 16 MB. Major performance gains shouldn't be expected but you can expect your system to run better and have better reliability. Although Win95 has been good to me I'm ready for the next step in our evolutionary chain to Windows NT. How about you? ◆

(Comments.....Continued from page 3)

tures you want to put on your web page or hang on the walls of your VR world. What follows are the first few lines of the VR file for the MOSI VR project.

```
Separator{
    ShapeHints {shapeType SOLID vertex-
Ordering COUNTERCLOCKWISE}
    SpotLight  {on FALSE}
    PerspectiveCamera{
        orientation 0 1 0 0.00170909
        position 5415 3009 11346
        heightAngle 2.42572
    }
    DEF BackgroundColor Info{
        string" 0.517647 0.768627
0.721569"
    }
    Coordinate3{
        point[
         256 0 6144, 256 0 9984, 256 896
9984, 256 896 6144, 7680 0 6144, 7680 896
```

and much, much more. If I knew what all those numbers meant, I probably would know why my colors aren't reproducing properly.

Visual Basic - ActiveX

I am always on the lookout for interesting things to do with Visual Basic. This last month produced two. Creating an ActiveX component to place on a web page and enumerating all the installed programs on a computer.

In some sense creating an ActiveX component for a web page is similar to creating a VR object to place on a web page. In both cases you use a special program to create the object. For ActiveX, I used Microsoft Visual basic to create a special type Visual Basic program to be uploaded to the web site, which is similar to what I did above with the VR object. Next, just as your browser needed to have the VMRL add-on installed to be able to view the VR world, you will need to download what I would call the Microsoft Visual Basic runtime environment files to your computer to be able to view the ActiveX object on your web page. Once you have these files, you will not have to download them again, but that first time could be time consuming, since the minimal size is around 700 KB. Once you have all the required files, you can do some powerful things with ActiveX. In my simple example, I just had a real time clock running on the page, spaces for the user to fill in information, some of which was numerical, and hen a button to press to do calculations with the numerical information, and spaces to display the various calculations. Then just for a lark, I had the component change colors if you clicked on it.

All this is very cute and indeed useful; however, there is one

(Comments.....Continued on page 7)

(Comments.....Continued from page 6)
problem other than the need for the one time download of the run time environment files. It is all the warnings you will get along the way from your browser telling you of the potential dangers of renegade ActiveX components from untrustworthy developers. And I am relegated to the untrustworthy category, since I don't have a "certificate" from what, as best I can tell, is the self appointed issuer of such things. To get such a certificate, one needs to have a "substantial presence and evidence of financial responsibility as evidenced by such things as a Dun & Bradstreet rating." So unless there is a way figured out to make people like me "trustworthy", I don't think there will be much reason for me to put any such components out on the web just yet

Visual Basic - Counting the installed programs

How many programs are installed on your computer? I have 701 on my C drive alone. You say, “No one has that many programs installed." Well, it all depends on what you call a program. Using the definition of a program as being a file with the .EXE extension, I have 701 programs on my C drive. And you probably have at least 200.

Why would anyone want to know such a thing, and, then, how can you enumerate the programs? The last part of the question is what someone asked me. The first answer is that Microsoft has some such program for managing the installed programs on all the computers on a network. And, of course, in Windows 95 you have a list of the programs that you can uninstall, but the non-Windows 95 programs will not be there. For these types of programs, I suppose, you could check every .INI file. And then it came to me that all you needed to do was use the find feature in Windows Explorer with the file name set to *.exe. This would produce a list of executable files. Of course, it is a list with which you can't do much.

My project was to write a Visual Basic project that would also find these files and additionally present you with a list that could be dealt with as any other text file: saved, printed, sorted. With this sort of information, you can compare the state of the installed program base now with the previous month, look for major software titles, and what interests your boss--look for game titles.

To write such a program you need to think of a drive, e.g. C, as a tree trunk with all the folders as branches, the subfolders as branches off the branches, etc., with the programs as the leaves on the branches. You then proceed to search along all the tree's branches. As I said I came up with 701 leaves on my tree. What I am going to do with this information , I don’t know. But it was interesting project, and it helps keep my programming skills alive. ◆

(History.....Continued from page 4)

Unfortunately, the transfer of operations was not a smooth one. The entire list of items actually transferred amounted to two backup tape cartridges. A company whose name cannot be found, offered to donate equipment for the operation to continue. Kevan's first encounter with building PC's began with a trip through a repair shop: "Here is a computer case and keyboard. And we'll use these memory chips. Let's see. Yes here is a mother board…. Whoops, let's use this one instead. A 20 meg hard drive…" The company really should get credit here for donating this equipment because they did make it possible to continue the BBS. They also loaned the use of a backup tape drive.

It was September 1, 1988. With a pile of components and a modem, Kevan proceeded. He affectionately (well MOST of the time) called this the "Frankenstein System" and once built, the restore from backup could begin. The next lesson was: Backups do not always work. Halfway through the first of two tapes a block was apparently unreadable, thus ending the restore. Some 1500 files were never restored. Fortunately the core files needed to run the BBS were recovered. The next month was spent finding out how to make it run. On October 8, the BBS software, RBBS-PC version 15.1A, was upgraded to RBBS-PC version 17-1A providing lots of new features.

The first official (non sysop) call to the "new" BBS was on October 14, 1988. The sysop spent the next few months learning about modems and how to handle them. Fortunately the BBS software included all the BASIC source code which gave him enough information to allow him to write a new set of modem control programs for his other job (the paying one). This was the first time his BBS experience helped his career. Terms like Baud, BPS, Parity, Stop Bits, and Flow-Control now meant something. Constant system trouble also gave him valuable experience with the operating system and hardware connections. "Wait! You mean the location AND order of the memory chips make a difference???"

In May 1989 Edward Buzza wrote "So,… You've Got A Modem" for new callers to the BBS. Distributed on the BBS and mainly on new group member disks, this manual continues to be the ultimate resource for new BBS users. In April of 1990 a second 20 MB disk drive was added and ZMODEM, YMODEM, and PUMA file transfer protocols were added too. Right after that memory parity errors started to happen causing the system to be taken down for repair. With a new motherboard and completely empty disk drives the next lesson was Low Level Disk Formatting. A program called FDISK now became a friend. Previously learned lessons paid off as the backups worked this time. The support of several group members helped greatly during this low period.

(History.....Continued on page 9)

Screen Resolutions

By Merle Nicholson, President,
Tampa PC users Group

You really don't ever do one thing at a time do you? No, absolutely not, and Windows was designed for doing multiple tasks as well. As Windows was developed over the years, it's gotten better and better at that. My own screen right now has a window on the Internet , sized pretty small in the top left hand corner. It's waiting for someone else to pop up into the TPCUG online Chat window. But I'm really concentrating on what I'm writing right now. I have a clock going at the top of my screen, and I'm kind of tracking the time, hoping to get this article together before bedtime. I have Outlook Express minimized also, because I'm hoping my son will send a note to me by e-mail. I'll hit send/receive a couple of times during the evening, and maybe print out the note for my wife if something interesting comes in. That's it for the moment. Sometimes I have more going on, but this is a night that I have to concentrate on this article.

What the computer is doing (and my brain also) is called "multi-tasking", and for those of us brought up on technologies of the past; Apple and Atari and Commodore and DOS, we're really living luxuriously. So what does this have to do with screen resolution? Screen resolution has to do with how much you can see on the screen at once.

So if your brain is capable of multi-tasking and your computer is also, what about the computer's ability to present that information to you? It's all through the screen (and also sound to a limited degree). So how do you know what you have? Start with the monitor specs. What size is it? Common sizes are 14", 15" and 17". There's a new 19" size becoming popular, and 21" has been around for quite a while if you have lots of money. This is a diagonal measure. My own 17" monitor has an actual diagonal measurement of 15-3/4 inches. Now for the resolution. Right-click on your desktop and select properties, or go to Start, Settings, Control Panel, Display. Select the Settings tab, and on that panel, look at "Desktop Area". At the moment, mine is set to 1024 x 768 the "intended" resolution of a 17" monitor. (We'll debate this in a moment). In one sense, "desktop area" is a good description of resolution.

Slide the pointer back and forth, and you'll see - depending on your monitor specs and your computers' video card - just what your system is capable of. The resolutions that you'll see are:

640 x 480 - called VGA
800 x 600 - called Super VGA, and sometimes SVGA
1024 x 768 called 1024x768 and sometimes XGA.
1152 x 864 is rare, but some video cards support this (mine does)
1280 x 1024
1600 x 1200

The specifications for my monitor says that it's built to a maximum of 1280 x 1024. As a rule, the larger the monitor, the higher the resolution. All monitors that I've heard of will handle from 640x480 up to some maximum, depending on how expensive and how big the monitor is. I have an older 14" monitor in my computer room that handles 1024x768 (and did this terribly, even when it was new). Certainly all newer 14" monitors will do that. 15" monitors will do 1024x768, and sometimes 1280x1024. 17" monitors will all do 1280x1024, and sometimes 1600x1200.

What does this do for us? The higher the resolution, the more "things" we can put on the desktop at once. It's that simple. I very often switch my resolution to 1280x1024, mostly when I'm programming in Visual Basic where I must have six or so windows up at the same time, and still have my e-mail and appointments on-screen and handy. I'll switch it down - usually to 1152x864 when the demands of what I'm doing are lower.

By the way, you'll see both 14" and 15" monitors sell with the same resolution capability, and also many 15 and 17's have the same specifications. What do we gain? Easy - the bigger the screen, the easier it is to see, given the same resolution.

I'm writing this because I've been amazed to see that people do not experiment around with their settings. I've seen dozens of people with expensive 17" monitors with the resolution set at 800x600, a resolution that any 14" monitor will do with ease.

So here's Merle's middle-of-the-road guidelines given ,say, mid-life capable eyes and then (young eyes) in Parenthesis
14" - 640x480 (800x600)
15" - 800x600 (1024x768)
17" - 1024x768 or 1152x864 (1280x1024)
19" - 1280x1024 (1600x1200)

You obviously need to modify this depending on the quality of the monitor; the real need you have to juggle many windows on the screen at once; the age of your eyes and also how well your glasses or contacts - if any - are "tuned" to the distance to the screen.

Because of my age, I went to "computer glasses" many years ago that have the upper part prescribed for a distance of 22 inches from the screen. That allows me to use a very high 1280x1024 with very little fatigue.

Sit down at your computer, don't be afraid to change it to see what the effect is, and work with each one for a few days; you may discover something you like. ◆

(History.....Continued from page 7)
A new 286 computer was purchased from LORAN Computers in November 1990 (we actually traded our old system in!). Steve Speairs donated two 65 MB RLL hard disk drives, as the previous D: drive (containing only files to download) failed.

By 1992 the BBS had many message areas (or topics) that had a lot of activity. Two doors, Silver Express and TQM, were added to allow callers to download, read, and send mail while offline (not connected to the BBS). To make things better, there was a new "network" called FIDOnet. With a dog as the logo and using a system of computers, a new way to transfer messages between people was developed. Each 'node' on the network wasn't always connected to other nodes. Special programs called "mailers" were written to handle the transfer of messages. A program called D'Bridge (version 1.3) was installed in March 1992. For those interested, our node address was 1:377/32. Fidonet allowed the sysop to ask questions in the DesqView "echo" and get helpful answers from a caller to another BBS located in Australia (in just 3 days!).

The BBS joining Fidonet gave all of its callers access to the world. Additionally fido membership gave the sysop access to other local BBS sysops, a wealth of PC knowledge. This also led to the addition of a US Robotics 16,800 baud modem, a big leap in online speed.

The next very big boost for the BBS came from a donation in Dec 1992: A brand new computer! A 486/33, 200 MD Hard Drive, and 8 MEG RAM. With a better computer a second phone line was added with Desq View running two nodes of the BBS software. This sysop lesson was called file sharing along with a BIG boost in the member support lesson.

Things change, and during 1995 the sysop was no longer able to spend the same amount of time on the BBS. System operation was transferred to Mary Sheridan in September when the system was moved to their home (cutting the monthly phone bill in half).

Things changed even more when the Internet took hold. Overall usage went down over the next year or so, and life with a PC changed as well. The local fidonet feed ended on February 20 1998. Mary took these changes (and more) into consideration when she decided to recommend the TPCUG board stop BBS support in March of 1998. With that, the history is over.

On a personal note: When I started, I spent about thirty to forty hours a week on the BBS (down to ten by March 1994). During that time I learned a huge amount about modems, programming, and people. I spent months and even years learning software. I was allowed to install just about any program I wanted to, each one helping in one way or another. I spent countless hours trying to make hardware or software work properly. And after all of this I believe that I had the better part of the deal! I also believe I couldn't have done it without the unending support of many group members. I would like to personally thank these people for their special support (without which nothing could have happened): Harvey Bruneau, Vern Semrad, Ed Buzza, Larry Anders, Bill Fuller, and Connie Kincaid. I would also like to thank my wife Mary for helping me change my life from a keyboard to the real world. By the way, I met her on the BBS! ◆

SHAREWARE

By Larry Anders, Librarian,
Tampa PC Users Group, Inc.

For this month's newsletter I thought I'd pass along some Shareware files that can be easily downloaded from the Internet. As I have written about in the past, there are plenty of reputable locations where good software is available, and you don't have to worry about downloading some gosh-awful virus along with the software. That's not to say that you shouldn't always be leery of viruses but I've been downloading Shareware for years and I have ***NEVER*** obtained a virus from a downloaded file. I have also been a registered user of McAfee VirusScan for years and so far it's been well worth the minimal expense.

At this point, before I go any further, I would be remiss not to mention the passing of a very good friend of mine, which was responsible for me joining the Tampa PC Users Group several years ago, our very own *Bits of Blue BBS*. She is gone but not forgotten. Thank you for many, many hours of enjoyment. May it rest in peace! Enough said, now for the good stuff.

Back in the days of Bits of Blue BBS, before the Internet, there was a download protocol called Zmodem that would allow an interrupted download to start back up where it left off without having to start all over again. Now you can expect the same on the Internet with:

GetRight (32-bit), File size: 920 K (Shareware) GetRight gracefully recovers from the many errors that can occur while you're downloading files. No matter how you loose your connection, GetRight can resume downloading a file. It can dial your telephone, download a file, hang up, and even shut down your computer automatically. It can also schedule files for later downloading, support a file mirror list, and switch be-

Special Interest Groups

Communications SIG

This SIG meets the first Monday of the month at 6 PM at the Reflectone Building. **Directions: Proceed west on Waters from N. Dale Mabry across the railroad tracks, about 1.5 miles; take second left on Savarese. Proceed on Savarese until you reach the Reflectone building. Use the north door.** You must sign up to get on the list and to get by security. *Contact Charles Howe: at 968-1207 or HOWE@INTNET NET*

Genealogy SIG

This SIG meets the second Monday of the month at 7:00 PM at the Museum of Science and Industry. *Contact Jenny Lind Olin at 960-5723 or Ford Bond at 987-6309 .*

(Minutes.....Continued from page 2)
took us through a "walking" tour of a virtual building that had been created by someone at Corel. This building was complete with wall paintings, windows looking out, and it even had a fire "burning" in the fireplace. Oh, and don't forget to include sounds in your pages.

Corel Draw 8 was the next program on the agenda. With over 100 new features in this version of Corel Draw the system requirements may be evident. Minimum requirements: Pentium 90 (133 recommended), Windows 95 or Windows NT 4.0, CD-ROM, 32 MB RAM, 80 MB hard disk space, SVGA, and a mouse or tablet.

This version uses a different user interface. The Property Bar is now context-sensitive, and there are now roll-up dialog boxes, and something called Dockers. It also handles multiple objects better than before using, for example, a 'digger' action to quickly move through multiple images or objects. ALT-SHIFT-PAGEUP and a right mouse will let you copy properties. If you want to duplicate images, try smart duplicate and place copies wherever your mouse goes. Most tools are now interactive to let you see changes as you type them in. Distortion, Zipper, Extrude, Drop Shadow, Envelope, and Smart Duplicate are just some of these. The 3D effects also look quite impressive in both results and speed. Throw in light source control, color gradient control, transparency, and import text tools and you can have sentences wrapping around in spirals.

Sussane Gramann can be reached at (613) 728-0826 Ext. 1637 or E-mail: sussaneg@corel.ca
John Torres can be reached at (813) 620-8094 or E-mail: torresjd@aol.com

The door prize followed a short break. Ford Bond won a copy of Web Master Suite. William LaMartin won a sweatshirt. Finally, Connie Kincaid won a copy of Corel Draw 8.

Next Month look for a demonstration of surge protectors. ◆

(Shareware.....Continued from page 9)
tween download sites transparently to ensure that you find the best download site. In addition, GetRight supports clipboard monitoring, which can help you start the download process more easily. Other features include username and password storage, integration with Netscape Navigator, download filtration by file type, and a "speed limit" that limits GetRight's share of your modem's resources. Minimum requirements: Windows 95/NT.

Although I have all of the top rated graphic manipulation programs such as PhotoShop, CorelDraw and Micrografx I still use this program more than the rest. Here's their latest effort at making it better with a little extra added:

Paint Shop Pro (with Animation Shop), File size: 7.3 MB (Shareware) Paint Shop Pro 5.0 (currently in beta 2.1) is the latest version of this popular graphics editor, with powerful new features such as complete layer support, Picture Tube brushes, CMYK separations, and pressure-sensitive tablet support. The program also includes enhancements to Paint Shop Pro's flexible painting and retouching brushes, adjustable cropping and selection tools, and images. If you have an existing installation of Paint Shop Pro (registered or shareware) and would like to keep this preexisting installation intact, simply install the Paint Shop Pro 5.0 beta into a different directory. This program will expire on April 6, 1998, but it's worth the look until then. Minimum requirements: Windows 95/NT.

I've been doing my taxes on the PC for years but have never transmitted them electronically because of the charge. It's starting to sound reasonable with this one:

Federal Tax Wizard (Nelco, Inc.), File size: 1.9 MB (Free) Now you can file your tax return electronically without using a paid preparer or buying tax preparation software. Download Nelco's free Tax Wizard electronic filing software and get the benefits of electronic filing. For $4.95 per return, you can transmit up to three returns using this software. This eliminates all of the delays associated with a mailed tax return and a mailed refund. Just enter your completed tax return information into Tax

Our meeting room at MOSI has changed

We have followed the computer lab to its new location in the new wing of MOSI. Enter the main lobby, take the stairs to the second floor, then turn left and proceed to the computer lab. Someone should be available to direct you.

President's Message

by Merle Nicholson, President, Tampa PC Users Group

Well, we moved into the new location at MOSI for the January meeting. For those of you that didn't make it to the meeting, you're in for a nice surprise. The room is much easier to find and just feels more in the "center of things". Just head for the main lobby, past the reception area and up the left stairway. The room is the first one you come to. We owe MOSI a great deal for accommodating us over the past year. And, of course, we also owe Ford Bond our thanks for his personal interest in the group.

When you're there, be sure to pick up the course catalog; there's a stack of them inside the door. And if you can spare some of your time, Ford is always looking for people to teach classes. Several of our members have done this, and there's room for more. Be sure to speak with Ford about this. One thing he has assured us is that you don't have to be an "expert" to teach a class. Many of the classes are entry level and many are for kids.

While I'm at it, I'd like to remind all members that our newsletter - BITS OF

The use of trademarked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or uploaded to the BBS as a message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

SECRETARY'S REPORT & MINUTES OF MEETING January 14, 1998

Minutes and Comments by Kevan Sheridan, Secretary, Tampa PC Users Group

The pre-meeting Tax Cut demonstration began at 6:20 PM, followed by introductions and announcements. After a short talk by Tech Systems, the presentation by MicroStar began. Following a short break the meeting concluded with the door prize drawing. Ticket sales brought in $36.

The first meeting of the year began in a new room located in the new wing of MOSI. Look for directions to the new room on the front page. Appropriately, former president Connie Kincaid gave us a nice showing of Kiplingers' Tax Cut program. This program is packed with features and will run under Windows 3.1, Win95, or MAC. She began with a short video (part of the program included on CD) giving an overview of some of the program's features and functions. Tax Cut supports electronic filing ($15 filing fee not included) and is available locally for around $24.95 and up. Next month look for a demo of Turbo Tax. At the end of the session, Don Patzsch said that those who would like any IRS forms, including publication 17 (a free full book of complete instructions for form 1040xxx) could get them from http://www.irs.ustreas.gov.

President Merle Nicholson began the regular meeting at 6:55 with introductions of the 1998 officers and appointees: Vice President Mike Hodges, Secretary Kevan Sheridan, Treasurer Jenny Lind Olin, Member at Large Bruce Register, Newsletter Editor William LaMartin, Librarian Larry Anders, BBS Sysop/Program Director Mary Sheridan, and MOSI Liaison Ford Bond. Merle also talked about the new meeting schedule: 6 –6:30 class or demo; 6:30 – 7:00 Business; 7:00 – 8:00 (more or less) main demo; followed by a short break and then the meetings will close with the drawings. SIGS (Special Interest Groups) now include: Genealogy SIG meets on the second Monday of the month at MOSI, contact Ford Bond. The Communications SIG meets on the first Monday, contact Charles Howe. Sign up sheets were passed around the room.

At 7:15 Shannon Stumpf, a Technical Recruiter from Tek Systems talked about the job market in the Tampa Bay area. It seems there are many more jobs than people to fill them. Shannon can be reached at (813) 207-2619 or sstumpf@teksystems.com. Bruce Register started a few short discussions after that.

The main presentation of the evening began at 7:25. Joe Roediger, an Account Representative from MicroStar Re-

(Minutes.....Continued on page 10)

Comments: Hard Drives & Disappearing Hardware

by William LaMartin, Editor,
Tampa PC Users Group

Hard Drives

Last month I wrote about buying a second hard drive, a 5.1 GB *Western Digital* drive for $279. Recall that I detailed what a bargain such things are now compared to, say, five years ago. But, as is to be expected when buying computer hardware, you can now get the same drive $50 cheaper. For those who haven't installed a drive or who can't recall the exact process, I will describe the installation of the drive.

First, let me say that I am not totally dumb. I bought the drive several days before I completed the January newsletter, and, even though I was sure that the installation would be completed without a problem, I restrained myself and waited until the newsletter was completed until I did the installation. This was not a bad choice, since what I was sure would be a 45 minute operation lasted probably three hours.

Second, some hard drive facts. If you use *Windows 95*--and it is not *Windows 95 OSR2* (OEM Service Release 2)--then you are using the standard FAT file system, as opposed to the FAT 32 file system. If you are using Windows 95 OSR2, you may or may not be using FAT 32 . As I understand it, you can only get Windows 95 OSR2 on new computer systems--you can not go to a store and buy it. Furthermore, even if you purchase a new computer with Windows 95 OSR2 installed, unless it came from Gateway, you probably are not using the FAT 32 file system, since Dell, Compaq, and Micron, as far as I can tell, are not enabling the FAT 32 option--probably since they don't want to deal with the extra customer support it would entail. In fact, if you, on your own, change to the FAT 32 file system, you may lose your free support from these companies.

So, why would one want to have FAT 32? Simply because it overcomes the DOS/Windows limitations of a maximum hard drive size of 2.1 GB, allowing drives of up to 2 terabytes, and it has smaller clusters of size 4 KB on drives smaller than 8 MB. Recall that a few years back we had a maximum hard drive size of around 500 MB since our computers' BIOS wouldn't support anything larger. The hard drive manufacturers came up with software programs, called overlays, to trick the BIOS into using the full capacity of the newer hard drives up to the 2.1 GB limit.

Now, back to my situation. I already had a 2.5 GB drive divided into a 2.1 GB partition and a .4 KGB partition, and there would be nothing to gain by making the new drive my master drive, since under my version of Windows 95 I could have partitions no larger than 2.1 GB. Thus, I would install the new 5.1 GB drive as the slave drive. To do this, you simply set the jumpers on each drive to the positions indicated in the instructions--the old drive is the master and the new drive is the slave.

Next, comes the physical installation of the new drive into the computer. The current drive was mounted vertically, instead of horizontally as in older systems. However, the obvious place to mount the new drive was in one of the horizontal drive bay openings, as I had done with the half dozen or so drives I have installed over the years. That created my first problem. There was no drive bay close enough to the existing hard drive for the cabling to work. Some thought led to the conclusion that I should try to mount the new drive vertically next to the existing drive. It was a tight fit, but it worked. Now my only problem was to install the four screws holding it in place--with only an inch of clearance above and below. This was too little room for a standard screwdriver, but with the aid of a pair of needle nose pliers holding each screw and a small right angle screwdriver doing the turning I finally got it secured. By now I was well past my allotted 45 minutes.

The next step is to turn on your computer and,when it begins to boot, go into the BIOS setup. On these modern computers, all you need do is make sure that for the new hard drive you select auto configuration, and you are on your way. Recall the old days when you had to select the drive type or know the number of cylinders, etc. Once the BIOS is set correctly then you can continue with the boot. Western Digital's instructions now said that I should use their EZ-Drive setup Software to partition and format my new drive. I said, why not. In the past I had always used the DOS program FDISK to partition the new drives and then FORMAT to format the drives. But why not use EZ-Drive and not have to think?

Well, I had to start thinking real fast. The first message I got was that my computer's BIOS didn't support large hard drives and that EZ-Drive would like to install EZ-BIOS to overcome that. That sounded a lot like a disk overlay to me--something I didn't want and didn't need--since at present I already had a drive installed with a 2.1 GB partition--the largest that DOS/Windows allows. Perhaps EZ-BIOS was going to make it possible for me to have a 5.1 GB partition. I don't know and didn't find out.

I could now go back to the tried and true FDISK and FORMAT; however, as many of you did at one of our meetings, I had purchased *PartitionMagic 3.0* from the PowerQuest representative and--probably just like many of you--hadn't yet used it. I had used *PartitionMagic 2.0* to remove a Windows NT NTFS partition from a drive that used to be an NT drive but was now a Win 95 drive—when no other method could be found to remove it. As Don Patzsch keeps saying, *PartitionMagic* is a useful program. I just don't get as much excitement

Software Review

Family Tree Maker 4.0

Family Tree Maker ONLINE

by William LaMartin, Editor,
Tampa PC Users Group

I have been using Family Tree Maker from Banner Blue, which is now a division of Broderbund, since it was a DOS program only. I remember when it could either not export or not import GEDCOMs—a fairly important feature to be omitted. It was simply a special use database for entering genealogical data. It provided for printing some nice descendant and ancestor charts, but that was about it. As I recall, there was no way to enter extended notes and information about an individual--or perhaps you just couldn't paste it into the program--since it was not a Windows program. I recall that I was so frustrated with this shortcoming and their reluctance to produce a Windows version that I set out to write a Windows genealogical program using Visual Basic. I was making good progress along these lines when Banner Blue produced their first Windows version and called it Family Tree Maker for Windows. Since this program did everything I needed, I discontinued work on my program and bought into the Banner Blue scheme of things.

Family tree maker was not and still is not the only genealogical program, but to me they seemed to be proceeding more in the direction I thought such programs should go than was the competition. And as I have watched them add new features with each upgrade I bought over the years, I still feel as though they have the premier genealogical database program. I believe that I have missed only one upgrade.

What is new to me in this version, but possibly not to those who had the immediately preceeding version, is the new report called a genealogy report, the ability to create a book, a Sources database, and a direct link to the Family Tree Internet site. At the right is a listing of Family Tree Maker's features for different versions. As you can see, they are about to come out with a new version, 4.4. It is due in late February. My version 4.0 seems equivalent to the 4.4 Standard Edition III, with the exception that I only have two CDs. They are the Family Finder Index. The Family Finder Index, by the way, can also be found online at the Family Tree Web site, http://www.familytreemaker.com.

As I said earlier, Family Tree Maker is a specialized database for recording your family members, their places and dates of birth, death, marriage, etc. You may include brief additional facts or extensive notes. You may create an additional Source database which will track your sources of information. Additionally, you may include photos or medi-

What Do Librarians Do These Days?

by Larry Anders, Librarian,
Tampa PC Users Group

Initially, when I first became the librarian for the Tampa PC Users Group, my job was easily defined; collect shareware and freeware files and provide access to these files for our members. I used to lug a large container of diskettes to each meeting with a portable computer of some type and allow our members to copy to their hearts' content. When the BBS became popular, my role changed to uploading massive amounts of files to the BBS, so our members would have easy access to the latest programs offered. On occasion, I would be asked to try and locate specific files through my connection of national BBSs. Then came the Internet and everything changed. At least my duties as librarian did.

Now, with the Internet, everyone has access to some of the best software packages offered today. In this article this month I will try and inform you of a few of the places to go to find these jewels of the super I-way. (I can only say that if you still do not have access to the Internet, then what the heck are you waiting for?)

CNET.COM (http://www.cnet.com/) is a free online information service that provides access to two of the largest shareware distributors on the Internet. They are:

SHAREWARE.COM http://www.shareware.com/

and 

DOWNLOAD. COM http://www.download.com/ .

I'm not sure what the difference is between the two but all the files are not duplicated on each service. For instance, the top ten files downloaded on ***SHAREWARE.COM*** are:

winzip95.exe WinZip 6.3 SR-1 for Windows 95/NT addresses an issue in the original release of WinZip 6.3. If you have the original release or a beta release of 6.3, you are encouraged to download SR-1. WinZip is a straightforward zip and unzip.

netlight.zip Speed-up your Internet connection with Net Lightening.

windiag.zip Put your PC to the test with BCM Diagnostics.

wz32v63.exe WinZip v6.3 SR-1 for Windows 95/NT . (If you don't have a previous issue.)

Win95one.exe The Windows 95 Sample Collection One is everything you always wanted for Windows 95. It's a free grab bag of utilities that will aid and enhance your everyday use of the desktop.

v95i312e.zip McAfee VirusScan for Win95 v3.12. (The Best!)

icq98a.exe ICQ 98 is the latest version of the popular, user-friendly Internet program that notifies you in real time when friends or colleagues are online.

psp414.zip Paint Shop Pro Shareware v4.14

xpsw1.zip EXTREME PINBALL features Ultra-Realistic table dimensions, animated arcade style 3D dotmation scoreboard, multi-ball play and a new music and sound system that changes the music with gameplay events.

digib33.exe Tired of those plain old FM/AM Radio Stations? Listen to the dawn of the new age with DigiBand Radio.

Whereas the top 10 ten files downloaded from ***DOWNLOAD.COM*** are:

ICQ (32-bit) Seek out friends and colleagues on the Internet

WinZip (32-bit) Handle ZIP files with ease

PowWow Chat and share files over the Internet

LView Pro View and edit images in a variety of file formats

Netscape Communicator (32-bit complete install) Try the latest shipping release of Netscape's Internet suite

ICQ Update Patch Upgrade to ICQ 98 to seek out friends and colleagues on the Internet

Quake II Play this "compatibility test" release of Quake II

Newnix Shell Get Unix-like control over your DOS or Windows system

DirectX Drivers Install this 32-bit gaming requirement

Applet Button Factory Add Java buttons to your Web pages without Java or HTML programming savvy

The main difference I see is the size of the description of the file.(I shortened them for this publication.) There are hundreds of other files sorted by category and operating system. You

(Librarian.....Continued on page 7)

(Librarian.....Continued from page 6)
even have the ability to search for a file if you don't know it's exact name. These are both very current, up-to-date sites and you don't have to worry about viruses. Best of all…. It's **FREE!**

Shareware Shop http://www.bsoftware.com/share.htm

www.32bit.com http://www.32bit.com/

the best shareware http://www.concentric.net/~rickid/

Children's Software and More! http://www.gamesdomain.com/tigger/sw-kids.html

Download.Net http://www.download.net/download.shtml

FILE MINE http://www.filemine.com/

FILEPILE http://filepile.com/nc/start

JUMBO! http://www.jumbo.com/

WINDEX http://win95.daci.net/

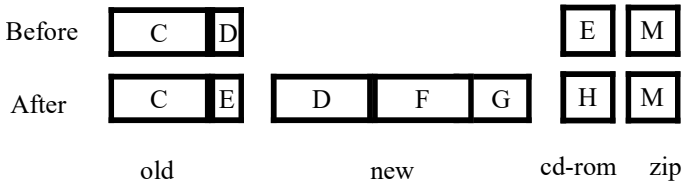
Believe me, this is only a few of them. For a list of some of the best locations on the Internet to find software, go to the father of shareware

Father of Shareware http://www.halcyon.com/knopf/jim.html and click on distributors.

After visiting just a few of these sites you will see why my job as librarian for the TPCUG is really hard to define now. If you've got any suggestions, just get in touch with me. If you have any sources for good software, please let me know too. I'm always interested in good, cheap software. **Happy hunting.** ◆

Note: This article is written in Word97, which allows me to include hyperlinks. When this newsletter is published to our Web site http://canx.com/tpcug/, you can download the .PDF file and read it in color on your own computer, if you have the free Adobe Acrobat reader on your PC. If not, there are instructions on how and where to get it on the Web site where the newsletter articles are listed. You really get the full effect of all the hard work William puts into each newsletter by reading it with Acrobat. While reading it on your own PC, if you click on the hyperlinks while on-line to the Internet, you will be automatically transported to the Web site referenced in the article. It can't get any easier than that. Ain't computing GREAT!

(Comments.....Continued from page 3)
as he does from resizing my partitions every so often when I get bored.



Anyway, I installed the new version of *PartitionMagic*, didn't bother to read the instructions and created three primary FAT partitions. Unfortunately two of them turned out to be Hidden Partitions. What had I done wrong? It had been over a year since I had partitioned a hard drive, and I had forgotten that you are allowed only one active (visible) primary partition--as a reading of the *PartitionMagic* manual would have disclosed. Back to the drawing boards. I removed the two extra primary partitions. That left me with one primary FAT partition of 2.1 MB. I then created an extended partition using all the remaining disk space. Inside that extended partition, I created two logical partitions of sizes 2.1 GB and .9 GB. By the way, *PartitionMagic* automatically formats the partitions when you create them. I was finished

There was, however, one surprise left. I had forgotten how DOS names your hard drives. Before I installed the new drive I had logical drives C & D on the original Drive, and my CD-ROM drive was E and the ZIP drive was M. After installing the additional drive, I had C and E on the original drive and D, F, and G on the new drive; the CD drive was now H, and the Zip was still M. A graphical description of this is at the bottom of the column. Luckily the *PartitionMagic* CD has a program called, I believe, *Drive Mapper* which goes through all your INI files and the Windows 95 registry looking for all instances of old drive letters and makes the appropriate changes. For example, I had it map old drive E to new drive H for my CD. I didn't have it map the old D drive to the new drive E, since, everything there being data, I just moved it to the new drive D. I have had to install only two programs that couldn't adjust to the change. *Drive Mapper* apparently correctly changed the drive information for the rest of my programs.

I recommend *PartitonMagic* as an easy way of accomplishing the above since it provides a graphical interface for the process.

(Comments.....Continued on page 9)

Drive configuration before and after adding a new hard drive

(Family Tree.....Continued from page 4)
cal histories of individuals. You may import data from or export data to other genealogical programs as a GEDCOM. And, as with any database, you have your reports.

For an individual, these reports may take the form of:

- Ancestor and Descendant trees in twelve styles, including fan trees, with your choice of contents and size
- Outline Descendant Tree
- Genealogy reports, such as Register, NGS Quarterly, and Ahnentafel, automatically create narrative family histories, complete with names, dates, notes, sources, and more
- Kinship Reports showing how individuals in your file are related
- Family Group Sheets and individual fact sheets
- Book
- Multimedia Scrapbook images

You may also print out a calendar with the important dates for all the individuals in your database noted on the calendar . I didn't find the Book feature of much use, since the items you may add to it were very limited, as best I could tell. I do use the outline Descendant Tree quite often when I want to send someone a brief sketch of a particular line I am interested in to see if they might have information of interest. An abbreviated example of such a report is as follows

Descendants of Thomas Blount, Jr.

1 Thomas Blount, Jr. 1687 - 1729 b: 1687 in Perquimans Precinct, Albermarle Co., N. C. d: 1729
.... +Anne Elizabeth Reading
..... 2 John Blount Abt. 1715 - Abt. 1765 b: Abt. 1715 in Beaufort Precinct, Bath Co., N. C. d: Abt. 1765 in Beaufort Precinct, Bath. Co., N. C.
..... +Martha Lewis
..... 3 Jacob Blount Abt. 1740 - b: Abt. 1740 in Beaufort County, North Carolina
..... +Martha
..... 4 James Blount Abt. 1760 - b: Abt. 1760 in Beaufort County, North Carolina
..... +Martha Radford Spears
..... 5 John Churchill Golding Readding Blount 1791 - 1879 b: March 12, 1791 in Auusta, Georgia d: February 22, 1879 Bartow, Florida
..... +Elizabeth Varn 1796 - 1861 b: April 22, 1796 in Beaufort District, South Carolina d: October 12, 1861 Tampa, Florida

Of course, you may maintain more than one family tree database. You could, for example, have separate ones for your wife's ancestors and your ancestors.

In my opinion, the WWW is revolutionizing how genealogy is done. As individuals research their family history, many are posting that information to the WWW, either to personal Web sites, other genealogical sites, or to the Family Tree Maker site.

As an example of the free online search of the Family Finder Index, here is a small selection of the information returned on my surname, LaMartin.

The Robert Lamartin listed is my father, and the listing comes from the Social Security records of individuals who died between 1936 and 1995. If I either buy this CD from Family Tree Maker (they have loads of genealogically related CDs for sale, having bought the Family Archive CDs several years back and continuing to add to their collection) or go to our local public library and view it, I will find the following information about my father.

Name	Est.Date Location	Archive Type
Lamartin, John	1775-1782 U.S.	Revolutionary War
Lamartin, Kirk David	Private Private	World Family Tree
Lamartin, Lois	Private Private	World Family Tree
Lamartin, Margt	1870 Massachusetts	Census CD 284
Lamartin, Marjorie	1937-1995 U.S.	Social Security
La Martin, Mary	b1810-1819 France	World Family Tree
Lamartin, Mary	1860 MA	Census CD 318
Lamartin, Neil Stuart	Private Private	World Family Tree
Lamartin, Rebecca Ann	Private Private	World Family Tree
Lamartin, Robert	1937-1995 U.S.	Social Security
Lamartin, Shelley Marie	Private Private	World Family Tree
Lamartin, Sofia Elisa	Private Private	World Family Tree
Lamartina, Alice	1937-1995 U.S.	Social Security

- The individual's name and Soundex code
- Dates of birth and death
- Social Security number and state where it was issued
- State of residence at death
- ZIP CODE of last known residence and the primary location it is associated with (77% of the time)
- ZIP CODE of the address where the death benefit payment was sent and the primary location associated with it (15% of the time)

With Family Tree Maker 3.4 or later, for free you can go online and create your own Web page at the Family Tree Maker site. It can include text, up to five reports from your Family Tree Maker file and, with Family Tree Maker 4.0, a box-style InterneTree™ using Java technology. Others will, then, have the ability to search the Family Tree Maker site using the Internet Family Finder for surnames that interest them. If such a surname is on your home page—or any other place on the Internet that has been indexed by the Internet Family Finder— it will be found, and the interested individual may then contact you or anyone else who has placed that information there.

Of course, as with all genealogy, the information you find at such sites may be incorrect and totally misleading. The computer with the Internet gives us a powerful tool in our quest for information about our ancestors. It allows us to easily

(Family Tree.....Continued on page 12)

(Comments.....Continued from page 7)

Lost Hardware

This past month I have turned on my computer and found on three different occasions that

- My microphone produced no sound
- My Zip drive was missing
- My scanner was missing

The first thing one should do on such an occasion is not panic. Stop and think and consider your options. In reading messages in the Usenet Newsgroups, I notice that people quite often reinstall Windows when they have the slightest problem. I don't recommend that—or the more extreme method of re-formatting your hard drive and reinstalling everything—until you have exhausted other less destructive solutions.

Quite often when it is a hardware problem you either have an IRQ or address conflict with another hardware item. Windows 95 makes it fairly easy to check that out, which you do by going to Control Panel | System | Device Manager and looking at the properties of the particular—your sound card, for example. My problems were not conflicts, though.

When I noticed the microphone didn't work, my first thought was a bad connection, then a bad microphone. Checking to see if it was plugged in and then trying a different microphone didn't help. Checking that it was not muted and the volume level was not zero in the multimedia volume control program did not help. Win 95 also said that the sound card was functioning properly—and it was for output—just not microphone input. The solution that worked was to, from the Device Manager, remove all mention of the sound card, reboot and let Windows find the sound card again. It worked.

In the past, occasionally I had noted that my Zip drive would not be listed in My Computer or Windows Explorer. A simple reboot of the computer always brought it back. This time, however, nothing produced any mention of the Zip drive. Again I checked all connections; everything was tight. Using the utility Tweak UI, I checked that I hadn't mistakenly set the Zip Drive not to show. There was no listing of the Zip in Tweak UI; it couldn't find it either. So it really was not there. I got out my Zip installation disk and reinstalled it. It was back, and has functioned perfectly for the past week.

Several days after missing my Zip drive, I tried to scan in a document for OCR using *TextBridge Pro* and the program went into suspension (an hourglass forever). It apparently got confused when trying to find my scanner, since I discovered that, when trying to run my scanning software, I would get the message that I had no scanner installed. I checked the Win 95 Device Manager. It listed my scanner and said that it was functioning properly—apparently Win 95 does not yet know everything. Again, the obvious solution was to remove the device from Win 95 and reinstall.

Before doing this, though, I had an idea. Even though my Zip drive uses a parallel interface, it installs a SCSI controller. Could this controller be conflicting with the SCSI controller for my HP scanner? To check this idea, I removed the Zip drive from the Windows setup, unplugged the Zip drive, and rebooted. Still no scanner. So much for that idea. I then reinstalled my Zip drive, removed the scanner from the Device

(Minutes.....Continued from page 2)

search & Trading, Inc. brought Indigo Investment Software, a very impressive investment trading system. With over four pages of notes, it would be very hard to organize and trim them enough to be able to do the program justice here. Here are just some high points: The program is written for the non-technical person who wishes to maintain his/her own investment portfolio. With a subscription to a daily data service (about $25 per month), the system tracks your stocks and tells you when to place buy or sell orders. It does this by looking at the market activity of your stocks based on the model you select (from the many available). The buy/sell orders are for the daily opening price. Some of the methods/models used include The Prior Year's Best, Growth "Relative Strength", Mutual Fund Timing, and Momentum Swing (MSX).

You determine the investment size and the program uses this information to determine the number of shares to buy or sell. Joe gave us quite a few examples of the program at work. He explained that in a 10 stock portfolio the "program" will "own" no more than about eight stocks normally. If the market should go that way, it will even tell you when to sell all stocks (100% to cash). If you have 150 MB of disk space available, then you have enough disk space to last until the year 2020. It tracks about 850 stocks, and you may add others. For the price of a year's worth of commissions (depending upon your investment/activity) you can own this software package (selling price $2495), with annual updates. The purchase price may even be tax deductible. Joe very generously offered the group a 20% discount ($1995) and even offered a payment plan! ($1000 down plus five months @ $200). Joe Roediger may be reached at (800) 315-5635 or (941) 918-8068.

The door prizes followed a short break. Brian Lance won a Space Adventure Game. Connie Kincaid won Work Safe Office, Clark Evans an Adobe cap. Finally, Ed Snow won a Tek Systems coffee mug.

Next Month, look for Corel. ◆

(President.....Continued from page 1)

BLUE - is written entirely by members of the club. For many years, the previous editors had chosen to reprint articles from other clubs' newsletters when needed to make up a complete publication, but that hasn't happened for some time because our editor has managed to wheedle articles from TPCUG members pretty successfully. But I have to hand it to William, it's a tough job.

We really need more members to write about their experiences and knowledge. Wouldn't it be great if William actually had a backlog of articles waiting to be published. I know that absolutely every member has *something* he can write about. For instance, we have not had a "beginners" level article for … maybe never, I'm not sure. If you'll look at the past year's - or more - articles you'll find that almost all of them have been written by the same six or so people. If every member wrote just one article a year, it'd be a bonanza! Think about it and crank something out. Find a volunteer to edit it if you're not sure of your writing skills. Your club needs your help.

As a reminder, the board meeting is open to all members. We meet at Reflectone at 6:00PM on the Thursday prior to the Wednesday meeting. ALL MEMBERS ARE WELCOME and NEEDED. If you think you can serve in some capacity during the following year, come to the meeting and participate, and maybe scope out your next job, or just help out. Contact Mike Hodges first to get on the security list.

BE SURE TO COME TO THE COREL PRESENTATION !! IT'S ALWAYS THE BEST OF THE YEAR!

Thanks, and I'll see you at the next - Corel - meeting
Merle ◆

April in Tampa

A Monthly Publication of the Tampa PC Users Group, Inc.

Vol. 11 No. 4 April 1998

Meeting

MGI Photo Suite and MGI VideoWave Presentation
April 8, 1998
6:00 PM
Museum of Science and Industry

Meeting Preview: At the April meeting you will see two products from MGI Software, MGI PhotoSuite and MGI VideoWave, which give you unlimited options when it comes to your photos and videos. MGI PhotoSuite is a complete PC photography solution. It's allows you to edit and organize your photos while giving you creative freedom. And with MGI VideoWave, you can now capture, edit, and produce your own videos on your PC.

Dick Kellerman will be the guest speaker representing MGI Software. He has worked with user groups for over 14 years. Dick is an informative and entertaining presenter. You will come away from this meeting with a much better understanding of photo editing, cataloging & transforming your photos! Dick promised to bring informative handouts for all, door prizes, and a special user group price for those wishing to purchase any MGI products at the meeting.

President's Message

By Merle Nicholson

This month, I'd like to mention once again the need for all club members to participate in some way. There are opportunities limited only by imagination. Here aresome ideas: Serve on the board, write newsletter articles, call vendors for donations, telephone past members and re-invite them to meetings. Hand out our club flyers. Do personal invitations to club meetings. Encourage other members to do the same. I'm sure there's more. The board of directors and the people writing articles are very small groups that especially need new blood. Ask any board member how to get started on the activity that appeals to you most, and if you're not satisfied with the answer, persist.

I have written two beginners' articles, last month and this, and I'd like US to continue to do more. It would be just wonderful to have some beginners' articles written by beginners. If you're concerned that you'll miss on something techni-

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members. Our mailing address is P. O. Box 3492, Tampa, FL 33601-3492.

However, for business concerning this newsletter, Bits of Blue, please contact the Editor, William LaMartin, at 821 S. Boulevard, Tampa, FL 33606-2904; 813-251-3817; lamartin@ix.netcom.com.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII, Microsoft Write, Microsoft Word, or Word Perfect file to the editor at 821 South Blvd., Tampa, Florida 33606-2904 or to lamartin@ix.netcom.com.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

The use of trademarked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

(President.....Continued from page 1)

cal, someone can edit it or make suggestions for you. Send articles by e-mail to lamartin@ix.netcom.com or call William or myself. All our telephone numbers and e-mail addresses are elsewhere on the page. Thanks, and I'll see you at the meeting on April 8th.

Minutes of the March 11 Meeting

By Merle Nicholson for Secretary, Kevan Sheridan

The meeting started with a demo on the web site, followed by a talk on surge protectors. The Door prize drawing was held following the break.

The meeting was opened by President Merle Nicholson at about 6:30. After announcements and officer introductions, our Newsletter editor William LaMartin gave a live demo of the virtual reality world that is posted on the TPCUG club web site. William created a model of the lobby portion of MOSI as a demo of Corel Web.World, the virtual reality component of Corel WebMaster.

Melanie Arsenault of Kinematics Corporation gave a good overview of what is necessary to protect your home from power surges. They advise the installation of a general household protector at the breaker panel, heavy-duty surge protectors on all electronic appliances, protectors to suppress surges coming in on the telephone lines and even the cable TV.

Two very important points Melanie stressed were that you can't accomplish anything with a $14 power strip. You have to look at the specifications, and to look at the warranty. If the warranty offers to replace the power strip in case of damage, and not the protected device, you've not accomplished anything.

Kinematics offers a free home survey and estimates. A very complete installation protects everything including pool pumps and garage door operators (an often forgotten item). They're located in Masaryktown. For a free estimate, call 800-393-6966. Thanks to Melanie for an informative talk.

After the break, the door prize drawing was held. Ted Rodenbach won a printer stand, David Clary a printer stand. Frank Reguero won a mouse pad, Merle Nicholson a copy of Helicops, and finally David Clary won a MicroFiche unit that he donated to MOSI. Thanks to Bruce Register for donating the stands and the Fiche unit. ◆

Road Runner Cable Modem - Part 1

by Merle Nicholson, President,
Tampa PC Users Group

I finally got the telephone call I've been waiting months for from Road Runner saying they're ready in my area. They asked if I'd be willing to serve as a beta tester and could they install next Tuesday? You bet they could. That day was just three days ago as I write this. So my experience is limited, and I'll be following up with more next month as I gain experience. But I've learned a lot of details about what it is–and is not–that I'd like to share.

First a little background in case you've not heard about it at all. The Time Warner Cable Company wants to be your Internet service provider, and they want to bring the connection into your house along with the TV signal at an extraordinary speed far exceeding anything a dial-up modem will do. The cost to the customer is just $40 a month for an existing cable subscriber. The normal installation cost is $100 a month but just $50 for members of our club.

The data signal comes in on your TV cable. The catch is that the strength of the signal must meet some standards that are not necessarily required by your TV sets. Mine did not, and when that's the case they beef up what is necessary to bring it to cable modem standards. So they schedule a TV installer at the same time as the cable modem/software installer. If for instance the signal strength at the pole outside is good, and by the time it reaches your TV set it's not good, they'll run a new cable in. Your TV may not care too much, but the modem will. A friend of mine a mile south of me is getting one too, and they ran a new cable in just for the cable modem because the existing interior cable just was too old. In my case, Time-Warner brought in a new cable for me five years ago to service a bedroom and my computer room. So I had a TV and VCR in one room on a good cable. He did replace the splitter and short jumper cables to the outlets to improve that part, and then replaced a cable that ran around the room. He wasn't happy with my 25 feet store-bought variety. He said his was much better quality. All this is included in the cost.

He wasn't at all happy with the signal strength after he was done, but the problem was on their end at the pole, and they scheduled repair people to come out and do that the same day. That was done, and in the process improved the quality of one TV set that was a bit snowy on some channels.

The cable is plugged into a box that looks like a 1985 model 2400-baud modem. It's big, about 7x3x11 inches. It has a power cube about the size of my regular modem. Fortunately the cube uses a power cord, so it doesn't eat up a power strip. He installs a Network Interface Card (NIC) in the computer - a nice little 3-com 10 PCI Ethernet card. There's a short standard network cable patching between the modem and the PC.

I just found out today from Michael Solomon of TWC that the modem doesn't like being turned off more than two hours, so he asked me to plug it into something always turned on. They're monitoring the data rate and lot of other performance things remotely to make sure my service stays good. They can tell if my modem is misbehaving. It was, so he called me and I reset it for him while he was monitoring.

I already have browser and e-mail software. The only thing to do is install the software support for the NIC, configure that to use TCP/IP and install the Road Runner login software. Then set Internet Explorer and Outlook Express to use the Road Runner proxy servers. All this Ty Abrahams of Groupware International did for me while he was at my house. This part went pretty smoothly considering that I'm running a local-area network in my house and the two NICs–his and mine didn't want to coexist. So I disabled my network and plugged the modem in my own NIC just to make sure everything was working. I've since restored my LAN, and everything is running perfectly.

Fortunately I had already gone to IE4.0, which handles multiple e-mail accounts. So I'm continuing to access my GTE e-mail account through Road Runner. I'll start notifying all my e-mail buds of my new address–merlenic@tampabay.rr.com, for the next month, and I'll be ready to drop the GTE account.

The Road Runner software is just to log onto the system as far as I can tell. It comes on one diskette, and during the installation it connected for the first time and did a very fast download of some software, and Ty very quickly stopped the download as it began downloading Internet Explorer 4.0. All this leaves you with one small login program to run on startup called Login, with a picture of the Warner Brothers' Road Runner on it. When you run the login program, a very simple panel comes up with a place to type the login name and password and press the Login button.

Now the silly stuff. As it logs on, it plays that Road Runner sound thing that cartoon Road Runners make and then runs Internet explorer for you. The sound was funny once or twice, but after that I wanted it to go away. And I just don't want IE to launch. Usually I do e-mail first, but most of the time I just want to connect, and do nothing until I'm ready. Ty said that the login really just wants to run *something* and it doesn't matter what. And it's configurable. The other annoying thing is that it doesn't save the password. It has to be typed in every time. Jeez. I guess in the overall scheme of things, say, compared to weapons inspections in Iraq, it's not important. But Jeez … guys! Obviously I'm not the only person who thinks this way because there's a freeware program called *QuickRR* that fixes all that. The annoying beep-beep gets replaced by a .wav file that plays … silence. And the program that gets run does … nothing. And it remembers my password! And then the login program goes away completely.

(Road Runner.....Continued on page 5)

Software Junkie

By Larry Anders, Librarian,
Tampa PC Users Group

For all of you who do not know me personally, this article this month is my 'coming out-of-the-closet' article. ***"I am a software junkie."*** There! I've said it. I have been a member of software-aholics anonymous (SAA) for several years, but if anything, I am worse now than ever before. One of the reasons I became the TPCUG Librarian years ago was to help me through the hard times when I just had to have a software program. I figured if I was the person in charge of the library of files, then anytime I needed a fix I could just go to the tray of diskettes and fondle all the software I could get my hands on. But instead of making things better it actually made things worse.

Originally, just having to pay the absurd costs of software off the shelf in that fancy shrink-wrap was deterrent enough, but when you become a junkie you find ways to get your hands on that next fix. I found that one of the easiest ways to get really good commercial software was to start writing software reviews for *Bits of Blue,* our users group newsletter. I'll never forget the rush I got from that first major software package I reviewed, (Lotus for Windows). And the fact that it was free made the high even greater. But there are just so many vendors that are willing to feed my addiction, at least with enough good software so that I wouldn't be looking for more software before the next newsletter was published. After all, I would never consider reviewing someone else's software. I'm not that low!

Then I discovered Shareware. WOW! That's like shopping with a credit card you never have to pay, or at least not as often as with store-bought software. I mean, I could get my fix, decide I didn't like, and not have to pay for it. Although I will admit that quite a few packages have caught my eye and I did the right thing and registered the Shareware. I mean, I'm not a low-life software junkie. Give me some credit! But even the Shareware buzz couldn't always satisfy me. The highest high I can experience is finding good FREEWARE. Think about it! Great software utilities that you can actually use but you don't have to pay for, ever!

Obviously, the hardest thing about Freeware is finding it. Right? Wrong! My friends *at PC World Magazine* have just published their 3rd annual "Best Free Stuff Online" issue for April 1998. The magazine is loaded with great Freeware/ Shareware reviews and worldwide web addresses so you can download these treasures immediately. Along with the software they also give you tips for smart downloading and explain exactly how to "try before you buy" Shareware.

There really is good software out there that you don't have to pay an arm and a leg for, written by people, like you and me, who don't have the major dollars to market their products. The Shareware concept exists to help these people inform the world about their software. Support these people every chance you get so that this form of marketing remains a viable resource for them and us. Enough commentary. . . . back to the FREE stuff.

This year PC World Magazine offers:

- Best Free Windows Utilities
- Best Freeware and Shareware Apps
- Best Free Software Sites
- Best Free Browser Plug-ins
- Best Free Web Services
- Best Places to Find Drivers
- Best Graphics and Sound Tools
- Best Free Financial Information
- Best Free Government Sites (Oxymoron?)
- Best Ways to Personalize Your PC
- Best Free Gaming Sites

An example of some of the Free stuff listed is a program called Screen Loupe, which allows you to get a close-up view of any part of your screen you choose. You can also save that portion of the screen you've magnified to the clipboard to print out later, etc. Speaking about clipboard, there is also a program called Yankee Clipper that adds a very useful feature to Windows that should have been included. It saves up to 50 Clipboard text-only images, like boilerplate text that you continually retype, such as your return address, for later retrieval.

One of the most popular e-mail programs is listed, Eudora Light, that has many of the features of the big boys, such as strong message filtering, a find function, and encryption to keep those messages private. If you're into building web sites, it lists a web site called MetaBuilder that has a whole bunch of free tools and utilities that you can use to 'spiff-up' that new web site of yours.

Another interesting site listed is called "Nonags", which lists an impressive library of Shareware and Freeware software

(Junkie.....Continued on page 9)

(Road Runner.....Continued from page 3)

Now to the last thing. Accounts. They pick one for you. It's made up of your first initial, some of your last name and one number, limited to 8 characters. So mine is … well you don't need to know, because I'm not using it. You **do** need to log on under that "primary" account to go to the customer Account management on their web site. There you can create four more accounts, login and e-mail. Make up your own. This is good. I did have problems getting into the account management– failed, no access rights, so I sent e-mail, and then called next day. But it took until late that night to resolve it. I sent the help desk e-mail describing the problem again and to my surprise, about 11 PM I got mail back with a setting in my browser to try. It worked. The help desk is open from 8AM to midnight. Very good.

Have I mentioned that it's FAST ?? How about a 1.6MB download in about 8 seconds? It's **F.A.S.T**.

More next month. ◆

Internet picture of the month

MIR live broadcast

This is a screen capture of NASA Astronaut Andy Thomas (on Mir) from a live March 23 Webcast interview with Alan Alda (on Earth).

Please excuse the poor quality of the photo, but for those who have viewed them on a regular modem, this quality of Real Video images is nothing new. This one was a little worse than usual. But it is historic, I think.

Mixman Studio

By Brian Lance, Tampa PC Users Group

First of all, I would like to mention that if you are looking for a sequencer or MIDI-compatible program, this is not it. What it does is allow *anyone* to create music using a unique interface to mix supplied tracks (.TRK) live and save a mix (.MIX) to a standard wave file (.WAV).

Minimum requirements listed:

Windows 95
Pentium (MMX for optimal performance)
16MB RAM
5MB HD space (100MB preferred)
CD-ROM
16-bit DirectX-compatible soundcard

I would add that you will need DirectX 5 or later, and MMX is required for pitch-shifting.
On the other hand, the quality of output (.WAV) is not related to the performance of your machine. You always get CD-standard output.

Setup was easy. I took the full install, so the total was 103MB with all mixes and tracks. After perusing the manual, I opened the Demo Mix. My first mix took only 10 minutes, and most of that was messing with settings. I mixed once and then recorded it to a .WAV. A 93 second mix resulted in a 16,170KB file. This is not surprising - CD-quality sound is 16-bit PCM stereo at 44,100Mhz; or 172kb/sec. So you could burn this right onto a CD! You can also import .WAV files or record directly into Mixman Studio. By comparison, my .MIX was 40KB, only having the track, timing and other information. The tracks used were 1.61MB.

I used Windows 95's Sound Recorder (SNDREC32) to convert the resultant .WAV. SNDREC32 will convert to different formats and do simple editing. Try this: right-click on a .WAV, select Properties and go to the Preview tab. This is quicker for previewing a large .WAV, versus actually loading it into SNDREC32.

At 22050Mhz, 8bit PCM stereo, 4043KB, there was no appreciable change in music quality (low-end Labtec speakers). At 8000Mhz, 8bit PCM stereo, 1467KB, the quality suffered: Cymbal crashes weren't crisp, bass was dull, and there were small amounts of noise.

Under ADPCM format, music is uneditable (not Mixman's fault!). Changed to ADPCM 22050, 4bit Stereo, eighth the size (2046KB). With my speakers, this was indistinguishable from the original.

There are also much better sound editors on the market, and better converters. One I have used is *GoldWave:* http://www.goldwave.com/

Items that would be nice to add in a later release are:

- Track names by each mixing 'turntable', over the (very nice) graphics.
- The ability to copy settings to a text file, like track modifications.
- Concatenation of two or more mixes.

One small problem I had with displaying dialogs was easily solved by looking online at their Product Q & A. I believe they are going to put tracks online for downloading, but they are not online yet.

Overall, Mixman Studio has a decent interface, and the help manual has a comprehensive tutorial. On-screen help is a nice touch with overlays.

Like the material mentions, you can mix live, create a tape, a CD, add it to a multimedia presentation, wherever you need music.

Online: http://www.mixman.com/

- Technical support through Q&A and Email. Registering gets you a CD of tracks.
- Description: http://www.mixman.com/studio.html .
- Make sure to stop by the links page!
- Demos of the original Mixman (Win 3.11/95) and reviews.

Available soon: Mixman Soundiscs. Files in various styles: Gospel, Funk (George Clinton), Hip-hop, etc. in .TRK, .WAV and stereo audio files.

Ordering: 1-888-4MIXMAN (1-888-464-9626). ◆

How Many EXE Files Do You Have?

By Tom Cone, Tampa PC Users Group

One thing that's kept me interested in personal computing is the seemingly never-ending potential it offers for doing tedious chores quickly and easily. Basically, I guess I'm pretty lazy. If there's something the PC can do faster and more accurately than I can do by hand, I'll spend some time and effort to "make it happen". I also enjoy the challenge of pushing the technology a bit, using the PC to solve problems on my own. This combination of personal "quirks" has led me to learn a little about programming, and to use that knowledge from time to time to solve an occasional "puzzle". Sometimes the investment in the puzzle's "solution" is greater than the value of the solution. In other cases, like the one I'm going to describe in this article, you can sometimes avoid "reinventing the wheel", by relying on advice from folks who share your interests, and are a step or two ahead of you on the PC "learning curve".

Recently I learned that our editor, William LaMartin, was embarked on a programming project using Visual BASIC. He was building a short program that would scan his entire hard drive and give him a count of the number of "EXE" files installed on the drive. This struck me as a problem ideally suited for a computerized solution. I liked the problem because I could understand it. At least I thought I did. What was needed was a way of opening every folder, scanning and counting any EXE files found therein, then closing the folder, and moving on to the next folder. If you repeated the cycle for every folder, you'd have an accurate tally of all EXE files on the drive.

So, I dropped William an email note and asked if he would mind sending me what he had developed so far. He quickly sent me the source code, and looking it over I began to see how he was approaching the problem. Although I don't know Visual BASIC, it began to look like there were several tricky little "details" that had to be solved in order to come up with a correct solution. First, you needed a reliable way of figuring out where all the folders were located on the hard drive. As you know, folders (directories) can hold folders (subdirectories), which can hold folders (sub-subdirectories) which have folders (sub-sub-subdirectories) inside, also. How can you be sure you've scanned each and every folder on the hard drive? I began to see that this "riddle" could be trickier than I had imagined.

Next, you need a way to scan the file directory within each folder, one entry at a time, and test whether an entry meets the search criteria, or not, e.g. look at the first filename, is it an EXE file? If so, count it, if not, skip it and go to the next one, and so one.

This task seemed to be working well for William, but he told me that he wasn't all that happy with how he had figured out how to find all the folders on the hard drive. Using specific Visual BASIC commands he built a list of "level one" folders, each of which would then be opened and scanned. He then opened the level one folders and built a list any sub-folders found therein. These became "level two" folders, which were processed similarly, and so on. He counted seven levels "deep" noting that eight levels of sub-folders provided no additional hits.

I began to think of ways to solve the problem using a different programming language, Visual dBASE and quickly ran into the same difficulty as had William. The program must tell the computer which folders to open and scan, but the number and location of folders is unknown to the programmer when the program begins to run. I began to work on a solution which opened the root directory, built a list of all "primary" folders located there, and then processed them in series. As each primary folder is opened and scanned, a new list of sub-folders located within, if any, is built. These would then be processed one at a time, in series. I wanted to process all the folders in a single "root" stemming from the root directory. When a "stem" in the root directory had been carried to its logical extreme, I would eventually open a folder and find zero folders within it. I would know that all folders in that particular branch of the directory "tree" would have been checked, regardless of how many sub-folder levels might exist. If I repeated the process for all "stems" in the root directory, I would have covered, comprehensively, all folders on the hard drive.

Doing this proved very, very difficult. If a folder could only hold one sub-folder the problem would be soluble, at least by me. However, since multiple subdirectories can exist anywhere along the "stem", I began to flounder. My "directory" tree resembled an ancestral family tree so much that I began to wonder if I hadn't stumbled into a "genealogical" quagmire, and almost called Jenny Lind, our Geneology SIG Leader, to see if she had any suggestions for me!

Instead, I asked myself what William would do? I got on the Internet and asked for help. This was done by posting an email message in a VisualDBASE newsgroup. Within the space of several hours I received a really great suggestion. Why not look "outside the box" and take advantage of services available from the operating system? Huh? Well, it turns out that the lowly DOS "DIR" command, in its Windows 95 incarnation, contains a lot of power that I'd not been using.

We've all gone to the command line, typed "DIR" and pressed the ENTER key to see a list of files in the current directory, right? Some of us know that if you add "/p" after the command, the display will pause instead of scrolling quickly through and off the top of your screen. Remember, also, that you can limit the display to files which match a particular pattern. "DIR *.EXE", for example, will list only files that have the letters "EXE" in their extension.

(Exe.....Continued on page 10)

Florida Association of Computer User Groups Meeting in Orlando

By Don Patzsch, Tampa PC Users Group

At the FACUG meeting in Orlando on March 13, the first vendor was Adobe. They gave each person present a shrink wrapped copy of PageMill version 3.0. The girl who demonstrated PageMill ver 3.0 and PhotoDeluxe really did a beautiful job. She had her talk down perfectly, with no hems or haws and she knew how to use her computer to advantage in showing us these programs. I give her an A+, and the programs are A+ also. Another thing regarding Adobe. They have a Reader on their Internet site which is free. You should look at it. A copy was given to us. (This is not Adobe Acrobat, that's another program.)

Saturday morning JASC software told us about their Paint Shop Pro 5 and other software on their web site. Some of the software is shareware. Paint Shop Pro 5 is their easy-to-use graphics editor. It features complete layer support, picture tube brushes, CMYK separations, and pressure sensitive tablet support. The demo was very good. I ordered a copy for my own personal use. It is about $50. http://www.jasc.com .

Then there were sessions on making money for your group, publicity and public relations, and user group newsletters. Following that, sessions on user group home pages, SIGs, and using volunteers. In each session, you learned from the folks from all the groups. It would be difficult to place all the notes we took in this short review of the meetings.

Saturday noon, Alps Electric presented a talk on their new printer.

Then a session with all the vendors up at the front of the room so we could pester them with silly questions and requests of all kinds. This is where you meet all the vendors and you get to ask them how to get them to come to your meetings and what they want from you.

At 6 P.M., Microsoft representatives gave us a talk on some of their products.

About 9:30 P.M. Micrografx gave us a talk on some of their products. This girl was very good, she kept the demo down to earth. They sell Webtricity, which gives you easy animations and 3D graphics. Great! Also, Windows Draw 6, a general purpose drawing, diagramming, and publishing program. You can output HTML without knowing any code. Micrographx gave us all a CD ROM of Picture Publisher.

Sunday morning, there were group sessions on running a user group, building membership, and obtaining grants.

We attended Joan Dineen's session on how to obtain grants. She does a great job of telling us how their Women's PC User Group received a grant of $10,000 cash for them to buy an InFocus Projector for their group. Several members present told how they obtained grants, some for large sums of money. This is always a very interesting session. I recall about three or four years back, Roger Meissner of the Sun City Center group chaired this group session and told us how they received their grant of $10,000 to buy a projector for their group. They got their money in three batches of $3,333 each year for three years. Sun City Center has probably been the most active in applications and receipt of grant monies. Since Roger Meissner's session, for the last two or three years or so Joan Dineen has chaired this panel discussion. By the way, the Tampa Bay Computer Society has applied for a grant to give their group a projector also.

Following this session, were others: The Internet as a User Group Facility, New Member Orientation, and Meeting Presentations and Programs.

Cybermedia was to present the talk and demo at Sunday's noon session. The presenter was ill and could not make it, so Gene Barlow talked about PowerQuest's programs, Partition Magic, Drive Copy, and the New Drive Image, version 2.0. Gene has been at most of the sessions since it started in maybe 1989. I don't remember when Gary Schweinshaupt started this gathering of the User Groups, but it was about eight years ago. I have attended all the meetings each year except one in the Space Coast group's area a year or two ago.

Also to share the lunch time, we were given a talk on Real Help, and other programs by Quarterdeck. At the end of his talk, we were each given a copy of RealHelp.

After lunch on Sunday the vendors set up displays of their products and we all walked around to see and talk for an hour or two. Corel gave us a CD ROM of CorelDraw 8. It is good for only 30 days but will give us time to look it over. Lotus gave out a copy of SmartSuite 97 on CD ROM. Then, many prizes were given away by calling our ticket numbers out. Everyone got at least one prize, some were very expensive shrink wrapped software. Then back to the car to drive home. ◆

FACUG

Beginners' Column

By Merle Nicholson, President,
Tampa PC Users Group

Do you know how to "run" a program? Lets say, for instance, you are on the Internet and download a program, maybe the Adobe Acrobat Reader from the link on the club web site. You're asked to "Open" it or "Save this program to disk". If you (rightly) select "Save to disk", it brings up a Directory box, and you press Open. What do you do with it after you have it? If you can't answer that question, read on. We have the right stuff here for you - I hope.

Let's start with a quick tutorial on file names. A good example of a file will be C:\Downloads\ar32e301.exe. The C: part of the name is the *drive letter*, the \Downloads\ part is the *Path*, the *ar32e301* is the name and *.exe* is called the *extension,* or in Windows terminology, the *file type.* The *extension* is what I really need to tell you about. The file type for the extension part "*.exe"* is *program* or *application*. The terms *program* and *application* are somewhat interchangeable. In a strict sense, a program can be a part of an *application*, because you can apply the term *application* to Microsoft Office, which is a suite of *programs*. But if you use Windows Explorer (you do, don't you?) and show Details (under view, details), look to the right of any file with *.exe* and in the *Type* column, it will say *Application*. While you're in Windows Explorer if you were to double-click (DON'T !) on an application, it will "run" the application. There are several ways to run an application and I'll get to that and what it means, but I'll continue first with Types and how Types relates to the *extension*.

In a broad sense, the file type - the three letters at the end following the dot - determines what the file is used for. We know that if you use Word and save a letter called MyLetter, Word will add the ".doc" extension to the name, and there's a very good reason for this. If you were to double-click on a document file with the name Myletter.doc, what happens? Microsoft Word starts up and loads the file automatically. That's because when you installed Word, the installation program registered the extension .doc in the System Registry as belonging to Word and from that time on, .doc "belongs" to word, just as .wpd belongs to Corel WordPerfect and .txt belongs to Notepad and .bmp belongs to Paint. You can misname a file easily to something that the operating system doesn't have an association for and mess things up. Let's say in Notepad you type some characters and then save-as and type in "Mystuff.bmp" for the name and you **really** enclose the name in quotes. The file gets saved as mystuff.bmp. If you didn't enclose it in quotes, Notepad would have saved it as *mystuff.bmp.txt* ! But you did and now we have a file that is most certainly not a graphic file. If you were to double-click on it, Paint will start and then error out and tell you that it cannot read the file mystuff.bmp. The lesson to be learned here is: **Always make sure that all files are saved with a three letter extension !** It was very common usage back in the DOS days to name a file MYBOSS.MEM (for a memo to my boss) or something like that. In windows you can't do that any longer. Actually you *can* do things like this, but it just complicates your life and doesn't accomplish anything.

What's all this leading to? Well the operating system has reserved many three-letter extensions for specific purposes, and *.exe* is reserved for an *application*. So if you were to double-click on it, or create a shortcut from it and double-click on that (again DON'T), Windows will know what to do with it, just as it does for Word or Paint. And this is a good place to break. We'll continue next month with running files. ◆

(Junkie.....Continued from page 4)

where none of the packages are hindered with reminders to register, disabled features, time bombs that shut down the software after a certain time, or any other tricks that limit the trial software.

I've only touched on a very few of the many, many free things that are referenced in April's issue of PC World. If you don't subscribe, you should. But, have no fear. There is another way to get all this free stuff. Go to ***http://www.pcworld.com*** and follow the links. But please be for-warned or you'll end up like me, hooked! This is an addictive site with addictive software. The kind people of PC World Online will even assist you in becoming a software junkie like me. If you will go to ***http://www.tipworld.com*** and fill out the form, they will send you an e-mail everyday with their choice of Shareware files of the day. How can a junkie ever hope to kick the habit when it's crammed down your throat, or rather your modem, for free?!

If I have opened any of your eyes enough to admit that you too may be a software junkie, maybe we could get together and form a SIG for software-aholics and share our sources. Just a thought! ◆

Special Interest Groups

Communications SIG

This SIG meets the first Monday of the month at 6 PM at the Reflectone Building. **Directions: Proceed west on Waters from N. Dale Mabry across the railroad tracks, about 1.5 miles; take second left on Savarese. Proceed on Savarese until you reach the Reflectone building. Use the north door.** You must sign up to get on the list and to get by security. *Contact Charles Howe: at 968-1207 or HOWE@INTNET NET*

Genealogy SIG

This SIG meets the second Monday of the month at 7:00 PM at the Museum of Science and Industry. *Contact Jenny Lind Olin at 960-5723 or Ford Bond at 987-6309 .*

(Exe.....Continued from page 7)

In the distant past I also remember that many DOS commands permit you to "redirect" output from the display screen to other devices, like the printer, or the hard disk. For instance, the command "DIR > C:\FILELIST.TXT", when executed from the command line, will scan the current directory, and instead of displaying the file list on screen, will "redirect" the file list to a DOS text file called "FILELIST.TXT" which will be written in your root directory on the C: drive. Try it yourself, but be warned, any earlier file by the same name (FILELIST.TXT) will be "overwritten" by the file created in this way by the DIR command.

This much was familiar to me, but its usefulness for the EXE file count problem was not apparent until the additional command line arguments "/S" and "/B" were shown to me.

The Command "DIR /S" will list all files in the current directory, and all files in any subdirectories found within it. If this were executed from the root directory it would display a list of all files on the hard drive, including those in any subdirectories, sub-subdirectories, and so on. The Command "DIR /B" will list data on each file "Briefly", excluding information like date created, date last modified, and so forth. All you get is the filename, including its DOS path.

If you go to the command line in the root directory and type the DOS command DIR C:*.EXE /S/B > C:\EXE.TXT , you create a DOS Text file called "EXE.TXT" in your root directory which contains a list of every single EXE file on your hard drive. Once this file is created, all my program has to do is open the list, count the number of lines, and display the answer

In VisualDBASE I did this by building a program which shuts itself down temporarily, runs the DOS DIR command with the necessary arguments to build a text file containing the EXE filenames, and then opens an array, reads the file list from the disk file one line at a time, each line going into a separate element in the array, and when the end of file is reached, I see how big my array is, and display the result. It would run a bit faster if I didn't build the array, and simply counted lines in the text file, but I wanted a more general solution which permits me to actually display the filenames on screen from within the program. This solves the problem comprehensively, but makes more experienced programmers shudder. My approach is "quick and dirty", lacking the elegance which solving my "folders within folders" dilemma without using the crutch of a temporary disk file would have meant. But it works, works quickly, and is accurate and thorough.

Naturally, I shared "my" approach with William, managing to create the impression, without actually lying about it, that I simply recalled these arcane command line arguments for the DOS DIR command from memory, instead of having them "fed" to me by more experienced programmers on the Internet!

But you've heard enough from me, he'll finish the story for himself.

William LaMartin's additional comments:

Using Tom's approach, here is what my program reduced to:

```
Private Sub Command1_Click()
Dim MyAppID

If Dir("C:\TEMP\EXE-2.TXT") <> "" Then Kill
"C:\TEMP\EXE.TXT"
MyAppID = Shell("C:\command.com /C DIR C:\*.EXE /S/B >
C:\TEMP\EXE.TXT", 1)    ' Run DOS DIR comand
start = Timer
Do While Timer - start < 40  'give time for the DOS program to
run
Loop
Open "C:\TEMP\EXE-2.TXT" For Input As #1
   Do Until EOF(1)
   Line Input #1, A$
   List1.AddItem A$
   Loop
Close
```

This is much shorter than my first attempt. There is one fly still left in the ointment, though. Notice the Timer loop that waits 40 seconds. That is to allow time for the DOS program to finish cataloguing all the EXE files before the VB program begins to display them. It would be more elegant to have the main program check to see when the DOS program has finished and then to display all the files that had been found. Unfortunately VB does not have the ability to do this. Thus, we need to step out of the box, as Tom calls it, and appeal to the Win 95 operating system with what are known as Win32API calls. This was beyond my current knowledge, but Tom pointed me to a site on the WWW that had such information. Modifying what I found there to fit my situation, I was able to create a program with code about twice as long as the one above which did the job elegantly with no need for the timer.

This is just one more example of how we members can help each other and the usefulness of the WWW. ◆

Meeting Preview: At the May meeting, Phil Humphrey and David Parsley of Waldec-IKON Technology Services will present Microsoft and Internet related products. In addition we will have several better than usual door prizes—the best being Microsoft Office 97 Professional donated by a member of our group.

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group

I think it has been a sufficient length of time since I last mentioned the word, so I will say it again—**NetMeeting.** If you don't have it, get it. I am talking about Microsoft NetMeeting, one of the programs in the large Internet Explorer 4.0 package. If you downloaded the small IE package, you didn't get it; however, it is also available as a separate download from Microsoft. The file is 2.09 MB and takes 58 seconds to download.....with a cable modem, according to Merle Nicholson.

For those not familiar with the program, NetMeeting is an Internet conferencing program which allows two people to use audio and video to communicate over an Internet connection. While they converse, they can transfer files, use a white board, display one computer's running program on the other computer's screen—even allowing the other individual to collaborate in using that program. More than two people can simultaneously use NetMeeting, but the audio and video are restricted to only two of the participants. The program is much better behaved now than in its first version, and it works surprisingly well with 28,800 modems. However, when you add video and sharing of programs the audio is sometimes degraded.

What prompts me to mention this is that my son, who is away at college and is about to graduate and take a job, and I recently had a NetMeeting which demon-

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

Member of Association of Personal Computer User Groups APCUG

Minutes of the April 8 Meeting

By Kevan Sheridan, Secretary, Tampa PC Users Group

Merle started the meeting at 6:15pm by welcoming everyone and introducing the officers. There were discussions about starting a Windows SIG possibly at HCC. Mary Sheridan passed around a sheet to see how much interest there might be in this. Merle announced the start of a 50/50 drawing at the meetings, separate from the software drawings. As always donations for the tickets are $1.00 each or 6 tickets for $5.00.

One of the members asked about information on electronic filing of taxes and using Tele-File. It was discussed and hopefully cleared up by the other members at the meeting.

Mary Sheridan announced how important it was for everyone to be involved and asked that some try to attend the board meetings.

At 6:30pm Dick Kellerman, a self-proclaimed User Group Evangelist, began his presentation. He was showing two programs by MGI software, Photo Suite and Video Wave. He explained that both programs needed a greater resolution than our projector provided and apologized that they wouldn't appear as good as possible. Photo Suite is a complete photograph manipulation program. It allows for touching up, resizing and photo album creation. You can make slide shows from various media, scanned pictures, captured pictures, digital cameras and photo disks. A free upgrade will be available for those who bought Photo Suite, and the upgraded program will include the ability to morph photos and use on the Internet.

The Video Wave program was for manipulation of videos. He couldn't demonstrate this program since it required a higher resolution than the 640 x 480 our projector produced. He offered a great price for the software purchased at the meeting.

The door prizes were MGI Suite won by Kevan Sheridan, Norton Utilities won by Jim Weber and Magic Cap won by Roger Waters. Roger also won the 50/50 drawing, so it was a good meeting for him. ◆

(Comments.....Continued from page 1)

strates how useful this program can be. While we spoke into our microphones and listened to our computer's speakers, just like with a regular phone conversation, he shared with me a listing on his computer of apartment rentals in a potential job city while I shared a Street Atlas USA map of that city from my computer with him. I could move around the apartment list on his computer and he could manipulate the map on mine. I was familiar with the city and could orient him by moving my

Windows 95 Enhancements

By Larry Anders, Librarian,
Tampa PC Users Group

As the June 25th release of Windows 98 draws nearer all of us that use Windows 95 hope that there will be some much needed additions to 98 that should have been included in 95 from the beginning.

I don't know about you but I have my desktop set up with several of the programs that I use continually so that I don't have to click Start, Programs and go looking every time I want to run a program. And I don't let Windows automatically arrange my icons for me. Well, at least I try not to. But every now and then Windows decides to hiccup, and all my icons end up left-justified on the desktop and all scrambled up. Boy, does that just burn me! Why isn't there a button somewhere that you can push when that happens to put it back like it was?

I use Windows Explorer all the time. So much in fact that it starts up automatically when I start up Windows. And I agree that 95's long file name feature has made it much easier to find files that have been saved for a while. But why can't you make notes alongside a file in case there's more info you need to remember than you want to include in a file name?

I get so tired of those clouds flying around when 95 takes forever to load. Why isn't there an easy way to change that opening screen to some cute picture or animation of my choice instead of what Bill Gates wants me to see?

Are you like me and wish there were more choices on the menus of the programs you use? Who decided that those choices were the only ones we wanted?

Have you ever deleted a file in DOS mode that you wish you hadn't and wonder why it couldn't have been sent to the recycle bin like in 95?

Ever load a new program, like a graphics program, that automatically changes an association to a particular type of graphics file that you would rather have loaded automatically by another program but was changed when the new program was loaded? Maybe we would like to have it load with a different program, or better yet load with the program of choice at the time we double click on it.

Have you ever wished the recently used menu was easier to get to and that you didn't have to use RegEdit to make changes to it?

Why doesn't 95 have a built-in utility that lets me swap around keys on my keyboard, especially the ones I keep hitting in error?

Ever had so many programs running that your task bar was so full you couldn't make out which program was which and you decide you need to load one more program from your desktop, but don't feel like minimizing all the programs to get to your desktop?

Better yet, why couldn't there be one button to push to clear off all the garbage from the screen and get to a clean desktop? But, if I wanted to go back to the garbage screen, it would still be available.

All of this seems a little much to ask the Redmond, Washington team to cure in Windows 98, all at one time. And I don't really expect them to cure all the ills. But everything I just wished for is available for Windows 95 right now and they are all FREE. That's right, *PC Magazine Online* has come through again. Last month, when I was doing research for my article, I came across the mother-lode of much needed utilities or fixes for Windows 95. So much so, if the justice department or some of the states keep Mr. Gates from releasing 98 on time I don't really care. . . . for now that is!

Send your browser to http://www.zdnet.com/pcmag/pctech/download/win95.html and behold the bevy of free programs available just for the download. And they are all relatively small so the download time is minimal for the benefit you'll receive. Here's what you'll see there:

- ***Explorer Notes*** enhances Windows 95 explorer by letting you associate a note of up to 255 characters with any file or folder.
- ***BigBin*** enhances the Windows 95 Recycle Bin so those files deleted from within DOS boxes are protected along with those deleted through Explorer.
- ***MultiLaunch*** lets you associate more than one application with a file extension and adds a section to the context menu that lists programs that can be used to open that file.
- ***TrayLaunch*** lets you access all the icons on your desktop from the task bar, including system utilities such as My Computer and Recycle Bin that are placed there by Windows. These system utilities are normally accessible only from their desktop icons.
- ***ZDKeyMap*** adds a property page to the Control Panel's Keyboard applet that lets you remap all the standard keys on your keyboard. Thus, you can swap the CapsLock and Left Ctrl keys to avoid pressing CapsLock accidentally, or turn little-used keys on a notebook into other keys that the notebook may be missing.
- With ***LogoMania***, you can replace the standard startup logo with your own animated or static bitmaps.

(Enhancements.....Continued on page 4)

Road Runner Cable Modem - Part 2

by Merle Nicholson, President,
Tampa PC Users Group

Last month, I related that I was offered the Road Runner cable modem service as a Beta tester. It's been more than a month on the Road Runner service now. I've resolved some problems I had having to do with my own PC setup, and I've had a couple of outages on my service that were resolved quickly. I've been very happy with the service.

I had kind of a complicated setup in my home. I would guess that most people don't have a LAN in their home, but I personally know two other families besides my own who do. I wanted to take advantage of my LAN and route the Internet service to both PC's. I've managed to do that satisfactorily by using two Ethernet cards in my own PC, and installing a nice little $50 software package called Sygate. The software part was easy, and after I figured out that I was out of interrupts in my PC, which prevented the LAN Ethernet card and the Cable modem Ethernet card both from working, I resolved it by pulling my PS/2 mouse and reinstalling it to a serial port. That freed up the interrupt (12) that I needed, and my system was happy again.

That complicated my life some, because I had a docking station for my little electronic Sharp Wizard in that serial port; my modem is in the other, so I had to install an a-b switch so that I could switch between the two. That works well.

I've had a couple of short duration outages on the cable modem during the month; the last one was cleared within about three hours after I called it in. I haven't had any trouble contacting the help desk by phone, and so far they've responded to my e-mail almost immediately in the evenings. Even though it's Beta in my neighborhood (I have to remind myself of that sometimes!) I really haven't had any more problems than with my conventional GTE service. Time will tell, but it's very encouraging.

As for performance, I'd say that my browser is pretty easily double the 28.8 that I was getting. E-mail send and receive is fast, newsgroups are pretty much instantaneous once the headers are loaded. Downloads from FTP sites are just amazing. I get a very consistent 30kb/sec, about 15 times faster than my 28.8. Some people report even faster than that.

One concern I had was accessing my e-mail from my office. They have that covered with a regular e-mail server address that's outside the Road Runner network. That is working very well.

Very highly recommended --Roadrunner Cable ISP service from Time Warner Cable. ◆

(Enhancements.....Continued from page 3)

- ***MenuEdit*** lets you easily edit the commands available on context menus and add new ones.
- ***RUPL2*** allows users to put a Recently Used menu on either the Programs menu or the Start menu. It also eliminates the need to use RegEdit for configuration.
- Organize your Windows 95 desktop and keep it in order with ***WinTidy 95***. Use its predefined icon layouts to create an initial arrangement, then make any fine-tuning changes to the icon positions. The utility will automatically tidy your desktop when it starts up and when the screen resolution changes.
- The ***ZDDesk*** utility creates multiple configurations on your Windows desktop, or virtual desktops (up to 9). This lets you run a greater number of applications without cluttering the task bar. Users can toggle from one virtual desktop to another with a click of the mouse.

I've tried them all, and my favorites are ***WinTidy 95*** and ***ZDDesk***. I would find it hard to live without either one now. So if the justice department wants to play with Bill Gates for a couple of months, let them. I figure these ten new utilities will keep me busy until the Buccaneers start winning again in August. Besides, there are other freebies located at this site, like the ***Top Ten Utilities***, some of which I talked about last month, ***Classic Games*** and ***Internet Utilities***. **WOW! What a find!**

I've said it before. . . . if you're not on the Internet you don't know what you're missing. Find your way to the ***I****-way*. You won't be sorry! You'll only wonder why you took so long to get there in the first place.

There is an interesting tidbit I'd also like to pass on to everyone. There are several free email services out there but to my knowledge none allow you to attach files or pictures… at least until now. ***ZDNet*** (Ziff-Davis Publications) will now give you free email and allow you to send and receive attachments. They also allow you to store up to 4 megabytes on their server so you can save the more important stuff if you want. Follow the super ***I****-way to* http://www.zdnetmail.com and check it out for yourself. ***Happy Computing!*** ◆

Corel's WebMaster Suite

By William LaMartin, Editor,
Tampa PC Users Group

According to Corel, "Corel WebMaster Suite offers a complete solution for creating web sites." My assessment of this is that they are close with this statement, but the suite of programs could use some improvements in the area of HTML editing and site management.

Why, for example does the HTML editing component of Web.Designer not have a replace feature? That said, Corel's HTML editor is a bit better than Microsoft FrontPage's HTML editing component of its FrontPage Editor. In this price range, Corel's competition is Microsoft FrontPage. Which program you buy will depend on what graphic programs you already own, where you plan on posting your web site, and how much you want to pay. I will come back to this later, and next month I hope to have a review of FrontPage 98.

There are really three different groups of programs in the suite. The first group, and most important, consists of the WEB.DESIGNER program, which is a "what you see is what you get" type of HTML editing program, and the WEB.SiteManager program, which is sort of like Windows Explorer for web sites. The second group of programs is comprised of the ones that assist you in creating graphics for the web: WEB.PhotoPaint and WEB.DRAW. These are scaled down versions of Corel PhotoPaint and CorelDraw especially adapted for web graphics. WEB.GALLERY organizes these graphics. The third group is what are called accessories--sort of like freebies--things you are glad to have but which are not very important to creating your web site. This group consists of the last three programs in the list below. By the way, these last three programs, along with the two graphics programs, are 16 bit programs; the two main programs are 32 bit. Since they licensed WEB.WORLD, I understand why it is 16 bit, but why WEB.DRAW is 16 bit is beyond me.

In sum, we have included in the Corel's WebMaster Suite:

- WEB.DESIGNER
- WEB.SiteManager
- WEB.PhotoPaint
- WEB.GALLERY
- WEB.DRAW
- WEB.WORLD
- WEB.MOVE
- WEB.DATA

Also included are OReilly's WebSite 1.1 server software (allowing you to run a web site from your computer), Netscape Navigator 3.0 (somewhat outdated), 7500 clipart images (nice collection of Internet ready images instead of Desktop Publishing images), and a free 30-day web site hosting offer (from MicroCrafts web hosting service). The price for all of this is $199.99. To see what Corel has to say or to place an order you may go to http://www.corel.com/corelweb/webmaster/.

You use **WEB.DESIGNER** to create the individual pages for your site. It has all the usual tools for point and click creation of links, tables, and pages with frames, to mention just a few items. To create or polish the graphics you will be inserting in these pages you can use **WEB.DRAW** or **WEB.PhotoPaint**. And, to me, these two programs are the strong selling points of the suite if you don't already have good quality graphics programs. Microsoft FrontPage is equally good at creating web pages with their FrontPage Editor; they have, I think, a slightly better "SiteManager" component in FrontPage Explorer than does Corel, and they include Microsoft Image

(WebMaster.....Continued on page 7)

Treasures on the Web

By Larry Anders, Librarian, Tampa PC Users Group

In a recent article I told the world about my addiction to software. Shareware, Freeware, Bloatware, I don't care. Obviously, the less I have to pay for it the better, because the less I pay the more I get. The World Wide Web is a gigantic storage vault of excellent software. And now, my friends at *PC Magazine Online* have gathered a bunch of these treasures together at one site to make it easy for me and all of you who haven't admitted you're just as crazy about good, inexpensive software as I am.

If you will travel to http://www.zdnet.com/pcmag/features/utilities98/index.html, you will find a listing of their choice of the top 225 Windows utilities and they have divided them into 13 assorted categories to make it easier for you. These categories are:

- antivirus
- backups
- file viewers
- messaging
- search and navigation
- parental filtering
- uninstallers
- troubleshooting
- other Internet
- security
- other operating systems
- browser acceleration
- miscellaneous

There are reviews, editor's choices and summaries of features to take all the guesswork out of finding just the right tool for the just the right price. For example, under "browser acceleration" you'll find reviews on *Go Ahead Got It!*, *Java Booster*, *NetAccelerator*, *PeakJet*, *Speed Surfer*, *Surf Express*, and *WebEarly*. The editor's choice under this category is *Go Ahead Got It!* because it is the only product that lets you specify which pages to preload, giving you ultimate power over accelerating your surfing experiences. You can also have the program preload frequently visited pages, and it's the only program to notify you when pages have changed. A partial summary of features looks something like this.

	Go Ahead Got It! 3.01 (Editors' Choice)	Java Booster 1.0a	Net-Accelerator 1.1	PeakJet 1.56	Speed Surfer 3.2	Surf Express 1.0	WebEarly 1.70
Price	$19.95 (list)	$29.00 (list)	$30 (street)	$29.95 (list)	$30 (street)	$34.95 (list)	$24.95 (list)
Preloads links to current page	Yes	No	Yes	Yes	Yes	No	Yes
Preloads frequently viewed pages	Yes	No	Yes	Yes	Yes	Yes	Yes

Most of the software reviewed has links to either the parent company's web site, where you can purchase and download immediately, or to PC Magazine's Online Shareware library. There is also a full explanation of the system requirements, so there is no doubt as to whether the software will work on your PC or not. It really couldn't get much easier to purchase software.

Also, at http://www.zdnet.com/pcmag/pctech/index-ut.html you can link to PC Magazine's superb ***FREE*** utilities such as *Dupeless,* to get rid of duplicate files on your system, *SiteSnagger,* that lets you download entire websites and read them offline, *Checkers,* where you can play against the computer or a friend and *COA32,* that allows you to move some of those 32-bit Windows programs that are taking up so much space off that crowded C drive onto that new hard drive.

These are just a very few of the many treasures that are located at PC Magazine Online. Next time you're out for a spin on the super I-way stop by and browse for a while. You'll be glad you did! ◆

(WebMaster.....Continued from page 6)

Composer to manipulate graphics for the web. But the inclusion of WEB.PhotoPaint and WEB.DRAW, I think, make up for this difference. I must confess that I really have not looked closely at these two "light" graphics programs since I have CorelDraw and Corel PhotoPaint on my computer.

Thus, if you are not going to be hosting your web site at a provider that supports (and charges for) Microsoft FrontPage Extensions, which allow for increased functionality like the Discussion Group or Site Search at our group's web site, then going with Corel's WebMaster Suite possibly makes sense--except that it goes for $199 versus FrontPage's $149. However, with WebMaster you also get the accessory programs.

The accessory program **WEB.DATA** turns your Database tables into web documents--something that the newer versions of database programs like Microsoft Access 97 also do. But if you don't have one of these newer versions, then this program may be of use to you. The most interesting of the accessory programs to me was **WEB.WORLD**, which is really an earlier version of the Virtual Reality Markup Language (VRML) program, Cosmo HomeSpace Designer. I enjoyed using it to create a virtual reality tour of our Museum of Science and Industry meeting site, which you can view by taking the "TPCUG Virtual Reality" link on our main page. You will have to have a VRML plug-in installed to be able to view this with your browser (something that can be downloaded for free). Sometime, when I have time, I want to redo it to make it more accurate now that I have studied the layout of MOSI.

(WebMaster.....Continued on page 10)

System Commander Deluxe from V Communications

By Don Patzsch, Tampa PC Users Group

System Commander allows you to install and run any combination of PC compatible operating systems, including Windows 95/98, Windows 3.x, Windows NT, DOS, OS/2, and all of the PC compatible Unixes.

When I tried to install the program I got a message that I should unprotect the installation disk to allow writing to it. I didn't want to do that with the original disk, so I sent an email to V communications, and they said to go ahead and do it! Of course, I made a diskcopy of the installation disk and used that. The System Commander boot installation disk will have the backup files written to it as you progress. These may be useful some day, and of course that's why you have to unprotect the installation disk. I was surprised at how easy it is to install this program.

The next thing I encountered was that I was using BOOT MANAGER, a similar program that comes with OS2 and also with Partition Magic version 3.0. Due to that program, the System Commander did not come up. It was as though I had not installed it. I set up Partition Magic and deleted the BOOT MANAGER primary partition on the hard disk. Then I reinstalled System Commander and all worked as shown in the System Commander manual.

I could switch from Windows95 to Windows NT Server Version 4.0 on startup. Those are the only operating systems on this computer, although I use OS2 Version 4.0 and Linux, as well as P.C.DOS 7.0. I will add each as time permits now that I have the System Commander working. These operating systems are installed on my everyday computer.

The manual says that when you install System Commander, a copy of the various Master Boot Records (MBR) are made. One reason for this is that if you want to uninstall the program it will be possible to do it. Another is that if System Commander detects a MBR virus, a copy of the Master Boot Record is installed automatically, to remove the virus.

The Master Boot Record is the first sector of the first physical hard disk. The MBR consists of a master boot program and a partition table that describes the disk partitions. This area holds data about each of the four primary partitions, such as the size and the starting location of each partition, for each hard disk you have in that computer. The master boot program looks at the partition table to see which primary partition is active. It then starts the boot program from the boot sector of the active partition.

A hidden part of the hard disk is the DISK PARTITION TABLE. This specifies how the hard disk is divided. You may divide your hard disk into one to four primary partitions. System Commander provides both automatic and manual partitioning, and you may even resize the partitions without losing the data on the disk using this program. Extended and Logical partitions are the way to divide a Primary partition. OS2 and WindowsNT can be installed in a Logical partition. The WindowsNT boot program must be in the active primary partition on the first physical drive. DOS must be installed in a Primary partition in order to boot from the hard drive.

What can we do now that we have System Commander Deluxe?

- System Commander will boot from up to 16 Logical partitions.
- System Commander will manage up to 32 different operating systems in a single primary DOS partition, including different DOS versions, Windows95/98, WindowsNT, and OS2. No one is expected to have that many operating systems, but it allows us to better understand how these things work when we list the possibilities.
- DOS boot sector virus protection checks every boot and replaces infected boot sector and hidden system files.
- Operating systems that can be booted from the second or any hard drive include OS2, Linux, Solaris, and Coherent.
- You may create, resize, delete, and use advanced tools. Looks a lot like a copy of Partition Magic is included, even to appearance.

I have read the entire System Commander manual and tried each of the processes suggested in the manual. I also reread the Partition Magic manual to be sure there was agreement between the two manuals and a compatibility between the two programs. Note: In the Partition Magic Version 3 manual, on page 165, an option for the System Commander is given. Instructions tell you how to prevent System Commander from opening multiple visible primary partitions.

I even learned more about DOS by reading those manuals! It makes sense to compare all the variables when you set up a new program. Their URL is http://www.v-com.com/ ◆

(Comments.....Continued from page 2)

cursor on the map. And all the while we were carrying on our "phone" conversation. It was quite productive. And with Merle's cable modem, I am sure it would have been even more productive. ◆

Beginners' Column

(Running programs - part 2)

By Merle Nicholson, President,
Tampa PC Users Group

Well, I'm encouraged. I've received some feedback from last month's article. I want to reply to one question I received and then continue where I left off last month. You may want to read last month's article as a refresher because I'll be assuming you did as I continue.

I received some e-mail from a club member with a very good question. *"... why did you mention in the beginners' article, not to 'double click' on a file in explorer? I do this now and then, ... I thought the worst thing that could happen when you double clicked on a file is that it would launch the host application."* I twice cautioned against double-clicking an *application;* that is a file with a *.exe* extension. This is very good advice. Most often, unless you're very familiar with the application, you are not going to know what the results of double clicking an app is going to be; and that can be dangerous to your PC at worst, or annoying to you at best. Here's why.

Executables (in the form of applications or programs with *.exe, .com* or *.bat* extensions) are delivered to you from external sources like purchased installation packages or Internet downloads. Most often they come to you by CD or by diskette with installation programs. The installation process copies programs and all associated files to the correct locations on your hard drive and then, most importantly, supplies you with a shortcut or start menu item to run the program. It may register an associated *file extension* as I described last month. Like say *.ask* for an AskSam file. So the correct way to run the AskSam application is to click on the start menu item OR double-click on a file with an extension of *.ask.* Double clicking on the asksam.exe (if there is one - it *could* be named something else) is not necessary or recommended. Clicking on the shortcut item will launch AskSam without a data file, and double clicking on an asksam file will launch AskSam and momentarily will load the asksam file into AskSam. Clear? Let's reflect on the *bad* things that can happen.

Let's say you read about a neat utility called *neatstuff* and get it from a download site on the internet. The download process - after asking if you want to open it or save it to disk - lets you specify where it goes, and for some reason defaults to Desktop, and you accept it (ever done this? I have !). So it downloads neatstuff.exe to your desktop and shows a neat icon on the desktop. Do I want to double-click it and run it??? **NO ! oops, too late.** What happened? Well as it turned out neatstuff.exe was a "self extracting zip file", and it contained 1,533 files that it extracted to your desktop! And they're **ALL OVER THE PLACE!** How am I going to clean this up? They're all mixed up with my good, well organized desktop icons. I can't remember all this stuff! What are the good files, and what are the bad? Wished I hadn't done that.

Let's say I had thought ahead and created a directory called "d:\downloads" and am in the habit of placing all downloads to that directory, but I then inadvertently double-click on it, and neatstuff.exe does a quick installation and without warning makes all my graphics files its own. Darn! So instead of ACDSee opening when I double-click on a .GIF, it opens this terrible neatstuff application that looks like it was written by an old geezer that's real proud of his newly-learned Visual Basic skills. What do I do now? Re-install ACDSee, I guess, and hope it all gets straightened out. (I can joke about geezers with impunity, since I'm one.) So to summarize: Use the icon supplied with a program to run it, after installation, or double-click on a file that is registered to an application.

How do we know what files are registered to what application? The best way is to use Windows Explorer features. Unless you've been experimenting, you may not know what Explorer can do for you. Here are some things to try. Follow this through and you'll have the information you'll need to determine what file types are registered.

Open Windows Explorer from the Start Menu. Go to the menu under View, Options. On the panel with the View tab, click "Show all files", then check "Display the full MS-DOS path in the title bar", un-check "Hide MS-DOS file extensions for file types that are registered", and check "Include description bar for right and left panes", click OK. Go back to the menu, click View, then Details. Look at the right pane as you click on directories in the left pane. The right pane should have file headers called Name, Size, Type, Modified. Under Type there's now a description of the type for every file. An exe is "Application", an ico is an "icon", a BMP file (maybe) is a "paint" file.

Some programs will come to you as a single executable that must be double-clicked on. This has become very rare, and is mostly restricted to DOS programs. It's nearly impossible (and probably inefficient) to deliver a Win95/NT application as a single file. If you do have a program like this, drag a shortcut out from the exe and place it in an appropriate place in your Start Menu.

So, let's continue with running applications. As an experiment, do this: Go to Start, Run and type in `Wordpad /p c:\autoexec.bat,` and click Ok. If you're still running Windows 3.1, instead of Wordpad, use Write. So, see what happens. Wordpad launches, loads your autoexec.bat file, then prints it and then closes out. Gone. We'll continue with this next month. ◆

Special Interest Groups

Communications SIG

This SIG meets the first Monday of the month at 6 PM at the Reflectone Building. **Directions: Proceed west on Waters from N. Dale Mabry across the railroad tracks, about 1.5 miles; take second left on Savarese. Proceed on Savarese until you reach the Reflectone building. Use the north door.** You must sign up to get on the list and to get by security. *Contact Charles Howe: at 968-1207 or HOWE@INTNET NET*

Genealogy SIG

This SIG meets the second Monday of the month at 7:00 PM at the Museum of Science and Industry. *Contact Jenny Lind Olin at 960-5723 or Ford Bond at 987-6309 .*

(WebMaster.....Continued from page 7)

To see what you can do with **WEB.MOVE** take the "Animated Movie of our last Meeting" link on our main page. It is not a real movie, just a background with three separate animations that appear and disappear on a schedule. Cute--but of what value I am not sure.

Once you have created the pages for your web site, you then upload them to the Internet using either Corel WEB.DESIGNER's *Instant Publishing Wizard* or the standard File Transfer Protocol (FTP). All of this is explained very well in the online help or the printed manual.

After you have published your site, you can then maintain it and view its organization with **WEB.SiteManager**. The graphic accompanying this article is a small portion of the SiteManager's page view of a small portion of our TPCUG web site. You can have SiteManager check the site for broken links, having it list them and the pages on which they reside. This is very useful in keeping a site current, since links to external URLs will be dying on you all the time--hopefully this is not the case for internal links. On our "Editor's choice of useful WWW links" alone there are over 400 external links that should be checked for currency regularly. A feature like this makes the process easy.

Of course, as with all programs now, there is a wizard that will guide you through the process of creating a web site with designs you can use if you are short on imagination at the moment.

I bought the program because Corel gave members of our group good pricing on it, and I hope to use some of the graphics features it has that Microsoft FrontPage doesn't. However, since I have access to a site with Microsoft FrontPage Extensions and since this gives me Discussion Groups, site searches, hit counters, and very easy uploading, I will stay with FrontPage for maintaining the User Group site at http://www.canx.com/tpcug/ . But I sometimes use Corel WEB.DESIGNER to create pages (I prefer its HTML editor to FrontPage Editor's), and I am interested in Corel's new Barista technology which allows you to make web pages employing Java to remove the limitations imposed by HTML while offering rich formatting options, advanced layout control, and improved graphics display.

The idea behind Barista is to create your fancy graphic in WEB.DRAW, "publish" it using Barista (you don't have to know Java, the program does the work), and everyone then enjoys a web page with much richer graphics and layout than is possible with HTML. What you see on your web page is really the results of a Java applet. Sounds good doesn't it?

I just had to try this out, so I cranked up CorelDraw (no need to use WEB.DRAW when you have the real thing), created a simple graphical document, then used the Barista option to create a package of files (mostly Java Class files). To test this, you open the one HTML file that starts everything with your browser. This cranks up a Java applet that after a bit of a wait displays your graphic. Corel warns that this process can be quite slow over the Internet and is more appropriately used on Intranets until Java is tweaked so as to run faster.

Of course, an alternate method of getting a Corel Draw document on the web is to save it as a GIF or JPG graphic which work well on HTML pages. I did this too and then compared the results. The Barista version was much truer to the colors of the original Draw document. However, the Barista version did not print properly from the browser, and the GIF version did. The Barista version also requires about 500 K of additional storage for all the Java class files (this is a one time thing, though, since additional Barista graphics can use the same Java class files).

So I was in a bit of a quandary as to exactly what Barista will do for me. I put a query concerning this on the CorelDraw newsgroup. Here are two answers I got:

- "There is no good reason to use Barista."
- "Security: It's a good way publish something you don't want anybody to print. <g>"

From these two answers and my experience, I gather that perhaps Barista's time has not yet come. But since this is a very, very small part of the WebMaster Suite, don't let it have any

influence on a decision to buy or not to buy. You should study other reviews (which you can probably easily find on the WWW) of the suite and its competitors, consider the price, then make your decision. You might even decide that you can get along fine with one of the free web page creating (but not site managing) programs.

If you would like to read Usenet newsgroup messages concerning the WebMaster Suite and other Corel products, you may need to get them from the Corel newsgroup server CNEWS.COREL.COM instead of your IP's newsgroup server. That is what I have to do since NetCom does not carry them.

For those who don't follow any newsgroups, but who want to better understand an operating system or program they use a lot, I strongly recommend that you start following a newsgroup covering these topics. It is easy, since most mail readers also function as newsgroup readers. ◆

Meeting Preview: At the June meeting, Mike Bruzzone from IDT/Centaur will discuss Winchip Processors for your computer. This is a replacement chip for your Pentium computer. To quote the manufacture, "The WinChip serves up blistering speed, smaller die size, better heat dissipation and 100% Windows compatibility. " They are at http://www.centtech.com/..

President's Comments

By Merle Nicholson, President, Tampa PC Users Group

This month on a general note, I'd like to make an appeal to every member to invite a friend, neighbor or co-worker to our meetings. Our membership is declining. It's slow, but it's happening, and we need suggestions from our membership on how to improve it, but, most of all, we need new faces. Email me at MerleNic@tampabay.rr.com with your suggestions.

Our cash doorprize has been doing well since we started two months ago. The proceeds are small, but needed. Our thanks to Mary Sheridan, who suggested that it be revived and volunteered to collect it at both meetings.

Our longtime hardworking Comm SIG leader Charles Howe has resigned from the Board of Directors. Charles has steadfastly dedicated his time for the SIG for many years. It will be difficult to replace you, Charles. Thanks for these many years of dedicated service, Charles.

On a personal note, I'd like to mention my foray into graphics and photo editing. I bought a scanner just before Christmas and then in January picked up an HP722C deskjet printer. This printer is one of two inkjet printers that use a larger, newer type of ink cartridge. It started with the professional series 820C, replaced by the 890C. The 890C ($400) and 722C ($300) have labels on them

(Comments.....Continued on page 9)

July 8: Tim Adams from Gateway 2000 will give a hardware presentation.
August 12: Peter Schenk from Quarterdeck will present their products

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

Minutes of the May 13 Meeting

By Kevan Sheridan, Secretary, Tampa PC Users Group

The members were a little late in showing up, so Merle Nicholson, our president didn't start the meeting until 6:30 p.m. Merle welcomed everyone and introduced the officers. He asked that we limit the use of the computers on the desks while the vendors are giving their presentations. Sign up sheets for the Communications, Genealogy and a possible Windows SIG were circulated. Charles Howe made available copies of a DOS browser for anyone interested in trying it out. There was a discussion about a program called "Opera". It's a small Internet browser that will run on a 386 machine with Windows 3.1. A question was asked about the Internet phone and William LaMartin explained how NetMeeting was working well for him. Our members will soon be able to link from our web site to their own web sites. If you're interested submit the needed information to William LaMartin.

The presenter was Mike Austin with Waldec/IKON Office Solutions. Waldec/IKON is an authorized Microsoft reseller. They provide software and networking installations to businesses. He first gave a nice summary on his growing company and what it does. Mike then gave an interesting presentation on the future direction of Microsoft operating systems. The presentation was originally created to help make business decisions for future purchases of software, but he adapted well to our mixed audience. He presented some slides that listed a matrix that classified types of software and suitable operating systems and the direction that Microsoft is going. He stated again what we've been hearing for some time: Windows NT is targeted to be in everyone's future by the year 2001 when it and Windows 95 will converge. One thing that NT does not do well - and never will - is run just any old DOS software, and a lot of Windows 3.1 software, too. NT version 5 will be bringing us plug and play support so the hardware issues will be improved for us. But the bottom line is, for compatibility, Windows 95/98 is best, and for crash-proof, secure systems NT is the way to go for now.

Mike also gave us a sample of some other business considerations - servers, networking and TCO - Total cost of ownership; thin clients, fat clients and Net PC's. It was interesting to know where the industry is headed. Thanks to Mike for an interesting and informative presentation.

Mike presented Warren Fuss and William LaMartin with very nice laptop bags for answering his questions.

Mary Sheridan won a copy of Office 97 Professional in our software drawing and Ford Bond won Windows 95. Other

FrontPage 98 from Microsoft

By William LaMartin, Editor
Tampa PC Users Group

FrontPage 98 is a refined and improved version of FrontPage 97. Microsoft has corrected a few minor flaws and added several new features to this version. It is the program I use to maintain our group's web site, and I highly recommend it for a site of our size or larger. However, it may be overkill for the simplest of personal sites consisting of just a few pages. For that you might do just fine with FrontPage Express, which comes free with Microsoft Internet Explorer 4.0, or some other such free HTML point and click editor.

Since switching to FrontPage for both creation and maintenance of the site from a simple text editor to create the HTML code and an FTP program to upload the pages to the web server, I could never think of doing it any other way. Moving up to FrontPage 98 has just made the job a little smoother.

FrontPage is made up of two main applications: FrontPage Explorer and FrontPage Editor. FP Editor is used to create the HTML pages that make up your site, and FP Explorer displays the site you have created in either a folder view or a hyperlink view. A screen shot of the hyperlink view of part of the TPCUG Web site is above. The whole site could not be presented in hyperlink view here since there are over 400 links in the "Links" folder alone.

For the uninformed, a web site on the World Wide Web is simply a collection of files on some computer (called a server) that is connected to the Internet. One of these files is designated as the home page. Within TPCUG this is the file index.htm, which is the HTML file you see when you first go to our site. That is the file labeled Tampa PC Users Group, Inc. on the hyperlink view above. The page labeled Genealogy SIG is the HTML page your browser goes to when you click on the Genealogy hypertext link on our home page.

FP Editor allows you to type in text, format it just as you would in a word processor to the extent the HTML rules allow, insert graphics, insert tables and hypertext links to other files at your site or on the WWW. This is the standard stuff of an HTML editor; however, FP Editor provides for more: It simplifies the process of creating forms like questionnaire or feedback forms and the creation of frames as in the HTML version of the newsletter page at the TPCUG site where the scrollable list of articles appears on the left part of the screen and the article being read on the right. And it allows for a what-you-see-is-what-you-get creation of tables. In general, everything is as much WYSIWYG as possible.

Using FP Editor you are spared the need for knowing HTML, since it is pretty much point and click. It does, however, provide for an HTML view of the page. Unfortunately (from my point of view), this HTML view leaves out all the HTML code used to create any of the special features that FrontPage so easily creates—like themes, shared borders and navigation bars. I suppose Microsoft didn't want anyone messing with their creations. Unfortunately I have found it sometimes necessary to crank up the old text editor and make such changes when things get a little out of kilter.

FrontPage is a unified approach to creating, publishing and maintaining a web site. First, you use the FP Editor to create your home page and all the pages branching off of it; you use FP Explorer in either Folder View or Navigation View to create however many folders you need to contain and organize all of this on your computer. To allow real-time testing, your own Personal Web Server (PWS) software is supplied.

Once you have created your new Microsoft Front Page Web, which is now stored in the PWS directory on your computer, you can test it there and fine tune it. In fact, you can do more there than at most Internet Service Providers (ISP) because FrontPage will have installed the Microsoft FrontPage Server Extensions at your PWS. These extensions are necessary to utilize the full functionality of FrontPage. With these extensions also on your ISP's server you can create more powerful web sites without bothering your ISP with things like password protection, text searches on the site, and saving form results. The presence of the extensions also allows you to use the Discussion Group Wizard to create a FrontPage web site which is a discussion group like the one at the TPCUG site. You also get hit counters for free.

After you have your FP web created, you are ready to put it on the Internet for the world to see. In a perfect world, you would simply choose the option to publish your FrontPage web, and FrontPage would handle all the details of dialing up your ISP and transmitting all of your files to the proper place at the ISP, keeping the structure intact just as it was on the PWS on your computer. As you know, the world is not perfect, and most likely your ISP will not be supporting the FrontPage Server Extensions for the free home pages they provide you for your $20 each month. For this you will have to buy one of their upgraded

Put the Power in the Palm of Your Hand

By Larry Anders, Librarian, Tampa PC Users Group

In my line of work I travel a lot, and I was recently stranded in an airport for several hours because of bad weather. I always save up the latest of my computer magazines to take along and read on my trips. On this occasion I had enough time to read the two magazines twice over. While I was sitting there, I noticed several people working (or playing) with what appeared to be Gameboys (small game machines made by Nintendo). I've never been much into playing games on the computer; I don't seem to have the patience. But on this unusually long day in the airport I think I would have made an exception.

As luck would have it, when I finally got on the plane a young lady sat down beside me with one of these new hand-held things. It turned out to be a Palm III™ (P3) connected organizer, or better yet, a palm-top computer. I had just finished reading (twice) the review on the P3 in one of my magazines and was anxious to check it out. But up until this point I had never been in contact with or even given these things a second glance. I asked the nice lady if she would mind telling me about it and how she used hers. She was very obliging and told me all she knew about it, which wasn't much, because she had just recently purchased hers, too. She did tell me enough to more than whet my appetite and in the process of her demonstration she made one BIG mistake; she let me hold it and that's all it took. I was hooked. That was on a Friday.

All that next weekend I went on the Internet and researched these things. I'm not one to rush right out and buy something like this on the spur of the moment. I usually wait at least 12 hours, <grin>. This time I had to wait a little longer because the P3 had just recently been released and was still a hot ticket item. I called around locally and no one had them. Everyone said they sell out as soon as they come in. Then the nice people at CompUSA told me to check back Tuesday when a shipment was due in. I did. They opened at 10:00 A.M. and I called at 10:01. A shipment of P3's had come in so I had them put my name on one, and I took an early lunch. Needless to say I had an interesting Tuesday afternoon. And yes, it's much more than just a Gameboy clone.

The Palm III™ made by 3Com, which also makes the industry standard U.S. Robotics modem, utilizes an operating system called Palm OS3. And, as you can see by the picture, they do fit in the palm of your hand. This is the third revision of the Palm series by 3Com and apparently the third time is a charm. The 3Com connected organizer family consists of three models: the Palm III™, PalmPilot™ Professional, and the PalmPilot™ Personal Edition. The P3 is their top of the line but each one has their own niche. Although there weren't many sweeping changes from the previous models, the refinements are obviously for the best. Or so say the reviews I've read.

So, what can you do with the P3 other than play games…. a bunch of things. The P3 connected organizer is designed as a companion product (not replacement) to my personal computer and enables a mobile user like myself to manage my schedule, contacts and other critical personal and business information on my desktop and remotely. The P3 automatically synchronizes its information with my PC locally or over a local or wide area network at the touch of a button through the use of a graphical user interface and a desktop docking cradle which facilitates two-way synchronization between the PC and organizer. The docking cradle easily connects to a serial port but nothing else can use that serial port at the same time. (Make sure you have an extra serial port or you might have to add an extra serial card, which is really no big chore and not very expensive.)

The P3, and the rest of the 3Com organizers, are equipped with a complete suite of built-in personal information management (PIM) software. These include a date book, address book, to-do list, and memo pad that are accessible through permanent buttons along the bottom of the case (see below). There are also four permanent buttons on the touch-screen that provide direct access to the applications, the menus in each of the applications (similar to Windows), a calculator and a find feature.

The P3 works simply by touching the stylus pen (included and stored in the back of the case) to the touch screen (which is also a backlit screen) to open the application of your choice and enter your data or information. At the end of the day,

Your own software - Most of the reviews in the newsletter are done on software packagers purchased by the reviewer and not supplied by vendors. Join the group of reviewers by reviewing a software package you have purchased.

Internet picture of the month

Belle Grae Inn, Staunton, Virginia

This is one of many fine Bed and Breakfast Inns for which you can find detailed information on the Internet. Many, in addition to prices and locations, provide dining menus and photos of various rooms. The Belle Grae site is at http://www.valleyva.com/bellegrae/index.html. Visit the site; it may make you want to make a real visit, as your editor's family did.

To search for more B& B's online go to Bed & Breakfast Inns Online at http://www.bbonline.com/. Unfortunately many B&B's either do not have web sites yet, or, if they do, they choose not to list them with a site like this, making it very hard for the Internet traveler to find them.

The Sun Coast Freenet

By Ted Rodenbach, Tampa PC Users Group

The Sun Coast Freenet Do you have an older computer, and still want to be able to send and receive mail at no cost? Do you like to learn fascinating, yet exotic new ways of computing?

Well there is a way that all this can be done. It's called the Sun Coast Freenet. I know many of you have already heard of it, but how many people really know what it's all about?

Sun Coast Freenet, or SCFN for short, is a free service of the Tampa/Hillsborough County library system. Once you register (which by the way, is free to the residents of Hillsborough County), you are able to log on, and, through using 'lynx', a text based browser, you can go to all of the numerous links they have on the system. You are also provided an Email account, and through PINE, the Email program, you can check your mail, manage folders, and go to thousands of varying newsgroups.

The main problem most people will encounter is the non-graphical interface that lynx uses. SCFN uses an operating system called UNIX. I'll get to that later on.

Once logged on, you see a non-flattering splash screen come up. From there, you are prompted to enter your 'logon name' and 'password'. Unless you opt to pay an extra fee, the system will provide you with both a name and a password; these can be very arcane, so please write them down. A typical user name and password for example would be something like tw45wwx.

If all this hasn't scared you away by now, then read on, and I'll explain many of the other features of the system.

UNIX Some of you might be saying "What's this UNIX stuff I keep hearing about?" UNIX is an operating system, just like Windows. Well, not just like Windows, but an operating system nonetheless. It was developed by AT&T in the late 60's and is still in wide use today. Many companies' computer networks run on UNIX, and the telephone networks use routers and computer systems running UNIX. As a matter of fact, 90 percent of all web servers use it.

So, if it's so powerful and widespread, why aren't we all using it? Well, mainly because it's a very difficult and unforgiving operating system to use. But I know people who use it exclusively, and they haven't had to reboot in over a year! It's pretty stable.

With that brief description done with, I'll move on to navigating the system.

Everything you do on SCFN is done with numbered links. You can either enter the link number, or move the highlighted bar under the link and hit enter. The type of link is also included in brackets next to it. This tells you whether it's a GIF, JPEG, or some other type of embedded file. What we're interested in is links. Once you choose the link you want to go to, you'll see a status bar at the bottom of the screen. It's similar to that of Netscape or Microsoft except it's text. Once it's fetched the page, you can browse through it, either by hitting the space bar to move down a page, or using the page down button. One of the things that is confusing is that every time you move down a page, the screen refreshes itself and writes over the current text. You cannot scroll back; you might if you have a terminal that can do so, but I use hyperterm, and when I scroll back, I get garbage. There's a help section with SCFN that helps you configure your terminal. This bring us to the (J)ump command.

You can jump to any part or section of the freenet system, with the exception of when you're in PINE, by using the 'J' command. When you hit this key, a message will appear at the bottom of the screen asking to input a keyword. As mentioned earlier, you can find help on configuring your terminal software by hitting 'J', then entering "commhelp" without the parentheses.

There's also a way to bookmark sites that you visit on freenet. This can be done by pressing "a", then choosing 'link' or 'document'. This will add either a link or document to your bookmark list. You can view your bookmarks whenever you want, by pressing "v" and then choosing the link of your choice.

I realize most of this seems very confusing and esoteric, but as a free alternative to an ISP, this might be your best bet.

There's a ton of other quirks and tricks associated with SCFN, but there are way too many to mention.

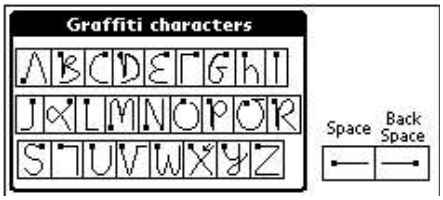
You can also visit their site at http://scfn.thpl.lib.fl.us/bbs/welcome.html

This is a close approximation of what the system is really like. You can also view many of the help files mentioned, so you won't be ill prepared when you do sign on.

I hope this article has helped you learn more about the freenet and the many features it has to offer.

LYNX INTERNET COMMAND GUIDE

- **Arrow Keys** - Up and down arrows allow you to move



(Freenet.....Continued on page 12)

(Palm.....Continued from page 4)
week, or whenever you choose, it's easy to synchronize, utilizing the Palm™ Desktop organizer software (a companion desktop PIM), HotSync® local or remote synchronization software and the docking cradle.

The trick to the whole thing is entering the data into the P3, which can be done in any one or all of three ways: (1) You can utilize an enhanced version of **Graffiti®** power writing software, which enables the user to enter data at up to 30 words a minute with 100 percent accuracy. All in all, Graffiti® is mostly like printing capital letters with the primary importance on where you start and which direction the stylus moves. It took me about half an hour to get pretty comfortable with the handwriting recognition software.

This is the area that most of the complaints come from with users of the P3. You either love Graffiti® or hate it. I have had absolutely NO trouble with learning to use Graffiti®. Once I learned that there was an area to input letters and another to input numbers, it was a piece of cake. Although it was kind of touch and go to begin with. (Sorry!) <grin> The characters look something like this graphic above.

(2) You can also use the P3's **on-screen keyboard** that looks like this:

Just tap the screen with a stylus like you would a regular keyboard.

(3) You can also key-in information using your **desktop computer's keyboard**, then use the HotSync® technology to synchronize the data with your P3. It's easy. Just drop the P3 into the HotSync cradle attached to your PC and press the HotSync button. You'll never have to worry about retyping anything again. That process looks something like the picture in the next column.

My favorite part is the ability to check my email wherever I am without having to lug my notebook computer everywhere. There is a small modem that plugs into the bottom of the P3 and with the proper after market software you can check your email from any POP3 account. (It doesn't work with AOL yet but that's coming.) The software I purchased allows me to download only the headers first and then pick and choose which mail I want to read. It also has complete email filtering to eliminate most of the junk mail that comes in every day. I can then read my mail online or at my leisure later on. You can also do the same with news groups and web pages in text or graphic-based style, although I recommend the text based style because the size of the screen makes it difficult to read everything properly. I guarantee that the average web designer is not designing for a palm computer.

Oh yes, all this is done with only two megabytes of Flash RAM memory. I currently have exactly 50 assorted applications stored in that two megabytes, along with the built-in applications previously mentioned, and still have over 400k of storage remaining. There is also built in infrared transfer ability. The Palm III™ lists for $399 (not including $129 for the modem) and operates off of two AAA alkaline batteries that apparently keep going… and going… and going! <grin>. I'm still on my original set. You can store some 6000 addresses, 5 years of appointments (approximately 3000), 1500 to do items, 1500 memos, 200 e-mail messages and a bunch of other stuff. Windows 95/NT required.

I'm new to this but it's fun being a 'newbie' again. If any of you out there use the P3 or any of the many other palm-tops, please let me know. Maybe we could form a SIG. Please remember though that this IS NOT a replacement for the desktop, only a companion to use with it. I'm sure I'll be telling you more about the P3 it in the future because there are just loads of software (especially games) out there for this thing and you know how I am about software…. but that's another story. **Way to go 3Com!!!** ◆

(Minutes.....Continued from page 2)
winners of miscellaneous items were Brian Lance, Vince McCoy and Clark Evans. The 50/50 drawing is proving to be a success. ◆

Put Your Hard Drive On A Diet!

By Larry Anders, Librarian,
Tampa PC Users Group

Need more hard drive space? Who doesn't! In a recent past article I mentioned that one of the benefits of the soon to be released Windows 98 will be a converter from the inefficient FAT16 to the much enhanced FAT32 (**FAT** is an acronym for **F**ile **A**llocation **T**able). Quite possibly you are like I was until recently. I didn't really know what the heck that meant, except that FAT16 wastes hard drive space. And because the prices of hard drives have dropped so rapidly lately I haven't really cared either.

Well, I read recently that FAT32 could reduce the hard drive access time by as much as 50%, and who doesn't want more speed. So I decided to find out what all this FAT stuff was all about and pass it along. Here it is in a nutshell.

The minimum space needed to store a file in most Windows 95-based PCs is in a 32K cluster (since most users don't bother to create or don't want small partitions on their hard drive). In Windows 98, the minimum space needed to store anything has been reduced to a 4K cluster--even with very large partitions. Based on this reduced cluster size, the average you can expect to gain is as much as 28% more hard drive space.

What all this is leading to is a neat little (40 kb) ***FREE*** FAT32 utility that is available from Microsoft at http://www.microsoft.com/windows/download/fat32.exe that will allow you to check just how much space you could gain by using Windows 98 and converting to the enhanced FAT32 file system.

I recently purchased a new 6.4-gigabyte drive, which brought my total hard drive space to 10.7-gigabytes. After I installed and set up the new drive I had approximately 5 gigabytes of free space left. When I ran the FAT32 utility I found out that I could re-gain another 1 gigabyte of space already utilized.

I don't know what it's going to cost to upgrade to Windows 98 but the extra hard drive space, along with the possibility of decreasing my hard drive access time by up to 50%, is enough for me. Sign me up! ◆

(FrontPage.....Continued from page 3)
service plans. The server at the TPCUG site does support the extensions, and that makes publishing only the updated pages each time as simple as one click of the mouse. Couldn't be easier.

If FrontPage detects that the server extensions are not supported, it invokes its Publishing Wizard to create a web site for you at your ISP without the extra functionality that you would have if the server extensions were available. In this case, you would have no free discussion group or hit counter, for example.

So what is new in FrontPage 98? First, they have made it much easier to edit your site off line. For some reason, many of us had problems in getting FP 97 to function well when not connected to the Internet. That problem is now solved. Also, now when you delete a file on your local site and then publish, FP asks if you want to also delete the file from the remote site. Previously you had to do this manually.

I should comment that once your site is set up, one very valuable tool is the hyperlink check. As I have noted, on our links page alone we have over 400 hyperlinks to other sites. Checking each of these manually would be a big job. With FrontPage, one click starts the process; when it is finished (a fair length of time later), I have a list of sites with potential problems, meaning that they didn't respond in a certain length of time.

As for new features, they have added many more themes, which get you up and running with a stylish site fast. This is something I have found no use for; I like to create my own "theme"--tacky though it may be. You can now make all your pages have shared borders or navigation bars to give a consistent look to your site—something the TPCUG site lacks. So, you see, even though I think a lot of the program I haven't bought into all the new features which mainly affect the appearance of a site. Additionally you can now easily create hover buttons (move your mouse over them and they change appearance). Now, I might add a few of those.

Like any program, the more you work with it the easier it gets. I have been using it for so long that most everything is second nature. I have noted, though, that beginning users often complain (on the Usenet newsgroup *microsoft.public.frontpage.client* that they get a little lost when they venture away from simple page creation in FP Editor to the actual publishing and maintenance of their web.

The local price is about $50 for the upgrade and $140 for full version. ◆

Beginners' Column

By Merle Nicholson, President,
Tampa PC Users Group

This month, let's work on shortcuts. In previous months we worked a bit with executables (.exe files). You may want to review the previous two articles to recall file names. Remember that our web site has the last several months' newsletters in HTML format and also Acrobat Reader.

Have you set your Windows Explorer to show all files and their extensions? Remember that **Open** means Double-click and **Select** means one click. **Open** *My Computer.* **Open** *Drive C.* (Launches Windows Explorer). **Select** *View, Options, View.* **Select** *Show all Files*, **De-select** *Hide files of these types*, **Select** *Display the full MS-DOS path in the title bar,* and **De-select** *Hide MS-DOS file extensions.* And last, **Select** *Ok.* Let's close this version of Explorer out and use the one on the Start menu. **Select** *Start*, **Select** *programs*, **Select** *Windows Explorer*.

Now back to Explorer. This Explorer has two panes, left and right, called the *Tree Pane* and the *File Pane*. **Select** *View*, then *Details.* Remember that an executable says *Application* under the heading *Type* in the right-hand pane. In the Tree view (the left pane), find *C*: and then find the folder *Windows*. If you select the folder icon, the icon changes from a closed folder to an open folder. If you select the "+" to the left of it, Explorer expands the directories one level below it. If you select the word *Windows*, the effect is the same as selecting the folder icon. Selecting the folder icon is preferred, because selecting the name is also the way to rename a folder and we certainly don't want to do that!

In the right pane there are some things to observe. The columns are named *Name*, *Size*, *Type*, and *Modified.* If you select any of these column headers, you'll see that they are made to sort by that category. The default is to sort by ascending *Name*. But if you click on *Name* and then again, you see that it's now sorted by descending name. I often use this sorting to help me find items, usually to sort by descending date, so that a file I just changed will be at the top.

For this practice, we want to have some of the desktop visible, so look at the top right corner at the three symbols called *Minimize*, *Full* (or *Restore*) and *Close*. *Full* is a square box with the top edge heavier. *Restore* is a symbol depicting two overlaid boxes. If it's currently *Restore*, then click it to change it to *Full*, then grab a corner and resize the window so that Explorer covers either the top or bottom half of the screen. Don't be confused by their names, because they don't describe the current state of the window. If the center symbol is *Full*, then clicking on it will make the window go to full screen, and the symbol changes to *Restore*, so that you can restore it to a smaller size. Confusing until you practice with it a bit.

We want to find a file Calc.exe for this exercise. An easy way is to sort by ascending name, and since we're looking for an Application, it should be at the top near the folders. So **select** Type once and then scroll down to Applications, and find Calc.exe. Let's make a shortcut for it first, then go on to placing it in the start menu.

Select the file Calc.exe by placing the mouse over the Calc icon and **select** it with the right mouse button, and drag it to an open place on the desktop. When you let go of the mouse button a small pop-up menu comes up with *Move here, Copy here, Make Shortcut(s) here* and *Cancel*. Just before you let go of the mouse, the grayed-out symbol you were dragging changed into a Shortcut symbol. The Shortcut symbol is a box with an up arrow in it bent in the middle to the right. It's small, but this symbol tells you the default action is Make Shortcut(s) here, and indeed if you look at the pop-up menu when you let go, that same selection is bolded, meaning you could have used the left mouse instead and just dropped it and it would have created a shortcut on its own. All of these actions have a default, but the default changes according to what type of file it is and whether you're dropping it onto the same or a different drive. This takes a little practice. Since you use this same technique to copy and move files you'll need to mess with it for a while until you get some idea of what it will do.

Now that we've gotten a shortcut, let's move it to the Start Menu - next month-- since this fills my allotted space. ◆

(Comments.....Continued from page 1)

"Includes Kodak Image enhancements". These printers render just outstanding color pictures. I've bought photo paper and also a pack of greeting card paper. My photo editing so far has been limited to cropping and red-eye elimination and some brightness/contrast adjustments. I've sent two cards out to relatives, with photos and personal notes using Printmaster. They were just delighted with the cards. The prices on scanners have just hit rock bottom. A hundred dollars gets you a good parallel port model and for $20 or so more you can get one that uses a SCSI interface. Great fun. See you at the next meeting. ◆

Special Interest Groups

Communications/Internet SIG

This SIG meets the first Monday of the month at 6 PM at the Reflectone Building. **Directions: Proceed west on Waters from N. Dale Mabry across the railroad tracks, about 1.5 miles; take second left on Savarese. Proceed on Savarese until you reach the Reflectone building. Use the north door.** You must sign up to get on the list and to get by security. *Contact Charles Howe: at 968-1207 or HOWE@INTNET NET*

Genealogy SIG

This SIG meets the second Monday of the month at 7:00 PM at the Museum of Science and Industry. *Contact Jenny Lind Olin at 960-5723 or Ford Bond at 987-6309 .*

Travel, Jobs, and the Internet

By William LaMartin, Editor,
Tampa PC Users Group

I have recent, first hand knowledge of how useful the Internet can be. In May, my son was graduated from the University of Virginia in Charlottesville, VA. The computer, along with information from the WWW and mapping programs, made our trip there much easier to plan and execute.

To begin with, plane reservations were needed. From the Editor's choice of useful WWW links page at our site, I visited two Travel sites specializing in plane schedules: **The Trip.Com** at http://www.thetrip.com/ and **Southwest Airlines Ticketless Travel** at http://www.iflyswa.com/cgi-bin/buildItinerary2. Both sites allow you to choose departure and arrival cities and days of travel. They then provide you with a list of flights available, their prices, restrictions for discount fares, types of planes, etc. After finding the round trip flights that were best for us, I could have made the reservations online but chose to do that part by phone--just in case the person on the other end knew something that the Internet didn't. We then made rental car reservations by hookup from the airline.

Next thing on the list was somewhere to stay. We combined **AAA** with several sites on the WWW. From the TPCUG Travel section, I used **Hotel, Motel & Bed & Breakfast Directory** at http://www.travelnett.com/. Since we prefer Bed & Breakfast Inns, I also used **Bed & Breakfast Inns Online** at http://www.bbonline.com/, which is in our Newsletter's June Links and soon to be added to the web site.

We fast found that Charlottesville was full to overflowing, being a one business town—the University of Virginia. That led us to Staunton, Va and to the Belle Grae Inn featured in this month's Internet picture of the month.

Once I knew where we would be staying, I could crank up Street Atlas USA 5.0 and have it calculate the best route from Dulles International Airport to the Belle Grae Inn in Staunton and from Staunton to UVa. I printed out the maps and took them with us, including a detailed map of Staunton—something that AAA doesn't carry. To be on the safe side, I also brought the Delorme GPS TripMate unit, the Street Atlas USA CD, and my laptop.

The next thing on my agenda was to get information about graduation at Virginia. For that I went to the UVa site at http://www.virginia.edu/. They had thoughtfully provided a link called **Final Exercises 1998** at http://www.virginia.edu/~major/finals98/ . Here were a schedule of events, maps of where visitors could park, a detailed map of the immediate Lawn area where the graduation exercises would take place showing the seating plan and where the procession would be. Nothing was left to doubt. If you go there now all this information will be gone, replaced by video clips of the final exercises, including speeches by Christopher Reeve and the Governor of Virginia. I have found Virginia to be a very "wired" university. When my son applied, I recall it as one of the few universities that offered an online application form.

After graduation, then what? A job! My son went through the usual job interviews on campus, but the job he finally took was found on the Internet. He went to **Yahoo** at http://www.yahoo.com, searched for "jobs"; something called "**Career Mosaic**" popped up at the top of the screen, he entered more information, and eventually found several companies that specialized in placing programmers. After considering several openings in far-flung places, much to my surprise and pleasure he chose a position in West Palm Beach.

After a job, what's next? A place to live. Back to the Internet. He found the site **Rent Net** at http://www.rentnet.com, called me on the phone from Virginia to set up a NetMeeting, and we viewed apartment complexes in West Palm that were close to his planned work site. All provided detailed specifications, floor plans, photos, and location maps. Some even provided a video tour.

I give the Internet an A+ this past month. ◆

Meeting Preview: At the July meeting, Gateway 2000 will talk to us about their computers and trends in the hardware and computing industry. Gateway is a major mail order computer retailer. They have recently also started selling from retail stores, one of which is on North Dale Mabry in Tampa.

President's Comments

By Merle Nicholson, President, Tampa PC Users Group

Since it's halfway through the calendar year, I'd thought I'd do a quick summary for you of where we are and how we're doing as a club. This is something I don't recall any of my predecessors having done, but it's equally your club as mine.

Financially, we're just holding our own-taking in almost as much as our expenses. We just obtained a new insurance policy to cover liability for damages at a reduced cost thanks to our diligent treasurer, Jenny Lind Olin. Insurance cost is now our highest single item. Printing the newsletter used to be by far the most expensive item, but that has been dramatically reduced through the generosity of a club member. Our newsletter costs have dropped to just the cost of the paper and the post office bulk mail rate. If our newsletter expenses had stayed the same as they were at the beginning of the year, we'd be looking at the financial end to the club by year's end.

Another big change-the quality of our monthly presenters-is due to Mary Sheridan's efforts alone. We have now booked past the first of next year. Just an outstanding achievement. All we had to do was give her a job title. What a woman!

We dismantled our BBS, further reducing our monthly costs. The BBS just

However, for business concerning this newsletter, Bits of Blue, please contact the Editor, William LaMartin, at 821 S. Boulevard, Tampa, FL 33606-2904; 813-251-3817; lamartin@ix.netcom.com.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII, Microsoft Write, Microsoft Word, or Word Perfect file to the editor at 821 South Blvd., Tampa, Florida 33606-2904 or to lamartin@ix.netcom.com.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

The use of trademarked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

Minutes of the June 10 Meeting

By Kevan Sheridan, Secretary, Tampa PC Users Group

The pre-meeting Windows SIG was run by Mary Sheridan, Program Chairman. This SIG should be a regular occurrence at the beginning of future meetings beginning at 6:00 PM. After a short discussion, the introductions and announcements began at 6:45 PM. Merle announced there would be two drawings, with hardware being part of one drawing. We are still putting together the Visual Basic SIG so get ready if you are interested. The IDT/Centaur demonstration of WinChip began at 7:00 and lasted until about 8:15. Following a short break the meeting concluded with the door prize drawing. The amount brought in from ticket sales was $53.50.

The WinChip demonstration was presented by Mike Bruzzone of IDT/Centaur. Mike began by passing out several handouts for the group to read. This interesting information was about who Integrated Device Technologies (IDT) and Centaur Technologies are, what chips they produce and why. Mike also announced that he brought four motherboards (with WinChips in them) for the group. For every motherboard that is reviewed in this newsletter the reviewer will receive an upgrade (faster) chip. He also said that if we review the two designated motherboards the group will receive a complete PC.

The major portion of Mike's talk was about the technical side of PC Chip manufacturing. We learned a wealth of information about the side of computers, chips, software, marketing, and manufacturing that we all normally don't even think about. He talked about the advantages the WinChip brings to the market and what target markets the WinChips are aimed at. For example, the low power consumption of these chips makes them attractive to notebook manufacturers.

Two motherboards were used for the drawing, two boards for club use and two motherboards were given to the group for review. If you are interested in reviewing one of these please contact Merle Nicholson, president of the group.

Mike Bruzzone may be reached at (408) 492-8637 or E-mail: campmkting@aol.com

The door prize followed a short break. Mary Sheridan won the 50/50 drawing. Roger Waters and Mary Sheridan both won a motherboard (with WinChip) donated by IDT Centaur.

Next month look for a demonstration by Gateway 2000. ◆

Power Desk Utilities 98

By Larry Anders, Librarian,
Tampa PC Users Group

For as long as I've been using Windows, way back to Windows 3.0, I have made it my main ambition to find utility programs that Microsoft left out. I'll have to admit that Microsoft has done a heck of a job adding utilities over the years but their File Manager, or Windows Explorer, has always been thin on built-in utilities. And as much as I work with files this has been my area of concentration. Well, not anymore!

MIJENIX™ Corporation has developed PowerDesk® Utilities 98 that took the "work out of working with Windows." (Not my phrase – it came from their website, as does some of the text below.) PowerDesk is actually several programs in one. All of the standard stuff is there like ***move***, ***copy*** and ***format*** but there's a whole lot more too. Here's some of what you get:

- **File management.** ***PowerDesk*** is the heart of PowerDesk Utilities 98. PowerDesk is a supercharged file manager that optionally replaces the Windows Explorer, and is also the "umbrella" program, providing access to most of the various other tools. Each tool can also be accessed independently of PowerDesk. In addition, you can split PowerDesk's window into two panes (rather than opening a second copy of the program, as you have to do with Windows Explorer), which makes drag-and-drop operations between folders or network drives much easier.
- **File Finder.** PowerDesk's ***File Finder*** is a Super Search Engine for your PC that finds files over multiple drives, views the files you've found, and uses more advanced choices to narrow your search.
- **Instant graphic viewing of what's eating up space on your hard drive.** The ***Size Manager*** shows you which files are cluttering up your drive.
- **Open and save files easier than ever before.** Have you ever forgotten the name of a file you were working on? The PowerDesk ***Dialog Helper*** includes two enhancements to the Windows "common" file dialogs (open, save, and save as). ***Fullview*** allows users with larger monitors to resize their dialogs, and the ***Tracker*** "remembers", for each program, which files or locations were recently opened or visited (up to 20 per application).
- **Built-in Zip/Unzip.** With the power of a complete ***Zip File Manager***, PowerDesk's built-in zip utility supports every major compression format, including zip, arj, arc, lzh, z, gz, tar, rar. In addition, support is also included for automatically detecting the need for and spanning of large compressed files over multiple disks, password protection for zip files, multiple compression ratios and more.
- **Convert image files.** PowerDesk has the ability to convert files from over 20 different graphic file formats: *LEAD, JPEG, JTIF, GIF, (Animated/Interlaced* /Normal), *TIFF, BMP, ICON, CURSOR, KODAK, EXIF, PCX, WMF, PSD, PNG, TARGA, EPS, SUN, WPG, PCT, FAX, MAC, MSP, IMG*, and it even supports "batch" conversion, for large-scale multi-format conversions from one graphic format to another.
- **Keep folders in sync and up-to-date.** The ***Synchronizer*** makes quick work of comparing and updating folders. Select two folders, compare the contents, and quickly synchronize their contents with one click. Great for backups! (Far superior to Windows' Briefcase!)
- **Toolbar provides quick access to favorite programs and files.** Create your own Custom ***Toolbar*** for one-click access to your favorite files and applications, as well as functions like Print Screen, restarting your PC, or changing your active printer. Even display multiple clocks for different time zones, or get a quick view of system resources!
- **Fast access to file viewing**. A fully integrated ***File Viewer*** that supports over 80 file formats (too many to list- but believe me I don't think you'll have any problems here viewing anything you have) lets you view your files as you browse your hard drive. You can quickly scan the contents of files without launching a viewer or separate application.
- **Decode those unreadable email attachments.** Nothing is more frustrating than receiving an email attachment that you can't open. PowerDesk Utilities includes a powerful ***Email Attachment Decoder***, so you can right-click on a file to decode MIME/ Base64, BinHex and UUencoded mail attachments (it can create UUencoded files as well).
- **Keep your files private**. Protect your data with PowerDesk Utilities' own encryption, DES encryption, or completely remove all traces of a file through low-level deletion.

…and much, much more.

As I said before, I am always looking for the best utilities to make Windows work better, faster and easier. PowerDesk Utilities 98 is by far the **BEST** set of utilities I have come across for Windows 95. It is absolutely everything that Explorer should have been all along. It's almost like Explorer on steroids. And the best part is it works fine under Windows 98,

(PowerDesk.....Continued on page 12)

TPCG Help Line and Microsoft Access

By William Lamartin, Editor,
Tampa PC Users Group

The past few weeks I have received several questions from members regarding their computing and, I think, answered them satisfactorily. Let's see, I recall questions on not being able to reinstall Win 95, a missing CD ROM drive, getting a DOS program to run properly in a DOS window in Win 95, installing Win 95 C over Win 95, and Microsoft Access. I believe that my answers solved all problems except possibly with Win 95 C, which I had never heard of until a few days before at our regular meeting. I think it is basically Win 95 B with USB support plus Internet Explorer 4.0. I couldn't give a definite answer on this, only discuss with the member his various options.

I also know that several other members listed in our Help Line have been receiving calls to answer questions from members. Apparently the Help Line is providing a useful service. This is one of the functions of a user group, and, I think, it not only helps those who ask but also those who answer. That may sound surprising, but I find that in solving other's problems you are forced to better understand and clarify your thinking on the topics in question. The question I received on *Microsoft Access* is a good case in point.

I am a relatively recent convert to databases having gotten by storing most tabular data in Microsoft Excel until several years back when I bought my first copy of Access. Now, I had owned a database program before. It was called *Superbase*, and, if I remember correctly, was the first Windows based database. About six years ago we had a demonstration of it at one of our meetings, the members were offered a good price on it, and I bought it. I used it a bit but never really saw much advantage to using it over a spreadsheet to store my limited amount of tabular data—my fault, not the program's. A few years later, through, I used Superbase (then essentially out of business) to get a competitive upgrade to my first copy of MS Access. Two or three versions later, I have not only quit using Excel to store non-numeric data, I am becoming moderately proficient in Access' finer points.

A Microsoft Access database consists of a collection of tables, queries, forms, reports, and Visual Basic Code Modules. As I use it, my original data is in a table (consisting of rows called records and columns called fields) or, perhaps, in two or more tables; I then generate queries (other tables) by putting conditions on the records in my original data. The reports and forms are used to display answers to various questions I ask regarding the data. The Visual Basic code, if included, is used to accomplish manipulations of the tables that either are not possible with the other tools available in Access or are not easily possible. Additionally, one can write a separate Visual Basic program which will open up an Access database (totally distinct from using VB code from within Access) and perform the desired manipulations.

Here is where the member's Access question prompted me to sharpen my skills in Access: How to solve his problem by not resorting to a separate Visual Basic program that opened the database and did what was desired, since he didn't want to have to deal with a separate program. This forced me to figure out how to put the same code into a VB module within the database, have a form use this code and display the desired results. But, once I had gone this far, why not do away with the code altogether and somehow accomplish the same thing. After several days of off and on again thinking about the problem, I finally produced the solution using one extra query and one report—a far cry from my original solution. I assume that someone who works with Access every day would have immediately adopted this approach.

Now that I have led you this far, you might like to know the original question. A member had a database of recent car sales listing everything (probably from an auction) with fields for the buyer's name, address, ZIP, VIN, year, auto make, model, and much more we won't list. So a typical record might look like John Doe, 4254 Main, Saint Augustine FL, 32084, 4T1BG22K4VU071602, 97, Toyota, Camry ce/le/xle sedan 4dr.

The problem was to group the records based on the first word in the model field (not the whole field) and to count the number in each such group. One such grouping would consist of all sales where the model began with Camry, for example. Sounds easy doesn't it, and I suppose it is for database professionals. But several casual Access users tried it before it got to me with no solution.

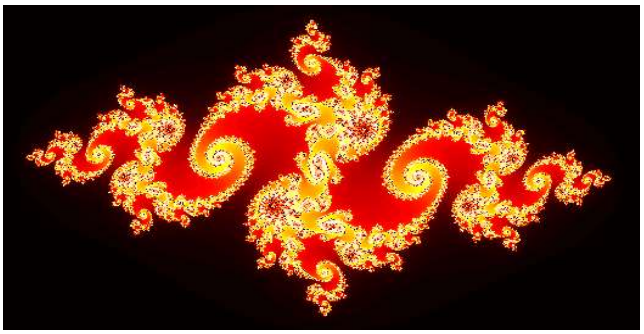
My first thought was to write a simple VB program to open the database, find all the different first words in the model field, count the number of records in each such group and display the results. This is indeed a solution as far as I am concerned. However, it requires one to step outside of the Access environment—and was not preferred by the one who presented me with the problem.

The next method was to create a VB module within Access that did basically the same thing. To display the results, I used a form with a list box based on a one column table, where the table's values were the results found in my VB module. To find the solution, all an individual had to do now was click on a button on the form causing the VB code in the module to run, which when finished updated the one column table whose values were then posted to the list box on the form, where a typical line in the list box might read "Toyota

(Help Line.....Continued on page 8)

(Comments.....Continued from page 1)

wasn't being used enough to justify the cost. And rightly so. The Internet has just taken over that function completely. If you'll look at our web site, you'll see a very, very good example of what can be done by a club. There isn't praise enough to describe William LaMartin's contribution, doing the newsletter AND the web site. For those of you who lament the passing of the BBS, go to the web site and post something of interest on the discussion group, won't you? We have excellent facilities on the web, with chat and threaded messages and more.



Our membership level is suffering, unfortunately. Please come to the meeting and bring a relative, friend or neighbor. And we need to discover the kind of services that will bring in new members, so please send in your ideas. All the officer email addresses are posted in this newsletter and on the web site. See you at the meeting.

IDT Motherboard Offer

For those of you who couldn't make it to the June meeting,

Internet picture of the month

A connected Julia set

This is one of many interesting fractal images at Fabio Cesari's Fractal Image Gallery. Fabio says he is a 22 years old student of computer engineering at the University of Bologna, Italy, interested in astronomy, chaotic systems and fractals. The address of his site is http://www.geocities.com/CapeCanaveral/2854/ .

One of the great things about the Internet is how it allows people to express themselves in a creative way and to share their interests with others.

There are many other sites featuring fractal images. A good starting point is the Yahoo category http://www.yahoo.com/Arts/Visual_Arts/Computer_Generated/Fractals/ .

T.H.O.R (FREENET'S COUSIN)

By Ted Rodenbach, Tampa PC Users Group

Last month I told you about the Suncoast freenet (SCFN). This month I'd like to tell you about another service similar to "freenet" called THOR. THOR stands for: Tampa Hillsbough Online Resource. It's similar to "freenet" in that they look about the same. And once you discover many of its wonderful features, you'll see what a powerful resource it is.

There are a couple ways to sign on. If you have already signed on to freenet (you did, right?), the way you log on to THOR is pretty much the same. There are two methods for logging on to THOR: Direct dial and indirect connect.

To log on indirectly, while logged on to "freenet" using the "J" command I told you about last month, type "thpl" Once you're at the desired menu, go ahead and select "Connect" to THOR" or "link 15" at the bottom of the list. This will connect you to the system via TELNET. After the connection has been made, you'll see a screen similar to SCFN. When asked to log on, log on as "thor". You don't need a password.

To direct dial into THOR, using your COMM program, dial 276-2770. The procedure, then, is the same for logging on using this method as going through freenet.

O.K, We're ready to get our feet wet and start exploring. I should mention that THOR uses the same operating system as freenet. So if you haven't read my last article, or are unfamiliar with UNIX, you might find the way THOR and SCFN work a little confusing. So if you are new to this, then go back and read my first article; you'll thank yourself later.

Once logged on, the first thing the system will ask you for is "What terminal type are you using?" I could go into detail on why these systems ask that, but in a nutshell, back in the old days, there were many different terminal types. And UNIX is very picky about what kind of hardware it's using. So, there came about things like VT standards and such.

When asked to select the type of terminal, select "VT100"; this is compatible with 99% of all PC's. Next it will ask you if you want to test your "terminal emulation". You can go ahead and say yes, but most of the time it'll be set up right, so the next time just say no. No pun intended.

Still awake? Hang on, we're almost there. At this point we're one click away from the main menu. Hit "enter".

From here, you'll see the welcome screen; once again, it's not much to look at. After you exit the main screen, you should see a list of different options from which you can select. I've spent time exploring each one and was very impressed with the depth of information I was able to find. There are an on-line dictionary, reading lists, events' calendar, and you can even check out your library record. You can even search for books in the library and reserve them on line! This was one of the most impressive features of the system. I've used it quite a few times, and every time it worked like a charm. What you do is, once you find a book you want to check out, use the menu to select "place a hold" or "PH" from the bottom menu. Then you select the library you want it delivered to, and as soon as it arrives, you get a call to come and pick it up.

If you go to "library catalogue", you can search any of the resources listed below by entering the number you want to use:

1. Library Catalog
2. American Heritage Dictionary
3. Bestsellers & Other Reading Lists
4. Clubs and Organizations
5. Frequently Asked Questions
6. Library Events Calendar
7. Print Saved List
8. TRAILS - Tampa History Index
9. VISTA: Online Indexes & Articles
10. Your Library Record
11. Logoff

Take your time exploring each one; you'll be amazed at what you find. If you want to spend a considerable amount of time using THOR, then use the direct dial method, since, if you connect to THOR through "freenet", you are still constricted to the 60 minute time limit.

VISTA: In my opinion, this is the best part of the entire system. Select number 9 from the list, and this will connect you though telnet to VISTA. I'm not exactly sure what it stands for, but it really doesn't matter. Once you connect, you see some text which tells you that you are connecting, and once again it'll ask you what type of terminal you're using. You can start to see why it does this. You are connected to a computer in Utah that doesn't know anything about you, or your provider's system. It does tend to get a little confusing. But as long you can remember VT-100 is the standard, you will have little trouble. Here is what you'll see.

MAIN MENU

* Indicates FULL TEXT is available.

Available search options:

Commands: SO = Start Over, B = Back, SL = Sort List, ML = Mark List, PR = PRint, <Return> = Next Screen, VA = View Article, L = Limit Search

When there's a "VA" in the title, it means that you can view the article online. You can also sort the list by author, subject, etc.

There are so many other features, it would take a novel to write about them all. But this is the crux of what you need to know to access the system. Also, when at the "THPL" in freenet, select link 14; this will give you even more information about THOR and its many features.

There probably are those of you who don't see the need for services like this. You figure that most of this stuff is already on the net, and why bother going through the trouble. In my personal experience, 98 percent of all useful information I've obtained Online has come either from local BBS's like our former Bits of Blue and a service such as THOR. I'm not saying that "the net" isn't bountiful with its own resources, but maybe it would be worth your while to pull off of the information superhighway and take a stroll down a country road. BBS's were around long before "the net"—well, at least the net as we know it today. So do yourself a favor and check it out. ◆

The + AND – of Internet Searches

By Larry Anders, Librarian,
Tampa PC Users Group

All of us who use the Internet to any extent have searched for something at some point on the web. Never before in history has so much, mainly free, information been so easy to access. But, because all this information is out there, finding what you're looking for often requires more than luck (although luck helps, too). The goal of a good search is to cut down the amount of time you spend sifting through all those search results for that proverbial needle in the haystack. The key is to create more accurate search queries using advanced syntax and Boolean logic operators that are available through most commercial search engines. But don't let the term Boolean logic throw you. You actually use it every day in conversation.

Boolean logic lets you set up relationships between concepts based on operators such as **AND**, **NOT**, and **OR**. For example, if you were looking for information on (football) stadiums but not (baseball) stadiums you might think of the logical relationship as being expressed by: find me stadiums with baseball and without football. Boolean logic just takes a simple statement like that and formalizes it a little, so it looks like this: "stadiums AND football AND NOT baseball." This query will find documents on the Net which contain the keywords "stadiums" and "football" but which don't contain the word "baseball." Most all of the Boolean operators also have symbolic equivalents. So the same query above can also be written as: "stadiums +football –baseball."

Some other Boolean operators are:

- "" (quotes) - Specifies that documents must contain the phrase within the quote marks. For example, "Tampa, Florida" will find documents with this exact phrase.
- OR (|) - This operator indicates a search for documents containing any of the terms joined by the operator.
- NOT (!) - This operator excludes documents containing the term that follows the operator. So, "salt AND NOT pepper" or "salt !pepper" will find documents about salt that don't mention pepper.
- NEAR (N) - This operator finds documents in which two words appear within 25 words of each other.
- (), {}, [], <> (parentheses) - This nesting operator can be used to group expressions when building more sophisticated queries. For example, (Marshall +Stephens) AND (appraisals |valuations) is a sample of a nested query.
- + (plus sign) - Placed at the beginning of a word, this operator indicates that the word is required. For example, Florida +beaches will return docs that mention both Florida and beaches.
- - (minus sign) - Placed at the beginning of a word, this operator indicates that the word must be excluded. For example, Florida -beaches will return docs only with Florida.
- *, ? (wildcard) - Wildcards can be used to truncate words so that results contain variations of a word. So, apprais* or apprais? will return results containing such variations as appraiser, appraisers, appraising and so on. These should be used more often.

(NOTE: Search engines may differ slightly on how to use the operators. The above list is typical but if you continually use one particular search engine you should probably become familiar with their requirements.) I use a free search utility called WebFerret (http://www.ferretsoft.com/netferret/webferret.htm), which I have written about in past newsletters, that searches multiple search engines at one time, and the above listed operators work fine.

For a complete list of the Boolean operators, next time you're on the Net go to: http://www.zdnet.com/products/garage/search/search.master/cheatsheet.html, and bookmark this page for future searches. ◆

(Help Line.....Continued from page 4)
Camry has 20 sales."

This, however, was still unsatisfying in some sense. I just knew that a solution existed using basically no VB code. When gotten, the final method of solution consisted of creating a query with an additional field displaying the first word in the model field gotten using as the definition of the new field the expression left$([model],InStr([model],” “) – 1). So you see that we didn't entirely get away from VB. Once I had this query, it was then a matter of creating a report that grouped all the records based on this new field (all the Camrys would be together) and counted the number in each of the groups—something that can be accomplished within a report if the right "buttons" are pushed.

So why have I drug those of you who have made it to this point through all of this? Mainly to show how one member's question lead me on a path of learning. Not only did I solve his problem, better yet I taught myself a bit more about Access which should help me in the future. ◆

Beginners' Column

By Merle Nicholson, President,
Tampa PC Users Group

Last month we had embarked on a journey to get an application icon onto the Start menu. We got as far as creating a shortcut on the desktop and hopefully we'll get it to the Start Menu this month. You may want to review last month's article. Our web site has the last several month's newsletters in HTML format and also the Acrobat Reader format. Go to http://www.canx.com/tpcug.

For just a quick review, have you set your Windows Explorer to show all files and their extensions? Remember that **Open** means Double-click and **Select** means one click. **Open** *My Computer.* **Open** *Drive C.* (Launches Windows Explorer). **Select** *View, Options, View.* **Select** *Show all Files*, **De-select** *Hide files of these types*, **Select** *Display the full MS-DOS path in the title bar,* and **De-select** *Hide MS-DOS file extensions ….* And last, **Select** *Ok.* Now look at last month's article and follow the steps to get an application's icon on the desktop.

I'd like to ask you, please; this article should not just be read. Sit at your computer and poke around and follow around with the mouse. All this needs practice to learn well. It isn't cerebral in nature, it takes experience and practice. I remember very well when I got my first computer with a graphical interface, an Atari 1040 ST. The first couple of evenings I was sweating it. I was convinced I'd made a very serious mistake spending a thousand dollars (for something without a hard drive) and I was never going to get the hang of it. After a few days, something just clicked in my brain, and I was having fun again, discovering how the thing worked.

Although you may want all your most useful icons on the desktop, there's a practical limit, when the desktop becomes so cluttered that you can't find what you want. And besides, application windows cover up desktop icons. What about the applications you need while you have other windows covering it up? What if a desktop icon is inadvertently deleted? That's easy to do. If it's on the Start menu, it's never covered up because it pops up over everything, and it's difficult to delete.

Let's look at the Start Menu. By default, when Windows is first installed, reading from the bottom is Sh*utdown, Run, Help, Find, Settings, Documents* and *Programs.* Since the menu is hierarchical in nature, expanding as needed, we'll call this level the *First*, or *Root* level. Some program installations add some items above Programs at the root. Office 95 and 97 do that. Personally, I like to reserve that right for my own stuff. So when Office put that "New Office Document" and "Open Office Document" at the root, I simply moved them to a newly created "MS Office" group myself. While Office is important to me, it's not so important that I want to skip around it all the time.

If you move your cursor to *Programs* and let it expand, this is where another level of items branch out. We'll call this the *second*, or *Programs* level. Most of the items at this level have new branches of their own that contain program items and also more branches. You'll see that for instance if you expand the level *Accessories,* that this level contains single items like *Notepad*, and also contains other levels like *System Tools*. Inside *System Tools*, there's nothing except items. I'm referring to single items as applications or shortcuts that do not have an expansion right arrow to go further. All this may seem obvious to you, I suppose, but my intention is to take the mystery out of all this because we need to relate this cascading *tree* to directories, or folders.

To successfully navigate this whole exercise, you may notice that we're having to learn a lot of background stuff that leads up to where we're going. That's ok. Hopefully we'll have a lot of background that'll be useful for a lot of other things. Like directories, also called folders. We'll call them *folders*. Ok, here we go. **Select** *Start*, **Select** *Settings*, and **Select** *Taskbar*. **Select** the tab *Start Menu Programs*. **Select** the button *Advanced*. Is the Explorer view a double pane, with *All Folders* on the left and *'Contents of C:\WINDOWS\Start Menu* on the right? Also if the details of the files on the right are not showing, ***Select*** *View* from the Explorer menu, then **click** *Details*.

Now, we'll explore just a bit. Size the window so that it's short, but wide, then move it to the top of your screen. Next move your mouse to the Start menu. **Select** *Start*, **Select** *Programs*, **Select** *Accessories*, **Select** *System Tools*. Then move to the explorer window, **click** on the folder icon *Start Menu*, and look at the items on the right. You're positioned at the root if the *Start Menu* folder on the left is *open*. Then **select** the "+" attached to Programs. It'll expand to folders. **Select** the folder icon *Programs*. Look at the right. You're at the *Programs* level.

In addition to Folders on the right you'll also see a couple of items -program icons -like MS-DOS and Windows Explorer. **Right-click** the *Windows Explorer*, and **drag** it to the left pane and **drop** it on the folder *Start Menu*. When the small pop-up menu appears, **Select** *Copy*. Then go back to the bottom of the screen, and look at the result. Above the Programs level, at the root, you'll see a Windows Explorer. What my intentions here are for you to see the relationship between this directory structure and the Start Menu. The *Start Menu* is just a collection of directories underneath a directory called c:\windows\Start Menu. Now let's finalize by selecting the icon for Calc.Exe we left on the desktop with the left mouse, drag it to Programs in the left pane and drop it. Select **Move**

Special Interest Groups

Communications/Internet SIG will NOTmeet in July.

This SIG meets the first Monday of the month at 6 PM at the Reflectone Building. **Directions: Proceed west on Waters from N. Dale Mabry across the railroad tracks, about 1.5 miles; take second left on Savarese. Proceed on Savarese until you reach the Reflectone building. Use the north door.** You must sign up to get on the list and to get by security. *Contact Charles Howe: at 968-1207 or HOWE@INTNET NET*

Genealogy SIG

This SIG meets the second Monday of the month at 7:00 PM at the Museum of Science and Industry. *Contact Jenny Lind Olin at 960-5723 or Ford Bond at 987-6309 .*

(Beginner.....Continued from page 9)

this time, because we don't need it on the desktop anymore. **Close** out the windows-all of them-and look at the *Start Menu*. You should see two changes. One is a copy of *Windows Explorer* in the root of the menu, and a nice location as far as I'm concerned, and also a Calc item under programs, which I would delete now. Go back through the instructions to open up the directories and delete the Calc shortcut. Just for the fun of it.

There are a couple of other ways to access the *Start Menu* directories, the most notable one being to **Right-Click** on the *Start* button, and select **Open** from that menu. This isn't my favorite way to do menu maintenance, but it will work, and I'd admit it's more of a personal preference.

Now you're in control of your own *Start Men*u. One of the things that will happen is that your second level -Programs level -will get too tall as you've added programs over time. If that's the case, it's time to reorganize. Move all your games folders at the program level to a new folder called Games, for instance. MS Office always moves its program items to the Program level. I prefer to make a folder MS Office and move all Office icons into that folder.

Practice. You're in control of this thing, and the more you do, the easier it gets.

If you're enjoying these articles -or not -and have suggestions for me, be sure to e-mail me. I'm looking for ideas and I do appreciate any feedback. MerleNic@tampabay.rr.com ◆

(Comments.....Continued from page 5)

IDT has given us four motherboards for review. We're taking names for the moment for volunteers to take these boards, assemble a complete computer from them and submit an article to the club newsletter. The boards and processors are yours to keep. The two 225's will be upgraded by IDT as new processors are available, and mailed to the current owner

There are two ATX motherboards with 225MHz CPU's and two 200Mhz, one an ATX and one a baby AT.

You'll need to either upgrade an existing computer by replacing the motherboard and other needed items or build a new computer from scratch. It may take as much as an additional $800 to complete the project.

One thing, if you're not aware, even if you have a Pentium now, chances are good that you don't have an ATX case. The ATX motherboard is taller, with the peripheral connectors built onto the motherboard where they're exposed through a large rectangular opening in the back. An ATX case is significantly more expensive than a baby AT.

In exchange for the articles, TPCUG will receive a full, completed computer for club use.

If you are seriously interested, will commit to assembling the computer and writing the article, please e-mail me at MerleNic@tampabay.rr.com or call me at 879-3602. In case of more volunteers than boards, we'll draw by lot. Thanks. Merle. ◆

President's Comments

By Merle Nicholson, President, Tampa PC Users Group

Good news! We're finally going to start the Visual Basic SIG August 18th. After some foot-dragging on my part, we have a classroom reserved at the Gateway Country Store on North Dale Mabry. This arrangement was made partly through the two Gateway employees Rich Podolsky and Beth Wood who gave us a very fine talk on Gateway last meeting.

One thing that I hadn't realized was the sheer number of Gateway customers in our membership! And those who mentioned it were all very positive about the experience. Nice to know there are good recommendations out there among us.

I would expect when someone in the group buys something, be it a complete PC or a printer or whatever, that he or she would draw on the experience of other club members, and except for short discussions at the meeting, I don't see much of that going on. We have the perfect forum for the exchange of information. All we have to do is use it – the discussion page on our web site. Won't you please go there today and see what's there? It really makes sense, and this is a perfect example of what a club is for – to post a message and title it "What's the best scanner?" and see just how many responses you get. I'll bet you would be surprised how much free information will be posted.

Even if you aren't in the market for anything right now, if you'll just scan the titles every day, you'll be bound eventually to answer someone else's question.

(President.....Continued on page 7)

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members. Our mailing address is P. O. Box 3492, Tampa, FL 33601-3492.

However, for business concerning this newsletter, Bits of Blue, please contact the Editor, William LaMartin, at 821 S. Boulevard, Tampa, FL 33606-2904; 813-251-3817; lamartin@ix.netcom.com.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII, Microsoft Write, Microsoft Word, or Word Perfect file to the editor at 821 South Blvd., Tampa, Florida 33606-2904 or to lamartin@ix.netcom.com.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

The use of trademarked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

Minutes of the July 8 Meeting

By Merle Nicholson, President, Tampa PC Users Group

We started with the Windows SIG at 6:00PM, led by Mary Sheridan. The purpose of the SIG is to provide a discussion forum for Windows issues and helping each other. The half-hour was easily filled with a lively discussion, mostly concerning Windows 98 and who has done what so far. We were reluctant to stop, but finally had to because the main event got set up and going - Gateway 2000.

Rich Podoisky and Beth Wood from the Gateway 2000 Country Store gave a very nice talk about their company, interesting facts about the company, about the founder and how he started the company. The founder simply started in his house building computers for people in South Dakota and expanded into his father's barn - hence the cow logo and barn theme in their advertising.

Beth and Rich led some lively discussions and gave out many T-shirts, pencils, cups and key chains to people who would speak up with answers. A prize was given to the person with the fastest computer, the slowest and for computer trivia. As the evening progressed it was obvious that there are a lot of Gateway computer owners among our membership. Some time was devoted to discussing various members' purchases. All the comments were very positive.

Beth and Rich talked some about the newest ads that offer a computer for $49 a month. It was understandable because the ads really do not offer much detail. But if I understood it correctly, the deal is simply a direct financed purchase of whatever computer you want with payments up to four years. After two years, Gateway will accept the computer back as a trade, with the trade-in value based on the "computer bluebook" published value.

Rich and Beth gave a lively, entertaining talk and we appreciate them coming out to talk to us. They're welcome back any time. During the break, we discussed arranging to use their training room for our Visual Basic SIG, and they were very enthusiastic about the idea. (See page 10 in this newsletter for information on the SIG)

As you know we have two door prize drawings - one for prizes and one for cash. We had good sales and some fun with it. The details - who won what - will be reported next week. ◆

Yeah Write

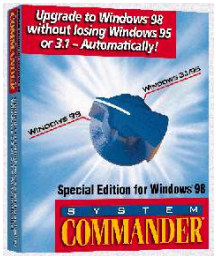
By Merle Nicholson, President, Tampa PC Users Group

Yeah Write is a word processor. It's an interesting word processor. That much I can say; interesting enough that I've been continuing to use it even though I have alternatives that I'm more familiar with. My own personal choice is MS Word, but I can't honestly say that I've looked at alternatives. And this is certainly ... well ... an interesting alternative. I'll say to you what I've been reminding myself. A word processor shouldn't cost $150 or $89. What about people whose word processing needs are simple? What about people who really can't justify the cost of a full blown word processor? What about simple?

There's always WordPad, isn't there? And Write in Windows 3.1? They're both more than adequate to write your credit card company a note when they've messed up and you want to tell them a thing or two. So why start a company and create a brand new word processor? I'll give it a try first by listing some features.

1. It's $19 or free or $29. Take your choice. (More later on this.)
2. It takes up 2MB on your disk when fully installed. (Do I care about this? No, but YOU might if your hard drive is limited.)
3. They're honest. Read the box. They list all the things it CAN'T do.
4. It's fast. (Does a word processor need to be fast? If you're running Win 95 on a 486, yes.)
5. It does a lot of neat things.

This is a new product. The company is made up of ex-WordPerfect employees in Orem, Utah. On the CD, if you buy the CD, is a 16 bit version for Windows 3.1 and also a 32 bit version for Windows 95, 98 and NT. The minimum requirement is Windows 3.1 with 4MBof RAM and 4MB of hard drive space. I'm not kidding.



This is my sixth document, including one FAX document. The program loads fast. And it starts where you last left off, even (especially) if you were last editing a document. All documents that you create seem to be contained "in" the word processor. You don't deal with external files, you simply select a tab and add more documents to a list of documents under the tab. The list gives you the date, the title and some of the first line of the text. You double-click on <New> to create a new one or double-click on an existing one. That opens an editing window with the date and title at the top and a text area for typing in the rest of the window. The edit area is sizeable. The tabs at the top classify all the categories of documents you can make. Starting with Address, then Diary, Email, Faxes, General, Journal, Letters, Memos, Notes, Text, To Do, and YW Info. This last is the documentation for Yeah Write, implemented as text. It's easy to use, and not complicated, just as you'd expect. You can add tabs of your own as I did for TPCUG and select the default document type for the documents under that tab. Each tab has a different form or "style" that pre-formats your document. This is very hard to describe. You'll not see a "Made for Windows 95" logo on this box!!

(Yeah.....Continued on page 8)

System Commander:
Special Edition for Windows98

By Don Patzsch, Tampa PC Users Group

This is a very interesting program. You do not need this program if you have SYSTEM COMMANDER 3.0 or SYSTEM COMMANDER Deluxe.

When you install this program, it makes copies of various components of the Windows95 program, or if you are using Windows 3.x, it will make copies of those program components.

The purpose of this program is to put a boot menu choice on your screen when you start your computer. If you now have Windows95, you will see--OS selection Menu. A: Windows95 B: Windows98

You may then select whichever operating system you wish to boot. That is the purpose of this System Commander Special Edition. Use this program only if you plan to install Windows98 UPGRADE. You do not need to set up a separate partition to install the UPGRADE. Another interesting feature is that the DOS boot sector virus protection checks for viruses on every boot-up. If one is found, the program replaces the infected boot sector and hidden files.

Remember, with this program, you may install the Windows98 UPGRADE without affecting your Windows95 or Windows 3.x system. Quite an unusual idea.

For User Group prices, contact sales@v-com.com. For a description of the program visit http://www.v-com.com/ ◆

PowerBASIC Console Compiler for Windows

By Tom Cone, Tampa PC Users Group

The **PowerBASIC Console Compiler for Windows** creates EXEcutables (.EXE) capable of running in the Win32 environment (Windows 95, 98 and NT). It's published by PowerBASIC,316 Mid Valley Center, Carmel, CA 93923. (http://www.powerbasic.com)

The program features an Integrated Development Environment for writing and debugging your BASIC code. It will feel very familiar to you if you ever worked in QuickBASIC, PowerBASIC for DOS, or (even longer ago) TurboBASIC.

What is a Console?
A console is a text mode interface connected right to the heart of 32-bit Windows. If you double-click on the MS-DOS icon in Windows, the window that opens with the C:\> prompt is your text console. In it you can execute commands such as DIR, CLS, COPY, etc. Additionally, you can run text mode applications such as XCOPY32.EXE and PING.EXE. These programs are actually 32-bit Windows applications which use special calls to the Win32 API in order to display text inside of the console window.

PB/CC eliminates the need for you to learn these special Win32 API calls in order to create console applications. The whole process is handled for you when you use the PRINT, LOCATE, COLOR, CLS, and other statements in the PB/CC language. This frees you to concentrate on the task at hand.

While not every application written for Windows will need to be a console application, the console seems suitable for many types of tasks. I, for example, have long been interested in database programming. Databases do not require sophisticated graphical components. Usually, it's "heads down" full speed keypunching data entry that's more important. Speed and ease of use are valued more highly than pretty screens. In that setting, having to lift your hand off the keyboard to position and click the mouse slows one down.

Every programmer is familiar with the "Hello, World!" program. It simply displays the greeting text to an end user. While not a significant program, it does measure two important things. The amount of source it takes to write a complete application, and the size of the executable generated by the compiler.

In Visual Basic I believe you have to create a form with a static text label and write the code to change the label. You then have to set the text of the label. And finally you have to access several different menu items and property sheets in order to configure VB to compile a true EXE as small as it possibly can. The result? About 1.9 megabytes of executable and runtime DLL files, I've been told from reliable sources..

In PB/CC only three lines of code are necessary,

```
FUNCTION PbMain()
  PRINT "Hello, World!"
END FUNCTION
```

And the PB/CC compiler takes care of the rest automatically.

There are some differences. Unlike most DOS versions of BASIC, PB/CC requires that all executable code be contained inside of a Sub or Function. Only scanned statements (such as meta-statements, constant declarations and procedure declarations) can be placed outside of Subs and Functions.

The following PB/DOS program:

```
PRINT "At the tone the time will be "; TIME$
BEEP
```

Simply needs to be placed inside of a Function called PbMain() in order to execute:

```
FUNCTION PbMain() AS LONG
  PRINT "At the tone the time will be "; TIME$
  BEEP
END FUNCTION
```

When your program is loaded, the function PbMain() is executed automatically by PB/CC. This is where the main code of your application should be placed. The program stops when there are no more statements in PbMain() or an EXIT FUNCTION is encountered.

By default, all variables are local to Subs and Functions. Which means they can not be seen by other Subs or Functions. If you need to share a variable or array throughout your program, you should use the GLOBAL statement to change the scope. This promotes modular programming styles, which can lead to more efficient programming and easier debugging.

Besides the text console interface, the publisher says PB/CC offers BASIC programmers complete access to the complete Win32 API. It supports all true 32 bit DLL's, including the Winsock API for Internet access and ODBC for accessing SQL and other database servers. Win32 console applications also have a 2 gigabyte flat memory address, so trying to fit everything into 640k or 16 megs of EMS memory is no longer required. A string variable can be many megabytes in size and the limitation on arrays is measured in gigabytes instead of 'k' bytes.

Internet picture of the month

I-95 & Palm Beach Lakes Blvd in West Palm Beach, FL

This is one of an almost infinite number of satellite photos available at http://terraserver.microsoft.com/, the Microsoft TerraServer site mentioned in the Editor's Comments on page 9. The photos come from US and Soviet satellites. You can view the photos at different resolutions, and for the best resolutions you can pay to download better quality images. Essentially all of Florida is covered, a fair amount of the USA and various other locations worldwide. I was interested in the above location since I spent some time there recently.

PhotoSmart Photo Scanner from Hewlett Packard

By William LaMartin, Editor, Tampa PC Users Group

This last Father's Day brought me something I have wanted for a long time, a scanner for negatives and slides. I have been using an HP ScanJet llcx flat bed scanner for, perhaps, five years to bring photos or printed text into my computer. But this scanner does not have the ability to scan negatives or slides. There was a negative scanning attachment (actually a new top for the scanner as I remember) available when I bought the scanner. The price was over $600. Needless to say, I didn't buy it.

The price of the new PhotoSmart Photo Scanner is $399. In addition to 35mm negatives and slides, it will also scan in a photograph up to 5" x 7" in size. It comes with a SCSI interface card and cable. When I first saw the scanner, my worry was how I was going to install it. If it required an interrupt, then I had problems, since, like many of you, my computer is out of interrupts. But a little thought and $35 led to a very nice solution.

The solution was to connect it to the already existent HP ScanJet llcx in a SCSI daisy chain. Specifically the llcx was already connected to a SCSI interface card in the computer, and the llcx had an additional SCSI connector on its back to connect another SCSI device. However, to accomplish this I had to locate a special SCSI cable that had a DB 25 pin male connector on one end and a Mini 50 pin male High Density connector on the other. HP sold one for $30, but I more conveniently also found one for $35 at a local cable store (Advanced Cable Connection Inc.). After connecting the new scanner to the back of the old one, I just had to set the new scanner's SCSI address to a different number than 2, which was used by my original scanner. Then, shut down Windows 95 and restart. Windows 95 finds the new scanner, and I install the scanner's imaging software.

To use the scanner you first select by pressing a button which media you are going to scan: 35 mm negative, 35 mm slide or photo. Second, you insert the item and the scanner takes it inside, where the software takes over and presents you with a view of the resulting photo on screen. For negatives, it will take in as many as five frames at once and display them on screen in thumbnail size. You then click on the one you want to work with, and, as with a slide scan or a photo scan, that one is enlarged on the screen.

Once on the screen, you can rotate, resize, modify the color, or change the brightness and contrast of the image. Additionally, you have a number of different formats in which to save the image file including tif and jpg. You may also specify the size of the resulting image. An 8 x 10 in the tif format will eat up about 5.5 MB of your hard drive. I mostly save my files as 4 x 6 tif images. If I am going to send the photo to someone in an email message or use it on the web, I will save it instead as a jpg file, reducing the file size considerably (using the standard 10:1 compression, a 4 x 6 photo with a 1.5 MB file turns into a 150 KB file).

Although the PhotoSmart scanner software is fairly adequate for correcting most simple problems like exposure correction and color correction, I prefer to simply scan it and save it. I then open the file in Corel Photo-Paint, where I have a much larger pallet of tools with which to work. If you don't have a graphics program like Corel Photo-Paint or Micorografx Picture Publisher, then HP has also included Microsoft® Picture It!™ photo manipulation software that lets you easily enhance your photos and use them to create photo projects on your PC. I didn't install this software since I already have Corel Photo-Paint..

The scanning resolution for photos is an optical 300 DPI; for 35 mm negatives and slides it is an optical 2400 DPI. Note that you need the higher DPI for 35 mm negatives and slides since you will usually be enlarging them so much more than you would a photo that you scanned.

Regarding quality, a scan of a negative produces a much sharper image than does a scan of a photo made from that negative. I have sent email with jpg images made from some negative scans, and people tell me they can not believe the quality of the images—the best they have ever seen.

(PhotoScanner.....Continued on page 7)

Ed Snow assembling the newsletter Aug. 1996—from a negative scan. Unfortunately newsletter reproduction does not lend itself to quality photos.

Microsoft Windows 98

Is it worth it?

One Guy's Opinion on Windows 98

By Larry Anders, Librarian, Tampa PC Users Group

Just in case you don't want to read the entire article let me tell you up front …. Yes, I think it is! Why? …. Let me tell you ….

First of all it's more stable and reliable. With Windows 98 you're much less likely to experience those dreaded lock-ups that everyone experienced with 95. The bugs of 95 (approximately 3,000 of them) have been corrected and Windows has been optimized to run the way you want it to and be much more reliable doing so. If you should have problems you can now access the Support Online Web site for answers and even update your copy of Windows. System maintenance is now much easier with the Disk Cleanup Wizard, which automatically deletes unnecessary files, and the Maintenance Wizard, which walks you through the scheduling of basic disk maintenance. If you're a power user, you'll love the Task Scheduler and System Configuration utility.

It supports all kinds of new hardware like DVD, MMX, and USB. You can now utilize more than one monitor at the same time. FAT32 on my computer recaptured 2.5 gigabytes of hard drive space. That alone made up for the $87 upgrade cost.

It's just plain all around faster. Internet access, hard drive access and memory access have all been tweaked to make Windows as a whole faster. Programs open faster than before. Choosing the desktop option to single-click, where you used to double-click, makes things faster and … easier.

If you're into the Web then you're into Windows 98 already because of the web integration that's built in. Although Netscape works fine under 98, Microsoft Internet Explorer is included and is as good as Netscape if not better. There's an Internet Connection Wizard to make connecting to the web a simple process. Also included is Outlook Express for your email, FrontPage Express to create your own web pages, NetMeeting to collaborate and hold conferences on the Internet, NetShow for streaming media, just to name a few.

The one thing I find humorous is the person who says, "Never buy version one of anything.…let them get the bugs out first". Years ago that may have made some sense but considering some 100 million beta testers have spent years testing 98 I think it's safe to say it's ready for prime time. And installation for me was really a snap. I just followed the instructions and in about 45 minutes I was upgraded.

No, it isn't as dramatic a change as it was from 3.1 to 95 but it's well worth the money and time. Do yourself a big favor and upgrade. For under $90 it well worth it! … and by the time your friends get 98 release 2 you'll already be a power user. ◆

(President.....Continued from page 1)

As my most recent contribution to the discussion page, I just started a discussion on Windows 98 tips that hopefully will grow as the members get going on Win98 upgrades. And look on pages 5 & 9 at the items on TerraServer! This is a database of satellite photos that you can get online. What fun I had using this, just finding my house on a photo taken from space! Thanks to William LaMartin who found this and posted it on the discussion group.

Also while you're at the web site, you'll notice some small changes William has been making to tidy up, including new background music. Read more about this on page 9.

So here's the message from the pres… Use our web site as often as you can and come to the meetings or tell us why not – we want to know. See the e-mail addresses under officers.

Finally, the TPCUG web site may be changing its URL late in the month. If you don't receive a new URL and can't find the site, contact me at merlenic@tampabay.rr.com or William LaMartin at lamartin@ix.netcom.com. Merle ◆

(Photo Scanner.....Continued from page 6)

The only thing missing from this piece of hardware is the ability to scan in negatives larger than 35 mm. I have a lot of large format negatives both from old photos—when all negatives were large—and from my more recent work with a camera using the 6 cm x 7 cm format.

HP has two companion pieces of hardware, a digital camera and a photo printer. Their prices are coincidentally $399 also. I have not worked with either. ◆

Moving Hard Drives

By Forest Wilcox, Tampa PC Users Group

I own two computers, one in New York, my home, and one in Tampa where I spend half of my time. Thus, I am faced with the problem of keeping them in sync with each other. I have struggled with full back ups, backups of files with the archive bit set using Iomega's Ditto tape and Zip disk backup drives. They work fine for most files, but I have found no way to transfer things like Window settings and Desk Top settings between the computers. The way I use my computers, these settings are constantly changing.

After successfully upgrading a hard disk from a one Meg drive to a 4.3 Meg, I was emboldened to carry the new hard disk with me as I traveled back and forth. I was also encouraged by the fact that both computers were of the same make (Acer Pentiums) and vintage, though one is a tower and one is a conventional desktop.

The first transfers weren't without problems, mainly getting the unlike modems to work. I had problems until I discovered Plug N'Play. It really works! All I do now is use Control Panel's Add New Hardware (Start, Settings, Control Panel) after physically installing the drive. I use the default settings, that is, let Windows search for new hardware. Now my Desk Top remains the same wherever I am.

Not willing to quit while I am ahead, I took my hard disk with me on a visit to my daughter in California. I could have made floppy copies of interesting things to exchange and demo, but why not demo the whole hard drive? My daughter's computer is an unknown clone, though a Pentium, and with Windows 95. We had that much in common. This transfer was interesting.

We went through the procedure using Add New Hardware but now Windows requested at various times the original Windows Upgrade CD and other original disks to pick off the necessary drivers and files needed for the strange computer. We had to repeat the process several times until Windows found no new hardware. The other necessary changes required were local telephone numbers for my AT&T Internet, Juno e-mail and Reuters Service accounts, all of which were obtained from 800 number telephone calls. Since this was a very temporary arrangement, we did not make a physical installation. We connected an unused power cable, borrowed the ribbon data cable and let the drive sit outside the chassis. This was an unqualified success.

A precaution, don't try to install the moved drive as a second hard drive; only one operating system per machine is allowed unless you have System Commander or its equivalent.

When I transport my hard drive, I use the anti-static envelope that it came in and then wrap it in bubble wrap. I have carried it in my carry-on luggage as well as put it in my checked suitcase. I am undecided about putting it through the security system, but have done it without a problem so far.

I still make a full backup before I transport the hard drive (using a Zip drive), but I do save the up to two hours required if I were to use the backup to restore onto a second hard drive. ◆

(Yeah.....Continued from page 3)

All this is organized under "Drawers" that you can name. A drawer is analogous to a folder, and indeed if you create a new drawer, it creates a new folder under the YW directory. When you create that folder you get a new set of tabs with blank lists for documents. If you look in the YW program directory, you can identify the drawers, but not the underlying files in them. This is interesting and may be very appealing to some people, because a lot of people have a concept that a document is "in" WordPerfect or Word. I've many, many times seen people who otherwise use computers efficiently use the file manager in WordPerfect 5.1 to move files. They open a file and save it in another location then go back and use WP's file facilities to delete in the old location. Those people will love YW, no doubt about it. Yes, there are a lot of businesses still using WP 5.1 for DOS, even on a Win 95 machine. I've seen them.

Now, the editing area is NOT WYSIWYG. To see the finished product, you press Print, and you get a graphic print preview. In preview, you can change some basic document format, paragraph style, tabs and font. That is, font, singular - because you can have all the fonts you want up to one (1).

It has a very, very fast spell checker. It's like in the olden days (1994) where you had to press the spell button. You can add your own words to the dictionary. By the way, the spell checker flags YW, Orem and WordPlace (but not WordPerfect) as needing correcting. There is a more traditional Windows Help available on a button at the bottom.

And last - file formats. Obviously it has its own internal format. The import and export formats are Yeah Write, WordPerfect 5.1, Text with ANSI, or Text ASCII Only. You can also import/export to an FTP site. The help suggests if you want to export to another word processor, use WP 5.1 format because that's the only one available that will preserve formatting and most word processors will accept that format. Interestingly, the file open and save as dialog boxes are old "short" file name boxes on my 32-bit version. That's an oversight and a serious disappointment to me, because it's very easy for the programmers to do. I wanted to export to the desktop so I could drop it in e-mail, but

(Yeah.....Continued on page 12)

Editor's Comments

By William LaMartin, Editor,
Tampa PC Users Group

As is usual, when there is empty space to fill in the newsletter, you are subjected to hearing about what I have been doing lately with my computer. This month I can write about a slight redesign of the TPCUG web site, writing a Visual Basic Program to teach a bird to speak, some interesting web sites, and, if room permits, some Microsoft Access and bulk mail topics.

Web site redesign For some time, I have felt that our TPCUG site http://www.canx.com/tpcug/ needed a face lift. It was beginning to look a little dowdy, so I selected a new photo of Tampa and modified the top 25% of the page. I also selected new background music for those who said they were getting a bit tired of Pachabel's Canon. And on many of the other pages I put at the top of the page some quick links to other parts of our site. That way one doesn't have to always go back to the main page to find the link to somewhere else at the site. I also made other minor changes throughout the site to make the pages look a little more consistent—nothing like a theme—just trying to make them look like they belonged together.

Unfortunately, when you make changes to a web page, it probably won't look the way you want on all browsers at all font settings and screen resolutions. I have received feedback from members regarding this problem and made changes to the layout to try and make it display better in the situations they described. If there are still problems with the display on your system, let me know. It looks fine on mine.

Visual Basic & Birds Some time back Larry Anders wrote a review of a program designed to teach your bird to speak. Well, we now have a new cockatiel in the house, and that came to my mind. But why should I buy someone else's program (although it was very cheap), when I could write my own in Visual Basic. That is the way that I have learned VB over the years—writing programs to solve problems that I encounter—not by simply studying the VB manual (back when they actually provided you with hard copy manuals).

The result is a fairly polished little program that allows you to record sounds up to 15 seconds in length, save them, and then play them for the bird to listen to a selected number of repetitions. You may record as many sounds as you like and select as many repetitions for play back as you like. I typically select 120 repetitions, since that gives the bird 30 minutes to listen to me saying something like "Hello..... Hello..... Hello..... Hello, Bird".

What I got from this exercise is a better understanding of the Visual Basic Multimedia control, which I had had no interest in using before. What the bird gets out of this, we will have to wait and see. Contact me if you are interested in the program.

TerraServer and HouseCall Online Virus Checking Each month in the newsletter I list the new and interesting sites I have come across since the previous newsletter. This month I have two real good ones: Microsoft TerraServer and HouseCall.

Microsoft TerraServer is at http://terraserver.microsoft.com. This is a site containing what is called the "largest database in the world". It contains satellite photos of many different locations on earth. Not every place is photographed, but all of Florida is. The photo of Tampa was taken in 1995. See if you can find your house. Look at famous locations around the world. Their photo of West Palm Beach is shown on page 5.

Reading ZDNet about the latest virus scare in late July led me to the most interesting site--HouseCall, a site that checks your computer for viruses while you are online. You have to be using either Microsoft IE or Netscape Navigator and not mind either an ActiveX component or a Java applet being downloaded and run on your computer (you have to trust Trend Micro). These programs scan that portion of your computer's hard drive designated by you for viruses, including CIH variants (which the ZDNet article was about). By doing this from the Internet, this removes the worry about whether the user's PC is already infected (some viruses apparently attach themselves to the virus checking program).

The site's URL is http://housecall.antivirus.com. It will take it a few minutes to load since it is setting up the Java applet or ActiveX component. The site has a certificate and is also recommended by ZDNet, so I suppose it is safe. It had better be since I used it with no ill effects so far. In fact, it found that some of my old Word documents were infected with the Word Concept virus. I had such a problem one or two years back. Apparently I didn't get everything cleaned up then (it is not a very bad virus, and , if I am not mistaken, Word 97 actually detects it and removes it--I just hadn't opened these files with this newer version of Word).

After finding a file that is infected, the program with your permission will attempt to remove the virus. If that is not successful, it will give you the opportunity to delete the file then and there. It cleaned up all my Word Concept infected documents.

Microsoft Access and MySoftware's MyMail List I continue to encounter people who need help with fairly large databases they want to extract information from to then use with bulk mail. In a typical procedure, I first import the database into Access, then using queries, retain only the fields needed and do any manipulations required of the data like combining house number, street name and apartment number into one field. One could then use this data for a mailing, but if you want to get the

Internet SIG

This SIG meets the first Monday of the month at 6 PM at the Reflectone Building. **Directions: Proceed west on Waters from N. Dale Mabry across the railroad tracks, about 1.5 miles; take second left on Savarese. Proceed on Savarese until you reach the Reflectone building. Use the north door.** You must sign up to get on the list and to get by security. *Contact Mike Hodges at hodges@reflectone.com* .

Genealogy SIG

This SIG meets the second Monday of the month at 7:00 PM at the Museum of Science and Industry. *Contact Jenny Lind Olin at 960-5723 or Ford Bond at 987-6309* .

Visual Basic

This SIG will hold its first meeting Tuesday, August 18 at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6 PM. For information, contact Merle Nicholson at merlenic@tampabay.rr.com .

(PowerBASIC.....Continued from page 4)

Here's a sample, furnished by the publisher, which I've modified to contain explanatory notes and to cause the text mode interface to remain on screen until the user presses a key.

```
==========================================
Hello, World!
Copyright (c) 1998 by PowerBASIC, Inc. All Rights Reserved.
        Modifications by Tom Cone, 6/23/98
==========================================
'$RESOURCE "HELLO.PBR"   'embed icon in executable if desired

FUNCTION PBMAIN() AS LONG   'PbMain is a user-defined function called
                            'by Windows TO begin execution of an
                            'application.
    COLOR 7,1    'set to white on blue
    CLS
    LOCATE 15, 10
    PRINT "Hello, World!" ;
    WAITSTAT     'wait for any key
      'program will end, and console
      'will close.
END FUNCTION
```

The foregoing code compiled to an EXE that was 9,725 bytes in size. That's less than 10k of 32 bit code. The program will run under Windows 95, Windows 98, and Windows NT. It will not run under Windows 3.x When you run the program a text mode window opens on screen. It's resizable and moveable with your mouse. It seems to behave exactly like a DOS mode program, except that it's actually a 32 bit Windows program. If you're curious what it looks like, send me your e-mail address and I'll send it to you.

The program has other features including support for WinCGI applications, but does not support ActiveX controls. However, it does include support for threaded processes, an inline assembler, and other advanced features that I'm not familiar with (yet).

System Requirements

- Personal computer with a 80386 or higher processor
- Windows 95/98 or Windows NT 3.51 or later
- 2 MB of available memory
- One 3.5" high-density disk drive
- A hard disk with 3.0 MB available for installation

PB/CC version 1.0 is priced at $149 plus shipping.

Documentation for this product is provided in electronic form, as it allows the maximum amount of information, without the physical size limits of a book. Optionally, printed documentation can be purchased for $29 plus shipping. ◆

(Comments..... from page 9)

best bulk mail rates, you will need to CASS (a postal term) certify the list. That is where a program like MyMail List comes in. It is a specialized database program for mail management. It also comes with an extra CD (for a fee) that has the most current postal address information. After importing the modified database into MyMail List, you then do an address check using this CD. When you are finished (3.5 hours for 61,000 names), you have a CASS certified list. Now you can select the whole list or any subset of this list using a filter (e.g. voted in last election field is True for a database of voters), and MyMail List will print the mailing labels in the correct order and prepare the necessary forms for bulk mail. It is a bit more complicated than this, but you get the idea. ◆

(Yeah.....Continued from page 8)
I had to drill down to the desktop folder with this.

Now ... what it won't do .. taken from the back of the box: Tables, Columns, Multiple fonts, EndNotes, Footnotes, Table of Contents, Index, Headers and Footers. I'd miss Footnotes and, of course, graphics. If graphics were implemented in the same manner as WP 5.1 for DOS, I could use this baby for all my word processing needs.

For what Yeah Write does, it does well. And it does it cheaply. I like it. Thanks to Stacie Bise for sending it.

There's a free version, both 16-bit and 32-bit on their web site http://www.wordplace.com. After downloading, you can keep the free version, or you can use it for 15 days as a trial version of the $19 standard product. After sending the $19, they'll send you an email message with a name and registration number. And if you find it in a store, it's in a nice standard package on CD for $29.

Meeting Preview: At the December meeting, El Shaddai Edwards from Jasc Software will be giving the presentation. He will demonstrate Paint Shop Pro. Come out and see a great graphics program. Mary Sheridan, as usual, will conduct a 30 minute Windows discussion at the beginning of the meeting. Possibly she will tell us a little about her trip to COMDEX.

President's Message

By Merle Nicholson, President, Tampa PC Users Group

Last reminder, everyone. The election of officers is this December meeting. Please attend the meeting and show your support for your club.

On that note, I'd like to recognize those people on the Board of Directors who contribute so much of their own time to make this club possible. TPCUG is an organization that offers a quality contribution to the membership and to the community. The club obviously doesn't run itself; and it's only through the dedication of the board and the membership that it remains a viable organization.

Mike Hodges, as TPCUG Vice President provides experienced organizational ability to the board. He's willing to step in and keep our meetings on track. He offers experience and insight and creative ideas. Mike is also our host at Reflectone for our board meetings and the Internet SIG, a resource that would be very hard to replace.

Kevan Sheridan, as TPCUG Secretary and very long time member, has donated his time to help track our ongoing projects and discussions. He's always in there at the meetings to help with anything needing doing. He's going off the board as secretary next year, but we fully expect him to carry on as before.

(President.....Continued on page 2)

However, for business concerning this newsletter, Bits of Blue, please contact the Editor, William LaMartin, at 821 S. Boulevard, Tampa, FL 33606-2904; 813-251-3817; lamartin@ix.netcom.com.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII, Microsoft Write, Microsoft Word, or Word Perfect file to the editor at 821 South Blvd., Tampa, Florida 33606-2904 or to lamartin@ix.netcom.com.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users' groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

The use of trademarked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

Minutes of the November 11 Meeting

By James Weber, Tampa PC Users Group

The November meeting started with Mary Sheridan presiding over a Windows SIG. As usual, several topics were discussed. The idea of recycling old motherboards or recovering the gold from computer components was probably the most intense. There appears to be quite a few people in the group who have old equipment that they might be willing to part with.

Robert Armstrong from BCD was the guest speaker. He related very interesting information about Intel's strategic plans for the next few years, including the Xeon and Merced processors, and AMD's new K-7 chips. Mr. Armstrong then made a brief sales pitch for the "Flash Net" Internet service.

After a brief beak, we had the door prize drawing. Bruce Register and Roger waters were among the winners. ◆

(President……..Continued from page 1)

Jenny Lind Olin, TPCUG Treasurer, stepped into the job at the right time last January when we thought we might not survive financially. Jenny leaves no doubt where every penny of our club money is. I can't tell you enough about how difficult club life is when the financials aren't in order. An organized treasury enables the board to make decisions with minimal discussion and maximum dispatch.

Those three and I are the four elected board members. The other board members are volunteers. They're appointed by the board and have full voting rights in board decisions.

Mary Sheridan as TPCUG Programs Chairman made up her own job. She was on the board as BBS Sysop and filled a job that was very badly needed as Programs Chairman, then proceeded to eliminate her old one as Sysop. Mary has done an outstanding job getting quality speakers in and is a very major contributor to our success.

William LaMartin is Newsletter Editor and Web Site Editor in one, and I need not point out the dedication to quality William brings to us. You can see that for yourselves when you get the newsletter and use the web site. One thing he had done when he took over the job was to make the newsletter an "All TPCUG" newsletter. All articles are submitted by members, where previously many articles were reprinted from other clubs' newsletters. What isn't so obvious is that he also prints, folds, staples and mails the newsletters also, with some volunteer help. He dedicated no small amount of time in getting our web site moved to another internet provider and got the club's web name

(President……..Continued on page 6)

ZIFF DAVIS SHAREWARE AWARDS

Summarized by: Larry Anders, Librarian
Tampa PC Users Group

Ziff Davis (ZD) publishes several excellent magazines for the personal computer user. I know because I have subscribed to a few of them for years. They also have one of the best web sites on the Internet for computer users at http://www.zdnet.com. Recently ZD held their 5th Annual Shareware Awards and have published their winners at http://www.zdnet.com/swlib/zdawards/zdawards.html#Winners. Not only are just the winners listed here but all the runner-ups for each category are also listed. Below is a summary of the winners of each of the categories selected by *PC Magazine*. All of these files can be downloaded from the above link.

APPLICATIONS: NoteTab Pro, Eric G.V. Fookes NoteTab Pro is a powerful editing tool especially suited for programmers and web developers that can open multiple documents of up to 16MB each in their own tabbed window. NoteTab's Editor's Clipbook tool lets you easily insert any kind of boilerplate text, such as HTML tags, glossaries, etc., into your documents. Many conversion functions are included, such as stripping HTML tags, changing text to HTML, sorting lines, converting between ASCII and ANSI, and changing case. Some features include the ability to open links or view documents in your web browser, search-and-replace text in all open documents or disk files, format outlines to organize notes, and calculate mathematical expressions. The evaluation edition is functional for approximately 30 days. Spell checking and thesaurus functionality are available once you register. Free to try; $19.95 if you decide to keep it.

DESKTOP ACCESSORIES: Judy's TenKey, Judy's Applications Judy's TenKey Calculator is regular calculator, RPN, or ten key adding machine, that uses a tape that can be saved, printed, notated, and even edited. It's very versatile with a good introductory demo of its many capabilities. It supports scientific notation, and can smoothly exchange data with other Windows applications. This versatile calculator can be nearly whatever type of calculator you need it to be at the time. Free to try; $19.95 if you decide to keep it.

BUSINESS: Power Utility Pak 97, JWalk & Associates Power Utility Pak 97 adds 31 general-purpose utilities, 40 custom worksheet functions, and enhanced shortcut menus to Microsoft Excel 97. Run Power97.xla only when you need the features or install it to the Excel add-in list. This shareware version gives you information and help for all of the features, but they are not all functional until you register. System Requirements: Microsoft Excel 97 and Windows 95. Free to try; $39.95 if you decide to keep it.

COMMUNICATIONS: WinProxy (Ositis), Ositis Software WinProxy lets you connect multiple computers on a LAN to the Internet through a single point. It runs on any Windows 95 or NT. The program walks you through setup step by step, providing guidance all the way. All Internet interactions are then seamlessly routed through the WinProxy server. Save money by using a single Internet account, modem, and dialup or leased line on one station for all Internet accesses. Free to try; $299 if you decide to keep it. (This is by far the most expensive shareware program I've seen!)

E-MAIL, NEWSREADERS, CHAT: ICQ (32-bit), Mirabilis Ltd. ICQ means "I-seek-you," And it's free! (And you know how I like free things.) ICQ lets you communicate directly (no IRC) with any other ICQ user on the Internet, either by direct messaging or in a text-based windowed interface for multi-person chat. ICQ has dozens of options such as file transfers and linking to audio/visual chat applications. It's simple, operates seamlessly and is well documented. And it's FREE!

FILE UTILITIES: Turbo Browser 98, Pacific Gold Coast Corp. Turbo Browser 98 is a file-management replacement that mimics the Explorer interface but adds a viewing window. With support for dozens of file formats, it can convert, print, zip and unzip, and even encrypt files. The system is tightly integrated with Explorer's options, plus offers all the conveniences, such as drag and drop, rename, cut, copy, paste, delete and more, and it makes the same right mouse menus available to you. Free to try; $69.95 if you decide to keep it.

GRAPHICS & MULTIMEDIA: Screen Saver Toolkit, Stardust Software The Stardust Screen Saver Toolkit can help you to build a professional-quality Windows 9x/NT screen-saver product without programming knowledge. It uses wizard interfaces to create a slideshow or presentation style screen-saver application. The system supports common image formats and .avi videos and includes an image conversion utility. Free to try; $249 if you decide to keep it. (Another expensive one!)

HTML EDITORS: HomeSite, Allaire Corp. Homesite was originally a highly functional non-WYSIWYG HTML editor. Now it has drag-and-drop WYSIWYG editing and an abundance of other features and functions and well-written help documentation, including sections on HTML tags and web page design. Free to try; $89 if you decide to keep it.

INTERNET UTILITIES: WS_FTP Professional, Ipswitch, Inc. WS_FTP Professional is a 32-bit Windows FTP client that provides two intuitive interfaces for easily transferring files and directory structures between FTP servers and your local computer: classic WS_FTP interface and a new Explorer-style interface similar to My Computer. You can group select multiple files and/or directories and transfer them in a single operation. Features include firewall support, UNIX permission

(Shareware.....Continued on page 4)

(Shareware.....Continued from page 3)
switches, basic transfer logging, and a comprehensive logging option. Many display features can be customized. Also included is WS_FTP Pro Explorer, an extension for Windows Explorer that lets you transfer files via FTP. Full online help is provided. Free to try; $37.50 if you decide to keep it.

PROGRAMMING TOOLS: Setup Specialist 98 TG, Byte Software Setup Specialist offers a user-friendly visual development environment that does not require you to learn any script language; you set all options using a wizard-like graphical interface. Setup Specialist provides a training card feature that guides you through each step of creating your 32 or 16 bit setup program in English or in German. Each program you create features the typical Windows 95/98 Wizard. Setup Specialist supports selective installations, uninstall, creation of program groups, and Registry modifications. It can check for a variety of existing requirements -- including minimum display properties and CPU, Windows platform and version. Because it creates a single .exe file, you can easily distribute your applications through the Web, Internet, or even email. Finally, Setup Specialist supports many other features, such as billboards, checking for an expiration date, and efficient data compression. Free to try; $89 if you decide to keep it.

SYSTEM UTILITIES: Take Command/32, JP Software Take Command/32 brings the power and convenience of the popular 4DOS Command.com replacement to the Windows desktop. If you're a diehard command prompt user, you'll find this utility useful for performing tasks such as managing your hard disk, scripting a series of steps with a batch file or alias, or starting programs. The program's many features make it well worth a look by anyone who frequently uses the DOS command line from within Windows. You can try it out for 21 days before registering. Free to try; $69.95 if you decide to keep it.

WEB DEVELOPMENT: GDIdb, Global Data Industries GDIdb is a tool for anyone who needs to create, manage, and present an ODBC database or spreadsheet on a web site. It works from your local PC, with an intuitive, dockable toolbar environment for generating operational scripts containing all the necessary HTML to transform an existing database into a fully functional "data server." The only requirements are the data source and a dial-up connection to your web site. GDIdb even includes a built-in FTP interface and transfer-progress indicator for automatic publication and management of your new pages. You can evaluate this well-documented trial version for 30 days. A sample MS Access database is included. Free to try; $38 if you decide to keep it.

So if you're into Shareware as I am…. Merry Christmas! …. If you're not into Shareware…. Merry Christmas anyway. ◆

My Favorite Software – Info Select 5

By Tim Condon, Tampa PC Users Group

It seems that---with William LaMartin asking for articles on a regular basis---we might want to consider sharing "a few of our favorite things"…namely favorite software programs. You know, the one that you use for just about everything, and you can't imagine switching to another program because this one just does perfectly for you what it's supposed to…**so** well? (For instance, I think we can all agree that WordPerfect 5.1 for DOS was the premier word processor in all of history, and it's been downhill ever since then…but that's another story.)

Well, let me be the first to lead off. I've been using computers in my law practice since about 1985, when I finally figured out how to use DOS on the 40-pound Zenith Z-160 "luggable" that I'd bought with the two 360K floppy drives and the tiny orange CRT. Sigh. Those were the days, weren't they? But I digress. Back in the mid-1980's there was a little pop-up TSR ("terminate and stay resident," lest we forget) program that was advertised in all the computer magazines called "Tornado." It wasn't quite totally clear what the program could or would or should be used for, but the marketing campaign said it would be mightily useful…if you could figure out what you were gonna do with it.

At that time Tornado was one of a nascent class of programs that years later would come to be called "PIMs" (personal information managers). Of course, no one called it that then, because no one had ever seen anything quite like it. It was originally trumpeted as a terrific way to keep names, addresses and telephone numbers, as well as "random information" (whatever that meant). Well, as a shiny young lawyer I figured I had more than enough random information to keep track of…so I took a flyer on the program and bought it…I think it was $39.95 or something like that.

Now this brings me to another digression, but one that will lead us back to little Tornado's latter-day incarnation in due time. Have you ever noticed that---in years past, at least---one of the hardest things to figure out about software was…how you were gonna use it? Like, how you were going to actually put it to work so that it fit your circumstances, your work structure, your…your…way-of-doing-things? Even today I find that's still a Major Question. Well, in those nether days of yore, when we were all fiddling around with DOS and DOS programs and TSR's and these newfangled things called "word processors" (remember what a sensation WordPerfect 4.2 caused?), I couldn't exactly figure out how I was going to use Tornado…but I figured that I could at least start by using it for my address/contacts/telephone book. And it served that purpose well, as I remember.

(Info Select.....Continued on page 5)

(Info Select.....Continued from page 4)

Well that, as they say, was then. And this is now. My favorite program, the one that gets cranked up in Windows 95 at the very beginning of the day, and the one that is repeatedly used for all kinds of things, is Info Select 5.0, the latest end product of its distant ancestor, Tornado (when they made the jump from DOS to Windows, I heard, they got into some kind of copyright snafu with some other Tornado-name-user, so they switched the name of the little program to the inelegant but pretty descriptive "Info Select").

Now, before I tell you the myriad ways I use Info Select, I've got to say there's a funny thing about it: Many of the computer world pundits and reviewers don't seem to like it…or understand it. When you sniff out a "comparison" review of PIMs on the Internet, you'll often find the writers scratching their heads over Info Select. The "standard" PIMs like EccoPro and Lotus Organizer and Act! and even Time and Chaos32 and Above & Beyond…well, those they can understand just fine, with all those clear little boxes and fields and fill-in-the-blank thingies. Problem is…Info Select doesn't have just about any of that. It just lets you---no, no, it insists that you---figure it out yourself and then set it up and use it the way you want.

That seems to unnerve a lot of computer users, especially the pundits. I had a friend, Chad, who asked me what PIM I would recommend, back in the late '80's. I was only too glad to tell him about Info Select. Well…he tried it, and he couldn't stand it. Just couldn't get comfortable with it. He…just…couldn't "figure it out," that is. He couldn't figure out how it was that he was going to use it. Strange, I thought. But then he got an early version of Lotus Organizer…and oh well,

Internet picture of the month

Front Dining Room at Antoine's, New Orleans, LA

Antoine's Restaurant in the New Orleans French Quarter is one of the great restaurants of America. Antoine's has been in continuous operation since 1840 under the same family's management. If you can't make it there for a meal just now, you can still pay a virtual visit at http://www.yatcom.com/neworl/dining/antoines/netscape/welcome.html

Chad was in hog-heaven with that little program. Thing was, I couldn't see how Organizer had any versatility or usability at all compared to Info Select….

Well, again, "that was then, this is now." Since the 1980's when a few of those little babies were popping up here and

(Info Select.....Continued from page 5)
there, modeled for the most part on existing paper organizers… since then a whole galaxy of those little huggers has appeared. Oh, it's just been grand. First of all, the suites all had ta have a PIM as a component, from Microsoft Office's "Outlook," to Corel WordPerfect 8's "CorelCentral," to the aforementioned Lotus "Organizer" (and Organizer 97, and Organizer 97 GS, and Organizer Premium Edition…sheesh), they've all become tails that sometimes wag the dog, an indispensible part of every suite.

And the rest? Oh yeah, "the rest": You get to choose. From EccoPro to Act!5.0 to Day-Timer Organizer Deluxe, to Franklin Quest Ascend, to Janna Contact 95, to Maximizer 97is, to Pack-Rat, to InTouch, to Comm Assistant, to PhoneBook95 Professional Edition, to Virtual Secretary, to Above & Beyond, to Time and Chaos32, to Client Tracks, to Organizer 97, to Quick Organiser, to AMF Daily Planner and PIM, to…to…well shucks, we can go on like this all day, and then all next week naming these little boomers. It's like there are more PIM's out there than cockroaches, and they seem to be multiplying almost as fast! It's like everyone with a keyboard has decided he's gonna bat out the dee-finitive PIM and slap it on the Internet… and it seems they're all just doing just that!

But I digress again. I was talking about my little gem, Info Select. Now, lemme tell ya this about that little enchilada! Oh. Oops…William says wait! William says I can't do unlimited babbling in a single issue of the newsletter. So I'll reluctantly shut up for the time being. Next newsletter, I'll tell you all about my baby, Info Select, and the myriad ways I use it.

In the meantime, I'm sure the rest of you have just as strong feelings about your favorite PIM! How's about we get some kind of Socratic dialog going here? Everybody send William a few nicely-crafted paragraphs about why your PIM is the best in the world, and what specifically you like about it, and how you use it and how it perfectly fits your work-style and needs. You know, all this brings a thought to mind. It's a great thing, the destruction of the commies' Evil Empire. I mean, look at us, we all get to not only pick our own software and tools from a universe of choices, but we also get to argue loudly and long about all of 'em. Without being shot. Of course, to my mind, anyone who doesn't cop to the extraordinary superiority of Info Select…well, they should be shot! But I'll tell ya all about it next month. ◆

(President……..Continued from page 2)
registered.

I should also take a moment to thank all those who contribute articles for the newsletter each month. There is a fairly small

Memory & Office Problems

By William LaMartin, Editor, Tampa PC Users Group

Memory My Gateway P-166 now has 96 MB of memory. However, the process of putting it in was a little convoluted.

I bought two 32 MB SIMM modules for $40 each at CompUSA with a $40 mail in rebate. That seemed like a pretty good price—remember when a 1 MB SIMM was $40? Unfortunately before I went to CompUSA, I opened up the computer to look at the RAM that was already installed--two 16 MB SIMMs. To get a better look, I took one of them out. Then, when I tried to reinstall it, it wouldn't go in. A little investigation revealed that its socket on the motherboard now had a problem. About five of the 72 metal wires that run parallel to each other along the inside of the socket had sprung up from the bottom of the socket. With a fair amount of force you could insert the SIMM, but when the computer was rebooted it let you know that there was a problem by emitting a collection of loud beeps.

Fortunately I could install the memory I had in the two other sockets on the motherboard, and everything was fine. That meant, however, that I couldn't install any new memory in the two sockets that had been in use before the problem. So I called Gateway, and they offered to send me a new motherboard—not bad for what they thought was a one year warranty on a computer that was over two years old. However, when I convinced them that I actually had a three-year on site warranty, they agreed to send the motherboard with new memory, processor, cache, etc. for a technician to install. Everything was to be exactly like the original.

The technician came, did the installation, and everything worked fine except the network card and the scanner SCSI card. They were conflicting with each other, and he couldn't remove the conflict. I couldn't either--even with an uninstall and reinstall of each item in the Winnows Device Manager. Since I had solved such problems in the past, I told him not to worry about it and sent him on his way to his next appointment. About 15 minutes after he left, I had everything working. There was a BIOS setting for plug & play that was set incorrectly. Once I changed that, the cards were assigned different interrupts (something that couldn't be done earlier), and everything was in good order.

Office 97 If it is not a hardware problem, then it is a software problem. I know you think I probably make up these problems just to have something to write about, but that is not the case. I have enough problems occur naturally that there is no need to manufacture them, believe me. Of course, I may have a lower tolerance of things not working correctly than most people do. If something is wrong with my computer setup, I want it fixed. My Microsoft Office 97 saga is as follows:

The Win Chip C-6 Processor

By James Weber, Tampa PC Users Group

At our June 10th group meeting, a representative from IDT/ Centaur, Mike Bruzzone, spoke about the new Win Chip or C-6 processor. Two chips with a board were offered to the group for evaluation, and I was one of the ones to receive a Win Chip Processor for evaluation.

The processor I received was one of the 225Mhz ones with a Tyan motherboard. I purchased all parts for the test system new so as to limit any hardware problems later on down the road. I purchased a Samsung 2.1 gig hard drive, 32meg SDRAM memory, a Trident 4meg AGP video card, U.S. Drives 24X CD-ROM, Ensonic PCI sound card, a Diamond 56K V.90 PCI modem, and a new ATX case. The only things used were my PS2 mouse and keyboard and a Maxtech 15" monitor.

I had no difficulty installing any of the components. I always build a system one piece at a time starting with the motherboard/processor, video card, and memory; I tend to stop after each component and turn on the power. This way if a problem develops I can isolate the newest component to see if it is defective or just causing a conflict with another device. After a bare bones construction of motherboard, Win Chip, memory, hard drive and video card, I did a bare system format of the hard drive. This was just enough to start up the system and check the functionality of the primary components. The bios recognized the Win Chip right off and booted to the hard drive without a hiccup. I next installed the 24X CD and loaded its DOS drivers and copied the setup files from the Windows 95 CD. As a rule I load the necessary files from the Windows 95 CD onto the hard drive and install from there. This allows me to change or add system settings on the fly without the need to swap out CDs. This also allows me to check the function of the CD in DOS mode just to be sure it works.

A new, clean, installation of Windows 95 ran fine on the first attempt, so I began to add the rest of my components. An Ensonic PCI sound card and Diamond PCI 56k modem rounded out my hardware. Again, all the new components installed and worked properly. A brief note about PCI modems. Windows 95 and 98 will install these cards and will not give any indication that there is a problem. A quick check of the System Properties box will not show any conflicting ports or memory addresses. However, the modem will fail to initialize in some cases. If you should ever have this problem, either disable one of the two serial ports from the motherboard in the bios, or go to the Control Panel \ Add Hardware button and add one or two more Comm ports to the system configuration before physically reinstalling the card and drivers. This error doesn't happen often, but it has happened enough for me to be cautious building a system.

I was able to run Windows 95 on the Win Chip without problems. I ran through all the accompanying programs that come with Windows and left it running for a week with various system utilities set to run during the day. I never had a system crash or lock up, and the processor showed no signs of over heating. Next, I loaded up Microsoft Office. Again, everything worked well. Word, Excel, and Power Point all responded without hang-ups. Internet access was not affected by the C-6. I used both AOL and Mindspring for Internet access with both Netscape and Internet Explorer running as browsers at different times. I didn't experience any difference in performance with any combination of these programs. I then loaded up a copy of Quick Books and ran my bank statements from the last year through it. (Had to do it sometime.) I left the machine running the whole time to look for any instability. Even though I still can't balance my checkbook, I didn't experience any problems with any of the programs I installed. The most remarkable thing I can say for the C-6 was that it didn't cause me any trouble up to this point. The whole experience had been remarkably uneventful.

Finally, I came across something the Win Chip couldn't handle: Games! Now, I know some of you don't think the use of games is important to the overall computer industry, but just look at all the money Americans spend on computer gaming every year. And I guarantee that any computer system you could possibly imaging will at some time have games running on it. I have a benchmark demo of Forsaken and Quake II that I used for my test. Forsaken refused to run at all beyond the introduction. Quake II was unstable at a resolution higher than 400 X 300. Even at low resolution, frame rates were never higher than 15 to 25 fps. I installed an Intel 233MMX chip into the motherboard at the end of the test, to see if my problems were video card related, but these games ran appropriately with the Intel chip.

The system I configured for this test was probably left running continuously for three weeks. Other than the few game problems I liked working with the C-6. In an office environment the C-6 would make a legitimate alternative to Intel or AMD for a Windows workstation, but don't expect the C-6 to be an inexpensive replacement for that new P-II Junior wants. ◆

(Comments…….Continued from page 6)

I noticed in MS Access that I no longer had the office assistant working properly—you know the little thing that bounces around on the page, makes noises and is there to assist you--so I reinstalled Access from the CD. That got back the assistant. I then figured I needed to reinstall the two Office 97 patches SR-1 and SR-2. Neither would install. The Sr-1 log file said that it would not install because it encountered incorrect ver-

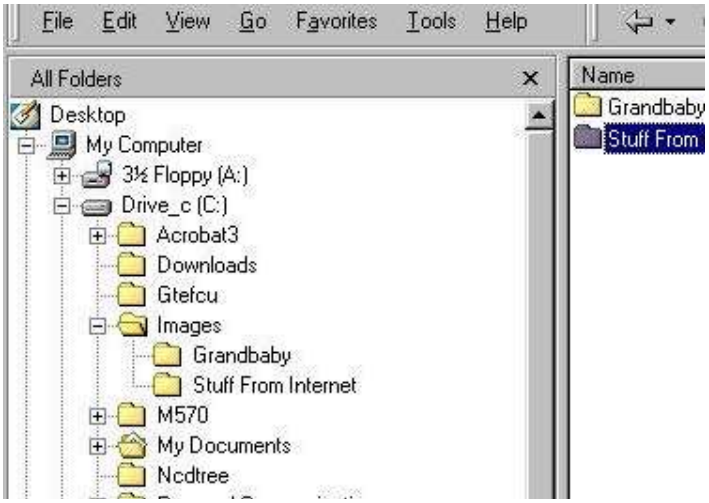
Beginners' Column: Files & Folders for the Folder Inhibited

By Merle Nicholson, President, Tampa PC Users Group

Because of a completely overwhelming response from my one fan, I'd like to review files and folders this issue. I know it seems pretty fundamental, but have you ever, say, downloaded a file from the Internet and then can't find it? Or has someone sent you an email attachment and, after dragging it to the desktop, have you realized that there are twenty other files on the desktop, and it's gotten overwhelming? Do you know what to do with these files? If you don't, then read on.

We're going to use Windows Explorer for the rest of this article. If you're using something called File Manager, shame on you. If you are using Windows 95, Windows Explorer is fairly good. It has some quirks, but even with quirks it handles long file names. File Manager does not and should not be used.

Now, please don't just sit on the couch and read this article. I'm writing it intending for you to be seated at your PC and actively following my instructions and to repeatedly do these instructions as an exercise until it becomes second nature. This is a foundation to understanding most of what goes on in your PC, so it's important.



Windows 98 has an improved Explorer and is very configurable. It's main improvement is that once you set the style of how it looks, it stays that way. The Windows 95 version doesn't seem to remember much of anything. But there are a few things we must do here to make Windows 95/98 Explorer more useable. Open Explorer from its icon in the Start menu. This is the view that has a dual pane. The left pane has a directory tree diagram, and the right pane has a folder and file list. Go to the Menu, View, and click on Details. This gives you a pretty easy-to-read picture of the files in any directory. Browse to any directory on the left pane and see what files appear on the right. You'll need to go to View, Options and set Explorer to use the same window for all directories to keep it from launching a new window for each directory. And you'll have to click on View, Details sometimes to keep Explorer (95) behaving. While you're at it, display the toolbar too. The most useful feature on the toolbar is the "up" button.

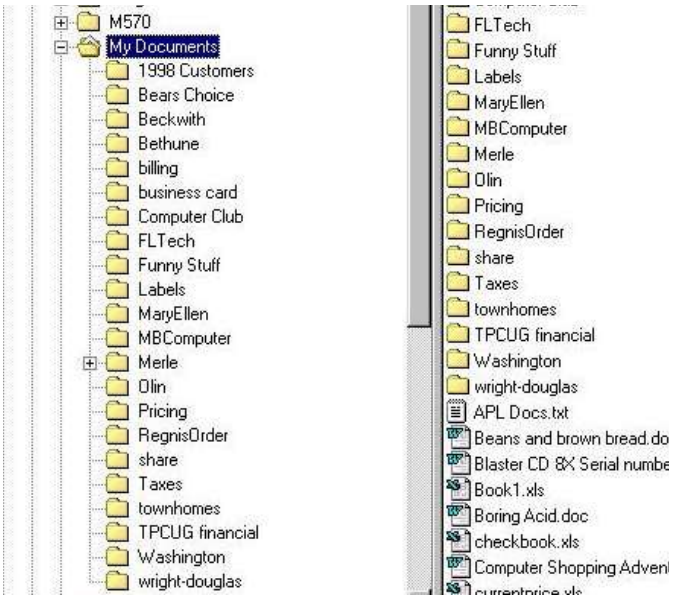
For those of you with Windows 98, try setting your Explorer as "custom" and "use windows classic desktop" and "open each folder in the same window". I'm wary of imposing my personal preferences on you here. I prefer a traditional view of a hard drive, so I'll ask that for the purposes of this article, try it this way then experiment with the settings later.

So, we'll just assume now that your own files are not organized. When I say "your own files", I mean attachments to e-mail from your Aunt Tilly; interesting pictures or recipes you've captured from web sites; A letter to Uncle Bus that you started in WordPad; a spreadsheet to calculate how much interest you paid on the old clunker .. that sort of thing. What about the digital pictures of the "Worlds Most Perfect Grandbaby" the kids have been sending you? Can you find them? So let's organize your hard drive a bit.

Go to Explorers' Left pane and expand (C:). To do this, click on the + in the box next to the "(C:)" to expand the drive if it's not already expanded. If it's already expanded it has a "-" in the box.

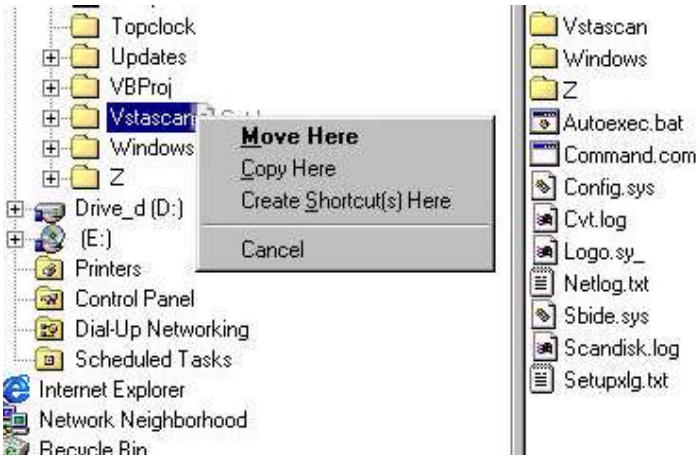
Select the (C:) ("Select" means click once so an object is highlighted), then on the menu, click on File, New, Folder. In the right pane, a "new folder" will appear, and is ready to be renamed from "new folder" to let's say "Images". You'll see that when it's renamed it also will appear in the left pane, alphabetically under (C:). So let's add a subfolder under that one. Select the folder "Images", then on the menu, select File, New, Folder. And rename it "Grandbaby". Add another one under Images called "Stuff from Internet". So here's what it looks like in my Explorer.
Now that you have the idea, create a new one called

"Downloads" under (C:) and also make sure you have a document directory. Since I have Microsoft Office, notice that I have a folder called "My Documents". Other word processors may or may not create a document directory for you. If not, then go ahead and do it now. If you look at my expanded "My Documents" directory in the next picture, you'll see that I've categorized all my "stuff" into separate folders. So when I create a new document I always immediately do a "Save As" and select the correct directory or create a new one on the fly.



The best reason to organize in this way, besides being "organized", is that you're also making it much easier to back up your important files.

So now, what are we going to do with all that "stuff" you've



(Beginner.....Continued on page 9)

(Beginner.....Continued from page 8)

been accumulating in the root directory and on your desktop? We're going to move it all and get it organized. You can move all your files, one at a time or as groups. You can open two Windows Explorers if you like, one to move files *from* and one to move files *to*. You can size these so that you can see them both. Locate the files you want and drag each one to the destination folder. Using the right mouse key to click and drag gives you the most flexibility. When you "select" a file (or files) they become highlighted. Select them using the right mouse, drag them to the other window and when you drop the file, you get a small pop-up menu.

The item that is highlighted on the pop-up is the current "default" action. It's best to go ahead and select the action you want. Our objective here is to relocate a file, so **Move Here** is appropriate. So navigate through the hard drive using the left pane of one Windows Explorer and select the files on the right. Find the destination folder in the other Windows Explorer, drag each file to its destination folder with the right mouse and when you drop it, select Move.

You can easily select more than one file at a time and move files as groups. The trick here is to get them all highlighted and then ,when you have them all, right click on the *icon* of one of the files in the group and drag it where it's to go, just like moving one file. When you're ready to drag the group, it's easy to mess it up if you aren't careful to select a file icon from the group. You may need to practice this a bit.

Now to select multiple files, just click on the first file in the group, hold down Ctrl and then left click on another, and each one in turn until you have them all. If you want to select a contiguous group of files you can select the **first** of a list, then hold down Shift, and select the **Last** of the group. All files between those clicks will be selected. If you wanted to then exclude one of them you can de-select using Ctrl + mouse click. You can add or subtract any number of files in this way.

If you have multiple files on your desktop and want to drag them to a folder, you can drag a rectangle over any number of files and all within that rectangle will be selected. You can add or subtract from that group using Ctrl + mouse clicks. When you're ready to drag, remember to grab it by one of the icons in the group, otherwise you lose all the selections you've made.

There are other ways to move or copy files. For instance, if you look at the left pane of Windows Explorer, at the top will be a "Desktop" icon. Select that and on the right you'll see an organized view of all the files on your desktop. You can also right click on any file and get the long file menu – the one ending in properties. In the middle of that menu you'll see *Cut* and *Copy.* If you'll select Copy, and then navigate to another folder, and right click in that folder, you'll see that the menu has changed. It now has *Paste*, *Paste Shortcut* and *Undo Delete.* In this case select *Paste*, and the file you selected earlier will be copied to the new folder. If you had originally selected *Cut* from the menu when you selected the file in its originating location, the file would have been *moved*. That's because the *Cut -then- Paste* operation is the same as *move*, and the *Copy-then-Paste* operation is the same as *Copy*.

You'll need to practice to get this all right. Then as you use the software you have, use them with some discipline. Pay close attention to where the software puts you when you *Save* and *Save As*. It's much easier to maintain an organized system as you go along than to correct one. ◆

Special Interest Groups

Internet SIG

This SIG meets the first Monday of the month at 6 PM at the Reflectone Building, off West Waters Ave. You must sign up to get on the list and to get by security. Contact Mike Hodges at hodges@reflectone.com. For directions, see the map at our web site or contact Mike Hodges.

At last month's meeting, we critiqued a participant's web site, offering alternate ways of doing things, and then visited several interesting sites. We also looked at how to set your own walking order for a store for the online grocery list compiler at http://www.lamartin.com. This led to a discussion of cookies.

Genealogy SIG

This SIG meets the second Monday of the month at 7:00 PM at the Museum of Science and Industry. *Contact Jenny Lind Olin at 960-5723 or Ford Bond at 987-6309 .*

Visual Basic SIG

This SIG meets the third Tuesday of the month, at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6 PM. For information, contact Merle Nicholson at merlenic@tampabay.rr.com .

Last month we learned the many different ways of manipulating string variables.

(Comments.....Continued from page 7)
sions of certain files. I figured that I needed to download the newest versions of each patch. After downloading SR-1, it seemed to run fine. I then ran the old version of SR-2 (I hadn't downloaded the new 23 MB version of it yet), and it ran, but seemed to run too quickly to have done much.

Next, when I tried to run Microsoft Word, I received the message that it might have problems due to missing or corrupted files and that I should run the Word installation. Everything seemed to run OK, but to be on the safe side I uninstalled Word and reinstalled it from the Office setup. That solved nothing. Additionally, Access had also lost the ability to import .csv or .txt files, and the Access setup would not allow me to reinstall this feature—saying that it was already installed.

I then decided that there might be a problem with versions of files and not that they were missing or corrupted, so I downloaded SR-2 and the version checker utility and ran both of them. Again SR-2 seemed to go mighty fast. However, the version checker said that I had SR-2 installed and everything was OK. Word still gave the error message about corrupted or missing files, and Access still had its problems.

This was another instance, like I had with Visual Basic 5, where an uninstall and reinstall of a program did not put things right. It seemed impossible to completely remove Word or Office. What do you do when a reinstall will not eliminate the missing file or possible corruption message? I think it was simply a version discrepancy among the SR-1 patch, the SR-2 patch and the original word installation. But how do we wipe the slate clean and start fresh--short of wiping the hard drive clean? Only recently have I run into this type of problem: Uninstalling a program and reinstalling will not fix a problem. It seems that things get stuck in the registry, and you can't get rid of them, and RegClean doesn't help.

Eraser97.exe to the rescue! Someone on the Office 97 newsgroup suggested a Microsoft utility called Eraser97 that would remove all traces of said program suite, and it certainly does its job. You wouldn't believe how much a regular uninstall leaves. Eraser97 gets all of that. Unfortunately other programs need some of what it removes.

So far, I have found three programs that had to be reinstalled because of Eraser97: the Active Server Page component for Microsoft Personal Web Server and my two scanners. I also reinstalled WinFax since I at first thought the reason that I couldn't scan and send from that program was the fault of the program, but, as I discovered, I could use scanners in none of my programs. Unfortunately, reinstalling WinFax probably installed a lot of old DLLs.

If you think you need Eraser97, you can get it at ftp://ftp.microsoft.com/softlib/mslfiles/eraser97.exe. Of course, afterwards, you may have to reinstall a few programs in addition to Office 97. ◆

group of people who selflessly give their time to do this. It's they who are helping maintain the quality of the club for all to enjoy.

Bruce Register, Member at Large, is a long time mainstay of the club. In the board meetings, Bruce's ideas and comments are always thoughtful and creative. You can expect that if there's a small task to be done, Bruce probably has already done it. He's a tireless and outspoken promoter of the club.

Larry Anders is the TPCUG Librarian. This job – and Larry along with it - has transitioned from the BBS to Internet Shareware research, so he's also become an invaluable regular contributor to the newsletter. Larry contributes to the administration of the club in so many ways.

Ford Bond is TPCUG MOSI Liaison. Ford represents us at MOSI, which provides us with our meeting place. Ford contributes at the board meetings and is a valuable supporter for our club. As our "MOSI guy", Ford is present and ready at all our meetings and Genealogy SIG too, making sure everything is set up and in working order.

That's the gang, the Board members who work for you to make this club great! ◆

President's Comments

By Merle Nicholson, President, Tampa PC Users Group

One more reminder, my fellow club members – elections! Well it's hardly an "election", because no one is running! We have to have a full slate by the November meeting. Remember that it's YOUR club, and to make sure that it continues, it takes YOUR active participation. I really, honestly believe that absolutely everyone must hold an office at least one time while a member. Please don't think you can't contribute. You can.

At the moment, we are especially in need of a secretary. The secretary simply takes notes during two meetings a month and types them into a file. One gets published in the newsletter, the other (the board meeting) is archived and is also used to track ongoing issues or tasks that carry from one meeting to the next. Each is about one typewritten page. It's an important job, but really is not demanding.

But any office – all offices – are open. Most of the people on the board are serving for their third or fourth year in some capacity, maybe more in a few cases. Every one of us would very gladly give the job to anyone who we feel would do the office credit.

And while I'm at this, I'd need to mention that the board members are a great bunch of people, and I truly enjoy our meetings. In the two years I've been on

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

Minutes of the September 9 Meeting

By Mary Sheridan – for Secretary Kevan Sheridan

Mary Sheridan's Windows SIG got underway right at 6 PM. The SIG strays from time to time with discussions about Comdex and Digital Camera, but for the most part it's about Windows. Any suggestions on topics you'd like covered will be appreciated. You can email Mary at mcpease@aol.com or give her a call at 988-6480.

Merle Nicholson began the club business portion of the meeting at 6:35 PM. He announced the importance of keeping the PCs quiet during the presentation. SIG sign up sheets were distributed. The current SIGs we offer are: Windows SIG at 6pm before the regular meetings, Internet SIG the first Monday of every month at Reflectone, Genealogy SIG, the second Monday of the month at MOSI and the Visual Basic SIG the third Tuesday of the month at Gateway . Check the SIG page of the newsletter for any additional SIG information. Bruce Register announced the nominations for next year's officers will be presented at the October meeting. Be sure to come and nominate yourself or someone you'd like to see as an officer.

At 6:50 PM Steve Singer of RDI Hardware (morevalu@tampabay.rr.com) presented the group with a video camera for a door prize. The camera is used for video conferencing with 30 frames per second in 24 bit color capability. The camera uses a USB port on the computer. Steve says you must load the driver before plugging in the camera. Windows 98 (recommended) and USB make the camera very easy to use. When used with NetMeeting, there isn't any jerky video because of an onboard chip. Video movies can be made into AVI files. The price of the camera is $98 and the name is C-It. Steve gave tips on the industry and how memory manufacturers raise prices by shutting down plants and decreasing supply.

The presentation started at 7:15 PM. Vinny Barber from Alps Printer started by explaining what Alps is and the products they make. It's a 50 year old company that has for 48 years made the components used in almost every device you can think of. They make (of course) printers, but they also produce a mouse, keyboards, and Touch Pro. They are the third largest makers of floppy drives in the world. They make VCR parts, switches, power window switches, Alpine stereos, etc. The printer was the focus of the meeting, and it really is a wonderful machine.

The MD 1000 is a micro dry printer with dry ink. It uses a thermal print heat, so heat is how the ink adheres to the page. The ink is a resin based, plastic pigment based product; it will not fade, and it's waterproof. It uses a Deposition on Silicone (DOS) print head and a ribbon. The printer notifies you when the ribbon is empty. They have a gloss ribbon that prints a photographic quality print on notebook paper. It was really some-

Active Server Pages & More

By William LaMartin, Editor,
Tampa PC Users Group

LaMartin.Com

Last month I wrote briefly about my new web site at http://www.lamartin.com (http://lamartin.com will work just as well). I noted that I needed a place to try out my ideas separate from our group's site. Over the past two years I have devoted a lot of time to what is now http://www.tpcug.org, building what I think is a pretty good user group site. However, the user group site is hardly the place for me to post genealogical and historical data, photographs of interest to me, and other such things. Hence lamartin.com, which has been up and running for about a month. I have added a lot to it since I first mentioned it in last month's newsletter.

What is there will probably be of little interest to most people. Certainly the few individuals I have heard from who have found information about their ancestors there are interested and in some cases extremely grateful to be given information and photos they didn't know existed. A slightly larger number may find the old photos of the Okeechobee, Florida area interesting. And more probably will consider the Mardi Gras and Louisiana photos worth at least one look. But what could I add that would be of interest to a larger audience?

My first attempt at a general interest item is the online grocery list compiler that allows you to select from a list of about 260 items those you wish to purchase at the grocery store. After making your selection and adding any comments, you can submit your list, which will then be displayed on screen to be printed out and taken to the store. If you happen to live near my part of Tampa, Florida, you will want to take advantage of the additional opportunity to have the list of items selected displayed in walking order of one of four stores I have an order for in that part of town.

In the future, I shall reduce the number of items in the master list. There is really no need for Aluminum Foil and Aluminum Foil (Large), for example, since such differences can be noted in the comment text box next to each item. The big challenge is to come up with some scheme to allow users to do a one-time ordering of the items for the store they shop frequently. It wouldn't be as precise as the ordering I have for the four stores listed, but would rather be based on the order in which such general categories as fresh vegetables/fruit, meat, dairy, etc. appear. Once you had established such an order it could possibly be saved as a "cookie" (greatly feared by Microsoft conspiracy buffs) on your machine so that you wouldn't have to reorder the next time you visit the site. Possibly I will have that ready for next month (I need something to write about).

Active Server Pages (ASP)

So how did I create the online grocery compiler? If you have never done any work with HTML pages – the pages you view when you browse the WWW – then you may not think there is any more to be done than with a normal page– one with some text and a few pictures. And actually you are correct as regards the appearance of the page that displays the 261 grocery items, each with a check box for selection and a text box for comments. That page could all have been done with standard HTML coding. But it would have taken a long time. For each item you would need a line like

```
<input type="checkbox" name="C1"
value="ON>Aluminum Foil<input type="text"
name="T1" size="40">
```

When finished, you would have 261 such lines. No one would want to do this 261 times, each time changing Aluminum Foil to the correct item name, C1 and T1 to different names. That is where ASP enters the picture. ASP allows you to combine Visual Basic Script (similar to Visual Basic) with standard HTML coding to enable the server to dynamically create web pages. The code to create those 261 lines is as follows:

```
<p><% ' Now lets input the data from the
database
do while not rstemp.eof %><input
type="checkbox" name="<%="C"&i+1%>"
value="ON">
<%=rstemp(0)%>   <input
type="text" name="<%="T"&i+1%>"
size="40"><br>
<%rstemp.movenext
i = i+1
loop%></p>
```

I am sure to some, perhaps, most of the readers, the above is gibberish. First, the <% tags are used to indicate VB script. Then, what we are doing is stepping through a database table called rstemp and retrieving the grocery item name part of each record. We then create a check box on the page, insert the item name, and finally create a text box on the page. The loop allows us to do this for each record of the database table (261 times at present).

Before executing the above VB script, though, we had to first open the database table. This was done on the ASP page with code like

```
<%set
conntemp=server.createobject("adodb.conne
ction")
conntemp.open "DSN=lamartincom_data"
set rstemp=conntemp.execute("select *
from grocery")%>
```

(ASP.....Continued on page 4)

(ASP.....Continued from page 3)
This code was run when the page was first loaded, so that a database with my store data is now temporarily called rstemp and is ready for use. rstemp(0) is the first field of whatever record we happen to be on; rstemp(1) is the second field but is not used in the present example. If i = 0 (the first record) then rstemp(0) = "Aluminum Foil".

After being processed by the server, the above mixture of VB script and HTML code produces 261 lines of HTML code producing a check box, item name, and text box for each line. Later, if you change any items in the database, the next time the page is loaded, those changes will appear on the page. This is how the list of items is generated. Note the VB script is being run on the server, not the client's browser. This is termed server side scripting as opposed to client side scripting (run on the client's machine). An example of client side scripting is the Java script that is used on the TPCUG home page to display the scrolling announcement at the bottom of the screen. Another is the Java script on the TPCUG Announcements page that gives a count down to Year 2000 – which I bet you haven't even noticed.

To get a list of his selections, the user checks the items wanted, makes any comments desired in the text boxes, selects to receive either an alphabetical list of selected items or one in walking order of one of four South Tampa stores, then presses the submit button on the page. When the next page appears it again is an ASP page and displays the results by using VB scripts to display only those items selected along with the appropriate query from the database to display them in walking order of the particular store selected. There is no way this page could have been done with standard HTML.

Thus, when your browser tries to access an ASP page, the server steps in, reads the combination of HTML code and VB Script (or Java Script), does any calculations required and returns to the browser a stream of HTML code that is used by the browser to display the page. If you do a view source on the page, you will only see the resulting HTML--not the original combination of VB Script and HTML.

My first use of ASP was to create a user name and password protected collection of pages at another site. You can see how this would work. When you initiate a session at the site, the ASP page induces the server to make a note that you have begun a session and ask for your user name and password. It then "follows" you around making sure that you have permission to visit any other ASP pages that have been tagged as restricted. This allows you to set up password protection on your own without having to give a list of people and passwords to the server administrator.

Now that I had this new tool, I needed to think of ways to use it. One idea that came to mind was an online mortgage payment calculator. Given the principal amount, interest rate, and term, it would first display the fixed monthly payment, then display for each month the portion of the monthly payment going to interest and the portion going to principal, along with the remaining balance. I did it locally on my computer. Then I had to decide if I should put it at my site. Was the world crying out for such a thing? I have seen loan payment calculators all over the Internet but haven't seen one that lists where you stand for each period (month) of the loan. So, you can now find a loan calculator at http://www.lamartin.com.

What's next, an online income tax calculator? It could be done, I am sure, for simple returns. However, the number of options to be considered for more complicated returns is mind boggling.

ASP on your Computer

A web developer should always test out his new creations locally before posting them to the WWW. That introduces the question of how you test out ASP pages on your local setup. First, you need for your computer to act as a server. If you are using Windows 95/98, the easiest way to accomplish this is to download for free from Microsoft their Personal Web Server (PWS). After you install the PWS, you can locally host a web site. In fact, while connected to the Internet, if you give out your temporary Internet address, anyone in the world can connect to your computer and view whatever HTML files you have set up in the PWS's directory. The PWS also has FTP capability, and I have used it to allow others to send files to and receive files from my computer via the Internet. If you have Microsoft FrontPage, it will install PWS as part of the FrontPage installation.

The next thing you will need is an ASP engine. Microsoft also provides this for free. The file is ASP.exe, if I recall correctly. You may download it or, if you have FrontPage 98, copy it from that CD. After you run this file, you should have the ability to host an ASP setup on your local PWS. The final thing you will need is a database like Microsoft Access if you want to use a database file as I did in the grocery list compiler (note the mortgage payment calculator doesn't use a database). To set up the particular database file, you move the file to your local web directory in PWS, then run the 32bit ODBC entry in Control Panel and tell it the name of the data base and where it is located. When you move everything to the Internet, you will have to have your server administration do this last thing for you. And that bring us to:

ASP on the Internet

If you are hosting your site on an NT server running IIs, then you probably have everything already set up for ASP pages. You just need to set the folders containing the ASP pages as executable (that is, scripts can be run). If you want the ability to access a database with the ASP pages, you will have to ask

(ASP.....Continued on page 6)

(President.....Continued from page 1)

the board I don't recall any argument or any bad feelings about anything. Everyone does his job knowing that if he needs help, someone else will pick up the slack and make sure our deadlines are met. We have some fun together; everyone on the board contributes his opinion, and, when votes are taken, it's almost always unanimous.

Talk to any officer about this. Find out what the jobs entail. Come to a board meeting to look it over and see if there's anything of interest for you.

And last, do you know anyone who'd like to come to a meeting to look our club over? You're a member, so you believe the club is worthwhile, and if you know anyone, friend, neighbor, spouse or family, invite them and help the club grow.

I'd like to extend my personal thanks to Steve Singer of RDI @ Tampa Bay Inc. for coming to our meeting and donating a C-it color digital camera for our door prize. Thanks to Steve and also to Quarterdeck's contribution the previous month, we collected the highest amount of money we have seen all year and then some.

Thanks. See you on the 14th. ◆

Opening page of the HTML version of the Independent Counsel's Report

History was made September 11, 1998 when Congress released the Independent Counsel's Report to the world via the Internet. The Congressional servers were jammed at first, but other organizations, like Yahoo, CNN, and most major newspapers, made the report available at their sites, so within a few hours anyone that wanted to view or download it could. The report was 840 KB in size. A 243KB zipped version is available at our site.

Search Engines

By Larry Anders, Librarian, Tampa PC Users Group

A couple of months ago I wrote an article about the proper techniques of smart Internet searches using Boolean search strings. So now that you know **HOW…. WHERE** do you go to search the Internet? There are well over 100 search engines available for your every searching need...you don't need to know all of them, but there are a few important ones you should know and remember. Most function about the same, but to get the best results out of your search you should check each search engine's help section to instruct you on how to make your searches smarter. There are different kinds of search engines, too.

General search engines are ones that use their own internal engine to search for your text string. Some general search engines to remember are:

Alta Vista	Lycos
Excite	Magellan
Filez	Snap!
Hotbot	Webcrawler
Infoseek	Yahoo

Multiple search engines are just what the name implies. They are set up to search several engines simultaneously for your text string. Some multiple search engines to remember are:

All-In-One	Metacrawler
Cyber411	Profusion
Dogpile	USE IT!
Mamma	

For email addresses or phone numbers try these:

555-1212	Four11
BigFoot	WhoWhere

Most of these search engines can be reached by just typing "***http://www.***" in front of the name and adding ".com" after the name. Or just type in the name as a search string at any other engine. If all of these aren't enough for you, then go to http://www.beaucoup for more than 1,000 listings of search engines, directories and indices to help you find just about anything you're looking for.

My favorite way to search the Internet is to use an internal PC based search utility. I use two; one I paid for (***WebSeeker 98*** from Blue Squirrel at http://www.bluesquirrel.com), the other is **FREE** for the download (***WebFerret*** from FerretSoft at http://www.ferretsoft.com). Both programs are accessed the same way, by clicking on **START,** then **FIND**, **WEB PAGES,** and both work approximately the same way by accessing several search engines at the same time.

Webseeker comes with 13 major search engines built in and allows you to add and utilize more than 100+ search engines, eliminates duplicate results and dead links, monitors Web pages for any changes, schedules automatic, unattended searches and automatically updates itself over the Internet. It sells for $49.95, and is well worth the money if you do a lot of Internet searches.

Webferret, which as I mentioned is **FREE**, searches 10 engines automatically but you can't add any more search engines. For quick searches I find myself using ***Webferret*** more than WebSeeker because of its simplicity and speed. Searches can be narrowed by choosing to match any keyword, match all keywords or by submitting the keywords as an exact phrase. Double click on a result or use the right mouse button to open the web pages using your default browser. It is also designed to keep up with the changing nature of the search engines by automatically updating how they are searched. If the engines change, WebFerret changes too, so that searches always work and are accurate. And did I forget to mention that it's **FREE**? … and, you know how much I like **FREE** stuff.

The Internet is by far the best source of information we have ever had available to us but knowing how and where to search can make all the difference in the world. So…. here's to smarter searches! ◆

(ASP.....Continued from page 4)

your server administrator to set it up and possibly pay an extra fee. If you are hosting your site on a UNIX server, it is possible to use ASP pages but not guaranteed. It depends on the software they are using.

Help on ASP – Usenet Newsgroups

If you want to learn how to use ASP, where do you go? I suppose you could buy a book, but that is not my method of late.

(ASP.....Continued on page 8)

Linux and Us

By Tim Condon, Tampa PC Users Group

You know, you get in some of the strangest discussions when you start talking about using a non-Microsoft operating system like Linux, the "Unix-like" alternative operating system first introduced in 1991 by a Finnish university student named Linux Torvalds. Releasing the operating kernel source code onto the Internet, Torvalds invited programmers from anywhere and everywhere to hack, change, modify, insert, and generally participate in making the nascent operating system better and better and bolder.

Legions of programmers and hackers from all over the world responded, and Linux has become something of a phenomenon. The buzz on Linux in the computer world is currently loud and getting louder. Corel has announced they'll produce a Linux office suite in 1999. Netscape has supported Linux virtually from the beginning (of Netscape) by porting its browsers to the OS. Although the operating system kernel source code is now and must always be "public" (and distributed for free) under its public license, several companies are producing and selling commercial, shrink-wrapped, "value added" versions of Linux, including Red Hat, Caldera, S.u.S.E., Debian, and others. The cost? If you choose to buy a commercial distribution of the OS, about $50. Or you can simply download the latest version of the OS from the Internet for free.

Because of the burgeoning popularity of Linux, new companies seem to be signing on to support it almost weekly. For instance, software giants like database powerhouses Informix and Sybase Software, Inc. have announced their support for Linux in the past year. But what has really gotten computer-tongues wagging is what happened just last month: Two of the biggest names in computing---Intel and Netscape---announced that they were pumping a few hundred million dollars (ahem…pocket change) into the company that distributes probably the most popular Linux shrink-wrapped version, Red Hat Software, Inc.

For Intel---half of the Microsoft/Intel duopoly sitting astride the computer world---and Microsoft arch-enemy Netscape to cooperate in supporting Linux has virtually caused eyeballs to snap throughout the industry. Why? Because although Linux is essentially distributed for free, and therefore no one knows for sure how many users it has, studies amounting to educated guesses put the number now at between 9 million and 14 million users, and growing fast.

In addition, studies have shown that only two operating systems are gaining users over the last couple of years: Windows NT…and Linux (this statistic may not include new users, but only existing computer users who are upgrading). When you consider that Linux didn't even exist nine years ago, and that its distribution and development have been and continue to be "free," it's nothing short of astounding that the OS is even on the radar screen.

Mark Andreeson, executive VP of Netscape, explaining his company's investment in Red Hat at a trade show a couple of weeks ago, said Linux "is free, it's stable, it's fast and scalable, it's Unix, it's the OS of choice on the Internet, and it runs on cheap Intel hardware." It also is capable of doing everything Windows NT is touted as being able to do---the operating system that Microsoft has said we will all be migrating to over the next few years---and more. Studies comparing Windows NT and Linux have even in some cases shown Linux to be superior to NT…something the dedicated Linux following of computer nerds, hackers, programmers and Unix gurus have loudly asserted for several years.

So. I decide to take a flyer on Linux, buy a shrink-wrapped version, visit the local Linux users group, and maybe see if I can make the OS work on a spare Intel 486 machine I have with 16 megs of RAM. And what do people say when I tell them I'm going to try out Linux? "I don't get into any of that radical computer stuff," said one fellow lawyer. "I just stick with Microsoft."

How about a more knowledgeable computer aficionado? Like our own newsletter editor, Fred LaMartin? "Now why would you want to waste time learning a new operating system when Windows works just fine for everything you want to do?" he said. Later he was even more supportive: "I know what Linux is," he said. "It's just the latest fad of the anti-Microsoft people. First it was DOS, and people didn't want to switch to Windows." (Yep, I said, that describes me.) "And then when they were forced to go to a Windows-type OS they went to OS/2," Fred said. (Yep, I said, I tried out OS/2 before being forced to go to Win95.) And now, Fred continued, the anti-Microsoft cranks (yep, that may well describe me too, I thought) are all rallying behind Linux. Doom and gloom, and you're wasting your time, our editor seemed to be telling me.

And yet…and yet…there is the…you might call it "underlying philosophy" of Linux, which has fueled its explosive growth, and undergirds the entire "world domination" movement that the Linux-lovers jokingly say is their ultimate aim. That philosophy, which was impossible before the advent of the Internet, has been called "the bazaar model." And it has been most powerfully explicated in a seminal article written by Eric Raymond in 1997 called "The Cathedral and the Bazaar." Within seven months of the publication of the article, Netscape Communications executives had read it and announced the release of the source code for Netscape Communicator 5.0. And I admit it: The notion of what might be called "spontaneous co-

(Linux.....Continued on page 8)

SIG REPORT

By Merle Nicholson & Jenny Lind Olin
President & Treasurer, Tampa PC Users Group

A SIG – (Special Interest Group) is an informal gathering of club members who meet to exchange ideas and knowledge of common interest. TPCUG has four SIGs, Genealogy, Internet, Windows and Visual Basic.

Genealogy SIG – meets on the second Monday of the month in the MOSI lab at 7:00 PM. That's October 12th and November 9th. Contact Jenny Lind Olin. jlolin@aol.com

The Genealogy and Internet SIGs had a joint meeting on the second Monday in September. William LaMartin demonstrated his relatively new web site that included his own family genealogy as well as some very interesting photographs of family members and places of interest such as Okeechobee and New Orleans. The participants turned on their computers and were able to browse his web site, viewing it from that vantage point and from the screen at the front of the room. William's recent encounter with another researcher demonstrates how the genealogy home page is a wonderful way to make contacts and share information with others doing research on the same family. William's experience with designing pages for the Internet and his genealogy provided a well-integrated program for the combined meeting of the two SIGs.

Internet SIG – The first Monday of the month at Reflectone at 6:00PM. That's October 5th and November 2nd. Contact William LaMartin at **lamartin@ix.netcom.com**

Visual BASIC SIG - This SIG will hold its Third meeting Tuesday, October 20th at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6 PM. Contact Merle Nicholson at merlenic@tampabay.rr.com

The second meeting on September 15th was well attended. William LaMartin started reproducing a working program a part at a time by way of demonstrating how a program goes together. There was a lot of discussion during the session about how things were done and about how it can be done differently or better (or worse).

Windows SIG – This is an informal discussion group led by Mary Sheridan during the half hour preceding the monthly meeting: 6:00-6:30PM. There is always a lively discussion on any topic of interest related to Windows. The emphasis is on helping each other by sharing experiences. Come to this SIG armed with all your questions about using Windows or any other software; someone will help, and, if not, you'll have fun anyway. ◆

(Linux .....Continued from page 7)
operative software development" does appeal to me.

Want to read the piece? You can find "The Cathedral and the Bazaar" all over the Internet. Just do a search for the name of the article and lots of locations will pop up. What makes the entire development of Linux so fascinating is how it has (1) seemingly come out of nowhere, and (2) constitutes an almost diametrically opposed philosophy and structure for software development from Microsoft. Where Linux has come about through the apparently spontaneous operation and organization of "the bazaar model," Microsoft is a resolute of "the cathedral" model. Read the paper; it'll all become more clear then.

In the meantime, I wonder if there are any Linux-users in the TPCUG? And I wonder if there might be any interest in forming a Linux SIG? Hello? Hello? Anyone out there? I'm going to be loading my copy of S.u.S.E. Linux onto one of the hard drives in my old 486 machine here before too long. I'll let you all know how it turns out, if there's any interest. And if anyone has particular knowledge about Linux, let me know by email at condon@usa.net. I might want to pester you for help…if all does not go well. ◆

(ASP.....Continued from page 6)
What I did first was search the Microsoft site for articles on ASP and VB Script. I found a few, one particularly good one on setting up an ASP page to access a database. But I needed more information – especially examples. I then turned to the source of much of my computer help, the Usenet Newsgroups that you read using your mail reader (same as the email program). Interest in ASP not being all that great, I was only able to find one newsgroup: microsoft.public.inetserver.iis.activeserverpages. But it was loaded with information. Not only did I learn from reading the questions and answers posted there, but I was also directed to several WWW locations that specialized in ASP. People on the Internet, I have found, are very happy to share their knowledge on different aspects of computing. For now, this particular newsgroup and the WWW locations I have found will be my tutorial on learning ASP.

Since I have found them so useful, I want to fill in the rest of the empty space in this month's newsletter writing about the Usenet newsgroups. Part of an editor's job is filling up all the

(ASP.....Continued on page 9)

Observations, Tips, etc.

By Larry Anders, Librarian,
Tampa PC Users Group

Most of you who know me or have read some of my articles know that I subscribe to several PC magazines. I travel a lot and save up my magazines to read on the plane. I especially like the special issues that tell you about the 101-Best of whatever's such as the best freeware, websites, buys, etc. Well, this month's PC World Magazine (October) has a bunch of tips and tricks and I thought I'd pass along some, so here's a few.

We've all heard of "***cookies***". If you're new to using the Internet or just want to find out more about the nosy little critters go to Cookie Central (www.cookiecentral.com) for one of the best sources for cookie information on the web. Here you'll find complete info on what they are, how to find and read them on your PC and what to do about them.

If you use Microsoft's wheel-mouse like I do, there is a new IntelliPoint 2.2 driver out at www.microsoft.com/msdownload/intellipoint/intellieng.asp that is supposed to take care of some glitches under Windows 98. I didn't have any trouble with mine but it's **FREE!** (and you know how I like **FREE STUFF!**)

If you have a favorite CD-ROM that's gotten a bad scratch on it, try cleaning it by placing a few drops of water on a lint-free cloth and gently wiping the data side (non-label) of the disc from its center to its edge. After it has dried, place it back in the CD-ROM drive and try again. If that doesn't work, Memorex makes a Scratch Repair Kit for $10 (www.memorex.com) and Esprit makes ***Wipeout*** for $15 that does the same thing (www.cdrepair.com). To protect your CD discs you should always handle them by the edges and store them in their sleeves when not in use.

For some reason many people are leery of giving a credit card number over the Internet to purchase something but think nothing of physically giving the credit card to a waiter or waitress whom they have never seen before. Does this make sense? Estimates are that sales via the Internet will reach $20 billion by the year 2000. Just make sure you're using a secure server and go for it. There are a lot of good buys over the Internet and, if nothing else, you're likely to save on the sales tax. But obviously not all buys are best buys. To find out if you're getting a good deal, comparison-shop at sites such as Excite's Product Finder (www.excite.com). Use this service before you settle on a particular vendor.

If you have scads of folders and sub-folders, as I do, you may have trouble finding particular folders from time to time, as I do. Well, there is a **FREEWARE** utility (and you know I like **FREE STUFF!**) that you can get from www.fileworld.com called ***DirNow*** that appears as a small box in which you type a few characters of the folder you are seeking, press <**Enter**>, and up pops a list of folders matching your entry. ***DirNow*** is fast and small and **FREE!**

For a more complete listing of tips and tricks and a troubleshooting guide for your PC, pick up a copy of PCWorld Magazine. It's worth the cost. ◆

(ASP.....Continued from page 8)

space left over after including all the articles that members' have submitted. Of course, I could move from 10-point type to 12-point and that would do the job nicely, but I prefer to add content and stick with the 10-point type.

To be able to read newsgroups, you first have to set up the your mail reader so that it knows where on your Internet Provider to look for them. I use Microsoft Outlook Express as my mail and news reader. To set up News on it, I click on the "Tools" menu item, then "Accounts", then the "News" tab; next click on "Add". I then need to supply some information about my Internet Provider's (IP) news server. The most important item is the server name, which, since I use NetCom, is "nntp.ix.netcom.com." Your IP will provide you with the appropriate name somewhere at their WWW site.

Once you have set up the News account, you are ready to download a list of all the newsgroups that your IP carries on their server. At present, the number that NetCom carries is well over 20,000. After this information is downloaded, you can then have the program search this list for key words in the name of a newsgroup. Subscribe to such a group and start reading the messages. Post a message of your own if you desire. But be warned that any thing you post will end up being indexed by such search sites as DejaNews (http://www.dejanews.com/) and be available to anyone using DejaNews to do a search. If you do a search using my last name "LaMartin", you will find about 30 "recent" messages and hundreds of "past" messages. All – I hope – dealing with computer questions. I have left my electronic trail. But it is nothing I am ashamed of. There are no newsgroups listed there with names like "*..alt.pervert*" (the kind of Internet items that give politicians and preachers something to be against). What you will see listed for me are names like *microsoft.public.frontpage.client, comp.lang.basic.visual.misc*,

(ASP.....Continued on page 10)

Special Interest Groups

Internet SIG

This SIG meets the first Monday of the month at 6 PM at the Reflectone Building. **Directions: Proceed west on Waters from N. Dale Mabry across the railroad tracks, about 1.5 miles; take second left on Savarese. Proceed on Savarese until you reach the Reflectone building. Use the north door.** You must sign up to get on the list and to get by security. *Contact Mike Hodges at hodges@reflectone.com* .

Genealogy SIG

This SIG meets the second Monday of the month at 7:00 PM at the Museum of Science and Industry. *Contact Jenny Lind Olin at 960-5723 or Ford Bond at 987-6309* .

Visual Basic

This SIG will hold its third meeting Tuesday, October 20, at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6 PM. For information, contact Merle Nicholson at merlenic@tampabay.rr.com .

Norton's Uninstall Deluxe

By Clark J. Evans, Tampa PC Users Group

Dear TPCUG Members,

I am the type of person who believes in making things simple for people to understand.

When I couldn't get a bunch of programs out of my computer by regular means, I asked my friends what to do. The answer I got was, "Don't use anything but Norton's Uninstall Deluxe program." I heard a lot of bad reports on other Uninstall Programs.

I got Norton Uninstall Deluxe, and to make it simple, it worked so well I never read the instruction book, just did what it said on each window that came up.

The questions make it so simple to use. It had a disk clean-up that gets rid of duplicate files,and a program to get rid of those programs you can't get rid of. If you make a mistake and kill a wrong program you can get it back from the recycle bin.

It is so simple for anyone to use. I give Norton's Uninstall Deluxe an A++. It does what it says and more. ◆

(Minutes.....Continued from page 2)
thing to see this demonstration and to look at the finished product with a photographic loop. It was impressive. The printers are comparable in cost to other brands, and the inks are the same price or cheaper. The MD 1300 is like a dye-sublimation printer. This is the kind of printer used by magazines for the glossy photos. The printer had true photo quality output.

Vinny gave away photo loops and a squirt gun for everybody.

Vinny was one of the funniest and most entertaining presenters we've ever had. You really missed something special if you weren't able to attend.

Charles Howe won the 50/50 drawing. Brian Lance won the video camera. Charles, this was your lucky night: Charles Howe also won a copy of Partition It. Warren Fuss took home a game called Gnome and Brian Lance left with Disk Clone (Charles isn't the only lucky one). ◆

(ASP.....Continued from page 9)
or *comp.periphs.printers*; not very exciting stuff by most standards but great forums for sharing information on narrowly defined topics relating to computers. I probably follow at least 20 such newsgroups off and on but only two or three at any one time, since that is about the limit of what I will be actively interested in at any one time.

So join the Usenet newsgroup crowd. As I said, there are over 20,000 such public forums to share information on almost anything you can think of: health, medicine, religion, philosophy, cars, money, sex, computing, farming, gardening, genealogy, photography, pets, mathematics ..... The list is essentially endless.

I have used the computer related groups to solve many of my

problems with software (almost every program has its own newsgroup) and a few with hardware. As I have become more expert over the years, I, in turn, have been able to return the favor. It is a good feeling to be able to reply to a query with a solution and to then receive a message that your solution worked.

You can lurk, and no one will ever know you were there. You only end up being listed in newsgroup search engines like DejaNews if you post a message. But I warn you, if you lurk long enough, you are going to see a message to which you just have to respond. Then you will be electronically recorded as perhaps of the opinion that "...all politicians do it, so it is not a sin." in the "alt.politicians.clintonmustgo" newsgroup. Is there such a newsgroup? I don't know, but I do know that one could be created. All you need is a server to host it. But I have filled all the empty space, so you will have to figure out how to do that on your own. ◆

Meeting Preview: At the November meeting, Robert Armstrong from BCD, a local computer store, will be doing the presentation. He will demonstrate the latest in hardware. Come out and see what to put on your Christmas wish list. Mary Sheridan, as usual, will conduct a 30 minute Windows discussion at the beginning of the meeting. Come and bring your questions.

Cheap Computers, Cookies & Internet Banking

By William LaMartin, Editor, Tampa PC Users Group

Assembling your own Machine

In this issue of the newsletter Ford Bond and Brian Lantz write about their experiences building a computer from scratch. In Ford's case he put together his machine from mostly spare parts along with the WinChip and motherboard supplied to members of our group by IDT/Centaur. Brian it appears is using mostly new components. His articles (this is the second of three) are more general in that they provide details of things you might encounter in any PC assembly and not just the particular one he is describing. But if assembling your computer yourself is not your thing, read on.

Cheap Computers

Those computer prices just keep going down, and the power of the stuff inside them just keeps going up. Last week my sister ordered a Gateway 350 configured as follows for $1698 plus tax and shipping.

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

President's Message

By Merle Nicholson, President, Tampa PC users Group

Last reminder, everyone. The election of officers is close at hand. Won't you step up and volunteer for a job? Contact Bruce Register at bregis@gte.net.

Talk to any officer about this. Find out what the jobs entail. Come to a board meeting to look it over and see if there's anything of interest for you.

Do you know anyone who'd like to come to a meeting to look our club over? You're a member, so you believe the club is worthwhile, and if you know anyone, friend, neighbor, spouse or family, invite them and help the club grow.

Our Visual Basic SIG is going just great. The interest in the group is as strong as ever. There is room for a few more, so if you'd like to look it over to see what we're doing, send me an email; I'll send the meeting times and a reminder to you.

You may be thinking of Christmas presents to yourself. I've been using my scanner to reproduce photos quite a lot. We've also been creating our own greeting cards and placing family photos on them. The results are just spectacular. If you're thinking of getting a scanner, you couldn't pick a better time, price-wise. Look for a SCSI or USB model if you can afford the $50 higher cost. Also, as I found out the hard way, it takes a pretty decent PC with plenty of memory. I'm thinking of increasing mine to 128MB, when I can get some loose money. 32MB was inadequate, so I upgraded to 64MB when I built my current PC. When I pull up a large photo scanned at 600x600, my PC does the job, but very, very slowly.

A true photo-quality printer is still a $300 item, although if you are willing to accept somewhat reduced quality, you can save quite a lot. Look at the current PC magazine for a complete review of printers. Hewlett-Packard and Epson are still the front runners in inkjet models. They also give the Alps printer good marks.

Thanks. See you on the 11th. ◆

Building a Computer with the WinChip CPU

By Ford Bond, MOSI Liaison,
Tampa PC Users Group

"Sure I have the parts. I can build a computer with spare parts".

Wishful , but, after all, with 15 years of computers and 10 years of upgrading computers, I have boxes of parts. XT parts, 286 parts, 386's, 486's, 586's, Pentiums, etc. There is one box dedicated to abandoned motherboards, another to hard drives. What do I do with an XT hard drive? Well, so much for organization; the other boxes are a jumble of parts. Tens of thousands of dollars invested in parts that are now rendered obsolete. Passed by with cheaper parts and faster parts and tens of thousands of dollars of newer parts. I cringe when I think how much that obsolete memory cost.

Oh well, now is not the time to bemoan the cost of my addictions, but to create a computer. The problem is the word abandoned. Why did I abandon this part or that? They may be dusty, but they look good. Only a few still smell smoky. After all, I now remember which way the cable goes. Why did I put all the parts, including those which were fried, broken and otherwise inoperable into the same boxes. I could have put notes on them even If I couldn't bear to throw them away. That would be like giving up on children. There must be some future value to these parts. I couldn't throw them away, not yet anyway. No, not I. Nevertheless, such nostalgia is not getting the computer built.

Oh well, time to assemble parts. I have a motherboard and a WinChip. Great start, but it will only fit into the cases I have with a hammer and drill. Off to the store and $90 dollars for a new case. Oops, I think I better look further. After much searching Jim at MB's says "We have one for $39."

Great! Now for memory; after some looking through the boxes I have two matched 8MB SIMMs, two unmatched 8MB SIMMs and two 4MB SIMMs. If I put the unmatched SIMMs away, I have 24MB. Things are going better. There was reason to keep parts. Small ones anyway; maybe the cases are going to have to go. I'll think about that tomorrow.

Video cards. OK, what's that funny slot? Looks like a PCI turned backwards. AG what? Oh! AGP? Now I remember, had one in the Pentium II I built last year. Last year when they were $150. I can hear the sucking sound now. Wonder what they cost now. Oh boy, I can get one for $35 and that includes video out, as well. Now I can bemoan the cost of TruVision and Matrox cards that cost thousands of dollars just to get video out. They now sit lonely and abandoned on shelves in boxes (out of reverence to their cost) because they didn't like the new chipsets. Maybe one of these days I will rebuild a 386 so that they will work again.

Sound card. Shuffle through the boxes again, and here is a sound blaster and another and another. OK which one of them works? Where oh where have the drivers gone? So many thousands of disks; so little time. OK, drivers located and boards working. Why are they all working? Dim memory says that they worked but were a problem to configure. There must have been some reason for abandoning them. Could it be one set of drivers for three boards? Mysteries will never cease. Chalk it up to middle age dyslexia or early signs of senility.

Hard drives. Now which one shall I choose? Here I have a great selection: MFMs, SCSIs, IGIs— no, that's genealogy IDEs? Finally, there are two 1.2 GB IDE that look good. Wonder why they are here? I'll check them out later.

The pile of parts is getting bigger. Is everything here? Time to check it out: case, motherboard, CPU, memory, storage, sound card, and hard drive. Oops, where is the CD, and how can I boot without a floppy drive? Back to the storeroom. Found the 3-1/2 drive and CD but no drivers. Well thank goodness for the Internet. Some time passes, and futile search follows futile search. Why do they make it so hard to find drivers? Is it really a conspiracy to get one to buy new parts rather than find drivers for older CD's? There are drivers for 12X's and up but no drivers for my poor little 8X drive. I guess it will remain lonely and abandoned. Back to the shelf and back to the store where I find that CD's are now only $35 for a 24X. Whoop de do. Why did I spend so much time on the Internet; this is easier than finding a driver.

Back to the pile of parts. Now there are enough parts, and it's time to check out the motherboard and CPU. Experience tells me that rather than put it together and turn on the power, it's time to read the manual. At least when no one is looking I can read the manual. Chip in place. Time to check the jumpers. Where is the magnifying glass? Bus settings OK. CPU multiplier setting's OK; CMOS, OK; CPU voltage OK, SIMMS voltage is set for 5 volts instead of 3.3 volt. Back to the manual. No explanation of SIMMS voltage. OK ,call a teckie. SIMMS voltages usually have a default setting of 3.3 volts. So I change the voltage setting. Now that the board setup is confirmed, it's time to put the parts together and turn it on.

Screen comes on, video card checks out. Memory checks out. Hit the delete button for setup. On to BIOS. Hmm, let's check out the hard drive with IDE detection. Oh well, nothing is there. Try another hard drive and repeat process. Success!! Second hard drive checks out OK. BIOS features OK. Turn off power management (personal thing). Save settings. We're

(WinChip.....Continued on page 5)

MicroLogic's DiskMapper Version 2

By Don Patzsch, Tampa PC Users Group

Here is a real neat program. It comes on a single 3.5 inch disk. It is very simple to install, but it has many advantages. The one I like most is that the screen that resembles Windows Explorer has the size of the folder or the file right after the entry.

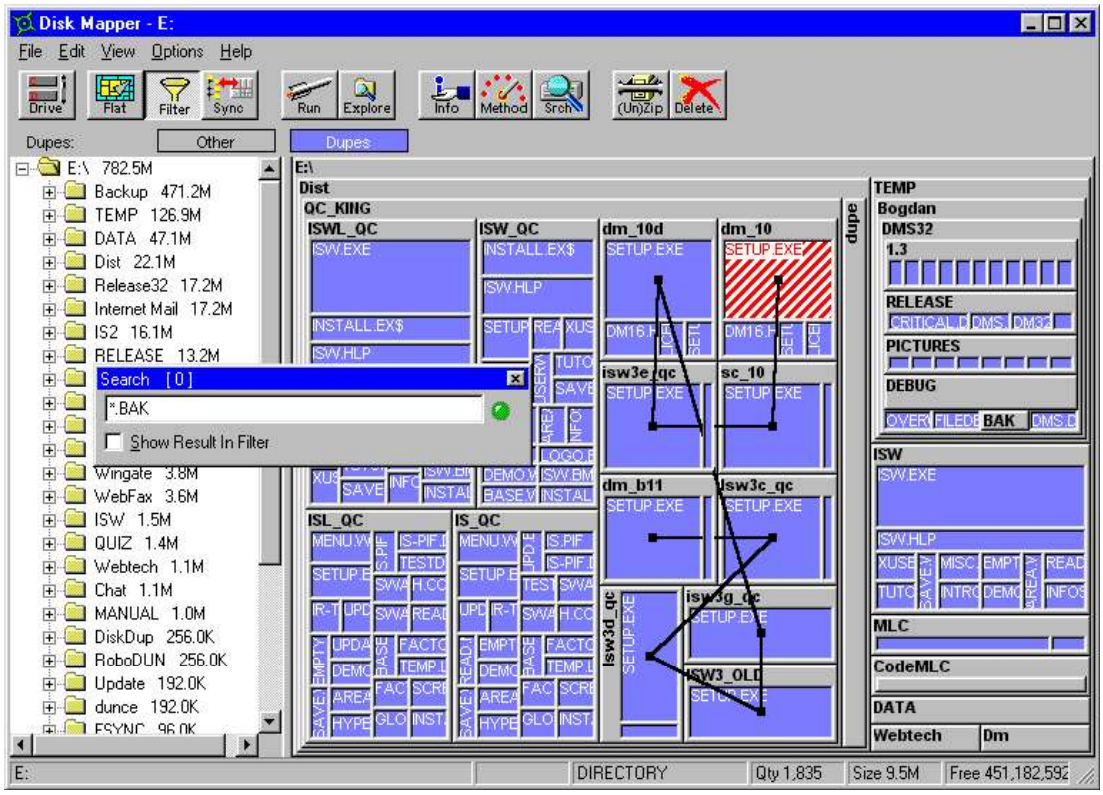
For example, C:\folder 900MB. Just below that is Windows 240MB Program Files 175MB and so on; each folder is listed and followed by the number of bytes or MB's it contains. After the folders come the files, again listed by the number of bytes in each entry. See the graphic below to get the view of the screen.

This sounds innocent at first, but think for a minute. If you had a listing of all the folders and files on your C: drive, starting at the top with the largest entry, you could quickly see where you could go to remove some unused or seldom used folders or files and thereby get that space you need for the latest and greatest program you want to add.

Now click on Windows and then FONTS and notice that your fonts are all listed with the largest entry first. You can run down and see all the fonts that your computer is loaded with, and right here you can save a lot of space by removing a few dozen fonts you never use. My FONTS folder has 21.1MB of FONTS and I use maybe four or five. This DiskMapper feature is worth having.

If you want to see the files you have installed but never used, simply click on "Never Used After Creation". The files or folders you have installed but never used are then highlighted. You can get an idea of how they are spread out on the disk representation, and also you can get an idea of how many such entries are on your hard disk.

Put the mouse cursor on any file and get a description of the file, its size, the date you entered it and the quantity at the bottom of the screen. Double click on the file, and it will come up in a viewer, your browser or a text editor, or whatever you have set up.



When DiskMapper comes up, the view (like Explorer) that you see is a color coded map. On the left is the familiar folder and file list similar to Explorer, on the right is a map consisting of rectangles; the size of each represents the relative size of the file or folder. You can easily see where the large files that take up the bulk of your disk space are.

If you bring up Windows Explorer, you can right click on any folder and access DiskMapper by clicking on DiskMapper. You can find duplicate files by simply clicking on the Duplicate File button. The duplicate files show up in colors on the graphic side of the DiskMapper screen. Click on one file and a line forms to the duplicate file. You can then easily see where they are located on the hard disk. Look at the black connecting lines on the graphic to see this.

In a similar fashion you can see all the .GIF (or any other extension) files on the graphic representation by clicking on the ext button. This is really a neat representation.

A special feature for users of Office 97 helps you see how much space Office 97 consumes and shows you which files are optional. You'll see how much space Office 97 takes up and see files classified into four types.

DiskMapper by Micro-Logic, $49.95 list price. http://www.miclog.com. Recommended. Street price will be much lower, I believe. ◆

(WinChip.....Continued from page 3)

on our way. Let's see what 95 does. Time to reboot and reboot and reboot. Isn't 95 fun? Finally, 95 is happy with the computer. Nuf work for the day.

Back in the salt mines it's now time to try again. Power on. The screen is black. Where's the video? Last thing I need is a hardware failure? Pull the AGP card and plug in a new video card. Thankfully, a PCI video card was lurking in the stack of spare parts, proud to show that it worked when a new fangled AGP Card didn't. Now the video works. Back to the computer store. Hope it's still under warranty. Looks like it's time to replace the video card. Thankfully, it doesn't work on their computer either and they replace the board. Once again I fulfill my role as quality control for the import market. Back to the motherboard (drawing board or future). Plug in the video card and every thing works including Windows95.

That was too easy. The hard drive already had Windows95 installed and some people had problems loading Windows95. OK, now, let's start over and load Windows95 from the beginning. Let's make sure that we have all the software, drivers and tools. First create a boot disk in Windows Explorer. Next, copy FDISK.exe, Format.com, Edit.com, edit.hlp, mscdex.exe, sys.com, autoexec.bat, and config.sys files to this floppy disk. Edit the autoexec.bat and config.sys files so that the CD ROM Drivers are directed to the A:\ drive. Make sure we have a Windows95 disk, CD ROM Drivers and boot disk. Now we are ready to start. Boot the computer. Now there are two choices: 1. Boot as normal and begin pressing the F8 key until you are given the choice of ways to start the computer, then choose command prompt; or, alternately, 2. Boot from the floppy. From the a:\ prompt, type FDISK. Choose "delete

Vinnie Barber of ALPS Printers giving the presentation at the September Meeting

(WinChip.....Continued from page 5)

partitions" and wipe out the existing partitions. Reboot the computer with the floppy and type FDISK again; now, go to the command "create a new DOS partition" and create a new dos primary partition. Next, format the hard drive, remembering not to put a system on the hard drive or the OEM Windows95 will not load. Reload the CD ROM drivers. Start Windows95.

After reloading Windows95, everything seems OK. Computer is spunky and has not crashed. Install clean and easy. Only glitch was the SIMMs voltage jumpers and it would have worked either way. Hardest thing was to find parts that worked and the appropriate drivers for them. As a bonus, now the parts are better organized, and best of all the computer works smoothly. Now to load Office 97 and test the program. Oops, Windows Office 97 is an upgrade and will not install. Time to find the Office 95 disks. As usual, Microsoft is providing entertainment and pain in installing programs.

Programs load smoothly. Time to run benchmarks. Then I can test my patience by putting both a network card and a modem in the computer. Finally, I will turn it over to Bambi and James to see if they can confuse it.

That it set up simply is a tribute to the WinChip CPU and the Trinity ATX with AGP motherboard by Tyan. Having worked with Tyan boards in the past, this was not a surprise. It is pleasant that the CPU followed suit. Once the parts were assembled and tested, this combination of chip and motherboard has been the easiest to set up in the last 100 plus computers I have built or supervised building. Also, a tribute to all those spare parts which contributed to the project, well sort of. Spare parts and $100 plus motherboard and CPU isn't bad for a 200 MHz computer. Using current wholesale prices the computer could be built for under $400 plus software. Probably cost more in time to find and check out all the spare parts but it does appeal to my Scottish ancestors, or were they my wife's ancestors. Have to load the genealogy program and check it out. ◆

Gateway GoldSM Service for PCs

Actually, she exchanged the 17" monitor for a 15" one due to space limitations on her desktop, and, per my suggestion, upgraded the Winmodem to a standard modem. I think the final price with tax and shipping was a little over $1,800. And if one is willing to forgo some of the above features like the large hard drive, the large monitor, the DVD instead of a CD, 32 MB RAM instead of 64 MB, you can get the price down closer to $1,200 without tax and shipping. Sales tax is one of the drawbacks with Gateway for Florida residents. Local stores mean sales tax on ordered items. Quite possibly if you buy from Dell or Micron you will not have to pay a sales tax.

As we all know from the ads in the newspaper, computers well below $1,000 are out there--and from name brand companies. So why spend $1,800 when $999 will get you a better computer than you could have bought a couple of years back? I suppose the main reason is that one wants the features of the more expensive computer--but not the much more expensive one priced at close to $3,000. And I recommend Gateway

(Comments.....Continued on page 7)

(Comments.....Continued from page 6)
since they have served me so well in the past. I bought a Gateway 386 in 1991 for $2,490 (no tax back then). I think it had a 125 MB hard drive and 4 MB RAM. The hard drive was eventually upgraded to 1.1 GB, and the memory to 16 MB--at prices of $75/MB to $45/MB. Boy how those memory prices have come down. Of course, the 386 had only a 14" monitor and no modem or sound card--both items purchased within a few months.

Then there was a no name 386 that we had which I upgraded to a 486 80 Mhz. I forget the price of all that. The next Gateway was bought in 1996 for $3,347 including tax and shipping. It was a P-166 with 32 MB RAM and a 2.5 GB hard drive, 17" monitor, 28,800 modem, sound card & 12 speed CD, and Microsoft Office Professional. That is the computer I am using to write this on. I have added a second 5 plus MB hard drive, and I do need to get around to adding another 32 MB of RAM. It is interesting to compare my sister's computer above to this one. Two years and five months get you more computer for just over half the price.

There are, however, still some expensive computers out there if you want to buy on the bleeding edge. To thank our son for getting through college in record time, thus saving us many thousands of dollars in tuition and expenses, as a graduation present last June we gave him the best Gateway had to offer at the time. It was a system with a 450 MHz processor, 19" monitor, 128 MB RAM, 14 GB hard drive, etc. coming in just under $4,000. I would never buy such a system for myself. I believe in dropping back at least one step from the bleeding edge machine, which, then, would probably have been around $2,800. You pay a big premium to have the latest technology.

So, I have purchased three Gateways, and advised others to do the same when asked for a recommendation (which most of the time is not followed since they can not stand to wait the 10 - 14 days from placing the order to receiving the machine. They opt for the instant gratification gotten from going to CompUSA and purchasing a Compaq or HP off the shelf). I have done it because of my belief that Gateway gives good value for the price you pay--if you don't buy on the bleeding edge. Others feel the same about buying a Dell or a Micron.

When it comes to laptops, however, I started with and have remained with IBM. In laptops, I feel that the ability to get parts for or get the machine repaired is more important than the absolute lowest price. And IBM provides that; plus in the current 385 series there is a good cost to value ratio. I bought two ThinkPads (the less expensive versions) for my son while he was in college. And now that he is out earning his own living, he just purchased a new one for himself. Each time he gets a new one, he always passes along the old one to me. The latest one he purchased, a ThinkPad 385XD-LEU**,** features a 233MHz Intel Pentium Processor with MMX , a 12.1" TFT Active Matrix Display, 32MB EDO memory , 3.2GB^2 Hard Drive 24X Max CD-ROM, and a 56K PCMCIA Modem with X-Jack Sound Blaster Pro-Stereo. That has more power than my current P-166 desktop, and it cost about $1,000 less than did the P-166 in 1996. Perhaps he will tire of it soon and pass it on to me.

Grocery Shopping List Update

Last month I wrote about the grocery shopping list compiler I had created at http://www.lamartin.com. Recall that if you didn't shop at one of the four stores in South Tampa for which I had a walking order, your list of selections would have to be printed in alphabetical order. I mentioned that I would work on a method of allowing you to order by food category the store at which you usually shopped.

Well, I have now done that. If you now visit the site, at the bottom of the page where you select the items you wish to purchase, you will see an 18 x 18 matrix of radio buttons which allow you to indicate the order in which the 18 food categories appear in your particular store. For example: Produce, Dairy, Meat, Canned, etc. You only have to make the ordering once, since when you set the radio buttons for your ordering, select the order by food category option, then click the submit button, a cookie will be written to your hard drive storing this information. On a subsequent visit, the cookie will be read and the radio buttons will be set the way you selected them the previous visit.

Cookies

Some people fear cookies, and a lot of fuss is made over them in the media and by certain individuals. It is like they are some sort of invasion of privacy. I don't see it that way at all. They basically store information about the settings you use when you last visited a site, e. g., a user name and password necessary to visit the site, or certain preferences you have about the way the site displays information or what information it displays. This is all to the user's advantage.

Now, of course, if some devious programmer creates a site that asks you for your social security number, your credit card number, etc., and you are foolish enough to enter this information, then cookies don't even need to enter the picture for him to grab this information. I can think of nothing of importance that a cookie can record that you don't explicitly give it by entering information that is requested.

Internet Banking

You simply can't depend on banks to not hit you with a fee if they think they can get away with it. I am sure you have noticed all the ads this year touting **free** Internet banking to ac-

The Do's and Don'ts of PC Assembly Part Two: Installation

By Brian Lance, Tampa PC Users Group

Before we throw it all into a box and hit the switch, let's review Part One of this article, which appeared in the September newsletter:

Bring your tools, hardware, software and miscellaneous items to a handy work surface. Familiarize yourself with the case and layout of the cards. A good example is an Enlight case (on a computer I recently built). The diagram shows arrows parallel to the case, so I pulled on it until I thought I was going to break something (hopefully, not a finger!). There are six little bud-like snap-onto connectors on the inside of the front panel, which was removed easily when I noticed there was a handle of sorts on the underside. Had I looked the case over a little more carefully, I could have avoided that scene. The rest of the case comes apart easily, and without tools. Lesson learned.

Some tips: Remember to always handle processors, memory modules and cards without touching pins or circuit traces. Check your cables and other parts for damage. Write down the model number and common name of your peripherals and cards. This will help when locating new drivers and updates. The FCC ID, which will appear on modems and other devices, may be useful as well.

Check your jumpers again and set according to the configuration you need. Definitely mark the location of ones you may have to change later in your manual. Some on-board devices (video, sound) may appear to disable themselves after installation of a like card, but if there is a conflict or the on-board device appears in Windows, you may need to manually disable it via jumpers.

If you don't have a grounding leash, touch a grounded metal surface on the case before you begin. This should drain any residual static charge. If you're worried about static building up due to carpeting (you should be!), get off the carpet, get a leash and come back here when you're done.

Now, let's start with the on-board components. Locate your memory DIMMs or SIMMs (Dual- and Single Memory Modules) and install them according the directions in the manual. SIMMs have to be installed at a 45° angle and pushed to vertical to install. Note the direction that they will have to angle from. If the chips have to be pushed to the right, start installing the chips from the rightmost slot in that bank. DIMMs install straight down. Open the retaining clips so they are laid back from the slot, align the chip, push down evenly, and the clips will close automatically. Check all memory to ensure proper contact.

I've noticed that certain motherboards advertise a maximum amount of RAM that can be installed. Say 1024MB. When looking in the manual, you might see a warning not to populate the board with both SIMMs and DIMMs, therefore making it impossible to attain the maximum memory. You can ask, “Why would I need a Gigabyte of memory?” You probably don't - yet. Memory will, in all likelihood, get cheaper per unit and the memory needs of applications will grow accordingly. How much memory was in a standard PC five years ago? The point is that if you do happen to need the advertised capacity, ask if can be reached without going against the manufacturer's recommendations. This is also true for bus or clock speeds - you can go past the recommendations, but you may not get support.

If your case has a removeable mounting plate, take it out of the case. Otherwise, your plate is part of the case and cannot be removed, so ignore references to the plate, substituting the case itself. Line up the motherboard with the plate, keeping in mind the card slots face the rear of the case. There should be at least four mounting holes that line up through both motherboard and plate. Note the location of these on the plate and set the motherboard aside. Find your standoffs. These may be little doohickeys with a hexagonal internally threaded head and a screw base or (the cheaper and much less desirable) tiny plastic christmas trees. Screw the standoffs into the plate. If these leave an uneven plane to put the motherboard onto, you may have to make do with one or more of the trees. These go into slots on the plate with a hole at one end and are to be pushed to the other end of the slot until they lock in place. The motherboard will then be secured to the standoffs by machine screws - and insulating rigs, if you have them. The trees will just push up through the motherboard and clip onto the holes.

Installing the CPU is a snap with a ZIF socket, which the Socket 7 CPUs are. Raise the lever on the side of the socket. Line up the corner of the CPU that is not square with pin 1 - this should be indicated on the chip as well as the socket. The CPU should drop right in. Slowly lower the lever (you may hear a squeak). That puppy is seated! The new Intel chips (Pentium II) are Slot 1 and install similar to a memory module.

Before you affix your heat sink (and possible fan), lay it on the CPU to see just how they will bond. This is usually done via a clip of some sort. Determine if you need anything special to help dissipate the heat, such as thermal grease or silicone. If so, apply this in a thin layer to the CPU and heat sink. The CPU and heat sink meet as flat planes, so if too much is applied, it may ooze out. This is not good. Go clean it up and continue. Now mate the heat sink with the CPU.

(PC Assembly.....Continued on page 9)

(PC Assembly.....Continued from page 8)
There's a good chance the first time will be problematic, and you may need an extra hand to help out. On Socket 7 systems, there will be little tabs the heat sink will latch onto.

Next, let's attach any onboard cables, such as IDE, floppy drive, sound, video and USB (Universal Serial Bus). If you have an ATX case with predefined panels (there will be several), choose the one you are going to use and screw this into the case. If it does not have the panels, decide whether to use ports behind the cards - which will block external access to that card - or knock-outs built into the case (recommended). For instance, the TX Pro motherboard in my Enlight with case has built-in sound and video. I used the video through a case knock-out until I bought a card to replace it. So there are now two video ports, but the onboard is disabled. If I had a 'knock-out pop-in', I'd remove the cable and port and plug the hole.

Note how many slots you have open and what type they are. Current systems may have a combination of ISA, PCI and AGP slots. The AGP slot is for an AGP video card only. Check to see if any of the cards have connectors that need cables attached. Sometimes the cables will prevent cards being adjacent to each other, so you will need some idea of what will go where. On a new system, you may have cabling from the modem or CD-ROM (to sound card), from a video card to a 3D accelerator or cards dedicated to I/O, such as a SCSI.

Next, install your storage (floppy drive, hard drive, Zip drive, CD-ROM, DVD, tape drive, etc...). These will all have bays designed for them, in 3.5" or 5.25" form factors, and will be outlined in the documentation for your case. Cases will vary, but most hard drives will be mounted internally, vs. the "external" bays for floppy drives. There should be four screw holes visible through the sides of the bay for each device. The sides of the bay are slotted and sometimes more holes are on the devices; these are to accommodate a wide variety of device/bay combinations. Make sure the external drives are mounted flush with the face of the case, or, for cases where the face covers the floppy (or Zip), just behind the case's face. All storage devices are designed to be mounted horizontally. Most can also be on edge (rolled 90 °) as well. The documentation I have here mentions that a hard drive should not be more than 5° off from horizontal, so don't put a phone book under one corner!

After a final check, put the plate with the motherboard into the case and secure it. Plug in the power connections from the power supply to the various components. If there is a separate plug by itself (not chained to another plug), use it for the CPU's fan. Most components, except for a 3.5" floppy, will use the larger 4-pin connector. The power for the motherboard is two separate plugs for a non-ATX power supply. These are white rectangles with 6 wires each. These snap onto the motherboard with the black wires in the middle. An ATX connector is one plug with two rows of ten.

Next time: Part Three: Everything Else. ◆

President Merle Nicholson at the September meeting

(Comments.....Continued from page 7)
cess your account information and transfer funds between accounts over the Internet. Now if you want to pay your bills via the Internet, then there would be a fee, but no fee for just looking at transactions. I jumped at the chance to Internet enable an account at Huntington and one at Nations. Well, as of December 1, Huntington says they will no longer provide the service free--even though, in my opinion, it saves them money over other ways I can use to get account information. However, they are still pushing it as a free service at their Internet site.

Should I simply move the Huntington Account to Nations to get the free service. I just might; however, I purchased 1000 computer checks from Quicken for this account. They would be no good at Nations, and I have only used a little over 100 of them. Additionally, once Nations sees that Huntington--and many other banks--are charging for Internet access, they will probably keep their Internet access free just long enough to snare people like me, then impose the fee. ◆

Special Interest Groups

Internet SIG

This SIG meets the first Monday of the month at 6 PM at the Reflectone Building, off West Waters Ave. You must sign up to get on the list and to get by security. Contact Mike Hodges at hodges@reflectone.com. For directions, see the map at our web site or contact Mike Hodges.

At last month's meeting, we discussed Active Server Pages at William LaMartin's site, lamartin.com.

Genealogy SIG

This SIG meets the second Monday of the month at 7:00 PM at the Museum of Science and Industry. *Contact Jenny Lind Olin at 960-5723 or Ford Bond at 987-6309 .*

Last month the interest seemed to return to questions about scanning and scanners. Ford demonstrated scanning a member's large photo of a family reunion. The second part of the demonstration was to cut and enlarge one person's face from the large photo. The discussion resulting from the demonstration was about the different features to look for when selecting a scanner.

Visual Basic SIG

This SIG meets the third Tuesday of the month, at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6 PM. For information, contact Merle Nicholson at merlenic@tampabay.rr.com .

Last month we learned how to create a VB program to calculate fixed mortgage payments for a loan and display the portion of each month's payment that goes to principal and to interest and the remaining balance.

Fall FACUG Meeting

By Don Patzsch, Tampa PC Users Group

The Fall Florida Association of Computer User Groups (FACUG) meeting was held in West Palm Beach.

One of the things I noticed was that several of the User Groups have been giving real service to their communities. And they have found out that public schools cannot refuse to let them hold their meetings in the schools in Florida. Federal and state buildings are also open according to law. Several of the groups told of their experiences with school people.

We met in the Palm Beach Lakes High School Media Center. The West Palm Beach User Group met with the evening school principal and they talked about how the school could benefit from allowing the user group to meet there. After a while, both the principal and the user group became enthusiastic about the idea. At the present time, the school allows the group to set up auctions to make money for the group. These are held in the school cafeteria to provide enough room for the tables. Other rooms are available for SIGs. All this is free to the WPBUG, and no insurance has been required of the user group. The same is true for other groups in the FACUG.

Several User Groups have now purchased projectors, mostly by getting a grant. Another interesting thing that you notice is that both Mac groups and PC groups are represented in the FACUG meetings.

The Orlando group now has about 850 members and sends out 5,000 newsletters each month. Each group told a little of how their group is set up and what they do.

We broke into small groups and discussed a subject in each of the groups. The Internet is well known now, and so the discussion there became quite technical, each person describing how his group obtained an individual domain address. The fun comes in listening to the different ways in which each group goes about its objective.

We broke for lunch at a unique place. The cost of the meeting is $8 per person and these folks made arrangements with a Chinese buffet, and we carpooled and went to the buffet which was included as part of the $8 entrance fee! Carpooling and all of us having lunch in the same place allowed us to talk about other experiences besides those in the User Group meeting. This was one of the better FACUG Fall meetings as I see it. Of course there are prizes at the conclusion of the day.

Another thing that was brought up at the meeting was how to teach the elderly or "senior citizen". When people call me and say they are disgusted because the grandkids can use the computer but they can't and they don't have the money to take any courses, this is what I do. First, talk to them a little to ensure that they are rational and really want to learn. Then remind them that free training is available at ANY library. Just call and set up an appointment, and a volunteer will sit with

you and show you email, how to get civic info, and how to use the Internet. In Hillsborough County, the Library has NETSCAPE available and also Time Warner cable connections (free to the library). That is one way to learn at no cost, and you don't need a computer. Just go to each library, a different one each week is what I tell them.

I took several Bits of Blue along to the meeting to hand out. These are placed on a side table along with those from other computer groups. This is an excellent source of information on how the other groups accomplish their objectives. ◆

Meeting Preview: At the December meeting, El Shaddai Edwards from Jasc Software will be giving the presentation. He will demonstrate Paint Shop Pro. Come out and see a great graphics program. Mary Sheridan, as usual, will conduct a 30 minute Windows discussion at the beginning of the meeting. Possibly she will tell us a little about her trip to COMDEX.

President's Message

By Merle Nicholson, President, Tampa PC Users Group

Last reminder, everyone. The election of officers is this December meeting. Please attend the meeting and show your support for your club.

On that note, I'd like to recognize those people on the Board of Directors who contribute so much of their own time to make this club possible. TPCUG is an organization that offers a quality contribution to the membership and to the community. The club obviously doesn't run itself; and it's only through the dedication of the board and the membership that it remains a viable organization.

Mike Hodges, as TPCUG Vice President provides experienced organizational ability to the board. He's willing to step in and keep our meetings on track. He offers experience and insight and creative ideas. Mike is also our host at Reflectone for our board meetings and the Internet SIG, a resource that would be very hard to replace.

Kevan Sheridan, as TPCUG Secretary and very long time member, has donated his time to help track our ongoing projects and discussions. He's always in there at the meetings to help with anything needing doing. He's going off the board as secretary next year, but we fully expect him to carry on as before.

(President.....Continued on page 2)

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

Minutes of the November 11 Meeting

By James Weber, Tampa PC Users Group

The November meeting started with Mary Sheridan presiding over a Windows SIG. As usual, several topics were discussed. The idea of recycling old motherboards or recovering the gold from computer components was probably the most intense. There appears to be quite a few people in the group who have old equipment that they might be willing to part with.

Robert Armstrong from BCD was the guest speaker. He related very interesting information about Intel's strategic plans for the next few years, including the Xeon and Merced processors, and AMD's new K-7 chips. Mr. Armstrong then made a brief sales pitch for the "Flash Net" Internet service.

After a brief beak, we had the door prize drawing. Bruce Register and Roger waters were among the winners. ◆

(President……..Continued from page 1)

Jenny Lind Olin, TPCUG Treasurer, stepped into the job at the right time last January when we thought we might not survive financially. Jenny leaves no doubt where every penny of our club money is. I can't tell you enough about how difficult club life is when the financials aren't in order. An organized treasury enables the board to make decisions with minimal discussion and maximum dispatch.

Those three and I are the four elected board members. The other board members are volunteers. They're appointed by the board and have full voting rights in board decisions.

Mary Sheridan as TPCUG Programs Chairman made up her own job. She was on the board as BBS Sysop and filled a job that was very badly needed as Programs Chairman, then proceeded to eliminate her old one as Sysop. Mary has done an outstanding job getting quality speakers in and is a very major contributor to our success.

William LaMartin is Newsletter Editor and Web Site Editor in one, and I need not point out the dedication to quality William brings to us. You can see that for yourselves when you get the newsletter and use the web site. One thing he had done when he took over the job was to make the newsletter an "All TPCUG" newsletter. All articles are submitted by members, where previously many articles were reprinted from other clubs' newsletters. What isn't so obvious is that he also prints, folds, staples and mails the newsletters also, with some volunteer help. He dedicated no small amount of time in getting our web site moved to another internet provider and got the club's web name

(President……..Continued on page 6)

ZIFF DAVIS SHAREWARE AWARDS

Summarized by: Larry Anders, Librarian
Tampa PC Users Group

Ziff Davis (ZD) publishes several excellent magazines for the personal computer user. I know because I have subscribed to a few of them for years. They also have one of the best web sites on the Internet for computer users at http://www.zdnet.com. Recently ZD held their 5th Annual Shareware Awards and have published their winners at http://www.zdnet.com/swlib/zdawards/zdawards.html#Winners. Not only are just the winners listed here but all the runner-ups for each category are also listed. Below is a summary of the winners of each of the categories selected by *PC Magazine*. All of these files can be downloaded from the above link.

APPLICATIONS: NoteTab Pro, Eric G.V. Fookes NoteTab Pro is a powerful editing tool especially suited for programmers and web developers that can open multiple documents of up to 16MB each in their own tabbed window. NoteTab's Editor's Clipbook tool lets you easily insert any kind of boilerplate text, such as HTML tags, glossaries, etc., into your documents. Many conversion functions are included, such as stripping HTML tags, changing text to HTML, sorting lines, converting between ASCII and ANSI, and changing case. Some features include the ability to open links or view documents in your web browser, search-and-replace text in all open documents or disk files, format outlines to organize notes, and calculate mathematical expressions. The evaluation edition is functional for approximately 30 days. Spell checking and thesaurus functionality are available once you register. Free to try; $19.95 if you decide to keep it.

DESKTOP ACCESSORIES: Judy's TenKey, Judy's Applications Judy's TenKey Calculator is regular calculator, RPN, or ten key adding machine, that uses a tape that can be saved, printed, notated, and even edited. It's very versatile with a good introductory demo of its many capabilities. It supports scientific notation, and can smoothly exchange data with other Windows applications. This versatile calculator can be nearly whatever type of calculator you need it to be at the time. Free to try; $19.95 if you decide to keep it.

BUSINESS: Power Utility Pak 97, JWalk & Associates Power Utility Pak 97 adds 31 general-purpose utilities, 40 custom worksheet functions, and enhanced shortcut menus to Microsoft Excel 97. Run Power97.xla only when you need the features or install it to the Excel add-in list. This shareware version gives you information and help for all of the features, but they are not all functional until you register. System Requirements: Microsoft Excel 97 and Windows 95. Free to try; $39.95 if you decide to keep it.

COMMUNICATIONS: WinProxy (Ositis), Ositis Software WinProxy lets you connect multiple computers on a LAN to the Internet through a single point. It runs on any Windows 95 or NT. The program walks you through setup step by step, providing guidance all the way. All Internet interactions are then seamlessly routed through the WinProxy server. Save money by using a single Internet account, modem, and dialup or leased line on one station for all Internet accesses. Free to try; $299 if you decide to keep it. (This is by far the most expensive shareware program I've seen!)

E-MAIL, NEWSREADERS, CHAT: ICQ (32-bit), Mirabilis Ltd. ICQ means "I-seek-you," And it's free! (And you know how I like free things.) ICQ lets you communicate directly (no IRC) with any other ICQ user on the Internet, either by direct messaging or in a text-based windowed interface for multi-person chat. ICQ has dozens of options such as file transfers and linking to audio/visual chat applications. It's simple, operates seamlessly and is well documented. And it's FREE!

FILE UTILITIES: Turbo Browser 98, Pacific Gold Coast Corp. Turbo Browser 98 is a file-management replacement that mimics the Explorer interface but adds a viewing window. With support for dozens of file formats, it can convert, print, zip and unzip, and even encrypt files. The system is tightly integrated with Explorer's options, plus offers all the conveniences, such as drag and drop, rename, cut, copy, paste, delete and more, and it makes the same right mouse menus available to you. Free to try; $69.95 if you decide to keep it.

GRAPHICS & MULTIMEDIA: Screen Saver Toolkit, Stardust Software The Stardust Screen Saver Toolkit can help you to build a professional-quality Windows 9x/NT screen-saver product without programming knowledge. It uses wizard interfaces to create a slideshow or presentation style screen-saver application. The system supports common image formats and .avi videos and includes an image conversion utility. Free to try; $249 if you decide to keep it. (Another expensive one!)

HTML EDITORS: HomeSite, Allaire Corp. Homesite was originally a highly functional non-WYSIWYG HTML editor. Now it has drag-and-drop WYSIWYG editing and an abundance of other features and functions and well-written help documentation, including sections on HTML tags and web page design. Free to try; $89 if you decide to keep it.

INTERNET UTILITIES: WS_FTP Professional, Ipswitch, Inc. WS_FTP Professional is a 32-bit Windows FTP client that provides two intuitive interfaces for easily transferring files and directory structures between FTP servers and your local computer: classic WS_FTP interface and a new Explorer-style interface similar to My Computer. You can group select multiple files and/or directories and transfer them in a single operation. Features include firewall support, UNIX permission

(Shareware.....Continued on page 4)

(Shareware.....Continued from page 3)
switches, basic transfer logging, and a comprehensive logging option. Many display features can be customized. Also included is WS_FTP Pro Explorer, an extension for Windows Explorer that lets you transfer files via FTP. Full online help is provided. Free to try; $37.50 if you decide to keep it.

PROGRAMMING TOOLS: Setup Specialist 98 TG, Byte Software Setup Specialist offers a user-friendly visual development environment that does not require you to learn any script language; you set all options using a wizard-like graphical interface. Setup Specialist provides a training card feature that guides you through each step of creating your 32 or 16 bit setup program in English or in German. Each program you create features the typical Windows 95/98 Wizard. Setup Specialist supports selective installations, uninstall, creation of program groups, and Registry modifications. It can check for a variety of existing requirements -- including minimum display properties and CPU, Windows platform and version. Because it creates a single .exe file, you can easily distribute your applications through the Web, Internet, or even email. Finally, Setup Specialist supports many other features, such as billboards, checking for an expiration date, and efficient data compression. Free to try; $89 if you decide to keep it.

SYSTEM UTILITIES: Take Command/32, JP Software Take Command/32 brings the power and convenience of the popular 4DOS Command.com replacement to the Windows desktop. If you're a diehard command prompt user, you'll find this utility useful for performing tasks such as managing your hard disk, scripting a series of steps with a batch file or alias, or starting programs. The program's many features make it well worth a look by anyone who frequently uses the DOS command line from within Windows. You can try it out for 21 days before registering. Free to try; $69.95 if you decide to keep it.

WEB DEVELOPMENT: GDIdb, Global Data Industries GDIdb is a tool for anyone who needs to create, manage, and present an ODBC database or spreadsheet on a web site. It works from your local PC, with an intuitive, dockable toolbar environment for generating operational scripts containing all the necessary HTML to transform an existing database into a fully functional "data server." The only requirements are the data source and a dial-up connection to your web site. GDIdb even includes a built-in FTP interface and transfer-progress indicator for automatic publication and management of your new pages. You can evaluate this well-documented trial version for 30 days. A sample MS Access database is included. Free to try; $38 if you decide to keep it.

So if you're into Shareware as I am…. Merry Christmas! …. If you're not into Shareware…. Merry Christmas anyway. ◆

My Favorite Software – Info Select 5

By Tim Condon, Tampa PC Users Group

It seems that---with William LaMartin asking for articles on a regular basis---we might want to consider sharing "a few of our favorite things"…namely favorite software programs. You know, the one that you use for just about everything, and you can't imagine switching to another program because this one just does perfectly for you what it's supposed to…**so** well? (For instance, I think we can all agree that WordPerfect 5.1 for DOS was the premier word processor in all of history, and it's been downhill ever since then…but that's another story.)

Well, let me be the first to lead off. I've been using computers in my law practice since about 1985, when I finally figured out how to use DOS on the 40-pound Zenith Z-160 "luggable" that I'd bought with the two 360K floppy drives and the tiny orange CRT. Sigh. Those were the days, weren't they? But I digress. Back in the mid-1980's there was a little pop-up TSR ("terminate and stay resident," lest we forget) program that was advertised in all the computer magazines called "Tornado." It wasn't quite totally clear what the program could or would or should be used for, but the marketing campaign said it would be mightily useful…if you could figure out what you were gonna do with it.

At that time Tornado was one of a nascent class of programs that years later would come to be called "PIMs" (personal information managers). Of course, no one called it that then, because no one had ever seen anything quite like it. It was originally trumpeted as a terrific way to keep names, addresses and telephone numbers, as well as "random information" (whatever that meant). Well, as a shiny young lawyer I figured I had more than enough random information to keep track of…so I took a flyer on the program and bought it…I think it was $39.95 or something like that.

Now this brings me to another digression, but one that will lead us back to little Tornado's latter-day incarnation in due time. Have you ever noticed that---in years past, at least---one of the hardest things to figure out about software was…how you were gonna use it? Like, how you were going to actually put it to work so that it fit your circumstances, your work structure, your…your…way-of-doing-things? Even today I find that's still a Major Question. Well, in those nether days of yore, when we were all fiddling around with DOS and DOS programs and TSR's and these newfangled things called "word processors" (remember what a sensation WordPerfect 4.2 caused?), I couldn't exactly figure out how I was going to use Tornado…but I figured that I could at least start by using it for my address/contacts/telephone book. And it served that purpose well, as I remember.

(Info Select.....Continued on page 5)

(Info Select.....Continued from page 4)

Well that, as they say, was then. And this is now. My favorite program, the one that gets cranked up in Windows 95 at the very beginning of the day, and the one that is repeatedly used for all kinds of things, is Info Select 5.0, the latest end product of its distant ancestor, Tornado (when they made the jump from DOS to Windows, I heard, they got into some kind of copyright snafu with some other Tornado-name-user, so they switched the name of the little program to the inelegant but pretty descriptive "Info Select").

Now, before I tell you the myriad ways I use Info Select, I've got to say there's a funny thing about it: Many of the computer world pundits and reviewers don't seem to like it…or understand it. When you sniff out a "comparison" review of PIMs on the Internet, you'll often find the writers scratching their heads over Info Select. The "standard" PIMs like EccoPro and Lotus Organizer and Act! and even Time and Chaos32 and Above & Beyond…well, those they can understand just fine, with all those clear little boxes and fields and fill-in-the-blank thingies. Problem is…Info Select doesn't have just about any of that. It just lets you---no, no, it insists that you---figure it out yourself and then set it up and use it the way you want.

That seems to unnerve a lot of computer users, especially the pundits. I had a friend, Chad, who asked me what PIM I would recommend, back in the late '80's. I was only too glad to tell him about Info Select. Well…he tried it, and he couldn't stand it. Just couldn't get comfortable with it. He…just…couldn't "figure it out," that is. He couldn't figure out how it was that he was going to use it. Strange, I thought. But then he got an early version of Lotus Organizer…and oh well,

Internet picture of the month

Front Dining Room at Antoine's, New Orleans, LA

Antoine's Restaurant in the New Orleans French Quarter is one of the great restaurants of America. Antoine's has been in continuous operation since 1840 under the same family's management. If you can't make it there for a meal just now, you can still pay a virtual visit at http://www.yatcom.com/neworl/dining/antoines/netscape/welcome.html

Chad was in hog-heaven with that little program. Thing was, I couldn't see how Organizer had any versatility or usability at all compared to Info Select….

Well, again, "that was then, this is now." Since the 1980's when a few of those little babies were popping up here and

(Info Select.....Continued from page 5)
there, modeled for the most part on existing paper organizers… since then a whole galaxy of those little huggers has appeared. Oh, it's just been grand. First of all, the suites all had ta have a PIM as a component, from Microsoft Office's "Outlook," to Corel WordPerfect 8's "CorelCentral," to the aforementioned Lotus "Organizer" (and Organizer 97, and Organizer 97 GS, and Organizer Premium Edition…sheesh), they've all become tails that sometimes wag the dog, an indispensible part of every suite.

And the rest? Oh yeah, "the rest": You get to choose. From EccoPro to Act!5.0 to Day-Timer Organizer Deluxe, to Franklin Quest Ascend, to Janna Contact 95, to Maximizer 97is, to Pack-Rat, to InTouch, to Comm Assistant, to PhoneBook95 Professional Edition, to Virtual Secretary, to Above & Beyond, to Time and Chaos32, to Client Tracks, to Organizer 97, to Quick Organiser, to AMF Daily Planner and PIM, to…to…well shucks, we can go on like this all day, and then all next week naming these little boomers. It's like there are more PIM's out there than cockroaches, and they seem to be multiplying almost as fast! It's like everyone with a keyboard has decided he's gonna bat out the dee-finitive PIM and slap it on the Internet… and it seems they're all just doing just that!

But I digress again. I was talking about my little gem, Info Select. Now, lemme tell ya this about that little enchilada! Oh. Oops…William says wait! William says I can't do unlimited babbling in a single issue of the newsletter. So I'll reluctantly shut up for the time being. Next newsletter, I'll tell you all about my baby, Info Select, and the myriad ways I use it.

In the meantime, I'm sure the rest of you have just as strong feelings about your favorite PIM! How's about we get some kind of Socratic dialog going here? Everybody send William a few nicely-crafted paragraphs about why your PIM is the best in the world, and what specifically you like about it, and how you use it and how it perfectly fits your work-style and needs. You know, all this brings a thought to mind. It's a great thing, the destruction of the commies' Evil Empire. I mean, look at us, we all get to not only pick our own software and tools from a universe of choices, but we also get to argue loudly and long about all of 'em. Without being shot. Of course, to my mind, anyone who doesn't cop to the extraordinary superiority of Info Select…well, they should be shot! But I'll tell ya all about it next month. ◆

Memory & Office Problems

By William LaMartin, Editor, Tampa PC Users Group

Memory My Gateway P-166 now has 96 MB of memory. However, the process of putting it in was a little convoluted.

I bought two 32 MB SIMM modules for $40 each at CompUSA with a $40 mail in rebate. That seemed like a pretty good price—remember when a 1 MB SIMM was $40? Unfortunately before I went to CompUSA, I opened up the computer to look at the RAM that was already installed--two 16 MB SIMMs. To get a better look, I took one of them out. Then, when I tried to reinstall it, it wouldn't go in. A little investigation revealed that its socket on the motherboard now had a problem. About five of the 72 metal wires that run parallel to each other along the inside of the socket had sprung up from the bottom of the socket. With a fair amount of force you could insert the SIMM, but when the computer was rebooted it let you know that there was a problem by emitting a collection of loud beeps.

Fortunately I could install the memory I had in the two other sockets on the motherboard, and everything was fine. That meant, however, that I couldn't install any new memory in the two sockets that had been in use before the problem. So I called Gateway, and they offered to send me a new motherboard—not bad for what they thought was a one year warranty on a computer that was over two years old. However, when I convinced them that I actually had a three-year on site warranty, they agreed to send the motherboard with new memory, processor, cache, etc. for a technician to install. Everything was to be exactly like the original.

The technician came, did the installation, and everything worked fine except the network card and the scanner SCSI card. They were conflicting with each other, and he couldn't remove the conflict. I couldn't either--even with an uninstall and reinstall of each item in the Winnows Device Manager. Since I had solved such problems in the past, I told him not to worry about it and sent him on his way to his next appointment. About 15 minutes after he left, I had everything working. There was a BIOS setting for plug & play that was set incorrectly. Once I changed that, the cards were assigned different interrupts (something that couldn't be done earlier), and everything was in good order.

Office 97 If it is not a hardware problem, then it is a software problem. I know you think I probably make up these problems just to have something to write about, but that is not the case. I have enough problems occur naturally that there is no need to manufacture them, believe me. Of course, I may have a lower tolerance of things not working correctly than most people do. If something is wrong with my computer setup, I want it fixed. My Microsoft Office 97 saga is as follows:

(Comments…….Continued on page 7)

The Win Chip C-6 Processor

By James Weber, Tampa PC Users Group

At our June 10th group meeting, a representative from IDT/ Centaur, Mike Bruzzone, spoke about the new Win Chip or C-6 processor. Two chips with a board were offered to the group for evaluation, and I was one of the ones to receive a Win Chip Processor for evaluation.

The processor I received was one of the 225Mhz ones with a Tyan motherboard. I purchased all parts for the test system new so as to limit any hardware problems later on down the road. I purchased a Samsung 2.1 gig hard drive, 32meg SDRAM memory, a Trident 4meg AGP video card, U.S. Drives 24X CD-ROM, Ensonic PCI sound card, a Diamond 56K V.90 PCI modem, and a new ATX case. The only things used were my PS2 mouse and keyboard and a Maxtech 15" monitor.

I had no difficulty installing any of the components. I always build a system one piece at a time starting with the motherboard/processor, video card, and memory; I tend to stop after each component and turn on the power. This way if a problem develops I can isolate the newest component to see if it is defective or just causing a conflict with another device. After a bare bones construction of motherboard, Win Chip, memory, hard drive and video card, I did a bare system format of the hard drive. This was just enough to start up the system and check the functionality of the primary components. The bios recognized the Win Chip right off and booted to the hard drive without a hiccup. I next installed the 24X CD and loaded its DOS drivers and copied the setup files from the Windows 95 CD. As a rule I load the necessary files from the Windows 95 CD onto the hard drive and install from there. This allows me to change or add system settings on the fly without the need to swap out CDs. This also allows me to check the function of the CD in DOS mode just to be sure it works.

A new, clean, installation of Windows 95 ran fine on the first attempt, so I began to add the rest of my components. An Ensonic PCI sound card and Diamond PCI 56k modem rounded out my hardware. Again, all the new components installed and worked properly. A brief note about PCI modems. Windows 95 and 98 will install these cards and will not give any indication that there is a problem. A quick check of the System Properties box will not show any conflicting ports or memory addresses. However, the modem will fail to initialize in some cases. If you should ever have this problem, either disable one of the two serial ports from the motherboard in the bios, or go to the Control Panel \ Add Hardware button and add one or two more Comm ports to the system configuration before physically reinstalling the card and drivers. This error doesn't happen often, but it has happened enough for me to be cautious building a system.

I was able to run Windows 95 on the Win Chip without problems. I ran through all the accompanying programs that come with Windows and left it running for a week with various system utilities set to run during the day. I never had a system crash or lock up, and the processor showed no signs of over heating. Next, I loaded up Microsoft Office. Again, everything worked well. Word, Excel, and Power Point all responded without hang-ups. Internet access was not affected by the C-6. I used both AOL and Mindspring for Internet access with both Netscape and Internet Explorer running as browsers at different times. I didn't experience any difference in performance with any combination of these programs. I then loaded up a copy of Quick Books and ran my bank statements from the last year through it. (Had to do it sometime.) I left the machine running the whole time to look for any instability. Even though I still can't balance my checkbook, I didn't experience any problems with any of the programs I installed. The most remarkable thing I can say for the C-6 was that it didn't cause me any trouble up to this point. The whole experience had been remarkably uneventful.

Finally, I came across something the Win Chip couldn't handle: Games! Now, I know some of you don't think the use of games is important to the overall computer industry, but just look at all the money Americans spend on computer gaming every year. And I guarantee that any computer system you could possibly imaging will at some time have games running on it. I have a benchmark demo of Forsaken and Quake II that I used for my test. Forsaken refused to run at all beyond the introduction. Quake II was unstable at a resolution higher than 400 X 300. Even at low resolution, frame rates were never higher than 15 to 25 fps. I installed an Intel 233MMX chip into the motherboard at the end of the test, to see if my problems were video card related, but these games ran appropriately with the Intel chip.

The system I configured for this test was probably left running continuously for three weeks. Other than the few game problems I liked working with the C-6. In an office environment the C-6 would make a legitimate alternative to Intel or AMD for a Windows workstation, but don't expect the C-6 to be an inexpensive replacement for that new P-II Junior wants. ◆

(Comments…….Continued from page 6)

I noticed in MS Access that I no longer had the office assistant working properly—you know the little thing that bounces around on the page, makes noises and is there to assist you--so I reinstalled Access from the CD. That got back the assistant. I then figured I needed to reinstall the two Office 97 patches SR-1 and SR-2. Neither would install. The Sr-1 log file said that it would not install because it encountered incorrect ver-

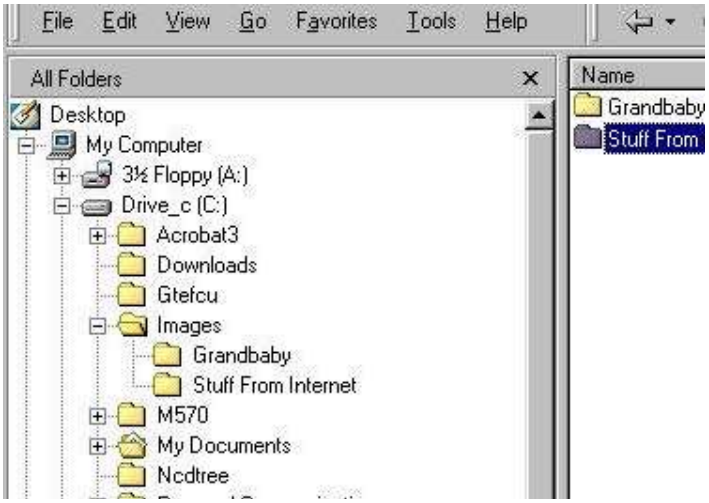
Beginners' Column: Files & Folders for the Folder Inhibited

By Merle Nicholson, President, Tampa PC Users Group

Because of a completely overwhelming response from my one fan, I'd like to review files and folders this issue. I know it seems pretty fundamental, but have you ever, say, downloaded a file from the Internet and then can't find it? Or has someone sent you an email attachment and, after dragging it to the desktop, have you realized that there are twenty other files on the desktop, and it's gotten overwhelming? Do you know what to do with these files? If you don't, then read on.

We're going to use Windows Explorer for the rest of this article. If you're using something called File Manager, shame on you. If you are using Windows 95, Windows Explorer is fairly good. It has some quirks, but even with quirks it handles long file names. File Manager does not and should not be used.

Now, please don't just sit on the couch and read this article. I'm writing it intending for you to be seated at your PC and actively following my instructions and to repeatedly do these instructions as an exercise until it becomes second nature. This is a foundation to understanding most of what goes on in your PC, so it's important.



Windows 98 has an improved Explorer and is very configurable. It's main improvement is that once you set the style of how it looks, it stays that way. The Windows 95 version doesn't seem to remember much of anything. But there are a few things we must do here to make Windows 95/98 Explorer more useable. Open Explorer from its icon in the Start menu. This is the view that has a dual pane. The left pane has a directory tree diagram, and the right pane has a folder and file list. Go to the Menu, View, and click on Details. This gives you a pretty easy-to-read picture of the files in any directory. Browse to any directory on the left pane and see what files appear on the right. You'll need to go to View, Options and set Explorer to use the same window for all directories to keep it from launching a new window for each directory. And you'll have to click on View, Details sometimes to keep Explorer (95) behaving. While you're at it, display the toolbar too. The most useful feature on the toolbar is the "up" button.

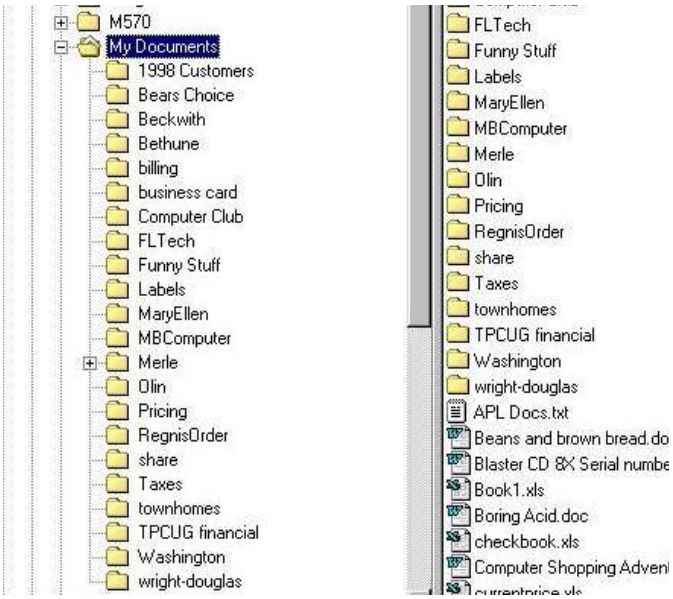
For those of you with Windows 98, try setting your Explorer as "custom" and "use windows classic desktop" and "open each folder in the same window". I'm wary of imposing my personal preferences on you here. I prefer a traditional view of a hard drive, so I'll ask that for the purposes of this article, try it this way then experiment with the settings later.

So, we'll just assume now that your own files are not organized. When I say "your own files", I mean attachments to e-mail from your Aunt Tilly; interesting pictures or recipes you've captured from web sites; A letter to Uncle Bus that you started in WordPad; a spreadsheet to calculate how much interest you paid on the old clunker .. that sort of thing. What about the digital pictures of the "Worlds Most Perfect Grandbaby" the kids have been sending you? Can you find them? So let's organize your hard drive a bit.

Go to Explorers' Left pane and expand (C:). To do this, click on the + in the box next to the "(C:)" to expand the drive if it's not already expanded. If it's already expanded it has a "-" in the box.

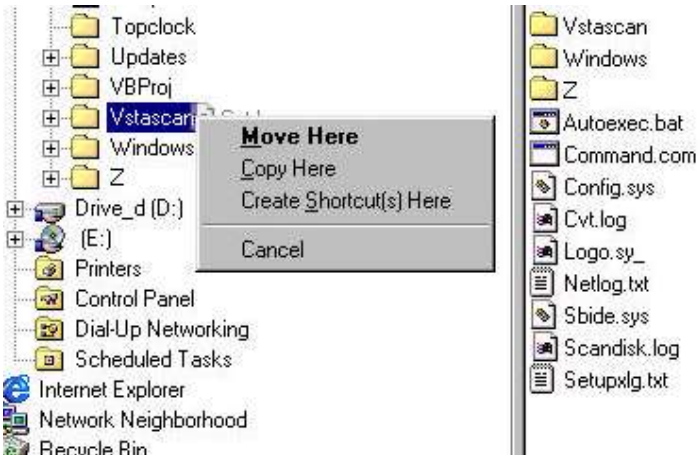
Select the (C:) ("Select" means click once so an object is highlighted), then on the menu, click on File, New, Folder. In the right pane, a "new folder" will appear, and is ready to be renamed from "new folder" to let's say "Images". You'll see that when it's renamed it also will appear in the left pane, alphabetically under (C:). So let's add a subfolder under that one. Select the folder "Images", then on the menu, select File, New, Folder. And rename it "Grandbaby". Add another one under Images called "Stuff from Internet". So here's what it looks like in my Explorer.
Now that you have the idea, create a new one called

"Downloads" under (C:) and also make sure you have a document directory. Since I have Microsoft Office, notice that I have a folder called "My Documents". Other word processors may or may not create a document directory for you. If not, then go ahead and do it now. If you look at my expanded "My Documents" directory in the next picture, you'll see that I've categorized all my "stuff" into separate folders. So when I create a new document I always immediately do a "Save As" and select the correct directory or create a new one on the fly.



The best reason to organize in this way, besides being "organized", is that you're also making it much easier to back up your important files.

So now, what are we going to do with all that "stuff" you've



(Beginner.....Continued on page 9)

(Beginner.....Continued from page 8)

been accumulating in the root directory and on your desktop? We're going to move it all and get it organized. You can move all your files, one at a time or as groups. You can open two Windows Explorers if you like, one to move files *from* and one to move files *to*. You can size these so that you can see them both. Locate the files you want and drag each one to the destination folder. Using the right mouse key to click and drag gives you the most flexibility. When you "select" a file (or files) they become highlighted. Select them using the right mouse, drag them to the other window and when you drop the file, you get a small pop-up menu.

The item that is highlighted on the pop-up is the current "default" action. It's best to go ahead and select the action you want. Our objective here is to relocate a file, so **Move Here** is appropriate. So navigate through the hard drive using the left pane of one Windows Explorer and select the files on the right. Find the destination folder in the other Windows Explorer, drag each file to its destination folder with the right mouse and when you drop it, select Move.

You can easily select more than one file at a time and move files as groups. The trick here is to get them all highlighted and then ,when you have them all, right click on the *icon* of one of the files in the group and drag it where it's to go, just like moving one file. When you're ready to drag the group, it's easy to mess it up if you aren't careful to select a file icon from the group. You may need to practice this a bit.

Now to select multiple files, just click on the first file in the group, hold down Ctrl and then left click on another, and each one in turn until you have them all. If you want to select a contiguous group of files you can select the **first** of a list, then hold down Shift, and select the **Last** of the group. All files between those clicks will be selected. If you wanted to then exclude one of them you can de-select using Ctrl + mouse click. You can add or subtract any number of files in this way.

If you have multiple files on your desktop and want to drag them to a folder, you can drag a rectangle over any number of files and all within that rectangle will be selected. You can add or subtract from that group using Ctrl + mouse clicks. When you're ready to drag, remember to grab it by one of the icons in the group, otherwise you lose all the selections you've made.

There are other ways to move or copy files. For instance, if you look at the left pane of Windows Explorer, at the top will be a "Desktop" icon. Select that and on the right you'll see an organized view of all the files on your desktop. You can also right click on any file and get the long file menu – the one ending in properties. In the middle of that menu you'll see *Cut* and *Copy.* If you'll select Copy, and then navigate to another folder, and right click in that folder, you'll see that the menu has changed. It now has *Paste*, *Paste Shortcut* and *Undo Delete.* In this case select *Paste*, and the file you selected earlier will be copied to the new folder. If you had originally selected *Cut* from the menu when you selected the file in its originating location, the file would have been *moved*. That's because the *Cut -then- Paste* operation is the same as *move*, and the *Copy-then-Paste* operation is the same as *Copy*.

You'll need to practice to get this all right. Then as you use the software you have, use them with some discipline. Pay close attention to where the software puts you when you *Save* and *Save As*. It's much easier to maintain an organized system as you go along than to correct one. ◆

Special Interest Groups

Internet SIG

This SIG meets the first Monday of the month at 6 PM at the Reflectone Building, off West Waters Ave. You must sign up to get on the list and to get by security. Contact Mike Hodges at hodges@reflectone.com. For directions, see the map at our web site or contact Mike Hodges.

At last month's meeting, we critiqued a participant's web site, offering alternate ways of doing things, and then visited several interesting sites. We also looked at how to set your own walking order for a store for the online grocery list compiler at http://www.lamartin.com. This led to a discussion of cookies.

Genealogy SIG

This SIG meets the second Monday of the month at 7:00 PM at the Museum of Science and Industry. *Contact Jenny Lind Olin at 960-5723 or Ford Bond at 987-6309 .*

Visual Basic SIG

This SIG meets the third Tuesday of the month, at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6 PM. For information, contact Merle Nicholson at merlenic@tampabay.rr.com .

Last month we learned the many different ways of manipulating string variables.

(Comments.....Continued from page 7)
sions of certain files. I figured that I needed to download the newest versions of each patch. After downloading SR-1, it seemed to run fine. I then ran the old version of SR-2 (I hadn't downloaded the new 23 MB version of it yet), and it ran, but seemed to run too quickly to have done much.

Next, when I tried to run Microsoft Word, I received the message that it might have problems due to missing or corrupted files and that I should run the Word installation. Everything seemed to run OK, but to be on the safe side I uninstalled Word and reinstalled it from the Office setup. That solved nothing. Additionally, Access had also lost the ability to import .csv or .txt files, and the Access setup would not allow me to reinstall this feature—saying that it was already installed.

I then decided that there might be a problem with versions of files and not that they were missing or corrupted, so I downloaded SR-2 and the version checker utility and ran both of them. Again SR-2 seemed to go mighty fast. However, the version checker said that I had SR-2 installed and everything was OK. Word still gave the error message about corrupted or missing files, and Access still had its problems.

This was another instance, like I had with Visual Basic 5, where an uninstall and reinstall of a program did not put things right. It seemed impossible to completely remove Word or Office. What do you do when a reinstall will not eliminate the missing file or possible corruption message? I think it was simply a version discrepancy among the SR-1 patch, the SR-2 patch and the original word installation. But how do we wipe the slate clean and start fresh--short of wiping the hard drive clean? Only recently have I run into this type of problem: Uninstalling a program and reinstalling will not fix a problem. It seems that things get stuck in the registry, and you can't get rid of them, and RegClean doesn't help.

Eraser97.exe to the rescue! Someone on the Office 97 newsgroup suggested a Microsoft utility called Eraser97 that would remove all traces of said program suite, and it certainly does its job. You wouldn't believe how much a regular uninstall leaves. Eraser97 gets all of that. Unfortunately other programs need some of what it removes.

So far, I have found three programs that had to be reinstalled because of Eraser97: the Active Server Page component for Microsoft Personal Web Server and my two scanners. I also reinstalled WinFax since I at first thought the reason that I couldn't scan and send from that program was the fault of the program, but, as I discovered, I could use scanners in none of my programs. Unfortunately, reinstalling WinFax probably installed a lot of old DLLs.

If you think you need Eraser97, you can get it at ftp://ftp.microsoft.com/softlib/mslfiles/eraser97.exe. Of course, afterwards, you may have to reinstall a few programs in addition to Office 97. ◆

group of people who selflessly give their time to do this. It's they who are helping maintain the quality of the club for all to enjoy.

Bruce Register, Member at Large, is a long time mainstay of the club. In the board meetings, Bruce's ideas and comments are always thoughtful and creative. You can expect that if there's a small task to be done, Bruce probably has already done it. He's a tireless and outspoken promoter of the club.

Larry Anders is the TPCUG Librarian. This job – and Larry along with it - has transitioned from the BBS to Internet Shareware research, so he's also become an invaluable regular contributor to the newsletter. Larry contributes to the administration of the club in so many ways.

Ford Bond is TPCUG MOSI Liaison. Ford represents us at MOSI, which provides us with our meeting place. Ford contributes at the board meetings and is a valuable supporter for our club. As our "MOSI guy", Ford is present and ready at all our meetings and Genealogy SIG too, making sure everything is set up and in working order.

That's the gang, the Board members who work for you to make this club great! ◆

Meeting Preview: At the January meeting, Capt. Rod Stebbins will tell us how he runs a successful home based publishing/outdoor writing business with the help of his PC. Working with Frank McAllister he has also designed software for Loran-C and GPS positioning. Looks like an interesting presentation. Mary Sheridan, as usual, will conduct a 30 minute Windows discussion at the beginning of the meeting.

President's Message

By Merle Nicholson, President, Tampa PC Users Group

Welcome to the New Year from your TPCUG Board of Directors.

1998 was most certainly a successful year in terms of our financial status and also the quality of our invited speakers. Having a dedicated Program Chairman has really paid off for the club, and Mary Sheridan most certainly stepped up to the job. The newsletter, Bits-of-Blue, and the quality of the web site has continued to develop due to the unselfish dedication of editor William LaMartin. Our membership is at least steady.

In 1999, my personal agenda is to increase our membership. The BOD discussed this last month. (Actually we don't stop discussing it throughout the year.) We'll be calling on all of you to participate in some way.

The elections went off very smoothly at the December meeting, for those of you who couldn't make it. I won't go over the slate here, having done that last month, but I'd like to welcome James Weber to the board as secretary, and give Kevan Sheridan, the outgoing secretary, a very hearty "Thank You" for his years of dedication. I know Kevan won't be disappearing on us, since he's been a very, very long term member of the group. His most notable job was as the BBS SYSOP. He was "Mr. SYSOP" for many years until his wife Mary

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

Minutes of the December 9 Meeting

By James Weber, Secretary,
Tampa PC Users Group

Mary Sheridan presided over the Windows SIG, which started at 6:00. One member had a problem with his Win 3.1 sound card not working in Win 98. A suggestion from the group was to check the web site of the card's manufacturer for an updated device driver. No one in the group had any specific suggestions for solving this problem. Another member was trying to record sounds over 60 seconds using Windows Sound Recorder. No one present at the group had an answer. We also had an open discussion on LCD monitors.

Mary gave a brief run down of her experience at Comdex, the annual computer industry expo in Nevada. She got to see Bill Gates and listen to him take questions from the crowd. Mary was impressed with the clear and eloquent manner in which Mr. Gates answered questions, even though some of the questions lacked intelligence.

The general meeting started at 6:40. Nominations were read to the group for new officers. Ford Bond passed a motion to have the entire list voted on simultaneously with Bruce Register seconding. A unanimous vote passed the election of officers. The installation of officers will occur at the January meeting.

Sign up sheets were passed out for attendance and SIGs. The idea of a Linux SIG was discussed again as well as a presentation of the operating system.

The guest presentation started at 7:00 with Julie Altstatt of Jasc Software demonstrating Paint Shop Pro 5.0. Paint shop Pro is an image and photo-editing program offering a wide range of functionality. Ms Altstatt demonstrated how to make a Christmas card by importing image files and creating new images. She also showed Paint Shop Pro's photo cropping ability by editing and combining several existing photos and touching up damaged photos. Ms Altstatt quoted a price of $59.99 for group members and a free upgrade off the web site to version 5.01 for registered users.

Ms Altstatt brought two copies of Paint Shop Pro and Quick View Plus, a file translation program, for the drawing. Bruce Register and Jim Weber won copies of Paint Shop Pro and Kevin Sheridan and Jim Weber won copies of Quick View Plus. $64.00 was raised.

The meeting ended at 8:05. ◆

Microsoft Publisher 98

By William LaMartin, Editor,
Tampa PC Users Group

Well, I now have in hand my third or fourth version of Microsoft Publisher, the program I have been using to publish this newsletter for the past three years. There are more sophisticated publishing programs and much more expensive publishing programs, but for the needs of our newsletter I have found Publisher more than adequate. With each new version, too, new features are added. I suppose the big new feature this time is the ability to publish your document easily to the web. As I recall, the previous version had this ability, but it didn't work very well, so, as far as I was concerned, that feature really wasn't there. As is often the case with Microsoft, they got it correct the second time around.

Publisher 98 comes in two versions: Standard and Deluxe. With the Deluxe version, you get Microsoft PictureIt, a "user-friendly" graphics manipulation program. Since I already have both Corel Photo-Paint and Micrografx Picture Publisher on my computer, I have no need for such a program. But if that is not your situation, for an extra $30 it looks like a good deal.

This will mark at least the second review I have done of Microsoft Publisher, possibly the third, so first allow me to tell you why a publishing program is necessary even if you already have a very good word processor. If you are only going to write letters and simple reports, then a word processor is more than sufficient. But for quality brochures, newsletters, fancy reports, greeting cards or business cards—a publishing program is a must. The reason is placement and text flow. You simply can not get good placement of graphics on a word processor page, and if you have more than one "article" in your document, you will find that in a word processor controlling the text flow from one page to the next is almost impossible without simply daisy-chaining the articles one after another—something you most likely don't want to do. I know, because, three years back, my first three or four newsletters were done in Microsoft Word. With two columns per page and more than one article on some pages, I about went crazy trying to control the text flow within each article when a change was made toward the beginning of the article. Boy was I glad to get my first copy of Microsoft Publisher.

In Publisher, text and graphics are contained in "boxes". If you want two columns of text on a page, you put two text boxes the size of the columns on that page. If you would like to additionally have a picture in the middle of the page, you place a picture box there. The text in the text boxes will then behave nicely and flow around the picture. You are allowed different layers of text and graphics which, depending on one's creative ability, can produce some nice results.

And, of course, there are the **wizards** which, according to Microsoft, "provide step-by-step instructions that guide you through setting up a publication, then allow you to use the power of the wizard to make global changes to your publication at any time." For the novice, the collection of over 1600 **design templates** produced by these wizards should be a great help. You have templates for newsletters, envelopes, letterheads, menus, business cards, logos, reports, brochures, etc.

You have the ability to set up profiles, which include items like name, address, logo, color scheme, and have them applied to new publications. Using this feature, you could easily achieve a consistent look for your company's newsletter, brochures and business cards. Of course, one must be careful here. If you use the Publisher supplied "**design looks**", then your company's look might turn out to resemble very much the look of another that used Publisher. One thing you can say about my publications (our newsletter & web site, for example) is that they don't have a consistent look and certainly don't have a **coordinated color scheme**.

I think the thing I like best about the new version is the automatic spell checking which underlines possible errors in red as you type—just like in Microsoft Word. As before, you also have the ability to edit each article in Word. It now takes one more click of the mouse to get there, though. In fact, several of the features that I used in the previous version that were accessible with a right click to get a menu, then a left click to select an action now require a right click for a menu, then a left click to choose between a selection of secondary menus and a final left click to choose the action. More options mean more time required to choose the one you want. If everything were still plain ASCII text, then we wouldn't have to make any choices—but we would have typewriter output.

Another nice new feature is the **multilevel undo**. Before there was only a one level undo. There is also the fixing of common errors as you type. For example, I just noted that Publisher supplied an uppercase A for the beginning of this paragraph to replace the lowercase a that I had typed. Of course features like this can sometime be a problem. Perhaps the lowercase a was not an error, and I wanted it there. Then it would be a fight with Publisher until I went into options and disabled the auto correct feature. But, for most of us and most of the time, such features are nice.

Besides producing this newsletter in Publisher, I have made brochures, business cards, envelopes, personalized mailing labels with graphics. And since Publisher has a **mail merge** feature, after creating a nice mailing label, you could use the mail merge to access your database of addresses and print out a nice label for everyone for whom you wanted to print a

(Publisher.....Continued on page 4)

(Publisher.....Continued from page 3)
card—or you could print the address information directly on each envelope, or, in fact, print any personalized information you might have in a database into any Publisher document.

Now, once you have created your document, for example our monthly newsletter, you can do several things with it. First you can simply print it out on your printer. That is what I do with the newsletter, then I use this master copy to run the Xerox copies you get in the mail. Second, if you have the money, you could save the document in Publisher format or in PostScript format (if you have that driver installed) for a printing service. If you have the Adobe Acrobat printer driver installed, you could print it to an Acrobat file, as I do for a download via the Internet of the newsletter in this format. This is also an easy way to share your document with others who may not have Publisher, since the Acrobat reader is free for the downloading from Adobe. A final possibility is to publish the newsletter to the World Wide Web.

To accomplish this you need to take care with the layout of your document. The main consideration here is to avoid having any of your text boxes or picture boxes overlap (something I never worry about—in fact desire—in the creation of the newsletter for printing). If they overlap, Publisher will treat that section as a graphic when it creates a web document from your Publisher file—something that is not optimal. After Publisher has transformed each page of your publication into a separate HTML page and created graphic files in the GIF format for all the graphics in your publication, it remains for you to then link all the pages together and provide any further hyperlinks you wish in the document. When finished, publisher will invoke the **Web Publishing Wizard** to upload your new web document (actually a collection of HTML and GIF files) to the Internet. If you already have your own method of exporting files to the web, you can simply take the folder that contains all these files and export it to the web yourself in your usual manner, e.g., via FTP.

To see the November newsletter turned into a web document with Publisher 98 go to http://www.tpcug.org/publisher/pub9811/page1.html, hidden away in the study material section for our Internet SIG. It looks a lot like the original or the Adobe Acrobat version, but it has the additional feature that you can navigate through it while viewing it on the web. Even though Publisher 98 can be used to create nice looking web pages or even web documents like the newsletter example, it is not a web site management tool like Microsoft FrontPage.

Regular version around $99 and Deluxe around $129.◆

Urban Legends (on the Internet)

By Cheryl Alexander, Tampa PC Users Group

Rumors flying. Gossip galore. Knowing something that very few others know, even if it isn't true. Human nature has loved these things since the dawn of time and will continue to do so. However, with the Internet and email putting the world at our fingertips, individuals can do it faster and reach more people at the same time than ever before.

Many of these are stories that were passed on by word of mouth. They never happened to someone known to the individual and usually involved a Friend Of A Friend (FOAF). For the really gross stories, camp and slumber parties were the travel method. With the arrival of fax machines, the stories could circulate even faster. The advent of email brought ease of personal communication and, yes, the very same stories! They've been the basis of at least two movies ("Dead Man on Campus" and "Urban Legend"), a line of commercials for K-Mart, and several different TV series episodes.

These, my friend, are known as Urban Legends. Some of them are even true! However, the vast majority are made up or an old story placed in a modern setting. Many of them serve as cautionary tales in these “dangerous” times. We've all heard them or received them as a fax or many-times forwarded email. I remember hearing all the spooky ones at a slumber party and didn't sleep well for a long time!

What kind of stories are Urban Legends (UL)? The Choking Doberman, Alligators in Sewers, Maniac in the Back Seat, Diver Found in Tree are just a very tiny fraction of the stories that are out there. How do you know if you've been told or passed a UL? Quite often, there are few verifiable details, such as names, places, and dates. But that isn't always a guarantee. There actually are several sites that deal with Urban Legends. The one that I read the most is The San Fernando Valley Folklore Society's Urban Legends Reference Pages. Here is a list of some stories that I have been passed and found on the web site Urban Legends Reference Pages (http://snopes.simplenet.com/ or http://www.snopes.com):

- $1,000 email chain letter from 'Bill Gates' (BETA tracking program) http://snopes.simplenet.com/spoons/faxlore/billgate.htm
- Monster AOL cookie http://snopes.simplenet.com/spoons/faxlore/aol.htm
- aircraft carrier vs. the lighthouse in Canada http://snopes.simplenet.com/spoons/faxlore/lighthse.htm
- using 90# for long distance calls from jail http://snopes.simplenet.com/spoons/faxlore/jailcall.htm

(Legends.....Continued on page 9)

(President.....Continued from page 1)
took over the job two years ago. He was pressed into service as secretary last year despite his increasingly busier and busier schedule. So, thanks Kevan, and if you'll stick around we promise not to elect you to something else.

Now my monthly nag. Let's all try to bring in new members. Now. This Month. You know someone, friend, relative or co-worker who can derive as much benefit as you do from being a member. I know you do. Pick up some Tri-Folds. (These are handouts with club and membership information on them.) Drag a friend in. I'm doing just this and it's working, and it really isn't much effort.

I'd like to thank JASC, the Paint Shop Pro people for allowing Julie Altstatt to speak to us at the last meeting. We depend on companies like JASC who will devote some resources for User Group support for our monthly programs. And a special thanks for the door prizes too.

Did anyone manage to take advantage of the discount sales going on this season? I went to Best Buy on the 26th and snagged up a 6.4G Hard drive for $99 (well, after I wait 2 months for a $30 rebate). While I was there I found some fantastic prices for scanners. I had bought mine a year ago, and I'm still amazed at how useful it is and how often I do use it. And there were great discounts on CD-ROMs and modems. There's still free installation coupons for new roadrunner subscribers too, good through January 31st. Current cable modem subscribers have these coupons – actually from a web site. Email me, and I'll send it to you with instructions.

Internet picture of the month

1998 stock price chart for Amazon.Com (AMZN)

1998 was the year of the Internet stock, and few did better than the on-line book retailing pioneer Amazon.Com (*http://www.amazon.com).* It experienced a yearly low of 24, a high of 361, and closed at 321. That resulted in a market capitalization of about 16.9 billion dollars. For each quarter 1/1/97 – 9/30/98, Amazon has failed to make a profit.

The chart above was from The Wall Street Journal's Interactive Edition at http://interactive.wsj.com/. You will, however, need to be a subscriber to view the same chart online. But there are many other places on the WWW providing the same information for free, e.g., Bloomberg at http://www.bloomberg.com/.

Happy New Year, to our fellow TPCUG'ers, and we'll see you at the January meeting. Merle ◆

Make your own removable hard drive for fun and profit and backups.

By Merle Nicholson, President,
Tampa PC Users Group

I'd been developing this idea in my head for some time. And it's a pretty simple idea. You have a removable hard drive that you put into the PC, do a full system backup in 20 minutes, pop it out and put the hard drive in a safe place. If you're running a business from it, just take the hard drive home.

The idea got started mostly because of my lack of confidence in tape backups since Windows 95 came out. I think all of my own personal objections to tape backups have been satisfied now with better software except for two – cost and convenience, where a removable HD has the edge.

TAPE

The newest tape software now has you make DOS recovery diskettes that will load your operating system back on a new or reformatted disk and restore your hard drive as it was at the time of your last backup. For many years the procedure was to install Windows first, then your tape recovery program, recover from tape and then start reinstalling all the things that didn't work. The main problem is that you can't update files that are in use, and you have to use Windows to recover. It's time to look at your backup software now to see if it's time to upgrade.

The objections I have to using tape are many. One thing of course is that it takes a long time, so it has to run unattended. Do you look at the log (indeed, does it make a log for you in the first place?) to make sure everything went smoothly? Do you at least get a catalog of the tape each time to make sure the backup has actually been completed? Look at the date and size of the backup to make sure. I have known people who thought they were making backups and they were actually not accomplishing anything. You can set the software so that it doesn't halt on errors (a reasonable thing to do), set it to close when finished and not log the results. What do you have? No backup, probably. It's possible to get good useful backups, but it takes diligence and knowledge; it's not for disinterested employees who want to go home but have to do the weekly backup first.

DISK IMAGES

In the meantime, PowerQuest (DriveImage), Seagate (Ghost) and a couple of other companies came out with disk imaging software. These are really useful, and it's a mystery to me why it took so long to develop the products.

This type of software accomplishes many things, such as duplicating drives. The function that I'm interested in will make a compressed copy of a disk and write it to a file. One thing needs explaining. You have to write this file out to some other disk or partition or network drive, but not to itself, so a one drive system just can't be done. As for a network drive, this software runs in DOS, so you would have to have networking program files for DOS that are small enough to run from a diskette. I'm still looking for Microsoft Networking for DOS.

STARTING OUT

On my personal machine, I have one drive with two partitions. In its previous incarnation it had two drives. When one failed, I removed both, bought a 6.4G and partitioned it in two so it would have the same file arrangement without installing all software, and just built a new computer to use as a server with the one remaining. Also I built my spouse a computer to replace her nice old 484 Toshiba Portege. So I have three computers at home (and two at work) to contend with, and life is getting complicated. For a while I was making a monthly drive image from one to the other partition, and then copying the files to the server drive for safekeeping. I even once copied the two files to tape. It worked, but hard drives are too cheap and life is just too short, and besides, I have two other machines to worry about that were getting occasional tape backups. I'd duplicate document directories from the two personal machines to the server when I thought of it.

ENTER THE REMOVABLE HD

So I looked at an IDE removable drive kit. As you can see from the pictures, it consists of a case that installs in a 5-1/4 bay, the same size as a CD-ROM but an important ¾" longer.

On the outside back of the case is a standard IDE 40 pin connector and a standard power connector, both just like the end of a hard drive. Inside the cartridge is a ribbon cable and a power connector that connects to the HD. The interface connector inside resembles a Centronics printer plug and socket. Notice also the small fan for cooling the hard drive. On the front is a key interlock. This key turns power off to the drive and releases a mechanical lock before allowing you to pull the

(Backup……Continued on page 7)

(Backup.....Continued from page 6)
cartridge out. It's a standard PC lock key. I hate these keys and would prefer a conventional lock with a unique key. The kits are $45 to $50 retail. From some ads I've seen it's possible that some brands don't have the fan. I needed three cases and one cartridge. They can be purchased separately on special order, but there wasn't much cost savings, so I bought three complete sets.

In addition to moving a single hard drive from machine to machine, another possibility is to have multiple hard drives for the same machine, so if you're, for instance, trying to learn Linux or NT server and have one machine, this may beat the "dual boot" situation. I suggested this to my oldest son who is learning operating systems, so I'm sending him my two extra cartridges and one complete set.

INSTALLING
Installation is straightforward. Install the case and connect the ribbon cable and power connector. In my case I used a connector from my CD-ROM cable and set the drive jumper to "slave" since all my machines have single hard drives and the CD-ROM is set as Secondary IDE Master. I set all the BIOS to detect a Secondary Slave as AUTO. Each machine hesitates only a moment looking for that drive when it's not installed. In the inside of the cartridge, connect the ribbon, paying attention to the pin numbering to make sure it isn't backwards, plug the power connector to the drive and last, position the drive and put the four mounting screws in. Thankfully I haven't seen a non-standard hard drive in many years where the power connector is on the other side of the IDE connector.

As an aside, I had gotten a good price a month ago on the 6.4G drive I'm using, but I just got a 6.4G Maxtor at Best Buy the day after Christmas for $99 after rebate. This is one reason it's cheaper than tape.

I used Partition Magic to partition the drive in two at about one-third as FAT16 and two thirds FAT32. One of our three

machines is Win 98a, and my spouse doesn't want me messing with it. The other two are Win98 FAT32, which the Win 95 machine won't even recognize. In retrospect I should have used one partition FAT16, but it's not worth changing back now. Eventually we'll have them all Win 98 or Windows 2000.

USING THE DRIVE
Simply shut down Windows, turn the machine off, open the lock on the drive, insert the drive and lock it in the on position. Turn on the computer. If you have a partitioned main drive, as I do on my personal machine, just hold down Ctrl (Win 98) or press F8 at the right time (Win 95 and Win 98) to get the boot menu and select Command Line prompt. Since my main drive is partitioned as C and D, the removable will insert itself between as D, with the old D partition as E, and my CD-ROM as F … so the best thing to do is to just not go into Windows. On my other two machines, it doesn't matter.

Since image programs run in native DOS, Windows must not be running. You can set up what you need three basic ways: On a boot diskette, as an icon on the desktop or Start Menu, or on the removable drive.

As an icon under Windows, no matter where the executable is, the properties for the program must be set to MS-DOS Mode under Properties, Program, Advanced. This causes Windows to exit, and reboot into DOS Mode and start the program automatically. If you go into Command Line Prompt, you can run the program manually from the command line, and if you use a boot diskette, you can call the image program in autoexec. bat. The boot diskette method is pretty clean, and you can have the image program on the diskette or on the removable drive.

So once a week, I go to one machine, restart with the removable in, boot to DOS, run the image software, go away for twenty minutes, shut down, remove the drive and start the machine again. I've backed up all three machines in an hour, easy.

INTERIM BACKUPS
You can't make an image backup every day, I wouldn't think, unless you're running a business and are developing things for clients, something like that where recovery time is critical. I have a reminder to do this weekly, and I have to admit I sometimes skip it. Not often though.

I do daily file copies of the document directories from our personal machines to the server. I'm evaluating a small shareware program called Backer 4.0 from Leanware. It's $35, and it seems to do what I want. It's a little difficult to understand how to set it up at first. To their credit, they have excellent online help and examples. The help recommends that you start

(Backup.....Continued on page 12)

Info Select 5 – part 2

By Tim Condon, Tampa PC Users Group

Like I said last month, Info Select is a program that people either love…or hate. And many of the software reviewers---accustomed to those orderly rows of boxes and fill-in-the-blanks of the "normal" Personal Information Manager (PIM)---well, they just, plain, flat, don't **like** this program. Consider David Haskin in the November 1997 *Computer Shopper*, commenting on Info Select 4: "Beyond its unique abilities to manage both free-form and structured information, Info Select's other PIM capabilities are weak….Info Select's to-do list capabilities are even more anemic….Info Select also scores poorly on more advanced contact management capabilities." Or Kathy Yakal in the December 14, 1998 issue of *Shop & Compare:* "Info Select is a terrific idea for an information manager, but its execution doesn't fulfill that promise, and the PIM lacks the polish it should have by now."

On the other hand, *Byte* magazine's famous columnist, Jerry Pournelle, weighed in on Info Select in the November 1996 *Byte*, that the program is great for helping him write his novels, and "it's also great for diaries, keeping track of work in progress, and other stuff. You can learn to use it in about 5 minutes, and I don't see how anyone gets along without it." Ditto for some fans caught raving on the Info Select web page (or I should say, Micro Logic's web page, the company that puts Info Select out). Said one: "I just wanted you all to know that I am completely enamored of Info Select 3. It has quite literally reorganized my entire information life….It's hard now to imagine life without it…a truly astonishing piece of software engineering."

Okay…what's going on here? Well, I can't explain everyone else's rants and raves, both for and against Info Select, but I can tell you that Info Select 5 is the most important single program that I use every day in my law practice (out of, say, a dozen other programs that are used daily or almost daily).

Does Info Select do my calendar and scheduling (super-important for a lawyer)? No, although it does have such capabilities. Does it do my word processing? No, although it has extensive capabilities in that area also, from templates to spell checking to the ability to generate fill-in-the-blank forms. Does it handle my email? No again, although it has extremely extensive capabilities in that area. Does it even do my to-do list (another super-important function for a lawyer)? No yet again; for that I use a little standalone shareware program called To-Do List Pro.

Well, then, why is Info Select so dang-blasted important and useful to me? Well…hmmm…kind of…duh…well, like…I guess, almost **everything.** And therein lies the rub when it comes to this little bombshell. It's **so** flexible, and so good at **so** many things, that every user uses it as an absolutely crucial program for…whatever that user finds it most useful for. Jerry Pournelle uses it for keeping scenes and characters straight in writing novels. He's a writer. I'm a lawyer. I use it for…

- Keeping track of what's going on in individual lawsuits and disputes, which (as you might imagine) have numbered in the thousands over the years. I use the free-form note-taking ability that Info Select gives me to notate everything that happens in every case I have. Then when I need to refer to any particular lawsuit, whether it be with regard to discussions on the telephone, or what the judge did at the last hearing, what position the opposing shyster…uh, **lawyer**, is taking, or what the phone number and/or address of any-of-the-above might be…I just pop it up in Info Select.
- Keeping track of names and addresses and telephone numbers and email addresses and the such (finally, something that **other** PIM's are used for…and I can't imagine that any other PIM could do it better or more effortlessly).
- Keeping a "personal dictionary." Yep, that's what I said. Don't we all run across words that just aren't in our pitiful vocabularies from time to time? When that happens to me, I strike back: I pop that bugger into my Info Select dictionary (i.e. "list of words you don't know"), plug in the definition, and when that word pops up again I just check in my personal dictionary. Strange, admittedly, but there it is.
- Keeping…uh…"miscellaneous or oddball information." Do I remember how to send and pay for a certified letter when I'm asking for a signed receipt back? And what's the procedure and cost difference between certified and registered mail? Who knows? Info Select knows, because I put the instructions for myself in there years ago. Ditto for, oh, billing procedures, contact information, legal clauses in various documents, procedural hurdles in various situations, etc.
- Legal authorities: Admittedly, this could be grouped under "oddball information" above, but it's what I do. Do you want to know what interest rate a circuit court judgment drew in 1954? I've got it. Or how about the authority for slapping an attorneys' fees claim on an opponent when the contract only says **they** can get such rewards? I've got it (it's statutory, for all you lawyers out there). Or what about the various charges involved in issuing and serving a post-judgment continuing writ of garnishment? Who the hell would know? I certainly wouldn't if I didn't have it stashed in an Info Select window.
- Let's see…what else is there. Lots. Closed file lists. Payments by debtors. "Miscellaneous interests." Computer information. Neighborhood civic association newsletter information and volunteers. Professional associations info and happenings. "Projects in process." Client lists, cross-referenced with files and lawsuits. Internet information and locations. Out-of-town lawyer contacts. Plot and character information for writing projects (yep, I dabble in the black

(Info Select.....Continued on page 9)

(Info Select.....Continued from page 8)

art of fiction writing). Info about repairs, upkeep, modifications, components, records, etc. on….everything, from the lawn mower to the copy machine to the oven and stove, to the various computers around here.

And plenty more. And I really only scratch the surface of what Info Select can be used for. That's the funny thing about the program: Everyone uses it in a different way, for different purposes, none of which may be the "most popular" uses by others, or even "most recommended" by the manufacturer.

Which brings me to an odd thought: In all this talking about what Info Select 5.0 can be used for, I haven't described how the program actually works. The answer to that is…well…it's a free-form, text-driven, windowing PIM database that has uses, as Micro Logic puts it, "limited only by your imagination" (whereupon they list about 50 examples off the top of their corporate heads). That doesn't adequately describe the software in a supposed software review, I know. So thank goodness for the Internet. To get the real flavor of the program, go to http://www.miclog.com/isover.htm. You'll find full information on Info Select 5.0 there, including screen shots.

In the meantime, that's my most important, beloved, and crucial program, used every day in every way to make my life more organized and easy. What about the rest of you? Having shared with you that part of my daily computing life, I'd be interested in hearing about the "fave programs" of others in TPCUG. Come on, don't be shy. Step right up and talk. The information you impart may---dare I say it?---change the (computing) lives of the rest of us. ◆

- most bizarre suicide http://www.snopes.com/spoons/faxlore/opus.htm
- diver found in tree http://snopes.simplenet.com/horrors/freakish/scuba.htm
- Points Off Licence http://snopes.simplenet.com/spoons/faxlore/ticket.htm

It is a nicely organized site. They also have a message board where rumors and facts are tossed around with abandon. Before posting anything that you've heard on the board, search the site. It's probably there, and you will prevent unnecessary threads. However, if you just use this site (or a similar one that has researched the stories) to check the email with a subject line that is just too scary or too good to be true, then you can avoid passing on a story that is totally without basis in fact. ◆

Epson Stylus® Photo 700

By Larry Anders, Librarian,
Tampa PC Users Group

As a lot of you probably know, it's hard to buy a computer-type gift for a computer-type person at Christmas time. So my wife gave up on that idea a long time ago… at least picking out the gift on her own. So it's one of my challenges each year to decide what I want Santa to bring me. Of course it would be easy in this day and time to ask for a new computer but I'm still happy with what I have. So more thought was put into solving this dilemma for this year.

I will admit that after seeing the demonstration of the Alps line of printers at one of our recent user group meetings I was tempted to ask for one of them (one of which I hear our newsletter editor **was** fortunate enough to get). Hands down the Alps line has the best output I've seen for photo quality pictures, and if I wanted nothing but a photo printer I would have asked for one of those. But I was interested in finding a good photo quality printer that was also good for printing pages with heavy graphics ***and*** text, such as web pages. I personally think it's unrealistic to use an Alps printer to do this. The speed is too slow (up to 20 minutes to print a full-page photo), and the cost per page is too high (the Alps uses special paper to get the best quality output). Enter the new **Epson Stylus® Photo 700** ink-jet printer. (The one I asked Santa to bring me.)

This new printer not only prints sharp photo quality pictures but it also has crisp looking text that rivals any laser printer that I've ever used, so that makes it perfect for printing other things like greeting cards, calendars, reports and web pages. The Epson 700 prints up to 1440 dpi resolution and uses something called enhanced Super MicroDot™ technology that creates a lot of detail on the image. Its **6-color** print cartridges print photos as smooth as those I've gotten from the photo-lab. Also, Epson's Micro Piezo™ print head creates clean, consistent printing, no matter what type of paper I use. But obviously, the better the paper, the better the output. The monochrome print head has 32 nozzles while the color print head has 160 nozzles (32 x 5). I have found that printing in 1440 dpi the paper tends to ripple on the backside of lighter paper. On a heavier card stock type paper, it prints just fine.

It can print a standard 5" x 9" photo in about 90 seconds and an 8" x 10" photo in about 5 minutes, which is about ¼ of the time of the Alps printers. While it can print 1440 dpi its standard resolution is 720 x 720 dpi and will also print 360

(Epson.....Continued on page 10)

Special Interest Groups

Internet SIG

This SIG meets the first Monday of the month at 6 PM at the Reflectone Building, off West Waters Ave. You must sign up to get on the list and to get by security. Contact Mike Hodges at hodges@reflectone.com. For directions, see the map at our web site or contact Mike Hodges.

We again critiqued a participant's web site, offering alternate ways of doing things. We also looked back on what we have been doing, trying to get some perspective on not only how but why we build web sites.

Genealogy SIG

This SIG meets the second Monday of the month at 7:00 PM at the Museum of Science and Industry. *Contact Jenny Lind Olin at 960-5723 or Ford Bond at 987-6309* .

Visual Basic SIG

This SIG meets the third Tuesday of the month, at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6 PM. For information, contact Merle Nicholson at merlenic@tampabay.rr.com .

The projector was broken last month, so we couldn't run VB on a laptop and project it to the screen. Thus, we went off topic a bit and used the Gateway computers to view and discuss Active Server Pages (which use VB script) on the Internet.

(Epson.....Continued from page 9)

or 180 dpi. The input tray can hold 100 pages or 10 envelopes. By the way, it prints envelopes better than any printer I have ever used. It can print on single sheets from 3" x 5" all the way up to a panoramic of 8.3" x 23.4" and can print on plain bond, photo paper, transparencies, iron-on transfers, and a bunch more.

The EPSON Stylus Photo 700 also came with Digital Photo Lab™ software suite, which is a pretty decent photo project package for editing and organizing photos, sharing photos on the Internet, and creating personalized calendars or panoramic images.

I've owned nothing but HP DeskJets in the past so this Epson is a first for me. But this Epson cost half of what I've paid for every HP I've ever purchased. And that was a pretty good deal for Santa, if you know what I mean. ◆

Getting Rich, Alps Printer, Buy.Com & Extended Length Sound Recording

By William LaMartin, Editor, Tampa PC Users Group

Since my contributors came through so splendidly this month, I have very little space to fill. It is a new year, and I am sure all of our computer savvy members made a killing last year by early on buying stock in AOL, Amazon.Com, Yahoo and any of the other computer/Internet items and then sitting back and watching them quadruple every few months. I am jealous of you. I was just too busy editing the newsletter and web site to get around to increasing my wealth.

But I have contributed in my own way to this Internet frenzy by making several online purchases. Most recently I have been keeping the connection to Buy.Com busy with orders for Alps printer cartridges and paper. If I don't stop I will soon have as much money in consumables as in the printer. There is serious money to be saved (as much as 40%) by buying such supplies online, and I have had good service so far through Buy.Com. The MD 1300 printer was bought locally and was my Christmas present. Perhaps I will do a review on it next month. Using the photographic quality paper and cartridges, it produces output that looks essentially like a photograph. Coupled with my HP PhotoSmart slide, negative & photograph scanner, it is producing superb results.

Those who watch the web site or read my email messages will know that I have added a TPCUG events calendar to our site. It is another example of using Active Server Pages. It updates itself each month as to our fixed meetings with no input from me. I also rearranged the order of the links on our main page.

I added a slightly different calendar to the ASP section of my site, http://www.lamartin.com. This one will create a calendar for any month and year you choose. I am also slowly adding more photos to that site. The latest are black and white shots of the New Orleans area, and I hope to soon add some black and white Mardi Gras shots to complement the color ones.

Finally, recall the question at last month's meeting concerning the one minute time limit on the Windows Sound Recorder? Well, that is indeed the limit. But when you know Visual Basic you can create your own programs, and I created an Extended Length Sound Recorder-Player which records for 90 minutes. You can download it from the VB section of http://www.lamartin.com (for free, of course) ◆

out simple and grow to your needs, and I agree. The way I have it configured, I have two batch jobs, one for each personal machine. I have the folders on the two machines identified that I want backed up as the source and a directory structure on the server set up as the destination. I have it set up to synchronize the destination only to mirror the source. Many, many other options are available. Synchronize to the destination makes the destination reflect the source identically, so that when I delete a source file it deletes the backup too.

The part that I hesitate about is I'm not confident about my ability to identify all that must be backed up daily. Would you remember your Outlook or Netscape Address book?

One thing I know, is that ***when*** I have a full hard drive crash, the worst I can be is a week old, I can recover in not much more time than it takes to go buy a hard drive, and that lets me sleep better.

If you have any questions about this, don't hesitate to email me at MerleNic@TampaBay.rr.com. ◆

Meeting Preview: At the March meeting Jason Velasco-Jewell from Ontrac Data International will speak about recovery software and the prevention of data loss. Mary Sheridan, as usual, will conduct a 30 minute Windows discussion at the beginning of the meeting.

President's Message

By Merle Nicholson, President, Tampa PC Users Group

Well, I have very little to rant and rave about this month. The SIGS, Windows, Internet and Visual Basic, are all going pretty well. Genealogy is being under attended. Please, if you have an interest in this SIG, show your support by attending. I'm very pleased with the other SIGs, and we have some interest in starting a new one for Linux.

What I think a Linux group needs to get off the ground is a volunteer to locate a meeting place and send out email to those people we know have an interest. Call the first meeting an exploratory one and decide on locations and subjects as you go along. It's really not much work; the Visual Basic SIG is a good example; it takes just a few minutes work each month.

On a personal front, I received a notice from American Express this month stating that I would not be held responsible for internet purchases on AMEX that I did not make. That is reassuring. I had given the hazards of online purchasing some thought in the past, and I have to say I'm not comfortable with it. I've only made a couple of purchases, one to Amazon, and two to purchase software licenses. I'm not ready to jump into buying a lot of things like clothes for instance. My oldest son, who lives in a remote area in Colorado buys on line and also from catalogs all the time and just doesn't worry about it. One thing I do tell myself is that I let that same card go out of my sight all the time at restaurants. That isn't to say I don't worry about it.

(President.....Continued on page 7)

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

Minutes of the February Meeting

By Bruce Register, substituting for James Weber

The education session was opened by Mary Sheridan with discussion of Windows 95 and Windows 98. Some members asked for help. Other members provided the helpful guidance.

Virus checking became a subject. It was suggested that if a virus check indicates "no virus" then one should check for the date of the virus check program. One may need to have a new virus program update. A great deal of comments were devoted to pluses and minuses regarding virus solutions. Some Microsoft programs have built in virus protection. Comments were made about the invasion of macro viruses into Word. The best protection is to have the best and most recent version of virus checker.

William LaMartin announced that the Discussion Group on our web site was not working at present because of a technical problem with the TPCUG ISP. He assumed the problem would be resolved shortly.

President Merle Nicholson followed Mary's discussion with a brief business meeting and proffered several announcements of interest. He reported on the various SIGs.

Guest speaker, Mark Haley, presented CD products including "Planets and Stars", "America's National Parks and Forests" and "World's Great Cities, Parks and Wildlife". He previewed the CDs on the big screen. He presented videos, stills and maps. He discussed the use of the Internet for making travel and lodgings reservations. Rather then restate the presentation on his CDs, let us note that he found a way to capture many public domain movies and still photos, linked together with maps to which he added a narrative to make CDs. I obtained the CD "Planets and Stars", which contained material seen on commercial and educational TV. He did add a sketch locating some planets in relation to each other. He sold CDs for $10. Last month we had a presentation on how each of us can prepare and produce CDs for the market. This program provided another example of that idea.

Following Mark Haley, William LaMartin presented "How to Make Your Web Pages Do Something by Using Active Server Pages". He presented and commented on ASP pages, web sites that employ them, html , and server side scripting. He demonstrated a site created by Microsoft and his own site, http://lamartin.com, where he showed us how to use an ASP created online grocery list compiler.

Door prizes were won by Rick Mills, Mike Hutchison, Bob LaFavr and Kevan Sheridan. ◆

Complete Hard Disk Backup to CD-R Disks

By John G. Hatsios, Tampa PC Users Group

Merle Nicholson's fine article on backing up a hard disk by using a removable hard disk appeared in January's "Bits of Blue" newsletter. After reading it, I was reminded I must backup my hard disk and better do it sooner than later.

In my case, I wanted to use a CD-R/RW to backup my hard disk on CD-R media. Although many software companies advertise the capability of backing up the hard disk to a CD-R, they hide the fact that they mean "only if all the data can fit in a single CD-R"! One of the reasons I bought the CD-R/RW was for backing up my hard disk, but now it looked as if I had to do a little more investigating. After asking Adaptec, the foremost company with CD-R supporting software, and inquiring on the subject in a couple related forums on the Internet, I was told the software for backing up to multiple CD-R's is not available yet, but it is under development.

The reason I am writing this article is that I did backup my hard disk in multiple CD-R's, and I will take you through it so you can use the information if you need to do something similar. But before I tell you how, let me tell you why.

Yes, I know, why should anyone bother? To buy the hardware, then the software, then to go through the learning process on how to do it and finally backup the hard disk. Bottom line: Spend $200-$300 and 10-20 hours. Then wait for the hard disk to crash, and nothing happens to the hard disk for years. Is it a waste of money and time? I think not.

From my personal experience I have been on both sides of the fence. First, from my first IBM PC to 286, 386, portables, etc. never backed up anything and never had a problem. But with my first Gateway 2000 Pentium I thought it was time to backup. I bought a Colorado 1400 MB tape and I made a point to regularly backup my disk. I never had a problem and consequently never needed to use the backup.

Now I come to my present system, a fast IBM Aptiva with plenty of resources, all kinds of system tools (Config Safe, PC Doctor, Norton Anti-virus, etc.), Windows 98, and an array of fine software. Did I need to backup such a solid system? Why should I, since I never had any problem before. Well, I found out the hard way that I should have backed up my hard disk.

After having my system set up the way I wanted it, which took many, many hours spread over many weeks, it crashed. It really crashed. No Config safe, PC Doctor, Windows 98 Startup Disk, or DOS could revive it.

The first indication was a message during booting up, "Cannot find VMM.VXD". But that was only the tip of the iceberg. The complete registry was all messed up and the Windows \System directory had only a small number of files left; all others were an indistinguishable rubble, a complete mess. There was no hope of restoring my hard disk. I had to start from scratch, formatting, reloading the software and then rebuilding my configuration. Luckily, most of my data were backed up in diskettes.

A couple of weeks later I found an entry in the "known problems" area of the IBM Aptiva Tech Support web page. It said the problem is due to the incompatibility of a particular scanner with the operating system software. I assume they meant the Windows 98 OEM software. I did not ask whose fault it was... I have a scanner but not from the same manufacturer. The fix recommended was to format the hard disk and reload Windows and all the software, literally start from scratch. Little consolation! Also, now there was a downloadable BIOS update to correct the problem. However, the cautious language used in the instructions left the door open for possible future problems. It said, in essence, that even after the BIOS update "if problem is repeated, please repeat procedure", and that left me kind of wary.

FINDING THE RIGHT SOFTWARE

Well, it just happens that I listened to the PowerQuest people saying their "Drive Image" software can backup a hard disk to multiple CD-R's. There were three conditions:

1. There had to be more than one partition, so as to be able to use one for a backup file.
2. The partition with the backup file could not be backed up.
3. The backup file, or image, had to be split into a number of sections, 650 MB maximum each, in order to fit in each CD-R.

My hard disk was a single partition. I could create a partition using Drive Image but because of some additional features I was sold on a second product for this from PowerQuest. Partition Magic creates additional partitions on the fly without destroying the data, as long as there is adequate free space on the disk. More information can be found in their web site http://www.powerquest.com.

It sounded good ,and the price was right, $30 each plus shipping, around $65 total, less than half the regular price. So I ordered the two programs.

In the meantime, while examining other alternatives, Merle informed me through the Internet TPCUG Discussion Group that he knew someone who had backed up his hard disk on CD-R's using PowerQuest software and also using a Seagate backup program. I knew Seagate made the Windows 98 native backup program, but I had already written it off since it was

(Backup.....Continued on page 4)

(Backup.....Continued from page 3)
not supporting CD-R/WR. What about an update?

Yes, I found an update in the Seagate web site, http://www.seagate.com. For $49 for Windows 98 owners, $99 for others, plus shipping, I could get a backup program that would support removable media, including CD-R/WR. It sounded perfect, and, since there were no conditions, I could backup directly on the CR-R and then use my CD-ROM to restore. I ordered it.

All along I've been concerned about restoring. A regular backup program works in the DOS environment. To restore, DOS has to recognize the device containing the backup file(s). The startup, or rescue, diskette contains the DOS program, but it also needed to contain the DOS driver for the device to be used to restore.

The PowerQuest documentation says to backup directly from Windows, using the Windows version of Drive Image and then, for restoring, using the DOS version of the same program. The instructions ask you to contact your device manufacturer for a DOS driver. In my case it was an OEM CD-ROM. However, as you might know, the Windows 98 Startup diskette already has a generic CD-ROM driver and you can choose to have it loaded during boot-up. Seagate did not say much about restoring in their documentation, which is only available in their backup program's "help" file, but I assumed I would find more information as I proceeded, so I chose to try Seagate first, since it seemed to be a straightforward backup program.

TRYING TO BACK UP USING SEAGATE BACKUP

The Seagate upgrade, called Backup Exec, came on a single CD-ROM without any documentation, except basic installation instructions. I felt these instructions were not adequate because they did not say anything on system requirements, what changes will be made in my system, will it update the existing backup program or install an entirely new one. Right from the start I did not get the impression of a good and well-documented program. The Backup Exec was loaded by default to its own directory, different from the original Windows 98 Seagate Backup directory, so it is a complete stand-alone program.

The instructions for backing up to CD-R's contained two steps:

1. Backup to a file on the hard disk.
2. Copy the backup file to CD-R.

Both backup and restore are executed within the Windows environment. That caused two concerns:

1. How Windows 98 will back itself up completely. Or will it?
2. I will need to load Windows 98 before restore.

In my case, Windows 98 OEM is part of a number of compressed files on a single CD along with all the other OEM programs, and they are automatically installed if you install Windows from this CD. So I needed another extra step installing all the original programs and then uninstalling the ones I did not want. This was not a pleasant task to look forward to. A lot of junk is loaded 'free' in today's computers.

OK, I backed up to a file on the hard disk, in the same partition. I formatted three CD-R's to ensure I had enough space for 2.2 GB of uncompressed files. I needed a little over 1.3 GB with compression. Looking at the size of the backup file I could tell it did backup Windows 98; however, during compare it generated an error report of a few Windows files it could not backup. This, however, was no longer important, since reinstalling Windows 98 will be required before restore. I assume they backup Windows 98 to include any updates, upgrades, and customization, but files in use could not be backed up.

The copying to the CD-R started normally. The CD-R/RW was recognized and started burning the backup files to CD-R at the normal 2X speed. But while I was waiting for the 'Insert CD-R number 2' message, I got an unpleasant surprise: "Error-The end of CD-R media has been reached unexpectedly. Copying has been terminated." The first CD-R stopped after copying 637 MB, and there was no recovery path. Seagate Tech Support next morning told me that not all CD-R/RW are supported. I was told the supported list did not include my Acer CRW6206A. I thanked them for the news and asked for an RMA number. The damage was $15 for shipment and registered return and two weeks wasted.

BACKING UP USING POWERQUEST SOFTWARE

The PowerQuest packages came with very good documentation. Both Partition Magic 4.0 and Drive Image 2.0 came each on a single CD-ROM and each with a good printed manual. I also received BootMagic for use with multiple operating systems to enable switching among them. It sells separately for $15-$30, but it is included with Partition Magic in its CD-ROM and a separate smaller printed manual. I had never used any PowerQuest software before, but I had heard good comments about them. I expected everything to go very smoothly, at least this time. However, it did not quite happen that way.

I installed both programs, following the usual installation instructions, and generated a "Rescue Disk", actually a two floppy startup pair for each program. For obvious reasons, this is recommended before attempting to partition a hard disk to

(Backup.....Continued on page 5)

(Backup.....Continued from page 4)

run Scandisk and Defrag. I did both. Also, there was a bold caution note to backup the hard disk before attempting to partition. I had no way of doing that. As a matter of fact this was to be the end result of the process I had just started. A little ironic, but I would not blame them for being extra careful.

Here I had another minor distraction. The documentation said if I had more than one CD-ROM installed, Windows 98 might not automatically assign the proper new drive letters to the CD-ROM(s), so I might not be able to copy to CD-R. I followed the recommended procedure and when I pre-tested, the assignment was incorrect. I disregarded the above and returned to my previous setting. This was probably my error, since I assumed CD included CD-ROM and CD-R/WR.

I started Partition Magic and got the initial screen. But as soon as I tried the first pull down menu everything froze. This was the kind of freeze no Ctrl-Alt-Del or Power-Off buttons could fix. It was a solid hang-up. I had to pull the plug out of the wall. Tried again, after making sure all other programs were turned off. The result was the same. I performed Scandisk and Defrag on the hard disk again and reloaded the program. There was still no solution.

Next morning the PowerQuest Tech Support, after examining the procedure, tried several times without success, then told me to use the "Rescue Diskette(s)" to start and open the pro-

Backer 4.0 by Leanware

By Merle Nicholson, President,
Tampa PC Users Group

Boy, I like shareware. What a concept shareware is. I used Backer for more than a month before I decided that it did everything I needed. So I ordered it online, and they sent me a license a day later by email. Slick.

Backer 4.0 is file backup software, and I needed it to complement my current full backup scheme. If you remember from our January Bits-of-Blue, I set up a method of doing full image backups to a removable hard drive. I have three Pentium-like computers in the house and I'm trying my best to keep backups from ruling my life as much as possible and yet give me the best protection.

So I'm doing full image backups whenever I install something significant on the machines. But as important as it is to have full recovery capability, it doesn't address keeping up with the files we generate daily in between when we make full backups.

Valerie does our Quicken financials and daily logs and accounting for her business. I generate accounting stuff, invoices and expenses for my business, in addition to my occasional programming projects, writing articles and course materials for my teaching. And what about things like internet email addresses, and recent email itself that you accumulate? If I have a full system failure, all my recent stuff will be lost.

So I went looking for shareware backup software. My requirements were simply this: On a daily basis, copy all new files generated on Valerie's and my machines to a backup directory on the server over the network. I'll admit I really did luck out on this one because I didn't have to look at many before I found this on Shareware.com. It's $35,and made by a German company, Leanware. It appears that this is their only product.

Backer 4 is a very slick, kind of complicated program that will synchronize directories between computers, between directories, between a desktop and notebook, over a network, to Zip drives, floppies or whatever. It has a time scheduler to do daily or weekly backups or whatever your needs are.

To understand what the complications are, let me explain directory synchronization. If you have a source directory that you want to duplicate elsewhere (called the destination directory), the rules are pretty easy. If a file has a later date in the source, copy it. If it doesn't exist in the destination, copy it. If it is in the destination and not in the source, delete it from the destination. This is called one-way synchronization. Backer calls it "touch destination only" and needs the "erase destination" option.

Two way synchronization is harder. You'd use this if you had a notebook and a desktop and wanted to make sure certain directories were both the same, regardless of which machine you used. The basic rule is to move a copy of any file that has a later date to the other directory. The difficulty is in handling orphans. Let's say you have one orphan in one of the directories. Is it an orphan because you deleted it from the other? Or is it orphaned because you created it here or copied it to here, and needed to duplicate it to the destination? Don't know, can't tell. For now, what you do is set an "overview" option so that it displays a very attractive, readable panel with a summary of all files it intends to copy or erase and which way it is to be copied so you can change it before it happens.

Leanware intends to improve on this in the next revision by (optionally) keeping a small database on each folder, so it can tell if a file was added (then copy it) or deleted from the other (then delete it).

In Backer, you create a backup file that describes all you want to do on a particular source and destination drive. You set up all the rules, designate what directories you want to synchronize from and to. This becomes a "work file." The directory structure on the destination does not reflect the exact structure as the source. For instance, I created a single directory, "Backups", on my server, and then two more directories under that for Valerie's and my machines. Underneath each of those, the directory structure reflects that of the source. I designate the directories, specify all files and all directories underneath those, select what file types to compare (by age), enforce (copy always regardless of age), erase, and exclude all using standard wildcard conventions.

Then, if you have more than one drive, either source or destination , you set up a "batch" file that will run any number of "work files".

All this is complicated. Leanware recognizes this and provides very exceptional help files. And it comes with a sample "learning" backer file. They specifically warn you to go about the process of setting up slowly. If you start by using advanced options right away, the program will pop up a warning that you may be in over your head, and suggests a sample file to work from. You can make the warning go away easily. I can't say enough about the help files; they're really excellent.

The shareware version is not much different from the licensed version. On the shareware version, it has a startup pop-up screen with an "agree" or "disagree" button to press. This effectively prevents you from scheduling it to run unattended. It alters the position of the buttons on each startup, I suppose, to keep you from starting it with a windows macro.

I registered my copy online from a jump from the Leanware

(Backer……Continued on page 7)

(Backer.....Continued from page 6)
website to a secure ordering service in this country. The next day I had an email from Leanware with the name and password. That made the startup panel go away, and now I have it running on my server. Daily, it goes out to the data directories on the other two machines and copies all the latest files. ◆

(President……..Continued from page 1)

Once, an Olive Garden restaurant switched my card with someone else's. I got his and he got mine. The bill amount was very close, and I actually paid his bill, he mine, and a week later when I tried to use it, a cashier at Office Depot wouldn't let me have my card because this card, with someone else's name on it had been reported stolen. Why didn't the guy just phone me, instead of reporting his stolen? AMEX was very nice about it and got a new card to me quickly. The manager at the Olive Garden basically said, "Oh well, these things happen!" when I called him about it. It doesn't happen to me anymore, I'll tell you that.

I just used my card to buy a software license for Backer 4, the software I reviewed elsewhere in this issue. I elected to go through a secure software site, which I'm sure takes a cut off the top of my $35 purchase. I could have just emailed Leanware and given my card number, but that was more than all my conservative bones could take. I'll get used to it. ◆

Editor's Comments: Genealogy & Photography

By William LaMartin, Editor, Tampa PC Users Group

Since my contributors came through so well this month, I have very little space to fill. In fact, there is really no room for graphics within the articles. I had decided to do a review of the latest version of Family Tree Maker (FTM) if there was space, but it looks as if that will have to wait until another issue. FTM, like Quicken, is one of those programs that I usually skip versions of between purchases, but this time I had to buy the latest version about nine months after buying the previous version if I wanted to share data files with my sister, who had the latest version. So I might as well write a review.

That brings to mind my latest Visual Basic project: retrieving data from FTM. It works as follows: I export my FTM data to a GEDOM file (a standard genealogical data format for storing such information in text files—but which is hard to decipher if you view it with a text editor). Next, I write a VB program to retrieve the information from the GEDCOM file and store it in several tables in a Microsoft Access database, e. g. there is a table of individuals with fields for information about the individuals, and a table of families, etc.

Why do I want to do this when FTM allows me to display my data in so many ways? My two reasons are: First, I just like to be able to get at my data and not be at the mercy of some program—no matter how well-behaved the program. Second, I would like eventually to do things with the data in the genealogy section at my WWW site, http://lamartin.com, that require having the data in a database I can access using the Active Server Page (ASP) server side scripting I discussed in the February general meeting.

My second recent project was to create a contact sheet for a roll of 35 mm film using my HP PhotoSmart scanner and my ALPS MD 1300 printer. A contact sheet has all the photos on the roll printed at a size so that the entire roll fits on one sheet of paper. I always had the ability to do this—it would just have taken forever since the scanner software would only allow me to work with one frame of the negatives at a time. And with that image from one negative, I would then have to size it appropriately, etc. One such contact sheet, very much reduced, is at the left.

The solution to my problem was a piece of shareware called VueSmart from Hamrik software for the HP PhotoSmart scanner that allows batch scanning. VueSmart scans in all the negatives on a strip up to 8 frames long and creates a separate graphics file for each frame of size and format of your choosing, which are then all opened in your default viewer for that graph-

(Editor.....Continued on page 9)

Installing Linux

By Charles Howe, Tampa PC Users Group

Objective: Install Linux "on my own". I had sort of installed Linux on a plausible machine (plausible from the standpoint of CPU speed, amount of memory, disk space) at a meeting of the Suncoast Linux User Group (charming acronym: SLUG). A couple of helpful people guided me through it, but the process didn't allow me to mull over each step and let me fix what happened in my brain.

Rather than wipe it out, I decided to try putting it on a machine with a 40 MHz 386 motherboard. I brought memory on that machine up to 16 mb and hard disk space to 540 mb. The video card had 1 mb of video RAM, and there was a CD ROM drive and an AHA1520 SCSI card to handle it. I had Red Hat Linux, version 5.1. A mantra of Linux types is that it will install on hardware like this. Ought to work.

Did work.

Did it go to completion first time? Of course not. There was stuff to figure out beforehand. I had tried installing with a 170 MB hard disk, but it ran out of space. That was when I bought a used Connor 540 MB hard disk. I also put in a 120 MB Maxtor hard disk to be used for the Linux Swap partition, but it didn't get recognized when partitioning took place, even though it was recognized by the BIOS at boot up. That has been the only disappointment so far.

The installation process: You have to experience it for yourself, of course. I put the boot diskette in A: and the CD in the CD-ROM drive and turned the power on. The first screen shows up! A morale booster. Then screen after screen. What you do for several screens is obvious and simple minded. Then comes the one entitled "Disk Setup", the choices being Disk Druid and FDISK. A legend tells you that Disk Druid does partitioning and setting up mount points and is usually easier to use than FDISK so I chose it. The next screen to show up, entitled "Current Disk Partitions", and its derivatives are all important.

In the middle of the screen is the legend "Disk Summaries". If you have just one hard disk, just below the first header it reads "hda". (If you have two, the second line would read "hdb"; a single SCSI drive would read hdsa, etc.) The second header is "Geom [C/H/S]". The entry is something like "[866/15/26]", meaning 866 cylinders, 15 heads and 26 sectors. Note that the drive geometry was autodetected! These numbers pertained to the 170 MB hard disk that was abandoned in favor of a 540 MB drive.

The third column header is "Total". Below it is 164 M. The fourth column is "Used". At one point it was 162 M. Then came the column "Free", below which was 2 M. The last column is untitled. Below it was [########], roughly indicating percentage occupied.

The top of the screen has a line of column headers reading "Mount Point", "Device", "Requested", "Actual" and "Type". There are as many lines as there are partitions. Initially the "Mount Point" column is blank. The "Device" column might contain entries like "hda1", "hda5" "hda6", etc. In other words, there may be skips. The "Requested" and "Actual" columns are filled with partition sizes. It isn't clear to me what would have to happen for the two columns not to be identical. The last column must show at least one "Linux native", and there has to be one "Linux swap".

Along the bottom is a line of five push buttons. What they are used for is obvious.

Initially the first partition is highlighted, selected and active and the first disk drive is highlighted and selected. I'm not going to try to describe every keystroke you can take, many of which will lead you to a dead end. Do enter and key in the mount point. I do not yet comprehend what would be a good partitioning scheme, but I took the easy way out and designated one mount point only, the root -- "/". The installation takes care of everything, but if anything goes wrong, everything goes wrong disk-wise. I also made a 32 MB swap partition. I would have used the entire second drive had installation recognized it. A bit of arcana: the largest allowable swap partition is 127 MB, one MB less than 128. (Don't ask.)

I didn't install a modem, a GUI and TCP/IP. Later. I did install X Windows, in which programs can be run from the command prompt. In that manner multitasking can proceed. There are two GUIs, KDE and GNOME. Red Hat didn't include either in version 5.1 and also didn't in version 5.2, which is now out. However, GNOME is almost certain to be included in version 6.0, which is expected to be out by midsummer.

Tip about attending a SLUG meeting: There are two meetings a month. One is on the second Wednesday of the month at Thomas Jefferson High School. In addition to a conflict with our own TPCUG meeting, the meeting room is a long distance away from where you park, so bringing your computer is very inconvenient unless you have a cart to tote everything. The other meeting is on the fourth Saturday of the month (5th Saturday in January) at the Dunedin Public Library, at 9 am. An early start, but otherwise much better. ◆

(Backup…….Continued from page 5)
gram in DOS. That helped a little. We got to three steps before freezing. Then I was told I might not have enough conventional memory. We inserted a line in the Autoexec.bat of the Rescue diskette to load the program "high". By that time I was on the phone for 45 minutes and I told the tech to study the problem and either call me back or e-mail me with any suggestions.

I am sure this experience is not out of the ordinary. As a matter of fact, it happens so often that some of us have developed certain "defensive" or should I say "offensive" mechanisms. One of them is that we call again, hoping to get a different tech who will have a new idea. It worked. The other tech said I had to lock my hard disk, which is supposedly done by the program automatically. After that the program worked, although only in the DOS mode.

I have a 6 GB disk with 2.2 GB used. It is FAT 32. My cluster size is minimal, 4K, so there was no need for multiple small partitions. I decided to leave another 1 GB to the primary C: partition and make a new D: partition 2.8 GB to be used for backups, etc. You see, if I had a backup file of my C: disk in the D: partition when my computer crashed, I could have recovered just from that file alone, easily. So the strategy now was to leave the backup file in D: even after copying it to CD-R's. This will give me additional insurance and facilitates making interim backups, since backing up to HD is very fast. I will need my removable media, CD-R's, only to recover from a major HD damage.

The creation of the extended logical partition now went smoothly, and the graphical representation of the disk partition sizes and status was excellent.

Ready to backup? Well, not quite yet.

The last PowerQuest tech I talked to cautioned me to ensure I have the Version 2.02 update for Drive Image, especially if I am to backup using a CD-R/W. He assumed the version I received a week ago was 2.0 so I had to do a two step update, first to Version 2.01 and then to 2.02. Checking the version in the Windows 98 program showed 2.0 but in DOS showed 2.01. The updates were downloadable from the PowerQuest web site. Each update was compressed and large, a few MB and a few hundred KB, respectively. They were not self-extracting. The instructions called for downloading to a Temp directory, copying to the Drive Image directory, and expanding by using PKZIP or a compatible utility.

Checking the Windows program, it showed version 2.0 while the DOS showed version 2.01. Besides the question of what version I already had, I also found out there were three directories using the words, Drive Image. Anyway, the directory I chose was the one containing the application, exec file. The update 2.0 to 2.01 did not do anything to either Windows or DOS programs. The update from 2.01 to 2.02 changed a couple of important files. It was now obvious I had version 2.01 for both programs. In any case, however, I was interested in the DOS program, since that's the one I would use for both backup and restore.

This is the end of the suspense. The rest worked just fine. I backed up the entire drive C: in a three part split backup file in D: using the high compression setting. Then I copied the backup file from D: to F:, my CD-R/RW drive, one CD-R each file part. The C: to D: backup took, approximately, half an hour and the D: to F: copying another 75 minutes. There were no errors and no more problems.

I do not expect problems with restore. The Windows 98 Startup Disk loads the DOS CD-ROM driver and the Drive Image Rescue Disk contains the DOS version of the program. Although I have not done the restore, I am confident the complete drive C: is restorable. I did check it as much as it is possible with a dry run. ◆

(Editor…….Continued from page 7)
ics format. In my case, for each negative strip of four frames, I have four pictures opened in Corel Photo-Paint each of which I simply copy and paste in a row to another 8.5 x 11 window I have open in Photo-Paint. To do a roll of 24 requires repeating this six times and takes about 16 minutes.

I then also have the 24 individual thumbnail sized graphics files, which I may at a later date use in a database of my photos, and I have the Photo-Paint page containing all 24. I certainly save this page, and I also print it out using the ALPS in photographic quality mode. The results are stunning.

Possibly at some distant time in the future, all my photographic work will be catalogued in a database with digitized thumbnails and accompanying hard copy contact sheets. Then, again, that project may suffer the same fate as the never finished database of books in this house and the cans of paint bought to paint a certain room in the house which is still unpainted. But at least I now know how to make those contact sheets—just like I know how to paint the room. ◆

Special Interest Groups

Internet SIG

This SIG meets the first Monday of the month at 6 PM at the Reflectone Building, off West Waters Ave. You must sign up to get on the list and to get by security. Contact Mike Hodges at hodges@reflectone.com. For directions, see the map at our web site or contact Mike Hodges.

We consider all topics concerned with creating web sites. We study sites of interest from the web and those created by members of the SIG. Last meeting among other topics we studied such a member site.

Genealogy SIG

This SIG meets the second Monday of the month at 7:00 PM at the Museum of Science and Industry. *Contact Jenny Lind Olin at 960-5723 or Ford Bond at 987-6309 .*

Visual Basic SIG

This SIG meets the third Tuesday of the month, at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6 PM. For information, contact Merle Nicholson at merlenic@tampabay.rr.com .

Last month, we reviewed how to open text files, manipulate the textual date and then save the file. We then studied an example of a VB program that creates a calendar for the month and year of our choice. The study material is posted at our web site under the SIG link on the Announcements page.

Book Review: Peter Norton's Complete Guide to Windows 98

By Donald W. Patzsch, Tampa PC Users Group

The world of computers has changed in the last few years. We used to have lots of programs like Stac and WordPerfect. There were so many of them that we had a hard time keeping up. At that time, I used to buy lots of books.

My new computer has Windows 98 installed ,so it seemed sensible to go to the library and see what books were available. One of these is Peter Norton's Complete Guide to Windows 98. Most books now are very thick, and this one is about an inch and three quarters thick. Much of the "new" books consist of word for word repetition of what is in the on line manuals. None of the manufacturers likes to give you a book of instructions with the program as they used to. No doubt this saves them money.

Now for the book. I was not sure what Microsoft's reference to Active Desktop really meant. Norton points out that you may use the Win 95 static desktop, or you may opt for an Active Desktop by using the "View as Web Page" option. After you set "View as Web Page", go to a blank space on your desktop. Right click, click on Active Desktop. You will see three options, View as Web Page, Customize my Desktop, and Update Now. Click Customize my Desktop, then Web. An Active Desktop allows you to have a stock ticker or some such thing on your desktop. The ticker can update as often as you wish. Or each morning you may have the newspaper of your choice appear when you start up. In other words, your desktop can be an "active" thing with some changing data to aggravate you as you work. (You have to add small programs to access the Internet every few minutes, that's what Active Desktop really means.) In the book, Norton goes into detail,.

The book tells you things like "If you go to File | Open in most applications you get the same dialog box. That dialog box is part of the COMMDLG.DLL located in your SYSTEM directory." All through the book Norton gives you little bits of information like this.

Norton suggests that if you are going to install a new operating system, you might like to make not one but two different startup disks. The first is the regular startup disk that the program tells you to make. The second is a DOS startup disk of Norton's makeup, and it may take three floppies. You might like to look this up on page 124 of the book. These disks will get you up and running if you have any serious kind of a crash.

Norton tells you why, when, and how to install FAT 32 support on hard disks larger than 540 MB, and he teaches you about the possible incompatibilities and pitfalls of FAT 32. He also discusses multimedia capabilities with MMX, DirectX, OpenGL and ActiveMovie. These take up too much space for this review. That's the reason for the thick book!

(Norton.....Continued on page 12)

(Norton……Continued from page 10)

The section on the new Windows 98 Problem Resolution Utilities includes the System File Checker. The System File Checker allows you to do two things - first to scan your system files for errors, and second to extract files from the installation disk. If Windows acts strange because of a corrupted or missing system file, or because a crucial system file has been replaced with an older version by a bad installation program for another program, you may recover from these problems with System File Checker. Go to Start | Programs Accessories | System Tools | System File Checker. (My computer and some others I work on have a slightly different path, maybe yours does also.) Give this a try and see how easy it is to replace the bad file even if it is buried in a CAB file on your installation disk.

In the past three months, I have read about fifteen books, very thick books on Windows 98. This is the best one for the person who needs a little coaching and a lot of reference material!

This book is in the library if you wish to look it over. In it you can find the answer to most of your questions on Windows 98. There are many tips and tricks scattered throughout the book, and it is easy reading. There are 644 pages, and it is published by Sams. The list price is $29.95. ◆

Meeting Preview: At the February meeting, Mark Hayley will present Travel Software and other CD programs for the first part of the meeting. In the second half, William LaMartin will discuss creating interactive web pages with Visual Basic scripting and active server pages. Mary Sheridan, as usual, will conduct a 30 minute Windows discussion at the beginning of the meeting.

President's Message

By Merle Nicholson, President, Tampa PC Users Group

In this issue, please look at two notable items. One is the announcement of the new officers. The installment of new officers occurred at the January meeting. Part of this is, of course, so that you, the membership, will know who the dedicated workers are. But, since we are also a Florida corporation, it's a good idea to announce the change in a public manner.

The other item to look for is a very brief financial statement. The club passed a resolution many years back to publish this yearly. Please note that our balance has increased considerably. This is due the reduction of printing costs through the generosity of a club member and a small team of volunteers who put this together at the lowest possible cost.

I'd like to make a plug right now for our SIGs. SIG is Special Interest Group. At the moment we have three SIGs: Windows, Internet, Visual Basic and Genealogy. All meet monthly. There is further information in this newsletter and on our web site with a contact name for each. There is some current interest in a Linux SIG. A Linux SIG will get started only when someone will volunteer some time to collect names and find at least an initial meeting place.

A SIG gets started if, One, there are enough people interested to support it, and, Two, if there's a volunteer or two to make the arrangements. There can

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

Minutes of the January Meeting

By James Weber, Secretary,
Tampa PC Users Group

Mary Sheridan started the Window SIG at 6:05 PM. The meeting began with a discussion of Y2K and its possible effects on data access. Many group members are aware that older versions of DOS and Windows, as well as certain motherboards, will not work properly after the year 2000. Everyone present seemed to have some type of solution for their own needs, but not everyone was aware that having a Y2K compliant operating system does not make your data safe. Many programs use two digit time stamps that are unaffected by the O.S. This means your database program could essentially disappear before your eyes. Mary shared a story with us about a power plant that shut down during a Y2K test because a pollution sensor in a smokestack was not compliant. We were assured that TECO is aware of similar problems, and they are addressing them now.

The latest beta version of Microsoft's Office 2000 is out, and there are already problems. Steve Singer passed along his experience with it when his Peach Tree accounting and UPS tracking software quit functioning after installing Office 2000. Apparently the ODBC.DRV file is being rewritten in such a manner that older programs can no longer recognize it. Steve said that uninstalling Office 2000 did not cure the problem. Thanks, Bill!

One of our members was having a problem with his 56K modem. Apparently his phone line will ring back to his house when he disconnects his modem. The problem does not happen all the time, only during certain types of connections.

Merle started the general meeting at 6:30 PM. An attendance sheet was passed out along with sign up sheets for the SIGs. Four people present raised their hands when asked if there was still an interest in starting a Linux SIG, and there are approximately 3 others who were not present who have expressed an interest in the past few months. Jenny pitched the Genealogy SIG.

Cheryl Alexander was introduced to the group as the new Membership Coordinator. Among Cheryl's duties will be making contact with members who have not been attending meetings to see if there is anything we could do to increase participation, as well as contacting old members who have quit the group.

Our guest presenter, Capt. Rob Stebbins, began his presentation at 7:05 PM. Capt. Stebbins created a publishing company

(Minutes.....Continued on page 10)

PC Haste, not the case, or new displays for old

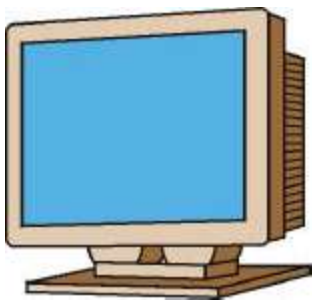
By Mike Hodges, Vice-President, Tampa PC Users Group

Recall the old adage "Haste make waste". Well, if you are well prepared, you can indeed act quickly. Such was the case for me recently. Having attended the TPCUG monthly meetings for the best part of three years, I believe I have been well prepared to buy a new PC at any time and would feel comfortable that I was getting a good shake for my money. In the rapidly changing PC market, new models are constantly being introduced, and the price ranges appear to change daily. Yesterday's good buy is only a good bargain today at a far lower price. The computer marketplace is forever rapidly changing. However, my frequent attendance at the TPCUG monthly presentations and exposure to the web sites of sense and good value, as recommended to me by the various other members, each with heaps of experimental experience to call on, had set me in good stead to act quickly if called on to do so.

Recently I was put to the test. My son, who has been slaving away at his studies at the University of Florida, called to say that his PC had finally refused to come on, and yes, of course, he had many papers due within the week. Apparently he used good back-up practices, so he did not fear data loss but urgently needed a PC to complete his self-created masterpieces. Let me first describe the PC he had been laboring with up to the point of failure. It was a Pionex ASD machine I had purchased from a now long defunct retail outlet called Computer Warehouse sometime back in 1992. A 486 machine with the then outstanding speed of a 33 MHz processor. The system was initially configured with 4 MB of memory, a 200 MB hard drive, a 2x CD-ROM and a 2400 baud modem. I believe I had upgraded the modem for $40 some years back, but this had been providing at best an intermittent connection. Also, as any aspiring writer knows, an HP 540 inkjet printer was needed, as most college professors prefer to grade hardcopy in the solitary confinement of their bathrooms and the like. Getting the PC to power up had become temperamental at best. This power problem was becoming so prevalent that my troubleshooting by phone had now reverted to a final single advisory. "If it comes up this time, keep it on all the time." Finally the machine became totally dormant, so it appeared that I would have to travel up to Gainesville in person to kick some life into the machine or replace the machine if it would not respond to my coaching anymore. Well, on arrival at my son's apartment in Gainesville on my first available non-work day, which turned out to be within three days of the last time the machine showed signs of life, I found that no end of power cycling and switch and cable shaking would bring the machine back to life. Yes, I do have a Masters in Electrical Engineering pending, and I took along my Simpson meter.

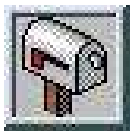
Having been a weekly reader of all the major discount computer store brochures found in the Sunday papers, I considered that for approximately $500 a replacement PC could be acquired. I inquired of my son as to which was the closest computer store to his apartment, as he and I both were in a hurry and found myself at the local Office Depot within a 3-minute drive. I quickly inspected all the many offerings on display and quickly found a Compaq Presario Model 2266 offered for $599. Yes, I did see a machine for $499 on display but decided that the increase in processor speed of the 300 MHz over the 200 MHz model was worth the extra $100. Within ten minutes I was back in my son's apartment and had the new computer replete with a super duper keyboard and mouse connected up in no time with the old display monitor and HP printer. This rapid connectivity was really child's play as all the connectors and cables are conveniently color-coded. This color-coding really helps to ensure that the left and right speakers are correctly located for instance and that the phone lines in and out to the phone are quickly identifiable. The fully connected system was powered on within minutes of my return to the apartment with the new PC, and this included time to unpack in a very confined college town apartment bedroom.

The system booted up and asked lots of questions in what I describe as DOS format via the ancient display monitor, an early nineties model Magnavox. I had acquired the Magnavox Super VGA display second hand some time after the original display had failed and burnt out most of the resistors in the drive circuitry. The Windows 98 screen appeared and then a problem occurred: the screen went blue, and a central static noise pattern stretched horizontally across the middle two inches of the screen. I rebooted once or twice and the same sequence prevailed. I located the convenient installation manual, which up until this moment I had ignored, and quickly found the tech help 800 number. I was connected to a real person after answering all the right questions that the central computer posed to me and was indeed connected within the 3.7 minutes predicted by the central computer. The technical service person from Compaq had not encountered my problem before and suggested that I reload the system from the back up CD provided with the purchased machine. The hard drive of the system software might have been corrupted. This seem plausible to me, so I followed the instructions and reloaded the system from the CD and went and ate lunch as the reload required 75 minutes even with the 24x CD ROM. Back from lunch and even after the reload the blue screen sequence was repeated yet again.



At this point I had a real stroke of luck. Being only a few minutes from the point of purchase, I returned to the store with the intent of swapping out the system for one that would work completely. I found the assistant manager and described the

(PC Haste.....Continued on page 4)



(PC Haste.....Continued from page 3)
problem. Now this is where I really got lucky by encountering a truly savvy individual. He knew exactly the nature of the problem as he had experienced a similar problem with another model some six months earlier. The display was of an old type and some incompatibilities existed between the video driver and the old type display monitor. Sure enough, he was able to get beyond the blue screen impasse and knew how to optimize the display by adjusting the number of colors and other parameters, such as adapter type, to be found under the control panel display settings menu options. Unfortunately, the edge of the Windows motif could not be optimized on my ancient monitor to be a smooth non-jagged edge. I volunteered at this point to buy a new 14" monitor, which the store had on sale for $99. This new display immediately solved the problem, and the system responded automatically by means of the plug and play technology, just as it should.

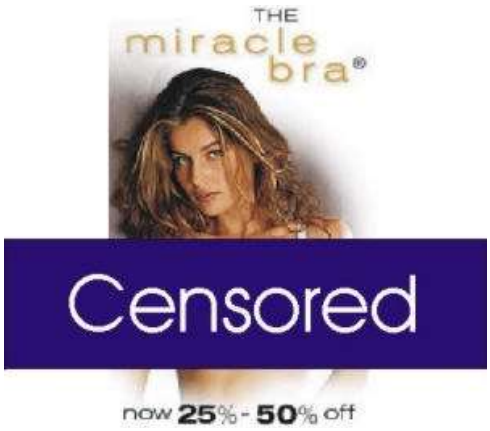
The moral of this story is that if you are attempting to put new wine in old bottles, then you need luck on your side in the form of more computer system knowledge. I therefore highly recommend that if you plan to buy any computer in Gainesville you stop by at Office Depot and also continue attending our monthly meetings held on the second Wednesday of the month at MOSI to stay informed.

By the way, with the help of some talented technician colleagues from my office, the power supply in the 486 has now been replaced, and that machine with its old display monitor is up and running as slowly as it ever did. This recovery took about a week as the five-year-old power supplies, which can cost $30, are hard to find, but I was yet again lucky and found an old power supply going begging. I had disassembled the 486 and determined with my Simpson meter that the switch assembly was sound and that the power supply was clearly defunct on the night of the Communication SIG presented on the 7th of December by our very own William LaMartin. So I guess the trip to Gainesville took place on 5 December. You can set your calendar on account of the regularity of the TPCUG events. See you at our next regular monthly meeting held on the second Wednesday of the month at MOSI. ◆

Email Netiquette

By Larry Anders, Librarian, Tampa PC Users Group

We may not all surf the Internet, but most us have some form of an email address (or two, or three). The email programs we have available to us today allow for better communication than ever before, but there are a few rules we should follow and a few things we should be aware of.



- You should probably consider any message as permanent and that you have very little control over who will see it. The message may lay dormant for quite awhile on someone's computer until someday someone resurrects it. It may not have been anything you would have wanted anyone else to see. Remember this the next time you send an email.
- It's always possible that a message can be misinterpreted, causing the recipient to react negatively. Email doesn't allow for immediate personal feedback. Be succinct and avoid responding while emotional. If you have to be emotional, use some of the "emoticons" listed below.
- To avoid receiving a computer virus, proceed with caution when opening an attachment (a binary or executable file) to the email. If you do not know the sender or were not expecting the attachment, find out who is sending it and what it is first. Remember, though, that most attachments serve a purpose, so don't be overly hasty to delete the message. Likewise, if you're sending an attachment let the recipient know what it is.
- Commonly used acronyms in email messages are: **BTW** – by the way; **F2F**– Face to face; **FWIW** – For what it's worth; **FYA** – for your amusement; **FYI** – for your information; **HHOK** – Ha ha only kidding; **IOW** – in other words; **IMHO** – in my humble opinion; **LOL** – laughing out loud; **TIA** – Thanks in advance; **TNX** – thanks. (Don't overuse these.)
- Commonly used emoticons in email messages are: **:-)** Happy; **:-(** Sad; **:-||** Really Angry; **:-(o)** Yelling; **:-D** Laughter; **;-)** Winking; **:-}** Grinning; **:-o** Shocked or Amazed; **:-&** Tongue-tied; **:-#** My lips are sealed; **;-(** Feel like crying; **:-o** Shocked or amazed; **:-*** Kiss; **X-** Brain dead; **:-P** Sticking tongue out. (Don't overuse these either.)
- Case sensitivity doesn't usually matter in an email address as it does in a URL or Internet address. ie., johndoe @tpcug.org is the same as JohnDoe@TPCUG.org.
- Make sure to always include a subject line. That will make sure the message gets read and if it's forwarded to others they will be able to understand the subject matter. Be creative!

(email.....Continued on page 5)

(email.....Continued from page 4)

- Try to limit your line character length to 65. Some email programs wrap at the wrong place which causes the email to be really hard to read.
- If you quote part of the message in your response edit out unnecessary verbiage and include your reply at the beginning of your message.
- Create a signature file to be added to all outgoing messages. Signature lines are the letterhead (or rather letter-footer) of your email message. Almost every modern email program allows you to create a signature file that typically includes 5-10 lines of contact information about you or your company which is automatically appended to each message you send.
- DON'T TYPE IN ALL CAPS. This is perceived as shouting.
- Don't send entire web pages. Just the link to the page will do.
- Don't attach files larger than 50k without permission from the recipient.
- Always read over your email before sending it and use a spellchecker when possible.
- And last, but not least, sometimes a telephone call will work much better than email. Know when to post… and when to call! ◆

Internet picture of the month

Victoria's Secret Online Catalog Item

1998 was not only the year when Internet stocks deified gravity, it was the year when online retailing really took hold. One of the last name brand retailers to come online in 1998 was Victoria's Secret. There is no need to go to your local store anymore or thumb through the mail order catalog; just point your mouse toward http://www.victoriassecret.com and click.

As you can see, the TPCUG Censor has been at work.

ALPS MD 1300 Printer

By William LaMartin, Editor, Tampa PC Users Group

Several months back ALPS gave our group a presentation at our regular meeting. For most of us it was our first contact with ALPS Micro Dry printers. And for many of us it was lust at first site. I almost bought one on the spot since the presenter handed out a preferential user group pricing sheet, but I restrained myself. Apparently a few members decided to make the plunge after returning home. And, since the presenter recommended searching the WWW for prices even lower than the ALPS user group prices, they did exactly that and were happy with their "Internet shopping experience."

Thanks to my wife, I received my ALPS MD 1300 for Christmas, bought from the local COMP-USA for approximately $400 + Tax. At the time I think the best Internet price was around $360 + shipping. COMP-USA, I believe, now has the 1300 on sale for $339, and on the Internet it appears for $340 at my favorite shopping site http://www.buycom.com/. So it appears that buying locally right now is a good idea. If you want to buy the photographic quality ink cartridges or the photographic quality paper, you will save a lot of money by purchasing them via a company like Buy.Com on the Internet. More on that later. Now to the printer.

From the ALPS site, http://www.alpsusa.com/, one sees that ALPS is currently selling three printers: the MD – 1000, the MD – 1300, and the MD – 5000. The 1000 and the 1300 are the same except that—and this is very important to me—the 1300 allows you to print in dye sublimation mode using the special ALPS' photographic paper and ink cartridges which produce results approaching closer to photo quality than any other printer I have seen. I have given framed 8 x 10 color prints made in dye sublimation mode to relatives, and they cannot tell that it is not a photo. I have shown members of our group 4 x 6 prints made from scanned color slides, and they agree they look like real "photos".

The normal printing process for the 1000, 1300 and the 5000 is Micro Dry—not dye-sublimation. It is a printing technique, invented and developed by ALPS, to produce fade-proof, water-proof and smear-proof images to a wide variety of media (almost any kind of paper) using a thermal process. The 5000 is a new 2400 DPI micro dry printer (the 1000 & 1300 are 600 DPI), costing around $600. For some reason, though, you have to pay an extra $75 to add the dye-sublimation feature to the 5000. I think possibly it also uses different paper for one of its printing modes from that used by the 1300 (so many paper choices can get confusing). But the regular 2400 DPI mode is quite stunning. Check it out at COMP-USA.

Dye-sublimation is a thermal-transfer process. Ink is heated to "sublimation", the chemical term for moving a substance from a solid state to a gaseous state. The image is then transferred onto special paper. Prints made using this process are beautiful, and you will see no individual dots under magnification, but they are not cheap. I paid about $31 + shipping at Buy.Com for the three ink cartridges and one overcoat cartridge necessary to produce these results. A 20 sheet package of the special photographic quality paper runs $13 + shipping. I bought enough of the ALPS consumables so that the shipping allocated to one set of cartridges and the 20 sheets of paper was approximately $6. ALPS claims that with one set of the photographic quality ink cartridges you can do 31 of the 8.5 x 11 pages at 56% coverage, that is 1,623 square inches of coverage. This is equivalent to doing 20 full 8 x 10 prints. How convenient for our calculations. So it appears that with one set of cartridges and one package of paper you get twenty 8 x 10 color photographic quality prints at a cost of $50, or $2.50 per 8 x 10 print. With more expensive consumables, I suppose this figure could go to $3.50 or $4.00.

When I bought my very large supply of ALPS' consumables from Buy.Com (it almost appears as if I have as much money in consumables as in the printer), their prices were 40% below that of ALPS or COMP-USA and about 20% below most other Internet retailers. Additionally, Comp-USA and many of the online retailers didn't offer the entire product line of cartridges and paper. Unfortunately a recent check shows that Buy.Com has increased their prices on these items by about 17%; a photo quality ink cartridge that cost me $6.95 in December now runs $8.13. So, check around before you buy.

In addition to the photographic quality paper and cartridges, I purchased additional regular cartridges and something called photo realistic paper—which produces glossy near photo quality prints using the regular ink cartridges. The photo realistic paper is a good bit cheaper than the photo quality paper, just as the regular cartridges are cheaper than the photo quality ones—and the results are still quite stunning. I use this setup for printing color graphics work I create in Corel Draw. It is a big improvement over what I was getting with my HP 855 C DeskJet. I should note, though, that simply using the regular ink cartridges and regular laser paper produced results only slightly better than my HP 855 C DeskJet.

I only use the new ALPS for color work and direct all text documents to my HP 4 Plus LaserJet , so I am not a normal user. I think most people want to own only one printer. Personally, even though I have nothing but praise for the photographic quality output of the 1300, I cannot recommend it as a

(ALPS……..Continued on page 7)

(ALPS.....Continued from page 6)
printer for very much text output. The black and white text output is excellent; however, it is quite slow—too slow for me but perhaps not for others, since most people are content with the speed of their ink jet printers.

Speaking of speed, in the dye-sublimation mode the printer uses four passes to print the photographic quality output. It takes approximately 6 minutes to print a 4 x 6 print and about 18 minutes to print an 8 x 10. I didn't check on the speed of printing a standard letter, since I doubt I will ever use it for that. For me the ALPS MD – 1300, used in conduction with my HP PhotoSmart negative, slide and photograph scanner, is like having my own photographic darkroom (which I have but never seem to find time to use). The only outside work needed is getting your color film developed. Of course, a digital camera could solve that problem. Except that an affordable digital camera has a long ways to go to equal the quality of my Nikon N70. The ALPS MD – 1300's dye-sublimation prints are very close in quality to the product produced by the one hour photo places that most of us use for our prints.

I should also note that in dye-sublimation mode the 1300 also prints beautiful black and white photos. All the different shades of gray are produced by the same photographic quality cartridges that produce color. It is really an education of color mixing to watch as the printer puts down the three basic colors in three passes and ends up with a beautiful gray scale print.

One warning: do not use the photographic quality ink cartridges with regular paper or the non-glossy side of the photographic quality paper. If you should do this, the ribbons in them will stick to the paper and tear. You will then have a tedious job or repair ahead of you if you want to salvage your cartridges. And at their price, you will want to do this unless they are very near the end. To accomplish this, you will have to carefully pry open each cartridge that has a broken ribbon and use scotch tape to splice the ribbon, just as some of us old timers used to do with home movies. Then you will have to reassemble the cartridges, being careful not to lose them, and replace to their correct positions the several interior springs and spindles. I speak from experience. Probably I should tape a note to the top of the printer saying "**Put glossy side of paper face up**". The regular cartridges do not have this problem.

Unfortunately there is no way to demonstrate the quality of the prints in this newsletter. ◆

TPCUG Officers for 1999

President	Merle Nicholson
Vice President	Michael Hodges
Secretary	James Weber
Treasurer	Jenny Lind Olin
Member at Large	Bruce Register

Appointed

Editor	William LaMartin
Librarian	Larry Anders
Program Coordinator	Mary Sheridan
MOSI Liaison	Ford Bond
Membership Chairman	Cheryl Alexander

Members, please contact any of your leaders with any ideas or suggestions. All the above have made a commitment to serving you, the members in 1999. If you have program suggestions, contact Mary Sheridan; for membership suggestions, contact Cheryl Alexander. Please volunteer wherever you might feel a need. Members are invited to attend the Board Meetings held on the Thursday before the regular Wednesday business meeting. Let us all give Merle Nicholson, our president, our best support. *Bruce Register*

(President.....Continued from page 1)
really be very little work in running a SIG: finding a meeting place (the hardest), notifying and reminding the members, and coordinating a monthly program or agenda. Many SIGs go on very well as simple discussion groups, with a demo rotating among the members to show what each person's involvement in the subject is. Everyone benefits from the exchange of information, advice and viewpoints.

I mentioned that I have two goals this year. We spent last year getting our financial house in order, and I believe that's behind us. We also had a very good year for presentations. This year I'd like to concentrate on building the membership. I plan to do this in two ways – the first is to build partnerships with other organizations, and the second is to enlist the aid of the membership to recruit family, friends and neighbors. If you come to the meetings, you must surely benefit from the experience. Please share that with one or two people during this year, and we'll be on solid footing.

The other goal of mine is to find a replacement TPCUG president by October at the latest. If you're interested, please mention it to me or any of the board members. Come to the monthly board meetings to see how we are organized; make suggestions, whatever you can contribute.

Thanks, and I'll see you at the next meeting. ◆

Over Clocking Processors

By Merle Nicholson, President, Tampa PC Users Group

An interesting thing is going on in the computer gaming world right now with "over clocking" Pentium II Celeron processors. There's quite a lot being circulated about this lately, so I thought I would explain what is going on.

To put it as simply as possible, over clocking is running a computer above its intended speed. Why would you do that? It all boils down to money. Right now the cost of an Intel Pentium Celeron 300a processor is $100, and an Intel Pentium II 450 processor is $550. So instead of buying the expensive version, just buy the Celeron and over clock it to 450. Why isn't everyone doing this? What are the risks? Read on; all is explained here.

Hobbyists have been over clocking computers for a long time now, and I've never really understood what there was to gain. Back when we were all on 486 computers, much was made of the new AMD 486-80 that could sometimes be run at 100. That's a 25% increase in processing power. Why bother? Would you see the difference? My opinion was then that it wasn't worth the work. You had to have a motherboard capable of running it faster in the first place; in other words, make the settings that make it possible. And you had to add a fan inside to keep it cool because it ran hotter. And it didn't always work.

The price to pay – when it didn't work - was instability. Sometimes the processor wouldn't work at all, but many times it would work, but badly. You would have program faults and the deadly Windows "blue screen" errors that forced you to reboot. And sometimes you would get spontaneous reboots. But that's about the extent of the risks, and if you don't like the way it behaves just put it back.

Back to the present, the issues and risks are identical to what they were five years ago. But one thing has changed this time: the gain is greater.

Intel and other chip manufacturers would prefer that their processors not be over clocked. Their main concern is that an unscrupulous manufacturer would buy cheaper processors for their computers and pass them off as more powerful machines— an opportunity to cheat the public. And obviously it would cut into the revenue stream. So with the Pentium II they go to some trouble to make sure they can't be over clocked. And that takes some technical explanation. Stick with me here; I'll try to make it painless.

A processor's power is mainly dependent on two things; the capability of the internal program, and the speed at which it is run. The capability of the "instruction set" – that's the internal program, is slowly evolving with each new processor type. Two things have to be accomplished here. One is that the processor does all the things it used to do so it can run all the older programs, and that any new instructions are useful enough so that there's interest in software development to take advantage of them. MMX is a very good example of this. MMX doesn't hurt anything, and as programs are available to utilize the capability of MMX, some significant performance gains are possible.

I said two things – the other is the speed at which the processor is being run. All other things being equal (the instruction set) the faster a processor is run, the more it can do in a given time (the speed). Why not just build a Pentium II 10,000 then, instead of just messing around with 300's or 450's? The answer is just evolving technology. They're basically making them as fast as the technology allows. And there's been a constant revolution in manufacturing techniques for many years. If they were capable of building a compatible, say, Pentium 600, and they could make it for a price that would make it worth it, it would be done. And they're working on it; you can count on that.

Every once in a while they figure that a major change in chip architecture is needed to take advantage of current technology, so we have a major change like the P II. And the next one is already available - the Xeon, and AMD is coming out with a 500 MHz K7 midyear.

So, back to speed. Motherboards have a clock. They run a speed measured in frequency called Hertz, and since the range we're dealing with is in millions, the term is in Mega-Hertz (MHz). It's simply the number of "ticks" per second, and the processor does a certain number of instructions at every "tick" of the clock. The Motherboard supplies the clock and normally has several settings that can be made so that it will accommodate more than one speed of processor. So a manufacturer will use the same motherboard for a Pentium 233 and a 266 or 300, for instance.

Motherboards have basic "board speeds"; that is the speed that the board ships information around to its several components. The most important function is the speed at which the processor ships data to the memory. Over time, Pentiums used 25 , 60 and 66 MHz bus speeds. Other speeds needed by the other processors have been 75 and 83.3. Now we're using 100 MHz for many computers. And the new K7 will be using a 200 MHz bus. Each of these speed increases required more technology development and expense.

The board must also be capable of handling a given range of processor speeds, and that is set by a "multiplier". The multiplier is a function of the board speed, and to get say a 266, you have to multiply 66.667 times four. And a 400 MHz CPU is run with a multiplier of four also, but uses a 100 MHz bus instead. Boards typically have multipliers of 2x through 5x or more; in half steps; 2.5, 3, 3.5 etc.

(Over clocking.....Continued on page 9)

(Over clocking…….Continued from page 8)
Now back to over clocking and the Celeron. Intel reportedly builds into their processors the capability of detecting both the board speed and the multiplier. But the story goes that someone decided that detecting the board speed of a 300 wasn't necessary. And then it was discovered that the Celeron 300 would actually run at 450 if you reset the board speed from its normal 66 to 100. The multiplier stays the same at 4.5. Successful over clocking at a 50% increase is unheard of. The catch is that the processor voltage must be increased from the normal 2.0 volts to 2.2 or 2.3 volts. And that's the tricky part. And it also increases the risk – of burning out your $100 processor. But an increase from 300 to 450 is very much noticeable, especially if you're running games.

So first you have to buy a board and processor. And you have to get PC-100 memory. Sorry, you can't use your old memory for this. And do your homework and some research on this. There's a lot available at Tom's Hardware page at http://www.tomshardware.com and several other sites. At Tom's, there're good pictures available, and you'll need them, because to set the voltage on most boards, you must actually paint fingernail polish on some of the pins on the processor board.

PC gaming enthusiasts discovered this. There are people out there who routinely experiment with this. But this particular discovery was pretty noteworthy because the 300a is at the bottom end of the processor food chain. So if you would rather put your money into game software and still have the power of a machine that would cost $500 more, it has a lot of appeal.

If you're interested in doing this, you have some research to do, but there's a lot of help out there. People like to write about what they're doing, and the Internet is the perfect place to publish this information. ◆

Editor's Comments

By William LaMartin, Editor,
Tampa PC Users Group

I think I have had enough computer problems this past month to fill the small amount of space available. Luckily all problems have been solved except the most recent: As I write this, the Discussion Group at TPDUG.ORG will not allow posting of messages or replies. In addition, I cannot use Microsoft FrontPage to open the site. So, possibly there is a write permissions problem. You need to write to certain folders on the server when you use FrontPage, and you certainly need to write somewhere if you are going to post a message. And to do this you need the server's permission. But that is just a guess. I assume, though, by the time you get this newsletter everything will be back to normal.

The most interesting problem this month was on a new Gateway Solo laptop—not mine unfortunately. The microphone jack produced no sound; using different microphones did no better. Obviously the microphone was muted in the volume control. Wrong. Obviously something was wrong with the recording settings. Wrong. Obviously all that was needed was to remove all mention of the sound card from the Win 98 Device Manager, reboot and let Windows install all the sound drivers again. Wrong. In fact one of the three sound card components would not install.

Since it was a new machine, the thing to do was call Gateway. The technician I got was the best I have ever worked with. He never missed a beat as he led me toward a solution, and he never broke for a moment to consult a resource (tech talk for asking someone else for help). Of course, he had me do what I had already done with the same result. He then instructed me to insert the recovery disk into the CD drive (not to run the setup program on it, since that would have restored the computer to its status when new—wiping out all the programs we had installed), have Win 98 search a certain folder for the needed driver for this one component, and that is where we stopped. The computer just would not open the folder.

I said I had seen it act like that before and that the drives on this computer seemed slow to react . He said he thought the computer had a corrupted driver for the hard drive, and he had me boot in safe mode, where he had me again remove all mention of the sound card plus some additional Microsoft sound drivers that hadn't shown up in normal mode—and most importantly he had me remove the Intel driver for the hard drive controller. A reboot produced a driver for the hard drive and drivers for two of the three sound components. This time, however, when we had Windows search the recovery CD for the needed driver, there was no problem in getting it.

Miraculously the microphone began to work. Who would have thought that you would need to reinstall the software for your hard drive to get your microphone to work.

My own desktop computer had a problem which I posted to our Discussion Group (when you could still do that). This problem manifested itself by producing an error and closing down Internet Explorer (IE) whenever I would try to type a URL into the URL text box of IE. The same thing would occur when you tried to type anything into the Start | Run text box. I could, however, paste text into the boxes with no problem.

Special Interest Groups

Internet SIG

This SIG meets the first Monday of the month at 6 PM at the Reflectone Building, off West Waters Ave. You must sign up to get on the list and to get by security. Contact Mike Hodges at hodges@reflectone.com. For directions, see the map at our web site or contact Mike Hodges.

We again reviewed what we have done. We also spent a good bit of time studying how the calendars at TPCUG.ORG and LAMARTIN.COM were made.

Genealogy SIG

This SIG meets the second Monday of the month at 7:00 PM at the Museum of Science and Industry. *Contact Jenny Lind Olin at 960-5723 or Ford Bond at 987-6309 .*
The members of the TPCUG Genealogy SIG have learned a lot in the past year even if they didn't attend all meetings. Several interesting items have been sent to the members with e-mail addresses. A list of epidemics was a unique tool to use while doing genealogy. A list of wars fought on American continents and a list of ailments found in the census reports and their modern disease names were very interesting.

Web sites have been shared this past year. There were URLs for maps of the counties as they changed from census to census, Irish genealogy sites, and an opportunity to visit ancestry.com free for a month.

Visual Basic SIG

This SIG meets the third Tuesday of the month, at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6 PM. For information, contact Merle Nicholson at merlenic@tampabay.rr.com .

We studied various ways of opening text files for both input and output and how to write data to them and retrieve data from them.

1998 Financial Report

in his own home with a combination of his experience as a seaman and a little bit of programming experience. His annual circulation is around six thousand units. Capt. Stubbins claimed his inspiration came after he bought a boat in 1980 and was not able to catch any fish. After a friend's advice, Capt. Stebbins bought a Loran navigation device and still couldn't catch fish. It was at this point he learned about "secret" spots, or Loran coordinates. Unfortunately, no one ever published a list of coordinates; they were kept secret by the people who discovered them. It was here that Capt. Stebbins decided that there was a market for a published list of GPS and Loran-C coordinates.

The product Capt. Stebbins came up with is a fully searchable and configurable data base of all waterways along America's Atlantic and Pacific coasts as well as the Gulf Coast, the Great Lakes, interior lakes and rivers, and a good portion of the Caribbean. He demonstrated how to find objects of interest, like fishing holes or wrecks, by either searching by site description or entering GPS or Loran-C coordinates. The Captain says that the thousands of coordinates and the database program only take up about 40 MB of disk space. He uses an HP 890c printer to create his own labels and has two computers running a 2X and a 4X CD burner creating the program disk. His presentation ended at 8:15 PM.

We had our drawing after the presentation. Brian Lance won a copy of Clean Sweep and Ed Snow won a book called Windows 98 Annoyances and a 3-D clip art program called Live Art. Kevan Sheridan won a GPS coordinate book. $42.00 was raised from the door prizes.

We ended at 8:30 PM. ◆

I thougt about this for 24 hours and could not solve the problem. I searched Microsoft's knowledge Base and the Usenet newsgroups. Suspecting a problem with IE, I reinstalled it. No luck. I then contacted Microsoft and received the answer that my problem was caused by a corrupted history file for IE coupled with the auto complete feature. The solution was to temporarily disable auto complete, delete all entries in the history file and the cache for IE. That solved the problem, and I decided to not enable auto complete again since it was usually more of a nuisance than a help. I now think if I had uninstalled IE before reinstalling it, that probably would also have solved the problem. Isn't computing fun?

A final problem, actually the first problem of the month, was the inability to get help on the common dialog control in Visual Basic 5 after I installed a program. This program apparently installed a newer version of this control. The control worked but required a different help file. I had various complicated schemes for solving the problem but wanted a simpler one. Again, after checking all my usual resources, I contacted Microsoft and they provided a simple solution: unregister the new version of the control, delete it, get the original version off the CD, register the original version. You can't simply replace the new with the old. You must register and unregister using Regsvr32.exe.

Thanks, Microsoft. Thanks, Gateway. ◆

President's Message

By Merle Nicholson, President, Tampa PC Users Group

It's been an interesting past month for me. I took the month "off" from the TPCUG and went on vacation. My son and his family were visiting, and we did some Disney and some other Florida things. One was a trip to Titusville to see a satellite launch. I had researched at the NASA web site and came up with a good one because it was to go off at near 6 PM, and we'd be watching from the west so the missile would be highlighted by the sun just after liftoff. It was perfect. A couple of days later my wife and I decided to look at the Apollo 13 movie we had on tape. We lived in Cape Canaveral during those days and were pretty involved in it, and I have to say I really choke up when I see that film.

Hold on – I'm getting to the computer part. .. .. .. I was watching the film and was reminded that the trajectory numbers had to be moved from the Command Module's "computer" to the Lunar Module "computer" by hand. I was once again reminded that the whole computing power in the entire array of space equipment wouldn't be greater than a Commodore 128K computer of 1986. Probably not any more than some baby toys of today. And how lucky I am that I'm able to program a computer, and even that I've actually built some number of them. Wow, isn't life great?

I need to remind you again as always … we need to bring in new members. Remember there's a prize for bringing in the most members. So harass your friends and neighbors; make a nuisance of yourselves and drag some new faces in. See you at the next meeting. ◆

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

Minutes of the April Meeting

Our secretary was absent from the meeting, and no one realized it, so we have no official record of what transpired. Briefly, though, here is Mary Sheridan's best recollection.

As usual, Mary Sheridan conducted a Windows discussion at the beginning of the meeting.

Tom Walsh from American Power Conversion (APC) spoke to us about surge protectors and Uninterruptible Power Supplies (UPS). He explained that the danger to electrical components from electrical surges was well known, but that the greatest damage to PC's can be the brown-outs that occur all the time. He also was very generous in providing one of the UPSs for our drawing, which was won by John Whitmer. Tom also offered huge discounts to the user group members. Several pieces of software were also raffled.

Editor's Comments – Virus Attack

By William LaMartin, Editor,
Tampa PC Users Group

CIH (Chernobyl) Virus Strikes Close to Home On April 26, while returning to Tampa, I called home and was informed of a computer problem at someone's office for whom I provide support. The message was that their computer wouldn't boot. Sounded like a power supply problem at first thought. When I was able to contact the individual, I found out the problem was not electrical. The problem was that on attempting to boot the computer they received the message, "Place bootable media in an appreciate drive". Not a good message, and that immediately brought to mind the warning my wife had shown me in the Tribune a few days back concerning the Chernobyl virus that was scheduled to strike on—April 26.

And it did strike. When I got to the computer, the only drive you could use was the A drive. Trying to access the C drive produced a message like "inappropriate drive parameter". A check of the BIOS showed that there was a Quantum Bigfoot hard drive. So we had a BIOS and a hard drive, but the hard drive was inaccessible. I had brought a DOS bootable floppy with generic CD ROM drivers on it and could access the CD-ROM drive, but no C drive access. I also had FDISK on the

Lost & Found

By Don Patzsch, Tampa PC Users Group

TPCUG provided me with a copy of Lost and Found by PowerQuest Corp. Before I begin my review of the program, let me say that I hope you all saw William LaMartin's comments in the April 28 St Pete Times. (About the virus Chernobyl.) Very timely!

When I tried to install the program, I found that you were given a screen that asked if you wanted to register the program. If you said no, the program terminated. I didn't like that, but fortunately the PowerQuest web site has an update which removes that copy protection scheme. I am a fan of PowerQuest; I have been since I got my copy of Partition Magic, version 1.0.

Those of you who believe Microsoft when they say forget about DOS are missing a great deal, as I see it. DOS sets aside your drive letters, and if you have an older machine, it limits you to 2 gig hard drives, maximum. However, DOS is a most valuable program and I use it very often as it is easier than using Windows utilities in so many ways.

By now, you probably have guessed that before running Lost and Found, you must exit Windows and bring your machine up in DOS! It is best to have a second hard drive, or a removable media drive, or one of the newer floppy drives, to recover your files to. Lost and Found tells you the size of the files it is recovering and how long the process will take. The program comes on two 3.5 inch 1.44 floppies.

The Lost and Found manual is very small, but I always read the manual at least twice before I try to run any new program. I think this is a sensible procedure.

To start Lost and Found, insert disk 1 and start the computer. It comes up in Caldera DR-DOS version 7.02.

You are presented with a screen that asks you to select the SOURCE DRIVE. This is the drive you want to recover files from. It may be the floppy drive or any of the hard drives shown. Choose to analyze an entire drive to locate files that are not visible and do not have a drive letter.

I chose the floppy drive as the drive to use as the SOURCE DRIVE so it would be faster. The disk is analyzed and a screen tells you what has been found. Current disk cylinder, the Head number, the Sector number and the Logical Block Address are displayed as the scan progresses. Hit enter and you will see the listing of the files on the disk. In my case, I was using an old disk, and the screen I see fills the monitor. It lists very many files. The undamaged files are at the top, and all sorts of files are listed just below these undamaged files. You may select any file to be recovered by hitting the space bar to mark that file. Then hit escape and you go back to the first screen. The files are color coded so you can tell if they are easily recoverable (light green); possible recovery (yellow); unlikely recoverable (red); and so on.

Continue following the menu on the screen and you will recover the files you "mark". I recovered an old (1996) Lotus Wordpro file that was 1,007,476 bytes in length. This file was marked with a YELLOW color, which means possible to recover. I did not want to test with a file that was marked LIGHT GREEN or easily recoverable. The file was on drive A: the floppy drive, and I recovered it to drive D: my second hard drive.

Enough of recovering. There are utilities on disk two of Lost and Found. Refresh brings back the long file names created under Windows 95, 98, or NT. Restore restores files you recovered using the compressed form.

Now it is not practical to deliberately crash a hard disk just to prove this program works as advertised. So I will list the attributes of the program as listed on their shrink wrapped cover:

Unlike other data repair and recovery software solutions, Lost & Found:

- Does not need to be installed prior to the recovery of lost or corrupted files.
- Does not alter, write to or attempt to repair critical sectors on the damaged disk, increasing the chances of a successful data recovery. Recovers your files even after reformatting, as long as you have not written over them.
- Performs a disk analysis and reports the odds of recovery via color coding. Allows you to save data to a network drive.
- Offers exceptional data error handling, allowing you to recover files from disks that have suffered head crashes or other damage.
- Recovers lost or damaged data even if the critical sectors, such as the boot sector or root directory, are corrupted or missing.
- Recovers data from both FAT16 and FAT32 partitions. Works with all possible IDE, EIDE and SCSI disk drive configurations.

The experience I have had with PowerQuest tells me that the above are reliable statements. I have played with the program and deleted files and recovered them, formatted disks and still recovered files! And so I ask you to accept the above as a review of this program. If anyone has an old hard disk that I can use that has been really crashed but still rotates, I will attempt to recover anything you may want from it.

The cost for Lost and Found is $69.95 list, but probably $30 to User Group members. www.powerquest.com is the URL to the home page. ◆

LapLink Professional

By William LaMartin, Editor,
Tampa PC Users Group

Until recently, the last time I used LapLink was before Windows 95, whenever that was. I originally purchased LapLink so as to transfer files between two Windows 3.1 computers connected via a serial or parallel cable. With the introduction of win 95 and its Direct Cable Connection feature, I no longer needed LapLink. After I installed network cards in most of my computers, I needed it even less.

But what about LapLink's ability to transfer files between two computers running LapLink and connected by a phone connection anywhere in the world? You can't do that with Win 95's Direct Cable Connection—unless you have a mighty long cable. Well, you can do what most people do now days. You send files back and forth as email attachments.

And there is an even better way to transfer files via the Internet: Microsoft's NetMeeting. And NetMeeting does much more than just allowing you to transfer files. While connected to the Internet and running NetMeeting, you can have an audio conversation, watch each other on video, write on a white board, or have a keyboard chat. Then there is the real neat feature of being able to share an application you are running on your computer with the other individual with whom you are having a NetMeeting. And once you have done this, you may take the further step of allowing them to share control of the program. For example, if I have Windows running, I can give the individual access to it, and he can then move around my computer looking at all my files. Or, if I am running Microsoft Word, I can give him the ability to run Word on my computer, creating documents, typing into them, etc. The only problem with all this is a lack of bandwidth using regular modems.

So why am I writing about LapLink—and why did I pay for a new version of it—if NetMeeting is so wonderful? I purchased a new Windows 95/98 version simply because LapLink is better suited to controlling a remote computer, which is something that is quite important if you are going to help people with their computer problems.

With LapLink running on both computers (the software license allows you to install your copy on up to three computers) and the computers connected basically any way you can think of (cable, LAN, phone, Internet), you can easily transfer files and control the remote computer. This allows the computer technician to take control of his client's machine and do basically anything that the client could do. If the client was unsure of how to install or configure a program, the technician could do it for him. If the client was having a problem with a particular piece of software, the technician could duplicate it and hopefully correct the problem.

For computers that are both connected to the Internet and located more than a local phone call apart, it makes sense to connect via the Internet to use LapLink since the connection will be free. To do this you use the TCP/IP protocol (which can also be used for connections over a LAN). However, I immediately ran into a problem when I first tried to do this after installing LapLink on my desktop and Laptop. I had the TCP/IP protocol enabled in LapLink on my desktop machine, but it could not be enabled in LapLink on the laptop. The Laptop had TCP/IP installed, and it worked fine in connecting the computer to the Internet, but this is not the same as having it enabled in LapLink. Furthermore Help just said to check my network settings (I was first testing using TCP/IP over the LAN before moving on the Internet).

A search of the Microsoft and the LapLink sites produced no solution. So where else do I always turn for answers in such situations? I do a search of the Usenet newsgroups via http://www.dejanews.com. I found my answer in a message in the newsgroup *comp.sys. laptops.* Here is the pertinent part of the message. Who could ask for more?

Apparently, the problem does lie with FrontPage 98. More specifically, it can be traced to the fact that when one installs the Personal Web Server that comes with FrontPage 98, a different version of WINSOCK.DLL is installed. This version of the DLL has a compatibility problem with LapLink and, thus, is the cause for the TCP/IP server not being available.

The resolution to the problem is to restore the original DLL using the System File Checker (SFC) utility to extract and install that DLL from the Win 98 CD. The steps to do that are as follows:

1. Go to START
2. Go to RUN...
3. Type "SFC" then click OK
4. Select "Extract one file from installation disk"
5. Type "WINSOCK.DLL" in the text box and click START
6. At "Restore from: click browse button and browse to the Win 98 directory on the Win 98 CD or the CAB

(LapLink.....Continued on page 5)

(LapLink.....Continued from page 4)

Files directory on your hard drive, then click OK.

You will note that he mentions Win 98. The laptop runs Win 98 and the desktop runs Win 95. I had installed FrontPage 98 on both of them, but the problem didn't occur on the Win 95 machine. With that problem corrected, I had TCP/IP enabled on the laptop and was ready to control or retrieve files from my home computer from anywhere in the world—most probably from somewhere else in Florida.

There is a danger here, though. If you leave LapLink running on your computer and either leave your computer connected to the Internet or set to answer the phone, then anyone running LapLink who knows your computer's IP address or dials your computer's phone line can gain total control of your computer—unless you password protect everything in LapLink (highly recommended).

How much control do you have? Well, right now I am running Microsoft Publisher on the desktop computer via LapLink on the laptop and typing this in from the laptop. But that is not a real test. From the laptop, I just started my scanning software on the desktop and am scanning in a photo and directing it to the laptop. Oops, an error message about not enough memory. Well, we have plenty of memory, so maybe I cannot control the desktop computer via the network connection and at the same time send a file over the network. So

ZipMagic 98

By Robert A. LaFave, Tampa PC Users Group

I had been using the SHAREWARE program ***WinZip*** for a couple of years and I was lucky in the club raffle and won a copy of ***ZipMagic98*** by **Mijenix Corporation** and now have a full registered version of a Zip Utility. So let me tell you what I found out about ***ZipMagic98:*** "***Read the MANUAL***" before you install so that you will be expecting what choices you will need to be make during installation because Zip Magic is made to be running in the background and you need to set up your preferences during installation. They also give good explanations on how the choices affect the initial setup.

After installation you will find along with a new program group on your menu, an icon in the system tray and a new icon in the Control Panel. Both of these icons allow you to change options (your preferences) after installation for how the program is going to run. When working in Windows Explorer you will also be offered a separate Zip Magic menu to work with when you right click an individual file (files) or folder. When looking at the Program Group you can look at Properties, Uninstall the Program or START the ***ZipMagic98*** program itself.

There are two ways to start ZipMagic program. One is called ***Zip Wizard,*** and the second is the ***Zip Tools***. The easiest to use for straight Zip and Unzip process is ***Zip Wizard,*** where you get forms to guide your choices: 1. Extract from an archive, 2. Make a zip archive, 3. Make a self-extracting archive and convert zip to be self-extracting.

On starting the WIZARD these four methods progress from form to form with you having to make minimal selections of the METHOD, other than which FILES to work with and the AREA to save the files to during the process. When files or an area are needed for selection Zip Magic offers a directory tree much like Windows Explore for you to use in the selections. ***Zip Wizard*** is so easy and straightforward that no HELP is offered or needed to do the four methods that it allows you to do.

Zip Tools is completely different and starts with a look very similar to Windows Explorer but with added features useful in file management. Not only can you perform the four methods that the Wizard allows, but you can also perform Find Files, Copy Disk, Format Disk, Create Folders, Delete Files and about anything else you would want to do. There is the option to view individual files with a **FILE VIEWER** that opens most common file types, and they offer to sell you an optional viewer which they say will open any file format for viewing. These features again are easy to use and to understand for anyone familiar with file manipulations and Windows Explorer. HELP is offered here, and it appears to be

extensive from its Table of Contents. ***Zip Tools*** allows you to work on individual files which have been Zipped, and Zip-Magic will make the necessary changes and keep the file in a Zip format. You don't have to go through the process of manually unzipping the file, then making the necessary changes and then re-zipping the file. Both the ***Wizard*** and ***Tools*** perform Disk-Spanning when creating Zip files and moving the files to floppy drives.

Zip Magic has another feature that allow you to easily zip files and attach them to e-mail when using MS EXCHANGE, MS OUTLOOK, or OUTLOOK EXPRESS. It adds an icon button to the toolbar template so you just push one button to attach files. You have control of cache size used and compression speed through the properties, so it has been friendly to use. There is also an " Easy Update " feature in Zip Tools that allows quick and accurate access to Mijenix Corporation.

The only feature that I am still getting used to is that if you load the program at START UP it will be working in the background until you disable it. This causes Zip Magic to operate with your settings at ALL TIMES. As an example, if your settings show ZIP FILES AS FOLDERS: Say you download a Zip file from the Internet and give it a folder to save to on your hard drive, and you go to view it in Windows Explorer. The file will be shown as a FOLDER with all the individual files that were included when it was created as a Zip. If you have used Zip programs, you know that by showing the individual files you pretty much are Unzipping to get the file information and this takes TIME. Sometimes the Zip Magic emblem appears in the upper left of your monitor showing that it is working to correctly show Zip files, but at other times you get no emblem and you start to think that your computer has ***FROZEN.*** This lag in time also occurs when any Zipped file is being used, such as using OUTLOOK EXPRESS, which stores E-MAIL messages as compressed files, or when using Norton Anti-Virus to scan Zip files.

(ZipMagic……..Continued on page 7)

(ZipMagic……..Continued from page 6)
I am pleased with the program and how easy it is to use and have stopped using Windows Explorer for file management and have been using Zip Tools instead. Zip Tools gives me additional tools that save me time and provide greater flexibility than did Windows Explorer. ◆

(Virus……..Continued from page 2)
floppy, and it indicated a 4.3 GB primary partition on Drive 1 called partition 1. If I recall correctly it indicated 4.3 GB of free disk space—another bad sign. It looked like the virus had done its dirty work and wiped out the File Allocation Table (FAT), the Master Boot Record (MBR), and who knows what else. But we were lucky to have a BIOS. In many of the cases I was subsequently to read about, computers hit by this virus also had their BIOS destroyed.

Luckily for us, only two months back our group had a presentation on data recovery by Ontrac. Additionally they had supplied us with a floppy with their Data Advisor program on it. I inserted the floppy into the A drive and powered up the computer. It booted from the floppy and the program set to work analyzing the hard drive. It said the drive was physically OK, but the Master boot record was invalid, remote data recovery was possible, and all we had to do was let it find the modem and it would communicate with Ontrac. Of course, I knew that there was a $100 minimum charge just to talk to Ontrac regarding this since that had been explained at our meeting. Additional charges would apply depending on how hard the recovery job turned out to be.

All this was moot, however, since the program could not find the computer's modem. It wasn't until later that I figured out why the modem couldn't be found. It was a Win Modem (meant to run in Windows). This is another reason to pay a little more when you buy a new computer and upgrade to a regular modem from the non standard Win modem.

After discussing the options with the client, we decided to create new partitions and reformat the drive, losing all the data in the process. But this wasn't as bad as it sounds, since we had a full system tape backup made January 15. Fortunately there were also paper copies of most of the documents that had been created since then. A full system backup would put the computer back to the exact state it was in on January 15.

To do this, I first had to run FDISK to create new partitions on the drive. Unfortunately I had no idea what version of Windows 95 had been installed before. I didn't even know how many partitions there had originally been. So I created a primary DOS partition of 2.047 GB and an extended partition of the same size in which I created one logical drive. That left a few stray megabytes left over that I didn't worry about. I then ran FORMAT to format the new C & D drives. I should note that there was a recovery CD for this machine but no associated floppy to boot from could be found. I, of course, had my bootable floppy with it's generic CD drivers, so I could actually look at the files on the recovery CD, but I could find none that would start the recovery process. I suppose that must start on the floppy. If I could have used this recovery CD to put the computer back to its original state, then I would have had the hard drive partitioned as original. I would then have restored with my tape backup.

But you work with what you have. After getting the hard drive back into a usable state, I inserted the floppy that was to start the full system restore from the Colorado Backup tape. Everything went smoothly for the first few minutes. Then I got the message that the backup did not have a copy of the Windows Registry and it would be necessary for me to first install Windows before the restore could proceed. This was not the way the program was advertised. The whole idea behind a full system backup was to include the Registry. Discouraged I quit for the evening.

Next morning, I started the full system restore from an older backup tape., and this time everything was OK. Apparently the January 15 "full system back" was not done correctly, and the registry was not included.—a good reason to have more than one such backup. The process continued for about 4 hours and then stopped with 80% of the files restored and a message that the C drive was out of space.

Just what I had feared. The original partition was one 4 + GB drive. But this was just another problem to be overcome. Since the restore first restores the root directory and the Win-

(Virus.....Continued on page 8)

(Virus.....Continued from page 7)

dows directory, I had Windows up and running on the computer. So I just uninstalled a bunch of programs on the C drive that should have been removed long ago anyway. Then I moved several folders containing a large number of graphics files to the D drive. Before I knew it I had 400 MB of free space on the C drive. Additionally the files that were being restored when the process stopped were in excess of several hundred megabytes, being mapping data, so I didn't include that in the restore when I started back. After probably another hour I had everything restored except the mapping program. I simply reinstalled this program from CD to the D drive.

I was almost finished. The next thing to do was to do a restore of only data files from the more recent backup. After that, I only had to get the modem working, get the network card recognized, and set up RoadRunner again. Setting up the modem was when I realized that the computer had a Win modem. It took a few extra minutes to get the network card installed since it didn't seem to like the information on the first of two installation floppies. I finally read the details on installing the card from its manual and found out that in Win 95 you only use floppy 2.

Setting up RoadRunner was a snap until I tried to log on. It logged on fine and started downloading files to the computer like crazy. Oh, how nice, I thought. It is updating its program files. Then I noticed that it said it was installing Internet Explorer 3.0. Merle Nicholson, whom I had consulted several times during all of this, had warned me about this and said that it was OK to abort the process, since that is what the RR technician had done at his house. And that is exactly what I did, since I didn't want IE 3 to replace IE 4.

As you might guess, this is not the end of the story. Halting the download froze the computer, and it would not unfreeze. Upon rebooting, it came up in safe mode and refused to run in any other mode. A check of the bootlog text file indicated that it wasn't loading many of the font files. What to do? Well, there was a good copy of the Windows installation files in the Windows\Options directory, so I simply reinstalled Windows.

After the installation, a reboot of the computer produced a message that there was a device driver in the Window System.ini file calling for the file Ntkern.vxd, which was either missing or damaged and that I should do something about this. I did. I looked at the system.ini file, and there was no mention of Ntkern.vxd. Anyway, a couple presses of the return key always got you past the message and Windows seemed to run OK. Since the installation of Win 95 included IE 3, I saw no harm in trying to log onto RR again. This time, however, it made no attempt to download IE 3 but instead asked me to supply a path to the browser I wished to use. After doing this, RR was up and running, and I was ready to call it a day. Tomorrow I would install IE 4.0, see if I couldn't remove the cause of the annoying boot-up message, and tie up a few loose ends.

A check of the Usenet newsgroups on http://ww.dejanews.com said that if I wanted to remove the Ntkern.vxd message, I should uninstall USB support and reinstall it. So, next morning I did that first thing, but didn't reinstall USB since the computer had no such ports. Next I installed IE 4, did a few other computer items for the individual unrelated to the virus attack and left for lunch. Before leaving, though, we set Colorado Backup to doing a full system backup of our newly restored hard drive, and the individual was off to the computer store to get a new copy of their antiviral program.

What is to be learned?

- First, you should have a current backup of everything important to you. We actually had a backup of the entire system—but it was several months old.
- You should also know the number and size of your logical hard drives, since the restore needs to be applied to the exact setup from which it came. Note the restore can not partition or format your drives for you. You have to first do that before restoring if the damage has been that severe.
- You should have antiviral software running on your computer.
- This antiviral software should be up to date. My client was running McAfee, but it was over two years old and incapable of catching this particular virus.
- You should not play around on the Internet, downloading executables as files or as attachments and then running them on a computer that is important to you. We are fairly certain that this virus came in from AOL via such an attachment to a message.

End of the story? I don't know. This morning I received a call saying that, first, the computer was now spontaneously rebooting if you let it sit doing nothing for several hours and that it had done this before the installation of the new virus program. My only suggestion here was to disable all energy saving features and screen savers and see if the problem stopped.

The second problem was that the installation of the virus program on a laptop (might as well put a newer version of the antiviral software on that computer too) had killed its ability to connect to AOL. It could connect to NetCom but not AOL. If you uninstalled the program, then you could connect to AOL. A little research revealed that to make the newest version of McAfee work with AOL, you needed to download a patch (10 minutes via RR and over an hour on the laptop's regular modem). Sounds like a new program to me, not just a patch.

(Virus…….Continued on page 10)

Book Review: Microcosm: The Quantum Revolution in Economics and Technology

By Tim Condon, Tampa PC Users Group

It's safe to say---is it not?---that all of us members of the Tampa PC Users Group are either computer nerds or aspire to computer nerddom? (I know I do.) But in order to arrive at that exalted place, we need a good foundation in the historical evolution of the microelectronics revolution.

Enter George Gilder and his book, "Microcosm: The Quantum Revolution in Economics and Technology." Gilder, a philosopher, writer and economist, penned his book exactly ten years ago. It was then a definitive roadmap for the upcoming economic and technological upheaval that continues to sweep over us all to this day.

The author, in surveying the tidal wave of change to come, waxed lyrical and poetic about a tiny object, the integrated chip, which would soon power all of our machines as well as our economy and our very civilization:

"Every era has its pinnacle," he wrote. "In medieval Europe, it was the Gothic cathedral. In the late twentieth century, it is the very large scale integrated circuit, the Gothic cathedral of modern America. Like a cathedral, it is wrought of common elements---glass, sand, and metal--- transfigured by human genius and art. Viewed through a microscope, the chip unfolds as a panorama of infinitesimal tapestries, as intricate and variegated, efflorescent and symmetrical, radiant and colorful, as all the glass and stone of Notre Dame or Chartres. Passing over for a time the issue of whether it will be comparably given to God, the feat of designing and producing a modern microchip entails craft, devotion, diligence, genius, and vision comparable to any artistic pinnacle of ages past."

In telling the amazing story of "the descent into the microcosm"---the creation of integrated chips in the realm of micron measurements---Gilder recounts the personal histories of a number of individuals central to the surging microelectronics upheaval. Some at that time were famous, some nearly unknown, but all helped to light the fuse of the revolution.

Central to that story are people like Carver Mead, an engineering professor at the California Institute of Technology in the 1950's and '60's; Dick Gossen, a refugee from Texas Instruments who headed up a company named Silicon Design Labs in 1984; Dick Oettel and Vince Corbin, students of Carver Mead who founded Seattle Silicon in 1983; Gordon Campbell, founder of SEEQ, an early maker of EPROM chips; Bob Widlar, an engineer refugee from Fairchild Semiconductor who jumped to National Semiconductor, became a millionaire and disappeared into Mexico where he "was said to enjoy 'the beach, the bimbos, and an occasional exotic smoke'." And plenty of others, each seemingly more eccentric and foresightful than the last.

Gilder's book captures the sense of awe that we all feel from time to time, as we contemplate our increasingly intelligent machines and participate in a drama that surpasses the Industrial Revolution in terms of the changes being wrought upon humanity's stage. The author, however, didn't always write about the microelectronics revolution. He started his career as more of an insightful sociologist, swimming mightily against the dominant trends in the 1970's. "Naked Nomad," "Visible Man," and "Men and Marriage" all pinpointed multiple causes of societal problems long before his views came to be accepted in the debate, if not conventional wisdom.

Then, in 1979 he burst upon the stage with "Wealth and Poverty," another seminal work that combined sociology, economics and politics, and which provided the intellectual blueprint for what came to be known as the Reagan Revolution. That political and economic program in turn set the stage for an economy that would give birth to the personal computer revolution and eventually undermine and destroy the communist empire, with emphasis on low taxes, less regulation, and more entrepreneurship and individual initiative.

Today Gilder has followed up upon his path breaking earlier work in "Microcosm" with further books on microelectronics and the microcosm, including "Life After Television" and the more recent "Telecosm." Both books are accounts of the imminent demise of "bottleneck" entertainment and programming, in favor of virtually total personal choice, made possible and practicable by...you guessed it, the tiny integrated chips that suffuse our lives today.

Whether Gilder's current prognostications will come true or not is still an open question. Yet there is no doubting that he saw and "called" the computer revolution before it was fully upon us. One reader of a recent book about Gilder, writing on the Internet, was moved to say that "I think Gilder will go down in history as one of the great minds of our time."

Want to see where it all started? You may want to try finding "Microcosm" at the library. Or, if you're particularly intent upon earning your wings of nerddom, you may want to go to Amazon, the online bookseller, where you will find that Gilder's "Microcosm" is...out of print! But they say they can find one for you from used booksellers. Why the book was allowed to go out of print, I don't know, because it's a *terrific* read if you have any interest at all in the scientific and technological changes that are reordering all of civilization. ◆

Editor's note: If you go to Amazon, please use the link on the TPCUG home page.

Special Interest Groups

Internet SIG

This SIG meets the first Monday of the month at 6 PM at the Reflectone Building, off West Waters Ave. You must sign up to get on the list and to get by security. Contact Mike Hodges at hodges@reflectone.com. For directions, see the map at our web site or contact Mike Hodges.

We consider all topics concerned with creating web sites. We study sites of interest from the web and those created by members of the SIG. Last meeting we considered the problem of downloading viruses & continued with FrontPage. The previous meeting we looked at the winners of the FACUG home page contest and saw how one web host provides statistics of web site activity.

Genealogy SIG

This SIG meets the second Monday of the month at 7:00 PM at the Museum of Science and Industry. *Contact Jenny Lind Olin at 960-5723 or Ford Bond at 987-6309 .*

Visual Basic SIG

This SIG meets the third Tuesday of the month, at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6 PM. For information, contact Merle Nicholson at merlenic@tampabay.rr.com .

Last month, we studied Dynamic Data Exchange between a VB program and another Windows Program. A member presented some very old BASIC programs he would like to convert to VB. We will consider them at our next meeting.

(LapLink……..Continued from page 5)

let's just do the scan over the network and save the results to the desktop computer. Then we can do a transfer of the photo file. That worked fine.

Now to see how all this works over the Internet. I have Laplink running on both my laptop and the desktop. I connect each computer to the Internet using two different Internet accounts. On the desktop computer, I run the program WINIPCFG.EXE (it is on all Win 95/98 computers) to find the desktop's temporary IP address. Then on the laptop, I tell it I want to connect over Dial-Up Networking and provide the desktop's IP address. Momentarily I am prompted for my user name and password and am then connected.

If you are going to connect to a remote computer, you can use either the regular modem dial or the dial-up connection to the Internet. They should be about the same speed since they are both going over the phone lines. The Internet connection has the advantage of being free. How fast is such an Internet connection? Certainly much slower than a LAN connection.

I did a test of opening Microsoft Word remotely on the desktop computer via the Internet from the laptop. It took essentially one minute from the time I clicked on start | programs…. on the desktop's screen as viewed on the laptop until I was able to start typing into a new document.

Obviously the value in using LapLink to access another computer remotely is not in creating Word documents on the remote computer. To me it is useful for accessing the files on a remote computer and for being able to take control of the remote computer so as to diagnose problems or, in general, to help when someone is having problems with their machine.

Symantec makes a competing program called PC Anywhere. I think it basically does the same thing. Additionally, in the latest CompUSA Ad., I saw some pretty good pricing on LapLink (especially if you had a recent version from which to upgrade). I, however, don't see too much of a future for these products since right now Microsoft's NetMeeting does essentially the same tasks (just not as smoothly) as long as you connect via the Internet—and it is free. ◆

(Virus……..Continued from page 8)

I do find it odd that a company would create a new antiviral program and have it incompatible with the major ISP. I know AOL does everything in a nonstandard way, but they are the largest Internet provider. Then, again, perhaps McAfee is onto something here. Not letting people connect to AOL will probably greatly reduce the incidence of such virus attacks. Look on it as a feature and not a flaw. Larry Anders has informed me that this problem was caused by AOL making changes after the release of the latest McAfee Virus Scan.

Just as the newsletter was going to press, I ran across the following news item:

Bangladeshi Student Says He Can Cure Chernobyl Virus
DHAKA — A Bangladeshi student said Sunday he had invented a software program that can quickly revive computers crippled by the "Chernobyl" virus.

I think his claim may be accurate in some cases but certainly not in others. Not all computers are affected the same way. Some, for example, have their BIOS destroyed in addition to losing hard drive data. Some only have the MBR and the FAT destroyed. Others have varying amounts of the hard drive overwritten. I think he would be hard pressed to recover from an overwritten hard drive. However, I certainly wish I had had his software to try out when I visited that infected hard drive one week ago today. ◆

President's Message

By Merle Nicholson, President, Tampa PC Users Group

Membership drive April 1 through September 30

The TPCUG is having a membership contest, with a dinner for two going to the person who brings in the most new members!

The contest rules are:

1. You have to be a member in good standing at the conclusion of the drive, September 30.
2. You must lay claim to any new people you bring in to our drive chairman, VP Mike Hodges. Mike will track the results and declare the winner at the October meeting. You do not have to be present to win.
3. In case of a tie, the winner will be selected by a drawing.
4. The prize will be a gift certificate, tentatively at Applebee's in an amount that will cover a meal for two.

It would be best if you'd send an email to Mike when – or shortly after - each of your new members join. His email is hodges@reflectone.com. He will acknowledge all emails. In the case that you do not have email (is it possible?) you'll need to write your claim down and make sure some officer gets it, or you can send snail-mail to our mailing address: TPCUG, PO Box 3492, Tampa FL 33601. Be sure to do this by September 30.

(President.....Continued on page 12)

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

Minutes of the March Meeting

By Jim Weber, Secretary, Tampa PC Users Group

The Windows SIG started in the MOSI computer lab at 6:00 PM with Mary Sheridan at the helm. The discussion soon turned toward Linux again with several members expressing an interest in the OS.

The next topic of discussion was Windows networking. With more homes having multiple computers these days, home networking is becoming increasingly popular. William LaMartin was quick to point out that his own home network allows him to use one computer as an internet router, so only one computer has to be configured for calling outside the home and the other computers connect through it. For people with high speed Internet connections, like RoadRunner, you would only have to pay for the single connection. We talked about simple "Direct Cable Connections" between two computers to running wire and installing network cards in your home. New network products now on the market work through the existing phone lines or connect wirelessly, like a cordless phone, and will help make a home network easier to install. The network discussion went from setting up a Windows network to the cost of on site network service. With some places charging over $200.00 per hour to come out to work on a network, some of us considered a career change.

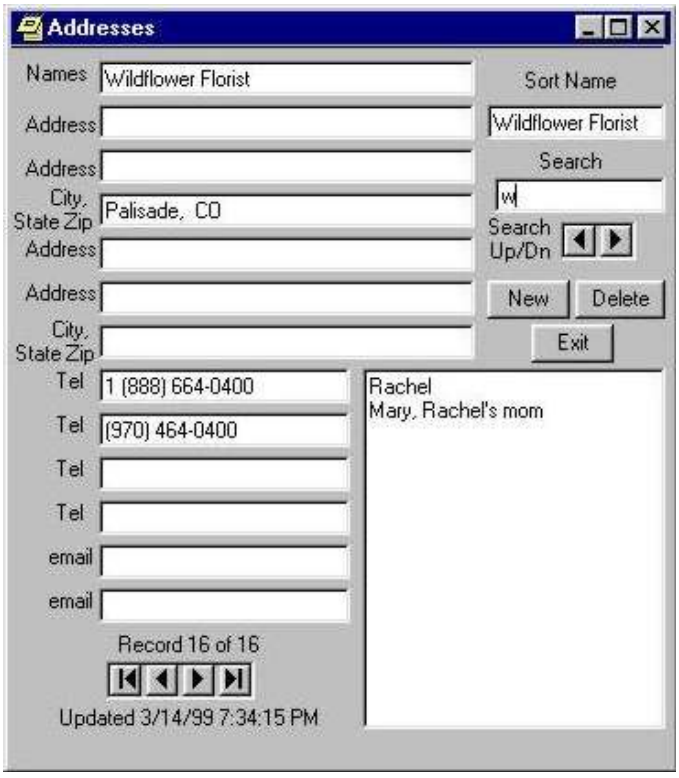
If anyone is interested in starting new SIGs like Access or Linux, or a study group for certification such as A+ or MCSE, please contact any of the board members or bring it up during the meeting.

President Merle Nicholson called the meeting to order at 6:35 PM. He started by introducing guests and new members to the group. Merle then passed along a warning to users of RoadRunner that, since the system is basically a large Windows network, if you don't have your security features set properly, outside users can obtain your I. P. address without your knowledge, or access information on your hard drive. This means someone else can pretend to be you on the Internet. Merle announced the dates and times for our SIGs and reminded everyone that they are listed in the newsletter. Mary Sheridan and Bruce Register returned from this years FACUG meeting in Orlando and brought back new users group price lists from Power Quest, Jasc, and Symantec.

Merle then announced the new membership drive. For those who missed it, we will be giving away a meal for two at Applebee's to the member in good standing who brings in the most new members beginning April 1, 1999 to October 1, 1999. In case of a tie, the winner will be determined by a

(Minutes.....Continued on page 4)

Visual Basic Projects



By Merle Nicholson, President,
Tampa PC Users Group

As all our members know, we have a Visual Basic SIG that's doing well. It's well attended and interesting. I'd like to mention something to some of the members of that group and anyone else who is just beginning to have an interest in programming. Here it is, and you can quote me on this. "You have to *do it* to learn anything about it". It isn't like going to a history class where more study improves your performance. It's more like learning to drive. You can study it forever, but as we all know, 99.9% of the skills you learn is doing the driving.

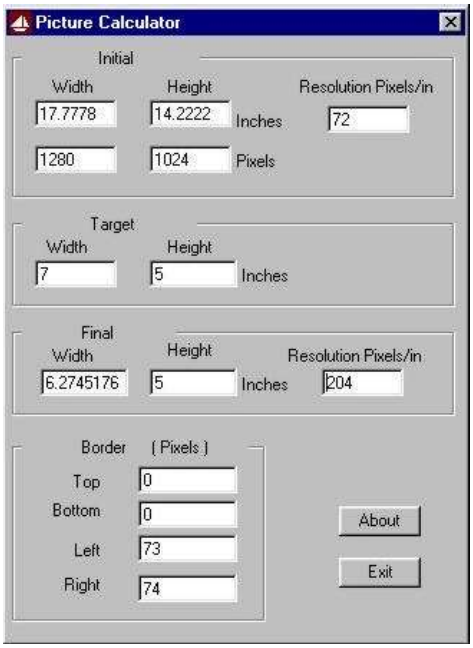
I'd like to present two very recent projects I've done by way of illustrating some of the useful things you can accomplish with programming. One is an Address Book, and the other is a picture re-size calculator. I'm not going to give you any programmer-type language here, just what it does and why I did the projects, so read on.

Address Book

What this world does NOT need is another address book. Definitely. But I have this project as an aid for the VB classes I teach. Also the address books I've looked at don't quite fit what Valerie and I use one for. We have this small brown book by the telephone downstairs that has, yes, names and addresses, but also things like peoples' birthdays, and when their children graduated from school, and things like what kind of illness their mother has. This way Valerie and I can kind of know what each other knows about people we talk to and send cards to. One thing that it doesn't have though that we need is say the phone number to Ho Ho's so we can order carryout, things like that, that would definitely make that little book too complicated.

Also, it's downstairs. My part of the house is in an upstairs "office". Valerie's computer is downstairs, and both are networked to the server, an ideal place to keep a central database. So why not? I revamped the fields some, and added a search field. Note in the picture, the example has "wildflower florist" in it so you can search for either word. Also simply typing in a "w" got to the first record that has a "w" in the first word. The search works just about instantaneously, and the upper right navigation buttons allow you to page through all qualifying entries. In this case all records that start with a "w" in the search field.

I deliberately do not search through Last Name, First Name as you would expect. Instead, you must enter some category words in the search field. In the case of personal friends, perhaps starting with the last name, but if you normally refer to a person as "Dan", that's all you'd put there. Maybe Ho Ho's would be "Ho Chinese food". Notice that there are four telephone entries and two email addresses. Valerie and I have four telephone numbers between us, not counting the modem phone, so for version 2, I'm considering just a free-form box for telephone numbers.



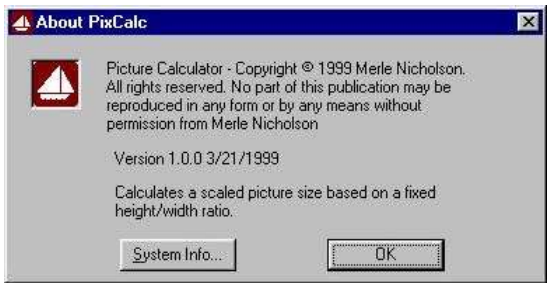
We've just begun putting all the "little book" entries in, and by the time we're done, I may have changed the appearance completely. Also I may give it a way to address envelopes and also some way to go through and check off about thirty entries to do Christmas envelopes. It may just be a Word Basic program instead that accesses the database independently. We'll see. In my household a program is never done.

PixCalc

This is one that I really had fun with. It took about three or four hours to program, and it takes a bit of explaining. When I got Paint Shop Pro 5, I discovered a new (for version 5) feature. It shows any picture with a ruler on it, showing the size of the picture in inches. And I'm REALLY interested in this, because I want to place these pictures on the printed page. I want to print a picture out say as a 5 by 7 or 8 by 10, or I may want to place six small pictures on a single page. If you "scale" a picture you must maintain an "aspect ratio" to keep the picture from being elongated or distorted. So how does a picture that is 5.389 by 2.750 at 72 pixels per inch fit into a 5 by 7, or 7 by 5? Probably not too well unless you do some accurate calculations. I've been doing this with a calculator for a while. And it's just a simple matter of proportions, some straightforward algebra. But it's tedious, and many times you must do it a number of times

(VB.....Continued on page 4)

(VB.....Continued from page 3)



to decide what to do. As you increase the size, one dimension or the other will meet the target dimension, but the other won't if you maintain the original aspect ratio. So you need to know the final dimension, and sometimes you want to know how may pixels to add left and right or top and bottom, so you can sometimes add a border to fill out to the required dimensions.

Some experimentation shows that the initial size in inches is determined by the resolution in pixels, at 72 pixels per inch. Now let's say if it's high resolution you don't just want to scale the picture and maintain 72 pixels per inch. What you really want to do is increase the pixels per inch to reduce the physical size so that either the width or height meet the target printed size.

And this little baby does all that all by typing in the initial size in inches and the pixels in inches. Paint Shop Pro gives you this on the Image, Resize panel. That automatically fills in the Initial Pixels. Sometimes because of round off error, those two pixel numbers may need changing by one or two, and you can do that.

Then you fill in the Target Width and Height and automatically, the new (Final) Pixels/In and the Final Width and Height are calculated. Internally, a judgement must be made about which dimension is reached first. In the example shown, the height target was met, and the width was not. It's short of meeting that target by .73 inches. And if you were to add 73 pixels on the left and 74 pixels on the right, the picture will be exactly 7 by 5. In Paint Shop Pro, you can add borders like this in any color you like. Doing it in white just makes it easier to center the 7 by 5 on the printed page. All you need to do is plug the Final Resolution number in PSP's Image, Resize panel, and it'll print exactly the correct size.

That's it! Except for the About panel, which I'm showing here also. The System Info is interesting, I think. It's the same one that you see on the About panel in MS Word. This About panel was made from a Wizard in Visual Basic, with some modifications. If you're interested in this program, I'll be happy to send it to you by email. The only catch is if you have the Visual Basic 5 product, you don't want this. It's written in VB 6, and the files play havoc with a VB 5 compiler product. As do ALL VB 6 programs. There's no problem otherwise to everyone else. Send me email at merlenic@tampabay.rr.com and indicate if you want the source code also. ◆

(Minutes……..Continued from page 2)

drawing.

Jason Velasco of Ontrack software started his presentation at 7:00 PM. Ontrack is a company that specializes in data recovery. They were originally known for their disk manager program, which allowed older computers to recognize and use newer, larger hard drives. Now they perform minor miracles by resurrecting lost data. Mr. Velasco passed along some interesting statistics on data loss, like hardware failure being the most common cause of loss (44%) followed by human error (32%). Virii fell far below at only 7%. Larger hard drives have shown a greater rate of failure than smaller ones, probably because they spin faster and have more closely packed data areas.

Mr. Velasco then described the methods used by Ontrack to recover your lost data. Copies of "Data Advisor" were brought in for the group to take home. This program boots from the floppy only when your hard drive fails and loads directly to system memory. No information is moved to or from the hard drive. Data Advisor begins with a mechanical and electrical test of the drive's hardware before ever checking the data files on the disk. If the drive fails at this point the test stops. The program then tests the integrity of the data on the disk, and it then tests the disk sectors. Again, if any part

(Minutes……..Continued on page 5)

(Minutes.....Continued from page 4)
of the test fails the whole process ends. Where Data Advisor makes itself truly useful is a modem driver that will run strictly from memory and call Ontrack. The technicians at Ontrack can then attempt to recover lost data remotely over the modem. This process won't work with a Win modem; the drivers are too large for a single floppy. Ontrack also has Class 100 clean rooms where they can open a hard drive to physically repair a damaged disk. Most hard drive manufacturers will continue to honor their warranty after Ontrack has opened the drive. Try that at home. If you choose to send the drive to Ontrack they charge a standard $100.00 fee for just the evaluation.

Data Advisor is available from Ontrack at http//www.ontrack.com for free. There is also a Y2K Bios tester available as freeware. I found this to be a very handy tool.

After a short break we began the drawing for the door prizes. A special congratulations goes out to one of our new members, Mike Torres. Mr. Torres won a copy of Nuts & Bolts, Via Grafix training CD, and an Ontrack T-shirt. Arthur Young, another new member, won a spell-checking program called "Spell Catcher." Ford Bond won a Via Grafix disk and Bob LaFave won "Glider 4.0." ◆

Family TreeMaker 5.0/6.0

By William LaMartin, Editor,
Tampa PC Users Group

How many versions of Family TreeMaker have I purchased over the years? It is easier to count how many I haven't bought—very few. And since my version 4.0, 4.1 or whatever, was not all that old, I didn't plan on purchasing 5.0 when it came out sometime last year. But my sister, who does the bulk of data gathering in our genealogical searches, had version 5.0, and, as is usual in these matters, version 4.0 can not load version 5.0 files. I don't know what new feature added makes the way the data is stored different in the newer versions, but I do know that it is a good feature for the software marketers. Since I couldn't load version 5.0 files, I had to buy the new version also. And as I write here about version 5.0 being relatively new, guess what our friends at Family TreeMaker have done. They now have produced Version 6.0. I truly believe that within the last 12 months you could have bought the most recent versions available and produced three different versions.

It seems as if every time they think up a new way of displaying your data in a report they feel it incumbent upon themselves to produce a new version—the files of which I assume the older versions will not open. Of course, they only want $20 from me for version 6.0, but this constant updating of the program—now more often than once a year—is getting bothersome. If Microsoft updated their programs as rapidly, you would hear people cry foul.

A little history. I first bought Family TreeMaker as a DOS program made by a company called Banner Blue. Then, along came their first Windows version called Family TreeMaker for Windows. That was a welcome addition. Then came the newer and newer versions, each one adding a feature or two. I think the first version either couldn't import or export to a GEDCOM file, and the notes and the types of reports were limited. But with each new version these deficiencies were removed. In version 5.0, for example, we got the ability to spell check our Notes (actually that was in version 4.4, I think, but I never saw that version). Before I got around this problem by first creating the note in a word processor, spell checking it there then copying it and pasting it into the Family TreeMaker note.

While all these improvements were being made to the program, the company was obviously growing due to the increasing popularity of its product. As a result, BannerBlue became the BannerBlue division of Broderbund, which in turn was gobbled up by the Learning Company. And in the past few months, the Learning Company has become part of the toy maker Mattel. Not a good situation as far as I am concerned, since I see little of value that a toy company can offer a software company. Time will tell.

Obviously this is not your standard product review. But with a bow to such, I will note that any genealogy program is nothing more than a fancy interface to a database where you have the ability to input your data and then view it in a variety of different reports. What Family TreeMaker is doing with each newer version is to give you more latitude in what sort of data you can enter and more variety in the type of reports it will produce. For example with 5.0 you got the ability to view an "hourglass" report, which displays an individual's ancestors and descendants on the same chart. With 6.0 you get the ability to determine the relationship between any two particular individuals. With version 5 and earlier, you could only display all relationships of a particular individual; thus, to get the relationship to another particular individual, you would have to search through this list. Big deal.

With version 6.0, you have the ability to find the Soundex code for anyone in your family tree. They have also enhanced the book feature—the option that weaves the data you select into a "book". Isn't technology great? You can now have the computer write a family book for you, weaving your genealogical data into a sensible narrative by supplying the appropriate connecting words between your basic facts.

I like Family TreeMaker. As a genealogical database, I recommend it, having used it almost from the beginning of its existence, but I am tired of these constant upgrades.

Back around Version 2 or 3, they started offering additional CDs with genealogical information: the social security database, marriages in Georgia 1776 – 1845 (I don't recall if this is an actual title), etc. I think they got started at this by buying a company that had been providing such CDs to libraries. And over the years, Family TreeMaker has added greatly to the list of available CDs they offer. In fact, when you buy Family TreeMaker now you are confronted with several different prices depending on how many extra CDs you would like in the package.

Once the Internet started booming, they jumped on that too with a useful site at http://www.familytreemaker.com. The products they sell make up only a small part of the site, most of which is devoted to articles on genealogy. They also give you the ability to search for information on individual names. If you get a "hit" on a name, you are presented with a list of sources for more information. Quite naturally most of these sources are CDs produced by Family TreeMaker. So if you want to see the information, you know what you need to do. Buy that CD.

They also host individual Family TreeMaker users' genealogical web sites (not mine, though). They are obviously trying to make themselves your one stop for genealogy. ◆

Quicken 99 Deluxe from Intuit

By Jenny Lind Olin, Treasurer,
Tampa PC Users Group

I have used Quicken, well let's just say, since DOS. That is like BC in computer time. I upgraded to the Windows version in due time, and I didn't think Quicken could get much better. It is, and that is an understatement.

Last March, as my luck would have it (a change for the better), I won a copy **of Quicken 98 Deluxe** at the Florida Association of Computer Users Group (FACUG) Convention. That Deluxe version of Quicken was actually more and better than I expected. My new **Quicken 99 Deluxe** just has more features. I thought I had died and gone to heaven.

A very "in" thing in today's world is doing your investing via the Internet. Quicken 99 provides a complete **investment tracking** feature. I plan to use the **One Step Update** to download all of my financial data, as well as stock quotes, right over the Internet and into Quicken. Since I am prone to forget, I need to store my passwords and PIN numbers. **PIN Vault** will hold all of my passwords and PIN numbers using state-of-the-art encryption.

I have thoroughly enjoyed using Quicken 99 Deluxe for my personal accounting and recommend this software package to anybody who is interested in tracking as little as just their checkbook entries or as much as keeping track of every aspect of their financial life as I do. Quicken 99 Deluxe has **60 reports and graphs** available. I like to run reports and file them so I have a record to use for future purposes.

Also as treasurer of this group, I have been using **Quicken 99 Deluxe** to keep track of our finances. I am able to run an **itemized category report** each month and thus give the Board of Directors a report of where we have been, what we have done, and where we are going financially speaking.

As for my own accounting endeavors, I keep track of everything. I remember watching my brother using a little black book where he wrote down everything he spent. He was trying to see where his money was going and how to spend more wisely. It must be in the genes, as I track everything, as I said before. If I write a check to pay for my groceries, it is always for a larger amount than the total amount of the groceries. The excess is tracked in my Cash account. That is where **splitting the amounts to different account categories** comes into play--part goes to groceries and part goes to cash. Now I can see how much I actually spend for groceries. I track my checking account, savings account, credit card accounts, money market account, other intangible accounts as well as my real estate, my car (s), etc. If I own it and it changes in value, I track it.

Quicken 99 makes all those tasks so easy. My eye doctor, Dr. Anderson, recommended Quicken to me. He was telling me how easy it was to **reconcile the bank statement**. In fact he was actually reconciling his bank statement with his Quicken entries as we were talking on the telephone. I am the person who would spend all Saturday afternoon balancing my checkbook to the penny. I still do that, but it takes only seconds now, and I can do something else at the same time. When Quicken tells me that I jive with the beginning and ending balances, then I have the choice to run the **reconciliation report**, or not.

Also I don't keep track of my check writing in the manual check register anymore. I do use checks that make a carbon copy and when I sit down at the computer, I try to record any checks I have written that day. If I have forgotten to enter a transaction, I can edit in the middle of the reconciliation.

Another Quicken 99 feature is their improved **online banking and bill payment**. I do not use this feature, as my financial institution does not offer that. You have the choice of printing your checks or manually writing them. I don't have to use the check writing feature very often, as I have most of my bills paid by electronic transfer, automatically drafting my account. When my bill comes in I immediately enter the transaction in the checking register and date the transaction on the day my bank will be drafted. Now Quicken offers a **Quick Entry 99** icon. I click on the new icon, then I can quickly enter one or more transaction(s). Most of my transactions have been memorized by Quicken so with a speedy edit it is a done deal. I can forget about it. No pile of receipts sitting on top of my computer waiting for me to muster up a block of time to enter them. Later when I do bring up the whole package, I am prompted to add the quick entries at that time. I might just break my habit of procrastinating. Not only will I be more financially sound, I will be a better person.

When I pull up the full Quicken Deluxe 99 package, I see the **Quicken Home Page**, a display of my accounts with the current value for each. The bottom line is I can see my net worth at a glance. I click on my checking account link that takes me to the register to enter new transactions. If the CD is in place there is a **Quicken Audio** that talks to me telling me what I am do at this point. This feature is great for the novice, or if you are lonely, you can listen to a very nice woman's voice.

To help with your taxes, Quicken has provided two features, the **Tax Activity Center** and the **Free TurboTax Online**, both new to Quicken 99 Deluxe. When you categorize your transactions especially if it is tax deductible, Quicken automatically tracks it for your tax purposes, giving you a summary of your current tax status. When you are ready to file your income taxes, run the report for the **Quicken tax data**, then go online and use the free online service or load it into your tax preparing software and most of your entries are automatically done. ◆

A New Sound of Music

By Larry Anders, Librarian., Tampa PC Users Group

No, Julie Andrews hasn't resurrected her roll of the singing nun-wannabe. The Internet has spawned a new breed of music called MP3, which is short for MPEG-1 Layer 3. MPEG (Moving Picture Experts Group) was developed for the compression and storage of video. Layer 3 is that part of the standard that addresses the compression and storage of audio.

Are you totally confused? Don't be. Plain and simple…MP3 compresses audio to a fraction of the size of a standard audio file found on today's music CDs. What does this mean? Audio files have now become easily transferable electronically (over the Internet). The modern music album that is sold today uses up most of the real estate of a 680-megabyte CD. A CD with the same music in MP3 format can be stored on less than 50 megabytes. MP3 typically uses one megabyte for one minute of music.

What's better yet is that anyone can record an MP3 file, which has spawned this revolution of an abundance of music now available for nothing, or next to nothing, on the Internet. Do a search on the Internet for 'MP3' and see what you come up with. It's everywhere.

Is it as good as a store bought CD that you pay $10 - $15 for? Probably not, but close enough for my ears and the price is hard to beat.

Okay… so how do you play and record this music? There's a bunch of shareware and freeware MP3 players and recorders all over the Internet. You can also download these files from your computer to portable players like the 'Diamond Rio', which is slightly larger than a pager and sells for about $100, and take your music with you. My favorite place for anything that deals with MP3 is aptly named MP3.com. Here you can find every popular MP3 player and enough free music to keep you busy for months. But, this is not the only place. Just do your search and see how many you come up with. Even Lycos, one of the Internet's major search engines, now has an MP3 database search ability.

You can also translate your own personal music CDs into MP3 and with the size of the new files play them directly off your own PC, or, like I do, copy them to your notebook and take your music along with you. If you have a CD writer you can convert about 10 CDs to MP3 and copy all of them to one CD. But remember, you are still dealing with copyright laws here. Making personal copies for yourself is one thing, but giving away or selling copies is still **ILLEGAL** no matter what format you use.

One of the reasons there is so much music out there is because it is so easy and inexpensive to make your own MP3 music. That has opened the door for many new musicians that otherwise would have had to wait for their big break to get a record deal, which doesn't come easy. Don't get me wrong… your definition of music and mine are probably different. But there is so much choice that I'm sure that all of our tastes in music can be satisfied. And with the popularity of MP3 growing every day, there are more and more seasoned artists deciding to publish their music in the MP3 format also.

None of this is hard to learn so do yourself a favor and start enjoying some of the benefits of having that Internet account. You won't be sorry! ◆

Amazon Link If you are going to make a purchase through Amazon.Com, don't forget to go there through the Amazon link on our home page. If you then make a purchase, the TPCUG gets a 5% commission at no extra cost to you.

FACUG Web Site Contest Our humble TPCUG web site placed fourth in the annual Florida Association of Computer User Groups home page contest. In order, the winners were

1 Greater Tampa Bay PC User Group
http://members.cftnet.com/gtbpcug/
2 Sarasota PCUG http://www.spcug.org
3 PCRAMS Computer Club (West Palm)
http://www.pcrams.org
4 Tampa PC Users Group http://www.tpcug.org/

I was quite pleased with my fourth place prize of *Adobe PhotoShop 5.0*. Now I have a new program to learn. It will be interesting to compare it with the CorelDraw Package I have been using. You will probably see a review of it in the future.

Genealogy from last month Last month I mentioned my effort to get my Family TreeMaker (FTM) data into a Microsoft database. I accomplished that and showed the results to the VB SIG, since I had created a VB program to import the data from a FTM GEDCOM into Access. However, most of the work was in creating queries, form and reports in Access to replicate the way FTM allows you to display data. The most difficult part was creating the query and report to display an individual's ancestors or descendants for up to 10 generations. I did the above for two reasons. First, it gave me some VB practice (but taught me nothing new), second, it not only gave me practice with Access, but I actually learned a couple new techniques.

Meeting of the FACUG, Orlando

By Donald Patzsch, Tampa PC Users Group

March 5 through 7, the Florida Association of Computer User Groups (FACUG) met in Orlando at the Adams Mark Hotel.

On Friday night, Adobe sponsored the dinner. They told us a bit about the programs Acrobat 4 and PageMaker Plus version 6.5. After dinner each person present was given a copy of Adobe PhotoDeluxe, Business Edition. Adobe also furnished all the User Groups with discount coupons.

On Saturday morning, Gene Barlow of PowerQuest presented all their programs. He especially told us about the new Lost and Found, a program to recreate files on your hard disk if you have a crash, or if you simply accidentally deleted some files. The disk drive must be rotating, though. The drive may also have been formatted, and recovery is still possible, by you, not a place you send it. PowerQuest sponsored the breakfast, and they provided discount coupons so that we can buy any one of the programs for a cost of $30 plus a small shipping cost.

For the next session, Joan Dineen presented a talk on grants. There was also a second session on grants on Sunday afternoon. Grants are a hot item right now apparently.

When we here in Tampa (not the TPCUG) were given a grant of $140,000, I was authorized to spend most of the money personally. I took bids and carried out the process. All this is in the public records so you may visit the work and then trace it back to the grant application if you like. It is easy to accomplish if you have a definite purpose in mind.

To apply for a grant, first decide what you want to ask for. Don't forget to include extras. The people who approve the grants understand this need (extra cords, tapes, extended warranties, etc.). Second, Look over a few foundations and pick one. Third, Get in your car and drive to the foundation after you make an appointment. Ask to see some successful grants and be sure to ask what they want on their application. Some want a short specific comment here, and maybe something "special" there. The people who pay attention to this detail are the ones who are most likely not to see their application thrown out.

Saturday's lunch was sponsored by Symantec. Everyone, about 150 people, was given an alarm clock. This is one of the most interesting clocks. It has a screen about the size of those on a cell phone. On the top is the year and the month and the date. Just below that is a real calendar that changes with the month. And below that is the time. Across the bottom are the control buttons. One of those buttons will bring up the time remaining until Y2K. It's a countdown also! Many of the Norton programs were shown and a User Group discount form handed out.

In the afternoon, I attended the session on incorporation and obtaining non-profit status for user groups.

The evening dinner was sponsored by Intuit. The two men who put on the presentation are terrific. They not only tell you about the products, but they entertain you as well.

Following the dinner, the home page contest prizes were given. First, GTBPCUG, Brandon's homepage. Written by Charles Vanderford of USF. Second, Sarasota's home page. Great job, Gary. Third, PC Rams home page. Always a real nice home page. Fourth. Tampa PC Users Group, Written by William LaMartin. This page has won honors before.

Sunday morning breakfast was sponsored by JASC, maker of the Paint Shop Pro version 5 software. They provided a user group discount coupon for all. After breakfast there were two more open sessions, and then at noon lunch was sponsored by the Corel Corporation. Their products are well known and used throughout the world.

Following the luncheon, the sponsors set up displays where anyone could visit with any of the individual representatives. This is good way to get answers to your questions on their software. After that, a wrap up and then prizes were drawn for all. The meetings ended at 4 P.M.

Each year there are a Fall meeting and a Spring meeting. The Fall meeting is only one day. These meetings are worth attending. ◆

(Comments…….Continued from page 8)

That is how I learned Microsoft Access—by creating database applications that solve problems in which I have an interest.

New Laptop I have a new laptop passed on to me by son when he purchased a still newer one. It is a ThinkPad 385XD-LEU with 233 MHz processor, 3.2 hard drive, 32 MB RAM and a 12.1" screen. What surprises me is that it is a little more than 7 months old, was a new model at the time of purchase, but is now no longer made. IBM has a new model in its slot—at a considerably lower price. Laptops are now truly affordable, have large hard drives, fast processors and fairly large screens.

It came with Win 98, and I had a question about something which led me to click on Help. I got a message saying that Win Help had some fatal problem. So the only way to get help was to reinstall Win 98, and that reminded me of one of my main complaints concerning computer makers—many do not provide a true copy of Windows on a CD. They either provide a "recovery" CD and/or have Win 98 installation files in a folder somewhere on your hard drive. With a recovery CD, you can

Special Interest Groups

Internet SIG

This SIG meets the first Monday of the month at 6 PM at the Reflectone Building, off West Waters Ave. You must sign up to get on the list and to get by security. Contact Mike Hodges at hodges@reflectone.com. For directions, see the map at our web site or contact Mike Hodges.

We consider all topics concerned with creating web sites. We study sites of interest from the web and those created by members of the SIG. Last meeting we had our first look at Microsoft FrontPage.

Genealogy SIG

This SIG meets the second Monday of the month at 7:00 PM at the Museum of Science and Industry. *Contact Jenny Lind Olin at 960-5723 or Ford Bond at 987-6309 .*

Visual Basic SIG

This SIG meets the third Tuesday of the month, at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6 PM. For information, contact Merle Nicholson at merlenic@tampabay.rr.com .

Last month, we studied a VB program that imported data for a GEDCOM (genealogical file) and exported it to a Microsoft Access database. This was a little advanced, so this month we will drop back to something more basic.

(Comments……Continued from page 9)

only reinstall Windows 98 by restoring the original preloaded image from the Recovery CD. This will wipe out everything else on your drive and replace it with whatever software originally came with the computer. Not a very good option. With a Gateway laptop I recently worked on, you had a recovery CD, but it also allowed you to browse through its files, and there was a Windows 98 directory for which you could run the Win 98 setup program to reinstall if you wished. Not so with the ThinkPad. None of the files made any sense. There were only 10 of them, and they appeared for the most part to image files, I assume, of various directories that would be placed on your hard drive.

So I ran the Win 98 setup program from the Win 98 folder on the hard drive—an option that would not be available if you somehow had corrupted it. When finished, Win 98 help now functioned. But, as you might guess, that is not the end of the story.

I had the Win 98 laptop and a Win 95 computer connected via a LAN with network cards with no problems. After the reinstall of Win 98 on the laptop, the Win 95 machine didn't show up in the network neighborhood in Windows Explorer of the Win 98 machine. You could, however, find it from "Tools | find computer." But once found, a double click on it produced a message that the win 95 machine was not accessible--not logged on. Additionally the log on screen that had appeared for Windows networking during the boot up of the win 98 machine no longer appeared.

At first I had no problem seeing the Win 98 computer from the Win 95 computer. But then to try and solve my problem, I went into the network properties and, under file and printer sharing for Microsoft networks, enabled browse master on the Win 95 machine since I had read that this might help. All it did was make it so that the Win 98 machine now didn't show up in the network neighborhood of the Win 95 machine. Luckily I could still do a "tools | find" and get the Win 95 machine, where a double click on it produced all the shared folders. Removing the browse master feature did not return things to their previous state either. Seems things can only get worse—not better.

I then removed and reinstalled basically every adapter and protocol I could in Network Neighborhood to no effect. I was sure it was something simple but could not find the answer. I then noted that if I clicked on start, one of the options was to log off. I did that. And guess what, my network log on screen appeared asking me for a username & password. A click on OK got me back to Windows--and now the Win 95 computer showed up on the Win 98 one and vice/versa. Furthermore, if I now clicked Start, I had the option of logging off LaMartin. Apparently the reinstall of Win 98 caused 98 to start up with another user other than me--once I logged off that user, I had all my network functionality back.

Another half-day wasted to discover that a simple click of the mouse produced the desired result. The final problem was how to make it log me on at the beginning? The solution came from where many of my solutions come from—a Usenet Newsgroup. I had posted my problem to the comp.os.ms-windows.networking.win95 newsgroup, and a fellow named Steve Winograd posted the following solution: "The most likely fix is to delete this registry key HKEY_LOCAL_MACHINE\Software\Microsoft\Windows\CurrentVersion\Network\Real Mode Net\AutoLogon. See this Microsoft Knowledge Base article for more information: No Windows or Network Logon Dialog Box at Startup http://support.microsoft.com/support/kb/articles/q141/8/58.asp." I had searched Microsoft but had found nothing myself. I cannot recommend the Usenet newsgroups enough as sources of solutions.

Please take note of the membership contest. And remember the SIGs. We have a lot going for us: an outstanding newsletter and web site, our SIGs are very well attended and the most successful in a great many years, and the fine quality of our meeting presentations is continuing. We have everything going for us except an expanding membership. It's stable, but that's really not enough over the long haul. It doesn't have to grow fast, just expand enough that we can ride through the summer slump. The biggest concern that we have is our continuing ability to attract quality presenters. We're too much on the small side for a lot of vendors, and we need to pick it up a bit. Let's see what we can do over the next six months. ◆

My Many Computer Problems: All Solved, I hope

For the past month my computer had seemed to move more slowly than before; most likely because of all the new programs I had recently installed: McAfee Virus Scan, a new version of TextBridge Pro, Via Voice, and Internet Explorer 5.0. I suspected McAfee and IE 5.0 as the main culprits. But the situation was tolerable—just not perfect. Things, however, came to a head

Minutes of the May Meeting

By Jim Weber, Secretary, Tampa PC Users Group

Our May 12 meeting began with Mary Sheridan presiding over the Windows SIG. As our guest speaker was from RoadRunner, alternate ISPs were discussed. A new way of connecting to the Internet with existing copper phone lines at high speeds is called ADSL. Asynchronous Data Service Lines offer the potential to connect to the internet at cable modem speeds, while using existing phone lines. This means you wouldn't need to wait for all those shiny new fiber optic cables to be laid in your neighborhood before you could enjoy super fast access to the web. Recent articles in the business section of the Tampa Tribune stated GTE would be contracting with outside companies to use GTE's lines to offer ADSL service in the Bay area. No price schedules were available at this time. GTE also offers an alternate Internet connection program using existing phone lines. They can offer a guaranteed 1.2 meg upload and download connection for the tidy sum of $600 a month. This may be clearly geared toward a small business, but lower price/connection services are available.

Merle started the meeting at 6:35. He reminded the members about our membership drive, so please try to help your group by finding a new member. Sign up sheets for the meeting and SIGs were passed around.

Our presenters for RoadRunner (http://www.timewarnercable.com) were Steve Tulloh, Jim Canale and Robert Marotta. Steve started out with a brief history of how Motorola got the cable modem industry started and then how RoadRunner is being set up in the Tampa area. For installation, RoadRunner will send a representative to your home to install an Ethernet network card in your computer with the RoadRunner software. The technician who comes out will also give about 15 minutes of training. The equipment has a one-year warranty, and the $99.95 installation fee lets you keep the Ethernet card.

Since the RoadRunner system is a WAN, the shared lines in any given neighborhood will have a degraded contact when more people activate their service. The network runs on a fiber optic backbone with RoadRunner operating three T3 lines at the same time. This allows RoadRunner a 622-megabit connection to the Internet. The fiber optic backbone supplies various ATM (Asynchronous Transfer Mode) hubs, which in turn supply service to the home. Each hub can service 45,000 homes. RoadRunner claims that a guaranteed upload speed of 768kbs is available because of the Token Ring

(Minutes.....Continued on page 5)

Copernic 99

By Larry Anders, Librarian, Tampa PC Users Group

For a few years now I have been singing the praises of free stuff that can be downloaded off the Internet. One of my most used utilities, free or otherwise, that I have downloaded has been WebFerret, a free Internet search utility that automatically searches several search engines each time, one after the other. What could be better? A metasearch utility that searches several search engines *at the same time*, not just one after the other. Enter **Copernic 99**. **Copernic 99** can search up to 30+ search engines at the same time! There's a maximum of 300 search results per engine and a maximum of 1000 results per query.

With **Copernic 99** you don't need to learn which search engine is the correct engine to use, nor do you have to learn the different rules for each search engine. **Copernic 99** does all that for you utilizing the best search engine for that specific search. **Copernic 99** doesn't just find the information you're looking for; it also stores the results on your PC for offline browsing, organizing them by a relevancy score that's easy to understand, and removes duplicates automatically. If you continually search for the same info you won't have to key in the same search over and over again; just click on Update.

Copernic 99 automatically updates its list of search engines and you don't have to constantly check to see if you have the latest version of the software. When a new upgrade is available, an automatic upgrade button will appear on your screen. Just click that button and **Copernic 99** takes care of the rest.

It really is easy to use. Just choose your field of interest (category), i.e., *web, newsgroups, email addresses*, enter your keyword(s) for the search and click the Search button. All engines of a selected category can be contacted simultaneously, up to 32, and the speed is mainly limited by your computer's capabilities and your Internet connection. (On my Time Warner's RoadRunner service it flies!) **Copernic 99** will know which search engines are best suited for your query, such as DejaNews, AltaVista, HotBot, Excite, Lycos, Infoseek, WebCrawler, Yahoo and Magellan. One feature that I really like is that it automatically highlights your keyword(s). It can display your search results in a summary report format in your default browser, remove dead links and download your results to disk for later viewing (up to 32 simultaneous transfers). Another feature is exporting and saving search results in various file formats (HTML, XML, TXT and DBF). You can also share your results with others by e-mail.

Copernic 99 is a fully-functioning metasearch utility which includes the three most used categories mentioned above, which should be more than enough for the beginner to above average Internet user. But, if you want more fields of interest there's the commercial version, **Copernic 99 Plus**, which includes 21 categories, giving you access to some 125 search engines and specific directories. These categories are:

Web	Newsgroups
Email Addresses	Buy Books
Business & Finance	Newswire
Games	Recipes
Health	Sciences
Kids	Software Download
Life	Sport News
Movies	Tech News
Music	Tech Reviews
Newspapers	Top News
	Travel

Minimum requirements are:

486-33 MHz, 8 MB of RAM, 5 MB of disk space

Windows 95/98, Windows NT 4.0 or later

Microsoft Internet Explorer 3.0 or later, Netscape Navigator 3.0 (32-bit) or later

Copernic 99:

Is Year 2000 compliant

Supports multi-user configurations for individual searches and settings

Has Windows compliant software uninstall procedure

Has accessibility to the program from Windows Start/Find menu (I've placed it on my Quick Launch toolbar so I can get to it more easily.)

Supports the International Windows versions

There are a whole host of customizable configurations and options in either program. While the standard version of **Copernic 99** is **FREE, Copernic 99 Plus** sells for $29.95. Either program can be downloaded from http://www.copernic.com and either program would be an *excellent* addition to your collection of Internet tools. ***Get this one!*** ◆

(Problems.....Continued from page 1)
when **the computer locked up** while transferring scanned and OCRed text from TextBridge Pro to Microsoft Word. The lockup occurred when I tried to cancel a McAfee Virus Scan that started up (on schedule) right in the middle of the TextBridge transfer. Obviously, in retrospect, I shouldn't have done that. When the computer was rebooted and Word started, the response in Word was more than sluggish. If I selected some text and then clicked with the mouse to make it bold, it would be almost 10 seconds before I was able to use the mouse to select more text. This was not tolerable.

My first thought was that the problem might be with the file, since, to create it, I had started TextBridge from a menu button on the Word menu bar and,after scanning in a few pages, had instructed TextBridge to close and put the text into Word. I had used this process several times to place approximately 40 pages of text into Word before the crash. In the past I had noticed a slow response in Word when dealing with large Rich Text Format (RTF) documents opened in Word before they were saved as Word documents. Perhaps this was similar. Unfortunately a check using other documents produced the same very slow response. The proof that something was wrong with Word and not the files was when I opened the same file in Word on my laptop and everything zipped along as it should.

The obvious solution was to reinstall Word. However, a reinstallation did not help, and an uninstall and reinstall did not help. Time now for drastic measures: **Eraser97** (see my comments in the December 1998 newsletter). The uninstall of Office 97 and the use of Eraser97, which removed all trace of Office 97 from the registry, and the reinstallation of Office97 did not help. When I reinstalled Word, I kept getting "**cannot update registry**" warnings. So, I was no better off, and worse, I now had other problems. I knew beforehand that after running Eraser97 I would have to reinstall my two scanners, Personal Web Server and Active Server Pages (ASP), since I had been through something similar before. But this time ASP would not reinstall. It had something to do with the msdasql. dll in the C:\Program Files\Common Files\System\ole db folder. Couldn't load a library or something.

After some thought, I figured this was probably a Windows file and it could most easily be corrected by reloading Windows. I really didn't want to reinstall Win 95, since I had added so many patches over the past 2.5 years that it had been on the computer, and I wasn't sure that any of them would be retained, so I decided to **move up to Win 98 on this machine**.

After the installation of Win 98, Word loaded and ran very much faster than before, my scanners worked, and everything else seemed OK. ASP could now be reinstalled, and it is working fine in spite of a note at the end of the installation that said "Incorrectly Registered, run regsrv32.exe to register". I would have done that, but I have no idea what file to include with the run regsrv32.exe command. Perhaps there is an Installation Log that I can view and see what process gave the error.

As they say, **it is not over until it is over**. There were still several more problems ahead to be discovered as I tried to use other programs or different features in programs which I already thought were OK.

First, when I tried to use my HP PhotoSmart photo scanner, it worked fine—except that the instructions were written out in the symbol font. For Example, **Insert photograph to be scanned** looked like **Ινσερτ πηοτογραπη το βε σχαννεδ**. As usual, a reinstallation did no good. And I could find no solution for this problem for the moment.

Second, when I tried to start Microsoft Publisher 98 to work on this newsletter, I got the message that it couldn't run because of some missing DLL (**Eraser97 strikes again**). This was solved by simply reinstalling Publisher 98—the only instance of a simple reinstallation solving one of my recent problems. Furthermore, this also removed the problem of the scanner software using the symbol font for instructions. Figure that one out.

Third, I noticed that after installing Win 98, when the computer booted I got an error message on my HP 4 Plus printer: "**22 PAR I/O ERROR**". As usual, I turned to **http://search.microsoft.com** and found the following:

CAUSE: This behavior occurs when the Drvwppqt.vxd virtual device driver is loaded or if you are not using an IEEE 1284 printer cable.
RESOLUTION: To prevent this driver from being loaded, follow these steps: ……omitted material…….

1. Click Start, point to Find, and then click Files Or Folders.
2. In the Named box, type "drvwppqt.vxd" (without the quotation marks), and then
click Find Now.
3. Rename all instances of the file by changing the file name extension. You must change the extension to prevent the driver from being loaded.

Three down; more to go.

Next I started Microsoft Access—at least I tried to. Instead I received the message: *"**Microsoft Access can't start because there is no license for it on this machin**e."* (As one of my clients said about a similar message,"*What do you mean no li-*

(Problems.....Continued on page 8)

(Minutes……..Continued from page 2)
system used on the upstream. Download speeds vary greatly by the number of people accessing the network at any given time, but 1.2 meg downloads are possible. The existing pipelines are running at around 15% to 20% capacity. If a pipeline exceeds 70%, RoadRunner increases the number of fiber optics serving that area. Monthly service is $39.95 with standard Time Warner cable service, $49.95 without cable service. Five e-mail addresses are offered per service, with an additional five addresses for $10.00. If you need more than one TCP/IP address, that will also be an additional $10.00.

A Quake II game server is available at this time. A Half-Life server is coming soon.

During the presentation we had several occasions to wander into Question & Answer sessions with group members lending their own experience and expertise to various discussions. The group was very patient and understanding during these exchanges and at some moments appreciated an additional voice to explain a topic another member was having difficulty understanding.

After the presentation we had our door prize drawing. Bob LaFave won a copy of Adobe Pagemill, Arthur Young won a copy of Partition Magic, and Cheryl Alexander won an IBM Sports Bottle. ◆

Internet picture of the month

A portion of the Washington, DC Metro map

If you are planning a trip to the nation's capitol, the metro system is a very convenient means of moving around the city. For an interactive map of the system, go to *http://www.wmata.com/USINGMET/systemmap.HTM*. A click on any station will give station details including nearby points of interest. Similar maps exist for other cities. Another example of useful information to be found on the Internet.

Beginners Column:

How to install a hard drive, a CD-ROM drive, and an IDE removable media drive

By Merle Nicholson, President, Tampa PC Users Group

OK, so you think you need a bigger hard drive. The kids have been installing games again, of course. It certainly isn't your fault. No, the new golf game with 10 bonus courses surely can't be the reason. So first let's just talk you out of this right at the beginning. Have you uninstalled all the old stuff you don't use? Searched the hard drive for all the downloads you've done and need no longer? Have you checked to see if the PC supplier put the entire Windows CD on the hard drive? Look in c:\windows\options (or any other location) for a lot of .cab files. Be careful here, make sure you have a Windows installation CD, then delete the files. It's also common to have say an entire Internet Explorer 4 or 5 installation file – about 25MB. Once you install this, there's no reason not to erase the file. Now go to your Internet Explorer properties, and locate "Temporary Internet files" on the General tab, then press Settings. Look at "Amount of disk space to use" and make sure this number is consistent with the size of your drive. You may need only say 20MB allocated to it. Click on OK, then on the previous panel press "Delete Files", OK to exit.. Then defrag the hard drive and see what remains.

Consider if a removable media drive might not be appropriate here. If you're storing a lot of music or video files you don't need often, an Orb, ZIP, LS120 or a CD-R or CD-RW might be a much better idea if you don't have a good backup system anyway. The ZIP and LS120 aren't suitable for full system backups, but it's good for the "important stuff". The Orb drive at 2.2GB gives you the best capacity for the dollar. It costs about the same as a 250MB ZIP. Media for it is only $30-$40. Check it out at http://www.castlewood.com. There's a good article about removable media drives at http://www.pcworld.com .

Now here's a really, really dumb question … do you have a hard drive in your system you're not using? This is not really far-fetched, and here's why. On many systems (Windows 95A and previous systems) there is a restriction on the size of a disk partition at 2.1GB. So if you bought a system with a 3.5GB hard drive, where did the other 1.4 Gigs go? Obviously, check to see if you have a D drive that's not a CDROM. If that doesn't yield anything, be sure to look at what the BIOS says about the hard drive on bootup and compare it to the capacity that Windows reports. If the BIOS doesn't give the information, take the cover off the system box, dismount the drive and look at the label. Believe it or not, many drives don't have the capacity marked on them unless they were manufactured within the last couple of years. Many web sites have all the documentation you need on this, though. Even for very old drives.

If there is some remainder that isn't partitioned, it won't show up as a drive. And you'll have to use FDISK or Partition Magic to partition the remainder. Be careful now, partitioning a drive isn't for most people. You're putting the entire system at risk and should not do it at all if there isn't a full system backup.

Don't give up... here's more. You may have a reason here to install Windows 98 if you have a drive larger than about 2.1GB. After you upgrade to Windows 98, do a convert to FAT32. The larger the partition you have the more savings there will be. FAT32 reduces the cluster size and can free up a considerable amount of wasted space. And the bonus is that you have Windows 98! Be very cautious if your system is a notebook. FAT32 cannot be installed on some notebooks, and the Drive Converter warns you of that fact.

One last thing. You may want to consider a disk compression driver. DriveSpace 3, that comes with the Win 95 Plus Disk, is the best. Do this only if you feel that you can stand a small slowdown of your hard drive response. Most people can. Disk compression works very well. It eliminates virtually all wasted space on the drive. It does not slow down program loading to any extent, and some claims have been made that it's actually faster because less data has to be moved off the drive. Make sure you have plenty of memory for this. It's definitely not for a marginal system. And it's not compatible with FAT32.

Well, you've gotten this far, so I guess we have to go ahead and install a new drive. Most of what we'll talk about applies to all three devices; Hard Drive, IDE CD-ROM and IDE removable media. – four I guess if you include IDE Tape drives. I'll explain all the stuff that's in common with these devices first: that is, how Pentium-class boards handle IDE devices. This also applies to 486 computers for the most part. We'll assume here that we have a Pentium-class board with the IDE controller on the system board, or a 486 machine with the controller on an add-in card.

Here are some facts about IDE on a Pentium class board. There are two controllers, a primary and a secondary. Each has a connector (a socket) for a 40-pin ribbon cable on the motherboard. They are marked either IDE-0 and IDE-1, or IDE-1 and IDE-2. The first is the primary, the other is the secondary. You can connect two IDE devices on each ribbon cable, for a total of four devices. The two devices on a single cable are the "master" and the "slave". There are jumpers on the drives that must be changed to mark them as master or slave.

To summarize, the four devices are: Primary Master, Primary Slave, Secondary Master and Secondary Slave. If you have four drives in Windows 95/98, they will appear as drive letters in a different order. The more technical bits are at the end of this

(Install……Continued on page 7)

(Install……..Continued from page 6)
article.

We have to look at your system and make some decisions. First, it's not a good idea to put a CD-ROM on the same controller (same physical cable) as a hard drive. Let's say it should be avoided, but do it only if you have to. The reason is that the system can read and write to drives on separate cables simultaneously, but can read and write only to one device at a time on the same cable. So in situations where you have hard drive and CD-ROM operations at the same time on the same controller there will be a definite performance slowdown. If that operation is just installing software from a CD-ROM or doing a straight copy to disk, there shouldn't be a perceptible difference. On the other hand, where there's a lot of action going on, say in a fast game, it's a no-no. I've seen plenty of business systems where there are just two IDE devices and they're both on the same cable. But that's just sloppy workmanship, or an attempt to save a dollar on the cable, and I correct that whenever I can. It's where you get into three devices that you have to make the decisions. If one of the devices is an IDE tape, I don't see there's a problem because when you do tape stuff, you're probably not interested in background performance anyway.

So, having made the decision on where this second hard drive should connect, ...let's assume it's the primary slave because the CD-ROM is secondary master..., you have to work out the physical problems. You should have a second connector on this cable (see cable notes below) and a place to physically mount it. Usually the rack where the primary drive is mounted is tall enough to accommodate a second drive. Also, is there a power connector available that will reach the location you've selected? If not, you can buy a 'Y' power cable that will extend an existing one to where you want it.

Now it's time to buy a new drive. Surprised? You shouldn't be. You need to work all this stuff out before you buy, right? Now look for a good deal with a rebate. Set a goal for a 6.4G drive for 100 bucks, and see how close you can come to this. If you're reading this well after June 1999, it'll still be a hundred bucks, but it'll be an 8.4 or 10.4 or something else. Be sure that the warranty is for three years, and it's a UDMA. It's also called Ultra-DMA and sometimes UDMA-33. The newest drives are UDMA-66, and you have to have the correct support on the motherboard for this. You'll need the same support for UDMA-33, and if your board doesn't support this, buy it anyway. You'll be upgrading your motherboard soon, won't you?

Most of the drives are packaged in huge boxes, enough for 10 hard drives. These boxes will contain a floppy, some installation instructions and a cable. If you go to a store that builds its own computers, you can get "bulk" drives in just a plastic wrapper, sometimes for less (sometimes not). If it's a "bulk" drive, try to negotiate a cable in the deal if you need one.

When you get home, if you've gotten the boxed type of drive, open it up, find the floppy disk that comes with it, and, if you have a Pentium system, throw the floppy away. Don't even format it, just sail it across the room into the trash. (I'm pretty good at sailing floppies.) If you've got a 486 system and don't have EIDE support, use it with caution. Better still, take the new drive back to the store and buy a new Pentium system; you won't regret it for a moment. Life's too short to use 486's, old cars, old washing machines and not have any fun.

OK, you have the hard drive and you've figured out the physical problems. There are a few other things to figure out. First, is the new hard drive faster than the old? If so, or if you'd simply like to make the new one the primary drive because it's really bigger, we need to manage that; and before you've mounted the drive is the best time to deal with it. There's a separate reference below for this (see "Making the new drive the primary drive" below), and it's especially complicated if your old drive is partitioned.

The next step after getting it physically in and hooked up is to make sure the motherboard recognizes it. So you'll need to go into the BIOS and make a change. You do that by going into BIOS setup during the system POST, sometimes with the Delete key and sometimes with an F key. You'll see the familiar Primary Master, Primary Slave … etc. The position you want will probably have a "disabled" on it. If you have a system not more than a few years old, it should have an Auto setting. Auto is my personal preference, because it requires less fiddling over time. Also sometimes you can just hit Enter and the bios will recognize the drive and make a "User" setting. That's OK, and sometimes doing this will shave a few seconds off the boot up time. Exit and save the settings.

You'll have to partition and format the new hard drive, easily done if you're just adding a second drive. If partitioning and formatting a hard drive is not a familiar process to you, I recommend buying PowerQuest's Partition Magic. It has a very good step-by step instruction manual. PowerQuest offers very attractive prices for user group members.

When all this is done, Windows 95/98 will boot up and all will be well, with lots of space to last you a long time. Check out the position of the CD-ROM, though, and adjust it if necessary. Happy Hard Drive!

CD-ROMs and Removable Media Drives:
CD-ROMS and removable media drives have the same basic issues as any other drive, with the added complexity of driv-

(Install.....Continued on page 8)

(Install.....Continued from page 7)
ers. Remember that IDE CD-ROMS don't need drivers for Windows 95/98. If you inadvertently install from the floppy, you'll need to edit the config.sys and autoexec.bat files and remark out the CD-ROM drivers. It's not really bad to have the DOS drivers around, in case you need to boot into DOS and do a Windows re-install in case of a hard drive catastrophe.

Technical bits:
The primary controller is at port 1F0h, IRQ 14, and the secondary port is 170, IRQ 15. The ports and IRQs don't seem to be negotiable. If, for instance, you had a network card and no secondary IDE device, the system may assign the network card to IRQ 15. But if you then added a secondary IDE device, the system would assign IRQ 15 to it every time, and the network card would be forced to go elsewhere.

Drive order:
Drives letters appear in a peculiar order. An active drive means the active (normally the first) partition. 1) Primary master active drive, 2) secondary master active drive, 3) primary slave active drive, 4) secondary slave active drive, 5) first primary master logical drive, 6) first secondary master logical drive... The problem that this presents is that if you have a partitioned drive c: and d:, and then install a second physical drive, that new drive will be inserted between your old c: and d:. So your old logical partition d: will appear as e:, because the new one will be d:. If the new drive is partitioned also, then the old one will have c: and e: and the new one will have d: and f:. Your CD-ROM will be pushed down the chain as well. This poses a particular problem if you have Windows programs installed to the old d:. They simply won't work. If I were trapped with problems like these, I would be tempted to buy Windows 98, wiping out the partitions and all the software, use FDISK from Windows 98 and repartitioning so that each drive has one partition each. And, of course, reinstalling all the software. A lot of work, I know. A real advantage here though is that you won't be carrying legacy problems with you. I hope you saved your old Windows 95 CD as proof of license to install Windows 98 upgrade.

Cable notes:
The cables will mostly have three connectors on them, but not always. It's very common for a CD-ROM to ship with a cable with two connectors, one for the motherboard socket and one for the CD-ROM, but no other. It can be replaced with the three-connector ribbon without any concern. The two drive connectors are closer to one end, with the longest part from the second connector to the motherboard, although it's not uncommon for the wrong end to be used at the motherboard. In that case, just reverse it. There are various lengths of cables available at computer stores. They are even made in very, very long lengths.

Making the new drive the primary drive:
If you've decided to make the new drive the primary drive, and the old one an auxiliary drive, you can copy the disks binary image from the old to the new, so that the new drive will boot right up with no fiddling with the operating system. I use PowerQuest's DriveImage product. Install DriveImage on the old disk. Be sure to make a boot disk as instructed during the installation. Mount the new disk with the data cable and the power cables after setting the new drive as a slave. You should check the old drive to make sure that a jumper may (or may not) need changing when adding a slave drive. Boot the system with the boot disk you made. Read the instructions carefully, and copy, using the disk-to-disk function. Use the "Resize Partitions" button so that DriveImage makes a new partition using the full capacity of the drive if that's your objective. When you're done, shut the system down, get at the jumpers on the drives and reverse master and slave. It should boot now on the new. You can erase the software on the old, saving data files or documents if you wish.

Master and Slave settings:
Some drives and CD-ROMS have a jumper setting called "cable select". Sometimes it's marked just "cs". We're ignoring this setting, since it's not used. Disks may have three settings; master with one drive; master with two drives, and slave. Other drives have only two: master and slave. CD-ROMS (all that I've seen anyway) have just two. Some are marked "cs", "ma" and "sl". Drives made in recent years have a label with the size of the drive and pictures of the jumper settings. Some have a small paper with the settings on them. If the label isn't complete, I always make my own label with all the specs of the drive and stick it down on the top of the drive: cylinders, heads, sectors and capacity and all the jumper settings. Western digital prints all this stuff on the anti-static bag so you'll be sure to throw it away. ◆

(Problems……Continued from page 4)
cense? I paid for it, didn't I?") A reinstallation of Access, as I had begun to realize, didn't solve the problem. Time to turn again to http://search.microsoft.com, type in some key words and see what came up. Here is the solution (the strangest one yet). I am including most of the details to illustrate how careful Microsoft is in guiding you to the solution.

Certain fonts that are installed by Microsoft Publisher can result in the incorrect registration of Microsoft Access 97
……omitted material……..

Follow these steps to correct the registry error:

(Problems……Continued on page 9)

(Problems…….Continued from page 8)

1. On the Start menu, point to Find, and then click Files or Folders.
2. In the Name box, type "hatten.ttf" (without the quotation marks).
3. In the Look In box, type "C:\Windows\Fonts" (without the quotation marks) or the path to the Fonts folder on your computer.
4. Click the Find Now button to start the search.
5. Under Name, right-click the hatten.ttf file, and click Rename on the menu that appears.
6. Change the name of the file to "hatten.xxx" (without the quotation marks).
7. Minimize (but do not close) the Find dialog box.
8. On the Start Menu, point to Settings, and click Control Panel.
9. In Control Panel, double-click Add/Remove Programs.
10. In the Add/Remove Program Properties dialog box, select the Install/Uninstall tab and select Microsoft Office 97, Professional Edition from the program list.
11. Click the Add/Remove button to run Office Setup in Maintenance Mode.
12. In the Microsoft Office 97 Setup dialog box, click Reinstall.
13. Once the reinstallation is finished, click the Find dialog box on the Windows taskbar to maximize it.
14. Under Name, right-click the hatten.xxx file, and click Rename on the menu that appears.
15. Change the name of the file to "hatten.ttf" (without the quotation marks).
Microsoft Access should now be properly registered.

Back to Word. Word, as I noted, was really zipping along now; all the sluggishness was gone. Additionally, a lot of the extras that had been added to it by other programs like TextBridge and ViaVoice (buttons on the menu bar that incorporated these programs with Word) had been removed from the Normal.dot, so it loaded much faster. But an unwelcome wrinkle had been added: When you tried to close a document, you were now confronted with an unfamiliar message box, where the choices were Cancel, Yes, and OK. That should have been Yes, No, and Cancel. Back to http://search.microsoft.com, and, with a bit more searching, this time I found the following (again I include most of the details):

SYMPTOMS: When you attempt to close a file, a dialog box appears with three buttons: Cancel, Yes, and OK. When you click them, the buttons perform functions that you do not expect them to ……omitted material……..

RESOLUTION: To resolve this problem, replace the Mso97.dll and Mso7enu.dll files on your computer and run the Office 97 SR-1 Patch Setup again. To do this, follow these steps:
1. Press CTRL+ALT+DELETE to display the Close Program dialog box. Click the OSA item and click End Task.
2. Press CTRL+ALT+DELETE to display the Close Program dialog box. Click the Findfast item and click End Task. Another dialog is displayed. Click End Task. Press CTRL+ALT+DELETE again to display the Close Program dialog box. Ensure that Findfast and OSA do not appear in the list. If they do, click the item and click End Task.
3. Insert the Office 97 compact disc into your CD-ROM drive. NOTE: If you have Microsoft Project 98 installed on your computer, insert the Microsoft Project 98 CD-ROM instead of the Microsoft Office 97 CD-ROM.
4. Using Windows Explorer, open the following folder on the CD-ROM drive: <CD-ROM Drive>:\Office where <CD-ROM Drive> is the drive letter for your CD-ROM drive (usually drive D). For example, if your CD-ROM drive letter is D, open the following folder: D:\Office
5. On the View menu, click Options. Click the View tab. Click to select Show All Files. Click OK.
6. Right-click the Mso97.dll file. On the shortcut menu, click Copy.
7. Using Windows Explorer, open the following folder on your hard disk: Program Files\Microsoft Office\Office
8. On the Edit menu, click Paste.
9. Repeat steps 3 through 7. In step 5, copy the Mso7enu.dll file instead of the Mso97.dll file.
10. In Windows Explorer or File Manager, run the patch by double-clicking the Sr1off97.exe file. This step is not necessary if you copied Mso97.dll and Mso7enu.dll from the Project 98 compact disc.

Well, that was quite a list. If you have made it this far into the article, I applaud your fortitude. I think there is a moral to all of this, and it is that "**all computer software problems are solvable—if you can just locate the source of an answer**." And for Microsoft software, Microsoft probably has the answer at their site. All you have to do is phrase your query correctly.

I strongly recommend that everyone learn how to use the Microsoft search page at http://search.microsoft.com. I find my answers to these technical problems by checking the "Support & the Knowledge Base" radio button when doing the search; you won't find the answers you need by searching the rest of the Micorosoft site. Of course, another good source of solutions is searching the Usenet newsgroups using a tool like DejaNews, now found at http://www.deja.com.

It will apparently never be over. I just tried to access Windows Help and was informed that "**the file hh.exe or one of its components could not be found**." But I have seen that message before on my Win 98 laptop, and I now know that the way to fix the problem is to run the Win 98 System File Checker tool and extract that particular file from the Win 98 CD. ◆

Special Interest Groups

Internet SIG

This SIG meets the first Monday of the month at 6 PM at the Reflectone Building, off West Waters Ave. You must sign up to get on the list and to get by security. Contact Mike Hodges at hodges@reflectone.com. For directions, see the map at our web site or contact Mike Hodges.

We consider all topics concerned with creating web sites. We study sites of interest from the web and those created by members of the SIG. And, in general, we consider anything of interest concerning the Internet. Last meeting we began working with Microsoft FrontPage to create a web site in order to learn the features of FrontPage.

Genealogy SIG

This SIG meets the second Monday of the month at 7:00 PM at the Museum of Science and Industry. *Contact Jenny Lind Olin at 960-5723 or Ford Bond at 987-6309.*

Visual Basic SIG

This SIG meets the third Tuesday of the month, at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6 PM. For information, contact Merle Nicholson at merlenic@tampabay.rr.com.

Last month, we reviewed Dynamic Data Exchange between a VB program and another Windows Program. Then we saw the results of porting a very old BASIC program to Visual Basic. We will consider this program again along with graphing in VB at our next meeting.

Computing Tip from Don Patzsch

By Don Patzsch, Tampa PC Users Group

When we get email, quite often there are URL's somewhere in that email. Here is what I do.

First, open Notepad and make up a file called "links". Save it and then put your cursor on the - sign in the upper right corner to minimize it, but keep it easily available. Then when you come across a URL in your email or anywhere else, simply highlight the URL with your mouse and hit EDIT, then COPY. Now restore Notepad by putting your cursor on the Windows task bar and clicking on Notepad.

Next, simply go up to the EDIT – PASTE command and you have the URL and also any explanation that came with it in Notepad. Save it and keep doing this until you have gone through all the email. Now you can leave the stuff in Notepad for a few days or so until you get to it, and meantime you have added several more URL's to that "links" file.

When you go on the Internet, first bring up Notepad and minimize it so it is convenient while you are on the net. Open the Notepad and highlight one URL, hit EDIT – COPY and then go to the browser command line and hit EDIT – PASTE. Now hit ENTER and you will go to the URL, without ever having to type anything. This is a simple procedure once you get used to it. When you have a real long URL, you will appreciate having this way of transferring the URL to your browser, but also you don't have to hunt around for where you left that URL you read about in last week's newspaper! ◆

A Web Site to Reduce Your Electric Bill

By Don Patzsch, Tampa PC Users Group

Suppose you wanted to reduce your electric bill, how could you go about that?

This is a story of what they have been doing in Europe, and now the process has come to the United States. It involves computers. California has deregulated their electrical energy companies. A new company has moved in and is using the Oracle database to plot the use of electricity by their customers on an hour by hour basis so that they know how much power is required each hour. Now through the software and wireless network of CellNet, another California company, the new company, Utility.com, can bid for electrical power from all the generating companies in California, and, I suspect, soon they will get the power they want to sell anywhere by the use of the nationwide grid.

Now, how does this affect you? Well, at the present time, we have to await action by the legislature and then wait for the company to set up its business here. I have asked them to keep me informed of when this may be.

So, right now Tampa Electric probably sells you your electricity. If this company comes in, and if the power is deregulated here, they will connect you at no cost, and you may do one of two things, either buy your power without interrup-

Meeting Preview: At the July meeting, Mark Komula from Network Technologies speaks on home networking. Mary Sheridan, as usual, will conduct a 30 minute Windows discussion at the beginning of the meeting.

President's Message

I'd like to thank a few people who are doing such a great job for us on the Board of Directors. Jenny Lind Olin, Mary Sheridan and William LaMartin. Now everyone on the BOD deserve a round of thanks, but these three are doing more than their share. Jenny is so diligently watching our club treasury that we all can sleep knowing the money is all accounted for. Mary, as programs chairperson, does such an outstanding job of getting guest speakers month after month. The quality of the programs has never been better. And all you have to do is look at our web site to see what a job William LaMartin is doing. The web site is always developing; slowly because a lot of thought must be given before making changes, and the quality of that thought is very evident. And of course our newsletter has been consistently outstanding since he took it over. In addition to building the newsletter, William also has to badger writers every month for material, make up the newsletter, print it (with one volunteer) and then fold and mail it (with a small but loyal group of helpers), also maintain the mailing list, and finally run to the post office to mail it! Did I mention that he also writes a usually large article himself?

Which leads me into one (non) favorite subject: soliciting articles for the newsletter. Now hear me out. If you'll notice there are three or four people who are there month after month. There are three or four that can be counted on to contribute every few months or a couple of times a year. That's basically it. Everyone, and that means **everyone**, is capable of writing an article for the newslet-

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more

Minutes of the June Meeting

By Jim Weber, Secretary, Tampa PC Users Group

Our meeting began as usual with a Windows SIG, which Merle Nicholson started and Mary Sheridan picked up upon her arrival. We discussed one member's problem with a modem not connecting properly. After a brief debate the group decided it was time for our friend to upgrade to a version of Windows a little newer than 3.1.

Disposal of computer parts came up again. As you all know, monitors cannot be thrown out with your regular trash, but were you aware that those old motherboards couldn't go out on a regular pickup either? They contain elements such as lead that qualify as toxic or hazardous material. If you have any of these items you can still take them to the dump yourself. Homeowners will need to bring a copy of your tax receipt for proof of residence, and apartment dwellers can use a phone or electric bill.

Power saver problems were brought up, with several members claiming similar stories. It seems that when the system goes into power saver mode it will occasionally crash instead of warming up. This appears to be common to Win95 and Win98 users. It was suggested that, if you suffer from this problem, you should disable power saver functions in Windows. If the problem continues, then try disabling the BIOS settings.

For those of you who want a web browser with 128 bit encryption, but couldn't find it in Internet Explorer 5.0, Microsoft has the plug-in available on their site.

Merle started our general meeting at 6:45 PM. He reminded the members present of our membership drive, so please try to enlist the aid of your friends into our little family. An announcement was made that if any of you have a personal web site, we would like to link it from our User's Group web site. If you are interested contact our editor, William LaMartin.

Chuck McPhearson of Laser Perfect was our first presenter. His company started in 1988 recycling toner cartridges for copiers. They now remanufacture laser and ink jet cartridges as well. There is less than a 2% failure rate on their product, and if it does fail, Laser Perfect will replace it postage paid both ways. The cost of a remanufactured cartridge can save you up to 50% off retail cost if you send them your old cartridge, but if you don't have the empty available yet you can still purchase a backup at less than the cost of a new one. To order call their number, 1-800-989-2666, and they will send

Building "Cemeteries of Florida":
http://users.quadra.net/cemetery/

By Cheryl Alexander, Membership Coordinator, Tampa PC Users Group

"I'd like to do something for the Web." Oh, what a can of worms that can be! "Something for the Web" can range from a freebie-walk-you-through-the-template personal page to a huge web site with hundreds (or thousands) of pages. There are many decisions to be made before code is even written:

- What will it be about? - How will you edit it?
- What is your naming convention?
- What do you want it to look like?
- What does it look like on someone else's computer or browser?
- How will I keep up with it all? - How will anyone find it?

I don't have all the answers but maybe I can share my process.

The hardest part of building a web site for me was selecting the subject. That sounds easy until one actually tries to make a decision. For some, it's easy; they pick out their dominant interest. I went through my interests and tried to pick just one. That proved to be too difficult. Meanwhile, I kept poking around the web, looking for what interested me, how they did it, what I liked and what I didn't like on all kinds of web pages and sites. I finally decided that no matter what the subject was, I wanted to add new information to the web, not just another list of links. I had a tentative design that was just horrible. I dumped it and started over. (It was good for practicing how to write code and helped with finding the editing program. So, it wasn't wasted time.)

I decided on "Cemeteries of Florida" by a very strange process. I discovered "Graveyards of Chicago" and many other cemetery photo sites. I looked for similar sites on Florida and found that there was none. My subject is narrow enough to give me a focus but broad enough to give me material for a huge site!

Before I had narrowed my subject, I was already trying to find a program to write this site with. I tried HTML Assistant Pro '97. I can't remember why I didn't like it because it's been so long since I attempted to use it. I tried Corel WEB. SiteBuilder. It tries to do too much for the user without giving any leeway to do anything else. William LaMartin had demonstrated FrontPage Express which is included with Microsoft Internet Explorer. I like that it is WYSIWYG and that I can edit the HTML code easily. I don't use the tool buttons very much because I don't like giving up that much control to the program.

I was ahead of the game on developing a naming convention. Organizing large numbers of documents with graphics was part of my job for a long time. It was very natural to revive the concepts. I knew that I had to number for growth. I could have used what is called the friendly naming system where actual names are used instead of what amounts to a personal code. But there are too many duplications of names of people and cemeteries, so I went with a code: aa000b00.ccc:

1. aa = two letter code that tells me what level I'm dealing with, main page (cf), cemetery (cm) or photo (cp)
2. 000 = a numeric designator, not necessarily in order of use, gives me up to 999 before I have look for two more letters
3. b = usually an f for figure, could have been p for plate, anything that links with the page of the same number
4. 00 = in conjunction with the figure, tells me how many I have, example: f1, f2, f10, f11 etc., gives me up to 99
5. ccc = simply is the extension, jpg, gif, htm

It sounds complicated and not friendly but in the long run makes a lot of sense. My way is good for me but may not be good for someone with a much smaller site. This method is very flexible and allows for expansion.

I looked at a lot of cemetery photo sites before I decided on the layout of my site. I have used "Graveyards of Chicago" as a pattern because it followed the hierarchical set up that I was used to, didn't rely on thumbnails, gave space to add informational text and created a respectful, instead of spooky, atmosphere. Happily, he didn't mind that I copied some of his code, especially since I had asked permission first.

I got some of my page sets from Website-Designs. There are a huge number of sites on the web that will give you all the graphics that you need (background, buttons, bars, animated gifs, icons) to build a site in exchange for a link to their page. I've used Paint Shop Pro 5.01 to modify existing graphics and create my own page sets. One portion of the process is that you have to tinker with the graphics and colors of text, active/visited/link text. Also, I had to take into consideration how a photo would look against its background. I needed something that was neutral but not stark, which would contrast but not conflict with colors in the photo. I make notes of what I name my creations, sizes of buttons, font name and size for title graphics and buttons and color codes.

Testing is dreary, boring and absolutely necessary. Yep, I had experience in this aspect also! I tested all links repeatedly on my machine before I put it on my hosting server. At that point, I drafted about five or six friends to look at my site with their computers and browsers. I asked them to tell me about their computer type, modem speed, monitor resolution, their opinions of the look, the navigation buttons that I had

(Cemeteries.....Continued on page 4)

(Cemeteries.....Continued from page 3)
provided. Try not to take all their advice to heart. If you have thought carefully about your layout from the beginning and have done the best that you know how, it will probably be okay. (For example, one person suggested that I use frames for navigation. I don't know how to use that yet, but maybe in the future, I'll do just that.) However, testing can tell you that some things just will not work and must be re-designed or scrapped.

Maintaining a site starts at the beginning. I have kept a list of all the counties, cemeteries, and photos from the very start. Some of my lists have gotten so large that I have had to split them up! My goal is to include photos from one cemetery per county. At this point I have six counties, 29 cemeteries, and about 750 photos. I use a notebook to keep notes about the elements that I use for each page or set of pages just in case the unspeakable crash happens and I have to reconstruct the whole mess. I may eventually use a maintenance program but, for now, I make upload lists and make notes of changes that I make.

I've just started the process of getting listed with search engines and using meta tags such as “description” and “keywords.” So far, I am listed only on Yahoo!. I have joined five web rings that deal with my subject. I distribute business cards with my site information on it to those who are interested. I exchange links with other sites who have the same subject that I would like to be associated with. I also make notes of link exchange requests and search engine listings. It takes time, but I hope that my site will be noticed and maybe even win awards!

Two books that I have used extensively in this process are:

- *Information Architecture for the World Wide Web* by Louis Rosenfeld & Peter Morville, published by O'Reilly & Associated, Inc.
- *SAMS Teach Yourself Paint Shop Pro 5 in 24 Hours* by T. Michael Clark, published by Sams Publishing.

Any web site worth its HTML code is never really finished. But it will reach a stage where it will become presentable. Improvements and additions can continue as long as there are material and time to work on them. ◆

Recognizing Text and Speech

By William LaMartin, Editor,
Tampa PC Users Group

Several months back CompUSA ran a special on a bundle of two software items--TextBridge Pro 98 and ViaVoice Office 98. It was $49 after the in-store $50 rebate. But at $100 it would have still been a bargain based on recent prices of both programs. The implied goal here was to set the computer user up so that he would have little typing to do in the future. He could either scan in old paper documents and then have TextBridge Pro turn them into textual documents, all the while preserving the layout and graphics. Or he could simply sit in his chair with his hands folded and dictate into the supplied headset microphone and have ViaVoice turn his speech into a textual document in the computer.

One of these scenarios worked superbly and one didn't. Can you guess which one fell short.? It was the voice recognition. Up front I must admit that the computer I tried ViaVoice on, a Pentium 166 with 96 MB of memory fell one notch short of the required configuration--it needed to additionally be MMX. But I think the problem was more than that. The first time I tried out the program, letting it train itself while reading a short Mark Twain story, things seemed to go OK. During the setup for training, I got where I could speak the continuous speech required in a manner that produced few retires to get the training phrases understood. And after the training was over, the program recognized my speech in a so-so manner. The main problem was that the recognition was quite slow. But I will attribute that to my slow processor.

So I closed out the program and set it aside for a couple of weeks with the thought that when I next tried the program it would undoubtedly do better, since it would have learned my speech patterns better. That was not the case. On the second try, using the same profile I had created before, it recognized almost nothing of what I said. So I decided to train it again. This time I read a passage from *Treasure Island*. And after training, things were better--but not anywhere nearly as good as my first try with the program. In frustration I decided to

(Recognition.....Continued on page 5)

(Recognition……..Continued from page 4)
shelve the program until I had a faster desktop computer. I suppose I could try it on my faster laptop, but I think I will wait until I have one of those 400 Mhz or 500 Mhz machines. That way I will be sure it is the program and not the computer which has shortcomings.

In general, I think the voice recognition programs have a long way to go. I previously tried some Microsoft developmental software for discrete speech recognition and wrote about it in the October 1997 newsletter (see http://www.tpcug.org/reviews/microsoft_dictation.html). I got it to work a bit better than I did IBM's Via Voice. I know others who have tried other programs with poor results. In fact, one of our members has a speech recognition program right now from another of the big name producers of such programs for which he is supposed to write a review. Unfortunately he can not get it to work satisfactorily and has yet not produced a review. So, if there are any members out there who have had success with a speech recognition program, let us hear about it.

Text recognition, on the other hand, has come of age. I am simply amazed at how well TextBridge does on converting the printed page to a computer document. For years I have been using an earlier version of TextBridge Pro and was happy with the results. TextBridge Pro 98, however, leaves

Software Summary of Windows 98 SE (Second Edition)

By Larry Anders, Librarian,
Tampa PC Users Group

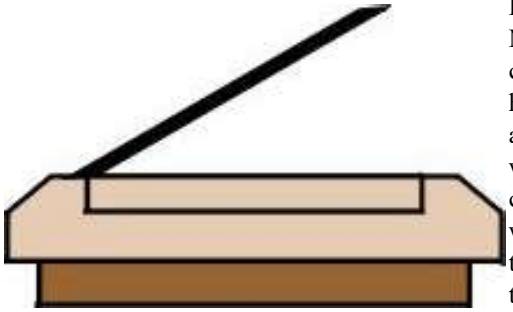
There's a little known and little heralded release of Windows 98 out now called **Second Edition** (**W98SE**). In my situation it came out at just the right time. I recently had my first involvement with networking several computers together when we relocated our offices to a new facility. Prior to this we had not been networked, but now we are. And it wasn't very hard to set up our new peer-to-peer network, which I handled myself. After finding out that it wasn't that tough, my *home* network is next on my agenda.

Then along comes **W98SE,** which is an update to Windows 98 (W98) that enhances W98 with the latest Internet, **home-networking** and hardware technologies. And notice I said *home-networking*. And that's just a few of the things included in this upgrade. Here's a full list of the enhanced capabilities related to the Internet and hardware compatibility:

- **Internet Explorer 5**, Microsoft's popular browser software, provides breakthroughs in Web performance, usability and flexibility, including the new Outlook Express 5 integrated email software. There's also a great new feature called Radio Tool Bar that lets you listen to live radio while browsing.
- **Windows NetMeeting® 3**, the latest version of Microsoft's award-winning Windows-based conferencing software, brings Internet conferencing capability to consumers by offering an easier user interface, data conferencing security, enhanced standards support and more.
- **Internet Connection Sharing**, a set of advanced home networking technologies, enables multiple users to share a single connection to the Internet for simultaneous Internet access. (This is the one I'm interested in most!)
- **Windows Media™ Player 6.1**, the latest version of Windows Media Player, enables playback of popular multimedia formats, including streaming media such as Windows Media, MP3 and more.
- **Enhanced IEEE 1394 support** gives support for more devices, such as digital camcorders.
- **Advanced Configuration and Power Interface (ACPI) advancements** deliver hardware optimizations and more granular control over settings on a device-class basis.
- **USB improvements** include the capability to work with devices on a per-device basis rather than a per-port basis.
- **WDM modem support** supports USB modems and enables hardware vendors to write a single WDM modem driver for Windows 98 and Windows 2000 Professional.
- **WebTV® for Windows updates** provides support for a broader array of analog television tuner cards and Advanced Television Enhancement Forum (AVTEF) standards for HTML-based enhanced programming.
- **DirectX® API 6.1** delivers a variety of improvements to Windows multimedia technologies, including better audio and video synchronization.
- **Processor and motherboard optimizations** for the latest hardware technologies, including Intel Pentium III, are featured.
- **Device Bay support** enables a system to ship with Device Bay hardware.
- **Windows 98 Service Pack 1** addresses top issues in existing Windows 98 features, such as Windows 98 Year 2000 updates
- **Multiple monitor support** can be extremely beneficial to users in many areas, including desktop publishing, web site development, video editing and gaming.
- **Intel MMX technology** support provides faster audio and video functionality.

Key performance and reliability features include the following:

- **Setup enhancements** reduce the number of setup steps, allowing for a faster and simplified setup.
- **Applications load faster** by identifying the most frequently used applications and placing the files associated with their startup together on the user's hard drive so they load quickly.
- **Faster shutdown** dramatically reduces the time needed to shut down the computer.
- **More disk space** is available as a result of the ability to store information more efficiently with a new feature called FAT32.
- **Windows Maintenance Wizard** automatically schedules and executes "tune-up" activities to keep users' PCs running in top form.



For new users to Windows 98, Windows 98 Second Edition will replace W98 in retail stores, new machines, etc. Existing W98 users can update their system to the Second Edition technologies via a CD that can be ordered directly from the Microsoft Web site for $19.95 (plus S&H). Also included is a book detailing features and benefits of Internet Connection Sharing.

To me it's a cheap price to upgrade an otherwise pretty stable operating system. And for you people still on Windows 3.1 or 95, who have been waiting for Microsoft to get the bugs out of Windows 98 (…and God only know why!)…, **now is the time for all good computer users to come to the aid of their computers.**

(Note: I know that "bashing Bill Gates" almost seems like the stylish thing to do these days but you won't hear it out of my mouth, or my keyboard. I'm thankful Gates and Microsoft have accomplished what they have because they sure have made computing a lot more enjoyable than it was in the early days (early 80's) of personal computing. Thanks Bill!) ◆

(Recognition……..Continued from page 5)
that program in the dust as to speed and accuracy of the process. As one of my first projects with the new program I converted to a computer document a small book a friend of mine had written 22 years ago and which was now out of print. The average time it took to scan a page (you need a scanner before you can use such a program), perform optical character recognition (OCR) on it, and then present any questionable words to you was less than one minute. Additionally there were usually no more than a couple of questionable words on a page. In fact, the program had usually guessed correctly and I only had to click OK. Then on to the next page.

I used the feature that allows you to open TextBridge directly from Microsoft Word (a similar feature is available for WordPerfect and Microsoft Excel). After I had done about a dozen pages I would then close and it would convert those 12 pages to a Word document.

Then I would open TextBridge again in Word and do another dozen pages. I was afraid of doing too much at one time and possibly losing it due to some computer glitch. If you choose not to work with Word, you can save your scanned text as an RTF file. I do miss one feature of the old TextBridge that allowed you to also save your work to the clipboard (in RTF format I assume).

Once I had the entire book in my computer as a Word document, I could of course print it out as a normal printed document. But this is the age of the Internet, so I saved it in HTML format, brought it into Microsoft FrontPage, scanned in separately (this has nothing to do with TextBridge) most of the photos used in the book and sent to me by the author, brought them into FrontPage, inserted them in the web document, and published everything to my web site, http://www.lamartin.com. To view the results, go there and click on the link *History of Okeechobee County Florida.* By the way, preparing the photos for the web took a lot more time than scanning the text.

Optical Character Recognition, in my opinion, is one of the great success stories of computing. Voice recognition—in time—probably will be a success too.◆

(Minutes.....Continued from page 2)
you a price list with a prepaid return box. Fill out the order form, put your empty in the box and the new cartridge will be back to you within seven working days. If you have a larger item they will send you a postage paid label.

Laser Perfect also assists charitable organizations by purchasing old, empty cartridges at $1.50 each. These organizations in turn get larger sponsors to save empty ink cartridges instead of throwing them away, helping the environment along the way.

Next, Jim Weber gave a brief discussion on MP3 music with a demonstration of Music Match Jukebox. MP3 is a compression scheme that allows a 10:1 compression ratio over standard .WAV and CD music files. This means a minute of CD quality audio now only takes up 1 Meg of disk space. Songs can be transmitted over the Internet without tying up a phone line for hours, and music can be stored and played directly from a hard drive. That means you can now store the long version of "In A Godda Davida" without buying a new hard drive. MP3 works with a combination of removing sounds the human ear can't pick out anyway and mathematical compression algorithms. Since MP3 is a compression scheme, processor power comes into play for decoding during playback. A Pentium 75 is the minimum recommended speed with 16 Meg of memory. In reality a P166 is the least you will want to use on a Windows system if you plan on doing anything else while MP3s are playing. Music Match Jukebox is the first, and therefore favorite, MP3 recorder and decoder I use. It allows a user to create MP3 files from Compact Disks or wave files and convert MP3 files to a wave file. It functions like a Jukebox, which means I can set up a play list of up to 99 songs depending on the type of music I'm in the mood for, and it will proceed to play through my selections. A full description and a demo version is available from http://www.musicmatch.com. It costs $29.95 and comes with a FREE lifetime upgrade. I've upgraded mine twice without any trouble.

In the door prize drawings, Mary Sheridan won a free year of ink cartridge refills, Clark Evans won Nuts & Bolts 98, Roger Waters won ProComm Plus, and Brian Lance won McAfee's Virus Scan. The meeting ended at 8:30 PM. ◆

UPS Surges of the Mind

By Merle Nicholson, President,
Tampa PC Users Group

You realize, don't you, that we live in the area (Tampa) with the highest concentration of lightning in the United States? You do have the best protection available don't you? I try to. I have all three of my computers on UPS's and I also have a whole-house surge protector on my outside wall under the meter. Besides buying (I thought) good quality UPSs that also have good surge protection specifications, I have insurance! To me that's the best lightning protection of all; the $25K or so that you get when you buy an APC or Tripplite UPS. I have a positive conviction that if lightning wants to zap your beloved 'puter, it will, period. So I have my machines well backed up to a removable hard drive, and I have insurance. The UPS, as far as I'm concerned, lets my machines survive the one-second blink-outs that frequently happen at my house. And for double insurance, I turn my computers off and unplug the modems.

One thing I hadn't been able to figure out until now is how to disconnect my Roadrunner modem. Actually I can, I just don't want to on the theory that if I mess with that cable too much I'll cause more problems. The cable modem is powered by my UPS and must stay on, 24 hours a day. RR doesn't want you to turn it off. What I want to do is disconnect the modem output to my PC while I'm away. The cable is a standard short network CAT 5 cable with RJ45 connectors on them. They look just like a telephone jack only bigger; they have eight conductors in the cable. I can buy a pin-to-pin adapter that is used to join two network cables and get another short cable so that the adapter is out in plain sight where I can disconnect it easily. I may do that.

I have the same kind of adapters for my telephone lines; they're glued to the underneath side of my computer table at the outer edge, so I can easily tell they're unplugged as I look in the door from 10 feet away.

So back to UPS's. I bought one of those large surge strip/UPS combinations for my wife's PC. This one was made by Tripp. The prices are seriously coming down, and I picked this one up for $75 at CompUSA. It's rated at 280VA. This one was perfect because I could fasten it to the back of her desk which is located next to the living room. We worked hard to hide the wires to her PC to keep it from looking too junky. I even fastened some very small speakers to the back of the desk under the lip of the top so they can't be seen. Hers was the last of the computers to get a UPS, mostly because I started feeling guilty for being so conscientious about my own and neglecting hers. This was after she asked what kind of surge protection was on hers. She assumed I did that when I built the computer for her.

Anyway, after only three months of loyal service, her UPS sacrificed its life, maybe, .. or maybe just committed suicide, I'm not sure. A real outage of six or eight minutes occurred one morning two weeks ago, and she was witness to it, but I had failed to instruct her on how to plug the monitor into the UPS just long enough to shut down Windows. The time on the little batteries was too much, so it died.

Now this really isn't bad on the surface. My own experience is that the worst you can do to an electrical device is to blip it off and back on; characteristic of our one second power blips. So it had been doing a good job up until now. Not having the monitor on the backup is normal; it just shortens the time that the CPU is backed up because of the additional load. Under these circumstances the best thing to do if you're sitting there and it looks like the power will not be coming on soon is to just power the system down after waiting for the hard drive activity to settle out. What you don't want to happen is for the power to blip out while the hard drive is writing to the disk, and that's what the UPS is good for, even a little one.

So she powered everything down and went on to work. I was first to the PC that evening, and saw that there were several lights blinking on the UPS, so I switched it off and back on, and now not only were all the lights blinking, but also it was making a low, short, regular alarm sound. So I disconnected everything from it, unplugged it from the wall, and it was still blinking and beeping. I set it down on the formica counter and then noticed it was warm, and, as the evening went on even warmer, so I had to take it outside so in case it burst into flames it wouldn't burn the house down!

It was dead in the morning, so later I dug the receipt out and called them long distance (no 1-800 number) for an RMA number. The guy was OK with me I guess, after I assured him that the only thing that was plugged into it was the CPU and the answer machine power cube. I gained some respect from him there I think, so he gave me the address to ship it and to put a note "possible internal short" (Hah! Definite Internal Short in my opinion!) on it. I pleaded a bit that I needed him to ship me the replacement **now** because I'm in the lightning capital of the US at the beginning of lightning season and I can't survive two or three weeks without a UPS! No, my guess is that the call center he is in is somewhere in the desert maybe and he's never seen a lightning storm. So it has to go by "trackable" carrier, which for those who know where I live is about a 45 minute trek through town to the guys in the brown trucks.

By the way, why doesn't the postal service know where my stuff is? Now I'm talking like Andy Rooney.

(UPS……..Continued on page 10)

FAT 32 and SexHeaven.com

By William LaMartin, Tampa PC Users Group

Here are a few loose items from my month of computing in June. There were far fewer problems this month than last.

FAT 32

First off, in the last newsletter I noted that I had installed Win 98 on my main desktop after having some problems that necessitated the reinstallation of the operating system. That gave me an excuse to move up to 98 on that machine. This month, since I was running a bit low on space on my C drive, having to religiously delete unneeded files in order to maintain 200 – 300 MB of free space, I decided it was time to convert that drive from FAT 16 to FAT 32, moving from 32 KB clusters (the smallest allowable block of data) to 4 KB clusters. The idea is to recover a lot of wasted space. And it worked. Under FAT 16, I had 232 MB of free space; after the conversion I had 888 MB—quite an improvement.

But the conversion was not without problems. Windows 98 has a FAT 32 conversion program in its System Tools that does the job. As usual with such things you are supposed to stop all running programs before starting. I forgot about the virus scanner, and a few minutes into the process I received the message "There is not enough memory to convert the drive. Edit your ConfigSys and your Autoexec.bat file……". I was being asked to remove any programs that were started in these two files. McAfee virus scan was the only one, and I put a REM in front of the pertinent line to stop it from loading.

Starting the conversion process again, I got the same message. Of course, there was nothing now in those two files to start, but just in case the process got into the Windows' part of the boot, I removed everything that was in the Windows' startup folder and everything set to run in, I think, the Win.ini file. That should have taken care of everything. But it didn't.

The same message appeared, but this time I had paid attention to what was scrolling on the DOS screen as the computer booted. And I saw two file names go by. One was C:\Tools_95 \guest.exe and the other was C:\logitech\mouse\mouse.exe, the first dealing with my Zip drive and the second dealing with my Logitech marble. I could find nowhere that they were loading from, but I knew how to stop them from loading—I simply renamed both of them temporarily. After that the FAT 32 conversion was happy and did its thing, taking about an hour to convert a 2.1 GB C drive. When finished, I changed the two file names back to the correct ones.

SexHeaven.Com

The second thing of note last month was a Visa charge of $59.95 to DMR* info@4hlp.com that I didn't recognize. There was also an 800 telephone number after the name so I called it and was informed of the company name, which I can't remember. I do recall that they said that they were a clearing house for Internet charges made to various online companies. I said I believed they had a charge for me that I hadn't made. No problem, they said, just give us your account number and we will see to whom the charge was made. I did and was informed that on a certain date I had made a charge of $59.95 to SexHeaven.Com. Not I, I said. Oh, she said, it looks here as if the company has already issued a credit (probably exactly when she got my phone call), but you should contact your Visa company just to make sure. I, of course, contacted Visa, and they eventually sent me a print out showing that DMR* info@4hlp.com had issued a credit.

The question is, how did I get charged in the first place. Worst case scenario—my card number, etc. had been stolen from an Internet transaction. That didn't seem likely, since just one incorrect charge had been made. On the other hand, the speed of their "credit issued" announcement implies these "errors" are frequent. Nonetheless, my guess is that a transaction for someone else was simply keyed in wrong and their credit card information was just a digit or two different from mine. So check out those credit card bills. If you enter everything in Quicken or Microsoft Money, you will know what is yours and what isn't.

Computer prices

My most recent purchase brought home how much we in the computer world have benefited from falling prices—should I say plummeting prices. My laptop came with 32 MB of RAM, and I thought that should be enough, but during the previous Internet SIG I had a half dozen applications running—FrontPage, Corel Draw, PhotoPaint, Family TreeMaker, Microsoft Word, and Internet Explorer and then started a conversion of a Word document that was close to .5 MB to an HTML document. Something went wrong and the computer hung. I don't know if memory was the culprit, but a couple of days later I purchased an additional 32 MB. The price was $99. Less than two years ago, the 32 MB I purchased for my previous IBM ThinkPad cost around $350.

Memory, hard drives, monitors; the prices of everything in computing (except Internet stocks) is dropping like a rock. A year or so back, entire systems that would do what most users needed dropped below $1,000, then to $600 more recently—and now to nothing. That's correct—nothing. Well, almost nothing; you have to purchase three years of Internet service for $20 per month. This final offer reminds me of the old Polaroid camera pricing. They sold you the camera very cheaply, then you had to buy the special film at their usual high price. Except, here I am not sure what the equivalent of the film is. Is it the Internet service? Today $20 per month is sort of the going rate for the usual ISP. But what about two years down the

(Comments.....Continued on page 10)

Special Interest Groups

Internet SIG

This SIG meets the first Monday of the month at 6 PM at the Reflectone Building, off West Waters Ave. You must sign up to get on the list and to get by security. Contact Mike Hodges at hodges@reflectone.com. For directions, see the map at our web site or contact Mike Hodges.

We consider all topics concerned with creating web sites. We study sites of interest from the web and those created by members of the SIG. And, in general, we consider anything of interest concerning the Internet. There will be no meeting in July, since it would have been right after July the Fourth.

Genealogy SIG

This SIG meets the second Monday of the month at 7:00 PM at the Museum of Science and Industry. *Contact Jenny Lind Olin at 960-5723 or Ford Bond at 987-6309.*

Visual Basic SIG

The VB SIG will not meet in July.

This SIG meets the third Tuesday of the month, at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6 PM. For information, contact Merle Nicholson at merlenic@tampabay.rr.com.

Last month, we reviewed the surveying program mentioned last month and then took a quick look at a VB program that queries a web site for information.

(Comments……Continued from page 9)
road? If the rate drops to $10 or nothing (if you are willing to look at an ad on each page), then signing up for three years to get that computer may not seem like such a good deal. Especially if you could then get twice the computer for $200.

Why can't auto parts follow the same price decline curve as computer parts? Every time I spend a small fortune on the simplest auto repair, I think of all the nice computer doodads that I could get for the price of the repair parts. Sometimes it would be an entire system. Perhaps the government should investigate auto parts pricing instead of Microsoft.

Office 2000
Office 2000 is out, but I am not jumping at it. The problem is that I use every one of the programs in the most costly version, Office 2000 Premium: Word, Excel, Access, PowerPoint, Publisher and FrontPage. All are working fine now, so I will wait and collect opinions and comments from the Usenet newsgroups concerning the various components before jumping on the 2000 bandwagon. I am particularly interested in the changes to Access and FrontPage.◆

(UPS……Continued from page 8)

So I'm waiting. I mailed it 10 days ago and I expect it will be another ten days, and in the meantime Valerie has to go back to unplugging her PC – the best surge protection of all, as we well know. ◆

Getting your Freenet email — from anywhere

By Don Patzsch, Tampa PC Users Group

Perhaps you will be in another city some day and want to read your Suncoast Freenet email. If you do not have a computer with you, you may go to the library and read your email there for free. We have done this in Phoenix, Los Angeles, Portland, Seattle, etc. Most large cities have many computers on the Internet now, and they allow public use, even for nonresidents.

How do you go about it? Ask the librarian if they permit you to read your email on their computers. They may put you at a desk and give you a temporary name and password. You may then bring up Netscape and type in telnet://scfn.thpl.lib.fl.us in the "location" line. This will take you to the Suncoast Freenet. I get half of my email there.

If you want to try this out now, get on the Internet and if you have a copy of telnet either on your machine (Windows 95/98 have it) or the server you work through, just type the above, or whatever URL you want to go to, on the "location" line in Netscape. I do not use Internet Explorer so I can't tell you how that would work, but it would probably be the same.

When I am on my ISP here in Tampa, I bring up Netscape and type in that FREENET URL above and use the telnet program. I can use the email service on the ISP's location also; I just tried that here at home once more to be sure you can do it if the circumstances allow. ◆

ter! It doesn't have to be top quality. It can be on an everyday subject, something that you do or have experienced during your time on computers. We need much, much more material. If twenty five of our most loyal members would write one article a year, we could lighten the burden for a few dedicated members and increase the diversity of subjects.

I'd like to thank our member and secretary Jim Weber for an outstanding talk on MPEG-3 last month. It was just outstanding. I enjoy home-grown presentations as much as the outside speakers.

I need to remind you again as always … we need to bring in new members. Remember there's a prize for bringing in the most members. So harass your friends and neighbors, make a nuisance of yourselves and drag some new faces in.

See you at the next meeting. Merle Nicholson ◆

President's Message

By Merle Nicholson, President, Tampa PC Users Group

This month I'd like to give some well deserved recognition to MOSI for supplying our meeting facilities. We first made contact with the organization through Ford Bond, who is still our MOSI Liaison and a member of our Board of Directors with full voting rights. In addition to coordinating the facilities, he has proved to be a valuable voice in Board discussions. We owe Connie Kincaid, our former TPCUG president, our thanks for the initial arrangements.

I'd also like to thank Jan Luth, Director of Education at MOSI. I've spoken to Jan a few times and I'm delighted to say that we have a commitment from Jan of her continued support at MOSI. We are very lucky to have this support; it would be very difficult to match these facilities. It's not only the right size for us, but also the projector and PC interface are absolutely invaluable.

And again I'd like to mention that Ford has been with us unfailingly. He not only joined the club, but he's been there month after month for us. Thanks, Ford, and thank you, MOSI. ◆

September 8: The meeting topic is yet to be announced — Check the web site later.

Minutes of the June Meeting

By Jim Weber, Secretary, Tampa PC Users Group

Merle Nicholson started the Windows SIG at 6:00 PM. One of our members has had a problem with his AMD 233 processor causing blue screen crashes. It turns out the CPU fan was the culprit. AMD has a list of recommended fans to use with its chips listed on their web site. Windows 98 second edition is now available, but some compatibility issues have been seen in newer hardware. If you plan to upgrade, make sure you have the newest drivers available for your computer components.

Merle started the general meeting at 7:00 PM. He announced the upcoming elections in December. Anyone interested in becoming the group's next president please speak up. Merle also reminded the members present about the membership drive currently under way.

David Henry of Senior Net spoke briefly to the group about his organization. They provide computer education for older adults at the USF campuses in Tampa and Lakeland, as well as the Science Center of Pinellas County in St Petersburg. They are currently looking for volunteers to assist in their training programs. They meet for 3 hours in the daytime only, and classes are 4 to 8 weeks in length. If you would be interested in assisting, please call (813) 974-8037 or 974-5263.

Mark Komula of Network Technology Solutions gave a presentation on home networking. He passed out some network cards and explained briefly about how they connect together. An advantage of home networking can be the sharing of peripherals such as printers, external drives, or scanners. Software can be shared over a network as well, saving the cost of buying several different copies of a program that only one person will use at a time. Internet connections can be shared over the network, too, with only one computer needing to be connected to a phone line at a time.

Mr. Komula also discussed ADSL Internet connections. His company provides ADSL connections and service. They offer a guaranteed 256K dedicated connection for $50 a month with an installation cost of $200, which includes a network card and an external modem connection. ADSL works with existing copper phone lines, but the line into your home is split. This means you are not adding the recurring expense of adding a new phone line. Unlike Roadrunner, there is no additional cost to connect to a business account. If interested, their web site is http://www.net-techno.com.

The meeting ended at 7:40 PM. ◆

Mijenix Fix-It Utilities 99

By Don Patzsch, Tampa PC Users Group

An evaluation copy of the program arrived on July 8. I installed the two suites of programs that are included, Fix-It Utilities 99 and Powerdesk Utilities 99. The programs install easily and work well.

When I receive a program, the first thing I do is read the manual, and this manual is over 200 pages, which should tell you there is a lot of valuable material here. These Utility programs will also work with Windows NT; others don't.

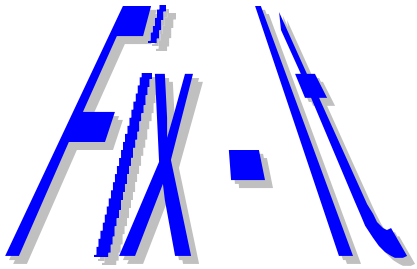
Here is a list of the qualities of Fix-It Utilities 99 as shown on the shrink-wrapped cover.

1. Crash protection. Computer programs do crash. Computers also do crash. You can set Crashproof 99 so it is always on. If a crash were to happen with your computer, this can help you save data, even if no one is around to help you. The manual tells you about the program and how to set it "always on".
2. Disk Defragmentation. Defrag Plus defrags your disks. It gives you a neat graphic as it works.
3. #1 Registry cleaning. When you bring this up, there are a number of options. Run fixer and you will see any number of items you may want to remove from the registry. Other registry views are provided for.
4. Virus protection. One free year of updates is included. Good anti-virus protection, but there was not a convenient A/V disable feature that appeared on my computer.
5. Hard Disk Fixer. Checks individual boot records and header data against the master boot record. NTFS, FAT, and FAT32 disk repair. There are too many detailed areas to enter for me to write them all up here.
6. Hardware Diagnostics. System diagnostics are provided in greater detail than any other program I've seen. A year 2000 checker is included to make sure your computer is Y2K compatible.

Installing the program is simplicity itself. Running the program consists of clicking the icon on the desktop. A menu comes up that includes Fix Wizard; Disk and Files, Optimization and Repair; System Registry, Registry Repair and Clean; System Diagnostics, Hardware and System; and lastly, System Protection, World Class Protection. Clicking on each headline takes you to a sub-menu for that category.

Going through these menu items, I found Undelete Plus. The list of files on my hard disk that I could recover with this utility is unbelievable.

A startup disk can be created to allow you to start up if the hard disk crashes. Also, an Emergency Rescue Disk comes with the program. This disk has a Help section that displays a text file to give you hints as to what to do next when something has gone wrong. Disk Snapshot is a program that writes out your FAT table and boot sector and stores it in case your rescue disk needs help in recovering data.



A manual is included in the program to be there if you have a crash; it will assist you in using the rescue disk and the startup disk. It includes much more than just that, but what a nice thing to have if a real crash occurs when no one else is around.

An update program takes you to the Mijenix site and allows you to update your programs components.

I put the program on a computer with a bad internal modem and when I checked COM1 in System Check, a large red X appeared on the modem menu, in contrast to the checks on the other items listed. In the Diagnostics Suite, you can look deeply into the motherboard, memory, or hard drives. It makes it easier to decide if you have a software or a hardware problem.

Before this review gets too long, let me point out that the program PowerDesk is included on the CD ROM. This is a program that offers powerful file viewing, file removal, and also a graphics conversion utility that has provisions for 19 graphic formats. We reviewed the PowerDesk Utilities 98 in the July 1998 issue of Bits of Blue. (Yes, I save all the old copies, from years back.) An email attachment decoding feature is included. With PowerDesk, you can set up two Explorer windows so that it is easy to drag and drop between them.

Fix-It Utilities 99 is a suite of programs. To go into detail on all the various features included would make this review way too long. I recommend this suite over the competition (Norton's System Works, Nuts and Bolts98, First Aid 2000) as it is easy to use, and the various components have similar interfaces. The cost of this program (including the $30 street price PowerDesk Utilities) is $40 to $50. The Mijenix Company can be contacted at 800-645-3649 or http://www.mijenix.com. ◆

More Power !
New processors from AMD

By Merle Nicholson, President,
Tampa PC Users Group

The latest announcement from AMD is the new Athlon, claimed to be the most powerful processor ever for the x86 market. But this article is about the almost-latest of AMD's processors, the K6-3. It has some features that are unique and not available in any other processor. Its biggest claim to fame is that it works in all recent Socket-7 motherboards. Socket 7 is the technology started by the Pentium processor when it first came out. You won't see much of the Pentiums on the market, but they're still manufactured and available today at very low cost. Most of what you can find on the market are Celerons, the Pentium II and III (in the Intel world anyway).

The K6-3 is supposed to be the successor to the K6-2, but both are being manufactured today, with the cost differential being more than $150. The K6-3 is available in 400 and 450MHz versions, with 475 and 500MHz versions coming soon.

Warning - Geek paragraph ahead. If it hurts your brain, skip this, and go to the next paragraph: The K6-3 is unique in that the processor contains a large second level cache memory (in addition to the first level cache) ***ON the chip***. There are two 32KB level one caches, and then a built-in second-level 256K cache. AND it supports up to 2MB external cache on the motherboard. The Pentium II and III have two 32KB caches only; but the Celeron has two 32KB, plus a 128K L2 cache on the processor board, running at half the clock speed.

Cache is simply very fast memory. It is essential to running the processors at speeds so very much higher (up to 5.5 times) than the main bus speed. So the cache acts as a "bucket" for data, because the processor pushes it out faster than the bus can handle. The idea is that the processor, being so powerful, can spend its time **predicting** what it's going to be asked to do next, and then doing it, in hopes that when the bus asks for it, the data will already be there. And this is a very successful way to do it. So it may follow that the bigger the memory cache is, and the more successful you are at predicting, the faster the computer will be.

There's more to it than this. If you're interested in learning more, I'd suggest going to http://www.mkdata.dk/click.

The new PC

So to experience first hand what the K6-3 is all about, I built one a few days ago. I'm using it daily, and I have just a few observations to make about speed. But first, back to cache, sorry. Besides the Level 1 and 2 cache, the processor will support up to 2MB of Level 3 cache. Now with the K6-2 and Pentium II and III, that memory would have been called Level 2, because there are only two, one set on the chip and one on the motherboard. The Celerons all seem to have one set on the chip and one on the processor module.

The motherboard

So for a motherboard designed for the K6-2, when you put a K6-3 on it, it actually makes three caches available. I was able to find a motherboard with 2MB of onboard cache. It's an interesting board in that it has no ISA slots and no slots for SIMMs. Just one AGP video and six PCI slots. That's OK; there's nothing in ISA that I can't get (or already own in this case) in PCI. It's an ATX configuration (as opposed to the older Baby-AT form).

The case

ATX boards must have a different case. It's usually about 1" wider; most are a couple of inches taller than a typical Mid-size AT case and two inches deeper. ATX boards are taller, narrower, and they use a different (and easier to plug in) power connector. And all the external connectors are made right on the board, so that they extend out the back of the case: keyboard, mouse, USB, serial and parallel connectors.

Putting it together problems

So this was pretty easy to put together because the ATX case is so large and has plenty of interior room. I did have one major problem though. Usually when I build a new machine, I set it up on my bench before actually putting it in the case. This is just to resolve any issues with the board, and it usually pays off because you have to get settings right on the board – moving jumpers around - and doing that outside of the case is easier than after it's inside. But this time I did not because I don't have a bench power supply with ATX connectors on it, and because I was in a hurry to go sailing that evening. And wouldn't you figure, I powered it up, and everything is dead. No beeps, nothing on the screen, just nothing. But I do have a little diagnostic card I can plug in and detect fundamental problems. But NO! The card plugs into an ISA slot! I don't have any!

So I did 45 minutes of dismantling all my work one piece at a time to see if I had a bad component plugged in, and substituting some things I had lying around and still I had a dead system. So I left to pick up some things and came back with a fresh mind, remembering that I hadn't pulled all the small wires off the board that do things like power the LEDs on the front and the reset button and the power-up switch. So I just

(AMD.....Continued on page 5)

(AMD……..Continued from page 4)
yanked them all off except for the power switch and … it worked! So I put it all back together and got the system running all OK. So finally I started putting the little wires back on and discovered that the thing that made it fail was the reset switch. The case manufacturer had wired it wrong so that it was normally closed instead of open. It was like you stood there with your finger on the reset switch all the time!

So .. How's it work?

Fast ! Don't ask me why, but I now own an AMD K6-2/400, a K6-2/300, and my server is an older IBM PR166+, and now I have this new AMD K6-3/450! I was of the opinion that you had to double the speed of a system for a subjective comparison, that with anything less than that you wouldn't notice enough of a difference. So my expectations weren't real high that I'd see the difference, but I'm very happy to report that it's (subjectively) faster than anything I've used, including Pentuim II 500's. AMD's published benchmarks bear this out, but, after all, it's *they* who are publishing the numbers. Even their own benchmarks show that the floating point speeds do not equal any comparable Pentium. And other benchmarks I've seen show a higher disparity – for floating point. But for what I do – Visual Basic and Access program development, it's just amazingly fast.

Now, what I need maybe is a faster hard drive for my new system. ◆

SETI at Home

By Merle Nicholson, President, Tampa PC Users Group

Everyone knows what SETI is? Right? The movie *Contact*, if nothing else. No, SETI wasn't made up for Jodie Foster. It's Search for Extraterrestrial Intelligence. And that big radio telescope antenna in Arecibo isn't made up either.

SETI has been receiving data from that antenna for a long time now, and receiving data at a very alarming rate. All that data must be processed by computers. The data is processed to look at patterns that may suggest that they were sent by intelligent beings in other star systems.

A couple of years ago someone had a great idea that there are millions of computers out there with far more computing capacity than would ever be needed to do the job. Your PC and mine, all interconnected by the largest distributed network imaginable – the internet.

So that's what I'm doing right now. My PC has been contributing to that process by analyzing a half megabyte of data from the SETI antenna captured Wednesday, Jan. 13, 1999 at 17:31:49 GMT. There's a wonderful graphic of the process on my screen giving the progress. So far my PC has worked on this data 39 hours, 45 minutes and 50.0 seconds, and it is 71.425% complete.

When it's done, the data results will be sent back to the originator and set back into a database, and I'll receive my next chunk. Also, a credit in computer hours will be logged into my account with them. They've promised that if I find any sign of extraterrestrial life that I'll be given some credit for doing all the hard work!

The program runs in two modes; as a screensaver and as a background process. I have an AMD K6-300 that I'm running this on, and it doesn't seem a burden as I write this. They do warn you, though, to run it as a background process you should have 64MB of memory to limit the page swapping. The screensaver mode needs less memory.

Now I'm not going to upstage these people by giving you all the history. You need to go to the web site and look at all the fascinating information there; but I'll give you a couple of highlights. There are 355,750 active contributors. There are 910,000 total users, with 80,000 new contributors signed up in the last 15 days. 1E+07 total number of results received... let's see … that's 10,000,000, isn't it? And last, more than

(SETI……Continued on page 12)

Visual Basic 6.0

By William LaMartin, Editor,
Tampa PC Users Group

I have used Visual Basic since version 1, missing only one version update along the way, I think. I need to see a need to update, like a collection of new and useful tools. At first Version 6 didn't seem to offer that much in the way of an improvement over Version 5, so I programmed along happily with Version 5. And quite possibly if you are not interested in improved database connectivity or Dynamic HTML, you would gain nothing from upgrading—except that an upgrade to Version 6.0 should solve all of the problems some of us have with incorrect versions of some of the VB controls creeping into our computers.

Many of you will recall my writing in this newsletter about problems caused by programs I installed overwriting certain OCX files (the ActiveX VB controls) on my computer, resulting in VB not being able to use the control—or I couldn't get help for the control. The solution was to unregister the control, delete it, find the correct control, copy it to the hard drive and then register it. It happened so many times I got fairly good at the routine. With VB 6 on my computer this problem should go away—until VB 7 is released, causing problems for VB 6.

Another advantage of VB 6 would be the correction of many problems in VB 5 without the use of service packs. I think I was up to service pack 3 on VB 5. There are service packs for VB 6, but they don't seem as necessary.

With the above in mind and the promise of improved database tools like being able to create data reports in VB (like Microsoft Access reports), I installed VB 6 on my desktop computer. At least I tried to install it. Everything went smoothly until the end of the installation when I received the two messages, **"The version of resource DLL MSDASQLR.DLL is not valid" and "MSDASQL.DLL was unable to register itself in the system registry"**. Such problems seem to plaque me. It is the persistent problem of different versions of DLLs.

I looked at these files on my computer and the files appeared the same as on the installation CD. To try again, I renamed the offending files so the installation wouldn't see them and ran the installation again—with the same result. Time to try another tack. I searched Microsoft's Knowledge Base and found only that the files had to do with Microsoft Data Access Components. I then checked my laptop and found newer versions of the same files. After copying them to my desktop, the installation went fine. I can't explain it other than to guess that these newer versions were on my desktop before the installation (having been put there by some unknown piece of software) and registered in the registry, then the installation replaced them but was unable to subsequently register the files it had replaced them with. I don't really understand the registering of DLLs, etc, other than you do it with the program REGSVR32.EXE and that I seem to have an inordinate number of problems with incorrect DLL and OCX versions.

Anyway the problem was solved, and VB 6 was installed. So what can I do now that I couldn't do before? First, let me tell you about what you can do in Visual Basic, in general, then I will address what version 6 has added.

With VB I have written programs to:

- Transfer files via a serial port connection from an Apple II e to a PC
- Open text files and modify the text
- Use Dynamic Data Exchange to import and export data between running Windows programs.
- Construct a sound recorder/player (use it to try to teach your bird to speak)
- Create programs to teach children to read a clock, learn musical notation, practice arithmetic
- Serve as a terminal program to communicate with a BBS
- Check if my Internet mail server has any mail for me
- Check the current IP address of an Internet connection
- Batch verify the correctness of mailing address via the Postal Service Internet site
- Calculate mortgage payments and display a payment schedule
- Solve a system of linear equations
- Parse text to perform an arithmetical operation indicated by that text
- Run a WebCam
- Make a grocery shopping list from items I choose and display it in the order of the store I choose
- Open a database and manipulate the data, e.g., parsing out the separate street address, city & zip from a combined address field
- Open a genealogy GEDCOM file and store the data in a database
- Create the HTML code for a web page with data from a database table, e.g. the links page at TPCUG.ORG
- Create a label printing program using addresses from a database

VB is a great tool, but you have to use it in order to learn it—something I stress in our VB SIG. In fact, there is also a learning edition of VB—much cheaper than the VB Professional version I am writing about—that I am endeavoring to get a review of out of one of the SIG members who is using it. I recommend a beginner purchase this first to see if they really have a taste for VB before investing over $400 in the Professional Version.

(VB.....Continued on page 8)

(VB.....Continued from page 7)

VB is object oriented and event driven. It is nothing at all like your old BASIC programming tool. The code you write to go along with an event is, however, similar to code you would have used in BASIC. Everything in VB is an object, and an object has properties, events and methods associated with it. A VB program starts with a form (itself an object with properties, events and methods). On that form you may place other objects which are called controls, e.g., a text box, list box, command button, or timer.

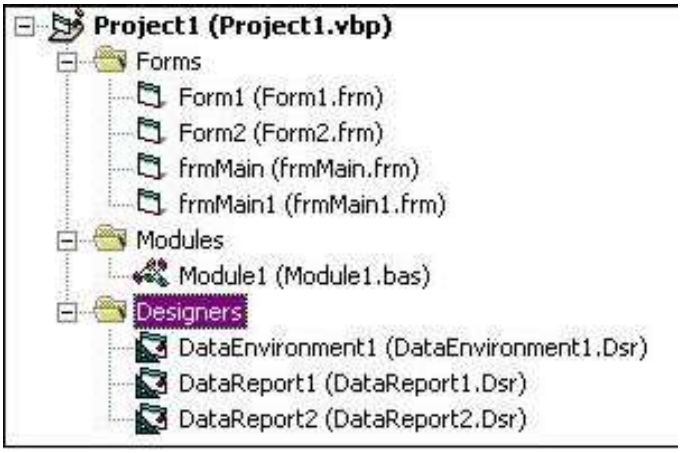
The following screen capture is of a form with a text box and command button showing, and a Timer control that is hidden.

The text "Thanks" in the text box is the result of pressing the command button. This is called the click event for the button, and its associated code is the simple subroutine:

```
Private Sub Command1_Click()
Text1.Text = "Thanks"
End Sub
```

So by causing the click event for the button object we changed the text property of the text box object.

The time and date printed across the bottom is actually a label whose caption property is changed every second (a timer event) to reflect the current date and time.



So in this very simple example, a timer (which is an object) event causes via the code below the caption property of the label object to change to the current date and time.

```
Private Sub Timer1_Timer()
Label1.Caption = "The date and time are " & Now
Label1.Refresh
End Sub
```

A full grown VB program will have numerous forms, with each form having numerous controls. To achieve the goal of the program you will have to write code for the various events that performs the manipulations and calculations needed.

One goal of VB 6 is to reduce the amount of code you have to write to interact with databases. To accomplish this it has added several new items: the **Data Environment, Data Reports and a VB Data Form Wizard**. See the screen shot below for the Project Explorer display of these new items.

The Wizard will create a form containing a data grid displaying a table from your chosen database along with buttons for updating, adding, deleting, etc. the records. The Data Environment is a bit more complicated. It allows for creating several data connections and within each connection you set up various "Commands" corresponding to the tables or queries in the connection. Each Command can have child commands. The goal is to set up your commands (tables/queries/SQL) so that VB can then create a Data Report based on a command and its child commands that will resemble what you could do with reports in Microsoft Access.

This is a nice addition. Such reports could not be created in VB 5, and it is at least 50% of my reason for upgrading. My problem at present is to get these VB Data Reports to do what I can get such reports to do in Access. If I make my report a little complicated it doesn't turn out as planned—for example, two levels of grouping of the report data. I assume this is due to my ignorance, and that, as with Microsoft Access, I will eventually learn how to accomplish the desired results. What is frustrating is the lack of examples in Help (only one. and it doesn't go far enough) for doing the type of thing I want to do.

VB Help, in general, is quite good, and you are going nowhere with VB if you don't learn how to use it, but it seems to fall

(VB……Continued on page 10)

Hardware Summary
HP OfficeJet R 80
Color Copier / Printer / Scanner / Fax

By Larry Anders, Librarian, Tampa PC Users Group

Well, there is a Santa, and sometimes Christmas comes in July, at least at my house. I had been waiting a few weeks for Hewlett Packard to finally release their latest line of ***All-In-Ones*** (AIO). They were three to four weeks behind according to my calculations, but that may be just because I was anxious to get my hands on it.

A couple of months back I was visiting our local computer superstore on a day that the Hewlett Packard (HP) representative was showing his wares. I was real impressed with the Model R 60, which was HP's current all-in-one on the market at that time. I have always been a little leery of AIO's in the past because I was concerned that if they put all of those features together on one machine quality would suffer. Well, not from what I saw with my hands-on testing. After that I was hooked! My only regret was that there were no faxing capabilities in either the R 40 or R 60 models. The HP representative then proceeded to give me the brochure on the new Model R 80 due out in July. Well, as he promised it hit the streets in July, but to my chagrin it was the end of July, not the beginning. So you see, having to wait those extra weeks was just like having to wait for Christmas. Okay, so what is it and what does it do? Here goes…

Just as the title implies it's a color copier, printer and scanner with a built-in, stand-alone fax machine, and it's fast! The integrated copying, printing, and scanning functions work together with no apparent compromises in quality and/or performance. There is excellent photo-quality color printing on any paper. HP uses PhotoREt II color-layering, a technology that mixes colors to create millions of other colors. The flatbed design gives you a full page of optimized scanning with a cover that adjusts upwards to allow for easy scanning of books and magazines, as well as a single sheet of paper.

The printed result is very professional looking for reports and other documents because of the 600 x 600 dpi for black text and color printing. As I said earlier, it is very fast for its inkjet design with speeds up to 11 ppm for black text and 8.5 ppm for color print-outs. It also prints on a wide range of paper types and sizes including letter, legal and A4 sizes: plain, transparency, photo, envelopes, labels, cards, and iron-on T-shirt transfers.

It has a very easy-to-use control panel with walk-up, one-step scanning at the push of a button. In fact, your computer does not have to be on for color copying or faxing. HP's state-of-the-art technology with PrecisionScan simultaneously scans and optimizes photos, text and line art within a single document. There is built-in Optical Character Recognition (OCR) software that automatically converts scanned-in text into editable text. Scanned images are brought in at 600 x 2400 dpi optical, up to 9600 dpi enhanced with 30-bit color and 8-bit grayscale (256 levels of gray). You can insert images directly into most Windows applications and the scanning and copying can be hands-free because of a 30-page automatic document feeder.

Excellent copies can be made in color or black and white (grayscale) at the same speed as the print-outs: 11 cpm black and 8.5 cpm color. Along with the 30-page automatic document feeder for unattended copying, HP's advanced CopySmart II includes features such as clone, poster, mirror, auto-enlarge, super zoom, and 2 on 1 copy modes, reduction and enlargements from 25%-400% and multiple copies up to 50 or 99. It also copies legal size documents in black-and-white only.

It has an easy to use plain paper fax with the quality results you'd expect from an inkjet printer. There are 12 one-touch dial-keys and 100 speed dials for quick dialing. The 30-page document feeder also works while faxing for unattended multi-page faxes. You can send and receive letter and legal size faxes and there is a 100-page memory with automatic redial.

It comes with black and color ink cartridges, a bi-directional cable (IEEE 1284C), HP OfficeJet R Series software on CD-ROM, HP PrecisionScan software, OCR software (built into the HP PrecisionScan software), Adobe PhotoDeluxe Business Edition software, and KMT Office in Color templates for use with Microsoft Office 95, Office 97 and Office 2000.

System requirements are: Windows 95, 98, or NT 4.0, Pentium 166 or higher recommended, 32 MB RAM (64 MB of RAM recommended for Windows NT 4.0), 50 MB free hard disk space for HP printing and scanning software (210 MB for all in-box software), 256-color SVGA monitor, CD-ROM drive, bi-directional parallel port dedicated to HP OfficeJet (included).

It lists for $799 but you can get it for less if you shop around, especially on the Internet, and it should be in the discount warehouse clubs by the time Christmas really comes around, but I couldn't wait that long!

Although I purchased this for personal use in my home, it would make a perfect All-In-One utility for any small office or home office (SOHO) and I understand it networks well. I couldn't pass this one up.

Warning: On my system anyway, Norton AntiVirus Auto-Protect had to be disabled on the Taskbar to be able to scan. HP's tech support knew nothing of this problem. ◆

Special Interest Groups

Internet SIG

This SIG meets the first Monday of the month at 6 PM at the Reflectone Building, off West Waters Ave. You must sign up to get on the list and to get by security. *Contact Mike Hodges at hodges@reflectone.com.* For directions, see the map at our web site or contact Mike Hodges.

We consider all topics concerned with creating web sites. We study sites of interest from the web and those created by members of the SIG. And, in general, we consider anything of interest concerning the Internet.

Genealogy SIG

This SIG meets the second Monday of the month at 7:00 PM at the Museum of Science and Industry. *Contact Jenny Lind Olin at 960-5723 or Ford Bond at 987-6309.*

Visual Basic SIG

This SIG meets the third Tuesday of the month, at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6 PM. For information, *contact Merle Nicholson at merlenic@tampabay.rr.com.*

Neotrace 2.02

By Brian Lance, Tampa PC Users Group

Looking for a way to see what is where on the net? Wondering just why the page you're trying to reach is *so* slow? Would you like to visually comprehend the distances involved in net traffic? Look no further than Neotrace!

This tool was recommended by my ISP, and I have found it useful for many different things. Tracking down junk mail is one major point in my current online activities. Getting the best game server and finding alternate download locations are others. I can only guess at the various uses for this remarkable tool - like network health, locating customers/subscribers, network load/planning and security.

The latest version (2.02) includes geophysical mapping, locating on a modified Mercator projection each node along the route. Nodes that report geographic data - from RFC 1876 - show as different symbols than those derived from Zip code or address information. You also have the ability to add locations stored in a local file.

Features include the ability to ping 5 separate traces at once, graphical nodelist, tabular nodelist (exportable) and minimum/maximum/average display of ping times for each node. You can configure the display of nodes, latency, how often to ping, sounds and others. All of the screens and configuration dialogs are shown on the web site.

I applaud Neoworx's stance on spam. There is a simple tutorial on looking at email headers, just the thing for tracing that multilevel marketing spiel, after getting it the tenth time. The tool is easy to use and great fun, also. The things you can look up are amazing! After tracing a few addresses like my ISP, I decided to look up something really interesting: lamartin.com. The network info? I leave that exercise up to you. Hint: it has something to do with Constantinople...

Neotrace is currently 1.13MB and sells for $29.95.

down as concerns the Data Reports, as it did with the Internet controls in VB 5. As an aside, I originally moved up to VB 5 to gain the ability to access WWW and FTP sites with VB programs. As regards the Help format, it is now like viewing a web page. What I don't know yet is if VB 6 includes a tool that will allow you create this new type of Help file for your own project. At present, I think not.

Finally, VB 6 enables you to create Dynamic HTML applications. DHTML applications allow you to write Visual Basic code to respond to actions on an HTML page without transferring processing to the server. There is only one drawback with

President's Message

By Merle Nicholson, President, Tampa PC Users Group

We have three months of very good programs lined up for you. Be sure to attend the meetings. We need you there very badly. The attendance is what speakers look at when deciding how to spend their travel money and what club to go to. It's as simple as this: if you don't attend, we can't get the speakers, period.

My wife and I just got back from a week in Seattle, where our son interned for the summer. So we got a chance to see the Microsoft "campus" a couple of times. It's kind of interesting, I guess, because it's just a collection of low office buildings, none of which was any better than the rest. I think to try to get an idea of its size you'd need an aerial view. In Redmond, where most of it is, there's an ordinance limiting building height so they won't show above the treetops. All are just three stories except where the buildings spill over to the south into the city of Bellevue, and they take a jump to four or five stories. One is planted squarely on the city line, and it's "stepped" from three stories to four

Minutes of the August 11 Meeting

By Jim Weber, Secretary, Tampa PC Users Group

Mary Sheridan started off our Windows SIG at 6:00 PM.

William LaMartin presided over the general meeting in the absence of our president and vice-president. He announced that we would be changing our web host, and he will keep us advised if there are any problems.

William gave a demonstration of Adobe Acrobat 4.0. This was not just the reader we all have access to online but also the full program necessary to create a PDF file for distribution. Acrobat comes in three parts: Acrobat, Distiller, and Catalog. Acrobat is naturally the main part of the program. This is where you can create new documents and edit and add functionality to existing documents. Distiller turns Post Script files into PDF files. Catalog indexes a collection of PDF files. William demonstrated how to turn an existing Microsoft Publisher document (last month's newsletter) into a PDF file. He then demonstrated how to set up links in the document so if you should click on a key word you will automatically go to the associated lines or pages. Finally he demonstrated using Catalog to make a searchable index of all the newsletters for the past three years.

William presented Charles Howe, who is moving to Virginia, with a framed certificate of appreciation for all his contributions to the group.

A copy of Adobe Acrobat was awarded to Clark Evans, and Brian Lance won a T-shirt. The meeting ended at 8:30 PM. ◆

(President……..Continued from page 1)
right on the line.

But Seattle in the summer is just a wonderful, alive place with gorgeous flowers and interesting parks and neighborhoods surrounded by water. It was hard to come back to 90 degree temperature and 90% humidity weather.

Back to TPCUG, remember that we need you to volunteer to serve in some capacity on the Board of Directors. Tag a Board member and ask what you can do for the upcoming year. You should not expect that this small band of good people would go on year after year serving your needs. The club is run by the membership, and that's **you.**

See you at the meeting on September 8th. ◆

HP CD-Writer Plus 820i

By William LaMartin, Editor,
Tampa PC Users Group

I am almost never the first to buy into new technology. How long have CD-Writers been out? Certainly over five years. I do remember the first ones I took serious notice of cost around $1,000 and wrote at a 1X speed and read at 2X speed. I think the very first ones were over $1,500. Furthermore the writable CD media was quite expensive. Didn't each such CD cost $10? Well, things have changed a lot now. The Hewlett Packard CD-writer Plus 820i that I recently purchased is a 4 speed write, 4 speed rewrite, and a 24 speed read. The drive cost $350, but if you go with another brand and a 2x rewrite speed and a little slower read speed you can probably get one for around $150. And the regular recordable (not rewritable) CD's are now under $1.00 each when bought in quantity.

Until recently I have really had no need for a CD-Writer, but since I started writing Visual Basic programs with database connectivity I have watched a typical VB program installation setup go from two 1.44 MB floppies to at least eight such floppies. Who wants to return to the days of feeding numerous floppies into the computer to install a program. So it's time to move on to installation via CD's.

Of course, CD-writers have other uses. The main one for me is data storage. I can now quit using 100 MB Zip disks to archive all of the images I have scanned in from photos, negative and slides. I can archive all my writing, spreadsheet, database, VB programming, Corel Draw, and whatever other files I can think of on CD. And one CD will hold the contents of six or seven Zip disks. You do the price comparison. A good price for a 100MB Zip disk is $10; a good price for a 600+ MB CD is $1. And $1 is less than $60. Furthermore, retrieving information from a CD is much faster than from a Zip disk. Zip disks, of course, still have their uses, such as backing up data that changes daily.

What else can you do with a CD-Writer. Well, you can duplicate audio (music) CD's if your second CD-ROM drive supports digital audio extraction. I think the newer CD-ROM drives probably all do, since my 1.5 year old 12 speed does. This feature is the primary reason for some I know to have bought a CD-Writer. Also, if you have the HP software mentioned below you can create a set of Disaster Recovery CD's that will restore your system to its current configuration.

As a test I used both the bundled Adaptec software *Easy CD creator* and the *CD Copier* programs to create copies of two audio CD's. The CD copier program is very fast . It took only 21 minutes to make a copy of a music CD. The copying was done without first testing and was done at 4x speed.

Using the *Easy CD Creator* software at 2x without testing, it took 53 minutes to copy a different music CD. So it appears that copying at 4x with no testing produces good results. So why test? I believe you use the testing feature if you think there might be a problem with the copying.

In fact, the first time I tried to copy a music CD using the *Easy CD Creator* I set the testing option. It got down to the last .4 MB on the last track after having run for a little over one hour (at 2x) and froze. The computer was locked up. So much for testing on that CD. The second attempt to copy that CD was what I described above as using the CD Copier program with no testing at 4x which took 21 minutes and was successful

But I have very little interest in copying music CD's. Possibly I will do a few for my car. I have more of an interest in getting the contents of my old LP records on CD. To do this, I first have to get the LP onto my computer's hard drive as a wave (.wav) file or a collection of wave files. That means I need some sort of sound recorder program that will record in CD quality. The bundled software that came with the drive called *Sonic Foundry Acid Music* will do this, among other things (the other things it will do I haven't had time to figure out yet). To simplify things, I simply recorded the entire side of the record as one wave file, not taking the time to do each song as a different file. Then I used the *Easy CD Creator* software to turn these two wave files into an audio CD, although the *Acid* program had a button to click on that was supposed to do the same thing. The process is fairly fast. The recording, of course, takes as long as it would take to listen normally to the record, but the transferring to CD goes much faster.

Another of the bundled programs is Adaptec *DirectCD. DirectCD* is a program that allows you to write files directly to a CD-Recordable (CD-R) or CD-ReWritable (CD-RW) disk in much the same way that you copy files to a floppy diskette or removable drive.

DirectCD lets you read and write your files directly to your CD with any software application that can read from and write to a drive letter. You can leave the CD in this format so that it acts as an extra drive for your computer, or you can close it and turn it into a CD that can be read by other systems.

You might note here that I haven't mentioned using rewritable CD's. Well I bought five such fellows, and my drive will use them, but with the price of the write-one-time

(CD-Writer.....Continued on page 4)

(CD-Writer.....Continued from page 3)
(recordable) ones being so much cheaper, I haven't yet found a good reason to try out the rewrite feature. I suppose they would be good for use in frequent backups of your data. If you were going to be backing up valuable files to CD every day, it certainly would make sense to use the rewritable media. Of course, I would still want to have a fairly recent copy of that same material on the write-one-time CD's since I have more faith in the readability of this type of CD if I should need to load it on a different computer with a different CD drive.

Below is a listing of the software bundled with the drive. For some reason, my drive didn't have the Broderbund CD, but that didn't bother me since I will use Corel Draw for anything that I might have used the Broderbund program for. As a point of interest, I scanned in an image of one of the CD label stock pages, imported it into Corel Draw as a non-printing layer and then made text and graphics for my CD labels with it as a guide. When finished I printed out the page containing two labels on the label stock. For the jewel case inserts, I used the HP provided software, since after a CD had been made *with Easy CD Creator*, the software was already aware of the separate tracks and their times.

The one thing I definitely plan do but haven't yet had time is run the HP Disaster recovery program to make a sufficient number of CD's to back up my system.

The bundled software, as described by HP, is:

- *Adaptec DirectCD and Easy CD Creator—Drag-and-drop your data, photo, audio, and video files for easy storage and access.*
- *HP Simple Trax—Automatically back up, index, and find your files.*
- *HP Disaster Recovery—Quickly and easily restores your hard drive files and operating system.*
- *CD Labeler—Create custom CD labels and jewel cases.*
- *Broderbund Multimedia Organizer—Choose from thousands of images, clipart, and photos.*
- *ACID Music Creator—Create your own compositions on CD.*

The site for the 820i is at http://www.hpcdwriter.com/products/fs_products.asp

A comparison of the various HP CD-Writer drives is at http://www.hpcdwriter.com/products/CompareSelect/compchart.htm. ◆

New Computer (and new things)

By Merle Nicholson, President, Tampa PC Users Group

As some in the club may know, I build computers in very small volume as a side business, and I'm always looking out for new products and ideas. I've built two of these particular PC's – one of them for myself, and I'm especially pleased with the results. It is certainly an extremely fast machine using the new AMD K6-3/450 processor. You'll have to go to the AMD web site to look at the benchmark numbers, but they make a case for this processor being faster than the new Pentium III at much less cost.

I chose the components pretty carefully, trying not to spend much more than I had to, given my goal of making a very fast machine. One thing that caught my eye in looking for performance components was a motherboard that had 2 MB of cache on board. Now this is very unusual. Most boards have 512K, one-fourth of this new board, and the Pentium boards have none, dependent instead on the L1 cache built into the chip or L2 cache built onto the little plug-in board next to the processor.

One characteristic of this AMD processor is that it will handle 2 MB of external cache, so it was interesting that I found a motherboard with just that. The other interesting feature is that the chip itself has both L1 and L2 cache built into the chip that runs at the chip speed. So the 2 MB on the motherboard is a Level 3! I combined the board and processor with a pretty good 16 MB Diamond Monster Fusion video card and a Quantum 7200 RPM, 9.1G hard drive with Windows 98 SE.

A low end machine typically uses an AMD K6-2/400 or Cele-

(Computer.....Continued on page 5)

(Computer……..Continued from page 4)

ron processor and a slightly smaller hard drive and 32 MB of memory. This PC is only about $300 more at about $1350 with a 17" monitor.

ATX form

The board in this case is an ATX form. If you'll refer to the side view on the previous page, you'll see that it's a tall, narrow board. The processor in all these are at the top nearest the power supply fan for better cooling, and the case is a good two inches wider than a standard AT case. Referring to the back view on the next page, the keyboard, USB and mouse ports and the serial and parallel ports are all clustered together on a panel because these are all mounted directly on the motherboard, also a characteristic of ATX.

Size of the case

Had you wondered why all of a sudden, most new PC's are tall? If you were designing an ATX case and had to leave room above a standard ATX board for the power supply, the minimum height would be the same as this case at 17 inches. Pretty tall. But it leaves room for plenty of 5-1/4 bays – four in this case. Another feature of this case is a very quiet case fan that's built in the front bottom.

Slots

Besides the 2 MB cache, another interesting feature of this

motherboard is, first, no ISA slots! That's right, there are six PCI slots and one AGP for the video. ISA slots have been around since the IBM PC AT a zillion years ago, and we've given them up at last. There's no reason not to on a new PC because you get the best prices on sound, network and modem cards if you buy PCI boards anyway.

Hard Drive

The only thing this motherboard lacks is UDMA 66. UDMA 66 is the newest hard drive interface that will handle data bust rates of 66MB/sec from the hard drive, compared to the old standard of 33MB/sec. I did buy a 7200 RPM drive which reduces program loading by at least 20%. And I certainly believe that it makes that much difference after using it for a few weeks.

Plug-ins

The other thing about this board is that it has no built-in systems. The minimum you should expect is that it have sound on board, and the newest ones have Sound, Video, Ethernet and Modem! But this board has none of those, making it a bit more expensive. Still this board does not lack for slots, so I have a Yamaha 3D sound card and a Windows Modem on cards. There are still four slots left. You'll need one for the RoadRunner Internet Service, and, let's see, … video capture … DVD …. ◆

Editor's Comments

By William LaMartin, Editor,
Tampa PC Users Group

Road Runner & Networking

When the RR installation crew shows up at your house, they have one objective: getting RR up and running—not necessarily leaving your computer the way they found it. One fellow installs the cable and attaches it to the modem, then a second person installs a network card in your computer (if necessary), connects the cable modem to it and installs the RR software. They do this as many as five or six times each day. So they obviously know what they are doing.

What they don't like to see is a Local Area Network. They will tell you up front that your network will probably not work correctly when they leave. And they are not wrong. The inside fellow makes all the changes he feels are necessary to get RR running on the RR network. In my case, that consisted of removing every network protocol I had installed except TCP/IP on the network card in the main computer. He then set it to have a server assigned IP address.

When he left RR worked fine, but my LAN was nonfunctional. Part of the problem was my fault. I thought, based on bad advice I had read on the Internet, that I could simply connect the cable modem output to the uplink socket on my network hub, with each of the computers on the network—including the one with the RR software installed—connecting as usual to the hub. RR still worked fine, but now none of the computers could see each other.

Adding the protocol NetBEUI back to the network card in the main computer got me back to where the main computer could now see the other two, but this was not true 100% of the time, and the other computers could never see the main one. I am not talking about the other computers being able to connect to the Internet through the main computer's RR connection. I am referring to simple networking.

All sorts of tweaking the network properties on all the computers made no difference. So after some more Internet research (this time correct), I went out and bought a second network card for the main computer—something I could have had for free from RR if I had thought I had needed one (the installation fellow was all too happy to not have to find a free IRQ to install a second card when I told him just to use the one already in the computer).

Installing a second network card

I knew this might present a problem. I had a PSI slot for it but no free IRQ. I put it in anyway and let Win 98 find it and prompt me for the driver. It seemed to install OK, choosing to

(Comments……..Continued on page 7)

(Comments……..Continued from page 6)
share an IRQ with the video card and the other network card. Who am I to question this? Win 98 knows a lot more about such things than I. I had consulted with Merle Nicholson, and he said that sharing an IRQ would cause a problem—and it did. My mouse would now freeze randomly for brief moments. The video card and the first network card had been sharing IRQ 11 OK, but they obviously didn't like a visitor.

What to do now? Well, Merle had suggested that I might want to disable COM 2 in the BIOS since I wasn't using it (my mouse is a PS2 mouse and my modem uses COM 1). That should make the IRQ 3 used by COM 2 available. Unfortunately a removal of the second network card from the Windows Device setup and a reboot did not produce a move of it to IRQ 3. It went right back with its friends on IRQ 11.

To make a long story short—and it took me several days to figure this one out—I did the following:

- In addition to disabling COM 2 in the BIOS, disabled it in the Windows Device Manager configuration.
- Physically removed one of the network cards from the computer.
- Rebooted the computer and then found that the remaining network card was now on IRQ 3.
- Shut down, put the second network card back in the computer and rebooted. Windows found it again , asked for the driver disk and the card was installed. And to my joy it was also on IRQ 3 instead of 11.

Why should I be happy since they were now both on IRQ 3 instead of IRQ 11? Well, the video card was on 11, not 3—and despite Merle's foreboding, the mouse worked fine. However, a quick check showed me that my networking was still not working correctly. Again, this may have been due to ignorance on my part. I was—and still am—of the opinion that for peer to peer networking between computers you only need the NetBEUI protocol to be bound to the network cards. I had that and had added IPX/SPX for good measure, but that did no good. Finally after some thought I added TCP/IP to the three network cards on the network and assigned each of the computers the fixed IP addresses of 192.168.0.1, 192.168.0.2, and 192.168.0.3.

I should note that while my network was down I was still able to do all the usual network things via LapLink on each computer under the IPX protocol. Chalk one up for LapLink.

Moving TPCUG to another web server

One of my primary reasons for wanting a cable modem was the need to upload web sites consisting of 20 plus megabytes to the Internet. With a regular modem, that can take a long time with the very good possibility that the connection will be lost before the upload is finished. With the cable modem, uploads go much faster. It took me 28 minutes to publish our 19 MB TPCUG site to the new server. With a 28,800 modem (or with a 56,000 modem since at my home the telephone line will not let any dial-up connection go faster than around 28,800), it would have taken probably five times that long.

The upload was done the evening after our regular meeting and one day after getting the cable modem. It was not done without incident, though. When I went to use Microsoft FrontPage (FP) to do the upload, FP said it couldn't run until it had a web server to use on my computer (Microsoft PWS). PWS had somehow become uninstalled. I could, of course, blame it on the RR installation. But who knows. Don't blame, just insert the FrontPage CD and get the PWS installation file off that. Not quite—the CD auto-started, and the FP installation program came up, noted that PWS was not installed and informed me that in order to install FP, I should first let it install PWS. Since that is what I planned doing anyway, I said go ahead. After PWS was installed I tried to cancel the FP installation that was to follow, but that apparently caused problems, since when I tried to open FP, it wouldn't run. So I had to reinstall FP anyway. Once that was done, finally I was able to publish the TPCUG site to the new server.

But, as usual, my problems were not over. Since I had reinstalled PWS that meant that I had to redo the aliases for the local versions of web sites and I needed to reinstall the Active Server Pages Component (ASP). But that didn't make the computer too happy, since ASP was trying to install an older version of OBDC than Visual Basic 6.0 had just installed a month back. It seems there will never be any peace from the problem of the older version trying to install over the newer version of something. Not to worry, though, since both ASP and VB 6 seem to work OK, which means probably that the older version did not get installed and ASP works fine with the newer version. At least that is what I think the situation is.

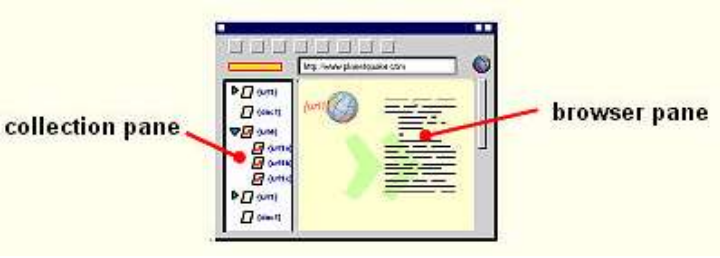
It was good that I persevered in getting the web site moved to the new server, since next morning when I checked, the domain name TPCUG.ORG had been moved to numeric address of the new server.

Cable Speed

I have not observed the blazing speed that has been mentioned with cable, but I am happy with the increase over my dial up connection with uploads five times as fast on average and downloads that are perhaps 15 to 16 times as fast. When I have time I will try to get a more accurate measure of these speeds. ◆

HP Web PrintSmart

By Larry Anders, Librarian, Tampa PC Users Group



When the email arrived and then re-arrived from our editor asking for articles for this month's newsletter, I was at a loss as to what to pass along this month. Because I tend to work better under pressure I just waited until the last minute for something to pop onto the scene. (That's okay… my wife doesn't buy that "works better under pressure" scenario either … she calls it procrastination.) Our newsletter editor told me to go out and buy something new so I would have something to write about. Good idea, but a little drastic, especially after what I spent to write last month's article. So, I just waited until the last day when the pressure got really strong, and low-and-behold, there it was, right in front of me… **HP's Web PrintSmart™**.

Lately I've been doing a lot of printing of web pages, and usually not with the results I was expecting. Well, I remember a few months back trying a new program from Hewlett Packard (HP) called Web PrintSmart, but I wasn't too impressed. It was a little cumbersome and didn't really do what it promised, at least for me anyway. I receive a free newsletter regularly from HP called *HP at Home* that's loaded with ideas, solutions and tips for home computing customers of HP products, which I happen to be several times over. Recently I remembered reading in this newsletter that HP had upgraded Web PrintSmart so I went looking for it. Frankly, I went to HP.com but could not find it. So I did a search for it using Copernic (http://www.copernic.com) and ended up at: http://www.software.hp.com/. I clicked on *Internet and Security* and had a choice of two versions of Web PrintSmart. One was a Plus version for $29.95 and one was a Beginner version for free. Which one do you think I chose? Right again! The difference being, as far as I can tell, more control over page formatting such as changing the fonts and appearance of the page on the one you pay for. The size of the file download is 4.5 megabytes or you can opt to have a CD ROM mailed to you for $9.95 plus $7 shipping and handling. Either way, just fill out a short registration form and it's yours – ***FREE!*** Okay, what is it and what does it do?

The basic concept behind Web PrintSmart is collecting web pages you want to print, and then printing the collection as a single document. This collection can also be saved as a file for later retrieval and you can save as many different collection files as you choose. However, you can only work with one collection at a time. I mean, it is ***free!***

So, what would you want to collect from the web? How about information on a new computer you're planning to purchase. This collection could contain web pages of the manufacturers about the brands and models you're considering, price comparisons, reviews from computer magazines, and contact information for vendors. Or what about the student who is working on a research paper. This collection could contain the best results of your web searches on the topic of interest. Or how about a personal daily summary. This collection could contain your company's web page with press releases or news stories related to your product and your competitor's products, and reports posted to the web by your people in the field. Get the idea? These collections can actually be whatever you come across on the web.

The Web PrintSmart application window is divided into two areas, or "panes". On the left is the collection pane, which lists all the web pages in the current collection. On the right is the browser pane, which functions generally like other web browsers. You use this pane to find web pages for your collection. To start, I just find the pages using a search tool or search engine in my regular browser and then copy the initial link into the URL line in the right pane and off I go. Or once you find the page in your browser, switch to PrintSmart and use a shortcut key to automatically transfer the URL into PrintSmart.

When you find a web page you want in your collection just click the '*Add to Collection*' button. The web page displayed in the browser pane gets added to the collection and you will see its title appear on the list in the collection pane. If you already have a lot of pages in your 'Favorites' list just import your favorites list into PrintSmart and print what you choose.

Even in this free version there is still a lot of flexibility in the way you can format the printed output by choosing from several pre-defined style sheets, which determines the fonts and colors, or just print all text in black. You can also choose to add a cover page, table of contents, index of links, exclude/include certain paragraphs or pages and add headers and/or footers. Choosing which page to print is easy enough. Just put a check mark in the box next to the page in the collection pane and that's it. Or, if you choose, you can use automatic marking to mark a web page and all its linked web pages. This enables you to print all those pages without marking each of them manually.

One little trick I use is that my printer has the ability to print multiple pages per sheet of paper and print booklets and tablets. By printing two pages per side and on both sides of the

(PrintSmart……Continued on page 12)

Internet Call Manager

Editor's note: The following "blurb" was sent to our group by Mary-Lynn Bedard, a publicist for the following program. If you have only one phone line and spend a lot of time on the Internet, then this may be of use to you.

- Internet Call Manager
"Call-Waiting for Internet users"
Internet Call Manager is InfoInterActive's special patented telephone service which provides Internet users with computer-screen notification of incoming telephone calls – including the caller's name and number – even while the phone line is tied up during Internet usage. The customer then has a number of options to handle the call with the click of a computer mouse.

The InfoInterActive service solves the common problem of families and small businesses missing important phone calls and faxes during Internet use and is a fraction of the cost of acquiring and leasing a second phone line just for Net use.

The latest version of ICM, Internet Call Manager for Business, also allows small businesses and home offices to monitor incoming calls on a number of lines, including those not related to their Internet connection. A "Remote Control" feature also allows business people to monitor incoming calls to their office from home, a subsidiary office, or while they are travelling – and vice-versa.

Internet Call Manager High-Speed is a version of ICM that can be used with all of the latest high-speed Internet services.

When a customer receives an incoming phone call during Internet use, a message instantly appears on the customer's computer screen, identifying the caller by name and phone number. With the click of a computer mouse, the customer then has the option* to:

- Answer the call by logging off the Internet while holding the incoming call.
- Acknowledge the call by sending a special voice message to the caller, indicating the customer is on the Internet and will return the call later.
- Ignore the call, sending it to voice mail or a busy signal.
- Transfer the call to a different number, such as a cellphone or another phone line (for instance, a nearby fax/phone).

***** Some functions may vary by region.

Internet Call Manager also provides customers with a permanent log of incoming calls, including the caller's name and number and the time of the call.

Internet Call Manager does not require any custom calling features such as Call Waiting or Caller I.D., nor any special phone or computer equipment. When a customer is not on the Internet, the phone system operates exactly as normal.

The InfoInterActive service works with virtually all Internet Service Providers and web-browser software. The service is extremely simple to acquire and use, activating automatically to monitor incoming calls as soon as a customer logs on to the Internet.

Internet Call Manager is a special Internet adaptation of conventional telephone services such as Call Waiting, most of which have little or no functional value during Internet use. (For instance, the beeps on the line indicating Call Waiting and Voice Mail messages cannot be heard during Net use.)

The vast majority of North American telephone customers (approx. 83%) have single-line phone service and a low tolerance for missed calls. Consumers currently spend an estimated $2 billion a year on the conventional Call Waiting phone feature alone.

Cincinnati Bell Telephone, a lead distributor of the InfoInterActive service in the U.S., estimates that without Internet Call Manager, households with regular Internet users miss an average of 80% of incoming telephone calls.

1. To demonstrate Internet Call Manager, simply go to the web site at http://www.internetcallmanager.com and hit the "download" circle to get to the signup form.
2. Enter the ten digit phone number you'll use to try ICM. This should be a phone number that you can use to dial in to the Internet.
3. The screens that follow offer three options users can choose from to use ICM.
   - Give out our 1-888-289-9066 number to their friends, so they can reach them while they're on the net.
   - Use the Call Forwarding option to forward their phone to our ICM server during Internet sessions so ICM can handle their calls.
   - Order a Call Forward on Busy option for their phone from the telephone company so ICM can automatically monitor their line while they're on the net. ◆

Special Interest Groups

Internet SIG

This SIG meets the first Monday of the month at 6 PM at the Reflectone Building, off West Waters Ave. You must sign up to get on the list and to get by security. *Contact Mike Hodges at hodges@reflectone.com.* For directions, see the map at our web site or contact Mike Hodges.

We consider all topics concerned with creating web sites. We study sites of interest from the web and those created by members of the SIG. And, in general, we consider anything of interest concerning the Internet.

Genealogy SIG

To be included on the TPCUG genealogy mailing list, contact Jenny Lind Olin at 960-5723 or jloin@aol.com

Visual Basic SIG

This SIG meets the third Tuesday of the month, at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6 PM. For information, *contact Merle Nicholson at merlenic@tampabay.rr.com.*

10 Years ago in the TPCUG

By William LaMartin, Editor,
Tampa PC Users Group

A few months back, longtime member Roger Waters gave me a stack of old issues of this newsletter. They start in 1989 with a couple of issues and then continue up almost to the present. Not all months are represented. The oldest issue Roger gave me was February, 1989, and it is identified as Volume II, Issue 02, so we know that they started publishing in 1988. Recall that our group was formed in 1984. Perhaps the newsletter was not always printed each month. Anyway, I thought it would be interesting and instructive to occasionally look at what was being discussed back then when we have some extra space to fill in the present newsletter.

In 1989 the newsletter was printed on six 8.5 x 11 sheets of light blue paper, so there were 12 pages as there are today, but in 1989 there was a lot of white (really blue) space and the print size was quite large. The group met at the GTE building between Zack and Twiggs downtown, and Harvey Bruneau was president of the group. Robin L. Pokoj was the Editor, and Steve Speairs and Vern Semrad seemed to be the most prolific contributors. Of the Board of Directors, the only name listed of a current member was Kevan Sheridan, who was listed as BBS Sysop. Current member Ed Buzzza had a software review in the February, 1989 issue on AUTOMAXX – a combined file manager and menu system.

Back then people were using IBM 286 XT machines, and a lot of attention was paid to the AUTOEXEC.BAT file. More than one article was written on modifications you could make to this file to improve your system—or cause problems for your system. Another big topic was Serial Communications, modems, and the different communication protocols. How many of you remember XMODEM and YMODEM? When was the last time you worried about start bits, data bits, and stop bits? And what do you think was the rate of data transfer for these modems? It appears from the articles that 1,200 BPS was what was being used. That is a far cry from our 28,800 or 56,000 now.

Of course, they didn't have as much need for fast modems since everything they were sending was text based. This was a DOS based group. I see no mention of Windows in the 1989 issues. Perhaps Windows 3.0 was not out yet. My history of Windows is sketchy.

The February newsletter lists the minutes of the January meeting, where Linda Confer of Software Publishing Corporation was the guest speaker. She gave an overview of their product line. Do you recognize any of the following? PFS: First Choice, PFS: First Publisher, PSF: First Graph, PFS: Professonal Writer, PFS: File, Professional Plan, Harvard Graphics, Harvard Project Manager, and Office Writer.

In the June, 1989 newsletter, the minutes for the May meeting note that the planned presentation was delayed for another session due to the lack of the overhead projector. So they had a general discussion instead where it was noted that due to an apparent bug in WordPerfect 5.0 (I bet there are still people using this program), if a space is included in the file name, the

paper I not only save paper (and trees) but I also save ink and money. And the quality is the same just smaller.

And in case you're wondering, you don't have to own an HP printer; it works fine on my Epson also. Actually, you don't have to own anything made by HP. This program is *free* to anyone who fills out the registration. Web PrintSmart is one of the better freebies I've ever come across on the Internet, and it also goes to show that just because you try a program the first time and you don't care for it, be open minded enough to try it again at a later time. Sometimes they do get better, even if they are ***FREE!*** ◆

(Old Issues……Continued from page 10)
document will be saved but cannot be retrieved by WordPerfect. The solution is to use DOS to rename the file, e.g. to rename MY FILE.DOC, the DOS command would be REN MY? FILE.DOC MY_FILE.DOC. It was also noted that the most recent version had corrected this problem.

How things have changed. The only mention of Microsoft I saw was the phrase MS-DOS several times. Certainly there was no mention of Windows or the Internet. And I doubt gigabyte was a size even contemplated then. What size hard drives were they using? I am sure they were no more than 40 MB. ◆

Meeting Preview: At the October meeting we look forward to another interesting presentation from BCD on the latest directions in hardware and software. Mary Sheridan, as usual, will conduct a 30-minute Windows discussion at the beginning of the meeting.

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group

Western Digital If you have recently purchased a WD hard drive, go to the site http://www.westerndigital.com/fitness/drive-alert.html and read the notice. It seems there is a problem with their drives manufactured between August 27, 1999 and September 24, 1999.

Newsletter I wish to thank all the contributors to this month's newsletter. It is a big help to me when the membership comes through early with enough material to fill the newsletter and have an extra article left over with which to the start the next month.

Meetings It is not enough that you pay your dues, contribute to and/or read the newsletter and visit our web site regularly, though all that is great, of course. We also need your live bodies at our monthly meetings. It is important to fill the room so as to make our presenters feel they are appreciated. It is also important to the health of the group.

Full System Backup to CD Last month I wrote an article about the HP CD-Writer 8210i, describing how I had made data and music CD's with it. Now I can report that I have also used the supplied software to make a

The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more

Minutes of the September Meeting

By Jim Weber, Secretary, Tampa PC Users Group

Our meeting started at 6:00 PM with our Windows SIG. We began with a discussion on incompatibilities with the latest version of Office 2000 and older versions of the Office suite. Word and Excel don't show any incompatibilities at this time, but Publisher and Access have demonstrated an inability to correctly identify and open older file formats. We also had a piracy alert from one of our members. It seems Microsoft contacted him with reference to a piracy complaint that he was selling illegal programs. Microsoft had his home number and other information the member thought was confidential. Not only is he unaware of how Microsoft got this information, but also he doesn't own a copy of the software in question. The closest we can figure is our member was hacked while online or a company he deals with was hacked. Either way, this is another warning of how dangerous hacking can be, and how far it can spread from its original source.

The General Meeting began at 6:30 PM with representatives from an online mall called Quixtar. Quixtar promises to be the biggest on-line store in the world with financial backing from companies like Microsoft and IBM. It offers you the ability to buy any product imaginable direct from the manufacturer at a guaranteed markup of no more than $50.00 over cost. Quixtar claims big savings because the distribution network they will use is Amway. Speaking of Amway, Quixtar offers Multi-Level-Marketing options to anyone who gets a user ID number and convinces other people to use their number when making on-line purchases.

Merle took over the meeting at 7:00 PM. He reminded everyone that nominations for Board members are coming up, so be prepared to make nominations or be drafted. A program coordinator is especially needed. We gave Ford Bond a special moment of recognition for all his hard work and dedication in helping us move from the HCC Ybor Campus to MOSI and the time he spent as our MOSI liaison.

The meeting ended at 7:30pm. There was no drawing this week. ◆

(Comments……..Continued from page 1)

collection of CD's for disaster recovery. The process first makes a Windows 98 startup floppy that it customizes for this particularly recovery process. It then copies the contents of all of your hard drives to however many CD's as it takes to totally backup your system. In my case it used 5 CD's and took about

(Comments……..Continued on page 9)

WordPerfect Office 2000 Pro

By Don Patzsch,*Tampa PC Users Group*

WordPerfect Office 2000 Pro includes

- WordPerfect 9 with Dragon's Naturally Speaking, a speech recognition program.
- Trellix 2, a web publisher.
- Quattro Pro Version 9, my favorite spreadsheet program.
- Corel Presentations Version 9, a slideshow presentation program.
- CorelCentral Version 9, a personal information manager.
- Corel Print Office, a small business publishing program. (Good for newsletters.)
- Last, but certainly not least, is Paradox Version 9, a relational database program.

The word processor known as WordPerfect has been my favorite program for many years. The current version is 9. When I bring up this program it has all the items I want already on the toolbars. I don't have to set anything up. When you wish to write a letter, all the possible things you might want to include are here. Fonts, tables, create columns, save in many different forms such as Word, text, and others are right on the toolbar. Another thing, WordPerfect allows you to view the Reveal Codes, which are embedded codes in your letter that show you how your document is formatted or how fonts are changed within the document. This allows for great formatting.

You may set the default as Microsoft Word, and you can write and read MS Word files. Adobe Acrobat Version 4.0 is included, allowing you to exchange documents with Mac and Unix computers. You can save WordPerfect and Corel Presentations in Adobe Acrobat PDF file format. WordPerfect allows you to put a watermark in your letter, and also it is easy to import graphics into your letter. I know of no word processor feature that is not included in WordPerfect. More than 1000 typefaces are included. AutoScroll will advance the text automatically so you can read it over without using the mouse. Speedlink will allow you to create a hyperlink that takes you to that location on the WWW. I could go on, but I hope I have made this point clear: The reason I like WordPerfect is that it is user friendly, and then some.

WordPerfect has the Real-Time Preview feature allowing you to see how any formatting change will look in your document before making those changes. Plenty of clipart and bitmap images are included with the program and a booklet included allows you to view these, so you can easily find what you want.

Dragon Naturally Speaking, Version 3 and a microphone headset is included. I have not really become interested in using this voice dictation, and so I have not worked with this system much. It is my opinion that IBM's Executive Via Voice is much better.

Netperfect is a server-side application that allows you to publish WWW documents through a central server.

Microsoft Visual Basic for Applications is included in the WordPerfect Office 2000 package.

Trellix 2. Trellix lets you create, convert, maintain, and update content without specialized knowledge of HTML or graphic design. I have not used this feature much because I do not do much publishing on the web. You may publish files in Extensible Markup Language (XML), Adobe's PDF, or Trellix format hyperlinked files.

One of the more interesting changes in this version of WordPerfect Office is in the CorelCentral PIM. It is a calendar, memo writer, card file, task list and an address book. It is one of the better personal information managers due to the fact that it is coordinated with all the other parts of Office 2000. You may use your Windows address book, and it will use your default email program to send messages on the Internet.

Paradox 9. This relational database has been around for many years and is one of the top programs of its type. This program came from Borland originally. A visual database designer allows you a graphic layout of the relationship between the various tables in your database. A new Find Duplicate Expert allows a query that finds and eliminates duplicate field values within the records of a table. Spell checking is now included. PerfectExperts provide you with the ability to create, in a step by step manner, tables, reports, labels and forms.

Paradox can communicate with most databases via the .dbf format. It is hard to know where to stop listing the features, but be advised there are many more.

Quattro Pro. I have been using Quattro Pro since Borland gave me a copy of Version 1 at a seminar in Tampa years ago. I like the way that you can "fit to the page" and print out the spreadsheets. I have put all my financial information into this program and have used it for years. You can produce a spreadsheet of a million rows and 18,000 columns. I've used Excel, and I like Quattro Pro's user friendliness much better for my needs. You can exchange data with databases using OLAP (online analytical processing) as long as the programs are OLAP compliant.

Corel Presentations is another program I have used for a long time. It is easy to bring in slides from PowerPoint or other pro-

(WordPerfect.....Continued on page 5)

Paint Shop Pro 6.0 Including Animation Shop

By Larry Anders, Librarian, Tampa PC Users Group

Jasc at http://www.jasc.com just continues to make an already good program better. Paint Shop Pro 6's (PSP6) ease of use allows you to easily capture, create, enhance, and optimize your graphic projects. Whether you're creating web graphics or just wanting to work on a digital photo, PSP6 gives you the tools to do the job easily.

I've reviewed this program a couple of times in the past, and I'm not going into all of its abilities again, but considering all of the newly added features it bears a third article…. because, if you aren't using it… you should be.

I have nearly all of the upper end graphic programs like Adobe's PhotoShop and Corel's Photo-Paint, but they all take so long to load that they are almost bothersome. Not so with PSP6. I have always used PSP to do all my scanning because it starts so much quicker and doesn't use near the overhead or computer resources that the others do. Now, I'm not saying that PSP6 is better than the upper end stuff, but it sure comes real close. And, if you want to talk about what's better, then let's talk about price. JASC sells PSP6 direct over the Web as a download for $99, or delivered FedEx or UPS for $109. Some resellers are selling it for the same price plus a $30 rebate. And if you're lucky enough to already own it, and you should, the upgrade is only $49. Considering all the tools you get with PSP6, plus Animation Shop 2, that's relatively inexpensive when compared to the upper end programs.

One of PSP's weaknesses in the past has been its text tool, but not anymore. Now text can be created as a selection on the current layer, as a floating selection above the current layer, or added as a ***vector object*** on its own layer that can be edited, deformed, and moved. Text is placed horizontally unless a path is created. When created on a path, the text follows the path.

Also new to PSP6 are many other new features and enhancements that include powerful new gradient options, a wide variety of new image effects and deformations, color adjustment layers, expanded digital camera support, multiple image printing and optimization features for producing high-quality web graphics with the smallest possible file sizes. Below is a list of new features and enhancements that JASC lists on their web site:

Editable Text and Drawing Tools

- Editable Text with Character-level Formatting
- Vector Drawing Tools
- Object Manipulation & Node Editing
- Text on a Path

Creative Tools

- Multiple Color Gradients
- Special Effects and Filters
- Enhanced Non-build up brush tools

Web Graphics Solutions

- JPEG Optimizer
- GIF Optimizer
- Animation Shop 2

Digital Imaging Solutions

- Expanded Digital Camera Support
- Adjustment Layers
- Multiple Image Printing

Productivity Enhancements

- Browser File Management
- OLE Screen Capture
- Multiple-level Redo
- Expanded File Format Support

Product Refinements

- Enhanced Control Palette
- Enhanced Tool Options palette
- Enhanced Layers palette for Mask creation
- Roll up feature for tool palettes which minimizes palette
- Enhanced Zoom Tool
- New Recent Colors dialog window
- Numeric edit controls for precise input
- Enhanced Help system
- Eraser mode support for pressure sensitive tablets
- Enhanced Picture Tubes for easier installation and use
- Visual preview pane for Picture Tube options palette
- New preference which defaults saved file type to last format saved
- Multiple-level Undo, Redo and a Command History

And with Animation Shop 2 included, you can also:

- Quickly create animations using built-in wizards
- Edit animations with drag-and-drop flexibility
- Apply high-quality image and text effects
- Optimize and export animations for use on the web
- Optimize and export animations for presentations with full integration with PSP6

All things considered this program should already be part of your arsenal of software. If it isn't, get it. You won't be disappointed with this one! ◆

(WordPerfect……..Continued from page 3)
grams, and this is a great program to produce slide shows for the WWW.

Corel Print Office produces desktop publishing, business cards, and brochures. A most useful addition to the Office Suite.

When I started to write this review, I hoped that it would be easy to do. I find that it is very easy to use the programs, but very difficult to tell you what I would like to about them. If you buy this program, I believe you will agree with me that it is the very best. The suites that I know of are: WordPerfect Office 2000, Lotus Smartsuite, Microsoft Office 2000, Star Office (a program from Germany), Ability Office, and 602pro Suite.

WordPerfect has decided to port at least the word processor to Linux, and they offer it FREE. ◆

Internet picture of the month

TV Station WITN in Washington, NC
http://broadcast.com/television/witn/

During Hurricane Floyd, several TV stations moved to a round-the-clock Internet broadcast of their hurricane coverage. WPEC in West Palm Beach started it off, followed by two of the North Carolina stations. The screen capture above is from WITN, http://broadcast.com/television/witn/ in North Carolina. The feed was at 20 KB/sec, so the small image was OK, updating fairly smoothly, and the audio was good.

Using VBA Functions in Access

By Merle Nicholson, President,
Tampa PC Users Group

Using Visual Basic for Applications (VBA) isn't really hard. Instead, I'd call it complex. This means that in order to do it proficiently you have a lot of small things to learn. And most of all, you have to stick to the task and don't give up. Find a reasonably easy task and just work with it until it's done.

I teach a beginning class in Visual Basic, three hours on a Saturday, spread over six weeks. That's only 18 hours of instruction, and, for the most part, it's been pretty successful. But only after I've learned a few very important things. I tell my students that if they attend every week and work hard in class … they'll not learn anything, actually fail…And they're just wasting our time.

Programming has to be practiced. It's a continual voyage of discovery and accomplishment.

Now to the subject of user-written functions. Understanding functions is a very fundamental part of programming. Surprisingly though, you can program in Access (or Excel or …) for years and never write a function. If that's you, you're missing something essential. Functions give you reusable code. You write functions to be general purpose so that on your next program, and the next, you just merge this function into your module and it's ready to go without modification. ("Without modification" is a goal, not a rule.)

You have to think of a function as an encapsulation of a single idea. To illustrate this, let's look at *built-in functions.* A built-in function – called *intrinsic functions* - are the building blocks of all programs. Let's take Int() for instance. Here's an example of how you use Int(). Dollars = Int(Cost). This takes a variable called Cost, cuts off the fractional part, and stores it in Dollars as a whole number. So if Cost was 3.65, then Dollars will be 3. Int() is just one of dozens of intrinsic functions like Format, Ucase, Mid etc …

If you were going to write your own Int function, here's what it will look like:

```
Public Function Int( ByVal InputVariable As Dou-
ble ) As Double

'Takes the Input Variable, and magically
'cuts off the fractional part if any, and
'returns it by assigning it to Int.

Int = … do something clever with math …
End Function
```

The first line is the function declaration. It simply defines the rules whereby it runs. The name is Int. It takes as a parameter one variable containing any number – InputVariable – and returns a number. Both the input and output are of type Double. Int is dimensioned as Double – the output and InputVariable is of type Double.

The lines beginning with an apostrophe are comments. Comments are ignored. The next line is incomplete. Frankly I can't think of any way to accomplish this with math, but the objective is to take the value stored in Input Variable and cut off any fractional part. Since I can't think of a way to do this, I substituted "psuedo code". The result is that this function won't work, making it a bad example, but I hope you get the idea.

Here's a better example that actually works.

```
Public Function Round2( ByVal ToBeRounded as Dou-
ble ) as Double

'Take the Input variable ToBeRounded, and
'magically round it to two places.
Round2 = Int( ( ToBeRounded * 100 ) + 0.5 ) / 100
End Function
```

To use this function, in your code anywhere in your application, use it like this: Dollars = Round2(Cost). So if Cost was say $105 times 1.0675 tax and you wanted it in dollars and cents, you'd need to round off to the penny. Useful ? Yes, absolutely. If you were to add a column of numbers that had them all rounded off, the result would be very different than if you didn't.

I'd really not program Round this way. I'd add another argument that specifies the places that it would round to. So I'd make the header: Public Round(ByVal ToBeRounded As Double, Places As Integer) As Double. This way it's even more useful because I can round to zero places, or ten places.

OK, now you have the idea, I hope. That is to encapsulate an idea into a single, reusable function. Both examples stand alone with no outside support. They are completely portable. These kinds of functions can be thought of as "*filters*". There are a couple of entire computer languages that operate on the principle of taking data and "*filtering*" it until you get it where you want it.

I'll give a much more complex example. I was asked to help with a problem from another employee in my company. She wanted to calculate 20 working days from now. Whoops. This is more complex.

Simulate it on paper first. Write the date. 7/1/1999 is a good one, and the date plus one, and the date plus 2 in a column on the paper. Write down say 35 days.

Look up the second date on a calendar. If it's not a weekend or

(VBA……Continued on page 7)

(VBA……..Continued from page 6)
holiday, mark a 1 beside it, otherwise skip to the next date. If that one is not a weekend or holiday, mark it one plus the last one. The answer is the one that has 20 written beside it.

That's not too bad. And here's the next step, reproducing the ideas in a kind of a fake (pseudo-code) programming language. I made up my own pseudo-code so that you can easily read this example. It does exactly the same thing as the example above except that it delineates the repetitive part in a computer loop.

```
Set a counter to 0
Get a StartDate
Top of the Loop
If Counter = 20, then stop looping and go below
the bottom of the loop
Add 1 more to Startdate and save it in StartDate
If StartDate is not a holiday AND is not a week-
end day Add one to Counter
Else don't
Go back up to the Top of the Loop
Here is where we go when the loop stops.
Since the counter is now 20, the result is the
new StartDate
```

Now this code needs to be translated into the real thing. The header – the function definition – would be AddWorkDays (StartDate, NumberOfWorkDays) as Date. So this function returns a date, and that date is NumberOfWorkDays more than StartDate.

There are a couple of key things to work out. First, how do we know whether a date is a weekend day? And second, how do we find out if a date is a holiday? As it turns out, the first part is easy. There's a function DatePart that does this. DatePart needs a date and two parameters, one that specifies that DatePart returns the day of the week. And the other parameter specifies that Sunday is the first day of the week. You use it like this: Result = DatePart("w", Date, vbSunday). It returns a 1 for Sunday, and a 7 for Saturday.

A holiday is much harder. The problem is that workday holidays don't occur on the same days. Most holidays are predictable, but those aren't necessarily the days we don't work. So the only solution is to make a table. The table must be maintained manually. So I made a simple table in Access called tblHolidays. It has one column called Holiday, defined as Date/Time, and the Primary Key is placed on that column. And then I typed the workday holidays in the column.

Now we need to get dates from the table. Actually all we need to do is see if a date we have is also in the table.

We do this with some DAO programming. DAO uses the Access Jet engine to manipulate data tables. Here's the sequence needed. Refer to the example below as we do this.

1) Connect to the database. In Access that's easy. Just use the current database. The connection to do that is easy. Set db = CurrentDB does that.
2) Open the table. We use db.OpenRecordSet for this. And we name the table "tblHolidays" and specify that the access method is dbOpenTable. For our purposes, dbOpenTable is the fastest.
3) Set the search index as the primary key. rs.Index = "PrimaryKey" does this.
4) Search for a specific date. rs.Seek = DateToBeSearched
5) If a property called rs.NoMatch is True then it wasn't found. If it WAS found, rs.NoMatch will be False.
6) Seek all the dates you want and check rs.NoMatch.
7) Close the recordset and database rs.Close and db.Close

Now these concepts need to be integrated into the program. And it turns out pretty much as below. The structure of the program is the same as the pseudo-code above. But the DAO programming and the DatePart function is worked into it.

```
Public Function AddWorkDays(ByVal StartDate As
Date, ByVal NDays As Integer) As Date
'
**********************************************
************************
' Add NDays of workdays to StartDate.
' Use:  NewDay = WorkDay( "7/1/1999",20)  Adds 20
Workdays days to 7/1/1999
' Work days is defined as weekdays that do not
appear in a table tblHolidays
' The Table tblHolidays has one field called
Holiday, defined as Date/Time,
'                   required, no duplicates, and
being the primary key
' ************************
Dim db As Database
Dim rs As Recordset
Dim D As Integer
Dim DayIncrement As Date
' ************************
D = 0
Set db = CurrentDb  ' Use the current Access da-
tabase
Set rs = db.OpenRecordset "tblHolidays", dbO-
penTable)  ' Use the holiday table
rs.Index = "PrimaryKey"  ' Assign the Primary key
as the search column
DayIncrement = int(StartDate) ' Make sure there's
no time part on the startdate
Do Until D = Ndays     'Top of the loop
  DayIncrement = DayIncrement + 1     ' Add a day
  if Not ((DatePart("w", DayIncrement, vbSunday)
  = 1) Or _
  (DatePart("w", DayIncrement, _ vbSunday) = 7))
  Then
  rs.Seek "=", DayIncrement  ' See if it's a
  holiday
    If rs.NoMatch Then   ' If not a holiday, add
    one to D.
    D = D + 1
    End If
  End If
Loop
```

(VBA.....Continued on page 9)

The Way It Was

By Ed Buzza, Tampa PC Users Group

Have you noticed a rather curious thing in the trade magazines lately? All the ads are for hardware and, except for Microsoft products (and not many of them either), practically nothing else. And the bloated sizes of these new packages are simply awful. What happened to the old days of fascinating software packages and simple operating systems?

I remember...

in the summer of '87 bugging Walt, a TPCUG member, to let me try out some stuff I'd read about in his copy of the DOS manual. This was before I had my own computer. He had a Kay-Pro. With an 8088 processor. No hard drive. Just two 5.25 floppy drives. With 640K of memory and a floppy disk drive with 360k bytes of whatever. It was a big step up from the Commodore that he had contemplated as his first computer.

But can you imagine - having to put a disk in the A: drive every time you loaded a new program? You see, DOS back then didn't keep but a portion of COMMAND.COM (the heart and soul of DOS) in memory. It had to read the rest of itself from the floppy disk so's it could do something. So every time you wanted to do something in DOS or load another program, you had to put in the DOS disk in the A: drive, then replace that disk with the program disk of the application you wanted to run. You see, you kept the B: drive for your data files.

Then some people would make use of some of the "power" tools available to them in DOS. They would create a virtual disk of 60-70k bytes in memory and put COMMAND.COM, and a few other vital routines up there on the virtual disk. What a breakthrough! No more popping of the master DOS disk just to switch to another program.

Sure you sacrificed some memory but programs back in those days usually got by with just 512k of memory. Now that included the program and whatever space it needed for work files. As for DOS, it used just a pittance of memory; the full COMMAND.COM was under 24k. Just how big was DOS? Version 3.2 (476k bytes, less than 60 files) took up 508k bytes on a floppy.

Oh yeah, back then there was no such thing as buying a box of pre-formatted floppies; no siree, you formatted your own floppies! One nice thing though, since there was no hard drive, there was no need to run backups on your software. 'Cause you loaded a fresh copy each time you ran the program. Now for the data files, some of the scaredy cats did make back-up copies.

Walt was running an integrated package called "Ability". It had a word processor, spreadsheet, database, and a crude telecommunication package. I can still see that dismal green background on the CGA screen. But it did the job. He wrote letters, had a database of addresses, and used a spreadsheet for his household budget.

How many of you remember the 9 pin dot matrix printers of back then? Today, they look pretty awful but then, they were the cat's meow! And the CGA screen with lines running through the text on the screen? You did have eight colors you could use; but only four at a time. You had to switch to a new monitor mode whenever you wanted to change the color "set".

Disk files were remarkable. One box (ten disk capacity) held all your programs and another box held all your data files. However it wasn't long before you expanded your program library. Nor were all the programs legitimately acquired. How many of you had a utility program that would allow you to bypass the copy protection that almost all of the commercial software vendors used to stop just such pirating? F'sure, we all learned to install from a copy of the master disks and never used the master disks to install software. Further, it was gospel that you never, and I mean NEVER bought or installed version 1 of anything. But then, that's still true! Of course the Xerox machines got a good work out making copies of the instruction manuals. None of that "modern" (read: cheapskate) method of putting the manual on disk/CDs.

Then there were all the goodies out there known as shareware. Sad to say, many thought this meant freeware. There were even software houses that issued catalogs and marketed shareware programs (People's Choice comes to mind) that did a thriving business. Plus, who can forget the little programs listed in many of the trade magazines. PC Magazine was famous for that. You copied the code and then compiled the program using DEBUG. Heaven help you if you keyed in the wrong data. Since most didn't know what the code stood for, users were very careful and double checked their data before running it through DEBUG.

One of the things many of our members looked forward to was the Library maintained by our user group. Some one would bring in a "lunchbox" computer and we'd crowd around making copies of shareware and freeware programs. The "lunchbox"? That was a portable computer that had a small cathode ray screen (7"-9"? monitor) and a couple of disk drives. Later, they had hard drives which made copying easier. That lunchbox PC was a far cry from today's laptops and notebooks. And it was HEAVY!

But things change, everyone soon got into the habit of upgrading equipment to handle all the new features of the new upgraded software. Make you wonder (like the question about the chicken and the egg) which came first: improved hardware or improved software. But that's another story. Stay tuned.◆

(VBA……..Continued from page 7)

```
rs.Close
db.Close
AddWorkDays = DayIncrement
End Function
```

It may take a little time to see how this works. I suggest highlighting some of the keywords like OpenRecordSet and press the Help button and learn as much about it as you can. Have Fun! ◆

(Comments……..Continued from page 2)

two hours. I have two hard drives totaling about 7.5 GB (with perhaps 2 GB free) partitioned into a total of five partitions. To be able to use your disaster recovery CD's you need to have the drives partitioned exactly as they were originally, so you should write down somewhere what the drive sizes are. I put that information in a text file on the boot floppy. That will allow you to repartition and format your drives exactly as before, boot from the floppy and let the disaster recovery process go on its own from there with you just inserting CD's when necessary. I hope I never have to use it.

Wonders of the Web This past month I found the web useful for two things: watching hurricane Floyd on TV in West Palm Beach, FL and Washington, NC via the web and ordering a microwave door handle from Sears.

If you go to http://www.broadcast.com, you will find numerous radio and TV stations that you can listen to and watch on your computer. The TV stations, for the most part, only broadcast live during their morning, noon, and evening news hours. But for Hurricane Floyd the West Palm station stayed with it for more than 24 hours, which was of interest at our house since we were putting up a couple refugees from that area. As the storm moved north, two North Carolina stations began their continuous Internet feed. The feed was about 20 KB/sec, so to take full advantage of it you need something faster than a regular dial-up connection.

While visiting my mother a few weeks back, I noticed that her Sears microwave door handle was broken. A year or two ago I had checked if Sears had a parts web site; they didn't. But now a search of the words "Sears parts" in AltaVista produced the site. http://www3.sears.com/ for Sears Parts Direct. Once at the site, I entered the model number for the microwave and then clicked my way to a schematic of the door, clicked on the handle, got the price, gave my mailing and credit card information, and the part was ordered.

Y2K I finally got around to checking on the Y2K readiness of my two main computers. I did this by going to the Microsoft site and clicking on their Y2K link (http://www.microsoft.com/y2k/). There you can download the Microsoft Year 2000 Product Analyzer, which, when run on your computer, tells you the readiness of the Microsoft programs you are running. I had to do a little updating on both computers. They also had links to major hardware manufacturers' Y2K pages, where I checked on the readiness of my computers.

(Comments……..Continued on page 12)

Computers and Ham Radio

By Clark J. Evans, Tampa PC Users Group

Computers and Ham Radio have some elements in common. The basic of Ham Radio is digital. Ham Radio starts with Morse code or c.w. or continuous wave. Morse Code is on and off of the transmitter. So if the transmitter is on we have a one and off we have a zero. Where did I hear of ones and zeros before? They are the language used by computers.

A dit in Morse code is as fast as you can send it with a Morse code key and a dah is three times longer then a dit. How, you may ask, did Samuel Morse come up with the different beats of dit and dah for each letter? He went to the local printer and asked him to keep track of the number of letters he used each day by letters. The one the printer used the most was "E" so Samuel gave it dit. The least used letter he gave the most dits and dahs. Example: (Z) he gave dah dah di dit.

You can get a Morse code message through when you can't get a voice message through, because Morse code is digital.

So what else in Ham Radio is computer related? Packet Radio is sending messages around the world by digital, computer to computer links around the world.

Next we have satellites we transmit through. Most Ham Radio satellites are on a low orbit of 200 to 300 miles above the earth. This includes the MIR, Space Shuttles, and the Hubble. Because of the low orbit you only have about eight to ten minutes while they pass over you to communicate with them.
That is why we use computers to keep track of them so we know when they are flying over us so we can contact through them.

The Federal Government asks Ham Radio operators to do one thing when they pass their test and get an Amateur Radio License, to help provide communication for Red Cross, and Federal, State and County Governments when hurricane, earthquakes, or any disaster happens.

Ham Radio operators will use any form of communication to get the message through radio, Morse code, voice, computers and satellites. ◆

Special Interest Groups

Internet SIG

This SIG meets the first Monday of the month at 6 PM at the Reflectone Building, off West Waters Ave. You must sign up to get on the list and to get by security. *Contact Mike Hodges at hodges@reflectone.com.* For directions, see the map at our web site or contact Mike Hodges.

We consider all topics concerned with creating web sites. We study sites of interest from the web and those created by members of the SIG. And, in general, we consider anything of interest concerning the Internet.

Genealogy SIG

To be included on the TPCUG genealogy mailing list, contact Jenny Lind Olin at 960-5723 or jloin@aol.com

Visual Basic SIG

This SIG meets the third Tuesday of the month, at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6 PM. For information, *contact Merle Nicholson at merlenic@tampabay.rr.com.*

Book Review: Teach Yourself Paint Shop Pro 5 in 24 Hours

By Cheryl Alexander, Membership Contact, Tampa PC Users Group

The product presentation for December 1998 was Julie Altstatt of JASC Software demonstrating Paint Shop Pro 5.0. When I mentioned to her that we already used this program, she gave me a book: *Sams Teach Yourself Paint Shop Pro 5 in 24 Hours* by T. Michael Clark.

I have been a long-time fan of Paint Shop Pro (PSP) ever since I was dragged kicking and screaming to it. (I was emotionally attached to a program that I knew well but had betrayed me by becoming obsolete.) I was aware that it could do many things but had no clue how to use the functions to make graphic magic. So, I poked, prodded, read the very decent manual and remained clueless. Then I got The Book.

The layout of this book is 24 lessons designed to take about an hour each. Thus, one learns a manageable amount of information each session if one chooses to follow the lesson plan. These lessons are outlined on the inside of the front cover and in more detail in the table of contents. This helped when looking for a specific lesson. The lessons are very clear and step-by-step. Explanations as to why something is done in a certain manner are included.

Mr. Clark covers the basic functions of PSP extensively and clearly. In fact, the first four lessons are for the rankest beginner. As I read through the material, I learned many things about functions that I thought that I understood and knew how to use. However, he goes beyond the basics and explains how to use these fairly easy functions in various combinations to produce some spectacular effects, such as glowing text a la X-Files, textured text, and metallic effects.

He takes one from the point of "okay, I got this, now what?" to "so **that's** what it does!" by explaining the use and how to of color, layers, masks, channels, picture tubes and filters. He then demonstrates how to use these functions to retouch photos, correct color problems and combine pictures for phenomenal results.

The last four lessons help in the preparation of graphics for the web: how to use jpg's compression facility to best advantage, how to make those animated gifs and pagesets (coordinating backgrounds, buttons, horizontal/vertical rules). Also included are resources on the web where picture tubes, tutorials and plug-ins for PSP can be found.

I have been using this book to create title graphics, backgrounds, and pagesets for my web site. Also, anything I can learn about color and its adjustments is a bonus since my site is photo-oriented.

Sams Publishing (http://www.samspublishing.com) has been producing technical books for over 50 years and computer oriented books for almost 20. You can order books or learn online.

The author, T. Michael Clark, has been an artist all his life. He runs GrafX Design (http://grafx-design.com), a web site that features online tutorials for several graphic programs. ◆

(Comments……..Continued from page 9)

Next, from Quicken I accessed their update page while online and was supposedly supplied with all the necessary updates. The Corel site said that Draw 8 and Photo-Paint 8 were compliant, but their WebMaster suite would not be tested. Now, how hard is it to test a two-year old piece of software for compliance? Symantec doesn't list my WinFax Pro 7.0 as compliant, but it probably wasn't tested since it is a number of years old. Traveling software says that LapLink Professional is, and so it goes. I assume most programs I have purchased in the past few years are compliant, and the older ones will not be tested by their vendors.

TPCUG Solves Plumbing Problem One of the main benefits of our group is being able to call another member when you have a computer problem or just to share computer information. Wade Herman sent me a link to an article on Cable vs. DSL service. That prompted a phone call from me to him to discuss some other computer matter, and during the conversation I let drop that I had just twisted off a 1/2" pipe inside the wall while trying to install some new pipe along with a new faucet. I had a call in for a plumber since I could see no way to fix this short of making a large hole in my bathroom's tile wall. "You need to borrow the large bolt extractor that I have for just such problems with my lawn sprinkler system," he said. He brought it over, I hammered it into the broken pipe until tight, then to my surprise the pipe began to screw out as I turned the extractor with a wrench. Another documented TPCUG benefit. Cancel that call for a plumber. ◆

Meeting Preview: At the November meeting we look forward to an interesting presentation from Quicken on their popular software. Mary Sheridan, as usual, will conduct a 30-minute Windows discussion at the beginning of the meeting.

President's Message

By Merle Nicholson, President, Tampa PC Users Group

Monthly Programs: We've had a couple of "program emergencies" in recent months, and I'd like to thank Brian Lance and William LaMartin for stepping in there and making a success of the evening. The Windows SIG discussion at 6:00 prior to the meeting is going very well, too. Thanks to Mary Sheridan for conducting these. The Windows SIG is a discussion forum for anyone to discuss their current computer problems and successes. Please don't think you don't know enough to participate. Make use of this, just one more reason that the club works for you, the membership.

Please come to the meeting this month. It's the month for officer nominations, the election itself being in December.

I'd decided to mess around with setting up voicemail on one of my computers, the intention being to use it as an intelligent screening tool for the useless and annoying calls I get. First I'd like to state that I've failed but have not given up hope. I removed the trial software I had and intend to try again later, perhaps early next year.

If I'd been successful, it would make a good article, but since it failed, I

Minutes of the September Meeting

By William LaMartin, Editor, Tampa PC Users Group

Since the official minutes were not available at press time, what follows is a reconstruction of the meeting to the best of your editor's memory.

Our presenter from BCD didn't show. Thus, with a little forewarning Mary Sheridan lined up member Brian Lance, who just happens to work at BCD, to do a presentation for part of the meeting. She also persuaded William LaMartin to speak.

The meeting started at 6:00 with Mary Sheridan leading the Windows SIG discussion. We continued this a little longer than usual since our scheduled speaker was not coming.

Merle Nicholson then took over and conducted the group's business session. Bruce Register then reminded everyone about the upcoming election of officers. We will have nominations at the November meeting and vote at the December meeting.

Brian Lance then did a presentation on the software product he uses to diagnose hardware problems with computers, demonstrating the various tests available for the different components

Brian's presentation was followed by William LaMartin displaying the statistics for the group's web site for the month of September. Of note was that we averaged 134 user sessions per day with each visitor staying an average of 7.5 minutes. He highlighted the most visited pages—some surprises here—and noted that AltaVista was by far the leading search engine directing people to our site. ◆

(President……Continued from page 1)
want to make a short mention of the product in case anyone else is interested. I couldn't get the tech support for the product to help because it wasn't tested on Win 98 SE, so I've given up for now.

Anyway, the product is called Cognitel, made by NovCom, a company in Minsk, Belarus. It has some very intriguing features. First, it uses caller-id to identify the caller. If the caller-id is not in its database it asks for the caller's last name and then asks for the first name. It uses voice recognition then to decide who the caller is! You can program specific actions depending on who it is. The actions you can take are: Play a specific message for a specific person, take a message in any number of

SpinRite 5.0 from Gibson Research

By William LaMartin, Editor,
Tampa PC Users Group

SpinRite is a disk maintenance utility. Its main use is with hard drives, but it can also be used with floppies and removable media such as Jaz and Zip drives. It is similar to Scandisk in that it, like Scandisk, searches your hard drive for disk surface problems. But it does much more than Scandisk. Ideally, you should verify the logical file system structure of the disk using Scandisk and then switch to SpinRite to scan the disk surface. Here is a quote from the SpinRite web site.

"*Running SpinRite periodically prevents disk crashes by containing any problems that are discovered. SpinRite examines the data storage surface of a drive one region at a time. It first reads the data out of a region, then exercises that region with patterns of data that SpinRite has determined are the most difficult for the drive to read and write. In this way, any weak and failing areas within the region are located and removed from use while none of the drive's original data is being stored there. Only after the region has been made absolutely safe, will the drive's original data be restored to that area. This crucial process of testing the surface of a drive while it contains data is completely unique to SpinRite."*

When your hard drive has trouble reading or writing data that in the past caused no problem, you may not at first notice it, since the drive will retry the read many times if it has trouble getting a good read the first time on some data. So if it finally gets the data, it proceeds as if there is no problem, and you know nothing about it. When things get bad enough that you finally notice something is wrong, if you are lucky the drive will still function well enough for you to back it up or at least get all your important data off it. If you are not so lucky, then you may wish that you had used SpinRite regularly. Again, quoting from the web site:

"SpinRite reads and re-writes the entire surface of the drive, reporting everything it finds. Thus, it is able to provide early warning of increasing numbers of regions that are becoming troublesome for the drive. ……..Scandisk's 'surface analysis test' is read-only and provides no exercise for the drive or the data surfaces. Just before a drive fails, Scandisk indicates that everything is completely fine, whereas SpinRite goes nuts showing the user that the drive is near death."

Even when there is damage to the disk, SpinRite claims to recover much, if not all, of the data in a damaged sector. It does this using its DynaStat Data Recovery method to reconstruct the "lost" data. Don't confuse this with recovering lost files due to deletion or a virus, for which a program like PowerQuest's *Lost & Found* is useful. This is recovery of data that is "lost" due to the difficulty in reading that particular sector of the drive.

You run SpinRite from a floppy disk which has been formatted with the system files. Simply add SpinRite.exe to the floppy, boot from this floppy, then type in SpinRite.exe at the DOS prompt, and the program takes over from there.

When the program starts, it first analyzes your hard drive and gathers information about the drive's characteristics by running such tests as an integrity test, viral infection test, ram test, revolutions/minute test, physical intersection angle (didn't know there was such a thing did you?), and many more.

For example, on my ThinkPad 233 with an approximate 3.2 GB hard drive it noted that the drive was performing an average of 4,201.49 revolutions/minute and had a physical intersection angle of 2.43 degrees. The partition information for the C partition was a sector size of 512, 8 sectors/cluster and 4,096 bytes per cluster. It also gave benchmarks for drive access time.

After the initial disk analysis, SpinRite starts its real work. There are various levels of disk analysis/repair. I chose level four (locate surface defects). This process took about 8.5 hours to process the 2,098 MB C partition. It took another 5 hours to do the 1,1152 MB D partition. Both partitions were FAT 32. No errors were found. That is what you use SpinRite for—Peace of mind. If you need that comfort, get SpinRite.

You can view one of seven screens while this is going on, including one that looks like the detail view when Scandisk is running. Everything is happening so fast, screens like the Surface Analysis Monitor flash their changing information so quickly, that it is of little value. I settled on the Screen Blanker display that displays the estimated time to completion and the percent done.

SpinRite costs $89, less for updates, and is downloadable from the Gibson Research web site. The program is only about 90 KB in size (it is written in assembly language), so you are paying about $1/KB—probably the most expensive program I have bought when figured on a per KB basis. Technical help is free, and an 800 number is provided.

The license is for use on only one computer. To test the pro-

(SpinRite.....Continued on page 4)

Software Summary of AOL 5.0

By Larry Anders, Librarian, Tampa PC Users Group

For all of you AOL users, America Online has introduced their latest integrated software package that is used to access AOL. Below is a list of changes and enhancements in **AOL 5.0** that makes this download worthwhile.

New Welcome Screen
The new Welcome Screen has several new features:

- Channel Guide -- one-click access to all of AOL's channels.
- AOL Search -- one-click access to searching AOL and the rest of the Internet.
- My Places -- a customizable list of places that are most often visited.

You've Got Pictures
Developed in partnership with Eastman Kodak, *You've Got Pictures* lets you choose to have your pictures delivered online so you can share the pictures with friends and family. Additionally, you can order reprints, enlargements and personalized merchandise.

My Calendar
My Calendar is the new, easy-to-use, interactive calendar that allows you to plan and manage important parts of your life by tracking appointments, key dates and other personal events -- all online. With an online calendar, you'll be able to check your calendar from anywhere.

AOL Search
This all-new search product enables you to easily search AOL and the rest of the Internet without leaving the AOL service. It delivers a comprehensive list of results -- both categories and sites -- ranked by relevancy drawn.

Seven Screen Names
AOL 5.0 offers you 2 additional screen names, bringing the total number of screen names for each AOL account to 7.

Retrieve Recently Deleted E-mail
You can recover e-mail that you deleted in the last 24 hours.

Personalized E-mail Signatures
You can create personalized "signatures" that are automatically added into your e-mail messages. The signatures can include your name, contact information, a personal quote, or however you like to end each of your e-mail messages.

Switch Screen Names for Auto AOL
You can set up Auto AOL to sign on and download e-mail and newsgroups from multiple screen names without disconnecting.

Favorite Places and Address Book Save/Replace Features
Now you can save copies of your Address Book and Favorite Places. You can use these copies to update AOL software on another computer where you might also use AOL.

Easily Locate Files that You've Downloaded
The Download Manager now contains a "Locate" feature that will show you the directory location of the file that you downloaded.

Get Profile Button on the Instant Message Form
A Get Profile button has been added to the Instant Message form. You can click the Get Profile button to instantly access a member's profile in the Member Directory.

System Information (SysInfo) Tool
The SysInfo tool was developed to aid Member Services' Technical Support in providing timely and efficient help to you. This tool provides system and modem information, error messages, update status and version numbers, and additional troubleshooting utilities.

Auto detect new modems
After you install a new modem, AOL will automatically begin detecting the new modem and prompt you to update your AOL setup.

Download times range from 40 minutes at 56K to 2 hours 40 minutes at 14.4K. If the icon doesn't show up when you connect, just type ***"AOL 5"*** in ***Keyword*** and you'll be taken directly to the download area. Don't be the last one to update, especially when it's free. ◆

(SpinRite……Continued from page 3)
gram for this article I had to disregard that, since I wanted to see how it ran on various machines. My first choice was another laptop on which the hard drive had definite problems and indicated as much by a message to that effect and a requirement that Scandisk be run. Unfortunately, Scandisk would start then eventually freeze (probably when it got to the problem area). Sadly SpinRite also stopped responding during its initial disk integrity test. A call to the tech line got the response that "if Scandisk wouldn't run, neither would SpinRite". That, however, is not what you are led to believe at the web site, where it says, "If MS-DOS is aware of the existence of a drive, then SpinRite will run on it." I could do a

(SpinRite……Continued on page 5)

(SpinRite……..Continued from page 4)
DOS directory and , in fact, used a ZIP drive in DOS to transfer files to the Zip drive, so DOS was aware of the drive.

My next attempt to use SpinRite was on an old 486 laptop with a compressed drive, which I use for testing purposes. SpinRite is supposed to work on such compressed drives (it says it works with Microsoft's Double Space), and I made the boot floppy on that machine so that it included drvspace.bin (Is this the same as Double Space? I don't know; it has been too long since I dealt with such things.) I even created a config.sys file containing a device line about drvspace.sys and included it on the floppy. Indeed, SpinRite started up, did a little something to begin its initial drive analysis, gave a message to wait a moment—and never did any more. I tried the suggestion to add the command line option "nocachetest" to no avail. I suspect the compressed drive was the problem. Anyway, I then moved on to the machine I used for this review.

Frederick O'Keefe reviewed SpinRite 4.0 in the August 1997 newsletter. That review was more extensive than what I have done here. And most of what is mentioned there is still applicable to version 5.0. He obviously had used the product much more than I and had a better understanding of its technical aspects. If you find the topic of interest, you would benefit from reading that article at http://www.tpcug.org/reviews/SpinRite.html.

The Gibson Research site is http://www.grc.com/ and offers much information about the product.◆

New Sony FD73 Digital Camera Improves the Older FD71

By Merle Nicholson, President, Tampa PC Users Group

In case you're wondering how you take a picture of your camera when you only have one of them, you take it in a mirror, and, through the magic of Paintshop Pro, mirror the image!

Only problem is, then you have to edit out the fingers.

This $499 camera is at the low end of the models. It looks pretty much like the old FD71. It still does 640x480, not the mega-pixels of the higher end models, but they've improved a lot of things. For the original article on the FD71 by Larry Anders, go to our web site and view the article at the link http://www.tpcug.org/reviews/mavica.html.

Three things stand out about this model. First, it's very much lighter in weight. Second, the floppy disk is much, much faster, and, third, it snaps pictures faster. The obvious advantage to a floppy is the ease of transferring pictures to your PC. Insert the diskette and drag.

In case you're new to the subject, Sony has taken a different approach to storing the images. All the models (and there are a lot of them) have a slot for floppy disks. Depending on the format you want, one disk will store from one to forty images. Mostly you'll store twenty.

There's a "bitmap" format (.BMP) that takes nearly a whole diskette. When you take one of these, it puts the standard JPEG file on the disk, too. The one picture I tried this on, I did a slideshow of the two images, so it would flip from one to the other every two seconds, and then maximized to the full screen, and I just couldn't tell one from the other (actually I couldn't even tell when it flipped).

Sony calls this floppy drive "2X", and I can tell you that it's a very welcome improvement. There are other improvements like adding a "series" file numbering option so that you don't repeat the file number between diskettes, handy when you're dragging more than one diskette's worth to a single directory.

Other features: a 10X optical zoom, three levels of flash, and a half dozen pre-programmed modes that preset shutter speed and aperture. This model is cheap, slick and very easy to use. Sony FD73, $499. ◆

I Remember...

By Ed Buzza, Tampa PC Users Group

I remember my first 286 PC from Leading Edge. I remember, with a secret smirk, how powerful MY machine really was. Why, there was a switch to adjust the speed of the processor. What a charge to jack that switch up to "turbo" mode; yeah, man, I was cruising.

You'd try 10 MHz and it would run most programs. There were some where you had to step it down to 8 MHz for them to run properly. And then there were some where you had to crank down the PC to 6 MHz. These were the game programs that depended on timing by using an instruction loop. Like you'd put a number in a counter and subtract 1 each time you went through the loop and kept checking for zero. And that's how they'd time the program for showing objects on the screen or moving icons, etc.. Later, this method was abandoned since the PC speed kept getting faster and faster and soon an internal clock/timer was available to programmers.

Note in the above sentence that the use of two m's in programmer is a sign of an old timer. Old - like mid-1950's!! The first computers were monsters in size. The old ENIAC took up the space of a large garage. In the IBM 702, cathode ray tubes served as memory components. The IBM 705 used ferrite doughnut cores as memory. They were small but still large enough that the charging and sensing wires were actually threaded by hand. A 20K (yup, twenty thousand) core box was about the size of one of those containers the county used for recycling stuff.

Now 20k was pretty daunting to program. You learned to put your housekeeping routines in the I/O areas reserved for your working files. Then, after you'd done the housekeeping and you'd set up the machine for your program, you "abandoned" the code that was in the I/O areas. Sort of like putting socks and hankies and stuff inside of shoes when packing for a trip.

Later, we (Social Security Administration) were offered 40k of

(Remember…….Continued on page 9)

Broadband Internet Access

By Tim Condon, Tampa PC Users Group

Fast Internet Access. What a subject. When our esteemed newsletter editor William LaMartin asked me to write an article about cable modem access and asynchronous data subscriber line (ADSL) access to the Internet, I figured it would be a simple either-or proposition. After all, several years ago I was a beta tester for the Roadrunner cable modem service when it was rolled out in South Tampa. And I've now been using Roadrunner's service for several years on a daily basis.

Then came DSL. Recently I became one of the first customers to sign up for GTE's new lower-priced "DSL access service," also in South Tampa, at my office.

So now I use Roadrunner when I'm at home on a Pentium running at 233 MHz with 64 megs of RAM; and at the office I use GTE's DSL access service on a Pentium II running at 433 MHz with 128 megs of RAM. Does the faster and newer machine at work speed up my daily Internet activities? Not really. The speed with which you access the Internet is primarily a function of your "bandwidth" (that is, the speed or "broadness" of the "pipe" you have connecting you to the Internet, which in turn is a function mainly of what kind of access service you use).

Look at it this way. If you have an Internet connection giving you high bandwidth (that is, a big, "wide" pipe), you'll be zipping along on the Internet whether you're on a Pentium 133 or a hotrod running at 700 MHz. Conversely, if you have a low bandwidth connection, then your Internet experience is going to crawl regardless of whether you're running a slow machine or a speedster. However, your ultimate Internet experience is also affected by the machine you're using, particularly with respect to your PC bus and video display.

Got all that? So cable modem Internet access and DSL Internet access are known as "broadband connections." And the traditional dialup modem connections---which started at 1200 baud some years ago and successively moved up through fairly predictable increments to 2400, then 9600, then 14,400, then 28,800, and finally, today's standard, 56,600 BPS (bits per second)---might be called "narrowband," although you never hear at 56.6 connection referred to quite that way.

Incidentally, the original measure of throughput was "baud," meaning roughly (very roughly) "characters per second" (one character in the "old days" generally consisting of one 8-bit instruction; today we're all using 32-bit chips and operating systems, with 64-bit chips and the 64-bit operating system, Windows NT, soon to appear). Somewhere along the line the measure of modem throughput got changed from "baud" to the current standard, "bits per second" or "BPS." Thus, today's standard 56.6 KBPS modem stands for a throughput of 56.6 kilobits per second, or 56,600 bits per second. (As with every other subject in the world, you can find an excellent primer on modems and modem technology on the Internet, in this case provided by the University of Chicago Campus Computer Stores, at http://www-desktop.uchicago.edu/store/technotes/misc/Modems.html.)

Which brings us back to today's Internet reality. First reality: When it comes to Internet access, dialup modems are dead, or soon will be. They are being replaced by various sorts of broadband access, starting with cable modems and DSL service. Second reality: The ultimate struggle over Internet access won't be fought out between DSL service and cable access, but rather will be fought out among four contenders...but more about that later.

What about today's choice between Roadrunner's cable modem and GTE's DSL service?

First cable modem access, because it's been available longer. In Hillsborough County cable Internet access is a service of Time Warner Cable, and is available virtually everywhere in the county. It is an adjunct to cable TV service and runs over the same cable network. Cost is $39.95 for current Time Warner cable TV subscribers for non-business service, and $49.95 for non-cable subscribers. Then there's a one-time installation fee of $99.95 for desktop PC's and $149.95 for laptops. (Roadrunner sends a tech out to your location to install a cable modem and get you up and running.) For business use, Roadrunner charges $79.95 per month, with a one-time installation charge of $149.95.

Speed? Using cable modem access to the Internet is a whole new experience, as anyone can tell you who's tried it. Access speeds are measured by "downstream" and "upstream" data speeds. Downstream is the important measure, as that tells you how fast Internet text and pictures are downloaded or "painted" onto your computer screen. Actually, "painted" isn't a good term for broadband access, because the images don't slowly scan onto the screen, they just "pop up."

"Upstream" measures of speed have to do with how fast your own instructions, from your browser to the Internet, are transmitted. Thus, upstream bandwidth is concerned mainly with mouse clicks and file requests you do.

Roadrunner advertises its downstream speed of "up to 27 MBPS over the network, but the device with the slowest throughput along this path determines the effective speed. Typically, this is the PC bus and/or video display." Upstream speeds are advertised as ranging from one to three megabits per second.

Now. How does all this comport with reality? On the one

(Broadband.....Continued on page 8)

(Broadband.....Continued from page 7)
hand, I can't really say, as I don't have the capabilities of measuring upstream and downstream throughput independently of my own machine. But I can give you anecdotal evidence. And that is that Roadrunner is terrifically faster in downloads than any modem connection I've ever experienced, yet much slower than the advertised "maximum speeds." In downloading files (after all, that's the kind of activity that ties up our machines the most, for the longest periods of time, right?), I have on rare occasions had my computer tell me that I was downloading data at the rate of up to 150 kilobits per second. When compared with the theoretical 27 megabits per second, that doesn't seem all that fast. But trust me, it is.

I have also been told by my computer geek friends that what my Netscape software says is my download speed may not be, and that the only way to get a really accurate measure of downstream throughput is by downloading a file of a known size, and measuring the download time with a stopwatch. That I haven't done. And the 150 kilobits per second mentioned above is a relative surprise. More often Roadrunner gives me reported download speeds in the range of 20 Kbps to 50 Kbps... still blazingly fast compared to what is possible on a dialup modem (usually in the range of 3 to 7 Kbps was what I experienced on my 33.6 Kbps dialup modem when I was using it).

All of the above means that really large files can be downloaded off the Internet in just a few minutes. The largest Netscape Communicator install, for instance, takes less than five minutes to download.

A few technical caveats need to be mentioned here also. Much has been made of the fact that the design and structure of cable networks is "shared," and as more users log on at the same time, network performance is degraded. Here's what Roadrunner says about it: "Data bandwidth is shared from the neighborhood node to users in individual homes, so performance may vary depending on how many customers are actively using the system at any given time. The system has been designed to offer worst-case bandwidth exceeding that of ISDN service (which stands for Integrated Services Digital Network), and that worst case assumes continuous, maximal usage by every Roadrunner user in a neighborhood, simultaneously."

Translation: You get better performance from the cable modem network at 5:00 a.m. than at 5:00 p.m. Nevertheless, when you have a worst-case designed speed in excess of ISDN (offered by GTE at a designed speed of 128 Kbps which is itself being supplanted by the much faster ADSL service), you're still flying, even in the worst-case situation.

Let's talk about ADSL service now. Asynchronous Digital Subscriber Line service is the fastest Internet access service offered by GTE, the telephone service-provider for our area. They also offer dialup access, at 56.6 Kbps, and ISDN service at 128 KBPS. With the recent rollout of more reasonable pricing of DSL service---which I would hope will inevitably fall over time-- -traditional dialup access and ISDN service seem to be fading.

And there's the bandwidth. DSL Internet access, according to GTE, offers downstream speeds of from 256 KBPS to 1.544 MBPS. Compare that with 56.6 KBPS and we find that the slowest DSL connection is almost five times faster than your normal dialup modem...and potentially nearly 30 times faster.

How does DSL work? Basically, it takes the "twisted-pair" technology---the two small copper wires that are twisted together and which serve us all as telephone lines---and applies "a three-way channel data delivery system." Pretty snazzy technology, when you think that just recently everyone was talking about how the phone companies were "trapped in a copper cage" and would have to massively re-deploy fiber optic cable (yes in the long-term, no in the here and now).

According to GTE, the three-way channel data delivery system mentioned above operates like this: “One channel transmits voice services, so normal phone usage can continue regardless of whether a user is connected to the Internet. A second channel can transmit a massive downstream of up to 1.544 MBPS, and a third bi-directional channel allows upstream of up to 768 KBPS.” Furthermore, per GTE, “DSL Internet access also gives the consumer a constant connection at a click of an icon, eliminating the time spent waiting for call set-up and busy signals.”

The first question I had when I read the above information was "How do they do that?" It has to do with frequency bands. Again, GTE: "Traditional analog voice band modems use the same frequency band, 0-4 kilohertz (kHz), as telephone service, preventing concurrent voice and data use. Because the new DSL modems operate at frequencies above the voice channel from 100 kHz to 1.1 Megahertz, POTS (plain old telephone service) and DSL data service can operate concurrently. By using the same telephone line, there's no need to get a new telephone number to use your DSL service."

That means you save on having to have a second telephone line for your computer. However, unlike cable modem access, you still have to have an ISP (Internet Access Provider; in the case of cable modem service, the cable company itself is the access provider).

Up until recently GTE insisted on pricing its DSL service like a monopoly. The result was that cable access beat their pants off for the past several years. However, someone at GTE finally got through to the old monopoly-pricing-heads, and DSL service has now fallen to a roughly comparable range with cable

(Broadband……..Continued on page 9)

(Broadband……..Continued from page 8)
access. GTE has rolled out various "service packages" referred to by the names of metals: Bronze Plus, Bronze, Silver, Gold, Platinum, and Platinum Plus, in ascending order in terms of speed. Prices for those services range from $32.50 per month up to $230 per month

But remember, you also have to pay for an ISP when you use DSL service. GTE is offering a pretty attractive ISP package with unlimited access for as low as $14.95 per month. When combined with the cheapest DSL access (the one I chose, of course), then the monthly charge comes out to $49.95, which is the same as cable access for those who don't have existing television cable subscriptions.

DSL setup charges? Yes, they're there: a one-time charge of $150 if you provide your own network interface card (that is, a usable network card), and $200 if GTE provides the network card. And the tech who sets you up will wire your telephone system up with a "frequency splitter"; from that little box, one plug goes to your telephone, and the other heads for your computer.

There's a further hitch on DSL service also: Your computer has to be within a certain distance from a telephone company switching station, or the technology won't work. The distance is about 16,000 feet, I'm told.

So what's the bottom line in terms of prices? You can compare the prices listed above. Further information on both DSL service and cable modem access can be obtained on the Internet by going to: http://www.gte.net/pands/residential/dsl.html (as to DSL service), or http://www.tampabay.rr.com (as to cable modem access service).

What's the bottom line in terms of speeds? Well, the "designed" speeds are all outlined above, with the Hillsborough County Roadrunner access advertising up to 10 MBPS on a typical Pentium machine (there's a designed maximum speed of 27 MBPS and a worst-case scenario, shared-network speed of 128 KBPS). GTE's DSL service, on the other hand, advertises anywhere from 256 KBPS up to 1.5 MBPS upstream.

So you'd think that cable modem access is clearly a faster mode of accessing the Internet, right? I'd have to say wrong, given my experience with both services. In fact, I'd have to say the quality of the Internet experience, in terms of speed, is roughly the same, as far as I can tell. Part of the reason for that is doubtless that once you get into the higher speeds of accessing the Internet, incremental increases or decreases in speed aren't noticeable. I mean, you hit a key, a picture pops up. Who can tell if it pops up in 2.4 seconds or 2.3 seconds, you know?

My personal favorite? You had to ask. Well...I'd have to say... ummmm...hmmmmm...well, uh...ahhhh...the final answer is... neither. I must say that I like them both. Anyone who is considering broadband access---and once you experience it, you'll be through with dial-up modem access in the long run---has to look at the options available. You may not be close enough to a telephone switching station for broadband DSL service. Time-Warner's Roadrunner cable modem access service may not be available in your area. Check them both out. And then if you find you have the terrible situation where both services are available, check out the information at the above web pages, and talk to other users of the broadband services. In the end, you really can't go wrong.

Afterword: You may have noticed that I mentioned in the above article that "The ultimate struggle over Internet access won't be fought out between DSL service and cable access, but rather will be fought out among four contenders...but more about that later." Well, this article spun out of control in terms of length, and I never did have a chance to get to that issue, which is kind of futuristic. However, the future seems to be rushing upon us with great speed. If there's any demand, and you want to hear about it, I'll write another article about that area. Otherwise, I'm a curmudgeon, leave me alone. ◆

(Remember……..Continued from page 6)
memory in the 705-II. Now we could breathe. Do all kinds of fancy stuff. Soon, IBM upgraded (even way back then, computers were being upgraded on a very fast time table) and offered us the 705-III with 80k of memory. We refused it! At the time, we didn't need it.

Then, when the micro-computers, the original personal computers, were introduced, it wasn't long before they too joined the upgrade merry-go-round. Like the story about the chicken and the egg, you wondered which came first, bigger and faster PC's or bigger and hoggier programs. Needless to say, that question has never been answered.

As on the main frame (affectionately called "big iron"), the first PCs were programmed in a symbolic language that was just one step up from actual machine language. People took pride, and were rewarded, for "tight code". That is, "doing the mostest with the leastest". Soon their bosses, always concerned with the "bottom line" figure of profit, were demanding faster delivery times for programs.

That lead to the so-called higher language programming, assemblers and compilers like FORTRAN (FORmula TRANslation), arguably the first higher language, COBOL (COmmon Business Oriented Language), and then the rest such as Jovial, Pascal, etc. While it made life easier all around for the programmers and the bosses, it sure did take up a lot more of the computer resources like memory and created the need for big disk drives.

Special Interest Groups

Internet SIG

This SIG meets the first Monday of the month at 6 PM at the Reflectone Building, off West Waters Ave. You must sign up to get on the list and to get by security. *Contact Mike Hodges at hodges@reflectone.com.* For directions, see the map at our web site or contact Mike Hodges.

We consider all topics concerned with creating web sites. We study sites of interest from the web and those created by members of the SIG. And, in general, we consider anything of interest concerning the Internet.

Genealogy SIG

To be included on the TPCUG genealogy mailing list, contact Jenny Lind Olin at 960-5723 or jloin@aol.com

Visual Basic SIG

This SIG meets the third Tuesday of the month, at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6 PM. For information, *contact Merle Nicholson at merlenic@tampabay.rr.com.*

FACUG Meeting

By Don Patzsch, Tampa PC Users Group

Review of the FACUG meeting at Sarasota October 23, 1999

This meeting reminds me of the first meetings we had when this group started about eight years ago. Right now, the software companies are not sponsoring much, as the cost of software has dropped to the point that no one company is making real large incomes as they did in the more recent past.

The registration started at 9:30 and there was a continental breakfast for all. There were about 75 people in attendance. There was a handout of the usual cloth carrying bag, containing a lot of goodies such as pens. These bags came from Office Depot.

In the first morning session, I attended the session on Volunteers. About one hour was spent in talking about how to find volunteers and keep them interested long enough to get the job done. There were perhaps 30 people in the room, and many good ideas came up.

The second morning session was about Web Pages, and was chaired by Gary Schweinshaupt. This was a fascinating session as the group talked about many URL's that are used by the members to help them prepare their home page and the rest of their web sites. Several groups have over 1,500 members, so they have fairly complex web sites. Orlando is thinking about putting all its members' names on their site. (They have way over 1000 members.) This was one of the best sessions I have ever attended, but there is far too much to list all the discussion here.

The lunch was free and was served in the Masonic (SAHIB) building in which we met. We had grilled chicken breasts, fish, salads, and all the extras. A great lunch, and we could get to meet some new people and find out what they thought about computers in general.

After lunch, the people from Office Depot and also from Compaq talked about their companies and what they are doing currently.

Following the lunch hour, I attended the session on Grants. The art of applying for a grant has now reached a point where any group should be able to get what they want fairly easily. A very long discussion was held about the fact that the Gainesville group is applying for a grant for a whole building and the associated lot! Sun City Center also has that idea. One foundation has over a billion dollars to give away. Everyone had some stories to tell and all the groups are interested in grant applications. Many groups have now bought LCD projectors and other equipment with the grants they have received.

The last session I attended was that of Incorporating as a tax-exempt group. You get to know what groups have had special tax considerations and also you find out in detail how to set up your own incorporation papers. A discussion was held about the C designation; there is more than just a C3 designation.

Following that session, a prize drawing was held. Software and other materials were given away by the number on your ticket given you at lunch. The meeting wrapped up about 4 p. m. From my standpoint this was one of the better meetings of the last two years. And no software people were there at all! Just OFFICE DEPOT and COMPAQ. We can't stop without commending Mary for her work with the FACUG. ◆

So what used to be a 40-60k routine or program suddenly became a bloated giant needing ten and twenty times as much in memory and disk requirements. Sure, some will say that with today's prices and availability of huge memory and disk space, all that is irrelevant. But do we really need a twenty ton semi to haul the garbage can from the backdoor out to the curb?

My next PC will be a 700 MHz Pentium III. Can you imagine that speed? Way back on that old 286 (in turbo mode at 10 MHz) my typing speed was about 40 words per minute. I know that with the new 700 screamer my typing speed will STILL be 40 words per minute. And I will have acres of hard disk space to store my 15-20k word processor files which, if stored in ASCII, will only take up 3-4k of space. ◆

(President…….Continued from page 2)

voicemail boxes, send a message to your pager or forward the call to your cell phone – or any other phone. You can set up the initial voice recognition part yourself by saying the names yourself, and when that person calls, it will update to the person's actual voice. And it's only $50. The downside is that you must have some specific type of modem that meets the TAPI standard. There are increasingly more modems being built for that standard, but, sorry, you can't use the old Zoom or Hays turkey. Let me know if you decide to try it. I'm still very much interested. ◆

Meeting Preview: At the December meeting we look forward to a Christmas party and election of officers. Mary Sheridan, as usual, will conduct a 30-minute Windows discussion at the beginning of the meeting.

President's Message

By Merle Nicholson, President, Tampa PC Users Group

For our December meeting, we'll serve Food!

At our December 8th meeting, the program will be an open discussion, sort of an extension of the Windows SIG, and also have some time for some personal networking. We have the annual elections to conduct and Pizza, drinks and some dessert will be served. So don't forget and eat before you come to the meeting—we'll have plenty.

As you know, this is my last month as president of TPCUG. It's been two years of some fun and some struggling, and I'm ready to pass the position to the next person. The elections are to be held at my last meeting as President, on December 8th.

I have just a few comments to pass on that hopefully will be of some benefit. First, I'd like to say the club exists because a very few members are willing to dedicate their time to make it so. Secondly it exists also because a core group of dedicated members come to the meetings month after month. It's really remarkable that a fairly high percentage of our membership comes to the meetings. I'd like to think that the reason is that the meeting topics and selection of speakers is the draw, because so much effort goes into that very thing. The attendance for the speaker from

Minutes of the November Meeting

By James Weber, Secretary, Tampa PC Users Group

Mary Sheridan started our Windows SIG at 6:00 PM. The main topic of the SIG was the growth of CD recorders in home PCs. There are a growing number of members who have purchased CD recorders in the last few months, and using a CD for a backup media as a replacement for tape or (Heaven Help You) floppy disk has caught our attention. If anyone has a suggestion for a backup utility that can recognize a CD recorder, come to our web site. Your opinions would be appreciated in our discussion group.

The arrival of the "Bubble Boy" virus was brought up. If you were unaware of its presence, don't be alarmed. No one had yet reported an actual infection. If you are concerned about any e-mail related virii check out http://www.ZDNet.com for virus warning updates.

Merle started the general meeting at 6:30 PM. Current nominations were announced at this time and the floor was opened for any additional nominations. A motion was placed before the group to accept the nominations. It was seconded and passed unanimously. The nominations for this year's Board of Directors will be:

President, Mary Sheridan.
Vice-President, Mike Hodges.
Treasurer, Jenny Lind Olin.
Secretary, James Weber.
Member At Large, Merle Nicholson.

A vote for board members will be taken at the December 8th meeting. We will be having a pizza party after the conclusion of business.

Mr. Matt McCann presented Quicken 2000 to our group. Users of the latest version will recognize the layout and will find transition to this version easy. Mr. McCann highlighted several features designed to enhance use. Quicken 2000 also comes linked to its own web site, http://www.Quicken.com. This site tailors itself to each user based on your preferences. It creates a cookie that tracks your preferences as to which features to load when you access the web site. You can have stock quotes from your investment portfolio display automatically so you don't have to go fishing for them.

Quicken also provides a way to estimate the value of your car or home. It uses Edmonds.com as a reference point. You can enter year, make, model and mileage and get an estimate. For

(Minutes.....Continued on page 3)

PartitionMagic Version 5

By Don Patzsch, Tampa PC Users Group

You've just bought a new computer with a 12 gigabyte hard drive.

Some people say that it works fine with only one partition. But let's take another look. The other day I thought I was on the A: drive, and I typed "del *.*". After I hit enter I realized that I had a problem. I had to format the C: drive and put back all the programs I had just lost. (When you are in DOS the deleted programs do not go to the recycle bin.)

Previous to this time, I had copied the files from C:\ to a new partition D:\. I copy over the files every few days. So when I put the operating system and all the programs back, I only needed to transfer all the files I wanted to keep from drive D:\. There are many reasons that some day you will also lose your drive C: drive, and you will find it convenient to just copy over your files from a 2 gigabyte partition that I think you should make on that new drive.

After the first of the year, we expect that new computers will not come with a CD that contains the operating system and all the programs. So it may be worth considering a method of backing up the software on a new computer with a second hard drive of smaller size. Other reasons to partition your new drive are, for example, you may want to have more than one operating system, or you may want to store all your data in one place on a separate drive to make it easy to copy to a backup system.

I used version one of Partition Magic, and I have used each new version; we are now on version 5. The first thing you need to do with any program is to read the manual. I read mine three times before I run the program. Do you understand the BIOS 1024 cylinder limit? Or the 2GB boot code boundary? It helps after you become familiar with Partition Magic to read about these things so that you know where they came from. Don't be afraid of these terms. They are described very simply and you can, if you want to, become very understanding of the various limitations of operating systems and bios configurations. The description of what a hard drive is all about is worth the cost of Partition Magic Version 5. The copy disk program is also very valuable. You may "diskcopy" a partition from one place to another or to another drive. (Neat for new computers, or when you are going to take out the old hard drive and put in a larger one; you copy the old one onto the new one and proceed from there.)

Now let's look at the process of partitioning a hard drive.

The first thing you are told to do in the manual is get out of any programs that are running. Disable your virus program, for example. After you are sure no other programs are running, you can partition your drive easily using the wizards that are provided, or do it manually just because you want to. Creating a new partition may cause your drive letters to change and so you use DriveMapper (included) to rearrange all the programs so that they go to the proper drive and you will find no difference in how your programs work.

Now let's see what is in the new version.

You may merge partitions, change a logical drive to a primary drive, and convert from NTFS file system to FAT32. You may merge FAT and FAT32 partitions.

Reading the manual will show you some of the shortcomings of Windows NT now that larger drives are common. Windows 2000 (Windows NT version 5) will use a non-standard "Dynamic" hard drive, which this Partition Magic v 5 will not work with. You may create 64k FAT clusters to work with Windows NT so it will work with the larger drives.

Partition Magic v 5 supports drives over 20 gigabytes in size. Also it supports FAT16, FAT32, FAT32X, NTFS, HPFS, and Linux ext2 partitions.

You may set up the changes you want to make, add partitions, etc. and then you have a choice of applying the change or changes, or discarding the change. The program switches to DOS to actually make the changes.

I don't want this to become another manual, so I will stop here. Let me say that I do not believe that anyone who owns a computer should be without Partition Magic Version 5. There is a wealth of information in the manual and in the online help so that you can answer almost all of your questions about hard drives simply and on your own. Also, the program works so simply that it is easily used by a beginner. ◆

(Minutes……Continued from page 2)

your home, Quicken uses www.ConsumerInfo.com. This site allows you to enter your city, street, and square feet. The site will estimate the value based on similar homes sold within a ½ mile area of your home. There were questions as to the accuracy of getting a value this way. But, it was pointed out that banks and other financial institutions use this method of estimation. If you are using a 128 bit encryption capable web browser you can send bank book and expense information to your home computer while out on the road.

Quicken 2000 Deluxe was given out as a door prize. The meeting ended at 8:15. ◆

GoBack from Wildfile

By Mary Sheridan, Program Coordinator, Tampa PC Users Group

I had just attended the fall conference of the Florida Association of Computer Users (FACUG) in Sarasota. I rode back to Tampa all smiles because I had won, in the raffle, Microsoft's Office 2000 Premium Edition. In the mail the next day, I receive promotional material from a company called Wildfile. They send the group a copy of "Go Back" for review. I took this as an omen and decided to install, review and use Go Back before installing Office 2000. Yes, I am a chicken when it comes to installing Microsoft new releases.

Wildfile is a 19 year old Minnesota company that specializes in the development of multimedia systems and other software products. Wildfile says Go Back belongs in a new software category called Time Travel Technology. Released in December 1998, Go Back was designed to fill the gap between the undo button and tape recovery. By continually monitoring changes to your disk, Go Back can return your hard disk to the way it was minutes, hours and even days ago.

Enough of the hype, now on to the program. I was worried up front that it would take too much hard drive space. The only information I could find on the subject was "Go Back stores special information on the existing hard drive that allows it to re-create the past. It is recommended that users reserve 10 percent of hard drive space for GoBack's use. More or less space can be reserved, depending on user needs. However, if less space is reserved, users will have a shorter reach back in time from which to retrieve data." Finding percentages involves the use of division, so I decided to move on and take my chances.

The program allows you to set how much hard drive space to allocate. For my four Gig drive, it recommended 280mb, but I changed it to 150 because my hard drive is getting full. It installed in a few seconds and then needed to restart my computer. After rebooting the program went to all the drive partitions and appeared to scan them. 45 seconds later the computer rebooted again. Looking at "my computer" shows Gb_21d(H:), which I assume is a virtual drive.

According to the "short video" on how to use GoBack, "If you cannot get your computer to run properly, then use GoBack to step back in time. First restart your computer. (Turn

Second Chance from PowerQuest

By James Weber, Secretary, Tampa PC Users Group

If you are anything like me you are always trying new things with your computer, this utility, that game, or some new piece of hardware. I have found all too often that things don't always work the way they were intended. A conflict between competing programs, or hardware competing for system resources can cause at least an unstable system, or a complete crash. Power Quest has a program they say can help you recover from these problems with Second Chance.

With Second Chance installed you will be able to reset your system to a time when things were working properly. Once the program is installed it will automatically save an image of your system settings and track files and directories that are deleted or changed. Second Chance works with each fixed drive or partition in your system. It doesn't save removable drives like floppies or zips. Second Chance also ignores some directories such as Temp or Internet cache files. The individual checkpoints are not very large in size. The initial checkpoint I created on my machine was just under 6 megs in size for the 2 gigs of data I have on my machine.

Second Chance calls the saved files a Checkpoint. Checkpoints can be set up to save at a specific time of day from once a day to once a week, or they can be done manually. If you really screwed things up and can't even get into Windows, there is also an option to create a start up disk. This disk opens its own operating system and gives you the ability to recreate your system from a stored checkpoint. The number of checkpoints you can create is controlled by variables you set yourself. The checkpoints can be saved for one day to fourteen days depending on your preferences. The total size of your checkpoints can also be controlled by setting a maximum disk size for the checkpoints, and setting a minimum free space on your disk drive. This allows a great deal of flexibility when adding or uninstalling files. Second Chance deletes the oldest checkpoints first when their time limit expires or when the minimum free space on the target drive is reached. Second chance will even ignore the maximum disk size as long as the minimum free space is available on your drive. This allows you to add or delete even the largest programs and not have to worry about losing your checkpoints.

When launching Second Chance, an Explorer type window pops up with three different view panels. A large vertical

(SecondChance.....Continued on page 6)

(GoBack……..Continued from page 4)
the power off and then on, or press the reset button.) Now get ready to press the space bar. Early in the start up process you will see the GoBack Boot Screen. Press the space bar when prompted. You will have about five seconds to press the space bar. If you miss it, simply restart your computer and try again. Next, you will be given the option of returning your computer to exactly the way it was at an earlier time." Lost files are recovered by double clicking on the icon and using GoBack to recover the file. You can make a back up after you need it, by reverting the computer to "the way it was" and then backing it up.

If you have created a document that you don't want to come back and haunt you (e.g., a love letter), you should clear the GoBack history. Click on the Options button in the main GoBack Menu to bring you to this option.

I permanently deleted many files and they were all brought back seamlessly. I hope I don't need to use this program because of a major problem and I hope it works if I ever need to. I plan to install the Office 2000 programs with the hope that all goes well. If it doesn't, I'll be writing follow up articles.

Dining Room from the Ethan Allen Online Catalog

The online catalog and site for the furniture dealer Ethan Allen is at http://www.ethanallen.com/. It is only for browsing now. To make a purchase you must go to one of their stores.

Like a lot of other retailers, they are trying to figure out how to get into e-commerce without alienating their existing stores.

Internet Security

By Merle Nicholson, President, Tampa PC Users Group

I've learned a couple of things about security recently that I'd like to share. This should be of particular interest to xDSL and cable modem subscribers. I know a good number of TPCUG members have Roadrunner.

Now, I don't claim to know a lot on the subject, but I have some help in the form of a web site called http://www.grc.com. Basically what I've been doing is following the advice given on that website. GRC has a web program called ShieldsUp! that looks at your site and gives you back all the information it can find about your computer and gives advice on what to do about it.

I've known that cable modem subscribers have particular problems in keeping their systems safe. That's because the Roadrunner system is actually a network of computers that you're attached to as long as your computer is on. Also, cable modems have one thing in common with xDSL subscribers, a semi-permanent IP address. You may be logged into the network for weeks at a time, and you keep the same address until you log off and on again, lengthening the time that a hacker will have to work on breaking into your computer.

My first awareness of the problem was when a friend of mine called me one evening and said that my computer was wide open and that if he wanted to, he could send a file right to my hard drive! Now, this is an unusual circumstance having to do with the fact that I am also running a local network in my house. My immediate solution was to simply put a good "full" password on my hard drives.

Later, I got email from the Roadrunner help desk warning about running Wingate Internet sharing software in the default configuration, and what to set to prevent intrusion. Also, they advise turning off – uninstalling - "File and printer sharing for Microsoft Networks".

So let's talk about File and printer sharing first. Now this applies to everyone. If you have one computer … you don't need it. So check to see if you have it installed. You may be surprised. Go to Control Panel, Networks and look at the main window where it lists the network components; adapters, protocols and clients. See if "File and printer sharing for Microsoft Networks" is there and remove it after locating your Windows CD; it'll ask for it.

So what if you have a network? I do need File sharing. If I didn't, I wouldn't have a network, would I? Here's what I learned from ShieldsUp!. If you have TCP/IP networking protocol "bound" to File and printer sharing, you're exposing everything you share to the whole network! (As I was, but with a password.) Now it's simple to fix. In Networking, select the protocol TCP/IP, Properties, and the Bindings tab. UNcheck File and Printer Sharing. You don't need it, because if you go to NetBEUI properties, and select Bindings, you'll see that you have a perfectly good protocol for file sharing.

So back to ShieldsUp!. I was exposing much less, but the site could still read my Computer name, my Workgroup name, and Computer Description. So I'm still not completely happy. Coincidently, I got some email from SyberGen, the maker of my Internet Sharing, notifying me a new version was available free to current license holders. So I upgraded, and also found they have a new firewall product called SyShield. Installing the SyShield demo software completely protected my computer, but it was too troublesome. From time to time I'd lose my connection altogether. So I removed it. And in reading the very good documentation on the SyberGen site it suggested enabling the firewall option on SyGate, the sharing software. Well,... I had missed this option altogether, and it fixed everything. Now ShieldsUp! says my computer is "unusually secure" for a Windows 98 machine.

So this is simply building up to a very hearty recommendation for SyGate Internet Sharing software. It's extremely easy to set up. It'll work with xDSL, dial up modems and cable modems. For cable modems (and I presume xDSL) you must have two Ethernet cards: one for the modem and one for your network. With Wingate, you could use but one Ethernet cable to a hub, but both Wingate and Roadrunner recommend that you do not do that, because of a serious security hole to the Internet.

Sygate is at www.SyberGen.com. There's a 30 day trial download of the software. You can subsequently buy a license key for $50. It's a relatively small download and has been perfectly reliable. They notify you when a new version is available (I'm on my third) free. It uses no interrupts and is virtually unnoticeable running on a lightweight computer like the 166 I have it on. But you do have to have two Ethernet cards. On some systems it will share an single interrupt for both cards, but don't count on it. ◆

(SecondChance……Continued from page 4)

panel on the left of the screen lists the folders for the current checkpoint you're viewing. A second panel on the top right shows a list of the recoverable files in the selected directories. The bottom right window shows which files are new or changed. The file and directory entries are color coded so you can easily see which ones were added, deleted, or somehow modified. To go back to a previous system setting, you high-

(SecondChance……Continued on page 8)

Power BASIC DLL Compiler for Windows

By Tom Cone, Tampa PC Users Group

A number of years ago I wrote several articles presenting a series of programming "puzzles" for members of the users' group. My original solutions were written in various DOS languages including dBaseIII+ and PowerBASIC. Recently the publishers of PowerBASIC have added extensions to their windows BASIC compiler that caught my eye. I decided to take the plunge and try to write a true 32-bit native code solution to one of my early puzzles.

The compiler I am using is called Power BASIC DLL Compiler for Windows, PB/DLL vers. 6.0. This version includes new features collectively called Dynamic Dialog Tools. These permit you to build and manipulate the Windows graphic user interface using command line statements with varying argument lists. You can create different types of dialog forms (checkboxes, listboxes, text boxes, message boxes, combo boxes, and so), adding controls to them for interaction with the user.

Using this compiler you can build DLL's for use with Visual BASIC (in fact that's how the publisher positioned the product initially, and it's still apparently a major portion of their market). But you can also build stand alone EXE files which don't require any runtime support.

The source code below is what I developed. You programmer types may be surprised at how easy it is to read, and how little work was required to create and manipulate the interface.

When this code is compiled it creates a single stand alone EXE file which is 12 kb in size. That's right! 12 kilobytes.

Here's the source (comment lines are preceded by an apostrophe):

```

END FUNCTION      'WinMain ends here.  Program terminates when user presses OK.
' end of source
```

As the program runs, the text box appears on screen with spinning numeric counters. Here's a snapshot:

When the calculations are ended, this text box is closed, and a final message box is presented. It looks like this:

I am intrigued with this compiler and am particularly attracted to the small size and fast speed of the resulting executable file. If you would like more information on it, visit http://www.powerBASIC .com. The compiler is available for $189 (plus shipping) with documentation on disk. A softcover book is available at extra charge.

If you are working with a different language (like Visual BASIC, for example), I challenge you to try your hand at converting my code so that it will work for you. Maybe one of you would be willing to write it up for publication next month for comparison purposes. How about it? Any takers out there? ◆

(SecondChance……..Continued from page 6)

light the checkpoint and click the restore button, just that simple. The system will reboot and a prompt will ask if you want to reinstall any file that is after your previous checkpoint. This works well if you have done several things since you started experiencing problems and didn't want to undo all of them.

When I first received Second Chance for this review I figured on trying it out by adding and removing a few programs, maybe a few JPGs, or text files too. Then I would see how well it recognized my system changes. But I had the unfortunate opportunity to try Second Chance out on a real world system failure. As I said before, I like to play around inside my machine. This means I'm more prone to major crashes than most people. I try to back up my system files on a regular basis for the inevitable system crash, and I was doing just that last month when my power supply died right in the middle of my backup. Not only did I lose my backup, but the system files that were being read were toasted, too. I could no longer get Windows to even attempt to boot into safe mode. Armed with my Second Chance boot disk I was able to restore my system files from a checkpoint I had created when I first installed Second Chance. Now I could get back into Windows. From there I rebuilt the corrupted or missing VXD files that Windows insisted were no longer present. By opening the Second Chance window and viewing the different checkpoints, I was able to locate various missing system files that didn't load the first time. I was able to get my system up and running, including all the add on programs I use, in less time then it normally takes to just reinstall Windows.

As far as most utility programs are concerned, we see a lot of things on the market that try to be all things to all people. Most of the times they do one or two things well but fall short with the rest of their included tools. Power Quest does a remarkable job of producing powerful tools that function just the way you would need them to. Second Chance worked just as the manual said it would, and I could not be happier with the way things worked out for me. If you would like a quick easy way to protect your computer from corruption but don't do regular backups, I would whole-heartedly recommend picking up a copy of Second Chance. ◆

It's time to browse the virtual aisles

By Larry Anders, Librarian,
Tampa PC Users Group

The Thursday after Thanksgiving officially opened the last holiday shopping season of this millennium. Some people live for that face-to-face interaction we call shopping. Since the dawn of time that is all we've ever had, besides mail-order catalogs. Although the shopping phenomenon we call *malls* is new to the last half of this century there is now a new kid on the block and it is a *virtual super-mall* filled with *virtual values*.

No longer do just the people that live in the northeastern portion of the United States get to be the only ones that are able to shop at places like Macy's or Bloomingdale's department stores. Typically you can just type the name of the store into your browser and the usual http:// and dot com (.com) before and after the name and like magic you're transported there. No crowded stores, no long lines.

Last year was officially the first major cybercommerce shopping season but in one short year E-commerce has really come on-line (excuse the pun). And although there has been extraordinary growth in on-line shopping this past year it is still only a scratch on the surface of total retail sales… but it is growing, exponentially.

One of the reasons, I believe, that on-line shopping hasn't come of age is the fear by most people of giving their credit card information over the Internet. Yet, these same people will hand that same credit card to some person in a restaurant or retail store whom they have never met before and think nothing of it. Now does that make sense? Secure shopping on-line is a breeze if you know what to look for and you use common sense.

- Look for and read the website's privacy statement. Make sure you are aware of how your information will be used.
- Look for what the Internet calls *Trustmarks*, or indications that the site is being monitored by an outside agency such as the Better Business Bureau.
- Always use a credit card and place your orders through secure servers. Most sites alert you when you are about to enter a secure server but to be sure the web address usually changes to *https* rather than just *http* once you have entered the secure side. In most cases there is also a lock or key visible in the status bar at the bottom of the browser. Remember, if you use a credit card and there is a problem you will be able to contest the charges and under federal law you are only ever liable for $50 if your credit card information is misused. (This is always the part that gets to the people who are skeptical about purchasing over the Internet. But if you think about it, and have done the above, you should feel more secure than physically giving the credit card to someone you've never met before.)
- And, as I mentioned before, use common sense. Don't give out any information you wouldn't disclose over the phone or in person. You have the ability to feel as secure as you want by reading and understanding the web site's privacy and security practices before you make your purchases.

One last thing to think about when shopping on-line during this holiday season is to make sure you check out the deadline for ordering to guarantee a delivery in time. Although the purchasing is done electronically they still haven't found a way to *beam* the gift…… yet….. but….maybe by the end of the next millennium.

Happy Secure Shopping and Happy Holidays ! (Remember the reason for the season.) ◆

(President……..Continued from page 1)
Intuit last month was outstanding.

The club itself has a couple of very good things going for it that hopefully will sustain it for the future. Two I've mentioned: a dedicated board and fairly consistent attendance. Three other things: An excellent newsletter, an outstanding web site and consistently good programs. One thing we did this year was find a willing person to chair a membership position. It was slow in getting on track, but we can see the results I think because the membership drop/add rate has gone positive, and that's very good news. For one thing we are doing some advertising and also we're phoning people who did not renew membership, with some very positive results.

Two areas where we seem to come up short on: We're not growing and the SIG attendance is variable. We're still struggling with these two areas, and frankly we need your suggestions. It seems that all the discussion on the topics we need help on is confined to the board. **We need to know what you need**, not just suggestions that may help. We're small enough to be flexible to tailor the SIGs to meet the needs directly. For instance – would anyone be interested in doing some Access study at the VB SIG? Give us a call – in this case, William LaMartin or myself.

(President……..Continued on page 12)

Special Interest Groups

Internet SIG

This SIG meets the first Monday of the month at 6 PM at the Reflectone Building, off West Waters Ave. You must sign up to get on the list and to get by security. *Contact Mike Hodges at hodges@reflectone.com.* For directions, see the map at our web site or contact Mike Hodges.

We consider all topics concerned with creating web sites. We study sites of interest from the web and those created by members of the SIG. And, in general, we consider anything of interest concerning the Internet.

Genealogy SIG

To be included on the TPCUG genealogy mailing list, contact Jenny Lind Olin at 960-5723 or jloin@aol.com

Visual Basic SIG

This SIG meets the third Tuesday of the month, at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6 PM. For information, *contact Merle Nicholson at merlenic@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting at MOSI and is devoted to a general Windows and computing discussion. Mary Sheridan moderates the discussion.

Editor's Comments

By William LaMartin, Editor,
Tampa PC Users Group

It seems as if the months are getting closer and closer together. No sooner do we get last month's newsletter in the mail than it is time for the next. And many times, it is one week before the newsletter needs to be printed so as to get it to you on time, and I have only an article or two. In fact, there have been times when there was no article one week before printing time. But with a bit of prodding , the articles flow in. I certainly appreciate the help of all those who contribute much time and creative energy to writing articles for the newsletter. Likewise for those who very faithfully help me assemble it.

As is the case each month, it is up to me to fill whatever left over space there is. This month there is blessedly little to fill.

The past several months I have been pretty deep into Visual Basic, using it to manipulate the information in databases for the most part. It might surprise you, but one of the prime uses of VB is in dealing with databases. I use it to work with an Access database, but I rarely actually use Microsoft Access other than to build the database in the beginning.

Visual Basic 6.0 introduced a new database tool, the Data Report, similar to the Microsoft Access report. On the surface it seems to lack a lot of the power of an Access report, but that is on the surface. I have found that by properly constructing an SQL (Structured Query Language) query on which to base the VB data report, I can display just about anything I want. It is not as easy as using the Access report, but once done, being an integral part of the VB program, it allows me to do things in VB that were not previously possible.

Another topic of interest this past month was the creation of what is called an ActiveX Document EXE for placement on a web page. This is basically a program that downloads to your computer then runs inside your browser. It provides for much more power than does the use of Active Server Pages (ASP) in conjunction with Visual Basic Script. Recall the ASP web pages I mentioned in the past like the Grocery List Compiler, Mortgage Loan Calculator and others at my web site http://www.lamartin.com.

As usual, though, to get this power we must give up something. To be able to run ActiveX Document EXE's in your browser, you need to be using a fairly new version of Internet Explorer with its security settings on low. Netscape declines to support the technology.

I had visited this technology some time back, but couldn't get it to work. Microsoft's information on the topic is not very clear. Also, when you run the program for the first time, the VB runtime files will be downloaded from the Microsoft site to your computer along with whatever extra files the program may need. This can take some time if you have a slow Internet connection, and I wondered if anyone would really be interested enough to wait for the download.

Well, I gave it another try, and the result is at http://www.lamartin.com/vb/activex_test/index.htm. It is a program that I

To close, I'd like to thank all those who have supported the club the last couple (and more) years to make my tenure a very positive and rewarding experience. Thank you … and I'll see you at the next meeting. I'll be there and I hope you will be too.

Merle ◆

(Comments……..Continued from page 10)

wrote for my daughter many years ago to teach her to tell time with an analog clock. I have now turned it into an ActiveX Document EXE. If you have a fast connection, the download should only take a few seconds; if not, it could take several minutes.

Since Microsoft Internet Explorer and a low security setting are required, it is apparent why this technology is at present better suited for Intranets than the Internet, but I am intrigued by it and will try other examples as time permits.◆

Meeting Preview: At the January meeting we will have a hardware presentation covering motherboards, processors, hard drives, hubs and other topics. Mary Sheridan, as usual, will conduct a 30-minute Windows discussion at the beginning of the meeting.

President's Message

By Mary Sheridan, President, Tampa PC Users Group

My first president's article and I have no idea what to say. Since we've all survived the "end of the world", I guess congratulations are in order. I knew we'd make it.

I hope we can make the year 2000 the best year ever, both in our personal lives and for the Tampa PC Users Group.

First of all, it's important to thank the people who have worked so hard to make things run smoothly. I'd like to let Merle Nicholson know how much his excellence in serving as our president for the past two years is appreciated. Kudos to Mike Hodges for his professionalism and willingness to stay late at work so we can use the Reflectone facilities. To William LaMartin who is always willing to help anyone who needs it, who creates and maintains our wonderful website AND tirelessly publishes our newsletter month after month goes our deepest gratitude. To Don Patzsch for knowing so much and writing it down to enable all of us to share his knowledge, much thanks. Hats off to James Weber for his note taking which keeps us all abreast of the meetings we aren't able to attend. Thanks to Jenny Olin, our dedicated treasurer, who keeps the books up to the minute and always makes sure the budget is balanced. Thanks to

(President.....Continued on page 2)

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy

Minutes of the December Meeting

By James Weber, Secretary,
Tampa PC Users Group

During this month's general meeting we had an opportunity to sit together and talk among ourselves about some of the many things that have been going on over the past year, without the constraints of a fixed agenda. Our members also supplied a mixed fare of food. There was definitely the air of the holidays about.

We started at 6:00 PM with the election of officers. As there was no opposition to any of the seats it was motioned and seconded that we vote on all seats at once. A voice vote to elect the officers was unanimous.

The remainder of the meeting was spent socializing. There was no drawing.

To you and your families, I hope you had a wonderful holiday season and look forward to what we can do together in the new millennium. ◆

(President……..Continued from page 1)

Larry Anders for all he does and never wants any credit for. To Bruce Register who will do whatever you need for him to do, whenever you need it. To Kevan Sheridan for his years of dedication to the group and for being such a special person. Cheryl Alexander has taken over as our membership "committee" and is doing a great job. Last, but hardly least, to all the other members who make our group the best it can be. Thanks and thanks again.

My personal goals for the year 2000 are establishing working relationships with other user groups in the area. I'd also like to work on partnerships with local businesses.

I appreciate being given the chance to serve as your president. ◆

New Hard Drives for Improved Performance

By Merle Nicholson, Member at Large, Tampa PC Users Group

Look for new hard drive standards when you're upgrading or buying a new system. The words to look for are UDMA 66, Ultra 66 or UIDE 66 and 7200 RPM. These new drives give significant improvements in your computer's performance. They've become inexpensive too.

On my current system I set the computer up with a standard hard drive first, then copied over to a 7200 RPM drive a week or so later, and a few months after that, installed Ultra-66 support. So I have some subjective comparisons. The system is an AMD K6-3/450 with 2M cache.

Drive Speed

It makes sense, doesn't it? The faster the hard drive spins, the faster the data will go on and come off. The "normal" rotation speed for IDE has been 5400 RPM for a long time. Faster drives for SCSI are available, though. Seagate and IBM - that I know of – have had even 10,000 RPM drives for some time. They've always been with SCSI interfaces, and very high prices. SCSI drives are used in servers and in very high-end workstations.

The newest drives for consumer PCs are 7200 RPM, a 33% increase in rotational speed. These drives should give you a very noticeable 20% improvement in program load time. The price difference between 5400 and 7200 drives is very low, and very often the new ones go on sale with rebates.

Notice that I mention "program load time". Loading large files from disks is where you'll notice the biggest difference; and notice it you will!. You'll see a dramatic improvement when you turn on the computer and it's loading Windows, and you'll notice it when loading large programs like MS Word or MS Access. But the hard drive is used for nearly everything. The extra speed will be used when moving data to the swap file, for instance, and when caching pictures from the Internet and so on, but in my own experience it won't be as dramatic a difference. You'll know it's there, but it isn't a "wow" thing like loading Word or Paint Shop Pro.

Drive Interfaces

The SCSI standard has been upgraded over time to specify higher and higher data rates, starting with 5MB/sec (in 1986) up to 80MB/sec (in 1996), making it possible to raise the data rate of hard drives themselves (or maybe it was the other way round). SCSI drives are not normally used in consumer PC's because of their much higher price. You can do it though, and some people do, when the cost isn't a great factor.

IDE, on the other hand, had been stuck at 33MB/sec for some time, starting with 486 systems, until recently. IDE is the standard for all personal computers other than workstations and servers. IDE drives are inexpensive (I wouldn't have been saying that two years ago), but the recent big news is Ultra-66. It's also called UDMA-66 (Ultra DMA-66). This new standard specifies a data burst transfer rate of 66MB/sec.; technically, "burst transfer rate" means the data transfer from the hard drive's cache memory.

You need four things to get Ultra-66. A hard drive that supports it, a system board or alternately an Ultra-66 controller card, a special 80-wire cable and, last, a utility program that sets the hard drive to either 33 or 66.

Hard Drive

What you're looking for - 66 - should be obvious, but believe it or not there were many drives manufactured that are 66-capable, but set as 33 and shipped that way. Look at the specs on the box if the 66 isn't obvious. Look for DMA Mode 3 or 4. Mode 3 is 44 MB/sec, and Mode 4 is 66 MB/sec. There's a utility program that should be shipped with the drive, but sometimes is not, and can be easily downloaded from the manufacturer's web site. It's a tiny DOS program, and it's used to set the drives speed from 33 to 66 or vice-versa. Recent drives are set to 66 out of the box. So be careful here if you're hooking it up to a 33-only controller. A 66 controller will handle both, but a 33-only will give you drive errors if you connect a drive set to 66 to it. Boot into DOS first, and insert the diskette with the setting software and run it. Follow the instructions.

System board or 66 Controller card.

I've used both – several system boards and also I have a Promise Ultra66 PCI controller card on my personal system. It will simply recognize the drive and use mode 4. Look at the bootup information closely, and you should see it. Mode 4.

Ultra-66 Cable

As you supposed, when you go to Ultra-66, the old 40-pin ribbon cable won't work. It's still a 40-pin ribbon cable but it now has 80 wires. The extra 40 wires are grounded to eliminate interference. It's easy to spot, too. The cable is stiffer because it has two layers of wires and seems – to me – more fragile. It's an additional cost unless either the motherboard or the drive comes with it. In my case the cable came with the controller card, making the Promise board a better deal for me than others. Drive cables normally come with the motherboard, and many boards do not include a 66 cable, just a 33, even though 66 is supported. The cable is expensive - $15 or

(Hard Drives.....Continued on page 4)

(Hard Drives.....Continued from page 3)
so.

Promise Ultra66 controller card - technical

The Promise Ultra 66 works the same as a system board except for one thing, and I discovered it by accident. I don't think it's the Promise Card's fault, but the Quantum Hard drive 33/66 utility would not find the hard drive when it's plugged into the controller card. So I switched the cable to the (33) system board to set it. It had me going for a while. This controller card will recognize that the correct cable is being used and refuse to put it into Mode 4 if not.

A couple of interesting things about this board. All technical. It uses one interrupt (IRQ). That's in addition to the two that your system board takes. But they'll run simultaneously, for up to eight drives total. If you put all your drives – including CDROM – on the controller card, you can disable the system board devices both in Windows and in the bios. In that order. That'll free up IRQs 15 and 14.

Promise is at http://www.promise.com/Products/idecards/u66.htm .

My personal trials

I'd bought the Quantum 9.4G UIDE66/7200RPM drive from Buycomp.com for an incredible price. It was backordered, but I didn't care. I'd wait. When I copied the drive image over to it and installed it – with the system board that does not do 66 – I started having some program failures and some disk errors. But I puzzled over it for a while, lived with it, and in the meantime ordered the Promise card. So when I got it and installed it, I ran the Quantum utility to set it to 66, and found it already was. Errors explained. Read the manual, dummy. Of course that was how I found out that the Quantum software couldn't find the drive at all when it was on the card.

So I got the card in, and Windows up and running, and within twenty minutes got a corrupt registry error message, requiring a shutdown. On bootup the registry utility restored the last backup and restarted Windows, with an immediate error message again, reboot again, etc., to go on forever.

So I decided to reinstall Windows SE. The first thing that Windows SE does on a reinstall is to check for a corrupt registry, and if it finds it, run a repair utility. Good. I cancelled the rest of the installation, and rebooted into Windows, and it worked for a while, but the same evening I got the corrupt registry back.

So I pulled the Promise card out, and connected to the system board and ran the Quantum utility to set it to 33, and we're up and running fine. The machine ran like blazes with that 7200 RPM drive in it.

I used the machine with no problems for a month or so and then got the registry corrupt problem again. Some research on Microsoft knowledge base came up with the reason, a bad memory module. That's what it said. So it wasn't the Promise card at all, and I don't have to send it back – I didn't want to anyway. I bought a 64M memory module and installed it as the first DIMM, and I had no problems for another month, when it happened again. This time I didn't repair the registry, I just pulled one 32M module out of the machine, and I've had no problem since. I got lucky, I had a 50-50 chance of getting the right one of two.

So at last I can install the Promise card again. I was ready to do that because I wanted my machine in a smaller case to go on my desktop, and while I was at it, I wiped the drive clean and have been installing software for four days now.

Adding Ultra66 support wasn't a wow thing because I'd been using an older AMD K6-2/300 system while I rebuilt. I'm so happy with the speed of the new machine, I'm still amazed at how fast the programs load. For a test, I put this article on the desktop, and rebooted the machine, and as soon as Windows was loaded, I double-clicked on the document. MS Word loaded up and read this 2-1/4 page file in 2.75 seconds by my stopwatch. It was worth it. ◆

A Note from our Membership Coordinator

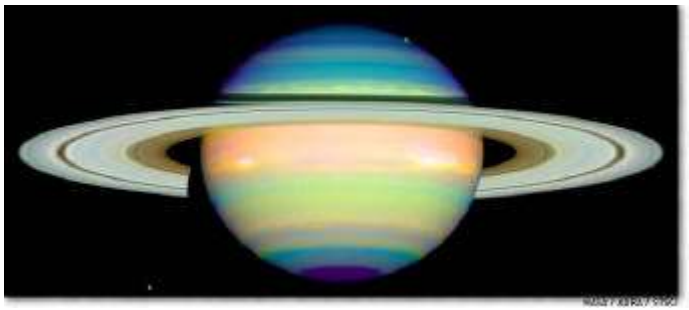
By Cheryl Alexander, Membership Coordinator, TPCUG

Allow me to introduce myself: I'm Cheryl Alexander, the Membership Coordinator. This is a fairly new, appointed position for the TPCUG, so the defined responsibilities are still rather fluid.

I plan to make calls to members every month. For lack of a better roster, I will be using the list of expired memberships. Part of my call will be to remind you that your dues are, well, due. Another part of my call will be simply to make contact with our members and let them know that we care for them as people. The most important part of my call will be to find out if the members are benefiting from being part of the Tampa PC Users Group. If not, please tell us. We can work together.

Input from the members concerning what they want and need will help us help you. Also ideas and contacts for programs would be appreciated. So, when I call, if you have anything to pass on to us, this will be a golden opportunity for all of us. ◆

Editor's Comments: Old photographs, New Computer & Online Shopping



By William LaMartin, Editor,
Tampa PC Users Group

Old Photographs My main project last month was creating an online, searchable index for the Tampa-Hillsborough County Library System's collection of old Tampa photographs in their Burgert Bothers Photographic Archive. To access this collection on the Internet you have to use Telnet instead of the World Wide Web (like DOS as compared to Windows). Then use key strokes to move about the different Telnet screens and enter keywords to do a search. Doing a search results in a new Telnet screen with at most seven entries, where you have to enter some more key strokes until you get to a screen that lists the URL for a particular photo. Finally, you have to copy this URL and paste it into your web browser before you can finally view the photograph.

This was like the Dark Ages compared to what we have become used to on the WWW. So, I wrote a Visual Basic program that connected to the library's Telnet site and captured the approximately 4,500 titles listed under Burgert Brothers along with their descriptions and URL's. I then did more programming to

Hard Drive Problems

By Merrill Friend, Tampa PC Users Group

When starting up my personal computer recently I found that Scandisk was under the mistaken impression that I had not turned off my computer properly and insisted on checking out my directory structure as well as my hard drive for drive problems. That has happened before when there was a power outage or for some other reason the computer was powered down and not correctly turned off, but in those cases Scandisk only checked out the directory structure so this was a bit different. Now it wanted to check out the entire drive. Nevertheless I didn't expect anything serious. I was certain I had powered down correctly but it seemed a bit mysterious that Scandisk wanted to check out the entire drive. Scandisk has never found anything serious before so why expect problems now, I told myself. Well, I do want everything to work right so go ahead and see what you can do Mr. Scandisk, I thought. As it turns out it did find and marked one sector as bad. So now I was impressed and felt the worst was behind me. But that was not to be the case.

When I began to use my browser, Netscape Communicator 4.5, it failed to work because it was unable to find the key file Netscape.exe. Based on this I uninstalled Netscape and reinstalled it again. Now, my browser ran all right but it loaded up perhaps a bit slower than it had in the past. I checked some other programs and they also worked OK so now once again I felt the problems were all behind me. Well I was wrong again.

The next time I powered up the computer Scandisk gives me the same message as last time and wants to start all over, not only checking out the directory structure but also scanning the entire hard drive again. Well, since I had already been there and done that, I exited out of Scandisk and proceeded to use my computer as usual. When I attempted (while using my browser) to pull up for downloading a program using Adobe Acrobat Reader it mysteriously ceased to bring up the selected Adobe file. I asked for it again and after three tries it did bring it up and I was able to print out all but the first page. For some reason the first page printed blank even though it appeared there on the screen in front of me. So, I then decided to uninstall and reinstall Adobe Acrobat, after which it worked flawlessly.

The next day I booted up the computer again, and my old buddy Scandisk appears like the ghost of Christmas past with more dire suggestions of impending disaster. Then I put a message on the User Group Web Site and William LaMartin was kind enough to respond in the discussion area of the Web Site, but he phoned me as well. In our phone conversation he suggested that I might want to consider buying and using a copy of SpinRite about which he had written recently, so I took his advice and did so. I was able to download a copy direct from their web site and was using it before the day was over.

The program was simple to use and in the areas of the disk where my hard drive was apparently in good shape it ran very fast. Where there apparently were problems it spent a good bit of time working with one cluster after another.

When I began SpinRite I had been told by Scandisk that I had only one bad cluster. SpinRite found another 40 bad clusters, plus it recovered data from about 18 other places. Most of the bad sectors were in areas where no data was stored so I guess I was lucky there. I set it on level 5 which is the highest and most thorough setting and which not only attempts to recover data but also to make previously unreadable sectors readable. When I started, SpinRite estimated all this would take about 10 hours on my computer. It actually took about 17 hours, so obviously it had a lot of work to do. My spirits were bolstered by all the good things it said it was doing. The messages on the log were so well written and to the point it would not have been difficult to think I was directly connected to some human typist inside there somewhere who was talking to me personally.

I now started up the computer once again, this time thinking that now I have all the gremlins removed. Not the case. Once again Scandisk starts to roll forward like a bad nightmare. This time the problem is one of my Netscape plug-ins. It seems some images produced by the plug-in and stored on the hard drive are corrupted but this program has an uninstall program so I use it thinking this will get rid of this problem. Well, the uninstall program tried but it could not read all the information it needed to uninstall the plug-in. Once again I was stumped. I couldn't remove this corrupted program from the computer because some part of the uninstall program is apparently corrupted. At this point I contacted Dell computer on their 24 hour toll free technical line and was instructed to run Scandisk from Windows using **"Programs/accessories/system tools/scandisk."** Previously, I had run Scandisk only when the computer first started. Apparently this runs the program from DOS. Well I was impressed; running Scandisk from Windows seemed to do the job although it took the program about four (4) hours to run on my computer, a Dell Dimension XPS P166s, using Windows 95. I am certain much of this time was caused by Scandisk having great difficulty reading the drive.

Just to see what would happen on startup I went to the shutdown window and selected RESTART THE COMPUTER, and it restarted without pulling up Scandisk again. Then I got really confident and selected SHUT DOWN THE COMPUTER and after a short while started it up again. This time

(Problems……Continued on page 7)

(Problems……..Continued from page 6)
Scandisk was back again suggesting I might have problems with one or more disk drives so I let it run again to see if it would do any better now that Scandisk run from Windows had been so successful. It began to do a full hard drive scan. Finally I got a message that "Windows has detected a registry configuration error click here to restore this from a known back up copy." I selected this option, really I didn't feel I had any choice, and the program ran until completion. I then got a message that "At least one area of drive C has sustained physical damage –although such damage might be caused by an isolated incident such as a power failure, it is often a sign of impending hard drive failure." The message further suggested that I run Scandisk daily for awhile and if more errors develop the hard drive should be checked by a qualified technician.

At this point I shut down the computer and rebooted from a cold start and miraculously everything ran perfectly. I shut down the computer several times and it restarted and ran without any incident the rest of that day. The next day the old problem was back again.

I found that my 3-year parts warranty with Dell Computer would expire January 22, 2000 so perhaps I was in luck. All this happened in mid December. I phoned the Dell 24-hour line again and got another technician. I learned that they maintain a call log and the new guy was fully up on my earlier problems. He agreed it sounded like a hard drive problem but asked if I still had the Diagnostics disk that came with my computer when it was new three years ago. I did. He asked that I run that program and then call back on the technical line. He also guided me through the start up part of the diagnosis. The Dell technician suggested that this test might take an hour or more. Well it only took about 20 minutes before the program stopped and announced an unreadable area on the disk and announced it as a hard drive failure.

I called Dell back again and they said they would send me a new hard drive under my warranty. Now I only have to learn how to install a new hard drive, which I have never done before but Dell tells me it will come with instructions and if I have problems I can call back and they will walk me through the process. The number is toll free which is a big help although on average it takes about 20 minutes before the technician comes on the line so I spend that playing a computer game while holding the phone to my ear.

The replacement drive is covered by my warranty as long as I return the defective drive to Dell. That makes sense, otherwise there may be too much of an incentive for an unethical individual to talk Dell into a replacement drive when the existing drive is still in good working condition.

When I bought this computer several years ago Dell had set it up so I could make copies of all the supplementary files Dell had installed in addition to Windows, including special video drivers, Windows 95 drivers, etc., which were not on the Windows 95 disk. Now that I have had a hard drive failure, I am so glad I produced these discs at a time when the computer was new and all was working flawlessly.

The replacement drive arrived by Airborne Express Monday morning. The Dell technician had authorized it the previous Friday evening. Now, on Monday morning I got out my original Windows 95 disc, the special Dell driver discs, my various program discs and called Dell for assistance. Since this was my first time doing this sort of thing I wanted all the hand holding I could get.

I thought I would have to run Fdisk and Format the new drive but Dell said that was not to be necessary since the drive was already set up and ready for loading Windows 95. I booted up using the Dell systems disk but when the Windows 95 disc was put in the CD-ROM drive nothing happened. The CD ROM drive would not operate. The Dell technician had me look for the mscdex.exe file, but for some reason it could not be found. It was also not to be found on any of the special discs I had prepared when the computer was new. The Dell technician then wanted to know if I understood DOS because he needed my help using DOS to get my machine functioning. I indicated I felt I knew enough to be of assistance.

I was then instructed to disconnect the CD ROM drive and attach those connections to my old hard drive which enabled us to copy the mscdex.exe file from there along with a number of other files the Dell technician indicated were necessary. We ended up with a modified Systems disc, which also contained the additional files Dell required. I had to exercise a lot of care to make certain that the old hard drive did not come in contact against any other metal parts of the computer possibly causing a short of some sort. I was able to rig a book so that it provided the necessary insulation. And, of course, the computer was turned off whenever any of these connections were changed. I must tell you that it had me holding my breath at times.

Finally, at the Dell technician's direction, the config.sys file was edited and in a short time the CD-ROM drive was functioning properly. After that Windows 95 was installed along with my old programs and files. I did find that some of my accessory items, such as the all important solitaire and hearts games were not installed but I learned that I could go to the Control Panel and select "Add/Remove" programs, then double click on "Accessories", select the missing games and insert the Windows 95 disk and now include them on my hard drive. This was all very new to me since I am much more a computer user than I am a computer technician.

(Problems……..Continued on page 8)

(Problems.....Continued from page 7)
Then I thought disaster had struck again because now my computer had no sound. However, I found that one of the speaker wires had become partly disconnected and all the sounds returned.

Once I had everything running again, I mailed the old hard drive back to Dell as part of their exchange arrangement. The old drive was put in the box in which the new drive was shipped and protected with the same materials used for the original shipment. Dell had a return prepaid Airbill for Airborne so all I had to do was call Airborne who came by the house several hours later and picked up the old drive and got it on its way to Dell.

The drive I returned was manufactured by Western Digital, and the new one was a "refurbished" drive made by "Quantum Fireball." The name infers that it is fast and frankly it seems to be faster than the old drive. Of course it is hard to tell since the old drive was in poor shape and perhaps had been gradually slowing down over the last couple of years, making comparisons difficult.

I am happy with the result. Since I had no prior experience with this sort of thing, it did take a lot of my time. But then, the price was right. The phone calls to Dell did not cost me anything, and their personnel were skilled, helpful, courteous, and took the time needed to get the job done. ◆

(Comments……..Continued from page 5)
provide two ways of viewing these photographs.

In the first way, I created five web pages at my web site, since the photographs are stored on the library's server in five different archives. On each of the five pages are listed the titles in that archive with descriptions and hyperlinks that you simply click on to view a particular photograph. Some of these pages may contain as many as 1,100 links.

In the second method of viewing the photographs, I created a searchable database of the titles and URL's, then using the Active Server Page (ASP) technology and Visual Basic Scripting, I placed this database online at my lamartin.com web site. Note that after you have done a search, you can click on the word Date at the top of the Date field and the search results will be ordered by date. This is one more example of the usefulness of ASP. To try this out, go to http://lamartin.com and click on the *Hypertext Index to the Burgert Brothers Online Photography Collection of Tampa Photos* link.

New Computer There is a new Gateway 600 MHz Pentium III computer in our house. I am just amazed at what you can get on these machines now: 128 MB RAM, 20 GB hard drive, DVD/CD drive and a flat screen monitor. That monitor is what really sets this machine apart. The 15 inch flat screen has as much viewable area as a regular 17 inch monitor--and takes up less than 1/10 of the space. Of course, it costs a bit more than a standard 17 inch monitor. Gateway was also basically giving away a color printer, an Intel PC Camera and some software. By paying $100 more, we upgraded the printer to an HP 832 C DeskJet. I didn't really need another printer in the house, but since this machine will be residing in my daughter's room, I thought having her own, newer printer would be nice.

You read correctly, the new computer is for my daughter. I am still working away happily on my Gateway 166 machine. However, I will be able to use the new machine, and it will be networked into our home network. Right now it is networked with a temporary cable running through the house that can be rolled up when not in use, but I have plans to run a permanent network cable to it under the house and through the attic.

The only problem I have discovered with the new computer is with the DVD drive. As with most new computers bought from major retailers, there is no DVD decoder card. All the decoding is done with software, Software CeniMaster99 in my case. Not having a decoder card is good since it is not taking up an expansion slot in the computer; however, it is also bad, since there are going to be some DVD's that the software will not decode. And wouldn't you know it, the first DVD we purchased, *October Sky*, could not be played on our system. It played fine on fellow member, Wade Herman's, computer, and all of his DVD's played fine on our computer. But apparently *October Sky* is not going to play on our machine until CeniMaster puts out a patch to their software to cover those titles for which there is a problem.

I had no problem getting through to Gateway's toll free support, but after several calls, I realized that the technicians I was speaking with really had no solution to the problem--probably didn't even understand the problem. That is when I brought the computer into the local Gateway store and the technician there said that everything was fine with my system. It played each of the 15 DVD's they had for testing, but there would always be some DVD's that would not play on a software decoded setup. Anyway, for the 95% or more of DVD's we can view, the quality and sharpness of that 15 inch flat screen LCD monitor makes it quite easy to watch a DVD movie.

Online Purchases With the closing of 1999, you probably

Space Explorer II

By Mike Hutchison, Tampa PC Users Group

Well, some of you may have gotten a new bike or Barbie, but I got a Meade 60mm (2.4") refracting telescope for Christmas from my wife Laura. It was a surprise, but I couldn't be much happier with the selection. This reaction was augmented greatly when I got a peek at the software that came with the telescope. O.K., O.K. the name sounds a bit hokey, but the program is not. Certainly not for someone such as myself who cannot consistently differentiate the Big Dipper from a large redneck with a lip full of Copenhagen. At one point in time I had a schoolboy level of familiarity with the constellations, etc., but this faded, and once I began trying to keep track of MBRs, FATs, EXEs, ASPs, et alia, lots of things got jettisoned to make room in my old melon for subjects currently in the forefront.

The software includes an Ephemeris which allows the user to see data for the Sun, Moon and all major planets. The information provided covers the Right Ascension (celestial counterpart to the Earth's longitude) and Delination (celestial equivalent to Earth's latitude), the rise and set times for the object and transit time. Also listed are Apparent Size in arc seconds, Disk Illumination in %, and Geocentric Distance/ Heliocentric Distance (distance from the Earth or Sun) expressed in Astronomical Units, Kilometers, or Miles. By clicking the Auto Update On button, the data will be updated in real time.

The Moon Calendar feature, which is located near the bottom of the Ephemeris drop down menu, shows the phases of the Moon for any month and year and may be printed out for use as a calendar.

I would have to say the most impressive part of the package from the strictly visual standpoint is the Star Map. Once this feature is activated, options to print the map, toggle it on and off, zoom in and out, change the view of the current zenith (a snapshot of the whole sky centered overhead) become enabled. Other items such as star and constellation names, grid lines, etc. can be turned on and off. The Star Map can be animated, allowing you to track the orbits of objects such as the moon, the planets and so on for hours, days or years. You can select the interval time to see what the sky will look like in subsequent hour by hour steps, or day at a time intervals. The Star Map can be set up to show you what the sky looked like on the day and year of your birth and you can set down and plan an observing session for a given day and time a month or more in advance if you like.

The Viewing Log which is accessed by left clicking anywhere on the Star Map lets an observer enter the time, date, object being observed, camera used & comments about an observation session. You can also select and attach an image (if you have a camera and the interface attached) to the log entry.

The program has dialog boxes to let the user enter data to make the software work for the specific location and time that observation is taking place. Various dialog boxes ask for latitude and longitude down to degrees, minutes and seconds. You can deal with time via the Gregorian or the Julian calendars.

Now all I have to do to utilize all these features is find a primer on basic telescope orientation and navigation to answer some questions that have occurred to me. For instance, in terrestrial mapping the variation between Grid North and Magnetic North can be sizable depending on your location on the geoid. So exactly where do you set 0 degrees before you start spinning angles both horizontal and vertical to look for Galaxies and Fairlanes (wait a minute that's something else again) in deep space. Never fear, I'm searching the Internet as we speak on these topics. ◆

(Comments……..Continued from page 8)

have heard all you want to hear about e-commerce, but since I have a little more space to fill, I will relate how I found a difficult item to find, saved a lot of money and received everything in a very timely fashion.

My mother needed new transmitters for two garage door openers made by Pulsar. Pulsar no longer exists. As you might expect, if you don't own a Genie opener, you are not going to easily find a transmitter at Home Depot, Scotties or anywhere else. Furthermore, those "universal" transmitters are not all that universal. However, a search on Yahoo yielded two California companies that could supply a replacement for a Pulsar transmitter of the frequency I needed. The cost was $20 per transmitter plus about $6 in shipping.

My next foray into e-commerce was to Buy.com to purchase some additional ribbons, both photographic and regular, for my ALPS printer. I purchase a lot when I order, and the price came to a total of $95. However, if I had made the purchase locally, the price would have been $160. Quite a savings, and they arrived in two days with regular shipping.

I buy most things locally. The new computer came from the

Special Interest Groups

Internet SIG

This SIG meets the first Monday of the month at 6 PM at the Reflectone Building, off West Waters Ave. You must sign up to get on the list and to get by security. *Contact Mike Hodges at hodges@reflectone.com.* For directions, see the map at our web site or contact Mike Hodges.

We consider all topics concerned with creating web sites. We study sites of interest from the web and those created by members of the SIG. And, in general, we consider anything of interest concerning the Internet.

Genealogy SIG

To be included on the TPCUG genealogy mailing list, contact Jenny Lind Olin at 960-5723 or jloin@aol.com

Visual Basic SIG

This SIG meets the third Tuesday of the month, at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6 PM. For information, *contact Merle Nicholson at merlenic@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting at MOSI and is devoted to a general Windows and computing discussion. Mary Sheridan moderates the discussion.

Quick View Plus Version 5.1

By Don Patzsch, Tampa PC Users Group

Quick View Plus is a real neat program. It allows you to view graphics (pictures), text, html files, and much more. A condensed version of Quick View comes with Windows 95 and 98, but the number of programs that it supports is limited. The latest version adds 175 more file types to view, copy and/or print.

Installing Quick View Plus from the CD ROM is simple and easy. Once you have it installed, you can bring up any file, such as a picture, or an attachment to an email, or an html file you have just downloaded and want to check; you may view spreadsheets, or database files also. It shows you the format, and displays the fonts, style, columns, headers and footers, embedded graphics, and OLE objects, etc., exactly as the original program would show them. Hyperlinks can be seen and activated. On my hard disk all the files that are produced here are saved in one location so that it is easy to back up or to copy them to a disk to be stored elsewhere. You can then go to this list of your files and view any one very simply, whether they are pictures, html files, encoded or whatever. This makes it easy to find the ones you want.

Two manuals are furnished with Quick View pro. The guide for win95, win98, and winNT; and the guide for win 3.1.

Suppose you have a couple of compressed files, PKZIP, TAR, or LZH, etc. that you want to look at. Simply bring up Quick View Pro and it will show you the files contained in the zipped files, and you can click on EXTRACT this file, EXTRACT SELECTED files, or EXTRACT ALL files. and you can read any files included in the zipped file, without the need to unzip the whole file first.

You can view a UUENCODED encoded text file from the Internet or any HTML file, and the text will show on the screen in a simple text file view. In other words, the file formatting does not show unless you prefer it to. Makes it easy to print an HTML file from the Internet in simple text form, without the HTML coding showing.

You may edit your files easily. Just click on File "open file for editing". This review is being edited right now in Quick View Pro.

QVP works with all the major e-mail and groupware programs, Microsoft Exchange, Outlook, Eudora, Netscape mail, and Lotus Notes. It is easy to configure QVP with other programs.

You may zoom and/or rotate graphics.

You may view Mac or Windows files on your PC. Take your files home from the office and view them at home; there is no need to have the programs that you have on the office machines.

The QVP program is written by Inso Corporation and sold by JASC, the people who write Paint Shop Pro. The version of QVP used here is 5.1. It is useful enough so that it is on the task bar in the lower right of the screen on this computer. ◆

local Gateway store, and most of my books come from the local Inkwood bookstore; however, technical books I usually order from our User Group's link to Amazon.com, as I did with the DVD above. However, on comparing Amazon.com's price of $50 to Borders.com's price of $35, I was forced to deny the TPCUG their 5% commission and order from Borders. So it pays to compare—something the Internet makes easy. Finally, my daughter made some last minute gift purchases from Nordstrom—and they arrived for Christmas with no special handling. So our e-commerce experiences were all positive.

2000 January 1, 2000 has come, and my computers seem to be fine. The four newer computers seem OK, but not everything has been checked. And on the three older machines, two 486's and a 386—all of whose batteries are dead, thus requiring me to set their clocks to make it 1/1/2000—only the 386 exhibits a problem. Something seems to be wrong with the Microsoft Office Suite. In Note Pad, I could copy and paste for example, but this could not be done in the Office Suite. I also could not insert or format anything in Word. I think this most likely has nothing to do with Y2K. Somehow the Office setup on this machine got corrupted. I am going to relegate this machine to the garage anyway. It is really too old to test anything on. I keep these older machines around to test Visual Basic programs on different platforms, but since no one uses a 386 anymore, it doesn't make sense to take time testing on such a machine anyway. ◆

Meeting Preview: At the March meeting we will have a presentation by Dan Pfeiffer from CompUSA. Mary Sheridan, as usual, will conduct a 30-minute Windows discussion at the beginning of the meeting.

President's Message

By Mary Sheridan, President, Tampa PC Users Group
mcpease@mindspring.com

Hi ho fellow computer fans! I'm enjoying this president thing. It's just a lot of fun working with all you great people.

Thanks to James Weber for contacting Glen Gasbarrow of e-stamp and allowing us another interesting presentation. I've been considering online postage for a few months and now I'm going to try it. I bought the e-stamp software at buy.com and I'm waiting for it to arrive. As I use the product, I'll try to get an article to William for the newsletter.

This is my second reminder that the Florida Association of Computer Users Groups is holding their Spring Conference in Kissimmee Florida. The conference will begin March 4th. There will be registration and networking on Friday night. The conference will run through March 6th (Sunday afternoon). The conference is for officers of Florida user groups to get together and exchange ideas on ways to make their groups better. Anyone who is interested in attending can be given temporary officer status. For more information go to http://www.facug.org . If you want to go, let me or any of the officers know.

(President.....Continued on page 10)

April 12: George Pilat of Intnet.net will give a presentation on DSL

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

Minutes of the February Meeting

By James Weber, Secretary, Tampa PC Users Group
jlweber9@mindspring.com

Our meeting started at 6:00 PM with our Windows SIG. The first and most vocal discussion was AOL 5.0 and the number of problems it seems to be causing in Windows. Most of the members had, or knew someone who had, problems with AOL 5.0 upgrade. I think there were only two members who said they had not experienced any issues with their own upgrade. We need to give these people money for next week's lottery. Mary Sheridan passed along some more Windows shortcuts. One that got the most attention (I saw everyone try it right then) was use of the "Print Screen" key. If the print screen key is pressed, a snapshot of your screen is saved to the clipboard. It can then be "Pasted" to any other program through the "Edit" drop down menu.

The general meeting started at 6:30 PM with our president, Mary Sheridan, presiding. Mary announced that Microsoft has agreed to give a presentation on April 4, 2000 at 7:00 PM in the USF Bio-Science Building. They require a 100-person minimum to guarantee their presence, so we will be combining with the Greater Tampa Bay Users Group to beef up the numbers. The Visual Basic SIG is going to be changed around a bit to focus on VB programming for MS Office. Merle was quick to point out that this will be more than just macros: Actual programming to customize and enhance Office. Sign up sheets for attendance and SIGs were passed around.

Our guest presentation started at 6:50 PM. Glen Gasbarro of e-stamp (http://www.e-stamp.com) demonstrated their new prepaid postage service. With e-stamp, postage is downloaded from the Internet, stored on a device attached to your local machine, and printed from your printer. The first time e-stamp runs you register on their web site. This activates the "vault", a device that attaches to your computer's parallel port. When you purchase postage, it is stored in the vault for future use. This offers the definite advantage of having access to postage without being online. Up to $500 can be purchased and stored at one time.

Printing requires a printer with at least 300 dpi resolution, which is any ink jet on the market today. Dot-matrix users may be out of luck. The postage looks a bit like a metered mark common today on envelopes, with the notable addition of an enhanced bar code. These new bar codes look like a checkerboard pattern, but they carry far more information than the original bar codes. Encoded are the amount of postage, mailing address, return address, date postage was printed, envelope size, and serial number. Bar code readers at the Post Office can automatically process this type of postage and ensure proper delivery even if up to 40% of the postage stamp is damaged or if no

(Minutes.....Continued on page 10)

Microsoft Office 2000

By William LaMartin, Editor,
Tampa PC Users Group
lamartin@tampabay.rr.com

A little history. I am going to stretch this review of Office 2000 over several articles in upcoming newsletters. To do the suite justice would take an entire newsletter. There is so much you can do with these programs. I know I haven't begun to push them to their limits, and I have been using them for many years. I started with Microsoft Word 2.0, I believe it was, late in 1991, shortly followed by Excel. I didn't add Access until probably a couple of years later, since at the time I didn't see much need for a database, assuming that I could manage any tabular data that might arise in Excel. Boy, have I learned a lot since then. Now I probably spend as much time using Access as Word and Excel combined.

In the beginning these three programs sold separately, and they were quite expensive--probably at least $200 each. I just don't remember the prices. I do recall that my brother-in-law gave Excel to me as a Christmas gift in 1991 and that when I bought Access a couple years later, I used the fact that I owned a copy of the Windows database program, SuperBase, to get a special upgrade price for Access of less than $150. At some point these three programs were combined into the "Office Suite". Later PowerPoint was added to the suite, and now the suite has expanded to include the additional programs in the table on the right.

Also, when I got started with Word and Excel, they did not dominate the market as they do now. Back then WordPerfect and Lotus 123 were still kings of the word processing and spreadsheet worlds, respectively. Now, of course, both Lotus 123 and WordPerfect are only shadows of their former selves. Additionally, PowerPoint has done in Harvard Graphics and the other presentation software programs. And certainly Access dominates the desktop database market. Thus, Microsoft, in the past nine years since I started using their "office" software, has gone from a small part of this market to dominate it. Why did I purchase it originally instead of the then current industry leaders? Basically I did it because I wanted products made by the same company that worked well together and worked well in Windows. I believe WordPerfect still did not have a Windows version of its program in 1991. I recall, too, that Microsoft also offered some pretty nice pricing to gain market share then.

Now, of course, as mentioned, Microsoft dominates the "office" market. Unfortunately their pricing is not all that aggressive anymore. A quick price check shows Office Standard is $395; Office Professional is $427 (this is a good price); Office Premium is $628. The upgrade versions would be cheaper, of course. You do get a lot for your money, but, for those who are cost conscious, the approximately 50% cheaper price of the competing Corel WordPerfect product vs. Office Standard or Professional may be a draw. In fact, when Corel first took over the WordPerfect suite, they were essentially giving it away to try and gain market share, as I recall.

But they will not get my business at any price—not because I have a dislike for WordPerfect, but simply because I know the Microsoft Office products like the back of my hand and because they blend so well with the other Microsoft programs I use daily like Publisher and FrontPage (which, of course, are now included in the ever expanding Office Suite) and Visual Basic. And almost anything I can think of doing, I can do in these programs.

Two places where Microsoft has not beaten the competition is in high-end desktop publishing and computer graphics. Although I use Publisher and find it quite adequate for our newsletter, I don't think it has made any inroads in the high-end desktop publishing market. Additionally, I have no plans for replacing Corel Draw and Corel Photo-Paint on my computers with PhotoDraw from Microsoft.

	Standard	Small Bus.	Pro.	Premium
Word	X	X	X	X
Excel	X	X	X	X
Outlook	X	X	X	X
PowerPoint	X		X	X
Access			X	X
FrontPage				X
PhotoDraw				X

The Suite Office 2000 comes in four flavors as indicated in the table above. I have the Professional version. This difference in the versions is simply what programs are included. I currently use all these programs except Outlook and PhotoDraw, and I have used Outlook in the past. Now that I have Office 2000, I will begin migrating to the newer versions which are installed on our newest Gateway computer. However, I will still be keeping Office 97 along with Publisher 98 and FrontPage 98 on our older Gateway. (Our ancient Gateway has Office 95 on it.)

Office 2000 Professional comes on two CDs, with the second CD containing Publisher. The one thing I noted about the installation was that there was no indication which component of Office was being installed at any given time. In previous versions, it would say something like "Installing Microsoft Word...", then "Installing Microsoft Excel...", etc. Now it is something like "Completing Office 2000 Installation." Additionally, I was given no opportunity to register online at the end of the installation. That seemed odd.

(Office……Continued on page 4)

(Office……Continued from page 3)

An additional new feature of the installation is that, if you do a custom installation, for many of the features of the different Office programs you may choose to install that feature on your computer, to install it the first time it is called for, to run it from the CD, or simply not to install it. Another new feature is that the Microsoft Windows installer can detect and repair problems associated with installed Microsoft Office 2000 programs, such as missing files and registry settings. On the Help menu, simply click Detect and Repair.

New File Formats While I am writing this I am using Word 2000 as a text editor for Publisher 2000 (there is no real need for this, since Publisher functions quite well as a text editor; however, Word does give you a bit more control over certain formatting features—at least from my point of view). The two programs work together seamlessly. Word 2000 has the same file format as Word 97, but Publisher 2000's file format is different from Publisher 98. However, something new in Publisher is the ability to save a Publisher 2000 document in Publisher 98 format with the possible loss of some of the new features. In the past, when you converted a Publisher document to the newer version, there was no going back.

Access 2000 also has a different file format from Access 97, and, as with Publisher, you can also save an Access 2000 database in an Access 97 format. This latter fact is important for people like myself who have written Visual Basic programs that use Access databases. These programs (until they are modified) will not work with the newer Access file format.

Word Now to the best known program in the Office Suite, Microsoft Word. The look and feel of Word 2000 is the same to me as Word 97. What can I say, it is a word processor—probably the best in the world. You can do all the usual things you would expect from such a modern program. But there are some additions, changes, and improvements. The first thing I noticed was the HTML type of help. Once you have learned how to use this type of on-screen help, you really have no desire to go back to the days of the paper help manuals.

The next thing I noticed was that opening new documents produced an additional entry on the Windows Task bar, just like for a separate program. I like the feature. Now, instead of having to click on the Windows menu item to be able to move between the several documents you may be using, you can click on the Task bar to select, or do the usual Alt-Tab routine to select. Surprisingly, many people apparently don't like this feature.

The second new item I found was the Clipboard feature. It maintains the last 12 items saved to the Windows clipboard from any Windows program. Now that is a real convenience. The next thing I noted is how much better this version of Word handles inserted graphics than previous versions. Now you can easily place a picture anywhere on the page you want and have the text flow around, in front of or behind it. This, with the ability to have text flow from one inserted text box to another (not a new feature), makes Word a candidate for simple desktop publishing, something that I couldn't recommend for earlier versions.

Then, of course, there is the Internet. As with Word 97, you can save your document as a web document in HTML format. You can also import HTML documents into Word and any unknown tags in the document will be preserved, even though Word won't be able to display them. You can now also preview the document as a web document in your browser. But the big addition is web collaboration.

With web collaboration, you can place your documents on a web server for others to review and edit. For this process to work you need the use of a web server running Microsoft Office Server Extensions. Since I don't have access to such a server at the moment, I can not test this feature. But it should work similarly to the more easily attainable form of collaboration through routed email—a feature which existed in Word 97. Here you select the individuals you want to send the document to and the order in which they will receive it. Then when an individual receives the document attached to an email message, the individual may make changes or additions and these alterations will be highlighted in color and the author of the changes identified. The individual then sends the document on to the next individual on the list.

Collaboration seems to be the main thrust ofn changes in Office, and I hear the next version of Office (yes, there is new version that will soon go into Beta testing) will tilt even more in this direction. This is something of interest to large corporate workgroups as opposed to the individual. You might say that Office is moving away from individual use towards group use.

I still think the suite of programs is of use for individuals and advise people I deal with to purchase the Professional version so as to have Access in the package. There are certainly much cheaper alternatives available—but nothing better. I have lived with these programs for the past nine years, learning more as I used them. At present I am discussing their common programming language, Visual Basic for Applications, in our Visual Basic SIG. Come join us if you have an interest.

In the next newsletter I plan on discussing Excel and Access. ◆

Did You Survive February 29th?

By Merle Nicholson, Member at Large,
Tampa PC Users Group
merlenic@tampabay.rr.com

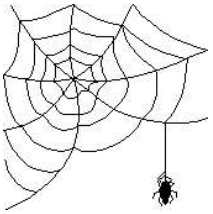
You may not have known that the Y2K computer correction wasn't really over on January 1st. Companies still had the leap day of February 29th as a concern for possible computer problems, and here's why.

As everyone knows, the calendar isn't perfect, and the reason is that there aren't exactly 365 days in a year. And further, it isn't exactly 365 and ¼ days either. If it were, adding a leap day every four years would work perfectly but … it's more than 365.25. So to get the calendar eventually right, we need to skip the leap day every 100 years on years that are evenly divided by 100. But … and you guessed it … that still isn't accurate enough because the calendar would be OVER-corrected if that was done absolutely every 100 years, so the plan is to skip not having it on years divisible by 400.

As a result, the years 1900, 2100, 2200 and 2300, even though they're divisible by four, are not leap years because they're divisible by 100. But since 2000 is divisible by 400, it is a leap year.

The temptation when writing code back in the 60's 70's and 80's would be to just divide the year by four (actually for the math majors out there - take the modulus using 4 and test the remainder) because it would take care of all dates through

(February 29… … ….Continued on page 12)



INTERNET PICTURE OF THE MONTH

TRS-80 Model 1
http://www.fortunecity.com/marina/reach/435/

This image is from the PC Museum site at http://www.fortunecity.com/marina/reach/435/
In 1977, the TRS-80 from Tandy Radio Shack was one of the three first personal computers. TRS-DOS was its operating system. The CPU was a Z80 chip, and it had 16 KB of RAM.

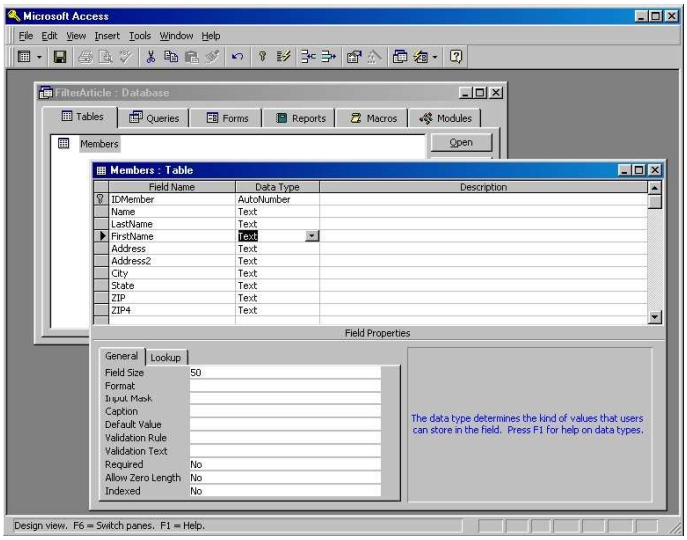
Beginning Access Connections to Data

By Merle Nicholson, Member at Large, Tampa PC Users Group
merlenic@tampabay.rr.com

Very often you must import data into an Access table and do some corrections to the data. The example in this article splits a column containing names (lastname,firstname) into separate columns for LastName and FirstName. It's very easy to do these things with a small amount of VBA code and an Update Query.



I like to make Functions to accomplish these "data filtering" problems like separating the Last Name from the First Name, Uppercasing just the first letter of each word and so on. So I have a little tool kit of general purpose functions to do this routinely. But what I'll present here is a greatly simplified version of three of these.

So to begin, I'll show you the fictitious data we're going to correct and also the end result. The idea here is that we start off

with the column "Name" that isn't adequate for our purposes and create two new columns "LastName" and "FirstName". Actually, "LastName" is the first word in the Name column (a 'String" of text) and "FirstName" is the rest of the "String". Notice that strings in the original column have commas separating the data, which makes it a little easier to accomplish, but we could have used just a blank or anything else.

So the first thing to do is to insert the columns we need. I simply inserted two new columns, "LastName" and "FirstName", and made them text. Then, referring back to Picture 1, I made a backup of the original data. In the Database Manager, simply right click on Members, and select Copy, then right click again and select Paste. Access selects "Structure and Data" for you, click OK on that and it will ask you for a new name. I selected "BackUp".

Now for a couple of VBA Functions. Open a new module, and start a new function:

```
Public Function ParseLastName(ByVal S As String) As String

End Function
```

This will be our first go at a function to pull the last name from the Name column. The S is the old, long Name string and it "returns" the last name. That's what the "As String" at the end does. A Function takes zero or more parameters (in this case ByVal S as String) and returns a result. Notice that we want to do one database record at a time, and that suits this approach very well. Add to this:

```
Public Function ParseLastName(S As String) As String
' ************************************************************
' Returns all the characters in S that appear before the Comma
' Lowercase all, then Uppercase the first letter.
' ************************************************************
Dim I As Integer
   I = InStr(1, S, ",", vbTextCompare)
   If I < 2 Then
      ParseLastName = ""
      Exit Function
   Else
      S = Mid(S, 1, I - 1)
      S = LCase(S)
      Mid(S, 1, 1) = UCase(Mid(S, 1, 1))
      ParseLastName = S
   End If
End Function
```

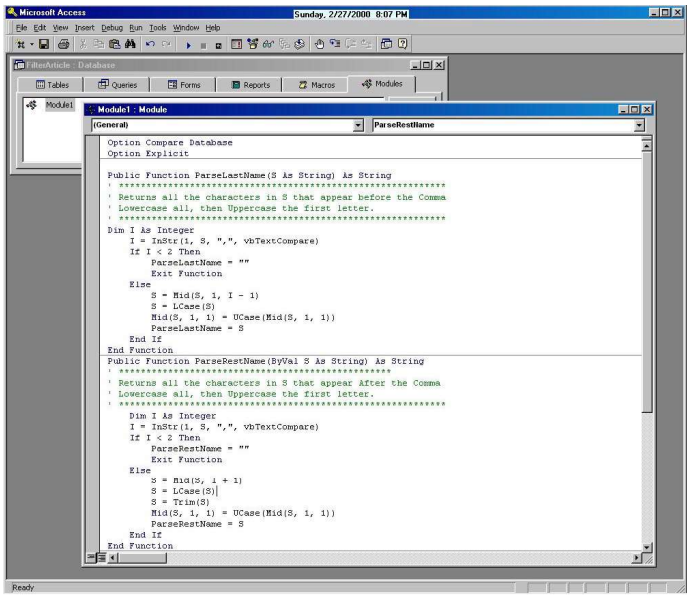
The first four lines are comments (note the single quote at the beginning of the lines)

```
' ************************************************************
' Returns all the characters in S that appear before the Comma
' Lowercase all, then Uppercase the first letter.
```

(Access… … …Continued on page 7)

(Access… … ….Continued from page 6)

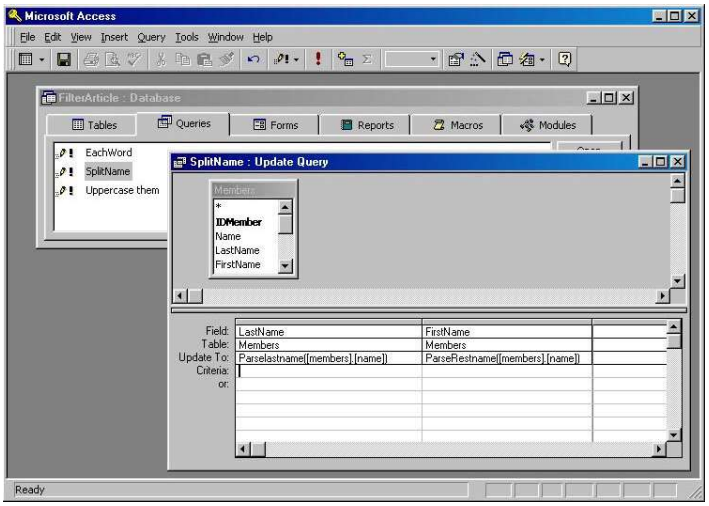
```
' ***************************************************************
```



Two of the lines are just decoration for readability, but the middle lines are a description of what the Function does. The line Dim I As Integer declares a variable that we'll be using to save the position of the comma.
I = InStr(1, S, ",", vbTextCompare) uses the Instr(ing) function built into VBA. The Instr function uses three parameters: The position to start (1), The string to search (S) and the character string to look for—in this case, a comma. The vbTextCompare is an option that ignores case, so a lowercase "a" is the same as an uppercase "A". It doesn't apply here because we're looking for a comma, but we use it anyway. Instr saves the result in I. So this lines reads: Look for the comma in S, starting with the first character and save the result in I.

The line If I < 2 then is a test to see if the comma is not found (I will be a 0) or if it's the first character (I = 1). If the comma is the first character, then obviously there is no last name, so we'll just set the result to an empty string (the "") and exit the function. If I is 2 or more then there will be a last name of at least one character, so we'll do the four lines between the Else and the End If.
S = Mid(S, 1, I –1) Uses the VB Mid function to extract the part of S from 1 to I – 1 and assigns it back to S.
S = LCase(S) Uses the LCase function to change the entire word to lower case.
Mid(S, 1, 1) = UCase(Mid(S, 1, 1)) Uses both the Mid function and the UCase function to change the first letter of the word to upper case.
ParseLastName = S Finishes it up, assigning the result to the function name ParseLastName before exiting the function.

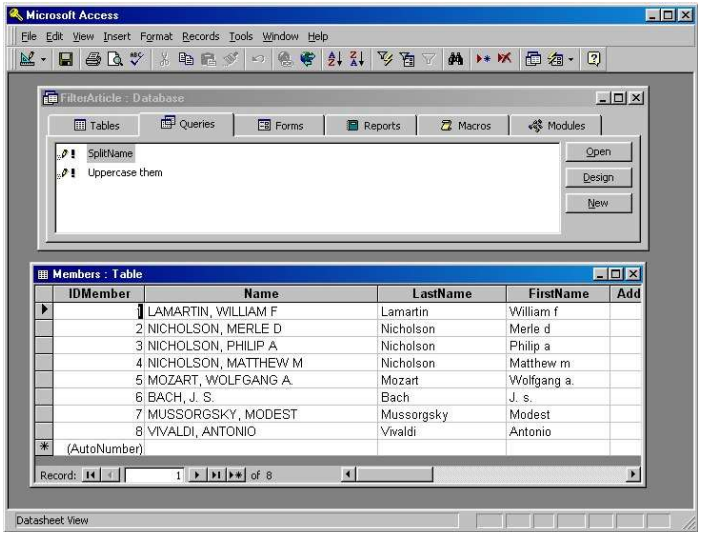
The second function ParseRestName is almost identical to ParseLastName. Two changes were made. S=Mid(S, I + 1) is different from the previous function in that this one returns the part of S from I + 1 through to the end of the string – the remainder of the string past the comma. And we've added one line S=Trim(S). This removes any leading and trailing blanks from the string.



```
Public Function ParseRestName(ByVal S As String) As String
' ***************************************************
' Returns all the characters in S that appear After the Comma
' Lowercase all, then Uppercase the first letter.
' ***************************************************************
   Dim I As Integer
   I = InStr(1, S, ",", vbTextCompare)
   If I < 2 Then
      ParseRestName = ""
      Exit Function
   Else
      S = Mid(S, I + 1)
      S = LCase(S)
      S = Trim(S)
      Mid(S, 1, 1) = UCase(Mid(S, 1, 1))
      ParseRestName = S
   End If
End Function
```

So now we have the two functions for now. They look as shown in Picture 3.

Now we'll use the two Functions in an **update query**. Select the Query tab and press New. Select Design View, and in this case I'll select the Members table in the Show Table, then close it. Go to the menu under Query, and select Update Query. From the list of fields in the table, pull the LastName column down to the first Field column and then pull the FirstName column down to the second Field column.



In the Update to: row for LastName type in: ParseLastName ([members].[name]), and for FirstName type in: ParseRestName([members].[name]). So this will use the ParseLastName function to update the LastName column and the ParseRestName to update the FirstName column. Close the query and name it SplitName, then run it. Here's the query – Picture 4:

And when you run the query, here's what the data will look like. (This picture is minus the Cline, P; I put this in later as a further test.)

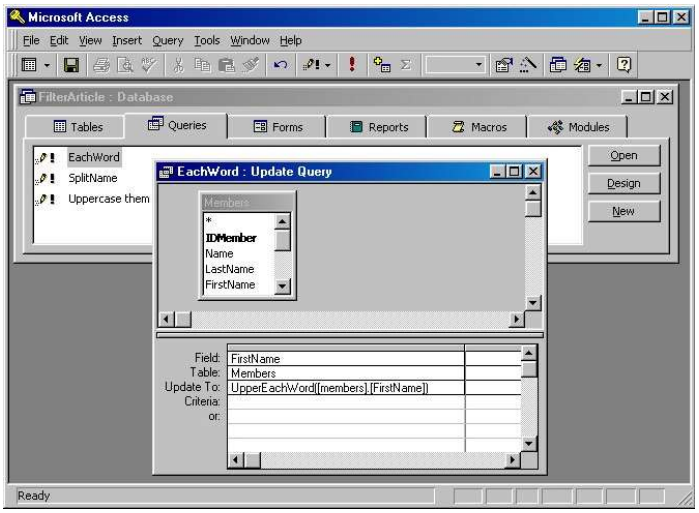
(Access… … ….Continued on page 8)

(Access… … …Continued from page 7)

Well, what's wrong with this? Two things. One is that LaMartin is not correct, and the initials are not uppercased. So we'll have to correct the initials. There just isn't any way to correct LaMartin except manually. That's OK here because we've saved a lot of work. Imagine if there were a thousand names.

Now to tackle the second problem, and we'll write a new function UpperEachWord to Module1 for this.

```
Public Function UpperEachWord(ByVal S As String) As String
' ****************************************************
' Lowercases all text and then Uppercases the first
' Letter of each word.
' ****************************************************
   Dim I As Integer
   S = LCase(S) ' Lower case all characters
   Mid(S, 1, 1) = UCase(Mid(S, 1, 1)) ' Always uppercase the first letter
   For I = 1 To Len(S) - 1            ' Look at all characters except the last
      If Mid((S), I, 1) = "." Or Mid((S), I, 1) = " " Or Mid((S), I, 1) = "," Or
Mid((S), I, 1) = ";" Then
         Mid(S, I + 1, 1) = UCase(Mid(S, I + 1, 1))
      End If
   Next I
   UpperEachWord = S
End Function
```



Dim I As Integer As before, reserves I as a variable
S = LCase(S) Lower case all characters
Mid(S, 1, 1) = UCase(Mid(S, 1, 1)) Always uppercase the first letter
For I = 1 To Len(S) - 1 The top of a loop to look at all characters except the last
Next I Is the bottom of the loop.

And in between the For – Next statements:

```
If Mid((S), I, 1) = "." Or Mid((S), I, 1) = " " Or Mid((S), I, 1) = "," Or Mid
((S), I, 1) = ";" Then
         Mid(S, I + 1, 1) = UCase(Mid(S, I + 1, 1))
End If
```

And as the loop steps through each character of S, this group of statements tests the characters to see if the character is a blank, period, comma or semicolon. And if any are found, the combination of Mid and UCase will uppercase the *Next* character.

So we'll close and save the module – it now has three functions. And we'll make a new Update Query as before, and name it EachWord. It looks like this:

So in this update query, we'll just update the FirstName column with an Update to: of UpperEachWord([members].[FirstName]). Save and run it. So the results now are:

Members : Table

IDMember	Name	LastName	FirstName
1	LAMARTIN, WILLIAM F	Lamartin	William F
2	NICHOLSON, MERLE D	Nicholson	Merle D
3	NICHOLSON, PHILIP A	Nicholson	Philip A
4	NICHOLSON, MATTHEW M	Nicholson	Matthew M
5	MOZART, WOLFGANG A.	Mozart	Wolfgang A.
6	BACH, J. S.	Bach	J. S.
7	MUSSORGSKY, MODEST	Mussorgsky	Modest
8	VIVALDI, ANTONIO	Vivaldi	Antonio
10	Cline, P	Cline	P

Now to finish it up, you can select the Name column and hit the delete key. And save the module for the next time you have to transform names. I've probably converted a dozen or more tables in this manner.

It also points out the versatility of Visual Basic for Applications. VBA allows you to extend the language itself by writing your own functions and using them in the same manner as built-in functions. ◆

Free ISPs and Other Thoughts

By Don Patzsch, Tampa PC Users Group
patzsch@acomp.usf.edu

For those of you who might be interested, let me tell you that I have never had to pay for Internet access.

Many years ago I joined the University IBM PC Users Group. The University gave the group 15 MB of space on the mainframe used by the students. (The University has many mainframes.) This space was used to store the group's member list, and also for general information. We made the mailing labels for a large membership list. In 1981 all the people who had an interest in computers were a member of this group.

Now, in the year 2000, if you are over 60 you may take courses at the University of South Florida at no cost. I have paid for some courses because I wanted to receive credit for those courses. The advantages of this system are not readily apparent. You get many, many perks as a student: discounts on computer purchases, and we used to get about half price for the newspapers, for instance. (The Tribune and the Times were real cheap compared to the "regular" price) At USF they have many locations where there is computer stuff set up for you to use. When you run computers of different makes and styles, you gain a lot of "experience". I have taken almost every computer course they offer at USF: C, UNIX, FORTRAN, COBOL, BASIC, and other computer languages; Software Engineering, HTML, Internet, and so on. If you elect to take the course for free, you do not have to take any exams, nor do you get University credit. You do, however, get an account on the University system. You might elect to take a course called Biblical Archaeology, or maybe Astronomy, or Life after Death, or any of many courses if you want a rounded education. Staff members and their spouses also get a free account on the system. I can't list it all.

Now, the web became a worldwide phenomenon, as you already know. At the present time, many, many sites are offering absolutely free access to the internet. Many others will now be offering a free fast connection called xDSL. You may go to the AltaVista site and register for free access. It takes only a few minutes, and there are no embarrassing questions to be answered. You can be on the Internet in a few minutes by this means. What you see is a one-inch advertising bar across your screen. You can move it up or down but you can't take it off your screen. You must click on one of the advertisements occasionally (though you need not buy anything) as that is the way that AltaVista pays for the process. I have been using this for several months, and it is very worthwhile to join. If for any reason your current ISP site is not convenient, you can fall back to this one. I can find nothing but user friendly, always there and steady service. I have not ever called and found the lines busy. I really recommend AltaVista.

Yesterday, I bought some shoes at Kmart, and I noticed they had a free CD ROM for their free access which they offer with Yahoo. I put the software on my computer and filled out the registration. It asked for the yearly income, but I tagged "less than $24,000" because I do not want to put my income down on any of the Internet sites. In a matter of minutes, I was on the Internet, a space of about one inch across the bottom of the screen has advertisements and other information. I set my screen to bring up Yahoo and I use my own custom screen. It has the latest news, and the stock market info that I want and other bits of information so that I can one click go to various sites. There are music videos as you start the call to Bluelight, and this takes a minute or so. Once that you get on, the only drawback is the advertising. I do not find that a problem as I know that they must try to make money some way. If a minute's delay at sign on and a one inch line of advertising bother you, try AltaVista as it is better in that respect.

I use the Netscape browser, and I just signed on to the AltaVista service, which I am now on. I type google.com in the Netscape location box, and when I got there I searched for "free internet access". You see a list of sites: AltaVista, Juno, Netzero, Free Internet Access, FreePC, Freei.net, Lifestyle, Excite, Monday, Tritium, and many other free sites.

Remember, free Internet access is not new; in Europe it has been available for some time. I also went to Free DSL access, and the list of information is too long to be printed here. I have signed up for a free DSL access to start in April. By that time, I expect we will all be looking at the various services offered free.

Juno: it is a long winded process to join Juno. It is not the type of service I would choose because they also have a subscription service, and I expect that they will want you to join that. The advertising space is about the same as the others. I much prefer AltaVista because it is so easy to use, and it is simple. Juno is more unfriendly to the user. I have used it, and it works, but I am not interested in it. One other thing. Newsgroups are not available from some of these sites. You can't have everything!

I have tried to give you a thought about what I do in my spare time. We need YOU to write an article for the newsletter to tell us what YOU do with your computer. Everyone wants to know. ◆

Special Interest Groups

Internet SIG

This SIG meets the first Monday of the month at 6 PM at the Reflectone Building, off West Waters Ave. You must sign up to get on the list and to get by security. *Contact Mike Hodges at hodges@reflectone.com.* For directions, see the map at our web site or contact Mike Hodges.

We consider all topics concerned with creating web sites. We study sites of interest from the web and those created by members of the SIG. And, in general, we consider anything of interest concerning the Internet.

Genealogy SIG

To be included on the TPCUG genealogy mailing list, contact Jenny Lind Olin at 960-5723 or jlolin@aol.com

Visual Basic SIG

This SIG meets the third Tuesday of the month, at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6 PM. For information, *contact Merle Nicholson at merlenic@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting at MOSI and is devoted to a general Windows and computing discussion. Mary Sheridan moderates the discussion.

(President…….Continued from page 1)

On April 4th at 7pm, The Greater Tampa Bay Computer Users Group will host a Microsoft presentation at USF in the Bio Science Facility auditorium. The Bio Science Facility is known as BSF and is located just west of the northern end of the main entrance of USF (from Fowler Ave.). The auditorium is room 100 and is bracketed by the "L" shaped BSF building and can seat 200 people in a theater-style setting. We've been invited to attend. I told Parker Monroe that he should be able to count on at least 30 of us attending, so if you have an interest in whatever Microsoft has to present, please try to make it. USF now requires all visitors to pay a $2.00 parking fee. You will need to stop at the Visitor's Center located just off of Fowler on the East side of the main entrance road. You can get more information about USF at http://www.usf.edu and a map at http://www.lib.usf.edu/geninfo/campus.html. **We will also have our regular April 12th meeting.**

I saw a few of you at the Microsoft Windows 2000 "Event" (their word, not mine!). I never nap in the afternoon, but I was sure tempted. I also rarely complain, but I really felt my time had been terribly wasted. The program was disorganized and uninformative. I did run into some old friends from my SYSOP days, so it wasn't a total waste.

Dan Pfeiffer of CompUSA will be the presenter at our March 8th meeting. He's done several presentations for the Brandon group, so it should be a good meeting. Please come and bring a friend.

Once again I need to mention that the presentations calendar for 2000 is almost empty. If you have experience with a specific program, please share your talents with the group. If you aren't comfortable standing up and giving a presentation, then write down what you know and submit it to William LaMartin for the newsletter. The strength of the group is based on the efforts of each individual. Hope to see you on March 8th. ◆

(Minutes…….Continued from page 2)

other information is on the envelope. The bar code readers require the 300 dpi resolution to work properly. Postage can be printed to either an envelope or labels, and, with integration into programs like Word or Outlook, postage can be printed directly to a document and used with a windowed envelope. If the postage becomes damaged you can contact e-stamp for a postal claim form to be reimbursed by the Post Office.

The e-stamp program itself is capable of automatically determining correct postage for many different variables. Charts for different zones, package size and weight, shipping preferences, etc., are all accessible through pop up windows. e-stamp keeps up to date on all changes to postal regulations and prices, and updated rates will be made available to all users for the life of the company. They do not currently support registered mail, but they are working on it. The Postal Service requires printed postage to be sent in 24 hrs. E-stamp allows post dating of up to three days, and, if you forget to send your mail in time, a date correction label can be printed and added to the original postage.

The electronic vault is transferable to any machine equipped with a parallel port. When the vault is added to a new machine, you have to return to e-stamp's web site and enter your registration information. This will verify the correct user is still in possession of the vault and prevents theft. Re-registering is only required the first time a user moves to a new machine. The vault can be moved back and forth to any machine it has been registered on.

e-stamp is available in retail stores or by calling 888-4 e-stamp. The initial purchase price is $49.99. There is no monthly service fee as with other online postage companies, but they make their income by charging a service fee from 10% to 5% on postage purchases. The minimum service fee is $4.99 and the maxi-

2099. I saw (and wrote – myself) plenty of that kind of code. But, of course, it would have been no good if you were doing calculations on days in the past or future. For instance, on a 30-year house payment or a 100-year property lease, calculating the wrong number of days may throw the payment off by maybe the price of a cup of cappuccino.

So, when we spent the $100 billion the last couple of years for Y2K, we all did the right thing - right? We simply made it accurate from now on. So instead of calculating for a modulo 4, we also did 100 and 400.

And you'd thought you'd heard the last of this in January! ◆

Meeting Preview: At the January meeting we will have a presentation by Glen Gasboro of E-Stamps. Mary Sheridan, as usual, will conduct a 30-minute Windows discussion at the beginning of the meeting.

President's Message

By Mary Sheridan, President, Tampa PC Users Group
mcpease@aol.com

We're already a month into the "brand new year". Where does the time go? For those of you who weren't able to attend our last meeting, you really missed an outstanding presentation. Steve Singer of RDI showed us some new motherboards and CPU's. His information was easy to understand and I, for one, learned things I didn't know I didn't know.

The Florida Association of Computer Users Groups is having their Spring Conference in Kissimmee Florida, March 5th and 6th. The conference is for officers of Florida user groups to get together and exchange ideas on ways to make their groups better. Anyone who is interested in attending can be given temporary officer status. The conference is $35.00, and the food in previous years has been wonderful. If you want to go, let me or any of the other officers know.

The Greater Tampa Bay Computer Users Group has gotten a date from Microsoft of April 4th for a presentation. They don't have enough people to meet Microsoft's 100-person minimum, and neither do we. They are currently trying to find a place to hold the event and have invited us to participate. I'll keep you informed as information becomes available. All those who want to attend need to mark that date on their calendars.

(President.....Continued on page 12)

March 8: Dan Pfeiffer from Comp USA

* * OFFICERS * *
President: Mary Sheridan(mcpease@aol.com) 988-6480
Vice President : Mike Hodges (hodges@reflectone.com) 962-2114

The use of trademarked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

Minutes of the January Meeting

By James Weber, Secretary, Tampa PC Users Group *jlweber9@mindspring.com*

Our new president, Mary Sheridan, started the Windows SIG at 6:00 p.m. She began with some new shortcut commands for Windows 95/98. We also discussed how all the new devices like PDAs or cameras have their own special battery and how six months from now no one will carry that battery because an “Improved” device is on store shelves. This brought up a local company called “Batteries Plus”. Batteries Plus makes it a point to carry any battery from any device imaginable, and they have been able to custom make batteries not in stock, for a price.

Mary also announced we may be having a swap meet with the Brandon Users Group. No definite date has been set at this time, but there was considerable interest among the members present. Mike Hodges made a plea to anyone with an older system they would like to donate to a needy family. Mike will post a request on our discussion page for anyone interested.

The general meeting started at 6:30 p.m. with Mary introducing the new officers. She also announced a tentative schedule for upcoming presentations.

Steve Singer of RDI was our guest speaker. He gave a presentation of current and upcoming computer hardware. Mr. Singer started with motherboards by passing out an Intel and an AMD motherboard for everyone to inspect while he pointed out and described the function of all the slots and ports. He then briefly described the types of memory likely to be encountered in your machine. Mr. Singer even passed out a new AMD Athlon processor for our enjoyment, but he didn’t let it get too far out of sight. Steve also made us aware of a new development with Intel’s new P-III processors: They will do away with the cartridge based Slot 1 and enhance the socket 370 that current Celeron based systems are built around. A bit of bad news for Celeron owners is current 370 boards won’t accept the new P-III “Flip Chips,” as they will be called.

With the February release of Windows 2000 upon us, Steve warned that all DOS code has been fully and finally removed from the Windows kernel. For most people this is not a problem, as Windows 2000 will probably be shipped to them on a new system, but if you are going to use hardware or software that has been around awhile you may find yourself out of luck.

Y2K Glitch with Outlook

By Tom Cone, Tampa PC Users Group
tcone@ix.netcom.com

Some of you may use Microsoft's Outlook application to manage your calendar, contact lists, e-mail mailboxes, and so on. I've bumped into a Y2K problem with Outlook's import and translation utility which you should know about. Even if you don't use Outlook, you might find this interesting, because it illustrates a type of problem you might encounter in other contexts.

I learned during the first week of January that Outlook 97 was unable to recognize dBase tables so that data within those tables could no longer be imported into contact lists inside Outlook. When the import process was started, Outlook returned an error message saying that the source file was either corrupt, or possibly that it wasn't a dBase file in the first place. dBase3 and dBase3+ tables have been around a long time, I daresay since before 1985, possibly longer. These are database files in which each individual record has the same overall length. This particular kind of fixed length format is well understood and is often included in the import routines of other commercial programs. For example, both Microsoft Word and Corel WordPerfect can easily read and import dBase files. Spreadsheet programs like Excel and Quattro Pro can, too. Prior to 1/1/2000, so could Outlook. But not afterwards.

I was asked to troubleshoot the problem to see if the problem could be identified. My first guess was that the dBase files had, in fact, become corrupted, possibly with a virus. Testing disproved the presence of any viruses, however. I then tested the integrity of the dBase files by importing them into a variety of other programs. All worked as expected, except for Outlook. I then speculated that perhaps Outlook 2000, the latest release from MicroSoft, might not have the problem, so I tried it. Oops. Same problem. Both Outlook 97 and Outlook 2000 are unable to import dBase files created after 12/31/1999.

Interestingly, Outlook contains an "export" engine which permits one to export data from contact lists and store them in external files. One of the file types supported by the export routine was dBase, so I exported some into files of this format to see if they could then be immediately imported back into Outlook. Oops. The export routine works, but the import engine continued to complain that it could not recognize the source file as a dBase file, stopping the import process dead in its tracks.

dBase files and early versions of FoxPro tables employ the same file format, so I tried to import some FoxPro DBF files. Oops, again. Outlook cannot import FoxPro files created after 12/31/1999 either.

At this point I was stumped. Testing revealed that if I dialed back the system date on my PC to a date earlier than 1/1/2000 I could create dBase or FoxPro files that Outlook would recognize and import. This confirmed for me at last that I was dealing with a Y2K problem.

I posted some inquiries in relevant newsgroups on the internet and received a helpful response reminding me that, in addition to the data, each dBase file contains a variable length header record which precedes the data itself. When the file is created on disk, the header is written first, and then the records containing actual data follow. The respondent mentioned that one of the elements stored in the header of each dBase file is the date the file was last modified.

Doing a bit of research, I discovered that the second, third and fourth bytes of each dBase file contain numbers representing the year, month and day, respectively, on which the file was last modified. Using a disk editor utility, I opened a few dBase files and examined the values stored in the second, third and fourth bytes at the top of each file. I found that there were numbers present in each position and that these numbers are stored as hexadecimal values. For you non-programmer types, this means that each numeric value was stored as a number using base 16 notation. I compared the "year last modified" byte in files created in 1999 against files created in 2000. It turns out that 1999 is represented as hexadecimal 63 or 63h. This is the same as a decimal 99 or 99d. The “year last modified” byte is stored as 64h if the file was created in the year 2000. The value 64h is the same as 100 decimal.

Using the disk editor I was able to modify the second byte of some dBase files, changing the stored value from 64h to 63h (i.e. from 100 to 99 expressed in decimal notation). When I did this, the files would then be recognized by Outlook as valid dBase files and could be imported without incident, even when the system file date for the dBase file was itself 1/1/2000 or later. This confirmed for me that Outlook was not using the system file date of the DBF file to reject the files. Instead, it suggests strongly that Outlook's import utility was designed to check for "valid" values in the "year last modified" byte in the header of dBase and FoxPro files, using routines which stumble when the value there equates to decimal values greater than 99. The internal logic declares the source file invalid and does not recognize it as a valid dBase or FoxPro file unless the value in the second byte of the DBF file equates to 99 or less.

I mentioned this to one of our members, who asked a pertinent question. Whose fault is this glitch? One might argue that the original dBase file format is flawed by using only

(Y2K.....Continued on page 4)

(Y2K.....Continued from page 3)
one hexadecimal byte value to represent the "year last modified". With only one byte to use, values are limited to a range from zero to 255. The designers of dBase (and FoxPro) must have decided to simply subtract 1900 from the current year and store the resulting difference value in this field. For files last modified in 1985, an 85 would be stored there (55h). For files last modified in 2001, a 101 would be stored there (65h). This design covers all the way to the year 2155 without requiring an additional byte to distinguish the century. It's true that if the designers had dedicated two bytes of storage to express the year last modified, they would have been able to save the decimal equivalent of both the century and the year. However, it's hard to argue that their design is flawed when it reliably covers all years from 1900 to 2155. Remember, this is not data. These values are simply a record of the year the file itself was last modified. Covering file modifications over such a long period of time seems a generous and reasonable approach to me.

So I lay the blame at Microsoft's doorstep. The Outlook import engine is flawed and fails to adequately deal with dBase and FoxPro format files. Its internal "technique" of recognizing dBase and FoxPro files mishandles the second byte of the source file, improperly rejecting it when values there equate to decimal 100 or higher. Whether this is a problem in Outlook, per se, or possibly in the ODBC interface between Outlook and the source tables, I don't know, but it's clear to me that the problem exists and is found within the import routines employed by Outlook.

Fortunately, it was relatively easy for me to write a BASIC program which opens DBF files and resets the second byte to 99 decimal, thereby making the file "visible" to Outlook again. This work around will be awkward but it's fast and reliable. Unfortunately, it's going to be necessary until Microsoft releases a patch which corrects Outlook. ◆

(Minutes……..Continued from page 2)
Mr. Singer then covered some of the newer peripherals available, such as AGP, USB, Fire Wire, and UDMA 66. AGP is a new video card standard that greatly increases the speed at which images are drawn to your screen. USB and Fire Wire are plug-ins for external devices that will replace the old serial and parallel ports. USB offers the ability to add or remove devices like printers or scanners without shutting down the computer and rebooting. The USB port can address up to 127 devices at a time, with the help of powered hubs. Fire Wire is a faster data transfer technology that has seen a lot of use in the digital camera/camcorder industry. UDMA 66 is the newest connection for IDE hard drives that offers twice the speed of the previous stan-

Editor's Comments: Scan Disk, Defrag, Scuzzies, and More

By William LaMartin, Editor, Tampa PC Users Group *lamartin@tampabay.rr.com*

Scan Disk and Defrag This past month I encountered a couple of problems with hard disk maintenance. I have Scan Disk and Defrag set up to run at certain scheduled times. The last couple of times that the defragmentation program ran, for my F drive it gave the message:

> *Windows cannot finish defragmenting this drive because it has encountered a problem. Click Help and carry out the instructions for running Scan Disk, and then try defragmenting again.*
>
> *ID No:DEFRAG00205*

I had run Scan Disk several times to no avail over a period of a couple of weeks. F still could not be defragged, and I began to get a bit worried that a hard drive problem was developing. So I ran SpinRite (see the November 1999 newsletter for a review) to check the drive for surface errors. After a three-hour check, SpinRite declared that F was in perfect shape. Of course, SpinRite doesn't check the logical file structure of the drive.

Time to turn to http://search.microsoft.com. I typed in the first eight or so words of the error message and did a search. I was rewarded with an article stating the following:

> *This issue can occur if the Applog file in the hidden C:\Windows\Applog folder is damaged. ……..*

It then instructed me to find the folder, select all entries in the folder and delete them. After doing this I was able to successfully run defrag on the F drive. Now, how long do you think that it would have taken me to figure this out without Microsoft's help? Forever! What would be the normal response of a computer technician or help desk person to the question? I think they would probably tell you to either live with not being able to defrag the drive or to do their favorite fix--reformatting the drive and starting over. But this would not have solved anything, since the problem was on the C drive.

A few days later Scan Disk gave me trouble on the C drive. I received a message from Windows concerning incorrect file information on the C drive. Windows said to run Scan Disk and have it repair the error. The only problem was that Scan Disk would hang and never finish with the drive. I solved this problem myself without any help from the Internet by dropping to DOS and running the DOS version of Scan Disk. It found a

(Comments.....Continued on page 5)

(Comments……..Continued from page 4)
discrepancy in the amount of free disk space being reported on the C drive and corrected it.

Since I don't have enough computer problems of my own, I help others solve theirs. My most recent such endeavor was setting up a client's new Dell computer: Moving data from the old computer; installing all the old programs on the new computer; setting up printers, a tape drive and a scanner; importing the old Windows address book, mail messages, Internet Explorer Favorites, etc. There is a lot more to do than you would think—that is, until you actually start to do it. Once you start the process, you see how much is to be done--and some of it doesn't go smoothly. Added to the list above, there is still the Internet connection to configure, the email program to configure, and many other simple but necessary tasks. Then you need to check that all the programs you have reinstalled work correctly with their data. There are always minor problems to be worked out: You forget to bring over the data for a particular program, or, one you wouldn't think of, a particular document needs a special font that the new computer setup doesn't have. So it's back to the old computer to collect some of those old fonts.

With all this going back and forth it is nice to have a network setup. Of course with the Road Runner cable modem connected to the network card in the new computer, each time I want to set up a network connection to the old computer, I need to change the network settings, shut down, disconnect from the

Microsoft Cordless Phone

By Merle Nicholson, Member at Large, Tampa PC Users Group
merlenic@tampabay.rr.com

Microsoft makes a telephone? Are they keeping it a secret? Well, in some ways maybe they should keep it a secret, but overall it's a computer geeks' telephone, tailor-made for people like me!

I first heard of it from Kevan and Mary Sheridan at our December board dinner, and a few weeks later I started looking for prices on the Internet and got this baby delivered to my door for less than $65. I'd been looking for a cordless phone for some time and hadn't found one that suited me for any price, until now.

Briefly, it's a cordless phone in two parts. One is a base station connected to your computer. The second part is the handset and charger base. This is exactly what I'd been looking for – the handset never has to return to the base station to be recharged. I don't understand why all cordless phones don't do this. You need to locate the base near a telephone outlet, and the phone itself anywhere you want! Good concept.

So as you may have guessed by now, the system provides you with an answering system facilitated by the computer connection. The connection is by way of a serial port, and the base is actually a voice modem with a 900 MHz radio transmitter/ receiver to communicate with the handset. The entire setup is done on the computer in software. It has full voicemail capability, allowing you to set up mailboxes and corresponding announcements.

The handset looks pretty standard except for a number of extra keys. You use the handset to play messages, store and delete them. You can speed dial from a speed dial directory you create on the computer, and you can use its voice recognition capability to speed dial. Yep, it has voice recognition, and it also has computer voice speech, again enabled by the power of your computer. You can use voice commands at the handset to handle messages if you wish. I find it kind of clunky to do that, but I can certainly see an impaired person doing it, and indeed there's some disability enabling built in and it's pretty well documented, too.

The handset has a speaker on the back so that you can hear the recorded messages from nearby like a normal recording machine works, but is also used to broadcast announcements when incoming calls come in. It uses caller ID to announce the caller. It looks up the incoming call in the address book for an entry, uses any special announcement you've built in for that person and alternately will read the name if it's transmitted by caller ID, and also announce if the caller ID is blocked or unavailable.

On the computer side, there's a Call Manager that needs installing. It uses the Address book from Outlook Express for the database, and adds a couple of tabs in the Address book for announcement and also custom greetings. A custom greeting can be made for any person in the address book. It stores all messages as .WAV files and since it goes to the hard drive you don't have any serious limitations on length and number, although you can choose to limit the length if you wish.

The Call Manager saves all incoming and outgoing calls in a log, saving the number called (if called from the handset) and all numbers received, date, time and duration of each call. You can retrieve messages from the Call Manager, and make calls using speakers and microphone plugged into the sound card. In my case I use a headset and attached microphone. This works for me because I use a networked PC that also is my Internet sharing on my network and don't care about sound otherwise. This PC is always on anyway and is on a UPS.

There's much more that this puppy does. It even reads your incoming Internet mail to you if you remotely call in for messages. There's more, but you can do more research on the Internet if you're interested.

The downside – there always are some aren't there? First – the obvious. You have to have your computer on all the time. And it has to be able to run some pretty intensive software at the same time. Speech synthesis and voice recognition (as a separate, concurrent application).

And the criticisms. The handset speaker is cheesy, and that's a kind description. The telephone is a single line (that's ok with me). The software isn't totally reliable, although it's good in my opinion. I have had a couple of lockups in the last couple of months. The voice command features are slow. (I don't use them anyway.) The phone is good for a geek like me, but I can't see it being sold at Best Buy until some more development is done.

Still, I like it and as long as I'm willing to do the care and feeding, my spouse likes it, too. We especially like the voice announcement of incoming calls, and the ease of managing the recorded messages both from the handset and from a remote call, which is excellent.

Microsoft Cordless Phone, PC Phone System MP-900 $199 retail, but $59 and up at many on-line outlets. http://www.microsoft.com/phone/ ◆

(Comments……..Continued from page 5)
cable modem, connect to the other computer and boot up again. Then I can find the old computer on the network and transfer the necessary files. To keep from doing the above again when I needed a particular directory I had missed getting from the old computer, I decided to do a Direct Cable Connection between the two computers parallel ports. First, I had to install the Direct Cable connection feature on the new machine. It seems no computer manufacture ever enables this Windows feature. Doing such a connection is never a sure thing in my experience. Sometimes I have had to reach into my bag of tricks and spend some time with the network settings to get it to work, but this time the two computers found each other fine. What I noticed, though, was how slow the Direct Cable Connection between parallel ports was when compared with a network connection between network cards.

Well, I had saved what I dreaded until toward the end--installing the HP 3c scanner. Moving an older SCSI scanner to a new Windows 98 computer can be difficult. You have two problems right off. You need new software and you need a new SCSI interface card, since the old Deskscan II software will not work in Win 98 and the old ISA HP SCSI card must be replaced by a PCI plug and play SCSI card. I knew this because HP tells you this at their site. When I installed Win 98 on my computer some time back, I had to pay for the new software for my HP ScanJet IIcx, but now you can download it for free.

What I didn't realize was the difficulty I was going to have in getting the new computer to give the SCSI card an IRQ with no conflicts. I installed the SCSI card, booted the computer, and when I opened up the Windows Device Manager, my heart sank. The Adaptec SCSI adapter had the dreaded yellow tag next to it. A check showed that it was sharing IRQ 3 with several other devices. Now, IRQ 5 appeared to be free, so why was the computer assigning IRQ 3 to the Adaptec card? A check of the BIOS showed that IRQ 5 was reserved for legacy devices and was not available. I changed the setting, making it available, and assumed that when I rebooted everything would be fine. It wasn't. The SCSI card had indeed jumped to IRQ5, but so had the sound card, and the SCSI card still had its yellow tag.

I tried the usual trick of switching the PCI cards in the computer to different slots to no avail. Next, I disabled COM 1, freeing IRQ 4, but for some reason none of the devices would use this interrupt. And there is no way in the BIOS of this computer to make them. Time to call Dell, where, after a 30 plus minute wait, I was advised that, since they didn't sell or install the SCSI card, they couldn't help me. Well, I asked, couldn't they then tell me how to make a card—any card—use a free IRQ. No, not really was the answer, since the computer determined all of that. So much for Dell's help. I was on my own. So I called Merle Nicholson, our hardware expert. He had some suggestions, some of which I had already tried, and one that I hadn't. He suggested switching from a PS2 mouse to a serial mouse, freeing IRQ 12. Since I didn't have such a mouse available at the moment, I continued with my efforts.

I discovered that if I took the sound card out, the SCSI card and scanner installed fine, with the SCSI card using IRQ 5. But put the sound card back, and the yellow tag came back to the SCSI card. Somehow, the sound card got preference. But that gave me an idea: Create two hardware profiles, one in which you had a scanner but no sound and the other in which you had sound but no scanner. I did that, and it worked. When you booted the computer, you were given a choice as to which profile you were going to operate under. You could either listen to sounds or you could scan in photographs and documents. My client didn't think much of my solution. And, really, I didn't either. It was just a temporary solution until I could produce the real one.

A good night's sleep and a bit of Internet research produced the fact that of the several sound components listed in the Windows Device Manager, the one called "Sound Blaster 16 Emulation" was only used for sound in DOS programs. Well, I could do away with that. So the next morning, I went into the Scanner only Hardware Profile and added back all the sound components except the Sound Blaster 16 Emulation one. And to my relief, I now had both sound and a scanner working. Both the SCSI card and the sound card were happily sharing IRQ 5. I then removed the other profile and renamed the remaining one "Original Configuration". To test things out, I scanned a few photographs and put in a DVD disk and listened to a surround-sound sound track. Yes, this computer has a surround-sound system. And I didn't have to try the serial mouse that I had brought along at Merle's suggestion.

Now, why couldn't that Dell fellow have suggested that I disable SoundBlaster 16 Emulation? IRQ conflicts must be a common problem they encounter all the time.

There was one major hurdle left--moving the HP Colorado 8 GB tape drive from the old computer to Dell. Of course, physically removing the drive from the old computer and installing it in the new computer is no problem. You just make sure that the CD drive on the new computer is set to master and the tape drive is set to slave, since the IDE tape drive is attached to the empty connection on the secondary IDE controller cable where the CD drive is already attached. The tape drive appeared in the computer's BIOS and in the Windows Device Manager (although it might have been only identified as tape drive there). You are then supposed to run a little HP utility that determines if the installation is correct—at least that is what you did in Win 95. It said no deal--

Killer Collection of Software

By Larry Anders, Librarian,
Tampa PC Users Group *larry.anders@gtemail.net*

Anyone that has read any of my articles in the past knows that I have kind of an addiction to software. I guess that's why I've been the librarian for our users group for over 10 years now. Originally my job as librarian was to collect shareware software, copy it to diskette, catalog it and bring it all to the monthly meetings so that our members could make copies. With the advent of the Internet, sites such as http://www.Download.com and http:///www.Tucows.com have replaced my original duties as librarian. There was no reason for me to continue to collect the files when these online databanks of Shareware (and Freeware) have it all right there just for the downloading.

To start your own collection of software just jump onto the Internet and do a search for Shareware or Freeware and you'll have enough places to visit to keep you busy for several days. If you're not into searching for software, there are plenty of Internet sites like ZDNet.com that will send you daily or weekly updates of the hottest software on the market. And it is all usually free for the downloading.

So, what's a librarian for a users group do these days? Try to keep you informed of some of the good software that's out there that everyone should have in their collection. So here goes (but not necessarily in any order…)

- **ICQ** - This is one of the most popular Internet instant messaging tools, and it's free. I use it every day for direct contact and exchanging files with certain individuals over the Internet. It's fast, easy and free, which meets my criteria for good software. Similar to **AOL's Instant Messenger** but does not have to go through a server which, I think gives greater privacy and security.
- **Copernic 2000** - Another freebee that is one powerful search tool for the Internet. It's easy to use and you get great results. (As a side note, there are also two Internet based search agents located at http://google.com and http://alltheweb.com that are also extremely fast.)
- **Go!Zilla** or **GetRight** – If you're into downloading software from the Internet, as I am, these two download managers are a must. They both have familiar Explorer style interfaces and work similar to what you're already used to. I personally use GetRight that automatically uses my virus scanning program to check for viruses on each file I download, which we all know is a must! Just select the files you want to download and you choose when the download will take place. There are too many benefits of each to list here. Go!Zilla is free and GetRight is Shareware. Also out there is **NetZip** and **Download Demon**.
- **Paint Shop Pro** – I couldn't begin to compute without this one. It's now up to version 6 and I've used it since version 1. I've reviewed it a couple of times in the past in this newsletter, and it just keeps getting better. It will stack up against any of your professional graphics programs that cost several times Paint Shop's $79 cost. They've recently added an animator program to the mix that most of the big boys don't come with.
- **WinZip** – I'm not sure if there is anyone who doesn't know about this one, but, just in case, I thought I'd better mention it. A utility that makes it very easy to compress and uncompress one or several files together, which is especially useful for sending files over the Internet.
- **Homesite** – If you haven't created your own web site yet, you will eventually. Homesite makes it real easy with its WYSIWYG design component. No more code to learn. Just jump right in and create. Homesite has consistently gotten high honors and is worth its Shareware price tag. But try it. If you like it… buy it for $89. If you don't like it… don't buy it. That's what Shareware is all about.
- **RealJukebox** – Another excellent free program that lets you create and play your own collection of digital music in several formats, one of the most popular being MP3, which takes up much less space than the standard audio file on your music CD. The difference with RealJukebox and most of the other "ripper" programs is that you can listen to your CDs while you rip (copy) the tracks off of them. I've used this program to take my favorite songs off different CDs and make one CD with all my favorites. (Yes, it's legal!) There is also support for automatically downloading the names and songs from your CDs off the Internet (CDDC) to create a database of your music. To go along with this program, check out **WinAmp** and **Sonique**, two free music players with a lot of bells and whistles.
- **ClipMate for Windows** – One thing Windows has always lacked is the built-in ability to manage your clipboard. It's always been *first in – first out* (FIFO). You can copy just about anything and paste it just about anywhere but as soon as you copy something else the last thing copied is gone. Enter ClipMate. Now you can clip text, bitmaps, pictures, etc., and paste them whenever you like. ClipMate allows thumbnail views of Clipboard contents, lists, content editing, printing, magnification, and more. It's Shareware but well worth the $20.
- **iHarvest** – If you use the Internet to search for information, like most of us do, then you should really have iHarvest in your collection. It is advertiser-funded freeware that collects data of your choosing, whether it be whole pages or selected text and graphics, and adds it to your "WebBase," which iHarvest lets you categorize to your liking. You can also add other content, such as

(Software……..Continued on page 9)

(Software……..Continued from page 8)

emails, spreadsheets, or shortcuts and set up agents to categorize information you collect automatically. This is a great idea.

I've only mentioned a few of the thousands of programs that are available on the Internet, and I really only mentioned application and utility type software. If you're into games, business, education, development, Internet, graphics or whatever, it's out there, and not just Windows based stuff either. You can also find software for Unix, Linux, Palm-computing and other operating systems, too. What's the catch?… Nothing… and if you think it's probably not as good as the software you can buy off the shelf, I can tell you this. Typically, the only difference is the price, and a lot of it is **FREE!** You make the choice. ◆

(Comments……..Continued from page 7)

the drive was not installed. Well, I knew that it was and that all the cables were connected and the jumpers were set correctly. So after checking everything again, I went ahead and installed the Colorado Backup software. Well, it ran but could find no tape drive to work with. Time to call HP.

From HP, I received excellent service--at no charge--on this year old drive. There were two problems. First, the drive needed a firmware update, which I was instructed to download from the HP web site and to run. I did that, and the downloaded program updated the tape drive's firmware. At one point in the update, you get the warning that you are now past the point of no return. If you stop the process now before it is finished, your drive will probably be rendered useless. I didn't plan on stopping the process, but what about Tampa Electric. Just the day before, the power had flicked off momentarily, causing the computer to reboot while I was luckily doing nothing crucial with it. These are the times you wish you had a battery backup system.

Second, with the firmware update finished, I was instructed to uninstall the HP Colorado Backup Software since it wouldn't work correctly in Windows 98. The new software could not be downloaded via the Internet but would have to be ordered from HP at a total cost of around $30. The technician transferred me to the software order person, where I was informed that the software was on back order. So until the new software arrives, the tape drive will be useless.

Dell versus Gateway In the past month I have had an opportunity of dealing with both a new computer from Dell and one from Gateway. Which computer or company is better? I really can't answer that. The answer probably depends on the problems an individual encounters in using the new computer—and the way we use our computers is quite varied. You may never encounter the problems that I might run into the first day. You would then be happier with your choice than I.

I bought my new computer from Gateway since I have been very happy with them since 1991. Their machines are a good value and the support is good. They also have a store in Tampa where I can bring my machine for service if needed. However, this last item proved to be a stumbling block for the individual who bought the Dell. She said that in the Gateway warranty was a clause to the effect that if you lived near a Gateway store, you might be required to bring the computer in to the store for service during the usual first year of on site service. That, along with a perceived better price on the Dell computer, pushed her to Dell. (It is not that easy to compare two systems from different manufacturers, since they don't offer the exact same setups.)

You will not go wrong buying from either Dell or Gateway. Of course, you will not get the best possible price, either. There will always be better bargains elsewhere.

As to phone help, I have to give Gateway the nod. You usually have a technician on the phone within five minutes who will do their best to help you. In two calls made to Dell, a technician was never available in less than 30 minutes. And, as indicated above, one of them refused to help with the SCSI card installation since the card wasn't bought from Dell. I suppose they expect you to buy new scanners and other peripherals from them when you buy your computer. The second technician at Dell was quite willing to spend a lot of time trying to figure out how to make the Dell supplied modem hang up after a specific interval of inactivity. There is usually a setting for this in the modem setting in Control Panel, but for this modem it was grayed out. After about an hour we agreed that this modem probably didn't support this feature.

Regarding the Gateway technicians, with whom I have had much more contact over time, I have found some of the them very thin on knowledge about my particular problem. In fact, some simply gave incorrect information. Of course, there are those among them who know the solution right off the bat. What I have never found with a Gateway helper, though, is the refusal to help you on a problem.

Second in importance to phone help is online help at the company's web site. And here I have to give the nod to Dell. Their support site seems better than Gateway's. For a new computer, when you go there for the first time and enter the identification of your computer, you can look at all the specifications of your computer at the site. When you return to the site, they recognize you (by a cookie, I suppose) and take you directly to your machine's information. Additionally there are many documents on how to solve various problems. ◆

Special Interest Groups

Internet SIG

This SIG meets the first Monday of the month at 6 PM at the Reflectone Building, off West Waters Ave. You must sign up to get on the list and to get by security. *Contact Mike Hodges at hodges@reflectone.com.* For directions, see the map at our web site or contact Mike Hodges.

We consider all topics concerned with creating web sites. We study sites of interest from the web and those created by members of the SIG. And, in general, we consider anything of interest concerning the Internet.

Genealogy SIG

To be included on the TPCUG genealogy mailing list, contact Jenny Lind Olin at 960-5723 or jlolin@aol.com

Visual Basic SIG

This SIG meets the third Tuesday of the month, at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6 PM. For information, *contact Merle Nicholson at merlenic@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting at MOSI and is devoted to a general Windows and computing discussion. Mary Sheridan moderates the discussion.

More On My Dell Warranty

By Merrill Friend, Tampa PC Users Group
mfriendtampa@worldnet.att.net

Back in December, Dell Computer replaced my hard drive under my parts warranty. That was the worst of my problems. I had been living with another deficiency in my computer for many months, so I decided to get it repaired also before the warranty expired.

This other "deficiency," as I have called it, seemed quite minor. The On/Off button on the front of the computer had ceased to function. I had removed the front plate to see if I could repair the problem and learned that a small plastic part had broken and a piece of it was missing. I thought if I could find the missing piece I could possibly glue it back together and be almost as good as new. I looked everywhere and the missing broken part could not be located. Lacking a proper switch I had removed the front panel so I could get to the On/Off button, which I activated with the rubber eraser of a number 2 pencil.

Frankly, I was tiring of this procedure, so Dell was again called, and the technician said he would have the replacement part sent me by Airborne. Days passed and no shipment. I called again and spoke to a different technician who found my reference number but could not find anything on the status of the shipment. This technician offered to put through a priority request to his parts department. Another week passed by, and, as I was about the put in another call to Dell, I heard a vehicle door shut in my drive, and there was the Airborne delivery truck.

In his hands he held two items. One was a letter sized sign off sheet for me to sign accepting delivery. The other was a box about two feet square. Now I wondered why was I getting such a large package. All was looking for was a small plastic switch about the size of a silver dollar. So I opened the box like a kid wondering what kind of Christmas present the box contained. Well, I was really surprised.

The box contained an entire replacement front panel. It appears that Dell has changed the appearance of the front panel or no longer has the one which originally came with my computer. Also, the little switch behind my old front panel was no longer used. Now the replacement front panel has a heavier duty switch built into the panel itself.

Anxiously, I attempted to install the new panel. Unfortunately, it fits too closely to my 3 ½" floppy drive which now makes that drive unusable. At this point I go back into the big box and find another smaller box and darned if it didn't contain another floppy drive which I was to learn fit more deeply into the front slot meshing perfectly with the new front panel. All I have to do now is return my old 3 ½" floppy to Dell as credit for the replacement one they sent.

I certainly got more than I bargained for in this exchange and wanted to share this experience with everyone. ◆

dard. For those of us with older systems or those who don't want to deal with a complete system upgrade, add-in cards for UDMA 66, Fire Wire, and USB are available.

With the proliferation of high speed, always on Internet connections, network security is becoming more important. A web site called Gibson Research Corporation (http://WWW.GRC.COM) has a service available called Shields Up! It will automatically probe your computer for security holes, then walk you through their suggestions on how to fix the problem.

Mr. Singer then went over networking. Most of us were at least familiar with network cards and hubs, but Steve pointed out the difference between hubs and switches. A hub, which most people tend to use, shares its bandwidth with each connection. The more machines on, the slower the network. Hubs are also half duplex, meaning they only communicate one way at a time. Switches give full bandwidth to each connection and run at a full duplex. ◆

Meeting Preview: At the April meeting we will have a presentation by George Pilat from Intnet.net on DSL. Mary Sheridan, as usual, will conduct a 30-minute Windows discussion at the beginning of the meeting.

President's Message

By Mary Sheridan, President, Tampa PC Users Group
mcpease@mindspring.com

If you missed the March 8th meeting, I'm sorry to tell you, but you missed a lot of fun. We had a tremendous presentation by Jay and Max of CompUSA. The door prizes were exceptionally nice and we beat our record for raffle ticket sales. We even had cookies and juice. A big "thank you" to everyone who contributed to the refreshment fund for the next meeting.

The 3rd, 4th, and 5th of March we were in Orlando for the FACUG Spring Conference. Jenny Olin, Don Patzsch, Kevan Sheridan, Bruce Register, and myself spent the weekend attending round table discussions and learning as much as possible. William LaMartin won 1st Runner Up in the Web Page Contest. Thanks William for making us all look good.

We're still working on a Rummage/Garage Sale Event with the Greater Tampa Bay Computer User Group in Brandon. Al Pesche, our MOSI contact, is looking at possible options for the event. The Brandon people are also trying to see what they can find. The event will be on a Saturday or Sunday in June. If you know of a likely location, please let one of the board members know.

Spring Comdex is coming up soon, April 17th through the 20th in Chicago. Anyone who is interested in attending can go to http://www.zdevents.com/comdex/ and register.

(President.....Continued on page 12)

May 10: Mike Galvin of Office Depot will do a presentation on scanners

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

Minutes of the March Meeting

By James Weber, Secretary, Tampa PC Users Group
jlweber9@mindspring.com

Mary Sheridan started our Windows SIG at 6:00 PM. William LaMartin was presented with a nice award from our group for the fine work he has done with the group's web site. FACUG, the state body that governs users groups, judged our site as second place among all users group sites in the state.

CD recording software became our next topic, with most of the group singing the praises of Adaptec. It was pointed out, though, that you should make the plunge and buy the full "Deluxe" version, as the "Lite" version that ships with most CD burners is too lite.

Hard drive upgrades are always a fun topic, and this time was no exception. When a question was put out on how to move Windows 3.1 programs onto a new computer the obvious response was, "Why?" But, thankfully, someone had a useful response with "Aloha Bob," which allows moving programs from one hard drive directly to another without the original disks.

The general meeting began at 6:30 PM with official business. Sign up sheets were passed out for SIGs and attendance. The Office Depot on Fowler has asked us to display our newsletter at their location. Other users groups have found this a benefit in gaining new members.

Jay Kirth of CompUSA presented a demonstration of digital cameras and video recorders. While setting up, he went over CompUSA's warranty policies. Most work is done on site, but most people aren't aware that Sony requires any system or component be sent back to the manufacturer for warranty work. This can be inconvenient for customers, but it is one of those things out of CompUSA's control. Mr. Kirth also pointed out that CompUSA has an on-line presence for ordering products or ordering can be done by calling 1-800-8-DIRECT.

Jay set up a Sony Viao laptop to demonstrate the different cameras. By plugging the video camera directly into the laptop, the laptop became a large viewfinder, and, with the software included with the camera, movies or still images could be captured to the hard drive for editing. For people looking to add video to web pages, some of the less expensive cameras on the market would be more than sufficient. For high quality movies with a VHS or 8mm clarity, look for as high a megapixel count as you can afford. Also, different cameras handle zoom and stabilization by mechanical or software means. Digital zoom works by cutting out the borders in the view screen and interpolating the magnified pixels between the real pixels. At lower magnifi-

Web Site Design Pitfalls to Avoid

By Cheryl Alexander, Membership Coordinator, Tampa PC Users Group cbear@quadra.net

Remember the image that you want to project with your page or site. You strive for professionalism in your logo, stationery, presentations and other aspects of your business. Don't blow it on your site. Don't put anything up on your site that you wouldn't put in a newspaper advertisement.

There are many reliable services that can construct a simple page for you that will do just fine for a web presence. Always remember that the surfer is looking for information about you and your services. Bells and whistles (animated gifs and midi files) can always be added after solid content is written.

Before you even start writing code, look at several web sites by similar small businesses, the more the better. Write down what you like and what you don't. Use this information as a starting point when designing your site. What features irritate you will probably irritate a surfer.

If you are building your site yourself and are a beginner, there are several books in the stores for learning "how-to". Good ones will explain everything about web site design, including how to name your files. Checking them out of the library will give you a chance to decide which one suits you best before you buy it. Some titles are:

HTML 4 for the World Wide Web, Fourth Edition: Visual Quickstart Guide by Elizabeth Castro, *HTML 4 for Dummies* by Ed Tittler & Stephen Nelson James (includes CD-ROM), *Creating Web Pages for Dummies, Third Edition* by Bud Smith & Arthur Bebak (includes CD-ROM)

There are many pitfalls with designing a web page or site but here are the most common:

Too many animated gif files. Background sound that is slow to download and plays too long. Background image/color that renders text unreadable Pages that look good as HTML but don't print well. Pages that are too long

Animated gifs: A graphic file that contains several images that are displayed in a sequence either as a "slide show" or to approximate motion.

These files add motion and interest to a web page. However, for every such file on the page, time is added for the loading of each frame of the animation. Some animations have several frames, essential for smooth motion. Too many animated gifs take up too much time to load and if there isn't enough content to keep the surfer's interest, they will leave the page before all the gifs load. There are also programs available to help compress (make smaller) gifs and jpgs.

Background sound: A wav or midi file that downloads to the surfer's computer and plays while the page is being viewed.

Music does add a nice touch to a web site. However, again, it can be a huge file that can take a while to download. And, again, if there isn't enough content, the surfer may leave before the first note even plays. Also, be careful when selecting your file and how many times it is to play. If it's too irritating, the surfer will either disable it or not return to your site.

Background image/color: A tiled (repeated over an area) image or a single color that is used to fill the browser space with the text displayed over it.

Let's face it, gray can be very drab. And we don't like to be drab. Colors and images used for the background are excellent for adding some pizzazz to a site. However, once again, don't forget that information must be legible to be useful. There are background images that look very sharp until you try to read text on them! Choosing a good contrasting color can rescue that really cool image that you are dying to use. Be aware that monitors are getting better. The background that is designed for a 640x480 screen will look good for that resolution but may look odd if not unreadable on a 1024x768 screen. On the other hand, you can only pick a median range of resolution (usually 800x600) and hope for the best.

PDF Downloads: A file that is printable on most printers and is downloaded for that purpose. It can also be viewed with a "reader" program.

This is excellent for a file that you have prepared to be a handout in a word-processing program and decide to save as HTML to display on your site. This method is also good for a page that will make a good information sheet but has features that may not print well straight from the web. It is better to use Adobe Acrobat Distiller to make a Portable Document File (PDF) so that it can be printed on many different printers. Since it is an expensive program, check with your local copy center such as Kinko's or Pro-Copy or other place where computer access or time can be rented. When a PDF file is used, the layout won't be changed by font unavailability, graphics not being the correct resolution for printing (screen resolution: 72 dpi; printing resolution: at least 300 dpi), or the browser window not being fully open.

Page organization: The method of connecting information with hyperlinks.

There is a method of linking from one part of a page to another. This can be convenient. However, again, if your page is too long, it will take a long time to load and interest will be lost. It's better to have many quick loading pages than a single long page. Your web hosting service charges by total amount

Microsoft Office 2000 Part II: Excel & Access

By William LaMartin, Editor,
Tampa PC Users Group
lamartin@tampabay.rr.com

Review Last month I looked at Microsoft's Office Suite in general and how it has evolved over the many years I have used it into the number one such product. I then concentrated on Word, its word processor. As noted then, the product seems to be evolving toward the corporate user and the web. There is not really much new in the suite for the casual, individual user in a home or small office environment. How many people do you know involved in web coloration of Office documents?

Of course, there have been refinements and minor additions (like the ability to have tables inside of tables in Word, which I have already discovered can be a useful item). But, for the casual user, I don't think these additions will be noticed or prompt one to upgrade from an older version.

However, I can think of one reason to move up, and that is to get away from having to deal with the less than perfect service packs for Office 97. People fault Microsoft regarding service packs, but as a small-time software developer, I can assure you it is impossible to produce a program that is bug free. And at least Microsoft does produce corrections for their mistakes. Some vendors seem to never get around to doing this. The Office 97 service packs, SR1 and SR2, however, were not always that easy to install, and seemed to keep changing, at least in the case of SR1. An upgrade to 2000 should do away with all of that. Not quite, SR1 is now out for Office 2000. But, as best I can tell, the things corrected by it are far less extensive than those for SR1 for Office 97, and I have no plans to download and install it at this time.

Excel and Access Like Word, Excel doesn't seem to have changed much. Excel looks almost exactly the same when you open up a workbook. Access does have a different look as regards displaying the window with your list of tables, queries, forms, etc. It is more like a two pane Windows Explorer view. And there is a new object in the Access window's left pane, the data access page, which is a form-like object to be published to a web site along with its supporting files for viewing by—and interacting with—other Office 2000 users. More on this later.

Another addition to Access is the Visual Basic Editor for any Visual Basic for Applications code you may wish to use. In Access 97, you could use such code, but the method for editing it was less robust than that provided by the VB Editor which Word and Excel already had in Office 97.

However, again, the VB Editor is a feature, like the data access pages, that, I suppose, at least 90% of Access users will never use. Of course, it could be argued that Access is not meant for the casual user anyway. In fact, it is not part of the standard version of Office, and, indeed, most people can get along fine using Excel to keep their "data." But for more demanding uses of data, a database is indispensable.

Much of my work now with Visual Basic involves interacting with Access databases. When Office 2000 first hit the shelves, it caused me to worry a bit about my VB programming. VB 6 was written to work with Microsoft Access 97 databases, and I worried about what would happen if someone were to update an Access 97 database that provided data to one of my VB applications to Access 2000 format—they are different.

I follow several VB Usenet newsgroups, and I had read about the problem. I had also read that to get a VB 6 application to work with a Microsoft Access 2000 database, you needed to set up your program to use *Microsoft.Jet.OLEDB.4.0* as your data connection provider and have a reference to the Microsoft DAO 3.6 object library in the project. So I started using that setup in my programs even though I was still working with Access 97 databases. And it appears to have worked. If I now take an Access 97 database that is used in one of these VB applications and update it to Access 2000 format, all the database components in the VB program still seem to work properly.

But I have drifted away from the average user who will never use VB with a database. As to this person, I think you are getting the drift that there is not really much in Office 2000 that should make him or her want to move up from Office 97. In fact, Office 97 is overkill for most people, and the Microsoft Works Suite (not just Works but the Suite), consisting of Microsoft Word, the Works spreadsheet and the Works database (really just using one table at a time), is sufficient. To me, it seems Office 2000 is aimed at the corporate computing environment where people will collaborate on documents placed on a company intranet or on the web—and to individuals like me who want to work with the latest software technology.

The Latest Software Technology With Office 2000, there are three ways of putting your documents on the Web: As static pages, as pages with limited interactivity, and as documents with an interactivity just like you would have if the document were on your own computer. Office 97 provided for the creation of static web pages from Word documents, Excel worksheets and Access tables or queries. With Office 2000, we get a good bit more.

(Office.....Continued on page 5)

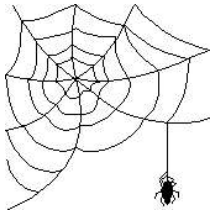
(Office……Continued from page 4)

To publish documents to the web for collaboration by different individuals, everyone using it needs to be running Office 2000 and the server where the document is installed needs to be running Microsoft Office Extensions. I haven't been able to test this out, since I don't have access to a server with Office Extensions. However, I have tested publishing both Excel worksheets and Access tables where anyone using Office 2000 can interact with them and make certain changes. To see the results of this, go to http://tpcug.org/office_2000. Of course, nothing will display properly or work if you don't have Office 2000 on your computer with the Web Component option installed.

There are four examples at present. The Excel example is an interactive work sheet that does a loan calculation and displays the first two years of payments. There are two Access examples, which are essentially the same. One is an interactive display of a database of around 2,500 auto body shops in Florida, the name, address, phone number, etc. for each body shop being displayed one at a time on a form that you can scroll through and either filter or order on any of the display fields. The second example is the same, but consists of only Tampa auto body shops. The final example is a chart from Access that graphs the number of body shops in each zip code in Tampa.

For the above to work, nothing special seems to be required of the web site, but, as stated before, the viewer must have the Office 2000 Web Components on his or her computer.

It is all interesting—at least to me—and I can see the use for organizations. And I look forward to being able to place my documents on a Microsoft Office Extensions enabled server. But for most individuals this is not a must-have upgrade. ◆



INTERNET PICTURE OF THE MONTH

Bourbon Street Web Cam, Mardi Gras Day in New Orleans

Having enjoyed the New Orleans Mardi Gras eight times 25 to 30 plus years ago, I like to check back and revive memories. The Bourbon Street web cam at http://www.nolalive.com/bourbocam/classic/ allows me to do that. Mardi Gras is over this year, but the cam is functional 24 hours a day, 365 days a year.

FACUG in Kissimmee

By Don Patzsch, Tampa PC Users Group
patzsch@acomp.usf.edu

At Kissimmee, Friday, Saturday, and Sunday, March 3, 4 and 5, the FACUG held their spring meeting. President Larry Tyler and all his helpers did a great job of planning and then carrying out the series of meetings. There were well over a hundred enthusiastic people in attendance.

On Friday night, we were registered and all were given a tee shirt courtesy of Visitalk. We were also given a cloth bag containing many goodies and brochures from the vendors. Refreshments and soft drinks were available, and we broke into groups and talked.

On Saturday morning at 8 A.M., a breakfast was served. Larry gave us a talk about the FACUG and what we could expect for the next two days. Bart then put the FACUG web page on the screen and showed much of the very worthwhile information you may obtain by going to that site. It is at http://www.facug.org.

Next we broke into sessions, and the first one I attended was on databases. Each group described what information they put into their database; also they told about who was allowed to view or to use the information. Mailing labels are made from most databases; also, the date each person is to renew their membership and, in some cases, many other details are included there. This was a very interesting session. It is not possible for me to describe the enthusiasm of the people and the interest they express as these sessions progress.

At 12 we broke for lunch, supplied by Adobe. Adobe always gives us CD's and other goodies as they tell us about Adobe. Louise Miller was the host.

After lunch, I attended the Publicity and Public Relations session, then the Web Pages session. Everyone takes part in each session, and you can pick up a great deal of information from each one. At 5:30 we broke for dinner, sponsored by MGI software. We were shown how to use PhotoSuite III, and VideoWave III.

At 7:30 Saturday evening, we were shown the prizes and told the names of the winners of the web page contest. A meeting of the board followed. The winners are: Winner - Southwest Florida PCUG. First runner up - Tampa PCUG. Second runner up - Space Coast PCUG. Third runner up - Tie: PCUG of Jacksonville and Venice Area Computer UG.

All during the three days, the Kissimmee Utility Authority had four computers on the web for us to use. Two were notebooks and two were desktops. I used them to telnet to my two email sources and they are fast! The KUA offers free computer courses, monthly rates starting at $4.50, and other advantages. (http://www.kua.net)

Some of you may not have thought about it, but a utility has rights-of-way all across the country. This means that long electrical lines, natural gas lines and also railroads can install the conduits needed for cross country glass fiber connections to all of the major areas. This is in addition to telephone line rights-of-way. See Boardwatch's "Internet Service Providers" magazine at your local bookstore for the maps of many "backbones" and lots of general information on the www. It is worth the price—$9.95 for the largest amount basic information on the Internet you have ever read.

On Sunday, the morning started with a breakfast sponsored by Microsoft. We were told about such things as how to locate what we want on the Microsoft web site, and also about the events and how to find the dates and times. The Microsoft representative, Mary Sue, introduced herself.

Following that, I attended a real neat session on the Mac. Now this was a real treat. The lady from one of the user groups who led the discussion is very talented and really enthusiastic. Her topic was Vendor Relations. She suggested we meet and get to know the people behind the store. One thing her group did was get to know the CompUSA people and CompUSA keeps a room open after hours now so that the Mac group there in Miami can hold a class! She also told us that she or the others in their group may throw beach balls or other little stuff into the audience as their meetings progress, just to add a little something to the whole meeting night! Rose Lynn is a dynamo. She may add a bunch of Mac people to our FACUG meetings next year. We learned some things about the Mac and the Mac groups.

The final session was on Advertising. Now I did not expect to find so many neat ideas and so much discussion on what and how to place advertisements in your newsletter. You can't help but catch the excitement as everyone tells you what their group does or doesn't do advertising-wise.

At noon, we broke for lunch with Inprise-Borland as the sponsor. Yolanda Davis, our host, gave us a lot of humor and described many uses for the Delphi 5 program. They produce Jbuilder 3 and C programs also.

After lunch, we broke for the Vendors tables. Each of the Vendors people is available for questions and to provide further information about their products. One of the surprises for me at this meeting was Office Depot's people. They give you the names of each store manager, who will work with you to provide a program for your user group. These people were at

(FACUG… … ….Continued on page 7)

(FACUG……Continued from page 6)
the fall meeting also.

Matt, the Intuit speaker provided fabulous humor and a great presentation of his Intuit program, Quicken.

Corel provided an eighteen page White Paper on Linux. Linux is now in use on more than twenty five per cent of the world's servers. The Post Office uses Linux as its operating system, all over the country. Linux is scalable and stable (more so than other operating systems). Businesses are using it more each month. Corel packages a shrink-wrapped LINUX that is easy to install. You know the rest of Corel's programs: WordPerfect, CorelDraw etc.

JASC has its Paint Shop Pro Version 6, and I think we all use that now. Casady and Greene, Corel, and Inprise-Borland provided the carry bags. Visitalk and Laser Perfect were there to answer questions. Kris Canning of Wizcom Technologies showed off their new Quick Link Pen. You have to try it to understand what it will do for you. You can follow a line of print and the scanning takes place. Neat product.

Gene Barlow now represents Caldera Linux as well as the PowerQuest products, Partition Magic, Drive Image, Datakeeper, and Second Chance. Gene and his wife are favorites at these shows.

If you want to know why so many enthusiastic computer people spent the weekend in Kissimmee, come to the fall session that will be hosted by the Tri County PC Users Group in Port St Lucie. Watch for the October announcement on the FACUG web site. ◆

(Web Design……Continued from page 3)
of web space used, not by how many files are using the web space.

A good web site can add to a small business. By considering these possible pitfalls, you can build that web site. ◆

Editor's Comments: Installing Network Cable, USB Network Adapters & e-stamp

By William LaMartin, Editor, Tampa PC Users Group lamartin@tampabay.rr.com

Network cabling I have had the computers in the house supplied with network cards and a crude sort of Windows Peer to Peer network setup for a couple of years. It was crude because if I wanted to connect any two computers I had to stretch out up to 75 feet of network patch cable through the living room, up the stairs and across the hall. That was for the upstairs computer and the main downstairs computer. To connect other computers I had to transverse other rooms. Then everyone including our bird had to be careful not to get their feet caught in the cable. I include the bird since the cable passed right by her cage, and when we let her out to sit on top of her cage, she sometimes would find the cable irresistible. Luckily she never did more than superficial damage to it.

Finally after getting a new Gateway, I decided something had to be done. After going to Home Depot and purchasing a 500 foot roll of Category 5 network cable, a collection of 8 wire modular jacks, outlet boxes, cover plates, 3/4 inch PVC conduit and necessary fittings, I was ready for the big job. And it was a big job, because any time I have to crawl around under my house and go into the attic in the same day, I have had about as much as I can take.

I ran the conduit from the outside wall of the room where my main computer is, under the house for about 30 feet, then up another outside wall inside the sheet metal channel containing the air conditioner's refrigerant lines into the living room attic. Once in the attic I dispensed with the conduit. Of course, there were wall outlet boxes to be installed on each end of the run and the job of pulling the cable through the conduit from one outlet box to the other. To finish the job, I had to connect the eight wires of the cable to the modular jocks on each end.

I actually pulled three network cables through the conduit at the same time, since I wanted one cable for the Windows network, one for a direct connection to the cable modem which is downstairs, and an extra cable for the future. The total time for the job was six hours. And if you think I am a slow worker, I invite you to come and crawl around under my house and then fish wires from under the roof at the edge of the attic.

USB Network Adapter You might ask why I wanted a separate network cable to connect the upstairs computer to the cable modem when Windows 98 SE allows you to share an Internet connection. That is, if I were running Win 98 SE on the computer attached to the cable modem, I could then set up things so that any other computer on the Windows Peer-to-Peer network could also con-

(Comments……Continued on page 8)

(Comments… … ….Continued from page 7)
nect to the Internet using this same connection. Well, I had used proxy server software in the past (see http://www.tpcug.org/reviews/december97.html) and wasn't particular enamored with it and thought that I would simply like to be able to switch the cable modem between different computers by switching the network cable that was plugged into the modem. We rarely have two computers on the Internet at the same time anyway. And in those rare cases, one of the computers can use the regular NetCom dial-up connection.

And this is where I got the idea of using a USB network adapter to provide a second network connection to whatever computer I wanted to connect to the cable modem. Actually I must thank Larry Anders for first bringing my attention to the fact that there were such things as USB network adapters.

Now, in the computer connected to the cable modem I have two network cards installed, one for the cable modem and one for the regular Windows network. In the past if I wanted to connect, say, my laptop to the cable modem, I had to reconfigure the properties of its one network card before connecting it to the cable modem. That worked fine and allowed me to do some large Windows updates to the laptop software, but it was a little trouble. With the installation of the USB modem on the laptop that has all changed. I set the properties of the USB network adapter to what the RoadRunner cable modem wants to see, and, when I desire to use RoadRunner on the laptop, I simply unplug the connection from the cable modem to the desktop computer and connect it to the USB network adapter attached to the laptop. I then only have to run WIPCFG.exe on the laptop to allow RoadRunner to assign an IP address to the USB network adapter, and I am off and running.

I also installed the same USB network adapter on the new Gateway upstairs. My first use of the RoadRunner connection on that computer was to download the newest version of Internet Explorer, IE 5.01. With all of its attendant programs, the full package came to 18,511 KB. To download that on a regular modem would have been several hours. On RoadRunner it took 3 minutes, 52 seconds, which is approximately 4.8 MB per minute.

For those not familiar with USB devices, note that you can simply disconnect them from one computer and move them to different computers. The device I purchased was made by 3COM and cost around $70. It comes with three CDs, so there is much more there than simply driver software. In fact, there is something called Microsoft Home Networking which is supposed to configure your Win 95 and above computers for networking in a hassle-free manner. I am sure some people would be happy to have that happen, since it has been my experience that setting up a network is not always trouble free. However, I already had a network that was working fine, so I didn't take Microsoft up on their offer. The second CD is actually a Win 98 SE upgrade disk for those with Win 98. The software there will upgrade you to Win 98 SE and additionally lead you through the process of setting up the Internet connection sharing I mentioned earlier. I declined to take advantage of that also. The third CD is some Microsoft game sampler CD. The location at the 3COM site for this device is http://www.3com.com/client/pcd/homeconnect/homenetworking/products/p34_key.html. The size of this device is about that of a pack of cigarettes.

E-stamp After seeing the e-stamp demonstration at a recent meeting, I couldn't resist the offer at the Microsoft Office web site and the e-stamp site of the e-stamp software and $50 of e-stamp postage for about $55. Unfortunately, the offer had to be acted on by March 31, so by the time you read this newsletter it will be too late. However, I did post it at our discussion forum, so if you follow that, you would have seen it in time.

You order via an Internet site and pay with a credit card. When you place your order it is recommended that you also at that time apply to the Post Office for a license to use the product, which e-stamp conveniently helps you do from their site. As might be expected, this product is highly regulated by the Postal Service. For example, if you move from your present Zip Code area, you must return the small piece of hardware called the vault that attaches between your printer and computer. It apparently is programmed to be used in one originating zip code, 33606 in my case.

The software package arrived in about three days via priority mail, and the program was easy to install. The next thing to be done was to install the electronic vault as close to the printer as is possible in the parallel connection between the printer and computer. (Note there may be other parallel devices like Zip drives in the parallel chain.) During the installation, the program went on the Internet to the e-stamp site to check on my account and, among other things, it credited my account with the $50 in postage that came with the special offer.

After setting everything up, you print out an address to e-stamp in California and a $.33 e-stamp and mail this to e-stamp so that they can be assured of the quality of your printer.

The first thing I noted was that the date of the stamp was that day's date, but the postman had already picked up the mail, and one of the e-stamp requirements (from the Post Office, I am sure) is that the letter be mailed within 24 hours of the date of the stamp. That was fine, since the letter would get mailed the next afternoon and presumably be processed before 12 midnight. But I made a note that in the future if the mail had already gone out, I would set the date of mailing forward one day to avoid any possible problem. You are allowed to move forward up to three days—but you can't go back any.

Email a Phone Call Away

By Larry Anders, Librarian,
Tampa PC Users Group larry.anders@gtemail.net

I've been doing this PC stuff so long now that it's been a while since I've found something really interesting. Well, the other day I was doing a routine search for something I can't even remember now and up popped this link: http://evphone.com. I followed the link and read a little about ***E-mail Via Phone*** (EVP). It sounded good to me so I downloaded their 10MB trial version, which, by the way, on a cable modem only took a couple of minutes.

In a nutshell… EVP will call you and read you your email or you can call your computer and have EVP read your email to you. The keyword here is ***read***. EVP uses a text-to-voice engine to translate your email text to an easily understood electronic voice that even seems to put some emotion into it sometimes.

I downloaded, installed, ran setup and it didn't work. I then went back and read the instructions, but evidently not very well because it still did not work. I sent an email to their online support and within an hour I had an answer back. I reread the instructions and help file and it made a little more sense to me then. (As I said above… the keyword was ***read***.) It actually did work and quite well.

First of all, you need a voice modem, and make sure you have the latest drivers, to eliminate some problems if your driver is kind of old. Although I installed a cable modem sometime back I still kept my 56K voice modem installed and now I'm glad I did. But that wasn't my problem. You also must have a standard email account (POP3). Although I have RoadRunner installed I continued to use MSN for my email, which I had prior to RoadRunner. I didn't want to change my email address again. But MSN uses a secure server to access their email and EVP doesn't support a secure server. That was my problem! So I activated my RoadRunner email account, which is a standard email account, and soon I was hearing my email, and quite well too. Along with the above you also need Windows 95/98 (NT and Win2K are currently not supported), a 486/66 or better, 8MB of RAM and a sound card.

Some other things you can do with EVP (from their website) are:

Check e-mail automatically.

- Check in pre-defined time intervals.
- Check for E-mail at a pre-defined time using EVP's scheduler.
- Check it daily, weekly, weekdays and more.

It's a phone call away!

- You can call E-mail Via Phone anytime you want.
- Schedule a call to your phone whenever you like.
- EVP's rule system allows you to specify when EVP will call you.

Filter undesired e-mail messages.

- Delete a message based on sender's name.
- Use a keyword in the subject to delete.

Listen to whatever you like from the message.

- Listen only to the subject and/or sender's name.
- Customize what you want to hear.

Browse e-mail messages using your phone.

- Skip to the next message.
- Repeat the current message.
- Listen to the previous message.
- Delete the message.

Supports Modem and Network users.

- Dial-Up networking using a voice modem.
- Network Users, Cable Modem, DSL Connection.

It only costs $29.95 but you can download a fully functioning trial copy and use it for 14 days to try it out for free. They even give you a 30-day money back guarantee after you purchase it. I don't see how you can go wrong with this. If you decide to get it let me know and you'll be ***hearing*** from me soon! ◆

(Comments… … ….Continued from page 8)

The program can print out postage in three ways. On certain sized labels, on several different sizes of envelopes, and from Microsoft Word or Outlook on these same sizes of envelopes. I have printed only on the regular business size envelopes using both printing directly from the program and from Word. The program seems to run more smoothly when it does its own printing than when trying to do things through Word. I have printed two stamps from Word and three without Word. One of the Word stamps went off into limbo land, and I lost my $.33. Furthermore my printer couldn't be used by any program including e-stamp until I rebooted. So I would say that the e-stamp/Word connection may not be bug free.

You have to have selected a mailing address that is then run through the program's address checking software to be matched against correct addresses on a separate CD before you can print out a stamp. There is no printing of postage without a valid address (more Post Office rules, I suppose).

Special Interest Groups

Internet SIG Changing to Microsoft Access SIG

We will tentatively have our first meeting of the new Microsoft Access SIG the first Monday in May. It will meet at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6 PM.

We will post an announcement at our web site in the discussion forum when the time nears. For information contact either William LaMartin or Merle Nicholson. See page 2 of this newsletter for email addresses and phone numbers.

Genealogy SIG

To be included on the TPCUG genealogy mailing list, contact Jenny Lind Olin at 960-5723 or jlolin@aol.com

Visual Basic SIG

This SIG meets the third Tuesday of the month, at the Gateway 2000 Store on North Dale Mabry at 6 PM. For information, *contact Merle Nicholson at merlenic@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting at MOSI and is devoted to a general Windows and computing discussion. Mary Sheridan moderates the discussion.

(Comments… … ….Continued from page 9)

Now we come to the main shortcoming of the program from my point of view. The program provides no database to store the addresses you want to use over and over. It expects you to be using certain Microsoft programs like Outlook or Windows Messaging that utilize certain address books, like the Microsoft Personal Address Book. Unfortunately my computer has nothing like this set up. Outlook Express uses the Windows Address Book, and that is not accepted, as are none of the common Personal Information Management programs, like ACT or Lotus Organizer.

So, what I have to do is to either type the mailing address into the e-stamp program each time I use it, or I can have the address stored, say, in Lotus Organizer, copy it from there to the clipboard and paste it into e-stamp, Not ideal but workable. Possibly in a new version of the program they will address this problem.

When you are ready to print the envelope or label, you may do a test print to see if everything is working correctly before committing to a final print at which time the postage used will be deducted from the amount stored in the "vault."

Features I haven't tried yet include the postage calculator and printing postage on labels for express or priority mail. I like the idea of the program, and the price was right. I basically only paid a little over five dollars for shipping. However, future postage purchases will carry a convenience charge of around 10% based on the amounts that I would probably buy.

My general impression is that the software might be a bit buggy. It definitely does not respond very fast. Possibly that is because it has to communicate with the vault. That could be a problem for volume production right now. For home use it is fine, and I enjoyed using it.

A potential problem is that initially and every two weeks the program needs to connect and upload a usage log file to satisfy another one of those Postal Service requirements. Using my cable modem, the program connected fine to e-stamp, set up my account and even download a software upgrade, so how could uploading this log file be a problem. Well, it was. I could never get the process to finish. Customer support decided that the problem was due to my using a cable modem connection and that the cable provider, RoadRunner, was using some sort of proxy setup. I would need to contact RR and get all sorts of specific information to reconfigure my LAN settings to make the upload work.

That wasn't for me, so while the lady was telling me this, I signed on to my NetCom dial-up account and tried to send the log file again—this time successfully. So the warning is that you may have a problem with a cable modem and this program until certain LAN settings are changed. ◆

(Minutes… ….Continued from page 2)

cation this can work well, but higher magnification causes fuzzy or blurry images. Mechanical magnification uses lenses like on your old trusty 35 mm. Digital stabilization works in a similar manner by cutting out the edges of the image in the viewfinder and attempts to keep the remainder of the image in the center of the screen. Mechanical stabilization, like in the Sony cameras, uses servos and optics to provide a clearer, better image. When downloading images from a still camera to a computer, Jay recommends using a card reader instead of

plugging directly into the camera. By plugging into the camera, it becomes a removable drive in the eyes of your computer and its batteries will soon die.

Jay brought in an HP970CSP printer for the demo. The colors and resolution on the more expensive Sony cameras was impressive. Jay warned that with printers, though, you get what you pay for. He also pointed out a major difference between HP and Epson printers. HP uses a built in heating unit to warm the ink before printing. This helps prevent clogging of the ink jets if the printer has sat unused for any great length of time.

Mike Hodges won the big prize of the night, a digital camera. Not bad for someone who wasn't supposed to be in town. Clark Evans won a PC tool kit. ◆

(President… … ….Continued from page 1)

Our next Board meeting will be Thursday, April 6th at BAE (formerly Reflectone). All members are welcome and we'd love to have you attend. Due to security at BAE, you need to contact a board member ahead of time to get your name on the list. We try to start promptly at 6:30 PM and hopefully we're done by 8 PM. ◆

Meeting Preview: At the May meeting we will have a presentation by Mike Galvin from Office Depot on scanning. Mary Sheridan, as usual, will conduct a 30-minute Windows discussion at the beginning of the meeting.

President's Message

By Mary Sheridan, President, Tampa PC Users Group
mcpease@mindspring.com

Happy Springtime! Attendance is improving at our monthly meetings and I'd like to thank everyone who fights the rush hour traffic to get there. The presentation by George Pilat of Intnet.net was interesting and informative. His operation is geared towards the business client, but, as he expands into more of Hillsborough County, he will offer his service to the home user as well.
The garage/rummage sale with the Greater Tampa Bay Computer Users Group (Brandon) for July 17 is still in the works. This sale will enable all of us to clean out some of those old components and software and help the users group at the same time.

I'm trying to find someone to do a Linux presentation at our June 14th meeting. If you know of someone who is fairly proficient in Linux who might be willing to share their information with the group, please let me know. Mostly I want to know the advantages of using it.

If you sign up for one of our SIGs at the regular meeting, please contact someone if you're not able to attend. Sometimes a SIG leader will be the only person able to make it to the SIG meeting. That's a huge waste of time and resources, so let us know if you can't make it.

I upgraded my home computer to 500 MHz Pentium II and added another 64

(President.....Continued on page 2)

June 14: To be announced. Check our web site later.

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

Minutes of the April Meeting

By Mary Sheridan substituting for
James Weber, Secretary, Tampa PC Users Group
jlweber9@mindspring.com

At 6:00 PM Mary Sheridan started the Windows SIG. Some Windows tips and tricks were presented, and a broad discussion of computer problems followed.

The general meeting started at 6:30 PM with our president, Mary Sheridan, presiding. Mary introduced the officers who were present and handed out information about a free upcoming event called "The Road Warrior Tour" at the Doubletree on Cypress 4/20/00.

At 7 PM the presentation began. George Pilat, our speaker, was from Intnet.net, an Internet Service Provider. In addition, they are a complete communications solutions provider. He spoke about the different levels and different kinds of digital subscriber lines. He compared DSL to the cable modem, as well as explaining the different kinds of DSL. DSL is an "always-on" connection.

At 8:30 a break was taken and we had a drawing for the door prizes at 8:45 PM. Bob LaFave won first prize, a copy of Windows 2000. We also gave away three T-Shirts to Arthur Young, William LaMartin and Bill DeLucia. Brian Lance won an insulated mug and a gift certificate for a Laser Perfect free refill. ◆

(President……Continued from page 1)

MB of memory. It flies now thanks to Steve Singer of http://morevalu.net/. He was available on the weekend and walked me through the changeover. You'll remember Steve from the great presentation he gave at one of our meetings. Thanks Steve, for all you've done to help the group.

Several of us attended the Microsoft presentation at USF sponsored by the Greater Tampa Bay Computer Users Group. Mary Sue Cameron of Microsoft did an excellent presentation. I didn't walk away with much new information though. It seems that Microsoft is having trouble with their Millennium release. And that's hardly a "news flash".

A great big **THANK YOU** to the Tampa Tribune, The St. Petersburg Times and Temple Terrace News for publishing information about our meetings.

(President……Continued on page 8)

Delphi 5 Professional from Borland

By William LaMartin, Editor,
Tampa PC Users Group
lamartin@tampabay.rr.com

One of the prizes for second place in the recent FACUG web site contest was a copy of Borland's programming package Delphi 5 Professional. Quite a nice prize, since the discounted price of the package at CDW's online store is $540 (retail $799). There are two other versions available. Delphi 5 Standard costs $89 and Delphi 5 Enterprise is a whopping $2,468 at CDW. The Standard version is sort of like a learning edition and contains no database connectivity. It does allow you to create the small stand-alone EXE's that I mention below. The Enterprise edition contains one feature I would like—ADO database connectivity, but there is enough in the Professional edition to keep me busy for a long time. So my hard work on the web site over the years has resulted in my getting a program that is also going to demand much work in the coming years.

I have been programming in Microsoft's Visual Basic for quite a number of years, so it is interesting to compare the two programming environments. Both Delphi and Visual Basic are considered Rapid Application Development environments, since they allow the programmer to get a working model of his application out much faster than, say, the C language would. Visual Basic's programming language is based on BASIC. Delphi's language is based on Pascal and is called Object Pascal. The program comes with a hard copy developer's guide and an Adobe Acrobat version of the Object Pascal Programming Language guide. Of course, there is extensive online help. I judge the online help about as easy to use as the VB online help. Of course, I could always use more examples of code than is provided. It is one thing to see the definition of a particular function or statement and quite another to see an actual example in code of its use.

With Pascal being a new language to me, there is some learning to do. But I have written several small programs and one simple database program. The database program was the only one so far that has required an installation package for installation on another computer. With Visual Basic, if you want to install the program you have written on your development computer on a different computer you have to create an installation package using VB's Packaging and Deployment Wizard and then use that package to install your program on the other computer. And no matter how simple your program, the installation package is always going to be too large to fit on just one floppy.

And here is the beauty of Delphi 5. For simple applications you write—those not using ActiveX controls or database connectivity—you can simply take the resulting executable file, place it on another computer and run it. I think the base size of such an executable is around 300 KB – 350 KB.

My first application consisted of creating a program that had a running clock, allowed the user to search a directory tree to select a text file or RTF file to open, then displayed that file so that the user could make modifications to the text and formatting and then choose from a directory tree where to save the file. It allowed him or her to again search a directory tree for a graphic file to display. Finally, there were several text boxes and drop down combo and list boxes where various information was displayed and the user could select from items in the combo and list boxes. Command buttons were supplied that when clicked on did various calculations with the items selected. The executable for all of this was around 600 KB and required no installation to run on another computer. I simply placed the application on the other computer's desktop and double clicked on its icon to run it.

I have always wondered why something like the above couldn't be managed in Visual Basic. Now it doesn't matter. Delphi 5 has solved that problem for me. It will be interesting to see how many different computing tasks can be accomplished without having to create an installation package.

My second project was to duplicate a simple program I had written for someone in VB that ran on a client machine which each morning checked for a certain file that was on both the client machine and a server on the network. If the server's version of the file was more recent than the client's, then the program copied the server's version over the client's version. Of course, there was a setup menu where the user could look at a directory tree over the network and select the two locations of the file in question. In writing the code in VB I had used a call to a Windows API file copy function. Once I figured out how to do the same thing in Delphi, I noticed how much simpler it was in Delphi. Although I have done very little with such, it appears that in Delphi you have easier access to the Windows API (Application Programming Interface).

My third Delphi project was to display a database table (our membership list with addresses, etc.) and create a report based on certain fields that could then be printed. Setting this up was very similar to what you would do in Visual Basic 6. You drop data access components on a form and set certain of

(Delphi… … ….Continued on page 4)

(Delphi……Continued from page 3)
their properties so as to connect to the database table you want to use. The main difference in using Delphi is that my Microsoft Access Database is not "native" to this Borland product as it is to Microsoft VB, so I had to set up a Data Source Name (DSN) for the Members database using the OBDC entry in the Windows Control Panel (You probably wondered what it was for). That done, then the Borland database engine could use ODBC to connect to the Membership database.

The report was constructed using Delphi's Quick Report feature, similar to VB 6's Data Report Designer. Here you place labels and text boxes (that get their values from the fields of the database) on the report page either in the Header, Detail or Footer sections.

Once finished, it is time to create the installation package. To do this Borland has provided InstalledShield Express, a "lite" version of the installation program that you have seen many times when installing commercial programs. The first time I ran InstallShield Express I made two mistakes. I forgot to include the Borland Database engine as part of the package and I did not fill in one of three fields about the program where it asks for Project Name, Version, and Company. I left the company field blank. The program seemed to install fine but would produce a database type of error when I tried to run it. That was solved by including the Borland Database Engine as part of the installation. However, with that solved, I then noticed that the program did not appear in the list of programs that could be uninstalled in the Add/Remove section of the Windows Control Panel. A search of the InstallShield web site produced an article stating that this is exactly what would occur if you left any of the three fields mentioned above blank. So I went back and put in something for Company, and everything was then fixed.

I have much to learn and am really a beginner with Delphi and its Object Pascal language. However, I have been pleased how well my trials with it have gone so far. At this point, I cannot really compare it with VB very well, since I have been working with VB for many years, and I have only been using Delphi off and on for a month. But I do like the ability to make stand-alone executables of simple programs.

Also included in the package are JBuilder Sandard (Java development), C++Builder Standard (C++ programming) and HotMetal PRO 5.0 (Web Pages). I think, though, that I have more than enough on my hands without trying to use JBuilder to develop Java programs.

Perhaps after I have worked with Delphi for a much longer time, I will have material for another article.

I should note that the ability to access data sources using ADO

(Delphi.....Continued on page 6)

ClipCache Plus

By Larry Anders, Librarian,
Tampa PC Users Group
larryanders@email.msn.com

Occasionally I come across a program that's a real keeper, and I'll admit it's been a while since I've found one, but ClipCache *Plus* version 2.6 fits the bill. In a past newsletter article (February 2000), where I listed some killer software, I mentioned another program similar to ClipCache *Plus,* called Clipmate for Windows, which is also a clipboard extender. By that I mean it allows you to save more than just the last text or graphic copied. While Clipmate does a good job of saving your clips, that's about all it does. ClipCache *Plus,* on the other hand, is a clipboard extender with quite a few other options.

ClipCache *Plus* sits in your system tray monitoring all clipboard activity and automatically saves clipboard objects to a currently active group folder. Your clips may then be retrieved within minutes, hours or whenever you need them. You can also create new folders where you can drag and drop a clip into that folder for long-term storage. Any text clip can be edited on the spot using any of the many handy cleanup functions I'll discuss later. There are no limits on the number of clips ClipCache *Plus* can store and organize, other than the usual disk space and memory requirements.

ClipCache *Plus* has several text editing and formatting operations. For example, the one that got my attention was its ability to strip, or remove, certain characters from your clips, like that gosh-awful bracket indention (>) on forwarded emails. I refuse to forward an email without first removing all the greater-than signs, which sometimes takes a little while. Not any longer. Just highlight and copy the text to be forwarded and click on "clean-up text". Put a check in the box next to "trim bracket indentation '>' " and voilà, it's done. Other text operations and changes that can be made are:

Trim '|' indentation	Trim ':' indentation
Trim space indentation	Trim tab indentation
Trim custom character indentation	Make upper case
Make lower case	Transpose case
Sentence case	Sentence strict case
Word case	Word strict case
Remove empty lines	Remove line breaks
Remove CR/LFs	Paragraph spacing
Strip < > from email addresses	Strip HTML tags
Trim Left	Trim Right.

A **Cleanup Text** dialog box allows all formatting operations to be simultaneously processed. Your favorite settings can be saved as pre-sets for later use. Text items may be **merged** into one clip, the order of the clips to merge may be reorganized,

(ClipCache.....Continued on page 5)

(ClipCache… … ….Continued from page 4)

and/or text may be inserted between existing clips. **Append** mode allows the appending of copied text to the current clipboard contents. And the preview pane supports in-place editing and a context menu that includes **Find and Replace** and **Undo** commands.

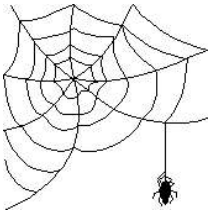
ClipCache *Plus* adopts a standard Windows look and feel (drag and drop, property pages, context menus) and its highly intuitive and configurable options cater to the individual needs and preferences of all kinds of users. If you prefer to use hotkeys, the system tray, the main application window, they're all configurable.

The ClipCache *Plus* main window is divided up into three separate areas (panes): Group, Item and Preview panes. The Item pane may be sorted by clicking (or right clicking) on the required column (name, size, format, date or source window); click again to toggle between ascending or descending sort. Items may be dragged from the item pane to different groups or to different applications which support that format.

QuickPaste automatically pastes into the most recently used application, while **FormPaste** can paste automatically into the most recently used application and then tab to the next field of that application, ready to paste the next item - handy for filling in forms. If **AutoPaste** is enabled, then everything copied (from any application) to the Windows clipboard will automatically be pasted into a chosen target application. Ideal for collating snippets of information. A **Find** feature allows quick and easy location of any items, and clips can be printed or sent by email.

While future versions plan to support more formats, currently the clipboard formats supported are:

(ClipCache… … ….Continued on page 6)



INTERNET PICTURE OF THE MONTH

From the April 28, online version of CNN

The graphic above headed CNN's April 28 online story about the Justice Department's specific plans regarding the punishment of Microsoft. Although the story indicated that the government intended to break the company into two pieces, the graphic had it split into three. http://www.cnn.com/

Some of these links will join the many already on the Links page at our web site, where you need only click on the name.

(ClipCache.....Continued from page 5)

- Text (plain text)
- Rich Text (font type, size, colour etc. is retained)
- OEMText (Text displayed in an OEM font)
- Bitmap (Device Independent Bitmap)
- Enhanced Metafiles
- Drop (files copied to the clipboard are imported as text file names)

The following are just some of the cool things you can do with ClipCache *Plus*:

- Storing of text clips from applications for reading later or pasting into other applications.
- Copying text and making changes to it prior to pasting.
- Instant retrieval and pasting of frequently used text clips.
- Removing unwanted forwarding indents ">>>>" from emails.
- Removing white space and large gaps from text copied from web tables or email.
- Formatting text prior to pasting.
- Assign hotkeys to your favorite functions.
- Clip hotkey assignments can be managed from a central Hotkey window.
- Collating several text snippets into one pastable clip.
- Use as a text editor.
- Fill in web forms.
- Storing of images for later viewing or transferring to an image editor.
- Ideal research tool for copying information (text/images) from various sources.
- Game cheats: visit your favorite game cheat site and copy any cheats to a "cheats" group, then print them out with ClipCache *Plus* later.
- Create Text Clips allows sticky notes usage, which can be pasted any time.
- The 3 pane view (Group, Item and Preview) allows easy management of clips.
- Easy to use explorer style interface.
- Displays clip attributes: Name (supports renaming), Size, Format, Date & Source Window.
- Sort clips based on any clip attribute.
- Edit clips by typing directly in the preview pane.
- Merge selected clips to a list or with any separators you wish, such as commas, semicolons, hyphens, etc.
- Append text to the clipboard, rather than replacing the clipboard.
- Save captured clips to individual files.
- Manage folder/group size using the "purge" feature, or set size limits for each folder.
- Trashcan group avoids accidental deletion of clips.
- No restriction imposed by ClipCache *Plus* on number of clips.
- Expanded Search/Find facility with highly effective "Search and Replace".
- FormPaste facility pastes selected clip into the most recently used application and then automatically TABs to the next field.
- QuickSelect hotkey shows a tooltip of the currently selected clip below the mouse pointer.
- ClipMenu displays captured clips as a popup menu under the mouse pointer.
- Emptying the Windows clipboard to free up memory.
- Many custom configurations possible.
- Drag & drop clips from the item pane to applications.
- Drag & drop selected text from the preview pane to applications.
- Drag & drop data from applications to the Group, Item or Preview pane.

A trial copy of this handy utility that Microsoft left out of Windows can be downloaded at http://www.xrayz.co.uk/. If you like it - it's only $19.95. I believe I'll be keeping this program for a long time. ◆

ClipCache *Plus*

(Delphi..... .....Continued from page 4)

(ActiveX Data Objects) can be added to Delphi 5 Professional for around $200. It is the main method I use in VB to connect to data sources, and in VB 6 it is free.

Recent Computer News

By William LaMartin, Editor,
Tampa PC Users Group
lamartin@tampabay.rr.com

Microsoft Breakup The big news item recently in the computer (and business) world is the Justice Department's idea on what should be done with Microsoft now that Judge Penfield Jackson has declared that they have abused their monopoly position in the software industry. The Justice Department and 19 states (or at least 17 of the 19 states) have proposed splitting Microsoft into two parts. The Windows business would be split from the Applications business. Microsoft would have to submit a breakup plan within four months, the two companies would have separate boards of directors, and the breakup would have to last for at least 10 years. The breakup, however, would not take effect until Microsoft had exhausted the appeals process. Bill Gates said that Microsoft could never have developed Windows under such rules, that they are bad for the software industry and software consumer, that such rules make no sense, and that Microsoft is sure that an appeals court will overturn such a ruling if a court does implement it according to the Justice Department's recommendations. The Justice Department's Joel Klein portrays the Department's actions as in the best interest of computing and the consumer.

You be the judge. For myself, I sort of like Microsoft, don't really think the lawyers at Justice understand software, think they have a bias against Microsoft (they use WordPerfect at the Justice Department) and don't think that their actions will lower the price of software to the consumer. Now, instead of one monopoly, after the breakup we will have two monopolies. That said, I do think Microsoft has done some pretty low things over the years to its competition—just about the same as the competition would have done to them if they could have pulled it off. I seem to recall that one of the goals of the Netscape crowd when they were riding high (for about six months) was the destruction of Microsoft by rendering everything in computing browser centric with the removal of the Windows desktop environment to the margins of computing.

Stock Values Of course, with the news of the possible breakup of Microsoft, its stock took a dive along with the values of many other computing related stocks (including the stocks of Microsoft's enemies) and the tech sector as a whole. And some pundits were quick to claim that the Justice Department was putting the economy into a tailspin. I agree that the recent Microsoft problem was good reason to devalue its stock, but I don't think we can blame Microsoft's woes for the decline of the stocks of all those dot.coms that have very little product and no income but were valued up there with the giants of American industry. Here are some examples of the deflation in such stocks. I gathered the information the latter part of August.

RedHat Inc. (RHAT): close 27 3/8 on 4/26/2000; 52-Week High 151 5/16 on 12/8/1999 ; 52-Week Low 20 on 8/11/ 1999. The close is about 18% of the high.

VA Linux Sys (LNUX): Close 42 1/2 on 4/26/2000; 52-Week High: 320 on 12/9/1999; 52-Week Low 26 7/8 on 4/14/ 2000. The close is about 13% of the high.

Ivillage Inc. (IVIL): Close 10 1/16 on 4/28/2000; 52-Week High 79 on 5/3/1999; 52-week Low 9 1/2 on 4/4/2000. The close is about 13% of the high.

drkoop.com Inc. (KOOP): Close 2 3/4 on 4/28/2000; 52-Week high 45 3/4 7/6/1999; 52-Week Low 1 15/16 on 4/18/2000. The close is about 6% of the high,

Peapod Inc. (PPOD): Close 3 on 4/28/2000; 52-week High 16 3/8 on 11/5/1999; 52-Week Low 2 on 4/14/2000. The close is about 18% of the high.

Cdnow, Inc. (CDNW) Close 4 5/16 on 4/28/2000; 52-Week High 23 17/24 on 7/12/1999; 52-Week Low 3 on 4/17/2000. The close is about 18% of the high.

And one that is not quite as bad as those above:

Amazon.Com Inc. (AMZN) 55 3/16 on 4/28/2000; 52-Week high 112 3/8 on 12/9/1999; 52-Week low 40 3/16 on 4/14/2000. The close is about 49% of the high.

And to make maters worse, these companies and many, many other dot.coms have only enough cash on hand to keep spending at their current rates for just a few months, which introduces the following shocking item—at least to me as a long time Corel Draw user, it is shocking.

Corel in its quarterly filing with the Securities and Exchange Commission said a "cash deficiency" may occur if its merger with Imprise/Borland isn't approved by shareholders or the company fails to secure other sources of financing.

Quoting the Wall Street Journal, "Last month, Corel reported cash holdings of about $29 million along with a $12.4 million loss for the quarter ended Feb. 29. It said the prospects for the next two quarters wouldn't improve because of falling sales of its two main products, the WordPerfect and Corel Draw software applications."

When you note that Imprise/Borland has about $250 Million in cash, you can see why Corel might want the merger. It is less clear what Borland will gain other than software that is apparently not selling well and Corel's gamble with Linux, which also may fail. ◆

Presenter's Tribute

By Mary Sheridan, President, Tampa PC Users Group
mcpease@mindspring.com

I've been trying since I took over the office of president to find someone to be our Program Chairperson. Not having any luck, I thought I'd stroll down memory lane and remember all the presenters of the past couple of years. Maybe it will give someone the incentive to get the kinds of presentations that they want to see instead of the ones I've wanted to see.

The first presentation I scheduled was Pat Horvath of Mindspring. He lost his scheduler on the plane to Tampa and never showed up at the meeting. Well, I was off to a great start.

At that time, Robert Armstrong of BCD came every year to talk about the latest hardware. He came to the next meeting, answered lots of difficult questions and gave away two $50 gift certificates. Next, there was Joe Roediger of Micro Star. He had an extensive stock market tracking software package. It was pretty expensive, but I heard that a least one person in the group bought one.

I missed the next meeting, but Melanie Arsenault of Kinematics gave an overview of surge protectors. Then, Dick Kellerman, the software "Evangelist", represented MGI software. Last time we saw Dick, he was showing Partition Magic.

Mike Austin of Waldec/IKON Office Solutions was very knowledgeable about Microsoft and the Microsoft certifications. He explained the use of different types of server/client computer setups used in the office environment. In June of 1998, Mike Bruzzone brought the WinChips into our lives, and some of us will never be the same. I have to admit I learned a lot because of the experience.

Gateway sent Rich Podoisky and Beth Wood, and they fielded some very technical questions. Quarterdeck came, and I haven't heard anything about the company since. Tom Rivers and his son were starting their own consulting business, so I guess they're doing okay.

Vinnie Barber was as much fun as I've ever had at a user group meeting. He showed us the Alps Printer, a cheaper web site than Alps.com to buy the printers, and made us laugh. He went to Applebee's with a group of us after the meeting, and he told us that he was doing stand up comedy when someone from Alps asked him to represent them. Now that's different!

Robert Armstrong of BCD came again and introduced an ISP that BCD was involved in.

Jasc Software sent Julie Alstatt. She was smart and cute and very easy to listen to. She got a few people to even buy Paint Shop Pro. Cheryl Alexander told her she was having trouble with a feature of Paint Shop and Julie gave Cheryl a book to help her.

Captain Rod Stebbins told us how to start our own business at home. Mark Haley sold some "not too great" National Parks CD's (my opinion only). Jason Velasco of Ontrack guaranteed to recover anyone's hard drive, for a price. I don't know of anyone who used the service, but in a crisis it would be invaluable. Tom Walsh of American Power Conversion gave away a rather nice UPS. Roadrunner came again and gave away pens and free installations.

Laser Perfect, a printer ink refill company was represented by Chuck McPherson. I've been getting my cartridges refilled every since and I've been very happy with it. I missed another meeting and didn't get to see Mark Komula of Network Technology Solutions. He explained the ins and outs of home networking. William LaMartin did a great presentation of Adobe Acrobat 4. The multi-level marketing fiasco came next. I'm still apologizing over that one.

BCD was scheduled again, but they were a no-show and Brian Lance saved the day by showing us the diagnostic software he used on his job. Matt McCann was funny and informative in his demonstration of Quicken. We had our first ever Christmas Party, and I thought it was grand.

Steve Singer gave an excellent hardware presentation, Glen Gasbarrow showed us E-Stamp and Jay Kirth came from CompUSA and brought amazingly enough a digital camera for the door prize.

I hope I've brought back some memories and that someone may have gotten interested in bringing in new and innovative presentations in the future. ◆

(President…… ….Continued from page 2)
Last, but not least, Mike Galvin of Office Depot will be our presenter at the May 10th regular meeting. Hope to see you then. ◆

A Step Back in Time: 12 & 11 Years Ago in the TPCUG

In 1988, meetings were in the NCNB building at 600 N Florida Ave., and the president was Steve Speairs

The OS/2 Solution
By Bob Fultz
From the February 1988 Bits of Blue

OS/2 is here and I wish to address the effect, at least how I see it, that it will have on our use of microcomputers. First, let us understand that OS/2 is not for everyone. The operating system alone demands a large investment in either new hardware or an expansion of that which we already have. An Intel 80286 or 80386 based PC with a 60 meg hard disk (or bigger) and 2 meg RAM minimum is a must. The operating system alone will take over 1 meg, not including any application which you intend to run. So we have an investment of $1000 to $2000 in memory and storage alone for the AT or PS/2 model 50/60 owner, and $8000 to $10000 for the rest of us. *Just to run OS/2 and our existing DOS applications!*

Similarly, we will need new versions of existing software and/or new products which will take advantage of the capabilities of OS/2. Our current DOS applications, while able to work under OS/2, will still be limited to the 640K barrier as always. While OS/2 is not multiuser, multitasking will still be available. Early users claim it is very slow when using disk intensive programs. Also, some early reports show that it is difficult to switch between protected-mode and real-mode operations (by some reports you have to re-boot the system). OS/2 may not be as transportable as DOS has been, allowing different versions of OS/2 to run on other vendors' machines. Because of these problems it appears that OS/2 will not overtake DOS until sometime in mid 1989. By then we will be looking forward to OS/2 for the 80386 family of Intel processors.

After all the technical jargon and difficulties are cleared out of the way, I feel that it will be the users who will decide whether OS/2 will take over in 1989. DOS will not die quietly, it still has a long life ahead. EMS will take care of that. There are a large number of the users out there who will never need what OS/2 has to offer and who will never spend the required monies to upgrade hardware. Yes, OS/2 will open up a new era of microcomputing, but its impact is up the road a long ways yet.

****

President's Podium (February 1988)

It's wonderful to see the good turnouts that we have been having lately at our meetings. I know that we can increase our attendance if we let our friends know about our group, the good information and the fellowship that is available here. Remember, the more people that we have attend on a regular basis, the greater the expertise that we have available to our group. Additionally, we are far more likely to attract the top software and hardware companies to give us demonstrations.

We want to extend our warmest thanks to Kathy Johnson and IBM for their excellent demonstration of the PS/2 Model 50 and a general discussion of the thrust of the whole new IBM Personal Computer Operations. The improvements in the video resolution and the new Micro Channel Architecture do show that these new machines are designed for the late 80s and early 90s when we can expect the software to match their capabilities. My only caveat on these machines is that the Models 50 and 60 are based on the 80286 chip which I regard as no more than a souped-up 8088 chip in capability. Personally, I would not plan on any purchases of these AT type machines if I needed true multi-tasking capability and could afford one of the new 80386 machines that are now rapidly entering the market.

Next meeting we will see a demonstration of the Quattro Spreadsheet and Paradox Database by a Borland Representative. We will have an overhead projector to make this demonstration visible to all.

We look forward to seeing you there. Bring a friend and have a good time!

Steve Speairs, President

****

In 1989, the meetings were at GTE downtown, the president was Harvey Bruneau and the only current member listed as an officer then is Kevan Sheridan. However, current member Ed Buzza was also writing articles for the newsletter.

Special Interest Groups

Microsoft Access SIG

This SIG meets the first Monday of the month at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6 PM.

For information contact either William LaMartin at lamartin@tampabay.rr.com or Merle Nicholson at *merlenic@tampabay.rr.com.*

Genealogy SIG

To be included on the TPCUG genealogy mailing list, contact Jenny Lind Olin at 960-5723 or jlolin@aol.com

Visual Basic SIG

This SIG meets the third Tuesday of the month, at the Gateway 2000 Store on North Dale Mabry at 6 PM. For information, *contact Merle Nicholson at merlenic@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting at MOSI and is devoted to a general Windows and computing discussion. Mary Sheridan moderates the discussion.

(Remember……Continued from page 9)
member should learn how to take advantage of this valuable asset and its offerings. Unfortunately, many members do not understand what a RBBS is or how to fully use it. This month I want to introduce the BBS to you and encourage the membership to use and enjoy the Board.

Our Remote Bulletin Board System (RBBS) consists of a XT compatible with a 20M hard drive and a 300/1200 Baud modem. It is accessible 24 hours a day, seven days a week. It contains a variety of free public domain programs which include games, DOS tools, telecommunication packages, and much more. The Board also has a computerized bulletin board, an electronic mail system, a files system, and much. much more. And all of this is just a modem call away.

When you call the Board use your name to tell the system who you are. If you have not called the Board before it will ask you if you wish to register as a newuser. When you answer YES the system will then ask you about your "setup". For a simple first time use answer No or None to most of these questions. Later, when you learn what they mean you can change them with the utilities. From there remember to read the prompts. If you have trouble enter a question mark for further help. Once you have called the system once you can then "TURBO LOGON". By this you just enter your FULL name AND password when asked for your FIRSTNAME. If you have done it right you will see dots as you type your password. ◆

Editor's Note: Our BBS has been replaced by our web site.

Linux Comments

By Don Patzsch,
Tampa PC Users Group
patzsch@acomp.usf.edu

Linux is a computer operating system. The trade magazines tell us that IBM has set up Linux so that it is used on their 390 mainframe. IBM's workstations and servers using Linux are selling well. The trade magazines further state that Linux is now on 30 per cent of the world's servers and is used in millions of businesses around the world. Recently, Corel is reported to have "bet the farm" on Linux, and they put on a great show of Corel Linux in Tampa recently. I bought my first book on Linux in 1995. It is *Using Linux* by Que books, and it contains a Linux CD ROM. Since then, I have toyed with the program but have not tried to go into it seriously. I first used UNIX at USF in 1982 on the mainframe, and I have been using it at USF since. We used it on the command line in the course "Internet" in the summer of 1994. We did not use a browser much during that course. In other words, no GUI. All of you who have been using the Freenet have been using the command line and a DOS browser called LYNX. It doesn't require graphical interface of any kind, i.e. no Apple, Mac, or Amiga. So you all use UNIX and you all use LYNX, one way or another, in my opinion.

I wanted to find out a little about the Linux computer operating system, because I plan to have my computer loaded with Linux ONLY.

On the Internet, http://www.linux.org/users/index.html lists people in your community that are interested in Linux. Also, on the Internet at the URL http://www.linux.org/hardware/, you can find many, many companies that manufacture and sell computers with only Linux installed. Linux comes with Office Suites

and programs to connect to the Internet, etc. The interesting feature of this URL is that you may now buy a Linux computer that contains Winux. Winux is a program that allows you to have a computer that has Linux as the main operating system, however, you can call up Windows 98 like a shell and run the Windows programs even though you have Linux running your computer. If you do not understand what this means, simply go to several of the companies above and read the story for yourself. I spent about five hours looking these URL's over to be sure I can run the computer after I have the Linux programs installed. I also called many people to verify that I can run the computer once it is set up, just as they did at the Corel show.

At Best Buy, SUSE Linux costs $29.99. On the box, it says there are six CD ROM's inside, and they contain 1,500 programs. There is, also, a large, easy to understand manual. ◆

President's Message

By Mary Sheridan, President, Tampa PC Users Group
mcpease@mindspring.com

Half of the year 2000 is already gone and half of my year as President. I'm enjoying it, and I hope I'm doing a good job

We went to ITEC (Information Technology Exposition and Conference) at the Convention Center recently. It wasn't as large as I had expected, but it was interesting nonetheless. I met the President of the Tampa Bay Computer Society, Dave "Doc" Dockery. The group is headquartered in Clearwater and meets at the Clearwater Central Catholic High School. They had a table for the event, and Doc said that people were asking if there was a group in Tampa. He was giving them our web address. The following day I took our brochures down there, and they handed them out for us. What an amazingly philanthropic thing for them to do. I want to extend a great big "Thank You" to them and hope we can find some way to repay them in the future.

The garage/rummage sale with the Greater Tampa Bay Computer User Group (Brandon) for this summer has been postponed until December. MOSI has some old equipment they would like to sell, also. This sale will enable all of us to clean out some of those old components and software and help the user group at the same time. We decided it would be better to have the sale after the "Snowbirds" return for the winter.

(President.....Continued on page 2)

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

Minutes of the May Meeting

By James Weber, Secretary, Tampa PC Users Group
jlweber9@mindspring.com

Our meeting started with the Windows SIG. Just like the news this month, the "Love Bug" virus was the first point of discussion. Following that was a discussion on setting up a network to share a high-speed Internet connection at home. It was suggested a Road Runner connection can be run straight into a hub with the other computers connect to the hub to get on the net. One possible problem was two computers might not be able to access the net at the same time. Another option would be to run your Internet connection to the network card that came with the RoadRunner package, and then add a second network card to connect to the hub. To connect the other computers to the Internet through your first computer, connect them to the hub and install proxy server software on the main computer or install Windows 98 SE with its Internet connection Sharing enabled on that computer. Of course, these solutions require knowledge of how to implement a small local network. With the growth of high-speed Internet connections, security is a growing concern also. Road Runner is an always-on connection that shares a network environment with all other Road Runner customers in your area. Anyone with basic hacking skills can "surf" the network and see your hard drive. Another security issue that is also common to DSL is a static IP address. Hackers can find this and either attack you directly or become you when your connection goes down. A precaution would be to install a firewall on your computer. I'm not talking about the stand-alone machines that filter e-mail and web sites you'd find in large companies. Firewall programs are available for the home user and are installed directly on your machine.

The general meeting started at 6:30 PM with our president passing out sign up sheets and making announcements. Our demonstration of scanning devices didn't go far due to a software issue with the computer Office Depot brought in. We did have our door prize drawings. Brian Lance won a Visual C++ and a gardening program, William Coleman won a T-Shirt, Nellie Lim (one of our guests) won a resource CD, and Gary Ennis won a copy of Drive Image.

The meeting closed at 8:00 PM. ◆

(President,,,,,,,,,Continued from page 1)

The presenter at the next meeting (June 14th) will be Bill Preece. He plans to talk about the Linux operating system, and I'm looking forward to hearing what he has to say.

(President……Continued on page 9)

The Pocket PC has Truly Arrived

By Larry Anders, Librarian, Tampa PC Users Group
larryanders@msn.com

Originally I went running and yelling, "The Palm is dead", and I wasn't referring to the palm tree in my yard that's dying because of this draught we're currently in here in the Tampa Bay area. I was talking about the Palm Operating System. More later on this….

I had read an article in the Wall Street Journal (WSJ) a few months back that really caught my attention when it described Microsoft's third try at Windows CE, their operating system based on the Windows platform and aimed at the palmtop and handheld market. This newly released operating system is now called PocketPC, and the new devices pictured above are coincidentally called PocketPCs also. Heretofore most palmtops were just PDAs (personal digital assistants) or PIMs (personal information managers) but not anymore, and that's what caught my attention in the WSJ article. I travel for a living, and although my notebook isn't all that heavy, by the end of a long travel day it feels like it weighs a ton. Most of the time I just carry my notebook for the ability to check email and access the web, but not anymore. Now I can carry something much lighter and be able to check my mail and browse the Internet anywhere I go.

After reading in the WSJ article about what was to come in the future, I started doing my research on these new PocketPCs and decided that I wanted an HP Jornada 540 series color pocket PC (HP PPC). It's the one on the right in the picture above. Symbol, Casio, and Compaq units are also pictured with it. Why the HP PPC? Name recognition, features included, highly rated bright color screen and the fact that it is one of the first to be released.

The HP545 was already available when I decided I ***needed*** one, but the 548 was due out May 1st. Well, I called HP on May 1st, and I had a 548 in my hand by May 3rd. I never have been one to wait too long for new technology. Two days was a lifetime.

This new line of handhelds is actually a PocketPC, not just a PDA. I have been a 3Com Palm user for about three years now, and although I had never used a PDA, or even any type of PIM before my Palm III, I could not live without one now. The Palm has been my right hand for quite a while, and I get a sinking feeling in my stomach when I realize it's not close by.

When I first got the HP548, and realized it could do everything my Palm III could do and so much more, I immediately decided the "Palm was dead." Then I read an article about the new PocketPC operating system in a recent PC World magazine that made me stop and re-think about the entire situation. I don't agree with the author's conclusion that most Palm users aren't willing to "sacrifice the simplicity of the Palm for the fripperies of Windows CE" (PC World, June 2000, Alexandra Krasne). First of all, what the heck is a frippery? And second, it is no longer Windows CE. It is a revamped operating system that has obviously been retooled for speed. My new HP548 has a 133Mhz 32-bit Hitachi processor and the new operating system is permanently on the 16 MB ROM chip. It also has 32MB of RAM.

The screen on my 548 is a 240 x 320 pixels, 4,096 colors (it was originally supposed to be 65,000 colors), LCD color display. With Microsoft's ClearType™ technology, on-screen reading approaches the quality of reading text printed on paper. Input into the PPC is provided by a pen and touch interface using the included stylus that has a nickname of "string-bean", which is stored neatly in the flip-top lid. You can enter text utilizing handwriting recognition software or an on-screen keyboard that is much more functional and useful than the keyboard on the Palm. On the Palm I immediately began using the handwriting recognition but so far on the 548 I have stayed with the keyboard input. The battery is a built-in Lithium-ion rechargeable with an 8-hour battery life. The unit recharges in a little over an hour. Input/output consists of RS232 serial, IrDA infrared, USB, CompactFlash type 1 card slot and an AC input jack. There is an external audio speaker and a microphone for the voice recorder. There is also a stereo earphone jack for the digital audio player. It is slightly larger than my Palm III and weighs less than 9 ounces.

The software (http://www.hp.com/jornada/products/540/prod_software.html) included is:

- Microsoft® Windows® for Pocket PC
- Microsoft Pocket Outlook (manage calendars, tasks, contacts, and e-mail)
- Microsoft Pocket Internet Explorer (browse Web pages, AvantGo™ Mobile Channels, Mobile Favorites Synchronization, Microsoft Mobile Channels)
- Microsoft Pocket Word (view and edit Word documents)
- Microsoft Pocket Excel (view and edit Excel documents)
- Microsoft Pocket Money (manage your stocks and checking account)
- Microsoft Pocket Streets (view U.S. maps)
- Microsoft Reader (read electronic books)
- Microsoft Windows Media Player (enjoy digital music and more)

(Pocket… … ….Continued on page 4)

(Pocket… … ….Continued from page 3)

- Landware OmniSolve (Business/financial calculator)
- Conduit Technologies' PeaceMaker 1.0 (exchange contacts with other PDAs via IrDA – *even the Palm*)
- Socket Communications™' drivers for Ethernet and digital phone cards
- HP settings, backup, home, task switcher, game buttons, Microsoft ActiveSync® 3.1 (synchronize files with your desktop PC)
- Microsoft Outlook 2000 (full retail desktop version)
- AOL Mail 1.0 (send and receive AOL e-mail)
- Yahoo! Messenger (send and receive instant messages to online friends and check news, stock prices, and more)
- Sierra Imaging's Image Expert (view, edit, and share digital images)
- MusicMatch JukeBox 4.4 (record, organize, and play digital music)
- Emusic.com (free sample digital music tracks)
- AudiblePlayer for Windows PocketPC 2.0 and AudibleManager 2.5 (if you don't feel like reading, listen to audiobooks and news)
- ZIO Interactive's ZIO Golf 1.1 (play realistic 3D golf)
- Inso's Quick View Plus (view e-mail attachments in Word, embedded tables, and selected graphics formats)
- HP's JetSend 2.0 for Windows PocketPC (exchange information with digital cameras, printers, and more)
- PhatWare's HPC Notes 3.03 Lite and Professional (create and organize notes)

I could go on and on, but if you really want to see what it's all about go to http://www.hp.com/jornada/tour/index.html and take the tour. Pocket PC technology is available with the following devices: HP Jornada 545, HP Jornada 548, Casio E-115, Casio EM-500, Casio EG-80, Casio EG-800, Compaq iPAQ, and the Compaq Aero 1500.

Do I still think that the Palm is dead? … No, not really. Do I think that most Palm users aren't willing to "sacrifice the simplicity of the Palm for the fripperies of Windows CE?" …No, not really. Why? We're looking at two different tools serving two different purposes. I just happen to have need for a PocketPC with many of the features of my desktop and notebook, including MS Word, Excel and Internet Explorer. The fact that it is also a PDA… hey… ***life is good!*** (…and I still have my Palm III too.)

HP548 - $599 ◆

Book Review: The Age of Spiritual Machines

By Tim Condon, Tampa PC Users Group
tim@free-market.net

Attention all inhabitants of Earth: This is a message for all human beings, including those of you who are members of the Tampa Bay PC Users Group in Tampa, Florida. There is something you should be aware of: The human species is going to go extinct, and that will happen relatively soon, probably within the next few hundred years. It's not that we're all going to die at the same time. It's that within the next 100 years most people, if not everyone, will voluntarily merge into the intelligent machines that are even now being planned and created, resulting in what will arguably be a new species.

At least that's what well-known scientist, author and inventor Ray Kurzweil postulates in his book, recently out in trade paperback, *The Age of Spiritual Machines.* Yes, I know, it sounds like just so much mumbo-jumbo baloney, on the same level as the predictions 50 years ago that we'd all be commuting to work in helicopters today. But Kurzweil deals with such skepticism, and draws upon an extremely good record in predicting the future of technology to bolster his vision.

Many of us in the TPCUG remember quite clearly the dawn of the "microcomputer" revolution. It happened, if any event like that can be specifically pinned down, in 1981 when the IBM-PC was introduced. Prior to that everyone was fiddling with Apple II's and Texas Instrument TI-88's (was that it?), and Altairs, and Commodores, and various computer operating systems, mostly CP/M. Of course, the stodgy, backward business world resisted all along, regarding microcomputers as mere "toys"...until IBM came out with its Personal Computer, whereupon the new "micro"computer was "validated", and the revolution began in earnest.

That revolution has been driven by the inexorable march of "Moore's Law." Gordon Moore, an inventor of the integrated circuit and in 1965 the chairman of Intel Corporation, postulated then that the number of switches (transistors, if you will) that could be placed onto the face of a silicon wafer would double about every twelve months. In 1975 he is said to have increased the timeline to "every 18 months" (although Kurzweil notes that Moore today says that "his 1975 update was to twenty-four months, and that does appear to be a better fit to the data").

So far no insurmountable obstacles have been encountered to the continuation of Moore's Law. But Kurzweil notes that chip companies only have confidence that the process can continue for about another 15 to 20 years, when "the paradigm

(Kurzweil……..Continued on page 5)

(Kurzweil… … ….Continued from page 4)

will break down. The transistor insulators will then be just a few atoms thick, and the conventional approach of shrinking them won't work."

"What then?" Kurzweil asks.

He spends a considerable portion of his book explaining "what then." And explaining why the continued exponential growth of computing power won't hit a brick wall as expected around 2018 (think quantum computers for starts). If he's right, the result will be the creation of machines with computing power billions of times more powerful than the human brain, and, ultimately, the merging of human intelligence with machine (or "artificial") intelligence.

Mere science fiction? Kurzweil, who is the inventor of the music synthesizer, reading machines for the blind, and a leading variant of speech-recognition technology, was named Inventor of the Year in 1988 by the Massachusetts Institute of Technology. In addition, Carnegie Mellon University awarded him its top science prize in 1994. He's not a nut case. And, in fact, he has an enviable record of correctly predicting the future over the past 20 or so years (which he goes over in the book).

What he predicts now—in fact, postulates as "an inexorable emergence"—is the imminent arrival of machine intelligence superior to human intelligence:

In the second decade of the next century [that is, from 2011 to 2020], it will become increasingly difficult to draw any clear distinction between the capabilities of human and machine intellgence. The advantages of computer intelligence in terms of

(Kurzweil… … ….Continued on page 6)

(Kurzweil.....Continued from page 5)
speed, accuracy, and capacity will be clear. The advantages of human intelligence, on the other hand, will become increasingly difficult to distinguish....Before the next century is over, human beings will no longer be the most intelligent or capable type of entity on the planet.

Kurzweil is so sure of his predictions that he includes a detailed timeline, handing over the last five chapters of his book to explicit scenarios that he sees emerging in 1999, 2009, 2019, 2029, and finally what the world will look like in 2099. He postulates that by about 2020 a computer that can be purchased with $1,000 of today's dollars will have the computing power of a single human brain. Then...well, here's what he says:

After human capacity in a $1,000 personal computer is achieved around the year 2020, our thinking machines will improve the cost performance of their computing by a factor of two every twelve months. That means that the capacity of computing will double ten times every decade, which is a factor of one thousand (2^{10}) every ten years. So your personal computer will be able to simulate the brain power of a small village by the year 2030, the entire population of the United States by 2048, and a trillion human brains by 2060. If we estimate the human Earth population at 10 billion persons, one penny's worth of computing circa 2099 will have a billion times greater computing capacity than all humans on Earth.

I know, I know, it's incredible (i.e. "not credible") and beyond belief, and there are all kinds of arguments to throw in Kurzweil's face. We all know about the *current* limitations of computers and computing, and it seems reasonable that it's going to be more than a little hard to overcome hurdles in the future to attaining the kind of computing power Kurzweil is talking about. Yet he's an acknowledged expert in the area, active in computing and invention for over 20 years and making spot-on predictions through the whole time.

There are two concepts which Kurzweil argues are driving the evolution of humans and machines: The Law of Time and Chaos and The Law of Accelerating Returns. The definition of the Law of Time and Chaos is this: "In a process, the time interval between salient events (that is, events that change the nature of the process, or significantly affect the future of the process) expands or contracts along with the amount of chaos." A further definition of "chaos" is needed: "It refers to the quantity of disordered (that is, random) events *that are relevant to the process*....If we're dealing with the process of evolution of life-forms, then chaos represents the unpredictable events encountered by organisms, and the random mutations that are introduced in the genetic code."

The next Law postulated by Kurzweil, which he says is the opposite of the Law of Time and Chaos, "is the most important and relevant for our purposes." This "inverse sublaw" to the Law of Time and Chaos is "the Law of Accelerating Returns." Definition? "As order exponentially increases, time exponentially speeds up (that is, the time interval between salient events grows shorter as time passes)." Thus, "The Law of Accelerating Returns...applies specifically to evolutionary processes. In an evolutionary process, it is order—the opposite of chaos—that is increasing."

But wait! Surely Kurzweil isn't arguing that biological evolution itself is "speeding up"! Well...yes, he does make that argument. Evolution has one huge deficiency, he notes:

[It] is very slow. While it is true that it has created some remarkable designs, it has taken an extremely long period of time to do so. It took eons for the process to get started, and, for the evolution of life-forms, eons meant billions of years. Our human forebears also took eons to get started in their creation of technology, but for us eons meant only tens of thousands of years, a distinct improvement.

The Law of Accelerating Returns also suggests that evolution will devise a way to bypass itself. That is, it evolves intelligence (namely, us) which is capable of devising intelligence (namely computers) that surpasses itself. Furthermore, says Kurzweil, the Law of Accelerating Returns "predicts that the progression in the capabilities of human-created machines will only continue to accelerate. The human species creating intelligent technology is another example of evolution's progress building on itself. Evolution created human intelligence. Now human intelligence is designing intelligent machines at a far faster pace."

In fact, Kurzweil argues that normal biological evolution will eventually have to be scrapped altogether by humans. Consider the human brain, the most complex object known in the universe, a crowning achievement of billions of years of biological evolution. Says Kurzweil:

The human brain is eminently capable in some ways, and remarkably weak in others. Its strength is reflected in its massive parallelism, an approach that our computers can also benefit from. The brain's weakness is the extraordinarily slow speed of its computing medium, a limitation that computers do not share with us. For this reason, DNA-based evolution will eventually have to be abandoned. DNA-based evolution is good at tinkering with and extending its designs, but it is unable to scrap an entire design and start over. Organisms created through DNA-based evolution are stuck with an extremely plodding type of circuitry.

But the Law of Accelerating Returns tells us that evolution will

(Kurzweil..... .....Continued on page 7)

(Kurzweil……Continued from page 6)

not remain stuck at a dead end for very long. And indeed, evolution has found a way around the computational limitations of neural circuitry. Cleverly, it has created organisms that in turn invented a computational technology a million times faster than carbon-based neurons (which continue to get yet faster). Ultimately, the computing conducted on extremely slow mammalian neural circuits will be ported to a far more versatile and speedier electronic (and photonic) equivalent.

Yes, everyone, he's talking about scanning and exactly replicating every neural connection and synapse in our brains, in a computer a billion or more times more powerful than the most powerful computers in existence today. "When will this happen?" Kurzweil asks, not figuratively. His guess is that by the year 2023 a personal computer costing $1,000 will have equal processing power to a human brain. From there it is only a short jump to being able to replicate all the connections of a single brain in a single computer.

In the second half of the twenty-first century, there will be a growing trend toward making this leap. Initially, there will be partial porting—replacing aging memory circuits, extending pattern-recognition and reasoning circuits through neural implants. Ultimately, and well before the twenty-first century is completed, people will port their entire mind file to the new thinking technology.

There will be nostalgia for our humble carbon-based roots, but there is nostalgia for vinyl records also. Ultimately, we did copy most of that analog music to the more flexible and capable world of transferable digital information. The leap to port our minds to a more capable computing medium will happen gradually but inexorably nonetheless.

As we port ourselves, we will also vastly extend ourselves. Remember that $1,000 of computing in 2060 will have the computational capacity of a trillion human brains. So we might as well multiply memory a trillion fold, greatly extend recognition and reasoning abilities, and plug ourselves into the pervasive wireless-communications network. While we are at it, we can add all human knowledge—as a readily accessible internal database as well as already processed and learned knowledge--- using the human type of distributed understanding.

Ultimate meaning? Immortality. That is, we're not going to have to die.

Actually there won't be mortality by the end of the twenty-first century. Not in the sense that we have known it. Not if you take advantage of the twenty-first century's brain-porting technology. Up until now, our mortality was tied to the longevity of our hardware. When the hardware crashed, that was it. For many of our forebears, the hardware gradually deteriorated before it disintegrated....As we cross the divide to instantiate ourselves into our computational technology, our identity will be based on our evolving mind file. We will be software, not hardware.

And evolve it will. Today, our software cannot grow. It is stuck in a brain of a mere 100 trillion connections and synapses. But when the hardware is trillions of times more capable, there is no reason for our minds to stay so small. They can and will grow.

So that's it. Ray Kurzweil, a respected scientist and inventor, is either off his rocker, or is foretelling a future that is assured and unavoidable, and will happen within the lifetime of many us reading this article.

Don't believe it? Read the book. It'll blow your mind. ◆

New Projector Fund Drive

By Merle Nicholson, Member at Large, Tampa PC Users Group,
merlenic@tampabay.rr.com

The TPCUG needs a video projector desperately and as quickly as possible. I've started a drive to collect funds to buy one. We need to raise $3,000 to $4,500.

Anyone who's been at the meetings lately knows of the failures we've had with the projector we're using at MOSI. It's just VGA resolution, and it's increasingly becoming incompatible with speakers' notebooks. And more than once – it didn't work at all when we needed it.

I feel very strongly that the future of our club depends on owning our own projector. We must attract good presenters to continue and to attract new members, and some of the very good ones depend on our having the facilities. But it's not just the projector that's critical, it's also the room where we hold the meetings. We hold three meetings a month: the regular meeting and two SIGs. A portable projector gives us far more flexibility to use different rooms and different locations.

The fund was announced at the meeting last month, and so far we have $215 in four donations. I'd like to set a goal of ten donations at $100 each, and the remainder with $25 to $50

(Projector……Continued on page 12)

Windows Startup Disk

By Merle Nicholson, Member at Large, Tampa PC Users Group
merlenic@tampabay.rr.com

Do you have a startup disk? Do you know where it is? Do you know how to use it? Better still, DOES IT WORK? What are you going to do if your PC doesn't boot because of a disk or Windows file problem? What if you have the seemingly correct diskette and when you boot, the CDROM doesn't work? Never happen to you? It will; sooner or later your good luck will run out, and you'll be glad you're prepared. To get ready for the coming sad event, read on.

Let's start at the beginning. Locate your Windows CD. Read the label. Is it an upgrade or a full version? Does it say "Only for use on a new computer" or "OEM version for a new computer"? Let's cover an upgrade version first, then the full version.

Upgrade Version CD. What are the issues for an upgrade CD? Well, when you installed this version, you already had a qualifying operating system installed, either say Windows 3.1 or a Windows 95a, b or c, or perhaps a Windows 98 and you have an SE upgrade. What's the big deal? Well, you **still** have to have the qualifying product to re-install from your CD if for some reason you have to reformat the hard drive. So, for instance, I have a Windows 98SE upgrade, but I also have a Windows 95 upgrade CD. If I have to reinstall Windows 98SE from scratch, the installation program will ask for my qualifying product, and I'll insert my Windows 95 CD for it to look at before it will continue with the setup. I even have Diskette #1 of my Windows 3.1 product!

Now look at the CD you intend to install or reinstall. Is the CD key on the jewel case or paper sleeve? If not, you're in trouble! Better find it now while you're not in a hurry. And if you do have it, a good idea is to put a paper CD label on the CD with the CD Key written on the label. I also have been writing the key directly on the top of the CD with a permanent marker. The idea is that with it labeled on the CD, you'll never lose it.

Full Version CD. Two issues exist with the full version. One, is that it came with a boot diskette. Do you still have it? It can substitute for a startup disk that we'll make later; it's not as good, but it does have an advantage in that you can do a full installation to a blank hard drive at any time. The other issue is the same as the upgrade version – the CD Key.

Now for the Startup Disk. There are a couple of issues with this diskette, mainly in making sure all the possible needed utilities are on it and also that it works – that is, that it will boot the computer, and that the CD ROM drive is working.

If you already have this disk made, you can skip this part, but pick it up a little further on because we're going to test it. First you need a diskette. I'd use the newest one you have around. Don't for heaven's sake use your old Quicken For DOS disk. Diskettes do have a shelf life, you know. Open Control Panel, click on Add/Remove Programs and select the "Startup Disk" tab. I really do have trouble remembering where this is. If it's a used disk, the program will replace any files on it. Click on the "Create Disk" button. It will tell you how to label the disk, insert it in the drive and click OK. It takes a few minutes to copy all the files.

Now, the above process was just a little different if you have Windows 95 than it is if you have Windows 98. Windows 95 needs the Windows 95 CD in its drive to make the diskette, Windows 98 does not. And there are other differences, and those of you who already have a startup disk need to pay attention here.

Win 98. You should hopefully have a good bootable diskette now. There's just one thing I'd do. Find the files C:\windows \command\EDIT.COM C:\windows\command\SYS.COM and copy them to the boot diskette. I find that these two programs are especially helpful when I have a dead system to contend with.

Now with the diskette still inserted, select Start, Shutdown, Restart. As the system boots, you'll get a DOS menu like this:

1. Start computer with CD-ROM support
2. Start computer without CD-ROM support
3. View the help file.

Select 1. You'll see that a CD-ROM device driver – usually the OakCD driver - should load, and then a number of ASPI for DOS drivers in case you have some SCSI drives, and finally the MSCDEX driver. This is the DOS driver for the CD-ROM. It should appear successful, and hopefully it will be. It's crucial. You should now have an A:> prompt.

Now with any data CD – your Windows CD may be best – do a directory list on the CD-ROM. Usually it'll be drive E:. The reason? This boot disk installs a virtual disk drive (a ramdisk) in memory for a few files, and it takes the first letter after the hard drive. So that'll be D: and then the CD-ROM driver loads as E:. I mention this because you don't want to be fooled into believing the files you see in the directory list are the CD, when they're really the ramdisk. Look at the light on the drive when you do the DIR E: command and make sure it spins up, and if you have the Windows CD there, it'll show you a WIN98 directory.

So all is well. And if not – perhaps the CD-ROM drivers are

(Startup……Continued on page 9)

(Startup… … ….Continued from page 8)
NOT loaded – then just read on, because the Windows 95 boot diskette has similar problems.

Win 95. We have some real work to do here, and it's more complicated. You can go ahead and boot your system with the new diskette, but you'll see that the CDROM doesn't work. There are no drivers on the diskette. Also there's no ramdisk, and that's a good thing. The disk does have EDIT.COM and SYS.COM on it. That's good. Re-boot back into Windows without the disk, then insert the disk again so we can copy missing files to it.

First we have to find the CD-ROM real-mode device driver. And it'll be a file like SBIDE.SYS or OAKCDROM.SYS. You will probably find one of these on the hard drive. One clue may be had from the c:\config.sys file. Edit or view that file and see if at one time the CDROM drive was used. Often it was, and then REM'd out. You may also have a diskette that came with the CDROM with the right one on it, and this is the best one you can get. DO NOT install the diskette. Instead open it with the Windows Explorer and look for the file. Copy this to the boot disk. Then find the c:\windows\command \mscdex.exe file and copy that to the diskette. OK. Now we have to do some file editing.

There's already a config.sys file on the diskette. Edit it with notepad, and add a line after the himem.sys line like: DEVICE=A:\OAKCDROM.SYS /D:MSCD001, or whatever the name of your device driver is. The /D part is the same for everyone. Save the file and then open a:\autoexec.bat. It'll be blank because there isn't a file. Just let Notepad create one for you. It needs one line. A:\MSCDEX.EXE /D:MSCD001. Save that file. Now boot with it. Hopefully you'll have a CDROM after booting. If not, pay particular attention to the screen when the device driver and the MSCDEX programs run. You'll usually have a clue from the messages. The MSCDEX program will not connect to the drive if the device driver in config sys doesn't find the drive. So make sure the device driver messages look good. Usually it'll tell you how many drives it found. (One). Look for keying errors. I have seen a couple of systems where you have to tell the device driver which IDE drive and interrupt it's attached to. In this case the config.sys line would read: DEVICE=A:\SBIDE.SYS /P:170,15. This is right only if the cdrom drive is installed in the secondary IDE port. Get this fixed! The Windows 95 reinstallation assumes that most of the system is still working, and in my own experience, that doesn't happen very often.

Aren't you glad you're doing this now instead of when it's all broken? ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

My contributors came through early and strong this month, so there is just a small space for me to fill. I encourage others to send me your thoughts on computing. The newsletter can always use a new slant.

Since last month's newsletter, I have learned more about Delphi and written a couple more programs. One makes a log file of all the WWW URLs you visit, and the other compares your system time to the Universal Time available via the Internet. Both still need a little polishing. But I have been pleased with my ability to pick up Delphi and use it to complement what I do in Visual Basic.

For those of you interested in the collection of old Tampa photos taken by the Burgert Brothers and being digitized by the Tampa/Hillsborough County Library, the searchable database of them (as well as the static listing) I created at my web site http://www.lamartin.com is now of use again. The Library is again allowing access to the photos via the Internet. ◆

(President… … ….Continued from page 2)
We are in need of a projector for meetings in other rooms at MOSI and at the SIGs. Merle Nicholson has started a projector fund. He generously made the first pledge to get the ball rolling, and Bruce Register was next to pledge. Thanks to both of them and everyone else who is able to help out. Mike Hodges has some older projectors that can hopefully be used as "trade-ins". This should lower the cost of the projector. Let's all pull together and make this a successful project.

I've gotten a couple of phone calls this month from people looking for beginner computer classes. If anyone has ideas of how to serve the needs of new PC users, please let me know. Most people seem to be intimidated by our regular meetings, so we may need to have a beginners' SIG. Any thoughts on this subject will be welcome.

I got an invitation to the Fall APCUG Conference in Las Vegas during Comdex week. My response was, NO, I cannot think about November yet! I do well to know where I might be next week.

Thanks to everyone for continuing to support the group. ◆

Special Interest Groups

Microsoft Access SIG

This SIG meets the first Monday of the month at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6:30 PM.

For information contact either William LaMartin at *lamartin@tampabay.rr.com* or Merle Nicholson at *merlenic@tampabay.rr.com.*

Genealogy SIG

To be included on the TPCUG genealogy mailing list, contact Jenny Lind Olin at 960-5723 or jlolin@aol.com

Visual Basic for Applications SIG

This SIG meets the third Tuesday of the month, at the Gateway 2000 Store on North Dale Mabry at 6:30 PM. For information, *contact Merle Nicholson at merlenic@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting at MOSI and is devoted to a general Windows and computing discussion. Mary Sheridan moderates the discussion.

Update your Anti-Virus NOW !!

By Merle Nicholson, Tampa PC Users Group, Member at Large, merlenic@tampabay.rr.com

Man, there's some nasty stuff going around now. And you can prevent viruses from coming into your PC by:

1) Own a good Anti-Virus program.
2) Make sure it's running !!
3) Get the virus signatures UP-TO-DATE!
4) Disable Windows Scripting Host.
5) Reject incoming Outlook messages with "FW:" in the subject line.
6) Reject any file attachments with .vbs
7) Go to http://www.microsoft.com or http://www.netscape.com and get any Internet security updates.

There's no excuse for not having anti-virus software running on your machine at all times if you have a Pentium class machine. Office Depot puts Norton Anti-Virus on sale regularly for $15. I bought a couple of copies at $9.95!

Make sure it's properly installed. If you're not sure, call one of the club members. This is very important. Further, make sure it's scanning all files. Many times it will scan only at startup and scan only executables (program files). Go into the settings and make sure you're doing the maximum possible.

If you have an anti-virus package that's not more than a couple of years old, you can get free updates. If you can't get free updates, then you need a new program for sure. The companies are now putting out new signature files several times a month, instead of once a month as before because of the proliferation of new viruses. They're on the Internet, and they're free.

Open the anti-virus software you have and do a help | about and see if you can't find the web address. The most popular ones are McAfee, Symantec (Norton), Dr. Solomon and Trend Micro(PC-cillin) at:
http://www.mcafee.com, http://www.symantec.com. http://www.drsolomon.com, and http://www.antivirus.com.

The latest email virii come to you as a file with a .vbs extension. VBS stands for Visual Basic Script. Users of Windows 95 and 98 should turn off the Windows Scripting Host. Click on Start (the button on lower left of your Windows desktop). Click on Settings. Choose Control Panel. Click on Add/Remove. Choose the Windows Setup tab. Click on Accessories to obtain details. Uncheck Windows Scripting Host if it is checked. It may not be in the list at all for Windows 95 if it's an older copy. Click on OK to save any changes.

Last, be conscientious. Set a schedule to get anti-virus updates at least monthly. Don't forget you're a member of a community of other users who can help. See the members help inside the back cover of this issue. ◆

amounts. Remember that we're a 501-C3 non-profit corporation. So what you'll get in return is a letter of thanks – by way of a receipt to show the Tax Man and, if you wish, recognition in the newsletter. The recognition is optional, of course.

I'm optimistic that we can do this. It's unusual for the TPCUG to raise the money this way, but it's an extraordinary need. And anyone in the group who's participated in the search for a new meeting location will tell you our options are very, very limited without a projector.

Please don't take this as a desire to vacate MOSI ! We have an excellent relationship with MOSI, and we'll continue as long as they can accommodate us. They do have other rooms that may be more suitable than the computer lab. But we can't do anything at all without a projector!

Think of all the time you have invested in the club. Hasn't it paid back to you in value exceeding $100? It certainly has for me. Give it some thought will you? Make a check made out to Tampa PC Users Group right away. You can contact me:

Meeting Preview: At the July meeting we will have a presentation on those handy little things called Personal Digital Assistants. Mary Sheridan, as usual, will conduct a 30-minute Windows discussion at the beginning of the meeting.

President's Message

By Mary Sheridan, President, Tampa PC Users Group
mcpease@mindspring.com

I really enjoyed the lively discussions at the last meeting. It sort of reminded me of the old MSDOS/OS2/DRDOS debates. People take their operating systems very seriously. The debate seemed kinder and gentler than in the past though. Maybe we're all getting mellower.

Our projector project is off to an excellent start. I'm so grateful to all who have donated.

As usual, the summer brings with it a shortage of presenters for our meetings. The representatives want to travel to Florida to talk to us in January, but they aren't that keen on being here in July and August. If you know of anyone locally who would like to talk to the group about their products, please let someone on the board know.

Cheryl Alexander has volunteered to handle our need for "Novice Users" information and help. We haven't worked out exactly how it will be implemented, but hopefully we find a way to be a resource for those who are new to the computer environment.

We also are painfully short on software for the door prizes. If you've bought

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members. Our mailing address is P. O. Box 3492, Tampa, FL 33601-3492.

However, for business concerning this newsletter, Bits of Blue, please contact the Editor, William LaMartin, at 821 S. Boulevard, Tampa, FL 33606-2904; 813-251-3817; lamartin@tampabay.rr.com.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII, Microsoft Write, Microsoft Word, or Word Perfect file to the editor at 821 South Blvd., Tampa, Florida 33606-2904 or to lamartin@tampabay.rr.com.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

The use of trademarked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

Minutes of the June Meeting

By Mike Hodges substituting for James Weber
hodges@reflectone.com

As usual Mary Sheridan opened the meeting with a far ranging discussion of MS Windows topics. Two new members were welcomed along with four visitors.

The opening discussions centered on virus detectors, as this was the burning topic at this juncture in the PC Internet developments. The "I LOVE YOU" virus being prevalent in early June causing many email systems and ISP providers to be totally on their knees. The main virus detector announced was PC-cillin98 as this is free for the download.

It was also stated that Defrag could double as a memory checker. If Defrag runs without aborting then it has most likely determined that the PC memory is sound. It was also announced that PC memory prices have started to rise again. A 64-MB module has risen by $25 in price in recent weeks.

IP routers were stated to provide an excellent firewall for DSL and Road Runner users. IP routers or cable system routers were stated to sell for $200. Contact Steve Singer of RDI for further details at http://morevalu.net/, the RDI web site.

Our featured presenters for this meeting, one of our more interesting, haled from the Suncoast Linux Users Group (SLUG) which boasts 250 members already. Monthly meetings are held at the Brandon Town Center Barnes and Noble bookstore. Our presenters, namely Bill Preece and Norbert, whose last name I have misplaced, host the SLUG meeting on the first Thursday of each month between 8 & 9 PM. The group also holds other monthly meetings in the area. Our presenters were clearly most enthused as to their conviction that Linux was a far superior operating system than MS Windows and believed it would be only a short time until the PC community would use nothing other than Linux operating systems. A number of Linux application programs are currently available and our presenters believed that the whole world would quickly wholeheartedly embrace Linux as the first choice as a total replacement for Windows. Being skeptical of all and any claims, I asked our presenters to state the reasons for their adoration of all things Linux. First, however, comparisons were rendered between the various competing versions of Linux, Turbo Linux, RedHat Linux and Corel Linux. Turbo Linux was stated to be preferable as a workplace system. Staples is apparently offering a 100% rebate on Turbo Linux. It was also stated that Red Hat Linux is the choice for server systems. Corel Linux was a newer version but was very well supported. Our presenters had indulged in Linux only for the last six months but were

The Handspring Visor PDA

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

Last month Larry Anders described the HP Jornada 548 Pocket PC—cost $600 (http://www.tpcug.org/newsletter/nl_2000/june2000/pocket_pc.htm). In June, 1998, he also wrote about the Palm III (http://www.tpcug.org/newsletter/june1998/palm_3.html). This month I will describe the HandspringVisor—cost $179 ($249 for the Visor Deluxe).

The Pocket PC and the Visor are obviously different, the first being a miniature PC with a 133 MHz processor, with 32 MB RAM and a color display. The latter is a Personal Digital Assistant (PDA) with 2 MB RAM and a gray scale display. However, if you think you might need more RAM to load some heavy-duty software, the Handspring Visor Deluxe comes with 8 MB RAM and a leather case. If you are not going to use it to connect to the Internet, edit Word documents, listen to digital music, or need a color display, then you don't really need the Jornada, and might just as well get either a Palm or the Visor.

This Visor was developed by the original developers of the Palm at 3COM, and it uses the Palm operating system, version 3.1. Furthermore, all of the software add-ons that work with the Palm can be used with the Visor. The most comparable Palm appears to be the Palm IIIxe. To see a side-by-side comparison of this Palm and the Visor Deluxe, go to http://www.handspring.com/products/vcomparison.asp.

Why get a Visor instead of a Palm? At first, price was a good reason, but Palm has now introduced the Palm IIIxe for $249, and it compares very closely to the Visor Deluxe at the same price. The Visor claims to have enhanced versions of the core applications—date book, address book, memo pad, etc.— used by the Palm, so I suppose this is a plus for the Visor, but the main plus, I think, is the Springboard expansion slot on the Visor that accommodates such plug and play peripherals as extra memory modules, modems, and GPS receivers in a more compact way than does the Palm with its peripherals. Additionally, the Visor comes with a USB connector to sync it with the software on your computer. This is an extra with the Palm. A USB connection is a much faster way to synchronize your PDA with your computer than is a serial connection.

I never thought I really needed such a thing as the Visor until one was given to me by my son for Father's Day. Then I found all sorts of uses. The obvious is to import my address book into it from my computer. If you are using Microsoft Outlook, you can import directly. If not, as was the case for me, you first need to export your address data to a comma delimited file and then import that into the Palm Desktop

that you have installed on your computer. Once you have your address in the Address Book in the Palm Desktop, you get them into the Visor by Hot Syncing. To do this you simply connect the Visor's cradle to the USB connection on your computer, put the Visor in the cradle, then press the button on the cradle.

Similarly, you can fill in appointments in the Palm Desktop's date book , then when you sync with the Visor, this information is added to the Visor's date book. If you add an appointment to the Visor's address book, when you sync, that appointment is added to the computer's date book.

One of my uses of the memo pad is to create shopping lists that I used to keep on paper. For example, I have a Home Depot list where I enter items to get the next time I go there. I could do the same for a grocery list, but I have a much better way of doing that. I am sure you have seen me mention my grocery shopping list compiler before at http://www.lamartin.com. To create my shopping list for my neighborhood Publix, I go to the site, select the items I want and have the web site put the list in walking order of that store. I then have my ordered list on the computer's screen. In the past, BV, i.e., before Visor, I would have then printed the list and taken it with me to the store. Now I save one sheet of paper by selecting the list and copying it to the clipboard and then pasting it into a new memo in the Palm Desktop and then Hot Syncing with the Visor. I now have my ordered shopping list in the Visor, which I take to the store.

Once you start using the Visor, or the Palm, you soon want to download those extra programs, some shareware, some commercial. I download a free reader called CSpotRun and then downloaded the novel Jungle by Theodore Dresser and a collocation of poems by Carl Sandburg. Now, when I have to sit in a doctor's office or an airport terminal, I can start CSpotRun, select a document and have it scroll the text as I read.

There are two types of commercial programs, those that are free and those that are not. The free ones are free because they give you some sort of information from which they hope to get some return. This is the case with Vindigo, a program that lists many of the restaurants, shops and entertainment venues in select cities. I chose to download the database for New York City. This package takes up 563 K of memory—a very

(Visor…….Continued on page 4)

(Visor……..Continued from page 3)
large amount compared with other Palm programs. This is why at some point you might want an extra memory module. When you run Vindigo, you first select whether you want to eat, shop or be entertained. Then you select your location as an intersection, e.g., Broadway and 61st St. To find a place to eat breakfast, you would select this category of food, and Vindigo then displays a list of restaurants in order of closeness (or by rating or by cost). For each restaurant listed it displays ratings for food, décor, service and costs. There are also reviews and even a place to enter notes that could be sent to Zagat, the provider of the reviews in the program. What I think is the neatest piece of information provided is the walking directions from your location to the restaurant. Similar free modules exist for other major cities—but not for Tampa.

The second type of commercial program, the one you pay for, is represented by two programs: The Jungle Mapping program and the Tiny Sheet spreadsheet program.

For all major cities, again excluding Tampa, you can get a Jungle Map—for about $10. They have a free demonstration using the southern tip of Manhattan. If you want to go further north than 20th ST, then you will have to pay. The map allows you to zoom in and out, and at the higher levels of magnification you get street names. Additionally you can search for an address and place markers on the map. It is quite a nice little program.

The Tiny Sheet ($20) program allows for basic spread sheet functions, including many of the functions in a usual spread sheet. But the program is limited—after all it is on a PDA—in that you can't do some common things like sort and filter. You can also download an additional free program that runs on your computer and allows you to bring small Excel sheets into the Visor and open them with Tiny Sheet. I now have several spreadsheets useful to me stored on the Visor.

The Jungle demo is good for about 10 days, and the Tiny Sheet demo-using the full features of the program—is good for 30 days.

There are many, many programs you can add. I have only scratched the surface. Of the ones I have viewed, as with anything, some are good and some are so-so. For example, I downloaded a map of the Manhattan subway system that was not particularly easy to read since it apparently originated from a color map, and in gray scale many of the line and stop identifiers were not distinct. By the way, to view the map, I had to find a free viewer and download it. The viewer seemed to work fine on other images.

http://www.handspring.com/ ◆

Napster and Gnutella: Death to the Music Industry

By Tim Condon, Tampa PC Users Group
tim@free-market.net

How many times have we all heard that some innovation or invention is going to "change everything"? The end of this! The end of that! Everything's going to be different from now on! **Really**!

Yeah, yeah, blah, blah, blah. We TPCUG members have heard it all, and then some.

And just about then something comes along that really **does** "change everything." I'm talking not only about the Napster and Gnutella phenomena, but about the very notion that we are rapidly---and I mean **really fast---**approaching a time when anything which consists of "sensory information" can be virtually limitlessly reproduced and transported, at virtually zero cost. What do I mean by sensory information? You name it: For your eyes, any and all writing including novels, articles, poetry, books of any kind and any type…**and** any type or kind of picture, film, video, artwork, sculpted representation, etc. For your ears, music, music, and music, not to mention audio books, audio novels, audio poetry, audio-anything. For your taste buds, your nose, and your sense of touch (to round out the five overt senses), we're not there yet. But we will be, you can bet on it.

Right now the ability to endlessly copy and trade audio recordings is what is driving the death of the music industry. First, a few words of explanation: Napster is a program that can be downloaded from virtually anywhere on the web. When you install it the program will hook you up with a web server named Napster.com which then enables you to "share" for copying all the music (that you specify) on your computer with whomever and wherever in the rest of the world people may be looking for what you might have.

And then there's the other side: Not only can you share what you have, but everyone else in the world running Napster is similarly sharing all their music files with you. So, you download Napster, crank it up, run a search for whatever you might be interested in, and in a few moments a whole giant list of what you've been looking for pops up on your screen, from Napster users all over the world. From there you just specify which ones you want to download. Then, you've got the music to use and share as you see fit, with the result that you don't have to go out and buy $17.95 CD's anymore (more importantly, our **kids** don't have to spend their money that way…and we all know they're better on computers than we are).

(Napster……..Continued on page 5)

(Napster……..Continued from page 4)

All of which is why the Recording Industry Association of American (RIAA), hard-metal rocker band Metallica, and rapper Dr. DRE are all piling on Napster.com, suing them for zillions of dollars and asking a federal judge to issue an injunction shutting the web site down. Permanently.

Which is where Gnutella comes in. **This** program is what might be called a "next generation Napster." Except it dispenses with the inconvenience of a central server. Everyone in the world running Gnutella can connect and share music files directly, without any central coordinating location. That is, no location that can be legally attacked and shut down. Um.

The more important implication of Napster and Gnutella **type** programs is how they extend the notion of "sharing" property which was previously protected and kept sacrosanct for owners and creators (often not the same people, remember) by federal copyright law. The emerging "ebook" industry is already being held back by worries about how Napster-type sharing can be prevented for **text-based** works of art. I mean, there's music and there are books, right? And books are made out of paper and ink, right? Not for long. Already the Softbook Reader and Rocket Ebook are on the market. And while they're primitive and expensive as first generation "electronic readers," the future is quite clear for those who care to contemplate it: Printed and bound paper-and-ink books will soon shrink drastically as a method of transferring written information and eventually may be totally supplanted by electronic text on small, inexpensive, portable reading appliances.

Now. Let's talk. What about copyright? What about musicians

(Napster.....Continued from page 5)
and authors? What about a concept as simple as the right to "private property," i.e. being able to enjoy the fruits of that which is yours. **Especially** when that property was created by you. That's what the growing legal, media, and ultimately cultural battle is all about. How can artists hope to be compensated, when as soon as their work is released it becomes instantly available to the entire world for **free**? Perhaps more importantly, how can we as a society hope to **encourage** artists and writers and sculptors and playwrights and musicians and poets and other "purveyors of beauty" to work when they may get paid nothing for what they create?

And that's where the struggle now stands. To the leaders of the "music industry," and plenty of musicians, the kids who invented Napster.com are simply encouraging thievery, threatening an entire industry with wholesale theft. Many of the millions of people who are actively using Napster and Gnutella snarl back that the music industry has been ripping off consumers---not to mention the musicians themselves---for far too long with their overpriced CD's and cutthroat contracts.

So where should the rest of us come down? If the copyright law is clear, this is just wholesale copyright violation. But wait! The Napster.com kids and lawyers are arguing in court that, first of all, **they** don't have any responsibility for what other people do with the program (and even have, ahem, a somewhat disingenuous anti-copyright-violation warning on their web site). And secondly, they argue that the copying and sharing of music files among private citizens, where there's no money changing hands, isn't a violation of copyright law anyway! I mean, if you have a record you like, and you copy it and give it to your friend to hear, is that a violation? Or does it come under the copyright exception rubric of "fair use"?

Interestingly enough, the most erudite and thoughtful writings I have seen on the subject have come from two big-time rockers: One from the (in)famous bandleader and widow of grunge rocker Kurt Cobain, **Courtney Love**, and the other from Grateful Dead confidant and songwriter **John Perry Barlow**.

First Courtney Love: In a long and very insightful speech she gave just a few weeks ago as a keynote speaker at the Digital Hollywood Conference in New York City, she argued that the Napster phenomenon is a "radical democratization of music," resulting in betterment to both musicians and fans. Citing dismal figures from the recording industry that make it look little better than chattel slavery of musicians, she proclaimed that in fact artists will also ultimately benefit financially from the Napster wave. Said Love, the "real" music pirates are the record companies and the RIAA, who have recently successfully changed federal copyright law so that musicians and bands are little more than "sharecroppers."

Clearly Courtney Love has not endeared herself to either musicians on the other side of the barricades, or the RIAA (which may be one reason she's involved in a ferocious legal battle with her former recording label, Geffen Records, which maintains it is owed five more albums by Hole, the rock band that Love fronts). Yet if you read the unedited text of Love's speech, she makes eminent sense. (Which may be why it took me a so long to find an unedited version on the Web: Go now, before it's too late, and download her speech from http://www.undercover.net.au/rncourtney.html. Read what she has to say yourself.)

The other quite thoughtful and important writing I've seen about the Napster phenomenon was written by John Perry Barlow, a former songwriter for The Grateful Dead, co-founder of the Electronic Frontier Foundation (EFF), which exists to lobby the government in favor of the Internet and cyberspace in general. To give you an idea of where Barlow comes down on the issue, his essay begins like this: "I expect most of you are aware that the Recording Industry Association of America has been fighting a desperate struggle against technologies that would end its century-long enslavement and exploitation of musicians. One of these developments is something called Napster.com…."

Barlow, like Love, is an insightful observer of the modern music industry, having been involved in it himself for decades. "The music industry," he observes, "is generally despised by both music-lovers and musicians, to whom they've been returning about five percent of the retail value of their works." What will happen? "I'm convinced that the traditional music business is finished," Barlow states. "Napster and other environments like it will polish off the likes of BMG and Tower Records within five years. Personally, I can't say I'll miss it. For over a century, it has exploited both musicians and audiences….Whatever models evolve to protect the creation of music, I am not concerned that we will fail to economically support its makers….For some reason, humans absolutely require music, and they were providing for the material needs of musicians for tens of thousands of years before copyright law, just as they will do so for tens of thousands of years after this brief and anomalous period has been forgotten."

You can read Barlow's entire essay by reading or downloading it (for free!) at http://www.technocrat.net/958163435/index_html.

How will it all play out? Can't tell now. My guess is that Barlow is right, and the "music industry" will be destroyed, to be replaced by more direct contact between artists and their fans. Perhaps the most straightforward statement came from a friend of mine who lives and works close to a center of the music industry in southern California. When asked about the apparent copyright violation aspect of Napster, he tried to beg off by saying "My stuff is music that's long out of copyright." But when I pressed him and asked "What about music being downloaded that **is** still covered by copyright?" he paused, then said "Well, I guess they'll just have to kiss my ass."

Chalk up one more supporter of Napster.com. ◆

By Larry Anders, Librarian, Tampa PC Users Group
larryanders@msn.com

I'm running short on time this month, and William, our newsletter editor, has already issued his second notice for articles, so I thought I had better pull one of my reserves out of the closet so I can fulfill my obligation.

As anyone can attest that knows me or has read any of my articles, I like free stuff, especially software. That's one of the reasons I became the librarian of the TPCUG years ago, so that I could be the keeper of all that shareware we made available to our users at the monthly meetings. Well… that was before the Internet became so user friendly and certainly before **The Freesite.com** "*home of the web's best freebies*" (http://www.thefreesite.com/). It would be easy enough for me to say just follow the link above and be done with it, but that wouldn't get this article written, now would it? So…

TheFreeSite.com is separated into many different categories to make it easier to decide which free stuff you want to download to fill up your hard drive. If you're concerned about your privacy on the Internet there is **Anonymous Freebies** (Encryption, E-mail, Web Surfing) at http://www.thefreesite.com/Anonymous_Freebies. If you're in the business world they have **Business Freebies** (Stock Quotes, Management, Jobs) at http://www.thefreesite.com/Business_Freebies. If you're wanting email alternatives there is **Email Freebies** (E-mail Services, Free Newsletters) at http://www.thefreesite.com/Email_Freebies. If you're into family computing then check out **Family Freebies** (Chat Freebies, Children's freebies) at http://www.thefreesite.com/Family_Freebies. If you don't already have a million fonts or you need something to manage the million fonts you already have then see **Free Fonts** (True Type, Logos, Library) at http://www.thefreesite.com/Free_Fonts. Just in case you need a few more games they have **Free Games** (Online Games, Freeware Games) at http://www.thefreesite.com/Free_Games. For the graphic freaks, **Free Graphics** (Banner Graphics, Free Clipart) at http://www.thefreesite.com/Free_Graphics. And after all this, if you haven't had your fix of free stuff on the Internet, then you've got it worse than I do and you need to join the F.S.A.A. (Free Stuff Addicts Anonymous)!!! Contact me and I'll give you the time and location of our next meeting…for free, of course. Good Luck! ◆

(Minutes……..Continued from page 2)

clearly fanatics in their belief of the superiority of Linux as an operating system. Our presenters stated they live, eat and sleep with Linux.

What are these magnificent features that endear Linux so much to our presenters. First Linux can run on a 386 with only 4MB and in general compared to Windows runs faster. Sez who? Linux is very robust with the latest Avalon chip sets due to the extra cache on the chip set that Linux uses to maximum advantage. Linux offers better security and the cost advantage will win over the corporate PC world. Some versions of Linux are as inexpensive as only two dollars a copy. The scalability of installation packages ranges from 720 KB to a system that requires 18 CD's…. Turbo Cluster! The prime advantage is that open source allows everyone free accessibility to every line of code for both operating systems and applications.

Linux was originally developed in the early nineties by the Finn Linus Torvalds as a hobby project and over 10 years has gained approximately 20 million users.

Not all chip sets achieve compatibility and consequently many variants now exist. However the problem is considered not as great as that experienced by MS Window users. Free rapid support is currently available to all users at Linux.COM. Support for PDA devices is also available. There are two major

MP3s, USB CD Writers and Renegade Programs

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

It has been an interesting month of computer problems. Some months are like that. The previous month almost nothing happened of interest. June was a different matter. And much of it can be traced to the MP3 download craze.

MP3, Napster & Gnutella are words we didn't know only a short time back. Now they appear often in the computer news (see Tim Condon's article in this newsletter), the regular news, and in what is not a good omen, the legal news. I don't intend on touching on the legality of sharing recordings in the MP3 format via the Internet by using Napster and Gnutella. I will leave that to the courts to hash out. As for me, I only got involved to figure out what it was all about so as to help someone with their request. You know, "I tried it, but I didn't inhale."

It all started with a request from someone I help to tell them how to turn music in the MP3 format that they had downloaded from the Internet using Napster into music on a CD that they could play in any CD player. It ended with many hours of work getting a CD Writer to write without freezing on their computer and getting Visual Basic and Microsoft Access to again work correctly on my computer. If you don't see the connection, well, that's what the article is about.

HP USB CD Writer First things first. I told them to go buy an internal HP CD Writer, any of several that I had chosen from the HP site on the Internet. And I would come over and install it. Then if the software that came with this new drive wouldn't do what we wanted we would see about getting the appropriate software.

The next day, I went to their house and opened the box of an HP 9300i CD Writer. Having installed similar devices before, I put the software CD in the computer and ran the program to let it tell me which IDE connector was free—and then it hit me. My problem was not in finding which IDE connection to use. My problem was that this $4,000 Dell computer only had two 5.25" drive bays, and both were taken, one with the DVD/CD drive and the other with an HP Colorado tape drive. Another reason to buy a large tower case.

Back to the drawing board and back to Comp USA for the client, a trip which produced an HP 8200e CD Writer which connects via a USB connection. Since there was already a USB printer and a USB device for connecting a digital camera, I also requested a USB hub.

The USB CD writer installed easily, as did the accompanying software, which included Adaptec's Easy CD Creator 3.5 (they do not give you the most recent version with the drives). Everything seemed to work OK, but we couldn't put any of the MP3 files on the CDs being made because the MP3 files need to be converted to .wav files before Easy CD Creator 3.5 will make an audio CD of them.

When I got home later, I went on the Internet and found several shareware programs that claimed to create audio CDs directly from MP3 files. My client downloaded one of these and tried it. Unfortunately the program would not work. In talking with a friend, he suggested a program called, I think. Ear Jam that he had just found that came highly recommended and which was freeware. He sent all 10 MB of it to me, and I installed it on my computer before he even got it installed on his.

This is where my problems probably started, for as the program installed, I saw a message that said it was installing some sort of data components. I think it possibly said something about DAO. "Uh Oh," I thought. That isn't good. I bet that messes up something. Furthermore, why does a music CD creation program need to use a database. I think the answer to this is that the program also had some sort of marketing angle and would probably keep track of what music you turned into CDs.

Anyway, the program never got past the first track on making a CD on either my computer or my friend's. So I uninstalled it, but made a mental note to watch out for database problems. Next day a bit of research revealed that Adaptec's Easy CD Creator 4.0 (I had 3.5 also) would do exactly what was needed: Go directly from MP3 files to audio tracks on a CD. So the client bought it, installed it, and had problems. It would never get more than two or three tracks written before the program would freeze.

I arrived, checked out the problem and noted that the error message was: "A fatal exception 0E has occurred at 0028: C14F38DD in VXD APIX (01) +……". A reinstallation of the program didn't help. After running out of ideas, I called Adaptec (this was the big mistake in all of this—not because of anything bad about Adaptec help, but because their program was not the problem). I spent several hours on the phone with a very nice fellow doing all sorts of things: renaming files, deleting files, taking everything out of the startup section of the Windows Configuration except Systray and Explorer, slowing down the Video Card, writing at 2 speed, 1 speed, etc. All to no avail. I went home with the promise from him that he would send me two utilities to check and then update the ASPI layer. I bet you didn't know your computer had one.

Next day they had no record of our long session, and we are assigned another tech. A couple of hours with him, and we mutually agree that Adaptec can't solve the problem with their

(Comments……Continued on page 9)

(Comments……..Continued from page 8)
Easy CD Creator 4.0 not being able to write to more than a few tracks. But that error message concerning the APIX.VXD certainly pointed to them.

I had also moved the USB connection for the CD Writer to a direct connection to the USB port on the computer instead of the hub, thinking that might help. But it didn't.

My next try was the correct one—many hours too late. I called HP. In describing our travails and attempts at correction I also mentioned that we had a USB printer and a USB hub connected to the computer. I bet it is the printer, the HP tech said. It most probably generates USB traffic at random times and that traffic causes the CD Writer to freeze. I knew better than to try and use any USB device or to plug or unplug any USB device while the CD Writer was creating a CD, but I never dreamed that you couldn't have another USB device plugged in.

However, before we tried his theory, he also wanted to rename and delete a bunch of files to be on the safe side. Apparently there are a lot of files that are installed by other software for devices, scanners, ZIP drives, etc. that also use the Adaptec ASPI layer that aren't removed or updated properly when newer versions are installed.

After about 45 minutes of playing with files, we were ready to make a CD—with all other USB devices unplugged. Ten tracks of ten attempted were successfully written at 4x speed.

So much time wasted in looking for a solution in the wrong place. I then sent an email to the Adaptec technician for whom I had a email address since he had sent me the two files, and a day later he responded that he had used that information to help someone who hadn't been able to use his HP USB CD Writer for 10 days since purchasing it—and who, I might add, had also called Adaptec instead of HP.

By the way, the printer, while connected—even if it were turned off—would cause a freeze in the CD creation process.

Access and VB Several days after installing that freeware CD writing program on my computer, I needed to print out the mailing labels for the June newsletter to be assembled the next morning. I kept getting error messages in Access, but they didn't make much sense. Nothing had changed since last month to speak of, and I couldn't figure it out.

So I finally exported my data and brought it into another machine and used Access there to print the labels. I then noted that I couldn't run certain queries on my regular machine, and would instead get the error message "Function Isn't Available in Expressions in Query Expression" with the problem function described. I did a search of Microsoft and came up with the article http://support.microsoft.com/support/kb/articles/Q194/3/74.ASP. I used their first method mentioned to easily fix the problem. I strongly suggest that those of you who use Access go and read the article. Quite possibly you may need it sometime. I am convinced the problem was caused by installing the program mentioned.

About a week later I opened a VB project that I written months back and not looked at in the past month or so. When I tried to run it I got the message: "Compile error: Error in loading DLL". The program used DAO database components and I immediately suspected that same program. I assumed that some of the DLLs used by my program had been either corrupted or were the wrong version. I spun my wheels a lot as usual looking at the DLLs, checking their versions, etc. And I found one that was highly suspect, since its version description was "MSVCRT40.dll version: 4.20-OS use only. DO NOT DISTRIBUTE." That wasn't good, and I replaced it with the one on my laptop and registered it. Neither that nor a lot of other ideas solved the problem. Of course, I could reinstall VB along with its two service packs, but VB didn't appear to be the problem. Projects that didn't use the Recordset property of the DAO Data control ran fine.

I contacted Microsoft via email and exchanged several messages over the next few days—all to no avail. Then I got the idea of exporting the problem VB project—which I had now refined down to a very simple one with only the Data Control and three lines of code—to my laptop. The project, of course, worked fine there within VB. But now I created an installation package for it and sent this package back to other computer, where I installed it as a stand alone program. Surprise, the packaged program ran fine, whereas it would not run from within the VB environment. I was hoping that this would correct what I still thought was a problem on the main computer with the DLLs the program used. But when I tried again to run the project from within VB I got the same error.

Finally it dawned on me that the problem was not with the DLLs the project used but rather with some DLL that VB needed to implement the Data Control. So VB did need to be installed, something that anyone but myself and the Microsoft tech. would probably have done in the first place.

A reinstallation of VB solved the problem. Well, I was finally made whole after my excursion in to the world of MP3s. ◆

Special Interest Groups

Microsoft Access SIG — For July, moved to July 10

This SIG meets the first Monday of the month at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6:30 PM.

For information contact either William LaMartin at *lamartin@tampabay.rr.com* or Merle Nicholson at *merlenic@tampabay.rr.com.*

Genealogy SIG

To be included on the TPCUG genealogy mailing list, contact Jenny Lind Olin at 960-5723 or jlolin@aol.com

Visual Basic for Applications SIG —No meeting in July

This SIG meets the third Tuesday of the month, at the Gateway 2000 Store on North Dale Mabry at 6:30 PM. For information, *contact Merle Nicholson at merlenic@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting at MOSI and is devoted to a general Windows and computing discussion. Mary Sheridan moderates the discussion.

NEW PROJECTOR FUND DRIVE IS AT $740 AND RISING

By Merle Nicholson, Member-At-Large

The TPCUG needs a video projector, desperately and as quickly as possible. Some very loyal club members (and a "friend of TPCUG") have contributed very nicely. RDI@TampaBay – known to us as Steven Singer – has donated $200 to the fund.

I feel very strongly that the future of our club depends on owning our own projector. We must attract good presenters to continue and to attract new members, and some of the very good ones depend on our having the facilities. But it's not just the projector that's critical, it's also the room where we hold the meetings. We hold three meetings a month; the regular meeting and two SIGs. A portable projector gives us far more flexibility to use different rooms and different locations.

The fund was announced at the meeting two months ago, and so far we have $740 in eight donations. I'd like to set a goal of ten donations at $100 each, and the remainder with $25 to $50 amounts. Remember that we're a 501C non-profit corporation. So what you'll get in return is a letter of thanks – in way of a receipt to show the Tax Man, and if you wish, recognition in the newsletter. The recognition is optional, of course.

I'm optimistic that we can do this. Anyone in the group who's participated in the search for a new meeting location will tell you; our options are very, very limited without a projector.

Think of all the time you have invested in the club. Hasn't it paid back to you in value exceeding $100? It certainly has for me. Give it some thought will you? Make a check made out to Tampa PC Users Group right away. You can contact me:
Email: merlenic@tampabay.rr.com
Tel daytimes: (813) 225-5227
Tel evenings & weekends (813) 879-3602
Or contact any officer. ◆

any programs and never got around to using them, please consider donating them to the group. Someone else may be delighted to get them and your donations are tax deductible. Jenny Olin can give you a receipt for filing your taxes.

The date for the FACUG Fall Conference has been confirmed. It is Saturday, October 14, 2000, and will be held at the Sunlight Community Church, Port St. Lucie, FL. You can get additional information at http://www.facug.org. If you'd like to attend, contact an officer of the TPCUG for details.

I did a phone interview with one of the technical writers for the St. Pete Times last week. Her name was Yilu Zhao, so be watching for the article to appear. The topic was User Groups in general.

I'm sorry my column is so short, but I'm leaving on vacation and haven't prepared anything for the trip.

Thanks to everyone for continuing to support the group. ◆

problems have been encountered.

It was determined also that our presenters had experienced crashes; however, the system did not normally abort and recovery was easy and did not require a re-boot of the PC. Therefore Linux is more crash proof than MS Windows because it handles itself more gracefully. One of our most conservative members, namely Merle Nicholson, claims that he has no problems with MS Windows, as he is very careful as to what applications he installs on his computer. This only requires patience and understanding and a good knowledge of compatibility. Norbert takes great pride in running a whole host of applications simultaneously under Linux.

Overall this was one of our best presentations of recent years. No doubt we thrive on controversy…….

Meeting Preview: At the August meeting we will have a presentation on the future of DSL and broadband by Ryan Harris from Atlantic.Net. Mary Sheridan, as usual, will conduct a 30-minute Windows discussion at the beginning of the meeting.

President's Message

By Mary Sheridan, President, Tampa PC Users Group
mcpease@mindspring.com

I'd like to start by thanking everyone who contributes articles to the newsletter. I hear nice things about Bits of Blue all the time, and it's because of everyone who pulls together to make it a great newsletter. William LaMartin works very hard as the editor. He needed more help last month than he had when it came time to assemble and mail the newsletters. If you can help with this, please contact William and find out when and where you need to go to volunteer.

The president of the Clearwater group is compiling a list of available presenters for the local user groups. We should hopefully be able to benefit from this. However, I thought member William LaMartin did a great job with his "hand held" presentation last month. Thanks, William!

The FACUG Fall Conference is October 14, 2000 at the Sunlight Community Church in Port St. Lucie, Florida. If you're interested in attending, just let me know and I'll be glad to tell you how to register.

Things seem to get a little slower and more sluggish in the summer, and the User Group is no exception. Fewer people attend the meetings, and it's more difficult to get presenters. The Board didn't meet last month because of vacations. So enjoy the summer and get ready for things to get livelier in the next month or so.

(President.....Continued on page 10)

September 13: To be announced. Check our web site later.

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

apcug Member of The Association of Personal Computer User Groups

Minutes of the July Meeting

By James Weber, Secretary, Tampa PC Users group
jlweber9@mindspring.com

Our meeting started at 6:00 PM with Mary Sheridan and me sharing Windows shortcuts with the group. We also had a brief discussion about video card problems.

The general meeting was called to order at 6:30 PM. It was announced that we have applied for tax-exempt status. As you well know, we are a non-profit organization, and being tax-exempt will greatly help us when making purchases for the use of the group.

William LaMartin presented us with a very well done PowerPoint presentation on the Palm Pilot and Visor Personal Digital Assistants. Both PDAs operate under the "Palm OS" and run the same core applications. Since we all couldn't really crowd around one little hand held device, William set up an emulator for the Palm and Visor on his laptop computer and used the projector to allow all of us the opportunity to see the different functions of the Palm at work in a real, not scripted, environment.

He demonstrated the core Palm applications along with an additional spreadsheet program, a map of New York City and even a program he had written for the Palm using a program called *PDA Toolbox*.

Finally, he mentioned how he makes up a grocery shopping list for his Visor by using the grocery list compiler at his web site and then pasting the ordered list into a memo on the Palm Desktop application and then hot-syncing with the Visor.

The door prize drawing drew $23.00. Jenny Lind Olin won a Web Cam and John Witmer won a copy of "Oil Change".

The meeting ended at 8:30pm. ◆

Sony DSC-S70 Cyber-shot Digital Camera

By Larry Anders, Librarian, Tampa PC Users Group
larryanders@msn.com

About four years ago, I jumped into the then not-too-old digital camera market with my first digital camera. It was Sony's first Mavica, the only camera that allows you to save your snapshots directly to a standard 3.5" floppy disk. I've used it regularly for over four years in my work and also in my personal life with absolutely no problems and outstanding battery life, never less than 2 hours (total time) on a full charge.

Back when I purchased my Mavica, 640 x 480 pixels was the upper end of the range on picture resolution and there was no other choice of photo size in that camera. Since that time the measurement is now in megapixels with a whole host of different choices for picture resolutions all in the same camera. Obviously there have been a lot of improvements in digital technology in four years but comparing my new Sony DSC-S70 with my older Mavica is a quantum leap forward in technology and quality.

I purchased my Mavica to use primarily in my work, taking pictures of the industrial equipment I appraise, for which it still does a good job. But when taking portraits, the Mavica leaves a lot to be desired.

In the past four years the quality output of color printers has also taken a major leap forward, the result of which is I have a couple of good printers available to me, so I thought it was about time I got serious about purchasing myself a "better-quality" digital camera. I've always been one to stick with a brand I like so when I started my research I was prejudiced towards purchasing another Sony, and I had really gotten used to being able to save my photos on a floppy. I looked at some of the newer Mavicas that still save to a floppy but obviously the larger 3.3 megapixel output with up to 2048 x 1536 image size that I was wanting would not fit on a floppy, or at least that's what I thought.

During my research I learned about the new "Memory Stick" that Cyber-shot uses to save the photos on. The memory stick is 2" x .75" x .125" thick or about one half the size of a pack of book matches. Although the Cyber-shot comes with a USB connector for accessing the files via a PC, the memory stick can also be removed from the camera and slid inside a "Memory Stick/Floppy Disk Adapter", which in turn can be inserted into a standard floppy drive. (Drivers are required to

be installed on the receiving PC to use the floppy adapter and the USB adapter – and it does not work with Windows 2000.)

Okay… enough history, here's a review of the specifics:

- Color depth is 24 bit or 16.7 million colors
- Resolution is 2,048 x 1,536 (high - 1.3 Mb file size), 1,600 x 1,200 (middle – 850 Kb), 1,280 x 960 (low – 525 Kb), 640 x 480 (extra-low – 60 Kb), 320 x 240 (video mode – 1.368 Mb for 60 seconds). I must say though, the quality of the picture of a 640 x 480 on this camera compared to the previous camera is excellent. Must be the lens.
- Image formats are JPEG (.jpg), TIFF (.tif), MPEG (.mpg) and TEXT (.gif). (The text is for taking photos of text for possible later scanning and OCR or just reading.)
- Image sensor is 1/1.8" CCD chip with 3,340,000 pixels.
- Removable memory is 8 Mb memory stick included (no internal memory).

  (16, 32 & 64 Mb memory sticks are also available.)
- Computer connections are USB, AC adapter, PAL/NTSC video adapter, & audio output.
- Focal length is equal to a 35 mm camera with a Carl Zeiss™ Vario-Sonnar 3X optical Zoom lens (34 to 102 mm) & 6X precision digital zoom.
- Power supply is a lithium-ion rechargeable battery with an AC adapter with 2.5 hours battery life.
- Focusing is automatic (4 cm to infinity) or manual.

CD-RW Problems

By Bob LaFave, Tampa PC Users Group
boblala@ij.net

Part I Last September I bought a CD burner because my son Chris was interested in making music CD's and because I wanted to have the use of one for copying larger files without having to use a zip utility and spanning multiple floppy disks. I was able to find an Imation on sale at BestBuy and installed it into the computer that Chris and his brother Joshua use, a homemade (Merle Nicholson brand) running an AMD233-MMX. It installed easily, and we encountered the first problem. I had installed it on the IDE cable that contained a 40X CD, and when we tried to copy from one CD to the other CD we encountered buffer error messages. Calling the local TECH SUPPORT (Merle), it was suggested that we needed to have each CD an a separate IDE controller, and after some rearranging of both CD's and both hard drives we were up and running. Everything appeared to be working, and we both learned how to use the Adaptec software that was included with the CD writer. Between the kids and myself we made use of it 1 or 2 times a day for different projects and had become very happy with its performance.

Then a couple of months ago Chris started complaining that it wasn't working right, and that he was getting BLUE SCREENS which were preventing him from making a CD. I would use it daily to copy downloaded files that I could use on my computer and also take to other locations. Without the use of a cable modem this allowed me to only download once at night when less traffic was on the net. Very seldom did I copy a CD, but I was continually adding files to re-writable CD's. I had not encountered any BLUE SCREEN copying single files and asked Chris if he could create a BLUE SCREEN for me.

The BLUE SCREEN message offered no clues on which file had a problem so I couldn't look at a specific problem file, but I had had a similar experience in the past that suggested maybe an overheating problem with the AMD processor. I had encountered countless similar problems when the computer was built. I removed the AMD chip and replaced it with a Cyrix chip that ran great and found out later that the AMD needed a special heat sink and fan for cooling, I replaced them with AMD approved equipment and solved those early BLUE SCREEN problems.

I opened the computer case to see if maybe the fan wasn't working or was off-center and saw what was a possible problem: one of the IDE cables was directly over the fan, cutting down the air flow. I than called Imation to find out if there was anything else I could try to get it working again, and they suggested that I update the firmware. So I obtained a longer IDE cable and downloaded the suggested version of firmware. Since I had the case open to replace the cable I decided that I would add some grease to the heat sink to further help with the cooling, and I routed all cables away from the chip. I then went to replace the firmware as suggested and proceeded to kill the CD completely. The access light stayed on at all times, the ejection buttons did not work and the CD properties appeared as the firmware update. Imation was called and more help was requested. They apologized and stated that sometimes the firmware updates didn't work, but they would e-mail me the original firmware version to return it to the beginning condition. That also didn't work, and the CD remained locked. When I called Imation and *offered* to return it to them, they agreed and issued the RMA authorization. That night when I walked in to dismantle the case and remove the CD, I noticed the CD access light was off and pushed the eject button. It was working, so I went to the CD properties to see what it showed and saw that the original version was there. I was impressed to say the least. I grabbed a blank CD and proceed to make an audio CD. It worked correctly, and I told Chris that his machine was back in working order. I called Imation and offered to keep the CD and give it a week of use before taking them up on their return and exchange for a new CD-RW. It performed with no problems for a month and all was well until……

Part II Chris wanted to replace the the 4x4x20 CD-RW drive with a faster CD-RW, and we started watching the ads to see if we could find an affordable 8x speed for him. BestBuy had an ACER 8x4x32 on sale so here we go again. I removed the Imation and replaced it with the ACER and have experienced no problems (other than he now wants a faster CD-ROM installed to keep up with the new CD-RW—he wants a 50X instead of the 40X) up to the time I am writing this. But what to do with the Imation CD-RW?

My computer has an empty bay, and we can't have that now can we. The CD-RW installed quite easily in my case, and the Adaptec software as well. The CD-RW properties showed correctly, so I proceeded to try to create a CD as a test. A BLUE SCREEN appeared the minute the computer tried to read the blank CD, but this time I got files included in the BLUE SCREEN and started to look for help. Both files were vxd (device drivers), so I began to experiment with them. I called Imation and explained that I was moving the CD-RW to another machine and was having problems again. I declined the first suggestion to upgrade the firmware because of the last experience with that update.

We started by renaming the vxd's to see what would happen. We were able to get the CD-RW to work sometimes but even-

(CD.....Continued on page 6)

(Sony……..Continued from page 3)

- Exposure control is program AE, aperture priority & shutter priority.
- Aperture is F2.0 to F8.
- View finder is a 2" TFT LCD monitor with diopter adjustment and LED status indicators, High Quality 16 frame/sec 1/4 VGA mode with full screen play-back. And there is also a standard optical viewfinder.
- The built in flash is flash on, flash off, auto flash, and red-eye reduction. There is also a connection for an external flash too.
- Also included is a self-timer and pictures can be de-leted singularly or all at once.

The Cyber-shot DS-S70 has a built-in microphone on top and a speaker on the side. It comes with an 8 Mb memory stick that's really too small for taking many pictures. I purchased an extra 32 Mb card for $79 when I bought the camera and have had plenty of room to take all sorts of different sized still and motion images. The camera is very light and has a feel similar to a standard 35 mm camera. The onscreen user interface was a little confusing at first, so I broke down and read the man-ual. After that it was a piece of cake. The last picture taken can be easily viewed with one click, and if the picture is not what you wanted, with a couple of more quick clicks, it can be easily be erased or the file can be protected against erasing.

Napster Server Unavailable Due to Heavy Usage

Napster (http://www.napster.com) was much in the news this past week with one judge telling them to basically shut down, then a judicial panel allowing them to continue operating. I decided to visit their site to see what was posted on all the judicial maneuvering and received the browser message above. Apparently the traffic was very heavy at their site on 7/29/2000.

A SCSI Experience

By Wade Herman, Tampa PC Users Group
wherman1@tampabay.rr.com

Some time ago I purchased an Adaptec AHA-8945 combination SCSI (Small Computer System Interface) and Firewire (IEEE-1394) card. For those not familiar with Firewire, it is a Very High Speed serial port allowing multiple devices to be chained together. Currently it is used mainly for Digital Video, but increasingly other devices such as CD-ROM burners are being made for this interface because the data transfer rates are much faster than either SCSI or USB (Universal Serial Bus) connections.

The external SCSI connector on this card is a special Extremely High Density (Lots of connections in a very small space) 68 pin connector which is not available at local computer stores. Also it is a SCSI-2 bus, and to connect my external scanners I need a plain 50 Pin SCSI bus connection. To use these devices you not only have to have a conversion to the proper connector but also the now unused terminals must be terminated. When you ask the local computer emporium about this you get a blank stare. I have been using a separate SCSI card for my scanners but now find that I need to free up that slot for another card. So I decided the only way to solve my problem was to contact Adaptec. The same card is also used to connect an internal high speed Seagate SCSI-2 HD (Hard Drive) and a SCSI Yamaha CD-ROM burner. Hello, Napster. The HD has never seemed to have the speed it should, so I would inquire if I was correctly connecting things.

I searched the Adaptec web site for what I thought I needed. I find their web site a bit confusing. Still unsure, I decided to call them. You cannot reach tech support either by phone or the net without some sort of special password . So the only alternative is to call and "Speak with a Friendly and Knowledgeable Adaptec Sales Associate……". So I called and the computer talked to me while I pressed buttons. Finally I was connected to a voice who assured me he was a real live human being (always check that), and he was very Friendly. One Down. I proceeded to explain about my need to connect my external scanners. After some initial confusion about the connector on the card and being told no can do, he found that they had a new cable that would do the job for only $60. **OUCH.**

Now for the internal devices. They have a cable, adapter and terminator that would allow me to do what I wanted, sort of. Then he asked why would I want to do dat? Now for the meat of this whole diatribe! If I did what I wanted, he assured me, I would severely compromise the performance of the HD as the data transfer would be limited to the speed of the slowest device, the CD-ROM. That was not my understanding of SCSI so I double checked and was assured he had given me the correct poop. Now who am I to question a "Knowledgeable Adaptec Sales Associate….". Should I decide to purchase all the aforementioned stuff anyway, what would be the damage? $175. **OOOOOUCH**. Nonetheless I decided to place the order as I would eventually need most items. Next I spent several hours searching for confirmation of what I had been told to no avail. Finally, I returned to the Adaptec site, found a searchable knowledge base containing an article dealing with the exact performance question, and Guess What? It said what I had been told is a "Common Misconception" (abortion), and each device would operate at its maximum data rate. So what I got was poop. I will have the proof of the pudding next week.

The moral of this story is Trust but Verify. ◆

(CD……..Continued from page 4)
tually we would get a BLUE SCREEN referencing the same two files , CD_Read.vxd and CDVSD.vxd, even after they were renamed. I could get the CD-RW to work making data CD's or Audio CD's depending on which file was renamed, but I wasn't going to rename files each time I wanted to make a CD. These files where located in WINDOWS\SYSTEM \IOSUBSYS and CD_Reader.vxd was also located in an additional folder called Recordit for a program from IOMEGA. The tech person suggested that maybe the IOMEGA Zip that was on the same IDE cable might be causing the problem. He suggested that we uninstall Recordit and also remove the ZIP drive from the cable. The problem remained.

I also had noticed, each time a BLUE SCREEN froze the computer, upon the restart an error message from AdaptecDirectCD stated that the CD properties had either the "Disconnect" or the "AutoInsert" settings unchecked and that they needed to be returned to the correct settings and the computer restarted. According to the tech, Imation had reports that on some computers the "AutoInsert" needs to be turned off but never that the "Disconnect" needed to or could be turned off.

We then decided to try turn them both off to see what would happen, but first we needed to stop the error message from AdaptecDirectCD each time that the machine started. We uninstalled the Adaptec program then went and turned off both the "AutoInsert" and "Disconnect", returned the two vxd's to their original names and rebooted the machine.

I have made one each Data and Audio CD's successfully as of this writing with no apparent problems and definitely no

Norton Antivirus 2000

By Clark J. Evans, Tampa PC Users Group
CETrain320@aol.com

We had McAfee Virus Scan in our Compaq Presario 7222 computer for the last three years. It worked great, but the time came to get a newer antiviral program. Virus Scan only did five checks.

I saw new anti-virus software on sale at Best Buy for $9.95 last month. It was Dr. Solomon's Anti-Virus. I figured that $9.95 was a good deal, so I bought the Dr. Solomon software and installed it in our computer. The Dr. Solomon software made our computer run slow and would cause the computer to lock up. I uninstalled Dr. Solomon and the computer ran great. I again installed the Dr. Solomon software a week later hoping my $9.95 was not spent in vain. Again it ran slow and locked up our computer. Again I took it out, and the computer ran great again. I had to install new Anti-Virus software in the computer as my wife works at USF and the Love Bug Virus had hit her and really messed up her computer at work.

A week later I was going through Best Buy and saw the Norton Anti-Virus 2000 program for $19.99. I was totally impressed with Norton's Uninstalled Program, which I purchased a few years ago. So, I bought Norton's Anti-Virus program, and took it home and installed it on our computer. It ran all kinds of tests and said I had no viruses in my computer. The Dr. Solomon Anti-Virus had said there were possibly two viruses in my computer.

I see by the information I got from Dr. Solomon that they have a link with Macao because their advertisements are all over Dr. Solomon's paperwork in the box that Dr. Solomon's came in.

So, I would say save the trouble. Don't buy the Dr. Solomon Anti-Virus software. Spend the extra $10.00 and go with a winner—Norton. ◆

Member Frank Harrell passed away March 19, 2000. Interment was at Florida National Cemetery in Brooksville, Florida.

Frank and his wife Mary had not attended meetings for some time due to his illness.

Internet Shopping

By Mary Sheridan, President, Tampa PC Users Group
mcpease@mindspring.com

Well, it's official; I love shopping on the Internet. I started off slowly a couple of years ago. I was scared to use my credit card and expected to have horror stories about the experience. I've been very lucky, and except for one bad time it's all been wonderful.

I guess I'll start with the bad time to get it out of the way. I bought a Visioneer scanner at buy.com and couldn't get it to work. I returned it, and buy.com sent me another one. I had the same problems, so I assumed it was my computer. I updated the bios and the drivers and called tech support to the tune of $1.00 a minute. Time passed, and I'd had the unit over 90 days, so I returned it this time to Visioneer. I didn't pay to send it registered mail so naturally it was lost. The address I mailed it to doesn't seem to be a valid address, and I'm out $130.00 for the scanner plus the cost of trying to get it to work because I just don't have the time to pursue the problem any more.

Now for the good news, everything else has been positive. I did all my Christmas shopping last year online. The presents were delivered to my door, I wrapped them and stuck on bows and never had to leave the saftey of my home. I could have had them gift wrapped, but didn't want to pay extra for it. And I saved money on every single item.

I've saved on books, software, hardware, clothes, shoes, etc. I got hotel suite rooms at Priceline.com for $70.00 instead of the regular price of $249.00. I've flown several times for small amounts of money. I've paid less for the items that I've gone to a bricks and mortar store to buy because of researching things on the Internet first. I'm buying some groceries now through Priceline.com, and every day something new and interesting is added to my list of ways to use the Internet to shop.

If you've had any experiences that other members could benefit from, either good or bad, please write them down and send them to William LaMartin to be included in the newsletter. Happy Shopping!

My favorite sites: buy.com, barnesandnoble.com, necx.com, amazon.com (be sure to link from tpcug.org to this site), priceline.com, lowestfare.com, and of course, mercedes.com. ◆

Napster Redux: Round II Comin' At Ya

By Tim Condon, Tampa PC Users Group
tim@free-market.net

So here we have it: A federal judge entered an injunction to shut down the Napster music-sharing server and shut out its more than 20 million users. On July 26, 2000 Judge Marilyn Patel shocked just about everyone, including the lawyers for the Recording Industry Association of America (RIAA), by abruptly entering a verbal order for Napster to shut down its server by midnight on Friday, July 28th (Pacific Standard Time). Then, within 48 hours of that ruling, the next judicial level up, the 9th Circuit Court of Appeals, heard an entreaty from the Napster lawyers…and countermanded the lower court's injunction. So Napster remains online and serving its millions of customers...for the time being, at least.

"Pirates" is how the RIAA characterizes both Napster and the music-copying and music-trading fans of the software. While the RIAA argued that the entire Napster operation was a front for wholesale copyright infringement and piracy, the Napster lawyers argued that people have an inherent right to copy and share music downloaded on the Internet as long as no money is changing hands. Round I for the RIAA. Round one-and-a-half for Napster. Where to now? Good question!

The Napster phenomenon has become a cause celebre for both sides of the struggle. Probably because the issues presented involve digitized information that can be utilized for writings as well as pictures, recordings, software and any other kind of information. The battle has been joined on the frontlines of most media outlets, including newspapers, magazines, online forums, online magazines, television reports, etc. And now the stars of the music industry have begun to weigh in, complementing the split ranks (about 85% to 15%) of the music industry "suits". So let's take a look at who's who among those manning each side of the Napster/Anti-Napster barricades:

1. On the Anti- side is a growing list of musicians who feel their work is being "ripped off" by consumers utilizing the Napster software and web site…consumers who they believe would otherwise be buying their pricey music CD's. A short review of current articles on the question shows that these include Aimee Mann, Kristin Hersh (a founding member of The Throwing Muses), Scott Sapp (lead singer of Creed), Chris Robinson (lead singer of the Black Crowes), Sean "Puffy" Combs (aka "Puff Daddy"), Jonatha Brook, Morgan Rose of the hard rock band Sevendust, Mandy Barnett, former Blondie star Debbie Harry, and last but not least, recording star Bif Naked.

2. But wait! Coming up fast on the outside is a list of music writers and performers who, if they're not as numerous as the Anti's, make up for it with their star-power. Included on this side is a list of people who argue that the "music industry" as it is constituted today is based upon the wholesale exploitation and abuse of artists, and that the destruction of this distribution and marketing semi-monopoly can do nothing other than benefit both artists and their fans. Examples? Courtney Love, lead singer of the band "Hole," who has indicted the music industry as little more than an organized system of stealing from artists (her recent inflammatory speech before a Chicago convention can be found at http://www.salon.com/tech/feature/2000/06/14/love/); rapper Chuck D (who says "I believe in the technology…it's a fantastic way to build a minor league system of artists"); Grateful Dead songwriter and philosopher John Perry Barlow (who maintains that the music industry is inherently corrupt, greedy, abusive and grasping); the band Limp Bizkit; Marianne Faithfull; and non-star musician Christian Viveros, who simply says "The recording industry is a Mafia."

3. In addition, there are renegade music industry professionals who are bolting from the anti-Napster line and saying that the music-sharing revolution can birth an entirely new (and profitable) way of doing business. Included are Alan Kovac, president of a management company that represents the bands Motley Crue, the Bee Gees, and others. Ditto for Jim Guerinot, a manager for the bands Offspring and No Doubt, who thinks that the music industry and Napster can work together to birth a new way of serving both artists and fans.

What's going to happen? Well, first of all Napster is probably going to lose the lawsuit that the RIAA has brought against it (although the case could well end up going all the way to the U.S. Supreme Court). Most copyright lawyers and other professionals seem to agree that Napster and the services it offers are clear examples of copyright violation as the law exists today.

Secondly, it looks like "the genie is out of the bottle" when it comes to digital copying and trading of music (not to mention pictures, movies, software, books, and all other forms of information transfer). Even as the Judge Patel was ordering Napster to shut down, alternate methods of doing the same thing were being revved up on the Internet in different parts of the world. All of these alternatives do essentially the same thing as Napster, allowing the wholesale free copying and sharing of music files. They include Gnutella (a decentralized software system for sharing music files); AudioGnome (which relies on about 70 servers in half a dozen countries running a

(Napster……..Continued on page 9)

(Napster……..Continued from page 8)
free program called OpenNap); Freenet (which makes every participating computer in essence a file-sharing server and is believed to be "invulnerable to any attack" by the authorities because of its decentralized nature and the use of encryption); Napigator and the "Open Napster" movement (which consists of more than 100 Napster servers running Napster-clone software located in a number of countries); and even MP3Board, Inc., which is being sued by the RIAA for being a company which points to locations on the Internet where bootleg music recordings may be found.

Stay tuned. The recording industry is fighting for its right to force music buyers to buy CD's for $17 or $18 which cost about 35 cents to manufacture (and which have multiple songs on them that no one wants to hear instead of just the song hits which people do want to buy). Essentially, the music/recording industry is fighting any effort to use the Internet to cut them out of the distribution function which up until now they have dominated. In the long run, however, look for the death of the "music industry" and the birth of a new industry which could be called "the artists and fans industry." ◆

Editor's Comments

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

First, I thank all those members who sent me articles for the newsletter after my email request for material. It was good to see that I wasn't doing this all alone.

I also want to thank John Witmer for bringing his company's computer projector to our meetings. It really helps in that it is so superior to the older MOSI one we had been using.

RoadRunner On a recent trip to New York City, my RoadRunner connection with my laptop at an apartment in Manhattan was 1236.4 kbps. This is essentially a T-1 line. Right now in Tampa it is 401.2 kbps, which is a bit faster than usual for my home. We need to ask RR in Tampa why we are connecting at 1/3 the speed of New York City. Could it be that there are some Time/Warner executives living near where I connected in Manhattan? I determined the speeds using the site http://computingcentral.msn.com/topics/bandwidth/speedtest500.asp.

TPCUG.ORG Our domain name TPCUG.ORG as been renewed with Network Solutions for another year. Speaking of the web site, in June we had an average of 162 user sessions each day with the average visitor staying at the site for 10 minutes and 17 seconds. Most of the visitors come to the site due to a search engine sending them there. AltaVista was the top referring engine to our site.

E-stamp I wrote sometime back about using e-stamp for postage. The program is a bit slow—at least on my computer. I think the reason is that for each mailing it needs to communicate with the "vault", the device that attaches to your parallel port and stores all your postage data—and this is not a very fast procedure. Additionally, I have not had good results printing postage on envelopes from Microsoft Word, so I now stick to printing from the e-stamp program. With some help from their support, I installed Windows Messaging, and this gave me an address book that the program would work with. On my last use, the program went to the e-stamp web site and downloaded an upgrade, so perhaps things will go a little smoother now. The software is now on version 1.1 SP2. I believe I started with just version 1.1. As I use it more, things seem to go more smoothly, and the other day I printed out two Priority Mail labels with postage and address for $3.20 each. That was convenient—printing Priority Mail postage and not having to visit the post office. It is the future, I am sure, but there are still a few kinks to work out.◆

(CD……..Continued from page 6)
BLUE SCREENS. Imation says that the "Disconnect" setting should be enabled in order for the CD-RW to work correctly, but the tech and I agree that if it works not to change it. I had told them that the IDE controllers and chipset were capable of UDMA66 the first time that I called after installing in the second machine, and they now "THINK" that may be the reason for the problems. Imation also offered that this model was not designed for Windows98 or for the UDMA66 speed.

I have learned a few more things about computers with this experience, which is always good, but the one I will remember is that, eight months after I purchased an Imation CD-RW I was able to get a support person on the phone each time I called within two minutes and they were more than helpful. I will look for their products in any future purchase simply because of this terrific support. ◆

Special Interest Groups

Microsoft Access SIG

This SIG meets the first Monday of the month at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6:30 PM.

For information contact either William LaMartin at *lamartin@tampabay.rr.com* or Merle Nicholson at *merlenic@tampabay.rr.com.*

Genealogy SIG

To be included on the TPCUG genealogy mailing list, contact Jenny Lind Olin at 960-5723 or jlolin@aol.com

Visual Basic for Applications SIG

This SIG meets the third Tuesday of the month, at the Gateway 2000 Store on North Dale Mabry at 6:30 PM. For information, *contact Merle Nicholson at merlenic@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting at MOSI and is devoted to a general Windows and computing discussion. Mary Sheridan moderates the discussion.

NEW PROJECTOR FUND DRIVE

By Merle Nicholson, Member-At-Large

The TPCUG needs a video projector, desperately and as quickly as possible. At present we are still at $740—the same as last month.

I'd like to set a goal of ten donations at $100 each, and the remainder with $25 to $50 amounts. Remember that we're a 501-3C non-profit corporation. So what you'll get in return is a letter of thanks – by way of a receipt to show the Tax Man, and if you wish, recognition in the newsletter. The recognition is optional, of course.

I'm optimistic that we can do this. Anyone in the group who's participated in the search for a new meeting location will tell you: Our options are very, very limited without a projector.

Think of all the time you have invested in the club. Hasn't it paid back to you in value exceeding $100? It certainly has for me. Give it some thought, will you? Make a check made out to Tampa PC Users Group right away. You can contact me:

Email: merlenic@tampabay.rr.com
Tel day: (813) 225-5227; evening & weekends: (813) 879-3602
Or contact any officer. ◆

(President……..Continued from page 1)

The theme for COMDEX/Fall is Technology Decisions for the New E-conomy. The dates are November 13-17, 2000 in Las Vegas, Nevada. If you have plans to go, check out the APCUG web site for discounted rooms and information on the conference that the APCUG holds at the same time as COMDEX.

If you have an opinion as to whether or not there should be snacks at the regular meetings, please email me at mcpease@mindspring.com. There hasn't been much money in the snack donation basket, and I don't know if it's a good thing or a waste of time. I'd also like to know how important the quality or quantity of the 'raffle prizes' are. Thanks in advance for your input.

I'd like to express my sympathy to the Harrell family. Frank was a gentle, sweet man, and he will be missed.

The next meeting of the Board will be on August 3, 2000 at BAE (unless that location becomes unavailable). Everyone is invited to attend. Just let a Board member know in advance that you plan to be there, so your name can be included on the list for security reasons.

Thanks to everyone for making it fun to be part of the group. ◆

(Sony…….Continued from page 5)

The camera is fairly new and street price is still in the $800 range. On the Internet I found it for under $700 but it was back-ordered. The floppy adapter is a little under $100. I am very impressed with the overall ease of use and the excellent quality of the pictures rivals any 35 mm pictures I've had printed. I'm especially pleased with the movie with sound capability and the ability to connect it directly to my television and have an instant slide show. I'd recommend this camera to anyone. **Bravo Sony!** ◆

Meeting Preview: At the September meeting we will have a presentation by John Locke and Michelle Nelson from the local Gateway 2000 store. Mary Sheridan, as usual, will conduct a 30-minute Windows discussion at the beginning of the meeting.

President's Message

By Mary Sheridan, President, Tampa PC Users Group
mcpease@mindspring.com

These are the "Dog Days" of summer. I hope you're all keeping as cool as possible and planning on going to the next TPCUG meeting. We'll have the new projector and a Gateway presentation. I plan on having snacks again, so I hope to see you there.

On September 27th and 28th, a "Computer Technology Showcase" will be held at the Tampa Convention Center from 10:00 AM until 4:00 PM both days. Tampa Bay Computer Society will have a booth at the event. They've invited representatives from all the local groups to come and join them at their booth. I'll be attending on September 27th. I plan to hand out our tri-folds and try to get new members. Anyone who is interested can go to http://www.tampa-bay.net or http://www.techshows.com for further information.

Window Me (Millennium) will be available in retail stores on September 14th. I hear that you can already be using the product if you've bought a new computer or new hard drive recently. I've ordered a copy for $49.95 through http://www.buy.com. Microsoft is selling it for $59.95 plus tax.

The FACUG Fall Conference is October 14, 2000 at the Sunlight Commu-

Bits of Blue is published by the Tampa PC Users Group, Inc., a State of Florida registered non-profit corporation, to provide educational information about personal computer systems to its members. Our mailing address is P. O. Box 3492, Tampa, FL 33601-3492.

However, for business concerning this newsletter, Bits of Blue, please contact the Editor, William LaMartin, at 821 S. Boulevard, Tampa, FL 33606-2904; 813-251-3817; lamartin@tampabay.rr.com.

Technical information found in this publication is not necessarily compatible with your hardware and software; plus other errors or misprints could occur from time to time. Therefore, the use of programs, commands, functions or anything of a technical nature appearing in this publication will be at your own risk.

Contributors are asked to submit articles as an ASCII, Microsoft Write, Microsoft Word, or Word Perfect file to the editor at 821 South Blvd., Tampa, Florida 33606-2904 or to lamartin@tampabay.rr.com.

Permission to reproduce portions which are not specifically copyrighted is given to other computer users groups for nonprofit use. Reprints must be unaltered; proper credit given to the author and publication; and a copy of the publication must be sent to the attention of the Bits of Blue Editor at the club address. All other reproduction is prohibited without the specific written permission of the original author.

The use of trademarked and copyrighted names herein is not intended to infringe upon the owner's rights but rather to identify the products for the enlightenment of our users.

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

Minutes of the August Meeting

By James Weber, Secretary, Tampa PC Users group
jlweber9@mindspring.com

The Windows SIG started at 6:00. Our President was not in attendance at this meeting, so we had Steve Singer give us brief presentation on Windows Millennium (Me). Me will be the new Win 95/98 upgrade, and it is due for retail sale on September 14. Along with fixes and updates, Me contains Internet Explorer 5.5, a new Media Player and network wizard, and built in movie capture and editing

Mike Hodges started the general meeting at 6:30. We now have a new projector, which was presented to the group at this meeting. Special thanks to William LaMartin for his initiative in this matter. Our presentation was from Ryan Harris of Atlantic.net. His company provides both analog and DSL Internet service. Mr. Harris discussed the differences and advantages of DSL service over cable modem. Cable modems offer a theoretical speed of 30 megabytes per second compared to DSL's 1.5 mps. However, real world use shows cable in the consumer market is only running between 300 kbs and 1.6 mps. Cable is also a shared bandwidth network, the more users on at one time, the slower the individual connection. DSL does not share this problem. DSL also has the added advantage of using existing phone lines to provide point of service to the customer.

A good reason to start looking into broadband will be the growth of Application Service Providers. Several companies, including Microsoft, have announced plans to make their applications and programs available only over the internet on a pay per use schedule. Priceline.com is an example of an Application Service Provider. Mr. Harris ended his presentation at 7:40.

Our monthly drawing was held after the presentation. Mike Hodges was the big winner with a month free internet access from Atlantic.net and three T-shirts (don't be surprised to get one for Christmas). Roger Waters, Brian Lance, Denise Adams, Mike Brazas, and Jim Purcell were all also winners.

The meeting ended at 8:00. ◆

nity Church in Port St. Lucie, Florida. If you're interested in attending, just let me know, and I'll be glad to tell you how to register.

(President……..Continued on page 12)

Windows Millennium & a "New" Computer

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

Some Background By now, most members probably know about the projector our group recently purchased. Certainly those attending our August general meeting or the most recent VBA SIG do, since the projector was used at those meetings. I will leave it to Merle Nicholson, the member responsible for starting the projector fund and who had the faith that we could indeed raise the money to make such a purchase, to give the details of the purchase somewhere else in this newsletter. What I want to talk about is what I bought for myself at the same going-out-of-business sale where the projector was purchased.

At the August meeting an announcement was made regarding this sale, and a number of members of the group made purchases, myself included, with which, I think, all are quite happy. We owe member Tom Cone thanks for alerting us to the sale.

I bought a Compaq computer that had Win 95 OSR2 on it. It also had a small 3.2 GB hard drive, so the first thing I did was to buy a 20 GB drive and install Windows Millennium on it. You might ask how I have Windows Millennium now when it is not due until the middle of September. Actually I have an OEM version, intended for installation on new computers, which I purchased from Steve Singer at RDI. You can get an OEM version from a dealer if you buy a new motherboard or hard drive, as I did. I purchased a 20 GB Seagate drive and Windows Me. The final price of the Compaq 333 Pentium II computer with 128 KB of RAM, and now with a 20 GB hard drive, 24 Speed CD, external 56K modem, sound card, speakers and network card was around $1,000, plus tax plus the price of Windows Me (I would have had to eventually buy the Windows Me anyway, so I won't include that in the price).

Oh, you say, I overpaid . Not really, since I failed to mention that the system also included a ViewSonic ViewPanel VP 150 15" flat screen monitor—a $1,000 monitor for $500.

Actually I bought the monitor and then added the computer as an afterthought. I love that type of monitor. The Gateway Pentium III we got in December had one, but that computer is used mainly by my daughter, and I was still stuck with a regular 17" monitor (which used to be state of the art for me). The flat screen monitor takes up almost no space and displays a 15" diagonal image—almost the same size displayed by the much larger 17" regular monitor. Not to be outdone on the monitor front, Wade Herman got one also, and my son said he would reimburse me if I got one for him too, which I did and he did.

Installing the Drive I wasted a lot of time trying to figure out how to get what's known as the Compaq diagnostic partition on the new drive. It is something unique to Compaq--a hidden partition with diagnostic software. I could get software at their web site that would install the partition. It was probably there, and I just couldn't find it. I then decided to see if the partition was on the drive that came with the computer. So I installed Partition Magic (to be able to see hidden partitions)--and it wasn't there. Perhaps on newer Compaq computers they quit using this partition. Anyway you can download the same diagnostic software that you install as you would any other Windows program.

Windows Millennium Once I decided to not worry about the Compaq diagnostic partition, I simply installed the drive in the computer, put the Windows Me CD in the CD ROM, made sure in the BIOS that the computer would boot from the CD drive, turned off the computer, switched the cable and power to the new drive and booted up. It took 10 to 12 minutes for the setup to format the 20 GB drive, and the setup took just 14 minutes to install everything. It then restarted the computer and began to set up the hardware and Plug and Play devices and do various other setup things. This took about 15 minutes. This computer has a video card, sound card, network card, and external modem.

After a total of 41 minutes (12 +14 + 15), Windows Me was running for first time. I got a Windows logon instead of a Network logon, so there was a bit of network stuff yet to do. And

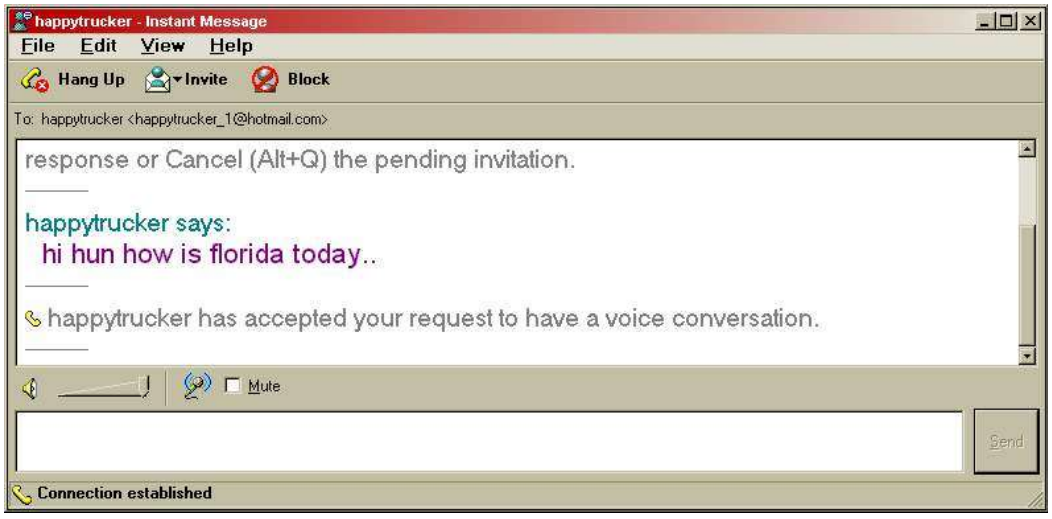
(Millennium……Continued on page 5)

MS Messenger

By Bob LaFave, Tampa PC Users Group
boblala@ij.net

When the instant chat programs ICQ and AOL Messenger first came out, I looked at the literature describing what they did and thought that they were useful little gadgets but decided against using them on my personal computer because of a fear of incompatibility with the Microsoft Windows and Internet Explorer. I installed AOL Messenger on my sons' computer when they "just had to have it", and it appeared to work correctly and caused no problems that I could see on the computer. I looked at the help files and looked at the program itself and still just didn't feel it was worth the possible problems of installing it on my computer.

I also didn't like some of the control functions the program incorporated. Then along came MS Messenger, and it was offered as part of the automatic Windows 98 Update process. I went to the information files that described what the program was and decided to give it a try since my largest concern of compatibility was now incorporated into Windows 98 and should cause no extra problems to solve.



I installed the first version offered and have kept up with the updates that are now at version 3. The only requirement for this service is an Hotmail account or a Passport account. You get instant notification while using Messenger of any e-mail received into this Hotmail account. Your "Buddies" are completely controlled by you so that you don't get any unwanted traffic. I have it set to " Run the program" when I am online and use it almost each time I am online to say a quick "Hi" to friends that I have met online and friends that I have locally. This is also the best way to reach me while I surf since I have a phone modem and one line only. The newer version of MS Messenger is much more than the simple "CHAT" it started out as with typed messages and has progressed to actual voice communications and more. MS Messenger now allows voice communication instead of the chat, after you use an "Auto Tuning Wizard" to set up your sound card and microphone, to talk to your friends. This is considered a "Call" from PC to PC. It takes a few calls to get used to listening through your speakers and talking into a microphone; you can purchase headsets that make it a little easier, and it does sound different from a phone, but you can communicate easily. I play cards on the web with friends in Toronto, Canada and we are able to talk to each other after the games and chitchat with ease. You can also start NetMeeting as easily as voice chat, and the one time I used it was foolproof. The choice of NetMeeting was one of the options in the drop down menu and it was a point and click to make the connection from another easy connection wizard.

The last chat feature that is now available is a "Call" from PC to Phone and Microsoft has incorporated net2phone with Messenger to accomplish this. I have not done this yet but you need to set up an account with net2phone, which takes just a few minutes because there is a charge for this PC to Phone service. I have registered and it was stated at that time that there could be a charge of one cent per minute for this service. Compared to the other long distance phone companies, that seems very fair.

And the last feature that is in version 3 is file transfers from you to any of your buddies. Again this is a point and click process and I was able to transfer a file the first time I tried. This goes directly to the other party and does not have to sit in an e-mail box.

REQUIREMENTS ARE: Free long distance applies to calls initiated on a PC. Calls placed using Messenger Service 3.0 are free PC to PC or free to the 50 United States, District of Columbia, and Canada when made PC to telephone or mobile. Connect-time charges, cell phone, and mobile charges may apply. Certain country restrictions also apply; void where prohibited by law. Requires a Passport or Hotmail account, multimedia PC, 28.8 Kbps modem, sound card, speakers, microphone, and Internet access.

To download this program please go to http://messenger.msn.com and to find out more about the features go to http://messenger.msn.com/support/features.asp .◆

(Millennium……Continued from page 3)

after 3 more minutes it finished. I noted that it didn't pick up my video card and I only had 640 x 480 resolution at the moment, but it did get the ViewSonic monitor. And after setting up a network TCP/IP address for the computer and a reboot, I got a message that I needed to accept some agreement for my Alps printer (which is attached to another computer on the network)--so I now had networking. After doing that and another reboot, I got the Network logon.

It still didn't have the correct driver for the video card, so I needed to install that, which I had already downloaded from ATI. Since that file is over 7 MB, it is lucky that I am on a network to the Gateway where the driver was.

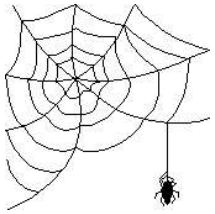
The video driver installed perfectly. I then installed a USB network adapter in addition to the network card already installed so that I can connect to Road Runner when I want using the USB adapter.

What's New There is no Windows Explorer anymore under Start | Programs. Ah, but I did find it in Accessories. And when you click on My Computer on the desktop, you see your local drives but not the network. To see the Network, you need to click on the My Network Places link on the left portion of the window or on the MyNetwork Places icon on the desktop--what used to be called Network Neighborhood.

And—this is a big one—there doesn't appear to be a DOS prompt. There is no option on Shutdown to restart in DOS mode. There is also no entry on the Start menu for a DOS

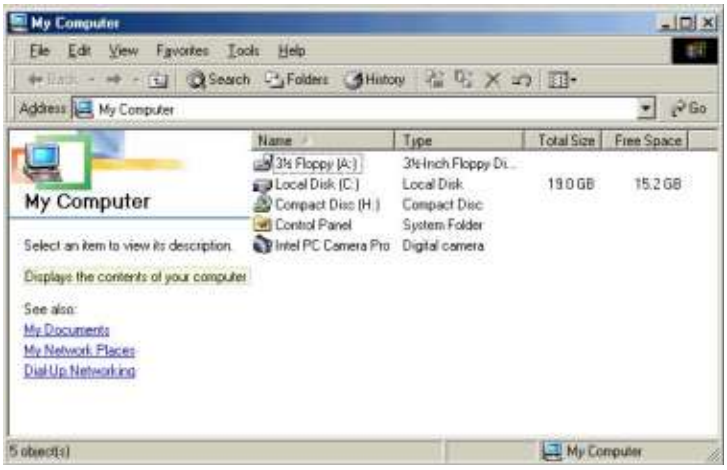
(Millennium……Continued on page 6)

Internet picture of the month



The 16 inch piece of metal that most likely caused the Concorde crash

The photo is from http://www.concordesst.com. This is a site run by an individual, and it is not the official site for the plane.



The piece of metal is now thought to have come from a Continental DC-10 which took off just minutes before the Concorde.

(Millennium…….Continued from page 5)
window. But Command.Com is still there so you can run it from Start | Run, or you can create your own Program Entry for the MS-DOS Prompt as I just did. If you want to get to the real DOS prompt, you will need to create a Windows Millennium Startup disk and boot from it.

Millennium is much like Windows 98, except for some slight changes in appearance of the various Windows like what I just mentioned about MyComputer. There are, however, several new features worth noting. They are

- System Restoration
- System File Protection
- Boots and closes down faster than Windows 98/95.
- Video Editing
- Improved Networking

System Restore is similar to GoBack (see the article by Mary Sheridan in our December 1999 newsletter) and such programs which return your computer to an earlier time of your choosing. Furthermore you lose none of your work that has been saved in the MyDocuments Folder. I used this feature a day after getting the computer up and running. Needing a virus protection program, I installed a version of McAfee Virus Scan I had, then went to the Internet and downloaded their update of the program. Unfortunately the update never would complete its installation. I gave up on McAfee, used Add/Remove to uninstall what I could of McAfee and then did a System Restoration to when I first booted the computer that day. I then successfully installed Norton's antiviral program. Note that System Restore requires at least 200 MB of hard disk space; the more you give it to use (up to 2.4 GB), of course, the better it works. So this is not for older systems with small hard drives.

System File Protection will not allow any file that is important to Windows to be deleted or over written by an improper version. This should be a big help with what is known as DLL Hell, where the installation of a program results in its old and possibly defective DLLs replacing ones that were on your computer.

It seems to **boot and shutdown down faster** than 98. It certainly opens some programs very fast—especially the Microsoft Office products. This, however, may be due to how the Office programs are structured. I didn't notice any improvement in the opening of programs like Delphi or Corel Draw.

I will take Microsoft's word that **networking** has been made almost foolproof, since I already have a network up and running and thus didn't need that feature.

Regarding networking, though, there does seem to be something happening in the background that I would like to be able to stop since it slows things down considerably. When I access another computer on the network from the new computer, after I get to the directory I want and begin to, say, select some files for copying, things sometimes move very slowly. I think some aspect of Windows Me is possibly indexing the network drive and directory. When I access a directory on the Windows Me computer from another computer on the network, nothing like this happens. I would be interesting in hearing any ideas on this.

I didn't think much of the **Movie Maker** Program. It seemed sort of primitive to me. You can string together videos, still images and sound, but I saw no option to superimpose text. I suppose it is to real Video editing programs what Paint Brush is to real graphic programs like Corel Draw and Adobe Illustrator.

Not to end on a negative note, I think it is worth the upgrade from 98—especially at the prices I have seen quoted of $49 from Buy.Com and $59 from Microsoft. Of course, these are prerelease prices. I think the price after the September 14 release will be $109 from Microsoft for the upgrade and $209 for the regular version.

Minimum Requirements:

- Pentium 150 MHz or higher
- 32 MB RAM
- 200 MB – 400 of free Hard drive space for installation
- VGA monitor, CD drive & mouse ◆

Linksys EtherFast Cable/DSL Router

By Larry Anders, Librarian, Tampa PC Users Group
larry.anders@gtemail.net

If you have ever thought about setting up a home network (LAN) to share your Cable or xDSL connection with more than one computer, the Linksys Router was made specifically for this purpose. I've wanted to setup a network at my home now for quite a while. I have had a RoadRunner connection on my computer for a couple of years now, while my wife suffered-by on a dial-up connection on her computer (which meant that I actually suffered too because… well, you know what I mean.) I had tried to set up a connection sharing network when Win98se first came out, but I had so much trouble that I just let it slide. (I didn't realize initially that I had to have two NIC (Network Interface Cards) in the Server PC and one NIC in the client.) By the time I figured out what was wrong I had lost interest. But my wife is using her computer more and more these days, and the pressure was back on to do something about our Internet connection speed variance problem in our home.

Fortunately I have a neighbor who is also a computer geek, and he told me about a way that it could be done that was actually a piece of cake to install. I really didn't believe him at first so I put it off for a while. Recently I was visiting this neighbor and saw how he had networked three PCs to his RoadRunner connection and easily added his notebook while I was sitting there. So I made the commitment.

I went home, logged on the Buy.com and ordered a BEFSR41 Linksys EtherFast Cable/DSL router, and three days later darn near got instant broadband access to my wife's computer. It really was much easier than I had ever expected.

I unpacked the router, plugged in the power cord, plugged in a connection from my cable modem to the router, from the router to my wife's computer—all connections using Category 5 cable— and voilà, I had a broadband connection. Really! Only one NIC card was needed in each PC. I already had one in both PCs so it really was a snap (excuse the pun).

All you need to do is install a NIC card, which in Windows nowadays is literally just a snap. Once you do as I mentioned above there are only a couple of other things you need to do before you're connected. Start Internet Explorer (sorry, I don't know how to do it in Netscape), click on Tools, Internet Options, Connections and run the Setup Wizard. Choose to Setup your connection manually, connect through the LAN,

automatic discovery of proxy server, setup a mail account or not if you already have one and click on finish. Then, on your desktop right click on the Network Neighborhood icon, click on the Identification tag and make sure the Workgroup name is the same on both computers. At that point you should be able to log on the Internet at broadband speed. I had had an MSN account on my wife's PC in the past and had to disable MSN before it would connect properly. But that was it! My wife was happy, so I was happy. (…know what I mean?!)

Now, I used all the default settings, but the router comes with a web-based utility to set it up anyway you choose. It is a Hardware Based DHCP Server that allows you to share your Internet connection with up to 253 client PC's. You can **share out your single Internet connection** to that many systems. It also acts as a hardware Firewall, providing the security and protection from Internet Hackers and Peeping Tom's (lurkers). And, to top it all off, it's the ONLY Router in its class which uses a 4-Port 10/100 Switch, instead of a standard non-switching HUB! (In English: It's both fast and compatible.) It also has a dedicated uplink port so you can easily add more switches or hubs. This will allow you to expand your network beyond the built-in 4 port limit. Obviously, this Router provides for enough potential connections to satisfy the most insatiable tech-addict or small business. If you are considering this Router for a small business, it is capable of handling a fat (business level) **1.5MBps** pipe! (A business level T1 is only capable of 1.5Mbps. This router can handle a connection 8 TIMES faster than that.)

Some of the features are:

- Connects to a Broadband Modem Or to An Ethernet Backbone
- Equipped With a 4-port 10/100 Switch
- Connects All of Your PCs to the Internet With Only One Purchased IP Address
- Creates a Firewall to Protect Your PCs From Outside Intruders
- Configurable Through Any Networked PC's Web Browser
- The Switch Dramatically Speeds Up Your Gaming and Multimedia Connections
- Can Act as Either a DHCP Server or Client
- Compatible with All Standard Internet Applications

(Router……..Continued on page 8)

(Router……..Continued from page 7)

- Administrators Can Block Specific Interior Users' Internet Access
- Technical Support - 24 Hours a Day, 7 Days a Week
- Full 1-Year Warranty or Small Office

The Firewall is a Hardware-Based "Port Closer". A primary feature of this is that the Router will not respond to unsolicited requests from the Internet but there is not much control over this. It's either on or off. I prefer a software firewall with options to allow me more control. But it wasn't a problem. I just don't use the hardware-based firewall.

By the way, if you allow printer and file sharing you also have

a full-fledged peer-to-peer network thrown in for the price of the router, which was $149. I had a $30 off coupon from Buy.com so my final cost was $119 plus $7 shipping. It was well worth it for my peace of mind, (if you know what I mean). It really was very simple to set up. ◆

Personalizing & Mobilizing Your World
BLUESQUIRREL

ClickBook 2000

By William LaMartin, Editor, Tampa PC Users Group
lamartin@tampabay.rr.com

ClickBook from BlueSquirrel is a handy little printer utility that you really need, but you never knew it. Only a few programs allow double side printing. For such a program you have to reinsert the pages into the printer when it is time to print the second side—unless you have a duplex printer—but the program handles the chore of printing all the pages in the correct order. Microsoft Word is such a program. It allows you to first print even pages in reverse order, then turn the pages over and put them in the printer again and tell the program to print odd pages in regular order. Most programs don't do this. Enter ClickBook.

ClickBook enables double sided printing and more from any Windows program and on almost every printer. The more is also printing your document in many different booklet formats. Here is how the ClickBook people themselves describe the program:

….ClickBook 2000 is a program that will allow users to create and print normal documents into booklets of any size, as well as greetings cards, CD jewel case covers, day planner pages, etc. …… ClickBook 2000 ….. [is compatible] with 99% of the PCL printers out there, and some PS printers. In addition to that, it offers a flexible range of what you want to create to make booklets so small (and legible) as it would require a magnifying glass to read, all by simply printing out a regular document to one of our custom ClickBook drivers.

ClickBook works by intercepting standard-size pages on the way to your printer from virtually any Windows program that prints. ClickBook takes the pages, shrinks them down, and rearranges them to print out as a double-sided booklet. Create your documents as you usually do in whatever Windows programs you normally use. When you're ready to print, select the "CB" printer driver that was installed during ClickBook's setup, just as you would choose another printer.

I plan to use the program to print out a 40 page neighborhood directory on 8 x 11 paper with two 4.25 x 5.5 pages on each side of the paper (with no reduction in size). As a test, I took our newsletter, which consists of 12, 8.5 x 11 single sided pages in Microsoft Publisher, and printed to the ClickBook Printer driver for my HP 4 plus printer in the format described above for the neighborhood directory. The result was a reduced size version of the newsletter printed on both sides of three 8.5 x 11 sheets of paper instead of the usual three 11 x 17 double sided sheets you get in the mail.

Copyrighting the Internet

By James Weber, Secretary, Tampa PC Users Group
jlweber9@mindspring.com

Allow me a moment to vent my feelings. The last two issues of our newsletter discussed the most recent flap over copyright laws in this country, specifically Napster. Whether you agree with the federal court system in this case or not, Napster is going to lose out, period. Recent case law has upheld the notion that "sharing" copyrighted material by copying and keeping the original and giving away the copies for free is "distribution" in the eyes of the courts. Even though the defendant in this case (sorry, the name eludes me at this time) claimed he made no profit and money never changed hands, "distributing" MP3s on the internet violated the conditions of current copyright law. Read that as the CRIMINAL conditions of current copyright law. This was one person running a private MP3 web site, not a business providing access to hundreds of interconnected users. There were those in the internet community who felt this one lone gunman was a guinea pig before the record industry moved in on larger operations like Napster, and time has shown this to be more than just the paranoia of a few hackers.

Last year, if you remember, there was a similar case concerning MP3. The record industry pooled its resources, hired lawyers, and claimed in court that MP3 served no legitimate purpose other than breaking the law. After several early setbacks the MP3 community survived. If someone remembers the time frame please tell me, but I believe about five years ago the record industry had a short-lived attempt to close down businesses that sold used CDs as well. The claim then was only the person who initially purchased the tape or CD had rights to its use and the tapes and CDs couldn't be "distributed" further. Since I just bought a Tom Petty CD at Sound Exchange I don't think that went anywhere either.

Of similar but unheralded news we have federal judge Lewis Kaplin coming down hard on something known as DeCSS. Never heard of it? If Hollywood had its way you never would. DeCSS is a utility that unscrambles DVD signals and allows copying. This sounds like a no-brainer, "I'm not allowed to own a utility or machine to copy something I already own?" "What about my VCR or cassette recorder?" Don't forget, the movie and recording industry have attacked those in the recent past also. They tried to get the court system to interpret copyright law similar to computer software. If you haven't been listening to the radio recently there has been an enormous increase in scare commercials from a group called the "Business Software Alliance" reminding people of the severe penalties involved in software piracy. Piracy, or copyright infringement, involves the use of a single program on multiple computers, even if they are used for personal use and not "distributed". Imagine what would have happened if this strict enforcement had applied to every CD, tape, or VHS purchase.

These large industries fear something they don't understand and are trying to hold off their obsolescence as long as possible. I feel that the recording and movie industry have found themselves in the classic "buggy whip" situation where technology is making them obsolete and they are using the only tool they understand, lawsuits, to protect their vested interests. The internet was originally designed as a distributed network to store and share information outside of one central authority. Even though it was envisioned as a military endeavor, the recording industry and the government have no place complaining about the internet being used as it was intended. The law needs to be changed to enhance the growth of technology not to protect aging industries from technological development.

A new industry will arrive when and where we least expect it to take the changes around us and turn them into the sort of business that fills the needs of the consumer while protecting the rights and livelihood of the artists. If a company like Napster can create an environment where the artist is getting direct feedback from the consumer instead of market research figures, we may see more original talent like Elvis Presley and Jimmy Hendrix instead of Milli-Vanilli and the Backstreet Boys. This sort of direct connection between the end user and the artist is the way theater, painting, and music have been done for millennia and our culture has not suffered any the worse for it. ◆

(ClickBook……Continued from page 8)
The program is simple to install, and at the end of the installation it offers for each of your installed printers to add a ClickBook version of the printer to your Printers Folder.

To read more about the program, to download a free demonstration program or to purchase the program go to http://www.bluesquirrel.com. The program costs $49. ◆

Special Interest Groups

Microsoft Access SIG

This SIG meets the first Monday of the month at the Gateway 2000 Store on North Dale Mabry (just south of Columbus Drive) at 6:30 PM. **For September only we will meet on the first Tuesday.**

For information contact either William LaMartin at *lamartin@tampabay.rr.com* or Merle Nicholson at *merlenic@tampabay.rr.com.*

Genealogy SIG

To be included on the TPCUG genealogy mailing list, contact Jenny Lind Olin at 960-5723 or jlolin@aol.com

Visual Basic for Applications SIG

This SIG meets the third Tuesday of the month, at the Gateway 2000 Store on North Dale Mabry at 6:30 PM. For information, *contact Merle Nicholson at merlenic@tampabay.rr.com.*

Windows SIG

This SIG occupies the first 30 minutes of our monthly, regular meeting at MOSI and is devoted to a general Windows and computing discussion. Mary Sheridan moderates the discussion.

NEW PROJECTOR FUND DRIVE

By Merle Nicholson, Member-At-Large, Tampa PC Users Group
merlenic@tampabay.rr.com

The deed has been done. We are now owners of an excellent Proxima 9210 projector thanks to all the contributors. We had it in time to use it for the last meeting, and what a wonderful display it has! You definitely have to see it to believe the quality and brightness of the screen.

So the fund is officially closed. I announced the impending closure of the fund at the August meeting and have since gotten some last minute money in. It was needed. Thanks.

Most of the contributors asked to remain anonymous. Everyone will get a letter and receipt for tax purposes. Most of those are mailed out, but if you don't have yours yet, just be patient.

I do want to recognize three businesses for their very generous contributions. They are:

RDI-TampaBay – Steven Singer
L&M Graphic Designs – Mike Huchinson
Fort Knox Security Systems – John Witmer family

We got a very timely opportunity to get this system used from a rental company going out of business. The tip came from member Tom Cone. William LaMartin met Mike Hodges and Wade Herman there and tested it on a notebook. They also decided to pick up a projection screen. It comes in a large bulletproof suitcase. We still must discuss buying a replacement bulb or reserving the money for it, as they are very expensive: not less than $350 apparently.

So a special thanks goes to William, Mike, Wade and Tom for jumping on the deal and getting it accomplished so quickly.

And a very special thanks goes to all the people who contributed money. You have made our club much more viable and versatile. Thanks to all. ◆

Meeting Preview: At the October meeting we will have a presentation on MP3 from Bruce Fries, author of *The Internet Handbook.* Mary Sheridan, as usual, will conduct a 30-minute Windows discussion at the beginning of the meeting.

President's Message

By Mary Sheridan, President, Tampa PC Users Group
mcpease@mindspring.com

I'm really looking forward to the MP3 presentation this month. If you know a young person, please bring them with you to the meeting. Most are very interested in anything that's music related. I'm bringing my son-in-law and it was his idea to come when he found out whom the presenter was.

I'm writing this early, so I won't be able to tell you about the "Computer Technology Showcase". Watch for all the details in the November newsletter.

Windows ME was delivered to my door on the 15th of October. Have I installed it yet? No. Why? Because I'm basically a chicken and my computer is working great and, you know why! I'll take the plunge soon, but would really like to hear more about how it really works and installs from the people I trust,

(President.....Continued on page 2)

November 15: To be announced — Check the web site later

Commercial advertisements will be accepted. For rate information please contact the Editor by one of the above listed methods.

All advertisements must be prepaid by check payable to TPCUG, be in camera ready format (actual size, black ink on white paper), and be submitted on or before the 20th of the month preceding the month of publication. Commercial advertising is usually limited to 25% of the total space of an issue. The Editor reserves the right to hold ads if the total space for ads exceeds this limit or if they are not received on time.

Members may insert non-commercial ads at no charge with the following limitations: no more than 4 ads per member per year; no more than 40 words (240 bytes including spaces); must be camera ready copy or an ASCII file on diskette or as an attachment to an email message to the Editor. Those wishing to place ads are to contact the Editor, William LaMartin, at (813) 251-3817 for space availability and for further information.

Minutes of the September Meeting

By James Weber, Secretary, Tampa PC Users Group
jlweber9@mindspring.com

Our monthly meeting started at 6:00 PM. Mary moderated a discussion on DSL and cable modems. Even though there is much interest in DSL, no one present is currently subscribed to a DSL service. This was followed by a discussion of Windows ME problems. For those of you considering an update, be aware that many Windows 98 devices aren't functioning in ME.

The end of the year is approaching and recommendations for new officers will be appreciated.

The Gateway presentation was postponed due to a lack of participation on the part of Gateway. Member Jim Weber was able to give an impromptu presentation on the new wireless dispatch and report writing system being implemented by the Tampa Police Department.

While Jim was retrieving his laptop computer, William LaMartin demonstrated his BirdCam on the Internet. This was a picture of a bird at his home photographed by a video camera at one minute intervals with the picture being uploaded to the Internet via FTP. The video capture and FTP upload were accomplished with software he had written in Delphi.

Roger Waters won a Krups coffee maker in the drawing. The meeting was called to a close at 8:20 PM. ◆

(President……..Continued from page 1)
namely you guys.

Another reminder about the FACUG Fall Conference on October 14, 2000 at the Sunlight Community Church in Port St. Lucie, Florida. I'm making my hotel reservations today for October 13th and 14th. I use every chance I get for a mini-vacation. Since I'm

A $100 Digital Camera

By Forrest Wilcox, Tampa PC Users Group
fwilcox1@juno.com

I made my first purchase on the Home Shopping Network, a color digital camera. I wasn't expecting much, but now I declare it a bargain. It is made by Aiptek Inc., Lake Forest, Ca. Its pluses:

- It's the size and shape of a large butane lighter and weighs ounces.
- Has a USB port (many $200 cameras do not).
- Uses two AA batteries good for two hours of snap shots. Otherwise powered by the USB port.
- Low battery indication.
- Capacity of 80 pictures at high resolution, 360 pictures at low resolution.
- Will make a video stream, 0.9/0.2 fps.
- Has some unusual software.
- A ten second self-timer.
- E-mailing option.
- Powers down after 30 Seconds.

It's minuses:

- High resolution is 352 x 288, low is 176 x 144.
- Only supports Windows 98. (Not Windows 95 or ME)
- Manual is sketchy, but the programs are reasonably intuitive.

For my intended purpose the "low" resolution is not a problem. I use the camera for record purposes; I'll not be making portraits or enlargements. See photo printed in grayscale. With its small size it fits weightlessly in any pocket.

The camera has two buttons, one to snap the picture and one to turn on the camera and go through the menu:

- High Resolution
- Continuous (video stream)
- Self-timer
- Clear memory

- Low Resolution

The software installation (CD ROM) was without any problems and the software included is a Manager program, a special effects program including the usual greeting card stuff, Microsoft NetMeeting, and a fun program that will make a 360 degree moving panorama from a series of still shots. This requires a series of 10 - 20 shots that slightly overlap in a 360 degree circle. It is really quite dramatic. A second CD ROM is "Video Studio" for editing and capturing video clips.

The Manager program will make an AVI file from the video stream.

The only problem I have had is the e-mail function. I get "MAPI Failure" when I try to use it. Could that be because I use cheapo Juno as my ISP? It comes with a stand so it can sit on your monitor and act like the usual live PC video camera.

I am pleased with my bargain. ◆

(President…….. Continued from page 2)
the secretary for the FACUG, I'll need the R and R because of all that note taking. If you're interested in attending, just let me know and I'll be glad to tell you how to register.

(Continued on page 9)

Carpal Tunnel Vision

By Michael Hutchison, Tampa PC Users Group
myankee@ij.net

This is not a review of a program or recap of a solution to a computer problem (nor a recounting of a thwarted attempt at same). File this more along the line of reaction to what I see as burgeoning cyber-elitism. The manifestations of this phenomenon can range from frustration among older members of the work force to across-the-board featherbedding of public school budgets all over America. Those culpable are by and large the sales departments of the computer industry and politicians whose slush funds are in need of reformatting. Three years ago the Tampa Tribune ran an article in their Commentary section entitled ***Wired to Learn*** by Larry Cuban. This Op/Ed piece gave voice to viewpoints which I thought then and still feel are being bulldozed by the computer industries and their various admen, lobbyists and assorted other shills.

In this article the author raised questions which should be given serious thought by every parent, educator, school board member and legislator in this country. The general theme was that there was (and is) a real danger that we are trying to hand over the task of education to the computer manufacturers and software companies. I do not have an agenda which is fundamentally opposed to the computer industry. I use computers over my own network every day. I recently purchased a laptop that I did not have a comprehensive plan to implement in my business at the time of remittance. Thus, I feel it is *not* a bias against computers which compels me to commit to paper (via Email to our Editor) these thoughts. It is also my strong feeling that Mr. Cuban's article did not carry the line of reasoning out to its conclusion. While it is my central contention here that a techno-snob culture is in full bloom, one must look at the heralds and harbingers of the information age to find the genesis of this attitude. What is the true, fulsome motivation of those relentlessly telling the world that the computer is the alpha and the omega? It is, of course, the last 2-3 decades track record for sales in the field and the very reasonable expectation of like returns in the foreseeable future. The fact that a book by *the* captain of the industry held sway to any extent by touting the role which still more, newer and better computer devices will play in our lives should be a warning sign on that road. That billboard should be colored with irony; apparently it was deemed necessary to use the tired old printed word to help round up the laggard cattle, prod them to finish this cycle of rumination and prepare them for the next "must-have" device or application which will be obsolete before being fully debugged.
